To: Kimberly Henry <kimberly.henry@lacity.org>

I received a notice of extension regarding this case. Please advise if you need anything from LAFD, I have recently taken over this process and do not know if you have received a response previously. I do not have a current request or proof of payment regarding a response request.

Thank you

If you are not the intended recipient, be aware that any disclosure, copying, distribution or unauthorized use of the content of this information is prohibited. If you have received this communication in error, please notify us immediately by e-mail and delete the original message and any attachments without reading or saving in any manner.

Kimberly Henry <kimberly.henry@lacity.org> Mon, Apr 18, 2022 at 3:44 PM
To: Matthew Craig <Matthew.Craig@lacity.org>

Hi Inspector Craig,

We previously sent the LAFD Service Letter Request regarding this project, to LAFD (Captain Mittino at the time) on October 28, 2020, at the time that the Notice of Preparation was sent out for the Draft EIR. I then received LAFD's response on February 20, 2021. Therefore, as far as I know, I've received what we needed from LAFD for this project, unless you have additional comments on the project that you would like to provide.

I've attached the original Service Letter Request and the Response from LAFD that I received, for your reference. Please let me know if you need anything from me for this project, or if you'd like to provide any additional comments to us on the Project from LAFD.

Thanks,
Kimberly

Good Morning Ms. Henry,

The Los Angeles Department of Water and Power (LADWP) is submitting a comment letter for the Harvard-Westlake Project. I have also attached the notification letter we received regarding the project for your reference. Please let me know if you have any questions, and thank you for the opportunity to provide comments on this project.

Thank You,

Marshall Styers

Ms. Kimberly Henry
Department of City Planning
City of Los Angeles
221 North Figueroa Street, Suite 1350
Los Angeles, CA 90012

Dear Ms. Henry:

Subject: Harvard-Westlake River Project Draft Environmental Impact Report

The Los Angeles Department of Water and Power (LADWP) appreciates the opportunity to provide comments on the Harvard-Westlake River Project (Project) Draft Environmental Impact Report. The mission of LADWP is to provide clean, reliable water and power to the City of Los Angeles. Based on our review of the Project Initial Study we respectfully submit the below comments.

Comments:

Joint:

1) The City of Los Angeles, herein referred to as City, shall pertain to its employees, agents, consultants, contractors, officers, patrons, or invitees of the City, or by any other of the City's affiliated entities.

2) This response shall not be construed as an approval for any project.

Water System:

IV. Environmental Impact Analysis I. Hydrology and Water Quality

1. The project description on page IV.I-28 indicates that the construction will require grading, excavation and dewatering activities below the historical groundwater level. These activities could potentially impact and/or deplete the San Fernando

Basin's (SFB) groundwater supplies, a principle groundwater resource in the Upper Los Angeles River Area (ULARA). The City of Los Angeles (City) relies on groundwater from the SFB to supply its over four million customers. The City has prior and paramount pueblo water rights to the native ground waters rights, as well as the right to store and recapture water, as set forth in the judgment in The City of Los Angeles v. City of San Fernando, Los Angeles Superior Court Case No. 650079, dated January 26, 1979 (ULARA Judgment). To avoid impacting the City's rights, the project should incorporate the following:

a. Establish communication with the court appointed ULARA Watermaster, Richard C. Slade & Associates LLC, 14051 Burbank Boulevard, Suite 300, Sherman Oaks, CA 91401, Phone (818) 506-0418, http://ularawatermaster.com/ and LADWP staff Mr. Manuel Aguilar at (213) 367-3465 or via email at Manuel.Aguilar@ladwp.com. The ULARA Judgment requires safe yield operations for the SFB to ensure groundwater extractions over the long-term do not create a condition of overdraft. Basin management in SFB is achieved by collective efforts of a court-appointed Watermaster and an administrative committee consisting of representatives from the City's LADWP and other public water supply agencies.

b. Install flow meters on extraction wells and report extractions to LADWP. Contact LADWP staff Mr. Manuel Aguilar at (213) 367-3465 or via email at Manuel.Aguilar@ladwp.com for information on how to report extractions.

c. Compensate the City by annual payment for the loss incurred from groundwater extractions. Contact LADWP staff Mr. Manuel Aguilar at (213) 367-3465 or via email at Manuel.Aguilar@ladwp.com for more information.

2. Beneficial reuse of dewatering discharge (as an alternative to discharging to the storm drain or sewer) on or off-site is encouraged as a conservation measure. In addition to water conservation, beneficial reuse may reduce or eliminate costs associated with storm drain and sewer permitting and monitoring. Common applications of Beneficial Reuse include, Landscape irrigation, Cooling tower make-up, and Construction (dust control, concrete mixing, soil compaction, etc.)

Power System:

1) The Project encompasses an area with various LADWP overhead and underground distribution lines. LADWP advises the City to coordinate overhead or underground electrical distribution conflicts through the following email address: dwpps.coordination@ladwp.com.

For any questions regarding the above comments, please contact Mr. Marshall Styers of my staff at (213) 367-3541 or Marshall.Styers@ladwp.com.

Sincerely,

Nadia Parker Digitally signed by Nadia Parker

Kimberly,

LADOT concerns appear to have been thoroughly expressed and represented in the assessment letter provided for this project on June 10th and 11th, 2021. At this time, there are no further comments.

Sincerely,

Brandon Wilson, T.E., MPA

Transportation Engineering Associate III (Acting)
Valley Development Review

Subject: Comments on the Draft Environmental Impact Report for Harvard-Westlake River Park Project, SCH #2020090536, Los Angeles County

Dear Ms. Henry:

The California Department of Fish and Wildlife (CDFW) has reviewed the Draft Environmental Impact Report (DEIR) for Harvard-Westlake River Park Project (Project) from the City of Los Angeles (City). Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code.

CDFW's Role

CDFW is California's Trustee Agency for fish and wildlife resources and holds those resources in trust by statute for all the people of the State [Fish & G. Code, §§ 711.7, subdivision (a) & 1802; Pub. Resources Code, § 21070; California Environmental Quality Act (CEQA) Guidelines, § 15386, subdivision (a)]. CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (Id., § 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect state fish and wildlife resources.

CDFW is also submitting comments as a Responsible Agency under CEQA (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381). CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code, including lake and streambed alteration regulatory authority (Fish & G. Code, § 1600 *et seq*.). Likewise, to the extent implementation of the Project as proposed may result in "take", as defined by State law, of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 *et seq.*), or CESA-listed rare plant pursuant to the Native Plant Protection Act (NPPA; Fish & G. Code, §1900 *et seq.*), CDFW recommends the Project proponent obtain appropriate authorization under the Fish and Game Code.

DocuSign Envelope ID: F712168D-17BC-4278-A5A0-7AA0D1E7F5B2

Project Description and Summary

Objective: The Harvard-Westlake River Park Project (Project) involves the redevelopment of the approximately 16.1-acre Weddington Golf & Tennis site and an adjacent approximately 1.1-acre open space portion of property along the Los Angeles River leased from Los Angeles County. The collective 17.2-acre Project site will be developed for use as an athletic and recreational facility for the Harvard-Westlake School and for shared public use. The Project would remove the existing golf course, driving range, and tennis facility. The Project would then develop two athletic fields with bleacher seating; an 80,249-square-foot, two-story multi-purpose gymnasium; a 52-meter swimming pool with seating; eight tennis courts with seating; one level of below-grade parking; and a surface parking lot. The Project would include ancillary field buildings, three security kiosks, exterior light poles, walls/fencing, retention of the existing clubhouse structure, putting green, low brick retaining wall with weeping mortar, and golf ball-shaped light standards. The Project would remove 240 of the existing 421 trees and plant 393 new trees. The Project would include a 1-million-gallon stormwater capture and reuse system for water conservation and treatment purposes. The Project would also provide approximately 5.4 acres of publicly accessible open space and landscaped trails connecting to the adjacent Zev Yaroslavsky Los Angeles River Greenway (Zev Greenway). The Project would also provide on-site landscaped areas, water features, and recreational facilities. The Project involves off-site improvements to the Valleyheart Drive public right-of-way, portions of the Zev Greenway adjacent to the Project site, and an ADA compliant ramp to provide a pedestrian connection between the Zev Greenway and Coldwater Canyon Avenue northwest of the Project site. Project development would require excavation and grading of the Project site to a maximum depth of approximately 21 feet below grade and a net cut/fill volume of approximately 250,000 cubic yards.

Location: The area proposed for the Project is owned by the Harvard-Westlake School located at 4047, 4141, and 4155 N. Whitsett Avenue and 12506, 12600, and 12630 W. Valley Spring Lane. The Project site consists of one parcel generally bounded by Bellaire Avenue to the west, Valley Spring Lane to the north, the Los Angeles River and Valleyheart Drive to the south, Whitsett Avenue to the east, and Los Angeles Fire Department Fire Station 78 to the southeast. The property leased from Los Angeles County is located between the Project site and the Los Angeles River.

Comments and Recommendations

CDFW offers the comments and recommendations below to assist the City in adequately identifying, avoiding, and/or mitigating the Project's significant, or potentially significant, direct, and indirect impacts on fish and wildlife (biological) resources. Editorial comments or other suggestions are also included to improve the environmental document. CDFW recommends the measures or revisions below be included in a science-based monitoring program that contains adaptive management strategies as part of the Project's CEQA mitigation, monitoring and reporting program (Pub. Resources Code, § 21081.6; CEQA Guidelines, § 15097).

DocuSign Envelope ID: F712168D-17BC-4278-A5A0-7AA0D1E7F5B2

Specific Comments

Comment #1: Impacts from New Path Installation

Issue: The Project proposes to install a trail along the Zev Greenway.

Specific Impacts: The DEIR states, “implementation of the Project would result in limited impacts from a proposed river connection (trail), river fence, and river overlook to 0.14 acre of recently restored California brittlebush scrub (16 percent of off-site sensitive natural community).” Elevated pedestrian usage is likely to create direct and indirect impacts to local wildlife species through the loss of potential habitat.

Why impacts would occur: The area of influence that the trail has upon the surrounding habitat is being increased. An increase in use has potential to impact sensitive wildlife species and their habitat through a variety of ways:

- increased numbers of people and dogs using the trail
- loss of habitat due to erosion from footpaths
- increased noise levels
- increased trash or pet waste
- introduction of unnatural food sources via trash and trash receptacles
- introduction of invasive species from other sites

Outdoor recreation has the potential to disturb wildlife, resulting in energetic costs, impacts to animals’ behavior and fitness, and avoidance of otherwise suitable habitat. These impacts may negatively affect wildlife’s ability to persist in an area or cause potential mortality. Studies have shown that outdoor recreation is the second leading cause of the decline of federally threatened and endangered species on public lands (Losos et al. 1995) and fourth leading cause on all lands (Czech et al. 2000). As a result, natural resource managers are becoming increasingly concerned about impacts of recreation on wildlife (Knight and Gutzwiller 1995).

Recreational trails can fragment the habitat that they pass through. These negative impacts generally result from the expansion of the area of influence that a trail has on its surrounding open space. Trails can create artificial boundaries or areas of avoidance for wildlife as they bring outsiders into areas that would otherwise be unvisited. Along with these perceived outsiders, in this case pedestrians, comes a new set of perceived threats to local wildlife in the form of visual, auditory, and olfactory cues that remain along the trail well after recreational usage.

If habitat is available, wildlife may move to areas farther from trails, beyond the areas of influence, to avoid recreation-related disturbance (Reed et al. 2019). However, the Los Angeles County leased area and Zev Greenway, is already small (1.1 acres) and is the only open space in the Project vicinity where wildlife might retreat to. With the addition of the trail, it reduces the opportunities for wildlife to retreat from nearby recreational users in an area with already little habitat available.

DocuSign Envelope ID: F712168D-17BC-4278-A5A0-7AA0D1E7F5B2

With increased recreational usage of trails through open spaces comes increased exposure of wildlife to humans. Habituated urban wildlife is less likely to avoid contact with humans, which may increase the probability of human-wildlife conflicts and of attraction to anthropogenic food sources; both are considered problematic in many urban areas (Whittaker and Knight 1998; George and Crooks 2006). Wildlife habituation to humans may also increase wildlife aggression toward humans, or render wildlife more vulnerable to predators, poaching, or roadkill (Whitaker and Knight 1998; George and Crooks 2006; Marzano and Dandy 2012). Furthermore, habituation of wildlife may impact their reproductive success. Habituation of adult individuals may also be associated with negative consequences for their offspring as habituation of adults does not necessarily lead to immediate habituation of juveniles (Reilly et al. 2017).

Evidence impacts would be significant: Project activities and humans that may utilize the trail may negatively impact wildlife behaviors. Appropriate avoidance, minimization, and mitigations have not been included for the trail creation. Without avoidance, minimization, or mitigation measures, the Project may have a substantial adverse direct and cumulative effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by CDFW.

Recommended Potentially Feasible Mitigation Measure(s):

Mitigation Measure #1: Educational materials and signage should be made available to trail users to keep aware of the impacts that human disturbance brings to open spaces. People should be made aware of the impacts that they have on surrounding habitat (such as noise or smells), particularly during breeding seasons.

CDFW recommends the City install appropriate public information signage at trailheads to: 1) educate and inform the public about wildlife present in the area; 2) advise on proper use of the trail in a manner respectful to wildlife; and 3) provide local contact information to report injured or dead wildlife. Signage should be written in the language(s) understandable to all those likely to recreate and use the trails. Signage should not be made of materials harmful to wildlife such as spikes or glass. The City should provide a long-term maintenance plan to repair and replace the signs.

Mitigation Measure #2: Trash receptacles should be placed only at trailheads to avoid creating an unnatural food source that may attract nuisance wildlife and to minimize waste.

Comment #2: Impacts to Rivers

Issue: The DEIR proposes a 1-million-gallon underground stormwater capture and reuse system. The system will treat water that is collected on site as well as water collected from the 39-acre residential neighborhood to the north of the Project site.

Specific impacts: The Project has potential to result in the permanent impacts to stream function and biological diversity downstream of the Project.

Why impacts would occur: Project activities will potentially permanently alter the stormwater flow into the Los Angeles River, potentially impacting fish and wildlife resources downstream. According to the DEIR, “during rainfall events and with dry weather flows (such as residential

DocuSign Envelope ID: F712168D-17BC-4278-A5A0-7AA0D1E7F5B2

landscape irrigation and car washing), water flows from this residential neighborhood to an inlet that directs water into the Los Angeles River." CDFW is concerned this could potentially reduce water availability in stream, which could be considered a significant impact to biological resources. Flow reductions, especially dry season flow, could impact beneficial uses directly or indirectly through habitat modifications. Diverting water from streams, such as Los Angeles River, during the dry season could reduce the availability and extent of shallow water sheet flow. The resulting sheet flows may allow phytoplankton (algae and cyanobacteria), microorganisms, and herbaceous vegetation to establish. The algae provide habitat and a food source for benthic invertebrates, a vital food source for wading birds. The diversion of water could potentially impact algae and benthic invertebrates, and eventually birds.

Seasonality: During the dry season, typically April through September in southern California, the many concrete-lined channels are largely maintained by urban runoff and discharge from wastewater reclamation plants. Diverting water could be significant during the dry season and could either significantly reduce water flow or result in complete loss of water flow.

Drought: Since 2000, the longest duration of drought in California lasted between 2011 and 2019 (USGS 2021) and in southern California, between 2012 through 2016 (Los Angeles Almanac 2021). The 2017-2018 rainfall season was below normal and the driest for Los Angeles since 2006-2007 (Los Angeles Almanac 2021). Diverting water during a below-normal rainfall year may significantly reduce water flow or result in complete loss of water flow.

Downstream and associated biological resources beyond the Project development footprint may also be impacted by Project-related releases of sediment or debris and altered watershed effects resulting from Project activities.

Evidence impacts would be significant: Changes to hydrology, both within the Project area and downstream, are reasonable potential direct and indirect physical changes in the environment. Said changes and their potential impacts on biological resources should be analyzed and disclosed in an environmental document. Adequate disclosure is necessary for CDFW to assist a lead agency in adequately identifying, avoiding, and/or mitigating a project's significant, or potentially significant, direct, and indirect impacts on biological resources.

Fish and Game Code section 1602 requires any person, State or local governmental agency, or public utility to notify CDFW prior to beginning any activity that may do one or more of the following:

- Divert or obstruct the natural flow of any river, stream, or lake;
- Change the bed, channel, or bank of any river, stream, or lake;
- Use material from any river, stream, or lake; or,
- Deposit or dispose of material into any river, stream, or lake.

The Project may adversely affect the existing hydrology pattern of the Project site as well as downstream. This may occur through the alteration of flows to streams. In addition, impacts to biological resources off site, such as the Glendale Narrows, may occur. The Project may substantially adversely affect the existing stormwater flows into streams through the alteration of drainages on site. It is unclear if these stormwater diversions would impact biological resources offsite because an investigation has not been made to determine so. Therefore, appropriate avoidance, minimization, and mitigations have not been determined. Inadequate investigation

DocuSign Envelope ID: F712168D-17BC-4278-A5A0-7AA0D1E7F5B2

may result in the Project continuing to have a substantial adverse direct and cumulative effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by CDFW.

Recommended Potentially Feasible Mitigation Measure(s):

Mitigation Measure #1: The Project may result in the alteration of streams. For any such activities, the Project applicant (or "entity") must provide written notification to CDFW pursuant to section 1600 *et seq.* of the Fish and Game Code. Based on this notification and other information, CDFW determines whether a Lake and Streambed Alteration (LSA) Agreement with the applicant is required prior to conducting the proposed activities. Please visit CDFW's Lake and Streambed Alteration Program webpage for information about LSA Notification and online submittal through the Environmental Permit Information Management System (EPIMS) Permitting Portal (CDFW 2021a).

Mitigation Measure #2: CDFW recommends the LSA Notification include a hydrology report to evaluate whether altering streams within the Project site may impact hydrologic activity within and downstream of the Project site. The hydrology report should also include an analysis to determine if Project activities will impact the current hydrologic regime or change the velocity of flows on site and downstream. The hydrology report should also determine if the Project will result in substantial changes to water availability downstream for biological resources in the Glendale Narrows. CDFW also requests a hydrological evaluation of any potential scour or erosion at the Project site and downstream due to a 100, 50, 25, 10, 5, and 2-year frequency storm event for existing and proposed conditions to determine how the Project activities may change the hydrology on site.

Mitigation Measure #3: CDFW recommends the Project implement Best Management Practices (BMPs) to prevent erosion and the discharge of sediment and pollutants into drainages during Project activities. CDFW recommends BMPs be monitored and repaired, if necessary, to ensure maximum erosion, sediment, and pollution control. The Project proponent should prohibit the use of erosion control materials potentially harmful to fish and wildlife species, such as mono-filament netting (erosion control matting) or similar material, within stream areas. All fiber rolls, straw wattles, and/or hay bales utilized within and adjacent to the Project site should be free of nonnative plant materials. Fiber rolls or erosion control mesh should be made of loose-weave mesh that is not fused at the intersections of the weave, such as jute, or coconut (coir) fiber, or other products without welded weaves. Non-welded weaves reduce entanglement risks to wildlife by allowing animals to push through the weave, which expands when spread.

Recommendation #1: CDFW recommends the DEIR include an analysis of potential impacts on biological resources resulting from the proposed water diversion. At a minimum, the analysis should evaluate a study reach that includes the channel downstream from the Project site. The study reach should extend a minimum of one mile downstream or an appropriate distance determined by both a qualified biologist and hydrologist, whichever is greater. The analysis of the study reach should discuss changes in hydrology and hydraulics, including the following:

1. Under pre-project (i.e., baseline) conditions, the volume of water flow from both the Project area and study reach during a) the wet (November through March); b) the dry

DocuSign Envelope ID: F712168D-17BC-4278-A5A0-7AA0D1E7F5B2

season (April through October); and c) above-average and below-average water year (i.e., wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year). The analysis should clearly define above-average or below-average rainfall year.

2. Under proposed Project conditions, the percent reduction in flow from both the Project area and study reach for a wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year.
3. A quantitative analysis comparing the flow from the Project area and other tributaries into the study reach, and their relative contribution to the hydrograph of the study reach.
4. A quantitative analysis of other potential stormwater diversion Projects along the Los Angeles River, both up and downstream, and their cumulative impact to the hydrograph of the study reach.
5. An analysis of potential Project-related changes to river hydraulics in both concrete-lined and soft-bottom reaches. This includes water depth (percent change), wetted perimeter (acres gained/lost), and velocity (percent change).

Recommendation #2: CDFW's issuance of an LSA Agreement for a Project that is subject to CEQA will require CEQA compliance actions by CDFW as a Responsible Agency. As a Responsible Agency, CDFW may consider the CEQA document from the City for the Project. To minimize additional requirements by CDFW pursuant to Fish and Game Code section 1600 et seq. and/or under CEQA, the CEQA document should fully identify the potential impacts to the stream or riparian resources and provide adequate avoidance, mitigation, monitoring, and reporting commitments for issuance of the LSA Agreement.

To compensate for any on- and off-site impacts to wetlands or riparian resources, additional mitigation conditioned in any LSA Agreement may include the following: erosion and pollution control measures, avoidance of resources, protective measures for downstream resources, on- and/or off-site habitat creation, enhancement or restoration, and/or protection, and management of mitigation lands in perpetuity

Additional Comments and Recommendations

Phased Removal. CDFW recommends the City consider phased removal of trees (i.e., phased Project approach) in order to minimize impacts resulting from the temporal loss of trees and to provide structurally diverse tree replacement habitat while mitigation for impacts to tree removal occurs.

Bats. CDFW recommends modifying BIO-MM-1 to include underlined language and remove language with strikethrough.

"Due to the presence of potentially suitable roosting habitat (ornamental trees) for special-status bat species (i.e., western yellow bat), Harvard-Westlake School shall demonstrate and guarantee to the satisfaction of the Los Angeles Department of City Planning that either of the following has been or shall be accomplished:

1. Tree removal activities shall be scheduled outside of the maternity roosting season (October 1 through February 28) to avoid potential impacts to special-status bat species.

DocuSign Envelope ID: F712168D-17BC-4278-A5A0-7AA0D1E7F5B2

2. Any construction or palm tree removal activities that occur during the maternity roosting season for special-status bat species (March 1 through September 30) shall require a qualified biologist experienced with bat roost biology to conduct a pre-construction (or pre-tree removal) survey, using sonic bat detectors (e.g., Anabat or Sonobat) to determine whether special status bat species are roosting within trees that would be removed. The surveys shall be conducted at dusk and after nightfall by a biologist. If an active roost site is located during the pre-construction survey, the roost shall be avoided and Project activities shall be conducted as recommended by the biologist to avoid the area, which may include temporary postponement or provision of a suitable buffer established around the roost until roosting activities cease. Suitable buffers could include netting, canvas, or similar materials as recommended by the biologist. A report shall be submitted to the City with the results of the pre-construction or tree removal survey and any needed maternity roost avoidance actions. Depending on the survey results, a qualified bat specialist should discuss potentially significant effects of the Project on bats and include species specific mitigation measures to reduce impacts to below a level of significance (CEQA Guidelines, § 15125). Surveys, reporting, and preparation of robust mitigation measures by a qualified bat specialist should be completed and submitted to the City prior to any Project-related ground-disturbing activities or vegetation removal at or near locations of roosting habitat for bats.

3. If bats are not detected, but the bat specialist determines that roosting bats may be present at any time of year and could roost in trees at a given location, during tree removal, trees should be pushed using heavy machinery prior to using a chainsaw to remove them. To ensure the optimum warning for any roosting bats that may still be present, trees should be pushed lightly two or three times, with a pause of approximately 30 seconds between each nudge to allow bats to become active. A period of at least 24 hours, and preferable 48 hours, should elapse prior to such operations to allow bats to escape".

Nesting Birds. As currently written, the measures included in Section 2.a.2.a. *California Department of Fish and Wildlife* on pages IV.C-4 and IV.C-5 of the DEIR for nesting birds may not be enforceable as they are not listed as mitigation. CDFW recommends the measures be considered enforceable biological mitigation measures for the Project and be included as BIO-MM-4.

It should be noted that the temporary halt of Project activities within nesting buffers during nesting season does not constitute effective mitigation for the purposes of offsetting Project impacts associated with habitat loss. Additional mitigation would be necessary to compensate for the removal of nesting habitat within the Project site based on acreage of impact and vegetation composition. CDFW shall be consulted to determine proper mitigation for impacts to occupied habitat depending on the status of the bird species. Mitigation ratios would increase with the occurrence a California Species of Special Concern and would further increase with the occurrence of a CESA-listed species.

Data. CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations [Pub. Resources Code, § 21003, subd. (e)]. Accordingly, please report any special status species detected by completing and submitting CNDDB Field Survey Forms (CDFW 2021b). This includes all documented occurrences of Nevin's barberry and other special status species. The City should ensure the data has been properly submitted, with all data fields applicable filled out, prior to Project ground-disturbing

DocuSign Envelope ID: F712168D-17BC-4278-A5A0-7AA0D1E7F5B2

activities. The data entry should also list pending development as a threat and then update this occurrence after impacts have occurred. The City should provide CDFW with confirmation of data submittal.

Mitigation and Monitoring Reporting Plan. Per Public Resources Code section 21081.6(a)(1), CDFW has provided the City with a summary of our suggested mitigation measures and recommendations in the form of an attached Draft Mitigation and Monitoring Reporting Plan (MMRP; Attachment A). A final MMRP shall reflect results following additional plant and wildlife surveys and the Project's final on and/or off-site mitigation plans.

Filing Fees

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the City of Los Angeles and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required for the underlying Project approval to be operative, vested, and final (Cal. Code Regs., tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089).

Conclusion

We appreciate the opportunity to comment on the Project to assist the City of Los Angeles in adequately analyzing and minimizing/mitigating impacts to biological resources. CDFW requests an opportunity to review and comment on any response that the City of Los Angeles has to our comments and to receive notification of any forthcoming hearing date(s) for the Project [CEQA Guidelines, § 15073(e)]. If you have any questions or comments regarding this letter, please contact Felicia Silva, Environmental Scientist, at Felicia.Silva@wildlife.ca.gov or (562) 292-8105.

Sincerely,

Attachment A: Draft Mitigation and Monitoring Reporting Plan

CDFW recommends the following language to be incorporated into a future environmental document for the Project. A final MMRP shall reflect results following additional plant and wildlife surveys and the Project's final on and/or off-site mitigation plans.

Biological Resources (BIO)			
Mitigation Measure (MM) or Recommendation (REC)		**Timing**	**Responsible Party**
MM-BIO-1-Trail Installation	Educational materials and signage shall be made available to trail users to keep aware of the impacts that human disturbance brings to open spaces. People shall be made aware of the impacts that they have on surrounding habitat (such as noise or smells), particularly during breeding seasons. CDFW recommends the City install appropriate public information signage at trailheads to: 1) educate and inform the public about wildlife present in the area; 2) advise on proper use of the trail in a manner respectful to wildlife; and 3) provide local contact information to report injured or dead wildlife. Signage shall be written in the language(s) understandable to all those likely to recreate and use the trails. Signage shall not be made of materials harmful to wildlife such as spikes or glass. The City should provide a long-term maintenance plan to repair and replace the signs.	Prior to Project construction and activities	City/Project Applicant
MM-BIO-2-Trail Installation	Trash receptacles shall be placed only at trailheads to avoid creating an unnatural food source that may attract nuisance wildlife and to minimize waste in core habitat areas.	Prior to Project construction and activities	City/Project Applicant
MM-BIO-3-LSA	The Project may result in the alteration of streams. For any such activities, the Project applicant (or "entity") must provide written notification to CDFW pursuant to section 1600 *et seq.* of the Fish and Game Code. Based on this notification and other information,	Prior to Construction	Project Applicant

DocuSign Envelope ID: F712168D-17BC-4278-A5A0-7AA0D1E7F5B2

	CDFW determines whether a Lake and Streambed Alteration (LSA) Agreement with the applicant is required prior to conducting the proposed activities. Please visit CDFW's Lake and Streambed Alteration Program webpage for information about LSA Notification and online submittal through the Environmental Permit Information Management System (EPIMS) Permitting Portal (CDFW 2021a).		
MM-BIO-4-Hydrology Report	The LSA Notification shall include a hydrology report to evaluate whether altering streams within the Project site may impact hydrologic activity within and downstream of the Project site. The hydrology report shall also include an analysis to determine if Project activities will impact the current hydrologic regime or change the velocity of flows on site and downstream. The hydrology report shall also determine if the Project will result in substantial changes to water availability downstream for biological resources in the Whittier Narrows. CDFW also requests a hydrological evaluation of any potential scour or erosion at the Project site and downstream due to a 100, 50, 25, 10, 5, and 2-year frequency storm event for existing and proposed conditions to determine how the Project activities may change the hydrology on site.	Prior to Construction	Project Applicant
MM-BIO-5-BMPs	The Project shall implement Best Management Practices (BMPs) to prevent erosion and the discharge of sediment and pollutants into drainages during Project activities. BMPs shall be monitored and repaired, if necessary, to ensure maximum erosion, sediment, and pollution control. The Project proponent shall prohibit the use of erosion control materials potentially harmful to fish and wildlife species, such as mono-filament netting (erosion control matting) or similar material, within stream areas. All fiber rolls, straw wattles, and/or hay bales utilized within and adjacent to the Project site shall be free of nonnative plant materials. Fiber rolls or erosion control mesh shall be made of loose-weave mesh that is not fused at the intersections of the weave, such as jute, or coconut (coir) fiber, or other products without welded weaves. Non-welded	Prior to Construction	Project Applicant

DocuSign Envelope ID: F712168D-17BC-4278-A5A0-7AA0D1E7F5B2

	weaves reduce entanglement risks to wildlife by allowing animals to push through the weave, which expands when spread.		
REC-1-Diversion Analysis	CDFW recommends the DEIR include an analysis of potential impacts on biological resources resulting from the proposed water diversion. At a minimum, the analysis should evaluate a study reach that includes the channel downstream from the Project site. The study reach should extend a minimum of one mile downstream or an appropriate distance determined by both a qualified biologist and hydrologist, whichever is greater. The analysis of the study reach should discuss changes in hydrology and hydraulics, including the following: 1. Under pre-project (i.e., baseline) conditions, the volume of water flow from both the Project area and study reach during a) the wet (November through March); b) the dry season (April through October); and c) above-average and below-average water year (i.e., wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year). The analysis should clearly define above-average or below-average rainfall year. 2. Under proposed Project conditions, the percent reduction in flow from both the Project area and study reach for a wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year. 3. A quantitative analysis comparing the flow from the Project area and other tributaries into the study reach, and their relative contribution to the hydrograph of the study reach 4. A quantitative analysis of other potential stormwater diversion Projects along the Los Angeles River, both up and downstream, and their cumulative impact to the hydrograph of the study reach.	Prior to Construction	Project Applicant

DocuSign Envelope ID: F712168D-17BC-4278-A5A0-7AA0D1E7F5B2

	5. An analysis of potential Project-related changes to river hydraulics in both concrete-lined and soft-bottom reaches. This includes water depth (percent change), wetted perimeter (acres gained/lost), and velocity (percent change).		
REC-2-Phased Removal	CDFW recommends the City consider phased removal of trees (i.e., phased Project approach) in order to minimize impacts resulting from the temporal loss of trees and to provide structurally diverse tree replacement habitat while mitigation for impacts to tree removal occurs.	Prior to Construction	Project Applicant
REC-3-Bats	CDFW recommends modifying BIO-MM-1 to include <u>underlined</u> language and remove language with strikethrough. Due to the presence of potentially suitable roosting habitat (ornamental trees) for special-status bat species (i.e., western yellow bat), Harvard-Westlake School shall demonstrate and guarantee to the satisfaction of the Los Angeles Department of City Planning that either of the following has been or shall be accomplished: 1. Tree removal activities shall be scheduled outside of the maternity roosting season (October 1 through February 28) to avoid potential impacts to special-status bat species. 2. Any construction or palm tree removal activities that occur during the maternity roosting season for special-status bat species (March 1 through September 30) shall require a qualified biologist experienced with bat roost biology to conduct a pre-construction (or pre-tree removal) survey, using sonic bat detectors (e.g., Anabat or Sonobat) to determine whether special status bat species are roosting within trees that would be removed. The surveys shall be conducted at dusk and after nightfall by a biologist. If an active roost site is located during the pre-construction survey, the roost shall be avoided and Project activities shall be conducted as recommended by the	Prior to Construction	Project Applicant

DocuSign Envelope ID: F712168D-17BC-4278-A5A0-7AA0D1E7F5B2

	biologist to avoid the area, which may include temporary postponement or provision of a suitable buffer established around the roost until roosting activities cease. Suitable buffers could include netting, canvas, or similar materials as recommended by the biologist. A report shall be submitted to the City with the results of the pre-construction or tree removal survey and any needed maternity roost avoidance actions. Depending on the survey results, a qualified bat specialist should discuss potentially significant effects of the Project on bats and include species specific mitigation measures to reduce impacts to below a level of significance (CEQA Guidelines, § 15125). Surveys, reporting, and preparation of robust mitigation measures by a qualified bat specialist should be completed and submitted to the City prior to any Project-related ground-disturbing activities or vegetation removal at or near locations of roosting habitat for bats. 3. If bats are not detected, but the bat specialist determines that roosting bats may be present at any time of year and could roost in trees at a given location, during tree removal, trees should be pushed using heavy machinery prior to using a chainsaw to remove them. To ensure the optimum warning for any roosting bats that may still be present, trees should be pushed lightly two or three times, with a pause of approximately 30 seconds between each nudge to allow bats to become active. A period of at least 24 hours, and preferable 48 hours, should elapse prior to such operations to allow bats to escape		
REC-4-Nesting Birds	As currently written, the measures included in Section 2.a.2.a. *California Department of Fish and Wildlife* on pages IV.C-4 and IV.C-5 of the DEIR for nesting birds may not be enforceable as they are not listed as mitigation. CDFW recommends the measures be considered enforceable biological mitigation measures for the Project and be included as BIO-MM-4.	Prior to Project construction and activities	City/Project Applicant

DocuSign Envelope ID: F712168D-17BC-4278-A5A0-7AA0D1E7F5B2

	It shall be noted that the temporary halt of Project activities within nesting buffers during nesting season does not constitute effective mitigation for the purposes of offsetting Project impacts associated with habitat loss. Additional mitigation would be necessary to compensate for the removal of nesting habitat within the Project site based on acreage of impact and vegetation composition. CDFW shall be consulted to determine proper mitigation for impacts to occupied habitat depending on the status of the bird species. Mitigation ratios would increase with the occurrence a California Species of Special Concern and would further increase with the occurrence of a CESA-listed species.		
REC-5-Data	CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations [Pub. Resources Code, § 21003, subd. (e)]. The City shall ensure that all data concerning special status species within the Project site be submitted to the CNDDB by completing and submitting CNDDB Field Survey Forms. The City shall ensure the data has been properly submitted, with all data fields applicable filled out, prior to Project ground-disturbing activities. The data entry shall also list pending development as a threat and then update this occurrence after impacts have occurred. The City shall provide CDFW with confirmation of data submittal.	Prior to Project construction and activities	City/Project Applicant
REC-6-Mitigation and Monitoring Plan	Per Public Resources Code section 21081.6(a)(1), CDFW has provided the City with a summary of our suggested mitigation measures and recommendations in the form of an attached Draft Mitigation and Monitoring Reporting Plan (MMRP; Attachment A). A final MMRP shall reflect results following additional plant and wildlife surveys and the Project's final on and/or off-site mitigation plans.	Prior to approval of CEQA document	City/Project Applicant

Kimberly Henry <kimberly.henry@lacity.org>

Comments from Council District 4 on the Harvard-Westlake River Park Project

Mashael Majid <mashael.majid@lacity.org> Thu, May 12, 2022 at 12:15 PM
To: Kimberly Henry <kimberly.henry@lacity.org>
Cc: Milena Zasadzien <milena.zasadzien@lacity.org>, Andrea Conant <andrea.conant@lacity.org>

Dear Ms. Henry,

I am reaching out on behalf of Councilmember Nithya Raman to share our thoughts for the proposed Harvard-Westlake River Project (Project) located at 4047, 4141, and 4155 Whitsett Avenue and 12506, 12600, and 12630 Valley Spring Lane at the former Weddington Golf & Tennis site. This site is now in Council District 4 after the 2020 City of Los Angeles redistricting process.

It is our understanding that the site, which is currently occupied by a private nine-hole, 27-par golf course and tennis facility, was purchased by Harvard-Westlake School from the Weddington family in 2017 for the purpose of redesigning, building, and operating an athletic and recreational facility for the School's students, staff, and the general public. This sale and purchase took place after previous proposals for the 16-acre property by the Weddington family, such as one which included preservation of golfing and tennis on the site while adding housing units, failed to move forward.

As detailed in the Draft Environmental Impact Report (Draft EIR), this Project involves the redevelopment of the approximately 16.1-acre Weddington Golf & Tennis site and an adjacent approximately 1.1-acre portion of property along the Los Angeles River leased from Los Angeles County for use as an athletic and recreational facility for the Harvard-Westlake School and for shared public use.

The Project would remove the existing golf course, driving range, and tennis facility to develop two athletic fields with bleacher seating, an 80,249-square-foot, two-story multi-purpose gymnasium with a maximum height of 30 feet, a 52-meter swimming pool with seating, eight tennis courts with seating, one level of below-grade parking and a surface parking lot. The Project would include ancillary field buildings, three security kiosks, exterior light poles, walls/fencing, and retention of the existing clubhouse structure, putting green, low brick retaining wall, and golf ball-shaped light standards. It would remove 240 of the existing 421 trees and plant 393 new trees, include a one million-gallon stormwater capture and reuse system for water conservation and treatment purposes, provide approximately 5.4 acres of publicly-accessible open space and landscaped trails connecting to the adjacent Zev Yaroslavsky Los Angeles River Greenway, and would incorporate on-site landscaped areas, water features, and recreational facilities. Lastly, the Project would provide off-site improvements to the Valleyheart Drive public right-of-way, portions of the Greenway, and an ADA compliant ramp to provide a pedestrian connection between the Greenway and Coldwater Canyon Avenue.

We want to ensure that community questions, concerns, feedback, and strategies related to potential environmental impacts and as shared in response to the Draft EIR are thoroughly assessed and adequately responded to in the Final EIR, including but not limited to: noise, traffic, circulation, active transportation access, habitat protection, public access to the waterway and upkeep of the river park, public access to athletic and recreational facilities, light pollution, grading, construction (including for projects in close proximity to this site and on the same theoretical timelines pending city actions), the nature of on-site special events, shuttling services, water runoff, landscaping and canopy coverage, retainment of structures deemed historic per the Historic Cultural Monument designation, and neighborhood buffering and screening.

We understand that there will be more opportunities for community members to weigh in, including at a public hearing held by City Planning following publication of the Final EIR release, as well as at a future City Planning Commission meeting. We deeply appreciate and would like to commend the high level of robust engagement around this Project, and our office looks forward to continued conversations with residents, the Harvard-Westlake School, city departments and other public agencies, and additional stakeholders.

Our office looks forward to the progression of the environmental review process as an opportunity to address all issues raised and will remain engaged to support a positive resolution for all affected stakeholders.

Kind regards,

Mashael Majid

Kimberly Henry, Major Projects Unit
Department of City Planning
200 N. Spring St., Los Angeles, CA 90012
Re: Harvard-Westlake River Project (Case Number: ENV-2020-1512-EIR)

Dear Ms. Henry,

I am reaching out on behalf of Councilmember Nithya Raman to share our thoughts for the proposed Harvard-Westlake River Project (Project) located at 4047, 4141, and 4155 Whitsett Avenue and 12506, 12600, and 12630 Valley Spring Lane at the former Weddington Golf & Tennis site. This site is now in Council District 4 after the 2020 City of Los Angeles redistricting process.

It is our understanding that the site, which is currently occupied by a private nine-hole, 27-par golf course and tennis facility, was purchased by Harvard-Westlake School from the Weddington family in 2017 for the purpose of redesigning, building, and operating an athletic and recreational facility for the School's students, staff, and the general public. This sale and purchase took place after previous proposals for the 16-acre property by the Weddington family, such as one which included preservation of golfing and tennis on the site while adding housing units, failed to move forward.

As detailed in the Draft Environmental Impact Report (Draft EIR), this Project involves the redevelopment of the approximately 16.1-acre Weddington Golf & Tennis site and an adjacent approximately 1.1-acre portion of property along the Los Angeles River leased from Los Angeles County for use as an athletic and recreational facility for the Harvard-Westlake School and for shared public use.

The Project would remove the existing golf course, driving range, and tennis facility to develop two athletic fields with bleacher seating, an 80,249-square-foot, two-story multi-purpose gymnasium with a maximum height of 30 feet, a 52-meter swimming pool with seating, eight tennis courts with seating, one level of below-grade parking and a surface parking lot. The Project would include ancillary field buildings, three security kiosks, exterior light poles, walls/fencing, and retention of the existing clubhouse structure, putting green, low brick retaining wall, and golf ball-shaped light standards. It would remove 240 of the existing 421 trees and plant 393 new trees, include a one million-gallon stormwater capture and reuse system for water conservation and treatment purposes, provide approximately 5.4 acres of publicly-accessible open space and landscaped trails connecting to the adjacent Zev Yaroslavsky Los Angeles River Greenway, and would incorporate on-site landscaped areas, water features, and recreational facilities. Lastly, the Project would provide off-site improvements to the Valleyheart Drive public right-of-way, portions of the Greenway, and an ADA compliant ramp to provide a pedestrian connection between the Greenway and Coldwater Canyon Avenue.

We want to ensure that community questions, concerns, feedback, and strategies related to potential environmental impacts and as shared in response to the Draft EIR are thoroughly assessed and adequately responded to in the Final EIR, including but not limited to: noise, traffic, circulation, active transportation access, habitat protection, public access to the waterway and upkeep of the river park, public access to athletic and recreational facilities, light pollution, grading, construction (including for projects in close proximity to this site and on the same theoretical timelines pending city actions), the nature of on-site special events, shuttling services, water runoff, landscaping and canopy coverage, retainment of structures deemed historic per the Historic Cultural Monument designation, and neighborhood buffering and screening.

We understand that there will be more opportunities for community members to weigh in, including at a public hearing held by City Planning following publication of the Final EIR release, as well as at a future City Planning Commission meeting. We deeply appreciate and would like to commend the high level of robust engagement around this Project, and our office looks forward to continued conversations with residents, the Harvard-Westlake School, city departments and other public agencies, and additional stakeholders.

Our office looks forward to the progression of the environmental review process as an opportunity to address all issues raised and will remain engaged to support a positive resolution for all affected stakeholders.

Kind regards,

Mashael Majid
Planning Director
Office of Los Angeles City Councilmember Nithya Raman, 4th District

Subject: Request extension for public comment review period of the DEIR (ENV-2020-1512-EIR)

Dear Councilmember Raman and Director Bertoni,

Save Weddington, Inc. is a community based nonprofit corporation in Studio City. We are in receipt of the Draft Environmental Impact Report ENV-2020-1512-EIR Harvard-Westlake River Park Project. We request that the Planning Department agree to extend the comment period from 45 days to 90 days. It is important to our community and to other concerned stakeholders in the San Fernando Valley that enough time be permitted for a meaningful response to be made.

Unusual circumstances exist for making this request. This DEIR was released 17 months after the Notice of Preparation was posted. In addition, the DEIR's Environmental Impact Analysis section consists of 19 elements that must be reviewed and commented on by appropriate experts in their respective fields, the DEIR's Alternatives section consists of seven sections, and the overall document is thousands of pages long. Finally, the developers have unlimited funds and have had years to produce data supporting their desired outcomes. Developers are not required to include studies or data that do not support the proposed project. That job falls to the community and is not funded by public dollars.

CEQA Guidelines Section 15105 states that the comment period for a project like the current one should be 45 days, at a minimum, but should only be more than 60 days in unusual circumstances. Save Weddington believes that the proposed development is being presented during and with unusual circumstances.

A 90-day public comment period is not unusual. For the NBCUniversal Evolution Plan DEIR, a 90-day response was granted, given the scope and impact on the surrounding community. Such is the case with the plan proposed in the DEIR (ENV-2020-1512-EIR).

Save Weddington requests that the public comment period be extended to 90 days. We also request that you reply to this request as soon as possible.

Thank you,

Kim Tashman

Dear Ms. Henry:

This firm represents "Save Weddington." Please find my client's comment letter in response to the Draft Environmental Impact Report ("DEIR") for the Harvard-Westlake River Park Project.

Please confirm receipt.

Regards,

RE: Comments on the Draft Environmental Impact Report for the Harvard-Westlake River Park Project (ENV-2020-1512-EIR; SCH N. 2020090536)

Dear Ms. Henry:

This firm represents "Save Weddington." As detailed in this comment letter, the Draft Environmental Impact Report ("DEIR") for the Harvard-Westlake River Park Project ("Project" or "proposed Project")[1] is fatally flawed and must be revised and then recirculated for additional public comment and review.

1.0 INTRODUCTION

The proposed Project involves substantial modification of a City of Los Angeles Historic-Cultural Monument ("HCM"), the Studio City Golf and Tennis Club (or Weddington Golf & Tennis Club). The proposed Project involves the demolition of the private nine-hole, 27-par golf course and tennis facility and the construction of athletic and recreation facilities to serve a private two-campus school, Harvard-Westlake School, with campuses located 1.2 and 4.25 driving miles from the Project site. Students would thus be required to access the new facilities via vehicles. The proposed Project would also allow for some public use of the site. The public would have access to approximately seven acres of walking paths and wooded areas. They would also have access, with a reservation, to the tennis courts and the putting green after checking-in at the clubhouse, but would not be provided with direct access to the athletic facilities.

[1] The DEIR is available at: https://planning.lacity.org/development-services/eir/harvard-westlake-river-park-project-0

As detailed in the Notice of Completion and Availability ("NOC/NOA")[2] for the proposed Project:

> The Harvard-Westlake River Park Project (Project) involves the redevelopment of the approximately 16.1-acre (701,428 square foot) Weddington Golf & Tennis site, and an adjacent approximately 1.1-acre (47,916 square foot) portion of property along the Los Angeles River leased from Los Angeles County, collectively comprising an approximately 17.2-acre (749,344 square foot) project site (Project Site), for use as an athletic and recreational facility for the Harvard-Westlake School and for shared public use. The Project would remove the existing golf course, driving range, and tennis facility to develop two athletic fields with bleacher seating, an 80,249-square-foot, two-story multi- purpose gymnasium with a maximum height of 30 feet, a 52-meter swimming pool with seating, eight tennis courts with seating, one level of below-grade parking and a surface parking lot. The Project would include ancillary field buildings, three security kiosks, exterior light poles, walls/fencing, and retention of the existing clubhouse structure, putting green, low brick retaining wall with weeping mortar, and golf ball-shaped light standards. The Project would remove 240 of the existing 421 trees and plant 393 new trees. The Project would include a one million-gallon stormwater capture and reuse system for water conservation and treatment purposes. The Project would also provide approximately 5.4 acres (235,224 square feet) of publicly-accessible open space and landscaped trails connecting to the adjacent Zev Yaroslavsky Los Angeles River Greenway (Zev Greenway) and would provide on-site landscaped areas, water features, and recreational facilities. The Project involves off-site improvements to the Valleyheart Drive public right-of-way, portions of the Zev Greenway adjacent to the Project Site, and an ADA compliant ramp to provide a pedestrian connection between the Zev Greenway and Coldwater Canyon Avenue northwest of the Project Site. Project development would require excavation and grading of the Project Site to a maximum depth of approximately 21 feet below grade and a net cut/fill volume of approximately 250,000 cubic yards.

The proposed Project would include a below-grade parking structure located in the eastern portion of the Project Site, with approximately 503 automobile parking spaces. An additional 29 surface parking spaces would be provided at the Valleyheart Drive entrance to the parking structure, for a total of 532 spaces, as compared to the

[2] The NOC/NOA is available at: https://planning.lacity.org/eir/Harvard-Westlake_River_Park_Project/deir/Draft%20EIR%20Sections/DEIR_NOCA_Signed.pdf

existing 89 surface parking spaces. This represents a net gain of 443 parking spaces associated with the proposed intensification of use.

Seating for observing sports at facilities included as part of the proposed Project include: 488 bleacher seats for Field A seating; 255 seats for Field B seating; 1,026 retractable bleacher seats in the Gymnasium; 348 bleacher seats for the pool; and 100 seats for the tennis courts. This can be compared to the 532 parking spaces to be provided.

During Project construction, according to page II-62 of the DEIR, demolition and site preparation activities would generate up to 252 daily haul trucks. During the grading and excavation phase up to 300 export haul trips would be generated between the hours of 8:00 a.m. and 4:00 p.m. This equates to a haul truck leaving the site more frequently than every 2 minutes, as well as a haul truck arriving at the site more frequently than every two minutes between these hours. Given that 250,000 cubic yards of earth would be exported, and the standard capacity of a large dump truck of between 10 and 16 cubic yards,[3] this equates to between 25,000 and 15,625 two-way haul truck trips, or 31,250-50,000 one-way trips just for soil export, over the course of Project construction, or between 50,000 and 31,250 one-way haul trips,[4] without consideration of the fact that compacted soil expands in size once excavated.[5] The DEIR needs to disclose whether the soil excavation and removal quantities are bank cubic yards, loose cubic yard or compacted cubic yards and the analysis corrected accordingly. The DEIR Project Description fails to identify the length of key construction phases. Please provide a table indicating the length of each construction phases and the equipment to be used during each construction phase.

The Project Site is adjacent to residential neighborhoods to the north, east, and west. To the south it is adjacent to the Los Angeles River and the Zev Greenway along the Los Angeles River. To the south, it is also adjacent to Fire Station 78.

As noted in the NOC/NOA and the DEIR, the proposed Project would result in significant and unavoidable impacts related to Project-level and cumulative on-site and off-site construction noise, and Project-level and cumulative off-site construction

---

[3] https://www.jdpower.com/cars/shopping-guides/how-many-cubic-yards-are-in-a-dump-truck

[4] According to page IV.B-36 of the DEIR, the DEIR assumes 14 cubic yard soil capacity haul trucks for the grading/excavation phase. This equates to 17,858 two-way haul trips, or 35,714 one-way haul trips.

[5] See: https://www.nationwideconsultingllc.com/excavation-and-compaction/

> Swell and shrinkage are two important, and often misunderstood, terms. Consider the simple example of digging a 1.0 cubic yard hole with a shovel and then throwing the dirt into wheelbarrows. In the ground the 1.0 cubic yard of soil is in its virgin (or natural) state. Upon being shoveled into the wheelbarrows the soil is in a loose (or lower density) state and probably has a volume of 1.2 to 1.4 cubic yards. This process of soil increasing in volume from its virgin state to a loose state is called swell.

It does not appear that the soil export volumes in the DEIR account for swell and thus both earth quantities to be exported and haul trips have been underestimated resulting in an underestimate of impacts.

vibration (human annoyance). According to the DEIR other potential impacts would be less than significant or mitigated to less-than-significant levels.

1.1 Inappropriate Consideration of Project Design Features in the Analysis

However, in making important judgements regarding the Project's potential for impacts, the DEIR impermissibly relies on Project Design Features ("PDFs") which are in fact mitigation measures designed to avoid or lessen Project impacts, as detailed more fully in **Section 3.0** of this comment letter. As noted on page II-61 of the DEIR's Project Description Chapter:[6]

> h) Project Design Features
>
> The above sections identify general characteristics of the Project upon which the analyses of this Draft EIR are based. In addition to these Project characteristics, Harvard-Westlake School proposes to implement a number of PDFs that specifically relate to environmental considerations. The PDFs will be included in the Mitigation Monitoring Program required in association with certification of the EIR. The PDFs are presented in the Executive Summary of the Draft EIR, as well as in individual topical sections of the Draft EIR, where applicable. **The PDFs are taken into account in the analysis of potential Project impacts** provided in Chapter IV, *Environmental Analysis*, of this Draft EIR. (Emphasis added).

As detailed on pages ES-26 to ES-31 of the DEIR's Executive Summary,[7] PDFs for the following issue areas were "take into account in the analysis of potential Project impacts". This has resulted in an under-identification of impacts or failure to identify significant impacts for these issue areas:

- Biological Resources (nesting birds)
- Cultural Resources (rehabilitation plan, documentation requirements, interpretation requirement)
- Greenhouse Gas Emissions (solar voltaic system)
- Hazardous Materials (artificial turf formulation)
- Noise and Vibration (wall and canopy requirements, limitations on amplified sound system, construction time limitations)
- Police Services (security features during construction and operation)

[6] The Project Description Chapter is available at: https://planning.lacity.org/eir/Harvard-Westlake_River_Park_Project/deir/Draft%20EIR%20Sections/II.%20Project%20Description.pdf

[7] The Executive Summary is available at: https://planning.lacity.org/eir/Harvard-Westlake_River_Park_Project/deir/Draft%20EIR%20Sections/01%20Executive%20Summary.pdf

- Transportation (Construction Management Plan, requirements for flashing red warning lights, restrictions on number of trips to the site and requirements for provision of School shuttle service during events)
- Utilities and Service Systems – Water Supply (artificial turf, capture and reuse system.

1.2 Required Discretionary Approvals

As detailed in pages II-62 to II-63 of the Project Description, the discretionary entitlements, reviews, permits and approvals required to implement the proposed Project include, but are not necessarily limited to, the following:

- Pursuant to LAMC Section 12.24 T, a Vesting Conditional Use Permit to allow the operation of a private-school athletic and recreational campus in the A1 zone.

- Light Poles: Pursuant to LAMC Section 12.24 F, the following maximum heights for light poles ancillary to the athletic and recreational campus, in lieu of the 30- foot height limit otherwise required by LAMC Section 12.21.1 A.

  – Two 60-foot-tall light poles on the southeast and southwest sides of the pool facility.

  – Three 80-foot-tall light poles on the north side of Field B.

  – One 60-foot-tall light pole on the east side of Field B.

  – Two 60-foot-tall light poles on the south side of Field B.

  – One 70-foot-tall light pole on the south side of Field B.

  – Three 70-foot-tall light poles on the west sideline, and three 70-foot-tall light poles on the east sideline, of Field A.

  – Twelve 40-foot-tall light poles located on all four sides of the proposed tennis courts.

- Walls/Fences: Pursuant to 12.24 F, the following maximum heights for walls and fences ancillary to the athletic and recreational campus, in lieu of the 8-foot maximum height limitation for fences and walls in side yards and the 6-foot maximum height limitation for fences and walls in front yards, in the A1-1XL-RIO zone.

- A maximum 10-foot-height wall along Whitsett Avenue.

- A maximum 11-foot-height wall along Valley Spring Lane and Bellaire Avenue.

- Pursuant to LAMC Section 16.05, a Site Plan Review because the Project would result in an increase of more than 50,000 square feet of non-residential floor area.

- Execution of a rental agreement with the Los Angeles County Flood Control District for use of the Leased Property.

In addition, Harvard-Westlake School will submit requests related to the Project, which may include approvals and permits from various City and County departments, including the Department of Building and Safety, the County Flood Control District, Bureau of Street Services (Urban Forestry Division) and other City and County municipal agencies for Project construction activities, including but not limited to demolition, haul route, excavation, shoring, grading, foundation, temporary street closure, and building and interior improvements and Department of Public Works approval for the removal of trees located on the public right-of- way. Harvard-Westlake School will also request a revocable permit to make certain improvements in the Valleyheart area. Other discretionary and ministerial permits and approvals that may be deemed necessary, including, but not limited to, temporary street closure permits, grading permits, excavation permits, foundation permits, building permits, Department of Public Works approval to remove non- protected trees from the Project Site, and sign permits.

1.3 CEQA Requirements for Recirculation of a DEIR

As detailed in this comment letter, the DEIR is fatally flawed and must be corrected and recirculated. Section 15088.5 of California Environmental Quality Act ("CEQA") Guidelines specifies when recirculation of an EIR is required prior to certification. CEQA Guidelines Section 15088.5 states in part:[8]

> (a) A lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review under Section 15087 but before certification. As used

[8] CEQA Guidelines Section 15088.5(e) specifies: A decision not to recirculate an EIR must be supported by substantial evidence in the administrative record.

in this section, the term "information" can include changes in the project or environmental setting as well as additional data or other information. New information added to an EIR is not "significant" unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement. "Significant new information" requiring recirculation include, for example, a disclosure showing that:

(1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.

(2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.

(3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.

(4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. (Mountain Lion Coalition v. Fish and Game Com. (1989) 214 Cal.App.3d 1043).

1.4 Organization of This Comment Letter

This comment letter details defects in the DEIR, it's analysis and impact judgements. This comment letter is organized as follows:

- Section 2 addresses the DEIR's inadequate Project Description and resulting failure to conducted required analysis of Project and cumulative impacts.

- Section 3 addresses the DEIR's improper reliance on Project Design Features (PDFs) when making impact judgements resulting in an underestimate of impacts and a failure to identify significant impacts.

- Section 4 addresses the defects in some of the DEIR's impact analyses and resulting failure to identify a number of significant Project impacts and/or the DEIR's underestimate of impacts.

- Section 5 addresses the DEIR's use of improperly deferred mitigation measures or infeasible mitigation measures.

- Section 6 addresses the DEIR's inadequate mitigation.

- Section 7 addresses the DEIR's inadequate alternatives analysis.

- Section 8 addresses the DEIR inadequate cumulative and growth-inducing analysis.

- Section 9 concludes with the need for the DEIR to be revised and recirculated.

2.0 INADEQUATE PROJECT DESCRIPTION AND ASSOCIATED FAILURE TO ANALYZED PROJECT AND CUMULATIVE IMPACTS

2.1 Use of Project Facilities for Non-Harvard Westlake Events

DEIR pages II-47 to II-51 disclose the likely use of the Project facilities by Harvard Westlake. The DEIR represents the likely number and size of events, with 27 events of up to 500 people and three events of up to 2,000 per year. However, there is no mitigation measure to ensure that the assumptions used in the analysis are valid. The DEIR needs to include a mitigation measures limiting the size of events to no more than 27 events of up to 500 people per year, and no more than three events of up to 2,000 people per year, otherwise the DEIR underestimates Project and cumulative impacts. In addition, the analysis in the DEIR needs to represent the worst-case scenario.

The DEIR fails to disclose whether Harvard Westlake will rent or loan the facilities to other schools, non-profits, companies, local jurisdictions, or other groups for special events or regular use. Given that Alternative 4 is an alternative which does not allow for special events for the public, the implication is that the proposed Project does allow for outside special events. While the Project Description details the likely frequency and magnitude of use by Harvard Westlake, it is silent on use of the facilities by other groups. As a result, the potential for, and magnitude of, impacts is underestimated.

For example, the DEIR relies on a PDF, TRAF-PDF-3, which prohibits parents, students and spectators from driving to the Project site when event attendance is expected to surpass 300 spectators, and instead requires use of the School's shuttle service. Is this PDF feasible or would it be enforced if there is a non-school event with more than 300 persons? How would that be handled? If shuttle requirements do not apply to non-

School events, then the DEIR underestimates project impacts and the DEIR must be revised and recirculated. If shuttle requirements do apply to non-School events, the DEIR needs to address impacts associated with additional trips to the two existing campuses by non-school users in order to access the Shuttle service, and the DEIR needs to be revised and recirculated to address these potential impacts.

If Harvard Westlake does not intend to rent or provide the facilities to other groups for non-school events, then the DEIR needs to include a mitigation measure preventing Harvard Westlake for renting or loaning out the facilities for non-Harvard Westlake events and providing a penalty for violation of the mitigation. If Harvard Westlake does anticipate renting or loaning out the facilities, then the number and allowable size of such events needs to be both disclosed and analyzed in the DEIR and a mitigation measure limiting events to that assumed in the analysis needs to be required. Any impact judgements which rely on TRAF-PDF-3 would need to be revisited, which they need to be anyway due to the impermissible consideration of PDFs which making impact judgements. As currently written, the DEIR Project Description and analysis of event impacts is inadequate due to its failure to disclose and analyze the impacts of outside events, and the DEIR must be revised and recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4).

2.2 Excavation and Soil Removal

As noted on pages 11-61 to 62 of the Project Description Chapter, the project involves substantial excavation and soil removal:

> Project development would disturb a majority of the Project Site (746,532 square feet)[17] and require excavation and grading of the Project Site to a maximum depth of approximately 21 feet for construction of the one-level subterranean parking structure, gymnasium basement, and proposed one-million-gallon stormwater capture and reuse system. Rough grading cut volumes would be approximately 251,836 cubic yards (unadjusted), and the fill volume would be approximately 1,836 cubic yards (unadjusted), for a net cut/fill volume of approximately 250,000 cubic yards (unadjusted).[18] Because cut soils would exceed fill soils, export and disposal off-site would be required.
>
> [17] The total assumes all portions of the Project Site (i.e., 17.2 acres or 749,344 square feet) would be disturbed less the existing buildings on the Project Site (i.e., 2,700 square feet). Disturbed areas included in this total include Project improvements such as graded and excavated areas as well as minor disturbances such as minor landscaping upgrades to understory vegetation, replacement of poles, etc.
>
> [18] "Unadjusted" cut and fill is a programmed estimate that does not account for minor shrinkage from compaction, swelling, or other factors that may require final manual adjustments to achieve finished gradients/ heights.

It is therefore estimated that 250,000 cubic yards of soil will be removed from the site and, as noted in the DEIR, off-site disposal is required. However, the DEIR fails to identify the disposal site, or to address impacts to that site which would result from the dumping of 250,000 cubic yards of soil. The California Environmental Quality Act ("CEQA") requires that both the direct and indirect impacts of a project be addressed in an EIR.[9] The EIR therefore needs to identify the soil disposal site(s) and to address impacts to those site areas which would result from the proposed Project.

While the DEIR discloses the following haul route for accessing the Project site, it is silent on the location of the disposal site(s) and on the haul routes and adjacent uses at the other end of the haul route. DEIR page II-62 indicates that the "inbound haul route would come from US-101, head southbound on Coldwater Canyon Avenue, eastbound on Moorpark Street, and southbound on Whitsett Avenue to access the Project Site" and that the "outbound haul route would leave the Project Site and head southbound on Whitsett Avenue, westbound on Ventura Boulevard, and northbound on Coldwater Canyon Avenue to reach US-101." Where will soil and construction material be hauled to? What are the adjacent uses and impacts to those uses associated with the proposed Project? The DEIR needs to disclose this.

It is important to understand the sheer volume of soil to be exported from the site. One cubic yard is roughly the size of a washing machine. According to Los Angeles County Public Works, by way of comparison, the Rose Bowl in Pasadena would hold about 400,000 cubic yards.[10] It should be noted that "[a]t a modern capacity of 92,542, Rose Bowl Stadium is the 15th-largest stadium in the world, the 11th-largest stadium in the United States, and the 10th largest NCAA stadium."[11]

The proposed Project thus involves the removal of enough soil to fill the Rose Bowl 62.5% full. This is an enormous quantity of earth to be removed. The DEIR must make this clear, identify the disposal site(s), justify and trip length assumptions associated with soil removal trips, specify the length of each phase of Project construction, analyze impacts associated with soil hauling and the disposal of this volume of soil at the disposal site, address cumulative impacts associated with soil hauling and disposal in combination with other past, present and reasonably foreseeable related projects involving substantial soil disposal such as debris basin sediment removal projects such as Big Tujunga,[12] Cogswell and San Gabriel,[13] Devil's Gate,[14] Morris,[15] and Pacoima,[16] and address the impact of this project on the availability of soil disposal sites for future public works and debris basin cleaning projects and thus the functioning of the area's debris basin and flood control system. Given the DEIR's failure to address these

key issues, pursuant to CEQA Guidelines Section 15088.5(a)(2) and (4), the DEIR must be revised and recirculated.

3.0 IMPROPER RELIANCE ON PROJECT DESIGN FEATURES WHEN MAKING IMPACT JUDGEMENTS HAS RESULTED IN AN UNDER-IDENTIFICATION OF IMPACTS

It is clear from the impact analyses in the DEIR, that the impact judgements in the DEIR are after-implementation-of-the-PDFs impacts. While several of the PDF are standard regulatory measures, or include components that are regulatory measures, the PDFs are, for the most part, clearly measures intended to mitigate, minimize or avoid Project impacts. The way the EIR has relied on PDFs in making impact judgements is contrary to the requirement that project impact significance determinations under CEQA be made without consideration of mitigation measures.

The EIR for the proposed project thus understates Project impacts, by improperly relying on PDFs which are in fact mitigation measures, as a basis for concluding that Project impacts are less than significant. In *Lotus vs. Department of Transportation* (2014) 223 Cal.App.4th 645 (*Lotus*), the court found that an EIR violated CEQA by incorporating proposed mitigation measures into the description of the project, and then basing its conclusion of less-than-significant impacts in part on those mitigation measures. This is exactly what has been done in the EIR for the proposed Project. The court found that this improperly compressed the analysis of impacts and mitigation measures into a single issue.

In *Lotus v. Dep't of Transp.* (2014) 223 Cal.App.4th 645 (*Lotus*), Caltrans was found to have certified an insufficient EIR based on its failure to properly evaluate the potential impacts of a highway project. The *Lotus* court found that Caltrans erred by:

> . . . incorporating the proposed mitigation measures into its description of the project and then concluding that any potential impacts from the project will be less than significant. As the trial court held, the "avoidance, minimization and/or mitigation measures," as they are characterized in the EIR, are not "part of the project." They are mitigation measures designed to reduce or eliminate the damage to the redwoods anticipated from disturbing the structural root zone of the trees by excavation and placement of impermeable materials over the root zones. By compressing the analysis of impacts and mitigation measures into a single issue, the EIR disregards the requirements of CEQA. (*Lotus v. Dep't of Transp.*, *supra*, 223 Cal.App.4th at pp. 655–656, emph. added.

The court ordered Caltrans' certification of the EIR be set aside, finding:

> [T]his shortcutting of CEQA requirements subverts the purposes of CEQA by omitting material necessary to informed decisionmaking and informed public participation. It precludes both identification

> of potential environmental consequences arising from the project and also thoughtful analysis of the sufficiency of measures to mitigate those consequences. The deficiency cannot be considered harmless. *Ibid*.

(*Id*. at 658.)

As documented in the succeeding discussion, the analysis of the proposed Project is fatally flawed because many of the PDFs are in fact mitigation measures. The EIR thus understates impacts in a way that is far more extreme than what happened in *Lotus*. Under CEQA, significance determinations must be made without consideration of avoidance, minimization, and/or mitigation measures. The EIR for the proposed Project has violated this precept and has thus understated and failed to identify impacts. The EIR is therefore fatally flawed and all of the impact determinations which rely on PDFs must be redone. This fatal flaw must be corrected and the EIR recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4).

3.1 Biological Resources

The DEIR relies on Project Design Feature PDF-BIO-1 when concluding that impacts to nesting birds and conflicts with policies or ordinances protecting nesting birds would be Less Than Significant. PDF-BIO-1 states:

> **PDF-BIO-1:** Prior to the issuance of any grading permit that would remove potentially suitable nesting habitat for raptors or songbirds, Harvard-Westlake School shall demonstrate and guarantee to the satisfaction of the Los Angeles Department of City Planning that either of the following have been or shall be accomplished:
>
> 1. Vegetation removal activities will be scheduled outside the nesting season (September 1 to February 14 for songbirds; September 1 to January 14 for raptors) to avoid potential impacts to nesting birds.
> 2. Any construction activities that occur during the nesting season (February 15 to August 31 for songbirds; January 15 to August 31 for raptors) will require that all suitable habitat be thoroughly surveyed for the presence of nesting birds by a qualified biologist experienced in avian nesting bird behavior before commencement of clearing. If any active nests are detected, a buffer of 300 feet around the nest (500 feet for raptors), or as determined appropriate by the biologist based on species and site-specific conditions, will be delineated, flagged, and avoided until the nesting cycle is complete. The buffer may be modified and/or other recommendations proposed as determined appropriate by the biological monitor to minimize impacts.

The fact that this is a mitigation measures is highlighted by comparing the language of PDF-BIO-1 with the language of Mitigation Measures BIO-MM-1 which addresses potential bat roosting habitat, as follows:

> **BIO-MM-1:** Due to the presence of potentially suitable roosting habitat (ornamental trees) for special-status bat species (i.e., western yellow bat), Harvard-Westlake School shall demonstrate and guarantee to the satisfaction of the Los Angeles Department of City Planning that either of the following has been or shall be accomplished:
>
> 1. Tree removal activities shall be scheduled outside of the maternity roosting season (October 1 through February 28) to avoid potential impacts to special-status bat species.
> 2. Any construction or palm tree removal activities that occur during the maternity roosting season for special-status bat species (March 1 through September 30) shall require a qualified biologist experienced with bat roost biology to conduct a pre-construction (or pre-tree removal) survey, using sonic bat detectors (e.g., Anabat or Sonobat) to determine whether special-status bat species are roosting within trees that would be removed. The surveys shall be conducted at dusk and after nightfall by a biologist. If an active roost site is located during the pre- construction survey, the roost shall be avoided and Project activities shall be conducted as recommended by the biologist to avoid the area, which may include temporary postponement or provision of a suitable buffer established around the roost until roosting activities cease. Suitable buffers could include netting, canvas, or similar materials as recommended by the biologist. A report shall be submitted to the City with the results of the pre-construction or tree removal survey and any needed maternity roost avoidance actions.

The DEIR clearly reached its conclusion that "indirect impacts from lighting, noise, and human activity during Project operation would not diminish long-term survival of nesting birds . . . and, therefore, would not be significant" by relying on BIO-PDF-1, as explained on DEIR pages IV-C-47 to 48:

> Disturbing or destroying active nests is a violation of the MBTA. In addition, nests and eggs are protected under Fish and Wildlife Code Section 3503. As such direct impacts to breeding birds or roosting bats (e.g., through nest or roost removal) or indirect impacts (e.g., by noise causing abandonment of the nest or roost) would be a potentially significant impact as defined by the thresholds above. **Project Design Feature PDF-BIO-1**, which

demonstrates compliance with regulatory requirements for nesting bird protection, and Mitigation Measure BIO-MM-1 **would reduce any direct impacts to nesting birds** and roosting bat species **to a less-than-significant level.**

PDF-BIO-1 is clearly a mitigation measure. The analyses regarding impacts to nesting birds and conflicts with policies or ordinances protecting nesting birds must be redone and the DEIR recirculated pursuant to pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and/or (4).

3.2 Cultural Resources

The DEIR relies on Project Design Features CUL-PDF-1, CUL-PDF-2 and CUL-PDF-3 when concluding that impacts to historical resources would be Less Than Significant and that no mitigation is required. The DEIR also relies on CUL-PDF-1 and CUL-PDF-3 when concluding that impacts due to a conflict with any applicable land use plan, policy or regulation adopted for purposes of avoiding or mitigating an environmental effect will be Less Than Significant (without mitigation). These PDFs read as follows:

> **CUL-PDF-1: Rehabilitation Plan.** A Rehabilitation Plan will be prepared as part of the Project to ensure appropriate treatment and protection of the identified character-defining features on the Project Site. This includes the appropriate treatment of the golf ball- shaped light standards during relocation, and documentation that the rehabilitation of the clubhouse, putting green, and low brick wall with weeping mortar complies with the Secretary of the Interiors Standards for Rehabilitation (the Standards). Standards compliance is required by the City of Los Angeles Cultural Heritage Ordinance for properties that are designated Historic-Cultural Monuments (Los Angeles Administrative Code, Section 22.171.14). The Project team will include a historic architect or qualified historic preservation consultant who meets the Secretary of the Interior's Professional Standards in Architectural History or Historic Architecture. The Rehabilitation Plan will be submitted for review and approval by the Department of City Planning, Office of Historic Resources. At a minimum, the Rehabilitation Plan will address the following:
>
> - Appropriate measures for the relocation of the golf ball-shaped light standards.
> - Appropriate measures for protecting all identified character-defining features of the Project Site during construction activity. If necessary, a physical barrier (e.g., exclusion or cyclone fencing) will be erected to separate and protect the clubhouse, and other features as needed, during construction.

- Retention and appropriate treatment of the significant characteristics of the original Ranch-style architecture and the relationship of the clubhouse within the context of the Project Site overall and its relationship to other character-defining features on the Project Site and in the surrounding neighborhood. This includes retaining the clubhouse in its historic location, and maintaining the significant features that have collectively served as the public face of the Project Site since the 1950s as identified in the Historical Report, including: the clubhouse's angled position facing Whitsett Avenue and Valley Spring Lane; the existing setback; the relationship of the clubhouse and the putting green; the mature trees; the golf ball-shaped light standards; and the low brick wall.
- Retention and rehabilitation of the distinctive features of the exterior of the clubhouse, including its original Ranch-style plan, massing, and original architectural details as identified in the Historical Report. The Project is not proposing significant additions to the clubhouse, or alterations to the building that would obscure or remove important exterior features.
- Retention and rehabilitation of the distinctive original features of the interior of the clubhouse as identified in the Historical Report.

CUL-PDF-2: Documentation. In order to memorialize the extant features of the Project Site prior to implementation of the Project, the Project Site will be documented according to Historic American Buildings Survey (HABS) Level III standards to include: sketch plan; a maximum of 40 photographs with large-format negatives that documents the Project Site overall and the relationship of the features on the Project Site, exterior and significant interior spaces of the clubhouse, and views of the associated putting green and low brick wall; and golf ball-shaped light standards; and short form historical report. The documentation will be reviewed and approved by the Department of City Planning, Office of Historic Resources. The documentation will be retained on-site, and digital copies will be offered to the following repositories: Los Angeles Public Library, Los Angeles Office of Historic Resources, and San Fernando Valley Historical Society.

CUL-PDF-3: Interpretation. Harvard-Westlake School will prepare interpretation of the history of the Project Site to be housed on-site. The interpretive program may be housed in the clubhouse and may include historic

> photographs or other ephemeral materials documenting the history of the Weddington family, the development of the San Fernando Valley, and the history of the Project Site as a postwar recreational facility. A digital copy of the interpretive materials will be provided to the Department of City Planning, Office of Historic Resources and may also be made available to interested parties.

These are clearly mitigation measures for historical resource impacts and are illustrative of the types of mitigation measures commonly used in EIRs when there is the potential for impacts to an historical resource. In fact, the effectiveness of both documentation and interpretive displays as historic resource mitigations has been addressed by the courts.[17] The DEIR acknowledges on page IV.D-34 that these, essentially, mitigation measures were relied on when making historic-resource related impact judgements:

> As described above, the Project would retain its significance as a 1950s community recreational facility, all of the identified character-defining features of the HCM, Studio City Golf and Tennis Club, **and it includes Project Design Features to ensure the significance of the HCM is retained, specifically PDF-CUL-1, Rehabilitation Plan, PDF- CUL-2, Documentation, and PDF-CUL-3, Interpretation.** Accordingly, impacts on an historical resource as defined in CEQA Guidelines Section 15064.5 were determined to be less than significant. Therefore, no mitigation measures are required. (Emphasis added).

Because the DEIR considered these PDFs when making a determination that historical resource impacts would be Less Than Significant without mitigation, the DEIR has failed to accurately classify historic resource impacts. (See also **Section 4.3** of this letter). The DEIR must be revised and recirculated pursuant to pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and/or (4).

3.3 Greenhouse Gas Emissions

The DEIR relies on Project Design Feature GHG-PDF-1 when concluding that operational impacts on energy resources will be Less than Significant (without mitigation). It relies on GHG-PDF-1, along with WS-PDF-1 and WS-PDF-2 when concluding that conflicts with State or local plans for renewable energy or energy efficiency with be Less Than Significant (without mitigation). The DEIR also relies on GHG-PDF-1 when concluding that Greenhouse Gas emission impacts will be Less Than Significant (without mitigation) and when concluding that conflicts with any applicable

[17] See: *Architectural Heritage Association v. County of Monterey* (19 Cal. Rptr. 3d 469 *and League for Protection v. City of Oakland*, 52 Cal.App.4th 896).

plans, policies or regulations adopted for purposes of reducing the emissions of GHGs will be Less Than Significant (without mitigation). This PDF reads as follows:

> **GHG-PDF-1: Solar Voltaic System.** The Project will be designed to include solar voltaic panels providing 339,000 kilo Watt-hours (kWh) per year[6] on the roof of the gymnasium that would reduce the amount of electricity demand from City utilities.
>
> [6] The solar voltaic panel system would supply approximately 11.5 percent of the Project's energy demand. For complete list of assumptions refer to Appendix C of this Draft EIR.

This is clearly a Project-specific mitigation measure as illustrated by the discussion on DEIR page IV-G.58 to 59:

> The Project's consistency with these applicable regulatory plans and policies to reduce GHG emissions, along with implementation of Project Design Features as discussed in this Draft EIR, **particularly Project Design Feature GHG-PDF-1 in Subsection IV.G.3.c), *Project Design Features*, would reduce the Project's GHG emissions by 21 percent** (or 32 percent on a net GHG emissions basis) compared to the Project without implementation of GHG reduction characteristics, features, and measures. In summary, the plan consistency analysis provided below under Threshold (b) demonstrates that the Project's design features would not conflict with regulations and policies and would comply with or exceed the regulations and reduction actions/strategies outlined in the Climate Change Scoping Plan, the 2020-2045 RTP/SCS, City's Green New Deal, and the Los Angeles Green Building Code. **The Project's evaluation of consistency with the above plans is the primary basis for determining the significance of the Project's GHG-related impacts on the environment. Accordingly, as shown below in Threshold (b), since the Project would not conflict with applicable plans, regulations or goals, the Project would not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.** (Emphasis added).

GHG-PDF-1 is clearly a mitigation measure. The analyses regarding operational impacts on energy resources, conflicts with State or local plans for renewable energy or energy efficiency, Greenhouse Gas emission impacts, and conflicts with applicable plans, policies or regulations adopted for purposes of reducing the emissions of GHGs must be redone and the DEIR recirculated pursuant to pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and/or (4).

3.4 Hazards and Hazardous Materials

The DEIR relies on Project Design Feature HAZ-PDF-1 when concluding that operational impacts associated with the routine transport, use or disposal of hazardous materials will be Less Than Significant (without mitigation). This PDF reads as follows:

> **HAZ-PDF-1: Artificial Turf Formulation.** The artificial turf fiber, backing, and underlayment installed on the Project Site will not have a lead concentration level higher than 50 parts per million as determined using a testing protocol in accordance with U.S. Environmental Protection Agency Method 30508; U.S. Environmental Protection Agency Method 6010c or alternatively Method 6020A will be used to analyze digestate.

HAZ-PDF-1 is clearly a mitigation measure. The analyses regarding impacts associated with the routine transport, use or disposal of hazardous material must be redone and the DEIR recirculated pursuant to pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and/or (4).

3.5 Noise and Vibration

The DEIR relies on Project Design Feature NOI-PDF-3, along with mitigation measures NOI-MM-1, MM2 and MM3 when concluding that project construction will result in significant and unavoidable impacts associated with an increase in ambient noise levels. The DEIR relies on NOI-PDF-3 when concluding that construction vibration impacts will be Significant and Unavoidable and provides no mitigations for vibration impacts. The DEIR relies on NOI-PDF-1 and NOI-PDF-2 when concluding that operational noise impacts will be Less Than Significant (without mitigation). As noted on DEIR page IV-K-38 to 39:

> The following project design features (PDF) **are proposed to reduce the noise impacts from Project operation** to the nearby sensitive receptors: (Emphasis added).
>
> **NOI-PDF-1**: The Project will include sections of solid walls and an overhead canopy above the swimming pool that will reduce noise associated with the athletic activities to the adjacent residences, as follows:
>
> - An 8- to 10-foot-high wall along portions of the northeastern and eastern sides of Field A.
> - An 8- to 11-foot-high wall along portions of the western and northern sides of Field B.
> - A 30-foot solid overhead canopy above the swimming pool bleachers and pool buildings.
> - An 8-foot-high solid wall along the northern edge of the tennis courts.

> **NOI-PDF-2**: The Project's amplified sound system for special events at Field A will be installed and designed using a line-array speaker system, so as to not exceed a maximum noise level of 92 dBA (Leq) at a distance of 50 feet from the amplified sound system. In addition, the stage for special events will be located at the north side of Field A, with the amplified sound system facing south in the opposite direction from the off-site sensitive uses to the north of Field A, which would reduce speaker noise at the nearest off-site sensitive uses to the north and east of Field A.
>
> **NOI-PDF-3**: Project construction will be limited to Monday through Friday between 7:00 a.m. and 6:00 p.m.; and Saturdays between 8:00 and 6:00 p.m., which is within the allowable hours per Los Angeles Municipal Code Section 41.40.

NOI-PDF-1, NOI-PDF-2 and NOI-PDF-3 are clearly a mitigation measures. The analysis regarding operational noise impacts must be redone and the DEIR recirculated pursuant to pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and/or (4).

3.6 Police Services

The DEIR relies on Project Design Features POL-PDF-1 along with TRAF-PDF-1 when concluding that Project construction impacts on police protection will be Less Than Significant (without mitigation). The DEIR relies on POL-PDF-2 when concluding that Project operational impacts on police protection services will be Less Than Significant (without mitigation). These PDFs read as follows:

> **POL-PDF-1: Security Features During Construction.** During construction, on-site security measures will include security lighting and a construction security fence with gated and locked entry around active construction areas.
>
> **POL-PDF-2: Security Features During Operation.** During operation, the Project will incorporate a security program to ensure the safety of its students, employees, and spectators, as well as public users of the Project Site. The Project's security will include, but not be limited to, the following design features:
>
> - Construction of three security kiosks: (1) a security kiosk constructed south of the tennis courts; (2) a security kiosk located in the underground parking structure; and, (3) a security kiosk located in proximity to the roundabout and at-grade parking.
> - Security personnel would be present onsite 24 hours per day every day of the year, and range in numbers from two to as many as ten guards depending on the time of day and number of scheduled activities.

- One security person would be stationed at the underground garage security kiosk throughout business hours. Patrols would be conducted at random during each guard's eight-hour shift.

- Security patrols present north of the Project Site on Valley Spring Lane during events to enforce no neighborhood or other off-site parking or visitor drop-off.

- Security guard placed at the pedestrian entrance on Whitsett Avenue during larger events (i.e., days on which the number of event/game attendees is expected to be 300 or more for any individual game, or concurrent games combined) to screen visitors for neighborhood parking and to return visitors to their car if inappropriately parked.

- Lighting would be provided along all pathways, around the Project's gymnasium building, in the surface parking area, and in entrance areas for security and wayfinding purposes. As required by LAMC Section 93.0117(b), exterior light sources would be designed such that they would not cause more than two foot- candles of lighting intensity or generate direct glare onto nearby sensitive uses (i.e., residential uses).

- North Hollywood Community Police Station would be provided with diagrams showing access to each portion of the Project Site.

- Installation of and monitoring of closed circuit television (CCTV) cameras.

As noted on DEIR page IV.L.2-16:

> The Project Site would need to be secured during construction in order to avoid potential theft. Security lighting and fencing (refer to Project Design Feature POL-PDF-1), would be provided at the Project Site during construction, **thereby reducing the potential need for LAPD services**. (Emphasis added).

As noted on DEIR page IV.L.2-17:

> As the Project would include fencing and security lighting, as part of Project Design Feature POL-PDF-1, no additional officers from LAPD would be needed to monitor the Project Site during

> construction outside of existing officers that already patrol the area.

As noted on DEIR page IV.L.2-18:

> Moreover, the Project's increased operational demand for police protection services would be offset as the result of the security services that would be provided on the Project Site as part of Project Design Feature POL-PDF-2.

POL-PDF-1 and POL-PDF-2 are clearly a mitigation measures. The analysis regarding impacts police services during Project construction and operation must be redone to identify these as mitigation measures and the DEIR recirculated pursuant to pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and/or (4).

3.7 Transportation

The DEIR relies on Project Design Feature TRAF-PDF-1 when concluding that Project impacts on fire protection services during construction will be Less Than Significant (without mitigation). The DEIR relies on TRAF-PDF-2 when concluding that Project impacts on fire protection services during operation will be Less Than Significant (without mitigation). The DEIR relies on Project Design Feature TRAF-PDF-1 along with POL-PDF-1 when concluding that Project construction impacts on police protection will be Less Than Significant (without mitigation). The DEIR relies on TRAF-PDF-3 when concluding that Project impacts due to a conflict with a program, plan, policy or ordinance addressing the circulation system will be Less Than Significant (without mitigation). The DEIR relies on PDF-TRAF-1 when concluding that Project emergency access impacts during construction will be Less Than Significant (without mitigation) and relies on PDF-TRAF-2 when concluding that Project emergency access issues during operation would be Less Than Significant (without mitigation). The DEIR also relies on TRAF-PDF-1 when concluding that Project construction impacts on water and wastewater infrastructure will be Less Than Significant (without mitigation). These PDFs read as follows:

> **TRAF-PDF-1: Construction Management Plan.** Prior to the issuance of any demolition permit or building permit for the Project, a detailed Construction Management Plan (CMP), including street closure information, a detour plan, haul routes, and a staging plan, will be prepared and submitted to the City for review and approval. The CMP will formalize how construction will be carried out and identify specific actions that will be required to reduce effects on the surrounding community. The CMP will be based on the nature and timing of the specific construction activities and other projects in the vicinity of the Project Site. Construction management meetings with City Staff and other surrounding construction-related project representatives (i.e., construction contractors), whose projects will potentially be

under construction at around the same time as the Project, will be conducted bimonthly, or as otherwise determined appropriate by City Staff. This coordination will ensure construction activities of the concurrent related projects and associated hauling activities are managed in collaboration with one another and the Project. The CMP will include, but not be limited to, the following elements as appropriate:

- As traffic lane, parking lane, and/or sidewalk closures are anticipated, worksite traffic control plan(s), approved by the City of Los Angeles, will be developed and implemented to route vehicular traffic, bicyclists, and pedestrians around any such closures.
- Ensure that access will remain unobstructed for land uses in proximity to the Project Site during project construction.
- Coordinate with the City and emergency service providers to ensure adequate access, including emergency access, is maintained to the Project Site and neighboring businesses and residences. Emergency access points will be marked accordingly in consultation with LAFD, as necessary.
- Schedule deliveries and pick-ups of construction materials during non-peak travel periods to the extent possible and coordinate to reduce the potential of trucks waiting to load or unload for protracted periods.
- Prohibit construction worker and equipment parking on the adjacent residential streets.

According to DEIR page IV.L.1-19:

> . . . pursuant to Project Design Feature TRAF-PDF-1, the Project would implement a Construction Management Plan that would include measures to ensure emergency access to the Project Site and adjacent properties. **Project Design Feature TRAF-PDF-1 would minimize impacts to vehicular and other forms of circulation during construction.** (Emphasis added).

According to DEIR page IV.L.1-21:

> Project construction activities could temporarily impact emergency access. However, with implementation of Project Design Feature TRAF-PDF-1 . . . construction of the Project would not result in the need for a new fire station or the expansion of an existing facility, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection services. Therefore, impacts to fire protection during Project construction would be less than significant.

Per DEIR page IV.L.2-17:

> Accordingly, impacts to police protection services would be less than significant for the following reasons:
>
> 1. Emergency access would be maintained to the Project Site during construction through marked emergency access points approved by the LAPD (refer to Project Design Feature TRAF-PDF-1 in Section IV.M, *Transportation*, of this Draft EIR); . . .

TRAF-PDF-2 is similarly clearly designed to avoid or minimize impacts of Project traffic on Fire Station operation. TRAF-PDF-2 reads as follows:

> **TRAF-PDF-2:** A flashing red warning light(s) will be installed on the southern exit driveway within the Project Site at a point located before vehicles reach Valleyheart Drive that will hold back vehicles exiting the Project Site roundabout onto Valleyheart Drive. This warning light will be activated by a remote control button pressed by LAFD staff in the emergency vehicle when an emergency vehicle is approaching Valleyheart Drive from Whitsett Avenue or exiting from one of the two LAFD driveways on Valleyheart Drive.

As noted on DEIR page II-53, the "south driveway" for the aboveground and underground parking areas would be "via a driveway at the paved portion of Valleyheart Drive located just south of LAFD Fire Station 78". As explained on DEIR page II-53 to II-55:[18]

> The southern driveway via Valleyheart Drive would lead to both the below-grade parking structure and to a drop-off/pick-up roundabout area at the southeast corner of the Project Site. The

[18] See also page IV.L.1-25:

> As part of the Project design and per Project Design Feature TRAF-PDF-2, a flashing red warning light(s) will be installed on the southern exit driveway within the Project Site at a point located before vehicles reach Valleyheart Drive that will hold back vehicles exiting the Project Site roundabout onto Valleyheart Drive. This warning light will be activated by a remote control button pressed by LAFD staff in the emergency vehicle when an emergency vehicle is approaching Valleyheart Drive from Whitsett Avenue or exiting one of the LAFD driveways on Valleyheart Drive. The warning light would allow for adequate emergency access by LAFD vehicles between Valleyheart Drive and Whitsett Avenue by reducing conflicts between vehicles leaving the Project Site and emergency vehicles leaving/coming back to the station. Further, the warning light would minimize the eastbound queues by vehicles leaving the Project Site along Valleyheart Drive at Whitsett Avenue when emergency vehicles need to access Valleyheart Drive. With the warning light in operation, LAFD would be able to effectively maintain adequate emergency vehicle access to LAFD Fire Station 78. Further, the warning light would ensure emergency response times are not substantively increased.

> south driveway would only allow entry into the subterranean garage, and all exits from the garage would be via the north driveway off Whitsett Avenue. The roundabout has been designed to accommodate buses, shuttles, and automobiles. The roundabout would lead to a 29-space, short-term surface parking lot near the parking structure's southern entrance. Rideshare vehicles would use the southern driveway (with roundabout) to access the surface parking lot. . .
>
> **To minimize conflicts with emergency vehicles exiting LAFD Fire Station 78**, a flashing red warning light(s) would be installed on the southern exit driveway within the Project Site at a point located before vehicles reach Valleyheart Drive that will hold back vehicles exiting the Project Site roundabout onto Valleyheart Drive. This warning light would be activated by a remote control button pressed by LAFD staff in the emergency vehicle when an emergency vehicle is approaching Valleyheart Drive from Whitsett Avenue or exiting from one of the two LAFD driveways on Valleyheart Drive. This feature is identified as Project Design Feature TRAF-PDF-2 in Section IV.M, *Transportation*, of this Draft EIR. (Emphasis added).

It is thus very clear that this PDF is a mitigation measure designed to address impacts of the proposed Project on Fire Station operations. By treating this mitigation measures as a PDF, the DEIR has failed to identify significant impacts to Fire Station operations that would result from Project operations. This must be corrected and the EIR recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4). (See also discussion in **Section 4.8** of this letter).

TRAF-PDF-3 is also clearly designed to mitigate Project impacts. TRAF-PDF-3 reads as follows:

> **TRAF-PDF-3**: On days in which event attendance is expected to surpass 300 spectators, including parents and other spectators, students will not be permitted to drive to the Project Site and will be required to use the School's shuttle service. Shuttles will follow a prescribed driving route, travelling northbound on Coldwater Canyon Avenue, turning right at Moorpark Street, and turning right onto Whitsett Avenue. Spectators will park on the Project Site, and tickets and parking passes will be required to enter the Project Site. Spectators without a parking pass will be directed to park on the School's Upper Campus and ride the School-provided shuttles to the Project Site. Parking in the neighborhood will not be permitted and will be enforced by security personnel.

TRAF-PDF-1, TRAF-PDF-2 and TRAF-PDF-3 are clearly mitigation measures designed to reduce or avoid impacts. The following impact determinations which rely on

these PDF must be corrected and the DEIR recirculated pursuant to pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and/or (4): impacts on fire protection services during construction; impacts on fire protection services during operation; construction impacts on police protection; impacts due to a conflict with a program, plan, policy or ordinance addressing the circulation system; Project emergency access impacts during construction; Project emergency access issues during operation; and Project construction impacts on water and wastewater infrastructure.

3.7 Utilities and Service Systems – Water Supply

The DEIR relies on WS-PDF-1 and WS-PDF-2 along with GHG-PDF-1, when concluding that conflicts with State or local plans for renewable energy or energy efficiency with be Less Than Significant (without mitigation). The DEIR relies on WS-PDF-2 when concluding that the impact of Project operations on consistency with water quality standards and waste discharge requirements will be Less Than Significant (without mitigation). It also relies on WS-PDF-2 when concluding that operational impacts on groundwater supplies and recharge will be Less Than Significant (without mitigation). The DEIR relies on WS-PDF-1 and WS-PDF-2 when concluding that Project operational impacts on the water supply will be Less Than Significant without mitigation. These PDFs read as follows:

> **WS-PDF-1: Artificial Turf.** The Project will use artificial turf on Fields A and B, which would serve to reduce water demand compared to natural grass.
>
> **WS-PDF-2: Capture and Reuse System.** The Project would capture, treat, and store up to 1 million gallons of stormwater and other urban runoff at a time from the developed portions of the Project Site, as well as from an approximate 38.64-acre off-site drainage area to the north of the Project Site, through a stormwater Low Impact Development (LID) capture and reuse cistern system, which will then use the treated stormwater for irrigation or water features on the Project Site.

WS-PDF-1 and WS-PDF-2 are clearly measures designed to reduce Project water use and thus mitigation measures. The analyses regarding impacts to conflicts with State or local plans for renewable energy or energy efficiency, the impact of Project operations on consistency with water quality standards and waste discharge requirements, operational impacts on groundwater supplies and recharge, and Project operational impacts on the water supply need to be redone to identify the level of impact with and without these mitigation measures. (See also discussion in **Section 4.12**)

4.0 FAILURE TO IDENTIFY SIGNIFICANT PROJECT IMPACTS AND DEFECTS IN THE IMPACTS ANALYSES

4.1 Air Quality Analysis Underestimates Project Emissions

As detailed in the letter from SWAPE included in **Attachment 1**, the DEIR underestimates and fails to adequately address the air quality impacts associated with the proposed Project. We therefore request detailed responses to the issues raised by SWAPE in their letter included in **Attachment 1** to this letter, and that the analysis be corrected and that the DEIR be recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4). As detailed in the SWAPE letter, as quoted or paraphrased below:

- The off-road emissions calculated with CalEEMod, and the on-road emissions calculated outside of CalEEMod, each "do not represent the emissions that would occur every day during Project construction." As neither account for the entirety of the criteria air pollutants that would be generated during Project construction, the DEIR should have summed the off-road and on-road emissions estimates in order to accurately evaluate the Project's maximum daily construction-related emissions.

- When reviewing the Project's CalEEMod output files, provided in the Air Quality and Greenhouse Gas Report ("AQ & GHG Report") included Appendix C to the DEIR, SWAPE found that several model inputs were not consistent with information disclosed in the DEIR. As a result, the Project's construction and operational emissions are underestimated.

    - The DEIR's analysis is incorrect, as the size of the existing land uses to be removed from the Project site was overestimated in the Project's air modeling. By overestimating the area of the existing land use, the model overestimates the emissions associated with the existing land uses, resulting in an underestimation of the net change in operational emissions associated with the proposed Project.

    - The air emissions modeling includes several changes to the default individual construction phase lengths which are not supported by substantial evidence. These unsubstantiated changes present an issue, as the construction emissions are improperly spread out over a longer period of time for some phases. As a result, the model underestimates the peak daily emissions associated with some phases of construction and therefore cannot be relied upon to determine Project air quality impacts, or the lack thereof.

    - Review of the construction on-road emissions in the AQ & GHG Report demonstrates that only 82 vendor trips are included in the calculations (Appendix C, pp. 254). As such, the number of vendor trips required for Project construction is reduced from the CalEEMod default value by 570 trips. However, the AQ & GHG Report fails to provide sufficient

justification for this reduction. By including an unsubstantiated reduction in the number to vendor trips in the on-road emissions analysis, the DEIR underestimates the Project's mobile-source construction-related emissions and should not be relied upon to determine Project significance.

- The air quality analysis includes several construction-related mitigation measures without properly committing to their implementation. The model therefore underestimates the Project's construction-related emissions and should not be relied upon to determine Project significance.

4.2 Inadequate Analysis of Biological Resources Impacts

Scott Cashen**,** an environmental biologist with 29 years of professional experience in wildlife biology and natural resources management has reviewed the biological resource impact analysis contained the DEIR has found it deficient because:

- The DEIR does not adequately disclose, analyze, or mitigate impacts to the western yellow bat (and potentially other special-status bat species).

- The DEIR fails to provide an accurate assessment of impacts to the California brittlebush scrub community (a sensitive natural community). In addition, the DEIR impermissibly defers critical components of the proposed mitigation.

- The DEIR fails to disclose, analyze, or provide mitigation for the avian collision hazard associated with Project design features (large expanses of glass).

A copy of his findings are included as **Attachment 2** to this letter. We hereby request responses to all of his comments.

Failure to Identify and Adequately Mitigate Impacts to the Western Yellow Bat

As noted on page IV.C-32 of the DEIR:

> One special-status bat species, the western yellow bat (species of special concern), was considered to have moderate potential to roost and forage in the Biological Study Area. **Construction of the Project could result in potentially significant direct impacts to this bat species if tree removal commences during the maternity roosting season (generally March 1 through September 30).**

As noted on DEIR page IV.C-27:

> The Biological Study Area supports a number of palm trees that would be suitable roosting habitat for this species. Additionally, the adjacent Los Angeles River may provide suitable foraging habitat above the river and near the southwestern boundary of the Biological Study Area. There is only one CNDDB occurrence of this species within the region of the

> Biological Study Area, which was recorded in 1984 approximately 8.5 miles to the east in a developed area of Glendale.

This species roosts in trees, particularly palm trees, and forages over water and among trees. There are 174 Mexican fan palms on the Project Site. In fact, approximately one-half (51 percent) of the inventoried trees are Mexican fan palms according to DEIR page II-29. Of the 240 trees to be removed from the Project Site, 122 are Mexican fan palms. The proposed Project would thus result in the loss of 70 percent of the potential bat roosting habitat on the Project Site. The DEIR provides no analysis of this habitat loss. As noted by Mr. Cashen:

> Because the loss of suitable roosting habitat is one of the primary threats to the western yellow bat population,[19] and because the DEIR does not incorporate compensatory mitigation, potentially significant impacts on the western yellow bat remain unmitigated.

Despite the potential for western yellow bats to occur on the Project Site, no surveys to assess the presence or absence of the species were conducted as part of the preparation of the DEIR. Instead, the DEIR assumes that Mitigation Measure BIO-MM-1, tree removal outside of the roosting season, or pre-construction surveys if tree removal occurs during the roosting season, is sufficient to mitigate impacts to this bat species. However, this assumes that displaced bats can easily relocate and that the only impacts are from tree removal during roosting season. This is belied by the relatively few colonies of this bat species in the Los Angeles area. The DEIR underestimates and fails to mitigate potential displacement impacts to these bats and the potential impact on the colony's survival.

Furthermore, as noted by Mr. Cashen:

> Direct impacts to the western yellow bat (and other bat species) are not limited tree removal during the maternity roosting season. Some western yellow bats are year-round residents in southern California.[20] These bats may use trees at the Project site as day roosts, night roosts, or maternity roosts.[21] Consequently, western yellow bats may occur in trees (especially the palms) at the Project site at any time of day (or night), on any day of the year.
>
> Yellow bats are deep sleepers.[22] Even when fully awake, they feel safe in palm fronds and generally will not flush at signs of

---

[20] Pierson ED, Rainey WE. 1998. Western yellow bat, *Lasiurus xanthinus*. In: Bolster BC, ed. Terrestrial Mammal Species of Special Concern in California. pp. 50 and 51.
[21] Day roosts are used during the day for sleep and protection from predators and heat exposure. Night roosts are used at night to rest, digest food, conserve energy, and avoid predators. Maternity roosts are used to give birth and raise young.
[22] Austin Bat Refuge. 2021. Palm Trees [webpage]. Available at: https://austinbatrefuge.org/palm-trees (Accessed 6 May 2022).

> danger.[23] As a result, yellow bats are frequently killed or injured when palm trees are felled.[24] Because bats are a prey species that has few behavioral defenses against predation, they rely on concealment (at roosts) to avoid predation by diurnal predators. Therefore, even if bats flush from a tree as it is being felled, most of these individuals are likely to die due to predation or exposure. The DEIR fails to analyze impacts to, or incorporate mitigation for, bats that may occupy trees at the Project site during the non-maternity season.

In addition, the DEIR fails to adequately analyze the impacts of Project construction and operational noise on the bats, as detailed by Mr. Cashen in his comments included in **Attachment 2**.

The potential for impacts to the western yellow bat remain significant and unmitigated and must be acknowledged as such in the DEIR. Pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4), the DEIR must be revised and recirculated.

Failure to Identify and Mitigate Impacts to the Brittlebrush Scrub Community

As detailed by Mr. Cashen in his comments included in **Attachment 2**, the DEIR's analysis of impacts to the Brittlebrush Scrub Community is inaccurate and fails to identify a significant impact to this community:

> The DEIR's rationale is flawed because it fails to recognize that the Project would not only increase human activity along the existing trail, but that it would also create a new trail that bisects the California brittlebush scrub community, thereby increasing the proportion of that community that would be susceptible to trampling, weed invasion, and other adverse edge effects associated with fragmentation. In addition, because the proposed river connection trail would not provide the shortest route to the Zev Greenway trail, students and spectators are likely to create shortcuts (and other unauthorized trail routes) through the California brittlebush scrub . . . This would cause further loss, degradation, and fragmentation of the sensitive natural community. The DEIR fails to incorporate mitigation for this potentially significant indirect impact.

In addition, the DEIR's analysis fails to account for impacts associated with the installation of 38 trees in the community and the impact of the associated loss of sunlight on this sensitive nature community. The DEIR has thus failed to identify and mitigate

[23] *Ibid. See also* Tatarian G. 2018. Conserving California's Bats Through Environmental Review and Permitting. CDFW Conservation Lecture Series Archive. Available at: https://wildlife.ca.gov/Conservation/Lectures/Archive#ACEApr12 (Accessed 6 May 2022).
[24] *Ibid.*

impacts to this community. The DEIR has also failed to demonstrate that the MM-BIO-2 for impacts to this community is feasible.

Failure to Disclose, Analyze or Incorporate Mitigation for Avian Collisions

As detailed by Mr. Cashen in his comments included in **Attachment 2**:

> The Project site and adjacent Los Angeles River corridor support at least 74 species of birds,[25] some of which are classified as special-status species.[26]. . . Collision with windows is second only to predation by domestic cats as an anthropogenic source of avian mortality.[27]. . . A poorly designed building can kill hundreds of birds per year.[28]

The proposed Project incorporates design variables known to cause high levels of avian mortality:

1. Buildings with reflective or transparent windows, large windows, or a high percentage of glass.
2. Buildings with windows located adjacent to extensive vegetation.

As noted by Mr. Cashen:

> The American Bird Conservancy and New York City Audubon Society have developed bird-friendly design standards for new buildings.[29] Because the Project does not incorporate these (or comparable) design standards, the Project's impact on bird populations would be potentially significant.

The DEIR's analyses of impacts to bats, migratory and special-status birds, and the Brittlebrush communitt are deficient and, as a result, the DEIR has failed to identify significant biological resource impacts. Moreover, as detailed by Mr. Cashen, there are problems with the biological resource mitigations measures included in the DEIR which render them ineffective in mitigating impacts to a level considered Less Than Significant.

The DEIR analysis must be corrected and that the DEIR recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4).

4.3 Failure to Identify Significant Historic Resource Impacts

The DEIR fails to accurately identify impacts to an historical resource, the Weddington Golf and Tennis Club (or "Studio City Golf and Tennis Club"), a historic resource which has been found to be both locally eligible for listing as a City Historic-Cultural Monument ("HCM"), and eligible for listing in the California Register of Historical Resources ("California Register").[30] The DEIR fails to identify impacts to the resource, first by inappropriately treating mitigation measures as Project Design Features, as discussed in **Section 3.2** of this letter, and secondly by inappropriately omitting some of the character-defining features of the Project property, which have been identified by historic resource consultants meeting the Secretary of the Interiors Professional Standards, so as to limit the identification of impacts. The DEIR on page IV-D-22 states that: "the clubhouse, putting green with brick wall, and golf ball-shaped light standards are identified as character-defining features that support its status as a Historic-Cultural Monument, as well as it being a private recreational facility open for public use." The DEIR limits the identified character-defining features so as to exclude important aspects of the property, such as the golf course, which will be demolished as part of the Project. It does this while acknowledging on DEIR page IV-D-22 that the "primary physical characteristics of the Project Site include a nine-hole golf course, a twenty-five-stall driving range, sixteen tennis courts, a tennis shack, a clubhouse, a putting green surrounded by a brick wall, and six golf ball-shaped light standards."

The omission of consideration of the Project's impact to the golf course as a character defining-feature, as well as impacts to other additional character-defining features identified by historic resource experts, is not supported by substantial evidence, defies common sense, and has led to a DEIR which has failed to identify significant Project historic resource impacts. In omitting the golf course portion of the Project Site from the character-defining features, the DEIR ignores the expert opinions of the City's own Office of Historic Resources staff, as well as multiple historic resource consultants. As a result, the DEIR must be corrected to identify a significant impact to an HCM and California Register eligible resource and recirculated for public review and comment pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4).

On April 15, 2021 the Cultural Heritage Commission at its regular meeting[31] considered the designation of the Weddington Golf and Tennis Club as an Historic Cultural Monument. A copy of the Staff Report is included as **Attachment 3** to this comment letter.[32] The agenda packet includes:

7. Supplemental Photos from the Applicant, received January 20, 2021; and,
8. Supplemental Photos from the Applicant, received February 25, 2021. As part of the hearing, testimony was provided by Jenna Snow, a historical resource consultant.[33]

Evidence that the golf course and several other features of the Project Site are character-defining features of the historic resource is provided by 2012 ARG report attached to this Cultural Heritage Commission Staff Report (see **Attachment 3** to this letter). This information needs to be included in the revised DEIR. As detailed in the ARG report which predates the property's HCM designation:[34]

> **V. Evaluation of Eligibility**
>
> For CEQA purposes, a historical resource is a resource listed in, or determined to be eligible for listing in, the California Register of Historical Resources (CRHR) or a qualified local register (for further explanation of qualifying local registers, see IV. Regulations and Criteria of Evaluation). California properties formally determined eligible for or listed on the National Register of Historic Places are automatically listed on the CRHR. Weddington Golf and Tennis Club has not been previously listed on or determined eligible for the CRHR or the NRHP, nor has it been designated as a City of Los Angeles Historic-Cultural Monument.
>
> For the purposes of this report, the Weddington Golf and Tennis Club was evaluated against the criteria of the California Register of Historical Resources, as is required by CEQA. It was not evaluated

for national (National Register) or local (Los Angeles Historic-Cultural Monument) landmark eligibility.

Significance Under the California Register

The Weddington Golf and Tennis Club appears to be eligible for the California Register of Historical Resources under the following criteria:

Criterion 1. It is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States.

The Weddington Golf & Tennis Club appears to be locally significant in the area of recreation and entertainment as a community recreation center. Specifically, the 9-hole golf course and driving range were constructed in the mid-1950s and developed over the next ten years to provide the growing Studio City community with a publicly-accessible facility where children and adults alike could learn and practice the sport. The clubhouse, course, and driving range were a community draw, particularly for many patrons at all levels of the entertainment industry. The course and driving range reflects the broad popularity of golf in the 1950s and 1960s, and how such recreational facilities were valuable amenities to serve the rapidly growing suburban population base in the San Fernando Valley during its most significant period of community development.

Criterion 3. It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master, or possesses high artistic values.

The Weddington Golf Course represents the essential characteristics of a local, community golf course in the mid-1950s. It has high associative value and it effectively communicates the features of such a facility. Its setting has high integrity, as do the component elements including the low- slung, Ranch style clubhouse (and its compatible, adjoining driving range shelter) that echo the preferred residential forms of the San Fernando Valley in that era, the golf course with its fairways lined in palm, eucalyptus, and pine trees, and associated features such as the golf ball-shaped light standards and putting green.

Integrity

The National Register Bulletin series provides guidance in regard to eligibility, integrity, period of significance and resource type.

Essentially, for a property to qualify as an historic resource it must represent a significant part of the history, architecture, archeology, engineering, or culture of an area, and it must have the characteristics that make it a good representative of properties associated with that aspect of the past (National Park Service, National Register Bulletin 15, 2002).

Bulletin 15 notes that an historic property derives its importance from its association with an important historic context and its retention of historic integrity of those features necessary to convey its significance. Insensitive modifications to an historic property can have a negative impact on that building's integrity. The evaluation of integrity is sometimes a subjective judgment, but it must always be grounded in an understanding of a property's physical features and their relation to its significance.

Integrity is based on significance: why, where, and when a property is important. Only after significance is fully established can you proceed to the issue of integrity. The steps in assessing integrity are:

- Define the essential [or character-defining] physical features that must be present for a property to represent its significance
- Determine whether the essential physical features are visible enough to convey their significance
- Determine whether the property needs to be compared with similar properties
- Determine, based on the significance and essential physical features, which aspects of integrity are particularly vital to the property being nominated and if they are present

Character-Defining Features

All properties change over time. It is not necessary for a property to retain all its historic physical features or characteristics. The property must retain, however, the essential physical features that enable it to convey its historic identity. The essential physical features are those features that define both *why* a property is significant (Applicable Criteria and Areas of Significance) and *when* it was significant (Periods of Significance.)

The character-defining features of the Weddington Golf and Tennis Club include:

- 9-hole golf course, composed of fairways, greens, and tees (5^{th} & 6^{th} holes altered).
- Park-like setting on the property created by extensive trees and open space.
- Clubhouse: including board-and-batten siding, shake roof with rectangular cut-outs at planters, brick fireplace and chimney, knotty-pine interior paneling, and lunch counter.
- Driving range (altered) with shed-roof canopy with shake roof.
- Putting green in front of clubhouse.
- Golf ball light standards.

Evaluation

Within the concept of integrity, the National Register criteria recognize seven aspects or qualities that, in various combinations, define integrity. To retain historic integrity, a property must always possess several, and usually most, of the aspects: location, design, setting, materials, workmanship, feeling, and association. Ultimately, a property either does or does not have integrity. The following is a definition and analysis of each of the seven aspects of integrity in relation to this property.

Location: The place where the historic property was constructed or the place where the historic event occurred.

The historic property remains in its original location. The property retains this aspect of integrity.

Design: The combination of elements that create the form, plan, space, structure, and style of a property.

The Weddington Golf and Tennis Club has been partially altered in terms of design. The northern portion retains its 1958 design in terms of golf course layout, location and design of the putting green and clubhouse. Alterations completed in 1974 to accommodate tennis courts required the realignment of two holes and the reduction in size (by nearly half) of the driving range. However, the alterations reflect the evolution of the property as a community recreation center. These alterations have the potential of becoming significant and, therefore, do not substantially subtract from the property's integrity of design.

A 1966 maintenance building was demolished, but it was located in a part of the property that was removed from the clubhouse and

starting and ending points of the course and did not contribute to the historic design.

The more recent construction of the fire station at the southeast corner of the site is not associated with the property's historic significance as a community recreation center. However, its siting at the southeast corner of the property minimizes the impact of the new construction on the property's integrity of design as the golf course layout remained unaffected.

Setting: The physical environment of a historic property.

Unlike location, setting refers to the character of the place in which the property played a historic role. It involves how, not just where, the property is situated, and its relationship to surrounding features and open space. Examples of features that create setting are: topographic features, vegetation, simple manmade features, and relationships between buildings and other features or open spaces.

Weddington Golf and Tennis Club largely retains its integrity of setting. Setting is a particularly important aspect of integrity for this property, and refers both to the property's surroundings and the setting created within the property by the arrangement and integrity of its component parts, combining buildings, outdoor spaces and hardscape, and landscaped areas, all with a particular purpose that contributes to the recognition of the property type and the associated use. The clubhouse is the nexus of all of the golf-related uses on the property, including the putting green, the starting and ending points of the golf course, and the driving range. The setting of the property is defined not just by the functional interrelationships of elements, but also by the sense of open space created by the design and location of the golf course. The site is buffered from Ventura Blvd. by its location along the Los Angeles River channel, and along each of the boundaries (as well as within the site), mature trees act as windbreaks, visual buffers, and markers of open space within the neighborhood and on the property.

The southeast corner of the property has been disrupted by the construction of a new fire station; however, it is oriented away from the significant areas of the historic property's. Furthermore, the station removed maintenance structures that were secondary to the significance of the property and only partially removed the tennis elements of the property. (The tennis courts are not considered contributing features.) Therefore, the overall impact of the new construction has been limited.

Materials: The physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.

The site retains its integrity of materials. This aspect of integrity refers mainly to building materials and to whether the original materials from the period of significance continue to compose the significant structures, objects, and hardscape of the grounds. The substantially unaltered clubhouse retains the characteristic materials of the interior and exterior, such as the board and batten siding, shingled roof, and knotty pine paneling. The concrete patios that lie between the driving range, clubhouse, and first and last holes also contribute to the setting and design of the property. The driving range shelter is also unaltered and composed of its original materials.

Workmanship: The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.

Workmanship is not a significant aspect of integrity for this property. Most of the building materials of the structures were mass produced and did not reflect either traditional building crafts or significant new materials or methods. Workmanship for this property is best exhibited in the superior maintenance of the fairways and greens. In this respect, the skilled craft of golf course maintenance reflects the property's workmanship and the Weddington Golf and Tennis Club retains its integrity of workmanship.

Feeling: A property's expression of the aesthetic or historic sense of a particular period of time.

As a result of retaining all material aspects of integrity, in whole or in part, Weddington Golf and Tennis Club retains its integrity of feeling.

Association: The direct link between an important historic event or person and a historic property.

As a result of retaining all material aspects of integrity, in whole or in part, Weddington Golf and Tennis Club retain its integrity of association.

The ARG report thus found that the character-defining features of the Weddington Golf and Tennis Club include:

- 9-hole golf course, composed of fairways, greens, and tees (5th & 6th holes altered).
- Park-like setting on the property created by extensive trees and open space.
- Clubhouse: including board-and-batten siding, shake roof with rectangular cut-outs at planters, brick fireplace and chimney, knotty-pine interior paneling, and lunch counter.
- Driving range (altered) with shed-roof canopy with shake roof.
- Putting green in front of clubhouse.
- Golf ball light standards.

Evidence that the golf course is a character-defining feature of the historic resource was provided at the meeting of the Cultural Heritage Commission. In the Staff Report for the April 15, 2021 Hearing, the City's historic resource staff recommended designation of the property as a City Historical Cultural Monument, finding that it met two of the City's criteria.[35] The Staff Report reads in part:[36]

> **FINDINGS**
>
> - Weddington Golf and Tennis Club "exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community" **as an excellent example of a 1950s private recreational facility and golf club in Studio City**.
> - Weddington Golf and Tennis Club "embodies the distinctive characteristics of a style, type, period, or method of construction" **as an excellent example of a 1950s community golf course**.
>
> **SUMMARY**
>
> Weddington Golf and Tennis Club is a private recreational facility located on a triangular lot bounded by Valley Spring Lane to the north, Whitsett Avenue to the east, Valleyheart Drive to the south, and Bellaire Avenue to the west in the Studio City neighborhood of Los Angeles. Sited on the former sheep ranch of San Fernando Valley pioneer Wilson C. Weddington, the golf course was built in 1955 when the Weddington family leased the property to actor and golf professional Joe Kirkwood, Jr. That year, architect William M. Bray (1905-1998) designed a golf shop and clubhouse in the Ranch architectural style that was erected by the Colonial

[35] The Staff Report is signed by the Planning Director as well as: Ken Bernstein, AICP, Principal City Planning Office of Historic Resources; Shannon Ryan, Senior City Planner, Office of Historic Resources; Lambert M. Giessinger, Preservation Architect, Office of Historic Resources; and Melissa Jones, City Planning Associate, Office of Historic Resources.

[36] Final Determination Staff Recommendation Report, Page 3 - 7

Construction Company. The subject property was largely developed over the next ten years, with the addition of tennis courts in the 1970s, and the site now consists of a golf course, driving range, tennis courts, tennis clubhouse, and golf clubhouse. Operated by the McCallister family from 1958 until 2008, the subject property was called the Studio City Golf and Tennis Club. Since 2008, it has been called the Weddington Golf and Tennis Club.

Formed around 1927, Studio City was conceived as a combined studio, commercial development, and residential subdivision; however, the area remained largely rural until the 1950s. Similar to the rest of Southern California, the San Fernando Valley experienced a dramatic construction and population boom fueled by the increased demand for housing following World War II. Migration to the region was driven by a booming postwar economy, led by the defense industry that provided thousands of new jobs in aviation. In the development of Studio City and surrounding areas, communities were designed and built to be complete neighborhoods, with schools, churches, shopping centers, and parks located within a close drive of residential streets. Neighborhoods were promoted for their balance of work and recreation opportunities, such as golf courses and tennis courts, that had previously been unavailable to the average middle-class citizen.

The subject property spans approximately 16 acres, and the primary entrance is oriented to the east facing Whitsett Avenue. Much of the property maintains a park-like setting with landscaping and more than 400 mature trees. Most of the trees were planted during or following the development off the golf course, but a row of Eucalyptus trees along Valley Spring Lane predates the course. Golf-related resources are located at the northeastern portion of the site and include a one-story clubhouse; a nine-hole, par three golf course; a 24-stand, 230-yard driving range; and a putting green. The clubhouse is of wood-frame construction with board and batten cladding and has a side-gabled roof with wood shingles and overhanging eaves. The structure sits at an angle facing the northeast corner of the site and is approached by a walkway from the parking lot to the south. The primary entrance is recessed beneath the overhang and consists of aluminum-frame glass doors with flanking full-height sidelites. Interior features include knotty pine paneling, wrought iron light fixtures, and a slab fireplace wall with variegated brick cladding. The interior includes a reception area, a coffee shop and a pro shop. The golf course loops around the property, partially encircling the driving range, and winds back to the clubhouse. A

wood, shed- style canopy shelters the northern half of the stands within the driving range, and temporary awnings shelter those on the south end. Eight original light standards, designed in the form of a golf ball set atop a tee, line the fence along the Whitsett Avenue parking lot and provide light to the driving range.

The southeastern corner of the parcel is dedicated for tennis use and includes a small club structure and 16 concrete courts located in staggered rows. The club structure faces west toward the tennis courts and features board and batten cladding and a front-gabled roof with wood shingles. Fenestration consists of aluminum sliding windows, and the entrances consist of single doors with inset panels and a cross-timber detail. There is also a temporary maintenance structure east of the tennis courts at the southern property line, which consists of a fenced yard with a roof.

William M. Bray, architect of the golf clubhouse, practiced architecture in Southern California for over 60 years, with an office located in Encino. Aspects of Bray's residential designs were periodically featured in the *Los Angeles Times* throughout the 1950s and 1960s. Bray was responsible for two of the residential designs for the Aladowney Homes subdivision in Downey (1951) and Brighton Hills in Montebello (1961), where he employed the popular Ranch architectural style. He also designed a retirement community in Palm Desert called "Palm City." In 1994, Bray was awarded a lifetime achievement award from the San Fernando Valley chapter of the American Institute of Architects. His son and business partner, Roger W. Bray, continues the practice today as Bray Architects.

The subject property has experienced several alterations that include an addition to the clubhouse in 1962; the demolition of a maintenance building, construction of a new maintenance building and the construction of an enclosure at the driving range, creating 10 sheltered tees, in 1966; the construction of tennis courts, court fencing and a tennis shop in 1974; the installation of tennis court fencing in 1975; the installation of fencing with lights in 1976; and the demolition of four original tennis courts and a 1966 maintenance structure as part of the construction of a fire station in 2007 at the southern corner (land now owned by the City of Los Angeles). Other alterations noted during the Commission site inspection consist of the reconfiguration of the fifth and sixth holes, ninth tee, and a reduction in the size of the driving range from the original 1958 design.

SurveyLA, the citywide historic resources survey, identified the subject property as individually eligible for listing under the

national, state, and local designation programs **as an excellent example of a 1950s private recreational facility/tennis club/golf course in Studio City.** The survey found that the property appears to meet the eligibility standards, but it noted that it was not fully visible from the public right-of-way.

DISCUSSION

Weddington Golf and Tennis Club meets two of the Historic-Cultural Monument criteria.

The subject property "exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community" **as an excellent example of a 1950s private recreational facility and golf club in Studio City**. The suburbanization of the middle class and the boom in home and automobile ownership during the 1950s and 1960s enabled larger populations to live near and access golf courses. The golf course and driving range were developed to provide the growing Studio City community with a publicly accessible facility where visitors of all ages could learn and practice the game of golf. Previously a sport reserved for elites, golf began to attract middle-class suburban players and enjoy popular appeal in the postwar period. The televising of golf tournaments greatly increased the sport's profile and audience and contributed to its popularization. Facilities like the subject property opened to the public to serve this growing demand for the sport. In addition, the subject property reflects the value of recreational amenities to the suburban population base in the San Fernando Valley during a significant period of growth.

Furthermore, the subject property "embodies the distinctive characteristics of a style, type, period, or method of construction" **as an excellent example of a 1950s community golf course**. It **retains many essential characteristics of the small, local community golf courses that became popular nationwide in the 1950s.** As open spaces were rapidly disappearing in light of the increased development of urban and suburban landscapes, the combination of greenery, open spaces, social outlets, and community recreation provided by golf courses were valued throughout the mid-20th century. **In addition, the golf course retains associative value with the post-World War II era in the San Fernando Valley: the golf ball-shaped lights are a form of programmatic architecture, a type of roadside attraction contemporaneous with the popularity of car culture, and the clubhouse reflects the Ranch architectural style, the preferred**

> **residential forms of the San Fernando Valley during that period.**
>
> While the property has experienced some alterations, they are all related to its **evolution as a community golf course over time**. As such, **the subject property retains a high level of integrity of location, design, setting, materials, workmanship, feeling, and association to convey its significance.**
>
> Separately, staff recommends that the subject property's proposed monument name be changed to the "Studio City Golf and Tennis Club," to reflect the original, historic name with which it was associated for 50 years. (Emphasis added)

In addition, at the hearing, Jenna Snow, an historic resource consultant meeting the Secretary of the Interior's Professional Standards testified regarding the site's evolution and overall integrity, provided an evaluation of the Project Site as a designed historic landscape,[37] and listed the character-defining features of this "mid-20th Century recreational facility" as including the: "club house, putting green, golf ball light standards, lawn, tees, fairways, greens, concrete paths and other landscape details." She noted that: "To separate out the club house, putting green and golf ball light standards from the rest of the property would be artificially separating character-defining features that must be considered as an entire unit."[38]

Eric Van Breene, the Preservation Coordinator for the Los Angeles Conservancy also testified at the hearing stating:[39]

> . . . speaking on behalf of the Los Angeles Conservancy, the nomination of Weddington golf course, the property is a cultural landscape developed during the mid-century period and embodies the distinct characteristics of the community golf course at that time. Weddington played a significant role in developing recreational sports for middle-class Angelenos in the San Fernando Valley during a period of suburban growth. The property retains a high degree of integrity with many of its original character defining features still intact.
>
> These character defining features are not limited to the William and Bray design ranch clubhouse, but include fairways with mature plantings, tennis courts, and unique features such as programmatic golf ball light standards. Alterations discussed largely reflect

> continued use as a community golf course and do not negatively impact the properties eligibility as a historic cultural monument.

The DEIR's conclusions have also been reviewed by Architectural and Historic Consultant Kim Tashman who has a Master's degree in Historic Preservation-Heritage Conservation from the University of Southern California. A copy of her comment letter on the DEIR is included as **Attachment 4** to this letter. We hereby request responses to Ms. Tashman comments. In her expert opinion:

> [T]he analysis is defective because it fails to address the impacts of the project on all of the character-defining features of the site. Per my thesis research, and according to the 2012 Architectural Resources Group Historical Resources Assessment Report (ARG Report) regarding the site, Weddington Golf's historic and character-defining features include: the 9-hole golf course, the clubhouse, the putting green located in front of the clubhouse, the driving range, the golf ball light standards, and the open green space and park-like setting of the site (including the extensive canopy of mature trees). These features are not adequately nor individually addressed in the DEIR. The DEIR arbitrarily limits its own list of "character defining features" to only the clubhouse, putting green, and golf ball light standards. . . Should the Project go forward as planned, these conveniently excluded historic elements will be either damaged or lost entirely – a significant impact on the site's historic characteristics.
>
> . . .
>
> The historic nature of the course's design is thoroughly documented in my thesis research attached. In removing these terms from the HCM, and ignoring the significance of the golf course itself in the DEIR, the DEIR is deliberately downplaying or outright denying the historic quality of the course, relegating the defining features of the historic site as irrelevant. As such, the DEIR has failed to accurately assess the impact of the Project on the HCM, a California Register eligible resource, and the site's cultural and historic landscape. It has failed to identify significant and unmitigated impacts of the Project.

The DEIR asserts that because the site will retain the historic clubhouse facility, putting green, and golf ball light standards, that there will be no significant cultural or historic losses to the site with the construction of the new facility. This is plainly inaccurate, given that one of the things that makes the site itself historic is the unique nine-hole golf course and driving range facilities, according to a number of experts.

It is only common sense that a significant impact to the historic resource would result from removing the golf course feature from a property, which the City's expert staff

has found to historic as both: “as an excellent example of a 1950s private recreational facility and golf club in Studio City”; and “as an excellent example of a 1950s community golf course” which “retains many essential characteristics of the small, local community golf courses that became popular nationwide in the 1950s.” Removing the golf course component and any other character-defining features would materially alter, in an adverse manner, those physical characteristics of the historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the local register and/or the California Register of Historical Resources. The Project, as proposed, would remove a number of key character-defining features, including the golf course. The Project would clearly result in significant adverse impacts to a historic resource which is both an HCM and eligible for listing in the California Register of Historic Resources. The DEIR must be revised and recirculated to acknowledge this significant Project impact on an historic resource.

The DEIR includes three PDF which are in fact typical historic resource mitigation measures. The DEIR authors have inappropriately considered these PDFs prior to making impact judgements. The three PDFs are: (1) requirements for a Rehabilitation Plan to ensure that rehabilitation of just the clubhouse, putting green, and low brick wall with weeping mortar complies with the Secretary of the Interiors Standards for Rehabilitation (Secretary’s Standards); (2) a requirement for preparation of Historic American Buildings Survey (HABS) Level III documentation; and (3) a requirement for the preparation of an interpretation of the history of the Project Site to be housed on-site. However, even if the DEIR had correctly identified significant Project historic resource impacts, and these PDFs had been properly identified as mitigation measures, they would not be sufficient to fully mitigate Project historic resource impacts associated with the substantial proposed modification of the Project site. The requirement for treatment consistent with the Secretary’s Standards only applies to three of the character-defining features of the Project Site. It therefore would not fully mitigate Project impacts. As noted by the court in *Architectural Heritage Association v. County of Monterey* (19 Cal. Rptr. 3d 469*)*: "As drawing a chalk mark around a dead body is not mitigation, so archival documentation cannot normally reduce destruction of an historic resource to an insignificant level.” The documentation PDF, even if it were a mitigation measure, thus would not fully mitigate Project impacts. The same is true of the requirement for an interpretive display (see *League for Protection v. City of Oakland*, 52 Cal.App.4th 896). As proposed, the Project would result in significant unmitigated Project impacts. The DEIR must be revised and recirculated for public review and comment pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4).

4.4 Failure to Identify Significant Greenhouse Gas Impacts

The DEIR’s analysis of Project Greenhouse Gas (“GHG”) emissions underestimates Project GHG impacts for a number of reasons. First, the analysis fails to account for the GHG emissions from removing existing turf and soil from the site. This will both release sequestered carbon and result in the loss of turf-related carbon sequestration as existing turf is removed, disposed of and replaced with artificial turf.

Recent studies have shown that both home of golf course turf results in net carbon sequestration:

> The Colorado Carbon Project, a collaborative effort among Colorado State University, the USDA and the Rocky Mountain Golf Course Superintendents Association and other entities, suggests that if the average fairway is 1.7 acres, then a single fairway will sequester .75 tons of carbon per year, which is equivalent of driving 6,500 miles with the average car. In addition, putting greens have the potential to sequester .40 tons of carbon per acre per year.[40]

Agricultural Research Service soil scientists have similarly found that golf course turf serves to sequester carbon:

> Agricultural Research Service soil scientist Ronald F. Follett and Colorado State University researcher Yaling Qian have studied soil records from 16 Denver-area golf courses. Follett says they found that carbon sequestration in the soil under turf- grass occurred at a "significant rate that is comparable to the carbon sequestration rate reported from U.S. land that has been placed in the Conservation Reserve Program." That voluntary program, run by USDA's Farm Service Agency, pays agricultural landowners to "establish long-term, resource-conserving covers on eligible farmland," which helps trap carbon.
>
> Follett explains that golf course managers generally keep excellent soil records; some of the records used for this research go back 45 years. The scientists found that carbon sequestration lasts for up to 31 years in fairways and 45 years in greens, after which the rates slow or become negligible.[41]

The DEIR's GHG analysis needs to account for the loss of carbon sequestration from the turf and the release of sequestered carbon as the removed turf rots. The DEIR's GHG analysis also needs to account for carbon release from the large volume of soil to be removed from the Project Site. As noted by the United States Department of Agriculture's Natural Resources Conservation Service:

> It is also important to limit soil disturbance because research has shown that large amounts of carbon dioxide are released when the soil is disturbed. The greater the volume of soil disturbed, the greater the carbon lost from the soil.[42]

---

[40] https://www.golfcourseindustry.com/article/gci-0310-golf-carbon-sequestration/
[41] https://agresearchmag.ars.usda.gov/AR/archive/2003/Jun/golf0603.pdf
[42] https://www.nrcs.usda.gov/wps/portal/nrcs/detail/pa/soils/health/?cid=nrcseprd1201408

The DEIR's analysis has failed to account for the GHG impacts of turf and soil removal. The analysis also contains a number of errors as documented by the environmental consulting firm, SWAPE.

As detailed in the letter from SWAPE included in **Attachment 1**, and quoted or paraphrased herein, there are a number of problems with the GHG analysis in the DEIR. SWAPEs full comments need to be addressed in the responses to comments and revised DEIR.

According to SWAPE, the DEIR estimates that the Project would generate net annual greenhouse gas ("GHG") emissions of 1,533- and 2,226-metric tons of carbon dioxide equivalents per year ("MT CO_2e/year") with and without GHG reduction measures, respectively (see p. IV.G-53, Table IV.G-7). However, the DEIR elects not to apply a quantitative GHG threshold. Instead, the DEIR concludes a less- than-significant GHG impact based on "the Project's compliance with performance-based standards included in the regulations outlined in the applicable portions of CARB's Climate Change Scoping Plan, the 2020-2045 Regional Transportation Plan/Sustainable Communities Plan ("RTP/SCS"), City's Green New Deal, and the Los Angeles Green Building Code" (p. IV.G-40). However, the DEIR's analysis, as well as the subsequent less-than-significant impact conclusion, is incorrect for five reasons:

(1) The DEIR's quantitative GHG analysis relies upon an incorrect and unsubstantiated air model;
(2) The DEIR fails to indicate a potentially significant GHG impact;
(3) The DEIR should incorporate PDFs as formal mitigation measures, not PDFs;
(4) The DEIR fails to consider the performance-based standards under CARB's *Scoping Plan*; and
(5) The DEIR fails to consider the performance-based standards under SCAG's *RTP/SCS.*

As detailed in **Attachment 1**, in an effort to quantitatively evaluate the Project's GHG emissions, SWAPE compared the Project's GHG emissions, as estimated by the DEIR, to the SCAQMD 2035 service population ("SP") efficiency target of 3.0 MT CO_2e/SP/year, which was calculated by applying a 40% reduction to the 2020 targets. When dividing the Project's net annual GHG emissions, as estimated by the DEIR, by a SP of 100 people, SWAPE found that the Project would emit approximately 15.5 MT CO_2e/SP/year. When applying this threshold, the Project's incorrect and unsubstantiated air model indicates a potentially significant GHG impact.

Additionally, according to SWAPE, the CalEEMod output files demonstrates that the "Harvard Westlake - Operations" model includes a manual reduction to the default CO_2 intensity factor (Appendix C, pp. 279, 291, 388, 403). This unsubstantiated reduction presents an issue, as CalEEMod uses the CO_2 intensity factor to calculate the Project's greenhouse gas ("GHG") emissions associated with electricity use. Thus, by including an unsubstantiated reduction to the default CO_2 intensity factor, the model may

underestimate the Project's GHG emissions and should not be relied upon to determine Project significance.

Given the errors in the GHG analysis in the DEIR, the analysis and DEIR must be revised and recirculated for public review and comment pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4).

4.5 Deficiencies in the Discussion of Hazardous Materials, Health, Water Quality and Waste Management Impacts – Artificial Turf

The analysis of the hazards posed by the proposed Project's artificial turf in the DEIR oversells the safety of such turf and fails to adequately disclose the health unknowns of artificial turf. The most pertinent concern, echoed by many scientists and advocates, is that researchers don't know much about the safety of artificial turf crumb rubber. In 2008 researchers from Robert Wood Johnson Medical School put it like this:

> Neither systematic testing nor post-test evaluation has been performed on the composition and fate of either the turf or the filler. . . . Is the crumb rubber contaminated with metals as it comes from ground up used tires that have been in contact with many road- ways and dirt surfaces; what is the surface temperature of the artificial turf as the crumb rubber is black and will absorb more heat than a grass surface; how are the fields safely disposed of once they exceed their usable lifetime; and what happens to the rubber material that does not stay attached to the turf as it becomes mobilized and is released into the environment or becomes attached to the skin and clothing of the users? Numerous mothers have told us that this crumb rubber comes home with the child and is distributed around the house. Furthermore, there are now residential uses of turf with and with- out "in fill" marketed in many colors with unspecified coloring agents. Is the rubber and turf safe? (J. Expo. Sci. Environ. Epidemiol. 2008;18:533–4; doi:10/1038/jes.2008.56)

As noted in Journal of National Cancer Institute (JNCI), 2016, Vol. 108, No. 12:[43]

> Griffin's concern is that the way scientists have been testing the safety of artificial turf may not reflect the way some soccer players interact with the material. She has seen blood cancers mostly in soccer players who were goalkeepers. They dive into the turf, often breathing only inches away from it, and end up ingesting much more of the substance orally than the average player. That's not the sort of interaction researchers tend to investigate.

[43] Artificial Turf and Cancer Risk by Daniel Luzer available at starting on page 2: https://academic.oup.com/jnci/article/108/12/djw311/2706944

> Despite widespread adoption of the crumb rubber–filled synthetic turf (the U.S. has some 12,000 such fields now), no epidemiological studies have examined populations with experience playng on such fields. Nor have researchers conducted animal testing on rubber fill, in which mammals are directly exposed to the substance for long periods and researchers examine the effects.
>
> Andrew Watterson, Ph.D., professor of health and director of the Centre for Public Health and Population Health Research at Scotland's University of Stirling, has found cancer-causing chemicals in crumb samples from artificial soccer fields. He argues that the problem is just that so little is known about such a potentially dangerous substance.
>
> "The surprising thing to me is that the health issues were not checked out much earlier—bearing in mind how long such pitches have been around and how many millions of people, especially children, use the surfaces worldwide—and we still don't know what, if any, health risks there are from widely recognized carcinogenic substances used in crumb rubber and what uptake rather than simply exposure there is," Watterson said. "It would have been in both government and industry interests to have sorted this [out] a long time ago."
>
> Tania Bush Isaksen, Ph.D., M.P.H., lecturer in the department of environmental and occupational health sciences at UW's School of Public Health, is investigating cancer rates among athletes across Washington State. What she's working on won't tell whether artificial turf causes cancer, but "it'll [tell] us if these rates are higher than we should expect."
>
> The Environmental Protection Agency, the Consumer Product Safety Commission, and the Centers for Disease Control and Prevention also are studying the issue.

The USEPA is currently conducting research on recycled tire crumb used in artificial turf on playing fields. As noted by the EPA:[44]

> Concerns have been raised by the public about the potential health risks from playing on synthetic turf fields in the U.S. containing tire crumb rubber. Studies to date have not shown an elevated health risk from playing on fields with tire crumb rubber, but the existing studies have been limited.

[44] https://www.epa.gov/chemical-research/federal-research-recycled-tire-crumb-used-playing-fields

> To help address these concerns, the Centers for Disease Control and Prevention/Agency for Toxic Substances and Disease Registry (CDC/ATSDR) and the U.S. Environmental Protection Agency (EPA), in collaboration with the Consumer Product Safety Commission (CPSC), launched a multi-agency research effort in February 2016.
>
> This multi-agency research effort, known as the Federal Research Action Plan on Recycled Tire Crumb Used on Playing Fields and Playgrounds (FRAP), is focused on assessing potential human exposure, which includes conducting research activities to characterize the chemicals associated with tire crumb rubber and to identify the ways in which people may be exposed to those chemicals based on their activities on synthetic turf fields. Also, the FRAP includes characterizing emissions and bioaccessibility to differentiate what is present in the tire crumb rubber from what people may actually be exposed to from tire crumb rubber. . .
>
> The study has four parts:
>
> - Literature Review/Gap Analysis (EPA and CDC/ATSDR)
> - Recycled Tire Crumb Characterization (EPA and CDC/ATSDR)
> - Exposure Characterization Study (EPA and CDC/ATSDR)
> - Playground Study (Consumer Product Safety Commission)

Only the *Synthetic Turf Field Recycled Tire Crumb Rubber Characterization Research Final Report: Part 1 -Tire Crumb Rubber Characterization* has been completed, to date.[45] The study found:

[45] The report is available at: https://www.epa.gov/chemical-research/federal-research-recycled-tire-crumb-used-playing-fields. A presentation on the report from an August 6, 2019 public webinar is available at: https://www.epa.gov/chemical-research/public-webinar-part-1-tire-crumb-rubber-characterization The webinar sliders are available at: https://www.epa.gov/sites/default/files/2019-08/documents/tc_public_webinar_-_august_6_2019.pdf

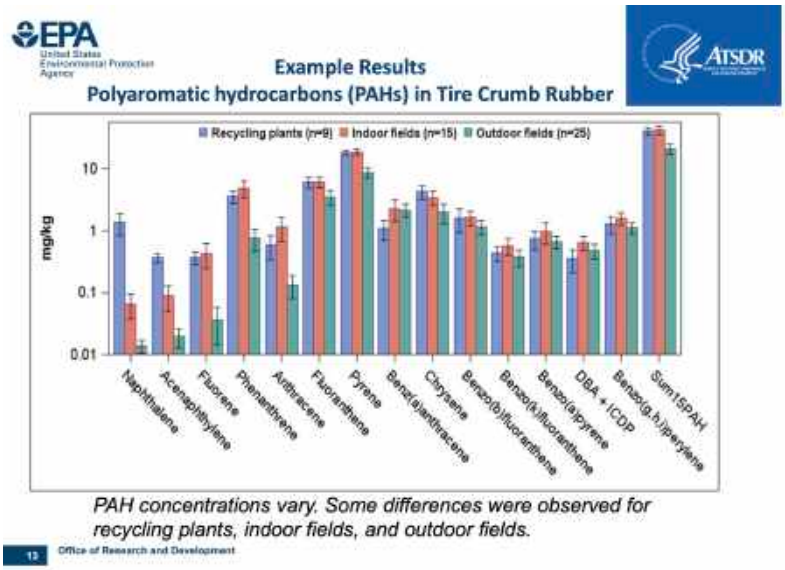

FIGURE 2 – PAH Concentrations in Artificial Turf Crumb Rubber
Source: https://www.epa.gov/sites/default/files/2019-08/documents/tc_public_webinar_-_august_6_2019.pdf

- Most of the target analytes among the 21 metals and 49 SVOCs, and several of the 31 target VOCs, were found in tire crumb rubber collected at fields across the U.S.

- Average concentrations ranged from <1 mg/kg for several metals and extractable SVOCs to up to 15,000 mg/kg for zinc.

- For most VOC and SVOC chemicals, air emissions were low at 25 °C and in many cases, not measurable above the detection limit or above background levels.

- At 60 °C, higher emissions were measured for some, but not all, VOCs and SVOCs.

- Every sample from the 40 fields was positive for total bacteria.

    - 42% had at least one sample with Staphylococcus aureus.
    - 70% had a least one positive sample for methicillin resistance.

Given that the proposed Project is in the San Fernando Valley, with it's high heats, the DEIR needs to address the potential for off-gassing of VOCs and SVOCs. This should be addressed as part of the Hazardous Material discussion, the air quality analysis and the needed health risk assessment.

The second phases of the EPA study, which will include a health risk assessment has yet to be completed. The EPA has yet to determine whether the health risks of artificial turf which includes crumb rubber are less than significant.

According to the Mount Sinai Children's Environmental Health Center:[46]

> **What chemicals can be contained in the infill crumb rubber?**
>
> Because infill crumb rubber is made from recycled tires and other recycled materials, it can contain a mixture of chemicals. These chemicals include rubber, polycyclic aromatic hydrocarbons (PAHs), volatile organic compounds (VOCs), and heavy metals (lead, zinc, iron, and manganese).[1]
>
> **How can people be exposed to these chemicals?**
>
> (1) Inhalation: Exposure to airborne chemicals was recently studied by Connecticut's Departments of Public Health and Environmental Protection, their Agricultural Experiment Station, and UCONN Division of Occupational and Environmental Medicine. They studied both indoor and outdoor turf fields. Results showed that each field had a different mixture of airborne

[46] https://icahn.mssm.edu/files/ISMMS/Assets/Research/PEHSU/ArtTurfFactSheet_2011.pdf

chemicals. When the amount of airborne chemicals at outdoor turf fields was compared to background (non turf field) levels, they did not find a difference. However, there were more airborne chemicals (e.g. benzothiazole) in one indoor field as compared to outdoor fields.[2] This result supports the idea that chemicals remain in the air longer with decreased ventilation. Based on these measurements, the Connecticut Department of Health found that health risk from playing on turf fields (even indoors) was "...within typical risk levels in the community from ambient pollution sources and are below target risks associated with many air toxics regulatory programs."[2] However, one limitation of the Connecticut findings is that chemical measurements were taken on summer days when the temperature was below 90 degrees. They did not assess the potential for increased chemical release with hotter temperatures typical of summer heat waves.

(2) Ingestion: Pellet infills can stick to the hands and bodies of children playing on the fields. This can lead to ingestion in young children who often put hands and toys into their mouths.[4]

(3) Skin: Certain chemicals may be absorbed through direct skin contact. This is of greater concern in young children whose skin barrier is not as thick, or keratinized, as older individuals.[4]

What are the health and environmental effects of chemical exposures related to infill rubber?

Exposures to chemicals present in crumb rubber at very high levels, typical of animal or occupational studies, are known to cause birth defects, neurologic and developmental deficits, and some can even cause cancer.[4] These are higher exposures than would be found in infilled tire crumb. What is not yet known is the extent to which these chemicals actually enter the bodies of children playing on turf fields. Several studies have attempted to approximate exposure to concerning components of crumb rubber by using theoretical estimates of inhalation, ingestion, and dermal exposure; these studies found that exposure would in most cases be too small to have health effects.[4] A limitation of these studies is that exposure level is only theoretical. In addition, the long term health effects of very small doses is still unknown.

Another concern is the extent to which chemicals may leach from the fields into the surrounding environment, soil and groundwater. The New York State Department of Environmental Conservation is investigating the impact of chemicals in rubber infill on groundwater and the environment. Results, as of May 2009, have not shown significant groundwater contamination, however, the study is still ongoing.[8] Lastly, the ability of infill-related chemical

exposure to cause allergic reaction or irritation (skin or respiratory) has not yet been studied.

What are the proven hazards of turf fields?

(1) Heat: It is unsafe for children to be playing on surfaces at extreme temperatures as they can develop heat-induced illnesses (eg. dehydration, heat stress, heat stroke, and heat burns).[4] Temperatures on artificial turf fields are elevated as compared to natural grass turf. At the University of Missouri's turf field, surface temperature reached 173°F and "head level" height temperature reached 138°F on a 98°F day.[4] Heat levels on artificial turf fields are slightly lower in areas shaded from sunlight.[4]

(2) "Turf burn" or friction abrasions: Athletes who fall on turf fields can get friction abrasions called "turf burns", which should be cleaned with soap and water. However, injuries on turf fields are not increased with respect to injury rate or severity as compared with natural grass fields.[3,5,6,7,9,10]

In addition, the possible presence of polyfluoroalkyl substances – known as PFAS chemicals (or forever chemicals) in artificial turf blades and backing is a concern. As noted by the organization Public Employees for Environmental Responsibility (PEER):[47]

> In September, the Ecology Center, working with PEER, found elemental fluorine in artificial turf blades, suggesting that PFAS is an ingredient in the carpet grass fibers or a byproduct of the manufacturing process. It also found specific PFAS chemicals in discarded turf backing and an adjacent wetland. Per-and polyfluoroalkyl substances (PFAS), often referred to as "forever chemicals," do not break down in the environment and bio-accumulate in the food chain. Human exposures to PFAS are associated with cancer, birth defects, and other impairments. On October 14, 2019, the Synthetic Turf Council put out a statement that did not deny the presence of PFAS but nonetheless blasted the groups' "inaccurate, non-verified report using questionable test methods." Yet, it is hard for industry to dispute that:
>
> - Two specific PFAS substances were found in backing of two different turf samples: one had 6:2 FTSA, the other had PFOA from samples taken by three PhD scientists who collected samples using proper lab protocols;
>
> - Shaw Industries, one of the companies that produced the turf that tested positive for elemental fluorine, admits, "These chemicals are commonly used by synthetic turf manufacturers as a non-stick agent…. We are exploring alternatives with our technical teams and suppliers but have not yet identified a substitute that provides the non-stick properties required for manufacturing synthetic turf." (emphasis added); and

[47] https://peer.org/industry-in-a-dither-about-pfas-in-synthetic-turf

- ACTGlobal also concedes it uses a "fluorelastomer process aid" (likely a PFAS) in the manufacture of synthetic grass.

> Significantly, the groups can only test for 36 PFAS because widespread claims of "confidential business information" prevent release of data about hundreds of other PFAS compounds. "We are asking manufacturers to fully disclose all PFAS chemistry used, including fluoropolymers and any other fluorinated processing aids used in the production of turfgrass fibers and backing," said Jeff Gearhart of the Ecology Center. "Industry continues to claim this chemistry is proprietary, however, the public has a right to know."
>
> Two big concerns about PFAS in the turf blades and backing is the direct chemical exposure to children, and the potential for PFAS to leach off the fields into groundwater, surface water and eventually, drinking water.

The DEIR needs to disclose the unknowns regarding the potential health risks of artificial turf. Given the unknowns, impact should be classified as potentially significant.

It should also be noted in the DEIR that PEER has filed a complaint with the Federal Trade Commission ("FTC") alleging that artificial turf manufacturer claims that artificial turf is recyclable are false and that recycling is not possible due to the difficulty of separating component parts.[48] The complaint states that artificial turf fields last eight to ten years[49] and that there are currently no facilities in the United States that can recycle artificial turf.[50] The DEIR, therefore, also needs to disclose and address the solid waste impacts associated with the use of artificial turf.

4.6 Inadequate Health Risk Assessment and Failure to Identify Significant Health Risks

As detailed in the SWAPE letter included as **Attachment 1** to the letter and quoted or paraphrased below, the DEIR concludes that the Project would have a less-than-significant health risk impact without conducting a quantified construction or operational health risk analysis ("HRA") (p. IV.B-61 – IV.B-62). The DEIR's evaluation of the Project's potential health risk impacts, as well as the subsequent less-than-significant impact conclusion, is incorrect and the analysis is insufficient for three reasons:

> First, this qualitative as opposed to quantitative approach is inconsistent with CEQA's requirement to make "a reasonable effort to substantively connect a project's air quality impacts to likely health consequences."[51] The Project will generate a substantial number of Project-related trips both during construction and operation. For example, during construction 250,000 cubic yards of soil must be removed from the Project Site. The DEIR needs to quantitively evaluate health risks both in the vicinity of the Project Site, along the haul route, and in the vicinity of the soil disposal site.
>
> Second, the analysis is inconsistent with guidance from the Office of Environmental Health Hazard Assessment ("OEHHA"), the organization responsible for providing guidance on conducting Health Risk Assessments ("HRAs") in California. OEHHA released its most recent *Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments* in February 2015. Specifically, OEHHA recommends that all short-term projects lasting at least 2 months assess cancer risks and that exposure from projects lasting more than 6 months should be evaluated for the duration of the project.[52] Thus, as the Project's anticipated construction duration exceeds the 2-month and 6-month requirements set forth by OEHHA, construction of the Project meets the threshold warranting a quantified HRA under OEHHA guidance and should be evaluated for the entire 30-month construction duration.

However, Re-Match has no deed or mortgage recorded within any Pennsylvania County Clerk of Records, only a Consent of Landowner has been filed within Luzerne County. *See* Exhibit A.

[51] "Sierra Club v. County of Fresno." Supreme Court of California, December 2018, a*vailable at:* https://ceqaportal.org/decisions/1907/Sierra%20Club%20v.%20County%20of%20Fresno.pdf.

[52] "Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf, p. 8-18.

> Third, by claiming a less than significant impact without conducting a quantified construction or operational HRA for nearby, existing sensitive receptors, the DEIR fails to compare the Project's excess cancer risk to the SCAQMD's specific numeric threshold of 10 in one million.[53] Thus, in accordance with the most relevant guidance, an assessment of the health risk posed to nearby, existing receptors as a result of Project construction and operation should be conducted.

The DEIR needs to be revised to include the required quantitative Health Risk Assessment. The DEIR must then be revised and recirculated for public review and comment pursuant to CEQA Guidelines Section 15088.5(a)(4).

4.7 Lack of an Adequate Cumulative Noise Assessment

The DEIR needs to address the potential of the proposed Project in combination with cumulative noise sources such as increasing aviation noise in the Project area, to result in cumulative noise impacts. As explained by Studio City for Quite Skies:[54]

> NextGen is the Federal Aviation Administration's new satellite GPS system for guiding aircraft. It is being implemented all over the country. It creates concentrated flight paths supposedly to promote efficiency and save money for the airlines but it has not achieved its goal (according to the Inspector General) and has been a complete failure inspiring lawsuits nationwide. . . .
>
> **How is it different from the previous system?**
> The FAA formerly used a radar system that dispersed flights in six-mile wide paths. With NextGen, the FAA has compressed these paths into narrow, undeviating half-mile corridors - massively increasing noise and pollution for those living under them. Previously, jets departing Hollywood Burbank Airport were dispersed over a six-mile area, sharing the burden of noise across the East San Fernando Valley. Since NextGen, however, flight paths have been narrowed to a half-mile wide area, at dramatically lower altitudes, and were shifted south directly above our once-tranquil hillside suburb, including the protected, 4(f)-designated wilderness of the Santa Monica Mountains. This High Fire Severity Zone was never studied as part of Metroplex and residents were never given notice of the change. Studio City is now subjected to almost 200 low and loud jets per day from Burbank,

---

[53] "South Coast AQMD Air Quality Significance Thresholds." SCAQMD, April 2019, *available at:* http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf.

[54] https://www.studiocityforquietskies.com/copy-of-about

expected to increase by 15% per year - with an all-new Expanded Burbank Terminal coming in 2024. This is on top of some 80-100 flights per day from Van Nuys Airport - also increasing.

How does all this affect Studio City, Sherman Oaks and Encino?
Control towers and airlines gradually rolled out NextGen in Southern California ("The Southern California Metroplex") in November, 2016 and officially in March, 2017. See evidence of November 2016 rollout HERE. At Burbank Airport, Air Traffic Control began vectoring flights far south of the 101 Freeway in anticipation of the FAA creating two new departure procedures, named SLAPP TWO and OROSZ THREE. Since the Task Force recessed in May 2020, FAA has added multiple new operations over our community in addition to just departures. We now receive simultaneous arrivals and departures from both BUR and VNY, when prior to the Task Force, we received arrivals only on "wind days," and instead of departures.

What are the two New Proposed Procedures?
FAA has proposed TWO NEW BURBANK DEPARTURE PROCEDURES (SLAPP TWO and OROSZ THREE) which will create GPS-guided waypoints over Colfax/Ventura (near Carpenter Community Charter Elementary School) and at Hollyline, south of Valley Vista (near The Buckley School). These will serve to legitimize and make permanent flight paths that are already destroying our quality of life - while extending the air noise misery to Sherman Oaks and Encino. These procedures were proposed without an Environmental Assessment or any consultation with affected communities. Studio City has suffered a devastating increase in airplane noise since the introduction of NextGen.

The DEIR needs to address the cumulative noise impact of the proposed Project in combination with the related cumulative noise impact resulting from past, present and reasonably foreseeable changes in Burbank Airport operations.

4.8 Public Services – Failure to Identify Significant Impacts to Fire Station Operations During Construction and Operation and on Emergency Access

As noted on DEIR page II-53, the "south driveway" for the aboveground and underground parking areas would be "via a driveway at the paved portion of Valleyheart Drive located just south of LAFD Fire Station 78". **Figure 3** shows the proximity of this driveway to the Fire Station. **Figures 4 and 5** shown the configuration of the Fire Station and its driveways.

FIGURE 3 – Location of South Driveway and Dropoff Area in Relation to Fire Station No. 78
Source: DEIR Figure II-6 – The number 2 indicates vehicular entry; the number 5 indicates a vehicular gate

FIGURE 4 – Aerial View of Fire Station 78
Source: Google Earth

FIGURE 5 – View of Fire Station 78 from Valleyhart – Eastern Driveway
Source: Google Earth

Construction

DEIR page II-62 indicates that the "inbound haul route would come from US-101, head southbound on Coldwater Canyon Avenue, eastbound on Moorpark Street, and southbound on Whitsett Avenue to access the Project Site" and that the "outbound haul route would leave the Project Site and head southbound on Whitsett Avenue, westbound on Ventura Boulevard, and northbound on Coldwater Canyon Avenue to reach US-101."

As noted on page IV-M-18 of the DEIR:

> With regard to LAFD Fire Station 78 emergency access, **the station's main driveway used for the departure of the larger fire trucks from the station bays is located on Whitsett Avenue**, north of Valleyheart Drive. The station also has two driveways on the north side of Valleyheart Drive. Of these two driveways, the westerly driveway is used for the return of the larger fire vehicles, which swing wide and use most of the Valleyheart Drive roadway to enter the fire station before proceeding to the bays. The easterly driveway to the fire station is used for the entry and departure of smaller vehicles, such as ambulances. (Emphasis added).

DEIR page IV.M-44 concludes without providing any evidence that:

> emergency access would be maintained at all times as no road closures would be necessary. However, while construction activities would not require full street closures (i.e., at least one travel lane would be open at all times) and most Project construction activities would be confined to the Project Site, the Project would still implement a CMP (see Project Design Feature TRAF-PDF-1). Because of the short-term nature of the construction activities and with implementation of a CMP, the Project's construction activities would not require a new, or

> significantly interfere with an existing, risk management, emergency response, or evacuation plan. The Project would not result in inadequate emergency access during construction.

Given the volume of construction truck traffic associated with the project, the fact that the construction haul route will use Whitsett, the fact the DEIR admits that some travel lanes may be closed during construction, the location of Fire Station 78 and its driveways, and the fact that the DEIR relies on Project Design Feature TRAF-PDF-1 (a Construction Management Plan), the specifics of which have not been disclosed, the conclusion that impacts to emergency response during construction will be less than significant are not supported by substantial evidence. There has been no demonstration that the Construction Management Plan will fully mitigate emergency access and response impacts during construction or that such mitigation is really feasible. The potential for significant emergency response impacts during construction remains.

Operation

As previously discussed in **Section 3.7**, the DEIR impermissibly relies on a Project Design Feature, TRAF-PDF-2, the installation of a flashing warning light installed on the southern exit driveway as the mechanism for ensuring that vehicles existing the Project Site will not conflict with emergency vehicles entering and existing Fire Station 78 site and POL-PDF-2, the existence of security kiosks, when making impact judgements.

The DEIR concludes on page IV.M-45 that:

> The warning light would allow for adequate emergency access by LAFD vehicles between Valleyheart Drive and Whitsett Avenue by reducing conflicts between vehicles leaving the Project Site and emergency vehicles leaving/coming back to the station. Further, the warning light would minimize the eastbound queues by vehicles leaving the Project Site along Valleyheart Drive at Whitsett Avenue when emergency vehicles need to access Valleyheart Drive. With the warning light in operation, LAFD would be able to effectively maintain adequate emergency vehicle access to the fire station. Also, the Project would include an at-grade security kiosk located near the roundabout, thereby placing a security guard nearby to assist with traffic management when the warning light is activated. . . .
>
> **Based on the above, Project impacts with respect to emergency access would be less than significant.**

The DEIR has thus failed to identify a significant emergency access impact, by relying on PDFs which are clearly mitigation measures when conducting the analysis. Given that the DEIR has failed to identify a significant impact, by relying on PDFs which are in fact clearly mitigation measures, recirculation of the DEIR is required pursuant to CEQA Guidelines Section 15088.5(a)(1).

The Traffic Analysis included as Appendix M to the DEIR identifies, on page 62, two mitigation measures for Project access issues at the south Project driveway:

> **Potential Corrective Actions**
>
> After identifying the Project related access constraint at the south driveway on Whitsett Avenue during the Special Event Scenario, the following corrective action was identified to minimize the access constraints:
>
> - On Special Event Days, prohibit left turns out of the south driveway and force all exiting vehicles to turn right onto Whitsett Avenue. This can be employed using traffic control officers (TCOs) as part of an event management plan to be developed with LADOT. This change would improve the projected LOS at the southern driveway from LOS F to LOS B, and would reduce the projected queue length from 150 feet to 25 feet, as shown in **Table 12A** and **Table 12B**.
>
> - To minimize effects on access for LAFD vehicles on Valleyheart Drive, implement a warning light that would hold back vehicles exiting the Project turnaround onto Valleyheart Drive when an emergency vehicle is approaching Valleyheart Drive from Whitsett Avenue or exiting from one of the two LAFD driveways on Valleyheart Drive. This warning light would be activated by a button pressed by LAFD staff in the emergency vehicles.

While the second of these needed mitigations has been included as Project Design Feature (TRAF-PDF-2), the left-turn restriction has not been required as a mitigation measure. In the absence of this mitigation, significant Project impacts remain and the DEIR needs to be recirculated to acknowledge these impacts.

In addition, the analysis on pages IV.M-44 to 45 of the DEIR and PDFs only addresses traffic exiting the Project Site via the driveway adjacent to Fire Station 78. No analysis has been provided in the DEIR of the potential of vehicles, turning onto Valleyhart in the vicinity of Fire Station 78 from Whitsett to enter the Project Site for drop-off or parking purposes, to interfere with the operation of the Fire Station.[55] The DEIR needs to address both left and right-turn movements onto Valleyhart from Whitsett into the south Project driveway. If exiting vehicles will result in impacts to Fire Station operations, so too will entering vehicles. This impact has not been identified in the DEIR. Recirculation of the DEIR is required pursuant to CEQA Guidelines Section 15088.5(a)(1) and (4). Please also see and address all of the comments by Aperture,

[55] See for example

included in **Attachment 5** to this letter. Aperture is a forensic engineering firm and has identified defects in the DEIR's analysis.[56]

Furthermore, the Traffic Analysis needs to be redone since the trip assignment used makes no sense given that one of the Harvard-Westlake schools that would use the facilities is located on Coldwater Canyon Boulevard and the other is located west of Coldwater Canyon. As shown in **Figure 6**, which reproduces Figure 8A from the Traffic Analysis in DEIR Appendix M, the Traffic Analysis assumes that 60 percent of Harvard-Westlake visitors to the site would arrive from the eastbound 101 freeway and 20 percent would be coming from east of Whitsett. The same trip distribution was also used for Harvard-Westlake employees (see Appendix M, Figure 8C). The trip distribution used in the analysis therefore makes no sense and is likely to underestimate right turns onto Valleyheart from Whitsett after vehicles pass Fire Station 78. Furthermore, a separate trip distribution and analysis needs to be provided for non-Harvard-Westlake events at the Project Site. The analysis of potential impacts from Project vehicular movements needs to be completely redone and the DEIR recirculated for public review and comment pursuant to pursuant to CEQA Guidelines Section 15088.5(a)(4).

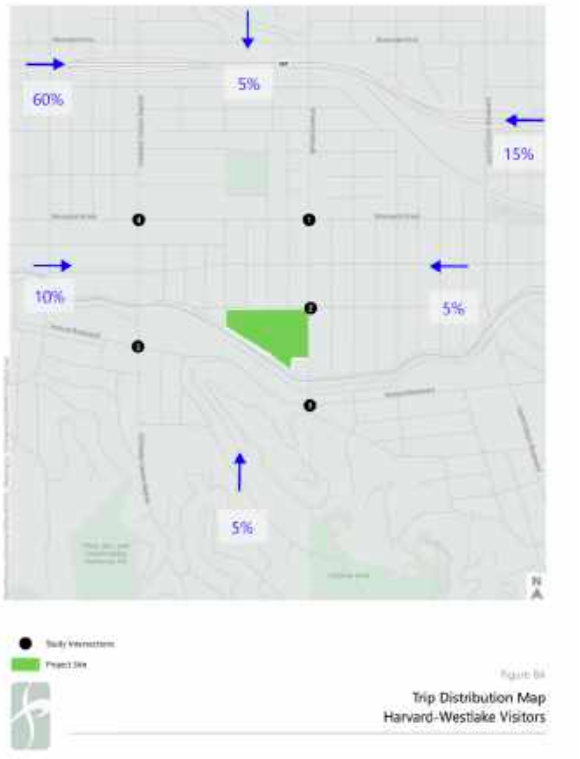

FIGURE 6 – Trip Distribution Assumptions for Harvard-Westlake Visitors and Employees Used in the Traffic Analysis
Source: Figure 8A from the Traffic Analysis in DEIR Appendix M

[56] See https://www.aperturellc.com or https://wexco.net Apertures services include: accident reconstruction, animation & graphics, biomechanics, construction defect and premises liability analyses.

Given that impacts are underestimated, recirculation of the DEIR is required pursuant to CEQA Guidelines Section 15088.5(a)(2). Due to both the failure to identify an impact and the underestimate of impacts recirculation of the DEIR is also required pursuant to CEQA Guidelines Section 15088.5(a)(4).

4.9 Traffic – Failure to Identify Pedestrian and Vehicular Safety Impacts

Please also see and address the comments by Aperture regarding pedestrian and vehicular safety, included in **Attachment 5** to this letter.

4.10 Traffic – Inadequate Analysis of Construction Impacts to Freeway Safety and Off-Ramp Queuing

DEIR pages IV.M-41 to IV.M-44 include an analysis of the impacts of Project operations on local and freeway safety, including the operation of the US-101 Southbound Off-ramp to Coldwater Canyon Avenue during the peak afternoon hour. This analysis largely consists of a narrative unsupported by quantitative data or analysis. It is therefore not supported by substantial evidence.

Furthermore, no such analysis is provided of the impacts of Project construction-related activities on local and freeway safety. The proposed Project will generate an enormous amount of truck traffic during construction, more than one inbound and one outbound truck trip every two minutes. As required by CEQA, the DEIR needs to address construction, as well as operational impacts of the Project on local roadway and freeway safety and the operation of the freeway ramps. A quantitative analysis of the impact of truck traffic, with truck traffic converted to passenger car equivalents as appropriate, needs to be included in the DEIR, otherwise, based on the sheer volume of truck traffic, there is the clear potential for significant unmitigated truck-related impacts to the safety and operation of the freeway and freeway ramps at both ends of the haul routes. Given that truck traffic will be generated during both the a.m. and p.m peak period, both periods need to be addressed in the analysis.

4.11 Traffic –Failure to Identify Significant Neighborhood Impacts

The proposed project includes 532 parking spaces to serve the 80,249 square foot, two-story gymnasium with basement, playing fields, courts and clubhouse with 10-seat café. DEIR Table II-6 shows the calculation of required parking per LAMC Section 12.21 A4 as 444 spaces and is based on the number of fixed seats associated with the gymnasium, tennis courts, Field A, Field B and Pool. While LAMC Section 12.21 A4 (e)[57] does provide for calculating parking requirements based on fixed seats as follows, this has been inappropriately applied to the gymnasium portion of the Project:

> (e) **For Auditoriums**. There shall be at least one automobile parking space for each five seats contained within any theatre, church, high school, college or university auditorium, or general

[57] See: https://codelibrary.amlegal.com/codes/los_angeles/latest/lapz/0-0-0-5183

> auditorium, stadium or other similar place of assembly. Where there are no fixed seats in the auditorium or place of assembly, there shall be one parking space for each 35 square feet of floor area (exclusive of stage) contained therein.

However, LAMC Section 12.21 A4 (c)(2) specifies:

> (2) **Health Clubs**: There shall be at least one automobile parking space for each 100 square feet of floor area in the building being utilized for a health club, athletic club, bath house, **gymnasium**, dance studio, dance hall, or any similar establishment, which operates as a private facility or offers the use of the premises and equipment to the general public for physical exercise, dance or sports activities. This provision does not include such a facility located in a building which is accessory to an elementary school, junior high school or senior high school as defined in Section 12.03 of this article or any other institution of learning under the jurisdiction of the State Department of Education. This provision does not include such a facility located within an office building of at least 50,000 square feet or more of gross floor area, or located within the Downtown Business District parking exception area described in Paragraph (i) of this subdivision.

The gymnasium does not qualify as accessory to a school, since it is not located on the same lot as the school.[58] Parking requirements for the gymnasium should therefore have been calculated based on square footage. Given the 80,249 square foot size of the gymnasium, 802 parking spaces would be required for this portion of the proposed Project.[59] In total 1,041 parking spaces would thus be required for the Project. The Project is thus severely under-parked and it is therefore likely that event parking will spill over into nearby neighborhoods, particularly given that DEIR page II-50 acknowledges that school events will include attendance by up to 2,000 persons:

> In addition to the school athletic and recreational activities described above, the Project Site could be used for up to 30 school-related special events per year, 27 of which are conservatively assumed to have up to 500 people and three with 2,000 people. These special events would include a maximum of 15 weekday events, 10 Saturday events and 5 Sunday events. Special events are defined as any non-athletic, non-recreational or non- regular academic activity involving more than 100 persons.

[58] See LAMC definition of accessory use at: https://codelibrary.amlegal.com/codes/los_angeles/latest/lapz/0-0-0-886#JD_12.03

[59] It should be noted that parking requirements are typically established based on studies of trip generation associated with different uses.

According to DEIR page II-56:

> By providing more parking spaces than required by the LAMC, the School would accommodate the parking needs of its students, employees, and visitors on-site, to ensure they do not park in the surrounding community. Off-site parking for the Project Site's users would be prohibited through the following measures:
>
> - Security patrols present north of the Project Site on Valley Spring Lane during events to enforce no neighborhood or other off-site parking.
> - Security guard placed at the pedestrian entrance on Whitsett Avenue to screen visitors for neighborhood parking and to return visitors to their car if inappropriately parked.
> - On days in which event attendance is expected to surpass 300 spectators, tickets and parking passes would be required for visitors to enter the Project Site. This includes single events or combined events. For reference, attendance reached this level fewer than ten times during Harvard-Westlake School's 2018-2019 school year and is anticipated to be similarly infrequent at the Project Site. On ticketed days, visitors without parking passes would be directed to the upper school campus on Coldwater Canyon Avenue to utilize the shuttle service to the Project Site.
> - Three shuttles are anticipated to transfer students, coaches, and visitors between the campus and the Project Site between 2:30 p.m. to the end of the day's latest activity. Shuttles would have an estimated rider capacity of 24 and service is anticipated every 5 to 10 minutes. Ingress and egress at the Project Site would be at the south driveway drop-off roundabout, at Valleyheart Drive, just west of the LAFD Fire Station 78.

Requirements for use of a Shuttle and parking passes is required by TRAF-PDF-3, which is clearly intended as a mitigation measures for potential impacts. POL-PDF-2 specifies the provision of the specified security personnel, and is clearly intended as a mitigation measure for potential impacts. The DEIR has therefore failed to identify significant pre-mitigation neighborhood impacts.

The DEIR silent on the number of frequencies of non-school special events that will be permitted at the Project Site and how parking for such events will be controlled. In the absence of a mitigation measure prohibiting non-school special events, assumptions about the frequency of large events that will occur at the site are not supported by substantial evidence, and impacts associated with special events has been underestimated. Both the impact analysis and DEIR's Project Description are silent on how non-school special event traffic will be managed.

The DEIR fails to adequately analyze the impact of visitors to the Project Site seeking parking on nearby streets and neighborhoods and its impact on both neighborhoods and roadway operations and the operation of Fire Station 78. The DEIR similarly fails to adequately analyze the impact noise generation associated with visitors and special events. Given that impacts are underestimated, recirculation of the DEIR is required pursuant to CEQA Guidelines Section 15088.5(a)(1) and (2).

4.11 Inadequate Traffic, Public Facility and Recreational Impacts Due to Displaced Users Analyses

The DEIR fails to cite any source for the golf course and driving range usage figures provided on DEIR page IV.L.3-14 or to indicate what year and month(s) these figures are for. The DEIR should provide the source of the figures. The DEIR should also provide data showing how monthly usage rates have changed since Harvard-Westlake bought the property.

The DEIR needs to provide multiple-year, monthly data, regarding the use of golf and tennis facilities in the region, not just the limited data provided on page IV.L3-17 to 19. The DEIR indicates that golf and tennis reservations data are from surveys for February and March of 2021. However, there is no indication that these months are typical of historic patterns use pattern. Conclusions regarding the impact of displaced users on other facilities are thus not supported by substantial evidence. The DEIR's VMT analysis needs to account for the additional miles traveled by displaced site users that will have to travel a greater distance to access golf and tennis facilities.

The DEIR fails to provide substantial evidence to support its conclusions regarding the lack of recreational facility impacts resulting from the Project. The DEIR provides insufficient data to demonstrate that conclusions are based on data which is representative of historic patterns of site usage both before and after Harvard-Westlake purchased the property and at the other facilities in the region. Monthly data for multiple years is required to support the conclusions in the DEIR. The potential for significant impacts remains.

4.12 Failure to Identify Significant Cumulative Water Supply Impacts

According to page IV.O.1-28 of the DEIR, after improperly accounting for the water use reductions resulting from WS-PDF-1 (artificial turf) and WS-PDF-2 (capture and reuse system), which are in fact mitigation measures, the DEIR calculates Project water use as follows:

> Depending on rainfall frequency and volume, a minimum of one-third of the Project's total annual irrigation demand is expected to be provided by the Project's 1-million-gallon stormwater capture and reuse system. Thus, with Project Design Feature WS-PDF-2, the Project's irrigation demand would be reduced, at minimum, to 6,064 gpd or 6.8 afy; and, the Project's overall water demand would be reduced to 36,885 gpd or 41.31 afy.

. . .

> As indicated in Table IV.O.1-8, the Project would result in a total domestic water demand of 30,821 gpd or 34.52 afy, and a landscape/irrigation demand of 9,051 gpd or 10.13 afy. In total, the Project's overall water demand would be 39,872 gpd or 44.65 afy. The Project, as conservatively analyzed and as further explained below, would result in a net increase of 6,993 gpd or 7.82 afy compared to existing conditions.

The DEIR then goes on to concluded on page IV.O.1-31 that:

> As discussed in LADWP's 2020 UWMP and summarized in Tables IV.O.1-4 to IV.O-1-7, above, LADWP expects to have available water supplies during average year, single dry year, multiple dry years and drought condition scenarios. Assuming the conservative analysis included in Table IV.O.1-8 with a Project water demand of 44.65 afy or a net increase of 7.82 afy above existing conditions, the Project's water demand increase would be well within the City's total increase of 69,200 afy in water demand from 2025 to2045.[39] With its current water supplies, planned future water conservation and planned future water supplies, LADWP has available supplies to meet all demands under all three hydrologic scenarios (average, single dry, and multiple dry years) through the 25-year planning period covered by the 2020 UWMP. In addition, as shown in Table IV.O.1-7, LADWP would have available water supplies to meet water demand under drought conditions in 2025.

However, the DEIR has failed to account for an important cumulative project which will result in water demand in excess of that analyzed in the 2020 UWMP. That cumulative project is the City's 2021-2029 Housing Element and associated up-zoning of the City.

The Notice of Preparation for the EIR for the proposed Project was issued September 30, 2020, after the City received its Regional Housing Needs Assessment (RHNA) housing production targets for the 2021-2029 period, yet the analysis of Project water use impacts fails to address this important related impacts cumulative project. The additional demand, which arises from housing production targets and associated up-zoning goals established after adoption of the 2020 Urban Water Management Plan (UWMP), is not accounted for in the current 2020 UWMP (see 2020 UWMP Exhibit 1C and 1D on UWMP page 1-6).[60]

As detailed in the City's 2021-2029 draft Housing Element and the Housing Element DEIR, the draft Housing Element would result in the significant up-zoning of

[60] The 2020 UWMP is available at:
https://www.ladwp.com/cs/groups/ladwp/documents/pdf/mdaw/nzyy/~edisp/opladwpccb762836.pdf

land within the City. "In accordance with SCAG's RHNA Allocation Plan, adopted in March 2020, the City's 2021-2029 Housing Element must accommodate a total of ***456,643 units***, of which 184,721 units must be affordable to lower income households (Very Low and Low)."[61] This can be compared to its RHNA allocation of 82,002 units for the prior eight-year cycle. In January of 2020, the City had a total of 1,496,453 housing units according to the California Department of Finance (DOF).[62] The RHNA allocation thus requires a 30% increase in the City's total housing stock in just eight years.

In addition to meeting it's RHNA allocation, the City's 2021-2029 Housing Element includes a 15% buffer of additional housing units, resulting in a total housing production goal and associated rezoning to provide for 486,379 units additional housing units from 2021 to 2029.[63] These additional units substantially exceed the year 2030 housing unit assumptions in the UWMP. As shown in **Table 1**, this will result in water demand in excess of supply unless significant on-going water conservation is implemented. However, as noted in a recent Los Angeles Times article:[64] "Between July — when Newsom urged Californians to slash water use by 15% — and February, statewide cumulative water savings have amounted to just 5.8% relative to a 2020 baseline." (See **Attachment 6**). To date, even during a drought, water conservation has failed to meet targets.

TABLE 1
CUMULATIVE WATER DEMAND WITHOUT PROJECT
ESTIMATED WATER DEMAND COMPARED TO SUPPLY AVERAGE YEAR AND SINGLE DRY YEAR CONDITIONS (2030) ASSUMING 18.3% OF NEW UNITS ARE SINGLE-FAMILY WITH THE ADDITIONAL DEMAND RESULTING FROM ACHIEVING THE 2029 HOUSING ELEMENT'S HOUSING PRODUCTION TARGETS

				Average Year /1/	Single Dry Year /3/
Land Use	**Dwellings Per Unit**	**Daily Water Use Rate (GPD/unit)**	**Daily Water Demand (gpd)**	**Annual Water Demand (afy)**	**Annual Water Demand (afy)**
Housing Element Single-family Residential Demand	89,008	326	29,016,458	32,503	32,503
Housing Element Multi-family Residential Demand	397,371	189	75,103,119	84,127	84,127

The analysis of Project water supply impacts in the DEIR is inaccurate because it fails to address the amount of cumulative growth planned for and encouraged by the City in its 2021-2029 Housing Element, which is in excess of that addressed in the UWMP. As shown in **Table X**, with achievement of Housing Element targets, water demand in the City will exceed supply even in average years, unless substantial water conservation measures are undertaken. The Project's additional water demand of 7.82 afy compared to existing conditions, even after implementation of the PDFs which are in fact mitigation measures, would thus represent a significant cumulative water supply impact which has not been acknowledged in the DEIR, as it would contribute to pre-conservation demand in excess of supply in average years in a State which has to-date only managed to achieve

water conservation level which are well below the UWMP's water conservation scenario. Given the City is experiencing substantial drought conditions, which will persist for an unknown period of time, this cumulative impact may be even greater. The DEIR has failed to identify a significant cumulative water supply impact resulting from the Project. Recirculation of the DEIR is required pursuant to CEQA Guidelines Section 15088.5(a)(1) and (2).

5.0 IMPROPER DEFERRAL OF ANALYSIS OR MITIGATION AND INFEASIBLE MITIGATION MEASURES

The following mitigation measures demonstrate that the City has improperly deferred analysis of potential project impacts. They also constitute examples of improper deferral of mitigation.

> **HAZ-MM-1: Soil Management Plan**. Prior to the issuance of grading permits, Harvard- Westlake School shall retain a qualified environmental consultant to prepare a Soils Management Plan (SMP), which shall be submitted to the Los Angeles Department of Building and Safety (LADBS) and Los Angeles Regional Water Quality Control Board (LARWQCB), as necessary, for review and approval. The SMP shall specify soil testing parameters and sampling frequency for areas within the golf course and near the location of the 500-gallon UST removed from the Project Site in 1995. Sampling, testing, and analysis shall be conducted in accordance with appropriate California and local guidelines [e.g., Department of Toxic Substances Control (DTSC), California Environmental Protection Agency (CalEPA), and LARWQCB)]. Any soils qualifying as hazardous waste and/or soils that include concentrations of chemicals that exceed applicable State Office of Environmental Health Hazard Assessment (OEHHA) California Human Health Screening Levels (CHHSL), shall be subject to site-specific soil removal, treatment, and disposal measures included in the SMP to comply with applicable federal, State, and local overseeing agencies requirements to prevent unacceptable exposure of hazardous materials to construction workers, the environment or the public from contaminated soils or soil vapors during construction. The SMP shall also include, but is not limited to, protocols that address the following: screening measures for soil exhibiting impacts, stockpile management, vapor suppression and dust control, surface and groundwater protection, soil stockpile sampling, and exporting of contaminated soils. Upon completion of construction-related soil disturbing activities, Harvard-Westlake School shall obtain a closure letter(s) or No Further Action (NFA) letter from the LADBS, DTSC, LARWQCB, and/or other local or State agencies, as applicable, which states that no further soils testing or remediation is required on the Project Site, including near the former 500-gallon UST that was removed from the Project

Site in 1995 just south of the tennis courts near the adjacent LAFD site boundary. The closure letter and/or NFA letter(s) shall at a minimum address the on-site area, including the previously removed 500-gallon UST.

HAZ-MM-2: Health and Safety Plan (HASP): Harvard-Westlake School shall commission a HASP to be prepared in compliance with Occupational Safety and Health Administration (OSHA) Safety and Health Standards (29 CFR 1910.120) and Cal/OSHA requirements (8 CCR, General Industry Safety Orders and California Labor Code, Division 5, Part 1, Sections 6300-6719) and submitted for review and approval by the LADBS. The HASP would address, as appropriate, safety requirements that would serve to avoid significant impacts or risks to workers or the public in the event that contaminated soils or elevated levels of subsurface vapors are encountered during grading and excavation. The general contractor shall be responsible for health and safety concerns not related to contaminated soils or soil vapors, such as those associated with standard construction operations (e.g., excavation stability, stockpile placement, heavy equipment operation, etc.).

In addition, HAZ-MM-1 needs to be revised to specify that Harvard-Westlake School shall obtain a closure letter(s) or No Further Action (NFA) letter from the LADBS, DTSC, LARWQCB, and/or other local or State agencies, as applicable, which states that no further soils testing or remediation is required on the Project Site, and that documentation shall be obtained prior to the issuance of any demolition, grading, site preparation and construction permits.

Please also see and address comments from Mr. Cashen included in **Attachment 2** regarding improperly deferred and potentially infeasible Biological Resource mitigation measures. Recirculation of the DEIR is required pursuant to CEQA Guidelines Section 15088.5(a)(1) and (2).

6.0 INADEQUATE MITIGATION

The DEIR fails to include feasible mitigation measures to ensure Project operation consistent with assumptions used in the DEIR's impact analysis, such as number and size of both Harvard-Westlake and non-Harvard-Westlake events. The DEIR thus includes inadequate mitigation.

7.0 INADEQUATE ALTERNATIVES ANALYSIS

7.1 Impact Reducing Alternatives

As noted on DEIR page V-4:

> As described above, according to State CEQA Guidelines Section 15126.6(a) the purpose of analyzing project alternatives is to identify alternatives that "...would avoid or substantially lessen any of the significant effects of the project..."

The alternatives included in the DEIR fail to appropriately do this because the DEIR analysis fails to identify a number of significant Project impacts, as explained in **Sections 3 and 4** of this letter. As noted on DEIR page V-4:

> As shown in Chapter IV, *Environmental Analyses*, of this Draft EIR, the Project would not have significant long-term impacts due to Project operations that would require consideration of alternatives that would reduce such impacts.

The DEIR has thus inappropriately limited its definition of alternatives to those which would reduce only the construction noise and vibration impacts of the Project. The definition in the DEIR of alternatives is thus based on the faulty premise that the DEIR only needs to address two significant unmitigated construction-related impacts. Once the DEIR is corrected to appropriately identify a number of operational impacts, additional alternatives to address these impacts should be defined and added to the DEIR. This should include the addition of an alternative that would address the significant unmitigated historical resource impacts of the proposed Project.

7.2 Alternatives Considered and Rejected - Alternative Project Site Designs/Reduced Development Intensity

In Section 4 of Chapter V, the DEIR artificially rejects this alternative suggested in NOP comments as failing to meet five of the Project objectives. (See DEIR pages V-7 to V-8). However, the argument is disingenuous as no serious attempt has been made to design an alternative which would retain more of the character-defining features of the historic resource. The DEIR needs to include a serious alternative which retains more of the character-defining features of the historic resource and which address some of the other construction and operational impacts of the Project as discussed in **Section 4** of this letter.

7.3 Alternative Sites

The DEIR should be revised to include consideration of an alternative where the proposed facilities are constructed on the Los Angeles Valley College (LAVC) campus for joint use by Harvard-Westlake and LAVC. Under this alternative, limited improvements could be made to the Project Site to meet non-academic Project objectives and the facility could be maintained for public use, thus meeting objectives 3, 4, 5, 6, and 9 at the Tennis Club site and the remaining objectives at the LAVC site.

8.0 INADEQUATE CUMMULATIVE AND GROWTH-INDUCTING IMPACT ANALYSIS

8.1 Inadequate Related Project's List

CEQA Guidelines Section 15130(b) specifies that:

> The following elements are necessary to an adequate discussion of significant cumulative impacts:
>
> (1) Either:
>
> (A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency, or
>
> (B) A summary of projections contained in an adopted local, regional or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. Such plans may include: a general plan, regional transportation plan, or plans for the reduction of greenhouse gas emissions. A summary of projections may also be contained in an adopted or certified prior environmental document for such a plan. Such projections may be supplemented with additional information such as a regional modeling program. Any such document shall be referenced and made available to the public at a location specified by the lead agency.

The City has opted to use a related projects lists as the basis of the cumulative impact analysis in the DEIR. As noted on DEIR page III-4, under CEQA:

> Cumulative study areas are defined based on an analysis of the geographical scope relevant to each particular environmental issue. Therefore, the cumulative study area for each individual environmental impact issue may vary. For example, a cumulative land use impact generally may only affect the compatibility of uses within the vicinity of the project site, while a cumulative air quality impact may affect the entire South Coast Air Basin. The specific boundaries and the projected growth within those boundaries for the cumulative study area of each environmental issue are identified in the applicable environmental issue section in Chapter IV, *Environmental Impact Analysis*, of this Draft EIR.
>
> A list of proposed development projects in the area of the Project that could affect conditions in the Project area (e.g., by generating

> population increases requiring public services) was prepared based on information obtained primarily from LADOT and the City of Los Angeles Department of City Planning (DCP). A total of five (5) potential related development projects have been identified within the vicinity of the Project Site for inclusion in the cumulative impact analysis for this EIR.

As noted on DEIR page IV.A-21:

> All of the related projects are located within a 0.5-mile section of Ventura Boulevard, between 12544 and 12833 Ventura Boulevard. All of the related projects sites are zoned C-1.5 (Limited Commercial) and are currently developed with commercial uses.

This list of five related projects formed the basis of the cumulative impact analysis of: aesthetics (light and glare), geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, public services (police, fire and parks and recreation), transportation, tribal cultural resources, and wastewater generation. Only two of the five related projects were considered when assessing cumulative biological resource impacts and the analysis of cumulative historic resource impacts. Only the analyses of cumulative energy impacts, cumulative water supply impacts, and soil waste considered a wider geographic area.

The analyses of cumulative impacts in the DEIR, for most issue areas is thus based on an artificially constrained list of related projects, leading to an underestimate of the potential of the project in combination with related projects to result in significant cumulative impacts. The DEIR, in each of the issue area analyses, has failed to justify this artificially constrained definition of related projects. CEQA Guidelines Section 15130 specifies:

> (a) . . .
>
> (1) As defined in Section 15355, a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing **related impacts**." (Emphasis added).
>
> (b) . . .
>
> (2) When utilizing a list, as suggested in paragraph (1) of subdivision (b), factors to consider when determining whether to include a related project should include the nature of each environmental resource being examined, the location of the project and its type. Location may be important, for example, when water quality impacts are at issue since projects outside the watershed would probably not contribute to a cumulative effect. Project type may be

important, for example, when the impact is specialized, such as a particular air pollutant or mode of traffic.

(3) Lead agencies should define the geographic scope of the area affected by the cumulative effect and **provide a reasonable explanation for the geographic limitation** used. (Emphasis added).

The DEIR and City have failed to comply with CEQA Guidelines Section 15130(b)(2). The DEIR inappropriately constrains the related projects considered in the cumulative impact analyses by both geography and use type, rather than by related impacts, resulting in an underestimate of cumulative impacts. The cumulative impacts analysis is thus fatally flawed and must be redone and the DEIR recirculated pursuant to CEQA Guidelines Section 15088.5(a)(2) and (4).

8.2 Failure to Include Important Cumulative Projects

As discussed in **Section 4.12** of this letter, the DEIR needs to include as a cumulative project, the City's Housing Element targets and associated up-zoning requirements. This cumulative project will result in important related cumulative impacts on infrastructure demand and services as well as traffic and thus roadway operations in the project area. It also needs to included projects involving the substantial related disposal of soil as discussed in Section 1 of this letter. The failure to include projects related by impact in the analysis has led to an underestimate of cumulative impacts.

8.3 Failure to Address Reasonably Foreseeable Future Development on the Two Harvard-Westlake Campuses

The DEIR fails to identify or adequately address the cumulative and growth-inducing impacts of the proposed Project associated with the transfer of athletic facilities and uses from the two Harvard-Westlake campuses to the Project Site. The proposed Project would free up space on the two existing Havard-Westlake campuses currently used for playing fields and other athletic facilities, thus freeing up land that would allow for expansion of academic facilities and thus enrollment expansion on the two campuses. As shown in **Figures 7 and 8**, elimination of athletic fields at the two campuses would free up substantial land area for campus program expansion. The proposed Project would thus be growth-inducing. The DEIR's cumulative impact analysis and growth-inducing impact analyses needs to address the potential of the proposed Project to lead to enrollment expansion and new construction at the two existing campuses, as a result of the transfer of athletic activities to the Project Site. This additional development is a reasonably foreseeable consequence of the proposed Project.

9.0 CONCLUSION

In this comment letter and its attachments, we have provided substantial evidence regarding defects in the DEIR. In addition to our comments, as part of the response to comments, the City needs to provide detailed response to the comments provided by subject-matter experts contained in **Attachments 1, 2, 4 and 5** to this letter. As

documented herein, the DEIR fails to identify a number of significant impacts as well as underestimates impacts. The DEIR needs to be corrected and these issues addressed and the recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1) and (2).

Sincerely,

Jamie T. Hall

Subject: Comments on the Harvard-Westlake River Park Project (SCH No. 2020090536)

Dear Mr. Hall,

We have reviewed the March 2022 Draft Environmental Impact Report ("DEIR") for the Harvard-Westlake River Park Project ("Project") located in the City of Los Angeles ("City"). The Project proposes to demolish an existing 799-square-foot ("SF") tennis facility, 426,000-SF golf course, and 2,300-SF driving range, as well as construct an 80,249-SF gym, a 52-meter swimming pool, and 532 parking spaces on the 17.2-acre site

Our review concludes that the DEIR fails to adequately evaluate the Project's air quality, health risk, and greenhouse gas impacts. As a result, emissions and health risk impacts associated with construction and operation of the proposed Project are underestimated and inadequately addressed. An updated EIR should be prepared to adequately assess and mitigate the potential air quality, health risk, and greenhouse gas impacts that the project may have on the surrounding environment.

Air Quality

Incorrect Analysis of Construction-Related Criteria Air Pollutant Emissions

Regarding the DEIR's analysis of the Project's construction-related criteria air pollutant emissions, the Air Quality/Greenhouse Gas Emissions Technical Documentation ("AQ & GHG Report"), provided as Appendix C to the DEIR, states:

> "Emissions from off-road equipment and off-road vehicles were estimated through CalEEMod […] Emissions from worker trips, haul truck trips, concrete truck trips and vendor truck trips were estimated outside of CalEEMod to account for the ARB on-road vehicle emissions factor EMFAC2017 (EMFAC) model because it has not yet been incorporated in the current version of

> CalEEMod […] Emissions from haul trucks, vendor trucks and concrete trucks were also estimated outside of CalEEMod using EMFAC emission factors for haul, vendor and concrete trucks because CalEEMod assumes that the number of heavy-duty trucks input into the model occurs across the entire length of the applicable construction phases" (p. 2).

As demonstrated above, emissions associated with off-road equipment and vehicles during Project construction were calculated with the California Emissions Estimator Model ("CalEEMod"), while emissions associated with on-road vehicles during Project construction were calculated outside of CalEEMod. Furthermore, the AQ & GHG Report states:

> "The maximum daily emissions estimated based on maximum construction activity conditions for heavy-duty off-road construction equipment and onroad mobile sources and do not represent the emissions that would occur every day during Project construction" (p. 3).

As demonstrated above, the AQ & GHG Report acknowledges that the off-road emissions calculated with CalEEMod, and the on-road emissions calculated outside of CalEEMod, each "do not represent the emissions that would occur every day during Project construction." As neither account for the entirety of the criteria air pollutants that would be generated during Project construction, the DEIR should have summed the off-road and on-road emissions estimates in order to accurately evaluate the Project's maximum daily construction-related emissions. Specifically, the Project's mitigated off-road and on-road construction-related emissions, as estimated by the DEIR, are respectively presented below.

Off-Road Emissions (Appendix C, pp. 75, 120):

SCAQMD Regional Significance Threshold	75	100	550	150	150	55
Exceeds Threshold?	No	No	No	No	No	No

However, upon review of the DEIR's construction-related emissions summary, it appears that the DEIR fails to include the off-road emissions estimates calculated with CalEEMod (see excerpt below) (p. IV.B-55, Table IV.B-8):

TABLE IV.B-8
ESTIMATED MAXIMUM MITIGATED REGIONAL CONSTRUCTION EMISSIONS (POUNDS PER DAY) [a]

Source	VOC	NO_x	CO	SO_2	PM10 [b]	PM2.5 [b]
Construction Phases						
Site Preparation	1.4	33.3	31.8	0.1	4.3	1.3

[b] Emissions include fugitive dust control measures consistent with SCAQMD Rule 403.

SOURCE: ESA, 2021.

The DEIR's construction-related emissions summary, as displayed above, appears to be incorrect for two reasons. First, the overlapping phase estimates in the emissions summary are identical to the on-road construction-related emissions (Appendix C, pp. 65). Thus, the DEIR's analysis of the Project's construction-related emissions fails to include the estimates calculated by CalEEMod or account for emissions generated by off-road construction equipment. Second, the maximum daily emissions

presented in the emissions summary are underestimated and inconsistent with the on-road peak daily emissions (Appendix C, pp. 65). As such, the DEIR underestimates the Project's construction-related emissions and should not be relied upon to determine Project significance.

Unsubstantiated Input Parameters Used to Estimate Project Emissions

The DEIR's operational air quality analysis relies on emissions calculated with CalEEMod.2016.3.2 (p. IV.B-35).[1] CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence. Once all of the values are inputted into the model, the Project's construction and operational emissions are calculated, and "output files" are generated. These output files disclose to the reader what parameters are utilized in calculating the Project's air pollutant emissions and make known which default values are changed as well as provide justification for the values selected.

When reviewing the Project's CalEEMod output files, provided in the AQ & GHG Report as Appendix C to the DEIR, we found that several model inputs were not consistent with information disclosed in the DEIR. As a result, the Project's construction and operational emissions are underestimated. As a result, an updated EIR should be prepared to include an updated air quality analysis that adequately evaluates the impacts that construction and operation of the Project will have on local and regional air quality.

Overestimated Existing Land Use Size

Review of the DEIR demonstrates that the operational emissions associated with the existing land uses are subtracted from the operational emissions associated with the proposed land uses in order to determine the significance of the Project's air quality impact (see excerpt below) (p. IV.B-53, Table IV.B-7).

[1] "CalEEMod Version 2016.3.2." California Air Pollution Control Officers Association (CAPCOA), November 2017, *available at:* http://www.aqmd.gov/caleemod/archive/download-version-2016-3-2.

TABLE IV.B-7
ESTIMATED MAXIMUM REGIONAL OPERATIONAL EMISSIONS – PROJECT (POUNDS PER DAY) [a]

Source	VOC	NO_X	CO	SO_2	PM10	PM2.5

Exceeds Thresholds?	No	No	No	No	No	No

[a] Totals may not add up exactly due to rounding in the modeling calculations. Detailed emissions calculations are provided in Appendix C of this Draft EIR.
[b] Area source VOC emissions are primarily emitted by consumer product usage as estimated in CalEEMod.
SOURCE: ESA, 2021.

However, the DEIR's analysis is incorrect, as the size of the existing land uses to be removed from the Project site was overestimated in the Project's air modeling. Specifically, review of the CalEEMod output files demonstrates that the "Harvard Westlake - Existing" model includes 559,860-SF of golf course area (see excerpt below) (Appendix C, pp. 301, 309, 419).

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area
General Office Building	0.80	1000sqft	0.05	799.00
Other Non-Asphalt Surfaces	128.00	1000sqft	2.94	128,000.00
Parking Lot	89.00	Space	0.88	38,400.00
City Park	1.10	Acre	1.10	47,916.00
Golf Course	11.78	Acre	11.78	559,860.95

This is inaccurate, as the DEIR indicates that the existing golf course consists of only 426,000-SF (p. II-3). As such, the land use size is overestimated by approximately 133,860-SF in the model.[2]

This overestimation presents an issue, as the land use size feature is used throughout CalEEMod to determine default variable and emission factors that go into the model's calculations. The square footage of a land use is used for certain calculations such as determining the wall space to be painted (i.e., VOC emissions from architectural coatings) and volume that is heated or cooled (i.e., energy

[2] Calculated: 559,860-SF – 426,000-SF = 133,860-SF.

impacts).[3] By overestimating the area of the existing land use, the model overestimates the emissions associated with the existing land uses, resulting in an underestimation of the net change in operational emissions associated with the proposed Project. As a result, the model should not be relied upon to determine Project significance.

Unsubstantiated Changes to Individual Construction Phase Lengths

Review of the CalEEMod output files demonstrates that the "Harvard Westlake - Construction" model includes several changes to the default individual construction phase lengths (see excerpt below) (Appendix C, pp. 71, 116, 163, 210, 323).

Table Name	Column Name	Default Value	New Value
tblConstructionPhase	NumDays	20.00	310.00
tblConstructionPhase	NumDays	300.00	312.00
tblConstructionPhase	NumDays	300.00	446.00
tblConstructionPhase	NumDays	300.00	392.00
tblConstructionPhase	NumDays	300.00	365.00
tblConstructionPhase	NumDays	20.00	53.00
tblConstructionPhase	NumDays	30.00	181.00
tblConstructionPhase	NumDays	20.00	28.00
tblConstructionPhase	NumDays	10.00	27.00
tblConstructionPhase	NumDays	10.00	26.00

As a result of these changes, the model includes the following construction schedule (see excerpt below) (Appendix C, pp. 76, 121, 167, 171, 214, 328):

Phase Number	Phase Name	Phase Type	Start Date	End Date	Num Days Week	Num Days
1	Site Preparation-1	Site Preparation	6/30/2022	7/31/2022	6	27
2	Demolition	Demolition	7/1/2022	8/31/2022	6	53
3	Grading	Grading	8/1/2022	2/27/2023	6	181
4	Foundations	Building Construction	12/2/2022	11/30/2023	6	312
5	Utilities	Trenching	2/2/2023	4/5/2024	6	368
6	Building Construction	Building Construction	5/1/2023	10/1/2024	6	446
7	Site Preparation-2	Site Preparation	9/1/2023	9/30/2023	6	26
8	Landscape	Building Construction	10/2/2023	12/31/2024	6	392
9	Pool Area	Building Construction	11/2/2023	12/31/2024	6	365
10	Architectural Coating	Architectural Coating	1/2/2024	12/27/2024	6	310
11	Paving	Paving	11/1/2024	12/3/2024	6	28

[3] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 28

As you can see from the excerpts above, the "Site Preparation-1" phase is increased by 170% from the default value of 10 to 27 days; the "Demolition" phase is increased by 77%, from the default value of 30 to 53 days; the "Grading" phase is increased by 503%, from the default value of 30 to 181 days; the "Foundations" phase is increased by 4%, from the default value of 300 to 312 days; the "Building Construction" phase is increased by 49%, from the default value of 300 to 446 days; the "Site Prepartaion-2" phase is increased by 160%, from the default value of 10 to 26 days; the "Landscape" phase is increased by 31%, from the default value of 300 to 392 days; the "Pool Area" phase is increased by 22%, from the default value of 300 to 365 days; the "Architectural Coating" phase is increased by 1,450%, from the default value of 20 to 310 days; and the "Paving" phase is increased by 40%, from the default value of 20 to 28 days.

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[4] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is:

> "see construction assumptions" (Appendix C, pp. 71, 116, 163, 210, 323).

Furthermore, regarding the Project's anticipated construction duration, the DEIR states:

> "Construction of the Project is anticipated to begin in the third quarter of 2022 pending Project consideration and approval, and is estimated to be completed in the fourth quarter of 2025 with construction occurring for approximately two and a half years (approximately 30 months)" (II-61).

However, while the DEIR indicates an overall construction duration of 30 month, the DEIR fails to mention or justify the individual construction phase lengths. This is incorrect, as according to the CalEEMod User's Guide:

> "CalEEMod was also designed to allow the user to change the defaults to reflect site- or project-specific information, when available, provided that the information is supported by substantial evidence as required by CEQA." [5]

Here, as the DEIR only justifies the total construction duration of 30 months, the DEIR fails to provide substantial evidence to support the revised individual construction phase lengths. As such, we cannot verify the changes.

[4] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 1, 14.
[5] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 13-14.

These unsubstantiated changes present an issue, as the construction emissions are improperly spread out over a longer period of time for some phases, but not for others. According to the CalEEMod User's Guide, each construction phase is associated with different emissions activities (see excerpt below).[6]

> *Demolition* involves removing buildings or structures.
>
> *Site Preparation* involves clearing vegetation (grubbing and tree/stump removal) and removing stones and other unwanted material or debris prior to grading.
>
> *Grading* involves the cut and fill of land to ensure that the proper base and slope is created for the foundation.
>
> *Building Construction* involves the construction of the foundation, structures and buildings.
>
> *Architectural Coating* involves the application of coatings to both the interior and exterior of buildings or structures, the painting of parking lot or parking garage striping, associated signage and curbs, and the painting of the walls or other components such as stair railings inside parking structures.
>
> *Paving* involves the laying of concrete or asphalt such as in parking lots, roads, driveways, or sidewalks.

Thus, by disproportionately altering and extending some of the individual construction phase lengths without proper justification, the model assumes there are a greater number of days to complete the construction activities required by the prolonged phases. As such, there will be less construction activities required per day and, consequently, less pollutants emitted per day. As a result, the model may underestimate the peak daily emissions associated with some phases of construction and should not be relied upon to determine Project significance.

Unsubstantiated Number of Vendor Trips

Review of the CalEEMod output files demonstrates that the "Harvard Westlake - Construction" model includes several reductions to the number of vendor trips (see excerpt below) (Appendix C, pp. 74, 119, 165, 212, 326).

Table Name	Column Name	Default Value	New Value
tblTripsAndVMT	VendorTripNumber	163.00	0.00
tblTripsAndVMT	VendorTripNumber	163.00	0.00
tblTripsAndVMT	VendorTripNumber	163.00	0.00
tblTripsAndVMT	VendorTripNumber	163.00	0.00

As you can see in the excerpt above, the number of vendor trips is reduced from the default value of 652- to 0-trips. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[7] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is:

[6] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 32.
[7] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 1, 14.

> "construction mobile emissions calculated outside of CalEEMo.d" (Appendix C, pp. 71, 116, 163, 210, 323).

While we understand mobile-source construction-related emissions are calculated outside of CalEEMod, the number of vendor trips remains unsubstantiated. Review of the construction on-road emissions in the AQ & GHG Report demonstrates that only 82 vendor trips are included in the calculations (Appendix C, pp. 254). As such, the number of vendor trips required for Project construction is reduced from the CalEEMod default value by 570 trips. However, the AQ & GHG Report fails to provide sufficient justification for this reduction and therefore, we are unable to verify the number of vendor trips is accurate.

The unsubstantiated number of vendor trips presents an issue, as CalEEMod uses the vendor and worker trip numbers to estimate the construction-related emissions associated with on-road vehicles.[8] By including an unsubstantiated number to vendor trips in the on-road emissions analysis, the DEIR may underestimate the Project's mobile-source construction-related emissions and should not be relied upon to determine Project significance.

Incorrect CO_2 Intensity Factors

Review of the CalEEMod output files demonstrates that the "Harvard Westlake - Operations" model includes a manual reduction to the default CO_2 intensity factor (see excerpt below) (Appendix C, pp. 279, 291, 388, 403).

Table Name	Column Name	Default Value	New Value
tblProjectCharacteristics	CO2IntensityFactor	1227.89	626.49

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[9] According to the "User Entered Comments & Non-Default Data" table, the justification provided for the change is:

> "CO2 intensity factor linearly adjusted to account for SB100 RPS by year 2025" (Appendix C, pp. 278, 289, 386).

Furthermore, regarding the California's Renewables Portfolio Standard ("RPS"), the DEIR states:

> "Emission factors for GHGs due to electrical generation to serve the demands of the existing Project Site were obtained from the LADWP 2017 Power Strategic Long-Term Resource Plan, which accounts for the generation mix using renewable and non-renewable sources.[109] Approximately 34 percent of LADWP's 2019 electricity purchases were from renewable sources, which is similar to the 32 percent Statewide percentage of electricity purchases from renewable sources.110 LADWP would provide an increasing percentage from renewable sources in

[8] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 35.
[9] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 2, 9

> compliance with the RPS with 50 percent by 2025, 55 percent by 2030, and 65 percent by 2036. […] Based on LADWP future projections for the Project opening year of 2025, an estimated emission factor of 626.48 lbs CO2/MWh for electricity was calculated using LADWP projections from existing plans for compliance with the RPS (i.e., SB 100) and future projected energy supply resources" (p. IV.G-46).

However, these changes remain unsupported for two reasons. First, the *LADWP 2017 Power Strategic Long-Term Resource Plan*, which is the source provided for the revised CO_2 intensity factor, appears to be unavailable. Second, simply because the State has renewable energy goals, such as 50% renewable energy by 2025, does not ensure that these goals will be achieved locally on the Project site or by the Project's specific utility company. As such, the CO_2 intensity factor should be based on currently achieved power mixes, rather than future estimates based on statewide targets. As a result, we cannot verify the revised value.

This unsubstantiated reduction presents an issue, as CalEEMod uses the CO_2 intensity factor to calculate the Project's greenhouse gas ("GHG") emissions associated with electricity use.[10] Thus, by including an unsubstantiated reduction to the default CO_2 intensity factor, the model may underestimate the Project's GHG emissions and should not be relied upon to determine Project significance.

Incorrect Application of Construction-Related Mitigation Measures

Review of the CalEEMod output files demonstrates that the "Harvard Westlake - Construction" model includes the following construction-related mitigation measures (see excerpt below) (Appendix A, pp. 73, 110, 140):

3.1 Mitigation Measures Construction

Use Soil Stabilizer

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[11] However, the "User Entered Comments & Non-Default Data" table fails to provide a justification for these changes. Furthermore, regarding Project compliance with fugitive dust regulations, the DEIR states:

> "Rule 403 – Fugitive Dust: This rule requires projects to prevent, reduce or mitigate fugitive dust emissions from a site. Rule 403 restricts visible fugitive dust to the project property line, restricts the net PM_{10} emissions to less than 50 micrograms per cubic meter (µg/m3) and restricts the

[10] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 19.
[11] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 1, 14.

> tracking out of bulk materials onto public roads. Additionally, projects must utilize one or more of the best available control measures (identified in the tables within the rule). Best available control measures may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering, using chemical stabilizers and/or ceasing all activities. Finally, a contingency plan may be required if so determined by the USEPA" (p. IV.B-16).

However, the inclusion of the above-mentioned construction-related mitigation measures remain unsupported for three reasons.

First, the inclusion of the construction-related mitigation measures, based on the Project's compliance with SCAQMD Rule 403, is unsupported. According to the Association of Environmental Professionals ("AEP") *CEQA Portal Topic Paper* on mitigation measures:

> "By definition, mitigation measures are not part of the original project design. Rather, mitigation measures are actions taken by the lead agency to reduce impacts to the environment resulting from the original project design. Mitigation measures are identified by the lead agency after the project has undergone environmental review and are above-and-beyond existing laws, regulations, and requirements that would reduce environmental impacts."[12]

As you can see in the excerpt above, mitigation measures "are not part of the original project design" and are intended to go "above-and-beyond" existing regulatory requirements. As such, the inclusion of these measures, based solely on SCAQMD Rule 403, is unsubstantiated.

Second, according to the above-mentioned AEP report:

> "While not 'mitigation', a good practice is to include those project design feature(s) that address environmental impacts in the mitigation monitoring and reporting program (MMRP). Often the MMRP is all that accompanies building and construction plans through the permit process. If the design features are not listed as important to addressing an environmental impact, it is easy for someone not involved in the original environmental process to approve a change to the project that could eliminate one or more of the design features without understanding the resulting environmental impact."[13]

As you can see in the excerpt above, project design features ("PDFs") that are not formally included as mitigation measures may be eliminated from the Project's design altogether. Thus, as the above-mentioned construction-related measures are not formally included as mitigation measures, we cannot guarantee that they would be implemented, monitored, and enforced on the Project site.

Third, simply because the DEIR references SCAQMD Rule 403 does not justify the inclusion of the above-mentioned construction-related mitigation measures in the model. Specifically, according to SCAQMD

[12] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 5.
[13] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 6.

Rule 403, Projects can either water unpaved roads 3 times per day, water unpaved roads 1 time per day and limit vehicle speeds to 15 mph or apply a chemical stabilizer (see excerpt below).[14]

Table 2 (Continued)

FUGITIVE DUST SOURCE CATEGORY	CONTROL ACTIONS	
Unpaved Roads	(4a)	Water all roads used for any vehicular traffic at least once per every two hours of active operations [3 times per normal 8 hour work day]; OR
	(4b)	Water all roads used for any vehicular traffic once daily and restrict vehicle speeds to 15 miles per hour; OR
	(4c)	Apply a chemical stabilizer to all unpaved road surfaces in sufficient quantity and frequency to maintain a stabilized surface.

As you can see in the above excerpt, to simply comply with SCAQMD Rule 403, the Project may either water unpaved roads 3 times per day, water unpaved roads 1 time per day and limit vehicle speeds to 15 mph, or apply a chemical stabilizer. Thus, the "Use Soil Stabilizer," "Water Exposed Area," and "Reduce Vehicle Speed on Unpaved Roads" measures are not all explicitly required by SCAQMD Rule 403, and should therefore not be included in the model. By incorrectly including several construction-related mitigation measures without properly committing to their implementation, the model may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

Diesel Particulate Matter Health Risk Emissions Inadequately Evaluated

The DEIR concludes that the Project would have a less-than-significant health risk impact without conducting a quantified construction or operational health risk analysis ("HRA") (p. IV.B-61 – IV.B-62). Regarding the health risk impacts associated with Project construction, the DEIR states:

> "Temporary TAC emissions associated with DPM emissions from heavy construction equipment would occur during the construction phase of the Project. According to OEHHA and the SCAQMD Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis, 96 health effects from TACs are described in terms of individual cancer risk based on a lifetime (i.e., 70- year) resident exposure duration. Given the temporary construction schedule (approximately 30 months), the Project would not result in a long-term (i.e., lifetime or 70-year) exposure as a result of Project construction" (p. IV.B-61).

As demonstrated above, the DEIR concludes that the Project would result in a less-than-significant construction-related health risk impact because the temporary construction schedule would not result in long-term toxic air contaminant ("TAC") emissions. Furthermore, regarding the health risk impacts associated with Project operation, the DEIR states:

[14] "RULE 403. FUGITIVE DUST." SCAQMD, June 2005, *available at:* http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-403.pdf, p. 403-21, Table 2.

> "As a result, toxic or carcinogenic air pollutants are not expected to occur in any substantial amounts in conjunction with operation of the proposed land uses within the Project Site. Based on the uses expected on the Project Site, operation of the Project would not expose sensitive receptors to substantial TAC concentrations, and operational impacts would be less than significant" (p. IV.B-62).

As demonstrated above, the DEIR concludes that the Project would result in a less-than-significant operational health risk impact because the proposed land uses are not expected to generate substantial TAC emissions. However, the DEIR's evaluation of the Project's potential health risk impacts, as well as the subsequent less-than-significant impact conclusion, is incorrect for three reasons.

First, by failing to prepare a quantified construction and operational HRA, the Project is inconsistent with CEQA's requirement to make "a reasonable effort to substantively connect a project's air quality impacts to likely health consequences."[15] This poses a problem, as construction of the Project would produce diesel particulate matter ("DPM") emissions through the exhaust stacks of construction equipment over a duration of approximately 30 months (p. II-61). Furthermore, operation of the Project is expected to generate an estimated 3,932 total daily vehicle miles travelled ("VMT"), which would produce additional exhaust emissions and continue to expose nearby, existing sensitive receptors to DPM emissions during Project operation (p. IV.M-40). However, the DEIR fails to evaluate the TAC emissions associated with Project construction and operation, or indicate the concentrations at which such pollutants would trigger adverse health effects. Thus, without making a reasonable effort to connect the Project's TAC emissions to the potential health risks posed to nearby receptors, the DEIR is inconsistent with CEQA's requirement to correlate Project-generated emissions with potential adverse impacts on human health.

Second, the Office of Environmental Health Hazard Assessment ("OEHHA"), the organization responsible for providing guidance on conducting HRAs in California, released its most recent *Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments* in February 2015. This guidance document describes the types of projects that warrant the preparation of an HRA. Specifically, OEHHA recommends that all short-term projects lasting at least 2 months assess cancer risks.[16] Furthermore, according to OEHHA:

> "Exposure from projects lasting more than 6 months should be evaluated for the duration of the project. In all cases, for assessing risk to residential receptors, the exposure should be assumed to start in the third trimester to allow for the use of the ASFs (OEHHA, 2009)."[17]

Thus, as the Project's anticipated construction duration exceeds the 2-month and 6-month requirements set forth by OEHHA, construction of the Project meets the threshold warranting a quantified HRA under OEHHA guidance and should be evaluated for the entire 30-month construction

[15] "Sierra Club v. County of Fresno." Supreme Court of California, December 2018, a*vailable at:* https://ceqaportal.org/decisions/1907/Sierra%20Club%20v.%20County%20of%20Fresno.pdf.
[16] "Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf, p. 8-18.
[17] "Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf, p. 8-18.

duration. Furthermore, OEHHA recommends that an exposure duration of 30 years should be used to estimate the individual cancer risk at the maximally exposed individual resident ("MEIR").[18] While the DEIR fails to provide the expected lifetime of the proposed Project, we can reasonably assume that the Project would operate for at least 30 years, if not more. Therefore, operation of the Project also exceeds the 2-month and 6-month requirements set forth by OEHHA, and should be evaluated for the entire 30-year residential exposure duration as indicated by OEHHA guidance. These recommendations reflect the most recent state health risk policies, and as such, an updated EIR should be prepared to include an analysis of health risk impacts posed to nearby sensitive receptors from Project-generated DPM emissions.

Third, by claiming a less than significant impact without conducting a quantified construction or operational HRA for nearby, existing sensitive receptors, the DEIR fails to compare the Project's excess cancer risk to the SCAQMD's specific numeric threshold of 10 in one million.[19] Thus, in accordance with the most relevant guidance, an assessment of the health risk posed to nearby, existing receptors as a result of Project construction and operation should be conducted.

Greenhouse Gas

Failure to Adequately Evaluate Greenhouse Gas Impacts

The DEIR estimates that the Project would generate net annual greenhouse gas ("GHG") emissions of 1,533- and 2,226-metric tons of carbon dioxide equivalents per year ("MT CO_2e/year") with and without GHG reduction measures, respectively (see excerpt below) (p. IV.G-53, Table IV.G-7).

[18] "Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf, p. 2-4.
[19] "South Coast AQMD Air Quality Significance Thresholds." SCAQMD, April 2019, *available at:* http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf.

TABLE IV.G-7
ESTIMATED OPERATIONAL GREENHOUSE GAS EMISSIONS – PROJECT

Emissions Sources	CO_2e at Buildout Year (2025) (Metric Tons per Year) [a]: Project with implementation of GHG reduction characteristics, features, and measures	CO_2e at Buildout Year (2025) (Metric Tons per Year) [a]: Project without implementation of GHG reduction characteristics, features, and measures
Project Operational		
Mobile Sources [b] (Includes VMT associated from both the Project and Community Use)	1,420	1,865
Area	<1	<1
Electricity	693	972
Natural Gas	93	94
Water and Wastewater Treatment	64	73
Solid Waste	19	19
Construction (Amortized)	430	430
Project Subtotal	2,719	3,452
Existing Site (refer to Table IV.G-5)	1,186	1,186
Net Total (Project minus Existing)	**1,533**	**2,266**

[a] Totals may not add up exactly due to rounding in the modeling calculations.

[b] As discussed in subsection IV.G.3.b) *Methodology*, while the community use component of the Project, which is classified as a community-serving recreational facility, is exempt from VMT analysis per LADOT's *Transportation Assessment Guidelines*, the emissions associated with VMT from the community use component of the Project were accounted for in the Project's operational emissions for the purposes of this GHG analysis, including from typical weekday community use. The Project's GHG analysis also accounted for annual VMT from occasional community use events that could occur during the year, including five Community Events with approximately 500 attendees per event. Factoring in these various uses, estimated operational GHGs associated with community uses account for more than two-thirds of the Project total. Refer to VMT data in Appendix C and Appendix M of this Draft EIR.

SOURCE: ESA, 2021

However, the DEIR elects not to apply a quantitative GHG threshold. Instead, the DEIR concludes a less-than-significant GHG impact based on "the Project's compliance with performance-based standards included in the regulations outlined in the applicable portions of CARB's Climate Change Scoping Plan, the 2020-2045 RTP/SCS, City's Green New Deal, and the Los Angeles Green Building Code" (p. IV.G-40). However, the DEIR's analysis, as well as the subsequent less-than-significant impact conclusion, is incorrect for five reasons:

(1) The DEIR's quantitative GHG analysis relies upon an incorrect and unsubstantiated air model;
(2) The DEIR fails to indicate a potentially significant GHG impact;
(3) The DEIR should incorporate PDFs as formal mitigation measures;
(4) The DEIR fails to consider the performance-based standards under CARB's *Scoping Plan*; and
(5) The DEIR fails to consider the performance-based standards under SCAG's *RTP/SCS.*

1) Incorrect and Unsubstantiated Quantitative Analysis of Emissions

As previously stated, the DEIR estimates that the Project would generate net annual GHG emissions of 1,533- and 2,226-MT CO_2e/year with and without GHG reduction measures, respectively (p. IV.G-53, Table IV.G-7). However, the DEIR's quantitative GHG analysis is unsubstantiated. As previously discussed, when we reviewed the Project's CalEEMod output files, provided in the AQ & GHG Report as Appendix C to the DEIR, we found that several of the values inputted into the model are not consistent

with information disclosed in the DEIR. As a result, the model underestimates the Project's emissions, and the DEIR's quantitative GHG analysis should not be relied upon to determine Project significance. An updated EIR should be prepared that adequately assesses the potential GHG impacts that construction and operation of the proposed Project may have on the surrounding environment.

2) Failure to Identify a Potentially Significant GHG Impact

In an effort to quantitatively evaluate the Project's GHG emissions, we compared the Project's GHG emissions, as estimated by the DEIR, to the SCAQMD 2035 service population efficiency target of 3.0 MT CO_2e/SP/year, which was calculated by applying a 40% reduction to the 2020 targets.[20] When applying this threshold, the Project's incorrect and unsubstantiated air model indicates a potentially significant GHG impact.

As previously stated, the DEIR estimates that the Project would generate net annual GHG emissions of 1,533 MT CO_2e/year with GHG reduction measures (p. IV.G-53, Table IV.G-7). According to CAPCOA's *CEQA & Climate Change* report, a service population ("SP") is defined as "the sum of the number of residents and the number of jobs supported by the project."[21] According to the DEIR, the Project would employ a maximum of 100 people during operation (p. II-51). As the Project does not include any residential land uses, we estimate a SP of 100 people.[22] When dividing the Project's net annual GHG emissions, as estimated by the DEIR, by a SP of 100 people, we find that the Project would emit approximately 15.5 MT CO_2e/SP/year (see table below).[23]

DEIR Greenhouse Gas Emissions	
Annual Emissions (MT CO_2e/year)	1,553
Service Population	100
Service Population Efficiency (MT CO_2e/SP/year)	15.5
SCAQMD 2035 Threshold	**3.0**
Exceeds?	***Yes***

As demonstrated above, the Project's service population efficiency value, as estimated by the DEIR's net annual GHG emission estimates and SP, exceeds the SCAQMD 2035 efficiency target of 3.0 MT CO_2e/SP/year, indicating a potentially significant impact not previously identified or addressed by the DEIR. As a result, the DEIR's less-than-significant GHG impact conclusion should not be relied upon. An updated EIR should be prepared, including an updated GHG analysis and incorporating additional mitigation measures to reduce the Project's GHG emissions to less-than-significant levels.

---

[20] "Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #15." SCAQMD, September 2010, *available at:* http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/year-2008-2009/ghg-meeting-15/ghg-meeting-15-minutes.pdf, p. 2.

[21] "CEQA & Climate Change." CAPCOA, January 2008, *available at:* http://www.capcoa.org/wp-content/uploads/2012/03/CAPCOA-White-Paper.pdf, p. 71-72.

[22] Calculated: 100 employees + 0 residents = 100 total SP.

[23] Calculated: (1,553 MT CO_2e/year) / (100 service population) = (15.5 MT CO_2e/SP/year).

3) Project Design Features Should Be Incorporated as Mitigation Measures

As previously mentioned, the DEIR relies upon the Project's consistency with the CARB's Scoping Plan, SCAG's *RTP/SCS*, the City's Green New Deal, and the Los Angeles Green Building Code (IV.G-40). Furthermore, consistent with the emissions reductions strategies within the above-mentioned plans and policies, the DEIR includes the following Project Design Feature ("PDF"):

> "GHG-PDF-1: Solar Voltaic System. The Project will be designed to include solar voltaic panels providing 339,000 kilo Watt-hours (kWh) per year on the roof of the gymnasium that would reduce the amount of electricity demand from City utilities" (p. IV.G-50).

However, we recommend that the DEIR incorporates this PDF as a formal mitigation measure. According to the AEP *CEQA Portal Topic Paper* on Mitigation Measures:

> "While not "mitigation", a good practice is to include those project design feature(s) that address environmental impacts in the mitigation monitoring and reporting program (MMRP). Often the MMRP is all that accompanies building and construction plans through the permit process. If the design features are not listed as important to addressing an environmental impact, it is easy for someone not involved in the original environmental process to approve a change to the project that could eliminate one or more of the design features without understanding the resulting environmental impact."[24]

As demonstrated above, PDFs that are not formally included as mitigation measures may be eliminated from the Project's design altogether. Thus, as the solar voltaic system is not formally included as a mitigation measure, we cannot guarantee that it would be implemented, monitored, and enforced on the Project site. As such, until the PDF is included as a mitigation measure, the Project's GHG analysis should not be relied upon to determine Project significance.

4) Failure to Consider Performance-based Standards Under CARB's 2017 Scoping Plan

As previously discussed, the DEIR concludes that the Project would be consistent with CARB's 2017 Climate Change Scoping Plan (p. IV.G-40). However, this is incorrect, as the DEIR fails to consider performance-based measures proposed by CARB.

i. Passenger & Light Duty VMT Per Capita Benchmarks per SB 375

In reaching the State's long-term GHG emission reduction goals, CARB's 2017 *Scoping Plan* explicitly cites to SB 375 and the VMT reductions anticipated under the implementation of Sustainable Community Strategies.[25] CARB has identified the population and daily VMT from passenger autos and light-duty vehicles at the state and county level for each year between 2010 to 2050 under a "baseline scenario" that includes "current projections of VMT included in the existing Regional Transportation Plans/Sustainable Communities Strategies (RTP/SCSs) adopted by the State's 18 Metropolitan Planning

[24] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 6.
[25] "California's 2017 Climate Change Scoping Plan." CARB, November 2017, *available at*: https://ww3.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf, p. 25, 98, 101-103.

Organizations (MPOs) pursuant to SB 375 as of 2015."[26] By dividing the projected daily VMT by the population, we calculated the daily VMT per capita for each year at the state and county level for 2010 (baseline year), 2025 (Project operational year), and 2030 (target years under SB 32) (see table below).

2017 Scoping Plan Daily VMT Per Capita

	Los Angeles County			State		
Year	Population	LDV VMT Baseline	VMT Per Capita	Population	LDV VMT Baseline	VMT Per Capita
2010	9,838,771	216,979,221.64	22.05	37,335,085	836,463,980.46	22.40
2025	10,671,800	217,340,094.90	20.37	42,326,397	929,443,512.65	21.96
2030	10,868,614	215,539,586.12	19.83	43,939,250	957,178,153.19	21.78

As the DEIR fails to evaluate the Project's consistency with the CARB 2017 *Scoping Plan* performance-based daily VMT per capita projections, the DEIR's claim that the proposed Project would not conflict with the CARB 2017 *Scoping Plan* is unsupported. An updated EIR should be prepared for the proposed Project to provide additional information and analysis to conclude less-than-significant GHG impacts.

5) Failure to Consider Performance-based Standards under SCAG's RTP/SCS

As previously discussed, the DEIR concludes that the Project would be consistent with SCAG's *RTP/SCS* (p. IV.G-40). However, the DEIR fails to consider whether or not the Project meets any of the specific performance-based goals underlying SCAG's *RTP/SCS* and SB 375, such as: i) per capita GHG emission targets, or ii) daily vehicles miles traveled ("VMT") per capita benchmarks.

i. SB 375 Per Capita GHG Emission Goals

SB 375 was signed into law in September 2008 to enhance the state's ability to reach AB 32 goals by directing CARB to develop regional 2020 and 2035 GHG emission reduction targets for passenger vehicles (autos and light-duty trucks). In March 2018, CARB adopted updated regional targets requiring a 19 percent decrease in VMT for the SCAG region by 2035. This goal is reflected in SCAG's 2020 RTP/SCS Program Environmental Impact Report ("PEIR"), in which the 2020 RTP/SCS PEIR updates the per capita emissions to 18.8 lbs/day in 2035 (see excerpt below). [27]

[26] "Supporting Calculations for 2017 Scoping Plan-Identified VMT Reductions," Excel Sheet "Readme." CARB, January 2019, *available at*: https://ww2.arb.ca.gov/sites/default/files/2019-01/sp_mss_vmt_calculations_jan19_0.xlsx.

[27] "Connect SoCal Certified Final Program Environmental Impact Report." SCAG, May 2020, *available at*: https://scag.ca.gov/sites/main/files/file-attachments/fpeir_connectsocal_complete.pdf?1607981618, p. 3.8-74.

Table 3.8-10
SB 375 Analysis

	2005 (Baseline)	2020 (Plan)	2035 (Plan)
Resident population (per 1,000)	17,161	19,194	21,110
CO2 emissions (per 1,000 tons)	204.0/a/	204.5/b/	198.6/b/
Per capita emissions (pounds/day)	23.8	21.3	18.8
% difference from Plan (2020) to Baseline (2005)			–8%
% difference from Plan (2035) to Baseline (2005)			–19%/c/

Note:
/a/ Based on EMFAC2007
/b/Based on EMFAC2014 and SCAG modeling, 2019.
/c/ Includes off-model adjustments for 2035 and 2045
Source: SCAG modeling, 2019.
http://www.scag.ca.gov/committees/CommitteeDocLibrary/jointRCPC110515fullagn.pdf

As the DEIR fails to evaluate the Project's consistency with the SCAG's per capita emissions, the DEIR's claim that the proposed Project would not conflict with SCAG's *RTP/SCS* is unsupported. An updated EIR should be prepared for the proposed Project to provide additional information and analysis to conclude less-than-significant GHG impacts.

ii. SB 375 RTP/SCS Daily VMT Per Capita Target

Under the SCAG's 2020 *RTP/SCS*, daily VMT per capita in the SCAG region should decrease from 23.2 VMT in 2016 to 20.7 VMT by 2045.[28] Daily VMT per capita in Los Angeles County should decrease from 22.2 to 19.2 VMT during that same period.[29] Here, however, the DEIR fails to consider any of the above-mentioned performance-based VMT targets. As the DEIR fails to evaluate the Project's consistency with the SCAG's performance-based daily VMT per capita projections, the DEIR's claim that the proposed Project would not conflict with SCAG's *RTP/SCS* is unsupported. An updated EIR should be prepared for the proposed Project to provide additional information and analysis to conclude less-than-significant GHG impacts.

Feasible Mitigation Measures Available to Reduce Emissions

Our analysis demonstrates that the Project would result in a potentially significant GHG impact that should be mitigated further. As such, in an effort to reduce the Project's emissions, we identified several mitigation measures that are applicable to the proposed Project. Therefore, to reduce the Project's emissions, we recommend consideration of SCAG's 2020 *RTP/SCS* PEIR's Greenhouse Gas Project Level Mitigation Measures ("PMM-GHG-1"), as described below: [30]

[28] "Connect SoCal." SCAG, September 2020, *available at*: https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal-plan_0.pdf?1606001176, pp. 138.
[29] "Connect SoCal." SCAG, September 2020, *available at*: https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal-plan_0.pdf?1606001176, pp. 138.
[30] "4.0 Mitigation Measures." Connect SoCal Program Environmental Impact Report Addendum #1, September 2020, available at: https://scag.ca.gov/sites/main/files/file-attachments/fpeir_connectsocal_addendum_4_mitigationmeasures.pdf?1606004420, p. 4.0-2 – 4.0-10; 4.0-19 –

SCAG RTP/SCS 2020-2045
Greenhouse Gas Project Level Mitigation Measures – PMM-GHG-1 In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to violating air quality standards. Such measures may include the following or other comparable measures identified by the Lead Agency:
b) Reduce emissions resulting from projects through implementation of project features, project design, or other measures, such as those described in Appendix F of the State CEQA Guidelines.
c) Include off-site measures to mitigate a project's emissions.
d) Measures that consider incorporation of Best Available Control Technology (BACT) during design, construction and operation of projects to minimize GHG emissions, including but not limited to: i. Use energy and fuel-efficient vehicles and equipment; ii. Deployment of zero- and/or near zero emission technologies; iii. Use lighting systems that are energy efficient, such as LED technology; iv. Use the minimum feasible amount of GHG-emitting construction materials; v. Use cement blended with the maximum feasible amount of flash or other materials that reduce GHG emissions from cement production; vi. Incorporate design measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse; vii. Incorporate design measures to reduce energy consumption and increase use of renewable energy; viii. Incorporate design measures to reduce water consumption; ix. Use lighter-colored pavement where feasible; x. Recycle construction debris to maximum extent feasible; xi. Plant shade trees in or near construction projects where feasible; and xii. Solicit bids that include concepts listed above.
e) Measures that encourage transit use, carpooling, bike-share and car-share programs, active transportation, and parking strategies, including, but not limited to the following: i. Promote transit-active transportation coordinated strategies; ii. Increase bicycle carrying capacity on transit and rail vehicles; iii. Improve or increase access to transit; iv. Increase access to common goods and services, such as groceries, schools, and day care; v. Incorporate affordable housing into the project; vi. Incorporate the neighborhood electric vehicle network; vii. Orient the project toward transit, bicycle and pedestrian facilities; viii. Improve pedestrian or bicycle networks, or transit service; ix. Provide traffic calming measures; x. Provide bicycle parking; xi. Limit or eliminate park supply; xii. Unbundle parking costs;

4.0-23; See also: "Certified Final Connect SoCal Program Environmental Impact Report." Southern California Association of Governments (SCAG), May 2020, *available at:* https://scag.ca.gov/peir.

xiii. Provide parking cash-out programs; xiv. Implement or provide access to commute reduction program;
f) Incorporate bicycle and pedestrian facilities into project designs, maintaining these facilities, and providing amenities incentivizing their use; and planning for and building local bicycle projects that connect with the regional network;
g) Improving transit access to rail and bus routes by incentives for construction and transit facilities within developments, and/or providing dedicated shuttle service to transit stations; and
h) Adopting employer trip reduction measures to reduce employee trips such as vanpool and carpool programs, providing end-of-trip facilities, and telecommuting programs including but not limited to measures that: i. Provide car-sharing, bike sharing, and ride-sharing programs; ii. Provide transit passes; iii. Shift single occupancy vehicle trips to carpooling or vanpooling, for example providing ride-matching services; iv. Provide incentives or subsidies that increase that use of modes other than single-occupancy vehicle; v. Provide on-site amenities at places of work, such as priority parking for carpools and vanpools, secure bike parking, and showers and locker rooms; vi. Provide employee transportation coordinators at employment sites; vii. Provide a guaranteed ride home service to users of non-auto modes.
i) Designate a percentage of parking spaces for ride-sharing vehicles or high-occupancy vehicles, and provide adequate passenger loading and unloading for those vehicles;
j) Land use siting and design measures that reduce GHG emissions, including: i. Developing on infill and brownfields sites; ii. Building compact and mixed-use developments near transit; iii. Retaining on-site mature trees and vegetation, and planting new canopy trees; iv. Measures that increase vehicle efficiency, encourage use of zero and low emissions vehicles, or reduce the carbon content of fuels, including constructing or encouraging construction of electric vehicle charging stations or neighborhood electric vehicle networks, or charging for electric bicycles; and v. Measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse.
k) Consult the SCAG Environmental Justice Toolbox for potential measures to address impacts to low-income and/or minority communities. The measures provided above are also intended to be applied in low income and minority communities as applicable and feasible.
l) Require at least five percent of all vehicle parking spaces include electric vehicle charging stations, or at a minimum, require the appropriate infrastructure to facilitate sufficient electric charging for passenger vehicles and trucks to plug-in.
m) Encourage telecommuting and alternative work schedules, such as: i. Staggered starting times ii. Flexible schedules iii. Compressed work weeks
n) Implement commute trip reduction marketing, such as: i. New employee orientation of trip reduction and alternative mode options ii. Event promotions iii. Publications
o) Implement preferential parking permit program
p) Implement school pool and bus programs

q) Price workplace parking, such as:

i. Explicitly charging for parking for its employees;
ii. Implementing above market rate pricing;
iii. Validating parking only for invited guests;
iv. Not providing employee parking and transportation allowances; and
v. Educating employees about available alternatives.

These measures offer a cost-effective, feasible way to incorporate lower-emitting design features into the proposed Project, which subsequently, reduce emissions released during Project construction and operation. An updated EIR should be prepared to include all feasible mitigation measures, as well as include an updated GHG analysis to ensure that the necessary mitigation measures are implemented to reduce emissions to below thresholds. The EIR should also demonstrate a commitment to the implementation of these measures prior to Project approval, to ensure that the Project's significant emissions are reduced to the maximum extent possible.

Disclaimer

SWAPE has received limited discovery regarding this project. Additional information may become available in the future; thus, we retain the right to revise or amend this report when additional information becomes available. Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in this or similar localities at the time of service. No other warranty, expressed or implied, is made as to the scope of work, work methodologies and protocols, site conditions, analytical testing results, and findings presented. This report reflects efforts which were limited to information that was reasonably accessible at the time of the work, and may contain informational gaps, inconsistencies, or otherwise be incomplete due to the unavailability or uncertainty of information obtained or provided by third parties.

Sincerely,

Matt Hagemann, P.G., C.Hg.

B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 30 years of experience in environmental policy, contaminant assessment and remediation, stormwater compliance, and CEQA review. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) and directed efforts to improve hydrogeologic characterization and water quality monitoring. For the past 15 years, as a founding partner with SWAPE, Matt has developed extensive client relationships and has managed complex projects that include consultation as an expert witness and a regulatory specialist, and a manager of projects ranging from industrial stormwater compliance to CEQA review of impacts from hazardous waste, air quality and greenhouse gas emissions.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2104, 2017;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 300 environmental impact reports and negative declarations since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at more than 100 industrial facilities.
- Expert witness on numerous cases including, for example, perfluorooctanoic acid (PFOA) contamination of groundwater, MTBE litigation, air toxins at hazards at a school, CERCLA compliance in assessment and remediation, and industrial stormwater contamination.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.
- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted

public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9.

Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific

principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt is currently a part time geology instructor at Golden West College in Huntington Beach, California where he taught from 2010 to 2014 and in 2017.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Hagemann, M.F., 2005. Use of Electronic Databases in Environmental Regulation, Policy Making and Public Participation. Brownfields 2005, Denver, Coloradao.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Nevada and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Las Vegas, NV (served on conference organizing committee).

Hagemann, M.F., 2004. Invited testimony to a California Senate committee hearing on air toxins at schools in Southern California, Los Angeles.

Brown, A., Farrow, J., Gray, A. and **Hagemann, M.**, 2004. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to the Ground Water and Environmental Law Conference, National Groundwater Association.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Arizona and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Phoenix, AZ (served on conference organizing committee).

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in the Southwestern U.S. Invited presentation to a special committee meeting of the National Academy of Sciences, Irvine, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a tribal EPA meeting, Pechanga, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a meeting of tribal repesentatives, Parker, AZ.

Hagemann, M.F., 2003. Impact of Perchlorate on the Colorado River and Associated Drinking Water Supplies. Invited presentation to the Inter-Tribal Meeting, Torres Martinez Tribe.

Hagemann, M.F., 2003. The Emergence of Perchlorate as a Widespread Drinking Water Contaminant. Invited presentation to the U.S. EPA Region 9.

Hagemann, M.F., 2003. A Deductive Approach to the Assessment of Perchlorate Contamination. Invited presentation to the California Assembly Natural Resources Committee.

Hagemann, M.F., 2003. Perchlorate: A Cold War Legacy in Drinking Water. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. From Tank to Tap: A Chronology of MTBE in Groundwater. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. A Chronology of MTBE in Groundwater and an Estimate of Costs to Address Impacts to Groundwater. Presentation to the annual meeting of the Society of Environmental Journalists.

Hagemann, M.F., 2002. An Estimate of the Cost to Address MTBE Contamination in Groundwater (and Who Will Pay). Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to a meeting of the U.S. EPA and State Underground Storage Tank Program managers.

Hagemann, M.F., 2001. From Tank to Tap: A Chronology of MTBE in Groundwater. Unpublished report.

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, industrial, military and agricultural sources, unconventional oil drilling operations, and locomotive and construction engines. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities. Dr. Rosenfeld has also successfully modeled exposure to contaminants distributed by water systems and via vapor intrusion.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, creosote, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at sites and has testified as an expert witness on numerous cases involving exposure to soil, water and air contaminants from industrial, railroad, agricultural, and military sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Mr. Jamie T. Hall
Channel Law Group, LLP
8383 Wilshire Blvd., Suite 750
Beverly Hills, CA 90211

Subject: Comments on the Draft Environmental Impact Report for the Harvard-Westlake River Park Project

Dear Mr. Hall:

This letter contains my comments on the Draft Environmental Impact Report ("DEIR") prepared by the City of Los Angeles ("City") for the Harvard-Westlake River Park Project ("Project"). The Project Applicant, Harvard-Westlake School ("Applicant") proposes construction and operation of an athletic and recreational facility on a 16.1-acre parcel owned by the Applicant, and a 1.1-acre parcel leased from the Los Angeles County Flood Control District, in the community of Studio City. Although the majority of the Project site is currently occupied by a private golf course and tennis facility, some components of the Project extend into the Zev Yaroslavsky Los Angeles River Greenway ("Zev Greenway").

I am an environmental biologist with 29 years of professional experience in wildlife biology and natural resources management. I have served as a biological resources expert for over 150 projects in California. My experience and scope of work in this regard has included assisting various clients with evaluations of biological resource issues; preparation and peer review of environmental compliance documents prepared pursuant to the California Environmental Quality Act ("CEQA") and the National Environmental Policy Act ("NEPA"); and preparation of written comments that address deficiencies with CEQA and NEPA documents. My work has included written and oral testimony for the California Energy Commission, California Public Utilities Commission, and Federal courts. My educational background includes a B.S. in Resource Management from the University of California at Berkeley, and a M.S. in Wildlife and Fisheries Science from the Pennsylvania State University. A copy of my curriculum vitae is attached hereto.

The comments herein are based on my review of the environmental documents prepared for the Project, a review of scientific literature pertaining to biological resources known to occur in the Project area, consultations with other biological resource experts, and the knowledge and experience I have acquired during my 29-year career in the field of natural resources management.

ENVIRONMENTAL SETTING

The DEIR Fails to Establish the Environmental Setting with Respect to the Western Yellow Bat

The western yellow bat (*Lasiurus xanthinus*) is a California Species of Special Concern that appears to roost exclusively in the skirts of palm trees located near open water or wetlands.[1] The photographs provided in the tree report prepared by the Applicant's arborist depict numerous palms at the Project site with skirts suitable for roosting bats.[2] According to the DEIR:

> "Western yellow bat has moderate potential to roost and forage in the Biological Study Area. The Biological Study Area supports a number of palm trees that would be suitable roosting habitat for this species. Additionally, the adjacent Los Angeles River may provide suitable foraging habitat above the river and near the southwestern boundary of the Biological Study Area."[3]

Although the DEIR acknowledges there is potential for western yellow bats to occur at the Project site, there was no effort to determine presence, abundance, and distribution of the species at the site, nor were there any attempts to determine how many of the site's 174 palm trees contain bat roosts. The DEIR's failure to establish the environmental setting (with respect to bats) precludes informed decision making and public participation because it precludes understanding of the severity of the Project's impacts on the western yellow bat population. For example, without data on the number of active bat roosts at the Project site, the public (and City) have no idea whether the Project would affect 1 yellow bat, 100 yellow bats, or no yellow bats. This lack of information not only has implications on the public's ability to understand the Project's impacts, but also the City's ability to effectively evaluate the significance threshold used in the DEIR (i.e., "*[w]ould the Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species…"*). Whereas loss of one active bat roost from the Project site would not have a substantial adverse effect on the western yellow bat population, the loss of 50 active roosts (for example) would have severe, and potentially unmitigable impacts on the population. To properly disclose, analyze, and mitigate the Project's impacts on bats, the City must conduct surveys to determine the presence, abundance, and distribution of active roosts at the site, and these data must be released to the public in a recirculated DEIR.

PROJECT IMPACTS

The DEIR Fails to Adequately Disclose and Analyze Project Impacts to the Western Yellow Bat

Direct Impacts

The DEIR's analysis of direct impacts to the western yellow bat is limited to the statement that: "[c]onstruction of the Project could result in potentially significant direct impacts to this bat species if tree removal commences during the maternity roosting season (generally March 1 through September 30)."[4]

Direct impacts to the western yellow bat (and other bat species) are not limited tree removal during the maternity roosting season. Some western yellow bats are year-round residents in southern California.[5] These bats may use trees at the Project site as day roosts, night roosts, or maternity roosts.[6] Consequently, western yellow bats may occur in trees (especially the palms) at the Project site at any time of day (or night), on any day of the year.

Yellow bats are deep sleepers.[7] Even when fully awake, they feel safe in palm fronds and generally will not flush at signs of danger.[8] As a result, yellow bats are frequently killed or injured when palm trees are felled.[9] Because bats are a prey species that has few behavioral defenses against predation, they rely on concealment (at roosts) to avoid predation by diurnal predators. Therefore, even if bats flush from a tree as it is being felled, most of these individuals are likely to die due to predation or exposure. The DEIR fails to analyze impacts to, or incorporate mitigation for, bats that may occupy trees at the Project site during the non-maternity season.

The Project entails removing 121 of the Mexican fan palms that occur at the Project site. This represents a substantial number of potential roosts for the western yellow bat. Incredibly, the DEIR provides *no analysis* of this habitat loss. Because the loss of suitable roosting habitat is one of the primary threats to the western yellow bat population,[10] and because the DEIR does not incorporate compensatory mitigation, potentially significant impacts on the western yellow bat remain unmitigated.

[10] *Ibid.*

Indirect Impacts

According to the DEIR:

> "There would also be additional indirect impacts to special-status bat species from noise and human activities associated with Project construction; however, construction activities would be temporary on an intermittent basis, and potential on-site tree roosts would be removed during the initial construction phase if no active roosts are found. As such, impacts would not diminish the long-term survival of a special-status bat species and, therefore, would be less than significant."[11]

A fundamental flaw with the DEIR's analysis is that it fails to discuss *how* noise and human activities associated with construction would impact bats at the Project site. For example, the DEIR does not identify whether construction activities would affect vital rates (e.g., survival and recruitment), behavior (e.g., roost attendance, sleep and torpor, movement patterns), habitat use, predator-prey relationships, or other variables that may influence the bat population. This precludes the public's ability to validate the DEIR's conclusion that Project impacts "would not diminish the long-term survival of a special-status bat species and, therefore, would be less than significant."

The DEIR provides two reasons for its determination that Project impacts to special-status bats would be less than significant. The DEIR's first reason is that construction activities would be "temporary." Project construction activities would occur for approximately two and a half years,[12] which would encompass two or three reproductive cycles of the bat population (bats reproduce only once per year). Bats have low reproductive rates, high juvenile mortality, and long generational turnover.[13] Consequently, any reduction in reproductive output (or success) can have a substantial impact on viability of the bat population. Indeed, it can take a colony (population) many years to recover from activities that cause mortality or even temporary reduced fecundity (i.e., the ability to produce offspring).[14] Therefore, although a 2.5-year impact might be temporary from a human perspective, it is not "temporary" from the bat's perspective.

The DEIR's second reason is that potential roosts would be removed during the initial construction phase. This reason is both confusing and illogical. First, the rationale is confusing because the Project does not involve removal of all potential roosts (e.g., 181 trees would remain, of which 53 are Mexican fan palms).[15] Therefore, removing potential roosts (trees) during the initial construction phase does not eliminate the potential for significant indirect impacts to bats. Second, the rationale is illogical because removing potential roosts would generate a different type of indirect impact to bats. Specifically, removing roosts would eliminate a habitat element essential to survival and reproduction. If replacement roosts are not

[14] Johnston D, Tatarian G, Pierson E. 2004. California Bat Mitigation Techniques, Solutions, and Effectiveness. Report to California Department of Transportation, Sacramento, California. Project Number 2394-01.
[15] DEIR, pp. IV.C-54 and -55.

available, the loss of roosts from the Project site would eliminate the reproductive potential of all individuals that are displaced from the Project site. As a result, and contrary to the DEIR's assertion, removing roosts from the Project site would reduce the potential for "long-term survival," especially for an organism that is already exposed to numerous threats (e.g., habitat loss, pesticides, and wind turbine strikes, among others).

The DEIR Fails to Provide an Accurate Assessment of Impacts to the California Brittlebush Scrub Community (A Sensitive Natural Community)

In 2017, the Zev Greenway was restored to native coastal sage scrub habitat along a majority of the Project Site's southern boundary. The restored habitat includes a diverse mix of native species (although some non-native species remain). Because California brittlebush (*Encelia californica*) is the dominant species in the restoration area, it was classified as California brittlebush scrub, which is a sensitive natural community in the State of California.[16]

The DEIR states that the proposed river connection trail, river fence, and river overlook would directly impact 0.14 acres of California brittlebush scrub. However, according to the DEIR, the Project would not have significant indirect impacts on the California brittlebush scrub community because: (a) it occurs along an existing public trail (i.e., the Zev Greenway trail), and (b) "plants would not be affected by subtle changes in Project light, noise, or human activity."[17] The DEIR's rationale is flawed because it fails to recognize that the Project would not only increase human activity along the existing trail, but that it would also create a new trail that bisects the California brittlebush scrub community, thereby increasing the proportion of that community that would be susceptible to trampling, weed invasion, and other adverse edge effects associated with fragmentation. In addition, because the proposed river connection trail would not provide the shortest route to the Zev Greenway trail, students and spectators are likely to create shortcuts (and other unauthorized trail routes) through the California brittlebush scrub, as depicted in Figure 1 (below). This would cause further loss, degradation, and fragmentation of the sensitive natural community. The DEIR fails to incorporate mitigation for this potentially significant indirect impact.

The Project includes installation of 38 trees in the California brittlebush scrub community along the Zev Greenway.[18] As these trees mature, they will substantially decrease the amount of sunlight reaching plants in the shrub layer. This is important because California brittlebush, coast goldenbush, Nevin's barberry (an endangered species), and most of the other plant species that occur along the Zev Greenway are adapted to full sun (or part shade),[19] and thus are unlikely to persist in the shady conditions created by the Project's trees. The DEIR fails to analyze this potentially significant indirect impact on the California brittlebush scrub community and the two Nevin's barberry plants that occur therein.

The DEIR Fails to Disclose, Analyze, or Incorporate Mitigation for Avian Collisions

The Project site and adjacent Los Angeles River corridor support at least 74 species of birds,[20] some of which are classified as special-status species.[21] These include summer residents, winter residents, year-round residents, and birds that move through the Project area during migration.

Collision with windows is second only to predation by domestic cats as an anthropogenic source of avian mortality.[22] Klem (2009) estimated over one billion birds are killed each year due to collisions with clear and reflective sheet glass in the U.S. alone.[23,24] The visual system of birds is simply not capable of perceiving glass as a physical obstacle.[25] Casualties occur from head trauma after leaving a perch from as little as one meter away in an attempt to reach habitat seen through, or reflected in, clear and tinted panes.[26] Glass windows kill birds in urban, suburban, and rural settings.[27] There is no window size, building structure, time of day, season of year, or

weather conditions during which birds elude the lethal hazards of glass.[28]

Scientists have determined that bird mortality caused by collisions with structures is "biologically significant"[29] and that avian mortality from window collisions is contributing to population declines of special-status species and birds in general.[30] As a result, several cities (e.g., San Francisco, New York) have adopted standards for "bird-safe" buildings.

Causal Factors of Avian Collisions

There are two factors that cause birds to collide with human-built structures. The first is the lighting of structures at night, which "traps" and disorients many species of nocturnal migrants, making them vulnerable to collision with obstructions.[31] Those birds that are not killed outright by impact with lit windows are disoriented by the light and continue to fly around the light source, often to the point of exhaustion (which often leads to death).[32]

The second factor is the presence of architectural glass (e.g., windows), which birds in flight either cannot detect, or misinterpret.[33] Almost every type of architectural glass under the right conditions reflects the sky, clouds, or nearby trees and vegetation.[34] Glass that reflects the environment presents birds with the appearance of safe routes, shelter, and possibly food ahead. When birds try to fly to the reflected habitat, they hit the glass.

The bulk of bird deaths result when lone, confused birds mistake glass for a safe flight path.[35] During migration, birds make stops to rest and refuel. After landing, these birds make short, low flights near dawn, searching for feeding areas.[36] Thus, they are susceptible to collisions as they ascend, descend, and search for the resources needed to continue their migratory journey. Consequently, night-migrating songbirds[37]—already imperiled by habitat loss and other environmental stressors—face a dual risk, threatened both by illuminated buildings when they fly at night and by daytime glass collisions as they seek food and shelter.[38]

Project-Specific Hazards

A poorly designed building can kill hundreds of birds per year.[39] A few variables in particular have proven to be especially lethal to birds. As described below, the proposed Project incorporates design variables known to cause high levels of avian mortality:

1. Buildings with reflective or transparent windows, large windows, or a high percentage of glass.

Birds have been reported to strike two general types of windows: (1) transparent windows, which appear invisible to birds and (2) reflective windows, which mirror the facing habitat.[40] In addition, studies have shown that buildings with large windows or a high percentage of glass kill a disproportionately high number of birds.[41]

The proposed Project would have transparent and reflective windows.[42] All of the Project's buildings would have large windows (or panes of glass).[43] In addition, the proposed gymnasium and swimming pool buildings would contain a high percentage of glass. Indeed, one of the sustainability features touted in the DEIR is: "[n]atural light to be harvested for the main spaces in the gymnasium building using *large expanses of glass* and skylights…"[44]

The threat large expanses of glass pose to birds is exacerbated when windows are installed on opposite sides of a building directly across from one another or at a corner, because birds perceive an unobstructed passageway and fly towards the glass with no awareness of an obstacle.[45] The proposed gymnasium and pool buildings would possess this "design trap."

2. Buildings with windows located adjacent to extensive vegetation.

Several studies have provided evidence that buildings with windows adjacent to extensive vegetation kill numerous birds.[46] Buildings that have windows at lower stories (below 60 feet)

are the most dangerous because those windows are at or below canopy height and are more likely to reflect trees and other landscape features that attract birds.[47] In suburban areas, buildings with these features have been documented to kill an average of 30 birds per year (per building).[48] This combination may be even more lethal in urban areas. Studies of Manhattan structures with large swaths of windows adjacent to large open spaces have recorded well over 100 collisions per year (per structure).[49]

The proposed Project includes installation of large expanses of glass near ground level and adjacent to vegetation attractive to birds.[50] This would create a significant collision hazard to birds.

The American Bird Conservancy and New York City Audubon Society have developed bird-friendly design standards for new buildings.[51] Because the Project does not incorporate these (or comparable) design standards, the Project's impact on bird populations would be potentially significant.

MITIGATION ISSUES

BIO-MM-1 (Special-Status Bats)

BIO-MM-1 requires the Applicant to implement either of the following measures:

1) "Tree removal activities shall be scheduled outside of the maternity roosting season (October 1 through February 28) to avoid potential impacts to special-status bat species."
2) "Any construction or palm tree removal activities that occur during the maternity roosting season for special-status bat species (March 1 through September 30) shall require a qualified biologist experienced with bat roost biology to conduct a pre-construction (or pre-tree removal) survey, using sonic bat detectors (e.g., Anabat or Sonobat) to determine whether special-status bat species are roosting within trees that would be removed. The surveys shall be conducted at dusk and after nightfall by a biologist. If an active roost site is located during the pre-construction survey, the roost shall be avoided and Project activities shall be conducted as recommended by the biologist to avoid the area, which may include temporary postponement or provision of a suitable buffer established around the roost until roosting activities cease. Suitable buffers could include netting, canvas, or similar materials as recommended by the biologist. A report shall be submitted to the City with the results of the pre-construction or tree removal survey and any needed maternity roost avoidance actions."

---

[49] Gelb Y, Delacretaz N. 2009. Windows and Vegetation: Primary Factors in Manhattan Bird Collisions. Northeastern Naturalist 16(3):455-470.
[50] *See* DEIR, Figures IV.C-5 and -6.
[51] American Bird Conservancy and New York City Audubon Society. 2015. Bird-Friendly Building Design, 2nd Ed. Available at: <https://abcbirds.org/wp-content/uploads/2015/05/Bird-friendly-Building-Guide_LINKS.pdf>

As discussed previously, tree removal outside of the maternity roosting season would avoid direct impacts to bats that use the trees for maternity purposes, but it would not avoid direct impacts to bats that use the trees as day roosts.[52]

There are several reasons why the second approach (i.e., pre-construction survey and buffer) would not reduce potentially significant direct impacts on bats. First, the measure applies only to roosts occupied by special-status bats, thus providing no protection to maternity roosts occupied by other bat species. An impact to a maternity roost of *any* bat species would constitute a significant impact because it would "impede the use of native wildlife nursery sites" (i.e., CEQA significance threshold "d").[53]

Second, although bat detectors can be relatively effective in detecting bat activity, they do not identify roost locations. Furthermore, even when appropriate techniques are implemented (i.e., visually monitoring palm trees at emergence time), it is difficult to locate roosts occupied by western yellow bats.[54] As a result, the pre-construction survey methods required under BIO-MM-1 would not provide reliable information on yellow bat roosts that may be impacted by the Project. This issue is compounded by the DEIR's failure to establish standards for the "qualified biologist" that would conduct the survey.

Third, BIO-MM-1 lacks the specificity needed to ensure reliable data on presence of bats in areas that would be impacted by the Project. Bat detection probabilities during acoustic surveys at a given site are known to vary depending on a range of factors, including weather conditions, sampling duration, number of observers/detectors deployed, and sensitivity/directionality of detector types.[55] BIO-MM-1 fails to address these variables. Importantly, the single pre-construction survey proposed in BIO-MM-1 would not be sufficient to conclude absence of bat roosts. For example, Froidevaux and others (2020) found that a minimum of three and four acoustic surveys are required to be 95% confident that a building does not host a roost of *Pipistrellus* species and *Plecotus* species, respectively.[56]

Fourth, the DEIR fails to explain how "netting, canvas, or similar materials" could be used to create a buffer around a maternity roost. To the contrary, these materials are used to exclude bats from their roosts—not to protect active roosts from construction activities. Furthermore, bat biologists recommend against netting because it is known to trap (or entangle) bats and birds.[57] Consequently, the DEIR must disclose and analyze potentially significant impacts caused by implementation of BIO-MM-1 if netting might be installed at the Project site.

Fifth, the DEIR does not identify what would be considered a "suitable buffer," nor does it establish performance standards BIO-MM-1. Furthermore, although BIO-MM-1 requires a

[56] *Ibid.*
[57] Johnston D, Tatarian G, Pierson E. 2004. California Bat Mitigation Techniques, Solutions, and Effectiveness. Report to California Department of Transportation, Sacramento, California. Project Number 2394-01.

report that documents "any needed maternity roost avoidance actions," it does not require monitoring to evaluate the efficacy of those actions. As a result, the DEIR provides no assurances that BIO-MM-1 would be successful in preventing significant impacts to bats.

BIO-MM-2 (California Brittlebush Scrub)

BIO-MM-2 states:

> "Prior to issuance of a building permit, Harvard-Westlake School shall submit to the Department of City Planning a landscape plan or mitigation plan depicting replacement of an equivalent acreage of California brittlebush scrub removed at a 1:1 ratio. The sensitive natural community does not need to be dominated only by California brittlebush, but this species shall be prevalent within the community, and the native scrub mix proposed shall use similar species as used for the Zev Greenway restoration habitat. The replacement of sensitive natural community habitat shall be planted clustered adjacent to and contiguous with the Zev Greenway, and the locations and species shall be to the satisfaction of the Department of City Planning and in conformance with the landscape and planting guidelines in the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes. Replacement sensitive natural community habitat areas shall be planted on-site and shall be shown on the Project's landscape plan. The restored sensitive natural community shall be monitored for five years to verify that California brittlebush scrub has been successfully restored."

There are several problems with BIO-MM-2. First, the DEIR fails to demonstrate it would be feasible to create 0.14 acres of replacement habitat on-site and adjacent to the Zev Greenway. Most of the habitat adjacent to the Zev Greenway already consists of California brittlebush scrub (and therefore does not qualify as a potential mitigation site).[58] Although there are small patches of "Disturbed" and "Ornamental" vegetation along the Greenway near the Project's southwestern boundary, it is unclear whether there would be 0.14 acres "on-site" that could be restored to California brittlebush scrub, especially given the Applicant's plan to plant trees in that area.[59]

Second, the DEIR does not establish performance standards for BIO-MM-2, nor does it identify the variables that would be evaluated to determine whether the California brittlebush scrub had been "successfully restored." As a result, the DEIR lacks assurances that BIO-MM-2 would be effective in mitigating the Project's impacts to less-than-significant levels.

Third, BIO-MM-2 fails to incorporate a mechanism that would ensure the compensation habitat is maintained (and properly managed) in perpetuity. That is, there is not mechanism that would prevent the Applicant from removing the compensation habitat upon termination of the five-year monitoring period.

For these reasons, BIO-MM-2 does not ensure the Project's impacts to California brittlebush scrub would be mitigated to less-than-significant levels.

Sincerely,

Scott Cashen, M.S.
Senior Biologist

Scott Cashen, M.S.
Senior Wildlife Biologist

Scott Cashen has 28 years of professional experience in natural resources management. During that time he has worked as a field biologist, forester, environmental consultant, and instructor of Wildlife Management. Mr. Cashen focuses on CEQA/NEPA compliance issues, endangered species, scientific field studies, and other topics that require a high level of scientific expertise.

Mr. Cashen has knowledge and experience with numerous taxa, ecoregions, biological resource issues, and environmental regulations. As a biological resources expert, Mr. Cashen is knowledgeable of the various agency-promulgated guidelines for field surveys, impact assessments, and mitigation. Mr. Cashen has led field investigations on several special-status species, including ones focusing on the yellow-legged frog, red-legged frog, desert tortoise, steelhead, burrowing owl, California spotted owl, northern goshawk, willow flycatcher, Peninsular bighorn sheep, red panda, and various forest carnivores.

Mr. Cashen is a recognized expert on the environmental impacts of renewable energy development. He has been involved in the environmental review process of over 100 solar, wind, biomass, and geothermal energy projects. Mr. Cashen's role in this capacity has encompassed all stages of the environmental review process, from initial document review through litigation support. Mr. Cashen provided expert witness testimony on several of the Department of the Interior's "fast-tracked" renewable energy projects. His testimony on those projects helped lead agencies develop project alternatives and mitigation measures to reduce environmental impacts associated with the projects.

Mr. Cashen was a member of the independent scientific review panel for the Quincy Library Group project, the largest community forestry project in the United States. As a member of the panel, Mr. Cashen was responsible for advising the U.S. Forest Service on its scientific monitoring program, and for preparing a final report to Congress describing the effectiveness of the Herger-Feinstein Forest Recovery Act of 1998.

AREAS OF EXPERTISE

- CEQA, NEPA, and Endangered Species Act compliance issues
- Comprehensive biological resource assessments
- Endangered species management
- Renewable energy development
- Scientific field studies, grant writing and technical editing

EDUCATION

M.S. Wildlife and Fisheries Science - The Pennsylvania State University (1998)
Thesis: *Avian Use of Restored Wetlands in Pennsylvania*
B.S. Resource Management - The University of California, Berkeley (1992)

PROFESSIONAL EXPERIENCE

Litigation Support / Expert Witness

Mr. Cashen has served as a biological resources expert for over 125 projects subject to environmental review under the California Environmental Quality Act (CEQA) and/or the National Environmental Policy Act (NEPA). As a biological resources expert, Mr. Cashen reviews CEQA/NEPA documents and provides his clients with an assessment of biological resource issues. He then submits formal comments on the scientific and legal adequacy of the project's environmental documents (e.g., Environmental Impact Report). If needed, Mr. Cashen conducts field studies to generate evidence for legal testimony, or he can obtain supplemental testimony from his deep network of species-specific experts. Mr. Cashen has provided written and oral testimony to the California Energy Commission, California Public Utilities Commission, and U.S. district courts. His clients have included law firms, non-profit organizations, and citizen groups.

Forestry

Mr. Cashen has five years of experience working as a consulting forester on projects throughout California. Mr. Cashen has consulted with landowners and timber operators on forest management practices; and he has worked on a variety of forestry tasks including selective tree marking, forest inventory, harvest layout, erosion control, and supervision of logging operations. Mr. Cashen's experience with many different natural resources enable him to provide a holistic approach to forest management, rather than just management of timber resources.

REPRESENTATIVE EXPERIENCE

- Lead Consultant - CalFire fuels treatment projects *(SD and Riverside Counties)*
- Lead Consultant and supervisor of harvest activities – San Diego Gas and Electric Bark Beetle Tree Removal Project *(San Diego)*
- Crew Leader - Hillslope Monitoring Program *(CalFire: throughout California)*
- Consulting Forester – Forest inventories and timber harvest projects *(various clients throughout California)*

Grant Writing and Technical Editing

Mr. Cashen has prepared and submitted over 50 proposals and grant applications. Many of the projects listed herein were acquired through proposals he wrote. Mr. Cashen's clients and colleagues have recognized his strong scientific writing skills and ability to generate technically superior proposal packages. Consequently, he routinely prepares funding applications and conducts technical editing for various clients.

Historic-Cultural Monument Application

FINDINGS

- Weddington Golf and Tennis Club "exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community" as an excellent example of a 1950s private recreational facility and golf club in Studio City.

- Weddington Golf and Tennis Club "embodies the distinctive characteristics of a style, type, period, or method of construction" as an excellent example of a 1950s community golf course.

CRITERIA

The criterion is the Cultural Heritage Ordinance which defines a historical or cultural monument as any site (including significant trees or other plant life located thereon), building or structure of particular historic or cultural significance to the City of Los Angeles if it meets at least one of the following criteria:

1. Is identified with important events of national, state, or local history, or exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community;
2. Is associated with the lives of historic personages important to national, state, city, or local history; or
3. Embodies the distinctive characteristics of a style, type, period, or method of construction; or represents a notable work of a master designer, builder, or architect whose individual genius influenced his or her age.

SUMMARY

Weddington Golf and Tennis Club is a private recreational facility located on a triangular lot bounded by Valley Spring Lane to the north, Whitsett Avenue to the east, Valleyheart Drive to the south, and Bellaire Avenue to the west in the Studio City neighborhood of Los Angeles. Sited on the former sheep ranch of San Fernando Valley pioneer Wilson C. Weddington, the golf course was built in 1955 when the Weddington family leased the property to actor and golf professional Joe Kirkwood, Jr. That year, architect William M. Bray (1905-1998) designed a golf shop and clubhouse in the Ranch architectural style that was erected by the Colonial Construction Company. The subject property was largely developed over the next ten years, with the addition of tennis courts in the 1970s, and the site now consists of a golf course, driving range, tennis courts, tennis clubhouse, and golf clubhouse. Operated by the McCallister family from 1958 until 2008, the subject property was called the Studio City Golf and Tennis Club. Since 2008, it has been called the Weddington Golf and Tennis Club.

Formed around 1927, Studio City was conceived as a combined studio, commercial development, and residential subdivision; however, the area remained largely rural until the 1950s. Similar to the rest of Southern California, the San Fernando Valley experienced a dramatic construction and population boom fueled by the increased demand for housing following World War II. Migration to the region was driven by a booming postwar economy, led by the defense industry that provided thousands of new jobs in aviation. In the development of Studio City and surrounding areas, communities were designed and built to be complete neighborhoods, with schools, churches, shopping centers, and parks located within a close drive of residential streets. Neighborhoods

were promoted for their balance of work and recreation opportunities, such as golf courses and tennis courts, that had previously been unavailable to the average middle-class citizen.

The subject property spans approximately 16 acres, and the primary entrance is oriented to the east facing Whitsett Avenue. Much of the property maintains a park-like setting with landscaping and more than 400 mature trees. Most of the trees were planted during or following the development off the golf course, but a row of Eucalyptus trees along Valley Spring Lane predates the course. Golf-related resources are located at the northeastern portion of the site and include a one-story clubhouse; a nine-hole, par three golf course; a 24-stand, 230-yard driving range; and a putting green. The clubhouse is of wood-frame construction with board and batten cladding and has a side-gabled roof with wood shingles and overhanging eaves. The structure sits at an angle facing the northeast corner of the site and is approached by a walkway from the parking lot to the south. The primary entrance is recessed beneath the overhang and consists of aluminum-frame glass doors with flanking full-height sidelites. Interior features include knotty pine paneling, wrought iron light fixtures, and a slab fireplace wall with variegated brick cladding. The interior includes a reception area, a coffee shop and a pro shop. The golf course loops around the property, partially encircling the driving range, and winds back to the clubhouse. A wood, shed-style canopy shelters the northern half of the stands within the driving range, and temporary awnings shelter those on the south end. Eight original light standards, designed in the form of a golf ball set atop a tee, line the fence along the Whitsett Avenue parking lot and provide light to the driving range.

The southeastern corner of the parcel is dedicated for tennis use and includes a small club structure and 16 concrete courts located in staggered rows. The club structure faces west toward the tennis courts and features board and batten cladding and a front-gabled roof with wood shingles. Fenestration consists of aluminum sliding windows, and the entrances consist of single doors with inset panels and a cross-timber detail. There is also a temporary maintenance structure east of the tennis courts at the southern property line, which consists of a fenced yard with a roof.

William M. Bray, architect of the golf clubhouse, practiced architecture in Southern California for over 60 years, with an office located in Encino. Aspects of Bray's residential designs were periodically featured in the *Los Angeles Times* throughout the 1950s and 1960s. Bray was responsible for two of the residential designs for the Aladowney Homes subdivision in Downey (1951) and Brighton Hills in Montebello (1961), where he employed the popular Ranch architectural style. He also designed a retirement community in Palm Desert called "Palm City." In 1994, Bray was awarded a lifetime achievement award from the San Fernando Valley chapter of the American Institute of Architects. His son and business partner, Roger W. Bray, continues the practice today as Bray Architects.

The subject property has experienced several alterations that include an addition to the clubhouse in 1962; the demolition of a maintenance building, construction of a new maintenance building and the construction of an enclosure at the driving range, creating 10 sheltered tees, in 1966; the construction of tennis courts, court fencing and a tennis shop in 1974; the installation of tennis court fencing in 1975; the installation of fencing with lights in 1976; and the demolition of four original tennis courts and a 1966 maintenance structure as part of the construction of a fire station in 2007 at the southern corner (land now owned by the City of Los Angeles). Other alterations noted during the Commission site inspection consist of the reconfiguration of the fifth and sixth holes, ninth tee, and a reduction in the size of the driving range from the original 1958 design.

SurveyLA, the citywide historic resources survey, identified the subject property as individually eligible for listing under the national, state, and local designation programs as an excellent

example of a 1950s private recreational facility/tennis club/golf course in Studio City. The survey found that the property appears to meet the eligibility standards, but it noted that it was not fully visible from the public right-of-way.

DISCUSSION

Weddington Golf and Tennis Club meets two of the Historic-Cultural Monument criteria.

The subject property "exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community" as an excellent example of a 1950s private recreational facility and golf club in Studio City. The suburbanization of the middle class and the boom in home and automobile ownership during the 1950s and 1960s enabled larger populations to live near and access golf courses. The golf course and driving range were developed to provide the growing Studio City community with a publicly accessible facility where visitors of all ages could learn and practice the game of golf. Previously a sport reserved for elites, golf began to attract middle-class suburban players and enjoy popular appeal in the postwar period. The televising of golf tournaments greatly increased the sport's profile and audience and contributed to its popularization. Facilities like the subject property opened to the public to serve this growing demand for the sport. In addition, the subject property reflects the value of recreational amenities to the suburban population base in the San Fernando Valley during a significant period of growth.

Furthermore, the subject property "embodies the distinctive characteristics of a style, type, period, or method of construction" as an excellent example of a 1950s community golf course. It retains many essential characteristics of the small, local community golf courses that became popular nationwide in the 1950s. As open spaces were rapidly disappearing in light of the increased development of urban and suburban landscapes, the combination of greenery, open spaces, social outlets, and community recreation provided by golf courses were valued throughout the mid-20th century. In addition, the golf course retains associative value with the post-World War II era in the San Fernando Valley: the golf ball-shaped lights are a form of programmatic architecture, a type of roadside attraction contemporaneous with the popularity of car culture, and the clubhouse reflects the Ranch architectural style, the preferred residential forms of the San Fernando Valley during that period.

While the property has experienced some alterations, they are all related to its evolution as a community golf course over time. As such, the subject property retains a high level of integrity of location, design, setting, materials, workmanship, feeling, and association to convey its significance.

Separately, staff recommends that the subject property's proposed monument name be changed to the "Studio City Golf and Tennis Club," to reflect the original, historic name with which it was associated for 50 years.

CALIFORNIA ENVIRONMENTAL QUALITY ACT ("CEQA") FINDINGS

State of California CEQA Guidelines, Article 19, Section 15308, Class 8 "*consists of actions taken by regulatory agencies, as authorized by state or local ordinance, to assure the maintenance, restoration, enhancement, or protection of the environment where the regulatory process involves procedures for protection of the environment.*"

State of California CEQA Guidelines Article 19, Section 15331, Class 31 "*consists of projects limited to maintenance, repair, stabilization, rehabilitation, restoration, preservation, conservation or reconstruction of historical resources in a manner consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic buildings*."

The designation of the Weddington Golf and Tennis Club as an Historic-Cultural Monument in accordance with Chapter 9, Article 1, of The City of Los Angeles Administrative Code ("LAAC") will ensure that future construction activities involving the subject property are regulated in accordance with Section 22.171.14 of the LAAC. The purpose of the designation is to prevent significant impacts to a Historic-Cultural Monument through the application of the standards set forth in the LAAC. Without the regulation imposed by way of the pending designation, the historic significance and integrity of the subject property could be lost through incompatible alterations and new construction and the demolition of an irreplaceable historic site/open space. The Secretary of the Interior's Standards for Rehabilitation are expressly incorporated into the LAAC and provide standards concerning the historically appropriate construction activities which will ensure the continued preservation of the subject property.

The City of Los Angeles has determined based on the whole of the administrative record, that substantial evidence supports that the Project is exempt from CEQA pursuant to CEQA Guidelines Section Article 19, Section 15308, Class 8 and Class 31, and none of the exceptions to a categorical exemption pursuant to CEQA Guidelines Section 15300.2 applies. The project was found to be exempt based on the following:

> The use of Categorical Exemption Class 8 in connection with the proposed designation is consistent with the goals of maintaining, restoring, enhancing, and protecting the environment through the imposition of regulations designed to prevent the degradation of Historic-Cultural Monuments.
>
> The use of Categorical Exemption Class 31 in connection with the proposed designation is consistent with the goals relating to the preservation, rehabilitation, restoration and reconstruction of historic buildings and sites in a manner consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties.

Categorical Exemption ENV-2020-7765-CE was prepared on February 26, 2021.

BACKGROUND

On December 23, 2020, the Director of Planning determined that the application for the proposed designation of the subject property as an Historic-Cultural Monument was complete. On January 21, 2021, the Cultural Heritage Commission voted to take the property under consideration. On February 25, 2021, a subcommittee of the Commission consisting of Commissioner Kennard conducted a site inspection of the property, accompanied by staff from the Office of Historic Resources. The original expiration date of April 6, 2021 is tolled, and a revised date will be determined pursuant to *the Mayor's March 21, 2020 Public Order Under City of Los Angeles Emergency Authority re: Tolling of Deadlines Prescribed in the Municipal Code and April 17, 2020 Public Order Under City of Los Angeles Emergency Authority re: Tolling HCIDLA Deadlines and Revising Expiration of Emergency Orders***.**

In 2001, there was a proposed project to develop the subject property with a new 200-condominium unit senior housing complex with an associated subterranean parking structure on a portion of the site and the continued maintenance, reconfiguration, and reconstruction of the existing golf and tennis use (case nos. CPC-2001-1331-MPR-GPA-ZC-BL-VCU-CUB-SPR and VTT-74209). In 2012, Architectural Resources Group prepared an Historic Resources Assessment report as part of the Environmental Impact Report (case no. ENV-2001-1196-EIR), which found the subject property to be eligible for listing in the California Register of Historical Resources as locally significant in the area of recreation and entertainment as a community recreation center, and representative of a local, 1950s community golf course. On March 27, 2018, the project was withdrawn at the request of the applicant and property owner.

In 2020, a planning application was filed to develop the site of the subject property with a new athletic facility for a private school (case nos. CPC-2020-1511-VCU-SPR-WDI and ENV-2020-1512-EIR).

SUMMARY

Weddington Golf and Tennis Club is a private recreational facility located on a triangular lot bounded by W. Valley Spring Lane to the north, N. Whitsett Avenue to the east, W. Valleyheart Drive to the south, and N. Bellaire Avenue to the west in the Studio City neighborhood of Los Angeles. Sited on the former sheep ranch of San Fernando Valley pioneer Wilson C. Weddington, the golf course was built in 1955 when the Weddington family leased the property to actor and golf professional Joe Kirkwood, Jr. That year, architect William M. Bray (1905-1998) designed a golf shop and clubhouse in the Ranch architectural style that was erected by the Colonial Construction Company. The subject property was largely developed over the next ten years, with the addition of tennis courts in the 1970s, and the site now consists of a golf course, driving range, tennis courts, tennis clubhouse, and golf clubhouse. Operated by the McCallister family from 1958 until 2008, the subject property was called the Studio City Golf and Tennis Club.

Formed around 1927, Studio City was conceived as a combined studio, commercial development, and residential subdivision; however, the area remained largely rural until the 1950s. Similar to the rest of Southern California, the San Fernando Valley experienced a dramatic construction and population boom fueled by the increased demand for housing following World War II. Migration to the region was driven by a booming postwar economy, led by the defense industry that provided thousands of new jobs in aviation. In the development of Studio City and surrounding areas, communities were designed and built to be complete neighborhoods, with schools, churches, shopping centers, and parks located within a close drive of residential streets. Neighborhoods were promoted for their balance of work and recreation opportunities, such as golf courses and tennis courts, that had previously been unavailable to the average middle-class citizen.

The subject property spans approximately 16 acres, and the primary entrance is oriented to the east facing Whitsett Avenue. Much of the property maintains a park-like setting with landscaping and mature trees. Golf-related resources are located at the northeastern portion of the site and include a one-story clubhouse; a nine-hole, par three golf course; a 24-stand, 230-yard driving range; and a putting green. The clubhouse is of wood-frame construction with board and batten cladding and has a side-gabled roof with wood shingles and overhanging eaves. The structure sits at an angle facing the northeast corner of the site and is approached by a walkway from the parking lot to the south. The primary entrance is recessed beneath the overhang and consists of aluminum-frame glass doors with flanking full-height sidelites. Interior features include knotty pine paneling, wrought iron light fixtures, and a slab fireplace wall with variegated brick cladding. The interior includes a reception area, a coffee shop and a pro shop. The golf course loops around the property, partially encircling the driving range, and winds back to the clubhouse. A wood, shed-style canopy shelters the northern half of the stands within the driving range, and temporary awnings shelter those on the south end. Eight original light standards, designed in the form of a golf ball set atop a tee, line the fence along the Whitsett Avenue parking lot and provide light to the driving range.

The southeastern corner of the parcel is dedicated for tennis use and includes a small club structure and 16 concrete courts located in staggered rows. The club structure faces west toward the tennis courts and features board and batten cladding and a front-gabled roof with wood shingles. Fenestration consists of aluminum sliding windows, and the entrances consist of single doors with inset panels and a cross-timber detail. There is also a temporary maintenance structure east of the tennis courts at the southern property line, which consists of a fenced yard with a roof.

William M. Bray, architect of the golf clubhouse, practiced architecture in Southern California for over 60 years, with an office located in Encino. Aspects of Bray's residential designs were periodically featured in the *Los Angeles Times* throughout the 1950s and 1960s. Bray was

responsible for two of the residential designs for the Aladowney Homes subdivision in Downey (1951) and Brighton Hills in Montebello (1961), where he employed the popular Ranch architectural style. He also designed a retirement community in Palm Desert called "Palm City." In 1994, Bray was awarded a lifetime achievement award from the San Fernando Valley chapter of the American Institute of Architects. His son and business partner, Roger W. Bray, continues the practice today as Bray Architects.

The subject property has experienced several alterations that include an addition to the clubhouse in 1962; the demolition of a maintenance building, construction of a new maintenance building and the construction of an enclosure at the driving range, creating 10 sheltered tees, in 1966; the construction of tennis courts, court fencing and a tennis shop in 1974; the installation of tennis court fencing in 1975; the installation of fencing with lights in 1976; and the demolition of four original tennis courts and a 1966 maintenance structure as part of the construction of a fire station in 2007 at the southern corner (land now owned by the City of Los Angeles).

SurveyLA, the citywide historic resources survey, identified the subject property as individually eligible for listing under the national, state, and local designation programs as an excellent example of a 1950s private recreational facility/tennis club/golf course in Studio City. The survey found that the property appears to meet the eligibility standards; however, because it was not fully visible from the public right-of-way the evaluation could not be completed.

CRITERIA

The criterion is the Cultural Heritage Ordinance which defines a historical or cultural monument as any site (including significant trees or other plant life located thereon), building or structure of particular historic or cultural significance to the City of Los Angeles if it meets at least one of the following criteria:

1. Is identified with important events of national, state, or local history, or exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community;
2. Is associated with the lives of historic personages important to national, state, city, or local history; or
3. Embodies the distinctive characteristics of a style, type, period, or method of construction; or represents a notable work of a master designer, builder, or architect whose individual genius influenced his or her age.

FINDINGS

Based on the facts set forth in the summary and application, the Commission determines that the application is complete and that the property may be significant enough to warrant further investigation as a potential Historic-Cultural Monument.

BACKGROUND

On December 23, 2020, the Director of Planning determined that the application for the proposed designation of the subject property as an Historic-Cultural Monument was complete. The original 30-day expiration date of January 22, 2021 per Los Angeles Administrative Code Section 22.171.10(e)1 is tolled, and a revised date will be determined pursuant to *the Mayor's March 21,*

2020 Public Order Under City of Los Angeles Emergency Authority re: Tolling of Deadlines Prescribed in the Municipal Code and April 17, 2020 Public Order Under City of Los Angeles Emergency Authority re: Tolling HCIDLA Deadlines and Revising Expiration of Emergency Orders.

In 2001, there was a proposed project to develop the subject property with a new 200-condominium unit senior housing complex with an associated subterranean parking structure on a portion of the site and the continued maintenance, reconfiguration, and reconstruction of the existing golf and tennis use (case nos. CPC-2001-1331-MPR-GPA-ZC-BL-VCU-CUB-SPR and VTT-74209). In 2012, Architectural Resources Group prepared an Historic Resources Assessment report as part of the Environmental Impact Report (case no. ENV-2001-1196-EIR), which found the subject property to be eligible for listing in the California Register of Historical Resources as locally significant in the area of recreation and entertainment as a community recreation center, and representative of a local, 1950s community golf course. On March 27, 2018, the project was withdrawn at the request of the applicant and property owner.

In 2020, a case was filed to develop the site of the subject property with a new athletic facility for a private school (case nos. CPC-2020-1511-VCU-SPR-WDI and ENV-2020-1512-EIR).

HISTORIC-CULTURAL MONUMENT
NOMINATION FORM

1. PROPERTY IDENTIFICATION

Proposed Monument Name: Weddington Golf and Tennis Club			Current name of property
Other Associated Names: Studio City Golf and Tennis			
Street Address: 4141 North Whitsett Ave		Zip: 91604	Council District: 2
Range of Addresses on Property: 4141-4055 North Whitsett Ave		Community Name: Weddington Golf and	
Assessor Parcel Number: 2375018020	Tract: TR 19437	Block: none	Lot: LT1
Identification cont'd:			
Proposed Monument Property Type: ● Building	○ Structure	○ Object	○ Site/Open Space ○ Natural Feature
Describe any additional resources located on the property to be included in the nomination, here: golf ball light standards, par 3 golf course and driving range, putting green			

2. CONSTRUCTION HISTORY & CURRENT STATUS

Year built: 1956 ● Factual ○ Estimated	Threatened? Private Development
Architect/Designer: Joe Kirkwood, Jr. William M.Bray AIA (Clubhou	Contractor: Colonial Construction Co.
Original Use: golf club house, golf course, putting green and drivi	Present Use: same
Is the Proposed Monument on its Original Site? ● Yes ○ No (explain in section 7) ○ Unknown (explain in section 7)	

3. STYLE & MATERIALS

Architectural Style: Ranch, Traditional	Stories: 1	Plan Shape: Rectangular

FEATURE	*PRIMARY*	*SECONDARY*
CONSTRUCTION	Type: Wood	Type: Select
CLADDING	Material: Select	Material: Select
ROOF	Type: Gable	Type: Select
	Material: Wood shingle	Material: Select
WINDOWS	Type: Casement	Type: Casement
	Material: Wood	Material: Aluminum
ENTRY	Style: Off-center	Style: Off-center
DOOR	Type: Double	Type: Double

HISTORIC-CULTURAL MONUMENT
NOMINATION FORM

4. ALTERATION HISTORY

List date and write a brief description of any major alterations or additions. This section may also be completed on a separate document. Include copies of permits in the nomination packet. Make sure to list any major alterations for which there are no permits, as well.	
1962	Sept. 4 Permit to build food storage and additional room to clubhouse
1966	Sept. 21 demolish existing maintenance building
1966	Sept.27 construct new maintenance building
1966	Sept. 27 build tee roof, wood shake
1973	Aug. 8 Permit to build tennis courts 400 cubic yards, tennis shop, court fencing,
1973	Dec. 20 revise parking lot layout
1975	April 18 install tennis court fencing
1976	Oct.10 install fencing with lights

5. EXISTING HISTORIC RESOURCE IDENTIFICATION (if known)

☐	Listed in the National Register of Historic Places	
☐	Listed in the California Register of Historical Resources	
☐	Formally determined eligible for the National and/or California Registers	
☐	Located in an Historic Preservation Overlay Zone (HPOZ)	○ Contributing feature ○ Non-contributing feature
☑	Determined eligible for national, state, or local landmark status by an historic resources survey(s)	Survey Name(s): SurveyLA
Other historical or cultural resource designations:		

6. APPLICABLE HISTORIC-CULTURAL MONUMENT CRITERIA

The proposed monument exemplifies the following Cultural Heritage Ordinance Criteria (Section 22.171.7):	
☑	1. Is identified with important events of national, state, or local history, or exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community.
☐	2. Is associated with the lives of historic personages important to national, state, city, or local history.
☑	3. Embodies the distinctive characteristics of a style, type, period, or method of construction; or represents a notable work of a master designer, builder, or architect whose individual genius influenced his or her age.

HISTORIC-CULTURAL MONUMENT
NOMINATION FORM

7. WRITTEN STATEMENTS

This section allows you to discuss at length the significance of the proposed monument and why it should be designated an Historic-Cultural Monument. Type your response on separate documents and attach them to this form.

A. Proposed Monument Description - Describe the proposed monument's physical characteristics and relationship to its surrounding environment. Expand on sections 2 and 3 with a more detailed description of the site. Expand on section 4 and discuss the construction/alteration history in detail if that is necessary to explain the proposed monument's current form. Identify and describe any character-defining elements, structures, interior spaces, or landscape features.

B. Statement of Significance - Address the proposed monument's historic, cultural, and/or architectural significance by discussing how it satisfies the HCM criteria you selected in Section 6. You must support your argument with substantial evidence and analysis. The Statement of Significance is your main argument for designation so it is important to substantiate any claims you make with supporting documentation and research.

8. CONTACT INFORMATION

Applicant

Name: Teresa Austin		Company:	
Street Address: 4245 Laurelgrove Ave		City: Studio City	State: Ca
Zip: 91604	Phone Number: 310.968.6670	Email: bartnote1@aol.com	

Property Owner Is the owner in support of the nomination? ○ Yes ○ No ○ Unknown

Name: David Weil		Company: Harvard Westlake School	
Street Address: 3700 Coldwater Canyon Ave		City: Studio City	State: Ca
Zip: 91604	Phone Number: 818.980.6692/310.968.6670	Email: communications@hw.com	

Nomination Preparer/Applicant's Representative

Name: Teresa Austin		Company:	
Street Address: 4245 Laurelgrove Ave		City: Studio City	State: CA

HISTORIC-CULTURAL MONUMENT
NOMINATION FORM

9. SUBMITTAL

When you have completed preparing your nomination, compile all materials in the order specified below. Although the entire packet must not exceed 100 pages, you may send additional material on a CD or flash drive.

APPLICATION CHECKLIST

1. ✓ Nomination Form
2. ✓ Written Statements A and B
3. ✓ Bibliography
4. ✓ Two Primary Photos of Exterior/Main Facade (8x10, the main photo of the proposed monument. Also email a digital copy of the main photo to: planning.ohr@lacity.org)
5. ✓ Copies of Primary/Secondary Documentation
6. ✓ Copies of Building Permits for Major Alterations (include first construction permits)
7. ✓ Additional, Contemporary Photos
8. ✓ Historical Photos
9. ✓ Zimas Parcel Report for all Nominated Parcels (including map)

10. RELEASE

Please read each statement and check the corresponding boxes to indicate that you agree with the statement, then sign below in the provided space. Either the applicant or preparer may sign.	
✓	I acknowledge that all documents submitted will become public records under the California Public Records Act, and understand that the documents will be made available upon request to members of the public for inspection and copying.
✓	I acknowledge that all photographs and images submitted as part of this application will become the property of the City of Los Angeles, and understand that permission is granted for use of the photographs and images by the City without any expectation of compensation.
✓	I acknowledge that I have the right to submit or have obtained the appropriate permission to submit all information contained in this application.

Introduction

Resident of Studio City, California Teri Austin has completed an application that expands and updates the 2012 Weddington Golf and Tennis Club Historic Resources Assessment Report prepared by ARG. Weddington Golf and Tennis Club is located at 4141 Whitsett Avenue in Studio City, California and appears to be eligible for listing in the National and California registers, as well as being an Historical Cultural Monument.

I am not a historian, or professional research professional, or expert in this field. Having lived in Studio City for over 30 years I feel it would be a great loss to our local culture and history if the Weddington Golf and Tennis property were not preserved. At the end of this report I have added a very recent (June 30, 2020) article from the *Los Angeles Times*. The article highlights that the history of the film industry is tightly woven into the history of Los Angeles. Worldwide the very name "Los Angeles" is synonymous with movies and television. The article speaks to the fact that Los Angeles still retains some vestiges of our history in buildings and landscape that are so iconically, genuinely Los Angeles, that can be used as locations to accurately portray L.A.'s past. Los Angeles would be the poorer without Angel's Flight, The Boyle Hotel, the Bradbury Building, and yes, the Chili Bowl restaurant. They all are part of the history of Los Angeles, as is Weddington Golf and Tennis.

I am fortunate that the ARG study was done less than 8 years ago on this same property. It could have been done 20 or 30 years ago as nothing has changed on this stunning slice of landscape and structural post war history. The following report focuses on both the patterns of local history and the criterion (1 and 3) that qualifies this property as an Historic Cultural Monument. SurveyLA found Weddington Golf and Tennis to be an "excellent example of a 1950s private recreational facility/tennis club in Studio City."

I want to be clear that the majority of my support documentation is solely the professional work of ARG and, as it is public record, I am grateful to have such a complete study to support my application. On May 29, 2007, ARG representatives visited the project site to document existing conditions. Research was conducted at the Los Angeles Public Library and at the Los Angeles Building Department. In addition, an informal interview was conducted with George McCallister, Jr. on May 29, 2007 to gather oral history.

ARG first evaluated the significance of the property in 2007 and then again in 2012. As a result of ARG's evaluation, they found that the property appears eligible for the California Register of Historical Resources as well as an Historic Cultural Monument. ARG recommended the property as eligible to be an Historic Cultural Monument again in 2012. In our estimation, the historic significance of Weddington increases with each passing year. I have included updated photographs of the same views in the ARG report to substantiate that the integrity of the property remains the same today as it did in 2012.

NOTE: The Weddington Golf and Tennis Club was historically called the Studio City Golf and Tennis Club. For the purposes of this report, it is referred to by its current name, except when appropriate for historical context.

7. WRITTEN STATEMENTS

A. Proposed Monument Description

The following description has been excerpted from Weddington Golf and Tennis Club Historic Resources Assessment Report prepared by ARG:

> The project site is located within the boundaries of Studio City, which is a part of the City of Los Angeles located in the San Fernando Valley. Residential neighborhoods occupy most of the surrounding land to the north, east and west. The Los Angeles River channel and Ventura Boulevard, a major commercial thoroughfare, are directly south of the property.
>
> *Site*
> The Weddington Golf and Tennis Club is located at 4141 Whitsett Avenue, at the southwest corner of Whitsett and Valley Spring Lane. The triangular site is 16.1 acres with a flood control channel forming the diagonal southwestern boundary, Valley Spring Drive the northern boundary, and Whitsett Avenue the eastern boundary. A short length of Bellaire Ave. forms the western boundary. The southernmost section of the property extends into the public right-of-way for Valleyheart Drive and the Los Angeles River. The property's public entrance is oriented to the east toward Whitsett Avenue. An asphalt drive with fl anking parking serves as entrance and exit. A putting green and clubhouse at the property's northeastern corner signal the property's use. The majority of the property maintains a park-like setting as a result of the landscaping and mature trees. The southeastern corner of the parcel is dedicated for tennis use and, most recently, a portion of that area has been given over to the City of Los Angeles for use as a fire station.
>
> *Cultural Landscape Elements*
> According to the current property manager, virtually all design elements of the property were explicitly outlined in a conditional use permit. The recreational property is composed of multiple contributing elements. Golf-related resources include: a one-story clubhouse; a 24-stand, 230-yard driving range; a 9-hole, par 3 golf course; and a putting green. Tennis-related resources include: a small club structure and 16 concrete courts located in staggered rows at the southeast portion of the property, adjacent to the fire station site. Other elements include: a maintenance structure east of the tennis courts at the southern property line.
>
> *Clubhouse*
> The Weddington Golf and Tennis Club features a one-story clubhouse building near the southwest corner of Whitsett Avenue and Valley Spring Lane, on the northwest corner of the subject property. The building sits at an angle facing the corner. Its front lawn is a putting green, with a low, nonoriginal brick wall with weeping mortar bordering the street that replaced an earlier split rail fence. A walkway parallel to the front of the building approaches the entrance from the parking lot to the south.
>
> The clubhouse is wood frame construction on a concrete slab-on-grade foundation. It has a wood shingle-clad, side-gabled roof with deep eaves along the front and rear of the building to create generous overhangs. The front overhang is supported by square wood posts. The exterior cladding of the building is painted board and batten siding. The north side contains utility uses, with a shed-roofed garage (its roof parallel to the main gable) and a small shed (its roof perpendicular to the main gable, attached to the wall) and an exterior vestibule at the back of the pro shop enclosed with chain link fencing.

The recessed entrance is sheltered beneath the overhang, with the entrance and the glass wall of the front of the building recessed from the eave line. Large, low planters to the north and south of the entrance hold shrubs and small trees that pass upwards through rectangular cut-outs in the front slope of the roof. The entrance is on grade, with aluminum-frame glass doors and full-height plate glass windows to either side. It is not clear whether these expanses of glass are original or alterations. Inside the entrance, the main interior space is a reception room. The tile and carpet floor of the clubhouse is not original, nor is the wallpaper above the paneling or large mirror on the south wall, but most other features of the interior have changed very little, leaving the clubhouse with high interior integrity. Knotty pine paneling covers the walls up to a datum line set by the east (entrance) and west (rear) walls. The major feature of the reception room is a slab fi replace wall extending from floor to ceiling and clad in variegated brick. The rectangular cutout of the fi replace box is surrounded by two wrought iron, six-arm light fixtures that carry shaded hurricane lanterns. A matching four-arm fixture hangs near the pro shop desk. The reception space is flanked by offices to the north and restrooms to the south. The rear entrance to the greens is on axis with the front door, with an enclosed coffee shop to the south and a pro shop to the north.

The coffee shop or lunch counter is enclosed with wood-framed glass panels on the north side and at the entrance, directly north of the fireplace. The space has an open painted wood beamed ceiling with diagonal tongue and groove boards. The open kitchen on the south wall has a large copper hood, and an L-shaped laminate counter with built-in stools provides seating. Windows along the west wall look out to the greens side of the building, including a window for walk-up service.

The pro shop area, adjacent to the rear entrance, is marked by a high, L-shaped counter with wood paneling on the front similar to that seen in the rest of the interior. A small decorative corbelled shelf lines the opening. The rear patio of the clubhouse is partly shaded by the deep overhang of the roof. Extending from the south end of the rear patio of the clubhouse is a long open structure that serves as a shelter for golfers using the driving range. This structure has a shed roof that slopes upwards toward the west (i.e., toward the driving range). Its roof has a slight fan shape, with the beams converging toward the concave front of the structure. Each column bay has three berths for golfers using the driving range, separated with ground-mounted metal mesh dividers.

Golf Course

The nine-hole, par three golf course is laid out along the property lines that abut Valley Spring Lane, Bellaire Avenue on the west, and the river channel on the south. The course loops around the property, partially encircling the driving range, and winds its way back to the clubhouse. Concrete pads mark tees on each of the holes.

Upon exiting the clubhouse's eastern door, the first tee of the golf course is located a few yards due west of the clubhouse exit, immediately adjacent to (north of) the driving range fence. The fairway extends roughly 105 yards west of the concrete tee. Mature trees line both sides of the fairway, visually separating the first hole from the driving range to the south and the ninth hole to the north.

The second hole runs along the northern property line with the tee located on a northeasterly diagonal from the first green. The second fairway extends 130 yards to the second green, which is located on a small rise close to the northwestern corner of the

property. A row of mature eucalyptus trees buffers the second fairway from the property line to the north.

With a tee located at the northwest corner of the property, the third hole runs parallel to the western property line. The short, 75-yard fairway drops gently down to the green at the southwestern corner of the property, which is partially surrounded by a low decorative split rail fence. A row of mature Canary Island and Aleppo pine trees, with a few interspersed olive trees, lines the western edge of the third fairway, along Bellaire Avenue.

The fourth hole tees off just east of the third green and runs parallel to the river channel's path, roughly 105 yards. The fourth green is located at the approximate midpoint of the property's southern boundary along the edge of the river channel.
The fifth and sixth holes have been reconfigured from their original 1958 design. Originally, the fifth hole followed a dog-leg pattern with the tee located adjacent to a wider driving range. The fairway opened to a wide triangle, its base lined with mature eucalyptus trees that still stand and separate the property from Whitsett Avenue. Originally, the oval-shaped fi fth green was located at the southeastern corner of the property. Following the addition of tennis courts and division of the driving range in the 1970s, the fifth hole now runs along the south fence of the driving range for approximately 115 yards. The sixth hole, originally positioned parallel to the river wash, now runs parallel to the fi th hole but in the opposite direction, with its green located at the edge of the property along the river. The sixth fairway measures 105 yards.

From the sixth green, a player reaches the seventh tee by walking a short northwesterly diagonal between the fourth green and the fifth tee. A tall row of mature Mexican fan palm trees separates the seventh fairway from the fourth immediately to the south. The seventh green sits atop a short hill, directly east of the third green near the property's southwest corner. The fairway extends 115 yards to the green, located on a short rise above and immediately east of the third green.

From the course's eastern end, the eighth and ninth holes direct the player back to the clubhouse and the property's northeastern corner. The eighth tee is adjacent to the third fairway, between the seventh and second greens. The fairway extends 135 yards, lined on both sides by a row of mature palms, culminating at the kidney-shaped green immediately adjacent to the driving range's northwestern corner.

The ninth tee is reached by traveling a short northeasterly diagonal between the second tee and the first green. The ninth tee has been moved slightly east from its original ocation (which is still visible), foreshortening the ninth fairway to just 90 yards. A row of mature eucalyptus trees and Mexican fan palms line the northern property line along the ninth fairway. The green is located atop a slight rise. The length of the hole parallels the property's northern property line, returning the player to the clubhouse entrance.

Driving Range
A 24-stand driving range is located between the clubhouse and the tennis area. A wood, shed-style canopy shelters the northern half of the stands. Temporary awnings provide shelter to the stands on the south end. Extending 230 yards, the driving range is located directly southwest of the golf clubhouse and is enclosed by a high fence.

Light Standards
Eight original light standards, designed in the form of a golf ball set atop a tee, line the fence along the Whitsett Avenue parking lot and provide light to the driving range. The parking lot has not changed in configuration from the original (see aerial photo, p. 21) and so presumably the light standards are in their original locations. According to the current property manager, one of the historic standards has been removed. These standards have been retrofitted with new 1000-watt stadium style lights that replaced 750-watt incandescent lights that are no longer manufactured.

Tennis House
The tennis office was constructed in 1974, when tennis courts were added to the facility. The style of the building was patterned after that of the main clubhouse. It has a front-gabled roof clad in wood shingles facing west toward the tennis courts. A separate fl at canopy of open beams for a shade structure is attached to the front façade and supported on metal posts. The exterior siding is board and batten, and the fenestration, concentrated at the west end, consists of large, square aluminum-frame sliding windows. The front door, and a side door on the north side, have a large single light over an inset panel with a cross-timber detail. The tennis office and the adjoining courts were constructed outside of the period of significance for the site, and so are not considered historic features of the site.

Tennis Courts
Sixteen concrete tennis courts are situated, in a staggered pattern, at the southeastern corner of the property. Four courts of the original twenty were demolished as part of the construction of the fire station.

Maintenance Structure
A temporary maintenance building has been constructed at the southern end of the property, behind the tennis courts. A previous maintenance structure, constructed in 1966, was demolished as part of the fi re station project. The current structure is essentially a fenced yard with a roof; chain link fence with a windscreen form the structure's "walls." This structure does not contribute the significance of the property.

Maintenance Green
A small maintenance green, used to grow and harvest patch sod, is located at the southeastern corner of the tennis area, behind the fire station.

B. Statement of Significance

Weddington Golf and Tennis is significant as an Historic Cultural Monument under the first and the third criteria for designation. Under Criterion 1, SurveyLA found it to be an "excellent example of a 1950s private recreational facility/tennis club in Studio City." The ARG report further explains:

> The Weddington Golf & Tennis Club appears to be locally significant in the area of recreation and entertainment as a community recreation center. Specifically, the 9-hole golf course and driving range were constructed in the mid-1950s and developed over the next ten years to provide the growing Studio City community with a publicly-accessible facility where children and adults alike could learn and practice the sport. he clubhouse, course, and driving range were a community draw, particularly for many patrons at all levels of the entertainment industry. The course and driving range reflects the broad popularity of golf in the 1950s and 1960s, and how such recreational facilities were valuable amenities to serve the rapidly growing suburban population base in the San Fernando Valley during its most significant period of community development.

Under Criterion 3, the ARG Report describes importance of Weddington Golf and Tennis:

> The Weddington Golf Course represents the essential characteristics of a local, community golf course in the mid-1950s. It has high associative value and it effectively communicates the features of such a facility. Its setting has high integrity, as do the component elements including the low-slung, Ranch style clubhouse (and its compatible, adjoining driving range shelter) that echo the preferred residential forms of the San Fernando Valley in that era, the golf course with its fairways lined in palm, eucalyptus, and pine trees, and associated features such as the golf ball-shaped light standards and putting green.

The following is excerpted from Weddington Golf and Tennis Club Historic Resources Assessment Report prepared by ARG:

> **Historical Background and Context**
> **San Fernando Valley**
> The history of the San Fernando Valley is largely a story of its development. What was an undeveloped and arid valley of ranchos 150 years ago has been transformed into a dense urbanized "suburb" with a population of over 1.7 million (Roderick 2001, v). Through its short history, the San Fernando Valley has been home to some of the nation's largest agricultural producers, the rise of the film industry, a central hub for the aviation and defense industry, and most importantly, a relentless real estate growth machine that subdivided the valley and sold its image of the good life to people throughout the United States and the world. Infrastructure investments have been vital to this development. The Southern Pacific Railroad made the Valley accessible, providing an essential link to a nation-wide consumer market for the Valley's agricultural products and a steady supply of new residents. The arrival of a reliable water source through the Los Angeles Aqueduct supported dramatic growth. The Pacific Electric streetcar system linked the Valley within the Los Angeles region, enabling further access to vacant land for development. Most famously, the advent of the automobile and the mass-produced housing industry spread the Valley's prototypical subdivisions across nearly all remaining open spaces…

Growth in Valley Industry

Soon after the birth of the film industry in Los Angeles, the Valley attracted film production because of its diversity of terrain and bright natural light. In 1912, Universal became the first film studio to operate out of the Valley, utilizing its ranch along the base of the Cahuenga Pass for filming (Roderick 2001, 86). The Universal ranch was simultaneously developed both as a back lot as well as a residential neighborhood for studio workers, opening under the name "Universal City" in 1915 (Roderick 2001, 86).

Like Universal City, Studio City was conceived as a combined studio, commercial development and residential subdivision. Begun in 1926 on what had been a lettuce farm located along Ventura Blvd., the 500-acre parcel eleven miles north of downtown Los Angeles included a production studio for Sennet Studios, commercial developments along Ventura Boulevard, and nearby residential subdivisions. The first subdivision of the Studio City development, Maxwell Terrace, opened at Ventura Boulevard and Laurel Canyon Boulevard. Sennet became Revolution Studios, home to some of the leading Hollywood stars of the era: Gene Autry, Roy Rogers, and John Wayne (Roderick 2001, 89; Pitt & Pitt 1997, 488).

The aviation and defense industry was also vital to the growth of the Valley, especially during the periods leading up to and following World War II. By the end of the 1950's, nine of the ten biggest Valley manufacturers served defense contracts, the largest of which was Lockheed, which had moved to Burbank from Hollywood in 1938 (Roderick 2001, 133).

Postwar Suburban Expansion

After the War, the Valley entered a new phase in its development, with its suburban neighborhoods widely promoted to returning GI's and their families. Five years after the war, the population of the valley doubled to 402,538 residents. If considered separately from the city of Los Angeles, the Valley would have been the ninth largest urban area in the United States (Roderick 2001, 122). Migration was largely driven by a booming postwar economy, led by the defense industry that provided thousands of new jobs in aviation (Hise 1997, 8).

Considerable effort was given, both through government policy and private market efforts, to meet the demand for new housing that this massive workforce required (Hise 1997, 8). The goal was to provide ownership opportunities to all employed workers who had previously been unable to afford homes, though restrictive covenants in most new suburban subdivisions limited their availability to non-whites (Hise 1997, 7). This era marked the beginning of large-scale standardized practices now typical of suburban development, where developers would both subdivide as well as build homes, rather than sell lots to small scale builders (Hise, 1997, 136). Individual developers offered entire neighborhoods of small homes with just slight variations on floor plans and exterior treatments to conserve cost (Roderick 2001, 126). Federal mortgage guarantees through the Federal Housing Administration encouraged lenders to offer loans that made homeownership attainable to young middle-class—or approaching middle-class—families by dramatically lengthening repayment periods and decreasing required down payments (Hise 1997, 40).

Communities were designed and built to be complete neighborhoods, with schools, churches, shopping centers and parks located within a close drive of residential streets. Typically, subdivisions were also located near important industrial employment centers,

such as the concentration of defense contractors in the Valley (Hise 1997, 187). Neighborhoods were promoted for their balance of work and recreation opportunities that had previously been unavailable to the average middle-class citizen. Homes, though small, were outfitted with appliances that provided the convenience of modern life at a reasonable price. Small backyards provided open space for children's play, barbeques, and other informal gatherings.

This era marked the crowning of the automobile as the primary means of transportation within the Los Angeles region. The Cahuenga Pass was upgraded to freeway status in 1947 and connected with the Ventura Freeway in 1960, completing a freeway spine through the valley. The San Diego freeway was finished in 1962, providing a link through the Sepulveda Pass to the West Side of the City of Los Angeles (Roderick 2001, 136). High capacity arterial roads lined with commercial development connected new residential subdivisions with the freeways. What had been a primary regional transportation link, the electric trolley, ceased operation in the Valley on December 29, 1952 (Roderick 2001, 123)…

Weddington Family

The history of the Weddington Golf & Tennis Club parcel is a rarity in Los Angeles, for it has been owned by the same family continuously since the 1890s. The Weddingtons were originally from Iowa, but like many Iowans and other Midwesterners, the family moved to the Los Angeles region to try their hand at farming in the balmy climate of Southern California. Wilson Weddington, formerly a sheriff in Iowa, visited the region in 1890 with his wife Mary and two sons Fred and Guy. Soon after, he purchased his ranch in the newly formed town of Toluca for $60 per acre. nitially, Weddington operated a sheep farm, but then switched to wheat and then casaba melons before stopping agricultural operations as Studio City became developed. The Weddingtons were pillars of their community, operating the Toluca post office out of their home until it moved to the family's general store in 1894 ("Weddington House/Toluca Post Office," 1894). Other family businesses included the Bonner fruit cannery, which Guy bought out in 1907 ("Bonner Fruit Drying Co. Workers, circa 1900," n.d.). The Weddingtons were also influential in major developments in the Valley: Fred Weddington helped negotiate with Henry Huntington to bring the Pacific Electric Red Car to the Valley in 1911. Wilson Weddington was president of the area chamber of commerce between 1927-1929.

McCallister Family

Golf is something of a calling in the McCallister family. The McCallisters owned and operated what was known as the Studio City Golf & Tennis Club (leasing the property from the Weddingtons) from the time that George McCallister, Sr. purchased the business from Joe Kirkwood, Jr. in 1958 until June of 2007. McCallister Sr. was an avid golfer and member of the Wilshire Country Club, and an investor in sporting goods and real estate. George McCallister Sr.'s brother invented the first golf glove, which he had initially designed for fighter pilots when he was stationed with the Air Force in Illinois. In addition to operating the course, McCallister Sr. provided a forum for people to learn the game, offering individual golf instruction, as well as group swing lessons where an instructor demonstrated from a dais. McCallister Sr. was influential in lobbying the Los Angeles city schools to incorporate his form of golf instruction into physical education programs. George McCallister Jr. started working at the course when he was twelve. His brother John later brought him on to refurbish the course. McCallister Jr. became manager in 1993, and his brother John left to become a golf course designer. The younger

McCallister brothers also were partners in a live music club called Axiom in San Clemente (George McCallister, Jr., personal communication, 29 May 2007).

Recreation

Golf

Originally a Scottish game, golf came to the United States at the end of the 19th Century. Few Americans golfed in the early 1890s, but by 1930, the popularity of the sport had grown significantly, with 2.25 million Americans playing the game (Schackelford 1999, 2). The number of courses in the United States increased from 742 in 1896 to 5,691 by 1930, producing most of the nation's great courses between 1920-1930 (Schackelford 1999, 2-3).

Southern California was home to some of the first golf courses in the state. The first, on Catalina Island, was built in 1892, followed by courses in Pasadena and Riverside in 1894, Santa Monica in 1896, and Los Angeles in 1897 (Pitt & Pitt 1997, 177). The Valley's first grass golf club, The Hollywood Country Club, opened in 1922, located south of Ventura Blvd. at Coldwater Canyon. The course was the centerpiece in an upscale residential subdivision and was primarily used as an amenity to sell the development. The club eventually went defunct, and the course became the campus for the Harvard Boys Preparatory School.

For much of these founding years, golf was largely an elitist game, played by those able to afford memberships in expensive private country clubs. The sport was also an amateur game, as professional tournaments and tours had yet to become of primary importance to national golf organizations like the USGA (Barkow 2000, 55). The economic contraction during the Depression, and the rationing required during the war years of the 1940s, further limited golf's availability to those with lesser means. Golf remained an elite pastime, popular with Hollywood celebrities who frequented country clubs such as Lakeside in Toluca Lake (Roderick 2001, 97-98). However, two important changes altered this elite face of golf: rapid suburbanization with its attendant rise in middle-class home ownership in the post war era, and the televising of golf tournaments and the prominence of media-conscious players that greatly increased the sport's profile and audience.

The suburbanization of the middle class and the boom in affordable home and automobile ownership enabled larger populations to live near golf courses, and the car provided the necessary mobility to get them there. The economic expansion and corresponding optimism of the 1950s was a contrast to the dimmer Depression and war years, and golf, as a representative of "the good life" and upward mobility, likely attracted many in the middle-class who had been unable to play the game before (Barkow 2000, 82).

Perhaps even more important than the spread of home and automobile ownership was the solidification of television as the primary source for entertainment and information for most Americans. This provided a vehicle that enabled golf, a sport poorly suited for live viewing because of its slow pace and spread of action across a large course, to reach a wide audience (Barkow 2000, 82). While tournaments such as the Masters were well-respected in golf circles, the average American was not particularly engaged, but this changed after the first broadcast of the tournament in 1956 (Barkow, 2000, 90). Major golf tournaments became televised, and with network advertisement revenue increasing, both prize money for players and fees to golf organizations and clubs soared. The television market also enabled the promotion of mass-produced golf equipment, clothing,

and accessories that further cemented the game as a middle-class pastime. The increasing presence of television in golf competition brought about a new type of golfer, best typified by Arnold Palmer: a dynamic, exciting player who, through his media savvy, became the sport's first superstar (Barkow, 2000, 128).

As the popularity of golf dramatically increased, the number of municipal courses and other courses open to the public (rather than member-only institutions) also increased to serve this growing demand.

Tennis

The popular history of tennis, like golf, is that of a sport with an elitist association that moved into the mainstream. What had been played at exclusive country clubs became available to many in municipal parks for nominal fees or for free. During the peak of the popularity of tennis in 1978, in reflection of the sport's democratization, the United States Tennis Association moved the location for the U.S. Open from the private West Side Tennis Club to a complex in the public Flushing Meadows Park in the New York City Borough of Queens ("Tennis," n.d.). Like golf, tennis has enjoyed increased popularity through the televising of major tournaments, and the cultivation of top players into high profile colorful media celebrities, such as Jimmy Connors and John McEnroe in the 1970s and 1980s.

Because the peak popularity of tennis falls under the 50-year threshold for significance, the history of tennis plays a smaller role in the historic context of the Weddington Golf and Tennis Club and therefore has been kept to a minimum in this analysis.

Property Typology of the Community Golf Course

The Weddington Golf Course is characteristic of the small courses that became popular nationwide in the 1950s. A book published by the National Golf Foundation, Inc. of Chicago is helpful in identifying the elements of such courses. Entitled Municipal Golf Course Organizing and Operating Guide, it was written for public courses. While Weddington Golf Course was and is a private facility, it shares many qualities with municipal courses in its public accessibility and community orientation.

The combination of greenery, open spaces, social outlets, and community recreation provided by golf courses were valued in the 1950s. While some courses were carved out of wooded areas and some, like Weddington Golf Course, were on "leftover" pieces of land in already-developed areas, golf courses were considered a valuable use of land that still allowed for the open spaces that were rapidly disappearing as urban and suburban landscapes developed. An 18-hole golf course needed to be three miles long and one hundred yards wide, but "this ribbon of grass can be tied in bowknots, twisted into any desired shape, (or) laid in bits" (National Golf Foundation, Inc., 1955, 6). Golf was commonly combined with other recreational facilities such as swimming pools, or in the case of Studio City (though not until twenty years later), tennis.

Photographs of local golf courses in the Guide are easily recognizable as the same genre of facility as the Weddington Golf Course. The smaller clubhouses that are pictured show that these buildings, like that at Studio City, were often patterned on the residences in their suburban settings in both their scale and their style and materials. The L-shaped lunch counter and the knotty pine interior of the pro shops pictured show how this facility met the profile of a mid-1950s community golf center.

Aside from the course itself, the pro shop and the coffee shop or grill were important elements of a golf facility in the period. For the latter, the suburban location of the courses and the nature of the land use meant that patrons would stay at the facility for hours, and would need a place to eat on site. The pro shop was also essential to enabling people to learn to play and become equipped for the game. The Municipal Golf Course guide notes:

> Practically all municipal golf operators recognize the value of a good golf professional to their overall operations. They also recognize the value of a good cup of coffee or a good plate of food. Both of these special services are, in the mind of the golfer, yardsticks by which he will measure the entire facility. They build or tear down golfer relations.

The Weddington Golf Course represents the essential characteristics of this property type from the period. It has high associative value and very effectively communicates the character and feeling of a local community golf course of the post-war era.

Clubhouse Architect William Bray, AIA

William M. Bray, AIA practiced architecture in Southern California for over sixty years, with an office located in Encino. Aspects of Bray's residential designs were periodically featured in the home décor columns in the Los Angeles Times throughout the 1950s and 1960s. Bray was responsible for two of the residential designs for the Aladowney Homes subdivision in Downey (1951) and Brighton Hills in Montebello (1961), where he employed the popular Ranch style. He also designed a retirement community in Palm Desert called "Palm City" (Los Angeles Times, 7/29/1951; 7/21/1961).

In 1994, Bray was awarded a lifetime achievement award from the San Fernando Valley chapter of the American Institute of Architects. His son and business partner, Roger W. Bray, AIA, continues the practice today as William M. Bray, AIA, Architect & Associates (WMBA).

Site History

This site formed part of the vast territory in the San Fernando Valley that Pio Pico sold to Isaac Lankershim in 1869. Because of the timing of the parcel's purchase by the Weddingtons in 1890, it may have been a portion of the lands subdivided by James Lankershim. Wilson Weddington operated a sheep farm on the site, but then switched to wheat and, later, casaba melons ("Sheep ranch, circa late 1800s," n.d.). The Toluca post office operated out of the Weddington home until it moved to the family's general store in 1894. In 1927 the river portion of the parcel was dedicated to Municipal Improvement District #61 for the development of a flood control system. The river was lined with concrete during the late 1940's.

In the 1950s, the Weddingtons agreed to enter into a 50-year lease agreement with Joe Kirkwood, Jr. to develop the site as a golf course. Kirkwood, famous for his role as the boxer Joe Palooka in eleven films and a television series, was also a professional on the PGA tour, along with his father, Joe Kirkwood, Sr., a famous trick-shot golfer (George McCallister, Jr., personal communication, 29 May 2007). Kirkwood modeled the course on par 3 holes from famous golf courses, including the 7th Hole from Pebble Beach, the 15th Hole from Cypress Point, and three holes from Augusta (Curtis, 1955). At the 9-hole course, Kirkwood also built a golf shop and clubhouse with a snack bar. Though the course would have appealed to golf history buffs, it proved too challenging for most

average players, who also knew little about the history of the game. Because Kirkwood's Golf Center was essentially a neighborhood course, the difficulty of play limited its draw, and it went bankrupt (George McCallister, Jr., personal communication, 29 May 2007).

In 1957, Kirkwood, Jr. sold an option to the course to George McCallister, Sr., a golfer and investor in sporting goods and real estate, and his partner and fellow Wilshire Country Club member, Art Andersen, founder of Western Freight and an industrial real estate investor. Along with his groundskeeper Zeke Avila, McCallister Sr. redesigned the course to make play easier—filling in the water and sand traps, and rebuilding the greens—ensuring that the course would be more accessible to players from the neighborhood. McCallister Sr. also provided a forum for people to learn the game, offering individual golf lessons, as well as group swing classes where an instructor demonstrated from a stage. Golf lessons were promoted in local newspapers, and McCallister Sr. was influential in lobbying the Los Angeles city schools to incorporate his form of golf instruction into physical education programs. The Studio City Golf Course, as it was then called, was frequented by film studio workers who lived in the area. While most private clubs were prohibitively expensive for the middle class, the Studio City course, though private, was open to the public at a reasonable price, so was positioned to take advantage of the growing popularity of golf in the 1960s following the televising of the PGA Tour and the stardom of Arnold Palmer (George McCallister, Jr., personal communication, 29 May 2007).

In 1966, McCallister Sr. replaced the maintenance building with a larger structure and built an enclosure at the driving range, creating 10 sheltered tees. Construction on the tennis courts began in 1974 spurred on by the interest in tennis of McCallister's partner, Art Andersen. Andersen had built a court at his house which proved to be a popular amongst his friends and family. Recognizing a market need, Andersen and McCallister Sr. shortened and slightly repositioned the 5th and 6th tees to accommodate the construction of five tennis courts. Later, the width of the driving range was reduced to make room for an additional fifteen courts. Four were recently dismantled to accommodate the new Los Angeles City fi re station (George McCallister, Jr., personal communication, 29 May 2007).

The Weddington Golf Course has been operated by the McCallister family since 1958, initially by George McCallister Sr., and later by his sons John and then George Jr. when McCallister Sr. passed away in 1990. Having managed another family course in Pomona, and developed a remodeling business, George McCallister, Jr. was brought on by his brother John to refurbish the course. McCallister Jr. became manager in 1993, and his brother John left to become a golf course designer. Groundskeeping has also been passed to a new generation: Zeke Avila Jr. is the chief groundskeeper for the course (George McCallister, Jr., personal communication, 29 May 2007).

Most of the trees on site were planted during or following the development of the golf course, but a row of Eucalyptus trees along Valley Spring Lane predates the course. In the 1960's, the McCallisters entered the tree nursery business, planting small palm trees in pots with an eye towards future revenue streams. Eventually, rather than being sold, the palm trees were planted on the grounds of the course. Including the palms, there are over 400 trees of at least 30 years of age per a tree inventory conducted on the site.

Zone Variance Asked for Golf Recreation Center

An application has been filed with Huber E. Smutz, City Zoning Administrator, by Joe Kirkwood Jr. for a zone variance to permit use of property at 4141 Whitsett Ave., Studio City, as a privately operated recreation center consisting of a golf driving range and a nine-hole pitch-and-putt golf course.

A hearing will be conducted April 14.

GOLFAGRAPHS... By CHARLES CURTIS

The touring troupe of golf professionals gets a reputation, which tends to smear the whole lot, of being cantankerous, temperamental and just generally unpleasant. This comes from reporting of the incidents which happen along the way to a very few of the boys.

But after a good many years of viewing the pros in action for at least a few tournaments a year, we're happy to report that for every difficult character in the cast there are a dozen or more nice guys.

And we'd like to report on an incident involving one such nice guy.

We heard about it only recently from Jack Lovitt of Portland, although it happened in his home city last June.

No Professional Caddies

Portland doesn't have professional caddies, as we do in California and so the youngsters around town and the sons of club members are employed in tournaments. It was in the first round, at Portland Golf Club, of the Western Open and this player, at the 7th hole, hit an approach almost against the pin. The ball rested only inches from the cup and as the player walked up to tap it in, another player in the threesome called out, "Lift it," meaning the pin. But the youngster, a little confused, picked up the ball!

Result: a 2-strike penalty for the player. And three days later those 2 strokes stood between the player and a possible second-place tie in the tournament.

Fearful of End

We were a little fearful of how the story was going to end, of what the player said to the caddy, etc.

About all he said, at the time, and later, was "That's too bad." Didn't throw a club, didn't fire the caddy or anything.

Of course, about a month later he won a $50,000 first prize and got a contract for another $50,000 worth of exhibitions by taking the big Tam O'Shanter show in Chicago. So the loss of the prize money at Portland didn't mean too much to Julius Boros. But the incident proved again he's one of the real champions of golf.

Putter Patter

Scorecard jottings: Bill MacDonald, cosponsor with the Junior Chamber of Commerce of the L.A. Open, says he'll give up any connection with the local golf scene after his current contract expires. It has another year to go . . .

Qualifying for Southland pros will be Jan. 14 at Tijuana instead of the 13th. That's for the $12,500 Caliente Open, Jan. 19-22, sponsored by Carta Blanca beer and its owner, Faustino Gutierrez . . . Pro Red Bost of Tijuana CC says the course is in fine shape. It was closed in 1936, when gambling in Mexico was outlawed and the Caliente casino closed, but the course reopened in 1950 . . . Fred Morrison's 284 was the lowest 72-hole score shot there in the old days . . .

This week the troupe heads north to Pebble Beach and Bing Crosby's annual clambake. Cypress Point, Monterey Peninsula and Pebble Beach courses will be used, per the usual schedule, but without a Calcutta auction this year . . . Shirley Spork is now on the instruction staff at Tamarisk CC in Palm Springs.

Ashley Loulea is head pro at Joe Kirkwood Jr.'s Golf Center in North Hollywood. The driving range was opened in Hollywood first-nighter style last week and the nine-hole short course will be ready in a few months. Stan Watters and Bernie Guentner will be assistant pros . . . The Golf Center is at Whitsett Ave. and Ventura Blvd. . . . Rain over the condition of Rancho for the L.A. Open can be directed at Bill Johnson, the L.A. city head of golf course maintenance and construction, and Jerry Murphy, the Rancho course foreman. Their crews have been busy patching fairways for months.

WHAT'S COOKIN' WITH KOKON

By PETE KOKON

Sports flashes. . . . The grand opening of the pitch and putt course at **JOE KIRKWOOD'S GOLF CENTER** on Whitsett avenue near Ventura boulevard will take place Sunday, May 13. . . . And none other than my favorite man-about-the-fairways, **MAURIE LUXFORD**, will act as master of ceremonies for the event. . . . And it's going to be an event, top. . . . There will be many celebrities on deck that Sunday afternoon, including the glamorous **JANE RUSSELL** (Mrs. Bob Waterfield). . . . You see, there'll be 20 beautiful scorers to accompany the star-studded foursomes and Luxford says all proceeds will go toward the **WAIF's (WOMEN'S ADOPTION INTERNATIONAL FUND)** in which Mrs. Waterfield is very active. . . . In fact the group just had an election of officers this week and at the meeting the most important business on the agenda (other than voting for officers) was making plans for this gigantic **ALL-STAR GOLF EVENT.** . . . You not only will be seeing many top stars, as well as a unique golf layout at Kirkwood's, but your financial help will make many a youngster happy throughout the world. . . . Incidentally, at Kirkwood's new golf course every hole is patterned after a famous hole at various courses in the world. . . . Yep, he's got one patterned after a hole from **ST. ANDREWS IN SCOTLAND.** . . . Business seems to be booming at our golf driving ranges in the Valley. . . . **SCOTTY HAMILTON** is as busy as a bee at the **VICTORY BLVD. FAIRWAYS.** . . . See where **EWING RICHARDSON** is doing mighty fine at the Toluca Fairways on Barham Road near Lakeside; the tees at **ST. ANDREWS** driving range in Woodland Hills have been filled almost each evening and **DICK BOGGS** has a constant flow of golfers whacking the ball at the practice range at the **SEPULVEDA BASIN.** . . . As for **JOE KIRKWOOD'S** Golf Center, business is on the upswing too as he just ordered 30,000 more golf balls to accommodate the fairway enthusiasts. . . . Hearings oftentimes are a waste of time and money. . . . There are sensationalism and headlines, indeed, but then nothing comes of it. . . . Now, take for example this boxing hearing. . . . Charges and countercharges have been hurled and more will come. . . . **FIXES.** . . . **SETUPS.** . . . **ETC.** . . . But the one thing that gets under my skin is when a **PROMOTER** or **MATCHMAKER** dips into a fighter's purse. . . . That would be like the boss taking a bite out of your paycheck just because business was bad last week, but when business is good doesn't give you any more. . . . If this investigation can prove that promoters and matchmakers take part of fighters' purses then I feel that it is successful. . . . That's the lowest down thing a guy can do. . . . After all it's bad enough for a kid to get into the ring and get his brains knocked out but it's worse if you have some guy sitting back taking part of your purse as a "kickback" in order to continue fighting at his club or in the state. . . . That's no good. . . . I say "burn 'em." . . .

Kirkwood Course In May 13 Bow

The Joe Kirkwood Jr. Golf and Sporting Center, located in North Hollywood off Ventura boulevard on Whitsett avenue, will officially open its golf course, each hole of which is an exact duplicate of a famous hole in a golf course elsewhere in the world, on Sunday, May 13, with a charity, star-studded golf tournament sponsored by the Los Angeles Chapter of WAIF (Women's Adoption International Fund).

The Joe Kirkwood Jr. Golf Course opening is another step in the completion of the $2,200,000 sport center covering 45 acres. Future plans for 1956 for the center will be the construction of a championship swimming-pool, bowling alley, ice-skating rink, and a major restaurant.

SPORTS PARADE

By BRAVEN DYER

Before I give you the lowdown on Landy, listen to this . . .

Now that the NCAA has blackballed Texas A&M, Florida and other institutions and the Big Ten has banned Ohio State's Buckeyes for being too free with a buck, we may have to start all over again in the matter of bowl games.

We have the Rose Bowl and the Pro Bowl and for the benefit of these and other squads which may be in ill repute I suggest the Semipro Bowl.

And with both Ohio State and Michigan State ineligible for the Pasadena engagement next January you Michiganders might just as well make your reservations now.

LANDY'S FEAT FANTASTIC

It was a fantastic thing that Australia's great miler could travel 8000 miles and with less than five days of training here still run the mile under 4 minutes flat. That he was beaten by less than a stride is beside the point . . . Oregon's amazing Jim Bailey had to do some traveling himself, but not 8000 miles.

I've made that airplane trip. It is close to 35 hours in the air and if you don't think that ties you up some, I suggest you try it.

Barring some setback between now and next Friday night, I think Landy will run faster at Fresno than he did here Saturday. Bill Nicholas won't kiss me for this, but I suspect that the Fresno strip is a wee bit faster than our Coliseum track. And that balmy Fresno breeze always has loosened the runners up about as effectively as anything I know.

M'GINNITY HURLED FOR BUMS, TOO

In writing about Don Drysdale, the San Fernando Valley kid now pitching with Brooklyn, I casually mentioned that Iron Man Joe McGinnity had hurled for the Bums in the good old days.

This caused several of my devout readers to remark that I was slipping. Among them was Leo McQuary, an old ballplayer himself.

"You ought to know," snorted Leo over the phone, "that Iron Man McGinnity was a hero with the New York Giants. Everybody knows that. How can you be so stupid?"

Well, as Mortimer Snerd points out, it isn't easy, but in this particular case I was right.

McGinnity had a 27-8 record with Brooklyn in 1900. It is true that most of his major-league career was in Giant livery, 1902-08. But he also pitched for Baltimore, when the Orioles were big-league stuff.

Iron Man Joe was a fabulous figure. In 1904 he won 35 and lost but 8. Through eight seasons he never fell below 21 wins. Twice he won more than 30. His average wins per season for eight years was 27!

McQuary, of all people, should have remembered about the Iron Man . . . because McQuary and I were youngsters together in Tacoma when McGinnity managed the Tigers there.

BOTH KIRKWOODS IN ACTION SUNDAY

The name Joe Kirkwood is famed in golf and the entertainment world. Joe Kirkwood Sr. was one of our better pros 25 years ago and now does his trick shot routine at various sports shows. Joe Jr. gained his greatest fame in the movies by portraying Joe Palooka.

Both will be seen in action next Sunday when the nine-hole Joe Kirkwood Jr. Golf Center is to be officially opened at Ventura Blvd. and Whitsett, about four miles west of the Lakeside Golf Club.

Maurie Luxford, golf's man in motion, is in charge of the program which will feature 40 top celebrities from stage, screen and radio. All proceeds go to the Waifs, those wonderful women who spend so much time and money finding homes for children who were orphaned in the war. It should be a large afternoon with fun for all. Luxford never presents anything but a top show.

GOLFAGRAPHS

Joe Kirkwood Course Will Be Opened Today

BY CHARLES CURTIS

Joe Kirkwood's nine-hole course on Whitsett Ave. in North Hollywood (near Ventura Blvd. and Coldwater Canyon) will be opened this afternoon with a celebrity tournament for the benefit of the Women's Adoption International Fund.

Maurie Luxford has lined up a top field of Hollywood personalities who will play on the short course, beginning at 1 p.m. Admission will be one dollar, with all gross proceeds going to the WAIFs, who use receipts for their activities to find homes for orphaned children whose parents were lost in wartime.

The course is part of a $2,200,000 sports center covering 45 acres. The driving range was opened earlier.

Names in Action

Top names in action will include Mickey Rooney, Phil Harris, Bob Hope, Gordon MacRae, Adolph Menjou, Dennis Morgan, Dennis O'Keefe, Gen. Omar Bradley, Jimmy McLarnin and Hoagy Carmichael.

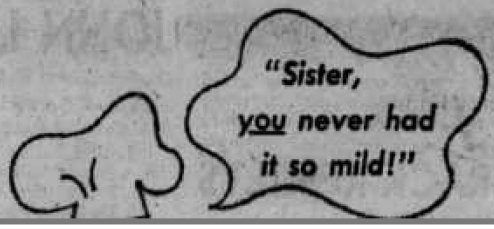
Southern California qualifying for the National Public Links Championship will be June 17 at Brookside. The entry deadline is June 1 . . . Tommy Jacobs, the Montebello whiz, is representing Clock CC this year and hence ineligible for public links play. He will play in some of the major championships such as the Trans-Mississippi

Regional qualifying for the National Open takes on new significance this year because of the caliber of the players who must go through the tests . . . Lloyd Mangrum, for instance, the Open champ in 1946, is not on the exempt list (limited to the last five champs, the 10 low scorers last year and a few others) . . . Gene Littler and Jerry Barber likewise will have to qualify . . . Thus the local test, at Hillcrest June 4, could be quite a tussle if all seek to qualify here . . .

Bill Shirley of The Times sports department is thinking of limiting his golf to the 7th and 8th holes of Montebello. When he holed out a wedge shot for an eagle deuce on the 7th the other day it was the second time in six months he accomplished that feat. He has also eagled the 5-par 8th twice recently . . . Loyola University's annual "200 Club" tournament will be held on the school's course Saturday . . .

Putter Patter

Donald Higuchi aced the 208-yard 8th at GI's Roosevelt course. Richard Davis bagged an ace on the Rancho short course . . . Two eagles were reported on tough 4-pars at municipal courses. Bill Selleck used a brassie for his second shot on the 446-yard 2nd at Rancho and Robert Simpson hit a 4-wood second shot on the 445-yard 16th at Wilson. And in the cup they went! . . .



Pomona Country Club holds the second annual Los Angeles County Men's Amateur Championship May 26-27, a 36-hole medal play event with handicap flight prizes . . . This is the week of the annual Cravens Cup Tournament at San Gabriel, one of the historic and excellent club invitationals. Qualifying concludes Thursday, with a buffet dinner that night in place of the previous Calcutta auction. The tournament proper, match play in Scotch foursomes, is Friday, Saturday and Sunday . . .

Harvard Spikers Win

WEST POINT, N.Y., May 12 (AP)—Harvard, a weak sister since 1947, flexed its muscles today and won the heptagonal track and field championship in an upset with 52 1-10 points.

WANTED
SALES MANAGER
Experienced able Easterling or Westerner, land starting District or Crew Manager wanted to organize, manage and direct selling organization in the San Gabriel Valley area.
An extraordinary opportunity for the qualified individual to represent prestige merchandise of finest quality advertised and sold through retail stores for more than half a century.
SMILE PERSONNEL AGENCY
465 E. UNION, PASADENA

WANTED
PHARMACIST
If you are a California Registered Pharmacist interested in a good job working in a Professional Pharmacy in the east San Gabriel Valley and like good hours with good pay: WRITE BOX Z-31-DA, TIMES, giving full details. Replies confidential.

VALLEY PROS FROLIC AT JOE KIRKWOOD'S CLAMBAKE

Professional Bobby Ross of El Caballero Country Club, left, watches Wee Willie Barber of neighboring San Fernando Valley Country Club recover from trouble in yesterday's first annual pro-amateur golf tournament at Joe Kirkwood's Golf Center. At right, Big Jim Ferrier of Lakeside Golf Club sends tee shot onto first green while, in background, Lew Ayers, cinema star, left, and Rial Smith, co-owner of the golf "plant," looks on. Eric Monti and Zell Eaton tied for low gross honors among the pros with a pair of sparkling 52s. Barber carved a 54 while Ferrier posted an even par 58. — Valley Times photos.

Lease for Land

Studio City Golf Course Inc. will pay the county $170 a month through Jan. 31, 1978, for the use of about 2½ acres of flood control land under a lease approved by county supervisors. The land is on the north side of the Los Angeles River extending from the west side of Whitsett Ave. to the east side of Bellaire Ave.

Pursuing Los Angeles, circa 1932

HBO's 'Perry Mason' uses real locations, not visual effects, to re-create the era

By Matt Brennan

Perry Mason is in a phone booth getting the crap kicked out of him by a Fatty Arbuckle type and suddenly it's 1932 in Bunker Hill, Los Angeles — or may as well be.

In point of fact it's a bright November morning in historic downtown San Pedro, and the sight of modern shipping cranes rising through the haze at the Port of Los Angeles on the drive in is enough to dispel any dreams of time travel. Still, on the set of HBO's "Perry Mason," an origin story for the fictional defense attorney starring Matthew Rhys, the city's Depression-era past is distinctly within reach.

"It is night and day," Rhys, sporting Mason's five o'clock shadow, tan leather jacket and fat red tie, says of the period detail, comparing it to the tedium of matching eyelines for green screens. "It adds to your experience of it in an unconscious way ... You can't help but believe the world you're living in."

Rhys, who considers himself something of an L.A. history buff after doing "vast amounts of research" for a project about Griffith J. Griffith, the man behind Griffith Park, knows it's a "mighty pain" to get the details right and is accordingly effusive about the results: He praises costar Juliet Rylance's ability to gun a 1930s car engine and calls the work of stunt pilots in "old biplanes" "inch perfect." (The sound of this phrase in Rhys' always disarming brogue is enough to make you wish Mason were Welsh.)

"We were not going for the highly stylized, cliched version of the '30s," explains executive producer Susan Downey, half of the Team Downey shingle she formed with husband Robert Downey Jr. in 2010. "We wanted to dirty it up."

Combined with director and "Boardwalk Empire" vet Tim Van Patten's desire to find the look of the series through real-life locations rather than visual effects, that meant canvassing Southern California to "find the right nooks and crannies," says Downey — Camarillo, Santa Paula, Fillmore and Pomona, to name a few, in addition to the four iconic L.A. locations (or cunning stand-ins) detailed below.

USC professor and historical consultant William Deverell, location manager Jonathan Jansen, production designer John Goldsmith were among those who helped "Perry Mason" capture the L.A. of yore, say series co-creators Rolin Jones and Ron Fitzgerald. As Jones jokes, "They went only where people who had been stripping copper had gone."

Ptomaine Tommy's

There's no fighting the march of time, but this stretch of 6th Street in San Pedro comes close.

Once the production subtracted bike and fire lanes, parking signs and painted red curbs, its collection of '20s and '30s facades required remarkably little dressing to make way for Perry's beat-down by a Hollywood star or a bite with unsavory partner Pete Strickland (Shea Whigham) at Ptomaine Tommy's. That real-life Lincoln Heights establishment, where the chili burger was reputedly invented in the 1920s, dovetailed with Jones' Woodland Hills upbringing to inspire the flavor of the series' DTLA substitute.

"I grew up on Tommy burgers," Jones says of the unaffiliated Southern California chain that supplanted Ptomaine Tommy's — in the eyes of Jonathan Gold, no less — after it closed in 1958. "If we're talking about a series that's really about the birth of Los Angeles as an international city or national city, and not, like, Phoenix or something, it was just kind of fun to [ask], 'What's a fast food joint that's still around?'"

ANGELS FLIGHT, the Bunker Hill funicular, is the scene of the animating event of "Perry Mason": the discovery of a dead infant.

THE ART of Living Center in West Adams, formerly the Second Church of Christ, serves as the series' Radiant Assembly of God.

THIS 19TH CENTURY farmhouse in Thousand Oaks serves as Mason's Glendale home. The owner let the crew add a runway.

Photographs by Mirrick Morton for the Times

PTOMAINE TOMMY'S in Lincoln Heights is no more, but the above stand-in space was found on 6th Street in San Pedro.

'Perry Mason'

Where: HBO
When: 9 p.m. Sunday
Rated: TV-MA (may be unsuitable for children under age 17)

... It captured a lot of the humor and the wildness of Los Angeles."

"We found a diamond," as executive producer Amanda Burrell describes the location. "It felt like it was undiscovered." Of course, there were other, more labor-intensive modifications required to capture L.A.'s then-bustling urban core. Producers built a Hooverville, or Depression-era homeless encampment, on an empty lot. They shot, treated and projected the faux period movie "Seize the Hay" for an early scene. And, Fitzgerald recalls, they accommodated the owners of the "cranky" 1920s cars used in production by allowing them to set up folding chairs and observe.

If there's a focal point of downtown San Pedro, it's the building most pristinely maintained in its Depression-era form: the Warner Grand movie palace, opened in 1931. "You can feel the ghosts in that place," Fitzgerald says. "I went up on the stage, hung out in the rigging, went down to the dressing rooms. I even went into the boiler room to see what was lying around."

Step outside the frame, though, and modernity comes rushing in: Inside, on the day of my set visit, the faces of extras in period garb are illuminated — not by the silver screen but by the blue light of their smartphones.

Perry Mason's farm

In the HBO series, Perry's Glendale home is a "two-cow dairy in an airport" inherited from his father. An emblem of an agrarian region's rapid transformation into a "metropolitan juggernaut," says historical consultant Deverell. By the time the series opens in 1932, he notes, the seeds of post-World War II (sub) urbanization that now define the Los Angeles landscape have already been planted by the emergence of the automobile and the establishment of the trolley system.

For Jones, this backdrop provides one of the series' key themes — a sense of dislocation. "When [Perry] was out there playing as a boy, there's 45,000 people there, and by the time ["Perry Mason"] begins there's 1.3 million," he says. And Perry's not alone: Both Rylance's Della Street, as an unapologetically modern woman working in a law firm, and Chris Chalk's Paul Drake, a Black police officer in the corrupt, racist LAPD, navigate restrictive social mores even as they pursue careers that would have traditionally been off limits to them.

As for finding the location for this dislocation? "Go north and go west," Jones says.

Knowing that "the 1930s had been razed and demolished across the city," he continues, the "Perry Mason" team found a 19th century farmhouse in Thousand Oaks and persuaded the owner to let them put in a runway. It makes literal, as Rhys puts it, "the encroachment of the new L.A. on the old" — a phenomenon familiar to Angelenos of any generation.

The Radiant Assembly of God

In its second episode, airing Sunday night, "Perry Mason" introduces one of the season's most compelling characters: Sister Alice McKeegan (Tatiana Maslany), a charismatic evangelical whose distinctive brand of preaching draws hundreds of congregants, and countless radio listeners, to her Radiant Assembly of God. "It's a heathen's morning in Los Angeles," she says, dressed head to toe in white.

Sister Alice is a thinly disguised avatar for Aimee Semple McPherson, the real-life religious leader whose International Church of the Foursquare Gospel, founded in 1923 and still headquartered in Echo Park, emerged as one of the city's most prominent institutions of the '20s and '30s. As Deverell explains, McPherson, a master of technology and popular media, combined theatrical ministrations, charitable support and a sense of community to appeal to the lonely, destitute or otherwise displaced, particularly those recently transplanted to the city from farms and villages.

"People like Sister Aimee are preaching a line of gospel that, 'We can steady your imbalance,'" he says. "'The world is unsteady; here's the rock.'" Though that theme resonates through "Perry Mason" as well, it was McPherson's use of techniques popularized by radio, vaudeville and the movies that made the fictional Radiant Assembly an attractive backdrop for so much of the series' action, Jones says.

"It was like, 'What have noirs done before?' And I don't think we had seen the sort of revival spirit you read so much about," he says. "It felt like that was a little untapped. And the theatrics that were involved in the productions of the temple, we thought, was an interesting substitute for Hollywood."

Unable to use the McPherson's Angelus Temple — "they've done so much renovation you couldn't fake it to look period anymore," Fitzgerald says — the production turned instead to the former Second Church of Christ, Scientist in West Adams, constructed in 1910. (The building is now owned by the international humanitarian and educational nonprofit Art of Living Foundation.) Its white Classical Revival columns function as the exterior of the Radiant Assembly, and also provided some of the locations for church offices depicted in the series, though Sister Alice's sermons were filmed elsewhere.

Angels Flight

The animating event of "Perry Mason" is the discovery of a dead infant on Angels Flight, the Bunker Hill funicular first opened on Dec. 31, 1901 — and, coincidentally, featured in a 1986 episode of the Raymond Burr original.

Since then, the railway has had a checkered history: After the neighborhood was redeveloped out of existence as part of the city's Bunker Hill Urban Renewal Project, Angels Flight closed in 1969. It reopened in 1996 just south of its initial location, only to be closed for nine years after a fatal accident in 2001; it closed again, this time for four years, after a 2013 derailment that resulted in no injuries.

Though now viewed by many primarily as a tourist attraction, Deverell says it places "Perry Mason" within a history that's been largely decoupled from modern L.A.

"Railroads are woven deep into L.A.'s velocity of takeoff, and Angels Flight is an eccentric little node of that," he says. "Pick up most of our freeways and look underneath them and a great many of them are trolley lines."

It's a different kind of efficiency that attracted Jones and Fitzgerald: narrative.

"There would be multiple points of view. There would be things to investigate there. There would be a lot of distractions," Jones says of the decision to make Angels Flight the scene of the crime. "For a set piece that you were trying to do, it gave you a lot of runway to play with."

"How in the very opening moments can you set time and place as efficiently as possible, and also intrigue?" Fitzgerald says. "Because you're like, what the hell is this thing? Did that really exist? Angelenos will know what it is, but someone in Philadelphia might have to look it up."

Programmatic architecture – The Weddington Golf Ball Standards

LOS ANGELES CONSERVANCY

Preserving the historic places that make L.A. County unique

" …programmatic architecture, in which the building is fashioned in the shape of a business's product or identity. Coinciding with the rise of automobile use, programmatic architecture or mimetic architecture was popularized during the 1920s along roadsides throughout the United States. During this period, the Los Angeles area was home to one of the highest concentrations of this architecture style.

Some of the Los Angeles's most notable programmatic buildings included Van De Kamp's Dutch Bakeries, the Big Cone ice cream stands, and the Chili Bowl restaurants because so few examples remain today,

Programmatic architecture is considered a rare resource type. The Chili Bowl in West Los Angeles is one of the oldest surviving examples of the style in L.A."* (Los Angeles Conservancy website)

Name: Weddington Golf and Tennis

Description:

Private recreational facility consisting of a golf course, driving range, tennis courts, tennis clubhouse, and golf clubhouse. Site includes brick wall, mature trees and other landscaping, and light standards designed to look like golf balls.

Significance:

Excellent and rare example of a 1950s recreational facility (golf and tennis club) in Studio City. Built on the former sheep ranch

I. Introduction

At the request of Planning Associates, Inc., Architectural Resources Group (ARG) has completed a historic resources assessment of the Weddington Golf and Tennis Club located at 4141 Whitsett Avenue in Studio City, California. ARG's assessment of the potential historic resources on the site serves as the basis for review of the project based on the requirements of the California Environmental Quality Act (CEQA) to identify the impacts of the proposed project on potential historic and cultural resources. CEQA Section 21084.1 states "a project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment."

CEQA defines substantial adverse change in the significance of a resource as the physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of the resource is materially impaired (CEQA Guidelines 15064.5). Under CEQA, the significance of an historical resource is considered to be materially impaired when a project demolishes or materially alters in an adverse manner those characteristics that convey its historical significance and account for its inclusion on an historical resource list. ARG staff's understanding of the proposed project is based on plans, a project description, and proposed site plan prepared by Franco & Associates, Inc. and dated January 23, 2008 and updated December 23, 2011 provided to ARG by Planning Associates, Inc. The site plan overlay illustrating the effect on the existing golf and tennis facilities is attached at the end of this report.

On May 29, 2007, ARG representatives visited the project site to document existing conditions. Research was conducted at the Los Angeles Public Library and at the Los Angeles Building Department. In addition, an informal interview was conducted with George McCallister, Jr. on May 29, 2007 to gather oral history.

ARG first evaluated the significance of the property in 2007 and has evaluated several iterations of the proposed project as it has developed since that time. As a result of our evaluation, we found that the property appears eligible for the California Register of Historical Resources, with the exclusion of the tennis facilities, and therefore was significant for purposes of CEQA. The project that ARG has reviewed for this final report appears to meet the Secretary of the Interior's Standards and will not have a significant impact on the historic resource of the golf club.

NOTE: The Weddington Golf and Tennis Club was historically called the Studio City Golf and Tennis Club. For the purposes of this report, it is referred to by its current name, except when appropriate for historical context.

II. Existing Conditions

The project site is located within the boundaries of Studio City, which is a part of the City of Los Angeles located in the San Fernando Valley. Residential neighborhoods occupy most of the surrounding land to the north, east and west. The Los Angeles River channel and Ventura

Boulevard, a major commercial thoroughfare, are directly south of the property.

Site

The Weddington Golf and Tennis Club is located at 4141 Whitsett Avenue, at the southwest corner of Whitsett and Valley Spring Lane. The triangular site is 16.1 acres with a flood control channel forming the diagonal southwestern boundary, Valley Spring Drive the northern boundary, and Whitsett Avenue the eastern boundary. A short length of Bellaire Ave. forms the western boundary. The southernmost section of the property extends into the public right-of-way for Valleyheart Drive and the Los Angeles River. The property's public entrance is oriented to the east toward Whitsett Avenue. An asphalt drive with flanking parking serves as entrance and exit. A putting green and clubhouse at the property's northeastern corner signal the property's use. The majority of the property maintains a park-like setting as a result of the landscaping and mature trees. The southeastern corner of the parcel is dedicated for tennis use and, most recently, a portion of that area has been given over to the City of Los Angeles for use as a fire station.

Cultural Landscape Elements

According to the current property manager, virtually all design elements of the property were explicitly outlined in a conditional use permit. The recreational property is composed of multiple contributing elements. Golf-related resources include: a one-story clubhouse; a 24-stand, 230-yard driving range; a 9-hole, par 3 golf course; and a putting green. Tennis-related resources include: a small club structure and 16 concrete courts located in staggered rows at the southeast portion of the property, adjacent to the fire station site. Other elements include: a maintenance structure east of the tennis courts at the southern property line.

Clubhouse Interior: Fireplace

Clubhouse Interior: Lunch Counter

Clubhouse Interior: Pro Shop

Clubhouse

The Weddington Golf and Tennis Club features a one-story clubhouse building near the southwest corner of Whitsett Avenue and Valley Spring Lane, on the northwest corner of the subject property. The building sits at an angle facing the corner. Its front lawn is a putting green, with a low, nonoriginal brick wall with weeping mortar bordering the street that replaced an earlier split rail fence. A walkway parallel to the front of the building approaches the entrance from the parking lot to the south.

The clubhouse is wood frame construction on a concrete slab-on-grade foundation. It has a wood shingle-clad, side-gabled roof with deep eaves along the front and rear of the building to create generous overhangs. The front overhang is supported by square wood posts. The exterior cladding of the building is painted board and batten siding. The north side contains utility uses, with a shed-roofed garage (its roof parallel to the main gable) and a small shed (its roof perpendicular to the main gable, attached to the wall) and an exterior vestibule at the back of the pro shop enclosed with chain link fencing.

The recessed entrance is sheltered beneath the overhang, with the entrance and the glass wall of the front of the building recessed from the eave line. Large, low planters to the north and south of the entrance hold shrubs and small trees that pass upwards through rectangular cut-outs in the front slope of the roof. The entrance is on grade, with aluminum-frame glass doors and full-height plate glass windows to either side. It is not clear whether these expanses of glass are original or alterations. Inside the entrance, the main interior space is a reception room. The tile and carpet floor of the clubhouse is not original, nor is the wallpaper above the paneling or large mirror on the south wall, but most other features of the interior have changed very little, leaving the clubhouse with high interior integrity. Knotty pine paneling

covers the walls up to a datum line set by the east (entrance) and west (rear) walls. The major feature of the reception room is a slab fireplace wall extending from floor to ceiling and clad in variegated brick. The rectangular cutout of the fireplace box is surrounded by two wrought iron, six-arm light fixtures that carry shaded hurricane lanterns. A matching four-arm fixture hangs near the pro shop desk. The reception space is flanked by offices to the north and restrooms to the south. The rear entrance to the greens is on axis with the front door, with an enclosed coffee shop to the south and a pro shop to the north.

The coffee shop or lunch counter is enclosed with wood-framed glass panels on the north side and at the entrance, directly north of the fireplace. The space has an open painted wood beamed ceiling with diagonal tongue and groove boards. The open kitchen on the south wall has a large copper hood, and an L-shaped laminate counter with built-in stools provides seating. Windows along the west wall look out to the greens side of the building, including a window for walk-up service.

The pro shop area, adjacent to the rear entrance, is marked by a high, L-shaped counter with wood paneling on the front similar to that seen in the rest of the interior. A small decorative corbelled shelf lines the opening. The rear patio of the clubhouse is partly shaded by the deep overhang of the roof. Extending from the south end of the rear patio of the clubhouse is a long open structure that serves as a shelter for golfers using the driving range. This structure has a shed roof that slopes upwards toward the west (i.e., toward the driving range). Its roof has a slight fan shape, with the beams converging toward the concave front of the structure. Each column bay has three berths for golfers using the driving range, separated with ground-mounted metal mesh dividers.

Clubhouse Rear Exterior

Second Hole Green

Third Hole Tee

Fourth Hole-View From Tee

Sixth Hole Green

Eighth Hole Green

Golf Course

The nine-hole, par three golf course is laid out along the property lines that abut Valley Spring Lane, Bellaire Avenue on the west, and the river channel on the south. The course loops around the property, partially encircling the driving range, and winds its way back to the clubhouse. Concrete pads mark tees on each of the holes.

Upon exiting the clubhouse's eastern door, the first tee of the golf course is located a few yards due west of the clubhouse exit, immediately adjacent to (north of) the driving range fence. The fairway extends roughly 105 yards west of the concrete tee. Mature trees line both sides of the fairway, visually separating the first hole from the driving range to the south and the ninth hole to the north.

The second hole runs along the northern property line with the tee located on a northeasterly diagonal from the first green. The second fairway extends 130 yards to the second green, which is located on a small rise close to the northwestern corner of the property. A row of mature eucalyptus trees buffers the second fairway from the property line to the north.

With a tee located at the northwest corner of the property, the third hole runs parallel to the western property line. The short, 75-yard fairway drops gently down to the green at the southwestern corner of the property, which is partially surrounded by a low decorative split rail fence. A row of mature Canary Island and Aleppo pine trees, with a few interspersed olive trees, lines the western edge of the third fairway, along Bellaire Avenue.

The fourth hole tees off just east of the third green and runs parallel to the river channel's path, roughly 105 yards. The fourth green is located at the approximate midpoint of the property's southern boundary along the edge of the river channel.

The fifth and sixth holes have been reconfigured

from their original 1958 design. Originally, the fifth hole followed a dog-leg pattern with the tee located adjacent to a wider driving range. The fairway opened to a wide triangle, its base lined with mature eucalyptus trees that still stand and separate the property from Whitsett Avenue. Originally, the oval-shaped fifth green was located at the southeastern corner of the property. Following the addition of tennis courts and division of the driving range in the 1970s, the fifth hole now runs along the south fence of the driving range for approximately 115 yards. The sixth hole, originally positioned parallel to the river wash, now runs parallel to the fifth hole but in the opposite direction, with its green located at the edge of the property along the river. The sixth fairway measures 105 yards.

From the sixth green, a player reaches the seventh tee by walking a short northwesterly diagonal between the fourth green and the fifth tee. A tall row of mature Mexican fan palm trees separates the seventh fairway from the fourth immediately to the south. The seventh green sits atop a short hill, directly east of the third green near the property's southwest corner. The fairway extends 115 yards to the green, located on a short rise above and immediately east of the third green.

From the course's eastern end, the eighth and ninth holes direct the player back to the clubhouse and the property's northeastern corner. The eighth tee is adjacent to the third fairway, between the seventh and second greens. The fairway extends 135 yards, lined on both sides by a row of mature palms, culminating at the kidney-shaped green immediately adjacent to the driving range's northwestern corner.

The ninth tee is reached by traveling a short northeasterly diagonal between the second tee and the first green. The ninth tee has been moved slightly east from its original

Ninth Hole-Tee & Fairway

Driving Range Shelter

Light Standards

Tennis Clubhouse

Tennis Courts

Tennis Courts-Walkway view towards driving range

location (which is still visible), foreshortening the ninth fairway to just 90 yards. A row of mature eucalyptus trees and Mexican fan palms line the northern property line along the ninth fairway. The green is located atop a slight rise. The length of the hole parallels the property's northern property line, returning the player to the clubhouse entrance.

Driving Range

A 24-stand driving range is located between the clubhouse and the tennis area. A wood, shed-style canopy shelters the northern half of the stands. Temporary awnings provide shelter to the stands on the south end. Extending 230 yards, the driving range is located directly southwest of the golf clubhouse and is enclosed by a high fence.

Light Standards

Eight original light standards, designed in the form of a golf ball set atop a tee, line the fence along the Whitsett Avenue parking lot and provide light to the driving range. The parking lot has not changed in configuration from the original (see aerial photo, p. 21) and so presumably the light standards are in their original locations. According to the current property manager, one of the historic standards has been removed. These standards have been retrofitted with new 1000-watt stadium style lights that replaced 750-watt incandescent lights that are no longer manufactured.

Tennis House

The tennis office was constructed in 1974, when tennis courts were added to the facility. The style of the building was patterned after that of the main clubhouse. It has a front-gabled roof clad in wood shingles facing west toward the tennis courts. A separate flat canopy of open beams for a shade structure is attached to the front façade and supported on metal posts. The exterior siding is board and batten, and the fenestration, concentrated at the west end, consists of large,

square aluminum-frame sliding windows. The front door, and a side door on the north side, have a large single light over an inset panel with a cross-timber detail. The tennis office and the adjoining courts were constructed outside of the period of significance for the site, and so are not considered historic features of the site.

Tennis Courts

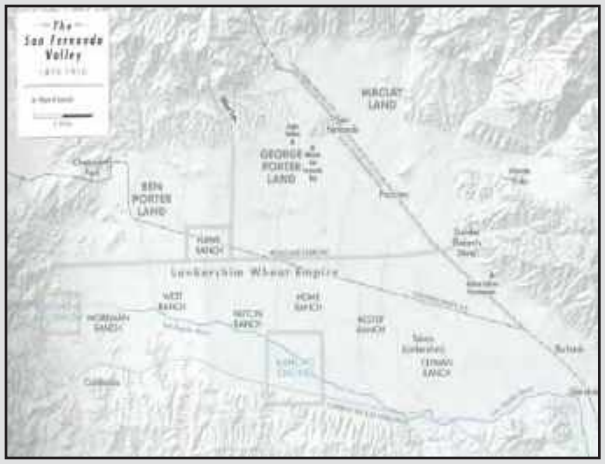
Sixteen concrete tennis courts are situated, in a staggered pattern, at the southeastern corner of the property. Four courts of the original twenty were demolished as part of the construction of the fire station.

Maintenance Structure

A temporary maintenance building has been constructed at the southern end of the property, behind the tennis courts. A previous maintenance structure, constructed in 1966, was demolished as part of the fire station project. The current structure is essentially a fenced yard with a roof; chain link fence with a windscreen form the structure's "walls." This structure does not contribute the significance of the property.

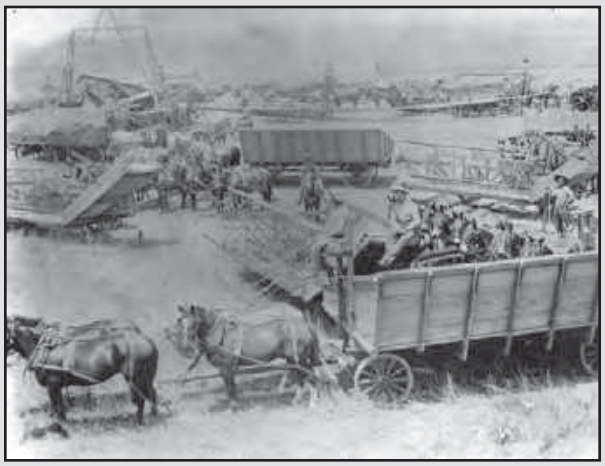
Maintenance Green

A small maintenance green, used to grow and harvest patch sod, is located at the southeastern corner of the tennis area, behind the fire station.



III. Historical Background and Context

San Fernando Valley



The history of the San Fernando Valley is largely a story of its development. What was an undeveloped and arid valley of ranchos 150 years ago has been transformed into a dense urbanized "suburb" with a population of over 1.7 million (Roderick 2001, *v*). Through its short history, the San Fernando Valley has been home to some of the nation's largest agricultural

Pio Pico (L.A. Public Library)

producers, the rise of the film industry, a central hub for the aviation and defense industry, and most importantly, a relentless real estate growth machine that subdivided the valley and sold its image of the good life to people throughout the United States and the world. Infrastructure investments have been vital to this development. The Southern Pacific Railroad made the Valley accessible, providing an essential link to a nation-wide consumer market for the Valley's agricultural products and a steady supply of new residents. The arrival of a reliable water source through the Los Angeles Aqueduct supported dramatic growth. The Pacific Electric streetcar system linked the Valley within the Los Angeles region, enabling further access to vacant land for development. Most famously, the advent of the automobile and the mass-produced housing industry spread the Valley's prototypical subdivisions across nearly all remaining open spaces.

Early Growth

The modern history of the San Fernando Valley began in 1869 when Pio Pico, the last Mexican governor of *Alta California*, sold his land to Isaac Lankershim, a farmer who had immigrated to California from Pennsylvania (Roderick 2001, 32). Pico's Valley holdings were vast, and he controlled nearly the whole southern half of the Valley. Previously, Pico had owned most of the land in the Valley, but was forced to sell half of it to raise funds for the unsuccessful war effort against the United States (Roderick 2001, 26). After the Lankershim sale, the heirs to the land that Pico sold to Eulogio de Celis, a Spanish businessman from Los Angeles, put their holdings up for sale. Railroad baron Leland Stanford, interested in expanding the market for the Southern Pacific, helped make a deal, convincing California State Senator Charles Maclay to purchase the de Celis land and build a new town. In return, Stanford would link the town to Los Angeles with the Southern Pacific Railroad (Roderick 2001, 34). Between Maclay and his two partners Ben and George Porter, the northern half of the Valley had been divided into three major parcels, and the first town, San Fernando, had been founded (Roderick 2001, 42).

The railroad arrived in San Fernando in 1874, and it proved to be an effective tool for growth, quickly sparking expansion in other areas of the Valley (Roderick 2001, 38). Maclay created a new 20,000-acre subdivision north of San Fernando, and George Porter sold off a large parcel of land south of the Mission. During the real estate boom of the 1880's, several new towns were formed in Southern California, including Pacoima and Glendale in the Valley (Roderick 2001, 43). While a real estate slowdown of the 1890's briefly stopped most growth, several valley towns, including Glendale, Burbank, and San Fernando, persisted (Roderick 2001, 44).

Initially, the Lankershim ranch remained an agricultural operation. It was first a sheep farm, but after a major drought in the 1870's killed most of the flock, Lankershim switched to wheat and became, at that time, the largest producer in the world (Roderick 2001, 44). The move towards real estate occurred in 1882 when Isaac Lankershim died, deeding half of his land to his son James Lankershim, and the other half to his son-in-law Isaac Van Nuys. While Van Nuys continued the wheat operation, James Lankershim entered the new town business, subdividing 12,000 acres of the family land east of Whittsett Avenue and founding the town of Toluca (now North Hollywood) (Roderick 2001, 45). Lankershim sold off the land in 40-acre ranches. The mild climate and fertile soils proved to be excellent conditions for growing fruit trees, a strong selling point for many local

residents as well as those from across the country (Roderick 2001, 45).

End of Large Scale Agriculture

A key moment in the Valley's transition from agricultural production to residential enclave was announced in 1909, when Van Nuys sold the remaining Lankershim lands for development to Los Angeles interests (Roderick 2001, 48). The buyers, who subsequently formed the development company The Los Angeles Suburban Homes Co., were the elite of Los Angeles: Chandler, business manager of the Los Angeles Times; Otis, owner of the Times; Sherman, a streetcar baron; Brant, an insurance magnate; and Whitley, a real estate man who managed the Hollywood subdivision (Roderick 2001, 56). The deal essentially put half of the Valley into the possession of the company, but the firm did not gain water rights with the deal because of a vested system dating to when the region was under Spanish control (Roderick 2001, 56). Without a reliable water supply, development opportunities were limited, but a solution was soon to come: On November 5, 1913, the Los Angeles Aqueduct, designed by William Mulholland, delivered Owens Valley water to the Valley for the first time (Roderick 2001, 53-54). The arrival of water secured the Valley's future as a residential suburb, allowing it to dramatically expand in population beyond what could previously have been supported.

After the completion of the aqueduct, the Los Angeles Suburban Homes Co. submitted Tract Map 1000, the largest ever filed in Los Angeles County (Roderick 2001, 57). New towns of Van Nuys, Marion (now Reseda) and Owensmouth (now Canoga Park), were established, linked by Sherman Way, a paved roadway with a streetcar line (Roderick 2001, 57-58). The first electric trolleys came December 16, 1911, connecting Van Nuys to Lankershim and Hollywood through the Cahuenga Pass, enabling commuters to travel to jobs in Downtown Los Angeles from their

residences in the Valley (Roderick 2001, 59). Though the Los Angeles Aqueduct provided a reliable water supply for Valley residents, water rights were controlled by the City of Los Angeles, which used its muscle to force most Valley communities to join the city. On March 29, 1915, with the exception of San Fernando, Burbank, Glendale, and Calabasas, most Valley communities agreed to be annexed by the city (Roderick 2001, 62).

Growth in Valley Industry

Soon after the birth of the film industry in Los Angeles, the Valley attracted film production because of its diversity of terrain and bright natural light. In 1912, Universal became the first film studio to operate out of the Valley, utilizing its ranch along the base of the Cahuenga Pass for filming (Roderick 2001, 86). The Universal ranch was simultaneously developed both as a back lot as well as a residential neighborhood for studio workers, opening under the name “Universal City” in 1915 (Roderick 2001, 86).

Like Universal City, Studio City was conceived as a combined studio, commercial development and residential subdivision. Begun in 1926 on what had been a lettuce farm located along Ventura Blvd., the 500-acre parcel eleven miles north of downtown Los Angeles included a production studio for Sennet Studios, commercial developments along Ventura Boulevard, and nearby residential subdivisions. The first subdivision of the Studio City development, Maxwell Terrace, opened at Ventura Boulevard and Laurel Canyon Boulevard. Sennet became Revolution Studios, home to some of the leading Hollywood stars of the era: Gene Autry, Roy Rogers, and John Wayne (Roderick 2001, 89; Pitt & Pitt 1997, 488).

The aviation and defense industry was also vital to the growth of the Valley, especially during the periods leading up to and following World War II.

By the end of the 1950's, nine of the ten biggest Valley manufacturers served defense contracts, the largest of which was Lockheed, which had moved to Burbank from Hollywood in 1938 (Roderick 2001, 133).

Postwar Suburban Expansion

After the War, the Valley entered a new phase in its development, with its suburban neighborhoods widely promoted to returning GI's and their families. Five years after the war, the population of the valley doubled to 402,538 residents. If considered separately from the city of Los Angeles, the Valley would have been the ninth largest urban area in the United States (Roderick 2001, 122). Migration was largely driven by a booming postwar economy, led by the defense industry that provided thousands of new jobs in aviation (Hise 1997, 8).

Considerable effort was given, both through government policy and private market efforts, to meet the demand for new housing that this massive workforce required (Hise 1997, 8). The goal was to provide ownership opportunities to all employed workers who had previously been unable to afford homes, though restrictive covenants in most new suburban subdivisions limited their availability to non-whites (Hise 1997, 7). This era marked the beginning of large-scale standardized practices now typical of suburban development, where developers would both subdivide as well as build homes, rather than sell lots to small scale builders (Hise, 1997, 136). Individual developers offered entire neighborhoods of small homes with just slight variations on floor plans and exterior treatments to conserve cost (Roderick 2001, 126). Federal mortgage guarantees through the Federal Housing Administration encouraged lenders to offer loans that made homeownership attainable to young middle-class—or approaching middle-class—families by dramatically lengthening repayment periods and decreasing required down payments (Hise 1997, 40).

Communities were designed and built to be complete neighborhoods, with schools, churches, shopping centers and parks located within a close drive of residential streets. Typically, subdivisions were also located near important industrial employment centers, such as the concentration of defense contractors in the Valley (Hise 1997, 187). Neighborhoods were promoted for their balance of work and recreation opportunities that had previously been unavailable to the average middle-class citizen. Homes, though small, were outfitted with appliances that provided the convenience of modern life at a reasonable price. Small backyards provided open space for children's play, barbeques, and other informal gatherings.

This era marked the crowning of the automobile as the primary means of transportation within the Los Angeles region. The Cahuenga Pass was upgraded to freeway status in 1947 and connected with the Ventura Freeway in 1960, completing a freeway spine through the valley. The San Diego freeway was finished in 1962, providing a link through the Sepulveda Pass to the West Side of the City of Los Angeles (Roderick 2001, 136). High capacity arterial roads lined with commercial development connected new residential subdivisions with the freeways. What had been a primary regional transportation link, the electric trolley, ceased operation in the Valley on December 29, 1952 (Roderick 2001, 123).

The more recent history of the Valley is one of continued urbanization, with extensive population

growth, an increasingly diverse population, and a move towards an urban density in many neighborhoods including Studio City, North Hollywood, and Sherman Oaks. Single-family homes are being replaced with apartments and condominiums as population pressures fuel another real estate boom that continues to shape the landscape of the Valley.

Los Angeles River

In addition to the development of the Los Angeles Aqueduct and the freeway system, the flood control infrastructure on the Los Angeles River and its tributaries stands as a third essential component that shaped the development of the San Fernando Valley. The history of the river also holds particular relevance in the historic context of the Weddington Golf & Tennis Club because the river forms the southern boundary of the site.

Until the river was placed in a concrete channel, it was especially prone to flooding during the wet winter months. Because the Los Angeles was a seasonal river situated in a dry climate, the river never cut deep channels, so when the volume of water dramatically increased after a storm, fueled by runoff from the San Gabriel Mountains, the river would flood its banks. In the last half of the 19th century, the river flooded on average every 4 to 5 years (Gumprecht 1999, 144). When the San Fernando Valley was a remote agricultural region, the damage caused by flooding was offset by the benefits of the silt deposited by the river's floods that enriched the soils. After the arrival of the railroad, and subsequent development of the Valley, population pressures and real estate demand encroached on floodplains, progressively increasing the risk and damage caused by each flood (Gumprecht 1999, 150).

A devastating flood in 1914, fed by dramatic rainfall in the mountains that overflowed riverbanks and flooded much of the Valley

and other areas in Los Angeles, became the catalyst that sparked calls for a flood control system (Gumprecht 1999, 167). Bonds were issued, and the plan called for the excavation of a channel through the San Fernando Valley (Gumprecht 1999, 181). However, most of the initial bond money was spent on a diversion for the mouth of the river away from the Port of Los Angeles, and for mountain dams. Due to pressure from San Fernando Valley interests, an additional bond was placed on the ballot, but because of controversy over the mishandling of a plan to construct the San Gabriel Dam, the public did not support the bond measure (Gumprecht 1999, 191-195).

Because the County of Los Angeles could not afford to complete the flood control system without bond funds, it turned to the federal government, which took over the project in the 1930's and managed it through the Army Corp of Engineers (Gumprecht 1999, 173). Since the river was unnavigable, the government did not automatically hold rights to the river, and so the right-of-way had to be purchased from individual owners (Gumprecht 1999, 182). The river portion of the Weddington parcel was likely purchased in 1927 and dedicated to the Municipal Improvement District #61. It was not until the 1940s that the channel was lined with concrete as it is in its current state.

Periodic real estate booms brought development to the river's edge, so the river channel was forced to be very narrow, which increased the speed of water flow and the potential for costly flooding. A 1938 flood, the largest in the San Fernando Valley, further proved that flood control was vital to the development of Los Angeles, but it also highlighted that the system performed best in places where the river flowed in a fully lined concrete channel (Gumprecht 1999, 200). Subsequently, between 1944-1958 nearly the entire length of the river, including the stretch through the San Fernando Valley

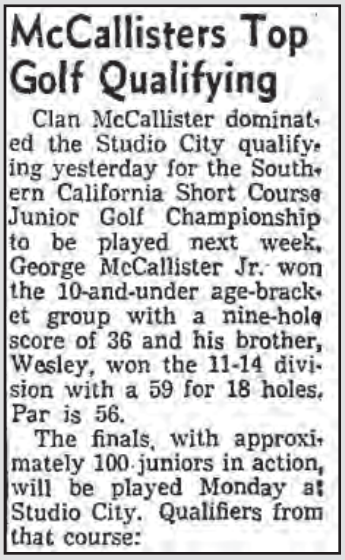
that borders the Studio City site, was encased in concrete. This completed the transformation of the river to its current state (Gumprecht 1999, 220).

Weddington Family

The history of the Weddington Golf & Tennis Club parcel is a rarity in Los Angeles, for it has been owned by the same family continuously since the 1890s. The Weddingtons were originally from Iowa, but like many Iowans and other Midwesterners, the family moved to the Los Angeles region to try their hand at farming in the balmy climate of Southern California. Wilson Weddington, formerly a sheriff in Iowa, visited the region in 1890 with his wife Mary and two sons Fred and Guy. Soon after, he purchased his ranch in the newly formed town of Toluca for $60 per acre. Initially, Weddington operated a sheep farm, but then switched to wheat and then casaba melons before stopping agricultural operations as Studio City became developed. The Weddingtons were pillars of their community, operating the Toluca post office out of their home until it moved to the family's general store in 1894 ("Weddington House/Toluca Post Office," 1894). Other family businesses included the Bonner fruit cannery, which Guy bought out in 1907 ("Bonner Fruit Drying Co. Workers, circa 1900," n.d.). The Weddingtons were also influential in major developments in the Valley: Fred Weddington helped negotiate with Henry Huntington to bring the Pacific Electric Red Car to the Valley in 1911. Wilson Weddington was president of the area chamber of commerce between 1927-1929.

McCallister Family

Golf is something of a calling in the McCallister family. The McCallisters owned and operated what was known as the Studio City Golf & Tennis Club (leasing the property from the Weddingtons) from the time that George McCallister, Sr. purchased the business from Joe Kirkwood, Jr. in 1958 until June of 2007. McCallister Sr. was an



avid golfer and member of the Wilshire Country Club, and an investor in sporting goods and real estate. George McCallister Sr.'s brother invented the first golf glove, which he had initially designed for fighter pilots when he was stationed with the Air Force in Illinois. In addition to operating the course, McCallister Sr. provided a forum for people to learn the game, offering individual golf instruction, as well as group swing lessons where an instructor demonstrated from a dais. McCallister Sr. was influential in lobbying the Los Angeles city schools to incorporate his form of golf instruction into physical education programs. George McCallister Jr. started working at the course when he was twelve. His brother John later brought him on to refurbish the course. McCallister Jr. became manager in 1993, and his brother John left to become a golf course designer. The younger McCallister brothers also were partners in a live music club called Axiom in San Clemente (George McCallister, Jr., personal communication, 29 May 2007).

Recreation

Golf

Originally a Scottish game, golf came to the United States at the end of the 19th Century. Few Americans golfed in the early 1890s, but by 1930, the popularity of the sport had grown significantly, with 2.25 million Americans playing the game (Schackelford 1999, 2). The number of courses in the United States increased from 742 in 1896 to 5,691 by 1930, producing most of the nation's great courses between 1920-1930 (Schackelford 1999, 2-3).

Southern California was home to some of the first golf courses in the state. The first, on Catalina Island, was built in 1892, followed by courses in Pasadena and Riverside in 1894, Santa Monica in 1896, and Los Angeles in 1897 (Pitt & Pitt 1997, 177). The Valley's first grass golf club, The Hollywood Country Club, opened in 1922, located south of Ventura Blvd.

McCallisters Top Golf Qualifying

Clan McCallister dominated the Studio City qualifying yesterday for the Southern California Short Course Junior Golf Championship to be played next week. George McCallister Jr. won the 10-and-under age-bracket group with a nine-hole score of 36 and his brother, Wesley, won the 11-14 division with a 59 for 18 holes. Par is 56.

The finals, with approximately 100 juniors in action, will be played Monday at Studio City. Qualifiers from that course:

L.A. Times 8/19/1958, C6

(L.A. Public Library)

at Coldwater Canyon. The course was the centerpiece in an upscale residential subdivision and was primarily used as an amenity to sell the development. The club eventually went defunct, and the course became the campus for the Harvard Boys Preparatory School.

For much of these founding years, golf was largely an elitist game, played by those able to afford memberships in expensive private country clubs. The sport was also an amateur game, as professional tournaments and tours had yet to become of primary importance to national golf organizations like the USGA (Barkow 2000, 55). The economic contraction during the Depression, and the rationing required during the war years of the 1940s, further limited golf's availability to those with lesser means. Golf remained an elite pastime, popular with Hollywood celebrities who frequented country clubs such as Lakeside in Toluca Lake (Roderick 2001, 97-98). However, two important changes altered this elite face of golf: rapid suburbanization with its attendant rise in middle-class home ownership in the post war era, and the televising of golf tournaments and the prominence of media-conscious players that greatly increased the sport's profile and audience.

The suburbanization of the middle class and the boom in affordable home and automobile ownership enabled larger populations to live near golf courses, and the car provided the necessary mobility to get them there. The economic expansion and corresponding optimism of the 1950s was a contrast to the dimmer Depression and war years, and golf, as a representative of "the good life" and upward mobility, likely attracted many in the middle-class who had been unable to play the game before (Barkow 2000, 82).

Perhaps even more important than the spread of home and automobile ownership was the solidification of television as the primary source for entertainment and information for most Americans. This provided a vehicle that enabled golf, a sport poorly suited for live viewing because of its slow pace and spread of action across a large course, to reach a wide audience (Barkow 2000, 82). While tournaments such as the Masters were well-respected in golf circles, the average American was not particularly engaged, but this changed after the first broadcast of the tournament in 1956 (Barkow, 2000, 90). Major golf tournaments became televised, and with network advertisement revenue increasing, both prize money for players and fees to golf organizations and clubs soared. The television market also enabled the promotion of mass-produced golf equipment, clothing, and accessories that further cemented the game as a middle-class pastime. The increasing presence of television in golf competition brought about a new type of golfer, best typified by Arnold Palmer: a dynamic, exciting player who, through his media savvy, became the sport's first superstar (Barkow, 2000, 128).

As the popularity of golf dramatically increased, the number of municipal courses and other courses open to the public (rather than member-only institutions) also increased to serve this growing demand.

Tennis

The popular history of tennis, like golf, is that of a sport with an elitist association that moved into the mainstream. What had been played at exclusive country clubs became available to many in municipal parks for nominal fees or for free. During the peak of the popularity of tennis in 1978, in reflection of the sport's democratization, the United States Tennis Association moved the location

for the U.S. Open from the private West Side Tennis Club to a complex in the public Flushing Meadows Park in the New York City Borough of Queens ("Tennis," n.d.). Like golf, tennis has enjoyed increased popularity through the televising of major tournaments, and the cultivation of top players into high profile colorful media celebrities, such as Jimmy Connors and John McEnroe in the 1970s and 1980s.

Because the peak popularity of tennis falls under the 50-year threshold for significance, the history of tennis plays a smaller role in the historic context of the Weddington Golf and Tennis Club and therefore has been kept to a minimum in this analysis.

Property Typology of the Community Golf Course

The Weddington Golf Course is characteristic of the small courses that became popular nationwide in the 1950s. A book published by the National Golf Foundation, Inc. of Chicago is helpful in identifying the elements of such courses. Entitled *Municipal Golf Course Organizing and Operating Guide,* it was written for public courses. While Weddington Golf Course was and is a private facility, it shares many qualities with municipal courses in its public accessibility and community orientation.

The combination of greenery, open spaces, social outlets, and community recreation provided by golf courses were valued in the 1950s. While some courses were carved out of wooded areas and some, like Weddington Golf Course, were on "leftover" pieces of land in already-developed areas, golf courses were considered a valuable use of land that still allowed for the open spaces that were rapidly disappearing as urban and suburban landscapes developed. An 18-hole golf course needed to be three miles long and one hundred yards wide,

Ticket Booth, Sandy Hollow Course
(Wickham 1955, 72)

Pro Shop, Johnson Park Course

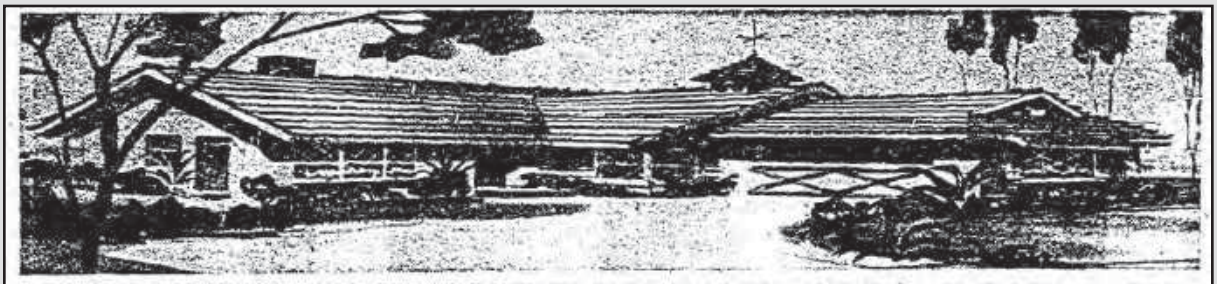
Lunch Counter, Beechwood Golf Course
(Wickham 1955, 87)



but "this ribbon of grass can be tied in bowknots, twisted into any desired shape, (or) laid in bits" (National Golf Foundation, Inc., 1955, 6). Golf was commonly combined with other recreational facilities such as swimming pools, or in the case of Studio City (though not until twenty years later), tennis.

Photographs of local golf courses in the *Guide* are easily recognizable as the same genre of facility as the Weddington Golf Course. The smaller clubhouses that are pictured show that these buildings, like that at Studio City, were often patterned on the residences in their suburban settings in both their scale and their style and materials. The L-shaped lunch counter and the knotty pine interior of the pro shops pictured show how this facility met the profile of a mid-1950s community golf center.

Aside from the course itself, the pro shop and the coffee shop or grill were important elements of a golf facility in the period. For the latter, the suburban location of the courses and the nature of the land use meant that patrons would stay at the facility for hours, and would need a place to eat on site. The pro shop was also essential to enabling people to learn to play and become equipped for the game. The *Municipal Golf Course* guide notes:

> Practically all municipal golf operators recognize the value of a good golf professional to their overall operations. They also recognize the value of a good cup of coffee or a good plate of food. Both of these special services are, in the mind of the golfer, yardsticks by which he will measure the entire facility. They build or tear down golfer relations.

The Weddington Golf Course represents the essential characteristics of this property type from the period. It has high associative value and very effectively communicates the character and feeling of

IN MONTEBELLO— One of the all-electric homes now on view at Brighton Hills in Montebello area.

MONTEBELLO HOMES AIR CONDITIONED

Refrigerated air conditioning is one of the features at Brighton Hills, a Medallion homes development in the Montebello hills, reports Jim Young, vice president of Brighton-Bilt Homes, builder-developer.

Priced from $29,950, the Brighton Hills homes are offered with veterans' 5%-down terms featuring 5¼%, 30-year loans. Also available is non - vets' 90%, 25-year financing at 6% interest.

On view are 7 model homes which incorporate 3 bedrooms and family room or 4 bedrooms and family room; 2 baths, and 2-car garages. Exterior stylings and floor plans are by Architect William Bray, AIA, while color harmonizing is by Mel Grau.

Brighton Hills includes all utilities, sewers, streetlights, sidewalks and streets, installed and paid for by Brighton-Bilt Homes. According to Dick Kurth, sales agent, volume has reached $5,730,000, with 191 purchases to date.

From Los Angeles Brighton Hills may be visited via San Bernardino Freeway to Garfield turnoff, right (south) to Pomona Blvd., left to Wilcox, right to Merle Drive, left to Gardner Drive, then left to model homes, open 9 a.m. to 9 p.m.

L.A. Times, 7/23/1961, 14

a local community golf course of the post-war era.

Clubhouse Architect William Bray, AIA

William M. Bray, AIA practiced architecture in Southern California for over sixty years, with an office located in Encino. Aspects of Bray's residential designs were periodically featured in the home décor columns in the Los Angeles Times throughout the 1950s and 1960s. Bray was responsible for two of the residential designs for the Aladowney Homes subdivision in Downey (1951) and Brighton Hills in Montebello (1961), where he employed the popular Ranch style. He also designed a retirement community in Palm Desert called "Palm City" (Los Angeles Times, 7/29/1951; 7/21/1961).

In 1994, Bray was awarded a lifetime achievement award from the San Fernando Valley chapter of the American Institute of Architects. His son and business partner, Roger W. Bray, AIA, continues the practice today as William M. Bray, AIA, Architect & Associates (WMBA).

Site History

This site formed part of the vast territory in the San Fernando Valley that Pio Pico sold to Isaac Lankershim in 1869. Because of the timing of the parcel's purchase by the Weddingtons in 1890, it may have been a portion of the lands subdivided by James Lankershim. Wilson Weddington operated a sheep farm on the site, but then switched to wheat and, later, casaba melons ("Sheep ranch, circa late 1800s," n.d.). The Toluca post office operated out of the Weddington home until it moved to the family's general store in 1894. In 1927 the river portion of the parcel was dedicated to Municipal Improvement District #61 for the

development of a flood control system. The river was lined with concrete during the late 1940's.

In the 1950s, the Weddingtons agreed to enter into a 50-year lease agreement with Joe Kirkwood, Jr. to develop the site as a golf course. Kirkwood, famous for his role as the boxer Joe Palooka in eleven films and a television series, was also a professional on the PGA tour, along with his father, Joe Kirkwood, Sr., a famous trick-shot golfer (George McCallister, Jr., personal communication, 29 May 2007). Kirkwood modeled the course on par 3 holes from famous golf courses, including the 7th Hole from Pebble Beach, the 15th Hole from Cypress Point, and three holes from Augusta (Curtis, 1955). At the 9-hole course, Kirkwood also built a golf shop and clubhouse with a snack bar. Though the course would have appealed to golf history buffs, it proved too challenging for most average players, who also knew little about the history of the game. Because Kirkwood's Golf Center was essentially a neighborhood course, the difficulty of play limited its draw, and it went bankrupt (George McCallister, Jr., personal communication, 29 May 2007).

In 1957, Kirkwood, Jr. sold an option to the course to George McCallister, Sr., a golfer and investor in sporting goods and real estate, and his partner and fellow Wilshire Country Club member, Art Andersen, founder of Western Freight and an industrial real estate investor. Along with his groundskeeper Zeke Avila, McCallister Sr. redesigned the course to make play easier—filling in the water and sand traps, and rebuilding the greens—ensuring that the course would be more accessible to players from the neighborhood. McCallister Sr. also provided a forum for people to learn the game, offering individual golf lessons, as well as group swing classes where an instructor demonstrated from a stage. Golf lessons were promoted in local newspapers, and McCallister Sr. was influential in lobbying the Los Angeles city schools to incorporate his form of golf instruction into physical education programs. The Studio City Golf Course, as it was then called, was frequented by film studio workers who lived in the area. While most private clubs were prohibitively expensive for the middle class, the Studio City course, though private, was open to the public at a reasonable price, so was positioned to take advantage of the growing popularity of golf in the 1960s following the televising of the PGA Tour and the stardom of Arnold Palmer (George McCallister, Jr., personal communication, 29 May 2007).

In 1966, McCallister Sr. replaced the maintenance building with a larger structure and built an enclosure at the driving range, creating 10 sheltered tees. Construction on the tennis courts began in 1974 spurred on by the interest in tennis of McCallister's partner, Art Andersen. Andersen had built a court at his house which proved to be a popular amongst his friends and family.

Recognizing a market need, Andersen and McCallister Sr. shortened and slightly repositioned the 5th and 6th tees to accommodate the construction of five tennis courts. Later, the width of the driving range was reduced to make room for an additional fifteen courts. Four were recently dismantled to accommodate the new Los Angeles City fire station (George McCallister, Jr., personal communication, 29 May 2007).

The Weddington Golf Course has been operated by the McCallister family since 1958, initially by George McCallister Sr., and later by his sons John and then George Jr. when McCallister Sr. passed away in 1990. Having managed another family course in Pomona, and developed a remodeling business, George McCallister, Jr. was brought on by his brother John to refurbish the course. McCallister Jr. became manager in 1993, and his brother John left to become a golf course designer. Groundskeeping has also been passed to a new generation: Zeke Avila Jr. is the chief groundskeeper for the course (George McCallister, Jr., personal communication, 29 May 2007).

Most of the trees on site were planted during or following the development of the golf course, but a row of Eucalyptus trees along Valley Spring Lane predates the course. In the 1960's, the McCallisters entered the tree nursery business, planting small palm trees in pots with an eye towards future revenue streams. Eventually, rather than being sold, the palm trees were planted on the grounds of the course. Including the palms, there are over 400 trees of at least 30 years of age per a tree inventory conducted on the site.

Site Development Chronology

April 1955	Zoning variance filed by Joe Kirkwood, Jr. to permit use of property "as a privately operated recreations center consisting of a golf driving range and a nine-hole pitch-and-putt golf course. (LA Times April 4, 1955, 36.)
Jan. 1956	Driving range opened
May 1956	Joe Kirkwood, Jr. Golf Center officially opened with a celebrity gala hosted by Maurie Luxford.
Nov. 1957	George McCallister assumes operations and management of Studio City Golf Course (LA Times 11/16/1957; A4)
May 1973	Studio City Golf Course, Inc. signs lease with County of Los Angeles for use of 2.5 acres of flood control land just north of the Los Angeles River between Whitsett & Bellaire Avenues. (LA Times, May 20, 1973, SF_B4)
1974	Original four tennis courts constructed
2007	Los Angeles County Fire Station begins construction at southeast corner of site
2008	Name changed to Weddington Golf and Tennis Club

Building Permit History

1955:	8/8	Permit issued for a "Golf Shop and Club House," 86' 6" by 58' 6". Owner: Joe Kirkwood; architect: William M. Bray, AIA; contractor: Colonial Construction Co.; cost: $25,000; exterior materials: wood & stone
	9/12	Permit issued to move storage building, 16' x 20', on lot
	11/8	Permit issued to add a partition around the clubhouse snack bar
1956:	1/5	Permit issued to build golf course & parking lot (use of land). Owner: Joe Kirkwood; architect: William M. Bray, AIA; contractor: Colonial Construction Co.
1962:	9/4	Permit issued to construct food storage room addition to clubhouse, 7'6" x 10'6". Owner: Studio City Golf Course, Inc.; contractor: owner
1966:	9/21	Permit issued to demolish existing maintenance/storage building. Owner: Studio City Golf Course, Inc.; contractor: owner
	9/27	Permit issued to construct maintenance building, 38'x52'. Owner: George McCallister; architect, Miller & Miller Associates; engineer: E.F. Escalle, contractor: Mandavich Brothers; cost: $15,800; materials: wood siding, shake roof
	9/27	Permit issued to construct tee cover roof shelter, 26' x 80'. Owner George McCallister; architect, Miller & Miller Associates; engineer: E.F. Escalle, contractor: Mandavich Brothers; cost: $8,300
1973:	8/22	Permit issued to cut/fill tennis court sites, 400 cubic yards. Owner: Studio City Golf Course; contractor: Gregory J. Merante
	11/15	Permit issued to construct Tennis shop 20'x25'. Owner: Studio City Golf Course; engineer: Elliott L. Moscovitz; cost: $7,600; materials: wood
	11/15	Permit issued to install tennis court fencing, 12" high, 1600 lf. Owner: Studio City Golf Course; contractor: Gregory J. Merante; engineer: Elliott L. Moscovitz; materials: chain link
	12/20	Permit issued to revise parking lot layout Owner: Studio City Golf Course; engineer: Elliott L. Moscovitz
1974:	12/12	Permit issued to install tennis court fencing, 12" high, 1,080 lf. Owner: Studio City Golf Course; engineer: Elliott L. Moscovitz; location: southeastern portion of site between tennis shop & clubhouse; cost: $9,000; materials: chain link
1975:	4/18	Permit issued to install tennis court fencing, 12" high, 960 lf.

		Owner: Studio City Golf Course; engineer: Elliott L. Moscovitz
1976:	10/10	Permit issued to install fencing with lights, 12" high, 800 lf. Owner: Studio City Golf Course; engineer: Herman Goodman; cost $14,000

IV. Regulations and Criteria of Evaluation

CEQA

Pursuant to Section 15064.5 of the CEQA *Guidelines*, a historical resource is presumed significant if it is listed on the California Register of Historic Resources (CRHR) or has been determined to be eligible for listing by the State Historical Resources Commission (SHRC). A historical resource may also be considered significant if the lead agency determines, based on substantial evidence, that the resource meets the criteria for inclusion in the CRHR. CEQA also contains the following additional guidelines for defining a historical resource:

- California properties formally determined eligible for, or listed in the National Register of Historic Places (NRHP) (Section 5024.1.d.1);
- Those resources included in a local register of historical resources, as defined in Section 5020.1(k) of the *Public Resources Code*, or identified as significant in a historical resources survey meeting the requirements of Section 5024.1(g) of the *Public Resources Code*;
- Those resources that a lead agency determines to be historically significant (generally, if it meets criteria for listing on the CRHC), provided the determination is supported by substantial evidence; or
- Those resources a local agency believes are historical for more broadly defined reasons than identified in the preceding criteria.

National Register of Historic Places

The National Register of Historic Places (National Register) is the nation's master inventory of known historic resources. The National Register is administered by the National Park Service (NPS) and includes listings of buildings, structures, sites, objects, and districts that possess historic, architectural, engineering, archaeological, or cultural significance at the national, state or local level. The National Register criteria and associated definitions are outlined in *National Register Bulletin Number 15: How to Apply the National Register Criteria for Evaluation.* The following is a summary of *Bulletin 15*:

Resources (structures, sites, buildings, districts, and objects) over 50 years of age can be listed on the National Register. However, properties under 50 years of age that are of exceptional importance or are contributors to a district can also be included on the National Register. The following list of definitions is relevant to any discussion of the National Register:

- A ***structure*** is a work made up of interdependent and interrelated parts in a definite pattern of organization. Generally constructed by humans, it is often an engineering object large in scale.

- A ***site*** is defined as the location of a significant event, a prehistoric or historic occupation or activity, or a building or structure, whether standing, ruined, or vanished, where the location itself maintains historical or archaeological value regardless of the value of any existing structure.

- *A* ***building*** *is* defined as a structure created to shelter human activity.

- A ***district*** is a geographically definable area—urban or rural, small or large—possessing a significant concentration, linkage, or continuity of sites, buildings, structures, and/or objects united by past events or aesthetically by plan or physical development. A district may also comprise individual elements separated geographically but linked by association or history.

- An ***object*** is a material thing of functional, aesthetic, cultural, historical, or scientific value that may be, by nature or design, moveable yet related to a specific setting or environment such as a historic vessel.

There are four criteria under which a structure, site, building, district, or object can be considered significant for listing on the National Register. These include resources that are one or more of the following:

- *Criterion A:* associated with events that have made a significant contribution to the broad patterns of history (such as a Civil War battlefield or a Naval Ship building Center);

- *Criterion B:* associated with the lives of persons significant in our past (such as Thomas Jefferson's Monticello or the Susan B. Anthony birthplace);

- *Criterion C:* embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction (such as Frank Lloyd Wright's Taliesin or the Midwestern Native American Indian Mounds) or;

- *Criterion D:* have yielded or may likely yield information important in prehistory or history (such as prehistoric ruins in Arizona or the archaeological sites of the first European settlements in St. Augustine, Florida or at the Presidio of San Francisco).

A resource can be considered significant in American history, architecture, archaeology, engineering, and culture. When nominating a resource to the National Register, one must evaluate and clearly state the significance of that resource. A resource can be individually eligible for listing on the National Register for any of the above four reasons. A resource can also be listed as contributing to a

group of resources that are listed on the National Register. In other words, the resource is part of a historic district as defined above.

Districts are comprised of resources that are identified as contributing and non-contributing. Some resources within the boundaries of the district may not meet the criteria for contributing to the historic character of the district even though the resource is located within the district boundaries.

Contributing resources add to the historic association, historic architectural qualities, or archaeological values for which the district is significant because the resource was present during the period of significance, relates to the documented significant contexts, and possesses integrity.

Non-contributing resources do not add to the historic associations, historic architectural qualities, or archaeological values for which the district is significant because the resource was not present during the period of significance, does not relate to the documented significant contexts, or does not possess integrity.

Resources that meet the above criteria and have been determined eligible for the National Register are subject to Section 106 of the National Historic Preservation Act when a federal undertaking is involved. Section 106 of the National Historic Preservation Act does not generally apply to resources where private funding is used to alter or change those resources.

California Register of Historical Resources

The California Register of Historical Resources (CRHR) is a listing of State of California resources that are significant within the context of California's history. The California Register criteria are modeled after National Register criteria. However, the California Register focuses more closely on resources that have contributed to the development of California.

All resources listed in or formally determined eligible for the National Register are eligible for the California Register. In addition, properties designated under municipal or county ordinances are also eligible for listing in the California Register. The primary difference between the National Register and the California Register is that the latter allows a lower level of integrity. The property must be significant at the local, state, or national level under one or more of the following criteria:

- *Criterion 1:* it is associated with events or patterns of events that have made a significant contribution to the broad patterns of local or regional history and cultural heritage of California or the United States.

- *Criterion 2:* it is associated with the lives of persons important to the nation or to California's past.

- *Criterion 3:* it embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master, or possesses high artistic values.

- *Criterion 4:* it has yielded, or has the potential to yield, information important to the

prehistory or history of the state or the nation.

The California Register criteria are linked to CEQA. Under CEQA, resources are considered historically significant "if the resource meets the criteria for listing on the California Register" [Title 14 California Code of Regulations 15064.5 (3)].

Resource Integrity

To be eligible for either the National or California Registers, a resource must not only be historically or architecturally significant, it must also retain integrity or the ability to convey its significance. Integrity is grounded in an understanding of a property's physical features and how they relate to its significance within one or more contexts. Integrity involves seven aspects: location, design, setting, materials, workmanship, feeling and association. These aspects closely relate to the resource's significance. For example, if the property is significant for architecture, the setting and association may not be as important as workmanship and materials. Integrity, particularly in the aspects important to the area of significance, must be primarily intact for National or California Register eligibility. Resources that have lost a great deal of their integrity are generally not eligible for the National Register. However, the California Register regulations have specific language regarding integrity, which note the following:

It is possible that historical resources may not retain sufficient integrity to meet the criteria for listing in the National Register, but they may still be eligible for listing in the California Register. A resource that has lost its historic character or appearance may still have sufficient integrity for the California Register [California Code of Regulations Title 15, 11.5 (c)].

V. Evaluation of Eligibility

For CEQA purposes, a historical resource is a resource listed in, or determined to be eligible for listing in, the California Register of Historical Resources (CRHR) or a qualified local register (for further explanation of qualifying local registers, see IV. Regulations and Criteria of Evaluation). California properties formally determined eligible for or listed on the National Register of Historic Places are automatically listed on the CRHR. Weddington Golf and Tennis Club has not been previously listed on or determined eligible for the CRHR or the NRHP, nor has it been designated as a City of Los Angeles Historic-Cultural Monument.

For the purposes of this report, the Weddington Golf and Tennis Club was evaluated against the criteria of the California Register of Historical Resources, as is required by CEQA. It was not evaluated for national (National Register) or local (Los Angeles Historic-Cultural Monument) landmark eligibility.

Significance Under the California Register

The Weddington Golf and Tennis Club appears to be eligible for the California Register of Historical Resources under the following criteria:

Criterion 1. It is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States.

The Weddington Golf & Tennis Club appears to be locally significant in the area of recreation and entertainment as a community recreation center. Specifically, the 9-hole golf course and driving range were constructed in the mid-1950s and developed over the next ten years to provide the growing Studio City community with a publicly-accessible facility where children and adults alike could learn and practice the sport. The clubhouse, course, and driving range were a community draw, particularly for many patrons at all levels of the entertainment industry. The course and driving range reflects the broad popularity of golf in the 1950s and 1960s, and how such recreational facilities were valuable amenities to serve the rapidly growing suburban population base in the San Fernando Valley during its most significant period of community development.

Criterion 3. It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master, or possesses high artistic values.

The Weddington Golf Course represents the essential characteristics of a local, community golf course in the mid-1950s. It has high associative value and it effectively communicates the features of such a facility. Its setting has high integrity, as do the component elements including the low-slung, Ranch style clubhouse (and its compatible, adjoining driving range shelter) that echo the preferred residential forms of the San Fernando Valley in that era, the golf course with its fairways lined in palm, eucalyptus, and pine trees, and associated features such as the golf ball-shaped light standards and putting green.

Integrity
The National Register Bulletin series provides guidance in regard to eligibility, integrity, period of significance and resource type. Essentially, for a property to qualify as an historic resource it must represent a significant part of the history, architecture, archeology, engineering, or culture of an area, and it must have the characteristics that make it a good representative of properties associated with that aspect of the past (National Park Service, National Register Bulletin 15, 2002).

Bulletin 15 notes that an historic property derives its importance from its association with an important historic context and its retention of historic integrity of those features necessary to convey its significance. Insensitive modifications to an historic property can have a negative impact on that building's integrity. The evaluation of integrity is sometimes a subjective judgment, but it must always be grounded in an understanding of a property's physical features and their relation to its significance.

Integrity is based on significance: why, where, and when a property is important. Only after significance is fully established can you proceed to the issue of integrity. The steps in assessing integrity are:

- Define the essential [or character-defining] physical features that must be present for a property to represent its significance

- Determine whether the essential physical features are visible enough to convey their significance
- Determine whether the property needs to be compared with similar properties
- Determine, based on the significance and essential physical features, which aspects of integrity are particularly vital to the property being nominated and if they are present

Character-Defining Features
All properties change over time. It is not necessary for a property to retain all its historic physical features or characteristics. The property must retain, however, the essential physical features that enable it to convey its historic identity. The essential physical features are those features that define both *why* a property is significant (Applicable Criteria and Areas of Significance) and *when* it was significant (Periods of Significance.)

The character-defining features of the Weddington Golf and Tennis Club include:

- 9-hole golf course, composed of fairways, greens, and tees (5th & 6th holes altered).
- Park-like setting on the property created by extensive trees and open space.
- Clubhouse: including board-and-batten siding, shake roof with rectangular cut-outs at planters, brick fireplace and chimney, knotty-pine interior paneling, and lunch counter.
- Driving range (altered) with shed-roof canopy with shake roof.
- Putting green in front of clubhouse.
- Golf ball light standards.

Evaluation
Within the concept of integrity, the National Register criteria recognize seven aspects or qualities that, in various combinations, define integrity. To retain historic integrity, a property must always possess several, and usually most, of the aspects: location, design, setting, materials, workmanship, feeling, and association. Ultimately, a property either does or does not have integrity. The following is a definition and analysis of each of the seven aspects of integrity in relation to this property.

Location: The place where the historic property was constructed or the place where the historic event occurred.

The historic property remains in its original location. The property retains this aspect of integrity.

Design: The combination of elements that create the form, plan, space, structure, and style of a property.

The Weddington Golf and Tennis Club has been partially altered in terms of design. The northern portion retains its 1958 design in terms of golf course layout, location and design of the putting green and clubhouse. Alterations completed in 1974 to accommodate tennis courts required the realignment of two holes and the reduction in size (by nearly half) of the driving range. However, the alterations reflect the evolution of the property as a community recreation center. These alterations have the potential of becoming significant and, therefore, do not substantially subtract

from the property's integrity of design.

A 1966 maintenance building was demolished, but it was located in a part of the property that was removed from the clubhouse and starting and ending points of the course and did not contribute to the historic design.

The more recent construction of the fire station at the southeast corner of the site is not associated with the property's historic significance as a community recreation center. However, its siting at the southeast corner of the property minimizes the impact of the new construction on the property's integrity of design as the golf course layout remained unaffected.

Setting: The physical environment of a historic property.

Unlike location, setting refers to the character of the place in which the property played a historic role. It involves how, not just where, the property is situated, and its relationship to surrounding features and open space. Examples of features that create setting are: topographic features, vegetation, simple manmade features, and relationships between buildings and other features or open spaces.

Weddington Golf and Tennis Club largely retains its integrity of setting. Setting is a particularly important aspect of integrity for this property, and refers both to the property's surroundings and the setting created within the property by the arrangement and integrity of its component parts, combining buildings, outdoor spaces and hardscape, and landscaped areas, all with a particular purpose that contributes to the recognition of the property type and the associated use. The clubhouse is the nexus of all of the golf-related uses on the property, including the putting green, the starting and ending points of the golf course, and the driving range. The setting of the property is defined not just by the functional interrelationships of elements, but also by the sense of open space created by the design and location of the golf course. The site is buffered from Ventura Blvd. by its location along the Los Angeles River channel, and along each of the boundaries (as well as within the site), mature trees act as windbreaks, visual buffers, and markers of open space within the neighborhood and on the property.

The southeast corner of the property has been disrupted by the construction of a new fire station; however, it is oriented away from the significant areas of the historic property's. Furthermore, the station removed maintenance structures that were secondary to the significance of the property and only partially removed the tennis elements of the property. (The tennis courts are not considered contributing features.) Therefore, the overall impact of the new construction has been limited.

Materials: The physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.

The site retains its integrity of materials. This aspect of integrity refers mainly to building materials and to whether the original materials from the period of significance continue to compose the significant structures, objects, and hardscape of the grounds. The substantially unaltered clubhouse retains the characteristic materials of the interior and exterior, such as the board and batten siding,

shingled roof, and knotty pine paneling. The concrete patios that lie between the driving range, clubhouse, and first and last holes also contribute to the setting and design of the property. The driving range shelter is also unaltered and composed of its original materials.

Workmanship: The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.

Workmanship is not a significant aspect of integrity for this property. Most of the building materials of the structures were mass produced and did not reflect either traditional building crafts or significant new materials or methods. Workmanship for this property is best exhibited in the superior maintenance of the fairways and greens. In this respect, the skilled craft of golf course maintenance reflects the property's workmanship and the Weddington Golf and Tennis Club retains its integrity of workmanship.

Feeling: A property's expression of the aesthetic or historic sense of a particular period of time.

As a result of retaining all material aspects of integrity, in whole or in part, Weddington Golf and Tennis Club retains its integrity of feeling.

Association: The direct link between an important historic event or person and a historic property.

As a result of retaining all material aspects of integrity, in whole or in part, Weddington Golf and Tennis Club retain its integrity of association.

VI. Project Description

The following summary project description is excerpted from a more extensive project description provided by Planning Associates, Inc. (The complete description and proposed site plan are attached as Appendix A.)

The proposed project involves the partial development of the Weddington Golf and Tennis Club site to make way for a senior residential condominium campus. As proposed, the existing property will be split into two parcels: Lot 1, which will retain its use as a golf course and driving range, and Lot 2, which will accommodate the senior residential condominium campus.

Lot 1, which will measure approximately 504,764 square feet, will retain the existing nine-hole golf course, club house, driving range, and 22 surface parking spaces. All existing elements (buildings, landscape, site features) of Lot 1 will remain unaltered by the proposed project.

Lot 2, which will measure approximately 196,946 square feet, will be located at the southeast corner of the current lot. The proposed project involves the removal of the existing tennis courts from the site. The parcel will be developed with a senior residential condominium campus, comprising five rectangular and one polygonal-shaped four-story buildings. Also on the site will

be approximately 109,176 square feet of landscape and hardscape, as well as subterranean parking spaces. These parking spaces will serve both the residential community and the golf club.

The proposed project leaves the existing clubhouse, putting green, and fairways intact. As shown on the attached site plan, the location of Building 4 of the proposed senior housing complex will encroach on the sixth tee, which will necessitate moving the tee a short distance to the west. The footprint of Building 2 encroaches on the south portion of the original parking lot, with its distinctive golf-ball-shaped light standards, which will necessitate the relocation of the affected light standards. To accommodate the lot subdivision and a proposed fire lane on Lot 2, the green for the fifth hole must be moved a short distance to the northeast. To accommodate the lot subdivision, the south driving range fence must be moved approximately twenty-one feet to the north, thus eliminating three driving range tees.

VII. Analysis of Project Impacts

Threshold of Significance

Section 15065 of the CEQA *Guidelines* mandates a finding of significance if a project would eliminate important examples of major periods of California history or prehistory. In addition, pursuant to Section 15064.5 of the CEQA *Guidelines*, a project could have a significant effect on the environment if it "may cause a substantial adverse change in the significance of an historical resource." A "substantial adverse change" means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource is impaired." Material impairment means altering "in an adverse manner those characteristics of an historical resource that convey its historical significance and its eligibility for inclusion in the California Register of Historical Resources."

Impacts to historical resources not determined to be significant according to any of the significance criteria described above are not considered significant for the purposes of CEQA. Generally, under CEQA, a project that follows *The Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings* or *The Secretary of Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Structures* is considered to have mitigated impacts to a historical resource to a less-than-significant level (CEQA *Guidelines* 15064.5).

Secretary of the Interior's Standard for Rehabilitation

The purpose of the *Secretary of the Interior's Standards for the Treatment of Historic Properties* (*The Standards*) is to promote responsible preservation practices that help to protect irreplaceable cultural resources. *The Standards* are meant to provide philosophical consistency in the preservation component of a development project and to guide essential decisions about the treatments to these properties. The preamble to the Standards states that they "are to be applied to specific rehabilitation projects in a reasonable manner, taking into consideration economic and technical feasibility." Under CEQA Guidelines Section 15064.5(b)(3), conformity with *The Standards* in a development project is considered to mitigate impacts to historical resources to a less-than-significant-level.

Although compliance with *The Standards* is presumed to constitute a less-than-significant impact on historical resources, compliance with *The Standards* is not the sole criteria for determining whether a project would cause a substantial adverse change in the significance of an historic resource, and a failure to comply with *The Standards* may or may not constitute a significant impact or substantial adverse change under CEQA Guidelines.

There are four overriding treatments discussed in *The Standards*: preservation, rehabilitation, restoration, and reconstruction. For this project, ARG has looked to the rehabilitation standards for guidance. The *Rehabilitation Standards* are a set of 10 guidelines intended to guide the rehabilitation process of an historical resource. Rehabilitation is defined as "the process of returning a property to a state of utility, through repair or alteration, which makes possible an efficient contemporary use while preserving those portions and features of the property which are significant to its historic, architectural, and cultural values."

The compatibility of the new design as a whole has been reviewed with respect to *The Standards.* Each of *The Standards* is listed below, followed by discussion of any potential for impacts in *italicized* text.

Standard #1: A property will be used as it was historically or be given a new use that requires minimal change to its distinctive materials, features, spaces and spatial relationships.

The proposed project meets Standard #1. The majority of the property will be used as it was historically, which is a driving range and golf course (Lot 1). The portion of the lot that will be used for the senior residential complex currently accommodates the tennis courts (Lot 2), which were constructed outside of the period of significance of the site and are therefore not considered historic features.

Standard #2: The historic character of a property will be retained and preserved. The removal of distinctive materials or alteration of features, spaces and spatial relationships that characterize the property will be avoided.

The proposed project meets Standard #2. According to the project description, all character defining features of the property will be retained. Lot 1, which is the portion of the site that includes the golf course, clubhouse, driving range, putting green, and light standards, will be unaltered.

Should any of the golf ball light standards be removed in the process of removing part of the surface parking lot located at the eastern boundary of the property, they must be retained and relocated on site.

Standard #3*:* Each property will be recognized as a physical record of its time, place and use. Changes that create a false sense of historical development, such as adding conjectural features or elements from other historic properties, will not be undertaken.

The proposed project meets Standard #3. The proposed plans do not suggest conjectural features

or elements from other historic properties.

Standard #4: Changes to a property that have acquired historic significance in their own right will be retained and preserved.

The proposed project meets Standard #4. No changes that have acquired historic significance were identified.

Standard #5: Distinctive materials, features, finishes and construction techniques or examples of craftsmanship that characterize a property will be preserved.

The proposed project meets Standard #5. Those elements that were determined to be character defining features will be retained unaltered in Lot 1.

Standard #6: Deteriorated historic features will be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature will match the old in design, color, texture, and, where possible, materials. Replacement of missing features will be substantiated by documentary and physical evidence.

The proposed project meets Standard #6. It does not include the modification or replacement of elements that were determined to be character defining features.

Standard #7: Chemical or physical treatments, if appropriate, will be undertaken using the gentlest means possible. Treatments that cause damage to historic materials will not be used.

The proposed project meets Standard #7. Current project plans do not indicate chemical or physical treatments will be used. Any treatments that could cause damage to historic materials should require review by a qualified professional in order to ensure conformance with this Standard.

Standard #8: Archeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measures will be undertaken.

The identification of archeological resources was not completed as part of this report.

Standard #9: New additions, exterior alterations, or related new construction will not destroy historic materials, features, and spatial relationships that characterize the property. The new work shall be differentiated from the old and will be compatible with the historic materials, features, size, scale and proportion, and massing to protect the integrity of the property and its environment.

The proposed project meets Standard #9. The proposed new senior housing development will occur apart from those features that have been determined to characterize the property. None of the buildings, landscape elements, or site features that were determined to be character-defining features will be destroyed by the proposed project. The lot subdivision, including the proposed siting of Building 4 and a necessary fire lane, necessitates the relocation of the sixth tee and

fifth hole, which will be moved approximately 90 feet and 25 feet, respectively, to the northwest along the property's south boundary. The fifth and sixth holes are not in their historic locations, owing to the 1970s reconfiguration of the southeastern portion of the course to make room for the construction of the tennis courts. No major landscape features (such as stands of trees) will be removed due to the development's encroachment.

Because the new project is located to the southeast of the existing golf course and driving range on what will be a different parcel, it will appear separate from the adjacent historic features. The project description does not describe how the two parcels will be differentiated from one another. ARG recommends that appropriate landscaping be used to create a "buffer" between the two parcels, such as the placement of trees or shrubs at the parcel boundary to act as a natural screen between the two properties.

The proposed project also calls for the elimination of some of the surface parking spaces at the eastern edge of the property due to the siting of Building 2. The golf ball light standards, which are located at this parking lot and were determined to be character defining features, should be retained in place. If they must be moved, they must be retained and relocated to an unaffected portion of the parcel.

Standard #10: New additions and adjacent or related new construction will be undertaken in such a manner that, if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.

The proposed project meets Standard #10. If in the future the senior residential condominium campus were to be removed, the adjacent driving range, golf course and associated buildings in Lot 1 would remain unimpaired.

VIII. Conclusion

Under CEQA, properties that meet the criteria for listing on the California Register and National Register of Historic Places are considered historic resources. The Weddington Golf and Tennis Club appears to be eligible for the California Register and is therefore a historic resource under CEQA. Weddington Golf and Tennis Club appears to be significant at the local level under California Register Criterion 1, as a privately-owned community recreation (golf) center built to serve the growing community of Studio City in the mid-1950s; and under Criterion 3, as a property that embodies the distinctive characteristics of a type as a typical example of a post-war community golf course. It was not evaluated for National Register or Los Angeles Historic-Cultural Monument eligibility.

Because the project as currently proposed meets the *Secretary of the Interior's Standards for Rehabilitation,* it will not result in a significant adverse effect under CEQA. Any future modifications to the design should be reviewed for compliance with *The Secretary of the Interior's Standards.*

DEIR REPORT REVIEW – COMMENTARY

The following reflects my professional comments and opinion with regards to the Draft Environmental Impact Report (DEIR) for the Harvard-Westlake River Park Project (Case Number ENV-2020-1512-EIR), based on the information about the project available as of March, 2022.

I hold a Master's degree in Historic Preservation-Heritage Conservation from the University of Southern California, and work as an architectural and historic preservationist. I wrote my Master's thesis on the historical and cultural aspects and value of the Weddington Golf site and its landscape. Based on this experience, and in my expert opinion, the Cultural Resources Impact Analysis in the DEIR is inadequate for the following reasons:

First, the analysis is defective because it fails to address the impacts of the project on all of the character-defining features of the site. Per my thesis research, and according to the 2012 Architectural Resources Group Historical Resources Assessment Report (ARG Report) regarding the site, Weddington Golf's historic and character-defining features include: the 9-hole golf course, the clubhouse, the putting green located in front of the clubhouse, the driving range, the golf ball light standards, and the open green space and park-like setting of the site (including the extensive canopy of mature trees). These features are not adequately nor individually addressed in the DEIR. The DEIR arbitrarily limits its own list of "character defining features" to only the clubhouse, putting green, and golf ball light standards. The DEIR's Cultural Resources analysis asserts that because the site will retain these limited features, there will not be significant cultural or historic losses. But this limited list is inaccurate, and contradicts their own statement on DEIR page IV-D-22 that the "primary physical characteristics" of the site include both the nine-hole golf course and the driving range. This more detailed list of character defining features is also supported by the ARG Report, which is referenced throughout the DEIR. Should the Project go forward as planned, these conveniently excluded historic elements will be either damaged or lost entirely – a significant impact on the site's historic characteristics.

Furthermore, the DEIR has completely failed to reference the existing lawsuit filed by Save Weddington Inc. against the City of Los Angeles (Superior Court of California, County of Los Angeles Case Number: 21STCP04158) regarding the last-minute removal of historically and culturally significant terms from final HCM determination. The essential defining terms "golf club" and "golf course" were improperly removed at the last minute during the final vote for the nomination. This was done without any evidence, as is required by law, as to why these essential historical and cultural terms were to be removed. This needs to be addressed and responded to in the DEIR, as once the case is settled it may alter the mitigation measures required to sustain the historic nature of the site. The removal of these terms is suspect, given how convenient their removal is for the developer's desired outcome for

the site. Ignoring, or outright invalidating, the historic nature of the golf course's landscape only serves to benefit the developer's interests.

Moreover, the DEIR is incorrect when it states on page IV-D-39 that "[c]umulative impacts to historic resources…were determined to be less than significant…and no mitigation measures are required." Once the lawsuit is settled, it is likely that numerous mitigation measures will be required in order to protect the golf course and driving range from significant damage to their historic character.

The historic nature of the course's design is thoroughly documented in my thesis research attached. In removing these terms from the HCM, and ignoring the significance of the golf course itself in the DEIR, the DEIR is deliberately downplaying or outright denying the historic quality of the course, relegating the defining features of the historic site as irrelevant. As such, the DEIR has failed to accurately assess the impact of the Project on the HCM, a California Register eligible resource, and the site's cultural and historic landscape. It has failed to identify significant and unmitigated impacts of the Project.

If you have any questions regarding the content of this document, please contact me using the information below.

Thank you for your time.

This thesis was inspired by my father Sheldon, who spent more than fifty years devoted to this particular golf course. As a child, the first phone number I learned besides my home number was the number of the Studio City Golf Clubhouse. I knew, that in an emergency, I could always reach my father there (the number remains the same to this day). This thesis is to honor him and his memory, and the countless magical hours we spent on the driving range and course. Those are some of my happiest childhood memories.

I would like to thank my committee chair Ken Breisch, who from my first lecture on the first day of this program, has supported my growth, offered invaluable guidance, and constant support. Your sense of humor has made me laugh, even during some of the most challenging moments of the past two years. I would also like to thank my committee members, Jay Platt and Meredith Drake Reitan. Your guidance, suggestions, and input – both in the classroom and on this thesis – have shaped my understanding of "place" and the story I am telling here.

A special thank you to Trudi Sandmeier, Director of Graduate Programs in Heritage Conservation, whose summer program was so inspiring, and whose personal encouragement was so sincere, that it led me to take a chance and return to school at the age of 53.

A huge thank you to my husband Kenny, who has endlessly supported every dream I've had since we were 16 years old. His love, help, understanding, and never-ending patience is what ultimately allowed me to complete this program and my thesis. He's thrilled this is now over. Thank you also to my incredible daughters, Alexandra and Sarah, who have been my biggest cheerleaders, and my mother Maxine, sister Kelli, and mother-in-law Janet for your wisdom and encouragement. A final thank you to my friends of many years, alongside the new and wonderful friends I've made throughout this program, who have listened endlessly, brought me coffee, and kept telling me I could do this. I love you all.

As my dad always said about golf, which holds true in life as well, "keep your head down, and keep your eye on the ball."

Abstract

Built in 1954, Weddington Golf (previously Studio City Golf, now Weddington Golf and Tennis) has played an important community role in the San Fernando Valley for more than half a century. A typical post-war neighborhood golf course, residents from Valley communities such as Sherman Oaks, Studio City, Valley Village, North Hollywood, and other nearby areas have flocked to the space, well utilizing its facilities. Originally developed by the Weddington and McCallister families as a nondiscriminatory municipal golf course, for almost 70 years the space has served as a social hub, clubhouse, coffee shop, and open green space for the community at-large to enjoy. Priced moderately, a round of golf was available to all. Since its opening, the mid-century golf course has been a hugely defining feature of the local landscape. Nestled along the L.A. River, the course contains wide open space and numerous irreplaceable mature trees. Presently, its community role is threatened by the possible development of a private sports facility on the site.

The land Weddington Golf sits upon remained in family hands from 1890 until 2012, when it was sold to a developer who intended to build a senior living facility on the site. The local community organized widely to fight against this, and as a result, the City of Los Angeles ultimately rejected that use. The site was subsequently sold to an elite college preparatory school, Harvard-Westlake, which plans to redevelop it into athletic facilities for its students. Again, community organizations and local residents are fighting against this plan, and have launched a "Save Weddington Golf" campaign. Signs supporting the historic use of the site litter the lawns of surrounding Valley homes from Encino to Toluca Lake.

Although the facility is under new ownership, the architectural features of the original one-story club house, 230-yard driving range, pro shop, nine-hole pitch 'n putt, par three golf course, small entryway putting green, and green space remain largely intact. During the decades it was owned by the Weddington family, the facility was run in a manner similar to public municipal courses of comparable size, providing an affordable, membership-free experience for golf enthusiasts of all ages, races, and genders.

The space looms large in the community consciousness. Los Angeles' District 2 Councilman, Paul Krekorian (who represents the area), said of the facility that "[t]his is the largest privately-owned open space adjacent to the Los Angeles River, and it is a vitally important component of long-term vision for revitalization of the river as an environmental,

aesthetic and recreational resource for the San Fernando Valley. It is also a precious and cherished part of our quality of life." Its proximity to the numerous Hollywood studios located in the Valley has made it a favorite of celebrities over the years, from Bob Hope and Jack Nicholson to Kevin Costner and Will Smith. And due to its social and financial openness, on any given day you might find a studio executive on the driving range taking golf tips from a local high school kid.

The open green space, original buildings, and community spirit make Weddington Golf an integral part of the Studio City neighborhood and its identity. The original mid-century architecture evokes a by-gone era, and the culture of the space – that it is for everyone – provides substantial value to the area at-large. In this case study, I intend to evaluate the architectural and socio-cultural value of Weddington Golf in order to show its community impact and historical relevance. Protecting this space is essential, not just to maintain the feeling of the neighborhood, but to maintain the heart of the community.

I: Introduction

Since opening in 1955, Weddington Golf has been known as a beautiful gem of recreational green space – an oasis, hidden amidst a rapidly developing urban and concrete landscape. Although its origins are rooted in an era when the neighborhood of Studio City was still a small, quiet town, its role as a central hub of community, recreation, and camaraderie has never changed. The history of the golf course, clubhouse, coffee shop and environs has been well documented and celebrated by both golf historians and the community at-large. Its ability to remain as an open green haven has been long fought for and hard won.

Family lore tells the story of how as a baby, my actual "first steps" were taken while my father was hitting balls on the driving range, and I was with my mother sitting on the benches nearby. That was over 50 years ago. I spent numerous hours of my youth on the course, not only to improve my skills, but also enjoying the spirit of community, a group consciousness of connection (a feeling that remarkably still exists today). I am not alone in this experience, my story is not unique. I am amongst thousands of San Fernando Valley residents whose sense of community has a connection to Weddington Golf.

Although much of Studio City's small-town feel has been altered by modern development, the Weddington site and its bordering residential streets, stand today almost entirely intact as originally built. They provide a last semblance of that historical, charming, small-town feel. Yet, that may not be the case moving forward.

This thesis will investigate the history of the Weddington Golf site, convey its value and importance to the community at large, and identify those aspects that support its significance in order to justify preservation per the Secretary of the Interior's Standards from an architectural, historical and/or cultural standpoint. The site is currently threatened by demolition, with the intent to replace it with athletic facilities to be used by an elite private school. If allowed, this project will irreparably destroy a rare and valuable open green space and community hub that is much needed in our congested city today.

The research herein will include a history of golf in Southern California, addressing the sport's roots and cultural growth in the region. It will also chart aspects of the development of the San Fernando Valley, reflecting the growth and urbanization of the area, and subsequent demand for recreation. The focus will then shift to the origins, design and continued use of Weddington Golf, before evaluating previous and current development projects that have been

attempted on the site. The purpose of this thesis is to support an argument for the importance of preserving the site as it exists in its current state today. It is a place that matters to the community and helps to define its identity. As philosopher Edward S. Casey states in Dolores Hayden's book *The Power of Place*, "[place memory] is the stabilizing persistence of place as a container of experiences that contributes so powerfully to its intrinsic memorability. . .It is the key to the power of historic places to help citizens define their public pasts: places trigger memories for insiders, who have shared a common past, and at the same time places often can represent shared pasts to outsiders who might be interested in knowing about them in the present."[1] The concepts of place and memory matter. The National Trust for Historic Preservation has a long-standing campaign entitled "This Place Matters," which encourages citizens to get involved in helping to preserve their communities. Weddington Golf is my community. This thesis will serve to prove that this place does indeed matter.

II. History of Golf in Southern California

The history of golf as a popular pastime in the greater Los Angeles area can be traced to the late 1800s. With the completion of the Transcontinental Railroad in 1869, bi-coastal travel became significantly easier, and launched a wave of development and investment along the West Coast. Along with the booming citrus industry, great wealth grew out of the golden state.[2] This subsequently created a surge in both tourists and new residents, causing a population increase across California. As local wealth grew, so too did the desire for recreation.[3] The first golf course on record in Southern California dates to 1871, in the town of Riverside.[4] Known as the "Orange Camp," this rough, five-hole course was created by Charles E. Maud.[5]

[5] Ibid.

Maud, a wealthy agricultural developer originally from England, was a great champion of the sport. He was a founding member of the Riverside Golf Club in 1891, and, in 1899, was elected as the first President of the Southern California Golf Association.[6] He continued promoting the sport throughout his life, and developed numerous courses in California (including the Riverside Golf Club, today known as The Victoria Club).[7] Maud laid out the Club's original nine holes, although architect Walter Farvoque redesigned the course to include a full 20 holes in 1920.[8] As golf began to gain popularity in California, the course was redesigned once again in 1923, by architect Max Behr.[9]

[9] Ibid.

Today, the course remains popular, and sits in a picturesque setting amidst large Italian Stone Pines, California Peppers, and Oak trees.[10] This type of course is reflective of the initial golf culture in California – highly elite, and generally accessible to only the wealthy.

Other courses were built in the area around the same period, predominantly by groups of affluent white men who had moved out west from New England, New York, Chicago and Scotland.[11] These courses include the Pachappa (1898) and Rubidoux Golf Clubs (1899), both nine-hole courses located in Riverside.[12] In nearby Redlands, as the tourism industry began to expand the population of the town, golf too began gaining in popularity.[13] By the late 1890s, the area was considered a top destination for tourists who could come see the sights including, "the private Stanley Heights Botanical Gardens, the beautiful mansions. . .and the navel groves framed by the San Bernardino mountains."[14] With its founding in 1896, the Redlands Country Club became the second country club to open in Southern California.[15]

Closer in proximity to the City of Los Angeles, golf continued to grow as a sport of the wealthy. In Pasadena, a city known in the early twentieth century for both its affluence and high-end hotels, golf was a popular recreational activity. The first two courses built in the area were completed in 1894 and 1906 respectively.[16] The game grew prominent with the idle wealthy across the region, and the City of Pasadena was even the site of the first caddie strike in Southern California.[17] The caddies were fighting for higher wages. As the *Los Angeles Times*' society page wrote on July 24, 1898, "[the caddies] claim that 15 cents a round is too little money to run all over a twenty-acre lot chasing golf balls and carrying sticks."[18] Another caddie strike was narrowly averted in San Gabriel in 1912, as caddies were promised higher wages if they obtained "half a dozen signatures from golfers testifying to the fact that they performed their duties

properly during a given round."[19] Strikes were frequent in the early part of the twentieth century, as the economic disparity between players and caddies remained stark. In 1915, the *Los Angeles Times* reported on a caddie strike in New Jersey that arose as a result of a new system that gave inexperienced caddies the same opportunities as elite ones.[20] The elite caddies wanted to retain their better wages and rejected this "paternal socialism" because they had "evidently absorbed the aristocratic ideas of the golfers themselves and decided in favor of the aristocracy."[21] In essence, there were so few opportunities to get ahead, the caddies clung to the few advantages they had.

the fall.

The many members of the Country Club who play golf are in a peck of trouble. The caddies, as the boys are called who carry the golf sticks and hunt up the balls, struck on Thursday for higher pay. They claim that 15 cents a round is too little money to run all over a twenty-acre lot chasing golf balls and carrying the sticks. The price paid in Oakland is but 10 cents a round, and the links are longer, but that makes no difference to the Pasadena youth, who is too healthy—or proud—to work for anything less than twice what his confreres in other cities get.

Mrs. E. W. Hitchings Wins Country Contest for Russell Cup—Rev. Robert J. Burdette Set Right—Continued Campaign for Rat Extermination.

PASADENA, Office of The Times, No. 26 South Raymond Avenue, July 17.—[From The Times' Resident Correspondent.] Unusual interest in golf is prevalent in Pasadena this summer, every week witnessing one or more tournaments at the Country Club course, while this and the Green links are visited daily by many who aspire to proficiency in the ancient and honorable game. Among those who are struggling with the vernacular of the game, and who have come to make the eighteen-hole rounds in 150 or better, are many young professional men whose duties prevent them from taking part in the sport in the winter. The opening of next season will find many of those among the expert amateurs of the city.

Figure 2.3: Coverage of golf in Pasadena in the *Los Angeles Times*. Images courtesy of *Los Angeles Times*, Jul 18, 1901.

Overall, caddies were and remain an integral facet of the golf experience, especially at the turn of the century, when the sport was particularly aristocratic. The term "caddie" (or "caddy") allegedly originated with Mary, Queen of Scots.[22]

> "Mary had a little course built around her chateau. She had her own sort of Secret Service, which guarded her everywhere she went. Its members were called cadets, pronounced ka-days in French. One carried her bag and the others were around to protect her as she walked. So the people took to saying, 'There goes Mary Queen of Scots playing her native game and there are her cadets following and carrying her clubs.'"[23]

During the early 20th century, golf – as both a social activity and a sport – grew due to increased wealth in the area (and thus, more leisure time for the affluent), with numerous courses being built across the Southland. However, with the onset of World War I, the building of courses – at hotels, private clubs, and for general public use – ground to a halt.[24] The popularity of golf courses began to reemerge over the course of the "roaring twenties," as leisure activities expanded across America.[25] This period, from roughly 1915 to 1930, is often considered the "golden age" of golf.[26] "The 'Golden Age' of golf course architecture in America is a loosely defined period during the early part of the twentieth century that saw the design and construction of some of the best known and most influential golf courses in the United States. Many of America's greatest course architects worked during this period and the number of courses grew from fewer than 750 in 1916 to nearly 6,000 by 1930."[27] In Southern California, the popularity of the sport continued to increase. In 1919, the Southern California Golf Association (SCGA) had approximately 1,371 members spread out over 18 clubs. By the end of 1925, the group had a roster of over 20,000 members, who could play on any of the now 45 courses that had been constructed across the region.[28] The boom in residential real estate developments in Los Angeles helped bring more courses to the area as well. Land speculators soon realized that having a nearby golf course served to enhance the desirability of their developments.[29] Both the Hollywood Country Club (located in Studio City, now the site of The Harvard-Westlake

School[30]) and Wilshire Club are examples of this. The Wilshire Club, located in wealthy Hancock Park, added further cache to the exclusive and prestigious neighborhood.[31] While much has been written about that renowned club, there is a dearth of information regarding Hollywood Country Club and the residential subdivision it was built for. Around 1920, two of the most powerful men in Hollywood at the time – Douglas Fairbanks and Sydney Chaplin – joined with investors to obtain open land, approximately 140 acres,[32] near what is now known as the intersection of Ventura Boulevard and Coldwater Canyon Avenue (then known as Diaz Canyon or Diaz Street).[33]

Fairbanks and Chaplin, along with the Hollywood Country Club investors, formed a partnership with local realtors, Sunday, Merrick & Ruddick in order to subdivide the portions of land owned, but not being utilized by the club in order to build tract homes.[34] "This development tied in with other businessmen's dreams of turning the land along Ventura Boulevard into a residential district they. . .describ[ed] as America's most beautiful suburb."

Both the game of golf, along with the development of courses (built alongside suburbs or otherwise) came to an abrupt halt with the onset of the Great Depression.[35] Naturally, lavish sports and the expenses that went along with them took a backseat to paying bills and keeping food on the table. Courses changed their offerings to cut expenses, with one even going so far as to "shut down the clubhouse, fir[e] most of the employees, and requir[e] members to carry their own bags and do most of the groundskeeping."[36] While the Depression resulted in a rapid decline in memberships in private clubs, one positive outcome was an increase in access to the game by the general public.[37] More and more municipal courses began to crop up.[38] "As more players crowded onto these grounds, city, state and federal relief programs hired laborers to upgrade existing links and build hundreds of new ones."[39] The outcome of this was an increase in accessibility – for the first time, golf became available to the less affluent, and its player population grew to reflect this demographic shift.[40]

Many of the private clubs that were able to keep their doors open came to the realization that membership would need to expand and become marginally more democratic. A 1933 article on the subject in the *New York Times* noted that, "[g]olf went democratic even before the national tide turned in that direction at the Presidential polls in 1932."[41] Clubs began creating new categories of less expensive memberships – often called "house" or "associate" memberships – which were open to women, younger people, and group work clubs.[42] As a result,

people from differing social classes began to interact. *American Golfer* magazine reported in 1933 that, "executives and office workers and machinists all mingle in the comradeship of golf, and more often than not, the subordinate in the shop is gloriously superior on the links."[43] Even a few large corporations, which suffered during the Depression but still managed to survive, built simple courses as a place for employee recreation and stress management.[44]

The government too, played a role in assisting with the survival and popularity of golf during this time. As one of the early Great Depression recovery initiatives, President Herbert Hoover and his cabinet established the Reconstruction Finance Corporation (RFC).[45] This program provided loans to eligible entities, including municipal golf courses, that were "economically desirable and self liquidating through fees charged through their use."[46] Further support for golf courses during the Depression came as a result of President Franklin Roosevelt's "New Deal." During his presidency, Roosevelt established the Civil Works Administration (CWA), which financed the construction of golf courses throughout the country. By 1935, another New Deal initiative – the Works Progress Administration (WPA) – had spent almost six million dollars on golf-related projects.[47] The WPA repaired, improved or constructed 103 golf courses, as well as sports stadiums, public parks and airports.[48] In Southern California, WPA golf projects included the building of Roosevelt Municipal Golf Course in Los Angeles' Griffith Park,[49] repairs and improvements to Pasadena's Brookside Park,[50] and the building of Arcadia's County Park golf course (now the Santa Anita golf course).[51] Golf's stature as "a game that was here to stay" was solidified in a 1936 *New York Times* editorial which stated, "[w]hen the

economic recession has receded it will not be quite the same America that rises above the waves. Among other things it will be studded with golf courses."[52]

The 1940s brought war-related military complexes, a growing movie industry and a population surge to the area. Although the majority of the country was growing, the population of Southern California was increasing at breakneck speed.[53] The local economy was energized by World War II. In the first half of the decade, investments were made to build over five thousand industrial plants at a cost of more than $800 million.[54] According to historian Carey McWilliams, "what the war has done in Southern California has been to telescope a quarter century's development into the brief space of a few years. . .Los Angeles has reached an economic development in the last 50 years that took New York City 175 years to accomplish."[55] Throughout the late 1940s, the nation as a whole was growing at a rate of nearly 15 percent.[56] However, in California, the population jumped by over 50 percent.[57] At the start of the decade, there were approximately seven million people living in California.[58] By the close of the 1940s, there were over 10 million, many settling down in the southern portion of the state.[59] As nearby neighborhoods began to grow and subdivisions continued to be developed, the need for community recreation grew in equal parts. Although some private golf clubs experienced a drop in memberships during the war years, a great effort was made by enthusiasts and experts alike to ensure its popularity survived.[60] Adding activities for the entire family, developing clubhouses into social hubs for members, and the popularity of the automobile helped the golf clubs prosper. Players no longer needed to live in a suburb which included a golf course and club in its community center – now, you could pile the whole family into the car and drive further out if

you preferred a course or a club that was some distance away.[61] However, neighborhood golf courses still generally maintained their popularity and community importance. By the mid-1940s, the majority of golf clubs in the Southland had "full rosters," and many held waiting lists.[62] Both the private, more expensive and elite clubs, as well as the public, more affordable options were seeking out land to expand their offerings.[63]

Although the popularity of the game continued to grow throughout the next decade, barriers to its expansion began to appear. Many clubs had to close their doors due to a heavy and, in the SCGA's view, unfair taxation system.[64] In 1960, a proposition was put forth on California's November ballot that would decide how golf courses were to be taxed.[65] Proposition 6 as it was known, was designed to bring relief on the heavy levy taxes nonprofit golf courses and clubs were subjected to.[66]

ASSESSMENT OF GOLF COURSES. Assembly Constitutional Amendment No. 20. Establishes manner in which non-profit golf courses should be assessed for purposes of taxation.

6

YES

NO

(For Full Text of Measure, See Page 7, Part II)

Analysis by the Legislative Counsel

This constitutional amendment would add Section 2.6 to Article XIII of the Constitution. It would prohibit an assessor, in assessing real property for taxation, from considering any factors other than those related to its use for golf course purposes if (a) the property consists of one parcel of ten acres or more and (b) it has been used exclusively for nonprofit golf course purposes for at least two successive years. The measure would not, however, preclude the assessor from considering the existence of any minerals (including oil and gas), mines or quarries in assessing the property.

Argument in Favor of Assembly Constitutional Amendment No. 20

so would you like the golf courses nearest ... or home to be converted into noisy factory layouts, cheerless supermarkets, traffic-jammed shopping centers, or brick-and-mortar apartment mazes?

Proposition 6 is designed to save these courses and their benefits to you and your family as wooded, planted, open space areas giving greenbelt breathing space to California's growing cities.

Proposition 6 provides clarification of assessment and taxation for these privately-paid-for parks, which under present short-sighted assessment practices are being taxed out of existence and forced into overbuilt industrial and commercial developments.

Here's why Californians should vote YES:

1. TAX ELIMINATION OF NON-PROFIT COURSES WILL RAISE YOUR TAXES by forcing your county or city to assume and operate them as public courses. This means increased taxpayer expense for courses previously operated at private cost with simultaneous removal of tax-paying property from tax rolls.

2. NON-PROFIT COURSES WILL CONTINUE TO PAY TAXES.

Proposition 6 does not give tax exemption or decrease to courses. Non-profit courses will continue to pay their taxes. Proposition 6 clarifies assessment practices and provides a fair tax formula benefiting every Californian by conserving the outdoor surroundings and fresh air for our cities at private cost while continuing to yield substantial tax revenues.

3. TAX REVENUE LOSS DUE TO DEPRECIATING VALUE OF SURROUNDING LAND WILL BE AVOIDED.

Residential areas surrounding courses pay higher taxes because of scenic charm and prestige. Unfair taxes on the courses, forcing them to sell out and convert into commercial use, drops the value of the residential areas surrounding, evades the tax base and throws a heavier tax burden on remaining taxpayers.

4. PROPOSITION 6 WILL HELP PROTECT OUR TOURIST AND CONVENTION INDUSTRY.

These courses are a leading tourist and convention attraction. Tourists bring more than $2 billion to new outside money yearly into California. This means jobs for thousands. Fair taxation under Proposition 6 will help protect a major facility sustaining this source of employment.

5. TAX PRESSURE HURTS THE THOUSANDS WHO SEEK RECREATION ON PUBLIC LINKS.

Courses cut down by the "tax ax" throw their membership into the public links, adding to the already great pressure there. Thousands who cannot afford to belong to private golf clubs will be victimized.

6. OUR CITIES NEED OF 'S AREAS AND "GREEN BELTS."

Civilian defense authorities say golf courses are indispensable facilities for use as mobilization areas in case of emergency. Parks and planted areas operated at private cost contribute to the beauty, health, and appeal of our growing metropolitan areas. Planted areas help decontaminate the air because plants absorb carbon dioxide and give off oxygen, thus combatting air pollution.

7. YOUR STATE LEGISLATURE, BY TWO-THIRDS VOTE OF BOTH HOUSES, PASSED PROPOSITION 6 TO PRESERVE OPEN AREAS AND PARKLIKE SURROUNDINGS AT NO COST WHATSOEVER TO TAXPAYERS.

ALAN G. PATTEE
Republican State Assemblyman

MRS. BOB HOPE

AUGUSTUS F. HAWKINS
Democratic State Assemblyman

Argument Against Assembly Constitutional Amendment No. 20

This legislation should never have been put on the ballot. Its purpose is to give golfers privileges not enjoyed by people who happen to prefer tennis, swimming, fishing, or any other sport. It has always been the practice in this State to tax property on the basis of the "highest and best use" to which it could be put, that is to say, what it is really worth on the open market.

This amendment, if adopted, could have an appreciable effect upon the tax structure of the State. In all probability the revenue from California golf courses will reach $2,000,000 by 1963 or shortly thereafter. The nonprofit courses will probably account for at least $1,200,000 of this. In all likelihood, some courses that are now profit-seeking enterprises would convert to nonprofit organizations if there were an important tax advantage to be gained thereby.

If this amendment is adopted some of these two million dollars could be lost to local governments which are already hard pressed to satisfy demands for schools, fire departments, police protection, and hundreds of other services.

The meaning of the phrase "used exclusively for nonprofit recreational purposes" is not clear and might stimulate litigation. It may be that ownership by a nonprofit corporation will be the principal criterion of nonprofit use. Under California law, carrying on business at a profit as an incident to the main purposes of the corporation is permitted to nonprofit corporations, and such corporations are allowed to distribute gains, profits, or dividends to their members upon dissolution.

The adoption of this amendment would make possible for land speculators to form a nonprofit corporation, start a golf club on the fringe of an expanding city and maintain it at the lowest possible cost for a number of years while making a profit as an incident to the main purposes of the corporation. Then, if the land value skyrocketed, the land could be sold, the corporation dissolved, and the profits realized as a result of this special tax status could be distributed to the shareholders.

A law was passed in 1959 which makes adoption of this amendment wholly unnecessary. Under this new law, a county or city may acquire by purchase or gift a restriction on a golf course that will preserve it as an open area. When such a restriction has been created, the land will not be assessable as a potential subdivision or building site. If golf course owners are really interested in preserving their properties as golf courses and not merely in property tax reduction, here is a means of achieving their objectives that does not contain the objectionable features of the proposed constitutional amendment.

Apart from the danger of underwriting land speculators at public expense, there still remains no reason to adopt this amendment. Either all sports and recreational facilities should be taxed as recreational areas or none should be.

JOHN A. O'CONNELL
Assemblyman 22nd Dist.
San Francisco County

The proposition served to determine a "fair tax formula" for these recreational parks, rather than determining their tax value based on the possibility of a future value if the land was developed.[67] Opponents argued that it gave "golfers privileges not enjoyed by people who happen to prefer tennis, swimming, fishing, or any other sport," and would cost the state

[67] UC Hastings Scholarship Repository, "Assessment Of Golf Courses, California Proposition 6."

revenues in excess of $2 million annually[68] ($17 million in 2020, adjusted for inflation).[69] Ultimately, the proposition passed, and golf in the region continues to thrive both socially and economically into the present day.[70]

STATE BALLOT MEASURES

Prop. 6 Will Decide Whether Golf Courses Are Taxed High Or Low

Editor's Note: This is the last of a five-part series on California ballot propositions to be voted on Nov 8.

By JERRY REYNOLDS

SACRAMENTO (UPI) — How some of the state's richest golf courses will be taxed high or low — is the crux of the argument over Proposition 6 on the November election ballot.

The issue is whether the state's private, nonprofit golf courses should pay property taxes according to their full value or whether their property taxes are assessed according to recreational use of the property regardless of surrounding land values.

Proposition 6 would permit tax assessments on these nonprofit golf courses only for their recreational use.

The situation arises, much as it does with farm lands and private airports, when land is developed around these large holdings. Pat Martin, spokesman for the backers, says that in most cases homes are built along the greens and wooded courses. Prices of bordering lots skyrocket to as much as $10,000 per lot for the prestige home sites.

Taxes Rising Rapidly

In some cases, he says, property taxes on these golf courses have shot up 600 per cent in five years. And he predicts many will go broke without tax relief.

Assemblyman John A. O'Connell, who wrote the official argument against the proposition, said it would cut local tax income.

"Its purpose is to give golfers privileges not enjoyed by people who happen to prefer tennis, swimming, fishing or any other sport," he said.

"It has always been the practice in this state to tax property on the basis of the highest and best use to which it could be put — that is to say, what it is really worth on the open market."

Ten other issues face voters on the election ballot. Here is a brief description of other major proposals:

Veterans Tax Proposal

Proposition 3 permits totally disabled veterans to retain their annual $5,000 property tax exemption and transfer it to any home they buy. At present, the exemption is given only on homes bought with federal government backing.

Proposition 11 does the same as Proposition 3. In addition, it would, in the future, extend the $1,000 property tax exemption only to veterans who lived in California at the time they entered the service or were residents as of No. 8.

Proposition 14 would permit use of gasoline tax money to finance bonds for local grade separation projects at highway-railway junctions. The Constitution now requires that gas tax money be used exclusively and directly for highway purposes.

Backers say many local communities cannot afford to build grade separations when they are needed. But opponents say railroads are required to pay a share and the state allocates about $5 million a year to help.

III. History and Development of the San Fernando Valley

For many, Los Angeles represented reinvention and opportunity. From young actors, hoping to change their names and make it big, to immigrant farmworkers, looking for an opportunity to build a better life, Los Angeles exists in both hearts and minds as a place to begin anew. People come from all corners of the world to create a better life in the sun. But this idea is not merely a product of the 20th Century – historically speaking, Los Angeles has long represented a fresh start. "The expansive gently pitched plain has been a destination in at least four centuries now, a landing place for travelers who picked up their lives in search of something better."[71] Los Angeles' long-held reputation for opportunity and prosperity can be clearly seen in the development of its most famous suburb – the San Fernando Valley. The original families who developed and established this area were able to transform themselves and their legacies, leaving indelible marks on the land and the community. To this day, their names adorn many of the Valley's streets and communities.

When the San Fernando Valley was first developed it was mostly farmland, with few residents – a far cry from the area's current population of more than 1.86 million people.[72] In the early years of settlement, the San Fernando Valley was a rural area filled with grasslands, jack rabbits, hawks, roaming turkey, and even some sheep.[73] The trees found throughout the Valley today were nowhere to be seen in the late 1800s, when it was initially settled.[74] For the early pioneers, it was a land of harsh elements, intense heat, and very little shade.[75] "Farmers drawn to this grassland planted trees madly, trying to break the north wind and the clouds of dust."[76] Against the backdrop of these harsh conditions, the San Fernando Valley would grow and evolve over the next hundred years into a bustling metropolis, with over 34 different neighborhoods.[77]

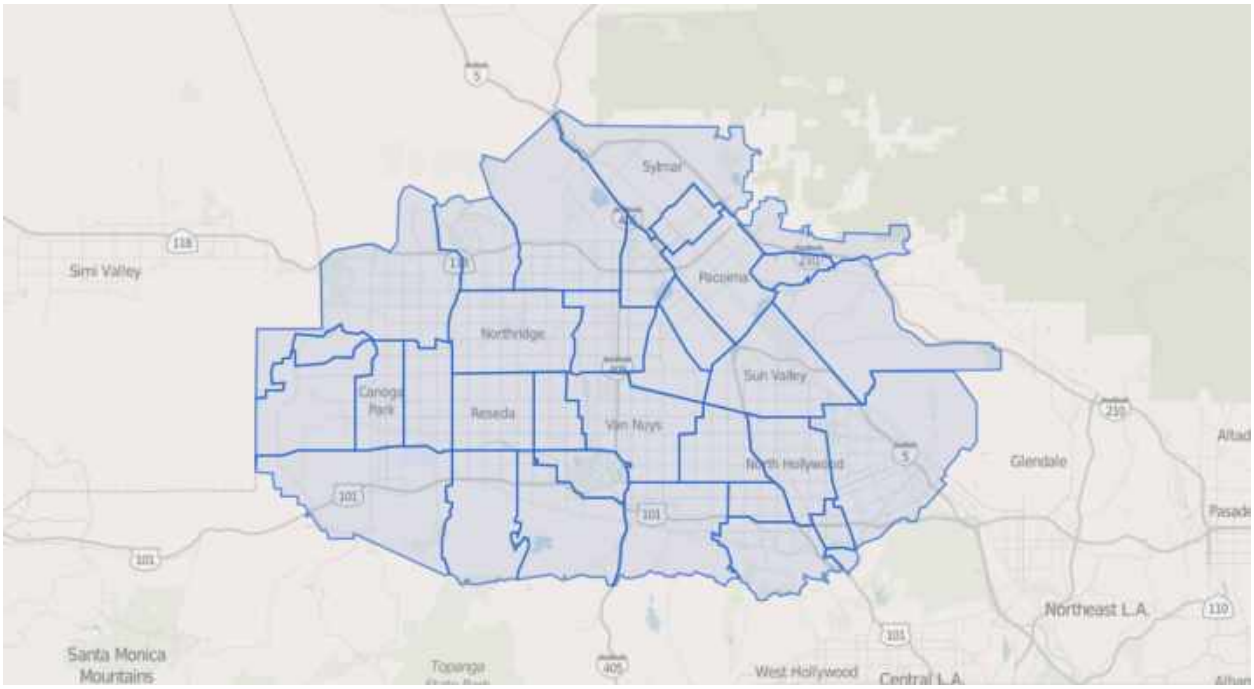

Figure 3.1: The 34 current neighborhoods of the San Fernando Valley. Image courtesy of *Los Angeles Times* (http://maps.latimes.com/neighborhoods/region/san-fernando-valley/).

The early growth of the San Fernando Valley centered around land development and agriculture. While the area had originally been populated by the Tongva, Spanish settlers began arriving in 1769, and referred to the area as "el Valle de los Encinos."[78] By 1797, the Spanish had begun to establish Mission San Fernando, converting and enslaving the Tongva, and doling out land grants to soldiers and settlers.[79] After Mexican independence from Spain, land conflicts arose between the church and the government of "the province of Alta California," often escalating into violence.[80] Local ranchers wanted the mission lands to be turned over to private farmers, which after a skirmish in 1831, did begin to occur.[81] In 1845, conflicts arose again when Governor Manuel Micheltorena tried to return the landholdings to church control.[82] His forces faced off in the Cahuenga Pass against ranchers (including a contingent of American settlers, led by John Sutter, later of Sutter's Mill) who supported Pio Pico, a native *Californio*, for governor.[83] The rancher forces prevailed, the land remained in private hands, and Pico went on to

become the last Mexican governor of California (the state joined the Union in 1850, after the Mexican-American War).[84]

But by the late 1800s, changes were underway. The area was shifting from a vast expanse of ranchos into the beginnings of a more traditional American suburb. In 1869, Pico sold his land holdings in the San Fernando Valley to a recently arrived farmer from Pennsylvania.[85] Isaac Lankshershim became one of the original and most important developers of the region, eventually having one of the Valley's most prominent streets named after him. Development in the area continued to grow as the Southern Pacific Railroad began service into San Fernando in 1874.[86] This transportation hub that helped the sleepy community grow to become the first official town of the newly forming Valley.[87]

[87] Ibid.

Although the area was growing, the lack of a reliable water source left the region looking, "a little like Kansas, with dryland farms stretching from the north side of the Santa Monica Mountains to the foothills of the San Gabriels."[88] As wheat did not require irrigation, it could be found growing in abundance across the Valley. Although Lankershim originally held vast lands for sheep farming, he ultimately lost the majority of those sheep to drought – eventually planting wheat fields as a replacement.[89] In 1888, his son founded the town of Toluca, which would go on to become the modern neighborhood of North Hollywood. Other parts of Lankershim's original sheep farm later developed into modern-day Studio City, where Weddington Golf sits today.

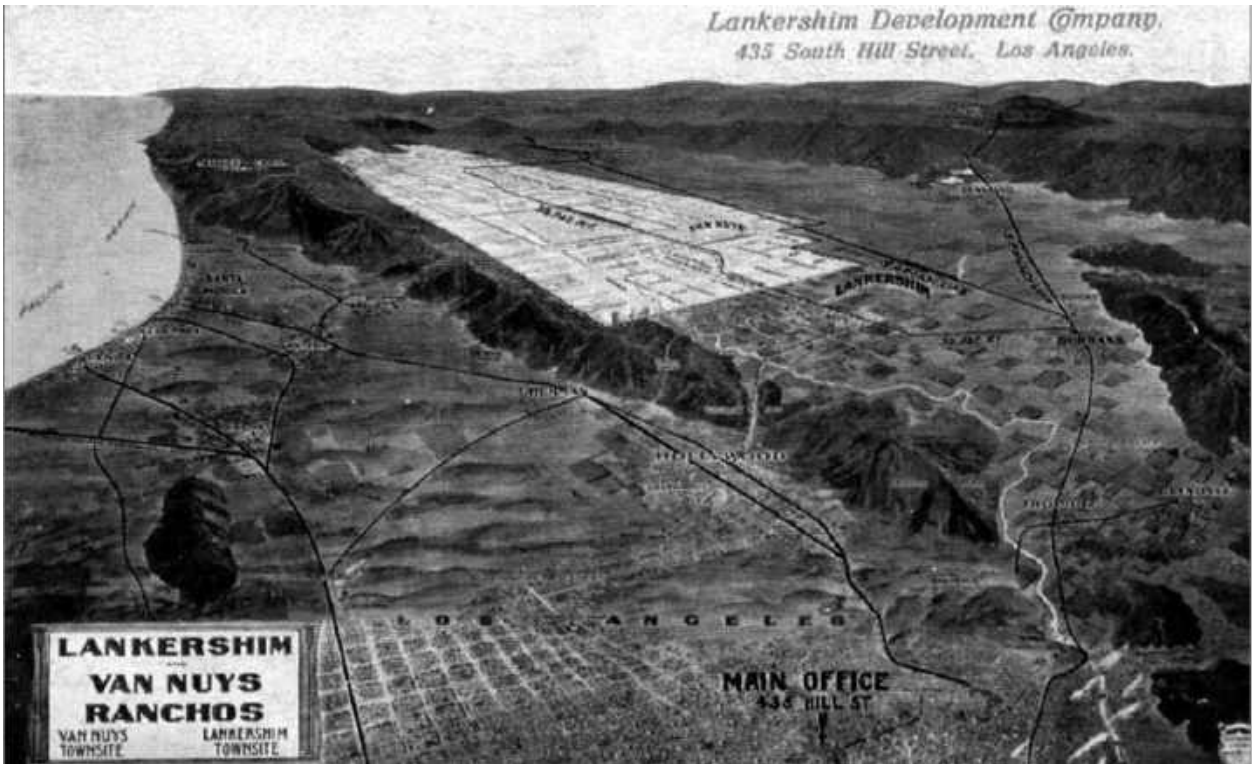

Figure 3.3: The Lankershim and Van Nuys family holdings (modern day North Hollywood) in the early 1900s. Image courtesy of Water and Power Associates; image Lankershim_Development_ca1908 (https://waterandpower.org/museum/Early_Views_of_the_San_Fernando_Valley_2_of_10.html).

The shift to agriculture and the development of residential suburbs began after Isaac Lankershim's death in 1882.[90] He left his land holdings to be divided equally between his son

James and his son-in-law, Isaac Van Nuys. The latter would go on to become an important figure in the development of the Valley – both the neighborhood of Van Nuys and the street Van Nuys Boulevard were named after him.[91]

Figure 3.4: Opening of the town of Van Nuys in 1911. Image courtesy of the Van Nuys Neighborhood Council; image vannuys34838 (https://vncblog.files.wordpress.com/2013/11/vannuys34838.jpg).

Van Nuys had been in charge of running the Lankershim land holdings prior to his marriage to Isaac's daughter Susan.[92] After his father's death, James Lankershim and a group of investors set out to subdivide 12,000 acres of the family's land.[93] Today, this area is identified as roughly Ventura Boulevard to the south, Whitsett Boulevard to the west, Burbank Boulevard to the north, and east toward Toluca Lake and North Hollywood.[94] While his brother-in-law was more focused on developing the town of Toluca, Van Nuys had broader dreams for his portion of the Lankershim holdings.[95] Through his development efforts, the area rapidly began to grow, and by 1910, the Valley had 3,300 residents.[96] Eventually, Van Nuys sold the bulk of the Lankershim lands to the Los Angeles Suburban Homes Co. (often referred to as the Board of Control[97]), a development company owned by some of Los Angeles' biggest power brokers.[98] The owners included Harrison Gray Otis (owner of the *Los Angeles Times*), Harry Chandler (Otis' son-in-

law, later the *Times* publisher), Otto Freeman Brandt (insurance mogul), Hobart Johnstone Whitley (manager of the Hollywood subdivision), and Moses Hazeltine Sherman (streetcar magnate).[99] Although this deal transferred half of the Valley to the company, their ability to develop the area into suburbs was limited by one crucial element – water.[100] Water rights in the area eluded them, due to a historic system heldover from when California was under Spanish control.[101] However, this rapidly changed beginning in 1913 with the arrival of the driving force which would shape the development of the entire city, not just the San Fernando Valley – the Los Angeles Aqueduct.[102] Designed by William Mulholland, the aqueduct would go on to transform the entire region, efficiently transporting water to the growing metropolis from the Owens Valley.[103] The development of a stable water source allowed the Valley to begin expanding at breakneck speed.

Shortly before the aqueduct opened, in 1911, the Los Angeles Suburban Homes Co. filed a subdivision map dubbed "Tract 1000," "the largest single land development in Los Angeles history."[104]

However, the Board of Control's timing wasn't entirely based on luck. Shady dealings between the Valley's developers and the aqueduct's builders are relatively well known, and have been the subject of countless books and movies – the backroom bargaining is an integral part of LA lore.[105] Although the precise details are murky, what is known is the following: a few years prior to the building of the aqueduct, the same group of businessmen comprising the Board of Control, also formed the San Fernando Mission Land Company, in order to purchase the 16,200 acre Porter Ranch.[106] Their goal was to divide up the ranch in order to sell smaller plots[107] while also building a streetcar line in order to provide easier access to the area.[108] It is widely believed that the men were able to purchase this land at a competitive price because they knew what the sellers did not – that the city planned to build an aqueduct, which would have undoubtedly raised the land's price had it been public knowledge.[109] This insider knowledge was most probably gained by Sherman, who held a seat on the water commission.[110] While there is no direct proof of this secret information being traded, there is some evidence to support this theory.[111] Sherman was clearly aware that Fred Eaton, then-mayor of Los Angeles, had been secretly obtaining water rights in the Owens Valley, in order to establish a stable source of water for the Los Angeles basin.[112] Knowing how key water would be for the growth of the San Fernando Valley, it is likely Sherman shared this information with his business partners.[113] The timing is particularly suspicious, because the day after the water board privately gave the official okay for the aqueduct plan to move forward, these powerful land speculators took possession of the Porter Ranch lands.[114]

With the opening of the "Los Angeles-Owens River Aqueduct" in 1913, the City of Los Angeles finally had the stable water source it needed. Although the city itself owned the aqueduct, it was providing more water than its residents needed.

Figure 3.6: Opening of the Los Angeles Aqueduct in 1913, with water flowing into the San Fernando Valley. Image courtesy of Water and Power Associates; image LA Aqueduct Cascade (1913) (https://waterandpower.org/museum/Early_Views_of_the_San_Fernando_Valley_3_of_10.html).

At the time, the city boundaries ended on the south side of the Santa Monica mountains – just short of where the Valley began – meaning although the aqueduct ran through the area, its residents did not have access to its water. Subsequently, landowners in the Valley attempted to buy the excess water from the city, but were met with an ultimatum – "be annexed by Los Angeles or stay dry."[115] Faced with no choice, the residents consented, and the City of Los

[115] Ibid., 62.

Angeles "annexed more than 188 square miles of the valley" in 1915.[116] Overall, as the main goal of the aqueduct was to create an area for land speculators to build residential development, the project was a success. Los Angeles shortly overtook San Francisco as the most populous city in the state.[117] In the decade from 1915-1925, the LA area grew to over a million residents.[118] By the mid 1920s, with increased ease of cross-country travel, the discovery of oil in the area, and a rapidly growing movie industry, Los Angeles began to experience a substantial real estate boom. Suburbs such as Burbank, North Hollywood, and Studio City formed.[119] By the start of the 1930s, the San Fernando Valley could count over 100,000 people as new residents.[120]

Four main industries were essential to the next phase of growth in the Valley. First, the film industry settled in. The topography of the area, along with access to numerous ranches and original mission structures, made it an ideal location for various movie backdrops.[121] Additionally the aviation, defense and agricultural industries continued to expand and further make their mark as powerful entities in the region.[122]

Studio City, where Weddington Golf is located, was originally envisioned as a residential subdivision whose value was its location near the movie studios.[123] This concept was not uncommon. In 1912, Universal Studios laid claim to being the first studio to run production from the Valley.[124] It was located adjacent to a residential suburb, so that its employees could live in close proximity to it.[125] When it opened in 1915, the neighborhood was dubbed "Universal City" for that reason.[126]

The population in the Valley as a whole continued to increase as the movie industry expanded, but much of its later growth was due to industries related to World War II. Both the government and private corporations established enterprises related to this effort during the early and mid-1940s.[127] The defense industry, and more specifically Boeing, can be credited for much of the Valley's population growth.[128] By the time the 1950s came to a close, nine of the ten largest manufacturers with a presence in the Valley were all related to defense contracts.[129] While the defense industry created the majority of jobs, the auto industry – in particular, the Van Nuys/Panorama City General Motors plant with an enormous assembly line – was responsible for additional growth.[130]

In the aftermath of the war, soldiers returning home flocked to these jobs, but they also needed places they could settle down to build a family. Nationwide, suburban communities were expanding in size and popularity. On the East Coast, communities such as Levittown met these

soldiers' needs and served as a template for suburban growth across the country.[131] In the San Fernando Valley, Panorama City typified the mass-produced housing boom of the era. Its developers – Fritz B. Burns and Henry J. Kaiser – announced their plans to build "thousands of mass-produced homes" on the day after V-E Day.[132] The area was "the first planned tract in the postwar Valley," with construction beginning in 1947.[133] Other Valley communities, including Owensmouth (later Canoga Park), Reseda, Tarzana, Burbank, Glendale, and Studio City also began to grow during this suburban boom.[134] While many of these communities existed before the war, they expanded significantly in the immediate post-war period.[135] Once the Valley's new residents had jobs and homes, demand rose for forms of recreation to keep them busy and entertained. By the early 1950s, Panorama City had a bowling alley, movie theater, and several shopping malls and department stores.[136] Developments like Weddington Golf in other Valley communities were not far behind.

Following the war, the Valley rapidly changed from an "intensive field of orchard agriculture to a function and morphological extension of the expanding urban industrial nucleus of Los Angeles."[137] Located approximately 15 miles from Downtown Los Angeles, made up of mostly flat land surrounded by mountain ranges, and situated adjacent to the newly-developed freeways, the Valley's location was a major draw for continued urban settlement following the war.[138] In 1930, the area had a population of roughly 77,000, and by 1940, that number had swelled to over 150,000.[139] Following the war, an expansion of employment opportunities and a growing real estate development boom, expanded the population even further. By 1945 the valley was home to more than 220,000 people.[140]

Over the course of the 1950s, suburban development grew at a rapid pace. Developers began to subdivide and build entire neighborhoods, and in many cases, joined the process of actually selling them as well.[141] "Tract" communities were built, offering a variety of floor plans within a single community.[142] Additionally, the Federal Housing Administration provided loans to help make buying a new home a reality for new families in the region.[143] Higher post-war incomes and the passage of the Servicemen's Readjustment Act in 1944 (better known as the GI Bill), led to veterans being able to combine "FHA insurance with. . .Veterans Administration loans" in order to buy homes – often with no down payment.[144] In essence, "[c]onsiderable effort was given, both through government policy and private market efforts, to meet the demand for new housing that this massive workforce required."[145] Unfortunately, as was very common in housing tract developments across the country, restrictive deed covenants typically attached to the property.[146] Developers "were explicit about race and ethnicity, and through the instrument of restrictive covenants, community builders excluded anyone "non-Caucasian" from purchasing dwellings in their development." [147] This practice was rampant across Los Angeles, with more affluent suburbs remaining predominantly White.[148] As far back as 1924, the National Association of Real Estate Boards created a discriminatory code of ethics.[149] This code, "prohibited realtors from introducing "members of any race or nationality" to a neighborhood that would threaten property values."[150] Many realtors included references to these restrictions in their advertisements and sales pitches as an enticement for prospective White customers to buy their properties.[151] These restrictions even attempted to block some of the country's most

celebrated artists from choosing where to live, such as the experience of nationally beloved singer and performer Nat King Cole.[152] After purchasing a home in Los Angeles' exclusive conclave of Hancock Park in 1948, Cole and his family were, "targeted by the homeowners association who attempted to keep the neighborhood exclusively white."[153] Cole was notified that the neighborhood was protected by 50 year covenants, "restricting ownership to members of the Caucasian race."[154] Cole refused to be scared away, staying put and owning the home for the rest of his life.[155] Although the United States Supreme Court had deemed racial covenants unenforceable in *Shelley v. Kraemer* in 1948,[156] many realtors and developers in the greater Los Angeles area, refused, albeit illegally, to sell homes to African Americans.[157]

CAL. NEGROES CAN NOW LIVE ANYWHERE, SAYS HIGH COURT

Homes Like These No Longer 'Out of Bounds'

FREED FROM RESTRICTIONS—Pictured above are two of the many homes in Los Angeles which have figured prominently in race restrictive covenant cases and which, by virtue of Monday's U.S. Supreme Court decision, are no longer "out of bounds" to Negroes. Both ... volving which have been awaiting action by the California Supreme Court for nearly two years. The cases will now undoubtedly be dismissed." At the left is the home of the late Ben Carter, well-known comedian and motion picture agent, who was teamed with Manton ... shown Hattie McDaniel's home. Her right to live there was challenged on racial grounds despite the fact that she has attained top rank in motion pictures and is currently giving a 15-minute nightly program, the "Beulah Show," over radio station KFI.

1946 construction of the Basilone Homes public housing complex and the privately developed Joe Louis Homes in Pacoima," a suburb in the San Fernando Valley[158] Although the Valley was still generally segregated, some neighborhoods did provide opportunities for black homeownership and greater integration.

Overall, the development of the Valley – from sleepy ranchos to a condensed suburb – followed nationwide trends for the post-War period. Increased population, economic stability, racial shifts, and the desire for family-oriented recreation collectively provided the ideal environment for the establishment of institutions like Weddington Golf in suburban Studio City.

IV. "What's in a Name?" – The Establishment of Kirkwood Recreation Center and the Beginnings of Weddington Golf

Although it has been through numerous name changes over the years, the facility today known as Weddington Golf and Tennis was originally known as the Joe Kirkwood Jr. Golf Center.[159] Opened as a golf driving range in 1955, the adjoining nine hole golf pitch and putt course opened the following year.[160] Joe Kirkwood Sr., the namesake's father, was a highly successful golfer and the first Australian to win the PGA.[161] "The name Kirkwood is famed in the golf and entertainment world."[162] Also known for performing various trick shots, he "earned more fame as a trick-shot artist than as a top golfer."[163] Kirkwood "once holed in one after hitting his shot from a watch face "that had been affixed to his golf club."[164] Known for being a showman and an entertainer, his son, Joe Kirkwood Jr., followed in his father's steps by becoming a professional golfer on the PGA tour.[165] Kirkwood Jr. was also a Hollywood actor of some renown – starring in 11 "Joe Palooka" films and a TV series – and even earned his star on Hollywood's Walk of Fame.[166]

It was in the mid 1950s that Kirkwood Jr. chose William M. Bray, Architect, AIA, NCARB, and Bray Architects, to design his golf center with the intention of representing the social and recreational culture of the time.[167] Bray – a longtime architect and resident of Southern California – and his associates dealt with and solved numerous issues related to the

topography of the site.[168] As it was situated along the Los Angeles River, "[t]he ground for the buildings and facilities necessitated the stabilization of the soil, with increased structural support, both below and above ground, due to a high underground water table; proximity to an active river; and location in an earthquake risk area."[169] Having had a successful career designing homes in the region, and often embracing the popular Ranch style of the time, Bray won a Lifetime Achievement Award in 1994 from the San Fernando Valley chapter of the American Institute of Architects.[170] Today the practice continues in the hands of his son, Roger W. Bray, AIA.[171]

The actual site of Weddington Golf is listed in Department of Building and Safety records as both 4155 and 4141 Whitsett Avenue, depending on the year (1955 or 1956 respectively).[172] The site is situated on the southwest corner of Whitsett Avenue and Valley Spring Lane, and runs west on Valley Spring from Whitsett to Bellaire Avenue.[173] It originally ran south on Whitsett to the Los Angeles River's edge, but currently the property borders the Studio City Fire Station (LA #78),[174] built in 2007 just north of the Los Angeles River pathway.[175] While some of the original trees were removed to make way for the fire station, "a row of eucalyptus trees along Valley Spring Lane predates the course."[176] The entire property has a neighborhood feel within a parklike setting. The grounds still include numerous trees, including palms, eucalyptus and pine.[177]

Figure 4.1: The 1956 "Application to Construct New Building" at 4155 Whitsett, listing Joe Kirkwood Jr. as owner, and William M. Bray as architect. VN15796. Image courtesy of City of Los Angeles Department of Building and Safety; document number 1956VN15796.

In 2011, a full tree assessment was completed as part of a Draft Environmental Impact Report for a senior center being proposed for the site. This draft identified a total of 400 trees within the grounds, with 47 deemed of size per the City of Los Angeles "Tree Preservation Guidelines."[178] The site was originally designated in 1946 as R3-1 medium density residential zoning on the Whitsett Avenue side, and R1-1 low density residential zoning along the rest of the property.[179] However, in 1971 this shifted to agricultural zoning (A1-1XL) due to an agreement between the Weddington family, the operators, and the City and County of Los Angeles.[180] The purpose of this was to designate the site as a recreational open space, and to place height restrictions on it.[181]

The clubhouse was designed in the ranch style that was popular for residential architecture was popular across the country through the 1960s, and for which Bray was known.[182] The Ranch style is loosely based on early Spanish Colonial precedents of the American Southwest modified by influences borrowed from Craftsman and Bungalow styles and Prairie modernism pioneered by Frank Lloyd Wright in the early twentieth century.[183] Although the Ranch style was usually found in residential architecture, it was also used for showrooms, groceries and golf clubhouses.[184] The driving range, club house, pro shop, and coffee shop were

designed using similar characteristics of small clubs during this era.[185] The design and materials create a warm and inviting feeling. "Knotty pine paneling covers the walls up to a datum line set by the east (entrance) and west (rear) walls."[186] The centerpiece of the main room is a fireplace, reaching to the ceiling and created using variegated brick.[187]

> "The clubhouse is of wood frame construction on a concrete slab-on-grade foundation. It has a wood shingle-clad, side-gabled roof with deep eaves along the front and rear of the building to create generous overhangs. The front overhang is sheltered by square wood posts. The exterior cladding of the building is painted board and batten siding. The north side contains utility uses, with a shed-roofed garage (its roof parallel to the main gable) and a small shed (its roof perpendicular to the main gable, attached to the wall) and an exterior vestibule at the back of the pro shop enclosed with chain link fencing."[188]

Figure 4.2: The Joe Kirkwood Jr. Golf Center in 1956, the year it opened. Image courtesy of J. Jones and GolfHistoricalSociety.org. (https://www.golfhistoricalsociety.org/ghswordpress/2009/06/01/the-joe-kirkwood-golf-center/).

City records show that the "Certificate of Occupancy" per the City of Los Angeles Department of Building and Safety was issued on January 4, 1956. The permit identifies the parcel as, "Use of Land Golf Course including 50' x 500' area for 77 cars."[189] This large number of parking spaces is significant, as the 1950s was a period of substantial growth for the automobile industry. Production of cars in America jumped from two million in 1946, to eight million in 1955.[190] "[T]he automobile freed motorists from the fixed routes of rail-based

transportation. This unprecedented mobility had a profound impact on urban form. Previously undeveloped areas that were too far from streetcar lines became ripe for development in the automobile era."[191] This freedom allowed people to travel further for a variety of activities, including recreational ones. So while the course was frequented by locals, who walked their clubs over for a round, it was also popular with golfers across the Valley, who drove to use the facility. The "Joe Kirkwood Jr. Golf Center was praised for its parking spaces, with their lane markings. . .important factors in the successful operation of a modern golf driving range."[192] The lot remains the same today. The site is further made unique by its outdoor lighting. "There's no shortage of nostalgia at the 1950s-era club, where kitschy dimpled lights shaped like giant golf balls [on tees] tower over the parking lot."[193]

Weddington Golf & Tennis Club is a unique space in Los Angeles, in part because "[the] parcel. . .ha[d] been owned by the same family continuously since the 1890s," until it was sold in 2014.[194] The original land ownership is ambiguous, but in all likelihood, the land where Weddington Golf now sits was initially owned by Isaac Lankershim.[195] What is clear is that the land was bought in 1890 by a young farmer from Iowa, Wilson Weddington, who had moved his family out West.[196] Weddington operated it as a sheep farm in the early years, before later switching over to wheat fields and then casaba melons.[197] The Weddington family went on to become local power brokers, even using their home as the first post office in Toluca Lake. Although "Lankershim was the biggest name in the area, Weddington made his presence known after President Grover Cleveland appointed him to the job of postmaster in 1893."[198] Eventually the post office was moved out of their home, and to a local general store Weddington opened in the late 1890s.[199] His children, both sons – Guy and Fred – also became pillars of the emerging San Fernando Valley community.[200] It was Guy, who along with magnate Henry Huntington, helped broker the deal to bring the Pacific Red Car to the Valley in the early 1900s.[201] All of the Weddingtons served on the area's chamber of commerce, with Wilson serving as president for most of the 1920s.[202] The family had its hand in numerous local enterprises. They opened the Bank of Lankershim in 1910, and when the city later changed its name from Lankershim to North Hollywood, it became part of Security Pacific.[203] The branch was operated out of a storefront located at the corner of Weddington Street and Lankershim Boulevard.[204] The Weddington family maintained their prominence throughout the 1930s and 1940s.

With the expansion of suburbanization and the post-war shift towards recreation near the home, the use of Weddington's land was due for a change. In 1955, Fred Weddington agreed to lease a portion of his family's property to actor Joe Kirkwood.[205] According to the *Los Angeles Times*, "[h]alf a century ago, the stubborn old banker had a mind to rent out the family farm. A rather bad deal in retrospect: $1,000 a month, regardless of inflation, for 50 years."[206] Kirkwood's vision was to use the site and build it out as a privately-owned, but functionally public golf course. In April 1955, he filed a zoning variance request with the city to "permit use of property at 4141 Whitsett Avenue, Studio City, as a privately-operated recreation center consisting of a golf driving range and a nine-hole pitch and putt golf course."[207]

Officially, the Joe Kirkwood Jr. Golf Center opened its driving range on January 1, 1956. When the nine-hole course reached completion in May of the same year, it did so with a celebrity golf tournament to raise funds for the Women's Adoption International Fund (WAIF).[208] The

money raised that day went to children whose parents had died in World War II.[209] It was a celebrity-filled event, hosting many of the biggest names in Hollywood at the time – including actors Mickey Rooney, Bob Hope, and Gordon MacRae.[210]

Figure 4.6: Dean Martin hits the first shot at the opening of the Joe Kirkwood Jr. Golf Center in 1956. Image courtesy of TESSA: Digital Collections of the Los Angeles Public Library (Valley Times Collection); image 00127797 (https://tessa.lapl.org/cdm/singleitem/collection/photos/id/59736/rec/9).

The original plan for the site was to ultimately create a recreation center with an 18-hole golf course, a driving range, and "a gigantic bowling center, championship swimming pool and an ice rink."[211] Kirkwood also hoped to include a drive-in restaurant. But these plans proved too

costly – the clubhouse cost an estimated $65,000, and the entire project totaled $1.25 million.[212] The golf course was to be composed of 18 holes resembling smaller versions of holes on world famous courses, though ultimately only nine were ever built.[213] Kirkwood originally considered including the "seventh at Pebble Beach" and the "15th at Cypress Point" (both located in Northern California), the "fourth at Colonial" (in Fort Worth, Texas), and "the 10th hole at Wing[ed] Foot" (in Mamaroneck, New York), but these holes were never built.[214] He also wanted to replicate the third, fifth, and 15th holes of the Augusta National Golf Club in Georgia, and while the third and fifth were indeed constructed, Kirkwood wound up swapping out the 15th hole for the eighth.[215] To put it simply, "Kirkwood had patterned each green after the best he'd played all over the world."[216]

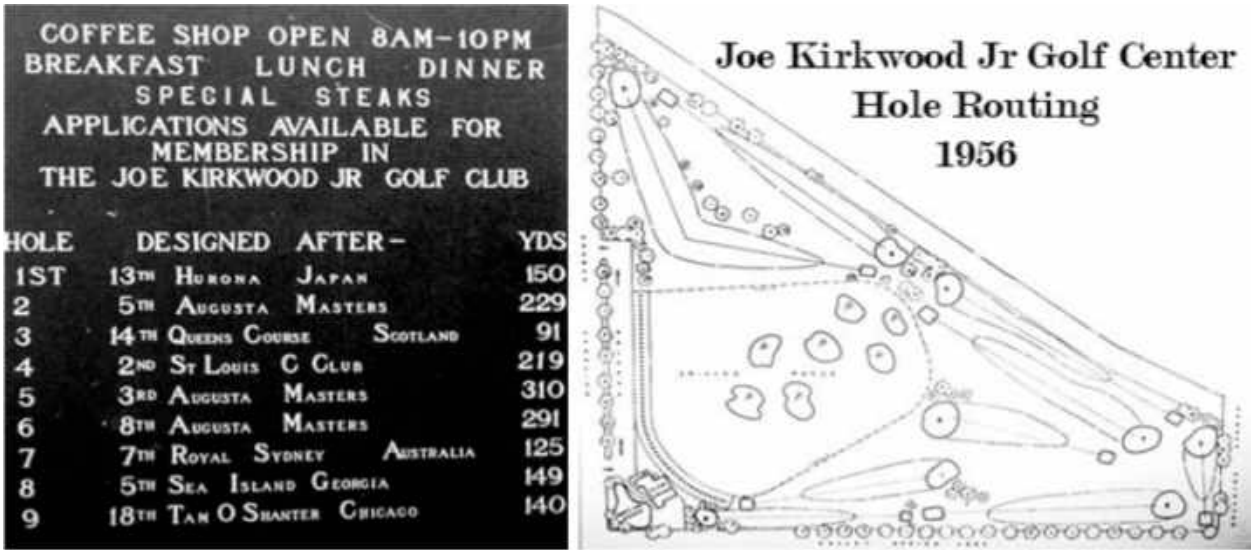

Figure 4.7: Original sign and map from the Joe Kirkwood Jr. Golf Center, detailing the courses the holes are modeled after. Image courtesy of J. Jones and GolfHistoricalSociety.org. (https://www.golfhistoricalsociety.org/ghswordpress/2009/06/01/the-joe-kirkwood-golf-center/).

The skating rink, pool, and drive-in never materialized. However, tennis courts were added to the southern end of the property in 1974 and remain today.[217] Although Kirkwood's name was the draw in the early years, he didn't stay involved for long. In 1957, Kirkwood sold

his interest to two local men: George McCallister Sr., and his developer friend Arthur "Bob" Anderson.[218]

Figure 4.8: Joe Kirkwood demonstrates his golf swing in front of members of the Studio City Rotary Club, including Fred Weddington. It was McCallister who purchased the lease and facility from the Weddington family and Joe Kirkwood Jr., and it was primarily McCallister who continued to run it until 2007 with the help of two of his five sons, George Jr. and John.[219] In the early years, the course had been popular with actors and studio executives, due to its close proximity to the numerous film and

[219] "Weddington Golf & Tennis Club: Historic Resources Assessment Report," 15-16.

television studios now located in the San Fernando Valley.[220] But it was under McCallister's watch that he "began turning Studio City (officially incorporated in 1958[221]) into a [golf] club whose reputation now stretches far beyond the studios."[222] The McCallister family also had power and success in their veins. McAllister Sr. held large investments in local real estate, and his brother was the inventor of the first golf glove.[223] He was also an avid golfer, and was pivotal in bringing golf to Los Angeles' masses by incorporating it into public schools.[224] "McCallister Sr. was influential in lobbying the Los Angeles city schools to incorporate his form of golf instruction into physical education programs."[225]McCallister Sr. also redesigned the course, making it more accessible for neighborhood and scratch golfers. "He redesigned the course to make play easier—filling in the water and sand traps, and rebuilding the greens."[226] He also added an irrigation and sprinkler system, and planted rose bushes and thousands of trees – including fir, various citrus, and 20,000 palm trees (of which only 10% survived).[227] I belong to Bel-Air," said Anderson of the course in 1987, "and this is prettier."[228]

In order to drum up more business, McCallister Sr. "began giving lessons to anyone who could hold a club."[229] He offered a variety of golf clinics in the neighborhood, taught at local schools, and ensured the price of lessons on site was reasonable.[230] In a *Los Angeles Times* interview from 1987, he stated "what really made our business here, was the price of our lessons. In those days, other clubs were charging $5 an hour. We charged 50 cents."[231]

McCallister Sr. was also unusual for the time, as he offered classes to women – something not found at many courses in the area.[232] Although racism was common in golf (the PGA did not allow non-white golfers to join until 1961), this was not the case at Weddington.[233] The course was open to golfers of all races – notably, Don Cornelius of *Soul Train* fame even took lessons there.[234] The course was also "nationally known for being the place where a major redesign of the club head was made."[235]

The 1970s saw the addition of tennis courts to the site, which McCallister charged the public to reserve by the hour.[236] Weddington "was one of the first. . .clubs in California – maybe *the* first" to do so.[237] Throughout this period, the course became further associated with celebrity. Famed golfer Roger Dunn taught lessons beginning in 1962, before leaving to open his chain of Roger Dunn Golf Shops (he eventually returned to teach golf at Weddington in the late 1980s,

[236] Ibid.
[237] Ibid.

and did so until his death in 2012).[238] Golf legend Arnold Palmer was also a known regular, and a friend of Anderson's.[239]

> "[Bob] Hope used to sit on a red Naugahyde couch in the knotty-pine clubhouse and watch 'Monday Night Football' on an ancient black-and-white television. Jack Nicholson [w]as. . .known to show up without money, identify himself behind his patented dark sunglasses and ask the cashier, 'Am I good for it tomorrow?'"[240]

Nicholson also took lessons at Weddington.[241] But despite the high-profile clientele, Weddington retained an open, relaxed atmosphere. Celebrities mingled with first time golfers, chatting happily at the driving range.

In contrast to Weddington, numerous private, highly exclusive, and expensive golf courses and country clubs can be found spread all over parts of Southern California.[242] Conversely, since 2001, the number of clubs that are open to the general public has continued to decline. There are currently only 18 open, including the following: Weddington Golf Course, Lindero Canyon, Verdugo Hills Golf Club, Arroyo Seco Golf Course, Lake Lindero Golf Course, Westlake Village Golf Course, Rancho Duarte Golf Course, Dominguez Golf Course, Azusa Greens Country Club, Palos Verdes Golf Course, and San Dimas Golf Course.[243]

This decline only serves to further highlight the importance of local community meeting places, such as public golf courses. Their relevance cannot be overstated – there were so few places in the 1950s, '60s, and even '70s, where people from all walks of life could congregate and feel welcome. Weddington Golf has long held an important role in the fabric and history of Studio City and its surrounding neighborhoods. This community importance continued throughout the 1980s and '90s and remains integral today.

V: Property Rights and Development Proposals

During the 1980s, Weddington Golf (then-named Studio City Golf and Tennis) became a site of interest for development. In 1987, the *Los Angeles Times* noted that "[o]ver the years, real-estate developers have drooled over the prospect of turning the club's 17 acres – now worth an estimated 50 million – into high density housing complexes."[244] In 1988, for the first time since purchasing the land in the late 1890s, the owners of the property attempted to sell the land, listing it for $42 million.[245] Part of the reason the owners were eagerly looking to sell was the low profit on the property. For years the family had "searched for a way out of a miserable lease signed in 1955 that brought in just $1,000 a month on 17.2 acres of prime real estate."[246] Guy Weddington McCreary, one of the family heirs, told the *Los Angeles Times* that "[the lease] was signed by my great uncle, and it's just been. . .a misery for a long time. . .It destroys you as far as economic return. You're land poor."[247]

Several factors blocked the heirs' path to a sale. First and foremost, finding a buyer was difficult, due to the long-held lease by the golf course.[248] But additionally, homeowner groups (such as the Studio City Residents Association (SCRA)) began to form with the hope of helping play a role in determining what might be developed on the site if it were sold.[249] When asked whether she supported the sale of the property for development, Polly Ward, then-president of the SCRA replied, "No way. This community wants to retain the open space."[250] Ultimately, nothing came of this initial attempt to sell.

The property went up for sale again in 1994, but the conflict surrounding development on the site remained. At this point, the Weddington heirs thought that, in addition to selling the land, they might be able to rid it of the lease as well – potentially increasing its value. This was because in early 1994, the heirs were informed that the conditional-use permit for the site had

[250] Ibid.

expired in 1985.[251] "First signed in 1958, the 50 year lease states that it will become null and void if the course does not have a conditional use permit."[252] The heirs immediately attempted to evict the golf course operators, with hopes of selling the valuable 17 acres without the encumbrance of the lease.[253] The course fought back, and filed for a new permit. In November 1994, a city official denied the course an updated permit until "legal questions surrounding the course's lease agreement are resolved."[254] Although local golfers were concerned that their beloved course could be lost, many involved with the fight were confident it would be over quickly, with the course remaining.[255] Attorneys who represented the course operators told the *Los Angeles Times* that "[w]e're not going to move out. . .the very plain language of that contract says the city must refuse to renew or extend the permit in order for the lease to be nullified. The city never has and we believe they never will."[256]

As the two sides debated their case, the community surrounding the course began to further voice their opinions and concerns. This would become a recurring pattern. Mort Allen, a local and well-known real estate agent, stated that he had received numerous inquiries about the possible sale of the land.[257] Residents, politicians, and activists expressed their fears as well, concerned about this "urban oasis." An aide to Zev Yaroslavsky, the area's then-city council member, stated "we think the recreational use is a valuable resource to the community and to the city as a whole, and we wouldn't want to see it go away."[258] Then-SCRA President Tony Lucente made it clear that, "any development would come under close scrutiny and powerful opposition from the neighborhood association. . .the land is zoned for light agricultural use and planned as open green space for park type facilities."[259]

[259] Slater, "Priced Well Under Par."

In January 1995 the issue of the permit was settled. [260] "In its decision announced Jan. 3, the zoning appeals board overturned an Oct. 18 ruling by Associate Zoning Administrator Horace Tramel denying the permit because of questions over the golf course's legal standing as a tenant. . .[I]n November, a Los Angeles Superior Court judge [had] dismissed a lawsuit by Weddington that charged that the previous permit's expiration had voided the lease."[261] In effect, this decision by the Los Angeles Board of Zoning Appeals determined that the operators of the course had met their lease terms, even though the permit had lapsed.[262] Although the community had come out in support of re-issuing of the permit, McCreary and the other heirs were extremely disappointed. Upon hearing the news, he stated, "it's like property rights don't really mean anything." Nevertheless, the fight over the land and its use did not end there.

In early 2000, a new proposal was put forward by a Del Mar-based development organization, Homeplace Retirement Communities of America.[263] Their proposal sought to build a 240-unit living facility for senior citizens on the site.[264] They intended to erect numerous four story buildings on at least five acres of the site, as well as build an underground parking lot that would be able to park approximately 500 cars.[265] At the time, Homeplace was a fairly new company, which had other housing projects being built in the San Fernando Valley.[266] This project would have included food services, as well as health care providers to be located on-site. Jim Schmitz, then-senior vice president for Homeplace, let the community know that although the company believed there was a very large demand for this type of facility in the area, they intended to keep the golf course in place "even if it must be reconfigured."[267] Moreover, Homeplace considered possibly donating the course itself to the city, in order for its use to continue (and to placate community members).[268] The development was specifically designed

with the intent to preserve 76% of the land.[269] Although Homeplace had only made an offer of interest to purchase the land at this point, it was still under the ownership of Weddington Investment Partnership. The fifty year golf lease remained in place, set to finally expire in 2005.[270]

The following figures are overviews of the proposed Homeplace development on the site taken from the City of Los Angeles' then-contemporary Environmental Impact Report (EIR):

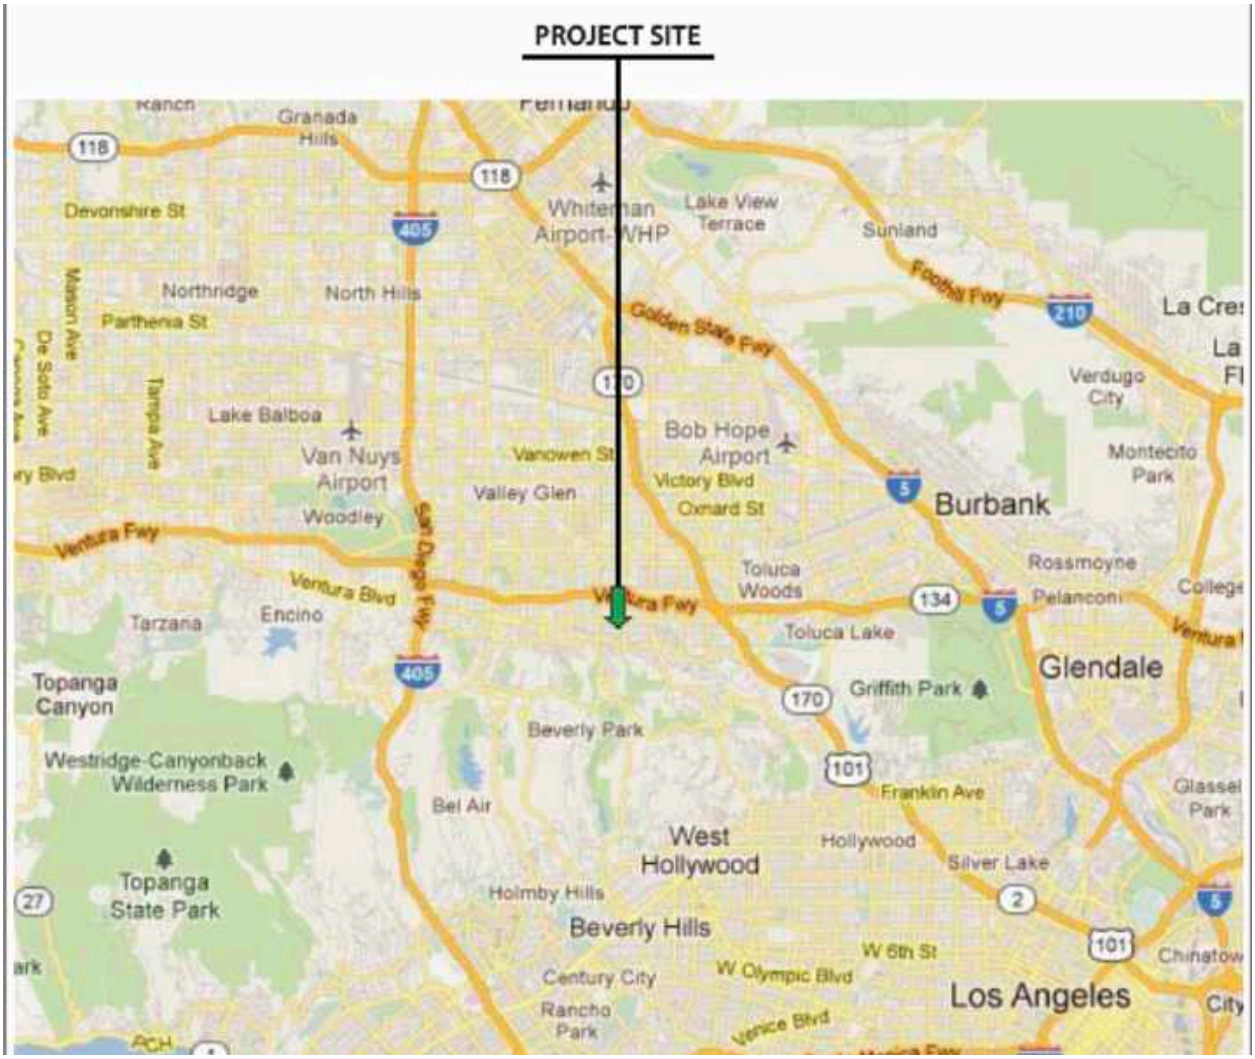

Figure 5.1: Project Site within the Southern California regional area. The SCRA once again came out against any proposed change to the site. “This is one of the crown jewels of Studio City, so this is one of those ‘chain yourself to the bulldozer’ kinds of

developments," said Lucente.[271] But it wasn't just the Association who cared about the course's fate. Players and non-golfers alike were concerned. "I think the community should decide what happens to it," said Garrett Meyers, a local teenager and golf student at Weddington.[272] Nearby residents also inundated the city planning offices with thousands of letters decrying what a mistake this development would be.[273] Even more letters were written to the *Los Angeles Times*. Karen Thorson Cotter of Valley Village wrote to the paper, "the golf course is the jewel of our town and our last open green space. We do not need this cement monstrosity and we are not drastically in need of senior housing." [274] Not surprisingly, the owners of the land disagreed with much of the community sentiment. As Guy Weddington McCreary reiterated, "everybody seems to think they own the. . .property except us" (a constant battle cry heard in the world of preservation).[275]

By 2003, the matter was nowhere nearer to being settled. In fact, the City of Los Angeles, now hoping to save the site as open green space, made a public announcement of their intent to try and purchase the site. Wendy Gruel, the city council member representing Studio City at the time, believed rapid action was needed to bring about a solution, even if it meant the city would use its power to condemn the property in order to force the sale. "This is a treasure. . .It is open space that should be preserved.[276] Although the motion to condemn the property was approved by an 11-1 vote, Homeplace pleaded with the council to reconsider, as they believed the city was in desperate need of residential dwellings for seniors.[277]

At the time, Gruel had been separately working hard on acquiring a portion of the Weddington land for a much needed new fire station in Studio City.[278] Following the 1994 Northridge earthquake, firefighters from Fire Station #78 had been living, eating, and working

out of temporary buildings due to the severe damage their station experienced on Coldwater Canyon (just north of Ventura Boulevard) as a result of the quake.[279] Station #78 needed to be relocated elsewhere, and a portion of the land nearest the Los Angeles River – just a half mile away on Whitsett Avenue – was where the city wanted to move it.[280] The council voted to use eminent domain to acquire one acre of Weddington, paying more than $1 million for it.[281] Homeplace tried unsuccessfully to delay the vote, even implying that the city could possibly get that acre for free or at a lower price if it was willing to hold off on a vote until after Homeplace's escrow closed.[282] However, Gruel, alongside other city officials such as then-Council Member Jack Weiss, remained opposed to the senior housing development. "I will continue to do everything I can to save the Studio City Golf and Tennis Center," Weiss told the *Los Angeles Times* in 2003. "This is a jewel of open space"[283]

Ultimately, Homeplace was unable to get approval to build, and the project was abandoned. In 2007, upon the official end of the lease, the Weddington family took over the operation of the course. The heirs then proposed their own senior housing development for the site, through their development partnership, Weddington Golf and Tennis, LLC. Known as the Studio City Senior Living Center Project (SCSLC), the proposal intended to eliminate the golf course, reconfigure the driving range, and move the tennis courts.[284] The plan was then to build a "200-condominium unit senior housing development with an associated subterranean parking structure on the site.[285]

Around the same time, the site became subject to the Los Angeles River Revitalization Master Plan (LARRMP) and its implementation companion document, the River Improvement Overlay (RIO), which guides development throughout the Los Angeles River corridor.[286] The

confluence of these events further brought attention to development efforts at the site, and in particular, raised public awareness about losing Weddington as open green space.

Over the course of the next seven years, from 2007 to 2014, the SCRA once again began fighting to preserve the site as open green space. With the support of lawyers and community members, they made a number of compelling arguments. One of the most relevant arguments was that the site's agricultural zoning is:

> "pursuant to an agreement among the landowners, operators, and the City and County of Los Angeles to permanently maintain the Project site as recreational open space with specific height restrictions. Consistent with that agreement, the Project site is designated as open space on the Sherman Oaks-Studio City-Toluca Lake-Cahuenga Pass Community Plan, which comprises the applicable land use element of the City's General Plan. The Project is inconsistent with the Community Plan and zoning designation for the site."[287]

Although the SCRA did acknowledge the importance of senior housing, their argument hinged on the belief that it should not be built at the expense of losing one of the last, and most frequently utilized, plots of open space in the San Fernando Valley.[288] Using statistics from the National Parks Service they argued that, "the Valley's park acreage is already far behind the National Recreation and Park Association's recommended average of 6 to 10 acres of accessible park space per 1,000 residents." They also noted that this was "the last remaining unprotected open space along the 22 miles of the Los Angeles River in the San Fernando Valley."[289]

Naturally, the Weddington's disagreed. Despite the changes to the golf course and the demolition of the tennis courts, they assured the community that they would attempt to preserve as much of the recreational space as possible. They also argued that the demand for housing in the community outweighed these concerns, and that the project would be aligned with "the existing density and character of residential developments in the neighborhood." This assessment was inaccurate. The six senior housing buildings were expected to be 45 feet fall, while the surrounding "residential buildings are smaller and shorter, resulting in significant aesthetic and land use impacts due to the inclusion of six 45 foot tall buildings." Moreover, "under current zoning in the extra limited height district, building height on the site is limited to 30 feet."[290] To

[290] Ibid.

highlight this contrast, the SCRA took pains to provide the heights of the buildings across the street from the site on Whitsett Avenue, which are as follows: 4032 Whitsett is a one-story church, 4068 Whitsett is 2.5 stories, 4100 Whitsett is three stories, 4104-4106 ½ Whitsett is one-story in front, two stories in the back, 4108 Whitsett is 2.5-stories, 4110 Whitsett is four stories (but below 45'), 4112 Whitsett is a one-story house, 4138 Whitsett is 3.5 stories, and 4148 Whitsett is 2.5 stories.[291]

The SCRA also offered what they viewed as the most viable and beneficial alternative for the site. Encouraging the city to purchase the land from the heirs, their idea was known as the LA River Park Alternative (or the Los Angeles River Greenway Trail).

Figure 5.4: Rendering of the proposed Los Angeles River Greenway Trail, spanning from Coldwater Canyon Avenue to Whitsett Avenue, in Studio City. Image courtesy of L.A. River Greenway Project (http://www.conservationsolutions.org/pdf/LARiver/CCS_LAR-Greenway_2014.pdf).

In a letter to Adam Villani, a Los Angeles City Planner, they stated that, "if implemented, the L.A. River Natural Park Alternative would retain the majority of the existing tennis facilities, the driving range, clubhouse and a golf putting green, while providing desperately needed parkland, creating native wetlands, increasing available habitat along the Los Angeles River."[292]

[291] Ibid., 33-34.
[292] Ibid., 3.

The idea gained some momentum, especially considering the site was the only "river-adjacent large undeveloped parcel in the East Valley."[293] There are no other sites within a five mile radius.[294]

In partnership with the Santa Monica Mountains Conservancy (SMMC), the LA River Park Alternative had four main points: "(1) Improve water quality and water conservation, (2) Create a regional public access and staging area for the future Los Angeles River greenway, (3) Restore native habitat, and (4) Integrate historic recreational uses (that would be golf and tennis)."[295] The Urban Waters Federal Partnership (which the SCRA brought in to help secure government funding for the project), expressed support for the alternative and stated it would be "one of the most significant River revitalization projects in this area and has been prioritized by the Urban Waters Federal Partnership in its Los Angeles River Work Plan to receive targeted support from the federal government to expedite its implementation."[296]

Separate from saving the Weddington Golf site, the City of Los Angeles approved and adopted the Los Angeles River Revitalization Master Plan ("LARRMP") as the regional vision and guide for development and improvement of multi-benefit projects along the Los Angeles River in the City of Los Angeles. The overall goal of this plan is to "transform the City's 32-mile stretch of the River into an 'emerald necklace' of parks, walkways, and bike paths, as well as provid[e] better connections to the neighboring communities, protect[ing] wildlife, [and] promoting the health of the river."[297] Kathy Hasset, co-director of Save LA River Open Space (SLAROS) believes the "alternative project" offers the best option for protecting and maintaining the site. "It has the potential to make a major contribution to our region, including improved water quality by halting pollutants from entering the LA River and creating a means for natural water treatment, better access to the Los Angeles River Greenway, the restoration of

native habitats and the preservation of recreational uses."[298] SLAROS itself was created in the early 2000s with the mission to "preserve the Weddington property as open space with permanent public access, and to protect it from unwanted development."[299]

Many community members supported the L.A. River Natural Park Alternative Plan, but the cost to the City to purchase the site proved too prohibitive. In 2017, while many locals were still under the assumption that the senior housing debate remained ongoing, behind the scenes, an alternative deal was being struck. The heirs were in fact entering into an agreement with an elite local private college preparatory school, Harvard-Westlake, to develop the site as the school's new state-of-the-art recreational and athletic facility (the site is located less than a mile from the school's campus). The site was purportedly sold for over $40 million.[300]

Initially, Harvard-Westlake claimed it would be impossible for the existing facilities to remain as-is. "It was impossible to incorporate the golf course in the plan that would meet the school's needs," school spokesman Ari Engelberg told *The Daily News* in 2019.[301] The initial plan proposed would include "two lighted all-weather playing fields, a main gym, locker rooms, swimming pool, tennis courts, underground parking, six acres of public plazas, a walking and jogging trail," but "no golf area."[302] Partially in response to backlash, the school has now agreed in its most recent proposal to preserve the "golf putting green, clubhouse, and restaurant," though not the course itself.[303]

[303] "Project Overview," Harvard-Westlake River Park, accessed August 30, 2020, https://www.hwriverpark.com/the-project/project-overview/.

There are a number of troubling elements brought about by this proposed development. The space will have limited public access, and the preserved public space "is not contiguous, it does not create a park environment. It is created by bits and pieces cobbled together mostly on the perimeter of the property."[304] Noise is another major factor, as the school is proposing to build facilities with a total of 2,117 spectator seats across their gyms, athletic fields, and pool.[305] Traffic and parking pose additional concerns. Currently, there are 532 proposed parking spaces for the site.[306] With spectator seats well in excess of that number, not to mention parking for students and faculty themselves, this poses a major impact on the surrounding neighborhood's traffic. Even with the school's proposed shuttles, this does not provide any guarantees.[307] The project would also see the removal of approximately 200 mature trees, which poses both carbon sequestration, historic, and aesthetic concerns.[308] Although the school would replace them with new trees, these would take 20 or more years to reach maturity.[309] There are also concerns about the site's water recapture proposal, given its location along the Los Angeles River. "The Harvard-Westlake recapture proposal reduces the catchment area of polluted runoff from 200 acres to 39 acres," and would likely see the runoff co-mingling with street water before running into the river.[310]

As it stands today, Harvard Westlake has submitted plans, proposed findings, and supplemental material along with a request for a Conditional Use Permit (CUP). The Los Angeles City Planning Office is currently reviewing these documents, and all interested parties

are awaiting a Notice of Preparation.[311] The six primary related documents pertaining to the Harvard Westlake plan include elevation plans, findings, photographs, and a floorplan, all of which were submitted to the city on March 5, 2020.[312] "The School must prepare a full Environmental Impact Report" (EIR) that requires an expanded public comment period for the community to analyze and mitigate the full environmental impact of the Harvard-Westlake Project."[313] The SCRA and other interested parties continue to actively oppose this development on the site.

Prior opposition to development on the site has not been based on any historical rationale. This changed, however, in 2012, when the course was listed as a potential historical resource on Historic Places LA and Survey LA. The site is currently being evaluated for inclusion on the California Register as a Historical-Cultural Monument (HCM) by a private entity.[314] These factors further impact possible development on the site, as well as the site's requested CUP (which is currently under review).

VI: Preservation and a Path Forward

"The relationship between history and memory is peculiarly and perhaps uniquely fractured in contemporary American life." – Michael Frisch, historian[315]

Preservation, as a practice, encapsulates more than just buildings. It addresses the landscape of a space in its entirety, conveying what a site has been, how (or if) it has changed over time, who has used it, and how it has affected them. To preserve a space is to continually manage change over the course of time. Preservation also helps define a society and a culture – it is a deliberate maintenance of a collective consciousness.

The choice to conserve – to value legacy – can reflect what's important to a community (depending on who's telling the story, and their intended audience). There are a number of players attempting to shape the narrative of Weddington Golf. The City of Los Angeles, Harvard-Westlake School, numerous grassroots groups, native tribes, community and nonprofit organizations, and private property owners each have a stake in the outcome (and believe their stake is the most valuable). Ultimately, there are a number of compelling reasons to preserve the space without necessarily valuing one stakeholder's perspective over another. Based on the historical research provided above and the analysis below, the reasons to preserve remain more compelling than the reasons to develop.

<u>Preservation Rationale 1: Community Use</u>

On any given weekend, the driving range at Weddington Golf is a loud and cheerful place. Regulars shout hello at one another, asking about this relative or that, and frequently chat up newcomers, providing advice or suggestions on how to improve their golf swing. You can find a diverse mix of individuals, from six year old girls to 80 year old men hitting a medium bucket of balls (for only $10).[316] For an additional five dollars, you can rent a set of clubs.[317] The first two of the 25 stalls are regularly reserved by the golf pros for lessons, which cost

[317] Ibid.

(depending on length and pro) around $50-60 per half hour.[318] Approximately 70,000 rounds of golf are played at Weddington each year – roughly 200 rounds every day.[319] During the week, the course – which is open to the public every day from 7 a.m. to 11 p.m. – is equally busy, if not more so, given the numerous local high school tennis and golf teams which use the facility to practice.[320]

Figure 6.1: Putting green and clubhouse as of June, 2020. Image courtesy of Teri Austin.

The surrounding Valley community uses Weddington Golf & Tennis in a variety of ways. In addition to lessons and school team practices, the course is a meeting place for business professionals, friend groups, and old timers alike. Seniors are the most common morning players, but the afternoon and weekend set is dominated by younger people. Golf, as a sport, has seen a dramatic influx of young women players in particular, whose participation in the sport has

[320] Weddington Golf & Tennis, "Weddington Golf."

jumped 21% since the year 2000.[321] More than 25% of these players are non-White.[322] Weddington Golf remains the only public course in the area where lower income players could have access to the sport. As Ron del Barrio, a long-time gold pro and instructor at Weddington said, "Where the hell is the next Tiger Woods going to come from if everything is a private club?"[323] One of the things del Barrio loves most about the site is that "it feels like a mini country club community without anyone needing to pay to be a member. People are blown away by the warm family atmosphere to this day. Everyone is welcome – that's how it's always been, and how it still is."[324]

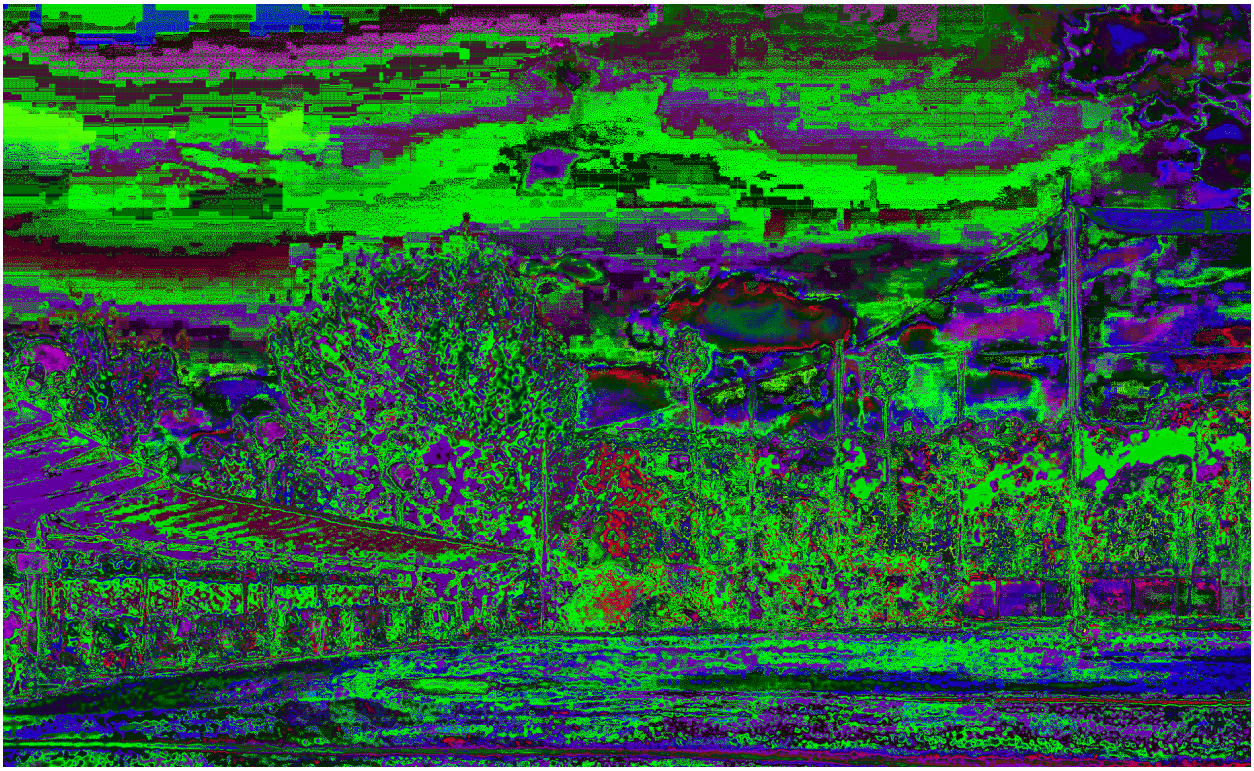

Figure 6.2: The original driving range remains intact as of June, 2020. Image courtesy of Teri Austin.

The price point significantly improves the accessibility of Weddington. Golf as a whole can be an extremely costly sport when you factor in club memberships, green fees, and the price of gear. For example, Lakeside Golf Club, which is the nearest course to Weddington is private. In addition to initial and annual membership fees (which are not disclosed to the public),

[324] Ibid.

members are required to pay monthly dues to play golf.[325] If you wish to bring a non-member friend, there's a $100 fee.[326] Golf clubs are not available for rent, but a caddy is (again, for a fee).[327] By contrast, although Weddington Golf is a shorter course, it only costs $12 on weekdays, $15 on weekends, and $10 for seniors to play a round.[328] This again, demonstrates the community element of Weddington – not only is everyone welcome, but it is truly affordable to all. This is important because golf has not historically been an accessible sport, as discussed above. Not only has Weddington been historically open along race and gender lines, but the low cost creates equity. Additionally, in terms of gender inclusion, many private clubs only allow women to play on specific, predetermined days. To use Lakeside as an example once again, the club does not allow women to be members at all. Women are only allowed to play if they're related to an immediate male club member, such as a father or a spouse, and even then, only on predetermined days. As another letter writer put it, "[I] have never felt so much a part of a community as I have since I started coming to Studio City Golf + Tennis. . .Recreation like this should be available to everyone, not just those who can pay $100,000 to join a private club."[329]

While Weddington's community openness is reflected by its economic accessibility, it has also long been known for its social inclusivity. This is reflected in a number of letters that were sent in 2002 and 2003, as part of the Notice of Preparation (NOP) written comments to the Homeplace Environmental Impact Report. At the time, the head of the Los Angeles Tennis Association wrote that "Generally speaking, many of our members, by virtue of their sexual orientation, felt left out or at least uninvited in sports during their developmental years in school, and therefore weren't able to use sports to the fullest to help develop those skills. . .It is important for us that you understand that Studio City Golf and Tennis [now Weddington Golf and Tennis] is a cultural resource not just to those who live in its neighborhood, city, or even the San Fernando Valley. . .Most of our members who use the facility weekly do not live in the San Fernando Valley. . .Most of our members pass many tennis courts on their drives to and from

Studio City Golf and Tennis to play in our leagues. Those courts do not offer what. . .Studio City Golf and Tennis [offers]. These courts are a cultural resource that we urge you not to change in any way."[330]

Figure 6.3: Clubhouse lunch counter and pro-shop interior, June, 2020. Images courtesy of Teri Austin.

The loss of Weddington's golfing facilities – as Harvard-Westlake currently plans to retain only the putting green – would leave local golfers who cannot or do not want to afford private fees (or do not feel welcome at private clubs) in the lurch. Even the nearest local city-owned public golf course, Balboa Golf Course, is more expensive than Weddington, and requires internet access to book a tee-time online and in advance.[331] It also lacks the same aesthetic and social environment. Balboa is not set on a residential street, as Weddington is.[332] It's off a main thoroughfare and next to the freeway, which creates additional noise.[333] "Weddington is a smaller course, so it's easier to just pop in for a round with your friends. You don't have to book ahead of time," said Neil Cohen, a Studio City resident who has been golfing at Weddington for over 20 years.[334] "It's so well maintained. The feeling of golfing there, when you're on the fourth

tee. . .it's elevated. . .and the scenery is framed by the river behind you and the dense older trees on all sides. Balboa just doesn't have that. It's like a desert by comparison."[335]

Figure 6.4 View from the fourth hole tee. Image courtesy of Teri Austin.

The community feel is not just tied into playing a round of golf. "It serves us not only for our recreation, camaraderie and many, many successful business deals, this very healthy heart of our community sends a living pulse that flows through our residential neighborhood, gentle, quiet, green and nourishing," wrote Barbara Robinson, in a March 28, 2002 letter of comment.[336] Community members often remark on the conviviality of the space. "It's like *Cheers*," said Chris Lyons, a Valley Village resident who has played golf at Weddington nearly every Sunday for the past 25 years.[337] "Everybody knows everybody, and everybody feels right at home."[338] Another letter writer echoed these sentiments, suggesting that "the complex is like a 'corner bar without

the liquor.' People feel safe there, parents feel safe knowing their kids are there playing golf and tennis without them. It's been there for over 50 years and truly is the 'jewel of Studio City.' What other facility can offer this?"[339]

Although the school claims that for this project, the community could still use the remaining tennis and putting green facilities, as well as those to be built, during specified hours (yet to be determined), no records can be found of Harvard-Westlake opening their existing school recreational facilities to the public at-large.[340] The logistics for this would also be challenging (if not unrealistic), given the ever-changing nature of the school's needs. Not to mention the possible insurance liability the school could acquire through this community use, which would further disincentivize them from allowing the public to use the space. Even if these facilities are readily available to the public, the community feel of the space cannot survive the school's proposed alterations. If there is no golf course, only half the tennis courts, and no driving range, the primary use of the space is gone. If Harvard-Westlake controls the hours, and they are structured around the school's schedule, the community simply cannot utilize the space seven days a week, 16 hours a day, as they do now.[341]

Preservation Rationale 2: Loss of Open Green Space

Weddington Golf remains the only publicly open and utilized green space in the Sherman Oaks-Studio City-Valley Village area. The space spans 16.1 acres, most of which is utilized by the nine-hole golf course.[342] There has been a concerted community effort to retain this space, particularly as it runs along the Los Angeles River.[343] The site is the last open space along the

[339] "Draft Environmental Impact Report: Studio City Senior Living Center Project – Appendix A-2," 100.

[340] Los Angeles Department of City Planning, *Notice of Preparation of Environmental Impact Report and Public Scoping Meeting – Harvard-Westlake River Park Project*, Environmental Case No: ENV-2020-1512-EIR, September 30, 2020, 2; As of publication, author was unable to find any records to this effect.

[342] "Draft Environmental Impact Report: Studio City Senior Living Center Project," IV.D-1.

[343] Save LA River Open Space, "Home."

river in the San Fernando Valley.[344] Community concerns about the loss of the green space are both environmental and psychological.

Air quality is one of the many environmental concerns, considering the proposed Harvard-Westlake construction would see the destruction of 200 mature trees. The site is separated from the congestion of Ventura Boulevard to the south thanks to the Los Angeles River, and the numerous trees provide windbreaks, visual barriers, and air quality improvements.[345] In particular, the loss of Blue Gum Eucalyptus trees on the site, which are "excellent for carbon sequestration,. . .control particulate pollution, [and] provide sound control," is a concern.[346] Although the school has stated that they intend to plant new trees, it will take decades for those trees to reach maturation, and thereby provide the same air quality benefits. Additionally, the increased traffic to the site – as demonstrated by the addition of 532 parking spaces – diminishes the surrounding neighborhood's air quality. This has been a recurring issue for any development on the site. As one of the 2002 letter writers noted, "The residents of the North Valley Heart Drive area will be disturbed constantly by the delivery, trash and other vehicles necessary to supply care and maintenance."[347] These issues, plus the addition of bus traffic shuttling students to and from the site, are still of great concern. This issue has even been addressed by Harvard-Westlake's own student newspaper, *The Chronicle*, which quoted Studio City resident Pam Friedman, stating:

> "Your kids are going to come down Coldwater [Canyon] and then make a right turn on Woodbridge and then fan out in my neighborhood with driving and parking..I have heard, as did some of my neighborhood, the mitigation plan, [and] I don't think that your people can enforce a traffic mitigation plan. I just think that's unrealistic. I can tell you that people that live closer to this project are freaking out."

The emissions that result as part of the demolition and construction process, pose further concerns. This particular issue was noted in the 2002 Environmental Impact Report compiled for the proposed Homeplace project, which warned that demolition and building of subterranean

parking "would result in a significant and unavoidable impact related to localized construction emissions."[348]

Figure 6.5 View from the eighth hole. Image courtesy of Teri Austin.

Harvard-Westlake contends that there will be 5.4 acres of open green space remaining on the site.[349] However, per the Notice of Preparation and its Conceptual Site Plan (CSP), these acres would not be contiguous, and would be made up mostly of pathways bordering the site – hardly open green space.[350] Further, plazas, water features, and landscaping all count toward their calculation of what defines open space.[351]

[348] "Draft Environmental Impact Report: Studio City Senior Living Center Project," xiii.

[350] Ibid., Conceptual Site Plan.
[351] Ibid., 2.

Figure 6.6: Conceptual Site Plan for the proposed Harvard-Westlake River Park. Image courtesy of "Notice of Preparation of Environmental Impact Report and Public Scoping Meeting – Harvard-Westlake River Park Project."

In order for Harvard-Westlake to obtain the Conditional Use Permit (CUP) necessary to begin demolition, the school must "ensure compatibility with surrounding land uses."[352] Per their NOP, building upon the remaining 11+ acres appears to be incompatible with the site's current use. On those acres, the school intends to build the following:[353]

Field A, 1.87 acres

Field A Ancillary/Facility Structures, 6,499 square feet

Field B, 4.12 acres

Field B Ancillary/Facility Structures, 3,080 square feet

Multi-purpose Gymnasium Structure, 80, 249 square feet

Pool, 0.28 acres

Ancillary/Facility Structures and Pool Canopy, 15,154 square feet

The school has also proposed a 180 square-foot security kiosk, and plans to keep eight of the 16 tennis courts and the clubhouse.[354] The CUP must also be in alignment with the "existing adopted General Plan, including local area and community plans." The present Sherman Oaks-Studio City-Toluca Lake-Cahuenga Pass Community Plan notes that "[o]pen [s]pace is broadly defined as land which is essentially free of structures and buildings and/or is natural in character and which functions in one or more of the following ways: 1. Recreational and educational opportunities. 2. Scenic, cultural and historic value. . ."[355] Although the proposed space will continue to serve a recreational purpose, it will not be "essentially free of structures and buildings," as is required by the plan.

However, the preservation of green space is more than just meeting government guidelines. It effects how a community looks and feels about itself. The following quotes are from letters written by community members supporting the preservation of Weddington in its current form:

> "This is a defining cultural icon of Studio City. . .Developing this open space would have an absolute, negative impact on the social environment and property values of the entire Studio City area." Richard Shamban, Sherman Oaks[356]
>
> "The sylvan glade is in the midst of quiet streets and proud residents who have helped keep this marvelous family recreational facility pristine and beautiful for the past five decades. . .But don't take my word for it. Those of you who make this decision, come out here any time, any day, and you will see what effect this wondrous recreational facility has on this part of our city." Robert and Maryln King, Sherman Oaks[357]
>
> "For those of us who neither play tennis or golf, the open space furnishes nourishment in a complex commercial and crowded residential area."[358] Carrie Henderson, Studio City
>
> "There are too many buildings around here and not enough green restful places." Steve[359]
>
> "It would be an ecological and environmental crime to deprive the citizens of Studio City of this recreational area. . ." Richard and Judy Groll, Studio City et al.[360]

These quotes reflect only a smattering of over a thousand letters submitted in support of keeping Weddington Golf intact.

Preservation Rationale 3: Cultural and Historic Relevance

"Bob Hope was there every Sunday night at 10 p.m., like clockwork."[361] Dean Martin hit the first ball on opening day.[362] Jack Nicholson belongs to multiple private courses, yet still drops in on a regular basis.[363] Weddington Golf's connection to the entertainment industry and Hollywood history looms large. While the famous may have played a round, Weddington's community role transcends far its celebrity connections.

[363] Cook, "Jack Nicholson."

At the state level, the California Register of Historical Resources (CRHR) requires sites to meet at least one of its four criteria for either preservation, rehabilitation, restoration, or reconstruction.[364] At the local level, in order to qualify as a Historic Cultural Monument (HCM), the City of Los Angeles has similar requirements.[365] Weddington Golf meets two of the four criteria required for preservation – Criterion 1 and 3.

Criterion 1 requires a site to be "associated with events or patterns of events that have made a significant contribution to the broad patterns of local or regional history and cultural heritage of California or the United States."[366] The Historic Resources Assessment Report for Weddington compiled in 2012 supports this argument in its findings, noting that "as a privately-owned community recreation (golf) center built to service the growing community of Studio City in the mid-1950s," the site qualifies under Criterion 1.[367]

In terms of contributions to "local history," Weddington Golf is reflective of the suburbanization of the San Fernando Valley. As discussed above, the area's rapid growth created significant demands for recreation during the 1950s and 1960s. The golf course also reflects the widespread popularity of the sport during this era, and in this area specifically (as numerous other courses were built in the Valley during this time). However, Weddington is unique in that although it has always been privately owned, it is open to the public. The site has additional historic relevance in that it has always been open to women and communities of color – which was particularly significant during the 1950s, 1960s, and 1970s.

In terms of "cultural heritage," the Historic Resources Assessment Report references the site's importance to the entertainment industry, which is of particular significance to the history and development of Studio City.[368] Surrounding neighborhoods were named for the founders of each community – by contrast *Studio* City was named for its industry.[369] And it is the employees

of this industry who made up the majority of its residential population, and who have long used and loved Weddington Golf. "Stallone, Schwarzenegger, Will Smith, Denzel, my list is ridiculously long, and nobody cared who they were at that place," said del Barrio.[370]

Criterion 3 states that a site must "embod[y] the distinctive characteristics of a type, period, region, or method of construction, or represent the work of a master, or possesses high artistic values."[371] Designed by a highly-respected architect, Weddington's "represents the essential characteristics of a local, community golf course in the mid-1950s."[372] These characteristics include the "low-slung, Ranch style clubhouse" and the similarly designed driving range shelter, which is consistent with the architectural style of many local homes of the era.[373]

Figure 6.7: The golf ball-shaped lights, as seen from the parking lot in June, 2020. Image courtesy of Teri Austin.

The site's golf ball-shaped lights, a form of programmatic architecture, are a unique and distinct feature that also speaks to the particular time period in which they were built, as they could be seen at a distance from an automobile. This form of roadside architecture also ties into the sites large for its time parking lot, which broadly reflects the expanding car culture of the mid-century period. Palm trees, so representative of the California lifestyle and dream, have surrounded the course for decades. As the Historic Resources Assessment Report states, it

[372] Ibid., 28.
[373] Ibid.

"embodies the distinctive characteristics of a type as a typical example of a post-war community golf course."[374]

The State of California requires preservation sites to "ha[ve] yielded, or ha[ve] the potential to yield, information important to the prehistory or history of the local area, California or the nation" (Criterion 4).[375] The city of Los Angeles does not have a matching criterion.[376] However, historically, the Fernandeño Tataviam Band of Mission Indians (as well as numerous other tribes) used the Los Angeles River in this general area as a ritual site and main thoroughfare.[377] It is possible that there may be archeological artifacts on the site, although further research would be required to determine this.

Finally, the site is so beloved that a private citizen (with no formal training) recently took it upon herself to research and submit an HCM nomination for Weddington to the City of Los Angeles' Office of Historic Resources.[378] It is currently under review.

Future Uses

Although it has been established that Weddington Golf holds tremendous value, the site has been owned since 2017 by the Harvard-Westlake School. As discussed in Chapter VIII above, the school plans to build athletic facilities on the majority of the site. The Studio City Residents Association (SCRA) and other grassroots organizations, including Save LA River Space, are hoping a compromise can be reached between the school and the community, which would allow the space to remain in its current state. This outcome seems unlikely, given the school's significant financial investment in the property. However, there are possible alternatives.

One potential approach would see the City of Los Angeles purchase the land from the school, and retain the space as a public park and utility. This would be the ideal scenario for those who wish it to remain intact. However, the City has had numerous opportunities to buy it before, and has not followed through. This makes this proposal unlikely. However, there is precedent for this type of purchase. "When a similar dilemma faced the city of Calabasas, i.e., a swim and tennis club closing down, that city. . .acquire[d] and r[a]n the facility in order to provide a healthy, pleasing environment and spirit for its citizens as well as creating a sense of well-being and unity for the area."[379] Although Calabasas may have had the money to do so, where Los Angeles may not, it still reflects precedent for such a move.

There would be an additional benefit to this that the City has yet to formally evaluate. As a site situated along the Los Angeles River, the land was originally owned and utilized by local indigenous populations that still exist today. The site lies between two of the traditional villages amongst many in the Valley, and was likely part of the traditional path the tribes used as a social network.[380] Over the course of Spanish, Mexican, and American colonization, the land was stolen from these native groups, and their ability to use it traditionally was taken away.[381] If the City were to own the site, they could (and should) provide access to any of these remaining tribes, in order to utilize the acres of open green space for specific tribal ceremonies (particularly those that require land and access to the river). Their "ceremonies have [had] to adapt and change in order to deal with settler colonization and the massive dispossession of [their] people."[382] There is no reason that they should not be able to use the land in a way that reflects their cultural heritage and practice, particularly if it was publicly owned.

Another option would involve the community raising the funds or develop a public-private partnership to buy the land from Harvard-Westlake. This has been attempted in the past, and was unsuccessful.[383] There is other vacant land also within a few mile radius of Harvard-Westlake's campus that show potential as sites to build athletic facilities and that are not

[383] "Save LA River Open Space."

currently in use as green space. A school spokesman, Ari Engelberg, said that the project "is entirely about increasing the capacity of our athletic facilities so we can get kids home earlier."[384] Hardly a viable rationale for demolishing history and removing open space.

There is also an argument that Weddington Golf should be preserved purely because the need and demand for the space has not waned, and the community wants it to remain intact. This is reflected by the scores of letters written over the years and the continued grassroots campaigns to save it. Finally, if the site were granted HCM status, it could incentivize Harvard-Westlake to develop elsewhere.

[384] Sondheimer, "Harvard-Westlake releases first draft."

VII: Conclusion

Los Angeles has changed radically since 1955. Weddington Golf has not. It remains a defining element of the cultural landscape of Studio City, and a central part of its legacy. As a largely intact post-war, neighborhood golf course, it has provided years of connection, fun, sportsmanship, history, and has even been the site of some major Hollywood business deals. Its relevance to the community cannot be overstated. Built during a time of mass popularity for golf and rapid suburban growth in the San Fernando Valley, the course evokes the values and aesthetics stylings of its time. The course's history and continued use and relevance make it a prime site for preservation. The loss of this space in its current form would be monumental. "The process of mourning for a lost neighborhood. . .places that may no longer exist physically" is a phenomenon experienced by people all over the world.[385] Not everything can be saved, but when the opportunity presents itself to save something of value to a community, the question becomes not why, but rather how to save it. Weddington Golf is such a place. Studio City resident Richard Shamban sums this up perfectly: "The Studio City Golf and Tennis facility has been in operation in the community for more than 50 years. The entire property, from the tennis courts and golf course to the coffee shop is a safe destination place for families and children. This is a defining cultural icon of Studio City. This facility is one of the primary attractions for families to live in the city. Developing this open space would have an absolute, negative impact on the social environment and property values of the entire Studio City area."[386]

DEIR REPORT REVIEW - COMMENTARY

*The following are intended to serve as comments regarding WEXCO's observations of the Draft Environmental Impact Report (DEIR) relative to the Harvard-Westlake River Park Project, as of **March, 2022**, based on the information available to date.*

The format of this document is: 1) an excerpt of the DEIR including page/section number, 2) WEXCO's Relevant Summary of the DEIR provision, 3) WEXCO's comment as to the DEIR proposal. This report does not include all of our observations and opins and is subject to enhancement or changes as additional data is received.

Opening Statement

Per Section IV H Hazards and Hazardous Materials of the DEIR there are a series of Thresholds of Significance that characterize a significant impacts related to hazards and hazardous materials if the project would:

(a) Create a significant hazard to the public or the environment …

We believe there are significant hazards and / or safety concerns (not limited to hazardous materials) associated with the proposed project not limited to the items listed below:

1. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Page II-53)

Vehicle parking would be provided in aboveground and underground parking areas located on the eastern portion of the Project Site. Vehicles would enter the Project Site on Whitsett Avenue via a driveway located several hundred feet south of Valley Spring Lane (to the north of Field A) (referred to as north driveway) and **via a driveway at the paved portion of Valleyheart Drive located just south of LAFD Fire Station 78 (referred to as south driveway).** Both driveways would provide access to the proposed single-level underground parking structure, as described below. **No new driveways would be installed** along Valley Spring Lane or Bellaire Avenue, and the existing service driveway on Valley Spring Lane would be removed, thus eliminating an existing potential conflict location.

Relevant Summary

The roadway serving the Fire Station 78 at Valleyheart Drive is proposed to also be utilized by Harvard Westlake patrons and employees.

WEXCO Commentary

The elimination of the relatively exclusive use of the Valleyheart Drive serving the Fire Station is Unsafe

The south driveway and Valleyheart Drive should not be shared with Harvard Westlake in the event of a fire, or earthquake, or other emergency situation or calamity that would require the Firefighters to use the south driveway and Valleyheart. If the Valleyheart Drive has a line of vehicles entering the proposed facility, that traffic would severely impact the emergency services personnel, vehicles and equipment from ingress and egress.

The proposed south driveway plan will hinder emergency services ability to timely egress which can slow response time and be life threatening.

To the extent that pedestrian access, in/out of the Proposed Facility via the proposed South Driveway to cross or impede Emergency Services access is also unsafe.

There should be no encumbrances to the Fire Station and Emergency Services personnel and vehicles and equipment at the proposed South Driveway.

According to the LAFD Statistics, for LAFD Station 78, the Operational Response Time for Emergency Medical Services (EMS) is currently 7 mins 11 sec. For Advanced Life Support (ALS) LAFD Station 78 response time is currently 6 mins 18 secs. For Structure Fires, the response time is 5 mins 24 secs.

Per Vehicle Code 22500, it is unlawful to Stop, Stand or Park within 15 feet of the driveway entrance to a fire station.

Per the California Fire Code and / or Ca. Vehicle Code the minimum clear width of fire access roads is 20 feet.

2. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Pages II-53-54)

The south driveway would only allow entry into the subterranean garage, and all exits from the garage would be via the north driveway off Whitsett Avenue.

The roundabout has been designed to accommodate buses, shuttles, and automobiles. The roundabout would lead to a 29-space, short-term surface parking lot near the parking structure's southern entrance.

Rideshare vehicles would use the southern driveway (with roundabout) to access the surface parking lot.

Visitors that are not affiliated with the School would be informed about preferred driving routes and neighborhood parking prohibitions via signage, the School's website, through the online athletic facility reservation system (i.e., tennis court reservation system), and **information made available at the security kiosks.**

Relevant Summary

The Southern Driveway and Valleyheart Drive will serve numerous types of traffic. Signage will be placed to direct visitors about preferred driving routes and parking prohibitions.

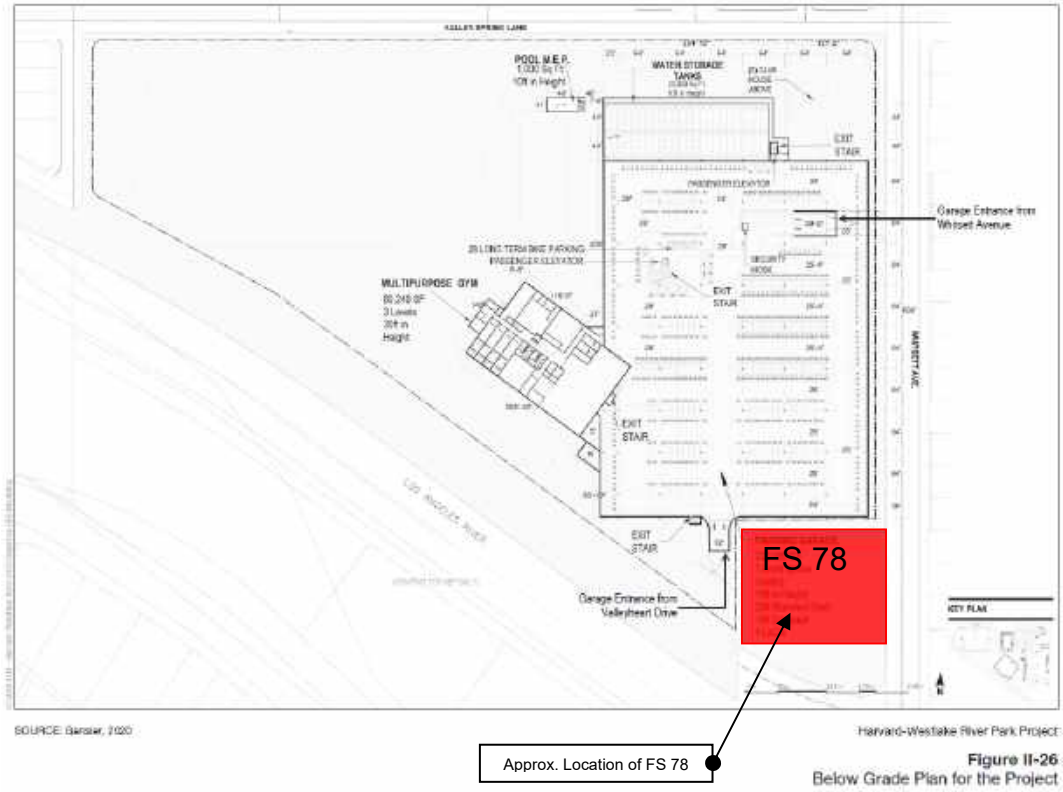
WEXCO Commentary

The north driveway will be congested given that the south driveway is slated for ingress only.

Traffic on Whitsett will be impacted by having a single exit point for a 500+ vehicle parking lot disbursing onto Whitsett from the proposed north driveway. Traffic congestion is a safety hazard. It is also a safety hazard in the proximity of

the Fire Station 78. Is there a controlled intersection planned for that north driveway? With a traffic signal? Will vehicles exiting the North driveway be allowed to turn left (north) onto Whitsett from the driveway?

There is no indication that the proposed internal roundabout would accommodate emergency vehicles. It is unclear how the 29-Parking Space vehicles on the surface lot will exit the proposed facility, since the North Driveway is for subterranean parking lot exit only.



Allowing Rideshare service Only into the Southern Driveway will cause confusion and a safety hazard. And, the confusion will further complicate the south driveway relative to the Fire Station 78 access/egress.

Visitors not familiar with the specialized proposed parking arrangements having to rely on specialized signs without fair warning will cause confusion and safety hazards.

There does not seem to be a plan to provide motorists enough lead time for motorists to assess the signs. That lack of lead time will force motorists to make snap decisions in using the North or South Driveway Entrance. There would need to be advanced signage along the roadway to accommodate motorists for proper specialized driveway entrance selection.

3. DEIR, Figure II-26

Indicates location of subterranean parking garage. (See below)

WEXCO Commentary

The proposed Below Grade Plan – does not indicate the Proximity of the Fire Station 78 and does not indicate the shared roadway (Valleyheart Drive) with Fire Station 78

The figure II-26 should provide more information so that the impacts to the Fire Station driveway is revealed.

4. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Page II-55)

To minimize conflicts with emergency vehicles exiting LAFD Fire Station 78, a flashing red warning light(s) would be installed on the southern exit driveway within the Project Site at a point located before vehicles reach Valleyheart Drive **that will hold back vehicles** exiting the Project Site roundabout onto Valleyheart Drive. This warning light would be activated by a remote control button pressed by LAFD staff in the emergency vehicle when an emergency vehicle is approaching Valleyheart Drive from Whitsett Avenue or exiting from one of the two LAFD driveways on Valleyheart Drive. This feature is identified as Project Design Feature TRAF-PDF-2 in Section IV.M, *Transportation*, of this Draft EIR.

Relevant Summary

A Flashing warning light will be added to alert Harvard Westlake patrons inside the proposed facility to "hold back".

WEXCO Commentary

The warning light will not serve traffic on Whitsett or Valleyheart.

It was indicated in the DEIR that the south driveway was only an entrance to the proposed facility. Why would a flashing light be needed inside the facility at the South driveway if it is only an entrance?

5. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Page II-55)

On days in which attendance is expected to surpass 300 spectators, tickets and parking passes would be required to enter the Project Site. **Spectators without a parking pass would be directed to park on the Upper School campus** and ride the School-provided shuttles to the Project Site. **Parking in the neighborhood would not be permitted and would be enforced by security personnel**, as discussed above.

Relevant Summary

If spectators do not have a parking pass they will be directed to turn around and park at the Harvard Westlake Campus (that already has limited parking and has overflow onto neighboring streets). (All Harvard Westlake related) parking will be enforced by Harvard Westlake security.

WEXCO Commentary

This scenario of re-directing motorists from the proposed facility to the HW Upper campus further complicates the traffic in proximity to Fire Station 78.

The Harvard Westlake Security agent has no authority to enforce the Vehicle Code or Parking Enforcement – this will further complicate the traffic conditions when spectators that are redirected to HW Upper Campus about 1 mile away – will have the option to park in the neighborhood

Harvard Westlake "enforcing" the neighborhood parking rules is unreliable and not lawful.

It should be noted that the existing facility (Tennis Courts, Driving Range, Club House/Pro Shop, Snack Shop and 9-hole Pitch and Putt Golf Course has 89 parking stalls with two exits on Whitsett. The proposed project includes 532 parking stalls (that reflects nearly a 600% increase in capacity) than what currently exists. It is unclear how this substantial (6x) increase in vehicle parking and traffic can be achieved safely with only one exit (the North Driveway).

The proposed project forecasts 2,217 "fixed" seating (there is always seats that can be brought in too). This increase in patronage and traffic for this neighborhood and the proximate Fire Station is excessive.

6. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Page II-56)

Three shuttles are anticipated to transfer students, coaches, and visitors between the campus and the Project Site between 2:30 p.m. to the end of the day's latest activity. **Shuttles would have an estimated rider capacity of 24 and service is anticipated every 5 to 10 minutes. Ingress and egress at the Project Site would be at the south driveway drop-off roundabout, at Valleyheart Drive, just west of the LAFD Fire Station 78.**

Relevant Summary

HW Shuttles will be used to transport patrons to and from the proposed site every 5 to 10 minutes in proximity to the LAFD Station 78.

WEXCO Commentary

The HW Shuttles are yet additional sources (amongst multiple sources) of traffic that further complicates the congestion and frequency of traffic in proximity to Fire Station 78

It should be noted in this analysis that years of construction of the proposed project will severely impact traffic along Whitsett, and the feeder streets and neighborhood including the LAFD Station 78.

(Continued)

7. DEIR, IV. M. Transportation 3. Project Impacts, (f) Vision Zero (Page M 35)

Vision Zero is a plan that **strives to eliminate traffic-related deaths** in Los Angeles by 2025 through strategies, such as modifying streets to better serve vulnerable road users. Projects located in the HIN should make improvements or fund them. **The Project's frontages are not along streets in the Vision Zero network.** The Project frontages are not along streets that are on the HIN, and, therefore, **the Project would not preclude or conflict** with the implementation of future Vision Zero projects in on the HIN.

Relevant Summary

HW claims the project frontages do not enter the Vision Zero network, therefore the project would not conflict with Vision Zero.

WEXCO Commentary

In LADOT's High Injury Network (HIN), Ventura Blvd from Coldwater Canyon Ave to Carpenter Ave is identified as a street with one of the City's highest incidences of severe and fatal injury collisions. Although the DEIR claims "The Project Site's frontages are not along streets that are part of the HIN," shouldn't the HIN be taken into account for all aspects of the project, including:

1) construction haul routes (which are planning to utilize Ventura Blvd between Whitsett Ave and Coldwater Canyon Ave),

2) prescribed student and visitor trip routes (from the Project Site back to the upper campus would entail heading southbound on Whitsett Ave, turning right and heading westbound on Ventura Blvd, and turning left on Coldwater Canyon Ave),

3) and daily, cumulative traffic impacts.

8. DEIR, IV. M. Transportation 3. Project Impacts, (e) LADOT Manual of Policies and Procedures (Page M 34-35)

MPP 321 states that on arterial highways, such as Whitsett Avenue, serving lots with frontages greater than 250 feet driveways should not be placed within 150 feet of the adjacent street. The Project proposes two driveways. The north driveway on Whitsett Avenue is more than 150 feet away from the closest intersection at Valley Spring Lane to the north. The south driveway on Valleyheart Drive that leads to Whitsett Avenue is more than 150 feet away from the closest intersection at Ventura Court to the south. MPP 321 also allows up to two driveways for up to 400 feet of frontage. The Project proposes two driveways and therefore does not propose more driveways than allowed by MPP 321.

WEXCO Commentary

The proposed driveways do not comply with the City's applicable requirements, as the north driveway is proposed to be 39 feet wide and the south driveway is proposed to be 33 feet wide.

Additionally, the south driveway is the extension of a public street, Valleyheart Drive, which is currently 33 feet wide. The Project is not consistent with the recommendation in the MPP Section 321.

9. DEIR, IV. M. Transportation 3. Project Impacts, Threshold (d) (Page M 44-45)

(a) Construction

The Project would include temporary construction activities (e.g., temporary lane closures, etc.) and generate construction traffic that could potentially affect emergency access to the Project Site and surroundings. As stated in the TA, the Project would not require construction activities that would take place within the right-of-way, which would necessitate temporary lane, alley, or street closures for more than a day at a time. Furthermore, emergency access would be maintained at all times as no road closures would be necessary. However, while construction activities would not require full street closures (i.e., at least one travel lane would be open at all times) and most Project construction activities would be confined to the Project Site, the Project would still implement a CMP (see Project Design Feature TRAF-PDF-1). Because of the short-term nature of the construction activities and with implementation of a CMP, the Project's construction activities would not require a new, or significantly interfere with an existing, risk management, emergency response, or evacuation plan. **The Project would not result in inadequate emergency access during construction.**

(b) Operation

Operation of the Project would not include the installation of barriers (e.g., perimeter fencing, fixed bollards, etc.) that could impede emergency vehicle access to the Project Site and in the Project vicinity. Drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. As discussed in Section IV.L.1, Fire Protection, **impacts to these services from Project implementation would be less than significant.** In addition, as discussed in Section IV.H, Hazards and Hazardous Materials, none of the streets adjacent to the Project Site are a City-designated disaster route.

…**the Project would not result in inadequate emergency access.**

WEXCO Commentary

The document addresses that "the Project would not result in inadequate emergency access." But, it does not specifically address the impacts to the Public. The above does not consider the effects of the construction in such close proximity to the LAFD Station 78 relative to the need of the Public. We are of the opinion that the proposed project would result in inadequate emergency egress to serve the General Public.

We disagree that the construction activities will be "less than significant" relative to Traffic and Emergency Services from LAFD Station 78.

10. DEIR, IV. M. Transportation 3. Project Impacts, Threshold (b) (Page M 40-41)

See Table IV M-5 Project Net Total Daily VMT (Vehicle Miles Traveled) Estimate

… **No mitigation measures were required or included, and the impact level remains less than significant.**

WEXCO Commentary

If the data in the DEIR is correct, the proposed project reflects a decrease in the VMT in the area from 6,000 Daily VMT (Existing Use) to 4,000 Daily VMT (but, only as it pertains to HW inbound miles).

However, if the Daily VMT included outbound miles the proposed project would be greater than the existing use (i.e. 8,000 Daily VMT). Therefore the subject proposed project VMT will be increased.

We would like to see the source of the data relative to the existing use data. It is hard to believe that the existing facility (with 89 parking stalls) generates more VMT than the proposed sports facility with 532 parking stalls and numerous Shuttles and other vehicles (Deliveries, Rideshare, etc.).

11. DEIR, IV. Appendix L. Public Service Provider Correspondence, Section L-1 Los Angeles Fire Department Correspondence, Fire Protection

The Los Angeles Fire Department continually evaluates fire station placement and overall Department services for the entire City, as well as specific areas. The **development of this proposed project, along with other approved and planned projects in the immediate area, may result in the need for the following:**

1. Increased staffing for existing facilities. (i.e., Paramedic Rescue Ambulance
and EMT Rescue Ambulance resources.)
2. Additional fire protection facilities.
3. Relocation of present fire protection facilities.

WEXCO Commentary

We agree.

12. DEIR, IV. V. Alternatives

(5) maximizes public safety through 24-hour, seven-day a week on-site security, monitored points of entry, and enforcement of a prohibition on off-site parking

WEXCO Commentary

We disagree. On-Site security has no authority to prohibit or enforce off-site parking.

13. DEIR, IV. V. Alternatives H. Hazards and Hazardous Materials (Page V-47)

As the Project would require grading and excavation of the Project Site, including a net cut/fill volume of approximately **250,000 cubic yards** (unadjusted), these grading activities could result in the exposure of construction works to hazardous conditions associated with contaminated soils or soil vapor. **As such, the Project could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving hazardous materials as a result of contaminated soils, and impacts would be potentially significant.**

WEXCO Commentary

Upon excavation, undisturbed soil may emit pollutants, contaminants, and particulate matter to the detriment of public health and safety (e.g., Valley Fever) that can compromise those with respiratory conditions.

The DEIR does not indicate any Swell Calculation of the Export soils.

Swell of compacted soil -as it is being excavated and placed into dump / haul trucks -is commonly estimated to be between 20%-25%. The amount of anticipated haulage of Export is misleading.

In other words, the Proposed excavation amount of 250,000 Cubic Yards of compacted earth materials will increase in size by 20%-25% as it is distributed from the earth to the dump trucks; thereby increasing the amount of haulage of earth materials from the 250,000 CY to 310,000 CY (i.e. 22.5% Swell Factor).

The DEIR does not indicate the weights of various construction elements that will impact the Roads and Infrastructure

WEXCO has not seen, in the DEIR, any calculations as to the weight of:

1) *Imported soils to the Site.*

2) *Imported Concrete to the Site.*

   The DEIR does not indicate the number of Concrete Trucks per day during the Project,

   The DEIR does not indicate the amount (in Cubic Yardage - CY) of concrete for the proposed project.

3) *Imported Steel and Reinforcing Steel to the Site.*

4) *Heavy Equipment transported to/from the site*

5) *.... and other substantive Construction Equipment and Materials.*

14. Additional Points

.1 Even if there is a median on Whitsett to prevent left-hand turns, when there are special events with visitors/cars exceeding the 500+ parking spaces, it is likely that people will park on the east side of Whitsett Ave and then either walk around the block to the nearest cross-street (with currently no crosswalk) or dart across Whitsett (east to west).

.2 Even if there are no street parking along Valley Spring Lane, what is to stop patrons from finding other nearby street parking? What safety ramifications were accounted for in the DEIR for the increased pedestrian travel along the surrounding streets that feed into the proposed project?

.3 Motorists heading northbound on Whitsett Ave. from Ventura Blvd. to the proposed project – where vehicles can't turn left into the project's north driveway - it is foreseeable that these northbound motorists will likely make a U-turn at the intersection of Whitsett Ave. and Valley Spring Lane to be able to enter the North Driveway. The DEIR does not seem to take that scenario into account.

.4 The methane gas emitted from the installation of artificial turf, along with the urban heat island effect are significant health (odor and or fumes) and safety (heat) impacts to occupants and the public.

.5 Significant light and noise pollution. Cumulative noise pollution (Crowds, Vehicles, Event generated sounds, Emergency Vehicles from LAFD Station 78 – coupled with the jet-noise impacts from Burbank and Van Nuys airports - is significant. Over 40 stadium-lights that are 40' or over in height (many of which are 80' tall) are slated to be added. The DEIR does not seem to account for the glare and light pollution generated by the proposed project.

.6 Per IV. Environmental Impact Analysis; L.1 Public Services – Fire Protection… As noted herein but worth repeating. As part of the Project design and per Project Design Feature TRAF-PDF-2, a flashing red warning light is proposed to be installed at the Project-facing side of the southern exit driveway within the Project Site at a point located before vehicles reach Valleyheart Drive that purports to "hold back" vehicles exiting the Project Site onto Valleyheart Drive. This warning light is proposed to be activated by a remote control button pressed by LAFD staff in the emergency vehicle when an emergency vehicle is approaching / or departing Valleyheart Drive / Whitsett Avenue or exiting one of the LAFD driveways on Valleyheart Drive. The warning light will purportedly reduce conflicts between vehicles leaving (but not entering) the Project Site and emergency vehicles leaving/coming back to the station. Also, the Project would include an at-grade security kiosk located near the roundabout, thereby placing a security guard nearby to assist with traffic management when the warning light is activated.

The proposed red flashing light solution is not nearly enough… More and other options are needed to address the impacts to the Public Safety relative to the impacts of the construction and proposed project to the LAFD Station 78.

The DEIR even suggests that LAFD Station 78 may need to be RELOCATED resulting from the proposed project (see Section L-1 Los Angeles Fire Department Correspondence, Fire Protection)

> ***LAFD Fire Station was built in 2004 – it would be a tremendous burden to now (because of the proposed project) resort to relocating an 18 year-old LAFD Station 78.***

Manual operated safety systems, such as those proposed, are subject to human error.

.7 In addition to the excessive stadium lighting issue (see 14.5 above) the existing street lighting on Whitsett Ave. is particularly not suitable for the increased pedestrian traffic that would be generated by the proposed project. Potential mitigation of this hazard would be to eliminate events or day-time only usage of the site.

.8 Given the proximity of the proposed tennis courts to Valley Spring, not only will there be noise pollution from the tennis players but also a risk of errant tennis balls entering the roadway. There is a potential for errant sports related equipment to enter Whitsett from Field A as well.

.9 **Liquefaction issue and the proposed construction of the subterranean garage, and sports facilities at the southern edge of the property near the LA River channel wall:**

Prior to the construction of LAFD Station 78 that was built in 2008, the Geotechnical Engineering Division (GED) commissioned URS Corporation (URS) to perform subsurface exploration at the site and laboratory testing of samples collected from the site.

The URS 2004 report Conclusions and Recommendations section states:

"Liquefaction-induced settlements and lateral spreading were evaluated for the proposed Fire Station #78. For a design seismic event with a probability of occurrence of 10% in 50 years (PGA=0.53g), we estimate that liquefaction-induced settlements would be about 2 inches. For such an event, **lateral spreading would produce ground displacements of up to 8 inches in a zone extending about 125 feet behind the channel wall,** with displacements being greatest immediately behind the wall. Attenuating with increasing distance from the wall, horizontal ground displacements are expected to approach zero at the edge of the 125-foot wide zone affected by lateral spreading. With the proposed building footprint being located just outside this zone, the building foundations are not subjected to shaking-induced lateral spreading"

> "Because the site is underlain by loose soils to depths of up to 15 feet, and **because there is a potential for liquefaction-induced settlements from saturated loose sands at depth, we recommend that the building be supported on piles**. In addition to supporting the building loads, **the piles will have to be designed to accommodate negative skin friction caused by liquefaction-induced settlement** of the loose sands at depth."

The subject DEIR recommends a mat foundation system (not piles), but what remains unclear is how close the proposed planned development is to the LA River channel wall and if any development (including underground) is within that 125 feet zone from the northern wall of the River channel.

According to the URS 2004 report, anything within the 125-foot zone, which would also be "40 feet north of the northern right of way of Valleyheart Drive" would be "susceptible to distress as the result of lateral movement." ***It appears that the proposed improvements would be susceptible to distress and therefore unsafe for occupants and the general public given the proximity of the proposed project to a vital storm drain system (LA River). This aspect of the proposed project does not appear to have been thoroughly analyzed.***

California's water conservation has been a bust so far. Will drought restrictions work?

A man with a leaf blower cleans a driveway as a sprinkler irrigates a lawn on Sunset Boulevard in Los Angeles. (Mel Melcon / Los Angeles Times)

BY JAIMIE DING | STAFF WRITER

MAY 7, 2022 **UPDATED** 7:53 AM PT

Almost a year after Gov. Gavin Newsom pleaded with Californians to voluntarily cut their water use by 15% amid a worsening drought, water conservation figures are still nowhere near that mark.

Now, as millions across Southern California face unprecedented water restrictions beginning next month, some water experts say that much broader cuts, such as those ordered by former Gov. Jerry Brown during the last drought, are needed to rouse the state from its false sense of water security.

“Even during the last drought, when Gov. Brown asked for voluntary cuts, we didn’t meet those,” said Heather Cooley, director of research at the Pacific Institute, a water think tank in Oakland. “We really need to go toward the mandatory. It really does send a signal that we are all in this together, and that everyone needs to be doing their part.”

Between July — when Newsom urged Californians to slash water use by 15% — and February, statewide cumulative water savings have amounted to just 5.8% relative to a 2020 baseline.

forcing the water supplier to move to Stage 4 of its drought contingency plan.

The North Coast region also reduced water usage by 14.5% and the San Francisco Bay region by 10.5%.

But in Southern California, which had ample reserves last year, the story has been very different. In the South Coast hydrologic region, which is home to more than half the state's population, water use dropped by just 4.6% in the same period, and the Los Angeles Department of Water and Power saw just 2.6% cumulative savings.

Water conservation falling short

In July, Gov. Gavin Newsom asked Californians to reduce their water usage by 15%. As of February, the state conserved only about 5.8%.

The percentages shown are the sum of conservation activities between July 2021 and February 2022.

California State Water Resources Control Board

Salma Loum LOS ANGELES TIMES

A few water districts even increased their water usage significantly, with El Segundo reporting 44.6% more water since last July.

El Segundo officials say that increase was tied to the disastrous flooding of L.A.'s Hyperion Water Reclamation Plant in July. After debris

clogged filtering screens at the Playa del Rey plant, industrial customers that usually used recycled water for cooling had to use potable water for several months, said Elias Sassoon, El Segundo's director of public works.

After California experienced its driest ever January, February and March, leaving State Water Project supplies perilously low, officials with the Metropolitan Water District of Southern California declared unprecedented restrictions that are set to begin next month. Though Cooley said the action may serve as a "wake-up call" for many, it still remains to be seen whether the state can change course.

Experts have offered a variety of reasons for California's lackluster conservation efforts.

Some point to the drier-than-usual climate, which caused Californians to water their lawns and gardens more often than usual at the start of the year.

Cooley and others say the lack of statewide mandatory restrictions on water use, such as those ordered by Brown two years into the last drought, is to blame.

Still others say there's a psychological aspect that comes with dealing with drought for an extended period of time.

"We've been talking about drought for a really long time at this point, even though we had like a brief little lapse," said Kelly Sanders, a professor of environmental engineering at USC Viterbi School of Engineering. People are "becoming desensitized to the severity of the drought. You don't hear people talking about it quite as much as you did in 2015 and 2016."

The possibility of your water being shut off is

also “less tangible” than something like having your electricity going out, Sanders said.

CLIMATE & ENVIRONMENT

One way around California’s water restrictions: Recycle water from your laundry

May 4, 2022

Still, the experts insist a 15% statewide goal is achievable.

There remain many opportunities to reduce long-term water use, such as replacing old appliances that use significantly more water than ones on the market now, Cooley said.

The Pacific Institute’s research found that urban water use could be decreased by an additional 30% just by adopting current standards for appliance water efficiency. This includes fixing leaky pipes and replacing washing machines and toilets.

Further investment in what is considered more “leading-edge technology” could increase water savings to 48%, Cooley said.

Officials are also targeting lawns as one of the biggest culprits of unnecessary water use.

The State Water Resources Control Board is considering a ban on the irrigation of turf on industrial, commercial and institutional properties like schools and hospitals, “where that turf is not serving a functional purpose,” said James Nachbaur, director of research, planning and performance at the state water conservation agency.

This would not affect individual homeowners, parks or other areas where people are actively using the turf, Nachbaur said.

Many water suppliers around the state also offer various rebates for replacing lawns with drought-tolerant gardens or standard sprinkler systems with drip irrigation, which use 20% to 50% less water than sprinklers. The Los Angeles Department of Water and Power has offered a $3.00 rebate per square foot of turf for up to 5,000 square feet since 2019.

Changing a landscape is still a "relatively easier way" to become more efficient in our water use than tackling indoor water use, which has already been dropping over time in California and continues to decline, Nachbaur said.

Despite the slow progress in water conservation so far, Nachbaur believes the actions by the water board and local suppliers as well as ramped-up messaging campaigns build on each other and are "adding up to more cumulative awareness of drought."

The MWD approved a nearly $11-million media campaign in hopes of capturing people's attention amid a "dizzying" news cycle, according to the board's chief operating officer, Deven Upadhyay.

There's a cultural resistance, however, to these kinds of changes, experts say. The verdant lawns and expansive yards are certainly an object of American obsession, a trademark of homeownership and the subject of inspection by homeowners associations, nosy neighbors and the like.

"For a very, very long time, we've kind of told everybody that you can have whatever kinds of plants that you want," Sanders said. "We're just going to have to get used to a landscape that looks a little bit more native to Southern California and its current climate, you know. The times of big lush green lawns might be

limited.”

Save Weddington DEIR Comment Letter 5.10.2022.pdf
17214K

May 10, 2022

Kimberly Henry
Los Angeles City Planning Department

RE: ENV-2020-1512-EIR

Dear Ms. Henry,

Save Weddington is a neighborhood non-profit group whose mission is to preserve and protect the last 16 acres of unprotected green open space along the Los Angeles River in the San Fernando Valley at Weddington Golf & Tennis as recreational space available for public use and enjoyment.

Save Weddington submits the following comments on the proposed Project. In addition, we are submitting as part of this letter two independent expert reports: air quality/greenhouse gases and safety.

We are also attaching a copy of our online petition, wherein nearly 14,000 citizens voice both their support for the preservation of the entire 16-acre Weddington Golf & Tennis parcel and concern over the proposed Project's negative impact to precious green open space.

The Draft Environmental Impact Report (DEIR) does not consider the impact of providing so many exceptions and variances to City building codes and limits for this Project, nor the precedential effect that approval of this Project would have on future development.

We continue to have serious concerns about the negative impact of this Project in regards to Aesthetics, Air Quality, Biological Resources, Construction and Operational Noise, Land Use Compatibility, Lighting, Safety, and Traffic hazards created by the Project.

Finally, please note that more than 14,000 community members have signed a petition supporting the preservation of the 16-acre Weddington property in its *entirety*. The community urges you to reject the DEIR's inaccurate and incomplete picture of potential environmental impacts, as well as deny approval of the required Condition Use Permit and certification of the DEIR.

Thank you for your time and consideration of this most important matter.

14. Community Views of Harvard-Westlake School and its Proposed Project **26**

- ***Dismissal of Community Needs and Desires***

1. Air Quality and Air Pollution Impacts (Excavation, Construction, and Operational)

A report was performed by Soil/Water/Air Protection Enterprise (SWAPE) regarding the Project's air quality, health risk, and greenhouse gas (GHG) impacts (Attachment 1). The SWAPE report finds that "the DEIR underestimates the Project's construction-related emissions and should not be relied upon to determine Project significance." The report also finds that "several model inputs were not consistent with information disclosed in the DEIR." These include overestimated existing land use size, unsubstantiated changes to individual construction phase lengths, unsubstantiated numbers of vendor trips, incorrect CO_2 intensity factors, and incorrect application of construction-related mitigation measures. In addition, the report finds that diesel particulate matter health risk emissions were inadequately evaluated with no quantified construction or operational health risk analysis (HRA). The report also finds that the DEIR fails to adequately evaluate GHG impacts (e.g., incorrect and unsubstantiated quantitative analysis of emissions, failure to identify a potentially significant GHG impact, project design features should be incorporated as mitigation measures, failure to consider performance-based standards under CARB's 2017 scoping plan, and failure to consider performance-based standards under SCAG's RTP/SCS). Additional considerations and recommendations for inclusion in a recirculated DEIR (RDEIR) can be found in the SWAPE report (Attachment 1).

2. Noise Pollution Impacts (Construction and Operational)

Excess noise, like that proposed as part of the Project is widely-known to have adverse health impacts in humans, including increased blood pressure and is associated with an increased risk of developing cardiovascular disease, hypertension, stress, sleep disturbances, among other adverse effects. Noise also has adverse impacts on wildlife (e.g., communication interference for songbirds, prey species becoming distracted, etc.) and the DEIR fails to analyze how these impacts to wildlife from increased noise may be reduced to a non-significant level. The DEIR fails to acknowledge these impacts of noise on human or animal health and consider them when determining mitigation measures. A recirculated DEIR (RDEIR) must include this information.

The DEIR does offer a sound study, but one that merely predicts Project noise generated will be similar to other sport venues, but not how drastically the noise level will increase from what it is now in this residential neighborhood, with some homes as close as 45 feet away.

The DEIR is incomplete as it also fails to accurately identify what noise impacts are avoidable. Several proposals to avoid or minimize construction and operational noise pollution impacts exist (e.g., type of public address (PA) system used, speaker locations, etc.). However, the DEIR does not provide adequate data regarding:

- No public address (PA) system
- No games or scrimmages

- No spectators

The community is extremely unconvinced that the Applicant will be able to preserve the tranquility (and related noise levels) of the existing site, as was pledged by Councilmember Krekorian in his 2017 letter announcing the Applicant's purchase of the Project Site (Attachment 2). More specifically, the letter indicated that "the school has also acknowledged that it will respect the community's desires by maintaining the tranquility of the property." The Project's proposed components are simply not in compliance with this notion that was promised to the community. Transitioning from a site that is predominantly comprised of a 9-hole golf course to a private school sports complex that offers different, louder sports (e.g., football, soccer, lacrosse, swimming) will not be able to satisfy the commitment of the Applicant conveyed by Councilmember Krekorian.

In fact, the issue of noise and noise mitigation on the Applicant's existing upper school campus was raised during the Applicant's previous proposed failed development plan (ENV-2013-0150-EIR). A study at the Applicant's upper school campus by Veneklasen Associates found that even though the Applicant was attempting to expand its facilities, which would obviously add to the cumulative noise impact, the Applicant did not even comply with its existing Conditional Use Permit (CUP), with its current field generating noise in excess of the LAMC and Noise Ordinance (Attachment 3). What is to say this won't happen again at the Project's proposed facilities? In a recirculated DEIR (RDEIR), the Lead Agency must study this occurrence in greater detail before the potential approval or issuance of a CUP.

Finally, cumulative noise impacts must include jet noise from altered Federal Aviation Administration (FAA) flight paths and flights that originate from Hollywood Burbank Airport. Numerous lawsuits have been filed and resolution of this issue is ongoing. The Project site is also very close to the Santa Monica Mountains and Foothills, where jet noise is amplified by canyons and hillsides.

3. Lighting and Light Pollution Impacts

Lighting impacts as a result of the Project will be noticeable and significant for the entire community. A majority of the existing Weddington Golf & Tennis site (the 9-hole golf course) is not lit past sundown at night and an increase in illumination of any magnitude will be severe and significant. A lighted gymnasium, two lighted fields, and eight lighted tennis courts, among other lighted Project components, where there is now almost complete darkness will be a significant shock to both the local community and wildlife.

Lighting impacts will impact the Western Yellow Bat, among other species. The DEIR reads, "If present on-site, the special-status bat species are already adapted to living in an urbanized setting with the existing night lighting on-site, as well as from the adjacent residential and commercial

areas and traffic along roads." This statement negates the fact that the bats are not currently faced with human activity on the golf course past nightfall. So, the bats may be accustomed to surrounding neighborhood streetlights and car headlights, but they are not used to any light emanating from light poles on the golf course, like those that are being proposed in the Project.

The DEIR admits that "the illumination of the new Project site would produce more footcandles on the athletic facilities than the lighting of the existing Weddington Golf & Tennis facility" and "this would make the Project site's surfaces more prominent at night than the previous facility, as the athletic fields will be brighter." This is absolutely true, given the fact that there is no light whatsoever on a large portion of the Project site as a 9-hole golf course. Furthermore, the Project proposes security lighting, which indicates there will be some level of light on the Project site 24 hours a day, which is in stark contrast to the existing Weddington Golf & Tennis site. Finally, variances for 80 foot light poles cannot be approved without significant detrimental impacts to the surrounding community and therefore, any of the Project's proposed light poles must remain at the same height of existing light poles at Weddington Golf & Tennis.

The DEIR then continues to explain that because the target plane would be at ground level, which is perpendicular to views from tested receptor locations, views of the illuminated surfaces would be limited. However, it is mentioned that "the residential neighborhood on the hill above Ventura Boulevard has a more direct view of the facilities, unobstructed by landscape or architecture, from which to observe the "glow" of the Project site." Many of these community members already experience the "glow" from Ventura Boulevard and would consider additional "glow" from the proposed Project to be a cumulative significant impact.

In a July 15, 2019 Los Angeles Times article titled "Harvard-Westlake Releases First Draft for New Athletic Facilities on 16-Acre Site in Studio City,"[1] a Harvard-Westlake School spokesperson said that the Project "is entirely about increasing the capacity of our athletic facilities so we can get kids home earlier." If that is still a primary goal of the School with the Project, no lights on the Project site would compel practices and activities to end earlier so that students can leave school and arrive home earlier. Therefore, we believe there should be no more light than that which presently exists on the Project site.

The DEIR analysis also does not take into consideration the reflectivity of turf, which has been shown to be about 55% when light is shown directly downwards on turf. However, with slightly different light positioning (60° angle), only 12% of the light is reflected upward. This reflection creates light spillover and glare conditions around the Project site that will be bright enough to affect both human and animal health. Research has shown that in regions with high light pollution, both humans and other animals experience a suppression of the melatonin hormone, which impacts

[1] Available at: https://www.latimes.com/sports/highschool/varsity-times/la-sp-vti-harvard-westlake-athletic-facilities-20190715-story.html

circadian rhythms. There also appears to be a correlation to outdoor lighting and cancer rates in humans. In birds, specifically, increased illumination can change bird behavior such that normal singing times are altered.

Finally, although we would have commented on lighting designs, including photometric calculation reports, plot maps, and cut sheets, the DEIR Appendix B. Lighting Report does not seem to include the Appendix 2 that was referenced in the Appendix B. Lighting Report. A recirculated DEIR (RDEIR) needs to include all materials (including all appendices of appendices).

4. Traffic Impacts and Calculations

The DEIR is defective because the baseline condition was never measured, but rather, modeled using pre-COVID data. All other calculations stem from that original modeled baseline. This is a serious problem and therefore, these calculations need to be nullified, since they would not take into account any changes in traffic patterns, populations, usage, or developments during the period from April 2019 to the present.

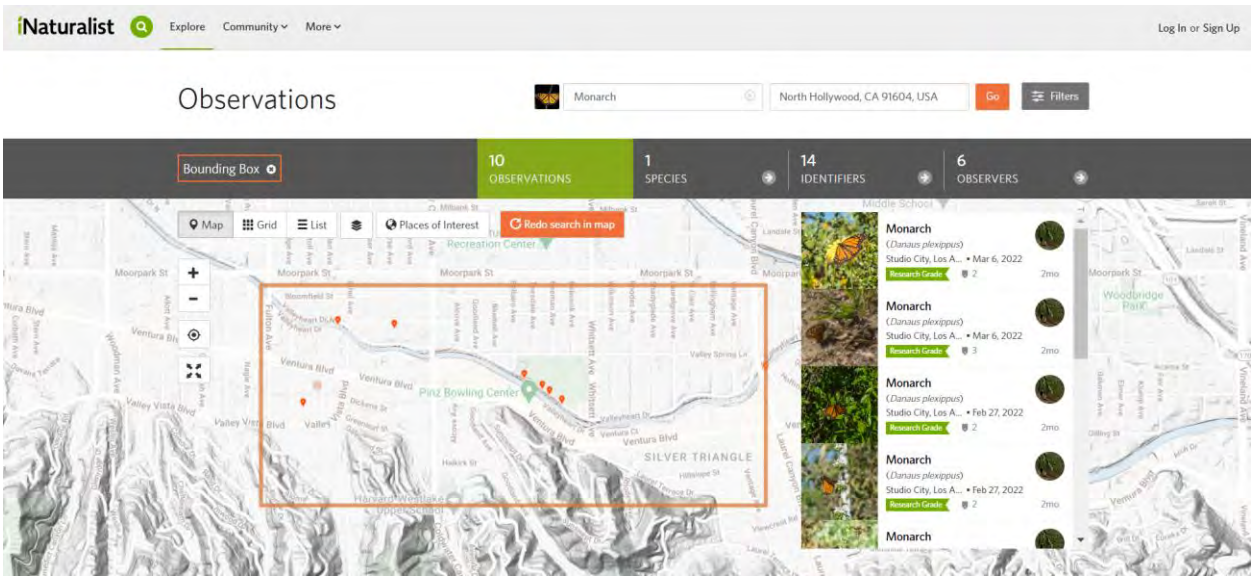
In addition, in the DEIR, historical Los Angeles Department of Transportation (LADOT) traffic counts from 2017 were used for Intersections 4 (Coldwater Canyon Avenue and Moorpark Street) and 5 (Coldwater Canyon Avenue and Ventura Boulevard). However, these counts in 2017 would have been analyzing traffic flows before construction for the Sportsman's Landing development began (2019) or was completed (2021), which severely compromises additional analyses. A recirculated DEIR (RDEIR) must perform traffic analyses using accurate baseline data, as well as data that incorporate the significant impact of cumulative projects on local traffic.

The DEIR is inadequate because the Applicant's proposed Project would result in a conflict, since it would "preclude the City from implementing adopted transportation-related programs, plans and policies" as it related to Los Angeles' Green New Deal Sustainability pLAn. The pLAn calls for the "redu[ction of] Vehicle Miles Traveled (VMT) per capita by at least 13% by 2025; 39% by 2035; and 45% by 2050."[2] The Applicant's proposed private school sports complex would increase the existing parking space capacity by nearly 600% (from 89 existing spaces to 532 proposed spaces). The increased capacity for parking would inherently encourage VMT at a time when the Green New Deal Sustainability pLAn calls for reducing reliance on single-occupancy vehicle use and trips. More specifically, the pLAn calls for "increas[ing] the percentage of all trips made by walking, biking, micro-mobility / matched rides or transit to at least 35% by 2025; 50% by 2035; and maintain at least 50% by 2050."[2]

[2] Available at: https://plan.lamayor.org/sites/default/files/pLAn_2019_final.pdf

The DEIR is inconclusive, as it lacks in providing full and current transportation support data. The community use component of the Project or community-serving recreational facilities are exempt from vehicle mile traveled (VMT) analysis. It does not make sense why the VMT analysis only focuses on "the educational facility portion of the Project" or "on the Harvard-Westlake athletic activities use, as an educational facility." With the Applicant eager to supposedly increase public access to the Project site, it remains unclear why DEIR VMT analysis would not include visitors from the general public. Unfortunately, it appears that the DEIR is using miles driven by "community" participants as an "impact write off." The community truly believes this Project, and especially the transportation and traffic impacts, needs to be examined with a holistic lens.

The Project calls for a total of 532 parking spaces, 88 more than legally required. Alternatives must focus on decreasing the number of parking spaces at the Project site. According to the United States Department of Transportation 2017 National Household Travel Survey, the average number of miles driven by Americans peaked in the 1990s and as of 2017, dipped below 2001 mileage levels.[3] This phenomenon, coupled with a decreased individual car ownership preference among millennials (who are the nation's largest living adult generation),[4] indicates that future development planning should place less emphasis on accommodating visitors' individual cars with designated parking spaces. With the construction of a 532-space parking structure, which represents a roughly 600% increase over the number of spaces currently on site, the proposed Harvard-Westlake project substantially increases visitors' reliance on cars, a concept steeped in the past, not the future.



5. Biological Resources and Destruction of "Desirable Open Space"

Specific Animal Species

The DEIR is incomplete, as there remains an underestimation of the value the parcel of green open space at Weddington Golf & Tennis provides to various species. For example, the DEIR flora and fauna inventory lists two bird species (Allen's Hummingbird and Rufous Hummingbird) that appear on the watchlist of Partners in Flight, a network of organizations focused on landbird conservation. This watchlist identifies species that are of highest conservation concern at the continental scale.[5] In addition to the two listed in the RDEIR inventory, according to eBird, a citizen science database, two other bird species (Oak Titmouse and Band-Tailed Pigeon) have been cited at Weddington Golf & Tennis and/or along the Los Angeles River between Whitsett Avenue and Coldwater Canyon Avenue.[6] All four species mentioned above are listed on the Partners in Flight watchlist due to "population declines and moderate to high threats."[5] According to eBird,

[3] Available at: https://nhts.ornl.gov/assets/2017_nhts_summary_travel_trends.pdf
[4] Available at: https://uspirg.org/sites/pirg/files/reports/Millennials%20in%20Motion%20USPIRG.pdf
[5] Available at: https://partnersinflight.org/wp-content/uploads/2017/03/SPECIES-OF-CONT-CONCERN-from-pif-continental-plan-final-spread-2.pdf
[6] Available at: https://ebird.org/hotspot/L6684917

Weddington Golf & Tennis is one of the most biologically diverse parcels of green open space on the Valley floor between the Sepulveda Basin and Universal Studios.[6] In addition, the DEIR lists the potential occurrence for monarch butterflies (one species listed on the California Department of Fish and Wildlife (CDFW) Special Animals List) to be "none." However, according to an iNaturalist search, monarchs have been identified in the Zev Greenway, immediately adjacent to the Biological Study Area. There even seems to be a grouping of sightings along the Zev Greenway.

Also, importantly, monarchs typically follow the same migration route of their ancestors, so a presence of some may indicate more are around or there are more who use the general area in their migration patterns.[7,8] Additional analysis and inventories must be performed in a recirculated DEIR (RDEIR).

The types of trees that are used by species like birds and bats matter and this information is absent from the DEIR. Although the DEIR emphasizes the non-native nature of the existing, mature tree canopy, it is critical that the habitat value of these trees is understood. The DEIR states that the "Biological Study Area supports some potential nesting and foraging habitat for migratory birds and raptors." Additionally, the DEIR flora and fauna inventory lists several raptors that were "observed in the Biological Study Area" or "in the off-site portion of the Biological Study Area along Zev Greenway," including Cooper's Hawks, Red-Tailed Hawks, and Red-Shouldered Hawks. According to the Los Angeles Raptor Study 2021 Final Report,[9] for a variety of reasons,

[7] Available at: https://www.fs.fed.us/wildflowers/pollinators/Monarch_Butterfly/documents/ConservationManagementMonarchButterflies.pdf
[8] Available at: https://www.fs.fed.us/wildflowers/pollinators/Monarch_Butterfly/migration/
[9] Available at: https://friendsofgriffithpark.org/wp-content/uploads/2021/09/FoGP-Raptors-2021F.pdf

raptors prefer and utilize pine and eucalyptus trees for nesting, even though they are non-native species.

The report reads, "Looking at nest tree and substrate type (Tables 3c – 3d), as in prior years, (non-native) pines (Pinus spp.) were the most common nest tree used in 2021 (99 of 266 observed nests; 37%), followed by gums (Eucalyptus spp.) and related species (n = 54), Shamel ash (Fraxinus uhdei) with 30 nests, sycamores with 22 nests, and figs (Ficus spp.) with 19 nests … As noted in 2020, the low usage rate of native trees must correlate strongly with availability, as native trees are almost non-existent as street trees (except for sycamores), and large specimens of most native trees (e.g., coast live oak) are largely restricted to patches of open space like the eastern Santa Monica Mountains, and sparingly elsewhere … As we wrote in 2019, by virtue of their abundance across the urban and suburban landscape of the study area, pines and eucalyptus "accounted for a relatively large proportion of our local nests, highlighting the importance of the very large, non-native trees in and around the park, many of which have matured – and are now the tallest trees around – since they were planted decades ago. While non-native, they clearly provide excellent nesting opportunities to the local raptor community, and have essentially outpaced native substrates locally, perhaps enabling native raptors to continue using the habitats."[9]

The DEIR claim that "a significant number of native replacement trees (a 36-percent increase as compared to existing conditions)" would enable "species adapted to urban areas … to persist on-site" underestimates the importance of the existing, mature urban tree canopy. For instance, the Western Yellow Bat (Lasiurus Xanthinus) prefers the Mexican Fan Palm, as evidenced by the United States Department of Interior, Bureau of Reclamation, Lower Colorado River Multi-Species Conservation Program Report on the Western Yellow Bat (WYBA).[10] The 2015 report states, "In a study of bat roost site habitat conducted at the LCR, WYBA were documented to use Mexican fan palms (Washingtonia robusta) almost exclusively and did not exhibit roost switching behavior."[10] Therefore, while non-native, the Mexican fan palms serve an important function for this California Department of Fish and Wildlife (CDFW) species of special concern. Additionally, the DEIR states that the Project would remove the majority of Mexican fan palms, and therefore, potential habitat, leaving only 53 from the original count of 174. The DEIR is incomplete, since it greatly underestimates the impact of the removal of this many trees of the same species, which is suitable potential habitat for the Western Yellow Bat.

Urban Tree Canopy

The DEIR is defective, as it fails to describe the importance of preserving existing, mature urban tree canopy and the time lag in benefits provided by proposed plantlings versus existing trees. The 2016 Los Angeles County Tree Canopy Assessment (conducted by TreePeople, SavATree, The Center for Urban Resilience at Loyola Marymount University, The Spatial Analysis Laboratory at

[10] Available at: https://www.lcrmscp.gov/reports/2015/g06_wyba_cem_2015.pdf

the University of Vermont's Rubenstein School of the Environment and Natural Resources, Dr. Dexter Locke, United States Forest Service, and CalFire) mentions this goal explicitly when the report says, "keeping the trees you have is more efficient than removing and replacing them."[11]

The report goes on to state, "Preserving existing tree canopy is critical. The ecosystem services provided by trees are directly related to the amount of canopy they provide. When trees are removed and replaced, there is not only a size difference in the canopy provided by the new tree compared with the mature tree; there is also a time lag of reduced benefits until the new tree can grow to the size of the mature tree. Keeping the trees you have is more efficient than removing and replacing them."[11]

A recirculated DEIR (RDEIR) must include calculations that determine exactly how long it will take for the Applicant's proposed plans (tree removal and tree planting) to equal the benefits provided by the existing, mature urban tree canopy. The community cannot afford to wait for a definitive answer on how long it will take for the proposed urban tree canopy to match the benefits of the existing canopy.

It is widely understood that Los Angeles' urban tree canopy is not equitably distributed. According to the TreePeople Los Angeles County Tree Canopy Map Viewer, tree canopy occupies 42.4% of land in Studio City (ZIP code 91604), which is 24.4% higher than the LA County average (18.0%).[12] The Studio City neighborhood is extremely fortunate to have a sizeable urban tree canopy. However, as a result, the local community is at risk of losing significant portions of its existing tree canopy due to irresponsible development projects, like the one currently proposed by the Applicant. Community members are opposed to the removal of such a large chunk of mature tree canopy - regardless of the species.

An Environmental Cost-Benefit Analysis for the existing, mature urban tree canopy at Weddington Golf & Tennis was performed by Angelenos For Trees, a community group uniting Los Angeles neighborhoods to preserve and regenerate its rapidly shrinking tree canopy (Attachment 4). The Angelenos For Trees report describes various economic appraisals of tree canopy at Weddington Golf & Tennis, as well as calculates several critical measures that help quantify the benefits of the existing tree canopy. Notable findings include:

- Yearly estimate of carbon dioxide (CO_2) sequestration is $1,584.14.
- Yearly estimate of carbon dioxide (CO_2) sequestration is 67,439.56 lbs.
- Yearly estimate of storm water mitigation is $413.32.
- Yearly estimate of storm water runoff avoided is 46,330.26 gals.
- Yearly estimate of storm water rainfall intercepted is 312,555.20 gals.

[11] Available at: https://digitalcommons.lmu.edu/cgi/viewcontent.cgi?article=1005&context=cures_reports
[12] Available at: https://www.treepeople.org/los-angeles-county-tree-canopy-map-viewer/

- Yearly estimate of air pollution removal is $2,412.25.
- Yearly estimate of air pollution carbon monoxide removal is 237.83 oz.
- Yearly estimate of air pollution ozone removal is 6,027.37 oz.
- Yearly estimate of air pollution nitrogen dioxide is 1,469.45 oz.
- Yearly estimate of air pollution sulfur dioxide is 104.49 oz.
- Yearly estimate of air pollution (fine particles or particulate matter) is 63.00 oz.
- Estimate of carbon dioxide (CO_2) stored to date is $35,281.18.
- Estimate of carbon dioxide (CO_2) stored to date is 1,520,466.02 lbs.

According to the performed Environmental Cost-Benefit Analysis, the 240 trees slated to be removed as part of the Project sequester a total of 898,772.54 lbs of carbon dioxide (CO_2) (Attachment 4). This figure is immense, but not surprising, as mature trees serve as excellent storers of carbon. However, the DEIR fails to perform such an analysis or describe how the removal of these trees and the release of nearly one million pounds of carbon dioxide (CO_2) will impact the local community. The DEIR is also inadequate because it fails to examine relocating existing tree canopy, which has been done in other development projects, including The Village at Westfield Topanga.

The Project also calls for the installation of a pedestrian ramp leading to the Zev Greenway at Coldwater Canyon Avenue. Although the DEIR states that "the Project Site (Property and County Leased Property) and the off-site improvement areas comprise the Biological Study Area," Appendix D. Biological Resources Technical Report fails to include a cluster of what appears to be three significant pine trees. A recirculated DEIR (RDEIR) must include these resources if they are designated in the Project's Biological Study Area.

The DEIR proposes that non-protected "significant" trees would be replaced at a 1:1 ratio with RIO District-compliant trees and public street trees from the right-of-way would be replaced at a 2:1 ratio. The DEIR claims that these ratios would result in the 240 removed trees being replaced by 393 trees (which would exceed the minimum required) for a total of 574 in the Biological Study Area. However, in its current configuration, the Project cannot accommodate the proposed tree planting program. As it stands now, much of the Project site's natural, green open space is slated to be paved over to erect a gymnasium, two artificial turf fields, an Olympic-size swimming pool, and eight new tennis courts. The remaining area is inadequate to plant 393 trees, except, perhaps, in ways that would be ecologically and arboriculturally inappropriate.

Developers often use these planting ratios as a means to an unjustified end, not recognizing that we cannot add more trees to less space to plant our way out of the emergency our City faces and specific sites must be designed properly to support these plantings. For example, according to Environmental Protection Agency reports, "Big trees require large volumes of soil and aboveground and belowground space to grow… A large-sized tree (16 inches DBH) needs <u>at least</u>

1,000 cubic feet of uncompacted soil. A tree's ability to establish, grow to its full potential, and remain healthy is largely dependent upon soil volume."[13,14] Plans for compacting soil in various locations across the Project site also adds to the unrealistic and nonviable proposal of planting 393 trees and ensuring they reach maturity. A recirculated DEIR (RDEIR) must calculate the carrying capacity of what remaining open space land is available (factoring planning for tree height, spread, and root growth) and determine what the exact number of trees at maturity will be, so community members can have a better understanding of what they could expect long-term before the removal of any significant portion of our existing mature, urban tree canopy is allowed to commence.

6. Geotechnical, Grading, and Soil Excavation Impacts

The DEIR is flawed, as it fails to disclose the specific proximity of the proposed Project development to the northern wall of the Los Angeles River channel. A 2004 geotechnical report states that "proposed structures within 125 feet of the northern wall of the river channel, corresponding to approximately 40 feet north of the northern right of way of Valleyheart Drive, will be susceptible to distress as the result of lateral movement that could occur as the result of seismic shaking" (Attachment 5). Based on anticipated liquefaction-induced settlement, analyses of the Project site from 2004 (Attachment 5) and 2019 (DEIR Appendix G. Geotechnical and Paleontological Resources Documentation) also recommend that proposed structures be supported on piles or a mat foundation system. Therefore, more detailed information on what type of development is planned in this sensitive zone of potential lateral spreading (within 125 feet of the northern wall of the Los Angeles River channel) is required in a recirculated DEIR (RDEIR).

According to the Aperture report (Attachment 6), the DEIR does not include any swell calculation of the export soils. As a result of soil swell, "the proposed excavation of 250,000 cubic yards of compacted earth materials will increase in size by 20%-25%," resulting in a more accurate haulage amount estimate of 310,000 cubic yards. While the initial figure of 250,000 cubic yards could be considered large, the 310,000 cubic yards estimate is even more astounding. For reference, 250,000 cubic yards is about five times as big as the United States Capitol Rotunda and about seven-and-a-half times as big as the Lincoln Memorial Reflecting Pool. The larger, more accurate estimate of 310,000 cubic yards is about six-and-a-half times as big as the United States Capitol Rotunda and about nine-and-a-half times as big as the Lincoln Memorial Reflecting Pool. This more accurate estimate affects other DEIR subjects, including haul truck trips. While the DEIR indicates a total of 35,714 haul truck trips are required for export of 250,000 cubic yards of excavated materials, how many more truck trips would be required for 310,000 cubic yards of soil?

[13] Available at: https://www.epa.gov/sites/default/files/2015-11/documents/stormwater2streettrees.pdf
[14] Available at: https://www.epa.gov/sites/default/files/2016-11/documents/final_stormwater_trees_technical_memo_508.pdf

Additionally, the DEIR defers analysis of mitigation for haul routes, as the haul routes are not clearly delineated. The community needs to know the identified receptor site for the excavated materials, as haul trucks don't simply appear or disappear at the US-101 Freeway off-ramp/on-ramp at Coldwater Canyon Avenue. Since the community will be put at risk by the emissions caused by the enormous excavation and hauling associated with this Project, the public deserves to know what the true amount of soil excavation and true number of haul truck trips will be. Clearly, soil excavation and truck trips have been underestimated and a recirculated DEIR (RDEIR) should include more accurate information by incorporating the swell effect into grading export and truck trip calculations, as well as provide complete haul routes.

7. Hazards and Hazardous Materials

Although the DEIR describes potential inhalation, ingestion, or contact hazards related to artificial turf, there is limited discussion regarding Per- and polyfluorinated alkyl substances (PFAS) or "forever chemicals." Artificial turf compliance to the California Department of Public Health's lead content is listed as 50 parts per million (ppm) or less. However, there is no mention of allowable content of PFAS. The California Office of Environmental Health Hazard Assessment recently proposed new limits to regulate PFAS because they do not break down in the environment. The State's goal would limit two of the most notorious PFAS compounds: 1) Perfluorooctanoic acid (PFOA) to 7 parts per quadrillion and 2) Perfluorooctanesulfonic acid (PFOS) to 1 part per trillion.[15] The State's current response level is 10 and 40 parts per trillion for PFOA and PFOS, respectively.[16] The DEIR fails to disclose mitigation or adherence strategies once these fields are no longer in compliance with the State's crackdown on these "forever chemicals."

Artificial turf fields also leach microplastics into the soil and groundwater. Since the artificial turf field is permeable and the planned rainwater capture cistern is located nearby Field A, PFAS may contaminate the planned 1-million gallon stormwater capture and reuse system that is expected to provide a minimum of one-third of the Project's total annual irrigation demand. Also, considering the potential for runoff from both of the Project's proposed artificial turf fields into the Los Angeles River, which flows to the Pacific Ocean, filtration systems that are equipped to and aimed at removing PFAS are necessary. Various options exist and technologies recommended by the Environmental Protection Agency (EPA) include granular activated carbon absorption, ion exchange resins, and high-pressure membranes.[17]

Some of the most well-known artificial turf manufacturers are AstroTurf, FieldTurf, MatrixTurf, and SporTurf. These manufacturers often claim that their various turf products do not contain PFAS. But, these claims are often based on industry laboratory testing and independent testing is

[15] Available at: https://oehha.ca.gov/sites/default/files/media/downloads/crnr/pfoapfosphgdraft061021.pdf
[16] Available at: https://www.waterboards.ca.gov/press_room/press_releases/2020/pr02062020_pfoa_pfos_response_levels.pdf
[17] Available at: https://www.epa.gov/sciencematters/reducing-pfas-drinking-water-treatment-technologies

always required to verify such claims. For example, AstroTurf claims its Rhino Blend 46 does not contain PFAS[18] and FieldTurf pledged that its Revolution 360 product does not contain PFAS.[19] However, citizens had samples of FieldTurf's Revolution 360 independently tested and the results did show that several types of PFAS were found in surface water adjacent to a newly-constructed artificial turf field at a local high school and other cases have produced similar findings.[19] As a result, despite claims from industry representatives that no PFAS are present in its products, use of artificial turf must be prohibited, for the safety of all in our community, including the Applicant's own students.

Finally, a recirculated DEIR (RDEIR) must contain a contingency management plan for the filtration and storage of these "forever chemicals," as they cannot ever truly be disposed of or destroyed and must be properly contained and stored.

Other hazards of artificial turf include greenhouse gases emitted in its production, transportation, and processing. Artificial turf hazards also include crumb rubber, which, according to the DEIR, "may also emit trace to low levels of volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) (including PAHs and phthalates) into the air, depending on outdoor air temperatures. PAHs and phthalates refers groups of compounds, some of which have been identified by OEHHA as compounds known to have a risk of causing cancer or reproductive toxicity, such as chrysene, naphthalene, and di(2-ethylhexyl)phthalate (DEHP)."

The DEIR also only includes limited discussion regarding the contribution of artificial turf on the urban heat island effect. On warm, sunny days, artificial turf fields become dangerously hot, often forcing the postponement of athletic practice or contests due to the possibility of heat-related injuries. Surface temperatures can be significantly higher on artificial turf than natural turf. Finally, although the Applicant has informed the community that its newer technology turf will minimize the significance of these issues, according to a study in *The Journal of Sports Engineering and Technology* titled "Comparison of Surface Temperatures of Different Synthetic Turf Systems and Natural Grass: Have Advances in Synthetic Turf Technology Made a Difference,"[20] any kind of artificial turf (newer technologies or not) will cause higher temperatures for the local climate.

The DEIR also fails to discuss or analyze the fact that although artificial turf may reduce irrigated water, water will be required to cool the turf for use at certain times of the year. In fact, a recent study in the *Journal of Irrigation and Drainage Engineering* titled "Water Requirements for Cooling Artificial Turf"[21] describes a mathematical model that was developed based on the heat

[18] Available at: https://www.boston.gov/sites/default/files/file/2021/05/Showa%20Boston%20-%20SMRT%20Supplemental%20Information%20Submission_210526.pdf
[19] Available at: https://files.cityofportsmouth.com/agendas/2021/citycouncil/cc101821cp.pdf
[20] Available at: http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.848.8800&rep=rep1&type=pdf
[21] Available at: https://ascelibrary.org/doi/epdf/10.1061/%28ASCE%29IR.1943-4774.0001506

balance equation to determine heat dissipation from artificial turf-based fields with comparison of the predicted values to experimental data. The report reads, "This model indicates that the amount of water required to maintain Artificial Turf (AT) temperatures at levels comparable to irrigated Natural Turf (NT) over a 24-hr period exceeds the water requirements of bermudagrass NT in the same environment."[21] While the study was conducted in New Mexico, which has been classified as having an arid climate zone, according to the Thornthwaite climate classification system, Los Angeles is semiarid and mesothermal. Moreover, subject experts have considered Los Angeles's climate to be semi-arid Mediterranean.[22] Additional research also reveals that the cooling effect of water being applied to artificial turf only lasts for less than one hour and "in order to provide a cool, playable surface, irrigation amounts for artificial turf are greater than for natural warmseason turf."[23] In conclusion, if the use of water to irrigate natural turf is comparable to the amount of water required to cool artificial turf, DEIR claims touting artificial turf as a water-saving measure to reduce irrigation water demand must be re-considered. This information must be examined further in a recirculated DEIR (RDEIR) and re-calculated in the Water Supply section of the RDEIR.

Although there is one peer-review article cited in the DEIR Hazards and Hazardous Materials section, the study was conducted by scientists at the Gradient corporation, an industry consulting firm.[24] Additionally, no author hailed from a neutral academic institution. In fact, towards the end of the article, under the funding disclosure section, the study says that the lead corresponding author, Michael K. Peterson, "was retained as a scientific advisor by the Recycled Rubber Council from 2015 to May 2017. Gradient has been involved in many projects related to recycled rubber for a variety of entities, including school districts, health districts, synthetic turf manufacturers, rubber recyclers, and trade associations." If peer-reviewed studies are going to be referenced, they should be truly non-partisan and include authors from a range of institutions, including universities, health systems, or academic medical centers. Although many researchers often interact with industry in some fashion, the inclusion of authors from academic institutions helps provide rigor that may be lacking when academicians are not included in studies.

The DEIR completely omits analysis of artificial turf-related athlete injuries. Findings from the following peer-reviewed studies are intended to provide the Lead Agency with helpful information on this topic that is absent from the DEIR. According to a study of National Football League (NFL) athletes published in *The American Journal of Sports Medicine* titled "Higher Rates of Lower Extremity Injury on Synthetic Turf Compared With Natural Turf Among National Football League

---

[22] Available at: https://laist.com/news/is-los-angeles-a-desert
[23] Available at: https://www.researchgate.net/profile/Ahmed-Kanaan/publication/327540438_Quantifying_Water_Required_to_Cool_Artificial_Turf/links/5b947486299bf147392bafcf/Quantifying-Water-Required-to-Cool-Artificial-Turf.pdf
[24] Available at: https://www.sciencedirect.com/science/article/abs/pii/S0013935117303936

Athletes,"[25] "play on synthetic turf resulted in a 16% increase in lower extremity injuries per play than that on natural turf" and "synthetic turf surfaces have a causal impact on lower extremity injury." According to a study of National Collegiate Athletic Association American (NCAA) football players published in *The American Journal of Sports Medicine* titled "Incidence of Knee Injuries on Artificial Turf Versus Natural Grass in National Collegiate Athletic Association American Football: 2004-2005 Through 2013-2014 Seasons,"[26] "athletes participating in competitions on artificial turf experienced posterior cruciate ligament (PCL) injuries at 2.94 times the rate as those playing on grass," "injury rates for PCL tears were significantly increased during competitions played on artificial turf as compared with natural grass," and "lower NCAA divisions (II and III) also showed higher rates of ACL injuries during competitions on artificial turf versus natural grass." According to a study of NCAA football players published in *The American Journal of Sports Medicine* titled "Incidence and Risk Factors for Injuries to the Anterior Cruciate Ligament in National Collegiate Athletic Association Football: Data From the 2004-2005 Through 2008-2009 National Collegiate Athletic Association Injury Surveillance System,"[27] "the rate of anterior cruciate ligament (ACL) injury on artificial surfaces is 1.39 times higher than the injury rate on grass surfaces." According to a study of NCAA football players published in *The Knee* titled "The Effect of Playing Surface on the Incidence of ACL Injuries in National Collegiate Athletic Association American Football,"[28] "the rate of ACL injury on artificial surfaces is 1.39 times higher than the injury rate on grass surfaces" and "non-contact injuries occurred more frequently on artificial turf surfaces (44.29%) than on natural grass (36.12%)." According to a study of major league soccer players published in *The American Journal of Sports Medicine* titled "Injury Surveillance in Major League Soccer: A 4-Year Comparison of Injury on Natural Grass Versus Artificial Turf Field,"[29] "within injury subgroups, overall ankle injury, Achilles injury, and ankle fracture were found to have a statistically higher incidence on artificial turf" and "within individual injury categories, a higher rate of ankle injury was found on artificial turf." According to a retrospective cohort study of high school athletes published in *Current Orthopaedic Practice* titled "Injury Incidence is Higher on Artificial Turf Compared with Natural Grass in High School Athletes: A Retrospective Cohort Study,"[30] "athletes were 58% more likely to sustain injuries on artificial turf than natural grass," "lower extremity, torso, and upper extremity injuries were significantly more likely to occur on artificial turf," and "football, girls soccer, boys soccer, and rugby had higher injury incidences on artificial turf." The DEIR underestimates the significance of this hazard. In light of studies showing extensive athlete injury risks while playing sports that

[25] Available at: https://journals.sagepub.com/doi/pdf/10.1177/0363546518808499?fbclid=IwAR1TQEjsCTwhz5C2imYhSq9sEtrYVP7IvGpED-cy4_Q5HgHqHhvD_7ZwpIo

[30] Available at: https://journals.lww.com/c-orthopaedicpractice/Abstract/2021/07000/Injury_incidence_is_higher_on_artificial_turf.6.aspx

are proposed to be played on the Project site, a recirculated DEIR (RDEIR) must address how the safety of student athletes and the general public will be assured when using artificial turf.

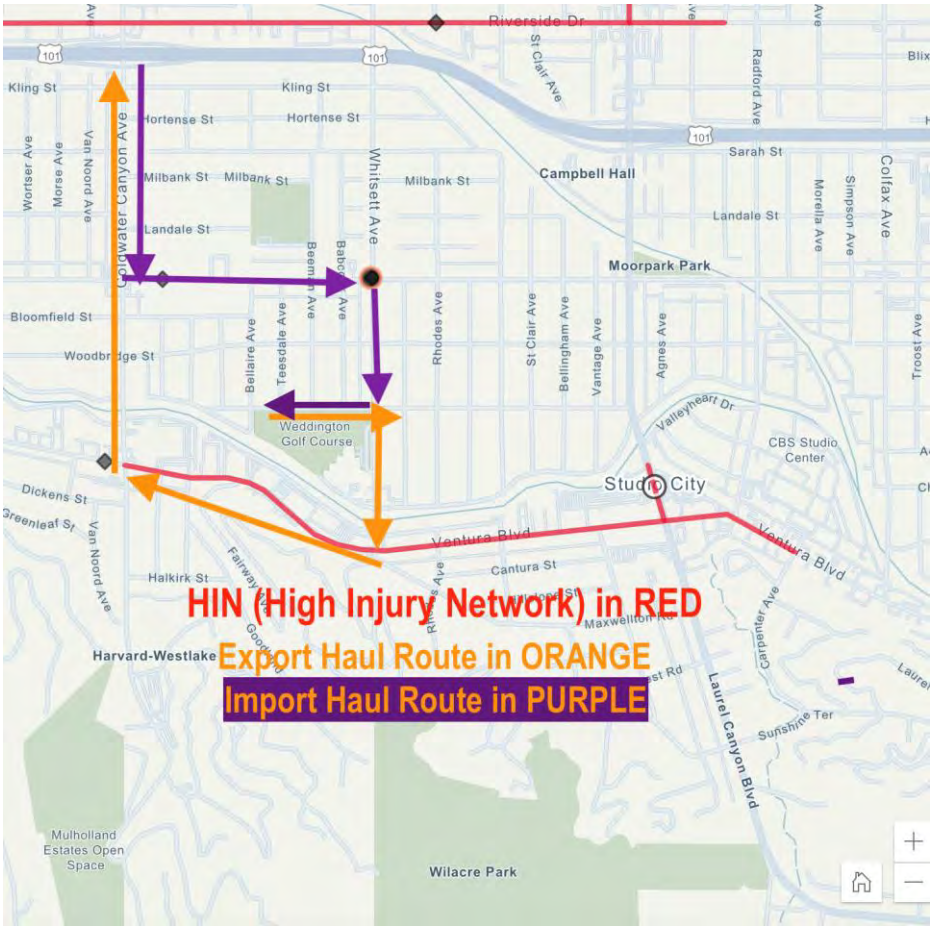
The DEIR also completely omits analysis of athlete perceptions of artificial turf safety. The following peer-reviewed studies and letters from players unions provide clarification and additional context. According to a study of professional soccer players published in the *Journal of Applied Statistics* titled "Elite Players' Perceptions of Football Playing Surfaces: A Mixed Effects Ordinal Logistic Regression Model of Players' Perceptions,"[31] "the majority of players expressed a strong preference for the use of Natural Turf pitches over alternatives such as Artificial Turf." According to a study of professional soccer players published in *BMC Sports Science, Medicine and Rehabilitation* titled "The Perceptions of Professional Soccer Players on the Risk of Injury From Competition and Training on Natural Grass and 3rd Generation Artificial Turf,"[32] "players believed that playing and training on artificial turf (FT) increased the risk of sustaining a non-contact injury," "the players identified three surface related risk factors on FT, which they related to injuries and greater recovery times: 1) Greater surface stiffness 2) Greater surface friction 3) Larger metabolic cost to playing on artificial grounds," and "overall, 94% of the players chose FT as the surface most likely to increase the risk of sustaining an injury."

The President of the National Football League Players Association (NFLPA), the union representing the players of the National Football League, cited years of higher rates of injury on artificial turf versus natural turf when advocating that "NFL clubs should proactively change all field surfaces to natural," "our occupation is dangerous enough, and the increased rate of lower extremity injuries linked to the field surface we are forced to play on is unacceptable," and "the NFLPA is advocating for teams to convert artificial practice and game fields to natural grass fields."[33] Furthermore, the United States National Soccer Team Players Association (USNSTPA), the players union for members of the United States men's national soccer team, "is opposed to playing any game on sod placed atop artificial surfaces."[34]

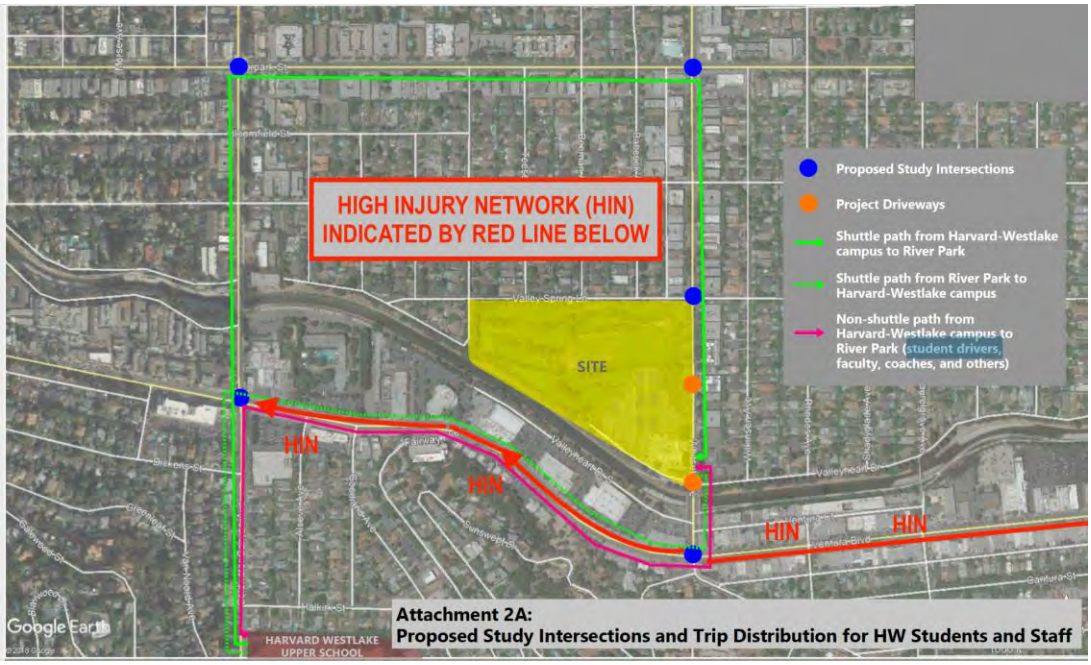
The DEIR is inaccurate when it states that, "in addition to compliance with applicable disposal regulations, artificial turf consists of material that can be recycled at the end of its useful life" misrepresents the truth and requires additional context. In fact, a consultant report for CalRecycle (Attachment 7) and investigative journalism[35] have proven that the recycling options are extremely limited or virtually non-existent. The consultant's report was commissioned by (under contract to) CalRecycle, part of the State of California Environmental Protection Agency (EPA), for its

[31] Available at: https://www.tandfonline.com/doi/pdf/10.1080/02664763.2016.1177500
[32] Available at: https://link.springer.com/content/pdf/10.1186/2052-1847-6-11.pdf
[33] Available at: https://nflpa.com/posts/only-natural-grass-can-level-the-nfls-playing-field
[34] Available at: https://ussoccerplayers.com/2019/04/usnstpa-statement-for-playing-on-sod-at-nippert-stadium-on-june-9.html
[35] Available at: https://www.theatlantic.com/science/archive/2019/12/artificial-turf-fields-are-piling-no-recycling-fix/603874/

consideration. The report indicates that most of the State's crumb-rubber fields are going to the dump. The report states "it appears that in practice landfill disposal is by far the most common method for managing field components after removal, and no complete examples of an actual recycling project for the components of a removed field in California were identified." The report also found that "markets for recycled crumb rubber infill are extremely limited" (Attachment 7). Therefore, a life-cycle assessment for artificial turf and a contingency management plan for the disposal of artificial turf must be presented in a recirculated DEIR (RDEIR).



8. Safety Impacts



A report (Attachment 6) performed by Aperture (formerly WEXCO) regarding the Project's safety impacts is included. The Aperture report raises a number of concerning topics, many of which relate to ensuring the safe ingress and egress for emergency services personnel and vehicles at the Los Angeles Fire Department (LAFD) Station 78. First off, the report states that eliminating the Fire Station's relatively exclusive use of Valleyheart Drive and allowing vehicle and pedestrian traffic on Valleyheart Drive to access the Project site and the south driveway is unsafe. It is crucial to note that residents living south of Ventura Boulevard are located in a Very High Fire Hazard Severity Zone (VHFHSZ). Any impacts to emergency services personnel and vehicle response times stemming from the proposed Project may pose a significant threat to the entire Santa Monica Mountains, as any fire in this VHFHSZ can quickly become uncontrolled and spread rapidly.

The report also states that for Project Design Feature TRAF-PDF-2, "the proposed red flashing light solution is not nearly enough" and "manual systems such as those proposed are subject to human error." In light of the fact that the DEIR raises the possibility that increased staffing for existing facilities, additional fire protection facilities, or that relocation of the existing LAFD Station 78 may be needed, "more and other options are needed to address the impacts to the Public Safety relative to the impacts of the construction and proposed project to the LAFD Station 78" (Attachment 6).

In addition, the Aperture report (Attachment 6) asks the Lead Agency if a controlled intersection with a traffic signal is being planned for the north driveway, as this is the only exit point for all 503 underground parking spaces. The report also clarifies that although parking in the neighborhood would not be permitted, the Applicant's security guards do not have the authority to enforce the Vehicle Code or Parking Enforcement, so the proposed enforcement is not truly enforceable. Additionally, the report suggests that all aspects of the Project (construction haul routes, planned student and visitor trip routes, and daily, cumulative traffic impacts) should be examined in light of the Los Angeles Department of Transportation (LADOT)'s High Injury Network (HIN), which designates Ventura Boulevard between Coldwater Canyon Avenue and Carpenter Avenue as a street with one of the City's highest incidences of severe and fatal injury collisions.

Please refer to the two maps below, the first of which illustrates the construction haul routes in the context of the HIN and the second of which illustrates planned student and visitor trip routes in the context of the HIN.

The Aperture report also raises the possibility of errant sports-related equipment entering roads, like Valley Spring Lane (from the proposed tennis courts) and Whitsett Avenue (from the proposed Field A). Golf balls are found on Valley Spring Lane and Whitsett Avenue now, so it is likely sports-related objects will enter these streets, which could be dangerous (Attachment 7).

Speaking of dangerous roads, the Aperture report suggests that when there are special events, "it is likely that people will park on the east side of Whitsett Avenue and either walk around the block to the nearest cross-street (with currently no crosswalk) or dart across Whitsett (east to west)." In addition, the street lighting on Whitsett Avenue is not particularly suitable for the increased pedestrian traffic that would be generated by the proposed project (Attachment 7). Potential mitigations proposed would be to eliminate events and allow day-time only usage of the Project site.

The DEIR is inadequate because by not including a comprehensive Health Risk Assessment, it has alarmingly failed to consider the health risks to nearby residents (many of which are seniors and children) from construction-related toxics and the cumulative toxic air contaminant (TAC) emissions that include operational emissions. Again, as the Project site is uniquely situated within a residential neighborhood, with some homes as close as 45 feet away, the DEIR must comprehensively analyze all risks to ensure the community's health and safety. We encourage the Lead Agency to insist on the use of AERMOD to characterize increased health risks of exposures to TACs. A recirculated DEIR (RDEIR) must demonstrate that the Lead Agency considers it a priority to protect public health by including a comprehensive Health Risk Assessment to definitely determine which of the Project's many impacts are truly significant.

9. Recreation Impacts

The DEIR is inadequate because it fails to explain how different sports offer different opportunities and challenges for different athletes or users. Replacing the current multi-generational sports of golf and tennis with team sports (basketball, football, lacrosse, etc.) that require schedules, practices, and uniforms will dramatically reduce public access for people of all ages and instead, cater to a much smaller demographic of school-aged participants. The DEIR is also defective, since in many instances, it uses “as the crow flies” as a measure, instead of actual measurements.

The assumption in the DEIR that people using the par 3 golf course at Weddington Golf & Tennis will "migrate" to larger, 18-hole courses fails to take into account that seniors and younger children will be excluded by either age or stamina to utilize much larger courses. Also, the increased cost and travel involved will also deprive many of opportunity and access.

The proposed reduction of publicly-available tennis courts (from 16 to 8) will restrict the ability of Southern California community members to learn and play tennis. Since the early 1970s, Weddington’s courts have served as a teaching hub, with pros offering instruction to beginners and experienced players, alike. Approximately 100,000 Angelenos of all backgrounds and from across the San Fernando Valley and City of Los Angeles (according to a survey in the DEIR, tennis players at Weddington are widely distributed and originate from 74 regional ZIP codes) use Weddington Golf & Tennis each year. If the proposed development is approved (for the primary benefit of approximately 800 Harvard-Westlake School students), tens of thousands of community members will be forced to relocate to continue playing tennis or may simply stop playing tennis altogether. We urge City Planning to consider this question: Is privatizing spaces that have been open to the public for nearly 70 years, for the limited use of a select few, really in the best interest of the City and its residents?

Although the DEIR lists alternate "tennis courts in the East San Fernando Valley available to the public," the average number of courts at those facilities is less than five, which fails to account for the fact that associations and leagues cannot utilize so few courts at these facilities. A greater number of courts for tournaments, like the 16 at Weddington, is needed for association and league use (Attachment 8, Attachment 9). More importantly, City facilities do not permit the block reservations utilized by pros, associations, and leagues as are currently allowed at Weddington.

The DEIR claims the proposed Project would be able to continue to host league matches "as under existing conditions”; however, this is false. Associations and leagues need, on average, greater than 4 courts per facility at a time for tournaments. And, they are already starved for courts (Attachment 9). How could the proposed Project continue to host associations when only eight courts are being proposed and historical precedent reveals a single organization cannot book all the courts at once? (Some courts need to remain available for non-association/league public use).

In addition, there is only a tepid acknowledgement in the DEIR that "the reduction in tennis courts from 16 to 8 available to the public and hours of use during weekdays and Saturdays when the courts would be used by the School, indicates that some tennis players would either need to conduct their tennis activities at other times of the day or other days when there is ample court availability, than under existing conditions, or relocate to other tennis facilities in the area." The Project will result in the displacement of thousands of tennis players, much to the detriment of the community.

The DEIR Table IV.L.3-6's comparison between existing average use versus future project capacity is extremely misleading and requires clarification in a recirculated DEIR (RDEIR). The table is not comparing apples to apples. If it was, it would be comparing existing capacity to future capacity. Instead, it is comparing existing average use to future capacity. Of course, it is obvious that capacity and opportunity for play would be greater with the existing 16 courts versus the proposed 8 courts.

Finally, in the DEIR, there are multiple disclaimers and pre-conditions for use of the proposed project's facilities, including access to facilities "when not in use by School," "for pre-approved Studio City-based organizations," and "for pre-approved swim program members." These limitations are in stark contrast to the publicly available amenities at Weddington Golf & Tennis, which have always been open to all community members without restrictions of any kind at any time.

10. Cultural Resources

The DEIR is defective because it fails to address the impacts of the Project on a character-defining feature of the Project site (the golf course) and fails to identify significant Project-related historic resource impacts.

First, the DEIR Historic Resources Technical Report Figure 3 fails to identify the Weddington Golf & Tennis facility or Project site as a Designated Historic-Cultural Monument or SurveyLA Identified Historic Resource. The figure needs to clearly identify if the Project site is a Designated Historic-Cultural Monument or SurveyLA Identified Historic Resources.

The DEIR also fails to reference the existing lawsuit filed against the City of Los Angeles (Superior Court of California, County of Los Angeles Case Number: 21STCP04158) regarding the suspicious, last-minute removal (without evidence, as required by law) of historically and culturally significant terms from the final Historic-Cultural Monument (HCM) designation determination. The essential defining terms "golf club" and "golf course" were improperly removed at the last minute during the final vote for the designation. The revised findings

inappropriately limit the scope of the HCM designation and do not honor the full history, heritage, culture, and experience of Weddington Golf & Tennis. We are also gravely concerned about any precedent this may set for Los Angeles preservation moving forward.

The DEIR asserts that "the Project would not result in a substantial adverse change in the significance of a historical resource" because "the Project site would remain a private recreational facility open for public use in Studio City, and the character defining features of the HCM, specifically the clubhouse, putting green, golf ball-shaped light standards, and brick wall with weeping mortar, would all be retained such that the Project Site would retain its historic integrity and continue to convey its significance as a 1950s community recreational facility." However, this rationale would need to be revised if the City is instructed to correct its oversight and amend its HCM designation for Weddington Golf & Tennis.

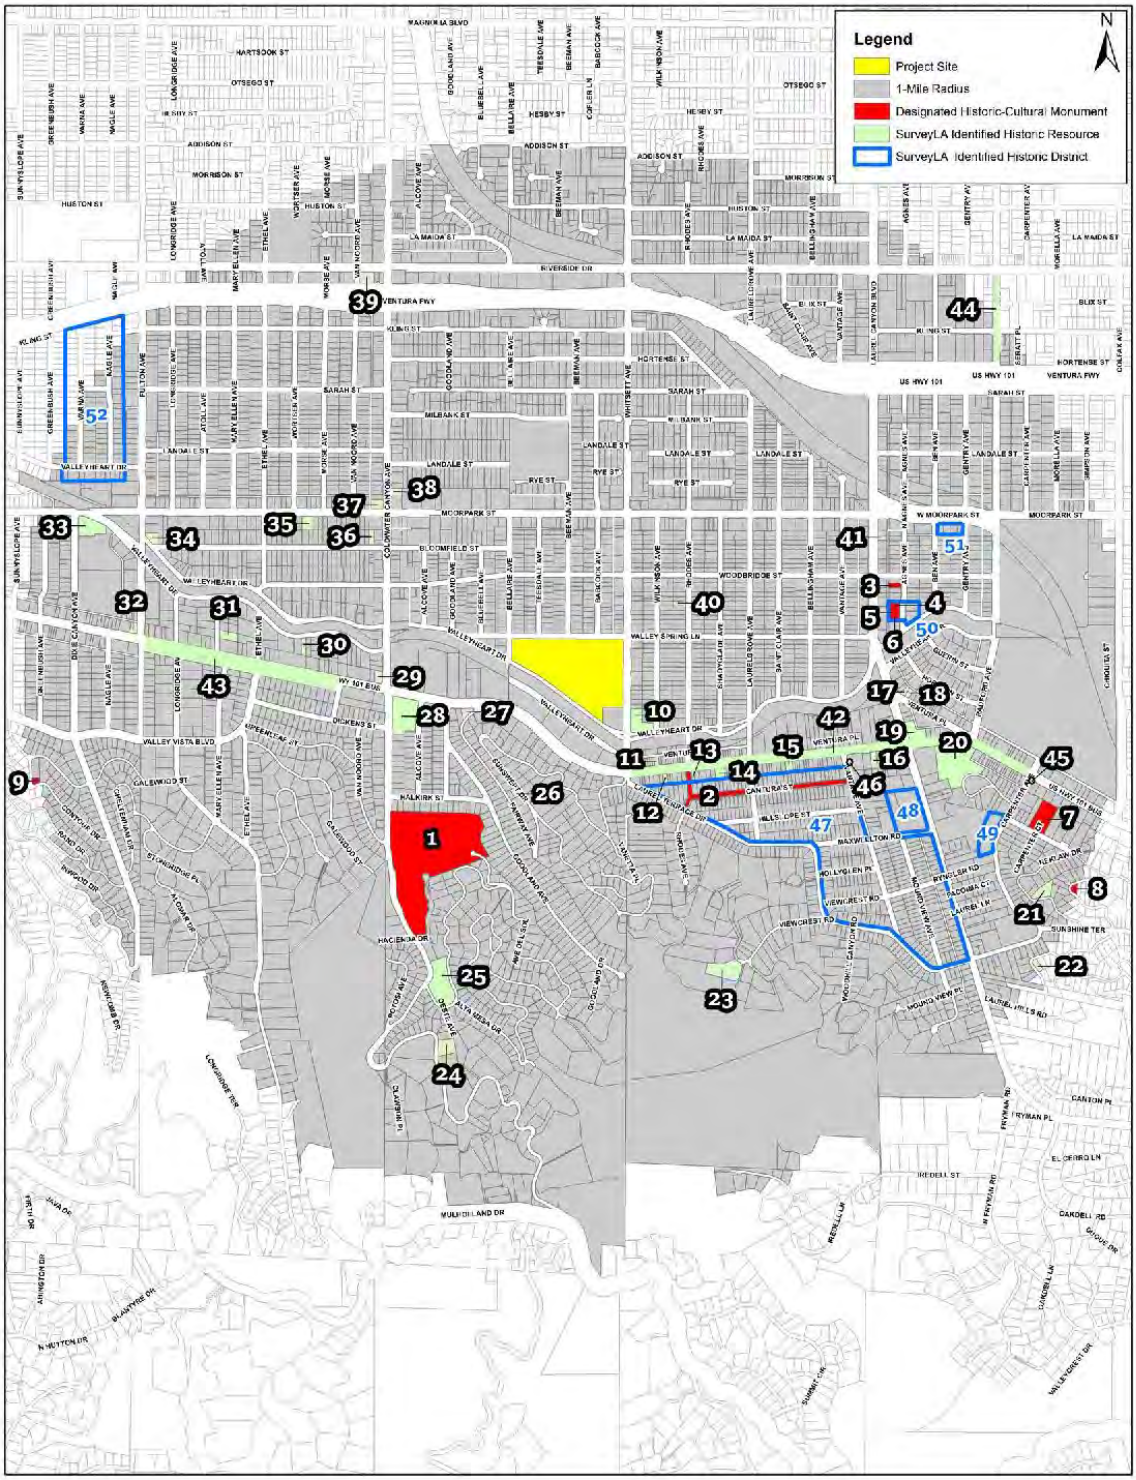
The DEIR underestimates the historic quality of the entire Weddington Golf & Tennis subject property, relegating the value of historic resources to only the putting green, clubhouse, and golf ball light standards. It is likely that numerous mitigation measures will be required to protect the golf course and driving range from significant, irreparable damage to their historic nature. As a result, the DEIR cannot accurately assess the Project site's historic and cultural landscape until the scope of character-defining features is revised. Future City Planning analyses need to be delayed until more definitive mitigation measures for historic preservation are identified.

11. Land Use Compatibility/Impacts to Open Space Land

Only after receiving numerous zone variances and a Conditional Use Permit (CUP), would the Project be compatible with the current A1-1XL-RIO zone. Although there is brief mention that the Biological Study Area "may facilitate wildlife movement between these two areas that support higher quality resources for wildlife" (referring to Griffith Park/Bette Davis Picnic Area and Sepulveda Dam) and "could serve as patch habitat along the river and provide some habitat value to urban-adapted wildlife species and may support live-in and movement habitat for species on a local scale," more information is needed in a recirculated DEIR (RDEIR) to describe the importance of so-called "habitat patches." This is needed, especially in light of research that has shown that preserving smaller isolated patches is more beneficial than contiguous tracts.[36]

Also, please refer to the two renderings below, both of which illustrate just how intrusive the Project components would be in a largely residential neighborhood.

[36] Available at: https://www.pnas.org/doi/epdf/10.1073/pnas.1813051115



Story Poles and Transparency of Project's Scale

In an effort to make the Project known to the community-at-large, including all motorists who travel along Whitsett Avenue, and all residents included in our Sherman Oaks - Studio City - Toluca Lake - Cahuenga Pass Community Plan, Save Weddington requests the erection of story poles. These markers are regularly used in other municipalities to make the public aware of the scale and scope of a proposed development project. There is also precedent for the use of story poles in Harvard-Westlake's previously proposed failed development plan (ENV-2013-0150-EIR), which was also supported by the local Studio City Neighborhood Council (SCNC) and the Studio City Residents Association (SCRA). The Lead Agency, along with Councilmember Raman, should require the Applicant to erect story poles that visually demonstrate all components of the Project. The story pole demonstration must be erected as soon as possible to alert citizens of what might happen to this irreplaceable green open space if the Project is permitted to move forward.

12. Study Area and Alternative Sites

In a re-circulated DEIR (RDEIR), the Study Area radius for including sensitive receptors and identifying potential alternative sites must be expanded. Although it remains unclear from which exact point of the 16-acre Weddington Golf & Tennis site the 0.5 mile radius emanates from, regardless, the Study Area Radius must be expanded due to the many concerns this Project raises for the immediate neighborhood around the Weddington Golf & Tennis site, as well as the greater Studio City community. The DEIR uses differing Study Area radii, with a 0.5 mile radius being used in some instances and a 1 mile radius being used in others, as evidenced in Figure 3 of the Historic Resources Technical Report.

FIGURE 3. MAP OF HISTORICAL RESOURCES WITHIN ONE-MILE RADIUS OF PROJECT SITE

As the Study Area radius for many projects is arbitrarily decided, we propose utilizing an established, relevant distance. For example, this may include the distance between the two existing Harvard-Westlake School campuses (since the Project is being considered a third campus) or, at the very least, the distance between the upper school campus and the Project site or between the Project site and the US-101 Highway at the Coldwater Canyon Avenue on-ramp/off-ramp (which is the origination point in the preliminary projected haul route in the DEIR). The shortest route (which utilizes Coldwater Canyon) between the Applicant's two existing campuses [(700 North Faring Road, Los Angeles, CA 90077) and (3700 Coldwater Canyon Avenue, Studio City, CA 91604)] has a distance of 6.5 miles. The distance between the upper school campus and Weddington Golf & Tennis utilizing the Applicant's prescribed transportation route is 1.3 miles. The distance between the Project site and the US-101 Highway at the Coldwater Canyon on-ramp/off-ramp is 1.2 miles.

The DEIR is woefully inadequate in its production of alternatives to the Project. There is no evidence of true effort made to identify viable alternatives. Additionally, none of the four alternatives to the Project listed in the DEIR are good-faith attempts to incorporate the community's true concerns. The alternatives listed are extremes and do not represent the Applicant's ability to truly value the community's concerns and compromise with a Project plan that would be supported by both the Applicant and the greater Studio City, San Fernando Valley, and Los Angeles community.

Although the DEIR claims that "in order for the Project to satisfy the Project Objectives, a property would need to be of sufficient size to accommodate two playing fields, tennis courts, a pool, all with respective bleachers, and a gymnasium that would provide for recreational practice and instruction, as well as allow for competitive meets with available spectator seating and adequate onsite parking to preclude off-site parking." If the athletics-related Project Objective that is being referenced is to "develop a state-of-the-art indoor and outdoor athletic and recreational facility to support the School's existing athletic programs and co-curricular activities, including basketball, soccer, football, track and field, tennis, swim, water polo, volleyball, fencing, weight training, dance, yoga, physical fitness, and wrestling programs," wouldn't the Applicant's existing facilities suffice and allow for this Project Objective to be met?

The DEIR inadequately explains the need for the Applicant's Project Objectives and inadequately describes why an additional campus is required, considering the fact that the Applicant's current campuses already meet stated Project Objectives. The Applicant can also refer to and consult with three other similar, nearby schools (Campbell Hall, Notre Dame High School, and The Buckley School) that all operate fewer athletic facilities for roughly the same number of students.

As described above, considering the fact that, excluding the Project site, the Applicant already has two athletic fields, two swimming pools, two gymnasiums, two sports performance centers, two

baseball/softball fields, and eight tennis courts, it seems like the Applicant has enough facilities to satisfy the Project Objective in question.

An alternative that was rejected from further analysis was the use of natural turf fields instead of the Project's artificial turf fields. The DEIR claims that "this alternative was considered to result in a much higher water demand than the Project"; however, mathematical modeling has shown that the use of water to irrigate natural turf is comparable to the amount of water required to cool artificial turf."[21] Therefore, a recirculated DEIR (RDEIR) must examine this alternative.

While all of the alternatives in the DEIR are insufficient, Alternative 3 is particularly shocking because of the proposed placement of a 239 parking space parking lot in the northwest corner of the Project site - less than 45 feet away from a residential neighborhood with single family homes. This alternative is also in direct contradiction with the Applicant's stated commitment to preserving the "the community's desires by maintaining the tranquility of the property," which was stated in Councilmember Krekorian's 2017 letter to the community (Attachment 2). Of note, the "No Project/No Build" alternative is considered the overall environmentally superior alternative.

Several recommendations for alternatives are described below, each of which City Planning must seriously consider in lieu of the Project.

- The Applicant could partake in a land swap with Los Angeles Valley College (LAVC). The Applicant could build everything that is currently included in the current Project plans and Weddington Golf & Tennis would become part of the City of Los Angeles Department of Recreation and Parks and be open to the public in perpetuity. Also, there is already precedent for Harvard-Westlake School sharing facilities with LAVC, as the School refurbished the eight Tribull Tennis Courts at LAVC and has previously used these facilities for its tennis operations. If the land swap is pursued and completed, the Applicant would not take a beloved asset away from the community, but rather, provide for the community by improving the facilities at LAVC.
    - Improvements to the current golf course could be pursued, such as using recycled water, changing turf types, reducing the amount of fertilizer and pesticides used, pursuing regenerative practices, and receiving designation in the Audubon Cooperative Sanctuary Program for Golf Courses.[37] Due to its existing, mature urban tree canopy, Weddington Golf & Tennis is home to many species, but with Audubon's guidelines and assistance, could become a leader in the movement to balance biological needs with recreational desires by enhancing wildlife and habitat management, enhancing water conservation and water quality management, and reducing chemical use.

[37] Available at: https://audubonintenational.org/acsp-for-golf/

    - Although the Applicant has claimed that the Project site, in its current use, is no longer financially viable, the Applicant's 990 Tax Returns (which are available to the public, as the School has non-profit status) refute this claim. The Weddington Golf & Tennis facility has been extremely busy over the last few years and the facility generates sufficient income to cover the operation of the facility, which again, is described in the Applicant's 990 Tax Returns.
- The Applicant could partake in a land swap next to its current baseball and softball facilities (O'Malley Family Field and Encino-Sherman Oaks Softball Facility at Encino Franklin Fields) on City-owned land at Balboa Park. The Applicant could maintain its baseball and softball fields and build some or all of its proposed Project on directly-adjacent land. However, as proponents of true green open space, we would advocate for the new Project site to preserve as much permeable parkland as possible. Then, Weddington Golf & Tennis would become part of the City of Los Angeles Department of Recreation and Parks and be open to the public in perpetuity.
- The Applicant could scale down the Project to focus on the southern part of the property, thus reducing many of the most egregious impacts to the community and preserving a significant portion of the property for its historic use (golf and tennis) for a wide demographic. The Applicant could use their current surface level parking lots to build another gymnasium and utilize underground parking. Then, the Applicant could reduce the number of proposed Project fields to one (the smaller field) on the Project site, since the Applicant already has a field and track stadium on its upper school campus. Any way a potential Project is configurated, it would cause significant impacts to community members (either to the immediate north, immediate west, east of Whitsett Avenue, or south of Ventura Boulevard). Therefore, the Project must be rejected for the benefit of <u>all</u> community members.
- No additional parking at the Project site (retaining the existing lot), with students and visitors utilizing shuttle bus services or parking at the Studio City public parking lot (12225 Ventura Boulevard Studio City, CA 91604) and walking a short distance to the Project site.
- Reduction in Project's proposed 532 parking spaces, 88 more than legally required. Alternatives should focus on decreasing the number of parking spaces at the Project site, as the concept of reliance on cars is steeped in the past, not the future.
- Re-location of tennis courts and/or pool on top of the gymnasium, thus enabling the retention of more green open space that the community is requesting. The preservation of more open space would inherently serve as a mitigation measure, reducing aesthetic, noise, and excavation disturbances, etc. One specific recommendation that community members have proposed is preserving the strip of land on the northern edge of the Project site along Valley Spring Lane from Bellaire Avenue to Whitsett Ave (golf course 9th hole, 2nd hole, and 3rd hole tee), which would provide a buffer between the residential neighborhood and the Project. The retention of more open space acreage to form a truly contiguous green space park might then finally justify the Applicant's Project site name of "River Park."

Any way a potential Project is configurated, it would cause significant impacts to community members (either to the immediate north, immediate west, east of Whitsett Avenue, or south of Ventura Boulevard). Therefore, the Project must be rejected for the benefit of all community members.

13. Discretionary Actions/Entitlements That Negatively Affect Local Community

The DEIR is inadequate, since the requested entitlements will not mitigate significant environmental impacts. Since said entitlements fail to address the negative impacts, they must not be granted. Save Weddington is extremely concerned about the numerous, far-reaching entitlements that the Applicant seeks as part of its proposed development project, including:

- Pursuant to LAMC Section 12.24, a Vesting Conditional Use Permit (CUP) to allow the operation of a private school athletic and recreational campus in the A1 zone.
- Two (2) 50-foot light poles on the east and west side of the pool facility (in lieu of the LAMC Section 12.21.A-1 required 30-foot maximum height limitation for buildings or structures in the A1-1XL-RIO zone, with "XL" signifying an "Extra Limited Height District").
- Three (3) 60-foot light poles on the north side of Field B (in lieu of the LAMC Section 12.21.A-1 required 30-foot maximum height limitation for buildings or structures in the A1-1XL-RIO zone, with "XL" signifying an "Extra Limited Height District").
- One (1) 50-foot light pole on the west side, and one (1) 50-foot light pole on the east side, of Field B ((in lieu of the LAMC Section 12.21.A-1 required 30-foot maximum height limitation for buildings or structures in the A1-1XL-RIO zone, with "XL" signifying an "Extra Limited Height District").
- Three (3) 80-foot light poles on the south side of Field B (in lieu of the LAMC Section 12.21.A-1 required 30-foot maximum height limitation for buildings or structures in the A1-1XL-RIO zone, with "XL" signifying an "Extra Limited Height District").
- Three (3) 60-foot light poles on the west side, and three (3) 60-foot light poles on the east side, of Field A (in lieu of the LAMC Section 12.21.A-1 required 30-foot maximum height limitation for buildings or structures in the A1-1XL-RIO zone, with "XL" signifying an "Extra Limited Height District").
- Twelve (12) 50-foot light poles located on all four sides of the proposed tennis courts (in lieu of the LAMC Section 12.21.A-1 required 30-foot maximum height limitation for buildings or structures in the A1-1XL-RIO zone, with "XL" signifying an "Extra Limited Height District").
- 10-foot privacy walls along Whitsett Ave (in lieu of the 8-foot maximum height limitation for fences and walls in side yards and the 6-foot maximum height limitation for fences and walls in front yards in the A1-1XL-RIO zone).

- 11-foot privacy walls along Valley Spring Lane and Bellaire Ave (in lieu of the 8-foot maximum height limitation for fences and walls in side yards and the 6-foot maximum height limitation for fences and walls in front yards in the A1-1XL-RIO zone).

The Conditional Use Permit (CUP) required for Project operations should not be granted, since, per LAMC Section 12.24, the following conditions are ***not*** satisfied:

- that the Project will enhance the built environment in the surrounding neighborhood or will perform a function or provide a service that is essential or beneficial to the community, city, or region;
- that the Project's location, size, height, operations and other significant features will be compatible with and will not adversely affect or further degrade adjacent properties, the surrounding neighborhood, or the public health, welfare, and safety; and
- that the Project substantially conforms with the purpose, intent and provisions of the General Plan, the applicable community plan, and any applicable specific plan.

The DEIR is inadequate because it fails to address the continued expansion efforts by the Applicant. Based on past precedent of the Applicant's proposed expansion initiatives, Save Weddington requests (a) presentation, circulation, and certification of a long-term Harvard-Westlake School master strategic plan; (b) that the Project may only operate using a comprehensive Conditional Use Permit (CUP) that covers all three Harvard-Westlake School campuses; and (c) a 25-year building moratorium. During the Applicant's previous proposed failed development plan (ENV-2013-0150-EIR), it was explained that "Despite receiving permits based on enrollment at much lower numbers than the Applicant currently has, the Applicant has continued to increase enrollment since 1992, and alleges that they are not subject to an enrollment cap. Obviously, should the Project go forward, the Applicant must be held to an enforceable and clear enrollment cap at the current level of enrollment" (Attachment 3). Save Weddington agrees with the sentiment outlined by Save Coldwater Canyon!. Thus far, the Applicant has not linked the proposed Project to other plans for construction at either of its two other campuses. If the Applicant is discovered to be developing in a piecemeal manner, this would amount to unlawful segmentation: without a plan, segmentation is not permissible. In fact, it is illegal to divide a project with potentially significant impacts into smaller components so that when reviewed separately, the smaller components are not likely to represent significant impacts (*Court Street Development Project, LLC v Utica Urban Renewal Agency; Sandora v City of New York*). In various instances through the DEIR, the Project is referred to as the "Harvard-Westlake River Park Campus." The DEIR proposes the construction of Project facilities not only for athletics, but for educational opportunities, as well - even going so far to explain that, for example, inside the proposed gymnasium, there would be "flex-meeting spaces for … students to do homework." Clearly, the proposed athletic and educational operational uses are connected and intertwined. If the Project is approved and the site does indeed serve as a third

campus, a comprehensive CUP would be needed to prevent continual shifting of operations and the Applicant must operate its three campuses under that single CUP.

14. Community Views of Harvard-Westlake School and its Proposed Project

In light of the numerous concerns the proposed Project raises, community members do not understand why the Applicant is pursuing this Project. In short, many in the community believe that this Project is excessive. As has been brought to our knowledge, if the proposed Project is permitted to proceed, Harvard-Westlake School (across both existing campuses with a student body of roughly 1,600 students) would be the only private school within the Los Angeles Unified School District (LAUSD) to have or utilize four athletic fields, three swimming pools, three gymnasiums, three sports performance centers, two baseball/softball fields, and eight tennis courts spread across five sites (including the middle school, upper school, and proposed "River Park" campuses).

According to the Applicant's website, Harvard-Westlake School athletics facilities (with locations and descriptions) include:[38]

- Sprague Athletic Field (Middle school campus; Sprague Field is used to host middle school football, field hockey, lacrosse, soccer, and softball games.)
- The Marshall Center Gymnasium (Middle school campus; The gym hosts basketball and volleyball games as well as wrestling meets.)
- The Marshall Center Sports Performance Facility (Middle school campus; The sports performance facility is used for middle school PE and ninth grade sports performance training.)
- Marshall Center Swimming Pool (Middle school campus; The pool hosts PE classes and middle school swim practices and meets.)
- Taper Gymnasium (Upper school campus; The Taper Gymnasium is located on Harvard-Westlake's upper school campus. Festooned with league, CIF-Southern Section, State and National Championship banners, its walls tell of the storied Wolverine athletic program. Taper Gym is home of the Wolverine basketball and volleyball programs.)
- Ted Slavin Field (Upper school campus; Ted Slavin Field is located on the upper school campus. Built in 2003, it features an NFL-caliber Field Turf surface and a synthetic track. It is the proud home of Wolverine football, soccer, track and field, lacrosse, and field hockey. Many of our student athletes who have graced the Ted Slavin field have gone on to professional, Olympic, and collegiate success in their chosen sports.)
- Copses Family Pool (Upper school campus; Located on Harvard-Westlake's upper school campus, the Copses Family Pool is a 50-meter pool manufactured by Myrtha Pools of Mantua, Italy. The stainless-steel pool features a surge tank underneath the pool deck to keep the water level, which reduces water resistance for swimmers. The facility also

[38] Available at: https://www.hw.com/athletics/Facilities-Locations

includes a pool house and bleachers. The Copses Pool is home to the Wolverine swimming and water polo teams.)

- Upper School Sports Performance Center (Upper school campus; The Sports Performance Center provides our student athletes with the movement and mental tools to realize their highest skill potential. Multidisciplinary training methods and physically prepare our student athletes for the rigors of competition and increase their resilience. Our positive-coaching atmosphere is designed to instill a championship attitude and educate our student athletes so they can navigate their lifelong journey toward health and fitness.)
- O'Malley Family Field (Off-campus; 17301 Oxnard St., Encino 91316. The recently renovated O'Malley Family Field is Harvard-Westlake's state-of-the-art baseball complex, featuring professional grade turf, drainage and irrigation systems, dugouts, bullpens, clubhouse, and a covered hitting facility behind the right-field fence. O'Malley Family Field is located in Encino, off of Louise Avenue and Oxnard Streets, next to Balboa Park. Please park only in the O'Malley Family Field parking lot located on the left just after you turn onto Oxnard Street. No parking is allowed on Oxnard Street or on any street in the adjacent neighborhood.)
- Encino-Sherman Oaks Softball Facility at Encino Franklin Fields (Off-campus; Softball is played on Field 6 at 17301 Oxnard Street, Encino, CA 91316.)
- Tribull Tennis Courts at Los Angeles Valley College (Off-campus; The Tribull Tennis Courts are located at 6290 Fulton Avenue, Valley Glen, CA 91401. Take the 101 freeway, exit Coldwater Canyon. North on Coldwater, left on Burbank. Courts are at Ethel and Burbank.)
- Weddington Golf & Tennis (Off-campus; 4141 Whitsett Ave, Studio City, CA 91604. Weddington Golf Course is a 9 hole, par 27 course that plays 1088 yards from the back tees. Weddington Golf also has a 25 stall driving range, a putting green and a chipping practice area. The Weddington Tennis Court facility features 16 lighted tennis courts. The facility is on Whitsett Ave. between Ventura Blvd. and the 101 Freeway.)

At a time when our City and Country is attempting to rectify decades and centuries-long patterns of spatial inequality, including the unequal distribution of resources and opportunities, it's shocking that the Applicant would look to build a $100 million sports complex for a select few of its own when hundreds of thousands of students across Los Angeles are lacking the most basic tools needed to succeed. Harvard-Westlake School may be able to afford anything it wants, but the rest of us cannot afford its reckless decisions.

Based on our community outreach, not only do we hear that the overwhelming majority of community members are in opposition to this Project, but a majority of Harvard-Westlake School students do not support the Project either. In a poll conducted by Harvard-Westlake School's newspaper, The Chronicle, just 41% of survey respondents said they were in favor of the School's

plan to build the "River Park" project.[39] So, if both the community and Harvard-Westlake students are against the Project, who is the Project for and why is it needed at all? A question many community members have been asking for years now is: "What is Harvard-Westlake School - an educator or developer?"

Another question from the community that remains unanswered is whether or not this Project site will be (a) utilized for any kind of 2028 Olympic Games activities, (b) utilized by colleges, or (c) rented out by professional sports teams or leagues. In accordance with the requirements of the Conditional Use Permit (CUP), the Project site must not host activities beyond high-school athletic levels or non-professional athletic use.

The community also recognizes the proposed Project for what it is - an appropriation of green open space available for public use. Community members also recognize that the so-called "River Park" is not a continuous acreage "park," but rather cobbled-together bits and pieces on the perimeter of the Project.

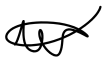
The DEIR is insufficient in its explanation of its proposed reservation and payment system for public access to the Project site and security protocols that will be followed to permit members of the public to utilize facilities on-site. More specifications are needed in a recirculated DEIR (RDEIR). The DEIR is also inadequate in its explanation of phrases pertaining to public use and access. For example, the Applicant has made vague commitments to public access with pre-condition phrases like "when not in use by School," "for pre-approved Studio City-based organizations," and "for pre-approved swim program members" appearing in the DEIR. These unclearly defined terms need to be clarified and the community must receive this information, especially since the Applicant continually mentions it will offer public use of the Project site. However, with nearly 100,000 Angelenos utilizing the Weddington Golf & Tennis facility each year, the community stands to lose access to the Project site, due to the regulations and conditions described above. Although the DEIR briefly mentions non-athletic special events, a recirculated DEIR (RDEIR) must clarify intentions for any other special event use (e.g., Olympic Games or third-party athletic events), as well as terms, commitments, and conditions for public use.

Dismissal of Community Needs and Desires

The Project design package prepared by Gensler Architects dated March 5, 2019 (Attachment 10) was completed in March 2019, before any meetings were held for community feedback. The March 2019 Project design is identical to the version that was eventually submitted to the Department of City Planning in March 2020. The Applicant consistently states that it made changes to the Project design based on input from the community. However, this is false. In fact, there were zero changes

[39] Available at: https://hwchronicle.com/57585/uncategorized/weapons-of-mass-construction/

made to the Project from its March 2019 design to the March 2020 iteration that was submitted. In essence, no changes were made to address any of the community's many concerns that were voiced during outreach meetings.



Similar to the Applicant's dismissal of concerns regarding the Project site, petitioners in the community have also raised their opposed the installation of a ramp off of Coldwater Canyon Avenue onto the Zev Greenway to the City and the Applicant (Attachment 11). However, proposed Project plans do not incorporate community members' concerns. Petitioners claim that the proposed ramp is not needed, since the City's goal of promoting Los Angeles River connectivity has already been satisfied with a connecting path between Coldwater Canyon Avenue and Whitsett Avenue (ramps at both ends) on the south side of the Los Angeles River. Anyone wanting to access the River from Coldwater Canyon Avenue can easily utilize the ramp on the south side. Furthermore, petitioners claim that the proposed ramp is not an added benefit, since, on the north side, there are already existing entrance ramps on either side of the Project site.

In a July 15, 2019 Los Angeles Times article titled "Harvard-Westlake Releases First Draft for New Athletic Facilities on 16-Acre Site in Studio City," a spokesperson for the Applicant said, "This is entirely about increasing the capacity of our athletic facilities so we can get kids home earlier."[1] This demonstrates what the community has known all along: the Project has never been designed for the benefit of the community and if approved, will not be constructed or operated for the benefit of the community.

In conclusion, we believe that the DEIR is defective, the proposed Project is terribly flawed, and the Lead Agency should deny approval of the required Conditional Use Permit and certification of the DEIR. We urge the Lead Agency to recirculate the DEIR to properly address the critical errors and omissions that were raised in this letter. We appreciate your careful review of our comments on this Project as our community collectively works to preserve and protect this precious, publicly accessible true green open space for future generations.

Again, thank you for addressing our concerns and comments regarding this Project.

Sincerely,

Kim Tashman, President
Save Weddington

Subject: Comments on the Harvard-Westlake River Park Project (SCH No. 2020090536)

Dear Mr. Hall,

We have reviewed the March 2022 Draft Environmental Impact Report ("DEIR") for the Harvard-Westlake River Park Project ("Project") located in the City of Los Angeles ("City"). The Project proposes to demolish an existing 799-square-foot ("SF") tennis facility, 426,000-SF golf course, and 2,300-SF driving range, as well as construct an 80,249-SF gym, a 52-meter swimming pool, and 532 parking spaces on the 17.2-acre site

Our review concludes that the DEIR fails to adequately evaluate the Project's air quality, health risk, and greenhouse gas impacts. As a result, emissions and health risk impacts associated with construction and operation of the proposed Project are underestimated and inadequately addressed. An updated EIR should be prepared to adequately assess and mitigate the potential air quality, health risk, and greenhouse gas impacts that the project may have on the surrounding environment.

Air Quality

Incorrect Analysis of Construction-Related Criteria Air Pollutant Emissions

Regarding the DEIR's analysis of the Project's construction-related criteria air pollutant emissions, the Air Quality/Greenhouse Gas Emissions Technical Documentation ("AQ & GHG Report"), provided as Appendix C to the DEIR, states:

> "Emissions from off-road equipment and off-road vehicles were estimated through CalEEMod […] Emissions from worker trips, haul truck trips, concrete truck trips and vendor truck trips were estimated outside of CalEEMod to account for the ARB on-road vehicle emissions factor EMFAC2017 (EMFAC) model because it has not yet been incorporated in the current version of

> CalEEMod […] Emissions from haul trucks, vendor trucks and concrete trucks were also estimated outside of CalEEMod using EMFAC emission factors for haul, vendor and concrete trucks because CalEEMod assumes that the number of heavy-duty trucks input into the model occurs across the entire length of the applicable construction phases" (p. 2).

As demonstrated above, emissions associated with off-road equipment and vehicles during Project construction were calculated with the California Emissions Estimator Model ("CalEEMod"), while emissions associated with on-road vehicles during Project construction were calculated outside of CalEEMod. Furthermore, the AQ & GHG Report states:

> "The maximum daily emissions estimated based on maximum construction activity conditions for heavy-duty off-road construction equipment and onroad mobile sources and do not represent the emissions that would occur every day during Project construction" (p. 3).

As demonstrated above, the AQ & GHG Report acknowledges that the off-road emissions calculated with CalEEMod, and the on-road emissions calculated outside of CalEEMod, each "do not represent the emissions that would occur every day during Project construction." As neither account for the entirety of the criteria air pollutants that would be generated during Project construction, the DEIR should have summed the off-road and on-road emissions estimates in order to accurately evaluate the Project's maximum daily construction-related emissions. Specifically, the Project's mitigated off-road and on-road construction-related emissions, as estimated by the DEIR, are respectively presented below.

Off-Road Emissions (Appendix C, pp. 75, 120):

2.1 Overall Construction (Maximum Daily Emission)

Mitigated Construction

	ROG	NOx	CO	SO2	Fugitive PM10	Exhaust PM10	PM10 Total	Fugitive PM2.5	Exhaust PM2.5	PM2.5 Total

Exceeds Threshold?	No	No	No	No	No	No

However, upon review of the DEIR's construction-related emissions summary, it appears that the DEIR fails to include the off-road emissions estimates calculated with CalEEMod (see excerpt below) (p. IV.B-55, Table IV.B-8):

[b] Emissions include fugitive dust control measures consistent with SCAQMD Rule 403.

SOURCE: ESA, 2021.

The DEIR's construction-related emissions summary, as displayed above, appears to be incorrect for two reasons. First, the overlapping phase estimates in the emissions summary are identical to the on-road construction-related emissions (Appendix C, pp. 65). Thus, the DEIR's analysis of the Project's construction-related emissions fails to include the estimates calculated by CalEEMod or account for emissions generated by off-road construction equipment. Second, the maximum daily emissions

presented in the emissions summary are underestimated and inconsistent with the on-road peak daily emissions (Appendix C, pp. 65). As such, the DEIR underestimates the Project's construction-related emissions and should not be relied upon to determine Project significance.

Unsubstantiated Input Parameters Used to Estimate Project Emissions

The DEIR's operational air quality analysis relies on emissions calculated with CalEEMod.2016.3.2 (p. IV.B-35).[1] CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence. Once all of the values are inputted into the model, the Project's construction and operational emissions are calculated, and "output files" are generated. These output files disclose to the reader what parameters are utilized in calculating the Project's air pollutant emissions and make known which default values are changed as well as provide justification for the values selected.

When reviewing the Project's CalEEMod output files, provided in the AQ & GHG Report as Appendix C to the DEIR, we found that several model inputs were not consistent with information disclosed in the DEIR. As a result, the Project's construction and operational emissions are underestimated. As a result, an updated EIR should be prepared to include an updated air quality analysis that adequately evaluates the impacts that construction and operation of the Project will have on local and regional air quality.

Overestimated Existing Land Use Size

Review of the DEIR demonstrates that the operational emissions associated with the existing land uses are subtracted from the operational emissions associated with the proposed land uses in order to determine the significance of the Project's air quality impact (see excerpt below) (p. IV.B-53, Table IV.B-7).

[1] "CalEEMod Version 2016.3.2." California Air Pollution Control Officers Association (CAPCOA), November 2017, *available at:* http://www.aqmd.gov/caleemod/archive/download-version-2016-3-2.

TABLE IV.B-7

Exceeds Thresholds?	No	No	No	No	No	No

[a] Totals may not add up exactly due to rounding in the modeling calculations. Detailed emissions calculations are provided in Appendix C of this Draft EIR.
[b] Area source VOC emissions are primarily emitted by consumer product usage as estimated in CalEEMod.
SOURCE: ESA, 2021.

However, the DEIR's analysis is incorrect, as the size of the existing land uses to be removed from the Project site was overestimated in the Project's air modeling. Specifically, review of the CalEEMod output files demonstrates that the "Harvard Westlake - Existing" model includes 559,860-SF of golf course area (see excerpt below) (Appendix C, pp. 301, 309, 419).

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area
General Office Building	0.80	1000sqft	0.05	799.00
Other Non-Asphalt Surfaces	128.00	1000sqft	2.94	128,000.00
Parking Lot	89.00	Space	0.88	38,400.00
City Park	1.10	Acre	1.10	47,916.00
Golf Course	11.78	Acre	11.78	559,860.95

This is inaccurate, as the DEIR indicates that the existing golf course consists of only 426,000-SF (p. II-3). As such, the land use size is overestimated by approximately 133,860-SF in the model.[2]

This overestimation presents an issue, as the land use size feature is used throughout CalEEMod to determine default variable and emission factors that go into the model's calculations. The square footage of a land use is used for certain calculations such as determining the wall space to be painted (i.e., VOC emissions from architectural coatings) and volume that is heated or cooled (i.e., energy

[2] Calculated: 559,860-SF – 426,000-SF = 133,860-SF.

impacts).[3] By overestimating the area of the existing land use, the model overestimates the emissions associated with the existing land uses, resulting in an underestimation of the net change in operational emissions associated with the proposed Project. As a result, the model should not be relied upon to determine Project significance.

Unsubstantiated Changes to Individual Construction Phase Lengths

Review of the CalEEMod output files demonstrates that the "Harvard Westlake - Construction" model includes several changes to the default individual construction phase lengths (see excerpt below) (Appendix C, pp. 71, 116, 163, 210, 323).

Table Name	Column Name	Default Value	New Value
tblConstructionPhase	NumDays	20.00	310.00
tblConstructionPhase	NumDays	300.00	312.00
tblConstructionPhase	NumDays	300.00	446.00
tblConstructionPhase	NumDays	300.00	392.00
tblConstructionPhase	NumDays	300.00	365.00
tblConstructionPhase	NumDays	20.00	53.00
tblConstructionPhase	NumDays	30.00	181.00
tblConstructionPhase	NumDays	20.00	28.00
tblConstructionPhase	NumDays	10.00	27.00
tblConstructionPhase	NumDays	10.00	26.00

As a result of these changes, the model includes the following construction schedule (see excerpt below) (Appendix C, pp. 76, 121, 167, 171, 214, 328):

Phase Number	Phase Name	Phase Type	Start Date	End Date	Num Days Week	Num Days
1	Site Preparation-1	Site Preparation	6/30/2022	7/31/2022	6	27
2	Demolition	Demolition	7/1/2022	8/31/2022	6	53
3	Grading	Grading	8/1/2022	2/27/2023	6	181
4	Foundations	Building Construction	12/2/2022	11/30/2023	6	312
5	Utilities	Trenching	2/2/2023	4/5/2024	6	368
6	Building Construction	Building Construction	5/1/2023	10/1/2024	6	446
7	Site Preparation-2	Site Preparation	9/1/2023	9/30/2023	6	26
8	Landscape	Building Construction	10/2/2023	12/31/2024	6	392
9	Pool Area	Building Construction	11/2/2023	12/31/2024	6	365
10	Architectural Coating	Architectural Coating	1/2/2024	12/27/2024	6	310
11	Paving	Paving	11/1/2024	12/3/2024	6	28

[3] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 28

As you can see from the excerpts above, the "Site Preparation-1" phase is increased by 170% from the default value of 10 to 27 days; the "Demolition" phase is increased by 77%, from the default value of 30 to 53 days; the "Grading" phase is increased by 503%, from the default value of 30 to 181 days; the "Foundations" phase is increased by 4%, from the default value of 300 to 312 days; the "Building Construction" phase is increased by 49%, from the default value of 300 to 446 days; the "Site Prepartaion-2" phase is increased by 160%, from the default value of 10 to 26 days; the "Landscape" phase is increased by 31%, from the default value of 300 to 392 days; the "Pool Area" phase is increased by 22%, from the default value of 300 to 365 days; the "Architectural Coating" phase is increased by 1,450%, from the default value of 20 to 310 days; and the "Paving" phase is increased by 40%, from the default value of 20 to 28 days.

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[4] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is:

> "see construction assumptions" (Appendix C, pp. 71, 116, 163, 210, 323).

Furthermore, regarding the Project's anticipated construction duration, the DEIR states:

> "Construction of the Project is anticipated to begin in the third quarter of 2022 pending Project consideration and approval, and is estimated to be completed in the fourth quarter of 2025 with construction occurring for approximately two and a half years (approximately 30 months)" (II-61).

However, while the DEIR indicates an overall construction duration of 30 month, the DEIR fails to mention or justify the individual construction phase lengths. This is incorrect, as according to the CalEEMod User's Guide:

> "CalEEMod was also designed to allow the user to change the defaults to reflect site- or project-specific information, when available, provided that the information is supported by substantial evidence as required by CEQA." [5]

Here, as the DEIR only justifies the total construction duration of 30 months, the DEIR fails to provide substantial evidence to support the revised individual construction phase lengths. As such, we cannot verify the changes.

[4] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 1, 14.
[5] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 13-14.

These unsubstantiated changes present an issue, as the construction emissions are improperly spread out over a longer period of time for some phases, but not for others. According to the CalEEMod User's Guide, each construction phase is associated with different emissions activities (see excerpt below).[6]

> *Demolition* involves removing buildings or structures.
>
> *Site Preparation* involves clearing vegetation (grubbing and tree/stump removal) and removing stones and other unwanted material or debris prior to grading.
>
> *Grading* involves the cut and fill of land to ensure that the proper base and slope is created for the foundation.
>
> *Building Construction* involves the construction of the foundation, structures and buildings.
>
> *Architectural Coating* involves the application of coatings to both the interior and exterior of buildings or structures, the painting of parking lot or parking garage striping, associated signage and curbs, and the painting of the walls or other components such as stair railings inside parking structures.
>
> *Paving* involves the laying of concrete or asphalt such as in parking lots, roads, driveways, or sidewalks.

Thus, by disproportionately altering and extending some of the individual construction phase lengths without proper justification, the model assumes there are a greater number of days to complete the construction activities required by the prolonged phases. As such, there will be less construction activities required per day and, consequently, less pollutants emitted per day. As a result, the model may underestimate the peak daily emissions associated with some phases of construction and should not be relied upon to determine Project significance.

Unsubstantiated Number of Vendor Trips

Review of the CalEEMod output files demonstrates that the "Harvard Westlake - Construction" model includes several reductions to the number of vendor trips (see excerpt below) (Appendix C, pp. 74, 119, 165, 212, 326).

Table Name	Column Name	Default Value	New Value
tblTripsAndVMT	VendorTripNumber	163.00	0.00
tblTripsAndVMT	VendorTripNumber	163.00	0.00
tblTripsAndVMT	VendorTripNumber	163.00	0.00
tblTripsAndVMT	VendorTripNumber	163.00	0.00

As you can see in the excerpt above, the number of vendor trips is reduced from the default value of 652- to 0-trips. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[7] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is:

[6] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 32.
[7] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 1, 14.

> "construction mobile emissions calculated outside of CalEEMo.d" (Appendix C, pp. 71, 116, 163, 210, 323).

While we understand mobile-source construction-related emissions are calculated outside of CalEEMod, the number of vendor trips remains unsubstantiated. Review of the construction on-road emissions in the AQ & GHG Report demonstrates that only 82 vendor trips are included in the calculations (Appendix C, pp. 254). As such, the number of vendor trips required for Project construction is reduced from the CalEEMod default value by 570 trips. However, the AQ & GHG Report fails to provide sufficient justification for this reduction and therefore, we are unable to verify the number of vendor trips is accurate.

The unsubstantiated number of vendor trips presents an issue, as CalEEMod uses the vendor and worker trip numbers to estimate the construction-related emissions associated with on-road vehicles.[8] By including an unsubstantiated number to vendor trips in the on-road emissions analysis, the DEIR may underestimate the Project's mobile-source construction-related emissions and should not be relied upon to determine Project significance.

Incorrect CO_2 Intensity Factors

Review of the CalEEMod output files demonstrates that the "Harvard Westlake - Operations" model includes a manual reduction to the default CO_2 intensity factor (see excerpt below) (Appendix C, pp. 279, 291, 388, 403).

Table Name	Column Name	Default Value	New Value
tblProjectCharacteristics	CO2IntensityFactor	1227.89	626.48

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[9] According to the "User Entered Comments & Non-Default Data" table, the justification provided for the change is:

> "CO2 intensity factor linearly adjusted to account for SB100 RPS by year 2025" (Appendix C, pp. 278, 289, 386).

Furthermore, regarding the California's Renewables Portfolio Standard ("RPS"), the DEIR states:

> "Emission factors for GHGs due to electrical generation to serve the demands of the existing Project Site were obtained from the LADWP 2017 Power Strategic Long-Term Resource Plan, which accounts for the generation mix using renewable and non-renewable sources.[109] Approximately 34 percent of LADWP's 2019 electricity purchases were from renewable sources, which is similar to the 32 percent Statewide percentage of electricity purchases from renewable sources.110 LADWP would provide an increasing percentage from renewable sources in

[8] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 35.
[9] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 2, 9

> compliance with the RPS with 50 percent by 2025, 55 percent by 2030, and 65 percent by 2036. […] Based on LADWP future projections for the Project opening year of 2025, an estimated emission factor of 626.48 lbs CO2/MWh for electricity was calculated using LADWP projections from existing plans for compliance with the RPS (i.e., SB 100) and future projected energy supply resources" (p. IV.G-46).

However, these changes remain unsupported for two reasons. First, the *LADWP 2017 Power Strategic Long-Term Resource Plan*, which is the source provided for the revised CO_2 intensity factor, appears to be unavailable. Second, simply because the State has renewable energy goals, such as 50% renewable energy by 2025, does not ensure that these goals will be achieved locally on the Project site or by the Project's specific utility company. As such, the CO_2 intensity factor should be based on currently achieved power mixes, rather than future estimates based on statewide targets. As a result, we cannot verify the revised value.

This unsubstantiated reduction presents an issue, as CalEEMod uses the CO_2 intensity factor to calculate the Project's greenhouse gas ("GHG") emissions associated with electricity use.[10] Thus, by including an unsubstantiated reduction to the default CO_2 intensity factor, the model may underestimate the Project's GHG emissions and should not be relied upon to determine Project significance.

Incorrect Application of Construction-Related Mitigation Measures

Review of the CalEEMod output files demonstrates that the "Harvard Westlake - Construction" model includes the following construction-related mitigation measures (see excerpt below) (Appendix A, pp. 73, 110, 140):

3.1 Mitigation Measures Construction

Use Soil Stabilizer

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[11] However, the "User Entered Comments & Non-Default Data" table fails to provide a justification for these changes. Furthermore, regarding Project compliance with fugitive dust regulations, the DEIR states:

> "Rule 403 – Fugitive Dust: This rule requires projects to prevent, reduce or mitigate fugitive dust emissions from a site. Rule 403 restricts visible fugitive dust to the project property line, restricts the net PM_{10} emissions to less than 50 micrograms per cubic meter (µg/m3) and restricts the

[10] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 19.
[11] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 1, 14.

> tracking out of bulk materials onto public roads. Additionally, projects must utilize one or more of the best available control measures (identified in the tables within the rule). Best available control measures may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering, using chemical stabilizers and/or ceasing all activities. Finally, a contingency plan may be required if so determined by the USEPA" (p. IV.B-16).

However, the inclusion of the above-mentioned construction-related mitigation measures remain unsupported for three reasons.

First, the inclusion of the construction-related mitigation measures, based on the Project's compliance with SCAQMD Rule 403, is unsupported. According to the Association of Environmental Professionals ("AEP") *CEQA Portal Topic Paper* on mitigation measures:

> "By definition, mitigation measures are not part of the original project design. Rather, mitigation measures are actions taken by the lead agency to reduce impacts to the environment resulting from the original project design. Mitigation measures are identified by the lead agency after the project has undergone environmental review and are above-and-beyond existing laws, regulations, and requirements that would reduce environmental impacts."[12]

As you can see in the excerpt above, mitigation measures "are not part of the original project design" and are intended to go "above-and-beyond" existing regulatory requirements. As such, the inclusion of these measures, based solely on SCAQMD Rule 403, is unsubstantiated.

Second, according to the above-mentioned AEP report:

> "While not 'mitigation', a good practice is to include those project design feature(s) that address environmental impacts in the mitigation monitoring and reporting program (MMRP). Often the MMRP is all that accompanies building and construction plans through the permit process. If the design features are not listed as important to addressing an environmental impact, it is easy for someone not involved in the original environmental process to approve a change to the project that could eliminate one or more of the design features without understanding the resulting environmental impact."[13]

As you can see in the excerpt above, project design features ("PDFs") that are not formally included as mitigation measures may be eliminated from the Project's design altogether. Thus, as the above-mentioned construction-related measures are not formally included as mitigation measures, we cannot guarantee that they would be implemented, monitored, and enforced on the Project site.

Third, simply because the DEIR references SCAQMD Rule 403 does not justify the inclusion of the above-mentioned construction-related mitigation measures in the model. Specifically, according to SCAQMD

[12] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 5.
[13] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 6.

Rule 403, Projects can either water unpaved roads 3 times per day, water unpaved roads 1 time per day and limit vehicle speeds to 15 mph or apply a chemical stabilizer (see excerpt below).[14]

Table 2 (Continued)

FUGITIVE DUST SOURCE CATEGORY	CONTROL ACTIONS	
Unpaved Roads	(4a)	Water all roads used for any vehicular traffic at least once per every two hours of active operations [3 times per normal 8 hour work day]; OR
	(4b)	Water all roads used for any vehicular traffic once daily and restrict vehicle speeds to 15 miles per hour; OR
	(4c)	Apply a chemical stabilizer to all unpaved road surfaces in sufficient quantity and frequency to maintain a stabilized surface.

As you can see in the above excerpt, to simply comply with SCAQMD Rule 403, the Project may either water unpaved roads 3 times per day, water unpaved roads 1 time per day and limit vehicle speeds to 15 mph, or apply a chemical stabilizer. Thus, the "Use Soil Stabilizer," "Water Exposed Area," and "Reduce Vehicle Speed on Unpaved Roads" measures are not all explicitly required by SCAQMD Rule 403, and should therefore not be included in the model. By incorrectly including several construction-related mitigation measures without properly committing to their implementation, the model may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

Diesel Particulate Matter Health Risk Emissions Inadequately Evaluated

The DEIR concludes that the Project would have a less-than-significant health risk impact without conducting a quantified construction or operational health risk analysis ("HRA") (p. IV.B-61 – IV.B-62). Regarding the health risk impacts associated with Project construction, the DEIR states:

> "Temporary TAC emissions associated with DPM emissions from heavy construction equipment would occur during the construction phase of the Project. According to OEHHA and the SCAQMD Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis, 96 health effects from TACs are described in terms of individual cancer risk based on a lifetime (i.e., 70- year) resident exposure duration. Given the temporary construction schedule (approximately 30 months), the Project would not result in a long-term (i.e., lifetime or 70-year) exposure as a result of Project construction" (p. IV.B-61).

As demonstrated above, the DEIR concludes that the Project would result in a less-than-significant construction-related health risk impact because the temporary construction schedule would not result in long-term toxic air contaminant ("TAC") emissions. Furthermore, regarding the health risk impacts associated with Project operation, the DEIR states:

[14] "RULE 403. FUGITIVE DUST." SCAQMD, June 2005, *available at:* http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-403.pdf, p. 403-21, Table 2.

> "As a result, toxic or carcinogenic air pollutants are not expected to occur in any substantial amounts in conjunction with operation of the proposed land uses within the Project Site. Based on the uses expected on the Project Site, operation of the Project would not expose sensitive receptors to substantial TAC concentrations, and operational impacts would be less than significant" (p. IV.B-62).

As demonstrated above, the DEIR concludes that the Project would result in a less-than-significant operational health risk impact because the proposed land uses are not expected to generate substantial TAC emissions. However, the DEIR's evaluation of the Project's potential health risk impacts, as well as the subsequent less-than-significant impact conclusion, is incorrect for three reasons.

First, by failing to prepare a quantified construction and operational HRA, the Project is inconsistent with CEQA's requirement to make "a reasonable effort to substantively connect a project's air quality impacts to likely health consequences."[15] This poses a problem, as construction of the Project would produce diesel particulate matter ("DPM") emissions through the exhaust stacks of construction equipment over a duration of approximately 30 months (p. II-61). Furthermore, operation of the Project is expected to generate an estimated 3,932 total daily vehicle miles travelled ("VMT"), which would produce additional exhaust emissions and continue to expose nearby, existing sensitive receptors to DPM emissions during Project operation (p. IV.M-40). However, the DEIR fails to evaluate the TAC emissions associated with Project construction and operation, or indicate the concentrations at which such pollutants would trigger adverse health effects. Thus, without making a reasonable effort to connect the Project's TAC emissions to the potential health risks posed to nearby receptors, the DEIR is inconsistent with CEQA's requirement to correlate Project-generated emissions with potential adverse impacts on human health.

Second, the Office of Environmental Health Hazard Assessment ("OEHHA"), the organization responsible for providing guidance on conducting HRAs in California, released its most recent *Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments* in February 2015. This guidance document describes the types of projects that warrant the preparation of an HRA. Specifically, OEHHA recommends that all short-term projects lasting at least 2 months assess cancer risks.[16] Furthermore, according to OEHHA:

> "Exposure from projects lasting more than 6 months should be evaluated for the duration of the project. In all cases, for assessing risk to residential receptors, the exposure should be assumed to start in the third trimester to allow for the use of the ASFs (OEHHA, 2009)."[17]

Thus, as the Project's anticipated construction duration exceeds the 2-month and 6-month requirements set forth by OEHHA, construction of the Project meets the threshold warranting a quantified HRA under OEHHA guidance and should be evaluated for the entire 30-month construction

[15] "Sierra Club v. County of Fresno." Supreme Court of California, December 2018, a*vailable at:* https://ceqaportal.org/decisions/1907/Sierra%20Club%20v.%20County%20of%20Fresno.pdf.
[16] "Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf, p. 8-18.
[17] "Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf, p. 8-18.

duration. Furthermore, OEHHA recommends that an exposure duration of 30 years should be used to estimate the individual cancer risk at the maximally exposed individual resident ("MEIR").[18] While the DEIR fails to provide the expected lifetime of the proposed Project, we can reasonably assume that the Project would operate for at least 30 years, if not more. Therefore, operation of the Project also exceeds the 2-month and 6-month requirements set forth by OEHHA, and should be evaluated for the entire 30-year residential exposure duration as indicated by OEHHA guidance. These recommendations reflect the most recent state health risk policies, and as such, an updated EIR should be prepared to include an analysis of health risk impacts posed to nearby sensitive receptors from Project-generated DPM emissions.

Third, by claiming a less than significant impact without conducting a quantified construction or operational HRA for nearby, existing sensitive receptors, the DEIR fails to compare the Project's excess cancer risk to the SCAQMD's specific numeric threshold of 10 in one million.[19] Thus, in accordance with the most relevant guidance, an assessment of the health risk posed to nearby, existing receptors as a result of Project construction and operation should be conducted.

Greenhouse Gas

Failure to Adequately Evaluate Greenhouse Gas Impacts

The DEIR estimates that the Project would generate net annual greenhouse gas ("GHG") emissions of 1,533- and 2,226-metric tons of carbon dioxide equivalents per year ("MT CO_2e/year") with and without GHG reduction measures, respectively (see excerpt below) (p. IV.G-53, Table IV.G-7).

[18] "Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf, p. 2-4.
[19] "South Coast AQMD Air Quality Significance Thresholds." SCAQMD, April 2019, *available at:* http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf.

TABLE IV.G-7
ESTIMATED OPERATIONAL GREENHOUSE GAS EMISSIONS – PROJECT

Emissions Sources	CO_2e at Buildout Year (2025) (Metric Tons per Year) [a]	
	Project with implementation of GHG reduction characteristics, features, and measures	Project without implementation of GHG reduction characteristics, features, and measures
Project Operational		
Mobile Sources [b] (Includes VMT associated from both the Project and Community Use)	1,420	1,865
Area	<1	<1
Electricity	693	972
Natural Gas	93	94
Water and Wastewater Treatment	64	73
Solid Waste	19	19
Construction (Amortized)	430	430
Project Subtotal	2,719	3,452
Existing Site (refer to Table IV.G-5)	1,186	1,186
Net Total (Project minus Existing)	**1,533**	**2,266**

[a] Totals may not add up exactly due to rounding in the modeling calculations.

[b] As discussed in subsection IV.G.3.b) *Methodology*, while the community use component of the Project, which is classified as a community-serving recreational facility, is exempt from VMT analysis per LADOT's *Transportation Assessment Guidelines*, the emissions associated with VMT from the community use component of the Project were accounted for in the Project's operational emissions for the purposes of this GHG analysis, including from typical weekday community use. The Project's GHG analysis also accounted for annual VMT from occasional community use events that could occur during the year, including five Community Events with approximately 500 attendees per event. Factoring in these various uses, estimated operational GHGs associated with community uses account for more than two-thirds of the Project total. Refer to VMT data in Appendix C and Appendix M of this Draft EIR.

SOURCE: ESA, 2021.

However, the DEIR elects not to apply a quantitative GHG threshold. Instead, the DEIR concludes a less-than-significant GHG impact based on "the Project's compliance with performance-based standards included in the regulations outlined in the applicable portions of CARB's Climate Change Scoping Plan, the 2020-2045 RTP/SCS, City's Green New Deal, and the Los Angeles Green Building Code" (p. IV.G-40). However, the DEIR's analysis, as well as the subsequent less-than-significant impact conclusion, is incorrect for five reasons:

(1) The DEIR's quantitative GHG analysis relies upon an incorrect and unsubstantiated air model;
(2) The DEIR fails to indicate a potentially significant GHG impact;
(3) The DEIR should incorporate PDFs as formal mitigation measures;
(4) The DEIR fails to consider the performance-based standards under CARB's *Scoping Plan*; and
(5) The DEIR fails to consider the performance-based standards under SCAG's *RTP/SCS.*

1) Incorrect and Unsubstantiated Quantitative Analysis of Emissions

As previously stated, the DEIR estimates that the Project would generate net annual GHG emissions of 1,533- and 2,226-MT CO_2e/year with and without GHG reduction measures, respectively (p. IV.G-53, Table IV.G-7). However, the DEIR's quantitative GHG analysis is unsubstantiated. As previously discussed, when we reviewed the Project's CalEEMod output files, provided in the AQ & GHG Report as Appendix C to the DEIR, we found that several of the values inputted into the model are not consistent

with information disclosed in the DEIR. As a result, the model underestimates the Project's emissions, and the DEIR's quantitative GHG analysis should not be relied upon to determine Project significance. An updated EIR should be prepared that adequately assesses the potential GHG impacts that construction and operation of the proposed Project may have on the surrounding environment.

2) Failure to Identify a Potentially Significant GHG Impact

In an effort to quantitatively evaluate the Project's GHG emissions, we compared the Project's GHG emissions, as estimated by the DEIR, to the SCAQMD 2035 service population efficiency target of 3.0 MT CO_2e/SP/year, which was calculated by applying a 40% reduction to the 2020 targets.[20] When applying this threshold, the Project's incorrect and unsubstantiated air model indicates a potentially significant GHG impact.

As previously stated, the DEIR estimates that the Project would generate net annual GHG emissions of 1,533 MT CO_2e/year with GHG reduction measures (p. IV.G-53, Table IV.G-7). According to CAPCOA's *CEQA & Climate Change* report, a service population ("SP") is defined as "the sum of the number of residents and the number of jobs supported by the project."[21] According to the DEIR, the Project would employ a maximum of 100 people during operation (p. II-51). As the Project does not include any residential land uses, we estimate a SP of 100 people.[22] When dividing the Project's net annual GHG emissions, as estimated by the DEIR, by a SP of 100 people, we find that the Project would emit approximately 15.5 MT CO_2e/SP/year (see table below).[23]

DEIR Greenhouse Gas Emissions	
Annual Emissions (MT CO_2e/year)	1,553
Service Population	100
Service Population Efficiency (MT CO_2e/SP/year)	15.5
SCAQMD 2035 Threshold	**3.0**
Exceeds?	***Yes***

As demonstrated above, the Project's service population efficiency value, as estimated by the DEIR's net annual GHG emission estimates and SP, exceeds the SCAQMD 2035 efficiency target of 3.0 MT CO_2e/SP/year, indicating a potentially significant impact not previously identified or addressed by the DEIR. As a result, the DEIR's less-than-significant GHG impact conclusion should not be relied upon. An updated EIR should be prepared, including an updated GHG analysis and incorporating additional mitigation measures to reduce the Project's GHG emissions to less-than-significant levels.

---

[20] "Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #15." SCAQMD, September 2010, *available at:* http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/year-2008-2009/ghg-meeting-15/ghg-meeting-15-minutes.pdf, p. 2.

[21] "CEQA & Climate Change." CAPCOA, January 2008, *available at:* http://www.capcoa.org/wp-content/uploads/2012/03/CAPCOA-White-Paper.pdf, p. 71-72.

[22] Calculated: 100 employees + 0 residents = 100 total SP.

[23] Calculated: (1,553 MT CO_2e/year) / (100 service population) = (15.5 MT CO_2e/SP/year).

3) Project Design Features Should Be Incorporated as Mitigation Measures

As previously mentioned, the DEIR relies upon the Project's consistency with the CARB's Scoping Plan, SCAG's *RTP/SCS*, the City's Green New Deal, and the Los Angeles Green Building Code (IV.G-40). Furthermore, consistent with the emissions reductions strategies within the above-mentioned plans and policies, the DEIR includes the following Project Design Feature ("PDF"):

> "GHG-PDF-1: Solar Voltaic System. The Project will be designed to include solar voltaic panels providing 339,000 kilo Watt-hours (kWh) per year on the roof of the gymnasium that would reduce the amount of electricity demand from City utilities" (p. IV.G-50).

However, we recommend that the DEIR incorporates this PDF as a formal mitigation measure. According to the AEP *CEQA Portal Topic Paper* on Mitigation Measures:

> "While not "mitigation", a good practice is to include those project design feature(s) that address environmental impacts in the mitigation monitoring and reporting program (MMRP). Often the MMRP is all that accompanies building and construction plans through the permit process. If the design features are not listed as important to addressing an environmental impact, it is easy for someone not involved in the original environmental process to approve a change to the project that could eliminate one or more of the design features without understanding the resulting environmental impact."[24]

As demonstrated above, PDFs that are not formally included as mitigation measures may be eliminated from the Project's design altogether. Thus, as the solar voltaic system is not formally included as a mitigation measure, we cannot guarantee that it would be implemented, monitored, and enforced on the Project site. As such, until the PDF is included as a mitigation measure, the Project's GHG analysis should not be relied upon to determine Project significance.

4) Failure to Consider Performance-based Standards Under CARB's 2017 Scoping Plan

As previously discussed, the DEIR concludes that the Project would be consistent with CARB's 2017 Climate Change Scoping Plan (p. IV.G-40). However, this is incorrect, as the DEIR fails to consider performance-based measures proposed by CARB.

i. Passenger & Light Duty VMT Per Capita Benchmarks per SB 375

In reaching the State's long-term GHG emission reduction goals, CARB's 2017 *Scoping Plan* explicitly cites to SB 375 and the VMT reductions anticipated under the implementation of Sustainable Community Strategies.[25] CARB has identified the population and daily VMT from passenger autos and light-duty vehicles at the state and county level for each year between 2010 to 2050 under a "baseline scenario" that includes "current projections of VMT included in the existing Regional Transportation Plans/Sustainable Communities Strategies (RTP/SCSs) adopted by the State's 18 Metropolitan Planning

[24] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 6.
[25] "California's 2017 Climate Change Scoping Plan." CARB, November 2017, *available at*: https://ww3.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf, p. 25, 98, 101-103.

Organizations (MPOs) pursuant to SB 375 as of 2015."[26] By dividing the projected daily VMT by the population, we calculated the daily VMT per capita for each year at the state and county level for 2010 (baseline year), 2025 (Project operational year), and 2030 (target years under SB 32) (see table below).

2017 Scoping Plan Daily VMT Per Capita

	Los Angeles County			State		
Year	Population	LDV VMT Baseline	VMT Per Capita	Population	LDV VMT Baseline	VMT Per Capita
2010	9,838,771	216,979,221.64	22.05	37,335,085	836,463,980.46	22.40
2025	10,671,800	217,340,094.90	20.37	42,326,397	929,443,512.65	21.96
2030	10,868,614	215,539,586.12	19.83	43,939,250	957,178,153.19	21.78

As the DEIR fails to evaluate the Project's consistency with the CARB 2017 *Scoping Plan* performance-based daily VMT per capita projections, the DEIR's claim that the proposed Project would not conflict with the CARB 2017 *Scoping Plan* is unsupported. An updated EIR should be prepared for the proposed Project to provide additional information and analysis to conclude less-than-significant GHG impacts.

5) Failure to Consider Performance-based Standards under SCAG's RTP/SCS

As previously discussed, the DEIR concludes that the Project would be consistent with SCAG's *RTP/SCS* (p. IV.G-40). However, the DEIR fails to consider whether or not the Project meets any of the specific performance-based goals underlying SCAG's *RTP/SCS* and SB 375, such as: i) per capita GHG emission targets, or ii) daily vehicles miles traveled ("VMT") per capita benchmarks.

i. SB 375 Per Capita GHG Emission Goals

SB 375 was signed into law in September 2008 to enhance the state's ability to reach AB 32 goals by directing CARB to develop regional 2020 and 2035 GHG emission reduction targets for passenger vehicles (autos and light-duty trucks). In March 2018, CARB adopted updated regional targets requiring a 19 percent decrease in VMT for the SCAG region by 2035. This goal is reflected in SCAG's 2020 RTP/SCS Program Environmental Impact Report ("PEIR"), in which the 2020 RTP/SCS PEIR updates the per capita emissions to 18.8 lbs/day in 2035 (see excerpt below). [27]

As the DEIR fails to evaluate the Project's consistency with the SCAG's per capita emissions, the DEIR's claim that the proposed Project would not conflict with SCAG's *RTP/SCS* is unsupported. An updated EIR should be prepared for the proposed Project to provide additional information and analysis to conclude less-than-significant GHG impacts.

ii. SB 375 RTP/SCS Daily VMT Per Capita Target

Under the SCAG's 2020 *RTP/SCS*, daily VMT per capita in the SCAG region should decrease from 23.2 VMT in 2016 to 20.7 VMT by 2045.[28] Daily VMT per capita in Los Angeles County should decrease from 22.2 to 19.2 VMT during that same period.[29] Here, however, the DEIR fails to consider any of the above-mentioned performance-based VMT targets. As the DEIR fails to evaluate the Project's consistency with the SCAG's performance-based daily VMT per capita projections, the DEIR's claim that the proposed Project would not conflict with SCAG's *RTP/SCS* is unsupported. An updated EIR should be prepared for the proposed Project to provide additional information and analysis to conclude less-than-significant GHG impacts.

Feasible Mitigation Measures Available to Reduce Emissions

Our analysis demonstrates that the Project would result in a potentially significant GHG impact that should be mitigated further. As such, in an effort to reduce the Project's emissions, we identified several mitigation measures that are applicable to the proposed Project. Therefore, to reduce the Project's emissions, we recommend consideration of SCAG's 2020 *RTP/SCS* PEIR's Greenhouse Gas Project Level Mitigation Measures ("PMM-GHG-1"), as described below: [30]

[28] "Connect SoCal." SCAG, September 2020, *available at*: https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal-plan_0.pdf?1606001176, pp. 138.
[29] "Connect SoCal." SCAG, September 2020, *available at*: https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal-plan_0.pdf?1606001176, pp. 138.
[30] "4.0 Mitigation Measures." Connect SoCal Program Environmental Impact Report Addendum #1, September 2020, available at: https://scag.ca.gov/sites/main/files/file-attachments/fpeir_connectsocal_addendum_4_mitigationmeasures.pdf?1606004420, p. 4.0-2 – 4.0-10; 4.0-19 –

SCAG RTP/SCS 2020-2045
Greenhouse Gas Project Level Mitigation Measures – PMM-GHG-1 In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to violating air quality standards. Such measures may include the following or other comparable measures identified by the Lead Agency:
b) Reduce emissions resulting from projects through implementation of project features, project design, or other measures, such as those described in Appendix F of the State CEQA Guidelines.
c) Include off-site measures to mitigate a project's emissions.
d) Measures that consider incorporation of Best Available Control Technology (BACT) during design, construction and operation of projects to minimize GHG emissions, including but not limited to: i. Use energy and fuel-efficient vehicles and equipment; ii. Deployment of zero- and/or near zero emission technologies; iii. Use lighting systems that are energy efficient, such as LED technology; iv. Use the minimum feasible amount of GHG-emitting construction materials; v. Use cement blended with the maximum feasible amount of flash or other materials that reduce GHG emissions from cement production; vi. Incorporate design measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse; vii. Incorporate design measures to reduce energy consumption and increase use of renewable energy; viii. Incorporate design measures to reduce water consumption; ix. Use lighter-colored pavement where feasible; x. Recycle construction debris to maximum extent feasible; xi. Plant shade trees in or near construction projects where feasible; and xii. Solicit bids that include concepts listed above.
e) Measures that encourage transit use, carpooling, bike-share and car-share programs, active transportation, and parking strategies, including, but not limited to the following: i. Promote transit-active transportation coordinated strategies; ii. Increase bicycle carrying capacity on transit and rail vehicles; iii. Improve or increase access to transit; iv. Increase access to common goods and services, such as groceries, schools, and day care; v. Incorporate affordable housing into the project; vi. Incorporate the neighborhood electric vehicle network; vii. Orient the project toward transit, bicycle and pedestrian facilities; viii. Improve pedestrian or bicycle networks, or transit service; ix. Provide traffic calming measures; x. Provide bicycle parking; xi. Limit or eliminate park supply; xii. Unbundle parking costs;

4.0-23; See also: "Certified Final Connect SoCal Program Environmental Impact Report." Southern California Association of Governments (SCAG), May 2020, *available at:* https://scag.ca.gov/peir.

xiii. Provide parking cash-out programs; xiv. Implement or provide access to commute reduction program;
f) Incorporate bicycle and pedestrian facilities into project designs, maintaining these facilities, and providing amenities incentivizing their use; and planning for and building local bicycle projects that connect with the regional network;
g) Improving transit access to rail and bus routes by incentives for construction and transit facilities within developments, and/or providing dedicated shuttle service to transit stations; and
h) Adopting employer trip reduction measures to reduce employee trips such as vanpool and carpool programs, providing end-of-trip facilities, and telecommuting programs including but not limited to measures that: i. Provide car-sharing, bike sharing, and ride-sharing programs; ii. Provide transit passes; iii. Shift single occupancy vehicle trips to carpooling or vanpooling, for example providing ride-matching services; iv. Provide incentives or subsidies that increase that use of modes other than single-occupancy vehicle; v. Provide on-site amenities at places of work, such as priority parking for carpools and vanpools, secure bike parking, and showers and locker rooms; vi. Provide employee transportation coordinators at employment sites; vii. Provide a guaranteed ride home service to users of non-auto modes.
i) Designate a percentage of parking spaces for ride-sharing vehicles or high-occupancy vehicles, and provide adequate passenger loading and unloading for those vehicles;
j) Land use siting and design measures that reduce GHG emissions, including: i. Developing on infill and brownfields sites; ii. Building compact and mixed-use developments near transit; iii. Retaining on-site mature trees and vegetation, and planting new canopy trees; iv. Measures that increase vehicle efficiency, encourage use of zero and low emissions vehicles, or reduce the carbon content of fuels, including constructing or encouraging construction of electric vehicle charging stations or neighborhood electric vehicle networks, or charging for electric bicycles; and v. Measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse.
k) Consult the SCAG Environmental Justice Toolbox for potential measures to address impacts to low-income and/or minority communities. The measures provided above are also intended to be applied in low income and minority communities as applicable and feasible.
l) Require at least five percent of all vehicle parking spaces include electric vehicle charging stations, or at a minimum, require the appropriate infrastructure to facilitate sufficient electric charging for passenger vehicles and trucks to plug-in.
m) Encourage telecommuting and alternative work schedules, such as: i. Staggered starting times ii. Flexible schedules iii. Compressed work weeks
n) Implement commute trip reduction marketing, such as: i. New employee orientation of trip reduction and alternative mode options ii. Event promotions iii. Publications
o) Implement preferential parking permit program
p) Implement school pool and bus programs

q) Price workplace parking, such as:

i. Explicitly charging for parking for its employees;
ii. Implementing above market rate pricing;
iii. Validating parking only for invited guests;
iv. Not providing employee parking and transportation allowances; and
v. Educating employees about available alternatives.

These measures offer a cost-effective, feasible way to incorporate lower-emitting design features into the proposed Project, which subsequently, reduce emissions released during Project construction and operation. An updated EIR should be prepared to include all feasible mitigation measures, as well as include an updated GHG analysis to ensure that the necessary mitigation measures are implemented to reduce emissions to below thresholds. The EIR should also demonstrate a commitment to the implementation of these measures prior to Project approval, to ensure that the Project's significant emissions are reduced to the maximum extent possible.

Disclaimer

SWAPE has received limited discovery regarding this project. Additional information may become available in the future; thus, we retain the right to revise or amend this report when additional information becomes available. Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in this or similar localities at the time of service. No other warranty, expressed or implied, is made as to the scope of work, work methodologies and protocols, site conditions, analytical testing results, and findings presented. This report reflects efforts which were limited to information that was reasonably accessible at the time of the work, and may contain informational gaps, inconsistencies, or otherwise be incomplete due to the unavailability or uncertainty of information obtained or provided by third parties.

Sincerely,

Matt Hagemann, P.G., C.Hg.

Paul E. Rosenfeld, Ph.D.

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
Industrial Stormwater Compliance
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 30 years of experience in environmental policy, contaminant assessment and remediation, stormwater compliance, and CEQA review. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) and directed efforts to improve hydrogeologic characterization and water quality monitoring. For the past 15 years, as a founding partner with SWAPE, Matt has developed extensive client relationships and has managed complex projects that include consultation as an expert witness and a regulatory specialist, and a manager of projects ranging from industrial stormwater compliance to CEQA review of impacts from hazardous waste, air quality and greenhouse gas emissions.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2104, 2017;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 300 environmental impact reports and negative declarations since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at more than 100 industrial facilities.
- Expert witness on numerous cases including, for example, perfluorooctanoic acid (PFOA) contamination of groundwater, MTBE litigation, air toxins at hazards at a school, CERCLA compliance in assessment and remediation, and industrial stormwater contamination.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.
- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted

public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9.

Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific

principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt is currently a part time geology instructor at Golden West College in Huntington Beach, California where he taught from 2010 to 2014 and in 2017.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, industrial, military and agricultural sources, unconventional oil drilling operations, and locomotive and construction engines. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities. Dr. Rosenfeld has also successfully modeled exposure to contaminants distributed by water systems and via vapor intrusion.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, creosote, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at sites and has testified as an expert witness on numerous cases involving exposure to soil, water and air contaminants from industrial, railroad, agricultural, and military sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Deposition and/or Trial Testimony:

In the Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 5-14-2021
Trial, October 8-4-2021

In the Circuit Court of Cook County Illinois
Joseph Rafferty, Plaintiff vs. Consolidated Rail Corporation and National Railroad Passenger Corporation d/b/a AMTRAK,
Case No.: No. 18-L-6845
Rosenfeld Deposition, 6-28-2021

In the United States District Court For the Northern District of Illinois
Theresa Romcoe, Plaintiff vs. Northeast Illinois Regional Commuter Railroad Corporation d/b/a METRA Rail, Defendants
Case No.: No. 17-cv-8517
Rosenfeld Deposition, 5-25-2021

In the Superior Court of the State of Arizona In and For the Cunty of Maricopa
Mary Tryon et al., Plaintiff vs. The City of Pheonix v. Cox Cactus Farm, L.L.C., Utah Shelter Systems, Inc.
Case Number CV20127-094749
Rosenfeld Deposition: 5-7-2021

In the United States District Court for the Eastern District of Texas Beaumont Division
Robinson, Jeremy et al *Plaintiffs*, vs. CNA Insurance Company et al.
Case Number 1:17-cv-000508
Rosenfeld Deposition: 3-25-2021

In the Superior Court of the State of California, County of San Bernardino
Gary Garner, Personal Representative for the Estate of Melvin Garner vs. BNSF Railway Company.
Case No. 1720288
Rosenfeld Deposition 2-23-2021

In the Superior Court of the State of California, County of Los Angeles, Spring Street Courthouse
Benny M Rodriguez vs. Union Pacific Railroad, A Corporation, et al.
Case No. 18STCV01162
Rosenfeld Deposition 12-23-2020

In the Circuit Court of Jackson County, Missouri
Karen Cornwell, *Plaintiff,* vs. Marathon Petroleum, LP, *Defendant.*
Case No.: 1716-CV10006
Rosenfeld Deposition. 8-30-2019

In the United States District Court For The District of New Jersey
Duarte et al, *Plaintiffs,* vs. United States Metals Refining Company et. al. *Defendant.*
Case No.: 2:17-cv-01624-ES-SCM
Rosenfeld Deposition. 6-7-2019

In the United States District Court of Southern District of Texas Galveston Division
M/T Carla Maersk, *Plaintiffs,* vs. Conti 168., Schiffahrts-GMBH & Co. Bulker KG MS "Conti Perdido" *Defendant.*
Case No.: 3:15-CV-00106 consolidated with 3:15-CV-00237
Rosenfeld Deposition. 5-9-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
Carole-Taddeo-Bates et al., vs. Ifran Khan et al., Defendants
Case No.: No. BC615636
Rosenfeld Deposition, 1-26-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
The San Gabriel Valley Council of Governments et al. vs El Adobe Apts. Inc. et al., Defendants
Case No.: No. BC646857
Rosenfeld Deposition, 10-6-2018; Trial 3-7-19

In United States District Court For The District of Colorado
Bells et al. Plaintiff vs. The 3M Company et al., Defendants
Case No.: 1:16-cv-02531-RBJ
Rosenfeld Deposition, 3-15-2018 and 4-3-2018

In The District Court Of Regan County, Texas, 112th Judicial District
Phillip Bales et al., Plaintiff vs. Dow Agrosciences, LLC, et al., Defendants
Cause No.: 1923
Rosenfeld Deposition, 11-17-2017

In The Superior Court of the State of California In And For The County Of Contra Costa
Simons et al., Plaintiffs vs. Chevron Corporation, et al., Defendants
Cause No C12-01481
Rosenfeld Deposition, 11-20-2017

In The Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 8-23-2017

In United States District Court For The Southern District of Mississippi
Guy Manuel vs. The BP Exploration et al., Defendants
Case: No 1:19-cv-00315-RHW
Rosenfeld Deposition, 4-22-2020

In The Superior Court of the State of California, For The County of Los Angeles
Warrn Gilbert and Penny Gilber, Plaintiff vs. BMW of North America LLC
Case No.: LC102019 (c/w BC582154)
Rosenfeld Deposition, 8-16-2017, Trail 8-28-2018

In the Northern District Court of Mississippi, Greenville Division
Brenda J. Cooper, et al., *Plaintiffs,* vs. Meritor Inc., et al., *Defendants*
Case Number: 4:16-cv-52-DMB-JVM
Rosenfeld Deposition: July 2017

In The Superior Court of the State of Washington, County of Snohomish
Michael Davis and Julie Davis et al., Plaintiff vs. Cedar Grove Composting Inc., Defendants
Case No.: No. 13-2-03987-5
Rosenfeld Deposition, February 2017
Trial, March 2017

In The Superior Court of the State of California, County of Alameda
Charles Spain., Plaintiff vs. Thermo Fisher Scientific, et al., Defendants
Case No.: RG14711115
Rosenfeld Deposition, September 2015

In The Iowa District Court In And For Poweshiek County
Russell D. Winburn, et al., Plaintiffs vs. Doug Hoksbergen, et al., Defendants

OCT 30, 2017

UPDATE: HARVARD-WESTLAKE PARKING STRUCTURE PLANS SUSPENDED

On October 30, Harvard-Westlake made a tremendously important announcement: it is suspending its plans to build a parking structure on the west side of Coldwater Canyon Avenue, and will instead explore adding more parking capacity on campus. I want to thank the community for making its voice heard regarding the Coldwater project. I also appreciate that the school has listened to my concerns, and those of the community, and taken them seriously. The open discourse among the community, the city, the school and impacted neighbors highlights what makes our democratic process so great and important.

The administration and board of the school deserve credit for doing what we have asked of them by exploring other options to meet the school's parking needs. An on-campus parking facility would certainly have much less community impact, in that it will avoid the significant excavation and other construction impacts that the earlier proposal would require, and it will avoid the loss of open space across Coldwater.

Harvard-Westlake's announcement about the Coldwater Canyon proposal came at the same time it disclosed that it has reached an agreement to purchase Weddington Golf & Tennis from its owners. Although the school has only provided preliminary details about the

future of Weddington, this transaction is a major financial commitment that shows the school is ready to move in a different direction.

Weddington is a property central to the history of Studio City. It is the largest privately-held open space facing the Los Angeles River in the entire San Fernando Valley. It is very near and dear to my heart, and I know many of you feel this way too. For more than a decade, since my days as a State Assemblymember, I have worked hard to preserve open space at Weddington and improve access to the LA River, while fighting successfully to block any plans to build housing or other intrusive structures on the site.

Harvard-Westlake has indicated that it intends to work closely with the community in developing a plan for Weddington. The school has been clear in stating that it respects my insistence that no housing or above-ground parking structures will be built on the property. The school has also acknowledged that it will respect the community's desires by maintaining the tranquility of the property and preserving as much open space as possible, improving public access to the revitalized Los Angeles River, and enhancing community benefits from the property. If the right kind of plan is advanced with the full input of our community, this transaction could provide a historic opportunity to protect Weddington as open space and, once and for all, to permanently prevent the risk of condominiums or other housing development at this site.

As the school moves forward in developing its new plans, I will continue to advocate for Weddington to remain an environmental, aesthetic and recreational asset to Studio City. I will continue to work closely with the community and the school to find a truly suitable and beneficial community use for whatever project is ultimately proposed. Among other things, I will support increasing river access, implementing groundwater recharge, preserving open space, and allowing the public to use the property for recreation. I absolutely will not support any attempt to place housing or an above-ground parking structure on the site.

As further news develops, I will keep you informed about what is happening with Weddington. I will always insist that the community is engaged and protected from adverse impacts that may result from Harvard-Westlake's plans to the greatest degree possible. My goal will be to work closely with the school and the surrounding neighbors to ensure the community has opportunities for input and guidance every step of the way.

Thank you for your ongoing interest in and advocacy on this issue.

Very truly yours,

Paul Krekorian

Councilmember, District 2

community studio city

SAVE
COLDWATER CANYON!

March 20, 2016

Diana Kitching, City Planning Dept.
RE: ENV-2013-0150-EIR

Dear Ms. Kitching,

Save Coldwater Canyon!, Inc. (SCC) is a neighborhood non-profit group whose mission is to preserve and protect the Coldwater Canyon foothills. SCC submits the following comments on behalf of the 1,100 concerned citizens that have joined our cause.

We have previously submitted comments to the DEIR, yet this recirculated DEIR (RDEIR) has most of the same deficiencies and faulty assumptions, as well as a number of new issues of concern that we will address in this comment letter.

We are submitting as part of this letter four independent expert reports: air quality, safety, noise, and traffic. Three of these four reports indicate the gross underestimation of the impacts from soil excavation and truck trips necessary to and from the Project site.

We are also attaching a copy of our online petition, wherein over 1,300 citizens voice their concern over the Project's negative impact to designated desirable open space land.

The RDEIR does not consider the impact of providing so many exceptions to city building codes and limits (especially the Baseline Hillside Ordinance) for this Project, nor the precedential effect that approval of this Project would have on future development.

We continue to have serious concerns about the negative impact of this Project to Air Quality, Construction and Operational Noise, Biological Resources, Traffic, Aesthetics, Land Use Compatibility, Expansion, and Safety hazards created by the Project.

12400 Ventura Blvd, #775, Studio City CA 91604 savecoldwatercanyon@gmail.com

1. AIR QUALITY impacts during excavation and construction (now estimated at 30 months)

Information inadequate for fair public review

SCC is submitting an independent expert report from Greg Gilbert of Autumn Wind and Associates (AWA). Mr. Gilbert's report points out a number of inadequacies with the RDEIR and the current AQ Appendix. He was unable to get adequate information out of the Air Quality element and its Appendix to determine the assumptions they used for modeling and all the details involved with the modeling process. He requested this information from the Lead Agency but did not receive it in enough time to analyze the data within the comment period.

Even so, there are MANY issues of concern specific to the construction and operational air quality impacts.

No Health Risk Analysis/Modeling

"School children will be captive on-campus for many hours per day, day after day, month after month, with increased health risks as a result of the project's heavy reliance on extensive diesel-powered construction equipment and in combination with existing background TAC concentrations." (AWA report, p.6) We ask that the Lead Agency insist on the use of AERMOD to characterize increased health risks of exposures to Toxic Air Contaminants (TACs).

The RDEIR alarmingly has failed to consider the health risks to school children and nearby residents from construction-related toxics and the cumulative TAC emissions that include operational emissions.

"In light of the overwhelmingly sensitive-receptor population—children—served by the school, with residents as close as 72' from the construction zone, and against the backdrop of more protective OEHHA and SCAQMD TAC and health-risk guidance changes made prior to issuance of the RDEIR, **the Lead Agency should have put a priority on protecting public health** [emphasis added] by including a Health Risk Assessment in the RDEIR. Without a bona fide HRA, the Lead Agency cannot justifiably conclude that the project's project-specific and cumulative TAC impacts are less than significant." (AWA report, p. 7)

Impacts to sensitive receptors must be updated to new OEHHA standards
"In February 2015, OEHHA (State Office of Environmental Health Hazard Assessment) released updated Risk Assessment Guidelines that outline risk calculations for specific age groupings, including a more protective breathing rate for children." (AWA report, p.7) The RDEIR must use these new standards to analyze whether the negative air quality impacts are even more significant.

At RDEIR pg. 3.2-5 the RDEIR says diesel exhaust is only a "likely carcinogen". The RDEIR should be revised to properly categorize the diesel exhaust emissions as a toxic air contaminant based on its carcinogenicity. The RDEIR should not play fast and loose with our children's health.

Considering the proximity not only of residents and the School itself, but also the proximity of a number of sensitive receptors (elderly, student athletes, preschool children, and children of 100s of nearby residents), the accurate information for modeling and the verification of the modeling by an *independent outside source* (provided not by the Applicant but by the City) should be of paramount importance to the Lead Agency.

Mitigations unenforceable and inadequate

As further describe in the report, a number of the proposed mitigations are unenforceable, such as the supposed coordination of truck trips and excavation with Sunnyside Preschool. The Applicant seems to be suggesting favoring its relationship with Sunnyside (see MM-AQ09) while ignoring the impact to other sensitive receptors in the vicinity, such as young children in the nearby residences, the elderly (and children) who worship at St. Michael's church, and the School's own athletes.

Truck trips have been underestimated, according to multiple experts; however, even if we take "160 truck trips" as legitimate, we question the feasibility of 160 daily truck trips being able to avoid both peak traffic hours (as suggested in the Traffic section) AND times of day when these sensitive receptors are outside. Between athletic practices and events at Harvard-Westlake, weekday preschool hours, and St. Michael's church's weddings and other services on weekends, there are simply too many hours in the week when the community will be put at risk by the emissions caused by the enormous excavation and hauling of this Project.

Daily thresholds have changed in the RDEIR, by the Applicant deciding to draw the project out even longer and add more phases -- however, the new analysis in

the RDEIR showed the NOx went up. It went from 49 to 137 - and that's unmitigated. So the Applicant then apparently offered to change the diesel equipment to Tier 3 status, and the level dipped back under the daily thresholds. This is MM-AQ10. The problem with this suggested mitigation is that this shift to Tier 3 equipment is only "where available" -- there is no requirement and no enforcement in this mitigation measure.

The underestimation and mischaracterization of Truck trips and Hauling distances could lead to significant impacts on Air Quality and must be further analyzed in the EIR.

2. CONSTRUCTION AND OPERATIONAL NOISE pollution impacts

SCC reiterates its prior statements about the unmitigatable construction noise, as well as the ongoing operational noise from cars, engines, car alarms, field whistles, yelling, tires screeching, etc.

We further submit for the record a noise study done by Veneklasen Associates in December 2014. The Veneklasen report shows the noise impacts of the current Ted Slavin field, as well as documentation that the school's use of its current field makes noise in excess of the LAMC and Noise Ordinance, in violation of their current CUP. The report shows that game day noise raises the level of noise to a degree that is disruptive and creates a nuisance -- and it does so at distances far in excess of those allowable by ordinance. The study documents the Applicant's noncompliance of the parameters of the CUP for their existing field lights (CPC-2006-2375-PAD), and suggests likely noncompliance on other game days. The Lead Agency should therefore take any assertion the Applicant makes about being a "good neighbor" with the appropriate-sized grain of salt.

3. VISUAL QUALITY/AESTHETICS impacts to the scenic canyon and its natural views

SCC reiterates its prior statements about the visual blight of the private bridge, the 3-story, 4-level structure, the lighted practice field, and the parking garage on land that is currently a green hillside filled with open space, a rare oak and walnut woodland, and scenic natural views.

4. BIOLOGICAL RESOURCES impacts to protected trees and sensitive species

The RDEIR finally admits the "significant negative impact" the project would have on the rare oak and walnut woodland. Even so, the RDEIR still underestimates the impact to biological resources after proposed mitigations.

SCC echoes the concerns of the Sierra Club in their March 2016 comment letter, "The importance of saving healthy native trees becomes more urgent with each year of increasing drought and climate change."

"The project should be situated in a place that has no significant impact on the wild areas of the San Fernando Valley." (Sierra Club comment letter, March 15, 2016)

SCC reiterates the concerns raised in the independent expert report submitted by Land Protection Partners (LPP) (Comment letter, 2013) and once again asks that the many conclusions in that report be addressed in the FEIR.

Negative Impact to Sensitive Bird Species Still Underestimated
LPP pointed out, in their comment letter in 2013, the missing analysis of the impact to a number of species of concern for LA County that are present or likely to be present (Greater Roadrunner, Western Meadowlark, Golden-crowned Kingley, Ruby-crowned Kingley, California Towhee). Analysis of these bird species of concern remains missing from the RDEIR.

The RDEIR has added two sensitive species to the list of concerned species (San Bernadino ringneck snake and Coastal western whiptail lizard). The RDEIR Table (on page 3.3, 7-8) enumerates many bird species either *"Found on Site"* or *"Very Likely"* on site that are listed on the Partners in Flight watchlist (a coalition of NGOs including the National Audubon Society, National Fish and Wildlife Foundation) as *"threatened and declining"* and *"range restricted":* the Oak titmouse, the Rufous Hummingbird, the Nutall Woodpecker, the Cooper's Hawk. (3.3-7,8) The underlying Biological Resources report found a *"significant impact on these species region-wide"* as result of loss of habitat. (RDEIR, Apdix D.4, p.6)

Yet somehow, in its Impact Conclusions, the RDEIR strangely focuses on the two species of Reptile but singles out ONLY ONE (the Nutall woodpecker) of the many sensitive species of birds found on site. For the RDEIR to conclude that the only "significant" impact on wildlife is to reptiles is inadequate and inconsistent with its own findings. (Compare 3.3-7,8 to 3.3-22,23) The Land Protection Partners report submitted to the DEIR in 2013 addresses the many reasons why the analysis of the impact to bird species is inadequate to address the negative impact of this project to wildlife.

Mischaracterized Tree Damage and Wildlife Corridor

The RDEIR added to the number of protected trees that are on site and *increased* those which are proposed to be removed. Now it is 65 coast live oaks and 273 California black walnuts (total of 338 protected trees -- 147 to be removed). The RDEIR still exaggerates the poor state of the protected trees – only **15** of the 147 trees the school is proposing to destroy are F rated.

Even D rated trees -- most of which are semi-mature or mature -- "support partial foliage" and "are expected to survive." (Appendix D.3, p 16). The Santa Monica Mountains Conservancy agrees that even trees with "thousand canker disease" still provide habitat, and food source for wildlife and continue to thrive. (SMMC Comment Letter, Nov. 4 2013) This fact is overlooked in the RDEIR.

We also disagree with the RDEIR's characterization of the wildlife corridor at the site. The RDEIR, in its discussion of wildlife corridors, discounts the Project's negative impact to wildlife movement, saying: "…the Project is on the periphery of an open space area...the Development Site is located at the east edge of the northern end of a finger or peninsula of open space within surrounding suburban development"… [therefore]… "This impact is not considered significant" (3.3-21).

Experts have shown that wildlife use the full amount of the open space in this corridor; the fact that this part of land is on the Northern end, and up against Coldwater Canyon, does not diminish its impact to the wildlife corridor. Wildlife routinely crosses canyon roads throughout the Santa Monica Mountains. There are suburban residences surrounding the entirety of the Santa Monica Mountains' wildlife corridor, yet wildlife still make use of as much of the undeveloped land as there still is.

The RDEIR fails to take into account the cumulative impact to the wildlife corridor of developing this Site - if more and more Projects are allowed, with each one reducing wildlife habitat that is PART of the wildlife corridor, the wildlife will have less and less land on which to roam, live and breed. Where will this encroachment to the wildlife corridor end?

Elsewhere, the RDEIR admits "The southern ¾ of the Development Site is within the 'Desirable open space Special Boundary' and is immediately adjacent to land owned by the Santa Monica Mountains Conservancy." (3.3-23) The site is almost entirely on open space land and it is part of the wildlife corridor, regardless of its location on the Northern peninsula.

5. LAND USE COMPATIBILITY/OPEN SPACE impacts to this Desirable Open Space land

SCC reiterates its prior statements about protecting our desirable open space land. The RDEIR shows that project has increased in acreage from 5.5 to 6.83, and now "The southern ¾ of the Development Site is within the 'Desirable open space Special Boundary' and is immediately adjacent to land owned by the Santa Monica Mountains Conservancy." (3.3-23) As such, the Project is incompatible with the community plan and the current land use on the West side of Coldwater.

This is land which has a higher standard for protection in our City's community plan; its desecration should not occur absent some overwhelming public purpose.

Story Poles and Transparency of Project's Scale

In an effort to make this project known to the larger community, including all motorists who travel along Coldwater, and all residents included in our community plan (particularly those who are outside the 500 ft notification boundary, yet whose views will be severely negatively impacted by this Project, eg up Alta Mesa and Avenida del Sol), Save Coldwater Canyon supports the SCNC's recommendation of erecting story poles. They are regularly used in other municipalities to make the public aware of the scale and scope of a project.

The Lead Agency, along with Councilmember Krekorian, should require the Applicant to erect story poles that visually demonstrate all components of the project. This must be done as soon as possible to alert citizens of what might happen to the canyon if Project goes forward.

6. SAFETY impact, moving students and visitors across Coldwater Canyon to the West side

The independent expert report from WEXCO enumerates many safety concerns with the proposed Project. These include: moving students and visitors across

Coldwater; the dangers to students and visitors during an emergency with only the Bridge as an exit or Coldwater Canyon at grade; hazards of practice field netting; the gross underestimation of the soil excavation and truck trips necessary to and from the Project site.

Current Pedestrian Circulation and Bus Loading/Unloading is Safe

The report analyzes the current pedestrian circulation and finds that the current bus loading and unloading is entirely safe and that keeping pedestrians on the East side of Coldwater Canyon is the safest choice for the School community.

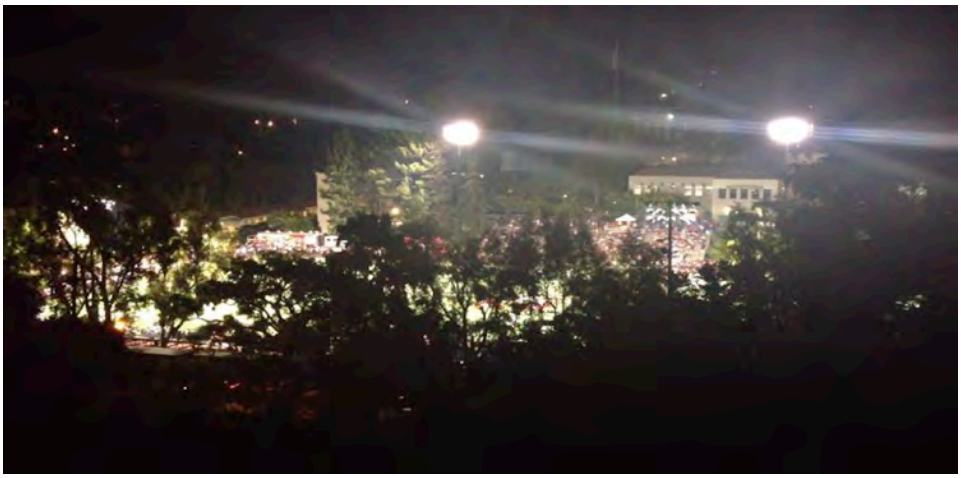
Moving the school community across Coldwater Canyon is what would jeopardize them. "There is no legitimate safety argument for moving the campus community…across Coldwater Canyon to the West so that they must travel eastward across Coldwater Canyon at risk." (Wexco, p.8)

Hazards of Practice Field Netting

The 32-ft netting is insufficient to guarantee that athletic balls will not fall (with great velocity from a height of over 83 ft) onto oncoming motorists. Anyone who has ever witnessed a "goal kick" during a soccer game knows how high and far a soccer ball can be kicked.

The netting is also a likely hazard to flying birds, especially given the suggestion that every effort is made for the netting to be camouflaged with the natural environment. Given the numerous threatened and declining species known to be on Site, and the numerous bird species on the LA County Watchlist, as well as the bats and butterflies known to be on Site, this netting causes a negative impact that has not been adequately analyzed.

7. EXPANSION of school and its activities to the West side



Moving the parking across Coldwater is clearly the beginning of a larger effort to expand the campus West of Coldwater. One need only look at the parcels that have been bought by the Applicant in the past few years. Yet the Applicant is not releasing a 10-yr plan, nor has it linked this Project to other plans to build buildings on existing parking lots (or elsewhere) on the existing campus. If the Applicant is found to be developing piecemeal, this would amount to illegal segmentation. <u>This is a serious concern for the community, and goes against the Applicant's claim to wish to be transparent to the community.</u>

Despite receiving permits based on enrollment at much lower numbers than the Applicant currently has, the Applicant has continued to increase enrollment since 1992, and alleges that they are not subject to an enrollment cap. Obviously, should the Project go forward, the Applicant must be held to an enforceable and clear enrollment cap at the current level of enrollment. Further they must be held to a 25 year building moratorium.

8. LIGHTING impacts with a lighted field, lighted bridge, and lighted garage where there is now only trees and hillside

SCC reiterates prior comments about negative impacts to residents and wildlife from lights. The community has documented the nuisance from both direct and indirect lighting from the current Ted Slavin field, even involving Dept of Building and Safety to demand that the Applicant shield and/or redirect their current field lights. The Applicant made small modifications (one resident did not even realize any adjustment had been made since light still shines into his home), and the Applicant received approval from DBS. Despite receiving approval from this agency, the lights from the Ted Slavin field continue to create significant glow to the hillside, and the lights themselves are still visible from many houses at grade on Van Noord, Alcove and Halkirk, as well as from the Western hillside. A number of Galewood Ave residents informed Save Coldwater Canyon that they still have light intrusion directly into their homes. Field lights "still shine on our

front yard," says one Galewood resident. "Direct lighting does still enter my property," says another Galewood resident. Field lights shine into "multiple rooms of our house," says a Van Noord resident.

SCC therefore does not support lights of any kind on the proposed practice field. The Applicant alleges that the one of the main reasons they would like the practice field is so that more students on sports teams can leave school early -- therefore having no lights on the field would help both student athletes as well as the residents and wildlife, by precluding practices after dark.

9. TRAFFIC impacts are much more significant than RDEIR suggests

Despite the fact that "Objectives" of the "Harvard-Westlake Parking Improvement Plan" include: "improve the flow of traffic on Coldwater Canyon Avenue," and

"enhance safety and security associated with vehicular and pedestrian circulation on the Harvard-Westlake Campus and in the surrounding area," (RDEIR 2-8) the Project will accomplish neither of these objectives and would, in fact, have disastrous effect on traffic during at least 30 months of construction and continue to have negative impacts after completion.

No Established Need

The attached report by Tom Brohard and Associates, dated February 29, 2016 concludes that there is "no justification… to double the existing number of parking spaces at Harvard-Westlake that were adequate in 1992, which are adequate today… Adopting a TDM Program including a progressive disciplinary system of enforcement, an alternative that has not been considered, would be a much more cost effective solution if parking issues develop in the future." (Brohard, p. 9)

The RDEIR (3.8-6) incorrectly states, "A total of 578 parking spaces are currently required and provided on the existing Harvard-Westlake Campus."

578 parking spaces do exist, but they are not required.

In 1994, the School stated in its application for a proposed science building, (ZA-1992-0579-PAD) "A Campus parking study completed by Crain and Associates confirms that the 436 parking spaces currently provided on the Campus are more than adequate to meet the parking needs of the Campus, including the proposed Science Building."

In 1992 the student population was 815 and has grown in 2016 to "about 900." The School has never since secured nor properly justified a need for more parking.

Harvard-Westlake states that they "currently undertake a number of measures to reduce trips," claiming that one-third of the 900 children are bused, that there are financial incentives to carpool, and ride-matching services are provided by the school. (RDEIR 3.8-6) These actions are voluntary, as there is no reference elsewhere in the RDEIR to what the school claims is a TDM (Transportation Demand Management) program.

In Section 5.0 Alternatives, the RDEIR states that they have "rejected, not considered" the option of "Increased Traffic Demand Management," stating that the "School has a complicated program of activities that includes a variety of after-school programs." The Brohard Report states:

> "Alternatives to the very expensive parking structure should have been seriously considered but they were not…A TDM must be proposed, analyzed and instituted before any need for an increase in parking spaces can be established. TDM limitations have not been established for Harvard-Westlake…These strategies typically provide incentives for carpooling/ridesharing and significant penalties for non-compliance with program goals and objectives for trip and parking reduction. To be effective, TDM programs must have timely monitoring and must have a progressive disciplinary system of enforcement."

Many private schools in the Los Angeles area, including The Buckley School in Sherman Oaks and The Archer School for Girls in Brentwood, operate successfully with comparably complex school activity schedules using strict Traffic Demand Management Plans. As schools operating in residential areas, these plans are mandated by each school's individual Conditional Use Permit with the City of Los Angeles. The schools have been required to develop and implement plans that require up to 70% bus ridership on a daily basis, as well as mandatory 3 and 4 person car pools. These TDMs require monitoring and reporting, as well as penalties for noncompliance. Harvard-Westlake should be held to no less a standard.

Underlying Traffic Studies/Traffic Counts:
The RDEIR states, "Updated counts were taken in 2015, but they showed lower traffic volumes than 2011 and therefore in the interests of being conservative, the 2011 counts are used in this analysis for all intersections. See Appendix G.2." (3.8-2)

"Lower traffic volumes" are clearly in opposition to any direct observation by residents and commuters. But of course that's because at the intersection of Coldwater and Ventura, lower volume would be occurring due to greater traffic congestion. Traffic counts tally the number of cars that GET THROUGH the intersection, so if traffic is stalled or stopped, FEWER cars get through and the traffic count is LOWER.

The Brohard report states: (p 3) "Capacity Calculations Were Not Verified in the Field" "When the vehicle demand exceeds the capacity, traffic volumes actually drop as lengthy queues form and vehicles are unable to clear intersections. In some cases, calculations provide false indications of the actual operating condition (level of service) since traffic volumes over peak time periods actually drop below

maximum flow rates. Minor disruptions cause significant queuing and further delays. Peak hours which had previously been limited to 7 to 9AM and 4 to 6PM have stretched well beyond those limits and typically range from 6 to 10 AM and 2 TO 7 PM."

Brohard goes on to point out the dramatic increase in incursions to adjacent south-of-Ventura Blvd. neighborhoods, amplified by access to WAZE, as desperate commuters look for any possible way to get to work (or school) on time. This is consistent with experiences of Van Noord and Greenleaf residents and others in the residential streets West of Coldwater Canyon.

Councilmember Krekorian acknowledged the dramatic increase in local traffic by securing funding for temporary assistance by traffic control officers during "peak" hours, saying:

> "… there is often a massive volume of traffic backed up in all directions..... These busy intersections are jammed up for a number of reasons. Studio City is a popular place to live, Ventura is a bustling commercial corridor and these streets provide an alternative transit route to the basin for drivers who don't want to idle on the southbound 101 parking lot. <u>But the main reason traffic is so bad is that there are far more vehicles traveling through these intersections during the morning rush today than they were originally intended to accommodate</u>."

<u>All impacted intersections</u> should have been studied and calculations verified in the field.

Traffic impacts DURING CONSTRUCTION

Truck trips underestimated

The RDEIR offers as a mitigation strategy the suggestion of delaying truck trips until after 9am, however the peak traffic congestion exceeds the conservative 7am-9am. A total of 160 truck trips per day are scheduled during the excavation phase -- up to 28 an hour, or one every two minutes (3.8-13,14). How could this activity have no negative impact on traffic flow?

As discussed in both the Wexco (WEXCO, p.6-7) and Autumn Wind expert reports (AWA, p.5), the truck trips and material hauling were grossly

underestimated, which would effect the impact of this project throughout its 3+ year duration.

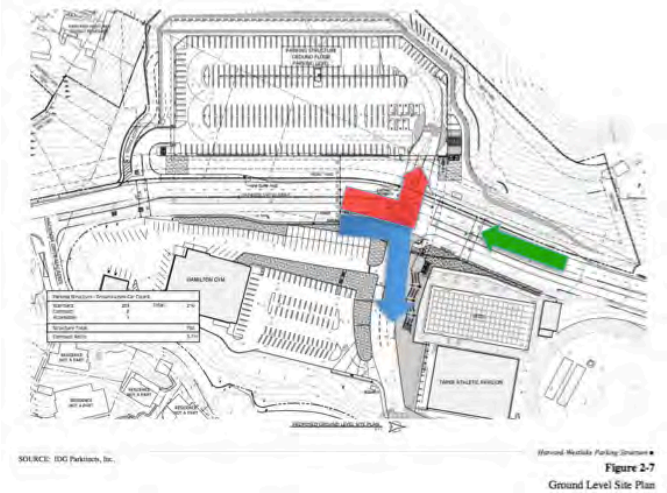
Haul routes and distances underrepresented, length of Project not clear
Haul distances were underrepresented in Air Quality modeling (AWA, p.5), so traffic impacts must be carefully re-analyzed with this specific correction accounted for. No haul routes have been established yet, so it is premature for the RDEIR traffic reports to conclude an insignificant impact to traffic flow. Please provide clarification and specific details used for modeling haul truck emissions to resolve haul truck and trip-related discrepant information contained within the RDEIR's various elements and appendices.

The Autumn Wind report describes that although the RDEIR project increased in duration to 30 months, the Air Quality modeling shows construction across 4 years, with construction phases likely extending to 42 months. This discrepancy of Project duration must be addressed in the FEIR.

Damage to road from 4 years of heavy machinery
Coldwater Canyon Avenue is an essential commuter artery that serves the City of Los Angeles as well as other local cities including Beverly Hills and West Hollywood. The Applicant must demonstrate that they will be able to protect the street and underlying infrastructure from DAMAGE OR DESTRUCTION during Project. The Applicant should be required to present a contingency plan in case of closure of the road. All costs of repairing or replacing damage or destruction to street and underground infrastructure should be the sole responsibility of the Applicant.

The Applicant must be required to supply a detailed daily and weekly Construction schedule including numbers of vehicles and their movement. This should demonstrate fully and accurately any overlaps in construction phasing as outlined in RDEIR 3.2-27. It should be required that this schedule and all revisions to the schedule distributed to SCNC, SCRA, CD2, CD4, and nearby residents. (This was required, for example, in the Archer School's FEIR)

The Applicant must be required to prove the SAFETY of running one 20 cubic yard, 5-axle truck, approximately every 2 minutes on Coldwater Canyon.



Traffic Impacts AFTER CONSTRUCTION

Extended operational hours, additional field and parking use

By building a parking structure with the same operating hours as the school: Monday through Friday 6:30am – 11:30pm and "some weekends" 6:30am – 11:30pm, (RDEIR 2-15, "The Harvard Westlake Campus would continue to operate these same hours with the Project,") as well as a practice field with operating hours of 8am – 8pm Monday through Friday and weekends 8a – 5p, there will only be a seven-hour window of quiet every Sunday through Thursday nights and an eight-hour window Friday and Saturday nights. If the Applicant is allowed to rent out (or donate) the use of their parking structure or their practice field to other groups, an increase in vehicle trips would be inevitable. The garage would empty and fill through the 17-hour operational day and evening.

There is notice on the School's website that the School would offer parking to selected community groups. This valiant effort to find some small community benefit to the Project also offers incentive to certain groups (such as Sunnyside Preschool) to support this project in return for the privilege of being one of those selected to use the Parking Structure. This additional use was not calculated in the RDEIR and presents an additional burden to neighbors and an additional traffic impact.

Brohard's report already raised concerns about the lack of analysis of delays caused by the change of 100s of cars needing to cross Southern traffic. (Red represents proposed new Left turns) (Blue represents the way traffic flows now, RIGHT turn into campus) (Southbound Cars that turn into campus now have a very long turn lane in the middle of Coldwater).

SOURCE: IDG Parkitects, Inc.

Figure 2-7
Ground Level Site Plan

If more cars are added to this traffic (ie from allowing Sunnyside Preschool parents to park in Applicant's garage), the impact of this traffic pattern change must be considered. Furthermore, if the Applicant eliminates more of its on-campus, eastern parking in the future, (for example, by building on existing parking lots after acquiring 200% more parking spaces via this Project) the number of vehicles parking in the Structure will increase even further, and those impacts must be considered.

Insufficient turning lanes

RDEIR claims, "…Traffic turning into the new Parking Structure would not disrupt through traffic flow on northbound nor southbound Coldwater Canyon Avenue…". Brohard refutes this claim as unsubstantiated. (Brohard, p. 7) Applicant should be required to provide data breaking down numbers of students and staff entering from north and south, so cumulative delays can be properly calculated. "As proposed, the lengths of the turning lanes are too short to meet accepted standards and practice…" (Brohard, p.6) The RDEIR does not analyze the impact to east-west traffic on Ventura Blvd. or local neighborhood streets not only during 3-4 years of construction, but also during normal operations, with insufficient turning lanes.

Traffic Light Gives Inappropriate Credit and False Improvement credited to Project

ATSAC/ATCS Credit

"The LADOT Level of Service Worksheets allow a full level of service credit (0.10) for installation of ATSAC/ATCS traffic signal system equipment that changes traffic signal timing in response to real-tie vehicle demands within a network of coordinated traffic signals." However, the distance between signals is well beyond the range of coordinated traffic signal benefits… and "cannot be considered as being within a system of traffic signals along an arterial corridor."

If the credit is eliminated from the calculations for future conditions with Project (Table 3.8-6 of page 3.8-23) "the Project causes a significant traffic impact at this location, operating at Level of Service "F" with an increase in the volume to capacity ratio from 1.051 to 1.138." Increase is 0.087 and any increase of >0.010 is a significant traffic impact that required further mitigation. (Brohard, p.7)

Truck Access

Brohard's report finds that truck access has still not been evaluated. " The RDEIR and Traffic Study do not discus the traffic control to be used to facilitate

construction trucks leaving the site… Proper study is required to properly analyze the exiting truck traffic during construction so that all significant impacts can be properly identified and analyzed, enabling feasible mitigation measures to then be developed." (Brohard, p. 5)

Traffic Safety and Speeding Concerns

Traffic safety and speeding concerns have not been documented in the RDEIR. Further, "the claim that moving school buses off of Coldwater would increase safety is unsubstantiated. The 250-foot long area immediately north of the Harvard-Westlake traffic signal on the east side of Coldwater Canyon Avenue is at least 12 feet wider than the other portions of the roadway and provides an area – out of the travel lane – for vehicle parking and/or bus loading/unloading. " (Brohard, p. 6) Wexco confirms that the current bus loading/unloading is safe for the School community, and says, "There is absolutely no need to move bus loading and unloading within the campus." (Wexco, p. 8)

Brohard also raises the safety concern of "the impossibility of physically preventing at-grade pedestrian crossings of Coldwater Canyon from the parking structure to the campus and vice-versa" (Brohard, p. 7). Wexco Safety report reiterates exactly this same concern, both on ordinary operational days and especially in an emergency situation. "There is no guarantee that pedestrians travelling to/from the Parking Structure/Harvard Westlake campus will refrain from illegally crossing Coldwater…" (Wexco, p.1)

The Applicant recognizes that access to Coldwater Canyon at grade is "associated with the danger of speeding vehicles." (Exec Summary, S-3, S-4)

Wexco affirms, "There is no legitimate safety argument for moving the campus community…across Coldwater Canyon to the West so that they must travel eastwards across Coldwater Canyon at risk." (Wexco, p.8)

Special Events not Properly Studied

Special event parking and Traffic impacts were not properly studied and parking demand and traffic volumes should be observed, counted and analyzed. (Brohard, p.8) A separate TDM for large events should be developed and implemented. The community rejects the notion that shuttle parking is not feasible.

DISCRETIONARY ACTIONS/ENTITLEMENTS THAT NEGATIVELY AFFECT HILLSIDE

SCC is very concerned about the numerous far-reaching exceptions the School seeks as part of the Vesting Conditional Use permit, including:

• **90 ft 5 in tall retaining wall** (in lieu of 30-ft height limit otherwise required). This is increased from the previous 87 ft high wall and would make it the tallest soil nail retaining wall in the entire City.

• **0 ft setbacks** (in lieu of 17-ft side yard setbacks otherwise required). Not having a shoulder/clearance for students to escape the Structure in an emergency leads to the safety hazard of students running into the street and the danger of speeding vehicles "…the lack of a designated shoulder is a safety hazard." (Wexco, p. 8)

• **Grading of 2,500 cubic yards in a Hillside area** on a lot in the RE40-1-H Zone (in lieu of 1,600 cubic yard maximum). ***This number, already almost double the allowable maximum, is CONTESTED by both Save Coldwater Canyon and the Hillside Federation, since the actual amount of grading is an astounding 137,000 cubic yards.*** The Lead Agency has accepted the School's incorrect interpretation of the underlying statute when it argues that the School should be exempt from 134,500 cubic yards of excavation. (LAMC Section 12.21 C.10 (f)(3).) If the School's interpretation were correct, then the BHO would have been meant to be more restrictive to dwellings than for a giant parking structure. Clearly, the intent of the BHO was to limit the excavation of the hillside in out-of-scale projects just like this one. (For more details on the proper legal interpretation of this statute, see the Hillside Federation Comment letter, March 2016.)

As the Wexco Report points out, this figure does not account for "swell" of the export soils. The actual figure is more likely 175,000 cubic yards, which would <u>be 40,500 cubic yards in excess of the limit</u> -- assuming the Applicant is able to prove its interpretation of LAMC Section 12.21 C.10 (f)(3) is defensible. If not, the amount is a shocking <u>173,400 cubic yards in excess of the Hillside limit.</u>

• **Earth export of 2,500 cubic yards in a Hillside Area** (in lieu of 1,000 cubic yard limit otherwise required)

• **Residential Floor Area of approx. 79,261 sq Ft in a Hillside Area** (in lieu of the maximum residential floor area limits otherwise required by the Baseline Hillside Ordinance.)

• **Vacation of Airspace and Public Right of Way on Hacienda Drive West** (the granting of which serves no public purpose and forever removes land from the public). SCC has submitted extensive comments on this subject to the Bureau of Engineering and cc'ed the Lead Agency in its 2015 Comment Letter RE: VAC-E 14012373. We are attaching a copy of that document to this submission as well.

These entitlement requests fly in the face of the tireless efforts of our City officials, and Neighborhood Council officers, as well as the Hillside Federation, to create the Baseline Hillside Ordinance and protect LA's hillsides from out-of-scale development. **Absent some overwhelming public purpose, excavation and retaining walls on this scale should not be permitted.** Exceptions and special treatment for this well-connected, deep-pocketed private school would be inappropriate and set a dangerous precedent for Los Angeles development.

ALTERNATIVES

Inconsistent rejection of Alternatives

The RDEIR rejects Smaller Parking Structures on the existing Campus because they do not allow for a practice field, yet it *does* consider the alternative of NO PROJECT and an alternative of 4 HOMES on the site (which doesn't meet their objectives either) and it *does* consider a 10-story alternative without a practice field. So the RDEIR inappropriately rejects many feasible alternatives for not meeting Project Goals while considering others.

The RDEIR rejects Shuttle Parking as "infeasible" and rejects "increased TDM," yet the Applicant does not currently have a TDM. (Also discussed at length on p. 13, 14, and 19 of this comment letter). SCC asks the Lead Agency to seek further explanation from the School about its current voluntary parking plan. The School has said they use "75% carpooling and busing" (according to their lobbyist, Mr. Khalatian) yet have not broken those numbers down. There are a number of factors that need to be explained, such as the number of the 400 students drivers who carpool, as well as the number of parent carpools. Further they should explain whether they are 3-person or 4-person carpools. The School should be asked to provide the exact number of yearly bus permits as well as the number of reserved, dedicated spaces they provide for Juniors and Seniors.

The RDEIR rejects increased TDM and shuttle parking, going so far as to say there is something "unique" about the parking needs and activities of Harvard-Westlake school. Yet Archer School, Oakwood School and Buckley School, to name only a few of other private schools in residential areas have TDMs and use shuttle parking for large events. There is nothing unique about the parking needs of Harvard-Westlake.

The RDEIR analyzes two viable, environmentally superior alternatives.
Alternative 1 (no project) compares No project vs the Project saying incorrectly that the result of mitigation measures would be "many more *protected* trees [emphasis added] being located on the Development Site" – not only are NONE of the proposed mitigation trees Oak or Walnuts, but there is only enough room on the site after the Project is built for a fraction of these mitigation trees.

In Alternative 2 (4 new homes) the RDEIR correctly states Alternative 2 would be "compatible with adjacent residential uses" and all impacts are less than significant. However, there is no reason to assume (as the RDEIR does) that the on-site walnut trees would die -- as we mentioned, even D-rated trees continue to provide habitat for wildlife and are likely to prevail.

The RDEIR correctly states that Both Alternative 1 and 2 are "environmentally superior alternatives".

Since the 2013 DEIR, the project has gotten bigger, taller, longer, and asked for even more entitlements, including a number of enormous exceptions to the municipal codes and the Baseline Hillside Ordinance. This project creates numerous significant negative environmental impacts and for the protection of our community only those Alternatives which seriously address those impacts and offer environmentally superior options should be allowed by the Lead Agency.

Thank you for your attention to our comments on this Project.

Sincerely,

Sarah Boyd, President /s/

ANGELENOS FOR TREES
LOS ANGELES

Kimberly Henry

Office of City Planning

221 N. Figueroa St, Suite 1350

Los Angeles, CA 90012

Re: Case No. ENV-2020-1512-EIR

Dear Ms. Henry:

Angelenos for Trees is submitting this response in conjunction with the DEIR prepared for the Harvard Westlake River Park Project ("HW Project").

Currently, at the proposed HW Project – Harvard Westlake is proposing to remove 240 trees which is over a 50% loss in the property tree canopy cover. Most of these trees are mature and according to the Davey Services iTree environmental services calculator have provided over 898,773 pounds of carbon sequestration services to date.[1] A copy of the full report of the data obtained from the environmental services calculator is attached to this letter. The city is using iTree to conduct its street tree inventory.

Taking out significant 70-year-old mature trees and replacing them with saplings (even if they are natives) that will need an additional 20-30 years of growth to provide these types of environmental benefits is a failure to recognize the value of mature trees and the ecosystems they support now.

We determined over a span of 10 years 390,794 pounds of carbon sequestration services will be lost. It will take at least 10 years until a sapling in a 46" inch box will start sequestering carbon at all.

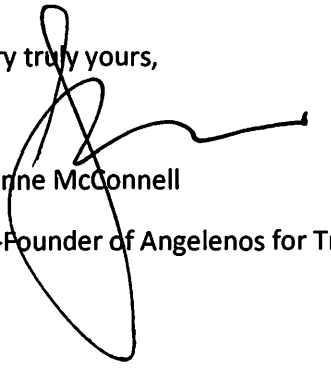
The effects of human – caused global warming are happening now. The latest IPCC (Intergovernmental Panel on Climate Change) report shows greenhouse gas emissions continue to rise, and current plans to address climate change are not ambitious enough and will worsen in the decades to come. It is common in large development projects in Los Angeles for the developer to remove the majority of the trees at a location. In this case on the site property (not the right of way or other adjacent locations), Harvard Westlake is removing over 80% of the trees. Harvard Westlake is essentially clear cutting the property for its development project.

New trees require a lot of support (water and otherwise) and have been shown in a field study conducted by the US Forest Service in a Mediterranean climate, like Los Angeles, to experience a 15% failure rate within 1 year that rose to 40% just 5 years later.

[1] Angeleno for Trees input each tree into the tree environmental services calculator to obtain these numbers.

Planting replacement trees 1:1 will result in a net loss of carbon sequestration, a loss of storm water mitigation and will result in a net loss of existing canopy coverage at that one particular location and fails to take into account the loss of canopy coverage over the last 10 years by adjacent properties (including Sportsman Lodge, Sunkist development, and Grant High School).

In 2019, Cy Carlberg, Harvard Westlake's consulting arborist, who was also paid to consult at the Grant High School project, pointed out in her report for LAUSD the proposed removal of healthy mature Redwoods, which are not native to Southern California could be subject to drought and die off in future years, therefore justifying the removal of these beloved trees from the high school. Removing a tree because it could be subject to drought and replacing it with a tree that requires more water than an existing mature tree makes no sense. Although what she said is not necessarily wrong as to its location the fact is these trees were healthy and showed no sign of stress. This argument is separated from reality and failed to recognize that we don't live in laboratory with only one species. It is similar to the current argument for the HW Project that the replacement of the slated mature trees with native saplings is a more "ecological beneficial project". This is also not necessarily wrong (without understanding the context) – however, the fact is that these trees slated for removal are over 70 years old, are healthy and are providing valuable environmental services now. Those replacement saplings will take at least 20 years to provide similar benefits. The idea that is okay to remove all mature trees in Los Angeles that are providing environmental benefits now and replacing them with native trees is ridiculous and self-defeating. Yes, as trees die, we should replace them with native species but to remove them prematurely is an environmental and ecological disaster.



This may be an isolated development project, but the impacts are far reaching to the entire San Fernando Valley and Los Angeles. We all breathe the same air and experience the increased heat. Air and temperature are not limited to a parcel – on a tax map. The mature trees are part of an urban ecosystem that helps reduce temperatures, sequester carbon, promote biodiversity, reduce storm water runoff, and clean the air. UCLA, USC, and Tree People have identified the San Fernando Valley to be uniquely susceptible to climate change. Los Angeles has the worst air quality in the nation, and City is already experiencing a spike in heat related deaths due to the increased heat of climate change and the urban heat island effect.

Ironically, instead of using the existing natural resources of permeable turf and trees already in place at the proposed HW Project, Harvard Westlake is looking to replicate the Army Corp of Engineers project of paving the LA River in the 1930s. The paving of the LA River, which was once the location of verdant wetlands, is now universally recognized as an over-engineered error due to the misunderstanding of the ecological impacts of isolating one part of the ecosystem rather than looking at the whole ecosystem.

Impermeable artificial turf is replacing existing permeable grass. The turf emits carbon dioxide and methane, provides no ecological benefit, and will negatively impact the ecosystem of birds, insects, and other endemic species native to Southern California. Removing 240 trees results in a loss of carbon sequestration benefits and Harvard Westlake's proposed installation of a built storm water management system is an over engineered solution to problem that doesn't exist because the mature trees at the location are already providing 312,555 gallons of rainfall interception and 46,330 gallons of run off avoidance per year. Removing the 240 trees will result in a more than a 50% net decrease of runoff avoidance equal to 26,267 gallons and more than a 50% decrease of 176,336 gallons.

Los Angeles in its many policies, including the green new deal, and the city's respected academic institutions all recognize the need for open green space, a healthy ecosystem, shade, and clean air. Although the proposed built environment of the HW Project could be considered "open" it is not open green permeable space and fails to take advantage of existing ecological science that will benefit the growth of our natural environment, provide shade, and clean our air. Angelenos for Trees, recommends that Harvard Westlake, maintain the space in its current configuration, introduce native species, including trees, over time, consistent with the current science relative to habitats and ecosystems and increase the tree canopy to support a healthy ecosystem. Such a project could operate as a lab for field biology projects while still providing tennis and golf as activities for its students and the community.

Very truly yours,

Jeanne McConnell

Co-Founder of Angelenos for Trees

Environmental Cost-Benefit Analysis for Existing, Mature Urban Tree Canopy at Weddington Golf & Tennis

Methodology and Additional Information

This report utilizes the i-Tree National Tree Benefits Calculator software, which was developed in partnership with the United Stated Department of Agriculture (USDA) Forest Service. Tree health ratings differed between the Biological Resources Technical Report and i-Tree, so for calculation purposes, the following describes the labeling methods employed. Ratings from the Biological Resources Technical Report of “A,” “B,” “C,” “D,” and “F” were assigned in i-Tree as “Excellent,” “Good,” “Fair,” “Poor,” and “Dead,” respectively.

In instances where the species were not inventoried in i-Tree, experts were consulted and similar inventoried species were substituted and utilized. These cases can be found on the calculation spreadsheet. Average DBH measurements utilized for the Mexican fan palm (Washingtonia robusta) and Windmill palm (Trachycarpus fortunei) species relied on USDA data and were 14.1 DBH and 9 DBH, respectively. 4 Spanish daggers (Yucca gloriosa) were excluded from analysis due to inconclusive DBH measurements.

Results

- Yearly estimate of carbon dioxide (CO_2) sequestration is $1,584.14.
- Yearly estimate of carbon dioxide (CO_2) sequestration is 67,439.56 lbs.
- Yearly estimate of storm water mitigation is $413.32.
- Yearly estimate of storm water runoff avoided is 46,330.26 gals.
- Yearly estimate of storm water rainfall intercepted is 312,555.20 gals.
- Yearly estimate of air pollution removal is $2,412.25.
- Yearly estimate of air pollution carbon monoxide removal is 237.83 oz.
- Yearly estimate of air pollution ozone removal is 6,027.37 oz.
- Yearly estimate of air pollution nitrogen dioxide is 1,469.45 oz.
- Yearly estimate of air pollution sulfur dioxide is 104.49 oz.
- Yearly estimate of air pollution (fine particles or particulate matter) is 63.00 oz.
- Estimate of carbon dioxide (CO_2) stored to date is $35,281.18.
- Estimate of carbon dioxide (CO_2) stored to date is 1,520,466.02 lbs.

Suite 600
Los Angeles, California 90014-1911

Attention: Mr. Michael Brown, P.E., G.E.
Manager – Geotechnical Engineering Division

Re: Data Report
Geotechnical Investigation
Proposed Fire Station # 78
Northwest corner of Whitsett Avenue and Valleyheart Drive
Los Angeles, California
Contract No. C-98920; W.O. E170073B
For LADPW/Geotechnical Engineering Division

Dear Mr. Brown:

INTRODUCTION

This data report presents the results of a geotechnical investigation performed by URS Corporation (URS) at the above referenced project site. The site consists of an approximately 1.1-acre parcel, located at the northwest corner of the intersection of Whitsett Avenue and Valleyheart Drive, within the Studio City area of the City of Los Angeles, California. We understand that the City of Los Angeles is proposing to construct a new Fire Station # 78 at the project site. The site is located within the Studio City Golf and Tennis Facility and is currently occupied by four tennis courts, a maintenance building, asphalt pavement, concrete sidewalks and landscaping. The site location relative to streets and topographic features is shown on the Vicinity Map, Figure 1.

This report provides geotechnical data as requested by the City of Los Angeles Department of Public Works/Geotechnical Engineering Division (GED). GED will be

URS Corporation
915 Wilshire Boulevard, Suite 700
Los Angeles, CA 90017-3437
Tel: 213.996.2200
Fax: 213.996.2458

reviewing the data from this investigation and will be responsible for providing geotechnical recommendations and information for use in the final design of the proposed fire station. This data report will be an attachment to a geotechnical investigation report that will be prepared by GED separately.

SCOPE OF SERVICES

Our work was performed under the direction of GED in general accordance with Contract No. C-98920 and as authorized on May 10, 2004. The scope of our services was outlined in our cost proposal dated May 4, 2004 and included performing the following tasks:

- A site reconnaissance by a field engineer to observe the existing conditions and to lay out the boring locations;
- Exploration of the subsurface conditions at the site by drilling and sampling 7 geotechnical borings to depths ranging from about 16 to 61 feet below the existing ground surface and 2 Cone Penetration Test (CPT) soundings to depths of 49 feet and 63 feet below the existing ground surface;
- Laboratory testing on selected soil samples obtained from the borings to evaluate index properties, shear strength, compressibility, and other pertinent properties of the soils; and
- Preparation of this data report.

FIELD EXPLORATION PROGRAM

Prior to mobilizing drilling equipment to the field, a representative from our Los Angeles office along with an Engineer from GED performed a site reconnaissance on May 11, 2004 to observe the existing surface conditions, evaluate access constraints, and to lay out the boring locations. On May 11, 2004, Underground Services Alert (USA) was notified

to identify the locations of subsurface utilities that may be in potential conflict with the boring locations.

The field exploration program was initiated on May 14, 2004 and completed on May 21, 2004 under the technical supervision of a representative from our Los Angeles office. The subsurface conditions at the site were explored by drilling and sampling seven (7) borings (Borings B-1, B-2, B-4 through B-8) and performing 2 CPTs (CPT-1 and CPT-2). Approximate locations of the borings and CPTs are shown on the Plot Plan, Figure 2. Our drillings subcontractors for Mobile Drill B-61 and limited access rig were C & C Drilling of Agoura Hills, California and Gregg In Situ of Signal Hill, California, respectively. CPT soundings were performed by Gregg In Situ of Signal Hill, California.

The borings were drilled using a Mobile Drill B-61 and a limited access, drilling rigs equipped with 8-inch diameter hollow-stem augers. Borings B-1, B-2, and B-6 were drilled using the limited access rig and borings B-4, B-5, B-7, and B-8 were drilled using the Mobile Drill B-61 rig. Borings were drilled to depths of approximately 16 to 61 feet below the existing ground surface. The borings were logged and sampled by a staff geologist, under the direct supervision of a certified engineering geologist from URS. URS geologist's maintained a detailed log of the soils encountered and visually classified the soils in accordance with the Unified Soil Classification System (USCS).

Samples were collected at depths of 2½ feet, 5 feet, 7½ feet, 10 feet, and every 5 feet thereafter from all the borings. Relatively undisturbed soil samples were obtained using a Dames & Moore Type-U Soil Sampler (see Figure 3) in all of the borings. The Type-U sampler was lined with 1-inch high brass rings for retaining geotechnical samples. Standard Penetration Tests (SPTs) were performed (per ASTM Test Method D-1586) in borings B-4 and B-5. In Boring B-5, SPTs were performed at depths of 7.5 feet, 10 feet, and every 5 feet thereafter and in Boring B-4, SPTs were performed 25 feet, and every 10 feet thereafter. After encountering groundwater in borings B-4 and B-5, water was added to the inside of the hollow stem augers to bring the water level to within five feet of the ground surface. The water level was maintained through the end of drilling.

The Type-U and SPT samplers were driven 18 inches into the subsurface soils using a 140-pound automatic-trip hammer falling 30 inches. Blow counts were recorded at 6-inch intervals for each sample taken. Sample designations and blowcount data are presented on the logs of borings. It should be noted that although careful precautions were taken to minimize soil disturbance during sampling, the blowcount data at a depth of 45 feet in boring B-5 suggests that some soil heave might have occurred within the underlying sandy soils at this depth. Therefore, the blowcount data at this depth may not be reliable and should be used with caution. Upon completion of the drilling activities, the boreholes were backfilled with the soil cuttings and the surface was patched with concrete or grass as appropriate.

A portable Photo Ionization Detector (PID) and Lower Explosive Limit (LEL) meter were used to screen for potential presence of hydrocarbons in the borings during the drilling activities. No significant reading was detected by the PID or LEL meter in the borings. The PID and LEL readings are shown on the logs of borings.

Latitude and longitude (NAD 27 coordinate system) of all the borings were measured using a handheld GPS (Garmin GPS 12 XL) unit. The boring coordinates are presented on the logs of borings.

A key to the Logs of Borings and description of the Unified Soil Classification System are presented in Figure 4. Graphic logs of the borings showing the contacts between the different soil types encountered and other pertinent information were prepared using the gINT software and are presented in Figures 5 through 11. The results of the CPT soundings are presented in Appendix A.

GEOTECHNICAL LABORATORY TESTING

Representative soil samples obtained from the borings were returned to our Los Angeles laboratory where they were further examined and classified. Selected representative

samples were tested to evaluate index properties, grain size distribution, expansion potential, compressibility characteristics, shear strength properties, corrosion potential, R-Value, and compaction data (maximum dry density/optimum moisture content) of the soils. All tests discussed below were performed as requested by GED in accordance with the latest American Society of Testing and Materials (ASTM) guidelines and indicated on the Logs of Borings. The test results are presented on the Logs of Borings or on individual data plots. The results are also summarized in Table 1. Brief descriptions of the laboratory tests are provided below:

Moisture and Density Tests (ASTM Test Methods D-2216 and D-2937)
The results of these tests can be used to compute existing soil overburden pressures, to correlate strength data and to aid in evaluating soil properties. These tests were performed in accordance with ASTM Test Methods D-2216 and D-2937. The results of these tests are presented on the Logs of Borings (Figures 5 through 11).

Sieve Analysis -Percent passing through the No. 200 sieve (ASTM Test Method D-1140)
Sieve analyses (percent passing through the No. 200 sieve) were performed on selected soil samples obtained from the borings. The tests were performed to aid in classification of the soils and were performed in accordance with ASTM Test Method D-1140. The results of the tests are presented on the Logs of Borings, B-4 and B-5 (Figures 7 and 8).

Sieve Analysis and Hydrometer Analysis (ASTM Test Method D-422)
Sieve and hydrometer analyses were performed on selected soil samples obtained from the borings. These tests were performed to aid in classification of the soils and were performed in accordance with ASTM Test Method D-422. The results of these tests are presented on the Logs of Borings and in Figures 12 and 22.

Atterberg Limits Tests (ASTM Test Method D-4318)
Atterberg Limits tests were performed to aid in classification and to evaluate the plasticity characteristics of fine-grained materials encountered in the borings. The tests were performed in accordance with ASTM Test Method D-4318. The results of the tests are

presented on the Logs of Borings, Figures 5 and 7 and also in a summary plot in Figure 23.

Expansion Index Tests (ASTM Test Method D-4829)

One Expansion Index (EI) test was performed on a selected representative sample to evaluate the expansion potential of the near-surface soils. The test was performed in accordance with ASTM Test Method D-4829. The results of the test are presented on the Log of Boring, B-5 (Figure 8) and in Table 2.

Direct Shear Tests (ASTM D-3080)

Consolidated-drained (saturated) direct shear tests were performed on selected undisturbed samples, as well as on a remolded bulk sample, to evaluate shear strength parameters of the site soils. The remolded sample was compacted to approximately 90 percent of the maximum dry density per ASTM Test Method D-1557. The direct shear tests were performed in accordance with ASTM Test Method D-3080. The results of these tests are presented in Figures 24 through 28.

Consolidation Tests (ASTM D-2435)

One-dimensional consolidation tests were performed on selected undisturbed samples, as well as on a remolded bulk sample, to evaluate compressibility characteristics of the on-site soils. The remolded sample was compacted to approximately 90 percent of the maximum dry density per ASTM Test Method D-1557. These tests were performed in accordance with ASTM Test Method D-2435. The consolidation test plots are presented in Figures 29 through 34.

Compaction Tests (ASTM D-1557)

One compaction test was performed on a representative bulk sample of the near-surface soils to evaluate the maximum dry density and optimum moisture content of the soils. The test was performed in accordance with ASTM Test Method D-1557. Results of the compaction test are presented in Figure 35.

Corrosion Test

Selected representative soil samples were tested in order to assess corrosivity parameters including chloride content, resistivity, pH, and sulfate contents. The tests were conducted in accordance with appropriate California Test Methods. The results of the corrosion tests are presented in Table 3.

R-Value Tests (ASTM D-2844)

R-value tests were performed on selected bulk samples of the near-surface soils to evaluate pavement design parameters. The tests were performed in accordance with ASTM Test Method D-2844 by LaBelle Marvin of Irvine, California, under subcontract with EGL. The results of the R-Value tests are presented in Logs of Borings B-2 and B-7 (Figures 6 and 10) and in Appendix B.

LIMITATIONS

URS warrants that our services are performed within the limits prescribed by our clients, with the usual thoroughness and competence of the geotechnical engineering profession in Southern California at this time. No other warranty or representation, either express or implied, is included or intended in this report.

- Approximate depth of perched water or groundwater

Laboratory and Field Test Abbreviations

(0,0,0,20.8)	(Methane/Lower Explosive Limit (LEL) in %, Hydrogen Sulfide in ppm, Carbon Monoxide in ppm, Oxygen in %)
COMP	Compaction test
CON	Consolidation test
CORR	Corrosivity test
DSCD	Consolidated drained direct shear test
EI	Expansion Index test (test result in parentheses)
LL	Liquid limit (Atterberg limits test)
PI	Plasticity Index (Atterberg limits test)
PP	Pocket Penetrometer test (test result in parentheses)
R-Value	Resistance Value test
SA	Sieve Analysis (-200 result in parentheses)
HA	Hydrometer Analysis (-200 result in parentheses)
SE	Sand Equivalent test (test result in parentheses)
SWELL	Swell Load test (test result in parentheses)
TV	Torvane test (test result in parentheses)
-200	Percent passing #200 sieve (test result in parentheses)
+4	Percent retained #4 sieve (test result in parentheses)

KEY TO LOG OF BORING

PROPOSED FIRE STATION # 78

LOS ANGELES, CALIFORNIA

GREGG DRILLING AND TESTING, INC.
GREGG IN SITU, INC.
ENVIRONMENTAL AND GEOTECHNICAL INVESTIGATION SERVICES

May 17, 2004

URS Corporation
Attn: S. Nesarajah
915 Wilshire Blvd., Suite 700
Los Angeles, California 90017

Subject: CPT Site Investigation
Fire Station #78
Studio City, California
GREGG Project Number: 04-139Sh

Dear Mr. Nesarajah:

The following report presents the results of GREGG IN SITU's Cone Penetration Test investigation for the above referenced site. The following testing services were performed:

1	Cone Penetration Tests	(CPTU)	☒
2	Pore Pressure Dissipation Tests	(PPD)	☒
3	Seismic Cone Penetration Tests	(SCPTU)	☐
4	Resistivity Cone Penetration Tests	(RCPTU)	☐
5	UVIF Cone Penetration Tests	(UVIFCPTU)	☐
6	Groundwater Sampling	(GWS)	☐
7	Soil Sampling	(SS)	☐
8	Vapor Sampling	(VS)	☐
9	Vane Shear Testing	(VST)	☐
10	SPT Energy Calibration	(SPTE)	☐

A list of reference papers providing additional background on the specific tests conducted is provided in the bibliography following the text of the report. If you would like a copy of any of these publications or should you have any questions or comments regarding the contents of this report, please do not hesitate to contact our office at (562) 427-6899.

Sincerely,
GREGG IN SITU, Inc.

Brian Savela
Operations Manager

Cone Penetration Test Sounding Summary

-Table 1-

CPT Sounding Identification	Date	Termination Depth (Feet)	Depth of Groundwater Samples (Feet)	Depth of Soil Samples (Feet)	Depth of Pore Pressure Dissipation Tests (Feet)
CPT-01	05/14/04	63	-	-	39.2, 44.6
CPT-02	05/14/04	49	-	-	-

Cone Penetration Testing Procedure (CPT)

Gregg In Situ, Inc. carries out all Cone Penetration Tests (CPT) using an integrated electronic cone system, *Figure CPT*. The soundings were conducted using a 20 ton capacity cone with a tip area of 15 cm^2 and a friction sleeve area of 225 cm^2. The cone is designed with an equal end area friction sleeve and a tip end area ratio of 0.85.

The cone takes measurements of cone bearing (q_c), sleeve friction (f_s) and dynamic pore water pressure (u_2) at 5-cm intervals during penetration to provide a nearly continuous hydrogeologic log. CPT data reduction and interpretation is performed in real time facilitating on-site decision making. The above mentioned parameters are stored on disk for further analysis and reference. All CPT soundings are performed in accordance with revised (2002) ASTM standards (D 5778-95).

The cone also contains a porous filter element located directly behind the cone tip (u_2), *Figure CPT*. It consists of porous plastic and is 5.0mm thick. The filter element is used to obtain dynamic pore pressure as the cone is advanced as well as Pore Pressure Dissipation Tests (PPDT's) during appropriate pauses in penetration. It should be noted that prior to penetration, the element is fully saturated with silicon oil under vacuum pressure to ensure accurate and fast dissipation.

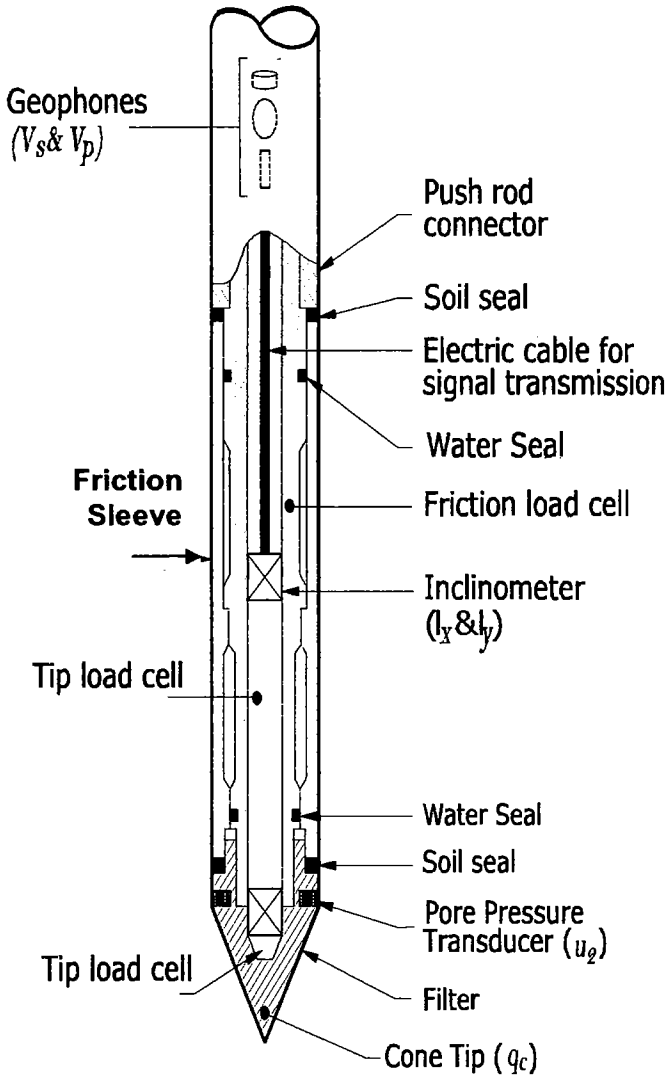

Figure CPT

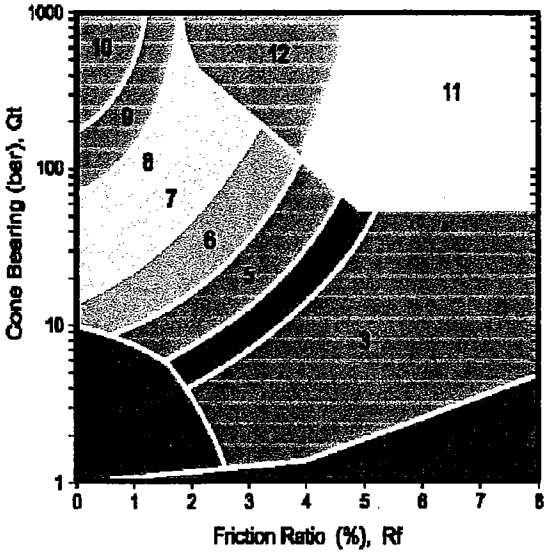
When the soundings are complete, the test holes are grouted using a Gregg In Situ support rig. The grouting procedure consists of pushing a hollow CPT rod with a "knock out" plug to the termination depth of the test hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole. Disruption or further contamination to the site is therefore minimized.

Cone Penetration Test Data & Interpretation

Soil behavior type and stratigraphic interpretation is based on relationships between cone bearing (q_c), sleeve friction (f_s), and pore water pressure (u_2). The friction ratio (R_f) is a calculated parameter defined by $100f_s/q_c$ and is used to infer soil behavior type. Generally:

Cohesive soils (clays)

- High friction ratio (R_f) due to small cone bearing (q_c)
- Generate large excess pore water pressures (u_2)



Cohesionless soils (sands)

- Low friction ratio (R_f) due to large cone bearing (q_c)
- Generate very little excess pore water pressures (u_2)

A complete set of baseline readings are taken prior to and at the completion of each sounding to determine temperature shifts and any zero load offsets. Corrections for temperature shifts and zero load offsets can be extremely important, especially when the recorded loads are relatively small. In sandy soils, however, these corrections are generally negligible.

The cone penetration test data collected from your site is presented in graphical form in Appendix CPT. The data includes CPT logs of measured soil parameters, computer calculations of interpreted soil behavior types (SBT), and additional geotechnical parameters. A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface.

Soil interpretation for this project was conducted using recent correlations developed by Robertson et al, 1990, *Figure SBT*. Note that it is not always possible to clearly identify a soil type based solely on q_c, f_s, and u_2. In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the soil behavior type.

ZONE	Qt/N	SBT
1	2	Sensitive, fine grained
2	1	Organic materials
3	1	Clay
4	1.5	Silty clay to clay
5	2	Clayey silt to silty clay
6	2.5	Sandy silt to clayey silt
7	3	Silty sand to sandy silt
8	4	Sand to silty sand
9	5	Sand
10	6	Gravely sand to sand
11	1	Very stiff fine grained*
12	2	Sand to clayey sand*

*over consolidated or cemented

Figure SBT

Pore Pressure Dissipation Tests (PPDT)

Pore Pressure Dissipation Tests (PPDT's) conducted at various intervals measured hydrostatic water pressures and determined the approximate depth of the ground water table. A PPDT is conducted when the cone is halted at specific intervals determined by the field representative. The variation of the penetration pore pressure (u) with time is measured behind the tip of the cone and recorded by a computer system.

Pore pressure dissipation data can be interpreted to provide estimates of:

- Equilibrium piezometric pressure
- Phreatic Surface
- In situ horizontal coefficient of consolidation (c_h)
- In situ horizontal coefficient of permability (k_h)

In order to correctly interpret the equilibrium piezometric pressure and/or the phreatic surface, the pore pressure must be monitored until such time as there is no variation in pore pressure with time, *Figure PPDT*. This time is commonly referred to as t_{100}, the point at which 100% of the excess pore pressure has dissipated.

A complete reference on pore pressure dissipation tests is presented by Robertson et al. 1991.

A summary of the pore pressure dissipation tests is summarized in Table 1. Pore pressure dissipation data is presented in graphical form in Appendix PPDT.

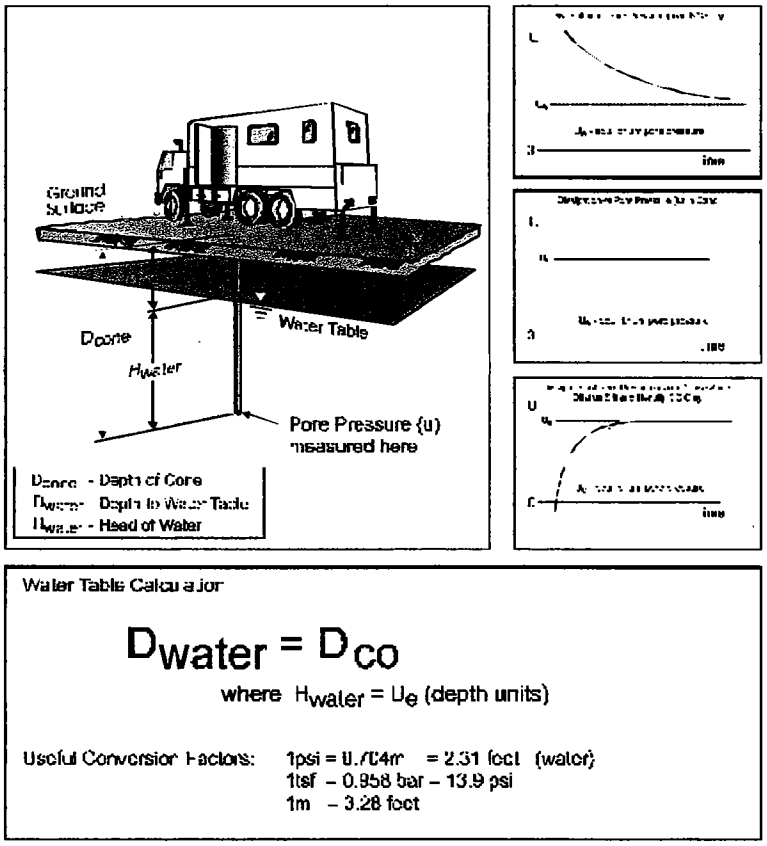


Figure PPDT

Attn: Mr. Michael P. Brown

Re: Letter Report
Evaluation of Liquefaction and Lateral Spreading
New Fire Station # 78
Studio City Area of Los Angeles, California
GED W.O. E170073B File No. 04-056

INTRODUCTION

This report discusses the technical approach and results of our simplified seismic-deformation analysis to evaluate the potential for, and magnitude of, liquefaction-induced settlements and lateral spreading at the site of the proposed Fire Station #78 in Studio City. Surface and subsurface conditions at the site were investigated previously by URS and are summarized in our Data Report dated July 8, 2004.

ANALYSIS METHODS and RESULTS

Seismic Hazard

Our analysis was performed using a design earthquake with a 10% probability of occurrence in 50 years, in accordance with site-specific response spectra (Figure 1) obtained from the USGS database. Six horizontal-acceleration time histories, representative for the Los Angeles basin, were scaled to match the peak ground acceleration (PGA) of 0.53g of these spectra (Figures 2 to 4).

Subsurface Conditions

Subsurface conditions at the site were interpreted based on our Geotechnical Data Report of July 8, 2004, plus additional data obtained subsequent to our field investigation. Figure 5 presents a map of exploration locations from recent and previous investigations in the general area of the proposed site. The site is underlain by 5 to 15 feet of loose to medium dense fills and silty, clayey alluvial sands over approximately 20 feet of stiff clay. Only 2 borings, B-4 and B-5 (Figures 6 and 7) were drilled deep enough to penetrate this clay

URS Corporation
915 Wilshire Boulevard, Suite 700
Los Angeles, CA 90017-3437
Tel: 213.996.2200
Fax: 213.996.2458

layer. In these borings, the stiff clay is underlain by about 15 to 20 feet of sandy silts and silty sands of varying consistency. In B-4, densities of these sandy layers increased with depth, ranging from medium dense to very dense, while B-5 encountered loose and dense sands randomly interbedded. Although special care was taken to minimize soil disturbance during sampling, some heave may have occurred while sampling the sandy soils in this boring. Specifically, the extremely low blow counts obtained for Sample # 11 just above the bedrock contact may not be reliable. Given that much higher blow counts were recorded just 5 feet above, the SPT data for Sample #11 were disregarded.

For the purpose of the liquefaction and lateral-spreading analyses reported herein, the idealized subsurface profile shown in Figure 8 was developed based on our interpretation of the borings above, plus taking into account the following additional data:

1. Cone Penetrometer soundings, CPT-1 and CPT-2 (Figures 9 and 10).
2. Additional CPT soundings performed after the initial field investigation (Figures 11 through 16)
3. US Army Corps of Engineers (USACE) borings drilled in 1945 for the design of the LA river channel (Figures 17 through 19).

The locations of all borings and CPT soundings mentioned above are shown on the Exploration Location Map in Figure 5. For the purpose of our analyses, the groundwater table at the site was assumed to be at the elevation of the top of the LA-river channel wall. According to USACE as-built drawings shown in Figure 20, both the channel walls and invert slab are provided with drainage layers connected to weep holes about 1 ft above the bottom of the channel. With no possibility of hydrostatic-pressure build up behind the wall, the phreatic line shown in the subsurface profile of Figure 8 was assumed for the purpose of our slope-stability analyses.

Lateral Support from LA-River Channel Structure

Analyzing the slope stability of the LA-river bank along the southern border of the site required taking into account the structural support provided by the reinforced-concrete wall and invert slab of the LA river channel. According to as-built drawings obtained from the LA District office of the US Corps of Engineers (Figure 20), the 15-foot high retaining walls and invert slab of the channel form a U-shaped moment frame. The walls are 12 inches thick at the top, widening to 18 inches at the bottom; and the invert slab is 18 inches thick at the wall, tapering down to 12 inches in the center of the channel.

A potential river-bank failure triggered by liquefaction of the soil beneath the channel would involve uplifting and breaking the invert slab in bending and/or shear. Such a failure mode cannot be addressed in a rational way with conventional rigid-body based slope-stability analysis tools. Hence, we utilized the finite difference code FLAC for computing the post-shaking static slope stability and the yield acceleration necessary for the Newmark analysis. Soils were modeled as a continuum with the material properties listed in Figure 21, and the channel walls were simulated by elasto-plastic beams capable of forming plastic hinges upon reaching their yield bending moments. Assuming a concrete compressive strength of 3,000 psi, yield moments were estimated to be 240, 170, and 100 kp-ft for wall and slab thicknesses of 18, 15, and 12 inches, respectively.

Liquefaction Analysis and Settlements

A simplified liquefaction analysis using the procedure outlined in NCEER (1997) was performed based on an average corrected SPT blow count of N1_60=12 for the deep sandy layers underlying the stiff clay at the site. Our analysis results indicated that these approximately 10-foot thick, loose to medium dense sands could liquefy during shaking with the design event, and liquefaction-induced settlements were estimated to be on the order of 2 inches.

Slope-Stability Analyses

Post-shaking static and pseudo-static slope-stability factors of safety were computed with FLAC, using the shear-strength reduction technique (Matsui & San, 1992). After equilibrium has been under gravity forces, the soil shear strength is reduced in stages until slope failure occurs. The resulting factor of safety is defined as the ratio of the soil's actual shear strength to the reduced shear strength at failure. Dawson et al. (1999) demonstrated that this definition is consistent with that used in conventional slope stability analysis. The shear strength reduction technique has a number of advantages over the method of slices. Problems to be solved may contain any type of structure, the most critical failure modes are found automatically without trial runs, and - depending on the physical properties of the soil, rock, or structures involved - may occur along distinct slip surfaces or be distributed over broad shear zones.

The slope-stability analyses were performed assuming that the 10-foot thick loose sands beneath the LA-river channel had liquefied and their shear strength dropped to a residual value of 400 psf, based on a SPT blow count of N1-60=12 (Seed and Harder, 1990). The critical failure modes are depicted by patterns of velocity vectors at the onset of failure,

as shown in Figures 22 through 24. Post-shaking safety factors without and with the channel structure were computed to be 0.97 and 1.84, respectively (Figures 22 and 23). The pseudo-static failure mode presented in Figure 24 is associated with lateral ground displacements (spreading) extending to about 125 feet behind the channel wall. The resulting yield acceleration of 0.16g was used in the Newmark sliding block analysis discussed below.

Liquefaction-Induced Lateral Spreading

The potential for, and magnitude of, liquefaction-induced lateral spreading were evaluated with the simplified Newmark sliding-block method. First, the yield acceleration was computed by performing the pseudo-static slope-stability analysis discussed above. Next, shaking-induced displacements were analyzed for negative and positive polarities of each of the 6 acceleration histories described above, by double-integrating and adding up those acceleration spikes which exceeded the yield acceleration.

It should be pointed out that shaking-induced ground displacements at this site are associated with a failure mode quite different from that commonly attributed to lateral spreading. The latter is usually understood as liquefaction-induced ground movement along a gently inclined straight path. In contrast, due to the geometry of the LA-river channel and the slope above the channel wall, shaking-induced displacements at this site are triggered by a rotational failure. Hence, lateral spreading is expected to attenuate with increasing distance from the channel, as indicated by the pseudo-static failure mode depicted in Figure 24.

Averaging the 12 computed displacement values mentioned above (Figure 25), we estimate that liquefaction-induced lateral spreading at the site could amount to about 8 inches. Based on the pseudo-static failure mode discussed above, we estimate that lateral spreading would extend for a distance of up to 125 feet behind the LA river channel wall. Ground displacements would be greatest immediately behind the channel and attenuate with increasing distance, approaching essentially zero at the edge of the 125-foot zone affected by lateral spreading.

CONCLUSIONS and RECOMMENDATIONS

Liquefaction-induced settlements and lateral spreading were evaluated for the proposed Fire Station #78. For a design seismic event with a probability of occurrence of 10 % in 50 years (PGA=0.53g), we estimate that liquefaction-induced settlements would be about

2 inches. For such an event, lateral spreading would produce ground displacements of up to 8 inches in a zone extending about 125 feet behind the channel wall, with displacements being greatest immediately behind the wall. Attenuating with increasing distance from the wall, horizontal ground displacements are expected to approach zero at the edge of the 125-foot wide zone affected by lateral spreading. With the proposed building footprint being located just outside this zone, the building foundations are not subjected to shaking-induced lateral spreading.

Because the site is underlain by loose soils to depths of up to 15 feet, and because there is a potential for liquefaction-induced settlements from saturated loose sands at depth, we recommend that the building be supported on piles. In addition to supporting the building loads, the piles will have to be designed to accommodate negative skin friction caused by liquefaction-induced settlement of the loose sands at depth.

Sincerely,

URS CORPORATION

DEIR REPORT REVIEW - COMMENTARY

*The following are intended to serve as comments regarding WEXCO's observations of the Draft Environmental Impact Report (DEIR) relative to the Harvard-Westlake River Park Project, as of **March, 2022**, based on the information available to date.*

The format of this document is: 1) an excerpt of the DEIR including page/section number, 2) WEXCO's Relevant Summary of the DEIR provision, 3) WEXCO's comment as to the DEIR proposal. This report does not include all of our observations and opins and is subject to enhancement or changes as additional data is received.

Opening Statement

Per Section IV H Hazards and Hazardous Materials of the DEIR there are a series of Thresholds of Significance that characterize a significant impacts related to hazards and hazardous materials if the project would:

(a) Create a significant hazard to the public or the environment …

We believe there are significant hazards and / or safety concerns (not limited to hazardous materials) associated with the proposed project not limited to the items listed below:

1. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Page II-53)

Vehicle parking would be provided in aboveground and underground parking areas located on the eastern portion of the Project Site. Vehicles would enter the Project Site on Whitsett Avenue via a driveway located several hundred feet south of Valley Spring Lane (to the north of Field A) (referred to as north driveway) and **via a driveway at the paved portion of Valleyheart Drive located just south of LAFD Fire Station 78 (referred to as south driveway)**. Both driveways would provide access to the proposed single-level underground parking structure, as described below. **No new driveways would be installed** along Valley Spring Lane or Bellaire Avenue, and the existing service driveway on Valley Spring Lane would be removed, thus eliminating an existing potential conflict location.

Relevant Summary

The roadway serving the Fire Station 78 at Valleyheart Drive is proposed to also be utilized by Harvard Westlake patrons and employees.

WEXCO Commentary

The elimination of the relatively exclusive use of the Valleyheart Drive serving the Fire Station is Unsafe

The south driveway and Valleyheart Drive should not be shared with Harvard Westlake in the event of a fire, or earthquake, or other emergency situation or calamity that would require the Firefighters to use the south driveway and Valleyheart. If the Valleyheart Drive has a line of vehicles entering the proposed facility, that traffic would severely impact the emergency services personnel, vehicles and equipment from ingress and egress.

The proposed south driveway plan will hinder emergency services ability to timely egress which can slow response time and be life threatening.

To the extent that pedestrian access, in/out of the Proposed Facility via the proposed South Driveway to cross or impede Emergency Services access is also unsafe.

There should be no encumbrances to the Fire Station and Emergency Services personnel and vehicles and equipment at the proposed South Driveway.

According to the LAFD Statistics, for LAFD Station 78, the Operational Response Time for Emergency Medical Services (EMS) is currently 7 mins 11 sec. For Advanced Life Support (ALS) LAFD Station 78 response time is currently 6 mins 18 secs. For Structure Fires, the response time is 5 mins 24 secs.

Per Vehicle Code 22500, it is unlawful to Stop, Stand or Park within 15 feet of the driveway entrance to a fire station.

Per the California Fire Code and / or Ca. Vehicle Code the minimum clear width of fire access roads is 20 feet.

2. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Pages II-53-54)

The south driveway would only allow entry into the subterranean garage, and all exits from the garage would be via the north driveway off Whitsett Avenue.

The roundabout has been designed to accommodate buses, shuttles, and automobiles. The roundabout would lead to a 29-space, short-term surface parking lot near the parking structure's southern entrance.

Rideshare vehicles would use the southern driveway (with roundabout) to access the surface parking lot.

Visitors that are not affiliated with the School would be informed about preferred driving routes and neighborhood parking prohibitions via signage, the School's website, through the online athletic facility reservation system (i.e., tennis court reservation system), and **information made available at the security kiosks.**

Relevant Summary

The Southern Driveway and Valleyheart Drive will serve numerous types of traffic. Signage will be placed to direct visitors about preferred driving routes and parking prohibitions.

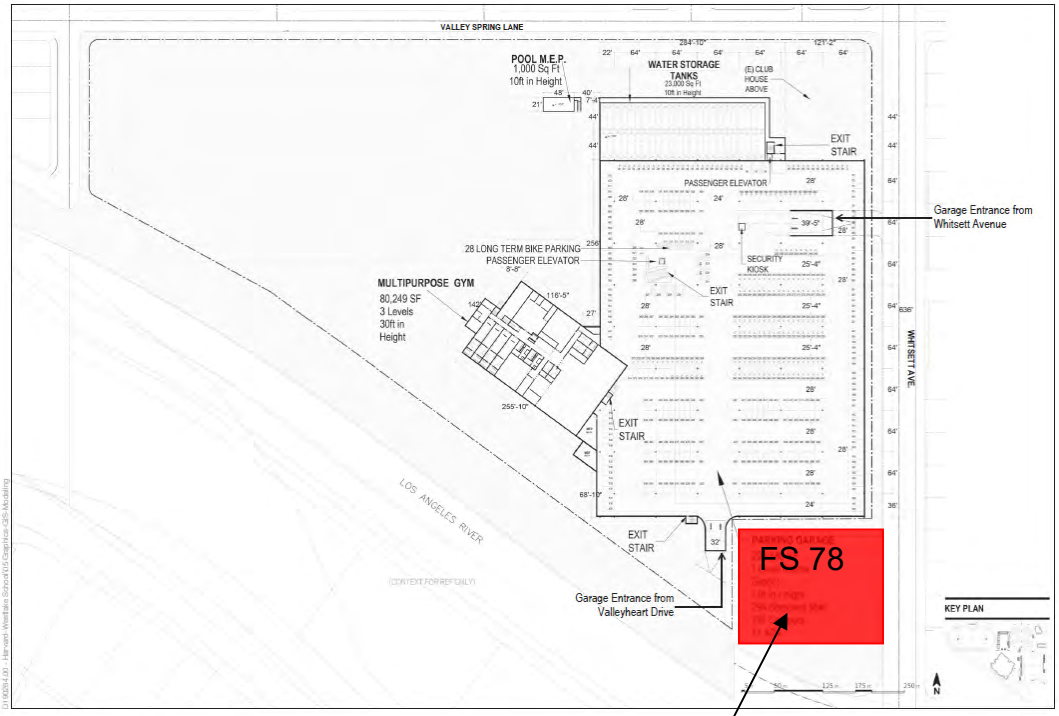
WEXCO Commentary

The north driveway will be congested given that the south driveway is slated for ingress only.

Traffic on Whitsett will be impacted by having a single exit point for a 500+ vehicle parking lot disbursing onto Whitsett from the proposed north driveway. Traffic congestion is a safety hazard. It is also a safety hazard in the proximity of

the Fire Station 78. Is there a controlled intersection planned for that north driveway? With a traffic signal? Will vehicles exiting the North driveway be allowed to turn left (north) onto Whitsett from the driveway?

There is no indication that the proposed internal roundabout would accommodate emergency vehicles. It is unclear how the 29-Parking Space vehicles on the surface lot will exit the proposed facility, since the North Driveway is for subterranean parking lot exit only.



Allowing Rideshare service Only into the Southern Driveway will cause confusion and a safety hazard. And, the confusion will further complicate the south driveway relative to the Fire Station 78 access/egress.

Visitors not familiar with the specialized proposed parking arrangements having to rely on specialized signs without fair warning will cause confusion and safety hazards.

There does not seem to be a plan to provide motorists enough lead time for motorists to assess the signs. That lack of lead time will force motorists to make snap decisions in using the North or South Driveway Entrance. There would need to be advanced signage along the roadway to accommodate motorists for proper specialized driveway entrance selection.

3. DEIR, Figure II-26

Indicates location of subterranean parking garage. (See below)

SOURCE: Gensler, 2020

Harvard-Westlake River Park Project

Approx. Location of FS 78

Figure II-26
Below Grade Plan for the Project

WEXCO Commentary

The proposed Below Grade Plan – does not indicate the Proximity of the Fire Station 78 and does not indicate the shared roadway (Valleyheart Drive) with Fire Station 78

The figure II-26 should provide more information so that the impacts to the Fire Station driveway is revealed.

4. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Page II-55)

To minimize conflicts with emergency vehicles exiting LAFD Fire Station 78, a flashing red warning light(s) would be installed on the southern exit driveway within the Project Site at a point located before vehicles reach Valleyheart Drive **that will hold back vehicles** exiting the Project Site roundabout onto Valleyheart Drive. This warning light would be activated by a remote control button pressed by LAFD staff in the emergency vehicle when an emergency vehicle is approaching Valleyheart Drive from Whitsett Avenue or exiting from one of the two LAFD driveways on Valleyheart Drive. This feature is identified as Project Design Feature TRAF-PDF-2 in Section IV.M, *Transportation*, of this Draft EIR.

Relevant Summary

A Flashing warning light will be added to alert Harvard Westlake patrons inside the proposed facility to "hold back".

WEXCO Commentary

The warning light will not serve traffic on Whitsett or Valleyheart.

It was indicated in the DEIR that the south driveway was only an entrance to the proposed facility. Why would a flashing light be needed inside the facility at the South driveway if it is only an entrance?

5. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Page II-55)

On days in which attendance is expected to surpass 300 spectators, tickets and parking passes would be required to enter the Project Site. **Spectators without a parking pass would be directed to park on the Upper School campus** and ride the School-provided shuttles to the Project Site. **Parking in the neighborhood would not be permitted and would be enforced by security personnel**, as discussed above.

Relevant Summary

If spectators do not have a parking pass they will be directed to turn around and park at the Harvard Westlake Campus (that already has limited parking and has overflow onto neighboring streets). (All Harvard Westlake related) parking will be enforced by Harvard Westlake security.

WEXCO Commentary

This scenario of re-directing motorists from the proposed facility to the HW Upper campus further complicates the traffic in proximity to Fire Station 78.

The Harvard Westlake Security agent has no authority to enforce the Vehicle Code or Parking Enforcement – this will further complicate the traffic conditions when spectators that are redirected to HW Upper Campus about 1 mile away – will have the option to park in the neighborhood

Harvard Westlake "enforcing" the neighborhood parking rules is unreliable and not lawful.

It should be noted that the existing facility (Tennis Courts, Driving Range, Club House/Pro Shop, Snack Shop and 9-hole Pitch and Putt Golf Course has 89 parking stalls with two exits on Whitsett. The proposed project includes 532 parking stalls (that reflects nearly a 600% increase in capacity) than what currently exists. It is unclear how this substantial (6x) increase in vehicle parking and traffic can be achieved safely with only one exit (the North Driveway).

The proposed project forecasts 2,217 "fixed" seating (there is always seats that can be brought in too). This increase in patronage and traffic for this neighborhood and the proximate Fire Station is excessive.

6. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Page II-56)

Three shuttles are anticipated to transfer students, coaches, and visitors between the campus and the Project Site between 2:30 p.m. to the end of the day's latest activity. **Shuttles would have an estimated rider capacity of 24 and service is anticipated every 5 to 10 minutes. Ingress and egress at the Project Site would be at the south driveway drop-off roundabout, at Valleyheart Drive, just west of the LAFD Fire Station 78.**

Relevant Summary

HW Shuttles will be used to transport patrons to and from the proposed site every 5 to 10 minutes in proximity to the LAFD Station 78.

WEXCO Commentary

The HW Shuttles are yet additional sources (amongst multiple sources) of traffic that further complicates the congestion and frequency of traffic in proximity to Fire Station 78

It should be noted in this analysis that years of construction of the proposed project will severely impact traffic along Whitsett, and the feeder streets and neighborhood including the LAFD Station 78.

(Continued)

7. DEIR, IV. M. Transportation 3. Project Impacts, (f) Vision Zero (Page M 35)

Vision Zero is a plan that **strives to eliminate traffic-related deaths** in Los Angeles by 2025 through strategies, such as modifying streets to better serve vulnerable road users. Projects located in the HIN should make improvements or fund them. **The Project's frontages are not along streets in the Vision Zero network.** The Project frontages are not along streets that are on the HIN, and, therefore, **the Project would not preclude or conflict** with the implementation of future Vision Zero projects in on the HIN.

Relevant Summary

HW claims the project frontages do not enter the Vision Zero network, therefore the project would not conflict with Vision Zero.

WEXCO Commentary

In LADOT's High Injury Network (HIN), Ventura Blvd from Coldwater Canyon Ave to Carpenter Ave is identified as a street with one of the City's highest incidences of severe and fatal injury collisions. Although the DEIR claims "The Project Site's frontages are not along streets that are part of the HIN," shouldn't the HIN be taken into account for all aspects of the project, including:

1) construction haul routes (which are planning to utilize Ventura Blvd between Whitsett Ave and Coldwater Canyon Ave),

2) prescribed student and visitor trip routes (from the Project Site back to the upper campus would entail heading southbound on Whitsett Ave, turning right and heading westbound on Ventura Blvd, and turning left on Coldwater Canyon Ave),

3) and daily, cumulative traffic impacts.

8. DEIR, IV. M. Transportation 3. Project Impacts, (e) LADOT Manual of Policies and Procedures (Page M 34-35)

MPP 321 states that on arterial highways, such as Whitsett Avenue, serving lots with frontages greater than 250 feet driveways should not be placed within 150 feet of the adjacent street. The Project proposes two driveways. The north driveway on Whitsett Avenue is more than 150 feet away from the closest intersection at Valley Spring Lane to the north. The south driveway on Valleyheart Drive that leads to Whitsett Avenue is more than 150 feet away from the closest intersection at Ventura Court to the south. MPP 321 also allows up to two driveways for up to 400 feet of frontage. The Project proposes two driveways and therefore does not propose more driveways than allowed by MPP 321.

WEXCO Commentary

The proposed driveways do not comply with the City's applicable requirements, as the north driveway is proposed to be 39 feet wide and the south driveway is proposed to be 33 feet wide.

Additionally, the south driveway is the extension of a public street, Valleyheart Drive, which is currently 33 feet wide. The Project is not consistent with the recommendation in the MPP Section 321.

9. DEIR, IV. M. Transportation 3. Project Impacts, Threshold (d) (Page M 44-45)

(a) Construction

The Project would include temporary construction activities (e.g., temporary lane closures, etc.) and generate construction traffic that could potentially affect emergency access to the Project Site and surroundings. As stated in the TA, the Project would not require construction activities that would take place within the right-of-way, which would necessitate temporary lane, alley, or street closures for more than a day at a time. Furthermore, emergency access would be maintained at all times as no road closures would be necessary. However, while construction activities would not require full street closures (i.e., at least one travel lane would be open at all times) and most Project construction activities would be confined to the Project Site, the Project would still implement a CMP (see Project Design Feature TRAF-PDF-1). Because of the short-term nature of the construction activities and with implementation of a CMP, the Project's construction activities would not require a new, or significantly interfere with an existing, risk management, emergency response, or evacuation plan. **The Project would not result in inadequate emergency access during construction.**

(b) Operation

Operation of the Project would not include the installation of barriers (e.g., perimeter fencing, fixed bollards, etc.) that could impede emergency vehicle access to the Project Site and in the Project vicinity. Drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. As discussed in Section IV.L.1, Fire Protection, **impacts to these services from Project implementation would be less than significant.** In addition, as discussed in Section IV.H, Hazards and Hazardous Materials, none of the streets adjacent to the Project Site are a City-designated disaster route.

…**the Project would not result in inadequate emergency access**.

WEXCO Commentary

The document addresses that "the Project would not result in inadequate emergency access." But, it does not specifically address the impacts to the Public. The above does not consider the effects of the construction in such close proximity to the LAFD Station 78 relative to the need of the Public. We are of the opinion that the proposed project would result in inadequate emergency egress to serve the General Public.

We disagree that the construction activities will be "less than significant" relative to Traffic and Emergency Services from LAFD Station 78.

10. DEIR, IV. M. Transportation 3. Project Impacts, Threshold (b) (Page M 40-41)

See Table IV M-5 Project Net Total Daily VMT (Vehicle Miles Traveled) Estimate

… **No mitigation measures were required or included, and the impact level remains less than significant.**

WEXCO Commentary

If the data in the DEIR is correct, the proposed project reflects a decrease in the VMT in the area from 6,000 Daily VMT (Existing Use) to 4,000 Daily VMT (but, only as it pertains to HW inbound miles).

However, if the Daily VMT included outbound miles the proposed project would be greater than the existing use (i.e. 8,000 Daily VMT). Therefore the subject proposed project VMT will be increased.

We would like to see the source of the data relative to the existing use data. It is hard to believe that the existing facility (with 89 parking stalls) generates more VMT than the proposed sports facility with 532 parking stalls and numerous Shuttles and other vehicles (Deliveries, Rideshare, etc.).

11. DEIR, IV. Appendix L. Public Service Provider Correspondence, Section L-1 Los Angeles Fire Department Correspondence, Fire Protection

The Los Angeles Fire Department continually evaluates fire station placement and overall Department services for the entire City, as well as specific areas. The **development of this proposed project, along with other approved and planned projects in the immediate area, may result in the need for the following:**

1. Increased staffing for existing facilities. (i.e., Paramedic Rescue Ambulance
and EMT Rescue Ambulance resources.)
2. Additional fire protection facilities.
3. Relocation of present fire protection facilities.

WEXCO Commentary

We agree.

12. DEIR, IV. V. Alternatives

(5) maximizes public safety through 24-hour, seven-day a week on-site security, monitored points of entry, and enforcement of a prohibition on off-site parking

WEXCO Commentary

We disagree. On-Site security has no authority to prohibit or enforce off-site parking.

13. DEIR, IV. V. Alternatives H. Hazards and Hazardous Materials (Page V-47)

As the Project would require grading and excavation of the Project Site, including a net cut/fill volume of approximately **250,000 cubic yards** (unadjusted), these grading activities could result in the exposure of construction works to hazardous conditions associated with contaminated soils or soil vapor. **As such, the Project could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving hazardous materials as a result of contaminated soils, and impacts would be potentially significant.**

WEXCO Commentary

Upon excavation, undisturbed soil may emit pollutants, contaminants, and particulate matter to the detriment of public health and safety (e.g., Valley Fever) that can compromise those with respiratory conditions.

The DEIR does not indicate any Swell Calculation of the Export soils.

Swell of compacted soil -as it is being excavated and placed into dump / haul trucks -is commonly estimated to be between 20%-25%. The amount of anticipated haulage of Export is misleading.

In other words, the Proposed excavation amount of 250,000 Cubic Yards of compacted earth materials will increase in size by 20%-25% as it is distributed from the earth to the dump trucks; thereby increasing the amount of haulage of earth materials from the 250,000 CY to 310,000 CY (i.e. 22.5% Swell Factor).

The DEIR does not indicate the weights of various construction elements that will impact the Roads and Infrastructure

WEXCO has not seen, in the DEIR, any calculations as to the weight of:

1) *Imported soils to the Site.*

2) *Imported Concrete to the Site.*

   The DEIR does not indicate the number of Concrete Trucks per day during the Project,

   The DEIR does not indicate the amount (in Cubic Yardage - CY) of concrete for the proposed project.

3) *Imported Steel and Reinforcing Steel to the Site.*

4) *Heavy Equipment transported to/from the site*

5) *.... and other substantive Construction Equipment and Materials.*

14. Additional Points

.1 Even if there is a median on Whitsett to prevent left-hand turns, when there are special events with visitors/cars exceeding the 500+ parking spaces, it is likely that people will park on the east side of Whitsett Ave and then either walk around the block to the nearest cross-street (with currently no crosswalk) or dart across Whitsett (east to west).

.2 Even if there are no street parking along Valley Spring Lane, what is to stop patrons from finding other nearby street parking? What safety ramifications were accounted for in the DEIR for the increased pedestrian travel along the surrounding streets that feed into the proposed project?

.3 Motorists heading northbound on Whitsett Ave. from Ventura Blvd. to the proposed project – where vehicles can't turn left into the project's north driveway - it is foreseeable that these northbound motorists will likely make a U-turn at the intersection of Whitsett Ave. and Valley Spring Lane to be able to enter the North Driveway. The DEIR does not seem to take that scenario into account.

.4 The methane gas emitted from the installation of artificial turf, along with the urban heat island effect are significant health (odor and or fumes) and safety (heat) impacts to occupants and the public.

.5 Significant light and noise pollution. Cumulative noise pollution (Crowds, Vehicles, Event generated sounds, Emergency Vehicles from LAFD Station 78 – coupled with the jet-noise impacts from Burbank and Van Nuys airports - is significant. Over 40 stadium-lights that are 40' or over in height (many of which are 80' tall) are slated to be added. The DEIR does not seem to account for the glare and light pollution generated by the proposed project.

.6 Per IV. Environmental Impact Analysis; L.1 Public Services – Fire Protection… As noted herein but worth repeating. As part of the Project design and per Project Design Feature TRAF-PDF-2, a flashing red warning light is proposed to be installed at the Project-facing side of the southern exit driveway within the Project Site at a point located before vehicles reach Valleyheart Drive that purports to "hold back" vehicles exiting the Project Site onto Valleyheart Drive. This warning light is proposed to be activated by a remote control button pressed by LAFD staff in the emergency vehicle when an emergency vehicle is approaching / or departing Valleyheart Drive / Whitsett Avenue or exiting one of the LAFD driveways on Valleyheart Drive. The warning light will purportedly reduce conflicts between vehicles leaving (but not entering) the Project Site and emergency vehicles leaving/coming back to the station. Also, the Project would include an at-grade security kiosk located near the roundabout, thereby placing a security guard nearby to assist with traffic management when the warning light is activated.

The proposed red flashing light solution is not nearly enough… More and other options are needed to address the impacts to the Public Safety relative to the impacts of the construction and proposed project to the LAFD Station 78.

The DEIR even suggests that LAFD Station 78 may need to be RELOCATED resulting from the proposed project (see Section L-1 Los Angeles Fire Department Correspondence, Fire Protection)

> ***LAFD Fire Station was built in 2004 – it would be a tremendous burden to now (because of the proposed project) resort to relocating an 18 year-old LAFD Station 78.***

Manual operated safety systems, such as those proposed, are subject to human error.

.7 In addition to the excessive stadium lighting issue (see 14.5 above) the existing street lighting on Whitsett Ave. is particularly not suitable for the increased pedestrian traffic that would be generated by the proposed project. Potential mitigation of this hazard would be to eliminate events or day-time only usage of the site.

.8 Given the proximity of the proposed tennis courts to Valley Spring, not only will there be noise pollution from the tennis players but also a risk of errant tennis balls entering the roadway. There is a potential for errant sports related equipment to enter Whitsett from Field A as well.

.9 **Liquefaction issue and the proposed construction of the subterranean garage, and sports facilities at the southern edge of the property near the LA River channel wall:**

Prior to the construction of LAFD Station 78 that was built in 2008, the Geotechnical Engineering Division (GED) commissioned URS Corporation (URS) to perform subsurface exploration at the site and laboratory testing of samples collected from the site.

The URS 2004 report Conclusions and Recommendations section states:

"Liquefaction-induced settlements and lateral spreading were evaluated for the proposed Fire Station #78. For a design seismic event with a probability of occurrence of 10% in 50 years (PGA=0.53g), we estimate that liquefaction-induced settlements would be about 2 inches. For such an event, **lateral spreading would produce ground displacements of up to 8 inches in a zone extending about 125 feet behind the channel wall,** with displacements being greatest immediately behind the wall. Attenuating with increasing distance from the wall, horizontal ground displacements are expected to approach zero at the edge of the 125-foot wide zone affected by lateral spreading. With the proposed building footprint being located just outside this zone, the building foundations are not subjected to shaking-induced lateral spreading"

> "Because the site is underlain by loose soils to depths of up to 15 feet, and **because there is a potential for liquefaction-induced settlements from saturated loose sands at depth, we recommend that the building be supported on piles**. In addition to supporting the building loads, **the piles will have to be designed to accommodate negative skin friction caused by liquefaction-induced settlement** of the loose sands at depth."

The subject DEIR recommends a mat foundation system (not piles), but what remains unclear is how close the proposed planned development is to the LA River channel wall and if any development (including underground) is within that 125 feet zone from the northern wall of the River channel.

According to the URS 2004 report, anything within the 125-foot zone, which would also be "40 feet north of the northern right of way of Valleyheart Drive" would be "susceptible to distress as the result of lateral movement." ***It appears that the proposed improvements would be susceptible to distress and therefore unsafe for occupants and the general public given the proximity of the proposed project to a vital storm drain system (LA River). This aspect of the proposed project does not appear to have been thoroughly analyzed.***

If you have any questions with the content of this document, please contact the undersigned at (310) 306-3877. This report is subject to further amendments subsequent to receipt of any new additional documents.

Recycling and Reuse of Crumb Rubber Infill Used in Synthetic Turf Athletic Fields

March 31, 2016

Louis Berger

TABLE OF CONTENTS

EXECUTIVE SUMMARY 3

1. INTRODUCTION 6

2. TRENDS AND BARRIERS 7

3. CALRECYCLE OPTIONS, KEY ISSUES AND RECOMMENDATIONS 17

4. CONCLUSIONS 20

APPENDIX A: DESCRIPTION OF SELECT COMPANIES RESEARCHED FOR THIS REPORT 21

APPENDIX B: BIBLIOGRAPHY 23

Executive Summary

This report provides a high level overview of trends, barriers and issues related to recycling crumb rubber infill used in synthetic turf athletic fields, and identifies options to boost recycling. The Louis Berger Group (Louis Berger) prepared the report under contract to CalRecycle, with support by DK Enterprises and Boisson Consulting. Following is a synopsis of key findings, along with some related issues and recommendations for CalRecycle consideration.

Trends

Synthetic turf infill is an important market for crumb rubber made from scrap tires. Since 2008 four-to-six percent of California generated scrap tires has flowed to this market (20-to-25 percent of all California-produced crumb rubber).

Most synthetic turf athletic fields continue to use infill comprised of crumb rubber and sand; however, alternative infill materials have gained market share recently.

The number of synthetic turf fields reaching the end of their useful life and in need of replacement is growing. The Synthetic Turf Council estimates that up to 1,000 fields per year nationally may be removed by 2017, with roughly 10 percent (about 100) of these in California.[1] However, some field owners have reportedly delayed replacement which may reduce these projections somewhat.

Interest in recycling synthetic turf athletic field components (i.e., infill, turf, etc.) has grown in recent years. Several firms offer removal, reuse and/or recycling services, recycling services and/or equipment. However, recycling levels remain low due to poor economics and other market constraints. One knowledgeable source estimates that, nationally, 15 percent of field removals reuse a portion of infill in the replacement field, and about five percent recycle some "carpet" components (that is, the backing layer and synthetic grass material).[2] In 2014, approximately 22.4 million pounds of California-produced crumb rubber was used in synthetic turf fields. Assuming 85 percent of this were to be ultimately disposed as these fields reach the end of their useful life over the coming decade that would equate to just over 19 million pounds, or 9,500 tons. The Synthetic Turf Council has established a Reuse and Recycling Committee to help strengthen current practices.

The situation for recycling synthetic turf athletic fields is similar to some other types of recycled-content products that do not have closed-loop markets, such as molded rubber products, plastic lumber and other rigid plastic products that are currently not typically recycled back into the same type of product.

Barriers

The multi-material nature of synthetic turf fields complicates recycling of individual components. Technologies to remove, separate and clean various turf components are available, though still evolving.

[1] As reported in "Trends in End-of-Life Management for Synthetic Turf Products." Presentation by Adam Coleman, Turf Reclamation Systems, at the 2015 CalRecycle Tire Conference.
[2] Mark Heinlein, President, Turf Reclamation Solutions.

Recycling crumb rubber infill is usually much more costly than disposal due to the comparatively high cost of separating and cleaning infill and turf materials, and transportation to processors and end-users.

Certain characteristics of recovered crumb rubber infill may be degraded compared to new crumb rubber, but it still performs well in new/replacement infill installations. Reuse is greatly facilitated when the same firm that originally installed the field is replacing it, so that material specifications are the same or similar.

Markets for recycled crumb rubber infill are extremely limited. The market that appears to have success is reusing a portion of the material in new/replacement synthetic turf athletic field installations. Other uses may have potential but would require additional material processing and market development efforts.

Field owners and developers lack information on synthetic turf athletic field recycling options and processes.

CalRecycle Options to Promote Recycling of Crumb Rubber Infill Recycling

Identified options include:

- Provide funding through grants, loans and/or incentives.
- Research the potential to establish a fixed facility to clean and process recovered crumb rubber infill.
- Research and provide information on potential markets and end-users, especially those with relatively forgiving specifications that may allow a degree of sand and/or other components with crumb rubber (e.g., use in kilns, rubberized asphalt, etc.).
- Fund technical assistance and demonstration projects involving the identified markets and end-users.
- Research issues related to recycling all end-of-life tire-derived products (e.g., molded rubber products).

Issues and Recommendations

Following are key issues and recommendations for CalRecycle's consideration:

Issue: What should be CalRecycle's top priorities to promote crumb rubber infill recycling?
Recommendation: For now, seek to prove the concept by researching potential markets and end-users, evaluating the feasibility of establishing a fixed processing facility for recovered crumb rubber infill, and funding a few technical assistance and demonstration projects to prove their viability.

Issue: Will increased crumb infill recycling reduce demand for newly-produced crumb rubber and what are the implications for CalRecycle programs?
Recommendation: Anecdotally, very little of the crumb rubber from synthetic turf fields being replaced is being reused in new/replacement fields. However, there is some potential for this amount to increase over time. True to its recycling mission, CalRecycle should seek to maximize the value of recycled crumb rubber (and other recycled materials) through prolonged and varied recycling uses.

Issue: Should CalRecycle shift a portion of waste tire market development resources away from new crumb rubber to focus on recycled crumb rubber infill material?
Recommendation: Yes, but not so much that it severely impacts other goals. For example, over one or more years CalRecycle could allocate $300,000 to $500,000 to cover an evaluation of potential markets, a

feasibility study on establishing capacity to process recovered crumb rubber infill, and a few California-based demonstration projects.

Issue: Should CalRecycle resources be used to help recycle EOL crumb rubber infill that originally was sourced from outside the state?
Recommendation: Yes. Some California crumb rubber producers report that crumb rubber from outside the state is sometimes in California synthetic turf field construction (an estimate of the amount is not available). Regardless of the original source of crumb rubber infill, when recycled from a California synthetic turf athletic field it is now a California waste product. Given that tire funds are required to be spent on tires originating in California, however, this approach may require concurrence by CalRecycle's legal department.

Issue: How can CalRecycle broadly promote recycling of other tire-derived products and recycled content products made from other materials that are not recycled in closed loop?
Recommendation: The market research mentioned above should also cover other non-closed-loop tire-derived products (e.g., molded rubber products or playgrounds) to identify opportunities to maximize the useful life of the materials used.

Conclusions

This brief, high-level report identifies several specific opportunities for CalRecycle to promote synthetic turf sport field crumb rubber infill recycling in a way that advances these other goals at the same time. As with other market development efforts, CalRecycle should view such activities as long-term investments that may pay dividends over time as the current trends play out and recycling infrastructure and markets continue to evolve.

1. Introduction

Over the past decade use of crumb rubber as infill in synthetic turf fields has become an important scrap tire recycling market. With a useful life-expectancy of 8 to 10 years, a growing number of fields are reaching the end of their useful life and require replacement, and this is driving increased interest in whether and how the materials used in synthetic fields can be reused or recycled.[3]

The purpose of this brief report is to provide CalRecycle staff and management with a high level overview of key trends, barriers and issues related to recycling the crumb rubber infill used in synthetic turf fields, and to identify options to boost recycling levels. Louis Berger prepared the report under contract to CalRecycle, with support by DK Enterprises and Boisson Consulting. Research was conducted in summer and fall, 2015, including a review of information available on the Internet, along with interviews with select industry stakeholders.

While CalRecycle is interested in promoting recycling of all products, including all materials used in synthetic turf fields, the focus of this particular report is on crumb rubber infill only. CalRecycle also initially asked that this report address the recycling of playground surfaces made with crumb rubber at the end of their useful life; however, no information sources on this topic were identified and the team is not aware of any specific examples of rubberized playground surfaces being recycled.

After this introduction, Section 2 presents key findings on related trends and barriers. Section 3 then identifies alternative policies and programs to boost crumb rubber infill recycling, and also presents recommendations on how CalRecycle can address several related issues. Section 4 provides broad conclusions regarding next steps. Finally, Appendix A provides information on several firms researched for the report, and Appendix B provides a bibliography of identified information sources.

[3] Except where noted, the term "recycled" is being used in this report to broadly refer to reuse and recycling.

2. Trends and Barriers

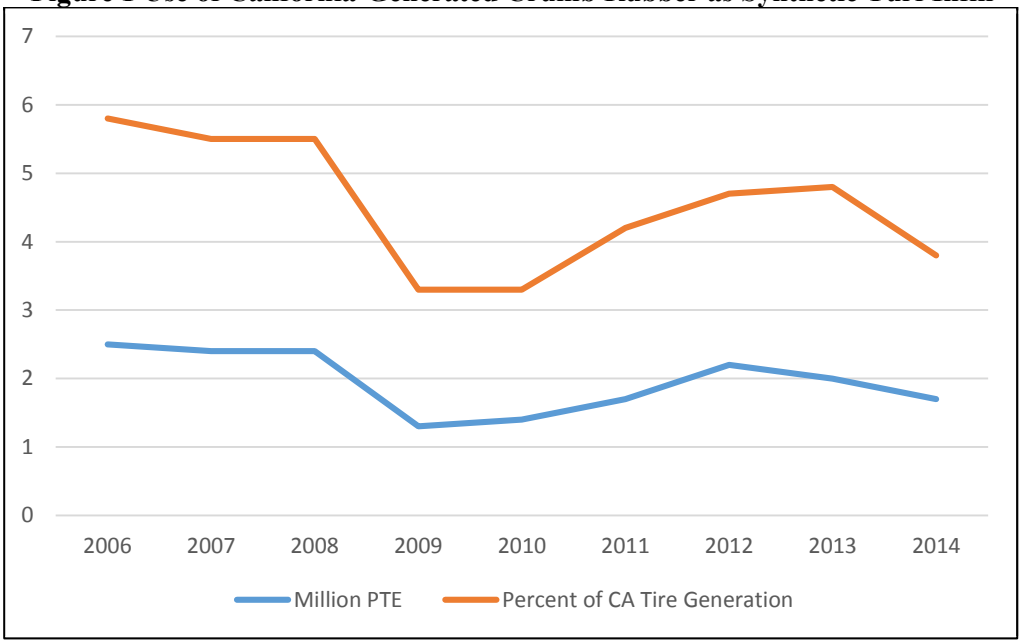
Following is a synopsis of key trends, barriers and issues related to recycling of crumb rubber infill derived from deconstructed synthetic turf fields, based on research conducted for this report.

Trends

Synthetic turf infill has become an important market for crumb rubber made from scrap tires.
Use of synthetic turf in soccer, football, rugby and other types of athletic fields has been growing for several years, driven by its durability, shock-absorbing qualities, substantially lower water use and lower maintenance costs.[4]

Synthetic turf athletic fields usually employ loose filled 10-20 mesh crumb rubber granules interspersed between the grass blades.[5] According to several sources, a typical 80,000 square-foot synthetic turf athletic field may contain approximately 200,000 to 225,000 pounds of crumb rubber, and the same amount or more of sand may be combined with the crumb rubber.[6]

The number of synthetic turf fields has been growing steadily for over a decade. Estimates vary somewhat, but according to one source, in 2014 there were more than 8,500 fields nationally, with more than 900 in California, and in 2013, 1,300 new fields were installed nationally, with 85 of these in California.[7] As shown in Figure 1, use of California-sourced crumb rubber as infill in synthetic turf fields uses about four to six percent of all California-generated scrap tires. In 2014, for example, synthetic turf athletic fields consumed 1.7 million passenger tire equivalent (PTE) of the total 44 Million waste tires generated in the state, accounting for 3.8 percent of all California waste tires in that year. While five percent may seem like a small portion, it is a vital component of California's diversified scrap tire market. And, the California-sourced crumb rubber flowing to infill markets has represented between 20 and 25 percent of all California-produced crumb rubber in recent years.[8] Also, a portion of crumb rubber used in California synthetic turf fields is sourced out-of-state, so the potential market for California crumb is larger than that shown in Figure 1.



Most synthetic turf athletic fields continue to use infill comprised of crumb rubber and sand; however, alternative infill materials have gained market share recently.
Some organizations have raised concerns regarding the environmental health and safety of crumb rubber infill, and beginning with a news story in October 2014, this topic has received national attention on numerous networks and major print publications. Numerous studies have failed to support these concerns, including a 2010 CalRecycle sponsored study on crumb rubber use in synthetic turf by the Office of

[4] Synthetic Turf is also used in many other applications, such as landfill closures, public green spaces, pet parks, golf courses, playgrounds, open-air malls and residential lawns. In contrast to athletic fields, however, these applications typically do not require the cushioning properties provided by crumb rubber infill.
[5] Crumb rubber may sometimes also be used in an underlayment pad or elastic layer beneath the turf. However, the project team is not aware of specific examples of such use in California.
[6] See, for example: "Removal, Recovery, Reuse and Recycling of Synthetic Turf and Its System Components." Synthetic Turf Council. January 2013.
[7] Opportunities for Recycling End-of-Life Turf Fields." Presentation by Mark Heinlein, President, Turf Reclamation Systems, at the 2014 CalRecycle Tire Conference.
[8] "California Waste Tire Market Report: 2014." Prepared by Louis Berger Group with support by Boisson Consulting and DK Enterprises, for CalRecycle. July 2015.

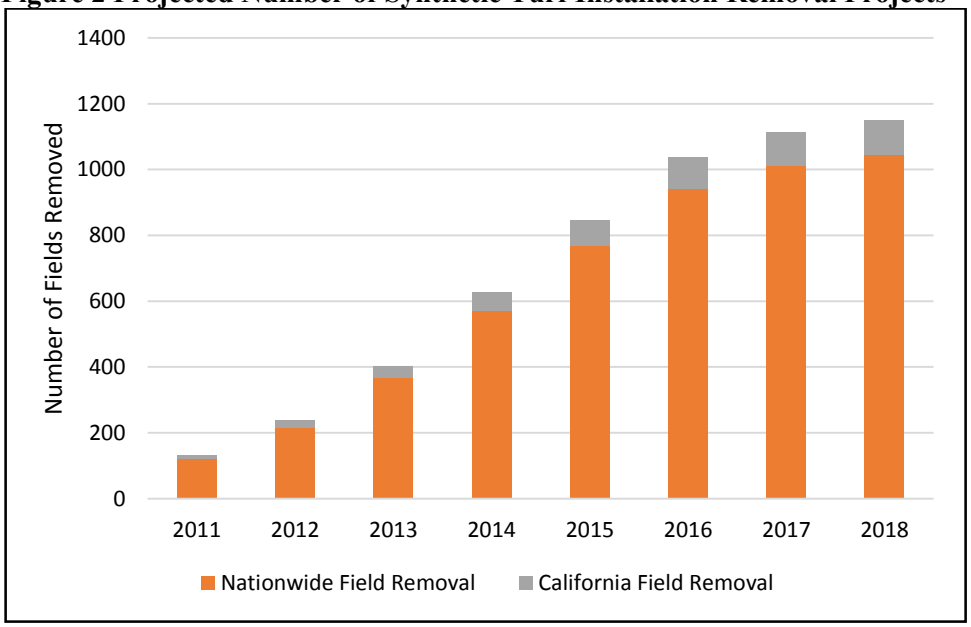
Environmental Health Hazard Assessment (OEHHA). CalRecycle is currently engaged in a new, broad study in partnership with OEHHA in an effort to comprehensively address these concerns.

Through spring 2015, industry perspectives on how this issue is impacting demand for crumb rubber were mixed. While bids for new turf fields increasingly required the inclusion of alternative infill materials, crumb rubber had held market share due to its superior price point and performance qualities. The issue continues to garner the attention of news media and, recently, industry representatives have indicated that some field developers and installers are choosing alternatives to crumb rubber. One national firm that markets and installs synthetic turf fields recently made the decision to completely stop using crumb rubber infill, citing concern over potential liability and law suits. While data on the extent of the shift are currently available, one well-informed industry representative estimated that crumb rubber's share of the infill market may have slipped from approximately 95 percent to perhaps 90 percent.

Figure 1 Use of California-Generated Crumb Rubber as Synthetic Turf Infill

Source: CalRecycle Annual Waste Tire Market Reports, 2008 – 2014.

The number of synthetic turf fields reaching the end of their useful life and in need of replacement is growing.



In replacement projects, the foundation and base layers often remain for direct reuse while the turf and infill material are replaced. Many industry sources say that a typical synthetic turf athletic field lasts about eight-to-ten years before reaching the end of its useful life and requiring replacement. The lifetime of any particular field may vary with its usage, exposure to intense sunlight, maintenance, and other factors, but eventually the need for replacement may be indicated by torn or trampled turf and disintegrated infill. As shown in Figure 2, often-cited industry projections indicate that by 2017, more than 1,000 synthetic turf athletic fields could be deconstructed annually nationwide, with approximately 10 percent of these in California. One source estimated that about 1,500 fields are being installed across the U.S. during 2015, with replacement projects accounting for 750 of these.[9] According to another source, in 2013 about 22

[9] "Trends in End-of-Life Management for Synthetic Turf Products." Presentation by Adam Coleman, Turf Reclamation Systems, at the 2015 CalRecycle Tire Conference.

percent of the 1,200 to 1,300 synthetic fields installed nationally were replacement fields.[10] Due to the high cost, some field owners may be choosing to prolong replacement as long as possible. However, industry representatives indicate that, even if some projects are prolonged, the projections in Figure 2 accurately describe the trend.

Assuming the figures above, a plausible scenario would be that 150 fields are installed in California in 2015 (10 percent of the projected national number), using a total of about 29.7 million pounds of crumb rubber infill (assuming 90 percent of the fields use an average of 200,000 pounds per field). Assuming 22 percent of these are replacement fields in which 100 percent of the recovered infill is reused (an upper maximum amount that is not realistic in practice), then a maximum of 6.5 million pounds of crumb rubber could be sourced from the deconstructed fields themselves. This would reduce demand for new crumb rubber in these installations from about 29.7 million pounds to 23.1 million pounds. (For comparison, as shown in Figure 1, use of California-sourced crumb rubber in synthetic turf athletic fields has averaged about 2 million PTE, or 24 million pounds of crumb rubber, over the past nine years. A portion of demand in California is filled by out-of-state suppliers.)

Figure 2 Projected Number of Synthetic Turf Installation Removal Projects[11]

Interest in recycling synthetic turf athletic field components has grown in recent years, but recycling levels remain very low.

As more and more synthetic turf fields reach their end-of-life, there has been growing interest in recycling rather than disposing their components. Many field owners have explored recycling projects, and some have chosen to pursue the option. A number of U.S. companies advertise the ability to provide synthetic turf field removal services, and a growing number offer maintenance, recycling services and/or offer recycling equipment. (Appendix A identifies several firms that were researched for this report.) At least one

[10] "Synthetic Turf Market Update and End-Of-Life Recycling." Presentation by John Baize, President, Act Global, at the 2014 CalRecycle Tire Conference.

[11] "Trends in End-of-Life Management for Synthetic Turf Products." Presentation by Adam Coleman, Turf Reclamation Systems, at the 2015 CalRecycle Tire Conference. The figure assumes that approximately 10 percent of national removal projects occur in California. It is not clear which estimates are actual removal projects and which are projections.

turf installation firm in California has purchased turf removal equipment. One California processor reported they were approached regarding their ability to process or market recovered crumb rubber infill, but they were unable to identify a viable use. Nationally, at least one firm (Turf Reclamation Systems) has focused its business model exclusively on turf field end-of-life management and recycling, both selling equipment and providing services. Where possible, the firm reuses a portion of crumb rubber from fields being dismantled in the replacement field; however, they have not identified other viable markets for the crumb rubber that would not require extensive processing, which is currently not available. Another firm (Everwood Recycling International) had been exporting carpet-related recovered field components from Washington State and the East Coast to facilities in Hong Kong and mainland China has reportedly stopped this practice due to the high cost of shipment. There are numerous companies that may extract the crumb rubber and sand and clean by shaking out the sand through a sieve shaker process. However, industry reported that there is not anyone commercially separating the sand and crumb rubber so that that crumb rubber could be used in other molded and tire-derived products. And, a small number of firms focus on attempting to "repurpose" (i.e., reuse) the carpet portion of dismantled fields in applications such as dog parks. Reportedly, one of these firms often warehouses material near deconstruction sites while they research such repurposing opportunities.

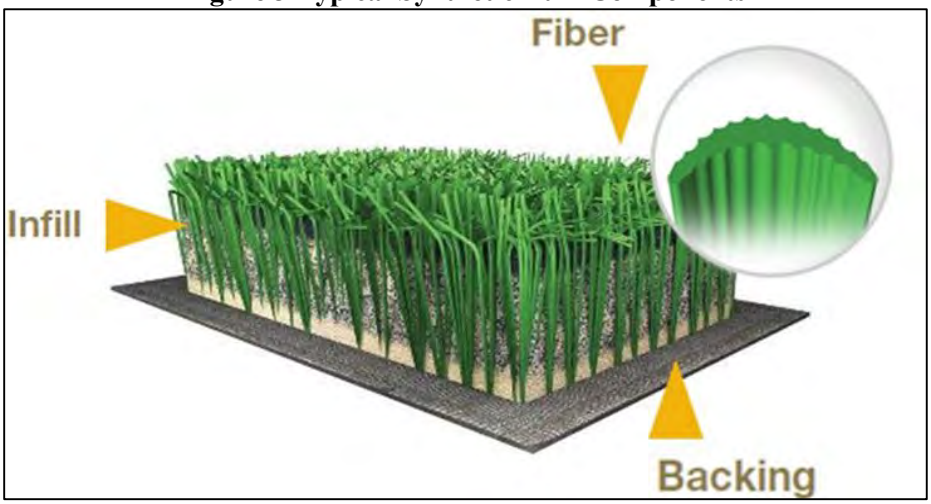
Anecdotally, it appears that in practice landfill disposal is by far the most common method for managing field components after removal, and no complete examples of an actual recycling project for the components of a removed field in California were identified. The reports and presentations listed in Appendix B: Bibliography identify several case studies of synthetic turf field recycling projects. Although it is not very common, there are reportedly opportunities for recycling the carpet-related plastic components of deconstructed fields in the established polyethylene and polypropylene plastics reclamation industry. However, the only use for recovered crumb rubber infill that the project team is aware of is to reuse a portion of the material in construction of new/replacement fields.

Overall, while we could not obtain statistics on the percentage of removed synthetic turf fields that were recycled, anecdotally it appears to be a very small portion. According to one knowledgeable source, of all field removal projects, perhaps 15 percent involve reuse of a portion of the infill in the replacement field, and only about five percent involve recycling "carpet" components. The Synthetic Turf Council has recently established a Reuse and Recycling Task Force which will begin operation in January 2016 to further advance recycling efforts.

The synthetic turf field recycling situation is similar to some other types of recycled content products that are not closed-loop markets.

While not researched for this report, generally the situation with synthetic turf is similar to that of other tire-derived products and other recycled-content products that are not recycled in a closed loop. That is, they are often used to produce durable recycled content products that may or may not themselves be recyclable. Examples of tire-derived products in this situation include molded products like pavers or mats. Similar recycled-content products made from other materials include lumber, nursery pots and other rigid plastic products made with recycled plastic, fiberglass and pressed glass products made from recycled glass and wallboard or cellulose insulation made from recycled paper. Government recycling agencies like CalRecycle and recycling advocacy organizations often call for closed-loop recycling in which a product is recycled and used to produce the same product, because this directly reduces natural resource use and the associated energy and emissions. Short of closed-loop recycling, there may be other alternatives to maximize the useful life of all recycled materials. However, the project team is not aware of any studies comprehensively analyzing this issue and providing a framework for decision making, whether for tire-derived products or other types of recycled content products.

Barriers



The multi-material nature of synthetic turf fields complicates recycling of individual components.
Although this report focuses on crumb rubber infill, it is useful to consider the broader context. Synthetic turf athletic fields are assembled in layers using many different material types. The mixture of material types increases the difficulty to remove and recycle the components because the layers of the system require separation.

According to the Synthetic Turf Council,[12] and as illustrated in Figure 3, a typical synthetic turf athletic field system consist of:

- Geotextile (polypropylene plastic film);
- Drainage pipes (polyvinylchloride);
- Drainage layer (stone aggregate or Expanded Polypropylene or Polystyrene);
- Underlayment (shock pad or elastic layer, which may not be removed in deconstruction);
- Turf backing (plastic film, which also may not be removed in deconstruction);
- Infill (crumb rubber, sand and/or various other materials); and
- Turf blades (plastic fiber).

This report sometimes makes a distinction between "carpet components" of turf fields (i.e., the backing and fibrous artificial glass blades) and the sand/crumb rubber misused as infill.

Figure 3 Typical Synthetic Turf Components

Source: Synthetic Turf Council

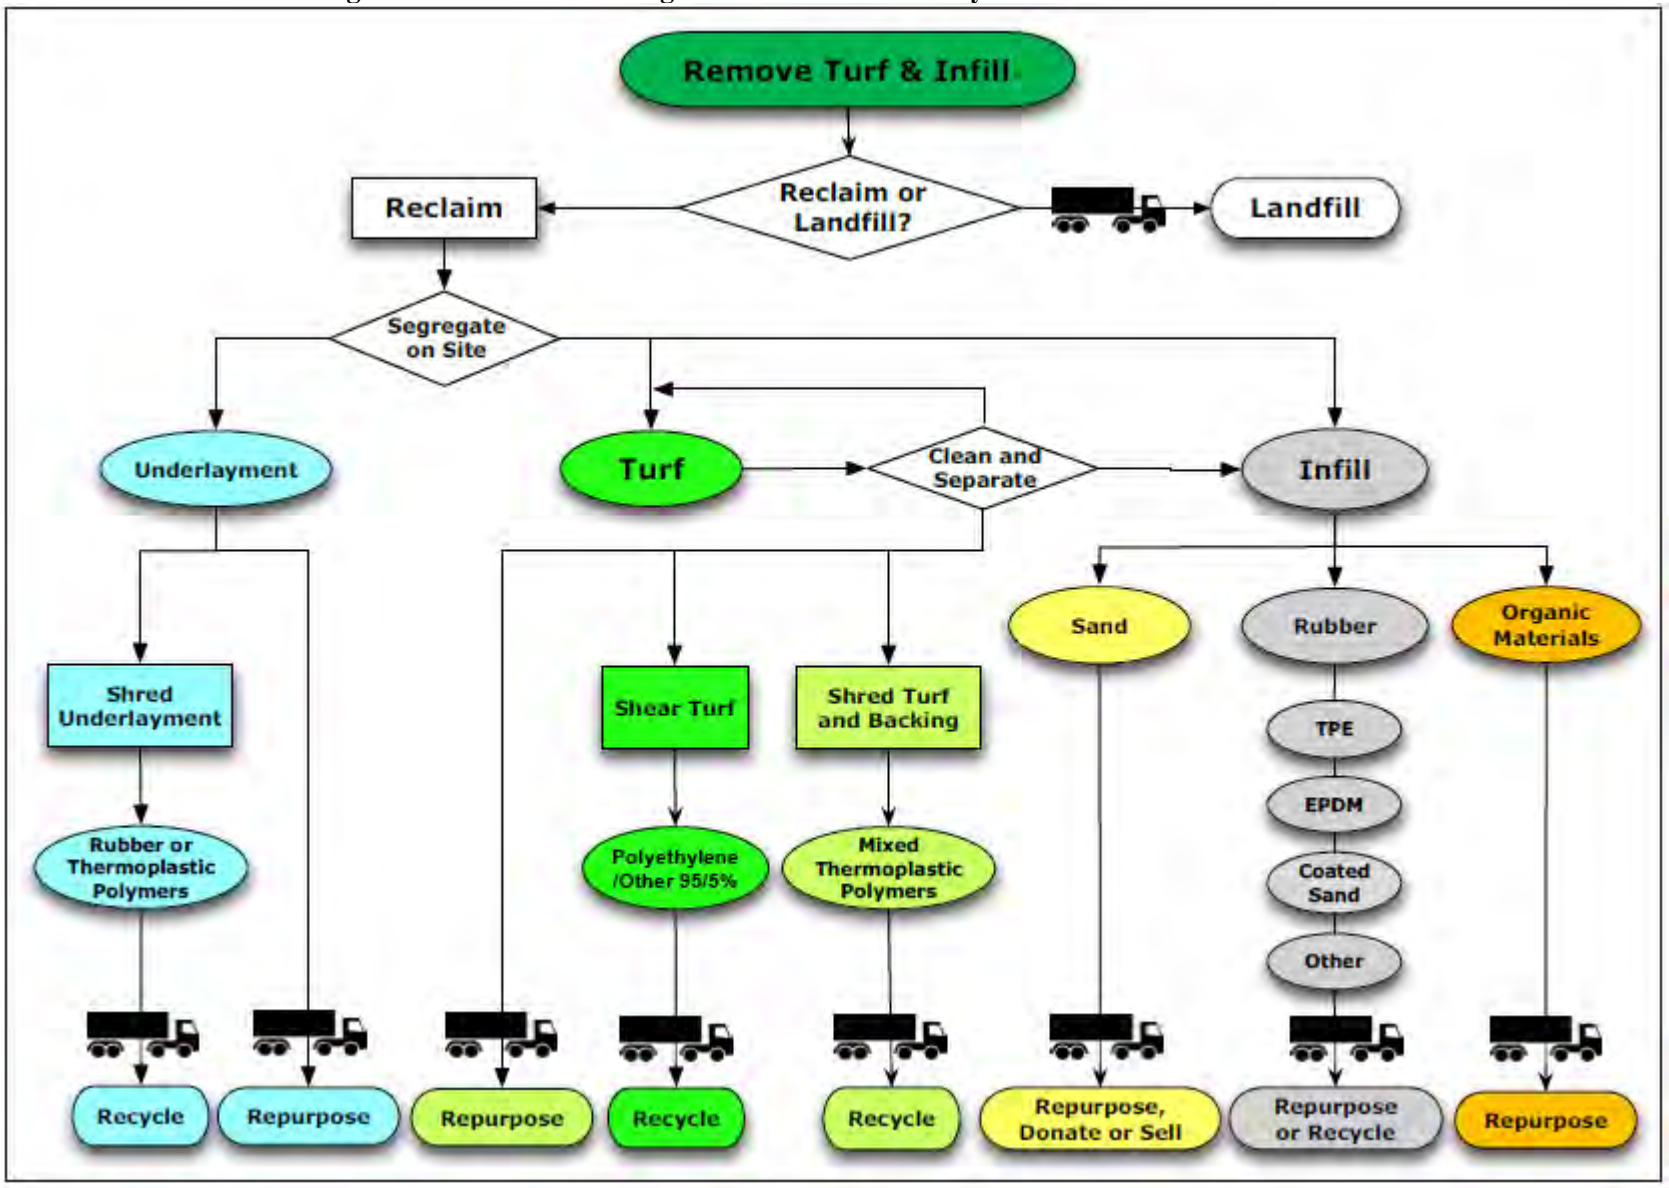
Infill is interspersed between the synthetic turf to provide the necessary stability, uniformity, and resiliency. Each blade customarily stands above the infill material. There are various types of infill materials including:

[12] "Removal, Recovery, Reuse and Recycling of Synthetic Turf and Its System Components." Synthetic Turf Council. January 2013.

- Crumb rubber[13] (post-consumer tire rubber, which may be coated with colorant, sealant or anti-bacterial substances);
- EPDM (ethylene propylene diene monomer);
- TPE (thermos-plastic elastomer);
- Cork (organic);
- Coconut husk (organic);
- Sand (silica); and
- Coated silica sand (elastomeric or acrylic coating).

Unlike residential or municipal park synthetic turf fields, athletic systems sometimes include a shock pad or elastic layer beneath the turf. When used, these underlayment layers provide additional protection by contributing to G-max[14] levels for impact attenuation, and include:

- Shock pad (PVC/NBR, polypropylene or crumb rubber/polyurethane); and/or
- Elastic layer (crumb rubber/polyurethane).



Technologies to remove, separate and clean various turf components are available, though still evolving.

As noted above, the multiple materials used in synthetic turf athletic fields are challenging to separate for recycling. However, technologies to remove turf materials and to separate and clean components are available, and are reportedly improving steadily. Figure 4 on the next page illustrates the processes and flows for different turf components. Equipment manufacturers have helped general contractors overcome the challenges by developing specialty equipment tailored to the task. Processes vary, but in recycling projects infill materials may be first removed via vacuum, and then the carpet portion is removed and rolled into compact bundles. In an alternative, reportedly less efficient approach, the carpet may be cut and then pounded from behind to remove infill. If destined for reuse on-site in a replacement field, a portion of the infill material may be stored on-site and then placed, often in the base layers of the new field, with additional, new crumb rubber infill placed on top of this. Carpet components must be shipped to processors for recycling. And, to be used in applications other than reuse as infill, the crumb rubber infill would need to be shipped to a processor for further processing to clean the crumb rubber of sand and other contaminants. No established facilities actively providing this service were identified, although the Pennsylvania facility noted above has recently begun such activities.

[13] In most field applications using crumb rubber for infill, it's common practice to mix it with sand at a 2:1 crumb rubber to sand ratio. Other mixture ratios and types are also used.

[14] G-max is a measure of a surface's maximum fall-height that satisfies safety criteria, as determined in product tests.

Figure 4 End-of-Life Management Flow Chart for Synthetic Turf Athletic Fields[15]

[15] "Removal, Recovery, Reuse and Recycling of Synthetic Turf and Its System Components." Synthetic Turf Council. January 2013.

Recycling crumb rubber infill is usually much more costly than disposal.

For several reasons, recycling crumb rubber infill derived from deconstructed synthetic turf athletic fields is usually much more costly than disposal, resulting in a key barrier to increased recycling. First, the cost of renting specialty equipment to separate field components and clean crumb rubber infill of sand and other materials is much more costly than the equipment needed to ship the materials to landfill. Second, the different material components will usually need to be shipped to distinct processing or end-use facilities, and, given that landfills are far more ubiquitous than the needed recycling facilities, the shipping distance and cost for recycling usually is much higher than for disposal. According to the Synthetic Turf Council, when compared to the $30,000 to $60,000 cost of landfilling an 80,000 square-foot sports field, it is unlikely that the cost of transporting the synthetic turf and/or infill farther than 200 miles could be considered feasible.[16] Finally, as discussed further below reusing crumb rubber infill in new/replacement fields is one of the only viable markets currently. However, while this is often feasible, it is usually uneconomical compared to purchasing new crumb rubber at a price of perhaps 15 to 20 cents per pound.

Recovered crumb rubber infill may have reduced performance characteristics compared to new crumb rubber, but is still often suitable for reuse in new/replacement installations.

According to tests conducted by Turf Reclamation Systems, recovered crumb rubber infill does show reduced performance characteristics but may still be suitable for certain applications.[17] According to this source, changes and/or degradation to crumb rubber infill in turf applications over time may include:

- Distribution of particle sizes based on sieves analysis;
- Increased specific gravity;
- Increased bulk density; and
- Reduced compression and recovery.

However, the net impact of these changes may have little impact on G-max fall safety test performance. In one reported test the recycled crumb rubber infill when used in a 50/50 mix with sand and no pad had a reduction in G-max score of less than 10 percent, and in another test a 2:1 crumb rubber/sand ration actually showed improved G-max scores.

Markets for recycled crumb rubber infill are extremely limited.

By definition any product is recyclable if there is a post-consumer market available and it is technically and economically viable to separate and ship the product to that market. The grass portion of synthetic fields can be repurposed (i.e., reused) in applications such as dog parks, landfill caps or other areas where a relatively low quality turf product is suitable. And, the plastic grass blades used in artificial turf may have a comparatively viable market in the established post-consumer polyurethane and polypropylene industry, or could be used to produce such products as synthetic lumber or molded parts used in the automotive, flooring and other industries. No specific examples of this being done in practice were identified.

While the Synthetic Turf Council cites a long list of potential markets for recycled crumb rubber infill, as shown in Table 1 on the following page, research for this report suggests that in practice, the actual market for recovered crumb rubber infill beyond reuse is virtually non-existent. One leading company involved in synthetic turf athletic field deconstruction indicates that they currently dispose 75 percent of the material in

[16] "Removal, Recovery, Reuse and Recycling of Synthetic Turf and Its System Components." Synthetic Turf Council. January 2013.

[17] Opportunities for Recycling End-of-Life Turf Fields." Presentation by Mark Heinlein, President, Turf Reclamation Systems, at the 2014 CalRecycle Tire Conference.

landfill, and are able to reuse 25 to 50 percent of crumb rubber infill in new/replacement fields. Reuse is limited to select projects where economics are relatively attractive (especially where landfill costs are high) or in which the field owner specifically elects to pay more to cover higher recycling/reuse costs. One company that had reportedly warehoused recovered turf materials for a time was said to have found a use in Mexico, but the project team was not able to verify this. One company had been shipping recovered field materials to facilities in Hong Kong and mainland China, but has since stopped due to prohibitively high transportation costs. It is unclear what type of market, if any, the crumb rubber infill portion of these materials found there. In California, a sample of recycled crumb rubber infill was reportedly tested for use as fuel by one of the state's cement kilns, but was rejected. And, one processor said recovered infill is undesirable for use in rubberized asphalt applications because of the costly and uncertain processing required to remove contaminants such as sand, dirt and turf fiber. No specific examples of recycled crumb rubber infill being used in the manufacture of a new product, other than reuse in new/replaced synthetic fields as infill, was identified. Because different turf installers use different crumb rubber specifications (which sometimes include coatings) and different mixtures of rubber and sand, reuse is usually feasible only when the same firm that originally installed the field is replacing it, so that material specifications are the same or similar.

Table 1 Potential Markets for Recovered Crumb Rubber Infill as Identified by the Synthetic Turf Council

Category	Examples[18]
Field/landscape Applications	▪ Reuse as infill on new synthetic turf sports field or landscape installations (AI) (CS) ▪ Natural turf soil amendments to improve wear tolerance and prolong playability of natural turf sports fields (AI) ▪ ADA-compliant playground surfacing (AI) (CS)
Road and Rail Applications	▪ Acoustic barriers (CS) (AI) ▪ Road base (CS) ▪ Portable traffic control devices (CS) ▪ Ripple strips and speed bumps (CS) ▪ Rail crossings, sleepers and buffers (CS) ▪ Asphalt (CS)
Construction & Industrial	▪ Industrial flooring (CS) ▪ Acoustic barriers (CS) (AI) ▪ Sprayed up roofing, insulation and Adhesive sealants (CS) ▪ Mounting pads and shock Absorbers (CS) ▪ Airfield runways (CS) ▪ Carpet underlay (CS) ▪ Children's playground surfacing (CS) (AI) (AIWP)
Marine	▪ Wharf buffers (CS) (AI) ▪ Floating docks (CS) (AI) ▪ Non slip flooring (CS) (AI)
Sporting	▪ Equestrian surfaces and workout areas (CS) (AI)
Landscaping	▪ Watering systems, rubber hosing & low pressure irrigation drip hoses (CS) ▪ Infill for Synthetic/Artificial Landscape Turf (CS) (AI)
Natural Turf Soil Amendment (to improve wear tolerance and prolong playability)	▪ Athletic Fields (AI) (CS) ▪ School Campus Areas (AI) ▪ Soil Compacted Walkway or Pathway Areas (AI)
Energy Recovery	▪ Energy can be recovered from crumb rubber infill by incineration, pyrolysis or gasification. ▪ The calorific value (CV) of tire rubber is 27.5 MJ/kg (14,000-16,000 BTU).

Source: "Removal, Recovery, Reuse and Recycling of Synthetic Turf and Its System Components." Synthetic Turf Council. January 2013.

[18] AI indicates the extracted infill may be used As Is with minimal cleaning. CS indicates Cleaning and Separating the sand and crumb rubber may be required.

Field owners and developers lack information on synthetic turf athletic field recycling options and processes.

Given the rapidly changing synthetic turf market place, evolving recycling technologies and the attention given to environmental health and safety issues, there may be a general lack of understanding about deconstruction and recycling options among public schools, local agencies and other organizations that own and manage synthetic turf athletic fields. As the turf recycling infrastructure continues to evolve, there is a need for consolidated information on: the firms available to do the work; typical costs; best management practices regarding contracting, oversight and regulatory/environmental issues; and generally expectations for how the process may play out. Most importantly, field owners need to understand their options for managing fields at the end of their useful life, and how they can most efficiently consider recycling options.

3. CalRecycle Options, Key Issues and Recommendations

Following are some options CalRecycle may wish to consider to help promote increased recycling of crumb rubber infill recovered from end-of-life synthetic turf athletic fields.

Provide funding through grants, loans and/or incentives.

CalRecycle's Tire-Derived Product grants have supported many synthetic turf installations in the past, and CalRecycle continues to consider them eligible for such funding. CalRecycle could explicitly adjust program rules to provide grants to cover all or a portion of the cost to deconstruct and recycle the rubber portion of existing fields at the end of their useful life. Such funding could be limited to the cost of recovering, processing the recycled crumb rubber (similar to current grants covering the cost of new crumb rubber). Or, CalRecycle could choose to support the process further by covering costs related to recycling other components of the field, if deemed allowable under current statutory authority for the tire fund. Similarly, loans could be provided to firms offering turf/infill recycling services to help cover the cost of new equipment and other fund uses as allowed under current loan program rules. Finally, recognizing the high cost and need for innovation related to recycling crumb rubber infill from turf installations, CalRecycle could create a special category within the relatively new Tire Incentive Program to provide a per pound payment for recovering and processing the infill rubber, or fund testing of recovered crumb rubber infill through the Feedstock Conversion Technical Assistance and Material Testing Program.

Research the potential to establish a facility to process recovered crumb rubber infill.

Another option would be to offer funding through one or more of these programs to help establish and/or support ongoing operations of a fixed facility capable of secondary processing and cleaning of recovered crumb rubber infill material. According to one industry source, such an operation might have capital costs (for needed processing equipment only) of about $500,000 or less, but would need a steady supply of recovered crumb rubber infill from 50 to 100 deconstructed fields per year to be viable. While California has apparently already reached this number of annual field deconstruction projects, it may be challenging to recover crumb rubber infill from a sizable number of the projects without CalRecycle support. Moreover, given the size of California, significant transportation would be required to ship materials to a centralized facility, which may be prohibitive. One option would be to support establishing two facilities (one north and one south), but this would reduce the volumes available to either facility.

Research potential markets and end-users.

As described above, a large number of potential markets for recycled crumb rubber infill have been identified, while the only viable market used in practice appears to be reuse, and only in certain situations. CalRecycle could sponsor or conduct research in-house to evaluate potential markets and to identify specific potential end-users. Such research could involve universities and/or companies involved in products that have relatively forgiving performance specifications and that can potentially benefit from the properties of crumb rubber combined with sand particles. Such markets may include, for example, certain applications for cement or certain asphalt paving applications. An application that allowed low-specification standards including some level of contamination with silica sand and requiring little to no pre-processing of reclaimed infill would be ideal.

Fund technical assistance and demonstration projects involving the identified markets and end-users.

CalRecycle could proactively reach out to partners and offer technical assistance and funding to execute a variety of demonstration projects, much like it has done with rubberized asphalt and tire-derived aggregate

used in civil engineering applications. Given the early stage of synthetic turf field recycling, this would appear to be an effective approach that could address many of the barriers identified above. One option would be to focus on testing recovered crumb rubber infill material processed through various systems to compare the costs and performance characteristics.

Research issues related to recycling all end-of-life tire-derived products.

As discussed above, the issues related to recycling end-of-life synthetic turf sports field components are similar to those of other tire-derived products and recycled content products made with other materials that do not have closed-loop markets. CalRecycle could consider a focus on recycling synthetic turf components as an initial effort to demonstrate opportunities to prolong the useful life of such recycled material applications, and/or to demonstrate the potential for continuous recycling that approximates the benefits of closed-loop systems. CalRecycle could sponsor a study to evaluate the need and options for promoting closed-loop recycling for a variety of products. In particular, given the special programs in place and the relationship of the carpet recovery industry to the synthetic turf industry, such a study could potentially start by focusing on those two product groups.

Issues and Recommendations

Following are some issues that CalRecycle Staff and Management should consider when determining whether and how to promote crumb rubber infill recycling.

What should be CalRecycle's top priorities to promote crumb rubber infill recycling?

Recommendation: For now, seek to prove the concept by researching potential markets and end-users, and funding a few technical assistance and demonstration projects. This could include sponsoring a feasibility study to explore the potential for establishing a fixed facility to process recovered crumb rubber infill. This report indicates the turf recycling infrastructure is still evolving and there is a need for enhanced markets. The good news is that reuse in new/replacement fields may hold the greatest potential. However, work is still needed to improve the economic, technical and market viability of this option.

Will increased crumb infill recycling reduce demand for newly-produced crumb rubber and what are the implications for CalRecycle programs?

Recommendation: Increased crumb rubber infill recycling does have the potential to reduce demand for new crumb rubber in new/replacement synthetic turf athletic fields. As noted in Section 2, based on several assumptions, initially maximizing reuse of recovered crumb rubber infill in new/replacement fields might reduce demand for new crumb rubber in such applications from about 29.7 Million pounds to 23.1 Million pounds. However, true to its recycling mission, CalRecycle should seek to maximize the value of recycled crumb rubber (and other recycled materials) through prolonged and varied recycling uses.

Should CalRecycle shift a portion of waste tire market development resources away from new crumb rubber to focus on recycled crumb rubber infill material?

Recommendation: Yes, but for now not so much that it severely impacts other goals. For example, over one or more years CalRecycle could allocate perhaps $300,000 to $500,000 to cover an initial evaluation of potential markets, a feasibility study on establishing a fixed processor for recovered crumb rubber infill, and a small number of California-based demonstration projects.

Should CalRecycle resources be used to help recycle EOL crumb rubber infill that originally was sourced from outside the state?

Recommendation: Yes. Regardless of the original source of crumb rubber infill, when recycled from a California synthetic turf athletic field it is now a California waste product. Given that tire funds are required to be spent on tires originating in California, however, this approach may require concurrence by CalRecycle's legal department.

How can CalRecycle leverage new experience with recycling end-of-life synthetic turf fields to more broadly promote recycling of other tire-derived products and recycled content products made from other materials that are not recycled in closed loop?

Recommendation: The market study mentioned above could include a scan of potential markets for other non-closed loop tire-derived products to identify opportunities to maximize the useful life of the materials used. Given the potential synergies with the carpet recovery industry, a focus on tires and carpet may be particularly appropriate.

4. Conclusions

The synthetic turf industry is going through a period of rapid change. A growing number of installed fields are reaching the end of their useful life, driving interest in recycling opportunities. The number of fields being installed continues to grow, in part due to demand for replacement fields. And a new infrastructure and market place for deconstructing and managing end-of-life fields, including recycling, is beginning to evolve. All of this is occurring with the backdrop of continuing concern over environmental health and safety issues and the potential for legislation making new field installation more difficult. The other important backdrop is CalRecycle's new focus on recycling, and the associated need to maximize the useful life and environmental benefits of all recycled materials through closed-loop recycling systems.

This brief, high-level report has identified several specific opportunities for CalRecycle to promote synthetic turf recycling in a way that advances these other goals at the same time. As with other market development efforts, CalRecycle should view such activities as long-term investments that may pay dividends over time as the current trends play out and recycling infrastructure and markets continue to evolve.

LOS ANGELES TENNIS ASSOCIATION

May 13, 2001

City of Los Angeles
Planning Department -Environmental Review Section
221 North Figueroa Street, Suite 1500
Los Angeles, California 90012

Re: Case No. MND # 2001-1196 MPR-SPR-ZV

To the Planning Department:

The Los Angeles Tennis Association (LATA) is made up of approximately 450 tennis players from throughout the Los Angeles area. For over twenty years, we have been one of the largest groups of tennis players in Los Angeles, and we have developed a very well organized league tennis program that many people say is the best of its kind in the area. Our leagues play every day of the week, and we use 9-15 courts each day. Since our leagues play in the evenings and on weekends, we are not allowed to use the magnificent City tennis facilities (the City will not allow us to reserve that many courts during prime playing hours). Therefore, we rely on large private tennis facilities such as the one at the Studio City Golf and Tennis complex at 4141 Whitsett Boulevard in Studio City.

As President of LATA, I am writing on behalf of our entire membership. We are vehemently opposed to the proposed development at the Studio City Golf and Tennis. The destruction of the tennis courts at that complex, coming on the heels of the destruction of two other large tennis centers at Third Street in Los Angeles and on Ventura Boulevard in Studio City, would have a huge impact on organizations like ours that organize large tennis leagues. We strongly oppose the proposed development and encourage you to look closely at the impact that the development will have on organizations such as LATA.

Therefore, we strongly oppose the Mitigated Negative Declaration and feel a full Environmental Impact Report is extremely important. It is obvious just from a cursory review of the project that there will be an enormous environmental impact. We cannot afford to lose any more open space which is so scarce in our community. Numerous tennis players from all over the city, as well as from many school tennis programs, use the facility. There will be a huge impact on traffic in an already extremely congested area. This will be the largest development in Studio City, 7 four story buildings and 1 one story building – casting shadows on the golf course, decreasing the size of the driving range to a possibly unsafe size, causing more traffic and congestion, blocking the open views, and very possibly decreasing property values in the area. The potential impact is tremendous.

Thank you for your attention to this matter.

Sincerely,

Karl J. Lott

ENVIRONMENTAL
UNIT

Ms. Maya Zaitzevsky
Project Coordinator
200 N. Spring St., Room 763
Los Angeles, CA 90012

Dear Ms. Zaitzevsky,

This letter is written on behalf of the members of the Los Angeles Tennis Association (LATA) in regards to the plans to modify the site known as Studio City Golf and Tennis to a residential area.

The importance of LATA to the southern California Gay and Lesbian community cannot be underestimated. The importance of sports and especially team sports (although tennis is considered a non-team sport, we offer *team* tennis) are crucial in acquiring and developing traits and skills useful throughout life. Generally speaking, many of our members, by virtue of their sexual orientation, felt left out or at least uninvited in sports during their developmental years in school, and therefore weren't able to use sports to the fullest to help develop those skills. We offer that to adults in a friendly, accommodating, and accepting environment.

LATA is the largest Gay and Lesbian tennis club in the world. Our membership at the end of 2001 was our highest ever, 545. Our members come from all over the metropolitan Los Angeles area. We offer, among other tennis events, team tennis and annual tournaments. Our team tennis leagues are our most successful events, and we fill eight leagues, twice annually, each lasting 14 weeks.

In order to offer the leagues to the Southern California Gay and Lesbian community, we need to use sites that allow us to reserve courts in blocks, well in advance. Currently, four of our eight leagues are playing at Studio City Golf and Tennis. Those leagues are offered on Mondays, Tuesdays, Thursdays, and Saturdays. Annually, we reserve 2,132 court hours for these four leagues. We would reserve more due to the popularity of our leagues, but Studio City Golf and Tennis gave us what they could. Los Angeles has a lot of tennis facilities, although they are dwindling and most of the sites are city-owned and are public facilities. Unfortunately, the city refuses to allow us to reserve the courts we need to put on our leagues. Should the developer of the senior citizen housing provide ten courts at the city's North Hollywood site, that won't be available for our use. Its as if the courts are gone.

Besides the team tennis we offer our membership, we also host an annual club tournament over two weekends in June which is typically played at Studio City Golf and Tennis, with more than 120 players, and host an international tournament, the Centre Court Championships, with more than 150 players, over Labor Day weekend, where Studio City Golf and Tennis is one of three sites used. This tournament has participants

from all over the U.S. as well as representation in the past from Australia, Canada, Europe and Mexico.

It is important for us that you understand that Studio City Golf and Tennis is a cultural resource not just to those who live in its neighborhood, city, or even the San Fernando Valley. Through our organization, it's an important recreational resource that is used weekly by our members who drive from as far away as Culver City, Redondo Beach and Venice on the west side of the LA Basin; from Ventura on the west to Victorville in San Bernardino County. All of these cities mentioned are current residences of our members who play at least one of our weekly leagues at the site. As a matter of fact, most of our members who use the facility weekly do not live in the San Fernando Valley, although most, if not all, of the cities in the valley are represented in our leagues. Most of our members pass many tennis courts on their drives to and from Studio City Golf and Tennis to play in our leagues. Those courts do not offer what LATA offers, and we offer that primarily at Studio City Golf and Tennis.

These courts are a cultural resource that we urge you not to change in any way. We've already lost facilities in Studio City (Racquet Center at Ventura and Vineland) and Los Angeles (Tennis LA at 3rd Street near LaBrea) that have required us to rely upon Studio City Golf and Tennis. Both the sites mentioned were demolished in the name of "progress" or city planning within the last 5 years. The open spaces in our area that add to everyone's quality of life are diminishing before our eyes. If Studio City Golf and Tennis were to lose its courts, even some of its courts, LATA may not exist as we know it, in a time when we are seeing annual expansion in membership. The southern California Gay and Lesbian community needs LATA as a resource, and LATA needs Studio City Golf and Tennis as its resource.

James A. Kloes
President
Los Angeles Tennis Association (LATA)

APPLICATION PROJECT DESIGN PACKAGE
LAKE RIVER PARK

Project Name: Harvard-Westlake River Park Project

Environmental Case No.: ENV-2020-1512-EIR

This project contains a provision, on page 2 of 4, of the above named Environmental Case number, under the subject titled Project Description, to which we object.

In this petition, "we" refer to the stakeholders of Studio City, who reside in the neighborhood bordered by Coldwater Canyon Avenue on the West, Whitsett Avenue on the East, The Los Angeles River on the South and Moorpark Street on the North.

"The Project involves off-site improvements to the Valleyheart Drive public right-of-way, portions of the Zev Greenway adjacent to the Project Site, and an ADA compliant ramp to provide a pedestrian connection between the Zev Greenway and Coldwater Canyon Avenue northwest of the Project Site."

In a letter dated January 23,2020 to Harvard Westlake President Richard Commons, CD2 Councilman Krekorian requests of Harvard Westlake "as a public benefit" ...build an ADA accessible ramp along the north side of the Los Angeles River at Coldwater Canyon to continue the connection through the walkway.

"We" stakeholders object to the proposed ramp access along the north side of the Los Angeles River at Coldwater Canyon. Our concern's are that this ramp will enable long term overflow parking in our neighborhood from the Sportsman's Lodge Mall at Coldwater Canyon Avenue and Ventura Blvd. and Harvard Westlake's Sport Center on Whitsett Avenue. Additional concerns include homeless encampments and crime issues.

Please consider removing the ADA accessible ramp provision identified above.

Danna Heydorn		4213 Beeman Ave, Studio City	As a homeowner in Studio City I am strongly opposed to this. This will impact the integrity of our family-friendly neighborhood and lead to an increase in crime.	10/24/20
Sean Heydorn		4213 Beeman Ave. Studio City	In addition to the crime concerns, between the athletic fields & new shopping center, there will no doubt be a negative impact on traffic & parking in our calm neighborhood, with no real benefit to the ramp. The city's inability to manage the trash, homeless issues at existing ramps reinforce the detrimental impact we would see.	10/24/2020

Harvard-Westlake River Park Project

Petition summary	Harvard-Westlake River Park Project - Environmental Case No.: ENV-2020-1512-EIR
Action petitioned for	"We" stakeholders object to the proposed ramp access along the north side of the Los Angeles River at Coldwater Canyon. Our concern's are that this ramp will enable long term overflow parking in our neighborhood from the Sportsman's Lodge Mall at Coldwater Canyon Avenue and Ventura Blvd. and Harvard Westlake's Sport Center on Whitsett Avenue. Additional concerns include homeless encampments and crime issues.

Project Name: Harvard-Westlake River Park Project

Environmental Case No.: ENV-2020-1512-EIR

This project contains a provision, on page 2 of 4, of the above named Environmental Case number, under the subject titled Project Description, to which we object.

In this petition, "we" refer to the stakeholders of Studio City, who reside in the neighborhood bordered by Coldwater Canyon Avenue on the West, Whitsett Avenue on the East, The Los Angeles River on the South and Moorpark Street on the North.

"The Project involves off-site improvements to the Valleyheart Drive public right-of-way, portions of the Zev Greenway adjacent to the Project Site, and an ADA compliant ramp to provide a pedestrian connection between the Zev Greenway and Coldwater Canyon Avenue northwest of the Project Site."

In a letter dated January 23,2020 to Harvard Westlake President Richard Commons, CD2 Councilman Krekorian requests of Harvard Westlake "as a public benefit" ...build an ADA accessible ramp along the north side of the Los Angeles River at Coldwater Canyon to continue the connection through the walkway.

"We" stakeholders object to the proposed ramp access along the north side of the Los Angeles River at Coldwater Canyon. Our concern's are that this ramp will enable long term overflow parking in our neighborhood from the Sportsman's Lodge Mall at Coldwater Canyon Avenue and Ventura Blvd. and Harvard Westlake's Sport Center on Whitsett Avenue. Additional concerns include homeless encampments and crime issues.

Please consider removing the ADA accessible ramp provision identified above.

RE: ENV-2-2-1512-EIR

Project Name: Harvard-Westlake River Park-Project

Applicant: Harvard-Westlake School

Project Address: 4047-4155 N. Whitsett Ave; 12506-12630 W. Valley Spring Lane and APN 2375-18-903 Los Angeles, CA 91604

Subject: Request extension for public comment review period of the DEIR

Dear Councilmember Raman and Director Bertoni,

The Studio City Residents Association (SCRA) is in receipt of the Draft Environmental Impact Report and request the Planning Department agree to extend the comment period. Unusual circumstances exist for making this request. It is of great importance to our members and to other concerned stakeholders in Studio City that enough time be permitted for a meaningful response to be made.

This DEIR came after 17 months of preparation by the applicant. The EIR consists in part of, #IV Environmental Impact Analysis consists of 19 elements that must be reviewed and commented on by the appropriate experts in their field: #V Alternatives consists of Seven elements: #VI Other CEQA Considerations: List of Figures: 38 elements and many others which amount to 6,500 pages.

CEQA Guidelines section 15105 states the comment period for a project such as this should be a minimum of 45 days, but should only be more than 60 days in unusual circumstances. The SCRA argues that this development presents unusual circumstances based on the foregoing and the impact on the Stakeholders over broad areas of the San Fernando Valley.

A 90 day comment period is not unusual. On the DEIR for the NBCUniversal Evolution Plan, a 90 days response was granted given scope and the impact on the surrounding community. Such is the case here.

SCRA therefore requests that the comment period be extended to 90 days.

Very Truly Yours,

Alan Dymond, president

Hi Kimberly,

Has Harvard Westlake filed form CP7768 listing the special events that will take place at the Harvard Westlake River Park. This information was omitted on their application however special events was checked.

Please let me know as soon as possible and if CP7768 has been filed please attach a copy.

Very truly yours,

Beth Dymond

Hi Beth,

Yes, the CP-7768 Form was filed by Harvard-Westlake at the time the Project case(s) were originally filed with Planning. Please see attached.

Thanks,

Kimberly

Dear Kimberly,

In regards to the request for a total of 90 days for the public review of the Harvard-Westlake DEIR, please see the last paragraph of Councilmember Krekorian's letter to you in the attachment below from October 30, 2020.

Also, this link https://planning.lacity.org/eir/NBC_UnivPlan/FEIR/files/0.%20TOC.pdf shows the front page of the NBC Universal Evolution Plan (ENV-2007-0254-EIR) which was *actually* prepared by the Los Angeles City Planning Department even though the land was a combination of City and County. Councilmember LaBonge and Councilmember Krekorian asked for and got an extension for a total of 90 days for public comment on what was another huge document. Councilmember Krekorian said in his letter, *"... I will be requesting an extended public comment period to ensure that my constituents have ample time to review and respond to the report."*
In my view, adding only 15 days to your 45 days does not meet the definition of "extended" as Councilmember Krekorian requested for his constituents... plus the "constituents" that were promised are still here, even though we have a different Councilmember due to Redistricting.

Between the link and attachment, there is precedence for a 90 day review period for public response to the Harvard-Westlake DEIR.

Sincerely,

Barry Johnson, Vice-President
Studio City Residents Association

Re: Harvard Westlake Initial Study

Dear Ms. Henry:

A complete and thorough environmental review process will be essential in ensuring that the Harvard Westlake River Park project proposal is evaluated with complete transparency and full information available to all stakeholders and decision makers. Accordingly, as the environmental review process for the Harvard Westlake Riverpark proposal progresses, I expect a full Environmental Impact Report to be conducted that analyzes every impact, including even those identified in the Initial Study as "less than significant."

I respectfully request that all of the potentially affected environmental impacts listed in the Initial Study be included in the environmental review and that none of these subsections be scoped out.

Additionally, once the full Environmental Impact Report is released, I will be requesting an extended public comment period to ensure that my constituents have ample time to review and respond to the report.

Very truly yours,

Paul Krekorian

River Park Campus Project - SUPPORT.pdf
105K

March 15, 2022

Department of City Planning:
Office of Historic Resources
Attn: Ms. Kimberly Henry
221 N. Figueroa St., Suite 1350
Los Angeles, CA 90012

Subject: River Park Campus Project - SUPPORT

Dear Ms. Henry,

The Valley Industry and Commerce Association (VICA) supports the Harvard-Westlake River Park project, which will offer athletic and recreational opportunities to Harvard-Westlake students and the Studio City community.

Harvard-Westlake understands the Weddington Golf & Tennis property has a long history in Studio City. Therefore, the development of the Harvard-Westlake River Park campus will be guided by key design principles and commitments, which will ensure that the Weddington Golf & Tennis site remains open and green.

The draft site plan for the Harvard-Westlake River Park calls for the development of two athletic fields, a fifty-meter swimming pool, eight tennis courts, and a gymnasium. Above ground, the plan also features a walking/jogging track around the entire perimeter of the site and a network of public plazas, water features, wooded areas, and other natural spaces that together comprise a publicly accessible six-acre River Park. The plan also includes one of the largest privately funded stormwater capture and treatment systems in Los Angeles, a testament to Harvard-Westlake's commitment to developing an environmentally responsible project.

Harvard-Westlake has conducted and will continue to conduct outreach to the broader Studio City community. Feedback from home and business owners, as well as from community stakeholder groups will be used to guide the plans submitted to the City of Los Angeles.

For these reasons, VICA supports the Harvard-Westlake River Park project and urge you to support this forward-thinking project as well.

Sincerely,

Victor Berrellez
VICA Chair

Stuart Waldman
VICA President

OPPOSITION TO - ENV-2020-1512-EIR Weddington Golf & Tennis

Tammy Scher <tammy@shermanoakschamber.org> Sat, Apr 30, 2022 at 8:26 AM
To: "councilmember.raman@lacity.org" <councilmember.raman@lacity.org>
Cc: Kimberly Henry <kimberly.henry@lacity.org>

Dear Councilmember Raman,

I am writing in opposition to Harvard Westlake's destruction of Weddington Golf and Tennis.

This huge project will degrade the integrity and character of Studio City and will be detrimental to the quality of life, property values, and access to recreational open space.

The studies included in the recently released DEIR paid for by Harvard Westlake, do not adequately address the most serious impacts including, but not limited to; traffic, noise, construction, and climate. The mandatory "alternative plans" suggested are disingenuous and lacking in a realistic effort to offer alternate sites or plans.

This property is zoned agricultural/open space and requires "special entitlements" and a "conditional use permit". Both would need your approval to be granted. You are the only councilmember who has a master's degree in urban planning. It is arguable that you know more about this subject than any other councilmember. Please use your unique skills to speak for over 100,000 Angelenos who enjoy this beloved facility annual and deny permission to build this project.

Sincerely,
Tammy Scher

Havard Westlake Project: ENV-2020-1512-EIR

Whitsett Green Homeowners Association <whitsettgreen.hoa@gmail.com> Thu, Mar 31, 2022 at 5:31 PM
To: Kimberly Henry <kimberly.henry@lacity.org>

Dear Kimberly,

We are in receipt and our HOA of 40+ residents located directly across the street of the project have reviewed the mail communication about the EIR.

I've carefully reviewed the report and we cannot locate our comments we supplied to the City of LA earlier in Fall of 2020.

We are still very concerned about the location of the underground parking entrance, that now includes a turn-lane directly across from our property. After careful review of the traffic studies, these were all done during COVID and do not reflect actual traffic, speed or other traffic patterns as of today.

We would like this addressed and re-evaluated to a different location in the public review/comment period. Example - the underground entrance is done more south on Whitsett with less residential impact or usage of the Valleyheart entrance on the West Side area.

Please advise any next steps we need to take to have this go on record during the public hearing period -- now extended to mid-May.

Thank you --

Todd Pimentel
HOA President
4128 Whitsett

Re: Case No. ENV-2020-1512-EIR

Dear Ms. Henry:

Angelenos for Trees is submitting this response in conjunction with the DEIR prepared for the Harvard Westlake River Park Project ("HW Project").

Currently, at the proposed HW Project – Harvard Westlake is proposing to remove 240 trees which is over a 50% loss in the property tree canopy cover. Most of these trees are mature and according to the Davey Services iTree environmental services calculator have provided over 898,773 pounds of carbon sequestration services to date.[1] A copy of the full report of the data obtained from the environmental services calculator is attached to this letter. The city is using iTree to conduct its street tree inventory.

Taking out significant 70-year-old mature trees and replacing them with saplings (even if they are natives) that will need an additional 20-30 years of growth to provide these types of environmental benefits is a failure to recognize the value of mature trees and the ecosystems they support now.

We determined over a span of 10 years 390,794 pounds of carbon sequestration services will be lost. It will take at least 10 years until a sapling in a 46" inch box will start sequestering carbon at all.

The effects of human – caused global warming are happening now. The latest IPCC (Intergovernmental Panel on Climate Change) report shows greenhouse gas emissions continue to rise, and current plans to address climate change are not ambitious enough and will worsen in the decades to come. It is common in large development projects in Los Angeles for the developer to remove the majority of the trees at a location. In this case on the site property (not the right of way or other adjacent locations), Harvard Westlake is removing over 80% of the trees. Harvard Westlake is essentially clear cutting the property for its development project.

New trees require a lot of support (water and otherwise) and have been shown in a field study conducted by the US Forest Service in a Mediterranean climate, like Los Angeles, to experience a 15% failure rate within 1 year that rose to 40% just 5 years later.

[1] Angeleno for Trees input each tree into the tree environmental services calculator to obtain these numbers.

Planting replacement trees 1:1 will result in a net loss of carbon sequestration, a loss of storm water mitigation and will result in a net loss of existing canopy coverage at that one particular location and fails to take into account the loss of canopy coverage over the last 10 years by adjacent properties (including Sportsman Lodge, Sunkist development, and Grant High School).

In 2019, Cy Carlberg, Harvard Westlake's consulting arborist, who was also paid to consult at the Grant High School project, pointed out in her report for LAUSD the proposed removal of healthy mature Redwoods, which are not native to Southern California could be subject to drought and die off in future years, therefore justifying the removal of these beloved trees from the high school. Removing a tree because it could be subject to drought and replacing it with a tree that requires more water than an existing mature tree makes no sense. Although what she said is not necessarily wrong as to its location the fact is these trees were healthy and showed no sign of stress. This argument is separated from reality and failed to recognize that we don't live in laboratory with only one species. It is similar to the current argument for the HW Project that the replacement of the slated mature trees with native saplings is a more "ecological beneficial project". This is also not necessarily wrong (without understanding the context) – however, the fact is that these trees slated for removal are over 70 years old, are healthy and are providing valuable environmental services now. Those replacement saplings will take at least 20 years to provide similar benefits. The idea that is okay to remove all mature trees in Los Angeles that are providing environmental benefits now and replacing them with native trees is ridiculous and self-defeating. Yes, as trees die, we should replace them with native species but to remove them prematurely is an environmental and ecological disaster.

This may be an isolated development project, but the impacts are far reaching to the entire San Fernando Valley and Los Angeles. We all breathe the same air and experience the increased heat. Air and temperature are not limited to a parcel – on a tax map. The mature trees are part of an urban ecosystem that helps reduce temperatures, sequester carbon, promote biodiversity, reduce storm water runoff, and clean the air. UCLA, USC, and Tree People have identified the San Fernando Valley to be uniquely susceptible to climate change. Los Angeles has the worst air quality in the nation, and City is already experiencing a spike in heat related deaths due to the increased heat of climate change and the urban heat island effect.

Ironically, instead of using the existing natural resources of permeable turf and trees already in place at the proposed HW Project, Harvard Westlake is looking to replicate the Army Corp of Engineers project of paving the LA River in the 1930s. The paving of the LA River, which was once the location of verdant wetlands, is now universally recognized as an over-engineered error due to the misunderstanding of the ecological impacts of isolating one part of the ecosystem rather than looking at the whole ecosystem.

Impermeable artificial turf is replacing existing permeable grass. The turf emits carbon dioxide and methane, provides no ecological benefit, and will negatively impact the ecosystem of birds, insects, and other endemic species native to Southern California. Removing 240 trees results in a loss of carbon sequestration benefits and Harvard Westlake's proposed installation of a built storm water management system is an over engineered solution to problem that doesn't exist because the mature trees at the location are already providing 312,555 gallons of rainfall interception and 46,330 gallons of run off avoidance per year. Removing the 240 trees will result in a more than a 50% net decrease of runoff avoidance equal to 26,267 gallons and more than a 50% decrease of 176,336 gallons.

Los Angeles in its many policies, including the green new deal, and the city's respected academic institutions all recognize the need for open green space, a healthy ecosystem, shade, and clean air. Although the proposed built environment of the HW Project could be considered "open" it is not open green permeable space and fails to take advantage of existing ecological science that will benefit the growth of our natural environment, provide shade, and clean our air. Angelenos for Trees, recommends that Harvard Westlake, maintain the space in its current configuration, introduce native species, including trees, over time, consistent with the current science relative to habitats and ecosystems and increase the tree canopy to support a healthy ecosystem. Such a project could operate as a lab for field biology projects while still providing tennis and golf as activities for its students and the community.

Very truly yours,

Jeanne McConnell

Co-Founder of Angelenos for Trees

Environmental Cost-Benefit Analysis for Existing, Mature Urban Tree Canopy at Weddington Golf & Tennis

Methodology and Additional Information

This report utilizes the i-Tree National Tree Benefits Calculator software, which was developed in partnership with the United Stated Department of Agriculture (USDA) Forest Service. Tree health ratings differed between the Biological Resources Technical Report and i-Tree, so for calculation purposes, the following describes the labeling methods employed. Ratings from the Biological Resources Technical Report of "A," "B," "C," "D," and "F" were assigned in i-Tree as "Excellent," "Good," "Fair," "Poor," and "Dead," respectively.

In instances where the species were not inventoried in i-Tree, experts were consulted and similar inventoried species were substituted and utilized. These cases can be found on the calculation spreadsheet. Average DBH measurements utilized for the Mexican fan palm (Washingtonia robusta) and Windmill palm (Trachycarpus fortunei) species relied on USDA data and were 14.1 DBH and 9 DBH, respectively. 4 Spanish daggers (Yucca gloriosa) were excluded from analysis due to inconclusive DBH measurements.

Results

- Yearly estimate of carbon dioxide (CO_2) sequestration is $1,584.14.
- Yearly estimate of carbon dioxide (CO_2) sequestration is 67,439.56 lbs.
- Yearly estimate of storm water mitigation is $413.32.
- Yearly estimate of storm water runoff avoided is 46,330.26 gals.
- Yearly estimate of storm water rainfall intercepted is 312,555.20 gals.
- Yearly estimate of air pollution removal is $2,412.25.
- Yearly estimate of air pollution carbon monoxide removal is 237.83 oz.
- Yearly estimate of air pollution ozone removal is 6,027.37 oz.
- Yearly estimate of air pollution nitrogen dioxide is 1,469.45 oz.
- Yearly estimate of air pollution sulfur dioxide is 104.49 oz.
- Yearly estimate of air pollution (fine particles or particulate matter) is 63.00 oz.
- Estimate of carbon dioxide (CO_2) stored to date is $35,281.18.
- Estimate of carbon dioxide (CO_2) stored to date is 1,520,466.02 lbs.

Dear Ms. Henry,

Attached please find a comment letter, without its attachments, from Amy Minteer regarding the above-captioned subject.

The below Dropbox link includes the letter with attachments.

We are also sending you a paper copy via FedEx which should arrive tomorrow.

Dropbox link:

https://www.dropbox.com/scl/fo/j9wel5q4lsx3wnr4x6z6p/h?dl=0&rlkey=16ro04prva1aa496t2mw27jn8

Please feel free to contact us with any questions or concerns.

Cynthia Kellman

Re: Comments on Draft Environmental Impact Report for Harvard-Westlake River Park Project, ENV-2020-1512-EIR

Dear Ms. Henry,

On behalf of the Studio City Residents Association (SCRA) and Save LA River Open Space (SLAROS), we provide the following comments on the draft environmental impact report (DEIR) for the proposed Harvard-Westlake River Park Project. SCRA is an all-volunteer membership organization that advocates for and enhances the quality of life in Studio City. The SCRA's volunteers educate our members and create a platform for the interests, concerns and passions regarding the Studio City community. SCRA consists of more than 2,100 members in the community surrounding the proposed Harvard-Westlake River Park Project (the "Project") on what is now the site of Weddington Golf & Tennis. SLAROS is a non-profit volunteer organization working with SCRA in their commitment to protect the last remaining 16 acres of unprotected open space along the Los Angeles River in the San Fernando Valley.

SCRA and SLAROS have serious concerns regarding the density and intensity of development proposed as part of Harvard-Westlake's Project, as well as the limited public access to the recreational facilities on the Project site. The Harvard-Westlake School ("School") has proposed to cram two large sports fields with artificial turf and a 50-meter swimming pool, with hundreds of bleacher seats and 70- to 80-foot-tall lighting and LED scoreboards, a two-story, 80,249-square-foot multi-purpose gymnasium and a 500-space subterranean parking garage on the site after eliminating the existing popular golf course and driving range and the hundreds of mature trees located on the Project site. This Project would have significant adverse impacts that are not fully disclosed in the DEIR due the elimination of the scenic trees that provide important biological resources,

the increase in intensity of use increasing traffic, air quality and greenhouse gas impacts, the change in hydrologic conditions on the site, the failure to comply with requirements the California Environmental Quality Act (CEQA) imposes on the treatment of Tribal Cultural Resources, lack of consistency with land use plan policies and programs, loss of public recreational access, and potential public health impacts. The DEIR fails to include fully enforceable mitigation measures for many of these impacts, in clear violation of CEQA's requirements.

The DEIR fails to provide an adequate project description, particularly with regard to the Project's public accessibility, intensity of School use of the site and special uses of the site. The DEIR also fails to disclose the reasonably foreseeable activities that will be spurred on Harvard-Westlake's Coldwater Canyon campus by making the extensive athletic facilities located there obsolete. Further, the DEIR's analysis of less impactful alternatives is based on improperly narrow project objectives and fails to include a reasonable range of alternatives that would reduce the Project's many significant impacts.

Due to the length of this letter, we include the following table of contents:

I. History of the Project Site 7

II. The DEIR Contains an Inadequate Project Description 8

III. The DEIR Improperly Segments the Relocation of Athletic Facilities from Expansion of Uses on Harvard-Westlake Campus 10

IV. The DEIR Improperly Relies on Project Design Features and Proposed Conditions to Mitigate Impacts Without Analysis or Enforceability 12

V. The DEIR Fails to Adequately Analyze the Project's Impacts 13

A. The DEIR Fails to Adequately Disclose and Mitigate Aesthetic Impacts .. 13

1. The DEIR Fails to Analyze Impacts to Scenic Quality of the Site .. 13

2. The DEIR Fails to Adequately Disclose Night Lighting Impacts ... 14

B. The DEIR Fails to Analyze and Disclose Air Quality and Hazards Impacts and Mitigation Measures 15

1. The DEIR Must Acknowledge the Project's Location in an Area of Extreme Nonattainment 15

2. Air Quality Analysis is Based on Faulty VMT Assumptions 15

3. The DEIR Understates the Project's Air Quality and Hazards Impacts Relating to Artificial Turf 16

4. The DEIR Fails to Analyze and Adopt All Feasible Mitigation Measures 17

C. The DEIR Fails to Adequately Analyze and Mitigation the Project's Biological Impacts 18

1. The DEIR's Assessment of Impacts Due to Tree Removal is Inadequate 18

2. The DEIR's Analysis of Impacts to Bat Species from Tree Removal and Nighttime Lighting is Inadequate 18

3. The DEIR Fails to Include Tree Removal Mitigation Recommended by CDFW and Relies on Mitigation That is Not Fully Enforceable 20

D. The DEIR Fails to Analyze and Disclose the Project's GHG Impacts and Mitigation 20

1. The DEIR's Analysis of GHG Impacts Must Reflect the Reality of the Climate Crisis 20

2. The DEIR Fails to Evaluate its Adopted Threshold of Significance, and Fails to Support its Conclusion that the Project will Have No Significant GHG Impacts 21

3. The DEIR Improperly Compresses GHG Impacts and Mitigation .. 24

4. The DEIR Relies on an Unsupported 30-Year Amortization Timeline 25

5. The DEIR Understates the Project's Urban Heat Island Effect 26

6. The EIR Fails to Include All Feasible Mitigation Measures 27

E. The DEIR Fails to Provide Enforceable Mitigation for Geotechnical Impacts 28

F. The DEIR Fails to Adequately Disclose and Mitigate Hydrological and Water Quality Impacts..... 28

1. The DEIR Fails to Include Fully Enforceable Mitigation Measures 28

2. The DEIR Fails to Provide Adequate Information Regarding Groundwater Infiltration 29

3. The DEIR Fails to Address Water Quality Impacts Associated with Artificial Turf 29

G. The DEIR Fails to Disclose Inconsistencies with Applicable Land Use Plans 30

1. The DEIR Buries the Land Use Analysis in an Appendix..... 31

2. The Project is Inconsistent with the General Plan 31

3. The Project is Inconsistent with the 2020-2045 RTP/SCS 33

4. The Project is Incompatible with the Los Angeles River Revitalization Master Plan and River Improvement Overlay District 34

5. The Project is Incompatible with Existing Height and Light Limitations 36

H. The DEIR Fails to Comply with CEQA's Requirements for Tribal Cultural Resources 36

I. The DEIR Fails to Disclose and Analyze New Significant Impacts Relating to Noise and Vibration 39

1. Effects of Noise Pollution on Health Are Extensive 39

2. The DEIR Fails to Evaluate All Sensitive Receptor Locations 40

3. The DEIR Must Evaluate Sleep Disturbance 41

4. The DEIR Fails to Disclose Conflicts with the Los Angeles Municipal Code Noise Regulations 41

5. The DEIR Fails to Implement All Feasible Mitigation for Construction Impacts 42

J. The DEIR Fails to Analyze and Disclose Significant Transportation and Traffic Impacts and Mitigation 43

1. The DEIR Relies on Traffic-Related Project Design Features That Improperly Defer and Segment Analysis and Mitigation of Project Impacts 43

2. The DEIR Fails to Adequately Assess Vehicle Miles Traveled (VMT) 44

3. The DEIR Fails to Analyze and Disclose the Project's Impacts to Emergency Access 45

4. The DEIR Fails to Evaluate Construction and Project Equipment Which May Cause Hazards 47

5. The DEIR Fails to Analyze and Disclose Conflicts with the Mobility Plan 47

6. Expert Analysis Reveals Further Deficiencies of the DEIR 48

K. The DEIR Fails to Adequately Disclose and Mitigate the Project's Adverse Recreational Impacts 48

L. The Project Could Increase Mosquito Activity in Project Vicinity, Resulting in Potential Public Health Impacts That the DEIR Fails to Address 49

VI. The DEIR's Alternatives Analysis is Inadequate 50

A. The DEIR Relies on Overly Narrow Project Objectives 50

B. The DEIR Relies on Improperly Narrow Project Objectives to Eliminate Consideration of a Reasonable Range of Alternatives 52

1. The DEIR Failed to Consider Off-Site Alternatives 53

2. The DEIR Failed to Consider Reasonable Alternatives That Would Meet Many of the Project Objectives 54

a. The DEIR Failed to Assess the Proposed Los Angeles River Natural Park Alternative 54

b. The DEIR Should Have Evaluated a Natural Golf Course Alternative 57

c. The DEIR Failed to Considered a Reduced School Use Intensity Alternative 57

C. The Alternatives Included in the DEIR are Inadequate 58

1. The No Project Alternative Relies on Unsupported Changes at the Project Site 58

2. The Alternatives Contained in the DEIR Are Designed to Fail 59

D. CEQA's Substantive Mandate Requires Adoption of Feasible Alternatives and Mitigation Measures 60

VII. Conclusion 61

I. History of the Project Site

In the early 1970's, the Project site was down-zoned from residential to its current agricultural (A-1) zoning pursuant to an agreement among Weddington, Studio City Golf Course, Inc., and the City of Los Angeles and County of Los Angeles to permanently maintain the Project site as recreational open space. Consistent with that agreement, the Project site is designated as open space, with a specific golf course designation, on the Sherman Oaks-Studio City-Toluca Lake-Cahuenga Pass Community Plan—the applicable land use element of the City's General Plan.

For more than 60 years, the Project site has been open to the public as the Studio City Golf & Tennis,[1] a recreational facility consisting of a 9-hole golf course, driving range, putting green, 16[2] tennis courts, and club house. The site includes numerous mature trees, providing rare green and open space in the otherwise heavily developed San Fernando Valley, is extraordinarily well-operated and maintained, and is used by tens of thousands of residents from throughout both the City and the Greater Los Angeles region. The tennis facilities are home to the teams from several high schools and tennis leagues, including the Los Angeles Tennis Association.

In September 2021, the Los Angeles City Council designated the Studio City Golf & Tennis Center as an Historic Cultural Monument. This designation was based on the fact that the site "exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community" as an excellent example of a 1950s private recreational facility and golf club in Studio City. The facility also "embodies the distinctive characteristics of a style, type, period, or method of construction" as an excellent example of a 1950s community golf course. (See https://planning.lacity.org/odocument/5ae20992-41fd-4739-a6b0-66003878f981/CHC-2020-7764-HCM_(4-15-21).pdf, incorporated by reference.) There was overwhelming community support for this designation, with commentors identifying the importance of the publicly available recreational facility, the facility's long-standing inclusivity and the importance of the open space the site provides.

Not only is the Project site an important historic resource that includes public recreational facilities and one of the few remaining open space areas in the San Fernando Valley, it is also unique due to its strategic location adjacent to the Los Angeles River. The Project site is a critical location as a key connection in the regional network of parks,

[1] The facility has also been identified as the Weddington Golf and Tennis Center.
[2] Four tennis courts were previously removed to allow for construction of Los Angeles Fire Department Station 78.

trails and natural lands that comprise the 51-mile Los Angeles River Greenway. The site has significant value as the last remaining unprotected undeveloped open space along the Los Angeles River. Large financial investments have been made at all levels of government and years of planning have gone into efforts to revitalize the Los Angeles River and lands adjacent to it. The Zev Yaroslavsky Los Angeles River Greenway Trail ("Zev Greenway") was completed on County property adjacent to the Project site in 2017. The Zev Greenway is a half-mile walking path that brings back native habitat to the River's edge and reincorporates the River into this urban San Fernando Valley neighborhood. The trail is popular with walkers and joggers, and those needing natural respite. Beautifully designed artistic gates and interpretive panels tell the story of the natural function of the River and the native people who once centered their lives around it.

A senior housing project was previously proposed for the Project site between approximately 2007 and 2014. The surrounding community opposed the privatization and development of this site. The previous development project did not move forward. However, before any individuals interested in preserving the Project site as public recreational facilities could make an offer on the Project site, the public was informed that Harvard-Westlake had purchased the site for private school use. The community similarly opposes the privatization of the Studio City Golf & Tennis Center site to be paved over with buildings, structures, and artificial turf to allow it to be converted to mainly private use as the athletic campus for an exclusive private school.

II. The DEIR Contains an Inadequate Project Description.

Every EIR must set forth a project description that is sufficient to allow an adequate evaluation and review of the project's environmental impacts. (CEQA Guidelines § 15124.) "An accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR." (*County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 192 93; accord *San Joaquin Raptor/Wildlife Reserve Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 730.) "[O]nly through an accurate view of the project may the public and interested parties and public agencies balance the proposed project's benefits against its environmental cost, consider appropriate mitigation measures, assess the advantages of terminating the proposal and properly weigh other alternatives." (*City of Santee v. County of San Diego* (1989) 214 Cal.App.3d 1438, 1454.)

Here, there are several aspects of the Project for which the DEIR fails to provide adequate information to fully assess the Project's impacts. Of overarching concern for SCRA and SLAROS, as well as the community as a whole, is the public accessibility of the Project site. The Project site is currently publicly accessible at all times the site is

open, prior to sunset for the golf course and prior to 10 p.m. for the driving range and tennis courts. The Project applicant has claimed to the community that the Project site will remain publicly accessible for recreational uses in response to concerns that the site will now become mainly a private school recreational facility instead of a public recreational facility.

The DEIR claims the site will have 5.4 acres of publicly available open space from 7 a.m. to 9 p.m. (DEIR p. II-2.) However, a review of the Project site plan shows the publicly accessible area is mainly just the landscaping around the new Harvard-Westlake school athletic facilities and the walking paths between those facilities. The Project site is so crowded with school facilities, very little space is left for the public. It is also unclear whether they are including County property in this calculation. The overstatement of the public open space is misleading.

Additionally, the Project includes extensive walls and fencing around the athletic fields, pool and massive gym building. This eliminates the public feel of the site and constrains the public to narrow paths, unlike the wide-open spaces currently on the site.

The DEIR also includes a table of anticipated public use for the athletic facilities on the Project site. The tennis courts, gym (with the exception of a token community room), the swimming pool and athletic fields are claimed to be available whenever "not in use by the school" and only for pre-approved organizations and programs. (DEIR p. II-34.) This eliminates individual use and use by any groups that are not pre-approved. No qualification for pre-approval have been disclosed. The DEIR project description fails to provide adequate information regarding public availability of the facilities and what portions of the public Harvard-Westlake would approve for access. Moreover, there is heavy weekend usage of the Project site anticipated by Harvard-Westlake, which is the time of heaviest recreational use of the current site. The significant reduction in public recreational uses must be disclosed.

Further, any approval for this Project must be conditioned upon clear requirements regarding availability of public use for the facilities. As set forth, the project description contains nothing more than estimates of the frequency of use based on previous use of existing facilities. But, the DEIR fails to address whether the frequency of athletic uses would increase with the development of these expansive facilities. Would more athletic games, including tournaments, be scheduled at Harvard-Westlake with the new facilities? Would new athletic teams be formed? It seems clear there would be an expansion beyond existing uses if the school will be significantly expanding its athletic facilities.

The DEIR discloses for the first time that the Project site will be used not only as a sports facility for Harvard-Westlake School, but also for academic uses, including science labs, meetings and classes. The DEIR fails to provide adequate information regarding these uses such as the frequency and where they would be located on the Project site. Since public use is halted when facilities are in use by the School, to adequately assess public accessibility, this information must be provided. The DEIR implies that prior to 3 p.m., more of the site would be publicly accessible. But, with the inclusion of academic classes on the Project site, Harvard-Westlake's use of the facilities could stretch throughout the entire day. The frequency of such use must also be disclosed because it could significantly increase the intensity of use of the site. The vague reference to using the Project site for classes fails to provide a complete project description. Harvard-Westlake must also disclose any further anticipated expansion of use of the site. It appears it may anticipate turning the site into a full-time school campus and not just an after school athletic facility.

The DEIR also claims there may be up to 30 "special events" at the Project site per year. As with the level of Harvard-Westlake athletic activities at the Project site, the DEIR is not proposing any conditions of approval to limit the use to levels described in the Project description. Without such conditions, the use could be significantly higher than disclosed. Further, Harvard-Westlake has failed to provide the City with adequate information regarding the special events. The Project application failed to include any description of these events or their frequency, despite this information being required in the application.

Finally, when previously proposing construction of a new athletic field on the Harvard-Westlake Coldwater Canyon campus, the School repeatedly cited the need for additional parking for students. This Project would provide over 500 parking spaces. The DEIR fails to disclose whether these parking spaces could be used by students attending school at the Harvard-Westlake campus, with shuttles to the campus, to make up for what the school has previously considered a significant deficit in student parking.

III. The DEIR Improperly Segments the Relocation of Athletic Facilities from Expansion of Uses on Harvard-Westlake Campus.

CEQA requires analysis of "the whole of an action," including activities that are a reasonably foreseeable consequence of a project, and prohibits evading comprehensive CEQA analysis by splitting projects into separate pieces. (CEQA Guidelines § 15378; *Bozung v. LAFCO*. (1975) 13 Cal.3d 263, 283-84; *Orinda Assn v. Board of Supervisors* (1986) 182 Cal.App.3d 1145, 1171.) The City must "construe the project broadly to capture the whole of the action and its environmental impacts." (*Save Berkeley's*

Neighborhoods v. Regents of University of California (2020) 51 Cal.App.5th 226, 239.) All phases must be considered together for environmental review. (*Natural Resources Defense Council, Inc. v. City of Los Angeles* (2002) 103 Cal.App.4th 268, 284.)

The Harvard-Westlake Coldwater Canyon campus already contains a number of athletic facilities, including:

- Tapper Gymnasium
- Ted Slavin Field, with sports field and synthetic track
- "50-meter pool manufactured by Myrtha Pools of Mantua, Italy"
- Large Sports Performance Center with weight room and full-size dry cleaning and laundry facility

(**Attachment A**, H-W Map; https://www.hw.com/athletics/Facilities-Locations, incorporated by reference.)

When Harvard-Westlake previously proposed an expansion of athletic facilities adjacent to its existing campus, only one new sports field was identified as necessary. No additional gyms, pools or other athletic uses were identified as being required. Harvard-Westlake has failed to provide information regarding the necessity of all components that have been included as overly narrow project objectives. (See Section VI.A, below.) Instead of providing only required additional facilities, Harvard-Westlake's goal appears to be creating an entirely new large campus where all School athletics, and some School academics, will be located.

The School has failed to identify a need for three large athletic fields, three gyms and two large pools, which is what would result from a combination of proposed new facilities and the currently existing facilities on the Harvard-Westlake campus. It is reasonably foreseeable that the athletic facilities currently existing on the campus will no longer be used if Harvard-Westlake creates an entirely new athletic facilities campus. Harvard-Westlake must disclose any potential plans to replace existing on campus athletic facilities with new or expanded uses.

The California Supreme Court rejected a similar attempt at project segmentation in *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 393–395.) There, the agency claimed future uses at a university building did not need to be assessed in environmental review because it had "not yet formally approved any particular use" for the future phase. (*Id.* at 394.) The Court found that even though the

specifics of the future phase had not yet been determined, there was adequate information to include that phase in the environmental review, either as a phase of the current project or as a cumulatively considerable future project. (*Id.* at 395.) The same requirement applies here. Harvard-Westlake must disclose its plans for future use of the on-campus athletic facilities that would become obsolete or unnecessary if the Project is developed as proposed. Failure to do so violates CEQA's important public disclosure principle. (*Laurel Heights I, supra*, 47 Cal.3d 376, 394.)

IV. The DEIR Improperly Relies on Project Design Features and Proposed Conditions to Mitigate Impacts Without Analysis or Enforceability.

Throughout, the DEIR improperly relies upon so-called Project Design Features (PDFs) and claims that conditions will be placed on the Project in an attempt to reduce many of the Project's impact without the required analysis of the impacts or the measures relied upon to mitigate them.

The majority of these PDFs and conditions appear to be mitigation measures that the Project applicant and City have failed to incorporate into the Project's Mitigation Monitoring and Reporting Program (MMRP). When a Project incorporates mitigation measures, CEQA requires that those mitigation measures be "fully enforceable through permit conditions, agreements, or other measures." (Pub. Resources Code § 21081.6(b).) As mere PDFs that will not necessarily be incorporated into Project approvals, conditions, and the MMRP, the PDFs are not properly enforceable by the City or third parties and cannot be relied upon for any reductions in Project impacts. CEQA's mitigation requirements exist for a reason. "The purpose of these requirements is to ensure that feasible mitigation measures will actually be implemented as a condition of development, and not merely adopted and then neglected or disregarded." (*Federation of Hillside & Canyon v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1261; *Katzeff v. California Dept. of Forestry and Fire Protection* (2010) 181 Cal.App.4th 601, 612; *Lincoln Place Tenants Assn v. City of Los Angeles* (2005) 130 Cal.App.4th 1491.)

The heavy reliance on Project PDFs and the future imposition of conditions also improperly compresses the DEIR's disclosure and analysis functions. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-656.) A "mitigation measure cannot be used as a device to avoid disclosing project impacts." (*San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 663-664.) Here, the DEIR claims that the PDFs are part of the Project itself and fail to assess the impacts of the Project without these PDFs. Recent Court of Appeal decisions disapprove of this practice:

> A 'mitigation measure' is a suggestion or change that would reduce or minimize significant adverse impacts on the environment caused by the project as proposed." (*Lincoln Place Tenants Assn. v. City of Los Angeles* (2007) 155 Cal.App.4th 425, 445, 66 Cal.Rptr.3d 120.) ***A mitigation measure is not part of the project***. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 656 & fn. 8, 167 Cal.Rptr.3d 382.) Thus, it is questionable whether these measures even qualify as mitigation measures.

(*Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 17 Cal.App.5th 413, 433, emphasis added.) An EIR cannot incorporate "the proposed mitigation measures into its description of the project and then conclude [] that any potential impacts from the project will be less than significant." (*Lotus*, *supra*, 223 Cal.App.4th 645, 655-657.) The DEIR's shortcut is "not merely a harmless procedural failing…[it] subverts the purposes of CEQA by omitting material necessary to informed decisionmaking and informed public participation." (*Id.* at 658.)

V. The DEIR Fails to Adequately Analyze the Project's Impacts.

A. The DEIR Fails to Adequately Disclose and Mitigate Aesthetic Impacts.

1. The DEIR Fails to Analyze Impacts to Scenic Quality of the Site.

As a matter of law, the EIR must comprehensively address the significant aesthetic effect of the Project. (*See Quail Botanical Gardens Foundation, Inc. v. City of Encinitas* (1994) 29 Cal.App.4th 1597.) Existing public views of the open and expansive Project site, with numerous trees and greenspace forming a scenic vista, would be adversely altered by the Project. The Project would remove approximately 240 trees, many of which are located in the publicly visible public right-of-way. During the lengthy construction period, the site would be almost entirely denuded. The Project would also install walls and fencing around the site that block the existing views of greenspace and trees. The DEIR fails to include any analysis of these aesthetic impacts, claiming the Project is located in an urbanized area but failing to recognize that this site provides an important respite from the urbanization.

Additionally, the DEIR fails to disclose that the Project would conflict with applicable zoning regulations intended to protect scenic quality. As discussed in Section V.G, addressing land use impacts, the Project includes numerous light poles that are 70 to 80 feet tall, making them at least 40 feet taller the allowable height on the Project site, and significantly taller than any other existing or planned structures. This height limit is intended to protect the scenic quality of this Los Angeles River-adjacent site that is

currently in open space. The Project's lack of compliance with this regulation could result in adverse aesthetic impacts not evaluated in the DEIR.

The Project is also inconsistent with the designation of the site as open space with a golf course. (**Attachment B,** Sherman Oaks-Studio City-Toluca Lake-Cahuenga Pass Community Plan Land Use Map.) The Sherman Oaks-Studio City-Toluca Lake-Cahuenga Pass Community Plan includes Policy 5-1.1 "Encourage the retention of passive and visual open space which provides a balance to the urban development of the Plan Area" and requires open space areas be protected from the encroachment of more intense uses. The DEIR fails to disclose that the Project would conflict with the Community Plan's designation of the site as visual open space to balance the surrounding urban development. Instead, the Project includes significant development on the site and an encroachment of more intense uses by Harvard-Westlake.

The DEIR fails to provide comparative visual renderings and simulations for the site and surrounding area with and without the Project. This prevents the public and decisionmakers from assessing the visual impacts of the Project. Additionally, the renderings of the Project contained in the DEIR's project description section rely on misleading angles, mainly within the site or from middle of the River, not surrounding residences or the Zev Greenway, and not with the small replacement trees that would need years to grow to the size of existing mature trees.

2. The DEIR Fails to Adequately Disclose Night Lighting Impacts.

The Project includes significantly more night lighting sources than currently exist on the Project site. Existing lighting on the Project site is limited to the eastern portion of the site. This lighting is buffered by the many mature trees on the site. Additionally, the lighting from the tennis courts is shielded from the Greenway in part by the Fire Station building. The new lighting would include 70- and 80-foot-tall polls for both fields and the pool area, plus LED screens. This significantly expands the height and number of lighting sources on the Project site. It also expands night lighting to the western portion of the site and even includes the installation of field lighting directly adjacent to the Greenway. (Compare DEIR App. B p. 15 (existing lighting locations) with p. 8 (proposed lighting locations for Project).)

The DEIR claims no PDFs or mitigation measures are required for night lighting impacts, relying on the Project applicant's claim that they will install and maintain a certain type of lighting and shielding. This claim is unenforceable mitigation and as such is improper under CEQA. Moreover, to the extent the DEIR relies on the future installation of trees as a source of night lighting mitigation, that shielding will not be

provided for many years. The Project is removing hundreds of mature trees and will replace them with much smaller trees. It will take years for the replacement trees to provide any shielding and they may never reach a height that would be able to shield lighting from the extremely tall athletic field lighting.

B. The DEIR Fails to Analyze and Disclose Air Quality and Hazards Impacts and Mitigation Measures.

1. The DEIR Must Acknowledge the Project's Location in an Area of Extreme Nonattainment.

The South Coast Air Basin, where the Project is located, is in extreme nonattainment for the federal ozone National Ambient Air Quality Standards (NAAQS). While the DEIR states the attainment status on page IV.B-21, the reader is given no information as to why the Basin fails to meet the federal ozone standard. Nor does the DEIR explain what "extreme" nonattainment means (it is the very worst category, with the highest ozone concentrations in the air contemplated by the Clean Air Act; 42 U.S.C. § 7511(a)), or as to how severe the ozone pollution problem is in the Basin. U.S. EPA's Green Book states that only two areas in the nation are so heavily polluted as to be in "extreme" nonattainment for ozone, namely Los Angeles-South Coast Basin, and the San Joaquin Valley. (https://www3.epa.gov/airquality/greenbook/jnc.html, incorporated by reference.) The omission is so glaring as to make the document misleading on this point.

A true picture of the severity of ozone pollution in the South Coast Air Basin is presented in the prestigious State of the Air Report, which is issued annually by the American Lung Association. A copy of the excerpts of the Report for 2022 is attached to these comments for the record. It lists the Los Angeles-Long Beach metropolitan area as the most-polluted for ozone in the nation (**Attachment C** - State of the Air Report, p. 17). None of this information made it into the EIR, but the decision makers and the public are entitled to, and need to, know it.

2. Air Quality Analysis is Based on Faulty VMT Assumptions.

This Project, as proposed, is a project that will have shuttles running continuous trips five days a week. (DEIR, p. II-55.) Harvard-Westlake has made no commitment to run 100% electric shuttles, so these shuttles will necessarily emit criteria pollutants. As we have explained in Section J.2, the Project's VMT analysis is based on unsupported assumptions and omissions. (**Attachment D**, Expert Comments from Tom Brohard.) The Air Quality analysis utilizes these faulty assumptions. For instance, the estimated mobile source emissions are dependent on the VMT analysis (DEIR, Appendix C, p. 13;

IV.B-38.). The DEIR must correct these assumptions and be recirculated with the corrected air quality analysis.

3. The DEIR Understates the Project's Air Quality and Hazards Impacts Relating to Artificial Turf.

Given the Project's location in an air basin already burdened with significant air pollution, the Project must take every available precaution to avoid contributing to air pollution and hazards. This goal cannot be achieved with the Project's use of artificial turf.

A component of artificial turf is crumb rubber, which contains contaminants of potential concern, including criteria pollutants such as particulate matter and VOCs. (DEIR, p. IV.H-31 to -32.) The DEIR states that the turf will need to be replaced every *eight* years, at which point the replaced turf will need to be disposed. (DEIR, p. IV.H-45.) The DEIR states that "In addition to compliance with applicable disposal regulations, artificial turf consists of material that can be recycled at the end of its useful life. **Compliance with applicable regulatory requirements would ensure that Project impacts related to disposal of artificial turf would be less than significant**." (DEIR, p. IV.H-45.)

But the DEIR provides no evidence that such recycling and safe disposal is even possible, and in fact substantial evidence demonstrates it is not possible. On February 28, 2022, Public Employees for Environmental Responsibility (PEER) filed a complaint with the Federal Trade Commission against turf manufacturers for false advertising, because "[t]here are no turf recycling plants in the U.S.," "[u]sed turf is not being exported to the two known recycling plants in Europe" and "[a]rtificial turf is extremely difficult and expensive to recycle since all the different plastics, rubber, and other materials used must be separated from each other." (**Attachment E** – PEER, March 7, 2022, "False Artificial Turf Recycling Claims Ripped," https://peer.org/false-artificial-turf-recycling-claims-ripped/.) In 2019, a CEO of a turf recycling company admitted that turf recycling is not possible, and even the Synthetic Turf Council has stated that it is not possible at the point of removal. (**Attachment F** – PEER, January 30, 2020, "*Artificial Turf's Big Lie: Old Fields Not Recycled*," https://peer.org/artificial-turfs-big-lie-old-fields-not-recycled/.)

The DEIR does not disclose the amount of artificial turf the Project will use as far as we have been able to ascertain, but generating artificial turf waste every eight years that cannot be recycled will likely have significant air quality and hazardous impacts.

4. The DEIR Fails to Analyze and Adopt All Feasible Mitigation Measures.

According to CalEnviroScreen, the Project Site ranks in the 70th percentile for pollution burden and 75th for ozone (Census Tract 6037143500). NOx emissions are a precursor to forming ozone. Thus, it is imperative that the Project reduce and avoid NOx emissions at any cost.

Despite this, the Project will have significant NOx emissions during its extended 2.5-year construction period. The DEIR must analyze and adopt all feasible mitigation measures to reduce NOx and other criteria pollutant emissions. These mitigation measures include:

- Prohibiting gas- or diesel-powered construction or maintenance equipment (e.g., leafblowers). Using electric equipment.
- Requiring all Project development to be all electric with no plumbing whatsoever for natural gas. Accordingly, no gas-powered water heaters, or any other gas-powered appliance shall be allowed.

- Including photovoltaic solar panels and batteries in the project design to provide the maximum amount of the Project's commercial needs, but in no event, less than 90 percent.

- Actually constructing enough electric vehicle charging stations in the project design to provide charging capacity adequate to service all anticipated vehicles to the Project site, not solely providing some of the infrastructure for "future" stations.

- Including electric heat pumps in the project design to provide air and water heating and cooling.

- Requiring that the shuttles running from the Harvard-Westlake Upper Campus to the Project site are 100% electric and mandating as an enforceable mitigation measure that use of such shuttles is required.

- Providing free transit passes to students, faculty, parents, and anyone who may utilize the Project.

- Providing a free shuttle to and from the nearest Metro Rail stations.

- Prohibiting vehicle idling.

These measures will also have co-benefits—all of them will reduce GHG emissions, and many of them will reduce the Project's significant unmitigated noise impacts.

C. The DEIR Fails to Adequately Analyze and Mitigation the Project's Biological Impacts.

1. The DEIR's Assessment of Impacts Due to Tree Removal is Inadequate.

The Project would have direct construction impacts on special-status birds and bats, raptors, and migratory birds that include the potential to disturb the lifecycle of avian species and migratory birds from damaging vegetation, affecting foraging, roosting, and nesting areas and disturbance of nesting, roosting, and foraging due to construction noise and vibration and night lighting. These temporary impacts must be addressed and mitigated, but were not.

The DEIR fails to acknowledge the long-term significant impacts to migratory birds and bat species that would result from the removal of approximately 250 mature trees currently at the Project site. The DEIR focuses on the replacement of these trees with native species, underestimating the habitat currently relied upon by birds and bats that will be lost for the years of construction and many years it will take for the replacement trees to reach a similar size.

Additionally, the DEIR does not address the cumulative loss of trees at both the Project site and for the Sportsmen's Lodge project located just over the River from the Project site. The Sportsmen's Lodge project has removed approximately 90 mature trees, adding to the cumulative loss of trees for species to rely upon in this area.

2. The DEIR's Analysis of Impacts to Bat Species from Tree Removal and Nighttime Lighting is Inadequate.

The large number of mature trees on the Project site coupled with its adjacency to the Los Angeles River provide good bat roosting and foraging habitat in an area surrounded by dense urbanization. The DEIR admits that the Project site could provide habitat to the special status Western yellow bat, but fails to provide mitigation to address this impact. Moreover, the DEIR fails to include an adequate survey of bat species at the Project site. The day time site visit conducted in November (reconnaissance biological

survey) was not adequate to provide evidence of bat occupancy of the Project site. (DEIR IV-C.13.) Nocturnal surveys with acoustic recordings for bats coupled with night vision observations should have been done between May and August to detect bats that may have maternity roosts in the trees. Additional bat species are likely to use the Project site and adjacent Zev Greenway, including those that are species of special concern. For example, the draft EIR prepared for the Los Angeles River Master Plan Update established that the Pallid bat, a species of special concern, was observed along the Los Angeles River in the vicinity of the Project site. (**Attachment G**, LARUMP pp. 3.3-11 and Fig 2-4.)

The DEIR does not assess best lighting practices for bat species, instead just claiming that the use of directed LED lighting will reduce impacts, failing to consider color temperature for lighting. "Best practices for lighting for bat species include avoiding green and red lights, as these interfere with migration patterns. White lighting tends to attract prey species and increase foraging. Lighting adjacent to wildlife areas should be limited to an upper limit of 3,000 on the Kelvin color temperature scale and shielded to prevent light from entering the wildlife area." (**Attachment H**, LARUMP DPEIR p. 3.3-127.)

The DEIR also fails to adequately address the night lighting impacts on species that currently use the Project site and adjacent Zev Greenway, particularly those that use the site nocturnally. The Project extends night lighting to the entire Project site, whereas it is currently limited to the eastern portion of the site. The new lighting is significantly taller than the existing lighting. The DEIR claims replacement trees would reduce impacts of these new lighting sources, but the athletic field light poles would greatly exceed the height of the replacement trees for many years.

Further, currently, only the eastern portion of the Project site is used at nighttime and there are limited noise impacts from the use of the tennis courts and driving range. The Project would open the entire site up to night time use and would significantly expand the number of persons on the site in the evenings, as well as the noise associated with activities on the site. Night time athletic games and meets, with hundreds of spectators, would generate increased noise levels on areas of the site that previously enjoyed tranquility for bird, bat and other species on the site and on the Zev Greenway. This increased human intrusion, along with the increased use of lighting and removal of mature trees will have major impacts on the ability of the Project site to support wildlife. The spillover noise and light and increased human presence at night will also negatively impact species that rely on the adjacent Greenway in the evening and nighttime.

3. The DEIR Fails to Include Tree Removal Mitigation Recommended by CDFW and Relies on Mitigation That is Not Fully Enforceable.

The DEIR fails to address mitigation set forth by the California Department of Fish and Wildlife (CDFW). CDFW provided scoping comments on the Project identifying the need to phase the tree removal during construction to reduce impacts. The DEIR fails to do so.

Mitigation measure BIO-MM-3 also fails to be fully enforceable. This measure provides for "replacement of each 'non-protected' significant tree removed at a minimum 1:1 ratio," but that goes on to state that the "actual mitigation requirement may be modified by the Department of City Planning." (DEIR IV.C-56.) This measure is not fully enforceable for several reasons. First, the DEIR does not define "significant tree." Thus, there is not an objective standard set for determining which trees will need to be replaced. (*Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467, 520 [mitigation is improperly deferred if it does not rely on objective standards].) The DEIR does not disclose how many replacement trees will actual be required for the Project.

Additionally, it is improper that this mitigation measure could be changed in the future outside of the environmental review process, in violation of the public participation goals of CEQA. (Pub. Resources Code § 21000.) Delegation of mitigation measure development to a post-approval process by lead agency staff has been found to be inadequate. (*Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 793-94.)

Further, the DEIR also again improperly relies on PDFs instead of mitigation measures to reduce the impacts to nesting raptors and songbirds. This fails to adequately disclose, evaluate efficacy and ensure enforceability of the measures. (Section IV.)

D. The DEIR Fails to Analyze and Disclose the Project's GHG Impacts and Mitigation

1. The DEIR's Analysis of GHG Impacts Must Reflect the Reality of the Climate Crisis.

Public agencies must "stay in step with evolving scientific knowledge and state regulatory schemes." (*Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 504; accord CEQA Guidelines § 15064.4.) The Intergovernmental Panel on Climate Change has recently identified that greenhouse gas

("GHG") emissions **must peak** by 2025 in order to limit the global temperature increase to 1.5 degree Celsius. (**Attachment I,** Excerpts Intergovernmental Panel on Climate Change Report.) In order to do so, all sectors must utilize deep emissions reductions. As the Project is expected to begin operation in 2025, all Project activities must align with a decrease in GHG emissions. Any increase in GHG emissions will subvert this goal. The Project will increase GHG emissions relative to baseline; thus, the DEIR must disclose this as a significant impact.

2. The DEIR Fails to Evaluate its Adopted Threshold of Significance, and Fails to Support its Conclusion that the Project will Have No Significant GHG Impacts.

The DEIR states that:

> In accordance with Appendix G of the CEQA Guidelines, a project would have a significant impact related to GHGs if it would:
>
> Threshold (a): Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; **or**
>
> Threshold (b): Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs.

(DEIR, p.IV.G-36, emphasis added.)

The DEIR thus adopts ***two*** thresholds of significance for GHG impacts. In evaluating Threshold (a), whether the Project generates GHG emissions directly or indirectly that may have a significant impact on the environment, the DEIR concedes that the Project would generate an increase of GHG emissions over baseline. (DEIR, p. IV.G-58.) However, the DEIR declines to evaluate whether ***this increase*** would have a significant impact on the environment, instead stating that due to the Project's purported consistency with applicable GHG reduction plans as evaluated in Threshold (b), the Project would not generate significant GHG emissions as defined in Threshold (a). (DEIR, pp. IV.G-58 to 59.)

This is an impermissible omission. The DEIR must actually evaluate the significance of the Project's increase in GHG emissions with respect to Threshold (a). CEQA Guidelines section 15064.4, subdivision (a) requires lead agencies to "make a good-faith effort, ***based to the extent possible*** on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project."

The DEIR states that the Project's GHG emissions would exceed baseline (DEIR, p. IV.G-53), but makes no attempt to show whether such an increase would be significant. Instead, the DEIR states "even a very large individual project would not generate enough GHG emissions on its own to significantly influence global climate change." (DEIR, IV.G-58.) This is not only a severely retrograde position that fails to acknowledge the ongoing climate emergency and the urgency for immediate GHG reductions, but it also contrary to the CEQA Guidelines, which state "A project's incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national or global emissions." (CEQA Guidelines § 15064.4, subd. (b).)

While compliance with GHG reduction plans is but ***one*** factor in determining the significance of GHG impacts (upon a showing of substantial evidence supporting such compliance), the CEQA Guidelines also specify that agencies should consider:

> (1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;
> (2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.

(CEQA Guidelines § 15064.4, subd. (b)(1) & (b)(2).) Accordingly, as Threshold (a) would address both of these factors, the DEIR must actually consider whether the Project's increase in emissions is significant. The failure to do so is an omission of necessary analysis that renders the EIR deficient. (*Friant Ranch, supra,* 6 Cal.5th 502, 514-15.)

Further, the CEQA Guidelines state that compliance with statewide GHG reduction goals may be considered "provided that substantial evidence supports the agency's analysis of ***how those goals or strategies address the project's incremental contribution to climate change and its conclusion that the project's incremental contribution is not cumulatively considerable***." (CEQA Guidelines § 15064.4, subd. (b)(3), emphasis added.) The DEIR has not provided such substantial evidence. In the DEIR and its Appendix C, the DEIR claims that the Project's purported consistency with various state, regional, and local GHG reduction programs justify its increase in GHG emissions, but this so-called consistency is based on several unfounded conclusions.

For example, the DEIR claims consistency with numerous statewide and regional policies that do not govern individual developments like the Project. The DEIR claims credit for emissions reductions resulting from policies such as the Renewable Portfolio Standard applicable to energy sellers, LEV and ZEV regulations applicable to vehicle manufacturers (DEIR, Appendix C, p. 18), Low Carbon Fuel Standard reductions

applicable to fuel suppliers (*Id.*, p. 22), Cap-and-Trade applicable to regulated entities (*Id.*, p. 23), numerous SCAG policies applying to local jurisdictions (*Id.*, pp. 25-29), among others. None of these policies apply to the Project, and all would be in place regardless of whether the Project were developed or not.

Further, even if the DEIR could validly assess comparison of the Project with these policies, agencies are required to "substantiate" their assumptions that the reductions specified in these policies "can also serve as the criterion for an individual land use project." (*Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 62 Cal.4th 204, 228.) The DEIR has not done so here.

The DEIR also inadequately supports its claims that other Project features demonstrate its consistency with GHG reduction plans. The DEIR Appendix C states in a conclusory manner that the Project would comply with SB 350 by meeting the requirements of Title 24, Part 6 and the Green Building Code. (DEIR, Appendix C, p. 18.) A bare assertion of compliance with these regulatory schemes is insufficient to demonstrate that the Project would have no significant impacts. (Cf. *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16.)

The DEIR also claims consistency with regulations intended to reduce mobile source pollution and implement SB 375 by stating that the Project would introduce shuttles that will "reduce" VMT. (DEIR, Appendix C, pp. 20-21.) As we have stated elsewhere, the Project inaccurately estimates VMT, and so this assertion is unfounded. (Section V.J.2.) Additionally, the DEIR fails to acknowledge that the almost daily running of shuttles continuously in the afternoon/evening is a GHG-intense activity.

The DEIR also claims that the Project's inclusion of "conduit and panel capacity" for "future electric vehicle charging stations" demonstrates its consistency with regulations relating to reducing mobile source pollution (DEIR, Appendix C, p. 20), SCAG RTP/SCS policies regarding encouragement of EV usage and fleet conversion (*Id.*, pp. 25, 29), and City Green New Deal policies to include EVs/ZEVs (*Id.*, p. 32.) This "future" Project feature is speculative, and not enforceable as a mitigation measure (see Section IV), and thus does not support the DEIR's conclusion of no significant GHG impacts.

The DEIR states that it would designate a minimum of 33 parking spaces for carpools or alternative-fueled vehicles. (DEIR, Appendix C, p. 20.) While certainly a laudable and worthy feature to include, this feature does not support the EIR's conclusion that the Project will have no significant GHG impacts because such designations are simply unenforceable.

Finally, the DEIR states that the Project's removal of 240 trees somehow supports the City Green New Deal's requirement to reduce the urban heat island effect, simply because the Project would replace a greater number of trees. (DEIR, Appendix C, p. 33.) This wrongfully assumes that the replacement trees, once planted, would immediately perform the same GHG-reducing and heat-reducing functions that the existing trees performed. The DEIR provides no evidence to justify this assumption.

For these reasons, the EIR's conclusion that the Project will have no significant GHG impacts is both unsupported and omits information necessary to informed decisionmaking.

3. The DEIR Improperly Compresses GHG Impacts and Mitigation.

As we have pointed out in other sections, the DEIR improperly compresses analysis of GHG impacts and mitigation, in violation of CEQA. (*Lotus, supra*, 223 Cal.App.4th 645, 656.) This error is fatal to the DEIR, because it precludes meaningful analysis and mitigation of the Project's GHG impacts, precludes analysis of the potential impacts imposed by mitigation measures (CEQA Guidelines § 15126.4, subd. (a)(1)(D)), and prevents a Statement of Overriding Considerations to be adopted if necessary.

The DEIR improperly compresses the analysis by declaring the Project's consistency with relevant GHG reduction plans through the implementation of "GHG reduction characteristics, features, and measures." (DEIR, p. IV.G-54.) The DEIR, however, does not properly analyze the significance of the Project's impacts without imposing such GHG reduction features. Instead, the DEIR makes a misleading comparison by comparing the Project's GHG impacts without any of these reduction features, to the Project *with* the GHG reduction features, and presenting the difference in GHG emissions to show the Project as proposed with the GHG reduction features is superior. (*Ibid*.) This is a strawman comparison, however, as there is no evidence to suggest that a version of the Project without these features is being proposed. Thus, the comparison to a hypothetical version of the Project without these features is misleading.

Further, the "GHG reduction" features do not even show that the Project would have less than significant GHG impacts. One of the features, a solar voltaic system on the gymnasium roof, is an unenforceable PDF that does not reflect a commitment by the Applicant. We have objected to the DEIR's reliance on such PDFs above in Section IV. Further, the solar panels are expected to supply only 11.5% of the Project's energy demand. (DEIR, p. IV.G-50.) The solar voltaic system thus is far from offsetting the Project's GHG impacts.

The DEIR also claims, as a GHG reduction feature, GHG reductions as a result of state requirements to reduce the carbon intensity of the energy supplied by the LADWP. (DEIR, p. IV.G-54.) These reductions do not reflect on the *Project's* impacts because they are dependent on whether LADWP meets its RPS requirements, and not within the control of the Project developer. GHG mitigation measures must be additional; that is, reducing emissions beyond what would otherwise occur (*Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467, 518) and GHG mitigation is illusory unless it provides additionality. CEQA prohibits illusory mitigation. (*Federation of Hillside & Canyon Assn. v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1261; *Katzeff v. California Dept. of Forestry and Fire Protection* (2010) 181 Cal.App.4th 601, 612; *Lincoln Place Tenants Assn v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1508.) As defined by California's Cap-and-Trade program, a GHG offset must "exceed any [GHG] reductions or removals that would otherwise occur in a conservative business-as-usual scenario." (17 Cal. Code Regs., § 95802, subd. (a).) Thus, a GHG mitigation measure must create GHG reductions beyond those that would occur without its implementation. It must also be "real, permanent, quantifiable, verifiable, and enforceable." (Health & Safety Code § 38562, subd. (d)(1).) The DEIR has not shown that its GHG reduction features are additional to what would normally occur.

Finally, the DEIR assumes GHG reductions based on the Project's purported VMT reductions. As noted in Section V.J.2, the DEIR's analysis of VMT is flawed, and does not account for all VMT. Thus, the DEIR's assumed GHG reductions are flawed as well.

The DEIR improperly compressed the analysis of Project impacts and spurious design features meant to mitigate GHG emissions. In doing so, it failed CEQA's mandate as an informational document. To correct this fatal flaw, the DEIR should analyze the impacts of the proposed Project first separately to assess the significance of impacts. Then, the DEIR should apply all feasible mitigation measures to reduce Project impacts.

4. The DEIR Relies on an Unsupported 30-Year Amortization Timeline.

The DEIR fails to disclose the total amount of GHGs expected to be emitted over the life of the Project. Instead, the DEIR relies on the assumption that the Project will have a lifespan of 30 years, and amortizes the construction emissions of the Project over that assumed lifespan. (DEIR, p. IV.G-43.) This lifespan is unsupported by substantial evidence. The DEIR understates the Project's GHG emissions by understating the useful life of the Project. The DEIR cites to a draft guidance document prepared by the South

Coast Air Quality Management District (SCAQMD) staff in 2008 for consideration by the SCAQMD Board ("Board"), discussing proposed Draft SCAQMD Guidance for setting significance thresholds under CEQA for GHG emissions. (**Attachment J**, December 2008 Board Summary.) This was the occasion when the SCAQMD adopted the 10,000 metric tons per year of GHG emissions significance threshold for ***industrial*** projects. (**Attachment J**, p. 2.) However, ***no significance threshold, and no useful lifespan*** were adopted for commercial uses such as the Project site. The Board declined to recommend a lifespan for commercial uses. Thus, insofar as the Project includes commercial activities, a lifespan of 30 years should not be used as an assumption in the EIR.[3]

It is simply not the case, as a matter of law, that SCAQMD requires that the residential and commercial portions of the Project be presumed to have a lifespan of only 30 years. Even if it wished to, the SCAQMD does not have approval authority over those portions of the Project, and could not impose or enforce a 30-year limit to the Project's life. Nor does the DEIR indicate that the Project will accept as a condition of approval that it will cease to operate after 30 years, even if the City proposed to impose one. No practical or legally binding 30-year limitation on the Project's life exists. Hence, the EIR should calculate insofar as possible what the GHG emissions of the Project will be after 30 years and for as long as the Project can reasonably be expected to remain in operation. These emissions must be publicly disclosed, and must be mitigated to the extent feasible. (Pub. Resources Code §§ 21002, 21081(a).)

5. The DEIR Understates the Project's Urban Heat Island Effect.

The DEIR understates the Project's impacts with respect to the urban heat island effect. As the DEIR's Appendix C-2 states, the urban heat island effect describes higher temperatures in urban environments, due to a greater concentration of heat-absorptive surfaces, heat generating activities, and less vegetation than in rural environments. (DEIR, Appendix C-2, pp. 1-2.) The urban heat island effect is important because it contributes to increased concentrations of heat, which leads to numerous deleterious health impacts. (**Attachment L,** Declaration of Dr. Futernick with supporting studies)

The DEIR concludes that because the Project's artificial turf would undergo rapid cooling during the nighttime, it would not retain heat overnight and thus not contribute to the urban heat island effect. This represents a significant gap in the analysis, as the DEIR

[3] A recent Superior Court decision in San Diego County noting that SCAQMD has not adopted a 30-year lifespan for residential/commercial projects is attached to these comments. (**Attachment K** [Decision in EHL v. County of San Diego], p. 3.)

fails to explain how a lack of nighttime heat absorption would relate to the public health outcomes due to increased heat. The DEIR explains that the urban heat island effect is more pronounced at night, but does not assert that the ***outcomes*** of the effect are more pronounced at night. Thus, the DEIR's conclusion is unsupported.

6. The EIR Fails to Include All Feasible Mitigation Measures

Due to its errors in failing to analyze and disclose the Project's significant GHG impacts, the DEIR fails to impose ***any*** GHG mitigation measures, even though the Project will increase GHG emissions.

Lead agencies are required to analyze all feasible mitigation measures. (*King & Gardiner Farms v. County of Kern* (2020) 45 Cal.App.5th 814, 869.) The City must implement numerous GHG mitigation measures to mitigate the significant GHG impacts of the Project. These include:

- Requiring all Project development to be all electric with no plumbing whatsoever for natural gas. Accordingly, no gas-powered water heaters, or any other gas-powered appliance shall be allowed.

- Including photovoltaic solar panels and batteries in the project design to provide the maximum amount of the Project's commercial needs, but in no event, less than 90 percent. The estimated contribution of 11.5% of the Project's energy demand from GHG-PDF-1 is insufficient. (DEIR, p. IV.G-50.)

- Actually constructing enough electric vehicle charging stations in the project design to provide charging capacity adequate to service all anticipated vehicles to the Project site, not solely providing some of the infrastructure for "future" stations (DEIR, p. IV.G-61).

- Including electric heat pumps in the project design to provide air and water heating and cooling.

- Prohibiting gas-powered landscape maintenance equipment.

- Requiring that the shuttles running from the Harvard-Westlake Upper Campus to the Project site are 100% electric and mandating as an enforceable mitigation measure that use of such shuttles is required.

- Providing free transit passes to students, faculty, parents, and anyone who may utilize the Project.

- Providing a free shuttle to and from the nearest Metro Rail stations for events.

- Prohibiting vehicle idling.

E. The DEIR Fails to Provide Enforceable Mitigation for Geotechnical Impacts.

The Project would require a massive amount of grading; as admitted by the DEIR approximately 250,000 cubic yards of material would need to be excavated and exported from the Project site. There are significant hazards to the adjacent Los Angeles River and surrounding community associated with this high level of site excavation, taking place over a number of years. Additionally, this level of excavation is required in part due to the fill and clayey, expansive soils that make up the existing conditions of the Project site.

However, the DEIR improperly relies on imposition of future conditions and proposed Project design to mitigation these potentially significant geotechnical impacts. The DEIR assumes an undisclosed stormwater pollution prevention plan (SWPPP) would eliminate hazards associated with blowing soils and runoff during excavation. As set forth in Section IV, the DEIR's reliance on this future condition, without including it as a mitigation measure, fails to adequately disclose the Project's impacts, fails to assess the adequacy of the measures to mitigate impacts and fails to provide fully enforceable mitigation as required by CEQA.

The geotechnical report found that to reduce the potential seismically-induced liquefaction, the existing upper soils be removed and recompacted for support of the proposed structures. The DEIR's assumption that fill and expansive clay materials will be removed before construction, without including it as a required mitigation measure, similarly fails to fully disclose impacts and provide fully enforceable mitigation.

F. The DEIR Fails to Adequately Disclose and Mitigate Hydrological and Water Quality Impacts.

1. The DEIR Fails to Include Fully Enforceable Mitigation Measures.

The DEIR again improperly relies on PDFs, including to-be developed BMPs and the development of a stormwater capture and reuse system to mitigate hydrological and

water quality impacts associated with the Project. These are mitigation measures, and as set forth above, must be treated as such in the DEIR to adequately disclose impacts, evaluate efficacy, and ensure enforceability. (Section IV.)

2. The DEIR Fails to Provide Adequate Information Regarding Groundwater Infiltration.

The DEIR claims that the Project would have a less than significant impact on groundwater, but fails to provide evidence adequate to support a claim there is no groundwater infiltration currently happening on the Project site. The DEIR geotechnical report found groundwater starting at depths of approximately 25 feet. (DEIR p. IV.F-10.) Thus, there is clearly infiltration currently occurring on the Project site. The DEIR includes an assumption that the groundwater discovered is perched and would not recharge groundwater basins, but not provide evidentiary support for that assumption.

The Project would eliminate all existing groundwater infiltration at the Project site. The DEIR fails to provide an assessment of current infiltration rates on the Project site. Without this information, the DEIR cannot adequately assess the Project's impacts on groundwater recharge. As such, the DEIR fails as an informational document. (*Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 517-18.)

Groundwater infiltration is the top priority use for stormwater for the City of Los Angeles. The Project's elimination of any existing groundwater recharge would be a significant adverse impact that must be disclosed and mitigated. Further, the DEIR fails to provide adequate evidence to claim future groundwater infiltration for the Project is infeasible.

3. The DEIR Fails to Address Water Quality Impacts Associated with Artificial Turf.

The DEIR fails to address the potential water quality impacts associated with the installation of massive amounts of artificial turf as part of the proposed Project. Artificial turf contains toxic fire retardants, UV inhibitors, plasticizers and PFAS. PFAS (Persistent Accumulative Mobil Hazardous) are called forever toxic chemicals. (See https://www.environmentalpollutioncenters.org/news/artificial-turfgrass-contains-toxic-pfas/, incorporated by reference; https://pfasproject.com/2019/10/09/toxic-pfas-chemicals-found-in-artificial-turf/, incorporated by reference.) Studies have found that these chemicals shed in the rain, sun and over time. Artificial turf sheds 600 lbs. of plastic bits per year along with PFAS and this plastic and chemicals do not biodegrade.

The DEIR improperly failed to evaluate the potentially significant water quality impacts associated with the use of artificial turf.

G. The DEIR Fails to Disclose Inconsistencies with Applicable Land Use Plans.

CEQA requires the EIR to discuss any inconsistencies between the proposed project and applicable land use plans. (CEQA Guidelines §15125, subd. (d).) Specifically, Appendix G of the CEQA Guidelines provides that a project would have a significant impact related to land use if it would "cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of mitigating an environmental effect." Under the City's 2006 L.A. CEQA Thresholds Guide, a project has a significant impact on land use if it is:

- Inconsistent with the adopted land use/density designation in the Community Plan, redevelopment plan or specific plan for the site;

- Inconsistent with the adopted designation of the General Plan and Community Plan; or

- Inconsistent with other adopted environmental goals or policies contained in other applicable plans.

As proposed, the Project is inconsistent with several applicable land use policies and regulations, including the City's General Plan, the Los Angeles River Revitalization Plan, and other policies intended to protect wildlife and habitat. The Project further proposes light poles up to 40 feet in excess of the 30-foot height limit and 11-foot-tall fences not otherwise permitted. The Project is also inconsistent with the applicable zoning in that school uses are not permitted without a CUP and in the Project's failure to incorporate community gardening. These are significant environmental impacts that must be disclosed, analyzed, and mitigated before the City may consider the Project further. (*Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 783-4, 32 Cal.Rptr.3d 177.)

The Project site is zoned OS (Open Space) and A1 (Agricultural), more specifically, A1-1XL-RIO. (DEIR p. II-8.) Schools are permitted in A1 zones only with a conditional use permit. The "1XL" denotes a height restriction of 30 feet and a floor area ratio (FAR) of 3:1. The site is also subject to the River Improvement Overlay (RIO) District, due to its proximity to the Los Angeles River. Since the Project would be adjacent to the River, the site is considered in the RIO District's "inner core." Uses in the

RIO district should support the Los Angeles River Revitalization Master Plan. Although the Project is located within an Urban Agriculture Incentive Zone, intended to encourage community gardens, the Project does not propose any garden or garden-related uses.

1. The DEIR Buries the Land Use Analysis in an Appendix.

Preliminarily, it must be noted that the DEIR fails to provide the requisite analysis of the Project's consistency with applicable land use plans in the DEIR itself. Instead, all tables containing the consistency analysis and any discussion of actual, applicable policies, is contained in tables contained in the Appendix. For example, consistency with the 2020-2045 RTP/SCS is hidden in "Table LU-1, Consistency of the Project with Applicable Strategies of the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy Intended to Avoid or Mitigate and Environmental Effect, provided in Appendix J." (DEIR p. IV.J-19.) The same occurs with each and every applicable land use plan (Table LU-2 [General Plan Framework Element], LU-3 [General Plan Open Space Element], LU-4 [General Plan Conservation Element], LU-5 [Sherman Oaks-Studio City-Toluca Lake-Cahuenga Pass Community Plan], LU-6 [Los Angeles River Improvement Overlay District Ordinance]); they are all buried in Appendix J.

"Burying information in an appendix has also been found to frustrate the legally required informational purposes of an EIR." (*Santa Clarita Organization for Planning the Environment v. County of Los Angeles* (2003) 106 Cal.App.4th 715, 723.) Courts have held that a commenter should not be required to "ferret out" information in technical appendices of an EIR. (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2005) 40 Cal.4th 412, 442.) While technical appendices exist for a reason – thousands of pages of numeric inputs to traffic and air quality models in the body of the EIR would be distracting and useless to the public – the information contained in the land use appendices is neither technical nor distracting. Instead, the tables contain the analysis itself. It is insufficient to provide the 30,000-foot level summary in the DEIR, as here. With a summary this basic, any project would be considered broadly consistent with nearly any plan. The DEIR must be revised to include the actual analysis *in* the body of the EIR and recirculated to the public.

2. The Project is Inconsistent with the General Plan.

The City's General Plan is the "'constitution' for future development" located at the top of "the hierarchy of local government law regulating land use." (*DeVita v. County of Napa* (1995) 9 Cal.4th 763, 773.) For this reason, discussed above, inconsistencies with general plan goals to protect specific lands must be disclosed in an EIR. (*Friends of the Eel River v. Sonoma County Water Agency* (2003) 108 Cal.App.4th

859, 881.) Here, the DEIR fails to disclose inconsistencies several General Plan policies, including, but not limited, to:

Framework Element

- The Studio City community has a demonstrated need for additional park space. The Department of Recreation and Parks' 2009 Citywide Community Needs Assessment identified small parks and walking and biking trails as the top priorities. The DEIR claims that the Project supports Framework Element policies concerning recreational opportunities and landscaped open space. The DEIR does not, however, identify the actual amount of time that the recreational facilities will be available to the public; the barriers introduced by the security and fencing; and the additional barriers to use of that recreational space posed by the reservation-only nature. Area residents will not be able to just walk over for a pickup basketball game or for a last-minute tennis game.

- The DEIR claims that the Project will reduce vehicle trips and VMT, in support of the Framework Element, by virtue of its location near transit, but the DEIR does not disclose the low number of Harvard-Westlake students and even lower number of Harvard-Westlake parents and sports fans who use this transit. Instead, the Project's trips will be additive as student athletes will continue to travel to and from school.

- The DEIR states that the Project would support General Plan Framework policies designed to protect the City's "natural resources from encroachment of urban development." (DEIR p. IV.J-21.) Yet, the Project will place 27 light poles of 40 to 70 feet in height in proximity to the Los Angeles River and all of the habitat the Project is ostensibly creating and protecting. On the contrary, the Project will likely frustrate these important policies.

Open Space Element

- For similar reasons, the Project cannot be found compliant with the Open Space Element policies aimed at ensuring the preservation and conservation of sufficient open space to serve the recreational needs of the City. (DEIR p. IV.J-22.) While the existing site is technically private open space, access to the entire site has never been difficult. Under the Project, athletic facilities will be restricted to times when they are not in use by the school's many, many athletic teams, camps, or other programs. It is unclear whether the Project will

actually increase public access to the site, and any conclusions that public access will increase are speculative, at best.

- Open Space Element policies aimed at protecting habitat and conserving wildlife will be frustrated by the Project's 27 light poles and night lighting, contrary to the DEIR's conclusions. (DEIR p. IV.J-22.)

Conservation Element

- The Project will conflict with the overall purpose of the Conservation Element, which is to preserve, protect, restore, and enhance the natural plant and wildlife diversity, habitats, and migratory bird corridors and linkages of the City. The Project will operate 27 sports field lighting poles of heights up to 70 feet, in close proximity to the Los Angeles River. Migratory and resident birds are highly sensitive to nighttime lighting, as are raptors and their prey. At 70 feet tall, these poles are much taller than those currently present on the site and present a greater risk of confusing migratory birds that follow the moon.

Sherman Oaks-Studio City-Toluca Lake-Cahuenga Pass Community Plan

- The DEIR claims that the Project will support a Community Plan need for more neighborhood parks, but fails to acknowledge that the public availability of many of the facilities will be quite limited in practice. (Goals 4 and 5)

3. The Project is Inconsistent with the 2020-2045 RTP/SCS.

The overarching purpose of the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy is to implement SB 375 by reducing vehicle miles traveled. However, the Project would likely *increase* vehicle miles traveled by moving sports practices, games, and other activities that currently occur on-campus to a new, off-campus location. Students will still have to travel to and from school, but they will now make an additional trip to and from the Project. Those miles increase, regardless of whether they occur on the school's proposed shuttle system or in private vehicles. And if they occur in single-occupancy vehicles, the RTP goal of reducing single-occupancy vehicle trips would not be met. These inconsistencies is not discussed in the DEIR. Instead, the DEIR discusses the location of nearby bus routes, which students are unlikely to use. (DEIR p. IV.J-19.)

The RTP/SCS further contains goals aimed at increasing amenities and connectivity within neighborhoods. The DEIR claims that the Project will increase

connectivity with pathways and ADA access and that it will essentially serve as a public park, but this is not actually true. (DEIR p. IV-19.) Public access to athletic facilities will be restricted to times when they are not in school use for practices, games, summer programs, or camps, meaning that public access to the facilities will likely be restricted to weekdays before 3 p.m. – and, even then, if they are not also being used by the school for science or other outdoor activities. The excessive fencing and security will also serve to limit the public use of the site, it is likely to be both confusing and unwelcoming.

The DEIR further claims that the Project would not conflict with policies aimed at reducing electricity reliance because would have sustainability features (DEIR p. IV.J-19), but this conclusion ignores any comparison between the existing facility's energy use and that of the Project, which would have to power several sets of locker rooms, a large gymnasium, and a pool not currently onsite.

The DEIR's claims about the Project's support of migratory bird corridors fail to discuss the impacts of the 70-foot-tall stadium lights. (DEIR p. IV.J-19 and 20.) Thus, the Project likely conflicts with RTP policies concerning wildlife, as well.

4. The Project is Incompatible with the Los Angeles River Revitalization Master Plan and River Improvement Overlay District.

The Project would be located in the inner core of the RIO District, a land use overlay implemented by the City in 2014 to ensure the consistency of land use development along the 32-mile corridor of the Los Angeles River with the Los Angeles River Revitalization Master Plan (LARRMP). The LARRMP's goals are to contribute to the environmental and ecological health of the City's watersheds; provide native habitat and support local species; establish a positive interface between the Los Angeles River and adjacent properties; promote pedestrian, bicycle and other multi-modal connections between the river and surrounding neighborhoods; provide an aesthetically pleasing environment; provide safe, convenient access to and along the river; promote river identity; and support the City's stormwater ordinances and programs. (DEIR p. IV.J.11.)

The Project may conceivably support some of the LARRMP's goals, but it would not further, and would instead frustrate, others. Regarding the goals of establishing a positive interface between the Los Angeles River and adjacent properties and of promoting connections between the river and neighborhoods, the Project would construct literal *barriers* in the form of 10- and 11-foot-tall fences. Existing chain link fences are six feet tall. While the Project would provide pedestrian gates to access the perimeter trail, which would ultimately connect to the river greenway, the proposed system does

not welcome the public. The DEIR heavily emphasizes security, the number of security guards at any time, and the use of other security measures, making it unlikely that the typical river user, or neighborhood pedestrian, would understand that they were permitted, let alone *welcomed*, into an exclusive private school and the adjacent Los Angeles River. The security regime may also discourage users who, even if they understand they are allowed onto the site, may not understand how to use it, or who feel uncomfortable with the security presence or fencing. For example, the DEIR emphasizes the CCTV aspects of the Project. The safety goal may be compromised by the pedestrian trail, which will be squeezed between two, tall fences, potentially preventing escape in the event of criminal activity. It is also unclear how the Project, which would further privatize and heavily fence this river-adjacent "opportunity site," would promote river identity. The Project's sports field lighting will also likely harm local species, particularly birds that could be exposed to the 60 and 70-foot-tall stadium light poles while in flight (and, therefore, not protected by measures restricting the angles or property line lightspill).

The DEIR includes similar justifications for claiming consistency with the RIO District Ordinance requirements. The Project's sports field lighting and scoreboards should be an issue. At the Field A site near the River in the Project's southeastern portion, the Project would install a 25 foot by 8-foot LED and 6, 70-foot-tall light poles. (II-57, Fig. II-27.) Field B, nearer to the River in the western portion of the site, would have 7 light poles and the same score board, including on the west side of Field B, the side nearest the River. One of the lighting poles would abut the Zev Greenway. (II-57, Fig. II-27.) The DEIR addresses the Project's sports field lighting, but claims that it will comply with the ordinance because it will not exceed certain lightspill limits at the Project boundaries. This does not address the unique circumstances of very night lighting far above the ground surface. The sports field lighting has the potential to adversely impact bird species the RIO District is designed to conserve and protect. The Project cannot be found in compliance with the purposes of the RIO District.

Finally, the DEIR makes no attempt to discuss the Project's implications for the Los Angeles River Master Plan Update, the draft of which has been publicly available for over one year. As the Project represents the redevelopment of an important river opportunity site and access point, its continued compliance with the Master Plan is imperative. This information must be included in a recirculated DEIR.

5. The Project is Incompatible with Existing Height and Light Limitations.

The DEIR explains that the Project seeks 27 light poles of up to 70 feet in height, up to 40 feet taller than the 30-foot height limit currently allowed on the property. (DEIR p. IV.J-28.) Similarly, the DEIR seeks to construct 10-foot and 11-foot-tall fences surrounding the Project, in lieu of the 6-foot and 8-foot-tall fences permitted by code. (*Ibid*.) The DEIR then lists other, unrelated approvals needed for the Project. It then concludes:

> Based on the above, the Project would be consistent with applicable regulations or provisions of the LAMC applicable to the Project Site. Therefore, the Project would not result in significant environmental impacts related to inconsistency with the LAMC's land use regulations. As such, impacts with respect to the land use provisions of the LAMC would be less than significant.

(DEIR p. IV.J-29.) The DEIR draws no link between its wish list of unpermitted height increases and the conclusion that impacts will not be significant. The over-height light poles will pose risks to resident and migrating birds, and the over-height fences will impede community use of the allegedly publicly available facilities. These conflicts with the Los Angeles Municipal Code create significant environmental impacts. Either the Project must be revised to adhere to the existing height limits for light poles and fences, or the EIR must be revised to disclose this conflict with applicable law.

H. The DEIR Fails to Comply with CEQA's Requirements for Tribal Cultural Resources.

CEQA includes specific requirements for consultations with Tribes and mitigation of potential impacts to Tribal Cultural Resources. The DEIR's treatment of Tribal Cultural Resources (TCRs) that could be found at the Project site fails to fully comply with CEQA's requirements for both.

CEQA requires the City to consult with Tribes traditionally and culturally associated with the Project site. Two Tribes requested that consultation from the City: the Fernandeño Tataviam Band of Mission Indians (FTBMI) and Gabrieleño Band of Mission Indians - Kizh Nation (Kizh Nation). (DEIR p. IV-N.7; App. N; Pub. Resources Code, § 21080.3.1.) Both Tribes informed the City of the high likelihood of the presence of Tribal Cultural Resources at the Project site. The Kizh Nation provided the City with detailed maps showing the Project site is located within the Village of Cahuenga and along a heavily used trad route, informing the City that "human activity can be

pronounced within the shared use areas due to the combined use by multiple villages and TCRs may be present in the soil layers from the thousands of years of human activity within that landscape." (DEIR App. N.) The DEIR and its Appendix N fail to include usable copies of the maps and historic information provided by the Kitz Nation, only showing that it was an attachment to an email submitted to the City. (DEIR App. N.)

Moreover, despite this clear information from the Kizh Nation and additional information provided by FTBMI, the DEIR downplays the potential for TCRs to be located on the Project site. Instead of using the information provided during consultation, the DEIR relies on the absence of previously discovered resources at the site to claim there would be no impacts to TCRs. (DEIR p. IV-N.11.) This is inadequate for a number of reasons. The overwhelming majority of this site has not previously been excavated in manner that would reveal such resources. The DEIR acknowledges the age of the site and Tribal representatives from two Tribes identified the high likelihood of resources occurring on site. The Project would excavate down 20 feet on large portions of the site, in areas without previous excavation. All of this establishes the potential for impacts to TCRs that require mitigation.

The City's consultation with the Tribes had not been completed as required by CEQA. This consultation is required to continue until one of the following occurs:

> (1) The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource.
> (2) A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached.

(Pub. Resources Code, § 21080.3.2.) Here, both Tribes presented specific mitigation measures that should be included to mitigate for the Project's likely impacts to TCRs. Specifically, FTBMI presented four measures necessary to ensure impacts to TCRs are properly mitigated:

- **FTBMI-TCR1**: In the event that Tribal Cultural Resources are discovered during Project activities, all work in the immediate vicinity of the find (within a 60-foot buffer) shall cease and a qualified archaeologist meeting Secretary of Interior standards shall assess the find. The Lead Agency or applicant shall contact the Fernandeño Tataviam Band of Mission Indians (FTBMI) to consult if any such find occurs.

- **FTBMI-TCR2:** Should the find be deemed significant, as defined by CEQA (as amended, 2015), the Project applicant shall retain a professional Native

> American monitor procured by the FTBMI to observe all remaining ground-disturbing activities including, but not limited to, excavating, digging, trenching, plowing, drilling, tunneling, quarrying, grading, leveling, clearing, driving posts, auguring, blasting, stripping topsoil or a similar activity, and archaeological work.

- **FTBMI-TCR3:** The Lead Agency and/or applicant shall, in good faith, consult with the FTBMI on the disposition and treatment of any Tribal Cultural Resource encountered during all ground disturbing activities.

- **FTBMI-TCR4:** Any and all archaeological/cultural documents created as a part of the project (isolate records, site records, survey reports, testing reports, and monitoring reports) shall be provided to the Fernandeño Tataviam Band of Mission Indians and interested Tribes consulting under AB52.

(DEIR App. N.) The DEIR instead relies on a significantly watered-down version of these measures and condition of approval to mitigate impacts to TCRs. The vague condition relied upon by the DEIR is not identified as a mitigation measure, and is therefore not fully enforceable as required by CEQA. Additionally, its lack of specificity results in improperly deferred mitigation. Further, the City did not agree to the measures presented by FTBMI, nor did it conclude a mutual agreement cannot be reached. Thus, the City has failed to comply with Public Resources Code section 21080.3.2.

The vague condition of approval that the DEIR claims will be imposed on the Project at some point, but not as a mitigation measure in the DEIR, does not include all mitigation measures set forth by CEQA for TCRs.

> (1) Avoidance and preservation of the resources in place, including, but not limited to, planning and construction to avoid the resources and protect the cultural and natural context, or planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
>
> (2) Treating the resource with culturally appropriate dignity taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
>
> > (A) Protecting the cultural character and integrity of the resource.
> > (B) Protecting the traditional use of the resource.

(C) Protecting the confidentiality of the resource.

(3) Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

(4) Protecting the resource.

(Pub. Resources Code, § 21084.3.) The DEIR fails to contemplate preservation of discovered TCRs in place and revising construction plans to avoid these resources. It simply requires a brief halt in construction and to then develop appropriate actions. Having not contemplated how to treat the potential discovery of TCRs now will limit the options available for mitigation, resulting in post hoc rationalization that avoidance of areas that should be protected is infeasible.

I. The DEIR Fails to Disclose and Analyze New Significant Impacts Relating to Noise and Vibration.

1. Effects of Noise Pollution on Health Are Extensive.

"[T]hrough CEQA, the public has a statutorily protected interest in quieter noise environments." (*Berkeley Keep Jets Over the Bay Committee v. Board of Port Com'rs* (2001) 91 Cal.App.4th 1344, 1380.) ***Despite this clear mandate to analyze noise impacts, the DEIR omits a discussion of the extensive health impacts of noise exposure***, as required by CEQA (Cf. *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 521).

Excess noise pollution can cause hearing damage and loss. Loud noise, either experienced as a single event or continuously over time, can damage cells in the inner ear that detect sound and help transmit information on sound to the brain. (https://www.cdc.gov/nceh/hearing_loss/how_does_loud_noise_cause_hearing_loss.html, incorporated by reference.) Damage to these receptor cells is permanent and cannot be repaired. (*Ibid.*) Such damage can make it difficult to hear, including causing difficulties in understanding speech. (*Ibid.*)

Sound level is measured in dBA. (https://www.nonoise.org/library/suter/suter.htm#physical, incorporated by reference.) In 1974 the EPA recommended that the equivalent A-weighted sound level over 24 hours ($L_{eq(24)}$) be no greater than 70 dBA to ensure an adequate margin of safety to prevent hearing loss and damage. (https://nonoise.org/library/levels74/levels74.htm, incorporated

by reference.) To prevent interference with activities and annoyance, the EPA recommended a day-night average sound level no greater than 45 dBA for indoors and 55 dBA for outdoors.

Excess noise can also lead to cardiovascular impacts. Traffic noise "leads to a significant increase in coronary heart disease" as demonstrated by meta-analyses. (**Attachment M**, Hahad et al., *The Cardiovascular Effects of Noise* (2019) 116 Deutsches Ärzteblatt International 245, 246.) Cohort studies "identified a significant association between road traffic noise and the occurrence of myocardial infarctions," i.e., heart attacks. (*Id.* at 247.)

The DEIR must relate these health impacts of excessive noise exposure to the Project's significant noise impacts.

2. The DEIR Fails to Evaluate All Sensitive Receptor Locations.

The DEIR fails to evaluate all sensitive receptor locations. It notes the different land uses that the 2006 Los Angeles CEQA Thresholds Guide identifies as sensitive receptors, but does not identify some of the sensitive receptors near the Project Site. The Thresholds Guide defines noise sensitive as residences, transient lodgings, schools, libraries, churches, hospitals, nursing homes, auditoriums, concert halls, amphitheaters, playgrounds, and parks within 500 feet of a project site. (**Attachment N,** Excerpt Thresholds Guide p. I.1-3.) The most striking omission is the absence of a noise measurement point at the Fire Station. (DEIR, p. IV.K-21.) Because Los Angeles Fire Department (LAFD) staff will presumably be working, residing, and sleeping at that location, there must be a noise measurement point located there.

Additionally, there should be a noise measurement point on the Zev Greenway, on the stretch between Bellaire Ave and Whitsett Ave. Because this stretch is part of a public greenway that abuts the Project Site, there should be a noise measurement taken somewhere along that stretch.

Further, there is a church across the street from the Project Site on Whitsett Ave, the 36th Church of Christ, Scientist. This should also be identified as a sensitive receptor and noise measurement location.

Finally, there is a recording studio located south of the Project site, Media City Sound, located at 12711 Ventura Blvd # 110, Studio City, CA 91604. Because of the sensitive nature of recording, this site should be considered a sensitive receptor for both noise and vibration impacts.

3. The DEIR Must Evaluate Sleep Disturbance.

Excessive sound level can have a profound health impact by disturbing sleep. Sleep disturbance is considered "the most deleterious non-auditory effect of environmental noise exposure . . . because undisturbed sleep of a sufficient length is needed for daytime alertness and performance, quality of life, and health." (**Attachment O**, Basner et al., *Auditory and Non-Auditory Effects of Noise on Health* (2014) 383 Lancet 1325, 1329.) Repeated sleep disturbance can change sleep structure, including "delayed sleep onset and early awakenings, reduced deep (slow-wave) and rapid eye movement sleep, and an increase in time spent awake and in superficial sleep stages." (*Id.* at 1330.) The short-term effects of sleep disturbance include "impaired mood, subjectively and objectively increased daytime sleepiness, and impaired cognitive performance." (*Ibid.*) Exposure to noise during sleep "may increase blood pressure, heart rate, and finger pulse amplitude as well as body movements." (**Attachment P,** Stansfeld and Matheson, *Noise Pollution: Non-Auditory Effects on Health* (2003) 68 Brit. Med. Bull. 243, 244.) In 1974, the EPA observed that a nighttime portion of a day-night average sound level of approximately 32 dB should protect against sleep interference. (**Attachment Q,** https://nonoise.org/library/levels74/levels74.htm, p. 28.)

Despite the potential for these harmful impacts, the DEIR fails to sufficiently analyze sleep disturbance and disclose the Project's risks of sleep disturbance to the public and decisionmakers. The DEIR is required to analyze and disclose "the nature and the magnitude" of the Project's potential impact on sleep disturbance and must connect the potential health impacts of sleep disturbance to the noise impacts from the Project. (*Friant Ranch, supra*, 6 Cal.5th 502, 519–21.) The Project will host sporting events that will run as late as 9:30 p.m., and with spectators filing out afterwards, may not clear out until much later. The Project is also adjacent to a Fire Station, where staff members may be sleeping at various hours throughout the day. The DEIR thus must evaluate whether the Project will impact sleep, as residential sensitive receptors abut the perimeter of the Project. (DEIR, p. IV.K-18.) The DEIR provides no analysis of single event nighttime noise levels to evaluate these impacts. (*Berkeley Keep Jets, supra*, 91 Cal.App.4th 1344, 1372-82 [EIR that failed to study impacts of single event noise levels was inadequate].)

4. The DEIR Fails to Disclose Conflicts with the Los Angeles Municipal Code Noise Regulations.

Section 111.00 of the LAMC states, "[i]t is hereby declared to be the policy of the City to ***prohibit*** unnecessary, excessive and annoying noises from all sources subject to its police power. At certain levels noises are detrimental to the health and welfare of the

citizenry and in the public interests ***shall be systematically proscribed.***" (Emphasis added.) Despite this strong policy, the Project will have significant impacts related to construction noise. If the City were to approve the Project without mitigating these noise impacts, the Project would certainly run counter to this policy.

Section 115.02, subdivision (a) of the Los Angeles Municipal Code ("LAMC") precludes the installation, operation, and use of amplifying equipment within 500 feet of residential zones for commercial purposes at any time. The Project will have paid spectator events, a commercial purpose, with amplified sound, despite the fact that the surrounding land uses include residential zones. Thus, the Project likely conflicts with LAMC section 115.02, subdivision (a).

5. The DEIR Fails to Implement All Feasible Mitigation for Construction Impacts.

The DEIR is required to consider and adopt all feasible mitigation measures. (*King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 852, 866, 869.) The following mitigation measures must be considered:

- Locating or parking all stationary construction equipment as far from sensitive receptors as possible, and directing emitted noise away from sensitive receptors.

- Verifying that construction equipment has properly operating and maintained mufflers.

- Limiting operation hours to daytime hours on weekdays.

- Paving roads where truck traffic is anticipated with low noise asphalt.

- Replacing gas- and diesel-powered equipment (e.g., leafblowers) with electric equipment to reduce the noise impacts associated with operation of that equipment.

J. The DEIR Fails to Analyze And Disclose Significant Transportation and Traffic Impacts and Mitigation.

1. The DEIR Relies on Traffic-Related Project Design Features That Improperly Defer and Segment Analysis and Mitigation of Project Impacts.

The DEIR relies on three Project Design Features ("PDFs") designed to reduce the Project's impact on traffic and circulation. As described above in Section III, this is improper because it compresses the analysis of Project impacts and mitigation, and fails to adequately assess and disclose the Project's impacts to traffic without imposition of the PDFs. (*Lotus, supra*, 223 Cal.App.4th 645, 655-657.)

Further, CEQA requires analysis of "the whole of an action," and prohibits evading comprehensive CEQA analysis by splitting projects into separate pieces. (CEQA Guidelines § 15378; *Bozung v. Local Agency Formation Com.* (1975) 13 Cal.3d 263, 283-84; *Orinda Assn v. Board of Supervisors* (1986) 182 Cal.App.3d 1145, 1171.) Agencies are also prohibited from undertaking post-approval environmental review. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 393-95.)

The PDFs improperly defer analysis of the Project's impacts with respect to construction impacts. The EIR contains a Project Design Feature, TRAF-PDF-1, which defers until after Project approval the preparation of a Construction Management Plan ("CMP"). (DEIR, p. IV.M-26.) The CMP will include "street closure information, a detour plan, haul routes, and a staging plan," and will "formalize how construction will be carried out and identify specific actions that ***will be required to reduce effects on the surrounding community***." (*Ibid*, emphasis added.) This analysis should be included in the EIR so that it can inform the public and decisionmakers whether and to what extent the measures of the CMP, such as street closures, haul routes, staging may create project impacts. Without providing this analysis, the EIR fails to disclose the Project's true impacts with respect to construction. Further, the CMP improperly defers mitigation for the Project's impacts, by deferring analysis of the "specific actions that will be required" to reduce the Project's effects on the surrounding community. Deferred mitigation violates CEQA. (*Endangered Habitats League v County of Orange* (2005) 131 Cal. App. 4th 777, 793-94; CEQA Guidelines § 15126.4(a)(1)(B).) Deferral is permitted when a mitigation measure commits to specific performance standards, but no such standards are included here.

2. The DEIR Fails to Adequately Assess Vehicle Miles Traveled (VMT).

The DEIR fails to adequately assess Project vehicle miles traveled (VMT). Traffic engineer Tom Brohard, P.E., a highly qualified traffic consultant with over 50 years of experience, reviewed the DEIR's transportation analysis. Mr. Brohard noted several deficiencies in the DEIR's analysis of Project VMT. Those deficiencies are identified below, and in **Attachment D**. We request an adequate response to each of Mr. Brohard's comments in his letter which we have attached herewith.

- Harvard-Westlake Trip Lengths - Trip lengths for shuttles and for private vehicles were assumed to be 1.5 miles. The measured distance along the recommended route on Coldwater Canyon Avenue, Moorpark Street, and Whitsett Avenue between the Upper Campus driveway and the passenger loading area on Valleyheart Drive is 1.7 miles. The 1.1-mile length of the return trip from the site back to the Upper Campus for shuttles via the Whitsett Avenue, Ventura Boulevard, and Coldwater Canyon Avenue route was incorrectly omitted from the VMT calculations.

- Freshman Sports - The schedule of events identified three Freshman sports at the site (Girls Field Hockey, Boys Basketball, and Girls Volleyball). VMT lengths for these sports to the Project must be calculated from the Middle School Campus, not from the Upper School Campus.

- Weddington Golf & Tennis - According to Page 24 of the Transportation Assessment, data for one week in September 2019 was provided for tennis users at the existing facility to calculate the daily trip generation and that was then credited against the Proposed Project. This data was not included or disclosed in the Transportation Assessment Appendix for review by the public. There is no information provided as to how the data for tennis players relates to those using the clubhouse or to the golfers using the driving range or the 9-hole par three golf course. The average daily trip generation of 1,022 or 511 round trips requires further study and evaluation to support the resulting net negative, offsetting credit of 2,098 daily VMT.

- Attachment 3C in the Traffic Assessment indicates the existing trips at the site were counted on February 12, 2019. The table indicates that 1,022 daily trips will be removed when the current Weddington Golf and Tennis operation is closed. However, the clubhouse and the putting green will remain open and in use after the site is redeveloped with the Project. Trips and VMT associated with these two remaining uses must be added back into trip generation and VMT for the site. It is

not reasonable to assume trips associated with Weddington Golf & Tennis will be identical during a week in September 2019 and on February 12, 2019.

- Right Turn Only Restrictions - Trip distribution to and from the Proposed Project indicates that 85% of all trips will have a trip end to the north and only 15% of all trips will have a trip end to the south. Right turn only restrictions at the north driveway and Whitsett Street will force 85% of the traffic to travel out of their way to return to their origin north of the Project. In addition, if all Valleyheart Drive vehicles are forced to turn right only on Whitsett Street, then all vehicles leaving the parking structure will be forced to travel 0.1 miles to Ventura Boulevard and then back, adding 0.2 VMT to 85% of the trips leaving the Project.

Additionally, the Transportation Assessment omits analysis of the vehicle trips and VMT associated with the seven acres of the Project site reserved for tennis and golf facilities, a clubhouse and café open to the public. (DEIR, Appendix M, Transportation Assessment, p. 22; DEIR, p. II-33 to -34.) The Transportation Assessment justifies its omission by stating that LADOT exempts "community-serving" recreational facilities from VMT analysis, but does not cite the LADOT Guidelines. (DEIR Appendix M, Transportation Assessment, p. 22.) On the contrary, LADOT Guidelines state that "For school . . . uses that are large in scale and are expected to attract people from a broader area, impacts would need to be further evaluated. . . ." (**Attachment R**- Excerpt LADOT Transportation Assessment Guidelines, p. 2-8.)

The DEIR must be recirculated with a corrected VMT analysis to address these deficiencies.

3. The DEIR Fails to Analyze and Disclose the Project's Impacts to Emergency Access.

The DEIR fails to disclose the Project's impacts to emergency access. The two entrances to parking facilities on the Project Site are located north and south of the LAFD Fire Station 78. (DEIR pp. II-53, II-16.) The south entrance is located immediately west of the Fire Station, and this entrance will serve as the entry point for numerous types of vehicles: vehicles entering the at-grade parking lot, vehicles entering the below-grade parking garage, shuttles and buses, and rideshare vehicles. The south entrance will have a roundabout for vehicles to enter and exit, and a security kiosk to screen access to the roundabout and at-grade parking.

Besides traffic from cars entering and exiting the site, three shuttle buses to the Harvard-Westlake campus will operate every 5 to 10 minutes every weekday from 2:30

p.m. until activities end, and also on days when large events will occur on the site. (DEIR, p. II-55.) During the school year, activities will end no later than 9:30 p.m., and shuttles will ostensibly be running continuously until that time. (DEIR, p. II-47.) This will create excessive and consistent traffic of large vehicles in and out of the Project Site, every weekday afternoon or large event day, creating congestion around the fire station.

All of these project components will result in extensive traffic congestion in and around the fire station entrance, and would block emergency response vehicles from exiting and entering the station. As we stated in our scoping comments, this is the wrong project in the wrong area.

The DEIR's conclusion that the Project will not have significant operational impacts to emergency access is unsupported. As detailed in Mr. Brohard's letter, extensive queueing at the Valleyheart Drive entrance will impede access at the Fire Station. (**Attachment D**, p. 5).) The DEIR states that the Project's lack of installed barriers will prevent impeding of emergency access at the Project site. (DEIR, p. IV.M-45.) While the lack of installed barriers may prevent matters from becoming worse, this point does not address the serious congestion that will occur at the Valleyheart Drive entrance, particularly as vehicles pour into the entrance, stop at the security kiosk, and then route to the appropriate location (e.g., garage, parking lot, roundabout). Further, the DEIR paints an unrealistic picture of the ability of emergency vehicles to cut through the congested traffic at the Project Site. The DEIR states that "Drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic." (DEIR, p. IV.M-45.) These "options" cannot overcome the physical reality of introducing too many vehicles into too constrained of a space. Neither sirens nor driving in the lanes of opposing traffic will help if there is no place for displaced vehicles to go, and the DEIR fails to address this.

For similar reasons, the DEIR's reliance on Project Design Feature TRAF-PDF-2 would likely be ineffective. (DEIR, pp. IV.M-45, IV.M-26.) TRAF-PDF-2 consists of a warning light placed at the south entrance to warn vehicles exiting the Project Site onto Valleyheart Drive that an emergency vehicle is approaching or exiting the Fire Station. (DEIR, p. IV.M-26.) The warning light, however, must be activated by a remote-control button pressed by LAFD firefighters/first responders in the emergency vehicle. As identified by Mr. Brohard's letter, this PDF will not prevent traffic congestion from blocking emergency access. (**Attachment D**, p. 5).) This PDF also does not improve access to the Project Site of other, non-LAFD emergency vehicles. Finally, even if the PDF were theoretically effective, it is unrealistic and places an undue burden on City firefighters/first responders responding to an emergency situation for the benefit of a

private school's recreational facility. Further, it is not clear whether such a PDF would be enforceable, as it places a requirement on the Fire Station, which is not involved with or part of this Project.

The DEIR bases its conclusion that the Project's construction will not have impacts to emergency access on the implementation of a Construction Management Plan ("CMP") as stated in Project Design Feature TRAF-PDF-1. As we have already pointed out, the CMP cannot be used to show that the Project will not have significant impacts to emergency access, because it is an improperly deferred and undefined measure. Although the measure was intended to reduce the Project's impacts, it is not identified as a mitigation measure in the DEIR and thus it is unclear whether the PDF will be retained in the approved Project and enforceable.

4. The DEIR Fails to Evaluate Construction and Project Equipment Which May Cause Hazards.

The DEIR states that the Project will have a less than significant impact in substantially increasing hazards due to geometric design features or incompatible uses. (DEIR, p. IV.M-43.) Yet Project construction will occur for approximately 2.5 years (DEIR, p. II-61), during which construction equipment will be present at the site, which may create hazards. There may also be specialized equipment for maintenance of the athletic facilities which may create hazards at the site. The DEIR must evaluate this. Instead, the Transportation Assessment merely states "The Project's multimodal amenities and location of driveways would not substantially increase transportation hazards." (DEIR, Appendix M at Appendix B.)

5. The DEIR Fails to Analyze and Disclose Conflicts with the Mobility Plan.

The DEIR fails to disclose conflicts with the following policies of the Mobility Plan:

- 1.3 – Safe Routes to Schools: This policy requires the prioritization the safety of school children on all streets regardless of highway classifications. As described above, the Project involves heavy traffic congestion surrounding a fire station, at a facility where students are expected to be traveling in and out of every weekday. The EIR must analyze the Project's consistency with this policy.

- 1.6 – Multi-Modal Detour Facilities: This policy requires the design of detour facilities to provide safe passage for all modes of travel during times of construction. As the project is anticipated to be constructed over 2.5 years and the

Project defers analysis and development of a CMP, the Project conflicts with this policy.

- 1.9 – Recreational Trail Safety: This policy requires balancing of user needs on the City's public recreational trails. Because the Project is adjacent to the Zev Greenway, the EIR must analyze the Project's conflict with this policy.

The DEIR also fails to disclose conflicts with the following objectives of the Mobility Plan (p. 124):

- Decrease VMT per capita by 5% every five years, to 20% by 2035. As described above, the Project fails to accurately assess VMT.

- Meet a 9% per capita GHG reduction for 2020 and a 16% per capita reduction for 2035 (SCAG RTP). The Project will *increase* GHG emissions relative to existing conditions.

6. Expert Analysis Reveals Further Deficiencies of the DEIR.

As described above, traffic engineer Tom Brohard, P.E. reviewed the DEIR's transportation analysis and identified several deficiencies in that analysis. Those deficiencies are identified in **Attachment D**. We request an adequate response to each of Mr. Brohard's comments in his letter which we have attached herewith.

K. The DEIR Fails to Adequately Disclose and Mitigate the Project's Adverse Recreational Impacts.

The existing uses on the Project site include heavily used golf and tennis facilities. The golf course is extremely busy; over 70,000 rounds are played each year, or about 200 rounds per day. It is a public golf course with diverse users and extremely low fees compared to other facilities throughout the City. (**Attachment S**, Weddington Golf: A Case Study In Cultural Relevance And Open Green Space.) "Weddington Golf ..only costs $12 on weekdays, $15 on weekends, and $10 for seniors to play a round." (*Ibid.*) The tennis courts are also extremely popular for use by teams, including the United States Tennis Association Team, leagues, and children's programs. The courts have been home to the tennis teams from a number of high schools and are also home to one of the City's largest tennis leagues, the Los Angeles Tennis Association.

The existing golf course and driving range at the Project site would be completely removed by the proposed Project. The loss of this recreational opportunity would cause a

significant project impact that must be analyzed and feasible mitigation measures or alternatives adopted. The Project would also eliminate half of the existing tennis courts, and limits public use to times the courts are not being used by the School.

While the DEIR relies on the Project including 5.4 acres of public space to absolve the Project of its impacts on recreational facilities, this is noncontiguous space, made up mainly of a walking path connecting the Project facilities that are intended mainly for Harvard-Westlake use. The Project does not include a true park with open space. At the same time, it privatizes the recreational facilities on this site for a significant portion of their operation and during times the public would be most likely to seek use of the facilities. This is contrary to the Sherman Oaks-Studio City-Toluca Lake-Cahuenga Community Plan Policy 4-1.1, which requires the City to "Preserve existing recreational facilities and park space."

L. The Project Could Increase Mosquito Activity in Project Vicinity, Resulting in Potential Public Health Impacts That the DEIR Fails to Address.

The Project site is located next to the Los Angeles River, an area that attracts mosquitoes. West Nile virus can be carried by mosquitoes and mosquitoes carrying this disease have previously been found in the Studio City area. (See, https://ktla.com/news/local-news/studio-city-neighborhood-will-be-sprayed-due-to-high-west-nile-virus-numbers-elevated-mosquito-activity/, incorporated by reference.) The DEIR fails to assess the Project's potential to allow for increased mosquito activity in the area.

As set forth in Section V.C.2, the Project could adversely impact bat populations that currently use the numerous trees located on the Project. Bats help control mosquito populations and thus reducing bat species at the site could lead to increased mosquito activity.

Additionally, the Project site currently contains 42 Blue Gum Eucalyptus trees. Eucalyptus trees are an effective mosquito repellant. (See https://www.simplygreenlawncare.com/blog/outdoor-plants-trees-and-shrubs-to-repel-bugs-this-summer/, incorporated by reference; https://www.fast-growing-trees.com/pages/repel-mosquitoes-naturally-plants, incorporated by reference.)

By decreasing the number of mosquito consumers on the Project site, while simultaneously eliminating a source of mosquito repellant, the Project could increase

mosquito activity, resulting in potential health impacts from this disease vector. The impact should have been analyzed in the DEIR, but was not.

VI. The DEIR's Alternatives Analysis is Inadequate.

A. The DEIR Relies on Overly Narrow Project Objectives.

The DEIR is also required to identify project objectives, are a "clearly written statement of objectives will help the lead agency develop a reasonable range of alternatives to evaluate in the EIR and will aid the decision makers in preparing findings or a statement of overriding considerations, if necessary. The statement of objectives should include the underlying purpose of the project and may discuss the project benefits." (CEQA Guidelines § 15124.) The City must exercise its independent judgment on project objectives, and must not uncritically accept the applicant's objectives. (Pub. Resources Code § 21082.1, subd. (c)(1); *Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 602-603; *Preservation Action Council v. City of San Jose* (2006) 141 Cal.App.4th 1336, 1352; *Save Round Valley Alliance v. County of Inyo* (2007) 157 Cal.App.4th 1437, 1460.)

In addition, use of unduly narrow project objectives violates CEQA (*In Re Bay Delta Coordinated Environmental Impact Report Proceedings* (2008) 43 Cal. 4th 1143, 1166 ["a lead agency may not give a project's purpose an artificially narrow definition"].) Narrowly defining objectives and using that to dismiss consideration of potential alternatives prejudicially prevents informed decision making and public participation. (*North Coast Rivers Alliance v. Kawamura* (2015) 243 Cal.App.4th 647, 668, 671.)

Here, the DEIR includes several broad project objectives, such as:

- Provide opportunities for shared use of a variety of types of recreational facilities and activities for the community.

- Create new publicly accessible open space with a broad array of recreational facilities in a safe and secure environment for the surrounding community and the public to use similar to a City-owned park…

- Increase public access to and enhance the adjacent Los Angeles River and Zev Greenway through a network of publicly accessible pathways

- Replacing non-native trees with native tree species.

- Incorporates sustainable design.

(DEIR p. V-2 to 3.) However, the DEIR also includes a number of overly narrow project objectives that essentially eliminate anything other than the Project exactly as proposed. This violates CEQA.

The underlying purpose of the Project is identified as the providing a supplement to Harvard-Westlake School's athletic and recreational facilities. Several very specific project objectives make clear that the only way to fulfill that overarching purpose is through the Project as proposed. The recreational and athletic facilities are required to provide facilities for all of the following:

- Develop a state-of-the-art indoor and outdoor athletic and recreational facility to support the School's existing athletic programs and co-curricular activities, including basketball, soccer, football, track and field, tennis, swim, water polo, volleyball, fencing, weight training, dance, yoga, physical fitness, and wrestling programs.

(DEIR p. V-2.) This overly narrow project objective requires the excessively dense development of the site that the community has repeatedly objected to and is the cause of many of the Project's impacts. Only a project that provides every single facility at exactly the large size proposed for the Project could meet this objective. This improperly prevents consideration of alternatives and thus violates CEQA.

While a portion of the project objective to provide public use of the site similar to a City-owned park is proper to rely upon, the objective then goes on to specifically designate the design proposed by the Project as being part of the objective, stating that the Project must provide "a community room café, and indoor and outdoor areas for public gatherings, performances, and occasional special events." (DEIR p. V-2.) The DEIR cannot use the project objectives to dismiss the possibility for any other project alternative.

The DEIR also improperly identify measures that are required to mitigate the oversized Project's impacts as being project objectives. This is done through including as an objective the design proposed to address Project impacts:

- Promote compatibility with the surrounding neighborhood through a design that (1) includes mature trees and extensive landscaping along the northern edge of the Project Site; (2) reduces off-site noise effects through placement of recreational

> facilities internal to the Project Site, use of landscaped walls and berms, and use of canopy structures adjacent to pool and playfield areas; (3) limits light spillover and glare through use of field lights with light-emitting diode (LED) technology, timer controls, and shields that comply with LAMC and RIO requirements; (4) provides ample on-site parking and prohibits off-site parking; and (5) maximizes public safety through 24-hour, seven-day a week on-site security, monitored points of entry, and enforcement of a prohibition on off-site parking.

(DEIR p. V-3.) The level of specificity included in this objective is improper. Moreover, relying on a project objective to mitigation Project impacts fails to provide the required assessment of Project's impacts, analysis of mitigation efficacy, and prevents the required full enforceability. (Section IV.) As such, it is in violation of CEQA.

The project objectives are further improperly narrow because they set forth that artificial grass is required. As discussed above, there are numerous adverse impacts associated with the use of artificial turf. Including this as a project objective improperly requires artificial turf be included in the project even if other natural turf would be less impactful.

B. The DEIR Relies on Improperly Narrow Project Objectives to Eliminate Consideration of a Reasonable Range of Alternatives.

The City has a duty under CEQA to evaluate a reasonable range of alternatives to the environmentally damaging proposed Project. (*Laurel Heights I, supra*, 47 Cal.3d at 400.) As the California Supreme Court has stated:

> Under CEQA, the public agency bears the burden of affirmatively demonstrating that . . . the agency's approval of the proposed project followed meaningful consideration of alternatives and mitigation measures.

(*Mountain Lion Foundation v. Fish and Game Commission* (1997) 16 Cal.4th 105, 134, emphasis added; accord *Village Laguna of Laguna Beach v. Board of Supervisors* (1982) 134 Cal.App.3d 1022, 1035.) As the Court has said, while an EIR is "the heart of CEQA", the "core of an EIR is the mitigation and alternatives sections." (*Citizens of Goleta Valley v. Bd. Of Supervisors* (1990) 52 Cal.3d 553, 564.) Preparation of an adequate EIR with analysis of a reasonable range of alternatives is crucial to CEQA's substantive mandate to "prevent significant avoidable damage to the environment" when alternatives or mitigation measures are feasible. (CEQA Guidelines § 15002(a)(3).)

Section 15126.6 of the CEQA Guidelines requires that an EIR "describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives . . . even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly." This discussion must include "sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project," and expressly must address "[t]he specific alternative of 'no project,'" the purpose of which "is to allow decisionmakers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project." Moreover, alternatives are not required to meet all project objectives, and in reality it "is virtually a given that the alternatives to a project will not attain all of the project's objectives." (*Watsonville Pilots Ass'n v. City of Watsonville* (2010) 183 Cal.App.4th 1059, 1087.)

Unfortunately, the DEIR's artificially narrow approach for describing the project objectives discussed above, improperly served to ensure that the results of its alternatives analysis would be a foregone conclusion. "One of [an EIR's] major functions ... is to ensure that *all reasonable alternatives* to proposed projects are thoroughly assessed by the responsible official." (*Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 565.) This DEIR fails to meet that function. When discussing alternatives rejected from consideration, the DEIR makes clear that only those alternatives that include every single athletic facility they have identified for the proposed Project would be considered, rejecting on reduced facilities or limits on use claiming these fail to meet basic project objectives. (DEIR p. V-7 to V-8.)

Instead, the DEIR only includes a stacked deck consideration of all student athletic facilities included in the proposed Project with public access limitations and a no project alternative that would cease existing operations.

The DEIR establishes improper limits to reject consideration of an off-site alternative. Additionally, SCRA and SLAROS presented several alternatives in scoping comments that should have been evaluated but were not, including a Natural Park alternative and a true Reduced Density Alternative. Herein, we propose an additional alternative that would preserve the historic Weddington Golf Course, while enhancing stormwater facilities.

1. The DEIR Failed to Consider Off-Site Alternatives.

The DEIR should have, but failed to consider alternative project locations. (CEQA Guidelines § 15126.6, subds. (a), (f)(2).) The DEIR improperly rejects

consideration any alternative location based on a claim that every single item on Harvard-Westlake's wish list needs to be provided and provided at the same site, claiming: a property would need to be of sufficient size to accommodate two playing fields, tennis courts, a pool, all with respective bleachers, and a gymnasium that would provide for recreational practice and instruction, as well as allow for competitive meets with available spectator seating and adequate onsite parking to preclude off-site parking" (DEIR p. V-6.)

As set forth above, this rejection of any alternative site is based on reliance on improperly narrow project objectives. (Section VI.A.) Additionally, the DEIR provides no reason that the sports facilities and fields need to all be located at the same site. Harvard-Westlake's baseball and softball team currently and would continue to use separate facilities in Encino. There is no reason other teams could not also be located at differing sites.

2. The DEIR Failed to Consider Reasonable Alternatives That Would Meet Many of the Project Objectives.

Initially, the analysis contained within the DEIR must be revised pursuant to the comments set forth above to allow for an accurate comparison of the proposed Project and potential alternatives. Once impacts are correctly assessed as significant, the discussion of alternatives must "focus on alternatives to the Project or its location which are capable of avoiding or substantially lessening any significant effects of the Project, even if these alternatives would impede to some degree the attainment of project objectives, or would be more costly." (CEQA Guidelines § 15126.6(b).)

a. The DEIR Failed to Assess the Proposed Los Angeles River Natural Park Alternative.

SCRA and SLAROS presented detailed information to the City regarding a Los Angeles River Natural Park Alternative for the Project site and requested this alternative be analyzed in the DEIR. (**Attachment T**, LA River Natural Park Analysis.) This alternative has been supported by SCRA, SLAROS, the Santa Monica Mountains Conservancy, the Chair of the California State Senate Committee on Natural Resources and Water and many others as a multi-use project for the site with many community and ecosystem benefits.

The Los Angeles River Natural Park Alternative concept was created using the following guiding principles:

- Emphasize, celebrate and protect the regional importance of the site
- Preserve and enhance connections and public access to the Los Angeles River
- Improve water quality by integrating natural treatment of urban runoff
- Provide for regional public access to the Los Angeles River and other river trails
- Emphasize pedestrian access and links to public transit
- Restore native habitat and preserve open space
- Preserve historic recreational uses
- Address regional and community needs and concerns
- Assist in meeting Los Angeles River and regional water quality improvement goals of the Santa Monica Mountains Conservancy and other conservation organizations
- Be consistent with the City of LA's Los Angeles River Revitalization Master Plan and the County of LA's Los Angeles River Master Plan

The Los Angeles River Natural Park Alternative combines a multi-acre Los Angeles riverfront park along the regional L.A. River Greenway with native habitat designed for runoff catchment, filtration and treatment systems to improve water quality in the Los Angeles River and assist in achieving State regulatory requirements and water quality improvement goals for the Los Angeles River. It also provides trail, habitat and open space lands immediately adjacent to the Los Angeles River. The Project site is the only remaining undeveloped site along 22 miles of the Los Angeles River in the San Fernando Valley where these recreational, biological, and water quality goals can be attained. The Los Angeles River Natural Park Alternative would improve water quality in the River by creating and restoring native habitats and naturally capturing and cleaning polluted urban runoff from 200 acres of the surrounding urbanized area.

This alternative would also retain the existing driving range, putting green and most of the tennis facilities, and would connect the Project site to the Los Angeles River Greenway Trail with public walking trails, viewing terraces, and ADA-compliant access. This alternative would provide the full range of native habitats necessary to sustain species biodiversity of plants, birds and animals, including open water, marsh, riparian and upland habitats, which would be engineered to naturally remove sediment, trash, debris, fertilizers, heavy metals, suspended solids, bacteria, oil and grease and pesticides. The Los Angeles River Natural Park would also include walking trails, a visitor center,

interpretive signage, shade structures and solar power generated on site to make the project "grid-neutral". The Los Angeles River Natural Park Alternative was specifically designed to achieve the objectives of the LARRMP.

SCRA and SLAROS also submitted comments detailing the feasibility of this alternative. (**Attachment U**, September 29, 2014 SCRA and SLAROS comments on the draft EIR for the Senior Living Center Project, incorporated by reference.) The technical feasibility studies regarding this alternative were conducted by Community Conservation Solutions, Mia Lehrer and Associates Landscape Architects, BlueGreen Consulting and Psomas Engineering. (**Attachment T**.)

In addition to technical feasibility, this alternative is also be financially feasible. Significant bond, grant and other funding has become available in recent years to address Los Angeles County and State of California water quality and lack of adequate park space. Of particular interest for this Natural Park Alternative is Measure W funding, the Safe, Clean Water Program adopted and funded by an overwhelming majority of voters. (See https://safecleanwaterla.org/scw-program-details/, incorporated by reference.)

Further, this alternative would meet a number of project objectives by provide a variety of recreational opportunities, providing opportunities for science labs and outdoor classes, creating publicly accessible open space, increasing public access to the Zev Greenway, restoring native plant communities and RIO-compliant tree species, promoting neighborhood compatibility, using sustainable and green design and preserving the historic clubhouse. This alternative should also be considered in conjunction with the alternative sites that allows other sites to provide additional athletic facilities.

b. The DEIR Should Have Evaluated a Natural Golf Course Alternative.

The DEIR should have also considered a version of the Natural Park Alternative that includes a revised and sustainable 9-hole golf course. The existing Studio City Golf Course is popular with local residents and those throughout Los Angeles and has been for many years. (**Attachment V**, ASGA, Water and Golf, Case Studies in Water Stewardship.) In recent years, existing golf courses have successfully investigated the potential to significant increase the sustainability of this land use. Since golf courses maintain sites as open space, they provide significant opportunities for groundwater infiltration and stormwater capture and reuse. (**Attachment V**.)

An alternative relying on similar design and principles to the Los Angeles River Natural Park Alternative, but that incorporates a golf course into the open space should also be considered. For the reasons set forth above regarding the feasibility of the Los Angeles River Natural Park Alternative, this alternative is also feasible.

c. The DEIR Failed to Considered a Reduced School Use Intensity Alternative.

As set forth in this comment letter, many of the Project's impacts result from the Harvard-Westlake's attempts to cram far too much building and too many uses on to this unique and sensitive site. SCRA and SLAROS provided scoping comments urging the City to include a "Reduced Intensity Alternative" that limits the amount of new development on the Project site for Harvard-Westlake athletic facilities and the intensity of uses to reduce the Project's traffic, noise, biological, aesthetic, cultural resource, hydrological and other impacts. The DEIR failed to include any such reduced development and intensity alternative. The failure to provide an analysis of such alternative violates the rule of reason that an EIR must present a reasonable range of alternatives, especially in light of the Project's significant adverse impacts

C. The Alternatives Included in the DEIR are Inadequate.

1. The No Project Alternative Relies on Unsupported Changes at the Project Site.

The DEIR turns the alternatives analysis into a post-hoc rationalization for the proposed Project by purposefully designing alternatives with the intent they would be rejected. The DEIR starts by making improper assumptions to allow for rejection of the No Project Alternative. CEQA requires that an EIR evaluate a "no project" alternative. "The purpose of describing and analyzing a no project alternative is to allow decisionmakers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project." (CEQA Guidelines § 15126.6, subd. (e)(1).)

While this no project alternative analysis is required to discuss the existing conditions, it must also assess "what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services." (CEQA Guidelines § 15126.6, subd. (e)(2).) The DEIR instead assesses a No Project alternative based on unsupported assumptions, stating: the DEIR "assumes that no new development would occur within the Project Site. The current Weddington Golf and Tennis facility would discontinue operation because the current use is not consistent with the School's educational mission or financially sustainable for the School." (DEIR p. V-9.) The DEIR assumes the entire site would be shuttered and unused. This disregards a number of relevant factors. First, the golf course, driving range and tennis courts are all currently heavily used. The DEIR provides no information to support a claim that they would not continue to be frequently used. The DEIR also fails to provide evidentiary support that operation of the Weddington Golf Course, which has operated for more than 60 years.

Further, this fails to consider the reasonable expectation that the Project site would be sold or otherwise acquired by an entity other than Harvard-Westlake if it is not developed as a School athletic facility campus. Significant grant and other funding is available to acquire this site for use as a public park or for watershed protection and habitat due to it being one of the largest open space areas located along the Los Angeles River. Failure to consider these reasonable possibilities is a CEQA violation. (*Save the Hill Group v. City of Livermore* (2022) 76 Cal.App.5th 1092.)

2. The Alternatives Contained in the DEIR Are Designed to Fail.

The DEIR considers only limited alternatives, that are designed to increase impacts and fail to comply with legal requirements. This is inadequate under CEQA.

The DEIR includes three alternatives, all designed to eliminate legally required and fundamentally important aspects of the Project. All three alternatives eliminate inclusion of the stormwater capture and reuse system. (DEIR p. V-4.) The DEIR fails to explain how these alternatives would otherwise include on-site stormwater retention and reuse as required the City's LID regulations.

All three alternatives also eliminate the subterranean parking garage and instead use large portions of the Project site for surface parking. This turns large portions of one of the few remaining open space sites located adjacent to the Los Angeles River into a parking lot. (See DEIR p. V-74, Fig V-1.)

In addition to the elimination of the stormwater recapture system and subterranean parking, Alternative 2 includes construction of one of the athletic fields elevated above at-grade parking, similar to a plan previously rejected on Harvard-Westlake's Coldwater Canyon campus. This elevates and increase the impact of the noise and lighting associated with use of the athletic field on the surrounding residential community and the adjacent biological resources.

Alternative 3 would also include the above identified subsurface eliminations. It would retain both athletic fields, the massive gymnasium building and swimming pool, but would eliminate the tennis courts as well as approximately half of the public open space on the Project site.

Alternative 4 would eliminate all public access to the Project site, a clearly unacceptable alternative. It would also eliminate open space and walking paths, as well as the connection to the Zev Greenway.

All three of these alternatives fail to reduce any of the excessive density of school athletic facilities wedged onto the site by the Project and eliminate only legally required, impact reducing and public benefit aspects of the Project. Thus, they are all improperly designed to fail and provide a false choice between a bad project and worse versions of the same bad project.

D. CEQA's Substantive Mandate Requires Adoption of Feasible Alternatives and Mitigation Measures.

Projects with significant environmental impacts *may not* be approved "if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects . . ." (Pub. Resources Code § 21002.) More specifically, CEQA states:

> Pursuant to the policy stated in Sections 21002 and 21002.1, no public agency shall approve or carry out a project for which an environmental impact report has been certified which identifies one or more significant effects on the environment that would occur if the project is approved or carried out unless . . .:
> (a). . . (3) Specific economic, legal, social, technological, or other considerations . . . make infeasible the mitigation measures or alternatives identified in the environmental impact report.

(Pub. Resources Code § 21081.) It is settled law that:

> CEQA contains *substantive* provisions with which agencies must comply. The most important ... is the provision requiring agencies to deny approval of a project with significant adverse effects when feasible alternatives or feasible mitigation measures can substantially lessen such effects.

(*Sierra Club v. Gilroy City Council* (1990) 222 Cal.App.3d 30, 41, italics added.)

"Feasible" is defined as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors." (Pub. Resources Code § 21061.1.) The definition *does not* require the agreement of the project applicant. "Each public agency shall mitigate or avoid the significant effects on the environment of projects that it carries out or approves *whenever* it is feasible to do so." (*Lincoln Place Tenants Ass'n v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1508, emphasis added.)

The DEIR admits that that the Project would have significant construction noise impacts. Throughout this comment letter, we establish that the Project would have numerous other significant adverse impacts that the DEIR fails to disclose. The feasible alternatives identified in the preceding section would substantially lessen and/or eliminate significant adverse impacts resulting from the Project. Thus, under CEQA's substantive mandate, the City cannot approve the Project as proposed.

VII. Conclusion

For all of the reasons set forth herein, SCRA and SLAROS find the DEIR to be wholly inadequate. If this Project does move forward as proposed, which we urge the City not to allow, a revised DEIR must be recirculated to address the many failings.

Additionally, we ask that you inform us of any future Project notices pursuant to Public Resources Code section 21092.2 and applicable Municipal Code requirements. We further request that you retain all Project related documents including correspondence and email communications as required by CEQA. (*Golden Door Properties, LLC v. Superior Court of San Diego County* (2020) 52 Cal.App.5th 837 [agency "must retain writings"].)

Thank you for your consideration of these comments.

Sincerely,

Amy Minteer
Sunjana Supekar

FOOTNOTES

1. Includes associated parking.
2. Height District No. 1VL.
3. Height District No. 1L.
4. Within the Ventura/Cahuenga Boulevard Specific Plan area the height districts and floor area ratios for commercial and multiple family residential development shall be governed by the regulations of the specific plan.
5. Height District No. 2.
6. Open Space designations on the Plan map conform to the definition of "Open Space Land" set forth in Article 10.5 of the State of California Government Code and to the City's Open Space Plan.
7. Desirable Open Space is land which possess open space characteristics which should be protected and where additional development controls such as proposed in this Plan and Open Space Plan are needed to conserve such characteristics. These lands may be either publicly or privately owned. Conservation of such characteristics is needed to ensure the usefulness, safety and desirability of adjacent lands and to maintain the overall health, safety, welfare and attractiveness of the community.
8. Land located in hillside areas may be developed in accordance with the following criteria: (a) less than 15% natural slope - according to the density category shown on the Plan Map; (b) when located in a minimum, very low or low designation with a 15% natural slope or greater - a maximum of 1.0 D.U./acre.
9. Boxed symbol denote the general location of a potential facility. The symbol does not designate any specific property for acquisition.
10. Local streets and freeways are shown for reference only.
11. Map designations for Collector Streets, Secondary Highways and Major Highways which does not occupy existing dedicated rights-of-way denotes proposed general locations and are not intended to indicate acquisition of any specific private properties.
12. Hillside roads may be developed to hillside or lesser standards as dictated by terrain or environmental factors.
13. Existing mobilehome parks are consistent with the Plan. Future mobilehome parks shall be consistent with the Plan when developed in the RMP Zone.
14. The Public Facility (PF) planning land use designation is premised on the ownership and use of the property by a government agency. The designation of the PF Zone as a corresponding zone is based on the same premise. The Plan also intends that when a board or governing body of a government agency officially determines that a property zoned PF is surplus, and no other public agency has indicated an intent to acquire, and the City is notified that the agency intends to offer the property for sale to a private purchaser, then the property may be rezoned to the zone(s) most consistent within 500 feet of the property boundary and still be considered consistent with the adopted Plan.
15. Each Plan category permits all indicated corresponding zones as well as those zones referenced in the Los Angeles Municipal Code (LAMC) as permitted by such zones unless further restricted by adopted Specific Plans, specific conditions and/or limitations of project approval, Plan footnotes or other Plan map or text notations.

    Zones established in the LAMC subsequent to the adoption of the Plan shall not be deemed as corresponding to any particular Plan category unless the Plan is amended to so indicate.

    It is the intent of the Plan that the entitlements granted shall be one of the zone designations within the corresponding zones shown on the Plan, unless accompanied by a concurrent Plan Amendment.
16. For the area bounded by Dickens Street on the north, Valley Vista Boulevard on the south, Saugus Avenue on the west, and Van Nuys Boulevard on the east, the minimum lot size shall be not less than 15,000 square feet.
17. The minimum lot size for properties bounded by Saugus Avenue on the west, Van Nuys Boulevard on the east, south side of Dickens Street on the north to the north side of Valley Vista Boulevard on the south, shall be no less than 15,000 square feet.

* Bikeways are shown on the Citywide Bikeways System maps contained in the 2010 City's Bicycle Plan, a component of the Transportation Element of the General Plan, which was adopted by the City Council on March 1, 2011.

American Lung Association.

State of the Air 2022

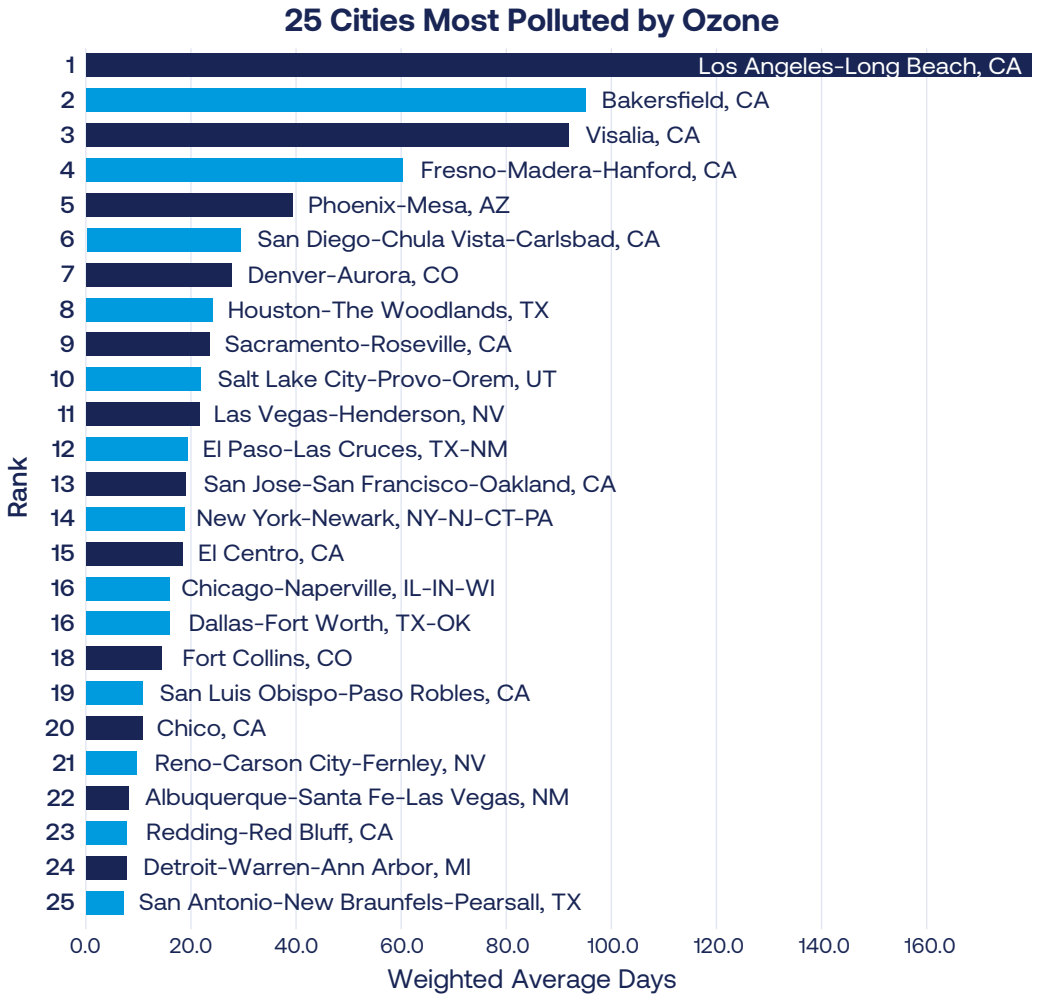
Tracking Air Pollution & Championing Clean Air

Pages Intentionally Omitted

Unlike the worst 25 cities for the daily measure of particle pollution, the worst 25 cities for long-term particle pollution were more distributed around the country. In addition to cities most affected by western wildfires, cities with high power plant emissions as well as local industrial and mobile sources continued to show up on this list. These included Cincinnati, Indianapolis, Pittsburgh, Detroit, Philadelphia, Chicago, Houston, St. Louis, Augusta and Shreveport.

For year-round average levels of fine particles, all cities but the ten most polluted meet the current national air quality standards and get a passing grade in "State of the Air". However, evidence shows that no threshold exists for harmful effects from particle pollution, even below the official standard. The Lung Association continues to advocate for standards more protective of health for fine particle pollution. *See **Recommendations for Action**.*

Ozone Pollution Trends



3 out of every 8 Americans live in counties with **F grades** for **ozone smog**

Exposure to unhealthy levels of ozone air pollution continues to make breathing difficult for millions of Americans all across the country. In the years 2018, 2019 and 2020, more than 122.3 million people lived in the 156 counties that earned an F for ozone. That is fewer than in the past four reports, but more than the 116.5 million people in the 2017 report. There are still a lot of vulnerable people, including 27.8 million children and 18.5 million people age 65 or older, exposed to ozone air pollution and increased risk of harm.

The list of 25 cities with the worst ozone pollution in "State of the Air" 2022 and their order of ranking remained relatively stable compared with last year's report. Cities that improved enough to move off the list were Milwaukee and Sheboygan, Wisconsin; Philadelphia; and the Washington-Baltimore metro area. They were replaced by San Luis Obispo, Reno, Detroit and San Antonio.

Cities in the West and the Southwest continue to dominate the most ozone-polluted list. California retains its historic distinction of having the most cities on the list, with 11 of the 25 most-polluted cities. The Southwest fills most of the remaining slots, with an equal number. In this year's report, only three of the worst 25 cities for ozone are east of the Mississippi River. And no metropolitan areas in the Pacific Northwest, the Mid-Atlantic or the Southeast rank among the 25 worst cities most polluted by ozone.

Overall, the 25 most ozone-polluted cities in the U.S. experienced fewer bad air days on average from 2018 to 2020 than did those in last year's report covering 2017 to 2019. Five California cities on the list plus the New York metro area recorded their fewest days of high ozone in the report's 23-year history, although three of them are still among the ten most ozone-polluted cities in the nation.

The geographical distribution of cities with the worst ozone problems continues a trend seen over the past six reports: fewer eastern cities and more western cities. Oil and gas extraction and population growth in the Southwest and improved cleanup of power plants in the East have shifted the cities that experienced the greatest number of unhealthy ozone days. However, there are still problems in the East, not only from mobile sources and industry, but also from transported pollution when ozone and ozone precursors enter from upwind sources, nearby and even from as far as the Midwest. For example, Fairfield County, Connecticut is the county with the highest ozone in the eastern half of the nation, in part because of pollution transported from other states.

Higher temperatures over longer periods also make a difference. Although cleanup of ozone precursor pollutants has been working to reduce ozone concentrations, climate change, with its higher temperatures and more frequent stagnation events, plays a significant role in making the number of unhealthy ozone days higher than it would otherwise be. Simply, climate change is undercutting the progress we would have made. The Lung Association continues to advocate for standards more protective of health for ozone pollution that better reflect the current science. *See **Recommendations for Action** for details.*

The three years covered by **State of the Air 2022** ranked among the **seven hottest years** on record globally.

Health Impact of Air Pollution

Health Effects of Particle Pollution

Particle pollution—also known as particulate matter—is a deadly and growing threat to public health in communities around the country. The more researchers learn about the health effects of particle pollution, the more dangerous it is recognized to be.

What is Particle Pollution?

Particle pollution refers to a mixture of tiny bits of solids and liquids in the air we breathe. Particle pollution comes from many sources. Factories, power plants, and diesel- and gasoline-powered motor vehicles (cars, trucks and buses) and equipment either directly emit fine particles or generate other pollutants such as nitrogen oxides (NOx), known as precursors because they can then form into fine particles in the atmosphere. Other sources of particle pollution include wildfires, burning wood in wood stoves or residential fireplaces and burning biomass for electricity.

Individual particles may be too small to be visible, but when pollution levels are high, they can make the air appear thick and hazy. Researchers and regulators categorize particles according to size, grouping them as coarse, fine and ultrafine. Coarse particles, called PM_{10}, can include wind-blown dust, ash, pollen and smoke. Fine particles, $PM_{2.5}$, are most often a by-product of burning wood or fossil fuels. The tiniest are called ultrafine particles, or $PM_{0.1}$, which are also produced by combustion.

The differences in size make a big difference in where and how particles affect our health. Our bodies' natural defenses help us to keep coarse particles out of the deepest parts of our lungs, although these particles do deposit in the larger airways. However, those defenses do not keep smaller fine or ultrafine particles from penetrating to the air sacs of the lungs. Many of these particles get trapped in the air sacs, while the smallest are so minute that they can pass from the air sacs into the bloodstream and disperse to other organs of the body.

What Can Particles Do to Your Health?

Particle pollution can be very dangerous to breathe, especially at higher concentrations. It can trigger illness, hospitalization and premature death. Researchers estimate that $PM_{2.5}$ is responsible for nearly 48,000 premature deaths in the United States every year.[1]

Short-Term Exposure

Short-term spikes in particle pollution that last from a few hours to a few days can kill. Premature deaths from breathing these particles can occur on the very day that particle levels are high, or up to a month or two afterward. Most premature deaths are from respiratory and cardiovascular causes. Particle pollution does not just make people die a few days earlier than they might otherwise—in many cases these deaths would not have occurred for years if the air were cleaner.[2]

Studies linking short-term exposure to $PM_{2.5}$ to death from all causes have been accumulating for a number of years. Taken together, this body of research provides consistent evidence of positive associations between particle pollution and mortality across diverse geographic locations and in populations with a wide range of demographic characteristics. Recently, a large international study found an association between short-term exposure to $PM_{2.5}$ and daily all-cause, cardiovascular and respiratory mortality in more than 600 cities across the globe.[3]

Summertime should be a great time to be outdoors in Montana, with warm weather and sunshine in a state full of natural splendors. But wildfire smoke often forces people to stay indoors.

Bailey B. lives in Butte, a western Montana city surrounded by mountains on three sides. Some days in the summer, thick smoke fully obscures the mountains. "There are times you can't go outside in the summertime," she says.

"There's no point in going outside if you can't breathe."

She notices more issues with runny noses, irritated eyes and coughing when wildfire smoke is in the air. Her father-in-law, who uses supplemental oxygen, can't leave the house on such days without wearing a good mask.

A Montana resident for the last 12 years, Bailey looks forward to hiking and camping in the summer, but she says wildfire smoke makes her consider spending those months elsewhere.

"The air quality in Montana is bad enough that if I could leave in the summers, I would."

Bailey B.
Butte, Montana

Even low daily levels of fine particles can be deadly. A 2016 study found that people aged 65 and older in New England faced a higher risk of premature death from particle pollution, even in places that met current standards for short-term particle pollution.[4] Looking nationwide in a 2017 study, researchers found more evidence that older adults faced a higher risk of premature death even when levels of short-term particle pollution remained well within the current national standards. This was consistent whether the older adults lived in cities, suburbs or rural areas.[5]

Particle pollution also has many other harmful effects, ranging from decreased lung function to heart attacks. Extensive research has linked short-term increases in particle pollution to:

- increased mortality in infants;[6]
- increased hospital admissions for cardiovascular disease, including heart attacks and strokes;[7]
- increased hospital admissions and emergency department visits for chronic obstructive pulmonary disease (COPD);[8]
- increased severity of asthma attacks and hospitalization for asthma among children.[9,10]

Year-Round Exposure

Decades of research have firmly established that breathing particle pollution day in and day out can also be deadly. Across numerous seminal studies that looked at different groups of people living in different parts of the country, the results consistently showed a clear relationship between exposure to particulate matter and mortality.[11]

Recent research using publicly available data on a cohort of more than one million adults in the U.S. reconfirmed that long-term exposure to $PM_{2.5}$ was associated with elevated risks of early death. The increased risk was primarily associated with death from cardiovascular and respiratory causes, including heart disease, stroke, influenza and pneumonia. Researchers also found a similar association between exposure to fine particle pollution and an increased risk of death from lung cancer among never-smokers.[12] Another study of 68.5 million Medicare-enrolled adults in the United States between 2000 and 2016 found a 6-8% increase in risk of all-cause mortality for every 10μg/m^3 increase in $PM_{2.5}$.[13]

Research has also linked year-round exposure to particle pollution to a wide array of serious health effects at every stage of life, from conception through old age. Among pregnant people, fetuses and children, long-term particle pollution exposure is linked to:

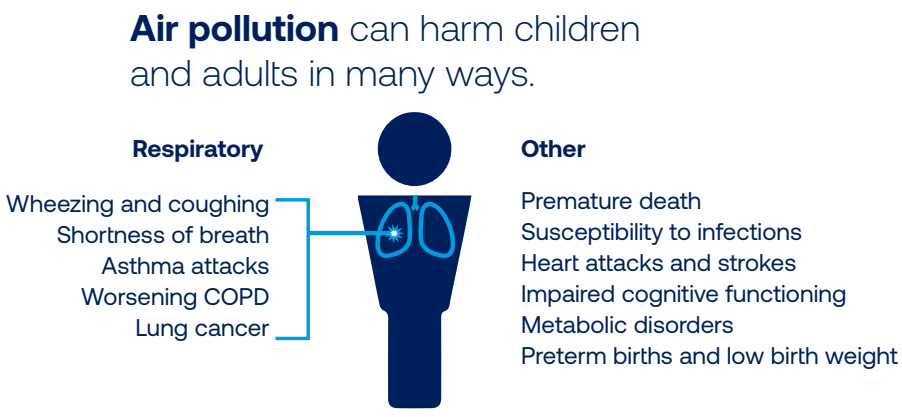
- Increased risk of preterm birth and low birth weight;[14]
- Increased fetal and infant mortality;[15]
- Reduced lung development and impaired lung function in children;[16]
- Higher likelihood of children developing asthma.[17]

In adults, long-term particle pollution exposure is linked to:

- Increased risk from existing cardiovascular and respiratory disease, including a worsening of heart disease, atherosclerosis and COPD;[18,19]
- Higher likelihood of developing diabetes;[20]
- Higher likelihood of getting lung cancer and of dying from it;[21]
- Impaired cognitive functioning and an increased risk of Parkinson's disease, Alzheimer's disease and other dementias later in life.[22,23]

The good news is, cleaning up particle pollution makes a difference. Research has shown a consistent relationship between decreasing $PM_{2.5}$ concentrations and improving respiratory health in children and adults in communities that have reduced their levels of year-round particle pollution.[24]

Particle Pollution and COVID-19



In the early days of the COVID-19 pandemic, several well-respected research teams in the U.S. set out to investigate possible links between long-term exposure to air pollution, especially $PM_{2.5}$, and increased risk of infection and death from the SARS CoV-2 virus that causes the disease. Using the limited population-based data available at the time, some of them found a positive association and estimates of a specific percentage of COVID deaths attributable to air pollution. However, there were a number of methodological issues that may have influenced their results. The virus had not yet reached many parts of the country; community testing was extremely limited; the number of infections and death was probably dramatically undercounted; and little was known about how the disease was spreading through the population.

Since that time, the virus has become more widespread and better understood, but much remains uncertain about the nature of the mechanisms linking exposure to air pollution with COVID-19-related infection, severity and death. But some connections are clear. Air pollution is known to impact the functioning of the immune system and increase susceptibility to respiratory infections in general. Air pollution also increases the risk of chronic lung and cardiovascular diseases that put people at higher risk of poor outcomes from COVID-19. Communities of color, which have been especially hard hit by the pandemic, are also disproportionately exposed to unhealthy air.[25]

Who is Most at Risk From Particle Pollution?

Anyone who lives where particle pollution levels are high is at risk. Some people face higher risk, however, based on their underlying health and other characteristics. (*See the **People at Risk** section for more information about vulnerable groups.*) Research has shown that the groups at the greatest risk from particle pollution include:

- Pregnant people and fetuses;[26]
- Infants, children and older people (>65 years of age);[27]
- People with lung disease, especially asthma, but also people with COPD;[28]
- People with cardiovascular disease;[29]
- People with lung cancer;[30]
- People of color;[31]
- Current or former smokers;[32]
- People with low incomes;[33] and
- People who are obese or have diabetes.[34]

Health Effects of Ozone Pollution

Ozone air pollution, sometimes known as smog, is one of the most widespread pollutants in the United States. It is also one of the most dangerous. Scientists have studied the effects of ozone on human health for decades. Hundreds of studies have confirmed that ozone harms people at levels currently found in many parts of the United States.

What is Ozone?

Ozone is a gas composed of molecules with three oxygen atoms. (The oxygen we need for life is made up of molecules with two oxygen atoms). Ozone forms in the lower atmosphere when a combination of other pollutants, usually nitrogen oxides (NOx) and volatile organic compounds (VOCs), "cook" together in sunlight through a series of chemical reactions. NOx and VOCs are produced primarily when fossil fuels such as gasoline, diesel, oil, natural gas or coal are burned or when solvents and some other chemicals evaporate. NOx is emitted from power plants, motor vehicles and other sources of high-heat combustion. VOCs are emitted from motor vehicles, oil and gas operations, chemical plants, refineries, factories, gas stations, paint, consumer products and other sources.

If these ingredients are present under the right conditions, they react to form ozone. Sunlight is key, with higher temperatures increasing ozone production. Because the reactions take place in the atmosphere, ozone often shows up downwind of the sources of the original emissions, sometimes many miles from where it formed.

Ozone air pollution is sometimes called ground-level ozone, to distinguish it from the much higher-altitude stratospheric ozone layer that protects the Earth from damaging ultraviolet rays from the sun.

What Can Ozone Pollution Do to Your Health?

Ozone gas is a powerful lung irritant. When it is inhaled into the lungs, it reacts with the delicate lining of the airways, causing inflammation and other damage that can impact multiple body systems. Ozone exposure can also shorten lives.

Ozone has a serious effect on the respiratory system, both in the short term and over the course of years of exposure. When ozone levels are high, many people experience breathing problems such as chest tightness, coughing and shortness of breath, often within hours of exposure. Even healthy young adults may experience respiratory symptoms and decreased lung function.[35]

Other breathing problems that have been tied to short-term exposure to ozone include:

- Worsening of symptoms, increased medication use, and increased emergency department visits and hospital admissions for people with asthma and COPD;[36]
- Susceptibility to respiratory infections such as pneumonia, resulting in an increased likelihood of emergency department visits and hospitalizations.[37]

Living with ozone pollution long term may cause lasting damage to respiratory health, including:

- Development of new cases of asthma in children;[38]
- Damage to the airways, leading to development of COPD;[39]

- Increased allergic response.[40]

The inflammation and systemic stress caused by short- and long-term exposure to ozone can also do damage to tissues, DNA and proteins throughout the body, which can cause or worsen other disease conditions over time. These include:

- Increased risk of metabolic disorders, including glucose intolerance, hyperglycemia and diabetes;[41]
- Impact on the central nervous system, including brain inflammation, structural changes and increased risk of cognitive decline;[42,43]
- Increased likelihood of reproductive and developmental harm, including reduced fertility, preterm birth, stillbirth and low birth weight;[44,45]
- Possible cardiovascular effects—although according to the most recent EPA review, the evidence linking ozone to heart disease, heart failure and stroke is mixed.[46]

The damage ozone does to the body can be deadly. Recent research has affirmed earlier findings that short-term exposure to ozone, even at levels below the current standard, likely increases the risk of premature death, particularly for older adults.[47] There is also a growing body of evidence that long-term exposures to ambient ozone may be associated with an increased risk of cardiovascular and respiratory disease mortality.[48]

Who is Most at Risk from Ozone Pollution?

Anyone who spends time outdoors where ozone pollution levels are high may be at risk. Some people face a higher-than-average risk, however, because of their underlying health and other characteristics. (*See the **People at Risk** section for more information about vulnerable groups.*) Research has shown that the groups at greatest risk from ozone pollution include:

- Pregnant people and fetuses;[49]
- Children;
- Anyone 65 and older;
- People with existing lung disease such as asthma and COPD;
- People who work or exercise outdoors.[50]

People at Risk

The health burden of air pollution is not evenly shared. There are people more at risk of illness and death from air pollution than others. Several key factors affect an individual's level of risk:

- Exposure—Where someone lives, where they go to school and where they work make a big difference in how much air pollution they breathe. In general, the higher the exposure, the greater the risk of harm.
- Susceptibility—Pregnant people and their fetuses, children, older adults and people living with chronic conditions, especially heart and lung disease, may be physically more susceptible to the health impacts of air pollution than other adults.
- Access to healthcare—Whether or not a person has health coverage, a healthcare provider and access to linguistically and culturally appropriate health information may influence their overall health status and how they are impacted by environmental stressors like air pollution.
- Psychosocial stress—There is increasing evidence that non-physical stressors such as poverty, racial/ethnic discrimination and fear of deportation can amplify the harmful effects of air pollution.

These risk factors are not mutually exclusive and often interact in ways that lead to significant health inequities among subgroups of the population.

People of Color

Research has shown that people of color are more likely to be exposed to air pollution and more likely to suffer harm to their health from air pollution than white people.[51,52] Much of this inequity can be traced to the long history of systemic racism in the United States. Practices such as redlining, the discriminatory outlining of riskier neighborhoods by mortgage lenders, institutionalized residential segregation in the 20th century, impairing the ability of many people of color to build wealth and limiting their mobility and political power. Over the years, decision-makers have found it easier to place sources of pollution, such as power plants, industrial facilities, landfills and highways, in economically disadvantaged communities of color than in more affluent, predominantly white neighborhoods. The resulting disproportionate exposure to air pollution has contributed to high rates of emergency department visits for asthma and other diseases[53,54]

People of color are also more likely than white people to be living with one or more chronic conditions that make them more susceptible to the health impact of air pollution, including asthma, diabetes and heart disease.[55]

People Experiencing Poverty

There is evidence that having low income or living in lower income areas puts people at increased risk from air pollution, although the correlation is not as strong as with race and ethnicity.[56,57] People living in poverty are more likely to live in close proximity to sources of pollution and have fewer resources to relocate than people with more financial security.[58] Poverty itself, along with the problems that beset many low-income communities, such as lack of safety, have been associated with increased psychosocial distress and chronic stress, which in turn make people more vulnerable to pollution-related health effects.[59] People with low income also have lower rates of health coverage and less access to quality and affordable health care to provide relief to them when they get sick.

Children

Children are both more susceptible to harm from air pollution and more likely to be exposed than adults. The growth and development of a child's lungs and breathing ability start in utero and continue into early adulthood. Exposure to air pollution at any stage of that development process can have both immediate and lasting impacts on developing lungs and children's health. In addition, the body's defenses that help adults fight off infections are still developing in children. Children have more respiratory infections than adults, which also seems to increase their susceptibility to air pollution.[60]

Children breathe more rapidly and inhale more air relative to their size than do adults. They are more likely to spend time outdoors, running around, being active and breathing hard. Consequently, they are more exposed to polluted outdoor air than adults typically are.

Older Adults

Much of the illness and premature death caused by air pollution occurs in older adults, who are at increased risk of harm for several reasons. As a person ages, the normal process of thinning and weakening of the lung tissue and the supporting muscle and bones of the ribcage results in diminishing lung function over time. The increased impairment that results from exposure to air pollutants then has an add-on effect, putting stress on the lungs and heart. Older people are also more likely to be living with chronic diseases, and there is evidence that co-existing chronic lung, heart or circulatory conditions may worsen following exposure to environmental pollutants.[61]

The strength of the immune system also declines with age, leaving older people at greater risk of contracting infections and less able to get them under control before they become serious. Because exposure to air pollution increases susceptibility to respiratory infections, it also increases the risk of severe illness and death in older adults.

People with Underlying Health Conditions

For the millions of people in the U.S. living with illnesses such as asthma, COPD, diabetes, heart disease and lung cancer, exposure to air pollution places them at greater risk of harm to their health than those without disease. The cellular injury and systemic inflammation triggered by breathing ozone and particle pollution put additional stress on people's lungs, heart and other organs already compromised by disease. This can result in a worsening of symptoms, increased medication use, more frequent emergency department visits and hospitalizations, an overall reduced quality of life and, far too often, premature death.

Pregnant People and Fetuses

Pregnancy is always a susceptible time for both the mother and the developing fetus. The pregnant body undergoes dramatic physiological changes in hormone levels, metabolism and circulation throughout months of gestation. The rapid and complex development of the fetus is a precisely timed and sequenced process. The inflammation and oxidative stress resulting from exposure to air pollution during pregnancy can increase the risk of hypertensive disorders, including preeclampsia, in the mother and lead to intrauterine inflammation and damage to the placenta that can disrupt the growth and development of the fetus. Fetal health may also be impacted in a number of ways by environmental contaminants that have been shown to cross the placenta.[62]

Exposure to both ozone and particle pollution during pregnancy is strongly associated with premature birth, low birth weight and stillbirth. These risks are amplified in pregnancies where the mother is already at higher risk, such as people of color and those chronic conditions, especially asthma.[63]

People with a Smoking History

There is some recent evidence suggesting that current and former smokers are at greater risk of health harm from exposure to fine particle pollution compared with never-smokers. They are more likely to develop lung cancer and to die prematurely.[64] Smoking damages the lungs, heart, blood vessels and other organs.[65] This impairment leaves the person with a smoking history more vulnerable to the health impact of air pollution than a never-smoker.

For people with lung conditions like asthma, checking the air quality is a regular part of life.

"It's something we automatically think about before we do outside activities," says LA resident Jaime K., who has asthma. "If the air quality is bad, we don't go out to the grocery store, out for walks or out to play with my daughter."

She says in an ideal world, she'd live near the ocean. But because housing costs by the water are so high, she purchased a home further inland near a highway. Despite using air filters to improve the air quality inside, soot builds up daily due to vehicles and, increasingly, wildfire smoke.

"No matter how much I clean," Jaime says, "I always have a layer of dust the next day."

Jaime K.
Los Angeles, California

Emerging Threats

Since the passage of the Clean Air Act in 1970, the federal, state, local and Tribal governments and businesses, community leaders and advocates have invested years of effort into reducing the public health threat from air pollution. By many measures, the air the nation breathes is dramatically cleaner than it was 50 years ago. "State of the Air" has documented this long-term improvement over the past 22 years. In recent years, however, new threats have emerged that are causing air pollution levels to rise and the potential harm to vulnerable populations to increase.

Climate Change

The scientific evidence has clearly shown for years that impacts from climate change threaten human health. These health impacts are no longer a concern for the future. They're happening now. What remains to be seen is how much these impacts increase in severity, how much action to reduce greenhouse gas emissions is able to mitigate them, and how much communities are able to adapt to the impacts that can't be avoided.

The rising global temperatures and disruption of short- and long-term weather patterns caused by climate change are putting the health Americans at risk. The impacts of

climate change currently being experienced in communities nationwide include an increase in extreme weather events, deterioration of air quality from increased ozone formation and wildfire smoke, expansion of the range of disease-carrying pests and increased stresses that affect mental health and well-being.

People and communities are differentially exposed to these climate-related hazards as well as being disproportionately affected by climate-related health risks. Populations experiencing greater health risks include children, older adults, low-income communities and some communities of color.

"State of the Air" largely focuses on the health harms linked to increases in particle pollution and ozone, but increasing heat itself is another significant risk factor that adds to the climate vulnerability of some of the same populations who face increased risk from air pollution.[66] Children are especially vulnerable to extreme heat. They spend more time playing outside and participating in vigorous activity than the average adult. Their bodies have a high surface area-to-mass ratio, so must divert more blood flow to their skin to dissipate heat, which may strain other bodily functions.[67]

Among older adults, increased heat and exposure to air pollution raises the risk of premature death and results in more emergency room visits and hospital admissions, especially among those older adults who spend more time outdoors. The physical changes associated with aging—including those that affect breathing and movement—can make it even more difficult to respond to climate change. In the past two decades, heat-related mortality for older persons has almost doubled, reaching a record high 19,000 deaths in 2018.[68] Heat waves also significantly increase the risk of illness and death in people living with chronic lung disease.[69]

Wildfires

Wildfires are posing a growing threat to public health in many parts of the U.S. Increased heat and drought caused by climate change are resulting in larger, more frequent fires that blanket communities in smoke and leave residents gasping for air. Smoke from large fires can spread over hundreds or thousands of miles, polluting the air breathed by millions of people. In the years 2016-2019, individuals in the U.S. experienced a 19% increase in the number of days they were exposed to high wildfire risk compared to 2001-2004.[70]

Wildfire smoke is a complex mixture of fine and course particulate matter and gases, including carbon monoxide, nitrogen oxides, volatile organic compounds and air toxics. The chemical composition of wildfire smoke varies widely depending on the location of the fire and the material burned. The details of how these differences impact health is the subject of ongoing research.[71]

The most widespread health threat from smoke is from fine particles. Like other sources of fine particle pollution, wildfire smoke can be extremely harmful to the lungs, especially for children, older adults and people with asthma, COPD, chronic heart disease and diabetes. Recent research has confirmed that severe wildfire episodes are associated with increased risk of hospital admissions for respiratory diseases for Medicare recipients.[72] Pregnant people exposed to wildfire smoke are more likely to experience adverse pregnancy outcomes, including preterm birth.[73] There is also strong evidence linking smoke exposure to increased risk of premature death.[74]

The health impact of breathing wildfire smoke for extended periods of time, year after year, as is happening in some hard-hit communities, remains unknown.

E-Commerce Shipping and Transport

The COVID-19 pandemic has transformed personal shopping behavior, accelerating the shift from in-store shopping for products and services to ordering them online. This has increased demand for fast, personalized delivery service and has resulted in

a rising number of delivery trucks and vans on neighborhood streets, supported by a proliferation of warehouses, distribution centers and long-distance haulers on highways. To maximize their efficiency, large retailers and shipping companies are clustering new warehouses together in sprawling complexes, often in already highly-polluted communities. More traffic in and out of these areas, especially since the bulk of it is diesel-powered, brings more unhealthy air pollution to the communities where it is concentrated.[75] The U.S. EPA estimates that 72 million Americans live along major truck freight routes, and notes that they are more likely to be people of color and have lower incomes.[76]

Changes in consumer behavior have also had a major impact on port cities, which are dealing with an increase in cargo imports. The rapid growth in shipping traffic has resulted in backlogs of ships idling in harbors and off-shore waiting to unload, as well as increased congestion of the port-related cargo freight system of trucks, trains and planes. Between January and September 2021, the busy Ports of Los Angeles and Long Beach in California saw an average increase of 20 percent in cargo movement compared to the same time in 2019 prior to the COVID-19 pandemic. According to estimates from the California Air Resources Board, as of October 2021, the increased congestion had resulted in overall container ship emissions increases of 20 tons per day (tpd) of oxides of nitrogen (NOx) and 0.5 tpd of particulate matter. This increase in NOx emissions from container ships is roughly equivalent to the total emissions from 5.8 million passenger cars. Additionally, the increased diesel particulate emissions are comparable to the exhaust particulate emissions from almost 100,000 diesel trucks.[77]

Exposure to traffic-related pollution is a serious health hazard to those living in freight-impacted communities. The mixture of emissions has been linked to poor birth outcomes, reduced lung and cognitive development, development and worsening of chronic respiratory and cardiovascular diseases, increased risk of dementia, cancer and premature death.[78] Unfortunately, the health burden for e-commerce-related pollution tends to disproportionately impact disadvantaged communities. Since low-income communities and communities of color make up a significant proportion of residents in disadvantaged communities, they are often burdened with the negative by-products of congestion and exposure to on-road emissions.[79]

Recommendations for Personal Action and Policy Change

Alia V. resides in an area with periodically severe air pollution. Yet there are many aspects of Houston she loves, such as its tremendous cultural and educational resources. The city also has green transportation initiatives, including a municipal hybrid fleet.

In summer, she and her husband limit their kids' time outside on ozone action days. Because public transit options in the region are limited, she relies on her car to travel even on days with high ozone levels.

She says awareness about the importance of air quality is on the rise locally, although it's a problem that really demands a statewide approach. For example, increasing the incentive to opt for electric vehicles "would help people balance their transportation needs with sustainability."

Also, with Houston being near the Gulf of Mexico, there are numerous oil refineries just south of the city. "There have been from time to time chemical fires where you'll have air impacts," Alia says. "When those things occur, people stay indoors."

Alia V.
Houston, Texas

We need action at every level to clean up air pollution and address climate change.

Individuals

You can take action to protect yourself and your family from the dangers of air pollution. Regardless of its grade or ranking in this report, any community can experience days with unhealthy levels of air pollution. Some simple precautions will reduce your risk:

1. Check daily air pollution forecasts in your area at airnow.gov. The color-coded forecasts let you know when the air is unhealthy in your community. When the air is bad, move your exercise plans and other activities indoors.
2. Protect yourself from wildfire smoke if you live in a fire-prone area. Learn more about using masks and creating a clean room inside your home with our wildfire resources at Lung.org/wildfire.
3. Reduce your own contributions to air pollution. Prioritize walking, biking and public transit over gasoline-powered vehicles. Conserve electricity and purchase your power from clean, non-combustion sources if you can. Don't burn wood, leaves or trash. Learn more about how to reduce your impact with our Stand Up For Clean Air initiative at Lung.org/air.

Local Governments

Local governments have the power to help ensure that city and county operations are zero-emission and that residents have the ability to choose zero-emission forms of transportation and electricity. These actions must benefit the communities most impacted by unhealthy air.

1. Adopt a climate action plan. Reduce city- and county-wide emissions by supporting walking, biking and transit and zero-emission-vehicle infrastructure, and ensuring that building and parking policies support these goals. Include measures to address the impacts of climate change on residents, including health impacts.
2. Purchase zero-emission fleet vehicles. Commit to purchasing zero-emission garbage and recycling trucks, transit buses, school buses and other vehicles.
3. Establish purchasing goals for renewable, non-combustion electricity. Power city and county operations with truly clean sources of electricity like wind, solar, geothermal or tidal.

State, Territorial and Tribal Governments

1. Set a clean or renewable electricity standard or clean peak standard that phases out the use of coal, oil, natural gas (also known as methane gas) and other combustion and replaces it with wind, solar, geothermal and tidal and other non-combustion forms of electricity. Do not allow for the increased use of biomass or municipal solid waste for electricity because of their contributions to particle pollution.
2. Invest in air quality monitoring. In addition to EPA funding placement of air quality monitors, communities should increase monitoring to capture pollution levels that disproportionately impact communities near polluting sources in order to address them.
3. States: Use Clean Air Act authority to adopt the California zero-emissions standards for light-, medium- and heavy-duty vehicles. These include California's Low-Emission Vehicle criteria pollutant and greenhouse gas regulations; Zero-Emission Vehicle regulations; and Advanced Clean Trucks regulations.

Federal Government

Every federal agency, the White House and Congress must act now to dramatically reduce air and climate pollution and drive an urgent nationwide transition to zero-emission transportation and electricity. 40% of the investments made to meet these goals must improve air quality, health and life in underserved communities. Key, urgent

opportunities for action include:

1. Congress must pass investments in zero-emission electricity and transportation into law. Key investments included in the House-passed Build Back Better Act urgently need to be passed into law in order to drive the nationwide zero-emission transition needed to clean up harmful air pollution and address climate change.
2. EPA must propose and finalize strong new emissions standards that transition the nation's cars and trucks to zero-emission vehicles. EPA must set stronger standards for greenhouse gas emissions for light-duty vehicles beginning in Model Year 2027. EPA must finalize a strong rule for heavy-duty vehicles this year and adopt an additional rule beginning in Model Year 2030.
3. EPA must set a stronger national standard for particulate matter. The research shows that the new standard should be set at 8 micrograms per cubic meter annually, and 25 micrograms per cubic meter daily, to protect those at greatest risk of harm. Not only will stronger standards drive cleanup of polluting sources nationwide, they will also mean that families across the country are better informed about when their local air quality may put their health at risk at Lung.org/sota-petition.
4. EPA must set a stronger national standard for ozone. The scientific evidence shows that a standard of 60 parts per billion would better protect people from harm, especially those at greatest risk. As with particulate matter, stronger standards will not only ensure cleanup of polluting sources, but also better empower people to avoid dangerous levels of this pollutant.

Hermosa Beach, CA 90254

SUBJECT: Review of the Draft EIR for the Harvard-Westlake River Park Project in the City of Los Angeles – Transportation Issues

Dear Ms. Minteer:

As requested, I, Tom Brohard, P.E., have reviewed the transportation portions of the March 2022 Draft Environmental Impact Report (Draft EIR) for the Harvard-Westlake River Park Project in the City of Los Angeles. The Proposed Project includes redevelopment of the Weddington Golf & Tennis Site including removal of the existing 9-hole par three golf course, driving range, and tennis facility while retaining the existing clubhouse and putting green. The proposed athletic and recreational facility for the Harvard-Westlake School is planned to include two athletic fields with bleacher seating, an 80,000 square foot two-story multi-purpose gymnasium, a 50-meter swimming pool with seating, eight tennis courts with seating, one level below grade parking structure with 503 vehicle parking spaces and 100 bicycle parking spaces, and a surface parking lot with 29 parking spaces.

In preparing these comments, I have reviewed various portions of the Draft EIR and Transportation Assessment (TA) including the following:

- Executive Summary
- Section I - Introduction
- Section II - Project Description
- Section IV.M - Transportation
- Appendix A-4 – NOP and Scoping Meeting Comments
- Appendix M – April 2021 Transportation Assessment Draft

In summary, the Draft EIR and TA do not properly analyze or address the following critically important transportation items and issues:

- Inaccurate vehicle miles traveled (VMT) calculations including:
  - Underestimated Harvard-Westlake trip lengths to the Upper Campus
  - Understated Middle School Campus trip lengths for Freshman sports
  - Undocumented existing trip length credits for golfers
  - Increased trip lengths associated with the right turn only restrictions at the project access points at Whitsett Street.

81905 Mountain View Lane, La Quinta, California 92253-7611
Phone (760) 398-8885
Email tbrohard0@gmail.com

- Failure to address and mitigate the significant queuing that will occur at the single lane parking structure exit to Whitsett Street where it will take more than one hour to empty the garage. With this major issue, timely evacuation of the parking structure during an emergency will not be possible.

- The absence of northbound left turn vehicle storage from Whitsett Street to Valleyheart Drive to enter the parking structure, the surface parking area, and the drop-off/pick-up area.

- Inadequate passenger loading/unloading space in the cul-de-sac terminus of Valleyheart Drive, with resulting queues blocking fire apparatus departures from LAFD Station 78. The proposed mitigation, with a flashing red light which means stop and then proceed with caution, will not keep the area at the Station's driveways on Valleyheart Drive clear of queued exiting vehicles.

- Entry procedures during major events will create excessive queuing that has not been analyzed, resulting in significant congestion for credential verification. It will take more than an hour to fill the parking structure.

- Congestion both entering and exiting the parking structure will attract motorists to park in the adjacent residential areas during late arrivals and for quick departures after event conclusions.

- Pedestrian access to the north side of the site at random points will not be deterred by 3' tall metal fencing and subsequent walking through immature landscaping.

- Painting pedestrian crosswalks at adjacent local intersections will not meet established and accepted traffic engineering practice used by the City of Los Angeles.

- Accessible and convenient parking for construction workers must be established and maintained on site to preempt and discourage undesirable parking within adjacent residential areas.

Education and Experience

Since receiving a Bachelor of Science in Engineering from Duke University in Durham, North Carolina in 1969, I have gained over 50 years of professional engineering experience. I am licensed as a Professional Civil Engineer both in California and Hawaii and as a Professional Traffic Engineer in California. I formed Tom Brohard and Associates in 2000 and now serve as Consulting Transportation Engineer for the City of San Fernando.

I have considerable experience in traffic engineering and transportation planning. During my career in both the public and private sectors, I have reviewed numerous environmental documents and traffic studies for various projects in California and Hawaii.

Transportation Issues

The following deficiencies were identified in my review of the documents associated with the Draft EIR and the TA for the Proposed Project:

1) VMT – Several components of the VMT (vehicle miles traveled) associated with the Project have been omitted or incorrectly calculated as follows:

    a. Harvard-Westlake Trip Lengths – Trip lengths for shuttles and for private vehicles were assumed to be 1.5 miles. The measured distance along the recommended route on Coldwater Canyon Avenue, Moorpark Street, and Whitsett Avenue between the Upper Campus driveway and the passenger loading area on Valleyheart Drive is 1.7 miles. The 1.1-mile length of the return trip from the site back to the Upper Campus for shuttles via the Whitsett Avenue, Ventura Boulevard, and Coldwater Canyon Avenue route was incorrectly omitted from the VMT calculations.

    b. Freshman Sports – The schedule of events identified three Freshman sports at the site (Girls Field Hockey, Boys Basketball, and Girls Volleyball). VMT lengths for these sports to the Project must be calculated from the Middle School Campus, not from the Upper School Campus.

    c. Weddington Golf & Tennis – According to Page 24 of the Transportation Assessment, data for one week in September 2019 was provided for tennis users at the existing facility to calculate the daily trip generation and that was then credited against the Proposed Project. This data was not included or disclosed in the Transportation Assessment Appendix for review by the public.

    There is no information provided as to how the data for tennis players relates to those using the clubhouse or to the golfers using the driving range or the 9-hole par three golf course. The average daily trip generation of 1,022 or 511 round trips requires further study and evaluation to support the resulting net negative, offsetting credit of 2,098 daily VMT.

Attachment 3C in the Traffic Assessment indicates the existing trips at the site were counted on February 12, 2019. The table indicates that 1,022 daily trips will be removed when the current Weddington Golf and Tennis operation is closed. However, the clubhouse and the putting green will remain open and in use after the site is redeveloped with the Project. Trips and VMT associated with these two remaining uses must be added back into trip generation and VMT for the site. It is not reasonable to assume trips associated with Weddington Golf & Tennis will be identical during a week in September 2019 and on February 12, 2019.

d. Right Turn Only Restrictions – Trip distribution to and from the Proposed Project indicates that 85% of all trips will have a trip end to the north and only 15% of all trips will have a trip end to the south. Right turn only restrictions at the north driveway and Whitsett Street will force 85% of the traffic to travel out of their way to return to their origin north of the Project. In addition, if all Valleyheart Drive vehicles are forced to turn right only on Whitsett Street, then all vehicles leaving the parking structure will be forced to travel 0.1 miles to Ventura Boulevard and then back, adding 0.2 VMT to 85% of the trips leaving the Project.

2) Project Access – The parking structure will have two vehicle access driveways. The north driveway will have one lane inbound and one lane outbound, with both channelized into right turn only movements entering from and exiting to Whitsett Street. The south driveway accessing Valleyheart Drive will have one lane inbound only (no exiting traffic). The parking structure contains 503 vehicle parking spaces and 100 bicycle parking spaces and there is a 29-space surface parking lot accessed by Valleyheart Drive.

a. Whitsett Street Access - From calculations in the Traffic Study Appendix, the queue to exit the north driveway will be 11 cars and will extend 275' back into the parking structure. This queue goes beyond the security kiosk, blocking the main north-south aisle within the structure. Only one vehicle will be on level ground before entering Whitsett Street, causing delay as vehicles climb the ramp before reaching the level area, stopping, and then making a forced right angle turn onto Whitsett Street, taking motorists to Ventura Boulevard.

With only a single exit lane, it will take an hour or more to empty the parking structure (see enclosed Table 4 from Entrance-Exit Design and Control for Major Parking Facilities, Robert W. Crommelin, October 5, 1972).

Timely evacuation out of the parking structure during an emergency will not be possible with only a single exit lane.

b. Valleyheart Drive – The south driveway for the parking structure located on Valleyheart Drive provides a second entry but there will be no exiting vehicles from the structure to Valleyheart Drive. Whitsett Street has a posted speed limit of 40 MPH. Whitsett Street does not have a separately striped northbound left turn lane at Valleyheart Drive. This requires traffic arriving from the south to wait in the inside through lane while seeking an adequate gap in southbound traffic flow before turning left on Valleyheart Drive.

   A passenger drop-off/pick-up area for shuttles and Uber/Lyft ride-share vehicles is proposed in the cul-de-sac terminus of Valleyheart Drive just west of Whitsett Street. The resulting 17-vehicle length of this passenger loading zone has not been studied to determine if it is adequate to avoid excessive queuing or that it will be managed to avoid significant delay.

   Vehicles leaving the 29-space surface parking lot will conflict with the adjacent passenger loading zone and together will cause significant queuing on Valleyheart Drive if motorists are allowed to turn left when entering Whitsett Street. This queuing will extend beyond LAFD Station 78 driveway used by small apparatus, blocking their exit from the fire station and blocking their access to Whitsett Street.

   A flashing red light (requiring vehicles to stop and then proceed with caution) is recommended on Page II-55 of the Draft EIR but that device will not keep the Valleyheart Drive roadway clear of vehicles and allow emergency vehicles to leave the fire station driveways. A "warning light" recommended on Page 63 of the Transportation Assessment would not "hold back vehicles exiting the Project turnaround onto Valleyheart Drive."

3) Limited Entry During Significant Events – The Draft EIR proposes to provide entry passes into the parking structure for major events. This will require security personnel to verify the parking passes before allowing vehicles to enter the parking structure. Unauthorized vehicles will necessarily have to enter the structure and then U-turn back to Whitsett Street across and through the single lane exit. U-turns within the parking structure will create significant additional congestion and confusion. Others with proper credentials who try to enter the parking structure may not be able to do so during credential checking. Some motorists will observe the congestion and then seek parking elsewhere, or others will

simply park elsewhere initially (such as the adjacent residential areas) to avoid the congestion and to provide for a quick getaway after their event concludes.

With required verification of parking passes, it will take an hour or more to load the parking structure (see enclosed Table 4 from Entrance-Exit Design and Control for Major Parking Facilities, Robert W. Crommelin, October 5, 1972).

4) Pedestrian Access – Page II-52 of the Draft EIR indicates that pedestrian access to the project at other than gated locations along Valley Spring Lane will be "prevented by a 3' tall metal fence and substantial, dense landscaping." It will take time for plantings to form a pedestrian barrier and the 3' tall metal fence will certainly not prevent pedestrian intrusions. Without a more substantial and an initial continuous barrier, motorists parking in the residential area to the north can gain access to the Project site by walking across Valley Spring Lane and entering over the 3' fence and through the immature landscaping.

   Page 34 of the Transportation Assessment states, "All crosswalks at the intersections surrounding the Project Site are unmarked and uncontrolled. Given the small number of pedestrians anticipated on any given crosswalk, the crosswalks are not anticipated to meet crosswalk warrants."

   In direct contradiction and contrary to accepted traffic engineering practice, Page 75 of the Transportation Assessment states, "The Project is expected to generate an increase in pedestrian volumes in the vicinity... It is recommended that marked crosswalks be installed at the intersections of Whitsett Avenue & Valley Spring Lane, Whitsett Avenue & Valleyheart Drive, Babcock Avenue and Valley Spring Lane, Beeman Avenue & Valley Spring Lane, and Teesdale Avenue & Valley Spring Lane as part of the Project improvements."

5) Construction Worker Parking – Page 66 of the Transportation Assessment states, "During all phases of construction, employees are expected to park on the Project Site." Parking facilities must be made available for construction worker parking on-site at all times during construction. If parking cannot be provided on-site, then remote parking with continuous shuttle service must be provided so construction workers do not park within the adjacent residential areas.

In summary, the Draft EIR and the TA for the Harvard-Westlake River Park Project do not properly calculate VMT for the Proposed Project. Further, feasible

mitigation for the Proposed Project is not developed or analyzed. As discussed throughout this letter, other deficiencies, errors, omissions, and inconsistencies must also be addressed before the City of Los Angeles considers the Proposed Project.

If you have questions regarding these comments, please call me at your convenience.

Respectfully submitted,

Experience: 50+ Years

Memberships: 1977 / Institute of Transportation Engineers – Fellow, Life
1978 / Orange County Traffic Engineers Council - Chair 1982-1983
1981 / American Public Works Association – Life Member

Tom is a recognized expert in the field of traffic engineering and transportation planning. His background also includes responsibility for leading and managing the delivery of various contract services to numerous cities in Southern California.

Tom has extensive experience in providing transportation planning and traffic engineering services to public agencies. In addition to conducting traffic engineering investigations for Los Angeles County from 1972 to 1978, he has previously served as City Traffic Engineer in the following communities:

- Bellflower ..... 1997 - 1998
- Bell Gardens ..... 1982 - 1995
- Big Bear Lake..... 2006 - 2015
- Indio..... 2005 - 2019
- Huntington Beach ..... 1998 - 2004
- Lawndale..... 1973 - 1978
- Los Alamitos ..... 1981 - 1982
- Oceanside..... 1981 - 1982
- Paramount ..... 1982 - 1988
- Rancho Palos Verdes ..... 1973 - 1978
- Rolling Hills ..... 1973 - 1978, 1985 - 1993
- Rolling Hills Estates ..... 1973 - 1978, 1984 - 1991
- San Fernando..... 2004 - Present
- San Marcos..... 1981
- Santa Ana ..... 1978 - 1981
- Westlake Village ..... 1983 - 1994

During these assignments, Tom has supervised City staff and directed other consultants including traffic engineers and transportation planners, traffic signal and street lighting personnel, and signing, striping, and marking crews. He has secured over $10 million in grant funding for various improvements. He has managed and directed many traffic and transportation studies and projects. While serving these communities, he has personally conducted investigations of hundreds of citizen requests for various traffic control devices. Tom has also successfully presented numerous engineering reports at City Council, Planning Commission, and Traffic Commission meetings in these and other municipalities.

In his 14 years of service to the City of Indio, Tom accomplished the following:

- Oversaw preparation and adoption of the 2008 Circulation Element Update of the General Plan including development of Year 2035 buildout traffic volumes, revised and simplified arterial roadway cross sections, and reduction in acceptable Level of Service criteria under certain conditions.

- Oversaw preparation of fact sheets/design exceptions to reduce shoulder widths on Jackson Street and on Monroe Street over I-10 as well as justifications for protected-permissive left turn phasing at I-10 on-ramps, the first such installations in Caltrans District 8 in Riverside County; reviewed plans and provided assistance during construction of both $2 million projects to install traffic signals and widen three of four ramps at these two interchanges under Caltrans encroachment permits.

- Reviewed traffic signal, signing, striping, and work area traffic control plans for the County's $45 million I-10 Interchange Improvement Project at Jefferson Street.

- Reviewed traffic impact analyses for Project Study Reports evaluating different alternatives for buildout improvements of the I-10 Interchanges at Jefferson Street, Monroe Street, Jackson Street and Golf Center Parkway.

- Oversaw preparation of plans, specifications, and contract documents and provided construction assistance for over 70 traffic signal installations and modifications.

- Reviewed and approved over 2,000 work area traffic control plans as well as signing and striping plans for all City and developer funded roadway improvement projects.

- Oversaw preparation of a City-wide traffic safety study of conditions at all schools.

- Obtained $47,000 grant from the California Office of Traffic Safety and implemented the City's Traffic Collision Database System. Annually reviews "Top 25" collision locations and provides traffic engineering recommendations to reduce collisions.

- Prepared over 1,500 work orders directing City forces to install, modify, and/or remove traffic signs, pavement and curb markings, and roadway striping.

- Oversaw preparation of engineering and traffic surveys to establish enforceable speed limits on over 500 street segments.

- Reviewed and approved traffic impact studies for more than 35 major projects and special events including the annual Coachella and Stagecoach Music Festivals.

- Developed and implemented the City's Golf Cart Transportation Program.

Since forming Tom Brohard and Associates in 2000, Tom has reviewed many traffic impact reports and environmental documents for various development projects. He has provided expert witness services and also prepared traffic studies for public agencies and private sector clients.

ENTRANCE-EXIT DESIGN AND CONTROL FOR MAJOR PARKING FACILITIES

Robert W. Crommelin, P.E., President
Robert Crommelin and Associates, Inc.
Encino, California

Prepared for Presentation at:

"SEMINAR '72" Los Angeles Parking Association, Biltmore Hotel
Los Angeles, California, October 5, 1972

It hasn't been too many years since a 500-space garage was thought of as a large parking facility. In recent years, garages with over 4,000 spaces have been placed in operation and larger ones are on the drawing boards. Success in the operation of these major parking facilities is dependent upon proper design of access to the facility, in addition to efficient management. Provision of adequate access design and control is a significant item which must be considered as part of the first design concept. The traffic engineer, teamed with the owner's representatives, the architect, and the future parking operator, must work together to develop a proper access and control plan. I have recently read a statement by a nationwide garage design consultant that reservoir space for entrances to garages is no longer an important consideration because of the capacity of ticket dispensers with gates. This is completely untrue as will be brought out later. Thinking of this type can lead to ineffective design which causes backup onto public streets with the accompanying potential hazards and congestion.

This paper covers three principal areas of concern: (1) determination of the number of entrance and exit lanes required based upon the parking control strategy and type of parker served; (2) data to allow comparison of the capacities of the various types of control strategies to allow selection of the one appropriate for each facility, and; (3) determination of needed reservoir space based upon the control strategy selected.

Typical capacity values for the various methods of parking control are included in this paper. A word of caution is necessary since there is much variation in capacity values due to physical conditions present as well as the familiarity of the parker with the parking facility itself. Each major facility requires detailed analysis of its needs and generalized factors are not always adequate.

Design Methodology

In order to provide adequate access design and control for major parking facilities, it is necessary to identify the probable characteristics of the future users of the facility. In this paper it is assumed that the size of the garage has been determined based upon a comprehensive parking study (general public facilities), or the amount necessary to serve a given land use (single purpose facility).

The first step is to determine directional peak hour volumes as related to the total size of the parking garage. Based upon the principal land use served, tables are included in this paper which allow the designer to prepare an estimate of peak hour volumes. In general, our research has found that it is adequate to assume for design purposes that the morning inbound peak flows are approximately equal to the evening outbound peak flows. After determining the peak volumes, a control strategy must be selected which would be appropriate for the intended operation of the garage. Selection of whether it would be best to allow parkers to enter without charge and pay as they leave or to pay a flat fee on the way in and have no control upon exiting will have a significant impact upon traffic capacity. Whether to use no fee, a flat fee, a variable fee, or a combination of fees must be determined as well as whether it is possible to receive the payment in advance, or to collect individual payment of the fee. All of these alternatives should be considered for each individual parking facility in order to determine its proper control strategy.

When the peak hour volumes and control strategy have been determined, it is then possible to determine the number of lanes which will be required to adequately serve inbound and outbound traffic to the parking facility. This requires knowledge of typical service rates of various methods of parking control. The next step is to determine the amount of reservoir space required to serve the parking control location. Following all of these steps will lead to an efficient, well-working garage which will have minimum impact upon the surrounding street system.

Determination of Peak-Hour Volumes

Comprehensive parking studies have provided much information concerning the characteristics of the users of major parking facilities. In general, it may be stated that the traffic characteristics of a garage will be principally related to the trip purpose of the user and the type of land use served by the facility. Both of these items relate to the length of time the parker is in the facility and the time of day during which major traffic flows occur.

Table 1 was prepared which compares the trip purpose of the parker with the length of time which he parks as observed in the Los Angeles Central Business District. Employees are considered long-term parkers since 80 percent parked three hours or longer; at the peak time of day, 84 percent of the daily employee parkers were present; and, their average parking duration was 5.6 hours.

A garage, which serves employees primarily, would tend to have higher peak hour volumes than would one which serves the other uses shown in the table. As an example, 85 percent of the shoppers had a parking duration of less than three hours with an average duration of 1.6 hours. More importantly, only 26 percent of the total daily parkers with a shopping trip purpose were present at the time of peak accumulation. This indicates that the peak hour inbound or outbound volume will be less for a garage serving principally shopper parkers than for a similar sized facility serving only employees.

Table 1

TRIP PURPOSE VS. LENGTH OF TIME PARKED

TRIP PURPOSE	PERCENT OF DAILY PARKERS WITH DURATION SHOWN		RATIO OF PEAK ACCUMULATION TO TOTAL DAILY PARKERS	AVERAGE DURATION
	SHORT-TERM (less than 3 hrs.)	LONG-TERM (3 hrs. or longer)		
	(percent)	(percent)		(hours)
Work	20	80	0.84	5.6
Shopping	85	15	0.26	1.6
Commercial Business	86	14	0.25	1.5
Social-Recreational	91	9	0.24	1.2
Personal Business	94	6	0.21	1.0
Eat Meal	97	3	0.22	0.9

Source: Los Angeles CBD Parking Study, 1967

In order to relate the type of land use served with peak hour volumes, the term entering-leaving ratio has been used. This term represents the volume of cars entering or leaving during a peak hour divided by the maximum accumulation of cars in the parking facility (taken as the size of the facility). If the inbound morning or outbound evening peak hour is equal to half the number of spaces in the garage, the entering-leaving ratio is 0.50. Using data obtained by special counts taken by personnel of my firm, as well as information reported in various parking studies, Table 2 was prepared which shows the range of values of the entering-leaving ratio for various land uses served. It may be seen in the table that the range of values for an individual parking facility may vary considerably. This variation may be explained by the typical length of time parked as well as the variation in the times when employees must start work or are let out of work. In locations where there is some staggering of employment hours, the entering-leaving ratio tends to be lower. The characteristics of the potential users of the parking facility must be studied in detail to arrive at the proper entering ratio.

Once the entering-leaving ratio has been selected, it is possible to determine the actual peak hour design volumes to be used in determining the parking control strategy and the design of access lanes.

Table 2

LAND USE SERVED VS. ENTERING-LEAVING RATIO

PRINCIPAL LAND USE SERVED	ENTERING-LEAVING RATIO [a] (Range of Values)
Hotel-Motel	0.25-0.35
College-University	0.40-0.60
Retail Commercial	0.45-0.65
Public Office Building	0.45-0.65
Private Offices-Multiple Tenant	0.45-0.60
Private Offices-Single Tenant	0.55-0.75
Hospital	0.60-0.70
Medical Offices	0.70-0.85
Airport (public parking)	0.70-0.85
Manufacturing Plant	0.70-0.90
Restaurant (sit-down)	0.80-0.95
Branch Bank	0.90-1.20

[a] Volume of cars entering and leaving in peak hour divided by maximum accumulation of cars (capacity of facility)

Parking Control Strategy Selection

Selection of the proper type of parking control strategy is exceedingly important in the successful operation of a major parking facility. The strategy involves the method of parking control, the charge which will be placed upon the user, and the type of payment to be collected from the user. Table 3 shows the application of various control strategies as related to the type of parking facility used as well as to the type of parking control equipment. For shopper and business parkers, it is normal to allow free entry with payment of a variable fee on an individual basis as they exit the garage. In the case of employees, it is more normal to allow them to enter freely and have a prepaid monthly charge which could be checked through the use of parking permits, coded cards, tokens, or other means as they exit. Parkers at sports events exhibit high peak volumes but have a length of time parked which can be estimated. For this type of condition, it is much more appropriate to collect a flat fee inbound and to have no control outbound. This latter type of control was the one which we recommended for use at the Los Angeles Convention Center.

Table 3

APPLICATION OF VARIOUS CONTROL STRATEGIES

ITEM	CONTROL STRATEGY APPLICABILITY					
	CONTROL METHOD		TYPE CHARGE		TYPE PAYMENT	
	Free-In Pay-Out	Pay-In Free-Out	Flat Fee	Variable Fee	Pre-Paid	Individual Payment
Preferred Method to Serve:						
Employee	X	X	X		X

Coded Card	X	X	X		X	
Coin-Operated Gate	X		X			X
Token-Operated Gate	X	X	X	X	X	
Parking Meter	-	-	X	X		X

Parking Control Operating Characteristics

Table 4 indicates our findings concerning the service rates for various types of parking controls. We have taken the design service rate as being equal to 80 percent of the maximum service rate. There is considerable variation in service rates and careful study must be given to the probable characteristics of the users of the parking facility as well as the experience of the personnel operating the facility.

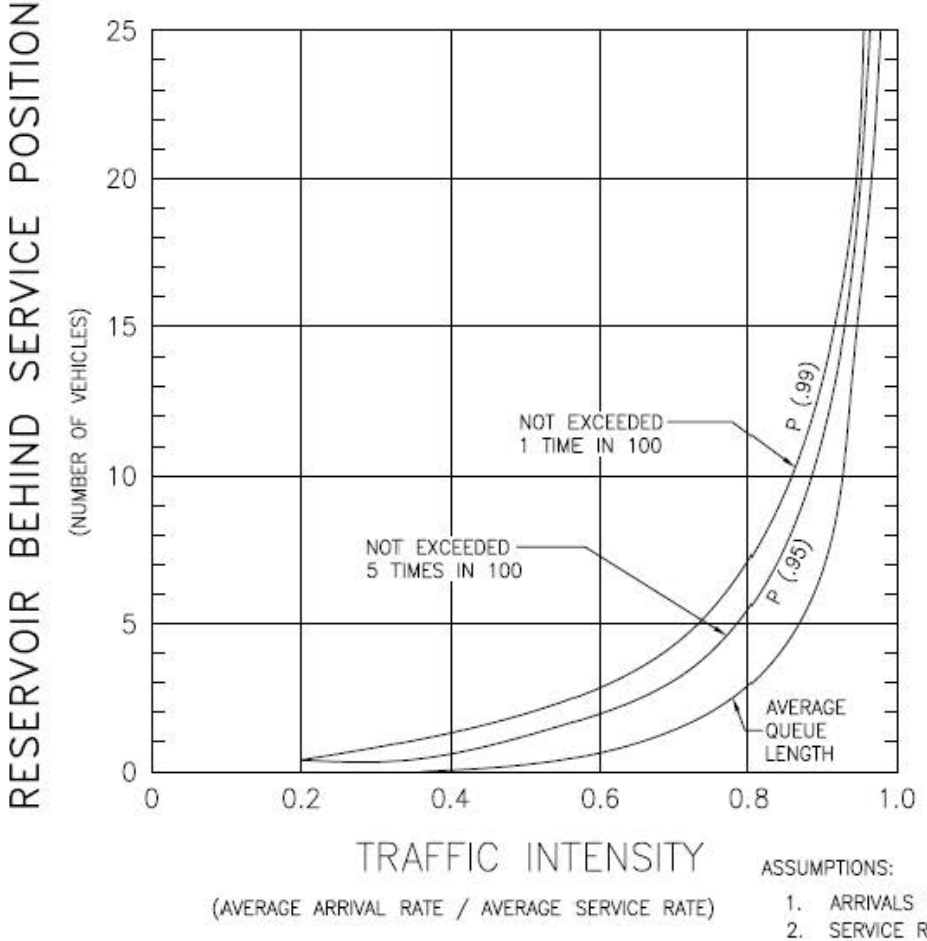
For the control measures normally used in entering a facility, the average headways vary from 3.6 seconds per vehicle for a clear aisle with no control to 20.4 seconds per vehicle for a coin-operated gate. In terms of design hourly capacities, the rates would be 800 per hour per lane for clear aisles and only 140 per hour per lane for coin-operated gates. The most common type of control used at major parking facilities is the ticket dispenser with a gate. Research in England identified the fact that there is a significant difference in the capacity of this equipment depending upon whether the parker has an easy direct approach or if a sharp turn is required to approach the equipment. This is obvious since a straight approach allows a parker to position himself in a reasonable location to pull the ticket to open the gate. Thus, the design of the approach to a ticket dispenser can cause the hourly capacities to vary between 305 and 520 vehicles per hour.

Internally, the circulation pattern can affect the capacity of the inbound approach. It is very important to have a minimum of interference within the parking facility so that once

a driver leaves the entrance parking control, he can do so without delaying the next inbound parker immediately behind him. This can be accomplished by avoiding situations where outbound parkers queued up from the exit control block parkers entering the facility.

The capacity of exits from a major parking facility are dependent upon adequate space approaching the exit control location as well as adequate reservoir between that location and the driveway to the public street. Analysis must be conducted on both of these reservoir needs and sufficient lanes as well as sufficient reservoir length provided to allow proper operation. The emphasis of this paper will be upon the capacity of the exiting parking control itself. The most common type of operation involves use of a cashier collecting a variable fee from a parker based upon length of time parked. This type of control has a capacity of approximately 150 vehicles per hour. Another approach might be to have the parker pay his fee to the cashier before entering his car and then utilize a token operated gate as a means of exit control. This control strategy would have over twice the capacity of a cashier lane itself and could have application where there is insufficient space to provide an adequate number of cashier lanes.

Table 4



PARKING CONTROL SERVICE RATE

TYPE OF CONTROL	TYPICAL SERVICES RATES PER LANE [a] AVERAGE HEADWAY (Sec/Veh)	HOURLY CAPACITY Design [b] (Veh/Hr)	HOURLY CAPACITY Maximum (Veh/Hr)
Entering:			
Clear Aisle, no control	3.6	800	1,000
Ticket dispenser, no gate	5.0	575	720
Time Stamp and hand to driver	8.5	340	425
Coded-card operated gate	8.9	340	425
Cashier, flat fee, no gate			
No information given	9.2	310	390
Direction-info needed	14.8	195	250
Ticket Dispenser w/gate			
Sharp turn at approach	9.5	305	380
Easy direct approach	5.5	520	650
Coin operated gate	20.4	140	175
Internal:			
Clear aisle or ramp, no parking	2.0	1,200	1,800
Straight ramp w/bend at end	2.2	1,000	1,610
Circular ramp, 30’ R at C/L	2.2	840	1,650
Aisle with adjacent 9 x 18’ stalls			
Inbound	3.5	830	1,040
Outbound	8.6	335	420
Exiting:			
Light street congestion	7.2	400	500
Moderate street congestion	9.0	320	400
Coded-card/token-operated gate	9.0	320	400
Cashier, flat fee w/gate	13.4	215	270
Casher, variable fee w/gate	19.5	150	185
Coin operated gate	20.4	140	175

[a] Assumes no significant interference by pedestrians, other traffic, etc.

[b] Taken as 80% of maximum rate; require 6 car lengths reservoir in advance of control points.

RESERVOIR NEEDS VS TRAFFIC INTENSITY

1

ASSUMPTIONS:

1. ARRIVALS FOLLOW A POISSON DISTRIBUTION
2. SERVICE RATE CAN BE REPRESENTED BY AN EXPONENTIAL PROBABILITY FUNCTION.
3. FLOW IS EQUALLY DIVIDED BETWEEN EACH LANE IF MORE THAN ONE IS AVAILABLE.

Reservoir Needs

If you have ever watched cars approaching any type of parking control, you know that they do not come at an even rate. Even though there may be nearby traffic signals which may cause the approaching parkers to arrive in groups or platoons, random arrival is the normal approach characteristic assumed. Research has shown that random arrivals or events in a traffic stream tend to follow the Poisson mathematical distribution. This distribution provides a means that, if the average rate is known, the probability of exceeding a given volume in a unit of time may be calculated. Thus, if you know the average volume, you may calculate the surges in volume to allow design of reservoir space. As an example, if the average number of cars in a five-minute interval is 10, use of Poisson statistical techniques will yield the fact that no more than 18 cars will arrive in the five-minute interval within a probability that this amount will be exceeded only one time in 100 five-minute intervals. Use of these calculation techniques allow the determination of the amount of reservoir required to serve a given type of parking control.

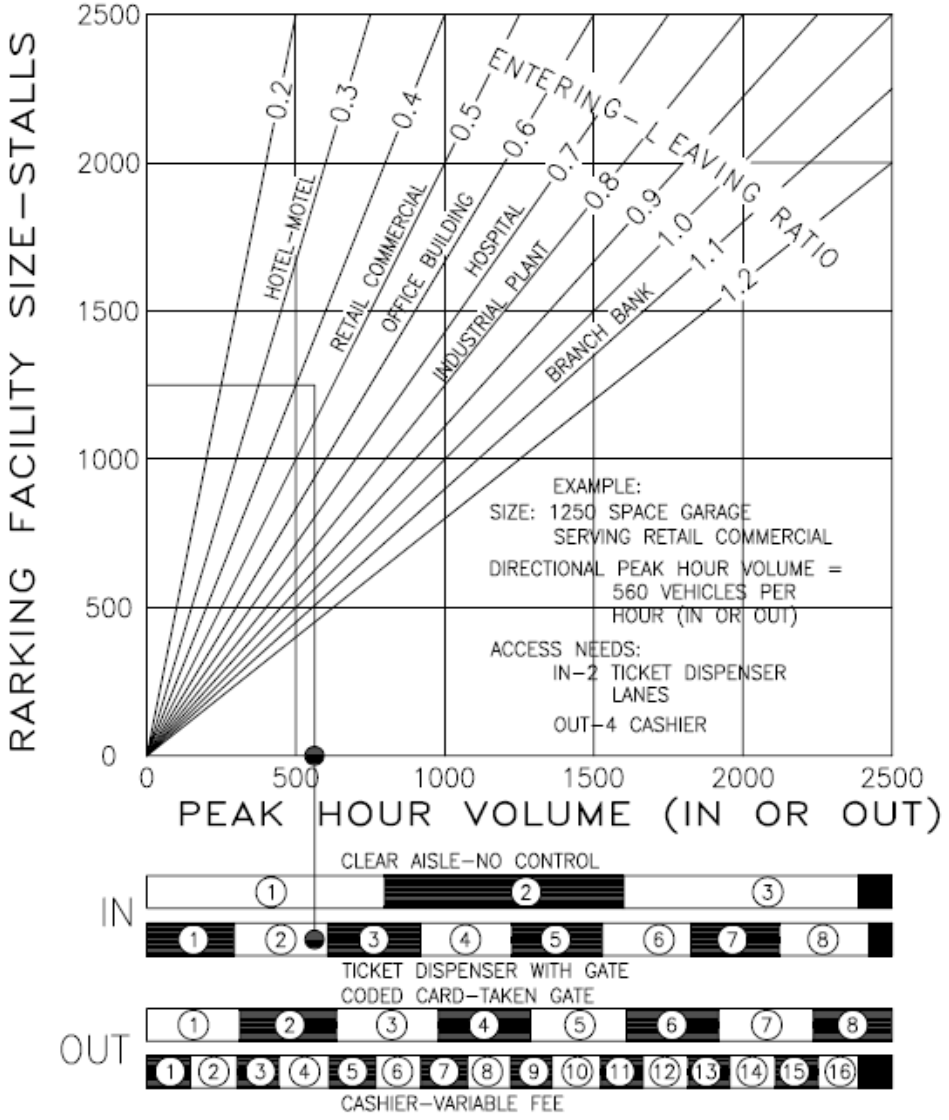
The relationship between the arrival of vehicles and the ability of the parking control equipment or strategy to handle these vehicles are the most important items in determining reservoir space. If the average number of arrivals per unit of time is called "v" and "s" is the average rate of service (discharge) per unit of time, the ratio of v/s is used to determine the amount of reservoir space. This ratio is called traffic intensity ("i"). The average length of the queue ($\bar{q}$) behind the vehicle being serviced is equal to $\bar{q} = \frac{i^2}{(1-i)}$. This formula assumes that the arrival of vehicles at the service point follows a random distribution, the servicing time for vehicles can be represented by an exponential probability function, and that the flow is equally divided among service facilities if there is more than one lane serving a given area of the garage.

Knowing the average queue length and selecting a probability value which represents the frequency that the design length will be exceeded, will allow the designer to determine the amount of reservoir required behind the service position. These formulas and probabilities were utilized to prepare Figure 1 which compares traffic intensity with required reservoir for common probabilities used in design. The mathematics are such that, as the average volume approaches the average service rate, the amount of backup will be infinite. In addition, the probability that the amount of reservoir space for a given volume will never be exceeded also is infinite. In actuality, these conditions do not occur but the general relationships hold true based on our field observations.

As may be noted in the figure, an insignificant amount of reservoir is required when the average arrival rate is 50 percent or less of the average service rate of the parking control device. At this level, only a two-car reservoir would be required. As the ratio of traffic intensity increases above 0.7, the amount of reservoir space increases rapidly. We have selected a traffic intensity of 0.8 as appropriate for design and a probability that the determined reservoir would be exceeded only five times in 100. Thus, if the average service rate for a given type of parking control is known and sufficient lanes are provided

so that the average arrival rate during the peak hour is 0.8 times the average service rate, a reservoir of six car lengths behind each service position would be adequate to meet the needs of the facility. If this is physically impossible, a traffic intensity of 0.6 should be used to determine the number of lanes requiring only a two-car reservoir.

Summary



Having determined the peak hour volumes, the parking control strategy, the number of lanes, and the reservoir length to adequately serve the peak-hour volumes, the physical design of the facilities then may be made. As noted previously, having an inadequate capacity to serve the traffic volumes approaching the control means can have a very drastic effect upon the backup which will occur. This backup creates adverse operating characteristics in and around the facility and also causes the length of time that a parker is involved in entering or leaving a garage to grow significantly. Thus, the design features of the facility can have an impact on the attitudes of the users and indirectly affect the success or failure of the parking facility in attracting customers or users.

To provide a means of easily determining the number of lanes necessary for various types of parking garages, Figure 2 was prepared which allows the designer to directly translate the size of the garage and the type of land use served into the number of necessary access lanes for the parking control strategy assumed. The example shows that a 1,250-space garage serving a retail commercial facility will normally have a directional peak hour volume of 560 vehicles per hour. If inbound ticket dispensers with gates are used, two lanes will be adequate to serve this garage. If cashiers collect variable fees, a total of four exit cashier lanes will be required. Normally these four lanes will not be provided all in the same location and, of course, it could be necessary to operate all four only during peak hours.

In the case of an office building rather than a retail facility, it would be possible to use coded card exit gates for monthly parkers. This would significantly reduce the required number of exit lanes since transient visitors are a much lower percentage of the peak hour volumes for an office building than they are in a garage serving a retail facility. The reduction in construction and operating cost would be significant.

A warning is necessary concerning the use of Figure 2 since it was based upon very generalized information. Each individual major parking facility must be considered on its own and its access needs determined in light of the characteristics of the probable users of the facility itself. In order to have satisfied customers and users of a major parking facility, thorough investigation and determination of access needs must be accomplished.

PRESS RELEASE

False Artificial Turf Recycling Claims Ripped

Mar 7, 2022 | Tags: artificial turf, PFAS

Kyla Bennett (508) 230-9933 **kbennett@peer.org**

False Artificial Turf Recycling Claims Ripped

FTC Enforcement Urged to End Deceptive Turf Industry Greenwashing

Washington, DC —Synthetic turf manufacturers are guilty of false and deceptive sales practices in pitching their products as recyclable, according to a complaint filed by Public Employees for Environmental Responsibility (PEER) with the Federal Trade Commission. The complaint seeks FTC enforcement action to end misleading turf manufacturer and vendor claims.

The complaint catalogs examples of marketing pitches that removed artificial turf is recyclable and is being sent to domestic recycling facilities. This not true because:

- There are no turf recycling plants in the U.S.;

- Used turf is not being exported to the two known recycling plants in Europe; and
- Artificial turf is extremely difficult and expensive to recycle since all the different plastics, rubber, and other materials used must be separated from each other.

"Artificial turf makers and vendors use recycling claims as a promotional ploy to portray this product as an environmentally responsible alternative to traditional grass fields – but it is not," stated PEER Science Policy Director Kyla Bennett, a scientist and attorney formerly with the U.S. Environmental Protection Agency. "The recycling claim for turf is illegal greenwashing."

Each synthetic field usually covers about 80,000 square feet with roughly 400,000 pounds of infill (often shredded tires). These fields typically have a design life of eight to ten years. There are an estimated 13,000 syn-turf fields in the U.S. Hundreds of fields installed in past decade are at or beyond their life spans, with that total growing each month.

When removed, the old turf is sent to a landfill or, as often appears, is illegally dumped.

In addition, the plastic "blades" coating the fields are found to contain PFAS (per-and polyfluoroalkyl substances), often referred to as "forever chemicals" since they do not break down in the environment. Human exposures to PFAS are associated with cancer, birth defects, and other impairments. Moreover, a safe disposal method for PFAS has yet to be developed. For years, focus was on the toxicity of the crumb rubber infill, but scientists now know that the carpet itself may be even more dangerous.

"Ironically, shredding old tires to serve as infill for artificial fields was originally thought to solve a solid waste problem but doing so simply created new solid waste headaches," Bennett added. "Both during and after their design lives, these fields leach a brew of toxic chemicals, from lead and arsenic to PFAS, into our soil and waters."

RE: Report No. 145028439

Complaint of Deceptive and Unfair Advertising of Artificial Turf

I. Introduction

Public Employees for Environmental Responsibility (PEER) asks that the Federal Trade Commission (FTC) investigate the vendors, manufacturers, and marketers of artificial turf to determine whether the companies' websites and marketing practices violate Section 5 of the Federal Trade Commission Act, which prohibits unfair and deceptive marketing practices. Our review of numerous websites advertising artificial turf and statements made to consumers shows at least one type of deceptive or unfair marketing common among these businesses. These include the following false and misleading statement:

- Artificial turf is recyclable, i.e., it can be collected, separated, or otherwise recovered from the waste stream through an established recycling program for reuse or use in manufacturing or assembling another item.[1]

[1] 16 C.F.R. § 260(12).

Therefore, we ask the FTC to end this unfair and deceptive marketing practice and any others it uncovers in its investigation.

II. Complainants

PEER is a non-profit public interest organization incorporated in Washington, D.C. and headquartered in Silver Spring, MD, with field offices in California, Colorado, Florida, Massachusetts, and Tennessee. Among other public interest projects, PEER engages in advocacy, research, education, and litigation relating to the promotion of public understanding and debate concerning key current public policy issues. PEER focuses on the environment, including the regulation of toxic substances and the remediation of pollution; public lands and natural resource management; public funding of environmental and natural resource agencies; and ethics in government.

III. Background

Artificial turf fields were designed and promoted as an environmentally responsible alternative to traditional grass fields. These synthetic fields were determined to be a partial solution to the solid waste issues surrounding old tires taking up landfill space, accumulating in stockpiles across the country, presenting toxic fire hazards, and acting as a breeding ground for mosquitos.[2] To resolve this, the rubber was ground up to create the infill for year-round plastic grass fields for schools, parks, and sports teams.

Artificial turf contains multiple layers of materials. The artificial grass blades are usually made of various polymers.[3] Between the artificial grass blades is infill, usually composed of sand

[2] ENVTL. PROT. AGENCY, OFFICE OF SOLID WASTE, *Markets for Scrap Tires*, 1 (Oct. 1991) https://archive.epa.gov/epawaste/conserve/materials/tires/web/pdf/tires.pdf.

and post-consumer tire rubber.[4] Some artificial turf fields use "organic infill products" such as "walnut shells, cork and cork/coconut blends."[5] Underneath the infill are more layers of plastic and rubber which often include shock pads and drainage mats.[6]

The diversity of components, the amount created, and the rate at which artificial turf must be replaced creates an enormous amount of waste that presents serious technical, economic, and logistical challenges to its recycling. The polymers in artificial turf include "polyethylene, polypropylene, polyester, nylon, styrene butadiene rubber and polyurethane," with polyester as "the primary material for non-woven turf backing."[7] Additionally, natural materials such as silica sand and calcium carbonate are present.[8] In order for these materials to be recycled, they must be separated from each other as they have different viscosities and melting temperatures.[9]

Each synthetic field usually covers about 80,000 square feet and contains roughly 400,000 pounds of infill.[10] An artificial turf field will last eight to ten years, with most warranties running for only eight years, at which point the turf is removed and replaced.[11] Currently, there

are roughly 13,000 artificial turf fields in the United States, though this number is estimated to grow by more than 1,000 each year.[12]

No facility in the United States can recycle artificial turf.[13] Currently, the only two facilities known to be able to recycle artificial turf are in Denmark[14] and The Netherlands.[15] This is due to the technical, economic and logistical challenges presented in recycling artificial turf.

Vendors of artificial turf have marketed, presented, and stated that the removed artificial turf is recyclable and is being sent to domestic recycling facilities where these materials are being recovered. However, as stated above, this is false. The plastic carpets and rubber crumb infill that make up these artificial fields are instead sent to landfill, incinerated, stockpiled,[16] or illegally dumped.[17]

IV. Manufacturers and Marketers of Artificial Turf Make False and Deceptive Claims about their Products

The vendors, manufacturers, and marketers that claim artificial turf is recyclable, such as Synlawn, TurfCycle, Playing Surface Solutions, Inc., and TenCate, make false and deceptive claims to consumers about the recyclability of their products.

[17] Re-Match has leased property from CNH Properties LLC where it has received a Notice of Violation for violating the Pennsylvania Solid Waste Management Act, 35 P.S. § 6018.610, and Pennsylvania's Residual Waste Management rules and regulations, 25 PA Code § 287.6. *See* Exhibit C.

Claim that Artificial Turf is "recyclable"

Various websites and promotional materials advertising artificial turf contend that the artificial turf is recyclable. These websites and promotional materials have made claims such as, ". . . SYNLawn . . . is recyclable in the United States"[18] ". . . TurfCycle . . . rescue[s] the materials and [diverts] them into recycle centers across the country"[19] ". . . Playing Surface Solutions, Inc. . . . recycles the material by sifting and cleaning the sand and rubber infill for use in other applications. The carpet is broken down, recycled, and repurposed as composite decking, such as Trex . . . synthetic fibers . . . are baled and sent to a recycling center for further process to be turned into fuel;"[20] and " . . . TenCate . . . is 100% recyclable."[21]

However, there is no artificial turf recycling center in the United States and, to our knowledge, no artificial turf has ever been recycled in the United States.[22] Despite this, artificial turf is labeled as "recyclable" without qualification and is an overstatement of the environmental attribute of recyclability. Even if artificial turf can be recycled in The Netherlands or Denmark, the turf itself has not yet been sent to these recycling facilities and instead is either placed in a

[22] Mark Curran, a representative from TenCate Grass, stated during a commission hearing in Martha's Vineyard, Massachusetts, that no artificial turf fields "have been taken out of the US and recycled in the Netherlands." Guy Oldenkotte, *'Recycling turf in the US is just a matter of time'*, SPORTSFIELDS, (Mar. 22, 2021) https://sportsfields.info/news/recycling-turf-in-the-us-is-just-a-matter-of-time/ ("[A] recycling facility doesn't currently exist in the country the rest [of the artificial turf] 'sit in big yards in different parts of the country, like Pennsylvania'"); *see also* PFAS Action Group (@PFASactiongroup), TWITTER (Oct. 29, 2021, 3:58 PM), https://twitter.com/PFASactiongroup/status/1454175852686577667?s=20; *see also see also Artificial Turf: "A Mounting Disposal Mess"*, WASTE360, (Jan. 7, 2020) ("[T]he technology to recycle [artificial turf]—separating the plastic grass and backing from the sand-and-rubber infill—still isn't fully developed in the United States, or is deemed too expensive.").

landfill, a storage facility, stockpiled,[23] or illegally dumped.[24] Claiming that artificial turf is "recyclable" asserts an environmental benefit where "the benefits are negligible," in violation of 16 C.F.R. § 260.3(c).

Additionally, manufacturers and marketers have not adequately qualified their claims of recyclability. "A product should not be marketed as recyclable unless it can be collected, separated, or otherwise recovered from the waste stream through an established recycling program to reuse or use in manufacturing or assembling another item."[25] As there are no such recycling facility within the United States these recycling facilities are not available to a substantial majority of consumers or communities where artificial turf is sold., as required by 16 C.F.R. § 260.12(b), and in fact it is not likely that recycling facilities are available to *any* U.S. consumers. No manufacturer has qualified recyclability claims by stating the percentage of consumers or communities that have access to facilities that recycle artificial turf.

Furthermore, marketers and manufacturers cannot make unqualified recyclable claims about artificial turf as the mix of materials used in artificial turf significantly limit its recyclability.[26] In order for the different plastics, rubber, and other materials used in artificial turf to be recycled, they must be separated from each other.[27] This deeply limits the recyclability of artificial turf. While the individual components of artificial may be recyclable, the entire turf itself cannot be, and would not be accepted in recycling programs.[28] Therefore, these unqualified

recyclable claims falsely mislead consumers to believe the entirety of the turf is recyclable despite the limits of recyclability due to the different materials used.

V. Manufacturers and Marketers of Artificial Turf Engage in Deceptive and Unfair Practices in Violation of § 5 of the Federal Trade Commission Act

Section 5 of the Federal Trade Commission Ace makes deceptive acts or practices in commercial advertising unlawful.[29] An advertisement or practice is considered deceptive under FTC policy when: (1) there is a representation, omission, or practice that is likely to mislead the consumer, (2) the act or practice is considered from the perspective of a reasonable consumer, and (3) the representation, omission or practice is material.[30] The advertising practices by artificial turf companies meet all three of these elements.

Artificial Turf Companies Misrepresent Their Products in Order to Mislead Consumers

As shown in detail above, artificial turf companies make false and unsupported claims in their advertising to mislead consumers and make them believes that these products are recyclable and recycled in the United States. These companies include written misrepresentations of their products on their websites. None of these claims have been supported.

A Reasonable Customer Would be Deceived by These Practices

In order for an advertisement to be deemed deceptive by the FTC, it must be likely to mislead a reasonable customer.[31] A consumer's interpretation of an advertisement "will be presumed reasonable if it is the one the respondent intended to convey."[32] These companies make statements on their websites that are presented to consumers as facts.

The term "recyclable" is clear. Unlike appearance, feel, taste, or smell, the word "recyclable" has an objective definition that is set out in the regulations: "A product or package

[29] 15 U.S.C. § 52.
[30] Matter of Cliffdale Associates, Inc., 103 F.T.C. 110, 174 (1984).

[32] *Id.*

should not be marketed as recyclable unless it can be collected, separated, or otherwise recovered from the waste stream through an established recycling program for reuse or use in manufacturing or assembling another item."[33] The Synthetic Turf Council itself has a similar definition of recyclable as a "series of activities by which material that has reached the end of its current use is processed into material and utilized in the production of new products."[34] A reasonable consumer would rely on this information, believing that the turf would be able to be recycled in the way described by the Synthetic Turf Council, despite the fact that no such activity is possible in the United States. This is a clear definition that a reasonable consumer of artificial turf would understand, and artificial turf companies have abused.

The Marketing Strategies Used by These Companies Are Material

The marketing strategies considered in this complaint result in material consequences for consumers. A material representation, omission, act or practice involves information that is important to consumers and, hence, likely to affect their choice of a product.[35] The strategies employed by these companies make consumers more likely to buy artificial turf because they offer false promises of an environmentally conscious product. Companies make thousands of dollars from the sales of artificial turf when consumers could be using traditional grass lawns.

The failure to include the fact that there are no recycling centers in the United States and that no artificial turf has been shipped overseas to known recycling facilities misleads consumers as to recyclability, and contributes to misleading consumers into thinking that artificial turf is a

[33] *See* 16 C.F.R. § 260.12(a).
[34] SYNTHETIC TURF COUNCIL, *A Guideline to Recycle, Reuse, Repurpose and Remove Synthetic Turf Systems*, 2 (Oct. 2017) https://cdn.ymaws.com/www.syntheticturfcouncil.org/resource/resmgr/guidelines/STC_Guideline_for_Recycle_Re.pdf.
[35] Matter of Cliffdale Associates, Inc., 103 F.T.C. 110 (1984).

more environmentally conscious choice than a natural grass field.[36] This is important to consumers who are trying to support products that are environmentally friendly. The lack of transparency places a heavy burden on the consumer to understand exactly what they are consuming and undermines companies and corporations that are "playing by the rules."[37]

V. Conclusion

The companies that create and sell artificial turf are using unsupported, misleading and false advertising claims to convince the public that artificial turf is recyclable and therefore environmentally conscious. These deceptive practices constitute an unfair business practice warranting a thorough investigation by the FTC.

Applicant/permittee Re-Match, Inc.

Site Name Re-Match, Inc.

Facility ID (as issued by DEP) TBD

Instructions: This form should be completed by **each** landowner owning a parcel of land within the permit area. If an applicant is applying for a mobile processing permit or land application of waste, completion of Part A of this form is not required.

(I) (We), the undersigned, are the landowner(s) ("Landowner") of a fee title interest at Lot No. 4A-2

160 Great Valley Boulevard, Hanover Township, PA 18706 on 16 acres of land located in,
(location of premises)

Hanover Township (Name and Type of Municipality) Luzerne (Name of County)

Pennsylvania, and shown by crosshatched lines on the map attached hereto ("Premises") which is signed in the original by the Landowner upon which Re-Match, Inc. (Solid Waste Management Permit Applicant) (hereinafter "Applicant") proposes to engage in waste processing and/or beneficial use activities.

Part A: This consent shall be deemed to be a recordable document. Prior to the initiation of solid waste management activities under the permit, this Consent shall be recorded by Re-Match, Inc. (Landowner or Applicant) and entered into the deed book (d.b.v.) index at the office of the recorder of deeds in the county(ies) in which the Premises are located.

1. This instrument has been recorded in Luzerne, County, Pennsylvania, this 3RD day SEPTEMBER, 2020, at Book 3020, Page(s) 166780

Part B: (I) (We), the undersigned DO HEREBY ACKNOWLEDGE THAT THE APPLICANT AND HIS/HER AGENTS AND REPRESENTATIVES HAVE THE RIGHT TO ENTER UPON AND USE THE LAND FOR THE PURPOSES OF CONDUCTING WASTE MANAGEMENT ACTIVITIES for which application for permit, including this Consent, is made to the Department of Environmental Protection ("Department") under the Act of July 7, 1980 (P.L. 280, No. 97), as amended, known as the Solid Waste management Act (35 P.S. §§6018.101 et seq.) and the regulations promulgated pursuant thereto ("Act"). The right the Landowner grants is not the subject of pending civil litigation. (I) (We), the undersigned, (is or is not) shall also allow the Applicant access to the Premises to carry out pollution prevention or pollution abatement activities as required by the Act or deemed necessary by the Department to carry out any purpose of the Act.

THE LANDOWNER agrees TO ALLOW THE ABOVE-NAMED APPLICANT TO TRANSFER OR (agrees or does not agree)
ASSIGN, BY WRITTEN AGREEMENT, THIS CONTRACTUAL CONSENT TO ANOTHER SOLID WASTE MANAGEMENT FACILITY APPLICANT.

REC Book 3020 Page 166781

Nothing in this Consent shall preclude or limit the Landowner's authority to terminate the right or privilege of the Applicant to conduct waste management activities on the aforesaid Premises. In the event of such termination, the Landowner shall allow the Applicant ample time to bring to closure all waste management activities.

Part C: (I) (We), the undersigned, do hereby irrevocably grant to the Commonwealth of Pennsylvania or any of its authorized agents, or employees, and to the Applicant the right to enter upon the Premises for the duration of solid waste management activities and for up to ten (10) years after final closure, as such term is defined by the Act, of a processing facility or up to 10 year(s) after beneficial use activities have ceased for the purposes of inspection, monitoring, and maintenance and for conducting pollution abatement activities deemed necessary by the Department to carry out the purposes or requirements of the Act. (I) (We) do hereby grant in addition to the Commonwealth, for the aforesaid period of time, a right of entry across any lands adjoining or contiguous to the Premises owned by (us) (me) in order to have access to the Premises.

It is specifically agreed and understood that this Consent gives the Commonwealth the right to enter, inspect, monitor, and conduct maintenance or abatement on the Premises to the extent deemed necessary by the Department as a matter within the police power, but does not obligate the Commonwealth to do so, and does not constitute any ownership interest by the Commonwealth in the aforesaid Premises.

I (we) HEREBY CERTIFY UNDER PENALTY OF LAW, 18 Pa. C.S. SECTION 4904(b), THAT THE INFORMATION PROVIDED HEREIN IS TRUE AND CORRECT TO THE BEST OF MY KNOWLEDGE, INFORMATIN AND BELIEF.

In witness whereof and intending to legally bind (myself) (ourselves), (my) (our) heirs, legal representatives, successors, (I) (we) have hereunto set (my) (our) hand(s) and seal this 1ST day of SEPTEMBER, 20 20.

Mr. Nikolaj Magne Larsen Re-Match A/S Hi-Park 415 7400 Herning Denmark	Property Owner and Property Leaser/Renter Mr. Larsen: T - 45 77 34 67 34 nml@re-match.com	Yes ☒ No ☐
Mr. Jim Halkias (Additional Responsible Party) CNH Properties LLC 4075 Linglestown Rd #244 Harrisburg, PA 17112	Mr. Halkias T - 717-623-6101 jimbo8394@aol.com	

On June 15, 2021, Adrian Bouknight, Solid Waste Specialist of the Pennsylvania Department of Environmental Protection (PADEP), conducted a follow-up inspection of CNH Properties LLC. (CNH), at 10244 Allentown Blvd. of Grantville PA. Mr. Jim Halkias (Property Owner) was present for an interview at the time of the inspection. This inspection report has been written as a follow-up for Complaint Tracking System (CTS) ID# 334321. Additional review of CTS entries was conducted for the generation of this report.

Observations:

1. The Department first observed turf rolls at the Grantville property in February 2019, following a complaint received regarding concerns over improper disposal. During the interview with Mr. Halkias on June 15, 2021, Mr. Halkias confirmed having allowed Re-Match, a turf roll recycling company based out of Herning, Denmark, to utilize his property for storage of turf rolls. Mr. Halkias further confirmed having received the turf rolls from their prior location of storage at Fox Transport of 100 N. Harris Street of Cleona PA.

2. During the inspection, there appeared to be greater than 1,000 turf rolls observed at the Grantville property. Turf rolls were observed in roughly 10-15 separate rows. Each row appeared to be at least

Inspector Name	Inspector Signature	Headquarters	Date	Telephone

This inspection report is notice of the findings of an inspection conducted by a representative of the Department. This report is formal notification of any violations observed during the inspection. Additional notification of violations may be issued concerning either violations noted herein, or other violations identified as a result of review of laboratory analyses or Department records.

This report does not constitute an order or other appealable action of the Department. Nothing contained herein shall be deemed to grant or imply immunity from legal action for any violation noted herein.

Signature by the person interviewed does not necessarily imply concurrence with the findings on this report but does acknowledge that the person was shown the report or that a copy was left with the person.

☐ White - File Copy ☐ Yellow - Facility Copy ☐ Pink - Inspector Copy

50-100 feet in length and roughly 8 to 10 feet high. One row appeared to be greater than 300 feet long, and each row appeared to be roughly 6 to 8 feet in width.

3. Turf rolls observed at the site did not display evidence of degradation.

4. Evidence suggests that the material has accumulated speculatively.

Additional Notes:

1. Preceding the follow-up inspection of the Grantville property, an interview was held with Mr. Nikolaj Magne Larsen, CEO of Re-match (Property Leaser/Renter). Mr. Larsen described the turf rolls as having value and described storage of the rolls as being beneficial to the start-up, functionality, and profitability of a recycling facility. Mr. Larsen also described previously communicating with the Department, while seeking permit approval for construction of a turf roll recycling facility. See CTS ID 334321 for further details.

Violations:

1. Re-Match consigned, assigned, sold, entrusted, gave or in any way transferred residual waste that was subsequently dumped or deposited by another person without a permit from the Department in violation of 25 PA Code §287.6(1) which states that a person may not consign, assign, sell, entrust, give or in any way transfer residual waste which is at any time subsequently, by another person dumped or deposited in any manner into the surface of the earth unless a permit for the dumping or depositing has first been obtained from the Department.

2. Re-Match permitted the deposition of solid waste onto the surface of the ground without first having obtained a permit from the Department. This occurrence is unlawful conduct pursuant to Section 610(1) of the SWMA, 35 P.S. §6018.610(1) which states that it shall be unlawful for any person to dump or deposit, or permit the dumping or depositing, of any solid waste onto the surface of the ground unless a permit for the dumping of such solid wastes has been obtained from the Department.

3. Re-Match disposed of solid waste in a manner which has created in a public nuisance. This occurrence is unlawful conduct pursuant to Section 610(4) of the SWMA, 35 P.S. §6018.610(4) which states that it shall be unlawful for any person to dispose of solid waste in any manner as to create a public nuisance.

4. Re-Match caused or assisted in the violation of any provision of the Solid Waste Management Act, and any rule or regulation of the Department. This occurrence is unlawful conduct pursuant to Section 610(9) of the SWMA, 35 P.S. §6018.610(9) which states that it shall be unlawful for any person to cause or assist in the violation of any provision of the Solid Waste Management Act, or any rule or regulation of the Department.

Recommendations:

1. The Department recommends that Re-Match and CNH Properties LLC coordinate to provide a written description or statement of what correspondence has been historically held with the Department regarding the permit application and review for the proposed recycling facility. This may include records demonstrating the submission of permit applications to the Department for review, or other forms of communication and correspondence.

2. The Department recommends that within fourteen days of receipt of this notice, that Re-Match and CNH Properties LLC coordinate to submit a proposed plan and schedule to the Department for correction of the violations.

On August 3, 2021, Adrian Bouknight, Solid Waste Specialist of the Pennsylvania Department of Environmental Protection (PADEP), conducted a follow-up inspection of CNH Properties LLC., at 10244 Allentown Blvd. of Grantville PA. This inspection report has been written as a follow-up investigation for Complaint Tracking System (CTS) ID# 334321. This inspection was conducted from a public roadway, and as a result, no interview was conducted at the time of the inspection.

Observations:

1. During the inspection, there appeared to be greater than 1,000 turf rolls observed at the Grantville property. Rolls appeared to be the same as observed in prior inspections of the site.

2. Turf rolls observed at the site did not display clear signs of degradation.

Outstanding Violations:

During the inspection of June 15, 2021, violations were noted as follows:

1. Re-Match consigned, assigned, sold, entrusted, gave or in any way transferred residual waste that was subsequently dumped or deposited by another person without a permit from the Department in violation of 25 PA Code §287.6(1) which states that a person may not consign, assign, sell, entrust, give or in any way transfer residual waste which is at any time subsequently, by another person dumped or deposited in any manner into the surface of the earth unless a permit for the dumping or depositing has first been obtained from the Department.

Signature by the person interviewed does not necessarily imply concurrence with the findings on this report but does acknowledge that the person was shown the report or that a copy was left with the person.

2. Re-Match permitted the deposition of solid waste onto the surface of the ground without first having obtained a permit from the Department. This occurrence is unlawful conduct pursuant to Section 610(1) of the SWMA, 35 P.S. §6018.610(1) which states that it shall be unlawful for any person to dump or deposit, or permit the dumping or depositing, of any solid waste onto the surface of the ground unless a permit for the dumping of such solid wastes has been obtained from the Department.

3. Re-Match disposed of solid waste in a manner which has created in a public nuisance. This occurrence is unlawful conduct pursuant to Section 610(4) of the SWMA, 35 P.S. §6018.610(4) which states that it shall be unlawful for any person to dispose of solid waste in any manner as to create a public nuisance.

4. Re-Match caused or assisted in the violation of any provision of the Solid Waste Management Act, and any rule or regulation of the Department. This occurrence is unlawful conduct pursuant to Section 610(9) of the SWMA, 35 P.S. §6018.610(9) which states that it shall be unlawful for any person to cause or assist in the violation of any provision of the Solid Waste Management Act, or any rule or regulation of the Department.

The Department, Re-Match, and CNH Properties LLC are currently working toward a solution and these violations are currently outstanding.

Recommendations:

The Department recommends that Re-Match continues to coordinate with the additional responsible party (CNH Properties LLC) and the Department in resolving violations noted in the June 2021 inspection report.

Additional Notes:

See CTS ID# 334321 and Inspection ID# 3217684 for further details.

Inspector Name	Inspector Signature	Headquarters	Date	Telephone
Adrian Bouknight	Adrian Bouknight P.G.	Reading District Office 1005 Crossroads Blvd. Reading PA 19605	08/06/2021	610-916-0145

This inspection report is notice of the findings of an inspection conducted by a representative of the Department. This report is formal notification of any violations observed during the inspection. Additional notification of violations may be issued concerning either violations noted herein, or other violations identified as a result of review of laboratory analyses or Department records.

This report does not constitute an order or other appealable action of the Department. Nothing contained herein shall be deemed to grant or imply immunity from legal action for any violation noted herein.

Signature by the person interviewed does not necessarily imply concurrence with the findings on this report but does acknowledge that the person was shown the report or that a copy was left with the person.

Re: General and Follow-up Inspection Reports
10244 Allentown Blvd. Grantville PA 17028
East Hanover Township, Lebanon County

Dear Mr. Larsen:

As a result of the June 15, 2021 General inspection and the August 3, 2021 Follow-up inspection at the referenced location, the Department of Environmental Protection ("DEP") has determined that you are in violation of the Solid Waste Management Act ("SWMA"), Act of July 7, 1980, P.L. 380, No. 97, 35 P.S. Section(s) 6018.101 et. seq., and the Residual Waste Management rules and regulations found at 25 Pa. Code Chapters 287 to 299 as follows:

A. During the June 15, 2021 and August 3, 2021 inspections, speculatively accumulated turf rolls were observed at the 10244 Allentown Blvd. property. During interviews with Mr. Halkias, property owner at 10244 Allentown Blvd. and Manager at CNH Properties LLC., and Mr. Larsen, CEO at Re-Match Turf Recycling, the Denmark based company that owns the turf rolls observed at the Allentown Blvd. property, it was confirmed that both parties came to an agreement to have the turf rolls transported to the 10244 Allentown Blvd. property. Re-Match therefore has consigned, assigned, sold, entrusted, gave or transferred residual waste that was subsequently dumped or deposited by CNH Properties LLC without a permit issued by the Department at 10244 Allentown Blvd., in violation of 25 PA Code §287.6(1) which states that a person may not consign, assign, sell, entrust, give or in any way transfer residual waste which is at any time subsequently, by another person dumped or deposited in any manner into the surface of the earth unless a permit for the dumping or depositing has first been obtained from the Department.

B. The occurrence listed in paragraph A constitutes unlawful conduct pursuant to Section 610(1) of the SWMA, 35 P.S. §6018.610(1) which states that it shall be unlawful for any person to dump or deposit, or permit the dumping or depositing, of any solid waste onto the surface of the ground unless a permit for the dumping of such solid wastes has been obtained from the Department.

C. The occurrence listed in paragraph A constitutes unlawful conduct pursuant to Section 610(4) of the SWMA, 35 P.S. §6018.610(4) which states that it shall be unlawful for any person to dispose of, or assist in the disposal of solid waste contrary to the rules or regulations adopted under this act, or orders of the department, or any term or any condition of any permit, or in any manner as to create a public nuisance or to adversely affect the public health, safety and welfare.

D. The occurrence listed in paragraph A constitutes unlawful conduct pursuant to Section 610(6) of the SWMA, 35 P.S. §6018.610(6) which states that it shall be unlawful for any person to Transport or permit the transportation of any solid waste to any storage, treatment, processing or disposal facility or area unless such facility or area possesses a permit issued by the department to accept such wastes, or contrary to the rules or regulations adopted under this act, or orders of the department.

E. The occurrence listed in paragraph A constitutes unlawful conduct pursuant to Section 610(9) of the SWMA, 35 P.S. §6018.610(9) which states that it shall be unlawful for any person to cause or assist in the violation of any provision of this act, any rule or regulation of the department, any order of the department or any term or condition of any permit.

You are notified of both the existence of the violations as well as the need to provide prompt correction. Failure to correct the violations may result in legal proceedings under the SWMA. Under the Act, each day of the violation is considered a distinct and separate offense and will be handled accordingly.

Within fourteen days of receipt of this notice, please submit a proposed plan and schedule to the DEP to correct the violations listed above.

This Notice of Violation is neither an order nor any other final action of the DEP. It neither imposes nor waives any enforcement action available to the DEP under any of its statutes. If the DEP determines that an enforcement action is appropriate, you will be notified of the action.

If you have any questions or concerns, please call me at 610.916.0145.

Sincerely,

Adrian Bouknight P.G. /s/

TENCATE ACCORDER®, WOVEN BASE CONSTRUCTION

Turn, shift, accelerate and score. The technical playing qualities of artificial grass are determined by the composition of and the materials used in the entire system. GreenFields is a specialist in this area. Working closely with the TenCate group of materials technology companies, GreenFields designs and supplies integrated artificial grass systems.

By combining numerous technological innovations in one artificial grass system that consists of multiple integrated layers, sports associations and clubs can provide their top talents and enthusiastic amateurs with a safe, durable and affordable playing surface.

GreenFields – The choice of Champions.

Stable sub base

TenCate has developed an innovative new product, called TenCate Accorder®, which provides a firm basis for high-quality artificial grass systems.

TenCate Accorder® consists of a durable geotextile module that is only approximately seven centimetres deep and divided into dozens of equal-sized compartments per square metre, which are filled with local (re)usable soil. In this way, GreenField's compact base layer is the most stable subsurface for playing sports available on today's market. On site, much less soil has to be dug away, which saves time as well as excavation and transport costs, whilst drastically reducing the total system's carbon footprint.

TenCate Accorder® is 100% recyclable.

Artificial Turf's Big Lie: Old Fields Not Recycled

Jan 30, 2020 | Tags: artificial turf

For Immediate Release: Thursday, January 30, 2020
Contact: Kyla Bennett (508) 230-9933; Kirsten Stade (202) 265-7337

No Recycling Facilities, So Tons of Plastic Carpet Dumped

Washington, DC — Artificial turf fields have been marketed as an environmentally responsible alternative to grass fields, providing a solution for a nasty solid waste problem by reusing old tires that are later recycled after removal. But this greenwashing is all a hoax, according to Public Employees for Environmental Responsibility (PEER). Since there are no U.S. facilities for recycling, the plastic carpets and rubber crumb infill are often dumped or sent back to landfills in a form that is even more environmentally problematic.

There are currently an estimated 13,000 artificial turf fields in the U.S., a number that is growing by more than 1,000 each year. A synthetic field usually covers about 80,000 square feet and contains roughly 400,000 pounds of infill, consisting of shredded tires or other material, and 40,000 pounds of carpet. An artificial turf field will last eight-to-10 years, with most warranties running for only eight years. At that point, the turf is ripped out at which point new difficulties arise.

An 80,000 square-ft. sports field fills between fifteen and twenty 30-yard dumpsters. That volume would cost roughly $30,000 to $60,000 to landfill. To avoid that cost, vendors routinely advise municipalities that there are

recycling facilities in the U.S.; specifically, they point to a company called Re-Match with a facility in Pennsylvania. One typical pitch claims –

"By partnering with Re-Match Turf Recycling, we will take the necessary steps to ensure that the synthetic carpet is recycled and does not end up in a landfill."

Despite these claims, the Re-Match facility does not exist. An email from the CEO of Re-Match says, "there is no synthetic turf recycling plant in America yet." Even the Synthetic Turf Council admits "Unfortunately, converting synthetic turf to a recyclable material that is useable cannot be done at the point of removal. Material must be shipped to different processing locations." However, those unspecified recycling locations have yet to be identified.

"In reality, rather than being recycled, these old turf fields and their rubber crumb infill are dumped in abandoned lots, alleys, and even wetlands," stated PEER Science Policy Director Kyla Bennett, a scientist and attorney formerly with the U.S. Environmental Protection Agency, noting EPA previously championed crumb rubber fields as a solid waste solution, turning waste into a product. "Crumb rubber fields do not solve a solid waste disposal problem; they merely delay and compound it."

In addition to the shredded tire infill, the plastic carpets are another waste disposal challenge. PEER has documented that they contain toxic per-and polyfluoroalkyl substances (PFAS), known as "Forever Chemicals" because they do not break down in the environment.

"Both current and retired synthetic turf fields are sources of contamination, leaching zinc, PFAS and micro-plastics into nearby waters," added Bennett, noting that some vendors even tantalize potential customers with hopes of Leadership in Energy and Environmental Design (LEED) points for these toxic fields. "When the true costs are considered, artificial turf makes fields of delusions, not dreams."

Subject: VS: US recycling facility are resources inquiry
To:

Dear

Thank you for your kind e-mail and inquiry.

No, there is no synthetic turf recycling plant in America yet. The word recycling is being used by many, but in reality it is not existing at the moment.
So the short answer is unfortunately no.

...

Venlig hilsen | Best regards,

Converting Synthetic Turf to a Recyclable Material

The graphic on the next page is a simplified view of the decisions required and the options available for synthetic turf removal. It shows the steps required to convert the synthetic turf materials into a form that is useful for recycling. Unfortunately, converting synthetic turf to a recyclable material that is useable cannot be done at the point of removal. Material must be shipped to different processing locations. The cost of shipping is one of the biggest challenges associated with synthetic turf reclamation.

Once the decision has been made to reclaim the synthetic turf, the materials must be separated. Infill must be removed from the turf. Further separation may be required to separate sand and debris from the infill.

After the synthetic turf has been separated from the infill it can be broken down into materials suitable for post-consumer recycle content in the plastics industry. This can be accomplished in much the same way that carpet is reclaimed and recycled today. The industry is working to identify the most economical way to process turf plastics.

Mitigation Measure BIO-11: Restrict Monofilament Materials.

The implementing agency will restrict the use of monofilament materials. Plastic monofilament netting (i.e., erosion control wattles or matting) or similar material will be prohibited as part of erosion-control activities. Alternative materials that could be used include, but are not limited to, geotextiles, fiber rolls, geomembranes, tackified hydroseeding compounds, loose-weave mesh, such as jute, hemp, and coconut (i.e., coir) fiber, and rice straw wattles (e.g., Earthsaver wattles: biodegradable, photodegradable, burlap).

If it is determined that special-status birds (or those protected by the MBTA and CFGC) and special-status mammals, reptiles, or amphibians have the potential to occur, then the following mitigation measures will be required.

Mitigation Measure BIO-12: Implement Best Practices for Night Lighting.

Construction and/or facility lighting will be designed to minimize or lessen the attraction of birds, bats, or their prey to the project site. Best practices for lighting for avian species conflict with those for bats. Best practices for avian species include using non-steady burning lights (e.g., red, dual red, and white strobe-like flashing lights) using motion or heat sensors and switches to reduce the time when lights are illuminated, using appropriate shielding to reduce horizontal or skyward illumination, and avoiding the use of high-intensity lights (e.g., sodium vapor, quartz, halogen). Best practices for lighting for bat species include avoiding green and red lights, as these interfere with migration patterns. White lighting tends to attract prey species and increase foraging. Lighting adjacent to wildlife areas should be limited to an upper limit of 3,000 on the Kelvin color temperature scale and shielded to prevent light from entering the wildlife area.

Night lighting will be designed for best practices for both avian and bat species, while also considering special-status reptiles and amphibians. Some design measures could include construction and facility lighting designed to prevent casting light toward surrounding wildlife habitats and the riverbed and using non-steady burning lights and avoiding green and red lights.

Mitigation Measure BIO-13: Avoid Bird and Bat Entrapment in Poles.

Biological monitors will ensure that any installed poles, whether temporary or permanent, will not have openings that could entrap birds or bats. Construction contractors will be required to seal and cap all openings in poles or provide for escape routes (i.e., openings accommodating escape for various species). Installation of poles will not begin until it is demonstrated that the poles can be adequately capped and/or sealed on installation.

If it is determined that special-status wildlife, nesting birds, raptors, or eagles could occur, then the following mitigation measure will be implemented.

Mitigation Measure BIO-14: Minimize Noise Disturbance of Wildlife.

The implementing agency will incorporate setbacks, berms, walls, or similar noise-attenuating method to avoid and minimize the effects of noise on special-status wildlife, nesting birds, raptors, or eagles in noise-generating activities affecting areas where special-status wildlife has been identified. Wildlife habitat areas occupied by sensitive species will not be subject to noise that will exceed residential noise standards as specified in Section 3.12, *Noise*. If the biological monitor determines that noise generation by construction activities may affect nesting, the biological monitor may require the monitoring of noise by a qualified technician, if attenuation

C. System transformations to limit global warming

C.1 Global GHG emissions are projected to peak between 2020 and at the latest before 2025 in global modelled pathways that limit warming to 1.5°C (>50%) with no or limited overshoot and in those that limit warming to 2°C (>67%) and assume immediate action. [Table SPM footnote [#9], FOOTNOTE 38] **In both types of modelled pathways, rapid and deep GHG emissions reductions follow throughout 2030, 2040 and 2050 (*high confidence*). Without a strengthening of policies beyond those that are implemented by the end of 2020, GHG emissions are projected to rise beyond 2025, leading to a median global warming of 3.2 [2.2 to 3.5] °C by 2100 [FOOTNOTE 39, 40] (*medium confidence*). (Table SPM.1, Figure SPM.4, Figure SPM.5) {3.3, 3.4}**

FOOTNOTE 38: All reported warming levels are relative to the period 1850–1900. If not otherwise specified, 'pathways' always refer to pathways computed with a model. Immediate action in the pathways refers to the adoption of climate policies between 2020 and at latest 2025 intended to limit global warming at a given level.

FOOTNOTE 39: Long-term warming is calculated from all modelled pathways assuming mitigation efforts consistent with national policies that were implemented by the end of 2020 (scenarios that fall into policy category P1b of Chapter 3) and that pass through the 2030 GHG emissions ranges of such pathways assessed in Chapter 4 (See FOOTNOTE 25) {3.2, Table 4.2}

FOOTNOTE 40: Warming estimates refer to the 50th and [5th–95th] percentile across the modelled pathways and the median temperature change estimate of the probabilistic WG I climate model emulators[Footnote 1] (Table SPM1).

C.1.1 Net global GHG emissions are projected to fall from 2019 levels by 27% [13–45%] by 2030 and 63% [52-76%] [FOOTNOTE 41] by 2050 in global modelled pathways that limit warming to 2°C (>67%) and assuming immediate action (category C3a, Table SPM.1). This compares with reductions of 43% [34–60%] by 2030 and 84% [73–98%] by 2050 in pathways that limit warming to 1.5°C (>50%) with no or limited overshoot (C1, Table SPM.1) (*high confidence*).[[FOOTNOTE 42] In modelled pathways that return warming to 1.5°C (>50%) after a high overshoot [FOOTNOTE 43], GHG emissions are reduced by 23 [0-44%] in 2030 and by 75 [62-91%] in 2050 (C2, Table SPM.1) *(high confidence*). Modelled pathways that are consistent with NDCs announced prior to COP26 until 2030 and assume no increase in ambition thereafter have higher emissions, leading to a median global warming of 2.8°C [2.1-3.4°C] by 2100 (*medium confidence*). [FOOTNOTE 24] (Figure SPM .4). {3.3}

FOOTNOTE 41: In this report, emissions reductions are reported relative to 2019 modelled emission levels, while in SR1.5 emissions reductions were calculated relative to 2010. Between 2010 and 2019 global GHG and global CO_2 emissions have grown by 12% (6.5 $GtCO_2eq$) and 13% (5.0 Gt CO_2) respectively. In global modelled pathways assessed in this report that limit warming to 1.5°C (>50%) with no or limited overshoot, GHG emissions are projected to be reduced by 37% [28-57%] in 2030 relative to 2010. In the same type of pathways assessed in SR1.5, GHG emissions are reduced by 45% (40-60% interquartile range) relative to 2010. In absolute terms, the 2030 GHG emissions levels of pathways that limit warming to 1.5°C (>50%) with no or limited overshoot are higher in AR6 (31 [21-36] $GtCO_2eq$) than in SR1.5 (28 (26-31 interquartile range) $GtCO_2eq$). (Figure SPM. 1, Table SPM.1) {3.3, SR1.5}

ATTACHMENT J

BOARD MEETING DATE: December 5, 2008 AGENDA NO. 31

PROPOSAL: Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans

SYNOPSIS: This action is to adopt a resolution approving the Interim CEQA GHG Significance Threshold for Stationary Sources, Rules, and Plans where AQMD is the lead agency. This interim threshold will be used for determining significant impacts for proposed projects. Once CARB adopts the statewide significance thresholds, staff will report back to the Board regarding any recommended changes or additions to the AQMD's interim threshold.

COMMITTEE: Climate Change, September 19, 2008 and October 29 2008

RECOMMENDED ACTION:
Adopt the attached resolution approving the Interim CEQA GHG Significance Threshold for Stationary Sources, Rules, and Plans for use by the AQMD.

Barry R. Wallerstein, D.Env.
Executive Officer

EC:LT:SN:SS

Background
The California Environmental Quality Act (CEQA) requires public agencies in California to analyze potential adverse impacts from proposed projects undertaken by a public agency, funded by a public agency, or requiring discretionary approval by a public agency. To disclose potential adverse impacts from a proposed project, pursuant to CEQA, lead agencies typically prepare a multidisciplinary environmental impact analysis and make decisions based on the analysis regarding the environmental effects of the proposed project (CEQA Guidelines §15002[a]).

In the past, air quality analyses tended to focus on potential adverse impacts from criteria pollutants and toxic air contaminants. Subsequent to the adoption of Assembly

Bill (AB) 32 – The California Global Warming Solutions Act of 2006, lead agencies have increasingly faced legal challenges to their CEQA documents for failure to analyze greenhouse gases (GHGs) or failure to make a determination of significance regarding GHG emission impacts.

Subsequent to the adoption of AB 32, there had been little regulatory guidance with regard to analyzing GHG emission impacts in CEQA documents until the Governor's Office of Planning and Research (OPR) released its Technical Advisory on CEQA and Climate Change (June 19, 2008). Consistent with Senate Bill (SB) 97, OPR's Technical Advisory was developed in cooperation with the Resources Agency, the California Environmental Protection Agency (Cal/EPA), and the California Air Resources Board (CARB). According to OPR, the Technical Advisory offers informal interim guidance regarding the steps lead agencies should take to address climate change in their CEQA documents, until CEQA guidelines are developed pursuant to SB 97 on how state and local agencies should analyze, and when necessary, mitigate greenhouse gas emissions.

Because of its expertise in establishing air quality analysis methodologies and comprehensive efforts to establish regional and localized significance thresholds for criteria pollutants, local public agencies have asked the AQMD for guidance in quantifying GHG impacts and recommending GHG significance thresholds to assist them with determining whether or not GHG impacts in their CEQA documents are significant. In response to these requests from the various stakeholders, AQMD established a stakeholder working group to receive input on establishing a GHG significance threshold. In the meantime, AQMD staff has joined many other stakeholders urging CARB to establish a statewide threshold for GHGs. AQMD has been making GHG significance determinations for its CEQA documents on a case-by-case basis. Staff believes it is more prudent to make GHG significance determinations using a GHG significance threshold that has gone through a public process and has been adopted by resolution by the Board than making GHG significance determinations on a case-by-case basis. In the absence of a statewide threshold, AQMD staff recommends its interim approach to the Board for consideration and it will also become part of the AQMD's input to the statewide process. The interim GHG significance threshold proposal recommended by staff to the Board that applies only to industrial (stationary source) projects where the AQMD is the lead agency is a narrower recommendation than the version presented at the October 29, 2008 Climate Change Committee meeting.

GHG Working Group – The GHG significance threshold Working Group was formed to assist staff's efforts to develop an interim GHG significance threshold and is comprised of a wide variety of stakeholders including: state agencies, OPR, CARB, and the Attorney General's Office; local agencies, city and county planning departments, utilities such as sanitation and power, etc.; regulated stakeholders, industry and industry groups; and organizations, both environmental and professional. Working group meetings are also open to the public. Part of the purpose of the Working Group is to

provide a forum to solicit comments and suggestions from the various stakeholders to assist AQMD staff with developing an interim GHG significance threshold that is consistent with CEQA requirements for developing significance thresholds, is supported by substantial evidence, and provides guidance to CEQA practitioners with regard to determining whether GHG emissions from a proposed project are significant. Since April 2008, seven Working Group meetings have been held. Detailed information on the GHG Working Group process is contained in Attachment E to this Board letter – *Draft Guidance Document – Interim Greenhouse Gas (GHG) Significance Threshold*. The staff-proposed interim GHG significance threshold resulting from the Working Group process is described later in this Board letter.

Legal Authority

CEQA Guidelines §15022(a) states that a public agency shall adopt objectives, criteria, and specific procedures consistent with CEQA and these [State] Guidelines for administering its responsibilities under CEQA. CEQA Guidelines §15022(d) states further, "In adopting procedures to implement CEQA, a public agency may adopt the State CEQA Guidelines through incorporation by reference. The agency may then adopt only those specific procedures or provisions described in subsection [15022] (a) which are necessary to tailor the general provisions of the guidelines to the specific operations of the agency." AQMD previously adopted the state guidelines and has since adopted specific provisions such as regional and localized are quality significance thresholds. Adopting GHG significance thresholds would be consistent with the CEQA Guidelines §15022 provision to tailor a public agency's implementing guidelines by adopting criteria relative to the specific operations of the AQMD.

Specifically with regard to thresholds of significance, CEQA Guidelines §15064.7(a) states, "Each public agency is encouraged to develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects." Subsection (b) of the same section states further, "Thresholds of significance to be adopted for general use as part of the lead agency's environmental review process must be adopted by ordinance, resolution, rule or regulation, and developed through a public review process and be supported by substantial evidence." Staff's recommended GHG significance threshold has undergone a public review process as part of stakeholder working group meetings that are open to the public. The currently proposed interim GHG significance threshold will be for projects where the AQMD is the lead agency.

Proposal

Policy Objective – The overarching policy objective with regard to establishing a GHG significance threshold for the purposes of analyzing GHG impacts pursuant to CEQA is to establish a performance standard or target GHG reduction objective that will ultimately contribute to reducing GHG emissions to stabilize climate change. Full implementation of the Governor's Executive Order S-3-05 would reduce GHG

emissions 80 percent below 1990 levels or 90 percent below current levels by 2050. It is anticipated that achieving the Executive Order's objective would contribute to worldwide efforts to cap GHG concentrations at 450 ppm, thus, stabilizing global climate.

As described below, staff's recommended interim GHG significance threshold proposal uses a tiered approach to determining significance. Tier 3, which is expected to be the primary tier by which the AQMD will determine significance for projects where it is the lead agency, uses the Executive Order S-3-05 goal as the basis for deriving the screening level. To avoid hindering attaining this goal, new or modified projects will need to be analyzed under CEQA and mitigated to the maximum extent feasible. Specifically, the Tier 3 screening level for stationary sources is based on an emission capture rate of 90 percent for all new or modified projects. A 90 percent emission capture rate means that 90 percent of total emissions from all new or modified stationary source projects would be subject to a CEQA analysis, including a negative declaration, a mitigated negative declaration, or an environmental impact report, which includes analyzing feasible alternatives and imposing feasible mitigation measures.

Therefore, the policy objective of staff's recommended interim GHG significance threshold proposal is to achieve an emission capture rate of 90 percent of all new or modified stationary source projects. A GHG significance threshold based on a 90 percent emission capture rate may be more appropriate to address the long-term adverse impacts associated with global climate change because most projects will be required to implement GHG reduction measures. Further, a 90 percent emission capture rate sets the emission threshold low enough to capture a substantial fraction of future stationary source projects that will be constructed to accommodate future statewide population and economic growth, while setting the emission threshold high enough to exclude small projects that will in aggregate contribute a relatively small fraction of the cumulative statewide GHG emissions. This assertion is based on the fact that staff estimates that these GHG emissions would account for slightly less than one percent of future 2050 statewide GHG emissions target (85 MMTCO2eq/yr). In addition, these small projects may be subject to future applicable GHG control regulations that would further reduce their overall future contribution to the statewide GHG inventory. Finally, these small sources are already subject to BACT for criteria pollutants and are more likely to be single-permit facilities, so they are more likely to have few opportunities readily available to reduce GHG emissions from other parts of their facility.

Staff does not believe a zero threshold, as recommended by some working group members would be feasible to implement. A 90 percent emissions capture rate will assure that all feasible GHG reduction measures will be implemented for a large majority of emissions from new or modified GHG stationary sources, while avoiding overwhelming the AQMD's capabilities to process environmental documents. Implementing the interim GHG significance threshold is expected to at least double or

triple the number of CEQA documents for permit application projects that are prepared by the AQMD each year (from approximately 10 to 15 to more than 45). Based on the number of permit applications received per year, it is likely that a zero GHG significance threshold would require preparing hundreds of additional CEQA documents per year with minimal additional environmental benefits.

Applicability – At this time, staff is recommending consideration of an interim GHG significance threshold that would apply to stationary source/industrial projects where the AQMD is the lead agency under CEQA. The types of projects that the staff proposal would apply to include: AQMD rules, rule amendments, and plans, e.g., Air Quality Management Plans. In addition, the AQMD may be the lead agency under CEQA for projects that require discretion approval, i.e., projects that require discretionary air quality permits from the AQMD. It should be noted that stationary source equipment associated with these projects are either at BACT or must comply with source-specific rules that reduce criteria pollutants and/or air toxics.

Emission Calculations and Significance Threshold Proposal – For the purposes of determining whether or not GHG emissions from affected projects are significant, project emissions will include direct, indirect, and, to the extent information is available, life cycle emissions during construction and operation. Construction emissions will be amortized over the life of the project, defined as 30 years, added to the operational emissions, and compared to the applicable interim GHG significance threshold tier. The following bullet points describe the basic structure of staff's tiered GHG significance threshold proposal for stationary sources.

- **Tier 1 –** consists of evaluating whether or not the project qualifies for any applicable exemption under CEQA. For example, SB 97 specifically exempts a limited number of projects until it expires in 2010. If the project qualifies for an exemption, no further action is required. If the project does not qualify for an exemption, then it would move to the next tier.

- **Tier 2 –** consists of determining whether or not the project is consistent with a GHG reduction plan that may be part of a local general plan, for example. The concept embodied in this tier is equivalent to the existing concept of consistency in CEQA Guidelines §§15064(h)(3), 15125(d), or 15152(a). The GHG reduction plan must, at a minimum, comply with AB 32 GHG reduction goals; include emissions estimates agreed upon by either CARB or the AQMD, have been analyzed under CEQA, and have a certified Final CEQA document. Further, the GHG reduction plan must include a GHG emissions inventory tracking mechanism; process to monitor progress in achieving GHG emission reduction targets, and a commitment to remedy the excess emissions if GHG reduction goals are not met (enforcement).

  If the proposed project is consistent with the qualifying local GHG reduction plan, it is not significant for GHG emissions. If the project is not consistent with a local

GHG reduction plan, there is no approved plan, or the GHG reduction plan does not include all of the components described above, the project would move to Tier 3.

- **Tier 3 –** establishes a screening significance threshold level to determine significance using a 90 percent emission capture rate approach as described above.

  The 90 percent capture rate GHG significance screening level in Tier 3 for stationary sources was derived using the following methodology. Using AQMD's Annual Emission Reporting (AER) Program staff compiled reported annual natural gas consumption for 1,297 permitted facilities for 2006 through 2007 and rank-ordered the facilities to estimate the 90th percentile of the cumulative natural gas usage for all permitted facilities. Approximately 10 percent of facilities evaluated comprise more than 90 percent of the total natural gas consumption, which corresponds to 10,000 metric tons of CO2 equivalent emissions per year (MTCO2eq/yr) (the majority of combustions emissions is comprised of CO2). This value represents a boiler with a rating of approximately 27 million British thermal units per hour (mmBtu/hour) of heat input, operating at a 80 percent capacity factor. It should be noted that this analysis did not include other possible GHG pollutants such as methane, N2O; a life-cycle analysis; mobile sources; or indirect electricity consumption. Therefore, when implemented, staff's recommended interim proposal is expected to capture more than 90 percent of GHG emissions from stationary source projects.

  If the project exceeds the GHG screening significance threshold level and GHG emissions cannot be mitigated to less than the screening level, the project would move to Tier 4.

- **Tier 4 –** consists of a decision tree approach that allows the lead agency to choose one of three compliance options based on performance standards. *(For the purposes of Board consideration, Tier 4 is not recommended for approval at this time.).*

  The purpose of Tier 4 is to provide a means of determining significance relative to GHG emissions for very large projects that include design features and or other measures to mitigate GHG emissions to the maximum extent feasible, but residual GHG emissions still exceed the interim Tier 3 screening levels. In this situation, since no additional project-related GHG emission reductions are feasible, staff is considering whether it is reasonable to consider that residual emissions are not significant. The intent of the Tier 4 compliance options is to encourage large projects to implement the maximum feasible GHG reduction measures instead of shifting to multiple smaller projects that may forego some design efficiencies that can more easily be incorporated into large projects than small projects. CARB's interim GHG significance threshold proposal incorporates a similar, but modified approach for determining GHG significance along with other suggested approaches that may have merit to consider and incorporate into AQMD staff's recommended

interim proposal. There are also policy and legal questions that need to be further resolved before adopting such an approach.

- **Tier 5 –** under this tier, the project proponent would implement offsite mitigation (GHG reduction projects) to reduce GHG emission impacts to less than the proposed screening level. Any offsite mitigation measures that include purchase of offsets would require the project proponent provide offsets for the life of the project, which is defined as 30 years. If the project proponent is unable to implement offsite GHG reduction mitigation measures to reduce GHG emission impacts to less than the screening level, then GHG emissions from the project would be considered significant. Since it is currently uncertain how offsite mitigation measures, including purchased offsets, interact with future AB 32 Scoping Plan measures, the AQMD would allow substitution of mitigation measures that include an enforceable commitment to provide mitigation prior to the occurrence of emissions. The intent of this provision is to prevent mitigating the same emissions twice.

Mitigation Preference – If a project generates significant adverse impacts, CEQA Guidelines §15126.4 requires identification of mitigation measures to minimize potentially significant impacts. Because GHG emissions contribute to global change, mitigation measures could be implemented locally, nationally, or internationally and still provide global climate change benefits. Because reducing GHG emissions may provide co-benefits through concurrent reductions in criteria pollutants, when considering mitigation measures when the AQMD is the lead agency under CEQA, staff recommends that mitigation measures that are real, quantifiable, verifiable, and surplus be selected in the following order of preference.

- Incorporate GHG reduction features into the project design, e.g., increase a boiler's energy efficiency, use materials with a lower global warming potential than conventional materials, etc.

- Implement onsite measures that provide direct GHG emission reductions onsite, e.g., replace onsite combustion equipment (boilers, heaters, steam generators, etc.) with more efficient combustion equipment, install solar panels on the roof, eliminate or minimize fugitive emissions, etc.

- Implement neighborhood mitigation measure projects that could include installing solar power, increasing energy efficiency through replacing low efficiency water heaters with high efficiency water heaters, increasing building insulation, using fluorescent bulbs, replacing old inefficient refrigerators with efficient refrigerators using low global warming potential refrigerants, etc.

- Implement in-district mitigation measures such as any of the above identified GHG reduction measures; reducing vehicle miles traveled (VMT) through greater rideshare incentives, transit improvements, etc.

- Implement in-state mitigation measures, which could include any of the above measures.

- Implement out of state mitigation measure projects, which may include purchasing offsets if other options are not feasible.

GHG Significance Threshold Components Deferred to the Future
Tier 4 Performance Standards – Based on reasons stated earlier, staff recommends that further evaluation be conducted to address comments raised and to consider other approaches as appropriate. Specifically, CARB staff proposed a hybrid approach in their Draft Proposal that combines the AQMD's Tier 3 and Tier 4 concepts for stationary source projects. If CARB's board does not take final action on their interim GHG significance threshold proposal by February 2009, AQMD staff will report back in the following month regarding the viability of the Tier 4 performance standards and recommended actions, if any.

Residential/Commercial Sectors GHG Significance Threshold – To achieve the same policy objective of capturing 90 percent of GHG emissions from new development projects in the residential/commercial sectors and implement a "fair share" approach to reducing emission increases from each sector, staff discussed with the working group a proposal combining performance standards and screening thresholds. The performance standards primarily focus on energy efficiency measures beyond Title 24 and a screening level of 3,000 MTCO2eq/yr based on the relative GHG emissions contribution between residential/commercial sectors and stationary source (industrial) sectors. Additional analysis is needed to further define the performance standards and to coordinate with CARB staff's interim GHG proposal. Staff, therefore, recommends bringing this item back to the Board for discussion and possible action in March 2009 if the CARB board does not take its final action by February 2009.

A comparison between CARB staff's initial concepts and AQMD staff's recommended interim GHG significance threshold proposal for stationary projects and approaches for residential/commercial sectors is summarized in Table 1 for reference. A more detailed discussion is contained in the Draft Guidance Document in Attachment E.

Table 1
Comparison of CARB's and AQMD Staff's Interim GHG Significance Threshold Approaches

	Stationary/Industrial Sector Projects	
	CARB	AQMD
Policy Objective	Capture 90% of statewide stationary project emissions	Capture 90% of district wide GHG emissions (industrial)
Exemption	Apply applicable exemption	Apply applicable exemption
Regional GHG Reduction Plan	N.A.	Project Consistent with Applicable GHG Reduction Plan with GHG inventorying, monitoring, enforcement, etc.
Thresholds	Project < 7,000 MTCO2eq/yr & meets construction & transportation performance standards	GHG emissions from industrial project is < 10,000 MTCO2eq/yr, includes construction emissions amortized over 30 years & added to operational GHG emissions
Performance Standards	See above	N.A.
Offsets	Offsite substitution allowed	Implement offsite mitigation for life of project, i.e., 30 years, with mitigation preference
Determination	GHG emissions significant, EIR is prepared, if meeting none of the above	GHG emissions significant, EIR is prepared, if meeting none of the above

-

Since not recommending specific GHG significance thresholds for residential/commercial sectors at this time, staff will perform its intergovernmental review (IGR) commenting function as a commenting and responsible agency by providing technical assistance in quantifying GHG emissions and making reference materials available to lead agencies. Reference materials from organizations other than AQMD may include the following:

- CAPCOA's *CEQA and Climate Change* white paper (http://www.capcoa.org/ceqa/CAPCOA%20White%20Paper%20-%20CEQA%20and%20Climate%20Change.pdf),

- CARB's Interim GHG significance threshold proposal (http://www.arb.ca.gov/cc/localgov/ceqa/meetings/102708/wkspslides102708.pdf), and

Future Activities – To assist other public agencies and CEQA practitioners with preparing a scientifically sound GHG analysis as part of preparing a CEQA document, staff will perform surveys of available data bases to compile GHG emission factors for as many GHG emission sources as possible. Staff has already compiled CO2 and methane emission factors for on-road and off-road mobile sources. Other GHG emission factors would be compiled and listed on the AQMD's CEQA webpages.

In addition to compiling GHG emission factors, staff will compile GHG mitigation measures to the extent specific measures with GHG control efficiencies are available. Mitigation measures will be compiled by source category and uploaded to the AQMD's CEQA webpages. Staff will continue the stakeholder working group process to seek input from working group members.

Finally, to further evaluate and refine the interim GHG significance threshold for residential/commercial projects and evaluate the compliance options in Tier 4, staff will participate in the statewide efforts and continue to work with stakeholders.

Resource Impacts

The AQMD periodically carries out the role of lead agency for permit application projects that have the potential to generate significant adverse impacts. On average, AQMD staff prepares 10 – 15 CEQA documents per year for permit application projects. In addition, all new and amended AQMD rules and regulations and Plans, e.g., Air Quality Management Plan, are evaluated for CEQA applicability and CEQA documents are prepared as necessary. If AQMD staff's proposed interim screening threshold of 10,000 MTCO2eq./yr is implemented, based on the permitting activities for 2006-2007 it will result in at least 31 additional CEQA documents per year, either MNDs or EIRs, being prepared by the AQMD as the lead agency unless another tier option is selected to demonstrate that the project is exempt or is consistent with a GHG reduction plan.

SUPERIOR COURT OF CALIFORNIA,

COUNTY OF SAN DIEGO

HALL OF JUSTICE

TENTATIVE RULINGS - September 21, 2021

EVENT DATE: 09/21/2021 EVENT TIME: 10:30:00 AM DEPT.: C-68

JUDICIAL OFFICER: Richard S. Whitney

CASE NO.: 37-2019-00038820-CU-TT-CTL

CASE TITLE: PETITION OF SIERRA CLUB [E-FILE]

CASE CATEGORY: Civil - ~~Unlimited~~ CASE TYPE: Toxic Tort/Environmental

EVENT TYPE: Hearing on Petition
CAUSAL DOCUMENT/DATE FILED:

TENTATIVE RULING:

(1) PETITIONERS' PETITION FOR WRIT OF MANDATE and PEOPLE'S PETITION FOR WRIT OF MANDATE IN INTERVENTION is GRANTED.

Petitioners ENDANGERED HABITATS LEAGUE, CALIFORNIA NATIVE PLANT SOCIETY, CENTER FOR BIOLOGICAL DIVERSITY, PRESERVE WILD SANTEE, CALIFORNIA CHAPARRAL INSTITUTE, and SIERRA CLUB's (collectively "Petitioners") Requests for Judicial Notice are granted (Exhibits A, B and C). Intervenor People of the State of California ex rel. Rob Bonta, Attorney General's ("AG") Requests for Judicial Notice are granted. Real Parties in Interest, Jackson Pendo Development Company, et al.'s ("GDCI") Requests for Judicial Notice are granted. The "JOINT OBJECTION BY THE PEOPLE AND PETITIONERS TO REAL PARTIES IN INTEREST'S NOTICE OF "OTHER RELEVANT EVIDENCE" PURSUANT TO GOVERNMENT CODE SECTION 12612 AND SUPPORTING DECLARATION OF ELIZABETH JACKSON" is granted. The AG did not intervene via Government Code section 12612, but 12606. Further, the evidence is extra-record evidence that post-dates Respondents and Defendants COUNTY OF SAN DIEGO and BOARD OF SUPERVISORS OF COUNTY OF SAN DIEGO's ("County") decision to approve the Project, defined below, which renders it irrelevant for purposes of this California Environmental Quality Act ("CEQA") action. (See *Western States Petroleum Assn. v. Superior Court* (1995) 9 Cal.4th 559.)

Background

GDCI's Project is located within the Proctor Valley, approximately one-quarter mile east of Chula Vista and immediately south of the unincorporated community of Jamul. (Administrative Record ["AR"] 1.) "The project is a planned community consisting of 1,119 dwelling units; 10,000 square feet of neighborhood commercial; 2.3 acre joint use Fire Station/Sheriff storefront; 9.7 acre elementary school site; 24 acres of public/private parks; 776 acres of open space and a preserve on 1,284 acres" (the "Project"). (AR 1.) The County's approval of the Project includes a General Plan Amendment ("GPA") of the County's General Plan. (AR 1.) The County approved the Final Environmental Impact Report ("EIR") as to the Project. (AR 1.) Petitioners and the AG challenge the EIR under CEQA as being unsupported by substantial evidence and the approvals as being an abuse of discretion based on a failure to proceed in the manner required by law. Petitioners and the AG also allege the Project is inconsistent with the

General Plan.

Standard of Review Under CEQA and Relevant Law

The issue before this Court is whether the County abused its discretion. "Abuse of discretion is shown if (1) the agency has not proceeded in a manner required by law, or (2) the determination is not supported by substantial evidence." (*County of Amador v. El Dorado County Water Agency* (1999) 76 Cal.App.4th 931, 945 [Citation omitted].)

Under CEQA, courts review quasi-legislative agency decisions for an abuse of discretion. (§ 21168.5.) At both the trial and appellate level, the court examines the administrative record anew. (*Vineyard, supra,* 40 Cal.4th at p. 427, 53 Cal.Rptr.3d 821, 150 P.3d 709.)

An "agency may abuse its discretion under CEQA either by failing to proceed in the manner CEQA provides or by reaching factual conclusions unsupported by substantial evidence." (*Vineyard, supra,* 40 Cal.4th at p. 435, 53 Cal.Rptr.3d 821, 150 P.3d 709, citing § 21168.5.) "Judicial review of these two types of error differs significantly" however. (*Vineyard,* at p. 435, 53 Cal.Rptr.3d 821, 150 P.3d 709.) For that reason, "a reviewing court must adjust its scrutiny to the nature of the alleged defect, depending on whether the claim is predominantly one of improper procedure or a dispute over the facts." (*Ibid.*)

1. Procedural Claims

Courts must "scrupulously enforce all legislatively mandated CEQA requirements." (*Goleta II, supra,* 52 Cal.3d at p. 564, 276 Cal.Rptr. 410, 801 P.2d 1161.) To do so, "we determine de novo whether the agency has employed the correct procedures" in taking the challenged action. (*Vineyard, supra,* Cal.4th at p. 435, 53 Cal.Rptr.3d 821, 150 P.3d 709.)

2. Substantive Claims

Compared with review for procedural error, "we accord greater deference to the agency's substantive factual conclusions." (*Vineyard, supra,* 40 Cal.4th at p. 435, 53 Cal.Rptr.3d 821, 150 P.3d 709.) We apply "the highly deferential substantial evidence standard of review in Public Resources Code section 21168.5" to such determinations. (*Western States, supra,* 9 Cal.4th at p. 572, 38 Cal.Rptr.2d 139, 888 P.2d 1268.) "The agency is the finder of fact and we must indulge all reasonable inferences from the evidence that would support the agency's determinations and resolve all conflicts in the evidence in favor of the agency's decision." (*Save Our Peninsula, supra,* 87 Cal.App.4th at p. 117, 104 Cal.Rptr.2d 326.) That deferential review standard flows from the fact that "the agency has the discretion to resolve factual issues and to make policy decisions." (*Id.* at p. 120, 104 Cal.Rptr.2d 326.)

The CEQA Guidelines define substantial evidence as "enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached." (Guidelines, § 15384, subd. (a).)

(*California Native Plant Soc. v. City of Santa Cruz* (2009) 177 Cal.App.4th 957, 984-85.)

"[W]hether a description of an environmental impact is insufficient because it lacks analysis or omits the magnitude of the impact is not a substantial evidence question. A conclusory discussion of an environmental impact that an EIR deems significant can be determined by a court to be inadequate as an informational document without reference to substantial evidence." (*Sierra Club v. County of Fresno* ("*Friant Ranch*") (2018) 6 Cal.5th 502, 514.) "The ultimate inquiry, as case law and the CEQA guidelines make clear, is whether the EIR includes enough detail 'to enable those who did not participate in preparation to understand and to consider meaningfully the issues raised by the proposed project.'" (*Id.*

at 516 [Citation omitted].)

"[T]he petitioner bears the burden of demonstrating that the record does not contain sufficient evidence justifying a contested project approval." (*Latinos Unidos de Napa v. City of Napa* (2013) 221 Cal.App.4th 192, 206.) "To do so, an appellant must set forth in its brief all the material evidence on the point, not merely its own evidence. [Citation.] A failure to do so is deemed a concession that the evidence supports the findings." (*Id.* [Citation omitted].)

GDCI asserts Petitioners failed to raise a number of issues, such that the exhaustion of administrative remedies doctrine precludes the claims.

"Exhaustion of administrative remedies is a jurisdictional prerequisite to maintenance of a CEQA action. ... The petitioner is required to have 'objected to the approval of the project orally or in writing during the public comment period provided by this division or prior to the close of the public hearing on the project before the issuance of the notice of determination.' ([Pub. Resources Code,] § 21177, subd. (b).) The petitioner may allege as a ground of noncompliance any objection that was presented by any person or entity during the administrative proceedings." (*Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1199, 22 Cal.Rptr.3d 203.)

" 'The petitioner bears the burden of demonstrating that the issues raised in the judicial proceeding were first raised at the administrative level.
...
"It is, however, "not necessary to identify the precise statute at issue, so long as the agency is apprised of the relevant facts and issues." (*McPherson v. City of Manhattan Beach* (2000) 78 Cal.App.4th 1252, 1264, 93 Cal.Rptr.2d 725.)

(*Center for Biological Diversity v. County of San Bernardino* (2010) 185 Cal.App.4th 866, 889–890.)

Mitigation Measures as to Green House Gases ("GHG")

The EIR recognizes the Project will emit at least 484,770 metric tons of climate pollution over 30 years. (AR 31823.) The EIR acknowledges this is a significant impact that should be mitigated. The EIR contends the impacts will be mitigated to less than significant by implementing, *inter alia*, M-GHG-1 through M-GHG-4. (AR 31819.) Both the AG and Petitioners challenge M-GHG-1 and M-GHG-2 as being inadequate. Both M-GHG-1 and M-GHG-2 attempt to address GHGs that will be created from construction and operation of the Project over 30-years. (AR 318-324.)

First, the EIR relies on an estimated 30-year life for the Project to estimate the amount of GHG that must be mitigated. (AR 42057.) The 30-year life span is taken from the South Coast Air Quality Management District's set of GHG thresholds of significance for industrial projects. (AR 121687-88.) However, the District stated that as to "Residential/Commercial Sector Projects" "Not Recommended at this Time" to use the 30-year life span for offsets, as is used by the EIR in this case. (AR 121688.) GDCI asserts the District was not asked to make a recommendation as to Residential/Commercial Sector Projects. This does not support that the evidence the EIR relies upon to use a 30-year life span is substantial. GDCI does not point to any evidence in the record that the EIR relied on specific standards for Residential/Commercial Sector Projects, which is at issue in this action. A 30-year life span for a residential project goes against common sense. As GDCI asserts, the homes will be more advanced, such that they could last longer than other homes which last longer than 30 years. However, comments in the EIR state "30-year project life also is widely used in CEQA documents by expert consultants and lead agencies," "Executive Order (EO) S-3-05 established 2050 as the target year for an 80 percent

reduction in statewide GHG emissions below 1990 levels," and that the incremental implementation the development will result in a later start time for the Project and the "modeling analysis likely overestimates the Proposed Project's GHG emissions because the modeling does not take into account reasonably foreseeable regulatory, programs and other governmental strategies and technological factors that likely would result in further reductions in GHG emissions levels throughout California that are needed to achieve the 2030 and 2050 targets." (AR 33525-26.)

Even if the 30-year life span were accepted as being supported by substantial evidence, the mitigation measures M-GHG-1 and M-GHG-2 are insufficient under *Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467. "An EIR shall describe feasible measures which could minimize significant adverse impacts, including where relevant, inefficient and unnecessary consumption of energy." (California Code of Regulations ("CEQA Guidelines") section § 15126.4(a)(1).) "Mitigation measures must be fully enforceable through permit conditions, agreements, or other legally-binding instruments. In the case of the adoption of a plan, policy, regulation, or other public project, mitigation measures can be incorporated into the plan, policy, regulation, or project design." (CEQA Guidelines section § 15126.4(a)(2).) "Under section 38562, subdivision (d)(1) and (2), cap-and-trade offset credits may be issued only if the emission reduction achieved is "real, permanent, quantifiable, verifiable, enforceable, and additional to any GHG emission reduction otherwise required by law or regulation, and any other GHG emission reduction that otherwise would occur." (*Golden Door, supra,* 50 Cal.App.5th at 506.)

" 'Real' means ... that GHG reductions ... result from a demonstrable action or set of actions, and are quantified using appropriate, accurate, and conservative methodologies that account for all GHG emissions sources, GHG sinks, and GHG reservoirs within the offset project boundary and account for uncertainty and the potential for activity-shifting leakage and market-shifting leakage." (Cal. Code Regs., tit. 17, § 95802.) " 'Permanent' means ... that GHG reductions ... are not reversible, or when GH reductions ... may be reversible, that mechanisms are in place to replace any reversed GHG emissi reductions ... to ensure that all credited reductions endure for at least 100 years." (*Ibid.*) " 'Quantifiable' means ... the ability to accurately measure and calculate GHG reductions ... relative to a project baseline in a reliable and replicable manner for all GHG emission sources ...." (*Ibid.*) " 'Verifiable' means that an Offset Project Data Report assertion is well documented and transparent such that it lends itself to an objective review by an accredited verification body." (*Ibid.*) " 'Additional' means ... greenhouse gas emission reductions or removals that exceed any greenhouse gas reduction or removals otherwise required by law, regulation or legally binding mandate, and that exceed any greenhouse gas reductions or removals that would otherwise occur in a conservative business-as-usual scenario." (Cal. Code Regs., tit. 17, § 95802.)

(*Id.* at 506-507.)

Similar to the County's Climate Action Plan (CAP) found to be inadequate under CEQA in *Golden Door*, M-GHG-1 and M-GHG-2 are for the purchase and retirement of carbon offsets that may be issued by "(i) the Climate Action Reserve, the American Carbon Registry, and Verra (previously, Verified Carbon Standard); or (ii) any registry approved by the California Air Resources Board (CARB) to act as a registry under the state's cap-and-trade program." In *Golden Door* the similarly labelled M-GHG-1 provided "the Director may approve offsets issued by any 'reputable registry or entity that issues carbon offsets consistent with ... section 38562[, subdivision] (d)(1).'" (*Golden Door, supra,* 50 Cal.App.5th at 514.) In both *Golden Door* and here, "M-GHG-1 says nothing about the protocols that the identified registries must implement." (*Id.* at 511.) "Unlike M-GHG-1, under cap-and-trade, it is not enough that the registry be CARB-approved. Equally important, the protocol itself must be CARB-approved." (*Id.*) "The CARB Protocols are the heart of cap-and-trade offsets-but the word "protocol" is not even mentioned in M-GHG-1.... M-GHG-1 is not equivalent to cap-and-trade offset programs because M-GHG-1 does not require the protocol itself to be consistent with CARB requirements under title 17, section 9597 subdivision (a)(1)-(9) of the California Code of Regulations." (*Id.* at 512.) The same is true in this case

the word "protocol" is not even mentioned in M-GHG-1 nor does the EIR require the protocol of the registry be consistent with CARB requirements. (AR 318-320.) The EIR parrots the words of California Health & Safety Code section 38562, subdivision (d)(l), stating "the purchased carbon offsets used to reduce GHG emissions from construction and vegetation removal shall achieve real, permanent, quantifiable, verifiable, and enforceable reductions." (AR 319.) More than mere lip service is required – there must be "objective criteria for making such findings." (*Id.* at 521–522.)

GDCI points to the fact the EIR cites to the program manuals for registries in the appendices. However, one of the registries, American Carbon Registry, provides "projects must commit to maintain, monitor, and verify Project Activity for a Minimum Project Term of 40 years...because no length of time, short of perpetual, is truly permanent...," but Permanent, as to GHG reductions, is defined as reductions that "endure for at least 100 years." (AR 75786; Cal. Code Regs., tit. 17, § 95802; see also *Golden Door, supra,* 50 Cal.App.5th at 522 [for example, CARB's forestry protocol requires sequestering carbon "for at least 100 years"].) As discussed above, GDCI's citation to extra-record evidence of actual purchases of offsets is not relevant. (See *Western States Petroleum Assn. v. Superior Court* (1995) 9 Cal.4th 559.) Even if it were considered, the evidence indicates GDCI purchased offsets from American Carbon Registry, which would not meet the permanence requirement under *Golden Door*.

Further, in both the EIR and the County CAP considered in *Golden Door,* M-GHG-1 is silent as to the additionality requirement in Health & Safety Code section 38562, subdivision (d)(2), which provides "the reduction is in addition to any greenhouse gas emission reduction otherwise required by law or regulation, and any other greenhouse gas emission reduction that otherwise would occur." (Health & Saf. Code, § 38562(d)(2); *Golden Door, supra,* 50 Cal.App.5th at 514.) M-GHG-1 and M-GHG-2 ignore the requirement that the reductions would not have otherwise occurred – that it would not result from a business-as-usual scenario. (*Golden Door, supra,* 50 Cal.App.5th at 521.) The EIR's requirement that the offsets achieve reductions that are "not otherwise required," consistent with Guidelines section 15126.4(c)(3) does not equate to requiring compliance with the additionality requirement in Health & Safety Code section 38562, subdivision (d)(2). Also, responses to comments in the EIR as to the acknowledgement of the additionality definition does not equate to a requirement within M-GHG-1 and M-GHG-2 that the offsets purchased meet the additionality requirement in Health & Safety Code section 38562, subdivision (d)(2). Finally, reliance on registry protocols is of no avail. As an example, one of the registries relies on the "project proponent" to sign an "Attestation of Legal Additionality form that confirms the mitigation project activity was not required by any law, statute, rule, regulation or other legally binding mandate by any national, regional, state, local or other governmental or regulatory agency having jurisdiction over the project." (AR 75925.) This is essentially the fox guarding the hen house, plus it does not address whether or not the reduction resulted from a business-as-usual scenario.

Petitioners also criticize the EIR's reliance upon forecasted reductions in relation to the purchase of carbon offsets. GDCI cites to the Newhall Ranch project, discussed with approval in *Golden Door*, which utilized estimated reductions and carbon offsets for past reductions. GDCI does not explain how this Project has safeguards to ensure the reduction would occur equivalent to those in the Newhall Ranch EIR. GDCI also relies upon the Climate Forward program, but the Climate Forward Program Manual recognizes it "does not guarantee the use of FMUs [Forecasted Mitigation Units] or CRTs will be accepted as a means to meet CEQA GHG mitigation obligations where required by an approving agency(ies)." (AR 75898.) The Court agrees the Climate Forward Program's reliance on a one-time verification of the mitigation project is troublesome. (AR 75916.) The lack of ongoing verification illustrates the protocols do not ensure that the forecasted reductions are real, additional, permanent, confirmable, and enforceable. "'[O]nce the project reaches the point where activity will have a significant adverse effect on the environment, the mitigation measures must be in place.'" (*King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 860 [Citation omitted].) While GDCI must provide proof of purchase of carbon offsets prior to permit issuance, a proper mitigation measure must be in place at that time. (AR 31819, 31822.) Without rigorous protocols to ensure the forecasted reductions

are real, additional, permanent, confirmable, and enforceable, it cannot be concluded the mitigat measures were permissibly implemented at proper times.

Finally, the EIR suffers from enforcement issues as to M-GHG-1 and M-GHG-2. In *Golden Door*, the court stated:

The only M-GHG-1 limit on mitigating with international offsets is the Director's unilateral decision that offsets are not feasibly available within (1) the unincorporated county; (2) the County; (3) California; and (4) the United States. The fundamental problem, unaddressed by M-GHG-1, is that the County has no enforcement authority in another state, much less in a foreign country. M-GHG-1 does not require a finding that an out-of-state offset site has laws at least as strict as California's with respect to ensuring the validity of offsets.

At oral argument, the County asserted that the "registries" would be the County's enforcement mechanism to ensure the validity of offsets originating in foreign countries. This argument fails, however, because it is premised on the assumption that the registry's protocol is Assem. Bill No. 32 compliant-and as explained *ante*, M-GHG-1 does not require use of an Assem. Bill No. 32 compliant protocol.

(*Golden Door, supra,* 50 Cal.App.5th at 512–513.) Similarly, here, the EIR relies upon the registries for enforcement, which is problematic because of their protocols. M-GHG-1 provides "the Director of the PDS shall require the Project applicant or its designee to provide an attestation or similar documentation from the selected registry(ies) that a sufficient quantity of carbon offsets meeting the standards set forth in this measure have been purchased and retired, thereby demonstrating that the necessary emission reductions are realized." (AR 319.) This enforcement mechanism pales in comparison to CARB, which discourages noncompliance "by deterring and punishing fraudulent activities." (AR 75598.) CARB has the enforcement authority to hold a party liable and to take appropriate action, including imposi penalties, if any of the regulations for CARB offset credits are violated. (17 C.C.R. §§ 95802(a), 960 96014.) GDCI does not cite to any evidence in the record that the registries have the same enforcement authority under their protocols.

One of the registries states it "will rely first and foremost on legal requirements within the jurisdiction(s) where the project is implemented." (AR 75909.) As *Golden Door* recognized, such reliance can be a problem in another state or foreign country where the County does not have any enforcement authority. There is nothing in M-GHG-1 or M-GHG-2 that requires the Director of the PDS to follow specific protocols when "offsets are unavailable and/or fail to meet the feasibility factors defined in CEQA Guidelines Section 15364 in a higher priority geographic category before allowing the Project applicant or its designee to use offsets from the next lower priority category" to ensure the offsets are ultimately enforced properly. Rather, the Director of the PDS merely needs to issue a written determination that considers information such as "availability of in-State emission reduction opportunities," "geographic attributes of carbon offsets," "temporal attributes of carbon offsets," "pricing attributes of carbon offsets," and "[a]ny other information deemed relevant to the evaluation...." (AR 320, 323-24.) This could allow for the Director to permit purchase of offsets almost entirely from international offsets. As a registry recognizes, "[d]epending on the location of the mitigation project, there may be insufficient compliance and/or enforcement of national, regional, state, local, or other regulations." (AR 75906.) As in *Golden Door*, "M-GHG-1 does not require a finding that an out-of-state offset site has laws at least as strict as California's with respect to ensuring the validity of offsets." (*Golden Door, supra,* 50 Cal.App.5th at 513.)

The EIR is inadequate as to M-GHG-1 and M-GHG-2.

Wildfire Ignition Risk

The AG and Petitioners assert the EIR fails to properly acknowledge the increased risk of wildfire ignition from the additional people who will be in the area as a result of the Project. The EIR states "the Project Area, in its current condition, is considered to be vulnerable to wildfire ignition and spread during extreme fire weather." (AR 32172.) The EIR goes on to states that the "introduction of up to 1,119 new homes would not increase the potential likelihood of arson, off-road vehicle-related fires, or shooting-related fires." (AR 32173.) The body of the EIR does not acknowledge an increase in risk of wildfire ignition as a result of more humans being in the area from the Project. However, a County expert acknowledges "southern California's increasing population will make it more likely that ignitions will occur, which could potentially cause large areas of chaparral to type-convert into grasslands." (AR 104506.) Further, it is known humans are the primary cause of wildfires, especially in Southern California. (AR 89718-23.) The EIR does not address this issue, but notes "[p]ost-construction ignition sources would include vehicles, although roadside FMZs would be provided, reducing the potential for a vehicle-related fire escaping into the Otay Ranch RMP/MSCP Preserve fuels." (AR 32173.) This does not acknowledge or analyze the impact of adding more than 1,100 new homes to the area as to humans being an ignition cause of wildfires. This is combined with the fact the EIR does not clearly, in the body of the EIR, acknowledge the area's designation as a Very High Fire Hazard Severity Zone. (AR 32172-77.) The EIR does not includes enough detail to enable those who did not participate in its preparation to understand and to consider meaningfully the issue of wildfire ignition raised by the Project.

The above issue is accompanied by an improper compressing of the analysis. Instead of independently acknowledging all the significant impacts of the Project as to wildfire risks and subsequently discussing mitigating measures to address such impacts, the mitigation measures are characterized in the EIR as being part of the project. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 656.) "By compressing the analysis of impacts and mitigation measures into a single issue, the EIR disregards the requirements of CEQA." (*Id.*) Here, the EIR considers the impacts of wildfire to be less than significant because the Project's "landscaped and irrigated areas and FMZs, as well as the paved roadways and ignition-resistant structures, would result in reduced fire intensity and spread rates around the Project Area, creating defensible space for firefighters." (AR 32173.) "Additionally, provisions for a fire station in the area would reduce the response time to wildfire ignitions and increase the likelihood of successful initial attacks that limit the spread of wildfires." (AR 32173.) The EIR also states "[u]nauthorized activities such as off-road vehicles and shooting may still occur, but there will be more 'monitors' (i.e., future residents) in the area to discourage and report such activities, resulting in an anticipated decreased occurrence." (AR 32173.) "'CEQA EIR requirements are not satisfied by saying an environmental impact is something less than some previously unknown amount.'" (*Ukiah Citizens for Safety First v. City of Ukiah* (2016) 248 Cal.App.4th 256, 264 [Citation omitted].) The adoption of the Fire Protection Plan (FFP) and compliance with applicable fire codes do not obviate the need for the EIR to analyze significant impacts that would exist prior to the implementation of any mitigation measures. The EIR fails to comply with *Lotus*.

Multiple Species Conservation Program

The Multiple Species Conservation Program ("MSCP") "is a multi-jurisdictional habitat conservation planning program that involves USFWS, CDFW, the County of San Diego, the City of San Diego, the City of Chula Vista, and other local jurisdictions and special districts...." (AR 31246.) "A total of 85 plant and animal species are 'covered' by the MSCP Plan." (AR 31246.) "Quino checkerspot butterfly *(Euphydryas editha qumo)* is not a covered species under the MSCP." (AR 31191.) "A species that is not an MSCP covered species is not allowed take through the MSCP." (AR 31191.) Normally, "take authorization" can be allowed when incidental to land development and other lawful land uses which are authorized by the County. (AR 31191.) GDCI points to evidence in the record that a previous owner of property that is part of the Project area proposed preserving PV1-3 and other areas of Otay Ranch in

exchange for allowing development of other open spaces within Otay Ranch; however, the par disagree as to whether an agreement was reached. The MSCP and County Subarea Plan designates PV1-3 as "No Take Authorized" areas (AR 115049), or "Otay Ranch Areas Where No 'Take Permits' Will Be Issued," while allowing take in other areas that were previously designated as open space. (AR 82930, 94838-43, 115049, 115051.) The County General Plan calls for implementation of the "MSCP Plans for North and East County in order to further preserve wildlife habitat and corridors, wetlands, watersheds, groundwater recharge areas and other open space that provide carbon sequestration benefits and to restrict the use of water for cleaning outdoor surfaces and vehicles." (AR 129683.) The County's EIR cannot ignore mitigation measures in a General Plan, as such failure violates CEQA. (*Sierra Club v. County of San Diego* (2014) 231 Cal.App.4th 1152, 1167.)

"The EIR shall discuss any inconsistencies between the proposed project and applicable general plans, specific plans and regional plans. Such regional plans include, but are not limited to, ...habitat conservation plans...." (CEQA Guidelines § 15125(d).) Petitioners raised the issue as to the Project's consistency with the MSCP, citing *Banning Ranch Conservancy v. City of Newport Beach* (2017) 2 Cal.5th 918. (AR 94708.) GDCI points to the Implementing Agreement between the Wildlife Agencies ("IA") where it states "as outlined in the letter attached to the South County Segment from the Baldwin Company Dated November 10, 1995, will be included if the agreements are reached." (AR 115255.) GDCI does not deny that the IA still includes a map showing PV1-3 as "Otay Ranch Areas Where No 'Take Permits' Will Be Issued." (AR 115285.) This appears to be why the California Department of Fish and Wildlife (CDFW) concluded "[t]he Implementing Agreement and Subarea Plan are consistent on this point. The Implementing Agreement includes a map as Exhibit F defining the area encompassed by the Subarea Plan." (AR 33276.)

Petitioners do not assert PV1-3 is undevelopable, but that the Project is inconsistent with the MSCP a the EIR does not address this issue. The Court agrees. The Project conflicts with the face of the MSC. While GDCI or the County is free to seek an amendment of the MSCP, the face of the MSCP reflects PV1-3 is subject to no take. The United States Fish and Wildlife Service (USFWS) did not disagree, but explicitly stated "because no take has been authorized in PV 1, 2, 3 we are evaluating approaches for authorizing take in those parcels including the options considered in the County's draft Condition of Approval for the Village 14 project." (AR 33270.)

CEQA does not "permit lead agencies to perform truncated and siloed environmental review, leaving it to other responsible agencies to address related concerns seriatim." (*Banning Ranch Conservancy v. City of Newport Beach* (2017) 2 Cal.5th 918, 941.) Petitioners assert the EIR fails to meaningfully address the issue. GDCI relies on the purported consistency with the MSCP and on the Biological Mitigation Ordinance (BMO) to support that the County did not violate CEQA. As discussed above, the Project is inconsistent with the MSCP as it currently designates PV1-3 as no take. Even though the Project may be consistent with the BMO, the EIR does not recognize nor analyze the consistency between the MSCP and the Project. Rather, the County concluded "the Proposed Project, including development of PV1-3, is consistent with the MSCP, Subarea Plan and Implenting [sic] Agreement" after reviewing findings as to the BMO. (AR 75554.) GDCI does not contest that the EIR failed to consider any Project alternative that would comply with the MSCP and preserve PV1-3.

In *Banning Ranch*, an EIR for a project in the coastal zone subject to the California Coastal Act was found inadequate. (*Banning Ranch, supra,* 2 Cal.5th at 941.) The EIR considered comments that the project would disturb environmentally sensitive habitat areas (ESHAs), that could not be developed under the Coastal Act, but it did not study the impact, instead deferring that task to the Coastal Commission. (*Id.* at 930-932.) Here, PV1-3 are currently in an analogous state – they cannot be developed given their designation as no take. As in *Banning Ranch*, the EIR improperly avoids the iss because the analysis assumes the Project is not inconsistent with the MSCP. (AR 40428-54.,

32897-900.) Consequently, the EIR fails as an informational document. (*Id.* at 942.)

The Quino Checkerspot Butterfly ("Quino")

The EIR must provide an accurate and complete description of the "baseline" existing environmental conditions against which a project's impacts are evaluated. (*Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439, 447-48; CEQA Guidelines § 15125.) The USFWS lists the Quino as endangered. (62 FR 2313-01.) Petitioners assert that the EIR's conclusion that Quino do not occupy area within the Project is erroneous. The Project is partially located on "Quino Occurrence Complexes" designated as "Unit 8" by the USFWS. (AR 97955, 98619, 98483-85; 74 FR 28776-01.) "The physical and biological features found in Unit 8 may require special management considerations or protection to minimize impacts from loss and fragmentation of habitat and landscape connectivity due to development...." (74 FR 28776-01.) USFWS defines Quino occupancy based on "population-scale occupancy" as "all areas used by adults during the persistence time of a population (years to decades)." (AR 97955.) Thus, "focused distribution studies over multiple years are required [in order] to quantify Quino checkerspot butterfly population distributions." (AR 97955.)

The EIR states Quino were not "detected during protocol surveys and, therefore, the Project Area is not currently considered occupied" by Quino. (AR 31258.) This conclusion was based on survey results in 2015 and 2016, when it was found the "species has been observed within and adjacent to the Project Area." (AR 82940.) "[T]he 2017 spring season, presumably fueled by above-normal rainfall following multiple years of drought, created the most favorable conditions for Quino since 2012. As a result, very high numbers of Quino were observed, particularly in nearby areas. Unfortunately, in 2017, protocol surveys were not performed on Village 14, qualified USFWS biologists were not allowed to survey the property during the peak of the flight season, and an excellent opportunity to obtain better information on the status of Quino on the property was lost." (AR 82940.) Notwithstanding, "in 2017 Service staff documented multiple Quino individuals adjacent to and interspersed within the Project Area," but the EIR "dismisses these sightings as incidental." (AR 82942.) Additionally, "qualified personnel from CDFW observed [Quino] on and around the site in 2018." (AR 76070-71.) Further, the County acknowledged observation during "low rainfall years...may not be considered adequate evidence to conclude a particular site is unoccupied, even if guidelines are followed." (AR 85305.) Nevertheless, the County encouraged "surveys be conducted regardless of rainfall levels because negative adult data can be useful long‐term to support conclusions of population absence." (AR 85305.) Finally, in spring of 2019, a non-drought year, qualified personnel documented Quino "widely throughout the Proctor Valley area, including locations immediately adjacent to the project site." (AR 76072.)

GDCI acknowledges 2016 was a below-average year for rainfall, but defends the EIR's conclusion because the "CDFW's 'limited' survey effort did not conform to any established protocols for surveys of this species." (AR 32944.) "Occurrence complexes are mapped in the Recovery Plan using a 0.6 mile (1 kilometer) movement radius from each butterfly observation, and may be based on the observation of a single individual (Figures 1 and 2)." (AR 98326.) The above 1 kilometer radius measurement is part of the "*only* accepted procedure for delineating [Quino] 'occupied habitat.'" (76074.) The observations where mapped based on GPS coordinates with accuracy within about 3 meters. (AR 94849-50.) Given there are more years of observation of Quino in the area than years of no observation and one of the years of no observation, 2016, was a below-average year for rainfall, the data supporting that Quino occupy at least some areas within the Project is more supported than the conclusion the Project area is not occupied by Quino. Moreover, multiple Quino experts and the CDFW determined that the area is occupied. (AR 82942, 83480-84, 97952-54.) In the context of the available data, the EIR's conclusion is erroneous. Without an accurate conclusion as to occupancy by Quino, the EIR fails "to give the public and decision makers the most accurate and understandable picture practically possible of the project's likely near-term and long-term impacts." (CEQA Guidelines section § 15125(a).) This failure also

affected the EIR's consideration of mitigation measures. (See GDCI's reliance on AR 29165.)

Cumulative Impacts

It is undisputed the EIR must disclose cumulative impacts. "'Cumulative impacts' refer to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." (CEQA Guidelines section § 15355.) "The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time." (CEQA Guidelines section § 15355(b).) "[I]t is vitally important that an EIR avoid minimizing the cumulative impacts. Rather, it must reflect a conscientious effort to provide public agencies and the general public with adequate and relevant detailed information about them. (CEQA, § 21061.)" (*San Franciscans for Reasonable Growth v. City and County of San Francisco* (1984) 151 Cal.App.3d 61, 79.) "The CEQA Guidelines specify that location may be important when the location of other projects determines whether they contribute to an impact. For example, projects located outside a watershed would ordinarily not contribute to cumulative water quality impacts within the watershed." (Kostka, *supra,* § 13:42, p. 651; Guidelines, § 15130, subd. (b)(2).)" (*City of Long Beach v. Los Angeles Unified School Dist.* (2009) 176 Cal.App.4th 889, 907.) However, "the geographic context or scope to be analyzed 'cannot be so narrowly defined that it necessarily eliminates a portion of the affected environmental setting.'" (*Id.* at 907.) Petitioners assert the EIR fails to consider the following pending projects in its analysis: Lilac Hills Ranch, Newland Sierra, Harmony Grove, Warner Ranch, Otay 250, and Valiano.

GDCI defends the EIR's exclusion of the six above projects based on geographic location, the assertion some of the projects have not sufficiently crystalized, and the projects were not closely related to this Project. Analysis of an entire air basis may be necessary and "[t[he primary determination is whether it was reasonable and practical to include the projects and whether, without their inclusion, the severity and significance of the cumulative impacts were reflected adequately." (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 722-23.) The six potential projects include the need for General Plan amendments to account for changes in densities. (AR 85509-11.) GDCI does not specifically explain how the potential projects would not impact air quality and GHG considerations, even considering their geographical distance from the Project. Given the enormous potential increase in homes, nearly 10,000, from the potential projects, the Court cannot conclude all of the six projects were properly excluded from the cumulative impact analysis, especially as to wildfire risk, air quality and GHG, unless the projects were not sufficiently crystallized such that it would have been unreasonable and impractical to evaluate their cumulative impacts. (*City of Maywood v. Los Angeles Unified School Dist.* (2012) 208 Cal.App.4th 362, 397.)

GDCI cites to evidence some of the projects face challenges, such as referendums and rescinding of some approvals. (See GDCI's RJN Exhibits 3-10.) However, GDCI does not point to evidence that the challenges prevented the projects from ultimately going forward at in time in the future and such was known at the time the EIR was being prepared. Further, not all of the projects have faced issues. GDCI merely points to the fact public review did not commence until March, April, and June of 2017 as to some of them. GDCI does not cite evidence that indicates the projects were "merely contemplated or a gleam in a planner's eye." (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 398.) Given the deferential treatment EIRs often receive, the Court cannot conclude projects that have commenced public review of draft EIRs are too speculative. The Court cannot conclude all of the six projects are not closely related to the Project – they are residential developments which could have similar impacts on wildfire risk, air quality and GHG. (See AR 85509-11.) The failure to consid the cumulative impacts from at least some of the potential projects was potentially significant. (An

85522-38, 84687-92, 98681, 90648, 84615-17.) This failure violated CEQA.

Standard of Review as to Inconsistencies with the General Plan

"A project is inconsistent if it conflicts with a general plan policy that is fundamental, mandatory, and clear." (*Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 782.) "[J]udicial review of consistency findings is highly deferential to the local agency." (*Naraghi Lakes Neighborhood Preservation Assn. v. City of Modesto* (2016) 1 Cal.App.5th 9, 18.) "'Reviewing courts must defer to a procedurally proper consistency finding unless no reasonable person could have reached the same conclusion.'" (*Covina Residents for Responsible Development v. City of Covina* (2018) 21 Cal.App.5th 712, 732 [Citation omitted]; *California Native Plant Society v. City of Rancho Cordova* (2009) 172 Cal.App.4th 603, 637.) "[T]he essential question is 'whether the project is compatible with, and does not frustrate, the general plan's goals and policies.'" (*Naraghi Lakes, supra,* 1 Cal.App.5th at 18 [Citation omitted].)

Affordable Housing Component Requirement Within the General Plan

The General Plan states at H-1.9: "Affordable Housing through General Plan Amendments. Require developers to provide an affordable housing component when requesting a General Plan amendment for a large-scale residential project when this is legally permissible." (AR 130098.) GDCI does not seriously dispute that the Project does not include an affordable housing component, but asserts it includes "attainable housing components." However, there is a statutory definition for affordable housing cost, which GDCI does not and cannot contend the Project meets. (Health & Saf. Code, § 50052.5.) Rather, GDCI points to the fact the County has not yet adopted an affordable housing ordinance, focusing on the "when this is legally permissible" portion of H-1.9.

GDCI's argument that the law disfavors ad hoc imposition of affordable housing conditions, citing *San Remo Hotel L.P. v. City And County of San Francisco* (2002) 27 Cal.4th 643, is of no avail because inclusionary housing ordinances do not violate the constitution where "the ordinance does not require a developer to give up a property interest for which the government would have been required to pay just compensation under the takings clause outside of the permit process." (*California Building Industry Assn. v. City of San Jose* (2015) 61 Cal.4th 435, 461.) GDCI cannot point to any requirement GDCI was required to give up a property interest without just taking under an ordinance, as no ordinance exists. GDCI's reliance on the lack of an adopted affordable housing ordinance is also unavailing. The County may not rely upon its failure to follow through in implementing an ordinance to ensure projects conform with the General Plan to justify its failure to conform with the General Plan. As GDCI points out, the County has delayed adopting an ordinance since at least 2012. (GDCI's RJN Exhibits 14-15; AR 135444.).

GDCI does not point to any authority stating an ordinance must be adopted before an agency is required to conform to the General Plan. "[A]n agency's interpretation of a regulation or statute does not control if an alternative reading is compelled by the plain language of the provision." (*Southern California Edison Co. v. Public Utilities Com'n* (2000) 85 Cal.App.4th 1086, 1088.) H-1.9 unambiguously requires an affordable housing component. Contrary to GDCI's suggestion, the General Plan does not bend to the requirements of ordinances, it is the other way around – ordinances must not be inconsistent with the General Plan. (*Lesher Communications, Inc. v. City of Walnut Creek* (1990) 52 Cal.3d 531, 541.) While the Court is sympathetic that the process to develop affordable housing criteria may not be easy, the evidence and law does not indicate the County is precluded from imposing affordable housing criteria nor that the County is permitted to ignore clear policies and goals in the General Plan based on the

difficulty in implementing them. Finally, GDCI's suggestion that H-1.9 only applies to amendments t. increase density is without support – nothing in H-1.9 nor other policies or goals within the General Plan support that H-1.9 only applies to amendments that increase density. The limitation on applicability of H-1.9 is its application to "large-scale residential project[s]," not density changes. The Project is inconsistent with H-1.9 of the General Plan.

The petition is granted as to the above discussed issues. As to the other issues raised by the AG and Petitioners, the Court finds GDCI's arguments sufficiently persuasive. The County is ordered to vacate its approvals of the Project.

(2) PETITIONERS' *UNOPPOSED* MOTION TO STRIKE DOCUMENTS IN ADMINISTRATIVE RECORD is GRANTED

Failure to file an opposition to the motion indicates the other parties' acquiescence that the motion is meritorious. (California Rules of Court, Rule 8.54(c).) Public Resources Code section 21167.6(e) sets forth the types of records to be included in a record of proceedings. (Pub. Resources Code, § 21167.6(e).) "[T]he Legislature intended courts to generally consider only the administrative record in determining whether a quasi-legislative administrative decision was supported by substantial evidence." (*Western States Petroleum Assn. v. Superior Court* (1995) 9 Cal.4th 559, 571.) "[E]xtra-record evidence is generally not admissible in traditional mandamus actions challenging quasi-legislative administrative decisions on the ground that the agency 'has not proceeded in a manner required by law' within the meaning of Pub. Resources Code, § 21168.5." (*Id.* at 561.) The potential exceptions acknowledged in *Western States* do not apply here. (*Id.* at 575, n. 5.) Petitioners explain how the documents included after the fact were considered by GDCI's consultant, but were not presented to the ager decision-makers and did not become part of the record. GDCI does not dispute this. The documents c not fall into a category under Public Resources Code section 21167.6(e). The motion is granted.

ATTACHMENT L

DECLARATION OF DR. MARC FUTERNICK

I, Dr. Marc Futernick, declare as follows:

1. I, Dr. Marc Futernick, am an emergency physician licensed to practice in California. I received a Bachelor of Science degree in Biochemistry from the University of California, Los Angeles and graduated from Tulane University, School Of Medicine, in 1996. I completed my Emergency Medicine residency at University of California, San Francisco-Fresno, and have been practicing emergency medicine for 20 years. I also serve on the Board of Directors of the California Chapter of the American College of Emergency Physicians, and am a Past President of the chapter. I am now practicing at California Hospital Medical Center in Los Angeles, and serve as Chairman of the Board of Directors and Regional Medical Director of VEP Healthcare. As an emergency room clinician, I have two decades of experience in seeing and treating the varied, serious, health impacts of severe heat on a wide variety of patients. I have personal knowledge of the facts contained in this declaration, and if called as a witness I could testify regarding them. While I state my qualifications and professional affiliation, I make this declaration as a private citizen. The views stated here do not necessarily reflect the views of my employers or other professional contacts.

2. The emission of greenhouse gases (GHGs) contributes to climate change, which in turn creates serious public health impacts. I, along with others, explained these concerns on a recent KCET program, *SoCal Connected: Heat,* Season 9, Episode 6. (*SoCal Connected: Heat*, available at https://www.kcet.org/shows/socal-connected/episodes/heat ("Heat Video").)

3. I believe that climate change is the biggest threat to human health right now in the world and I am not alone in thinking that.

4. Last year, the World Health Organization released its Top Ten list of global health threats, and air pollution and global climate together were listed as the number one

threat. (World Health Organization, *Ten Threats to Global Health in 2019*, available at https://www.who.int/emergencies/ten-threats-to-global-health-in-2019.)

5. The Third National Climate Assessment, as reported by the U.S. Centers for Disease Control, states in its Human Health Chapter that "Climate change presents a global public health problem," causing health impacts that include increased respiratory and cardiovascular disease, injuries and premature deaths related to extreme weather events, changes in the prevalence and geographical distribution of food- and waterborne illnesses and other infectious diseases, and threats to mental health."[1]

6. The California Natural Resources Agency, in its report *Safeguarding California: Implementation Action Plans, Public Health Sector Plan*, states that "Climate change is one of the most significant threats to public health of the twenty-first Century. . . The resulting human health impacts [of climate change] are varied and include increases in the risk and occurrence of asthma, allergies, and other respiratory ailments, cardiovascular disease, vector borne diseases, mental health impacts, civil conflicts and migration, malnutrition, injuries, and heat-related illness and death. These challenges disproportionately impact the State's most vulnerable populations. . . . (*Id*. at p. 146, available at http://resources.ca.gov/docs/climate/safeguarding/Public%20Health%20Sector%20Plan.pdf.) I agree with these assessments, and believe that climate change, and the resulting increases in heat and intense heat events, are going to increase mortality (i.e., deaths) and morbidity (i.e., illnesses) significantly.

7. When it is hot outside, I and my colleagues have observed more patients presenting with trauma, heart attacks, cerebral vascular diseases such as stroke, kidney disease, adverse birth outcomes such as premature births and stillbirths, respiratory ailments

[1] (Luber, G., K. Knowlton, J. Balbus, H. Frumkin, M. Hayden, J. Hess, M. McGeehin, N. Sheats, L. Backer, C. B. Beard, K. L. Ebi, E. Maibach, R. S. Ostfeld, C. Wiedinmyer, E. Zielinski-Gutiérrez, and L. Ziska, 2014: Ch. 9: Human Health. Climate Change Impacts in the United States: The Third National Climate Assessment, J. M. Melillo, Terese (T.C.) Richmond, and G. W. Yohe, Eds., U.S. Global Change Research Program, 220-256. doi:10.7930/J0PN93H5; available at https://nca2014.globalchange.gov/report/sectors/human-health.)

such as asthma attacks, and exacerbations of mental illness. Based on my and others' observations, I conclude that climate change is causing more deaths and illness.

8. As I stated in the KCET program *SoCal Connected*, "climate change is currently impacting the health of our community. People are dying at an increased rate and suffering all kinds of other illness related to the changes that are a result of global warming. (Heat Video at 23:34.) We need to start to reverse [the effects of climate change] to protect the health of our patients…. This is not theoretical… This is real." (Heat Video at 25:18.)

9. The health impacts of extreme heat and climate change are well established in peer-reviewed, scientific literature. A list of some of these papers is attached to this Declaration as Exhibit A; each paper's citation is followed by a short summary of its main conclusion(s). Health impacts of heat include increases in overall mortality, cardiovascular mortality, respiratory ailments, pre-term labor and delivery, low birth weight and fetal death, mental illness including more suicidal ideation and completed suicides, trauma and interpersonal violence, and hospital arrivals and length of visit. I will summarize these impacts in the next few paragraphs.

10. Research has shown that, for every 10 degree increase in temperature, the rate of deaths increases 2.3%. (Basu et al., *Characterizing Temperature and Mortality in Nine California Counties* (2008) 19 Epidemiology 138, 140.) According to Dr. Rupa Basu, an epidemiologist at CalEPA/OEHHA, "people are dying at epidemic levels because of climate change." (Heat Video at 6:38; see also Basu, *High Ambient Temperature and Mortality: a Review of Epidemiologic Studies from 2001 to 2008* (2009) 8 Envtl. Health 40.) In fact, heat caused the greatest number of weather-related fatalities and injuries in the United States, according to the National Weather Service. (National Weather Service, *Summary of Natural Hazard Statistics for 2018 in the United States*, available at https://www.weather.gov/media/hazstat/sum18.pdf.)

11. The California Department of Public Health has sponsored an assessment of the public health impacts of climate change to guide local health departments. (American Public

Health Association, the Public Health Institute, Center for Climate Change and Health, *Climate Change, Health, and Equity: A Guide for Local Health Departments* (2018), available at https://www.apha.org/-/media/files/pdf/topics/climate/guide_section4.ashx?la=en&hash=118F4FD2E4719EF51A76C0B0865BAEF57BEB7EDB ("*Climate Change, Health, and Equity*").) It states that "[h]eat already causes more deaths than any other natural disaster," noting that from 1999–2010, 7,415 people died from heat-related illness in the U.S., an average of 618 per year. Among the health effects of extreme heat it lists are "excess death and illness through heat stroke, heat exhaustion, and exacerbation of chronic illness. In addition, heat exposure triggers multiple physiological mechanisms that cause damage to the brain, heart, intestines, kidneys, liver, lungs, and pancreas. Increased ozone levels from extreme heat exacerbate asthma, respiratory disease, and cardiovascular disease. Heat stress and associated dehydration can exacerbate renal disease and may be linked to new epidemics of chronic kidney disease." (*Id*. at p. 24.) Further, increased apparent temperature has been associated with diagnoses of cardiovascular diseases, such as cardiac dysrhythmia, ischemic stroke, ischemic heart disease, and hypotension. (Basu et al., *The Effect of High Ambient Temperature on Emergency Room Visits* (2012) 23 Epidemiology 813, 817.)

12. In a 2014 study, hospital admissions for respiratory diseases were shown to be increased during a heat wave. (Guirguis and Gershunov, *The Impact of Recent Heat Waves on Human Health in California* (2014) 53 J. Applied Meteorology and Climatology 3, 10.)

13. Increased heat is associated with impacts to fetal development. Most disturbingly, researchers have found "positive associations between apparent temperature and stillbirth during the warm season in California." (Basu et al., *Association Between High Ambient Temperature and Risk of Stillbirth in California* (2016) 183 Am. J. Epidemiology 894, 899.) For every 10 degree Fahrenheit increase in apparent temperature, researchers found a 10.4% increase in the "excess risk of fetal death during the warm season." (*Id.* at p. 897.) Additionally, increased exposure to heat is connected to increased risk of pre-term

delivery (Basu et al., *High Ambient Temperature and the Risk of Preterm Delivery* (2010) 172 Am. J. Epidemiology 1108, 1111), as well as increased risk of low birth weight when exposed to higher temperatures during the full gestational period (Basu et al., *Temperature and Term Low Birth Weight in California* (2018) 187 Am. J. Epidemiology 2306, 2309).

14. Increased temperature is also significantly associated with an increase in mental illness. During the warm season, a 10 degree Fahrenheit increase in mean apparent temperature was associated with a 4.8% increase in risk of emergency room visits for overall mental health events; during the cold season, the same temperature increase is associated with a 5.3% increase in such visits. (Basu et al., *Examining the Association Between Apparent Temperature and Mental Health-Related Emergency Room Visits in California* (2017) 187 Am. J. Epidemiology 726, 728.) A 10 degree Fahrenheit increase is also associated with a 5.8% increase in the risk of ER visits for self-injury/suicide during the warm season and a 7.2% risk of such visits during the cold season. (*Ibid.*)

15. Increased heat is also correlated with increases in interpersonal violence. During the warm season, a 10 degree Fahrenheit increase in temperature was associated with a 7.9% increase in risk for ER visits for inflicted injury/homicide; during the cold season, the same temperature increase was associated with a 10.6% increase in risk for such visits. (Basu et al., *Examining the Association Between Apparent Temperature and Mental Health-Related Emergency Room Visits in California* (2017) 187 Am. J. Epidemiology 726, 728.)

16. Finally, increased heat is correlated with increases in hospital visits. Sustained increases in the heat index are associated with an increased volume of patients arriving to the emergency department, as well as an increase in patient length of stay. (Levy et al., *An Analysis of the Relationship Between the Heat Index and Arrivals in the Emergency Department* (2015) 7 PLoS Currents.) Another study found that the 2006 California heat wave "had a substantial impact on morbidity through California," noting an increase in emergency department visits and hospitalizations statewide. (Knowlton et al., *The 2006*

California Heat Wave: Impacts on Hospitalizations and Emergency Department Visits (2009) 117 Envtl. Health Persp. 61, 63–64.)

17. The effects of climate change and associated temperature increases do not affect all populations equally. Communities in urban environments, as well as socioeconomically disadvantaged communities, unfortunately bear the brunt of such effects.

18. The heat island effect is particularly severe in urban areas, since blacktop and concrete absorb heat. "When days and nights get too hot, city dwellers are the first to run into trouble." (Aimee Cunningham, *Are We Ready For the Deadly Heat Waves of the Future*, Science News, Apr. 3, 2018, available at https://www.sciencenews.org/article/are-we-ready-deadly-heat-waves-future.) *Climate Change, Health, and Equity, supra*, describes urban heat islands as "dense urban areas with fewer trees, less green space, more buildings, higher energy use, and more impervious asphalt and concrete. These characteristics create urban heat islands where nighttime temperatures may be as much as 22°F higher than surrounding areas." (*Id.* at p. 24.) This increased temperature exacerbates heat-related health impacts. Further, *Climate Change, Health, and Equity* reports that "Low income and communities of color are more likely to be located in 'urban heat islands'." (*Ibid*.) As stated in the KCET program, "Los Angeles is particularly impacted just because of the urban heat island effect." (Heat Video at 8:53.)

19. I believe that climate change's effects are particularly hard on socioeconomically disadvantaged communities. Across the nation, *Climate Change, Health and Equity* notes that as of 2013, African Americans were 52% more likely, Asian Americans 32% more likely, and Hispanics 21% more likely to live in heat vulnerable areas of the U.S. compared with non-Hispanic Whites. (*Climate Change, Health, and Equity, supra* at p. 24.)

20. Many of the health effects described in Paragraphs 10 through 16 are particularly pronounced in communities of color. (See Basu, *High Ambient Temperature and Mortality: a Review of Epidemiologic Studies From 2001 To 2008* (2009) 8 Envtl. Health 40.) Researchers have found that communities of color bear higher risks of heat-related mortality

(Basu and Ostro, *A Multicounty Analysis Identifying the Populations Vulnerable to Mortality Associated with High Ambient Temperature in California* (2008) 168 Am. J. Epidemiology 632, 635), pre-term delivery (Basu et al., *High Ambient Temperature and the Risk of Preterm Delivery* (2010) 172 Am. J. Epidemiology 1108, 1111, 1113), and low infant birth weight (Basu et al., *Temperature and Term Low Birth Weight in California* (2018) 187 Am. J. Epidemiology 2306, 2309). These results demonstrate that climate change and life-threatening heat disproportionately impact communities of color, which is an environmental injustice.

21. Exhibit A is a list of each of the scientific studies described in this declaration, with a short summary of each, and a copy of each study attached.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge.

Executed on February 3, 2020, at Pasadena, CA.

Dr. Marc Futernick

EXHIBIT A

Exhibit A
Supporting Studies for Dr. Marc Futernick Declaration

1. American Public Health Association, the Public Health Institute, Center for Climate Change and Health, *Climate Change, Health, and Equity: A Guide for Local Health Departments* (2018), available at https://www.apha.org/-/media/files/pdf/topics/climate/guide_section4.ashx?la=en&hash=118F4FD2E4719EF51A76C0B0865BAEF57BEB7EDB.

This source summarizes the health impacts that result from climate change, including extreme heat, drought, wildfires, air quality, allergens, sea level rise, storms and flooding, and nutrition and food security.

2. Basu, *High Ambient Temperature and Mortality: a Review of Epidemiologic Studies from 2001 to 2008* (2009) 8 Envtl. Health 40.

This paper is a review of epidemiological studies from 2001 to 2008 examining the relationship between high ambient temperature and mortality. The review examined thirty-six total studies from locations all over the world, and identified subgroups that may experience increased heat-related risk of mortality, including those at risk for cardiovascular or respiratory disease, members of the "Black racial/ethnic group, women, those with lower socioeconomic status, and all age groups, particular the elderly over 65 years of age as well as infants and young children."

3. Basu and Ostro, *A Multicounty Analysis Identifying the Populations Vulnerable to Mortality Associated with High Ambient Temperature in California* (2008) 168 Am. J. Epidemiology 632.

This study reviewed data on mortality in nine California counties from 1999-2003, and found that "[e]ach 10°F (~4.7°C) increase in mean daily apparent temperature corresponded to a 2.6% (95% confidence interval (CI): 1.3, 3.9) increase for cardiovascular mortality, with the most significant risk found for ischemic heart disease." The study also found elevated risk for "persons 65 years of age . . . infants 1 year of age or less . . . and the Black racial/ethnic group."

4. Basu et al., *Temperature and Term Low Birth Weight in California* (2018) 187 Am. J. Epidemiology 2306.

This study examined the relationship between temperature and term low birth weight among 43,629 full-term low birth weight infants and 2,032,601 normal-weight infants in California from 1999-2013. The study found that long-term apparent temperature exposure, specifically full gestational exposure driven largely by the third trimester of pregnancy, was positively associated with term low birth weight in

California. The study also observed greater risks among mothers who were Black, older, gave birth to male infants, or gave birth in the warm season.

5. Basu et al., *Examining the Association Between Apparent Temperature and Mental Health-Related Emergency Room Visits in California* (2017) 187 Am. J. Epidemiology 726.

This study examined the association between temperature and mental health-related outcomes in California during emergency room visits from the period between 2005-2013. The study found that during the warm season, a 10°F increase in mean apparent temperature was associated with:

- a 4.8% increase in risk of overall mental health events,
- a 2.9% increase in risk of psychotic events,
- a 5.7% increase in risk of neurotic events,
- a 5.8% increase in risk of self-injury/suicide ER visits and
- a 7.9% increase in risk of inflicted injury/homicide.

During the cold season, a mean apparent temperature increase of 10°F was associated with

- a 5.3% increase in risk of all mental health events,
- a 3.9% increase in risk of psychotic events,
- a 6.0% increase in risk of neurotic events,
- a 7.2% increase in risk of self-injury/suicide and
- a 10.6% increase in risk of inflicted injury/homicide visits.

6. Basu et al., *Association Between High Ambient Temperature and Risk of Stillbirth in California* (2016) 183 Am. J. Epidemiology 894.

This study examined the association between temperature and fetal death after 20 weeks of gestation during the warm season in California from 1999-2009, with a study population of 8,510 stillbirths. The study found that for every 10°F increase in apparent temperature over a cumulative average of lags 2-6 days, there was a 10.4% increase in the excess risk of fetal death during the warm season.

7. Basu et al., *The Effect of High Ambient Temperature on Emergency Room Visits* (2012) 23 Epidemiology 813.

This study examined 1,215,023 emergency room visits in California during the warm seasons of 2005-2008. The study found positive associations between same-day increases in temperature and ischemic heart disease, ischemic stroke, cardiac dysrhythmia, hypotension, diabetes, intestinal infection, dehydration, acute renal failure, and heat illness.

8. Basu et al., *High Ambient Temperature and the Risk of Preterm Delivery* (2010) 172 Am. J. Epidemiology 1108.

This study analyzed 58,681 preterm births in California between May and September, from 1999-2006. The study found that an 8.6% increase in preterm delivery was associated with a 10°F increase in weekly average apparent temperature. The study also found greater associations between preterm birth and increased temperature in younger mothers, as well as in Black and Asian mothers.

9. Basu et al., *Characterizing Temperature and Mortality in Nine California Counties* (2008) 19 Epidemiology 138.

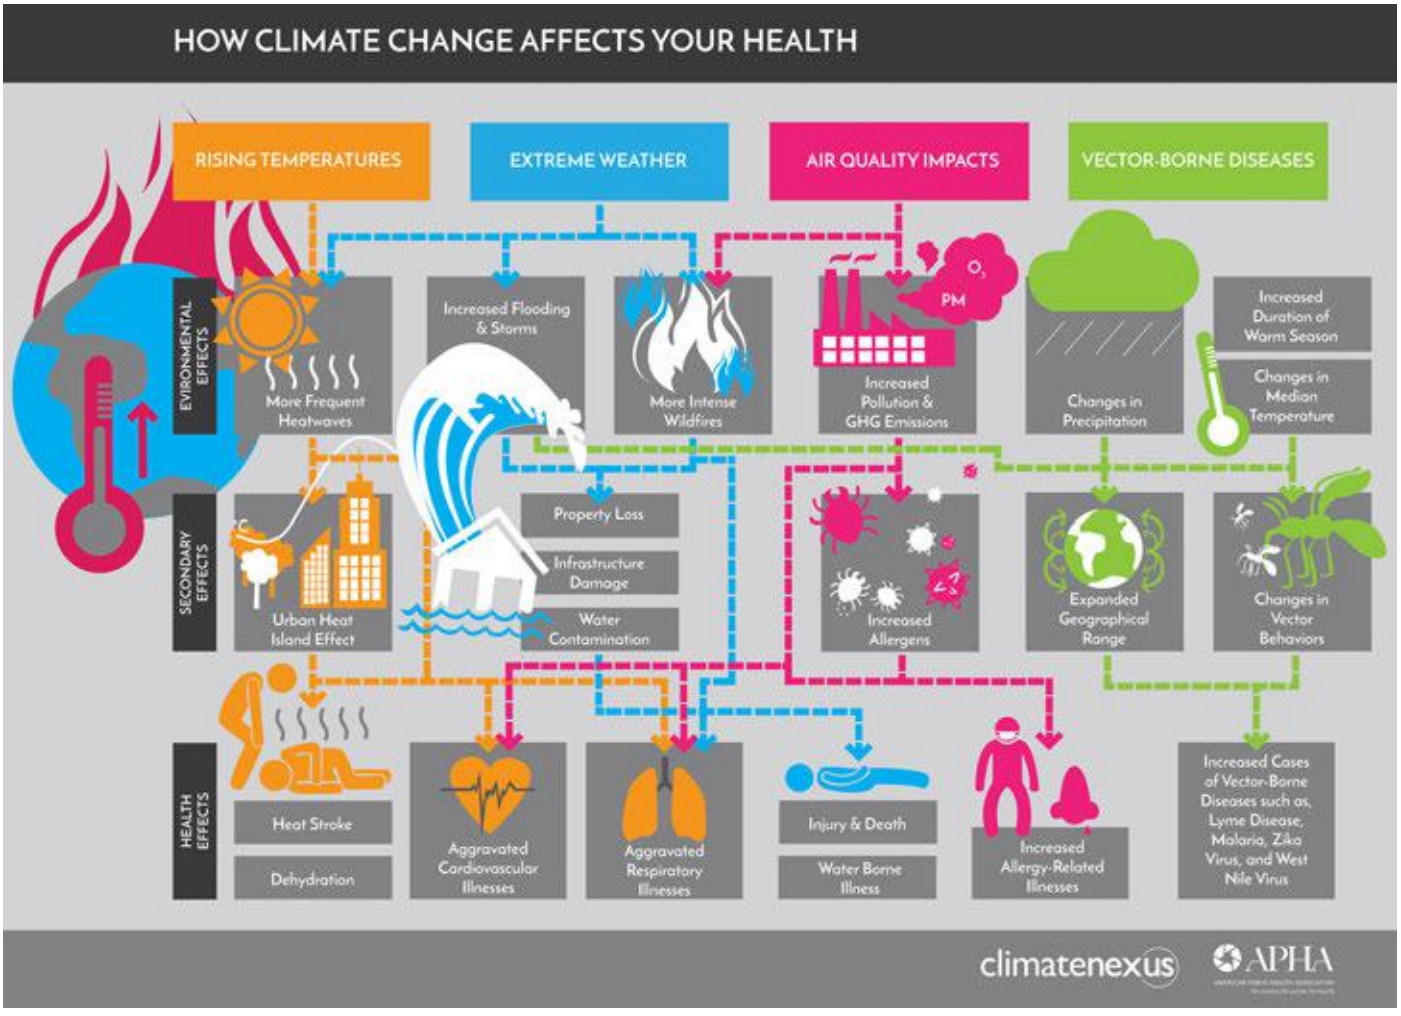
This study examined the association between mean daily apparent temperature and nonaccidental mortality in nine California counties, from May to September in the years between 1999-2003. Researchers examined 248,019 deaths during that time period. The study found that each 10°F increase in same-day mean apparent temperature was associated with a 2.3% increase in mortality.

10. Guirguis et al., *The Impact of Recent Heat Waves on Human Health in California* (2014) 53 J. Applied Meteorology and Climatology 3.

This study reviewed hospitalization data in California during the warm season (May-September) between 1999-2009. The study found significant increases in hospitalizations during heat waves, particularly hospital admissions due to cardiovascular diseases, respiratory diseases, mental health, acute renal failure, dehydration, and heat illness.

11. Knowlton et al., *The 2006 California Heat Wave: Impacts on Hospitalizations and Emergency Department Visits* (2009) 117 Envtl. Health Persp. 61.

This study investigated the impacts of the 2006 California heat wave on emergency room visits and hospitalizations in hospitals across California. The study found that there were 501,951 emergency department visits during the 2006 heat wave period, resulting in a statistically significant excess of 16,166 visits when compared with a non-heat-wave reference period. The main causes of these visits were heat-related illness, electrolyte imbalance, acute renal failure, nephritis and nephrotic syndrome, diabetes, and cardiovascular disease. The study also found that there were 1,182 excess hospitalizations during the heat wave period, though this figure was not statistically significant.



12. Levy et al., *An Analysis of the Relationship Between the Heat Index and Arrivals in the Emergency Department* (2015) 7 PLoS Currents.

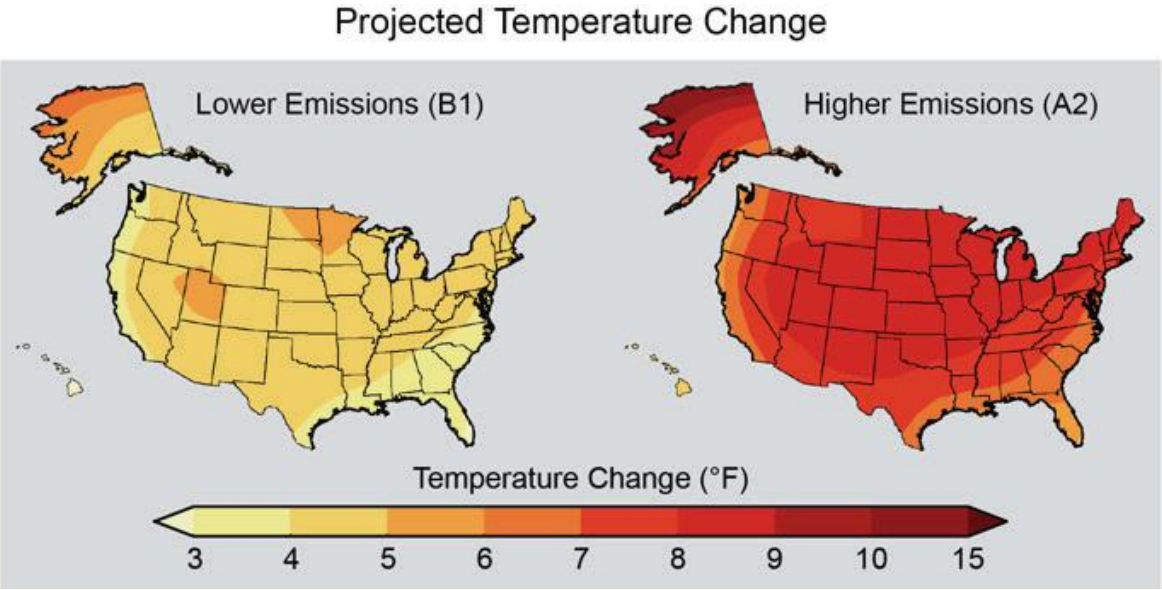
This study reviewed all emergency department arrivals at the Johns Hopkins Hospital in Baltimore, MD that occurred from April 15 through August 15 during 2008-2013 to determine the potential relationship between the heat index and emergency department visits, as well as the length of hospital stay. The study found a significant correlation between elevated heat index over a three day period and increased volume of patients arriving to the emergency department. The study also found an increase in length of hospital stay of approximately 5% when the mean heat index exceeded 100°F over three days. The study also found that during a 2012 heat wave, increase in the heat index was correlated with an approximately 10% increase in the length of hospital stay.

ARTICLE 1

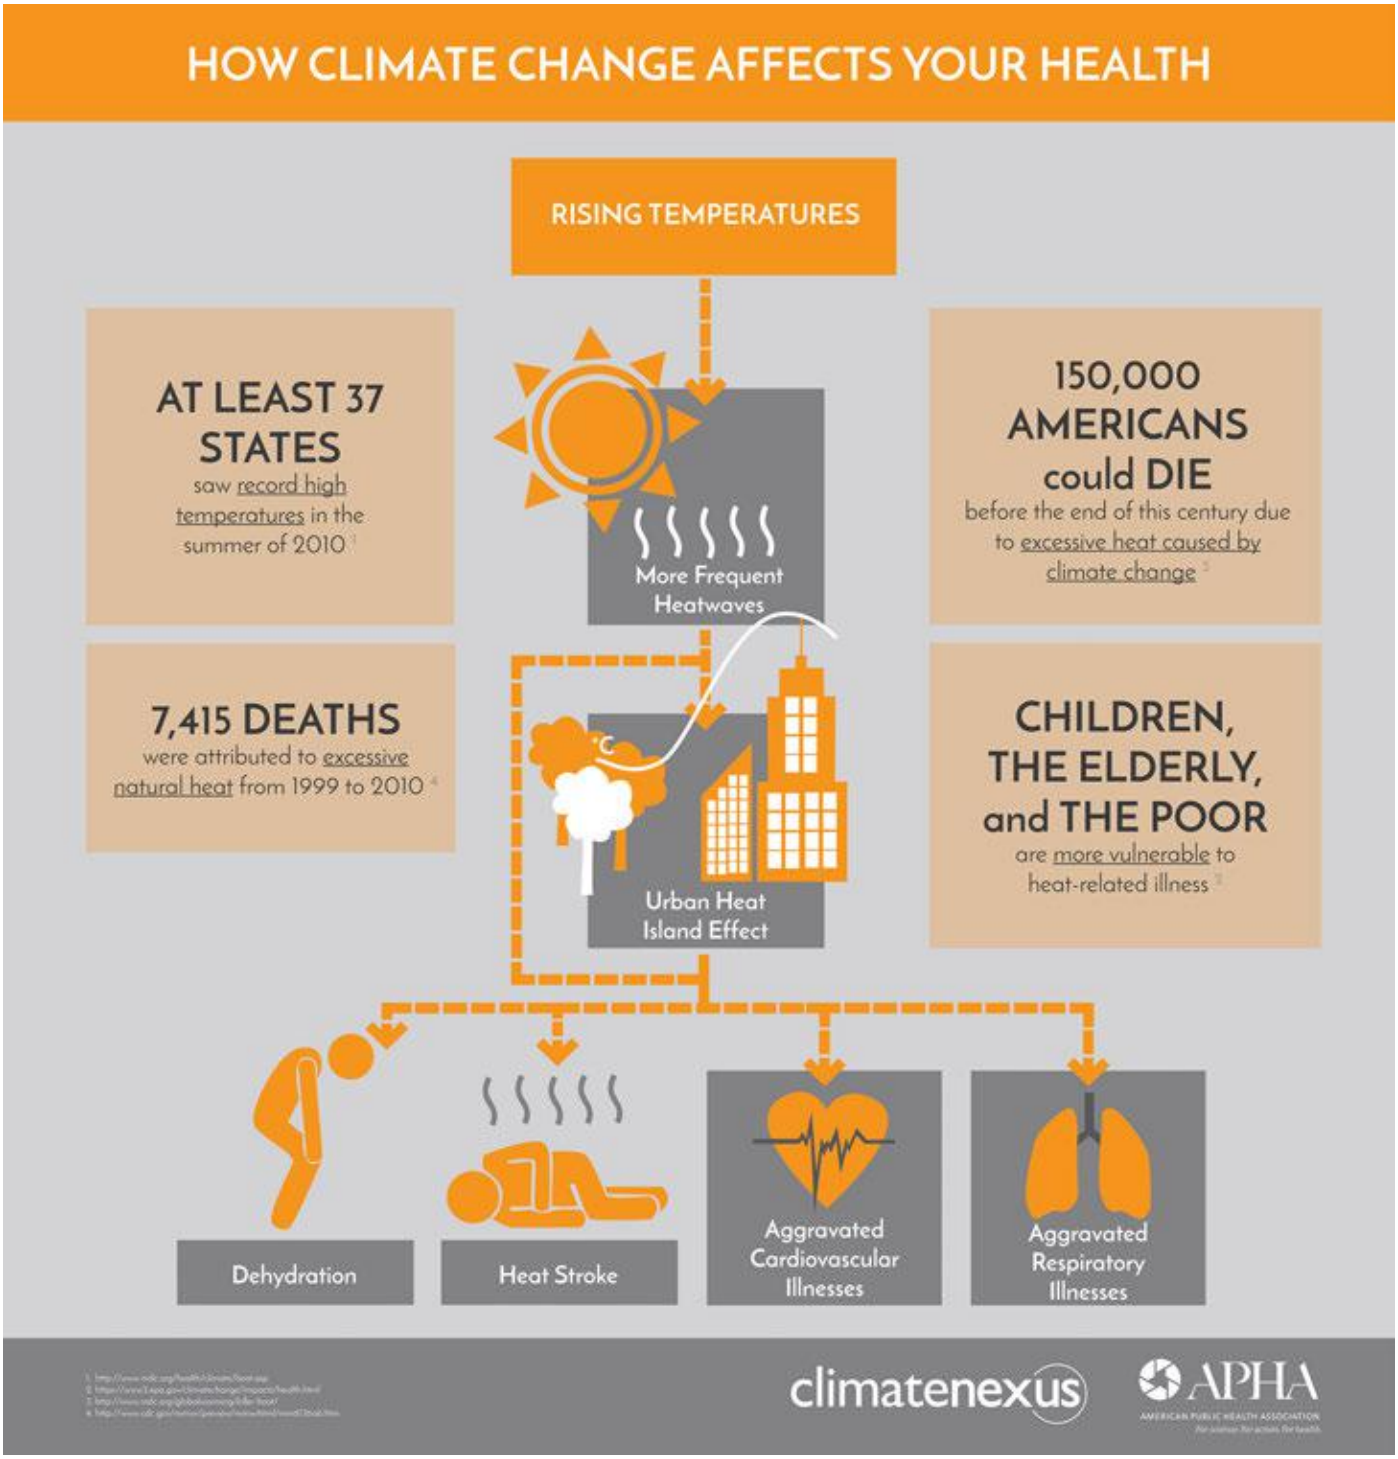
Health Impacts of Climate Change

Climate change threatens the fundamentals that sustain life and health—fresh water, food, clean air, shelter, and security—and thus threatens the health and possibly the very survival of the communities that local health departments serve. Climate change is a global phenomenon, but it is people and communities at the local level that experience its consequences. Climate change exacerbates local and global health inequities because some people and communities bear an unfair burden of these health harms, including low-income communities, communities of color, native and tribal communities, the very young and very old, and those with chronic illnesses. This Section provides an overview of the health impacts of climate change.

APHA, Climate Nexus 2016



4.1 Extreme Heat



The CDC defines extreme heat as "summertime temperatures that are substantially hotter and/or more humid than average for that location at that time of year."[1] *Climate change increases extreme heat exposure.*

Climate Change Worsens Extreme Heat

- Seventeen of the country's eighteen warmest years on record have occurred since 2001.[2]
- In 2017, periods of extreme heat broke state records throughout the summer and fall. Every state had an annual average temperature that was warmer than usual.[3] Arizona, Georgia, New Mexico, North Carolina, and South Carolina had the warmest year on record.[4] There has been a dramatic increase in hot night-time temperatures in the U.S., reducing critical hours of relief during heat waves.[5]
- Different regions of the U.S. are expected to see varying levels of temperature increase due to climate change; average temperature is projected to increase by 3–5°F by the mid-2030s and 2.8–10.8°F by the end of the century.[6] See Figure 4.1.1.

Figure 4.1.1: Projected change in average surface air temperature from 2071 to 2099 relative to 1970–1999 temperatures under a scenario that assumes substantial reductions in GHGE (B1) and a higher emissions scenario that assumes continued increases in global GHGE (A2)[7]

APHA, Climate Nexus 2016

Health Impacts of Extreme Heat

Heat already causes more deaths than any other natural disaster.[8]

- From 1999–2010, 7,415 people died from heat-related illness in the U.S., an average of 618 per year.[9] Extreme heat results in excess death and illness through heat stroke, heat exhaustion, and exacerbation of chronic illness. In addition, heat exposure triggers multiple physiological mechanisms that cause damage to the brain, heart, intestines, kidneys, liver, lungs, and pancreas.[10]
- Increased ozone levels from extreme heat exacerbate asthma, respiratory disease, and cardiovascular disease.[11]
- Heat stress and associated dehydration can exacerbate renal disease and may be linked to new epidemics of chronic kidney disease.[12]
- Exposure to extreme heat impacts mental health through increased incidence of disease, death, violence, aggression, suicide and higher rates of admission for those with a psychiatric condition. Persons with mental illness may have triple the risk of death during a heat wave.[13] In the U.S., there is an association between periods of extreme heat and increased rates of violent crimes in cities.[14]
- Some medications are sensitive to heat and may lose effectiveness or cause harmful side effects when exposed to heat.[15] Other medications alter individual tolerance to extreme heat, increasing the risk of heat illness.[16]
- Heat waves contribute to crop and livestock loss, resulting in rising food prices and increased food insecurity.[17,18]

Extreme Heat and Health Equity

- **Urban heat islands:** Low income and communities of color are more likely to be located in "urban heat islands"—dense urban areas with fewer trees, less green space, more buildings, higher energy use, and more impervious asphalt and concrete. These characteristics create urban heat islands where nighttime temperatures may be as much as 22°F higher than surrounding areas. These vulnerabilities often map onto areas of historical residential segregation.[19]
- **Race and ethnicity:** As of 2013, African Americans were 52% more likely, Asian Americans 32% more likely, and Hispanics 21% more likely to live in heat vulnerable areas of the U.S. compared with non-Hispanic Whites.[20]
- **Rural communities:** The risk of heat-related mortality may be about 3% higher in rural areas when compared to urban areas, potentially linked with less access to health care services, greater proportions of elderly people, many outdoor occupations, fewer media to share heat information, and less access to air conditioning and transportation.[21]
- **Working conditions:** Outdoor farmworkers are at greater risk of exposure to extreme heat, and from 1992–2006, heat-related deaths were 20 times higher among crop workers than the general U.S. population.[22] Occupational heat stress and chronic dehydration may lead to chronic kidney disease in outdoor workers.[23]

LHD Spotlight: Cooling Centers in Maricopa County, Arizona

In 2005, 35 individuals died over a 9-day period of extreme heat in Maricopa County.[29] MCDPH partnered with the Arizona Department of Health Services and Arizona State University to evaluate community access to and perceptions of cooling centers by surveying facility visitors and managers and observing use during an extreme heat event.

There are 58 private and public cooling centers in Maricopa County—locations that are air-conditioned or cooled and have been designated as a site individuals can go to during heat events.[30] The evaluation found that many cooling centers were open only on weekdays, primarily in community centers, senior centers, and religious institutions without clear or visible signs notifying the public of the availability of a cooling center.[31] Eighty-four percent of visitors were unemployed, 33% had no permanent residence, and 11% of those who indicated a permanent residence had no air conditioning at their place of living.[32]

Maricopa County subsequently developed a Heat Relief Regional Network—a partnership of municipalities, nonprofit organizations, and faith-based organizations—to mitigate heat health risks. The Network maintains a list of cooling centers and services on available maps and hosts trainings on heat illness prevention for facility managers.[33]

- **Social isolation:** Social, cultural, and linguistic isolation are all risk factors for heat illness.[24] In the European heat wave of 2003, elders living alone had the highest mortality rates.[25]
- **Physical or cognitive impairments:** Limited mobility increases the risk of isolation, and the ability to move to a cooler location. Cognitive impairment may limit the ability to recognize risk or seek assistance during an extreme heat event.
- **Age:** The very young and the elderly are less able to sense and adapt to changes in temperature, due to limitations in body temperature regulation.
- **Chronic Illness:** Those with conditions such as obesity, diabetes or renal, cardiovascular and respiratory diseases are at higher risk of heat illness, including exacerbation of complications related to their underlying illness.[26]
- **Air Conditioning Access:** A 2005 study found that African American households had 5.3% higher heat-related mortality rate than White households, and had half the access to central AC.[27]
- **Evolving Extreme Heat Geography:** People living in some regions of the U.S., such as coastal communities, may be especially vulnerable to extreme heat because they are not currently acclimatized to increased temperatures but will experience increased high heat days.[28]

World Health Organization's Core Elements of Heat–Health Action Plans[43]

1. Agreement on a lead body to coordinate a multi-purpose collaborative mechanism between bodies and institutions and to direct the response if an emergency occurs.
2. Accurate and timely alert systems.
3. A heat-related health information plan (what is communicated, to whom and when).
4. A reduction in indoor heat exposure, including medium- and short-term strategies and advice on how to keep indoor temperatures low during heat episodes.
5. Particular care for vulnerable population groups.
6. Preparedness of the health- and social-care systems (staff training and planning, appropriate health care and the physical environment).
7. Long-term urban planning to address building design and energy and transport policies that will ultimately reduce heat exposure.
