1. Affected age ranges are shown. Other age ranges are available, but the endpoints and age ranges shown here are the ones used by the USEPA in their health assessments. The age ranges are consistent with the epidemiological study that is the basis of the health function.
2. Health effects are shown in terms of incidences of each health endpoint and how it compares to the base (2035 base year health effect incidences, or "background health incidence") values. Health effects are shown for the Reduced Sacramento 4-km Modeling Domain and the 5-Air-District Region.
3. The percent of background health incidence uses the mean incidence. The background health incidence is an estimate of the average number of people that are affected by the health endpoint in a given population over a given period of time. In this case, the background incidence rates cover the 5-Air-District Region (estimated 2035 population of 3,271,451 persons). Health incidence rates and other health data are typically collected by the government as well as the World Health Organization. The background incidence rates used here are obtained from BenMAP.

4. The total number of health incidences across the 5-Air-District Region is calculated based on the modeling data. The information is presented to assist in providing overall health context.

5. The technical specifications and map for the Reduced Sacramento 4-km Modeling Domain are included in Appendix A, Table A-1 and Appendix B, Figure B-2 of the *Guidance to Address the Friant Ranch Ruling for CEQA Projects in the Sac Metro Air District.*

## INTRODUCTION

The Upper Westside Specific Plan Project (proposed project) is subject to the California Environmental Quality Act (CEQA). Accordingly, the lead agency is preparing an Environmental Impact Report (EIR) for the proposed project, which will assess whether the proposed project would result in significant air pollutant emissions impacts. If emissions exceed the Sacramento Metropolitan Air Quality Management District (SMAQMD)'s adopted thresholds of significance, then a mitigation plan, consistent with the SMAQMD *Guide to Air Quality Assessment in Sacramento County* (CEQA Guide), must be prepared to address the impacts.

Based on the Air Quality and Greenhouse Gas Impact Analysis prepared for the proposed project, operational air emissions associated with the proposed project, particularly related to ozone precursors (i.e., reactive organic gases [ROG] and nitrous oxides [$NO_X$]), were found to be significant.[1] This Air Quality Mitigation Plan (AQMP) addresses the identified significant impacts and has been prepared in compliance with the SMAQMD *Recommended Guidance for Land use Emission Reductions*.[2] In addition, this AQMP is intended to provide air quality impact mitigation measures that would be applied to the proposed project, as necessary, for the project to meet the requirements of SMAQMD. All modeling results are included as an appendix to this document.

## PROJECT SUMMARY

The Project Summary section includes a discussion regarding the specific location of the proposed project, as well as the project components.

### Project Location

The proposed project is located northwest of Interstate 80 (I-80), north and east of the Sacramento River and the Sacramento County limits, west of the Witter Canal, and south of Fisherman's Lake/Slough. The 2,066-acre site is outside of the Urban Policy Area and Urban Services Boundary in the Natomas New Growth Area, and is predominantly agricultural land with existing commercial uses, including a truck stop, restaurants, gas stations, and hotels located west of the I-80 off-/on-ramp (see Figure 1 and Figure 2).

Surrounding existing land uses include the Sacramento River to the south and west; agricultural land to the west; I-80, multi-family residences, and a business park to the east; and single-family residences to the east, west, north, and south.

The Sacramento County General Plan designates the site as Agricultural Cropland, Agricultural Residential, Commercial/Office, and Recreation and the site is zoned Agricultural, Agricultural Residential, General Commercial, and Highway Travel Commercial.

### Project Description

The proposed project would create a Specific Plan for the Upper Westside planning area, which would include 9,231 residential dwelling units, 130.5 acres of commercial uses, 147.1 acres of schools, 73.2 acres of parks, 49.8 acres of open space, 83.9 acres of agricultural residences, and 407.6 acres of agricultural cropland (see Figure 3). The project would also include roadway improvements, including the expansion of El Centro Road and the development of additional roadways throughout the project site.

NOTES
(1) NET ACREAGE BASED ON PRELIMINARY LAND USE PLAN GENERATED IN GIS/AUTOCAD BY WOOD RODGERS APRIL 2020. THIS PLAN IS SUBJECT TO CHANGE. ARTERIAL AND COLLECTOR ROADS, AND LANDSCAPE CORRIDORS AS SHOWN ON MAP ARE NETTED OUT.
(2) ESTIMATED POPULATION CALCULATION UTILIZING 2.8 PERSONS PER HOUSEHOLD (PPH) FOR SINGLE-FAMILY, AND 2.4 PPH FOR MULTI-FAMILY (MDR AND HIGHER). THIS IS A PRELIMINARY ESTIMATE AND SUBJECT TO CHANGE.
(3) THE ALLOCATED SQUARE FOOTAGE (SF) IS IN ADDITION TO EXISTING COMMERCIAL LAND USES.
(4) AGRICULTURAL RESIDENTIAL (AR) AND AGRICULTURAL CROPLAND (AG) AREAS ARE NOT INCLUDED IN PROPOSED 1,521-ACRE DEVELOPMENT AREA OF THE UPA/SOI EXPANSION REQUEST. IT IS ASSUMED THE "AG-BUFFER" AREA WILL REMAIN AS IS AND NO UNITS ARE ALLOCATED.
(5) THE 1.2 ACRE CMU SITE LOCATED SOUTHWEST OF THE TOWN CENTER IS INTENDED FOR A SPECIAL USE (e.g. FIRE STATION, SHERIFF SUB STATION, CHURCH, DAY CARE, ETC.) AND THEREFORE WAS NOT ALLOCATED FOR RESIDENTIAL UNITS.

Sacramento, CA 95816
Tel 916.341.7760
Fax 916.341.7767

The project would require County approval of the following entitlements:

1. **Amend the Urban Services Boundary** to include the Upper Westside Development Area.
2. **Amend the Urban Policy Area** to include the Upper Westside Plan Development Area.
3. **Amend the General Plan Land Use Element and Land Use Diagram** to change the land use designations for the Upper Westside Development Area (1,532-acres) from Agricultural Cropland (1,825.8± acres), Agriculture Residential (97.0± acres), Recreation (55.3±), and Commercial and Offices (49.5± acres) to Low Density Residential (805.4± acres), Medium Density Residential (41.4± acres), High Density Residential (25.4± acres), Commercial and Office (52.2± acres), Mixed Use (81.5± acres), Public/Quasi-Public (149.0± acres), Recreation (288.5± acres), Agricultural Cropland (407.6± acres)and Agricultural Residential (83.9± acres). The General Plan designations on parcels within the Ag Buffer area (534-acres) are proposed to remain unchanged.
4. **Amend the General Plan Transportation Plan Diagram** to include the roadway system as designated for the Upper Westside Plan Area by the Specific Plan document.
5. **Amend the General Plan Bicycle Master Plan Diagram** to include the bikeway system as designated for the Upper Westside Plan Area by the Specific Plan document.
6. **Amend General Plan Text.** Several policies within various elements of the General Plan are proposed for modification.
7. **Amend the Zoning Diagram** to change the Zoning Designations for the Participating Properties (292± acres) within the Development Area of the Upper Westside Plan Area from AG-40 to Special Planning Area (SPA).
8. **Adopt the Upper Westside Specific Plan** document to establish land use, zoning, and development standards for the parcels located within the Development Area.
9. **Adopt an Urban Services Plan** for the Upper Westside Plan Development Area.
10. **Adopt an Affordable Housing Strategy** for the Upper Westside Plan Development Area.
11. **Adopt a Water Supply Master Plan** for the Upper Westside Plan Development Area.
12. **Approve a Water Supply Assessment** for the Upper Westside Plan Development Area.
13. **Adopt a Public Facilities Financing Plan** for the Upper Westside Plan Development Area.
14. **Adopt a Reimbursement Fee** so that non-participating property owners within the Development Area can reimburse the sponsoring/participating property owners for the cost to prepare and process a Specific Plan and EIR for the Upper Westside Plan Area.
15. **Adopt a Development Agreement** for the sponsoring/participating property owners, controlling 295± acres, located within the Upper Westside Plan Development Area.

In addition to the above entitlements, separate Service District Annexation requests for the Upper Westside Plan Area are proposed to include:

- Annexation to County Service Area 10 (CSA-10) or the creation of a new CSA.
- Annexation to Sacramento Regional County Sanitation District (Regional San).
- Annexation to Sacramento Area Sewer District (SASD).

More detail regarding the components included as part of the proposed project can be found in the EIR.

## PURPOSE OF THE AQMP

CEQA requires that EIRs identify and evaluate any potential environmental impacts of a project. The analysis of potential effects must include both direct project impacts and indirect impacts. The analysis must then describe feasible measures that could reduce any potentially significant adverse impacts to less-than-significant levels. To assist in the evaluation of air quality impacts, the SMAQMD developed the CEQA Guide. The CEQA Guide outlines a methodology for calculating project emissions whereby a project is divided into separate construction and operational phases. For each phase, the CEQA Guide establishes significance thresholds related to elevated regional ambient ozone concentrations, which are considered a cumulative impact. Project emissions are compared to these significance thresholds, and mitigation measures are required for projects with emissions exceeding these thresholds.

As part of the CEQA process, project operational emissions are calculated and impacts are determined in the EIR. Any projects that generate emissions that exceed the adopted SMAQMD thresholds of significance for ozone precursor pollutants shall be deemed to have a significant environmental impact. According to SMAQMD, projects that generate a significant impact for ozone precursors should create an AQMP, subject to review and recommendation as to technical adequacy by SMAQMD, to minimize impacts. The AQMP shall consist of feasible measures to reduce operational ozone precursor emissions associated with the project and minimize impacts, which would be incorporated as mitigation into the project's EIR. Implementation of the measures set forth in this AQMP would be enforced by the County.

### Ozone Precursors

Ozone is a reactive gas consisting of three oxygen atoms. In the troposphere, ozone is a product of the photochemical process involving the sun's energy, and is a secondary pollutant formed as a result of a complex chemical reaction between reactive organic gases (ROG) and oxides of nitrogen ($NO_X$) emissions in the presence of sunlight. Ozone at the Earth's surface causes numerous adverse health effects and is a major component of smog. High concentrations of ground level ozone can adversely affect the human respiratory system and aggravate cardiovascular disease and many respiratory ailments. This AQMP focuses on two categories of ozone precursors, ROG and $NO_X$, which are discussed in further detail below.

#### Reactive Organic Gas

Reactive Organic Gas (ROG) refers to a group of reactive chemical gases composed of hydrocarbon compounds typically found in paints and solvents that contributes to the formation of smog and ozone by involvement in atmospheric chemical reactions. A separate health standard does not exist for ROG. However, some compounds that make up ROG are toxic, such as the carcinogen benzene.

#### Oxides of Nitrogen

Oxides of Nitrogen ($NO_X$) are a family of gaseous nitrogen compounds and are precursors to the formation of ozone and particulate matter. The major component of $NO_X$, nitrogen dioxide ($NO_2$), is a reddish-brown gas that discolors the air and is toxic at high concentrations. $NO_X$ results primarily from the combustion of fossil fuels under high temperature and pressure. On-road and off-road motor vehicles and fuel combustion are the major sources of $NO_X$. $NO_X$ reacts with ROG to form smog, which could result in adverse impacts to human health, damage the environment, and cause poor visibility. Additionally, $NO_X$ emissions are a major component of acid rain. Health effects related to $NO_X$ include lung irritation and lung damage and can cause increased risk of acute and chronic respiratory disease.

## METHODOLOGY

For this analysis, an unmitigated baseline and a mitigated operational scenario were modeled. The SMAQMD establishes the basis for the use of an unmitigated baseline scenario in the document *Recommended Guidance for Land Use Emission Reductions*, where the unmitigated baseline is considered to be development of the proposed project without consideration of any inherent design or site features (e.g., design enhancements, vehicle miles traveled [VMT] reductions, etc.). Although SMAQMD directs that the unmitigated baseline does not incorporate any design features of the project, the unmitigated baseline should incorporate any statewide regulations that may serve to reduce emissions. For instance, the California Building Standards Code (CBSC) requires that all single-family residential units of three stories or less be developed with on-site renewable energy systems sufficient to meet all electricity demands from the residences. The unmitigated baseline emissions estimates prepared for the project incorporate all relevant CBSC requirements, as all development in California is required to incorporate such features.

The unmitigated baseline was compared to the mitigated operational emissions that would result from the proposed project. The mitigated operational scenario includes mitigation measures and development strategies that would be incorporated as part of the proposed development. Both the unmitigated baseline and mitigated total ozone precursors for the proposed project were estimated using the California Emissions Estimator Model (CalEEMod) version 2020.4.0 software - a statewide model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify air quality emissions, including GHG emissions, from land use projects.[3] The model applies inherent default values for various land uses, including trip generation rates based on the Institute of Transportation Engineers (ITE) Manual, vehicle mix, trip length, average speed, etc. The emissions were modeled during the full buildout year, which was assumed to be 2045. All project modeling results are included as Attachment A.

### Required Air Quality Emissions Reduction Percentage

The SMAQMD has developed the *Recommended Guidance for Land use Emission Reductions Version 4.3*, dated February 2021, to instruct project proponents how to quantify, apply, and comply with various measures for projects within the SMAQMD jurisdictional area. Projects that are anticipated to emit 65 pounds or more of $NO_X$ or ROG per day, 80 pounds per day (or 14.6 tons/year) or more of $PM_{10}$, or 82 pounds per day (or 15 tons/year) or more of $PM_{2.5}$ are considered operationally significant for CEQA purposes and should apply feasible mitigation. SMAQMD guidance provides that the creation and implementation of an AQMP represents all feasible mitigation, provided a reduction of ozone precursors is illustrated to be below an unmitigated project by 15 percent for projects considered in the State Implementation Plan (SIP) and 35 percent for projects not considered in the SIP. For $PM_{10}$ and $PM_{2.5}$, SMAQMD does not recommend a percent reduction goal, and instead recommends incorporation of all feasible mitigation measures for projects that exceed the SMAQMD's PM thresholds. Consistent with the aforementioned requirements, preparation of an AQMP for the proposed project is required under Mitigation Measure AQ-1 of the project's Air Quality and Greenhouse Gas Impact Analysis.[4]

---

[3] California Air Pollution Control Officers Association (CAPCOA). *California Emissions Estimator Model User's Guide Version 2020.4.0.* May 2021.

[4] Upper Westside LLC. *Air Quality and Greenhouse Gas Impact Analysis Upper Westside Specific Plan Project* [pg 46]. March 2022.

The most recent SIP for the Sacramento region is the *Sacramento Regional 2008 NAAQS 8-Hour Ozone Attainment and Reasonable Further Progress Plan*.[5] As the proposed project has not been anticipated by the County in the General Plan or other community plan, development of the project would not have been included in the growth assumptions of the SIP. Because the SIP takes into account growth assumptions to determine when and how air quality standards could be achieved, emissions that are not accounted for in the SIP have the potential to conflict with the attainment goals set forth in the SIP. As such, a reduction of 35 percent below unmitigated emissions of ozone precursors would be required for the proposed project. According to SMAQMD, a project's ozone precursor emissions reductions goals should be based on mobile emissions only; however, reductions of ozone precursors from non-mobile emission reduction measures (e.g., natural gas or energy reductions) may still be accounted for and applied.

Two types of mitigation measures may be applied - those that are included in CalEEMod (known as on-model measures) and those located solely within the SMAQMD's *Recommended Guidance for Land Use Emission Reductions* (called off-model measures). Many of the on- and off-model measures are based on the California Air Pollution Control Officers Association's (CAPCOA) guidelines *Quantifying Greenhouse Gas Mitigation Measures*.[6] Further clarification on the measures can be found in the CalEEMod User Guide and the CAPCOA Measures.

## OZONE PRECURSOR ANALYSIS

The unmitigated baseline and mitigated operational emissions are presented below, and compared, in order to determine if the proposed project would meet the 35 percent reduction requirement.

### Unmitigated Baseline Operational Emissions

Using CalEEMod, baseline emissions of ROG and $NO_X$ from operations following build-out of the proposed project were estimated. Results of the modeling are presented in Table 1.

**Table 1**
**Unmitigated Baseline Operational Ozone Precursor Emissions**

| Source | ROG (tons/yr) | $NO_X$ (tons/yr) |
|---|---|---|
| Area | 79.52 | 1.11 |
| Energy | 1.41 | 12.40 |
| Mobile | 34.45 | 39.55 |
| ***Total*** | ***115.38*** | ***53.06*** |

***Source: CalEEMod, July 2021 (see Attachment A).***

As noted above, the unmitigated baseline scenario includes compliance with statewide regulations, but does not include consideration of any specific project design or site features. In particular, improvements in energy efficiency due to the implementation of the 2019 CBSC, as well as reductions in the carbon intensity of grid supplied electricity due to SMUD's anticipated compliance with statewide RPS standards, were included in the unmitigated baseline emissions estimation.

[5] El Dorado Air Quality Management District, Feather River Air Quality Management District, Placer County Air Pollution Control District, Sacramento Metropolitan Air Quality Management District, Yolo-Solano Air Quality Management District. *Sacramento Regional 2008 NAAQS 8-Hour Ozone Attainment and Reasonable Further Progress Plan*. July 24, 2017.

[6] California Air Pollution Control Officers Association. *Quantifying Greenhouse Gas Mitigation Measures*. August 2010.

## Establishing Emissions Reduction Targets

For projects not considered in the State Implementation Plan (SIP), including the proposed project, the SMAQMD recommends a 35 percent reduction of ozone precursor mobile source emissions. Accordingly, the emissions reductions that would be required for the proposed project are presented in Table 2 below.

**Table 2**
**Required Emissions Reductions**

| Pollutant | Estimated Mobile Emissions (tons/yr) | Percent Reduction Required | Reduction Target (tons/yr) |
|---|---|---|---|
| ROG | 34.45 | 35 | 12.06 |
| $NO_X$ | 39.55 | 35 | 13.84 |

***Source: CalEEMod, July 2021 (see Attachment A).***

As shown in Table 2, ROG emissions must be reduced by 12.06 tons/yr, and $NO_X$ must be reduced by 13.84 tons/yr. This AQMP will show that the proposed project would achieve the aforementioned emissions reductions by implementing the measures presented herein.

## Summary of Mitigation Measures

The project includes the following on-model and off-model features inherent in the project design, which would contribute to the reduction in emissions in comparison to the unmitigated baseline condition:

### On-Model Mitigation Measures

As discussed above, on-model measures are those that are included in CalEEMod. Further detail regarding the proposed project's on-model measures are provided below.

The protocol within SMAQMD's *Recommended Guidance for Land use Emission Reductions* focuses on reducing ozone emissions through reductions in VMT. Because vehicles release ozone precursors during use, reducing VMT results in a reduction of vehicles usage, and thus a reduction in the emission of ozone precursors. Reducing VMT is typically achieved through encouraging alternative means of transportation, which reduces the use of single-passenger vehicles, designing new developments with efficient circulation networks, and various other methods that reduce existing and anticipated VMT.

VMT reductions often result from a mode shift, where a commuter who previously relied on a single-passenger vehicle for commuting begins to instead use other means of transportations such as walking, biking, carpooling or using public transit. In order for such mode shifts to occur, the infrastructure must be designed to accommodate such activities. For instance, new developments must include sidewalks while reducing barriers to pedestrians such as walls, slopes, and excessive landscaping. In addition, bike lanes, bicycle parking, and bicycle-related signage would be provided within the project area, as appropriate. By increasing pedestrian and bicycle access and interconnectivity, projects can decrease the amount of VMT typically associated with development.[7] Development in the project area would be required to include pedestrian infrastructure to help facilitate pedestrian access, provide bicycle infrastructure, and encourage mode shifts away from single-passenger vehicle use, thus reducing project-wide operational VMT.

[7] California Air Pollution Control Officers Association. *Quantifying Greenhouse Gas Mitigation Measures*. August 2010.

The following project features that would provide a reduction in ozone precursor emissions as a result of VMT reductions were applied as on-model measures in CalEEMod:

### *1. Update Trip Generation Rates (TS)*

Trip generation rates were updated pursuant to the project-specific Trip Generation Technical Memorandum prepared by Fehr and Peers.[8] Trip generation estimates were prepared using the Mixed-Use Trip Generation Model (MXD+), which is highly sensitive to project location. Site-specific inputs that are considered in the model include, but are not limited to, the presence of transit, percentage of project households within 0.25-mile of transit stops, percentage of total regional employment centers within a 30-minute transit trip, and number of jobs within a 1-mile radius of the project. Other inputs considered in MXD+ include rates of vehicle ownership in the project area as well as average household size. MXD+ also considers pedestrian network connectivity using a proxy of intersection density, which indicates whether the project site is located in a walkable, grid layout or a more suburban, curvi-linear layout.

Overall, the complementary nature of land uses within the project site, combined with the availability of transit and walking/biking, would result in an overall 25 percent reduction in gross daily vehicle trips.

### *2. Implement Trip Reduction Program (TRT-1 and TRT-2)*

Participation in a trip reduction program was applied as on-model measures TRT-1 and TRT-2. According to the SMAQMD's *Recommended Guidance for Land Use Emission Reductions*, a Transportation Management Association (TMA) is a formally incorporated organization that applies carefully selected approaches to facilitate the low and zero-emission movement of people within a given area. A TMA must be legally constituted as a non-profit organization, Property/Business Improvement District, or a government entity with a non-revocable funding mechanism, such as a community finance district, dedicated to TMA operations and services. The TMA must provide a minimum level of transportation demand management services (TDM) to employees and residents within the area covered by the AQMP sufficient to achieve the emission reductions claimed by the measure. Services must be enumerated and funded to the satisfaction of Sacramento County in consultation with the SMAQMD including but not limited to the following: guaranteed ride home program; safe routes to school program; yearly reporting to Sacramento County and the SMAQMD on TMA program statistics and progress, trip planning assistance; telework support; bike and pedestrian support, and advocacy.

The proposed project would be required to participate in a qualifying TMA as part of this AQMP, and enforced by Mitigation Measure AQ-1 of the project's Air Quality and Greenhouse Gas Analysis. One example is North Natomas Jibe, which is a TMA that was founded in 1999. The proposed project could annex into the Jibe service area. Membership funding for Jibe is included as a line item on annual property taxes and, thus, funding for this measure would be ensured. The cost of membership dues for properties within the project site would be negotiated at the time of annexation.[9] The proposed project could also implement a separate TMA, subject to approval by Sacramento County and the SMAQMD.

---

[9] Becky Heieck, Executive Director, North Natomas Jibe. Personal Communication [phone] with Briette Shea, Senior Associated/Air Quality Technician, Raney Planning and Management. March 9, 2022.

## Off-Model Mitigation Measures

The following measure that would provide reductions in ozone precursor emissions were included in off-model emissions reductions calculations for the proposed project (see Attachment B):

### *3. No Natural Gas in Residential Land Uses (M-n)*

Features of a structure's envelope that use natural gas, such as water heaters and space heaters, as well as appliances that use natural gas, such as cooking equipment and clothes dryers, emit $NO_X$ and ROG during operation. In order to reduce $NO_X$ and ROG, as well as GHG, emissions from project operations, installation of infrastructure necessary to supply natural gas to future on-site residential developments has been prohibited by Sacramento County. As a result, all proposed residential uses within the project site would be developed using all-electric appliances, as well as all-electric space heating systems and water heating systems. Compared to the on-site combustion of natural gas, the use of electricity for all future on-site appliances and building envelope features within residential developments represents a much less emissions-intensive source of energy. Reductions in the use of natural gas, through the replacement of appliances that would otherwise be fueled by natural gas with all-electric appliances, would result in increases in the consumption of electricity.[10] However, in order to comply with statewide RPS requirements, SMUD is continually reducing the emissions intensity of grid-supplied electricity through development of renewable energy systems; thus, electricity supplied by SMUD is anticipated to become less emissions-intensive with time, eventually being fully renewably sourced by the year 2045. Additionally, pursuant to the 2019 CBSC, the single-family residential component of the proposed project would be required to generate 100 percent renewable energy on-site and, thus, would not be expected to regularly rely on grid electricity from SMUD.[11] The net effect of prohibiting natural gas consumption on-site would be an eventual removal of $NO_X$ and ROG emissions from the use of natural gas in residential uses on-site (see Attachment B).

## Project On-Model Mitigated Operational Emissions

The above described on-model measures would result in total mitigated operational emissions of ozone precursors as shown in Table 3.

**Table 3**
**Project Operational Ozone Precursor Emissions**

| Source | ROG (tons/yr) | $NO_X$ (tons/yr) |
|---|---|---|
| Unmitigated Baseline | 115.38 | 53.06 |
| On-Model Total | 106.50 | 42.70 |
| ***Reduction Achieved*** | ***8.88*** | ***10.36*** |

***Source: CalEEMod, July 2021; and CalEEMod, March 2022 (see Attachment A).***

It should be noted that Table 3 compares emissions from all operational sources before and after the implementation of on-model mitigation measures. As discussed previously, per SMAQMD's *Recommended Guidance for Land Use Emission Reductions*, while emissions reductions targets should be set based solely on mobile-sourced emissions from project operations, the project's

[10] California Commercial. *End Use Survey, Annual Summary Statistics*. Available at: http://capabilities.itron.com/CeusWeb/Chart.aspx. Accessed February 2020.
California Energy Commission. *California Residential Appliance Saturation Study, Volume 2: Study Results*. Available at: https://webtools.dnvgl.com/RASS2009/Uploads/2009_RASS_Volume%202_FINAL _101310.pdf. Accessed April 2020.

[11] It is noted that the residences would still be connected to the SMUD grid, and would have the ability to utilize grid electricity in the case of emergency.

achieved emissions reductions should be calculated based on total project emissions.[12] Therefore, the estimated emissions and the achieved emissions reductions presented in Table 3 represent emissions from all operational sources, not just the mobile sourced emissions.

## Project Off-Model Mitigated Operational Emissions

The off-model measures would result in a further reduction of mitigated operational emissions as presented below:

- Net ROG Reduction: 0.81 tons/yr; and
- Net NOx Reduction: 6.93 tons/yr.

The off-model calculations, which consider the prohibition of natural gas in residential developments, are included as Attachment B.

## Project Overall Mitigated Operations Emissions

The on-model and off-model measures, described above, would result in a total reduction of mitigated operational emissions as presented in Table 4, below:

**Table 4**
**Project Operational Ozone Precursor Emissions**

| Source | ROG (tons/yr) | $NO_X$ (tons/yr) |
|---|---|---|
| Unmitigated Baseline | 115.38 | 53.06 |
| Project Total (On-Model + Off-Model Measures) | 105.69 | 35.77 |
| ***Reduction Achieved*** | ***9.69*** | ***17.29*** |
| ***Reduction Goal*** | ***12.06*** | ***13.84*** |
| **Target Achieved?** | **NO** | **YES** |

***Source: CalEEMod, July 2021; and CalEEMod, March 2022 (see Attachment A).***

As demonstrated in the table, the proposed project would overachieve the $NO_X$ target by 3.45 tons/yr, but would underachieve the ROG target by 2.37 tons/yr. Additionally, it is noted that no further feasible on-site ROG reductions are available for the proposed project.

In the preparation of AQMPs, SMAQMD allows the conversion of ozone precursors at a rate consistent with the most current SIP.[13] As noted previously, the most recent SIP for the Sacramento region is the *Sacramento Regional 2008 NAAQS 8-Hour Ozone Attainment and Reasonable Further Progress Plan*.[14] An updated SIP for the 2015 Federal Ozone Standard is still in development, but this analysis assumes that the Sacramento region non-attainment area will still be $NO_X$-limited. Because the Sacramento region is $NO_X$-limited, reductions in $NO_X$ emissions are more beneficial to achieving the ozone standard than ROG reductions. In other words, reducing a ton of $NO_X$ would result in the same or better regional ozone air quality benefits as reducing a ton of ROG.

---

12 Sacramento Metropolitan Air Quality Management District. *Recommended Guidance for Land Use Emission Reductions Version 4.3 (for Operational Emissions)* [pg. 5]. February 10, 2021.

13 Sacramento Metropolitan Air Quality Management District. *Recommended Guidance for Land Use Emission Reductions Version 4.3 (for Operational Emissions)* [pg. 5]. February 10, 2021.

14 El Dorado Air Quality Management District, Feather River Air Quality Management District, Placer County Air Pollution Control District, Sacramento Metropolitan Air Quality Management District, Yolo-Solano Air Quality Management District. *Sacramento Regional 2008 NAAQS 8-Hour Ozone Attainment and Reasonable Further Progress Plan*. July 24, 2017.

Based on the above, a portion of the $NO_X$ reduction exceedance can be applied to the ROG reduction in order to achieve the required reduction goal.

## Ozone Precursor Conclusion

Based on the above analysis, and as presented in Table 5, the requirements of this AQMP would achieve the total reduction goal of 35 percent from unmitigated baseline mobile emissions for both ROG and $NO_X$.[15]

**Table 5**
**Project Operational Ozone Precursor Emissions**

| Source | ROG (tons/yr) | $NO_X$ (tons/yr) |
|---|---|---|
| Unmitigated Baseline | 115.38 | 53.06 |
| Project Total (On-Model + Off-Model Measures) | 105.69 | 35.77 |
| ***Reduction Achieved*** | ***9.69*** | ***17.29*** |
| ***Reduction Goal*** | ***12.06*** | ***13.84*** |
| **Target Achieved?** | **NO** | **YES** |
| ***Difference*** | ***2.37*** | ***3.45*** |
| *Reallocation of $NO_X$ to ROG* | *-2.37* | *+2.37* |
| ***Updated Difference*** | ***0*** | ***1.08*** |
| **Target Achieved?** | **YES** | **YES** |

***Source: CalEEMod, July 2021; and CalEEMod, March 2022 (see Attachment A).***

If one or more of the requirements of this AQMP are found to be infeasible at the time of development, the County shall allow for replacement mitigation measures to ensure that a minimum 35 percent overall reduction is achieved. For example, the County could require that trees used for landscaping within the project site are characterized as low-biogenic volatile organic compound (BVOC) species per the *Sacramento Regional 8-Hour Ozone Attainment and Reasonable Further Progress Plan* prepared by SMAQMD.

Promoting the use of low BVOC trees is identified as a viable strategy for SMAQMD to achieve emissions reductions within the Sacramento Valley Air Basin, the air basin in which the project site is located, thus improving air quality for the air basin.[16] The project applicant, in coordination with the SMAQMD, shall work with future developers to ensure proper implementation of the measures included in this AQMP, as well as any future replacement mitigation measures. Examples of replacement mitigation measures include the installation of Electric Vehicle (EV) charging equipment in excess of CBSC standards and the implementation of off-site pedestrian and bicycle infrastructure improvements.

# PARTICULATE MATTER ANALYSIS

Although SMAQMD's *Recommended Guidance for Land Use Emission Reductions* only includes recommendations for reductions of the ozone precursors $NO_X$ and ROG, the District maintains thresholds for Particulate Matter (PM) pollution.

[15] As noted above, the updated SIP that addressed the 2015 Federal Ozone Standard has not yet been approved by the SMAQMD board, the CARB, nor the USEPA. If the updated SIP determines that the SFNA is ROG-limited, rather than $NO_X$-limited, the proposed project would be required to purchase and surrender 2.37 tons of ROG Emissions Reduction Credits (ERCs) to achieve the required ozone precursor reduction.

[16] Sacramento Metropolitan Air Quality Management District. *Sacramento Regional 8-Hour Ozone Attainment and Reasonable Further Progress Plan*. September 26, 2013.

PM is a complex mixture of extremely small particles and liquid droplets. The district maintains construction related and operational thresholds for particles that are 10 micrometers in diameter or smaller ($PM_{10}$) and particles that are 2.5 micrometers in diameter or smaller ($PM_{2.5}$). The District's Operational thresholds for PM pollution are presented in Table 6.

**Table 6**
**SMAQMD Operational Thresholds for PM**

| $PM_{10}$ (lbs/day) | $PM_{10}$ (tons/yr) | $PM_{2.5}$ (lbs/day) | $PM_{2.5}$ (tons/yr) |
|---|---|---|---|
| 80 | 14.6 | 82 | 15 |

Note: The foregoing thresholds of significance only apply when all feasible BACT/BMPs are applied. If all feasible BACT/BMPs are not applied, then the applicable threshold of significance for emissions of PM is zero.

***Source: SMAQMD Thresholds of Significance Table. April 2020.***

While SMAQMD's *Recommended Guidance for Land Use Emission Reductions* does not require AQMPs to include specific measures to reduce PM emissions, many of the on- and off-model measures discussed above would have the co-benefit of reducing PM pollution. To demonstrate the PM emissions reduction that would be achieved by this AQMD, the baseline PM emissions were estimated using the same methodology as described above for baseline ozone emissions estimation. The baseline PM emissions for buildout of the annexation area is presented in Table 7.

**Table 7**
**Baseline Operational PM Emissions**

| $PM_{10}$ (lbs/day) | $PM_{10}$ (tons/yr) | $PM_{2.5}$ (lbs/day) | $PM_{2.5}$ (tons/yr) |
|---|---|---|---|
| 651.27 | 102.04 | 181.87 | 28.58 |

***Source: CalEEMod, July 2021 (see Attachment A).***

Similar to ozone precursors, much of the PM emissions related to the project would be related to mobile sources of emissions. Therefore, the application of the on-model mitigation measures presented above would result in a total reduction of PM emissions as shown in Table 8 below. As shown in the table, on-model mitigation measures applied to the proposed project would achieve reductions in PM emissions.

**Table 8**
**Total Reduction of Emissions Due to On-Model Mitigation Measures**

| | $PM_{10}$ (lbs/day) | $PM_{10}$ (tons/year) | $PM_{2.5}$ (lbs/day) | $PM_{2.5}$ (tons/year) |
|---|---|---|---|---|
| Baseline Emissions | 651.27 | 102.04 | 181.87 | 28.58 |
| Mitigated Emissions | 427.52 | 74.97 | 121.81 | 21.29 |
| Total Reduction from Baseline | 223.75 | 27.07 | 60.06 | 7.29 |
| **PERCENT REDUCTION** | **34.36%** | **26.53%** | **33.02%** | **25.51%** |

***Source: CalEEMod, July 2021; and CalEEMod, March 2022 (see Attachment A).***

Adopted methodology for estimating off-model reductions from PM emissions is not available at this time. However, the consumption of natural gas is not known to result in emissions of PM and, thus, application of Off-Model Measure 3, No Natural Gas in Residential Land Uses (M-n), is not expected to result in any additional PM reductions.

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied**

**(lb/MWhr) (lb/MWhr) (lb/MWhr)**

## 1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 intensity factor adjusted to reflect SMUD's RPS projections.

Land Use - All land uses are consistent with the project-specific traffic report.

Construction Phase - construction not modeled.

Vehicle Trips -

Water Mitigation -

| Table Name | Column Name | Default Value | New Value |
|---|---|---|---|
| tblConstructionPhase | NumDays | 6,000.00 | 1.00 |
| tblLandUse | LandUseSquareFeet | 109,130.59 | 208,000.00 |
| tblProjectCharacteristics | CO2IntensityFactor | 357.98 | 0 |

## 1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 intensity factor adjusted to reflect SMUD's RPS projections.

Land Use - All land uses are consistent with the project-specific traffic report.

Construction Phase - construction not modeled.

Vehicle Trips - Trip rates adjusted per the project-specific traffic report from F&P.

Mobile Land Use Mitigation -

Area Mitigation -

Water Mitigation - Water conservation strategy applied to reflect project compliance with MWELO.

Mobile Commute Mitigation -

## 1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 intensity factor adjusted to reflect SMUD's RPS projections.

Land Use - All land uses are consistent with the project-specific traffic report.

Construction Phase - construction not modeled.

Vehicle Trips - Trip rates adjusted per the project-specific traffic report from F&P.

Mobile Land Use Mitigation -

Area Mitigation -

Water Mitigation - Water conservation strategy applied to reflect project compliance with MWELO.

Mobile Commute Mitigation -

## 11.0 Vegetation

UWSP - Proposed Project - Sacramento Metropolitan AQMD Air District, Winter

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied**

# UWSP - Proposed Project

**Sacramento Metropolitan AQMD Air District, Winter**

## 1.0 Project Characteristics

### 1.1 Land Usage

| Land Uses | Size | Metric | Lot Acreage | Floor Surface Area | Population |
|---|---|---|---|---|---|
| General Office Building | 1,573.00 | 1000sqft | 36.11 | 1,573,000.00 | 0 |
| Government Office Building | 74.00 | 1000sqft | 1.70 | 74,000.00 | 0 |
| Medical Office Building | 41.60 | 1000sqft | 0.96 | 41,600.00 | 0 |
| High School | 1,500.00 | Student | 4.57 | 198,991.47 | 0 |
| Junior College (2yr) | 2,500.00 | Student | 2.51 | 208,000.00 | 0 |
| Junior High School | 3,000.00 | Student | 8.10 | 352,685.05 | 0 |
| Arena | 72.00 | 1000sqft | 23.14 | 72,000.00 | 0 |
| Fast Food Restaurant with Drive Thru | 24.00 | 1000sqft | 0.55 | 24,000.00 | 0 |
| Health Club | 65.00 | 1000sqft | 1.49 | 65,000.00 | 0 |
| High Turnover (Sit Down Restaurant) | 104.00 | 1000sqft | 2.39 | 104,000.00 | 0 |
| Hotel | 410.00 | Room | 13.67 | 595,320.00 | 0 |
| Hotel | 410.00 | Room | 13.67 | 595,320.00 | 0 |
| Apartments Mid Rise | 4,989.00 | Dwelling Unit | 131.29 | 4,989,000.00 | 13321 |
| Single Family Housing | 4,367.00 | Dwelling Unit | 1,417.86 | 7,860,600.00 | 11660 |
| Regional Shopping Center | 245.00 | 1000sqft | 5.62 | 245,000.00 | 0 |
| Supermarket | 65.00 | 1000sqft | 1.49 | 65,000.00 | 0 |

### 1.2 Other Project Characteristics

| | | | | | |
|---|---|---|---|---|---|
| **Urbanization** | Urban | **Wind Speed (m/s)** | 3.5 | **Precipitation Freq (Days)** | 58 |
| **Climate Zone** | 6 | | | **Operational Year** | 2045 |
| **Utility Company** | Sacramento Municipal Utility District | | | | |
| | | | | | AQMP - Project Features |
| **CO2 Intensity** | 0 | **CH4 Intensity** | 0.033 | **N2O Intensity** | 0.004 |

UWSP - Proposed Project - Sacramento Metropolitan AQMD Air District, Winter

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied**

**(lb/MWhr) (lb/MWhr) (lb/MWhr)**

## 1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 intensity factor adjusted to reflect SMUD's RPS projections.

Land Use - All land uses are consistent with the project-specific traffic report.

Construction Phase - construction not modeled.

Vehicle Trips - Trip rates adjusted per the project-specific traffic report from F&P.

Mobile Land Use Mitigation -

Area Mitigation -

Water Mitigation - Water conservation strategy applied to reflect project compliance with MWELO.

Mobile Commute Mitigation -

|---|

ROG and NOx emissions are not generated by electricity use. Refer to CalEEMod results Section 5.3, Energy by Land Use. As presented therein, the use of electricity generates GHG but does not generate criteria pollutants.

# 1.0 INTRODUCTION

HELIX Environmental Planning, Inc. (HELIX) prepared this Supplemental Biological Resources Assessment (BRA) Report on behalf of the Upper Westside Specific Plan project (UWSP; Project) proposed by Upper Westside, LLC (Proponent). The purpose of this report is to provide Sacramento County (County), other agencies, and the public with current data on biological resources necessary for reviewing the Project under the California Environmental Quality Act (CEQA) as well as the Federal Endangered Species Act (FESA), California Endangered Species Act (CESA) and related laws. This report includes information on the current biological resources in and adjacent to the Project site, including vegetation, land cover, aquatic resources, general flora and fauna, and natural communities. This BRA includes an analysis of the potential for regionally occurring special-status species to occur on the Project site, potential Project impacts to biological resources that may occur from Project development, and proposed measures to avoid, minimize, and offset impacts to biological resources.

## 1.1 PROJECT LOCATION

The UWSP encompasses approximately 2,199 acres (Study Area) located in the unincorporated community of Natomas in Sacramento County (County), approximately 3.5 miles northwest of downtown Sacramento (**Appendix A, Figure 1,** *Vicinity Map*). The Study Area is bounded by Interstate 80 Interstate (I-) 80 to the south, West Drainage Canal to the east, Fisherman's Lake Slough to the north, and Garden Highway to the west. Three sides of the Study Area are bordered by the North and South Natomas communities in the City of Sacramento. The Study Area is located outside of the County's current Urban Policy Area (UPA) and Urban Services Boundary (USB).

## 1.2 DESCRIPTION OF THE PROPOSED PROJECT

The Study Area is comprised of a multiple-owner Specific Plan Area encompassing 2,199 acres, which includes a 1,523.8-acre Development Area, a 542.4-acre Agricultural Buffer Area, and 133.17 acres of off-site improvement areas (**Appendix A, Figure 2, Proposed Project – Upper Westside Specific Plan**, and **Figure 3, Upper Westside Specific Plan and Sacramento Area Flood Control Agency Properties**). Approximately 271 acres of land within the proposed Agricultural Buffer Area has been acquired by the Sacramento Area Flood Control Agency (SAFCA), and is planned to be improved under the U.S. Army Corps of Engineers (USACE) seepage prevention levee improvements project. Improvements proposed by the levee improvements project will include cutoff walls, landside berms, and a new adjacent levee, as well as approximately 80 acres of woodland mitigation and 27.6 acres are under construction by SAFCA within this area.

As described in further detail below, the UWSP proposes a master-planned community encompassing 1,523.8 acres (Developed Area) consisting of mixed land uses, including residential and non-residential including up to 9,356 housing units with a mixture of densities to support all population segments, and over 3 million gross square feet (sq. ft.) of commercial, retail, and office uses that will serve the community's needs. Key project components include a mixed-use Town Center, eight active parks, a system of greenbelts and multi-use trails with linkages to downtown Sacramento, and an extensive agricultural buffer bordering the western edge of the Study Area.

Development within the Study Area is expected to occur in phases over many years, with the full buildout of the Study Area anticipated over a 20-year timeframe.

### 1.2.1 Proposed Land Use

Proposed land uses within Study Area include a full range of residential designations, from Very Low Density Residential (VLDR) at the north end with an anticipated density of 1.2 dwelling units per acre (du/acre) to Very High Density Residential (VHDR) and Commercial Mixed Use (CMU) within the Town Center District which has an anticipated density of 40 du/acre. Approximately 38 percent of the residential units are proposed for single-family within the VLDR, Low Density Residential (LDR), Low Medium Density Residential (LMDR), and Medium Density Residential (MDR) designations; approximately 7 percent are proposed for multi-family residential located within High Density Residential (HDR), VHDR, and CMU designations.

Three K-8 schools and their adjacent park sites have been distributed throughout the planned community so that approximately 94 percent of future residents are within 0.5 mile of a park and a school. The 25.8-acre Town Center Park is proposed directly east of the roundabout terminus of West El Camino Avenue and the Town Center, which would provide a large open lawn area for sports fields and gathering space for civic events. An Educational Node is planned in the northerly portion of the Study Area and includes a fourth K-8 school, a high school, a community college, and a vocational training campus focused on a 10-acre Urban Farm.

Public/Quasi Public Facilities include a water tank storage site, two electric substation sites, a sewer lift station, and a proposed fire station.

Several different types of Open Space are proposed, including four detention and water quality lake basins, several open drainage channels to convey storm water to the basins, which will be landscaped and provide trails for bicyclists and pedestrians, and an open space corridor. The Corridor and the canal banks will be planted to provide a landscaped buffer along Class 1 bike/pedestrian trails built into those features.

Greenbelt corridors will provide landscaped parkways with a Class I bike/pedestrian trail that will connect to a dispersed program of urban farming elements. A 250-foot open space setback lies south of Fisherman's Lake to create a preserve area for potential sensitive species. To the east, an open space buffer is planned adjacent to the Witter Canal.

The 86.1-acre area of existing agricultural residential located southwest of the proposed Study Area Development Area, will remain as Agricultural Residential to allow the continued operation of small-scale or "specialty" farming and provide a visual buffer and physical separation between the Development Area and residential uses along Garden Highway. Agriculture is designated on 414.3 acres of existing agricultural cropland area located west and northwest of the 1,523.8-acre Development Area. Table 1, Land Use Proposed under UWSP, presents the acres and percentage for each proposed land use in the Study Area. As shown on **Figures 2** and **3**, approximately 133.17 acres of additional off-site areas have been identified where future project-related improvements may be required, including an anticipated Class I bike trail and connection to regional trails to the east, areas of potential roadway tie-ins to Garden Highway, as well as highway interchange expansions, water line tie-in, sewer force main extension, and pump station expansions.

**Table 1**
**LAND USE PROPOSED UNDER UWSP**

| Land Use | Acreage | Percentage (%) |
|---|---|---|
| **Residential** | | |
| Very Low Density Residential (VLDR) | 166.7 | 8 |
| Low Density Residential (LDR) | 390.8 | 18 |
| Low Medium Density Residential (LMDR) | 134.9 | 6 |
| Medium Density Residential (MDR) | 61.9 | 3 |
| High Density Residential (HDR) | 36.4 | 2 |
| Very High Density Residential (VHDR) | 22.6 | 1 |
| ***Subtotal*** | ***813.3*** | ***37*** |
| **Commercial/ Employment** | | |
| Commercial Mixed Use (CMU) | 83.6 | 4 |
| Employment/Highway Commercial (E/HC) | 52.9 | 2 |

## 1.2.2 Proposed Services

### 1.2.2.1 Schools

The Study Area is located within the Natomas Unified School District (NUSD). There are three proposed K-8 schools encompassing 49.1 acres, one 81.1-acre high school, and an 11.0-acre vocational training campus. The K-8 schools are located so that they are within walking and biking distance of future students and are adjacent to parks to allow for shared use of green space. The high school and vocational training campus are located on sites already owned by NUSD and the Los Rios Community College District, respectively.

#### 1.2.2.2 Parks and Open Space

The Study Area is not currently within the boundaries of any recreation or park district. Parks are proposed to be distributed throughout the Study Area, within neighborhoods to be within convenient walking distance of future residents, and adjacent to school sites to allow for shared use. The Town Center District will include an "activated median" and may include small plazas or squares associated with adjacent high-density development, and a larger 25.8-acre park is located directly west of the Town Center District.

The proposed greenbelt and urban farm corridors provide connections throughout the Study Area, with trails through the landscaped corridors connecting between neighborhoods and to spaces targeted for urban farming. Amenities placed along these corridors could include raised planter beds to allow for gardening by local residents, sheds for tools, greenhouses, meeting rooms, and/or an outdoor demonstration kitchen. A 10.0-acre urban farm is proposed to be located next to the envisioned Los Rios Community College vocational training campus. This urban farm will allow for the production of crops and provides a place where students would have test plots and study agricultural methods.

The proposed Westside Canal is centrally located and connects north-south through the Project. It is proposed to be approximately one mile long with pedestrian and bike trails on either side, and front-on architecture. It will be similar to "Amsterdam-style" canals, and could provide recreational opportunities on the water with kayaks, canoes, rowboats, water taxis, etc.

Open space is proposed along the western edge of the Development Area as a buffer between existing agricultural residential and agricultural properties and the proposed housing. The open space corridor is proposed to be 30 to 40 feet in width, planted with native vegetation and trees, and will include a hiking/biking trail to facilitate connectivity and access to the area. This corridor will be located over the top of an underground Natomas Central Mutual Water Company water line.

The entity that would be in charge of operation and maintenance of these facilities has yet to be determined but may include the creation of a new recreation and park district, community service area (CSA), and/or community service district (CSD).

#### 1.2.2.3 Sewer Services

An existing gravity sewer main serving the development area located north of the Study Area is located in El Centro Road and continues east 1.1 miles in San Juan Road to the New Natomas Pump Station (NNPS). This existing sewer line has limited remaining capacity. The UWSP is projected to generate approximately 4.3 million gallons of wastewater per day (MGD) during average dry weather flow (ADWF) and 9.2 MGD during peak wet weather flow (PWWF). As a result, the UWSP proposes a centrally located on-site sewer pump station on a ±0.5-acre site northwest of the intersection of Farm Road and El Centro Road. The on-site backbone sewer system will convey via gravity sewer lines within proposed streets to the on-site sewer pump station, and wastewater will then be pumped via sewer force mains approximately 1.7 miles to the NNPS. It is estimated that a 24-inch force main would be required to serve the Project at full buildout. Multiple force mains to accommodate the anticipated buildout flow may be installed within the same trench to allow for phased development. The force main alignment extends from the on-site pump station as noted above, northward approximately 0.35 mile alongside or within El Centro Road, and eastward approximately 0.25 mile alongside or within San Juan Road to the West Drainage Canal (aka Witter Canal), from which point it will continue approximately 1.1 miles off-

site to the east to the NNPS. The sewer force main alignment in San Juan Road will likely require trenching within the existing street right-of-way, but precise designs or construction drawings have not yet been prepared.

An alternative off-site sewer force main route is also being evaluated to extend east in Farm Road following the existing 80-foot Sacramento Area Sewer District (SASD) interceptor sewer easement, and then continue northeast alongside the freeway to the NNPS in the same easement.

#### 1.2.2.4 Water Supply

The Study Area is located within the City of Sacramento's "American River Place of Use", and as such, the City has been identified as the wholesaler of treated water. The Sacramento County Water Agency (SCWA) is anticipated to be the retailer of water to the UWSP and will own and operate the on-site water distribution system. A potential water storage tank and booster pump station are proposed southeast of the intersection of San Juan Road and El Centro Road to support the water distribution system.

The City of Sacramento currently has an existing 24-inch water transmission main that connects to the existing San Juan Tank site, located off-site to the east. This 24-inch transmission main continues north from San Juan Boulevard in El Centro Road to serve existing development areas within North Natomas to the north and connects to the El Centro Tank.

The UWSP is planned to be served by a series of transmission mains that will extend from the existing 24-inch City of Sacramento transmission main at two points of connection. The first point of connection is at the proposed water storage tank and booster pump site (noted above), while the second point of connection is located in the northern Development Area along El Centro Road. On-site water mains are configured to provide "looped" water service by way of interconnection with service mains which will accommodate phased development.

Alternatively, if the City of Sacramento becomes the retailer of domestic water, then the need for a water storage tank site and booster pump station may be eliminated. In this case, two off-site connections, extending under I-80 to existing infrastructure south of I-80, would be required.

#### 1.2.2.5 Drainage

Four separate approximately 20-acre detention basins are proposed to serve the UWSP and the four main drainage sheds, which generally can be described as the south, west, east, and north basins. This configuration will allow the phased buildout of the UWSP. The backbone storm drainage system illustrates how the four sheds are configured to direct storm drainage via gravity pipes or open channel flow to the basins. These basins will be excavated to a depth that allows a permanent water surface elevation (i.e., "wet" basins) to be maintained, and side slopes will be landscaped to create a passive Open Space amenity. All four basins will have pumping systems to discharge storm water.

The South and West Basins will pump into existing and ultimately improved drainage channels (e.g., Westside Canal) that will convey runoff north and east to the East Basin, where the existing San Juan Pump Station will be upgraded to discharge stormwater into the RD-1000 West Drainage Canal (aka Witter Canal). The north shed drains to the North Basin, where the existing Riverside Pump Station will be upgraded to discharge flows into the RD-1000 West Drainage Canal.

Open drainage channels are proposed north of Farm Road and are located on the east side of Bryte Bend Road, the south side of San Juan Road, and the west side of El Centro Road and will convey storm water to the East Basin. The side slopes of these drainage channels will be planted to create a landscaped corridor and buffer.

Flood protection for the UWSP has also been carefully considered. The UWSP is within the Natomas Basin Federal Emergency Management Agency Zone A Flood Area, and the UWSP boundary abuts the Garden Highway levee. The SAFCA and the USACE are engaged in a separate process and are the lead agencies responsible for constructing levee improvements to provide 100-year and 200-year flood protection for the Natomas Basin, including along Garden Highway adjacent to the UWSP. Their efforts have been ongoing and are anticipated to be completed by 2025.

There is an existing local 100-year floodplain depicted by Flood Insurance Rate Map (FIRM) panels for ±380 acres within the central portion of the Development Area. A separate Conditional Letter of Map Revision (CLOMR) will be prepared as future phases of development advance on the parcels impacted by this designation. A conceptual mass grading plan was prepared for the entire Development Area to illustrate how earthwork from the basins and drainage channels can be utilized to raise development areas to allow the removal of this designation.

#### 1.2.2.6 Electricity

The UWSP is currently bisected by two overhead high-power electrical transmission lines. A Pacific Gas and Electric Company (PG&E) 120kV power line extends across the southerly tip of the UWSP north along Bryte Bend Road, continuing east on the north side of future Street 2, ultimately crossing Interstate 80. A Sacramento Metropolitan Utility District (SMUD) 69kV power line extends north-south along the east side of El Centro Road. Based on discussions with SMUD and the ever-increasing demands on the electrical grid due to electric vehicle charging and other current trends of usage, SMUD directed that the UWSP include two electrical sub-station sites that measure approximately 1.4 acres in size. The substations are planned to be located southwest of the intersection of El Centro Road and Street 2, and southeast of El Centro Road and San Juan Road. A location is also identified for the 12kV power line, which would loop underground through the UWSP along Collector Roads. No off-site electrical system improvements are anticipated.

#### 1.2.2.7 Natural Gas

Currently, there is an existing PG&E natural gas line transmission main that traverses the UWSP from the north down El Centro Road and then southwest along Interstate 80 to the southerly tip of the UWSP by Garden Highway. Given the trend toward electrification of residential development, it is anticipated that there will be significantly less residential demand for natural gas in the future but there could be certain commercial uses or public uses that require access to natural gas supply lines. Gas lines could be extended west in West El Camino Avenue, east in Farm Road, or west in Radio Road. No off-site natural gas system improvements are anticipated.

#### 1.2.2.8 Fire Protection

The UWSP is located within the boundaries of the Natomas Fire Protection District. Although the UWSP is not within the City of Sacramento's jurisdiction, fire protection and prevention services are currently provided by the City's Fire Department through a contract with the Natomas Fire Protection District. The

City's Fire Station 43, at 4201 El Centro Road, is the closest station to the UWSP and is located approximately two miles north of the town center district.

### 1.2.3 Project Phasing

The UWSP is designed to be constructed in four phases. Phase 1 initial project implementation will include mass grading for backbone infrastructure and development of centralized initial project components. Project development will commence upon receipt of approvals/certifications of all necessary permits, entitlements, and environmental documents (anticipated Spring 2024).

### 1.2.4 Project Objectives

The primary objectives defined for the Project[1] are outlined below:

1. Formulate a specific plan and related land use planning documents and regulatory approvals for the Project area as a means of expanding the USB and UPA in an orderly manner and accommodating the County's share of future regional population growth.
2. Create a land use plan that satisfies County policies, regulations, and expectations, as defined in the Sacramento County General Plan (General Plan), including Policies LU-114, LU-119, and LU-120.
3. Provide a comprehensively planned, high quality, large-scale, residential-based community in northwestern Sacramento County, directly northwest of the City of Sacramento, with a balanced mix of uses, employment opportunities, a wide variety of housing types, park and open space, and supporting public and quasi-public uses.
4. Develop a master-planned community that can be efficiently served by existing infrastructure or proposed infrastructure that would encourage logical, orderly development and would discourage leapfrog or piecemeal development and sprawl.
5. Provide residential housing within five miles of the existing job centers of downtown Sacramento and West Sacramento, as well as in close proximity to newly developing or proposed job centers.
6. Create a development that has an overall positive economic impact on Sacramento County and achieves a neutral to positive fiscal impact on the County's finances and existing ratepayers.
7. Create a community that can be logically and efficiently phased to allow the orderly build-out of the community.
8. Provide a safe and efficient circulation system that interconnects land uses and promotes pedestrian and bicycle circulation and transit options that will encourage non-vehicular trips, thereby reducing vehicle miles traveled (VMT).
9. Incorporate parks and open space, including an urban farm-greenbelt and canal, into the project design in a manner that provides community connectivity and encourages walking and bicycle use.
10. Make efficient use of development opportunities as the project site is bordered on three sides by existing or planned urban development.

[1] Project objectives identified by the CEQA Notice of Preparation (NOP).

11. Plan for enough units to provide housing choices in varying densities to respond to a range of market segments, including opportunities for rental units and affordable housing, and significant commercial uses, consistent with the General Plan and Housing Element.
12. Design a land use plan where the development footprint avoids impacts to wetland resources to the extent feasible.
13. Develop a specific plan that maintains existing agricultural land uses and operations to the west of the proposed Development Area.
14. Provide for development that meets the seven identified Sacramento Area Council of Governments (SACOG) Blueprint principles, including the provision of transportation choice, compact development, mixed-use development, housing choice and diversity, use of existing assets, natural resource conservation, and quality design.
15. Develop the Project and any associated on- and/or off-site mitigation to complement the Natomas Basin Habitat Conservation Plan (NBHCP) and the Metro Air Park Habitat Conservation Plan (MAPHCP).
16. Designate open space preserves along the south side of Fisherman's Lake Slough or along the West Drainage Canal that provide a natural buffer to these features, and along the westerly edge of the proposed Development Area to provide a transition between residential and agricultural designations to the west, which will provide a regional benefit for habitat, resources, and open space amenities.
17. Balance development with resource protection in an inter-connected, permanent open space.
18. Create multi-functional habitat within open space corridors that provide on-site habitat and contribute to water quality.

# 2.0 REGULATORY SETTING

Policies, regulations, and plans pertaining to the protection of biological resources on the project site are summarized in the following sections.

## 2.1 FEDERAL REQUIREMENTS

### 2.1.1 Federal Endangered Species Act

The U.S. Congress passed the Federal Endangered Species Act (FESA) in 1973 to protect species that are endangered or threatened with extinction. FESA is intended to operate in conjunction with the National Environmental Policy Act (NEPA) to help protect the ecosystems upon which endangered and threatened species depend.

FESA prohibits the "take" of endangered or threatened wildlife species. "Take" is defined to include harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species or any attempt to engage in such conduct (FESA Section 3 [(3) (19)]). Harm is further defined to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns (50 CFR §17.3). Harass is defined as actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns (50 CFR §17.3). Actions that result in take can result in civil or criminal penalties.

In the context of the proposed Project, FESA consultation with the U.S. Fish and Wildlife Service (USFWS) and/or the National Marine Fisheries Service (NMFS) would be initiated if development resulted in the potential for take of a threatened or endangered species or if the issuance of a Section 404 permit or other federal agency action could result in take of an endangered species or adversely modify critical habitat of such a species.

### 2.1.2 Executive Order 13186: Migratory Bird Treaty Act

The federal Migratory Bird Treaty Act (MBTA; 16 United States Code [USC], Sec. 703, Supp. I, 1989) regulates and prohibits taking, killing, possession of, or harm to migratory bird species listed in Title 50 CFR §10.13. The MBTA protects whole birds, parts of birds, and bird eggs and nests and prohibits the possession of all nests of protected bird species whether they are active or inactive. An active nest is defined as having eggs or young, as described by the Department of the Interior (April 16, 2003, Migratory Bird Permit Memorandum). Nest starts (nests that are under construction and do not yet contain eggs) are not protected from destruction. This international treaty for the conservation and management of bird species that migrate through more than one country is enforced in the United States by the USFWS. Additionally, as discussed below, §3513 of the California Fish and Game Code states that it is unlawful to take or possess any migratory non-game bird as designated in the MBTA. This provides California Department of Fish and Wildlife (CDFW) with enforcement authority for project-related impacts that would result in the "take" of bird species protected under the MBTA. Hunting of specific migratory game birds is permitted under the regulations listed in Title 50 CFR 20. The MBTA was amended in 1972 to include protection for migratory birds of prey (raptors).

### 2.1.3 The Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (Eagle Act) prohibits the taking or possession of and commerce in bald and golden eagles with limited exceptions. Under the Eagle Act, it is a violation to "take, possess, sell, purchase, barter, offer to sell, transport, export or import, at any time or in any manner, any bald eagle commonly known as the American eagle, or golden eagle, alive or dead, or any part, nest, or egg, thereof." Take is defined to include pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, destroy, molest, and disturb. Disturb is further defined in 50 CFR Part 22.3 as "to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available (1) injury to an eagle, (2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior."

## 2.2 STATE REQUIREMENTS

### 2.2.1 California Endangered Species Act

The California Endangered Species Act (CESA) (California Fish and Game Code Sections 2050 to 2097) is similar to the FESA. The California Fish and Wildlife Commission is responsible for maintaining lists of threatened and endangered species under CESA. CESA prohibits the take of listed and candidate (petitioned to be listed) species. "Take" under California law means to hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch capture, or kill (California Fish and Game Code, Section 86). The CDFW can authorize take of a state-listed species under Section 2081 of the California Fish and Game Code if the take is incidental to an otherwise lawful activity, the impacts are minimized and fully mitigated, funding is ensured to implement and monitor mitigation measures, and CDFW determines

that issuance would not jeopardize the continued existence of the species. A CESA permit must be obtained if a project will result in the "take" of listed species, either during construction or over the life of the project. For species listed under both FESA and CESA requiring a Biological Opinion under Section 7 of the FESA, CDFW may also authorize impacts to CESA species by issuing a Consistency Determination under Section 2080.1 of the Fish and Game Code.

### 2.2.2 California Code of Regulations Title 14 and California Fish and Game Code

The official listing of endangered and threatened animals and plants is contained in the California Code of Regulations Title 14 §670.5. A state candidate species is one that the California Fish and Game Code has formally noticed as being under review by CDFW to include in the state list pursuant to Sections 2074.2 and 2075.5 of the California Fish and Game Code.

Legal protection is also provided for wildlife species in California that are identified as "fully protected animals." These species are protected under Sections 3511 (birds), 4700 (mammals), 5050 (reptiles and amphibians), and 5515 (fish) of the California Fish and Game Code. These statutes prohibit take or possession of fully protected species at any time. CDFW has informed non-federal agencies and private parties that they must avoid take of any fully protected species in carrying out projects. However, Senate Bill 618 (2011) allows the CDFW to issue permits authorizing the incidental take of fully protected species under the CESA, so long as any such take authorization is issued in conjunction with the approval of a Natural Community Conservation Plan that covers the fully protected species (California Fish and Game Code Section 2835).

### 2.2.3 California Environmental Quality Act

Under the California Environmental Quality Act of 1970 (Public Resources Code Section 21000 et seq.), lead agencies analyze whether projects would have a substantial adverse effect on a candidate, sensitive, or special-status species (Public Resources Code Section 21001(c)). These "special-status" species generally include those listed under FESA and CESA, and species that are not currently protected by statute or regulation, but would be considered rare, threatened, or endangered under the criteria included in CEQA Guidelines Section 15380. Therefore, species that are considered rare are addressed under CEQA regardless of whether they are afforded protection through any other statute or regulation. The California Native Plant Society (CNPS) inventories the native flora of California and ranks species according to rarity; plants ranked as 1A, 1B, 2A, and 2B are generally considered special-status species under CEQA.[2] Plants from the database with a rank of "A" were considered special-status species under CEQA for the purpose of this report.

Although threatened and endangered species are protected by specific federal and state statutes, State CEQA Guidelines Section 15380(d) provides that a species not listed on the federal or state list of protected species may be considered rare if it can be shown to meet certain specified criteria. These criteria have been modeled after the definition in FESA and the section of the California Fish and Game Code dealing with rare or endangered plants and animals. Section 15380(d) of the State CEQA Guidelines allows a public agency to undertake a review to determine if a significant effect on species that have not yet been listed by either the USFWS or CDFW (i.e., candidate species) would occur. Thus, CEQA provides an agency with the ability to protect a species from the potential impacts of a project

[2] The California Rare Plant Rank system can be found online at https://www.cnps.org/rare-plants.

until the respective government agency has an opportunity to designate the species as protected, if warranted.

### 2.2.4 California Native Plant Protection Act

The Native Plant Protection Act (NPPA), enacted in 1977, allows the Fish and Game Commission to designate plants as rare or endangered. The NPPA prohibits take of endangered or rare native plants, with some exceptions for agricultural and nursery operations and emergencies. Vegetation removal from canals, roads, and other sites, changes in land use, and certain other situations require proper advance notification to CDFW.

### 2.2.5 Nesting Birds

California Fish and Game Code Subsections 3503 and 3800 prohibit the possession, take, or needless destruction of birds, their nests, and eggs, and the salvage of dead nongame birds. California Fish and Game Code Subsection 3503.5 protects all birds in the orders of Falconiformes and Strigiformes (birds of prey). Fish and Game Code Subsection 3511 states that fully protected birds or parts thereof may not be taken or possessed at any time. Fish and Game Code Subsection 3513 states that it is unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA. The Attorney General of California has released an opinion that the Fish and Game Code prohibits incidental take (CDFW 2018).

### 2.2.6 California Food and Agriculture Code Section 403

CDFA Code Section 7271 designates the CDFA as the lead department in noxious weed management responsible for implementing state laws concerning noxious weeds. Representing a statewide program, noxious weed management laws and regulations are enforced locally in cooperation with the County Agricultural Commissioner.

Under state law, noxious weeds include any species of plant that is, or is liable to be, troublesome, aggressive, intrusive, detrimental, or destructive to agriculture, silviculture, or important native species, and difficult to control or eradicate, which the director, by regulation, designates to be a noxious weed (CDFA Code Section 5004).

## 2.3 LOCAL PLANS AND POLICIES

### 2.3.1 Native Trees and Other Protected Trees

Sacramento County has adopted measures for the preservation of native trees through the County Code and the General Plan.

Chapter 19.12 of the County Code, titled “Tree Preservation and Protection”, provides protection for native oak trees in the designated urban area of the unincorporated county. Native oaks are defined as valley oak (*Quercus lobata*), interior live oak (*Q. wislizeni*), blue oak (*Q. douglasii*), and oracle oak (*Q. x morehus*) trees having a diameter at breast height (dbh) of at least 6 inches for a single stem tree or a combined dbh of 10 inches for a tree with multiple stems. Grading, trenching, or filling within the dripline, or removal, destruction, or killing of a tree as defined in the ordinance is prohibited without a

tree permit. Tree permits are issued by the Director of Public Works or by the body approving a discretionary action such as a conditional use permit. Section 19.12.150 provides authority to the approving bodies to adopt mitigation measures as conditions of approval for discretionary projects in order to protect other species of trees in addition to native oaks. The Tree Preservation Ordinance does not specify replacement obligations for native oaks removed under a tree permit; the approving body may impose "reasonable conditions of approval as are necessary to minimize the environmental, health, or safety effects of the development or use" and may require financial security to ensure completion of "additional work" specified in the conditions of approval. "Additional work" may include replanting.

The Conservation Element of the General Plan includes a section regarding landmark and heritage tree protection. The stated objective of the plan is that "heritage and landmark tree resources [are] preserved and protected for their historic, economic, and environmental functions." The plan states that:

> *"Conservation of native tree species other than oaks and preservation of native oaks and landmark trees is the primary intent of the policies in the section. However, if preservation cannot be attained, then loss of the protected trees shall be compensated. Compensation for tree loss may be achieved by on-site or off-site replacement or payment into a Tree Preservation Fund."*

The section discusses thresholds of significance under CEQA for impacts to trees and concludes that tree impacts are "circumstantial". The section states that projects that exceed the threshold of significance may have significant impacts even after mitigation, and conversely, tree loss of some species that exceed the threshold in certain circumstances may not constitute a significant impact. The section states that the final determination of significance will be made by the Environmental Coordinator. The section does not include a definition of "tree" based on dbh.

Policy CO-139 of the General Plan states that "Native trees other than oaks, which cannot be protected through development, shall be replaced with in-kind species in accordance with established tree planting specifications, the combined diameter of which shall equal the combined diameter of the trees removed." Tree replacement values are stipulated as follows:

- one D-pot seedling = 1 inch dbh
- one 15-gallon tree = 1 inch dbh
- one 24-inch box tree = 2 inches dbh
- one 36-inch box tree = 3 inches dbh.

### 2.3.2 Wetlands and Riparian

The Conservation Element of the General Plan includes policies regarding the preservation of natural habitats and land uses adjacent to rivers and streams. Policy CO-58 requires that the County ensure no net loss of wetlands, riparian woodlands, and oak woodlands; Policy CO-59 requires mitigation for loss or modification of vernal pools, wetlands, riparian, native vegetation, and special-status species habitat.

### 2.3.3 Swainson's Hawk Mitigation Fee Program

CDFW requires that mitigation for foraging habitat be provided within the known foraging radius of a nesting Swainson's hawk (SWHA). In 1997, in response to the need to mitigate for the loss of SWHA foraging habitat in Sacramento County, the County Board of Supervisors adopted an ordinance that

established a Swainson's Hawk Impact Mitigation Program (Chapter 16.130 of the Sacramento County Code). The Swainson's Hawk Impact Mitigation Program has been amended several times; the latest amendment went into effect in December 2009. By adopting the Swainson's Hawk Impact Mitigation Program, the Board of Supervisors found that "*the most effective means of mitigation for the loss of suitable Swainson's hawk foraging habitat is the direct preservation, in perpetuity, of equally suitable foraging habitat on an acre-per acre basis based on the Project's determined acreage impact*". The Sacramento County Department of Planning and Environmental Review administers the Swainson's Hawk Impact Mitigation Program.

Statewide, the CDFW recommends implementing the measures set forth in the CDFW *Staff Report Regarding Mitigation for Impacts to Swainson's Hawks (Buteo swainsoni) in the Central Valley of California* (CDFW 1994) for impacts to SWHA foraging habitat unless local jurisdictions develop an individualized methodology designed specifically for their location. Sacramento County has developed such a methodology and received confirmation from CDFW in May of 2006 that the methodology is a better fit for unincorporated Sacramento County and should replace the statewide, generalized methodology for determining impacts to foraging habitat.

Swainson's hawk foraging habitat value is greater in large expansive open space and agricultural areas than in areas that have been fragmented by agricultural-residential or urban development. The methodology for unincorporated Sacramento County is based on the concept that impacts to SWHA foraging habitat occur as properties develop to increasingly more intensive uses on smaller minimum parcel sizes. Therefore, the methodology relies mainly on the minimum parcel size allowed by zoning to determine habitat value. For the purpose of the methodology, properties with AR-5 zoning and smaller are assumed to have lost all foraging habitat value for the purposes of the mitigation fee program. The parcels that make up the project site are all zoned greater than AR-5 and impacts to foraging habitat will be greater than 40 acres. Therefore, mitigation for the loss of SWHA foraging is required for the project under the County's Swainson's Hawk Impact Mitigation Program.

### 2.3.4 Metro Air Park Habitat Conservation Plan

The MAPHCP is an additional guiding program developed by the Metro Air Park (MAP) Property Owners' Association as the MAP site was outside of the City of Sacramento limit lines and thus could not receive coverage under the NBHCP. The MAPHCP was designed to support the regional Conservation Strategy of the NBHCP. As a result, the MAPHCP Covered Species is a subset of species covered under the NBHCP, and its biological goals and objectives are a subset of the NBHCP's goals and objectives.

### 2.3.5 Natomas Basin Habitat Conservation Plan

The NBHCP was developed to satisfy the requirements of FESA and CESA to provide an overarching program that facilitates and mitigates for incidental take of threatened and endangered species (Covered Species) for project proponents planning projects within the NBHCP's boundaries. The NBHCP is intended to minimize incidental take of up to 22 Covered Species and habitat loss associated with urban development. Incidental "Take" is defined by FESA as "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect any threatened or endangered species. Harm may include significant habitat modification where it actually kills or injures a listed species through impairment of essential behavior (e.g., nesting or reproduction)."

The NBHCP and MAPHCP authorize approximately 17,500 acres of development collectively in the MAP, City of Sacramento, and Sutter County Permit Areas, and stipulate the preservation of 8,750 acres outside of these areas in a reserve system intended to mitigate for impacts to the 22 Covered Species. At full build-out, the planned TNBC reserve system will consist of approximately 4,375 acres of rice, 2,187 acres of created marsh, and 2,187 acres of upland habitat. In this reserve system, the land is planned to be managed to enhance its values for the Covered Species.

The USFWS established the reserve system within habitat created/managed by the NBHCP to mitigate and offset the effects of the loss of 17,500 acres of habitat. Consequently, most of the NBHCP's goals and objectives are related to creating a reserve system that provides interconnected habitat that is intended to sustain Covered Species' populations in the Natomas Basin for the foreseeable future. The NBHCP also includes avoidance, minimization, and mitigation measures to reduce the effects of development on Covered Species and to ensure the creation and effective operation of the TNBC reserve system.

# 2.4 JURISDICTIONAL WATERS

## 2.4.1 Federal Jurisdiction

### 2.4.1.1 Waters of the U.S.

On May 25, 2023, the U.S. Supreme Court issued a decision in the case of Sackett v. Environmental Protection Agency (Supreme Court of the United States 2023), which will ultimately influence how federal waters are defined. The May 25, 2023, Supreme Court decision in Sackett v. Environmental Protection Agency determined that "the CWA extends to only those 'wetlands with a continuous surface connection to bodies that are "waters of the U.S." in their own right,' so that they are 'indistinguishable' from those waters." The U.S. Environmental Protection Agency (USEPA) and the U.S. Army Corps of Engineers (USACE) after review issued a final rule to replace the 2023 rule that amends the "Revised Definition of "Waters of the U.S." to conform key aspects of the regulatory text to the U.S. Supreme Court's May 25, 2023, decision in the case of Sackett v. Environmental Protection Agency.

Unless considered an exempt activity under Section 404(f) of the Federal Clean Water Act (CWA), any person, firm, or agency planning to alter or work in "waters of the U.S.," including the discharge of dredged or fill material, must first obtain authorization from the USACE under Section 404 of the Clean Water Act (CWA; 33 USC 1344). Permits, licenses, variances, or similar authorization may also be required by other federal, state, and local statutes. Section 10 of the Rivers and Harbors Act prohibits the obstruction or alteration of navigable waters of the U.S. without a permit from USACE (33 USC 403). Activities exempted under Section 404(f) are not exempted within navigable waters under Section 10.

The Clean Water Act (33 United States Code (USC) 1251-1376) provides guidance for the restoration and maintenance of the chemical, physical, and biological integrity of the nation's waters.

Section 401 requires that an applicant for a federal license or permit that allows activities resulting in a discharge to waters of the U.S. obtain a state certification that the discharge complies with other provisions of CWA. The Regional Water Quality Control Board (RWQCB) administers the certification program in California and may require State Water Quality Certification before other permits are issued.

Section 402 establishes a permitting system for the discharge of any pollutant (except dredged or fill material) into waters of the U.S.

Section 404 establishes a permit program administered by USACE that regulates the discharge of dredged or fill material into waters of the U.S. (including wetlands). Implementing regulations by USACE are found at 33 CFR Parts 320-332. The Section 404 (b)(1) Guidelines were developed by the USEPA in conjunction with USACE (40 CFR Part 230), allowing the discharge of dredged or fill material for non-water dependent uses into special aquatic sites only if there were no practicable alternative that would have less adverse impacts.

## 2.4.2 State Jurisdiction

### 2.4.2.1 Waters of the State

Any action requiring a CWA Section 404 permit, or a Rivers and Harbors Act Section 10 permit, must also obtain a CWA Section 401 Water Quality Certification. The State of California Water Quality Certification (WQC) Program was formally initiated by the State Water Resources Control Board (SWRCB) in 1990 under the requirements stipulated by Section 401 of the Federal CWA. Although the CWA is a Federal law, Section 401 of the CWA recognizes that states have the primary authority and responsibility for setting water quality standards. In California, under Section 401, the State and Regional Water Boards are the authorities that certify that the issuance of a federal license or permit does not violate California's water quality standards (i.e., that they do not violate Porter-Cologne and the Water Code). The WQC Program currently issues the WQC for discharges requiring USACE permits for fill and dredge discharges within Waters of the United States, and now also implements the State's wetland protection and hydromodification regulation program under the Porter-Cologne Water Quality Control Act.

On May 28, 2020, the SWRCB implemented the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (Procedures) for inclusion in the forthcoming Water Quality Control Plan for Inland Surface Waters and Enclosed Bays and Estuaries and Ocean Waters of California (SWRCB 2019). The Procedures consist of four major elements:

I. A wetland definition;
II. A framework for determining if a feature that meets the wetland definition is a water of the state;
III. Wetland delineation procedures; and,
IV. Procedures for the submittal, review, and approval of applications for Water Quality Certifications and Waste Discharge Requirements for dredge or fill activities.

Under the Procedures and the State Water Code (Water Code §13050(e)), "Waters of the State" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state." "Waters of the State" includes all "Waters of the U.S."

More specifically, a wetland is defined as: "*An area is wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation*." The wetland definition encompasses the full range of wetland types commonly recognized in California, including some features not protected under federal law, and reflects current scientific understanding of the formation and functioning of wetlands (SWRCB 2019).

Unless excluded by the Procedures, any activity that could result in the discharge of dredged or fill material to Waters of the State, which includes Waters of the U.S. and non-federal Waters of the State, requires filing of an application under the Procedures.

#### 2.4.2.2 California Department of Fish and Wildlife

CDFW is a trustee agency that has jurisdiction under Section 1600 *et seq*. of the California Fish and Game Code. Under Sections 1602 and 1603, a private party must notify CDFW if a proposed project will "substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake designated by the department, or use any material from the streambeds… except when the department has been notified pursuant to Section 1601." Additionally, CDFW asserts jurisdiction over native riparian habitat adjacent to aquatic features, including native trees over four inches in dbh. If an existing fish or wildlife resource may be substantially adversely affected by the activity, CDFW may propose reasonable measures that will allow the protection of those resources. If these measures are agreeable to the parties involved, they may enter into an agreement with CDFW identifying the approved activities and associated mitigation measures. Generally, CDFW recommends applying for a Streambed Alteration Agreement (SAA) for any work done within the lateral limit of water flow or the edge of riparian vegetation, whichever is greater.

## 2.5 CEQA SIGNIFICANCE

Section 15064.7 of the CEQA Guidelines encourages local agencies to develop and publish the thresholds that the agency uses in determining the significance of environmental effects caused by projects under its review. However, agencies may also rely upon the guidance provided by the expanded Initial Study Checklist included in Appendix G of the CEQA Guidelines. Appendix G provides examples of impacts that would normally be considered significant. Based on these examples, impacts to biological resources would normally be considered significant if the project would:

1) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS;

2) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFW or USFWS;

3) Have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;

4) Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;

5) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; and

6) Conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional, or state habitat conservation plan.

An evaluation as to whether or not an impact on biological resources would be substantial must consider both the resource itself and how that resource fits into a regional or local context. Substantial impacts would be those that would diminish or result in the loss of an important biological resource, or those that would obviously conflict with local, State, or federal resource conservation plans, goals, or regulations. Impacts are sometimes locally important but not significant, according to CEQA. The reason for this is that although the impacts would result in an adverse alteration of existing conditions, they would not substantially diminish, or result in the permanent loss of, an important resource on a population-wide or region-wide basis.

### 2.5.1 California Native Plant Society

The CNPS maintains a rank of plant species native to California that have low population numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the *Inventory of Rare and Endangered Vascular Plants of California*. Potential impacts to populations of CNPS-ranked plants receive consideration under CEQA review. The following identifies the definitions of the CNPS Rare Plant Ranking System:

- Rank 1A: Plants presumed Extinct in California and either rare or extinct elsewhere
- Rank 1B: Plants Rare, Threatened, or Endangered in California and elsewhere
- Rank 2A: Plants presumed extirpated in California but common elsewhere
- Rank 2B: Plants Rare, Threatened, or Endangered in California, but more common elsewhere
- Rank 3: Plants about which we need more information – A Review List

All plants appearing on CNPS Rank 1 or 2 are considered to meet CEQA Guidelines Section 15380 criteria. The CDFW, in consultation with the CNPS, assigns a California Rare Plant Rank (CRPR) to native species according to rarity; plants with a CRPR of 1A, 1B, 2A, 2B, or 3 are generally considered special-status species under CEQA. Furthermore, the CNPS CRPR includes levels of threat for each species. These threat ranks include the following:

0.1 - Seriously threatened in California (over 80% of occurrences threatened/high degree and immediacy of threat);

0.2 - Moderately threatened in California (20 to 80% occurrences threatened/moderate degree and immediacy of threat); and

0.3 - Not very threatened in California (less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known).

Threat ranks do not designate a change of environmental protections, so that each species (i.e., CRPR 1B.1, CRPR 1B.2, CRPR 1B.3, etc.), be fully considered during the preparation of environmental documents under CEQA.

### 2.5.2 California Department of Fish and Wildlife Species of Concern

Additional fish, amphibian, reptile, bird, and mammal species may receive consideration by CDFW and lead agencies during the CEQA process, in addition to species that are formally listed under FESA and CESA or listed as fully protected. These species are included on the Special Animals List, which is maintained by CDFW. This list tracks species in California whose numbers, reproductive success, or

habitat may be in decline. In addition to "Species of Special Concern" (SSC), the Special Animals List includes species that are tracked in the California Natural Diversity Database (CNDDB) but warrant no legal protection. These species are identified as "California Special Animals".

# 3.0 METHODS

Studies conducted for the preparation of this BRA included a desktop evaluation and background research to identify sensitive biological communities and/or special-status species with the potential to occur on or near the project site, as well as biological field surveys to document baseline conditions and special-status species and/or their habitats on and adjacent to the site. These included biological reconnaissance surveys, aquatic resource delineations, habitat assessments and focused surveys for Swainson's hawk (*Buteo swainsoni*), giant garter snake (*Thamnophis gigas*) (GGS), and focused botanical surveys. Methods are presented below in Section 3.2.

## 3.1 DATABASE AND LITERATURE REVIEW

The most current available lists of special-status species known to occur and/or having the potential to occur in the project region were reviewed to determine their potential to occur on the project site or otherwise be affected by project-related activities on the project site.

For the purposes of this analysis, special-status species are defined as those species meeting one or more of the following criteria:

- Listed as Threatened or Endangered under FESA;
- Listed as Threatened or Endangered under CESA;
- Under review for listing under FESA or CESA (Candidate);
- "Fully Protected" under California Fish and Game Code Section 3511, 4700, 5050, or 5515;
- Included on the list of SSC by the CDFW;
- Included on the Watch List of species that may qualify as SSC by the CDFW;
- Having a California Rare Plant Rank (CRPR) of 1A (presumed extinct in California and rare elsewhere), 1B (rare in California and elsewhere), 2A (presumed extinct in California but more common elsewhere), 2B (rare in California but more common elsewhere), or 3 (more information needed); or

The following lists were reviewed and are included in Appendix B:

- The Sacramento Fish and Wildlife Office list of threatened and endangered species that may occur in the project site and/or may be affected by the project (USFWS 2024).
- The CNPS list of special-status plants documented in the *Sacramento West, Sacramento East, Saxon, Davis, Grays Bend, Rio Linda, Taylor Monument, Clarksburg,* and *Florin* 7.5-minute quads (CNPS 2024);

- The California Natural Diversity Database (CNDDB; CDFW 2024 list of special-status species documented in the *Sacramento West, Sacramento East, Saxon, Davis, Grays Bend, Rio Linda, Taylor Monument, Clarksburg,* and *Florin* 7.5-minute quads.

Table C-1 in Appendix C presents the general habitat requirements, status, the potential for the species to occur, and the rationale for each species evaluated. Species determined to have no potential to occur in the project site or be otherwise affected by activities in the site were excluded from further evaluation. Species having the potential to occur in the project site and/or be affected by project activities are evaluated in detail in Section 5 of this BRA.

**Will Not Occur**: Species is either sessile (i.e., plants) or so limited to a particular habitat that it cannot disperse on its own and/or habitat suitable for its establishment and survival does not occur on the Study Area;

**Not Expected**: Species moves freely and might disperse through or across the Study Area, but suitable habitat for residence or breeding does not occur in the Study Area, potential for an individual of the species to disperse through or forage in the site cannot be excluded with 100 percent certainty;

**Presumed Absent**: Habitat suitable for residence and breeding occurs in the Study Area; however, focused surveys conducted for the current project were negative;

**May Occur**: Species was not observed on the site and breeding habitat is not present, but the species has the potential to utilize the site for dispersal;

**High**: Habitat suitable for residence and breeding occurs in the Study Area and the species has been recorded recently in or near the Study Area, but was not observed during surveys for the current project; and

**Present**: The species was observed during biological surveys for the current project and is assumed to occupy the Study Area or utilize the Study Area during some portion of its life cycle.

Only those species that are known to be present, have a high potential to occur, or may occur are discussed further in the following sections.

The USFWS National Wetlands Inventory (USFWS 2023) was reviewed to determine the presence of wetlands and water features in the project area.

## 3.2 BIOLOGICAL SURVEYS

### 3.2.1 Biological Surveys

HELIX and staff from Bargas Environmental Consulting, LLC (Bargas) conducted numerous biological surveys over the last five years. Biological surveys conducted at the Project site are summarized. A list of plant and animal species observed during the general biological surveys conducted by HELIX (not including protocol surveys) is included in Appendix D. Biological surveys are described briefly below.

### 3.2.2 General Biological Reconnaissance

HELIX senior Biologist and wetland scientist Patrick Martin and HELIX Botanist/wetland scientist Greg Davis conducted biological reconnaissance surveys at the project site. Mr. Martin and Mr. Davis conducted biological reconnaissance surveys on March 7 and 8, 2023. Biological reconnaissance surveys included habitat mapping and recording plant and wildlife inventories. Boundaries of biological habitats were primarily determined based on the composition of dominant plant species. Transects were walked within accessible parcels to gather as much visual site coverage as possible. Inaccessible parcels were reviewed on aerial photographs and viewed remotely in the field via binoculars. Habitat types and animal species (and sign) observed on-site were documented. Representative photos of the site are provided in Appendix E.

### 3.2.3 Botanical Surveys

Bargas conducted botanical surveys (Bargas 2020) on a 568.7-acre portion of the Study Area. The surveys were conducted by Bargas biologists in March, April, May, June, and July 2019, which encompassed the appropriate blooming periods for each of the target species. Additional site visits were conducted by Bargas biologist Krystal Pulsipher in April and June 2020. Bargas stated that botanical inventories were conducted in compliance with the CDFW's *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (CDFW, 2018), *CNPS Botanical Survey Guidelines* (CNPS, 2001), and USFWS's *Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plants* (USFWS, 2000). Habitat types and plant species observed on-site were documented (Bargas 2020).

### 3.2.4 Swainson's Hawk Surveys

Bargas conducted protocol SWHA surveys (Bargas 2019) on a 568.7-acre portion of the Study Area, including a half-mile buffer around the 568.7-acre area. The surveys were conducted by Bargas biologists in March, April, and July 2019 that consisted of seven separate site visits. Bargas stated that protocol SWHA surveys were conducted following the methodology recommended by the Swainson's Hawk Technical Advisory Committee (2000). Habitat types and plant species observed on-site were documented (Bargas 2020). Surveys were conducted by vehicle using public roads, with limited vehicle access on unimproved interior roads where access had been granted. Some portions of the Project Vicinity were surveyed on foot where publicly accessible, such as along canals and in public parks. The interior portion of the Study Area was viewed using powerful optics that allowed sufficient viewing of all portions of the entire Project. Habitat types and animal species (and sign) observed on-site were documented.

### 3.2.5 Giant Garter Snake Habitat Assessment and Surveys

#### 3.2.5.1 Giant Garter Snake Habitat Assessment

Bargas performed a habitat assessment and surveys for GGS on a 568.7-acre portion of the Study Area from May 4 to May 16, 2018 (Bargas 2020). Bargas limited the field assessment to four areas that included canals and irrigation ditches that were considered suitable habitat for GGS. Upland habitat between the areas of interest and other wetland features were also assessed for GGS habitat.

#### 3.2.5.2 Giant Garter Snake Presence/Absence Surveys

Giant garter snake presence/absence studies were conducted by Eric Hansen to investigate the presence or absence of GGS in a 568.7-acre portion of the Study Area. Per Bargas, Mr. Hansen performed focused aquatic trapping conducted according to accepted protocols and searched for the occurrence of GGS using environmental DNA (eDNA) sampling techniques (Hansen 2019; Hansen 2020). Trapping took place from June through September in both 2019 and 2020. Mr. Hansen deployed 400 floating aquatic traps across suitable aquatic habitat and monitored them for a total of 40,703 trap-days. Full descriptions of the methods of this study are contained in Hansen (2019; 2020).

## 3.3 WETLANDS AND OTHER WATERS

Bargas biologists conducted an aquatic resources delineation of potential wetlands and other waters of the U.S. and State on the Project site on July 11 and 12, 2019, and April 22, 2020 (Bargas 2020). The presence of wetlands and other waters were determined based on the USACE three-parameter method described in the *Corps of Engineers Wetlands Delineation Manual* (USACE 1987) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0*; USACE 2008a), and *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE 2008b). Aquatic resources in the Project site were also evaluated for their potential to qualify as waters of the State subject to RWQCB jurisdiction and/or CDFW jurisdiction.

USACE issued a Preliminary Jurisdictional Determination (PJD) for the 568.7-acre Surveyed Area, which documented 18 aquatic resource features encompassing 11.22 acres of Other Waters potentially subject to jurisdiction under Section 404 of the Clean Water Act (CWA) (USACE 2020). Thirty-two features of the 38 identified features appear to be substantially interconnected through culverts or other infrastructure utilized for agricultural irrigation/drainage (Bargas 2022). One feature (R5UBFx-21) appears to receive water from the Sacramento River via the Riverside Pumping Plant. Five features (R5UBFx-25, -33, -34, -36, and -37) have an evident or likely hydrologic connection to the West Drainage Canal through either the pumping station (Bargas 2022), culverts, or other agricultural infrastructure.

The Bargas aquatic resource assessment did not include areas outside of the UWSP. HELIX prepared an aquatic resources delineation for the remaining Study Area that is summarized in Section 5.4 below.

### 3.3.1 Subsections 1 and 3

HELIX biologists Patrick Martin and Greg Davis conducted an aquatic resources delineation of potential wetlands and other waters of the U.S. and State on the Project site on March 7, 2023. Previously mapped jurisdictional features were reviewed in the field, and the remaining features in the 1,497.3-acre Study Area were assessed from publicly accessible areas. No new data was taken in the Study Area to classify the site's soils, vegetation, and hydrologic characteristics since access to the remaining 1497.3 acres of the Study Area not previously analyzed by Bargas (2020) was not available. HELIX followed the procedures from Subsection 1 and Subsection 3 of the Methods from the Wetlands Delineation Manual (USACE 1987) for the remaining 1,497.3-acre Study Area of the Study Area by applying information already collected from the 568.7-acre aquatic resources delineation completed by Bargas (2020). Subsections 1 and 3 of Section D. Routine Determinations of the Wetlands Delineation Manual (USACE 1987) describe procedures to prepare an aquatic resources delineation by using existing data that have already been collected for a portion of the Project site and applying those data to the

balance of the Study Area without an additional site visit. HELIX used existing resources, databases, and imagery to synthesize Bargas' data to map aquatic resources within the 1,497.3-acre area within the Study Area and within Phase I off-site areas. The USACE concurred with the request of a preliminary jurisdiction determination (SPK-2020-00237) that the aquatic resource boundaries for the 568.7-acre portion of the Study Area are regulated under Section 404 of the Clean Water Act. The original 44.94 acres of aquatic resources included in the 2023 delineation by HELIX are comprised of a total of 11.22 acres of aquatic resources that were verified by the USACE in 2020 (SPK-2020-00237), and a total of 33.72 acres of aquatic resources that were delineated by HELIX in 2023. A Preliminary Jurisdictional Determination has also been issued for the 33.72 acres of wetlands on February 23, 2024 (SPK-2020-00237). The additional 0.14 acre of added aquatic resources are likely potential jurisdictional waters, and have been added to the appropriate Project permit applications.

## 3.4 INVASIVE SPECIES

Plant species observed on the Project site were compared to the list of invasive plants in California maintained by the California Invasive Plant Council (Cal-IPC; 2006) and the list of noxious weeds maintained by the CDFA (2021). Several invasive and noxious weed species listed by Cal-IPC and CDFA occur in the Project site, as would be expected due to its highly disturbed nature. Invasive and noxious weeds are identified on the plant species observed list in Appendix D and discussed further in Section 5.6.3.

CDFA List "C" species warrant state-endorsed holding action and eradication only when found in a nursery; actions to retard spread outside of nurseries are conducted at the discretion of the commissioner; and warrant rejection only when found in a crop seed for planting or at the discretion of the commissioner. In addition, the Cal-IPC categorizes plants as "high, moderate, or limited," reflecting the level of each species' negative ecological impact in California. Each plant on the list received an overall rating of high, moderate, or limited based on the following evaluation criteria:

- High – These species have severe ecological impacts on physical processes, plant and animal communities, and vegetation structure. Their reproductive biology and other attributes are conducive to moderate to high rates of dispersal and establishment. Most are widely distributed ecologically.

- Moderate – These species have substantial and apparent, but generally not severe, ecological impacts on physical processes, plant and animal communities, and vegetation structure. Their reproductive biology and other attributes are conducive to moderate to high rates of dispersal, though establishment is generally dependent upon ecological disturbance. Ecological amplitude and distribution may range from limited to widespread.

- Limited – These species are invasive, but their ecological impacts are minor on a statewide level or there was not enough information to justify a higher score. Their reproductive biology and other attributes result in low to moderate rates of invasiveness. Ecological amplitude and distribution are generally limited, but these species may be locally persistent and problematic.

# 4.0 RESULTS: ENVIRONMENTAL SETTING

## 4.1 ENVIRONMENTAL SETTING

The Study Area is contained within the Natomas Basin. Lands within the Study Area are primarily agricultural, with existing agricultural residential homes inside the northeastern and southwestern boundaries, and commercial uses located near the intersection of El Centro Road and West El Camino Avenue. Existing General Plan Land Use designations include Agricultural Cropland (1,858.3 acres); Agricultural Residential (97.0 acres); Commercial and Office (52.2 acres); and Recreation (58.8 acres).

The Study Area predominantly consists of graded agricultural land, including row crops and dry farming. Well-known agriculturally related uses include Goblin Gardens Pumpkin Patch at Bastiao Farms and Perry's Garden. Several large agricultural residences are located along the southwestern border and northeastern corner of the Study Area. One of these residences, located in the northeastern corner, is used for farm equipment, automobile, and scrap metal storage. Numerous unlined drainage canals and ditches cross the agricultural areas and are generally oriented north-south and east-west along section lines and parcel boundaries to provide irrigation water and drainage.

The southwest quadrant next to the I-80 interchange is currently auto-oriented Highway Commercial and includes gas stations, restaurants, motels, self-storage facilities, and vacant lots. The northwest quadrant next to the interchange is currently "heavy" highway oriented with the 49er Truck Stop, the Pape Machinery & Equipment sales and repair yard, and two single-story industrial buildings that measure approximately 20,000 sq. ft. There are also several vacant or underutilized parcels. A radio broadcast tower is located in the northern part of the Study Area, and a television broadcast tower is located within the agricultural residential area along the southwestern boundary.

The Study Area is comprised of a multiple-owner Specific Plan Area encompassing 2,199 acres, which includes a 1,523.8-acre Development Area, a 542.4-acre Agricultural Buffer Area, and 133.17 acres of off-site improvement areas. Approximately 271 acres of land within the proposed western Agricultural Buffer Area has been acquired by the Sacramento Area Flood Control Agency (SAFCA) and is planned to be improved under the USACE seepage prevention levee improvements project, and will include cutoff walls, landside berms, and a new adjacent levee, as well as approximately 80 acres of mitigation and 27.6 acres of wetland creation. The SAFCA lands also incorporate what is known as the Allegheny Reserve – an approximately 50-acre reserve that is currently part of the NBHCP reserve system.

## 4.2 CLIMATE

The climate in Sacramento County is Mediterranean, characterized by wet, cool winters and dry, hot summers. The nearest weather station to the Study Area, which is similarly situated on the landscape with complete climate data is located at the Sacramento Metropolitan Airport approximately three miles northwest of the Study Area. Average daily minimum and maximum temperatures are 60° and 94° Fahrenheit (°F) in July (Natural Resource Conservation Service [NRCS] 2023a). Average daily maximum and minimum temperatures are 55° and 38° F in January (NRCS 2023a). The mean annual precipitation is 16.89 inches. The weather station received approximately 18.26 inches of rainfall in the 2022 rain season leading up to the first field delineation visit on March 7, 2023 (NRCS 2023a), which was above average for this time of year or 48 percent above average for this time of year through February 2023. In

the 2021/2022 rain year, the weather station received 15.03 inches, which was 89 percent of normal (NRCS 2023a).

## 4.3 SOILS

The NRCS has mapped nine soil units within the Study Area: Clear Lake clay, hardpan substratum, drained, 0-1% slopes, Columbia sandy loam, clayey substratum, partially drained, 0-2% slopes, Cosumnes silt loam, partially drained, 0-2% slopes, Cosumnes silt loam, drained, 0-2% slopes, Durixeralfs, 0-1% slopes, Egbert clay, partially drained, 0-2% slopes, Jacktone clay, drained, 0-2% slopes, Sailboat silt loam, partially drained, 0-2% slopes, MLRA 16, and San Joaquin-Xerarents complex, leveled, 0-1% slopes (**Appendix A, Figure 4, Soils Map**). The general characteristics and properties associated with these soil types are described below (NRCS 2024).

**Clear Lake clay, hardpan substratum, drained, 0-1% slopes** is a somewhat poorly-drained soil that consists of clay, clay loam, and cemented layers derived from alluvium. Clear Lake clay, hardpan substratum, drained, 0-1% slopes is found on basin floors and toeslopes. The restrictive layer consists of duripan at 48 to 64 inches below the surface. This soil series is considered prime farmland when irrigated. This soil unit and its minor components are considered hydric (NRCS 2024).

**Columbia sandy loam, clayey substratum, partially drained, 0-2% slopes,** is a somewhat poorly-drained soil that consists of sandy loam, stratified loamy sandy to silt loam, and clay loam derived from alluvium. Columbia sandy loam, clayey substratum, partially drained, 0-2% slopes is found on floodplains, natural areas, toeslopes, and summits. The depth to the restrictive layer is more than 80 inches below the surface. This soil series is considered prime farmland if irrigated. This soil unit and its minor components are considered hydric (NRCS 2024).

**Cosumnes silt loam, partially drained, 0-2% slopes,** is a somewhat poorly-drained soil that consists of silt loam and stratified silty clay loam to clay that is alluvium derived from igneous rock and metamorphic rock. Cosumnes silt loam, partially drained, 0-2% slopes is found on floodplains. The depth to the restrictive layer is more than 80 inches below the surface. This soil series is considered prime farmland if irrigated. This soil unit and its minor components are considered hydric (NRCS 2024).

**Cosumnes silt loam, drained, 0-2% slopes,** is a somewhat poorly-drained soil that consists of silt loam, stratified clay loam, and clay that is derived from alluvium. Cosumnes silt loam, drained, 0-2% slopes is found on floodplains and toeslopes. The depth to the restrictive layer is more than 80 inches below the surface. This soil series is considered prime farmland if irrigated. This soil unit and its minor components are considered hydric (NRCS 2024).

**Durixeralfs, 0-1% slopes,** is a somewhat poorly-drained soil that consists of clay, clay loam, and underlain by an indurated layer that is alluvium derived from granite. Durixeralfs, 0-1% slopes is found on terraces and toeslopes. The depth to the restrictive layer is more than 80 inches below the surface. This soil series is not considered prime farmland. The minor components of this soil unit are considered hydric (NRCS 2023b).

**Egbert clay, partially drained, 0-2% slopes**, is a poorly-drained soil that consists of clay, silty clay loam, and stratified sandy clay loam that is derived from alluvium. Egbert clay, partially drained, 0-2% slopes is found on floodplains and backswamps. The depth to the restrictive layer is more than 80 inches below

the surface. This soil series is considered prime farmland if irrigated. This soil unit and its minor components are considered hydric (NRCS 2024).

**Jacktone clay, drained, 0-2% slopes**, is a somewhat poorly-drained soil that consists of clay, clay loam, and stratified loam to clay loam that is derived from alluvium. Jacktone clay, drained, 0-2% slopes is found on basin floors and toeslopes. The restrictive layer consists of a duripan found between 34 to 52 inches below the surface. This soil series is considered prime farmland of statewide importance. This soil unit and some of its minor components are considered hydric (NRCS 2024).

**Sailboat silt loam, partially drained, 0-2% slopes, MLRA 16**, is a somewhat poorly-drained soil that consists of silt loam, clay loam, and loam that is alluvium derived from igneous, metamorphic, and sedimentary rock. Sailboat silt loam, partially drained, 0-2% slopes, MLRA 16 is found on floodplains and natural levees. The depth to the restrictive layer is more than 80 inches below the surface. This soil series is considered prime farmland if irrigated. This soil unit and its minor components are considered hydric (NRCS 2024).

**San Joaquin-Xerarents complex, leveled, 0-1% slopes**, is a somewhat poorly-drained soil that consists of silt loam, clay loam, an indurated layer, and stratified sandy loam that is alluvium derived from granite. San Joaquin-Xerarents complex, leveled, 0-1% slopes is found on terraces and toeslopes. The depth to the restrictive layer is more than 80 inches below the surface, but a duripan may exist between 28 to 54 inches below the surface. This soil series is considered prime farmland of statewide importance. Some of the minor components of this soil unit are considered hydric (NRCS 2024).

## 4.4 TOPOGRAPHY AND GEOLOGY

The Study Area is characterized and dominated by nearly flat agricultural land ranging from approximately 12 feet above mean sea level (msl) along the eastern border to approximately 27 feet above msl along the western border. The Study Area is located in the central portion of the Great Valley geomorphic province of California, which includes most of Sacramento County. The Great Valley province is an approximately 50-mile-wide by 400-mile-long alluvial plain that lies between the Sierra Nevada mountains to the east and the Coast Range mountains to the west. Once covered by ocean, this alluvial plain valley is underlain by an asymmetrical depression formed by intersecting, downward-sloping folds of bedrock in which sedimentary deposits have accumulated in a sequence of units (i.e., Great Valley Sequence) for over 100 million years.

Formation of the Great Valley Sequence began with marine sediments precipitating out of receding ocean waters followed more recently by layers of alluvial deposits washing down from creeks and rivers draining from the Sierra Nevada, Klamath, Cascade, and Coast Range mountains. The U.S. Geological Survey (USGS) Geologic Map of the Late Cenozoic Deposits of the Sacramento Valley and Northern Sierran Foothills shows the Study Area to be underlain by undivided Holocene basin deposits and the lower member of the Riverbank Formation (Helley and Harwood 1985). The Holocene basin deposits of the last 10,000 years consist of fine-grained silt and clay derived from the nearby mountain ranges and deposited by the Sacramento and American Rivers. The lower member of the Riverbank Formation consists of red semi-consolidated gravel, sand, silt, and clay derived from the nearby mountain ranges and deposited by the Sacramento and American Rivers. Deposits include the following:

- **Recent crevasse splay deposits** (Rcs) – Generally consist of medium stiff silts and very stiff lean clays. These deposits typically overlie Rob, Hob, or Qa.

- **Recent overbank deposits** (Rob) – Generally consist of soft to very stiff lean and fat clays, and typically overlie deposits of Hob or Qa.
- **Holocene overbank deposits** (Hob) – Generally consist of very soft to medium stiff silts and lean clays.
- **Quaternary alluvium** (Qa) –Typically consisting of very loose to very dense, poorly to well-graded sands with varying amounts of silty fines and some poorly or well-graded gravel lenses.
- **Quaternary marsh deposits overlying alluvial deposits** (Qs/Qa) – Typically consists of stiff silt and lean clay.
- **Holocene overflow channel deposits** (Hofc) – these deposits were "vertically stratified sand, silt, and clay."
- **Holocene basin deposits** (Qhb) – generally consist of stiff to hard fat clay blanketing older alluvium.
- **Pleistocene Riverbank Formation** (Qr) – nearby data suggests the Riverbank Formation includes very stiff to hard lean clays and silts as well as medium dense to very dense sands with varying amounts of fines.

## 4.5 HYDROLOGY

Consistent with the geologic history of the area, the Natomas Basin historically contained marshland and a variety of wetlands from the multiple rivers and creeks of surrounding mountains draining into the Basin. After the Sacramento River levee system was completed ca. 1915, the Natomas Basin area was drained and converted to farmland with a network of channels and pumping stations constructed in the 1930s for flood control and irrigation. The Natomas Central Mutual Water Company (NCMWC) maintains and operates water delivery channels throughout the Natomas Basin, and Reclamation District (RD) 1000 maintains and operates agricultural drainage and flood control channels.

## 4.6 LAND COVERS

Naturally-occurring vegetative communities (i.e., habitats) are typically classified based on the dominant plant species, whereas vegetative communities characterized by a high level of anthropogenic disturbance are often classified by the dominant land use. The NBHCP categorizes land cover within the Natomas Basin into 18 broad classifications. However, to refine mapping and better define the characteristics of lands within the Study Area, HELIX compiled new land cover data for the Study Area by combining portions of data from State and commercial sources (HELIX 2022). Land cover data were obtained from the Central Valley Flood Protection Planning Area Update project and the 2019 i5 Statewide Crop Mapping data. Aquatic resource data were obtained via Wood Rodgers and Bargas (Bargas 2022).

Table 2, *Land Cover Summary Crosswalk Table*, summarizes land cover classifications assigned by the NBHCP and the correlated classification used by HELIX in its comprehensive mapping of land cover in the Natomas Basin (HELIX 2022). Land cover descriptions have been taken from the BRA (Bargas 2022) with some modifications in the text for brevity, as well as refinement based on the data associated with the HELIX mapping sources. Land cover mapping for the Study Area, which is displayed on **Appendix A, Figure 5, Aquatic Resources Map,** displays aquatic resources, and **Appendix A, Figure 6**, **Existing Upper Westside Specific Plan Land Cover***,* which includes both upland and aquatic resources.

**Table 2**
**LAND COVER CROSSWALK**

| HELIX 2022 Land Cover | NBHCP 2003 Land Cover |
|---|---|
| Annual Grasses and Forbs | Grassland |
| California Sycamore | Tree Groves |
| Deciduous | Orchard |
| Eucalyptus | Tree Groves |
| Field Crops | Non-Rice Crops |
| Fremont Cottonwood | Riparian |
| Grain and Hay | Alfalfa |
| Partially Irrigated Crops | Non-Rice Crops |
| Pasture | Pasture |
| Rice | Rice |
| Riparian Mixed Hardwood | Riparian |
| Riparian Mixed Shrub | Riparian |
| Ruderal | Ruderal |
| Truck Crops | Non-Rice Crops |
| Tule – Cattail | Riparian |
| Urban/Developed (General) | Urban |
| Valley Oak | Tree Groves |
| Vernal Pool | — |
| Vineyard | — |
| Water (General) | Canals |
| Wet Meadows | Ponds/Wet Areas |
| Willow | Riparian |
| Willow (Shrub) | Riparian |

Land cover classifications carried forward throughout this document are summarized below in Table 3, UWSP Land Cover Acreages, by acreage within the UWSP, as well as the percentage of the UWSP.

**Table 3**
**UWSP LAND COVER ACREAGES**

| Classification | UWSP Acreage | (%) Percent of Total UWSP Acreage |
|---|---|---|
| Annual Grasses and Forbs | 17.31 | 0.79 |
| Deciduous | 4.38 | 0.20 |
| Field Crops | 334.71 | 15.22 |
| Fremont Cottonwood | 1.00 | 0.05 |
| Grain and Hay | 792.79 | 36.05 |
| Partially Irrigated Crops | 272.50 | 12.39 |
| Pasture | 17.91 | 0.81 |
| Ruderal | 285.5 | 12.98 |
| Truck Crops | 74.44 | 3.38 |
| Urban/Developed (General) | 258.18 | 11.74 |
| Valley Oak | 34.66 | 1.58 |
| Vineyard | 17.23 | 0.78 |

| Classification | UWSP Acreage | (%) Percent of Total UWSP Acreage |
|---|---|---|
| Water (General) | 45.08 | 2.05 |
| SAFCA Wetland Creation | 43.62 | 1.98 |
| **Total** | **2,199** | **100%** |

### Annual Grasses and Forbs

Annual grasses and forbs are found on 17.31 acres of the Study Area and occur where agricultural fields have remained fallow for an extended period. Annual grassland land cover consists primarily of open grasslands composed of annual plant species. Dramatic differences in physiognomy between seasons and years are characteristic of this habitat. Fall rains cause the germination of annual plant seeds. Plants grow slowly during the cool winter months, remaining low in stature until spring, when temperatures increase and stimulate more rapid growth. Large amounts of standing dead plant material can be found during summer in years of abundant rainfall and light to moderate grazing pressure. Heavy spring grazing favors the growth of summer-annual forbs. Many wildlife species use annual grasslands for foraging. This landcover also includes SAFCA-created wetlands that consist of a part of 27.6 acres of wetland creation. Created wetlands are still under development and likely to not meet wetland criteria.

### Deciduous

Deciduous orchards are found on 4.38 acres of the Study Area. Deciduous orchards are open, single-species tree-dominated habitats. Spacing between trees is uniform, depending on the desired spread of mature trees. The understory may be composed of low-growing grasses, legumes, and other herbaceous plants, or may be managed to prevent understory growth along tree rows. Orchards are planted on deep fertile soils which once supported productive and diverse natural habitats. Some avian and mammal species have adapted to orchard habitats.

### Field Crops

Field crops are found on 334.71 acres of the Study Area. Cover type, canopy, plant composition, and other metrics are variable - changing from year to year or even season to season. Vegetation in this habitat includes a variety of sizes, shapes and growing patterns, and vegetation cover can vary widely from 100 to zero percent. Some acreages are planted in rotation with other irrigated crops, and sometimes winter wheat or barley may be planted after harvest of a previous crop in the fall, dry farmed (during the wet winter and early spring months), and then harvested in the late spring. Row and field crops are established on fertile soils, which historically supported an abundance of wildlife. Many wildlife species have adapted to croplands.

### Fremont Cottonwood

Fremont cottonwood (*Populus fremontii*) is a native species that occurs in or around wetlands and riparian areas and is found on 1.00 acre of the Study Area. Undisturbed areas contain a subcanopy tree layer and an understory shrub layer. Fremont cottonwood and associated riparian areas provide food, water, migration and dispersal corridors, and escape, nesting, and thermal cover for an abundance of wildlife species.

### Grain and Hay

Grain and hay fields (alfalfa fields) are found on 792.79 acres of the Study Area. Like most agricultural habitat types, cover type, vegetation cover, plant composition, and other metrics are variable and may change from year to year or even season to season. This land cover is dense monoculture, with nearly 100 percent cover once plants have matured. Physiognomy of the habitat changes to a lower stature following annual harvest and subsequently reverts to bare ground following plowing or discing. Plowing may occur annually but is usually less often. This land cover can provide a high-quality seasonal resource for a variety of wildlife.

### Partially Irrigated Crops

Irrigated crops are found on 272.50 acres of the Study Area. Most irrigated field crops are annual species, grown in rows which are usually planted in spring and harvested in summer or fall. Like most agricultural habitat types, cover type, vegetation cover, plant composition, and other metrics are variable - changing from year to year or even season to season. Vegetation in this habitat includes a variety of sizes, shapes and growing patterns and canopy cover can vary widely from 100 to zero percent.

### Pasture

Pasture landcover is found on 17.91 acres of the Study Area. Like most agricultural types, cover type, vegetation cover, plant composition, and other metrics are variable and may change from year to year or even season to season. Pasture vegetation is commonly a mix of perennial grasses and legumes that normally provide 100 percent vegetation cover. Height of vegetation varies from a few inches to two or more feet on fertile soils, dependent on season and livestock stocking and grazing levels. Pastures are used by a variety of wildlife depending upon the geographic area and adjacent habitats. Ground-nesting bird species can nest in pastures if adequate residual vegetation is present at the onset of the nesting season. Flood irrigation of pastures provides feeding and roosting sites for many wetland-associated birds. This landcover also includes SAFCA-created wetlands that consist of a part of 27.6 acres of wetland creation. Created wetlands are still under development and likely to not meet wetland criteria.

### Ruderal

Ruderal land cover is present on 285.5 acres of the Study Area. Ruderal areas have typically been exposed to extensive ongoing anthropogenic disturbance and are characterized largely by non-native, weedy species or early native colonizing species. This land cover type is not paved, retaining a soil substrate. Ruderal land cover can be colonized by burrowing small mammals and thus can be suitable for animals such BUOW and SWHA that forage for prey in ruderal habitat.

### Truck Crops

Truck crops are present on 74.44 acres of the Study Area. Truck crops include low-growing row crops such as tomatoes and melons. This land cover can provide a high-quality seasonal resource for a variety of wildlife.

### Urban/Developed (General)

Urban land cover is found on 258.18 acres of the Study Area. The physiognomy of urban vegetation varies with the land use. Within the Study Area, areas mapped as urban include residential lots and commercial development. Impervious surfaces – such as pavement – are common in the latter, while the former often includes mowed lawns, gardens, and ornamental trees. Wooded cover in the urban portions of the Study Area provides shelter and foraging habitat for a wide variety of native and non-native wildlife, especially birds.

### Valley Oak

Valley oak is found on 34.66 acres of the Study Area. Valley oak habitat in the Study Area, is dominated by valley oak (*Quercus lobata*), interspersed with canopy tree species such as California Sycamore (*Platanus racemosa*), or can occur as a grassland dominated by valley oak. Undisturbed areas typically contain a subcanopy tree layer and an understory shrub layer. In the Study Area, valley oak understory is dominated by rural residential development, which diminishes the quality of the habitat for plants and wildlife. Valley oak land cover, particularly where it occurs near aquatic drainages, provides food, water, migration and dispersal corridors, and escape, nesting, and thermal cover for an abundance of wildlife species.

### Vineyard

Vineyard land cover is not a recognized land cover type in the NBHCP but is found on 17.23 acres of the Study Area. Vineyards are monoculture crops planted in rows, usually supported on wood and wire trellises. Vines are normally intertwined within the support structures along the row but land between rows is maintained as open space. Soil under the vines is usually sprayed with herbicides to prevent the growth of herbaceous plants. Between rows of vines, grasses and other low-growing herbaceous plants may be planted or allowed to grow as a cover crop to control erosion. Vineyards are typically planted on deep fertile soils which once supported productive and diverse natural habitats. Some avian and mammal species have adapted to vineyard habitats, including raptors, which often perch on supporting structures.

### Water (General)

Water (riverine habitat) is present on 45.08 acres of the Study Area in the form of irrigation canals and ditches, ponds and detention basins. Irrigation ditches and canals contain duckweed (*Lemna minor*), green algae, and a variety of emergent vegetation, and the banks of the irrigation canals and ditches were dominated by ruderal vegetation during surveys conducted by Bargas (2022).

## 4.7 WILDLIFE

The Study Area provides suitable land cover for a variety of wildlife species commonly inhabiting agricultural land in the Natomas Basin. The larger expanses of terrestrial land cover (e.g., grass, hay, alfalfa, etc.) in the Study Area provide suitable foraging habitat for raptors such as SWHA, western burrowing owl (*Athene cunicularia*; BUOW), loggerhead shrike (*Lanius ludovicianus*), white-tailed kite (*Elanus leucurus*), and northern harrier (*Circus hudsonius*).

Irrigation canals and associated land covers provide potentially suitable habitat for GGS, tricolored blackbird (*Agelaius tricolor*; TRBL), northwestern pond turtle (*Actinemys marmorata*; WPT), and valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*; VELB).

## 4.8 SPECIAL-STATUS SPECIES

Based on species' ranges and habitat affinities, a total of 17 regionally occurring special-status species (Table 4, S*pecial-status Species with the Potential to Occur*) are either known to occur or have the potential to occur in the Project site (this analysis is described in Section 3.1). Special-status species observed on-site during the March 7, 2023, site visit include Cooper's hawk (*Accipiter cooperii*) and osprey (*Pandion haliaetus*); however, no nesting locations of special-status species were observed within the Study Area during the March 2023 site visit. A red-tailed hawk was observed perching on trees and radio towers in the Study Area associated with existing nest structures. No other special-status plant or wildlife species were observed within the Study Area. Special-status species with the potential to occur within the Study Area are discussed in detail in Section 5.

**Table 4**
**SPECIAL-STATUS SPECIES WITH THE POTENTIAL TO OCCUR**

| Scientific Name<br>Common Name | Regulatory Status[1] | Status in the Project Site[2] | Suitable Habitat in the Project Site |
|---|---|---|---|
| ***Plants*** | | | |
| *Hibiscus lasiocarpos var. occidentalis*<br>woolly rose-mallow | --/--/1B.2 | Habitat present | Suitable freshwater habitat is present in agricultural canals and ditches in the Study Area. There is one record of this species within a 5-mile radius of the Study Area located at the Interstate 80 interchange at the W El Camino Avenue off ramp (CDFW 2024). |
| *Sagittaria sanfordii*<br>Sanford's arrowhead | --/--/1B.2, NBHCP | Habitat present | Suitable freshwater habitat is present in agricultural canals and ditches in the Study Area. There are two CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| ***Invertebrates*** | | | |
| *Desmocerus californicus dimorphus*<br>valley elderberry longhorn beetle | FT/--/--, NBHCP | Habitat assumed to be present | Elderberry shrubs that provide suitable breeding habitat for this species were not detected within the Study Area. However, not all of the Study Area was directly accessible and elderberry shrubs are likely present in valley oak woodland or as isolated shrubs in close proximity to riparian habitat that is contiguous with known records of this species. Observations of this species in the CNDDB are abundant in the region with the nearest CNDDB occurrence located 0.3-mile northwest of the Study Area in riparian forest along the Sacramento River (CDFW 2024). |

| Scientific Name<br>Common Name | Regulatory Status[1] | Status in the Project Site[2] | Suitable Habitat in the Project Site |
|---|---|---|---|
| ***Reptiles*** | | | |
| *Actinemys (=Emys) marmorata*<br>northwestern pond turtle | FPT/--/SSC, NBHCP | Habitat present (aquatic and upland refugia) | Suitable habitat is present for this species along canals and ditches in the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Thamnophis gigas*<br>giant garter snake | FT/ST/--, NBHCP | Habitat present (aquatic and upland refugia) | Suitable aquatic habitat that is inundated during the active season for this species is present in agricultural ditches and canals that occur throughout the Study Area. Additionally, upland habitat is present in areas adjacent to ditches and known occurrences of this species. This species is documented within the northern portion of the Study Area in West Drainage Canal and is well documented in areas surrounding the Study Area in the CNDDB (CDFW 2024). Protocol surveys that included trapping did not detect this species in portions of the Study Area; however eDNA sampling did test positive in ditches surrounding the Study Area which indicates this species utilizes the habitat (Bargas 2020, Hansen 2019). Protocol surveys and eDNA sampling were not conducted within West Drainage Canal where the CNDDB documents this species. |
| ***Birds*** | | | |
| *Accipiter cooperii*<br>Cooper's hawk | --/--/WL | Habitat present (nesting and foraging) | Suitable habitat is present for this species in the Study Area. This species could nest in trees throughout the Study Area and forage in forested areas along the Sacramento River, agricultural crops, fallowed fields or ruderal areas in the Study Area or in other adjacent habitats. There are two CNDDB reported occurrences for this species within a 5-mile radius of the Study Area. The nearest CNNDB reported occurrence is located approximately 3.9 miles south of the Study Area and documents a nest from 2008. (CDFW 2024). |
| *Agelaius tricolor*<br>tricolored blackbird | --/ST/SSC, NBHCP | Habitat present (nesting and foraging) | Nesting habitat for this species is present in the Study Area along ditches that supports trees, blackberry brambles and other emergent vegetation in ditches and canals. This species could also forage in the Study Area as they are known to forage in agricultural fields up to four miles from nesting sites. There are several CNDDB reported occurrences within a 5-mile radius of the Study Area. The nearest CNDDB reported occurrence is located approximately 1.9 miles northeast of the Study Area and documents an extirpated nesting colony from 1992 (CDFW 2024). |

| Scientific Name<br>Common Name | Regulatory Status[1] | Status in the Project Site[2] | Suitable Habitat in the Project Site |
|---|---|---|---|
| *Athene cunicularia*<br>Burrowing owl | --/--/SSC, NBHCP | Habitat present (nesting and foraging) | Suitable habitat is present for burrowing owl in the Study Area in ruderal or fallowed fields and along the banks of ditches and canals especially where small mammal burrows are present. But burrowing owl may also use other refuge sites such as abandoned irrigation pipes. CNDDB records for burrowing owl in the region are abundant with the nearest record located approximately 0.2 mile east of the Study Area. This record documents a wintering owl along a drainage ditch in 1991; however, this site is likely extirpated since the area has been developed (CDFW 2024). |
| *Buteo swainsoni*<br>Swainson's hawk | --/ST/--, NBHCP | Present (nesting and foraging) | Suitable habitat is present for this species in the Study Area. This species could nest on trees throughout the Study Area and forage in agricultural crops, fallowed fields or ruderal areas in the Study Area or in adjacent habitats. There are several CNDDB reported occurrences for this species within a 5-mile radius of the Study Area and this species is well documented to nesting and foraging in the Study Area and in the region. There are two documented CNDDB reported occurrences of this species nesting on the Study Area; the records document nesting activity in cottonwoods and oak trees in 1992 and 1993 (CDFW 2024). |
| *Circus hudsonius*<br>Northern harrier | --/--/SSC | Present (foraging); Habitat present (nesting) | Nesting and foraging habitat for northern harrier is present in the Study Area. This species has been detected foraging within the Study Area during field surveys. |
| *Elanus leucurus*<br>White-tailed kite | --/--/FP | Habitat present (nesting and foraging) | Suitable habitat is present for this in the Study Area. This species could nest on trees throughout the Study Area and forage in agricultural crops, fallowed fields or ruderal areas in the Study Area or in adjacent habitats. There are several CNDDB reported occurrences for this species within a 5-mile radius of the Study Area. The nearest CNNDB reported occurrence is located approximately 2.6 miles south of the Study Area, and documents a nest from 2017 in a large oak tree in a residential neighborhood (CDFW 2024). |
| *Lanius ludovicianus*<br>Loggerhead shrike | --/--/SSC, NBHCP | Habitat present (nesting and foraging) | Open habitat with perching sites along fences and some shrubs and small trees provides suitable nesting and foraging habitat for this species. There are no CNDDB reported occurrences for this species in a 5-mile radius of the Study Area and this species has not been detected in the Study Area (CDFW 2024). |

| Scientific Name<br>Common Name | Regulatory Status[1] | Status in the Project Site[2] | Suitable Habitat in the Project Site |
|---|---|---|---|
| *Melospiza melodia*<br>song sparrow (Modesto Population) | --/--/SSC | Habitat present (nesting and foraging) | Suitable nesting habitat is present for this species within vegetation along ditches and canals. There is one CNDDB reported occurrence for this species within a 5-mile radius of the Study Area, which is not a specific location. The record documents breeding in a canal along the edge of a wheat field in 1877 (CDFW 2024). |
| *Pandion haliaetus*<br>Osprey | --/--/WL | Present (nesting) | Suitable habitat is present for this in the Study Area. This species could nest on trees or structures throughout the Study Area. This species was observed in the Study Area on March 7, 2023, foraging over cropland. This species appeared to have captured a medium sized bird. |
| *Plegadis chihi*<br>white faced ibis | --/--/WL, NBHCP | Habitat present (foraging) | Nesting habitat for this species is not present in the Study Area. However, this species could forage in the Study Area as they are known to forage in agricultural fields. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Progne subis*<br>purple martin | --/--/SSC | Habitat present (nesting and foraging) | Suitable habitat is present for this species in the Study Area in tree cavities where large trees are present or in cavities of other artificial structures such as utility poles. There are several CNDDB reported occurrences for this species within a 5-mile radius of the Study Area. The nearest CNDDB record for this species is located 2.5 miles southeast of the Study Area and documents this species nesting in weep holes under the I-5 bridge in 2007 (CDFW 2024). |
| *Xanthocephalus xanthocephalus*<br>yellow-headed blackbird | --/--/SSC | Habitat present (nesting and foraging) | Nesting habitat for this species is not present in the Study Area. However, this species could forage in the Study Area as they are known to forage in agricultural fields. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| ***Mammals*** | | | |
| *Antrozous pallidus*<br>pallid bat | --/--/SSC | Habitat present (roosting and foraging) | Suitable habitat is present for this species in buildings, bridges, and tree hollows. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

[1] Regulatory Status is FESA listing/CESA listing/Other state status. FE=Federal Endangered; FT = Federally Threatened; FPT=Federally Proposed Threatened; ST=State Threatened; FP=Fully Protected; SSC=Species of Special Concern; WL = Watch List.

[2] Status in the project site is based on results of studies discussed in Section 3.1.

# 5.0 RESULTS: EVALUATION OF POTENTIAL BIOLOGICAL RESOURCES IMPACTS

## 5.1 GUIDELINES FOR DETERMINING IMPACT SIGNIFICANCE

The following threshold criteria from the CEQA Appendix G Checklist were used to evaluate project-related potential effects on biological resources. Based on these criteria, the project would have a significant effect on biological resources if it would:

1) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS.

2) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the CDFW or USFWS.

3) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

4) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.

5) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

6) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

## 5.2 POTENTIAL FOR IMPACTS TO SPECIAL-STATUS SPECIES

### 5.2.1 Special-status Plants

According to the database query, 30 listed and/or special-status plant species have the potential to occur on or in the vicinity of the Study Area (CDFW 2024). Based on field observations, published information, and literature review, two special-status plants have the potential to occur within the Study Area: woolly rose mallow and Sanford's arrowhead. Many special-status plant species in the vicinity of the Study Area occur on alkaline soils, or in vernal pools or chenopod scrub, which are not present in the Study Area. The soils in the Study Area are primarily neutral to slightly acidic (NRCS 2024). Additionally, many species require seasonal wetland habitats such as vernal pools or wetland swales, which are also absent from the Study Area.

CNDDB reports no occurrences of any NBCHP Covered Plant Species within the Study Area (CDFW 2024), and no NBHCP covered plant species were observed within the 568.7 acres of lands surveyed by Bargas in 2019, 2020, or 2021 (Bargas 2019, 2020, and 2022). Agricultural habitat in the Study Area is temporarily created as a result of fallow agricultural fields that will likely not remain fallow and thus do

not represent a natural or permanent state, which generally does not provide habitat for special-status species. However, agricultural canals and ditches that support wetland vegetation year-round and are not subjected to the same stressors as agricultural fields could support species such as woolly rose mallow and/or Sanford's arrowhead. Sanford's arrowhead is known to occur in ditches and other disturbed wetland areas. One record of woolly rose-mallow is documented outside of the southeastern boundary of the Study Area in canals with wetland habitat (CDFW 2024).

#### 5.2.1.1 Woolly Rose-Mallow

##### Listing Status

Woolly rose-mallow is ranked by the California Native Plant Society (CNPS) as a California Rare Plant Rank (CRPR) 1B.2 (plants rare, threatened, or endangered in California and elsewhere).

##### Life History and Habitat Requirements

Woolly rose-mallow is a perennial, deciduous shrub in the Malvaceae family that is native to California but can also be found elsewhere in North America. The species blooms from June to September and grows to approximately four to six feet in height. The species occurs at elevations up to 400 feet in full sun to partial shade in freshwater marshes, swamps, wetland riparian, and wetland habitats in the Cascade Range Foothills, and the Sacramento and San Joaquin Valleys and can frequently be found on riverbanks and low peat islands in sloughs as well as in riprap on the side of levees (CNPS 2023). Observed species often associated with woolly rose-mallow include valley oak, red buckthorn (*Frangula rubra*), California wild rose (*Rosa californica*), pennyroyal *(Mentha pulegium*), poison oak (*Toxicodendron diversilobum*), California mugwort (*Artemisia douglasiana*), California grape (*Vitis californica*), curly dock (*Rumex crispus*), rough cocklebur (*Xanthium strumarium*), willow (*Salix* spp.), and blackberry (*Rubus* spp.) (Calflora 2024; eJepson 2024).

The plant is easily distinguishable in the field because it is tall and has a large, showy flower. Individual plants produce many shoots that grow one to two meters tall, emerging from a large, woody rootstock each spring. The plants are in bloom from June through September, and individual flowers are only open for a single day. Flowers are 10 to 15 centimeters in diameter and have five white or pale pink petals with a deep crimson center (Calflora 2024; eJepson 2024).

Woolly rose-mallow - known variously as the hairy- fruited hibiscus or rose-mallow - is a self-compatible rhizomatous perennial pollinated by bees. The reproductive structures of these flowers are found emerging from the center of the flower on a single stalk-like structure. The stamens are fused into a tube with numerous anthers that offer an abundance of pollen. The stalk ends with a branched style that supports five rounded stigmas. These flowers produce so much pollen that it often falls off the anthers and can be found resting in small piles on the lower petals. A characteristic that distinguishes this species from other hibiscus is its pubescent leaves and stems. The leaves are covered by soft, dense hairs on the upper and lower surfaces and are velvety to the touch. The degree of pubescence varies from flower to flower, but the velvety nature of the leaves can often be easily seen from a distance. The fruit is a capsule that is densely-hairy and contains many seeds. The capsule opens to reveal the seeds and remains on the plant through much of the dormant season (Calflora 2024; eJepson 2024).

### Regional and Local Distribution

There are 10 occurrences of woolly rose-mallow documented in the CNDDB within the nine-quad search area centered on the Study Area. All occurrences are believed to be extant populations. Woolly rose-mallow is threatened by habitat disturbance, development, agriculture, recreational activities, and channelization of the Sacramento River and its tributaries. Other threats include erosion and weed control measures and canal and ditch maintenance and/or elimination.

### Status in the Upper Westside Specific Plan

This species has not been documented in the Study Area but is documented within approximately 432 feet of the Study Area boundary. This species was not detected during multiple rounds of botanical surveys of accessible areas conducted during 2019 and 2020 during the blooming period for this species (Bargas 2020). However, most of the Study Area remains unsurveyed for this species. There is one record of this species within a 5-mile radius of the Study Area located on the eastern boundary of the Study Area along the Interstate 80 interchange. This record documents two plants observed in a ditch lacking freshwater marsh habitat and was documented with upland non-wetland vegetation. CDFW ranks the record as poor, which was documented by Caltrans in 1988 (CDFW 2024).

## Project Effects to Woolly Rose-mallow

### Habitat Loss, Fragmentation, and Reduction in Patch Size

The canals and ditches within the Study Area provide suitable habitat for this species. Although these canals and ditches are used and maintained for agricultural use, hydrophytic vegetation within the canals and ditches is consistent with vegetation that this species occurs with. No other suitable habitat wetland habitat is present in the Study Area.

### Construction-Related Activities

If some canals and ditches are avoided by the Project, there would be no potential for Project impacts to woolly rose-mallow associated with Project construction in those canals and ditches. For canals and ditches that will be developed or where Project activities will occur in the canals and ditches, impacts to this species could include loss of individuals or a population if it is present or indirect impacts to potential habitat through changes in hydrology or other changes to habitat.

## Overall Effects on Population Viability

Although the UWSP would reduce the overall acreage of potential wetland habitat that could support woolly rose-mallow in the Natomas Basin, overall, the effects of the proposed action on woolly rose-mallow should be minimal since wetland habitat in the Study Area is limited to agricultural canals and ditches, and there are no documented accounts of this species in the Study Area or in the Natomas Basin with the exception of the 1988 Caltrans account of this species in otherwise unsuitable habitat (CDFW 2024). The UWSP has proposed measures that minimize and mitigate the impacts from the Project on this species, such as requiring botanical surveys to be conducted timed to coincide with the blooming period for this species and coordination with CDFW to determine appropriate mitigation in the event that wooly rose-mallow is present and will be impacted by the proposed action. Therefore, the proposed action is minimized and unlikely to affect the survival of the woolly rose-mallow in the Basin if

it is present. The mitigation measures identified in Section 6 of this document would reduce impacts to this species to less than significant.

#### 5.2.1.2 Sanford's Arrowhead

##### Listing Status

Sanford's arrowhead is ranked by the CNPS as a CRPR 1B.2.

##### Life History and Habitat Requirements

Sanford's arrowhead is a perennial, rhizomatous herb in the Alismataceae family that is native to California and is extirpated from southern California and nearly extirpated from the Central Valley (CNPS 2024). The species blooms from May to October. The species occurs at elevations up to 650 meters in freshwater marshes, swamps, and assorted freshwater wetlands, including ditches that support wetland habitats (CNPS 20234).

Sanford's arrowhead characteristic that distinguishes this species from other species of the genus is the fruit is oil-streaked on the side with an erect beak of 0.2 mm to 0.6 mm, and papillate filaments on the staminate flower (eJepson 2024).

##### Rangewide and Local Distribution

There are 26 occurrences of Sanford's arrowhead documented in the CNDDB within the nine-quad search area centered on the Study Area. There are two CNDDB reported occurrences within a 5-mile radius of the Study Area. The nearest record documents this species 3.1 miles east of the Study Area; this record documents two populations observed in Arcade Creek and a shallow ditch in 2011 (CDFW 2024).

Sanford's arrowhead is threatened by grazing, development, agriculture, recreational activities, non-native plants, road widening, and channel alteration and maintenance. Other threats include erosion and weed control measures and canal and ditch maintenance and/or elimination.

##### Status in the Upper Westside Specific Plan

This species has not been documented in the Study Area. This species was not detected during multiple rounds of botanical surveys of accessible areas within the Study Area conducted during 2019 and 2020 during the blooming period for this species (Bargas 2020). However, most of the Study Area remains unsurveyed for this species.

##### Project Effects to Sanford's Arrowhead

##### Habitat Loss, Fragmentation, and Reduction in Patch Size

The canals and ditches within the Study Area provide suitable habitat for this species. Although these canals and ditches are used and maintained for agricultural use, hydrophytic vegetation within the canals and ditches is consistent with vegetation that this species occurs with. No other suitable habitat wetland habitat is present in the Study Area.

### Construction-Related Activities

If some canals and ditches are avoided by the Project, there would be no potential for Project impacts to Sanford's arrowhead associated with Project construction in those canals and ditches. For canals and ditches that will be developed or where Project activities will occur in the canals and ditches, impacts to this species could include loss of individuals or a population if it is present or indirect impacts to potential habitat through changes in hydrology or other changes to habitat.

### Overall Effects on Population Viability

Although the UWSP would reduce the overall acreage of potential wetland habitat that could support Sanford's arrowhead in the Natomas Basin, overall, the effects of the proposed action on Sanford's arrowhead should be minimal since wetland habitat in the Study Area is limited to agricultural canals and ditches and there are no documented accounts of this species in the Study Area or in the Natomas Basin. The UWSP has proposed measures that minimize and mitigate the impacts such as requiring botanical surveys timed to coincide with the blooming period for this species and coordination with CDFW to determine appropriate mitigation in the event that Sanford's arrowhead is present and will be impacted by the proposed action. Therefore, the proposed action is minimized and unlikely to affect the survival of the Sanford's arrowhead in the Basin if it is present. The mitigation measures identified in Section 6 would reduce impacts to this species to less than significant.

## 5.2.2 Special-status Wildlife

According to the database query, 45 listed and/or special-status wildlife species have the potential to occur on-site or in the vicinity of the Study Area (CDFW 2024 and USFWS 2024). Based on field observations, published information, and literature review, 15 special-status wildlife species have the potential to occur within the Study Area: VELB, WPT, GGS, Cooper's hawk, TRBL, BUOW, SWHA, northern harrier, white-tailed kite, loggerhead shrike, Modesto song sparrow (*Melospiza melodia*), osprey, purple martin (*Progne subis*), yellow-headed blackbird (*Xanthocephalus xanthocephalus*), and pallid bat (*Antrozous pallidus*). These species are discussed in more detail below. In addition to these special-status wildlife species, nesting birds and raptors protected under federal, State, and local laws/policies also have the potential to occur within the Study Area.

## 5.2.3 Special-status Invertebrates

### 5.2.3.1 Valley Elderberry Longhorn Beetle

#### Listing Status

VELB is listed as Threatened by the USFWS.

#### Life History and Habitat Requirements

VELB has a four-stage life cycle (egg, larva, pupa, and adult) centered on the subspecies' host plant. Adult beetles are active - feeding and mating - from March until June. After mating, eggs are deposited on live elderberry bushes in crevices of the bark, stem/trunk junctions, and/or stem/petiole junctions. Post-hatching, larvae bore through the bark into the pith of the stem where they create a feeding gallery and eat for up to two years (Lang et al. 1989; Halstead and Oldham 1990; Woollett 2004). Elderberry stems hosting VELB larvae must be ≥1 inch in diameter at ground level to facilitate the completion of the

VELB life cycle. Prior to pupation, larvae chew through the bark of the stem (thereby creating the "exit hole") and then return to the feeding gallery, closing the exit hole. The larvae then enter the pupal stage. After transformation, the adult beetle breaks through the frass plug at the exit hole. The adult beetle lives for only a few weeks during spring (Eng et al. 1984; Collinge et al. 2001; Talley *et al.* 2006, 2007).

VELB is a native subspecies endemic to the Central Valley of California. The species is a riparian forest specialist in the valley and is typically found in riparian habitat, but only where the host plant, blue and/or red elderberry (*Sambucus* spp.), is present. Leaves and flowers of the elderberry provide food for the adult beetle while the interior pith of elderberry stems and roots provide food and shelter for the developing larvae (Barr 1991). In the Central Valley, the elderberry shrub is associated with riparian forests which occur along rivers and streams (Eng et al. 1984).

### Population Dynamics, Dispersal, and Detectability

Linsley and Chemsak (1972) suggested that VELB populations might have always been relatively small due to the species' specialized life history and restricted distribution. Presence of this subspecies is difficult to detect, as inhabitance within an elderberry shrub is rarely visibly apparent. Frequently, the only exterior evidence of the shrub's use by the species is an exit hole created by the larva just before the pupal stage (Halstead and Oldham 1990; Talley et al. 2006). As occupancy is cryptic – so much so that populations cannot be surveyed or censused directly – local abundance of shrubs has served as a surrogate metric.

In a study of regional- and local-scale occurrences of VELB in Central California, Collinge et al. (2001) found that patterns of VELB colonization of isolated sites or drainages is constrained by limited dispersal. Increased local population size of beetles was associated with higher elderberry density and the presence of larger, more mature plants (Talley et al. 2006). Surveys conducted throughout the known VELB range in 1991 and 1997 indicated that only 25 percent of apparently suitable sites were inhabited (Barr 1991; Collinge et al. 2001), strongly suggesting that factors beyond host plant abundance influence site selection.

### Rangewide and Local Distribution

Originally described by Fisher (1921), this subspecies is believed to have historically occurred as small populations in elderberry thickets along river margins within an approximately 190-mile x 65-mile area restricted to the lower Sacramento and upper San Joaquin Valleys, (Linsley and Chemsak 1972). Recent surveys have revealed the subspecies to persist only in scattered localities along the Sacramento, American, San Joaquin, Kings, Kaweah, and Tule rivers and their tributaries (Linsley and Chemsak 1972; Barr 1991). Barr's survey (1991), indicates that VELB's current, known geographic distribution reaches from Redding, CA at the northern end of the Central Valley to approximately 445 miles south to the Bakersfield area. In all reported studies, the majority of occupied sites are located near the geographic range centered along the Sacramento River (Barr 1991).

### Status in the Upper Westside Specific Plan

There are two occurrences of VELB documented within the Natomas Basin, approximately 0.2 mile southeast of the Study Area. Blue elderberry, a host plant for this subspecies, occurs in riparian areas along the Sacramento and American Rivers bordering the basin, but this host plant does not occur in the clay soils that dominate most of the central and northern basin. However, the Study Area consists of

loamy soils that are suitable for elderberry shrubs. However, isolated blue elderberry shrubs are known to grow in alluvial soils along the western edge of the Natomas Basin. Elderberry shrubs that could support VELB were not observed within the 568.7 acres of lands surveyed by Bargas in 2019, 2020 or 2021 (Bargas 2019, 2020, 2022), and HELIX 2023; however, other suitable habitat was not directly accessible to HELIX in 2023 and valley oak woodland habitat that could support VELB host elderberry shrubs was not thoroughly searched for this species to definitively determine if elderberry shrubs are present within the Study Area.

## Project Effects to Valley Elderberry Longhorn Beetle

### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, VELB habitat is present in the Natomas Basin primarily in the form of valley oak woodland that could provide habitat for elderberry shrubs. The Study Area is a partially fragmented, somewhat isolated patch of agricultural land surrounded on the eastern, northeastern, and southeastern proposed boundaries by the dense urban environs of the City of Sacramento. The western boundary of the Study Area abuts Garden Highway, which parallels the Sacramento River. The western portion (approximately 0.75 mile) of the northern boundary abuts TNBC preserve lands, whereas the remaining eastern portion of the northern boundary (approximately 0.75 mile) abuts the City of Sacramento and intersects with I-5. For VELB, a species that requires riparian habitat or oak woodland corridors for dispersal, the Study Area is essentially located on the edge of suitable habitat along the Sacramento River.

### Habitat Connectivity

The Study Area has very limited habitat for VELB, and the Study Area essentially occurs along the edge of riparian habitat located along the banks of the Sacramento River, where this species has been documented recently (CDFW 2024). Since valley oak woodland habitat is essentially connected to the riparian habitat along the Sacramento River, VELB could occupy the Study Area in suitable habitat if elderberry shrubs are also present. Construction of the project will preserve most valley oak habitat in its current condition as it is currently mapped as agricultural residential by the UWSP, and on the edge of the project footprint. Once constructed, the Study Area will still have a similar connectivity to suitable habitat outside the Study Area.

### Construction-Related Activities

Construction activities associated with the proposed development in the Study Area or construction of the proposed reserve sites could disturb elderberry shrubs that provide habitat for VELB. If present during construction, VELB in the Study Area may be injured or killed by construction-related activities, including ground-disturbing activities, equipment use, and/or construction of structures and infrastructure. Construction-related activities could result in indirect effects that would include the removal of elderberry shrubs with stems less than one inch in diameter at ground level. When development activities occur, these shrubs will not be considered suitable beetle habitat (because their stems are not yet large enough) and will, therefore, not be protected. Left alone, they would presumably grow to become suitable beetle habitat. Construction activities would preclude these shrubs from becoming suitable habitat for VELB (City of Sacramento et al. 2003). The UWSP has proposed measures that minimize and mitigate the impacts, such as requiring mitigation for shrub impacts or removal according to the USFWS's Beetle Guidelines.

### Overall Effects on Population Viability

Although the UWSP may reduce the overall acreage of woodland habitat that could support elderberry shrubs that provide habitat for VELB in the Natomas Basin, overall, the effects of the proposed action on the beetle should be minimal. There are few elderberry shrubs in the Basin, limited areas where elderberry shrubs would be likely to occur, and the VELB has never been observed in the Basin. The UWSP has proposed measures that minimize and mitigate the impacts, such as requiring mitigation for shrub impacts or removal according to the USFWS's Beetle Guidelines. Therefore, the proposed action is minimized and unlikely to affect the survival of the VELB in the Basin. Furthermore, because of the proposed action's minimal effects on VELB and the Basin represent only a small portion of VELB's current range, the proposed action is not likely to affect the survival or recovery of the species overall (City of Sacramento *et al*. 2003). The mitigation measures identified in Section 6 would reduce impacts to this species to less than significant.

## 5.2.4 Special-status Reptiles

### 5.2.4.1 Giant Garter Snake

#### Listing Status

GGS is listed as Threatened under CESA by CDFW and is federally listed as a Threatened species under the FESA by the USFWS.

#### Life History and Habitat Requirements

GGS is sexually dimorphic in size, as females are both longer and heavier than males. Females reach an average of 2.3 feet in length, with males reaching an average of 1.9 feet in length (Wylie et al. 2010). GGS mating primarily occurs in spring from March to May, with males searching for mates immediately upon emergence from brumation. GGS females are live-bearing and give birth to a range of 10 to 46 young between mid-June and early October (Hansen and Hansen 1990; Halstead et al. 2011), with a mean parturition date in mid-August in the Sacramento Valley (Halstead et al. 2011).

GGS is active from late March–early October (Wylie et al. 2009) and feeds primarily on aquatic prey such as small fish, frogs, and tadpoles (Rossman et al. 1996). Specific prey includes larvae and small adults of American bullfrogs (*Lithobates catesbeianus*) and all life stages of Sierran treefrogs (*Pseudacris sierra*). Fish prey includes smaller fish species, such as mosquitofish (*Gambusia affinis*) and small cyprinid (*Cyprinidae* spp.) and centrarchid (*Centrarchidae* spp.) fishes. Little is known about the diet of juvenile GGS.

GGS is endemic to freshwater marshes, sloughs, and marsh-like habitats with mud bottoms in California's Central Valley and is one of the most aquatic of the garter snakes occupying a niche like that of water snakes (i.e., rarely found away from water and forages for aquatic prey). Ninety percent of the species' tule marsh habitat has been lost or irrevocably altered; thus, GGS is listed as threatened at the state and federal level. Although the species is extirpated from most of the southern part of its former range, GGS persists in the Sacramento Valley in remnant marshes and sloughs and rice-growing agricultural habitats (Halstead *et al.* 2010). Rice fields function as emergent wetlands for a part of the GGS active season.

GGS habitat is typically treeless (Hansen 1980, 1986; Hansen and Brode 1980) and low in elevation with occupied habitat at 10 to 40 ft above mean sea level in the Sacramento area (Hansen 1986). GGS occurs in aquatic habitats where emergent vegetation, such as tules and cattails serve as cover, with decumbent tules serving as important basking sites that also provide quick escapes into the water below (Van Denburgh and Slevin 1918; Fitch 1940; Hansen 1986, 1988). Where both tules and cattails occur, GGS displays a preference for dense stands of perennial tules as basking sites. GGS is only occasionally found in slow-moving creeks (Hansen and Brode 1980; Hansen 1986; Halstead et al. 2015) and is absent from large rivers or bodies of water with little vegetation (Hansen 1986). Cover, in the form of vegetation, debris, or burrows, is a necessary component of GGS habitat (Hansen 1986; Wylie 1998). GGS can be found in canals and drainages associated with rice fields of the Central Valley (Hansen 1988).

Regardless of habitat type, GGS is typically found close to the water's edge, except in late autumn or early spring, when individuals can travel as much as 600 feet to reach the high-water line to avoid flooding during brumation[3]; however, brumation sites near active-season marsh habitat is preferred (Hansen 1986; Wylie 1998). During the inactive season from approximately November to mid-March, GGS brumates in muskrat, crayfish, or ground squirrel burrows (Hansen 1980), or riprap (Wylie et al. 2003) located on sunny aspects along south- or west-facing slopes.

### Population Dynamics, Dispersal, and Detectability

Nearly all natural freshwater marsh habitat in the Sacramento Valley has been eliminated through habitat alteration and conversion to agriculture (Frayer *et al*. 1989; Garone 2007); however, rice agriculture and its supporting network of irrigation and drainage canals, as well as the fairly recent restoration of marsh habitats, provide suitable habitat (Halstead *et al.* 2010). GGS has not been able to disperse into all suitable habitats and is largely restricted to areas near locations where the species likely was historically abundant. It is possible that locations at which GGS were extirpated did not have a nearby source of dispersing individuals to recolonize the remaining (or created) habitat (Halstead *et al.* 2015).

### Rangewide and Local Distribution

Historically GGS occurred from Butte County in the north to Kern County in the south (Fitch 1940; Hansen and Brode 1980). The draining of wetlands and subsequent urban and agricultural development contributed to the loss of more than 90 percent of wetlands in the Central Valley (Frayer et al. 1989). The few remaining natural wetlands are fragmented, and the natural cycle of seasonal valley flooding by High Sierra snowmelt has been limited, as water is presently diverted by a network of dams and levees. As a result, GGS populations have become fragmented, with only small, isolated populations remaining in the Sacramento and San Joaquin Valley. This species is documented within the northern portion of the Study Area in West Drainage Canal and is well documented in the surrounding areas (CDFW 2024).

### Status in the Upper Westside Specific Plan

Herpetologist Eric Hansen completed a two-year protocol GGS trapping and eDNA study in 2019 and 2020. Surveys were conducted between Del Paso Road to the north, El Centro Road to the east, Interstate 80 to the south, and Garden Highway (Sacramento River) to the west. Environmental DNA (eDNA) is DNA that is released, sloughed off, or expelled from an organism as it interacts with the environment and is accumulated in the organism's environmental surroundings. Sources of eDNA

[3] Torpor – not actual hibernation.

include (e.g., secreted feces, urine, mucous, shed skin, scales, hair, and carcasses). eDNA can be collected from a variety of environmental samples, such as soil, water, snow, or air, rather than directly sampled from an individual organism. Sampling for eDNA most commonly occurs in aquatic environments and is typically conducted by filtering large amounts of water to collect organic material on a filter apparatus. In the terrestrial environment, soil samples are collected from areas specifically identified as potentially suitable for a target group of organisms. Analyses of collected organic material is completed in a laboratory where results are compared to known DNA sequences housed in large databases collectively referred to as genetic banks (Dejean et al. 2011).

GGS eDNA was detected over two years in three locations outside of the Study Area and one location in the central portion of the Study Area. Intensive sampling efforts (40,703 total trap days) were accompanied by a high catch of valley garter snake (*Thamnophis sirtalis fitchi*) but no captures of GGS (Bargas 2022). This species has also been documented in the northern portion of the Study Area in West Drainage Canal, for a total of two occurrences in the Study Area. The West Drainage Canal occurrence data states GGS were detected in the canal and Fishermen's Lake in the 1970s, 1980s, 1990s, and from 2004 to 2016, but does not identify ongoing surveys post-2016 (CDFW 2024). Canals, ditches, and associated upland refugia within the Study Area are considered suitable GGS habitat. Approximately 22 acres of suitable aquatic habitat, 72.4 acres of suitable undisturbed upland habitat, and 396 acres of disturbed suitable upland habitat for GGS are present in the Study Area.

### Project Effects to Giant Garter Snake

#### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, aquatic habitat is present in the Natomas Basin and within the Study Area primarily in the form of irrigation canals and ditches. Upland habitat is present along the upland margins of canals and ditches. Agricultural lands are subjected to routine disturbances from agricultural practices and likely do not provide suitable upland refuge sites for this species. However, the canals and ditches are typically not subjected to the same level of disturbance as the agricultural croplands from harvesting activities.

The Study Area is a partially fragmented, somewhat isolated patch of agricultural land surrounded on the eastern, northeastern, and southeastern proposed boundaries by the dense urban environs of the City of Sacramento. The western boundary of the Study Area abuts Garden Highway, which parallels the Sacramento River. The western portion (approximately 0.75 mile) of the northern Study Area boundary partially abuts Cummings Preserves, the TNBC abuts the City of Sacramento, where it intersects with I-5. A small section of the northern portion of the Study Area intersects with West Drainage Canal at the intersection of El Centro Road. For GGS, a highly mobile aquatic species, the majority of the Study Area is essentially a dead-end as it is cutoff from potentially suitable GGS habitat to the south, east, and west; however, it is still accessible potential habitat if GGS enter the Study Area from the occupied areas north of the Study Area or through the West Drainage Canal.

#### Water Quality and Runoff

Aquatic communities may be greatly affected by surrounding land use. Urban areas can cause different and, in some cases, stronger effects than agricultural lands (Bury 1972b; Moore and Palmer 2005). Residential developments typically result in increased runoff of hydrocarbons and pesticides, fertilizers, and/or herbicides used for lawns and gardens, and increased stormwater volume (and associated increases in depths and velocities) because of high coverage of impervious surfaces. Significant impacts

to amphibian communities that are prey items for species, such as GGS, have been shown to occur because of exposure to herbicides, fertilizers, and/or pesticides (Sparling et al. 2010; Elliott et al. 2011). Aquatic habitat adjacent to the northwestern portion of the Study Area could be impacted by urban landscaping practices.

## Habitat Connectivity

The majority of the Study Area is essentially a dead-end as it is cutoff from potentially suitable GGS habitat to the south, east, and west as described above. Currently, there is no evidence of GGS utilizing the interior aquatic features within the Study Area for breeding and little evidence that GGS regularly forages in the Study Area as no GGS have been live trapped in the Study Area despite three years of efforts. The West Drainage Canal is hydrologically connected to Fisherman's Lake where GGS is known to occur. GGS have been previously documented in the West Drainage Canal within the northern portion of the Study Area. It is unclear if the surveys supporting this documentation continued past 2016 (and no detections occurred) or if the surveys simply ceased in 2016.. Construction of the Study Area will remove the irrigation canal system currently in place in the Study Area, and will retain a few isolated recreational water features as part of the planned design. Once constructed, the majority of the Study Area will have no aquatic connectivity to aquatic habitat outside the Study Area. The area of impacts within West Drainage Canal are considered temporary, and the habitat will remain hydrologically connected to Fisherman's Lake after culvert replacement. The Project Proponent/Permittee proposes the identification and creation of Off-Site Reserves of sufficient quality and quantity to offset all potential impacts to suitable habitat for GGS to be determined in consultation with local, state, and federal regulatory agencies. A particularly important benefit of habitat preservation in the agricultural Natomas Basin is that it ensures suitable habitat will always be available, which acts as a buffer against the year-to-year fluctuations in habitat availability based on the agricultural practices around growing rice.

## Construction-Related Activities

Construction activities associated with the development of the Study Area and future reserves could potentially affect GGS individuals and/or habitat. If present during construction, GGS in the Study Area or reserve, may be injured or killed by construction-related activities, including ground-disturbing activities, equipment use, and/or construction of structures and infrastructure. GGS could be killed or injured by vehicle strikes (Leidy 1992), crushed beneath heavy machinery, and/or entombed in or excavated from their winter retreats (Wylie and Casazza 2000). Individuals may be indirectly impacted during construction as a result of increased levels of fugitive dust, sedimentation, harmful substances, or waterborne contaminants.

## Overall Effects on Population Viability

Due to the presumed infrequent use of the Study Area by foraging GGS and the Study Area's geographic location surrounded on three sides by barriers to more suitable habitat, the loss of habitat in the Study Area would not adversely affect GGS, and the overall effect of the Study Area on population viability would be minimal. The area of impacts within West Drainage Canal are considered temporary, and the habitat will remain hydrologically connected to Fisherman's Lake after culvert replacement. Impacts to individual GGS that may be present in this area during culvert replacement will be avoided/minimized through the measures outlined in MM BIO-3a in Section 6.3 of this report. Historically a freshwater marsh-dwelling species - GGS, is now largely reliant on the artificial environs of rice farming. The reliance

on artificial habitats, such as rice fields, is not a long-term solution for population viability of the species as agriculture fluctuates annually and agricultural lands are frequently sold for urban development. Although some potentially suitable habitat will be lost because of the construction of the Study Area proposed development, the outcome of that development will be the procurement of additional reserves of natural habitat for GGS. Habitat preservation ensures that suitable aquatic habitat and upland hibernacula will remain in perpetuity for the benefit of GGS. GGS will benefit from the addition of new lands connected to the existing TBNC preserve system that will be acquired to mitigate for the loss of habitat in the Study Area.

Habitat enhancement, connectivity, and preservation contribute to population viability by reducing the level of human disturbance and proximity to activities that could harm or kill GGS. Habitat enhancement and management also reduce or eliminate agricultural activities that can harm or kill GGS or their amphibian prey base. In addition, the preservation and enhancement of GGS habitat will result in larger blocks of connected aquatic habitat, providing a mechanism for some genetic exchange between GGS in different parts of its current range. Larger blocks of connected aquatic habitat also reduce the potential for GGS to attempt road crossings, which results in increased mortality (Bonnet et al. 1999; Rosen and Lowe 1994). Final habitat acreages, mitigation ratios, and other project-specific compensatory mitigation requirements shall be determined through consultation between USACE/USFWS/CDFW as part of the required project-specific regulatory permitting processes, currently anticipated to consist of Section 404 Authorization/FESA Section 7 Consultation/CDFW Streambed Alteration Agreement and 2081 Incidental Take Permit. Implementation of mitigation measures provided in Section 6 would reduce impacts to this species to less than significant.

#### 5.2.4.2 Western (Northwestern) Pond Turtle

##### Listing Status

WPT is a CDFW Species of Special Concern and a proposed as threatened species under the FESA.

##### Life History and Habitat Requirements

WPT is California's only native aquatic turtle. The species is diurnal and typically active from February through November, depending on the temperature of the habitat. WPT overwinters in either aquatic or terrestrial habitat, with individuals in more northern areas typically overwintering on land. Overwintering sites are located in loose soil and leaf litter above the high-water mark. In aquatic habitats, WPT will overwinter in undercut banks, soft riparian substrates, or submerged snags (Reese 1996). WPT emerge from underground refugia when temperatures warm up enough for them to become active. WPT will emerge from creeks when heavy winter flows occur but will return in spring when the winter high-volume runoff subsides. Some WPT will estivate during hot dry summer droughts by burying themselves in the soft bottom mud of a pond or creek, relying on cloacal respiration. When creeks and ponds dry up in summer, some WPT will travel upstream along the creek until they find an isolated deep pool, whereas other individuals stay within moist mats of algae in shallow pools (Ernst et al. 1994; Germano and Rathbun 2008; Scott et al. 2008).

WPT is a long-lived species that does not reach reproductive age until approximately 8 to 10 years of age. Mating occurs in April and May with nesting occurring between late April and August. Females climb out of their aquatic habitat to select nest sites in soft, loose soils or sand located 100 to 500 meters from the water body. Clutch sizes range from 1 to 13 eggs that are deposited in the excavated

nest and covered over with soil. The eggs hatch in the fall and often hatchlings will remain in the nest living off the yolks and emerging in spring (Stebbins and McGinnis 2012).

WPT is an opportunistic omnivore and will consume a variety of small aquatic invertebrates (including insects, crustaceans, and mollusks) algae and other plant material, and even carrion and small vertebrates (Bury 1986).

WPT occurs in a broad range of aquatic water bodies including flowing rivers and streams, permanent lakes, ponds, reservoirs, settling ponds, marshes, and other wetlands, and will also temporarily use semipermanent or ephemeral water bodies, including stock ponds, vernal pools, and seasonal wetlands (Ernst et al. 1994; Bury and Germano 2008; Stebbins and McGinnis 2012;). This species will also (at least occasionally) enter sea water (Stebbins 1954; Holland 1989). The species is uncommon in high-gradient streams.

Water bodies with submergent vegetation such as pondweed (*Potamogeton* spp., *Stuckenia* spp.) or ditch-grass (*Ruppia maritima*) are especially favorable habitat, probably because this vegetation traps surface water and thus maintains relatively high water temperatures. The species also requires unshaded upland habitat with clay, sand, or silt substrate, typically on a slope, relatively near the water body for nesting and egg-laying. WPT is often found basking on rocks or logs during the daytime, while spending the night hibernating on the water bottom. Populations north of Shasta County spend the winter months, typically November to April, estivating in the muddy bottoms of stream pools. WPT south of Shasta County, however, may be active during all months of the year. During times of drought in the drier parts of California, the species is known to estivate in the soft bottoms of streambeds (Jennings and Hayes 1994).

### Population Dynamics, Dispersal, and Detectability

WPT was formerly abundant throughout much of California. As Bogert reported in 1930, the species was "common in larger streams along the coast and in many of the marshes adjacent to the coast," and many of these habitats still support relatively large populations (Jennings and Hayes 1994; Germano and Rathbun 2008; Thomson et al. 2016). Populations that remain in the Central Valley are smaller and more fragmented than they once were, due to the large-scale land conversion that occurred in this area beginning in the 1860s.

Pilliod et al. conducted a study of pond-dwelling WPT movements on the Carrizo Plain using radio-tracking techniques and found that most WPT spent over half of each year on land traveling from 800 to 3,600 feet but found that none of the WPT dispersed further than 1,100 feet from ponds (Pilliod et al. 2013). In some stream and river WPT populations, males and females leave the water for months each year and travel hundreds of meters into upland habitats (Reese and Welsh 1997; Bury and Germano 2008). Overwintering WPT are consistently found in shallow surface depressions within, and sometimes covered, by litter and duff (Reese and Welsh 1997).

### Rangewide and Local Distribution

WPT occurs mostly in Pacific slope drainages, in Washington, Oregon, California, and northern Baja California from sea level to 6,840 feet. The species occurs or historically occurred, throughout cismontane California, with isolated occurrences also in northeastern California and, in the southern deserts, along the Mojave River as far downstream as Afton Canyon, San Bernardino County, and in Andreas Canyon, Riverside County (Jennings and Hayes 1994; Thomson et al. 2016).

Large, relatively intact populations still exist in northern California throughout large areas of the Coast Range and the Sierra Nevada foothills, although agriculture and habitat modification have destroyed large areas of riparian and wetland habitat in the Sacramento Valley that almost certainly supported large populations of this species in the past. Scattered populations remain throughout the Sacramento Valley, but the extensive marsh habitat that dominated much of the valley floor has been largely drained and converted to agriculture. Kelly et al. (2005) estimated that the extent of wetland habitat in the Central Valley has declined by approximately 80 percent since the 1860s when large-scale land conversion began, which undoubtedly eliminated many WPT populations.

### Status in the Upper Westside Specific Plan

WPT is found in many of the Natomas Basin's aquatic habitats, particularly in the larger irrigation and drainage canals. There are previously recorded occurrences of this species within the database search area (Bargas 2022, CDFW 2024). There are no CNDDB records of WPT within the Study Area; however, this highly mobile species may occur within any of the aquatic features present within the Study Area. This species was frequently observed along the Natomas Main Drainage Canal, which is adjacent to the northeastern Study Area border, during NBHCP habitat mapping surveys (City of Sacramento *et al.* 2003). Habitat suitable for WPT within the Study Area is considered to be canals and associated upland refugia along the canals and ditches.

### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, aquatic and upland habitat for WPT is present in the Natomas Basin primarily in the form of irrigation canals and ditches and associated uplands. The majority of the Study Area is a partially fragmented, somewhat isolated patch of agricultural land surrounded on the eastern, northeastern, and southeastern proposed boundaries by the dense urban environs of the City of Sacramento. The western boundary of the Study Area abuts Garden Highway which parallels the Sacramento River. The western portion (approximately 0.75 mile) of the northern boundary abuts TNBC preserve lands whereas the remaining eastern portion of the northern boundary (approximately 0.75 mile) abuts the City of Sacramento where it intersects with I-5. However, the presence of I-5 and the Garden Highway or I-80 are incomplete barriers for this species. The Garden Highway is a busy two-lane highway with periods of low traffic that will not completely inhibit dispersal of WPT using the Sacramento River and the banks of the levees. Additionally, the West Drainage Canal provides abundant habitat along the northern and eastern boundaries of the Study Area, as well as a small section of the Canal that is within the Study Area. The West Drainage Canal is a warmwater habitat feature with emergent vegetation and basking sites that likely provide ideal habitat conditions for this species. Canals and ditches are within upland dispersal ranges of WPT and WPT are likely to disperse throughout the Study Area via irrigation canals and ditches.

### Water Quality and Runoff

Aquatic communities may be greatly affected by surrounding land use. Urban areas can cause different and, in some cases, stronger effects than agricultural lands (Bury 1972; Moore and Palmer 2005). Residential developments typically result in increased runoff of hydrocarbons and pesticides, fertilizers, and/or herbicides used for lawns and gardens, and increased stormwater volume (and associated increases in depths and velocities) because of high coverage of impervious surfaces. Significant impacts to amphibian communities that are prey items for species such as WPT, have been shown to occur because of exposure to herbicides, fertilizers, and/or pesticides (Sparling et al. 2010; Elliott et al. 2011).

Aquatic habitat adjacent to the northwestern portion of the Study Area could be impacted by urban landscaping practices.

### Habitat Connectivity

The majority of the Study Area is essentially a dead-end for this species as it is cut off from potentially suitable WPT habitat to the south, east, and west as described above. Construction of the Study Area will remove the irrigation canal system currently in place in the interior Study Area and will create a few isolated recreational water features as part of the planned design. Once constructed, the majority of the Study Area will have no aquatic connectivity to aquatic habitat outside the Study Area. The Project Proponent/Permittee proposes the identification and creation of Off-Site Reserves of sufficient quality and quantity to offset all potential impacts to suitable habitat for WPT to be determined in consultation with local, state, and federal regulatory agencies. A particularly important benefit of habitat preservation in the agricultural Natomas Basin is that it ensures habitat will always be available ensuring a buffer is in place against the year-to-year fluctuations in habitat availability based on the agricultural practices around growing rice.

### Construction-Related Activities

Construction activities associated with the development of the Study Area and future reserves could potentially affect WPT individuals and/or habitat. If present during construction, WPT in the Study Area or reserve, may be injured or killed by construction-related activities, including ground disturbing activities, equipment use, and/or construction of structures and infrastructure. WPT could be killed or injured by vehicle strikes (Leidy 1992) or crushed beneath heavy machinery (Wylie and Casazza 2000) if adults are in the upland area attempting to lay eggs in nests within the terrestrial habitat adjacent to aquatic habitat. Individuals may be indirectly impacted during construction as a result of increased levels of sedimentation or waterborne contaminants. The mitigation measures identified in Section 6 would reduce impacts to this species to less than significant.

### Overall Effects on Population Viability

Due to the Study Area's geographic location surrounded on three sides by barriers, the loss of habitat in the Study Area would not adversely affect WPT, and the overall effect of the UWSP on population viability would be minimal. The area of impact within West Drainage Canal is considered temporary, and the habitat would remain hydrologically connected to Fisherman's Lake after culvert replacement. Impacts to individual WPT that may be present in this area during culvert replacement would be avoided/minimized through the measures outlined in MM BIO-3a and MM BIO-4a in Section 6.3 of this report. WPT in the Natomas Basin, is now largely reliant on the artificial environs of rice farming and the irrigation systems in place to subsidize rice farming. The reliance on artificial habitats such as rice fields is not a long-term solution for population viability of the species as agriculture fluctuates annually and agricultural lands are frequently sold for urban development. Although some potentially suitable habitat will be lost as a result of the construction of the UWSP proposed development, the outcome of that development will be the procurement of additional reserves for GGS that will also benefit WPT. Habitat preservation ensures that suitable aquatic habitat and upland nesting habitat will remain in perpetuity for the benefit of WPT. WPT will also benefit from the addition of new lands connected to the existing TBNC preserve system that will be acquired to mitigate for the loss of habitat in the Study Area.

Habitat enhancement, connectivity and preservation contribute to population viability by reducing the level of human disturbance and proximity to activities that could harm or kill WPT. Habitat enhancement and management also reduces or eliminates agricultural activities that can harm or kill WPT. In addition, the preservation and enhancement of GGS habitat will result in larger blocks of connected aquatic habitat, which will also benefit WPT. Larger blocks of connected aquatic habitat will also reduce the potential for WPT to attempt road crossings which result in increased mortality (Rosen and Lowe 1994; Bonnet et al. 1999).

Final habitat acreages, mitigation ratios, and other project-specific compensatory mitigation requirements shall be determined through consultation between USACE/USFWS/CDFW as part of the required project-specific regulatory permitting processes, currently anticipated to consist of Section 404 Authorization/FESA Section 7 Consultation/CDFW Streambed Alteration Agreement and 2081 Incidental Take Permit.

## 5.2.5 Special-status Birds

### 5.2.5.1 Cooper's Hawk

#### Listing Status

Cooper's hawk is listed as Watch List species by CDFW. Cooper's hawk is not a Covered Species under the NBHCP.

#### Life History and Habitat Requirements

Cooper's hawk is a slender and medium-sized hawk, with a short wingspan and a long tail enabling this hawk to be highly maneuverable in woodland habitats. The long tail shows a very distinctive white rump patch prominently displayed during flight. Primary foraging and breeding habitat include dense woodlands such as live oak, riparian or deciduous habitats including patchy woodlands. This species will also forage and nest in landscaped or urban areas. While hunting, Cooper's hawk pursues small birds and small mammals which it will catch in the air or on the ground. Pursuit will occur through dense woodlands, through branches and sometimes Cooper's hawk will pursue prey on the ground through dense shrubs (Zeiner et al. 1990). Prey may also include amphibians, and reptiles.

Nesting occurs on deciduous trees from 10 to 80 feet above the ground. This species may also nest in conifers, and the nest consists of a stick platform nest placed in the crotch of the tree near streams (Zeiner et al. 1990). Breeding occurs from March to August. A nest will consist of a single brood of between two and six eggs. The female incubates the eggs while the male provides food. Fledging occurs approximately 34 days post-hatching.

#### Population Dynamics, Dispersal, and Detectability

Many populations in California are resident, but some northern populations migrate to California or to lower elevations from areas that receive heavy snow (Zeiner et al. 1990). This species is widespread across the contiguous U.S. and populations appear to be stable and increasing in some areas but are still recovering from a drastic decline between 1940 and 1970 that are likely a result of pesticides and habitat loss (NatureServe 2024). Cooper's hawk populations overall are stable to increasing, with limited data showing a decline in California (NatureServe 2024; Zeiner et al. 1990).

### Rangewide and Local Distribution

Cooper's hawk is widespread in North America where it occurs in densely wooded forests. The species occurs in suitable habitat throughout California at elevations from below sea level to 9,000 feet. Of 77 territories in oak woodland stands, the mean distance between nest sites was approximately 1.6 miles (Zeiner et al. 1990).

### Status in the Upper Westside Specific Plan

There are two CNDDB reported occurrences for this species within a 5-mile radius of the Study Area. The nearest CNNDB reported occurrence is located approximately 3.9 miles south of the Study Area and documents a nest from 2008 in the City of Sacramento (CDFW 2024). Cooper's hawk was observed in the Study Area during surveys conducted by Bargas and is noted in the species list as detected in 2019 (Bargas 2020). Cooper's hawk was observed in the Study Area by HELIX biologists on March 7, 2023.

## Project Effects to Cooper's Hawk

### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, foraging and nesting habitat for Cooper's hawk is present in the Natomas Basin and within the Study Area. With the implementation of the UWSP, foraging and nesting habitat will be reduced in the Natomas Basin. Fremont cottonwood and valley oak woodlands provide suitable nesting and foraging habitat for the species. Habitat fragmentation has been implicated as a major cause of population decline in Cooper's hawk, in addition to pesticide use (NatureServe 2024). Cooper's hawk populations overall are stable to increasing, with limited data showing a decline in California (NatureServe 2023; Zeiner et al. 1990). Cooper's hawk survival and reproduction are likely to be higher in larger, more contiguous habitat areas, such as riparian or woodland habitat along the Sacramento River.

### Increased Predation

Many mammalian species, such as foxes and opossums, that prey on eggs and fledgling birds increase near human habitation. Crooks and Soule (1999) have recorded increased avian extirpation rates in habitat fragments as a result of these increased predator populations.

Avian nest predators such as crows also typically increase in proximity to residential development, in response to introduced nesting trees, increased food supplies, and increased hunting perches such as streetlights and other infrastructure (Steenhof et al. 1993; Marzluff et al. 2001). Predation of avian nests is also more intense along roads, urban edges, and other linear habitats (DeGeus 1990), presumably because of the increased use of linear rights-of-way by crows and mammalian predators (Knight et al. 1995). Avian mortality from vehicle collisions has also been significant in some areas (Shuford et al. 2008) and may increase with increased traffic generated by the proposed residential development.

### Reduction of Prey Base

Changes in the Cooper's hawk prey base (birds, small mammals, and insects) may result from residential development affecting adjacent mammalian predators and communities. Crooks and Soule (1999) quantified the effects of domestic cats on small animals, estimating that the average domestic cat population in moderately sized fragments (~50 acres of upland habitat bordered by 100 residences) annually return approximately 840 rodents, 525 birds, and 595 lizards to residences. Assuming that cats

do not bring back all killed prey, actual effects on prey numbers are probably underestimated. Similarly, Blair (1996) reported one-third fewer avian species in lands adjacent to residential development as compared to habitat preserves in the same area. The Cooper's hawk prey base could be reduced by the increase in mammalian predators that prey on the same small bird and rodent species as Cooper's hawk and the prey base could be reduced by the conversion of agricultural and semi-natural lands to urban development.

### Nest Disturbance

Human disturbance to nesting has been identified as a primary threat to raptor populations as several studies have demonstrated declines in raptor populations resulting from human-associated disturbance (Voous 1977; Swenson 1979; Craighead and Mindell 1981). It is possible that the anticipated human activity associated with the Study Area's 1,573 acres of urban structures could result in nest disturbance to Cooper's hawk nests in the Study Area which could result in decreased nest success.

### Overall Effects on Population Viability

The UWSP is unlikely to have an effect on Cooper's hawk population viability, as the Natomas Basin accounts for a very small portion of the Central Valley's Cooper's hawk population and its habitat since the Study Area is mostly agricultural lands with only a small amount of valley oak woodland habitat suitable for nesting and foraging is present. Implementation of the UWSP would result in the loss of some Cooper's hawk habitat available in the Natomas Basin. The Natomas Basin accounts for only a small portion of the habitat in the Central Valley that is available to support the Cooper's hawk population. Thus, the loss of a small portion of nesting habitat in the Natomas Basin as a result of the implementation of the UWSP and the conservation of habitat for GGS, SWHA, and WPT would not alter the viability of the Cooper's hawk population using the Natomas Basin. The UWSP has proposed measures that minimize and mitigate the impacts such as requiring surveys during the nesting season for this species and coordination with CDFW to determine appropriate mitigation in the event that this species is nesting in the Study Area and will be impacted by the proposed action. Therefore, the proposed action is minimized and unlikely to affect the survival of the Cooper's hawk in the Basin if it is present. Therefore, implementation of the UWSP would not affect the viability of the Cooper's hawk population using the Natomas Basin. Mitigation measures identified in Section 6 would reduce impacts to this species to less than significant.

## 5.2.5.2 Tricolored Blackbird

### Listing Status

TRBL is listed by CDFW as Threatened under CESA and is also a Species of Special Concern. The species is considered a Bird of Conservation Concern by USFWS. TRBL is afforded further protection under the MBTA of 1918.

### Life History and Habitat Requirements

TRBL is a highly colonial and nomadic species that is largely endemic to the lowlands of California although it also occurs sparsely in Oregon and northwestern Baja California. TRBL is considered the most intensely colonial of all North American passerine species (Orians 1961; Beedy et al. 1991; Beedy 2008). Historically, breeding colonies of up to 200,000 nests were recorded (Neff 1937), and up to 20,000 nests have been recorded in cattail marshes of 10 acres or less (DeHaven et al. 1975). Individual nests are

often built within a foot or less of each other (Neff 1937; Orians 1961). Breeding is highly synchronized with most pairs in a colony initiating nesting within a few days of each other (Neff 1937; Payne 1969). This highly synchronized and colonial breeding system evolved to exploit a rapidly changing environment where the locations of secure nesting habitat and rich food supplies were ephemeral and likely to change each year (Orians 1961; Payne 1969). TRBL tends to move from one nesting location to another between years, presumably in response to changes in the abundance of preferred prey or to nesting habitat suitability (Graves et al. 2013; Meese 2017; Airola et al. 2016).

The breeding season lasts until early August, and birds are occasionally observed breeding from September to November. The nest is a deep cup of leaves and stems attached to plant stalks and constructed by the female. Two broods of usually four young are reared. Eggs are incubated by the female for 11 days, and nestlings are tended by either just the female or both parents for 13 days until they leave the nest.

TRBL prefers freshwater marshes with dense vegetation often dominated by cattails for breeding. During the non-breeding season, colonies abandon the marsh and are itinerant across agricultural lands, ranches, golf courses, and residential parks. TRBL is an opportunistic generalist, taking insects, seeds, arthropods, and agricultural resources such as rice and wheat. Seed and insects are generally taken from the ground or gleaned from dense vegetation.

Due to the drastic decline in wetland nesting habitat over the last century, TRBL nesting habitat has switched to newly available nesting substrates. Surveys conducted from 1931 to 1936, documented that almost 93 percent of 252 breeding colonies observed in the Sacramento Valley, were in freshwater marshes dominated by cattails (*Typha* spp.) or bulrushes (*Schoenoplectus* spp.) with the remaining (7 percent) in willows (*Salix* spp.), blackberries (*Rubus* spp.), thistles (*Cirsium and Centaurea* spp.), and nettles (*Urtica* spp.; Neff 1937). By the 1970s, only 53 percent of colonies occurring in the Sacramento and San Joaquin valleys were in cattails and bulrushes and 47 percent utilized the non-native Himalayan blackberry (*Rubus armeniacus*) and milk thistle (*Silybum marianum*; DeHaven et al. 1975).

### Population Dynamics, Dispersal, and Detectability

As of 2017, 19,503 birds were reported from 34 locations in the Sacramento Valley (Butte, Colusa, Glenn, Sacramento, Sutter, Tehama, Yolo, and Yuba counties; Meese 2017). Numbers of birds were down in the Sacramento Valley and Sierra Foothills in 2017, with a combined decline of more than 32,000 birds. This represents a decrease of 33 percent from that observed in 2014 due entirely to a decrease of over 57 percent in Sacramento County; all other counties in the region showed small increases in abundance over 2014 (Meese 2017).

Most TRBLs move between the Central Valley, Sacramento Valley and Sacramento-San Joaquin Delta during the winter and move into the San Joaquin Valley, and Sacramento Valley during the breeding season. Post-breeding, the species resides in the Central Valley and surrounding foothills from March through July, then moves up into the Sacramento Valley until mid-November. During winter, TRBL moves down into the Sacramento-San Joaquin Delta and east to Merced County and coastal locations during winter (Tricolored Blackbird Working Group 2007).

### Rangewide and Local Distribution

TRBL occurs from the Central Valley to San Francisco Bay and south to northern Santa Barbara County at elevations from sea level to approximately 4,000 feet (Beedy *et al*. 2020). Disjunct populations are also

present along the south coast from southern Ventura County down to Baja California, with disjunct populations northward to Washington. The species is largely endemic to California, with smaller populations in Baja California, Nevada, Oregon, and Washington (DeHaven 2000).

During the breeding season, TRBL occurs in the Central Valley, the low foothills of the Sierra Nevada and Coast Range from Shasta County south to Kern County, along the coast from Sonoma County south to the Mexican border, and on the Plateau (Grinnell and Miller 1944; Beedy *et al*. 1991). Band recoveries from this species indicate that some wintering individuals travel nomadically along the entire length of the Central Valley, into the San Francisco Bay and Sacramento-San Joaquin Delta area, up to the northern and eastern plateau region of California, and into southern Oregon (DeHaven *et al*., 1975).

### Status in the Upper Westside Specific Plan

Historically, TRBL populations were in the millions, but with the extensive loss of wetlands and marshes throughout the Central Valley beginning in the 1930s, the population declined by approximately 50 percent. As of the 1970s, the TRBL population included only 41 nesting colonies and 133,000 birds (DeHaven 2000). Historically and currently, most California colonies have been located in the Sacramento and San Joaquin valleys and their surrounding foothills. There are several CNDDB reported occurrences within a 5-mile radius of the Study Area; with the nearest reported occurrence located approximately 1.9 miles northeast of the Study Area that documents an extirpated nesting colony from 1992 (CDFW 2024).

Upon conclusion of the statewide survey, Meese reported in 2017 that the Sacramento Valley hosted 19,503 birds from 34 locations (Meese 2017). The current population in the Central Valley as of 2017, is approximately 79,325. This includes 13 colonies identified in the surveys conducted by DeHaven and Hamilton in 2000. The DeHaven/Hamilton surveys indicated that the general range and major breeding areas of TRBL in the Central Valley have remained largely unchanged since the 1930s when Neff conducted surveys of the population (DeHaven 2000). There have been nine documented occurrences of TRBL (seven extant, two extirpated) in Sutter County. The two extirpated occurrences are located slightly northwest of the confluence of the Sacramento River and the Feather River, northwest of the Basin. TRBL was located 0.2 mile below the Sacramento/Sutter County line, west of Natomas Drain Levee Road.

TRBL was first documented nesting in the Natomas Basin in 2005, and nesting for this species was documented over the next six years. However, no nesting occurred in the Natomas Basin in 2012. TRBL nesting was then documented in 2020, for the first time in nine years (ICF 2020). No nesting was documented in 2021 (ICF 2022).

The Natomas Basin colony resides on a 330-acre parcel in the Natomas Basin that was acquired by The Natomas Basin Conservancy (TNBC); the Betts-Kismat-Silva reserve in the eastern edge of the Natomas Basin, approximately 6.4 miles north/northeast of the Study Area. The population of this nesting colony includes approximately 4,000 nesting birds, which have located their nests in five scattered clumps of blackberry bushes near irrigated pastureland (DeHaven 2000). The Study Area contains potential TRBL foraging and nesting habitat. This species was not observed within the 568.7 acres of lands surveyed by Bargas in either 2019 or 2020 (Bargas 2019, 2020) and it was not observed by HELIX in 2023.

## Project Effects to Tricolored Blackbird

### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, the Study Area provides foraging and nesting habitat for TRBL. Foraging habitat in the Study Area consists of agricultural lands, annual grasslands, fallowed crops, and ruderal areas. With the implementation of the UWSP, TRBL potential foraging habitat will be reduced in the Natomas Basin and potential nesting habitat along canals and ditches will be reduced.

### Water Quality and Runoff

Aquatic communities may be greatly affected by surrounding land use. Urban areas can cause different and, in some cases, stronger effects than agricultural lands (Bury 1972; Moore and Palmer 2005). Residential developments typically result in increased runoff of hydrocarbons and pesticides, fertilizers, and/or herbicides used for lawns and gardens, and increased stormwater volume (and associated increases in depths and velocities) because of high coverage of impervious surfaces. Significant impacts to invertebrate communities that are prey items for species, such as TRBL, have been shown to occur because of exposure to herbicides, fertilizers, and/or pesticides (Sparling et al. 2010; Elliott et al. 2011). Aquatic habitat adjacent to the northwestern portion of the Study Area could be impacted by urban landscaping practices.

### Increased Predation

Many mammalian predators such as foxes, opossums, skunks, and other small predators increase near human habitation, and this increase has been shown to lead to increased avian extirpation rates in habitat fragments (Crooks and Soule 1999). Nest predators such as crows also typically increase in proximity to residential development, in response to introduced nesting trees, increased food supplies, and increased hunting perches such as streetlights and other infrastructure (Steenhof et al. 1993; Marzluff *et al*. 2001). Although increased predation near residential development would likely be much less for vigilant, mobile flocks of foraging TRBLs, predation rates would be expected to increase for all avian species near residential development.

### Nest Disturbance

Nesting colonies of TRBLs are highly sensitive to disturbance, which can cause nest abandonment or interfere with the incubation and feeding of young in a way that reduces reproductive success (City of Sacramento *et al*. 2003). Disturbance to TRBL nests would typically result from construction-related activities.

### Construction-Related Activities

Potential effects due to construction-related activities would be limited to the displacement of birds foraging or roosting within agricultural or semi-natural terrestrial habitat during the initial phases of construction. A summary of all conservation measures to be implemented with the construction and development of the Study Area is provided in Section 6. Implementation of UWSP conservation measures will avoid and/or minimize potential effects to the species' population due to construction-related activities.

**Overall Effect on Population Viability**

Implementation of the UWSP would have no overall effect on the population viability of TRBL as only a small amount of available nesting habitat is available in the Study Area. Further, the Study Area and the Natomas Basin account for only a small portion of the habitat in the Central Valley that is available to support the TRBL population. Thus, the loss of a small portion of nesting habitat in the Natomas Basin as a result of the implementation of the UWSP and the conservation of habitat for GGS, SWHA, and WPT would not alter the viability of the TRBL population using the Natomas Basin. The UWSP has proposed measures that minimize and mitigate the impacts, such as requiring nesting bird surveys during the nesting season for this species, and coordination with CDFW to determine appropriate mitigation in the event that this species is nesting in the Study Area and will be impacted by the proposed action. Therefore, the proposed action is minimized and unlikely to affect the survival of the TRBL in the Basin if it is present. Mitigation measures identified in Section 6 would further reduce impacts to this species to less than significant.

#### 5.2.5.3 Western Burrowing Owl

**Listing Status**

BUOW is a CDFW Species of Special Concern and is federally protected by the USFWS under the amended MBTA of 1918, which added protection to the original MBTA to include eagles, hawks, and owls (USFWS 1972). BUOW is also listed as "A Bird of Conservation Concern" by USFWS (CDFW 2023).

**Life History and Habitat Requirements**

Male and female BUOW can breed at 10 months of age, with intervals of one year between subsequent breeding. Nesting occurs from March through August, with BUOW pairs typically forming a bond for more than one year and exhibiting high site fidelity, reusing the same burrow year after year (Haug *et al.* 1993). Breeding in California typically begins in mid-April, with females laying between four to twelve eggs in an expanded cavity lined with debris several feet deep in a burrow (CA BUOW Consortium 1993). Both parents care for the young but play different roles. The female remains inside the burrow during most of the egg-laying and incubation period (~40 to 45 days) and is fed by the male throughout brooding. BUOW is an opportunistic feeder, consuming insects, small mammals, small birds, and occasionally, amphibians and reptiles (Haug *et al*. 1993).

The young are altricial at hatching and unable to move among nest burrows until approximately 10 days of age. Owlets emerge from burrows at approximately two weeks, where they wait for adults to bring food. Short flights are achieved at approximately four weeks and owlets can fly well by six weeks but remain close to the nest. Fledging occurs between 44 and 53 days of age (Poulin *et al.* 2020).

BUOW is generally found in dry, open areas of short grassland prairie habitat west of the Mississippi River in the continental U.S., southern portions of Canada, and further south into portions of Mexico and South America (Haug *et al.* 1993). In California, BUOW frequents open habitats that are characterized by short, sparse vegetation with few shrubs, level to gentle topography, and well-drained soils (Haug *et al.* 1993; Conway 2018), such as those occurring in grasslands, steppes, deserts, prairies, agricultural areas, ruderal grassy fields, vacant lots, and pastures. It is one of two diurnal owl species in California and is further distinguished by its use of small mammal burrows for protection from predators, and for roosting and breeding.

BUOW habitat is defined as including short or sparse vegetation (present for at least a portion of the year), and characterized by the presence of burrows, burrow surrogates, or fossorial mammal dens, well-drained soils, and abundant, available prey. Grassy fields, vacant lots, and pastures are all suitable habitat if they have low or open vegetation structures, small mammal burrows, and foraging habitat nearby (Gervais *et al*. 2008). The species is strongly associated with ground squirrel (*Otospermophilus beecheyi*), prairie dog (*Cynomys* spp.), and badger (*Taxidea taxus*) habitat.

### Population, Dynamics, and Dispersal

BBS data from 1966 to 2007 show significant increases in BUOW populations in California, Arizona, and New Mexico, and declines in Florida, Montana, Colorado, and South Dakota. However, the state-wide Institute for Bird Populations census in California demonstrated a decline of eight to 10 percent in BUOW breeding pairs since the 1993 census. Overall, the states of California and North Dakota have shown the sharpest declines in numbers in the past 20 years; California went from an increase of 5.3 percent per annum in 1997 to a decline of 1.79 percent per annum in 2017.

In a comprehensive review of BBS and Christmas Bird Count (CBC) data collected from 1966 to 2017, Sheffield found that almost all western states continue to show declining BUOW numbers (Sheffield 2021). In addition, a review of the peer-reviewed literature from 1997 to 2017 revealed that slight to steep population declines have been reported in the U.S. and Canada, and that in many locations where BUOW was formerly common, the species has disappeared at an alarming rate.

There are two distinct populations of BUOW differentiated by migratory behavior. Those that have been observed in the colder regions of the northern U.S. and Canada migrate to warmer climes for nesting and breeding activities but return to their northern territories following the end of the reproductive season. Populations in more temperate regions generally maintain year-round residence in the same geographic areas and do not migrate or may make only minor or local winter movements (Haug et al. 1993). California is believed to support the largest populations of resident and wintering BUOW in the western U.S., primarily in the Imperial Valley, where over 5,000 pair of BUOW are documented (Sheffield 1997).

### Rangewide and Local Distribution

BUOW is found in suitable open habitat throughout western North America from southern Canada to northern Mexico, as well as in Florida, the Caribbean, and Central and South Americas at elevations up to 5,250 feet (1,600 meters). Grinnell and Miller (1944) described historic BUOW range in California, indicating the species was present throughout most of the state and its islands, except the coastal counties north of Marin and mountainous areas. Historically, the species was abundant in suitable habitats occurring from Marin County to the Imperial Valley (Grinnell and Miller 1944). The historic range is also believed to have included Napa and Sonoma counties (Grinnell and Wythe 1927). Although BUOW has been assumed to be extirpated from these areas (Shuford and Garadali 2008), CNDDB documents a few verifiable historic records in Napa County (Townsend and Lenihan 2007) and four historical BUOW occurrences in Sonoma County. Therefore, assumptions that BUOW has been extirpated in these counties may be premature. In southwest Solano County, one locally abundant population has been documented in Benicia, with other known populations occurring near Travis Air Force Base. Wintering populations occur seasonally on Grizzly Island and on neighboring hilly ranchlands along the I-80 and I-680 corridors. Many of these occurrences represent documented wintering populations, although some BUOW in the Vacaville area are known to be resident year-round. Wintering

BUOW may be underrepresented from documented records, as most surveys for BUOW are undertaken during breeding periods. Six percent of the state's BUOW population is documented in nearby Yolo County, which is adjacent to Sacramento County.

### Status in the Upper Westside Specific Plan

BUOW has been documented in several locations in the Natomas Basin, including the higher terrace along the basin's eastern border, in the tree planter boxes in the Power Balance Pavilion parking lot, and along the higher berms of the larger irrigation and drainage canals in the central basin (City of Sacramento *et al*. 2003). This species was not observed within the 568.7 acres of lands within the Study Area surveyed by Bargas in 2019, 2020, or 2021 (Bargas 2019, 2020, 2022), or by HELIX in 2023.

## Project Effects to Western Burrowing Owl

### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, foraging and nesting habitat are present in the Natomas Basin and the Study Area. With the implementation of the UWSP, potential foraging and nesting habitat for BUOW will be lost in the Natomas Basin and the Study Area with the construction of the urban developments.

Habitat fragmentation has been implicated as a major cause of population decline in grassland birds in general. Helzer and Jelinski (1999) found that overall avian species richness and the presence of several common grassland species decrease with smaller habitat patch sizes (especially when <50 ha) likely due to edge effects. Upland bird populations have been found to be unstable in fragmented habitats (Hinsley et al. 1995; Crooks et al. 2001). BUOW forages in larger habitat patches than the 45 smaller birds studied by Crooks et al. (2001) and are likely to be similarly affected by fragmentation.

With the application of the UWSP screening criteria, future reserves developed to mitigate for the loss of SWHA habitat from the development of the Study Area will concurrently benefit BUOW and assure that BUOW retain sufficient nesting and foraging habitat in perpetuity to successfully raise young.

### Reduction of Prey Base

Changes in the BUOW prey base (small mammals and insects) may result from residential development affecting adjacent mammalian predator communities. Crooks and Soule (1999) quantified the effects of domestic cats on small animals estimating that the average domestic cat population in moderately sized fragments (~50 acres of upland habitat bordered by 100 residences) annually return approximately 840 rodents, 525 birds, and 595 lizards to residences. Assuming that cats do not bring back all killed prey, actual effects on prey numbers are probably underestimated. Similarly, Blair (1996) reported one-third fewer avian species in lands adjacent to residential development as compared to habitat preserves in the same area.

### Increased Predation

Many wild predators of BUOW increase near human habitation including coyotes, foxes, opossums, skunks, and other small predators that can easily predate eggs or young birds (Sheffield 1997; Wellicome 1997; Crooks and Soule 1999). Domestic cats are a common predator of avian species (Novak 1989) and would increase in abundance following the construction of the UWSP proposed development. Crooks and Soule (1999) observed increased avian extirpation rates as a result of predator increases

related to habitat fragmentation. Ground- and burrow-nesting avian species such as BUOW are particularly vulnerable to predation by domestic dogs and cats.

### Nest Disturbance

Although BUOW are tolerant of human activity outside of the breeding season, the species has been shown to abandon nests if disturbed during egg incubation. In addition to nest abandonment, significant disturbances near BUOW burrows may interfere with parental care and feeding of young in a way that reduces nest success.

### Construction-Related Activities

Earth-moving activities may trap or injure BUOW in their burrows and disturbance near active nests may cause abandonment. Nests could also be abandoned due to the loss of surrounding foraging habitat during construction. General mitigation measures such as pre-construction surveys and avoidance of occupied burrows during the nesting season are discussed in Section 6.1 below and specific-species measures for BUOW identified in Section 6.2.6 should be followed to avoid impacts to this species.

### Overall Effect on Population Viability

The UWSP is unlikely to have an effect on BUOW population viability, as the Natomas Basin accounts for a very small portion of the Central Valley's BUOW population and its habitat (City of Sacramento *et al.* 2003). The species has not been observed within the Study Area, and there are no CNDDB records of the species in the Study Area. Thus, the loss of a small portion of nesting habitat in the Natomas Basin as a result of implementation of the UWSP and the conservation of habitat for GGS, SWHA, and WPT would not alter the viability of the BUOW population using the Natomas Basin. The UWSP has proposed measures that minimize and mitigate the impacts such as requiring surveys during the nesting and wintering season for this species and coordination with CDFW to determine appropriate mitigation in the event that this species is nesting in the Study Area and will be impacted by the proposed action. Therefore, implementation of the UWSP would not affect the viability of the BUOW population using the Natomas Basin. The implementation of mitigation measures provided in Section 6 would further reduce impacts to this species to less than significant.

## 5.2.5.4 Swainson's Hawk

### Listing Status

SWHA is listed as Threatened by the CDFW under the California Endangered Species Act (CESA), and is federally protected by the United States Fish and Wildlife Service (USFWS) under the amended MBTA of 1918, which added protection to the original MBTA to include eagles, hawks, and owls (USFWS MBTA 1972). SWHA is also listed as a "Bird of Conservation Concern (BCC)" by USFWS (CDFW 2023).

### Life History and Habitat Requirements

SWHA breeds throughout the central U.S., north to Canada, and south to northern Mexico, with separate populations occurring in California. This species has one of the longest migrations of any raptor, traveling from its breeding range in North America to Mexico and Central and South America, with some individuals migrating as far south as Argentina. Immature and non-breeding individuals begin to gather and migrate south in late August and September and return in March and April (Schmutz et al.

2006). SWHA is found in multiple populations in California, with the larger part of the species' distribution in the northeastern part of the state, and disjunct populations in the Sacramento and San Joaquin Valleys, as well as occasionally south to Antelope Valley and Joshua Tree.

SWHA largely prefers low, open, and generally flat terrain, although a few territories have been detected in low rolling hills or agricultural habitat with scattered trees or riparian strips for nesting. No territories have been detected in wooded or mountainous terrain (Bloom 1980). Throughout the range of the species, SWHA nests almost exclusively in trees, unlike many other raptors that commonly nest on cliffs or artificially-created structures, such as poles or towers (England et al. 1997). In central California, SWHA nests are most likely to be found within riparian forest or remnant riparian forest trees, but they may also be detected within isolated trees or small groves where nest trees are adjacent to, or within easy flying distance of, foraging habitat that provides abundant prey. Trees most commonly used for nesting include oak (*Quercus* spp.), cottonwood (*Populus* spp.), willow (*Salix* spp.), sycamore (*Platanus* spp.), Eucalyptus (*Eucalyptus* spp.), and walnut (*Juglans* spp.) (CDFG 1994). SWHA has also been recorded nesting in urban landscapes in the Central Valley of California, but always within five (5) miles of suitable foraging habitat.

SWHA prefers open grassland, which facilitates effective prey location. Smaller home ranges generally include areas that have preferred crops of low height, such as alfalfa, fallow fields, and dry pasture, while larger home ranges are found in areas with less suitable crops, such as mature grain, row crops, orchards, and vineyards (Bechard 1983; Estep 1989; Woodbridge 1991; Babcock 1995). Home range size may shift in response to agricultural practices becoming larger over the course of the breeding season as crops mature, and increasing ground cover make prey more cryptic (Bechard 1983; Estep 1989; Woodbridge 1991; Babcock 1995). Individuals cease foraging when crops become too tall and return after mowing or burning.

SWHA is largely insectivorous during the non-breeding season, foraging primarily on invertebrates, such as grasshoppers (*Conocephalinae*), crickets (*Gryllidae*), and dragonflies (*Odonata*), but while feeding developing chicks during the breeding season, adults hunt larger, more substantial prey, such as California meadow voles (*Microtus californicus*), valley pocket gophers (*Thomomys bottae*), deer mice (*Peromyscus maniculatus*), young California ground squirrels (*Otospermophilus beecheyi*), mourning doves (*Zenaida macroura*), western meadowlarks (*Sturnella neglecta*), and other passerines (songbirds) (Palmer 1988; Estep 1989). Later in the breeding season many SWHA forage in groups, following tractors during agricultural harvest activities.

SWHA breeding season begins upon arrival back in the breeding grounds in early March and continues until late August through mid-September (Vennum 2017). A large, relatively flat stick nest is constructed in a tree, often in riparian corridors. A clutch of two eggs is laid and incubated by both parents for approximately 28 days. Young are fed by both parents until they fly at four to five weeks.

### Population Dynamics, Dispersal, and Detectability

Prior to state listing, Bloom (1980) found that SWHA had declined to as few as 375 breeding pairs throughout their summer range in California. In a study conducted from 2003 through 2009, Gifford et al. (2012) showed an increase in SWHA population size for portions of the Central Valley. According to Kane et al. (2020), the Butte Valley SWHA population (Butte County, California) has increased fourfold in the past 40 years.

Furnas *et al.* (2022) evaluated SWHA population trends by analyzing data from 1,038 locations surveyed throughout California in either 2005, 2006, 2016, or 2018. They concluded that the SWHA summering population in California grew rapidly between 2005 and 2018 at a rate of 13.9 percent per year and estimated a total statewide population of 18,810 breeding pairs in 2018. The study found that alfalfa (*Medicago sativa*) cultivation, agricultural crop diversity, and the occurrence of non-agricultural trees for nesting were positively associated with SWHA density. Although the species is doing well in Northern and Central California, SWHA remains largely extirpated from Southern California, where it was historically common. Recent studies suggest that reproductive success and, in turn, population-level recruitment may be associated equally - if not more closely - with the availability of nesting sites than with the current distribution of land cover (Fleishman et al. 2016).

Nest placement is highly cryptic and frequently obscured from view by tree foliage. Discovering a nest requires a keen knowledge of the natural history of the species, as well as patience and often, just plain luck. Most nests are only detected when a hawk enters or leaves the tree. It is important when surveying for this species to conduct an early survey (e.g., December) when trees are bare to identify the location of stick nests prior to initiating protocol surveys.

### Rangewide and Local Distribution

Once common throughout much of California, SWHA populations have declined precipitously within the state, and are now extirpated from many historical breeding areas (Bloom 1980; Woodbridge 1998). Many causative factors have been associated with this decline, including eggshell thinning, pesticide poisoning, mortality during migration, and breeding and wintering habitat loss and degradation. It is likely that causes of the population decline are multi-factorial (SWHA TAC 2000). The Central Valley region of California may support the highest density of nesting SWHA, as over 70 percent of recorded nest sites occur within the Great Valley ecoregion, which encompasses the Sacramento Valley and Sacramento-San Joaquin Delta (Bloom 1980; Gifford et al. 2012). In the Natomas Basin, SWHA nests primarily in the riparian areas along the Sacramento and American Rivers and along the Natomas Cross Canal. Home range sizes vary widely, as prey resources are influenced by land uses near the nest site.

Using radio-tracking technology Fleishman et al. tracked 23 adults SWHA in Natomas Basin from 2011 to 2013. Their results showed that the majority of adult SWHA radio-tracked throughout the breeding season traveled distances up to 5 to 6.8 miles from the nest; however, they also found that home-range sizes varied substantially among individuals, years, and life stages (e.g., arrival, courtship, hatching, nestling, fledging, and pre-migratory) (Fleishman et al. 2016). Home ranges generally were smallest when adult SWHAs were caring for young. Seasonal home-range sizes radio-tracked from 2011 to 2013 ranged from 5 to 886 miles. Home ranges of pre-migratory SWHA averaged 60 miles in 2011, 124 miles in 2012, and 55 miles in 2013.

There are several CNDDB reported occurrences for this species within a five-mile radius of the Study Area and this species is well documented as nesting and foraging in the Study Area and in the region. There are two documented CNDDB reported occurrences of this species nesting on the Study Area; the record documents nesting activity in cottonwoods and oak trees in 1992 and 1993 (CDFW 2024).

### Status in the Upper Westside Specific Plan

The Central Valley counties of Yolo, Solano, Sacramento, and San Joaquin are believed to support the largest and densest populations of SWHA in California (Gifford *et al.* 2012). In Butte Valley (Siskiyou

County, California), on the western edge of the Great Basin, the annual apparent survival of adults varied between 0.85 to 0.9 over 30 years (Briggs *et al*. 2011), and food availability locally may be associated with temporal variation in brood size and nestling survival (Schmutz et al. 2006). From 2001 to 2013, 43 to 65 nesting territories were active each year, and the number of pairs nesting in the Natomas Basin was stable, if not gradually increasing (ICF 2014). The mean number of young fledged per active nesting territory per year during this period was 1.00 (Fleishman *et al*. 2016).

Kane et al. (2020) conducted surveys from 1979 through 2018 in and around the Butte Valley observing 279 known-age adult SWHA 1,315 times. The average age of breeding SWHA in the Butte Valley across all surveyed years was 8.3 years. The oldest individual in the population whose age was known was 26 years old and the average age at death was 9.2. No difference in longevity was observed based on sex.

As of 2011, the Natomas Basin showed a fairly stable nesting population with the number of active nesting territories ranging from 43 to 62 between 2001 and 2011 (ICF 2012). Reproductive effort is reported to have remained relatively stable during this period ranging from 1.38 to 1.67 young per successful nest. Sixty-two nesting territories were confirmed active in 2011, representing the largest number of active territories since monitoring began in 2001.

Surveys from 2019 and 2020 documented at least three pairs of SWHA nesting on or within 0.5 mile of the Study Area. Nesting by one of the three pairs was within the Study Area and resulted in the successful fledging of one chick (Bargas 2019, 2020).

## Project Effects to Swainson's Hawk

### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, SWHA foraging habitat and nesting habitat are present in the Natomas Basin and the Study Area. Foraging habitat in the Study Area is limited to 1,573 acres which is approximately the patch size required to potentially support two nesting pairs of SWHA. The Study Area is a partially fragmented, somewhat isolated patch of agricultural land as it is surrounded on the eastern, northeastern, and southeastern boundaries by the dense urban environs of the City of Sacramento. The western boundary of the Study Area abuts Garden Highway, which parallels the Sacramento River. The western portion (approximately 0.75 mile) of the northern boundary abuts TNBC preserve lands whereas the remaining eastern portion of the northern boundary (approximately 0.75 mile) abuts the City of Sacramento, where it intersects with I-5. The proximity of foraging habitat and nest sites can be a factor in breeding success as long foraging flights carry higher energetic costs and reduce the amount of time adults are present to defend nests from predators. The majority of adult SHWA travel distances of up to five to six miles foraging from the nest throughout the breeding season (Fleishman *et al*. 2016). During the SWHA breeding season, small mammals generally comprise the majority of the biomass consumed by SWHA adults and delivered to nestlings, whereas during the non-breeding season, SWHA feeds opportunistically with insects (especially grasshoppers) as a primary food source (Fleishman et al. 2016). The UWSP Development Area would become urban land cover, contiguous with the City of Sacramento. As SWHA is documented to nest and forage in the Study Area, there is a potential for impacts to successful breeding due to a loss of foraging and nesting habitat, increased distance from nest sites to foraging grounds, and the loss of the prey base in the Study Area resulting from the conversion of agricultural lands to urban development.

### Reduction of Prey Base

Changes in the SWHA prey base (small mammals and insects) may result from residential development affecting adjacent mammalian predators and communities. Crooks and Soule (1999) quantified the effects of domestic cats on small animals, estimating that the average domestic cat population in moderately sized fragments (~50 acres of upland habitat bordered by 100 residences) annually return approximately 840 rodents, 525 birds, and 595 lizards to residences. Assuming that cats do not bring back all killed prey, actual effects on prey numbers are probably underestimated. Similarly, Blair (1996) reported one-third fewer avian species in lands adjacent to residential development, as compared to habitat preserves in the same area. The SWHA prey base could be reduced by the increase in mammalian predators that prey on the same rodent species SWHA preys upon, and the prey base could be reduced by the conversion of agricultural and semi-natural lands to urban development.

### Increased Predation

The majority of SHWA nesting records are documented along the riparian habitat on both sides of the Sacramento River (CDFW 2024). Corvids (crows and magpies) and great horned owls are the most common predators of SWHA eggs and nestlings (England *et al*. 1997). Corvid populations typically increase near human settlement because of the supplemental food source of human refuse and additional perches provided by urban trees, streetlights, and other infrastructure (Steenhof *et al*. 1993; Marzluff et al. 2001). This increase in predator abundance can result in increased nest predation near residential development. The conversion of 1,573 acres of agricultural lands to urban development could result in increased predator abundance in the Natomas Basin and an increase in SWHA nest predation as a result.

### Nest Disturbance

SWHA responses to nest disturbance vary with each nesting pair and the timing, regularity, and nature of the disturbance. Research shows varying responses with some disturbed nest sites successfully fledging young (Estep 1989; England *et al*. 1995), while other disturbed nest sites are abandoned, particularly if the disturbance occurred during nest construction and egg incubation (Bent 1937; Stahlecker 1975). Significant disturbances near SWHA nests can result in nest abandonment or interference with parental care and feeding of young resulting in decreased nest success.

The majority of SHWA nesting records are documented within riparian habitat present on both sides of the Sacramento River (CDFW 2024; eBird 2024). These riverine areas are also occupied by rural residential development that lie on the west side of Garden Highway and are termed riverfront properties in most cases. SWHA documented as regularly nesting along the Sacramento River appear to be habituated to the level of disturbance that is associated with the rural residences. It is possible that the anticipated human activity associated with UWSP's 1,573 acres of urban structures could result in nest disturbance to SWHA nests within 0.5 mile of the Study Area which could result in decreased nest success.

### Construction-Related Activities

Construction of the proposed development of the UWSP as well as habitat restoration and enhancement activities at future reserve mitigation sites has the potential to displace and/or disturb SWHA if construction activities occur during the SWHA nesting season. Noise, dust, and sound vibrations resulting from the operation of heavy construction equipment and human activity within 0.5 mile of

SWHA nest sites could cause nest abandonment or interfere with parental care, which could reduce nest success. The implementation of mitigation measures provided in Section 6 would further reduce impacts to this species to less than significant.

**Overall Effects on Population Viability**

Development of the UWSP proposed development could cause both adverse and beneficial effects on the SWHA population nesting and foraging in the Natomas Basin. Development of the Study Area would result in the loss of SWHA foraging habitat and trees suitable for SWHA nesting habitat in the Study Area. The UWSP has proposed measures that minimize and mitigate the impacts, such as requiring surveys during the nesting and wintering season for this species and coordination with CDFW in the event that this species is nesting in the Study Area and will be impacted by the proposed action. Implementation of mitigation measures provided in Section 6 would reduce impacts to this species to less than significant.

#### 5.2.5.5 Northern Harrier

**Listing Status**

Northern harrier is listed as Species of Special Concern by CDFW. Northern harrier is not a Covered Species under the NBHCP.

**Life History and Habitat Requirements**

Northern harrier is a slender hawk approximately 17 inches in size, with a wingspan of 43 inches and a weight of approximately 15 ounces. The long tail shows a very distinctive white rump patch prominently displayed during flight. Females are larger than males and have a brown back, brown wings, light-brown underside, and a streaked breast and belly. Immature birds of both sexes appear alike and resemble adult females, except that the underside is rufous-colored. Males are gray.

Primary foraging and breeding habitat include open, treeless habitats, most commonly fresh- or saltwater marshes, edges of streams or lakes, grasslands, densely planted agricultural areas, and desert sinks. In North America, populations of Northern harrier with the highest densities are associated with large tracts of undisturbed, dense vegetation. While hunting, Northern harrier often glides less than a meter over low-profile vegetation, scanning for prey both visually and aurally. When a potential prey item is detected, this species can reverse course abruptly in mid-flight to drop onto potential prey. Prey primarily consist of small mammals and birds, but can include amphibians, reptiles, and arthropods (Davis and Niemela 2008).

Adult males generally arrive to breed in suitable habitat 5 to 10 days before females. Northern harriers nest on the ground in densely vegetated areas with less than 30 percent woody cover. Aerial courtship and territorial displays begin when adult females arrive in late February to mid-May, and the breeding season extends through August. Most pairs are monogamous, but polygyny occurs with approximately one-third of females breeding in harems of two to five. Northern harrier raises a single brood per year (Simmons and Smit 1987).

Nesting occurs on slightly elevated ground within patches of dense, often tall, vegetation, such as cattails (*Typha* spp.; Baicich and Harrison 1997; Smith *et al*. 2011). The ground nest is constructed by the female of small sticks and reeds and lined with grass. The nest structure is generally fairly insubstantial

but can be significantly larger in more mesic areas. Nest-building is initiated from March to early June and takes as little as a few days or as much as two weeks. Females incubate eggs for 31 to 32 days (Baicich and Harrison 1997; Davis and Niemela 2008; Smith *et al*. 2011). The semi-altricial young remain in the nest for six weeks while being fed by both sexes. Fledging occurs approximately 35 days post-hatching, typically from late July to early August, and juveniles remain in the vicinity of the nest for up to four weeks (Schmutz and Schmutz 1975).

### Population Dynamics, Dispersal, and Detectability

Many populations in California are resident, but some northern populations migrate south from August to December and return north from February through May (Beske 1982). Northern harrier populations have been shown to fluctuate in response to changes in prey species abundance, particularly vole (*Microtus* spp.) populations (Collopy and Bildstein 1987). Due to its diet, northern harrier is prone to higher levels of pesticide contamination and lead poisoning than other species. Despite this, the most significant threat to northern harrier is habitat loss. As a species that requires large tracts of land for breeding, the continuing destruction of wetland and grassland habitat is a serious concern that could lead to drastic population declines.

### Rangewide and Local Distribution

Northern harrier is widespread in North America, but local distribution is dependent on habitat availability. The species occurs in suitable habitat throughout California at elevations from below sea level to 9,000 feet, but breeding has been extirpated in much of Southern California, due to habitat loss. The species is a widespread winter resident and migrant in suitable habitat. California populations have decreased in recent decades, but the species can be locally abundant where suitable habitat remains free of disturbance, especially from intensive agriculture. Northern harrier is most abundant in the Central Valley at present, despite considerable loss of habitat in that region. It is less abundant in coastal northwestern California than elsewhere and occurs only very locally in the southwestern deserts.

### Status in the Upper Westside Specific Plan

A total of 18 CNDDB occurrences of northern harrier are documented within the nine-quad search area, with the closest occurrence 10.56 miles from the Study Area. There are no CNDDB occurrences of northern harrier documented in the Study Area or within five miles of the Study Area (CDFW 2024). However, the species was observed utilizing habitat within the Study Area in 2019 and 2021, particularly in the eastern and northern portions of the SWHA survey area (Bargas 2019, 2021).

## Project Effects to Northern Harrier

### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, foraging and nesting habitat for northern harrier is present in the Natomas Basin and within the Study Area. With the implementation of the UWSP, northern harrier habitat will be lost in the Natomas Basin. Habitat loss has been implicated as a major cause of population decline of northern harrier as it is primarily a species of grasslands and marshes. Conversion of these habitats to agriculture is a major factor in the decline of the species in the last century (Hands *et al*. 1989).

### Reduction of Prey Base

Implementation of the UWSP could result in the decrease in prey base as result of developing land that previously supported prey animals and introducing nonnative predator competition as described in Section 5.2.2.7 for Cooper's Hawk under Reduction in Prey Base.

### Nest Disturbance and Increased Predation

Northern harrier nests on or near to the ground, and thus is extremely vulnerable to human disturbance and predation. Dogs, cats, and wildlife, such as foxes, coyotes, badgers, ravens, owls, and racoons, can easily predate eggs or young birds. Domestic cats are a common predator of avian species (Luukkonen 1987; Novak 1989) and would increase in abundance following the proposed development. Many mammalian predators, such as foxes, opossums, skunks, and other small predators also increase near human habitation. Crooks and Soule (1999) have recorded increased avian extirpation rates in habitat fragments as a result of these predator increases.

Nest predators such as crows also typically increase in proximity to residential development, in response to introduced nesting trees, increased food supplies, and increased hunting perches such as streetlights and other infrastructure (Steenhof et al. 1993; Marzluff *et al*. 2001).

### Construction-Related Activities

Construction activities associated with the proposed development in the Study Area or construction of the proposed reserve sites could disturb or displace northern harriers and may cause nest abandonment or nest destruction if nests are not detected prior to the start of construction. General mitigation measures provided in Section 6 include a requirement to conduct pre-construction surveys for a variety of avian species which would include all raptors such as northern harrier prior to the start of construction activities. If an active northern harrier nest is found, the disturbance would be avoided during the nesting season to the maximum extent possible. Similarly, the implementation of restoration activities in future reserves could impact this species if it is present. With the implementation of conservation measures, construction-related effects to Northern harrier would be minimized.

### Overall Effects on Population Viability

Although the UWSP would reduce the overall acreage of foraging and nesting habitat in the Natomas Basin, no effect on the viability of the northern harrier population would occur because the Natomas Basin represents only a small portion of the habitat used by the species in the Central Valley and throughout California (Hands *et al*. 1989). Based on CNDDB records northern harrier has not been documented nesting in the Natomas Basin. Thus, the loss of a small portion of nesting habitat in the Natomas Basin as a result of the implementation of the UWSP and the conservation of habitat for GGS, SWHA, and WPT would not alter the viability of the northern harrier population using the Natomas Basin. The UWSP has proposed measures that minimize and mitigate the impacts such as requiring surveys during the nesting season for this species and coordination with CDFW to determine appropriate mitigation in the event that this species is nesting in the Study Area and will be impacted by the proposed action. Therefore, the proposed action is minimized and unlikely to affect the survival of the northern harrier in the Basin if it is present. The implementation of mitigation measures provided in Section 6 would further reduce impacts to this species to less than significant.

#### 5.2.5.6 White-Tailed Kite

### Listing Status

White-tailed kite is listed as Fully Protected by CDFW under CESA and is federally protected under the amended MBTA of 1918. White-tailed kite is not a Covered Species under the NBHCP.

### Life History and Habitat Requirements

White-tailed kite is a relatively small member of the Accipitridae family approximately 16 inches in body length, with a 39-inch wingspan, and an average weight of 12 ounces (Dunk 1995; Sibley 2003). The species is distinguishable due to the white coloring on the underside, grey back, black scapulars, and marginal coverts. White-tailed kite is recognizable by the distinctive hovering and kiting style of hunting.

White-tailed kite is found primarily in open, low-elevation habitats with scattered trees (below 2,000 feet elevation), including grassland, agricultural fields, wetlands, oak-woodland, riparian, marshes, and savannahs (Clark and Banks 1992; Dunk 1995). This species specializes in hunting small mammals, primarily voles, but will also occasionally take birds, insects, reptiles, and amphibians. Hunting is conducted on the wing with stops to hover or "kite" while searching the ground for prey. When a prey item is sighted birds drop near the ground, often hover briefly, then snatch prey with their feet.

Breeding occurs from late January through October, with the peak season from May to August. White-tailed kite is a monogamous breeder but will nest semi-colonially in favorable habitat conditions (Dixon et al. 1957; Sibley 2003). Nests are constructed between January and August in a wide range of nesting substrates, including a variety of trees, such as willows (*Salix* spp.) and eucalyptus, and shrubs, such as saltbush and coyote bush (*Baccharis pilularis*) (Dunk 1995; Baicich and Harrison 1997). Nests are hastily built loose structures constructed over the course of one to four weeks. One brood (sometimes a second if the first is lost) of four to five eggs is laid in a twig nest lined with grass. Nests are usually found in the upper part of trees varying in height from 10 to 160 feet (Dunk 1995). Young hatch after 28 to 30 days of incubation by the female, with the male bringing food. Young fledge 35 to 40 days after hatching, and may be observed in large groups, as multiple broods gather within the local area while developing flight and hunting skills (Baicich and Harrison 1997).

### Population Dynamics, Dispersal, and Detectability

There is little understanding of the migration patterns of this species; some populations may be year-round residents, while others may be nomadic or fully migratory. In coastal California, the species is a year-round resident (Small 1994). During fall, white-tailed kites gather in large roosts of as many as 100 individuals between September and November.

### Rangewide and Local Distribution

White-tailed kite occurs throughout California, primarily west of the Sierra Nevada and southwestern deserts (Small 1994). The species is a common to uncommon, yearlong resident in coastal and valley lowlands; rarely found away from agricultural areas.

### Status in the Upper Westside Specific Plan

CNDDB documents 78 occurrences of white-tailed kite within the nine-quad search area. Eighteen occurrences are documented within five miles of the Study Area to the north and east; however, there are no occurrences of the species documented in CNDDB for the Natomas Basin. The nearest CNNDB reported occurrence is located approximately 2.6 miles south of the Study Area (and documents a nest from 2017 in a large oak tree in a residential neighborhood (CDFW 2024). White-tailed kite was observed foraging within the Study Area during surveys conducted by Bargas. One potential nest site was observed during the SWHA protocol survey during the 2019 and 2021 SWHA surveys. White-tailed kite was observed multiple times near the 2019 potential nest site, but no nesting activity was reported. White-tailed kite was observed to the east of the Study Area during the 2021 surveys with no nesting activity observed (Bargas 2022).

## Project Effects to White-tailed Kite

### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, foraging and nesting habitat for white-tailed kite are present in the Natomas Basin and within the Study Area. With the implementation of the UWSP, foraging and nesting habitat will be reduced in the Study Area. Some of the agricultural fields and annual grasses and forbs land cover in the Study Area provide potential foraging habitat, and Fremont cottonwood and valley oak tree groves provide suitable nesting habitat for the species. Habitat fragmentation has been implicated as a major cause of population decline in grassland birds in general. Helzer and Jelinski (1999) found that overall avian species richness and the presence of several common grassland species decrease with smaller habitat patch sizes (especially when <50 ha) likely due to edge effects. Upland bird populations have been found to be unstable in fragmented habitats (Hinsley et al. (1995) and Crooks et al. (2001). White-tailed kite survival and reproduction are likely to be higher in larger, more contiguous habitat areas.

### Reduction of Prey Base

Implementation of the UWSP could result in the decrease in prey base as a result of developing land that previously supported prey animals and introducing nonnative predator competition, as described in Section 5.2.2.7 for Cooper's Hawk under Reduction in Prey Base.

### Increased Predation

Implementation of the UWSP could result in the increase of mammalian predators and other nest predators, in addition to other causes of bird mortality, as discussed previously in Section 5.2.2.7 for Cooper's Hawk under Increased Predation.

### Nest Disturbance

Human disturbance to nesting has been identified as a primary threat to raptor populations as several studies have demonstrated declines in raptor populations resulting from human-associated disturbance (Voous 1977; Swenson 1979; Craighead and Mindell 1981).

Despite the common observation of the species (ICF 2021), there are no records in CNDDB documenting white-tailed kite nesting in the Natomas Basin nor in the Study Area. It is possible that the anticipated

human activity associated with UWSP's 1,573 acres of urban structures could result in nest disturbance to white-tailed kite nests near the Study Area which could result in decreased nest success.

### Overall Effects on Population Viability

The UWSP is unlikely to affect white-tailed kite population viability, as the Natomas Basin accounts for a very small portion of the Central Valley's white-tailed kite population and its habitat (City of Sacramento et al. 2003). Implementation of the UWSP would result in the loss of a small portion of white-tailed kite habitat available in the Natomas Basin. Thus, the loss of a small portion of nesting habitat in the Natomas Basin as a result of the implementation of the UWSP and the conservation of habitat for GGS, SWHA, and WPT would not alter the viability of the white-tailed kite population using the Natomas Basin. The UWSP has proposed measures that minimize and mitigate the impacts, such as requiring surveys during the nesting season for this species and coordination with CDFW to determine appropriate mitigation in the event that this species is nesting in the Study Area and will be impacted by the proposed action. Therefore, the proposed action is minimized and unlikely to affect the survival of the white-tailed kite in the Basin if it is present. The implementation of mitigation measures provided in Section 6 would further reduce impacts to this species to less than significant.

## 5.2.5.7 Loggerhead Shrike

### Listing Status

Loggerhead shrike is a USFWS BCC and is listed as a Species of Special Concern by CDFW. This species is further protected by the MBTA. In 1987, the USFWS designated the shrike as a Migratory Nongame Bird of Management Concern in the U.S.

### Life History and Habitat Requirements

Loggerhead shrike is one of three shrikes found in North America, and despite its taxonomic classification as a passerine (i.e., songbird), it behaves like a raptor or bird-of-prey. Sometimes called the "butcher bird" (*Lanius is Latin for butcher*), shrikes kill their prey with sharply hooked, raptor-like beaks, and then impale it on sharp thorns or barbs (Collins 2008). Loggerhead shrike diets vary seasonally and include arthropods (e.g., grasshoppers, crickets, beetles, and caterpillars), reptiles, amphibians, small rodents, and birds (Craig 1978).

Many loggerhead shrike pairs stay together through winter. Nesting season begins in January or February in the southern part of the range and late April or May in the north. Loggerhead shrike often lays two to three broods of four to nine eggs. A bulky cup nest is constructed primarily or completely by the female in dense vegetation, preferably with thorns or spikes, possibly for protection from predators. The female incubates the eggs for 14 to 16 days, with the young able to leave the nest 17 to 21 days after hatching. The young are cared for by both parents, with the female brooding for several days after hatching (Yosef and Grubb 1994; Shuford and Gardali 2008). The young become independent in July or August.

Shrikes, in general, utilize a variety of shrub, open woodlands, and grassland habitats that vary from shrub-steppe in the western United States to pasturelands in northeast Canada. Despite the diversity in habitats, a common characteristic of all occupied habitats includes open grassy foraging areas with scattered hunting perches (e.g., trees, shrubs, fences, and power lines), and small trees or shrubs for use as nest sites. In addition, shrikes require features such as barbed wire fencing or thorny, or multi-

stemmed shrubs to use as impaling sites for prey storage and manipulation (Craig 1978; Morrison 1980; Yosef 1996). Consequently, shrike foraging habitat requirements differ little between the breeding and nonbreeding seasons. Many shrikes now occupy "artificial" habitat that has been created or extensively altered by human activities.

### Population Dynamics, Dispersal, and Detectability

Loggerhead shrike populations have undergone a drastic decline, shrinking 76 percent since 1966 (Bohall-Wood 1987; Brooks and Temple 1990; USFWS 2000). It is one of the most persistently declining species surveyed by the North American Breeding Bird Survey (BBS); survey wide, the species declined at an average rate of 3.7 percent per year during the period 1966-1998 (USFWS 2000). The continuing loss of foraging habitat and hunting perches to modern agricultural practices seems the most likely explanation (Novak 1989, Pittaway 1991; USFWS 2000); however, it appears that this species is particularly vulnerable to diseases, such as West Nile Virus (WNV) (Smallwood and Nakamoto 2009; Schutten 2021) as well as pesticide poisoning that has been correlated with eggshell thinning (Morrison 1980).

Loggerhead shrike has been described as a partial migrant, with populations in the northern half of the breeding range being largely migratory while southern populations are resident. Miller (1931) suggested that permanent resident populations of loggerhead shrike occupy areas where snow cover does not persist for more than 10 days each winter.

### Rangewide and Local Distribution

Loggerhead shrike was once widely distributed and common over most of North America, occupying a wide variety of plant associations. The species was apparently always most abundant in the southern and western portions of its range, with high breeding densities observed from Florida to Texas and throughout the arid western U.S. (Grinnell and Miller 1944; Humple 2008). Deforestation and an increase in small-scale agriculture in the 1800s facilitated a northeastward expansion in range followed by a similar north-central expansion in the 1900s with agricultural development of the northern Great Plains and aspen parklands (Cade and Woods 1997). Since the 1940s, with forest regeneration, ongoing loss of pasturelands, and large increases in intensive row-crop agriculture, contraction of range and a decrease in numbers have been noted in parts of the loggerhead shrike range.

Loggerhead shrike occurs throughout much of California where suitable habitat exists and historically was described as abundant (Grinnell and Miller 1944). It is absent from northwestern California (except as a rare winter visitor along the coast from Del Norte County south to southern Mendocino County), much of the south Coast Ranges, the Sierra Nevada and southern Cascades, and high elevations of the Transverse Ranges (Sauer et al. 2017). Most are resident, though populations in the northernmost parts of the range move south for winter.

### Status in the Upper Westside Specific Plan

Loggerhead shrike declined 63 percent along all routes surveyed by Smallwood and Nakamoto in the Sacramento Valley between the four winters of 1990–1995 and the three winters of 2005–2008 (Smallwood and Nakamoto 2009). West Nile virus arrived in the Sacramento Valley of California in 2004 and began killing many corvids. This species appears to be extremely sensitive to WNV infection, which may have contributed to declines in the Study Area. Loggerhead shrike is a year-round resident of the Natomas Basin and found throughout the NBHCP area (City of Sacramento *et al*. 2003). Monitoring

conducted by TNBC has documented a decline in detections of loggerhead shrike since 2012, with a record low number of observations recorded in 2019 (ICF 2020). The mean number of loggerhead shrike detections per survey on reserve lands decreased again in 2020. Shrike detections have been decreasing substantially on reserve lands since 2012, with a more severe decline evident on non-reserve lands. The reasons for the decline are unknown. This species was not observed within the 568.7 acres of lands surveyed by Bargas in either 2019 or 2020 (Bargas 2019, 2020).

## Project Effects to Loggerhead Shrike

### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, loggerhead shrike foraging and nesting habitat are present in the Natomas Basin and within the Study Area. With the implementation of the UWSP, loggerhead shrike foraging and nesting habitat will be lost in the Natomas Basin. Some of the agricultural fields and annual grasses and forbs land cover in the Study Area provide potential foraging habitat, and Fremont cottonwood and valley oak tree groves provide suitable nesting habitat for the species. Habitat fragmentation has been implicated as a major cause of population decline in grassland birds in general and is likely to specifically affect loggerhead shrike. Helzer and Jelinski (1999) found that overall avian species richness and the presence of several common grassland species decrease with smaller habitat patch sizes (especially when <50 ha) likely due to edge effects. Upland bird populations have been found to be unstable in fragmented habitats (Hinsley *et al*. 1995; Crooks *et al*. 2001). Shrike survival and reproduction are likely to be higher in larger, more contiguous habitat areas.

### Increased Predation

Implementation of the UWSP could result in the increase of mammalian predators and other nest predators in addition to other causes of bird mortality, as discussed previously in Section 5.2.2.7 for Cooper's Hawk under Increased Predation.

### Nest Disturbance

Loggerhead shrikes will abandon nests if disturbed by humans during egg-laying or early in incubation. Shrikes are generally tolerant of human activity near nests later in the breeding season, and nest abandonment is not generally a significant factor in nest failure (Collister 1994). The implementation of the 542.4-acre Agricultural Buffer should reduce the potential for nest disturbance due to the conversion of agricultural lands to urban development and the concomitant increase in human activities.

### Construction-Related Activities

Construction activities associated with the proposed development in the Study Area or construction of the proposed reserve sites could disturb or displace loggerhead shrikes and may cause nest abandonment. General mitigation measures include pre-construction surveys for loggerhead shrike prior to the start of construction activities. If loggerhead shrike is found, the disturbance would be avoided during the nesting season to the maximum extent possible. Similarly, the implementation of restoration activities in future reserves could impact this species if it is present. With the implementation of conservation measures, construction-related effects to loggerhead shrike would be minimized.

**Overall Effects on Population Viability**

Although the UWSP would reduce the overall acreage of foraging and nesting habitat in the Natomas Basin, no effect on the viability of the loggerhead shrike population would occur because the Natomas Basin represents only a small portion of the habitat used by loggerhead shrike in the Central Valley (City of Sacramento et al. 2003). Thus, the loss of available habitat in the Natomas Basin as a result of the implementation of the UWSP and the conservation of habitat for GGS, SWHA, and WPT would not alter the viability of the loggerhead shrike population using the Natomas Basin. The UWSP has proposed measures that minimize and mitigate the impacts, such as requiring surveys during the nesting season for this species and coordination with CDFW to determine appropriate mitigation in the event that this species is nesting in the Study Area and will be impacted by the proposed action. Therefore, the proposed action is minimized and unlikely to affect the survival of the loggerhead shrike in the Basin if it is present. The implementation of mitigation measures provided in Section 6 would further reduce impacts to this species to less than significant.

#### 5.2.5.8 Song Sparrow (Modesto Population)

##### Listing Status

Song sparrow (Modesto population) is listed as Species of Special Concern by CDFW. Song sparrow (Modesto population) is not a Covered Species under the NBHCP.

##### Life History and Habitat Requirements

Modesto song sparrow is a resident and endemic species in California that breeds from March through August (Shuford and Gardali 2008). This species feeds mostly on vegetable matter, such as seeds, but will also feed on invertebrates. Modesto song sparrow nests low to the ground in dense vegetation associated with wetland or riparian habitats along waterways. Males are typically found singing on a perch of moderate height. Modesto song sparrow often lays three to four eggs with up to two broods and rarely three. Both parents tend to the nest, with the young leaving the nest at 10 days and independent of the parents at 25 days (Zeiner *et al.* 1990).

##### Population Dynamics, Dispersal, and Detectability

This endemic subspecies of song sparrow of California is a year-round resident (Shuford and Gardali 2008). There are a total of 24 subspecies of song sparrow, with nine of those subspecies occurring in California. This subspecies is locally abundant where found but has been extirpated from much of its range along with the decline in riparian and wetland habitat throughout the Central Valley. Largest populations of the Modesto song sparrow are in the Butte Sink and the Sacramento–San Joaquin Delta (Shuford and Gardali 2008). The primary threats to the Modesto song sparrow include the loss of habitat, the degradation of habitat, and nest predation. Habitat conversion is thought to increase the abundance and benefit potential nest predators (Shuford and Gardali 2008).

##### Rangewide and Local Distribution

Modesto song sparrow is an endemic sparrow subspecies of California to an otherwise widespread species in North America. This species is common where it still occurs but has been locally extirpated where its habitat has been developed or degraded.

### Status in the Upper Westside Specific Plan

There is one CNDDB reported occurrence for this species within a five-mile radius of the Study Area, which is not specific with its location. The record documents breeding in a canal along the edge of a wheat field in 1877 (CDFW 2024). Song sparrow was observed in the Study Area during surveys conducted by Bargas and is noted in the species list as detected in 2019 (Bargas 2020).

## Project Effects to Modesto Song Sparrow

### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, foraging and nesting habitat are present for Modesto song sparrow in the Natomas Basin and within the Study Area. The Study Area provides potential foraging habitat in agricultural lands, and Fremont cottonwood, valley oak tree woodland, and low vegetation along canals and ditches provide suitable nesting habitat for the species. The primary cause of the population decline of Modesto song sparrow is habitat fragmentation, loss, and degradation. Modesto song sparrow survival and reproduction are likely to be higher in larger, more contiguous habitat areas, such as riparian and oak woodlands along the Sacramento River. Implementation of the UWSP will result in a decrease of marginal habitat in the Natomas Basin, which would be considered to be of little effect to the species as a whole.

### Increased Predation

Implementation of the UWSP could result in the increase of mammalian predators and other nest predators in addition to other causes of bird mortality as discussed previously in Section 5.2.2.7 for Cooper's Hawk under Increased Predation.

### Nest Disturbance

Modesto song sparrows will abandon nests if disturbed by humans during egg-laying or early in incubation. Modesto song sparrows are generally tolerant of human activity near nests later in the breeding season, and nest abandonment is not generally a significant factor in nest failure (Collister 1994). Modesto song sparrows in the Sacramento area typically nest in woodlands or in vegetation along ditches and canals. The implementation of the 542.4-acre Agricultural Buffer should reduce the potential for nest disturbance due to the conversion of agricultural lands to urban development and the concomitant increase in human activities.

### Construction-Related Activities

Construction activities associated with the proposed development in the Study Area or construction of the proposed reserve sites could disturb or displace Modesto song sparrows and may cause nest abandonment. General mitigation measures include pre-construction surveys for nesting birds prior to the start of construction activities. If Modesto song sparrow is found, the disturbance would be avoided during the nesting season to the maximum extent possible. Similarly, the implementation of restoration activities in future reserves could impact this species if it is present. With the implementation of conservation measures, construction-related effects to Modesto song sparrow would be minimized.

### Overall Effects on Population Viability

Although the UWSP would reduce the overall acreage of foraging and nesting habitat in the Natomas Basin, no effect on the viability of the Modesto song sparrow population would occur because the Natomas Basin represents only a small portion of the habitat used by Modesto song sparrow in the Central Valley (Shuford and Gardali 2008). Thus, the loss of marginally suitable habitat in the Natomas Basin as a result of the implementation of the UWSP and the conservation of habitat for GGS, SWHA, and WPT would not alter the viability of the Modesto song sparrow population using the Natomas Basin. The UWSP has proposed measures that minimize and mitigate the impacts, such as requiring surveys during the nesting season for this species and coordination with CDFW to determine appropriate mitigation in the event that this species is nesting in the Study Area and will be impacted by the proposed action. Therefore, the proposed action is minimized and unlikely to affect the survival of the Modesto song sparrow in the Basin if it is present. The implementation of mitigation measures provided in Section 6 would further reduce impacts to this species to less than significant.

#### 5.2.5.9 Osprey

##### Listing Status

Osprey is listed as a Watch List species by CDFW. Osprey is not a Covered Species under the NBHCP.

##### Life History and Habitat Requirements

Osprey breeds in Northern California from the Cascade Ranges southward to Lake Tahoe, and along the coast south to Marin County. The species preys primarily on fish but will also prey on small mammals, birds, reptiles, and invertebrates. Foraging areas include open, clear waters of rivers, lakes, reservoirs, bays, estuaries, and surf zones. Habitat and nesting requirements include large trees, snags, and dead-topped trees in open forest habitats for cover and nesting (Zeiner *et al.* 1990).

##### Population Dynamics, Dispersal, and Detectability

Osprey is widespread throughout the world, except in South America, with many populations increasing. Northern populations in North America are migratory and arrive in breeding locations between March and May. Osprey populations were previously impacted by the use of pesticides during the 1960s and 1970s, but populations have since been increasing. Ongoing threats to this species include the ongoing use of organochlorine-based biocides in Central America. Organochlorine-based pesticides result in egg shelling thinning. Other threats to osprey include shooting, electrocution, or fishing nets. Due to its diet, osprey is susceptible to local population declines that are a result of declining or lost fish populations or disrupted nesting habitat (NatureServe 2024).

##### Rangewide and Local Distribution

Osprey is widespread in North America, where it breeds from northwestern Alaska and south to Baja California and as far south as Belize and to the east in Florida. Northern populations will winter in the Central Valley of California, the Gulf of Mexico, Bermuda, Central America, and South America (NatureServe 2024).

### Status in the Upper Westside Specific Plan

There are no CNDDB occurrences of osprey documented within the nine-quad search area. However, the species was observed utilizing habitat within the UWSP in 2019 and 2020, where it was observed during SWHA surveys (Bargas 2020), and it was observed by HELIX in 2023.

## Project Effects to Osprey

### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, nesting habitat for osprey is present in the Natomas Basin and within the Study Area. With the implementation of the UWSP, nesting habitat will be reduced in the Study Area. Foraging habitat is not present in the Study Area. Fremont cottonwood, valley oak tree woodland, and structures such as radio towers or cellular towers provide suitable nesting habitat for the species. Osprey survival and reproduction are likely to be higher in larger, more contiguous habitat areas, especially along the Sacramento River and associated riparian or oak woodland habitats.

### Reduction of Prey Base

Osprey is a piscivorous bird of prey, and foraging habitat is considered to be absent from the Study Area. This species is expected to forage along the Sacramento River or other nearby bodies of water with an adequate supply of fish. Development of the Study Area will have no impacts on the prey base of osprey.

### Increased Predation

Implementation of the UWSP could result in the increase of mammalian predators and other nest predators in addition to other causes of bird mortality as discussed previously in Section 5.2.2.7 for Cooper's Hawk under Increased Predation.

### Nest Disturbance

Human disturbance to nesting has been identified as a primary threat to raptor populations as several studies have demonstrated declines in raptor populations resulting from human-associated disturbance (Voous 1977; Swenson 1979; Craighead and Mindell 1981). Despite the observation of the species by HELIX in 2023, there are no records in CNDDB documenting osprey nesting in the Natomas Basin nor in the Study Area. It is possible that the anticipated human activity associated with UWSP's 1,573 acres of urban structures could result in nest disturbance to osprey nests near the Study Area which could result in decreased nest success.

## Overall Effects on Population Viability

The UWSP is unlikely to affect osprey population viability, as the Natomas Basin accounts for a very small portion of the Central Valley's osprey population and its habitat, and there are no documented occurrences of this species nesting within 10 miles of the Study Area (CDFW 2024). Implementation of the UWSP would result in the loss of a small portion of osprey nesting habitat available in the Natomas Basin, and development of the UWSP would have no effect on foraging habitat. Therefore, the implementation of the UWSP and the conservation of habitat for GGS, SWHA, and WPT would not affect the viability of the osprey population using the Natomas Basin. The UWSP has proposed measures that

minimize and mitigate the impacts, such as conservation of habitat for GGS, SWHA, and WPT and requiring surveys during the nesting season for this species, and coordination with CDFW to determine appropriate mitigation in the event that this species is nesting in the Study Area and will be impacted by the proposed action. Therefore, the proposed action is minimized and unlikely to affect the survival of the osprey in the Basin if it is present. The implementation of mitigation measures provided in Section 6 would further reduce impacts to this species to less than significant.

#### 5.2.5.10 White-faced ibis

##### Listing status

White-faced ibis was listed by CDFW as a Species of Special Concern until 2008. The species was downgraded to the CDFW Watch List in 2008.

##### Life History and Habitat Requirements

White-faced ibis is considered a shorebird that forages by wading in shallow water and probing in wetland mud for aquatic and soil-dwelling insects, crustaceans, and earthworms. The species will ingest amphibians and small fishes (Sibley 2003).

White-faced ibis is a colonial breeder and builds a shallow nest in low trees, shrubs, or thick emergent vegetation (e.g., tule and cattail). White-faced ibis typically breeds at two to three years of age (Capen 1977) fostering one brood per season with an average of three to four eggs. Both parents incubate the eggs, which hatch in 17 to 26 days. As young approach fledging, adults forage farther from nesting colonies, and adults and newly fledged young fly to more distant irrigated fields and mudflats along rivers and around lakes and reservoirs (Taylor *et al*. 1989).

White-faced ibis depends on shallow, emergent wetlands with high-quality fresh water. Safran et al. (2000) found that white-faced ibis foraged close to vegetation where prey abundances are greater. Wet meadows, irrigated pastures, flooded pond edges, and wet cropland (e.g., rice fields) can be suitable foraging habitat. Results of Shuford et al. (1996) suggested that white-faced ibis responds opportunistically to changing food resources, particularly by shifting from managed wetlands to agricultural lands after heavy winter rains. Overwintering white-faced ibis inhabits many of the same coastal wetland habitats used in summer and will also use flooded or partially flooded rice fields in Louisiana and California (Remsen *et al*. 1991; Ryder and Manry 2020).

##### Population Dynamics, Dispersal, and Detectability

White-faced ibis nesting populations and numbers of colonies in North America decreased precipitously during the 1960s and 1970s due to pesticide contamination and loss of habitat to drought and drainage (Ryder 1967). The winter population reached a low point in the 1970s, then began rising in the 1980s, with a sharp increase in the early 1990s as habitat improved. Both breeding and wintering populations have increased greatly in California since the 1980s (Shuford *et al*. 1996, Earnst *et al*. 1998), and estimates from the mid-1990s show winter populations in California at 28,000, and numbers appear to be continuing to increase, particularly in the Sacramento Valley rice country. The Colusa National Wildlife Refuge population increased from 50 to 500 pairs from 1985 to 1989 (Shuford *et al*. 1996).

Breeding range and populations have expanded in the last two decades, owing in part to improved nesting habitat management in federal and state refuges, increased planting of alfalfa used by feeding

birds, the banning of DDT and other pesticides in the 1970s, and improved breeding success at major nesting centers.

White-faced ibis is present year-round in southern California, coastal Texas and Louisiana but is migratory elsewhere, although migration between North and South America does not occur. Within North America, birds breeding in northern areas of the range move south to wintering areas. A highly mobile species, the northernmost populations undertake regular north-south migrations. All populations show some post-breeding wandering, with movements often coinciding with changing water levels and water quality. (Ryder and Manry 2020).

### Rangewide and Local Distribution

White-faced ibis is a New World species occurring only in the Americas which breeds in two discontinuous areas, western North America and the southern half of South America (Ryder 1967). The species is present in the western U.S. from California to Montana and the Dakotas and even includes Canada south to Durango and Jalisco states in Mexico. The largest breeding colonies are found in Utah, Nevada, Oregon, and coastal Texas, and Louisiana (Ryder and Manry 2020). In North America, white-faced ibis nest as far south as Tampico Lagoons and Tabasco Lagoons in Mexico. In South America, the species nests primarily in Peru, Bolivia, Paraguay, and extreme southern Brazil, Chile, and central Argentina. In the U.S., most white-faced Ibis winter in Mexico or along the Gulf Coast in Texas and Louisiana (Ryder 1967).

### Status in the Upper Westside Specific Plan

White-faced ibis is a year-round resident of the Sacramento Valley**,** breeding in permanent and semi-permanent wetlands during the summer and foraging in seasonal wetlands and flooded rice fields throughout the fall and winter.

White-faced ibis has not nested in the Natomas Basin since 2013, and no nests were detected in the most recent surveys conducted in 2020 (ICF 2020). Over the monitoring period, the species has been found to typically occur in very low numbers outside the breeding season and move into the Natomas Basin in large numbers from May through September.

There are no previously recorded occurrences of this species in the Study Area. White-faced Ibis nesting colonies have been periodically observed on several Natomas Basin Habitat Conservation Plan (NBHCP) protected lands north of the Plan Area, including the Central Basin Reserve in 2010 and Willey Wetlands Preserve in 2012 and 2013, but nesting has not been observed within the Natomas Basin since 2013 (ICF 2020).

## Project Effects to white-faced ibis

### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, the Study Area provides foraging habitat in the Natomas Basin for white-faced ibis. Foraging habitat in the Study Area consists of agricultural lands, annual grasslands, fallowed crops, and ruderal areas. With the implementation of the UWSP, white-faced ibis potential foraging habitat will be reduced in the Natomas Basin.

### Increased Predation

Implementation of the UWSP could result in the increase of mammalian predators and other nest predators in addition to other causes of bird mortality as discussed previously in Section 5.2.2.7 for Cooper's Hawk under Increased Predation.

### Nest Disturbance

There are no records in CNDDB documenting white-faced ibis nesting in the Natomas Basin nor in the Study Area, although approximately 24,900 acres of suitable winter habitat (i.e., rice, alfalfa, and other agricultural fields) exist in the Natomas Basin as foraging habitat for ibis. The land use attributed to urban development in the Basin, and would result in the overall net loss of potential foraging and roosting habitat acreage for white-faced ibis.

### Construction-Related Activities

Potential effects due to construction-related activities would be limited to the displacement of birds foraging or roosting within agricultural or semi-natural terrestrial habitat during the initial phases of construction. If white-faced ibis is found, the disturbance would be avoided during the nesting season to the maximum extent possible. Similarly, the implementation of restoration activities in future reserves could impact this species if it is present. With the implementation of conservation measures, construction-related effects to white-faced ibis would be minimized.

### Overall Effects on Population Viability

The UWSP is unlikely to affect white-faced ibis population viability, as the species is a rare visitor to the Natomas Basin, and there are no documented occurrences of this species nesting within Sutter or Sacramento counties (CDFW 2024). Therefore, implementation of the UWSP and the conservation of habitat for GGS, SWHA, and WPT would not affect the viability of the white-faced ibis population using the Natomas Basin. The UWSP has proposed measures that minimize and mitigate the impacts, such as conservation of habitat for GGS, SWHA, and WPT and requiring surveys during the nesting season for this species and coordination with CDFW to determine appropriate mitigation in the event that this species is nesting in the Study Area and will be impacted by the proposed action. Therefore, the proposed action is minimized and unlikely to affect the survival of the white-faced ibis in the Basin if it is present. The implementation of mitigation measures provided in Section 6 would further reduce impacts to this species to less than significant.

## 5.2.5.11 Purple Martin

### Listing Status

Purple martin is a CDFW Species of Special Concern and is federally protected by the USFWS under the amended MBTA of 1918.

### Life History and Habitat Requirements

Purple martin is a summer resident and migrant in California from March through September (Shuford and Gardali 2008), where it is considered a rare to uncommon species (Zeiner *et al*. 1990). This species migrates to and from South America and feeds on the wing, hawking insects high above the ground and

occasionally feeding on terrestrial insects (Zeiner *et al*. 1990). Purple martin nests in cavities in open areas with low canopy cover at the height of the nest, near large bodies of water that support high densities of large insects. Martins use a variety of cavities, including bridges, large tree snags, and collapsed lava tubes. The species is very sensitive to competition from European starlings and is extirpated from most low-elevation areas by starlings (Shuford and Gardali 2008).

Purple martin frequents old-growth forests, multi-layered forests, open woodlands with snags during the breeding season. Nesting season begins in April through August, Purple martin often lays three to eight eggs with up to two broods. Both parents tend to the nest, with the young leaving the nest at 24 to 31 days. Nests are located in old woodpecker cavities or human-made structures such as nesting boxes, bridges, or culverts (Zeiner *et al*. 1990).

### Population Dynamics, Dispersal, and Detectability

Purple martin populations are widely distributed and locally rare, and historically were considered to be common from sea level to 5,900 feet (Shuford and Gardali 2008). Purple martin populations were considered stable from the 1940s through the 1970s as this species was more thoroughly documented (Shuford and Gardali 2008). This species is most abundant in northwestern California, but breeding populations are scattered throughout California. In lowland habitats, competition with European starlings and the loss of riparian habitat are considered the major threats to this species (Shuford and Gardali 2008). No major threats to this species are known in other habitats, and purple martin appears to be tolerant of human presence in urban areas, such as nesting under bridges in weep holes. Purple martin use of weep holes in bridges avoids direct competition with European starlings, which do not use bridge structures for nesting. Declines of this species have been reported but have not been thoroughly documented (Shuford and Gardali 2008).

### Rangewide and Local Distribution

Purple martin populations statewide are estimated to consist of approximately 900 to 1,350 pairs that are widely distributed and locally rare, but more numerous in northwestern California (Shuford and Gardali 2008). Nesting populations appear to rely on redwood forest habitat, and the largest population occurs in northwestern California. Smaller populations in the Cascade Range, the Sierra Nevada, and the Tehachapi also support small populations of purple martin. Purple martins in the Central Valley nest in riparian areas and buildings from the Delta north through the Sacramento Valley. However, purple martin was largely extirpated in the Central Valley after the introduction of European starlings, with the exception of nesting colonies in Sacramento that use hollow spaces in bridges (Shuford and Gardali 2008).

### Status in the Upper Westside Specific Plan

Purple martin has not been documented in the Natomas Basin but has been documented at several locations in the City of Sacramento using weep holes under bridges. There nearest reported CNNDB record is located 2.5 miles south of the Study Area, where this species was identified using weep holes under the I-5 bridge in 2007 (CDFW 2024). However, purple martin has not been documented to occur in the Study Area (Bargas 2020). Purple martin could forage over the entire 2,102-acre Study Area but was not observed within the 568.7 acres of lands surveyed by Bargas in 2019, 2020, or 2021 (Bargas 2019, 2020, 2022).

## Project Effects to Purple Martin

### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, purple martin foraging and nesting habitat are present in the Natomas Basin and within the Study Area. With the implementation of the UWSP, a small amount of suitable foraging and nesting habitat for purple martin habitat will be lost in the Natomas Basin. The Study Area provides potential foraging habitat over agricultural lands, and Fremont cottonwood and valley oak woodlands provide suitable nesting habitat for the species. The primary cause of purple martin population declines is competition with European starlings for habitat with cavities and tree snags in addition to habitat fragmentation, loss, and degradation. Purple martin survival and reproduction are likely to be higher in larger, more contiguous habitat areas, such as riparian and oak woodlands along the Sacramento River, where insect prey is abundant. Purple martin is known to occupy weep holes or other places under bridges that are not suitable nest sites for European starling. European starlings have nearly extirpated purple martin from native habitats in California, with a remnant population using weep holes under bridges almost exclusively.

### Increased Predation

Implementation of the UWSP could result in the increase of mammalian predators and other nest predators in addition to other causes of bird mortality as discussed previously in Section 5.2.2.7 for Cooper's Hawk under Increased Predation.

Songbird nest predators such as crows also typically increase in proximity to residential development, in response to introduced nesting trees, increased food supplies, and increased hunting perches such as streetlights and other infrastructure (Steenhof *et al*. 1993; Marzluff *et al*. 2001). Predation of bird nests is also more intense along roads, urban edges, and other linear habitats (DeGeus 1990), presumably because of the increased use of linear rights-of-way by crows and mammalian predators (Knight *et al*. 1995).

### Nest Disturbance

Purple martin will abandon nests if disturbed by humans during egg-laying or early in incubation. Purple martin is generally tolerant of human activity near nests later in the breeding season, and nest abandonment is not generally a significant factor in nest failure (Collister 1994). Purple martin in the Sacramento area is primarily limited to nesting in artificial structures such as bridges since they have been nearly extirpated from natural habitats by European starlings. Artificial nest structures are not located in the Study Area. The implementation of the 542.4-acre Agricultural Buffer should reduce the potential for nest disturbance due to the conversion of agricultural lands to urban development and the concomitant increase in human activities.

### Construction-Related Activities

Construction activities associated with the proposed development in the Study Area or construction of the proposed reserve sites could disturb or displace purple martin and may cause nest abandonment. General mitigation measures include pre-construction surveys for nesting birds prior to the start of construction activities. If purple martin is found, the disturbance would be avoided during the nesting season to the maximum extent possible. Similarly, the implementation of restoration activities in future

reserves could impact this species if it is present. With the implementation of conservation measures, construction-related effects to purple martin would be minimized.

**Overall Effects on Population Viability**

Although the UWSP would reduce the overall acreage of foraging and nesting habitat in the Natomas Basin, no effect on the viability of the purple martin population would occur because the Natomas Basin represents only a small portion of suitable habitat used by purple martin in the Central Valley (City of Sacramento et al. 2003) and primary threats to purple martin include competition from nonnative species such as European starling. Thus, the loss of the suitable habitat in the Natomas Basin as a result of the implementation of the UWSP and the conservation of habitat for GGS, SWHA, and WPT would not alter the viability of the purple martin population using the Natomas Basin. The UWSP has proposed measures that minimize and mitigate the impacts, such as requiring surveys during the nesting season for this species and coordination with CDFW to determine appropriate mitigation in the event that this species is nesting in the Study Area and will be impacted by the proposed action. Therefore, the proposed action is minimized and unlikely to affect the survival of the purple martin in the Basin if it is present. With the implementation of mitigation measures provided in Section 6, impacts to this species would be reduced to less than significant.

#### 5.2.5.12 Yellow-headed Blackbird

##### Listing Status

Yellow-headed blackbird is listed as Species of Special Concern by CDFW. Yellow-headed blackbird is not a Covered Species under the NBHCP.

##### Life History and Habitat Requirements

Yellow-headed blackbird is a summer resident and migrant in California that breeds from April through July (Shuford and Gardali 2008). This species feeds mostly on seeds and grain but will also feed on invertebrates during the breeding season. Yellow-headed blackbird nests in dense emergent vegetation associated with wetland in lakes or ponds. This species is a colonial nester that typically nests during peak abundance of insects. Yellow-headed blackbird is a polygynous nester, each male may have up to five mates nesting on his territory. A single brood is most common, consisting of two to five eggs. Both parents tend to the nest, with the young leaving the nest 12 days after hatching, and flight capable at 20 days (Zeiner *et al*. 1990).

##### Population Dynamics, Dispersal, and Detectability

Yellow-headed blackbird populations are widely distributed across California, with populations in the Central Valley, east of the Sierra Nevada and Cascade ranges, in the deserts in southern California, and is considered locally common in these areas (Zeiner *et al.* 1990). This species is abundant in Canada and the rest of the United States and is most abundant in the Great Plains or in areas with expansive and productive marsh habitat. Historically they were considered to be common from sea level to 6,600 feet, with the largest population in northeastern California. The greatest declines of this species are considered to be in southern California where its marsh habitat has been drained, manipulated, and/or developed. Yellow-headed blackbird breeding range has changed little since the 1940s though local extirpations continue to occur largely as a result of wetland habitat degradation. The species has been known to expand into areas where wetlands have been created as a result of human habitation; in the

Sacramento Valley, it is known to breed at refuges with expansive marsh habitat (Shuford and Gardali 2008).

### Rangewide and Local Distribution

Yellow-headed blackbird populations are widely distributed across California with populations in the Central Valley, east of the Sierra Nevada and Cascade ranges, and in the deserts in southern California, and is considered locally common in these areas (Zeiner *et al*. 1990). This species is abundant in Canada and the rest of the United States and is most abundant in the Great Plains or in areas with expansive and productive marsh habitat. In the Sacramento Valley, this species is known to breed at refuges with expansive marsh habitat, such as the Yolo Bypass Wildlife Area, Davis Wetlands, and Sacramento Wildlife Area, among others (Shuford and Gardali 2008).

### Status in the Upper Westside Specific Plan

There is one CNDDB occurrence of yellow-headed blackbird documented in CNDDB within the nine-quad search area centered on the Study Area. There are no CNDDB reported occurrences within a five-mile radius of the Study Area (CDFW 2024). Yellow-headed blackbird was observed in the Study Area during surveys conducted by Bargas and is noted in the species list for 2020 (Bargas 2020).

## Project Effects to Yellow-headed Blackbird

### Habitat Loss, Fragmentation, and Reduction in Patch Size

Currently, the Study Area provides foraging and nesting habitat in the Natomas Basin for yellow-headed blackbird. Foraging habitat in the Study Area consists of agricultural lands, annual grasslands, fallowed crops, and ruderal areas. With the implementation of the UWSP, yellow-headed blackbird potential foraging habitat will be reduced in the Natomas Basin, and the potential nesting habitat along canals and ditches will be reduced.

### Water Quality and Runoff

Aquatic communities may be greatly affected by surrounding land use. Urban areas can cause different and, in some cases, stronger effects than agricultural lands (Bury 1972; Moore and Palmer 2005). Residential developments typically result in increased runoff of hydrocarbons and pesticides, fertilizers, and/or herbicides used for lawns and gardens, and increased stormwater volume (and associated increases in depths and velocities) because of high coverage of impervious surfaces. Significant impacts to invertebrate communities that are prey items for species such as yellow-headed blackbird, have been shown to occur because of exposure to herbicides, fertilizers, and/or pesticides (Sparling et al. 2010; Elliott et al. 2011). Aquatic habitat adjacent to the northwestern portion of the Study Area could be impacted by urban landscaping practices.

### Increased Predation

Implementation of the UWSP could result in the increase of mammalian predators and other nest predators in addition to other causes of bird mortality as discussed previously in Section 5.2.2.7 for Cooper's Hawk under Increased Predation.

### Nest Disturbance

Nesting colonies of yellow-headed blackbirds are typically found nesting with other blackbird colonies. Yellow-headed blackbirds are typically tolerant of low-intensity human activity, but similar to other blackbirds are intolerant of large disturbances to breeding colonies and are typically afforded large buffer distances from active nest colonies (Pacific Gas and Electric 2015). Disturbance to yellow-headed blackbird nests would typically result from construction-related activities.

### Construction-Related Activities

Potential effects due to construction-related activities would be limited to the displacement of birds foraging or roosting within agricultural or semi-natural terrestrial habitat during the initial phases of construction. If yellow-headed blackbird is found, disturbance would be avoided during the nesting season to the maximum extent possible. Similarly, the implementation of restoration activities in future reserves could impact this species if it is present. With the implementation of conservation measures, construction-related effects to yellow-headed blackbird would be minimized.

### Overall Effect on Population Viability

Implementation of the UWSP would have no overall effect on the population viability of yellow-headed blackbird as only a small amount of available aquatic foraging-nesting habitat is available in the Study Area. Further, the Study Area and the Natomas Basin account for only a small portion of the habitat in the Central Valley that is available to support the yellow-headed blackbird population. Thus, the loss of the suitable habitat in the Natomas Basin as a result of the implementation of the UWSP and the conservation of habitat for GGS, SWHA, and WPT would not alter the viability of the yellow-headed blackbird population using the Natomas Basin. The UWSP has proposed measures that minimize and mitigate the impacts, such as requiring surveys during the nesting season for this species and coordination with CDFW to determine appropriate mitigation in the event that this species is nesting in the Study Area and will be impacted by the proposed action. Therefore, the proposed action is minimized and unlikely to affect the survival of the yellow-headed blackbird in the Basin if it is present. The implementation of mitigation measures provided in Section 6 would further reduce impacts to this species to less than significant.

## 5.2.6 Special-status Mammals

### 5.2.6.1 Pallid Bat

### Listing Status

Pallid bat is a CDFW Species of Special Concern.

### Life History and Habitat Requirements

Pallid bat is common in open and dry habitats with rocky areas for roosting and forages along grasslands, shrublands, woodlands, and forests. This species has a good urine concentrating ability, and thus, is less reliant on sources of water than other bat species. Pallid bat is known to roost primarily in caves, crevices, mines, and occasionally in hollow trees and buildings. Roosting maternity colonies may consist of up to 100 individuals, with males typically roosting separately. Young are typically born from April through June and weaned by seven weeks after birth, and volant by July or August. Reproduction

typically occurs individually, with each liter consisting of one to three young. Pallid bat is very sensitive to disturbance of roost sites (Zeiner *et al.* 1990).

### Population Dynamics, Dispersal, and Detectability

Seasonal movements of this species are poorly known, as well as locations of hibernacula and winter roosting sites. Information is also limited as to how much pallid bat tolerates disturbance of roosting sites. However, this species is known to be sensitive to disturbance of roosting sites. Several roosting sites documented in museum records in coastal California have been extirpated, and this species is likely intolerant of suburban and urban development, even when patches of suitable habitat remain. However, pallid bat appears to be more tolerant of rural development. Threats to the species include vandalism, mine closures, recreation, timber harvest or other vegetation management activities, urbanization, and demolition of occupied structures (Bolster, ed. 1998). This species is difficult to detect in day roosts but is easier to detect during acoustic monitoring and visual observations, during emergence surveys, and with the use of mist netting (Western Bat Working Group 2023).

### Rangewide and Local Distribution

This species ranges widely across California up to elevations of 3,000 meters in low desert, oak woodland, coastal redwood forests. There are at least three subspecies of pallid bat occurring in California, with *A. pallidus* present in the Central Valley. Pallid bat is also found in Cuba, Mexico, British Columbia, and as far east as Texas in the U.S. (Bolster, ed. 1998).

### Status in the Upper Westside Specific Plan

Pallid bat has not been documented in the Natomas Basin, and there is one previously recorded occurrence of this species within the nine-quad database search area (CDFW 2024). There are no CNDDB records of pallid bat within five miles of the Study Area; however, this highly mobile species may forage over the Study Area or roost in suitable habitat within the Study Area. The documented occurrence of this species is a non-specific record from the collection of an individual that was preserved in the Museum of Vertebrate Zoology at Berkeley (CDFW 2024).

## Project Effects to Pallid Bat

### Habitat Loss, Fragmentation, and Reduction in Patch Size

The Study Area provides potential foraging habitat over agricultural lands, and Fremont cottonwood and valley oak tree groves provide suitable roosting habitat for the species. Abandoned buildings in the Study Area may also provide suitable roosting habitat, but most structures in the Study Area appear to be in use and are unlikely to provide roosting habitat for this species. The primary cause of population decline of pallid bat is the destruction or disturbance of their roosting sites. Pallid bat survival and reproduction are likely to be higher in larger, more contiguous habitat areas, such as riparian and oak woodlands along the Sacramento River and edge habitats with insect prey over agricultural fields and grasslands abutted to woodland habitats. Pallid bats are known to occupy caves, crevices, mines, and occasionally in hollow trees and buildings. Most of these habitats are not present in the Study Area, but tree hollows and crevices in trees or structures are present. Implementation of the UWSP will result in a marginal decrease of available habitat in the Natomas Basin which would be considered of little effect to the species.

### Roost Disturbance

Pallid bats will abandon roosts if disturbed by humans. Pallid bats are generally intolerant of human activity near roost sites and generally avoid roosting in areas with frequent activity. Potential pallid bat roosts in the Study Area are limited to valley oak woodland, small groves of trees, and abandoned buildings. The implementation of the 542.4-acre Agricultural Buffer should reduce the potential for roost disturbance due to the conversion of agricultural lands to urban development and the concomitant increase in human activities.

### Construction-Related Activities

Construction activities associated with the proposed development in the Study Area or construction of the proposed reserve sites could disturb or displace pallid bats and may cause roost abandonment. If pallid bat is found, the disturbance would be avoided during the maternity roosting season to the maximum extent possible. Similarly, the implementation of restoration activities in future reserves could impact this species if it is present. With the implementation of conservation measures, construction-related effects to pallid bat would be minimized.

### Overall Effects on Population Viability

Although the UWSP would reduce the overall acreage of foraging and roosting habitat in the Natomas Basin, no effect on the viability of the pallid bat population would occur because the Natomas Basin represents only a small portion of the habitat used by pallid bat in the Central Valley and in California. Thus, the loss of a small portion of roosting habitat in the Natomas Basin as a result of implementation of the UWSP and the conservation of habitat for GGS, SWHA, and WPT would not alter the viability of the pallid bat population using the Natomas Basin. The UWSP has proposed measures that minimize and mitigate the impacts, such as conservation of habitat for GGS, SWHA, and WPT and requiring surveys for bat roosts for this species and coordination with CDFW to determine appropriate mitigation in the event that this species is roosting in the Study Area and will be impacted by the proposed action. Therefore, the proposed action is minimized and unlikely to affect the survival of the pallid bat in the Basin if it is present. The implementation of mitigation measures provided in Section 6 would further reduce impacts to this species to less than significant.

## 5.2.7 Migratory Birds and Raptors

### 5.2.7.1 Nesting Impacts

The Project site and adjacent areas provide nesting habitat for a variety of native birds common to the region, and several species of birds were observed on and adjacent to the site (see Appendix D). The structures, radio towers, utility poles, shrubs, annual vegetation, bare ground, and trees on the Study Area provide potential nesting habitat for species that use these areas for nesting. Large trees adjacent to the Study Area also provide nesting habitat for migratory birds, including raptors. Active nests were not observed during surveys, although existing nest structures that belong to raptors and yellow-billed magpie (*Pica nuttalli*) were abundant in the Study Area. Raptor nests were observed in large trees and radio towers throughout the Study Area. Yellow-billed magpie nests were observed in valley oak woodland in the western portion of the Study Area. Ruderal areas dominated by annual grasses provide habitat for ground nesting birds, such as western meadowlark, red-wing blackbird, and a variety of sparrows.

Project activities during construction would directly disturb trees or shrubs and could result in noise and other indirect disturbances that have the potential to cause nest destruction, nest failure, and project activities will affect herbaceous vegetation, which could contain nests. In the absence of proposed mitigation, destruction of nests, eggs, or nestlings by vegetation clearing or ground-disturbing activities or indirect impacts to birds nesting off-site that resulted in forced fledging or nest abandonment could occur if construction commenced during the avian breeding season (February through August). This could occur with both common and special-status bird species. Such impacts would be considered a violation of California Fish and Game Codes and would be a significant impact. The UWSP has proposed measures that minimize and mitigate the impacts such as conservation of habitat for GGS, SWHA, and WPT and requiring surveys during the nesting season for these species and coordination with CDFW to determine appropriate mitigation in the event that these species are nesting in the Study Area and will be impacted by the proposed action.

Therefore, the proposed action is minimized and unlikely to affect the survival of the migratory birds in the Basin if is present. With the implementation of mitigation measures provided in Section 6, impacts to migratory birds and raptors would be reduced to less than significant.

## 5.3 SENSITIVE NATURAL COMMUNITIES

There are 31.75 acres of canals and ditches that support wetland vegetation that occur as an interconnected network throughout the Study Area that are potential waters of the U.S. and State could be considered a sensitive natural community. The proposed Project, as designed, could result in fill of these features. Potential impacts to the canals are discussed in Section 5.4, and mitigation is proposed to reduce impacts to these features to less than significant. There are no other sensitive natural communities in the Study Area. The site consists almost entirely of agricultural land that supports a mixture of non-native and native species and lacks native or naturalized vegetation communities. The Sacramento River and riparian habitat adjacent to the site are sensitive natural communities; however, the Project has been designed to avoid impacts to these features.

## 5.4 JURISDICTIONAL WATERS AND WETLANDS

A total of 45.08 acres of aquatic resources have been delineated in the Study Area. It should be noted, approximately 0.14 acre of aquatic resources were added to the Study Area after the delineation took place in 2023, due to a minor change of the Study Area boundary. This acreage is comprised of portions of West Drainage Canal that overlap the revised Study Area boundary. The original 44.94 acres of aquatic resources included in the 2023 delineation by HELIX are comprised of a total of 11.22 acres of aquatic resources that were verified by the USACE in 2020 (SPK-2020-00237), and a total of 33.72 acres of aquatic resources that were delineated by HELIX in 2023. A Preliminary Jurisdictional Determination has been issued for the 33.72 acres of wetlands on February 23, 2024 (SPK-2020-00237). The additional 0.14 acre of added aquatic resources are likely potential jurisdictional waters, and have been added to the appropriate Project applications. SAFCA-owned lands that consist of 43.62 acres of wetland creation are still under development and likely do not meet wetland criteria or currently qualify as potential waters of the U.S. This acreage is part of a conservation area and will be preserved in perpetuity. The canals and ditches and associated valley oak woodland community may also fall under the jurisdiction of Section 1600 of the California Fish and Game Code.

## 5.5 WILDLIFE NURSERIES AND MOVEMENT CORRIDORS

A wildlife corridor is a link of wildlife habitat, generally native vegetation, which joins two or more larger areas of similar wildlife habitat. Corridors are critical for the maintenance of ecological processes, including facilitating the movement of animals and the continuation of viable populations. Historically, the Study Area was part of the floodplain that belonged to the Sacramento River, with riparian forests along the river prior to the Sacramento River levees and agricultural practices. The majority of this area has been converted to urban and agricultural uses, fragmenting and separating riparian habitat. Riparian habitat is limited to the levee west of the Study Area, where the understory has been mostly developed. In addition, Garden Highway, I-5, and I-80 serve as barriers between the adjacent areas, with I-80 and the Garden Highway functioning as partial barriers since I-80 occurs as a bridge and Garden Highway is a small highway with periods of infrequent traffic where terrestrial wildlife may cross the road.

The Study Area is not included in any corridors mapped by the California Essential Habitat Connectivity project and does not provide any unique movement or dispersal habitat relative to surrounding lands for several miles in all directions. The Project site and surrounding lands, which consist predominately of row crop agriculture and urban development provide limited dispersal habitat. Currently, the Sacramento River west of the Study Area and associated riparian communities provide a dispersal habitat for wildlife movement in the region. No significant impacts to wildlife corridors would occur as a result of the proposed Project. In addition, open space and agricultural lands will be preserved, which may provide some benefit to dispersing wildlife. Impacts to wildlife corridors resulting from the proposed Project would be less than significant.

## 5.6 LOCAL POLICIES

### 5.6.1 Swainson's Hawk Mitigation Fee Program

The County Code and the General Plan provide protection for SWHA habitat. The County Code requires project proponents to provide Title or Easement to approved SWHA mitigation lands, with one acre preserved for each one-acre impacted. Removing or otherwise affecting Swainson's hawk habitat without compliance with the Swainson's Hawk Mitigation Fee Program would be a violation of local ordinances and would have a potentially significant impact. With the implementation of mitigation measures provided in Section 6, impacts to this species would be reduced to less than significant.

### 5.6.2 Tree Protection

The County Code and the General Plan provide protection for native oaks and other protected trees. Regulated activities include grading, trenching, or filling within the dripline, or removal, destruction, or the killing of a protected tree. Removing or otherwise affecting protected trees without a tree permit would be a violation of local ordinances and would have a potentially significant impact. With the implementation of mitigation measures provided in Section 6, impacts to protected trees would be reduced to less than significant.

### 5.6.3 Potential for Spread of Invasive Weeds

Ongoing agricultural activities in the Study Area likely reduce the spread of invasive species compared to leaving the land fallow because active agriculture regularly removes established vegetation and replaces it with a crop monoculture. Abandoned fields typically become overgrown with invasive species,

including host plants for agricultural pests. Converting active agricultural land to a developed community has the potential to result in increased establishment of weedy species by reducing the frequency of disturbance and would be a potentially significant impact. With the implementation of mitigation measures provided in Section 6, impacts resulting from the spread of invasive species would be reduced to less than significant.

## 5.7 HABITAT CONSERVATION PLANS/NATURAL COMMUNITY CONSERVATION PLANS

USFWS has approved the NBHCP and issued Incidental Take Permits to the City and Sutter County for take of federally listed species to result from urban development in the Natomas Basin. Sacramento County is not a permittee under the NBHCP, and the NBHCP does not cover urban development for unincorporated portions of Sacramento County, although the NBHCP does provide for land acquisition in these unincorporated areas on a willing-seller basis for conservation purposes. The NBHCP currently authorizes take associated with 17,500 acres of urban development in southern Sutter County and within the City and Metro Air Park (MAP) in Sacramento County.

The UWSP is located within an unincorporated area of Sacramento County within the boundaries of the NBHCP Plan Area, but not within the City of Sacramento or Sutter County Permit Areas, as defined by the NBHCP, where take of NBHCP Covered Species was previously authorized. As a result, potential effects related to the development of the UWSP were not evaluated in the NBHCP.

This BRA includes an analysis of the UWSP's effects on the special-status species covered under the NBHCP. The analysis includes two species that were heavily discussed in the NBHCP—GGS and Swainson's hawk. The NBHCP's goals and objectives place a high priority on the preservation and long-term management of high-quality habitat for GGS and Swainson's hawk in the Natomas Basin, which by default benefits the other 20 Covered Species. The NBHCP established a program to allow development in the Basin while maintaining the long-term viability of the Covered Species by allowing 17,500 acres of authorized development to occur within the City of Sacramento, Sutter County, and MAP and establishing 8,750 acres of reserves to offset the effects resulting from authorized development.

### 5.7.1 Potential Effects to NBHCP Conservation Strategy Key Components

The Study Area was evaluated to identify the potential effects of the proposed development on key components of the NBHCP[4] (taken from Chapter IV, Section C.1 of the NBHCP), which were developed to mitigate for 17,500 acres of urban development projected in 2003. The NBHCP key components are as follows:

a. Basis for 0.5 to 1 mitigation ratio (Section IV.C.1.a),

b. Preparation of site-specific management plans (SSMPs) (Section IV.C.1.b),

c. Buffers within the reserve lands (Section IV.C.1.c),

d. Connectivity (Section IV.C.1.d),

[4] The key component related to vernal pools is excluded from this EA as there is no vernal pool habitat within the UWSP.

e. Foraging habitat (Section IV.C.1.e), and

f. 2,500-acre/400-acre minimum habitat block size requirements (Section IV.C.1.f).

The goal of the NBHCP is the conservation of Covered Species through the acquisition (conservation easement or fee title), protection, and enhancement of existing habitats in the Natomas Basin, minimizing impacts of Covered Activities, including development activities, water facility maintenance, and reserve management activities, and focusing upon the preservation of the overall habitat values in the Natomas Basin. The NBHCP was developed to allow some urban development to occur, while ensuring that habitat values are maintained and increased, to the maximum extent practicable, within the Natomas Basin. The NBHCP sets forth guidelines and practices including the size and acreage of reserves to be established, acquisition criteria for upland and wetland areas to be acquired and managed by TNBC, and reserve management practices to be employed to ensure successful habitat enhancement to support the Covered Species.

The Study Area supports suitable habitat for most of the NBHCP Covered Species; however, the Study Area is adjacent to and largely surrounded by existing urbanized areas and is partially bisected by a peninsula of existing urban development.

The potential effects related to the development of the UWSP on key NBHCP components are discussed in the following sections.

### 5.7.2 Mitigation Ratio

The NBHCP proposed a minimum 0.5-to-1 mitigation ratio to be applied to authorized development covered under the NBHCP. In describing the basis for the 0.5:1 mitigation ratio, the NBHCP states that the 0.5:1 ratio mitigates the impacts of the incidental take authorized under the NBHCP because much of the land to be developed does not provide habitat or provides only marginal habitat, and the TNBC-managed reserves will provide habitat of higher quality than the eliminated habitat. The UWSP would not alter the habitat value of land authorized for development under the NBHCP and, as further discussed in Section 5.7.3 and Section 5.7.4 below, would not adversely affect the habitat value of existing TNBC reserves established under the NBHCP. Therefore, the UWSP would not affect the efficacy of the 0.5:1 mitigation ratio identified by the NBHCP. Although the UWSP would result in the net conversion of 1,529.7-acre acres of agricultural land and open space to urban development in addition to the 17,500 acres of permitted development under the NBHCP, the UWSP would fully mitigate that loss by preserving habitat of higher quality than the habitat that would be adversely affected by the development of the UWSP. This would provide higher quality habitat for protected species and other more common species that would be preserved in perpetuity and not subject to urban disturbances. The conversion of agricultural land to urban development proposed by the UWSP would therefore result in a minimal change to the conditions in which the NBHCP conservation strategy anticipated and is currently being implemented.

The UWSP would not alter the habitat value of land authorized for development under the NBHCP and would not adversely affect the habitat value of TNBC reserves established under the NBHCP; therefore, the UWSP would not affect the effectiveness of the 0.5-to-1 mitigation ratio for the 17,500 acres of urban development authorized by the NBHCP.

### 5.7.3 Site-Specific Management Plan

Development of the UWSP is not anticipated to adversely affect any Site Specific Management Plans ("SSMPs") for existing or future TNBC reserves in the vicinity of any of the properties associated with the UWSP. TNBC prepares and implements an SSMP for each reserve that addresses the specific resources and habitat values of each reserve site, and how these will be managed in support of the goals and objectives of the NBHCP. SSMPs for each existing TNBC reserve are currently designed to maximize benefits to NBHCP Covered Species using the resources within that individual reserve or reserve block and incorporate adaptive management strategies. Thus, changes in land use outside of an existing TNBC reserve are unlikely to necessitate changes to an SSMP. Although the UWSP would reduce available Swainson's hawk foraging habitat within the UWSP, which is in the vicinity of two existing TNBC reserves, this external factor would not alter the site-specific management of either nearby reserve. The two reserves include the 50-acre "Alleghany" property, which is part of the NBHCP reserve system managed by TNBC, and the approximately 56-acre Cummings Reserve, which is also part of the NBHCP reserve system, lies just north of the UWSP Agricultural Buffer Area, and west of the northernmost portion of the UWSP development area. The Allegheny Reserve will be embedded within the proposed Agricultural Buffer planned for the UWSP and thus would not be anticipated to be affected by development (**Appendix A, Figure 7, Natomas Basin Conservancy Mitigation Lands as of 2023**).

The proposed Agricultural Buffer is a ±505-acre area located between Garden Highway and the Study Area. This area contains Ag Residential and Ag Cropland land use designations and is utilized for small-scale farming and habitat mitigation. This area also contains ±33.6 acres of Open Space intended to provide a buffer between the agricultural and mitigation lands and proposed development. Included in this Open Space is a ±24.2-acre Open Space area providing a 250-foot setback from the south levee of Fisherman's Lake and the ±12.1-acre 30-foot to 50-foot West Edge Corridor. The Agricultural Buffer is not included in the County's growth lines; as such, existing farming operations and habitat are expected to continue, and the Agricultural Buffer will provide a physical separation between the development area and residential uses along Garden Highway.

Agricultural lands and their associated buffers can provide habitat for a variety of protected and common species. These lands often contain valuable nesting and foraging habitat for SWHA and other avian species, and if canals or other waterways are present, can also provide habitat for aquatic species such as GGS and western pond turtle. Agricultural land adjacent to existing preserved land can extend habitat values of the preserve into the adjacent agricultural land and provide connectivity to other areas, unlike urban or other more populated or impacted areas.

Changes in land use outside of an existing TNBC reserve as a result of the development of the UWSP are unlikely to necessitate changes to existing SSMPs.

### 5.7.4 Buffers within Reserve Lands

Per the NBHCP, buffers ranging from 30- to 70-foot-wide strips of native or ruderal vegetation along the edge of the reserve are often incorporated into TNBC reserves to minimize the effects of incompatible adjoining land uses. The NBHCP includes a requirement that reserves be initially sited at least 800 feet from existing or planned urban lands at the time of acquisition (City of Sacramento *et al*. 2003, page IV-16). The UWSP includes a 536.2-acre Agricultural Buffer Area. Certain project-related improvements are proposed within the Buffer Area, including roadway extensions with tie-ins to the Garden Highway, the

construction of which will necessitate the reworking of existing levees and patrol roads, and the grading of levee side slopes.

The Agricultural Buffer Area includes the Alleghany property and is adjacent to the Cummings Reserve to the north. The Alleghany property is located directly north of the proposed San Juan Road tie-in to Garden Highway. While the southern portion of the property, which borders San Juan Road, may experience temporary impacts during the improvement activities, it's important to note that these improvements will be carried out on an existing section of San Juan Road. An SSMP has been prepared for the preserve and should be reviewed to provide further clarification regarding the preserve boundary in relation to the existing road. To support minimal impacts to the preserve during the improvement activities, measures similar to those currently in place are expected to be implemented. For instance, access roads have already been created off San Juan Road adjacent to the southwestern corner of the preserve for a SAFCA levee improvement project.

Development of the north end of the UWSP is buffered from the Cummings Reserve by a proposed 250-foot Open Space corridor to the south of Fisherman's Lake Slough. Thus, planned urban development within the UWSP is not adjacent to existing TNBC reserves, and would, therefore, not alter the effectiveness of buffers within these reserve lands. As a result, implementation of the UWSP will not affect buffers within existing TNBC reserves.

### 5.7.5 Habitat Connectivity

The UWSP is not expected to significantly affect the connectivity of reserve habitat relative to avian species covered under the NBHCP due to their highly mobile and migratory nature. Most of the avian species that frequent the Natomas Basin and the TNBC reserves are migratory in nature, and no effects on habitat connectivity of TNBC reserves for avian species are anticipated due to the development of the Study Area. The Allegheny Reserve, recently acquired as part of SAFCA lands along the western border, will be embedded within the planned 542.4-acre Agricultural Buffer and thus would remain connected through the SAFCA lands to the north.

The NBHCP emphasizes maintaining connectivity of aquatic habitat between TNBC reserves to facilitate GGS movement within the Natomas Basin. This species is focal for two reasons: (1) GGS is the most prevalent Covered Species within the Basin that requires land/water connectivity to travel within the Basin, and (2) if adequate connectivity is provided for GGS, then it is anticipated that other Covered Species will also be afforded adequate opportunities to migrate within the Natomas Basin.

Aquatic habitat in the Natomas Basin consists primarily of drainage and flood control channels. RD 100, a public agency, operates the primary drainage canals within the Natomas Basin and is responsible for conveying and pumping nonurban stormwater runoff from the Natomas Basin. Runoff from agricultural lands within the Natomas Basin flows into numerous local drainage ditches that ultimately flow into the primary RD 1000 canals. RD 1000's primary system of interior drains includes the following:

- The East Drainage Canal conveys drainage water from the northern and eastern Natomas Basin to its confluence with the Main Drainage Canal northwest of the I-80/I-5 interchange. At its closest point, the East Drainage Canal is approximately 70 feet from the Study Area.

- The West Drainage Canal conveys drainage water from the western Natomas Basin northwest of Sacramento International Airport to its confluence with the Main Drainage Canal. Fisherman's

Lake, a natural slough, is a portion of the West Drainage Canal. The West Drainage Canal intersects with a small portion of the Study Area due to off-site improvements at the intersection of El Centro Road.

- The Main Drainage Canal conveys the combined flows of the East and West Drainage Canals from their confluence northwest of the I-80/I-5 interchange through portions of Willow Creek and Metro Center south of I-80. The Main Drainage Canal is within the Study Area at the confluence of the West and Main Drainage Canals.

- The Cross Canal conveys drainage water from central portions of Sutter County westward to the Sacramento River. The Cross Canal connects with the Sacramento River approximately 11.25 miles north of the Study Area.

- The Natomas East Main Drainage Canal conveys drainage water from Dry Creek, Arcade Creek, and a large portion of the Natomas area north of the confluence with Dry Creek. The Natomas East Main Drainage Canal is also referred to as Steelhead Creek. The Natomas East Main Drainage Canal is 1.3 miles from the Study Area.

In addition, NCMWC, a private water company, provides irrigation water through water diversions at five locations along the Sacramento River and the Natomas Cross Canal and distributes this water throughout the Basin through a series of canals and pump stations. These drainage and irrigation canals form a network throughout the Natomas Basin and provide a series of interconnected corridors for aquatic species to disperse and forage.

Pinch points for wildlife movement exist at culvert locations throughout the network of canals and ditches. While some species will utilize culverts, many do not and instead attempt to travel overland trying to cross major roads to return to aquatic habitat on the opposite side. In general, the use of culverts decreases with their length and with the presence of fencing or debris pits; conversely, the use of culverts increases with the presence of adjacent habitat or cover, roadside fencing that "funnels" animals towards culverts, and increased visibility through the culvert (Yanes 1995; Rodriguez *et al*. 1996; Clevenger *et al*. 2001; Forman *et al*. 2003; Ng *et al*. 2004).

Implementation of the UWSP will result in the loss of approximately 18.77 acres of existing canals and irrigation ditches (**Appendix A, Figure 8, Impacts to Upper Westside Specific Plan Aquatic Resources Map**). A few aquatic features are incorporated into the UWSP proposed development for recreation (e.g., biking and pedestrian walkways) but will not be connected to the Natomas Basin irrigation or drainage system. Currently, the Study Area is a partially fragmented, somewhat isolated patch of agricultural land surrounded on its eastern, northeastern, and southeastern boundaries by the dense urban environs of the City of Sacramento. The western boundary of the Study Area abuts Garden Highway, which parallels the Sacramento River. The western portion of the northern boundary (approximately 0.75 mile) abuts TNBC preserve lands, whereas the remaining eastern portion of the northern boundary (approximately 0.75 mile) abuts the City of Sacramento. For GGS, a highly mobile but largely aquatic species, the majority of the Study Area is essentially a dead-end as it is cutoff from potentially suitable GGS habitat to the south, east, and west. The impacts within West Drainage Canal are considered temporary, and the habitat would remain hydrologically connected to Fisherman's Lake after culvert replacement. Given that the majority of the UWSP development area does not currently provide connectivity of reserves or habitats, it would not reduce such connectivity following development, even though the removal of canals and ditches within the Study Area will eliminate the

Study Area from use by GGS, WPT, and other aquatic species. Further, off-site mitigation for the UWSP would be sited, to the extent feasible, to enhance connectivity between existing reserves or more conducive GGS habitats within the Natomas Basin.

### 5.7.6 SWHA Foraging Habitat

As stated in the NBHCP, suitable cover types for foraging habitats include, in order of suitability: (1) native grassland; (2) agriculture soon after discing; (3) alfalfa and other hay crops;(4) fallow fields; (5) lightly grazed pasture; (6) combinations of hay, grain, and row crops; (7) rice fields prior to flooding and after draining; and (8) heavily grazed pasture. Unsuitable cover types for foraging habitat include vineyards, mature orchards, cotton, thistle in fallow fields, and any crop where prey are unavailable due to high vegetation height and density, as well as flooded rice fields.

Based on the analysis in this BRA, the UWSP would reduce the overall upland land cover in the Basin, providing foraging habitat for Swainson's hawk by approximately 1,573.92 acres. Pursuant to the Sacramento County Swainson's hawk mitigation ordinance, however, the project will be required to provide mitigation for impacts to Swainson's hawk foraging habitat at a 1:1 ratio (Sacramento County Code, Chapter 16.130). The majority of the UWSP's development area is currently zoned for agriculture. However, the success of the NBHCP does not require a certain amount of agricultural land remaining in the basin.

The success of the NBHCP does not require a certain amount of agricultural land remaining in the basin. For example, portions of the UWSP area, along with other "uncommitted" agricultural acreage, were acknowledged by the NBHCP to provide foraging habitat for Swainson's hawk, but such "existing baseline foraging habitat is not considered mitigation under the NBHCP" (NBHCP, IV-13). Similarly, CDFW found that the impacts of development authorized by the NBHCP were fully mitigated by the implementation of the NBHCP avoidance and minimization measures, as well as the "establishment, enhancement, and active management of as much as 8,750 acres of high-quality reserve habitat in perpetuity designed and managed specifically for the benefit of the Covered Species" (NBHCP California Endangered Species Act Findings, p. 11.). CDFW's analysis did not mention, nor rely on, any additional "uncommitted" acreage remaining in agriculture.

The NBHCP identified a corridor along the Sacramento River known as the Swainson's Hawk Zone. This zone is defined as the lands that were not developed at the time the NBHCP was approved (excluding the 252 acres of land designated "Urban" on the City of Sacramento General Plan and the North Natomas Community Plan located within the City of Sacramento) and which are located within the Natomas Basin and within one mile east of the Sacramento River and extending from the Natomas Cross Canal on the north and Interstate 80 on the south. The City of Sacramento and Sutter County have limited development within that zone as part of their permits under the NBHCP.

SWHA is a focal species that shares habitat requirements with numerous NBHCP Covered Species in addition to other special-status species not covered by the NBHCP. The effects of the UWSP on foraging habitat would not alter the viability of any of the populations of NBHCP Covered Species.

### 5.7.7 Giant Garter Snake Habitat

The GGS inhabits agricultural wetlands and other waterways, such as irrigation and drainage canals, rice lands, marshes, sloughs, ponds, small lakes, low-gradient streams, and adjacent uplands in the Central

Valley. This species prefers freshwater marshes and low-gradient streams, and has adapted to drainage canals and irrigation ditches for habitat.

As stated in the NBHCP, the Natomas Basin contains a fairly widespread distribution of GGS, with nearly all observations from rice field areas. Within these areas, GGS are strongly associated with the rice fields themselves and the associated canal/drain components of the water conveyance system. The NBHCP presented an estimate for the amount of GGS habitat in the Natomas Basin at the time the NBHCP analysis was prepared by correlating it with the number of rice fields and associated canals/drainages in the Natomas Basin. At that time, these were estimated at 22,692 acres of rice fields and about 247 miles of canals and drains.

However, as stated in Section 5.2.3.1, due to the presumed infrequent use of the Study Area by foraging GGS and the Study Area's geographic location surrounded on three sides by barriers to more suitable habitat, the loss of habitat in the Study Area would not adversely affect GGS, and the overall effect of the Study Area on population viability would be minimal. The impacts within West Drainage Canal are considered temporary, and the habitat would remain hydrologically connected to Fisherman's Lake after culvert replacement. Although some potentially suitable habitat may be lost or temporarily impacted because of the construction of the Study Area proposed development, the outcome of that development will be the procurement of additional reserves of natural habitat for GGS. Habitat preservation ensures that suitable aquatic habitat and upland hibernacula will remain in perpetuity for the benefit of GGS. GGS will benefit from the addition of new lands complementing the existing TBNC preserve system that will be acquired to mitigate for the loss of habitat in the Study Area.

### 5.7.8 Minimum Block Size

The NBHCP stipulates that, by the end of its 50-year life span, the TNBC reserve system will have reached 8,750 acres with one habitat block at least 2,500 acres in size and the balance of reserve lands in habitat blocks of at least 400 acres in size. The NBHCP provides following the basis for the size requirements:

1. Large blocks minimize the "perimeter effect";

2. Large blocks promote biodiversity by allowing multiple species and niches to occupy the site;

3. The benefit to the genetic diversity of dispersing interconnected reserves throughout the Natomas Basin; and

4. The 400-acre reserve size is considered the minimum size to allow the persistence of Covered Species.

Implementation of the UWSP would not prevent TNBC from establishing 8,750 acres of reserves in the Natomas Basin as identified in the NBHCP as the Study Area constitutes only 3.86 percent of the acreage in the Natomas Basin.

The NBHCP is now about 20 years into that 50-year timeframe, and it has already successfully completed its largest land acquisition milestone by completing the 2,500-acre block requirement (Table 5). The requisite 2,500-acre block is made up of the following preserves, as shown on the NBHCP "2023 Base Map." **Figure 7** provides a visual representation of the preserves in relation to UWSP.

**Table 5**
**NBHCP 2,500-ACRE BLOCK ACREAGE**

| Tract | Acq. Date | Acres |
|---|---|---|
| 4. Bennett North | 05.17.99 | 227 |
| 5. Bennett South | 05.17.99 | 132 |
| 7. Lucich South | 05.18.99 | 352 |
| 14. Atkinson | 06.12.03 | 181 |
| 15. Ruby Ranch | 06.23.03 | 91 |
| 16. Huffman West | 09.30.03 | 158 |
| 17. Huffman East | 09.30.03 | 136 |
| 21. Bolen North | 04.29.05 | 114 |
| 22. Bolen South | 04.29.05 | 102 |
| 23. Vestal | 09.12.05 | 95 |
| 24. Bolen West | 09.01.06 | 155 |
| 25. Nestor | 09.01.06 | 233 |
| 31. Lauppe South | 06.30.20 | 172 |
| 32. Verona (CE) | 07.02.20 | 116 |
| 34. Willey | 10.19.20 | 108 |
| 36. Lauppe North | 01.05.22 | 185 |
| Total Acres in Block: | | 2557 |

Source: The Natomas Basin Conservancy, 2023 Base Map (https://natomasbasin.org/maps/; accessed 4-21-23).

With regard to habitat blocks of at least 400 acres, as shown on **Figure 7** the nearest NBHCP habitat blocks to the UWSP site include the Rosa East, Rosa Central, Souza, and Natomas Farms reserves totaling approximately 301 acres, and the Cummings and Rudin reserves, totaling approximately 109 acres. (See The Natomas Basin Conservancy, 2023 Base Map (https://natomasbasin.org/maps/; accessed April 21, 2023). The UWSP site does not include the property lying between these two nearby clusters of reserve land and would not preclude the future acquisition of connectivity between those two areas by TNBC.

Thus, when looking at all the above factors, the UWSP will not reduce the effectiveness of the NBHCP's operating conservation strategy.

# 6.0 PROPOSED MITIGATION MEASURES

The proposed mitigation measures for the Plan Area for reducing and avoiding UWSP impacts to special-status species and habitats are presented below. These avoidance and minimization measures would protect special-status species during construction activities within the Plan Area as well as during the development of the on- and off-site Reserves. Species with and without specific conservation measures will benefit from the habitat enhancement and preservation element through the project's regulatory permitting process, which includes establishing conservation reserves for the benefit of all the Covered Species.

In light of the unique circumstances associated with the location of the UWSP and surrounding HCPs, a biological conservation strategy will be prepared to characterize baseline ecological conditions within the UWSP, define resource conservation goals and objectives for the UWSP, and describe proposed conservation measures identified to avoid, minimize and/or reduce resource impacts during project implementation, as well as to identify proposed feasible/practicable mitigation options for project-

related impacts to biological and agricultural resources. Additionally, an effects analysis of the Upper Westside Specific Plan will be prepared and include an evaluation of the potential effects of implementation of the proposed UWSP on species covered by the Natomas Basin Habitat Conservation Plan, as well as potential effects to the NBHCP, including the ability of the NBHCP to achieve adopted goals and objectives. These documents will also outline anticipated regulatory authorizations required for the development of the UWSP and preliminary strategies to obtain required regulatory authorizations.

Known or potential biological constraints in the Study Area include the following:

- Potential habitat for special-status plants, including wooly rose-mallow and Sanford's arrowhead
- Potential habitat for special-status wildlife, including valley elderberry longhorn beetle, giant garter snake, western pond turtle, tricolored blackbird, Swainson's hawk, burrowing owl, loggerhead shrike, white-faced ibis, pallid bat, and migratory birds;
- Protected trees and canopy;
- Invasive Species; and
- Jurisdictional waters of the U.S and State.

## 6.1 Special-Status Plant Species

As discussed previously, potentially suitable habitat is present for special-status plant species, including woolly-rose mallow and Sanford's arrowhead that are known to occur in the vicinity of the Study Area.

A qualified botanist should conduct one botanical survey in July within the Study Area, which will overlap with the typical identification period of both potentially occurring special-status plant species. It should be noted that weather conditions during any given survey year may require surveys to be conducted earlier or later in the typical blooming period in order to conduct the survey during the appropriate weather conditions. This timing may result in the need to conduct more than one round of plant surveys to adequately survey all potentially occurring special-status plant species. The results of these surveys should be documented in a letter report to Sacramento County. If no special-status plants are observed during the botanical survey, no additional measures for special-status plants are recommended.

If any of the non-listed special-status plants are identified within areas of potential construction disturbance, the plants and/or the seedbank should be transplanted to suitable habitat within the Study Area outside of the project footprint or off-site if suitable habitat is not available within the Study Area. A qualified biologist should prepare an avoidance and mitigation plan detailing protection and avoidance measures, transplanting procedures, success criteria, and long-term monitoring protocols. In addition, pre-construction worker awareness training should be conducted, alerting workers to the presence of and protections for special-status plants in the vicinity of the work area.

In the absence of the proposed mitigation measures, potential adverse effects to special-status plants could include take of individuals during construction.

**MM BIO-1a** To avoid impacts to special-status plants, the following mitigation measures are recommended:

- Prior to the start of construction, a qualified biologist shall conduct focused survey(s) for wooly rose-mallow and Sanford's arrowhead within suitable habitat on the Study Area during the appropriate blooming season (June-September for wooly-rose mallow, May - October for Sanford's arrowhead). Multiple surveys may be required to determine the status of these species in the Study Area. If survey results are negative, no further mitigation would be necessary.

- If special-status plants are documented on the site, a report shall be submitted to CNDDB to document the status of the species on the site. If the project is designed to avoid impacts to habitat for special-status plants and/or individuals and habitat, no further mitigation for special-status plants would be necessary.

- If special-status plants are documented within the site, and project impacts to individuals and habitat are anticipated, the project shall be designed to avoid impacts to special-status plants if feasible. If it is not feasible to avoid impacts to this species, consultation with USFWS and/or CDFW shall be conducted to develop a mitigation strategy. The proponent shall notify USWFS and/or CDFW, providing a complete description of the location, size, and condition of the occurrence, and the extent of proposed direct and indirect impacts to it. The project proponent shall comply with any additional mitigation requirements imposed by USFWS and/or CDFW. Additional requirements could include but are not limited to, obtaining take authorization if necessary, the development of a plan to relocate special-status plants (seed, propagules, etc.) to a suitable location outside of the impact area, and monitoring the relocated population to demonstrate transplant success.

## 6.2 Valley Elderberry Longhorn Beetle

Based on numerous CNDDB records in riparian habitat along the Sacramento River (CDFW 2023) adjacent to the Study Area, elderberry shrubs that may provide habitat for VELB may occur in valley oak woodland in the Study Area. If elderberry shrubs are present in the Study Area, then VELB may occur in the Study Area and be impacted by the proposed project. If elderberry shrubs are determined to be present, then coordination with USFWS will be required to obtain concurrence on the potential for this species to be present in the Study Area and/or be impacted by the proposed project as well as to develop mitigation measures to avoid any potential take of the species. To avoid potential impacts to this species, the following measures are provided as recommendations, but potential impacts to this species and/or potentially suitable habitat for this species will require formal consultation with USFWS as required under Section 7 of the Endangered Species Act due to anticipated permitting associated with the project.

Conservation practices for the VELB set forth in the *Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle (Desmocerus californicus dimorphus)*, dated May 2017 (Framework) (USFWS 2017) should be followed. The Framework assumes that any effects to riparian habitat with elderberry shrubs present or effects to any elderberry shrub with exit holes in non-riparian areas within the range of the species are likely to result in adverse effects to VELB and must be mitigated according to the Framework. The measures provided below are consistent with Framework.

**MM BIO 2a** A pre-construction survey will be conducted prior to construction-related ground disturbance by a qualified biologist. If such survey determines VELB habitat is present (elderberry shrub within project footprint and if exit holes are present in stems greater than one-inch in diameter), the Implementing/lead agency shall require the developer to follow the following appropriate measures to avoid take and minimize of individuals:

- If elderberry shrubs are found on or adjacent to the site, a 100-foot wide avoidance buffer (measured from the dripline of the plant) will be established around all elderberry shrubs with stems greater than one-inch diameter at ground level and will be clearly identified in the field by staking, flagging, or fencing. No construction activities involving mechanized equipment will occur within the buffer areas. Human access may be permitted in the buffer, provided that it does not cause disturbance to the shrubs.

- Compensatory mitigation for adverse effects may include the transplanting of elderberry shrubs during the dormant season (November 1 to February 15), if feasible, to an area protected in perpetuity as well as required additional elderberry and associated native plantings as approved by the USFWS.

- If off-site compensation includes the dedication of conservation easements, purchase of mitigation credits, or other off-site conservation measures, the details of these measures will be included in the mitigation plan and must occur with full endowments for management in perpetuity. The plan will include information on responsible parties for long-term management, holders of conservation easements, long-term management requirements, and other details, as appropriate, for the preservation of long-term viable populations.

**MM BIO 2b** If elderberry plants cannot be avoided, or if project activities will result in the death of stems or the entire shrub, they shall be transplanted during the dormant season (November 1 to February 15) to an area protected in perpetuity and approved by the USFWS.

- The elderberry shrub will be cut back 3 to 6 feet from the ground or to 50 percent of its height (whichever is taller) by removing branches and stems above this height. The trunk and all stems measuring 1 inch or greater in diameter at ground level will be replanted. Any leaves remaining on the plant will be removed.

- A hole will be excavated of adequate size to receive the transplant.

- The elderberry shrub will be excavated using a Vermeer® spade, backhoe, front-end loader, or other suitable equipment, taking as much of the root ball as possible, and will be replanted immediately. The plant will only be moved by the root ball. The root ball will be secured with wire and wrapped with damp burlap. The burlap will be dampened as necessary to keep the root ball wet. Care will be taken to ensure that the soil is not dislodged from around the roots of the transplant. Soil at the transplant site will be moistened prior to transplant if the soil at the site does not contain adequate moisture.

- Replacement seedling plants will be provided at a ratio of 2 to 1 to 5 to 1 depending on the extent of VELB utilization of the plants moved or lost. An 1,800-square-foot area will be provided for each transplanted elderberry shrub or every five elderberry seedling plants.

**MM BIO 2c** Annual monitoring of VELB habitat will be provided in the planted mitigation sites for a 10-year period.

- Replacement elderberry shrubs will meet a 60% survival rate by the end of the 10-year period and the 60% survival rate shall be required for the term of the applicable permit.
- Final habitat acreages, mitigation ratios, and other project-specific compensatory mitigation requirements should be determined through consultation between USACE/USFWS/CDFW as part of the required project-specific regulatory permitting processes, currently anticipated to consist of Section 404 Authorization/FESA Section 7 Consultation/CDFW Streambed Alteration Agreement and 2081 Incidental Take Permit.

## 6.3 Giant Garter Snake

**MM BIO-3a** To avoid impacts to potential giant garter snake and their habitat, defined as 200 feet surrounding delineated aquatic resources in the project area, the following mitigation measures are recommended:

- A USFWS/CDFW–approved biologist will identify suitable giant garter snake habitat. If suitable habitat is identified, the project proponent will avoid and minimize impacts to the maximum extent practicable. Avoidance measures should include relocating impacts away from the habitat. Avoidance and minimization measures will be incorporated into the project design and other portions of the application package prior to submission for coverage under the Plan. If the project does not fully avoid impacts to suitable habitat, pre-construction surveys will be required.

- Prior to any ground disturbance related to construction activities, a USFWS/CDFW–approved biologist will conduct a pre-construction survey in construction areas identified as having suitable garter snake habitat and 200 feet of adjacent uplands, measured from the outer edge of each bank. The surveys will delineate suitable habitat and document any sightings of giant garter snake.

- If impacts on giant garter snake habitat as a result of construction activities are not avoided, the following measures will be implemented. These measures are based on USFWS's Standard Avoidance and Minimization Measures during Construction Activities in Giant Garter Snake Habitat (USFWS 1999).

    - Limit construction activity that disturbs habitat to the period between May 1 and September 30. This is the active period for giant garter snake, and direct mortality is minimized because snakes are more likely to independently move away from disturbed areas. If activities are necessary in giant garter snake habitat between October 1 and April 30, the USFWS Sacramento Field Office will be contacted to determine if additional measures beyond those described below are necessary to minimize and avoid take.

  - In areas where construction is to take place, dewater all irrigation ditches, canals, or other aquatic habitat between April 15 and September 30, to remove habitat of garter snakes. Dewatered areas must remain dry, with no puddled water remaining, for at least 15 consecutive days prior to the excavation or filling of that habitat. If a site cannot be completely dewatered, netting and salvage of prey items may be necessary.

- If suitable habitat for giant garter snake cannot be avoided between October 1 and April 30, the USFWS Sacramento Field Office will be contacted to determine if additional measures beyond those described below are necessary, and the following actions will be performed. A USFWS-approved biologist will conduct a construction survey no more than 24 hours before construction in suitable habitat and will be on-site during construction activities in potential aquatic and upland habitat to monitor construction and watch for the presence of giant garter snake. The biologist will provide USFWS with a field report form documenting the monitoring efforts within 24 hours of the commencement of construction activities. The monitor will be available thereafter. If a snake is encountered during construction activities, the monitor will have the authority to stop construction activities until appropriate corrective measures have been completed or it is determined that the snake will not be harmed. Giant garter snakes encountered during construction activities should be allowed to move away from the construction area on their own. Only personnel with a USFWS recovery permit pursuant to Section 10(a)(1)(A) of the ESA will have the authority to capture and/or relocate giant garter snakes that are encountered in the construction area. The project area will be reinspected whenever a lapse in construction activity of two weeks or more has occurred.

- To preserve nearby aquatic habitat for giant garter snake outside construction areas from potential effects of construction, silt fencing will be erected to clearly define the aquatic habitat to be avoided; restrict working areas, spoils, and equipment storage and other project activities to areas outside of aquatic or wetland habitat; and maintain water quality and limit construction runoff into wetland areas through the use of fiber bales, filter fences, vegetation buffer strips, or other appropriate methods.

  - Fill or construction debris may be used by giant garter snakes as over-wintering sites. Therefore, upon completion of construction activities, any temporary fill or construction debris must be removed from the site.

- Construction personnel will be trained to avoid harming giant garter snakes. A qualified biologist approved by USFWS will inform all construction personnel about the life history of giant garter snakes; the importance of irrigation canals, marshes/wetlands, and seasonally flooded areas such as rice fields to giant garter snakes; and project mitigation related to avoiding and minimizing impacts on giant garter snake.

**MM BIO-3b** If suitable habitat for giant garter snake cannot be avoided, compensatory mitigation for adverse effects to habitat may include preserving, creating, and/or enhancing upland and/or aquatic habitats in perpetuity at a location and ratio approved by the USFWS.

- If off-site compensation includes the dedication of conservation easements, purchase of mitigation credits, or other off-site conservation measures, the details of these measures will be included in the mitigation plan and must occur with funding for management in perpetuity. The plan will include information on responsible parties for long-term management, holders of conservation easements, long-term management requirements, and other details, as appropriate, for the preservation of long-term viable populations.

## 6.4 Western (Northwestern) Pond Turtle

The Project Area provides aquatic habitat suitable to support this species, with marginal upland habitat also present.

**MM BIO-4a** To avoid impacts to potential western pond turtle and their habitat The following mitigation measures are recommended:

- A qualified biologist should conduct a pre-construction survey within 14 days prior to the start of ground disturbance within 500 feet of riparian habitat or intermittent drainage. If no western pond turtles are observed, no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

- If western pond turtles are found, additional avoidance measures are recommended, including having a qualified biologist conduct a pre-construction survey within 24 hours prior to the commencement of construction activities, performing a Worker Awareness Training to all construction workers, and being present on the site during grading activities within 500 feet of the intermittent drainage and their surrounding riparian habitat for the purpose of relocating any western pond turtles found within the construction footprint to suitable habitat away from the construction zone, but within the property.

## 6.5 Tricolored Blackbird And Other Special-Status Birds (Loggerhead Shrike) And Nesting Migratory Birds And Raptors

Special-status birds and migratory birds and raptors protected under federal, State, and/or local laws and policies have the potential to nest and forage within the Study Area. Tricolored blackbird may nest and forage within the Study Area. Other migratory bird species have the potential to nest and forage within the Study Area. The Study Area and adjacent land contain suitable habitat to support a variety of nesting birds within trees, shrubs, structures, and on bare ground.

Active nests and nesting birds are protected by the California Fish and Game Code Sections 3503 and 3503.5, 3513, and the MBTA. Ground-disturbing and other development activities, including grading,

vegetation clearing, tree removal/trim, and construction could impact nesting birds if these activities occur during the nesting season (generally February 1 to August 31). To avoid impacts to nesting birds, all ground-disturbing activities should be completed between September 1 and January 31, if feasible.

**MM BIO-5a** If construction cannot occur outside of the nesting season, the following measures are recommended to avoid impacts to special-status and nesting migratory birds:

- If construction activities occur during the nesting season, a qualified biologist should conduct a nesting bird survey to determine the presence of any active nests within the Study Area. Additionally, the surrounding 500 feet of the Study Area should be surveyed for active raptor nests, where accessible. The nesting bird survey should be conducted within 14 days prior to the commencement of ground-disturbing or other development activities. If the nesting bird survey shows that there is no evidence of active nests, no additional measures are recommended. If development does not commence within 14 days of the nesting bird survey, or halts for more than 14 days, then an additional survey is required prior to starting or resuming work within the nesting season.

- If active nests are found, then the qualified biologist should establish a species-specific buffer to prohibit development activities near the nest and minimize nest disturbance until the young have successfully fledged or the biologist determines that the nest is no longer active. Buffer distances may range from 30 feet for some songbirds and 0.5 mile for some raptors. Nest monitoring may also be warranted during certain phases of construction to ensure nesting birds are not adversely impacted. If active nests are found within any trees slated for removal, then an appropriate buffer should be established around the tree and all trees within the buffer should not be removed until a qualified biologist determines that the nest has successfully fledged and/or is no longer active.

- A qualified biologist should conduct environmental awareness training that is given to all on-site personnel prior to the initiation of work.

If construction occurs outside of the nesting bird season (September 1 to January 31), a nesting bird survey and environmental training for nesting birds would not be required.

## 6.6 Burrowing Owl

**MM BIO-6a** To avoid impacts to potential burrowing owl and their habitat The following mitigation measures are recommended:

- A qualified biologist shall conduct focused burrowing owl surveys in the Project area and surrounding 500 feet, where accessible, in accordance with the CDFW's Staff Report on Burrowing Owl Mitigation (Staff Report), published March 7, 2012. Surveys shall be repeated if project activities are suspended or delayed more than 14 days.

    - According to the Staff Report, four survey visits shall be conducted during the breeding season (February 1 to August 31): (1) at least one site visit between February 15 and April 15, and (2) a minimum of three survey visits, at least three weeks apart, between April 15 and July 15, with at least one visit after June 15.

- Non-breeding season surveys shall be conducted during four site visits, spread evenly apart.

- Take avoidance surveys may also be conducted. An initial take avoidance survey shall be conducted no less than 14 days prior to initiating ground disturbance activities using the methods outlined in the Staff Report. Implementation of avoidance and minimization measures would be triggered by positive owl presence on the site where project activities will occur. The development of avoidance and minimization approaches would be informed by monitoring the burrowing owls. Burrowing owls may re-colonize a site after only a few days. Time lapses between project activities trigger subsequent take avoidance surveys, including but not limited to a final survey conducted within 24 hours prior to ground disturbance.

If no burrowing owls are detected, no further measures are required. If active burrowing owl burrows are detected, the avoidance, minimization, and mitigation methodologies outlined in the CDFW's Staff Report on Burrowing Owl Mitigation shall be followed prior to initiating Project related activities that may impact burrowing owls.

## 6.7 Special-Status Birds and Nesting Migratory Birds and Raptors

**MM BIO-7a** To avoid impacts to potential special-status birds and nesting migratory birds and raptors, the following mitigation measures are recommended:

Active nests and nesting birds are protected by the California Fish and Game Code Sections 3503 and 3503.5, 3513, and the MBTA. Ground-disturbing and other development activities, including grading, vegetation clearing, tree removal/trim, and construction could impact nesting birds if these activities occur during the nesting season (generally February 1 to August 31). To avoid impacts to nesting birds, all ground-disturbing activity should be completed between September 1 and January 31, if feasible. If construction cannot occur outside of the nesting season, the following measures are recommended:

- If construction activities occur during the nesting season, a qualified biologist should conduct a nesting bird survey to determine the presence of any active nests within the Study Area. Additionally, the surrounding 500 feet of the Study Area should be surveyed for active raptor nests, where accessible. The nesting bird survey should be conducted within 14 days prior to the commencement of ground-disturbing or other development activities. If the nesting bird survey shows that there is no evidence of active nests no additional measures are recommended. If development does not commence within 14 days of the nesting bird survey, or halts for more than 14 days, then an additional survey is required prior to starting or resuming work within the nesting season.

    - If active nests are found, then the qualified biologist should establish a species-specific buffer to prohibit development activities near the nest to and minimize nest disturbance until the young have successfully fledged or the biologist determines that the nest is no longer active. Buffer distances may range from 30 feet for some songbirds and 0.5 mile for some raptors. Nest monitoring may also be warranted during certain phases of construction to ensure nesting birds are not adversely impacted. If active nests are found within any trees slated for removal, then an appropriate buffer should be established around the tree and all trees within the

buffer should not be removed until a qualified biologist determines that the nest has successfully fledged and/or is no longer active.

- A qualified biologist should conduct environmental awareness training that is given to all onsite personnel prior to the initiation of work.

- If construction occurs outside of the nesting bird season (September 1 to January 31), a nesting bird survey and environmental training for nesting birds would not be required.

## 6.8 Swainson's Hawk

**MM BIO-8a** To avoid impacts to potential Swainson's hawk, the following mitigation measures are recommended:

- If construction activities will begin during the Swainson's hawk nesting season (March 20 to September 15), a qualified biologist should conduct at least the minimum number of surveys called for within at least two survey periods prior to the initiation of construction in accordance with the *Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley* (Swainson's Hawk Technical Advisory Committee 2000) or the current

  CDFW-approved protocol. Current survey periods specified by the Guidelines are March 20 to April 5, April 5 to April 20, April 21 to June 10, and June 10 to July 30. All potential nest trees within 0.5 mile of the proposed Project footprint should be visually examined for potential Swainson's hawk nests, as accessible.

- If no active Swainson's hawk nests are identified on or within 0.5-mile of the proposed Project, a letter report documenting the survey methodology and findings should be submitted to the Project proponent, and no additional mitigation measures are recommended.

- If active Swainson's hawk nests (a nest becomes active once the first egg is laid and remains active until the fledged young are no longer dependent on the nest [USFWS 2018]) are found within 0.5 mile of the Project footprint, a survey report should be submitted to CDFW, and an avoidance and minimization plan should be developed for approval by CDFW prior to the start of construction. The avoidance plan should identify measures to minimize impacts to the active Swainson's hawk nest depending on the location of the nest relative to the project footprint. These measures may include:

  - Conduct a worker awareness training program prior to the start of construction;

  - Establish a buffer zone and work schedule to avoid impacting the nest during critical periods. If possible, no work will occur within 200 yards of the nest while it is in active use. If work will occur within 200 yards of the nest, then construction will be monitored by a qualified biologist to ensure that no work occurs within 50 yards of the nest during incubation or within 10 days after hatching (Swainson's Hawk Technical Advisory Committee 2000);

- Have a biological monitor conduct regular monitoring of the nest during construction activities; and

- Should the project biologist determine that the construction activities are disturbing the nest; the biologist should halt construction activities until the CDFW is consulted.

- The Study Area contains cropland habitats, which provide suitable foraging habitat for Swainson's hawks. CDFW has provided guidelines for mitigating impacts to Swainson's hawk foraging habitat as summarized below (CDFW 1994):

  a) Projects within one mile of an active nest tree shall provide:

  - One acre of foraging habitat for each acre of development at a ratio of 1:1. Mitigated lands shall consist of 10 percent of the land requirements met by fee title acquisition or a conservation easement allowing for the active management of the habitat, and the remaining 90 percent of the land protected by a conservation easement on agricultural lands or other suitable habitats which provide foraging habitat for Swainson's hawk (grasslands, rangeland, etc.) and no requirements for active management of the habitat; or

  - One-half acre of foraging habitat for each acre of development authorized at a ratio of 0.5:1. All the land requirements shall be met by fee title acquisition or a conservation easement, which allows for the active management of the habitat for prey production on the land. Prey abundance and availability are determined by land and farming patterns, including crop types, agricultural practices, and harvesting regimes. Actively managed land for prey production may result in the land becoming less valuable for crop production due to management limitations but increases the value for Swainson's hawk through functional lift.

  b) Projects within five miles of an active nest tree but greater than one mile from the nest tree shall provide 0.75 acre of foraging habitat for each acre of urban development at a ratio of 0.75:1. All foraging habitat may be protected through fee title acquisition or conservation easement on agricultural lands or other suitable habitats.

  c) Projects within 10 miles of an active nest tree, but greater than five miles from an active nest, tree shall provide 0.5 acre of Habitat Management land for each acre of urban development at a ratio of 0.5:1. All foraging habitat may be protected through fee title acquisition or a conservation easement on agricultural lands or other suitable habitat.

Sacramento County Office of Planning and Environmental Review (PER) assumes that parcels zoned as AG-40 (Agriculture) or larger, are considered to have 100 percent habitat value, and the value decreases as the minimum parcel size drops. Properties zoned AR-5 and smaller, parcels zoned as RD-1 thru 40, and commercial and industrial zonings retain no foraging habitat value. Parcels within the Study Area are zoned SC (Shopping Center), LC (Light commercial), and RD-40 (Multiple Family Residential) (Sacramento County 2016). With the implementation of the measures provided in Section 6.8, the

Project would not affect the viability of the SWHA population in the Natomas Basin and would contribute to the overall success of the SWHA population in the Natomas Basin and beyond.

## 6.9 White-Faced Ibis

The Study Area contains foraging habitat, which consists of agricultural lands, annual grasslands, fallowed crops, and ruderal areas.

**MM BIO-9a** To avoid impacts to white-faced ibis, the following mitigation measures are recommended:

- A qualified biologist should conduct a pre-construction survey of potential breeding and nesting habitat for presence of breeding and nesting white-faced ibis.
- No more than three days prior to construction (if occurring during the nesting season), a white-faced ibis nesting survey will be conducted.
- If surveys determine the presence of active white-faced ibis nest sites, disturbance within 0.25 mile of nests will be avoided within the nesting season of May 15 through August 31 or until a qualified biologist, with concurrence of USFWs and CDFW, has determined that young have fledged or that the nest is no longer occupied.

## 6.10 Pallid Bat

Pallid bat has the potential to occur within the Study Area. The Study Area provides potential foraging habitat over agricultural lands, and Fremont cottonwood and valley oak tree groves provide suitable roosting habitat for the species.

**MM BIO-10a** To avoid impacts to potential pallid bat, the following mitigation measures are recommended:

- A qualified biologist should conduct a pre-construction survey for special-status bat species within 14 days prior to development or ground disturbing activities, including grading, vegetation clearing, tree removal, or construction. If no bats are observed, no additional measures are recommended. If development does not commence within 14 days of the pre-construction survey, or halts for more than seven days, an additional survey is required prior to resuming or starting work.
- If special-status bats are present and roosting in the Study Area or the surrounding 100 feet of the Study Area, the qualified biologist should establish an appropriate no disturbance buffer around the roost site prior to the commencement of ground-disturbing activities or development. No trees should be removed until the biologist has determined that a roost site is no longer active, and no bats are present. If avoidance is not feasible, then the CDFW should be consulted for additional avoidance measures and additional mitigation measures, such as the installation of bat boxes or alternate roost structures.

- A qualified biologist should conduct environmental awareness training for all construction personnel prior to the initiation of work.

## 6.11 PROTECTED TREES AND CANOPY

**MM BIO-11a** The project site contains trees potentially protected by the Sacramento County Tree Preservation Ordinance. Trees on the site should be protected from removal as well as from ground disturbance within the protection zone without a tree permit from the County. Prior to any removal, or ground disturbance within a radius of one foot greater than the maximum dripline of a protected tree, a tree survey should be conducted by an ISA-Certified Arborist to document the species, size, and condition of all trees in the Study Area. A tree permit will be required prior to the removal or impact of any protected native oak tree. The person requesting the permit, or the property owner, may also be required to pay the cost of obtaining and planting the replacement trees.

Mitigation for loss of both protected oak trees and other tree canopy may be implemented as a combination of avoidance, protection, on-site replacement, where feasible, and off-site preservation or creation of oak woodland habitat. Recommended tree protection measures below include Sacramento County guidelines for protection measures to be implemented around trees that will remain in the Study Area.

- Tree Protection Fencing, consisting of four-foot tall, brightly-colored, high-visibility plastic fencing, shall be placed around the perimeter of the tree protection zone (TPZ) (dripline radius + 1 foot) on the project side of existing oak trees;

- Tree protection fencing shall not be moved without prior authorization from the Project Arborist or Sacramento County;

- No parking, portable toilets, dumping or storage of any construction materials, grading, excavation, trenching, or other infringement by workers or domesticated animals is allowed in the TPZ;

- No signs, ropes, cables, or any other item shall be attached to a protected tree, unless recommended by an ISA-Certified Arborist;

- Underground utilities should be avoided in the TPZ where feasible (as previously discussed, trenching within the dripline of trees along the western side of the existing driveway is not expected to further impact these trees);

- Cut or fill within the dripline of existing native oak trees should be avoided;

- Pruning of living limbs or roots over two inches in diameter shall be done under the supervision of an ISA-Certified Arborist; and

- Where trenching results in impacts to the roots of protected trees, the roots should be trimmed to a clean edge.

## 6.12 INVASIVE SPECIES

**MM BIO-12a** Prior to the issuance of a grading permit, the Applicant shall prepare a Weed Control Plan for review and approval by the County. Prior to the start of construction activities, the Applicant shall implement a comprehensive, adaptive Weed Control Plan for pre-construction and construction invasive weed abatement. The long-term Weed Control Plan, shall include, but is not limited to, the following:

- A pre-construction weed inventory shall be conducted by surveying all areas subject to ground-disturbing activity, including but not limited to, staging areas, access roads, and areas subject to grading.
- Weed populations that (1) are rated High or Moderate for negative ecological impact in the Cal-IPC database, and (2) aid and promote the spread of wildfires (such as cheatgrass, Saharan mustard, and medusa head) shall be mapped and described according to density and area covered.
- In areas subject to ground disturbance, weed infestations shall be treated prior to construction according to control methods and practices for invasive weed populations.
- The Weed Control Plan shall be updated and utilized for eradication and monitoring postconstruction.
- Weed control treatments shall include all legally permitted herbicide, and manual and mechanical methods. The application of herbicides shall be in compliance with all state and federal laws and regulations under the prescription of a Pest Control Advisor and implemented by a Licensed Qualified Applicator.
- The timing of weed control treatment shall be determined for each plant species in consultation with USFWS with the goal of controlling populations before they start producing seeds.
- Surveying and monitoring of the identified and treated populations shall be required at all sites impacted by construction, and shall occur annually for years one to five and bi-annually for years six to ten.
- During project pre-construction and construction, vehicles and all equipment shall be washed (including wheels, undercarriages, and bumpers) prior to commencing work in off-road areas.

## 6.13 JURISDICTIONAL WATERS

**MM BIO-13a** Prior to the start of construction, the project proponent shall secure any required aquatic resources permits for impacts to jurisdictional waters of the U.S./State from the USACE, RWQCB, and CDFW, pursuant to Sections 404 and 401 of the Clean Water Act and Section 1600 of the Fish and Game Code and shall comply with all conditions of such permits including providing compensatory mitigation as required to achieve no net loss of wetlands or other waters.

Mitigation for potential impacts to jurisdictional waters shall consist of avoidance of preserved jurisdictional waters on or adjacent to the site. In the event such waters cannot be avoided, the project applicant shall obtain the appropriate permits and provide compensatory mitigation at a minimum of a 1:1 ratio. The type of mitigation shall be determined based upon the currently availability of mitigation options at the time of permitting.

- The Project shall be designed to avoid impacts to jurisdictional waters on and adjacent to the site. If jurisdictional waters cannot be avoided, prior to the start of construction, the Project applicant shall secure any required aquatic resources permits for impacts to jurisdictional waters of the U.S. and waters of the State from the USACE, Sacramento RWQCB, and CDFW, and shall comply with all conditions of such permits including providing compensatory mitigation as required to achieve no net loss of wetlands or other waters.

- For those waters of the U.S. and waters of the State and CDFW jurisdictional areas that are not avoided by Project construction, compensatory mitigation shall be provided. As approved by the Sacramento RWQCB and CDFW, the project applicant may purchase mitigation credits from an approved mitigation bank at a minimum 1:1 ratio or implement another method of mitigation satisfactory to the USACE, Sacramento RWQCB, and CDFW.

- Impacts shall also be minimized by the use of Best Management Practices to protect preserved waters of the U.S./State to ensure that water quality standards are not compromised in preserved wetlands and other waters within the watershed. These practices can include installing orange construction fencing buffers and straw wattles to keep fill from entering preserved/avoided wetlands and other waters, and other protective measures.

Project Code: 2024-0058045
Project Name: Upper Westside Project

March 05, 2024

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed, and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through IPaC by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)

(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at: https://www.fws.gov/sites/default/files/documents/endangered-species-consultation-handbook.pdf

**Migratory Birds**: In addition to responsibilities to protect threatened and endangered species under the Endangered Species Act (ESA), there are additional responsibilities under the Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act (BGEPA) to protect native birds from project-related impacts. Any activity, intentional or unintentional, resulting in take of migratory birds, including eagles, is prohibited unless otherwise permitted by the U.S. Fish and Wildlife Service (50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)). For more information regarding these Acts, see Migratory Bird Permit | What We Do | U.S. Fish & Wildlife Service (fws.gov).

The MBTA has no provision for allowing take of migratory birds that may be unintentionally killed or injured by otherwise lawful activities. It is the responsibility of the project proponent to comply with these Acts by identifying potential impacts to migratory birds and eagles within applicable NEPA documents (when there is a federal nexus) or a Bird/Eagle Conservation Plan (when there is no federal nexus). Proponents should implement conservation measures to avoid or minimize the production of project-related stressors or minimize the exposure of birds and their resources to the project-related stressors. For more information on avian stressors and recommended conservation measures, see https://www.fws.gov/library/collections/threats-birds.

In addition to MBTA and BGEPA, Executive Order 13186: *Responsibilities of Federal Agencies to Protect Migratory Birds*, obligates all Federal agencies that engage in or authorize activities that might affect migratory birds, to minimize those effects and encourage conservation measures that will improve bird populations. Executive Order 13186 provides for the protection of both migratory birds and migratory bird habitat. For information regarding the implementation of Executive Order 13186, please visit https://www.fws.gov/partner/council-conservation-migratory-birds.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Code in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

**Note:** IPaC has provided all available attachments because this project is in multiple field office jurisdictions.

- Bald & Golden Eagles
- Migratory Birds
- Wetlands

# OFFICIAL SPECIES LIST

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

**Sacramento Fish And Wildlife Office**
Federal Building
2800 Cottage Way, Room W-2605
Sacramento, CA 95825-1846
(916) 414-6600

This project's location is within the jurisdiction of multiple offices. However, only one species list document will be provided for all offices. The species and critical habitats in this document reflect the aggregation of those that fall in each of the affiliated office's jurisdiction. Other offices affiliated with the project:

**San Francisco Bay-Delta Fish And Wildlife**
650 Capitol Mall
Suite 8-300
Sacramento, CA 95814
(916) 930-5603

# PROJECT SUMMARY

Project Code: 2024-0058045
Project Name: Upper Westside Project
Project Type: Commercial Development
Project Description: Develop a specific plan for the Upper Westside Plan Area to support a master planned community to balance multiple land uses such as residential development and supporting infrastructure, agriculture, and conservation.

Project Location:

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@38.62203065,-121.54193793386312,14z

Counties: Sacramento County, California

# ENDANGERED SPECIES ACT SPECIES

There is a total of 9 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

## BIRDS

| NAME | STATUS |
|---|---|
| Least Bell's Vireo *Vireo bellii pusillus*<br>There is **final** critical habitat for this species. Your location does not overlap the critical habitat.<br>Species profile: https://ecos.fws.gov/ecp/species/5945 | Endangered |

## REPTILES

| NAME | STATUS |
|---|---|
| Giant Garter Snake *Thamnophis gigas*<br>No critical habitat has been designated for this species.<br>Species profile: https://ecos.fws.gov/ecp/species/4482 | Threatened |
| Northwestern Pond Turtle *Actinemys marmorata*<br>No critical habitat has been designated for this species.<br>Species profile: https://ecos.fws.gov/ecp/species/1111 | Proposed Threatened |

## AMPHIBIANS

| NAME | STATUS |
|---|---|
| California Tiger Salamander *Ambystoma californiense*<br>Population: U.S.A. (Central CA DPS)<br>There is **final** critical habitat for this species. Your location does not overlap the critical habitat.<br>Species profile: https://ecos.fws.gov/ecp/species/2076 | Threatened |
| Western Spadefoot *Spea hammondii*<br>No critical habitat has been designated for this species.<br>Species profile: https://ecos.fws.gov/ecp/species/5425 | Proposed Threatened |

## INSECTS

| NAME | STATUS |
|---|---|
| Monarch Butterfly *Danaus plexippus*<br>No critical habitat has been designated for this species.<br>Species profile: https://ecos.fws.gov/ecp/species/9743 | Candidate |
| Valley Elderberry Longhorn Beetle *Desmocerus californicus dimorphus*<br>There is **final** critical habitat for this species. Your location does not overlap the critical habitat.<br>Species profile: https://ecos.fws.gov/ecp/species/7850 | Threatened |

## CRUSTACEANS

| NAME | STATUS |
|---|---|
| Vernal Pool Fairy Shrimp *Branchinecta lynchi*<br>There is **final** critical habitat for this species. Your location does not overlap the critical habitat.<br>Species profile: https://ecos.fws.gov/ecp/species/498 | Threatened |
| Vernal Pool Tadpole Shrimp *Lepidurus packardi*<br>There is **final** critical habitat for this species. Your location does not overlap the critical habitat.<br>Species profile: https://ecos.fws.gov/ecp/species/2246 | Endangered |

## CRITICAL HABITATS

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

YOU ARE STILL REQUIRED TO DETERMINE IF YOUR PROJECT(S) MAY HAVE EFFECTS ON ALL ABOVE LISTED SPECIES.

# USFWS NATIONAL WILDLIFE REFUGE LANDS AND FISH HATCHERIES

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS OR FISH HATCHERIES WITHIN YOUR PROJECT AREA.

# BALD & GOLDEN EAGLES

Bald and golden eagles are protected under the Bald and Golden Eagle Protection Act[1] and the Migratory Bird Treaty Act[2].

Any person or organization who plans or conducts activities that may result in impacts to bald or golden eagles, or their habitats[3], should follow appropriate regulations and consider implementing appropriate conservation measures, as described in the links below. Specifically, please review the "Supplemental Information on Migratory Birds and Eagles".

---

1. The Bald and Golden Eagle Protection Act of 1940.
2. The Migratory Birds Treaty Act of 1918.
3. 50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)

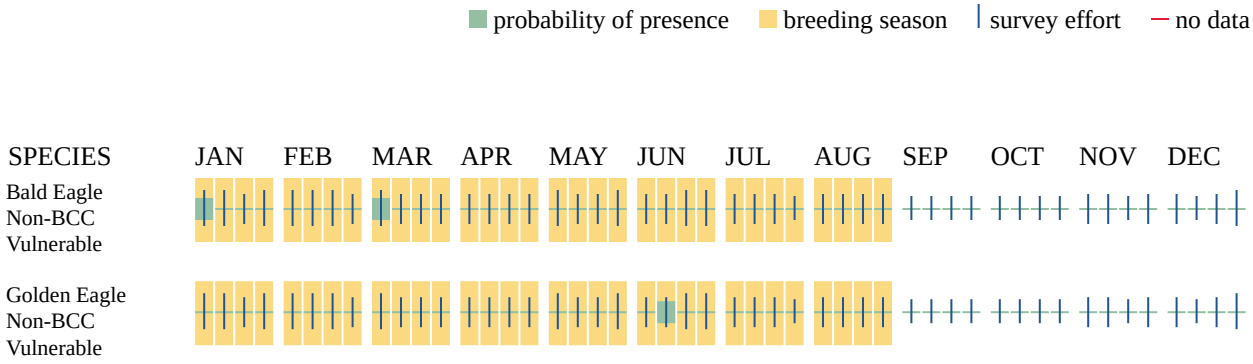
There are likely bald eagles present in your project area. For additional information on bald eagles, refer to Bald Eagle Nesting and Sensitivity to Human Activity

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, see the PROBABILITY OF PRESENCE SUMMARY below to see when these birds are most likely to be present and breeding in your project area.

| NAME | BREEDING SEASON |
|---|---|
| Bald Eagle *Haliaeetus leucocephalus*<br>This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.<br>https://ecos.fws.gov/ecp/species/1626 | Breeds Jan 1 to Aug 31 |
| Golden Eagle *Aquila chrysaetos*<br>This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.<br>https://ecos.fws.gov/ecp/species/1680 | Breeds Jan 1 to Aug 31 |

## PROBABILITY OF PRESENCE SUMMARY

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read "Supplemental Information on Migratory Birds and Eagles", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.



**Probability of Presence (■)**

Green bars; the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during that week of the year.

**Breeding Season** (▪)
Yellow bars; liberal estimate of the timeframe inside which the bird breeds across its entire range.

**Survey Effort** (|)
Vertical black lines; the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

**No Data** (–)
A week is marked as having no data if there were no survey events for that week.

Additional information can be found using the following links:

- Eagle Management https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds

- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

# MIGRATORY BIRDS

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats[3] should follow appropriate regulations and consider implementing appropriate conservation measures, as described in the links below. Specifically, please review the "Supplemental Information on Migratory Birds and Eagles".

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.
3. 50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, see the PROBABILITY OF PRESENCE SUMMARY below to see when these birds are most likely to be present and breeding in your project area.

| NAME | BREEDING SEASON |
|---|---|
| Bald Eagle *Haliaeetus leucocephalus*<br>This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.<br>https://ecos.fws.gov/ecp/species/1626 | Breeds Jan 1 to Aug 31 |
| Belding's Savannah Sparrow *Passerculus sandwichensis beldingi*<br>This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA<br>https://ecos.fws.gov/ecp/species/8 | Breeds Apr 1 to Aug 15 |

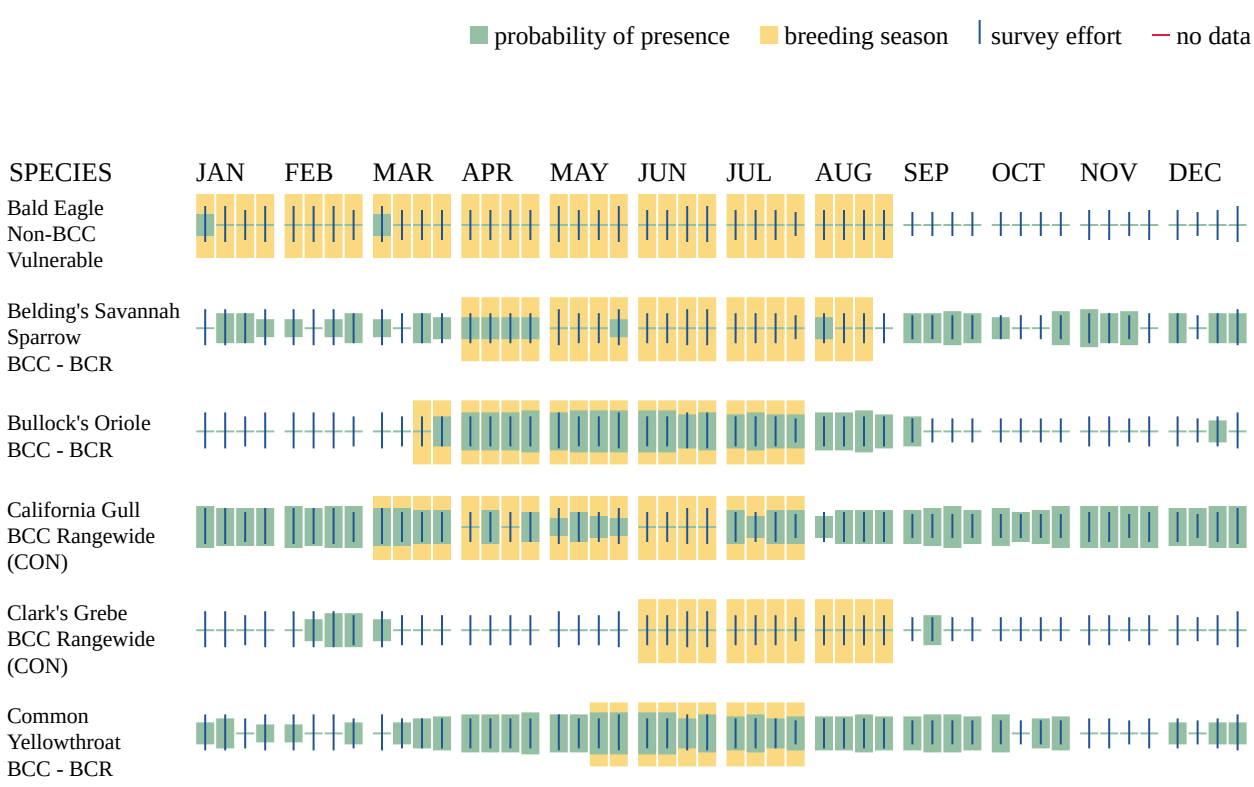
| Oak Titmouse *Baeolophus inornatus*<br>This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.<br>https://ecos.fws.gov/ecp/species/9656 | Breeds Mar 15 to Jul 15 |
| Olive-sided Flycatcher *Contopus cooperi*<br>This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.<br>https://ecos.fws.gov/ecp/species/3914 | Breeds May 20 to Aug 31 |
| Short-billed Dowitcher *Limnodromus griseus*<br>This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.<br>https://ecos.fws.gov/ecp/species/9480 | Breeds elsewhere |
| Tricolored Blackbird *Agelaius tricolor*<br>This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.<br>https://ecos.fws.gov/ecp/species/3910 | Breeds Mar 15 to Aug 10 |
| Western Grebe *aechmophorus occidentalis*<br>This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.<br>https://ecos.fws.gov/ecp/species/6743 | Breeds Jun 1 to Aug 31 |
| Willet *Tringa semipalmata*<br>This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.<br>https://ecos.fws.gov/ecp/species/10669 | Breeds elsewhere |
| Wrentit *Chamaea fasciata*<br>This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.<br>https://ecos.fws.gov/ecp/species/10668 | Breeds Mar 15 to Aug 10 |
| Yellow-billed Magpie *Pica nuttalli*<br>This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.<br>https://ecos.fws.gov/ecp/species/9726 | Breeds Apr 1 to Jul 31 |

# PROBABILITY OF PRESENCE SUMMARY

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read "Supplemental Information on Migratory Birds and Eagles", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.



**Probability of Presence** (■)

Green bars; the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during that week of the year.

**Breeding Season** (■)
Yellow bars; liberal estimate of the timeframe inside which the bird breeds across its entire range.

**Survey Effort** (|)
Vertical black lines; the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

**No Data** (–)
A week is marked as having no data if there were no survey events for that week.

# WETLANDS

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

Please note that the NWI data being shown may be out of date. We are currently working to update our NWI data set. We recommend you verify these results with a site visit to determine the actual extent of wetlands on site.

## Potential for Special-Status Species and Critical Habitats in the Region to Occur in the Project Site

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| **Plants** | | | |
| *Astragalus tener* var. *ferrisiae* Ferris' milk-vetch | --/--/1B.1 | An annual herb found in vernally mesic meadows and seeps, and subalkaline flats in valley and foothill grassland, from 2 to 75 meters elevation. Previously thought extinct and rediscovered in 1989; currently known from 13 locations in the Sacramento Valley. Blooms April to May (CNPS 2024). | **Will not occur.** There is no suitable wetland habitat, subalkaline flat or grassland habitat for this species on the Study Area. There is one record of this species within a 5-mile radius of the Study Area located 2.3 miles southwest of the Study Area (CDFW 2024). The record documents a non-specific area from 1954 (CDFW 2024). |
| *Astragalus tener* var. *tener* alkali milkvetch | --/--/1B.2 | An annual herb found in alkaline mesic habitats in playas, valley and foothill grassland (adobe clay soils), and vernal pools in the Central Valley from 1 to 60 meters elevation. Blooms March to June (CNPS 2024). | **Will not occur.** There is no suitable adobe soils or vernal pool habitat for this species on the Study Area. Soils in the Study Area are predominately neutral, but some soils range to slightly alkaline to acidic (NRCS 2024). There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Atriplex cordulata* var. *cordulata* heartscale | --/--/1B.2 | An annual herb found on saline or alkaline soils in chenopod scrub, meadows, seeps, sandy valley, and foothill grasslands from 0 to 560 meters elevation. Blooms April to October (CDFW 2024; CNPS 2024). | **Will not occur.** There is no suitable saline or alkaline soils or chenopod scrub habitat for this species on the Study Area. Soils in the Study Area are predominately neutral, but some soils range to slightly alkaline to acidic (NRCS 2024). There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Atriplex depressa* brittlescale | --/--/1B.2 | An annual herb found on alkaline, clay soils in chenopod scrub, meadows, seeps, playas, vernal pools, and valley and foothill grasslands from 1 to 320 meters elevation. Blooms April to October (CNPS 2024). | **Will not occur.** There is no suitable saline or alkaline soils or chenopod scrub habitat for this species on the Study Area. Soils in the Study Area are predominately neutral, but some soils range to slightly alkaline to acidic (NRCS 2024). There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Carex comosa* bristly sedge | --/--/2B.1 | A perennial rhizomatous herb found in coastal prairie, lake margins, and valley and foothill grassland in wet places from 0 to 625 meters elevation. Blooms May to September (CDFW 2024; CNPS 2024). | **Will not occur.** There is no suitable coastal prairie, lake margin or suitable mesic grassland habitat for this species on the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Centromadia parryi* ssp. *parryi* pappose tarplant | --/--/1B.1 | An annual herb found in alkaline habitats in valley and foothill grassland from 0 to 230 meters elevation. Blooms May to October (November) (CNPS 2024). | **Will not occur.** There is no suitable alkaline grassland habitat for this species on the Study Area. Soils in the Study Area are predominately neutral, but some soils range to slightly alkaline to acidic (NRCS 2024). here are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Chloropyron palmatum* palmate-bracted bird's-beak | FE/SE/1B.1 | An annual hemiparasitic herb found in alkaline wetlands in chenopod scrub, and valley and foothill grassland from 5 to 155 meters elevation in the Central Valley. Blooms May to October (CNPS 2024). | **Will not occur.** There is no suitable alkaline soil on chenopod scrub or suitable grassland habitat for this species on the Study Area. Soils in the Study Area are predominately neutral, but some soils range to slightly alkaline to acidic (NRCS 2024). There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Cuscuta obtusiflora* var. *glandulosa* Peruvian dodder | --/--/2B.2 | An annual parasitic vine found in freshwater marshes and swamps from 15 to 280 meters elevation. Known from 5 locations; last seen in 1948 in Merced County. Blooms July to October (CNPS 2024). | **Will not occur.** There is no suitable freshwater marsh or swamp habitat for this species on the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Downingia pusilla* dwarf downingia | --/--/2B.2 | An annual herb found in vernal pools and mesic microsites in valley and foothill grassland from 1 to 445 meters elevation. Blooms March to May (CNPS 2024). | **Will not occur.** There is no suitable vernal pool or mesic microsite habitat for this species on the Study Area. There is one record of this species within a 5-mile radius of the Study Area located 4.8 miles northeast of the Study Area. This record documents 50 plants observed in Northern Hardpan Vernal Pool habitat on private property in 1993 (CDFW 2024). |
| *Eryngium jepsonii* Jepson's coyote thistle | --/--/1B.2 | A perennial herb on clay soils in vernal pools and valley and foothill grassland from 3 to 300 meters elevation. Blooms April to August (CNPS 2024). | **Will not occur.** There is no suitable vernal pool or mesic microsite habitat over clay soil for this species on the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Extriplex joaquinana*<br>San Joaquin spearscale | --/--/1B.2 | An annual herb found in alkaline habitats in chenopod scrub, meadows and seeps, playas, and valley and foothill grassland from 1 to 835 meters elevation. Blooms April to October (CNPS 2024). | **Will not occur.** There is no suitable alkaline soil on chenopod scrub or suitable grassland habitat for this species on the Study Area. Soils in the Study Area are predominately neutral, but some soils range to slightly alkaline to acidic (NRCS 2024). There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Gratiola heterosepala*<br>Boggs Lake hedge-hyssop | --/SE/1B.2, NBHCP | An annual herb found on clay soils in marshes and swamps at lake margins, and in vernal pools from 10 to 2,375 meters elevation. Blooms April to August (CNPS 2024). | **Will not occur.** There is no suitable lake or vernal pool over clay soil for this species on the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Hibiscus lasiocarpos* var. *occidentalis* woolly rose-mallow | --/--/1B.2 | A perennial rhizomatous emergent herb found in freshwater marshes and swamps from 0 to 120 meters elevation, often in riprap along levees. Blooms June to September (CNPS 2024). | **Not expected.** Suitable habitat is present in agricultural ditches and canals that occur throughout the Study Area which may provide suitable wetland habitat for this species. This species was not detected during multiple rounds of botanical surveys conducted during 2019 and 2020 of accessible areas during the blooming period for this species (Bargas 2020). There are two records of this species within a 5-mile radius of the Study Area. The nearest CNDDB occurrence is located on the eastern portion of the Study Area along Interstate 80 at the W El Camino Avenue off ramp. This record documents two plants observed in a ditch lacking freshwater marsh habitat and documented with upland non-wetland vegetation. CDFW ranks the record as poor, which was documented by Caltrans in 1988 (CDFW 2024). |
| *Lasthenia chrysantha* alkali-sink goldfields | --/--/1B.1 | An annual herb found in alkaline vernal pools and wet saline flats from below 200 meters elevation. Blooms February to April (Jepson Flora Project 2024; CDFW 2024). | **Will not occur.** There is no suitable vernal pool or saline flats for this species on the Study Area. Soils in the Study Area are predominately neutral, but some soils range to slightly alkaline to acidic (NRCS 2024). There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Lathyurus jepsonii* Delta tule pea | --/--/1B.2, NBHCP | A perennial herb found in freshwater and brackish marshes from 0 to 5 meters elevation. Blooms May to July (September) (CNPS 2024). | **Will not occur.** There is no suitable freshwater marsh brackish habitat for this species on the Study Area and the Study Area is outside of this species' known range in the Delta. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Legenere limosa* legenere | --/--/1B.1, NBHCP | An annual herb found in vernal pools from 1 to 880 meters elevation. Blooms April to June (CNPS 2024). | **Will not occur.** There is no suitable vernal pool habitat for this species on the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Lepidium latipes* var. *heckardii* Heckard's pepper-grass | --/--/1B.2 | An annual herb found on alkaline flats in vernal pools and valley and foothill grasslands from 2 to 200 meters elevation. Blooms March to May (CDFW 2024; CNPS 2024). | **Will not occur.** There is no suitable alkaline soil or vernal pool habitat for this species on the Study Area. Soils in the Study Area are predominately neutral, but some soils range to slightly alkaline to acidic (NRCS 2024). There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Lilaeopsis masonii* Mason's lilaeopsis | --/SR/1B.1 | A perennial rhizomatous herb found in tidal zones of marshes, swamps, and riparian scrub from 0 to 10 meters elevation. Range is restricted to the Delta, Suisun Bay, and San Pablo Bay. Typically occurs in muddy or silty soil formed through river deposition. Blooms April to November (CDFW 2024; CNPS 2024). | **Will not occur.** The Study Area is outside of the extant range of this species. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Myosurus minimus* ssp. *apus* little mousetail | --/--/3.1 | An annual herb found in alkaline vernal pools in valley and foothill grassland from 20 to 640 meters elevation. Blooms March to June (CNPS 2024). | **Will not occur.** There is no suitable vernal pool or alkaline soil for this species on the Study Area. Soils in the Study Area are predominately neutral, but some soils range to slightly alkaline to acidic (NRCS 2024). There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Navarretia leucocephala* ssp. *bakeri* Baker's navarretia | --/--/1B.1 | An annual herb found in mesic meadows and vernal pools in cismontane woodland, lower montane coniferous forest, and valley and foothill grassland from 5 to 1,740 meters elevation. Blooms April to July (CNPS 2024). | **Will not occur.** There is no suitable mesic habitat in suitable woodlands or grasslands. Woodland and grassland habitats in the Study Area are disturbed and better described as ruderal that occur along roadsides, private residences or levees. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Neostapfia colusana* Colusa grass | FT/SE/1B.1, NBHCP | An annual herb found in the bottoms of large, deep vernal pools, typically on adobe substrate, from 5 to 200 meters elevation. Blooms May to August (CNPS 2024). | **Will not occur.** There is no suitable vernal pool or adobe clay soil for this species on the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Orcuttia tenuis* slender Orcutt grass | FT/SE/1B.1, NBHCP | An annual herb found in vernal pools from 35 to 1,760 meters elevation. Blooms May to October (CNPS 2024). | **Will not occur.** There is no suitable vernal pool habitat for this species on the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Orcuttia viscida*<br>Sacramento Orcutt grass | FE/SE/1B.1, NBHCP | An annual herb found in vernal pools from 30 to 100 meters in elevation. Currently known to occur in Sacramento county. Elevation: 30 to 100 m amsl. Flowering period April to July (September) (CNPS 2024). | **Will not occur.** There is no suitable vernal pool habitat for this species on the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Plagiobothrys hystriculus*<br>bearded popcornflower | --/--/1B.1 | An annual herb found in mesic valley and foothill grassland, and along the margins of vernal pools and vernal swales from 0 to 274 meters elevation. Blooms April to May (CNPS 2024). | **Will not occur.** There is no suitable vernal pool or suitable mesic grassland habitat for this species on the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Puccinellia simplex*<br>California alkali grass | --/--/1B.2 | An annual herb found in alkaline, vernally mesic sinks, flats, and lake margins in chenopod scrub, meadows, seeps, vernal pools, and valley and foothill grasslands from 2 to 930 meters elevation. Blooms March to May (CNPS 2024). | **Will not occur.** There is no suitable alkaline soil, vernal pool or other suitable wetland or grassland habitat for this species on the Study Area. Soils in the Study Area are predominately neutral, but some soils range to slightly alkaline to acidic (NRCS 2024). There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Sagittaria sanfordii*<br>Sanford's arrowhead | --/--/1B.2, NBHCP | A perennial rhizomatous herb found in marshes, swamps, and assorted shallow freshwater habitats that include ditches from 0 to 650 meters elevation. Blooms May to October (November) (CNPS 2024). | **Not expected.** Suitable habitat is present in agricultural ditches and canals that occur throughout the Study Area which may provide suitable wetland habitat for this species. This species was not detected during multiple rounds of botanical surveys conducted during 2019 and 2020 of accessible areas during the blooming period for this species (Bargas 2020). There are three CNDDB reported occurrences within a 5-mile radius of the Study Area. The nearest record documents this species 3.1 miles east of the Study Area. This record documents two populations documented in Arcade Creek and a shallow ditch which was observed in 2011 (CDFW 2024). |
| *Sidalcea keckii*<br>Keck's checker mallow | FE/--/1B.1 | An annual herb found in cismontane woodland and valley and foothill grassland, often in serpentinite and clay soils, from 75 to 650 meters elevation. Blooms April to May (June) (CNPS 2024). | **Will not occur.** There is no suitable clay or serpentinite soil habitat for this species on the Study Area. The Study Area is below the elevational range of this species. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Symphyotrichum lentum*<br>Suisun Marsh aster | --/--/1B.2 | A perennial rhizomatous herb found in freshwater and brackish marsh from 0 to 3 meters elevation. Blooms May to November (CNPS 2024). | **Will not occur.** There is no suitable freshwater marsh or brackish marsh habitat for this species. Freshwater habitat is limited to agricultural ditches and canals. There is one CNDDB within a 5-mile radius of the Study Area. The record documents this species 4.1 miles southwest of the Study Area at the southwest end of Green Lake (CDFW 2024). The record documents an observation of this species in 2005 and 2013, which needs to be studied further to determine whether this is Suisun Marsh aster (CDFW 2024). |
| *Trifolium hydrophilum*<br>saline clover | --/--/1B.2 | An annual herb found in marshes, swamps, mesic alkaline valley and foothill grassland, and vernal pools from 0–- 300 meters elevation. Blooms April to June (CNPS 2024). | **Will not occur.** There is no suitable marsh or wetland or suitable mesic grassland habitat for this species on the Study Area. Soils in the Study Area are predominately neutral, but some soils range to slightly alkaline to acidic (NRCS 2024). There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Tuctoria mucronata*<br>Crampton's tuctoria or Solano grass | FE/SE/1B.1 | An annual herb found on mesic soils in vernal pools, and valley and foothill grasslands from 5 to 10 meters elevation. Blooms April to August (CNPS 2024). | **Will not occur.** There is no suitable vernal pool or other suitable wetland or grassland habitat for this species on the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| **Animals** | | | |
| **Invertebrates** | | | |
| *Bombus crotchii* crotch bumble bee | --/SCE/-- | Crotch bumble bee occurs in grassland and scrub habitats (California Department of Fish and Wildlife [CDFW] 2019). New colonies are initiated by solitary queens, generally in the early spring, which typically occupy abandoned rodent burrows (CDFW 2019). This species is a generalist forager and has been reported visiting a wide variety of flowering plants. A short-tongued bumble bee; food plants include *Asclepias* spp., *Antirrhinum* spp., *Clarkia* spp., *Eschscholzia* spp., *Eriogonum* spp., *Chaenactis* spp., *Lupinus* spp., *Medicago* spp., *Phacelia* spp., and *Salvia* spp. (Koch *et al.* 2012). The flight period for queens in California is from February to October. New queens hibernate over the winter and initiate a new colony the following spring. Rare throughout its range and in decline in the Central Valley and southern California (CDFW 2019). The most current known range of this species follows a small strip from western Trinity County south to Tehama County and along the entire Central Valley and coast south of Monterey to the southernmost portions of the State. The range is generally bound on the east by the high Sierra Nevada range and areas east of Bishop, Ridgecrest, and the Salton Sea (CDFW 2023). | **Will not occur.** Suitable grassland habitat is not present in the Study Area. The Study Area has been managed for agriculture for over 100 years and has been subjected to use of herbicides and pesticides which are one of the leading causes for decline in bumble bees. Additionally, constant disturbance of soil from agricultural uses is not suitable for underground bee colonies and overwintering queens, which is further exacerbated by fragmented habitat (CDFW 2019). There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Bombus occidentalis* western bumble bee | --/SCE/-- | Bumble bees are primitively eusocial insects that live in underground colonies made up of one queen, female workers, and reproductive members of the colony. New colonies are initiated by solitary queens, generally in the early spring, which typically occupy abandoned rodent burrows (Thorp *et al.* 1983). This species occurs in meadows and grasslands with an abundance of floral resources (CDFW 2019). This species is a generalist forager and have been reported visiting a wide variety of flowering plants. A short-tongued bumble bee; select food plants include *Melilotus* spp., *Cirsium* spp., *Trifolium* spp., *Centaurea* spp., *Eriogonum* spp., and *Chrysothamnus* spp. (Koch *et al.* 2012). This species has a short tongue and typically prefers open flowers with short corollas but is known to chew through the base of flowers with long corollas. The flight period for queens in California is from early February to late November, peaking in late June and late September. New queens hibernate over the winter and initiate a new colony the following spring (Thorp *et al.* 1983). Rare throughout its range and in decline west of the Sierra Nevada crest. The most current known range of this species is limited to areas near the Klamath and northern Coast Range mountains as well as mountain areas in Shasta, Plumas, Sierra, Nevada, Placer, El Dorado, Lassen, Amador, Alpine, and Calaveras counties CDFW 2023). | **Will not occur.** Suitable habitat is not present in the Study Area and the Study Area is outside of this species current known range. The Study Area consists almost entirely of agricultural lands, developed lands and other isolated native habitats. The Study Area has been managed for agriculture for over 100 years and has been subjected to use of herbicides and pesticides which are one of the leading causes for decline in bumble bees. Additionally, constant disturbance of soil from agricultural uses is not suitable for underground bee colonies and overwintering queens, which is further exacerbated by fragmented habitat (CDFW 2019). There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Branchinecta conservatio* Conservancy fairy shrimp | FE/--/-- | Occupies large clay bottomed vernal pools to vernal lakes with turbid water in grasslands. The historical distribution of this species is unknown and it is currently distributed throughout the Central Valley and southern coastal regions of California (USFWS 2005). | **Will not occur.** Suitable aquatic habitat is not present in the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Branchinecta lynchi* vernal pool fairy shrimp | FT/--/-- | Vernal pools ranging from small, clear, sandstone rock pools to large, turbid, alkaline, grassland valley floor pools. It is most frequently found in pools measuring less than 0.05 acre; although has been collected from vernal pools exceeding 25 acres. The known range within California includes the Central Valley and southern California (USFWS 2005). | **Will not occur.** Suitable aquatic habitat is not present in the Study Area. There are four CNDDB reported occurrences for this species with the closest occurrence documented three miles east of the Study Area along railroad tracks. This record documents a 1995 observation of this species in a long and narrow wetland (CDFW 2024). |
| *Branchinecta mesovallensis* mid-valley fairy shrimp | --/--/NBHCP | Occurs in a variety of seasonally inundated habitats, especially shallower pools and swales. | **Will not occur.** Suitable aquatic habitat is not present in the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Danaus plexippus* pop. 1 monarch - California overwintering population | FCE/--/-- | The federal listing on December 17, 2020 was for overwintering populations of Monarch butterflies that roost in wind protected tree groves, especially with Eucalyptus sp., and species of pine or cypress with nectar and water sources nearby. Winter roost sites extend along the coast from Mendocino County to Baja California. As caterpillars, monarchs feed exclusively on the leaves of milkweed (Asclepias sp.; Nial *et al.* 2019 and USFWS 2020). Monarch butterfly migration routes pass east over the Sierra Nevada in the fall and back to the California coast in the spring. The overwintering population is located along the Coast while summer breeding areas occur in interior California and North America with spring breeding areas located further east (USFWS 2020). | **Will not occur.** Suitable overwintering habitat or larval food plants are not present in the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Desmocerus californicus dimorphus* valley elderberry longhorn beetle | FT/--/NBHCP | Endemic to elderberry shrubs (*Sambucus* spp.) occurring in riparian habitat in the Sacramento and San Joaquin Valleys, riparian habitats in the Sacramento and San Joaquin Valleys, and less common throughout riparian forests of the Central Valley from Redding to Fresno County (USFWS 2014) typically below 152 meters elevation (USFWS 2017a). | **Not expected.** This species could occur on elderberry shrubs in the Study Area, especially along riparian forests, such as valley oak woodland along the Sacramento River, which is contiguous with known observations of this species. Observations of this species in the CNDDB are abundant in the region with the nearest CNDDB occurrence located 0.3-mile northwest of the Study Area in riparian forest along the Sacramento River. This CNDDB record dates to 1985 and documents two exit holes on an elderberry shrub (CDFW 2024). |
| *Lepidurus packardi* vernal pool tadpole shrimp | FE/--/-- | Occurs in vernal pools from 54 square feet to 89 acres, containing clear- to highly-turbid water. It's known range is within the Central Valley of California and in the San Francisco Bay area (USFWS 2005). | **Will not occur.** Suitable aquatic habitat is not present in the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| **Fishes** | | | |
| *Acipenser medirostris* pop. 1 green sturgeon southern DPS | FT/--/-- | Spawn in freshwater streams, in fast, deep water, over gravel, cobble, or boulders. Juveniles inhabit estuarine waters for 1-4 years until dispersing into coastal marine waters as adults. Adults return to spawn in fresh water every 6-10 years. Sacramento River watershed, including the Feather River, is the only known historical and present spawning areas for green sturgeon (NMFS 2018). | **Will not occur.** Suitable aquatic habitat is not present in the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Archoplites interruptus* Sacramento perch | --/--/SSC | Extinct in its native range, all known populations of this species are the result of introductions. The species is adapted for life in sloughs, slow moving rivers, and large lakes in the Central Valley, and can tolerate high temperatures and salinities as well as high pH (alkalinity). Extant populations are in reservoirs; the species has been replaced in its native range by introduced game fishes (Crain and Moyle 2011). | **Will not occur.** Suitable aquatic habitat is not present in the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Hypomesus transpacificus* Delta smelt | FT/SE/-- | Delta smelt are tolerant of a wide salinity range. They have been collected from estuarine waters up to 14 ppt (parts per thousand) salinity. For a large part of their one-year life span, delta smelt live along the freshwater edge of the mixing zone (saltwater-freshwater interface), where the salinity is approximately 2 ppt. Shortly before spawning, adults migrate upstream from the brackish-water habitat associated with the mixing zone and disperse into river channels and tidally-influenced backwater sloughs. They spawn in shallow, fresh or slightly brackish water upstream of the mixing zone. Most spawning happens in tidally-influenced backwater sloughs and channel edge-waters. Although spawning has not been observed in the wild, the eggs are thought to attach to substrates such as cattails, bulrush, tree roots and submerged branches. Delta smelt are found only from the Suisun Bay upstream through the Delta in Contra Costa, Sacramento, San Joaquin, Solano and Yolo counties (USFWS 2017b). | **Will not occur.** Suitable aquatic habitat is not present in the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Oncorhynchus mykiss* pop. 11 Central Valley steelhead DPS | FT/--/-- | This distinct population segment includes all naturally spawned anadromous steelhead populations below natural and manmade impassable barriers in the Sacramento and San Joaquin Rivers and their tributaries, excluding steelhead from San Francisco and San Pablo Bays and their tributaries, as well as two artificial propagation programs: the Coleman NFH, and Feather River Hatchery steelhead hatchery programs. Steelhead spawn in rivers and streams with cool, clear, water and suitable silt free substrate (NMFS 2016). | **Will not occur.** Suitable aquatic habitat is not present in the Study Area. This species is known to migrate through the Sacramento River adjacent to the Study Area (CDFW 2024). |
| *Oncorhynchus tshawytscha* pop. 11 Central Valley chinook salmon spring-run ESU | FT/ST/-- | Central Valley spring-run Chinook salmon spawn in rivers and streams with cool, clear, water and suitable cobble and gravel substrate. Historically occurred in all major rivers and tributaries of the Central Valley. Spawning is currently located in tributary streams of the Sacramento River. Immigration of adults through the Delta and lower Sacramento River occurs from March through September. Spawning occurs between late-August through October (NMFS 2014). | **Will not occur.** Suitable aquatic habitat is not present in the Study Area. This species is known to migrate through the Sacramento River adjacent to the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Oncorhynchus tshawytscha* pop. 7 Sacramento River chinook salmon winter-run ESU | FE/SE/-- | Chinook salmon spawn in rivers and streams with cool, clear, water and suitable cobble and gravel substrate. Immigration of adults through the Delta and lower Sacramento River occurs from December through July. Spawning is currently limited to the Sacramento River downstream of Keswick Dam and upstream of the Red Bluff Diversion and the lower reaches of Battle Creek. Spawning occurs between late-April through mid-August (NMFS 2014). | **Will not occur.** Suitable aquatic habitat is not present in the Study Area. This species is known to migrate through the Sacramento River adjacent to the Study Area (CDFW 2024). |
| *Pogonichthys macrolepitodus* Sacramento splittail | --/--/SSC | Endemic to the Central Valley. They occur below the Red Bluff Diversion Dam in Tehama County to the downstream reaches of the Sacramento and American Rivers. They also occur in the lower reaches of the Feather, Merced, Tuolumne River and the San Joaquin Rivers. This species is largely confined to the Delta, Suisun Bay, Suisun Marsh, Napa River, Petaluma River, and Sacramento-San Joaquin estuary. This species occurs predominantly in freshwater estuarine systems and prefers low-salinity, shallow-water habitats. Occurs in slow-moving sections of rivers, sloughs, and marshes. Species abundance is strongly tied to outflows because spawning occurs over flooded vegetation (Moyle *et al* 2015). | **Will not occur.** Suitable aquatic habitat is not present in the Study Area. |
| *Spirinchus thaleichthys* longfin smelt | FC/ST/-- | The longfin smelt is a pelagic estuarine fish that spawns in freshwater and then moves downstream to brackish water to rear. They usually live for 2 years, spawn, and then die, although some individuals may spawn as 1- or 3-year-old fish before dying. Longfin smelt in the Bay-Delta may spawn as early as November and as late as June, although spawning typically occurs from January to April. The specific spawning substrate remains unknown (USFWS 2022). The known range of the longfin smelt extends from the San Francisco Bay-Delta in California northward to Alaska. Longfin smelt have been observed in their winter and spring spawning period as far upstream as Colusa State Park in the Sacramento River, the City of Lathrop in the San Joaquin River system, Hog Slough off the South-Fork Mokelumne River, and in the South Delta near Old River south of Indian Slough (USFWS 2022). | **Will not occur.** Suitable aquatic habitat is not present in the Study Area. This species is known to migrate through the Sacramento River adjacent to the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| **Amphibians** | | | |
| *Ambystoma californiense* California tiger salamander | FT/ST/NBHCP | California tiger salamanders are generally restricted to vernal pools and seasonal ponds, including many constructed stock ponds, in grassland and oak savannah plant communities from sea level to about 1,500 feet in central California. This species spends the majority of its life in upland areas in the vicinity of suitable breeding ponds, where it inhabits rodent burrows. In order to provide suitable habitat for this species, suitable breeding habitat must be present in combination with suitable upland habitat. In the Coastal region, populations are scattered from Sonoma County in the northern San Francisco Bay Area to Santa Barbara County, and in the Central Valley and Sierra Nevada foothills from Yolo to Kern counties (USFWS 2017c). | **Will not occur.** Suitable aquatic breeding habitat and adjacent upland habitat is not present in the Study Area for this species. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Spea hammondii* western spadefoot | --/--/SSC, NBHCP | Amphibian that breeds in vernal pools and seasonal ponds or slow portions of streams in grasslands and woodlands. Adults spend most of their time in underground burrows in grasslands surrounding breeding pools (Jennings and Hayes 1994). Breeding is typically finished by the end of March. Tadpoles mature through late-spring and disperse as pools dry (Zeiner *et al.* 1990). | **Will not occur.** Suitable aquatic breeding habitat and adjacent upland habitat is not present in the Study Area for this species. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| **Reptiles** | | | |
| *Actinemys (=Emys) marmorata* western pond turtle | FPT/--/SSC, NBHCP | Turtle that inhabits slow-moving water with dense submerged vegetation, abundant basking sites, gently sloping banks, and dry clay or silt soils in nearby uplands. Turtles will lay eggs up to 0.25-mile from water, but typically go no more than 600 feet (Jennings and Hayes 1994). This species is known to regularly overwinter on land (Ultsch 2006), which it likely does to avoid increased flows during the winter (Thomson *et al.* 2016). This species will use a variety of habitats to overwinter, but typically uses areas above the ordinary high water mark where it burrows into loose soil and/or under leaf litter. Other nonriverine habitats that experience little water level fluctuation, this species may overwinter under water (Thomson *et al.* 2016). | **May occur.** Suitable habitat is present for this species along canals and ditches in the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Thamnophis gigas* giant garter snake | FT/ST/NBHCP | Endemic to the San Joaquin and Sacramento Valley floors. Inhabits agricultural wetlands and other waterways such as irrigation and drainage canals, sloughs, ponds, small lakes, low gradient streams, and adjacent uplands. Requires adequate water during its active season (early spring through mid-fall) to provide food and cover, emergent, herbaceous wetland vegetation for foraging and cover, grassy banks and openings in waterside vegetation for basking, and higher elevation uplands for cover and refuge from flood waters during its dormant season (winter). Inhabits small mammal burrows and other soil crevices with sunny exposure along south and west facing slopes, above prevailing flood elevations when dormant. Primarily found in marshes and sloughs as well as slow-moving creeks but absent from large rivers (USFWS 2017d). | **Present.** Suitable aquatic habitat that is inundated during the active season for this species is present in agricultural ditches and canals that occur throughout the Study Area. Additionally, upland habitat is present in areas adjacent to ditches and there are known occurrences of this species in and around the Study Area. This species is documented within the Study Area in West Drainage Canal and is also well documented in areas surrounding the Study Area. The CNDDB occurrence within the Study Area documents the presence of this species in Fisherman's Lake and West Drainage Canal in 2016 (CDFW 2024). Protocol surveys that included trapping did not detect this species in the Study Area; however, eDNA sampling did test positive in ditches surrounding the Study Area which implies this species is present (Bargas 2020, Hansen 2019). |
| **Birds** | | | |
| *Accipiter cooperii* Cooper's hawk | --/--/WL | Nests in woodlands and urban trees. Preys on medium-sized birds and small mammals. Forages in open woodland and habitat edges (Zeiner *et al.* 1990). | **Present.** Suitable habitat is present for this species in the Study Area. This species could nest in trees throughout the Study Area and forage in forested areas along the Sacramento River, agricultural crops, fallowed fields or ruderal areas in the Study Area or in other adjacent habitats. This species was observed on March 7, 2023, during the site visit. There are two CNDDB reported occurrences for this |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| | | | species within a 5-mile radius of the Study Area. The nearest CNNDB reported occurrence is located approximately 3.9 miles south of the Study Area. This record documents a nest from 2008 in the City of Sacramento (CDFW 2024). |
| *Agelaius tricolor* tricolored blackbird | --/ST/SSC, NBHCP | Common locally throughout central California. Nests and seeks cover in emergent wetland vegetation and thorny vegetation such as Himalayan blackberry (*Rubus armeniacus*) as well as cattails and tules. Nesting area must be large enough to support a minimum colony of 50 pairs as they are a highly colonial species. Forages on ground in croplands, grassy fields, flooded land, and edges of ponds for insects (Shuford and Gardali 2008). | **May occur.** Nesting habitat for this species is present in the Study Area along ditches that supports trees, blackberry brambles and other emergent vegetation in ditches and canals. This species could also forage in the Study Area as they are known to forage in agricultural fields up to four miles from nesting sites. There are several CNDDB reported occurrences within a 5-mile radius of the Study Area. The nearest CNDDB reported occurrence is located approximately 1.8 miles northeast of the Study Area and documents an extirpated nesting colony from 1992 (CDFW 2024). |
| *Ammodramus savannarum* grasshopper sparrow | --/--/SSC | A summer resident of foothills and lowlands west of the Cascade-Sierra Nevada crest. Occurs in grasslands with scattered shrubs or other tall structures which it utilizes as singing perches. Nests on the ground in dense grass with overhanging taller grasses and forbs (Zeiner *et al.* 1990). | **Will not occur.** Suitable grassland habitat for this species is absent from the Study Area. Herbaceous habitats in the Study Area consist of agricultural crops and ruderal fields subject to constant and regular disturbance. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Athene cunicularia*<br>burrowing owl | --/--/SSC, NBHCP | Forages in grasslands, agricultural fields, and disturbed places where burrowing mammals are abundant with low and sparse vegetation. Nests in burrows, especially those of California ground squirrel, but will use other refuge sites (*Otospermophilus beecheyi*; Shuford and Gardali 2008). In the Central Valley of California, most foraging occurs within a 600-m radius of the nest (Gervais *et al.* 2003). | **May occur.** Suitable habitat is present for burrowing owl in the Study Area in ruderal or fallowed fields and along the banks of ditches, canals, and levees especially where small mammal burrows are present. But burrowing owl may also use other refuge sites such as abandoned irrigation pipes or other similar structures. CNDDB records for burrowing owl in the region are abundant with the nearest record located approximately 0.2 mile east of the Study Area. This record documents a wintering owl along a drainage ditch in 1991; however, this site is likely extirpated since the area has been developed (CDFW 2024). |
| *Branta hutchinsii leucopareia*<br>Aleutian cackling goose | --/--/NBHCP | This species may winter in the Study Area; however, the Study Area is outside of its breeding range. Cackling geese breed across a broad range of subarctic and arctic habitats in Canada and Alaska. Individual and/or semi-colonial nests are located in remote areas that provide a clear view in all directions but in the proximity of permanent water (e.g., lakes, ponds, larger streams, marshes, muskegs, and wet hummocky areas). Breeding habitat consists of tundra on grass-covered islands that are inaccessible to mammalian predators. Aleutian cackling geese nest on the Aleutian Islands, often on steep grassy slopes. Primary foraging wintering habitats are harvested cornfields, winter wheat, alfalfa, and irrigated pasture grasses (Dahl 1995). Roosting habitats are shallowly flooded agricultural lands or seasonal wetlands. | **Will not occur.** Suitable foraging habitat is present in the Study Area for this species; however, this species does not nest in California. This species has not been detected in the Natomas Basin since 2004 (ICF 2020) or by Bargas (Bargas 2019, 2020). There are no CNDDB reported occurrences for this species within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Buteo regalis* ferruginous hawk | --/--/WL (wintering) | Found in arid and semi-arid open grasslands, sagebrush flats, desert scrub, low foothills and areas of pinyon and juniper habitat. Ferruginous hawks' nest in trees, large shrubs, utility poles and occasionally on the ground near river cut banks, but this species does not nest in California near the Study Area. Preys upon ground squirrels, rabbits, mice, and gophers. (Dechant *et al.* 1999). | **Not expected.** This species is a winter migrant and will not nest in the Study Area. However, this species could disperse through the Study Area moving between suitable foraging habitat. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Buteo swainsoni* Swainson's hawk | --/ST/NBHCP | Swainson's hawk breeds in stands with few trees in juniper-sage flats, riparian areas, and in oak savannah in the Central Valley and forages in adjacent grasslands or suitable grain or alfalfa fields, or livestock pastures. Breeds in California and winters in Mexico and South America. Swainson's hawks usually arrive in the Central Valley between March 1 and April 1 and migrate south between September and October. Swainson's hawks usually nest in trees adjacent to suitable foraging habitat (CDFW 2016), but may travel as far as 9.3 miles when foraging on adjacent lands is limited (Babcock 1995). Swainson's hawk nests are usually located in trees near the edges of riparian stands, in lone trees or groves of trees in agricultural fields, and in mature roadside trees. Mature oak and riparian trees are the most used nest trees, typically associated with high quality foraging habitat (CDFW 2016). Suitable foraging areas for Swainson's hawk include native grasslands or lightly grazed pastures, alfalfa and other hay crops, idle land, certain grain and row croplands, and ruderal lands. Swainson's hawks primarily feed on voles; but will take a variety of prey including small mammals, birds, and insects (CDFW 1994). | **High.** Suitable habitat is present for this species in the Study Area. This species could nest in trees throughout the Study Area and forage in agricultural crops, fallowed fields or ruderal areas in the Study Area or in adjacent habitats. There are several CNDDB reported occurrences for this species within a 5-mile radius of the Study Area and this species is well documented as nesting and foraging in the Study Area and in the region. There are five documented CNDDB reported occurrences of this species nesting on the Study Area. Three records document nesting activity in cottonwoods and oak trees in 1992 and 1993; one historic record and one recent record document this species in valley oak woodland along the Sacramento River on the Western side of the Study Area; and the last record in the Study Area is an extirpated nest along San Juan Road from 2003 (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Circus hudsonius*<br>northern harrier | --/--/SSC | Inhabits a variety of treeless habitats including freshwater marsh, brackish- and saltwater marsh, wet meadows, lake margins, grasslands, croplands, desert sinks, and sagebrush flats. Builds nests on large mounds of vegetation between March and August. Forages in most open habitats (Shuford and Gardali 2008). | **Present.** Suitable habitat is present for this species to nest along canals and ditches. This species did not show up during the species query search, indicating there are no documented occurrences of this species within a 5-mile radius of the Study Area. However, this species has been observed foraging in the Study Area (Bargas 2019; 2021). |
| *Charadrius montanus*<br>mountain plover | --/--/SSC | A winter resident of the Central Valley, southern deserts, and southern coast, as well as Texas, Arizona, and northern Mexico; does not breed in California. Found in places with sparse, low-growing vegetation such as fallow or burned agricultural fields, heavily grazed pastures, and playas (Shuford and Gardali 2008). | **Not expected.** This species is a winter migrant and will not nest in the Study Area. However, this species could disperse through the Study Area moving between suitable foraging habitat. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Charadrius nivosus nivosus*<br>western snowy plover | FT/--/SSC | Federal listing applies only to coastal populations that nest on sand beaches above the high tide line. Interior populations nest on barren to sparsely vegetated flats along the shores of lakes, braided river systems, salt ponds, and agricultural sumps. Adults feed on insects and brine shrimp (Shuford and Garaldi 2008). | **Will not occur.** Suitable nesting habitat is not present in the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Coccyzus americanus occidentalis*<br>western yellow-billed cuckoo | FT/SE/-- | Occurs at isolated sites in Sacramento Valley in northern California, and along Kern and Colorado River systems in southern California. Frequents valley foothill and desert riparian habitats dominated by willows. Inhabits riparian habitats with dense understory foliage along river bottoms or other mesic habitats with high humidity. Prefers dense willows for roosting but will use adjacent orchard in the Sacramento Valley. Typically requires expansive riparian habitat for nesting (Zeiner *et al.* 1990). | **Will not occur**. Suitable expansive riparian forest required for nesting is not present in the Study Area. Small areas of valley oak woodland adjacent to the Sacramento River are developed in their understory and are unlikely to provide habitat for this species. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Elanus leucurus*<br>white-tailed kite | --/--/FP | Raptor that inhabits rolling foothills and valley margins with scattered oaks, as well as river bottomlands or marshes next to deciduous woodland. Nests in isolated, dense-topped trees in open areas. Forages in a variety of habitats including grassland, marshes, and agricultural fields (Zeiner *et al.* 1990). | **High.** Suitable habitat is present for this species in the Study Area. This species could nest in trees throughout the Study Area and forage in agricultural crops, fallowed fields or ruderal areas in the Study Area or in adjacent habitats. There are several CNDDB reported occurrences for this species within a 5-mile radius of the Study Area. The nearest CNNDB reported occurrence is located approximately 2.6 miles south of the Study Area, which documents a nest from 2017 in a large oak tree in a residential neighborhood (CDFW 2024). |
| *Falco columbarius*<br>merlin | --/--/WL<br>(wintering) | An uncommon winter migrant in California; breeds in Alaska and Canada. Uses a variety of habitats but requires trees close to water for cover and is usually found near coastlines, lakeshores, and wetlands (Zeiner *et al.* 1990). | **Not expected.** This species is a winter migrant and will not nest in the Study Area. However, this species could disperse through the Study Area moving between suitable patches of foraging habitat. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Lanius ludovicianus* loggerhead shrike | --/--/SSC, NBHCP | Loggerhead shrike prefers open habitats with scattered shrubs, trees, posts, or other perches. It can be found in shrublands or open woodlands with bare ground, or sparse herbaceous cover. The loggerhead shrike is often found in open cropland, but nests in dense shrubs and small trees (Zeiner *et al.* 1990). | **High**. Suitable foraging and nesting habitat are present for this species in the Study Area. Loggerhead shrike is a year-round resident of the Natomas Basin and found throughout the NBHCP area (City of Sacramento *et al*. 2003). There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024) and this species was not documented by Bargas in the Study Area (Bargas 2019, 2020). |
| *Laterallus jamaicensis coturniculus* California black rail | --/ST/FP | Inhabits brackish marsh, primarily in the upper marsh zone dominated by alkali heath (*Frankenia salina*), cattail, and rush (*Juncus* spp.); prefers lower salinity environments. In the Sierra Nevada foothills, black rail is a year-round resident along wetland edges where water is 1.2 inches or less. Black rail is typically associated with perennial wetlands associated with flowing water such as irrigation canals, perennial streams and springs with dense vegetation in the Sierra Nevada foothills. Forages on the ground, under cover of dense vegetation (Richmond *et al.* 2010). | **Will not occur.** Suitable marsh habitat is not present, and the Study Area is not located within this species' known breeding range. There is one CNDDB reported occurrence for this species within a 5-mile radius of the Study Area located 4.3 miles south of the Study Area at a constructed pond.. The CNDDB record references an eBird database record where several observers heard a California black rail calling in July of 2017 (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Melospiza melodia*<br>song sparrow (Modesto Population) | --/--/SSC | Breeds in riparian thickets in shrubs or vines near fresh or saline emergent wetland. Nests are typically situated low to the ground or on the ground under dense riparian vegetation (Shuford and Gardali 2008). | **High.** Suitable nesting habitat is present for this species within vegetation along ditches and canals. There is one CNDDB reported occurrence for this species within a 5-mile radius of the Study Area, which is not specific with regards to its location (CDFW 2024). The record documents breeding in a canal along the edge of a wheat field in 1877, which the eggs and nest were preserved at the Museum of Vertebrate Zoology in Berkeley (CDFW 2024). |
| *Nannopterum auritum*<br>double-crested cormorant | --/--/WL | A yearlong resident along the entire coast of California and on inland lakes, in fresh, salt and estuarine waters. Rests in daytime and roosts overnight beside water on offshore rocks, islands, steep cliffs, dead branches of tall trees, wharfs, jetties, or even transmission lines (Zeiner *et al.* 1990). | **Will not occur.** Suitable habitat is not present for this species in the Study Area. This species is more likely to occur along the Sacramento River and other nearby marshes with suitable nesting habitat. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Pandion haliaetus*<br>osprey | --/--/WL | Osprey breed in Northern California from the Cascade Ranges southward to Lake Tahoe, and along the coast south to Marin County. They prey primarily on fish but also predate small mammals, birds, reptiles, and invertebrates. Foraging areas include open, clear waters of rivers, lakes, reservoirs, bays, estuaries, and surf zones. Habitat and nesting requirements include large trees, snags, and dead-topped trees in open forest habitats for cover and nesting (Zeiner *et al*. 1990). | **Present.** Suitable habitat is present for this species for foraging along the Sacramento River and nesting in trees or structures in the Study Area. This species was observed in flight over the Study Area on March 7, 2023. A large nest structure was observed along the Sacramento River outside of the Study Area. |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Plegadis chihi* white faced ibis | --/--/WL/NBHCP | This species nests sporadically in the Sacramento-San Joaquin Valley but occurs as a transient throughout California. This species requires extensive marshes for nesting and forages in marshes, pastures, and croplands. It no longer nests regularly in the Central Valley (Zeiner *et al.* 1990). | **Not expected.** Suitable marsh habitat is not present in the Study Area; however, this species could forage in croplands and pastures. Nesting habitat is not present in the Study Area. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Progne subis* purple martin | --/--/SSC | Nests in cavities in open areas with low canopy cover at the height of the nest, near large bodies of water that support high densities of large insects. Martins use a variety of cavities including in bridges, large tree snags, and collapsed lava tubes. The species is very sensitive to competition from European starlings and is extirpated from most low-elevation areas by starlings (Shuford and Gardali 2008). | **May occur.** Suitable habitat is present for this species in the Study Area in tree cavities where large trees are present or other within artificial structures such as utility poles. There are several CNDDB reported occurrences for this species within a 5-mile radius of the Study Area (CDFW 2024). The nearest CNDDB record for this species is located 2.5 miles southeast of the Study Area and documents this species nesting in weep holes under the I-5 bridge in 2007 (CDFW 2024). |
| *Riparia riparia* bank swallow | --/ST/NBHCP | Found primarily in riparian and lowland habitat in California. Nests in colonies along cliffs or steep riverbanks in holes. In California, a majority of the population is situated along the Sacramento River and the Feather River. Other smaller populations persist near Monterey and north of Shasta counties (Zeiner *et al*. 1990). | **Will not occur.** Suitable steep riverbank habitat for colonial nesting is not present in the Study Area. There is one CNDDB reported occurrence for this species within a 5-mile radius of the Study Area. The record documents a nesting colony along the American River 2.9 miles southeast of the Study Area in 1986 (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| *Vireo bellii pusillus*<br>least Bell's vireo | FE/SE/-- | Is an obligate riparian species during the breeding season that prefers early successional habitat (USFWS 1998). Typically found in structurally diverse habitat such as cottonwood-willow forests, oak woodlands, and mule fat scrub (USFWS 1998) that generally contains both canopy and shrub layers and includes some associated upland habitat. This species will winter in arroyos that contain mesquite scrub habitat and are not limited to willow dominated habitats. Previously considered to be limited to southern California, recent account of this species with successful breeding in Salinas Valley and in Yolo County show that this species is expanding back into its former range (NatureServe 2024; CDFW 2024). | **Will not occur.** Suitable habitat is not present in the Study Area, which consists almost entirely of agricultural lands, developed lands and isolated natural communities surrounded by developed communities. Oak woodlands that occur in the Study Area are adjacent to the Sacramento River but these areas are developed under the tree canopy so suitable riparian understory does not exist. There is one CNDDB reported occurrence for this species within a 5-mile radius of the Study Area. The record documents a collection of this species in 1877 and was likely collected from riparian vegetation along the Sacramento River (CDFW 2024). |
| *Xanthocephalus xanthocephalus*<br>yellow-headed blackbird | --/--/SSC | Occurs in California mainly as a summer migrant, but small numbers over-winter in the southern San Joaquin Valley and deserts. Breeds in marshes with tall emergent vegetation, generally along edges over deep water. Usually forages on seeds and aquatic insects within individual territories but may use nearby agricultural fields if resources are scarce (Shuford and Gardali 2008). | **May occur.** Nesting habitat for this species is present in the Study Area along ditches and canals with emergent vegetation. This species is commonly found nesting with other species of blackbirds. This species could also forage in the Study Area as they are known to forage in agricultural fields. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

| Scientific Name/ Common Name[1] | Status[2] | Habitat, Ecology and Life History | Potential to Occur[3] |
|---|---|---|---|
| **Mammals** | | | |
| *Antrozous pallidus*<br>pallid bat | --/--/SSC | Occurs throughout California except for the high Sierra Nevada and the northern Coast Ranges. Habitats include grasslands, shrublands, woodlands, and forests from sea level to 6,000 feet. Most common in open, dry habitats with rocky areas for roosting; roosts also include cliffs, abandoned buildings, bird boxes, tree hallows, and under bridges (Bolster, ed. 1998). | **May occur**. Suitable habitat is present for this species in buildings, bridges and tree hollows. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |
| *Taxidea taxus*<br>American badger | --/--/SSC | Inhabits drier open stages of most shrub, forest, and herbaceous habitats with loose, friable soils. Preys on a wide variety of mammals, reptiles, birds, and carrion, and hunts mostly by digging out fossorial prey. Occasionally takes prey on the surface. Not tolerant of cultivation. No longer occurs in the Central Valley except in the extreme western edge (Williams 1986). | **Will not occur.** Suitable habitat is not present in the Study Area, which consists almost entirely of agricultural lands, developed lands and isolated natural communities surrounded by developed communities and the Sacramento River. There are no CNDDB reported occurrences within a 5-mile radius of the Study Area (CDFW 2024). |

1 Sensitive species reported in CNDDB or CNPS on the "*Sacramento West*" and eight surrounding USGS quads, or in USFWS lists for the project site.

2 Status is as follows: Federal (ESA) listing/State (CESA) listing/other CDFW status or CRPR. F = Federal; S = State of California; E = Endangered; T = Threatened; P= Proposed; C = Candidate; FP=Fully Protected; SSC=Species of Special Concern; WL=Watch List.

3 Status in the Project site is assessed as follows. **Will Not Occur**: Species is either sessile (i.e., plants) or so limited to a particular habitat that it cannot disperse on its own and/or habitat suitable for its establishment and survival does not occur on the project site; **Not Expected**: Species moves freely and might disperse through or across the project site, but suitable habitat for residence or breeding does not occur on the project site, potential for an individual of the species to disperse through or forage in the site cannot be excluded with 100% certainty; **Presumed Absent:** Habitat suitable for residence and breeding occurs on the project site; however, focused surveys conducted for the current project were negative; **May Occur**: Species was not observed on the site and breeding habitat is not present but the species has the potential to utilize the site for dispersal, **High**: Habitat suitable for residence and breeding occurs on the project site and the species has been recorded recently on or near the project site, but was not observed during surveys for the current project; **Present**: The species was observed during biological surveys for the current project and is assumed to occupy the project site or utilize the project site during some portion of its life cycle.

CRPR = California Rare Plant Rank: 1B to rare, threatened, or endangered in California and elsewhere; 2B to rare, threatened, or endangered in California but more common elsewhere. Extension codes: .1 to seriously endangered; .2 to moderately endangered.

## Plant and Wildlife Species Observed in the Project Site

| Family | Species Name | Common Name | Status |
|---|---|---|---|
| **Native** | | | -- |
| Asteraceae | *Erigeron canadensis* | Canada horseweed | -- |
| Cyperaceae | *Carex barbarae* | valley sedge | -- |
| | *Carex praegracilis* | field sedge | -- |
| | *Cyperus eragrostis* | tall flatsedge | -- |
| | *Schoenoplectus acutus* | hardstem bulrush | -- |
| Euphorbiaceae | *Croton setiger* | turkey-mullein | -- |
| Fagaceae | *Quercus lobata* | valley oak | -- |
| | *Quercus wislizeni* | Interior live oak | -- |
| Juncaceae | *Juncus balticus* | Baltic rush | -- |
| Onagraceae | *Epilobium brachycarpum* | annual fireweed | -- |
| Poaceae | *Phalaris arundinacea* | reed canarygrass | -- |
| Salicaceae | *Populus fremontii* | Fremont cottonwood | -- |
| | *Salix gooddingii* | Goodding's black willow | -- |
| | *Salix lasiandra* | Pacific willow | -- |
| | *Salix lasiolepis* | arroyo willow | -- |
| Solanaceae | *Datura wrightii* | sacred thorn apple | -- |
| Typhaceae | *Typha latifolia* | common cattail | -- |
| **Non-native** | | | |
| Asteraceae | *Carduus pycnocephalus* | Italian thistle | Moderate |
| | *Centaurea solstitialis* | yellow-star thistle | High |
| | *Cichorium intybus* | chicory | -- |
| | *Daucus carota* | wild carrot | -- |
| | *Dittrichia graveolens* | stinkwort | Moderate |
| | *Helminthotheca echioides* | bristly ox-tongue | Limited |
| | *Lactuca serriola* | prickly lettuce | -- |
| | *Silybum marianum* | milk thistle | Limited |
| | *Taraxacum officinale* | common dandelion | -- |
| Brassicaceae | *Brassica nigra* | black mustard | Moderate |
| | *Hirschfeldia incana* | summer mustard | Moderate |
| | *Raphanus sativus* | wild radish | Limited |
| Convolvulaceae | *Convolvulus arvensis* | field bindweed | --/C |
| Cyperaceae | *Cyperus rotundus* | nutgrass | -- |
| Fabaceae | *Medicago polymorpha* | bur clover | Limited |
| | *Medicago sativa* | alfalfa | -- |
| | *Trifolium hirtum* | rose clover | Limited |
| Geraniaceae | *Erodium botrys* | broadleaf filaree | -- |
| Lamiaceae | *Marrubium vulgare* | white horehound | Limited |
| Malvaceae | *Malva parviflora* | cheeseweed | -- |
| Myrtaceae | *Eucalyptus* spp. | eucalyptus | Limited |
| Plantaginaceae | *Plantago lanceolata* | English plantain | Limited |
| Poaceae | *Arundo donax* | giant reed | High |
| | *Avena fatua* | wild oats | Moderate |
| | *Bromus diandrus* | common ripgut grass | Moderate |
| | *Bromus hordeaceus* | soft brome | Limited |
| | *Cynodon dactylon* | Bermuda grass | Moderate |
| | *Elymus caput-medusae* | medusahead | High |
| | *Festuca myuros* | foxtail grass | Moderate |
| | *Festuca perennis* | Italian ryegrass | -- |

| Family | Species Name | Common Name | Status |
|---|---|---|---|
| Poaceae (cont.) | *Hordeum marinum* ssp. *gussoneanum* | Mediterranean barley | -- |
| | *Paspalum dilatatum* | dallisgrass | -- |
| | *Phalaris aquatica* | Harding grass | Moderate |
| | *Polypogon monspeliensis* | annual beard grass | Limited |
| | *Sorghum halepense* | Johnsongrass | -- |
| | *Triticum aestivum* | wheat | -- |
| Polygonaceae | *Rumex crispus* | curly dock | Limited |
| | *Rumex pulcher* | fiddledock | -- |
| Rosaceae | *Prunus* spp. | fruit trees | -- |
| | *Rubus armeniacus* | Himalayan blackberry | High |

Cal-IPC categorizes plants as “high, moderate, or limited,” reflecting the level of each species’ negative ecological impact in California.

| Family | Scientific Name | Common Name |
|---|---|---|
| **Birds** | | |
| Accipitridae | *Accipiter cooperii* | Cooper's hawk |
| | *Buteo jamaicensis* | red-tailed hawk |
| | *Buteo lineatus* | red-shouldered hawk |
| Anatidae | *Anas platyrhynchos* | mallard |
| | *Branta canadensis* | Canada goose |
| Ardeidae | *Ardea alba* | great egret |
| | *Ardea Herodias* | great blue heron |
| | *Egretta thula* | snowy egret |
| Cathartidae | *Cathartes aura* | turkey vulture |
| Columbidae | *Columba livia* | rock pigeon |
| | *Zenaida macroura* | mourning dove |
| Corvidae | *Aphelocoma californica* | California scrub jay |
| | *Corvus brachyrhynchos* | American crow |
| | *Corvus corax* | common raven |
| | *Pica nuttalli* | yellow-billed magpie |
| Fringillidae | *Haemorhous mexicanus* | house finch |
| | *Spinus psaltria* | lesser goldfinch |
| Hirundinidae | *Tachycineta bicolor* | tree swallow |
| | *Tachycineta thalassina* | violet-green swallow |
| Icteridae | *Agelaius phoeniceus* | red-winged blackbird |
| | *Euphagus cyanocephalus* | Brewer's blackbird |
| | *Sturnella neglecta* | western meadowlark |
| Mimidae | *Mimus polyglottos* | northern mockingbird |
| Pandionidae | *Pandion haliaetus* | osprey |
| Paridae | *Baeolophus inornatus* | oak titmouse |
| Parulidae | *Setophaga coronata* | yellow-rumped warbler |
| Passerellidae | *Zonotrichia leucophrys* | white-crowned sparrow |
| Pelecanidae | *Pelecanus erythrorhynchos* | American white pelican |
| Phalacrocoracidae | *Nannopterum auritum* | double-crested cormorant |
| Picidae | *Colaptes auratus* | northern flicker |
| | *Dryobates nuttallii* | Nuttall's woodpecker |
| | *Melanerpes formicivorus* | acorn woodpecker |
| Ptiliogonatidae | *Phainopepla nitens* | phainopepla |
| Sittidae | *Sitta carolinensis* | white-breasted nuthatch |
| Sturnidae | *Sturnus vulgaris* | European starling |
| Troglodytidae | *Thryomanes bewickii* | Bewick's wren |
| Turdidae | *Sialia mexicana* | western bluebird |
| | *Turdus migratorius* | American robin |
| Tyrannidae | *Sayornis nigricans* | black phoebe |
| | *Sayornis saya* | Say's phoebe |
| **Mammals** | | |
| Leporidae | *Lepus californicus* | black-tailed jackrabbit |
| **Reptiles** | | |
| Trionychidae | *Trachemys scripta elegans* | red-eared slider |

# 1 Introduction

Bargas Environmental Consulting, LLC (Bargas) has prepared this Biological Resources Assessment (hereafter, **Assessment**) on behalf of Upper Westside, LLC (**Applicant**). The Upper Westside Specific Plan proposes developing 2,065 acres for mixed and residential use within the Natomas Basin. This Assessment analyzes the potential biological effects of that proposal consistent with the California Environmental Quality Act (CEQA).

## 1.1 Project Summary

The Upper Westside Specific Plan Project (hereafter **Project**) encompasses approximately 2,065 acres in the unincorporated Natomas community of Sacramento County, approximately 3.5 miles northwest of downtown Sacramento (**Exhibit 1. Project Site and Vicinity**). It is bounded by Interstate 80 to the south, the West Drainage Canal to the east, Fisherman's Lake Slough to the north, and Garden Highway to the west. Three sides are bordered by the City of Sacramento communities of North and South Natomas.

Lands within the Upper Westside Plan Area limits are mostly agricultural, with existing agricultural residential homes inside the northeastern and southwestern boundaries, and commercial uses located near the intersection of El Centro Road and West El Camino Avenue. Existing Sacramento County General Plan Land Use designations include Agricultural Cropland (1,858.3± acres); Agricultural Residential (97.0± acres); Commercial and Office (52.2± acres); and Recreation (58.8± acres). Multiple individuals own property within the limits of the Plan Area.

## 1.2 Habitat Conservation Plans

The Natomas Basin contains two habitat conservation plans, developed to satisfy the requirements of the Federal Endangered Species Act and California Endangered Species Act to allow for the incidental take of threatened and endangered species.

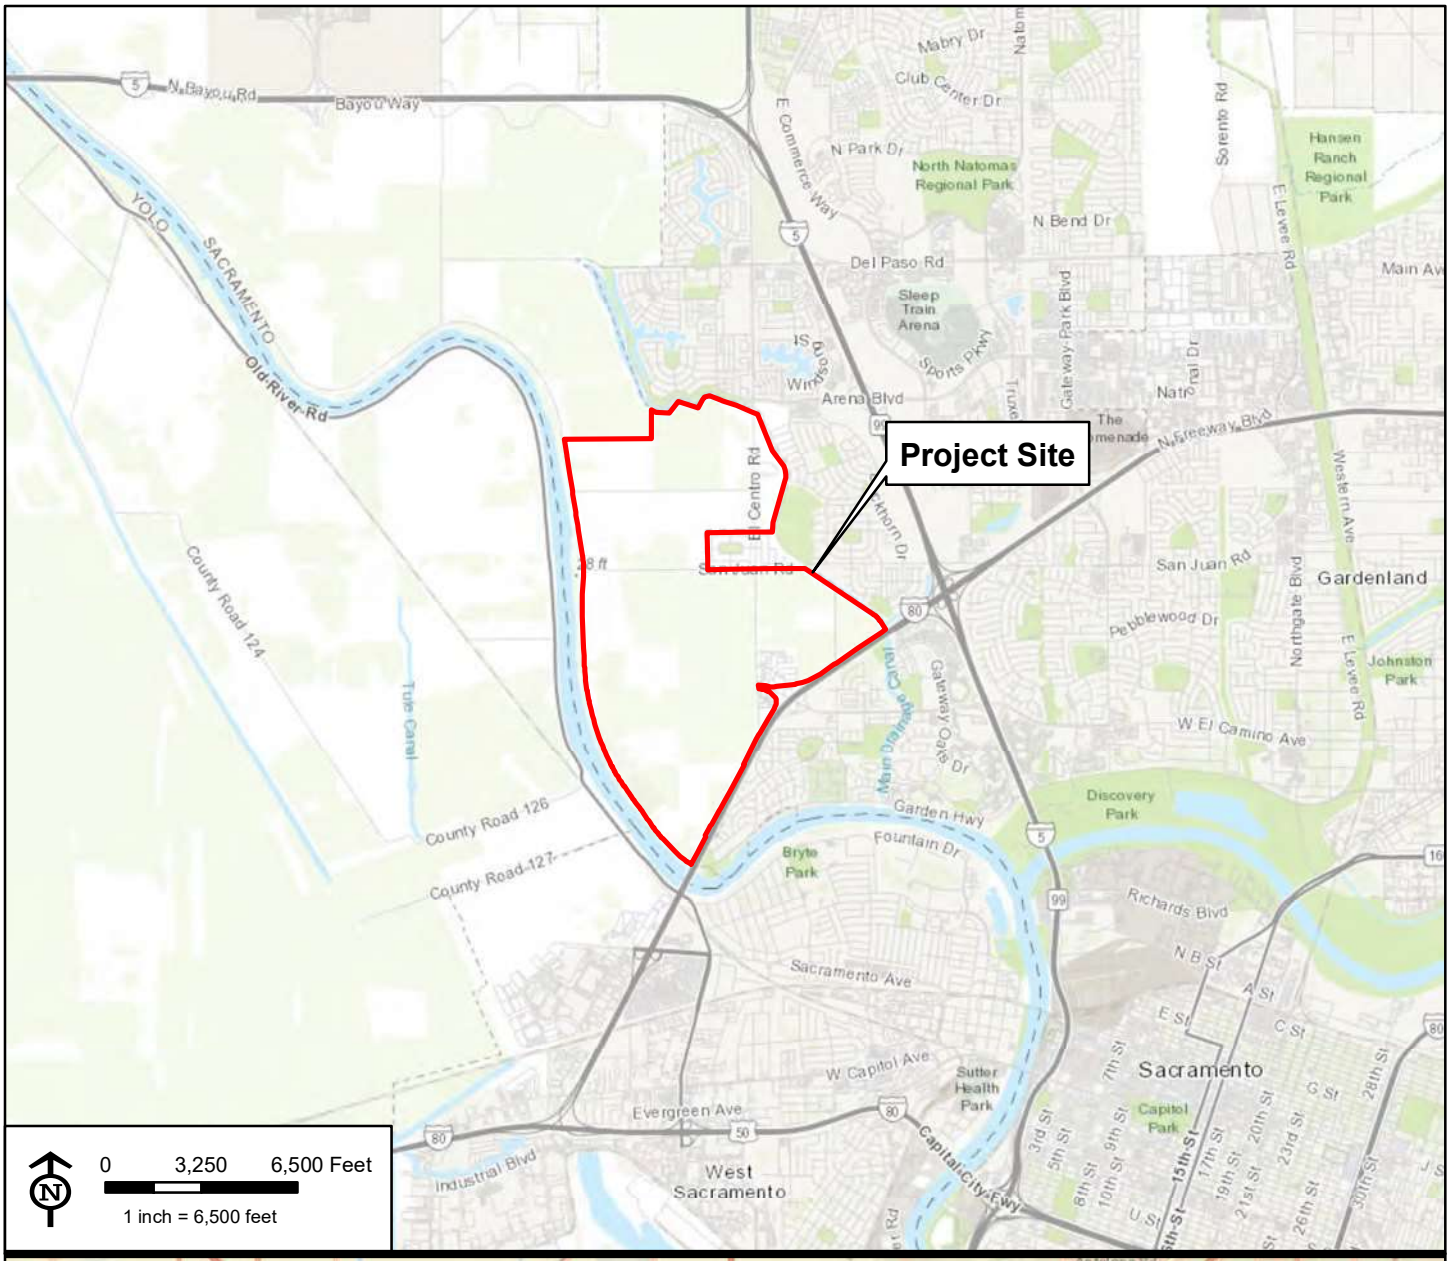
- The **Natomas Basin Habitat Conservation Plan (NBHCP)** is intended to minimize and mitigate the loss of habitat and the incidental take of 22 Covered Species that could result from urban development and management of reserves in the Natomas Basin. The NBHCP authorizes approximately 17,500 acres of development and preserves 8,750 acres in a reserve system surrounded by agricultural lands. At full build-out, the planned reserve system will consist of 4,375 acres of rice, 2,187 acres of created marsh, and 2,187 acres of upland habitat. In this reserve system, land will be managed to enhance its habitat values.
- The **Metro Air Park Habitat Conservation Plan (MAPHCP)** is intended to minimize and mitigate the loss of habitat and the incidental take of 14 Covered Species, many of which are shared with the NBHCP. The 2,011 acres of urban development associated with the MAPHCP are part of the total 17,500 acres of future Planned Development considered by the NBHCP in the Natomas Basin.

Both of these habitat conservation plans are discussed in greater detail in **Section 3.3** (Habitat Conservation Plans).

## 1.3 Definitions

This Assessment will use the following definitions for areas referred to herein:

- The **Upper Westside Specific Plan Area**, also referred to as **Plan Area**, is the 2,065 acres of the Upper Westside Specific Plan, exclusive of any off-site considerations related to the Project. At the time this Assessment was prepared, the extent and location of any off-site effects has not been determined.



- The **Surveyed Area** includes all lands directly accessible by biologists and other surveyors during the surveys conducted for the Project. The Surveyed Area measures approximately 568.7 acres.
- The **Biological Study Area** (BSA) is defined as the Plan Area with a surrounding half mile buffer. This area was used as the survey limits for Swainson's Hawk and Giant Gartersnake, however, Giant Gartersnake surveys were restricted to publicly accessible areas of the BSA outside of the Surveyed Area defined above. Swainson's Hawk could be surveyed from a distance using optics.
- The **Off-Site Reserves** are those areas proposed for conservation of habitats for special status species to offset the effects of the Project. Their location and size will be further defined during consultation with local, state, and federal regulatory agencies.
- The **Regional Study Area** (RSA) is defined as the limits of the Natomas Basin plus a surrounding additional buffer of five miles, used to assess the status of species and habitats within the basin and additional areas of biological relevance.

A map depicting these areas is provided as **Exhibit 2. Area Reference.**

## 1.4 Summary of CEQA Findings

In **Section 6** (CEQA Analysis: Effects and Minimization Measures) of this Assessment, the following conclusions are drawn regarding the potential effects of the Project under CEQA when considering all impacts and on- and off-site preservation:

- The Project will not have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations by the California Department of Fish and Wildlife or US Fish and Wildlife Service.
- The Project will not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or US Fish and Wildlife Service.
- The Project will not have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.
- The Project will not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.
- The Project will not conflict with any local policies or ordinances protecting biological resources, such as tree preservation policy or ordinance.
- The Project will not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

# 2 Project Description

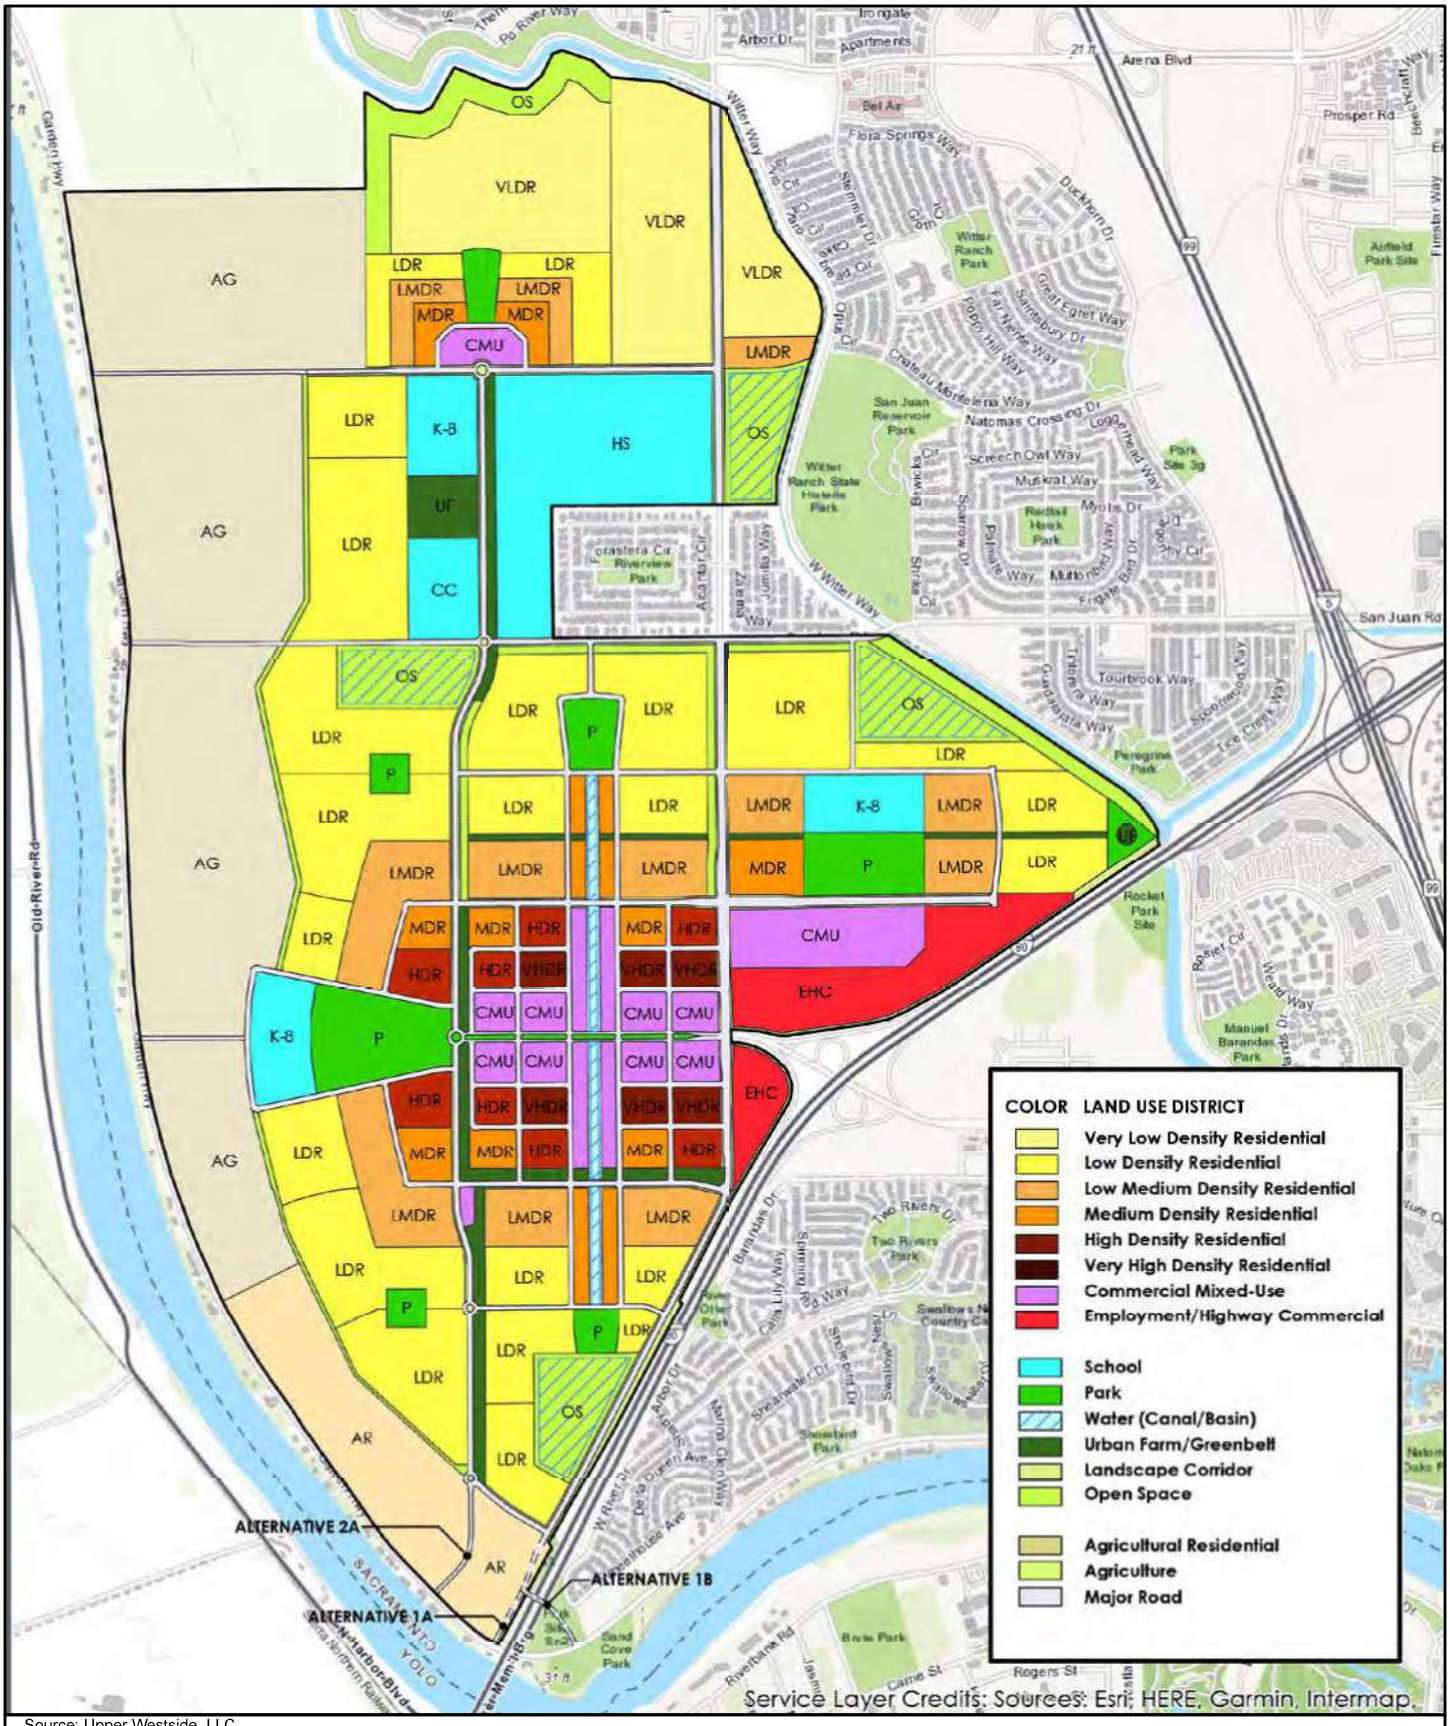
## 2.1 Overview

### 2.1.1 Specific Plan

The Plan Area encompasses approximately 2,065 acres adjacent to and directly west of the communities of North and South Natomas in an area formerly referred to as "The Boot Precinct." The Plan Area is bounded by Interstate 80 to the south and east, Witter Canal and Fisherman's Lake/Slough to the northeast, and Garden Highway and the Sacramento River to the west. The center of the Plan Area is located approximately 3.5 miles northwest from downtown Sacramento. The Project is outside of the Urban Policy Area (UPA) and Urban Services Boundary (USB) in the Natomas New Growth Area. The conceptual Upper Westside development plan is shown in **Exhibit 3. Upper Westside Specific Plan**.

### 2.1.2 Off-Site Reserves

The Project envisions the creation of one or more Off-Site Reserves. The extent and location of these reserves has not yet been identified, but their inclusion in this Assessment is integral to the discussion of the Project's biological effects. The acreage, location and composition of the Off-Site Reserves will be determined during consultation with local, state, and federal regulatory agencies. The Off-Site Reserves will permanently preserve habitat for special status plant and wildlife species on lands of sufficient quality and quantity to offset proposed direct Project effects on biological resources in the Plan Area.



## 2.2 Objectives

The primary objectives for the Project as submitted by the applicant are as follows[1]:

- Formulate a specific plan and related land use planning documents and regulatory approvals for the Plan Area as a means of expanding the USB and UPA in an orderly manner and accommodating the County's share of future regional population growth.
- Create a land use plan that satisfies County policies, regulations, and expectations, as defined in the General Plan, including Policies LU-114, LU-119, and LU-120.
- Provide a comprehensively planned, high quality, large-scale, residential-based community in northwestern Sacramento County, directly northwest of the City of Sacramento, with a balanced mix of uses, employment opportunities, a wide variety of housing types, park and open space, and supporting public and quasi-public uses.
- Develop a master-planned community that can be efficiently served by existing infrastructure or proposed infrastructure that would encourage logical, orderly development and would discourage leapfrog or piecemeal development and sprawl.
- Provide residential housing within five miles of the existing job centers of downtown Sacramento and West Sacramento, as well as in close proximity to newly developing or proposed job centers.

[1] Notice of preparation of a Draft Environmental Impact Report for Upper Westside Specific Plan (PLNP2018-00284), October 2020.

- Create a development that has an overall positive economic impact on Sacramento County and achieves a neutral to positive fiscal impact on the County's finances and existing ratepayers.
- Create a community that can be logically and efficiently phased to allow the orderly build-out of the community.
- Provide a safe and efficient circulation system that interconnects land uses and promotes pedestrian and bicycle circulation and transit options that will encourage non-vehicular trips, thereby reducing vehicle miles traveled (VMT).
- Incorporate parks and open space, including an urban farm-greenbelt and canal, into the project design in a manner that provides community connectivity and encourages walking and bicycle use.
- Make efficient use of development opportunity as the project site is bordered on three sides by existing or planned urban development.
- Plan for enough units to provide housing choices in varying densities to respond to a range of market segments, including opportunities for rental units and affordable housing, and significant commercial uses, consistent with the General Plan and Housing Element.
- Design a land use plan where the development footprint avoids impacts to wetland resources to the extent feasible.
- Develop a specific plan that respects existing agricultural land uses and operations to the west of the proposed Development Area.
- Provide development that meets the seven identified Sacramento Area Council of Governments (SACOG) Blueprint principles, including provision of transportation choice, compact development, mixed use development, housing choice and diversity, use of existing assets, natural resource conservation, and quality design.
- Develop the Project and any associated on- and/or off-site mitigation to complement the NBHCP and the MAPHCP.
- Designate open space preserves along the south side of Fisherman's Lake Slough or along the West Drainage Canal that provide natural buffer to these features, and along the westerly edge of the proposed Development Area to provide a transition between residential and agricultural designations to the west, which will provide a regional benefit for habitat, resources, and open space amenities.
- Balance development with resource protection in an inter-connected, permanent open space.
- Create multi-functional habitat within open space corridors that provide on-site habitat and contribute to water quality.

# 3 Regulatory Setting

## 3.1 Federal

### 3.1.1 Federal Endangered Species Act

The Federal Endangered Species Act (FESA) is the federal government's regulations protecting rare and declining plant and wildlife species. FESA is jointly implemented by the United States Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service (NMFS, marine resources only). FESA protects species using the following status designations:

- A federally **endangered** species is a species of invertebrate, plant, or wildlife formally listed by the USFWS under FESA as facing extinction throughout all or a significant portion of its geographic range.
- A federally **threatened** species is one formally listed by the USFWS as likely to become endangered within the foreseeable future throughout all or a significant portion of its range.
- A **proposed** threatened or endangered species is one officially proposed by the USFWS for addition to the federal threatened or endangered species lists.
- **Candidate** species are "plants and animals for which the USFWS has sufficient information on their biological status and threats to propose them as endangered or threatened under FESA, but for which development of a proposed listing regulation is precluded by other higher priority listing activities"(USFWS 2017).

"Take" of a federally endangered or threatened species or its habitat is prohibited by federal law without a special permit. The term "take," under FESA, means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in such conduct. "Harm" is defined by the USFWS to encompass "an act which actually kills or injures wildlife. Such an act may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding or sheltering" (50 CFR § 17.3).

Section 10(a)(1)(B) of the FESA allows for take of a threatened or endangered species incidental to development activities once a Habitat Conservation Plan (HCP) has been prepared to the satisfaction of the USFWS and a Section 10(a) incidental take permit has been issued to an applicant. For federal projects (including those involving federal funding), Section 7 of the FESA allows for consultation between the affected agency and the USFWS to determine what measures may be necessary to compensate for the incidental take of a listed species. A federal project is any project that is proposed by a federal agency or is at least partially funded or authorized by a federal agency. Additionally, if the listed species or its habitat occurs in a portion of the project subject to federal jurisdiction (such as Waters of the United States by the United States Army Corps of Engineers under Section 404 of the Clean Water Act), then consultation under Section 7 of the FESA is usually permissible and may be required.

FESA also requires the USFWS to consider whether there are areas of habitat essential to conservation for each listed species. **Critical habitat** designations protect these areas, including habitat that is currently unoccupied but may be essential to the recovery of a species. An area is designated as critical habitat after the USFWS publishes a proposed Federal regulation in the Federal Register and then receives and considers public comments on the proposal. The final boundaries of critical habitat are officially designated when published in the Federal Register.

### 3.1.2 Migratory Bird Treaty Act

The Migratory Bird Treaty Act of 1918 (MBTA) is a federal law governing the taking, killing, possession, transportation, and importation of various birds, their eggs, parts, and nests. The take of any number of a bird species

listed as protected on any one of four treaty lists is governed by the MBTA's regulation of taking migratory birds for educational, scientific, and recreational purposes and requiring harvest to be limited to levels that prevent over utilization. The MBTA also prohibits taking, possession, import, export, transport, selling, purchase, barter, or offering for sale, purchase or barter, certain bird species, their eggs, parts, and nests, except as authorized under a valid permit (50 CFR 21.11).

### 3.1.3 Clean Water Act and Waters of the United States

The U.S. Army Corps of Engineers (USACE) has primary federal responsibility for administering regulations that concern waters of the United States (U.S.) (including wetlands) under Section 404 of the Clean Water Act (CWA). Section 404 of the CWA regulates the discharge of dredged or fill material into waters of the U.S. The USACE requires that a permit be obtained if a project proposes the placement of structures within, over, or under navigable waters and/or discharging dredged or fill material into waters below the ordinary high-water mark (OHWM). The USACE has established a series of regulatory permitting processes that authorize certain activities in waters of the U.S.

In addition, a CWA Section 401 Water Quality Certification Permit is required to comply with CWA Sections 301, 302, 303, 306, and 307 which establishes discharge standards for effluents based upon technology-based guidelines and is regulated by the California State Water Resources Control Board (SWRCB) and the nine Regional Water Quality Control Boards (RWQCB). The CWA and state wetland regulations are discussed in greater detail in **Sections 3.27** and **3.28**. Furthermore, anyone that proposes to conduct a project that may result in a discharge to U.S. surface waters and/or "waters of the state," including wetlands (all types), year-round and seasonal streams, lakes, and all other surface waters, would require a permit. At a minimum, any beneficial uses that are lost must be replaced by mitigation of at least equal function, value, and area. Waste Discharge Requirements Permits are required pursuant to California Water Code Section 13260 for any persons discharging or proposing to discharge waste, including dredge/fill, that could affect the quality of the waters of the State.

Wetlands are defined under 33 C.F.R. 328.3(c)(16) as:

> *Those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.*

The limits of USACE jurisdiction in non-tidal waters extends to the OHWM, which is defined under 33 CFR 328.3(c)(7) as:

> *…That line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impresses on the bank, shelving, changes in the character of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas.*

Non-wetland features include:

> *…Upland and lowland areas that are neither deep water aquatic habitats, wetlands, nor other special aquatic sites. They are seldom or never inundated, or if frequently inundated, they have saturated soils for only a brief period of time during the growing season. If these features are vegetated, they normally support species that are predominantly adapted to aerobic soil conditions* (USACE - Environmental Laboratory 1987).

The Environmental Protection Agency (EPA) published a proposed revised definition of "waters of the United States" on December 7, 2021, in response to the U.S. District Court of the District of Arizona ruling resulting in "vacating and

remanding" the Navigable Waters Protection Rule (Federal Register 2021). This revised definition is consistent with the pre-2015 regulations based upon the Supreme Court cases of *Rapanos vs. United States* and *Carabell vs. United States* (EPA 2008), meaning the USACE will assert jurisdiction over traditional navigable waters (TNW) and the following types of features determined to have "significant nexus" to a TNW:

- wetlands adjacent to TNWs
- non-navigable tributaries of TNWs that are relatively permanent where the tributaries typically flow year-round or have continuous flow at least seasonally
- wetlands that directly abut non-navigable tributaries of TNWs

The current interpretation of “waters of the United States” is consistent with the pre-2015 definition and practice, incorporating guidance from the *Rapanos v. United States*, *Carabell v. United States Supreme Court*, and the *SWANCC* Supreme Court decisions.

## 3.2 State of California

### 3.2.1 California Environmental Quality Act

CEQA is a public disclosure process codified by California Public Resources Code 21000, requiring decision-makers to analyze the environmental impacts of a project, disclose those impacts to the public, and mitigate environmental impacts to the extent feasible. The state or local lead agency provides an evaluation of project effects on biological resources; determining the significance of those effects is guided by Appendix G of the CEQA guidelines. These evaluations must consider direct effects on a biological resource within the project site itself, indirect effects on adjacent resources, and cumulative effects within a larger area or region. Effects can be locally important but not significant according to CEQA if they would not substantially affect the regional population of the biological resource. Significant adverse impacts on biological resources would include the following:

- Substantial adverse effects on any species identified as candidate, sensitive, or special status in local or regional plans, policies, or regulations or by the CDFW or the USFWS (these effects could be either direct or via habitat modification);
- Substantial adverse impacts to species designated by the CDFW as Species of Special Concern (SSC);
- Substantial adverse effects on riparian habitat or other sensitive habitat identified in local or regional plans, policies, or regulations or by CDFW and USFWS;
- Substantial adverse effects on federally protected wetlands defined under Section 404 of the CWA (these effects include direct removal, filling, or hydrologic interruption of marshes, vernal pools, coastal wetlands, or other wetland types);
- Substantial interference with movements of native resident or migratory fish or wildlife species population, or with use of native wildlife nursery sites;
- Conflicts with local policies or ordinances protecting biological resources (e.g., tree preservation policies); and;
- Conflict with provisions of an adopted HCP, NCCP, or another approved local, regional, or state habitat conservation plan.

### 3.2.2 California Endangered Species Act

The California Endangered Species Act (CESA) prohibits the take of state-listed threatened and endangered species. Under CESA, state agencies are required to consult with CDFW when preparing CEQA documents. Under CESA, CDFW is responsible for maintaining a list of rare, threatened, and endangered species designated under state law (California Fish and Game Code § 2070-2079). CDFW also maintains lists of candidate species, SSC, and fully-protected species. Candidate species are those taxa that have been formally recognized by the CDFW and are under review for addition to the state threatened and endangered list. Species of special concern are those taxa that are considered sensitive, and this list serves as a "watch list." The CDFW can authorize "take" if an incidental take permit is issued by the Secretary of the Interior or Commerce in compliance with FESA, or if the director of the CDFW issues a permit under Section 2080 in those cases where it is demonstrated that the impacts are minimized and mitigated.

### 3.2.3 California Fish and Game Code

*Section 1600 et seq. – Lake and Streambed Alteration Agreement*. Section 1600 provides provisions for protecting riparian systems, including the bed, banks, and riparian habitat of lakes, seasonal and perennial streams, and rivers. This section requires an applicant to notify CDFW and obtain a Lake and Streambed Alteration Agreement (LSAA) if their project would divert or obstruct the natural flow of any river, stream, or lake; change the bed, channel, or bank of any river, stream, or lake; use material from any river, stream, or lake; or deposit or dispose of material into any river, stream, or lake.

*Section 2050 et seq. – California Endangered Species Act.* CESA establishes the policy of the state to conserve, protect, restore, and enhance threatened or endangered species and their habitats. CESA is administered by CDFW and prohibits the take of any species that the California Fish and Game Commission (CFGC) determines to be a threatened or endangered species. CESA also mandates that "state agencies should not approve projects as proposed which would jeopardize the continued existence of any endangered species or threatened species" if reasonable and prudent alternatives are available that would avoid jeopardy. CDFW administers CESA and authorizes take through California Fish and Game Code Section 2081 Incidental Take Permits or through Section 2080.1 (for species also listed under FESA, consistency determination with a USFWS Biological Opinion).

*Section 3511 – Fully Protected Species*. The legislature of the State of California designated certain species as "fully protected" prior to the creation of CESA. Section 3511 states that "fully protected" birds or parts thereof may not be taken or possessed at any time. Lists of fully protected species were initially developed to provide protection to those animals that were rare or faced possible extinction and included fish, mammals, amphibians and reptiles, and birds. Most fully protected species have since been listed as threatened or endangered under CESA and/or FESA.

*Sections 3503, 3503.5, 3505, 3513 — Birds*. These California Fish and Game Code sections protect all birds, birds of prey, and all nongame birds, as well as their eggs and nests, for species that are not already listed as fully protected and that occur naturally within the state. Sections 3503 and 3503.5 of the CFGC stipulate the following regarding eggs and nests: Section 3503 states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by CFGC or any regulation made pursuant thereto; and Section 3503.5 states that is it unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by CFGC or any regulation adopted pursuant thereto. Section 3513 states that it is unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA.

### 3.2.4 California Native Plant Protection Act

The California Native Plant Protection Act of 1977 (California Fish and Game Code § 1900-1913) affords the CDFW Commission the authority to designate native plants as endangered or rare and protect them from "take." The California Native Plant Society (CNPS) maintains a list of sensitive plant species native to California and assigns each a rank in the California Rare Plant Rank (CRPR) system defined below:

- List 1A: Plants presumed extirpated in California and either rare or extinct elsewhere;
- List 1B: Plants are rare, threatened, or endangered in California and elsewhere;
- List 2A: Plants presumed extirpated in California, but more common elsewhere;
- List 2B: Plant are rare, threatened, or endangered in California, but more common elsewhere;
- List 3: Plants about which more information is needed (on a review list);
- List 4: Plants of limited distribution (on a watch list).

This list is further defined as described below:

- 0.1: Seriously threatened in California, meaning there is a high degree (over 80% of occurrences) and immediacy of threat;
- 0.2: Moderately threatened in California, meaning there is a moderate degree (20-80% of occurrences) and immediacy of threat;
- 0.3: Not very threatened in California, meaning there is a low degree (less than 20% of occurrences) and immediacy of threat.

All plants on Lists 1 and 2 meet the standards for state listing under the CEQA Guidelines (14 CCR § 15380). CNPS recommends that plants on Lists 3 and 4 be evaluated for consideration under CEQA.

### 3.2.5 CDFW Special Status Species

The CDFW maintains lists of special status species that are protected under CEQA. These lists include the Special Vascular Plants, Bryophytes, and Lichens List and the Special Animals List.

#### *3.2.5.1 CDFW Special Vascular Plants, Bryophytes, and Lichens List*

Special plants include:

- Taxa listed under FESA or CESA as Endangered, Threatened, or Rare;
- A candidate for state or federal listing as Endangered, Threatened, or Rare;
- Taxa listed in the CNPS's Inventory of Rare and Endangered Plants (IREP) of California;
- Taxa which meet the criteria for listing, even if not currently included on any list, as described in Section 15380 of the CEQA Guidelines; these taxa may indicate "None" under listing status, but note that all California Rare Plant Rank 1 and 2 and some Rank 3 and 4 plants may fall under Section 15380 of CEQA;
- Taxa that are biologically rare, very restricted in distribution, or declining throughout their range but not currently threatened with extirpation;
- Taxa listed as a Bureau of Land Management, USFWS, or U.S. Forest Service Sensitive Species;

- Population(s) in California that may be peripheral to the major portion of a taxon's range but are threatened with extirpation in California; and
- Taxa closely associated with a habitat that is declining in California at a significant rate (e.g., wetlands, riparian, vernal pools, old-growth forests, desert aquatic systems, native grasslands, valley shrubland habitats).

#### *3.2.5.2 CDFW Special Animals List*

"Special Animals" is a broad term used to refer to all the animal taxa tracked by CDFW's California Natural Diversity Database (CNDDB), regardless of their legal or protection status. This list is also referred to as the list of "species at risk" or "special status species." CDFW considers the taxa on this list to be those of greatest conservation need.

Special animals include:

- Taxa listed or proposed for listing under FESA and/or CESA;
- Taxa considered by CDFW to be a SSC;
- Taxa which meet the criteria for listing, even if not currently included on any list, as described in Section 15380 of the CEQA Guidelines;
- Taxa that are biologically rare, very restricted in distribution, or declining throughout their range but not currently threatened with extirpation;
- Population(s) in California that may be peripheral to the major portion of a taxon's range but are threatened with extirpation in California;
- Taxa closely associated with a habitat that is declining in California at a significant rate (e.g., wetlands, riparian, vernal pools, old-growth forests, desert aquatic systems, native grasslands, valley shrubland habitats, etc.);
- Taxa designated as a special status, sensitive, or declining species by other state or federal agencies or a non-governmental organization (NGO) and determined by the CNDDB to be rare, restricted, declining, or threatened across their range in California.

### 3.2.6 CEQA Sensitive Habitats

Several natural vegetation communities and habitats have been classified as sensitive under CEQA and other applicable laws and regulations. They are defined as meeting one or more of the following criteria:

- Areas of special aquatic biological significance as identified by the SWRCB;
- Areas that provide habitat for locally unique biotic species/communities;
- Areas which provide habitat for species of special concern as listed by CDFW in the Special Animals List and CNDDB;
- Areas which provide essential habitat, or are adjacent to essential habitat, for rare or endangered species which meet the definition of Section 15380 of the CEQA guidelines or designated by the CFGC, USFWS, or CNPS;

- Nearshore reefs, rocky intertidal areas, sea caves, islets, offshore rocks, kelp beds, marine mammal hauling grounds, sandy beaches, shorebird roosting, resting and nesting areas, cliff-nesting areas and marine, wildlife or educational/research reserves;
- Dune plant habitats;
- All lakes, wetlands, estuaries, lagoons, streams, and rivers; and
- Riparian corridors

Non-sensitive vegetation communities are those communities that are not afforded special protection under CEQA or other state, federal and local laws, regulations, and ordinances. However, they may still provide suitable habitats for special status animals and plant species.

### 3.2.7 Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act of 1969 established the SWRCB and the nine RWQCBs and authorized them to provide oversight for water rights and water quality. It uses the National Pollutant Discharge Elimination System (NPDES) to monitor point source discharges into the waters of the State to prevent water quality degradation. It also protects wetlands, surface waters, and groundwater from both point and nonpoint sources of pollution.

### 3.2.8 State Wetland Definition and Procedures

The SWRCB adopted the State Wetland Definition and Procedures for Discharges or Fill Material to Waters of the State in 2019 and completed revisions to this set of procedures in 2021 (SWRCB 2021). Four major elements are included in these procedures as described below, in addition to procedures for the submittal, review and approval of CWA Section 401 permits not described in this report.

1. Wetland definition:

   *An area is wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration such saturation is sufficient to cause anaerobic conditions in the upper substrate; and 3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation.*

2. Framework for determining waters of the state:

   Waters of the state are broadly defined by the Porter-Cologne Water Quality Control Act as "any surface water or groundwater, including saline waters, within the boundaries of the state." The 2021 procedures expand upon this definition to clearly include natural wetlands, wetlands created by modification of a surface water of the state, and artificial wetlands meeting specific criteria.

   The criteria for an artificial wetland include wetlands created for agency-approved compensatory mitigation; those identified in a water quality control plan; and those greater than or equal to one acre in size unless they are constructed and maintained for wastewater treatment or disposal, sediment settling, stormwater permitting program pollutant or runoff management, surface water treatment, agricultural crop irrigation or stock watering, fire suppression, industrial processing and cooling, active surface mining, log storage, recycled water management, maximizing groundwater recharge, and rice paddies.

3. Wetland delineation procedures:

USACE-defined procedures for aquatic resources delineation (USACE 1987; USACE 2008, USACE 2010) used to assess the presence or absence of hydrophytic vegetation, hydric soils, and wetland hydrology are required by the SWRCB to delineate waters of the state, with one modification being that "the lack of vegetation does not preclude the determination of such an area that meets the definition of wetland."

## 3.3 Habitat Conservation Plans

An HCP is a planning document required as part of an application for an incidental take permit under Section 10(a)(1)(B) of FESA. Such permits are issued by the USFWS when take is not the intention of, and is incidental to, otherwise legal activities. An application for an incidental take permit under Section 10 of FESA must be accompanied by an HCP. HCPs describe the impacts of the proposed action that may result in take of federally listed species; how those impacts will be minimized or mitigated; and how the HCP is to be funded. HCPs can apply to both listed and non-listed species, including those that are candidates or have been proposed for listing. Conserving species before they are in danger of extinction or are likely to become so can also provide early benefits and prevent the need for listing.

Two HCPs have been approved for development within the vicinity of the Plan Area — the NBHCP and the MAPHCP. The Plan Area is within the Natomas Basin and the boundaries of the NBHCP but is not within the areas with take coverage. Further, the Plan Area is in Sacramento County, which is not a signatory to the NBHCP or the MAPHCP. As such, the Applicant is not eligible for the take coverage granted by USFWS and CDFW under the NBHCP or MAPHCP. The Plan Area is also outside of the Planned Development area of the NBHCP and potential impacts resulting from the development of the Project were not considered in the NBHCP.

### 3.3.1 Natomas Basin Habitat Conservation Plan

The NBHCP (City of Sacramento et al. 2003) provides for the conservation of 22 wildlife and plant species within the Natomas Basin. The NBHCP establishes a multispecies conservation program to minimize and mitigate the expected loss of habitat values and incidental take of Covered Species that could result from urban development, operation and maintenance of irrigation and drainage systems, and certain activities associated with The Natomas Basin Conservancy (TNBC) management of its system of reserves established under the NBHCP. The NBHCP applies to the 53,537-acre area interior to the toe of levees surrounding the Natomas Basin, located in the northern portion of Sacramento County and the southern portion of Sutter County. The Basin contains incorporated and unincorporated areas within Sacramento County and Sutter County.

Management of the NBHCP is heavily focused on the two most widely distributed covered species in the Natomas Basin: Swainson's Hawk (*Buteo swainsoni*) and Giant Gartersnake (*Thamnophis gigas*):

- Swainson's Hawk is an upland foraging species. It nests along the Sacramento River and in isolated trees and groves throughout the Natomas Basin. The NBHCP seeks to avoid development in the Swainson's Hawk Zone[2] and to acquire upland habitat as Mitigation Lands inside the Swainson's Hawk Zone.
- Giant Gartersnake is found primarily in agricultural wetlands (such as rice fields) and other waterways such as drainage canals as well as adjacent uplands in many portions of the Natomas Basin[3].

[2] The NBCHP Swainson's Hawk Zone is defined as the lands which are not currently developed [excluding the 250 acres of land designated "Urban" on the City of Sacramento General Plan and the North Natomas Community Plan located within the City of Sacramento] and which are located within the Natomas Basin and within one mile east of the toe of the inside levee of the Sacramento River and extending from the Natomas Cross Canal on the north and Interstate 80 on the south.
[3] https://www.fws.gov/sacramento/es_species/Accounts/Amphibians-Reptiles/giant_garter_snake/

It is anticipated that management of habitat for Swainson's Hawk and Giant Gartersnake will benefit the other covered species: Aleutian Cackling Goose (*Branta hutchinsii leucopareia*), Bank Swallow (*Riparia riparia*), Burrowing Owl (*Athene cunicularia*), Loggerhead Shrike (*Lanius ludovicianus*), Tricolored Blackbird (*Agelaius tricolor*), White-faced Ibis (*Plegadis chihi*), Northwestern Pond Turtle (*Actinemys marmorata*), California Tiger Salamander (*Ambystoma californiense*), Western Spadefoot Toad (*Spea hammondii*), Valley Elderberry Longhorn Beetle (*Desmocerus californicus dimorphus*), Midvalley Fairy Shrimp (*Branchinecta mesovallensis*), Vernal Pool Fairy Shrimp (*Branchinecta lynchi*), Vernal Pool Tadpole Shrimp (*Lepidurus packardi*), Boggs Lake Hedge-Hyssop (*Gratiola heterosepala*), Colusa Grass (*Neostapfia colusana*), Delta Tule Pea (*Lathyrus jepsonii* var. *jepsonii*), Legenere (*Legenere limosa*), Sacramento Orcutt Grass (*Orcuttia viscida*), Slender Orcutt Grass (*Orcuttia tenuis*), and Sanford's Arrowhead (*Sagittaria sanfordii*).

Adaptive management is a key provision of the NBHCP, allowing examination of "alternative strategies for meeting measurable goals and objectives, and then, if necessary, adjusting future conservation and management actions according to what is learned" (NBCHP Page I-41).

### 3.3.2 Metro Air Park Habitat Conservation Plan

The Metro Air Park (MAP) Property Owners Association applied for, and received, a 50-year permit, pursuant to section 10(a)(1)(B) of the Endangered Species Act of 1973 from USFWS for the incidental take of Giant Gartersnake, Valley Elderberry Longhorn Beetle, and 12 additional species in July 2001. The resulting MAPHCP area is contained entirely within the boundaries of the NBHCP and covers many (but not all) of the same species: Aleutian Cackling Goose, Bank Swallow, Burrowing Owl, Greater Sandhill Crane (*Antigone canadensis tabida*), Loggerhead Shrike, American Peregrine Falcon (*Falco peregrinus anatum*), Swainson's Hawk, Tricolored Blackbird, White-faced Ibis, Giant Gartersnake, Northwestern Pond Turtle, Valley Elderberry Longhorn Beetle, Delta Tule Pea, and Sanford's Arrowhead.

The 2,011 acres of urban development associated with the MAPHCP are part of the total 17,500 acres of future Planned Development considered by the NBHCP in the Natomas Basin. However, a portion of the MAP project, approximately 28 acres, is located within the City of Sacramento's NBHCP Permit Area. These 28 acres are included in the 8,050 acres of disturbance attributed to the City of Sacramento. As a result, MAP will disturb 1,983 acres of the 17,500 acres of disturbance addressed by the NBHCP. The MAPHCP provides for automatic revision of the MAPHCP to incorporate applicable provisions of the revised NBHCP upon approval of the latter by regulatory agencies.

## 3.4 Local Policies and Ordinances

The Plan Area is located in unincorporated Sacramento County and is subject to the following local and regional regulations.

### 3.4.1 Sacramento County General Plan

The Sacramento County General Plan is a set of goals, objectives, policies, implementation measures, and maps that form a blueprint for physical development in the unincorporated County. The General Plan contains numerous goals, policies, and strategies to protect and/or preserve biological resources (Sacramento County 2021).

The Conservation Element of the General Plan includes as an overarching goal the management and protection of natural resources for the use and enjoyment of present and future generations while maintaining the long-term ecological health and balance of the environment.

The Open Space Element also incorporates habitat preservation principles to aid in the preservation/recovery of endangered and threatened species through protection of vernal pools, wetlands, creeks, oak woodlands, and other native plant communities throughout Sacramento County.

In addition to Open Space, the Agricultural Element of the General Plan places specific emphasis on agricultural lands and their importance not only in agricultural and economic productivity, but the natural resource and cultural benefits they provide.

### 3.4.2 Sacramento County Code Chapter 19.12 Tree Preservation and Protection

Sacramento County has adopted a tree preservation and protection ordinance to prevent the loss of native oak trees. For the purposes of this ordinance, tree is defined as:

> *Any living native oak tree having at least one trunk of six inches or more in diameter measured four and one-half feet above the ground, or a multi-trunked native oak tree having an aggregate diameter of ten inches or more, measured four and one-half feet above the ground.*

The majority of the oak woodland in Sacramento County has been cleared for agricultural and development uses and constitutes a fraction of what existed prior to the arrival of Europeans to the region. The County Tree Preservation and Protection Ordinance states that "it shall be the policy of the County to preserve all trees possible through its development review process" (SCC 480 § 1, 1981) (Sacramento County 1981). The intent of the policy is to enhance the natural beauty of the area, sustain potential property values associated with oak woodlands, and preserve the natural ecology of the region. Oak woodlands are important ecosystems in the Sacramento Valley which provide unique ecological services including topsoil retention and the mitigation of extreme temperatures and poor air quality.

### 3.4.3 Sacramento County Swainson's Hawk Ordinance

Sacramento County provides for a Swainson's Hawk Mitigation Program. As amended by the Board of Supervisors in 2009, the program provides for the following voluntary means for mitigating impacts to Swainson's Hawk foraging habitat:

- For impacts of less than 40 acres, project proponents have the option to pay an impact fee or provide title or easement to suitable Swainson's Hawk mitigation lands on a per-acre basis.
- For impacts of 40 acres or greater, project proponents must provide title or easement to approved Swainson's Hawk mitigation lands with one acre preserved for each one acre impacted.

The determination of impacts and mitigation land suitability is evaluated by the County's Office of Planning and Environmental Review.

# 4 Methods

This Biological Resources Assessment is informed by data from a desktop analysis of the literature and numerous resource databases, as well as more than three years of site-specific field surveys. The methods used to complete these surveys and desktop analyses are described below.

## 4.1 Desktop Review

Prior to conducting field surveys, Bargas biologists conducted an initial review of pertinent literature and data sources to characterize the biological conditions on and within the vicinity of the Plan Area and to compile records of sensitive biological resources, including occurrences of special status species. These data have been subsequently reviewed repeatedly throughout the implementation of field surveys and the creation of this Assessment. The methods used for this analysis are described below.

### 4.1.1 Biological Setting

The biological setting includes terrain, hydrology, soils, land uses, and other features that support or inhibit biological resources in an area. In order to better understand the biological setting of the project, the following resources were reviewed in detail:

- US Fish and Wildlife Service's National Wetlands Inventory (NWI) (USFWS 2021) to determine if surface waters and wetlands have been mapped on or adjacent to the Plan Area;
- US Geological Survey's National Hydrography Dataset (NHD) (USGS 2021) to determine if hydrological features have been mapped on or adjacent to the Plan Area;
- US Department of Agriculture National Resource Conservation Service (soil survey maps and unit descriptions (NRCS 2020) to map and describe soil(s) within the Plan Area;
- Google Earth Pro aerial map images of the Plan Area, including historical aerial images (Google 2021).

### 4.1.2 Special Status Species and Habitats

When analyzing potential Project effects on special status biological resources effectively, it is important to create a well-defined list of habitats and species that could reasonably be expected to occur in the area of interest.

#### *4.1.2.1 Data Sources*

Species and habitat occurrences were queried from the following resources, with search areas that varied depending on the capabilities of the database:

- US Fish and Wildlife Service's *Information for Planning and Consultation* portal (IPaC; USFWS 2021) for a list of federally listed species and designated critical habitat recommended for impact analysis consideration, based on an upload of the Plan Area limits;
- California Department of Fish and Wildlife's *California Natural Diversity Database* (e.g., CNDDB, CDFW 2021) for special status species and habitat records within the *Sacramento West, Clarksburg, Davis, Florin, Grays Bend, Rio Linda, Sacramento East, Saxon,* and *Taylor Monument* USGS 7.5-minute quadrangles;
- California Native Plant Society's Inventory of Rare and Endangered Plants (CNPS 2021) for a list of special status plant species occurrences within the *Sacramento West, Clarksburg, Davis, Florin, Grays Bend, Rio Linda, Sacramento East, Saxon,* and *Taylor Monument* USGS 7.5-minute quadrangles;

#### *4.1.2.2 Special Status Designations Considered*

A variety of agencies and respected non-profit organizations assess the conservation status of plant and wildlife species. A number of species are tracked by the CNDDB, but otherwise have no special status designation applicable to this Assessment. The following designations were considered when determining special status species to be discussed in this assessment:

- **Federal:** Species listed as **Endangered (FE)**, **Threatened (FT)**, or as a **Candidate (FC)** for listing as Endangered or Threatened under the FESA
- **California:** Species listed as **Endangered (SE)**, **Threatened (ST)**, or as a **Candidate (SC)** for listing as Endangered or Threatened under the CESA as well as species listed as **Fully Protected (FP)** or as a **California Species of Special Concern (SSC)**
- **Plants Only:** Species listed in the CNPS *Inventory of Rare and Endangered Plants* (CNPS 2021)
- Any vegetation community, plant, or wildlife taxon with records in the area analyzed for the CNDDB
- Any species covered by the NBHCP or MAPHCP not otherwise included in the designations above, whether present in the database or not.

Bargas also included in this Assessment any special status species observed during field surveys that was not listed in the database review.

## 4.2 Field Surveys

Bargas biologists conducted more than 40 survey visits for biological resources from March 2019 to July 2021. The majority of these surveys had an emphasis on a particular resource of concern to Project permitting, but most gathered general biological information of significance to the completion of this Assessment:

- **Giant Gartersnake surveys:** Eric Hansen, a recognized expert in Giant Gartersnake biology and survey methods, completed trapping and eDNA surveys for the species consistent with the guidelines set forth in the USFWS two-year protocol and consistent with Hansen's 10(a)(1)(A) permit from June-September 2019 and June-September 2020 (Hansen 2019, 2020).
- **Swainson's Hawk surveys:** Swainson's Hawk protocol surveys with final reports were completed during three years:
    - March-July 2019, led by Bargas Principal Biologist Marcus England (Bargas 2019).
    - March-July 2020, led by Bargas Biologist Allison Ferkovitch (Bargas 2020d).
    - March-July 2021, led by Bargas Biologist Bekah Christianson (Bargas 2021).

  Surveys during all three years followed *Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley* (Swainson's Hawk Technical Advisory Committee 2000).
- **Botanical surveys:** Botanical surveys were conducted by Bargas Biologist Daniel Neal, Senior Biologists Bonnie Peterson and Krystal Pulsipher from March-July 2019, April 2020, and June 2020 (Bargas 2020c).
- **Arborist surveys:** Tree surveys were conducted in April and May 2021 by a team of biologists led by Krystal Pulsipher, a certified arborist (Bargas 2022).

- **Aquatic resources delineation:** Site surveys were conducted in June 2019, April 2020, June 2020 by a team of biologists led by Krystal Pulsipher (Bargas 2020a) and Bonnie Peterson in March 2021.

For detailed information on individual survey methods, please review the referenced reports.

Direct access during all field surveys in the Plan Area was restricted to the Surveyed Area defined previously in **Section 1.3-**Definitions. For some surveys, such as those for Swainson's Hawk, this was of minimal consequence because of the ability to survey the subject resource remotely using optics. For other resources, potential for occurrence had to be extrapolated based on remote observations in the field combined with detailed analysis of habitats as described below.

## 4.3 Habitat Analysis

Detailed GIS-based analyses were completed to create a vegetation layer, analyze habitat suitability, and assess the occurrence of wetlands and other potential jurisdictional features in the Plan Area where access could not be obtained by biologists. The methods used for these analyses are described below.

### 4.3.1 Vegetation

Vegetation in all portions of the RSA, including the Plan Area, have been mapped in significant detail. The underlying vegetation data used in this Assessment is derived from **Vegetation – Great Valley Ecoregion** (CDFW BIOS dataset ds2632). This dataset was produced to facilitate regional planning, conservation, and enhancement of biological resources by state agencies, project partners and regional stakeholders. Published in 2018, this geodatabase contains a map of vegetation within the Great Valley Ecoregion produced by the Geographical Information Center (GIC) at California State University – Chico. The minimum mapping unit for natural vegetation is 1.0 acre, with a minimum average width of 10 meters. The minimum mapping unit for agricultural and urban polygons is 10 acres. Vegetation is attributed to the Group and Alliance level of the state and national vegetation hierarchy.

This dataset was clipped to the limits of the RSA, and then further refined where needed, incorporating land use data from the California's Department of Water Resources (DWR) for Sacramento, Yolo, and Sutter Counties. Data were then manually assessed and reclassified where needed based on recent aerial photography.

### 4.3.2 Habitat Suitability

Various authors and agencies have developed frameworks for mapping habitats and using that data to assess habitat suitability for species. In California, the Department of Fish and Wildlife developed and maintains the *California Wildlife Habitat Relationships System* (CWHR). Among the tools provided by CWHR are the following:

- A habitat classification system, which can be cross-walked to other standard vegetation classifications (e.g., Holland 1986, Sawyer et al. 2009).
- A system for classifying size, cover, and habitat elements within a habitat classification.
- Habitat class and element preferences for all wildlife species in California.
- A software program for mapping habitat suitability for species based on a properly-structured input vegetation layer.

The system provides a structured and repeatable framework for analyzing habitat suitability for any wildlife species.

In order to analyze habitat suitability for key species, Bargas performed the following steps:

1. Prepared a table of structured vegetation attributes based upon the vegetation dataset described above in **Section 4.3.1**.
2. Ran the table prepared in Step 1 through the CWHR software for each species analyzed.
3. The output of Step 2 provides a habitat suitability matrix for each species and each provided vegetation type.
4. This table is then linked to the vegetation data for mapping of habitat quality and quantification of habitat availability and impacts.

### 4.3.3 Aquatic Resources

The USACE-verified (SPK-2020-00237) Aquatic Resources Delineation conducted in 2019 and 2020 covered the aquatic features mapped and overlapping the boundaries of the Surveyed Area. The USACE issued a Preliminary Jurisdictional Determination (PJD) for the project on 19 June 2020. The presence of potentially USACE jurisdictional aquatic features within the remaining portions of the Plan Area was assessed for this Assessment utilizing desktop methods. The following resources were reviewed to conduct this desktop analysis:

- USFWS NWI (USFWS 2021)
- USGS NHD (USGS 2021)
- NRCS Web Soil Survey (NRCS 2021)
- Aerial, including Bing "Bird's-Eye", imagery and street level imagery of the Plan Area (Google Earth Pro, 2021, Bing Maps 2021)

Current aerial and street level imagery were utilized to determine if aquatic features mapped within the databases listed above could still be extant. Current and available aerial and street level imagery were analyzed for possible aquatic features that were not mapped in the databases listed above. All potentially jurisdictional aquatic features identified using these methods were mapped in Google Earth Pro. Linear features were mapped by drawing the approximate centerline. Approximate OHWM was estimated using available imagery. Where visible in the imagery utilized, culverts were marked as point features. Non-linear or point features were drawn as polygons. A Google Earth KMZ file was then generated and converted into ESRI shapefile format. GIS was utilized to calculate the linear feet and surface area of each line and polygon feature, utilizing half of the OHWM widths to buffer the center-lines for linear features. The desktop-assessed aquatic features were then added to the exhibit from the USACE-verified aquatic resources delineation.

## 4.4 Occurrence Potential

Following the desktop review, field surveys, and habitat analyses, Bargas assessed the potential for the occurrence of special status species in the Plan Area. Biological conditions (vegetation communities, wildlife habitats, disturbances, etc.) and the habitat and life cycle requirements of special status species identified for analysis in the desktop review were considered. "Recent" occurrences are defined as observed within the past 30 years. Based on these considerations, species were assigned to the following categories:

- **Present:** Species is known to occur in Plan Area based on recent surveys, CNDDB (within 30 years), or other records.
- **High**: Species with known recent recorded occurrences/populations near the Plan Area and highly suitable habitat occurs within the Plan Area. Highly suitable habitat includes all necessary elements to support the species (e.g., elevation, hydrology, soils, cover, habitat type, food resources).

- **Moderate.** Species with known recent recorded occurrences/populations near the Plan Area; however, habitat within the Plan Area has been moderately disturbed, fragmented, or is small in extent. Moderately suitable habitat includes several elements to support the species (e.g., elevation, hydrology, soils, cover, habitat type, food resources). Furthermore, moderately suitable habitat may also be located at the edge of the species' range, or there are no reported occurrences nearby.
- **Low**. Species with few known recent recorded occurrences/populations near the Plan Area and habitat within the Plan Area is highly disturbed or extremely limited. A low potential is assigned to annual or perennial plant species that may have been detectable during a focused survey in the appropriate blooming period but was not found; however, small populations or scattered individuals are still considered to have a low potential to occur. Additionally, species for which poor-quality habitat may support the species within the Plan Area, but the reported extant range is far outside the Plan Area and/or any species observations would anticipate being migratory (i.e., not likely to reproduce within the Plan Area).
- **Presumed Absent/No Potential.** Focused surveys were conducted, and the species was not detected, or the species was found in the desktop review, but suitable habitat (soil, vegetation, elevational range) was not found in the Plan Area, or the Plan Area is not within the known geographic range of the species.

The potential for bird species were further distinguished into those that may: 1) nest within or near the Plan Area; 2) forage within or near the Plan Area; and/or 3) occur on or near the Plan Area only as transients during migratory flights or other dispersal events.

## 4.5 Taxonomy and Nomenclature

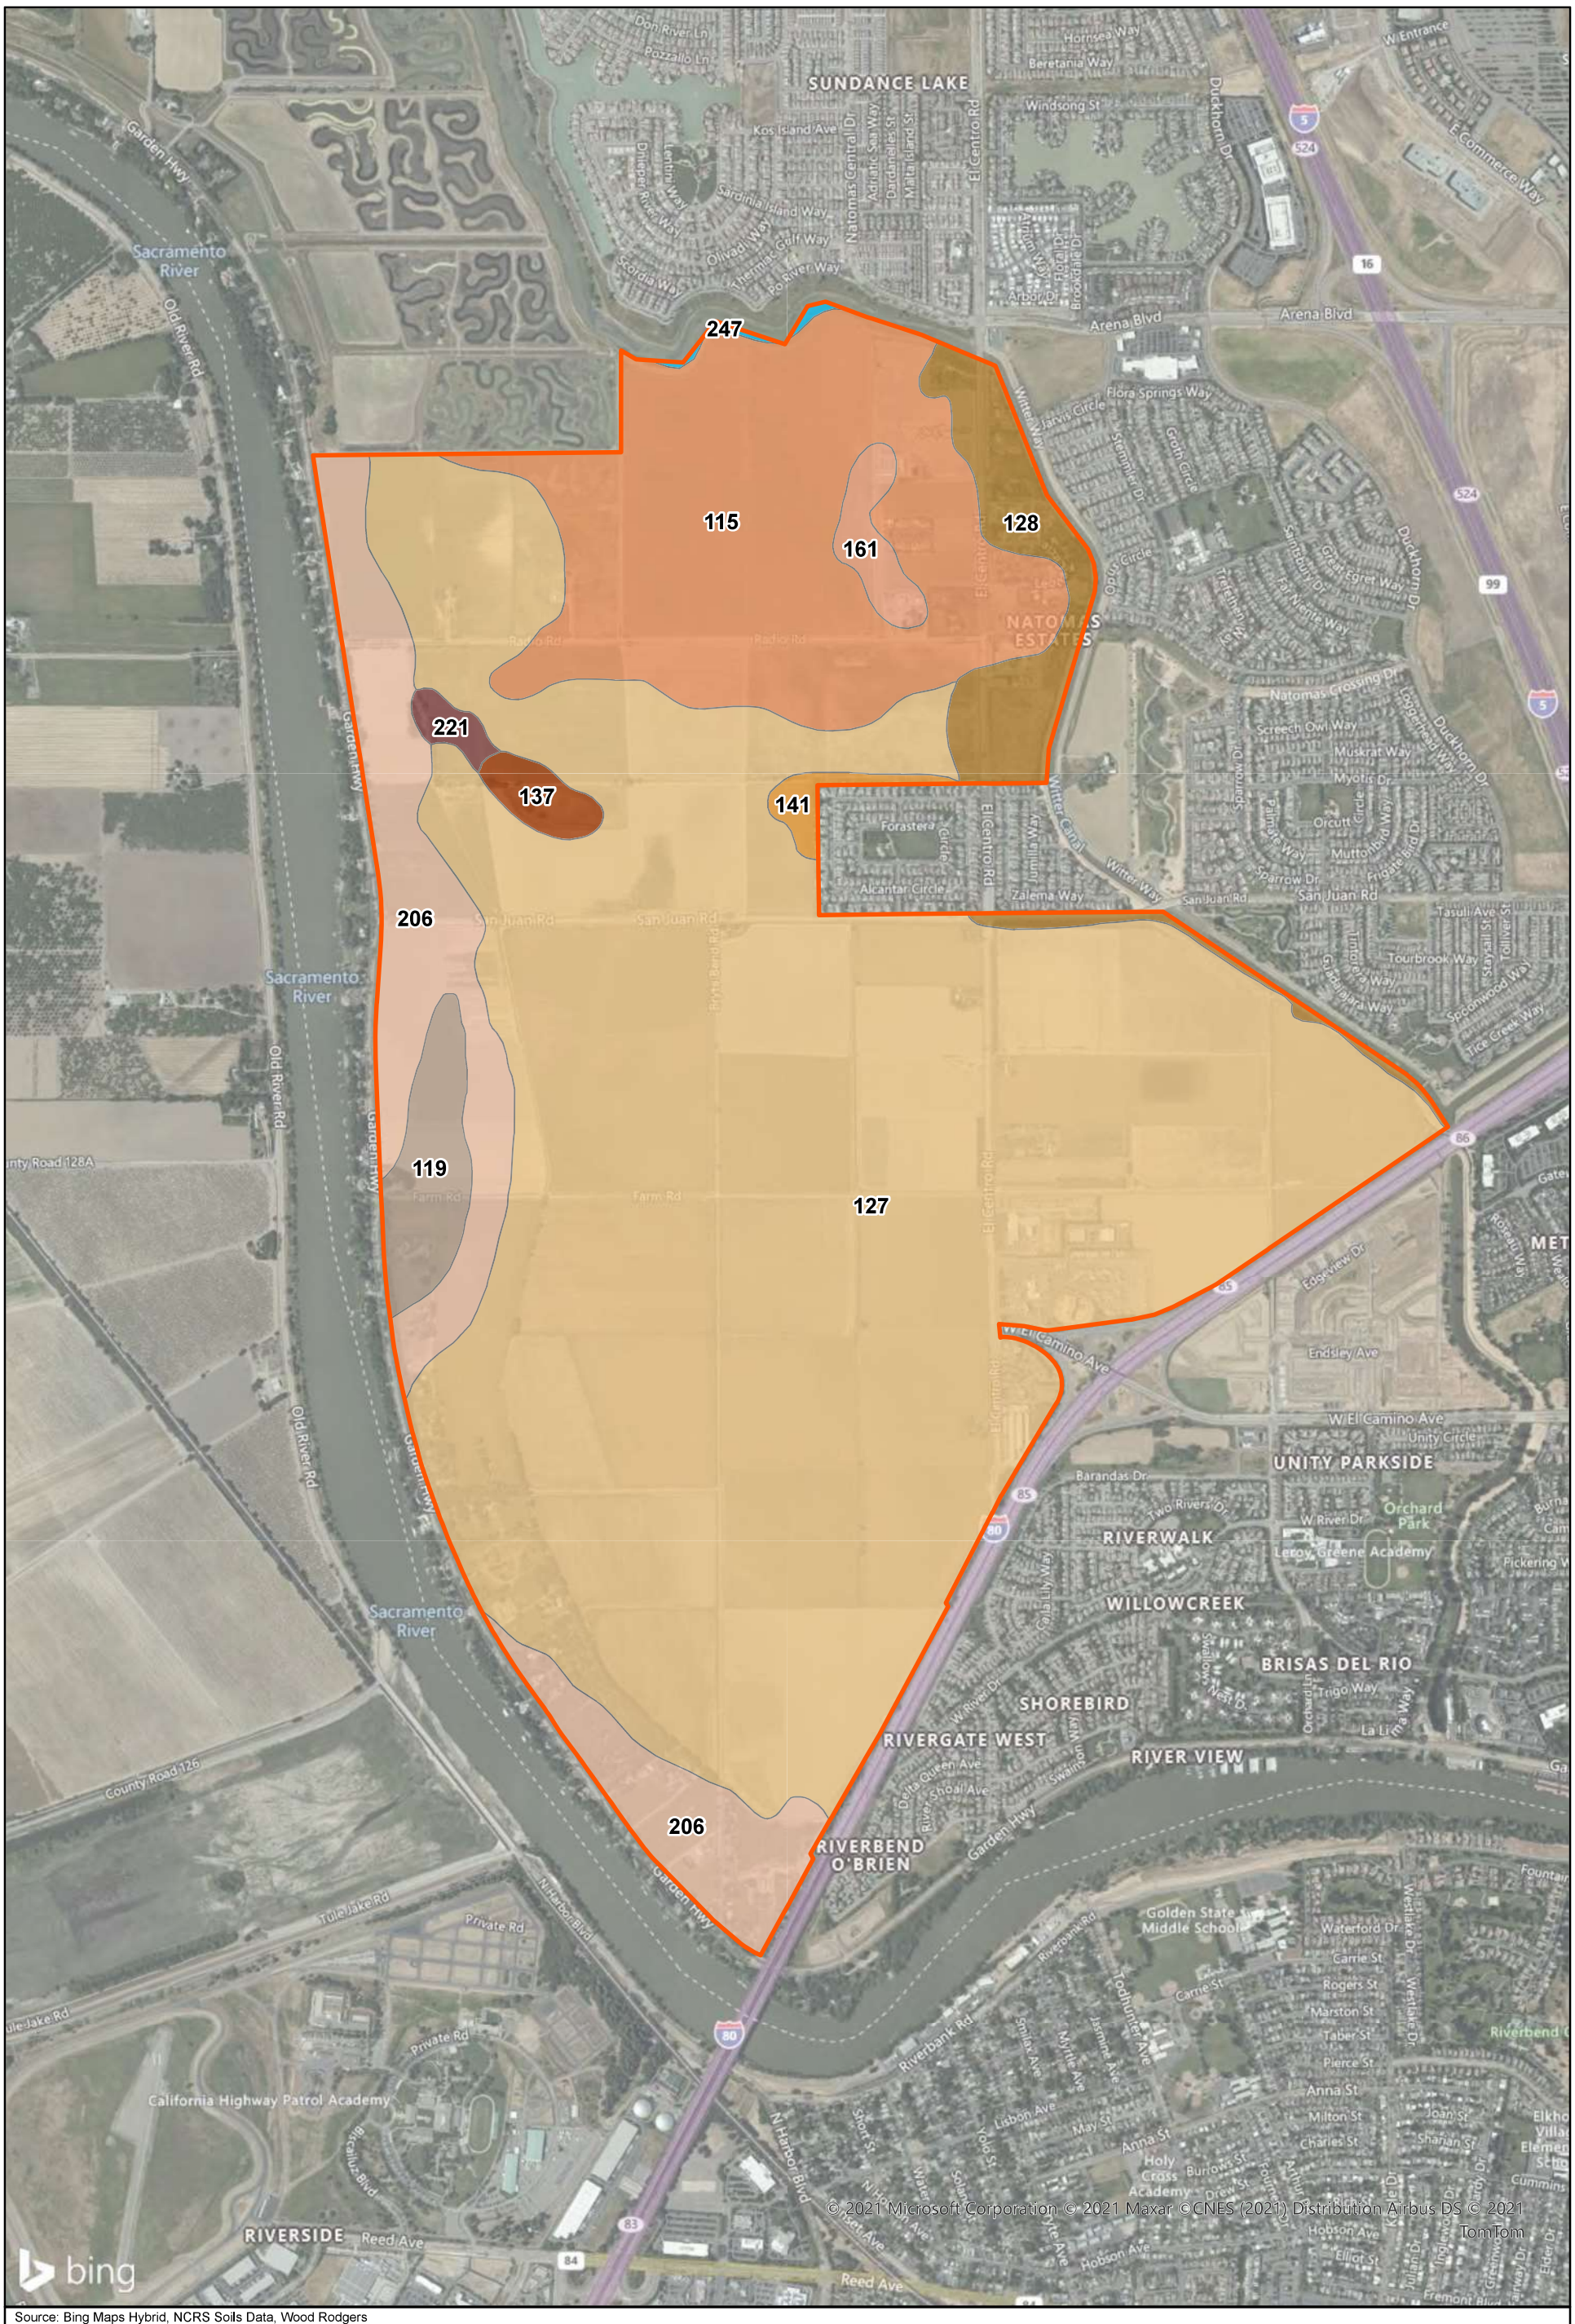
Every effort was made to use naming standards that are recognized by the scientific community, with the understanding that – for many wildlife groups – scientists may not always agree on a standard source. Because of this, some common names used in this report may not be the same as those used by the underlying data sources for species records. Bargas maintains a yearly-updated reference species list which uses the following taxonomic sources:

- **Birds** – American Ornithological Society Check-list and Supplements (AOS 2021)
- **Mammals** – The reference list in the CDFW's *California Wildlife Habitats Relationships Database* (CDFW 2014), with updates based on the American Society of Mammologists *Mammal Diversity Database* (2020)
- **Reptiles and Amphibians** – The technical website *californiaherps.com*, which is regularly updated based on the latest taxonomic literature.
- **Fish** – *Common and Scientific Names of Fishes from the United States, Canada, and Mexico*, 7th edition (AFS 2013)
- **Invertebrates** – no naming standard was identified that was current and applicable to freshwater and terrestrial invertebrates. Names used by the underlying data sources when a species was first identified were retained.
- **Plants** – the Jepson eFlora (Jepson eFlora 2021)

Birds have the most well-established naming standards of all taxonomic groups. These standards include instructions for the proper use of capitalization for common names to make clear that, for example, someone mentioning a Blue-winged Teal refers to the species "Blue-winged Teal" and not any species of teal with blue wings. The capitalization standards used for birds have been used with other taxa as well throughout this report.

# 5 Results

## 5.1 Biological Setting



When viewing the RSA limits in its entirety on aerial photography, the defining land use of the region is agriculture. Urban land uses are also significant and comprise the majority land use of the southeastern third of the RSA. Natural habitats are present, however, including interspersed and sometimes substantial annual grasslands, shrublands, and riparian woodlands along the margins of the Sacramento River in the west and American River in the southeast. Special status habitats such as vernal pools are also present in the region, particularly on sites with lesser disturbance. There are no significant terrain features in the RSA: elevations range from approximately 15 to 100 feet above mean sea level. The RSA is within the Lower Sacramento watershed, Hydrologic Unit Code (HUC)-8-18020109.

## 5.2 Soils

Nine soil types exist within the Plan Area, as summarized in **Table 1** below with the types, acreages, percentages, and hydric rating of each soil type. A map showing soils is provided as **Exhibit 4. Soils**. The NRCS soil report for the Plan Area is included in **Appendix D.**

*Table 1. Soil Types within the Plan Area*

| Soil Series | Map Unit Number | Map Symbol | Acreage within the Plan Area | Percent of the Plan Area | Hydric Rating |
|---|---|---|---|---|---|
| Clear Lake clay, hardpan substratum, drained, 0 to 1 percent slopes | 115 | hhlp | 310.3 | 15.0% | Hydric |
| Columbia sandy loam, clayey substratum, partially drained, 0 to 2 percent slopes | 119 | hhlt | 38.9 | 1.9% | Hydric |
| Cosumnes silt loam, partially drained, 0 to 2 percent slopes | 127 | 2x415 | 1,401.2 | 67.8% | Hydric |
| Cosumnes silt loam, drained, 0 to 2 percent slopes | 128 | hhm3 | 75.4 | 3.7% | Hydric |
| Durixeralfs, 0 to 1 percent slopes | 137 | hhmd | 13.3 | 0.6% | Not Hydric |
| Egbert clay, partially drained, 0 to 2 percent slopes | 141 | hhmj | 9.4 | 0.5% | Hydric |
| Jacktone clay, drained, 0 to 2 percent slopes | 161 | Hhn5 | 17.2 | 0.8% | Hydric |
| Sailboat silt loam, partially drained, 0 to 2 percent slopes, MLRA 16 | 206 | 2xlch | 189.6 | 9.2% | Hydric |
| San Joaquin-Xerarents complex, leveled, 0 to 1 percent slopes | 221 | Hhq3 | 7.3 | 0.4% | Hydric |
| Water | 247 | N/A | 2.4 | 0.1% | N/A |

## 5.3 Aquatic Resources

The aquatic resource site analysis was a combination of site surveys consistent with USACE wetland survey protocols, and desktop analysis for properties that were not currently accessible. A total of 20.03 acres and 103,879 linear feet of potential jurisdictional other waters of the U.S. have been identified within the Plan Area. The USACE issued a Preliminary Jurisdictional Determination (PJD) on 19 June 2020 for a 568.7-acre subset of the larger 2,065 Plan Area. **Table 2** below provides a summary of these features, including their classification, acreage, and length. **Exhibit 5. Aquatic Resources** displays each feature identified within the Plan Area in addition to an approximately 82-acre polygon in the northwest corner of the Plan Area within which construction of habitat mitigation wetlands and associated water conveyance features appears to be ongoing. The aquatic resource restoration construction is not linked to the anticipated unavoidable resource impacts associated with the Upper Westside Plan. The proposed Specific Plan designates the aquatic resource restoration area as AG – Agriculture Residential. A total of 11.22 acres and 41,881 linear feet, including all or portions of features R5UBFx-1 through -18, within the Surveyed Area have been verified by the USACE via the preliminary jurisdictional delineation (PJD) process (USACE 2020). Feature R5UBFx-19 was removed from the aquatic resources delineation for verification as the feature was confirmed to no longer exist through normal farming practices during the June 2020 supplemental site visit.

For the residual acreage that could not be accessed a desktop assessment of aquatic features was completed in 2022 and identified 8.81 acres, and 61,998 linear feet of potential jurisdictional other waters of the U.S. within the portions of the Plan Area beyond the boundaries of the Surveyed Area. Two of the features (R5UBFx-11, R5UBFx-15) identified during desktop analysis were contiguous with features mapped during the field ARD, therefore, the same feature name was assigned. Nine additional features (R5UBFx-20 through -29) were identified during a reconnaissance-level site visit completed to gather supplemental data requested by USACE during the PJD verification process. The desktop assessment identified nine more features (R5UBFx-30 through -38) within the Plan Area. A total of 38 other waters of the U.S. features have been identified within the Plan Area.

*Table 2. Potential Jurisdictional Features Mapped within the Plan Area*

| Feature Name | Classification | Area (acres)* | Length (linear feet) |
|---|---|---|---|
| R5UBFx-1 | Riverine, Unknown Perennial, Unconsolidated Bottom, Semipermanently Flooded, Excavated | 0.20 | 1,106 |
| R5UBFx-2 | Riverine, Unknown Perennial, Unconsolidated Bottom, Semipermanently Flooded, Excavated | 0.43 | 2,337 |
| R5UBFx-3 | Riverine, Unknown Perennial, Unconsolidated Bottom, Semipermanently Flooded, Excavated | 0.54 | 2,985 |
| R5UBFx-4 | Riverine, Unknown Perennial, Unconsolidated Bottom, Semipermanently Flooded, Excavated | 0.88 | 2,724 |
| R5UBFx-5 | Riverine, Unknown Perennial, Unconsolidated Bottom, Semipermanently Flooded, Excavated | 0.27 | 1,184 |
| R5UBFx-6 | Riverine, Unknown Perennial, Unconsolidated Bottom, Semipermanently Flooded, Excavated | 0.32 | 1,773 |
| R5UBFx-7 | Riverine, Unknown Perennial, Unconsolidated Bottom, Semipermanently Flooded, Excavated | 0.53 | 1,786 |
| R5UBFx-8 | Riverine, Unknown Perennial, Unconsolidated Bottom, Semipermanently Flooded, Excavated | 0.68 | 1,475 |
| R5UBFx-9 | Riverine, Unknown Perennial, Unconsolidated Bottom, Semipermanently Flooded, Excavated | 0.42 | 1,392 |

| Feature Name | Classification | Area (acres)* | Length (linear feet) |

Source: Bargas, 2020 and 2022. *Acreages for features R5UBFx-1 through -18 overlapping the Surveyed Area have been verified by the USACE as potential jurisdictional aquatic resources through PJD, SPK-2020-00237. The remaining acreage of features R5UBFx-1 through -18 are subject to modification pending formal verification by USACE. Features R5UBFx-20 through -38 are anticipated to require a formal aquatic resources delineation survey to obtain a PJD from USACE.

These features are best described as agricultural canals and ditches with very similar characteristics as some of the canals and ditches previously mapped during the field aquatic resources delineation. The features are classified as "R5UBFx," indicating that they are "Riverine, Unknown Perennial, Unconsolidated Bottom, Semi-permanently Flooded, [and] Excavated." The OHWM of the features vary in size from approximately one foot wide to 12 feet wide. The features which were field-mapped and verified exhibited evident beds and banks, as well as OHWM indicators. The desktop assessed waters were apparent in aerial imagery and, where street level imagery was available, appeared to have defined bed and bank.

Features R5UBFx-1 through -31 are located south of San Juan Road and appear to have substantial interconnectivity through culverts or other infrastructure utilized for agricultural irrigation / drainage. Features R5UBFx-32 through -38 are located north of San Juan Road and also appear to have substantial interconnectivity through various structures. The apparent hydrologic connection between these two regions (either side of San Juan Road) appears to be via culvert along RU5BFx-21 at the intersection of San Juan Road and Garden Highway. The following features have evident or likely hydrologic connection to either the Sacramento River or the West Drainage Canal through either pumping stations (Denham 2020), culverts, or other agricultural infrastructure:

- R5UBFx-21: Appears to receive water from the Sacramento River via the Riverside Pumping Plant
- R5UBFx-25: Appears to receive water from the West Drainage Canal via the San Juan Pump Station
- R5UBFx-33: Appears to receive water from the West Drainage Canal via the Riverside Pumping Station
- R5UBFx-34: Appears to have connectivity to West Drainage Canal via culvert or other structure
- R5UBFx-36: Appears to have connectivity to West Drainage Canal via culvert or other structure
- R5UBFx-37: Appears to have connectivity to West Drainage Canal via culvert or other structure

## 5.4 Habitats and Vegetation Communities

### 5.4.1 Vegetation Communities in the Plan Area

The following sections describe the vegetation communities and other landcover types found within the Plan Area. Vegetation community descriptions, which largely match those of the *California Wildlife Habitat Relationships* system, are derived from the descriptions contained therein with revisions to make them consistent with conditions observed by Bargas biologists in the Plan Area. This information is shown on the map provided as **Exhibit 6. Vegetation Communities –Plan Area** and summarized in **Table 2**.

#### *5.4.1.1 Irrigated Row and Field Crops*

Irrigated Row and Field Crops are found on 892.1 acres, or 43.2% of the Plan Area at the time of this Assessment. Like most agricultural habitat types, cover type, canopy, plant composition and other metrics are variable and may change year to year or even season to season. This is mapped as Field Crops and Orchard – Vineyard, which are non-CWHR types, on **Exhibit 6**. Depending on the growing season and crop planted, some areas may have 100 percent canopy while others may have significant bare areas between rows. Row and field crops are established on fertile soils, which historically supported an abundance of wildlife. Many species of rodents and birds have adapted to croplands. Availability of irrigation water during dryer months benefits many wildlife species as a source of water. This land use would be mapped as the Non-Rice Crops land classification of the NBHCP.

#### *5.4.1.2 Irrigated Hayfield*

Irrigated Hayfields are found on 511.1 acres, or 24.8% of the Plan Area at the time of this Assessment. Like most agricultural habitat types, cover type, canopy, plant composition and other metrics are variable and may change year to year or even season to season. This is mapped as Cropland, which is a non-CWHR type, on **Exhibit 6.** Except for 2 to 6 months initial growing period, depending on climate, and soil, this habitat is dense, with nearly 100 percent cover. Planted fields generally are monocultures. Structure changes to a lower stature following each harvest, grows up again and reverts to bare ground following plowing or discing. Plowing may occur annually but is usually less often. Layering generally does not occur in this habitat. This habitat can provide a high-quality seasonal resource for a variety of wildlife, however, where harvesting is constant, reproduction values for ground-nesting species are reduced to zero. This land use would be mapped as the Non-Rice Crops land classification of the NBHCP.

#### *5.4.1.3 Annual Grassland*

Annual Grasslands are found on 232.8 acres, or 11.3% of the Plan Area within the agricultural matrix and occur while fields have remained fallow for an extended period. Annual Grassland habitats are open grasslands composed primarily of annual plant species. Dramatic differences in physiognomy, both between seasons and between years, are characteristic of this habitat. Fall rains cause germination of annual plant seeds. Plants grow slowly during the cool winter months, remaining low in stature until spring, when temperatures increase and stimulate more rapid growth. Large amounts of standing dead plant material can be found during summer in years of abundant rainfall. Many wildlife species use Annual Grasslands for foraging, but some require special habitat features such as cliffs, caves, ponds, or habitats with woody plants for breeding, resting, and escape cover. This vegetation community would be mapped as the Grassland land classification of the NBHCP.

#### *5.4.1.4 Pasture*

Pasture is found on 193.3 acres, or 9.4% of the Plan Area at the time of this Assessment. Like most agricultural habitat types, cover type, canopy, plant composition and other metrics are variable and may change year to year or even

season to season. Pasture vegetation is commonly a mix of perennial grasses and legumes that normally provide 100 percent canopy closure. Height of vegetation varies, according to season and livestock stocking levels, from a few inches to two or more feet on fertile soils before grazing. Pastures are used by a variety of wildlife depending upon geographic area and types of adjacent habitats. Ground-nesting birds nest in pastures if adequate residual vegetation is present at the onset of the nesting season. Flood irrigation of pastures provides feeding and roosting sites for many wetland-associated birds. This land use would be mapped as the Pasture land classification of the NBHCP.

#### *5.4.1.5 Urban*

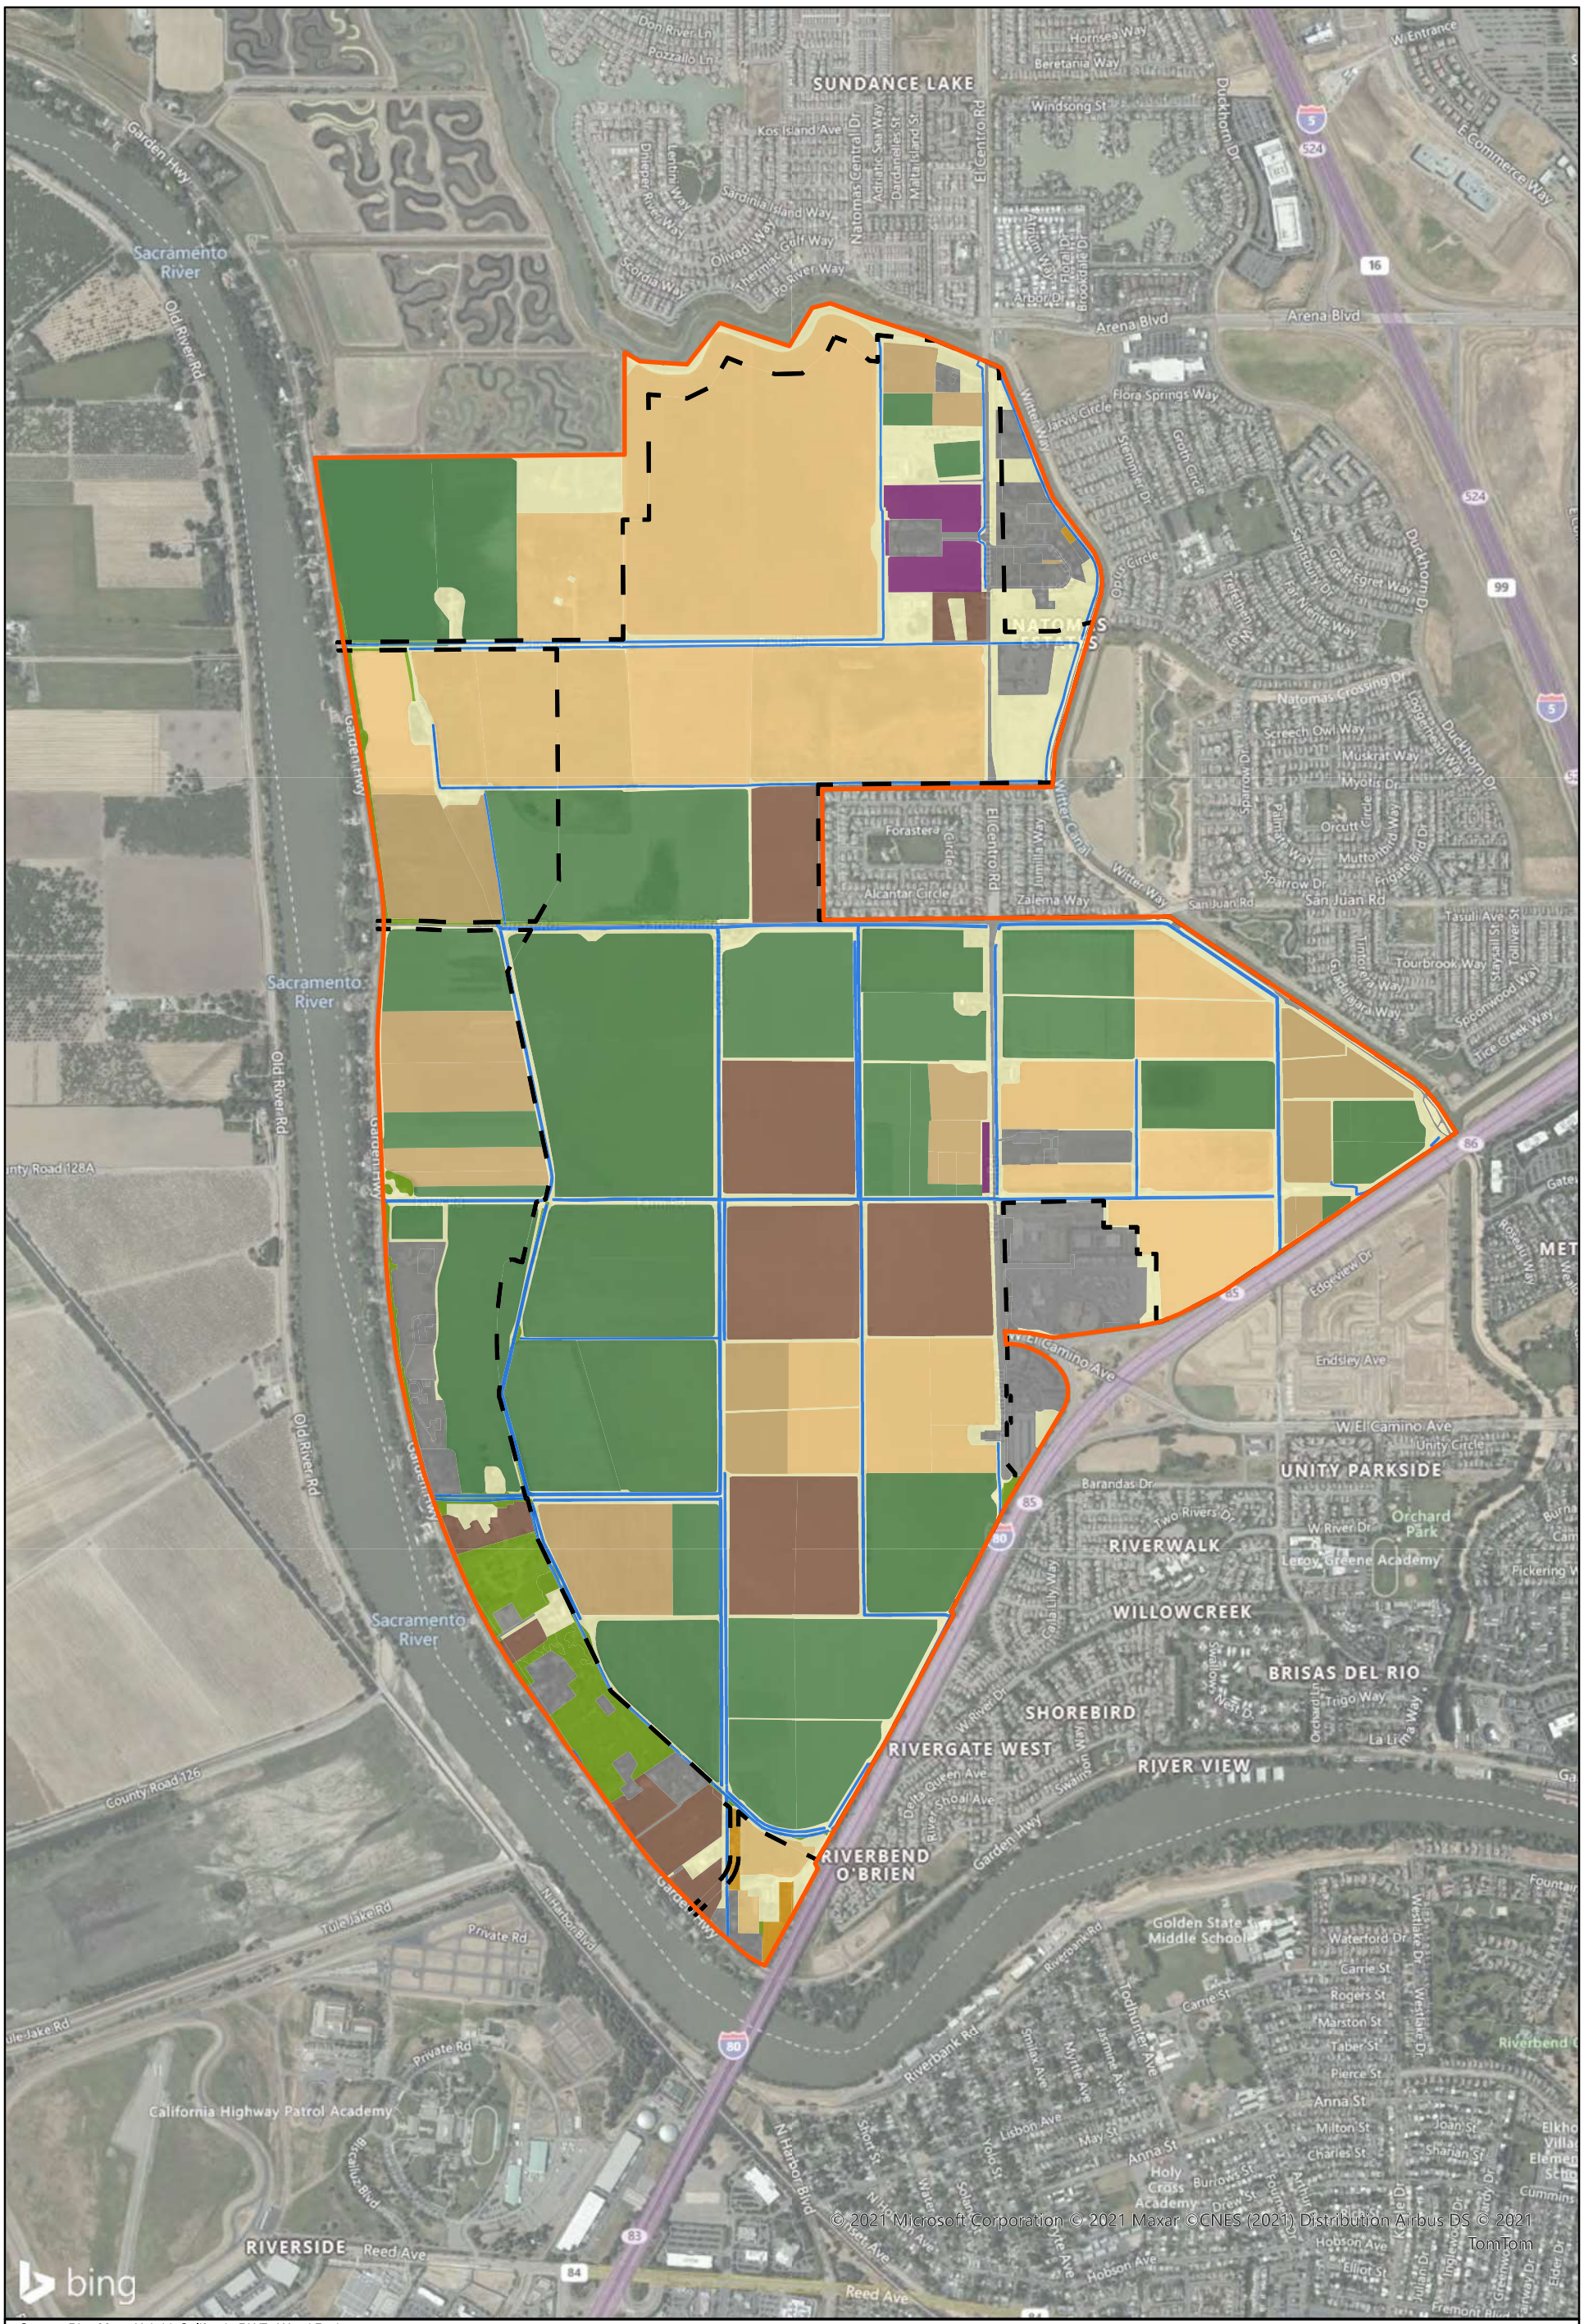
Urban habitats are found on 143.5 acres, or 6.9% of the Plan Area. The structure of urban vegetation varies with the land use. Within the Plan Area, areas mapped as Urban include residential lots as well as commercial development. Impervious surfaces – such as pavement – are common in the latter, while former often includes mowed lawns, gardens, and ornamental trees. The abundance of wooded cover in the Urban portions of the Plan Area provides shelter and foraging habitat for a wide variety of native and non-native wildlife, especially birds. This land use would be mapped as the Urban land classification of the NBHCP.

#### *5.4.1.6 Valley Foothill Riparian*

Valley Foothill Riparian is found on 50.0 acres, or 2.4% of the Plan Area. In the Plan Area, this habitat type is dominated by Valley Oak, with a handful of other canopy tree species such as California Sycamore. In the Plan Area, this habitat type often is part of a rural residential property. Undisturbed areas contain a subcanopy tree layer and an understory shrub layer. Valley-Foothill Riparian habitats provide food, water, migration and dispersal corridors, and escape, nesting, and thermal cover for an abundance of wildlife. This vegetation community would be mapped as the Riparian land classification of the NBHCP.

#### *5.4.1.7 Riverine*

Riverine is present on 20.1 acres, or 1.0% of the Plan Area. Within the Plan Area, this habitat type is represented by over 41,719 linear feet of irrigation canals and ditches. Within the Plan Area, the Riverine habitats contained Duckweed (*Lemna minor*), green algae, and a variety of emergent vegetation. The banks of the irrigation canals and ditches were dominated by ruderal vegetation. This land use would be mapped as the Canals land classification of the NBHCP.



#### *5.4.1.8 Vineyard*

Vineyards are found on 17.6 acres, or 0.9% of the Plan Area. Vineyards are composed of single species planted in rows, usually supported on wood and wire trellises. Vines are normally intertwined in the rows but open between rows. Rows under the vines are usually sprayed with herbicides to prevent growth of herbaceous plants. Between rows of vines, grasses and other herbaceous plants may be planted or allowed to grow as a cover crop to control erosion. Vineyards are typically planted on deep fertile soils which once supported productive and diverse natural habitats. Some species of birds and mammals have adapted to Vineyard habitats, including raptors, which often perch on supporting structures. This land use would be mapped as the Non-Rice Crops land classification of the NBHCP.

#### *5.4.1.9 Deciduous Orchard*

Deciduous Orchards are found on 4.7 acres or 0.2% of the Plan Area. Deciduous orchards are open single species tree dominated habitats. Spacing between trees is uniform depending on desired spread of mature trees. The understory may be composed of low-growing grasses, legumes, and other herbaceous plants, or may be managed to prevent understory growth totally or partially, such as along tree rows. Orchards are planted on deep fertile soils

which once supported productive and diverse natural habitats. Some species of birds and mammals have adapted to the orchard habitats. This land use would be mapped as the Orchard land classification of the NBHCP.

### 5.4.2 Vegetation Communities in the Regional Study Area and Natomas Basin

In assessing a project's effects on biological resources, it is important to understand the regional context of the biological resources that are found on a project site. The following, shown on **Exhibit 7. Vegetation Communities – Regional Study Area** and summarized in **Table 4** below, summarizes the vegetation communities found in the Plan Area relative to the Natomas Basin and the RSA:

- **Annual Grassland**, described above in **Section 5.4.2.3**, is located in 18,601.7 acres of the RSA, 3,895.8 acres of Natomas Basin, and 232.8 acres of the Plan Area. As such, the Plan Area harbors 1.3% of Annual Grasslands found in the RSA and 6.0% of the Annual Grasslands found in the Natomas Basin.
- **Deciduous Orchard**, described above in **Section 5.4.2.9**, is located in 18,349.6 acres of the RSA, 339.2 acres of the Natomas Basin, and 4.7 acres of the Plan Area. As such, the Plan Area harbors less than 0.1% of Deciduous Orchards found in the RSA and the Natomas Basin.
- **Irrigated Hayfield**, described above in **Section 5.4.2.2**, is located in 2,1321.6 acres of the RSA, 7,435.7 acres of the Natomas Basin, and 511.1 acres of the Plan Area. As such, the Plan Area harbors 2.4% of the Irrigated Hayfields in the RSA and 6.9% of the Irrigated Hayfields in the Natomas Basin.
- **Irrigated Row and Field Crops**, described above in **Section 5.4.2.1**, is located in 19,678.8 acres of the RSA, 1,927.0 acres of the Natomas Basin, and 892.1 acres of the Plan Area. As such, the Plan Area harbors 4.5% of Irrigated Row and Field Crops in the RSA and 46.3% of Irrigated Row and Field Crops in the Natomas Basin.
- **Pasture**, described above in **Section 5.4.2.4**, is located in 9,791.6 acres of the RSA, 1173.9 acres of the Natomas Basin, and 193.3 acres of the Plan Area. As such, the Plan Area harbors 2.0% of Pasture in the RSA and 16.5% in the Natomas Basin.
- **Riverine**, described above in **Section 5.4.2.7**, is located in 5,775.8 acres of the RSA, 625.1 acres of the Natomas Basin, and 20.1 acres of the Plan Area. As such, the Plan Area harbors 0.3% of Riverine in the RSA and 3.2% of Riverine in the Natomas Basin.

- **Urban**, described above in **Section 5.4.2.5**, is located in 64,794.1 acres of the RSA, 13,676.4 acres of the Natomas Basin, and 143.5 acres of the Plan Area. As such, the Plan Area harbors 0.2% of Urban habitats in the RSA and 1.0% of Urban habitats in the Natomas Basin.
- **Valley Foothill Riparian**, described above in **Section 5.4.2.6**, is located in 13,390.7 acres of the RSA, 2,313.3 acres of the Natomas Basin, and 50 acres of the Plan Area. As such, the Plan Area harbors 0.4% of Valley Foothill Riparian in the RSA and 2.2% of Valley Foothill Riparian in the Natomas Basin.
- **Vineyard**, described above in **Section 5.4.2.8**, is located in 26.3 acres of the RSA, 18.0 acres of the Natomas Basin, and 17.6 acres of the Plan Area. As such, the Plan Area harbors 66.9% of Vineyard habitat in the RSA and 97.6% of Vineyard habitat in the Natomas Basin.

The vegetation communities below are additional communities found in the RSA that are not present in the Plan Area:

- **Barren** is a series of habitat types – both natural and man-made – that are devoid of vegetation. Barren habitats are located in 35.2 acres of the RSA and 5.5 acres of the Natomas Basin.
- **Blue Oak Woodland** is a forested habitat located in 49.5 acres of the RSA, and not present in the Natomas Basin.
- **Coastal Scrub** is a shrub habitat located in 4.8 acres of the RSA, and not present in the Natomas Basin.
- **Eucalyptus** is a non-native woodland habitat located in 9.1 acres of the RSA, and not present in the Natomas Basin.
- **Fresh Emergent Wetland** is an aquatic habitat located in 3,616.8 acres of the RSA and 148.1 acres of the Natomas Basin.
- **Lacustrine** is an aquatic habitat located in 4,189.5 acres of the RSA and 492.4 acres of the Natomas Basin.
- **Montane Chaparral** is a tall shrub habitat located in 1.3 acres of the RSA, and not present in the Natomas Basin.
- **Montane Hardwood** is a forested habitat located in 7.8 acres of the RSA, and not present in the Natomas Basin.
- **Rice** is an agricultural habitat important to many wildlife species located in 52,374.9 acres of the RSA, and 21,333.3 acres of the Natomas Basin.
- **Wet Meadow** is an aquatic habitat located in 3.7 acres of the RSA, and not present in the Natomas Basin.

*Table 4. Regional Study Area Vegetation Summary*

| Community | RSA Acres | Natomas Acres | Plan Area | Plan Area/RSA | Plan Area/Natomas |
|---|---|---|---|---|---|
| Annual Grassland | 18601.7 | 3895.8 | 232.8 | 1.3% | 6.0% |
| Barren | 35.2 | 5.5 | - | - | - |

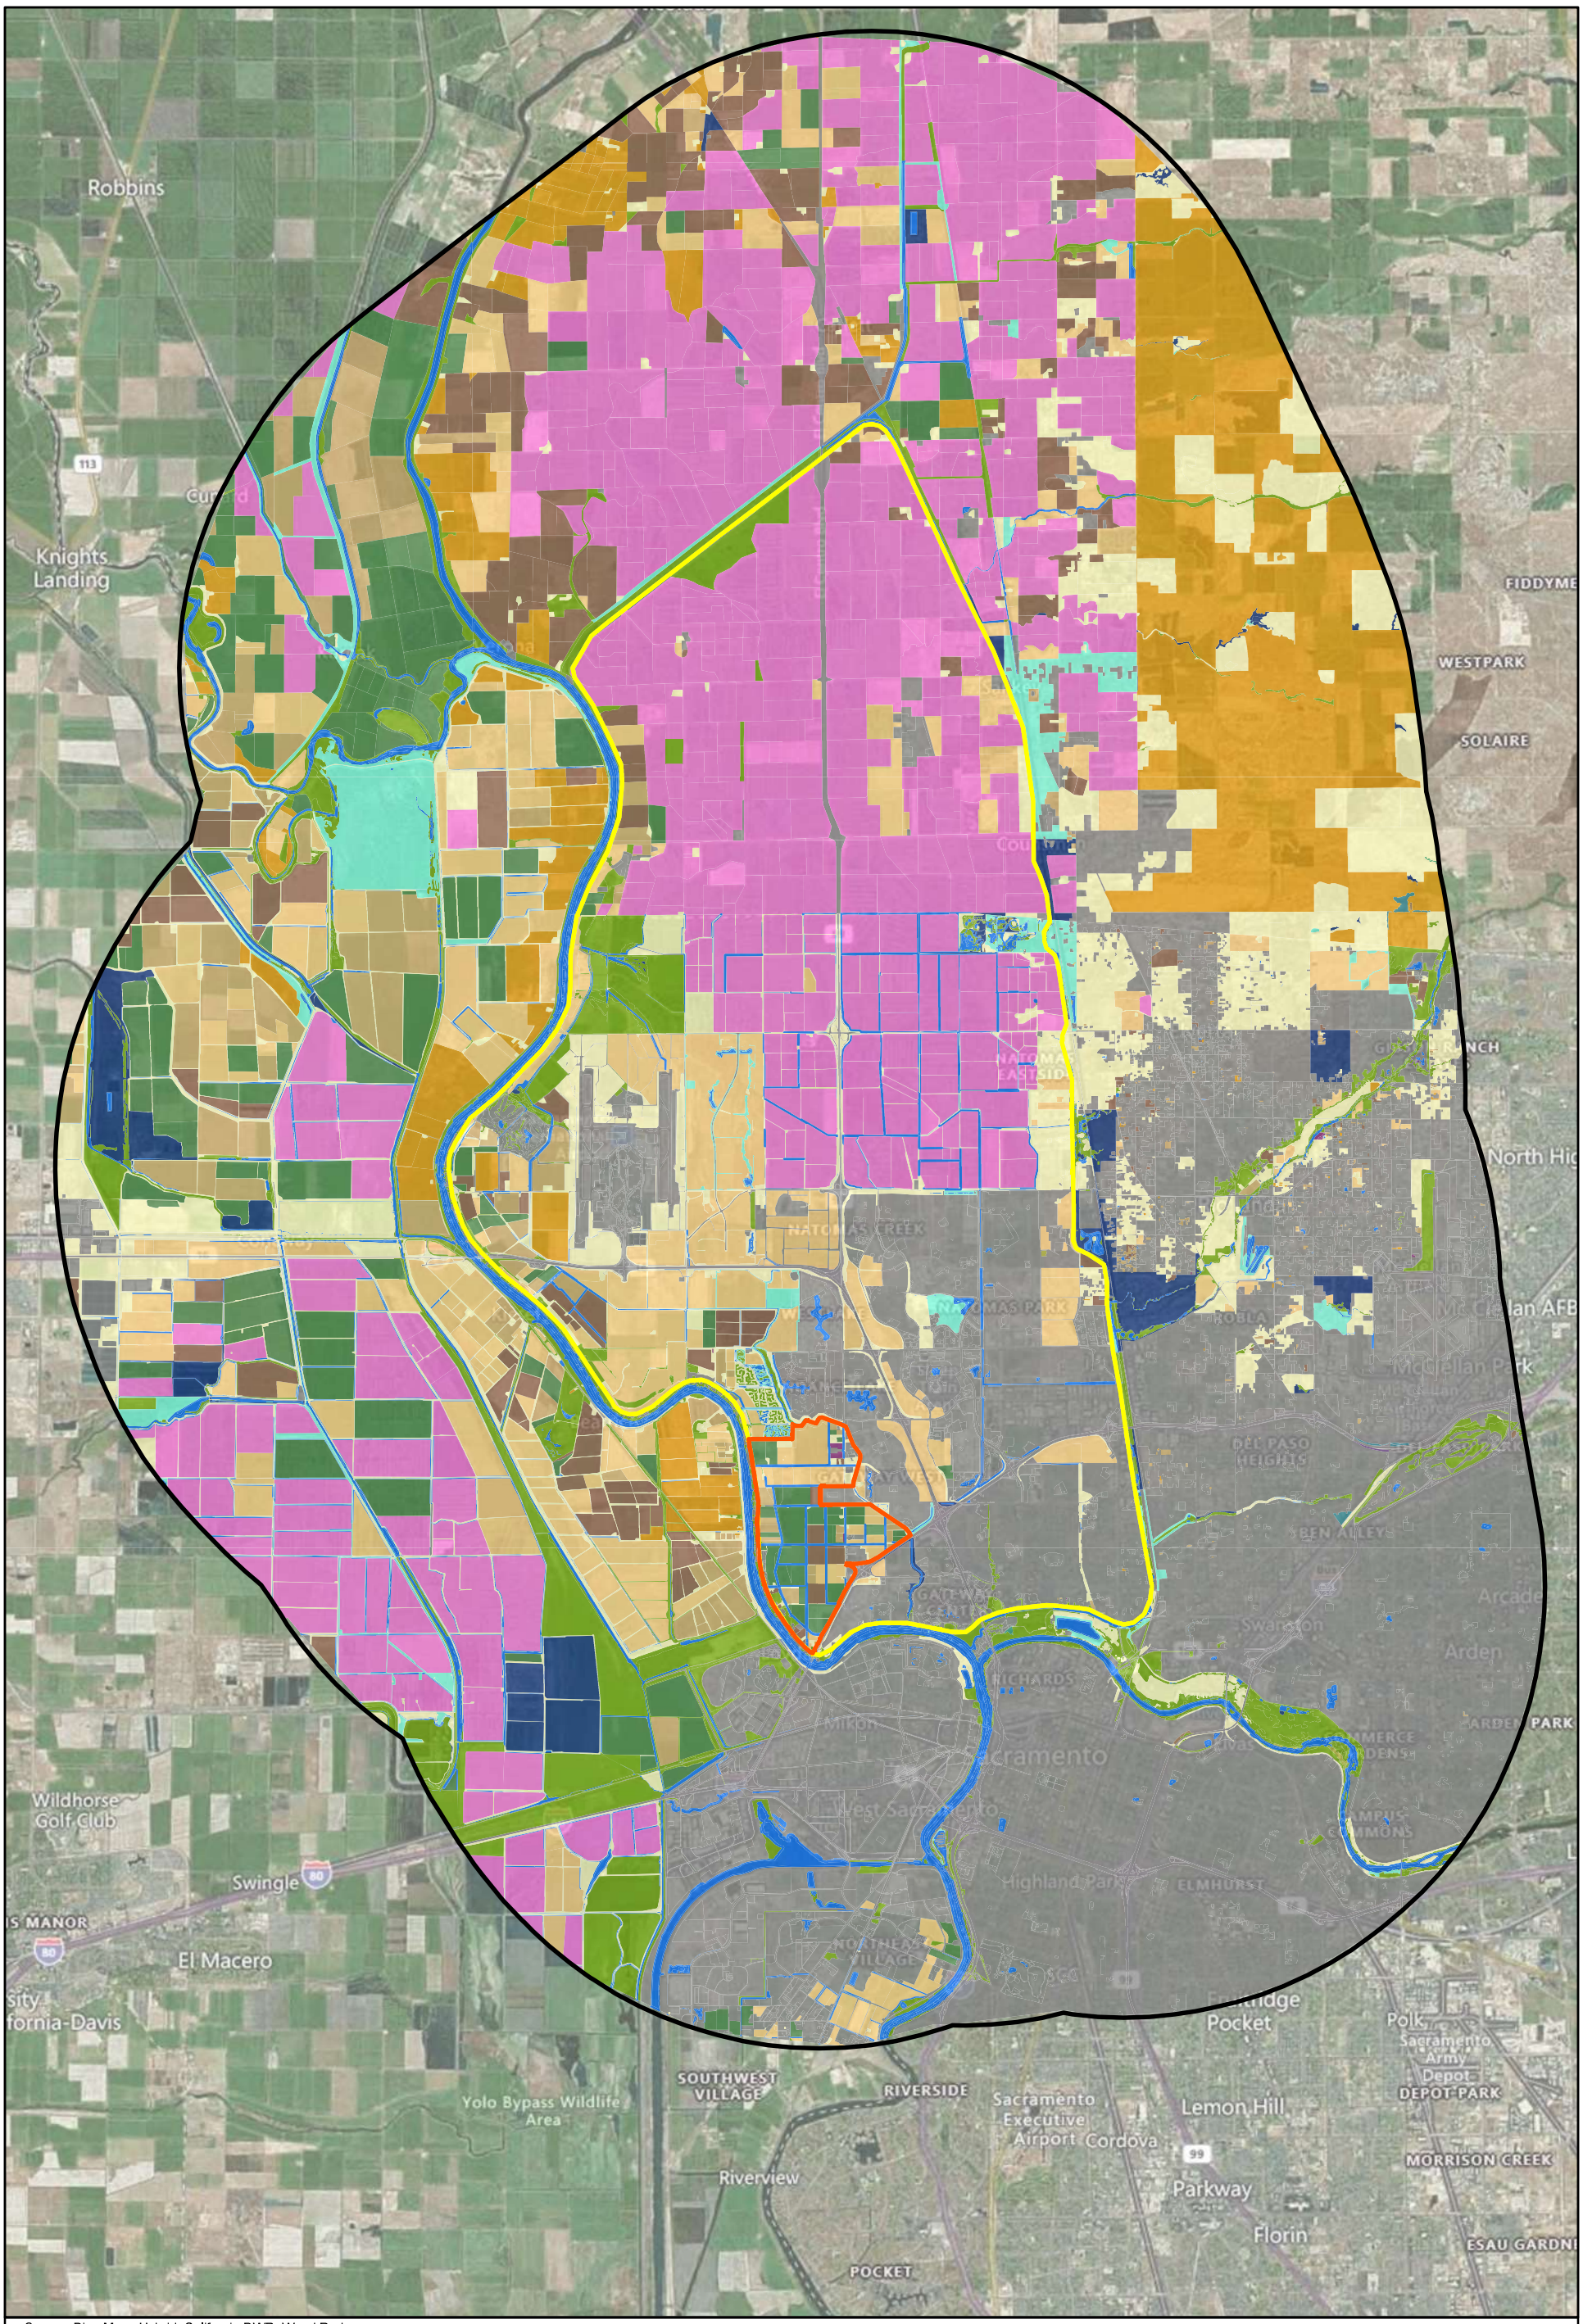
### 5.4.3 Sensitive Vegetation Communities



Three sensitive vegetation communities were mapped in the CNDDB for the area covered by the desktop review. None of these communities are present in the Plan Area. These are discussed below and summarized in **Appendix C.**

#### *5.4.3.1 Northern Hardpan Vernal Pool*

Holland (1986) describes Northern Hardpan Vernal Pool communities as *a low, amphibious, herbaceous community dominated by annual herbs and grasses. Germination and growth begin with winter rains, often continuing even when inundated. Rising spring temperatures evaporate the pools, leaving concentric bands of vegetation that colorfully encircle the drying pool.* There are eight location records for this community in the CNDDB desktop review, with the nearest being six miles northeast of Plan Area. Based on three years of surveys in the Surveyed Area, remote observations of the remainder of the Plan Area, a review of aerial photography at different seasons, and the absence of a restrictive clay layer across approximately 81% of the site, vernal pools communities were determined to be absent from the Plan Area.

#### *5.4.3.2 Northern Claypan Vernal Pool*

Holland (1986) describes Northern Claypan Vernal Pool communities as *similar to Northern Hardpan Vernal Pools, but with lower microrelief, and usually lower overall cover. Pools may be small (a few square meters) or quite large (covering several hectares).* There is a single location record for this community in the CNDDB desktop review four miles east of Plan Area. Based on three years of surveys in the Surveyed Area, remote observations of the remainder of the Plan Area, a review of aerial photography at different seasons, and the absence of a restrictive clay layer across approximately 81% of the site, vernal pools communities were determined to be absent from the Plan Area.

Source: Bing Maps Hybrid, California DWR, Wood Rodgers

**Exhibit 7**
**Vegetation Communities – Regional Study Area**

*Upper Westside*

Map Created: 1/13/2022, Map Revised: N/A, Bargas Project Number: 1024-18

#### *5.4.3.3 Great Valley Cottonwood Riparian Forest*

Holland (1986) describes Great Valley Cottonwood Riparian Forest communities as *a dense, broadleafed, winter deciduous riparian forest dominated by* Populus fremontii *and* Salix gooddingii variabilis*. Understories are dense, with abundant vegetative reproduction of canopy dominants.* There is a single location record in the CNDDB desktop review for this community, mapped along the far shore of the Sacramento River bend immediately southeast of the Plan Area. This location was field-verified as accurate during Swainson's Hawk surveys conducted in 2019. Otherwise, Great Valley Cottonwood Riparian Forest – which would have been visible in the Plan Area during surveys and on aerial photography – is absent from the Plan Area.

## 5.5 Plants

### 5.5.1 Floral Diversity

A list of plant species observed by Bargas biologists within the Surveyed Area is provided in **Appendix B**. A total of 58 plant species, none of which are special status species, have been observed between the botanical and arborist surveys. Approximately 55% of the observed species are non-native, 38% being recognized as invasive. Approximately 68% of the observed species occur in disturbed areas such as the ruderal roadside and agricultural land present within the Plan Area. Areas heavily disturbed by anthropogenic activities such as rural and urban development and agricultural activities can be expected to have lower floral diversity than areas containing intact natural plant communities and habitats.

### 5.5.2 Special Status Plants

The desktop review determined that a total of 26 special status plant species are known to occur in the nine-quadrangle search area surrounding the Plan Area. Legal status, natural history, and occurrence potential are described for each of these species below and summarized in **Appendix C.** Natural history information is taken directly from the CNPS *Inventory of Rare and Endangered Plants of California* (CNPS 2021). The botanical surveys were conducted during the blooming period for each of these 26 special status species, none were observed during the surveys conducted in the Survey Area, and none have greater than a low potential for occurrence in the Plan Area (including the portions that were not directly surveyed) given the extensive and long-term anthropogenic disturbance that characterizes the majority of the Plan Area.

#### *5.5.2.1 Taxa with Low Potential for Occurrence*

Of the 26 plant species analyzed for occurrence potential, 17 were determined to have a low potential for occurrence in the Plan Area. These species are described in detail below.

**Woolly Rose-Mallow (*Hibiscus lasiocarpos* var. *occidentalis*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.2 |
| NBHCP Covered: | No |
| Lifeform: | Perennial rhizomatous herb (emergent) |
| Blooming Period: | June to September |
| Elevation: | 0 to 395 feet |
| Habitat: | Freshwater marshes and swamps, wet banks, often in riprap on sides of levees |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are four previously recorded occurrences of this species within the database search area, the nearest recorded in 1988 within a mile of the Plan Area near the West El Camino Avenue exit for I-80. The Plan Area |

occurs within the elevational and distribution range of the species, however, primary threats to the species are agriculture and drainage channelization, which are predominant land uses in the Plan Area. Further, some of the irrigation canals and ditches within the Plan Area are periodically maintained (i.e. accumulated sediment removed, vegetation along banks mowed/trimmed), with some not always inundated with water (dependent upon the agricultural irrigation needs), reducing their suitability as potential habitat. As such, potential for the occurrence of this species is low in remainder of the Plan Area.

**Mason's Lilaeopsis (*Lilaeopsis masonii*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.1 |
| NBHCP Covered: | No |
| Lifeform: | Perennial rhizomatous herb |
| Blooming Period: | April to November |
| Elevation: | 0 to 35 feet |
| Habitat: | Brackish and freshwater marshes and swamps, intertidal marshes, riparian scrub |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are two previously recorded occurrences of this species within the database search area, the nearest recorded in 2009 along the banks of the Sacramento River Deep Water Ship Channel approximately 8.5 miles southwest of the Plan Area. The Plan Area occurs within the elevational and distribution range of the species, however, primary threats to the species are agriculture and drainage channelization, which are predominant land uses in the Plan Area. Further, some of the irrigation canals and ditches within the Plan Area are periodically maintained (i.e. accumulated sediment removed, vegetation along banks mowed/trimmed), with some not always inundated with water (dependent upon the agricultural irrigation needs), reducing their suitability as potential habitat. As such, potential for the occurrence of this species is low in remainder of the Plan Area. |

**Sanford's Arrowhead (*Sagittaria sanfordii*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.2 |
| NBHCP Covered: | Yes |
| Lifeform: | Perennial rhizomatous herb (emergent) |
| Blooming Period: | May to October |
| Elevation: | 0 to 2,135 feet |
| Habitat: | Shallow freshwater wetlands, ponds, ditches |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are four previously recorded occurrence of this species within the database search area, the nearest recorded in 1993 along an unnamed drainage within the American River Parkway approximately 5 miles southeast of the Plan Area. The Plan Area occurs within the elevational and distribution range of the species, however, primary threats to the species are agriculture and drainage channelization, which are predominant land uses in the Plan Area. Further, some of the irrigation canals and ditches within the Plan Area are periodically maintained (i.e. accumulated sediment removed, vegetation |

along banks mowed/trimmed), with some not always inundated with water (dependent upon the agricultural irrigation needs), reducing their suitability as potential habitat. As such, potential for the occurrence of this species is low in remainder of the Plan Area.

**Heartscale (*Atriplex cordulata* var. *cordulata*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.2 |
| NBHCP Covered: | No |
| Lifeform: | Annual herb |
| Blooming Period: | April to October |
| Elevation: | 0 to 1,835 feet |
| Habitat: | Saline or alkaline soils in chenopod scrub, meadows and seeps, valley and foothill grasslands (sandy soils) |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There is one previously recorded occurrence of this species within the database search area. While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. |

**Brittlescale (*Atriplex depressa*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.2 |
| NBHCP Covered: | No |
| Lifeform: | Annual herb |
| Blooming Period: | April to October |
| Elevation: | 5 to 1,050 feet |
| Habitat: | Playas, vernal pools, meadows and seeps with alkaline or clay soils in chenopod scrub and valley and foothill grassland communities |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There is one previously recorded occurrence of this species within the database search area. While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. |

**Bristly Sedge (*Carex comosa*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 2B.1 |
| NBHCP Covered: | No |
| Lifeform: | Perennial rhizomatous herb |
| Blooming Period: | May to September |
| Elevation: | 0 to 2,050 feet |
| Habitat: | Lake margins, wetland edges, and mesic places in coastal prairie, marshes and swamps, and valley and foothill grassland communities |

| | |
|---|---|
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There is one previously recorded occurrence of this species within the database search area but is of low accuracy. While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. |

**Pappose Tarplant (*Centromadia parryi* ssp. *parryi*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.2 |
| NBHCP Covered: | No |
| Lifeform: | Annual herb |
| Blooming Period: | May to November |
| Elevation: | 0 to 1,380 feet |
| Habitat: | Vernally mesic wetlands, marshes, or seeps often with alkaline soils in chaparral, coastal prairie, and valley and foothill grassland communities |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are previously documented occurrences of this species within the database search area. While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. |

**Palmate-bracted Bird's-Beak (*Chloropyron palmatum*)**

| | |
|---|---|
| Special Status: | Federal Endangered, State Endangered, California Rare Plant Rank 1B.1 |
| NBHCP Covered: | No |
| Lifeform: | Annual herb (hemiparasitic) |
| Blooming Period: | May to October |
| Elevation: | 15 to 510 feet |
| Habitat: | Alkaline flats in chenopod scrub and valley and foothill grassland communities |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are previously documented occurrences of this species within the database search area. While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. |

**Dwarf Downingia (*Downingia pusilla*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 2B.2 |
| NBHCP Covered: | No |
| Lifeform: | Annual herb |
| Blooming Period: | March to May |

| | |
|---|---|
| Elevation: | 5 to 1,460 feet |
| Habitat: | Vernal pool wetlands in valley and foothill grassland communities |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are previously recorded occurrences of this species within the database search area. While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. |

**Jepson's Coyote Thistle (*Eryngium jepsonii*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.2 |
| NBHCP Covered: | No |
| Lifeform: | Perennial herb |
| Blooming Period: | April to August |
| Elevation: | 10 to 985 feet |
| Habitat: | Vernal pools with clay soils and valley and foothill grassland communities |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are previously recorded occurrences of this species within the database search area. While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. |

**San Joaquin Spearscale (*Extriplex joaquinana*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.2 |
| NBHCP Covered: | No |
| Lifeform: | Annual herb |
| Blooming Period: | April to October |
| Elevation: | 5 to 2,740 feet |
| Habitat: | Meadows and seeps, playas, chenopod scrub, and valley and foothill grassland on alkaline soils. |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are previously recorded occurrences of this species within the database search area. While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. |

**Heckard's Pepper Grass (*Lepidium latipes* var. *heckardii*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.2 |
| NBHCP Covered: | No |

| | |
|---|---|
| Lifeform: | Annual herb |
| Blooming Period: | March to May |
| Elevation: | 5 to 655 feet |
| Habitat: | Valley and foothill grassland communities with alkaline soils. |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are previously recorded occurrences of this species within the database search area. While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. |

**Baker's Navarretia (*Navarretia leucocephala* ssp. *bakeri*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.1 |
| NBHCP Covered: | No |
| Lifeform: | Annual herb |
| Blooming Period: | April to July |
| Elevation: | 15 to 5,710 feet |
| Habitat: | Vernal pools and seeps in cismontane woodland, lower montane coniferous forest, and valley and foothill grassland communities |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are previously recorded occurrences of this species within the database search area. While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. |

**Bearded Popcorn Flower (*Plagiobothrys hystriculus*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.1 |
| NBHCP Covered: | No |
| Lifeform: | Annual herb |
| Blooming Period: | April to May |
| Elevation: | 0 to 900 feet |
| Habitat: | Vernal pool margins and mesic grasslands in valley and foothill grassland communities |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There is one previously recorded occurrence of this species within the database search area. While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. |

**California Alkaligrass (*Puccinellia simplex*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.2 |
| NBHCP Covered: | No |
| Lifeform: | Annual herb |
| Blooming Period: | March to May |
| Elevation: | 5 to 3,050 feet |
| Habitat: | Alkaline flats and sinks, mineral springs, and vernally mesic lake margins in chenopod scrub and valley and foothill grassland communities |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are previously recorded occurrences of this species within the database search area. While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. |

**Saline Clover (*Trifolium hydrophilum*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.2 |
| NBHCP Covered: | No |
| Lifeform: | Annual herb |
| Blooming Period: | April to June |
| Elevation: | 0 to 985 feet |
| Habitat: | Salt marshes, vernal pools, and open mesic areas with alkaline soils in valley and foothill grassland communities |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are previously recorded occurrences of this species within the database search area. While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. |

**Crampton's Tuctoria (*Tuctoria mucronata*)**

| | |
|---|---|
| Special Status: | Federal Endangered, State Endangered, California Rare Plant Rank 1B.1 |
| NBHCP Covered: | No |
| Lifeform: | Annual herb |
| Blooming Period: | April to August |
| Elevation: | 15 to 35 feet |
| Habitat: | Vernal pools and valley and foothill grassland. |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There is one previously recorded occurrence of this species within the database search area. While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. |

As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area.

#### *5.5.2.2 Taxa Presumed Absent/No Potential for Occurrence*

Of the 26 plant species analyzed for occurrence potential, nine were determined to be absent and have no potential for occurrence in the Plan Area. These species are described in detail below.

**Ferris' Milkvetch (*Astragalus tener* var. *ferrisiae*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.1 |
| NBHCP Covered: | No |
| Lifeform: | Annual herb |
| Blooming Period: | April to May |
| Elevation: | 5 to 245 feet |
| Habitat: | Vernally mesic meadows and seeps, subalkaline flats |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are previously recorded occurrences of this species within the database search area. This species was previously thought extinct until rediscovered in 1989 and is known from only six occurrences. The primary threat to this species is agriculture, which is the dominant land use in the Plan Area. As such, this species has been determined to have no potential for occurrence within the Plan Area. |

**Peruvian Dodder (*Cuscuta obtusiflora* var. *glandulosa*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 2B.2 |
| NBHCP Covered: | No |
| Lifeform: | Annual vine (parasitic) |
| Blooming Period: | July to October |
| Elevation: | 50 to 920 feet |
| Habitat: | Host plants include species in the *Alternanthera*, *Dalea*, *Lyrthrum*, *Polygonum*, and *Xanthium* genera in freshwater marshes and swamps |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There is one previously recorded occurrence of this species within the database search area but is of low accuracy. This species was last definitely documented in Merced County in 1948. Further, marsh and swamp habitat preferred by this species is not present in the Plan Area. As such, this species has been determined to have no potential for occurrence within the Plan Area. |

**Boggs Lake Hedge Hyssop (*Gratiola heterosepala*)**

| | |
|---|---|
| Special Status: | State Endangered, California Rare Plant Rank 1B.2 |
| NBHCP Covered: | Yes |
| Lifeform: | Annual herb |
| Blooming Period: | April to August |
| Elevation: | 0 to 7,790 feet |
| Habitat: | Vernal pools and lake margins with clay soils |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance. |

Remainder of Plan Area: There are previously recorded occurrences of this species within the database search area, however, the Plan Area lacks vernal pool or lake margins with clay soils and as such this species has been determined to have no potential for occurrence within the Plan Area.

**Delta Tule Pea (*Lathyrus jepsonii* var. *jepsonii*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.2 |
| NBHCP Covered: | Yes |
| Lifeform: | Perennial herb |
| Blooming Period: | May to July |
| Elevation: | 0 to 15 feet |
| Habitat: | Brackish and freshwater marshes and swamps |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are not any previously recorded occurrences of this species within the database search area. This species was included as an NBHCP Covered Species. The Plan Area lacks marsh and swamp habitat and as such this species has been determined to have no potential for occurrence within the Plan Area. |

**Legenere (*Legenere limosa*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.1 |
| NBHCP Covered: | Yes |
| Lifeform: | Annual herb |
| Blooming Period: | April to June |
| Elevation: | 5 to 2,885 feet |
| Habitat: | Vernal pools. |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are previously recorded occurrences of this species within the database search area, however, the Plan Area lacks vernal pools and as such this species has been determined to have no potential for occurrence within the Plan Area. |

**Colusa Grass (*Neostapfia colusana*)**

| | |
|---|---|
| Special Status: | Federal Threatened, State Endangered, California Rare Plant Rank 1B.1 |
| NBHCP Covered: | Yes |
| Lifeform: | Annual herb |
| Blooming Period: | May to August |
| Elevation: | 15 to 655 feet |
| Habitat: | Vernal pools with adobe clay soils. |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There is one previously recorded occurrence of this species within the database search area, however, the Plan Area lacks vernal pools and as such this species has been determined to have no potential for occurrence within the Plan Area. |

**Slender Orcutt Grass (*Orcuttia tenuis*)**

| | |
|---|---|
| Special Status: | Federal Threatened, State Endangered, California Rare Plant Rank 1B.1 |

| | |
|---|---|
| NBHCP Covered: | Yes |
| Lifeform: | Annual herb |
| Blooming Period: | May to September |
| Elevation: | 115 to 5,775 feet |
| Habitat: | Vernal pools often with gravelly soils. |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There is one previously recorded occurrence of this species within the database search area, however, the Plan Area lacks vernal pools and as such this species has been determined to have no potential for occurrence within the Plan Area. |

**Sacramento Orcutt Grass (*Orcuttia viscida*)**

| | |
|---|---|
| Special Status: | Federal Endangered, State Endangered, California Rare Plant Rank 1B.1 |
| NBHCP Covered: | Yes |
| Lifeform: | Annual herb |
| Blooming Period: | April to July |
| Elevation: | 100 to 330 feet |
| Habitat: | Vernal pools. |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are not any previously recorded occurrences of this species within the database search area. This species was included as an NBHCP Covered Species. The Plan Area does not occur within the elevational and distributional range of the species, and lacks the specific habitat types (vernal pools) required to support this species. This species has been determined to have no potential for occurrence within the Plan Area. |

**Suisun Marsh Aster (*Symphyotrichum lentum*)**

| | |
|---|---|
| Special Status: | California Rare Plant Rank 1B.2 |
| NBHCP Covered: | No |
| Lifeform: | Perennial rhizomatous herb |
| Blooming Period: | May to November |
| Elevation: | 0 to 10 feet |
| Habitat: | Brackish and freshwater marshes and swamps |
| Determination Reason: | Surveyed Area: Not detected during botanical surveys and almost certainly not present given extensive agricultural and other site disturbance.<br>Remainder of Plan Area: There are previously recorded occurrences of this species within the database search area. The Plan Area lacks marsh and swamp habitat and as such this species has been determined to have no potential for occurrence within the Plan Area. |

## 5.6 Wildlife

### 5.6.1 Wildlife Diversity

A list of wildlife species observed by Bargas biologists during surveys conducted for the Project is included **Appendix A**. While the majority of these observations were within the Plan Area, some were incidental to survey activities in surrounding survey buffers. A total of 100 wildlife species were observed across three years of surveys, including

two reptile species, six mammal species, and 92 bird species. Eight of the species observed are non-native. Three of the observed species are California Species of Special Concern: American White Pelican (*Pelacanus erythrorhynchos*), Yellow Warbler (*Setophaga petechia*), and Yellow-headed Blackbird (*Xanthocephalus xanthocephalus*).

### 5.6.2 Special Status Wildlife

The desktop review determined that five (5) invertebrate, three (3) fish, two (2) amphibian, two (2) reptile, and 13 bird species with special status had been documented as occurring in the nine-quadrangle search area surrounding the Plan Area. An additional three California Species of Special Concern were not in that data but were observed during surveys. Legal status, natural history, and occurrence potential are described for each of these species below and summarized in **Appendix C.** Natural history information for terrestrial vertebrate species is taken directly from the species accounts provided in the *California Wildlife Habitats Relationships System* with internal citations removed for brevity. Natural history sources for invertebrates and fish are cited where used.

#### *5.6.2.1 Taxa Confirmed Present*

Four (4) special status wildlife species were confirmed **Present** within the Plan Area.

**American White Pelican (*Pelacanus erythrorhynchos*)**

| | |
|---|---|
| Special Status: | California Species of Special Concern |
| NBHCP Covered: | No |
| Natural History: | In California, now nests only at large lakes in Klamath Basin, especially Clear Lake National Wildlife Refuge. It is common to abundant on nesting grounds April to August (sometimes March to September). Bred at Honey Lake in 1976, and formerly bred in large numbers in Central Valley and Salton Sea. From August to December common on salt ponds of San Francisco Bay and on the coastal slope from Sonoma County south. Locally uncommon to common on large lakes and estuaries in Central Valley. Fairly common at Lake Tahoe and Salton Sea in late spring and summer. Common spring and fall migrant at Salton Sea and Colorado River. In fall and winter, rare at Salton Sea, Morro Bay, and San Diego Bay; sporadic elsewhere. Migrant flocks pass overhead almost any month, but mainly in spring and fall throughout the state, especially in southern California. |
| Determination Reason: | Species was observed flying over as well as loafing/foraging on canals in the Plan Area. This species is fairly widespread and seasonally mobile, particularly in the non-breeding season. There is no breeding habitat for this species in the Plan Area. |

**Swainson's Hawk (*Buteo swainsonii*)**

| | |
|---|---|
| Special Status: | California Threatened |
| NBHCP Covered: | Yes |
| Natural History: | Uncommon breeding resident and migrant in the Central Valley, Klamath Basin, Northeastern Plateau, Lassen County, and Mojave Desert. Very limited breeding reported from Lanfair Valley, Owens Valley, Fish Lake Valley, and Antelope Valley. Breeds in stands with few trees in juniper-sage flats, riparian areas, and in oak savannah in the Central Valley. Forages in adjacent grasslands or suitable grain or alfalfa fields, or livestock pastures. In southern California, now mostly limited to spring and fall transient. Formerly abundant in California with wider breeding range. Decline resulted in part from loss of nesting habitat. |

Determination Reason: Species observed actively utilizing habitat within the Plan Area, with observations indicating the Plan Area is an important stopover site for migrants of the species. Four pairs were observed within the protocol survey study area (Plan Area plus a half-mile buffer) in 2021, with one pair confirmed nesting that year. Multiple year observations suggest two of these pairs have utilized habitat within this study area multiple years. Nesting was observed in this study area in 2019, 2020, and 2021.

**White-tailed Kite (*Elanus leucurus*)**

Special Status: California Fully Protected
NBHCP Covered: No
Natural History: Common to uncommon, yearlong resident in coastal and valley lowlands; rarely found away from agricultural areas. Inhabits herbaceous and open stages of most habitats mostly in cismontane California. Nests in isolated trees or in large stands, with nest trees varying in size from less than 3 m (10 ft) to greater than 50 m (164 ft) in height (Dunk 1995). Has extended range and increased numbers in recent decades.
Determination Reason: Species observed actively utilizing habitat within the Plan Area, primarily for foraging. One potential nest site was observed within the Swainson's Hawk protocol survey study area during the 2019 surveys. White-tailed Kite was observed multiple times near the 2019 potential nest site. This species was observed to the east of the Plan Area during the 2021 surveys with no nesting activity observed.

**Northern Harrier (*Circus hudsonius*)**

Special Status: California Species of Special Concern
NBHCP Covered: No
Natural History: Occurs from annual grassland up to lodgepole pine and alpine meadow habitats, as high as 3,000 m (10,000 ft). Breeds from sea level to 1,700 m (0-5,700 ft) in the Central Valley and Sierra Nevada, and up to 800 m (3,600 ft) in northeastern California. Frequents meadows, grasslands, open rangelands, desert sinks, fresh and saltwater emergent wetlands; seldom found in wooded areas. Permanent resident of the northeastern plateau and coastal areas; less common resident of the Central Valley. Widespread winter resident and migrant in suitable habitat. California population has decreased in recent decades, but can be locally abundant where suitable habitat remains free of disturbance, especially from intensive agriculture. Breeding population much reduced, especially in southern coastal district. Nests on the ground, usually in tall vegetation, making their nest locations often difficult to detect (Smith et a. 2011). Destruction of wetland habitat, native grassland, and moist meadows, and burning and plowing of nesting areas during early stages of breeding cycle, are major reasons for the decline.
Determination Reason: Species observed actively utilizing habitat within the Plan Area in 2019 and 2021, particularly in the eastern and northern portions of the Swainson's Hawk protocol survey study area.

### *5.6.2.2 Taxa with High Potential for Occurrence*

Four (4) special status wildlife species were determined to have a **High** potential to occur within the Plan Area

**Northwestern Pond Turtle (*Actinemys marmorata*)**

Special Status: California Threatened

NBHCP Covered: Yes

Natural History: *Actinemys* species are uncommon to common in suitable aquatic habitat throughout California, west of the Sierra-Cascade crest and absent from desert regions, except in the Mojave Desert along the Mojave River and its tributaries. Elevation range extends from near sea level to 1,430 meters (4,690 feet). Associated with permanent or nearly permanent water in a wide variety of habitat types. Western Pond Turtle was split into two species in 2014, with *A. marmorata* ranging from the Central Valley north. Northwestern Pond Turtles occur in a variety of fresh and brackish water habitats, including marshes, lakes, ponds, and slow-moving streams. This species is primarily aquatic; however, they typically leave aquatic habitats in the fall to reproduce and to overwinter. Deep, still water with abundant emergent woody debris, overhanging vegetation, and rock outcrops are optimal for basking and thermoregulation. Although adults are habitat generalists, hatchlings and juveniles require shallow edgewater with relatively dense submergent or short emergent vegetation in which to forage. Northwestern Pond Turtles are typically active between March and November, with mating occurring during late April and early May, and egg deposition between late April and early August. Eggs are deposited within excavated nests in upland areas, with substrates that typically have high clay or silt fractions. The majority of nesting sites are located within 650 feet of the aquatic sites; however, nests have been documented as far as 1,310 feet from the aquatic habitat.

Determination Reason: There are previously recorded occurrences of this species within the database search area. This species was frequently observed along the Natomas Main Drainage Canal, which is adjacent to the northeastern Plan Area border, during NBHCP habitat mapping surveys (City of Sacramento et al. 2003). The agricultural canals present within the Plan Area are significantly smaller than the Natomas Main Drainage Canal; however, the larger, deeper canals provide suitable aquatic habitat for this species. The Plan Area is heavily developed and disturbed by agricultural activities and commercial/residential development, therefore, breeding habitat for this species is severely limited within the Plan Area and restricted to relatively undisturbed areas immediately adjacent to the aquatic habitat. This species has been determined to have a high potential for occurrence.

**Loggerhead Shrike (*Lanius ludovicianus*)**

Special Status: California Species of Special Concern

NBHCP Covered: Yes

Natural History: A common resident and winter visitor in lowlands and foothills throughout California. Highest density occurs in open-canopied valley foothill hardwood, valley foothill hardwood-conifer, valley foothill riparian, pinyon-juniper, juniper, desert riparian, and Joshua Tree habitats. In the Great Basin, from Inyo County north, population declines markedly from November through March. Rare on

coastal slope north of Mendocino County, occurring only in winter. Occurs only rarely in heavily urbanized areas, but often found in open cropland. Sometimes uses edges of denser habitats. Often found in pastures and agricultural fields, this species is uncommon but widespread throughout the Sacramento Valley and Natomas Basin. This predatory songbird is often found along fence lines, utility poles, and other perches suitable for territorial defense, foraging, and courtship displays. These perches are especially valuable due to the species' unique foraging method. Loggerhead Shrikes lack the strong talons of larger birds of prey such as the American Kestrel or Cooper's Hawk. To compensate, Loggerhead Shrike use barbed wire fences, twigs, thorns, and other sharp protrusions to impale their prey after they have been captured. These impaling sites are used not only to kill prey items but also serve as a substrate for prey manipulation and storage (Morrison 1980). Common prey items include large arthropods, small reptiles and amphibians, and occasionally small mammals and birds. Loggerhead Shrike nest in shrubs, trees, and vines in open country and riparian habitats typically 1-2 m (3-6.5 ft) from the ground but nests may be found up to 15 m (49 ft; Bent 1950, Yosef 1996). Breeding season is typically from early March to late August with egg laying March to May. Incubation is 14 to 15 days and young leave the nest before 20 days (Yosef 1996).

Determination Reason: There are no previously recorded occurrences of this species in the database search area. Loggerhead Shrikes are a year-round resident of the Natomas Basin and found throughout the NBHCP area (City of Sacramento et al. 2003). Monitoring conducted by the Natomas Basin Conservancy has documented a decline in detections since 2012 with a record low number of observations recorded in 2019 (ICF 2020). Limited nesting habitat is present within the Plan Area in the form of shrubs and trees along some of the agricultural canals and on some of the commercial and residential parcels. The majority of the Plan Area provides suitable foraging habitat for this species. This species has been determined to have a high potential for occurrence.

**Yellow Warbler (*Setophaga petechia*)**

Special Status: California Species of Special Concern

NBHCP Covered: No

Natural History: Breeding distribution includes from the coast range in Del Norte County, east to Modoc plateau, south along coast range to Santa Barbara and Ventura counties and along western slope of Sierra Nevada south to Kern county. Also breeds along eastern side of California from the Lake Tahoe area south through Inyo co. Also breeds in several southern California mountain ranges and throughout most of San Diego County. Winters in Imperial and Colorado river valleys. Breeds in riparian woodlands from coastal and desert lowlands up to 2500 m (8000 ft) in Sierra Nevada. Also breeds in montane chaparral, and in open ponderosa pine and mixed conifer habitats with substantial amounts of brush. Numbers of breeding pairs have declined dramatically in recent decades in many lowland areas (southern coast, Colorado River, San Joaquin and Sacramento valleys). Now rare to uncommon in many lowland areas where formerly common. A common migrant on Channel and Farallon Islands in spring and fall.

Determination Reason: Common during breeding season in the riparian woodlands along the Sacramento River. Has potential to occur in landscaped urban areas within the

Plan Area, but unlikely to breed due to a lack of preferred riparian woodland elements.

**Yellow-headed Blackbird (*Xanthocephalus xanthocephalus*)**

Special Status: California Species of Special Concern
NBHCP Covered: No
Natural History: Breeds commonly, but locally, east of Cascade Range and Sierra Nevada, in Imperial and Colorado River valleys, in the Central Valley, and at selected locations in the coast ranges west of the Central Valley. Nests in fresh emergent wetland with dense vegetation and deep water, often along borders of lakes or ponds. Forages in emergent wetland and moist, open areas, especially cropland and muddy shores of lacustrine habitat. Restricted distribution in Central Valley in winter, occurring mainly in the western portion. Fairly common in winter in Imperial Valley. Occurs as a migrant and local breeder in deserts and along Orange County coast. Has bred, at least irregularly, as high as 2000 m (6600 ft) in San Bernardino Mountains.
Determination Reason: Recorded in a wetland east of the Plan Area during Swainson's Hawk surveys. While there is no appropriate breeding habitat in the Plan Area, this species is widespread during migration and winter and often forages on the ground in agricultural areas, such as those found in the Plan Area.

### *5.6.2.3 Taxa with Moderate Potential for Occurrence*

Five (5) special status wildlife species were determined to have a **Moderate** potential to occur in the Plan Area.

**Aleutian Cackling Goose (*Branta hutchinsii leucopareia*)**

Special Status: Federal Delisted
NBHCP Covered: Yes
Natural History: The only subspecies of *B. hudsonii* in California (*B.h. leucoparia*) was once considered a subspecies of *B. canadensis*, the Canada Goose (*B.c. leucoparia*). Preferred habitats include lacustrine, fresh emergent wetlands, and moist grasslands, croplands, pastures, and meadows. This species occurs mainly in these habitats during winter in Del Norte County, the San Francisco bay-delta, and southern Central Valley. Resident year-round in northeastern California, except most of the population departs in mid-winter if water freezes. Wintering populations elsewhere in California migrate north and east to breeding grounds in northeastern California, several western states, Canada, and Alaska, and are absent May to September. Nests mainly March to June in northeastern California, and February to June on the coastal slope.
Determination Reason: There are no previously recorded occurrences of this species in the database search area. Although there are no known occurrences within the Natomas Basin, the species may stop over in the Natomas Basin's marshes and agricultural fields on its way to nearby wintering areas in the southern San Joaquin Valley. A small population does winter to the north of the Natomas Basin along the border of Colusa and Sutter Counties (City of Sacramento et al. 2003). This species has not been detected within the NBHCP area since 2004 (ICF 2020). The Plan Area contains agricultural fields provide suitable foraging habitat during migration. This species has been determined to have a moderate potential for occurrence.

**White-faced Ibis (*Plegadis chihi*)**

Special Status: None

NBHCP Covered: Yes

Natural History: The White-faced Ibis is an uncommon summer resident in sections of southern California, a rare visitor in the Central Valley, and is more widespread in migration. It prefers to feed in fresh emergent wetland, shallow lacustrine waters, muddy ground of wet meadows, and irrigated or flooded pastures and croplands. Nests in dense, fresh emergent wetland. Formerly more common, especially in the San Joaquin Valley, this species no longer breeds regularly anywhere in California. A few pairs bred in 1977 and 1978 at the Salton Sea, and in 1979 at Buena Vista Lagoon, San Diego County. Has nested at Honey Lake, in the Klamath Basin, and at a few isolated areas in Central Valley. At Salton Sea area, fairly common April to September, and uncommon through winter; uncommon transient elsewhere in southern California, and very local winter visitant along coast. Rare in San Joaquin Valley, occurring mainly near Los Banos, August to April; and rare on northeastern plateau April to September.

Determination Reason: There are no previously recorded occurrences of this species in the database search area. This species is observed as a rare visitor to the Natomas Basin during migration (City of Sacramento et al. 2003). White-faced Ibis nesting colonies have been periodically observed on several NBHCP protected lands north of the Plan Area including the Central Basin Reserve in 2010 and Willey Wetlands Preserve in 2012 and 2013, but nesting has not been observed within the Natomas Basin since 2013 (ICF 2020). The Plan Area does not provide suitable nesting habitat for this species, but the agricultural fields may provide suitable foraging habitat depending upon the crop type being cultivated. This species has been determined to have a moderate potential for occurrence.

**Burrowing Owl (*Athene cunicularia*)**

Special Status: California Species of Special Concern

NBHCP Covered: Yes

Natural History: A yearlong resident of open, dry grassland and desert habitats, and in grass, forb and open shrub stages of Pinyon-Juniper and Ponderosa Pine habitats. Formerly common in appropriate habitats throughout the state, excluding the humid northwest coastal forests and high mountains. Numbers markedly reduced in recent decades. Present on the larger offshore islands. Found as high as 1600 meters (5300 feet) in Lassen County.

Determination Reason: This species is found in several locations in the Natomas Basin, including the higher terrace along the basin's eastern border, in tree planter boxes in the Power Balance Pavilion (formerly known as Arco Arena) parking lot, and along the higher berms of the larger irrigation and drainage canals in the central basin. Burrowing Owl has not been documented to occur in the Plan Area, however, it is most likely to occur during migration or winter. Within the Plan Area, Burrowing Owl would potentially be found in Annual Grassland and Urban habitats.

**Bank Swallow (*Riparia riparia*)**

Special Status: California Threatened

NBHCP Covered: Yes

Natural History: A neotropical migrant found primarily in riparian and other lowland habitats in California west of the deserts during the spring-fall period. A spring and fall migrant in the interior, less common on coast; an uncommon and very local summer resident. Casual in southern California in winter; a few winter records along central coast to San Mateo County. In summer, restricted to riparian, lacustrine, and coastal areas with vertical banks, bluffs, and cliffs with fine-textured or sandy soils, into which it digs nesting holes. In migration, flocks with other swallows over many open habitats. Range in California estimated to be reduced 50% since 1900. Formerly more common as breeder in California. Now, only approximately 110-120 colonies remain within the state. Perhaps 75% of the current breeding population in California occurs along banks of the Sacramento and Feather rivers in the northern Central Valley. About 50-60 colonies remain along the middle Sacramento River and 15-25 colonies occur along lower Feather River where the rivers meanders still in a mostly natural state. Other colonies persist along the central coast from Monterey to San Mateo counties, and northeastern California in Shasta, Siskiyou, Lassen, Plumas, and Modoc counties. Arrives in California from South America in early March and numbers peak by early May. Numbers fall off in July and August as colonies are abandoned and migration begins. Colonies are vacant by late July or early August, and migrants are observed usually through early or mid-September. There are few winter records for California.

Determination Reason: There are previously recorded occurrences of this species within the database search area. While breeding habitat is not present in the Plan Area, it is present locally along the adjacent Sacramento River, and the species may forage into the Plan Area. The species has also been reported in eBird by multiple observers at the nearby Sacramento Bypass Wildlife Area (eBird 2021). This species has been determined to have a moderate potential for occurrence.

**Tricolored Blackbird (*Agelaius tricolor*)**

Special Status: California Threatened, California Species of Special Concern

NBHCP Covered: Yes

Natural History: Mostly a resident in California. Common locally throughout Central Valley and in coastal districts from Sonoma County south. Breeds near fresh water, preferably in emergent wetland with tall, dense cattails or tules, but also in thickets of willow, blackberry, wild rose, tall herbs. Feeds in grassland and cropland habitats. Breeds locally in northeastern California. In winter, becomes more widespread along central coast and San Francisco Bay area and is found in portions of the Colorado Desert. Numbers appear to be declining in California. Usual breeding season mid-April into late July.

Determination Reason: There are previously recorded occurrences of this species within the database search area. The species is regularly reported in eBird at the nearby Sacramento Bypass Wildlife Area. Tricolored Blackbirds have been observed nesting north of the Plan Area including the BKS tract in 2005 through 2010, private lands north of the Natomas Basin in 2007, Frazer tract in 2008, and Willey Wetlands Preserve in 2011 and 2013 (ICF 2020). Suitable nesting habitat was determined to be absent from the Plan Area during numerous SWHA and other focused species surveys covering the entire Plan Area, however, the agricultural fields present in

the Plan Area provide suitable foraging habitat for this species. This species has been determined to have a moderate potential for occurrence.

#### *5.6.2.4 Taxa with Low Potential for Occurrence*

Three (3) special status wildlife species were determined to have a **Low** potential to occur in the Plan Area.

**Vernal Pool Fairy Shrimp (*Branchinecta lynchi*)**

Special Status: Federal Threatened

NBHCP Covered: Yes

Natural History[4]: The Vernal Pool Fairy Shrimp is currently found in 28 counties across the Central Valley and coast ranges of California, and in Jackson County of southern Oregon. Although the vernal pool fairy shrimp is distributed more widely than most other listed fairy shrimp species, it is generally uncommon throughout its range, and rarely abundant where it does occur. This species is adapted to the environmental conditions of their ephemeral habitats. One adaptation is the ability of the vernal pool fairy shrimp eggs, or cysts, to remain dormant in the soil when their vernal pool habitats are dry. Another important adaptation is that the vernal pool fairy shrimp has a relatively short life span, allowing it to hatch, mature to adulthood, and reproduce during the short time period when vernal pools contain water. This species occupies a variety of different vernal pool habitats, from small, clear, sandstone rock pools to large, turbid, alkaline, grassland valley floor pools.

Determination Reason: There are previously recorded occurrences of this species within the database search area. The Plan Area lacks vernal pool habitats required for this species to complete its life cycle, however, this species is known to be found in water accumulations with very short persistence, such as tire ruts and roadside ditches. As such, this species has been determined to have low potential for occurrence within the Plan Area.

**Valley Elderberry Longhorn Beetle (*Desmocerus californicus dimorphus*)**

Special Status: Federal Threatened

NBHCP Covered: Yes

Natural History[5]: When listed, the Valley Elderberry Longhorn Beetle was known from only 10 records in 3 locations (Merced County, Yolo County, and Sacramento County). Subsequent surveys throughout the Central Valley discovered more locations and the current presumed historical range is now believed to extend from Shasta County to Madera County below 500 feet in elevation (152.4 meters). Elderberry (*Sambucus* sp.) is the obligate larval host plant for the Valley elderberry longhorn beetle. After hatching, the larva creates a feeding gallery (set of tunnels) in the pith at the stem center. While only one larva is found in each feeding gallery, multiple larvae can occur in one stem if the stem is long enough to accommodate multiple galleries. Though rarely observed, adults have been described as feeding on the nectar, flowers, and leaves of the elderberry plant, or flying between trees. Previous studies of the beetle (both subspecies) estimated that the larval development period inside 2 the plant is 2 years, but laboratory

[4] https://www.fws.gov/sacramento/es/Recovery-Planning/Vernal-Pool/Documents/vp_fairy_shrimp.pdf
[5] https://ecos.fws.gov/docs/recovery_plan/Revised%20recovery%20plan%20for%20VELB.pdf

observations have indicated that the beetle may develop into an adult in a 1-year cycle. Because elderberry is the host plant for the beetle, environmental and habitat conditions that favor a robust elderberry community also benefit the beetle. Elderberry is an important component of riparian ecosystems in California. It can be found as an overstory plant or understory plant within these communities. Elderberry also occurs in upland communities such as oak woodland. Occupancy of elderberry by the Valley elderberry longhorn beetle is generally low but tends to be highest in riparian communities.

Determination Reason: There are previously recorded occurrences of this species within the database search area, primarily along the Sacramento and American Rivers. There are no known occurrences of this species within the Natomas Basin (City of Sacramento et al. 2003). Elderberry plants have not been observed within the Plan Area, though direct on the ground surveys have only been performed in the smaller Surveyed Area. There is no indication the Plan Area has specific habitat components required to support this species. This species has been determined to have low potential for occurrence within the Plan Area.

**Giant Gartersnake (*Thamnophis gigas*)**

Special Status: Federal Threatened

NBHCP Covered: Yes

Natural History: Historically ranged in the Sacramento and San Joaquin valleys. Its current range is much reduced, and it is apparently extirpated south of Fresno County except for western Kern County. Primarily associated with marshes and sloughs, less with slow-moving creeks, and absent from larger rivers. Active from May until October.

Determination Reason: While there are recent CNDDB records along the canal at the northern edge of the Plan Area, and DNA for the species was detected over two years in three locations outside of the Plan Area, and one location in the central portion of the Plan Area, habitat in the Plan Area has a low suitability for Giant Gartersnake. Further, intensive sampling efforts (40,703 total trap days), accompanied by a high catch of Valley Gartersnake (*Thamnophis sirtalis fitchi*), but zero captures of Giant Gartersnake, indicate there is low potential for occurrence of Giant Gartersnake population within the Plan Area, though the species may infrequently use interior canals for dispersal.

### *5.6.2.5 Taxa Presumed Absent/No Potential for Occurrence*

Twelve (12) special status wildlife species were assessed as **Presumed Absent/No Potential** within the Plan Area.

**Conservancy Fairy Shrimp (*Branchinecta conservatio*)**

Special Status: Federal Endangered

NBHCP Covered: No

Natural History[6]: The Conservancy Fairy Shrimp is known from a few isolated populations distributed over a large portion of California's Central Valley and in southern California. In the Northeastern Sacramento Valley Vernal Pool Region, four populations are clustered around the Vina Plains area in Tehama and Butte Counties. Populations are also found in the Solano-Colusa Vernal Pool Region on

[6] https://www.fws.gov/sacramento/es/Recovery-Planning/Vernal-Pool/Documents/conserv_fairy_shrimp.pdf

the Greater Jepson Prairie area in Solano County, at the Sacramento National Wildlife Refuge in Glenn County, and in the Tule Ranch unit of the CDFW Yolo Basin Wildlife Area, in Yolo County. The life history of this species is uniquely adapted to the ephemeral conditions of its vernal pool habitat. This species has been found to reach maturity in an average of 46 days, and live for as long as 154 days. However, aquatic invertebrate growth rates are largely controlled by water temperature and can vary greatly. This species produces one large cohort of offspring each wet season. Occurs in vernal pools found on several different landforms, geologic formations and soil types. At the Vina Plains in Tehama County, the species occurs in pools formed on Peters Clay soil on the volcanic Tuscan Formation. At Jepson Prairie, the species is found in large playa-like depressions on deep alluvial soils of Pescadero Clay Loam on Basin Rim landforms.

Determination Reason: There is one previously recorded occurrence of this species within the database search area. Based on extensive surveys of the Surveyed Area, remote observations of the remainder of the Plan Area, and aerial-based analysis of the remainder of the Plan Area, the vernal pool habitat required to support this species is not present. This species has been determined to have no potential for occurrence within the Plan Area.

**Vernal Pool Tadpole Shrimp (*Lepidurus packardi*)**

Special Status: Federal Endangered

NBHCP Covered: Yes

Natural History[7]: The Vernal Pool Tadpole Shrimp is currently distributed across the Central Valley of California and in the San Francisco Bay area. The species' distribution has been greatly reduced from historical times as a result of widespread destruction and degradation of its vernal pool habitat. Vernal pool tadpole shrimp are uncommon even where vernal pool habitats occur. The largest concentration of Vernal Pool Tadpole Shrimp occurrences are found in the Southeastern Sacramento Vernal Pool Region, where the species occurs on a number of public and private lands in Sacramento County. Vernal pool tadpole shrimp are also known from a few locations in Yuba and Placer Counties, including Beale Air Force Base. In the Solano-Colusa Vernal Pool Region the vernal pool tadpole shrimp occurs in the vicinity of Jepson Prairie, Travis Air Force Base, and near Montezuma in Solano County and on the Sacramento National Wildlife Refuge in Glenn County. Although the Vernal Pool Tadpole Shrimp is adapted to survive in seasonally available habitat, the species has a relatively long life span compared to other vernal pool crustaceans. This species has been found to generally take between 3 and 4 weeks to mature.

Determination Reason: There are previously recorded occurrences of this species within the database search area. Based on extensive surveys of the Surveyed Area, remote observations of the remainder of the Plan Area, and aerial-based analysis of the remainder of the Plan Area, the vernal pool habitat required to support this species is not present. This species has been determined to have no potential for occurrence within the Plan Area.

[7] https://www.fws.gov/sacramento/es/Recovery-Planning/Vernal-Pool/Documents/vp_tadpole_shrimp.pdf

**Midvalley Fairy Shrimp (*Branchinecta mesovallensis*)**

Special Status: N/A

NBHCP Covered: Yes

Natural History[8]: The Midvalley Fairy Shrimp is endemic to a small portion of California's Central Valley Based on the few known occurrences, the species' distribution is apparently limited to the Southeastern Sacramento, Southern Sierra Foothill, San Joaquin, and Solano-Colusa Vernal Pool Regions. In the Southeastern Sacramento region, most occurrences are clustered around the City of Sacramento and Mather Air Force Base in Sacramento County. In the Southern Sierra Foothills and San Joaquin Vernal Pool Regions, the Midvalley Fairy Shrimp has been documented in the vicinity of the Virginia Smith Trust property in Merced County and from isolated occurrences in San Joaquin, Madera, and Fresno Counties. However, because this species was described only recently, it is likely additional occurrences will be found in the future.

Determination Reason: There are no previously recorded occurrences of this species within the database search area, however, an analysis of this species was included because of NBHCP coverage. Based on extensive surveys of the Surveyed Area, remote observations of the remainder of the Plan Area, and aerial-based analysis of the remainder of the Plan Area, the vernal pool habitat required to support this species is not present. This species has been determined to have no potential for occurrence within the Plan Area.

**Chinook Salmon (*Oncorhynchus tshawytscha*)**

Special Status: Central Valley spring-run evolutionarily significant unit (ESU) - Federal Threated, California Threatened
Sacramento River winter-run ESU - Federal Endangered, California Endangered

NBHCP Covered: No

Natural History[9]: Chinook salmon have evolved a broad array of life history patterns that allow them to take advantage of diverse riverine conditions throughout the year. Four principal life history variants are recognized and are named for the timing of their upstream migration: fall-run, late fall-run, winter-run, and spring-run. The Sacramento River supports all four runs of Chinook salmon. The larger tributaries to the Sacramento River (American, Yuba, and Feather rivers) and rivers in the San Joaquin Basin also provide habitat for one or more of these runs. Winter-run Chinook salmon are unique because they spawn during summer months when air temperatures usually approach their yearly maximum. As a result, winter-run Chinook salmon require stream reaches with cold water sources that will protect embryos and juveniles from the warm ambient conditions in summer. Adult winter-run Chinook salmon immigration and holding (upstream spawning migration) through the Delta and into the lower Sacramento River occurs from December through July, with a peak during the period extending from January through April. Spawning occurs between late-April and mid-August, with a peak in June and July. Adult Central Valley spring-run Chinook salmon leave the ocean to begin their upstream migration in late January and early February, and enter the Sacramento River between March and September, primarily in May and

[8] https://www.fws.gov/sacramento/es/Recovery-Planning/Vernal-Pool/Documents/midvalley_fairy_shrimp.pdf
[9] https://media.fisheries.noaa.gov/dam-migration/central_valley_salmonids_recovery_plan-accessible.pdf

June. Spawning normally occurs between mid-August and early October, peaking in September.

Determination Reason: There are previously recorded occurrences of this species within the database search area, primarily along the Sacramento River. Critical habitat is also designated along the Sacramento River. The Plan Area, however, lacks the specific habitat components required to support this species. This species has been determined to have no potential for occurrence within the Plan Area.

**Steelhead (*Oncorhynchus mykiss irideus*)**

Special Status: Central Valley distinct population segment (DPS) - Federal Threatened

NBHCP Covered: No

Natural History[10]: Steelhead may exhibit anadromy or freshwater residency. Resident forms are usually referred to as Rainbow Trout, while anadromous life forms are termed ‘‘Steelhead.’’ Resident Rainbow Trout can produce anadromous smolts and anadromous steelhead can produce resident Rainbow Trout in the Central Valley. Steelhead typically migrate to marine waters after spending two years in fresh water. They reside in marine waters for typically two or three years prior to returning to their natal stream to spawn as four- or five-year-olds. Unlike Pacific salmon, steelhead are capable of spawning more than once before they die. However, it is rare for steelhead to spawn more than twice before dying, and most that do so are females. Central Valley Steelhead enter fresh water from August through April. They hold until flows are high enough in tributaries to enter for spawning. Steelhead adults typically spawn from December through April, with peaks from January through March in small streams and tributaries where cool, well oxygenated water is available year-round.

Determination Reason: There are previously recorded occurrences of this species within the database search area, primarily along the Sacramento River, American River, and Dry Creek. Critical habitat is also designated along the Sacramento River. The Plan Area, however, lacks the specific habitat components required to support this species. This species has been determined to have no potential for occurrence within the Plan Area.

**Longfin Smelt (*Spirinchus thaleichthys*)**

Special Status: California Threatened, Federal Candidate

NBHCP Covered: No

Natural History[11]: Historically, populations of Longfin Smelt in California have been present in: (1) Sacramento-San Joaquin estuary, (2) Humboldt Bay, (3) Eel River estuary, and, (4) Klamath River estuary. In the Sacramento-San Joaquin estuary, Longfin Smelt are rarely found upstream of Rio Vista or Medford Island in the Delta. Adults occur seasonally as far downstream as South Bay but they are concentrated in Suisun, San Pablo, and North San Francisco Bays. They are rarely collected outside the estuary. Adult and juvenile Longfin Smelt occupy mostly the middle or bottom of the water column in the salt or brackish water portions of the estuary, although larval Longfin Smelt are concentrated in near-surface, brackish

[10] https://media.fisheries.noaa.gov/dam-migration/central_valley_salmonids_recovery_plan-accessible.pdf
[11] https://ecos.fws.gov/docs/recovery_plan/961126.pdf

waters. Spawning takes place in freshwater, over sandy-gravel substrates, rocks, and aquatic plants.

Determination Reason: There are previously recorded occurrences of this species within the database search area, primarily along the Sacramento River. The Plan Area, however, lacks the specific habitat components required to support this species. This species has been determined to have no potential for occurrence within the Plan Area.

**Western Spadefoot (*Spea hammondii*)**

Special Status: California Species of Special Concern

NBHCP Covered: Yes

Natural History: The Western Spadefoot ranges throughout the Central Valley and adjacent foothills, and is usually quite common where it occurs. In the Coast Ranges it is found from Point Conception, Santa Barbara County, south to the Mexican border. Elevations of occurrence extend from near sea level to 1363 m (4460 ft) in the southern Sierra foothills. This species occurs primarily in grasslands, but occasional populations also occur in valley-foothill hardwood woodlands. Some populations persist for a few years in orchard or vineyard habitats.

Determination Reason: Western Spadefoot is not known to inhabit the Natomas Basin but has been found in Placer County and central Sacramento County. There are no CNDDB records for Western Spadefoot within the RSA.

**California Tiger Salamander (*Ambystoma californiense*)**

Special Status: Federal Threatened, California Threatened

NBHCP Covered: Yes

Natural History: Most commonly found in Annual Grassland habitat, but also occurs in the grassy understory of Valley-Foothill Hardwood habitats, and uncommonly along stream courses in Valley-Foothill Riparian habitats. The species occurs from near Petaluma, Sonoma County, east through the Central Valley to Yolo and Sacramento counties and south to Tulare County; and from the vicinity of San Francisco Bay south to Santa Barbara County. They occur at elevations from 3 meters up to 1,054 meters (3,200 feet).

Determination Reason: California Tiger Salamander has been not documented in the Natomas Basin, despite the presence of a narrow band of vernal pool habitats along the eastern edge of the basin. There are no CNDDB records for California Tiger Salamander within the RSA.

**Western Yellow-billed Cuckoo (*Coccyzus americanus occidentalis*)**

Special Status: Federal Threatened, California Endangered

NBHCP Covered: No

Natural History: An uncommon to rare summer resident of valley foothill and desert riparian habitats in scattered locations in California. Along the Colorado River, breeding population on California side was estimated at 180 pairs in 1977. Additional pairs reside in the Sacramento and Owens valleys; along the South Fork of the Kern River, Kern County; along the Santa Ana River, Riverside County; and along the Amargosa River, Inyo and San Bernardino counties. Also may nest along San Luis Rey River, San Diego County. Formerly much more common and widespread throughout lowland California, but numbers drastically reduced by habitat loss. Current population estimations show about 50 pairs existing in California.

Inhabits extensive deciduous riparian thickets or forests with dense, low-level or understory foliage, and which abut on slow-moving watercourses, backwaters, or seeps. Willow almost always a dominant component of the vegetation. In Sacramento Valley, also utilizes adjacent orchards, especially of walnut. Along Colorado River, may inhabit mesquite thickets where willow is absent. Nests typically in sites with at least some willow, dense low-level or understory foliage, high humidity, and wooded foraging spaces in excess of 93 m (300 ft) in width and 10 hectares (25 acres) in area.

Determination Reason: There are previously recorded occurrences of this species within the database search area, primarily along the Sacramento River to the north of the Natomas Basin. The Plan Area lacks the habitat components required by this species for nesting or foraging. This species has been determined to have no potential for occurrence within the Plan Area.

**California Black Rail (*Laterallus jamaicensis coturniculus*)**

Special Status: California Threatened

NBHCP Covered: No

Natural History: Rarely seen, scarce, yearlong resident of saline, brackish, and fresh emergent wetlands in the San Francisco Bay area, Sacramento-San Joaquin Delta, coastal southern California at Morro Bay and a few other locations, the Salton Sea, and lower Colorado River area. Formerly a local resident in coastal wetlands from Santa Barbara County to San Diego County; still winters there rarely. Significant loss of saltwater and freshwater wetland habitat in recent decades probably has reduced population. The majority of breeders in the San Francisco Bay area located in San Pablo Bay. Loss of higher wetland around San Francisco Bay apparently has eliminated breeding in the south bay area.

Determination Reason: The Plan Area is outside of the range of species and lacks the habitat components required by this species for nesting or foraging. This species has been determined to have no potential for occurrence within the Plan Area.

**Western Snowy Plover (*Charadrius nivosus nivosus*)**

Special Status: Federal Threatened

NBHCP Covered: No

Natural History: In fall and winter, common on sandy marine and estuarine shores. Nests locally in these same habitats from April through August, but the major nesting habitat now appears to be on salt pond levees. Inland nesting areas occur at the Salton Sea, Mono Lake, and at isolated sites on the shores of alkali lakes in northeastern California, in the Central Valley, and southeastern deserts.

Determination Reason: The Plan Area is outside of the range of species and lacks the habitat components required by this species for nesting or foraging. This species has been determined to have no potential for occurrence within the Plan Area.

**Least Bell's Vireo (*Vireo bellii pusillus*)**

Special Status: Federal Endangered

NBHCP Covered: No

Natural History: Formerly a common and widespread summer resident below about 600 m (2,000 ft) in western Sierra Nevada, throughout Sacramento and San Joaquin valleys, and in the coastal valleys and foothills from Santa Clara County south. Also was

| | |
|---|---|
| | common in coastal southern California from Santa Barbara County south, below about 1,200 m (4,000 ft) east of the Sierra Nevada, in Owens and Benton valleys, along Mojave River and other streams at western edge of southeastern deserts. Has declined drastically or vanished entirely throughout California range in recent decades, apparently from cowbird parasitism and habitat destruction and degradation. Now a rare, local, summer resident below about 600 m (2,000 ft) in willows and other low, dense valley foothill riparian habitat and lower portions of canyons mostly in San Benito and Monterey counties; in coastal southern California from Santa Barbara County south; and along the western edge of the deserts in desert riparian habitat. |
| Determination Reason: | The Plan Area is outside of the range of species and lacks the habitat components required by this species for nesting or foraging. This species has been determined to have no potential for occurrence within the Plan Area. |

## 5.6.3 NBHCP Key Species

This section of the Assessment discusses two key umbrella species of the NBHCP in depth: Swainson's Hawk and Giant Gartersnake.

### *5.6.3.1 Swainson's Hawk*

**Natural History**

*Figure 1. Swainson's Hawk Range in California.*

*Location of the Plan Area is represented by the red dot. Source: CWHR.*

In California, Swainson's Hawk is an uncommon breeding resident and migrant in the Central Valley, Klamath Basin, Northeastern Plateau, Lassen County, and Mojave Desert, with limited breeding reported from Lanfair Valley, Owens Valley, Fish Lake Valley, and Antelope Valley (Bloom 1980, Garrett and Dunn 1981). The species breeds in generally open habitats with isolated stands or narrow corridors of trees, or with widely scattered trees, such as in juniper-sage flats. Swainson's Hawks also breed in riparian areas and in the Central Valley in oak savannah, foraging in adjacent grasslands, suitable grain or alfalfa fields, or livestock pastures. Bloom (1980) estimated 110 nesting pairs, and a total population of 375 pairs, in California. In 2005, a state-wide breeding survey was conducted in the species' known range and estimated 1,893 breeding pairs. In 2006, the Central Valley breeding population was estimated to be 2,251 (CDFW 2016). In southern California, Swainson's Hawks are now mostly limited to spring and fall transients. This species was formerly abundant in California with a wider breeding range (Grinnell and Miller 1944, Bloom 1980, Garrett and Dunn 1981), but declines were noted as early as 1933 (Willett 1933). It is believed that the decline resulted in part from loss of nesting habitat.

Migrants move south through the southern and central interior of California from mid-August through late October and move north from late February through mid-May (eBird online database). The majority of birds migrate to the Argentine pampas in south-central South America, passing in large flocks over Central America (Ferguson-Lees and

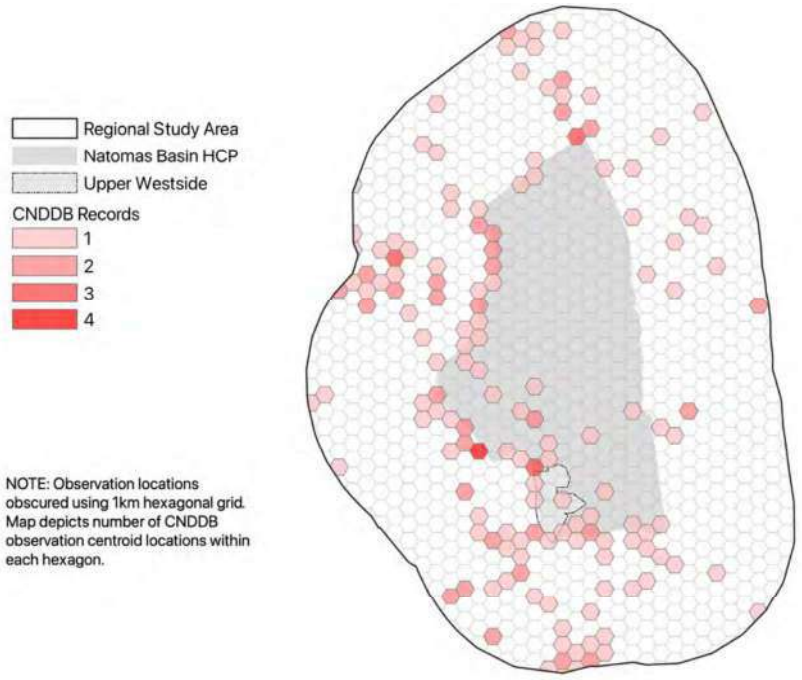
Christie 2001). Although formerly migrating in large numbers through much of California, they are now seen regularly in migration only in the extreme northeastern corner of the state and in a few places along the western edge of the deserts. They also congregate in spring migration at staging areas in Anza Borrego State Park and Morongo Valley, from which they move north along the eastern and northern flanks of the coast ranges, across the Tehachapi Mountains and Kern Valley, and into the Central Valley where the largest numbers of Swainson's Hawks still breed in California. In fall migration, Swainson's Hawks are more widely dispersed, with occasional small concentrations observed in the eastern Colorado Desert and Colorado River (Bloom 1980, Bechard et al. 2010, Small 1994). Other than small, isolated wintering populations in California's Sacramento-San Joaquin River Delta and in southern Florida, the majority of birds winter in South America (Bechard et al. 2010). Breeding occurs from late March to late August, with peak activity in late May through July.

Swainson's Hawk is listed as threatened under the California Endangered Species Act. It is also listed as "Sensitive" by the U.S. Forest Service and U.S. Bureau of Land Management, and as a "Bird of Conservation Concern" by the U.S. Fish and Wildlife Service (USFS 2005, BLM 2014, USFWS 2008).

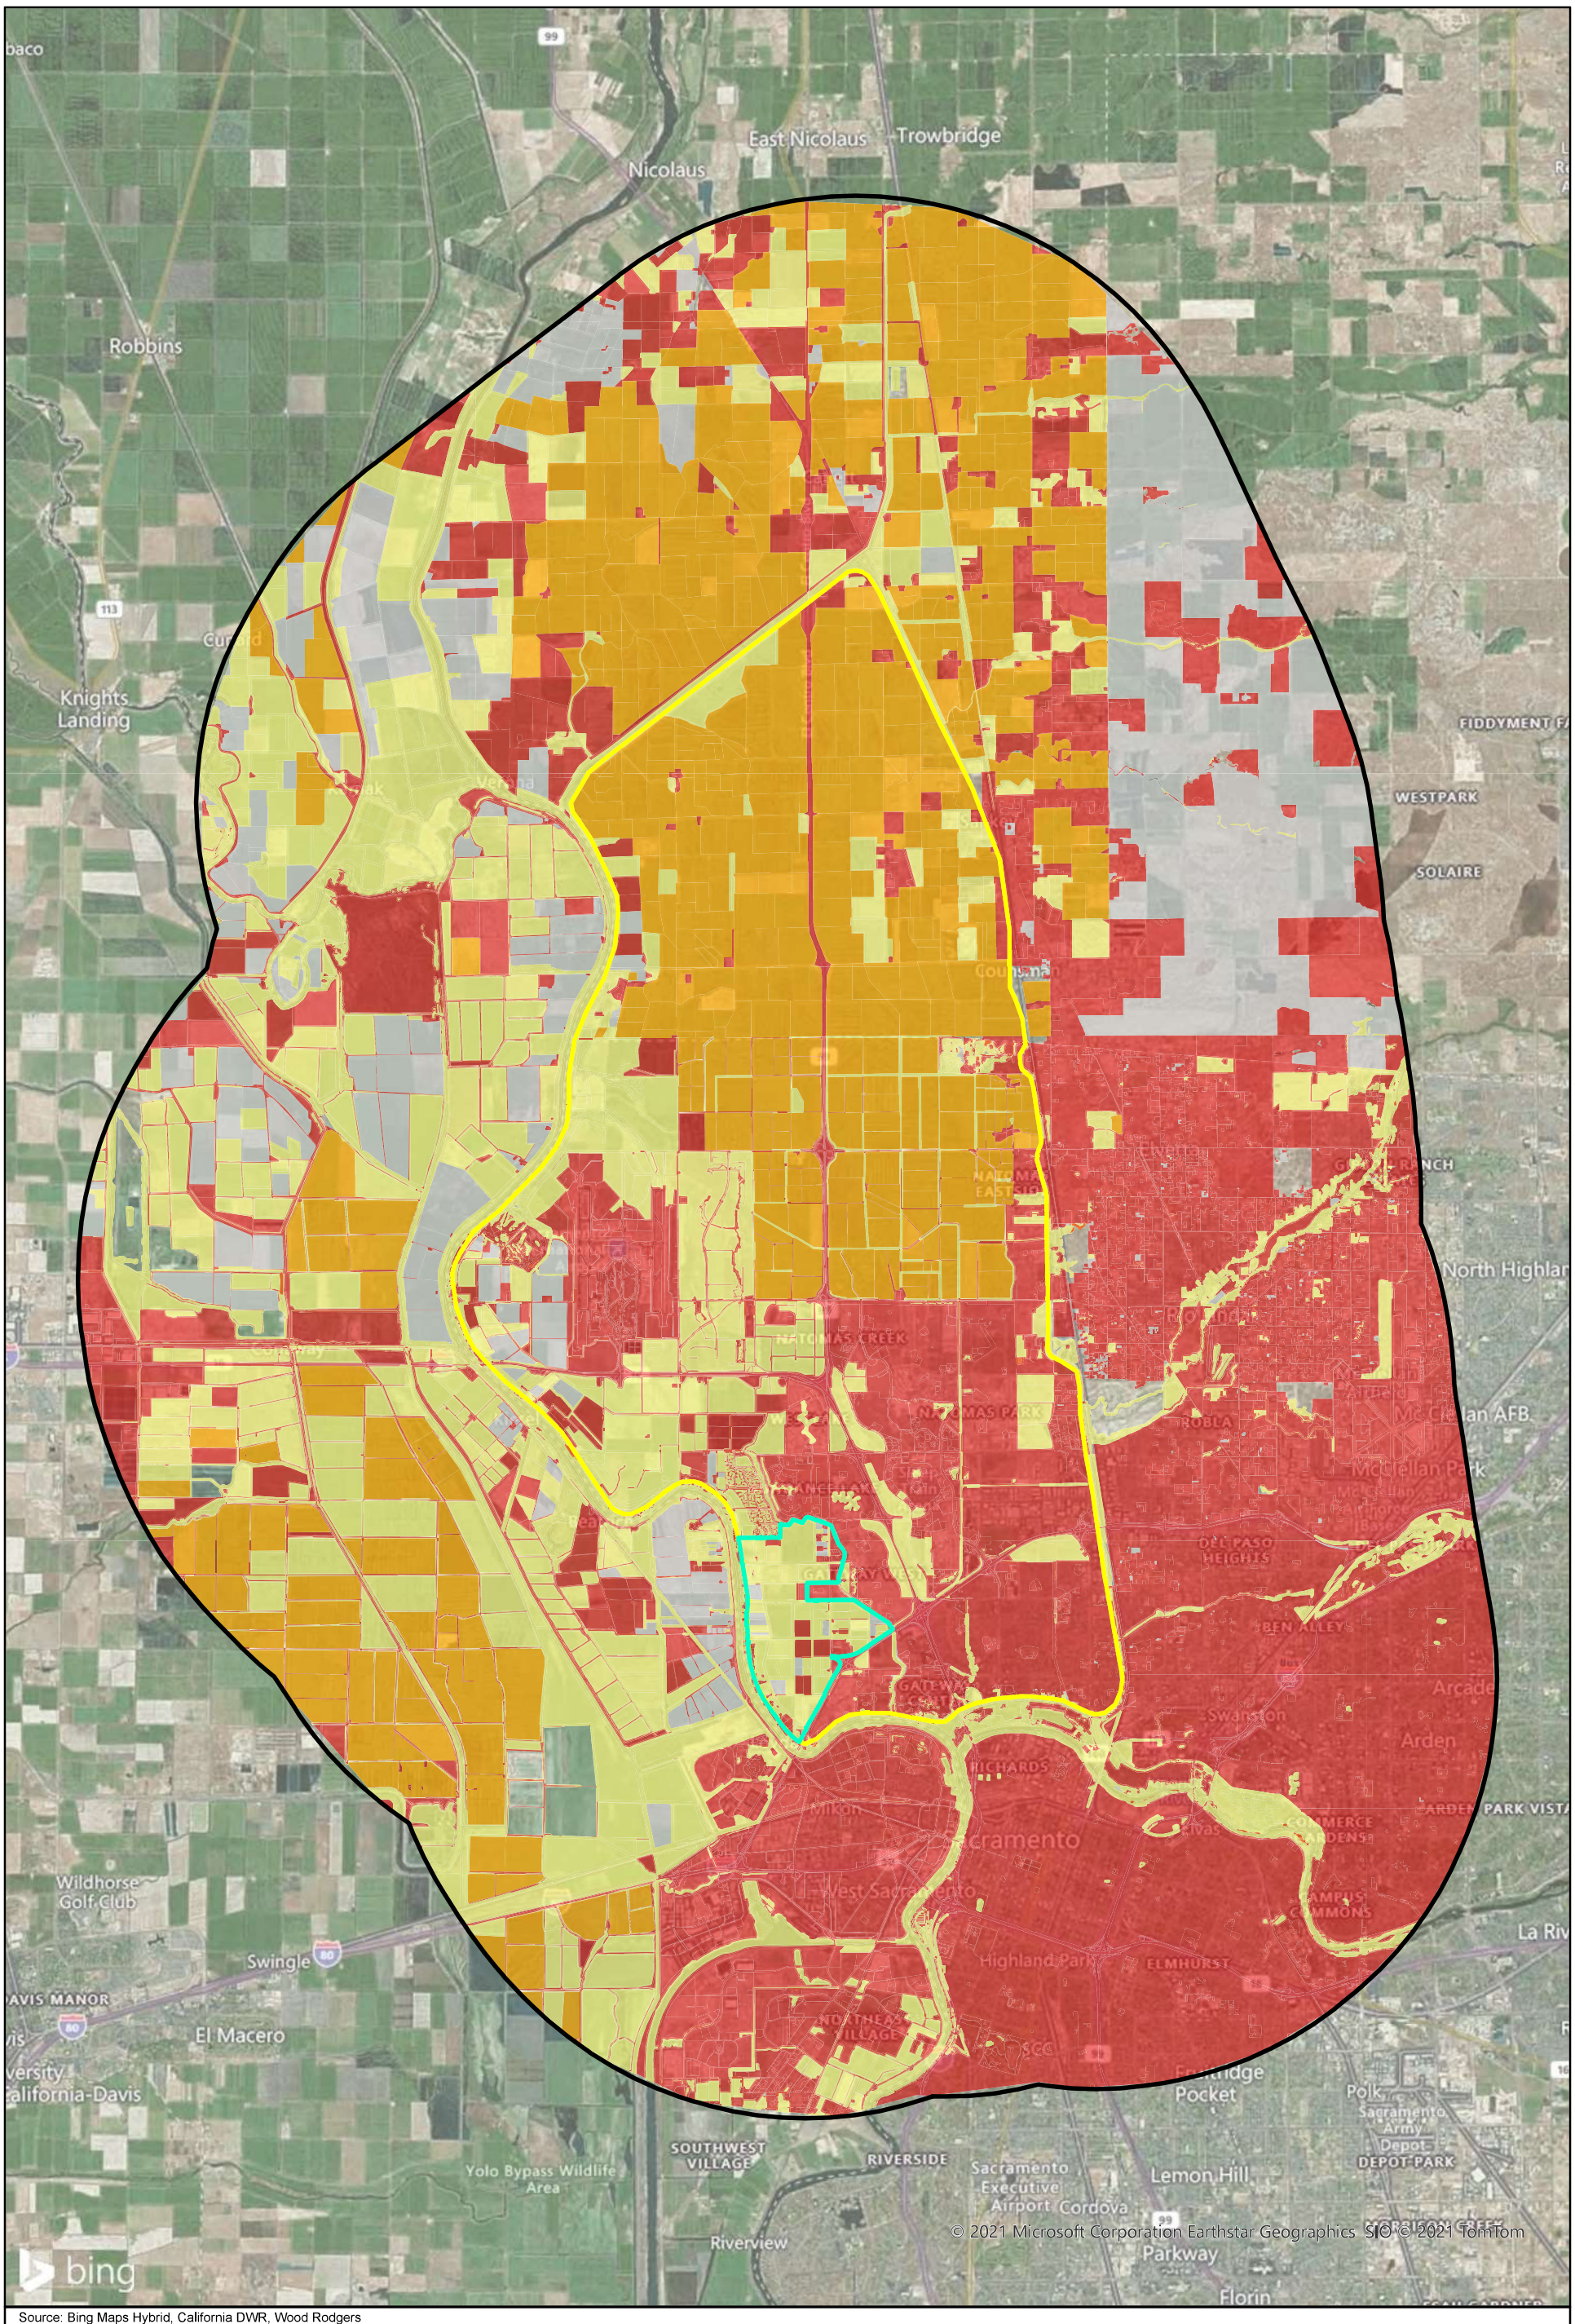
**Status in the Plan Area**

Swainson's Hawk is present in the Plan Area during the breeding season. Bargas qualified avian biologists conducted site surveys guided *by Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley* (Swainson's Hawk Technical Advisory Committee 2000). The breeding territories of three Swainson's Hawk pairs were documented within the Plan Area in 2019 (Bargas 2019). One of the three breeding pairs was observed nesting in 2020. Nesting by one pair of Swainson's Hawks was confirmed inside the study area during the 2021 surveys, and there was activity indicative of nesting pairs observed in the previously identified territories for Pair B and Pair C (Bargas 2021). The Sacramento River corridor is also an important flyway for migrating Swainson's Hawks in the spring, with many streaming over the Project Area and some stopping to forage.

**Status in the Natomas Basin and Regional Study Area**



While Swainson's Hawks can be found throughout the RSA, they are most frequently recorded on the western end, especially along the Sacramento River (which forms the western border of the NBHCP), which is also where most nesting records are located (see **Figure 2**). It is important to note, however, that the absence of CNDDB records does not equate to absence of occurrence, as occurrence records require a documenting surveyor to cover an area and later to submit the observation.



Habitats used by Swainson's Hawk in the RSA (**Table 5**) include Annual Grassland, Barren, Eucalyptus, Urban, Valley Foothill Riparian, and Wet Meadow. Habitat suitability in the RSA for Swainson's Hawk based on CWHR modeling is depicted in **Exhibit 8. Habitat Suitability – Swainson's Hawk.** As Swainson's Hawks use the Urban CWHR habitat type which can include a lot of different cover types including impervious surfaces, the regional-scale mapping of suitability within larger urban areas (such as the limits of the City of Sacramento) presented in Exhibit 8 should be viewed with caution. Swainson's Hawk, however, is present in naturally vegetated areas within the urban zone of the City of Sacramento.

*Table 5. Habitat Suitability Matrix for Swainson's Hawk in the RSA*

| Habitat | CWHR Habitat Metrics | | Suitability (0-1) | | | |
|---|---|---|---|---|---|---|
| | Size | Canopy | Reproduction | Cover | Feeding | Mean |
| Annual Grassland | 1 | M | 0.66 | 0.66 | 1 | 0.77 |
| Barren | 1 | - | 0 | 0.66 | 1 | 0.55 |
| Eucalyptus | 4 | M | 0.33 | 0.33 | 0.33 | 0.33 |
| Eucalyptus | 5 | M | 0.33 | 0.33 | 0.33 | 0.33 |
| Urban | 1 | - | 0.66 | 0.66 | 1 | 0.77 |
| Valley Foothill Riparian | 2 | M | 0 | 0 | 0.33 | 0.11 |
| Valley Foothill Riparian | 5 | M | 1 | 1 | 0.33 | 0.78 |
| Valley Foothill Riparian | 3 | M | 0.33 | 0.33 | 0.33 | 0.33 |
| Valley Foothill Riparian | 4 | M | 0.66 | 0.33 | 0.33 | 0.44 |
| Wet Meadow | 1 | M | 0 | 0.33 | 0.66 | 0.33 |

### *5.6.3.2 Giant Gartersnake*

**Natural History**[12]

- The Giant Gartersnake historically ranged in the Sacramento and San Joaquin valleys. Its current range is much reduced, and it is apparently extirpated south of Fresno County except for western Kern County. In this region, Giant Gartersnake typically occurs in agricultural rice fields and wetlands as well as other waterways such as drainage canals and adjacent uplands in many portions of the Natomas Basin[13].

This species is active from May until October.

- **Feeding:** Giant Gartersnakes forage primarily in and along waterways taking fish and amphibians and amphibian larvae. Most current food may be introduced species such as carp, mosquitofish, and bullfrogs, because the native prey such as blackfish, thick-tailed chub, and red-legged frog are no longer available.
- **Cover:** The preferred nocturnal retreats of this active diurnal snake are thought to be holes, especially mammal burrows, crevices, and surface objects. During the day the Giant Gartersnake often basks on emergent vegetation such as cattails and tules. In hotter weather, mammal burrows and piles of vegetation may be used as daytime refuges. When disturbed it usually retreats rapidly to water.
- **Reproduction:** Courtship and mating normally occur soon after spring emergence. Young are born alive between mid-July and early September, usually in secluded sites such as under the loose bark of rotting logs or in dense vegetation at the margins of a waterway. Mean litter size is 23.
- **Water:** No information on water requirements. This species is normally found in the immediate vicinity of permanent or semi-permanent sources of water.
- **Activity Patterns:** An active diurnal snake. During the warm days of summer most activity occurs during the morning and afternoon. During the cooler weather of spring and fall, snakes restrict their activity to the warm afternoons.

*Figure 3. Giant Gartersnake Range in California.*

*Location of the Plan Area is represented by the red dot. Source: CWHR.*

- **Seasonal Movements/Migration:** Migration is not expected.
- **Home Range:** The nature of the home range of gartersnakes in California is not well known. There is likely considerable overlap in the home ranges of neighboring individuals.

[12] Natural history sourced directly from the California Department of Fish and Wildlife's species account in the *California Wildlife Habitat Relationships* system.
[13] https://www.fws.gov/sacramento/es_species/Accounts/Amphibians-Reptiles/giant_garter_snake/

- **Territory:** Not thought to be territorial. Although this species is not well studied, other gartersnakes have not been observed exhibiting behaviors suggesting territoriality.
- **Niche:** Giant Gartersnakes are taken as prey by mammals, birds, and other snakes despite the release of a repulsive musk from the postanal glands of disturbed individuals. Their competitive relationships with other snakes (especially other gartersnakes) are not well understood.
- **Comments:** The Giant Gartersnake now is very scarce throughout its range in the Central Valley. Perhaps California's most aquatic gartersnake, populations have been eliminated or decimated by the elimination of natural sloughs and marshy areas. Heavy use of pesticides is suspected as a contributing factor in the decline of this once-abundant gartersnake of the Central Valley. Protection of waterfowl habitat may allow it to survive in a small portion of its original range.

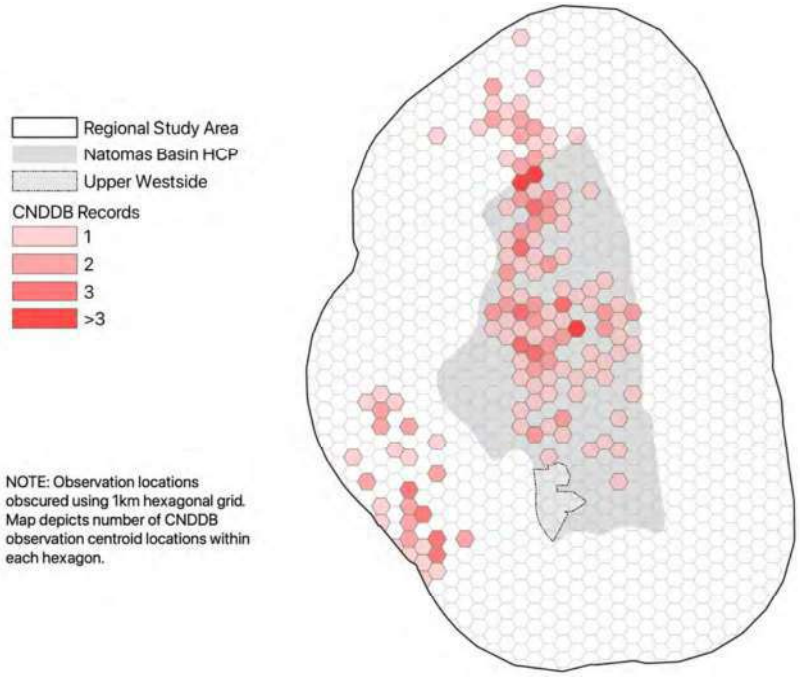
**Status in the Plan Area**

While there are recent CNDDB records along the canal at the northern edge of the Plan Area, and DNA for the species was detected over two years in three locations outside of the Plan Area and one location in the central portion of the Plan Area, habitat in the Plan Area has a low suitability for Giant Gartersnake. Further, intensive sampling efforts (40,703 total trap days), accompanied by a high catch of Valley Gartersnake (*Thamnophis sirtalis fitchi*), but zero captures of Giant Gartersnake, indicate there there is low potential for occurrence of Giant Gartersnake population within the Plan Area, though the species may use interior canals infrequently for dispersal.

The CNDDB record along the northern limits of the Plan Area is associated with a large canal that is hydrologically connected to Fisherman's Lake, where there is a known population of the species. This canal is significantly larger than the interior canals in the Plan Area with extensive areas of wetland vegetation. It also has steep sides that may impede use of adjacent uplands by this species.

**Status in the Natomas Basin and Regional Study Area**

CNDDB records (**Figure 4**) indicate historical occurrence for Giant Gartersnake throughout the northern three quarters of the NBHCP. In the RSA outside of the NBHCP, records are limited to the northern and southwestern ends.



Habitats used by Giant Gartersnake in the RSA (**Table 6**) include Annual Grassland, Freshwater Marsh, Lacustrine, Valley Foothill Riparian, and Wet Meadow. Habitat suitability in the RSA for Giant Gartersnake based on CWHR modeling is depicted in **Exhibit 9. Habitat Suitability – Giant Gartersnake.**

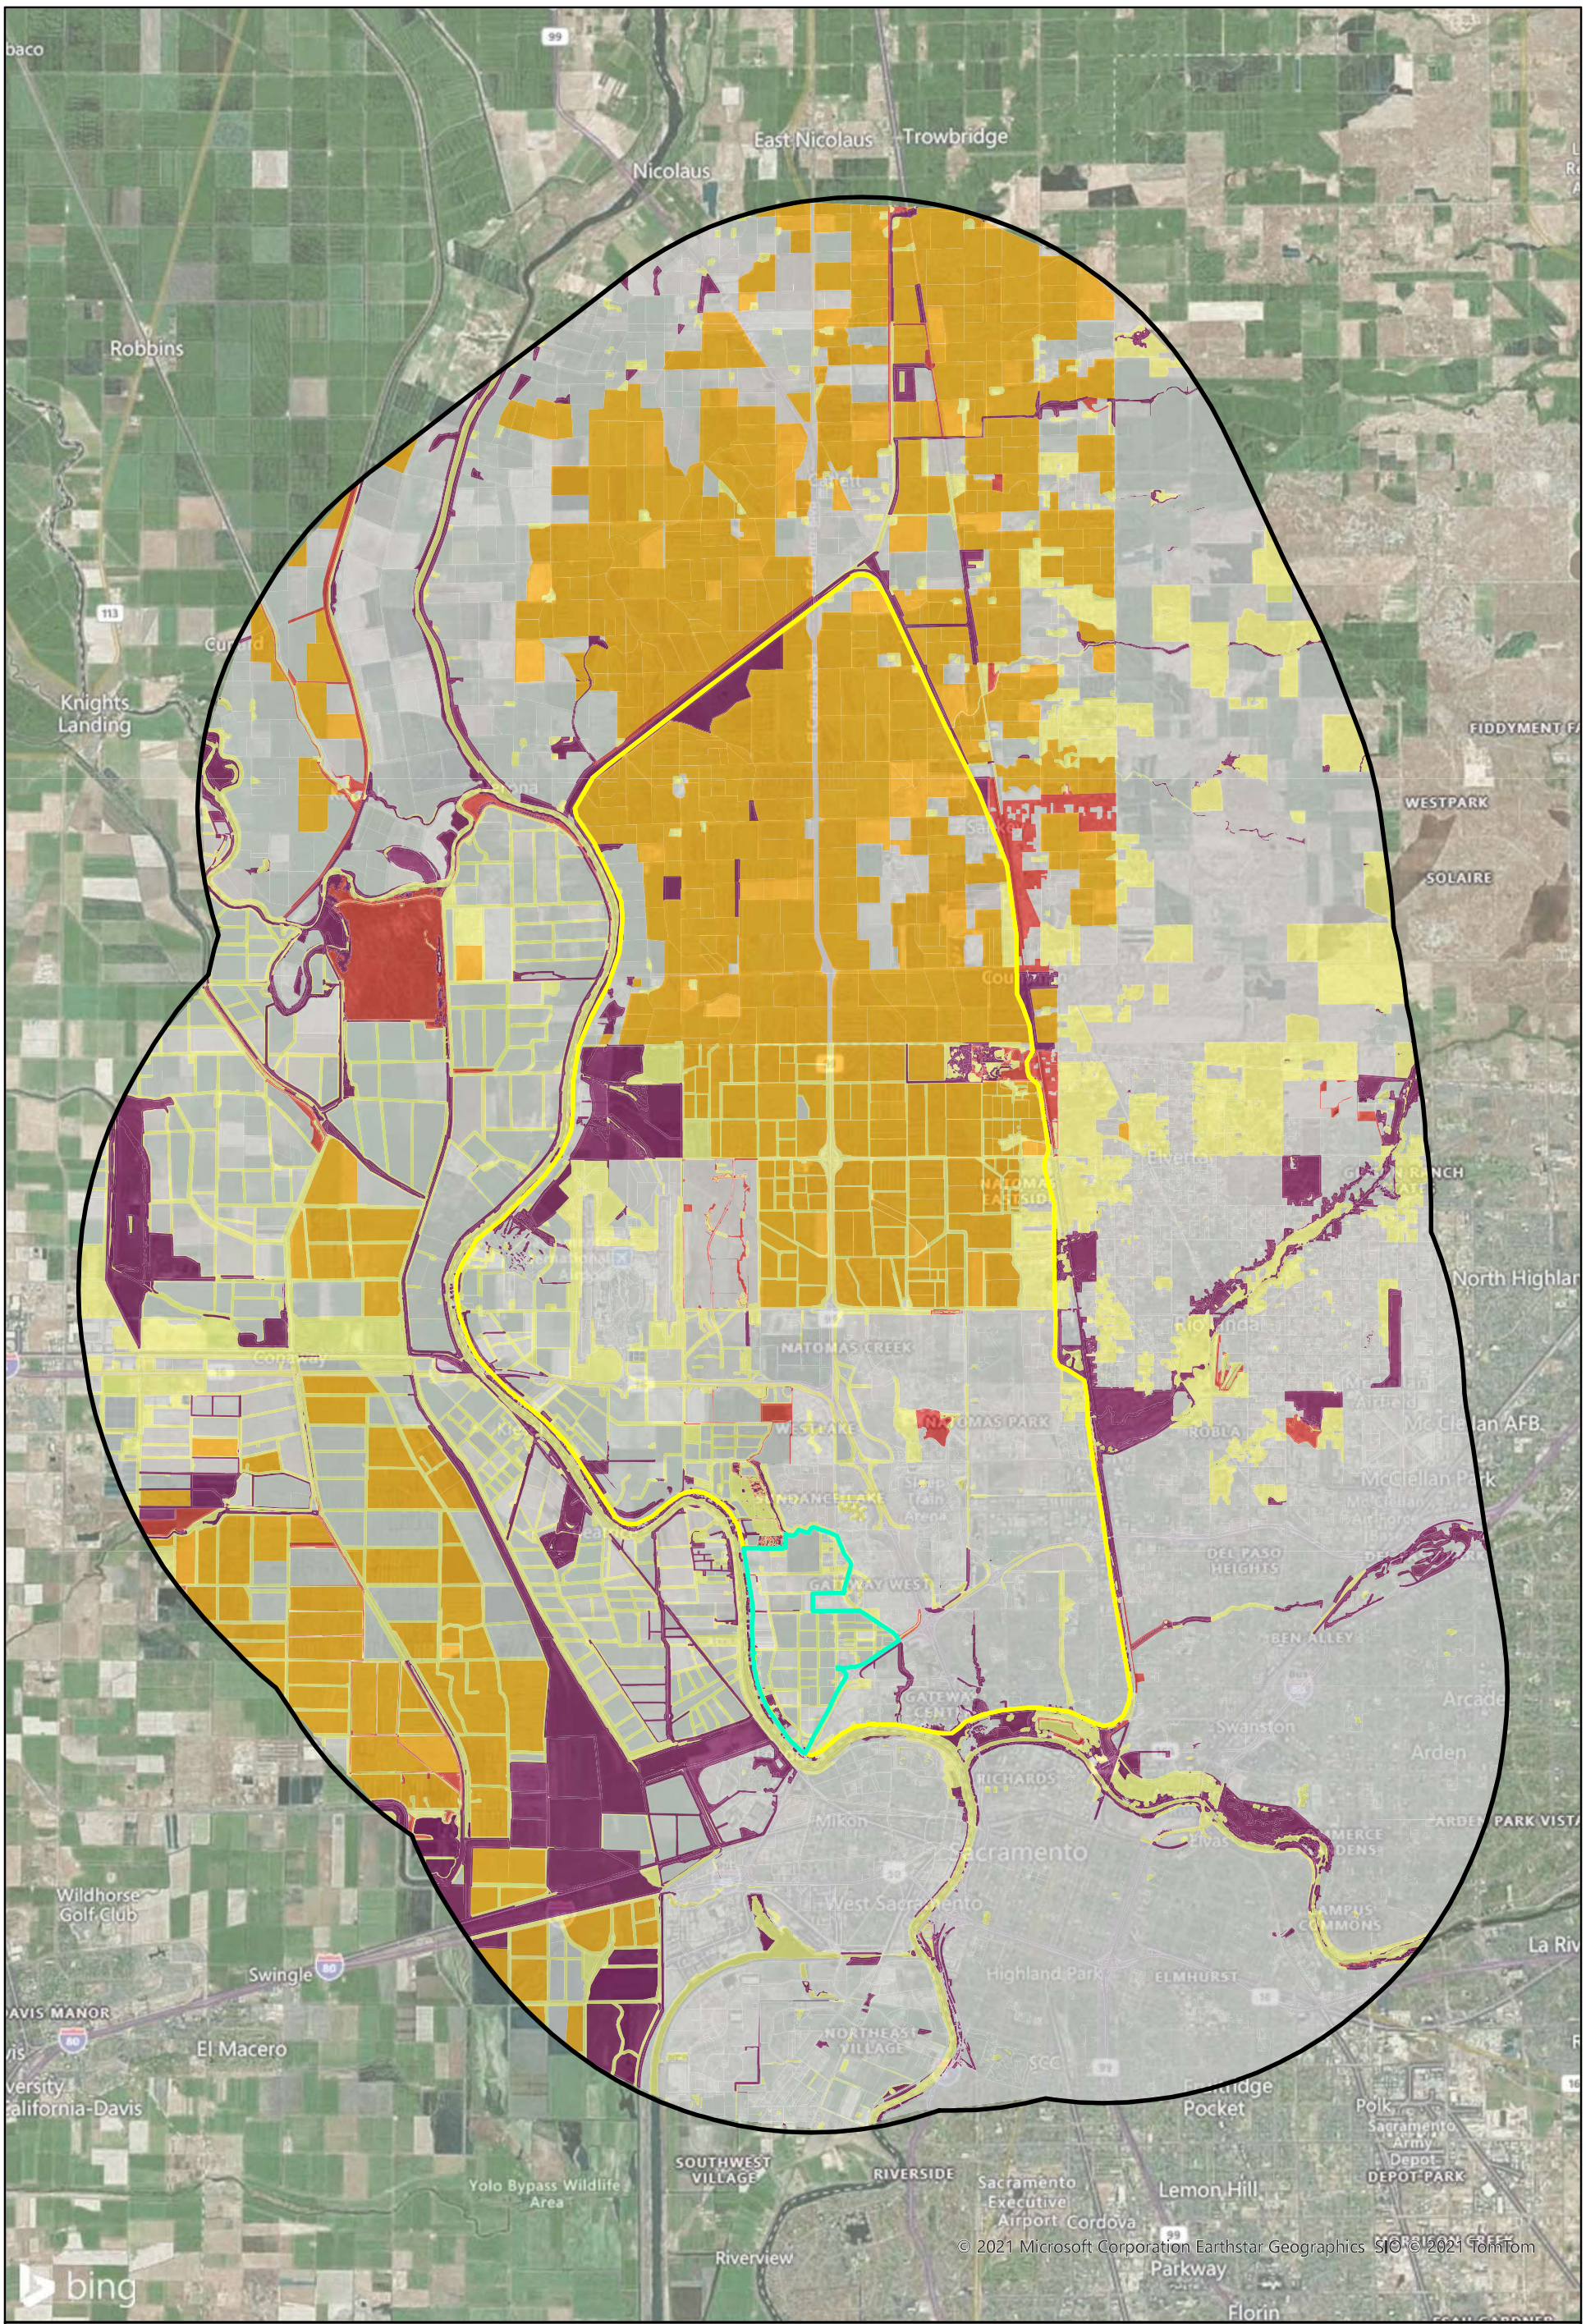


*Table 6. Habitat Suitability Matrix for Giant Gartersnake*

| Habitat | CWHR Habitat Metrics | | Suitability (0-1) | | | |
|---|---|---|---|---|---|---|
| | Size | Canopy | Reproduction | Cover | Feeding | Mean |
| Annual Grassland | 1 | M | 0.33 | 0.33 | 0.33 | 0.33 |
| Freshwater Marsh | 1 | M | 1 | 1 | 1 | 1 |
| Lacustrine | 1 | - | 0 | 0.33 | 0.33 | 0.22 |

## 5.7 Wildlife Movement and Habitat Corridors

Effects on wildlife movement are an important consideration when assessing any anthropogenic effect on biological resources. At a small enough scale, any project or activity can potentially affect the movement of wildlife if any wildlife are present. In general, however, the term "wildlife movement corridor" denotes an area of habitat that is important for the movement of wildlife between larger habitat areas. Wildlife movement corridors are important for maintaining population levels and genetic diversity.

Regionally, wildlife movement was modeled by ecologists at UC Davis in 2010[14]. The dataset was produced to analyze the impact of scale effects on conservation planning by analyzing conservation networks at local and regional scales within the central valley of California to analyze the impact of scale effects on conservation planning using industry-standard MARXAN and least corridor analysis technologies. The result, shown in **Exhibit 10. Central Valley Core Reserves and Corridors**, depicts a potential – albeit narrow – corridor through the southeast portion of the Plan Area. This appears, intuitively, to have been a direct connection between natural areas associated with the Dry Creek watershed and the Sacramento River. Since the time the analysis was completed, much of the area within that modeled corridor has been extensively developed and the modeled corridor is no longer valid. In essence, the Plan Area does not act as a wildlife corridor as classically considered.

At a smaller scale, the Plan Area has potential – via agriculture irrigation ditches – to support movement of wildlife species that use small waterways. Specifically, Giant Gartersnake DNA was identified in and adjacent to Reclamation District 1000's West Drainage Canal and within the drainage ditch adjacent to Bryte Bend Road, both sites outside of the Plan Area. The eDNA surveys in the BSA outside of the Plan Area returned three positive detections in 2019 (Hansen 2019) and one positive detection in 2020 (Hansen 2020). A comprehensive 2-year Giant Gartersnake trapping study found no species presence in the Plan Area, however their DNA was found in the canal north of the Plan Area and in a central portion of the Plan Area, and hence the snakes could potentially be using the agricultural irrigation ditches as dispersal corridors.

# 6 CEQA Analysis: Effects and Minimization Measures

## 6.1 Types of Effects Analyzed

CEQA describes three types of potential project effects that are pertinent to biological resources and are analyzed in this Assessment:

- **Direct Effects:** Section 15064(d)(1) of the CEQA Guidelines describes a direct effect as "a physical change in the environment which is caused by and immediately related to the project." In the context of the proposed project described in this report, direct effects include adverse effects that would occur to plants, wildlife, and vegetation communities within or immediately adjacent to the proposed Project footprint and other work areas.
- **Indirect Effects:** Section 15064(d)(2) of the CEQA Guidelines describes an indirect effect as any "physical change in the environment, which is not immediately related to the project, but which is caused indirectly by the project. If a direct physical change in the environment, in turn, causes another change in the environment, then the other change is an indirect physical change in the environment." Indirect effects, also known as secondary effects, are reasonably foreseeable and caused by a project but occur at a different time or place. Examples of indirect effects pertinent to many development projects could include a change in drainage patterns that ultimately affect vegetation communities not otherwise affected by the project or a reduction in native wildlife species resulting from a decrease in habitat.
- **Cumulative Effects:** Section 15355 of the CEQA Guidelines describe a cumulative effect as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." The CEQA Guidelines further state the following regarding cumulative effects:
    - The individual effects may be changes resulting from a single project or a number of separate projects.
    - The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.

  Section 15064 (h)(1) of CEQA Guidelines states that "the lead agency shall consider whether the cumulative impact is significant and whether the effects of the project are cumulatively considerable." 'Cumulatively considerable' means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects and the effects of probable future projects". Section 15064 (h)(2) states that "a lead agency may determine…that a project's contribution to a significant cumulative impact will be rendered less than cumulatively considerable and thus is not significant."

## 6.2 Thresholds of Significance

Appendix G of the CEQA Guidelines (as amended through January 2019) is frequently cited by public agencies to determine whether a project may have a significant impact on biological resources. Under Appendix G, a project may have a significant impact on biological resources if it would:

1. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations by the CDFW or USFWS.

2. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFW or USFWS.
3. Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.
4. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.
5. Conflict with any local policies or ordinances protecting biological resources, such as tree preservation policy or ordinance.
6. Conflict with the provisions of an adopted HCP, NCCP, or other approved local, regional, or state habitat conservation plan.

## 6.3 Key Metrics for Assessing Project Effects

Prior to assessing the significance of Project effects on biological resources, it is important to understand the factors to be considered in the analysis. Primary among these are direct impacts to vegetation communities/habitats due to grading, conservation measures being implemented by the Applicant to offset Project effects, and the regional context of the Project. These factors are discussed below.

### 6.3.1 Grading Impacts and Avoidance

Current plans for the Project proposing grading 1,486.7 acres of existing vegetation communities/land uses in the Plan Area. This proposes direct impacts to 72% of the Plan Area, with the remaining 28% to remain in its current state. These impacts are summarized in **Table 7**. As proposed, Project-related grading would impact the following habitat types:

- **Irrigated Row and Field Crops** comprise 892.1 acres of the Plan Area. The Project proposes direct impacts to 658.2 acres, or 73.8% of this habitat in the Plan Area. The Project would preserve 233.9 acres, or 26.2% of this habitat in the Plan Area.
- **Irrigated Hayfield** comprises 511.1 acres of the Plan Area. The Project proposes direct impacts to 402.6 acres, or 78.8% of this habitat in the Plan Area. The Project would preserve 108.5 acres, or 21.2% of this habitat in the Plan Area.
- **Annual Grassland** comprises 232.8 acres of the Plan Area. The Project proposes direct impacts to 168.6 acres, or 72.4% of this habitat in the Plan Area. The Project would preserve 64.2 acres, or 27.6% of this habitat in the Plan Area.
- **Pasture** comprises 193.3 acres of the Plan Area. The Project proposes direct impacts to 169.5 acres, or 87.7% of this habitat in the Plan Area. The Project would preserve 23.8 acres, or 12.3% of this habitat in the Plan Area.
- **Urban** comprises 143.5 acres of the Plan Area. The Project proposes direct impacts to 43.8 acres, or 30.5% of this habitat in the Plan Area. The Project would preserve 99.7 acres, or 69.5% of this habitat in the Plan Area.
- **Valley Foothill Riparian** comprises 50.0 acres of the Plan Area. The Project proposes direct impacts to 7.0 acres, or 14.1% of this habitat in the Plan Area. The Project would preserve 43.0 acres, or 85.9% of this habitat in the Plan Area.

- **Riverine** comprises 20.1 acres of the Plan Area. The Project proposes direct impacts to 18.2 acres, or 90.7% of this habitat in the Plan Area. The Project would preserve 1.9 acres, or 9.3% of this habitat in the Plan Area.
- **Vineyard** comprises 17.6 acres of the Plan Area. The Project proposes direct impacts to 17.6 acres, or 100% of this habitat in the Plan Area. The Project would preserve 0.0 acres, or 0% of this habitat in the Plan Area.
- **Deciduous Orchard** comprises 4.7 acres of the Plan Area. The Project proposes direct impacts to 1.1 acres, or 24.5% of this habitat in the Plan Area. The Project would preserve 3.6 acres, or 75.5% of this habitat in the Plan Area.

*Table 7. Vegetation Community Impacts and Avoidance*

| Mapped Type | Acres Existing | Acres Impacted | Percent Impacted | Acres Preserved | Percent Preserved |
|---|---|---|---|---|---|
| Irrigated Row and Field Crops | 892.1 | 658.2 | 73.8% | 233.9 | 26.2% |
| Irrigated Hayfield | 511.1 | 402.6 | 78.8% | 108.5 | 21.2% |
| Annual Grassland | 232.8 | 168.6 | 72.4% | 64.2 | 27.6% |
| Pasture | 193.3 | 169.5 | 87.7% | 23.8 | 12.3% |
| Urban | 143.5 | 43.8 | 30.5% | 99.7 | 69.5% |
| Valley Foothill Riparian | 50.0 | 7.0 | 14.1% | 43.0 | 85.9% |
| Riverine | 20.1 | 18.2 | 90.7% | 1.9 | 9.3% |
| Vineyard | 17.6 | 17.6 | 100.0% | 0.0 | 0% |
| Deciduous Orchard | 4.7 | 1.1 | 24.5% | 3.6 | 75.5% |
| **TOTAL** | **2064.9** | **1486.7** | **72.0%** | **578.2** | **28.0%** |

### 6.3.2 Conservation Strategy

The Project proposes to offset all potentially significant biological effects in the following manner:

- On-site (within the Plan Area) preservation of habitats in areas not directly impacted by grading.
- The permanent preservation of habitats in one or more Off-Site Reserves.

A Conservation Strategy is being prepared to outline the resource conservation goals and objectives for the Upper Westside Specific Plan, describe conservation measures to avoid, minimize and/or reduce resource impacts during project implementation, and discuss establishment, implementation, maintenance and long-term management for any reserve properties identified to mitigate impacts. For biological resources, the Conservation Strategy is guided by the biological goals and objective to avoid and minimize the take of covered species, and will be developed in consultation with local, state, and federal regulatory agencies.

## 6.4 Regional Context

To understand the significance of various biological effects of the Project, it is important to understand the Project's regional biological context. This includes disturbance, habitats, species, and other biotic factors within a distance of the Project that are biologically meaningful. For this Assessment, we have frequently referred to the Regional Study Area (or RSA), which includes the Natomas Basin and a five-mile buffer. While the Natomas Basin itself is of the greatest importance herein, the Plan Area is located at the extreme southwestern edge of the basin. As such,

considering only the basin itself would ignore resources immediately across the Sacramento River. Additionally, considering the value of resources in the RSA provides an opportunity to pursue conservation activities beyond limits of the Natomas Basin.

## 6.5 Project Effects on Candidate, Sensitive, or Special Status Species

This section addresses the portion of the CEQA Guidelines requiring an assessment of whether the Project will *have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations by the CDFW or USFWS.*

### 6.5.1 Summary Statement of Effects

Section 5 of this Assessment reviewed the potential for occurrence of 54 special status plant and wildlife species:

- 21 special status species were determined to have no potential to occur. Effects on these species due to Project implementation would not be expected.
- 20 special status species were determined to have low potential to occur and are unlikely to be affected by Project implementation.
- 5 special status species were determined to have moderate potential to occur and could be affected by the Project if found.
- 4 special status species were determined to have high potential to occur and are likely to be affected by Project implementation.
- 4 special status species were determined to be present in the Plan Area and are likely to be affected by Project implementation.

Proposed Off-Site Reserves, as well as on-site measures, will result in a net benefit for all special status species discussed in this Assessment.

### 6.5.2 Detailed Discussion of Effects and Avoidance and Minimization Measures

The Project proposes Off-Site Reserves that will permanently preserve habitat for special status plant and wildlife species on lands of sufficient quality and quantity to offset proposed direct Project effects on biological resources in the Plan Area. The acreage, location and composition of the Off-Site Reserves will be determined during consultation with local, state, and federal regulatory agencies.

USFWS and CDFW may need to be consulted regarding the potential for the proposed project to result in the take of listed species and any avoidance measures or mitigation measures suggested by USFWS and CDFW should be implemented.

#### *6.5.2.1 Special Status Species with No Potential to Occur in the Plan Area*

As detailed in Section 5 above, the following 21 special status species were determined to have no potential to occur in the Plan Area: Ferris' Milkvetch, Peruvian Dodder, Boggs Lake Hedge Hyssop, Delta Tule Pea, Legenere, Colusa Grass, Slender Orcutt Grass, Sacramento Orcutt Grass, Suisun Marsh Aster, Conservancy Fairy Shrimp, Vernal Pool Tadpole Shrimp, Midvalley Fairy Shrimp, Chinook Salmon, Steelhead, Longfin Smelt, Western Spadefoot, California Tiger Salamander, Western Yellow-billed Cuckoo, California Black Rail, Western Snowy Plover, and Least Bell's Vireo. These species have no potential to be adversely affected by the Project and will not be discussed further.

#### *6.5.2.2 Special Status Species with Low Potential to Occur in the Plan Area*

Twenty (20) special status species were determined to have low potential to occur in the Plan Area:

- **Woolly Rose-Mallow**: the Plan Area contains marginal habitat for this species and there are few records in the region. This species' presence is unlikely. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Mason's Lilaeopsis:** the Plan Area contains marginal habitat for this species and there are few records in the region. This species' presence is unlikely. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Sanford's Arrowhead:** the Plan Area contains marginal habitat for this species and there are few records in the region. This species' presence is unlikely. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Sanford's Arrowhead:** primary threats to the species are agriculture and drainage channelization, which are predominant land uses in the Plan Area. Further, some of the irrigation canals and ditches within the Plan Area are periodically maintained (i.e. accumulated sediment removed, vegetation along banks mowed/trimmed), with some not always inundated with water (dependent upon the agricultural irrigation needs), reducing their suitability as potential habitat. As such, potential for the occurrence of this species is low in remainder of the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Heartscale:** While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Brittlescale:** While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Bristly Sedge:** While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Pappose Tarplant:** While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Palmate-bracted Bird's-Beak:** While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As

such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.

- **Dwarf Downingia:** While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Jepson's Coyote Thistle:** While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **San Joaquin Spearscale:** While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Heckard's Pepper Grass:** While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Baker's Navarretia:** While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Bearded Popcorn Flower:** While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **California Alkaligrass:** While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Saline Clover:** While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.

- **Crampton's Tuctoria:** While grassland habitat was mapped in the Plan Area (Section 5.4), this habitat represents a temporary state of fallow agricultural fields and does not occur on the correct soils (Section 5.2) for this species. Other habitats preferred by this species are not present in the Plan Area. As such, this species is unlikely to occur and has been determined to have low potential for occurrence within the Plan Area. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Vernal Pool Fairy Shrimp:** with the absence of vernal pools in the Plan Area, this species is unlikely to be present, however, it cannot be entirely dismissed because it sometimes appears in temporary post-rain water accumulations such as tire ruts, which would not allow this species to complete its life cycle. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Valley Elderberry Longhorn Beetle**: the Plan Area has not been observed to contain suitable habitat, including host plants, for this species. Surveys have not been performed throughout the entire Plan Area and elderberry plants can become quickly established in new areas. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Giant Gartersnake:** Giant Gartersnakes were not located within the Plan Area after a two-year trapping effort but may use the agricultural irrigation ditches in the Plan Area for dispersal. This species is discussed in greater detail in **Section 6.5.2.6.**

#### *6.5.2.3 Special Status Species with Moderate Potential to Occur in the Plan Area*

Five (5) special status species were determined to have moderate potential to occur in the Plan Area:

- **Aleutian Cackling Goose:** while there is potential foraging habitat for this species in the Plan Area, there are no recorded occurrences in the Natomas Basin so it is unlikely to occur in the Plan Area. Implementation of the Project would impact potential winter foraging habitat, though foraging by this species in the Plan Area has not been documented. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **White-faced Ibis:** there is no nesting habitat but potential foraging habitat for this species in the Plan Area, however, this species rarely occurs in the Natomas Basin and is unlikely to occur in the Plan Area. Implementation of the Project would impact potential winter foraging habitat, though foraging by this species in the Plan Area has not been documented. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Burrowing Owl:** this species is rarely recorded in the southwestern portion of the Natomas Basin, though some habitat is present. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Bank Swallow:** there is no nesting habitat for this species in the Plan Area. Implementation of the Project would not affect foraging of this species, if it were to otherwise occur.
- **Tricolored Blackbird:** there is no nesting habitat for this species in the Plan Area. Implementation of the Project would impact potential winter foraging habitat, though foraging by this species in the Plan Area has not been documented. This species could potentially benefit from habitat preservation in proposed off-site reserves.

#### *6.5.2.4 Special Status Species with High Potential to Occur in the Plan Area*

Four (4) special status species were determined to have high potential to occur in the Plan Area:

- **Northwestern Pond Turtle**: this species has not been documented in the Plan Area, however, habitat is present and it is known to occur nearby. Effects on this species would be minimized by implementation of measures proposed for Giant Gartersnake in **Section 6.5.2.6**.
- **Loggerhead Shrike:** there is minimal nesting habitat and abundant potential foraging habitat for this species in the Plan Area. It has, however, been rarely recorded in the Natomas Basin. Effects on this species would be minimized by implementation of measures proposed for Swainson's Hawk in **Section 6.5.2.6**.
- **Yellow-headed Blackbird:** Implementation of the Project would impact potential winter foraging habitat, though foraging by this species in the Plan Area has not been documented. This species could potentially benefit from habitat preservation in proposed off-site reserves.
- **Yellow Warbler:** there is no breeding habitat in the Plan Area for this species. Its high potential to occur is based on its occurrence in adjacent riparian woodlands along the Sacramento River. Implementation of the Project would not adversely affect this species.

### *6.5.2.5 Special Status Species Present in the Plan Area*

Four (4) special status species were determined to be present in the Plan Area:

- **American White Pelican:** American White Pelicans are a transient and highly mobile species in many areas of California outside of the breeding season. There is no breeding habitat for this species in the Plan Area. Implementation of the Project would not have a significant adverse effect on this species.
- **Swainson's Hawk:** As a keystone species in the Natomas Basin, this species is discussed in greater detail in **Section 6.5.2.6.**
- **White-tailed Kite:** Effects on this species would be minimized by implementation of measures proposed for Swainson's Hawk in **Section 6.5.2.6**.
- **Northern Harrier:** Effects on this species would be minimized by implementation of measures proposed for Swainson's Hawk in **Section 6.5.2.6**.

### *6.5.2.6 Effects, Avoidance, and Minimization Measures*

#### *6.5.2.6.1 Special Status Species Pre-Construction Surveys*

As recommended by the NBHCP, not less than 30 days or more than 6 months prior to commencement of construction activities on sites in the Plan Area, a pre-construction survey of the specific site shall be conducted to determine the status and presence of, and likely impacts to, all potentially occurring special status species on the site. However, pre-construction surveys for an individual species may be completed up to one year in advance if the sole period for reliable detection of that species is between May 1 and December 31.

The results of the pre-construction surveys along with recommended minimization measures shall be documented in a report and shall be submitted to the appropriate agencies. Based upon the survey results, the project will identify applicable take avoidance and other site specific minimization measures, required to be carried out on the site.

Reconnaissance level surveys should be conducted prior to species specific surveys to determine what habitats are present on a specific development site and what, if any, more intensive survey activities should be conducted to accurately determine the status of the special status species on the site. Note: negative species-specific survey results may not obviate the requirement to implement minimization measures prescribed where a pre-construction survey indicates that habitat for a particular listed species exists onsite.

#### *6.5.2.6.2 General Measures to Minimize Take*

In order to generally minimize the impacts of development on special status species, the following requirements shall apply as recommended by the NBHCP:

a. Tree Preservation: Valley Oaks and other large trees should be preserved whenever possible. Preserve and restore stands of riparian trees used by Swainson's Hawks and other animals for nesting, particularly adjacent to Fisherman's Lake.

b. Native Plants: Improve the wildlife value of landscaped parks, buffers, and developed areas by planting trees and shrubs which are native to the Natomas Basin and therefore are used by native animals.

c. Protect Raptor Nests: Avoid the raptor nesting season when scheduling construction near nests..

d. Protected Plant/Animal Species, also referred to as "Special Status Species": Search for protected plants species during flowering season prior

#### *6.5.2.6.3 Swainson's Hawk*

The Project would directly impact Swainson's Hawk through potential removal of a minimum of one Swainson's Hawk nest tree. Based on the habitat modeling presented in Section 5.3.6.1, the Project could impact 791.6 acres of 1,130.6 extant acres of Swainson's Hawk habitat (**Table 8**). Impacts include 381.9 acres of modeled high-quality habitat, and 409.7 acres of modeled low-quality habitat. The Project would preserve 338.9 acres of modeled Swainson's Hawk habitat, including 187.6 acres of modeled high-quality habitat and 151.4 acres of modeled low-quality habitat.

Regionally, habitat modeling indicates 127,997.3 potential acres of Swainson's Hawk habitat are found within the RSA, with 28,500.6 acres in the Natomas Basin. The Plan Area supports:

- 0.8% of the modeled habitat for Swainson's Hawk in the RSA.
- 4% of the modeled habitat for Swainson's Hawk in the Natomas Basin.

*Table 8. Impacts and Conservation of Modeled Swainson's Hawk Habitat*

| Area | Habitat Quality | Total Acres |
|---|---|---|
| **Plan Area** | High | 569.5 |
| | Low | 561.1 |
| **Total** | | 1130.5 |
| | | |
| **Grading Limits** | High | 381.9 |
| | Low | 409.7 |
| **Total** | | 791.6 |
| | | |
| **Natomas Basin** | High | 18746.1 |
| | Low | 9749.0 |
| | Medium | 5.5 |

| Area | Habitat Quality | Total Acres |
|---|---|---|
| **Total** | | 28500.6 |
| | | |
| **Regional Study Area** | High | 93187.5 |
| | Low | 34774.6 |
| | Medium | 35.2 |
| **Total** | | 127997.3 |

Other potential adverse effects on Swainson's Hawk due to Project implementation include the following:

- **Construction-Related Effects:** Project construction has the potential to displace and/or disturb nesting Swainson's Hawks. Nest disturbance from the operation of heavy construction equipment and continued activity near nest sites could cause nest abandonment or interfere with the incubation and feeding of young in a way that reduces nesting success.
- **Decreased Habitat Quality:** Due to the indirect effects of habitat-adjacent anthropogenic land uses, including direct recreational disturbance, the introgression of non-native plants into natural areas, non-native predators such as domestic dogs and cats, excessive light, and noise.
- **Reduction of Prey Base:** Conversion of higher-suitability habitats to lower-suitability habitats would be accompanied by a reduction in prey base that may reduce nest survival or the fat reserves required by hawks for their fall migration to Central Mexico, without any change in overall habitat acreage.

The following measures are proposed to avoid and minimize construction-related effects on Swainson's Hawks:

- **Measures to Minimize Nest Disturbance:** The Applicant will undertake the following measures to minimize disturbance to nesting Swainson's Hawks, if present during Project construction.
    - Surveys shall be conducted by a qualified biologist on and adjacent to the Plan Area and a 0.5-mile buffer of any other properties associated with the Project where construction or restoration activities resulting in ground disturbance, mechanized land clearing, or vegetation management would occur. The surveys shall be conducted consistent with the *Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley* (SHTAC 2000) in the calendar year that construction is scheduled to commence.
    - If breeding Swainson's Hawks (i.e., exhibiting nest building or nesting behavior) are identified, no new disturbances (e.g., heavy equipment operation associated with construction) will occur within 0.5 mile of an active nest between March 15 and September 15, or until a qualified biologist, with concurrence by CDFW, has either determined that young have fledged or that the nest is no longer occupied, or that construction can commence with precautions developed in coordination with CDFW in place. Routine disturbances such as agricultural activities, commuter traffic, and routine facility maintenance activities within 0.5 mile of an active nest are not restricted.
    - Where disturbance of a Swainson's Hawk nest cannot be avoided, such disturbance shall be temporarily avoided (i.e., defer construction activities until after the nesting season), and then, if unavoidable, the nest tree may be destroyed during the non-nesting season. For purposes of this provision, the Swainson's Hawk nesting season is defined as the beginning of Swainson's Hawk Survey Period II to the end of Survey Period V (March 20 to July 31, Swainson's Hawk Technical

Advisory Committee [2000]). If a nest tree (any tree that has an active nest in the year the impact is to occur) must be removed, tree removal shall only occur between August 1 and March 19.

- If a Swainson's Hawk nest tree is to be removed and fledglings are present, the tree may not be removed until September 15 or until a qualified biologist in coordination with CDFW has determined that the young have fledged and are no longer dependent upon the nest tree.
- If construction or other project-related activities which may disturb nesting birds are proposed within a ¼-mile buffer zone of an active nest, intensive monitoring (funded by the Applicant) by a qualified biologist will be required. Exact implementation of this measure will be based on specific information at the construction area.

- **Measures to Minimize Loss of Nest Trees:** The Applicant will undertake the following measures to minimize loss of Swainson's Hawk nest trees.
  - Valley oaks, tree groves, riparian habitat, and other large trees will be preserved wherever possible. The Applicant shall preserve and restore stands of riparian trees used by Swainson's Hawks and other animals, particularly near Fisherman's Lake and elsewhere in the Plan Area where large oak groves, tree groves, and riparian habitat have been identified in the Plan Area.
  - The raptor nesting season shall be avoided when scheduling construction near nests in accordance with applicable guidelines published by CDFW and USFWS or through consultation with those agencies.
  - Annually, prior to the Swainson's Hawk nesting season (March 15 to September 15) and until the Project is complete, the Applicant will notify the County of Sacramento and CDFW of the location of all Swainson's Hawk nest(s) and implement the specific mitigation measures to avoid and minimize take of the species.

In addition to avoiding on-site effects during construction, the Project proposes the identification and creation of Off-Site Reserves in consultation with local, state, and federal regulatory agencies, as discussed in **Section 2** of this Assessment. Habitats within the Off-Site Reserves would be of sufficient quality and quantity to offset all potential impacts to suitable habitat for Swainson's Hawk. The Sacramento County Swainson's Hawk Ordinance requires project proponents to provide title or easement to approved Swainson's Hawk mitigation lands with one acre preserved for each one acre impacted.

Overall, based on the analysis of habitat quality and availability for Swainson's Hawk conducted for this Assessment, the Project would not affect the viability of the Swainson's Hawk population in the Natomas Basin and would contribute to the overall success of Swainson's Hawk population in the Natomas Basin and beyond.

#### *6.5.2.6.4 Giant Gartersnake*

While Giant Gartersnake has not been documented in the Plan Area, the species could use agricultural irrigation ditches in the Plan Area for dispersal. Based on the habitat modeling presented in Section 5.3.6.2, the Project would directly impact 193.9 acres of 302.8 extant acres of modeled Giant Gartersnake habitat (**Table 9**). Impacts include 7.0 acres of modeled high-quality habitat, and 186.9 acres of modeled low-quality habitat. The Project would preserve 108.9 acres of modeled Giant Gartersnake habitat, including 43.0 acres of modeled high-quality habitat and 66 acres of modeled low-quality habitat.

Regionally, habitat modeling indicates 97,953.1 potential acres of Giant Gartersnake habitat are found within the RSA, with 28,808 acres in the Natomas Basin. The Plan Area supports:

- 0.3% of the modeled habitat for Giant Gartersnake in the RSA.
- 1% of the modeled habitat for Giant Gartersnake in the Natomas Basin.

*Table 9. Impacts and Conservation of Modeled Giant Gartersnake Habitat*

| Area | Habitat Quality | Total Acres |
|---|---|---|
| **Plan Area** | High | 50.0 |
| | Low | 252.8 |
| **Total** | | 302.8 |
| | | |
| **Grading Limits** | High | 7.0 |
| | Low | 186.9 |
| **Total** | | 193.9 |
| | | |
| **Natomas Basin** | High | 2461.3 |
| | Low | 4520.9 |
| | Medium | 21825.8 |
| **Total** | | 28808.0 |
| | | |
| **Regional Study Area** | High | 17011.2 |
| | Low | 24377.6 |
| | Medium | 56564.4 |
| **Total** | | 97953.1 |

Other potential adverse effects on Giant Gartersnake due to Project implementation include the following:

- **Construction-Related Effects:** During Project construction, Giant Gartersnakes – if present – could be killed or injured by vehicle strikes, crushed beneath heavy machinery, and/or entombed in or excavated from their winter retreats.
- **Habitat Quality:** due to the indirect effects of habitat-adjacent anthropogenic land uses, including direct recreational disturbance, the introgression of non-native plants into natural areas, non-native predators such as domestic dogs and cats, excessive light, and noise. Additionally, water channels lose their habitat value for Giant Gartersnake when cleaned of aquatic vegetation, during low/no flow periods or when high water releases eliminate or alter basking sites, refugia, foraging areas or juvenile microhabitat (USFWS 1999a). In the Natomas Basin, canal and drain maintenance, and irrigation practices, involve periodic clearing of vegetation along waterways, and short-term, seasonal and inter-annual changes in flow in waterways. A recent habitat assessment of canals and drains throughout the Natomas Basin indicates that operation and management practices are reducing habitat quality along a substantial portion of these waterways (Jones & Stokes 2005). Water diversions may also reduce the abundance of the snakes' aquatic prey. Water diversions or changes in land use within the area served by a canal or drain watershed may alter

flows or even cause a canal or drain to be abandoned. Residential developments may also result in increased runoff of hydrocarbons and of chemicals used for lawns and gardens, and increased stormwater volume (and associated increases in flow depths and velocities) because of high coverage of impervious surfaces.

The following measures are proposed to avoid and minimize construction-related effects on Giant Gartersnake:

- Within the Natomas Basin, all construction activity involving disturbance of habitat, such as site preparation and initial grading, is restricted to the period between May 1 and September 30. This is the active period for the Giant Gartersnake, and direct mortality is lessened because snakes are expected to actively move and avoid danger.
- Pre-construction surveys for Giant Gartersnake must be completed for all development projects by a qualified biologist approved by USFWS and CDFW. If any Giant Gartersnake habitat is found within a specific site, the following additional measures shall be implemented to minimize disturbance of habitat and harassment of Giant Gartersnake, unless such project is specifically exempted by USFWS.
    - Between April 15 and September 30, all irrigation ditches, canals, or other aquatic habitats should be completely dewatered, with no puddled water remaining, for at least 15 consecutive days prior to the excavation or filling in of the dewatered habitat. The Applicant will ensure dewatered habitat does not continue to support Giant Gartersnake prey, which could detain or attract snakes into the area. If a site cannot be completely dewatered, netting and salvage of prey items may be necessary. This measure reduces the suitability of the habitat by reducing available prey. As a result of the loss of prey species, Giant Gartersnake may be induced to vacate the area of their own volition.
    - For sites that contain Giant Gartersnake habitat, no more than 24-hours prior to start of construction activities (site preparation and/or grading), the project area shall be surveyed for the presence of Giant Gartersnake. If construction activities stop on the project site for a period of two weeks or more, a new Giant Gartersnake survey shall be completed no more than 24-hours prior to the re-start of construction activities.
    - Confine clearing to the minimal area necessary to facilitate construction activities. Flag and designate avoided Giant Gartersnake habitat within or adjacent to the project as Environmentally Sensitive Areas. This area shall be avoided by all construction personnel.
    - Construction personnel completing site preparation and grading operations shall receive USFWS approved environmental awareness training. This training instructs workers on how to identify Giant Gartersnakes and their habitats, and what to do if a Giant Gartersnake is encountered during construction activities. During this training, an on-site biological monitor shall be designated.
    - A qualified biological monitor shall be present during grading activities within 200 feet of aquatic Giant Gartersnake habitat to ensure that construction activities do not encroach into unauthorized areas. If a live Giant Gartersnake is found during construction activities, the biological monitor shall immediately notify USFWS. The biological monitor shall have the authority to stop construction in the vicinity of the snake. The snake shall be monitored and given a chance to leave the area on its own. If the snake does not leave on its own within one working day, the biological monitor shall consult with the USFWS to determine any necessary additional measures. The biological monitor shall also report any Giant Gartersnake mortality within one working day to USFWS. Any project-related activity that results in Giant Gartersnake mortality shall cease so that this activity can be modified to the extent practicable to avoid future mortality.

- If a live Giant Gartersnake is found during construction activities, immediately notify the USFWS and the project's biological monitor. The biological monitor, or his/her assignee, shall stop construction in the vicinity of the snake. Monitor the snake and allow the snake to leave on its own. The monitor shall remain in the area for the remainder of the workday to make sure the snake is not harmed or, if it leaves the site, does not return. Escape routes for Giant Gartersnake should be determined in advance of construction, and snakes should always be allowed to leave on their own. If a Giant Gartersnake does not leave on its own within one working day, further consultation with USFWS is required.
- Fill, or construction debris may be used by Giant Gartersnake as an over-wintering site. Therefore, upon completion of construction activities, remove any temporary fill and/or construction debris from the site. If this material is situated near undisturbed Giant Gartersnake habitat and it is to be removed between October 1 and April 30, it shall be inspected by a qualified biologist to assure that Giant Gartersnake are not using it as hibernaculae.

In addition to avoiding on-site effects during construction, the Project proposes the identification and creation of Off-Site Reserves in consultation with local, state, and federal regulatory agencies, as discussed in **Section 2** of this Assessment. Habitats within the Off-Site Reserves would be of sufficient quality and quantity to offset all potential impacts to suitable habitat for Giant Gartersnake.

Preservation of habitat has benefits in addition to those of habitat enhancement. In the Natomas Basin, a particularly important benefit of habitat preservation is that it ensures that the habitat will continue to exist, and it buffers total habitat availability from year-to-year fluctuations. For Giant Gartersnake, privately owned habitat in the Natomas Basin is primarily rice and associated canals, and there are no assurances that rice cultivation will continue on any particular site. Furthermore, agricultural markets will cause the total acreage of rice, and consequently of Giant Gartersnake habitat, to fluctuate substantially from year to year. Such environmental fluctuations strongly influence populations and reduce their viability. In contrast, preserved lands will provide habitat on a much more consistent basis, and thus reduce the magnitude of fluctuations in habitat availability.

Both habitat enhancement and preservation also can contribute to population viability by reducing anthropogenic causes of mortality. Preservation reduces human disturbance and minimizes activities that could harm or kill snakes. Habitat enhancement and management also reduces or eliminates agricultural activities that can harm or kill snakes. In addition, the preservation and enhancement of habitat typically results in larger blocks of higher quality habitat, and this should reduce long distance movements by snakes, which would also reduce the risk of mortality associated with those movements. Dispersal and other long-distance movements are dangerous for snakes, particularly where road crossings are involved (Bonnet et al. 1999, Rosen and Lowe 1994).

#### *6.5.2.6.5 Measures to Reduce Take to Valley Elderberry Longhorn Beetle*

While Valley Elderberry Longhorn Beetle is unlikely to occur in the Plan Area, as recommended by the NBHCP the proposed project shall comply with conservation practices for the Valley Elderberry Longhorn Beetle set forth in the conditions of the *USFWS Compensation Guidelines for the Valley Elderberry Longhorn Beetle*, dated 1999, as it may be updated from time to time. This policy assumes that any elderberry bushes found within the range of the species are likely to provide beetle habitat, and any destruction or loss of such elderberry shrub habitat must be mitigated according to the Guidelines. The principle conditions of the Guidelines are summarized below.

Prior to the commencement of construction activities, a pre-construction survey shall be conducted. If such survey determines Valley Elderberry Longhorn Beetle habitat is present, the following measures, as appropriate, to avoid take and minimize of individuals shall apply:

- Impacts to Valley Elderberry Longhorn Beetle habitat including any direct and indirect effects on VELB critical habitat will be avoided whenever possible. To the maximum extent practicable, projects will be designed to avoid stands of elderberry bushes and to avoid isolation of the plants from other nearby populations. Pre-construction surveys at the construction impact site will be conducted to assess the appropriate amount of mitigation.
- If elderberry plants cannot be avoided, they shall be transplanted during the dormant season (November 1 to February 15) to an area protected in perpetuity and approved by the USFWS.
- Replacement seedling plants will be provided at a ratio of 2 to 1 to 5 to 1 depending on the extent of beetle utilization of the plants moved or lost. A 1,800-square-foot area will be provided for each transplanted elderberry shrub or every five elderberry seedling plants.
- Annual monitoring of Valley Elderberry Longhorn Beetle habitat will be provided in the planted mitigation sites for a ten year period.
- Replacement elderberry shrubs will meet a 60% survival rate by the end of the ten year period and the 60% survival rate shall be required for the term of the applicable permit.

#### *6.5.2.6.6 Measures to Reduce Take of Burrowing Owl*

While Burrowing Owl is unlikely to occur in the Plan Area, as recommended by the NBHCP, prior to the commencement of construction activities a CDFW approved qualified biologist shall perform a pre-construction survey of the site to determine if any Burrowing Owls are using the site for foraging or nesting. The pre-construction survey shall be submitted to the appropriate agencies prior to the commencement of construction activities and a mitigation program shall be developed, if applicable, prior to initiation of any physical disturbance on the site.

Occupied burrows shall not be disturbed during nesting season (February 1 through August 31) unless a qualified biologist approved by the CDFW verifies through non-invasive measures that either: 1) the birds have not begun egg-laying and incubation; or 2) that juveniles from the occupied burrows are foraging independently and are capable of independent survival.

If nest sites are found, the CDFW shall be contacted regarding suitable mitigation measures, which may include a 300 foot buffer from the nest site during the breeding season (February 1 - August 31), or a relocation effort for the burrowing owls if the birds have not begun egg-laying and incubation or the juveniles from the occupied burrows are foraging independently and are capable of independent survival. If on-site avoidance is required, the location of the buffer zone will be determined by a qualified biologist. The developer shall mark the limit of the buffer zone with yellow caution tape, stakes, or temporary fencing. The buffer will be maintained throughout the construction period.

If relocation of the owls is approved for the site by CDFW, the developer shall hire a qualified biologist to prepare a plan for relocating the owls to a suitable site. The relocation plan must include: (a) the location of the nest and owls proposed for relocation; (b) the location of the proposed relocation site; (c) the number of owls involved and the time of year when the relocation is proposed to take place; (d) the name and credentials of the biologist who will be retained to supervise the relocation; (e) the proposed method of capture and transport for the owls to the new site; (f) a description of the site preparations at the relocation site (e.g., enhancement of existing burrows, creation of artificial burrows, one-time or long-term vegetation control, etc.); and (g) a description of efforts and funding support proposed to monitor the relocation. Relocation options may include passive relocation to another area of the site not subject to disturbance through one way doors on burrow openings, or construction of artificial burrows in accordance with the CDFW's October 17, 1995, *Staff Report on Burrowing Owl Mitigation*.

Where on-site avoidance is not possible, disturbance and/or destruction of burrows shall be offset through development of suitable habitat on upland reserves. Such habitat shall include creation of new burrows with adequate foraging area (a minimum of 6.5 acres) or 300 feet radii around the newly created burrows. Additional habitat design and mitigation measures are described in the CDFW's October 17, 1995, *Staff Report on Burrowing Owl Mitigation.*

#### *6.5.2.6.7 Measures to Reduce Take on Loggerhead Shrike*

While Loggerhead Shrike is unlikely to occur in the Plan Area, as recommended by the NBHCP, prior to the commencement of construction activities, a pre-construction survey shall be conducted. If surveys identify an active Loggerhead Shrike nest that will be impacted by the proposed activities, the project proponent shall install brightly colored construction fencing that establishes a boundary 100 feet from the active nest. No disturbance shall occur within the 100 foot fenced area during the nesting season of March 1 through July 31. A qualified biologist, with concurrence of USFWS must determine young have fledged or that the nest is no longer occupied prior to disturbance of the nest site.

#### *6.5.2.6.8 Measures to Reduce Take on Aleutian Cackling Goose*

While Aleutian Cackling Goose is unlikely to occur in the Plan Area, as recommended by the NBHCP, prior to the commencement of construction activities, a pre-construction survey shall be conducted. If such survey determines Aleutian Cackling Goose are present, the project proponent shall consult with USFWS and/or CDFW to determine appropriate measures to avoid and minimize take of individuals. Such measures shall be appropriate for the use (e.g., foraging, roosting, etc.) and activity of the species, since this species is a seasonal visitor to the region.

#### *6.5.2.6.9 Measures to Reduce Take on White-faced Ibis*

While White-faced Ibis is unlikely to occur in the Plan Area, as recommended by the NBHCP, prior to the commencement of construction activities, a pre-construction survey shall be conducted. If surveys determine the presence of active nest sites of White-faced Ibis, disturbance within 1/4 mile of nests will be avoided within the nesting season of May 15 through August 31 or until a qualified biologist, with concurrence of Wildlife Agencies, has determined that young have fledged or that the nest is no longer occupied.

#### *6.5.2.6.10 Measures to Reduce Take on Bank Swallow*

Bank Swallow nesting colony habitat is not present in the Plan Area. If activities related to Project implementation could occur in the vicinity of Bank Swallow nesting colonies off-site, disturbance to Bank Swallow nesting colonies will be avoided within the nesting season of May 1 through August 31 (or until a qualified biologist, with concurrence of USFWS and CDFW, has determined that young have fledged or that the nest is no longer occupied) during all activities conducted in the Plan Area.

If surveys identify an active Bank Swallow nesting colony that will be impacted, the proponent shall install brightly colored construction fencing that establishes a boundary 250 feet from the active nesting colony. No disturbance associated with project shall occur within the 250 foot fenced area during the nesting season of May 1 through August 31. Additionally, disturbance within ½ mile upstream or downstream of the colony will be avoided if the colony is located upon a natural waterway.

#### *6.5.2.6.11 Measures to Reduce Take on Northwestern Pond Turtle*

As recommended by the NBHCP, take of the Northwestern Pond Turtle as a result of habitat destruction during construction activities, including the removal of irrigation ditches and drains, and during ditch and drain maintenance, will be minimized by the dewatering requirement described for Giant Gartersnake.

#### *6.5.2.6.12 Measures to Reduce Take of Vernal Pool Fairy Shrimp, Vernal Pool Tadpole Shrimp, and Midvalley Fairy Shrimp*

Vernal pool habitat and related species have not been detected in the Plan Area. As recommended by the NBHCP, however, prior to the commencement of construction activities, a pre-construction survey shall be conducted if applicable habitat is determined to be present. If such survey determines Vernal Pool Fairy Shrimp, Vernal Pool Tadpole Shrimp, and Midvalley Fairy Shrimp are present, the project proponent shall consult with USFWS to determine appropriate measures to avoid and minimize take of individuals.

#### *6.5.2.6.13 Measures to Reduce Take on Sanford's Arrowhead and Other Special Status Plant Species*

Prior to the commencement of construction activities, seasonally appropriate special status plant surveys shall be conducted. If no special-status plants are observed, the botanist should document the findings in a letter report to be sent to the project proponent and no additional measures are recommended. If a species is found within areas of potential construction disturbance, it should be avoided to the greatest extent feasible. If the plants cannot be avoided, then a qualified botanist should prepare an avoidance and mitigation plan detailing protection and avoidance measures, transplanting procedures, success criteria, and long-term monitoring protocols.

If Sanford's arrowhead plants are identified through a pre-construction survey, notice to USFWS, CDFW and the California Native Plant Society shall be provided. Under such circumstances, the proponent shall allow the transplantation of plants prior to site disturbance.

### 6.5.3 Significance Statement

With the implementation of the Project's proposed conservation measures, the Project will not have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations by the CDFW or USFWS.

## 6.6 Project Effects on Riparian Habitat or Other Sensitive Natural Community

This section addresses the portion of the CEQA Guidelines requiring an assessment of whether the Project will *have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFW or USFWS*.

### 6.6.1 Summary Statement of Effects

As proposed, the Project has potential to directly impact 14.1% of the Valley Foothill Riparian habitat mapped within the Plan Area. This is the only adverse effect on riparian habitat or other sensitive natural communities identified for the Project. This adverse effect would be minimized through the implementation of one or more mitigation measures.

### 6.6.2 Detailed Discussion of Effects and Avoidance and Minimization Measures

The desktop review identified Northern Hardpan Vernal Pool, Northern Claypan Vernal Pool, and Great Valley Cottonwood Riparian Forest as the only sensitive vegetation communities recorded within the area analyzed. As described previously in **Section 5.4.4,** none of these communities are present within the Plan Area.

Valley Foothill Riparian is a riparian habitat that comprises 50.0 acres of the Plan Area. The Project proposes direct impacts to 7.0 acres, or 14.1% of this habitat in the Plan Area. The Project would preserve 43.0 acres, or 85.9% of this habitat in the Plan Area. To offset the direct impact to 7.0 acres of Valley Foothill Riparian habitat, the Applicant shall do one or more of the following:

- Modify the grading plan to avoid impacting Valley Foothill Riparian habitat.

- Habitat replacement equal to the amount impacted, associated with mitigation for jurisdictional impacts as described in **Section 6.7**.
- Preservation of Valley Foothill Riparian habitat of equivalent quantity and quality in one or more Off-Site Reserves.

### 6.6.3 Significance Statement

With the implementation of the Project's proposed conservation measures, the Project will not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFW or USFWS.

## 6.7 Project Effects on State or Federally Protected Wetlands

This section addresses the portion of the CEQA Guidelines requiring an assessment of whether the Project will *have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.*

### 6.7.1 Summary Statement of Effects

As proposed, the Project would have direct impacts to a total of 18.21 acres and 88,732 linear feet of potential other waters of the U.S. subject to USACE jurisdiction. To offset this impact, the Project proposes in-kind preservation of jurisdictional waters within the Plan Area or at Off-Site Reserves.

### 6.7.2 Detailed Discussion of Effects and Avoidance and Minimization Measures

The proposed Project is likely to have adverse effects, either directly or through indirect impacts to downstream water quality, to state and federally protected aquatic resources. Based upon the verified aquatic resources delineation (USACE 2020) and subsequent desktop assessment, a total of 18.21 acres and 88,732 linear feet of potential other waters of the U.S. subject to USACE jurisdiction pursuant to CWA Section 404 are present within the proposed grading limits of the Project. Of the USACE-verified (USACE 2020) potential jurisdictional other waters of the U.S., 11.11 acres and 41,504 linear feet are anticipated to be directly impacted by the Project. A total of 7.1 acres and 47,228 linear feet of desktop assessed potential jurisdictional other waters of the U.S. are anticipated to be directly impacted by the Project. These features are also potential other waters of the state subject to Central Valley RWQCB (CVRWQCB) jurisdiction and aquatic / riparian habitat subject to CDFW jurisdiction pursuant to CWA Section 401 and California Fish and Game Code Section 1600 respectively.

As currently proposed, the Project is anticipated to directly impact portions of what was mapped within the Plan Area for features R5UBFx-14, -20, -21, -26, -27, -28, -30, -32, -33, and -38; whereas the entire area that was mapped within the Plan Area for the remaining features is anticipated to be directly impacted by the Project. **Table 10** below provides a summary of the area of each feature identified within the proposed grading limit of the Project. **Exhibit 5** displays each feature identified within the Plan Area with the proposed grading limit indicated by the hatching.

*Table 10. Potential Jurisdictional Aquatic Resources within Proposed Grading Limits*

| Feature Name | Area (acres)* | Length (linear feet) |
|---|---|---|
| R5UBFx-1 | 0.20 | 1106 |
| R5UBFx-2 | 0.43 | 2337 |
| R5UBFx-3 | 0.54 | 2985 |

| Feature Name | Area (acres)* | Length (linear feet) |
|---|---|---|
| R5UBFx-4 | 0.88 | 2724 |
| R5UBFx-5 | 0.27 | 1184 |
| R5UBFx-6 | 0.32 | 1773 |
| R5UBFx-7 | 0.53 | 1786 |
| R5UBFx-8 | 0.68 | 1475 |
| R5UBFx-9 | 0.42 | 1392 |
| R5UBFx-10 | 0.22 | 1894 |
| R5UBFx-11 | 2.77 | 7563 |
| R5UBFx-12 | 0.36 | 1323 |
| R5UBFx-13 | 2.05 | 6857 |
| R5UBFx-14 | 0.62 | 2249 |
| R5UBFx-15 | 1.69 | 7399 |
| R5UBFx-16 | 0.72 | 2414 |
| R5UBFx-17 | 0.15 | 1328 |

| R5UBFx-38 | 0.01 | 153 |
| **Total Direct Impacts from Proposed Grading Limits:** | **18.21** | **88,732** |

Source: Bargas 2020 and 2022. *Acreages for features R5UBFx-1 through -18 overlapping the Surveyed Area have been verified by the USACE as potential jurisdictional aquatic resources through PJD, SPK-2020-00237. The remaining acreage of features R5UBFx-1 through -18 are subject to modification pending formal verification by USACE. Features R5UBFx-20 through -38 are anticipated to require a formal aquatic resources delineation survey to obtain a PJD from USACE. Feature R5UBFx-19 was removed from the aquatic resources delineation for verification as the feature was confirmed to no longer exist during the June 2020 supplemental site visit.

Based on the results of the Applicant's USACE-verified aquatic resources delineation, the Applicant shall commit to replace, restore, or enhance on a "no net loss" basis, in accordance with the USACE and the CVRWQCB, as appropriate for each agency's jurisdiction, the acreage of all waters of the U.S. and wetland habitats, including USACE jurisdictional "isolated" wetlands that would be removed with implementation of the Project. Wetland restoration, enhancement, and/or replacement shall be at a location and by methods acceptable to the USACE, CDFW, and CVRWQCB, as determined during the Section 404, Section 1600, and Section 401 permitting processes.

The Applicant shall prepare and submit a habitat mitigation and monitoring plan to the USACE for the creation of jurisdictional waters at a mitigation ratio no less than 1:1 acres of created waters of the U.S., including wetlands, to each acre filled. The mitigation plans shall demonstrate how the USACE criteria for jurisdictional waters will be met through implementation. Wetland mitigation achieved through the establishment of Off-Site Reserves can satisfy this measure if conducted in such a way that it meets both habitat function and the USACE criteria for creation of waters of the U.S. The wetland creation section of the habitat mitigation and monitoring plan shall include the following:

- target areas for creation,
- a complete biological assessment of the existing resources on the target areas,
- specific creation and restoration plans for each target area,
- performance standards for success that will illustrate that the compensation ratios are met, and
- a monitoring plan including schedule and annual report format.

Consultations with the agencies may result in the need to acquire one or more of the following permits and regulatory approvals:

- **USACE CWA 404 Permit:** Authorization for the fill of jurisdictional waters of the U.S. shall be secured prior to placing any fill in jurisdictional wetlands from the USACE through the CWA Section 404 permitting process. Timing for compliance with the specific conditions of the 404 permit shall be per conditions specified by the USACE as part of permit issuance. It is expected that the Project would require an Individual Permit because wetland impacts would total more than 0.5 acre. In its final stage and once approved by the USACE, the mitigation plan is expected to detail proposed wetland restoration, enhancement, and/or replacement activities that would ensure no net loss of jurisdictional wetlands function and values in an agency-approved location. As required by Section 404, approval and implementation of the wetland mitigation and monitoring plan shall ensure no net loss of jurisdictional waters of the U.S., including USACE jurisdictional wetlands. Mitigation for impacts to USACE jurisdictional "isolated" wetlands shall be included in the same mitigation plan. All mitigation requirements identified through this process shall be implemented before construction

begins in any areas containing wetland features. Any additional measures required as part of the issuance of the permit shall be implemented.

- **CVRWQCB CWA Section 401 Water Quality Certification:** Prior to construction in any areas containing wetland features, the Applicant shall obtain a water quality certification pursuant to Section 401 of the CWA for the project. Any measures required as part of the issuance of the water quality certification shall be implemented.
- **CDFW Section 1602 LSAA**: The Applicant shall obtain a Streambed Alteration Agreement under Section 1600 et seq. of the California Fish & Game Code for impacts to Waters of the State as defined under Section 1602 of the California Fish & Game Code. Any measures required as part of the issuance of the Agreement shall be implemented.
- **CVRWQCB Waste Discharge Requirements**: The Applicant shall file a report of waste discharge with the CVRWQCB for activities affecting "isolated" waters of the state, if applicable.

### 6.7.3 Significance Statement

With the implementation of the Project's proposed conservation measures, the Project will not have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

## 6.8 Project Effects on Wildlife Movement and Nursery Sites

This section addresses the portion of the CEQA Guidelines requiring an assessment of whether the Project will *interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites*.

### 6.8.1 Summary Statement of Effects

The Project would not impact wildlife movement corridors. Proposed mitigation measures will avoid Project impacts to nesting birds.

### 6.8.2 Detailed Discussion of Effects and Avoidance and Minimization Measures

As discussed in **Section 5.7**, ecologists at UC Davis conducted a GIS-based study of wildlife corridors in the Central Valley in 2010. This study showed a potential – albeit narrow – corridor through the southeast portion of the Plan Area. Since the time the analysis was completed, much of the area within that modeled corridor has been extensively developed and the modeled corridor is no longer valid. In essence, the Plan Area does not act as a wildlife corridor as classically considered.

The Project could impact nesting birds protected by the federal Migratory Bird Treaty Act. The following avoidance and minimization measures shall be implemented prior to site disturbance to avoid impacts to nesting raptors and other birds in the Plan Area or immediately adjacent properties.

- A nesting bird survey shall be conducted within the Plan Area (raptors and non-raptors) and a 500-foot buffer (raptors only) prior to commencing with earth-moving or construction work if this work would occur during the typical nesting season (between February 1 and August 31).
- If nesting birds are identified during the surveys, a qualified biologist will determine an appropriate disturbance-free buffer zone and clearly demarcate that buffer zone in the field for avoidance by construction activities.

- The size of an established buffer may be altered if a qualified biologist conducts behavioral observations and determines the nesting birds are well acclimated to disturbance. If this occurs, the biologist shall prescribe a modified buffer that allows sufficient room to prevent undue disturbance/harassment to the nesting birds. If the buffer is reduced, the qualified biologist shall remain on site to monitor the behavior of the nesting birds during construction in order to ensure that the reduced buffer does not result in take of eggs or nestlings.
- No construction or earth-moving activity shall occur within the established buffer until it is determined by a qualified biologist that the young have fledged (are no longer dependent on the nest or the adults for feeding) and have attained sufficient flight skills to avoid project construction zones. This typically occurs by August 31. This date may be earlier or later and shall be determined by a qualified biologist. If a qualified biologist is not hired to monitor the nesting raptors, then the full buffer(s) shall be maintained in place from February 1 through the month of August. The buffer may be removed, and work may proceed as otherwise planned within the buffer on September 1.

### 6.8.3 Significance Statement

The Project will not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.

## 6.9 Project Effects on Local Policies or Ordinances Protecting Biological Resources

This section addresses the portion of the CEQA Guidelines requiring an assessment of whether the Project will *conflict with any local policies or ordinances protecting biological resources, such as tree preservation policy or ordinance*.

### 6.9.1 Summary Statement of Effects

Development of the Project has the potential to conflict with the Sacramento County Tree Preservation and Protection Ordinance and the Sacramento County Swainson's Hawk Ordinance. Conflicts with these plans will be avoided by implementing the measures required by each.

### 6.9.2 Detailed Discussion of Effects and Avoidance and Minimization Measures

As previously described in **Section 3.4**, Sacramento County has two ordinances pertaining to protection of biological resources:

- **Tree Preservation and Protection Ordinance:** Sacramento County's tree preservation and protection ordinance is intended to prevent the loss of native oak trees. The ordinance protects any living native oak tree having at least one trunk of six inches or more in diameter measured four and one-half feet above the ground, or a multi-trunked native oak tree having an aggregate diameter of ten inches or more, measured four and one-half feet above the ground. The Applicant will comply with the ordinance by implementing one of the following:
    - Minor modifications to the grading plan to avoid impacting protected trees.
    - Tree replacement, if required, as part of Valley Foothill Riparian habitat impact mitigation as discussed in **Section 6.6.**
    - Preservation of protected trees of equivalent quantity and quality in one or more Off-Site Reserves.

- **Swainson's Hawk Ordinance:** Sacramento County's Swainson's Hawk ordinance requires project proponents to provide title or easement to approved Swainson's Hawk mitigation lands with one acre preserved for each one acre impacted for impacts of 40 acres or greater. Compliance with this ordinance is described above in the **Section 6.5.2.6**.

### 6.9.3 Significance Statement

With the implementation of the Project's proposed conservation measures, the Project will not conflict with any local policies or ordinances protecting biological resources, such as tree preservation policy or ordinance.

## 6.10 Project Effects on the Provisions of an Adopted Habitat Conservation Plan

This section addresses the portion of the CEQA Guidelines requiring an assessment of whether the Project will *conflict with the provisions of an adopted HCP, NCCP, or other approved local, regional, or state habitat conservation plan.*

### 6.10.1 Summary Statement of Effects

The Project is located within the boundaries of the Natomas Basin Habitat Conservation Plan and provides potential habitat for a number of covered species.

### 6.10.2 Detailed Discussion of Effects and Avoidance and Minimization Measures

The Project does not seek take coverage under the federal Section 10(a)(1)(B) permit and the State Section 2081 Permit issued as part of the NBHCP process. To maintain consistency with the NBHCP and MAPHCP, the Applicant will endeavor to avoid conflicts with the provisions of those existing HCPs while USACE is conducting formal Section 7 consultation with USFWS under FESA regarding potential take as a result of the Project.

Because the Project would result in additional development and reserve establishment that was not addressed in the NBHCP, a programmatic effects analysis is also being prepared to evaluate its potential effects on the Covered Species and their habitats, the attainment of the goals and objectives of the NBHCP and MAPHCP, and on the viability of the populations of Covered Species in the Natomas Basin. Such mitigation would address the effect of reduced agricultural lands on the biological viability of the NBHCP.

The NBHCP and MAPHCP share the same overall goal of creating a multi-species conservation program to mitigate impacts to covered species that may result from development in the Natomas Basin. The goals of each HCP will be incorporated into the take coverage sought by the Applicant for the Project. Though there may be differences in the approach to these goals, such as the consideration of off-site mitigation, the intent of take coverage for the Project will be consistent with the existing biological goals and objectives of the NBHCP and MAPHCP.

### 6.10.3 Significance Statement

With the implementation of the Project's proposed conservation measures, the Project will not conflict with the provisions of an adopted HCP, NCCP, or other approved local, regional, or state habitat conservation plan.

# Appendix A. Faunal Compendium

The table below lists in taxonomic order the 100 wildlife species, including 2 reptiles, 92 birds, 6 mammals, detected during surveys conducted by Bargas from 2019 to 2021. Many species were detected off-site in the vicinity of the Plan Area, but likely could be found within the Plan Area at some point during their life cycle.

| | Common Name | Scientific Name |
|---|---|---|
| REPTILIA (Reptiles) | | |
| SQUAMATA (Lizards and Snakes) | | |
| PHRYNOSOMATIDAE (North American Spiny Lizards) | | |
| | Western Fence Lizard | Sceloporus occidentalis |
| TESTUDINES (Turtles and Tortoises) | | |
| EMYDIDAE (Box and Basking Turtles) | | |
| | Red-eared Slider | Trachemys scripta |
| AVES (Birds) | | |
| ANSERIFORMES (Screamers, Swans, Geese, and Ducks) | | |
| ANATIDAE (Geese, Ducks, and Swans) | | |
| | Snow Goose | Anser caerulescens |
| | Canada Goose | Branta canadensis |
| | Cinnamon Teal | Spatula cyanoptera |
| | Gadwall | Mareca strepera |
| | Mallard | Anas platyrhynchos |
| GALLIFORMES (Gallinaceous Birds) | | |
| ODONTOPHORIDAE (New World Quail) | | |
| | California Quail | Callipepla californica |
| PHASIANIDAE (Partridges, Grouse, Turkeys, and Old World Quail) | | |
| | Ring-necked Pheasant | Phasianus colchicus |
| | Wild Turkey | Meleagris gallopavo |
| PODICIPEDIFORMES (Grebes) | | |
| PODICIPEDIDAE (Grebes) | | |
| | Pied-billed Grebe | Podilymbus podiceps |
| COLUMBIFORMES (Pigeons and Doves) | | |
| COLUMBIDAE (Pigeons and Doves) | | |
| | Rock Pigeon | Columba livia |
| | Eurasian Collared-Dove | Streptopelia decaocto |
| | Mourning Dove | Zenaida macroura |
| APODIFORMES (Swifts and Hummingbirds) | | |
| APODIDAE (Swifts) | | |
| | White-throated Swift | Aeronautes saxatalis |
| TROCHILIDAE (Hummingbirds) | | |

| | | Common Name | Scientific Name |
|---|---|---|---|
| | | Anna's Hummingbird | Calypte anna |
| | | Rufous Hummingbird | Selasphorus rufus |
| | GRUIFORMES (Rails, Cranes, and Allies) | | |
| | | RALLIDAE (Rails, Gallinules, and Coots) | |
| | | American Coot | Fulica americana |
| | CHARADRIIFORMES (Shorebirds, Gulls, Auks, and Allies) | | |
| | | CHARADRIIDAE (Lapwings and Plovers) | |
| | | Killdeer | Charadrius vociferus |
| | | SCOLOPACIDAE (Sandpipers, Phalaropes, and Allies) | |
| | | Whimbrel | Numenius phaeopus |
| | SULIFORMES (Frigatebirds, Boobies, and Cormorants) | | |
| | | PHALACROCORACIDAE (Cormorants) | |
| | | Double-crested Cormorant | Phalacrocorax auritus |
| | PELECANIFORMES (Pelicans, Herons, Ibises, and Allies) | | |
| | | PELECANIDAE (Pelicans) | |
| | | American White Pelican | Pelecanus erythrorhynchos |
| | | ARDEIDAE (Herons, Bitterns, and Allies) | |
| | | American Bittern | Botaurus lentiginosus |
| | | Great Blue Heron | Ardea herodias |
| | | Great Egret | Ardea alba |
| | | Snowy Egret | Egretta thula |
| | CATHARTIFORMES (New World Vultures) | | |
| | | CATHARTIDAE (New World Vultures) | |
| | | Turkey Vulture | Cathartes aura |
| | ACCIPITRIFORMES (Kites, Hawks, Eagles, and Allies) | | |
| | | PANDIONIDAE (Ospreys) | |
| | | Osprey | Pandion haliaetus |
| | | ACCIPITRIDAE (Kites, Hawks, Eagles, and Allies) | |
| | | White-tailed Kite | Elanus leucurus |
| | | Northern Harrier | Circus hudsonius |
| | | Cooper's Hawk | Accipiter cooperii |
| | | Red-shouldered Hawk | Buteo lineatus |
| | | Swainson's Hawk | Buteo swainsoni |
| | | Red-tailed Hawk | Buteo jamaicensis |
| | | Rough-legged Hawk | Buteo lagopus |
| | STRIGIFORMES (Owls) | | |
| | | STRIGIDAE (Typical Owls) | |
| | | Great Horned Owl | Bubo virginianus |

| | Common Name | Scientific Name |
|---|---|---|
| CORACIIFORMES (Rollers, Motmots, Kingfishers, and Allies) | | |
| ALCEDINIDAE (Kingfishers) | | |
| | Belted Kingfisher | Megaceryle alcyon |
| PICIFORMES (Woodpeckers) | | |
| PICIDAE (Woodpeckers) | | |
| | Downy Woodpecker | Dryobates pubescens |
| | Nuttall's Woodpecker | Dryobates nuttallii |
| | Northern Flicker | Colaptes auratus |
| | Acorn Woodpecker | Melanerpes formicivorus |
| FALCONIFORMES (Caracaras and Falcons) | | |
| FALCONIDAE (Caracaras and Falcons) | | |
| | Prairie Falcon | Falco mexicanus |
| | American Kestrel | Falco sparverius |
| PASSERIFORMES (Passerine Birds) | | |
| TYRANIDAE (Tyrant Flycatchers) | | |
| | Black Phoebe | Sayornis nigricans |
| | Say's Phoebe | Sayornis saya |
| | Western Kingbird | Tyrannus verticalis |
| CORVIDAE (Crows and Jays) | | |
| | California Scrub-Jay | Aphelocoma californica |
| | Yellow-billed Magpie | Pica nuttalli |
| | American Crow | Corvus brachyrhynchos |
| | Common Raven | Corvus corax |
| PARIDAE (Chickadees and Titmice) | | |
| | Oak Titmouse | Baeolophus inornatus |
| ALAUDIDAE (Larks) | | |
| | Horned Lark | Eremophila alpestris |
| HIRUNDINIDAE (Swallows) | | |
| | Northern Rough-winged Swallow | Stelgidopteryx serripennis |
| | Tree Swallow | Tachycineta bicolor |
| | Barn Swallow | Hirundo rustica |
| | Cliff Swallow | Petrochelidon pyrrhonota |
| AEGITHALIDAE (Long-tailed Tits and Bushtits) | | |
| | Bushtit | Psaltriparus minimus |
| REGULIDAE (Kinglets) | | |
| | Golden-crowned Kinglet | Regulus satrapa |
| | Ruby-crowned Kinglet | Regulus calendula |
| BOMBYCILLIDAE (Waxwings) | | |

| | Common Name | Scientific Name |
|---|---|---|
| | Cedar Waxwing | Bombycilla cedrorum |
| SITTIDAE (Nuthatches) | | |
| | White-breasted Nuthatch | Sitta carolinensis |
| TROGLODYTIDAE (Wrens) | | |
| | House Wren | Troglodytes aedon |
| | Bewick's Wren | Thryomanes bewickii |
| MIMIDAE (Mockingbirds and Thrashers) | | |
| | Northern Mockingbird | Mimus polyglottos |
| STURNIDAE (Starlings) | | |
| | European Starling | Sturnus vulgaris |
| TURDIDAE (Thrushes) | | |
| | Western Bluebird | Sialia mexicana |
| | American Robin | Turdus migratorius |
| PASSERIDAE (Old World Sparrows) | | |
| | House Sparrow | Passer domesticus |
| MOTACILLIDAE (Wagtails and Pipits) | | |
| | American Pipit | Anthus rubescens |
| FRINGILLIDAE (Fringilline and Cardueline Finches and Allies) | | |
| | House Finch | Haemorhous mexicanus |
| | Lesser Goldfinch | Spinus psaltria |
| | American Goldfinch | Spinus tristis |
| PASSERELIDAE (New World Sparrows) | | |
| | Lark Sparrow | Chondestes grammacus |
| | Dark-eyed Junco | Junco hyemalis |
| | White-crowned Sparrow | Zonotrichia leucophrys |
| | Golden-crowned Sparrow | Zonotrichia atricapilla |
| | Savannah Sparrow | Passerculus sandwichensis |
| | Song Sparrow | Melospiza melodia |
| | Lincoln's Sparrow | Melospiza lincolnii |
| | California Towhee | Melozone crissalis |
| | Spotted Towhee | Pipilo maculatus |
| ICTERIDAE (Blackbirds) | | |
| | Western Meadowlark | Sturnella neglecta |
| | Hooded Oriole | Icterus cucullatus |
| | Bullock's Oriole | Icterus bullockii |
| | Yellow-headed Blackbird | Xanthocephalus xanthocephalus |
| | Red-winged Blackbird | Agelaius phoeniceus |
| | Brewer's Blackbird | Euphagus cyanocephalus |

| | | Common Name | Scientific Name |
|---|---|---|---|
| | | Great-tailed Grackle | Quiscalus mexicanus |
| | | Brown-headed Cowbird | Molothrus ater |
| | PARULIDAE (Warblers) | | |
| | | Common Yellowthroat | Geothlypis trichas |
| | | Yellow Warbler | Setophaga petechia |
| | | Yellow-rumped Warbler | Setophaga coronata |
| | CARDINALIDAE (Cardinals and Allies) | | |
| | | Black-headed Grosbeak | Pheucticus melanocephalus |
| | | Blue Grosbeak | Passerina caerulea |
| MAMMALIA (Mammals) | | | |
| | LAGOMORPHA (Rabbits and Hares) | | |
| | LEPORIDAE (Hares and Rabbits) | | |
| | | Black-tailed Jackrabbit | Lepus californicus |
| | RODENTIA (Rodents) | | |
| | SCIURIDAE (Squirrels) | | |
| | | California Ground-Squirrel | Otospermophilus beecheyi |
| | | Eastern Fox Squirrel | Sciurus niger |
| | CASTORIDAE (Beavers) | | |
| | | North American Beaver | Castor canadensis |
| | CARNIVORA (Carnivores) | | |
| | MUSTELIDAE (Weasels, Otters, and Badgers) | | |
| | | American Mink | Neovison vison |
| | | North American River Otter | Lontra canadensis |

# Appendix B: Floral Compendium

The table below lists in alphabetical order the 58 plant species observed during surveys conducted by Bargas from 2019 to 2021.

| Common Name | Scientific Name |
|---|---|
| Velvet Leaf | Abutilon theophrasti |
| Kiwi | Actinidia deliciosa |
| Tree-of-heaven | Ailanthus altissima |
| Pigweed Amaranth | Amaranthus albus |
| Scarlet Pimpernel | Anagallis arvensis |
| Wild Oats | Avena fatua |
| River Bulrush | Bolboschoenus fluviatilis |
| Black Mustard | Brassica nigra |
| Ripgut Brome | Bromus diandrus |
| Soft Chess | Bromus hordeaceus |
| Chili Peppers | Capsicum annuum |
| Italian thistle | Carduus pycnocephalus |
| Big Leaf Sedge | Carex amplifolia |
| Safflower | Carthamus tinctorium |
| Yellow Star Thistle | Centaurea solstitialis |
| Watermelon | Citrullus lanatus |
| Field Bindweed | Convolvulus arvensis |
| Turkey Mullein | Croton setiger |
| Tall cyperus | Cyperus eragrostis |
| Nutgrass | Cyperus rotundus |
| Yellow Nutsedge | Cyperus strigosus |
| Jimsonweed | Datura wrightii |
| Horseweed | Erigeron canadensis |
| Broadleaf Filaree | Erodium botrys |
| Gum species | Eucalyptus sp. |
| Strawberry | Fragaria x ananassa |
| Bristly Ox-tongue | Helminthotheca echioides |
| Summer Mustard | Hirschfeldia incana |

| Common Name | Scientific Name |
|---|---|
| Barley | Hordeum vulgare |
| Baltic Rush | Juncus balticus |
| Prickly Lettuce | Lactuca serriola |
| Duckweed | Lemna minor |
| Annual Ryegrass | Festuca perennis |
| Water Primrose | Ludwigia sp. |
| Hyssop Loosestrife | Lythrum hyssopifolia |
| Cheeseweed | Malva parviflora |
| Bur Clover | Medicago polymorpha |
| Alfalfa | Medicago sativa |
| Rice | Oryza sativa |
| Reed Canary Grass | Phalaris arundinacea |
| American Sycamore | Platanus occidentalis |
| Fremont's Cottonwood | Populus fremontii |
| Valley Oak | Quercus lobata |
| Wild Radish | Raphanus sativus |
| Himalayan Blackberry | Rubus armeniacus |
| Curly Dock | Rumex crispus |
| Fiddle Dock | Rumex pulcher |
| Gooding's Black Willow | Salix gooddingi |
| Tule | Schoenoplectus acutus var. occidentalis |
| Coastal Redwood | Sequoia sempervirens |
| Milk Thistle | Silybum marianum |
| Tomato | Solanum lycopersicum |
| Johnsongrass | Sorghum halepense |
| Dandelion | Taraxacum officinale |
| Wheat | Triticum aestivum |
| Common Cattail | Typha latifolia |
| Foxtail Fescue | Vulpia myuros |
| Maize | Zea mays |

# Appendix C. Special Status Resource Summary

The following table summarizes the legal status and potential for occurrence of three sensitive vegetation communities, as well as 26 plant, 5 invertebrate, 3 fish, 2 amphibian, 2 reptile, and 16 bird species with special status discussed in this Assessment.

| Common Name | Scientific Name | Status* | NBHCP Covered Species | Potential for Occurrence | Notes |
|---|---|---|---|---|---|
| VEGETATION COMMUNITIES | | | | | |
| Northern Hardpan Vernal Pool | Northern Hardpan Vernal Pool | - | - | Presumed Absent/No Potential | Eight location records in CNDDB desktop review. Nearest is six miles northeast of Plan Area. |
| Northern Claypan Vernal Pool | Northern Claypan Vernal Pool | - | - | Presumed Absent/No Potential | Single location record in CNDDB desktop review four miles east of Plan Area. |
| Great Valley Cottonwood Riparian Forest | Great Valley Cottonwood Riparian Forest | - | - | Presumed Absent/No Potential | Single location record in CNDDB desktop review, mapped along the far shore of the Sacramento River bend immediately southeast of the Plan Area. |
| PLANTS | | | | | |
| Ferris' Milkvetch | Astragalus tener var. ferrisae | CRPR 1B.1 | No | Presumed Absent/No Potential | Required habitat components absent in Plan Area, not observed during protocol surveys |
| Heartscale | Atriplex cordulata var. cordulata | CRPR 1B.2 | No | Low | Not found in Surveyed Area. Unlikely to occur in remainder of Plan Area, but can't be entirely dismissed without surveys. |
| Brittlescale | Atriplex depressa | CRPR 1B.2 | No | Low | Not found in Surveyed Area. Unlikely to occur in remainder of Plan Area, but can't be entirely dismissed without surveys. |
| Bristly Sedge | Carex comosa | CRPR 2B.1 | No | Low | Not found in Surveyed Area. Unlikely to occur in remainder of Plan Area, but can't be entirely dismissed without surveys. |
| Pappose Tarplant | Centromadia parryi ssp. parryi | CRPR 1B.2 | No | Low | Not found in Surveyed Area. Unlikely to occur in remainder of Plan Area, but can't be entirely dismissed without surveys. |
| Palmate-bracted Bird's-Beak | Chloropyron palmatum | FE, SE, CRPR 1B.1 | No | Low | Not found in Surveyed Area. Unlikely to occur in remainder of Plan Area, but can't be entirely dismissed without surveys. |
| Peruvian Dodder | Cuscuta obtusiflora var. glandulosa | CRPR 2B.2 | No | Presumed Absent/No Potential | Required habitat components absent in Plan Area, not observed during protocol surveys |
| Dwarf Downingia | Downingia pusilla | CRPR 2B.2 | No | Low | Not found in Surveyed Area. Unlikely to occur in remainder of Plan Area, but can't be entirely dismissed without surveys. |

| Common Name | Scientific Name | Status* | NBHCP Covered Species | Potential for Occurrence | Notes |
|---|---|---|---|---|---|
| Boggs Lake Hedge Hyssop | Gratiola heterosepala | SE, CRPR 1B.2 | **Yes** | Presumed Absent/No Potential | Required habitat components absent in Plan Area, not observed during protocol surveys |
| Jepson's Coyote Thistle | Eryngium jepsonii | CRPR 1B.2 | No | Low | Not found in Surveyed Area. Unlikely to occur in remainder of Plan Area, but can't be entirely dismissed without surveys. |
| San Joaquin Spearscale | Extriplex joaquinana | CRPR 1B.2 | No | Low | Not found in Surveyed Area. Unlikely to occur in remainder of Plan Area, but can't be entirely dismissed without surveys. |
| Woolly Rose-Mallow | Hibiscus lasiocarpos var. occidentalis | CRPR 1B.2 | No | Low | Marginal habitat present within the Plan Area, and previously recorded occurrences near the Plan Area |
| Delta Tule Pea | Lathyrus jepsonii var. jepsonii | CRPR 1B.2 | **Yes** | Presumed Absent/No Potential | Required habitat components absent in Plan Area, not observed during protocol surveys |
| Legenere | Legenere limosa | CRPR 1B.1 | **Yes** | Presumed Absent/No Potential | Required habitat components absent in Plan Area, not observed during protocol surveys |
| Heckard's Pepper Grass | Lepidium latipes var. heckardii | CRPR 1B.2 | No | Low | Not found in Surveyed Area. Unlikely to occur in remainder of Plan Area, but can't be entirely dismissed without surveys. |
| Mason's Lilaeopsis | Lilaeopsis masonii | CRPR 1B.1 | No | Low | Marginal habitat may present within the Plan Area, and previously recorded occurrences near the Plan Area |
| Baker's Navarretia | Navarretia leucocephala ssp. bakeri | CRPR 1B.1 | No | Low | Not found in Surveyed Area. Unlikely to occur in remainder of Plan Area, but can't be entirely dismissed without surveys. |
| Colusa Grass | Neostapfia colusana | FT, SE, CRPR 1B.1 | **Yes** | Presumed Absent/No Potential | Required habitat components absent in Plan Area, not observed during protocol surveys |
| Slender Orcutt Grass | Orcuttia tenuis | FT, SE, CRPR 1B.1 | **Yes** | Presumed Absent/No Potential | Plan Area is outside species' elevational/distributional range, required habitat components absent in Plan Area, not observed during protocol surveys |
| Sacramento Orcutt Grass | Orcuttia viscida | FE, SE, CRPR 1B.1 | **Yes** | Presumed Absent/No Potential | Plan Area is outside species' elevational/distributional range, required habitat components absent in Plan Area, not observed during protocol surveys |
| Bearded Popcorn Flower | Plagiobothrys hystriculus | CRPR 1B.1 | No | Low | Not found in Surveyed Area. Unlikely to occur in remainder of Plan Area, but can't be entirely dismissed without surveys. |

| Common Name | Scientific Name | Status* | NBHCP Covered Species | Potential for Occurrence | Notes |
|---|---|---|---|---|---|
| California Alkaligrass | Puccinellia simplex | CRPR 1B.2 | No | Low | Not found in Surveyed Area. Unlikely to occur in remainder of Plan Area, but can't be entirely dismissed without surveys. |
| Sanford's Arrowhead | Sagittaria sanfordii | CRPR 1B.2 | **Yes** | Low | Marginal habitat may present within the Plan Area, and previously recorded occurrences near the Plan Area |
| Suisun Marsh Aster | Symphyotrichum lentum | CRPR 1B.2 | No | Presumed Absent/No Potential | Required habitat components absent in Plan Area, not observed during protocol surveys |
| Saline Clover | Trifolium hydrophilum | CRPR 1B.2 | No | Low | Not found in Surveyed Area. Unlikely to occur in remainder of Plan Area, but can't be entirely dismissed without surveys. |
| Crampton's Tuctoria | Tuctoria mucronata | FE, SE, CRPR 1B.1 | No | Low | Not found in Surveyed Area. Unlikely to occur in remainder of Plan Area, but can't be entirely dismissed without surveys. |
| INVERTEBRATES | | | | | |
| Conservancy Fairy Shrimp | Branchinecta conservatio | FE | No | Presumed Absent/No Potential | No suitable habitat in the Plan Area. |
| Vernal Pool Fairy Shrimp | Branchinecta lynchi | FT | **Yes** | Low | No suitable habitat in the Plan Area for long term population persistence, but may occur in disturbed water accumulations. |
| Vernal Pool Tadpole Shrimp | Lepidurus packardi | FE | **Yes** | Presumed Absent/No Potential | No suitable habitat in the Plan Area. |
| Midvalley Fairy Shrimp | Branchinecta mesovallensis | - | **Yes** | Presumed Absent/No Potential | No suitable habitat in the Plan Area. |
| Valley Elderberry Longhorn Beetle | Desmocerus californicus dimorphus | FT | **Yes** | Low | No suitable habitat has been found in the Plan Area, however, elderberry plants are widespread and grow quickly. |
| FISH | | | | | |
| Chinook Salmon | Oncorhynchus tshawytscha | FT, ST | No | Presumed Absent/No Potential | No suitable habitat in the Plan Area. |
| Steelhead | Oncorhynchus mykiss irideus | FT | No | Presumed Absent/No Potential | No suitable habitat in the Plan Area. |
| Longfin Smelt | Spirinchus thaleichthys | ST, SSC | No | Presumed Absent/No Potential | No suitable habitat in the Plan Area. |
| AMPHIBIANS | | | | | |

| Common Name | Scientific Name | Status* | NBHCP Covered Species | Potential for Occurrence | Notes |
|---|---|---|---|---|---|
| Western Spadefoot | Spea hammondii | SSC | **Yes** | Presumed Absent/No Potential | No known occurrences in the Natomas Basin and limited suitable habitat in the Plan Area. |
| California Tiger Salamander | Ambystoma californiense | FT, ST | **Yes** | Presumed Absent/No Potential | No known occurrences in the Natomas Basin and limited suitable habitat in the Plan Area. |
| REPTILES | | | | | |
| Giant Gartersnake | Thamnophis gigas | FT | **Yes** | Low | Unlikely to occur regularly but may infrequently use canals in Plan Area for dispersal. |
| Northwestern Pond Turtle | Actinemys marmorata | ST | **Yes** | High | Appropriate habitat present within and adjacent to the Plan Area |
| BIRDS | | | | | |
| Aleutian Cackling Goose | Branta hutchinsii leucopareia | FD, SSC | **Yes** | Moderate | No record in Natomas Basin, but foraging habitat is present within the Plan Area. |
| Western Yellow-billed Cuckoo | Coccyzus americanus occidentalis | FT, SE | No | Presumed Absent/No Potential | Considered extirpated in region. No suitable habitat in the Plan Area. |
| California Black Rail | Laterallus jamaicensis coturniculus | ST | No | Presumed Absent/No Potential | Outside of the range of species and no suitable habitat present. |
| Western Snowy Plover | Charadrius nivosus nivosus | FT | No | Presumed Absent/No Potential | Outside of the range of species and no suitable habitat present. |
| American White Pelican | Pelecanus erythrorhynchos | SSC | **No** | Present | Observed once in Plan Area on a channel. No breeding habitat. |
| White-faced Ibis | Plegadis chihi | - | Yes | Moderate | Rare in the Natomas Basin but expanding range-wide. Appropriate foraging habitat present. |
| Swainson's Hawk | Buteo swainsonii | ST | **Yes** | Present | Has nested in Plan Area and uses much of it for hunting. |
| White-tailed Kite | Elanus leucurus | FP | No | Present | Uses Plan Area for hunting. No confirmed nesting. |
| Northern Harrier | Circus hudsonius | SSC | No | Present | Uses Plan Area for hunting. No confirmed nesting. |
| Burrowing Owl | Athene cunicularia | SSC | Yes | Moderate | Present in the Natomas Basin but not near Plan Area. Could occur as transient or in winter. |
| Least Bell's Vireo | Vireo bellii pusillus | FE | No | Presumed Absent/No Potential | Outside of the range of species and no suitable habitat present. |
| Loggerhead Shrike | Lanius ludovicianus | SCC | Yes | High | Suitable habitat present. Several older eBird records near Plan Area. |

| Common Name | Scientific Name | Status* | NBHCP Covered Species | Potential for Occurrence | Notes |
|---|---|---|---|---|---|
| Bank Swallow | Riparia riparia | ST | **Yes** | Moderate | Appropriate foraging habitat present and several nearby eBird records. No breeding habitat in Plan Area. |
| Tricolored Blackbird | Agelaius tricolor | ST, SSC | **Yes** | Moderate | Appropriate foraging habitat present and several nearby eBird records. No breeding habitat in Plan Area. |
| Yellow-headed Blackbird | Xanthocephalus xanthocephalus | SSC | No | High | Observed east of the Plan Area during surveys. Most likely to occur in winter. No breeding habitat. |
| Yellow Warbler | Setophaga petechia | SSC | No | High | Common in riparian habitat along the Sacramento River. |

**Federal Designations:**
(Federal Endangered Species Act, USFWS)

FE: Federally listed, Endangered
FT: Federally listed, Threatened

**State Designations:**
(California Endangered Species Act, CDFW)

SE: State-listed, Endangered
ST: State-listed, Threatened
SSC: California Species of Special Concern
FP: Fully Protected Species

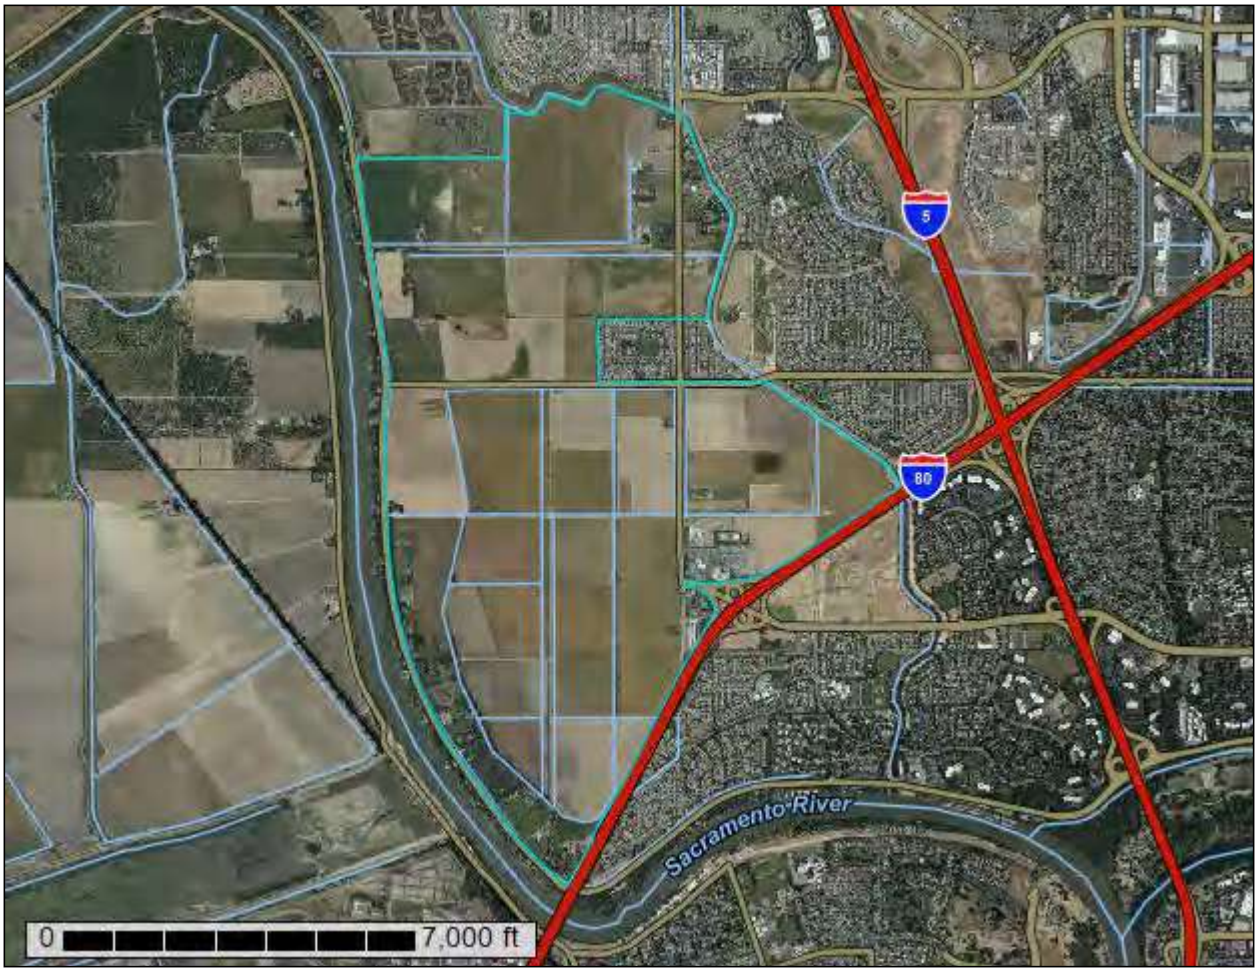
**California Rare Plant Rank (CRPR)**

1B: Rare, threatened, or endangered in California and elsewhere
2B: Rare, threatened, or endangered in California but more common elsewhere

0.1-Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
0.2-Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
0.3-Not very threatened in California (less than 20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

# Appendix D. NRCS Soils Report

United States Department of Agriculture



NRCS

Natural Resources Conservation Service

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

# Custom Soil Resource Report for Sacramento County, California

## Upper Westside Specific Plan

January 13, 2022

# Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. # How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

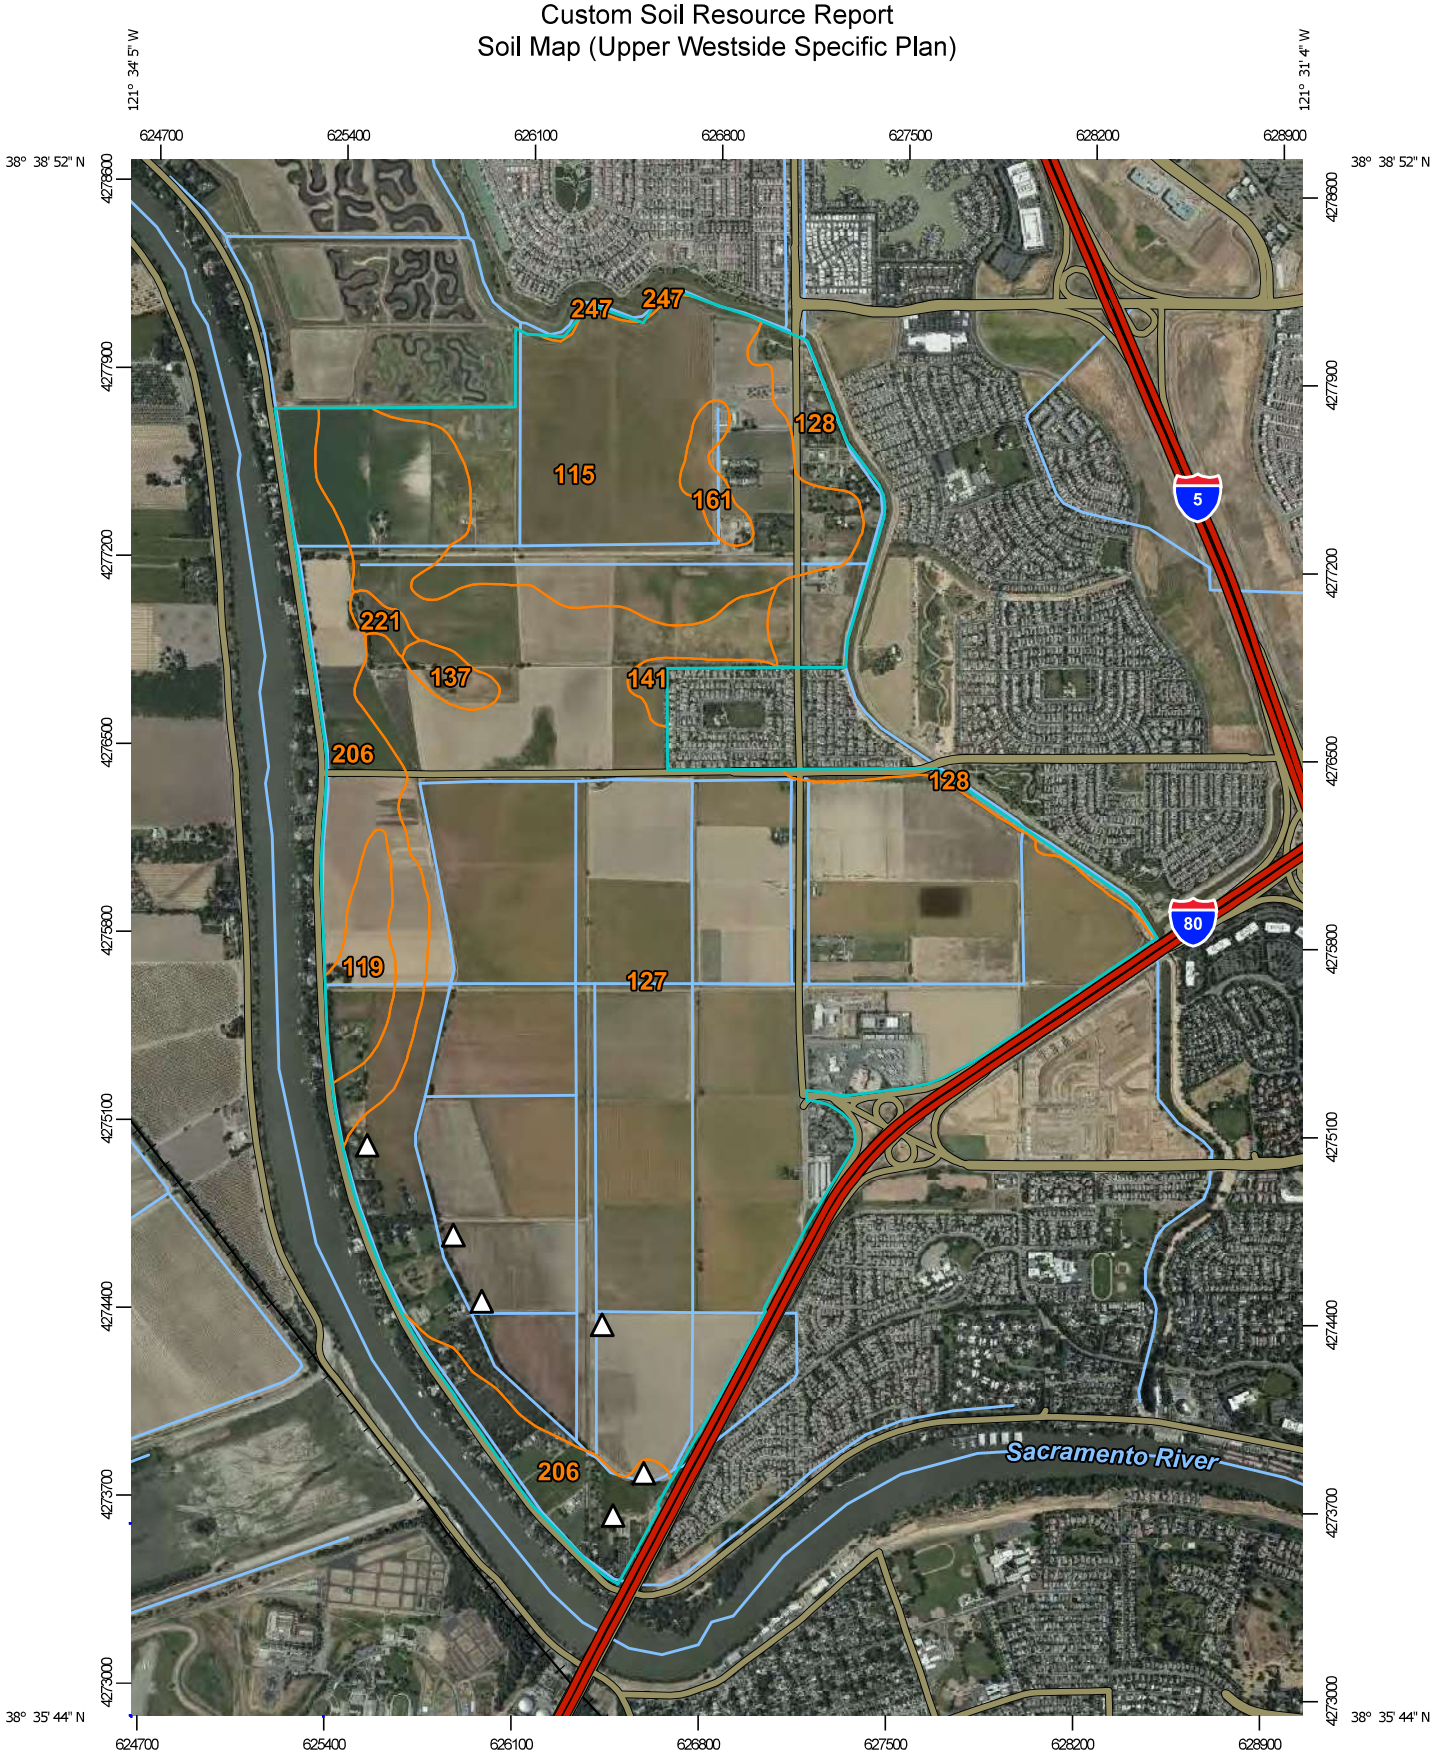
The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.



After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

# Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Sacramento County, California
Survey Area Data: Version 20, Sep 3, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: May 8, 2019—May 20, 2019

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

# Map Unit Legend (Upper Westside Specific Plan)

| Map Unit Symbol | Map Unit Name | Acres in AOI | Percent of AOI |
|---|---|---|---|
| 115 | Clear Lake clay, hardpan substratum, drained, 0 to 1 percent slopes | 310.3 | 15.0% |
| 119 | Columbia sandy loam, clayey substratum, partially drained, 0 to 2 percent slopes | 38.9 | 1.9% |
| 127 | Cosumnes silt loam, partially drained, 0 to 2 percent slopes | 1,401.2 | 67.8% |

# Map Unit Descriptions (Upper Westside Specific Plan)

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made

up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

# Sacramento County, California

## 115—Clear Lake clay, hardpan substratum, drained, 0 to 1 percent slopes

### Map Unit Setting

*National map unit symbol:* hhlp
*Elevation:* 0 to 100 feet
*Mean annual precipitation:* 12 to 18 inches
*Mean annual air temperature:* 61 degrees F
*Frost-free period:* 260 to 280 days
*Farmland classification:* Prime farmland if irrigated

### Map Unit Composition

*Clear lake and similar soils:* 85 percent
*Minor components:* 15 percent
*Estimates are based on observations, descriptions, and transects of the mapunit.*

### Description of Clear Lake

#### Setting

*Landform:* Basin floors
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Parent material:* Alluvium

#### Typical profile

*H1 - 0 to 15 inches:* clay
*H2 - 15 to 34 inches:* clay
*H3 - 34 to 48 inches:* clay loam
*H4 - 48 to 64 inches:* cemented

#### Properties and qualities

*Slope:* 0 to 1 percent
*Depth to restrictive feature:* 48 to 64 inches to duripan
*Drainage class:* Somewhat poorly drained
*Runoff class:* High
*Capacity of the most limiting layer to transmit water (Ksat):* Very low (0.00 to 0.00 in/hr)
*Depth to water table:* About 0 inches
*Frequency of flooding:* Rare
*Frequency of ponding:* None
*Calcium carbonate, maximum content:* 10 percent
*Maximum salinity:* Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
*Available water supply, 0 to 60 inches:* Moderate (about 7.3 inches)

#### Interpretive groups

*Land capability classification (irrigated):* 2s
*Land capability classification (nonirrigated):* 3s
*Hydrologic Soil Group:* C/D
*Ecological site:* R017XY901CA - Clayey Basin Group
*Hydric soil rating:* Yes

**Minor Components**

**Cosumnes**

*Percent of map unit:* 8 percent
*Landform:* Flood plains
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Hydric soil rating:* Yes

**San joaquin**

*Percent of map unit:* 7 percent
*Hydric soil rating:* No

## 119—Columbia sandy loam, clayey substratum, partially drained, 0 to 2 percent slopes

**Map Unit Setting**

*National map unit symbol:* hhlt
*Elevation:* 150 feet
*Mean annual precipitation:* 12 to 25 inches
*Mean annual air temperature:* 63 degrees F
*Frost-free period:* 230 to 340 days
*Farmland classification:* Prime farmland if irrigated

**Map Unit Composition**

*Columbia and similar soils:* 85 percent
*Minor components:* 15 percent
*Estimates are based on observations, descriptions, and transects of the mapunit.*

**Description of Columbia**

**Setting**

*Landform:* Flood plains, natural levees
*Landform position (two-dimensional):* Toeslope, summit
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Parent material:* Alluvium

**Typical profile**

*H1 - 0 to 11 inches:* sandy loam
*H2 - 11 to 43 inches:* stratified loamy sand to silt loam
*H3 - 43 to 64 inches:* clay loam

**Properties and qualities**

*Slope:* 0 to 2 percent
*Depth to restrictive feature:* More than 80 inches
*Drainage class:* Somewhat poorly drained
*Runoff class:* Very low

*Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.06 to 0.20 in/hr)
*Depth to water table:* About 0 inches
*Frequency of flooding:* Rare
*Frequency of ponding:* None
*Maximum salinity:* Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
*Available water supply, 0 to 60 inches:* Moderate (about 6.9 inches)

**Interpretive groups**

*Land capability classification (irrigated):* 2w
*Land capability classification (nonirrigated):* 3w
*Hydrologic Soil Group:* A/D
*Hydric soil rating:* Yes

**Minor Components**

**Sailboat**

*Percent of map unit:* 5 percent
*Landform:* Flood plains
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Hydric soil rating:* Yes

**Columbia**

*Percent of map unit:* 5 percent
*Landform:* Flood plains
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Hydric soil rating:* Yes

**Valpac**

*Percent of map unit:* 5 percent
*Landform:* Flood plains
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Hydric soil rating:* Yes

## 127—Cosumnes silt loam, partially drained, 0 to 2 percent slopes

**Map Unit Setting**

*National map unit symbol:* 2x4l5
*Elevation:* 0 to 40 feet
*Mean annual precipitation:* 17 to 20 inches
*Mean annual air temperature:* 61 to 62 degrees F
*Frost-free period:* 271 to 330 days
*Farmland classification:* Prime farmland if irrigated

**Map Unit Composition**

*Cosumnes and similar soils:* 85 percent
*Minor components:* 15 percent
*Estimates are based on observations, descriptions, and transects of the mapunit.*

## Description of Cosumnes

### Setting

*Landform:* Flood plains
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Parent material:* Alluvium derived from igneous and metamorphic rock

### Typical profile

*Ap - 0 to 8 inches:* silt loam
*C - 8 to 21 inches:* stratified silty clay loam to clay
*2Ab - 21 to 43 inches:* stratified clay loam to clay
*2Bk - 43 to 60 inches:* stratified clay loam to clay

### Properties and qualities

*Slope:* 0 to 2 percent
*Depth to restrictive feature:* More than 80 inches
*Drainage class:* Somewhat poorly drained
*Runoff class:* Low
*Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.06 to 0.20 in/hr)
*Depth to water table:* About 0 inches
*Frequency of flooding:* Rare
*Frequency of ponding:* None
*Calcium carbonate, maximum content:* 5 percent
*Maximum salinity:* Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
*Sodium adsorption ratio, maximum:* 2.0
*Available water supply, 0 to 60 inches:* High (about 9.6 inches)

### Interpretive groups

*Land capability classification (irrigated):* 2w
*Land capability classification (nonirrigated):* 3w
*Hydrologic Soil Group:* C/D
*Hydric soil rating:* Yes

## Minor Components

### Clear lake

*Percent of map unit:* 4 percent
*Landform:* Basin floors
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Hydric soil rating:* Yes

### Sailboat

*Percent of map unit:* 4 percent
*Landform:* Flood plains on delta plains, natural levees on delta plains
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Ecological site:* R016XA002CA - Freshwater, Stratified, Fluventic Sites (PROVISIONAL)
*Hydric soil rating:* Yes

**Columbia**

*Percent of map unit:* 4 percent
*Landform:* Flood plains
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Ecological site:* R016XA002CA - Freshwater, Stratified, Fluventic Sites (PROVISIONAL)
*Hydric soil rating:* Yes

**Egbert**

*Percent of map unit:* 3 percent
*Landform:* Flood plains on delta plains
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Ecological site:* R016XA001CA - Tidally-Influenced, Freshwater Sites (PROVISIONAL)
*Hydric soil rating:* Yes

## 128—Cosumnes silt loam, drained, 0 to 2 percent slopes

### Map Unit Setting

*National map unit symbol:* hhm3
*Elevation:* 10 to 70 feet
*Mean annual precipitation:* 15 inches
*Mean annual air temperature:* 61 degrees F
*Frost-free period:* 250 to 300 days
*Farmland classification:* Prime farmland if irrigated

### Map Unit Composition

*Cosumnes and similar soils:* 85 percent
*Minor components:* 15 percent
*Estimates are based on observations, descriptions, and transects of the mapunit.*

### Description of Cosumnes

#### Setting

*Landform:* Flood plains
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Parent material:* Alluvium

#### Typical profile

*H1 - 0 to 8 inches:* silt loam
*H2 - 8 to 21 inches:* stratified silty clay loam to clay
*H3 - 21 to 43 inches:* stratified clay loam to clay

*H4 - 43 to 60 inches:* stratified clay loam to clay

**Properties and qualities**

*Slope:* 0 to 2 percent
*Depth to restrictive feature:* More than 80 inches
*Drainage class:* Somewhat poorly drained
*Runoff class:* High
*Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.06 to 0.20 in/hr)
*Depth to water table:* More than 80 inches
*Frequency of flooding:* Rare
*Frequency of ponding:* None
*Calcium carbonate, maximum content:* 5 percent
*Maximum salinity:* Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
*Available water supply, 0 to 60 inches:* High (about 9.7 inches)

**Interpretive groups**

*Land capability classification (irrigated):* 2s
*Land capability classification (nonirrigated):* 3s
*Hydrologic Soil Group:* C
*Hydric soil rating:* Yes

**Minor Components**

**Columbia**

*Percent of map unit:* 3 percent
*Landform:* Flood plains
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Hydric soil rating:* Yes

**Egbert**

*Percent of map unit:* 3 percent
*Landform:* Flood plains
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread

*Landform position (three-dimensional):* Tread
*Hydric soil rating:* Yes

## 137—Durixeralfs, 0 to 1 percent slopes

### Map Unit Setting

*National map unit symbol:* hhmd
*Elevation:* 20 to 150 feet
*Mean annual precipitation:* 10 to 20 inches
*Mean annual air temperature:* 61 to 63 degrees F
*Frost-free period:* 250 to 300 days
*Farmland classification:* Not prime farmland

### Map Unit Composition

*Durixeralfs and similar soils:* 80 percent
*Minor components:* 20 percent
*Estimates are based on observations, descriptions, and transects of the mapunit.*

### Description of Durixeralfs

#### Setting

*Landform:* Terraces
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Parent material:* Alluvium derived from granite

#### Typical profile

*H1 - 0 to 6 inches:* clay
*H2 - 6 to 20 inches:* clay loam
*H3 - 20 to 60 inches:* indurated

#### Properties and qualities

*Slope:* 0 to 1 percent
*Depth to restrictive feature:* 20 to 60 inches to duripan
*Drainage class:* Well drained
*Runoff class:* Very high
*Capacity of the most limiting layer to transmit water (Ksat):* Very low (0.00 to 0.00 in/hr)
*Depth to water table:* More than 80 inches
*Frequency of flooding:* None
*Frequency of ponding:* None
*Maximum salinity:* Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
*Available water supply, 0 to 60 inches:* Very low (about 2.9 inches)

**Interpretive groups**

*Land capability classification (irrigated):* 4s
*Land capability classification (nonirrigated):* 4s
*Hydrologic Soil Group:* D

## 141—Egbert clay, partially drained, 0 to 2 percent slopes

**Map Unit Setting**

*National map unit symbol:* hhmj
*Elevation:* 10 to 20 feet
*Mean annual precipitation:* 17 inches
*Mean annual air temperature:* 63 degrees F
*Frost-free period:* 220 to 260 days
*Farmland classification:* Prime farmland if irrigated

**Map Unit Composition**

*Egbert and similar soils:* 75 percent
*Minor components:* 25 percent
*Estimates are based on observations, descriptions, and transects of the mapunit.*

**Description of Egbert**

**Setting**

*Landform:* Flood plains, backswamps
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread, dip
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Parent material:* Alluvium

**Typical profile**

*H1 - 0 to 18 inches:* clay
*H2 - 18 to 46 inches:* silty clay loam
*H3 - 46 to 60 inches:* stratified sandy clay loam to clay loam

**Properties and qualities**

*Slope:* 0 to 2 percent
*Depth to restrictive feature:* More than 80 inches
*Drainage class:* Poorly drained
*Runoff class:* High
*Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.06 to 0.20 in/hr)
*Depth to water table:* About 0 inches
*Frequency of flooding:* Rare
*Frequency of ponding:* None
*Maximum salinity:* Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
*Available water supply, 0 to 60 inches:* High (about 10.0 inches)

**Interpretive groups**

*Land capability classification (irrigated):* 2w
*Land capability classification (nonirrigated):* 3w
*Hydrologic Soil Group:* C/D
*Ecological site:* R016XA001CA - Tidally-Influenced, Freshwater Sites (PROVISIONAL)
*Hydric soil rating:* Yes

**Minor Components**

**Gazwell**

*Percent of map unit:* 5 percent
*Landform:* Backswamps
*Ecological site:* R016XA001CA - Tidally-Influenced, Freshwater Sites (PROVISIONAL)
*Hydric soil rating:* Yes

**Laugenour**

*Percent of map unit:* 5 percent
*Landform:* Levees
*Ecological site:* R016XA002CA - Freshwater, Stratified, Fluventic Sites (PROVISIONAL)
*Hydric soil rating:* Yes

**Clear lake**

*Percent of map unit:* 5 percent
*Landform:* Basin floors
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Hydric soil rating:* Yes

**Scribner**

*Percent of map unit:* 5 percent
*Landform:* Backswamps
*Ecological site:* R016XA001CA - Tidally-Influenced, Freshwater Sites (PROVISIONAL)
*Hydric soil rating:* Yes

**Valpac**

*Percent of map unit:* 5 percent
*Landform:* Levees
*Ecological site:* R016XA002CA - Freshwater, Stratified, Fluventic Sites (PROVISIONAL)
*Hydric soil rating:* Yes

## 161—Jacktone clay, drained, 0 to 2 percent slopes

**Map Unit Setting**

*National map unit symbol:* hhn5
*Elevation:* 10 to 100 feet
*Mean annual precipitation:* 12 to 20 inches
*Mean annual air temperature:* 61 to 64 degrees F
*Frost-free period:* 250 to 300 days
*Farmland classification:* Farmland of statewide importance

**Map Unit Composition**

*Jacktone and similar soils:* 85 percent
*Minor components:* 15 percent
*Estimates are based on observations, descriptions, and transects of the mapunit.*

**Description of Jacktone**

**Setting**

*Landform:* Basin floors
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Parent material:* Alluvium

**Typical profile**

*H1 - 0 to 11 inches:* clay
*H2 - 11 to 34 inches:* clay loam
*H3 - 34 to 52 inches:* indurated
*H4 - 52 to 60 inches:* stratified loam to clay loam

**Properties and qualities**

*Slope:* 0 to 2 percent
*Depth to restrictive feature:* 34 to 52 inches to duripan
*Drainage class:* Somewhat poorly drained
*Runoff class:* High
*Capacity of the most limiting layer to transmit water (Ksat):* Very low (0.00 to 0.00 in/hr)
*Depth to water table:* About 0 inches
*Frequency of flooding:* Rare
*Frequency of ponding:* None
*Calcium carbonate, maximum content:* 10 percent
*Maximum salinity:* Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)

*Available water supply, 0 to 60 inches:* Low (about 5.1 inches)

**Interpretive groups**

*Land capability classification (irrigated):* 3s
*Land capability classification (nonirrigated):* 3s
*Hydrologic Soil Group:* D
*Ecological site:* R017XY902CA - Duripan Vernal Pools
*Hydric soil rating:* Yes

**Minor Components**

**Cosumnes**

*Percent of map unit:* 3 percent
*Landform:* Flood plains
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Hydric soil rating:* Yes

**San joaquin**

*Percent of map unit:* 3 percent
*Hydric soil rating:* No

**Xerarents**

*Percent of map unit:* 3 percent
*Hydric soil rating:* No

**Clear lake**

*Percent of map unit:* 3 percent
*Landform:* Basin floors
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Hydric soil rating:* Yes

**Durixeralfs**

*Percent of map unit:* 3 percent
*Hydric soil rating:* No

## 206—Sailboat silt loam, partially drained, 0 to 2 percent slopes, MLRA 16

**Map Unit Setting**

*National map unit symbol:* 2xlch
*Elevation:* -10 to 30 feet
*Mean annual precipitation:* 18 to 20 inches
*Mean annual air temperature:* 61 to 62 degrees F
*Frost-free period:* 320 to 330 days
*Farmland classification:* Prime farmland if irrigated

**Map Unit Composition**

*Sailboat and similar soils:* 85 percent
*Minor components:* 15 percent
*Estimates are based on observations, descriptions, and transects of the mapunit.*

## Description of Sailboat

### Setting

*Landform:* Flood plains on natural levees
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Parent material:* Alluvium derived from igneous, metamorphic and sedimentary rock

### Typical profile

*Ap - 0 to 6 inches:* silt loam
*A - 6 to 16 inches:* silt loam
*C - 16 to 28 inches:* silt loam
*2Akb - 28 to 34 inches:* clay loam
*2C - 34 to 49 inches:* loam
*2Ck - 49 to 62 inches:* loam

### Properties and qualities

*Slope:* 0 to 3 percent
*Depth to restrictive feature:* More than 80 inches
*Drainage class:* Somewhat poorly drained
*Runoff class:* Negligible
*Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.14 to 1.42 in/hr)
*Depth to water table:* About 24 to 35 inches
*Frequency of flooding:* Rare
*Frequency of ponding:* None
*Calcium carbonate, maximum content:* 5 percent
*Maximum salinity:* Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
*Available water supply, 0 to 60 inches:* Very high (about 12.4 inches)

### Interpretive groups

*Land capability classification (irrigated):* 2w
*Land capability classification (nonirrigated):* 3w
*Hydrologic Soil Group:* C
*Ecological site:* R016XA002CA - Freshwater, Stratified, Fluventic Sites (PROVISIONAL)
*Hydric soil rating:* Yes

## Minor Components

### Scribner

*Percent of map unit:* 3 percent
*Landform:* Flood plains
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Ecological site:* R016XA002CA - Freshwater, Stratified, Fluventic Sites (PROVISIONAL)
*Hydric soil rating:* Yes

### Egbert

*Percent of map unit:* 3 percent
*Landform:* — error in exists on —
*Landform position (three-dimensional):* Tread

*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Ecological site:* R016XA002CA - Freshwater, Stratified, Fluventic Sites (PROVISIONAL)
*Hydric soil rating:* Yes

**Gazwell**

*Percent of map unit:* 3 percent
*Landform:* Backswamps
*Landform position (three-dimensional):* Dip
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Ecological site:* R016XA001CA - Tidally-Influenced, Freshwater Sites (PROVISIONAL)
*Hydric soil rating:* Yes

**Columbia**

*Percent of map unit:* 3 percent
*Landform:* Flood plains
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Ecological site:* R016XA002CA - Freshwater, Stratified, Fluventic Sites (PROVISIONAL), R016XA002CA - Freshwater, Stratified, Fluventic Sites (PROVISIONAL)
*Hydric soil rating:* Yes

**Cosumnes**

*Percent of map unit:* 3 percent
*Landform:* Flood plains
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Hydric soil rating:* Yes

## 221—San Joaquin-Xerarents complex, leveled, 0 to 1 percent slopes

**Map Unit Setting**

*National map unit symbol:* hhq3
*Elevation:* 0 to 2,500 feet
*Mean annual precipitation:* 10 to 22 inches
*Mean annual air temperature:* 61 to 63 degrees F
*Frost-free period:* 250 to 300 days
*Farmland classification:* Farmland of statewide importance

**Map Unit Composition**

*San joaquin and similar soils:* 45 percent
*Xerarents and similar soils:* 40 percent
*Minor components:* 15 percent
*Estimates are based on observations, descriptions, and transects of the mapunit.*

## Description of San Joaquin

### Setting

*Landform:* Terraces
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Parent material:* Alluvium derived from granite

### Typical profile

*H1 - 0 to 23 inches:* silt loam
*H2 - 23 to 28 inches:* clay loam
*H3 - 28 to 54 inches:* indurated
*H4 - 54 to 60 inches:* stratified sandy loam to loam

### Properties and qualities

*Slope:* 0 to 1 percent
*Depth to restrictive feature:* More than 80 inches; 28 to 54 inches to duripan
*Drainage class:* Moderately well drained
*Runoff class:* High
*Capacity of the most limiting layer to transmit water (Ksat):* Very low (0.00 to 0.00 in/hr)
*Depth to water table:* More than 80 inches
*Frequency of flooding:* None
*Frequency of ponding:* None
*Available water supply, 0 to 60 inches:* Low (about 3.4 inches)

### Interpretive groups

*Land capability classification (irrigated):* 3s
*Land capability classification (nonirrigated):* 3s
*Hydrologic Soil Group:* C
*Hydric soil rating:* No

## Description of Xerarents

### Setting

*Landform:* Terraces
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Down-slope shape:* Linear
*Across-slope shape:* Linear
*Parent material:* Alluvium derived from granite

### Typical profile

*H1 - 0 to 60 inches:* variable

### Properties and qualities

*Slope:* 0 to 1 percent
*Depth to restrictive feature:* More than 80 inches
*Drainage class:* Well drained
*Depth to water table:* More than 80 inches
*Frequency of flooding:* None
*Frequency of ponding:* None
*Available water supply, 0 to 60 inches:* Very low (about 0.0 inches)

**Interpretive groups**

*Land capability classification (irrigated):* None specified
*Land capability classification (nonirrigated):* 7e
*Hydric soil rating:* No

**Minor Components**

**Clear lake**

*Percent of map unit:* 3 percent
*Landform:* Basin floors
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Hydric soil rating:* Yes

**Columbia**

*Percent of map unit:* 3 percent
*Landform:* Flood plains
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Hydric soil rating:* Yes

**Sailboat**

*Percent of map unit:* 2 percent
*Landform:* Flood plains
*Landform position (two-dimensional):* Toeslope
*Landform position (three-dimensional):* Tread
*Hydric soil rating:* Yes

**Kimball**

*Percent of map unit:* 2 percent
*Hydric soil rating:* No

**Galt**

*Percent of map unit:* 2 percent
*Landform:* Terraces
*Hydric soil rating:* Yes

**Durixeralfs**

*Percent of map unit:* 2 percent
*Hydric soil rating:* No

**Unnamed, rarely flooded**

*Percent of map unit:* 1 percent
*Hydric soil rating:* No

## 247—Water

**Map Unit Composition**

*Water:* 100 percent
*Estimates are based on observations, descriptions, and transects of the mapunit.*

Project Name: Upper Westside Specific Plan

November 02, 2023

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)

(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

https://www.fws.gov/sites/default/files/documents/endangered-species-consultation-handbook.pdf

**Migratory Birds**: In addition to responsibilities to protect threatened and endangered species under the Endangered Species Act (ESA), there are additional responsibilities under the Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act (BGEPA) to protect native birds from project-related impacts. Any activity, intentional or unintentional, resulting in take of migratory birds, including eagles, is prohibited unless otherwise permitted by the U.S. Fish and Wildlife Service (50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)). For more information regarding these Acts, see https://www.fws.gov/program/migratory-bird-permit/what-we-do.

The MBTA has no provision for allowing take of migratory birds that may be unintentionally killed or injured by otherwise lawful activities. It is the responsibility of the project proponent to comply with these Acts by identifying potential impacts to migratory birds and eagles within applicable NEPA documents (when there is a federal nexus) or a Bird/Eagle Conservation Plan (when there is no federal nexus). Proponents should implement conservation measures to avoid or minimize the production of project-related stressors or minimize the exposure of birds and their resources to the project-related stressors. For more information on avian stressors and recommended conservation measures, see https://www.fws.gov/library/collections/threats-birds.

In addition to MBTA and BGEPA, Executive Order 13186: *Responsibilities of Federal Agencies to Protect Migratory Birds*, obligates all Federal agencies that engage in or authorize activities that might affect migratory birds, to minimize those effects and encourage conservation measures that will improve bird populations. Executive Order 13186 provides for the protection of both migratory birds and migratory bird habitat. For information regarding the implementation of Executive Order 13186, please visit https://www.fws.gov/partner/council-conservation-migratory-birds.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Code in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

**Note:** IPaC has provided all available attachments because this project is in multiple field office jurisdictions.

- Bald & Golden Eagles
- Migratory Birds
- Wetlands

# OFFICIAL SPECIES LIST

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

**Sacramento Fish And Wildlife Office**
Federal Building
2800 Cottage Way, Room W-2605
Sacramento, CA 95825-1846
(916) 414-6600

This project's location is within the jurisdiction of multiple offices. However, only one species list document will be provided for all offices. The species and critical habitats in this document reflect the aggregation of those that fall in each of the affiliated office's jurisdiction. Other offices affiliated with the project:

**San Francisco Bay-Delta Fish And Wildlife**
650 Capitol Mall
Suite 8-300
Sacramento, CA 95814
(916) 930-5603

# PROJECT SUMMARY

Project Code: 2023-0028133
Project Name: Upper Westside Specific Plan
Project Type: Mixed-Use Construction
Project Description: The UWSP would guide development on 2,066 acres of unincorporated land in northwestern Sacramento County, including a mix of residential and non-residential land uses, including a mixed-use Town Center, parks, and an extensive system of greenbelts and multi-use trails with linkages to downtown Sacramento.

Project Location:

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@38.62256705,-121.54329540452497,14z

Counties: Sacramento County, California

# ENDANGERED SPECIES ACT SPECIES

There is a total of 9 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

## BIRDS

| NAME | STATUS |
|---|---|
| Least Bell's Vireo *Vireo bellii pusillus* | Endangered |

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/5945

## REPTILES

| NAME | STATUS |
|---|---|
| Giant Garter Snake *Thamnophis gigas* | Threatened |

No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/4482

## AMPHIBIANS

| NAME | STATUS |
|---|---|
| California Tiger Salamander *Ambystoma californiense* | Threatened |

Population: U.S.A. (Central CA DPS)
There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/2076

## FISHES

| NAME | STATUS |
|---|---|
| Delta Smelt *Hypomesus transpacificus*<br>There is **final** critical habitat for this species. Your location does not overlap the critical habitat.<br>Species profile: https://ecos.fws.gov/ecp/species/321 | Threatened |
| Longfin Smelt *Spirinchus thaleichthys*<br>Population: San Francisco Bay-Delta DPS<br>No critical habitat has been designated for this species.<br>Species profile: https://ecos.fws.gov/ecp/species/9011 | Proposed Endangered |

## INSECTS

| NAME | STATUS |
|---|---|
| Monarch Butterfly *Danaus plexippus*<br>No critical habitat has been designated for this species.<br>Species profile: https://ecos.fws.gov/ecp/species/9743 | Candidate |
| Valley Elderberry Longhorn Beetle *Desmocerus californicus dimorphus*<br>There is **final** critical habitat for this species. Your location does not overlap the critical habitat.<br>Species profile: https://ecos.fws.gov/ecp/species/7850 | Threatened |

## CRUSTACEANS

| NAME | STATUS |
|---|---|
| Vernal Pool Fairy Shrimp *Branchinecta lynchi*<br>There is **final** critical habitat for this species. Your location does not overlap the critical habitat.<br>Species profile: https://ecos.fws.gov/ecp/species/498 | Threatened |
| Vernal Pool Tadpole Shrimp *Lepidurus packardi*<br>There is **final** critical habitat for this species. Your location does not overlap the critical habitat.<br>Species profile: https://ecos.fws.gov/ecp/species/2246 | Endangered |

## CRITICAL HABITATS

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

YOU ARE STILL REQUIRED TO DETERMINE IF YOUR PROJECT(S) MAY HAVE EFFECTS ON ALL ABOVE LISTED SPECIES.

# USFWS NATIONAL WILDLIFE REFUGE LANDS AND FISH HATCHERIES

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS OR FISH HATCHERIES WITHIN YOUR PROJECT AREA.

# BALD & GOLDEN EAGLES

Bald and golden eagles are protected under the Bald and Golden Eagle Protection Act[1] and the Migratory Bird Treaty Act[2].

Any person or organization who plans or conducts activities that may result in impacts to bald or golden eagles, or their habitats[3], should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

---

1. The Bald and Golden Eagle Protection Act of 1940.
2. The Migratory Birds Treaty Act of 1918.
3. 50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)

**There are bald and/or golden eagles in your project area.**

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

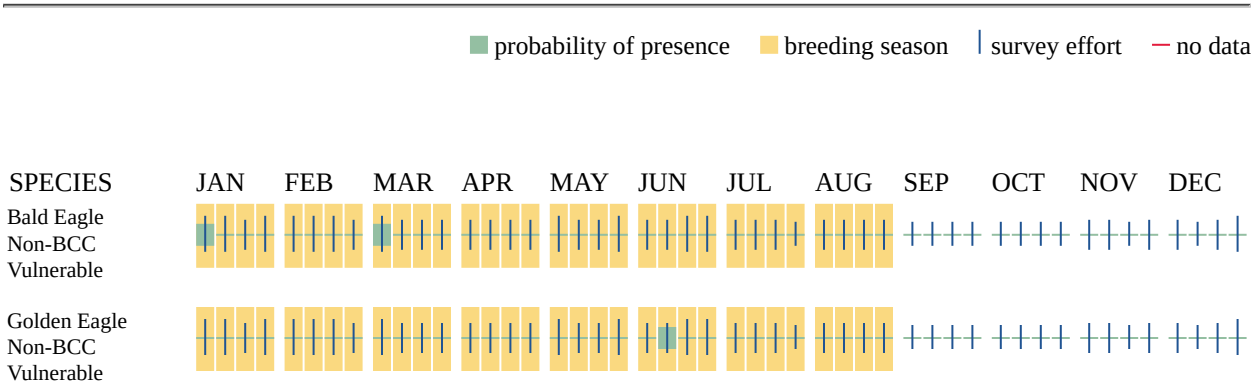
| NAME | BREEDING SEASON |
|---|---|
| Bald Eagle *Haliaeetus leucocephalus*<br>This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.<br>https://ecos.fws.gov/ecp/species/1626 | Breeds Jan 1 to Aug 31 |
| Golden Eagle *Aquila chrysaetos*<br>This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.<br>https://ecos.fws.gov/ecp/species/1680 | Breeds Jan 1 to Aug 31 |

# PROBABILITY OF PRESENCE SUMMARY

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read the supplemental information and specifically the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

**Probability of Presence (■)**

Green bars; the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during that week of the year.



**Breeding Season (■)**

Yellow bars; liberal estimate of the timeframe inside which the bird breeds across its entire range.

**Survey Effort** (|)
Vertical black lines; the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

**No Data** (–)
A week is marked as having no data if there were no survey events for that week.

---

# WETLANDS

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

Please note that the NWI data being shown may be out of date. We are currently working to update our NWI data set. We recommend you verify these results with a site visit to determine the actual extent of wetlands on site.

# 1. INTRODUCTION

The Upper Westside Project is a master planned community located in the Natomas Basin of Sacramento County. The project will span approximately 2,000 acres and accommodate approximately 9,356 dwelling units (DUs) and 3,000,000 square feet of commercial space. The Upper Westside plan seeks to create a one-of-a-kind community equipped with an Urban Town Center, Urban Farm, Greenbelt, the Westside Canal, and many other features that will contribute to this goal. The plan will incorporate sustainability and energy efficiency into several areas of the development including buildings and transportation.

The objective of this analysis is to estimate annual operational energy loads for the Upper Westside community to support Sacramento County in development of the Draft Environmental Impact Report (DEIR) and the project approval process. Assumptions align with those in the Specific Plan and reflect the relevant California Building Standards Codes, (California Code of Regulations (CCR)), Title 24, Part 6 Energy Efficiency Standards for energy performance and Title 24, Part 11 California Green Building Standards (CALGreen) for green building), and current or anticipated future state and local requirements. Energy use estimates are based on project information provided by the Client (including building types, conditioned floor areas, facility infrastructure, etc.), and goals agreed upon by the Client Team.

Given the preliminary conceptual level of design of the project, the data provided in this report are estimates only and provide quantities for use in high-level greenhouse gas emissions estimates and other sustainability analyses. They specifically should not be used for any engineering or architectural design, equipment sizing, or related uses that require more detailed engineering analysis.

# 2. METHODOLOGY

Analysis is based on the preliminary land use plan dated November 2020 and assumptions agreed upon by the Client Team, unless otherwise noted. See Table 1 for a summary of proposed land use types.

## BUILDINGS

Annual operational community energy consumption is estimated for all buildings including single-family, multifamily, mixed use commercial buildings, and educational facilities. Estimates are based on the best available information for energy use intensity based on building type for the Sacramento area and factor in current and expect code requirements and project specific factors. The primary data source applied in this study are simulation results from California's compliance software tools using Title 24, Part 6 prototype building energy models. The Consultant team also referenced data from previous studies to supplement prototype data where necessary. No energy modeling of the proposed buildings in the Upper Westside community was conducted. Limited modeling of prototype buildings was conducted to develop energy use intensity (EUI) estimates.

Estimates are provided for the proposed project and compared to a business-as-usual base case.

### BUILDING END-USES

Table 2 and Table 3 present assumptions applied in this analysis for the residential and commercial building end-uses: Space heating, space cooling, lighting, water heating, appliances, plug loads, and process loads. Base case energy use reflects mixed-fuel buildings constructed to today's 2019 Title 24 Building Standards Code, assuming natural gas appliances for space heating, water heating, cooking and clothes drying. Solar photovoltaics (PV) are not included except for low-rise residential buildings (all single-family and multifamily 3-stories and fewer) where PV is required under the 2019 code. The 2019 code was selected as the base case since it was the code in effect at the time the project Notice of Preparation of a Draft Environmental Impact Report was issued.[1]

Proposed project energy use reflects the construction of all-electric buildings, with few exceptions for process gas uses in commercial buildings, built to the proposed 2022 Title 24. Policy at state and local levels across California is increasingly moving towards electrification as a primary means to meet climate action plans and achieve deep reductions in greenhouse gas (GHG) emissions. Eliminating fossil fuel consumption throughout most of Upper Westside is consistent with anticipated local future policy including Sacramento County's Draft Climate Action Plan (Ascent Environmental, 2021) and the City of Sacramento's proposed building ordinance (Electrification of New Construction, 2021).

Anticipated 2022 Title 24 code requirements are based on the California Energy Commission's (CEC's) draft Express Terms released in February of 2021 (California Energy Commission, 2021), which are scheduled to go into effect January 1, 2023. All buildings constructed at Upper Westside must meet the minimum code requirements in effect at time of building permit application. At minimum, the project will be subject to the final adopted 2022 code requirements. This analysis does not include assumptions for code changes beyond the 2022 code even though many buildings in the community will be subject to the requirements of subsequent code cycles as a result of the project's long development schedule.

[1] The Notice of Preparation was issues 10/5/2020. https://planning.saccounty.net/PlansandProjectsIn-Progress/Documents/Notice%20of%20Preparation%20of%20an%20EIR_UpperWestside.pdf

*Table 1: Land Use Summary Table*

| Land Use Type | Description | Total DUs | Avg Square Foot / DU | Total Square Feet |
|---|---|---|---|---|
| VLDR (very low density residential) | Single-family detached (1 acre to 85' x 120') | 161 | 3,500 | 563,500 |
| LDR (low density residential) | Single-family detached (55' x 100') | 2,351 | 2,500 | 5,877,500 |
| LMDR (low/medium density residential) | Single-family detached (45' x 80') | 1,105 | 2,000 | 2,210,000 |
| MDR (medium density residential) | Single-family detached/townhome | 750 | 1,700 | 1,275,000 |
| HDR (high density residential) | Apartment or rowhome (2-3 story) | 910 | 1,200 | 1,092,000 |
| VHDR (very high density residential) | Urban stacked flats (3-4 story) | 791 | 900 | 711,900 |
| CMU (commercial mixed use) | Apartment over commercial (4-5 story) | 3,288 | 800 | 2,630,400 |
| | Mid-rise office | | | 1,040,213 |
| | Specialized (medical school/labs) | | | 208,043 |
| | Specialized (medical offices) | | | 41,609 |
| | Hotel | | | 312,032 |
| | Entertainment (theater/gym/clubs) | | | 124,826 |
| | Grocery | | | 15,000 |
| | Restaurant (small-med restaurant) | | | 89,021 |
| | Retail (small-medium retail) | | | 145,630 |
| | Institutional/religious | | | 104,021 |
| EHC (employment highway commercial) | Mid-rise office | | | 532,610 |
| | Hotel | | | 133,153 |
| | Restaurant (small restaurant) | | | 43,768 |
| | Supermarket | | | 45,000 |
| | Retail (small retail) | | | 44,384 |
| | Entertainment (theater/gym/clubs) | | | 44,384 |
| | Institutional/religious | | | 44,384 |
| S (schools) | (3) K-8 schools (800 students each) | | | 183,600 |
| | High school (1,500 students) | | | 142,500 |
| | Community college (1,200-2,400 students) | | | 35,000 |

*Table 2: Residential Building Energy Use Assumptions*

| Land Use Type | Description | Base Case | | | Proposed Project | | |
|---|---|---|---|---|---|---|---|
| | | Title 24 Code | Fuel Type | Solar PV | Title 24 Code | Fuel Type | Solar PV |
| Single-Family Residential | | | | | | | |
| VLDR | Single-family detached | 2019 | Mixed Fuel | Offset all end-uses except heating, water heating, cooking, clothes drying[1] | 2022 | All-electric | Same as base case |
| LDR | Single-family detached | | | | | | |
| LMDR | Single-family detached | | | | | | |
| MDR | Single-family detached/ townhome | | | | | | |
| Multifamily Residential | | | | | | | |
| HDR | Apartment or rowhome | 2019 | Mixed Fuel | Offset all end-uses except heating, water heating, cooking, clothes drying[1] | 2022 | All-electric | Same as base case |
| VHDR | Urban stacked flats [3] | | | None | | | 2.21 W/Sq.Ft[2] |
| CMU | Apartment over commercial | | | None | | | 2.21 W/Sq.Ft[2] |

[1]Based on 2019 Title 24, Part 6 code requirements which are not proposed to change for the 2022 Title 24 code.

[2]Based on proposed 2022 Title 24, Part 6 code requirements.

[3]For the purposes of the solar PV system the VHDR land use type is considered to be four-stories or greater.

*Table 3: Commercial Building Energy Use Assumptions*

| Land Use Type | Description | Base Case | | | Proposed Project | | |
|---|---|---|---|---|---|---|---|
| | | Title 24 Code | Fuel Type | Solar PV | Title 24 Code | Fuel Type | Solar PV[1] |
| CMU | Mid-rise office | 2019 | Mixed Fuel | None | 2022 | all-electric | 3.13 W/Sq.Ft |
| | Specialized (medical school/labs) | | | | | mixed fuel gas for lab services only | 0.44 W/Sq.Ft |
| | Specialized (medical offices) | | | | | all-electric | 0.44 W/Sq.Ft |
| | Hotel | | | | | all-electric | 0.44 W/Sq.Ft |
| | Entertainment | | | | | all-electric | 0.44 W/Sq.Ft |
| | Grocery | | | | | all-electric | 2.91 W/Sq.Ft |
| | Restaurant | | | | | mixed fuel gas for cooking equipment only | 0.44 W/Sq.Ft |
| | Retail | | | | | all-electric | 2.91 W/Sq.Ft |
| | Institutional/religious | | | | | all-electric | 0.44 W/Sq.Ft |
| EHC | Mid-rise office | | | | | all-electric | 3.13 W/Sq.Ft |
| | Hotel | | | | | all-electric | 0.44 W/Sq.Ft |
| | Restaurant | | | | | mixed fuel gas for cooking equipment only | 0.44 W/Sq.Ft |
| | Supermarket | | | | | all-electric | 2.91 W/Sq.Ft |
| | Retail | | | | | all-electric | 4.62 W/Sq.Ft |
| | Entertainment | | | | | all-electric | 0.44 W/Sq.Ft |
| | Institutional/religious | | | | | all-electric | 0.44 W/Sq.Ft |
| S | K-8 school | | | | | all-electric | 1.78 W/Sq.Ft. |
| | High school | | | | | all-electric | 1.78 W/Sq.Ft. |
| | Community college | | | | | all-electric | 1.78 W/Sq.Ft. |

[1]Based on proposed 2022 Title 24, Part 6 code requirements.

Energy use estimates are based on the CEC's residential and commercial building prototypes simulated in the latest research versions of the statewide compliance software: CBECC-Res 2022.0.1[2] for single-family and multifamily buildings and CBECC-Com 2022.0.1[3] for commercial buildings. Energy use estimates are also based on the latest weather files created for the 2022 software which capture changing climate conditions. The proposed land-use types at Upper Westside were matched to the most representative CEC prototype and energy use was calculated based on EUI of the prototype buildings. Where a representative prototype was not available for a few of the commercial land use types, slight changes were made to existing prototypes to better reflect the proposed land use. Table 23 in the Appendix lists which software and prototypes were used to estimate energy use for each land use type and what revisions were made.

EUIs for the residential buildings were based on the prototypes for both mixed-fuel and all-electric designs. Since the commercial prototypes assume mixed-fuel designs only, EUIs for all-electric and mostly electric designs were based on reach code studies conducted for the 2019 Title 24 code cycle which evaluated all-electric commercial prototypes ((Statewide Reach Code Team, 2019), (Statewide Reach Code Team, 2021)).

Multifamily buildings are being unified as part of the 2022 code cycle with an alignment between low-rise (three-stories and fewer) and high-rise (four-stories and greater) multifamily buildings. As a result, the energy use estimates in this analysis are based on the same assumptions regardless of building height. Multifamily energy use estimates are based on CBECC-Res algorithms and load assumptions, which are expected to be used for all multifamily buildings in 2022 as they generally are better reflective of residential load profiles. The one exception is for the PV systems as the 2022 code maintains a differentiation between the two building types for the PV requirement.

There are various proposed changes to energy requirements for commercial occupancies in the 2022 Express Terms (California Energy Commission, 2021). These proposed changes are not yet incorporated into the CEC's building prototypes. Savings for these measures relative to the 2019 code were estimated based on per square foot electricity and gas savings reported in the Codes and Standards Enhancement (CASE) reports developed by the Statewide CASE Team.[4]

### SWIMMING POOLS

The VLDR and LDR building types are anticipated to have swimming pools on some of the lots. It is estimated that 25 percent of the VLDR and 10 percent of the LDR will have an average 20,000 gallon pool. This analysis assumes that the pools are not heated and are used 7 months out of the year, roughly April through October.

Additionally, it's assumed there is a 150,000 gallon community pool and 4,000 gallon spa to serve residents at the multifamily buildings and a 500,000 Olympic size pool at the high school. These are expected to operate year-round and therefore will be heated in the winter. The energy use for community pool and spa are assigned to the HDR land use even though they may serve multiple land uses.

Pumping energy use is based on Title 24 and Title 20 requirements and assumes a variable speed motor which allows for filtration rates to be reduced during unoccupied times. Heating energy use assumes a minimum efficiency natural gas heater and no use of a pool cover. See Table 4 for a

[2] http://www.bwilcox.com/BEES/cbecc2022.html

[3] http://bees.archenergy.com/software2022.html

[4] https://title24stakeholders.com/measures/building-types/nonresidential/2022/

summary of assumptions and resultant annual energy use for pumping and heating. Energy use estimates for the base case and proposed project are the same.

*Table 4: Pool and Spa Assumptions*

| Land Use Type | Type | Volume (gallons) | Heated | Annual Availability | Daily Availability | Annual Pumping kWh | Annual Heating therms |
|---|---|---|---|---|---|---|---|
| VLDR – Single-family detached | Pool | 20,000 (at 25% of lots) | No | 7 months/year | 24-hours | 5,356 | 0 |
| LDR – Single-family detached | Pool | 20,000 (at 10% of lots) | No | 7 months/year | 24-hours | 5,356 | 0 |
| HDR - apartments | Pool | 150,000 | Yes | Year-round | 18-hours | 51,796 | 43,504 |
| | Spa | 4,000 | Yes | Year-round | 18-hours | 18,737 | 4,835 |
| High school | Pool | 500,000 | Yes | Year-round | 18-hours | 172,655 | 145,012 |

## SITE LIGHTING

### SURFACE & STRUCTURED PARKING

Table 5 presents parking assumptions for all buildings excluding single-family homes with private garages. Energy use for the single-family garages is included in the building energy estimates. All parking lighting is assumed to be light emitting diode (LED) technology meeting Title 24 requirements. Hardscape lighting requirements are proposed to be updated in the 2022 Title 24 code cycle. Base case energy use for the surface parking lots is based on the 2019 hardscape code requirements while the proposed project energy use is based on the 2022 code proposals. In all cases bi-level lighting with motion sensor and photosensor controls are assumed. Annual energy use calculations are based on 4,688 annual dark hours when the photosensor control will turn the lights on and 20 percent occupancy rate. The occupancy rate is based on data from the UC Davis California Lighting Technology Center and assumes that 20 percent of the time the area is occupied, and lights are on at full capacity. The remainder of the time the area is unoccupied and light levels are reduced to 40 percent of full capacity.

The structured parking is assumed to be enclosed and therefore ventilated and illuminated. Both base case and proposed energy use for the structured parking are estimated at the same value since there are no proposed changes for structured parking in the proposed 2022 code. Bi-level lighting with motion sensor and photosensor controls are assumed. Structured parking energy use estimates are based on 0.063 Watts per square foot and a blended occupancy rate of 55 percent to account for savings from lighting controls based on case study data.

Parking area is calculated as 350 square feet per parking space. Code allowances for hardscape parking are based on total area and total perimeter. Parking lot perimeter is estimated as 0.17 of the total surface parking area.

### PARKS

This analysis assumes that there is minimal illuminated area at each of the parks and urban farmland uses and illumination is limited to low-level pathway lighting. Total pathway lighting applied in the calculations assumes 500 feet of path for each of the major eight parks for a total of 4,000 feet and 500 feet in total for the urban farm. All lighting is assumed to be LED technology

meeting Title 24 requirements. Pathway lighting is subject to the Title 24 hardscape lighting requirements; however, in the Consultant Team's experience applying these requirements results in higher loads than are typical for narrow pathways. Therefore, a lighting density of 0.5 Watts per linear feet of path was used based on data from prior projects. Bi-level lighting with motion sensor and photosensor controls are assumed, and annual energy use calculations apply the same hours of operation, and light level reduction assumptions, as the surface parking lighting. Energy use estimates for the base case and proposed project are the same for parks and the urban farm land uses.

### PUBLIC ROADWAYS

Based on the land-use plan dated November 2020, 80,000 linear feet of roadway outside of the Ag-Buffer is estimated for this analysis. Public roadways are not regulated under the Title 24, Part 6 Energy Code. A lighting density of 0.23 Watts per linear feet of path was used based on LED data from prior projects. Annual energy use calculations assume a photosensor but no other controls. Energy use estimates for the base case and proposed project are the same. No energy use is estimated for roadway within the Ag-Buffer.

*Table 5: Parking Lot Assumptions*

| Land Use Type | Description | Estimated Spaces per Unit | Total Parking Spaces | |
|---|---|---|---|---|
| | | | Structured | Surface |
| HDR | Apartment or rowhome | 1.5 spaces/DU | | 1,365 |
| VHDR | Urban stacked flats | 1 space/DU | 791 | |
| CMU | Apartment over commercial | 1 space/DU | 3,288 | |
| | Mid-rise office | 1 space/300Sq.Ft | 3,467 | |
| | Specialized (medical school/labs) | 1 space/300Sq.Ft | 693 | |
| | Specialized (medical offices) | 1 space/300Sq.Ft | 139 | |
| | Hotel | 1 space/300Sq.Ft | 1,040 | |
| | Entertainment | 1 space/100Sq.Ft | 1,248 | |
| | Grocery | 1 space/300Sq.Ft | 50 | |
| | Restaurant | 1 space/100Sq.Ft | 890 | |
| | Retail | 1 space/300Sq.Ft | 485 | |
| | Institutional/religious | 1 space/100Sq.Ft | 1,040 | |
| EHC | Mid-rise office | 1 space/300Sq.Ft | | 1,775 |
| | Hotel | 1 space/300Sq.Ft | | 444 |
| | Restaurant | 1 space/100Sq.Ft | | 438 |
| | Supermarket | 1 space/300Sq.Ft | | 150 |
| | Retail | 1 space/300Sq.Ft | | 148 |
| | Entertainment | 1 space/100Sq.Ft | | 444 |
| | Institutional/religious | 1 space/100Sq.Ft | | 444 |
| S | K-8 school | 60 spaces/school | | 180 |
| | High school | 400 spaces/school | | 400 |
| | Community college | 200 spaces/school | | 200 |

## ELECTRIC VEHICLE CHARGING

Level 2 electric vehicle (EV) charging is assumed at the single-family garages and at parking lots serving the multifamily and commercial land uses. Proposed project energy use estimates are based on one EV chargers installed per each single-family garage space and EV chargers at 20 percent of multifamily and commercial parking spaces. Base case energy use reflects chargers at only one percent of spaces.

Single-family homes EV charging estimates are based on data from the U.S. Environmental Protection Agency and Federal Highway Administration, resulting in an annual estimate of energy use per EV charger of 3,387 kWh (see Table 6). This aligns with SMUD's Integrated Resource Plan which claims that the average light-duty EV uses approximately 3 MWh per year (Sacramento Municipal Utility District, 2019).

*Table 6: Single-Family EV Charging Assumptions*

| Metric | Value | Source |
|---|---|---|
| Average EV efficiency kWh per mile | 0.3042 | EPA's fuel economy data for 2019 through 2021 model year mid-size EVs (U.S. Environmental Protection Agency, 2021). |
| Average daily miles per vehicle | 30.5 | National Household Travel Survey Best Estimate of Annual Vehicle Mileage for 2017 (Federal Highway Administration. 2021) |

The energy estimates for the public chargers at the commercial and multifamily parking lots assume three full-hours of daily charging with a Level 2 charger that draws 10 kW during operation. This results in an annual estimate of 10,950 kWh per charger. This annual use estimate is applied as an average across all the anticipated public chargers for the project. However, the use profile of the public chargers may vary widely. There is a potential for greater use at the employment highway commercial parking lots which may have fast chargers and receive highway traffic with frequent turn-over, and lower demand in the commercial core area.

EV charging technology and use profiles are changing rapidly. These estimates are based on the best available information at the time of the analysis.

## WATER SUPPLY

Annual energy consumption is estimated for the potable water supply only. All water use is assumed to be potable water. The use of recycled water or untreated irrigation water remains an option for some uses (e.g., irrigation of open space, landscape corridors, agricultural uses, and make-up water for the canal); however, these uses have not yet been determined, and are therefore not included in these water energy estimates.

The potable water energy estimates are based on the March 6, 2020 Water Infrastructure Conceptual Plan developed by Wood Rogers,[5] which is the basis of the *Upper Westside Specific Plan February 2021 Administrative Draft (UWSP)*. The Water Infrastructure Conceptual Plan estimates a total water demand, including 7.5 percent System Losses, of 3,879 acre-feet per year (AFY), or

[5] Wood Rogers, "Upper Westside – Water Infrastructure Feasibility Review Memo," March 6, 2020. Available online as of 4/15/2021 at https://planningdocuments.saccounty.net/ViewProjectDetails.aspx?ControlNum=PLNP2018-00284

1,264 million gallons per year (MGY). These estimates are based on the Sacramento County Water Agency's projection methodology and the project's proposed land uses.

The UWSP Water Infrastructure Conceptual Plan proposes a water treatment plant and 1.5 MG water storage tank site southwest of the intersection of Byrte Bend Road and San Juan Road, on the west side of the proposed 20 acre detention basin. The Water Infrastructure Conceptual Plan requires a retailer to deliver treated water to the plan area. The retailer would own, operate, and maintain the plant area transmission and distribution facilities. The retailer is anticipated to be one of the following three options:

- Option 1 - City of Sacramento - Department of Utilities
- Option 2 - Sacramento County Water Agency through an established of a water supply zone; or
- Option 3 - Creation of an independent water district or annexation to an existing water district.

In addition to who would serve as the water retailer (options 1-3 above), the UWSP outlines four different water supply alternatives for where potable water supply would come from:

1. Alternative 1: City of Sacramento
   The City has excess water rights and could convey water through its existing infrastructure system to the proposed on-site treatment and storage facility.
2. Alternative 2: NCMWC via City of Sacramento
   The Natomas Central Mutual Water Company (NCMWC) has significant water rights to the Sacramento River. The City of Sacramento could utilize the NCMWC water rights to distribute water to the project through its system. From the energy standpoint, this is the same as Alternative 1, as the same water treatment infrastructure would be used; the only difference is whose water rights are used.
3. Alternative 3: NCMWC
   Sacramento River water from NCMWC's Riverside Plant could be conveyed to a new onsite water treatment and storage facility. The system would be connected to the City of Sacramento's system for redundancy.
4. Alternative 4: Groundwater
   Deep wells could be drilled on the project site and used to feed a new onsite water treatment and storage facility. This is similar to Alternative 3 but uses ground water instead of surface water. Alternative 4 would have a higher energy use because deep groundwater pumping has a higher energy intensity than sourcing water from surface waters (e.g. Alternatives 1-3).

Per the *Water Infrastructure Conceptual Plan*, Alternative 1 is the preferred option and serves as the basis for this analysis. Alternative 2 would have the same energy use as Alternative 1. Alternative 3 would likely have lower water pumping conveyance energy use, but the scale of the added water treatment plant is smaller and may be more energy intensive due to its size. Alternative 3 needs further refinement before a meaningful energy analysis can be performed. Similarly, Alternative 4 requires further development. Alternative 4 could potentially require the greatest amount of energy due to the deep groundwater pumping; however, the exact amount of energy would depend on the depth of the wells.

## WATER SYSTEM ENERGY USE INTENSITY (EUI)

The Energy Use Intensity (EUI) of the water supply system is the total kWh of electricity used per gallon of water for extraction, diversion, conveyance, storage, treatment and distribution of potable water. Urban Water Management Plans (UWMPs) are to be prepared by California's urban water suppliers to support their long-term resource planning, and to ensure adequate water supplies are available to meet existing and future water needs. California Department of Water Resources (DWR) made reporting of local water system EUIs optional in its 2015 Urban Water Management

Plan. Urban Water Management Plans must be prepared every five years. The City of Sacramento did not report EUI data for its 2015 UWMP. However, the Sacramento County Water Agency did report its 2015 water EUI, which was 701.4 kWh/acre-foot of potable water delivered.[6] Water system EUI reporting is mandatory for the 2020 Urban Water Management Plan, for which reporting is due July 1, 2021. The Project Team corresponded with the City of Sacramento to obtain its EUI data before officially reported but was unable to get the EUI data. Sacramento's sustainability, climate, benchmarking and other public reporting data were reviewed; however, there was insufficient data to calculate water supply EUIs. A detailed literature review was conducted to identify other relevant EUI data for use in this analysis.

Stanford's Water in the West program has tabulated the most comprehensive set of water infrastructure EUI data, broken out by individual water infrastructure phases (extraction, diversion, conveyance, treatment and distribution)[7]. Using Water in the West EUI data resulted in a similar total water supply EUI as reported in the Sacramento County Water Agency's 2015 Urban Water Management Report, but with a larger range of variability.

Therefore, for this analysis, Sacramento County Water Agency's *2015 Urban Water Management Report*'s overall water system EUI of 701.4 kWh/acre-foot was used. This is the most current and representative EUI of the water supply that will eventually serve this project. The mix of surface and ground water supplies, depth to groundwater, raw water quality, distribution distances and topography, and other factors are similar. The Sacramento County Water Agency provides only a total water infrastructure EUI. Individual components of the water supply chain (extraction, treatment and distribution) are estimated from literature data and broken out for reference.

*Table 7: Water infrastructure Energy Use Intensity (EUI)*

| Water Supply Component | kWh/AF | Source Notes |
|---|---|---|
| Extraction (Mix of surface and ground water) | 276.1 | Calculated. Extraction = Total – Treatment – Distribution *In the range of benchmark data for a mix of surface and ground water* |
| Treatment | 32.5 | Stanford, Water in the West, benchmark average |
| Distribution | 392.8 | Stanford, Water in the West, benchmark average |
| Total | 701.4 | Sacramento County Water Agency 2015 Urban Water Management Plan |

## WASTEWATER

Annual energy consumption is estimated for the wastewater infrastructure. The wastewater energy estimates are based on Wood Roger's *Upper Westside Level 1/2 Sewer Study updated February 2021*, and the *Upper Westside Specific Plan February 2021 Administrative Draft (UWSP).*

## SEWER SYSTEM DESCRIPTION

The project is partially within the Sacramento Area Sewer District (SacSewer); the remaining project area is planned to be annexed into the District. SacSewer's standards were used for Wood Roger's Level 1/2 Sewer Study.

Approximately 2% of the project's wastewater ("Shed G" in the *Upper Westside Level 1/2 Sewer Study*) will flow by gravity to an existing gravity trunk at the intersection of El Centro and San Juan Road. These flows go to the Sacramento Regional County Sanitation District (Regional San) New Natomas Pump Station (NNPS). The remaining 98% of the project's wastewater will drain by gravity to a new onsite pump station that will convey the wastewater to the NPPS via a force main. From the NNPS, sewage is conveyed to the Regional San's wastewater treatment plant near Elk Grove through a combination of force mains and gravity conveyance. Treated water is discharged into the Sacramento River. Regional San is constructing a new wastewater treatment plant, the "EchoWater Project,"[8] which is adjacent to the existing wastewater treatment plant. The new EchoWater Project plant is expected to be operational by 2023 and is planned to treat the project's wastewater to tertiary standards using advanced wastewater treatment processes. This will include improved ammonia and nitrate removal, among other improvements. This will be a more energy intensive process than the current wastewater treatment plant. The new plant has a permitted capacity of 181 million gallon per day (MGD) average dry weather flow (ADWF).

Table 8 summarizes the project's estimated wastewater generation from Wood Roger's *Level 1/2 Sewer Study*, *updated February 2021*. The Average Dry Weather Flows (ADWF), in MGD, are multiplied by 365 to get the estimated annual wastewater flows in million gallons per year (MGY) for the energy calculations. Additional infiltration and inflow (I/I) flows are not included in the annual wastewater estimate. The Sacramento Area Sewer District's *System Capacity Plan Update 2020* models future development groundwater infiltration (GWI) rates as zero (i.e., no additional ground water infiltration than is already included in the 310 gpd per equivalent single-family dwelling (ESD) value used to calculate the ADWF)[9]. Modeling rainfall dependent infiltration/inflow (RDI/I) is beyond the scope of this analysis. RDI/I is not expected to be a significant contributor to total annual wastewater flows. Moreover, the annual wastewater generation estimates already exceed the estimated potable water consumption. This is due to the differing methodologies the different agencies use for estimating the respective flows. Thus, the annual wastewater generation estimate is conservative and likely overestimates actual wastewater flows.

*Table 8: Wastewater Flows*

| Segment | Shed G | Pump Station | Total |
|---|---|---|---|
| $Q_{avg}$, Average Dry Weather Flow (ADWF), (MGD) | 0.09 | 4.19 | 4.28 |
| $Q_{annual}$, Annual ADWF (MGY) | 33 | 1,529 | 1,562 |

### WASTEWATER INFRASTRUCTURE ENERGY USE INDICES

System-specific wastewater infrastructure energy use indices (EUIs) are not available from the various agencies involved in the wastewater collection and treatment processes serving this project. The City of Sacramento is in the process of benchmarking its wastewater treatment energy use, which shares much of the same wastewater treatment infrastructure, and these EUIs are not currently available. The EIR and other planning documents for Regional San's new EchoWater treatment plant were reviewed for EUIs or performance data to calculate EUIs; however, these were also not available.

The best available EUI data for the wastewater treatment infrastructure serving this project is previous study data tabulated by Stanford's Water in the West Program, "Water and Energy Nexus: A Literature Review."[10] On average, wastewater collection consumes 150 kWh per million gallons (MG) for pumping. The pumping energy for the new pump station to be installed for the project is included in this system average, as well as the additional pumping energy required to get the wastewater from the NPPS to the wastewater treatment plant. Wastewater treatment is more variable, and depends upon the size of the plant, the level to which the wastewater is treated, and the treatment technology. The wastewater treatment EUI used for this analysis is based on characteristics for the Regional Sans's new EchoWater wastewater treatment plant, in terms of size (>100 MGD capacity), treatment level (tertiary) and technology (advanced wastewater treatment technology with nitrification). Wastewater treatment will consume approximately 1,588 kWh per MG per year. Wastewater treatment EUIs for this project are summarized in Table 9. These EUIs are multiplied by the annual sewer flows to get the annual wastewater energy use, which is summarized in Table 19.

*Table 9: Wastewater Infrastructure Energy Use Intensity (EUI)*

| Component | EUI (kWh/MG) |
|---|---|
| Wastewater Collection | 150 |
| Wastewater Treatment | 1,588 |
| Total | 1,738 |

## STORMWATER

Annual community energy consumption for stormwater pumping is estimated for the project's detention basins and regional stormwater pumping stations. The drainage pumping energy estimates are based on the March 6, 2020 drainage infrastructure conceptual plan developed by Wood Rogers,[11] and drainage plan preliminary design details provided by Wood Rogers on

[10] Stanford University, Water in the West program, "Water and Energy Nexus: A Literature Review," Table 5: Unit Electricity Consumption for Wastewater Treatment by Size of Plant. 2013. https://waterinthewest.stanford.edu/sites/default/files/Water-Energy_Lit_Review_0.pdf

[11] Wood Rogers, "Upper Westside – Drainage Infrastructure Conceptual Feasibility Review Memo," March 6, 2020. Available online as of 4/15/2021 at https://planningdocuments.saccounty.net/ViewProjectDetails.aspx?ControlNum=PLNP2018-00284

4/13/2021[12, 13]. These details include refined drainage watershed areas, estimated watershed imperviousness, and refined basin drainage flows.

## DRAINAGE SYSTEM DESCRIPTION

The project is divided into 83 drainage watersheds, ranging in size from 3.5 acres to 94.4 acres. Stormwater runoff from most of the watersheds drain by gravity into one of four large detention basins: watersheds SOUT01-SOUT16, ROADS1, and ROADS2 drain into the south detention basin; watersheds WEST01-WEST13 drain into the west detention basin; watersheds NORT01-NORT12 drain into the north detention basin; and watersheds EAST01-EAST15, and ROADE1-ROADE3 drain into the east detention basin. The watersheds surrounding the canal (CENT01-CENT05) drain directly into the project's central canal water feature (the "CENTRAL" basin). This canal then drains via gravity into the east detention basin. Stormwater runoff from the agricultural land uses on the west side of the project along the river (watersheds OFFS01-OFFS05, OFFW01- OFFW08, OFFN01-OFFN03) do not drain into the basins, and there is no pumping currently planned for stormwater flows for these watersheds. Most areas dedicated to school land uses drain into one of the four detention basins; however, there is a single 65.5-acre watershed (SCHOOL) that occupies most of the area planned for the high school that does not directly drain into one of the four main detention basins. This high school watershed will have a separate on-site detention basin, which will likely be pumped. This site will be required to detain flows to existing condition flow rates and will be designed at a later date. The SCHOOL watershed is just west of the east detention basin. For purposes of this analysis, it is assumed that runoff from this SCHOOL watershed will flow into a shallower detention basin located within its watershed, which will then be pumped into the adjacent east detention basin. This detention basin has not yet been designed. It is estimated that the pump lift will be four feet to estimate its pumping power.

The Upper Westside project is located in an area that has a high groundwater table. Due to the high-water table, the four detention basins will be lined to minimize groundwater seepage. Therefore, there will be minimal stormwater infiltration from the basins, and all runoff entering the basins must be pumped out of the basins. Each basin will have a pump station. The basin pump stations are planned to be staggered four-pump systems, consistent with the City of Sacramento Stormwater Standards. The lowest pump will be a 1 cubic foot per second (cfs) low-flow pump set to maintain the stormwater quality pond depth in the event of minor flows. The three remaining pumps will be equally sized and placed at varied elevations.

Water flowing into the north basin is pumped into the Reclamation District 1000 (RD1000) Natomas West Drainage Canal. The north basin's pump station will be located at the site of the existing RD1000 Riverside Pump Station, but this pump station will have to be rebuilt to accommodate the new flows and will in effect be a new pump station. Stormwater flowing into the west basin is pumped out of the basin, where it then flows via gravity to the east basin. Stormwater flowing into the south basin is pumped out of the basin, where it then drains into the project's central canal. The canal is primarily a water feature, but it also serves as a gravity stormwater conveyance from the south basin to the east basin. Water from the south basin flows through the canal via gravity and drains into the east basin. All of the flows into the east basin are pumped into

[12] Wood Rogers, "Preliminary Backbone Storm Drain Exhibit, Upper Westside Master Drainage Study," January 2021.This document shows proposed watersheds and basin locations based on refined land use plan and drainage plans. The watershed names referenced in this report are based on this document.

[13] Wood Rogers, "Table 2.1 Proposed Percent Imperviousness Table", 4/13/2021. Preliminary table showing area of each watershed and the estimates of imperviousness for each watershed based on land use.

the RD1000 Natomas West Drainage Canal. The east basin is at the site of the RD1000 San Juan Pump Station; this will also need to be rebuilt to accommodate the new flows and will effectively be a new lift station.

Stormwater discharged into the Natomas West Drainage Canal flows into the Main Natomas Drainage Canal, which ends at the RD1000 Pumping Plant 1A and 1B. Only pumping plant 1B is operational. Pumping plant 1B pumps the water into the Sacramento River. The following figure summarizes the stormwater flows and pumping.

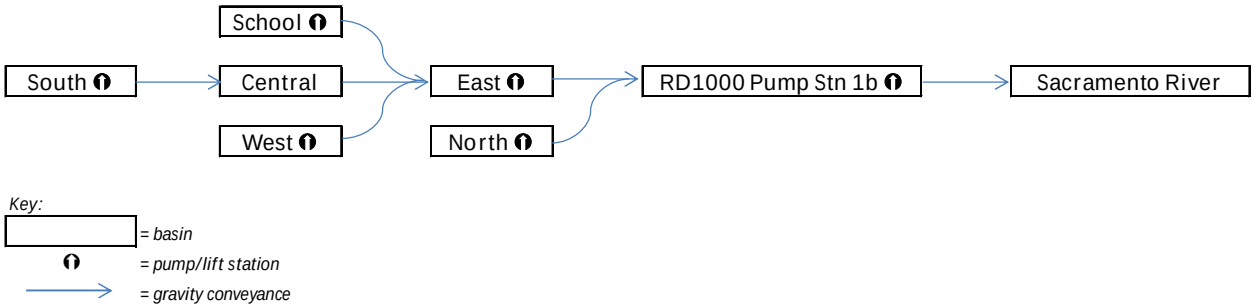

*Figure 1: Schematic of the stormwater drainage flows and pump/lift stations.*

## ANNUAL STORMWATER RUNOFF ESTIMATES

Stormwater runoff is influenced by the watershed areas feeding each detention basin and watershed imperviousness. The watershed areas and imperviousness are based on Wood Rogers' most recent (as of 4/13/2021) drainage system design.

Wood Rogers developed the conceptual drainage master plan and used peak storm events (200-year 10-day storm event, 100-year 10-day storm event, and a 10-year storm event) to size the drainage system to accommodate worst-case flows. To estimate annual pumping energy, annual stormwater generation for a typical meteorological year is required. The U.S. EPA's National Stormwater Calculator (SWC) was used to estimate annual stormwater flows. The SWC estimates the amount of stormwater runoff generated from a land parcel using long-term historical rainfall data, local soil conditions, land cover, and project-specific stormwater management design details. The SWC is designed for projects in the early phases of planning and design. The SWC uses the EPA's Storm Water Management Model (SWMM) as its computational engine. SWMM is a well-established, EPA developed model that has been used for over 40 years. The SWC accesses several national databases that provide soil, topography, rainfall, and evaporation information for a chosen site.

Table 10 identifies key data assumptions used to estimate the runoff from each watershed feeding the project's pumped detention basins. The watershed area and watershed imperviousness (the percent of the watershed area covered by roofs, roads, sidewalks, parking lots and driveways), come from the most recent (4/13/2021) drainage design data provided by Wood Rogers, aggregated to the detention-basin level. The "natural" land cover column represents the percent of the watershed area that is in a more natural, non-forested land cover with shrubs, scrub and some trees. This corresponds to the approximate area of the detention basins, landscape corridors, and wetland uses that are estimated to be in a more natural landscaped form. The "landscape" land cover column represents the watershed area covered in typical urban/suburban landscaping and grass. The SWC uses these variables to estimate runoff from different types of land cover. The Soil characteristics come from databases in the SWC. Figure 2 shows the soil type (runoff potential) for the site. The site has a uniform soil type C (moderately high runoff potential) in areas draining to the pumped detention basins. The site is fairly uniform except for an area (predominately in the

North watershed) that has a lower soil drainage characteristic. Precipitation data comes from historical Sacramento rain gauge "5 ESE" data (1970-2006); there is an average of 19.62 inches of precipitation per year. Evaporation data comes from the same weather station, but is based on 1970-2005 data, with an average evaporation rate of 0.22 inches/day. No climate change related modifications were made to the weather data used in the analysis. The last two columns show the calculated average annual runoff from each watershed, in inches and acre-feet.

*Table 10: Summary of Watershed Drainage Areas and Characteristics Used to Estimate Annual Runoff*

| Water-shed | AREA (ac) | Land Cover | | | Soil Characteristics | | | Runoff | |
|---|---|---|---|---|---|---|---|---|---|
| | | Imper-vious | Land-scape | Natural | Soil Type (Runoff Potential) | Soil Drainage (in/hr) | Slope | Avg. Annual Runoff (in) | Avg. Annual Runoff (ac-ft) |
| Central | 75.6 | 60.4% | 39.6% | 0.0% | C-Moder-ately high runoff potential | 0.5 | Flat (2% Slope | 9.94 | 63 |
| School | 65.5 | 50.0% | 50.0% | 0.0% | | 0.5 | | 8.24 | 45 |
| South | 404.1 | 53.4% | 42.1% | 4.5% | | 0.5 | | 8.79 | 296 |
| West | 342.8 | 42.9% | 51.8% | 5.3% | | 0.5 | | 7.07 | 202 |
| East | 408.6 | 55.0% | 38.4% | 6.7% | | | | 9.04 | 308 |

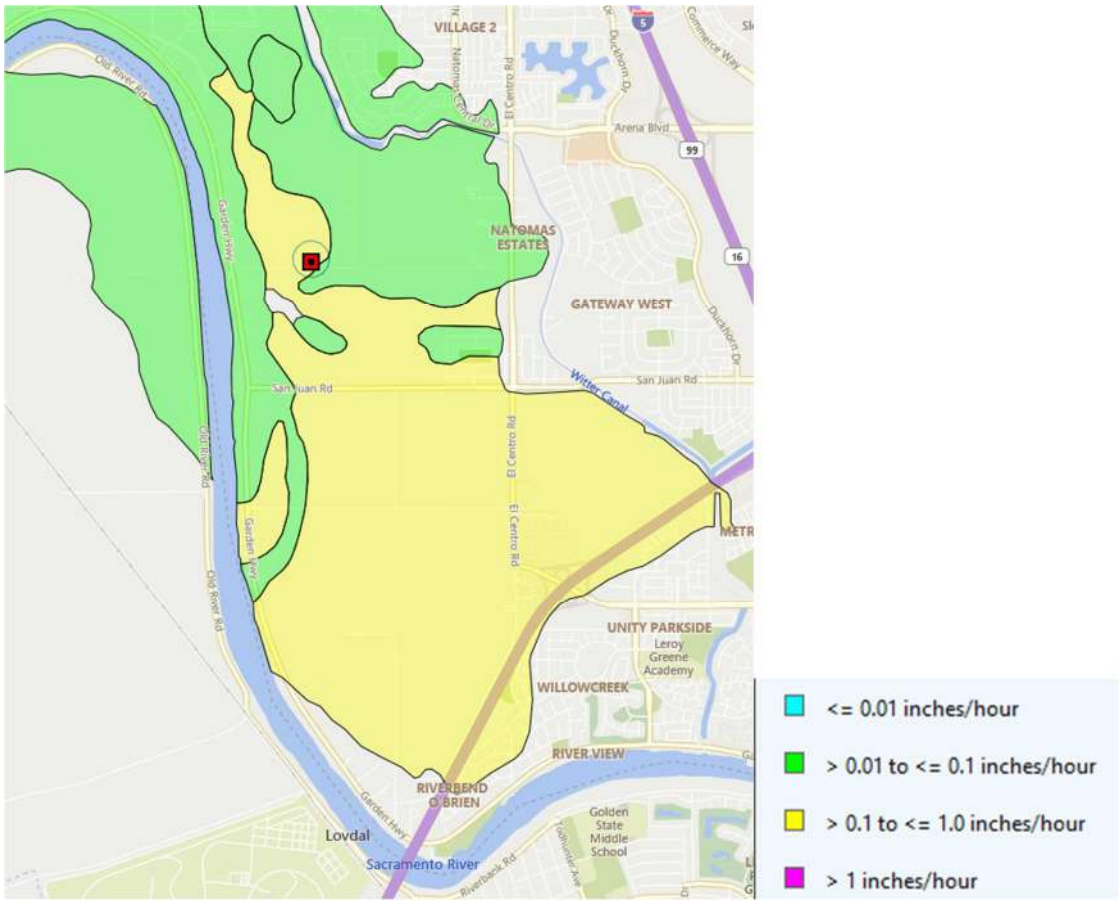

*Figure 3: Soil drainage characteristics for the project site.*

## PUMPING POWER—RD1000 PUMPING PLANT 1B

RD1000's Pumping Plant 1b consists of six 400 HP, 2,400 V vertically oriented mixed-flow pumps. Each pump has a capacity of 100 CFS. This pumping station was renovated in 2003. The pumps discharge into steel pipes that flow under the Garden Highway to the outfall structure on the Sacramento River.[14] Since rated horsepower and flow data are available, the pumping plant's energy use intensity is calculated: It is estimated that the 400 HP electric motors operate with a load factor of 1.1 at the design capacity of 100 CFS (i.e., power at rated flow = 400 HP/1.1), and that the motors have an electrical efficiency of 96%, which is a typical performance specification for this size/type/age of pump. This results in a specific power consumption of 32.0 kWh/acre-foot of water pumped. The project-related pumping power is calculated by multiplying this specific power by the total project runoff volume that enters the Natomas Drainage Canal. Pumping energy results are shown in Table 20.

[14] Reclamation District 1000, "Capital Improvement Program," Section 2: Description of Facilities, 8/2020. https://www.rd1000.org/files/8218c0ca3/CIP_Update+2020_Final_09042020.pdf

### PUMPING POWER—DETENTION BASINS

Basin pumping power is estimated from the following equation:

Annual Pumping Energy (kWh) = $V*\rho*g*h/\eta_{pump}/\eta_{motor}/$ (3,600,000 J/kWh)

where: V = annual pumped water volume [$m^3$]

$\rho$ = density of water = 997 $kg/m^3$

g = gravitational constant = 9.8 $m/s^2$

h = pump head (total static and frictional head), in m

$\eta_{motor}$ = motor efficiency, estimated at 92% average over the year

$\eta_{pump}$ = pump efficiency, estimated at 75% average over the year

33,600,000 J/kWh converts the pumping energy from Joules to kWh

The depths of the four main detention basins are all between 8-9 feet, with an estimated 9' static head (pump lift) for each basin. The SCHOOL detention basin is not yet designed, but it will not need to be as deep as the main basins. The pumping static head for this basin is conservatively estimated to be six feet. The dynamic (friction) head will be minimal since the horizontal runs are by surface gravity conveyance. Dynamic head is estimated to be 10% of the static head, rounded to the nearest foot. Pumping energy results are shown in Table 20. The South and West basins, along with the central canal (CENTRAL basin) and the school basin (SCHOOL) all drain to the East Basin, where the runoff must be pumped again into the Natomas Drainage Canal.

## GROUNDWATER PUMPING (DEWATERING)

The project site is in an area with a high groundwater table. The detention basins must be lined to minimize groundwater infiltration. However, even with the liners, there may still be some groundwater seepage into the basins, which must be pumped out. The pumping energy to remove this groundwater infiltration is estimated.

Table 11 shows the detention basin parameters used for the groundwater infiltration analysis. The existing site topography varies from an elevation of 10 to 20 feet above mean sea level (MSL), falling from west to east. The ground elevations for each basin are assumed equal to be the lowest planned street elevation (the top of the sewer system manhole rims) nearest each basin. Manhole rim elevations are taken from the Wood Rogers *Upper West Side Level 1/2 Sewer Study, Updated February 2021*. The basin depth and area data are from the Wood Rogers *3/6/2020 Drainage Infrastructure Conceptual Feasibility Study*[15].

[15] An updated drainage infrastructure plan was not available for use with this analysis, but Wood Rogers reports no planned changes in basin depths from the 3/6/2020 study.

*Table 11: Detention Basin Parameters for Groundwater Infiltration Analysis*

| Detention Basin | Ground Elevation (ft MSL) | Basin Depth (ft) | Basin Bottom Elevation (ft MSL) | Basin Area (ac) |
|---|---|---|---|---|
| N | 11.7 | 9 | 2.7 | 20 |
| W | 10.9 | 8 | 2.9 | 20 |
| E | 10.2 | 8 | 2.2 | 20 |
| S | 11.7 | 8 | 3.7 | 20 |

The groundwater level at the site is generally high with significant seasonal and annual variation. The groundwater is typically higher in the spring and lower in the fall. Wood Roger's *3/6/2020 Drainage Conceptual Drainage Design Plan* notes that "the available groundwater level data in the vicinity of project suggests groundwater has ranged between ground surface and a depth of approximately 30 feet between 1960 and 2019." This is based on California SWRCB data from nearby groundwater contamination and cleanup wells, from which the groundwater depth ranged from 10-11 feet, 6 to25 feet, ground surface to 30 feet, and 8 to 12 feet below the ground surface.

The Sacramento County Department of Water Resources maintained historical groundwater elevation contour maps for fall and spring from 1968 to 2007[16]. From 2007, the wells in the western region of the Sacramento Groundwater Authority (SGA), where the project is situated, have been read more sporadically, and the groundwater elevation contour maps have not been produced on a regular basis. SGA reports indicate that there have not been significant changes in groundwater levels from historical data, with the exception of abnormally dry periods. To estimate groundwater elevation at the project site for pumping energy estimates, the Sacramento County and SGA groundwater contour maps[17, 18] from 1998-2007, 2010, 2014, and 2016 were interpolated to get spring and fall groundwater levels at the project site. Average spring and fall groundwater elevations were then calculated. Figure 4 shows the historical groundwater elevations and the spring/fall calculated averages at the project site. The ground surface elevations at the detention basin locations and the elevations of the bottom of the detention basins are also indicated. As can be seen, the groundwater varies significantly both on a seasonal basis and over longer multi-year periods. The groundwater elevation is typically below or slightly above the bottom of the detention basins. Only on two occasions during the analysis period has the groundwater come near the ground surface; spring 1998 and fall 2006. For estimating annual pumping power, the site's typical monthly groundwater elevation is assumed to oscillate sinusoidally between the average spring elevation of 3.2 feet MSL and the average fall groundwater level of 2.8 feet MSL. The height of the groundwater above the bottom of each basin is the hydraulic head on the liner. Since each basin is situated at a slightly different ground elevation and the basins have different depths, the leakage into each basin is analyzed individually.

[16] Sacramento County Department of Water Resources. Ground Water Elevation Contour Maps, 1968-2007. https://waterresources.saccounty.net/Pages/ContourMaps.aspx Accessed 4/1/2021.

[17] Sacramento Groundwater Authority (SGA). "SGA Basin Management Report – 2016 Update." 2016 https://www.sgah2o.org/wp-content/uploads/2017/01/pub-bmreport-2015.pdf

[18] Sacramento Groundwater Authority (SGA). "SGA Basin Management Report – 2011 Update." 2011 https://www.sgah2o.org/wp-content/uploads/2016/06/pub-bmreport-2011.pdf

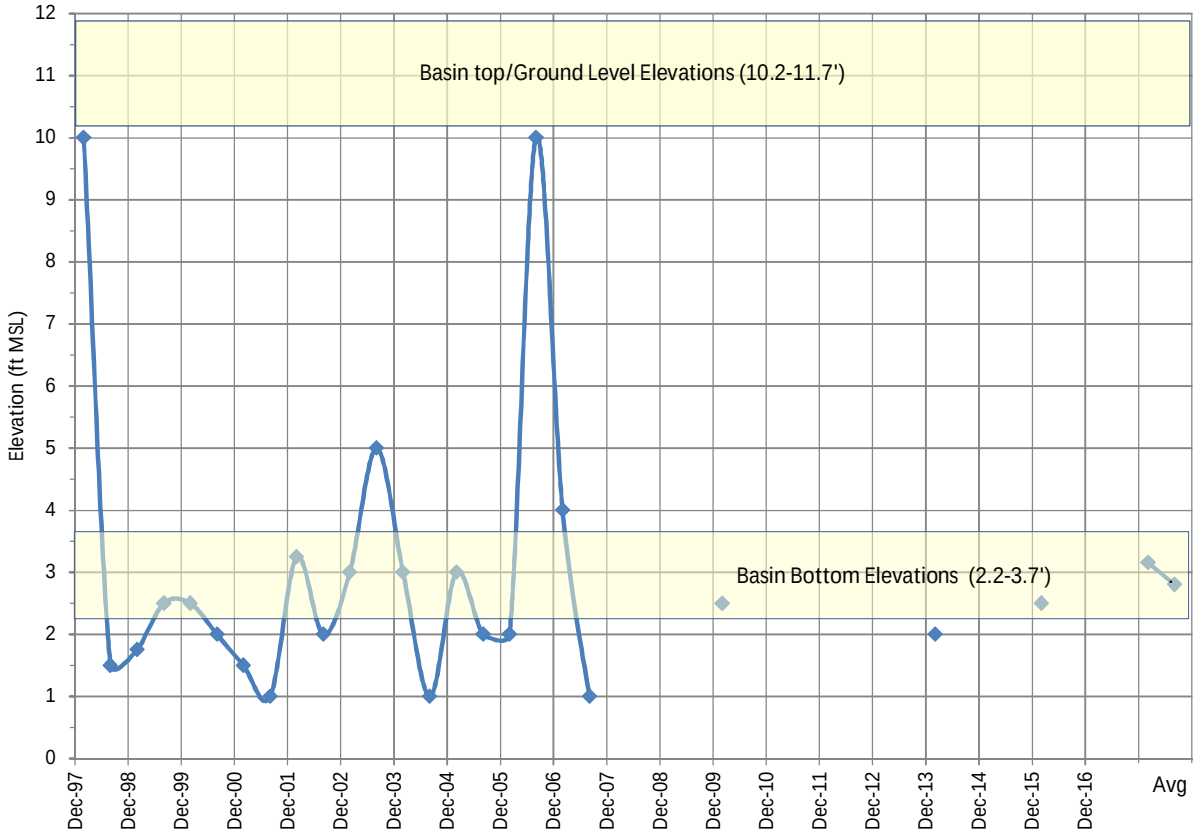

*Figure 4: Historical groundwater elevations at the project site.*

Table 12 shows the estimated monthly groundwater height above the bottom of each basin. This is the estimated hydraulic head driving groundwater infiltration through the basin liners. The average groundwater elevation is below the bottom of the south basin for all months; therefore, there will be no groundwater leakage into the south basin.

*Table 12: Groundwater Height (feet) Above Basin Bottom (Hydraulic Head)*

| Month | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| South Basin | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| West Basin | 0.2 | 0.3 | 0.2 | 0.2 | 0.1 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.1 | 0.2 |
| East Basin | 0.9 | 1.0 | 0.9 | 0.9 | 0.8 | 0.7 | 0.6 | 0.6 | 0.6 | 0.7 | 0.8 | 0.9 |
| North Basin | 0.4 | 0.5 | 0.4 | 0.4 | 0.3 | 0.2 | 0.1 | 0.1 | 0.1 | 0.2 | 0.3 | 0.4 |

Although not yet designed, it is assumed that the detention basins will be lined with a typical geotextile liner (e.g., HDPE). Giraud and Bonaparte's correlations for the leakage rate through geotextile liners vs. hydraulic head[19] are used to estimate the amount of groundwater that will leak through the basin geotextile liners. Analysis is performed for each basin and its hydraulic head with the liner in a range of conditions: no holes (permeation only), small holes (one 3.1-mm$^2$ hole

[19] Giroud, J. & R. Bonaparte. "Leakage through Liners Constructed with Geomembranes," Elsevier Science Publishers, Journal of Geotextiles and Geomembranes, Vol. 8, pp 27-67, 1989.

per acre), and large holes (one 1-cm$^2$ hole per acre)[20]. Large holes result in significant leakage. The no-hole condition (leakage is through water permeation through the membrane only) results in very minimal groundwater infiltration and no significant pumping power. The "small holes" condition is the most likely leakage scenario which is used for the final tabulated pumping power summary.

Additionally, analysis is made for both the "average" groundwater elevations and a "worst-case" scenario where groundwater levels are close to the surface. Fall 2006 and spring 2007 groundwater elevations (10' and 4' MSL, respectively) are used for the worst-case analysis, and result a situation where the groundwater is always above the bottom of the basins. The "best-case" conditions result in zero groundwater infiltration and occur when the groundwater elevations are below the basin bottoms for the entire year (i.e., 2000).

Table 13 summarizes the annual groundwater leakage into the basins for the range of liner conditions and groundwater elevations. Table 21 in the results section shows the estimated pumping energy for each of these conditions. The same methodology used for estimating stormwater pumping from the basins is used to estimate groundwater pumping from the basins. The results illustrate the significant range of possible groundwater infiltration into the basins and related pumping energy depending on the liner condition and groundwater levels. Overall, with the liner in good condition without major leaks, groundwater infiltration into the basins is expected to be small compared to the stormwater runoff entering the basins, even at high groundwater levels. Damage to the membrane (i.e., the "large holes" liner condition) is the most significant factor impacting groundwater pumping from the basins. This illustrates the importance of careful installation and protection of the detention basin liners to minimize liner damage.

*Table 13: Annual Groundwater Infiltration into the Detention Basins*

| | Groundwater Infiltration (ac-ft) | | | | | |
|---|---|---|---|---|---|---|
| | "Average" Groundwater Elevations | | | "Worst-Case" Groundwater Elevations | | |
| Basin | No Leaks | Small Leaks | Large Leaks | No Leaks | Small Leaks | Large Leaks |
| South Basin | 0 | 0 | 0 | 0 | 0 | 0 |
| West Basin | 0 | 2 | 11 | 0 | 14 | 454 |
| East Basin | 0 | 6 | 86 | 0 | 15 | 532 |
| North Basin | 0 | 4 | 31 | 0 | 14 | 476 |
| Total | 0 | 11 | 128 | 0 | 42 | 1,463 |

## CANAL AERATION

The central canal may need to be aerated for water quality. The canal has an approximate length of 2,500 feet and width of 90 feet, for an area of 5.2 acres. It will have a shallow water depth. There are a variety of ways to aerate the canal—a single large compressor station, or multiple smaller pumps. For shallow pond aeration, a series of smaller aeration pumps is often used. Performance

[20] Giroud and Bonapart analyzed membranes with a range of damage expected in the field due to stress on the membrane, poor installation, etc. Two hole sizes were analyzed (3.1 mm$^2$ and 1 cm$^2$), each at a frequency of 1 hole per acre.

specifications of several systems were reviewed, and average performance data was used to estimate aeration energy needs for the canal.

For the canal, a typical smaller-scale aeration pump used for this application can serve ½ an acre. This will necessitate approximately 11 pumps. Typical pumps have a power consumption of 126.5 W, and will operate continuously, for 1108 kWh/year/pump. For 11 pumps, this totals 12,190 kWh/year.

# 3. RESULTS

Table 14 summarizes annual energy use for each evaluated category. Table 15 through Table 22 present results from this analysis for each category of project energy use evaluated.

Estimated building energy use in Table 15 compares site gas and electricity use (including swimming pools) by building type. Shifting to all-electric or mostly-electric buildings significantly reduces on-site natural gas use by 81 percent but increases total building electricity use by 10 percent. When total energy is converted to GHG emissions, total emissions are reduced substantially in the proposed design.

Site lighting energy use presented in Table 16 shows a small difference between the base case and proposed estimates for surface parking lot lighting due to the change in code requirements between the 2019 and 2022 code and no difference for the other site lighting applications.

Table 17 presents EV charging energy use. This analysis covers estimated vehicle operational use for EVs only and not transportation energy holistically across the community. As a result, the proposed energy estimates are significantly higher than the base case. The project is proposing EV infrastructure above minimum code requirements and there is an anticipated market shift from gasoline to electric vehicles over the build-out of the project. Once total transportation energy is accounted for, total emissions are reduced substantially for the proposed design.

Table 18 summarizes the energy consumption related to the project's water supply system. All water use is assumed to be potable water, per discussion in the assumptions section. Energy use estimates for each component of the water supply system (extraction, treatment, and distribution) are provided.

Table 19 summarizes the annual energy consumption for the project's wastewater collection and treatment. Breakouts are provided for both the "Shed G" section of the project which drains to existing sewer infrastructure, and for rest of the project which will drain to a new wastewater pump station and force main.

Table 20 summarizes the annual energy consumption for stormwater pumping. Due to the project site's high groundwater tables, all runoff flowing into the project's detention basins must be pumped into the West Natomas Drainage Canal. Natomas Drainage Canal flows are then pumped into the Sacramento River. Pumping energy for both of these are estimated.

Table 21 summarizes the annual energy consumption estimated for aerating the project's central canal water feature to maintain water quality. Due to the project site's high groundwater table, the detention basins must be lined. However, even with the lining, some water will still leak into the basins. This water must be pumped out. Table 22 summarizes the range of water pumping energy that will required to remove groundwater leaking into the project's four detention basins. As with the stormwater pumping, both the basin pumping power and the Natomas Drainage Canal pumping power is included in these estimates. This category of energy use has a large range of potential variability, depending on groundwater depth and liner condition. In some years, the groundwater is always below the basin bottom and there will be no groundwater leakage. In other years, the groundwater is always above the basin bottom and there will be leakage year-round. This is the "worst case" groundwater level. In typical years, the groundwater level is above the basin bottom for some months and then below the basin bottom for the remaining months. This is the "average" groundwater level condition. The other major factor impacting groundwater leakage into the basins is the liner condition. Leakage rates are shown for the liner in new condition (i.e., no leaks), small leaks (presumed typical condition), and large leaks (significant liner damage). The liner condition has the largest impact on groundwater leakage. Damage to the liner can result in significant leakage, particularly during high groundwater levels. For comparison purposes, the "typical" leakage rate is that which occurs for "average" groundwater levels and small leaks.

*Table 14: Summary of Total Annual Estimated Energy Use by Category*

| Category | Base Case | | Proposed | |
|---|---|---|---|---|
| | Gas (therms) | Electricity (MWh) | Gas (therms) | Electricity (MWh) |
| Buildings | 3,168,566 | 47,985.3 | 588,173 | 52,842.1 |

Sacramento, CA 95814

Subject: Upper West Side Development
El Centro Road
Sacramento County, California

**PHASE I ENVIRONMENTAL SITE ASSESSMENT**

Dear Mr. Thomas:

ENGEO is pleased to present our phase I environmental site assessment of the subject property (Property), located in Sacramento County, California. The attached report includes a description of the site assessment activities, along with ENGEO's findings, opinions, and conclusions regarding the Property.

ENGEO has the specific qualifications based on education, training, and experience to assess the nature, history, and setting of the Property, and has developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312 and the American Standard Testing Method (ASTM) Practice E1527-13. We declare that, to the best of our professional knowledge and belief, the responsible charge for this study meets the definition of Environmental Professional as defined in Section 312.10 of 40 CFR Part 312 and ASTM E1527-13.

We are pleased to be of service to you on this project. If you have any questions concerning the contents of our report, please contact us.

Sincerely,

ENGEO Incorporated

Travis Chatters, PE

# EXECUTIVE SUMMARY

ENGEO conducted a phase I environmental site assessment for the property located at west of Interstate 80 in Sacramento County, California (Property). The Property is approximately 2,000 acres in area and consists of 141 parcels.

The subject parcels are bounded by Garden Highway to the west, Interstate 80 to the south and southeast, and the Sacramento West Drainage Canal to the north and east. Further east of the canal are several residential subdivisions. El Centro Road trends north-south through the eastern portion of the site; other roads within the site boundary include Bryte Bend Road, San Juan Road, Farm Road, and Radio Road. The parcels consist predominantly of undeveloped agricultural and fallow land. High voltage power lines cross the southern portion of the Property, entering through the eastern border and exit through the southern tip of the Property. Several large acreage/agricultural residences are located along the southwestern border and northeastern corner of the Property. One of these residences located in the northeastern corner is used for farm equipment, automobile, and scrap metal storage.

The West El Camino Avenue exit off of Interstate 80 is at the southern border of the Property and consists of multiple commercial properties which include several hotels, fast food and dine-in restaurants, a self-storage facility, a 49er Travel Plaza, several commercial buildings, and a large-scale machine shop. The 49er Travel Plaza is a truck stop facility, which includes fuel stations, convenience stores, an automotive repair shop, and car wash.

Active grading was taking place at the former Johnson Ranch (APN 225-0010-058) located in the northwestern corner of the Property. The work was part of the Natomas Flood Plain Reach B.

The proposed site plan consists of a mixed-use development plan including low to high density residential units, mixed-use commercial units, employment/highway commercial units, schools, parks, water and landscape corridors, urban farms/greenbelts, open space, and agricultural sites with and without private residences.

This assessment included a review of local, state, tribal, and federal environmental record sources, standard historical sources, aerial photographs, fire insurance maps and physical setting sources. A reconnaissance of the Property was conducted to review site use and current conditions to check for the storage, use, production or disposal of hazardous or potentially hazardous materials and interviews with persons knowledgeable about current and past site use.

The site reconnaissance and records review did not find documentation or physical evidence of soil, soil gas, or groundwater impairments associated with the use or past use of the Property. A review of regulatory databases maintained by county, state, tribal, and federal agencies found no documentation of hazardous materials violations or discharge on the Property and did not identify contaminated facilities within the appropriate American Society for Testing and Materials (ASTM) search distances that would reasonably be expected to impact the Property.

Based on the findings of this assessment, no Recognized Environmental Conditions (RECs), four historical RECs, and no controlled RECs were identified for the Property.

The following HRECs were identified:

- **Former Johnson Ranch**: (Case Number T10000012933) located at 3800 Garden Highway and identified by APN 225-0110-058, is listed as a closed leaking underground storage tank (LUST) cleanup site as of July 31, 2020. Elevated concentrations of pesticides, lead, and arsenic were identified in historic agricultural soils in 2006 and in 2009 soil and groundwater with total petroleum hydrocarbon (TPH) and motor oil contamination associated with a former 550-gallon underground storage tank (UST) and former aboveground storage tank (AST) were identified. Approximately 260 tons of contaminated soils were removed from the Property on February 26, 2020. The case was closed without restrictions by the Sacramento County Environmental Management Department (SCEMD) on July 31, 2020.

- **Private Residence**: (Case Number T0606748466) located at 3650 El Centro Road and identified by APN 225-0190-019, is listed as a closed LUST cleanup site as of February 22, 2016. Two 5,000-gallon USTs were removed from the Property in the 1980s. Elevated concentrations of TPH-gasoline (TPHg) in soils northwest the former USTs and elevated concentrations of TPHg, TPH-diesel (TPHd), TPH-motor oil (TPH-mo), and benzene were identified in a subsurface soil investigation in June 2006. Supplementary sampling in August 2006 delineated the impacts to areas around the former USTs. Four monitoring wells were installed in March 2007 for groundwater monitoring. Removal of contaminated soils was performed from July 2008 through September 2009 followed by treatment of in-situ soils through aeration processes. Groundwater and soil vapor samples were collected following remedial activities. Additional rounds of groundwater and soil vapor sampling were conducted in June 2014 and September 2015. The case was closed without restrictions by SCEMD on February 19, 2016.

- **49er Truck Plaza Case #1**: (Case Number T0606700843) located at 2828 El Centro Road and identified by APN 225-0220-055. Gasoline and diesel spills were documented on the Property as early as 1991, causing impacts to nearby soil and groundwater with TPHg and TPHd, followed by remediation activities to remove impacted soils and groundwater. Groundwater monitoring wells were first installed on the Property in 1992. In 1998, 10 USTs containing gasoline, diesel, waste oil, and lube oil were removed from the Property and monitoring wells were installed. The wells were monitored quarterly from 2005 to 2010. The monitoring wells were destroyed under direction of the SCEMD in 2013. The case was closed without restrictions by the SCEMD on March 26, 2014.

- **The #23 Satellite Dispenser pump at the 49er Truck Plaza Case #2**: (Case Number T0606700843) was damaged in an accident causing the release of diesel fuel into the backfill and surrounding soil on the Property in February 2019. Impacted soils were removed from the Property and followed by a soil investigation performed on July 12, 2019. The case was closed without restrictions by the SCEMD on April 16, 2020.

Based on the review of regulatory databases and site reconnaissance, we present information on features of potential environmental concern that were either contained in the databases or observed on the Property. These features were not considered to be RECs. We briefly discuss each feature below.

### Residential Sites/Areas

It is conceivable that during future site demolition and initial grading that potential areas of soil impacts or buried structures such as sumps/tanks and septic systems may be encountered. In addition, it is possible that asbestos-containing materials (ACM) and lead-based paint (LBP) materials may be present within the existing structures. Soil within the area of demolished structures could also contain ACM and/or LBP.

### Former Gas/Oil Wells

An abandoned gas/oil well is located within the Property. According to the Department of Conservation, Geologic Energy Management (CalGEM), the well can be located within the Property limits, provided it is not located underneath foundations and is accessible by a truck-mounted drill rig.

### Agricultural Fields

The majority of the Property consists of agricultural land, some of which was used at a time when organochlorine pesticides (OCPs) and heavy metals were used as pest deterrents. It is possible that OCPs, lead, and arsenic may be present at these sites. It is likely that soil sampling will be required by a regulatory agency in the future.

### Irrigation and Domestic Wells

A number of irrigation wells and domestic wells exist on the Property. Any irrigation or domestic wells on the Property should be abandoned in accordance with Sacramento County regulations, if no longer intended for use.

### Transformers

Pole-mounted transformer units were observed on the Property. While there did not appear to be evidence of leakage or soil impacts, it is conceivable some units could contain PCBs in coolant fluid. These units should be properly decommissioned as part of future demolition activities, if no longer in use.

ENGEO has performed a phase I environmental site assessment in general conformance with the scope and limitations of ASTM E1527-13 and the standards and practices of the All Appropriate Inquiry ï Final Rule (40 Code of Federal Regulations Part 312).

The data gaps identified during this process, may affect the conclusions as to the presence or lack of presence of RECs at the Property. The following data gaps were identified:

- We were unable to access any of the structures within the Property. These structures may contain asbestos containing materials, lead-based paint, and other potentially hazardous substances.
- We did not receive client or key site manager questionnaires.
- We did not receive preliminary title reports for any of the parcels.

Based on the nature of the data gaps, we cannot conclusively render a conclusion as to the presence of RECs at the Property.

This assessment has revealed no evidence of RECs in connection with the Property, and the Property may be suitable for future development. ENGEO recommends the following:

- Pre-demolition surveys of the existing structures to verify to presence of asbestos containing materials, lead-based paints, or any other hazardous substances present within the structures.
- Locating the former gas/oil well present on the Property. The well seal should be confirmed prior to development.
- Collection of near surface soil samples to determine if lead, arsenic, or organochlorine pesticides are present at the Property.
- Proper abandonment of irrigation and residential wells under the appropriate agency.
- Removal and disposal of pole-mounted transformers under the appropriate oversight.
- Preparation of a soil management plan for any work that might take place within the truck stop or any other HREC location.

# 1.0 INTRODUCTION

## 1.1 PURPOSE OF PHASE I ENVIRONMENTAL SITE ASSESSMENT

This assessment was performed at the request of Upper West Side LLC for the purpose of environmental due diligence. The objective of this phase I environmental site assessment is to identify Recognized Environmental Conditions (RECs) associated with the Property. As defined in the ASTM Standard Practice E1527-13, an REC is ñthe presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.ò

## 1.2 DETAILED SCOPE OF SERVICES

The scope of services performed included the following:

- A review of previous environmental reports prepared for the Property.
- A review of publicly available and practicably reviewable standard local, state, tribal, and federal environmental record sources.
- A review of publicly available and practicably reviewable standard historical sources, aerial photographs, fire insurance maps and physical setting sources.
- A reconnaissance of the Property to review site use and current conditions. The reconnaissance was conducted to check for the storage, use, production or disposal of hazardous or potentially hazardous materials.
- Written/oral interviews with owners/occupants and public sector officials.
- Preparation of this report with our findings, opinions, and conclusions.

## 1.3 SITE LOCATION AND DESCRIPTION

ENGEO conducted a phase I environmental site assessment for the Property located west of Interstate 80 and north of the Sacramento River in Sacramento County, California (Figures 1 and 2). The approximately 2,000-acre Property consists of 144 individual parcels. Individual parcel information is presented in Appendix A.

## 1.4 CURRENT USE OF PROPERTY AND ADJOINING PROPERTIES

The subject parcels are bounded by Garden Highway to the west, Interstate 80 to the south and southeast, and the Sacramento West Drainage Canal to the north and east. Further east of the canal are several residential subdivisions. El Centro Road trends north-south through the eastern portion of the site; other roads within the site boundary include Bryte Bend Road, San Juan Road, Farm Road, and Radio Road. The parcels consist predominantly of undeveloped agricultural and fallow land. High voltage power lines cross the southern portion of the Property, entering through the eastern border and exiting through the southern tip of the Property. Several large acreage/agricultural residences are located along the southwestern border and northeastern

corner of the Property. One of these residences, located in the northeastern corner, is used for farm equipment, automobile, and scrap metal storage.

The West El Camino Avenue exit off of Interstate 80 is at the southern border of the Property and consists of multiple commercial properties which include several hotels, fast food and dine-in restaurants, a self-storage facility, a 49er Travel Plaza, several commercial buildings, and a large-scale machine shop. The 49er Travel Plaza is a truck stop facility which includes fuel stations, convenience stores, an automotive repair shop, and car wash.

The proposed plan consists of a mixed-use development including very low to very high density residential units, mixed-use commercial units, employment/highway commercial units, schools, parks, water and landscape corridors, urban farms/greenbelts, open space, and agricultural sites with and without private residences.

Surrounding areas include agricultural and residential properties.

## 1.5 SITE AND VICINITY CHARACTERISTICS

According to published topographic maps, the Property ranges in elevation from approximately 12 feet above mean sea level (msl) along the eastern border of the Property to approximately 26 feet above msl along the western border of the Property. Our review of the Preliminary Geologic Map of the Sacramento 30ôx 60ôQuadrangle (Gutierrez, 2011) indicates the surface geologic formations are mapped as Holocene alluvium that includes various mixtures of clay, silt, and sand.

Geocheck ï Physical Setting Source Summary of the Environmental Data Resources, Inc. (EDR) report (Appendix A) indicated 14 Federal United States Geological Survey (USGS), 140 State wells, and six oil/gas wells are located within 1 mile of the Property. The following readings were collected from the Federal wells with groundwater data. Eleven of the water wells are located within the Property. Known and listed wells are shown in Figure 4.

**TABLE 1.5-1: USGS Wells Depth to Groundwater Readings**

| WELL ID | DEPTH TO GROUNDWATER (FEET) | DATE OF READING |
|---|---|---|
| USGS40000189687 | 10.7 | August 13, 1982 |
| USGS40000189625 | 14.22 | May 20, 1996 |
| USGS40000189602 | 17.55 | August 16, 1982 |
| USGS40000189508 | 24.00 | August 23, 1979 |
| USGS40000189505 | 21.00 | December 20, 1978 |
| USGS40000189491 | 15.00 | January 19, 1979 |
| USGS40000189490 | 16.00 | August 16, 1982 |
| USGS40000189473 | 20.00 | December 11, 1979 |

We reviewed the Department of Water Resources On-line Water Data Library for depth to water in the vicinity of the Property. The website identified four wells within the Property and 22 wells within 1 mile of the Property. The following well reading were taken from wells within the Property.

**TABLE 1.5-2: Dept. of Water Resources Well Readings within the Property**

| WELL LOCATION | WELL TYPE | WELL ID | APPROX. GROUNDWATER ELEVATION RANGE (FEET) | | GROUND SURFACE ELEVATION (FEET) | DATE RANGE |
|---|---|---|---|---|---|---|
| | | | HIGH | LOW | | |
| Southwest portion of the site, approximately 1,000 feet east of Garden Highway | Irrigation | 386121N12 15550W001 | 1 | -129.5 | 18 | 2014 to 2016, 2020 |
| South portion of the site, just east of Garden Highway | Irrigation | 386008N12 15488W001 | 8.5 | -63.7 | 20 | 2014 to 2016, 2020 |
| Eastern portion of the site, 275 feet east of El Centro Road | Residential | 09N04E22E 001M | 15.1 | 2 | 14.5 | 1963 to 1996 |
| | | | 10.7 | 4.2 | | 1996 to 2008 |
| Approximately 1,000 feet north for the northern boundary | Irrigation | 386421N12 15583W001 | 8.8 | -79.2 | 21 | 2015 to 2016, 2020 |

We reviewed the Sacramento Groundwater Authority (SGMA) Basin Management Report, 2016 Updated for the North American Subbasin. The SGMA Data Viewer displays seasonal groundwater level contours (10-foot intervals) interpreted from select regional well data. Based on these contours, the spring and fall seasonal groundwater elevations at the site from 2011 to 2020 are estimated in the table below; elevations between the 10-foot contours were approximated.

**TABLE 1.5-3: Estimated Seasonal Groundwater Level**

| APPROXIMATE GROUNDWATER ELEVATION RANGE (FEET) | | YEAR |
|---|---|---|
| SPRING | FALL | |
| -3 to 6 | - | 2011 |
| 3 to 6 | - | 2012 |
| -2 to 3 | -4 to 0 | 2013 |
| -3 to 1 | 1 to -6 | 2014 |
| 0 to 2 | 0 | 2015 |
| -50 to 0 | 0 | 2016 |
| 10 to 12 | 0 | 2017 |
| 6 to 11 | 0 | 2018 |
| 6 to 12 | 0 | 2019 |
| 0 to 3 | - | 2020 |

The site-specific depth to groundwater and direction of groundwater flow was not determined as part of this assessment. Fluctuations in groundwater levels may occur seasonally and over a period of years due to variations in precipitation, temperature, irrigation and other factors.

We reviewed the Department of Conservation, Geologic Energy Management (CalGEM), formerly the Department of Conservation, Division of Oil, Gas, and Geothermal Resources (DOGGR),

website and map database to determine if any historic oil and/or gas wells were located within the Property. One well was identified within the Property and five wells were mapped within 1 mile of the Property.

The oil/gas well was located within the Property at the parcel located at 3709 El Centro Road (APN 225-0110-054). The well (API 0406720111) was a dry hole and was not put into production. The well was abandoned in December 1976 under the California Department of Conservation Division of Oil and Gas oversight. Appropriate setbacks should be observed during future construction.

# 2.0 PREVIOUS ENVIRONMENTAL REPORTS

Brusca Associates Inc.; Phase I Environmental Site Assessment, El Centro Road Natomas Property, APNs 274-0010-043, -049, -050, -069, and -079, and 225-0210-005, -018, and -037, Vicinity of El Centro Road, Natomas, Sacramento County, California; July 25, 2018; Brusca Project No. 301-001.

Brusca Associates Inc. (Brusca) completed a phase I environmental site assessment of parcels 247-0010-043, -049, -050, -069, and -079, 225-0210-005, -018, and -037 within the greater Upper West Side Property. The assessment indicated that the parcels had never been significantly developed and had historically been used for agriculture. The assessment did identify the presence of two wells within the studied parcels. The assessment did not reveal evidence of any RECs, and no further studies were recommended.

Brusca Associates Inc.; Phase I Environmental Site Assessment, El Centro Road Bastio Parcels, APNs 274-0010-055 and -056, Vicinity of El Centro Road, Natomas, Sacramento County, California; August 30, 2018; Brusca Project No. 301-001.

Brusca Associates Inc. (Brusca) completed a phase I environmental site assessment of parcels 274-0010-055, and -056 within the greater Upper West Side Property. The assessment indicated that the parcels had never been significantly developed, and had historically been used for agriculture. The assessment did identify the presence of two wells within the studied parcels. The assessment did not reveal evidence of any RECs, and no further studies were recommended.

# 3.0 RECORDS REVIEW

## 3.1 PROPERTY RECORDS

### 3.1.1 Title Report/Ownership

The Title Report lists recorded land title detail, ownership fees, leases, land contracts, easements, liens, deficiencies, and other encumbrances attached to or recorded against a subject property. Laws and regulations pertaining to land trusts vary from state to state and the detail of information presented in a Title Report can vary greatly by jurisdiction. As a result, ENGEO utilizes a Title Report, when provided to us, as a supplement to other historical record sources.

We did not receive preliminary title reports for any of the parcels in the Property.

## 3.2 HISTORICAL RECORD SOURCES

The purpose of the historical record review is to develop a history of the previous uses or occupancies of the Property and surrounding area in order to identify those uses or occupancies that are likely to have led to RECs on the Property.

### 3.2.1 Historical Topographic Maps/Aerial Photographs/Sanborn Maps

Historical USGS topographic maps, aerial photographs, and Sanborn Fire insurance maps were reviewed to determine if discernible changes pertaining to the Property had been recorded. EDR provided the following maps and photographs, presented in Appendices D, E, and G.

**TABLE 3.2.1-1: Historical Review Summary**

| HISTORIC MAP/PHOTOGRAPH | YEARS |
|---|---|
| Topographic Maps | 1907, 1915, 1916, 1948, 1949, 1950, 1951, 1954, 1967, 1975, 1980, 1992, 2012 |
| Aerial Photographs | 1937, 1947, 1957, 1964, 1972, 1984, 1993, 2005, 2009, 2012, 2016 |
| Sanborn Maps | N/A |

The 1907, 1915, and 1916 topographic maps depict the site as largely undeveloped, with a large intermittent pond, identified as Bush Lake, occupying a large portion of the central and eastern site. Bush Lake was mapped intersecting the perennial Fishermans Lake to the north. A river-front road was mapped flanking the Sacramento River, and a few unimproved roads cross the site. The earliest aerial photographs viewed (1937) do not show the Bush Lake feature, however, the Natomas Main Canal and East and West Drainage Canals were visible. The site was almost entirely covered with agricultural fields with irrigation and drainage canals in the 1937 photograph. Subsequent aerial photographs through 1964 show similar site conditions. Topographic maps from 1948 through 1954 depict several roads, canals, and structures across the site.

Some of the agricultural parcels also included residences and associated agricultural structures. The majority of the agricultural use appears to have been irrigated row crops. Orchards and rice fields were observed within the northern portion of the Property, north of what is now identified as Radio Road. Over the years additional residences have been built along Garden Highway, located along the southwest boundary, and east and west of El Centro Road, in the northern portion of the Property.

Radio towers in the northern portion of the site are first shown in the 1949 photo, and a television tower is mapped in 1954 in the southwestern site.

Sometime prior to 1967 Interstate 80 was constructed along the southern boundary of the Property. Around this time, a truck stop and commercial structure was constructed north of the El Camino Avenue exit. The truck stop and commercial structure are currently the 49er Truck Stop and Pape Machinery site, respectively. In 1993, additional commercial structures were constructed east of the Pape Machinery site and the area to the south of El Camino Road began development. By 2011, development to the south appeared complete and included a gas station, fast-food and dine-in restaurants, hotels, and a self-storage facility. A driving range was constructed east of El Centro Road sometime prior to 1984, which is still present on the Property at the time of this report.

### 3.2.2 City Directory

City Directories, published since the 18th century for major towns and cities, list the name of the resident or business associated with each address. A city directory search conducted by EDR is located in Appendix G.

## 3.3 ENVIRONMENTAL RECORD SOURCES

EDR performed a search of federal, tribal, state, and local databases regarding the Property and nearby properties. Details regarding the databases searched by EDR are provided in Appendix A. A list of the facilities documented by EDR within the approximate minimum search distance of the Property is provided below.

### 3.3.1 Environmental Records

#### 3.3.1.1 Subject Property

The Property is listed on the following Environmental Record source databases.

**TABLE 3.3.1.1-1**

| FACILITY | STREET | DATABASES |
|---|---|---|
| Former Johnson Ranch | 3800 Garden Highway | CERS, CPS-SLIC, Sacramento Co. CS |
| KCTC Sac-American Tower | 3802 Garden Highway | Sacramento Co. ML |

#### 3.3.1.2 Other Properties

The following databases include facilities listed within the appropriate ASTM search distances of the Property on Environmental Records sources.

**TABLE 3.3.1.2-1**

| DATABASE | NUMBER OF FACILITIES |
|---|---|
| Sacramento Co. ML | 5 |
| CERS | 2 |
| CERS HAZ WASTE | 1 |
| CERS TANKS | 1 |
| ENVIROSTOR | 3 |
| SCH | 3 |
| SWEEPS UST | 1 |
| CA FID UST | 1 |
| HIST UST | 1 |
| AST | 2 |
| RCRA NonGen/NLR | 2 |

Based on the distances to the identified database sites, regional topographic gradient, and the EDR findings, it is unlikely that the above-stated database sites pose an environmental risk to the Property. There are 121 Properties listed on the ñOrphan Summaryò list, and all appear to be located beyond the ASTM recommended radius search criteria. The complete Orphan List summary is included in Appendix A.

## 3.4 REGULATORY AGENCY FILES AND RECORDS

The following agencies were contacted pertaining to possible past development and/or activity at the Property.

**TABLE 3.4-1: Regulatory Agency Records**

| NAME OF AGENCY | RECORDS REVIEWED |
|---|---|
| Sacramento Metropolitan Fire Department | We contacted the Sacramento Metropolitan Fire Department for regarding files for the Property. The Department was unable to fulfil our request due to COVID-19 restrictions. |
| Sacramento Environmental Management Department | We contacted the Sacramento Environmental Management Department for regarding files for the Property. The provided files included well installation and destruction, septic, hazardous waste, underground storage tank, liquid waste disposal, and well drillerôs permits. Other documents included liquid and hazardous waste plans, pipeline leak detection notifications, fuel release notifications, laboratory results, well driller logs and reports, inspection records, and percolation and infiltration testing results. A complete list of records found per parcel is included in Appendix H. |
| Sacramento County Assessorôs Office | The Sacramento County Assessorôs Office online database was used to confirm the Assessorôs Parcel Number for the Property. |
| California State Water Resources Control Board | The California State Water Resources Control Boardôs online database, GeoTracker, was reviewed for files relating to the Property. The following cases were identified on the Property. A detailed description of the cases are provided below.<br>• 3800 Garden Highway - Former Johnson Ranch<br>• 3650 El Centro Road ï Private residence<br>• 2828 El Centro Road ï 49er Truck Plaza (Case #1)<br>• 2828 El Centro Road ï 49er Truck Plaza (Case #2) |
| Department of Toxic Substances Control | The Department of Toxic Substances Controlôs online database, EnviroStor, was reviewed for files pertaining to the Property. No sites were listed within the Property on the EnviroStor site. |

Additional details about the Geotracker identified sites located within the Property that could present a potential environmental concern are presented below.

**Former Johnson Ranch**: (Case Number T10000012933) located at 3800 Garden Highway and identified by APN 225-0110-058, is listed as a closed leaking underground storage tank (LUST) cleanup site as of July 31, 2020. Elevated concentrations of pesticides, lead, and arsenic were identified in historic agricultural soils in 2006 and in 2009 soil and groundwater with total petroleum hydrocarbon (TPH) and motor oil contamination associated with a former 550-gallon underground storage tank (UST) and former aboveground storage tank (AST) were identified. Approximately 260 tons of contaminated soils were removed from the Property on February 26, 2020. The case was closed without restrictions by the Sacramento County Environmental Management Department (SCEMD) on July 31, 2020.

**Private Residence**: (Case Number T0606748466) located at 3650 El Centro Road and identified by APN 225-0190-019, is listed as a closed LUST cleanup site as of February 22, 2016. Two 5,000-gallon USTs were removed from the Property in the 1980s. Elevated concentrations of TPH-gasoline (TPHg) in soils northwest the former USTs and elevated concentrations of TPHg, TPH-diesel (TPHd), TPH-motor oil (TPH-mo), and benzene were identified in a subsurface soil investigation in June 2006. Supplementary sampling in August 2006 delineated the impacts to areas around the former USTs. Four monitoring wells were installed in March 2007 for groundwater monitoring. Removal of contaminated soils was performed from July 2008 through

September 2009 followed by treatment of in-situ soils through aeration processes. Groundwater and soil vapor samples were collected following remedial activities. Additional rounds of groundwater and soil vapor sampling were conducted in June 2014 and September 2015. The case was closed without restrictions by SCEMD on February 19, 2016.

**49er Truck Plaza Case #1**: (Case Number T0606700843) located at 2828 El Centro Road and identified by APN 225-0220-055. Gasoline and diesel spills were documented on the Property as early as 1991, causing impacts to nearby soil and groundwater with TPHg and TPHd, followed by remediation activities to remove impacted soils and groundwater. Groundwater monitoring wells were first installed on the Property in 1992. In 1998, 10 USTs containing gasoline, diesel, waste oil, and lube oil were removed from the Property and monitoring wells were installed. The wells were monitored quarterly from 2005 to 2010. The monitoring wells were destroyed under direction of the SCEMD in 2013. The case was closed without restrictions by the SCEMD on March 26, 2014.

**The #23 Satellite Dispenser pump at the 49er Truck Plaza Case #2**: (Case Number T0606700843) was damaged in an accident causing the release of diesel fuel into the backfill and surrounding soil on the Property in February 2019. Impacted soils were removed from the Property and followed by a soil investigation performed on July 12, 2019. The case was closed without restrictions by the SCEMD on April 16, 2020.

## 3.5 INDOOR AIR QUALITY

An evaluation of indoor air quality, mold, or radon was not included as part of the contracted scope of services. The California Department of Public Health has conducted studies of radon risks throughout the state, sorted by zip code. Results of the studies indicate that 67 tests were conducted within the Property zip codes and spanned both Sacramento and Yolo Counties. Some tests conducted within Sacramento County encountered radon levels which exceeded the current EPA action level of 4 picocuries per liter {pCi/L}[1]). These elevated levels were identified in basement levels, and found approximately 50% of the tests were below 4 pCi/L, and the remaining 50% were above. Radon levels detected in the first floor of these areas were below 4 pCi/L. Sacramento and Yolo Counties are mapped as Zone 3, having low potential for radon exposure.

In accordance with ASTM E2600-15 (Tier 1) (*Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions*); there is one potential petroleum hydrocarbon sources for vapor intrusion within 1/10 mile of the Property, as discussed in the paragraph below, and no volatile organic compound (VOCs) sources (active SLIC cases) within 1/3 mile of the Property.

One oil/gas well was located within the Property at the parcel located at 3709 El Centro Road (APN 225-0110-054). The well (API 0406720111) was a dry hole and was not put into production. The well was abandoned in December 1976 under the California Department of Conservation Division of Oil and Gas oversight. Appropriate setbacks should be observed during future construction.

[1] California Department of Public Health ï Radon Programï (https://www.cdph.ca.gov/Programs/CEH/DRSEM/CDPH%20Document%20Library/EMB/Radon/Radon%20Test%20Results.pdf).

# 4.0 SITE RECONNAISSANCE

## 4.1 METHODOLOGY

ENGEO conducted a reconnaissance of the Property on January 8 and 11, 2021. The reconnaissance was performed by Travis Chatters, a Project Engineer of ENGEO. The Property was viewed for hazardous materials storage, superficial staining or discoloration, debris, stressed vegetation, or other conditions that may be indicative of potential sources of soil or groundwater contamination. The Property was also checked for evidence of fill/ventilation pipes, ground subsidence, or other evidence of existing or preexisting underground storage tanks. Photographs taken during the site reconnaissance are presented in Appendix B.

We did not have permission to access the majority of the parcels; therefore, interior observations were limited. Some parcels which we were unable to access we performed a windshield survey of the parcel, which consists of observations made from the nearest adjacent public road.

## 4.2 EXTERIOR OBSERVATIONS

The following table summarizes our observations during the reconnaissance:

**TABLE 4.2-1: Exterior Site Observations**

| FEATURE TYPE | OBSERVATIONS |
|---|---|
| Structures | Numerous structures were observed during the site reconnaissance. These included:<br>• Residences ï single-family and mobile<br>• Barns, sheds, and auxiliary structures<br>• Gas Stations<br>• Hotels<br>• Commercial offices<br>• Convenience stores<br>• Fast-food and dine-in restaurants<br>• Self-storage facilities<br>• Semi-truck repair facilities<br>• Communication antenna facilities<br>• Large scale equipment storage and repair facilities<br>• Power lines<br>• Communication Antennas |
| Hazardous Substances and Petroleum Products in Connection with Identified Uses | No hazardous substances or petroleum products were observed within the Property during the site reconnaissance. However, we were unable to access the interior of the majority of the facilities to confirm. Given the use of some of the properties, it is likely that petroleum products, or other chemicals, are stored on select parcels. |
| Storage Tanks (underground and above-ground) | No above-ground storage tanks or evidence of existing underground storage tanks was observed during the site reconnaissance. |
| Odors | No odors indicative of hazardous materials or petroleum material impacts were noted at the time of the reconnaissance. |
| Pools of Potentially Hazardous Liquid | No pools of potentially hazardous liquid were observed within the Property at the time of our reconnaissance. |

| FEATURE TYPE | OBSERVATIONS |
|---|---|
| Drums | Drums were observed on the Property at the time of the reconnaissance, however, due to limited access we were unable to confirm the contents of the drum. |
| Polychlorinated Biphenyls (PCBs) Containing Equipment | Several pole-mounted transformers, potentially containing PCBS, were observed during the site reconnaissance. No staining or stressed vegetation was observed below the transformers. |
| Pits, Ponds, and Lagoons | No pits, ponds or lagoons were observed within the Property at the time of our reconnaissance. Several drainage and irrigation canals exist on the Property. |
| Stained Soil/Pavement | No stained soil was observed within the Property at the time of our reconnaissance. Stained pavement was observed within the commercial area located north and south of the El Camino Avenue exit. |
| Stressed Vegetation | No signs of stressed vegetation were observed on the Property at the time of our reconnaissance. |
| Solid Waste/Debris | Clandestine dumping of solid waste (garbage) was observed at various locations within the subject property. |
| Stockpiles/Fill Material | No stockpiles or fill material was observed on the Property during the reconnaissance. |
| Wastewater | Municipal sewer lines were observed parallel to El Centro Road heading north to San Juan Road where they head east. Additionally, large sewer interceptor appurtenances/vaults exist along the southern portion of the Property adjacent to the I-80 freeway. |
| Wells | Several well pumps were observed within the Property during our site reconnaissance. Based on data provided by Sacramento County we understand that numerous wells exist throughout the Property. |
| Septic Systems | No septic systems were observed within the Property during our site reconnaissance. However, based on data provided by Sacramento County we understand that numerous septic throughout the Property. |

### 4.3 INTERIOR OBSERVATIONS

Numerous structures are located throughout the Property. However, at the time of this assessment we were not given permission to enter any structures.

### 4.4 ASBESTOS, LEAD, AND PCB-CONTAINING MATERIALS

An asbestos, lead, and PCB-containing building material survey was not conducted as part of this assessment. Given the age of some of the existing structures, it is conceivable that asbestos, lead, and PCB-containing materials may exist within the structures.

## 5.0 INTERVIEWS

We did not receive any questionnaires at the time of this report.

# 6.0 FINDINGS AND CONCLUSIONS

This assessment included a review of local, state, tribal, and federal environmental record sources, standard historical sources, aerial photographs, fire insurance maps and physical setting sources. A reconnaissance of the Property was completed to review site use and current conditions to check for the storage, use, production, or disposal of hazardous or potentially hazardous materials and to conduct written/oral interviews with persons knowledgeable about current and past site use.

The site reconnaissance and records review did not find documentation or physical evidence of soil, soil gas, or groundwater impairments associated with the use or past use of the Property. A review of regulatory databases maintained by county, state, tribal, and federal agencies found no documentation of hazardous materials violations or discharge on the Property and did not identify contaminated facilities within the appropriate American Society for Testing and Materials (ASTM) search distances that would reasonably be expected to impact the Property.

Based on the findings of this assessment, no RECs, four historical RECs, and no controlled RECs were identified for the Property.

The following HRECs were identified:

- **Former Johnson Ranch**: (Case Number T10000012933) located at 3800 Garden Highway and identified by APN 225-0110-058, is listed as a closed leaking underground storage tank (LUST) cleanup site as of July 31, 2020. Elevated concentrations of pesticides, lead, and arsenic were identified in historic agricultural soils in 2006 and in 2009 soil and groundwater with total petroleum hydrocarbon (TPH) and motor oil contamination associated with a former 550-gallon underground storage tank (UST) and former aboveground storage tank (AST) were identified. Approximately 260 tons of contaminated soils were removed from the Property on February 26, 2020. The case was closed without restrictions by the Sacramento County Environmental Management Department (SCEMD) on July 31, 2020.

- **Private Residence**: (Case Number T0606748466) located at 3650 El Centro Road and identified by APN 225-0190-019, is listed as a closed LUST cleanup site as of February 22, 2016. Two 5,000-gallon USTs were removed from the Property in the 1980s. Elevated concentrations of TPH-gasoline (TPHg) in soils northwest of the former USTs and elevated concentrations of TPHg, TPH-diesel (TPHd), TPH-motor oil (TPH-mo), and benzene were identified in a subsurface soil investigation in June 2006. Supplementary sampling in August 2006 delineated the impacts to areas around the former USTs. Four monitoring wells were installed in March 2007 for groundwater monitoring. Removal of contaminated soils was performed from July 2008 through September 2009 followed by treatment of in situ soils through aeration processes. Groundwater and soil vapor samples were collected following remedial activities. Additional rounds of groundwater and soil vapor sampling were conducted in June 2014 and September 2015. The case was closed without restrictions by SCEMD on February 19, 2016.

- **49er Truck Plaza Case #1**: (Case Number T0606700843) located at 2828 El Centro Road and identified by APN 225-0220-055. Gasoline and diesel spills were documented on the Property as early as 1991, causing impacts to nearby soil and groundwater with TPHg and TPHd, followed by remediation activities to remove impacted soils and groundwater. Groundwater monitoring wells were first installed on the Property in 1992. In 1998, 10 USTs

containing gasoline, diesel, waste oil, and lube oil were removed from the Property and monitoring wells were installed. The wells were monitored quarterly from 2005 to 2010. The monitoring wells were destroyed under direction of the SCEMD in 2013. The case was closed without restrictions by the SCEMD on March 26, 2014.

- **The #23 Satellite Dispenser pump at the 49er Truck Plaza Case #2**: (Case Number T0606700843) The #23 Satellite Dispenser pump was damaged in an accident causing the release of diesel fuel into the backfill and surrounding soil on the Property in February 2019. Impacted soils were removed from the Property and followed by a soil investigation performed on July 12, 2019. The case was closed without restrictions by the SCEMD on April 16, 2020.

Based on the review of regulatory databases and site reconnaissance, we present information on features of potential environmental concern that were either contained in the databases or observed on the Property. These features were not considered to be RECs. We briefly discuss each feature below.

### Residential Sites/Areas

It is conceivable that during future site demolition and initial grading, potential areas of soil impacts or buried structures such as sumps/tanks and septic systems may be encountered. In addition, it is possible that asbestos-containing materials (ACM) and lead-based paint (LBP) materials may exist within the structures. Soil within the area of demolished structures could also contain ACM and/or LBP.

### Former Gas/Oil Wells

An abandoned gas/oil well is located within the Property. According to the Department of Conservation, Geologic Energy Management (CalGEM), the well can be located within the Property limits provided it is not located underneath foundations and is accessible by a truck-mounted drill rig.

### Agricultural Fields

The majority of the Property consists of agricultural land, some of which was used at a time legacy agrichemicals were used. It is possible that pesticides, lead, and arsenic may be present at these sites. It is likely that soil sampling will be required by a regulatory agency in the future.

### Irrigation and Domestic Wells

A number of irrigation wells and domestic wells exist on the Property. Any irrigation or domestic wells on the Property should be abandoned in accordance with Sacramento County regulations, if no longer intended for use.

### Transformers

Pole-mounted transformer units were observed on the Property. While there did not appear to be evidence of leakage or soil impacts, it is conceivable some units could contain PCBs in coolant fluid. These units should be properly decommissioned as part of future demolition activities, if no longer in use.

ENGEO has performed a phase I environmental site assessment in general conformance with the scope and limitations of ASTM E1527-13 and the standards and practices of the All Appropriate Inquiry ï Final Rule (40 Code of Federal Regulations Part 312).

Based on the nature of the data gaps, we cannot conclusively render a conclusion as to the presence of a REC at the Property.
This assessment has revealed no evidence of RECs in connection with the Property, and the Property may be suitable for future development. ENGEO recommends the following:

- Pre-demolition surveys of the existing structures to verify to presence of asbestos containing materials, lead-based paints, or any other hazardous substances present within the structures.
- Locating the former gas/oil well present on the Property. The well seal should be confirmed prior to development.
- Collection of near surface soil samples to determine if lead, arsenic, or organochlorine pesticides are present at the Property.
- Proper abandonment of irrigation and residential wells under the appropriate agency.
- Removal and disposal of pole-mounted transformers under the appropriate oversight.
- Preparation of a soil management plan for any work that might take place within the truck stop or any other HREC location.

# 7.0 LIMITATIONS

## 7.1 SIGNIFICANT ASSUMPTIONS OR DEVIATIONS FROM ASTM STANDARD PRACTICE

There were no significant deviations from ASTM Standard 1527-13.

## 7.2 OPINIONS AND DATA GAPS

It is our opinion that the findings of this study are based on a sufficient level of information obtained during our contracted scope of services to render a conclusion as to whether additional appropriate investigation is required to identify the presence or likely presence of a REC. The data gaps identified during this process may affect the conclusions as to the presence or lack of presence of RECs at the Property. The following data gaps were identified.

- We were unable to access any of the structures within the Property. These structures may contain asbestos containing materials, lead-based paint, and other potentially hazardous substances.
- We did not receive client or key site manager questionnaires.
- We did not receive preliminary title reports for any of the parcels.

## 7.3 LIMITATIONS AND EXCEPTIONS OF ASSESSMENT

The professional staff at ENGEO strives to perform its services in a proper and professional manner with reasonable care and competence but is not infallible. The recommendations and conclusions presented in this report were based on the findings of our study, which were developed solely from the contracted services. The findings of the report are based in part on contracted database research, out-of-house reports, and personal communications. The opinions formed by ENGEO are based on the assumed accuracy of the relied upon data in conjunction with our relevant professional experience related to such data interpretation. ENGEO assumes no liability for the validity of the materials relied upon in the preparation of this report.

This document must not be subject to unauthorized reuse; that is, reuse without written authorization of ENGEO. Such authorization is essential because it requires ENGEO to evaluate the document's applicability given new circumstances, not the least of which is passage of time. The findings from a phase I environmental site assessment are valid for one year after completion of the report. Updates of portions of the assessment may be necessary after a period of 180 days after completion.

This phase I environmental site assessment is not intended to represent a complete soil, soil gas, or groundwater characterization, nor define the depth or extent of soil, soil gas, or groundwater contamination. It is intended to provide an evaluation of potential environmental concerns associated with the use of the Property. A more extensive assessment that would include a subsurface exploration with laboratory testing of soil, soil gas, and groundwater samples could provide more definitive information concerning site-specific conditions. If additional assessment activities are considered for the Property and if other entities are retained to provide such services, ENGEO cannot be held responsible for any and all claims arising from or resulting from the performance of such services by other persons or entities. ENGEO can also not be held responsible from any and all claims arising or resulting from clarifications, adjustments, modifications, discrepancies or other changes necessary to reflect changed field or other conditions.

## 7.4 SPECIAL TERMS AND CONDITIONS

ENGEO has prepared this report for the exclusive use of our client, Upper West Side LLC. It is recognized and agreed that ENGEO has assumed responsibility only for undertaking the study for the Client. The responsibility for disclosures or reports to a third party and for remedial or mitigative action shall be solely that of the Client.

Laboratory testing of soil, soil gas, or groundwater samples was not within the scope of the contracted services. The assessment did not include an asbestos survey, an evaluation of lead-based paint, an inspection of light ballasts for polychlorinated biphenyls (PCBs), or a mold survey. A radon evaluation was not performed.

This report is based upon field and other conditions discovered at the time of preparation of ENGEO's assessment. Visual observations referenced in this report are intended only to represent conditions at the time of the reconnaissance. ENGEO would not be aware of site contamination, such as dumping and/or accidental spillage, that occurred subsequent to the reconnaissance conducted by ENGEO personnel.

# EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

## SUBJECT PROPERTY INFORMATION

### ADDRESS

UPPER WEST SIDE
SACRAMENTO, CA 95833

### TARGET PROPERTY SEARCH RESULTS

The Target Property was identified in the following databases.

Page Numbers and Map Identifcations refer to the EDR Area/Corridor Report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

## STANDARD ENVIRONMENTAL RECORDS

### *Federal RCRA generators list*

RCRA-SQG: RCRA - Small Quantity Generators

A review of the RCRA-SQG list, as provided by EDR, and dated 06/15/2020 has revealed that there is 1 RCRA-SQG site within the requested target property.

RGA LUST: Recovered Government Archive Leaking Underground Storage Tank

A review of the RGA LUST list, as provided by EDR, has revealed that there are 2 RGA LUST sites within the requested target property.

# EXECUTIVE SUMMARY

| Site | Address | Map ID / Focus Map(s) | Page |
|---|---|---|---|
| GARY ALVERNAZ TRUST | 3650 EL CENTRO | D22 / 5 | 63 |
| 49ER TRUCK STOP | 2828 EL CENTRO RD | F46 / 8 | 143 |

**SURROUNDING SITES: SEARCH RESULTS**

Surrounding sites were identified in the following databases.

Page Numbers and Map Identifcations refer to the EDR Area/Corridor Report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

**STANDARD ENVIRONMENTAL RECORDS**

***State- and tribal - equivalent NPL***

RESPONSE: State Response Sites

A review of the RESPONSE list, as provided by EDR, has revealed that there is 1 RESPONSE site within approximately1 mile of the requested target property.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal

**EMPIRE EQUIPMENT CO LP (Continued)** **1000595713**

facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
