 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
```

```
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
**Model Uses NO WET DEPLETION.  WETDPLT  =  F

**Model Uses RURAL Dispersion Only.

**Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.

**Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of:  OTHER

**Model Calculates  1 Short Term Average(s) of:   1-HR
   and Calculates PERIOD Averages

**This Run Includes:   4077 Source(s);      42 Source Group(s); and     148 Receptor(s)

               with:    28 POINT(s), including
                         0 POINTCAP(s) and      0 POINTHOR(s)
                and:  4049 VOLUME source(s)
                and:     0 AREA type source(s)
                and:     0 LINE source(s)
                and:     0 RLINE/RLINEXT source(s)
                and:     0 OPENPIT source(s)
                and:     0 BUOYANT LINE source(s) with      0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date:  18081

**Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     8.00 ;  Decay Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                 ;  Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3
```

**Approximate Storage Requirements of Model = 6.1 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**Detailed Error/Message File: SSCC.err
**File for Summary of Results: SSCC.sum

 **Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
```

3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.

**Other Options Specified:
ADJ_U* - Use ADJ_U* option for SBL in AERMET
CCVR_Sub - Meteorological data includes CCVR substitutions
TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: OTHER

**Model Calculates 1 Short Term Average(s) of: 1-HR
and Calculates PERIOD Averages

**This Run Includes: 8 Source(s); 8 Source Group(s); and 148 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 8 VOLUME source(s)
and: 0 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 18081

**Output Options Selected:
Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 8.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**Detailed Error/Message File: SSCC.err
**File for Summary of Results: SSCC.sum

VIA EMAIL TO:
Nicole.Moore@stocktonca.gov

SUBJECT: Comments on South Stockton Commerce Center EIR (SCH NO. 2020090561)

Dear Ms. Moore,

Thank you for the opportunity to comment on the Environmental Impact Report (EIR) for the proposed South Stockton Commerce Center. Please accept and consider these comments on behalf of Golden State Environmental Justice Alliance (GSEJA). Also, GSEJA formally requests to be added to the public interest list regarding any subsequent environmental documents, public notices, public hearings, and notices of determination for this project. Send all communications to Golden State Environmental Justice Alliance P.O. Box 79222 Corona, CA 92877. A-1

1.0 Summary

The project proposes a Tentative Map for the 422.22-acre site to create 13 development lots, two basin lots, two open space lots, one sewer pump station lot, and off-site sewer improvements. Of the 13 development lots, 12 will be for development of industrial uses and one will be for development of commercial uses. Based on a maximum FAR of 0.47, a maximum of 6,091,551 square feet of industrial type land uses could be developed throughout the site. Based on a FAR of 0.30, a maximum of 140,350 square feet of commercial land uses could be developed. Neither a conceptual or finalized site plan are provided for public review in the EIR. The project requires approval of a General Plan Amendment and Zoning Map Amendment to shift the boundaries of two areas currently designated Commercial (CG) and Industrial (IL) to be consistent with the future Commerce Drive right-of-way center line to enable vehicular truck/trailer access to the IL site. A-2

.

2.0 Project Description

Project Piecemealing
The EIR does not accurately or adequately describe the project, meaning "the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment" (CEQA § 15378). Figures 2.06 and 2.0-9 depict the western portion of the project site (west of the railroad- south of Airport Way) to change the existing residential zoning classification (RH) to an industrial classification (IL). The EIR only addresses this via a footnote that states, "The Stockton Zoning Map (last revised June 29, 2020) identifies the zoning for APN 177-050-09 as CG (Commercial), RM (Residential Medium-Density), and RH (Residential High-Density). However, City of Stockton Ordinance No. 2019-07-16-1501-02 (adopted July 16, 2019, effective August 15, 2019) rezoned APN 177-050-09 to IL (Industrial-Limited) and CG (Commercial), consistent with the Industrial and Commercial General Plan Land Use Designations. These zoning actions will be reflected in the next revision of the Stockton Zoning Map." Adoption of Ordinance No. 2019-07-16-1501-02 to rezone APN 177-050-09 to IL and CG was a necessary precedent for the proposed project and to reflect "the applicant's current development interests for the area[1]." The project has been piecemealed into at least two separate actions - a necessary rezoning and the development proposal of the proposed project. Additionally, it is clear that the currently proposed project was already in the pipeline at the time of Ordinance No. 2019-07-16-1501-02 as the staff report also states that "A new Development Agreement and MDP are not required because with the approval of the Zoning Map Amendment, *the modified project* will be consistent with the 2040 General Plan Land Use Map." A-3

CEQA § 15165 - Multiple and Phased Projects requires that:
"Where individual projects are, or a phased project is, to be undertaken and where the total undertaking comprises a project with significant environmental effect, the Lead Agency shall prepare a single program EIR for the ultimate project as described in Section 15168. Where an individual project is a necessary precedent for action on a larger project, or commits the Lead Agency to a larger project, with significant environmental effect, an EIR must address itself to the scope of the larger project. Where one project is one of several similar projects of a public agency, but is not deemed a part of a larger undertaking or a larger project, the agency may prepare one EIR for all projects, or one for each project, but shall in either case comment upon the cumulative effect."

---

[1] Stockton City Council File No. 19-5275 regarding Ordinance No. 2019-07-16-1501-02 and related actions https://stockton.legistar.com/LegislationDetail.aspx?ID=4059625&GUID=5250366C-C65C-43EC-93E3-006431546EDC

Piecemealing the necessary rezoning action for the project site misleads the public and decision makers by circumventing adequate and accurate environmental analysis for the whole of the action. A revised EIR must be prepared pursuant to Section 15168 which accurately represents the whole of the action without piecemealing the project into separate projects to present unduly low environmental impacts.

The EIR notes the following regarding a Development Agreement for the proposed project:

"The proposed project includes a request for approval of a Development Agreement (DA) governing the relationship between the City of Stockton and the SSCC Applicant, or its successors. A primary purpose of the DA may be to regulate development density and intensity over an extended period of time; however, the DA would not increase the maximum density or development intensity. The DA will also be used to establish other agreements between the City/Applicant (or its successors) related to the project. Such other agreements may include, but are not limited to, commitments to project entitlements and development standards as well as any other administrative and/or financial relationships that may be defined during the review of the initial application or subsequent applications related to developing the project."

The development agreement is not included as an attachment for public review in compliance with CEQA's requirements for meaningful disclosure. Incorporation by reference (CEQA § 15150 (f)) is not appropriate as the development agreement contributes directly to analysis of the problem at hand. The EIR must be revised to include the development agreement for review, analysis, and comment by the public and decision makers. This is especially vital as the EIR states the primary purpose of the DA is to regulate development density and intensity of the project.

A-3 cont'd

It is notable that the EIR states that "although a final and definitive Site Plan is not currently proposed, for planning purposes a conceptual site plan was prepared to establish a target Floor Area Ratio (FAR) that was used to generate the maximum square footage of building area for the Tentative Map and for purposes of environmental review." The basic components of a Planning Application include a site plan, floor plan, grading plan, and elevations. It is illogical to prepare a Project EIR (as stated in EIR Section 1.2) without final versions of these items. The EIR lacks basic project information and is inadequate as an informational document. Additionally, none of these items (including the conceptual site plan the EIR states was prepared) are included as part of the EIR for public review, which does not comply with CEQA's requirements for adequate informational documents and meaningful disclosure (CEQA § 15121 and 21003(b)). Incorporation by reference (CEQA § 15150 (f)) is not appropriate as the site plan, floor plan, grading plan, and elevations contribute directly to analysis of the problem at hand. The EIR must be revised to include all application items for review, analysis, and comment by the public and decision makers.

Additionally, it can be concluded that a final and definitive site plan was prepared for the project as a General Plan Amendment and Rezone of the two areas between Airport Way and the Union Pacific Railroad right-of-way is proposed. These areas are currently designated Commercial and Industrial and are zoned CG (Commercial, General) and IL (Industrial, Light), respectively. The current boundaries of the designations will be modified to be consistent with the future Commerce Drive right-of-way center line to enable vehicular truck/trailer access to the IL site. Circulation needs are dependent upon building and site layout, which are determined as part of a final and definitive site plan. The project would not be knowledgeable enough to propose these changes if a final and definitive site plan had not already been prepared. A-3 cont'd

3.3 Air Quality, 3.7 Greenhouse Gases, Climate Change, and Energy

Please refer to attachments from SWAPE for a complete technical commentary and analysis.

The EIR does not include for analysis relevant environmental justice issues in reviewing potential impacts, including cumulative impacts generated by the proposed project. This is especially significant as the surrounding community is highly burdened by pollution. According to CalEnviroScreen 4.0, CalEPA's screening tool that ranks each census tract in the state for pollution and socioeconomic vulnerability, the proposed project's census tract (6077003803) ranks worse than 99% of the rest of the state overall. The surrounding community, including sensitive receptors such as the single family and multi-family residences to the east, bears the impact of multiple sources of pollution and is more polluted than average on every pollution indicator measured by CalEnviroScreen. For example, the project census tract ranks in the 51st percentile for ozone burden and the 57th percentile for PM 2.5 burden, which is typically attributed to heavy truck activity in the area. A-4

Further, the project's census tract is a diverse community including 58% Hispanic, 11% African-American, and 9% Asian residents, which are especially vulnerable to the impacts of pollution. The community has a high rate of linguistic isolation, meaning 49% of households speak little to no English. The community has a high rate of low educational attainment, meaning 89% of the census tract over age 25 has not attained a high school diploma, which is an indication that they may lack health insurance or access to medical care. The community is especially vulnerable as it ranks in the 84th percentile for incidence of asthma and 89th percentile for incidence of cardiovascular disease, which can be attributed to high levels of pollution.

Additionally, the project's census tract is identified as a SB 535 Disadvantaged Community, which is not discussed or presented for analysis in the EIR.

3.4 Biological Resources

The EIR states regarding impact 3.4-1 that "Field surveys and habitat evaluations for the entire Project site were performed on May 4, and November 9, 2020. (De Novo Planning Group, 2020). No special-status invertebrates were observed within the Project site during field surveys and none are expected to be affected by the proposed Project based on the lack of appropriate habitat." A finding of no impact is also concluded for impacts 3.4-2 through 3.4-10.

A-5

However, the EIR does not include any meaningful evidence, such as a Biological Resources Assessment, to support these conclusions. The information provided in Figures 3.4-1 to 3.4-3 is based on general internet-based research and do not provide project-specific information regarding impacts to Biological Resources. The EIR must be revised to support the claims that there are no impacts to Biological Resources by providing meaningful, supporting evidence such as a project-specific Biological Resources Assessment. If a Biological Resources Assessment was prepared and not attached for public review, this is a violation of CEQA § 15150 (f) as the report contributes directly to the analysis of the problem at hand.

3.8 Hazards and Hazardous Materials

The proposed project site is within Traffic Pattern Zone 7a of the Stockton Airport's Safety Zones, as identified in the Airport's ALUCP. Lands within Traffic Pattern Zone 7a cannot be developed with non-residential intensities greater than 450 persons per acre and must have open land over 10 percent of the site. The EIR concludes that "given that the Project's proposed land uses are compatible with the safety requirements of the ALUCP, and that the Project and future development would be subject to existing Stockton Municipal Code Chapter 16.28 requirements as well as proposed General Plan requirements about development within the AIA, the impact would be less than significant."

A-6

However, the EIR has not provided any meaningful evidence or analysis to support the claim that the impacts are less than significant. SJCOG's Project Review Guidelines for the Airport Land Use Commission[2] (ALUC) list that state law mandates ALUC review for "adoption or approval of any amendment to a general or specific plan affecting the property within an airport influence area (Public Utilities Code Section 21676(b))." ALUC review is required by state law for the proposed project as it requires a General Plan Amendment to proceed. Delaying ALUC review to follow the CEQA process is implementation of the project prior to CEQA review. Additionally, the ALUC also requires project review for buildings 100 feet or taller, which may also be applicable

[2] SJCOG Project Review Guidelines for the Airport Land Use Commission
https://www.sjcog.org/DocumentCenter/View/5041/2019-ALUC-Project-Review-Guidelines?bidId=

to the project since the EIR has not included elevations for public review. The EIR notes the open land and persons per acre requirements of the ALUC, but does not provide any meaningful evidence or supporting information to demonstrate that the project complies with this requirement. The EIR must be revised to include a complete review by the ALUC for consistency with the Stockton Airport Land Use Compatibility Plan requirements. A-6 cont'd

3.9 Land Use and Population

The EIR concludes that project would "generate additional employment opportunities. The additional employees may come from Stockton or surrounding communities. The Project would not directly introduce new residents to the City as no housing is proposed as part of the Project. It is noted, however, that *some portion* of the proposed Project employees would become Stockton residents." This is uncertain language and does not provide any meaningful evidence that the project will have less than significant impacts. The EIR must be revised and recirculated to include a quantified analysis of the employees generated during project construction and operations.

Further, the EIR is erroneous and misleading to the public and decision makers by providing inaccurate data regarding SJCOG projections. The EIR states that SJCOG projects the City will add 48,270 new dwelling units, 153,530 new residents, and 41,030 new jobs between 2015 and 2040. SJCOG's Population, Household, and Employment Projections[3] actually project the City will add 41,030 dwelling units, 122,708 residents, and 39,754 jobs between 2015 and 2040. The EIR must be revised and recirculated to include the accurate information. A-7

The EIR concludes that the project "is expected to require approximately 2,964 full-time and part-time employees. It is *anticipated* that the employment growth would be met both by existing residents and through the attraction of new residents." However, the EIR does not provide a methodology for this calculation. The EIR must be revised to include the methodology for determining the number of employees generated by the project with meaningful evidence to support the use of the methodology. Utilizing the 2,964 jobs noted in the EIR in order to provide any method of calculation, the project represents 7.5% of Stockton's employment growth and 2.4% of the population growth from 2015 - 2040. A single project accounting for 7.5% of the employment growth and 2.4% of the population growth within Stockton over 25 years represents a significant amount of growth. The EIR must be revised to include this analysis, and also provide a cumulative analysis discussion of projects approved since 2015 and projects "in the pipeline" to determine if the project will exceed SJCOG's employment and/or population growth forecast. Additionally, the revised EIR must also provide demographic and geographic information on the

---

[3] SJCOG's 2018 RTP/SCS Appendix R- Population, Household, and Employment Projections https://www.sjcog.org/DocumentCenter/View/3722/Final-2018-RTPSCS-Technical-Appendix-R---Population-Household-and-Employment-Projections?bidId=

location of qualified workers to fill these positions in order to provide an accurate environmental analysis. The revised EIR must also include this information and analysis regarding project generated construction jobs. A-7 cont'd

It must also be noted that the EIR is internally inconsistent as this section utilizes 2,964 employees for analysis while Appendix F - Transportation Impact Assessment notes that the project operations will generate 3,200 employees.

Table 3.10-2 General Plan Policy Consistency does not provide a consistency analysis for all applicable General Plan goals, policies, and programs. The EIR is inadequate as an informational document and a revised EIR must be prepared with a consistency analysis with all General Plan policies, including the following:

POLICY LU-5.2 Protect natural resource areas, fish and wildlife habitat, scenic areas, open space areas, agricultural lands, parks, and other cultural/historic resources from encroachment or destruction by incompatible development.

Action LU-5.2A Continue to coordinate with the San Joaquin Council of Governments and comply with the terms of the MultiSpecies Habitat Conservation and Open Space Plan to protect critical habitat areas that support endangered, threatened, and special-status species.

Action LU-5.2B For projects on or within 100 feet of sites that have the potential to contain special-status species or critical or sensitive habitats, including wetlands, require preparation of a baseline assessment by a qualified biologist following appropriate protocols, such as wetland delineation protocol defined by the US Army Corps of Engineers. If such sensitive species or habitats are found to be present, development shall avoid impacting the resource, and if avoidance is not feasible, impacts shall be minimized through project design or compensation identified in consultation with a qualified biologist. A-8

Action LU-5.2C Require new development to implement best practices to protect biological resources, including incidental take minimization measures and other federal and State requirements and recommendations that are consistent with the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan.

Action TR-4.1A Strive for Level of Service (LOS) D or better for both daily roadway segment and peak hour intersection operations, except when doing so would conflict with other land use, environmental, or economic development priorities.

GOAL SAF-4: CLEAN AIR Improve local air quality.

POLICY SAF-4.1 Reduce air impacts from mobile and stationary sources of air pollution.

POLICY CH-2.3 Focus on reducing the unique and compounded environmental impacts and risks in disadvantaged communities.

Additionally, the EIR finds the project is consistent with Policy TR-3.2: Require new development and transportation projects to reduce travel demand and greenhouse gas emissions, support electric vehicle charging, and accommodate multi-passenger autonomous vehicle travel as much as feasible. This is erroneous and misleading to the public and decision makers as the project results in significant and unavoidable VMT and greenhouse gas emissions impacts. Further, regarding Action TR-4.1A, the EIR concludes the project will result in significant and unavoidable LOS impacts, which directly conflicts with this General Plan Action. The EIR must be revised to include these inconsistencies and make a finding of significance. A-8 cont'd

The EIR does not provide any consistency analysis with the Policies and Supportive Strategies of SJCOG's 2018 RTP/SCS[4]. Due to errors in modeling and modeling without supporting evidence, as noted throughout this comment letter/attachments, and the EIR's determination that the project will have significant and unavoidable cumulatively considerable impacts to Agricultural Resources, Air Quality and Greenhouse Gas Emissions/Climate Change/Energy, and significant and unavoidable impacts to Transportation (VMT and LOS), the proposed project is directly inconsistent with the following Policies and Supportive Strategies of SJCOG's RTP/SCS:

Policy: Enhance the Environment for Existing and Future Generations and Conserve Energy A-9

Strategy #1: Encourage efficient development patterns that maintain agricultural viability and natural resources

Strategy #3: Improve air quality by reducing transportation-related emissions

Policy: Maximize mobility and accessibility

Strategy #4: Improve regional transportation system efficiency

Policy: Preserve the efficiency of the existing transportation system

The EIR must be revised to include a finding of significance due to inconsistency with the 2018 RTP/SCS document.

3.13 Transportation and Circulation

The EIR concludes, "Implementation of the Proposed Project would not result in a geometric design feature that is inconsistent with applicable design standards for the City of Stockton. The project would not result in a significant change to the vehicle mix or speed of traffic that is not compatible with the design of existing or planned facility design. Therefore, the impact would be A-10

[4] SJCOG 2018 RTP/SCS https://www.sjcog.org/DocumentCenter/View/4156/Final-Compiled-RTPSCS-2018

Less-Than-Significant." The EIR also reaches a less than significant impact conclusion regarding access for emergency response vehicles. However, the EIR does not provide any meaningful evidence, such as a site plan, to support this conclusion. The EIR is not able to logically conclude that the project will not result in a geometric design feature inconsistent with design standards that creates a hazard, change the vehicle mix/speed of traffic, or impede emergency vehicle access without providing a site plan and circulation layout. The EIR must be revised to include these items for public review and analysis in order to be an adequate informational document. A-10 cont'd

Conclusion

For the foregoing reasons, GSEJA believes the EIR is flawed and an amended EIR must be prepared for the proposed project and recirculated for public review. Golden State Environmental Justice Alliance requests to be added to the public interest list regarding any subsequent environmental documents, public notices, public hearings, and notices of determination for this project. Send all communications to Golden State Environmental Justice Alliance P.O. Box 79222 Corona, CA 92877. A-11

Sincerely,

Gary Ho

Subject: Comments on the South Stockton Commerce Center Project (SCH No. 2020090561)

Dear Mr. Ho,

We have reviewed the October 2021 Draft Environmental Impact Report ("DEIR") for the South Stockton Commerce Center Project ("Project") located in the City of Stockton ("City"). The Project proposes to develop 6,091,551-SF of industrial space, 140,350-SF of commercial space, 54 acres of open space, 41 acres of public facilities, and 18 acres of right-of-way circulation improvements on the 422.22-acre site.

Our review concludes that the DEIR fails to adequately evaluate the Project's air quality, health risk, and greenhouse gas impacts. As a result, emissions and health risk impacts associated with construction and operation of the proposed Project are underestimated and inadequately addressed. An updated EIR should be prepared to adequately assess and mitigate the potential air quality, health risk, and greenhouse gas impacts that the project may have on the surrounding environment. A-12

Air Quality

Unsubstantiated Input Parameters Used to Estimate Project Emissions

The DEIR's air quality analysis relies on emissions calculated with CalEEMod.2016.3.2 (p. 3.3-27).[1] CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence. Once all of the values are inputted into the model, the Project's A-13

[1] CAPCOA (November 2017) CalEEMod User's Guide, http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4.

construction and operational emissions are calculated, and "output files" are generated. These output files disclose to the reader what parameters are utilized in calculating the Project's air pollutant emissions and make known which default values are changed as well as provide justification for the values selected.

A-13 cont'd

When reviewing the Project's CalEEMod output files, provided in the CalEEMod Outputs as Appendix B.1 to the Air Quality, Greenhouse Gas, and Energy Appendices ("AQ & GHG Report"), we found that several model inputs were not consistent with information disclosed in the DEIR. As a result, the Project's construction and operational emissions are underestimated. Thus, an updated EIR should be prepared to include an updated air quality analysis that adequately evaluates the impacts that construction and operation of the Project will have on local and regional air quality.

Failure to Model All Proposed Land Use Types

According to the DEIR:

> "For purposes of the environmental analysis, a range of industrial uses is assumed. These uses include General Light Industrial, Industrial Park, Warehousing, Mini-Warehouse, High-Cube Transload And Short-Term Storage Warehouse, High-cube Fulfillment Center Warehouse, High-Cube Parcel Hub Warehouse, And High-Cube Cold Storage Warehouse" (p. 2.0-5, Table 2.0-2).

As demonstrated above, the Project proposes to include several different industrial and warehouse land uses types. However, review of the CalEEMod output files demonstrates that the "South Stockton Commerce Center" model fails to differentiate between the above-mentioned land use types and rather includes all 6,091,551-SF as "General Light Industry" (see excerpt below) (Appendix B.1, pp. 651, 754, 848).

A-14

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Light Industry	6,091.55	1000sqft	298.00	6,091,551.00	0
Other Asphalt Surfaces	18.20	Acre	18.20	792,792.00	0
Regional Shopping Center	140.35	1000sqft	11.00	140,350.00	0
Other Non-Asphalt Surfaces	41.00	Acre	41.00	1,785,960.00	0
City Park	54.00	Acre	54.00	2,352,240.00	0

As you can see from the excerpt above, the model fails to distinguish between the various industrial land use types. This inconsistency presents an issue, as CalEEMod includes 63 different land use types that are each assigned a distinctive set of energy usage emission factors.[2] Furthermore, each land use type includes a specific trip rate that CalEEMod uses to calculate mobile-source emissions.[3] Thus, by failing to include all proposed land use types, the model may underestimate the Project's construction-related and operational emissions and should not be relied upon to determine Project significance.

[2] "CalEEMod User's Guide, Appendix D." CAPCOA, September 2016, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/upgrades/2016.3/05_appendix-d2016-3-1.pdf?sfvrsn=2.
[3] CalEEMod User's Guide, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/upgrades/2016.3/01_user-39-s-guide2016-3-1.pdf?sfvrsn=2, p. 14.

Unsubstantiated Changes to Individual Construction Phase Lengths

Review of the CalEEMod output files demonstrates that the "South Stockton Commerce Center" model includes several changes to the default individual construction phase lengths (see excerpt below) (Appendix B.1, pp. 652, 755, 849).

Table Name	Column Name	Default Value	New Value
tblConstructionPhase	NumDays	300.00	240.00
tblConstructionPhase	NumDays	775.00	620.00
tblConstructionPhase	NumDays	7,750.00	3,685.00
tblConstructionPhase	NumDays	550.00	440.00
tblConstructionPhase	NumDays	550.00	3,685.00

As a result of these changes, the model includes the following construction schedule (see excerpt below) (Appendix B.1, pp. 662, 762, 856):

Phase Number	Phase Name	Phase Type	Start Date	End Date	Num Days Week	Num Days
1	Site Preparation	Site Preparation	8/1/2021	7/1/2022	5	240
2	Grading	Grading	7/2/2023	11/14/2025	5	620
3	Building Construction	Building Construction	11/15/2025	12/30/2039	5	3685
4	Paving	Paving	11/15/2025	7/23/2027	5	440
5	Architectural Coating	Architectural Coating	11/15/2025	12/30/2039	5	3685

As you can see in the excerpt above, the site preparation phase was decreased by 20%, from the default value of 300 to 240 days; the grading phase was decreased by 20%, from the default value of 775 to 620 days; the building construction phase was decreased by 52%, from the default value of 7,750 to 3,685 days; the paving phase was decreased by 20%, from the default value of 550 to 440 days; and the architectural coating phase was increased by 570%, from the default value of 550 to 3,685 days. As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[4] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is: "Construction schedule based on project size and details" (Appendix B.1, pp. 652, 755, 849). Furthermore, regarding the Project's anticipated construction schedule, the DEIR states: A-15

> "The proposed Project is assumed to commence construction in 2021 and finish in late 2039" (p. 3.7-31).

However, these justifications remain insufficient. While the DEIR indicates the total construction duration, the DEIR fails to mention or justify the individual construction phase lengths. This is incorrect, as according to the CalEEMod User's Guide:

[4] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9

"CalEEMod was also designed to allow the user to change the defaults to reflect site- or project-specific information, when available, provided that the information is supported by substantial evidence as required by CEQA." [5]

Here, as the DEIR only justifies a total construction duration of approximately 18 years, the DEIR fails to provide substantial evidence to support the revised individual construction phase lengths. As such, we cannot verify the changes.

These unsubstantiated changes present an issue, as the construction emissions are improperly spread out over a longer period of time for some phases, but not for others. According to the CalEEMod User's Guide, each construction phase is associated with different emissions activities (see excerpt below).[6]

> *Demolition* involves removing buildings or structures.
>
> *Site Preparation* involves clearing vegetation (grubbing and tree/stump removal) and removing stones and other unwanted material or debris prior to grading.
>
> *Grading* involves the cut and fill of land to ensure that the proper base and slope is created for the foundation.
>
> *Building Construction* involves the construction of the foundation, structures and buildings.
>
> *Architectural Coating* involves the application of coatings to both the interior and exterior of buildings or structures, the painting of parking lot or parking garage striping, associated signage and curbs, and the painting of the walls or other components such as stair railings inside parking structures.
>
> *Paving* involves the laying of concrete or asphalt such as in parking lots, roads, driveways, or sidewalks.

A-15 cont'd

As such, by disproportionately altering the individual construction phase lengths without proper justification, the model may underestimate the peak daily emissions associated with some phases of construction, here specifically the architectural coating phase. Thus, the model should not be relied upon to determine Project significance.

Unsubstantiated Reduction to Acres of Grading Value

Review of the CalEEMod output files demonstrates that the "South Stockton Commerce Center" model includes a manual reduction to the default acres of grading value (see excerpt below) (Appendix B.1, pp. 654, 757, 851). A-16

Table Name	Column Name	Default Value	New Value
tblGrading	AcresOfGrading	1,550.00	328.00

As you can see in the excerpt above, the acres of grading value was decreased from the default value of 1,550- to 328-acres. As previously mentioned, the CalEEMod User's Guide requires any changes to

---

[5] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 12.
[6] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 31.

model defaults be justified.[7] According to the "User Entered Comments & Non-Default Data" table, the justification provided for this reduction is: "328 acres assumed to be graded" (Appendix B.1, pp. 652, 755, 849). However, this change remains unsupported for two reasons.

First, the model cannot simply assume that only 328 acres would be graded. According to the CalEEMod User's Guide:

> "CalEEMod was also designed to allow the user to change the defaults to reflect site- or project-specific information, when available, provided that the information is supported by substantial evidence as required by CEQA."[8]

Here, as the DEIR and associated documents fail to provide substantial evidence to support the revised acres of grading value, we cannot verify the reduction.

Second, according to the CalEEMod User's Guide: A-16 cont'd

> "[T]he dimensions (e.g., length and width) of the grading site have no impact on the calculation, only the total area to be graded. In order to properly grade a piece of land multiple passes with equipment may be required. The acres is based on the equipment list and days in grading or site preparation phase according to the anticipated maximum number of acres a given piece of equipment can pass over in an 8-hour workday."[9]

As demonstrated above, the acres of grading value is based on construction equipment and the length of the grading or site preparation phase. Thus, as the dimensions of the Project site have no impact on acres of grading, we cannot verify the revised value.

This unsubstantiated reduction presents an issue, as CalEEMod uses the acres of grading value to estimate the dust emissions associated with grading.[10] Thus, by including an unsubstantiated reduction to the default acres of grading value, the model may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance.

Failure to Implement All Feasible Mitigation to Reduce Emissions

As discussed above, the DEIR's air quality analysis relies upon an incorrect and unsubstantiated air model to determine the significance of the Project's criteria air pollutant emissions. However, despite the DEIR's reliance upon a flawed air model, the Project's construction-related and operational criteria air pollutant emissions estimates indicate a significant air quality impact. Specifically, the DEIR concludes A-17

[7] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 2, 9
[8] CalEEMod Model 2013.2.2 User's Guide, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/usersguideSept2016.pdf?sfvrsn=6, p. 12.
[9] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 9.
[10] "Appendix A Calculation Details for CalEEMod." *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 9.

that the Project's construction-related NO_X emissions, as well as operational NO_X, ROG, and PM_{10} emissions, would exceed the applicable SJVAPCD thresholds (see excerpts below) (p. 3.3-35, 3.3-31).

Table 3.3-7: Construction Project Generated Emissions (tons per year) - Mitigated

Pollutant	CO	NOx	ROG	SOx	PM_{10}	$PM_{2.5}$
Threshold	100	10	10	27	15	15
Maximum Annual Emissions	20.3	22.3	5.8	0.1	7.1	2.0
Exceeds Threshold?	N	Y	N	N	N	N

Sources: CalEEMod (v.2016.3.2)

Table 3.3-6: Operational Project Generated Emissions (tons per year)

Pollutant	CO	NOx	ROG	SOx	PM_{10}	$PM_{2.5}$
Threshold	100	10	10	27	15	15
Emissions	39.4	114.7	33.0	0.5	24.6	7.0
Exceeds Threshold?	N	Y	Y	N	Y	N

Sources: CalEEMod (v.2016.3.2)

A-17 cont'd

As a result, the DEIR concludes that the Project's construction-related and operational criteria air pollutant emissions would be significant-and-unavoidable (p. 3.3-34, 3.3-35). However, while we agree that the Project's criteria air pollutant emissions would result in a significant air quality impact, the DEIR's conclusion that these impacts are "significant and unavoidable" is incorrect. According to CEQA Guidelines § 15096(g)(2):

> "When an EIR has been prepared for a project, the Responsible Agency shall not approve the project as proposed if the agency finds any feasible alternative or feasible mitigation measures within its powers that would substantially lessen or avoid any significant effect the project would have on the environment."

As you can see, an impact can only be labeled as significant and unavoidable after all available, feasible mitigation is considered. Here, while the DEIR includes Mitigation Measures ("MM(s)") 3.3-1 through 3.3-5, the DEIR fails to implement all feasible mitigation (p. 3.3-34 – 3.3-36). Therefore, the DEIR's conclusion that the Project's air quality impacts are significant-and-unavoidable is unsubstantiated. To reduce the Project's air quality impacts to the maximum extent possible, additional feasible mitigation measures should be incorporated, such as those suggested in the section of this letter titled "Feasible Mitigation Measures Available to Reduce Emissions." Thus, the Project should not be approved until an updated EIR is prepared, including updated, accurate air modeling, as well as incorporating all feasible mitigation to reduce emissions to less-than-significant levels.

Diesel Particulate Matter Health Risk Emissions Inadequately Evaluated

The DEIR estimates that the maximum incremental cancer risk posed to nearby, existing sensitive receptors as a result of Project operation associated truck idling, truck on-site mobile, and TRU diesel A-18 particulate matter ("DPM") emissions would be 1.09 in one million, which would not exceed the SJVAPCD significance threshold of 20 in one million (see excerpt below) (p. 3.3-40, Table 3.3-9).

TABLE 3.3-9: SUMMARY OF MAXIMUM HEALTH RISKS

RISK METRIC	*MAXIMUM RISK*	*SIGNIFICANCE THRESHOLD*	*IS THRESHOLD EXCEEDED?*
Residential Cancer Risk (70-year exposure)	1.09	20 per million	No
Workplace Cancer Risk (40-year exposure)	0.14	20 per million	No
Chronic (non-cancer)	<0.01	Hazard Index ≥1	No
Acute (non-cancer) [1]	<0.01	Hazard Index ≥1	No

SOURCES: AERMOD (LAKES ENVIRONMENTAL SOFTWARE, 2022); AND HARP-2 AIR DISPERSION AND RISK TOOL.

However, the DEIR fails to discuss the health risk impacts associated with Project construction. The DEIR's evaluation of the Project's potential health risk impacts, as well as the subsequent less-than-significant impact conclusion, is incorrect for three reasons.

First, by failing to prepare a quantified construction HRA, the Project is inconsistent with CEQA's requirement to correlate the increase in emissions that the Project would generate to the adverse impacts on human health caused by those emissions. This is incorrect, as construction of the proposed Project will produce emissions of DPM through the exhaust stacks of construction equipment over a potential construction period of approximately 18 years (p. 3.7-31). However, the DEIR fails to discuss the potential TACs associated with Project construction or indicate the concentrations at which such pollutants would trigger adverse health effects. Thus, without making a reasonable effort to connect the Project's construction-related TAC emissions to the potential health risks posed to nearby receptors, the AQ & GHG Report is inconsistent with CEQA's requirement to correlate the increase in emissions generated by the Project with the potential adverse impacts on human health.

A-18 cont'd

Second, the State of California Department of Justice recommends the preparation of a quantitative HRA pursuant to the Office of Environmental Health Hazard Assessment ("OEHHA"), the organization responsible for providing guidance on conducting HRAs in California, as well as local air district guidelines.[11] OEHHA released its most recent *Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments* in February 2015, as referenced by the AQ & GHG Report (Appendix A, p. 2).[12] The OEHHA document recommends that exposure from projects lasting more than 6 months be evaluated for the duration of the project and recommends that an exposure duration of 30 years be used to estimate individual cancer risk for the maximally exposed individual resident ("MEIR").[13] Even though we were not provided with the expected lifetime of the Project, we can reasonably assume that the Project will operate for at least 30 years, if not more. Therefore, we

[11] "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act." State of California Department of Justice, *available at*: https://oag.ca.gov/sites/all/files/agweb/pdfs/environment/warehouse-best-practices.pdf, p. 6.
[12] "Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* http://oehha.ca.gov/air/hot_spots/hotspots2015.html
[13] "Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* http://oehha.ca.gov/air/hot_spots/2015/2015GuidanceManual.pdf, p. 8-6, 8-15

recommend that health risk impacts from Project operation also be evaluated, as a 30-year exposure duration vastly exceeds the 6-month requirement set forth by OEHHA. This recommendation reflects the most recent state health risk policies, and as such, we recommend that an analysis of health risk impacts posed to nearby sensitive receptors from Project operation be included in an updated EIR for the Project.

Third, while the DEIR includes an HRA evaluating the health risk impacts to nearby, existing receptors as a result of Project operation, the HRA fails to evaluate the cumulative lifetime cancer risk to nearby, existing receptors as a result of Project construction and operation together. According to OEHHA guidance, as referenced by the AQ & GHG Report, "the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk at the receptor location" (Appendix A, p. 2).[14] However, the DEIR's HRA fails to sum each age bin to evaluate the total cancer risk over the course of the Project's total construction and operation. This is incorrect and thus, an updated analysis should quantify the entirety of the Project's construction and operational health risks and then sum them to compare to the SJVACPD threshold of 20 in one million, as referenced by the DEIR (p. 3.3-40). A-18 cont'd

Greenhouse Gas

Failure to Adequately Evaluate Greenhouse Gas Impacts

The DEIR estimates that the Project would generate net annual greenhouse gas ("GHG") emissions of 72,615.9 metric tons of carbon dioxide equivalents per year ("MT CO_2e/year") (p. 3.7-32, Table 3.7-2).

TABLE 3.7-2: OPERATIONAL GHG EMISSIONS AT BUILDOUT (MITIGATED METRIC TONS/YEAR)

	BIO- CO_2	NON-BIO- CO_2	TOTAL CO_2	CH4	N2O	CO2E
Area	0	0.1	0.1	<1	0	0.1
Energy	0	21,602.5	21,602.5	0.8	0.3	21,699.6
Mobile	0	42,748.6	42,748.6	1.8	0	42,794.6
Waste	1,564.2	0	1,564.2	92.4	0	3,875.1
Water	450.2	2,305.8	2.756.0	46.3	1.1	4,246.4
Total	**2,014.4**	**66,657.0**	**68,671.4**	**141.4**	**1.4**	**72,615.9**

SOURCES: CALEEMOD (V.2016.3.2)

A-19

Furthermore, based on a service population of 2,964 people, the DEIR estimates a service population efficiency value of 24.5 metric tons of carbon dioxide equivalents per service population per year ("MT CO_2e/SP/year"), which exceeds the 2040 threshold of 4.84 MT CO_2e/SP/year. As a result, the DEIR concludes that the Project would result in a significant-and-unavoidable greenhouse gas ("GHG") impact after the implementation of mitigation measure ("MM") 3.7-1 (p. 3.7-33). However, while we agree that the Project would result in a significant GHG impact, the DEIR's assertion that this impact is significant-and-unavoidable is insufficient for two reasons:

(1) The DEIR's GHG analysis relies upon an incorrect and unsubstantiated air model; and

[14] "Guidance Manual for preparation of Health Risk Assessments." OEHHA, February 2015, *available at:* https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf p. 8-4

(2) The DEIR fails to implement all feasible mitigation.

1) Incorrect and Unsubstantiated Quantitative Analysis of Emissions

As previously stated, the DEIR estimates that the Project would generate net annual GHG emissions of 72,615.9 MT CO_2e/year (p. 3.7-32, Table 3.7-2). However, the DEIR's quantitative GHG analysis is unsubstantiated. As previously discussed, when we reviewed the Project's CalEEMod output files, provided in the AQ & GHG Report as Appendix B to the DEIR, we found that several of the values inputted into the model are not consistent with information disclosed in the DEIR. As a result, the model underestimates the Project's emissions, and the DEIR's quantitative GHG analysis should not be relied upon to determine Project significance. An updated EIR should be prepared that adequately assesses the potential GHG impacts that construction and operation of the proposed Project may have on the surrounding environment

2) Failure to Implement All Feasible Mitigation to Reduce GHG Emissions

As discussed above, the DEIR's GHG analysis relies upon an incorrect and unsubstantiated air model to determine the significance of the Project's GHG emissions. However, despite the DEIR's flawed air model, the DEIR concludes that the proposed Project's GHG emissions would be significant-and-unavoidable (p. 3.7-33). However, while we agree that the Project would result in a significant GHG impact, the DEIR's conclusion that this impact is "significant and unavoidable" is incorrect. As previously stated, according to CEQA Guidelines § 15096(g)(2): A-19 cont'd

> "When an EIR has been prepared for a project, the Responsible Agency shall not approve the project as proposed if the agency finds any feasible alternative or feasible mitigation measures within its powers that would substantially lessen or avoid any significant effect the project would have on the environment."

As you can see, an impact can only be labeled as significant-and-unavoidable after all available, feasible mitigation is considered. Here, while the DEIR implements MM 3.7-1, which requires the applicant to demonstrate prior to the approval of new development phases that the Project does not exceed SJVAPCD greenhouse thresholds for Project operations, the DEIR fails to implement all feasible mitigation. Therefore, the DEIR's conclusion that Project's GHG emissions would be significant-and-unavoidable is unsubstantiated. To reduce the Project's GHG impacts to the maximum extent possible, additional feasible mitigation measures should be incorporated, such as those suggested in the section of this letter titled "Feasible Mitigation Measures Available to Reduce Emissions." Thus, the Project should not be approved until an updated EIR is prepared, including updated, accurate air modeling, as well as incorporating all feasible mitigation to reduce emissions to less-than-significant levels.

Feasible Mitigation Measures Available to Reduce Emissions

The DEIR's analysis demonstrates that the Project would result in significant air quality and GHG impacts that should be mitigated further. In an effort to reduce the Project's emissions, we identified several mitigation measures that are applicable to the proposed Project. Feasible mitigation measures can be A-20 found in the Department of Justice Warehouse Project Best Practices document.[15] Therefore, to reduce the Project's emissions, consideration of the following measures should be made:

- Requiring off-road construction equipment to be zero-emission, where available, and all diesel-fueled off-road construction equipment, to be equipped with CARB Tier IV-compliant engines or better, and including this requirement in applicable bid documents, purchase orders, and contracts, with successful contractors demonstrating the ability to supply the compliant construction equipment for use prior to any ground-disturbing and construction activities.
- Prohibiting off-road diesel-powered equipment from being in the "on" position for more than 10 hours per day.
- Requiring on-road heavy-duty haul trucks to be model year 2010 or newer if diesel-fueled.
- Providing electrical hook ups to the power grid, rather than use of diesel-fueled generators, for electric construction tools, such as saws, drills and compressors, and using electric tools whenever feasible.
- Limiting the amount of daily grading disturbance area.
- Prohibiting grading on days with an Air Quality Index forecast of greater than 100 for particulates or ozone for the project area.
- Forbidding idling of heavy equipment for more than two minutes.
- Keeping onsite and furnishing to the lead agency or other regulators upon request, all equipment maintenance records and data sheets, including design specifications and emission control tier classifications.
- Conducting an on-site inspection to verify compliance with construction mitigation and to identify other opportunities to further reduce construction impacts.
- Using paints, architectural coatings, and industrial maintenance coatings that have volatile organic compound levels of less than 10 g/L.
- Providing information on transit and ridesharing programs and services to construction employees.
- Providing meal options onsite or shuttles between the facility and nearby meal destinations for construction employees.
- Requiring that all facility-owned and operated fleet equipment with a gross vehicle weight rating greater than 14,000 pounds accessing the site meet or exceed 2010 model-year emissions equivalent engine standards as currently defined in California Code of Regulations Title 13, Division 3, Chapter 1, Article 4.5, Section 2025. Facility operators shall maintain records on-site demonstrating compliance with this requirement and shall make records available for inspection by the local jurisdiction, air district, and state upon request.
- Requiring all heavy-duty vehicles entering or operated on the project site to be zero-emission beginning in 2030.
- Requiring on-site equipment, such as forklifts and yard trucks, to be electric with the necessary electrical charging stations provided.

A-20
cont'd

[15] "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act." State of California Department of Justice.

- Requiring tenants to use zero-emission light- and medium-duty vehicles as part of business operations.
- Forbidding trucks from idling for more than two minutes and requiring operators to turn off engines when not in use.
- Posting both interior- and exterior-facing signs, including signs directed at all dock and delivery areas, identifying idling restrictions and contact information to report violations to CARB, the air district, and the building manager.
- Installing and maintaining, at the manufacturer's recommended maintenance intervals, air filtration systems at sensitive receptors within a certain radius of facility for the life of the project.
- Installing and maintaining, at the manufacturer's recommended maintenance intervals, an air monitoring station proximate to sensitive receptors and the facility for the life of the project, and making the resulting data publicly available in real time. While air monitoring does not mitigate the air quality or greenhouse gas impacts of a facility, it nonetheless benefits the affected community by providing information that can be used to improve air quality or avoid exposure to unhealthy air.
- Constructing electric truck charging stations proportional to the number of dock doors at the project.
- Constructing electric plugs for electric transport refrigeration units at every dock door, if the warehouse use could include refrigeration.
- Constructing electric light-duty vehicle charging stations proportional to the number of parking spaces at the project.
- Installing solar photovoltaic systems on the project site of a specified electrical generation capacity, such as equal to the building's projected energy needs.
- Requiring all stand-by emergency generators to be powered by a non-diesel fuel.
- Requiring facility operators to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks.
- Requiring operators to establish and promote a rideshare program that discourages single-occupancy vehicle trips and provides financial incentives for alternate modes of transportation, including carpooling, public transit, and biking.
- Meeting CalGreen Tier 2 green building standards, including all provisions related to designated parking for clean air vehicles, electric vehicle charging, and bicycle parking.
- Achieving certification of compliance with LEED green building standards.
- Providing meal options onsite or shuttles between the facility and nearby meal destinations.
- Posting signs at every truck exit driveway providing directional information to the truck route.
- Improving and maintaining vegetation and tree canopy for residents in and around the project area.
- Requiring that every tenant train its staff in charge of keeping vehicle records in diesel technologies and compliance with CARB regulations, by attending CARB approved courses. Also require facility operators to maintain records on-site demonstrating compliance and make records available for inspection by the local jurisdiction, air district, and state upon request.

A-20
cont'd

- Requiring tenants to enroll in the United States Environmental Protection Agency's SmartWay program, and requiring tenants to use carriers that are SmartWay carriers.
- Providing tenants with information on incentive programs, such as the Carl Moyer Program and Voucher Incentive Program, to upgrade their fleets.

These measures offer a cost-effective, feasible way to incorporate lower-emitting design features into the proposed Project, which subsequently, reduce emissions released during Project construction and operation. Furthermore, we recommend the Project consider the mandatory and voluntary GHG emissions reduction measures in the City's CAP, specifically the measures relating to building energy, land-use and transportation, waste generation, water consumption, wastewater treatment, urban forestry, and off-road vehicles.[16] An updated EIR should be prepared to include all feasible mitigation measures, as well as include updated air quality, health risk, and GHG analyses to ensure that the necessary mitigation measures are implemented to reduce emissions to below thresholds. The updated EIR should also demonstrate a commitment to the implementation of these measures prior to Project approval, to ensure that the Project's significant emissions are reduced to the maximum extent possible. Geologic and Hydrogeologic Characterization
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
Industrial Stormwater Compliance
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 30 years of experience in environmental policy, contaminant assessment and remediation, stormwater compliance, and CEQA review. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) and directed efforts to improve hydrogeologic characterization and water quality monitoring. For the past 15 years, as a founding partner with SWAPE, Matt has developed extensive client relationships and has managed complex projects that include consultation as an expert witness and a regulatory specialist, and a manager of projects ranging from industrial stormwater compliance to CEQA review of impacts from hazardous waste, air quality and greenhouse gas emissions.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2104, 2017;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 300 environmental impact reports and negative declarations since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at more than 100 industrial facilities.
- Expert witness on numerous cases including, for example, perfluorooctanoic acid (PFOA) contamination of groundwater, MTBE litigation, air toxins at hazards at a school, CERCLA compliance in assessment and remediation, and industrial stormwater contamination.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.
- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted

public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9.

Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific

principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt is currently a part time geology instructor at Golden West College in Huntington Beach, California where he taught from 2010 to 2014 and in 2017.

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, industrial, military and agricultural sources, unconventional oil drilling operations, and locomotive and construction engines. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities. Dr. Rosenfeld has also successfully modeled exposure to contaminants distributed by water systems and via vapor intrusion.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, creosote, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at sites and has testified as an expert witness on numerous cases involving exposure to soil, water and air contaminants from industrial, railroad, agricultural, and military sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Presentations:

Rosenfeld, P.E., "The science for Perfluorinated Chemicals (PFAS): What makes remediation so hard?" Law Seminars International, (May 9-10, 2018) 800 Fifth Avenue, Suite 101 Seattle, WA.

Rosenfeld, P.E., Sutherland, A; Hesse, R.; Zapata, A. (October 3-6, 2013). Air dispersion modeling of volatile organic emissions from multiple natural gas wells in Decatur, TX. *44th Western Regional Meeting, American Chemical Society.* Lecture conducted from Santa Clara, CA.

Sok, H.L.; Waller, C.C.; Feng, L.; Gonzalez, J.; Sutherland, A.J.; Wisdom-Stack, T.; Sahai, R.K.; Hesse, R.C.; **Rosenfeld, P.E.** (June 20-23, 2010). Atrazine: A Persistent Pesticide in Urban Drinking Water. *Urban Environmental Pollution*. Lecture conducted from Boston, MA.

Feng, L.; Gonzalez, J.; Sok, H.L.; Sutherland, A.J.; Waller, C.C.; Wisdom-Stack, T.; Sahai, R.K.; La, M.; Hesse, R.C.; **Rosenfeld, P.E.** (June 20-23, 2010). Bringing Environmental Justice to East St. Louis, Illinois. *Urban Environmental Pollution.* Lecture conducted from Boston, MA.

Rosenfeld, P.E. (April 19-23, 2009). Perfluoroctanoic Acid (PFOA) and Perfluoroactane Sulfonate (PFOS) Contamination in Drinking Water From the Use of Aqueous Film Forming Foams (AFFF) at Airports in the United States. *2009 Ground Water Summit and 2009 Ground Water Protection Council Spring Meeting*, Lecture conducted from Tuscon, AZ.

Rosenfeld, P.E. (April 19-23, 2009). Cost to Filter Atrazine Contamination from Drinking Water in the United States" Contamination in Drinking Water From the Use of Aqueous Film Forming Foams (AFFF) at Airports in the United States. *2009 Ground Water Summit and 2009 Ground Water Protection Council Spring Meeting*. Lecture conducted from Tuscon, AZ.

Wu, C., Tam, L., Clark, J., **Rosenfeld, P**. (20-22 July, 2009). Dioxin and furan blood lipid concentrations in populations living near four wood treatment facilities in the United States. Brebbia, C.A. and Popov, V., eds., *Air Pollution XVII: Proceedings of the Seventeenth International Conference on Modeling, Monitoring and Management of Air Pollution*. Lecture conducted from Tallinn, Estonia.

Rosenfeld, P. E. (October 15-18, 2007). Moss Point Community Exposure To Contaminants From A Releasing Facility. *The 23rd Annual International Conferences on Soils Sediment and Water.* Platform lecture conducted from University of Massachusetts, Amherst MA.

Rosenfeld, P. E. (October 15-18, 2007). The Repeated Trespass of Tritium-Contaminated Water Into A Surrounding Community Form Repeated Waste Spills From A Nuclear Power Plant. *The 23rd Annual International*

Conferences on Soils Sediment and Water. Platform lecture conducted from University of Massachusetts, Amherst MA.

Rosenfeld, P. E. (October 15-18, 2007). Somerville Community Exposure To Contaminants From Wood Treatment Facility Emissions. The *23rd Annual International Conferences on Soils Sediment and Water*. Lecture conducted from University of Massachusetts, Amherst MA.

Rosenfeld P. E. (March 2007). Production, Chemical Properties, Toxicology, & Treatment Case Studies of 1,2,3-Trichloropropane (TCP). *The Association for Environmental Health and Sciences (AEHS) Annual Meeting*. Lecture conducted from San Diego, CA.

Rosenfeld P. E. (March 2007). Blood and Attic Sampling for Dioxin/Furan, PAH, and Metal Exposure in Florala, Alabama. *The AEHS Annual Meeting.* Lecture conducted from San Diego, CA.

Hensley A.R., Scott, A., **Rosenfeld P.E.,** Clark, J.J.J. (August 21 – 25, 2006). Dioxin Containing Attic Dust And Human Blood Samples Collected Near A Former Wood Treatment Facility. *The 26th International Symposium on Halogenated Persistent Organic Pollutants – DIOXIN2006*. Lecture conducted from Radisson SAS Scandinavia Hotel in Oslo Norway.

Hensley A.R., Scott, A., **Rosenfeld P.E.,** Clark, J.J.J. (November 4-8, 2006). Dioxin Containing Attic Dust And Human Blood Samples Collected Near A Former Wood Treatment Facility. *APHA 134 Annual Meeting & Exposition.* Lecture conducted from Boston Massachusetts.

Paul Rosenfeld Ph.D. (October 24-25, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. Mealey's C8/PFOA. *Science, Risk & Litigation Conference.* Lecture conducted from The Rittenhouse Hotel, Philadelphia, PA.

Paul Rosenfeld Ph.D. (September 19, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, *Toxicology and Remediation PEMA Emerging Contaminant Conference*. Lecture conducted from Hilton Hotel, Irvine California.

Paul Rosenfeld Ph.D. (September 19, 2005). Fate, Transport, Toxicity, And Persistence of 1,2,3-TCP. *PEMA Emerging Contaminant Conference.* Lecture conducted from Hilton Hotel in Irvine, California.

Paul Rosenfeld Ph.D. (September 26-27, 2005). Fate, Transport and Persistence of PDBEs. *Mealey's Groundwater Conference.* Lecture conducted from Ritz Carlton Hotel, Marina Del Ray, California.

Paul Rosenfeld Ph.D. (June 7-8, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. *International Society of Environmental Forensics: Focus On Emerging Contaminants*. Lecture conducted from Sheraton Oceanfront Hotel, Virginia Beach, Virginia.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Fate Transport, Persistence and Toxicology of PFOA and Related Perfluorochemicals. *2005 National Groundwater Association Ground Water And Environmental Law Conference*. Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, Toxicology and Remediation. *2005 National Groundwater Association Ground Water and Environmental Law Conference.* Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld, Ph.D. and James Clark Ph.D. and Rob Hesse R.G. (May 5-6, 2004). Tert-butyl Alcohol Liability and Toxicology, A National Problem and Unquantified Liability. *National Groundwater Association. Environmental Law Conference*. Lecture conducted from Congress Plaza Hotel, Chicago Illinois.

Paul Rosenfeld, Ph.D. (March 2004). Perchlorate Toxicology. *Meeting of the American Groundwater Trust*. Lecture conducted from Phoenix Arizona.

Hagemann, M.F., **Paul Rosenfeld, Ph.D.** and Rob Hesse (2004). Perchlorate Contamination of the Colorado River. *Meeting of tribal representatives*. Lecture conducted from Parker, AZ.

Paul Rosenfeld, Ph.D. (April 7, 2004). A National Damage Assessment Model For PCE and Dry Cleaners. *Drycleaner Symposium. California Ground Water Association*. Lecture conducted from Radison Hotel, Sacramento, California.

Rosenfeld, P. E., Grey, M., (June 2003) Two stage biofilter for biosolids composting odor control. *Seventh International In Situ And On Site Bioremediation Symposium Battelle Conference* Orlando, FL.

Paul Rosenfeld, Ph.D. and James Clark Ph.D. (February 20-21, 2003) Understanding Historical Use, Chemical Properties, Toxicity and Regulatory Guidance of 1,4 Dioxane. *National Groundwater Association. Southwest Focus Conference. Water Supply and Emerging Contaminants*.. Lecture conducted from Hyatt Regency Phoenix Arizona.

Paul Rosenfeld, Ph.D. (February 6-7, 2003). Underground Storage Tank Litigation and Remediation. *California CUPA Forum*. Lecture conducted from Marriott Hotel, Anaheim California.

Paul Rosenfeld, Ph.D. (October 23, 2002) Underground Storage Tank Litigation and Remediation. *EPA Underground Storage Tank Roundtable*. Lecture conducted from Sacramento California.

Rosenfeld, P.E. and Suffet, M. (October 7- 10, 2002). Understanding Odor from Compost, *Wastewater and Industrial Processes. Sixth Annual Symposium On Off Flavors in the Aquatic Environment. International Water Association*. Lecture conducted from Barcelona Spain.

Rosenfeld, P.E. and Suffet, M. (October 7- 10, 2002). Using High Carbon Wood Ash to Control Compost Odor. *Sixth Annual Symposium On Off Flavors in the Aquatic Environment. International Water Association*. Lecture conducted from Barcelona Spain.

Rosenfeld, P.E. and Grey, M. A. (September 22-24, 2002). Biocycle Composting For Coastal Sage Restoration. *Northwest Biosolids Management Association*. Lecture conducted from Vancouver Washington..

Rosenfeld, P.E. and Grey, M. A. (November 11-14, 2002). Using High-Carbon Wood Ash to Control Odor at a Green Materials Composting Facility. *Soil Science Society Annual Conferenc*e. Lecture conducted from Indianapolis, Maryland.

Rosenfeld. P.E. (September 16, 2000). Two stage biofilter for biosolids composting odor control. *Water Environment Federation.* Lecture conducted from Anaheim California.

Rosenfeld. P.E. (October 16, 2000). Wood ash and biofilter control of compost odor. *Biofest.* Lecture conducted from Ocean Shores, California.

Rosenfeld, P.E. (2000). Bioremediation Using Organic Soil Amendments. *California Resource Recovery Association*. Lecture conducted from Sacramento California.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation With High-Carbon Wood-Ash. *Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings*. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., and C.L. Henry. (1999). An evaluation of ash incorporation with biosolids for odor reduction. *Soil Science Society of America*. Lecture conducted from Salt Lake City Utah.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Comparison of Microbial Activity and Odor Emissions from Three Different Biosolids Applied to Forest Soil. *Brown and Caldwell.* Lecture conducted from Seattle Washington.

Rosenfeld, P.E., C.L. Henry. (1998). Characterization, Quantification, and Control of Odor Emissions from Biosolids Application To Forest Soil. *Biofest.* Lecture conducted from Lake Chelan, Washington.

Rosenfeld, P.E, C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation With High-Carbon Wood-Ash. Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., C.L. Henry, R. B. Harrison, and R. Dills. (1997). Comparison of Odor Emissions From Three Different Biosolids Applied to Forest Soil. *Soil Science Society of America*. Lecture conducted from Anaheim California.

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Deposition and/or Trial Testimony:

In the Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 5-14-2021
Trial, October 8-4-2021

In the Circuit Court of Cook County Illinois
Joseph Rafferty, Plaintiff vs. Consolidated Rail Corporation and National Railroad Passenger Corporation d/b/a AMTRAK,
Case No.: No. 18-L-6845
Rosenfeld Deposition, 6-28-2021

In the United States District Court For the Northern District of Illinois
Theresa Romcoe, Plaintiff vs. Northeast Illinois Regional Commuter Railroad Corporation d/b/a METRA Rail, Defendants
Case No.: No. 17-cv-8517
Rosenfeld Deposition, 5-25-2021

In the Superior Court of the State of Arizona In and For the Cunty of Maricopa
Mary Tryon et al., Plaintiff vs. The City of Pheonix v. Cox Cactus Farm, L.L.C., Utah Shelter Systems, Inc.
Case Number CV20127-094749
Rosenfeld Deposition: 5-7-2021

In the United States District Court for the Eastern District of Texas Beaumont Division
Robinson, Jeremy et al *Plaintiffs*, vs. CNA Insurance Company et al.
Case Number 1:17-cv-000508
Rosenfeld Deposition: 3-25-2021

In the Superior Court of the State of California, County of San Bernardino
Gary Garner, Personal Representative for the Estate of Melvin Garner vs. BNSF Railway Company.
Case No. 1720288
Rosenfeld Deposition 2-23-2021

In the Superior Court of the State of California, County of Los Angeles, Spring Street Courthouse
Benny M Rodriguez vs. Union Pacific Railroad, A Corporation, et al.
Case No. 18STCV01162
Rosenfeld Deposition 12-23-2020

In the Circuit Court of Jackson County, Missouri
Karen Cornwell, *Plaintiff,* vs. Marathon Petroleum, LP, *Defendant.*
Case No.: 1716-CV10006
Rosenfeld Deposition. 8-30-2019

In the United States District Court For The District of New Jersey
Duarte et al, *Plaintiffs,* vs. United States Metals Refining Company et. al. *Defendant.*
Case No.: 2:17-cv-01624-ES-SCM
Rosenfeld Deposition. 6-7-2019

In the United States District Court of Southern District of Texas Galveston Division
M/T Carla Maersk, *Plaintiffs,* vs. Conti 168., Schiffahrts-GMBH & Co. Bulker KG MS "Conti Perdido" *Defendant.*
Case No.: 3:15-CV-00106 consolidated with 3:15-CV-00237
Rosenfeld Deposition. 5-9-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
Carole-Taddeo-Bates et al., vs. Ifran Khan et al., Defendants
Case No.: No. BC615636
Rosenfeld Deposition, 1-26-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
The San Gabriel Valley Council of Governments et al. vs El Adobe Apts. Inc. et al., Defendants
Case No.: No. BC646857
Rosenfeld Deposition, 10-6-2018; Trial 3-7-19

In United States District Court For The District of Colorado
Bells et al. Plaintiff vs. The 3M Company et al., Defendants
Case No.: 1:16-cv-02531-RBJ
Rosenfeld Deposition, 3-15-2018 and 4-3-2018

In The District Court Of Regan County, Texas, 112th Judicial District
Phillip Bales et al., Plaintiff vs. Dow Agrosciences, LLC, et al., Defendants
Cause No.: 1923
Rosenfeld Deposition, 11-17-2017

In The Superior Court of the State of California In And For The County Of Contra Costa
Simons et al., Plaintiffs vs. Chevron Corporation, et al., Defendants
Cause No C12-01481
Rosenfeld Deposition, 11-20-2017

In The Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 8-23-2017

In United States District Court For The Southern District of Mississippi
Guy Manuel vs. The BP Exploration et al., Defendants
Case: No 1:19-cv-00315-RHW
Rosenfeld Deposition, 4-22-2020

In The Superior Court of the State of California, For The County of Los Angeles
Warrn Gilbert and Penny Gilber, Plaintiff vs. BMW of North America LLC
Case No.: LC102019 (c/w BC582154)
Rosenfeld Deposition, 8-16-2017, Trail 8-28-2018

In the Northern District Court of Mississippi, Greenville Division
Brenda J. Cooper, et al., *Plaintiffs,* vs. Meritor Inc., et al., *Defendants*
Case Number: 4:16-cv-52-DMB-JVM
Rosenfeld Deposition: July 2017

In The Superior Court of the State of Washington, County of Snohomish
Michael Davis and Julie Davis et al., Plaintiff vs. Cedar Grove Composting Inc., Defendants
Case No.: No. 13-2-03987-5
Rosenfeld Deposition, February 2017
Trial, March 2017

In The Superior Court of the State of California, County of Alameda
Charles Spain., Plaintiff vs. Thermo Fisher Scientific, et al., Defendants
Case No.: RG14711115
Rosenfeld Deposition, September 2015

In The Iowa District Court In And For Poweshiek County
Russell D. Winburn, et al., Plaintiffs vs. Doug Hoksbergen, et al., Defendants
Case No.: LALA002187
Rosenfeld Deposition, August 2015

In The Circuit Court of Ohio County, West Virginia
Robert Andrews, et al. v. Antero, et al.
Civil Action N0. 14-C-30000
Rosenfeld Deposition, June 2015

In The Iowa District Court For Muscatine County
Laurie Freeman et. al. Plaintiffs vs. Grain Processing Corporation, Defendant
Case No 4980
Rosenfeld Deposition: May 2015

In the Circuit Court of the 17th Judicial Circuit, in and For Broward County, Florida
Walter Hinton, et. al. Plaintiff, vs. City of Fort Lauderdale, Florida, a Municipality, Defendant.
Case Number CACE07030358 (26)
Rosenfeld Deposition: December 2014

In the County Court of Dallas County Texas
Lisa Parr et al, *Plaintiff*, vs. Aruba et al, *Defendant.*
Case Number cc-11-01650-E
Rosenfeld Deposition: March and September 2013
Rosenfeld Trial: April 2014

In the Court of Common Pleas of Tuscarawas County Ohio
John Michael Abicht, et al., *Plaintiffs,* vs. Republic Services, Inc., et al., *Defendants*
Case Number: 2008 CT 10 0741 (Cons. w/ 2009 CV 10 0987)

345 N. El Dorado
Stockton, California 95202
nicole.moore@stocktonca.gov

Dear Nicole Moore:

Thank you for providing the California Air Resources Board (CARB) with the opportunity to comment on the South Stockton Commerce Center Specific Plan (Project) Draft Environmental Impact Report (DEIR), State Clearinghouse No. 2020090561. The Project is proposed within the City of Stockton (City), California, which is the lead agency for California Environmental Quality Act (CEQA) purposes. The Project proposes the development of up to 6,091,551 square feet of industrial type land uses and 140,350 square feet of commercial land uses on approximately 422 acres of land. Once in operation, the Project is expected to generate approximately 22,633 daily vehicle trips, including 5,552 daily heavy-duty truck trips, along local roadways.

CARB submitted a comment letter, which is attached to this letter, on the Notice of Preparation (NOP) for the DEIR released in September 2020. CARB comments dated November 17, 2020, highlighted the need for preparing a health risk assessment (HRA) for the Project and encouraged the City and applicant to implement all existing and emerging zero emission technologies to minimize exposure to diesel particulate matter (diesel PM) and nitrogen oxides (NOx) emissions for all neighboring communities, and to minimize the greenhouse gases that contribute to climate change. Due to the Project's proximity to residences already disproportionately burdened by multiple sources of pollution, CARB's comments on the NOP expressed concerns with the potential cumulative health risks associated with the construction and operation of the Project. CARB reviewed the DEIR and has the following concerns: B-1

The City Uses Inappropriate Trip Lengths When Modeling the Project's Air Quality Impacts from Mobile Sources

The Project's operational mobile source air pollutant emissions may have been underestimated in the DEIR by using vehicle trip lengths unsupported by substantial evidence. The Project's operational air pollutant emissions were estimated using the California Emissions Estimator Model (CalEEMod). Based on CARB's review of the CalEEMod outputs found in Appendix B.1 (CalEEMod Ouputs) of the DEIR, the City relied on CalEEMod vehicle trip length defaults to estimate the Project's mobile source air pollutant emissions. After applying these defaults, 59 percent of the Project's total vehicle trips would have a B-2 travel distance of 9.5 miles and 41 percent of the Project's total vehicle trips would have a travel distance 7.3 miles.

The DEIR does not specify the distance workers and truck drivers would need to travel to operate the proposed industrial development. The Project is located within a short distance from the Port of Stockton and other industrial warehouses, which the Project could serve. However, the heavy-duty trucks transporting goods to the proposed industrial uses could travel greater distances, such as Port of Oakland or Port of Point San Pablo. Unless the City restricts the Project's truck trip distances to those specified in the Project's air quality analysis, the City must remodel the Project's air quality impacts assuming a truck trip distance supported by substantial evidence. B-2 cont'd

The DEIR Did Not Account for Air Pollutant Emissions from Heavy Duty Trucks During On-Site Grading

The DEIR did not account for mobile source air pollutant emissions from heavy-duty trucks during the Project's construction grading phase. The Project's description does not specify if the Project would require the export or import of soil to level the side. Also, based on CARB's review of the CalEEMod outputs, found in Appendix B.1 (CalEEMod Outputs) of the DEIR, the City assumed that no heavy-duty truck trips would be required to import or export soil during the on-site grading. However, some of the mitigation measures presented in the DEIR seems to suggest that heavy-duty trucks would be required Project's construction grading phase. For example, Mitigation Measures 3.3-4 requires all heavy-duty trucks leaving the Project site during construction phase to be fully covered, which suggests heavy-duty trucks will be required to either import or export soil from the Project site. If soil must be imported or exported to grade the Project site, the truck trips needed to accomplish that must be accounted for. B-3

The City must remodel the Project's construction air pollutant emissions using accurate heavy duty truck trip estimates. Residences and other sensitive receptors (e.g., daycare facilities, senior care facilities, and schools) located near construction haul routes could be exposed to diesel exhaust emissions that were not evaluated in the DEIR. The FEIR should clearly state the total number of heavy-duty truck trips expected during Project construction so the public can fully understand the potential environmental effects of the Project on their communities.

The DEIR Does Not Analyze Potential Air Quality Impacts from the Project's Transport Refrigeration Units

Although the HRA prepared for the Project evaluated cancer risks from the operation of onsite and off-site TRUs, the City and applicant did not model and report air pollutant emissions from TRUs in the DEIR. The air pollutant emission estimates, found in Table 3.3-6 (Operational Project Generated Emissions) of the DEIR, were modeled using CalEEMod. Although CalEEMod can estimate air pollutant emissions from area, energy, and mobile sources, the current version of CalEEMod does not account for air pollutant emissions from B-4

TRUs. Since a portion of the Project will be used for cold storage, CARB urges the City and applicant to model and report the Project's air pollution emissions from TRUs using CARB's latest emission factors. As indicated above, the City and applicant should assume that a conservative percentage of the Project's truck fleet is equipped with TRUs, as well as a conservative idling duration for each TRU. B-4 cont'd

The Health Risk Assessment Used Inappropriate Assumptions When Modeling the Project's Health Risk Impacts

The HRA prepared for the Project and presented in Appendix B.3 (Health Risk Assessment) of the DEIR, concluded that residences near the Project site would be exposed to diesel PM emissions that would result in cancer risks of 1.09 chances per million during Project operation. Since the Project's cancer risks are below the San Joaquin Valley Air Pollution Control District's (SJVAPCD) significance threshold of 20 chances per million, the DEIR concluded that the Project would result in a less than significant impact on public health. CARB has reviewed the Project's HRA and is concerned that the Project's cancer risk impacts may have been underestimated for the reasons detailed below.

The cancer risk impacts presented in the HRA should have been based on PM10 idling emissions factors obtained from the latest version of CARB's Emission Factors model (EMFAC). As shown in Table 2 (Emission Source Assumptions) of the HRA, the City used a 0.0035 grams per hour PM10 idling emission factor to calculate the cancer risk impacts while trucks are idling within the Project site. This PM10 idling emission factor was based on idling test data found in the EMFAC2014 Technical Documentation Guidebook. Since the public release of EMFAC2014 in May 2015, CARB has made many updates to the EMFAC model and has released two updated versions: EMFAC2017, released in May 2018, and EMFAC2021, released in January 2021. Some of the updates to the EMFAC model included updates to the heavy-duty truck activity and emission rates, and implementation of CARB's latest regulations. EMFAC2014 underestimated diesel PM emission rates from diesel heavy-duty trucks due to limited in-use test data for engine model year 2010 and newer, thus the Project's mobile source diesel PM emissions are likely underestimated in the DEIR. CARB urges the City and applicant to model and report the Project's air pollution emissions from mobile sources using emission factors found in CARB's latest EMFAC2021. Emission factors can be easily obtained by running the EMFAC2021 Web Database: *https://arb.ca.gov/emfac/emissions-inventory*. B-5

The HRA assumed all TRUs visiting the Project site would not idle longer than 15 minutes. Data obtained by CARB staff indicates that TRUs can operate for as long as two hours per visit, which is well above the 15-minute duration assumed in the HRA. Unless the applicant and City restrict TRU idling durations to less than 15 minutes, the Project's HRA should be revised to assume a TRU idling duration legitimized by substantial evidence.

The HRA prepared for the warehouse/logistics center cold storage scenario assumed 15 percent of the Project's total daily heavy-duty truck traffic would consist of trucks equipped with TRUs. It is unclear in the HRA how this estimate was derived. Due to the large size of the proposed warehouse development, CARB is concerned that the number of TRUs visiting the Project site may be underestimated in the HRA. CARB urges the City and applicant to provide substantial evidence to support this assumption.

The HRA assumed the TRUs accessing the Project site would have an average power rating of 34 hp. TRUs with a power rating of less than 25 hp have a higher PM emission rate (0.3 g/bhp-hr) than those greater than 25 hp (0.02 g/bhp-hr). Unless the applicant and City prohibit TRUs with a power rating of less than 25 hp from accessing the Project site, the Project's HRA should be revised. The revised HRA should assume a conservative percentage of the TRUs entering the Project site have a power rating of less than 25 hp, legitimized by substantial evidence.

The HRA did not evaluate cancer risk impacts from trucks and trucks with TRUs traveling along local roadways. According to the Project's description, a roadway named Commerce Drive will be constructed through the Project site. This roadway will connect the Project site to Airport Way and State Route 99. There are residences located adjacent to Airport Way that will be expose to diesel PM emissions from trucks and trucks with TRUs traveling to and from the Project site that has the potential to result in a potentially significant cancer risk impact. To fully understand the Project's impact on public health, the revised HRA should evaluate potential cancer risks along local roadways serving the Project site.

B-5

cont'd

Although the HRA did model cancer risk impacts at residences located south and southwest of the Project site, the HRA did not model cancer risk impacts at residences located west of the Project site, across form Airport Way. To fully understand the Project's public health impacts, the HRA should evaluate cancer risks at all residences near the Project.

The City did not evaluate the Project's potential cancer risks impacts in the HRA or provide any other quantitative or qualitative analysis to evaluate the Project's potential impact on public health during its construction. The Office of Environmental Health Hazard Assessment's (OEHHA) guidance, recommends assessing cancer risks for construction projects lasting longer than two months.[1] According to the Chapter 3.3 (Air quality) of the DEIR, the construction of the project would begin in 2021 and last for nearly two decades (i.e., 2040), which is beyond the construction duration that would require a project to prepare a construction HRA. To fully understand the Projects potential impacts on public health, the HRA should be revised to evaluate the Project's construction cancer risk impacts.

Since the Project is expected to be built out over a period lasting two decades, it is likely that portions of the Project could be build out and operational while other portions of the Project site is still being constructed. If this overlap is anticipated to occur, residences near the Project would be exposed to diesel PM emissions from onsite construction equipment and

1 Office of Environmental Health Hazard Assessment (OEHHA). Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments. February 2015. Accessed at: *https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf*

heavy-duty trucks serving the proposed industrial development that were not accounted for in the Project's HRA. To account for this potential overlap, the City must evaluate the combined cancer risk impacts from the combined construction and operation of the Project. If no overlap is expected to occur, the FEIR must include a project design measure that prohibits the operation of any industrial uses until the Project is completely built out in the year 2040.

Lastly, the HRA modeled the Project's cancer risk impacts using mobile emission factors obtained from EMFAC2017 assuming a 2040 operational year. The mobile PM10 emission factors in EMFAC will be lower in future years due fleet turnover and the development of cleaner vehicles with lower emissions over time. If a large portion of the proposed industrial development is anticipated to be operational sooner than 2040, such as 2025 or 2030, the mobile emission factors used to model the Project's cancer risk impacts could be underestimated. To conservatively estimate the Project's impact on public health, the cancer risks presented in the revised HRA should be based on mobile emission factors that take into account for early operational years. B-5 cont'

The City Must Include Additional Mitigation Measures to Minimize the Project's Significant and Unavoidable Impact on Air Quality

Chapter 3.3 (Air Quality) of the DEIR concludes that nitrogen oxides (NOx) emitted during Project construction and volatile organic compounds (VOC) and NOx emitted during Project operation would exceed the SJVAPCD's significance thresholds. To reduce the Project's impact on air quality, the DEIR included five mitigation measures (MM 3.3-1 through MM 3.3-5). These mitigation measures include requiring the applicant to comply with SJVAPCD's Rule 9510 to mitigate the Project's operational air pollutant emissions, and Rules 8011 through 8081 to mitigate the Project's construction fugitive dust emissions. These measures also require the Project applicant to implement dust control practices identified in the SJVAPCD's Guidance for Assessing and Mitigating Air Quality Impacts (GAMAQI) to further reduce emissions of fugitive dust emitted during the construction of the Project. After complying with all SJVAPCD's Rules, the City concluded in the DEIR that the Project's impact on air quality would remain significant and unavoidable. B-6

Although complying with local air district rules would reduce the Project's air pollutant and fugitive dust emissions, these rules should not be exclusively relied on to mitigate the Project's impact on air quality. In the DEIR, the City states that the Project would comply with SJVAPCD Rule 9510. This rule requires the applicant to reduce the Project's operational NOx and PM10 emissions by 33.3 and 50 percent, respectively. This rule also requires the applicant to reduce the Project's construction NOx and PM10 emissions by 20 and 45 percent, respectively. To achieve these reductions, the applicant will need to pay into an off-site mitigation fund managed by the SJVAPCD for any emission reductions required by the rule that are not achieved through on-site emission reductions. The City must explain in the DEIR how the rule will achieve the desired emission reductions after all feasible mitigation measures are implemented. The City must list all the Project design features and mitigation measures that would reduce the Project's operational air pollutant emissions and the amount of money the applicant will pay into SJVAPCD's off-site mitigation fund.

Under CEQA, Projects that will have a significant and unavoidable impact on the environment must implement all feasible mitigation measures to reduce those impacts (see California Public Resources Code§ 21081; 14 CCR§ 15126.2(b)). Based on CARBs review of the DEIR, the City has failed to meet this requirement under CEQA. To meet the minimum requirements of CEQA and protect public health, the City must include meaningful and project-specific mitigation measures in the FEIR to reduce the Project's air pollutant emissions. Appendix A of this letter contains a list of feasible measures that can be applied to the Project to minimize air pollution. The mitigation measures in the FEIR must be fully enforceable and imposed by the City.

B-6 cont'd

Conclusion

CARB is concerned about the potential public health impacts should the City approve the Project and how those impacts were evaluated in the DEIR. The Project's air quality impact analysis and conclusions are based on heavy-duty truck trip distances and mixes that were not supported by substantial evidence. The DEIR did not account for air pollutant emissions from haul truck trips during onsite grading or trucks with TRUs during Project operation. The cancer risk impacts presented in the Project's HRA were based on unsubstantiated evidence. Lastly, the City did not include meaningful and project-specific mitigation measures in the DEIR to reduce the Project's significant and unavoidable impact on air quality.

B-7

Given the breadth and scope of projects subject to CEQA review throughout California that have air quality and greenhouse gas impacts, coupled with CARB's limited staff resources to substantively respond to all issues associated with a project, CARB must prioritize its substantive comments here based on staff time, resources, and its assessment of impacts. CARB's deliberate decision to substantively comment on some issues does not constitute an admission or concession that it substantively agrees with the lead agency's findings and conclusions on any issues on which CARB does not substantively submit comments.

CARB appreciates the opportunity to comment on the DEIR for the Project and can provide assistance on zero-emission technologies and emission reduction strategies, as needed. Please include CARB on your list of selected State agencies that will receive the FEIR. If you have questions, please contact Stanley Armstrong, Air Pollution Specialist via email at *stanley.armstrong@arb.ca.gov*.

Sincerely,

Robert Krieger, Branch Chief, Risk Reduction Branch

November 17, 2020

Nicole Moore
Acting Planning Manager
City of Stockton
345 North El Dorado Street
Stockton, California 95202
Submitted via email: nicole.moore@stocktonca.gov

Dear Nicole Moore:

Thank you for providing the California Air Resources Board (CARB) with the opportunity to comment on the Notice of Preparation (NOP) for the South Stockton Commerce Center Project (Project) Draft Environmental Impact Report (DEIR), State Clearinghouse No. 2020090561. The Project proposes the development of a maximum of 140,350 square feet of commercial uses and 6,091,551 square feet of industrial uses on a 437.45-acre site. The proposed Project is within the City of Stockton (City), California, which is the lead agency for California Environmental Quality Act (CEQA) purposes.

Freight facilities, like the one proposed in the Project, can result in high daily volumes of heavy-duty diesel truck traffic and operation of on-site equipment (e.g., forklifts and yard tractors) that emit toxic diesel emissions, and contribute to regional air pollution and global climate change.[1] CARB has reviewed the NOP and is concerned about the air pollution and health risk impacts that would result should the City approve the Project.

I. The Project Would Increase Exposure to Air Pollution in Disadvantaged Communities

The Project, if approved, will expose nearby communities to elevated levels of air pollution. Residences are located south and west of the Project site, with the closest residences situated approximately 930 feet from the Project's western boundary. In addition to residences, the Venture Academy Family of Schools is located within 2 miles of the Project. The communities near the Project are exposed to existing toxic diesel particulate matter (diesel PM) emissions from aircraft operations at the Stockton Metropolitan Airport and vehicular traffic along Interstate 5 (I-5) and State Route 99 (SR-99). Due to the Project's proximity to residences and a school already burdened by multiple sources of air pollution, CARB is concerned with the potential cumulative health impacts associated with the construction and operation of the Project.

---

1. With regard to greenhouse gas emissions from this project, CARB has been clear that local governments and project proponents have a responsibility to properly mitigate these impacts. CARB's guidance, set out in detail in the Scoping Plan issued in 2017, makes clear that in CARB's expert view, local mitigation is critical to achieving climate goals and reducing greenhouse gases below levels of significance.

The State of California has placed additional emphasis on protecting local communities from the harmful effects of air pollution through the passage of Assembly Bill 617 (AB 617) (Garcia, Chapter 136, Statutes of 2017). AB 617 is a significant piece of air quality legislation that highlights the need for further emission reductions in communities with high exposure burdens, like those in which the Project is located. Diesel PM emissions generated during the construction and operation of the Project would negatively impact nearby communities, which are already disproportionally impacted by air pollution from aircraft operations at the Stockton Metropolitan Airport and vehicular traffic along I-5 and SR-99.

Through its authority under Health and Safety Code section 39711, the California Environmental Protection Agency (CalEPA) is charged with the duty to identify disadvantaged communities. CalEPA bases its identification of these communities on geographic, socioeconomic, public health, and environmental hazard criteria (Health and Safety Code, section 39711, subsection (a)). In this capacity, CalEPA currently defines a disadvantaged community, from an environmental hazard and socioeconomic standpoint, as a community that scores within the top 25 percent of the census tracts, as analyzed by the California Communities Environmental Health Screening Tool Version 3.0 (CalEnviroScreen). CalEnviroScreen uses a screening methodology to help identify California communities currently disproportionately burdened by multiple sources of pollution. The census tract containing the Project is within the top 5 percent for Pollution Burden[2] and is considered a disadvantaged community; therefore, CARB urges the City to ensure that the Project does not adversely impact neighboring disadvantaged communities.

II. The DEIR Should Quantify and Discuss the Potential Cancer Risks from On-site Transport Refrigeration Units

Since the NOP states the proposed industrial uses could be used for cold storage, it is likely that trucks and trailers visiting the Project site would be equipped with transport refrigeration units (TRU).[3] TRUs on trucks and trailers can emit large quantities of diesel exhaust while operating within the Project site. Residences and other sensitive receptors (e.g., daycare facilities, senior care facilities, and schools) located near where these TRUs could be operating, would be exposed to diesel exhaust emissions that would result in a significant cancer risk.

CARB urges the City to model air pollutant emissions from on-site TRUs in the DEIR, as well as include potential cancer risks from on-site TRUs in the Project's health risk assessment (HRA). The HRA prepared for the Project should account for all potential health risks from Project-related diesel PM emission sources such as backup

---

2. Pollution Burden represents the potential exposure to pollutants and the adverse environmental conditions caused by pollution.
3. TRUs are refrigeration systems powered by integral diesel engines that protect perishable goods during transport in an insulated truck and trailer vans, rail cars, and domestic shipping containers.

generators, TRUs, and heavy-duty truck traffic, and include all the air pollutant reduction measures listed in Attachment A of this comment letter.

In addition to the health risks associated with operational emissions, health risks associated with construction emissions should also be included in the air quality section of the DEIR and the Project's HRA. Construction of the Project would result in short-term diesel emissions from the use of both on-road and off-road diesel equipment. The Office of Environmental Health Hazard Assessment's (OEHHA) guidance (2015 Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments)[4] recommends assessing cancer risks for construction projects lasting longer than two months. Since construction would very likely occur over a period lasting longer than two months, the HRA prepared for the Project should include health risks for existing residences near the Project site during construction.

The HRA prepared in support of the Project should be based on the latest OEHHA guidance. The HRA should evaluate and present the existing baseline (current conditions), future baseline (full build-out year, without the Project), and future year with the Project. The health risks modeled under both the existing and the future baselines should reflect all applicable federal, state, and local rules and regulations. By evaluating health risks using both baselines, the public and City planners will have a complete understanding of the potential health impacts that would result from the Project.

III. Conclusion

To reduce the exposure of toxic diesel PM emissions in disadvantaged communities already disproportionally impacted by air pollution, the final design of the Project should include all existing and emerging zero-emission technologies to minimize diesel PM and oxides of nitrogen (NO_x) emissions, as well as the greenhouse gases that contribute to climate change. CARB encourages the City and applicant to implement the measures listed in Attachment A of this comment letter to reduce the Project's construction and operational air pollution emissions.

Given the breadth and scope of projects subject to CEQA review throughout California that have air quality and greenhouse gas impacts, coupled with CARB's limited staff resources to substantively respond to all issues associated with a project, CARB must prioritize its substantive comments here based on staff time, resources, and its assessment of impacts. CARB's deliberate decision to substantively comment on some issues does not constitute an admission or concession that it substantively agrees with the lead agency's findings and conclusions on any issues on which CARB does not substantively submit comments.

CARB appreciates the opportunity to comment on the NOP for the Project and can provide assistance on zero-emission technologies and emission reduction strategies, as needed. Please include CARB on your State Clearinghouse list of selected State agencies that will receive the DEIR as part of the comment period. If you have questions, please contact Stanley Armstrong, Air Pollution Specialist, via email at stanley.armstrong@arb.ca.gov.

Sincerely,

Richard Boyd

ATTACHMENT A

Recommended Air Pollution Emission Reduction Measures for Warehouses and Distribution Centers

The California Air Resources Board (CARB) recommends developers and government planners use all existing and emerging zero to near-zero emission technologies during project construction and operation to minimize public exposure to air pollution. Below are some measures, currently recommended by CARB, specific to warehouse and distribution center projects. These recommendations are subject to change as new zero-emission technologies become available.

Recommended Construction Measures

1. Ensure the cleanest possible construction practices and equipment are used. This includes eliminating the idling of diesel-powered equipment and providing the necessary infrastructure (e.g., electrical hookups) to support zero and near-zero equipment and tools.

2. Implement, and plan accordingly for, the necessary infrastructure to support the zero and near-zero emission technology vehicles and equipment that will be operating on site. Necessary infrastructure may include the physical (e.g., needed footprint), energy, and fueling infrastructure for construction equipment, on-site vehicles and equipment, and medium-heavy and heavy-heavy duty trucks.

3. In construction contracts, include language that requires all off-road diesel-powered equipment used during construction to be equipped with Tier 4 or cleaner engines, except for specialized construction equipment in which Tier 4 engines are not available. In place of Tier 4 engines, off-road equipment can incorporate retrofits, such that, emission reductions achieved equal or exceed that of a Tier 4 engine.

4. In construction contracts, include language that requires all off-road equipment with a power rating below 19 kilowatts (e.g., plate compactors, pressure washers) used during project construction be battery powered.

5. In construction contracts, include language that requires all heavy-duty trucks entering the construction site, during the grading and building construction phases be model year 2014 or later. All heavy-duty haul trucks should also meet CARB's lowest optional low-oxides of nitrogen (NO_x) standard starting in the year 2022.[1]

[1.] In 2013, CARB adopted optional low-NO_x emission standards for on-road heavy-duty engines. CARB encourages engine manufacturers to introduce new technologies to reduce NO_x emissions below the current mandatory on-road heavy-duty diesel engine emission standards for model-year 2010 and later. CARB's optional low-NO_x emission standard is available at: https://www.arb.ca.gov/msprog/onroad/optionnox/optionnox.htm.

6. In construction contracts, include language that requires all construction equipment and fleets to be in compliance with all current air quality regulations. CARB is available to assist in implementing this recommendation.

Recommended Operation Measures

1. Include contractual language in tenant lease agreements that requires tenants to use the cleanest technologies available, and to provide the necessary infrastructure to support zero-emission vehicles and equipment that will be operating on site.

2. Include contractual language in tenant lease agreements that requires all loading/unloading docks and trailer spaces be equipped with electrical hookups for trucks with transport refrigeration units (TRU) or auxiliary power units. This requirement will substantially decrease the amount of time that a TRU powered by a fossil-fueled internal combustion engine can operate at the project site. Use of zero-emission all-electric plug-in TRUs, hydrogen fuel cell transport refrigeration, and cryogenic transport refrigeration are encouraged and can also be included in lease agreements.[2]

3. Include contractual language in tenant lease agreements that requires all TRUs entering the project site be plug-in capable.

4. Include contractual language in tenant lease agreements that requires future tenants to exclusively use zero-emission light and medium-duty delivery trucks and vans.

5. Include contractual language in tenant lease agreements requiring all TRUs, trucks, and cars entering the project site be zero-emission.

6. Include contractual language in tenant lease agreements that requires all service equipment (e.g., yard hostlers, yard equipment, forklifts, and pallet jacks) used within the project site to be zero-emission. This equipment is widely available.

7. Include contractual language in tenant lease agreements that requires all heavy-duty trucks entering or on the project site to be model year 2014 or later, expedite a transition to zero-emission vehicles, and be fully zero-emission beginning in 2030.

---

[2]. CARB's technology assessment for transport refrigerators provides information on the current and projected development of TRUs, including current and anticipated costs. The assessment is available at: https://www.arb.ca.gov/msprog/tech/techreport/tru_07292015.pdf.

8. Include contractual language in tenant lease agreements that requires the tenant be in, and monitor compliance with, all current air quality regulations for on-road trucks including CARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation,[3] Periodic Smoke Inspection Program (PSIP),[4] and the Statewide Truck and Bus Regulation.[5]

9. Include contractual language in tenant lease agreements restricting trucks and support equipment from idling longer than five minutes while on site.

10. Include contractual language in tenant lease agreements that limits on-site TRU diesel engine runtime to no longer than 15 minutes. If no cold storage operations are planned, include contractual language and permit conditions that prohibit cold storage operations unless a health risk assessment is conducted, and the health impacts fully mitigated.

11. Include rooftop solar panels for each proposed warehouse to the extent feasible, with a capacity that matches the maximum allowed for distributed solar connections to the grid.

12. Including language in tenant lease agreements, requiring the installing of vegetative walls[6] or other effective barriers that separate loading docks and people living or working nearby.

---

3. In December 2008, CARB adopted a regulation to reduce greenhouse gas emissions by improving the fuel efficiency of heavy-duty tractors that pull 53-foot or longer box-type trailers. The regulation applies primarily to owners of 53-foot or longer box-type trailers, including both dry-van and refrigerated-van trailers, and owners of the heavy-duty tractors that pull them on California highways. CARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation is available at: https://www.arb.ca.gov/cc/hdghg/hdghg.htm.

4. The PSIP program requires that diesel and bus fleet owners conduct annual smoke opacity inspections of their vehicles and repair those with excessive smoke emissions to ensure compliance. CARB's PSIP program is available at: https://www.arb.ca.gov/enf/hdvip/hdvip.htm.

5. The regulation requires that newer heavier trucks and buses must meet particulate matter filter requirements beginning January 1, 2012. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model-year engines or equivalent. CARB's Statewide Truck and Bus Regulation is available at: https://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm.

6. Effectiveness of Sound Wall-Vegetation Combination Barriers as Near-Roadway Pollutant Mitigation Strategies (2017) is available at: https://ww2.arb.ca.gov/sites/default/files/classic//research/apr/past/13-306.pdf.

XAVIER BECERRA
Attorney General

State of California
DEPARTMENT OF JUSTICE

Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act

In carrying out its duty to enforce laws across California, the California Attorney General's Bureau of Environmental Justice (Bureau)[1] regularly reviews proposed warehouse projects for compliance with the California Environmental Quality Act (CEQA) and other laws. When necessary, the Bureau submits comment letters to lead agencies, and in rare cases the Bureau has filed litigation to enforce CEQA.[2] This document builds upon the Bureau's comment letters, collecting knowledge gained from the Bureau's review of hundreds of warehouse projects across the state. It is meant to help lead agencies pursue CEQA compliance and promote environmentally-just development as they confront warehouse project proposals.[3] While CEQA analysis is necessarily project-specific, this document provides information on feasible best practices and mitigation measures, the overwhelming majority of which have been adapted from actual warehouse projects in California.

I. Background

In recent years, the proliferation of e-commerce and rising consumer expectations of rapid shipping have contributed to a boom in warehouse development.[4] California, with its ports, population centers, and transportation network, has found itself at the center of this trend. For example, in 2014, 40 percent of national container cargo flowed through Southern California, which was home to nearly 1.2 billion square feet of warehouse facilities.[5] In the Inland Empire alone, 150 million square feet of new industrial space was built over the last decade,[6] and 21 of the largest 100 logistics leases signed in 2019 nationwide were in the Inland

[1] https://oag.ca.gov/environment/justice.

[2] https://oag.ca.gov/environment/ceqa/letters; *South Central Neighbors United et al. v. City of Fresno et al.* (Super. Ct. Fresno County, No. 18CECG00690).

[3] Anyone reviewing this document to determine CEQA compliance responsibilities should consult their own attorney for legal advice.

[4] As used in this document, "warehouse" or "logistics facility" is defined as a facility consisting of one or more buildings that stores cargo, goods, or products on a short or long term basis for later distribution to businesses and/or retail customers.

[5] Industrial Warehousing in the SCAG Region, Task 2. Inventory of Warehousing Facilities (April 2018), http://www.scag.ca.gov/Documents/Task2_FacilityInventory.pdf at 1-1, 2-11.

[6] Los Angeles Times, *When your house is surrounded by massive warehouses*, October 27, 2019, https://www.latimes.com/california/story/2019-10-27/fontana-california-warehouses-inland-empire-pollution.

Empire, comprising 17.5 million square feet.[7] This trend has not slowed, even with the economic downturn caused by COVID-19, as e-commerce has continued to grow.[8] Forecasts predict that the Central Valley is where a new wave of warehouse development will go.[9]

When done properly, these activities can contribute to the economy and consumer welfare. However, imprudent warehouse development can harm local communities and the environment. Among other pollutants, diesel trucks visiting warehouses emit nitrogen oxide (NO_x)—a primary precursor to smog formation and a significant factor in the development of respiratory problems like asthma, bronchitis, and lung irritation—and diesel particulate matter (a subset of fine particular matter that is smaller than 2.5 micrometers)—a contributor to cancer, heart disease, respiratory illnesses, and premature death.[10] Trucks and on-site loading activities can also be loud, bringing disruptive noise levels during 24/7 operation that can cause hearing damage after prolonged exposure.[11] The hundreds, and sometimes thousands, of daily truck and passenger car trips that warehouses generate contribute to traffic jams, deterioration of road surfaces, and traffic accidents. These environmental impacts also tend to be concentrated in neighborhoods already suffering from disproportionate health impacts.

II. Proactive Planning: General Plans, Local Ordinances, and Good Neighbor Policies

To systematically address warehouse development, we encourage governing bodies to proactively plan for logistics projects in their jurisdictions. Proactive planning allows jurisdictions to prevent land use conflicts before they materialize and guide sustainable development. Benefits also include providing a predictable business environment, protecting residents from environmental harm, and setting consistent expectations jurisdiction-wide.

Proactive planning can take any number of forms. Land use designation and zoning decisions should channel development into appropriate areas. For example, establishing industrial districts near major highway and rail corridors but away from sensitive receptors can help avoid conflicts between warehouse facilities and residential communities.

In addition, general plan policies, local ordinances, and good neighbor policies should set minimum standards for logistics projects. General plan policies can be incorporated into existing economic development, land use, circulation, or other related elements. Many jurisdictions alternatively choose to consolidate policies in a separate environmental justice element. Adopting general plan policies to guide warehouse development may also help jurisdictions comply with their obligations under SB 1000, which requires local government general plans to identify objectives and policies to reduce health risks in disadvantaged communities, promote civil engagement in the public decision making process, and prioritize improvements and programs that address the needs of disadvantaged communities.[12]

The Bureau is aware of four good neighbor policies in California: Riverside County, the City of Riverside, the City of Moreno Valley, and the Western Riverside Council of Governments.[13] These policies provide minimum standards that all warehouses in the jurisdiction must meet. For example, the Western Riverside Council of Governments policy sets a minimum buffer zone of 300 meters between warehouses and sensitive receptors, and it requires a number of design features to reduce truck impacts on nearby sensitive receptors. The Riverside County policy requires vehicles entering sites during both construction and operation to meet certain California Air Resources Board (CARB) guidelines, and it requires community benefits agreements and supplemental funding contributions toward additional pollution offsets.

The Bureau encourages jurisdictions to adopt their own local ordinances and/or good neighbor policies that combine the most robust policies from those models with measures discussed in the remainder of this document.

---

[12] For more information about SB 1000, *see* https://oag.ca.gov/environment/sb1000.

[13] https://www.rivcocob.org/wp-content/uploads/2020/01/Good-Neighbor-Policy-F-3-Final-Adopted.pdf (Riverside County); https://riversideca.gov/planning/pdf/good-neighbor-guidelines.pdf (City of Riverside); http://qcode.us/codes/morenovalley/view.php?topic=9-9_05-9_05_050&frames=on (City of Moreno Valley); http://www.wrcog.cog.ca.us/DocumentCenter/View/318/Good-Neighbor-Guidelines-for-Siting-Warehouse-Distribution-Facilities-PDF?bidId= (Western Riverside Council of Governments).

III. Community Engagement

Early and consistent community engagement is central to establishing good relationships between communities, lead agencies, and warehouse developers and tenants. Robust community engagement can give lead agencies access to community residents' on-the-ground knowledge and information about their concerns, build community support for projects, and develop creative solutions to ensure new logistics facilities are mutually beneficial. Examples of best practices for community engagement include:

- Holding a series of community meetings at times and locations convenient to members of the affected community and incorporating suggestions into the project design.
- Posting information in hard copy in public gathering spaces and on a website about the project. The information should include a complete, accurate project description, maps and drawings of the project design, and information about how the public can provide input and be involved in the project approval process. The information should be in a format that is easy to navigate and understand for members of the affected community.
- Providing notice by mail to residents and schools within a certain radius of the project and along transportation corridors to be used by vehicles visiting the project, and by posting a prominent sign on the project site. The notice should include a brief project description and directions for accessing complete information about the project and for providing input on the project.
- Providing translation or interpretation in residents' native language, where appropriate.
- For public meetings broadcast online or otherwise held remotely, providing for access and public comment by telephone and supplying instructions for access and public comment with ample lead time prior to the meeting.
- Partnering with local community-based organizations to solicit feedback, leverage local networks, co-host meetings, and build support.
- Considering adoption of a community benefits agreement, negotiated with input from affected residents and businesses, by which the developer provides benefits to the community.
- Creating a community advisory board made up of local residents to review and provide feedback on project proposals in early planning stages.
- Identifying a person to act as a community liaison concerning on-site construction activity and operations, and providing contact information for the community relations officer to the surrounding community.

IV. Warehouse Siting and Design Considerations

The most important consideration when planning a logistics facility is its location. Warehouses located in residential neighborhoods or near other sensitive receptors expose community residents and those using or visiting sensitive receptor sites to the air pollution, noise, traffic, and other environmental impacts they generate. Therefore, placing facilities away from sensitive receptors significantly reduces their environmental and quality of life harms on local communities. The suggested best practices for siting and design of warehouse facilities does not relieve lead agencies' responsibility under CEQA to conduct a project-specific analysis of the project's impacts and evaluation of feasible mitigation measures and alternatives; lead agencies' incorporation of the best practices must be part of the impact, mitigation and alternatives analyses to meet the requirements of CEQA. Examples of best practices when siting and designing warehouse facilities include:

- Per CARB guidance, siting warehouse facilities so that their property lines are at least 1,000 feet from the property lines of the nearest sensitive receptors.[14]
- Creating physical, structural, and/or vegetative buffers that adequately prevent or substantially reduce pollutant dispersal between warehouses and any areas where sensitive receptors are likely to be present, such as homes, schools, daycare centers, hospitals, community centers, and parks.
- Providing adequate areas for on-site parking, on-site queuing, and truck check-in that prevent trucks and other vehicles from parking or idling on public streets.
- Placing facility entry and exit points from the public street away from sensitive receptors, e.g., placing these points on the north side of the facility if sensitive receptors are adjacent to the south side of the facility.
- Locating warehouse dock doors and other onsite areas with significant truck traffic and noise away from sensitive receptors, e.g., placing these dock doors on the north side of the facility if sensitive receptors are adjacent to the south side of the facility.
- Screening dock doors and onsite areas with significant truck traffic with physical, structural, and/or vegetative barriers that adequately prevent or substantially reduce pollutant dispersal from the facility towards sensitive receptors.
- Posting signs clearly showing the designated entry and exit points from the public street for trucks and service vehicles.
- Posting signs indicating that all parking and maintenance of trucks must be conducted within designated on-site areas and not within the surrounding community or public streets.

V. Air Quality and Greenhouse Gas Emissions Analysis and Mitigation

Emissions of air pollutants and greenhouse gases are often among the most substantial environmental impacts from new warehouse facilities. CEQA compliance demands a proper accounting of the full air quality and greenhouse gas impacts of logistics facilities and adoption of all feasible mitigation of significant impacts. Although efforts by CARB and other authorities to regulate the heavy-duty truck and off-road diesel fleets have made excellent progress in reducing the air quality impacts of logistics facilities, the opportunity remains for local jurisdictions to further mitigate these impacts at the project level. Lead agencies and developers

---

[14] California Air Resources Board (CARB), Air Quality and Land Use Handbook: A Community Health Perspective (April 2005), at ES-1. CARB staff has released draft updates to this siting and design guidance which suggests a greater distance may be warranted under varying scenarios; this document may be found on CARB's website and is entitled: "California Sustainable Freight Initiative: Concept Paper for the Freight Handbook" (December 2019).

should also consider designing projects with their long-term viability in mind. Constructing the necessary infrastructure to prepare for the zero-emission future of goods movement not only reduces a facility's emissions and local impact now, but it can also save money as regulations tighten and demand for zero-emission infrastructure grows. In planning new logistics facilities, the Bureau strongly encourages developers to consider the local, statewide, and global impacts of their projects' emissions.

Examples of best practices when studying air quality and greenhouse gas impacts include:

- Fully analyzing all reasonably foreseeable project impacts, including cumulative impacts. In general, new warehouse developments are not ministerial under CEQA because they involve public officials' personal judgment as to the wisdom or manner of carrying out the project, even when warehouses are permitted by a site's applicable zoning and/or general plan land use designation. CEQA Guidelines § 15369.
- When analyzing cumulative impacts, thoroughly considering the project's incremental impact in combination with past, present, and reasonably foreseeable future projects, even if the project's individual impacts alone do not exceed the applicable significance thresholds.
- Preparing a quantitative air quality study in accordance with local air district guidelines.
- Preparing a quantitative health risk assessment in accordance with California Office of Environmental Health Hazard Assessment and local air district guidelines.
- Refraining from labeling compliance with CARB or air district regulations as a mitigation measure—compliance with applicable regulations is a baseline expectation.
- Fully analyzing impacts from truck trips. CEQA requires full public disclosure of a project's anticipated truck trips, which entails calculating truck trip length based on likely truck trip destinations, rather than the distance from the facility to the edge of the air basin. Emissions beyond the air basin are not speculative, and, because air pollution is not static, may contribute to air basin pollution. Moreover, any contributions to air pollution outside the local air basin should be quantified and their significance should be considered.
- Accounting for all reasonably foreseeable greenhouse gas emissions from the project, without discounting projected emissions based on participation in California's Cap-and-Trade Program.

Examples of measures to mitigate air quality and greenhouse gas impacts from construction are below. To ensure mitigation measures are enforceable and effective, they should be imposed as permit conditions on the project where applicable.

- Requiring off-road construction equipment to be zero-emission, where available, and all diesel-fueled off-road construction equipment, to be equipped with CARB Tier IV-compliant engines or better, and including this requirement in applicable bid documents, purchase orders, and contracts, with successful contractors demonstrating the ability to supply the compliant construction equipment for use prior to any ground-disturbing and construction activities.

- Prohibiting off-road diesel-powered equipment from being in the "on" position for more than 10 hours per day.
- Requiring on-road heavy-duty haul trucks to be model year 2010 or newer if diesel-fueled.
- Providing electrical hook ups to the power grid, rather than use of diesel-fueled generators, for electric construction tools, such as saws, drills and compressors, and using electric tools whenever feasible.
- Limiting the amount of daily grading disturbance area.
- Prohibiting grading on days with an Air Quality Index forecast of greater than 100 for particulates or ozone for the project area.
- Forbidding idling of heavy equipment for more than two minutes.
- Keeping onsite and furnishing to the lead agency or other regulators upon request, all equipment maintenance records and data sheets, including design specifications and emission control tier classifications.
- Conducting an on-site inspection to verify compliance with construction mitigation and to identify other opportunities to further reduce construction impacts.
- Using paints, architectural coatings, and industrial maintenance coatings that have volatile organic compound levels of less than 10 g/L.
- Providing information on transit and ridesharing programs and services to construction employees.
- Providing meal options onsite or shuttles between the facility and nearby meal destinations for construction employees.

Examples of measures to mitigate air quality and greenhouse gas impacts from operation include:

- Requiring that all facility-owned and operated fleet equipment with a gross vehicle weight rating greater than 14,000 pounds accessing the site meet or exceed 2010 model-year emissions equivalent engine standards as currently defined in California Code of Regulations Title 13, Division 3, Chapter 1, Article 4.5, Section 2025. Facility operators shall maintain records on-site demonstrating compliance with this requirement and shall make records available for inspection by the local jurisdiction, air district, and state upon request.
- Requiring all heavy-duty vehicles entering or operated on the project site to be zero-emission beginning in 2030.
- Requiring on-site equipment, such as forklifts and yard trucks, to be electric with the necessary electrical charging stations provided.
- Requiring tenants to use zero-emission light- and medium-duty vehicles as part of business operations.
- Forbidding trucks from idling for more than two minutes and requiring operators to turn off engines when not in use.
- Posting both interior- and exterior-facing signs, including signs directed at all

dock and delivery areas, identifying idling restrictions and contact information to report violations to CARB, the air district, and the building manager.

- Installing and maintaining, at the manufacturer's recommended maintenance intervals, air filtration systems at sensitive receptors within a certain radius of facility for the life of the project.
- Installing and maintaining, at the manufacturer's recommended maintenance intervals, an air monitoring station proximate to sensitive receptors and the facility for the life of the project, and making the resulting data publicly available in real time. While air monitoring does not mitigate the air quality or greenhouse gas impacts of a facility, it nonetheless benefits the affected community by providing information that can be used to improve air quality or avoid exposure to unhealthy air.
- Constructing electric truck charging stations proportional to the number of dock doors at the project.
- Constructing electric plugs for electric transport refrigeration units at every dock door, if the warehouse use could include refrigeration.
- Constructing electric light-duty vehicle charging stations proportional to the number of parking spaces at the project.
- Installing solar photovoltaic systems on the project site of a specified electrical generation capacity, such as equal to the building's projected energy needs.
- Requiring all stand-by emergency generators to be powered by a non-diesel fuel.
- Requiring facility operators to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks.
- Requiring operators to establish and promote a rideshare program that discourages single-occupancy vehicle trips and provides financial incentives for alternate modes of transportation, including carpooling, public transit, and biking.
- Meeting CalGreen Tier 2 green building standards, including all provisions related to designated parking for clean air vehicles, electric vehicle charging, and bicycle parking.
- Achieving certification of compliance with LEED green building standards.
- Providing meal options onsite or shuttles between the facility and nearby meal destinations.
- Posting signs at every truck exit driveway providing directional information to the truck route.
- Improving and maintaining vegetation and tree canopy for residents in and around the project area.
- Requiring that every tenant train its staff in charge of keeping vehicle records in diesel technologies and compliance with CARB regulations, by attending CARB-approved courses. Also require facility operators to maintain records on-site demonstrating compliance and make records available for inspection by the local jurisdiction, air district, and state upon request.
- Requiring tenants to enroll in the United States Environmental Protection Agency's SmartWay program, and requiring tenants to use carriers that are SmartWay carriers.

- Providing tenants with information on incentive programs, such as the Carl Moyer Program and Voucher Incentive Program, to upgrade their fleets.

VI. Noise Impacts Analysis and Mitigation

The noise associated with logistics facilities can be among their most intrusive impacts to nearby sensitive receptors. Various sources, such as unloading activity, diesel truck movement, and rooftop air conditioning units, can contribute substantial noise pollution. These impacts are exacerbated by logistics facilities' typical 24-hour, seven-days-per-week operation. Construction noise is often even greater than operational noise, so if a project site is near sensitive receptors, developers and lead agencies should adopt measures to reduce the noise generated by both construction and operation activities.

Examples of best practices when studying noise impacts include:

- Preparing a noise impact analysis that considers all reasonably foreseeable project noise impacts, including to nearby sensitive receptors. All reasonably foreseeable project noise impacts encompasses noise from both construction and operations, including stationary, on-site, and off-site noise sources.
- Adopting a lower significance threshold for incremental noise increases when baseline noise already exceeds total noise significance thresholds, to account for the cumulative impact of additional noise and the fact that, as noise moves up the decibel scale, each decibel increase is a progressively greater increase in sound pressure than the last. For example, 70 dBA is ten times more sound pressure than 60 dBA.

Examples of measures to mitigate noise impacts include:

- Constructing physical, structural, or vegetative noise barriers on and/or off the project site.
- Locating or parking all stationary construction equipment as far from sensitive receptors as possible, and directing emitted noise away from sensitive receptors.
- Verifying that construction equipment has properly operating and maintained mufflers.
- Requiring all combustion-powered construction equipment to be surrounded by a noise protection barrier
- Limiting operation hours to daytime hours on weekdays.
- Paving roads where truck traffic is anticipated with low noise asphalt.
- Orienting any public address systems onsite away from sensitive receptors and setting system volume at a level not readily audible past the property line.

VII. Traffic Impacts Analysis and Mitigation

Warehouse facilities inevitably bring truck and passenger car traffic. Truck traffic can present substantial safety issues. Collisions with heavy-duty trucks are especially dangerous for passenger cars, motorcycles, bicycles, and pedestrians. These concerns can be even greater if truck traffic passes through residential areas, school zones, or other places where pedestrians are common and extra caution is warranted.

Examples of measures to mitigate traffic impacts include:

- Designing, clearly marking, and enforcing truck routes that keep trucks out of residential neighborhoods and away from other sensitive receptors.
- Installing signs in residential areas noting that truck and employee parking is prohibited.
- Constructing new or improved transit stops, sidewalks, bicycle lanes, and crosswalks, with special attention to ensuring safe routes to schools.
- Consulting with the local public transit agency and securing increased public transit service to the project area.
- Designating areas for employee pickup and drop-off.
- Implementing traffic control and safety measures, such as speed bumps, speed limits, or new traffic signs or signals.
- Placing facility entry and exit points on major streets that do not have adjacent sensitive receptors.
- Restricting the turns trucks can make entering and exiting the facility to route trucks away from sensitive receptors.
- Constructing roadway improvements to improve traffic flow.
- Preparing a construction traffic control plan prior to grading, detailing the locations of equipment staging areas, material stockpiles, proposed road closures, and hours of construction operations, and designing the plan to minimize impacts to roads frequented by passenger cars, pedestrians, bicyclists, and other non-truck traffic.

VIII. Other Significant Environmental Impacts Analysis and Mitigation

Warehouse projects may result in significant environmental impacts to other resources, such as to aesthetics, cultural resources, energy, geology, or hazardous materials. All significant adverse environmental impacts must be evaluated, disclosed and mitigated to the extent feasible under CEQA. Examples of best practices and mitigation measures to reduce environmental impacts that do not fall under any of the above categories include:

- Appointing a compliance officer who is responsible for implementing all mitigation measures, and providing contact information for the compliance officer to the lead agency, to be updated annually.
- Creating a fund to mitigate impacts on affected residents, schools, places of worship, and other community institutions by retrofitting their property. For example, retaining a contractor to retrofit/install HVAC and/or air filtration systems, doors, dual-paned windows, and sound- and vibration-deadening insulation and curtains.
- Sweeping surrounding streets on a daily basis during construction to remove any construction-related debris and dirt.
- Directing all lighting at the facility into the interior of the site.

- Using full cut-off light shields and/or anti-glare lighting.
- Using cool pavement to reduce heat island effects.
- Installing climate control in the warehouse facility to promote worker well-being.
- Installing air filtration in the warehouse facility to promote worker well-being.

IX. Conclusion

California's world-class economy, ports, and transportation network position it at the center of the e-commerce and logistics industry boom. At the same time, California is a global leader in environmental protection and environmentally just development. The guidance in this document furthers these dual strengths, ensuring that all can access the benefits of economic development. The Bureau will continue to monitor proposed projects for compliance with CEQA and other laws. Lead agencies, developers, community advocates, and other interested parties should feel free to reach out to us as they consider how to guide warehouse development in their area.

Please do not hesitate to contact the Environmental Justice Bureau at ej@doj.ca.gov if you have any questions.

Subject: South Stockton Commerce Center Project DEIR

CAUTION: This email originated from outside the City of Stockton. Do not click any links or open attachments if this is unsolicited email.

Ms. Moore-

The Attorney General's Office appreciates the opportunity to review the DEIR for the South Stockton Commerce Center (SCH# 2020090561). Attached for your consideration is the Attorney General's "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act." We encourage Stockton to review the enforceable and feasible mitigation measures included in Section V "Air Quality and Greenhouse Gas Emissions Analysis and Mitigation." C-1

Thank you again for the opportunity to review the DEIR and provide Stockton with this guidance. Please feel free to contact me with any questions. C-2

Sincerely,

Scott Lichtig

Central Valley Regional Water Quality Control Board

29 November 2021

Nicole Moore
City of Stockton
345 North El Dorado Street
Stockton, CA 95202
Nicole.Moore@stocktonca.gov

COMMENTS TO REQUEST FOR REVIEW FOR THE DRAFT ENVIRONMENTAL IMPACT REPORT, SOUTH STOCKTON COMMERCE CENTER PROJECT, SCH#2020090561, SAN JOAQUIN COUNTY

Pursuant to the State Clearinghouse's 14 October 2021 request, the Central Valley Regional Water Quality Control Board (Central Valley Water Board) has reviewed the *Request for Review for the Draft Environmental Impact Report* for the South Stockton Commerce Center Project, located in San Joaquin County. D-1

Our agency is delegated with the responsibility of protecting the quality of surface and groundwaters of the state; therefore our comments will address concerns surrounding those issues.

I. Regulatory Setting

Basin Plan

The Central Valley Water Board is required to formulate and adopt Basin Plans for all areas within the Central Valley region under Section 13240 of the Porter-Cologne Water Quality Control Act. Each Basin Plan must contain water quality objectives to ensure the reasonable protection of beneficial uses, as well as a program of implementation for achieving water quality objectives with the Basin Plans. Federal regulations require each state to adopt water quality standards to protect the public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act. In California, the beneficial uses, water quality objectives, and the Antidegradation Policy are the State's water quality standards. Water quality standards are also contained in the National Toxics Rule, 40 CFR Section 131.36, and the California Toxics Rule, 40 CFR Section 131.38. D-2

The Basin Plan is subject to modification as necessary, considering applicable laws, policies, technologies, water quality conditions and priorities. The original Basin Plans were adopted in 1975, and have been updated and revised periodically as required, using Basin Plan amendments. Once the Central Valley Water Board has adopted a Basin Plan amendment in noticed public hearings, it must be approved by the State Water Resources Control Board (State Water Board), Office of Administrative Law (OAL) and in some cases, the United States Environmental

Protection Agency (USEPA). Basin Plan amendments only become effective after they have been approved by the OAL and in some cases, the USEPA. Every three (3) years, a review of the Basin Plan is completed that assesses the appropriateness of existing standards and evaluates and prioritizes Basin Planning issues. For more information on the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, please visit our website: http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/ D-2 cont'd

Antidegradation Considerations
All wastewater discharges must comply with the Antidegradation Policy (State Water Board Resolution 68-16) and the Antidegradation Implementation Policy contained in the Basin Plan. The Antidegradation Implementation Policy is available on page 74 at:
https://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/sacsjr_201805.pdf

In part it states:

Any discharge of waste to high quality waters must apply best practicable treatment or control not only to prevent a condition of pollution or nuisance from occurring, but also to maintain the highest water quality possible consistent with the maximum benefit to the people of the State. D-3

This information must be presented as an analysis of the impacts and potential impacts of the discharge on water quality, as measured by background concentrations and applicable water quality objectives.

The antidegradation analysis is a mandatory element in the National Pollutant Discharge Elimination System and land discharge Waste Discharge Requirements (WDRs) permitting processes. The environmental review document should evaluate potential impacts to both surface and groundwater quality.

II. Permitting Requirements

Construction Storm Water General Permit
Dischargers whose project disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit), Construction General Permit Order No. 2009-0009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). For more information on the Construction General Permit, visit the State Water Resources Control Board website at: D-4
http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

Phase I and II Municipal Separate Storm Sewer System (MS4) Permits[1]
The Phase I and II MS4 permits require the Permittees reduce pollutants and runoff flows from new development and redevelopment using Best Management Practices (BMPs) to the maximum extent practicable (MEP). MS4 Permittees have their own development standards, also known as Low Impact Development (LID)/post-construction standards that include a hydromodification component. The MS4 permits also require specific design concepts for LID/post-construction BMPs in the early stages of a project during the entitlement and CEQA process and the development plan review process. D-5

For more information on which Phase I MS4 Permit this project applies to, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/municipal_permits/

For more information on the Phase II MS4 permit and who it applies to, visit the State Water Resources Control Board at:
http://www.waterboards.ca.gov/water_issues/programs/stormwater/phase_ii_municipal.shtml

Industrial Storm Water General Permit
Storm water discharges associated with industrial sites must comply with the regulations contained in the Industrial Storm Water General Permit Order No. 2014-0057-DWQ. For more information on the Industrial Storm Water General Permit, visit the Central Valley Water Board website at: D-6
http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/industrial_general_permits/index.shtml

Clean Water Act Section 404 Permit
If the project will involve the discharge of dredged or fill material in navigable waters or wetlands, a permit pursuant to Section 404 of the Clean Water Act may be needed from the United States Army Corps of Engineers (USACE). If a Section 404 permit is required by the USACE, the Central Valley Water Board will review the permit application to ensure that discharge will not violate water quality standards. If the project requires surface water drainage realignment, the applicant is advised to contact the Department of Fish and Game for information on Streambed Alteration Permit requirements. If you have any questions regarding the Clean Water Act Section 404 permits, please contact the Regulatory Division of the Sacramento District of USACE at (916) 557-5250. D-7

[1] Municipal Permits = The Phase I Municipal Separate Storm Water System (MS4) Permit covers medium sized Municipalities (serving between 100,000 and 250,000 people) and large sized municipalities (serving over 250,000 people). The Phase II MS4 provides coverage for small municipalities, including non-traditional Small MS4s, which include military bases, public campuses, prisons and hospitals.

Clean Water Act Section 401 Permit – Water Quality Certification

If an USACE permit (e.g., Non-Reporting Nationwide Permit, Nationwide Permit, Letter of Permission, Individual Permit, Regional General Permit, Programmatic General Permit), or any other federal permit (e.g., Section 10 of the Rivers and Harbors Act or Section 9 from the United States Coast Guard), is required for this project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification must be obtained from the Central Valley Water Board prior to initiation of project activities. There are no waivers for 401 Water Quality Certifications. For more information on the Water Quality Certification, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/water_issues/water_quality_certification/ D-8

Waste Discharge Requirements – Discharges to Waters of the State

If USACE determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the proposed project area, the proposed project may require a Waste Discharge Requirement (WDR) permit to be issued by Central Valley Water Board. Under the California Porter-Cologne Water Quality Control Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands, are subject to State regulation. For more information on the Waste Discharges to Surface Water NPDES Program and WDR processes, visit the Central Valley Water Board website at:https://www.waterboards.ca.gov/centralvalley/water_issues/waste_to_surface_water/ D-9

Projects involving excavation or fill activities impacting less than 0.2 acre or 400 linear feet of non-jurisdictional waters of the state and projects involving dredging activities impacting less than 50 cubic yards of non-jurisdictional waters of the state may be eligible for coverage under the State Water Resources Control Board Water Quality Order No. 2004-0004-DWQ (General Order 2004-0004). For more information on the General Order 2004-0004, visit the State Water Resources Control Board website at: https://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2004/wqo/wqo2004-0004.pdf

Dewatering Permit

If the proposed project includes construction or groundwater dewatering to be discharged to land, the proponent may apply for coverage under State Water Board General Water Quality Order (Low Threat General Order) 2003-0003 or the Central Valley Water Board's Waiver of Report of Waste Discharge and Waste Discharge Requirements (Low Threat Waiver) R5-2018-0085. Small temporary construction dewatering projects are projects that discharge groundwater to land from excavation activities or dewatering of underground utility vaults. Dischargers seeking coverage under the General Order or Waiver must file a Notice of Intent with the Central Valley Water Board prior to beginning discharge. D-10

For more information regarding the Low Threat General Order and the application process, visit the Central Valley Water Board website at: http://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2003/wqo/wqo2003-0003.pdf D-10 cont'd

For more information regarding the Low Threat Waiver and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/waivers/r5-2018-0085.pdf

Limited Threat General NPDES Permit

If the proposed project includes construction dewatering and it is necessary to discharge the groundwater to waters of the United States, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. Dewatering discharges are typically considered a low or limited threat to water quality and may be covered under the General Order for *Limited Threat Discharges to Surface Water* (Limited Threat General Order). A complete Notice of Intent must be submitted to the Central Valley Water Board to obtain coverage under the Limited Threat General Order. For more information regarding the Limited Threat General Order and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/r5-2016-0076-01.pdf D-11

If you have questions regarding these comments, please contact me at (916) 464-4856 or Nicholas.White@waterboards.ca.gov.

RE: **South Stockton Commerce Center – Draft Environmental Impact Report, SU0014475 (2688)**

The San Joaquin County Environmental Health Department (EHD) recommends the following conditions as a part of developing this project: E-1

1. Any existing wells or septic systems to be abandoned shall be destroyed under permit and inspection by the EHD (San Joaquin County Development Title, Section 9-1110.3 & 9-1110.4) E-2

2. Any geotechnical drilling shall be conducted under permit and inspection by The Environmental Health Department (San Joaquin County Development Title, Section 9-1115.3 and 9-1115.6). E-3

Project: Draft Environmental Impact Report for South Stockton Commerce Center Project

District CEQA Reference No: 20211169

Dear Ms. Moore:

The San Joaquin Valley Air Pollution Control District (District) has reviewed the City of Stockton's (City) Draft Environmental Impact Report (DEIR) for South Stockton Commerce Center. Per the DEIR, the proposed project consists of the construction and operation of 6,091,551 square feet of industrial development, in addition to 140,350 square feet of commercial development on a 422.22 acre-site (Project). The Project is located west of the 99 Frontage Road and State Route 99, and east of Airport Way in Stockton, CA. F-1

The District offers the following comments:

1) **Assembly Bill 617**

Assembly Bill 617 requires CARB and air districts to develop and implement Community Emission Reduction Programs (CERPs) in an effort to reduce air pollution exposure in impacted disadvantage communities. The Project lies near one of the impacted communities in the State selected by the California Air Resources Board (CARB) under the Assembly Bill (AB) 617 (2017, Garcia) and has the potential to expose sensitive receptors to increased air pollution within the nearby impacted community. The Stockton CERP was adopted by the District's Governing Board in March 2021 and identifies a wide range of measures designed to reduce air pollution exposure. Therefore, in an effort to reduce air pollution exposure to the impacted disadvantaged community, the District recommends the City incorporate mitigation measures outlined in the Stockton CERP for the Project which can be found at: https://community.valleyair.org/media/2487/final-stockton-cerp-no-appendix-with-cover.pdf. F-2

2) Construction Emissions

The DEIR, specifically Table 3.3-7 (Construction Project Generated Tons per Year – Mitigated) identifies the maximum annual criteria pollutant emissions for a given year within the Project's estimated multi-year construction period. The DEIR specifically Table 3.3-7, should be revised to include the estimated criteria pollutant emissions for each construction year within the Project's estimated multi-year construction period and compare to the District's significance thresholds. This will fully demonstrate to the public the construction-related air quality impacts from the Project.

Additionally, construction air emissions are short-term emissions generated from construction activities such as mobile heavy-duty diesel off-road equipment. Since the Project's construction-related NOx emissions exceed District significance thresholds, the City should consider incorporating the below measure into the Project. F-3

Recommended Measure: To reduce impacts from construction-related diesel exhaust emissions, the Project should utilize the cleanest available off-road construction equipment, including the latest tier equipment.

3) Operational Emissions

The DEIR did not characterize an appropriate trip length distance for off-site heavy heavy-duty (HHD) truck travel. Based on the following factors: 1) the Project consists of industrial and commercial development and is expected to generate a high volume of HHD truck trips, and 2) HHD trucks generally travel further distances for distribution, it appears inaccurate to incorporate a default delivery trip length assumption of 7.3 miles as reflected in the California Emissions Estimator Model (CalEEMod) analysis. F-4

Based on the above, the Project operational emissions may be significantly underestimated. Therefore, the District recommends the DEIR be revised to include a discussion characterizing an appropriate trip length distance for HHD truck travel, and reflect the appropriate distance in the air quality emissions analysis for consistency.

4) Feasibility of implementing a Voluntary Emission Reduction Agreement

The Project's construction-related and operation-related emissions are expected to exceed District significance thresholds, resulting in a significant impact on air quality. F-5
Therefore, the DEIR should include a discussion on the feasibility of implementing a Voluntary Emission Reduction Agreement (VERA) for this Project.

A VERA is a mitigation measure by which the project proponent provides pound-for-pound mitigation of emissions increases through a process that develops, funds, and implements emission reduction projects, with the District serving a role of administrator of the emissions reduction projects and verifier of the successful mitigation effort. To implement a VERA, the project proponent and the District enter into a contractual agreement in which the project proponent agrees to mitigate project specific emissions by providing funds for the District's incentives programs. The funds are disbursed by the District in the form of grants for projects that achieve emission reductions. Thus, project-related impacts on air quality can be mitigated. Types of emission reduction projects that have been funded in the past include electrification of stationary internal combustion engines (such as agricultural irrigation pumps), replacing old heavy-duty trucks with new, cleaner, more efficient heavy-duty trucks, and replacement of old farm tractors. F-5 cont'd

In implementing a VERA, the District verifies the actual emission reductions that have been achieved as a result of completed grant contracts, monitors the emission reduction projects, and ensures the enforceability of achieved reductions. After the project is mitigated, the District certifies to the Lead Agency that the mitigation is completed, providing the Lead Agency with an enforceable mitigation measure demonstrating that project-related emissions have been mitigated. To assist the Lead Agency and project proponent in ensuring that the DEIR is compliant with CEQA, the District recommends the DEIR include an assessment of the feasibility of implementing a VERA.

5) Truck Routing

Truck routing involves the assessment of which roads HHD trucks take to and from their destination, and the emissions impact that the HHD trucks may have on residential communities and sensitive receptors. Based on the information provided, the Project consists of industrial and commercial development that is expected to generate a high volume of HHD truck trips (e.g. warehouses with deliveries).

The District recommends the City evaluate HHD truck routing within the scope of the Project, with the aim of limiting exposure of residential communities and sensitive receptors to emissions. This evaluation would consider the current truck routes, the quantity and type of each truck (e.g. Medium Heavy-Duty, HHD, etc.), the destination and origin of each trip, traffic volume correlation with the time of day or the day of the week, overall VMT, and associated exhaust emissions. The truck routing evaluation would also identify alternative truck routes and their impacts on VMT, and air quality. F-6

6) Cleanest Available Heavy Duty Trucks

The San Joaquin Valley will not be able to attain stringent health-based federal air quality standards without significant reductions in emissions from HHD trucks, the single largest source of NOx emissions in the San Joaquin Valley. The District's 2018 PM2.5 Plan includes significant new reductions from HHD trucks, including emissions reductions by 2023 through the implementation of CARB's Statewide Truck and Bus Regulation, which requires truck fleets operating in California to meet the 2010 standard of 0.2 g-NOx/bhp-hr by 2023. Additionally, to meet federal air quality attainment standards, the District's Plan relies on a significant and immediate transition of HHD fleets to zero or near-zero emissions technologies, including the near-zero truck standard of 0.02 g/bhp-hr NOx established by CARB. F-7

The Project will include industrial use development and is expected to generate a high volume of HHD truck trips per day (e.g. warehouses with deliveries). Therefore, the District recommends that the following measures be considered by the City for inclusion into the Project to reduce Project-related operational emissions:

- *Recommended Measure*: Fleets associated with operational activities utilize the cleanest available HHD trucks, including zero and near-zero (0.02 g/bhp-hr NOx) technologies.

7) Reduce Idling of Heavy Duty Trucks

The goal of this strategy is to limit the potential for localized PM2.5 and toxic air contaminant impacts associated with failure to comply with the state's Heavy Duty anti-idling regulation (e.g. limiting vehicle idling to specific time limits). The Project consists of industrial and commercial development that is expected to generate a high volume of HHD truck trips per day. The diesel exhaust from excessive idling has the potential to impose significant adverse health and environmental impacts. Therefore, the City should consider deploying strategies to ensure compliance of the anti-idling regulation, especially near sensitive receptors, and discuss the importance of limiting the amount of idling within/near the Project site. F-8

- *Recommended Measure*: Fleets limit vehicle idling pursuant to 13 CCR § 2485 and 13 CCR § 2480.

8) Electric On-Site Off-Road and On-Road Equipment

Since the Project consists of industrial and commercial development, the Project may have the potential to result in increased use of off-road equipment (i.e. forklifts) and/or on-road equipment (i.e. mobile yard trucks with the ability to move materials). The District recommends the following measure be considered by the City to incorporate electric or zero emission equipment used on-site for this Project. F-9

- *Recommended Measure*: All on-site service equipment (forklifts, pallet jacks, etc.) utilize zero-emissions technologies. F-9 cont'd

9) Health Risk Assessment

The District has reviewed the Project's Health Risk Assessment (HRA) and offers the following comments:

- The point source parameters included in the AERMOD model were the same for HHD truck transport refrigeration units (TRUs) and for HHD truck idling. The HRA should be revised to ensure TRU point source parameters reflect the Project's specific TRU dimensions and parameters. Please reference the District's Modeling Guidance for example TRU source parameters, which can be found at: https://www.valleyair.org/busind/pto/Tox_Resources/AirQualityMonitoring.htm#modeling_guidance

- The AERMOD model used the non-default regulatory terrain option, "flat." The HRA should be revised to ensure the default terrain option in AERMOD, "elevated," is used to estimate the potential risk of the Project's operational emissions on nearby sensitive receptors. F-10

- The AERMOD model excluded potential sensitive receptors south of the Project (e.g. residential units). The HRA should be revised to ensure all sensitive receptors near the Project are identified and included in the AERMOD model.

- Per Appendix B.3 (Analysis of Public Health Risks), the HRA assumed TRUs would operate 15 minutes per hour. However, TRUs are expected to operate for a longer duration. The HRA should include a discussion justifying the 15 minute per hour duration for TRUs. The HRA also identified that 15% of the total HHD trucks would have TRUs. The HRA should include the methodology used to determine the percentage of trucks with TRUs for the Project.

- Per Appendix B.3 (Analysis of Public Health Risks), the HRA utilized the average emission rate for summer and winter months assuming all HHD diesel trucks traveling to-and-from the Project site would be a 2009 or newer vehicle model. The HRA should include a discussion confirming and justifying the model years of all on-site HHD trucks associated with the Project.

- Per Appendix B.3 (Analysis of Public Health Risks), HHD truck off-site mobile emissions were not evaluated in the HRA for the Project. Therefore, the HRA should include mobile emissions associated with HHD trucks trips traveling 0.25 miles outside of the Project area, per the District Modeling Guidance.

- Per Appendix 1 (Emission Calculations), the HRA included emission rates (g/mile) associated with speed bins 10 and 30 miles per hour to calculate on-site HHD truck travel using the EMFAC2017 database. However, the District the HRA should be revised to include the average emission rate for the speeds 5, 10, 15, 20, and 25 miles per hour to calculate the operational on-site HHD truck travel emissions, per the District Modeling Guidance.

- Per Appendix 1 (Emission Calculations), the HRA included emission rates for operational mobile emissions assuming operation would begin in 2040. However, operation may occur before full-buildout is complete for the Project. Therefore, the District recommends that the HRA be revised to ensure operational emissions are assessed at the first year of operational use.

F-10 cont'd

- If the Project is expected to buildout in phases, the HRA should reflect the subsequent phase buildout for construction and operational emissions. Additionally, after each subsequent phase, newly added receptors to the area should be included in the AERMOD model.

- Since construction is expected to occur over a 20-year period, diesel particulate matter (DPM) exhaust emissions are expected to cause long-term and short-term health impacts for nearby sensitive receptors. Therefore, the HRA should be revised to ensure cancer risk, as well as chronic and acute hazard index scores, are evaluated for nearby sensitive receptors for construction related DPM exhaust mobile emissions.

- The HARP2 model for the HRA excluded homegrown produce as a pathway for toxic emissions. The HRA should be revised to include homegrown produce as a pathway in the HARP2 model, per District policy APR 1906 (Framework for Performing Health Risk Assessments), which can be found at: https://www.valleyair.org/policies_per/Policies/APR-1906.pdf.

- The HARP2 model for the HRA applied “fraction of time” at residences for the inhalation pathway exposure. The HRA should be revised to ensure the applied “fraction of time” at residences is not selected in the HARP2 model, per District policy APR 1906 (Framework for Performing Health Risk Assessments), which can be found at: https://www.valleyair.org/policies_per/Policies/APR-1906.pdf.

- The HARP2 model used the residential receptor type for the worker cancer risk assessment. The HRA should be revised to ensure the worker receptor type is used in the HARP2 model when evaluating the cancer health risk, chronic, and acute hazard index scores for nearby worker receptors. Additionally, the HRA should be revised to include a worker adjustment factor in the HARP2 model that reflects the Project operating schedule. For example, if the Project operates 7 days a week, 8 hours a day, and 52 weeks a year, the worker adjustment factor of 4.2 should be applied in the HARP2 model.

F-10 cont'd

Based on the above comments, the District recommends the HRA be revised to ensure the analysis adequately assesses the Project’s potential health impacts to nearby sensitive receptors.

10) Ambient Air Quality Analysis

An Ambient Air Quality Analysis (AAQA) uses air dispersion modeling to determine if emission increases from a project will cause or contribute to a violation of State or National Ambient Air Quality Standards. Since the Project’s emissions exceed 100 pounds per day, an AAQA should be performed for the Project.

F-11

Specific information for assessing significance, including screening tools and modeling guidance, is available online at the District’s website: www.valleyair.org/ceqa.

11) Vegetative Barriers and Urban Greening

There are residential units located southeast and west of the Project. The District suggests the City consider the feasibility of incorporating vegetative barriers and urban greening as a measure to further reduce air pollution exposure on sensitive receptors (e.g. residential units).

F-12

While various emission control techniques and programs exist to reduce air quality emissions from mobile and stationary sources, vegetative barriers have been shown to be an additional measure to potentially reduce a population’s exposure to air pollution through the interception of airborne particles and the update of gaseous pollutants. Examples of vegetative barriers include, but are not limited to the following: trees, bushes, shrubs, or a mix of these. Generally, a higher and thicker vegetative barrier with full coverage will result in greater reductions in downwind pollutant concentrations. In the same manner, urban greening is also a way to help improve air quality and public health in addition to enhancing the overall beautification of a community with drought tolerant low maintenance greenery. F-12 cont'd

12)Clean Lawn and Garden Equipment in the Community

Since the Project consists of commercial development, gas-powered commercial lawn and garden equipment have the potential to result in an increase of NOx and PM2.5 emissions. Utilizing electric lawn care equipment can provide residents with immediate economic, environmental, and health benefits. The District's Clean Green Yard Machines (CGYM) program, which provides incentive funding for replacement of existing gas powered lawn and garden equipment. The District suggests the Project consider the feasibility of utilizing electric lawn care equipment. More information on the District CGYM program and funding can be found at: http://www.valleyair.org/grants/cgym.htm
and http://valleyair.org/grants/cgym-commercial.htm. F-13

13)On-Site Solar Deployment

It is the policy of the State of California that renewable energy resources and zero-carbon resources supply 100% of retail sales of electricity to California end-use customers by December 31, 2045. While various emission control techniques and programs exist to reduce air quality emissions from mobile and stationary sources, the production of solar energy is contributing to improving air quality and public health. The District suggests that the City consider incorporating solar power systems as an emission reduction strategy for the Project. F-14

14)Charge Up! Electric Vehicle Chargers

To support further installation of electric vehicle charging equipment and development of such infrastructure, the District offers incentives to public agencies, businesses, and property owners of multi-unit dwellings to install electric charging infrastructure (Level 2 and 3 chargers). The purpose of this incentive program is to promote clean air alternative-fuel technologies and the use of low or zero-emission vehicles. The District suggests that the City and Project proponents consider the feasibility of installing electric vehicle chargers for this Project. F-15

Please visit www.valleyair.org/grants/chargeup.htm for more information.

15)District Rules and Regulations

The District issues permits for many types of air pollution sources and regulates some activities not requiring permits. A project subject to District rules and regulation would reduce its impacts on air quality through compliance with regulatory F-16 requirements. In general, a regulation is a collection of rules, each of which deals with a specific topic. For example, *Regulation II - Permits* encompasses multiple rules associated with the permitting of emission sources such as Rule 2010 (Permits Required), Rule 2201 (New and Modified Stationary Source Review), and others. F-16 cont'd

15a) District Rule 9510 - Indirect Source Review

The purpose of District Rule 9510 (Indirect Source Review) is to reduce the growth in both NOx and PM10 emissions associated with development and transportation projects from mobile and area sources associated with construction and operation of development projects. The rule encourages clean air design elements to be incorporated into the development project. In case the proposed project clean air design elements are insufficient to meet the targeted emission reductions, the rule requires developers to pay a fee used to fund projects to achieve off-site emissions reductions.

The DEIR states, specifically Mitigation Measure 3.3-1 "*…each project applicant shall coordinate with the SJVAPCD to ensure compliance with Rule 9510 for both operational and construction emissions. The intent is that each phase of development would demonstrate that in the individual project does not exceed the applicable SJVAPCD criteria pollutant thresholds for each project operations or construction. If the SJVAPCD criteria pollutant emissions for an individual project is exceeded, the project applicant shall develop a reasonably feasible offsite mitigation strategy to reduce long-term air quality impacts to below the applicable SJVPACD thresholds of significance. This may consist of fee payments to the SJVAPCD for their use in funding offsite mitigation strategies.*" F-17

To clarify, the entire Project is subject to District Rule 9510 because it will receive a project-level discretionary approval from a public agency and will equal or exceed 25,000 square feet of light industrial space. When subject to the rule, an Air Impact Assessment (AIA) application is required no later than applying for project-level approval from a public agency. In this case, if not already done, please inform the Project proponent to immediately submit one AIA application covering the entire Project to the District to comply with District Rule 9510.

In addition, per section 2.5.2 of District Rule 9510, "*non-residential projects with contiguous or adjacent property under common ownership of a single entity in whole or in part, that is designated and zoned for the same development density and land use, and has the capability to accommodate development projects emitting more than two (2.0) tons per year of operational NOx or PM10 when determining applicability of the rule under Section 2.1,…,are subject to this rule. Single parcels where the individual building pads are to be developed in phases <u>must base emissions on the potential development of all pads when</u>*

determining the applicability of this rule." Additionally section 9.0 of District Rule 9510 provides criteria for notifying the District in a scenario for which a portion of the Project changes ownership.

An AIA application is required and the District recommends that demonstration of submitting the AIA application to the District, before issuance of the first building permit, be made a condition of Project approval. F-17 cont'd

- Information about how to comply with District Rule 9510 can be found online at: http://www.valleyair.org/ISR/ISRHome.htm.

- The AIA application form can be found online at: http://www.valleyair.org/ISR/ISRFormsAndApplications.htm

15b) District Rules 2010 and 2201 - Air Quality Permitting for Stationary Sources

Stationary Source emissions include any building, structure, facility, or installation which emits or may emit any affected pollutant directly or as a fugitive emission. District Rule 2010 (Permits Required) requires operators of emission sources to obtain an Authority to Construct (ATC) and Permit to Operate (PTO) from the District. District Rule 2201 (New and Modified Stationary Source Review) requires that new and modified stationary sources of emissions mitigate their emissions using Best Available Control Technology (BACT). F-18

This Project may have certain activities subject to District Rule 2010 (Permits Required) and Rule 2201 (New and Modified Stationary Source Review) and may require District permits.

Prior to commencing construction on any permit-required equipment or process, a finalized ATC must be issued to the Project proponent by the District. For further information or assistance, the Project proponent may contact the District's Small Business Assistance (SBA) Office at (209) 557-6446.

15c) District Rule 9410 (Employer Based Trip Reduction)

The Project may be subject to District Rule 9410 (Employer Based Trip Reduction) if the project would result in employment of 100 or more "eligible" employees. District Rule 9410 requires employers with 100 or more "eligible" employees at a worksite to establish an Employer Trip Reduction Implementation Plan (eTRIP) that encourages employees to reduce single-occupancy vehicle trips, thus reducing pollutant emissions associated with work F-19 commutes. Under an eTRIP plan, employers have the flexibility to select the options that work best for their worksites and their employees.

Information about District Rule 9410 can be found online at: www.valleyair.org/tripreduction.htm.

For additional information, you can contact the District by phone at 559-230-6000 or by e-mail at etrip@valleyair.org.

F-19 cont'd

15d) District Rule 4002 (National Emissions Standards for Hazardous Air Pollutants)

In the event an existing building will be renovated, partially demolished or removed, the Project may be subject to District Rule 4002. This rule requires a thorough inspection for asbestos to be conducted before any regulated facility is demolished or renovated. Information on how to comply with District Rule 4002 can be found online at: http://www.valleyair.org/busind/comply/asbestosbultn.htm.

F-20

15e) District Regulation VIII (Fugitive PM10 Prohibitions)

The Project proponent may be required to submit a Construction Notification Form or submit and receive approval of a Dust Control Plan prior to commencing any earthmoving activities as described in Regulation VIII, specifically Rule 8021 – *Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities.*

The application for both the Construction Notification and Dust Control Plan can be found online at: https://www.valleyair.org/busind/comply/PM10/forms/DCP-Form.docx

Information about District Regulation VIII can be found online at: http://www.valleyair.org/busind/comply/pm10/compliance_pm10.htm

F-21

15f) Other District Rules and Regulations

The Project may also be subject to the following District rules: Rule 4102 (Nuisance), Rule 4601 (Architectural Coatings), and Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving and Maintenance Operations).

The list of rules above is neither exhaustive nor exclusive. Current District rules can be found online at: www.valleyair.org/rules/1ruleslist.htm. To identify other District rules or regulations that apply to this Project or to obtain information about District permit requirements, the applicant is strongly encouraged to contact the District's SBA Office at (209) 557-6446.

F-22

16)<u>District Comment Letter</u> F-23

The District recommends that a copy of the District's comments be provided to the Project proponent.

If you have any questions or require further information, please contact Diana Walker by e-mail at Diana.Walker@valleyair.org or by phone at (559) 230-5820. F-24

Re: South Stockton Commerce Center Project Draft Environmental Impact Report

The Delta-Sierra Group reviewed the Notice of Preparation/Initial Study (NOP/IS) and submitted comments on 10.27.2020 for the South Stockton Commerce Center Project. As will be explained later in our comments we only came to learn of the availability of Draft Environmental Impact Report (DEIR) on 12.28.2021. The South Stockton Commerce Center Project is for the planned industrial development of 437.45 acres of agricultural lands located off Airport Way immediately north of the confluence with French Camp Slough and the North Fork of Little John's Creek.

SETTING

G-1

PROPOSED PROJECT

The Project includes a Tentative Map for the 437.45-acre site to create 13 development lots, two basin lots, one park lot, one open space lot, and one sewer pump station lot.

TABLE 2.0-2: SSCC LAND USE SUMMARY

LAND USE	ACREAGE (NET)	TOTAL SQUARE FEET PER LAND USE	FLOOR AREA RATIO	MAXIMUM SQUARE FEET
Commercial	11.0	467,834	0.30	140,350
Industrial[1]	298.0	12,960,747	0.47	6,091,551
Open Space	54.0	--	--	--
Public Facilities (Storm Basins, Outfall and Pump Stations)	41.0	--	--	--
Roadway Right of Way	18.2	--	--	--
TOTAL	**422.2**	--	--	**6,231,901**

NOTE: FOR PURPOSES OF THE ENVIRONMENTAL ANALYSIS, A RANGE OF INDUSTRIAL USES IS ASSUMED. THESE USES INCLUDE GENERAL LIGHT INDUSTRIAL, INDUSTRIAL PARK, WAREHOUSING, MINI-WAREHOUSE, HIGH-CUBE TRANSLOAD AND SHORT-TERM STORAGE WAREHOUSE, HIGH-CUBE FULFILLMENT CENTER WAREHOUSE, HIGH-CUBE PARCEL HUB WAREHOUSE, AND HIGH-CUBE COLD STORAGE WAREHOUSE.

G-2

The DEIR does not include a full disclosure of impacts for this speculative and discretionary project. A final and definitive site plan is not currently proposed. Planned mitigation and environmental impact analysis is based on a conceptual site plan which underestimates impacts and fails to address cumulative impacts resulting from the operation of the Project.

All mitigation must be paid for before any permit is issued. This is a speculative project with several owners to be involved in the future. Without a final definitive site plan and the piecemeal analysis of impacts proposed for the 13 individual projects, the public will not have an opportunity to evaluate whether or not the mitigation measures are adequate for the individual projects. CEQA provides a seat at the table whereas the review of individual projects would not likely be at a level that would require public notice and engagement. If the DEIR is not significantly modified to address our comments and those of others and recirculated, the FEIR will include mitigation measures deemed acceptable by the City of Stockton through 2045 and pose an environmental burden on already burdened residents.

Mitigations proposed in the DEIR should not be static but requirements adjusted as conditions change related to future climate, groundwater, flooding, transportation, or air quality that will warrant additional mitigation during Project development of this speculative project.

The City of Stockton must release the mitigation monitoring and reporting results to the public throughout the development process.

COMMUNITY INVOLVEMENT

An email was sent to the City of Stockton contact for the Project, Nicole Moore on 3.19.2021 to follow up on the NOP/IS comments submitted on 10.25.2020[1]. This 3.19.2021 email expressed concerns about notification for the release of a draft environmental impact report and to provide a link for the Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act[2] which included best practices relating to community engagement. G-3

[1] https://www.sierraclub.org/sites/www.sierraclub.org/files/sce-authors/u14441/NOP_South_Commerence_10272020_F.pdf
[2] https://oag.ca.gov/sites/all/files/agweb/pdfs/environment/warehouse-best-practices.pdf

A subsequent email to the City of Stockton Project contact, Nicole Moore was sent on 3.19.2021 to follow up on the City of Stockton's 3.19.2021 response to our initial email of 3.19.202. This subsequent email requested clarification regarding the City of Stockton's CEQA process, ASK Stockton noticing, and the City of Stockton's CEQA process to comply with CEQA Guidelines. A suggestion was also made that the city as part of required outreach convene a committee to discuss possible city-specific adopted measures. No response to this email was received.

Yesterday, 12.28.2021, in the process of investigating a proposed housing project identified on a map, we discovered that the DEIR review periods for a similar type of project, Mariposa Industrial Park and for the South Stockton Commerce Center Project had ended. The Mariposa Industrial Park Project was completely unknown to the Delta-Sierra Group because two public notices in the newspaper were missed. We requested in the 10.25.2020 correspondence to the City of Stockton that we be placed on a CEQA notification list, as will be further described below. This 10.25.20 request was ignored.

The City of Stockton's continued reliance on the minimum public notice of CEQA projects or public hearings ignores the reality of residents' ability to engage in community affairs as volunteers. The process of public notice involves publishing a public notice in a newspaper of largest general circulation, notifying the State Clearinghouse at the California Office of Planning and Research, and providing a public notice to the San Joaquin County Recorder-Clerk's Office. The Clerk's Office places a paper copy of the notice on a second-floor wall where their office is located, for public viewing during office hours of 8:00 AM to 5:00 PM. G-3 cont'd

The purpose of the California Environmental Quality Act (CEQA)[3] is to:

- Prevent or minimize significant, avoidable damage to the environment.
- Disclose potential environmental effects of a proposed discretionary project, through a variety of publicly accessible documents.
- Encourage public participation in the environmental review and decision-making process.
- Ensure transparency in governmental decision-making process.

The CEQA Guidelines that were most recently published included the following statement:

> § 15087. Public Review of Draft EIR[4]
>
> (a) Notice shall be mailed to the last known name and address of all organizations and individuals who have previously requested such notice in writing.

In our 10.27.2020 comment letter the Delta-Sierra Group stated the following in writing:

> Please add the Delta-Sierra Group to your CEQA notification list. We became aware of the project through a CEQAnet link from a colleague. Please let us know if there is to be any public meeting regarding this project and when the draft environmental impact report becomes available to review. If you have any questions, you may contact me by email mebeth@outlook.com.

[3] https://www.conservation.ca.gov/dlrp/Pages/CA-Environmental-Quality-Act-(CEQA)-.aspx
[4] http://files.resources.ca.gov/ceqa/docs/2018_CEQA_FINAL_TEXT_122818.pdf

The DEIR included the following statements

> "Additionally, a public scoping meeting was held during the public review period to solicit recommendations for a reasonable range of alternatives to the proposed Project. No specific alternatives were recommended by commenting agencies or the general public during the NOP public review process."

We specifically asked for notification of a public meeting and no notification was provided by the City of Stockton. Additionally, the website where the South Stockton Commerce Center Project CEQA documents are found includes no notice of a specific public scoping meeting[5].

The DEIR included the NOP/IS notice which included the following statements:

> "A responsible agency, trustee agency, or other public agency may request a meeting with the City of Stockton or its representatives in accordance with Section 15082(c) of the CEQA Guidelines. A public scoping meeting and neighborhood meeting will be held during the public review period as follows:
>
> > 1. Virtual Scoping and Neighborhood Meeting: To obtain the call-in and access information please RFVP with Nicole Moore, Acting Current Planning Manager at Nicole.Moore@stocktonca.gov."

G-4

Our 10.27.2021 letter which was conveyed by email to Nicole.Moore@stocktonca.gov specifically requested to learn of the time for a public meeting. We were never notified of the time and date for this proposed public scoping and neighborhood meeting.

No notification of DEIR availability was provided by the City of Stockton, and we only learned of the DEIR availability on 12.28.2021 and initiated review and developed comments presented below. We hope that these comments will be included and considered when developing a revised DEIR or a Final Environmental Impact Report (FEIR) as the official comment period only ended on 12.14.2021.

DEIR Identified Impacts and Proposed Mitigation Measures

Aesthetics and Visual Resources Mitigation Measure 3.1-1

The Project proposes approximately 54 acres of open space areas within the site, which will include approximately seven acres of open space in which a portion of it will be for a habitat setback area located east of the UPRR, south of the future Commerce Drive and along French Camp Slough. The remaining 47 acres of open space area is associated with the French Camp Slough drainage area. Additional open space is needed to accommodate flood flows on the North Fork of Little John's Creek.

G-5

We are concerned with the newly proposed restriction on wildlife habitat setback area adjacent to the UPRR tracks. The restrictions on wildlife movement which construction of the proposed Project poses could create a situation where a protected wildlife corridor is needed to avoid increased wildlife kills due to rail or truck traffic. Additional habitat setback area is needed.

This open space is vital for localized wildlife habitat and must be protected from impacts related to the implementation of industrial/commercial future plans. A future lighting plan is to be submitted to the City of Stockton for review and should be made available for public review especially those that are wildlife and habitat experts to determine if the proposed plan will interfere with localized wildlife

[5] http://www.stocktonca.gov/government/departments/communityDevelop/cdSouth.html pdf created

activities. Lighting mitigation of impacts related to wildlife habitat is not the same as lighting mitigation in an urbanized setting. Additional lighting mitigation is necessary.

There is a proposed grade-separated overpass of the UPRR line and a proposed railroad spur line to provide rail access throughout the Project. Designs of overpasses that are aesthetically pleasing can add significantly to the sense of place. Additionally, the proposed new road, Commerce Drive, is proposed to have a 78-foot right-of-way with one 16-foot traffic lane in each direction, and a 16-foot center turn lane. Five-foot landscaped areas would separate the traffic lanes from the 8-foot sidewalks on both the north and south sides of the road. All landscaping must be maintained by the Project proponent so as not to put further burdens on City of Stockton residents to fund on-going maintenance relating to this discretionary project. Onsite vegetation should also be considered to provide shading and reduce the heat island effect associated with the proposed asphalt paving as well as vegetative buffers between the Project and residential areas can help to reduce pollutant dispersal.

G-5 cont'd

Agricultural Resources Mitigation Measure 3.2-1

The proposed Project will result in the conversion of farmland including prime farmland and farmland of statewide importance as indicated by the Department of Conservation Land Division in their NOP/IS comments available to the public[6].The San Joaquin County Multi-Species Habitat Conservation and Open Space Plan specifically addresses loss of habitat not loss of agricultural activities on agricultural lands[7]. There are different fees related to habitat potential with a category for agricultural lands.

All of the existing land is in active agricultural uses and should require both City of Stockton Agricultural Land Mitigation (1:1)[8] and San Joaquin County Habitat Mitigation based on a San Joaquin County Council of Government (SJCOG) biological study to determine mitigation level. The City of Stockton Agricultural Land Mitigation program was not referenced as part of the required mitigation.

Agricultural Land Mitigation Impact Fee - Central Valley Farmland Trust (CVFT): Under Municipal Code section 16-355.270, the City of Stockton has the authority to establish a Public Facilities Fee Program (PFF) on new development. In 2003, City Council approved resolution #2003-04-03-0105, establishing the PFF schedule. In 2007, the City Council agreed (through Council resolution #2007-02-07-0079) to add Agricultural Land Mitigation Fee to its Public Facilities Fee Program.

G-6

The City of Stockton Agricultural Land Mitigation Fee is collected for all applicable new development projects that would result from the conversion of important farmland, as defined by California Department of Conservation, into urban uses. All Agricultural Land Mitigation fees collected pursuant to the agreement should be remitted to Central California Farmland Trust. The Central Valley Farmland Trust is the land trust that facilitates the placement of agricultural conservation easements to fulfill farmland mitigation requirements in the Central Valley.

The Central Valley Farmland Trust does not fulfill the habitat mitigation required under the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan and the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan mitigation does not mitigate for the loss of agricultural production. Both mitigations should be required. The mitigation monitoring and reporting should include a full disclosure of agricultural land mitigation and should be readily available to the public.

[6] https://files.ceqanet.opr.ca.gov/264972-2/attachment/dv3sIblipUFd4VLrSuQGv7_BAFl5DauZjy-ZTT4RRtvMnYAvi9wC9xnbsdw9iaT_aegytYiiJ2hSU5GJ0
[7] https://www.sjcog.org/288/Habitat-Frequently-Asked-Questions
[8] https://www.calandtrusts.org/wp-content/uploads/2014/03/Overview-of-Legal-Restains-on-Ag-Land-Mit-Programs.pdf

Agricultural land mitigation only ensures that some other agricultural land cannot be easily developed through a conservation easement. Agricultural land mitigation does not create new agricultural land. Once the land is developed it is unlikely ever to return to food production.

We disagree that the Impact 3.2-2, relating to the conversion of nearby farmland to non-agricultural uses, is less than significant. The conversion of this land to non-agricultural uses will create additional development pressures on the surrounding farmland and should have been evaluated in the DEIR. For example, increased truck traffic will hinder agricultural operations that use the roadways. Monitoring of adjacent farmed land should be conducted throughout the life of the Project and if further agricultural lands are converted then the South Stockton Commerce Center Project proponents, developers, landowners should pay for additional agricultural land mitigation. G-6 cont'd

The conversion of this especially important agricultural land not only will have an effect on local food security, as row crops are food crops, but will significantly affect existing flood buffering, wildlife habitat, and water infiltration. The environmental analysis of the no Project alternative should have characterize the positive attributes which will be lost, if developed as described. Removing agricultural land removes the natural climate change attenuator that soils can serve also affecting the City of Stockton's ability to reduce carbon dioxide levels in the atmosphere through carbon sequestration.

Air Quality Mitigation Measure 3.3-1

The measures proposed relating to the San Joaquin Valley Air Pollution Control District Rule 9510 should have included more than just the offsite mitigation strategies proposed. The stated purposes of Rule 9510[9] include:

- Fulfill the District's emission reduction commitments in the PM10 and Ozone Attainment Plans.
- Achieve emission reductions from the construction and use of development projects through design features and on-site measures.
- Provide a mechanism for reducing emissions from the construction of and use of development projects through off-site measures.

No onsite operational measures were included to reduce emissions relating to the Project's proposed operation that is expected to generate a minimum of 22,633 daily vehicle trips, including 5,552 daily heavy-duty truck trips, along local roadways, except for some onsite mitigations of some construction activities. Onsite measures such as requiring on-site equipment, such as forklifts and yard trucks, to be electric, requiring all heavy-duty vehicles entering or operated on the project site to be zero emission beginning in 2030, constructing electric truck charging stations and electric plugs for electric transport refrigeration units are reasonable on-site requirements that should have been proposed in the DEIR. Without these onsite measures, the Project will add to the residents of Stockton already high pollutant burden. G-7

The only mention of zero emission vehicles in the DEIR was that some employees may use electric vehicles. Anti-idling measures were not included nor were any vegetative barriers planned as mentioned previously. Furthermore, the emissions may have been underestimated because it is likely that trip lengths will be greater than 10 miles relating to other nearby logistical centers in the Bay Area or beyond and the proposed rail connections. In our NOP/IS comment letter we identified problems with previous emission modeling performed by the City of Stockton's consultant and specifically

[9] https://www.valleyair.org/rules/currntrules/r9510-a.pdf

requested that best practices put forth by the California Air Resources Board be used for emission modelling:

> Again, evaluating impacts is challenging for a project that is not well defined. Recently, the City of Stockton used CalEEMod fleet mix defaults to estimate a project's mobile source air pollutant emissions and was notified that the mileage used required revisions. When performing air emission analyses and traffic impact studies a reasonable estimate of heavy-duty truck trips commensurate with the proposed project's size and location is necessary. Please be very clear and concise when disclosing the parameters used during emissions and traffic analyses.

The characterization of the Project's operational mobile source air emissions does not include analyses with supporting evidence that assumptions made will be protective of public health and the environment. G-7 cont'd

The City of Stockton did not include a maximum vehicle mile traveled for the Project to cap emissions. The DEIR did not describe how the process between the City of Stockton and the San Joaquin Valley Air Pollution Control District would be transparent while offsite mitigation strategies proposed on a project-by-project basis are reviewed and approved.

The proposed mitigation measures include a piecemeal analysis by considering each phase of development separately. Cumulative impacts occur as each "individual project" is developed. Mitigation of these individual projects will only be implemented if the pollutant threshold for an individual project is exceeded. This piecemeal method of impact analysis neglects cumulative air quality impacts associated with the full development that will occur if the existing DEIR is not significantly updated with further mitigation measures and recirculated for review.

Air Quality Construction Phase

Mitigation Measure 3.3-3, 3.3-4, 3.3-5

These mitigation measures relate primarily to dust and soil erosion/tracking controls and paving but does not address the heavy diesel equipment that will be used onsite and offsite to transport soil related to site flood mitigation grading activities and this heavy diesel equipment will be generating toxic air pollutants. G-8

Air quality impacts are not adequately characterized to disclose potential effects or to prevent or minimize significant, avoidable damage to the environment.

Cultural and Tribal Resources

Mitigation Measure 3.5-1

The mitigation proposes that a qualified archaeologist shall conduct pre-construction worker cultural resource sensitivity training. The Northern Valley Yokuts representative should be present during this training and records maintained for all construction workers in attendance. This training should be offered periodically throughout the construction process as onsite construction workers change. G-9

Mitigation Measure 3.5-2

The mitigation measure states only that a Native American monitor may be required if the archaeologist determines that Native American resources are identified. The Northern Valley Yokuts Tribal representative requested that in accordance with their policies that a tribal monitor should be present for all ground disturbing activities. Having a Native American monitor present when Native American G-10 resources have been identified should not be optional, but should be required, and paid for by the Project proponents. G-10 cont'd

Mitigation Measure 3.5-3

The mitigation measure proposes two separate processes involving the San Joaquin County Coroner. One places the San Joaquin County Coroner as the responsible party to contact the Native American Heritage Commission to identify a descendant. If no descendant is identified, the San Joaquin County Coroner may make a recommendation to the landowner or the person responsible for the excavation work to treat or dispose of the human remains and any associated grave goods without further Native American consultation.

The San Joaquin Coroner should be informed to determine that no further investigation of the cause of death is required. Once the Coroner has determined that there is no need for investigating the cause of death, the Native American monitor or the proper descendant of the deceased individual should propose proper reburial either onsite or an alternative location preferred by the Native American tribal representative in consultation with the Native American Heritage Commission. G-11

The City of Stockton or its authorized representative should not be allowed to reject the wishes of a descendant, or the Native American Heritage Commission measures be allowed to be rejected by the landowner, and those entities make the decision of reburial location on their own. Everyone must work together to come upon a mutually agreeable solution and communication should begin in advance of the construction process and on-going, so the City of Stockton, landowner, or Project proponent is not left with an "urgent" situation that occurs due to the lack of advanced communication and planning.

A Native American monitor, descendant, and an archaeology if recommended by the Native American monitor should oversee reburial in a mutual agreeable location that is not subject to further subsurface disturbance. The Project is located on unceded Northern Valley Yokuts lands.

Geology and Soils Mitigation Measure 3.6-2

The mitigation calls for a qualified paleontologist to evaluate any paleontological resources found during grading and construction activities. However, this mitigation fails to properly conduct pre-construction worker paleontological resource sensitivity training. This training should be required and training documents available for mitigation monitoring. G-12

Greenhouse Gases, Climate Change and Energy Mitigation Measure 3.7-1

The measures proposed to mitigate the greenhouse gases that will be generated are essentially the same as for air quality impacts and treats the Project in a piecemeal way ignoring cumulative impacts. Additionally, by treating the Project as individual projects it is more likely that these individual projects that will not exceed thresholds to require mitigation. Implementation of the Project as discussed in the DEIR will have a significant impact on goals set forth in the City of Stockton Climate Action Plan relating to proposed truck and rail transport associated with the 6 million plus square feet of industrial warehousing.

There were no mitigation measures proposed to reduce energy usage such as energy efficient lighting, use of other energy efficient equipment that are in use in a typical warehousing/commercial/industrial settings, installation of solar photovoltaic systems to equal the Project's energy needs, using electric on-site equipment warehousing equipment such as forklifts and yard trucks, and constructing electric truck charging and plug in stations suitable for heavy duty trucks and refrigeration units to reduce idling exhaust emissions. G-13

This is a speculative project that will significantly impact environmental resources. Additional greenhouse gas, climate change and energy mitigations are necessary so that Stockton residents do not bear solely the environmental burdens associated with the proposed Project.

The vehicle miles travelled that the proposed Project(s) would generate was not disclosed. We specifically requested this information in our NOP/IS comment letter.

> By July 1, 2020, public agencies evaluating the impact of development projects are required to use vehicle miles traveled (VMT) to evaluate transportation impacts. This change removes the focus on traffic at intersections and roadways immediately around project sites. Instead, the focus will be on how new development projects may influence the overall amount of automobile use.[10]

G-13 cont'd

Hydrology and Water Quality

The DEIR deemed Impact 3.9-2 as less than significant when in fact the construction of the proposed Project and the paving over of 350 acres has the potential to interfere substantially with groundwater recharge associated with the Project area and current land use such that the Project may impede sustainable groundwater management of the basin. The DEIR identified the Subbasin incorrectly as the Eastern San Joaquin River Groundwater Subbasin when the name of the Subbasin in which the Project is located is the Eastern San Joaquin Groundwater Subbasin. The Subbasin is critically overdrafted and the location of the current agricultural fields presents an opportunity to use flood flows to recharge our overdrafted aquifer and provide downstream flood protection. Lands adjacent to natural waterways are particularly good for cost effective groundwater recharge projects.

Furthermore, the DEIR deemed Impact 3.9-3 relating to drainage pattern changes due to the addition of impervious surfaces as less than significant without calculations estimating runoff under climate change scenarios with infrequent atmospheric river rainfall events causing substantial surface runoff, flooding, or surface runoff of polluted stormwater. Climate changes relating to global warming must be carefully considered especially relating to changes to precipitation patterns. Paved land has much higher runoff coefficients, as compared to the existing agricultural land use which has been shown to attenuate runoff and reduce flood risks. G-14

In fact, an additional General Plan Amendment and Rezoning of two areas will be necessary for the proposed Project due to limitations caused by the floodway along French Camp Slough. This floodway is a natural floodplain and a nexus facilitating the flow of floodwater from the waterway to adjacent lands lessening the flood risk to downstream residential areas.

Additional open space mitigation is needed to provide more floodway room for the North Fork of Little John's Creek along the southern boundary of the proposed Project.

Mitigation Measure 3.9.2 requires that prior to issuance of grading permits, the applicant and/or future Project proponent must submit a site-specific Project Stormwater Quality Control Plan to specify BMPs the Project will use to comply with State water quality regulations including those related to City of Stockton's Stormwater Management Plan. French Camp Slough joins the San Joaquin River in Stockton. The San Joaquin River is an impaired waterway and subject to regular hazardous algal blooms that are associated with heavy pollutant loading. The DEIR failed to fully disclose how the planned construction and operation of the 13 projects would result in a coordinated site plan to ensure that site runoff does not further impact the quality of water in our streams and rivers.

[10] https://dot.ca.gov/-/media/dot-media/programs/transportation-planning/documents/sb-743/2020-02-26-transmittal-and-draft-vmt-focused-tisg.pdf

Mitigation Measure 3.9-3 requires that prior to issuance of grading permits, the applicant shall obtain the local National Flood Insurance Program administrating community's approval and a CLOMR-based on fill followed by a Map update request. The DEIR stated that most of the Project site is located within the 100-Year designated FEMA Flood Zone and portions of the Project site adjacent to the French Camp Slough are designated within the Regulatory Floodway. Development within Regulatory Floodways are prohibited. The Project site is reportedly not within a 200-year flood zone. Senate Bill 5 requires all urban and urbanizing areas in the Sacramento and San Joaquin Valleys to achieve 200-year flood protection to approve development. The new law restricts approval of development after 2016 if "adequate progress" towards achieving this standard is not met. Urban and urbanizing areas protected by State-Federal project levees cannot use "adequate progress" as a condition to approve development after 2025. The City of Stockton just this year made a finding of adequate progress. G-14 cont'd

The DEIR stated that according to Stockton Municipal Code Title 16.90, new developments may be permitted in areas "of potential flooding of three feet or less from a storm event that has a 1-in-200 chance of occurring in any given year, from sources other than local drainage, in urban or urbanizing areas…" An analysis by a local engineering firm included in the DEIR as a draft report concluded that flooding of 3 feet or less is expected and they recommended elevation of grade. Whether or not this analysis evaluated an ever-increasing intensity of rainfall resulting from climate change conditions is unknown at this time. Greenhouse gases are responsible for climate change which the proposed Project failed to mitigate.

Transportation and Circulation Mitigation Measure 3.13-1

The proposed Mitigation Measure 3.3-1 includes some possible measures related to the San Joaquin Valley Air Pollution Control District Rule 9410[11] such as "incentives for project employees to utilize alternative transportation options such as buses, bicycles or electric vehicles." Rule 9410 is required whenever an employer exceeds 100 regular employees at a worksite. The treatment in the DEIR of the Project as one entity for analysis of impacts would infer that in the future once any of the individual 13 projects combined reach the threshold of 100 employees, a Trip Reduction Plan will be required.

The San Joaquin Valley Air Pollution Control District is the regulatory agency that is involved in the implementation of transportation demand management (TDM) strategies related to transport to the workplace from home. This transportation effort is small compared to the truck trips related to the operation of the proposed Project and effects on regional roadways. Mitigation should be required for ongoing impacts to city roadways relating to increased heavy duty truck travel which significantly increases roadway maintenance frequency and costs, especially related to the proposed noise reducing pavement. G-15

The same issues related to evaluating impacts for a project that is not well defined has made impossible an environmental analysis of local and regional transportation impacts. A railroad overpass proposed was not included in the mitigation measures.

The DEIR did not adequately describe existing and future transportation conditions relating to the vehicle mile traveled (VMT) associated with a logistical warehouse project of this size with access to rail and two highways. A detailed VMT analysis should have been conducted to determine if the Project would conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b). Without the Project there is no need for the construction of an overpass of the UPRR line.

[11] https://www.valleyair.org/Programs/Rule9410TripReduction/

The DEIR did not include a market analysis to investigate the need for up to 6,091,551 square feet of "employment-generating" industrial uses considering recently approved similar projects under development. There is active recruiting for existing warehouse jobs in our area which pay $15-$20/hour ($600 to $800/week) for full time work.

Governor Newson recently issued Executive Order N 82-20 announced on October 7, 2020[12]:

> "The science is clear that, in our existential fight against climate change, we must build on our historic efforts in energy and emissions and focus on our lands as well. California's beautiful natural and working lands are an important tool to help slow and avert catastrophic climate change, and today's executive order provides important new tools to take on this existential threat."

Ultimately, the lead agency will examine each of the environmental issues listed in the checklist… and decide whether the proposed Project has the potential to have a significant impact and what if any mitigation is to be required. If approved, a development agreement that is transferrable will be established without any defined Project. Without a defined Project it is very difficult to determine impacts which will result from this warehousing development. No clear responsible party for proposed mitigation measures was identified in the DEIR. Mitigation measures to be performed have mixed responsibilities: Project proponent vs. landowner vs. the persons responsible for excavation work throughout the DEIR.

G-15 cont'd

Land use is within the City of Stockton's regulatory purview and while the City of Stockton is not expected to enforce CARB or SJVAPCD standards. The City of Stockton's choice to approve projects with intense trucking and rail components means that the City of Stockton is adding new emission sources – like an attractive nuisance – which will increase the exposure of our residents to pollution. Mitigation is needed to reduce the impact of the Project and should be paid for by the developer not the residents of Stockton.

This Project is not vital for our recovery and the DEIR failed to provide sufficient details to determine the document's adequacy to describe the environmental costs associated with the Project.

Once again, please add the Delta-Sierra Group to your CEQA notification list. The requirements for public noticing are changing next year and we would welcome a conversation to provide our input. If you have any questions or wish to discuss ways that the City of Stockton could improve public outreach, you may contact me by email at mebeth@outlook.com.

Sincerely,

Mary Elizabeth M.S., R.E.H.S.

Re: South Stockton Commerce Center Project Notice of Preparation and Initial Study

The Delta-Sierra Group has reviewed the Initial Study for the planned industrial development located off Airport Way immediately north of the confluence with French Camp Slough and the North Fork of Little John's Creek. French Camp Slough continues through the southwestern part of the five parcels encompassing 437.45 acres of agricultural lands.

Setting

The five parcels are summarized below to help with understanding the discussion regarding General Plan Zoning Maps vs General Plan designations and a zone change designation. The information was obtained from San Joaquin County Assessors and City of Stockton Interactive Zoning Map[1]. There seems to be some discrepancies between the addresses cited in the Initial Study and City of

[1] https://stocktonca.mapgeo.io/datasets/properties?abuttersDistance=100&latlng=37.973764%2C-121.284422&themes=%22%5B%5C%22zoning%5C%22%5D%22&zoom=12

Stockton records (shown within parentheses). Additionally, there seems to be some discrepancies related to acreage sizes as illustrated below (shown within parentheses).

Parcel Table

APN	Address	Acres	Land value ($) SJC	Current SJC assessed use	City Zone	City General Plan
77-110-040	6110 S. Airport Way	218.29	4,357,515 (221.54 ac)	Irrigated row crop	IL (8210 S. Airport)	Industrial
177-100-030	7070 S. Airport Way	76.03	1,660,790 (80.81)	Irrigated row crop	OS (1865 E French Camp Road	Open Space/ Agricultural
177-110-050	6122 S. Airport Way	3.27	65,305	Irrigated row crop	IL (8222 S AIRPORT WY)	Industrial
201-020-010	9091 S. State Route FR 99	75.07	1,550,424 (73.74 ac)	Irrigated row crop	IL	Industrial
177-050-090	8606 S. Airport Way	64.79	1,289,060	Irrigated row crop	RH (Residential, High Density)	Industrial

The conversion of this especially important agricultural land not only will have an effect on local food security, as row crops are food crops, but will significantly affect existing flood buffering, wildlife habitat, and water infiltration. The environmental analysis of the no project alternative must characterize the positive attributes which will be lost, if developed as described in the Initial Study. Removing agricultural land removes the natural climate change attenuator that soils can serve also affecting the City's ability to reduce carbon dioxide levels in the atmosphere through carbon sequestration.

The Draft Environmental Report must include a market analysis to investigate the need for up to 6,091,551 square feet of "employment-generating" industrial uses considering recently approved similar projects under development. This maximum square footage is based on the Floor Area Ratio (FAR) of 0.47 for industrial uses including general light industrial, industrial park, warehousing, mini-warehouse, high cube transitional and short-term storage warehouse, high-cube fulfillment center warehouse, high-cube parcel hub warehouse and light-cube cold storage warehouse. There is active recruiting for existing warehouse jobs in our area which pay $15-$20/hour ($600 to $800/week) for full time work.

Agricultural Land Mitigation

All of the existing land is in active agricultural uses and should require both City of Stockton Agricultural Land Mitigation (1:1) and San Joaquin County Habitat Mitigation based on SJCOG biological study to determine mitigation level. The City of Stockton Agricultural Land Mitigation program was not referenced as part of the environmental analysis.

"Agricultural land or farmland" for the purposes of Agricultural Land Mitigation Guidelines means important farmland, as defined by the California Department of Conservation's Farmland Monitoring and Mapping Program (FMMP) and as shown on the most recent available FMMP map of San Joaquin County. Important farmland includes prime farmland, farmland of statewide significance, and unique farmland.

Agricultural Land Mitigation Impact Fee - Central Valley Farmland Trust (CVFT): Under Municipal Code section 16-355.270, the City has the authority to establish a Public Facilities Fee Program (PFF) on new development. In 2003, City Council approved resolution #2003-04-03-0105, establishing the PFF schedule. In 2007, the City agreed (through Council resolution #2007-02-07-0079) to add Agricultural Land Mitigation Fee to its Public Facilities Fee Program. The Ag. Mitigation Fee is collected for all applicable new development projects that would result from the conversion of important farmland, as defined by California Department of Conservation, into urban uses. All Ag. Mitigation fees collected pursuant to the agreement should be remitted to Central California Farmland Trust (CVFT).

City of Stockton
Public Facilities Fee Report (PFF)
FY 2018-19

CITY OF STOCKTON

Pass Through Fees Schedule - All Mitigation Fees

NOTES TO THE ANNUAL REPORT: Per California Government Code Section 66001(e), no refund of PFF fees.

Notes: All Mitigation Impact Fees apply to all fee areas and subject to additonal Administrative fee of 3.5%.

Agricultural Land Mitigation Fee Schedule:

		Effective Date 7/1/2017 Amount	Effective Date 7/1/2018 Amount
Non-Residential:	**Unit of Measure**		
Office / High Density	Per Acre of Net Parcel Area	$ 11,902.00	$ 11,902.00
Retail / Medium Density	Per Acre of Net Parcel Area	$ 11,758.00	$ 11,758.00
Warehouse / Low Density	Per Acre of Net Parcel Area	$ 10,494.00	$ 10,494.00
Residential:			
Single Family Units	Per Acre of Net Parcel Area	$ 14,352.00	$ 14,352.00
Multiple Family Units	Per Acre of Net Parcel Area	$ 12,841.00	$ 12,841.00
Guest Room	Per Acre of Net Parcel Area	$ 12,841.00	$ 12,841.00

For additional information or questions regarding to Ag. Land Mitigation Impact Fees, please contact CDD at (209) 937-8561.

Important Farmland Categories according to the State of California Department of Conservation

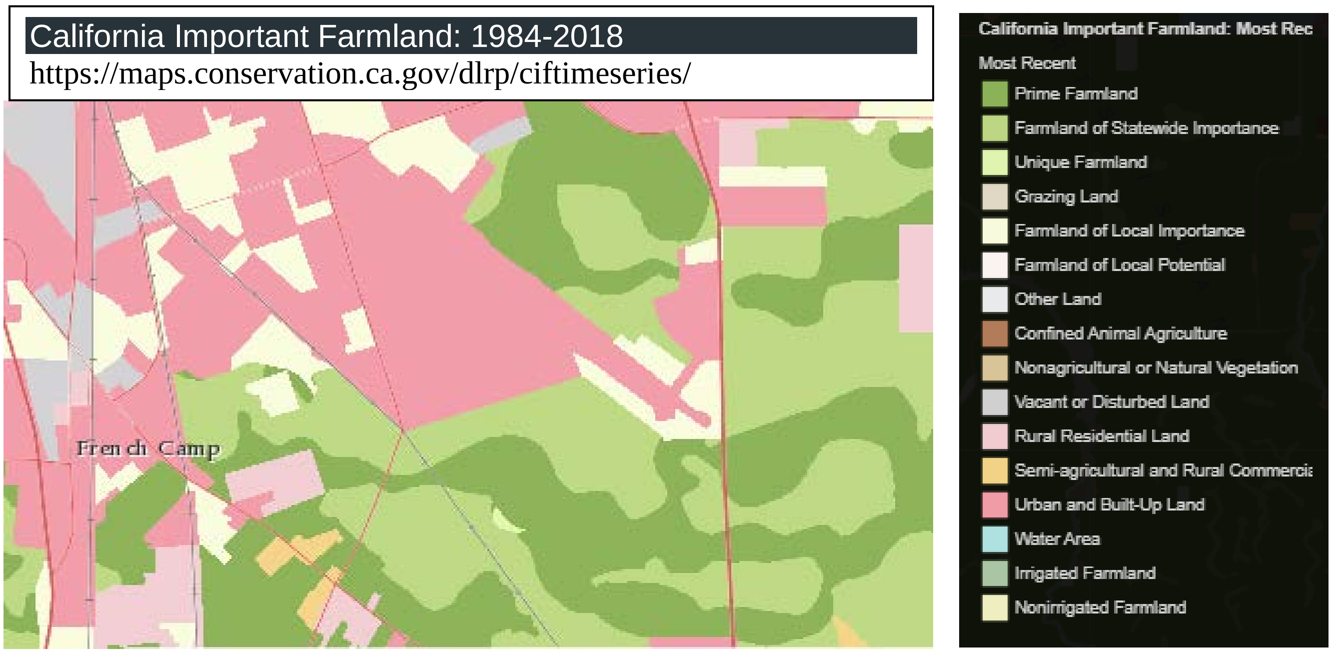
For environmental review purposes under CEQA, the categories of Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, and Grazing Land constitute 'agricultural land' (Public Resources Code Section 21060.1). The remaining categories are used for reporting changes in land use as required for FMMP's biennial farmland conversion report. Land must have been used for irrigated agricultural production at some time during the four years prior to the mapping date.

Prime Farmland (P)
Farmland with the best combination of physical and chemical features able to sustain long term agricultural production. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields.

Farmland of Statewide Importance (S)
Farmland similar to Prime Farmland but with minor shortcomings, such as greater slopes or less ability to store soil moisture.

Unique Farmland (U)
Farmland of lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated but may include non-irrigated orchards or vineyards as found in some climatic zones in California.

Farmland of Local Importance (L)
Land of importance to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee. In some counties, Confined Animal Agriculture facilities are part of Farmland of Local Importance (PDF), but they are shown separately.



Climate changes relating to global warming must be carefully considered especially relating to changes to precipitation patterns. Paved land has much higher runoff coefficients, as compared to the existing agricultural land use which has been shown to attenuate runoff and reduce flood risks. The draft EIR must include a full flood hazard analysis to the residential area downstream of the proposed outfall to French Camp Slough.

Governor Newson recently issued Executive Order N 82-20 announced on October 7, 2020[2]:

> "The science is clear that, in our existential fight against climate change, we must build on our historic efforts in energy and emissions and focus on our lands as well. California's beautiful natural and working lands are an important tool to help slow and avert catastrophic climate change, and today's executive order provides important new tools to take on this existential threat."

Agricultural land mitigation only ensures that some other agricultural land cannot be easily developed through a conservation easement. Agricultural land mitigation does not create new

---

agricultural land. Once the land is developed it is unlikely ever to return to food production. The costs associated with the loss of food production land must be analyzed in the draft EIR

The conversion of this land to non-agricultural uses will create additional development pressures on the surrounding farmland and this must be evaluated in the draft EIR.

Air Quality

The conversion of irrigated lands to paved industrial uses accessing SR-99, I-5, the Stockton Metropolitan Airport and rail lines is expected to potentially impact air quality in South Stockton. When considering mitigation measures please refer to the CARB Technical Advisory Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways[3].

(Adjust Font size) When assessing the Project's air pollution emissions from mobile sources use the emission factors found in CARB's latest EMFAC2017. These emission factors were updated from 2014 to provide the best available estimates of emission along with other site-specific variables which will be difficult to determine since the project is conceptual. Please include purple monitor data when evaluating local air quality conditions in the vicinity. Please provide descriptions of all zoned uses for the projects including general light industrial, industrial park, warehousing, mini-warehouse, high cube transitional and short-term storage warehouse, high-cube fulfillment center warehouse, high-cube parcel hub warehouse and light-cube cold storage warehouse. Any development agreements that would limit the amount of various zoned uses must be fully disclosed with complete descriptions of associated air emissions scenarios.

Ultimately, "the lead agency will examine each of the environmental issues listed in the checklist… and decide whether the proposed project has the potential to have a significant impact". This statement was found for each of the CEQA checklist type. The City of Stockton recently approved the conversion of agricultural land for a logistic center and made the finding that air quality will be improved.

If approved, a development agreement that is transferrable will be established without any defined project. Without a defined project it is very difficult to determine impacts which may result from development approved based on zoning. On previous similar projects there have been requests that a reasonable trip length for off-site heavy-heavy duty truck travel be used when analyzing emissions. The San Joaquin Valley AD will not be able to attain health based federal air quality standards without reductions in emissions from HHD which is the single largest source of NOX emissions in the San Joaquin Valley. Operational emissions for on-site sources must also be quantified.

EPA Air Quality Status[4]

pollutant	effec_rede	nonattain	class	part	population
1-Hour Ozone (1979)	- -	Yes	Extreme	W	685306
8-Hour Ozone (1997)	- -	Yes	Extreme	W	685306
8-Hour Ozone (2008)	- -	Yes	Extreme	W	685306

[4] https://www3.epa.gov/airquality/greenbook/anayo_ca.html

Community air quality can be linked to vehicular emissions

The SJVAPCD 2018 PM 2.5 Plan identifies how reductions can be achieved, through implementation of the CARB Statewide Truck and Bus Regulation. The regulation will apply to all truck fleets operating within California, including any fleets that may be associated with the proposed project. As stated, the regulation will require conformance with the identified CARB near-zero truck NOx emission standard.

Again, evaluating impacts is challenging for a project that is not well defined. Recently, the City of Stockton used CalEEMod fleet mix defaults to estimate a project's mobile source air pollutant emissions and was notified that the mileage used required revisions. When performing air emission analyses and traffic impact studies a reasonable estimate of heavy-duty truck trips commensurate with the proposed project's size and location is necessary. Please be very clear and concise when disclosing the parameters used during emissions and traffic analyses.

Land use is within the City's regulatory purview and while the City is not expected to enforce CARB or SJVAPCD standards the City's choice to approve projects with intense trucking and rail components means that it is adding new sources – like an attractive nuisance – which will increase the exposure of our residents to pollution. Mitigation is needed to reduce the impact of the project and should be paid for by the developer not the residents of Stockton.

Transportation

The same issues with regard to evaluating impacts for a project that is not well defined will confound the environmental analysis particularly if it is difficult to ascertain the estimates used when performing the transportation analyses.

> The EIR will describe existing and future transportation conditions and will analyze any potential conflicts with programs, plans, ordinances or policies addressing the circulation system. Potential impacts associated with site access, and on-site circulation will also be addressed in the EIR. A detailed vehicle mile traveled (VMT) analysis will be conducted to determine if the project would conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b). The VMT analysis would be completed consistent with the Office of Planning and Research's (OPR's) Technical Advisory on Evaluating Transportation Impacts in CEQA.

If the City of Stockton uses a full build out for the general plan designations then it is likely that regardless of the VMT analysis which is to be undertaken, the City with find: Impact TRANS-1: Consistency with CEQA Guidelines Section 15064.3(b). Compared with existing land use designations, the project would generate less VMT and would therefore be consistent with CEQA Guidelines which is the language used in a similar logistic industrial center. The existing use of the property is the no project alternative and should be used to determine whether or not the project will have a significant impact. Additionally, please provide at your earliest convenience the VMT analysis which the City must be developing consistent with CEQA guidance:

> By July 1, 2020, public agencies evaluating the impact of development projects are required to use vehicle miles traveled (VMT) to evaluate transportation impacts. This change removes the focus on traffic at intersections and roadways immediately around project sites. Instead,

> the focus will be on how new development projects may influence the overall amount of automobile use.[5]

The NOP did not specify what City of Stockton guidance would be used but it is likely not to be the Standards of the City's Transportation Impact Guidelines used in the analysis of a similar project earlier this year.

Tribal Cultural Resources

Please incorporate a paid tribal representative to be present during land disturbance activities recognizing tribal sovereignty. Two local Tribes include the United Auburn Indian Community and the Northern Valley Yokuts which we are in communication with.

Greenhouse Gas Reduction Requirements

The City of Stockton Climate Action Plan adopted in 2014 included the following statement which is even more true now that our community suffers from the economic and emotional impacts relating to the Covid-19 pandemic:

> The CAP would require substantial effort on the part of the entire Stockton community, including residents and business, schools, the San Joaquin Regional Transit District, other public entities, and the Stockton municipal government at a time when residents, businesses, and public agencies are struggling to pay current bills, keep businesses open, and provide basic services. This plan, if fully implemented, would result in a 20% reduction in per capita GHG emission from 2005 to 2020.
>
> Many of the measures included in the CAP would result in long-term economic, environmental, health and other benefits for the City and its residents and businesses in addition to the expected GHG emission reductions.

Vegetation has been shown to be effective at reducing energy and air pollutant transport. Any vegetation associated with the project or subsequent development must be paid for and maintained by the applicant not the residents of Stockton.

Removing agricultural land removes the natural climate change attenuator that soils can serve and must be accounted when evaluating greenhouse gas emissions.

CEQA is clear that "uniformly applicable development policies or standards" need to be considered in the analysis of environmental effects and their significance and the need for additional mitigation measures. These additional measures are those required by the lead agency to protect public health and the environment that may be harmed as a result of the approval of the project. Relying on state guidance which was developed prior to the project and did not consider the project's impact is not sufficient when parts of our community is unequally burdened by negative environmental impacts. All zip codes are not created equal.

This Project is not vital for our recovery and we hope that the draft environmental impact analysis will be sufficiently detailed so that the residents of Stockton can determine the document's adequacy to describe the environmental costs associated with the project. Cost to Benefits ratio must be clearly described.

Please add the Delta-Sierra Group to your CEQA notification list. We became aware of the project through a CEQAnet link from a colleague. Please let us know if there is to be any public meeting

FILE MEMORANDUM

December 31, 2020

To: Ryan Van Groningen, Trevor Smith

Subject: **DRAFT** Proposed Project Conditions Hydrologic and Hydraulic Assessment

Project: South Stockton Commerce Center

From: KSN

Background & Floodplain Regulations

The Five Corners Group, LLC (Owner) has requested Kjeldsen, Sinnock, & Neudeck, Inc. (KSN) assist in assessing flood plain issues associated with a 450± acre property for future develop for industrial/warehousing use (South Stockton Commerce Center Project). The South Stockton Commerce Center Project is situated along the banks of French Camp Slough near the Stockton Metropolitan Airport, in Stockton, California. Figure 1 shows the project location and extents. It falls under two floodplain regulatory frameworks: the National Flood Insurance Program (NFIP); and since the project location is within the City of Stockton, a designated "Urban Area", it also must comply with the California Central Valley Flood Protection Act of 2008 (Urban Level of Flood Protection). The influence of these two regulatory structures is discussed further below.

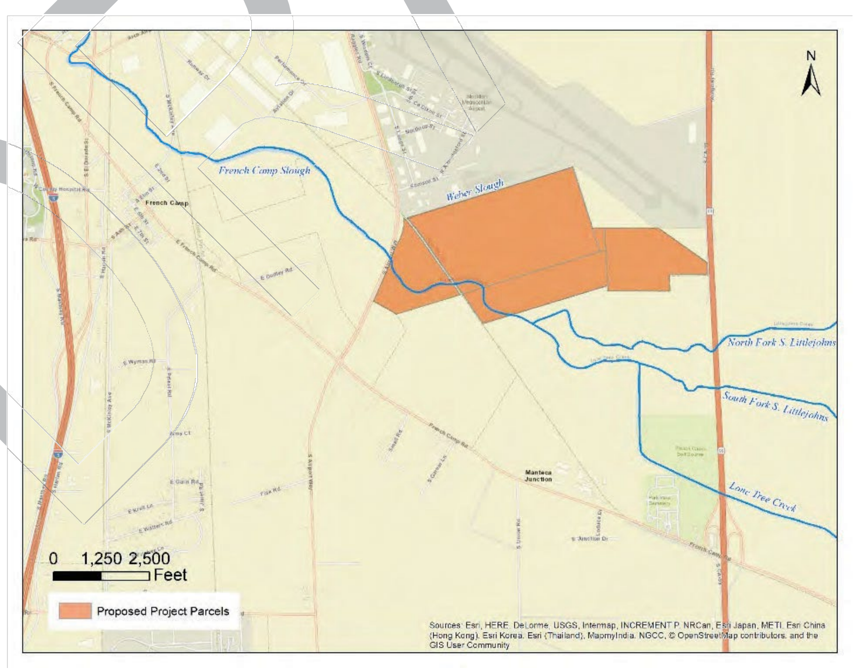

Figure 1 - South Stockton Commerce Center Project Location

Corporate Office: 711 N Pershing Avenue | Stockton, CA 95203 | 209-946-0268 | www.ksninc.com
West Sacramento: 1550 Harbor Boulevard, Suite 212 | West Sacramento, CA 95691 | 916-403-5900

National Flood Insurance Program

The NFIP is a federal program aimed at reducing the impacts of flooding on private and public structures. It does this primarily through two different mechanisms: flood insurance, and by requiring local communities to adopt floodplain ordinances which regulate the development of floodplains. The NFIP is administered by the Federal Emergency Management Agency (FEMA) at the national level, and by cities and counties at the local level. FEMA conducts periodic studies to identify and update maps of flood prone areas (flood zones). These maps, known as Flood Insurance Rate Maps (FIRMs) are used by the NFIP to identify areas where flood insurance is required for structures with federally backed mortgages, and where floodplain ordinance regulations must be applied. These flood prone areas are referred to as Special Flood Hazard Areas (SFHA) on the FEMA FIRMs. In order for structure owners to be able to purchase flood insurance, their communities (city or county) must adopt a minimum set of floodplain ordinances which regulate development within the FEMA identified floodplains.

A review of the FEMA FIRMs covering the South Stockton Commerce Center Project area was conducted to determine the potential FEMA floodplain regulatory impacts on the proposed project. The FIRMs which were reviewed are shown in Table 1 while Figure 2 shows this FIRM data overlain with the project footprint.

Table 1 - FEMA FIRM Maps Reviewed

Map Number	Effective Date
06077C0470F	October 16, 2009
06077C0490F	October 16, 2009
06077C0610F	October 16, 2009
06077C0630F	October 16, 2009

Figure 2 shows the National Flood Hazard Layer (NFHL) for the project site and it shows that the project site is located within several flood zones. The NFHL is the underlying data which is shown on the FEMA FIRMs. On these FIRMs, the Zone X designation is used by FEMA to indicate areas with a 0.2 percent annual chance of flooding (also known as the 500-year flood). The 1 percent annual chance of flooding (or 100-year flood) is shown with the Zone AO (Depth 1 Foot) area. Zone AO’s are typically used to indicate shallow flooding of a given depth.

For the unshaded (or area with no designated zones), there are no special FEMA related restrictions on development. The Zone X would likewise poses no FEMA prohibitions for this project. However, the Zone AO is considered a Special Flood Hazard Area (SFHA) and would require that the development be elevated above the base flood elevation (BFE). The City of Stockton’s Municipal Code states that in a Zone AO, the lowest finished floor be: “elevated above the highest adjacent grade to a height two (2) feet above the depth number specified in feet on the FIRM, or elevated at least four (4) feet above the highest adjacent grade if no depth number is specified.” As there is a depth (1 foot) published for the applicable Zone AO for this project, the building footpads should be elevated three feet (1-foot depth plus 2 feet freeboard) above the highest adjacent grade to the building.

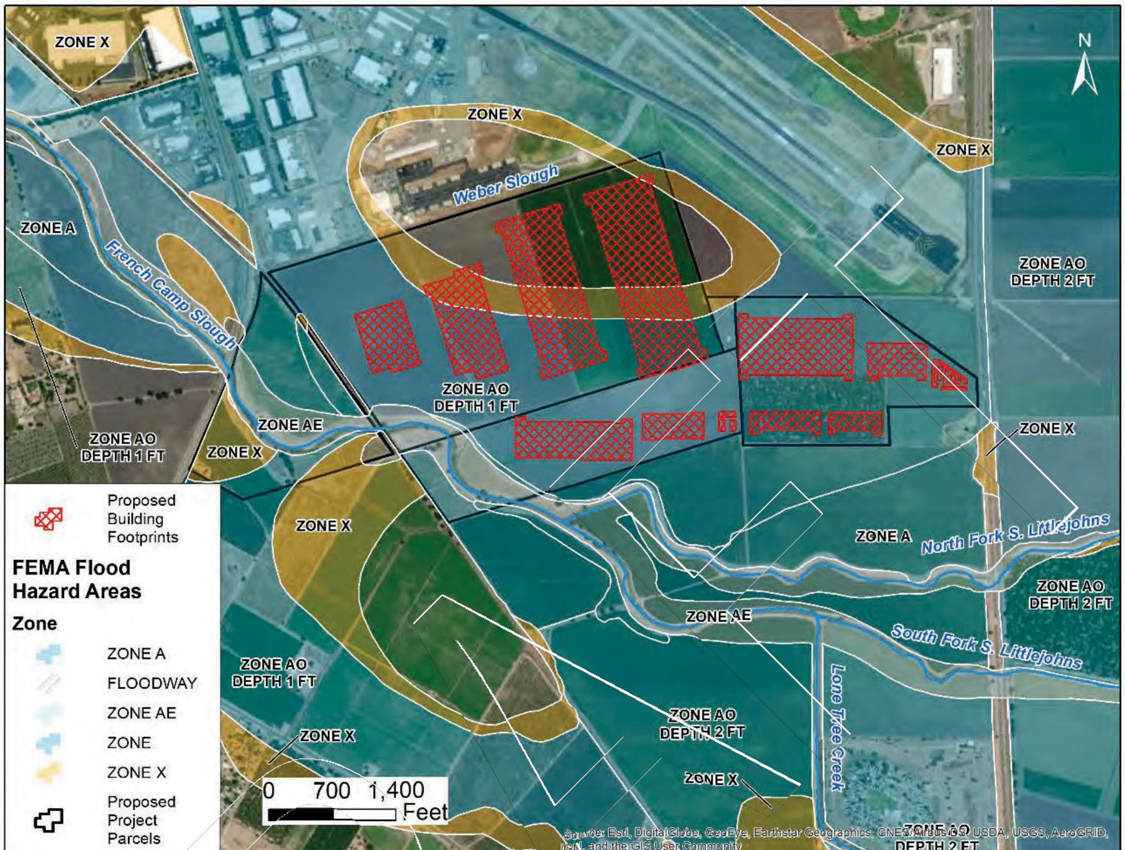

Figure 2 - NFHL & Project Site

The typical way to elevate larger developments is to build the development upon fill placed to bring the finished floor elevation to two feet above the BFE. In this project, a better route would be to revise the effective FEMA floodplain in this area to reflect the changes from improved flood control facilities (i.e. channel and detention basins). When using this approach, the typical method for obtaining FEMA approval is to file a Conditional Letter of Map Revision (CLOMR). This requires the local NFIP administrating community's approval before it can be submitted to FEMA for review and approval. The CLOMR provides the developer assurances that once the stated finished floor elevation is achieved, the structure will be removed from the SFHA. Once the project is constructed and 'as-built' information is provided to FEMA, a final Letter of Map Revision (LOMR) can be obtained through a similar process.

As Figure 2 indicates, a portion of the project site is located with an SFHA. Therefore, an analysis was conducted to determine potential impacts to the floodplain from placing fill to bring the finished floor elevation to three feet above highest adjacent grade. This analysis is discussed in detail below.

California Central Valley Flood Protection Act of 2008

The California Central Valley Flood Protection Act of 2008, also known as SB 5 adds additional flood risk considerations for development within urban or urbanizing areas in the California Central Valley. Stockton is considered under the law to be an urban area and thus falls under the purview of SB 5's

Urban Level of Flood Protection (ULOP) requirement. ULOP requires development within urban areas to meet certain standards related to a 200-year level of flood protection. The '200-year flood' is a flood that has a 0.5 percent chance of occurring in any given year.

In order to determine if the project site would be subject to ULOP regulations, the San Joaquin County Public Works 200-year Flood Map website[1] was reviewed for 200-year flood depths. According to Stockton Municipal Code Title 16.90, new developments may be permitted in areas "of potential flooding of three feet or less from a storm event that has a 1-in-200 chance of occurring in any given year, from sources other than local drainage, in urban or urbanizing areas…" Figure 3 shows the potential flooding from the San Joaquin County Public Works Webpage for the project area.

[1] http://sjc-gis.maps.arcgis.com/apps/webappviewer/index.html?id=3b352a92c2c142ccbf07266fd69fe1fb

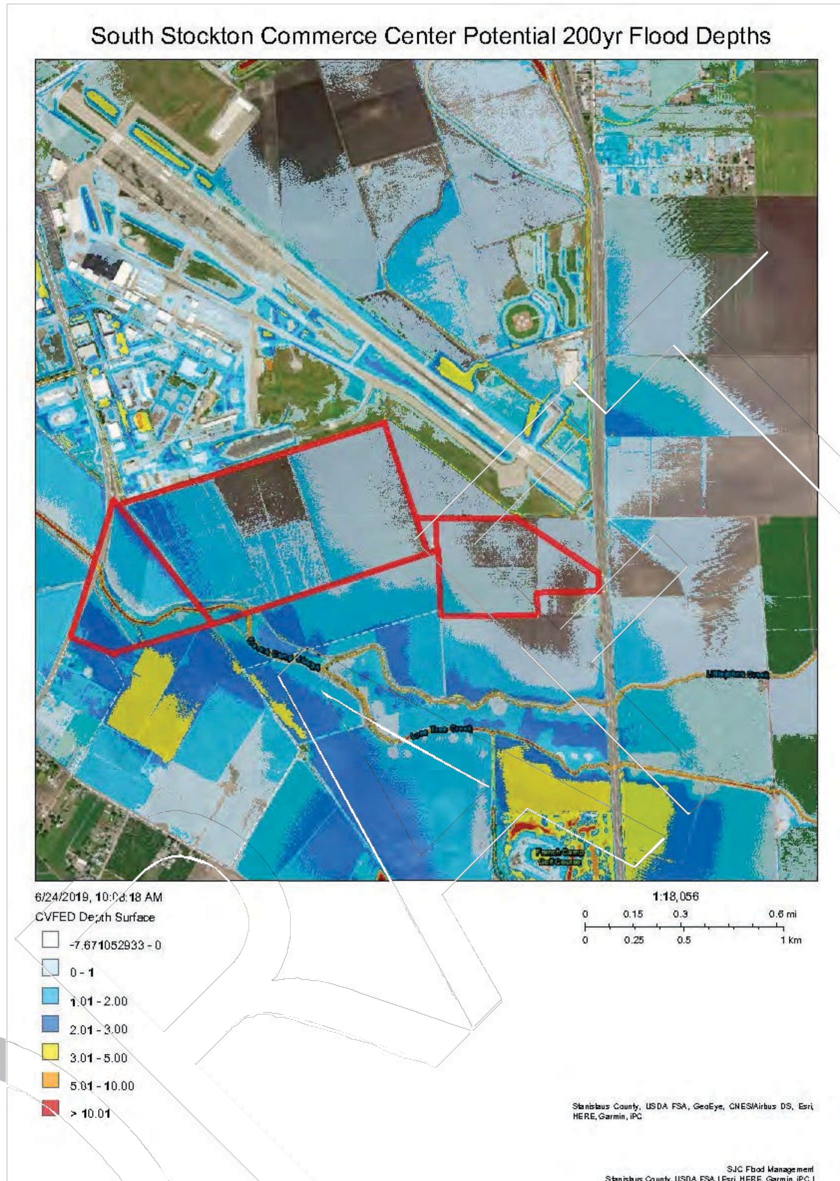

Figure 3 - Potential 200-year Flood Depths

As can be seen in Figure 3, there are no areas within the project area of three feet or more in potential flood depths and thus the project complies with SB 5. The City of Stockton will need to make an SB 5 compliance finding when issuing discretionary approvals for the project.

South Stockton Commerce Center Flood Assessment Analysis

Previous Studies

A review of previous studies was performed to determine potential starting points for analyzing potential impacts to the floodplain. In total, three previous studies were found for this project area and are discussed in further detail below.

Federal Emergency Management Agency

In October 2016, FEMA updated its Flood Insurance Study (FIS) for San Joaquin County and Incorporated Areas which includes the South Stockton Commerce Center Project site. While the FIS reports on the methods and techniques used in its analyses of French Camp Slough, North Littlejohns Creek, South Fork North Littlejohns Creek, and Lone Tree Creek it does not state when the analyses were performed, the methodologies used, or who developed these models. While FIS's typically report this information, for older studies it is usually reported as not available as was found to be the case for this area. This typically means the actual hydrologic and hydraulic analyses are many years old if not decades old. Older studies do not necessarily correlate to inaccurate studies, it does however, limit the amount of data that may be leveraged for future studies.

California Department of Water Resources

In 2013, the California Department of Water Resources (DWR) completed the Central Valley Floodplain and Evaluation Program (CVFED). CVFED was developed to support the ULOP required from the Central Valley Flood Protection Act of 2008. The products from this program were:

- LiDAR for the California Central Valley
- 200-year flood hydrology for select streams and rivers
- 200-year flood hydraulic models for select streams and rivers
- 200-year floodplain maps for urban areas

The program was focused on analyzing the State Plan of Flood Control Levees. However for the purposes of the South Stockton Commerce Center Project, the major sources of flooding for the project area were all studied under the CVFED Program. The CVFED hydraulic models were acquired from DWR and an initial comparison of the peak CVFED flood flows for French Camp Slough indicates that they are relatively close to the published FEMA flow rates.

Tidewater Crossings Project California Environmental Quality Act

In 2006, a study was conducted for a potential development called Tidewater Crossing along French Camp Slough in conjunction with a CEQA process. This study's hydrologic and hydraulic analyses analyzed the Littlejohns Creek Watershed, the Lone Tree Creek Watershed, the Weber Slough Watershed, and the French Camp Slough Watershed. The analysis consisted of a detailed hydrologic and hydraulic analyses of both the pre- and post-project conditions. The proposed project has not been constructed. The data developed to prepare the study's report are unavailable at the time of the drafting of this memorandum, but the general findings of the report have proven helpful even if out of date.

The above-mentioned studies were reviewed with the intent of leveraging existing data for use in determining the flood impacts and flood control needs for the proposed project. While no previous study captured everything needed to analyze the impacts of the proposed development upon the floodplain at the project site, there are still useful data to be leveraged from each. The following sections detail the engineering study to analysis the flood control aspects of the proposed project.

Existing Conditions – Hydrologic & Hydraulic Assessment

Hydrologic Data

The hydrologic data used in establishing the existing conditions were obtained from DWR's updated CVFED model. Selected 100-year flood event peak discharges, in cubic feet per second (cfs) used are presented below:

Table 2 - Selected 100-year Peak Discharges

Flooding Source	Peak Discharge (cfs)
North Littlejohns Creek	462
North Fork South Littlejohns Creek	1,390
South Fork South Littlejohns Creek	2,092
Weber Slough	301
Walker Slough	1,570

Hydraulic Model Source

The CVFED HEC-RAS model obtained from DWR was used to model the existing conditions of the project location. This model covered the project area and was already converted to the latest version of HEC-RAS which allowed needed modifications for the modeling of both pre- and post-project conditions. A significant assumption made for this model is that all levees hold. Overtopping of the levees is permitted in the model, but no seepage, breaching, or eroding of the levees is simulated.

Modifications made

In order to accurately simulate the conditions present at the project location, KSN made two primary modifications to the CVFED HEC-RAS model received from DWR: the addition to the model of Weber Slough and the conversion of several areas modeled as flood storage areas to two-dimensional model areas.

Weber Slough Modifications

The first modification made to the CVFED HEC-RAS model was to add Weber Slough to the hydraulic model. The model as provided by DWR did not have Weber Slough as part of the hydraulic stream network; rather it was included in a storage area and the flows coming from and through Weber Slough were aggregated with shallow surface flows modeled by the storage areas. While the previous approach sufficed for the CVFED modeling goals, the proposed project would be changing hydraulic conditions within one of the storage areas and the methods used in the CVFED program to model the project area were not detailed enough to capture the changes proposed.

The Weber Slough channel was added into the model using bridge and culvert data collected by NorthStar Engineering. Cross Section data was obtained from the CVFED LiDAR. A review of the LiDAR was performed to ensure that the Weber Slough Channel was sufficiently captured during the LiDAR acquisition. Once the channel, cross sections, and structures were added to the hydraulic model, channel 'n' values were determined through a combination of aerial imagery, survey photographs, and publicly available data. The upstream flow conditions were obtained from the DWR hydraulic model. The HEC-RAS model had hydrograph data which described the storm water discharges into Weber Slough from the outfalls located near the National Guard Armory and the flows upstream of that location. The flows from the outfall pipes were introduced into Weber Slough via a lateral inflow boundary condition at the appropriate location, while the remaining flow was input at the upstream limit of the Weber Slough channel (at the downstream face of Weber Slough's crossing of California State Highway 99).

Storage Area Conversions

The second modification made to the DWR HEC-RAS model was to convert two storage areas to four two-dimensional flow domains (see Table 3). While the project is physically located only in one of the storage areas, the other storage area was included in the conversion to ensure that areas adjacent to the project location were modeled in sufficient detail to accurate determine the project impacts (or lack thereof) both on and off the project site. The north-south dividing line between the areas was Weber Slough. The east-west dividing line is Airport Way. The areas can be seen in Figure 6.

Table 3 - Storage Areas Converted to Two-dimensional Areas (Existing Conditions)

Storage Area Name	2D Area Name	Area (square miles)	Nominal Cell Size (feet by feet)	Total Cells
3FCS30	3FCS30 North	0.73	50 x 50	7,959
	3FCS30 South	0.14	25 x 25	6,635
3FCS40	3FCS40 North	0.90	25 x 25	107,119
	3FCS40 South	2.27	25 x 25	44,457

Topographic Data Source

KSN acquired LiDAR data for the project area from the California Department of Water Resources. The bare earth LiDAR data was used to develop an existing conditions terrain surface for Weber Slough and the newly added two-dimensional flow areas. The specific LiDAR tiles used are presented below in Table 4.

Table 4 - CVFED Bare Earth LiDAR Tiles Used

0786n0374e5k	0786n0376e5k	0786n0378e5k	0786n0380e5k
0784n0374e5k	0784n0376e5k	0784n0378e5k	0784n0380e5k
0782n0374e5k	0782n0376e5k	0782n0378e5k	0782n0380e5k

The LiDAR data was provided by DWR in several formats. The bare earth digital elevation model (DEM) was input into HEC-RAS's RAS Mapper processing software to develop a digital surface model usable by HEC-RAS. The cell sizes used in the digital surface model were five feet by five feet.
The results of the hydraulic modeling to use to set "existing conditions" can be found in the Figure 4.

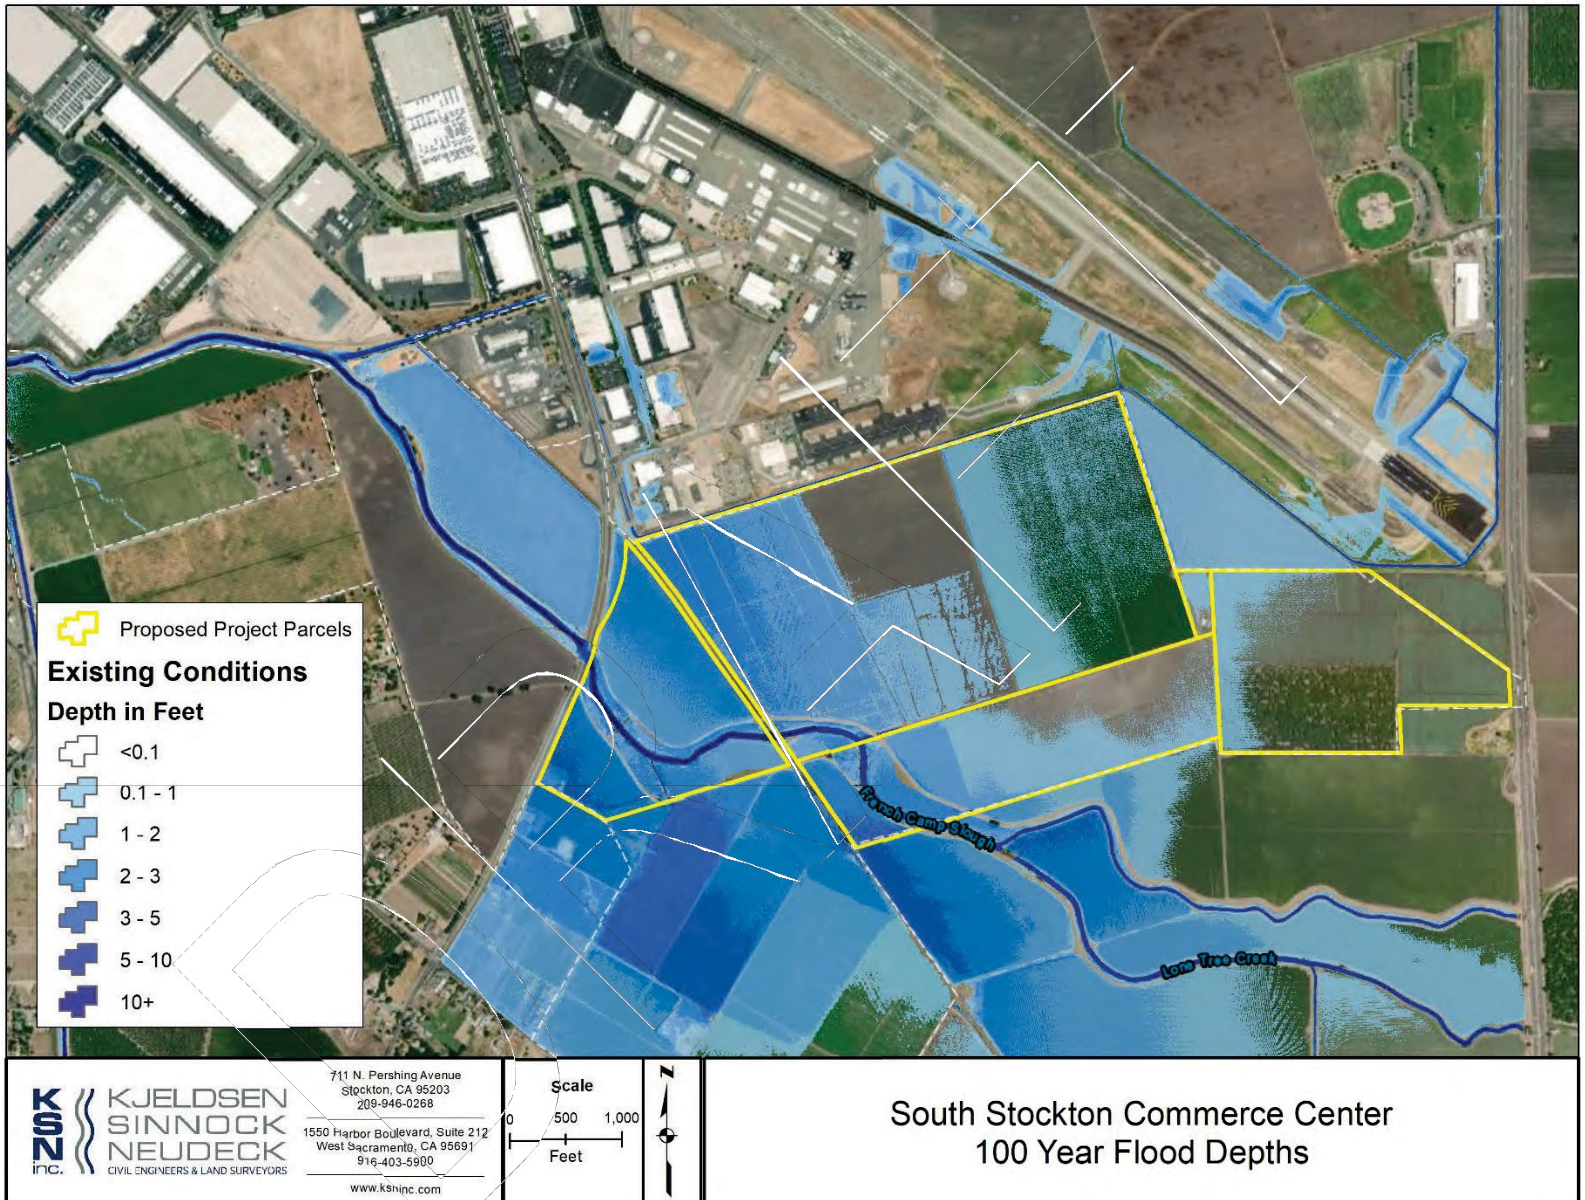

Figure 4 - Existing Conditions 100-year Flood Depths

Proposed Conditions – Description

Proposed Site Configuration

KSN received a post project site plan from NorthStar Engineering on October 21, 2020. This plan information included rough grading surfaces, proposed building layouts, flood control basin locations and flood control channel alignments. KSN used these proposed terrain modifications to build the proposed conditions model. A significant assumption made for this model is that all levees hold. Overtopping of the levees is permitted in the model, but no seepage, breaching, or eroding of the levees is simulated.

Flood Control Channel

In order to route floodwaters away from the proposed buildings and other infrastructure, a flood control channel was placed along the northern edge of the project. The total length is approximately 5,500 feet. Its layout is presented in Figure 7. The flood control channel slope is approximately 0.02%. The flood channel collects water leaving Weber Slough towards the south and routes it towards the west eventually discharging the Weber Slough overflow into the northern flood control basin (described below). The flood control channel widens at the northern edge of the project. A typical cross section is shown below in Figure 5.

Flood Control Basins

A pair of flood control basins are proposed as part of the project's flood control system. They are depicted in Figure 7 below. The northern flood control basin is fed directly by the flood control channel and is approximately ± 450 acre-feet (ac-ft) in capacity. The southern flood control basin (± 132 ac-ft capacity) is filled primarily by overflows from the French Camp Slough levee system to the south with some minor collection of Weber Slough overflows between Airport Way and the Union Pacific Railroad.

The Union Pacific Railroad provides a hydraulic break between the project areas contributing to the northern flood control basin and the southern flood control basin as it does not overtop during a 100-year flood event. The flood control basins are drained via pump systems which are not included in this analysis. The assumption is that the draining of both flood control basins will occur post flood event.

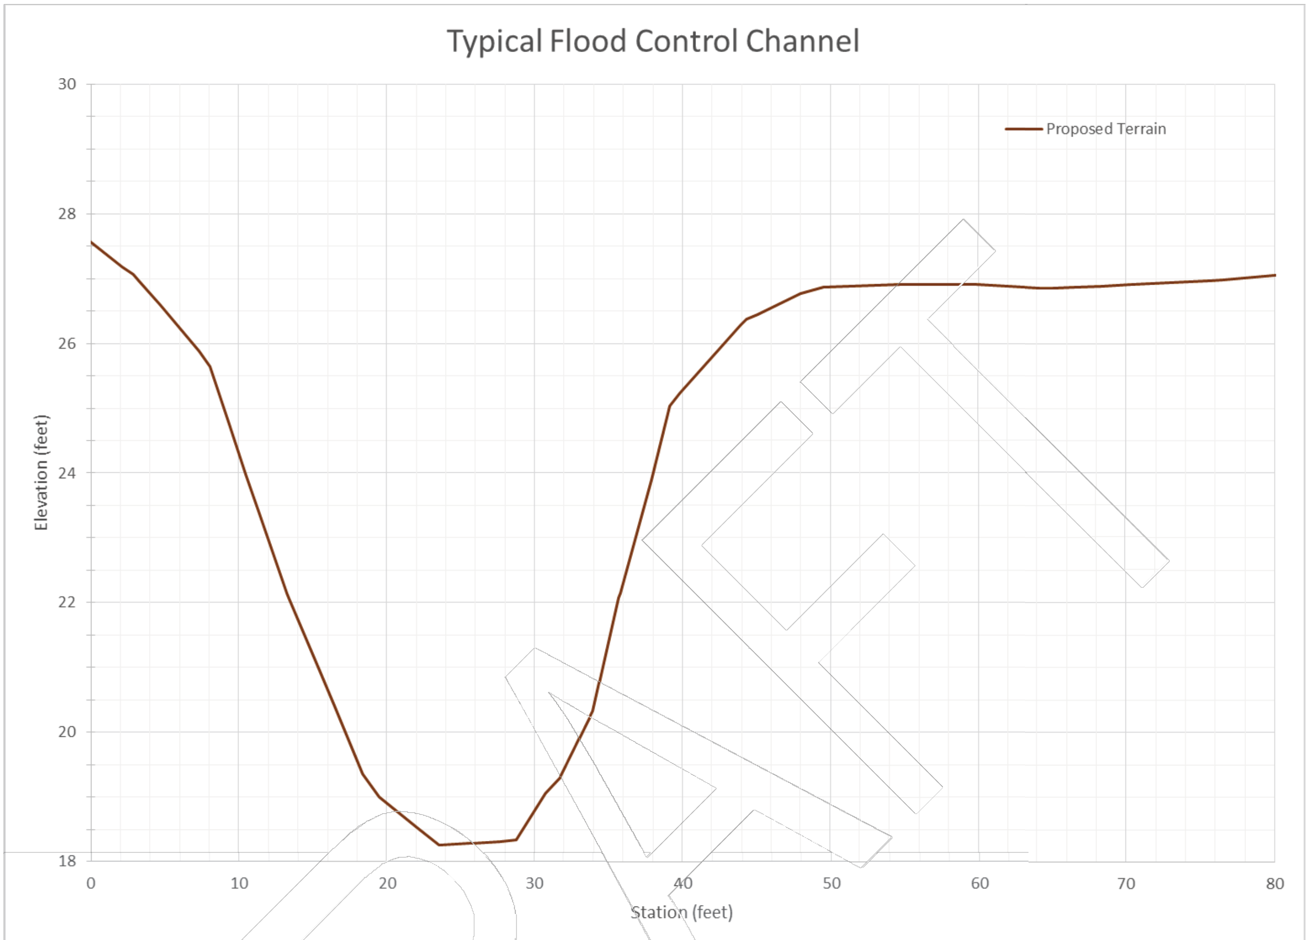

Figure 5 - Typical Proposed Flood Control Channel (Downstream)

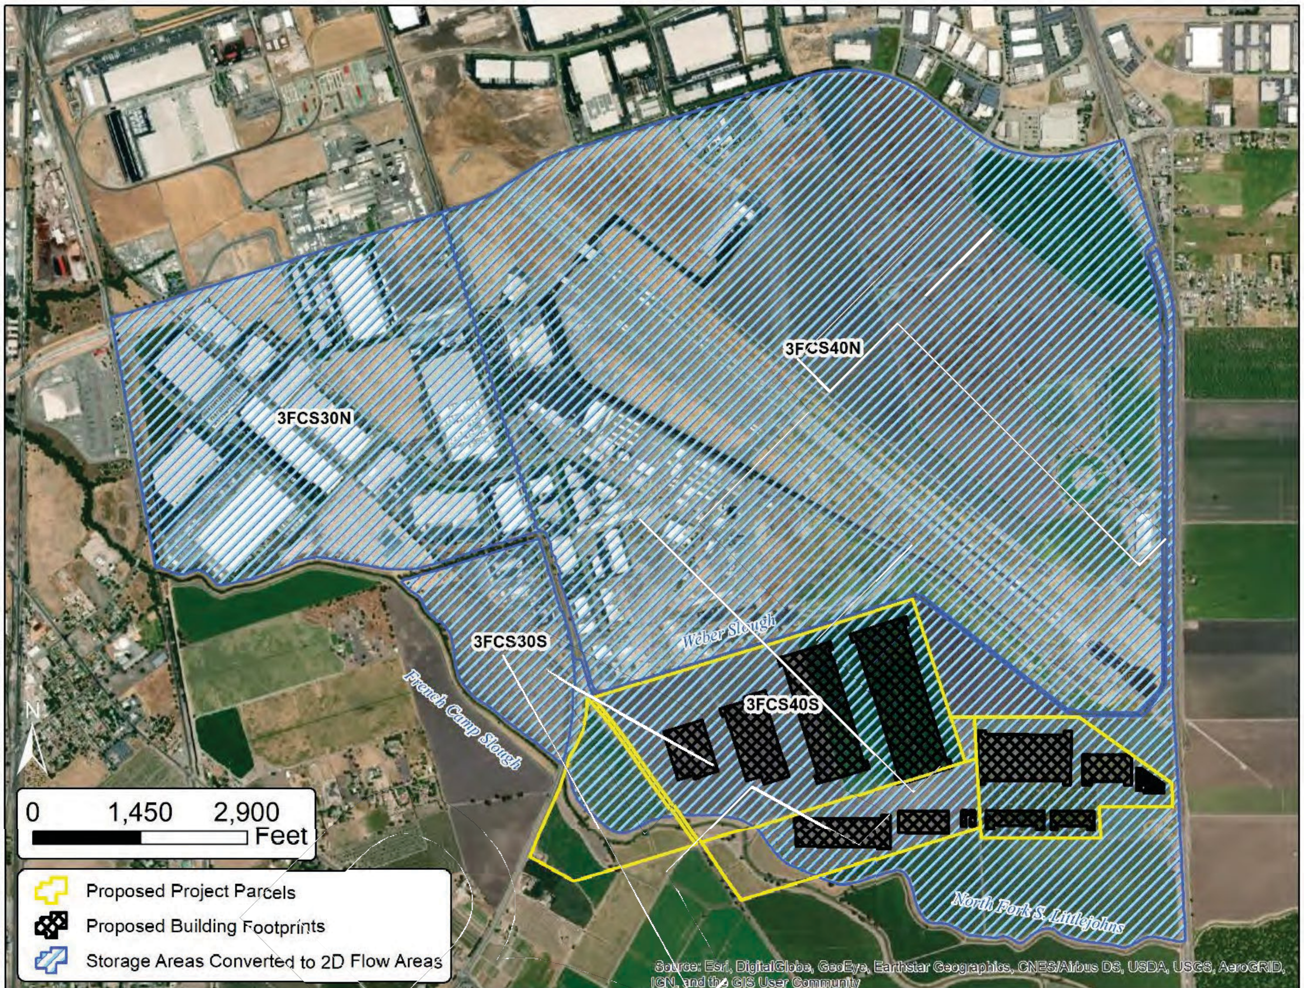

Figure 6 - Storage areas converted to 2d flow areas

Proposed Conditions – Hydrologic & Hydraulic Assessment

Hydrologic data

The proposed conditions do not involve any changes to the hydrologic boundary conditions of the hydraulic model. Therefore, no changes were made to the flow coming into the model or the downstream boundary conditions.

Flood Control Basins

Both the north and south proposed flood control basins were entered into the Existing Conditions terrain to account for the increased floodplain storage. The north basin was analyzed under two different assumptions: a) empty at the beginning of the flood event and b) with 10-year project site runoff in the north basin. The second assumption (with on-site stormwater) is unlikely to occur but was analyzed to determine the robustness of the flood control system. NorthStar Engineering calculated the 10-year post-project storm runoff to be 126 ac-ft. The inclusion of the 10-year event's project site runoff in the north flood control basin is a conservative assumption as a 10-year storm event followed very quickly by a 100-year storm event is not likely. The joint-probability analyses to determine the actual recurrence interval of this assumption is beyond the scope of this study.

Due to the size of the flood control basins, the nominal cell sizes were not reduced as the grid cells provided adequate resolution to simulate the capacity and drainage characteristics of the basins.

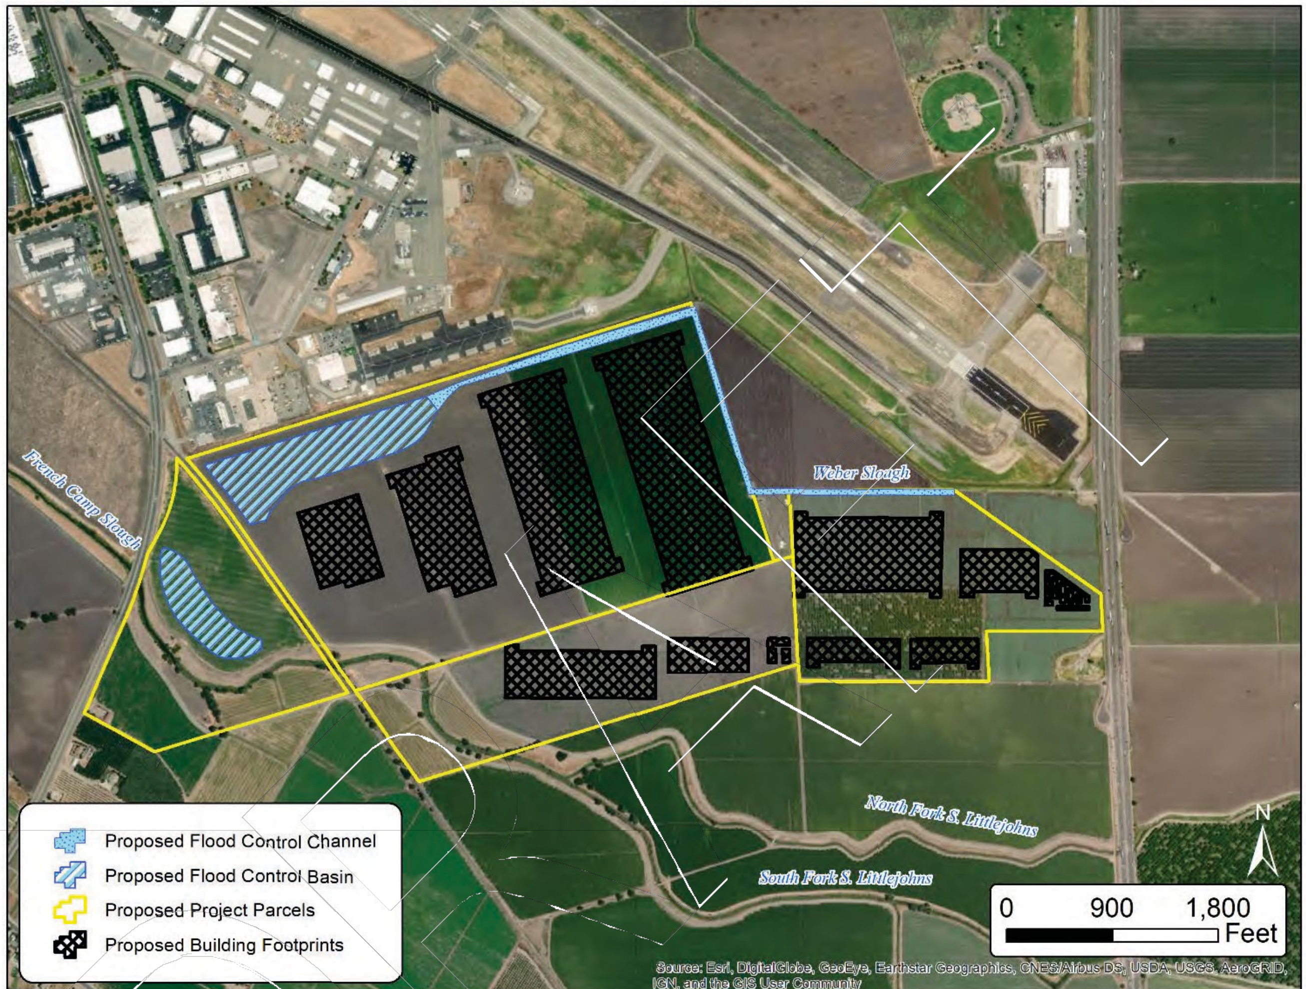

Figure 7 - Proposed Conditions

Flood control channel

The proposed South Stockton Commerce Center Flood Control Channel was modeled using HEC-RAS 2D methods. The geometry of the channel was entered into the existing conditions digital surface model and cell alignments modified to ensure that the channel was sufficiently captured in the two-dimensional mesh. Cell sizes in the vicinity of the flood control channel were reduced from the nominal cell size of 25 feet by 25 feet to approximately 10 feet by 10 feet to ensure adequate representation of the channel topography and adjacent grade. During the peak of the event, the flood control channels were conveying approximately 63 cfs to the north flood control basin. A total volume of 50.25 ac-ft was conveyed to the north flood control basin through the flood control channel during the simulation (See Figure 9).

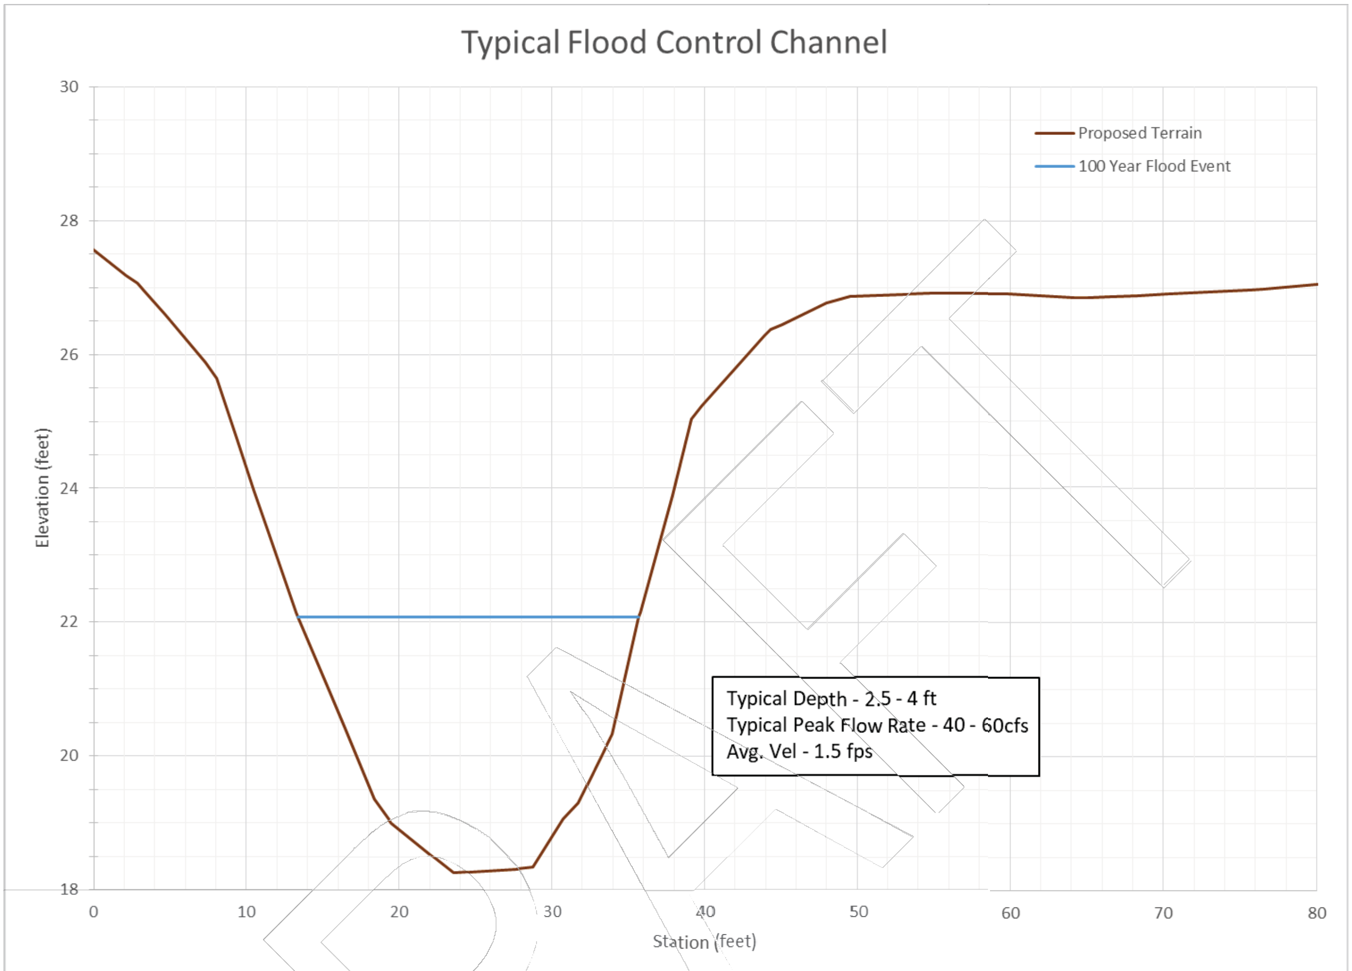

Figure 8 - Typical Flood Control Channel 100-year Results

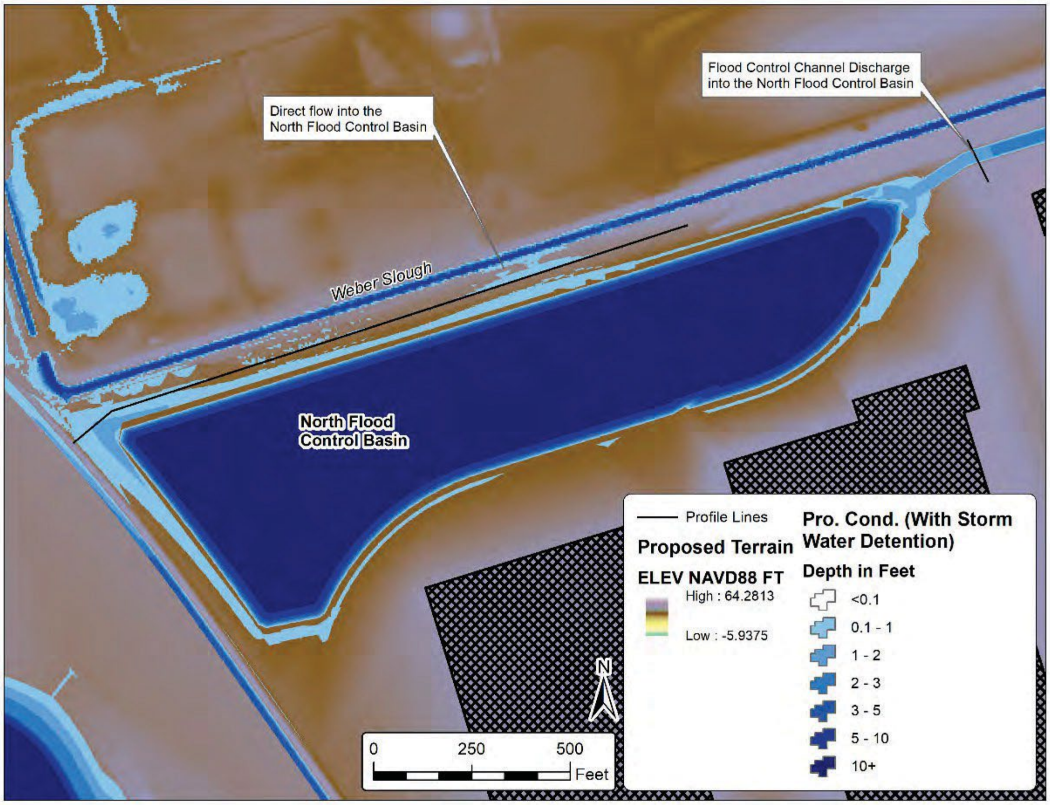

Figure 9 - North Flood Control Basin 100-year Results (with stormwater storage)

The results from the flood control channel were inspected to determine the appropriate sizing. Typical cross sections were analyzed with the peak water surface elevations and flow rates.

North Flood Control Basin

The majority of the floodwaters entering the north flood control basin are directly flowing from Weber Slough. Adjacent to the north basin's north western side, the Weber Slough channel capacity is insufficient to convey the 100-year flood within its banks. The lower bank is to the south and thus overflows occur on that bank. Approximately 138.1 ac-ft originating directly from Weber Slough in this area are intercepted by the north flood control basin and stored within the basin. At peak, approximately 87 cfs are flowing from Weber Slough in this area into the north flood control basin. The profile lines shown in Figure 9 are the lines across these flow rates and volumes are measured. Figure 10 shows the cross section of the north flood control basin for the maximum water surface elevation under the 100-year flood.

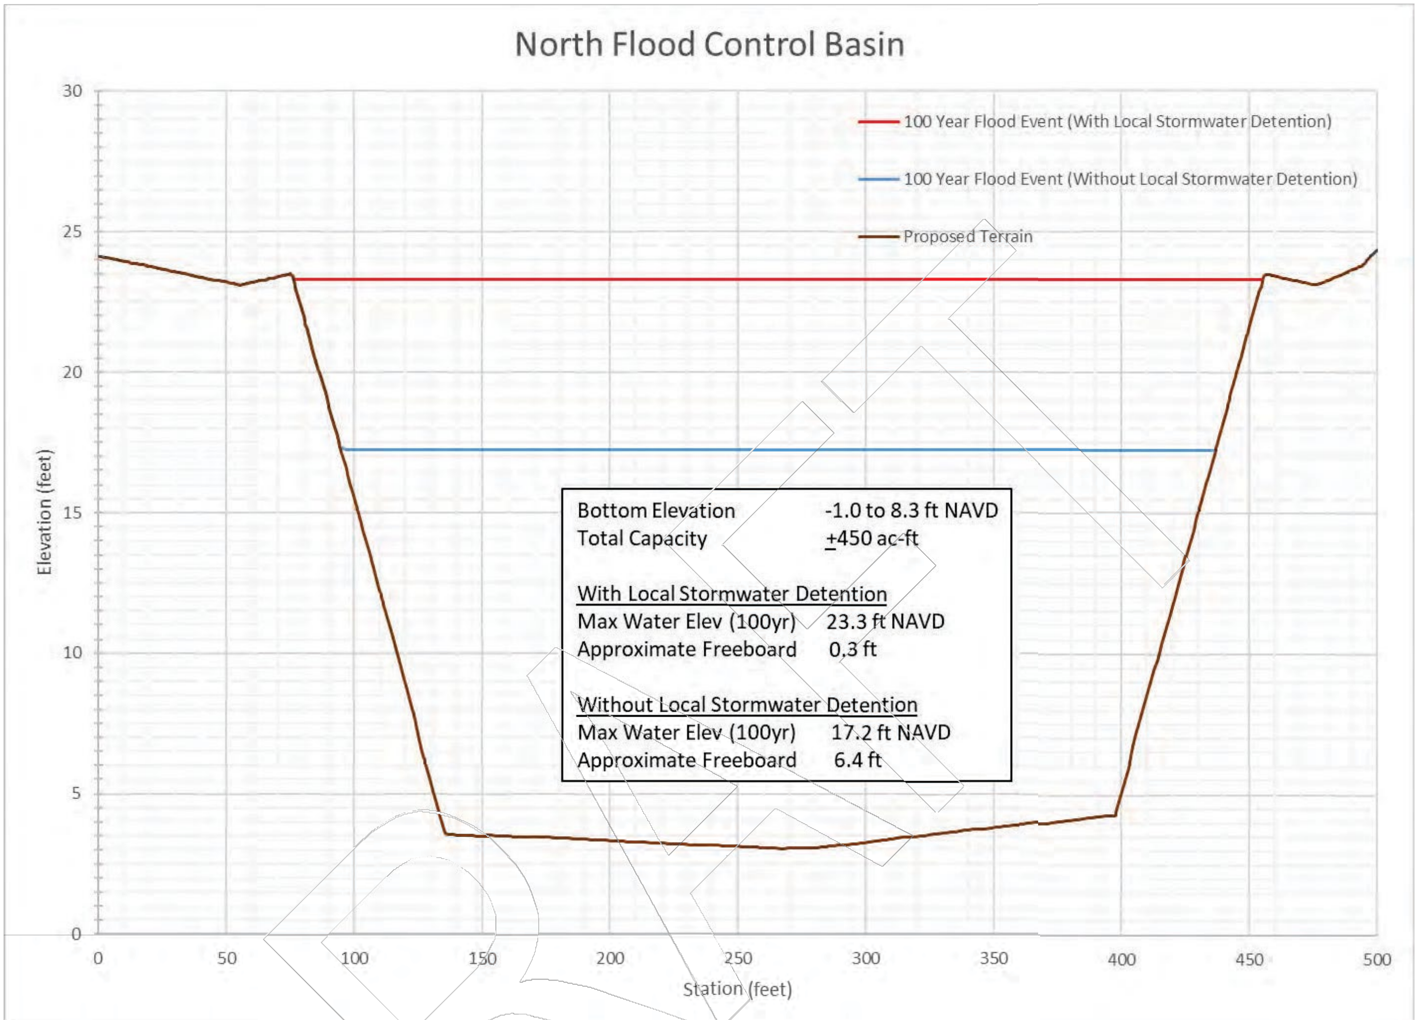

Figure 10 - North Flood Control Basin Maximum Water Surface Elevations

South Flood Control Basin

The majority of the floodwaters entering the south flood control basin originate from French Camp Slough. The basin was sized to offset lost storage from a proposed building pad opposite on the west side of the railroad bisecting the project. The proposed invert of the flood control basin is 6.0 ft NAVD. The proposed project roadway would be between the building pad and the proposed flood control basin. A typical cross section of the south flood control basin can be seen below in Figure 12. Figure 11 shows the maximum post project water surface depths around the south flood control basin.

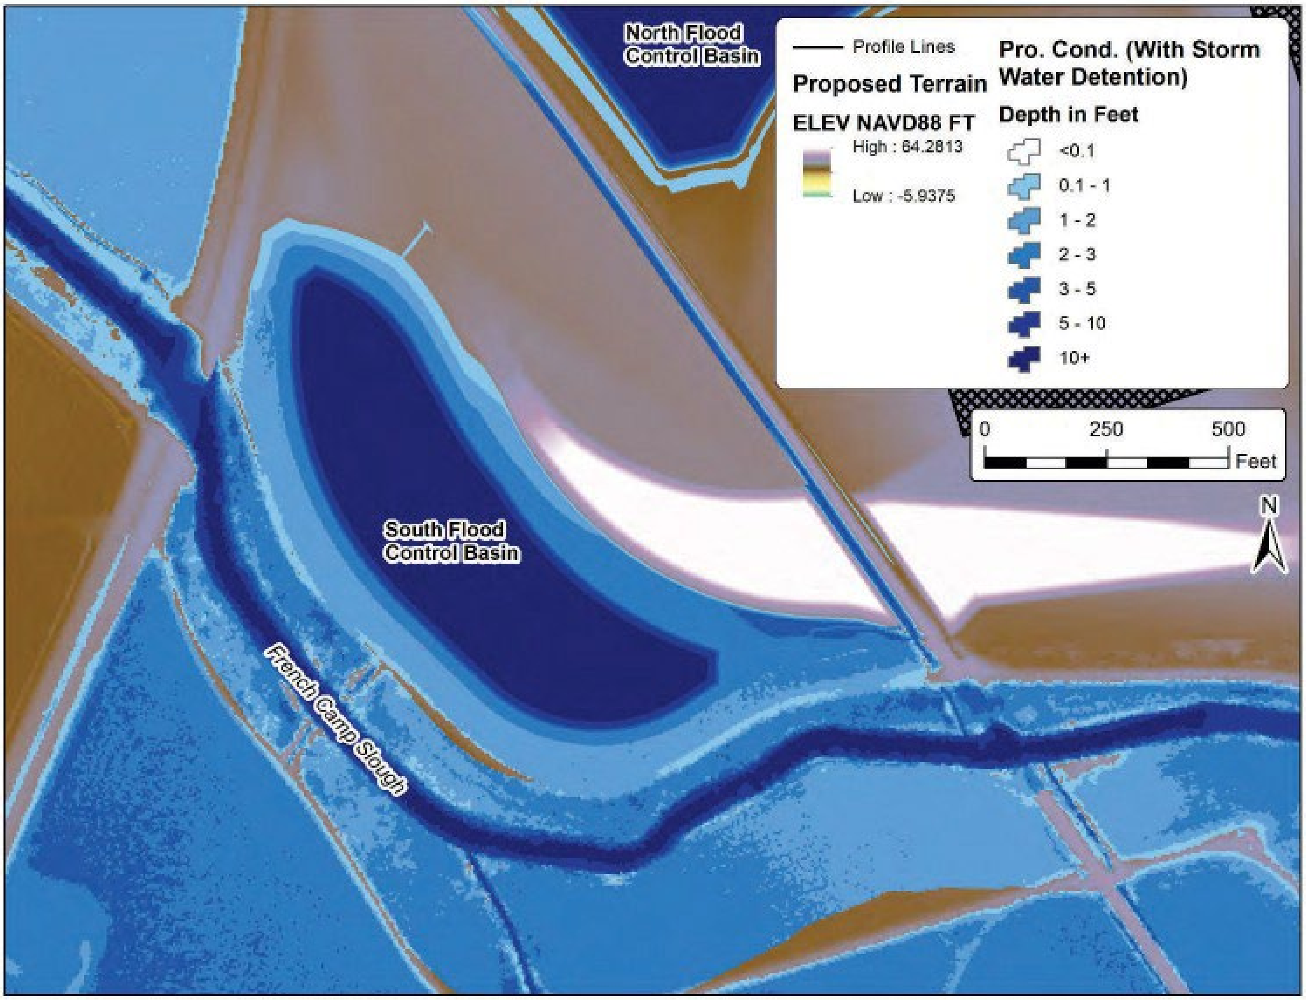

Figure 11 - South Flood Control Basin 100-year Results

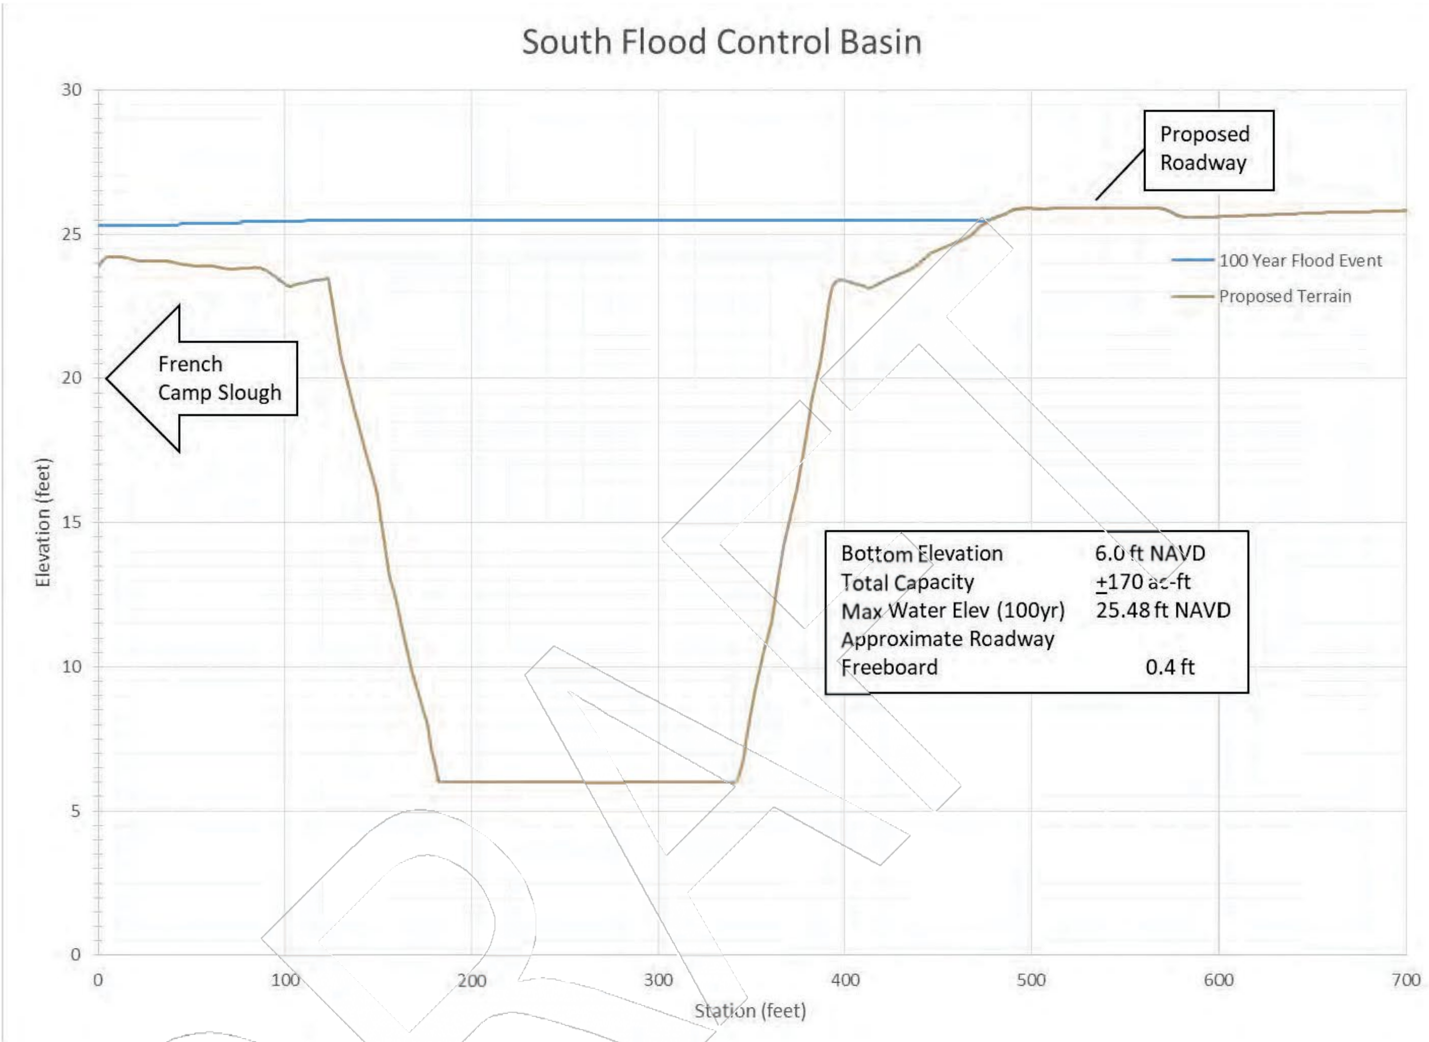

Figure 12 - South Flood Control Basin Maximum Post Project Water Surface Elevation

Land Use

The existing conditions land use for the two-dimensional flow areas was updated to represent proposed conditions. This was accomplished by adjusting the existing roughness coefficients on project parcels from pasture/field roughness to those more appropriate to a light industrial environment.

The results from the hydraulic modeling of the proposed conditions can be found below in Figure 13.

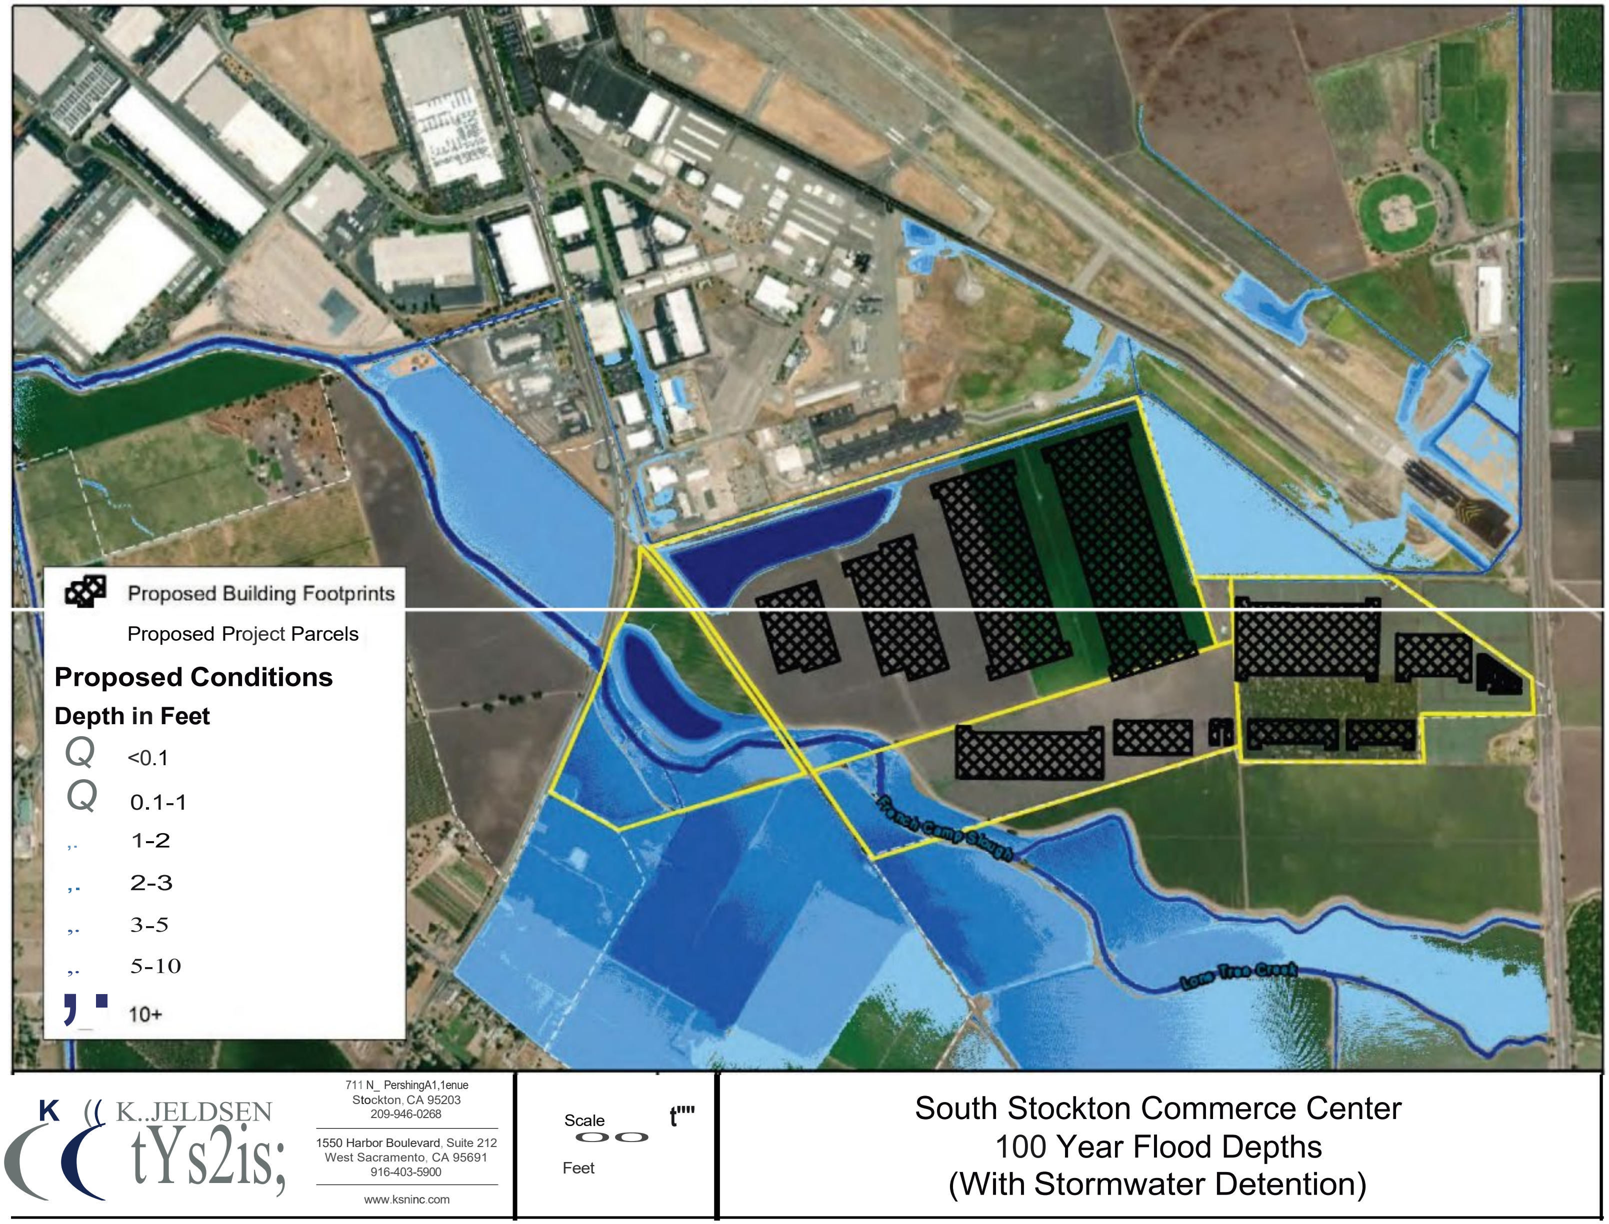

Figure 13 - Proposed Conditions 100-year Flood Depths

Comparison between Existing Conditions & Proposed Conditions

Cross Sections

For a full listing of the modeled hydraulic cross sections and the comparison against base conditions, please refer to the digital appendices (Cross Section Results).

2D Floodplain comparison

For the areas not modeled using cross sections, the maximum water surface elevations from the proposed conditions for the 100-year flood event and the maximum water surface elevations from the existing conditions were exported from HEC-RAS and then the differences in elevations were compared on a grid cell by grid cell basis using automated GIS routines to calculate the differences. There are no offsite impacts which would cause an increase in water surface greater than 0.05 feet.

North Flood Control Basin

In addition to the analyses described above, the proposed flood control system for this project was evaluated to determine if flood control system has sufficient capacity to both hold onsite run off and prevent offsite impacts from the 100-year flood event. Specifically, the storage available in the north flood control basin was reduced by 126 ac-ft at the beginning of the analysis. Again, these analyses were conducted under the assumption that the flood control basins would not be drained during the actual flood event. The results of this analysis indicate that there are no offsite impacts and that the 100-year flood can be contained on site with runoff from the 10-year storm event being held in the north flood control basin.

For the southern control basin, commercial properties which are west of the Union Pacific Railroad would be responsible for providing storm drain improvements including any required conveyance pipes, volume storage, pumps, force mains, etc. needed to handle runoff from their development and will additionally be responsible for analyzing any potential offsite impacts caused by it's proposed storm drain improvements.

Project Next Steps

The next steps would be to develop the necessary engineering data to support a CLOMR application to revise the effective FEMA floodplains.

Appendix 1 – Tabular Cross Section Result

APPENDIX E

Recirculated Draft EIR Notice of Preparation and NOP Comments (2024)

CITY OF STOCKTON
REVISED NOTICE OF PREPARATION
OF A RECIRCULATED ENVIRONMENTAL IMPACT REPORT

DATE: August 29, 2024

TO: Responsible and Trustee Agencies, Organizations, and Interested Parties

FROM: City of Stockton, Community Development Department (Lead Agency)

SUBJECT: **PROPOSED RECIRCULATION OF ENVIRONMENTAL IMPACT REPORT, SOUTH STOCKTON COMMERCE CENTER**

PROJECT TITLE: South Stockton Commerce Center

CITY PROJECT FILE NUMBER: P20-0024

STATE CLEARINGHOUSE NUMBER: 2020090561

The City of Stockton will revise and recirculate portions of the Draft Environmental Impact Report (EIR) for the South Stockton Commerce Center project (hereafter, the "project") pursuant to the requirements of Section 15088.5 of the CEQA Guidelines. The Draft EIR was originally circulated for agency and public review on October 15, 2021, and is available for review at:

www.ci.stockton.ea.us/documents/bySC/CommunityDevelopment.html

Current information related to the project, project background, and the reasons why the Draft EIR is being revised and recirculated are discussed in detail on the following pages.

When a Lead Agency requires preparation of an EIR, Section 15082 of the CEQA Guidelines requires the City to prepare a Notice of Preparation (NOP) to provide to the Office of Planning and Research, responsible and trustee agencies, and other interested parties with sufficient information describing the project and its potential environmental effects to enable the agencies and other parties to make a meaningful response. There is no known CEQA requirement that the Lead Agency prepare a revised NOP if it proposes to recirculate a Draft EIR. The initial NOP, circulated for review on September 30, 2020, and the original Draft EIR of October 15, 2021, did not reflect the changes in the Project Description resulting from compliance with the Stockton Municipal Code Title 16 Ordinance (establishing new logistics warehouse development standards) and the refined utility plans for the project. This change in the project requires modification of the Draft EIR's Project Description and other chapters related to the modifications. Therefore, in consultation with and concurrence from the applicant, the City is circulating this Revised NOP to announce and explain the decision to revise and recirculate portions of the Draft EIR and solicit comments on the contents and scope thereof.

The project description, location and an initial description of the probable environmental effects of the project to be considered in the Revised and Recirculated Draft EIR are described in the remainder of the NOP, below.

As specified by the CEQA Guidelines, the Revised NOP will be circulated for a 30-day comment period. The comment period for the Revised NOP runs from Friday, August 30, 2024 to Monday, September 30, 2024. The City welcomes your input during the comment period. In the event the City has not received either a response or a well-justified request for additional time from a Responsible Agency by the end of the review period, the City may presume that the Responsible Agency has no response (CEQA Guidelines Section 15082[b][2]).

By virtue of its potential employment, site acreage and potential building square footage the project is considered a project of "statewide, regional, or areawide significance" (CEQA Guidelines Section 15206 (b)(2)(E))[1] and therefore requires a scoping meeting (CEQA Guidelines Section 15082(c)(l)). A virtual scoping meeting for this project will be held from 5:30 p.m. to 6:30 p.m. on Tuesday, September 24, 2024. You may attend the meeting by going to https://us02web.zoom.us/j/2059653242?pwd=clRFUGNMQkVLWTYxc3NqSUNwM0M3dz09&omn=84277363385 and clicking "join."

The meeting number ID is **205 965 3242,** the meeting password is **7cSJD5.**

If you have any questions regarding this matter or would like to submit comments on behalf of your agency/organization or as an individual, please submit your comments to the City's Project Manager at:

City of Stockton
Community Development Department
Attention: Nicole Moore, Contract Planner

Email: nicole.moore.ctr@stocktonca.gov.

[1] CEQA Guidelines Section 15206(b)(2)(E) specifies that projects of "statewide, regional, or areawide significance" include: "A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or encompassing more than 650,000 square feet of floor area." The project meets all three of these criteria.

South Stockton Commerce Center
REVISED NOTICE OF PREPARATION
SUPPLEMENTAL INFORMATION

The following information consists of a description and location of the proposed project as well as information on the environmental issues to be discussed in the Revised and Recirculated EIR. As stated above in the NOP, the proposed project essentially unchanged from the project as it was described in the Draft EIR of October 15, 2021, except that the Project Description has been changed as a result of compliance with the Ordinance and the utility plans have been refined.

The Revised and Recirculated EIR will describe changes to the October 15, 2021 Draft EIR's description of the environmental effects, mitigation measures and alternatives resulting from that modification of the Project Description. These changes will be discussed in revised versions of all chapters of the Draft EIR.

1. Project Location

The South Stockton Commerce Center Project site (proposed Project site) is comprised of 422.22 acres located in the southern portion of the City of Stockton, south of and adjacent to the Stockton Airport. The Project site is located west of the 99 Frontage Road and State Route (SR) 99 and east of Airport Way. The Union Pacific Railroad (UPRR) extends south from Airport Way bisecting the western portion of the site. French Camp Slough extends southeast from Airport Way across the southwestern portion of the site. It continues east under the UPRR and then south across the southwestern portion of the site, before continuing south off-site. Additional project location details may be found in Chapter 2.0 of the October 15, 2021 Draft EIR and in the attached figures.

2. Project Description

The SSCC Project proposes a Tentative Map for the 422.22-acre site to create 13 development lots, two basin lots, one park lot, one open space lot, one sewer pump station lot, and off-site sewer improvements. Of the 13 development lots, 12 will be for development of a mix of industrial uses and one will be for development of commercial uses. Although a Site Plan is not currently proposed, for planning purposes a conceptual site plan was prepared to establish a target Floor Area Ratio (FAR) that was used to generate the maximum square footage of building area for the Tentative Map and for purposes of environmental review As described in Chapter 2.0, Project Description, the Project would result in a maximum of 6,091,551 square feet of industrial type land uses, 140,350 square feet of commercial land uses, 54 acres of open space, 41 acres of public facilities, and 18 acres of right-of-way circulation improvements. Additional project description detail is provided in Chapter 2.0 of the October 15, 2021 Draft EIR.

At the December 12, 2023 Stockton City Council meeting, the Council adopted a Stockton Municipal Code Title 16 Ordinance establishing new logistics warehouse development standards. These standards became effective on January 11, 2024. The Ordinance is referred to as the City's Warehouse Ordinance. Additionally, the proposed Project utility improvements have been refined since the prior (2021) public comment period. This Recirculated Draft EIR was prepared to reflect the changes in the Project Description resulting from compliance with the Ordinance and the refined utility plans. The Project Description chapter and the other sections herein have been updated to reflect such Project compliance with the Ordinance, as well as other Project refinements (such as utility plans, construction schedule, etc.).

The description of the proposed project in Chapter 2.0 of the Draft EIR is largely unchanged from the October 15, 2021 Draft EIR. The potential environmental effects of the project, which are largely dependent on the maximum potential size and layout of buildings and site improvements as described in the Draft EIR will be unaffected. Since the Draft EIR was published, a number of related conditions have changed, including the City's adoption of its Warehouse Ordinance in 2023 and an amendment to that ordinance in 2024. Additional background information related to the formerly proposed Mitigation Measures and adoption of the Warehouse Ordinance will be provided in detail in the Revised and Recirculated EIR.

3. Issues to be Analyzed in the Revised and Recirculated EIR

The applicant's 2020 submittal of an application for approval of the proposed project triggered the Lead Agency's (City of Stockton) determination that an Environmental Impact Report (EIR) would be prepared for the project. At the time, a Notice of Preparation was prepared and circulated that described the expected contents of the October 15, 2021 Draft EIR. Both the NOP and the October 15, 2021 Draft EIR are available for review on the City's website.

The Revised and Recirculated EIR will consider any changes to the potential environmental effects of the proposed project, along with any changes to mitigation measures and alternatives to the project as described in the October 15, 2021 Draft EIR that could result from compliance with the City's Warehouse Ordinance.

Environmental concerns that will be addressed in the various chapters of the Revised and Recirculated EIR are summarized on a chapter by basis below. It is anticipated that changes to the October 15, 2021 Draft EIR will be concentrated in Chapter 3.3 Air Quality and Chapter 3.7 Greenhouse Gases, Climate Change and Energy and that changes to other chapters will be minimal. Other October 15, 2021 Draft EIR chapters will be screened to identify changes in the environmental impact analysis and recommended mitigation measures that could result from compliance with the City's Warehouse Ordinance. Any substantive resulting changes to the Draft EIR will be described in the Revised and Recirculated EIR.

<u>Aesthetics and Visual Resources</u>

No substantive changes to the October 15, 2021 Draft EIR are anticipated. The Draft EIR adequately considered the potential effects of the project on aesthetics and visual resources.

<u>Agricultural Resources</u>

No substantive changes to the October 15, 2021 Draft EIR are anticipated. The Draft EIR adequately considered the potential effects of the project on agricultural resources.

Air Quality

Substantive changes to Chapter 3.3 of the October 15, 2021 Draft EIR are anticipated. The potential effects of the Stockton Warehouse Ordinance on air quality and aur quality impacts will be evaluated and reported in the Revised and Recirculated EIR as appropriate. Chapter 3.3 will be modified and included in the Revised and Recirculated EIR with the following changes:

Review of Environmental Setting information, update as required Review of Regulatory Setting, update as required

Review assumptions, adjustments and revised results of air emissions modeling, if any

Consider the mitigating effects of the adopted Stockton Warehouse Ordinance requirements as they pertain to air quality impacts

Identify revised mitigation measures needed to address the Stockton Warehouse Ordinance

Biological Resources

No substantive changes to the October 15, 2021 Draft EIR are anticipated. The Draft EIR adequately considered the potential biological effects of the project.

Cultural and Tribal Cultural Resources

No substantive changes to the October 15, 2021 Draft EIR are anticipated. The Draft EIR adequately considered the potential cultural resource effects of the project.

Geology and Soils

No substantive changes to the October 15, 2021 Draft EIR are anticipated. The Draft EIR adequately considered the potential geologic, soils and paleontological effects of the project.

Greenhouse Gases, Climate Change and Energy

The potential effects of the Stockton Warehouse Ordinance on GHGs and energy and associated impacts will be evaluated and reported in the Revised and Recirculated EIR as appropriate. Chapter 3.7, Greenhouse Gases, Climate Change and Energy will be modified and included in the Revised and Recirculated EIR with any changes resulting from the following considerations:

Review of Environmental Setting information, update as required Review of Regulatory Setting, update as required

Review assumptions, adjustments and results of greenhouse gas emissions modeling

Consider the mitigating effects of the adopted Stockton Warehouse Ordinance requirements as they pertain to greenhouse gas impacts

Identify revised mitigation measures needed to address the Stockton Warehouse Ordinance

Hazards and Hazardous Materials

No substantive changes to the October 15, 2021 Draft EIR are anticipated. The Draft EIR adequately considered the potential hazards and hazardous materials effects of the project.

Hydrology and Water Quality

No substantive changes to the October 15, 2021 Draft EIR are anticipated. The Draft EIR adequately considered the potential hydrology and water quality effects of the project.

Land Use and Population

No substantive changes to the October 15, 2021 Draft EIR are anticipated. The Draft EIR adequately considered the potential land use, population and housing effects of the project.

Noise

No substantive changes to the October 15, 2021 Draft EIR are anticipated. The Draft EIR adequately considered the potential noise effects of the project. The potential effects of the Stockton Warehouse Ordinance on noise and noise impacts will be evaluated and reported in the Revised and Recirculated EIR as appropriate.

Public Services and Recreation

No substantive changes to the October 15, 2021 Draft EIR are anticipated. The Draft EIR adequately considered the potential public services and recreation effects of the project.

Transportation and Circulation

No substantive changes to the October 15, 2021 Draft EIR are anticipated. The Draft EIR adequately considered the potential transportation effects of the project. The potential effects of the Stockton Warehouse Ordinance on noise and noise impacts will be evaluated and reported in the Revised and Recirculated EIR as appropriate.

Utilities

No substantive changes to the October 15, 2021 Draft EIR are anticipated. The Draft EIR adequately considered the potential utilities and services effects of the project. Updates to these planned services or construction details are emerging from refined utility plans. This information will be reviewed and disclosed in the Revised and Recirculated EIR as appropriate.

Cumulative Impacts

The Revised and Recirculated EIR will reconsider the potential cumulative impacts of the project in all the above-listed resource areas.

Alternatives to the Proposed Project

The Revised and Recirculated EIR will evaluate any changes to the October 15, 2021 Draft EIR's comparative description of alternatives to the proposed project that may be warranted based on the foregoing analyses.

Growth-Inducing Impacts

The Revised and Recirculated EIR will revisit and summarize the environmental impacts of the project considered significant and unavoidable and describe any changes to the irreversible environmental commitments identified in the October 15, 2021 Draft EIR. The Revised and Recirculated EIR will reconsider the potential growth-inducing impacts of the project and report any substantive changes.

RE: <u>City of Stockton's South Stockton Commerce Center Project Scoping Meeting (SCH#: 2020090561).</u>

Dear Nicole Moore,

On behalf of Carpenters Local Union 152 ("**Local 152**"), my Office is submitting these comments for the City of Stockton's ("**City**") September 24, 2024 Scoping Meeting for the South Stockton Commerce Center P20-0024 Project ("**Project**").

Local 152 is a labor union that represents thousands of union carpenters in the San Joaquin County, and has a strong interest in well-ordered land use planning and in addressing the environmental impacts of development projects.

Individual members of Local 152 live, work, and recreate in the City and surrounding communities and would be directly affected by the Project's environmental impacts.

Local 152 expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearing and proceeding related to this Project. Gov. Code, § 65009, subd. (b); Pub. Res. Code, § 21177, subd. (a); see *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal.App.4th 1184, 1199-1203; see also *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal.App.4th 1109, 1121.

Local 152 incorporates by reference all comments raising issues regarding the environmental documents submitted prior to approval of the Project. See *Citizens for Clean Energy v City of Woodland* (2014) 225 Cal.App.4th 173, 191 (finding that any party who has objected to the project's environmental documentation may assert any issue timely raised by other parties).

Moreover, Local 152 requests that the the City provide notice for any and all notices referring or related to the Project issued under the California Environmental Quality Act (**CEQA**) (Pub. Res. Code, § 21000 *et seq.*), and the California Planning and Zoning Law ("**Planning and Zoning Law**") (Gov. Code, §§ 65000–65010). California Public Resources Code Sections 21092.2, and 21167(f) and California Government Code Section 65092 require agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

I. THE CITY SHOULD REQUIRE THE USE OF A LOCAL WORKFORCE TO BENEFIT THE COMMUNITY'S ECONOMIC DEVELOPMENT AND ENVIRONMENT.

The City should require the Project to be built by contractors who participate in a Joint Labor-Management Apprenticeship Program approved by the State of California and make a commitment to hiring a local workforce.

Community benefits such as local hire can also be helpful to reduce environmental impacts and improve the positive economic impact of the Project. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project site can reduce the length of vendor trips, reduce greenhouse gas emissions, and provide localized economic benefits. As environmental consultants Matt Hagemann and Paul E. Rosenfeld note:

> [A]ny local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

March 8, 2021 SWAPE Letter to Mitchell M. Tsai re Local Hire Requirements and Considerations for Greenhouse Gas Modeling.

Workforce requirements promote the development of skilled trades that yield sustainable economic development. As the California Workforce Development Board and the University of California, Berkeley Center for Labor Research and Education concluded:

> [L]abor should be considered an investment rather than a cost—and investments in growing, diversifying, and upskilling California's workforce

> can positively affect returns on climate mitigation efforts. In other words, well-trained workers are key to delivering emissions reductions and moving California closer to its climate targets.[1]

Furthermore, workforce policies have significant environmental benefits given that they improve an area's jobs-housing balance, decreasing the amount and length of job commutes and the associated greenhouse gas emissions. In fact, on May 7, 2021, the South Coast Air Quality Management District found that that the "[u]se of a local state-certified apprenticeship program" can result in air pollutant reductions.[2]

Locating jobs closer to residential areas can have significant environmental benefits. As the California Planning Roundtable noted in 2008:

> People who live and work in the same jurisdiction would be more likely to take transit, walk, or bicycle to work than residents of less balanced communities and their vehicle trips would be shorter. Benefits would include potential reductions in both vehicle miles traveled and vehicle hours traveled.[3]

Moreover, local hire mandates and skill-training are critical facets of a strategy to reduce vehicle miles traveled ("**VMT**"). As planning experts Robert Cervero and Michael Duncan have noted, simply placing jobs near housing stock is insufficient to achieve VMT reductions given that the skill requirements of available local jobs must match those held by local residents.[4] Some municipalities have even tied local hire and other workforce policies to local development permits to address transportation issues. Cervero and Duncan note that:

> In nearly built-out Berkeley, CA, the approach to balancing jobs and housing is to create local jobs rather than to develop new housing. The city's First Source program encourages businesses to hire local residents, especially for entry- and intermediate-level jobs, and sponsors vocational training to ensure residents are employment-ready. While the program is voluntary, some 300 businesses have used it to date, placing more than 3,000 city residents in local jobs since it was launched in 1986. When needed, these carrots are matched by sticks, since the city is not shy about negotiating corporate participation in First Source as a condition of approval for development permits.

Recently, the State of California verified its commitment towards workforce development through the Affordable Housing and High Road Jobs Act of 2022, otherwise known as Assembly Bill No. 2011 ("**AB2011**"). AB2011 amended the Planning and Zoning Law to allow ministerial, by-right approval for projects being built alongside commercial corridors that meet affordability and labor requirements.

The City should consider utilizing local workforce policies and requirements to benefit the local area economically and to mitigate greenhouse gas, improve air quality, and reduce transportation impacts.

Sincerely,

Naira Soghbatyan

Subject: Local Hire Requirements and Considerations for Greenhouse Gas Modeling

Dear Mr. Tsai,

Soil Water Air Protection Enterprise ("SWAPE") is pleased to provide the following draft technical report explaining the significance of worker trips required for construction of land use development projects with respect to the estimation of greenhouse gas ("GHG") emissions. The report will also discuss the potential for local hire requirements to reduce the length of worker trips, and consequently, reduced or mitigate the potential GHG impacts.

Worker Trips and Greenhouse Gas Calculations

The California Emissions Estimator Model ("CalEEMod") is a "statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects."[1] CalEEMod quantifies construction-related emissions associated with land use projects resulting from off-road construction equipment; on-road mobile equipment associated with workers, vendors, and hauling; fugitive dust associated with grading, demolition, truck loading, and on-road vehicles traveling along paved and unpaved roads; and architectural coating activities; and paving.[2]

The number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[3]

[1] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[2] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[3] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

Specifically, the number and length of vehicle trips is utilized to estimate the vehicle miles travelled ("VMT") associated with construction. Then, utilizing vehicle-class specific EMFAC 2014 emission factors, CalEEMod calculates the vehicle exhaust, evaporative, and dust emissions resulting from construction-related VMT, including personal vehicles for worker commuting.[4]

Specifically, in order to calculate VMT, CalEEMod multiplies the average daily trip rate by the average overall trip length (see excerpt below):

> "$VMT_d = \Sigma(\text{Average Daily Trip Rate}_i * \text{Average Overall Trip Length}_i)_n$
>
> Where:
>
> n = Number of land uses being modeled."[5]

Furthermore, to calculate the on-road emissions associated with worker trips, CalEEMod utilizes the following equation (see excerpt below):

> "$\text{Emissions}_{pollutant} = VMT * EF_{running,pollutant}$
>
> Where:
>
> $\text{Emissions}_{pollutant}$ = emissions from vehicle running for each pollutant
>
> VMT = vehicle miles traveled
>
> $EF_{running,pollutant}$ = emission factor for running emissions."[6]

Thus, there is a direct relationship between trip length and VMT, as well as a direct relationship between VMT and vehicle running emissions. In other words, when the trip length is increased, the VMT and vehicle running emissions increase as a result. Thus, vehicle running emissions can be reduced by decreasing the average overall trip length, by way of a local hire requirement or otherwise.

Default Worker Trip Parameters and Potential Local Hire Requirements

As previously discussed, the number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[7] In order to understand how local hire requirements and associated worker trip length reductions impact GHG emissions calculations, it is important to consider the CalEEMod default worker trip parameters. CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence.[8] The default number of construction-related worker trips is calculated by multiplying the

[5] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 23.
[6] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 15.
[7] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.
[8] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 1, 9.

number of pieces of equipment for all phases by 1.25, with the exception of worker trips required for the building construction and architectural coating phases.[9] Furthermore, the worker trip vehicle class is a 50/25/25 percent mix of light duty autos, light duty truck class 1 and light duty truck class 2, respectively."[10] Finally, the default worker trip length is consistent with the length of the operational home-to-work vehicle trips.[11] The operational home-to-work vehicle trip lengths are:

> "[B]ased on the *location* and *urbanization* selected on the project characteristic screen. These values were *supplied by the air districts or use a default average for the state*. Each district (or county) also assigns trip lengths for urban and rural settings" (emphasis added). [12]

Thus, the default worker trip length is based on the location and urbanization level selected by the User when modeling emissions. The below table shows the CalEEMod default rural and urban worker trip lengths by air basin (see excerpt below and Attachment A).[13]

Worker Trip Length by Air Basin		
Air Basin	**Rural (miles)**	**Urban (miles)**
Great Basin Valleys	16.8	10.8
Lake County	16.8	10.8
Lake Tahoe	16.8	10.8
Mojave Desert	16.8	10.8
Mountain Counties	16.8	10.8
North Central Coast	17.1	12.3
North Coast	16.8	10.8
Northeast Plateau	16.8	10.8
Sacramento Valley	16.8	10.8
Salton Sea	14.6	11
San Diego	16.8	10.8
San Francisco Bay Area	10.8	10.8
San Joaquin Valley	16.8	10.8
South Central Coast	16.8	10.8
South Coast	19.8	14.7
Average	**16.47**	**11.17**
Minimum	**10.80**	**10.80**
Maximum	**19.80**	**14.70**
Range	**9.00**	**3.90**

[9] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

[11] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14.
[12] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 21.
[13] "Appendix D Default Data Tables." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-84 – D-86.

As demonstrated above, default rural worker trip lengths for air basins in California vary from 10.8- to 19.8-miles, with an average of 16.47 miles. Furthermore, default urban worker trip lengths vary from 10.8- to 14.7-miles, with an average of 11.17 miles. Thus, while default worker trip lengths vary by location, default urban worker trip lengths tend to be shorter in length. Based on these trends evident in the CalEEMod default worker trip lengths, we can reasonably assume that the efficacy of a local hire requirement is especially dependent upon the urbanization of the project site, as well as the project location.

Practical Application of a Local Hire Requirement and Associated Impact

To provide an example of the potential impact of a local hire provision on construction-related GHG emissions, we estimated the significance of a local hire provision for the Village South Specific Plan ("Project") located in the City of Claremont ("City"). The Project proposed to construct 1,000 residential units, 100,000-SF of retail space, 45,000-SF of office space, as well as a 50-room hotel, on the 24-acre site. The Project location is classified as Urban and lies within the Los Angeles-South Coast County. As a result, the Project has a default worker trip length of 14.7 miles.[14] In an effort to evaluate the potential for a local hire provision to reduce the Project's construction-related GHG emissions, we prepared an updated model, reducing all worker trip lengths to 10 miles (see Attachment B). Our analysis estimates that if a local hire provision with a 10-mile radius were to be implemented, the GHG emissions associated with Project construction would decrease by approximately 17% (see table below and Attachment C).

Local Hire Provision Net Change	
Without Local Hire Provision	
Total Construction GHG Emissions (MT CO_2e)	3,623
Amortized Construction GHG Emissions (MT CO_2e/year)	120.77
With Local Hire Provision	
Total Construction GHG Emissions (MT CO2e)	3,024
Amortized Construction GHG Emissions (MT CO_2e/year)	100.80
% Decrease in Construction-related GHG Emissions	***17%***

As demonstrated above, by implementing a local hire provision requiring 10 mile worker trip lengths, the Project could reduce potential GHG emissions associated with construction worker trips. More broadly, any local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

This serves as an example of the potential impacts of local hire requirements on estimated project-level GHG emissions, though it does not indicate that local hire requirements would result in reduced construction-related GHG emission for all projects. As previously described, the significance of a local hire requirement depends on the worker trip length enforced and the default worker trip length for the project's urbanization level and location.

[14] "Appendix D Default Data Tables." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-85.

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	45.00	1000sqft	1.03	45,000.00	0
High Turnover (Sit Down Restaurant)	36.00	1000sqft	0.83	36,000.00	0
Hotel	50.00	Room	1.67	72,600.00	0
Quality Restaurant	8.00	1000sqft	0.18	8,000.00	0
Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	9			**Operational Year**	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Annual

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	9			**Operational Year**	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Paul Rosenfeld Ph.D. (October 24-25, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. Mealey's C8/PFOA. *Science, Risk & Litigation Conference.* Lecture conducted from The Rittenhouse Hotel, Philadelphia, PA.

Paul Rosenfeld Ph.D. (September 19, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, *Toxicology and Remediation PEMA Emerging Contaminant Conference*. Lecture conducted from Hilton Hotel, Irvine California.

Paul Rosenfeld Ph.D. (September 19, 2005). Fate, Transport, Toxicity, And Persistence of 1,2,3-TCP. *PEMA Emerging Contaminant Conference.* Lecture conducted from Hilton Hotel in Irvine, California.

Paul Rosenfeld Ph.D. (September 26-27, 2005). Fate, Transport and Persistence of PDBEs. *Mealey's Groundwater Conference.* Lecture conducted from Ritz Carlton Hotel, Marina Del Ray, California.

Paul Rosenfeld Ph.D. (June 7-8, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. *International Society of Environmental Forensics: Focus On Emerging Contaminants*. Lecture conducted from Sheraton Oceanfront Hotel, Virginia Beach, Virginia.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Fate Transport, Persistence and Toxicology of PFOA and Related Perfluorochemicals. *2005 National Groundwater Association Ground Water And Environmental Law Conference*. Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, Toxicology and Remediation. *2005 National Groundwater Association Ground Water and Environmental Law Conference.* Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld, Ph.D. and James Clark Ph.D. and Rob Hesse R.G. (May 5-6, 2004). Tert-butyl Alcohol Liability and Toxicology, A National Problem and Unquantified Liability. *National Groundwater Association. Environmental Law Conference*. Lecture conducted from Congress Plaza Hotel, Chicago Illinois.

Paul Rosenfeld, Ph.D. (March 2004). Perchlorate Toxicology. *Meeting of the American Groundwater Trust*. Lecture conducted from Phoenix Arizona.

Hagemann, M.F., **Paul Rosenfeld, Ph.D.** and Rob Hesse (2004). Perchlorate Contamination of the Colorado River. *Meeting of tribal representatives*. Lecture conducted from Parker, AZ.

Paul Rosenfeld, Ph.D. (April 7, 2004). A National Damage Assessment Model For PCE and Dry Cleaners. *Drycleaner Symposium. California Ground Water Association*. Lecture conducted from Radison Hotel, Sacramento, California.

Rosenfeld, P. E., Grey, M., (June 2003) Two stage biofilter for biosolids composting odor control. *Seventh International In Situ And On Site Bioremediation Symposium Battelle Conference* Orlando, FL.

Paul Rosenfeld, Ph.D. and James Clark Ph.D. (February 20-21, 2003) Understanding Historical Use, Chemical Properties, Toxicity and Regulatory Guidance of 1,4 Dioxane. *National Groundwater Association. Southwest Focus Conference. Water Supply and Emerging Contaminants*.. Lecture conducted from Hyatt Regency Phoenix Arizona.

Paul Rosenfeld, Ph.D. (February 6-7, 2003). Underground Storage Tank Litigation and Remediation. *California CUPA Forum*. Lecture conducted from Marriott Hotel, Anaheim California.

Paul Rosenfeld, Ph.D. (October 23, 2002) Underground Storage Tank Litigation and Remediation. *EPA Underground Storage Tank Roundtable*. Lecture conducted from Sacramento California.

Rosenfeld, P.E. and Suffet, M. (October 7- 10, 2002). Understanding Odor from Compost, *Wastewater and Industrial Processes. Sixth Annual Symposium On Off Flavors in the Aquatic Environment. International Water Association*. Lecture conducted from Barcelona Spain.

Rosenfeld, P.E. and Suffet, M. (October 7- 10, 2002). Using High Carbon Wood Ash to Control Compost Odor. *Sixth Annual Symposium On Off Flavors in the Aquatic Environment. International Water Association*. Lecture conducted from Barcelona Spain.

Rosenfeld, P.E. and Grey, M. A. (September 22-24, 2002). Biocycle Composting For Coastal Sage Restoration. *Northwest Biosolids Management Association*. Lecture conducted from Vancouver Washington..

Rosenfeld, P.E. and Grey, M. A. (November 11-14, 2002). Using High-Carbon Wood Ash to Control Odor at a Green Materials Composting Facility. *Soil Science Society Annual Conferenc*e. Lecture conducted from Indianapolis, Maryland.

Rosenfeld. P.E. (September 16, 2000). Two stage biofilter for biosolids composting odor control. *Water Environment Federation.* Lecture conducted from Anaheim California.

Rosenfeld. P.E. (October 16, 2000). Wood ash and biofilter control of compost odor. *Biofest.* Lecture conducted from Ocean Shores, California.

Rosenfeld, P.E. (2000). Bioremediation Using Organic Soil Amendments. *California Resource Recovery Association*. Lecture conducted from Sacramento California.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation With High-Carbon Wood-Ash. *Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings*. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., and C.L. Henry. (1999). An evaluation of ash incorporation with biosolids for odor reduction. *Soil Science Society of America*. Lecture conducted from Salt Lake City Utah.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Comparison of Microbial Activity and Odor Emissions from Three Different Biosolids Applied to Forest Soil. *Brown and Caldwell.* Lecture conducted from Seattle Washington.

Rosenfeld, P.E., C.L. Henry. (1998). Characterization, Quantification, and Control of Odor Emissions from Biosolids Application To Forest Soil. *Biofest.* Lecture conducted from Lake Chelan, Washington.

Rosenfeld, P.E, C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation With High-Carbon Wood-Ash. Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., C.L. Henry, R. B. Harrison, and R. Dills. (1997). Comparison of Odor Emissions From Three Different Biosolids Applied to Forest Soil. *Soil Science Society of America*. Lecture conducted from Anaheim California.

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Deposition and/or Trial Testimony:

In the United States District Court For The District of New Jersey
Duarte et al, *Plaintiffs,* vs. United States Metals Refining Company et. al. *Defendant.*
Case No.: 2:17-cv-01624-ES-SCM
Rosenfeld Deposition. 6-7-2019

In the United States District Court of Southern District of Texas Galveston Division
M/T Carla Maersk, *Plaintiffs,* vs. Conti 168., Schiffahrts-GMBH & Co. Bulker KG MS "Conti Perdido" *Defendant.*
Case No.: 3:15-CV-00106 consolidated with 3:15-CV-00237
Rosenfeld Deposition. 5-9-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
Carole-Taddeo-Bates et al., vs. Ifran Khan et al., Defendants
Case No.: No. BC615636
Rosenfeld Deposition, 1-26-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
The San Gabriel Valley Council of Governments et al. vs El Adobe Apts. Inc. et al., Defendants
Case No.: No. BC646857
Rosenfeld Deposition, 10-6-2018; Trial 3-7-19

In United States District Court For The District of Colorado
Bells et al. Plaintiff vs. The 3M Company et al., Defendants
Case: No 1:16-cv-02531-RBJ
Rosenfeld Deposition, 3-15-2018 and 4-3-2018

In The District Court Of Regan County, Texas, 112th Judicial District
Phillip Bales et al., Plaintiff vs. Dow Agrosciences, LLC, et al., Defendants
Cause No 1923
Rosenfeld Deposition, 11-17-2017

In The Superior Court of the State of California In And For The County Of Contra Costa
Simons et al., Plaintiffs vs. Chevron Corporation, et al., Defendants
Cause No C12-01481
Rosenfeld Deposition, 11-20-2017

In The Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 8-23-2017

In The Superior Court of the State of California, For The County of Los Angeles
Warrn Gilbert and Penny Gilber, Plaintiff vs. BMW of North America LLC
Case No.: LC102019 (c/w BC582154)
Rosenfeld Deposition, 8-16-2017, Trail 8-28-2018

In the Northern District Court of Mississippi, Greenville Division
Brenda J. Cooper, et al., *Plaintiffs,* vs. Meritor Inc., et al., *Defendants*
Case Number: 4:16-cv-52-DMB-JVM
Rosenfeld Deposition: July 2017

In The Superior Court of the State of Washington, County of Snohomish
Michael Davis and Julie Davis et al., Plaintiff vs. Cedar Grove Composting Inc., Defendants
Case No.: No. 13-2-03987-5
Rosenfeld Deposition, February 2017
Trial, March 2017

In The Superior Court of the State of California, County of Alameda
Charles Spain., Plaintiff vs. Thermo Fisher Scientific, et al., Defendants
Case No.: RG14711115
Rosenfeld Deposition, September 2015

In The Iowa District Court In And For Poweshiek County
Russell D. Winburn, et al., Plaintiffs vs. Doug Hoksbergen, et al., Defendants
Case No.: LALA002187
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Jerry Dovico, et al., Plaintiffs vs. Valley View Sine LLC, et al., Defendants
Law No,: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Doug Pauls, et al.,, et al., Plaintiffs vs. Richard Warren, et al., Defendants
Law No,: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Circuit Court of Ohio County, West Virginia
Robert Andrews, et al. v. Antero, et al.
Civil Action N0. 14-C-30000
Rosenfeld Deposition, June 2015

In The Third Judicial District County of Dona Ana, New Mexico
Betty Gonzalez, et al. Plaintiffs vs. Del Oro Dairy, Del Oro Real Estate LLC, Jerry Settles and Deward DeRuyter, Defendants
Rosenfeld Deposition: July 2015

In The Iowa District Court For Muscatine County
Laurie Freeman et. al. Plaintiffs vs. Grain Processing Corporation, Defendant
Case No 4980
Rosenfeld Deposition: May 2015

In the Circuit Court of the 17th Judicial Circuit, in and For Broward County, Florida
Walter Hinton, et. al. Plaintiff, vs. City of Fort Lauderdale, Florida, a Municipality, Defendant.
Case Number CACE07030358 (26)
Rosenfeld Deposition: December 2014

In the United States District Court Western District of Oklahoma
Tommy McCarty, et al., Plaintiffs, v. Oklahoma City Landfill, LLC d/b/a Southeast Oklahoma City Landfill, et al. Defendants.
Case No. 5:12-cv-01152-C
Rosenfeld Deposition: July 2014

In the County Court of Dallas County Texas
Lisa Parr et al, *Plaintiff*, vs. Aruba et al, *Defendant.*
Case Number cc-11-01650-E
Rosenfeld Deposition: March and September 2013
Rosenfeld Trial: April 2014

In the Court of Common Pleas of Tuscarawas County Ohio
John Michael Abicht, et al., *Plaintiffs,* vs. Republic Services, Inc., et al., *Defendants*
Case Number: 2008 CT 10 0741 (Cons. w/ 2009 CV 10 0987)
Rosenfeld Deposition: October 2012

In the United States District Court of Southern District of Texas Galveston Division
Kyle Cannon, Eugene Donovan, Genaro Ramirez, Carol Sassler, and Harvey Walton, each Individually and on behalf of those similarly situated, *Plaintiffs,* vs. BP Products North America, Inc., *Defendant.*
Case 3:10-cv-00622
Rosenfeld Deposition: February 2012
Rosenfeld Trial: April 2013

In the Circuit Court of Baltimore County Maryland
Philip E. Cvach, II et al., *Plaintiffs* vs. Two Farms, Inc. d/b/a Royal Farms, Defendants
Case Number: 03-C-12-012487 OT
Rosenfeld Deposition: September 2013

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2014;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Hagemann, M.F., 2005. Use of Electronic Databases in Environmental Regulation, Policy Making and Public Participation. Brownfields 2005, Denver, Coloradao.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Nevada and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Las Vegas, NV (served on conference organizing committee).

Hagemann, M.F., 2004. Invited testimony to a California Senate committee hearing on air toxins at schools in Southern California, Los Angeles.

Brown, A., Farrow, J., Gray, A. and **Hagemann, M.**, 2004. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to the Ground Water and Environmental Law Conference, National Groundwater Association.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Arizona and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Phoenix, AZ (served on conference organizing committee).

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in the Southwestern U.S. Invited presentation to a special committee meeting of the National Academy of Sciences, Irvine, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a tribal EPA meeting, Pechanga, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a meeting of tribal repesentatives, Parker, AZ.

Hagemann, M.F., 2003. Impact of Perchlorate on the Colorado River and Associated Drinking Water Supplies. Invited presentation to the Inter-Tribal Meeting, Torres Martinez Tribe.

Hagemann, M.F., 2003. The Emergence of Perchlorate as a Widespread Drinking Water Contaminant. Invited presentation to the U.S. EPA Region 9.

Hagemann, M.F., 2003. A Deductive Approach to the Assessment of Perchlorate Contamination. Invited presentation to the California Assembly Natural Resources Committee.

Hagemann, M.F., 2003. Perchlorate: A Cold War Legacy in Drinking Water. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. From Tank to Tap: A Chronology of MTBE in Groundwater. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. A Chronology of MTBE in Groundwater and an Estimate of Costs to Address Impacts to Groundwater. Presentation to the annual meeting of the Society of Environmental Journalists.

Hagemann, M.F., 2002. An Estimate of the Cost to Address MTBE Contamination in Groundwater (and Who Will Pay). Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to a meeting of the U.S. EPA and State Underground Storage Tank Program managers.

Hagemann, M.F., 2001. From Tank to Tap: A Chronology of MTBE in Groundwater. Unpublished report.

Hagemann, M.F., 2001. Estimated Cleanup Cost for MTBE in Groundwater Used as Drinking Water. Unpublished report.

Hagemann, M.F., 2001. Estimated Costs to Address MTBE Releases from Leaking Underground Storage Tanks. Unpublished report.

Hagemann, M.F., and VanMouwerik, M., 1999. Potential Water Quality Concerns Related to Snowmobile Usage. Water Resources Division, National Park Service, Technical Report.

VanMouwerik, M. and **Hagemann, M.F**. 1999, Water Quality Concerns Related to Personal Watercraft Usage. Water Resources Division, National Park Service, Technical Report.

Hagemann, M.F., 1999, Is Dilution the Solution to Pollution in National Parks? The George Wright Society Biannual Meeting, Asheville, North Carolina.

Subject: South Stockton Commerce Center
DRAFT ENVIRONMENTAL IMPACT REPORT (DEIR)
SCH No. 2020090561

Dear Nicole Moore:

The California Department of Fish and Wildlife (CDFW) received and reviewed the Notice of Preparation of an Environmental Impact Report (EIR) from the City of Stockton (City) for the South Stockton Commerce Center (Project) in San Joaquin County pursuant the California Environmental Quality Act (CEQA) statute and guidelines.[1]

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish, wildlife, plants and their habitats. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may need to exercise its own regulatory authority under the Fish and Game Code (Fish & G. Code).

CDFW ROLE

CDFW is California's Trustee Agency for fish and wildlife resources and holds those resources in trust by statute for all the people of the State (Fish & G. Code, §§ 711.7, subd. (a) & 1802; Pub. Resources Code, § 21070; CEQA Guidelines § 15386, subd. (a).). CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (Fish & G. Code, § 1802.). Similarly, for purposes of CEQA, CDFW provides, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources.

---

1 CEQA is codified in the California Public Resources Code in section 21000 et seq. The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

CDFW may also act as a Responsible Agency under CEQA. (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381.) CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code. As proposed, for example, the Project may be subject to CDFW's lake and streambed alteration regulatory authority. (Fish & G. Code, § 1600 et seq.) Likewise, to the extent implementation of the Project as proposed may result in "take" as defined by State law of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 et seq.), the Project proponent may seek related take authorization as provided by the Fish and Game Code.

PROJECT DESCRIPTION SUMMARY

The Project site consists of 422.22 acres of historic agricultural land, located at approximately Latitude: 37.882924 and Longitude: -121.239930 (WGS 84 datum, decimal degrees) in the southern portion of the City of Stockton, south of and adjacent to the Stockton Airport. The Project site is located west of the 99 Frontage Road and State Route (SR) 99, and east of Airport Way.

The Project consists of the development of a 422.22-acre site with the creation of 13 development lots, two (2) basin lots, one (1) park lot, one (1) open space lot, one (1) sewer pump station lot, and off-site sewer improvements. The Project would result in a maximum of 6,091,551 square feet of industrial type land uses, 140,350 square feet of commercial land uses, 54 acres of open space, 41 acres of public facilities, and 18 acres of right-of-way circulation improvements.

COMMENTS AND RECOMMENDATIONS

CDFW offers the comments and recommendations presented below to assist the City of Stockton in adequately identifying and/or mitigating the Project's significant, or potentially significant, impacts on biological resources. The comments and recommendations are also offered to enable CDFW to adequately review and comment on the proposed Project with respect to impacts on biological resources. CDFW recommends that the forthcoming EIR address the following:

Project Description

The Project description should include the whole action as defined in the CEQA Guidelines § 15378 and should include appropriate detailed exhibits disclosing the Project area including temporary impacted areas such as equipment stage area, spoils areas, adjacent infrastructure development, staging areas and access and haul roads if applicable.

As required by § 15126.6 of the CEQA Guidelines, the EIR should include an appropriate range of reasonable and feasible alternatives that would attain most of the basic Project objectives and avoid or minimize significant impacts to resources under CDFW's jurisdiction.

Assessment of Biological Resources

Section 15125(c) of the CEQA Guidelines states that knowledge of the regional setting of a project is critical to the assessment of environmental impacts and that special emphasis should be placed on environmental resources that are rare or unique to the region. To enable CDFW staff to adequately review and comment on the Project, the EIR should include a complete assessment of the flora and fauna within and adjacent to the Project footprint, with emphasis on identifying rare, threatened, endangered, and other sensitive species and their associated habitats. CDFW recommends the EIR specifically include:

1. An assessment of all habitat types located within the Project footprint, and a map that identifies the location of each habitat type. CDFW recommends that floristic, alliance- and/or association-based mapping and assessment be completed following, *The Manual of California Vegetation*, second edition (Sawyer 2009). Adjoining habitat areas should also be included in this assessment where site activities could lead to direct or indirect impacts offsite. Habitat mapping at the alliance level will help establish baseline vegetation conditions.

2. A general biological inventory of the fish, amphibian, reptile, bird, and mammal species that are present or have the potential to be present within each habitat type onsite and within adjacent areas that could be affected by the Project. CDFW recommends that the California Natural Diversity Database (CNDDB), as well as previous studies performed in the area, be consulted to assess the potential presence of sensitive species and habitats. A nine United States Geologic Survey 7.5-minute quadrangle search is recommended to determine what may occur in the region, larger if the Project area extends past one quad (see *Data Use Guidelines* on the Department webpage www.wildlife.ca.gov/Data/CNDDB/Maps-and-Data). Please review the webpage for information on how to access the database to obtain current information on any previously reported sensitive species and habitat, including Significant Natural Areas identified under Chapter 12 of the Fish and Game Code, in the vicinity of the Project. CDFW recommends that CNDDB Field Survey Forms be completed and submitted to CNDDB to document survey results. Online forms can be obtained and submitted at: https://www.wildlife.ca.gov/Data/CNDDB/Submitting-Data.

   Please note that CDFW's CNDDB is not exhaustive in terms of the data it houses, nor is it an absence database. CDFW recommends that it be used as a starting point in gathering information about the *potential presence* of species within the general area of the Project site. Other sources for identification of species and habitats near or adjacent to the Project area should include, but may not be limited to, State and federal resource agency lists, California Wildlife Habitat Relationship System, California Native Plant Society Inventory, agency contacts, environmental documents for other projects in the vicinity, academics, and professional or scientific organizations.

3. A complete and recent inventory of rare, threatened, endangered, and other sensitive species located within the Project footprint and within offsite areas with the potential to be affected, including California Species of Special Concern and California Fully Protected Species (Fish & G. Code § § 3511, 4700, 5050, and 5515). Species to be addressed should include all those which meet the CEQA definition (CEQA Guidelines § 15380). The inventory should address seasonal variations in use of the Project area and should not be limited to resident species. The EIR should include the results of focused species-specific surveys, completed by a qualified biologist and conducted at the appropriate time of year and time of day when the sensitive species are active or otherwise identifiable. Species-specific surveys should be conducted in order to ascertain the presence of species with the potential to be directly, indirectly, on or within a reasonable distance of the Project activities. CDFW recommends the City of Stockton rely on survey and monitoring protocols and guidelines available at: www.wildlife.ca.gov/Conservation/Survey-Protocols. Alternative survey protocols may be warranted; justification should be provided to substantiate why an alternative protocol is necessary. Acceptable species-specific survey procedures should be developed in consultation with CDFW and the U.S. Fish and Wildlife Service, where necessary. Some aspects of the Project may warrant periodic updated surveys for certain sensitive taxa, particularly if the Project is proposed to occur over a protracted time frame, or in phases, or if surveys are completed during periods of drought or deluge.

4. A thorough, recent (within the last two years), floristic-based assessment of special-status plants and natural communities, following CDFW's *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (see www.wildlife.ca.gov/Conservation/Plants).

5. Information on the regional setting that is critical to an assessment of environmental impacts, with special emphasis on resources that are rare or unique to the region (CEQA Guidelines § 15125[c]).

Analysis of Direct, Indirect, and Cumulative Impacts to Biological Resources

The EIR should provide a thorough discussion of the Project's potential direct, indirect, and cumulative impacts on biological resources. To ensure that Project impacts on biological resources are fully analyzed, the following information should be included in the EIR:

1. The EIR should define the threshold of significance for each impact and describe the criteria used to determine whether the impacts are significant (CEQA Guidelines, § 15064, subd. (f)). The EIR must demonstrate that the significant environmental impacts of the Project were adequately investigated and discussed and it must permit the significant effects of the Project to be considered in the full environmental context.

2. A discussion of potential impacts from lighting, noise, human activity, and wildlife-human interactions created by Project activities especially those adjacent to natural areas, exotic and/or invasive species occurrences, and drainages. The EIR should address Project-related changes to drainage patterns and water quality within, upstream, and downstream of the Project site, including: volume, velocity, and frequency of existing and post-Project surface flows; polluted runoff; soil erosion and/or sedimentation in streams and water bodies; and post-Project fate of runoff from the Project site.

3. A discussion of potential indirect Project impacts on biological resources, including resources in areas adjacent to the Project footprint, such as nearby public lands (e.g., National Forests, State Parks, etc.), open space, adjacent natural habitats, riparian ecosystems, wildlife corridors, and any designated and/or proposed reserve or mitigation lands (e.g., preserved lands associated with a Conservation or Recovery Plan, or other conserved lands).

4. A cumulative effects analysis developed as described under CEQA Guidelines section 15130. The EIR should discuss the Project's cumulative impacts to natural resources and determine if that contribution would result in a significant impact. The EIR should include a list of present, past, and probable future projects producing related impacts to biological resources or shall include a summary of the projections contained in an adopted local, regional, or statewide plan, that consider conditions contributing to a cumulative effect. The cumulative analysis shall include impact analysis of vegetation and habitat reductions within the area and their potential cumulative effects. Please include all potential direct and indirect Project-related impacts to riparian areas, wetlands, wildlife corridors or wildlife movement areas, aquatic habitats, sensitive species and/or special-status species, open space, and adjacent natural habitats in the cumulative effects analysis.

Mitigation Measures for Project Impacts to Biological Resources

The EIR should include appropriate and adequate avoidance, minimization, and/or mitigation measures for all direct, indirect, and cumulative impacts that are expected to occur as a result of the construction and long-term operation and maintenance of the Project. CDFW also recommends the environmental documentation provide scientifically supported discussion regarding adequate avoidance, minimization, and/or mitigation measures to address the Project's significant impacts upon fish and wildlife and their habitat. For individual projects, mitigation must be roughly proportional to the level of impacts, including cumulative impacts, in accordance with the provisions of CEQA (Guidelines § § 15126.4(a)(4)(B), 15064, 15065, and 16355). In order for mitigation measures to be effective, they must be specific, enforceable, and feasible actions that will improve environmental conditions. When proposing measures to avoid, minimize, or mitigate impacts, CDFW recommends consideration of the following:

1. *Species of Special Concern*: Several Species of Special Concern (SSC) have the potential to occur within or adjacent to the Project area, including, but not limited

to: Burrowing Owl (*Athene cunicularia)* and Yellow-Headed Blackbird (*Xanthocephalus xanthocephalus*). Project activities described in the EIR should be designed to avoid any SSC that have the potential to be present within or adjacent to the Project area. CDFW also recommends that the EIR fully analyze potential adverse impacts to SSC due to habitat modification, loss of foraging habitat, and/or interruption of migratory and breeding behaviors. CDFW recommends the City of Stockton include in the analysis how appropriate avoidance, minimization and mitigation measures will reduce impacts to SSC.

2. *Sensitive Plant Communities*: CDFW considers sensitive plant communities to be imperiled habitats having both local and regional significance. Plant communities, alliances, and associations with a statewide ranking of S-1, S-2, S-3, and S-4 should be considered sensitive and declining at the local and regional level. These ranks can be obtained by querying the CNDDB and are included in *The Manual of California Vegetation* (Sawyer 2009). The EIR should include measures to fully avoid and otherwise protect sensitive plant communities from Project-related direct and indirect impacts.

3. *Native Wildlife Nursery Sites*: CDFW recommends the EIR fully analyze potential adverse impacts to native wildlife nursery sites, including but not limited to bat maternity roosts. Based on review of Project materials, aerial photography, and observation of the site from public roadways, the Project site contains potential nursery site habitat for tree roosting bats and is near potential foraging habitat. Bats are considered non-game mammals and are afforded protection by state law from take and/or harassment, (Fish & G. Code, § 4150; Cal. Code of Regs, § 251.1). CDFW recommends that the EIR fully identify the Project's potential impacts to native wildlife nursery sites, and include appropriate avoidance, minimization and mitigation measures to reduce impacts or mitigate any potential significant impacts to bat nursery sites.

4. *Mitigation*: CDFW considers adverse Project-related impacts to sensitive species and habitats to be significant to both local and regional ecosystems, and the EIR should include mitigation measures for adverse Project-related impacts to these resources. Mitigation measures should emphasize avoidance and reduction of Project impacts. For unavoidable impacts, onsite habitat restoration, enhancement, or permanent protection should be evaluated and discussed in detail. If onsite mitigation is not feasible or would not be biologically viable and therefore not adequately mitigate the loss of biological functions and values, offsite mitigation through habitat creation and/or acquisition and preservation in perpetuity should be addressed.

   The EIR should include measures to perpetually protect the targeted habitat values within mitigation areas from direct and indirect adverse impacts in order to meet mitigation objectives to offset Project-induced qualitative and quantitative losses of biological values. Specific issues that should be addressed include restrictions on access, proposed land dedications, long-term monitoring and management programs, control of illegal dumping, water pollution, increased human intrusion, etc.

5. *Habitat Revegetation/Restoration Plans*: Plans for restoration and revegetation should be prepared by persons with expertise in the regional ecosystems and native plant restoration techniques. Plans should identify the assumptions used to develop the proposed restoration strategy. Each plan should include, at a minimum: (a) the location of restoration sites and assessment of appropriate reference sites; (b) the plant species to be used, sources of local propagules, container sizes, and seeding rates; (c) a schematic depicting the mitigation area; (d) a local seed and cuttings and planting schedule; (e) a description of the irrigation methodology; (f) measures to control exotic vegetation on site; (g) specific success criteria; (h) a detailed monitoring program; (i) contingency measures should the success criteria not be met; and (j) identification of the party responsible for meeting the success criteria and providing for conservation of the mitigation site in perpetuity. Monitoring of restoration areas should extend across a sufficient time frame to ensure that the new habitat is established, self-sustaining, and capable of surviving drought.

   CDFW recommends that local onsite propagules from the Project area and nearby vicinity be collected and used for restoration purposes. Onsite seed collection should be appropriately timed to ensure the viability of the seeds when planted. Onsite vegetation mapping at the alliance and/or association level should be used to develop appropriate restoration goals and local plant palettes. Reference areas should be identified to help guide restoration efforts. Specific restoration plans should be developed for various Project components as appropriate. Restoration objectives should include protecting special habitat elements or re-creating them in areas affected by the Project. Examples may include retention of woody material, logs, snags, rocks, and brush piles. Fish and Game Code sections 1002, 1002.5 and 1003 authorize CDFW to issue permits for the take or possession of plants and wildlife for scientific, educational, and propagation purposes. Please see our website for more information on Scientific Collecting Permits at www.wildlife.ca.gov/Licensing/Scientific-Collecting#53949678-regulations-.

6. *Nesting Birds*: Please note that it is the Project proponent's responsibility to comply with all applicable laws related to nesting birds and birds of prey. Migratory non-game native bird species are protected by international treaty under the federal Migratory Bird Treaty Act (MBTA) of 1918, as amended (16 U.S.C. 703 *et seq.*). CDFW implemented the MBTA by adopting the Fish and Game Code section 3513. Fish and Game Code sections 3503, 3503.5 and 3800 provide additional protection to nongame birds, birds of prey, their nests and eggs. Sections 3503, 3503.5, and 3513 of the Fish and Game Code afford protective measures as follows: section 3503 states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by the Fish and Game Code or any regulation made pursuant thereto; section 3503.5 states that is it unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-

prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by the Fish and Game Code or any regulation adopted pursuant thereto; and section 3513 states that it is unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA.

Potential habitat for nesting birds and birds of prey is present within the Project area. The Project should disclose all potential activities that may incur a direct or indirect take to nongame nesting birds within the Project footprint and its vicinity. Appropriate avoidance, minimization, and/or mitigation measures to avoid take must be included in the EIR.

CDFW recommends the EIR include specific avoidance and minimization measures to ensure that impacts to nesting birds or their nests do not occur. Project-specific avoidance and minimization measures may include, but not be limited to: Project phasing and timing, monitoring of Project-related noise (where applicable), sound walls, and buffers, where appropriate. The EIR should also include specific avoidance and minimization measures that will be implemented should a nest be located within the Project site. In addition to larger, protocol level survey efforts (e.g., Swainson's hawk surveys) and scientific assessments, CDFW recommends a final preconstruction survey be required no more than three (3) days prior to vegetation clearing or ground disturbance activities, as instances of nesting could be missed if surveys are conducted earlier.

7. *Moving out of Harm's Way*: The Project is anticipated to result in the clearing of natural habitats that support native species. To avoid direct mortality, the City of Stockton should state in the EIR a requirement for a qualified biologist with the proper handling permits, will be retained to be onsite prior to and during all ground- and habitat-disturbing activities. Furthermore, the EIR should describe that the qualified biologist with the proper permits may move out of harm's way special-status species or other wildlife of low or limited mobility that would otherwise be injured or killed from Project-related activities, as needed. The EIR should also describe qualified biologist qualifications and authorities to stop work to prevent direct mortality of special-status species. CDFW recommends fish and wildlife species be allowed to move out of harm's way on their own volition, if possible, and to assist their relocation as a last resort. It should be noted that the temporary relocation of onsite wildlife does not constitute effective mitigation for habitat loss.

8. *Translocation of Species*: CDFW generally does not support the use of relocation, salvage, and/or transplantation as the sole mitigation for impacts to rare, threatened, or endangered species as these efforts are generally experimental in nature and largely unsuccessful. Therefore, the EIR should describe additional mitigation measures utilizing habitat restoration, conservation, and/or preservation, in addition to avoidance and minimization measures, if it is determined that there may be impacts to rare, threatened, or endangered species.

The EIR should incorporate mitigation performance standards that would ensure that impacts are reduced to a less-than-significant level. Mitigation measures proposed in the EIR should be made a condition of approval of the Project. Please note that obtaining a permit from CDFW by itself with no other mitigation proposal may constitute mitigation deferral. CEQA Guidelines section 15126.4, subdivision (a)(1)(B) states that formulation of mitigation measures should not be deferred until some future time. To avoid deferring mitigation in this way, the EIR should describe avoidance, minimization and mitigation measures that would be implemented should the impact occur.

California Endangered Species Act

CDFW is responsible for ensuring appropriate conservation of fish and wildlife resources including threatened, endangered, and/or candidate plant and animal species, pursuant to CESA. CDFW recommends that a CESA Incidental Take Permit (ITP) be obtained if the Project has the potential to result in “take” (Fish & G. Code § 86 defines “take” as “hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill”) of State-listed CESA species, either through construction or over the life of the Project.

State-listed species with the potential to occur in the area include but are not limited to: Swainson's Hawk (*Buteo swainsoni*), and Tricolored Blackbird (*Agelaius tricolor*).

The EIR should disclose the potential of the Project to take State-listed species and how the impacts will be avoided, minimized, and mitigated. Please note that mitigation measures that are adequate to reduce impacts to a less-than significant level to meet CEQA requirements may not be enough for the issuance of an ITP. To facilitate the issuance of an ITP, if applicable, CDFW recommends the EIR include measures to minimize and fully mitigate the impacts to any State-listed species the Project has potential to take. CDFW encourages early consultation with staff to determine appropriate measures to facilitate future permitting processes and to engage with the U.S. Fish and Wildlife Service and/or National Marine Fisheries Service to coordinate specific measures if both State and federally listed species may be present within the Project vicinity.

Native Plant Protection Act

The Native Plant Protection Act (Fish & G. Code §1900 *et seq*.) prohibits the take or possession of State-listed rare and endangered plants, including any part or product thereof, unless authorized by CDFW or in certain limited circumstances. Take of State-listed rare and/or endangered plants due to Project activities may only be permitted through an ITP or other authorization issued by CDFW pursuant to California Code of Regulations, Title 14, section 786.9 subdivision (b).

Lake and Streambed Alteration Program

The EIR should identify all perennial, intermittent, and ephemeral rivers, streams, lakes, other hydrologically connected aquatic features, and any associated biological resources/habitats present within the entire Project footprint (including utilities, access and staging areas). The environmental document should analyze all potential temporary, permanent, direct, indirect and/or cumulative impacts to the above-mentioned features and associated biological resources/habitats that may occur because of the Project. If it is determined the Project will result in significant impacts to these resources the EIR shall propose appropriate avoidance, minimization and/or mitigation measures to reduce impacts to a less-than-significant level.

Section 1602 of the Fish and Game Code requires an entity to notify CDFW prior to commencing any activity that may do one or more of the following:

1. Substantially divert or obstruct the natural flow of any river, stream or lake;

2. Substantially change or use any material from the bed, channel or bank of any river, stream, or lake; or

3. Deposit debris, waste or other materials where it may pass into any river, stream or lake.

Please note that "any river, stream or lake" includes those that are episodic (i.e., those that are dry for periods of time) as well as those that are perennial (i.e., those that flow year-round). This includes ephemeral streams and watercourses with a subsurface flow. It may also apply to work undertaken within the flood plain of a body of water.

If upon review of an entity's notification, CDFW determines that the Project activities may substantially adversely affect an existing fish or wildlife resource, a Lake and Streambed Alteration (LSA) Agreement will be issued which will include reasonable measures necessary to protect the resource. CDFW's issuance of an LSA Agreement is a "project" subject to CEQA (see Pub. Resources Code 21065). To facilitate issuance of an LSA Agreement, if one is necessary, the EIR should fully identify the potential impacts to the lake, stream, or riparian resources, and provide adequate avoidance, mitigation, and monitoring and reporting commitments. Early consultation with CDFW is recommended, since modification of the Project may avoid or reduce impacts to fish and wildlife resources. All LSA Notification types must be submitted online through CDFW's Environmental Permit Information Management System (EPIMS). For more information about EPIMS, please visit https://wildlife.ca.gov/Conservation/Environmental-Review/EPIMS. More information about LSA Notifications, paper forms and fees may be found at https://www.wildlife.ca.gov/Conservation/Environmental-Review/LSA.

Please note that other agencies may use specific methods and definitions to determine impacts to areas subject to their authorities. These methods and definitions often do not include all needed information for CDFW to determine the extent of fish and wildlife resources affected by activities subject to Notification under Fish and Game Code section 1602. Therefore, CDFW does not recommend relying solely on methods developed specifically for delineating areas subject to other agencies' jurisdiction (such as United States Army Corps of Engineers) when mapping lakes, streams, wetlands, floodplains, riparian areas, etc. in preparation for submitting a Notification of an LSA.

CDFW relies on the City of Stockton environmental document analysis when acting as a responsible agency issuing an LSA Agreement. CDFW recommends lead agencies coordinate with us as early as possible, since potential modification of the proposed Project may avoid or reduce impacts to fish and wildlife resources and expedite the Project approval process.

The following information will be required for the processing of an LSA Notification and CDFW recommends incorporating this information into any forthcoming CEQA document(s) to avoid subsequent documentation and Project delays:

1. Mapping and quantification of lakes, streams, and associated fish and wildlife habitat (e.g., riparian habitat, freshwater wetlands, etc.) that will be temporarily and/or permanently impacted by the Project, including impacts from access and staging areas. Please include an estimate of impact to each habitat type.

2. Discussion of specific avoidance, minimization, and mitigation measures to reduce Project impacts to fish and wildlife resources to a less-than-significant level. Please refer to section 15370 of the CEQA Guidelines.

Based on review of Project materials, aerial photography and observation of the site from public roadways, the Project site supports French Camp Slough. CDFW recommends the EIR fully identify the Project's potential impacts to the stream and/or its associated vegetation and wetlands.

ENVIRONMENTAL DATA

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database, which may be used to make subsequent or supplemental environmental determinations (Pub. Resources Code, § 21003, subd. (e)). Accordingly, please report any special-status species and natural communities detected during Project surveys to CNDDB. The CNNDB field survey form can be found at the following link: https://www.wildlife.ca.gov/Data/CNDDB/Submitting-Data. The completed form can be submitted online or mailed electronically to CNDDB at the following email address: CNDDB@wildlife.ca.gov.

FILING FEES

The Project, as proposed, would have an effect on fish and wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the City of Stockton and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying project approval to be operative, vested, and final. (Cal. Code Regs, tit. 14, § 753.5; Fish & G. Code § 711.4; Pub. Resources Code, § 21089.)

CONCLUSION

Pursuant to Public Resources Code sections 21092 and 21092.2, CDFW requests written notification of proposed actions and pending decisions regarding the Project.

Written notifications shall be directed to: California Department of Fish and Wildlife North Central Region, 1701 Nimbus Road, Rancho Cordova, CA 95670 or emailed to R2CEQA@wildlife.ca.gov.

CDFW appreciates the opportunity to comment on the Notice of Preparation of the EIR for the South Stockton Commerce Center and recommends that the City of Stockton address CDFW's comments and concerns in the forthcoming EIR. CDFW personnel are available for consultation regarding biological resources and strategies to minimize impacts.

If you have any questions regarding the comments provided in this letter, or wish to schedule a meeting and/or site visit, please contact Zach Kearns, Environmental Scientist at (916) 358-1134 or zachary.kearns@wildlife.ca.gov.

Sincerely,

DocuSigned by:

COMMENTS TO REQUEST FOR REVIEW FOR THE NOTICE OF PREPARATION FOR THE DRAFT ENVIRONMENTAL IMPACT REPORT, SOUTH STOCKTON COMMERCE CENTER PROJECT, SCH#2020090561, SAN JOAQUIN COUNTY

Pursuant to the State Clearinghouse's 30 August 2024 request, the Central Valley Regional Water Quality Control Board (Central Valley Water Board) has reviewed the *Request for Review for the Notice of Preparation for the Draft Environmental Impact Report* for the South Stockton Commerce Center Project, located in San Joaquin County.

Our agency is delegated with the responsibility of protecting the quality of surface and groundwaters of the state; therefore our comments will address concerns surrounding those issues.

I. Regulatory Setting

<u>Basin Plan</u>

The Central Valley Water Board is required to formulate and adopt Basin Plans for all areas within the Central Valley region under Section 13240 of the Porter-Cologne Water Quality Control Act. Each Basin Plan must contain water quality objectives to ensure the reasonable protection of beneficial uses, as well as a program of implementation for achieving water quality objectives with the Basin Plans. Federal regulations require each state to adopt water quality standards to protect the public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act. In California, the beneficial uses, water quality objectives, and the Antidegradation Policy are the State's water quality standards. Water quality standards are also contained in the National Toxics Rule, 40 CFR Section 131.36, and the California Toxics Rule, 40 CFR Section 131.38.

The Basin Plan is subject to modification as necessary, considering applicable laws, policies, technologies, water quality conditions and priorities. The original Basin Plans were adopted in 1975, and have been updated and revised periodically as required, using Basin Plan amendments. Once the Central Valley Water Board has

adopted a Basin Plan amendment in noticed public hearings, it must be approved by the State Water Resources Control Board (State Water Board), Office of Administrative Law (OAL) and in some cases, the United States Environmental Protection Agency (USEPA). Basin Plan amendments only become effective after they have been approved by the OAL and in some cases, the USEPA. Every three (3) years, a review of the Basin Plan is completed that assesses the appropriateness of existing standards and evaluates and prioritizes Basin Planning issues. For more information on the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, please visit our website:
http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/

Antidegradation Considerations

All wastewater discharges must comply with the Antidegradation Policy (State Water Board Resolution 68-16) and the Antidegradation Implementation Policy contained in the Basin Plan. The Antidegradation Implementation Policy is available on page 74 at:
https://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/sacsjr_201805.pdf

In part it states:

Any discharge of waste to high quality waters must apply best practicable treatment or control not only to prevent a condition of pollution or nuisance from occurring, but also to maintain the highest water quality possible consistent with the maximum benefit to the people of the State.

This information must be presented as an analysis of the impacts and potential impacts of the discharge on water quality, as measured by background concentrations and applicable water quality objectives.

The antidegradation analysis is a mandatory element in the National Pollutant Discharge Elimination System and land discharge Waste Discharge Requirements (WDRs) permitting processes. The environmental review document should evaluate potential impacts to both surface and groundwater quality.

II. Permitting Requirements

Construction Storm Water General Permit

Dischargers whose project disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit), Construction General Permit Order No. 2009-0009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). For more information on the Construction General Permit, visit the

State Water Resources Control Board website at:
http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

Industrial Storm Water General Permit

Storm water discharges associated with industrial sites must comply with the regulations contained in the Industrial Storm Water General Permit Order No. 2014-0057-DWQ. For more information on the Industrial Storm Water General Permit, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/industrial_general_permits/index.shtml

Clean Water Act Section 404 Permit

If the project will involve the discharge of dredged or fill material in navigable waters or wetlands, a permit pursuant to Section 404 of the Clean Water Act may be needed from the United States Army Corps of Engineers (USACE). If a Section 404 permit is required by the USACE, the Central Valley Water Board will review the permit application to ensure that discharge will not violate water quality standards. If the project requires surface water drainage realignment, the applicant is advised to contact the Department of Fish and Game for information on Streambed Alteration Permit requirements. If you have any questions regarding the Clean Water Act Section 404 permits, please contact the Regulatory Division of the Sacramento District of USACE at (916) 557-5250.

Clean Water Act Section 401 Permit – Water Quality Certification

If an USACE permit (e.g., Non-Reporting Nationwide Permit, Nationwide Permit, Letter of Permission, Individual Permit, Regional General Permit, Programmatic General Permit), or any other federal permit (e.g., Section 10 of the Rivers and Harbors Act or Section 9 from the United States Coast Guard), is required for this project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification must be obtained from the Central Valley Water Board prior to initiation of project activities. There are no waivers for 401 Water Quality Certifications. For more information on the Water Quality Certification, visit the Central Valley Water Board website at:
https://www.waterboards.ca.gov/centralvalley/water_issues/water_quality_certification/

Waste Discharge Requirements – Discharges to Waters of the State

If USACE determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the proposed project area, the proposed project may require a Waste Discharge Requirement (WDR) permit to be issued by Central Valley Water Board. Under the California Porter-Cologne Water Quality Control Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands, are subject to State regulation. For more information on the Waste Discharges to Surface Water NPDES Program and WDR processes, visit the Central Valley Water Board website at:https://www.waterboards.ca.gov/centralvalley/water_issues/waste_to_surface_water/

Projects involving excavation or fill activities impacting less than 0.2 acre or 400 linear feet of non-jurisdictional waters of the state and projects involving dredging activities impacting less than 50 cubic yards of non-jurisdictional waters of the state may be eligible for coverage under the State Water Resources Control Board Water Quality Order No. 2004-0004-DWQ (General Order 2004-0004). For more information on the General Order 2004-0004, visit the State Water Resources Control Board website at: https://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2004/wqo/wqo2004-0004.pdf

Dewatering Permit

If the proposed project includes construction or groundwater dewatering to be discharged to land, the proponent may apply for coverage under State Water Board General Water Quality Order (Low Threat General Order) 2003-0003 or the Central Valley Water Board's Waiver of Report of Waste Discharge and Waste Discharge Requirements (Low Threat Waiver) R5-2018-0085. Small temporary construction dewatering projects are projects that discharge groundwater to land from excavation activities or dewatering of underground utility vaults. Dischargers seeking coverage under the General Order or Waiver must file a Notice of Intent with the Central Valley Water Board prior to beginning discharge.

For more information regarding the Low Threat General Order and the application process, visit the Central Valley Water Board website at: http://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2003/wqo/wqo2003-0003.pdf

For more information regarding the Low Threat Waiver and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/waivers/r5-2018-0085.pdf

Limited Threat General NPDES Permit

If the proposed project includes construction dewatering and it is necessary to discharge the groundwater to waters of the United States, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. Dewatering discharges are typically considered a low or limited threat to water quality and may be covered under the General Order for *Limited Threat Discharges to Surface Water* (Limited Threat General Order). A complete Notice of Intent must be submitted to the Central Valley Water Board to obtain coverage under the Limited Threat General Order. For more information regarding the Limited Threat General Order and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/r5-2016-0076-01.pdf

NPDES Permit

If the proposed project discharges waste that could affect the quality of surface waters of the State, other than into a community sewer system, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. A complete Report of Waste Discharge must be submitted with the Central Valley Water Board to obtain a NPDES Permit. For more information regarding the NPDES Permit and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/help/permit/

If you have questions regarding these comments, please contact me at (916) 464-4684 or Peter.Minkel2@waterboards.ca.gov.

Re: Comments on the Notice of Preparation for the Recirculated Draft Environmental Impact Report for the South Stockton Commerce Center Project

Ms. Moore et al:
The Sierra Club submits the following comments on the NOP for the Recirculated Draft Environmental Impact Report (DEIR) for the South Stockton Commerce Center Project.

Please ensure that all future digital notices regarding this and every other discretionary project that are pending with the City are sent to Eric Parfrey, Sierra Club, at parfrey@sbcglobal.net.

We have attached the Club's original letter of Dec 31, 2021 responding to the first DEIR (Attachment A to this letter).

The South Stockton Commerce Center is a huge project, with over 6 million square feet of warehouse space on 422 acres of agricultural land near the Stockton Airport. This size is approximately double the size of the recently approved and under construction Mariposa warehouse project. It's important that the City of Stockton gets this environmental evaluation of the Project' impacts and mitigation measures correct.

We are disappointed that the City staff and applicant are apparently intending to reduce the scope of this new Recirculated DEIR to only a handful of topics, including air quality (AQ); greenhouse gases (GHG), climate change and energy; cumulative and growth induing impacts. Our original letter was very critical of the original DEIR's analysis and lack of mitigation for water quality/flooding issues related to Little John Creek and French Camp Slough (see below). We insist that this new DEIR must revisit that important issue, which were inadequately addressed in the first DEIR.

The Recirculated DEIR Must Include New Methodology and New Mitigation Measures

For the critical issues related to AQ, GHG and energy, this NOP states that only a very limited new analysis will be performed. The NOP states that

> "It is anticipated that changes to the October 15, 2021 Draft EIR will be concentrated in Chapter 3.3 Air Quality and Chapter 3.7 Greenhouse Gases, Climate Change and Energy and that changes to other chapters will be minimal. Other October 15, 2021 Draft EIR chapters will be screened to identify changes in the environmental impact analysis and <u>recommended mitigation measures that could result from compliance with the City's Warehouse Ordinance…" (emphasis added)</u>

This very limited description of potential changes to the original analyses is unacceptable. If the City and applicant proceed with such a limited revision of the original DEIR which only focuses on "recommended mitigation measures that could result from compliance with the City's Warehouse Ordinance," we will be forced to seek redress through a potential CEQA challenge in court.

At a minimum, this recirculated DEIR must include detailed, effective mitigation measures designed to reduce AQ, GHG and climate impacts by accomplishing the following:

- sufficient solar panels to provide power for the Project
- utilize a "clean fleet" of light vehicles/delivery vans/trucks (Class 2 through 6) at the onset of business operations
- adopt standards to provide 100% electrification of all heavy-duty trucks (Class 7 and 8) using the Project site by end of 2025 or when commercially available for the intended application, whichever date is later
- provide electric charging facilities on the Project site sufficient to charge all electric trucks and employee vehicles
- design the Project to include a setback of at least 1,000 feet from the nearest homes or sensitive receptors, as applicable
- provide a community benefits fund to assist local residents in upgrading air ventilation systems, if applicable

Since the original DEIR and deeply flawed Final EIR for this Project was released in late 2021 and early 2022, respectively, the world of logistics warehouse development and mitigation for air quality emissions and GHG has dramatically changed in California. Numerous court cases challenging CEQA documents in both the Inland Empire and in Northern California have set new standards. This revised DEIR must incorporate a meaningful discussion of these recent court cases and the most up to date measures that are being implemented by other distribution warehouse developers, largely at the urging of community activists and regulatory agencies.

The DEIR Must Incorporate Recent Mitigation Measures Adopted for the Mariposa 1 and 2, Costco, and Other Recent Projects

Since the issuance of the original 2021 DEIR numerous advances have been made in terms of devising new programs and measures that would significantly reduce diesel emissions and GHG emissions from increased truck traffic. Major advances have also been made in solar and battery technology that will reduce GHG and reduce reliance on the existing PGE power grid.

We have attached the executed Settlement Agreement (Attachment B to this letter) between the Sierra Club, the City of Stockton, and Greenlaw Development, LLC (developer of the approved 203-acre Mariposa Industrial Park). The City of Stockton and the developer agreed to include all of the mitigation measures noted above. In addition, at the time, assurances from the city planning director were made to us that the Mariposa 2 and South Stockton Commerce Center projects would also agree to include these measures in each project's Final EIR and conditions of approval.

The Project EIR for this speculative project must carefully consider all of the recommended mitigation measures outlined in the Attorney General's "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act" guidelines, and recent warehouse settlement agreements and state which measures will be applied to this Project. If measures are not included, the EIR must explain why the measures have been rejected.

We are making similar requests in comment letters on pending warehouse projects in the cities of Lathrop, Manteca, and in unincorporated San Joaquin County.

If enacted by all jurisdictions in San Joaquin County, a standard set of air quality and greenhouse gas emission criteria will create a level playing field for all warehouse developers and protect the health of San Joaquin County residents, lessening the impacts of climate change.

In addition to the Mariposa settlement agreement, we have also appended a summary of the detailed measures that have been adopted for more recent warehouse projects (Attachment C). We demand that the new DEIR incorporate these minimal standards. If these common-sense measures are rejected by the EIR authors, we will seek to have the measures enforced through a settlement agreement negotiated between the applicant and the City.

We have also, once again, appended the Attorney General's seminal guidance on "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act" (Attachment D to this letter). Although this document is somewhat dated, last updated September 2022, it is still a very good reference to guide lead agencies to do the right thing in terms of mitigating warehouse development impacts. We urged the City Planning Commission and Council to adopt many of these standards when the 2023 City of Stockton

Warehouse Ordinance was updated. They refused, even when there was documented developer support, continuing to place economic development over resident's health, safety and wellbeing.

The City's Warehouse Ordinance is Ineffective and Irrelevant

We won't include a detailed recounting of the sad recent history of the failure by the City of Stockton Planning Commission and City Council to adopt a meaningful, relevant warehouse ordinance. Sierra Club and our environmental justice allies were adamant throughout the process that the final version was so watered down and meaningless, in terms of mitigating the very real AQ, GHG, noise, public health and other impacts on nearby disadvantaged communities already impacted by warehouse related pollutants, as to be an insult and a continuation of business as usual. (See the letter of May 9, 2024 from the Sierra Club, Attachment E).

Perpetuating the charade that project compliance with this toothless ordinance would somehow make real environmental impacts go away is absurd, and we will challenge any conclusions in this recirculated DEIR that attempt to make this argument.

The ordinance is devoid of any regulations that would require applicants to transition quickly to a non-polluting, zero-emission clean truck fleet. The ordinance's requirements for on-site solar is weak and full of loopholes.   We could go on but won't.

Thankfully, Governor Newsom has just signed AB 98, which will force Stockton and other recalcitrant jurisdictions to adopt much more stringent regulations for warehouse development (see Attachment F).

Public Health Impacts Must be Analyzed

The new DEIR must include a believable health risk assessment that analyzes the increased health risks caused by additional diesel truck traffic on residents of south Stockton, Including proposed truck routes on surface streets and specific numbers of trucks of various types that will serve the 6 million square foot proposed Project. The cumulative effects of full build out of the Arch Road Warehouse complex and other nearby projects must also be accounted for and queuing times estimated for increased traffic emissions based on a comprehensive truck study of major intersections in the area as currently configured.

Statements included in the original EIR approval documents such as those that follow are unacceptable in an FEIR when making statements of overriding consideration and not aligned with CEQA which requires that the public be informed and able to comment.

- "Because there is not an end user, site plan review, architectural plan, etc., it is not possible to reasonably calculate the emissions or onsite mitigation of the end user/site/building, making it impossible to calculate the offsite mitigation needs."

- "It is anticipated that the best design measures, including the State of California Department of Justice's "Warehouse Projects: Best Practices and Mitigation Measures" would be **considered** for incorporation into site and/or building design as determined."

Disclosing air pollution emissions from the entire expected length of truck trips must be clearly presented and an explanation for the operational trip length be provided. CEQA requires full public disclosure of a Project's anticipated truck trips, which entails calculating truck trip length based on likely truck trip destinations, rather than the distance from the facility to the edge of the air basin, local jurisdiction, or other truncated endpoint. The air quality assumptions input into the CalEEMod model for each land use must be evidence based and for speculative projects must include conservative assumptions.

There is a proposed grade-separated overpass of the UPRR line and a proposed railroad spur line to provide rail access throughout the Project. Without including some rail specific land use alternatives, the air quality assumptions are incomplete. The FEIR states that "The project proposes to potentially include rail service to up to three large parcels (parcels 2, 3, and 4) within the Project site. A potential railroad spur line would extend east from the UPRR along the Project site's northern edge providing rail access to the parcels." Again, rail emissions were not included in the air quality modelling in the original DEIR.

All air pollution emissions associated with the Project must be considered, regardless of where those impacts occur.

Water Quality, Hydrology, Flooding Impacts Must be Analyzed and Mitigated

The NOP notes that for the Hydrology and Water Quality section: "No substantive changes to the October 15, 2021 Draft EIR are anticipated. The Draft EIR adequately considered the potential hydrology and water quality effects of the project."

We could not disagree more vociferously. Our letter of Dec 31, 2021 raised numerous objections to the original EIR's analysis and these objections were ignored in the response to comments.

The original DEIR deemed water related impacts as less than significant when in fact the construction of the proposed Project and the paving over of 350 acres has the potential to interfere substantially with groundwater recharge associated with the Project area and current land use such that the Project may impede sustainable groundwater management of the basin. The DEIR identified the Subbasin incorrectly as the Eastern San Joaquin River Groundwater Subbasin when the name of the Subbasin in which the Project is located is the Eastern San Joaquin Groundwater Subbasin. The Subbasin is critically overdrafted and the location of the current agricultural fields presents an opportunity to use flood flows to recharge our overdrafted aquifer and provide downstream flood protection.

Lands adjacent to natural waterways are particularly good for cost effective groundwater recharge projects. Additionally, mitigation to facilitate groundwater recharge should be an expected mitigation measure.

The City of Stockton has recently increased the groundwater pumping capacity in South Stockton and is spending millions of dollars to facilitate the development of a groundwater recharge facility in North Stockton. The most recent annual report, 2023, for the Eastern San Joaquin Subbasin shows decreased storage in the southern area of the basin so impacts to groundwater recharge and groundwater storage are significant.

The biological community living in the area may at times be dependent on groundwater as this is one of the few remaining natural areas which have not undergone development in the City of Stockton. It is critical that water, both surface and groundwater, impacts be evaluated in conjunction with biological resource impacts. Finally, chloride and total dissolved solid levels around that area are elevated, have historically been a recognized problem in terms of water quality and freshwater recharge, like from rain, are important to improve water quality.

Furthermore, the original DEIR deemed impacts relating to drainage pattern changes due to the addition of impervious surfaces as less than significant without calculations estimating runoff **under climate change scenarios with infrequent atmospheric river rainfall events causing substantial surface runoff, flooding, or surface runoff of polluted stormwater**. Climate changes relating to global warming must be carefully considered especially relating to changes to precipitation patterns. Paved land has much higher runoff coefficients, as compared to the existing agricultural land use which has been shown to attenuate runoff and reduce flood risks. Increased setbacks and open spaces adjacent to surface waterways are important mitigation measures for flood risk reductions.

The Hydrologic and Hydraulic Assessment memo in the 2021 DEIR dated December 2020 was completed in the midst of an extensive drought time when there had not been intense flooding for approximately 20 years. The climate change effects in Stockton, including weather whiplash, was characterized during the intense rains and flooding that occurred between December 2022-March 2023.

Airport Way in the area was closed due to flooding of French Camp Slough – even with all the open agricultural land and its increased permeability as compared to pavement. The project site is located within a FEMA SFHA requiring the lowest finished flow be “elevated above the highest adjacent grade to a height two (2) feed above the depth number specified in feet on the FIRM or elevated at least four (4) feet above the highest adjacent grade if no depth number is specified.”

The San Joaquin County Public Works 200-year Flood Map was referenced as a basis for approving the Project based on a visual inspection indicating that the Project area did not have three feet or more potential flood depth based on current land conditions, agricultural. The relationship to precipitation intensity and duration as was experienced in Stockton late 2022-early 2023 must be considered when calculating volumes of water which will be created when over 300 acres of existing agricultural land is proposed to be paved over to accommodate for the development of 13 speculative projects.

The size of the proposed flood control basins needs to be evaluated using more intense stormwater runoff than a 10 year storm which was calculated to be 126 ac-ft. The rationale for using a "conservative assumption as a 10-year storm" was not disclosed. The Hydrologic and Hydraulic Assessment memo in the 2021 DEIR stated that "The joint-probability analyses to determine the actual recurrence interval for this assumption is beyond the score of the study." Further, the Assessment stated that the existing development located to the west of the Union Pacific Railroad would be responsible for improvements to reduce stormwater runoff to French Camp Slough. The DEIR did not include any offsite mitigation measures or the avenue by which the City would make such a requirement. There was no analysis of the need for properties east of highway 99 that discharges to and that contributes to overflows of Weber Slough which the proposed north basin would mostly accommodate to reduce peak flows. The Assessment memo did not include a map showing the five flooding sources or include a rationale as to why only 100 year peak discharges obtained from DWR's updated CVFED model were used instead of 200 year peak discharges.

In fact, an additional General Plan Amendment and Rezoning of two areas will be necessary for the proposed Project due to limitations caused by the floodway along French Camp Slough. This floodway is a natural floodplain and a nexus facilitating the flow of floodwater from the waterway to adjacent lands lessening the flood risk to downstream residential areas. The recirculated DEIR must address this issue.

Many of South Stockton residents are paying for increased flood protection associated with the San Joaquin River, including French Camp Slough, the Mossdale Tract Assessment District. None of the warehouses existing adjacent to French Camp Slough or the proposed Project, or projects on the east side of Highway 99 contribute to improvements yet their development is responsible for increased peak flows which increases the likelihood of flooding. The DEIR must evaluate cumulative impacts relating to increased flooding, decreased groundwater recharge and storage.

The revised DEIR should address Project related changes to drainage patterns and water quality within, upstream, and downstream of the Project site, including: volume, velocity, and frequency of existing and post-Project surface flows; polluted runoff; soil erosion and/or sedimentation in streams and water bodies; and post-Project fate of runoff from the Project site and include cumulative impacts on drainage related other warehousing projects upstream and downstream. All assumptions made during the modeling and design of detention basins must be clearly articulated.

Conclusion

The recirculated DEIR analyses must be amended to include a more credible analysis of air quality, public health, GHG and climate, and hydrologic impacts.

We will be monitoring the upcoming recirculated DEIR very closely to ensure that it contains all the mitigation measures that have been previously adopted for the Mariposa 1, Mariposa 2, Costco, and other recent projects.

To be clear, if the City attempts to delete or weaken the mitigation measures included in those previous projects or in the original DEIR/FEIR in this recirculated DEIR for the South Stockton Commerce Center, the Sierra Club will challenge those actions.

Sincerely,

s/s Margo Praus, Chair, Eric Parfrey, Mary Elizabeth M.S., R.E.H.S., Conservation Chair

Attachment C

Detailed Mitigation Measures for

Recent Warehouse Projects

Solar

Developer shall install the maximum amount of on-site rooftop solar generation permitted under applicable law. On-site rooftop solar generation shall be in an amount sufficient to meet the Project's electricity demand, including but not limited to all building electrical demand, all warehouse equipment electrical demand (including yard goats, hostlers, sweepers, forklifts, and all other equipment required to be electric by these terms), and all electrical demand related to on-site charging of clean fleet and passenger electric vehicles. Under no circumstances shall onsite solar generation supply less than 50 percent of the Project's electricity demand. If rooftop space is insufficient to meet this solar generation requirement, Developer shall where feasible install additional solar photovoltaic panels on covered automobile parking spaces.

If the on-site solar photovoltaic system will not be able to supply the Project's full operational electricity demand, including demand resulting from EV charging requirements, Developer shall provide documentation prior to the issuance of any certificate of occupancy demonstrating that the additional electrical demand will be supplied with 100 percent carbon-free electricity sources for the life of the facility.

Prior to the issuance of any certificate of occupancy, Developer shall install an operational battery storage system that provides sufficient battery storage to support at least 4 hours of Project operation or is scaled to the size of the Project's on-site solar photovoltaic array as required by the current California Energy Code, whichever is greater

Facility Electrification

Building operations, including but not limited to HVAC, water heating, refrigeration, and automated equipment shall be powered by electricity for the lifetime of the Project. Neither natural gas nor propane shall be used.

Diesel-powered backup generators shall be prohibited during construction and for the lifespan of the facility unless required by the Fire Department for an onsite fire pump, in which case a generator shall be the minimum size necessary to support the fire pump and shall be used only for that fire pump in the event of a fire emergency.

All on-site equipment and vehicles, including but not limited to yard hostlers, yard equipment, forklifts, yard trucks, tractors, and pallet jacks shall be electric from the start of operations.

The Developer shall provide sufficient charging and other infrastructure to support all electric vehicles and equipment.

Parking and EV Charging

At least 15 percent of all passenger vehicle parking spaces shall be equipped with working Level 2 quick-charge electric vehicle (EV) charging stations that are installed and operational, prior to building occupancy. Level 2 quick-charge units shall generate at least 19kW of charging output power. These stations shall be maintained or replaced with equivalent or better-performing stations for the life of the Project. At minimum, an additional 25 percent of all passenger vehicle parking spaces shall be "EV Ready," as defined by the 2022 Green Building Code, and/or may be equipped with working Level 2 EV quick charge stations. Developer shall convert EV Ready spaces to working Level 2 EV quick charge stations at a rate of at least two spaces per year.

A minimum of 10 percent of heavy-duty truck loading docks shall be equipped with EV charging infrastructure for future use by electric trucks. Developer shall design such infrastructure to facilitate future expansion. At least one electric heavy-duty (Class 7 and 8) truck charger shall be installed by or before two years from the first final certificate of occupancy issued for a Project building. Conduit to support medium-duty vehicle, delivery van, and truck (Class 2 through 6) charging shall be installed during initial Project construction, and at least one charger shall be installed and operational prior to issuance of any final certificate of occupancy.

Air Quality and Clean Fleet Requirements

Developer shall ensure that all heavy-duty trucks (Class 7 and 8) serving the Project comply with model year 2014 or later emissions standards from start of operations and shall transition to electric vehicles (EVs), with the fleet fully electric within three (3) years of the issuance of the first final certificate of occupancy for the Project, or when widely commercially available for the intended application, whichever date is later. An EV shall ordinarily be considered widely commercially available if the vehicle is capable of serving the intended purpose and is widely available for purchase for less than 150% the cost of a Class 7 or 8 heavy-duty combustion-engine truck meeting the emissions standards in place at the time the comparison is made (model year 2014 or later emissions standards). For the purpose of this cost comparison, "cost" shall mean the total vehicle cost for the first five (5) years of ownership, including any purchase incentives, rebates, and fuel and electricity costs. Any comparison must be like-for-like, i.e., must compare an EV with a new production combustion-engine truck of the same class and substantially similar trim level that is widely available for purchase at the time the comparison is made.

In order to demonstrate that such vehicles are not widely commercially available, Developer must submit documentation to Petitioners from a minimum of three (3) EV dealers identified on the https://californiahvip.org website demonstrating the inability to obtain the required EVs or equipment meeting the above standard within 6 months ("Offer of Proof"). An Offer of Proof by Developer creates a rebuttable presumption that EVs are not widely commercially available for the intended application.

Developer shall ensure that all vehicles/delivery vans/trucks (Class 2 through 6) serving the Project meet the following requirements: (i) 33% of the fleet will be EVs at start of operations, (ii) 50% of the fleet will be EVs within two years of the first certificate of occupancy for the Project, (iii) 65% of the fleet will be EVs within four years of issuance of the first certificate of occupancy for the Project, (iv) 80% of the fleet will be EVs within five (5) years of issuance of the first certificate of occupancy, and (v) 100% of the fleet will be EVs within seven years of issuance of the first certificate of occupancy.

Re: South Stockton Commerce Center Project Draft Environmental Impact Report

The Delta-Sierra Group reviewed the Notice of Preparation/Initial Study (NOP/IS) and submitted comments on 10.27.2020 for the South Stockton Commerce Center Project. As will be explained later in our comments we only came to learn of the availability of Draft Environmental Impact Report (DEIR) on 12.28.2021. The South Stockton Commerce Center Project is for the planned industrial development of 437.45 acres of agricultural lands located off Airport Way immediately north of the confluence with French Camp Slough and the North Fork of Little John's Creek.

SETTING

PROPOSED PROJECT

The Project includes a Tentative Map for the 437.45-acre site to create 13 development lots, two basin lots, one park lot, one open space lot, and one sewer pump station lot.

TABLE 2.0-2: SSCC LAND USE SUMMARY

LAND USE	ACREAGE (NET)	TOTAL SQUARE FEET PER LAND USE	FLOOR AREA RATIO	MAXIMUM SQUARE FEET
Commercial	11.0	467,834	0.30	140,350
Industrial[1]	298.0	12,960,747	0.47	6,091,551
Open Space	54.0	--	--	--
Public Facilities (Storm Basins, Outfall and Pump Stations)	41.0	--	--	--
Roadway Right of Way	18.2	--	--	--
TOTAL	**422.2**	--	--	**6,231,901**

NOTE: FOR PURPOSES OF THE ENVIRONMENTAL ANALYSIS, A RANGE OF INDUSTRIAL USES IS ASSUMED. THESE USES INCLUDE GENERAL LIGHT INDUSTRIAL, INDUSTRIAL PARK, WAREHOUSING, MINI-WAREHOUSE, HIGH-CUBE TRANSLOAD AND SHORT-TERM STORAGE WAREHOUSE, HIGH-CUBE FULFILLMENT CENTER WAREHOUSE, HIGH-CUBE PARCEL HUB WAREHOUSE, AND HIGH-CUBE COLD STORAGE WAREHOUSE.

The DEIR does not include a full disclosure of impacts for this speculative and discretionary project. A final and definitive site plan is not currently proposed. Planned mitigation and environmental impact analysis is based on a conceptual site plan which underestimates impacts and fails to address cumulative impacts resulting from the operation of the Project.

All mitigation must be paid for before any permit is issued. This is a speculative project with several owners to be involved in the future. Without a final definitive site plan and the piecemeal analysis of impacts proposed for the 13 individual projects, the public will not have an opportunity to evaluate whether or not the mitigation measures are adequate for the individual projects. CEQA provides a seat at the table whereas the review of individual projects would not likely be at a level that would require public notice and engagement. If the DEIR is not significantly modified to address our comments and those of others and recirculated, the FEIR will include mitigation measures deemed acceptable by the City of Stockton through 2045 and pose an environmental burden on already burdened residents.

Mitigations proposed in the DEIR should not be static but requirements adjusted as conditions change related to future climate, groundwater, flooding, transportation, or air quality that will warrant additional mitigation during Project development of this speculative project.

The City of Stockton must release the mitigation monitoring and reporting results to the public throughout the development process.

COMMUNITY INVOLVEMENT

An email was sent to the City of Stockton contact for the Project, Nicole Moore on 3.19.2021 to follow up on the NOP/IS comments submitted on 10.25.2020[1]. This 3.19.2021 email expressed concerns about notification for the release of a draft environmental impact report and to provide a link for the Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act[2] which included best practices relating to community engagement.

[1] https://www.sierraclub.org/sites/www.sierraclub.org/files/sce-authors/u14441/NOP_South_Commerence_10272020_F.pdf
[2] https://oag.ca.gov/sites/all/files/agweb/pdfs/environment/warehouse-best-practices.pdf

A subsequent email to the City of Stockton Project contact, Nicole Moore was sent on 3.19.2021 to follow up on the City of Stockton's 3.19.2021 response to our initial email of 3.19.202. This subsequent email requested clarification regarding the City of Stockton's CEQA process, ASK Stockton noticing, and the City of Stockton's CEQA process to comply with CEQA Guidelines. A suggestion was also made that the city as part of required outreach convene a committee to discuss possible city-specific adopted measures. No response to this email was received.

Yesterday, 12.28.2021, in the process of investigating a proposed housing project identified on a map, we discovered that the DEIR review periods for a similar type of project, Mariposa Industrial Park and for the South Stockton Commerce Center Project had ended. The Mariposa Industrial Park Project was completely unknown to the Delta-Sierra Group because two public notices in the newspaper were missed. We requested in the 10.25.2020 correspondence to the City of Stockton that we be placed on a CEQA notification list, as will be further described below. This 10.25.20 request was ignored.

The City of Stockton's continued reliance on the minimum public notice of CEQA projects or public hearings ignores the reality of residents' ability to engage in community affairs as volunteers. The process of public notice involves publishing a public notice in a newspaper of largest general circulation, notifying the State Clearinghouse at the California Office of Planning and Research, and providing a public notice to the San Joaquin County Recorder-Clerk's Office. The Clerk's Office places a paper copy of the notice on a second-floor wall where their office is located, for public viewing during office hours of 8:00 AM to 5:00 PM.

The purpose of the California Environmental Quality Act (CEQA)[3] is to:

- Prevent or minimize significant, avoidable damage to the environment.
- Disclose potential environmental effects of a proposed discretionary project, through a variety of publicly accessible documents.
- Encourage public participation in the environmental review and decision-making process.
- Ensure transparency in governmental decision-making process.

The CEQA Guidelines that were most recently published included the following statement:

> § 15087. Public Review of Draft EIR[4]
>
> (a) Notice shall be mailed to the last known name and address of all organizations and individuals who have previously requested such notice in writing.

In our 10.27.2020 comment letter the Delta-Sierra Group stated the following in writing:

> Please add the Delta-Sierra Group to your CEQA notification list. We became aware of the project through a CEQAnet link from a colleague. Please let us know if there is to be any public meeting regarding this project and when the draft environmental impact report becomes available to review. If you have any questions, you may contact me by email mebeth@outlook.com.

[3] https://www.conservation.ca.gov/dlrp/Pages/CA-Environmental-Quality-Act-(CEQA)-.aspx
[4] http://files.resources.ca.gov/ceqa/docs/2018_CEQA_FINAL_TEXT_122818.pdf

The DEIR included the following statements

> "Additionally, a public scoping meeting was held during the public review period to solicit recommendations for a reasonable range of alternatives to the proposed Project. No specific alternatives were recommended by commenting agencies or the general public during the NOP public review process."

We specifically asked for notification of a public meeting and no notification was provided by the City of Stockton. Additionally, the website where the South Stockton Commerce Center Project CEQA documents are found includes no notice of a specific public scoping meeting[5].

The DEIR included the NOP/IS notice which included the following statements:

> "A responsible agency, trustee agency, or other public agency may request a meeting with the City of Stockton or its representatives in accordance with Section 15082(c) of the CEQA Guidelines. A public scoping meeting and neighborhood meeting will be held during the public review period as follows:
>
> > 1. Virtual Scoping and Neighborhood Meeting: To obtain the call-in and access information please RFVP with Nicole Moore, Acting Current Planning Manager at Nicole.Moore@stocktonca.gov."

Our 10.27.2021 letter which was conveyed by email to Nicole.Moore@stocktonca.gov specifically requested to learn of the time for a public meeting. We were never notified of the time and date for this proposed public scoping and neighborhood meeting.

No notification of DEIR availability was provided by the City of Stockton, and we only learned of the DEIR availability on 12.28.2021 and initiated review and developed comments presented below. We hope that these comments will be included and considered when developing a revised DEIR or a Final Environmental Impact Report (FEIR) as the official comment period only ended on 12.14.2021.

DEIR Identified Impacts and Proposed Mitigation Measures

Aesthetics and Visual Resources Mitigation Measure 3.1-1

The Project proposes approximately 54 acres of open space areas within the site, which will include approximately seven acres of open space in which a portion of it will be for a habitat setback area located east of the UPRR, south of the future Commerce Drive and along French Camp Slough. The remaining 47 acres of open space area is associated with the French Camp Slough drainage area. Additional open space is needed to accommodate flood flows on the North Fork of Little John's Creek.

We are concerned with the newly proposed restriction on wildlife habitat setback area adjacent to the UPRR tracks. The restrictions on wildlife movement which construction of the proposed Project poses could create a situation where a protected wildlife corridor is needed to avoid increased wildlife kills due to rail or truck traffic. Additional habitat setback area is needed.

This open space is vital for localized wildlife habitat and must be protected from impacts related to the implementation of industrial/commercial future plans. A future lighting plan is to be submitted to the City of Stockton for review and should be made available for public review especially those that are wildlife and habitat experts to determine if the proposed plan will interfere with localized wildlife

[5] http://www.stocktonca.gov/government/departments/communityDevelop/cdSouth.html pdf created

activities. Lighting mitigation of impacts related to wildlife habitat is not the same as lighting mitigation in an urbanized setting. Additional lighting mitigation is necessary.

There is a proposed grade-separated overpass of the UPRR line and a proposed railroad spur line to provide rail access throughout the Project. Designs of overpasses that are aesthetically pleasing can add significantly to the sense of place. Additionally, the proposed new road, Commerce Drive, is proposed to have a 78-foot right-of-way with one 16-foot traffic lane in each direction, and a 16-foot center turn lane. Five-foot landscaped areas would separate the traffic lanes from the 8-foot sidewalks on both the north and south sides of the road. All landscaping must be maintained by the Project proponent so as not to put further burdens on City of Stockton residents to fund on-going maintenance relating to this discretionary project. Onsite vegetation should also be considered to provide shading and reduce the heat island effect associated with the proposed asphalt paving as well as vegetative buffers between the Project and residential areas can help to reduce pollutant dispersal.

Agricultural Resources Mitigation Measure 3.2-1

The proposed Project will result in the conversion of farmland including prime farmland and farmland of statewide importance as indicated by the Department of Conservation Land Division in their NOP/IS comments available to the public[6].The San Joaquin County Multi-Species Habitat Conservation and Open Space Plan specifically addresses loss of habitat not loss of agricultural activities on agricultural lands[7]. There are different fees related to habitat potential with a category for agricultural lands.

All of the existing land is in active agricultural uses and should require both City of Stockton Agricultural Land Mitigation (1:1)[8] and San Joaquin County Habitat Mitigation based on a San Joaquin County Council of Government (SJCOG) biological study to determine mitigation level. The City of Stockton Agricultural Land Mitigation program was not referenced as part of the required mitigation.

Agricultural Land Mitigation Impact Fee - Central Valley Farmland Trust (CVFT): Under Municipal Code section 16-355.270, the City of Stockton has the authority to establish a Public Facilities Fee Program (PFF) on new development. In 2003, City Council approved resolution #2003-04-03-0105, establishing the PFF schedule. In 2007, the City Council agreed (through Council resolution #2007-02-07-0079) to add Agricultural Land Mitigation Fee to its Public Facilities Fee Program.

The City of Stockton Agricultural Land Mitigation Fee is collected for all applicable new development projects that would result from the conversion of important farmland, as defined by California Department of Conservation, into urban uses. All Agricultural Land Mitigation fees collected pursuant to the agreement should be remitted to Central California Farmland Trust. The Central Valley Farmland Trust is the land trust that facilitates the placement of agricultural conservation easements to fulfill farmland mitigation requirements in the Central Valley.

The Central Valley Farmland Trust does not fulfill the habitat mitigation required under the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan and the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan mitigation does not mitigate for the loss of agricultural production. Both mitigations should be required. The mitigation monitoring and reporting should include a full disclosure of agricultural land mitigation and should be readily available to the public.

[6] https://files.ceqanet.opr.ca.gov/264972-2/attachment/dv3sIblipUFd4VLrSuQGv7_BAFl5DauZjy-ZTT4RRtvMnYAvi9wC9xnbsdw9iaT_aegytYiiJ2hSU5GJ0

[7] https://www.sjcog.org/288/Habitat-Frequently-Asked-Questions

[8] https://www.calandtrusts.org/wp-content/uploads/2014/03/Overview-of-Legal-Restains-on-Ag-Land-Mit-Programs.pdf

Agricultural land mitigation only ensures that some other agricultural land cannot be easily developed through a conservation easement. Agricultural land mitigation does not create new agricultural land. Once the land is developed it is unlikely ever to return to food production.

We disagree that the Impact 3.2-2, relating to the conversion of nearby farmland to non-agricultural uses, is less than significant. The conversion of this land to non-agricultural uses will create additional development pressures on the surrounding farmland and should have been evaluated in the DEIR. For example, increased truck traffic will hinder agricultural operations that use the roadways. Monitoring of adjacent farmed land should be conducted throughout the life of the Project and if further agricultural lands are converted then the South Stockton Commerce Center Project proponents, developers, landowners should pay for additional agricultural land mitigation.

The conversion of this especially important agricultural land not only will have an effect on local food security, as row crops are food crops, but will significantly affect existing flood buffering, wildlife habitat, and water infiltration. The environmental analysis of the no Project alternative should have characterize the positive attributes which will be lost, if developed as described. Removing agricultural land removes the natural climate change attenuator that soils can serve also affecting the City of Stockton's ability to reduce carbon dioxide levels in the atmosphere through carbon sequestration.

Air Quality Mitigation Measure 3.3-1

The measures proposed relating to the San Joaquin Valley Air Pollution Control District Rule 9510 should have included more than just the offsite mitigation strategies proposed. The stated purposes of Rule 9510[9] include:

- Fulfill the District's emission reduction commitments in the PM10 and Ozone Attainment Plans.
- Achieve emission reductions from the construction and use of development projects through design features and on-site measures.
- Provide a mechanism for reducing emissions from the construction of and use of development projects through off-site measures.

No onsite operational measures were included to reduce emissions relating to the Project's proposed operation that is expected to generate a minimum of 22,633 daily vehicle trips, including 5,552 daily heavy-duty truck trips, along local roadways, except for some onsite mitigations of some construction activities. Onsite measures such as requiring on-site equipment, such as forklifts and yard trucks, to be electric, requiring all heavy-duty vehicles entering or operated on the project site to be zero emission beginning in 2030, constructing electric truck charging stations and electric plugs for electric transport refrigeration units are reasonable on-site requirements that should have been proposed in the DEIR. Without these onsite measures, the Project will add to the residents of Stockton already high pollutant burden.

The only mention of zero emission vehicles in the DEIR was that some employees may use electric vehicles. Anti-idling measures were not included nor were any vegetative barriers planned as mentioned previously. Furthermore, the emissions may have been underestimated because it is likely that trip lengths will be greater than 10 miles relating to other nearby logistical centers in the Bay Area or beyond and the proposed rail connections. In our NOP/IS comment letter we identified problems with previous emission modeling performed by the City of Stockton's consultant and specifically

[9] https://www.valleyair.org/rules/currntrules/r9510-a.pdf

requested that best practices put forth by the California Air Resources Board be used for emission modelling:

> Again, evaluating impacts is challenging for a project that is not well defined. Recently, the City of Stockton used CalEEMod fleet mix defaults to estimate a project's mobile source air pollutant emissions and was notified that the mileage used required revisions. When performing air emission analyses and traffic impact studies a reasonable estimate of heavy-duty truck trips commensurate with the proposed project's size and location is necessary. Please be very clear and concise when disclosing the parameters used during emissions and traffic analyses.

The characterization of the Project's operational mobile source air emissions does not include analyses with supporting evidence that assumptions made will be protective of public health and the environment.

The City of Stockton did not include a maximum vehicle mile traveled for the Project to cap emissions. The DEIR did not describe how the process between the City of Stockton and the San Joaquin Valley Air Pollution Control District would be transparent while offsite mitigation strategies proposed on a project-by-project basis are reviewed and approved.

The proposed mitigation measures include a piecemeal analysis by considering each phase of development separately. Cumulative impacts occur as each "individual project" is developed. Mitigation of these individual projects will only be implemented if the pollutant threshold for an individual project is exceeded. This piecemeal method of impact analysis neglects cumulative air quality impacts associated with the full development that will occur if the existing DEIR is not significantly updated with further mitigation measures and recirculated for review.

Air Quality Construction Phase

Mitigation Measure 3.3-3, 3.3-4, 3.3-5

These mitigation measures relate primarily to dust and soil erosion/tracking controls and paving but does not address the heavy diesel equipment that will be used onsite and offsite to transport soil related to site flood mitigation grading activities and this heavy diesel equipment will be generating toxic air pollutants.

Air quality impacts are not adequately characterized to disclose potential effects or to prevent or minimize significant, avoidable damage to the environment.

Cultural and Tribal Resources

Mitigation Measure 3.5-1

The mitigation proposes that a qualified archaeologist shall conduct pre-construction worker cultural resource sensitivity training. The Northern Valley Yokuts representative should be present during this training and records maintained for all construction workers in attendance. This training should be offered periodically throughout the construction process as onsite construction workers change.

Mitigation Measure 3.5-2

The mitigation measure states only that a Native American monitor may be required if the archaeologist determines that Native American resources are identified. The Northern Valley Yokuts Tribal representative requested that in accordance with their policies that a tribal monitor should be present for all ground disturbing activities. Having a Native American monitor present when Native American resources have been identified should not be optional, but should be required, and paid for by the Project proponents.

Mitigation Measure 3.5-3

The mitigation measure proposes two separate processes involving the San Joaquin County Coroner. One places the San Joaquin County Coroner as the responsible party to contact the Native American Heritage Commission to identify a descendant. If no descendant is identified, the San Joaquin County Coroner may make a recommendation to the landowner or the person responsible for the excavation work to treat or dispose of the human remains and any associated grave goods without further Native American consultation.

The San Joaquin Coroner should be informed to determine that no further investigation of the cause of death is required. Once the Coroner has determined that there is no need for investigating the cause of death, the Native American monitor or the proper descendant of the deceased individual should propose proper reburial either onsite or an alternative location preferred by the Native American tribal representative in consultation with the Native American Heritage Commission.

The City of Stockton or its authorized representative should not be allowed to reject the wishes of a descendant, or the Native American Heritage Commission measures be allowed to be rejected by the landowner, and those entities make the decision of reburial location on their own. Everyone must work together to come upon a mutually agreeable solution and communication should begin in advance of the construction process and on-going, so the City of Stockton, landowner, or Project proponent is not left with an "urgent" situation that occurs due to the lack of advanced communication and planning.

A Native American monitor, descendant, and an archaeology if recommended by the Native American monitor should oversee reburial in a mutual agreeable location that is not subject to further subsurface disturbance. The Project is located on unceded Northern Valley Yokuts lands.

Geology and Soils Mitigation Measure 3.6-2

The mitigation calls for a qualified paleontologist to evaluate any paleontological resources found during grading and construction activities. However, this mitigation fails to properly conduct pre-construction worker paleontological resource sensitivity training. This training should be required and training documents available for mitigation monitoring.

Greenhouse Gases, Climate Change and Energy Mitigation Measure 3.7-1

The measures proposed to mitigate the greenhouse gases that will be generated are essentially the same as for air quality impacts and treats the Project in a piecemeal way ignoring cumulative impacts. Additionally, by treating the Project as individual projects it is more likely that these individual projects that will not exceed thresholds to require mitigation. Implementation of the Project as discussed in the DEIR will have a significant impact on goals set forth in the City of Stockton Climate Action Plan relating to proposed truck and rail transport associated with the 6 million plus square feet of industrial warehousing.

There were no mitigation measures proposed to reduce energy usage such as energy efficient lighting, use of other energy efficient equipment that are in use in a typical warehousing/commercial/industrial settings, installation of solar photovoltaic systems to equal the Project's energy needs, using electric on-site equipment warehousing equipment such as forklifts and yard trucks, and constructing electric truck charging and plug in stations suitable for heavy duty trucks and refrigeration units to reduce idling exhaust emissions.

This is a speculative project that will significantly impact environmental resources. Additional greenhouse gas, climate change and energy mitigations are necessary so that Stockton residents do not bear solely the environmental burdens associated with the proposed Project.

The vehicle miles travelled that the proposed Project(s) would generate was not disclosed. We specifically requested this information in our NOP/IS comment letter.

> By July 1, 2020, public agencies evaluating the impact of development projects are required to use vehicle miles traveled (VMT) to evaluate transportation impacts. This change removes the focus on traffic at intersections and roadways immediately around project sites. Instead, the focus will be on how new development projects may influence the overall amount of automobile use.[10]

Hydrology and Water Quality

The DEIR deemed Impact 3.9-2 as less than significant when in fact the construction of the proposed Project and the paving over of 350 acres has the potential to interfere substantially with groundwater recharge associated with the Project area and current land use such that the Project may impede sustainable groundwater management of the basin. The DEIR identified the Subbasin incorrectly as the Eastern San Joaquin River Groundwater Subbasin when the name of the Subbasin in which the Project is located is the Eastern San Joaquin Groundwater Subbasin. The Subbasin is critically overdrafted and the location of the current agricultural fields presents an opportunity to use flood flows to recharge our overdrafted aquifer and provide downstream flood protection. Lands adjacent to natural waterways are particularly good for cost effective groundwater recharge projects.

Furthermore, the DEIR deemed Impact 3.9-3 relating to drainage pattern changes due to the addition of impervious surfaces as less than significant without calculations estimating runoff under climate change scenarios with infrequent atmospheric river rainfall events causing substantial surface runoff, flooding, or surface runoff of polluted stormwater. Climate changes relating to global warming must be carefully considered especially relating to changes to precipitation patterns. Paved land has much higher runoff coefficients, as compared to the existing agricultural land use which has been shown to attenuate runoff and reduce flood risks.

In fact, an additional General Plan Amendment and Rezoning of two areas will be necessary for the proposed Project due to limitations caused by the floodway along French Camp Slough. This floodway is a natural floodplain and a nexus facilitating the flow of floodwater from the waterway to adjacent lands lessening the flood risk to downstream residential areas.

Additional open space mitigation is needed to provide more floodway room for the North Fork of Little John's Creek along the southern boundary of the proposed Project.

Mitigation Measure 3.9.2 requires that prior to issuance of grading permits, the applicant and/or future Project proponent must submit a site-specific Project Stormwater Quality Control Plan to specify BMPs the Project will use to comply with State water quality regulations including those related to City of Stockton's Stormwater Management Plan. French Camp Slough joins the San Joaquin River in Stockton. The San Joaquin River is an impaired waterway and subject to regular hazardous algal blooms that are associated with heavy pollutant loading. The DEIR failed to fully disclose how the planned construction and operation of the 13 projects would result in a coordinated site plan to ensure that site runoff does not further impact the quality of water in our streams and rivers.

---

[10] https://dot.ca.gov/-/media/dot-media/programs/transportation-planning/documents/sb-743/2020-02-26-transmittal-and-draft-vmt-focused-tisg.pdf

Mitigation Measure 3.9-3 requires that prior to issuance of grading permits, the applicant shall obtain the local National Flood Insurance Program administrating community's approval and a CLOMR-based on fill followed by a Map update request. The DEIR stated that most of the Project site is located within the 100-Year designated FEMA Flood Zone and portions of the Project site adjacent to the French Camp Slough are designated within the Regulatory Floodway. Development within Regulatory Floodways are prohibited. The Project site is reportedly not within a 200-year flood zone. Senate Bill 5 requires all urban and urbanizing areas in the Sacramento and San Joaquin Valleys to achieve 200-year flood protection to approve development. The new law restricts approval of development after 2016 if "adequate progress" towards achieving this standard is not met. Urban and urbanizing areas protected by State-Federal project levees cannot use "adequate progress" as a condition to approve development after 2025. The City of Stockton just this year made a finding of adequate progress.

The DEIR stated that according to Stockton Municipal Code Title 16.90, new developments may be permitted in areas "of potential flooding of three feet or less from a storm event that has a 1-in-200 chance of occurring in any given year, from sources other than local drainage, in urban or urbanizing areas…" An analysis by a local engineering firm included in the DEIR as a draft report concluded that flooding of 3 feet or less is expected and they recommended elevation of grade. Whether or not this analysis evaluated an ever-increasing intensity of rainfall resulting from climate change conditions is unknown at this time. Greenhouse gases are responsible for climate change which the proposed Project failed to mitigate.

Transportation and Circulation Mitigation Measure 3.13-1

The proposed Mitigation Measure 3.3-1 includes some possible measures related to the San Joaquin Valley Air Pollution Control District Rule 9410[11] such as "incentives for project employees to utilize alternative transportation options such as buses, bicycles or electric vehicles." Rule 9410 is required whenever an employer exceeds 100 regular employees at a worksite. The treatment in the DEIR of the Project as one entity for analysis of impacts would infer that in the future once any of the individual 13 projects combined reach the threshold of 100 employees, a Trip Reduction Plan will be required.

The San Joaquin Valley Air Pollution Control District is the regulatory agency that is involved in the implementation of transportation demand management (TDM) strategies related to transport to the workplace from home. This transportation effort is small compared to the truck trips related to the operation of the proposed Project and effects on regional roadways. Mitigation should be required for ongoing impacts to city roadways relating to increased heavy duty truck travel which significantly increases roadway maintenance frequency and costs, especially related to the proposed noise reducing pavement.

The same issues related to evaluating impacts for a project that is not well defined has made impossible an environmental analysis of local and regional transportation impacts. A railroad overpass proposed was not included in the mitigation measures.

The DEIR did not adequately describe existing and future transportation conditions relating to the vehicle mile traveled (VMT) associated with a logistical warehouse project of this size with access to rail and two highways. A detailed VMT analysis should have been conducted to determine if the Project would conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b). Without the Project there is no need for the construction of an overpass of the UPRR line.

[11] https://www.valleyair.org/Programs/Rule9410TripReduction/

The DEIR did not include a market analysis to investigate the need for up to 6,091,551 square feet of "employment-generating" industrial uses considering recently approved similar projects under development. There is active recruiting for existing warehouse jobs in our area which pay $15-$20/hour ($600 to $800/week) for full time work.

Governor Newson recently issued Executive Order N 82-20 announced on October 7, 2020[12]:

> "The science is clear that, in our existential fight against climate change, we must build on our historic efforts in energy and emissions and focus on our lands as well. California's beautiful natural and working lands are an important tool to help slow and avert catastrophic climate change, and today's executive order provides important new tools to take on this existential threat."

Ultimately, the lead agency will examine each of the environmental issues listed in the checklist… and decide whether the proposed Project has the potential to have a significant impact and what if any mitigation is to be required. If approved, a development agreement that is transferrable will be established without any defined Project. Without a defined Project it is very difficult to determine impacts which will result from this warehousing development. No clear responsible party for proposed mitigation measures was identified in the DEIR. Mitigation measures to be performed have mixed responsibilities: Project proponent vs. landowner vs. the persons responsible for excavation work throughout the DEIR.

Land use is within the City of Stockton's regulatory purview and while the City of Stockton is not expected to enforce CARB or SJVAPCD standards. The City of Stockton's choice to approve projects with intense trucking and rail components means that the City of Stockton is adding new emission sources – like an attractive nuisance – which will increase the exposure of our residents to pollution. Mitigation is needed to reduce the impact of the Project and should be paid for by the developer not the residents of Stockton.

This Project is not vital for our recovery and the DEIR failed to provide sufficient details to determine the document's adequacy to describe the environmental costs associated with the Project.

Once again, please add the Delta-Sierra Group to your CEQA notification list. The requirements for public noticing are changing next year and we would welcome a conversation to provide our input. If you have any questions or wish to discuss ways that the City of Stockton could improve public outreach, you may contact me by email at mebeth@outlook.com.

Sincerely,

Mary Elizabeth M.S., R.E.H.S.

Re: South Stockton Commerce Center Project Notice of Preparation and Initial Study

The Delta-Sierra Group has reviewed the Initial Study for the planned industrial development located off Airport Way immediately north of the confluence with French Camp Slough and the North Fork of Little John's Creek. French Camp Slough continues through the southwestern part of the five parcels encompassing 437.45 acres of agricultural lands.

Setting

The five parcels are summarized below to help with understanding the discussion regarding General Plan Zoning Maps vs General Plan designations and a zone change designation.   The information was obtained from San Joaquin County Assessors and City of Stockton Interactive Zoning Map[1]. There seems to be some discrepancies between the addresses cited in the Initial Study and City of

[1] https://stocktonca.mapgeo.io/datasets/properties?abuttersDistance=100&latlng=37.973764%2C-121.284422&themes=%22%5B%5C%22zoning%5C%22%5D%22&zoom=12

Stockton records (shown within parentheses). Additionally, there seems to be some discrepancies related to acreage sizes as illustrated below (shown within parentheses).

Parcel Table

APN	Address	Acres	Land value ($) SJC	Current SJC assessed use	City Zone	City General Plan
77-110-040	6110 S. Airport Way	218.29	4,357,515 (221.54 ac)	Irrigated row crop	IL (8210 S. Airport)	Industrial
177-100-030	7070 S. Airport Way	76.03	1,660,790 (80.81)	Irrigated row crop	OS (1865 E French Camp Road	Open Space/ Agricultural
177-110-050	6122 S. Airport Way	3.27	65,305	Irrigated row crop	IL (8222 S AIRPORT WY)	Industrial
201-020-010	9091 S. State Route FR 99	75.07	1,550,424 (73.74 ac)	Irrigated row crop	IL	Industrial
177-050-090	8606 S. Airport Way	64.79	1,289,060	Irrigated row crop	RH (Residential, High Density)	Industrial

The conversion of this especially important agricultural land not only will have an effect on local food security, as row crops are food crops, but will significantly affect existing flood buffering, wildlife habitat, and water infiltration. The environmental analysis of the no project alternative must characterize the positive attributes which will be lost, if developed as described in the Initial Study. Removing agricultural land removes the natural climate change attenuator that soils can serve also affecting the City's ability to reduce carbon dioxide levels in the atmosphere through carbon sequestration.

The Draft Environmental Report must include a market analysis to investigate the need for up to 6,091,551 square feet of "employment-generating" industrial uses considering recently approved similar projects under development. This maximum square footage is based on the Floor Area Ratio (FAR) of 0.47 for industrial uses including general light industrial, industrial park, warehousing, mini-warehouse, high cube transitional and short-term storage warehouse, high-cube fulfillment center warehouse, high-cube parcel hub warehouse and light-cube cold storage warehouse. There is active recruiting for existing warehouse jobs in our area which pay $15-$20/hour ($600 to $800/week) for full time work.

Agricultural Land Mitigation

All of the existing land is in active agricultural uses and should require both City of Stockton Agricultural Land Mitigation (1:1) and San Joaquin County Habitat Mitigation based on SJCOG biological study to determine mitigation level. The City of Stockton Agricultural Land Mitigation program was not referenced as part of the environmental analysis.

"Agricultural land or farmland" for the purposes of Agricultural Land Mitigation Guidelines means important farmland, as defined by the California Department of Conservation's Farmland Monitoring and Mapping Program (FMMP) and as shown on the most recent available FMMP map of San Joaquin County. Important farmland includes prime farmland, farmland of statewide significance, and unique farmland.

Agricultural Land Mitigation Impact Fee - Central Valley Farmland Trust (CVFT): Under Municipal Code section 16-355.270, the City has the authority to establish a Public Facilities Fee Program (PFF) on new development. In 2003, City Council approved resolution #2003-04-03-0105, establishing the PFF schedule. In 2007, the City agreed (through Council resolution #2007-02-07-0079) to add Agricultural Land Mitigation Fee to its Public Facilities Fee Program. The Ag. Mitigation Fee is collected for all applicable new development projects that would result from the conversion of important farmland, as defined by California Department of Conservation, into urban uses. All Ag. Mitigation fees collected pursuant to the agreement should be remitted to Central California Farmland Trust (CVFT).

CITY OF STOCKTON

Pass Through Fees Schedule - All Mitigation Fees

NOTES TO THE ANNUAL REPORT: Per California Government Code Section 66001(e), no refund of PFF fees.

Notes: All Mitigation Impact Fees apply to all fee areas and subject to additonal Administrative fee of 3.5%.

Agricultural Land Mitigation Fee Schedule:

		Effective Date 7/1/2017 Amount	Effective Date 7/1/2018 Amount
Non-Residential:	**Unit of Measure**		
Office / High Density	Per Acre of Net Parcel Area	$ 11,902.00	$ 11,902.00
Retail / Medium Density	Per Acre of Net Parcel Area	$ 11,758.00	$ 11,758.00
Warehouse / Low Density	Per Acre of Net Parcel Area	$ 10,494.00	$ 10,494.00
Residential:			
Single Family Units	Per Acre of Net Parcel Area	$ 14,352.00	$ 14,352.00
Multiple Family Units	Per Acre of Net Parcel Area	$ 12,841.00	$ 12,841.00
Guest Room	Per Acre of Net Parcel Area	$ 12,841.00	$ 12,841.00

For additional information or questions regarding to Ag. Land Mitigation Impact Fees, please contact CDD at (209) 937-8561.

Important Farmland Categories according to the State of California Department of Conservation

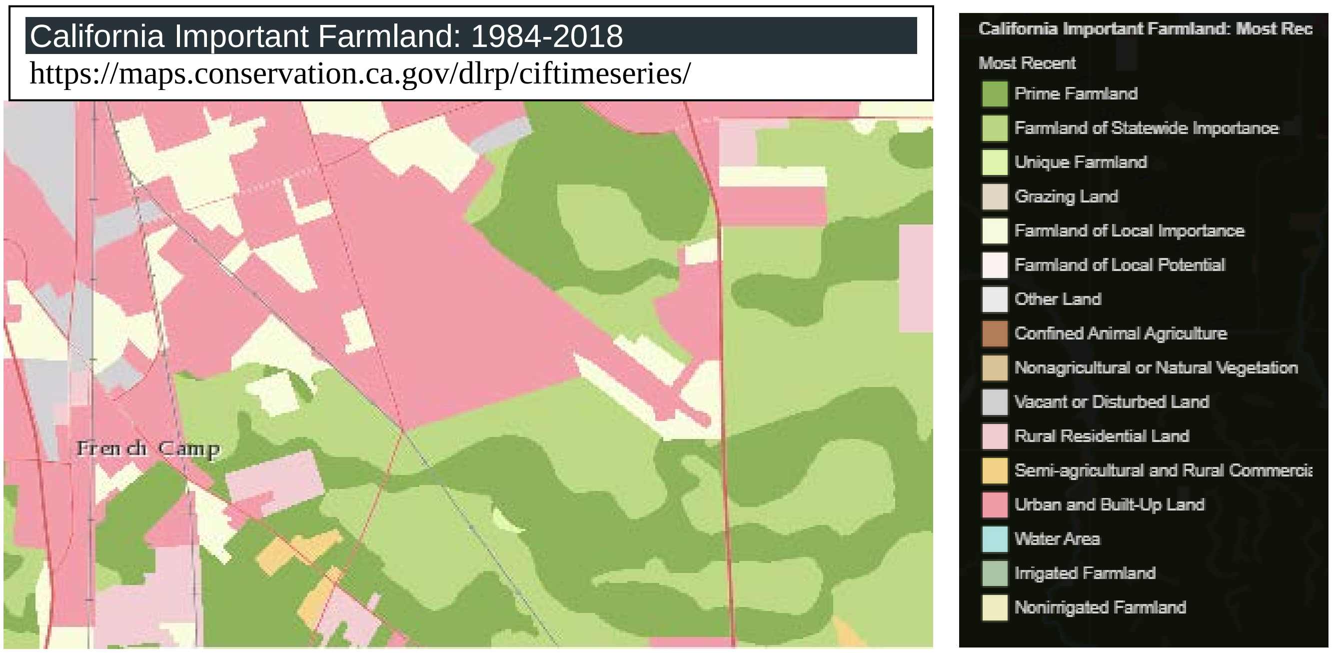
For environmental review purposes under CEQA, the categories of Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, and Grazing Land constitute 'agricultural land' (Public Resources Code Section 21060.1). The remaining categories are used for reporting changes in land use as required for FMMP's biennial farmland conversion report. Land must have been used for irrigated agricultural production at some time during the four years prior to the mapping date.

Prime Farmland (P)
Farmland with the best combination of physical and chemical features able to sustain long term agricultural production. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields.

Farmland of Statewide Importance (S)
Farmland similar to Prime Farmland but with minor shortcomings, such as greater slopes or less ability to store soil moisture.

Unique Farmland (U)
Farmland of lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated but may include non-irrigated orchards or vineyards as found in some climatic zones in California.

Farmland of Local Importance (L)
Land of importance to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee. In some counties, Confined Animal Agriculture facilities are part of Farmland of Local Importance (PDF), but they are shown separately.



Climate changes relating to global warming must be carefully considered especially relating to changes to precipitation patterns. Paved land has much higher runoff coefficients, as compared to the existing agricultural land use which has been shown to attenuate runoff and reduce flood risks. The draft EIR must include a full flood hazard analysis to the residential area downstream of the proposed outfall to French Camp Slough.

Governor Newson recently issued Executive Order N 82-20 announced on October 7, 2020[2]:

> “The science is clear that, in our existential fight against climate change, we must build on our historic efforts in energy and emissions and focus on our lands as well. California’s beautiful natural and working lands are an important tool to help slow and avert catastrophic climate change, and today’s executive order provides important new tools to take on this existential threat.”

Agricultural land mitigation only ensures that some other agricultural land cannot be easily developed through a conservation easement. Agricultural land mitigation does not create new

[2] https://www.gov.ca.gov/2020/10/07/governor-newsom-launches-innovative-strategies-to-use-california-land-to-fight-climate-change-conserve-biodiversity-and-boost-climate-resilience/

agricultural land. Once the land is developed it is unlikely ever to return to food production. The costs associated with the loss of food production land must be analyzed in the draft EIR

The conversion of this land to non-agricultural uses will create additional development pressures on the surrounding farmland and this must be evaluated in the draft EIR.

Air Quality

The conversion of irrigated lands to paved industrial uses accessing SR-99, I-5, the Stockton Metropolitan Airport and rail lines is expected to potentially impact air quality in South Stockton. When considering mitigation measures please refer to the CARB Technical Advisory Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways[3].

(Adjust Font size) When assessing the Project's air pollution emissions from mobile sources use the emission factors found in CARB's latest EMFAC2017. These emission factors were updated from 2014 to provide the best available estimates of emission along with other site-specific variables which will be difficult to determine since the project is conceptual. Please include purple monitor data when evaluating local air quality conditions in the vicinity. Please provide descriptions of all zoned uses for the projects including general light industrial, industrial park, warehousing, mini-warehouse, high cube transitional and short-term storage warehouse, high-cube fulfillment center warehouse, high-cube parcel hub warehouse and light-cube cold storage warehouse. Any development agreements that would limit the amount of various zoned uses must be fully disclosed with complete descriptions of associated air emissions scenarios.

Ultimately, "the lead agency will examine each of the environmental issues listed in the checklist… and decide whether the proposed project has the potential to have a significant impact". This statement was found for each of the CEQA checklist type. The City of Stockton recently approved the conversion of agricultural land for a logistic center and made the finding that air quality will be improved.

If approved, a development agreement that is transferrable will be established without any defined project. Without a defined project it is very difficult to determine impacts which may result from development approved based on zoning. On previous similar projects there have been requests that a reasonable trip length for off-site heavy-heavy duty truck travel be used when analyzing emissions. The San Joaquin Valley AD will not be able to attain health based federal air quality standards without reductions in emissions from HHD which is the single largest source of NOX emissions in the San Joaquin Valley. Operational emissions for on-site sources must also be quantified.

EPA Air Quality Status[4]

pollutant	effec_rede	nonattain	class	part	population
1-Hour Ozone (1979)	- -	Yes	Extreme	W	685306
8-Hour Ozone (1997)	- -	Yes	Extreme	W	685306
8-Hour Ozone (2008)	- -	Yes	Extreme	W	685306
8-Hour Ozone (2015)	- -	Yes	Extreme	W	685306
Carbon Monoxide (1971)	6/1/1998		Moderate <= 12.7ppm	P	373545
PM-10 (1987)	12/12/2008		Serious	W	685306
PM-2.5 (1997)	- -	Yes	Serious	W	685306
PM-2.5 (2006)	- -	Yes	Serious	W	685306
PM-2.5 (2012)	- -	Yes	Moderate	W	685306

[3] https://ww3.arb.ca.gov/ch/rd_technical_advisory_final.pdf
[4] https://www3.epa.gov/airquality/greenbook/anayo_ca.html

Community air quality can be linked to vehicular emissions

The SJVAPCD 2018 PM 2.5 Plan identifies how reductions can be achieved, through implementation of the CARB Statewide Truck and Bus Regulation. The regulation will apply to all truck fleets operating within California, including any fleets that may be associated with the proposed project. As stated, the regulation will require conformance with the identified CARB near-zero truck NOx emission standard.

Again, evaluating impacts is challenging for a project that is not well defined. Recently, the City of Stockton used CalEEMod fleet mix defaults to estimate a project's mobile source air pollutant emissions and was notified that the mileage used required revisions. When performing air emission analyses and traffic impact studies a reasonable estimate of heavy-duty truck trips commensurate with the proposed project's size and location is necessary. Please be very clear and concise when disclosing the parameters used during emissions and traffic analyses.

Land use is within the City's regulatory purview and while the City is not expected to enforce CARB or SJVAPCD standards the City's choice to approve projects with intense trucking and rail components means that it is adding new sources – like an attractive nuisance – which will increase the exposure of our residents to pollution. Mitigation is needed to reduce the impact of the project and should be paid for by the developer not the residents of Stockton.

Transportation

The same issues with regard to evaluating impacts for a project that is not well defined will confound the environmental analysis particularly if it is difficult to ascertain the estimates used when performing the transportation analyses.

> The EIR will describe existing and future transportation conditions and will analyze any potential conflicts with programs, plans, ordinances or policies addressing the circulation system. Potential impacts associated with site access, and on-site circulation will also be addressed in the EIR. A detailed vehicle mile traveled (VMT) analysis will be conducted to determine if the project would conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b). The VMT analysis would be completed consistent with the Office of Planning and Research's (OPR's) Technical Advisory on Evaluating Transportation Impacts in CEQA.

If the City of Stockton uses a full build out for the general plan designations then it is likely that regardless of the VMT analysis which is to be undertaken, the City with find: Impact TRANS-1: Consistency with CEQA Guidelines Section 15064.3(b). Compared with existing land use designations, the project would generate less VMT and would therefore be consistent with CEQA Guidelines which is the language used in a similar logistic industrial center. The existing use of the property is the no project alternative and should be used to determine whether or not the project will have a significant impact. Additionally, please provide at your earliest convenience the VMT analysis which the City must be developing consistent with CEQA guidance:

> By July 1, 2020, public agencies evaluating the impact of development projects are required to use vehicle miles traveled (VMT) to evaluate transportation impacts. This change removes the focus on traffic at intersections and roadways immediately around project sites. Instead,

> the focus will be on how new development projects may influence the overall amount of automobile use.[5]

The NOP did not specify what City of Stockton guidance would be used but it is likely not to be the Standards of the City's Transportation Impact Guidelines used in the analysis of a similar project earlier this year.

Tribal Cultural Resources

Please incorporate a paid tribal representative to be present during land disturbance activities recognizing tribal sovereignty. Two local Tribes include the United Auburn Indian Community and the Northern Valley Yokuts which we are in communication with.

Greenhouse Gas Reduction Requirements

The City of Stockton Climate Action Plan adopted in 2014 included the following statement which is even more true now that our community suffers from the economic and emotional impacts relating to the Covid-19 pandemic:

> The CAP would require substantial effort on the part of the entire Stockton community, including residents and business, schools, the San Joaquin Regional Transit District, other public entities, and the Stockton municipal government at a time when residents, businesses, and public agencies are struggling to pay current bills, keep businesses open, and provide basic services. This plan, if fully implemented, would result in a 20% reduction in per capita GHG emission from 2005 to 2020.
>
> Many of the measures included in the CAP would result in long-term economic, environmental, health and other benefits for the City and its residents and businesses in addition to the expected GHG emission reductions.

Vegetation has been shown to be effective at reducing energy and air pollutant transport. Any vegetation associated with the project or subsequent development must be paid for and maintained by the applicant not the residents of Stockton.

Removing agricultural land removes the natural climate change attenuator that soils can serve and must be accounted when evaluating greenhouse gas emissions.

CEQA is clear that "uniformly applicable development policies or standards" need to be considered in the analysis of environmental effects and their significance and the need for additional mitigation measures. These additional measures are those required by the lead agency to protect public health and the environment that may be harmed as a result of the approval of the project. Relying on state guidance which was developed prior to the project and did not consider the project's impact is not sufficient when parts of our community is unequally burdened by negative environmental impacts. All zip codes are not created equal.

This Project is not vital for our recovery and we hope that the draft environmental impact analysis will be sufficiently detailed so that the residents of Stockton can determine the document's adequacy to describe the environmental costs associated with the project. Cost to Benefits ratio must be clearly described.

Please add the Delta-Sierra Group to your CEQA notification list. We became aware of the project through a CEQAnet link from a colleague. Please let us know if there is to be any public meeting

[5] https://dot.ca.gov/-/media/dot-media/programs/transportation-planning/documents/sb-743/2020-02-26-transmittal-and-draft-vmt-focused-tisg.pdf

regarding this project and when the draft environmental impact report becomes available to review. If you have any questions you may contact me by email mebeth@outlook.com.

Sincerely,

Mary Elizabeth M.S., R.E.H.S.

Re: South Stockton Commerce Center Project Notice of Preparation and Initial Study

The Delta-Sierra Group has reviewed the Initial Study for the planned industrial development located off Airport Way immediately north of the confluence with French Camp Slough and the North Fork of Little John's Creek. French Camp Slough continues through the southwestern part of the five parcels encompassing 437.45 acres of agricultural lands.

Setting

The five parcels are summarized below to help with understanding the discussion regarding General Plan Zoning Maps vs General Plan designations and a zone change designation.   The information was obtained from San Joaquin County Assessors and City of Stockton Interactive Zoning Map[1]. There seems to be some discrepancies between the addresses cited in the Initial Study and City of

[1] https://stocktonca.mapgeo.io/datasets/properties?abuttersDistance=100&latlng=37.973764%2C-121.284422&themes=%22%5B%5C%22zoning%5C%22%5D%22&zoom=12

Stockton records (shown within parentheses). Additionally, there seems to be some discrepancies related to acreage sizes as illustrated below (shown within parentheses).

Parcel Table

APN	Address	Acres	Land value ($) SJC	Current SJC assessed use	City Zone	City General Plan
77-110-040	6110 S. Airport Way	218.29	4,357,515 (221.54 ac)	Irrigated row crop	IL (8210 S. Airport)	Industrial
177-100-030	7070 S. Airport Way	76.03	1,660,790 (80.81)	Irrigated row crop	OS (1865 E French Camp Road	Open Space/ Agricultural
177-110-050	6122 S. Airport Way	3.27	65,305	Irrigated row crop	IL (8222 S AIRPORT WY)	Industrial
201-020-010	9091 S. State Route FR 99	75.07	1,550,424 (73.74 ac)	Irrigated row crop	IL	Industrial
177-050-090	8606 S. Airport Way	64.79	1,289,060	Irrigated row crop	RH (Residential, High Density)	Industrial

The conversion of this especially important agricultural land not only will have an effect on local food security, as row crops are food crops, but will significantly affect existing flood buffering, wildlife habitat, and water infiltration. The environmental analysis of the no project alternative must characterize the positive attributes which will be lost, if developed as described in the Initial Study. Removing agricultural land removes the natural climate change attenuator that soils can serve also affecting the City's ability to reduce carbon dioxide levels in the atmosphere through carbon sequestration.

The Draft Environmental Report must include a market analysis to investigate the need for up to 6,091,551 square feet of "employment-generating" industrial uses considering recently approved similar projects under development. This maximum square footage is based on the Floor Area Ratio (FAR) of 0.47 for industrial uses including general light industrial, industrial park, warehousing, mini-warehouse, high cube transitional and short-term storage warehouse, high-cube fulfillment center warehouse, high-cube parcel hub warehouse and light-cube cold storage warehouse. There is active recruiting for existing warehouse jobs in our area which pay $15-$20/hour ($600 to $800/week) for full time work.

Agricultural Land Mitigation

All of the existing land is in active agricultural uses and should require both City of Stockton Agricultural Land Mitigation (1:1) and San Joaquin County Habitat Mitigation based on SJCOG biological study to determine mitigation level. The City of Stockton Agricultural Land Mitigation program was not referenced as part of the environmental analysis.

"Agricultural land or farmland" for the purposes of Agricultural Land Mitigation Guidelines means important farmland, as defined by the California Department of Conservation's Farmland Monitoring and Mapping Program (FMMP) and as shown on the most recent available FMMP map of San Joaquin County. Important farmland includes prime farmland, farmland of statewide significance, and unique farmland.

Agricultural Land Mitigation Impact Fee - Central Valley Farmland Trust (CVFT): Under Municipal Code section 16-355.270, the City has the authority to establish a Public Facilities Fee Program (PFF) on new development. In 2003, City Council approved resolution #2003-04-03-0105, establishing the PFF schedule. In 2007, the City agreed (through Council resolution #2007-02-07-0079) to add Agricultural Land Mitigation Fee to its Public Facilities Fee Program. The Ag. Mitigation Fee is collected for all applicable new development projects that would result from the conversion of important farmland, as defined by California Department of Conservation, into urban uses. All Ag. Mitigation fees collected pursuant to the agreement should be remitted to Central California Farmland Trust (CVFT).

<u>Important Farmland Categories according to the State of California Department of Conservation</u>

For environmental review purposes under CEQA, the categories of Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, and Grazing Land constitute 'agricultural land' (Public Resources Code Section 21060.1). The remaining categories are used for reporting changes in land use as required for FMMP's biennial farmland conversion report. Land must have been used for irrigated agricultural production at some time during the four years prior to the mapping date.

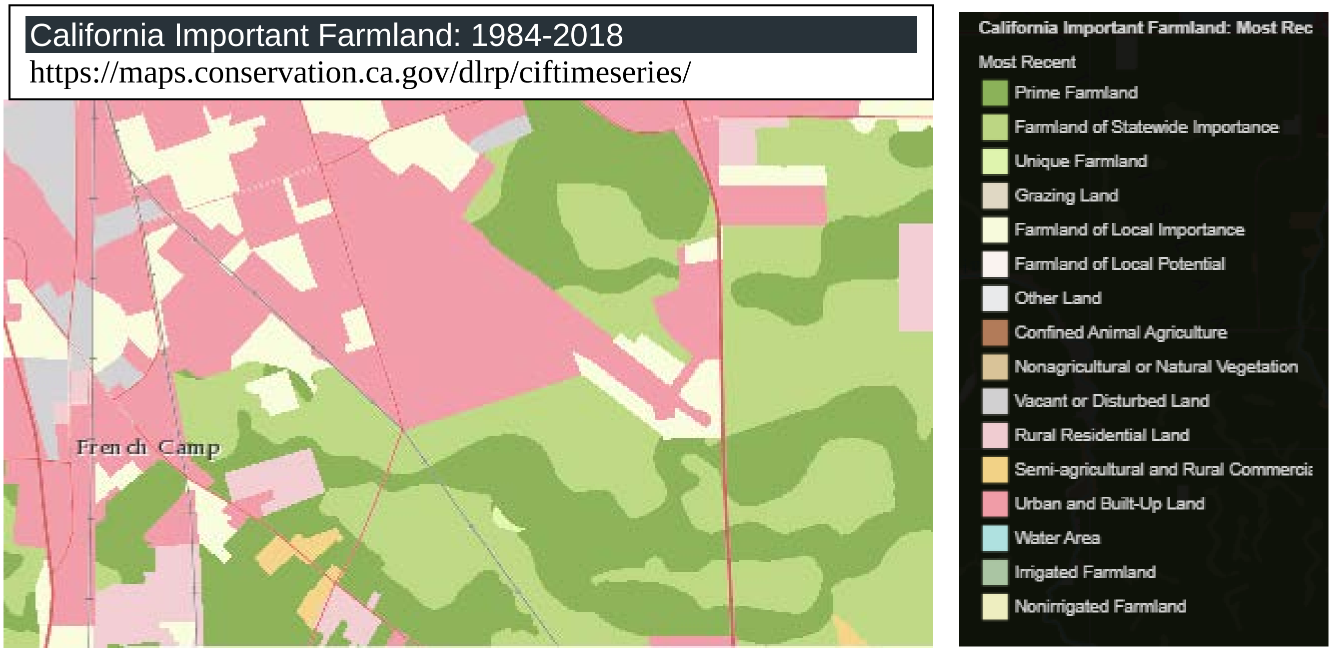
Prime Farmland (P)
Farmland with the best combination of physical and chemical features able to sustain long term agricultural production. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields.

Farmland of Statewide Importance (S)
Farmland similar to Prime Farmland but with minor shortcomings, such as greater slopes or less ability to store soil moisture.

Unique Farmland (U)
Farmland of lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated but may include non-irrigated orchards or vineyards as found in some climatic zones in California.

Farmland of Local Importance (L)
Land of importance to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee. In some counties, Confined Animal Agriculture facilities are part of Farmland of Local Importance (PDF), but they are shown separately.

California Important Farmland: 1984-2018
https://maps.conservation.ca.gov/dlrp/ciftimeseries/



Climate changes relating to global warming must be carefully considered especially relating to changes to precipitation patterns. Paved land has much higher runoff coefficients, as compared to the existing agricultural land use which has been shown to attenuate runoff and reduce flood risks. The draft EIR must include a full flood hazard analysis to the residential area downstream of the proposed outfall to French Camp Slough.

Governor Newson recently issued Executive Order N 82-20 announced on October 7, 2020[2]:

> “The science is clear that, in our existential fight against climate change, we must build on our historic efforts in energy and emissions and focus on our lands as well. California’s beautiful natural and working lands are an important tool to help slow and avert catastrophic climate change, and today’s executive order provides important new tools to take on this existential threat.”

Agricultural land mitigation only ensures that some other agricultural land cannot be easily developed through a conservation easement. Agricultural land mitigation does not create new

[2] https://www.gov.ca.gov/2020/10/07/governor-newsom-launches-innovative-strategies-to-use-california-land-to-fight-climate-change-conserve-biodiversity-and-boost-climate-resilience/

agricultural land. Once the land is developed it is unlikely ever to return to food production. The costs associated with the loss of food production land must be analyzed in the draft EIR

The conversion of this land to non-agricultural uses will create additional development pressures on the surrounding farmland and this must be evaluated in the draft EIR.

Air Quality

The conversion of irrigated lands to paved industrial uses accessing SR-99, I-5, the Stockton Metropolitan Airport and rail lines is expected to potentially impact air quality in South Stockton. When considering mitigation measures please refer to the CARB Technical Advisory Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways[3].

(Adjust Font size) When assessing the Project’s air pollution emissions from mobile sources use the emission factors found in CARB’s latest EMFAC2017. These emission factors were updated from 2014 to provide the best available estimates of emission along with other site-specific variables which will be difficult to determine since the project is conceptual. Please include purple monitor data when evaluating local air quality conditions in the vicinity. Please provide descriptions of all zoned uses for the projects including general light industrial, industrial park, warehousing, mini-warehouse, high cube transitional and short-term storage warehouse, high-cube fulfillment center warehouse, high-cube parcel hub warehouse and light-cube cold storage warehouse. Any development agreements that would limit the amount of various zoned uses must be fully disclosed with complete descriptions of associated air emissions scenarios.

Ultimately, “the lead agency will examine each of the environmental issues listed in the checklist… and decide whether the proposed project has the potential to have a significant impact”. This statement was found for each of the CEQA checklist type. The City of Stockton recently approved the conversion of agricultural land for a logistic center and made the finding that air quality will be improved.

If approved, a development agreement that is transferrable will be established without any defined project. Without a defined project it is very difficult to determine impacts which may result from development approved based on zoning. On previous similar projects there have been requests that a reasonable trip length for off-site heavy-heavy duty truck travel be used when analyzing emissions. The San Joaquin Valley AD will not be able to attain health based federal air quality standards without reductions in emissions from HHD which is the single largest source of NOX emissions in the San Joaquin Valley. Operational emissions for on-site sources must also be quantified.

EPA Air Quality Status[4]

pollutant	effec_rede	nonattain	class	part	population

8-Hour Ozone (1997)	- -	Yes	Extreme	W	685306
8-Hour Ozone (2008)	- -	Yes	Extreme	W	685306
8-Hour Ozone (2015)	- -	Yes	Extreme	W	685306
Carbon Monoxide (1971)	6/1/1998		Moderate <= 12.7ppm	P	373545
PM-10 (1987)	12/12/2008		Serious	W	685306
PM-2.5 (1997)	- -	Yes	Serious	W	685306
PM-2.5 (2006)	- -	Yes	Serious	W	685306
PM-2.5 (2012)	- -	Yes	Moderate	W	685306

[3] https://ww3.arb.ca.gov/ch/rd_technical_advisory_final.pdf
[4] https://www3.epa.gov/airquality/greenbook/anayo_ca.html

Community air quality can be linked to vehicular emissions

The SJVAPCD 2018 PM 2.5 Plan identifies how reductions can be achieved, through implementation of the CARB Statewide Truck and Bus Regulation. The regulation will apply to all truck fleets operating within California, including any fleets that may be associated with the proposed project. As stated, the regulation will require conformance with the identified CARB near-zero truck NOx emission standard.

Again, evaluating impacts is challenging for a project that is not well defined. Recently, the City of Stockton used CalEEMod fleet mix defaults to estimate a project's mobile source air pollutant emissions and was notified that the mileage used required revisions. When performing air emission analyses and traffic impact studies a reasonable estimate of heavy-duty truck trips commensurate with the proposed project's size and location is necessary. Please be very clear and concise when disclosing the parameters used during emissions and traffic analyses.

Land use is within the City's regulatory purview and while the City is not expected to enforce CARB or SJVAPCD standards the City's choice to approve projects with intense trucking and rail components means that it is adding new sources – like an attractive nuisance – which will increase the exposure of our residents to pollution. Mitigation is needed to reduce the impact of the project and should be paid for by the developer not the residents of Stockton.

Transportation

The same issues with regard to evaluating impacts for a project that is not well defined will confound the environmental analysis particularly if it is difficult to ascertain the estimates used when performing the transportation analyses.

> The EIR will describe existing and future transportation conditions and will analyze any potential conflicts with programs, plans, ordinances or policies addressing the circulation system. Potential impacts associated with site access, and on-site circulation will also be addressed in the EIR. A detailed vehicle mile traveled (VMT) analysis will be conducted to determine if the project would conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b). The VMT analysis would be completed consistent with the Office of Planning and Research's (OPR's) Technical Advisory on Evaluating Transportation Impacts in CEQA.

If the City of Stockton uses a full build out for the general plan designations then it is likely that regardless of the VMT analysis which is to be undertaken, the City with find: Impact TRANS-1: Consistency with CEQA Guidelines Section 15064.3(b). Compared with existing land use designations, the project would generate less VMT and would therefore be consistent with CEQA Guidelines which is the language used in a similar logistic industrial center. The existing use of the property is the no project alternative and should be used to determine whether or not the project will have a significant impact. Additionally, please provide at your earliest convenience the VMT analysis which the City must be developing consistent with CEQA guidance:

> By July 1, 2020, public agencies evaluating the impact of development projects are required to use vehicle miles traveled (VMT) to evaluate transportation impacts. This change removes the focus on traffic at intersections and roadways immediately around project sites. Instead,

> the focus will be on how new development projects may influence the overall amount of automobile use.[5]

The NOP did not specify what City of Stockton guidance would be used but it is likely not to be the Standards of the City's Transportation Impact Guidelines used in the analysis of a similar project earlier this year.

Tribal Cultural Resources

Please incorporate a paid tribal representative to be present during land disturbance activities recognizing tribal sovereignty. Two local Tribes include the United Auburn Indian Community and the Northern Valley Yokuts which we are in communication with.

Greenhouse Gas Reduction Requirements

The City of Stockton Climate Action Plan adopted in 2014 included the following statement which is even more true now that our community suffers from the economic and emotional impacts relating to the Covid-19 pandemic:

> The CAP would require substantial effort on the part of the entire Stockton community, including residents and business, schools, the San Joaquin Regional Transit District, other public entities, and the Stockton municipal government at a time when residents, businesses, and public agencies are struggling to pay current bills, keep businesses open, and provide basic services. This plan, if fully implemented, would result in a 20% reduction in per capita GHG emission from 2005 to 2020.
>
> Many of the measures included in the CAP would result in long-term economic, environmental, health and other benefits for the City and its residents and businesses in addition to the expected GHG emission reductions.

Vegetation has been shown to be effective at reducing energy and air pollutant transport. Any vegetation associated with the project or subsequent development must be paid for and maintained by the applicant not the residents of Stockton.

Removing agricultural land removes the natural climate change attenuator that soils can serve and must be accounted when evaluating greenhouse gas emissions.

CEQA is clear that "uniformly applicable development policies or standards" need to be considered in the analysis of environmental effects and their significance and the need for additional mitigation measures. These additional measures are those required by the lead agency to protect public health and the environment that may be harmed as a result of the approval of the project. Relying on state guidance which was developed prior to the project and did not consider the project's impact is not sufficient when parts of our community is unequally burdened by negative environmental impacts. All zip codes are not created equal.

This Project is not vital for our recovery and we hope that the draft environmental impact analysis will be sufficiently detailed so that the residents of Stockton can determine the document's adequacy to describe the environmental costs associated with the project. Cost to Benefits ratio must be clearly described.

Please add the Delta-Sierra Group to your CEQA notification list. We became aware of the project through a CEQAnet link from a colleague. Please let us know if there is to be any public meeting

Re: South Stockton Commerce Center Final EIR and Associated Documents

Greetings Commissioners,

The approval and recommended certification of the FEIR and associated documents for the South Stockton Commerce Center should be postponed until a workshop can be scheduled to explain how the project with 200+ acres of impervious surface will not contribute to the flood risks in South Stockton. Additionally, the air emission and projected traffic is based on speculation with no data indicating that market forces will support the assumptions; thusly the impacts and approved ministerially mitigation measures may be significantly undersized. Even though the DEIR stated that a development agreement would be prepared and requested by a commentor on the DEIR, no development agreement is included. The development agreement could include limitations so that the project impacts would be restricted by the type of operation allowed.

I submitted comments for this project on behalf of the Delta-Sierra Group of the Sierra Club regarding the Notice of Preparation/Initial Study and the Draft Environmental Impact Report. I have attached those comments for reference. Additionally, there has been "ad hoc" communication between the Sierra Club and the City of Stockton Staff regarding the listed mitigation measures in the attached settlement documents. You should have been provided a supplemental staff report and addendum changing the language of the Final Environmental Impact Report (FEIR) to reflect settlement agreement language between the Sierra Club and the City of Stockton as well as with the Attorney General's Office relating to the Mariposa Industrial Project; however we learned at the 4.10.2023 "ad hoc" meeting that these documents will be provided to you all in an "around the bench" memo in paper form. "Around the bench memos" are generally provided only to those seated in the dais, although I did request that copies be made to members of the public attending the meeting. The size and scope of Project impacts warrant additional study time and opportunities to develop and ask questions about mitigation measures that would further reduce the "Unavoidable Significant Impacts" that will occur should this Project be approved based on available documents.

Remaining Air Quality Impacts

This is a speculative project meant to tie up the property for an indefinite period of time, depending on market forces. Master Response 4 (Air Quality/Indirect Source Review-Rule 9510) in the FEIR states that "Because there is not an end user, site plan review, architectural plan, etc., it is not possible to reasonably calculate the emissions or onsite mitigation of the end user/site/building, making it impossible to calculate the offsite mitigation needs." The City also states in this master response that "It is anticipated that the best design measures, including the State of California Department of Justice's "Warehouse Projects: Best Practices and Mitigation Measures" would be **considered** for incorporation into site and/or building design as determined appropriate and feasible by the SJVAPCD and Engineer/Architect at the time of site design." Air quality monitoring must be required by the City and included as a mitigation measure to ensure that the operational impacts described are mitigated to required levels so as not to significantly increase the pollutant burden, especially since there are proposed significant and unmitigated air quality impacts that Stockton residents must bear.

In Mitigation Measure 3.3-1 of the DEIR, the City states that the project would comply with SJVAPCD Rule 9510 as the project is built out. This rule requires the applicant to reduce the project's operational NOx and PM10 emissions by 33.3 and 50 percent, respectively. This rule also requires the applicant to reduce the project's construction NOx and PM10 emissions by 20 and 45 percent, respectively. To achieve these reductions, the applicant must pay into an offsite mitigation fund managed by the SJVAPCD for any emission reductions required by the rule that are not achieved through on-site emission reductions.

The City should implement **all feasible on-site mitigation measures before paying for the offsite mitigation measures**. The mitigation measures listed in the CARB DEIR comment letter and the State of California Department of Justice's "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act"[1] should be included in Mitigation Measure 3.3-1. Paying a fee in lieu of mitigation adds to the pollutant burden of Stockton residents, because this mitigation fee may not be used in our County at all. Mitigation measures must be specified that can be implemented to reduce the project's air quality impacts rather than developing mitigation measures after the FEIR has been certified. Labeling compliance with CARB, the SJVAPCD or City of Stockton regulations as mitigation measures should be avoided.

Disclosing air pollution from the entire expected length of truck trips must be clearly presented and an explanation for the operational trip length be provided. CEQA requires full public disclosure of a project's anticipated truck trips, which entails calculating truck trip length based on likely truck trip destinations, rather than the distance from the facility to the edge of the air basin, local jurisdiction, or other truncated endpoint. All air pollution associated with the project must be considered, regardless of where those impacts occur.

In fact, while the City has disclosed a proposed mix of uses as follows, there is no way to conclude that the impacts are "conservative" and that is that the actual impacts could be less and what is proposed is over mitigated. The traffic assumptions input into the modeling utilize ITE codes as follows:

- ITE Land Use Code 110 – General Light Industrial: 7%
- ITE Land Use Code 130 – Industrial Park: 15%
- ITE Land Use Code 150 – Warehousing: 15%
- ITE Land Use Code 151 – Mini-Warehouse: 3%
- ITE Land Use Code 154 – High-Cube Transload & Short-Term Storage Warehouse: 15%
- ITE Land Use Code 155 – High-Cube Fulfillment Center Warehouse: 15%
- ITE Land Use Code 156 – High-Cube Parcel Hub Warehouse: 15%
- ITE Land Use Code 157 – High-Cube Cold Storage Warehouse: 15%

[1] https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf Updated September 2022.

The Project proposes an increased land use density, which would result in increased travel activity, including vehicles (cars and trucks), bicycle, pedestrian, and potentially transit trips, conceivably from Manteca or Stockton? The Department of Justice's "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act"[1] recommends that agreements be established for transit services before referencing as a mitigation measure. Sidewalks on Airport Way and along all the roads in the complex will help with worker health opportunities and must ensure connectivity with the Airport. Bicycle setbacks on Project property should be included in this mitigation measure since there are no planned road improvements other than an internal signaling.

According to the Traffic Study prepared for the proposed Project would increase automobile VMT by approximately 22,633 net new daily trips. As I indicated in my comments on the DEIR:

> The San Joaquin Valley Air Pollution Control District is the regulatory agency that is involved in the implementation of transportation demand management (TDM) strategies related to transport to the workplace from home. This transportation effort is small compared to the truck trips related to the operation of the proposed Project and effects on regional roadways. Mitigation should be required for ongoing impacts to city roadways relating to increased heavy duty truck travel which significantly increases roadway maintenance frequency and costs, especially related to the proposed noise reducing pavement.

The only disclosure of the operational impacts which I located are as follows:

> De Novo Planning Group used fleet mix data from the CalEEMod (v~~2016.3.2~~2020.4.0) output for the proposed **Project, Year 2040** gasoline and diesel MPG (miles per gallon) factors for individual vehicle classes as provided by ~~EMFAC2017~~EMFAC2021, weighted average MPG factors for gasoline and diesel were derived. Therefore, upon full buildout, the proposed Project would generate operational vehicle trips that would use a total of approximately ~~434~~399 gallons of gasoline and ~~633~~ 508 gallons of diesel per day, or ~~158,36~~345,694 gallons of gasoline and ~~231,137~~185,485 gallons of diesel per year.

This FEIR explanation does not address the required disclosure of impacts should the project be constructed next year instead of 2040 nor were truck trips disclosed as is required for a CEQA compliance. This updated information was not vetted before being included in the FEIR. Several DEIR commenters have requested that a revised DEIR be recirculated. At the 4.10.2023 "ad hoc" meeting, I was informed that neither the City nor Project proponents reached out to discuss the concerns of the commenters nor provided information to engage in a dialogue to verify that all concerns were addressed or to determine what remaining were the remaining concerns.

During an "ad hoc" meeting with project proponents and the City of Stockton on 4.10.2023, I was informed that there is an erratum that corrects this 2040-date error.

I was thinking that there must be some other document that I missed, so instead of continuing my comment preparation, I did a search for errata and found the following in the materials presented to the Planning Commission in the 4.13.2023 agenda packet:

Final EIR: The City of Stockton received six comment letters on the Draft EIR during the public review period. In accordance with CEQA Guidelines Section 15088, the Final EIR responds to the comments

CEQA Findings – South Stockton Commerce Center 3

83

EXHIBIT 3

CEQA FINDINGS

received during the public review period. The Final EIR also contains minor edits to the Draft EIR, which are included in Chapter 3.0, Errata.

Chapter 3.0 Errata includes the following (Pg 3.0-1.9):

ON-ROAD VEHICLES (OPERATION)

The proposed Project would generate vehicle trips during its operational phase. A description of Project operational on-road mobile energy usage is provided below.

According to the Traffic Study prepared for the proposed Project (Fehr & Peers, 2021), and as described in more detail in Section 3.13 of this EIR, the Project would increase automobile VMT by approximately 22,633 net new daily trips. In order to calculate operational on-road vehicle energy usage and emissions, De Novo Planning Group used fleet mix data from the CalEEMod (v~~2016.3.2~~2020.4.0) output for the proposed Project, Year 2040 gasoline and diesel MPG (miles per gallon) factors for individual vehicle classes as provided by ~~EMFAC2017~~EMFAC2021, weighted average MPG factors for gasoline and diesel were derived. Therefore, upon full buildout, the proposed Project would generate operational vehicle trips that would use a total of approximately 434~~399~~ gallons of gasoline and ~~633~~ 508 gallons of diesel per day, or 158,363~~45,694~~ gallons of gasoline and ~~231,137~~185,485 gallons of diesel per year.

The final EIR should be final not filled with errors and City Staff should have demanded that the corrections be made in the document so that residents do not have to request an "ad hoc" meeting when trying to prepare comments for the CEQA record. There should be at least 30 days to review the "Final EIR" if this is the quality of work that residents are to expect for approval consideration and to allow for some confidence that the FEIR analysis and response to comments is adequate.

The air quality assumptions input into the CalEEMod model for each land use.

- General Heavy Industry: 7%
- Industrial Park: 15%
- Unrefrigerated Warehouse – No Rail: 63%
- Refrigerated Warehouse – No Rail: 15%

Should the refrigerated – cold storage warehouse mix be increased the emissions will significantly increase, as refrigerated warehousing is extremely energy intensive activity with significant associated emissions for operation. If truly seeking a conservative estimate of emissions, the mix would be reflective of market needs in the near term and would not rely on subproject analyses, which may not be widely circulated and may be missed by interested parties, particularly in light of the City's minimal CEQA outreach.

Developer/Tenant restrictions/lease agreements are especially important as a mitigation measure and/or condition of approval to limit the cold storage warehouse size and associated transportation refrigerated units (TRU) that have substantially higher energy use and emissions.

I noted in the Delta-Sierra Group DEIR comments that there is a proposed grade-separated overpass of the UPRR line and a proposed railroad spur line to provide rail access throughout the Project. Without including some rail specific land use alternatives, the air quality assumptions are incomplete. The FEIR states that "The project proposes to potentially include rail service to up to three large parcels (parcels 2, 3, and 4) within the Project site. A potential railroad spur line would extend east from the UPRR along the Project site's northern edge providing rail access to the parcels." Again, rail emissions were not included in the air quality modelling.

The response in the FEIR is especially confusing since there are proposed changes, railroad overpass, rail spurs, possible transit services, yet this is part of the "Master Comments" in response to multiple commentors' concerns:

> Fehr and Peers found that the Project does not propose any new roadways or transportation facilities that would be inconsistent with applicable design standards for the City of Stockton. The Project proposes an increased land use density, which would result in increased travel activity, including vehicle (cars and trucks), bicycle, pedestrian, and potentially transit trips. In order to provide access to and from the Project site, the signalized Airport Way/Commerce Drive intersection will be designed to serve all travel modes and Surface Transportation Assistance Act (STAA) vehicles. These Project-generated trips would be served by existing and planned facilities that are constructed to applicable design standards to serve these travel modes. Therefore, the proposed Project would not result in a change to the vehicle mix or speed of traffic that is not compatible with the design of existing or planned roadways and transportation facilities. This impact would be less than significant.

STAA trucks are very long, weigh a lot, and impact roadways more than smaller trucks and vehicles. The mitigation fees that the City charges for roadways were established in the 1990's and do not reflect current costs. If the City continues to approve projects with inadequate mitigation fees, Stockton residents will be left with greater backlogged maintenance, as other funds will be directed to subside the approved development project impacts.

The California Air Resources Board and I questioned the under-reporting of emissions related to construction activities and the response provided is as follows:

> "The proposed Project is anticipated to have an on-site balanced cut and fill; this was confirmed via follow-up correspondence with the Project applicant. Therefore, no mobile source air pollutant emissions from heavy-duty trucks during the Project's construction grading phase are anticipated."

This additional follow-up correspondence should have been specifically included in the FEIR and should have explained how flood mitigation grading activities are to occur in the project description AND recirculated for comment. The grading and improvement plans, as well as the storm drainage and building plans for each phase of the Project will be designed in accordance with the recommendations provided in the final geotechnical evaluation which was not provided for public review.

Further Comments

The additional comments I have prepared address the following topics and include excerpts from news quotes that provide important perspectives:

- Climate Change and Flood Protection
- Vulnerable Populations affected by increased precipitation patterns and runoff intensities.
- Flood Protection Funding Challenges
- Public Information and Resident Engagement Process
- FEIR Comment Responses and Overriding Considerations

The land should never have been zoned Commercial/Industrial in the 2040 General Plan that was adopted in 2018 and at a time before our current flooding experience. In January 2023, Stockton received one-half of its annual precipitation in only 17 days after a series of atmospheric rivers hit the region.

How the City handles stormwater drainage in areas not directly attached to the City system is through maintenance districts that have annual assessments. The following is an excerpt from the most recent engineering report[2]:

> For each Zone, the City of Stockton, either directly or by subcontract, shall has the responsibility of establishing an ongoing storm drainage maintenance management entity, to be known as The Storm Drainage Maintenance District Manager. The Storm Drainage Maintenance District Manager shall be responsible for establishing the annual budget; keeping an account of the maintenance and operational administrative costs; administering and performing the storm drainage maintenance, whether directly or by subcontract; paying all fees, utility costs, taxes and any and all other operating costs. The Storm Drainage Maintenance District Manager for each Zone, and/or the Municipal Utilities Department of the City of Stockton, shall provide annually the operating budget, the administrative budget, and the description of maintained improvements to be included in the Annual Engineer's Report.

This Annual Engineer's Report is available on the City of Stockton website but does not include any inspection results or operational issues that may be of concern for example the erosion I observed on the east side of the proposed Project location on 2.19.2023, as shown.

After July 2, 2016, building and zoning code changes apply to all permits issued that include:

[2] https://www.stocktonca.gov/files/2023-2024_Fiscal_Year_Annual_Engineers_Report.pdf

- increased building setbacks for flood fighting along levees,
- requirements to elevate buildings above the floodplain or use flood-resistant building materials for development in areas identified as flood hazard zones on federal flood maps, and
- streamlining the process of making specific findings for development of residential and commercial land uses.

A "finding" is a conclusion based on facts and commonly required to support the decision to approve a land-use permit. Before an affected project can be approved, findings must be made that the proposal meets the new state flood protection requirements. Whether the City has made such a finding for the project is unclear and as the project will increase runoff – disclosure of the specifications that will be relied upon when planning holding basins is needed before a tentative map is approved.

According to the FEIR:

> ….the proposed Project is a tentative map at this stage of entitlement. The property owner does not know the end users or any operational characteristics of the end users because what is proposed is simply a subdivision of land with some master improvements that would enable industrial building design and site review by an end user.
>
> Impact 3.9-3: The proposed Project has the potential to alter the existing drainage pattern of the site or area, including the alteration of the course of a river or through the addition of impervious surfaces, in a manner which would result in substantial erosion, siltation, surface runoff, flooding, or polluted runoff. *Deemed to be less than significant requiring no mitigation.*
>
> Impact 3.14-6: The proposed Project has the potential to require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects. *Deemed to be less than significant requiring no mitigation.*

Mitigation Measure 3.6-1 (requiring a final Geotechnical Evaluation, and site recommendations) the proposed Project would have a less than significant impact relative to this topic. A preliminary geotechnical evaluation should have been included for public disclosure.

The scope of the drainage basin sizes (Impact 3.14-6) were not discussed except to state that there will be two: 28 and 13 acres (no depths disclosed). According to the DEIR one basin outfall will be located within the northeast area of the basin and the second to French Camp Slough. Two options are being considered for the French Camp Slough: 1) An overland flow discharge where the water will be released into a rock lined structure to slow flow velocities before flowing into French Camp Slough; or 2) A more tradition outfall structure and rock rip rap placed on the banks of French Camp Slough. The environmental effects of this choice were not disclosed nor possible impacts to downstream residents if the first year of operation results in a water year with multiple atmospheric rivers.

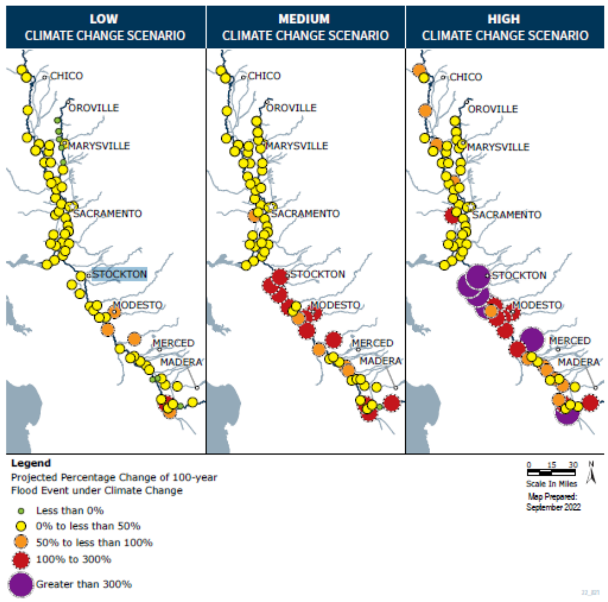
At the 4.10.2023 “ad hoc” meeting the staff working on the drainage plan indicated that they had been working on the plan for over a year – yet that plan was not included to provide evidence that the 200+ acres of impervious surfaces (Impact 3.9.3) would not further worsen flooding risks for Stockton residents.

Additionally, at the 4.10.2023 “ad hoc” meeting the flooding of Airport Way adjacent to French Camp Slough was discussed. The Project proponent staff stated that the problem was related to upstream issues on the North Fork of Little Johns Creek which feeds into French Camp Slough. Projects already approved now drain into the North Fork of Little Johns Creek and French Camp Slough. The Project proponent staff also stated that French Camp Slough did not top the levees near Airport Way. On 2.19.2023 I took a field trip and based on the vegetation and mud patterns; it appeared that French Camp Slough had topped the levee and spilled onto the floodway.

Climate Change and Flood Protection

Paving over agricultural/open space land adjacent to the French Camp Slough will increase runoff that will be discharged to French Camp Slough. The City’s drainage requirements do not incorporate climate change predictions which result in undersized drainage facilities. The City of Stockton approves drainage plans without any public review using ministerial actions. Below are diagrams from the 2022 Update Central Valley Flood Protection Plan published in November 2022.

Figure 2.5 Spatial Patterns of Change in Peak Regulated Flows Representing the 100-Year Flood or 1% Annual Exceedance Probability under 2022 CVFPP Climate Change Scenarios



The General Plan is long term planning document. Within the last 5 years since adoption, over 35 million square feet of warehousing on a hundreds of agricultural acres have been approved by the City of Stockton and are in active construction stages in the south and east of Stockton. Given the proximity of the project to important airport resources and French Camp Slough a tributary of the San Joaquin River, this project should not be approved at this time.

The following is a photograph looking north and east adjacent to French Camp Slough near Airport Way on 2.23 2023.

There was evidence that French Camp Slough had overtopped the levees and flowed onto the designated floodway and there had been some reports by the County of San Joaquin of road closures on Airport Way in the vicinity. As you will read below, an important mitigating measure for urban flooding is to include larger floodplains which are areas adjacent to floodways and reduce peak flows that top leaves because the water is spread out over a larger area. This land should be used for habitat mitigation for other needed flood control projects in addition to the mitigation that the City has designated a large part of the Van Buskirk Park for the Mossdale flood mitigation project.

California's next flood could destroy one of its most diverse cities. Will lawmakers try to save it?; Jake Bittle; 1.19.2023 Grist 3

"…lawmakers have overlooked Stockton's vulnerable populations, according to Jane Dolan, president of the Central Valley Flood Protection Board, a state agency that oversees flood management. But Dolan says the disparity also exists because leaders along the San Joaquin River have long tended to focus more on securing water for agricultural irrigation than on managing the rivers, which has made it hard to secure momentum for big flood improvements." "They don't have that consensus about managing floodwaters and allowing space for the river," she told Grist. "Politicians from city councils to Congress are all focused on water supply."

"You can build a levee stronger and better, but it's still vulnerable to breaking," said John Cain, director of conservation at River Partners, a nonprofit that advocates for such floodplain restoration projects. "If you want to have more resiliency in the system, you literally need more room."

Making room for waterways and reducing runoff intensities and volumes reduce flooding frequencies.

Adjacent to the San Joaquin River is the public housing project known as Conway Homes which provide essential housing assistance to some of our most vulnerable residents. While as a City of Stockton Planning Commissioner, my current City Council representative described possible flooding situations that could impact residents east of I-5. Brando Villapudua sent the following on May 24, 2022 to Mayor and City Council Members regarding an City Council item:

"Conway Homes and the housing developments surrounding the former Van Buskirk Golf Course and Community Center are one of the most vulnerable communities for flood threat within the Delta. Modeling from the Department of Water Resources estimates seven feet of overtopping of the levees near French Camp Slough and the San Joaquin River due to a combination of storm inundation, storm surge and sea level rise. In the event of such a storm event, water from the confluence of French Camp Slough and the San Joaquin River would overtop the west end of the golf course and could potentially back up into Walker Slough broadening a flood emergency."

We in San Joaquin County have been assisted by the Federal Government at the property owner and municipality level by the Federal Emergency Management Agency (FEMA) during this flooding season. Guidance has been developed to minimize flooding and that projects not be approved in floodways without adequate study4:

Title 44 of the Code of Federal Regulations, Section 60.3(d)(3), states: "A community shall prohibit encroachments, including fill, new construction, substantial improvements, and other development within the adopted regulatory floodway unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practice

[3] https://grist.org/extreme-weather/stockton-california-storm-flooding-atmospheric-river-central-valley-levees/
[4] https://www.nh.gov/osi/planning/programs/fmp/documents/sample-no-rise-certification.pdf

that the proposed encroachment would not result in any increase in flood levels within the community during the occurrence of the base flood discharge."

The Project proposes a maximum of 6,091,551 square feet of industrial type land uses, 140,350 square feet of commercial land uses, 54 acres of open space, 41 acres of public facilities, and 18 acres of right-of-way circulation improvements. The over-riding assumptions are difficult to accept when the no project was the best alternative and neither of the alternatives met the project objectives " that is to develop 422-acres of land for industrial uses, commercial uses, open space, public facilities, and public roadway right-of-way." The City acknowledged that other locations might be preferable, but no downsides of the proposed location was disclosed. "City's consideration of alternative locations for the Project included a review of previous land use planning and environmental documents in Stockton including the General Plan. The search included a review of lands in the south part of Stockton that are located within the Sphere of Influence and is otherwise suitable for development."

I find it strange that the City did not consider lands to the north or east of town when seeking alternative locations. Furthermore, the City has indicated that LU-4.1 is satisfied.

> LU-4.1 states: Encourage large-scale development proposals in appropriate locations that include significant numbers of higher-wage jobs and local revenue generation. Such development may utilize the Economic and Education Enterprise land use designation if the proposal meets all of the criteria listed under the definition of the designation. The rationale used by the City to satisfy LU4.1 is as follows: "The proposed Project is considered large-scale and would provide jobs and local revenue for the city. The Project location is appropriate for commercial and industrial warehouse uses because it is located on land planned for industrial uses by the General Plan. Additionally, the Project area is located near existing industrial warehouses, and can utilize Airport Way, the existing rail line, and State Route (SR) 99 for the transport of goods.

Since the project satisfies LU-4.1, I wonder why the northern part of Stockton was not inventoried for potential sites and only South Stockton was considered by the City.

Vulnerable Populations affected by increased precipitation patterns and runoff intensities.

Opinion: Catastrophic floods and breached levees reveal a problem California too often neglects; Jeffery Mount and Brett Sanders; 4.7.2023 Los Angeles Times[5]

> Finally, flood management is a social justice issue… First, we need to identify the risks and appropriate responses more accurately with our changing climate in mind. Communities and governments need to work together to increase resilience, particularly for the most vulnerable populations. The same risk assessments can be used to guide land use. The most cost-effective risk management strategy is to discourage new construction in areas at high risk of flooding.

[5] https://www.latimes.com/opinion/story/2023-04-07/flood-control-drought-levees-california

As floods endanger the San Joaquin Valley, Newsom cuts funding for floodplains; Alastair Bland; 3.29.2023 CalMatters[6]

> Barrigan-Parrilla of Restore the Delta said at least 17,000 houses in Stockton near Van Buskirk Park are at particular risk of flooding. Nearby a community of unhoused people lives beside Mormon Slough, which nearly spilled over its levee in January.
>
> "That $40 million could have been used to finish up planning for floodplains from Merced all the way to Van Buskirk Park," she said. "The more we can get floodplains back into use along the San Joaquin River system, the more we can keep people safe from flooding, especially in environmental justice communities."

Flood Protection Funding Challenges

California's next flood could destroy one of its most diverse cities. Will lawmakers try to save it?; Jake Bittle; 1.19.2023 Grist[7]

> "…lawmakers have overlooked Stockton's vulnerable populations, according to Jane Dolan, president of the Central Valley Flood Protection Board, a state agency that oversees flood management. But Dolan says the disparity also exists because leaders along the San Joaquin River have long tended to focus more on securing water for agricultural irrigation than on managing the rivers, which has made it hard to secure momentum for big flood improvements." "They don't have that consensus about managing floodwaters and allowing space for the river," she told Grist. "Politicians from city councils to Congress are all focused on water supply." "We have a severely disadvantaged community," said Chris Elias, director of the San Joaquin Area Flood Control Agency, the authority that manages the region's levees. "We cannot impose too much burden on them — they've borne too much burden already. So we explore those other funding avenues. But just like everything else, we are competing with a whole bunch of other priorities that the state has."

The San Joaquin Area Flood Control Agency has nevertheless initiated the Prop 218 process to garner more funds for flood control a part of which will go to funding some levee improvements on French Camp Slough downstream of the Project location. According to the San Joaquin Area Flood Control Agency[8]: "In January 2023, Stockton received one-half of its annual precipitation in only 17 days after a series of atmospheric rivers hit the region. Atmospheric Rivers are responsible for 80% of flood damages over the past 40 years in the western United States." How will this project ease the flood burden on South Stockton or pay for additional flood mitigation related to increased runoff coefficients and outdated precipitation projections.

Public Information and Resident Engagement Process

Referenced earlier, I have attached correspondence I prepared regarding the Notice of Preparation/Initial Study (NOP/IS) and Draft EIR. I only happened upon the DEIR despite

---

[6] https://calmatters.org/environment/water/2023/03/california-floods-funding-cut-san-joaquin-valley/
[7] https://grist.org/extreme-weather/stockton-california-storm-flooding-atmospheric-river-central-valley-levees/
[8] https://www.sjafca.org/finance/levee-construction-maintenance-assessment

multiple written communication with staff and formally requesting notice of availability in my NOP/IS comment letter.

The City continues to limit information sources for resident participation despite having been provided the Department of Justice's "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act" [1] which states:

> Early and consistent community engagement is central to establishing good relationships between communities, lead agencies, and warehouse developers and tenants. Robust community engagement can give lead agencies access to community residents' on-the-ground knowledge and information about their concerns, build community support for projects, and develop creative solutions to ensure new logistics facilities are mutually beneficial.

Multiple emails have been sent to the City to Staff when trying to follow this project is as my students say "doing too much". A project website which is regularly updated with newsletters of the process is just one example of the best practices for community involvement outlined in the Department of Justice's "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act"[1]

For example, the FEIR for this project was only made available on the agenda of the City of Stockton Planning Commission with notification from ASK Stockton on Friday 4.7.208. The City's continued use of minimal outreach is concerning for residents as well as for Planning Commissioners. The City knew of the finalization of the Project EIR and associated documents two months ago and could have held a workshop with the Planning Commission regarding the DEIR which is referenced in the FEIR prior to the 4.13.2023 meeting.

The Certificate of Posting: I declare, under penalty of perjury, that I am employed by the City of Stockton and that I caused this agenda to be posted in the City Hall notice case on April 6, 2023 in compliance with the Brown Act. City Hall was closed on 4.7.2023.

The date on the FEIR is March 17, 2023, at which time the information should have been made available to the residents of Stockton and beyond. The scope of the FEIR is so complex that the FEIR is not included in the associated information included in the e-agenda on pages 16 through 197. Many agencies submitted comments in addition to my comments on behalf of the Delta-Sierra Group. The FEIR should be posted for the public at least 30 days in advance and with an ASK notification for environmental documents available and the project website updated.

When comments were made regarding the notification process and suggestions the comments were noted. The response included the following:

> "The City has established policies for community involvement for CEQA projects. The City's policies follow state rules and regulations regarding noticing meetings, noticing hearings, holding scoping meetings, and holding hearings. The City has followed these rules and regulations. It is not the City's policy to establish new, ad hoc committees to discuss possible project--specific measures or actions for individual projects. The City relies on the Planning Commission and City Council for this purpose. The City will continue to utilize this established program for decision making."

The FEIR is not posted on the Project webpage but is on the Environmental/Other Projects page ¾ down the page. The link for the FEIR on the e-packet for the 4.13.2023 Planning Commission Agenda is found on a title page as follows: Due to the size of the electronic file, the complete Final EIR, MMRP, SOC and Findings for the South Stockton Commerce Center Project may be viewed at the following weblink: http://www.stocktonca.gov/government/departments/communityDevelop/cdPlanEnv.html. If just copying and pasting the link on the e-packet a 404 error is received and the link only works if a space is removed.

These established programs and policies are inadequate – the Planning Commission and City Council should be apprised of the projects long in advance of decision making. Volunteer Planning Commissioners and residents should not be expected to carry the burden of reading and developing questions and/or comments on over 1600 pages of DEIR, FEIR, and Staff reports in less than a week, if this was the first occasion to learn about the project.

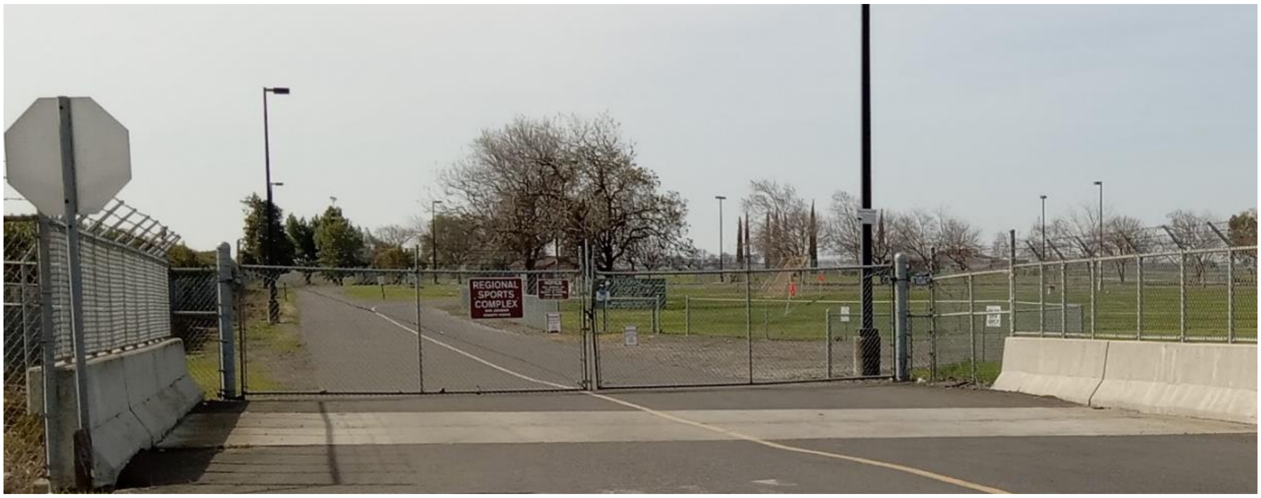
FEIR Comment Responses and Overriding Considerations

The FEIR responded to comments submitted from the following: Blum Collins & Ho, LLP, California Air Resources Board, California Attorney General's Office, Central Valley Regional Water Quality Control Board, San Joaquin County Environmental Health Department, San Joaquin Valley Air Pollution Control District, and Sierra Club, Delta-Sierra Group.

The City noted as a general response for some comments by state regulatory agencies the following: "noted that a lead agency is not required to accept a regulatory agency's recommendation that further studies be undertaken (Gray v. County of Madera (2008) 167 CA4th 1125)." These state agencies are generally far removed from the influence that increased warehousing development has on some city staff viewing warehouse development as a "tax source".

Aesthetics and Visual Resources Significant and Unavoidable Impacts

Compliance with the City's Heritage Tree ordinance is not mitigation. The removal of an orchard to be replaced with Warehouses can be avoided on the east adjacent to the Regional Sports Complex shown below with the planting of vegetative barriers on the fence line and along on the Airport Way. Furthermore according to "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act"[1] planting trees in parking areas to provide at least 35% shade cover of parking areas within fifteen years to reduce heat island impacts is a valid mitigation measure not included in the FEIR. Public amenities like riparian habitat viewing areas can also be incorporated which will enable Stockton residents to connect to nature along our waterways which is healing.



Mitigation Monitoring
The Statement of Overriding Considerations includes: "The City will use the Mitigation Monitoring Program to track compliance with Project mitigation measures." These compliance reports are not available through a public information request as the response from the City on other projects is to direct the requestor to the Mitigation and Monitoring Plan rather than any evidence that mitigation was monitored. There must be more transparency within the City of Stockton and between the residents of Stockton and the Development Community.

Agricultural Land Overriding Considerations
The proposed Project that is discretionary and speculative will result in the permanent loss of 158.6 acres of Prime Farmland and 359.4 acres of Farmland of Statewide Importance and 4.3 acres of Unique Farmland is considered a significant environmental impact. As I indicated in both the NOP and DEIR comments, the City of Stockton Agricultural Land Mitigation Program is not the same as the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan specifically addresses loss of habitat not loss of agricultural activities on agricultural

lands[9]. There are different fees related to habitat potential with a category for agricultural lands established annual by the San Joaquin Council of Governments. I have been informed that the City of Stockton is working on a new NEXIS study but have not seen any drafts, although I frequently request updates. However, I am certain that the current mitigation fee for the City of Stockton Agricultural Land Mitigation Fee is $10.494.00 for the 2022-2023 year[10].

The agricultural land conversion requires both City of Stockton Agricultural Land Mitigation (1:1)[11] and San Joaquin County Habitat Mitigation based on a San Joaquin County Council of Government (SJCOG) biological study to determine mitigation level.

The City of Stockton Agricultural Land Mitigation Fee is collected for all applicable new development projects that would result from the conversion of important farmland, as defined by the California Department of Conservation, into urban uses. All Agricultural Land Mitigation fees collected pursuant to the agreement entered into to avoid litigation in 2008 should be remitted to California Farmland Trust. The California Farmland Trust is the land trust that facilitates the placement of agricultural conservation easements to fulfill farmland mitigation requirements in the Central Valley.

The California Farmland Trust mitigation does not fulfill habitat mitigation required under the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan and the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan mitigation does not mitigate for the loss of agricultural production.

The mitigation monitoring and reporting should include a full disclosure of agricultural land mitigation and should be readily available to the public with annual reports from the California Farmland Trust available as well as a full mitigation fee accounting by project. I have specifically requested that the City of Stockton disclose agricultural mitigation efforts but have yet to receive such a disclosure which should include a financial summary of mitigation fees and project associated conservation easement acreage and locations.

Agricultural land mitigation only ensures that some other agricultural land cannot be easily developed through a conservation easement. Agricultural land mitigation does not create new agricultural land. Once the land is developed it is unlikely ever to return to food or other agricultural-related production.

The proposed CEQA Findings stated that the City's Agricultural Land Mitigation Program requires that projects provide "agricultural mitigation land" on a 1:1 basis for each acre of land converted including administrative costs of approximately $1,000 per acre or pay the established Agricultural Land Mitigation Fee of $12,822.

As stated previously the habitat mitigation fee is not for the purpose of preserving agricultural lands but to ensure that there is some habitat where wildlife can exist. The current SJCOG habitat fee for agricultural type habitat is $19, 255 per acre[12]. Together the mitigation for use

[12] https://www.sjcog.org/DocumentCenter/View/7379/HCP----2023-Fees-and-Endowment

and habitat for April 2023 is $19.255 + $10,494 = $29,749 which constitutes approximately one-half of the current average agricultural land for sale.

Environmental Justice

The California Environmental Quality Act outlines minimum requirements that must be considered before a lead agency approves a project. These minimum requirements do not take into account already overburdened – high poverty areas as stated by the City in the following statement:

> "However, CEQA does not use the terms "fair treatment" or "environmental justice". Rather, CEQA centers on whether a project may have a significant effect on the physical environment, regardless of socioeconomic conditions, including income levels of the residents. For instance, air quality impacts are measured against a threshold established for the region, which is not weighted or modified up or down based on a socioeconomic condition."

SB 1000, requires local government general plans to identify objectives and policies to reduce health risks in disadvantaged communities, promote civil engagement in the public decision making process, and prioritize improvements and programs that address the needs of disadvantaged communities

We know in our community that there are haves and have nots which is perpetuated by the reliance on complaints to garner city attention because our have nots are having to be overly concerned for providing housing, food, energy, and other necessities. Just because CEQA does not require consideration does not mean that, the City cannot employ more sensitivity and enhanced responses for our disadvantaged residents. Is not now the time to fully consider our overburdened residents and develop fair treatment policies that follow the Department of Justice's "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act"[1]?

Finally, as there are other warehousing projects planned for our community, a study session for the Planning Commission and residents should be scheduled as soon as possible so that Commissioners can become familiar with the Department of Justice's "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act"[1] which will be the basis of an ordinance under development by the City of Stockton to be completed by the end of 2023.

SETTLEMENT AGREEMENT AND RELEASE

This Settlement Agreement and Release of All Claims ("Agreement") is entered into by and between the Sierra Club, a California nonprofit public benefit association, the City of Stockton ("City"), a municipal services corporation, and Greenlaw Development, LLC, a California limited liability company ("Developer"), (collectively referred to as "Parties" or singularly "Party"), to terminate fully and finally all disputes concerning the matters set forth below.

RECITALS

WHEREAS, Developer, proposes to develop an approximately 203-acre site in the South Stockton area commonly known as the Mariposa Industrial Park for light industrial land uses (the "Project"). The conceptual site plan proposes construction and operation of 3,616,870 square feet of warehouse and ancillary office uses, approximately 1,831 auto parking spaces, 1,107 truck and trailer parking spaces, and related infrastructure. Developer has applied to the City for the following project approvals: (1) adoption of a Resolution certifying the Mariposa Industrial Park Environmental Impact Report (SCH #2020120283) ("EIR"), including a Statement of Overriding Considerations, and adoption of a Mitigation Monitoring and Reporting Program ("MMRP"); and (2) adoption of an Ordinance for the Pre-zoning of APNs 179-220-10; -11; -12; -13; -16; -17; -18-; 19; and -24 (the "Property") to Industrial, Limited (IL); and (3) adoption an Ordinance for a Development Agreement; and (4) adoption of a Resolution authorizing the filing of an annexation application with the San Joaquin Local Agency Formation Commission (collectively the "Project Approvals"); and

WHEREAS, The Sierra Club and the California Attorney General submitted comments on the EIR requesting that additional air quality and other mitigation measures be included in the EIR and MMRP for the Project and that a fund to mitigate impacts on affected residents be created; and

WHEREAS, the Parties wish to resolve fully and finally all disputes which may exist between the Parties concerning the Project Approvals.

NOW, THEREFORE, based upon the foregoing recitals and the terms, conditions, covenants, and agreements contained above and incorporated in full below, the Parties agree as follows:

AGREEMENT

For good and valuable consideration, the receipt of which is acknowledged by each Party hereto, the Parties promise and agree as follows:

1. If the City approves the Project, and (i) the certified EIR and adopted MMRP include all of the Mitigation Measures in the attached Mariposa Industrial Project Enhanced Measures, and (ii) the authorized Development Agreement includes all of the revised terms in the attached Mariposa Industrial Project Enhanced Measures, then (iii) neither the Sierra Club nor any of its affiliates will file any complaints, claims, grievances, special proceedings or any other actions against the City or Developer with any state,

federal, or local agency or court challenging the Project Approvals or the proposed annexation of the Project site to the City of Stockton. If an affiliate of the Sierra Club is determined to have made a challenge to the Project Approvals or the proposed annexation of the Project site to the City of Stockton in violation of this Section 1, such violation shall constitute a breach of this Agreement by the Sierra Club.

2. The City will draft and consider a comprehensive Warehouse Sustainability Ordinance for future projects that establishes development standards for the construction of industrial warehousing and distribution facilities that exceed 100,000 square feet subject to periodic review for consistency with current regulatory agency recommendations before December 31, 2023. The City may incorporate the addition of warehouse sustainability requirements through its current Development Code revision/update process, provided that the ordinance is considered before December 31, 2023. City staff shall recommend adoption of the ordinance.

3. The City agrees that the Mitigation Measures in the attached Mariposa Industrial Project Enhanced Measures are designed to mitigate potentially significant environmental impacts of warehouse projects. If, prior to adopting the Warehouse Sustainability Ordinance, the City considers approving a project that proposes to develop industrial warehousing or distribution facilities that exceed 100,000 square feet, the City shall include all such applicable measures from the Mariposa Industrial Project Enhanced Measures in any Environmental Impact Report or Mitigated Negative Declaration for the project and consider requiring the project to comply with them.

4. Developer agrees to comply with the attached Mariposa Industrial Project Enhanced Measures and will comply with all applicable City building code requirements.

5. If the City approves the Project, the City will coordinate with the County of San Joaquin to develop and install signage prohibiting non-emergency vehicle access to the project site from Clark Drive or Marfargoa Road. Developer will be responsible for the costs of signage determined to be appropriate by the City and the County.

6. Developer shall pay Sierra Club $34,350 as reimbursement for Sierra Club's attorney's fees and costs incurred in the administrative phase of the Project Approvals. Payment shall be made to the Shute, Mihaly & Weinberger LLP trust account. Developer shall make this payment within ten (10) days of the expiration of the statute of limitations set forth in Section 21167 of the Public Resources Code on actions or proceedings to attack, review, set aside, void, or annul the City of Stockton's determination of CEQA compliance for the Project Approvals, provided that no such action or proceeding has been initiated by the Sierra Club or its affiliates.

7. This Agreement shall be effective and binding upon the Parties only after the execution of both (1) this Agreement by all parties, and (2) the execution of a Memorandum of Understanding between the California Attorney General and the City relating to the City considering an ordinance to establish development standards for industrial warehouse land uses.

8. Miscellaneous.

a. Exclusive Remedies. The Parties' sole and exclusive remedy for breach of this Agreement shall be an action for specific performance or injunction. In no event shall any Party be entitled to monetary damages for breach of this Agreement. In addition, no legal action for specific performance or injunction shall be brought or maintained until: (a) the non-breaching Party provides written notice to the breaching Party which explains with particularity the nature of the claimed breach, and (b) within thirty (30) days after receipt of said notice, the breaching Party fails to cure the claimed breach or, in the case of a claimed breach which cannot be reasonably remedied within a thirty (30) day period, the breaching Party fails to commence to cure the claimed breach within such thirty (30) day period, and thereafter diligently complete the activities reasonably necessary to remedy the claimed breach.

b. All notices and other communications required to be provided pursuant to this Agreement shall be by electronic mail and by first class mail to the following persons at the following addresses:

c. Binding on Successors. The terms, covenants, and conditions of this Agreement shall be binding upon and shall inure to the benefit of the heirs, executors, administrators, successors and assignees of the respective Parties. Developer shall record a copy of this Agreement against the Property. Developer will provide a copy of the recorded Agreement to Sierra Club within fifteen (15) days of such recording. The Parties shall give notice to all other Parties of any successor or assignee to the Party.

d. Non-Admission of Liability. The Parties acknowledge and agree that this Agreement is a settlement of disputed claims. Neither the fact that the Parties have settled nor the terms of this Agreement shall be construed in any manner as an admission of any liability by any Party.

e. Assistance of Counsel. The Parties each specifically represent that they have consulted to their satisfaction with and received independent advice from their respective counsel prior to executing this Agreement concerning the terms and conditions of this Agreement.

f. Waiver. Failure to insist on compliance with any term, covenant or condition contained in this Agreement shall not be deemed a waiver of that term, covenant or condition, nor shall any waiver or relinquishment of any right or power contained in this Agreement at any one time or more times be deemed a waiver or relinquishment of any right or power at any other time or times.

g. Severability. Should any portion, word, clause, phrase, sentence or paragraph of this Agreement be declared void or unenforceable, such portion shall be considered independent and severable from the remainder, the validity of which shall remain unaffected.

h. Governing Law and Venue. This Agreement is made and entered into in the State of California, and shall in all respects be interpreted, enforced and governed under the laws of said State without giving effect to conflicts of laws principles. Any action to enforce, invalidate, or interpret any provision of this Agreement shall be brought in San Joaquin County Superior Court.

i. Entire Agreement. This Agreement constitutes the entire agreement between the Parties who have executed it and supersedes any and all other agreements, understandings, negotiations, or discussions, either oral or in writing, express or implied between the Parties to this Agreement. No representation, inducement, promise, agreement or warranty not contained in this Agreement, including, but not limited to, any purported supplements, modifications, waivers, or terminations of this Agreement shall be valid or binding, unless executed in writing by all of the Parties to this Agreement.

j. Each of the signatories hereto represents and warrants that he or she is competent and authorized to enter into this Agreement on behalf of the Party for whom he or she purports to sign.

k. Counterparts. This Agreement may be executed in multiple counterparts, each of which shall be considered an original but all of which shall constitute on agreement.

[SIGNATURES COMMENCE ON FOLLOWING PAGE]

IN WITNESS WHEREOF, the undersigned execute this Settlement Agreement and Release, and hereby agree to all terms and condition herein, on the dates set forth below.

Attachment (1): Mariposa Industrial Project Enhanced Measures

1585908.7

The Final EIR Mitigation Measures will be revised to include the following:
AMM AIR-1: Solar Power: Owners, operators or tenants shall include with the building permit application, sufficient solar panels to provide power for the operation's base power use at the start of operations and as base power use demand increases. Project sponsor shall include analysis of (a) projected power requirements at the start of operations and as base power demand increases corresponding to the implementation of the "clean fleet" requirements, and (b) generating capacity of the solar installation. AMM AIR -1 (continued): CDD shall verify the size and scope of the solar project based upon the analysis of the projected power requirements and generating capacity as well as the available solar panel installation space. The photovoltaic system shall include a battery storage system to serve the facility in the event of a power outage to the extent required by the 2022 or later California Building Standards Code. AMM AIR -1 (continued): In the event sufficient space is not available on the subject lot to accommodate the needed number of solar panels to produce the operation's base or anticipated power use, the applicant shall demonstrate how all available space has been maximized (e.g., roof, parking areas, etc.). Areas which provide truck movement may be excluded from these calculations unless otherwise deemed acceptable by the supplied reports. AMM AIR -1 (continued): The developer or tenant, or qualified solar provider engaged by the developer or tenant shall timely order all equipment and shall install the system when the City has approved building permits and the necessary equipment has arrived. The developer or tenant shall commence operation of the system when it has received permission to operate from the utility. The photovoltaic system owner shall be responsible for maintaining the system(s) at not less than 80% of the rated power for 20 years. At the end of the 20-year period, the building owner shall install a new photovoltaic system meeting the capacity and operational requirements of this measure, or continue to maintain the existing system, for the life of the project.

EMM AIR-1: Prior to the issuance of the first building permit, the applicant/developer shall demonstrate compliance with the SJVAPCD Rule 9510 (Indirect Source Review) to reduce growth in both NOx and PM10 emissions, as required by SJVAPCD and City requirements.
AMM AIR-1: Architectural Coatings: Construction plans shall require that architectural and industrial maintenance coatings (e.g., paints) applied on the project site shall be consistent with a VOC content of <10 g/L. Developer or tenant is not expected to exercise control over materials painted offsite by a third party.
AMM AIR-3: Construction Worker Trip Reduction: Project construction plans and specifications will require contractor to provide transit and ridesharing information for construction workers.
AMM AIR-2: SJVAPCD Regulation VIII Compliance: Construction plans and specifications shall include a Dust Control Plan incorporating the applicable requirements of Regulation VIII, which shall be submitted to the SJVAPCD for review and approval prior to beginning construction in accordance with the requirements of Regulation VIII.
AMM AIR -2: Emission Standards for Heavy-Duty Trucks: The following mitigation measures shall be implemented during all on-going business operations and shall be included as part of contractual lease agreement language to ensure the tenants/lessees are informed of all on-going operational responsibilities. The property owner/tenant/lessee shall ensure that all heavy-duty trucks (Class 7 and 8) domiciled on the project site are model year 2014 or later from start of operations and shall expedite a transition to zero-emission vehicles, with the fleet fully zero-emission by December 31, 2025 or when commercially available for the intended application, whichever date is later. A zero-emission vehicle shall ordinarily be considered commercially available if the vehicle is capable of serving the intended purpose and is included in California's Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project, https://californiahvip.org/ or listed as available in the US on the Global Commercial Vehicle Drive to Zero inventory,

https://globaldrivetozero.org/. The City shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made, and may (but is not required to) consult with the California Air Resources Board before making such final determination. In order for the City to make a determination that such vehicles are commercially unavailable, the operator must submit documentation from a minimum of three (3) EV dealers identified on the californiahvip.org website demonstrating the inability to obtain the required EVs or equipment needed within 6 months.

"Domiciled at the project site shall mean the vehicle is either (i) parked or kept overnight at the project site more than 70% of the calendar year or (ii) dedicated to the project site (defined as more than 70% of the truck routes (during the calendar year) that start at the project site even if parked or kept elsewhere)

Zero-emission heavy-duty trucks which require service can be temporarily replaced with model year 2014 or later trucks. Replacement trucks shall be used for only the minimum time required for servicing fleet trucks.

AMM AIR-3: Zero Emission Vehicles: The property owner/tenant/lessee shall utilize a "clean fleet" of vehicles/delivery vans/trucks (Class 2 through 6) as part of business operations as follows: For any vehicle (Class 2 through 6) domiciled at the project site, the following "clean fleet" requirements apply: (i) 33% of the fleet will be zero emission vehicles at start of operations, (ii) 65% of the fleet will be zero emission vehicles by December 31, 2023, (iii) 80% of the fleet will be zero emission vehicles by December 31, 2025, and (iv) 100% of thefleet will be zero emission vehicles by December 31, 2027.

"Domiciled at the project site" shall mean the vehicle is either (i) parked or kept overnight at the project site more than 70% of the calendar year or (ii) dedicated to the project site (defined as more than 70% of the truck routes (during the calendar year) that start at the project site even if parked or kept elsewhere).

Zero-emission vehicles which require service can be temporarily replaced with alternate vehicles. Replacement vehicles shall be used for only the minimum time required for servicing fleet vehicles.

The property owner/tenant/lessee shall not be responsible to meet "clean fleet" requirements for vehicles used by common carriers operating under their own authority that provide delivery services to or from the project site.

AMM AIR-4: Demonstrate Compliance with Clean Fleet Requirements: The applicant, property owner, tenant, lessee, or other party operating the facility (the "Operator") shall utilize the zero emission vehicles/trucks required to meet the "clean fleet" requirements in AMM AIR-2 (for Class 7 and 8 vehicles) and AMM AIR-3 (for Class 2 through 6 vehicles) above. Within 30-days of occupancy, the Operator shall demonstrate to the satisfaction of CDD staff, that the applicable clean fleet requirements are being met.

AMM AIR-4 (continued): In the event that vehicles/trucks are not commercially available for the intended application, the "clean fleet requirements" may be adjusted as minimally as possible by the CDD to accommodate the unavailability of commercially available vehicles/trucks.

AMM AIR 4 (continued) The City shall quantify the air pollution and GHG emissions resulting from any modification of this condition. Within 12 months of failing to meet a "clean fleet" requirement the property owner/tenant/lessee shall implement a Voluntary Emissions Reduction Agreement (VERA) providing pound for pound mitigation of the criteria pollutant, toxic air contaminants, and GHG emissions quantified by the City through a process that develops, funds, and implements emission reduction projects, with the Air District serving a role of administrator of the emission reduction projects and verifier of the successful mitigation effort. The VERA shall prioritize projects in the South Stockton and surrounding area. Property owner/tenant/lessee shall continue to fund the VERA each year in an amount necessary to achieve pound for pound mitigation of emissions resulting from not meeting the clean fleet requirements until the owner/tenant/lessee fully complies.

AMM AIR-4 (continued): The Operator shall implement the proposed measures after CDD review and approval. Any extension of time granted to implement this condition shall be limited to the shortest period of time necessary to allow for 100% electrification under the clean fleet requirements. The CDD staff may seek the recommendation of the California Air Resources Board in determining whether there has been a manufacturing disruption or insufficient vehicles/trucks commercially available for the intended application.

AMM AIR-4 (continued): Construction Meal Destinations: Project construction plans and specifications will require the contractor to establish one or more locations for food or catering truck service to construction workers and to cooperate with food service providers to provide consistent food service.

AMM AIR-5: Condition of Approved Compliance Report: The Operator shall submit a condition of approval compliance report within30 days of, but not later than, the following dates: December 31, 2023, December 31, 2025, and December 31, 2027. The report shall outline clean fleet requirements applicable at each report interval and include documentation demonstrating compliance with each requirement. The City shall consider each report at a noticed public hearing and determine whether the Operator has complied with the applicable clean fleet requirements. If the Operator has not met each 100% clean fleet requirement by December 31, 2027, then the Operator shall submit subsequent reports every year until the 100% clean fleet requirement is implemented. The City shall consider each subsequent report at a noticed public hearing and determinewhether the Operator has complied with the clean fleet requirements, including any minimal adjustments to the requirements by the CDD to accommodate the manufacturing disruption or unavailability of commercially available vehicles/trucks, as described in the previous paragraph. Notice of the above hearings shall be provided to all properties located within 1,000 feet of the project site and through the ASK Stockton list serve.

AMM AIR-5 (continued): After the 100% clean fleet requirement has been implemented and confirmed by the CDD, the Operator shall submit to the CDD an on-going compliance report every three years containing all necessary documentation to verify that the Operator is meeting the clean fleet requirements. At the time it confirms that the 100% clean fleet requirement has been implemented, the CDD will establish the due date for the first on-going compliance report. Each subsequent on-going compliance report shall be due within 30 days of, but not later than, the three-year anniversary of the preceding due date. The on-going compliance reports and accompanying documentation shall be made available to the public upon request.

AMM AIR-6: Zero Emission Forklifts, Yard trucks and Yard Equipment: Owners, operators or tenants shall require all forklifts, yard trucks, and other equipment used for on-site movement of trucks, trailers and warehoused goods, as well as landscaping maintenance equipment used on the site, to be electrically powered or zero-emission. The owner, operator or tenant shall provide on-site electrical charging facilities to adequately service electric vehicles and equipment

AMM AIR-7: Truck Idling Restrictions: Owners, operators or tenants shall be required to make their best effort to restrict truck idling onsite to a maximum of three minutes, subject to exceptions defined by CARB in the document: *commercial_vehicle_idling_requirements_July 2016*. Idling restrictions shall be enforced by highly-visible posting at the

site entry, posting at other on-site locations frequented by truck drivers, conspicuous inclusion in employee training and guidance material and owner, operator or tenant direct action as required. AMM AIR-8: Electric Truck Charging: At all times during project operation, owners, operators or tenants shall be required to provide electric charging facilities on the project site sufficient to charge all electric trucks domiciled on the site and such facilities shall be made available for all electric trucks that use the project site. AMM AIR-9: Project Operations, Food Service: Owners, operators or tenants shall establish locations for food or catering truck service and cooperate with food service providers to provide consistent food service to operations employees. AMM AIR-10: Project Operations, Employee Trip Reduction: Owners, operators or tenants shall provide employees transit route and schedule information on systems serving the project area and coordinate ridesharing amongst employees. AMM AIR-11: Yard Sweeping: Owners, operators or tenants shall provide periodic yard and parking area sweeping to minimize dust generation AMM AIR-12: Diesel Generators: Owners, operators or tenants shall prohibit the use of diesel generators, except in emergency situations, in which case such generators shall have Best Available Control Technology (BACT) that meets CARB's Tier 4 emission standards. AMM AIR-13: Truck Emission Control: Owners, operators or tenants shall ensure that trucks or truck fleets domiciled at the project site be model year 2014 or later, and maintained consistent with current CARB emission control regulations. AMM AIR-14: All tenant lease agreements for the project site shall include a provision requiring the tenant/lessee to comply with all applicable requirements of the MMRP, a copy of which shall be attached to each tenant/lease agreement.
AMM AIR-14 (continued): SmartWay: Owners, operators or tenants shall enroll and participate the in SmartWay program for eligible businesses
AMM AIR-15: Designated Smoking Areas: Owners, operators or tenants shall ensure that any outdoor areas allowing smoking are at least 25 feet from the nearest property line.
AMM AIR 16: Project construction shall be subject to all adopted City building codes, including the adopted Green Building Standards Code, version July 2022 or later. Prior to the issuance of building permits, the applicant/developer

shall demonstrate (e.g., provide building plans) that the proposed buildings are designed and will be built to, at a minimum, meet the Nonresidential Voluntary Measures of the California Green Building Standards code, Divisions A5.1, 5.2 and 5.5, including but not limited to the Tier 2 standards in those Divisions, where applicable, such as the Tier 2 advanced energy efficiency requirements as outlined under Section A5.203.1.2.
EMM AG-1: The project shall participate in and comply with the City's Agricultural Lands Mitigation Program, under which developers of the property shall contribute agricultural mitigation land or shall pay the Agricultural Land Mitigation Fee to the City.
The City and Applicant will revise the proposed Development Agreement to provide the following:
In the DA text and in Exhibit B, to clarify that cold storage facilities are prohibited on the site and transport refrigeration units (TRUs) may not enter the site. In the DA text provide that any future proposal to construct cold storage facilities on the site or to allow TRUs to enter the site would require an amendment to the Development Agreement that shall be deemed and processed as a Major Modification to the Development Agreement, an application to the City for a conditional use permit, and be subject to review under the California Environmental Quality Act and Stockton Municipal Code Chapter 16.168.
Section 8.3 of the DA will be revised as follows: **8.3** **<u>Mitigation Measures</u>**. Developer agrees to and shall comply with all applicable mitigation measures attached hereto as Exhibit C and with all applicable mitigation measures in the MIP EIR, as described in the Mitigation Monitoring/Reporting Program approved by the City on ____________, 2023. Developer shall include in all tenant lease agreements for the project site a provision requiring the tenant/lessee to comply with all applicable requirements of the measures in this Section 8.3, a copy of which shall be attached to each to each tenant/lease agreement. Section 10.1 of the DA will be revised as follows: **10.1** **<u>Annual Review</u>**. As required by California Government Code Section 65865.1 and pursuant to Section 16.128.110 of the Development Agreement Ordinance, the City of Stockton Planning Commission shall review

this Agreement and all actions taken pursuant to the terms of this Agreement with respect to the development of the Project every twelve (12) months at a duly-noticed public hearing to determine good faith compliance with this Agreement ("Annual Review"). Specifically, the Annual Review shall be conducted for the purposes of determining good faith compliance with the terms and/or conditions of this Agreement, including compliance with the mitigation measures in Section 8.3 of this Agreement. Each Annual Review shall also document the status of Project development. In the event the Planning Commission recommends modification or termination of this Agreement in connection with such Annual Review, the action to effectuate such modification or termination must be taken by City Council.
In the DA text, to require the City to coordinate with the County to develop and install signage prohibiting non-emergency vehicle access to the project site from Clark Drive or Marfargoa Road. The Applicant will be responsible for the costs of the signage determined to be appropriate by the City and the County.
In the text, to require the following: Construction plans shall include a 10-foot by 65-foot landscaped berm along the 623-lineal foot and 493-lineal foot portions of the west line of the site, located north and south of Marfargoa Road, which will be required by and shown on Exhibit B to the Development Agreement. Landscaping of the berm shall include fast-growing evergreen trees to provide maximum visual screening, as determined by a qualified landscape architect. Construction plans shall also include a 10-foot wall along the 881-lineal foot and 1,316-lineal foot portions of the west line of the site, located north and south of Clark Drive, which will be required by and shown on Exhibit B to the Development Agreement. Construction plans shall also identify a 60-foot "no truck" zone along the entire length of the west line of the site, which will be required by and shown on Exhibit B to the Development Agreement. Construction plans shall also identify and prohibit building construction within a setback area located a minimum of 300 feet from the property line of residential properties along Marfargoa Road and Clark Drive. Notwithstanding the foregoing, the stairwells of ancillary/accessory buildings may encroach into the 300-foot setback area.
In the text, to provide that, prior to the issuance of a grading permit, the Applicant will provide $200,000 to a non-profit organization serving disadvantaged residents of San Joaquin County approved by the City's Community Development Director, to fund a program to reduce exposure to emissions and noise from vehicle and truck traffic and industrial operations, for residents located with within the geographic area bounded by Munford Avenue, Mariposa Road, Little John's Creek and the SR99 Frontage Road. The program may fund or reimburse home air filtration systems, HVAC

modifications, window replacements, weather stripping, or similar improvements; publicly available electric vehicle charging station(s); and/or air quality monitoring censors with publicly available real time data (such as PurpleAir censors).

ROB BONTA
Attorney General

Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act

Table of Contents

In carrying out its duty to enforce laws across California, the California Attorney General's Bureau of Environmental Justice (Bureau)[1] regularly reviews proposed warehouse projects for compliance with the California Environmental Quality Act (CEQA) and other laws. When necessary, the Bureau submits comment letters to lead agencies regarding warehouse projects, and in rare cases the Bureau has filed litigation to enforce CEQA.[2] This document builds upon the Bureau's work on warehouse projects, collecting information gained from the Bureau's review of hundreds of warehouse projects across the state.[3] It is meant to help lead agencies pursue CEQA compliance and promote environmentally-just development as they confront warehouse project proposals.[4] While CEQA analysis is necessarily project-specific, this document provides information on feasible best practices and mitigation measures, nearly all of which have been adapted from actual warehouse projects in California.

I. Background

In recent years, the proliferation of e-commerce and rising consumer expectations of rapid shipping have contributed to a boom in warehouse development.[5] California, with its ports, population centers, and transportation network, has found itself at the center of this trend. In 2020, the Ports of Los Angeles, Long Beach, and Oakland collectively accounted for over 34% of all United States international container trade.[6] The Ports of Los Angeles and Long Beach alone generate about 35,000 container truck trips every day.[7] Accordingly, the South Coast Air Basin now contains approximately 3,000 warehouses of over 100,000 square feet each, with a total warehouse capacity of approximately 700 million square feet, an increase of 20 percent over the last five years.[8] This trend has only accelerated, with e-commerce growing to

13% of all retail sales and 2021 being a second consecutive record year for new warehouse space leased.[9] The latest data and forecasts predict that the next wave of warehouse development will be in the Central Valley.[10]

When done properly, these activities can contribute to the economy and consumer welfare. However, imprudent warehouse development can harm local communities and the environment. Among other pollutants, diesel trucks visiting warehouses emit nitrogen oxide (NO_x)—a primary precursor to smog formation and a significant factor in the development of respiratory problems like asthma, bronchitis, and lung irritation—and diesel particulate matter (a subset of fine particular matter that is smaller than 2.5 micrometers)—a contributor to cancer, heart disease, respiratory illnesses, and premature death.[11] Trucks and on-site loading activities can also be loud, bringing disruptive noise levels during 24/7 operation that can cause hearing damage after prolonged exposure.[12] The hundreds, and sometimes thousands, of daily truck and passenger car trips that warehouses generate contribute to traffic jams, deterioration of road surfaces, and traffic accidents.

These environmental impacts also tend to be concentrated in neighborhoods already suffering from disproportionate health impacts and systemic vulnerability. For example, a comprehensive study by the South Coast Air Quality Management District found that communities located near large warehouses scored far higher on California's environmental justice screening tool, which measures overall pollution and demographic vulnerability.[13] That

study concluded that, compared to the South Coast Air Basin averages, communities in the South Coast Air Basin near large warehouses had a substantially higher proportion of people of color; were exposed to more diesel particulate matter; had higher rates of asthma, cardiovascular disease, and low birth weights; and had higher poverty and unemployment rates.[14] Each area has its own unique history, but many of these impacts and vulnerabilities reflect historic redlining practices in these communities, which devalued land and concentrated poverty, racial outgroups, and pollution into designated areas.[15]

II. Proactive Planning: General Plans, Local Ordinances, and Good Neighbor Policies

To systematically guide warehouse development, we encourage local governing bodies to proactively plan for logistics projects in their jurisdictions. Proactive planning allows jurisdictions to prevent land use conflicts before they materialize and direct sustainable development. Benefits also include providing a predictable business environment, protecting residents from environmental harm, and setting consistent expectations jurisdiction-wide.

Proactive planning can take many forms. Land use designation and zoning decisions should channel development into appropriate areas. For example, establishing industrial districts near major highway and rail corridors but away from sensitive receptors[16] can help attract investment while avoiding conflicts between warehouse facilities and residential communities. Transition zones with lighter industrial and commercial land uses may also help minimize conflicts between residential and industrial uses.

In addition, general plan policies, local ordinances, and good neighbor policies should set minimum standards for logistics projects. General plan policies can be incorporated into existing economic development, land use, circulation, or other related general plan elements. Many jurisdictions alternatively choose to consolidate policies in a separate environmental justice element. Adopting general plan policies to guide warehouse development may also help

---

[14] *Id*. at 5-7.

[15] Beginning in the 1930s, federal housing policy directed investment away from Black, immigrant, and working-class communities by color-coding neighborhoods according to the purported "riskiness" of loaning to their residents. In California cities where such "redlining" maps were drawn, nearly all of the communities where warehouses are now concentrated were formerly coded "red," signifying the least desirable areas where investment was to be avoided. *See* University of Richmond Digital Scholarship Lab, Mapping Inequality, https://dsl.richmond.edu/panorama/redlining/#loc=12/33.748/-118.272&city=los-angeles-ca (Los Angeles), https://dsl.richmond.edu/panorama/redlining/#loc=13/32.685/-117.132&city=san-diego-ca (San Diego), https://dsl.richmond.edu/panorama/redlining/#loc=11/37.81/-122.38&city=oakland-ca (Oakland), https://dsl.richmond.edu/panorama/redlining/#loc=13/37.956/-121.326&city=stockton-ca (Stockton), https://dsl.richmond.edu/panorama/redlining/#loc=12/36.751/-119.86&city=fresno-ca (Fresno) (all last accessed September 18, 2022).

[16] In this document, "sensitive receptors" refers to residences, schools, public recreation facilities, health care facilities, places of worship, daycare facilities, community centers, or incarceration facilities.

jurisdictions comply with their obligations under SB 1000, which requires local government general plans to identify objectives and policies to reduce health risks in disadvantaged communities, promote civil engagement in the public decision making process, and prioritize improvements and programs that address the needs of disadvantaged communities.[17]

Local ordinances and good neighbor policies that set development standards for all warehouses in the jurisdiction are a critical and increasingly common tool that serve several goals. When well-designed, these ordinances direct investment to local improvements, provide predictability for developers, conserve government resources by streamlining project review processes, and reduce the environmental impacts of industrial development. While many jurisdictions have adopted warehouse-specific development standards, an ordinance in the City of Fontana provides an example to review and build upon.[18] Good neighbor policies in Riverside County and by the Western Riverside Council of Government include additional measures worth consideration.[19]

The Bureau encourages jurisdictions to adopt their own local ordinances that combine the strongest policies from those models with measures discussed in the remainder of this document.

III. Community Engagement

Early and consistent community engagement is central to establishing good relationships between communities, lead agencies, and warehouse developers and tenants. Robust community engagement can give lead agencies access to community residents' on-the-ground knowledge and information about their concerns, build community support for projects, and develop creative solutions to ensure new logistics facilities are mutually beneficial. Examples of best practices for community engagement include:

- Holding a series of community meetings at times and locations convenient to members of the affected community and incorporating suggestions into the project design.
- Posting information in hard copy in public gathering spaces and on a website about the project. The information should include a complete, accurate project description, maps and drawings of the project design, and information about how the public can provide input and be involved in the project approval process. The

[17] For more information about SB 1000, *see* https://oag.ca.gov/environment/sb1000.
[18] https://oag.ca.gov/system/files/attachments/press-docs/Final%20Signed%20Fontana%20Ordinance.pdf (last accessed September 18, 2022).
[19] For example, the Riverside County policy requires community benefits agreements and supplemental funding contributions toward additional pollution offsets, and the Western Riverside Council of Governments policy sets a minimum buffer zone of 300 meters between warehouses and sensitive receptors. https://www.rivcocob.org/wp-content/uploads/2020/01/Good-Neighbor-Policy-F-3-Final-Adopted.pdf (last accessed September 18, 2022) (Riverside County); http://www.wrcog.cog.ca.us/DocumentCenter/View/318/Good-Neighbor-Guidelines-for-Siting-Warehouse-Distribution-Facilities-PDF?bidId= (last accessed September 18, 2022) (Western Riverside Council of Governments).

information should be in a format that is easy to navigate and understand for members of the affected community.

- Providing notice by mail to residents and schools within a certain radius of the project and along transportation corridors to be used by vehicles visiting the project, and by posting a prominent sign on the project site. The notice should include a brief project description and directions for accessing complete information about the project and for providing input on the project.
- Providing translation or interpretation in residents' native language, where appropriate.
- For public meetings broadcast online or otherwise held remotely, providing for access and public comment by telephone and supplying instructions for access and public comment with ample lead time prior to the meeting.
- Partnering with local community-based organizations to solicit feedback, leverage local networks, co-host meetings, and build support.
- Considering adoption of a community benefits agreement, negotiated with input from affected residents and businesses, by which the developer provides benefits to the affected community.
- Creating a community advisory board made up of local residents to review and provide feedback on project proposals in early planning stages.
- Identifying a person to act as a community liaison concerning on-site construction activity and operations, and providing contact information for the community liaison to the surrounding community.
- Requiring signage in public view at warehouse facilities with contact information for a local designated representative for the facility operator who can receive community complaints, and requiring any complaints to be answered by the facility operator within 48 hours of receipt.

IV. Warehouse Siting and Design Considerations

The most important consideration when planning a logistics facility is its location. Warehouses located in residential neighborhoods or near sensitive receptors expose community residents and those using or visiting sensitive receptor sites to the air pollution, noise, traffic, and other environmental impacts they generate. Therefore, placing facilities away from sensitive receptors significantly reduces their environmental and quality of life harms on local communities. The suggested best practices for siting and design of warehouse facilities does not relieve lead agencies' responsibility under CEQA to conduct a project-specific analysis of the project's impacts and evaluation of feasible mitigation measures and alternatives; lead agencies' incorporation of the best practices must be part of the impact, mitigation and alternatives analyses to meet the requirements of CEQA. Examples of best practices when siting and designing warehouse facilities include:

- Per California Air Resources Board (CARB) guidance, siting warehouse facilities so that their property lines are at least 1,000 feet from the property lines of the nearest sensitive receptors.[20]
- Providing adequate amounts of on-site parking to prevent trucks and other vehicles from parking or idling on public streets and to reduce demand for off-site truck yards.
- Establishing setbacks from the property line of the nearest sensitive receptor to warehouse dock doors, loading areas, and truck drive aisles, and locating warehouse dock doors, loading areas, and truck drive aisles on the opposite side of the building from the nearest sensitive receptors—e.g., placing dock doors on the north side of the facility if sensitive receptors are near the south side of the facility.
- Placing facility entry and exit points from the public street away from sensitive receptors—e.g., placing these points on the north side of the facility if sensitive receptors are adjacent to the south side of the facility.
- Ensuring heavy duty trucks abide by the on-site circulation plans by constructing physical barriers to block those trucks from using areas of the project site restricted to light duty vehicles or emergency vehicles only.
- Preventing truck queuing spillover onto surrounding streets by positioning entry gates after a minimum of 140 feet of space for queuing, and increasing the distance by 70 feet for every 20 loading docks beyond 50 docks.
- Locating facility entry and exit points on streets of higher commercial classification that are designed to accommodate heavy duty truck usage.
- Screening the warehouse site perimeter and onsite areas with significant truck traffic (e.g., dock doors and drive aisles) by creating physical, structural, and/or vegetative buffers that prevent or substantially reduce pollutant and noise dispersion from the facility to sensitive receptors.
- Planting exclusively 36-inch box evergreen trees to ensure faster maturity and four-season foliage.
- Requiring all property owners and successors in interest to maintain onsite trees and vegetation for the duration of ownership, including replacing any dead or unhealthy trees and vegetation.
- Posting signs clearly showing the designated entry and exit points from the public street for trucks and service vehicles.
- Including signs and drive aisle pavement markings that clearly identify onsite circulation patterns to minimize unnecessary onsite vehicle travel.
- Posting signs indicating that all parking and maintenance of trucks must be conducted within designated on-site areas and not within the surrounding community or public streets.

[20] CARB, Air Quality and Land Use Handbook: A Community Health Perspective (April 2005), at ES-1. CARB staff has released draft updates to this siting and design guidance which suggests a greater distance may be warranted in some scenarios. CARB, Concept Paper for the Freight Handbook (December 2019), *available at* https://ww2.arb.ca.gov/sites/default/files/2020-03/2019.12.12%20-%20Concept%20Paper%20for%20the%20Freight%20Handbook_1.pdf (last accessed September 18, 2022).

V. Air Quality and Greenhouse Gas Emissions Analysis and Mitigation

Emissions of air pollutants and greenhouse gases are often among the most substantial environmental impacts from new warehouse facilities. CEQA compliance demands a proper accounting of the full air quality and greenhouse gas impacts of logistics facilities and adoption of all feasible mitigation of significant impacts. Although efforts by CARB and other authorities to regulate the heavy-duty truck and off-road diesel fleets have made excellent progress in reducing the air quality impacts of logistics facilities, the opportunity remains for local jurisdictions to further mitigate these impacts at the project level. Lead agencies and developers should also consider designing projects with their long-term viability in mind. Constructing the necessary infrastructure to prepare for the zero-emission future of goods movement not only reduces a facility's emissions and local impact now, but it can also save money as demand for zero-emission infrastructure grows. In planning new logistics facilities, the Bureau strongly encourages developers to consider the local, statewide, and global impacts of their projects' emissions.

Examples of best practices when studying air quality and greenhouse gas impacts include:

- Fully analyzing all reasonably foreseeable project impacts, including cumulative impacts. In general, new warehouse developments are not ministerial under CEQA because they involve public officials' personal judgment as to the wisdom or manner of carrying out the project, even when warehouses are permitted by a site's applicable zoning and/or general plan land use designation.[21]
- When analyzing cumulative impacts, thoroughly considering the project's incremental impact in combination with past, present, and reasonably foreseeable future projects, even if the project's individual impacts alone do not exceed the applicable significance thresholds.
- Preparing a quantitative air quality study in accordance with local air district guidelines.
- Preparing a quantitative health risk assessment in accordance with California Office of Environmental Health Hazard Assessment and local air district guidelines.
- Refraining from labeling compliance with CARB or air district regulations as a mitigation measure—compliance with applicable regulations is required regardless of CEQA.
- Disclosing air pollution from the entire expected length of truck trips. CEQA requires full public disclosure of a project's anticipated truck trips, which entails calculating truck trip length based on likely truck trip destinations, rather than the distance from the facility to the edge of the air basin, local jurisdiction, or other truncated endpoint. All air pollution associated with the project must be considered, regardless of where those impacts occur.

[21] CEQA Guidelines § 15369.

- Accounting for all reasonably foreseeable greenhouse gas emissions from the project, without discounting projected emissions based on participation in California's Cap-and-Trade Program.

Examples of measures to mitigate air quality and greenhouse gas impacts from construction are below. To ensure mitigation measures are enforceable and effective, they should be imposed as permit conditions on the project where applicable.

- Requiring off-road construction equipment to be hybrid electric-diesel or zero-emission, where available, and all diesel-fueled off-road construction equipment to be equipped with CARB Tier IV-compliant engines or better, and including this requirement in applicable bid documents, purchase orders, and contracts, with successful contractors demonstrating the ability to supply the compliant construction equipment for use prior to any ground-disturbing and construction activities.
- Prohibiting off-road diesel-powered equipment from being in the "on" position for more than 10 hours per day.
- Using electric-powered hand tools, forklifts, and pressure washers, and providing electrical hook ups to the power grid rather than use of diesel-fueled generators to supply their power.
- Designating an area in the construction site where electric-powered construction vehicles and equipment can charge.
- Limiting the amount of daily grading disturbance area.
- Prohibiting grading on days with an Air Quality Index forecast of greater than 100 for particulates or ozone for the project area.
- Forbidding idling of heavy equipment for more than three minutes.
- Keeping onsite and furnishing to the lead agency or other regulators upon request, all equipment maintenance records and data sheets, including design specifications and emission control tier classifications.
- Conducting an on-site inspection to verify compliance with construction mitigation and to identify other opportunities to further reduce construction impacts.
- Using paints, architectural coatings, and industrial maintenance coatings that have volatile organic compound levels of less than 10 g/L.
- Providing information on transit and ridesharing programs and services to construction employees.
- Providing meal options onsite or shuttles between the facility and nearby meal destinations for construction employees.

Examples of measures to mitigate air quality and greenhouse gas impacts from operation include:

- Requiring all heavy-duty vehicles engaged in drayage[22] to or from the project site to be zero-emission beginning in 2030.

[22] "Drayage" refers generally to transport of cargo to or from a seaport or intermodal railyard.

- Requiring all on-site motorized operational equipment, such as forklifts and yard trucks, to be zero-emission with the necessary charging or fueling stations provided.
- Requiring tenants to use zero-emission light- and medium-duty vehicles as part of business operations.
- Forbidding trucks from idling for more than three minutes and requiring operators to turn off engines when not in use.
- Posting both interior- and exterior-facing signs, including signs directed at all dock and delivery areas, identifying idling restrictions and contact information to report violations to CARB, the local air district, and the building manager.
- Installing solar photovoltaic systems on the project site of a specified electrical generation capacity that is equal to or greater than the building's projected energy needs, including all electrical chargers.
- Designing all project building roofs to accommodate the maximum future coverage of solar panels and installing the maximum solar power generation capacity feasible.
- Constructing zero-emission truck charging/fueling stations proportional to the number of dock doors at the project.
- Running conduit to designated locations for future electric truck charging stations.
- Unless the owner of the facility records a covenant on the title of the underlying property ensuring that the property cannot be used to provide refrigerated warehouse space, constructing electric plugs for electric transport refrigeration units at every dock door and requiring truck operators with transport refrigeration units to use the electric plugs when at loading docks.
- Oversizing electrical rooms by 25 percent or providing a secondary electrical room to accommodate future expansion of electric vehicle charging capability.
- Constructing and maintaining electric light-duty vehicle charging stations proportional to the number of employee parking spaces (for example, requiring at least 10% of all employee parking spaces to be equipped with electric vehicle charging stations of at least Level 2 charging performance)
- Running conduit to an additional proportion of employee parking spaces for a future increase in the number of electric light-duty charging stations.
- Installing and maintaining, at the manufacturer's recommended maintenance intervals, air filtration systems at sensitive receptors within a certain radius of facility for the life of the project.
- Installing and maintaining, at the manufacturer's recommended maintenance intervals, an air monitoring station proximate to sensitive receptors and the facility for the life of the project, and making the resulting data publicly available in real time. While air monitoring does not mitigate the air quality or greenhouse gas impacts of a facility, it nonetheless benefits the affected community by providing information that can be used to improve air quality or avoid exposure to unhealthy air.
- Requiring all stand-by emergency generators to be powered by a non-diesel fuel.
- Requiring facility operators to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of

trucks.
- Requiring operators to establish and promote a rideshare program that discourages single-occupancy vehicle trips and provides financial incentives for alternate modes of transportation, including carpooling, public transit, and biking.
- Meeting CalGreen Tier 2 green building standards, including all provisions related to designated parking for clean air vehicles, electric vehicle charging, and bicycle parking.
- Designing to LEED green building certification standards.
- Providing meal options onsite or shuttles between the facility and nearby meal destinations.
- Posting signs at every truck exit driveway providing directional information to the truck route.
- Improving and maintaining vegetation and tree canopy for residents in and around the project area.
- Requiring that every tenant train its staff in charge of keeping vehicle records in diesel technologies and compliance with CARB regulations, by attending CARB-approved courses. Also require facility operators to maintain records on-site demonstrating compliance and make records available for inspection by the local jurisdiction, air district, and state upon request.
- Requiring tenants to enroll in the United States Environmental Protection Agency's SmartWay program, and requiring tenants who own, operate, or hire trucking carriers with more than 100 trucks to use carriers that are SmartWay carriers.
- Providing tenants with information on incentive programs, such as the Carl Moyer Program and Voucher Incentive Program, to upgrade their fleets.

VI. Noise Impacts Analysis and Mitigation

The noise associated with logistics facilities can be among their most intrusive impacts to nearby sensitive receptors. Various sources, such as unloading activity, diesel truck movement, and rooftop air conditioning units, can contribute substantial noise pollution. These impacts are exacerbated by logistics facilities' typical 24-hour, seven-days-per-week operation. Construction noise is often even greater than operational noise, so if a project site is near sensitive receptors, developers and lead agencies should adopt measures to reduce the noise generated by both construction and operation activities.

Examples of best practices when studying noise impacts include:

- Preparing a noise impact analysis that considers all reasonably foreseeable project noise impacts, including to nearby sensitive receptors. All reasonably foreseeable project noise impacts encompasses noise from both construction and operations, including stationary, on-site, and off-site noise sources.
- Adopting a lower significance threshold for incremental noise increases when baseline noise already exceeds total noise significance thresholds, to account for the cumulative impact of additional noise and the fact that, as noise moves up the decibel scale, each decibel increase is a progressively greater increase in sound

pressure than the last. For example, 70 dBA is ten times more sound pressure than 60 dBA.

- Disclosing and considering the significance of short-term noise levels associated with all aspects of project operation (i.e. both on-site noise generation and off-site truck noise). Considering only average noise levels may mask noise impacts sensitive receptors would consider significant—for example, the repeated but short-lived passing of individual trucks or loading activities at night.

Examples of measures to mitigate noise impacts include:

- Constructing physical, structural, or vegetative noise barriers on and/or off the project site.
- Planning and enforcing truck routes that avoid passing sensitive receptors.
- Locating or parking all stationary construction equipment as far from sensitive receptors as possible, and directing emitted noise away from sensitive receptors.
- Verifying that construction equipment has properly operating and maintained mufflers.
- Requiring all combustion-powered construction equipment to be surrounded by a noise protection barrier
- Limiting operation hours to daytime hours on weekdays.
- Paving roads where truck traffic is anticipated with low noise asphalt.
- Orienting any public address systems onsite away from sensitive receptors and setting system volume at a level not readily audible past the property line.

VII. Traffic Impacts Analysis and Mitigation

Warehouse facilities inevitably bring truck and passenger car traffic. Truck traffic can present substantial safety issues. Collisions with heavy-duty trucks are especially dangerous for passenger cars, motorcycles, bicycles, and pedestrians. These concerns can be even greater if truck traffic passes through residential areas, school zones, or other places where pedestrians are common and extra caution is warranted.

Examples of measures to mitigate traffic impacts include:

- Designing, clearly marking, and enforcing truck routes that keep trucks out of residential neighborhoods and away from other sensitive receptors.
- Installing signs in residential areas noting that truck and employee parking is prohibited.
- Requiring preparation and approval of a truck routing plan describing the facility's hours of operation, types of items to be stored, and truck routing to and from the facility to designated truck routes that avoids passing sensitive receptors. The plan should include measures for preventing truck queuing, circling, stopping, and parking on public streets, such as signage, pavement markings, and queuing analysis and enforcement. The plan should hold facility operators responsible for violations of the truck routing plan, and a revised plan should be required from any new tenant that occupies the property before a business license

is issued. The approving agency should retain discretion to determine if changes to the plan are necessary, including any additional measures to alleviate truck routing and parking issues that may arise during the life of the facility.

- Constructing new or improved transit stops, sidewalks, bicycle lanes, and crosswalks, with special attention to ensuring safe routes to schools.
- Consulting with the local public transit agency and securing increased public transit service to the project area.
- Designating areas for employee pickup and drop-off.
- Implementing traffic control and safety measures, such as speed bumps, speed limits, or new traffic signs or signals.
- Placing facility entry and exit points on major streets that do not have adjacent sensitive receptors.
- Restricting the turns trucks can make entering and exiting the facility to route trucks away from sensitive receptors.
- Constructing roadway improvements to improve traffic flow.
- Preparing a construction traffic control plan prior to grading, detailing the locations of equipment staging areas, material stockpiles, proposed road closures, and hours of construction operations, and designing the plan to minimize impacts to roads frequented by passenger cars, pedestrians, bicyclists, and other non-truck traffic.

VIII. Other Significant Environmental Impacts Analysis and Mitigation

Warehouse projects may result in significant environmental impacts to other resources, such as to aesthetics, cultural resources, energy, geology, or hazardous materials. All significant adverse environmental impacts must be evaluated, disclosed and mitigated to the extent feasible under CEQA. Examples of best practices and mitigation measures to reduce environmental impacts that do not fall under any of the above categories include:

- Appointing a compliance officer who is responsible for implementing all mitigation measures, and providing contact information for the compliance officer to the lead agency, to be updated annually.
- Creating a fund to mitigate impacts on affected residents, schools, places of worship, and other community institutions by retrofitting their property. For example, retaining a contractor to retrofit/install HVAC and/or air filtration systems, doors, dual-paned windows, and sound- and vibration-deadening insulation and curtains.
- Sweeping surrounding streets on a daily basis during construction to remove any construction-related debris and dirt.
- Directing all lighting at the facility into the interior of the site.
- Using full cut-off light shields and/or anti-glare lighting.
- Requiring submission of a property maintenance program for agency review and approval providing for the regular maintenance of all building structures, landscaping, and paved surfaces.
- Using cool pavement to reduce heat island effects.

- Planting trees in parking areas to provide at least 35% shade cover of parking areas within fifteen years to reduce heat island impacts.
- Using light colored roofing materials with a solar reflective index of 78 or greater.
- Including on-site amenities, such as a truck operator lounge with restrooms, vending machines, and air conditioning, to reduce the need for truck operators to idle or travel offsite.
- Designing skylights to provide natural light to interior worker areas.
- Installing climate control and air filtration in the warehouse facility to promote worker well-being.

IX. Conclusion

California's world-class economy, ports, and transportation network position it at the center of the e-commerce and logistics industry boom. At the same time, California is a global leader in environmental protection and environmentally just development. The guidance in this document furthers these dual strengths, ensuring that all can access the benefits of economic development. The Bureau will continue to monitor proposed projects for compliance with CEQA and other laws. Lead agencies, developers, community advocates, and other interested parties should feel free to reach out to us as they consider how to guide warehouse development in their area.

Please do not hesitate to contact the Environmental Justice Bureau at ej@doj.ca.gov if you have any questions.

Re: Evaluation of the Industrial Warehouse Ordinance No. 2023-12-12-1602 and Amendments Proposed 5.9.2024 Agenda Item 5.1 24-0349

These amendments and the adopted Industrial Warehouse Ordinance fail to fully mitigate potential impacts to those disadvantaged communities within the City of Stockton, as the warehousing neither provides high paying jobs to provide a range of employment options, and negatively impacts the community, such as through increased exposure to pollutants. All the warehousing projects approved or in progress require some infrastructure improvements that are not solely paid for by developers. These City funding commitments are made when other investments of public money are not prioritized to provide infrastructure improvements that improve quality of life in disadvantaged communities. The recommendation by the Planning Commission and subsequent Industrial Warehouse Ordinance adoption by the City Council included requirements and allowances that were approved and supported by warehousing developers, while the requirements and allowances put forth by the affected disadvantaged communities and supporters were ignored. The 2040 General Plan was thought to elevate disadvantaged communities' concerns, but these goals, policies, and actions have not materialized during this process.

GOAL LU-6: EFFECTIVE PLANNING: Provide for orderly, well-planned, and balanced development.
POLICY LU-6.1 Carefully plan for future development and proactively mitigate potential impacts.

GOAL SAF-4:CLEAN AIR: Improve local Air quality.
POLICY SAF-4.1 Reduce Air impacts from mobile and stationary sources of Air pollution.

GOAL CH-2 RESTORED COMMUNITIES: Restore disadvantaged communities to help them become more vibrant and cohesive neighborhoods with high-quality affordable housing, a range of employment options, enhanced social and health services, and active public spaces.
Action CH-2.1A When considering parks and infrastructure maintenance and improvement projects, consider the following through an open and engaging process inclusive of community residents:

- Whether the affected community is underserved or disadvantaged
- What the priority needs of the community are and whether the project would address those needs.
- Whether the project would negatively impact the community, such as through increased exposure to pollutants or displacement of residents or local businesses.

Action CH-2.3A Build strong ties with disadvantaged communities to ensure that local residents can make significant contributions to planning decisions through the following:

- Use culturally appropriate approaches.
- Consider the convenience of the timing and locations of meetings to community members.
- Use social media and other communication techniques for those without time to attend public meetings.
- Provide translation services and translated materials when needed.
- Partner with non-profit organizations who are already active within the community.

The Zoning Update webpage developed for the Industrial Warehouse Ordinance gives members of the public the notion that as of 5.9.2024 there is no firm date for the Planning Commission Hearing which is scheduled 5.9.2024.[1]

Upcoming Meetings

- **Thursday March 28, 2024,** Planning Commission Informational Workshop (Informational Materials)
- (**Tentative May 2024**) Planning Commission Hearing for consideration of proposed Amendment.
- (**Tentative July 2024**) City Council Hearing for consideration of proposed Amendment.

---

[1] City of Stockton webpage. https://www.stocktonca.gov/business/planning___engineering/zoning/zoning_update.php

The practice of not updating webpages for which disadvantaged communities have expressed interest and expressed concerns does not lead to conditions that create strong ties to ensure that local residents can make significant contributions to planning decisions.

At the time the City of Stockton adopted preferred Industrial Warehouse Ordinance language, 12.12.2023, the City Council selected language supported by the warehouse development community, despite verbal and written pleas by community representatives on 12.5.2023[2] and 12.12.2023[3] for more restrictive language. The City Council further voted to direct the Community Development Department to explore six specific modifications and feasibility analyses to change the, just then adopted, Industrial Warehouse Ordinance. The 12.12.2023 Shute Mihaly and Weinberger correspondence submitted on behalf of the Delta-Sierra Group evaluated the feasibility analyses associated with the proposed ordinance options and found significant concerns which were expressed therein.[3] These six modifying amendments under consideration are summarized on Zoning Update City of Stockton website and materials contained in the 5.9.2024 Planning Commission:

- Modification #1: Increase Warehouse Size for Ordinance Applicability (Chamber of Commerce / San Joaquin Partnership). Change Ordinance to apply on warehouses 400,000 square feet and greater, instead of 100,000 square feet and greater (SMC Section 16.80.390(A)).
- Modification #2: Applicability for new logistic warehouses (Hollman LLC). Change Ordinance to apply to annexation projects submitted after December 31, 2023 (SMC Section 16.80.390(A)).
- Modification #3: Change Minimum Setback Requirements (Stockton Environmental Justice Advocates (SEJA)). Adjustments to setback standards (SMC Section 16.80.390(B)(1)(a)).
- Modification #4: Clarification on Solar Installation Process (SEJA). Clarification for solar installation (SMC Section16.80.390(B)(2)(f))
- Modification #5: Additional Electric Vehicle (EV) Charging Facilities (SEJA). Adjustments to truck charging requirements (SMC Section 16.80.390(B)(1)(k)).
- Modification #6: Additional Electric Vehicle (EV) Charging Facilities (SEJA). Adjustments to automobile charging requirements (SMC Section 16.80.390(B)(1)(l)).

A feasibility analysis was included in agenda materials which did not include answers to question posed during public meeting as will be noted under the applicable proposed modifications nor did the feasibility analysis address costs associated with environmental harm, including public health and welfare.[4]

Warehouse Size

The ordinance should apply to warehouses 100,000 square feet or greater NOT 400,000 square feet and greater. Documentation exists that warehouses 100,000 square feet or greater contribute to impacted air quality affecting public health.[5] The California Air Resources Board (CARB) commented on the health risk and air quality analyses performed in the Mariposa DEIR.[6] CARB stated that "according to the Fontana Truck Trip Generation Study, 20.4 percent of the total daily vehicle trips from a warehouse greater than 100,000 square feet (heavy warehouse) would consist of trucks." The study was based on 34 different sites and referenced in the CARB comment letter.[7]

The City responded in the Mariposa FEIR:

> "The correct CalEEMod run was based on a fleet mix that included approximately 10.7% heavy-heavy duty vehicles and 5.5% medium heavy duty vehicles; this was another adjustment made to the CalEEMod defaults to increase the accuracy and provide for adequately conservative results."
>
> "The Fontana study predicted different and higher truck trip percentages than did the Mariposa Industrial Park DEIR. For the purposes of the Mariposa Industrial project, this information cannot credibly be labeled "substantial evidence.' The data is derived from studies for a single project located in an entirely different geographic area. While the Fontana data may be useful and representative of projects in the San Bernardino and Riverside areas of Southern California, its applicability in rural northern California, an entirely different socio-economic area, cannot be assumed. No such study has been performed in the Stockton area, and in the absence of such data, the CalEEMod default values as modified by the consulting firm responsible for the project traffic studies, are considered by the City to be the best available and most reliable data."

The City of Stockton can hardly be considered rural as the City is the twelfth most populated city right after Riverside, the eleventh most populated city.[8] The City still does not have evidence that warehouses 100,000 do not pose a threat to human health and the environment, has not reviewed the Fontana Study since the study was based on 34 different sites not one, nor has the City considered in whole the comments by CARB, a responsible agency. During public meetings, residents requested information about the number of warehouses between 100,000 and 400,000 square feet. The same information presented in March was included in the feasibility analysis: "Since 2016, 37 building permits have been approved for new warehouses 100,000 square feet or greater (average size ±420,000 square feet) and the last 10 entitled logistics projects in Stockton measured an average total size range of 700,000 square feet to 1,000,000 square feet." The land acreage associated with these 37 building permits was not disclosed nor considered.

Without a doubt, the scope of warehousing and associated environmental impacts have escalated with every Statement of Overriding Consideration the City of Stockton issues, without requiring all feasible mitigation, and contributing to degraded air quality. Further studies conducted have indicated that frequently truck trips are more than estimated within CEQA document.[9] The South Coast Air Quality Management District continued evaluating truck trip impacts associated with warehouse projects and proposed Rule 2305 – Warehouse Indirect Source Rule, Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and PR 316 – Fees for Rule 2305. This Indirect Source Rule would not only regulate new 100,000 square feet warehouses but existing warehouses, applying to operators and owners of existing and new warehouses. This rule has been proposed for approval by the United States Environmental Protection Agency and is in the approval process.[10] By 7.14.2024, the EPA Administrator is required to sign a notice of final rulemaking to approve, disapprove, conditionally approve, or approve in part and disapprove in part, the SIP submittal from California entitled South Coast Air Quality Management District Rule 2305, Warehouse Indirect Source Rule—Warehouse Actions and Investments to Reduce Emissions Program, based on a January 2024 proposed consent decree.[11]

Significant air quality impacts are associated with warehouses of 100,000 square feet as evidenced through studies and rule-making processes. The City of Stockton 2040 General Plan goal to improve local air quality by reducing air impacts from mobile and stationary sources of air pollution does not support allowing warehouse projects between 100,000 – 400,000 square feet to conduct business as usual without the added public health benefits that the Industrial Warehouse Ordinance is meant to achieve.

Ordinance Applicability

Staff identified Stockton Municipal Code Section 16.04.050 that already regulates project applicability and "vested" rights of completed applications when new Code standards are adopted. If the proposed modification is adopted then the Industrial Warehouse Ordinance would not apply to new logistic warehouse facilities constructed on vacant properties that were located within the Stockton city limits prior to December 31, 2023, and would only apply towards future warehouse logistics development projects that were not currently in the Stockton city limits as of December 31, 2023.

The inclusion of the additional "vesting" option proposed by Modification #2: Applicability for new logistic warehouses (Hollman LLC) would reduce the City's use of the standards to just future annexation projects that meet the size thresholds. The feasibility analysis indicated that annexation of boundary farmland is to be avoided, yet if the benefit of the Ordinance is to be achieved, proposed modification must be rejected.

The City of Stockton's practice of continuing to do business as usual has created the environmental justice and environmental health harms experienced by those providing testimony to the City Council when the Industrial Warehouse Ordinance was considered on 12.5.2023 and 12.12.2023. Environmental justice and environmental health harms experienced by those providing testimony to the Planning Commission on 3.28.2024 indicate that community support for improved public health considerations and environmental justice considerations are warranted.[12]

The effective date of Industrial Warehouse Ordinance was January 11, 2024, and any project not already vested with entitlements and permitting applications MUST abide by the provisions of the Industrial Warehouse Ordinance, at a minimum. **Put residents' health and welfare concerns over those of an unknown number of speculative developers and do not adopt the proposed modification.**

Minimum Setback Requirements

The setback distances and uses are inconsistent with the adopted 2040 City of Stockton General Plan. The new Industrial Warehouse Development Standards adopted December 12, 2023, and effective January 11, 2024:

- **a.** Unless determined to be physically impossible, when adjacent to sensitive receptors, a loading dock door shall be oriented away from the sensitive receptor and located a distance of 300- feet from said receptor, unless the dock doors are utilized by zero emission trucks and equipment only. The building and auto parking can be located within the 300-foot distance. A sensitive receptor shall be defined as schools, health care facilities, libraries, churches, correctional facilities, parks/recreational facilities, in home daycare, health facilities (hospitals, long term care facilities, retirement, and nursing homes) or more than two directly contiguous residential units.
- **b.** A 20-foot landscaped planter (buffer) shall be installed along the property line adjacent to a sensitive receptor.
- **c.** The buffer shall be landscaped and not be less than 50 percent of the total buffer size with two rows of 15-gallon trees planted along the length of the property line adjacent to the sensitive receptor.
- **d.** The buffer landscape can include areas to be used for bioswales, retention/detention areas and/or other stormwater and water quality management areas in compliance with SMC Section 16.56 (Landscaping).
- **e.** The buffer area shall include a minimum 10-foot solid decorative wall(s), or landscaped berm and wall, or landscaped berm adjacent to sensitive receptors unless a noise analysis indicates an alternative height is needed for sound attenuation.

The Modification #3: Change Minimum Setback Requirements (Stockton Environmental Justice Advocates (SEJA)) included adjustments to setback standards (SMC Section 16.80.390(B)(1)(a)): Addition of a 2:1 setback to height ratio building requirement; remove options for design flexibility by not allowing "physically infeasible" from consideration for site with unique constraints in complying with 300-foot setback distance or the use EV trucks within the 300-foot setback area, and prohibit loading docks, truck entries, and drive aisles

[12] Minutes of the 3.28.2024 City of Stockton Planning Commission https://stockton.granicus.com/GeneratedAgendaViewer.php?view_id=49&clip_id=8618 and verbal comments https://archive-video.granicus.com/stockton/stockton_419bcd45-ee01-11ee-98bb-0050569183fa.mp4

from abutting adjacent sensitive receptors.

According to the existing City of Stockton Municipal Code § 16.80.170 Industrial uses (IL, limited industrial, and IG, general industrial, zoning districts that are located on two or more acres), commercial structures adjacent to residential zoning districts over 35 feet in height shall be set back from the property line adjoining the residential zoning district *an additional one foot for each two feet of building height over 35 feet.* According to Table 2-3 Development Standards (below) there is either a 60-foot maximum or no maximum for height and a minimum set-back of 10 feet for all industrial units, except for the Industrial Warehouse Ordinance setbacks as set forth previously. An existing set-back for a 100-foot-tall building would be 42.5 feet (32.5 + 10). This is insufficient for anywhere in our community, residential or commercial. Even in commercial areas people must breathe. The existing Development Standards are not consistent with creating walkable communities.

Municipal code setback standards are to ensure the provision of open areas around structures for: visibility and traffic safety; access to and around structures; *access to natural light and ventilation; separation of incompatible land uses; and space for privacy, landscaping, and recreation.*

The proposed height consideration: additional 2 feet of setback for each foot of height should apply to all industrial projects in all zoning districts. The extended setback can include areas for workers to recreate in nature or walking on pathways, have an outdoor lunch area and contain trees planted that meet the minimum requirements of the July 2024 Green Building Code and beyond. Some of these amenities will be proposed by City Staff for Planning Commission to consider.

Typically, property setbacks are building restrictions imposed on property owners. This can be a distance from a curb, property line, or structure **within which building is prohibited.**

The 300-foot buffer, as proposed and not negotiable, is not going to be open but will only restrict active trucking operations relating to loading and unloading. This is inadequate. The 300-foot buffer as adopted could contain a building or automobile parking.

Staff has indicated in the staff report, included for the 5.9.2024 Planning Commission meeting, that some other clarifying language could be proposed as follows:

> To address clarity concerns raised by SEJA and the development industry at the Planning Commission informational session held in March, staff proposes making clarifications on uses and design elements that may be included within the 300' setback area when adjacent to sensitive receptors. These uses and elements include stormwater basins, daytime employee gathering areas, pedestrian and bicycle pathways, outdoor storage areas, and an internal drive aisle for autos, trucks and emergency vehicles to circulate around the building, that would be located as close to the building as possible and not abut adjacent sensitive receptors. While the existing code did not explicitly include these, they are common elements of site design for industrial and office facilities. This language is not included in the proposed ordinance redlines (Attachment C - Redline/Strikeout Ordinance) as staff requests Planning Commission input prior to inclusion. With the Commission's concurrence, the language would be added for the City Council's review and consideration.

The proposed language that the Planning Commission is to consider on 5.9.2024 does not specify that the building would not be located within 300 feet of sensitive receptors and would include a "driveway" by which trucks and auto will travel. Leaving only the 20-foot landscaped buffer containing at least two rows of tree and some sound barrier as a true setback. This is inadequate.

The Amendment Feasibility Analysis (Attachment E), referenced previously, introduces some confusion with the language of the modification request, the proposed language, and the existing ordinance language. The adopted Industrial Warehouse Ordinance allows automobile parking and building within the 300-foot buffer.

The development considerations put forth in the Amendment Feasibility Analyses were focused on a situation where a 100,000 square foot warehouse is planned for a 5.5-acre lot. Lots of this size are located where sensitive receptors are also located and likely would never be proposed in an area where higher socioeconomic resident reside. No evaluation of the lot acreage for those 37 warehouses building permits issued since 2016 was included in the feasibility analysis.

From the Amendment Feasibility Analysis Attachment E:

> "The proposed standard is consistent with State, local, and best management practices. The new loading standard maintains the intent of the existing 300-foot buffer requirement and increases the setback distance from the building to the sensitive receptors which will reduce noise, visibility, and possibly also odor impacts."
>
> "It is important to note that, absent adoption of the ordinance, ministerial projects would not be required to exceed minimum standards, therefore, these standards will lessen environmental impacts for all future projects and align with the State's objectives on reducing noise, visibility, and possible odor impacts to sensitive receptors."
>
> "The modification could increase air quality protection of adjacent sensitive receptor; however an analysis would need to be performed, which would be difficult without project specific impacts to compare to."
>
> "This modification could also lead to the accelerated loss of farmland as future annexation projects may need to bring in additional acreage to accommodate the 300-foot buffer."

The Amendment Feasibility Analysis indicates that the proposed standard (absence any height consideration) is consistent with best practices and would be positive for those sensitive receptors then goes on to state, "ministerial projects would not be required to exceed minimum standards". This is very confusing as no evidence or example is provided to describe a warehouse project that would be ministerial instead of discretionary. The analysis goes on to state that further farmland conversions would occur if these proposed modifications are adopted. All recent warehousing projects in the City of Stockton have been located on farmland. The City of Stockton has allowed annexation of farmland and through zoning changes within the scope of the 2040 General Plan has converted hundreds of acres into industrial, even when those farmlands are within the floodplain and include a designated floodway.

The Amendment Feasibility Analysis stated that the required buffer could necessitate the developer purchasing additional land area that would provide no economic benefit for the property owner or tenant. This additional land buffer could provide an economic benefit to the community associated with better air quality translating into longer life spans for residents already pollutant overburdened. The costs of already zoned industrial land are high but that has not stopped development from purchasing land and seeking rezoning of agricultural land and annexation. How many of these projects have occurred in Stockton in the last 5 years, ten years, and twenty years?

The Amendment Feasibility Analysis included an economic analysis and referenced the *CBRE Central Valley Industrial Figures Q3 2023* report stating Stockton has the third highest lease rates in the Central Valley and any cost increase would put the City of Stockton at an economic disadvantage.

The Q1 2024 CBDRE report available January 2024 indicates that Stockton is now the fourth highest of the five cities (with available data) based on average asking rates, with Ceres the fifth as shown below.[13] The City of Stockton average asking price is \$0.71 whereas the City of Tracy is \$0.82. Is this cost associated with mitigation measures or mitigation fees? No analysis for possible reasons for an \$0.11 difference.

Source: CBRE Research, Q1 2024

The previously referenced South Coast Air Quality Management District Rule 2305 – Warehouse Indirect Source Rule included a *Final Socioeconomic Impact Assessment* which reported risks posed from $PM_{2.5}$ and diesel PM are higher for populations within 0.5 miles of warehousing facilities.[14] Also, communities within 0.5 miles have an average asthma rate of 56 per 10,000 individuals (64th percentile) and experience heart attacks at a rate of 9.2 per 10,000 individuals (65th percentile) supporting further mitigation of warehouse related air quality impacts.

According to the Asthma and Allergy Foundation of America in their 2023 Asthma Capitals Report the City of Stockton is ranked as the 41st worse city with a total score of 63.50 with worse than average number of emergency department visits for asthma.[15] The City of Los Angeles, a major metropolitan area within the South Coast Air Quality Management District, ranks 58th with a total score of 57.48 with an average number of emergency department visits for asthma, indicating that for these measures Stockton has worse health outcomes that can be related to air quality.

CARB funded the Stockton AB617 Community Emission Reduction Plan because air quality impacts were significant and affecting resident health as outlined in the Appendix G, Health Impacts of Local Air Pollution.[16] While these efforts have been underway, the City of Stockton and Port of Stockton have made and continue to make Statements of Overriding Significance allowing warehouse development to occur without mitigating the impacts estimated to levels less than significant, worsening air quality in the community.

Differences between parts of Stockton are easily visualized using the CalEnviroScreen 4.0 Data Dashboard describes the Stockton areas as follows with the darker colors indicating higher pollutant burdens and vulnerability to poor health outcomes.[17]

A 300-foot partial setback is not adequate to protect an already pollutant overburdened community as pollutants are not contained within such a limited boundary, particularly when considering warehousing projects over 1 million square feet containing multiple buildings. A tiered setback is needed to specifically protect sensitive receptors from warehouse developments over 100,000 to over 1,000,000 million square feet.

The existing Industrial Warehouse Ordinance does not consider development projects approved at the conceptual level, then the lots are split into smaller lots before specific site plans are proposed for building permit applications. The City Council will be considering an over 6 million square feet project on over 400 acres of prime farmland, farmland of statewide importance and unique farmland which is proposed to be split up into 13 development lots utilizing conceptual site planning for CEQA analysis. The existing Industrial Warehouse Ordinance does not specify that either the 100,000 square feet or 400,000 building size related setback would occur if conceptual development were proposed and then subdivided and developed piecewise.

Furthermore, greater notifications and protections are needed for residential and sensitive receptors than 300 feet. This notification of affected residents now is only directed to addresses within 300 feet of a project. This notification, pursuant to Municipal Code is for a public meeting two weeks in advance of a project that will be considered by City Council. A 300-foot notification distance is insufficient when the impacts of warehouse projects extend well beyond based on CARB modeling, as will be shown. According to California Air Resources Board (CARB) guidance, siting warehouse facilities so that their property lines are at least 1,000 feet from the property lines of the nearest sensitive receptors is recommended to protect public health.[18] CARB has continued to quantify the impacts associated with freight movement and has developed a conceptual freight handbook with recommended setbacks of 500 feet to reduce cancer risks.[19]

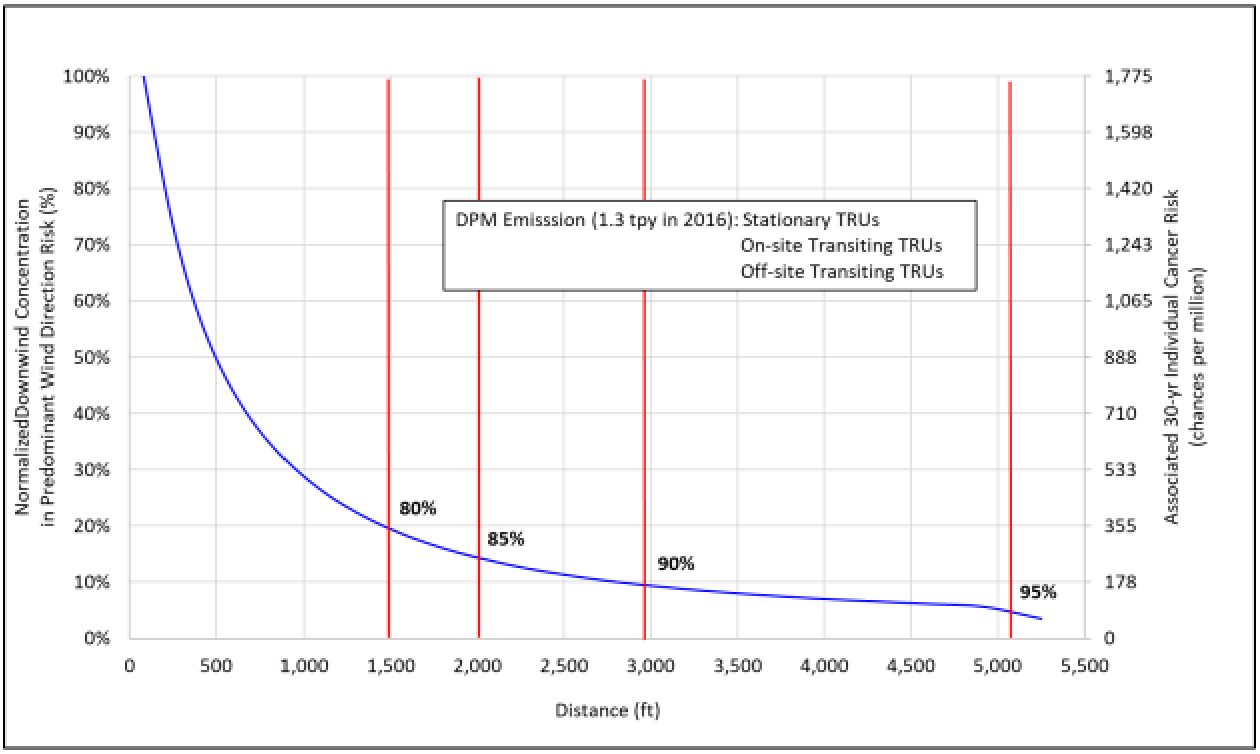
[19] 2019 Concept Paper for the Freight Handbook. https://ww2.arb.ca.gov/sites/default/files/2020-03/2019.12.12%20-%20Concept%20Paper%20for%20the%20Freight%20Handbook_1.pdf. Accessed 5.4.2024

Figure 2. Normalized Downwind Diesel PM Concentration and Associated 30-Year Cancer Risk by Distance



CARB should be consulted to develop transition zone widths based on science. Heart disease, asthma, low birth weights are already linked to air pollution in Stockton relating to historic land use decisions. The City of Stockton has an opportunity to do better.

On July 1, 2024, updates the CalGreen Building Standards referenced in the Industrial Warehouse Ordinance go into effect and will increase standards related to other issues under consideration.[20]

- We recommend that the warehouse size threshold not be increased but remains at 100,000 square feet. Numerous studies have indicated significant negative impacts with warehouses of this level.
- We recommend that there be no exemptions as put forth.
- We recommend that greater setbacks are incorporated into development standards. There is still language being considered for Modification #3 and the feasibility analysis was incomplete as stated elsewhere.
- We recommend a tiered approach for setbacks that includes some additional consideration for warehouses with heights over 60 feet or approximately 6 stories tall.
- We recommend that CARB be consulted so that a health-based setbacks be determined for Stockton residents rather than a developer based economic approach. The health and wellbeing of the residents of Stocktons living near warehouses, and warehouse districts where impacts can overlap with cumulative impacts, should come first. As shown above the CBDE data indicates that Stockton is not in dire need of more rentable warehouse area but our residents are in dire need of protection from warehouse related impacts.

The practice of making Statements of Overriding Consideration for economic development must end in our community. Recently, 3.12.2024, a public hearing was noticed to approve an office and industrial sales tax incentive agreement between the City of Stockton and Home Depot USA, Inc., and amend the office and industrial sales tax incentive program guidelines. The result of the incentive would have been a fifty percent reduction in sales taxes collected from these businesses to "attract and retain businesses and to facilitate easier engagement with enterprises." We submitted comments and shortly thereafter the public hearing was cancelled, and the item pulled from the agenda. We ended our comments with "Give the people a break and reject the Home Depot (TCNOR CAL) agreement and do not move forward with any more incentives until our infrastructure is made whole." We have many e-commerce facilities that are located here in Stockton, in part because we are "cheap", giving away our air quality, and not requiring mitigation fees that are commensurate with the actual costs to our infrastructure, human health and the environment. In December 2023, the Port of Stockton made a statement of overriding consideration regarding certification of the Home Depot (TC NOR CAL) FEIR leaving unmitigated impacts that affect the already pollutant overburden residents, within and beyond the AB617 boundary. Yet, the City has specifically offered a tax reduction for the Home Depot project.

We have been told since the Amazon Warehouse, Sanchez-Hoggan Annexation 2020 FEIR certification, and annexation of farmland, with a Statement of Overriding Consideration, that a Nexus study was underway to update the 1990's mitigation fees that the City of Stockton uses to access City infrastructure impacts resources. Stockton residents continue to be overburdened with a six percent utility taxes for soaring utility costs, yet instead of designated the "windfall" for redevelopment to improve conditions for residents, the City deposits those funds into the general fund for unrestricted use, with those general funds used to pay for planning and construction of infrastructure needs associated with warehouse development (i.e. Mariposa Lane expansions and Airport Way improvements near French Camp Road).

We suggest that the City of Stockton consider these comments and those of Shute, Mihaly, and Weinberger when performing feasibility analyses that take into account more than just development economics. We need development standard improvements, but these should be focused on improving conditions of our disadvantaged communities. Thank you for your consideration of our comments as you evaluate proposed language. You may contact the undersigned to discuss further.

Sincerely,

Mary Elizabeth M.S., R.E.H.S.

TABLE 2-3.A ZONING DISTRICT DEVELOPMENT STANDARDS																
Development Feature (See Division 8 for definition of each)	**REQUIREMENT BY ZONING DISTRICT**															
	RE	**RL**	**RM**	**RH**	**CO**	**CN**	**CG**	**CD**	**CL**	**CA**	**IL**	**IG**	**PT**	**PF**	**OS**	**MX, UC**
Minimum lot size	*Minimum area and width for new parcels. For a minimum specific zoning district area size requirement, see Section **16.16.020** (Zoning districts established)*															Per master development plan
Area	1 ac	5,000 sf		7,500 sf	7,500 sf	No minimum									5 acres	
Width	150 ft	50 ft			No minimum											
Density	*Number of dwellings permitted in a residential subdivision or in a multifamily residential project on an acre (net) of land.*															
Dwelling units per net acre (minimum-maximum)	For allowable densities see Table 2-3.B															
Setbacks	*Minimum setbacks required. See Division **8** for definitions. See Section **16.36.110** for setback measurement, allowed projections into setbacks, and exceptions.*															
Front	30 ft	20 ft	15 ft	15 ft	10 ft	None*	10 ft	None	10 ft						20 ft	
Side(s)	10 ft	5 ft			5 ft	None required, except when adjacent to a residential zone, structures shall be set back a distance of 10 feet or as required by Division 3 for specific land uses. In the CA zone, structures shall be set back from a residential zone equal to their height.									20 ft	
Sides, street	10 ft	10 ft			10 ft	None*	10 ft	None	10 ft						20 ft	
Rear	30 ft	10 ft			10 ft	None required, except when adjacent to a residential zone, structures shall be set back a distance of 10 feet or as required by Division 3 for specific land uses. In the CA zone, structures shall be set back from a residential zone equal to their height.									20 ft	
Site coverage	*Maximum percentage of site area that may be covered by structures. See Division **8** for definitions. See Section **16.36.120** for exceptions.*															
Maximum coverage	25 %	50%			60%	100%	60%	100%	50%		60%			50%	1%	
Height limit	*Maximum height for primary structures. See Section **16.36.090** for height measurement and exceptions.*															
Maximum height	35 ft	35 ft			45 ft	35 ft	45 ft	No limit	75 ft	45 ft	60 ft	No limit		75 ft	35 ft	
Landscaping	See Chapter **16.56** (Landscaping Standards)															
Parking and loading	See Chapter **16.64** (Off-Street Parking and Loading Standards)															
Signs	See Chapter **16.76** (Sign Standards)															

* If adjacent to residential zoning districts, the setback shall be none if the structure in the CN zoning district is at least 20 feet from the residential zoning district, otherwise the setback shall be 10 feet.

Glossary Division 8 : † Warehouses (Land Use). Facilities for the storage of farm products, furniture, household goods, or other commercial goods of any nature. Includes cold storage. Does not include warehouse, storage or mini-storage facilities offered for rent or lease to the general public ("Personal storage facility—Mini-storage"); warehouse facilities in which the primary purpose of storage is for wholesaling and distribution ("Wholesaling and distribution"); or terminal facilities for handling freight ("Vehicle and freight terminals").

Warehouses are listed within the CIO Commercial-Industrial Overlay ALLOWABLE LAND USES AND PERMIT REQUIREMENTS IN THE COMMERCIAL-INDUSTRIAL OVERLAY[21] -

No specific Zoning District is listed for warehouses, so it is assumed that the following zoning districts outlined in the 2040 General Plan include:

Industrial Zoning Districts.
1. IL (Industrial, Limited) District. The IL zoning district is applied to areas appropriate for light manufacturing uses that may generate more nuisance impacts than acceptable in commercial zoning districts and whose operations are totally conducted indoors. Includes retail stores and ancillary office uses. The IL zoning district is consistent with the Industrial land use designation of the General Plan.

2. IG (Industrial, General) District. The IG district is intended to allow a wide range of industrial land uses, including uses that may be conducted outdoors or associated with nuisance or hazardous impacts. Includes ancillary office uses. The IG zoning district is consistent with the Industrial land use designation of the General Plan

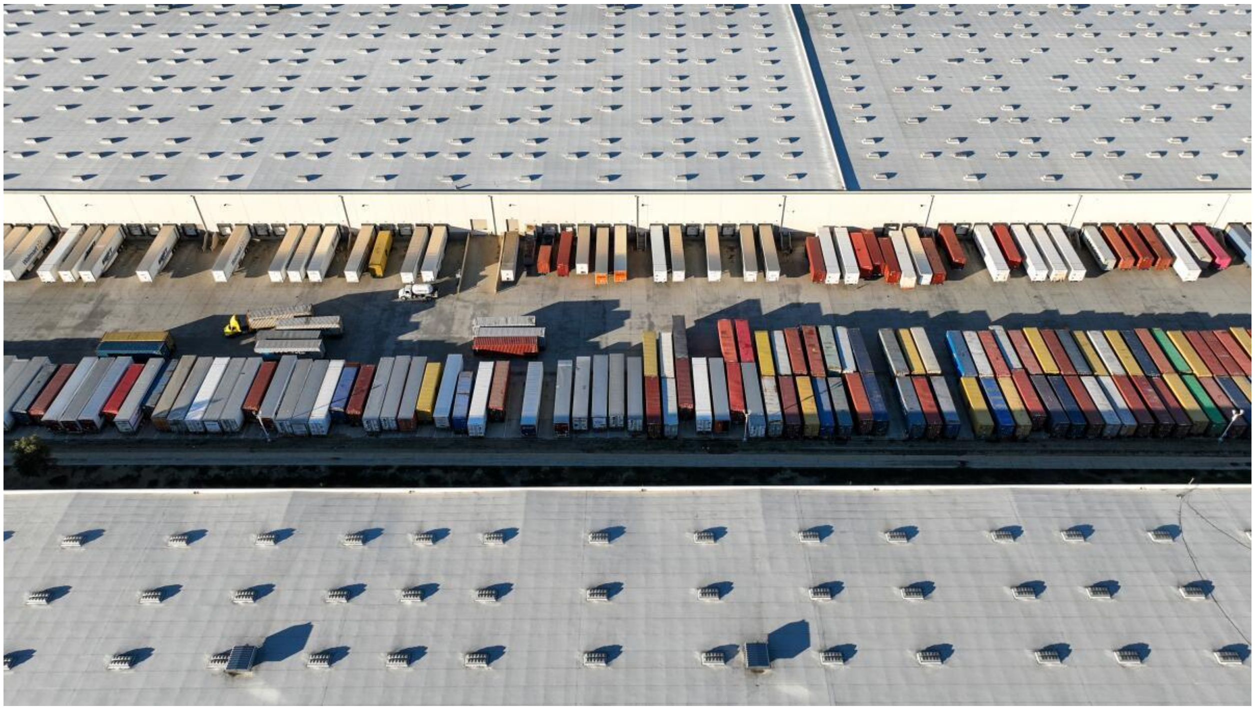
Gavin Newsom signs controversial bill regulating California warehouse development



A Walmart distribution center along Interstate 15 in Eastvale in the Inland Empire.

(Robert Gauthier/Los Angeles Times)

By Rebecca PlevinStaff Writer

Sept. 29, 2024 5:46 PM P

Gov. Gavin Newsom has signed a controversial bill that establishes siting and design standards for industrial warehouses that, according to supporters, would better protect the health of nearby residents.

The legislation comes as developers have converted large swaths of property along Inland Empire freeways into a logistics corridor for e-commerce, connecting goods shipped into Southern California ports with online shoppers across the nation. Although proponents of the developments say they bring jobs and infrastructure improvements, many residents living in the shadow lament the pollution, traffic and neighborhood disruption.

Beginning in 2026, Assembly Bill 98 will prohibit cities and counties from approving new or expanded distribution centers unless they meet specified standards. New warehouse developments will need to be located on major thoroughfares or local roads that mainly serve commercial uses. And warehouses will need to be set back several hundred feet from so-called “sensitive sites” such as homes, schools and healthcare facilities.

Additionally, if a developer demolishes housing to make way for a warehouse, the bill will require two new units of affordable housing for each unit that is destroyed. The developer will have to provide displaced tenants with 12 months' rent.

Assemblymember Juan Carrillo (D-Palmdale), co-author of the legislation, previously described the measure as a "very delicate compromise" that resulted from lengthy negotiations among a group that included labor, health, environmental and business representatives.

While some labor organizations supported the bill, environmental, community and civic groups statewide objected to the secrecy in which the bill was crafted in the final days of the session and said it fails to hold warehouse developers to higher standards.

Several cities also opposed the legislation, which, according to an analysis by the Senate Appropriations Committee, requires general plan updates that could result in one-time costs for cities and counties ranging from tens of millions to potentially hundreds of millions of dollars.

The League of California Cities is committed to fixing this "costly, burdensome bill" during next year's legislative session, President Daniel Parra said in a statement Sunday.

"AB 98 is a massive unfunded mandate that will harm our cities, stifle job growth, and threaten the economic lifeblood of communities throughout California," he said.

Environmental advocates are especially concerned about the bill's setback requirements for projects involving warehouses 250,000 square feet and larger that are within 900 feet of homes, schools, parks or healthcare facilities.

In those cases, the bill requires that truck loading bays are located at least 300 feet from the property line in areas zoned for industrial use and 500 feet from the property line in areas not zoned for industrial use. Warehouses would also need to comply with design and energy efficiency standards.

Advocates argued the bill would simply enshrine current warehouse development practices into law and undermine local efforts to advocate for the much bigger setbacks recommended by state agencies.

In a 2022 report on best practices for warehouse projects under the state's environmental laws, the state attorney general's office recommends locating warehouse facilities so that their property lines are at least 1,000 feet from the property lines of sensitive sites such as homes and schools. It cites the state Air Resources Board, which in 2005 estimated an 80% drop-off in pollutant concentrations at approximately 1,000 feet from a distribution center.

In a statement issued Sunday, environmental groups and community organizations called on the governor and Legislature to work with them next year to get "real protections for our communities."

"This is disappointing for our communities who will have to bear the brunt of weak standards," said Andrea Vidaurre, co-founder and policy analyst for the People's Collective for Environmental Justice in San Bernardino.
