Violations:
Site ID: 401116
Site Name: SACRAMENTO 49ER TRAVEL PLAZA
Violation Date: 7/10/2015
Citation: 23 CCR 16 2666(c) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2666(c)
Violation Description: Failure of line leak detector to detect a leak and/or failure of audible and visual alarm.
Violation Notes: Returned to compliance on 07/10/2015. OBSERVATION: The 91 Mechanical Line Leak Detector (MLLD) failed to detect a leak when tested. All MLLD's must detect a leak when a leak is introduced. CORRECTIVE ACTION: The 91 MLLD was replaced during todays inspection. It was retested with passing results.

Citation: 23 CCR 16 2715(a)(1)(B) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2715(a)(1)(B)
Violation Description: Failure to submit the G Designated Underground Storage Tank Operator Identification FormG within 30 days of installing a UST system or within 30 days of a change in DO.
Violation Notes: Returned to compliance on 07/08/2019. OBSERVATION: The DESIGNATED UNDERGROUND STORAGE TANK OPERATOR IDENTIFICATION FORM submitted to the California Electronic Reporting System (CERS) is not current. CORRECTIVE ACTION: Submit a current DESIGNATED UNDERGROUND STORAGE TANK OPERATOR IDENTIFICATION FORM to CERS. NOTE: This violation applies to all five tank systems onsite. NOTE: This violation was corrected at the time of inspection. OBSERVATION: The STATEMENT OF UNDERSTANDING AND COMPLIANCE FORM has not been submitted to the California Electronic Reporting System (CERS). CORRECTIVE ACTION:

**49ER TRUCK STOP (Continued)** **S100217062**

| Violation Description: | Failure to keep water out of the secondary containment of UST systems installed on or after July 1, 2003. |
| Violation Notes: | Returned to compliance on 07/11/2018. OBSERVATION: Liquid was observed in the Diesel 1, Diesel 2, Diesel 3, and 87 tank pump sumps. Liquid was also observed in Under dispenser containment for dispensers 18S, 19, 19S, and 20S. If water could enter into the secondary containment by precipitation or infiltration, it must be removed and disposed of properly. CORRECTIVE ACTION: Immediately remove this liquid, make a hazardous waste determination per Title 22 hazardous waste regulations, and manage it accordingly. Ensure that all sumps and UDC are maintained free of liquid. Send photos and a short verification statement to mccormackz@saccounty.net when this is complete. |

| Violation Description: | Leak detection equipment disabled or tampered with in a manner that would prevent the monitoring system from detecting and/or alerting the owner/operator of a leak. |
| Violation Notes: | Returned to compliance on 07/05/2018. OBSERVATION 1 : The Diesel 1 Turbine Pump sump sensor was raised to the top of the turbine and not located to detect a leak at the earliest opportunity. Monitoring equipment shall be maintained to be able to detect a leak at the earliest possible opportunity. CORRECTIVE ACTION 1 : Sensors have been |

**49ER TRUCK STOP (Continued)** **S100217062**

returned to proper position by BZ. Ensure that sensors are returned to the proper location after all maintenance actions. OBSERVATION 2 : The Diesel Piping sump sensor was laying on its side at the bottom of the sump and not able to detect a leak at the earliest opportunity. Monitoring equipment shall be maintained to be able to detect a leak at the earliest possible opportunity. CORRECTIVE ACTION 2 : Sensors have been returned to proper position by BZ. Ensure that sensors are returned to the proper location after all maintenance actions. OBSERVATION 3 : The Diesel 2 Turbine Pump sump sensor was placed on the riser which is approximately 4 inches off the lowest [Truncated]

Citation: 23 CCR 16 2712(b)(1)(G) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2712(b)(1)(G)
Violation Description: Failure to comply with one or more of the following overfill prevention equipment requirements: Alert the transfer operator when the tank is 90 percent full by restricting the flow into the tank or triggering an audible and visual alarm; or Restrict delivery of flow to the tank at least 30 minutes before the tank overfills, provided the restriction occurs when the tank is filled to no more than 95 percent of capacity; and activate an audible alarm at least five minutes before the tank overfills; or Provide positive shut-off of flow to the tank when the tank is filled to no more than 95 percent of capacity; or Provide positive shut-off of flow to the tank so that none of the fittings located on the top of the tank are exposed to product due to overfilling. Install/retrofit overfill prevention equipment that does not use flow restrictors on vent piping to meet overfill prevention equipment requirements when the overfill prevention equipment is installed, repaired, or replaced on and after October 1,- 2018. For USTs installed before October 1, 2018, perform an inspection by October 13, 2018 and every 36 months thereafter. For USTs installed on and after October- 1,- 2018, perform an inspection at installation and every 36 months thereafter. Inspected within 30 days after a repair to the overfill prevention equipment. Inspected using an applicable manufacturer guidelines, industry codes, engineering standards, or a method approved by a professional engineer. Inspected by a certified UST service technician. Maintain

**49ER TRUCK STOP (Continued)** **S100217062**

records of overfill prevention equipment inspection for 36 months.
Violation Notes: Returned to compliance on 10/02/2019. OBSERVATION: Owner/Operator did not maintain overfill prevention system to meet one of the following requirements:1. Alert the transfer operator when the tank is 90 percent full by restricting the flow into the tank or triggering an audible and visual alarm; or2. Restrict delivery of flow to the tank at least 30 minutes before the tank overfills, provided the restriction occurs when the tank is filled to no more than 95 percent of capacity; and activate an audible alarm at least five minutes before the tank overfills; or3. Provide positive shut-off of flow to the tank when the tank is filled to no more than 95 percent of capacity; or4. Provide positive shut-off of flow to the tank so that none of the fittings located on the top of the tank are exposed to product due to overfilling. Overfill prevention testing was required to be completed by October 13, 2018. During the initial testing conducted today, all three diesel overfill prevention devices failed. Citation: HSC 6.7 25284, 25286 - California Health and Safety Code, Chapter 6.7, Section(s) 25284, 25286
Violation Description: Failure to submit a complete and accurate application for a permit to operate a UST, or for renewal of the permit.
Violation Notes: Returned to compliance on 08/06/2018. OBSERVATION: UST tank information is not current in CERS. Your last UST submission has not been accepted. This applies to all tanks on site. CORRECTIVE ACTION: Please address the following issues below, resubmit the updated UST plans in CERS, and email brozekc@saccounty.net to accept. Tank Monitoring Plan: 1) For all tanks, please input the tank manufacturer. 2) For all tanks, please input the correct date the USTs were installed. 01/01/72 is listed for all tanks but this is not correct. 3) For all tanks, "liquid" is listed as the UDC Secondary Containment Monitoring, yet all UDCs are marked as "single-walled". Please correct this discrepancy. NOTE: Strongly recommend attending the next free UST Workshop at our Mather office. An Inspector will be paired with you to complete, upload, and submit all forms correctly. Call to reserve a seat (916 875-8484).

| Eval Notes: | ANNOUNCEMENT: Federal Regulations require that as of October 01, 2018, Overfill devices must be able to be tested every 3 years for functionality. This would involve Fill Tube Shutoff Valves (Flapper Valves) and/or ATGs with an external alarm. Be advised, a permit may be required. Contact your contractor for advice or call this office (916) 875-8550 and ask for your UST (tank team) specialist. |

Violation Date: 3/8/2019
Citation: 23 CCR 16 2712(b)(1)(G) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2712(b)(1)(G)
Violation Description: Failure to comply with one or more of the following overfill prevention equipment requirements: Alert the transfer operator when the tank is 90 percent full by restricting the flow into the tank or triggering an audible and visual alarm; or Restrict delivery of flow to the tank at least 30 minutes before the tank overfills, provided the restriction occurs when the tank is filled to no more than 95 percent of capacity; and activate an audible alarm at least five minutes before the tank overfills; or Provide positive shut-off of flow to the tank when the tank is filled to no more than 95 percent of capacity; or Provide positive shut-off of flow to the tank so that none of the fittings located on the top of the tank are exposed to product due to overfilling. Install/retrofit overfill prevention equipment that does not use flow restrictors on vent piping to meet overfill prevention equipment requirements when the overfill prevention equipment is installed, repaired, or replaced on and after October 1,- 2018. For USTs installed before October 1, 2018, perform an inspection by October 13, 2018 and every 36 months thereafter. For USTs installed on and after October- 1,- 2018, perform an inspection at installation and every 36 months thereafter. Inspected within 30 days after a repair to the overfill prevention equipment. Inspected using an applicable manufacturer guidelines, industry codes, engineering standards, or a method approved by a professional engineer. Inspected by a certified UST service technician. Maintain records of overfill prevention equipment inspection for 36 months.
Violation Notes: OBSERVATION: Overfill Prevention Inspection has not been completed and submitted. This inspection is required every 36 months. This applies to all tank systems on site. CORRECTIVE ACTION: Hire a properly certified and licensed professional to complete the overfill prevention inspection. Submit the results to mccormackz@saccounty.net within 30 days. NOTE: These forms can be found on https://www.waterboards.ca.gov/ust/forms/

| Violation Description: | Failure to properly label hazardous waste accumulation containers with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date. |
| Violation Notes: | OBSERVATION: The hazardous waste label on the fifty-five gallon drum of hazardous waste, located in the trash storage area, is faded and ont readable. All hazardous waste labels must be completely filled out and must be legible. CORRECTIVE ACTION: Submit a photo to this department demonstrating that the container listed above has been properly labeled. REPEAT VIOLATION: This is a repeat violation! You have 14-Days to gain compliance for this issue. Compliance with this hazardous waste labeling requirement may not preclude enforcement action being taken against this facility. |

| Violation Description: | Failure of leak detection equipment to be located such that equipment is capable of detecting a leak at the earliest possible opportunity. |
| Violation Notes: | Returned to compliance on 10/22/2019. -87, 89, 91, AND DIESEL TANK VIOLATION(S)- 1. OBSERVATION: The facility's 001 sensor was almost completely on its side in UDC 1/2 prior to starting today's monitoring system certification. Sensors must be positioned so that they can detect a leak at the earliest opportunity. 2. OBSERVATION: The facility's 001 sensor was at an angle in UDC 5/6 prior to starting today's monitoring system certification. Sensors must be positioned so that they can detect a leak at the earliest opportunity. CORRECTIVE ACTION (#1-2): No immediate action is required. BZ Maintenance will set up/properly locate the sensor prior to wrapping up today's monitoring system certification. However, the facility must make sure that the sensors stay properly located so that they can detect a leak at the earliest opportunity. |

| Violation Description: | Failure to provide initial and annual training to all employees in safety procedures in the event of a release or threatened release of a hazardous material or failure to document and maintain training records for a minimum of three years. |
| Violation Notes: | OBSERVATION: Hazardous Materials Emergency Response Employee Training for Gasoline, Diesel, Carbon Dioxide and Propane has not been conducted. Employers must conduct and document employee training for all hazardous materials in reportable quantities, i.e. 55 Gallons, 200 Cubic Feet and/or 500 Pounds. CORRECTIVE ACTION : Conduct Hazardous Materials Emergency Response Employee Training for the above mentioned chemicals. Have employees sign and print their name on a training record which describes the training content. Keep all employee training logs on site for 3 years. Conduct this training annually. When complete, send a copy of your 2014 employee training record to this office. NOTE: The Phoenix Fire Dept. did a nice job documenting a CO2 incident a few years back. Lucky for us here in Sacramento County, there are not a lot of basementsG Unfortunately for us, the larger dewar type bulk CO2 tanks are being installed at gas stations and are already located in most [Truncated] |

Violation Date: 2/11/2015
Citation: HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Description: Failure to complete and electronically submit hazardous material inventory information for all reportable hazardous materials on site at or above reportable quantities.
Violation Notes: OBSERVATION: The Hazardous Materials Business Plan (HMBP) Chemical Description page for Propane, Regular, Midgrade Premium and Diesel Fuel lists the wrong amount in the Largest Container and Maximum Daily Amount boxes and, the "Hazardous Components" section, is not filled out for Regular, Midgrade, Premium and Diesel fuel, (Select "Mixture" for the Hazardous Materials Type to access the Hazardous Components section). All Chemicals listed in your HMBP must be accurately filled out. CORRECTIVE ACTION: Login to the www.emd.saccounty.net/EMDportal.html website, make all necessary changes listed above and submit the HMBP electronically in this department's e-Reporting Portal. Call (916) 875-2377 if you need assistance. NOTE: Send a written statement to Inspector Douglas Osborn when your HMBP has been accepted by this department.

| Violation Date: | 3/8/2019 |
| Citation: | HSC 6.7 25284.2 - California Health and Safety Code, Chapter 6.7, Section(s) 25284.2 |
| Violation Description: | "Failure to meet one or more of the following requirements: Install or maintain a liquid-tight spill container. Have a minimum capacity of five gallons. Have a functional drain valve or other method for the removal of liquid from the spill container. Be resistant to galvanic corrosion. Perform a tightness test at installation, every 12 months thereafter, or within 30 days after a repair to the spill container. Tested using applicable manufacturer guidelines, industry codes, engineering standards, or a method approved by a professional engineer. Tested by a certified UST service technician. Maintain records of spill containment testing for 36 months. " |
| Violation Notes: | Returned to compliance on 03/08/2019. OBSERVATION 1: Owner/Operator did not test spill containment every 12 months. Testing was completed on 2/23/18 and was due within 12 months from that date. This applies to all tank systems on site. CORRECTIVE ACTION 1: Ensure that testing occurs within 12 months. Tested done today. Corrected on site. OBSERVATION 2: The 89 tank spill bucket did not pass the annual test. The facility did not maintain entry fitting such that it properly seals to the containment CORRECTIVE ACTION 2: Hire a properly certified and licensed professional to make any necessary adjustments or to install a new spill bucket that will pass the annual spill bucket test. A permit may be required if a new spill bucket is installed. Submit the results to mccormackz@saccounty.net. |

| Eval Notes: | Inventory Sheets in CERS must be corrected. NOTIFY M VAUGHAN (VaughanM@saccounty.net) WHEN THE SUBMITTAL OCCURS TO CLEAR THE VIOLATION. |
| Eval Division: | Sacramento County Env Management Department |
| Eval Program: | HMRRP |
| Eval Source: | CERS |
| Eval General Type: | Compliance Evaluation Inspection |
| Eval Date: | 02-23-2018 |
| Violations Found: | Yes |
| Eval Type: | Routine done by local agency |
| Eval Notes: | Sensors are functional and in correct position. Sumps & buckets are clean and free of debris. NOTE: The UST forms have not been approved as accurate in CERS online system. Several inaccuracies are present. Refer to email regarding corrections sent to Kamal Sivia on 6/23/17 when the submittal was 'Not Accepted" due to inaccuracies or omissions in the CERS submittal of 6/8/16. STRONGLY RECOMMEND attending the next UST Workshop which is February 27th at 1:30 pm at the Mather office. An Inspector will be paired with you or a representative to complete, upload, and submit all forms correctly. Call to reserve a seat (916 875-8550) - no charge. BE SURE TO HAVE YOUR USERNAME AND PASSWORD TO ACCESS YOUR CERS ACCOUNT (same one used for the HMP G Hazardous Materials Business Plan). REPEAT VIOLATION G 14 DAY RESPONSE (due March 09, 2018). ENFORCEMENT ACTION MAY BE TAKEN. These forms have been violations at this facility for 3 years - they were due by the end of 2014 at [Truncated] |

**EL CENTRO CHEVRON (Continued)** **S102313853**

Violations Found: Yes
Eval Type: Routine done by local agency
Eval Notes: Not reported
Eval Division: Sacramento County Env Management Department
Eval Program: UST
Eval Source: CERS

Eval General Type: Other/Unknown
Eval Date: 08-18-2017
Violations Found: Yes
Eval Type: Other, not routine, done by local agency
Eval Notes: This is a focused inspection to address Enhanced Leak Detection (ELD) testing requirements. Based on your facilities proximity to a public drinking water well(s) the State Water Resource Control Board required passing ELD results or an approved Request for Reconsideration (RFR) be submitted to the Environmental Management Department (EMD). EMD has not received ELD results or an approved RFR. Additional information regarding ELD testing is available on the SWRCB guidance document titled LG 161-5 (attached) and on the SWRCB website at https://www.waterboards.ca.gov/water_issues/programs/ust/eld/index.shtml Please contact Brion McGinness at (916) 876-7646 if you have questions.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

| NPL Status: | Not Listed |
| Description: | The 2.0-acre site is located 3 1/2 miles west of the City of Sacramento in West Sacramento, Yolo County, CA. The Sacramento and San Joaquin Drainage District currently own the land. |
| History: | The site was established prior to 1 January 1943 and was known as the Sacramento District Engineer Yard - Weir Area. The site was used by the Army for river and harbor purposes. On 11 August 1954, 2.0 fee acres were conveyed to the Sacramento and San Joaquin Drainage District. There were no recapture provisions. Currently, there are no potential hazards identified at this location, further investigation is needed. |

**BRYTE BEND WATER TREATMENT PLANT (Continued)** **S113804586**

Site History: A slow leak in a caustic feed line appears to have mixed with treated water to fill a cylindrical cement access vault. Soil removed around access vault. Groundwater extraction pumps installed at supply pipe elevation. When groundwater returns, groundwater extraction will be conducted to remove traces of caustic, if any remain.

| Description: | Historical: Caller states substance released to a containment vault due to a leaking pipe. Caller states the release occurred over an unknown period of time. Caller states the pipe has been fixed and the majority of the released has been pumped to drying beds with the remainder to be cleaned up by another party. Caller states one employee received a burn to his arm due to a drop splashing onto his skin. Caller states the employee was sent to a clinic for treatment and released the same day. |

Lead Agency Description: * DTSC
Project Manager: Not reported
Supervisor: Charles Ridenour
Division Branch: Northern California Schools & Santa Susana
Site Code: 104078
Assembly: 07
Senate: 06
Special Program Status: Not reported
Status: No Further Action
Status Date: 03/24/2000
Restricted Use: NO
Funding: School District
Latitude: 38.61047
Longitude: -121.5336
APN: 27405100410000
Past Use: AGRICULTURAL - ROW CROPS
Potential COC: Heptachlor, Heptachlor, DDT, * delta-BHC (delta-HCH, DDD, DDE
Confirmed COC: NONE SPECIFIED
Potential Description: NMA

| File Location: | Regional Board |
| Local Case Number: | Not reported |
| Potential Media Affect: | Aquifer used for drinking water supply |
| Potential Contaminants of Concern: | Diesel, Gasoline |
| Site History: | The case was opened following an unauthorized release from an underground storage tank system at the subject site. Corrective action is underway as directed by the CVRWQCB. Corrective action may consist of preliminary site investigation, planning and implementation of remedial action, verification monitoring, or a combination thereof. A summary of the site history is available by clicking on either the "Cleanup Status History", "Regulatory Activities" or the "Site Maps/Documents" tab. For a complete site history the case file at the CVRWQCB should be consulted. |

Completed Info:
Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Screening
Completed Date: 08/21/1991
Comments: Surface soils contaminated with total lead exceeding 1000 parts per million. Lead contaminated soils were remediated in 1990 & replaced onsite under Regional Water Quality Control Board (RWQCB) oversight. RWQCB monitoring groundwater. Recommend referral to RWQCB with request for deed restriction.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Screening
Completed Date: 01/12/1995
Comments: In November 1994, Yolo County Environmental Health contacted the Department to obtain information on the site. They informed Department staff that they would be providing oversight for the project. The Department agreed to refer the site to the County. The County file is #H95.

# GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

**Number of Days to Update:** Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

**STANDARD ENVIRONMENTAL RECORDS**

***Federal NPL site list***

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 10/28/2020

Next Scheduled EDR Contact: 01/11/2021
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

***Federal Delisted NPL site list***

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 10/28/2020
Date Data Arrived at EDR: 11/05/2020

***Federal CERCLIS list***

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 04/03/2019

Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

***Federal CERCLIS NFRAP site list***

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

***Federal RCRA non-CORRACTS TSD facilities list***

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 06/15/2020

***Federal RCRA generators list***

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 06/15/2020

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-VSQG: RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

**ADDITIONAL ENVIRONMENTAL RECORDS**

***Local Brownfield lists***

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

**EDR HIGH RISK HISTORICAL RECORDS**

***EDR Exclusive Records***

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

**OTHER DATABASE(S)**

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Engeo were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Engeo were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

## *Certified Sanborn Results:*

**Certification #** 12D2-4BAD-B36A

**PO #** NA

# EXECUTIVE SUMMARY

## DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2017. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

## RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

## Sacramento County Provided Documents

2184 Garden Highway (APN 274-0260-042)
- Domestic well installation permit

2196 Garden Highway (APN 274-0260-032)
- Several hazardous materials management plans, permits, regulatory notifications, inspection reports

2206 Garden Highway (APN 274-0260-007)
- Liquid waste plans, permit, percolation test results for septic system installation

2178 Garden Highway (APN 274-0220-054)
- Liquid waste permit and soil log for septic system installation

2250 Garden Highway (APN 274-0260-037)
- Hazardous materials plans, regulatory notifications, complaints
- Liquid waste permit for septic system installation

2306 Garden Highway (APN 274-0260-043)
- Domestic well installation permit
- Liquid waste plans, permit, percolation test results for septic system installation

2300 Garden Highway (APN 274-0260-044)
- Several domestic well installation permits
- Liquid waste permit and percolation test results for septic system installation

2350 Garden Highway (APN 274-0260-001)
- Underground storage tank (UST) permit
- Liquid waste permit for septic system installation

Garden Highway (APN 274-0250-015)
- Several abandoned well notifications

2425 Garden Highway (APN 274-0250-013)
- Domestic well installation permit
- Liquid waste plans and permit for septic system repair

Garden Highway (APN 274-0250-012)
- Several abandoned well notifications
- Domestic well inactivation permit

2460 Garden Highway (APN 274-0250-011)
- Liquid waste plans, correspondence, permit, soils log for septic system installation

2480 Garden Highway (APN 274-0250-006)
- Domestic well destruction permit
- Temporary sewage storage plans

2482 Garden Highway (APN 274-0250-004)
- Liquid waste plans for septic system

2486 Garden Highway (APN 274-0250-003)
- Domestic well installation permit application
- Liquid waste plans and permit for septic system installation

Garden Highway (APN 274-0250-040)
- Several abandoned well notifications

2590 Garden Highway (APN 274-0250-039)
- Domestic well installation application
- Several domestic well installation permits
- Well drillers report
- Abandoned well notification

2604 Garden Highway (APN 225-0210-023)
- Domestic well installation application

2600 Garden Highway (APN 225-0210-038)
- Liquid waste permit for septic system repair

2700 Garden Highway (APN 225-0210-024)
- Several domestic well installation permits

3000 Garden Highway (APN 225-0210-026)
- Domestic well installation permit application
- Well abandonment permit

3540 Garden Highway (APN 225-0190-008)
- Irrigation well inactivation permit application
- Several abandoned well notifications and permit renewal notifications
- Liquid waste permit, plans, soil log for septic system installation

3800 Garden Highway (APN 225-0110-058)
- Domestic well installation application, permit, well drillers report
- Abandoned well notification
- Several exploratory boring permits
- Soil removal action and groundwater investigating work plan

3802 Garden Highway (APN 225-0110-024)
- Well drillers report for domestic well installation
- Percolation test results for septic system installation

Garden Highway (APN 225-0110-019)
- Several abandoned well notifications

Garden Highway (APN 225-0110-020)
- Several abandoned well notifications

3955 El Centro Road (APN 225-0110-037)
- Liquid waste permit for septic system installation
- Well drillers report for domestic well installation

3845 El Centro Road (APN 225-0110-038)
- Several hazardous materials management plans, permits, regulatory notifications, inspection reports
- Above ground storage tank checklist and statement

- Liquid waste permit for septic system installation
- Domestic well installation permit

3809 El Centro Road (APN 225-0110-052)
- Domestic well installation application and permit

3705 El Centro Road (APN 225-0110-032)
- Liquid waste permit for septic system installation
- Several hazardous materials management plans, monitoring plans, permits, regulatory notifications, complaint reports, inspection reports
- Several above ground storage tank statement, tank testing results, tank removal, site closure permit
- Municipal well permit and drillers report

3709 El Centro Road (APN 225-0110-054)
- Liquid waste permit, correspondence, percolation test results for septic system installation and repair

3934 El Centro Road (APN 225-0121-001)
- Liquid waste permit, correspondence, percolation test results for septic system installation and repair
- Domestic well installation application and permit
- Well drillers report for domestic well installation

El Centro Road (APN 225-0121-003)
- Abandoned well notification

3850 El Centro Road (APN 225-0121-00)
- Failing septic system notification

3830 El Centro Road (APN 225-0121-005)
- Liquid waste permit, plans drillers soil log for septic system installation and repair

3670 El Centro Road (APN 225-0122-001)
- Industrial well installation permit

3650 El Centro Road (APN 225-0190-019)
- Site assessment report
- UST removal notification
- Several well inactivation permits and abandoned well notifications
- Percolation testing results for septic system
- Several hazardous materials management plans, monitoring plans, waste classification forms, regulatory notifications, complaint reports, public reviews

3291 El Centro Road (APN 225-0210-001)
- Several well installation and inactivation permits
- Abandoned well notification

El Centro Road (APN 225-0210-005)
- Irrigation well installation permit

2651 El Centro Road (APN 225-0210-007)
- Septic system destruction permit

El Centro Road (APN 225-0220-060)
- Several abandoned well notifications

3060 El Centro Road (APN 225-0220-062)
- Small water supply permit application
- Several domestic well installation permit, drillers well log, monitoring schedule, laboratory results, inspection reports, source assessments
- Hazardous materials classification form

El Centro Road (APN 225-0220-113)
- Abandoned well notification

2850 El Centro Road (APN 225-0220-051)
- Domestic water supply application and permit, monitoring schedule, sampling plans, laboratory results, inspection reports, consumer confidence reports, source assessments
- Several industrial well drilling permits, well driller report, well logs
- Several hazardous materials management plans, monitoring schedules, permits, inspection reports, regulatory notifications
- Above ground storage tank statement, checklist, waste tank assessment

2828 El Centro Road (APN 225-0220-055)
- UST statement, checklist, monitoring plan, waste tank assessment
- Small water supply permit application and permit, monitoring schedule, sampling plans, laboratory results, inspection reports, consumer confidence reports, source assessments
- Several hazardous materials management plans, monitoring schedules, permits, inspection reports, regulatory notifications
- Fuel release complaint report, environmental crime cases
- Several monitoring well drilling permits, well driller report, well logs
- Site assessment and mitigation report, work plan, site conceptual model

2840 El Centro Road (APN 225-0220-103)
- Small water supply permit application and permit, monitoring schedule, sampling plans, laboratory results, inspection reports, consumer confidence reports, source assessments
- Several industrial well drilling permits, siting plans, well driller report, well logs
- Fuel release notification

2836 El Centro Road (APN 225-0220-075)
- Small water supply permit application
- Several domestic well installation permit, drillers well log, monitoring schedule, laboratory results, source assessments

2738 El Centro Road (APN 225-1020-005)
- Several UST permits and tank testing results
- Pipeline leak detection and repair notification
- Several hazardous materials management plans, monitoring plans, permits, regulatory notifications, complaint reports, inspection reports

El Centro Road (APN 225-1020-009)
- Exploratory boring permit

3340 Leona Circle (APN 225-0131-002)
- Several domestic well installation permit applications
- Well drillers report for abandoned wells
- Several abandoned well notifications
- Liquid waste plot plans, permit, soil log, regulatory notifications for septic system installation

3320 Leona Circle (APN 225-0131-003)
- Liquid waste permit for septic system installation

3360 Leona Circle (APN 225-0131-001)
- Domestic well installation permit
- Liquid waste permit for septic system installation

3280 Leona Circle (APN 225-0131-005)
- Liquid waste permit for septic system installation

3260 Leona Circle (APN 225-0131-006)
- Several domestic well installation permit applications
- Several abandoned well notifications

3220 Leona Circle (APN 225-0131-008)
- Several domestic well installation permit applications and well driller reports
- Liquid waste permit for septic system installation

3337 Leona Circle (APN 225-0132-002)
- Domestic well installation permit

3201 Leona Circle (APN 225-0132-005
- Several domestic well installation permit applications
- Soil log for septic tank installation

3357 Leona Circle (APN 225-0132-008)
- Domestic well installation and abandonment permits
- Well drillers report
- Liquid waste plot plans, permit, soil log for septic system installation

Orchard Lane (APN 225-0220-039)
- Several domestic and cathodic protection well installation permit applications, well drillers reports
- Several abandoned well notifications

# APPENDIX I

## QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONAL

## SHAWN MUNGER, CHG
## Principal Geologist

### EDUCATION

BS, Geology, U.C. Davis, 1985

### EXPERIENCE

Years with ENGEO: 31
Years with Other Firms: 0

### REGISTRATIONS & CERTIFICATIONS

Certified Hydrogeologist, CA, 413

8 Hour HAZWOPER Training, CA, 160115576014

Professional Geologist, CA, 5810

Certified Environmental Manager, NV, 1332

40 Hour HAZWOPER Training, CA, 100830513934

### SPECIALIZATIONS

- Environmental Assessments and Remediation
- Environmental Restoration
- Water Quality Studies
- Water Wells/Hydrogeology

Since joining ENGEO in 1985, Shawn has been managing groundwater supply evaluations, hydrogeologic studies, chemical assessments, Phase I and II Site Assessment projects, UST site investigations, risk based corrective action (RBCA), VOC remediation, and agricultural impact evaluations. He serves as Principal-in-Charge or Project Manager for environmental and hazardous materials projects involving groundwater hydrology, contaminant fate and transport, and remediation. He is Principal-in-Charge of the environmental components of our on-call contracts with the City of Sacramento and the County of Sacramento.

### Select Project Experience

**14234 Saratoga Sunnyvale Road—Saratoga, CA**
*Project Geologist*. Shawn performed Principal review of ENGEO's environmental documents. This 2.2-acre townhome site is planned for a new multi-family development comprising up to 20 units in 8 buildings. The site immediately borders Saratoga Creek and contains numerous mature trees, many of which are to be saved. Site challenges include shallow groundwater, creek bank stability, and the potential for liquefaction and lateral spreading.

**Lenihan Dam Outlet Modification—Los Gatos, CA**
*Principal Geologist*. Shawn provided technical advice, coordination, consultation, and review of ENGEO's documents to provide quality mitigation measures. The findings were presented to SCVWD and it was concluded that the stockpile was sufficient for transportation. This analysis led to significant project budget savings by avoiding removal and disposal at a solid waste disposal facility. The project consisted of a stockpile approximately 6,000 cubic yards that required profiling as requested by Santa Clara Valley Water District before use of as site backfill.

**199 River Oaks Parkway—San Jose, CA**
*Principal in Charge*. Shawn provided principal oversight, data analysis, and consultation regarding site characterization, risk evaluation, and demolition observation plans. The project consists of a proposed six-story podium structure with one level to be constructed below grade. The property is a former semiconductor facility that has received conditional closure from the Regional Water Quality Control Board and is approved for construction.

**Riverside Avenue Property—Roseville, CA**
*Principal in Charge*. Shawn provided principal oversight of a Phase II Environmental Site Assessments and site

characterization. The project site consists of an active auto sales and service facility. The historic use of the facility for industrial purposes resulted in soil and groundwater impacts beneath the site. The City of Roseville revised its plans for acquiring and redeveloping the site due to the identified soil and groundwater impacts.

**1301 Standard Oil Ave—Pittsburg, CA**
*Principal in Charge*. Shawn provided principal oversight of a Phase II Environmental Site Characterization. The property is an abandoned wastewater treatment plant with processing buildings, clarifier tanks, and sludge beds.

**Pleasant Hill BART Station—Walnut Creek, CA**
*Principal in Charge*. Shawn provided oversight, data analysis and consultation during the preparation of a Phase II Environmental Site Assessment. The property is an existing BART station that encompasses 20 acres, including the platform/station area, electrical facilities, a parking garage and additional paved parking areas.

**County Crossings Property—Antioch, CA**
*Principal in Charge*. Shawn provided environmental consultation and data review with regard to soil and groundwater contamination. Constituents of concern include petroleum hydrocarbons, nitrates and manganese. The approximately 264-acre site includes several former industrial facilities and petroleum pipelines. Soil and groundwater at the site has been impacted with petroleum hydrocarbons, nitrates and manganese. Planned uses include commercial, residential, retail, and a BART-oriented transit village. The center, which is currently in the entitlement phase, is estimated to break ground in 2011.

**620 North Ninth Street—San Jose, CA**
*Principal in Charge*. Shawn provided oversight of soil, groundwater and soil gad characterizations, risk evaluations and Remedial Action Plan preparation. Shawn also closely interacted with RWQCB staff to achieve approval for residential development. The property is a former fruit packing plant and food preparation facility. The proposed development consists of a single-family residential subdivision.

**Westshore—Richmond, CA**
*Project Manager*. Shawn conducted Phase I and II Site Assessments, risk evaluations and prepared a soil management plan. The property was a former automotive manufacturing plant proposed for a multi-unit condominium development, including a 6-story podium structure to include five residential floors with 269 units and one parking floor.

**Mills Ranch—King City, CA**
*Principal in Charge*. Shawn provided principal oversight of Phase I/II Environmental Site Assessments and risk evaluations. The approximate 80-acre property is used for agricultural cultivation and commercial uses. The proposed mixed-use development includes over 400 single-family residential lots.

**Select Foods Site/Cross Creek—Hayward, CA**
*Principal in Charge*. Shawn provided principal oversight, consultation, and data analysis. The property was a former processed food facility, a drum recycling business, battery manufacturing operation and a bus assembly plant. Following completion of soil remediation under RWQCB oversight, the property was developed into a single-family residential subdivision.

**Arroyo Crossing—Livermore, CA**
*Principal in Charge*. Shawn provided oversight, data analysis and regulatory consultation while ENGEO provided geotechnical and environmental engineering services for this 34-acre site. This former corporation yard and quarry site was developed into a single-family residential subdivision.

**Renaissance Square—Concord, CA**
*Project Manager*. Shawn provided consultation, data analysis, and field observation. This former automotive dealership was redeveloped as a five-story multi-family residential structure supported on slab-on-grade foundations, with two levels of below-grade parking. Petroleum hydrocarbon-impacted soil was encountered during excavation of the parking structure, which required characterization and remediation. Soil impacts were attributed to former sumps, USTs and hydraulic lifts.

**Union Pacific Railroad Corridor—San Jose, CA**
*Project Manager*. Shawn prepared a Phase I and II Environmental Site Assessment. Work included a site reconnaissance, historical records research and recovery of soil samples with laboratory analysis. Lead impacted soil was identified which required risk evaluation. This former1800 lineal foot section of the former Union Pacific Railroad Corridor was proposed for mixed-use development.

**Former SFPP Alignment—Concord, CA**
*Project Manager*. Shawn prepared a Phase I and II Environmental Site Assessment. The site was a former ±6,500-foot corridor formerly occupied by the Southern Pacific Railroad. Kinder Morgan petroleum pipelines existed within an easement along the property. The southern portion of the site was crossed by East Bay Municipal Utilities District water distribution lines and a multi-lane highway overpass. The corridor was developed as a self-storage facility. Work included the recovery of soil and groundwater samples along the SP right of way.

**Hercules Property—Hercules, CA**
*Project Manager*. Shawn provided oversight of a Phase I Environmental Site Assessment, site asbestos survey, site characterization, and demolition observation/contaminant assessment. The project area consists of ±167 acres located near and along the southeastern shore of San Pablo Bay in Hercules. The property was once a portion of a 1300-acre manufacturing facility that was operated by DuPont from 1879 to 1913 and Hercules Incorporated from 1913 to 1979. The planned development includes single/multi-family residential development with some commercial components.

**Highlands Ranch—Antioch, CA**
*Principal in Charge*. Shawn provided oversight, data analysis, and collaboration with RWQCB personnel. The project site consists of a 140-acre portion of the former Chevron Los Medanos Tank Farm located in Pittsburg, California. The site was historically occupied by 24 crude oil tanks and four wax ponds. Remediation of the crude oil tank and wax pond locations was conducted according to a remedial action plan (RAP) and oversight was provided by the CRWQCB. Remediation was performed over a period of four months and consisted of excavating approximately 110,000 cubic yards of impacted soil and placing the material in windrows for ex-situ bioremediation.

## MASTER DRAINAGE STUDY

**Department of Water Resources**
Matt Satow
Director

**Divisions**
Water Supply
Drainage
Administrative Services/Finance

# County of Sacramento

**Date: 05/30/2024**

**To: Michael Motroni, P.E.**
**Michael Nowlan, P.E.**
Wood Rodgers, Inc.

**Subject:** Upper Westside Specific Plan (PLNP2018-00284) Master Drainage Study – Resubmittal 3 Approval Letter

The Sacramento County Department of Water Resources (Water Resources) reviewed the drainage master plan dated 05/24/2024 and deemed it technically sufficient to support the proposed preliminary backbone drainage infrastructure and initial entitlements. Level 2 and 3 drainage studies will be required prior to approval of subsequent entitlements, and level 4 drainage studies will be required to support eventual improvement plans.

Please feel free to call if you have any questions.

Sincerely,

J. Luis Rodriguez, P.E., M.S., C.F.M.
Associate Civil Engineer
Sacramento County Department of Water Resources
Drainage Development and Floodplain Management

**Nick Avdis**
Applicant

May 29, 2024

Kevin King
General Manager
Reclamation District 1000
1633 Garden Highway
Sacramento, CA 95833

Subject: **Review of Upper Westside Planning Area Level 1 Master Drainage Study Report**

**Introduction/Background**

The proposed Upper Westside (UWS) is planned for 2,066 acres of residential and commercial development. The UWS Specific Plan Area is bound by Interstate 80 (I-80) to the southeast, the West Drainage Canal to the northeast, Garden Highway to the west, and the Sacramento city limits and Fisherman's Lake to the north. The site is undeveloped land that drains west to east through existing canals, generally draining through culverts into the Reclamation District 1000 (RD1000) West Drainage Canal between Fisherman's Lake and I-80. Outlets to the West Drainage Canal are supplemented by pumping to achieve required stormwater evacuation during significant rainfall events. As proposed, the UWS would be improved with a network of stormwater infrastructure, improved drainage canals, detention storage, and new and upgraded pump stations to deliver stormwater from the development via two outfalls to the RD1000 West Drainage Canal.

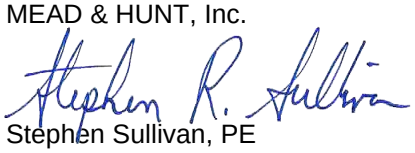
Mead & Hunt, with the assistance of West Yost, has completed reviews of multiple iterations of the drainage studies and modeling prepared for the UWS. The current version of the Master Drainage Study (MDS) reporting was completed by Wood Rodgers on May 24, 2024, and is the subject of this review.

The following updated documents were provided to RD1000 for review:

- Upper Westside Specific Plan, Master Drainage Study, Wood Rodgers, May 24, 2024
- UWS XP SWMM Modeling, Dated April 9, 2024[a]
- Responses to Mead & Hunt's April 29, 2024 comments

**Mead & Hunt Comment Response Backcheck:**

Drainage Study



Mead & Hunt's previous master drainage study report comments have been addressed and there are no further comments.

[a] According to email correspondence between Mike Motroni and Luis Rodriguez, the model was updated previously to address Sacramento County comments on the revised Nolte model to the satisfaction of Sacramento County. The model update was not separately reviewed by RD1000.

**Conclusions**

Based upon the analysis as documented in the Level 1 Drainage Study, the proposed plan is compatible with the RD1000 standards and mission, to avoid impacting operations and maintenance, as well as the drainage services provided to properties outside of the project area. We understand that as the project design progresses, additional design details will be provided for RD1000's review and we look forward to providing feedback.

Sincerely,
MEAD & HUNT, Inc.

|---|---|---|
| 1. | **Page 39, 3.3, El Centro West Drainage Canal**: Report indicates that the El Centro Road Crossing of the West Drainage Canal culverts will be replaced or extended to accommodate road widening. Include language to indicate that "The County will consult with RD1000 on the details of modifying the culvert encroachments on the West Drainage Canal, the condition of existing features, and the potential impacts to adjacent features." | Comment addressed as noted. |
| 2. | **Page 41, Ag-Buffer Drainage, 1st paragraph**: Clarify the statement that "additional channel and storm drain improvements would be constructed primarily within existing easements dedicated to RD1000 and to the Natomas Mutual Water Company." The improvements to accommodate drainage collection and rerouting should not encroach upon the existing RD1000 and NMWC easements. The Ag Buffer runoff collection features were not part of the RD1000 system and will be operated and maintained by the project proponent's designee. | Sentence revised to read:<br><br>*Where required to facilitate ag-buffer runoff, any additional channel and storm drain improvements would be constructed primarily within existing easements dedicated to RD 1000 and to the Natomas Central Mutual Water Company but not in conflict with their facilities. Drainage improvements will be subject to County jurisdiction will require quitclaim by RD1000.* |
| 3. | **Page 42, Figure 3.1 Ag-Buffer Urban Interface**: The figure indicates ditch placed directly against the fenced Ag-Buffer with no access to permit maintenance along the left bank. Notes indicate this is "To be considered with tentative maps." It is assumed that this facility will not be operated and maintained by RD1000, please confirm intent (see above). | Added, "Drainage facilities along the ag-buffer constructed to convey runoff per County Standards will be operated and maintained by the County." |
| 4. | **Page 65, Onsite 200-year analysis**: Prior iteration indicated that the project would include levee strengthening, raising, and retrofit of culverts. The latest report no longer includes this commitment and appears to indicate that no levee work will be required to meet 200-year level of protection and includes a justification. | Correct. The project grading has been designed such that pads will be at or above the 200-year water surface elevation. While not required, the future design will set back proposed detention basins from the West Drainage Canal to prevent failure during the 200-year, while maintaining no increases to existing ground separation or to peak water surface elevations currently contained in the West Drainage Canal channel banks. |

| # | Submittal Comment | Wood Rodgers Response |
|---|---|---|
| | a. The reference Figure 4.6 contains no topographic labeling and is therefore difficult to confirm assumptions. Include labeling of elevation contours. | Comment addressed in updated Figure 4.6. |
| | b. The statement that "While the project does not rely on the containment of the West Drainage Canal to protect pads, the project will be designed to keep the West Drainage Canal within its banks" could be misconstrued. The statement can be made that the project will not increase the 200-year, 10-day levels in the West Drainage Canal and therefore the project in an of itself does not increase the extent of mapped inundation shown. | First two paragraphs revised to read:<br><br>*While the project does not rely on the containment of the West Drainage Canal to protect pads, the project will be designed to maintain the West Drainage Canal within its banks. The project will not increase the 200-year, 10-day water surface elevations in the West Drainage Canal and therefore does not increase the extent of mapped inundation.* |
| | c. The statement of that "This will prevent intentional flow leaving the West Drainage Canal and entering the Plan Area through overtopping or piping" could be misconstrued and can be left out, as no project work related to the 200-year assessment is planned on the levee. | Comment addressed in revised text. |
| | d. The statement that "Wood Rodgers does not anticipate any modifications will be required to the existing containment features to achieve this goal," does not define the "goal". | Comment addressed as noted. Removed "…to achieve this goal." |

# 1.0 Introduction

Upper Westside (UWS) is a 2,066-acre Specific Plan Area (Plan Area) in Sacramento County (County) located within the Natomas Basin. The Plan Area is bound by Interstate 80 (I-80) to the southeast, the West Drainage Canal (also known as the Witter Canal) to the northeast, Garden Highway to the west, and the Sacramento city limits and Fisherman's Lake to the north.

## 1.1 Existing Conditions

The Plan Area currently encompasses land with primarily Agricultural and Agricultural-Residential designations, with some Commercial designations. Developed lands within the Plan Area include approximately 55 acres of commercial areas adjacent to the West El Camino Road interchange with I-80, approximately 40 acres of the partially-developed Natomas Estates residential development, and various individual residential areas along the east side of El Centro Road. Natomas Estates is located along El Centro Road from just north of the intersection of El Centro Road and Radio Road to the intersection of El Centro Road and the West Drainage Canal. The fully developed River View #2 subdivision area consisting of approximately 80 acres north of San Juan Road and west of the West Drainage Canal is not included in the Plan Area.

North and east of the Plan Area lies existing residential development in North Natomas that is nearing build-out. The community of South Natomas, which is also nearing build-out, is situated southeast of I-80. Across the Sacramento River to the west is Yolo County, where parcels along the river are zoned Agriculture Intensive (A-N) and are within the Federal Emergency Management Agency (FEMA) 100-year floodplain. Large development projects within 10 miles of the Plan Area that have begun planning or construction processes include Northlake (Greenbrier), The Panhandle, Grandpark (North Precinct), and Metro Air Park. **Figure 1.2: Vicinity Map** presents an existing conditions vicinity map for the Plan Area.

## 1.2 Project Description

The proposed project will consist of development within the Plan Area, including approximately 9,356 residential dwelling units and 3.11 million square feet of commercial and mixed land use. Roadway improvements, parks and open space, greenbelts and urban farm programs, and schools will also be included.

The Plan Area currently encompasses Agricultural and Agricultural-Residential designations; however, the project location makes the Plan Area suitable for a compact urban form based on the surrounding conditions. Because the project's center is within 3.5 miles of downtown Sacramento, the Plan Area provides an opportunity to create a sustainable urban Greenfield project that meets the needs of the growing Sacramento region.

The Plan Area includes a large, centrally-located open channel water feature that will be used as a conveyance as part of the storm drainage system. Drainage improvements include open channels and a backbone storm drain system to convey runoff from the Plan Area to detention basins and pump stations that will discharge into the West Drainage Canal.

## 1.3 Applicable Standards

This report is intended to comply with the requirements for a Level 1 Master Drainage Plan according to the Sacramento County Department of Water Resources (SCDWR) *Drainage Study Requirements* dated March 2020. Drainage improvements will be designed in accordance with the following design standards:

1. "Sacramento City/County Drainage Manual", Volume 2, Hydrology Standards, 1996.
2. "Sacramento Region Stormwater Quality Design Manual" (SQDM), July 2018.
3. Sacramento County Improvement Standards, Storm Drainage Design (Section 9), 2006.
4. Sacramento County Improvement Standards, Streets (Section 4), 2009.
5. "City of Sacramento Design and Procedure Manual", Section 11, Stormwater Collection Systems.
6. "City of Sacramento Design and Procedure Manual", Section 12, Storm Drainage Design Standards, Pump Stations.

### SCDWR Pump Station and Detention Basin Design Criteria

The SCDWR pump station and storage volume criteria are presented below in **Table 1.1: Pump Station Design Criteria**.

**Table 1.1: Pump Station Design Criteria**
*Source: Sacramento County, Department of Water Resources*

| Frequency | Duration | Pump Operation | Peak Water Surface Criteria |
|---|---|---|---|
| 10-year | All durations | Pumps 1 and 2 Operating | For pipe design and setting on elevation for 3rd pump |
| 100-year | 24 and 36 hours | All pumps operating | Minimum 1 foot freeboard in basin (designated flooding storage areas) |
| 100-year | 5 and 10 day | All pumps operating | Minimum 1 foot freeboard in basin (designated flooding storage areas) |
| 100-year | 24 and 36 hours | 50% of pumps not operating | Not to exceed 1 foot over the street gutter flowline |
| 100-year | 5 and 10 day | 50% of pumps not operating | Not to exceed 1 foot over the street gutter flowline |

Notes:
1. All scenarios do not include the low flow pump operation
2. 50% of pumps not operating; assumes that 2 of the 4 pumps (3 primary and 1 back up) are not operating.

## Nolte Hydraulic Grade Line Requirements for Storm Drain Pipe

Per Section 9 of the Sacramento County Improvement Standards, the Nolte hydraulic grade line (HGL) shall maintain a minimum of one-foot freeboard below the top-of-manhole for storm drain systems. The worst-case duration (varies) of the 10-year storm event was used to set the tailwater condition for the Nolte analysis. **Figure 1.1: Maximum WSE Exhibit, Street Section** below presents a visual display of freeboard criteria for street sections within the Plan Area. The Nolte method was used in determining pipe design using the maximum 10-year conditions with climate change tailwater conditions from either the 24-hour, 5-day or 10-day durations.

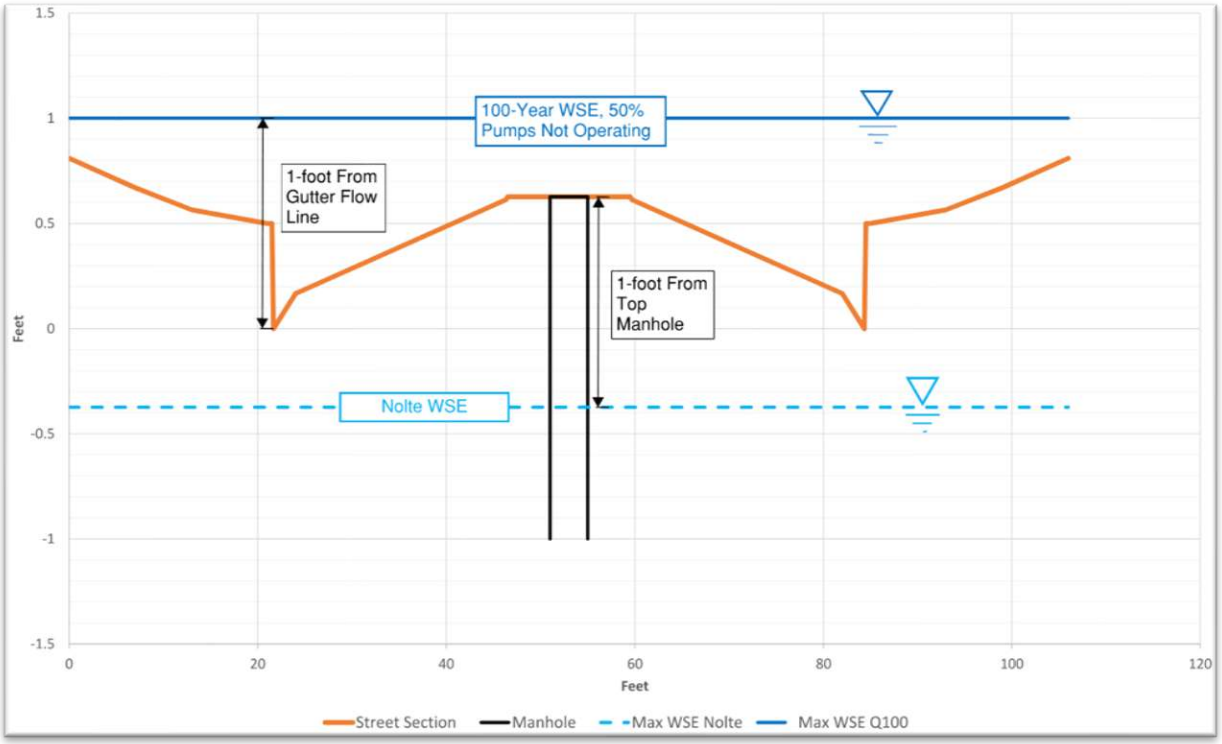

**Figure 1.1: Maximum WSE Exhibit, Street Section**

## RD 1000 Design Criteria

Reclamation District (RD) 1000 maintains and operates seven pump stations, over 42 miles of levees and over 30 miles of open channels within the Natomas Basin. To aid in evaluating the effects of development projects within the Natomas Basin, RD 1000 and its consultants, Mead and Hunt and West Yost Associates (WYA), developed and maintain a basin-wide XPSWMM hydrologic and hydraulic model of the Natomas Basin drainage system. Wood Rodgers has coordinated with RD 1000, Mead and Hunt, and WYA to determine the allowable measure of discharges into the West Drainage Canal so that development within the Plan Area would have no adverse impacts on the performance of storm drainage facilities within the Natomas Basin drainage system operated by RD 1000. Based on conversations with RD 1000 and Mead and Hunt, development within the Plan Area will not be allowed to increase peak flow rates from existing conditions into the West Drainage Canal. In addition, increased flow volumes from the Plan Area are not allowed to create adverse impacts to the RD 1000 drainage facilities.

The RD1000 XPSWMM system model evaluates worst-case conditions using the 100-year 10-day storm event, requiring the project to also evaluate 100-year 10-day conditions accordingly. The current RD1000

operational model (using XPSWMM) is expected to be replaced by the Natomas Basin 2D HEC-RAS model. Once adopted, new modeling representing the Upper Westside will need to incorporate the latest RD1000 system representations.

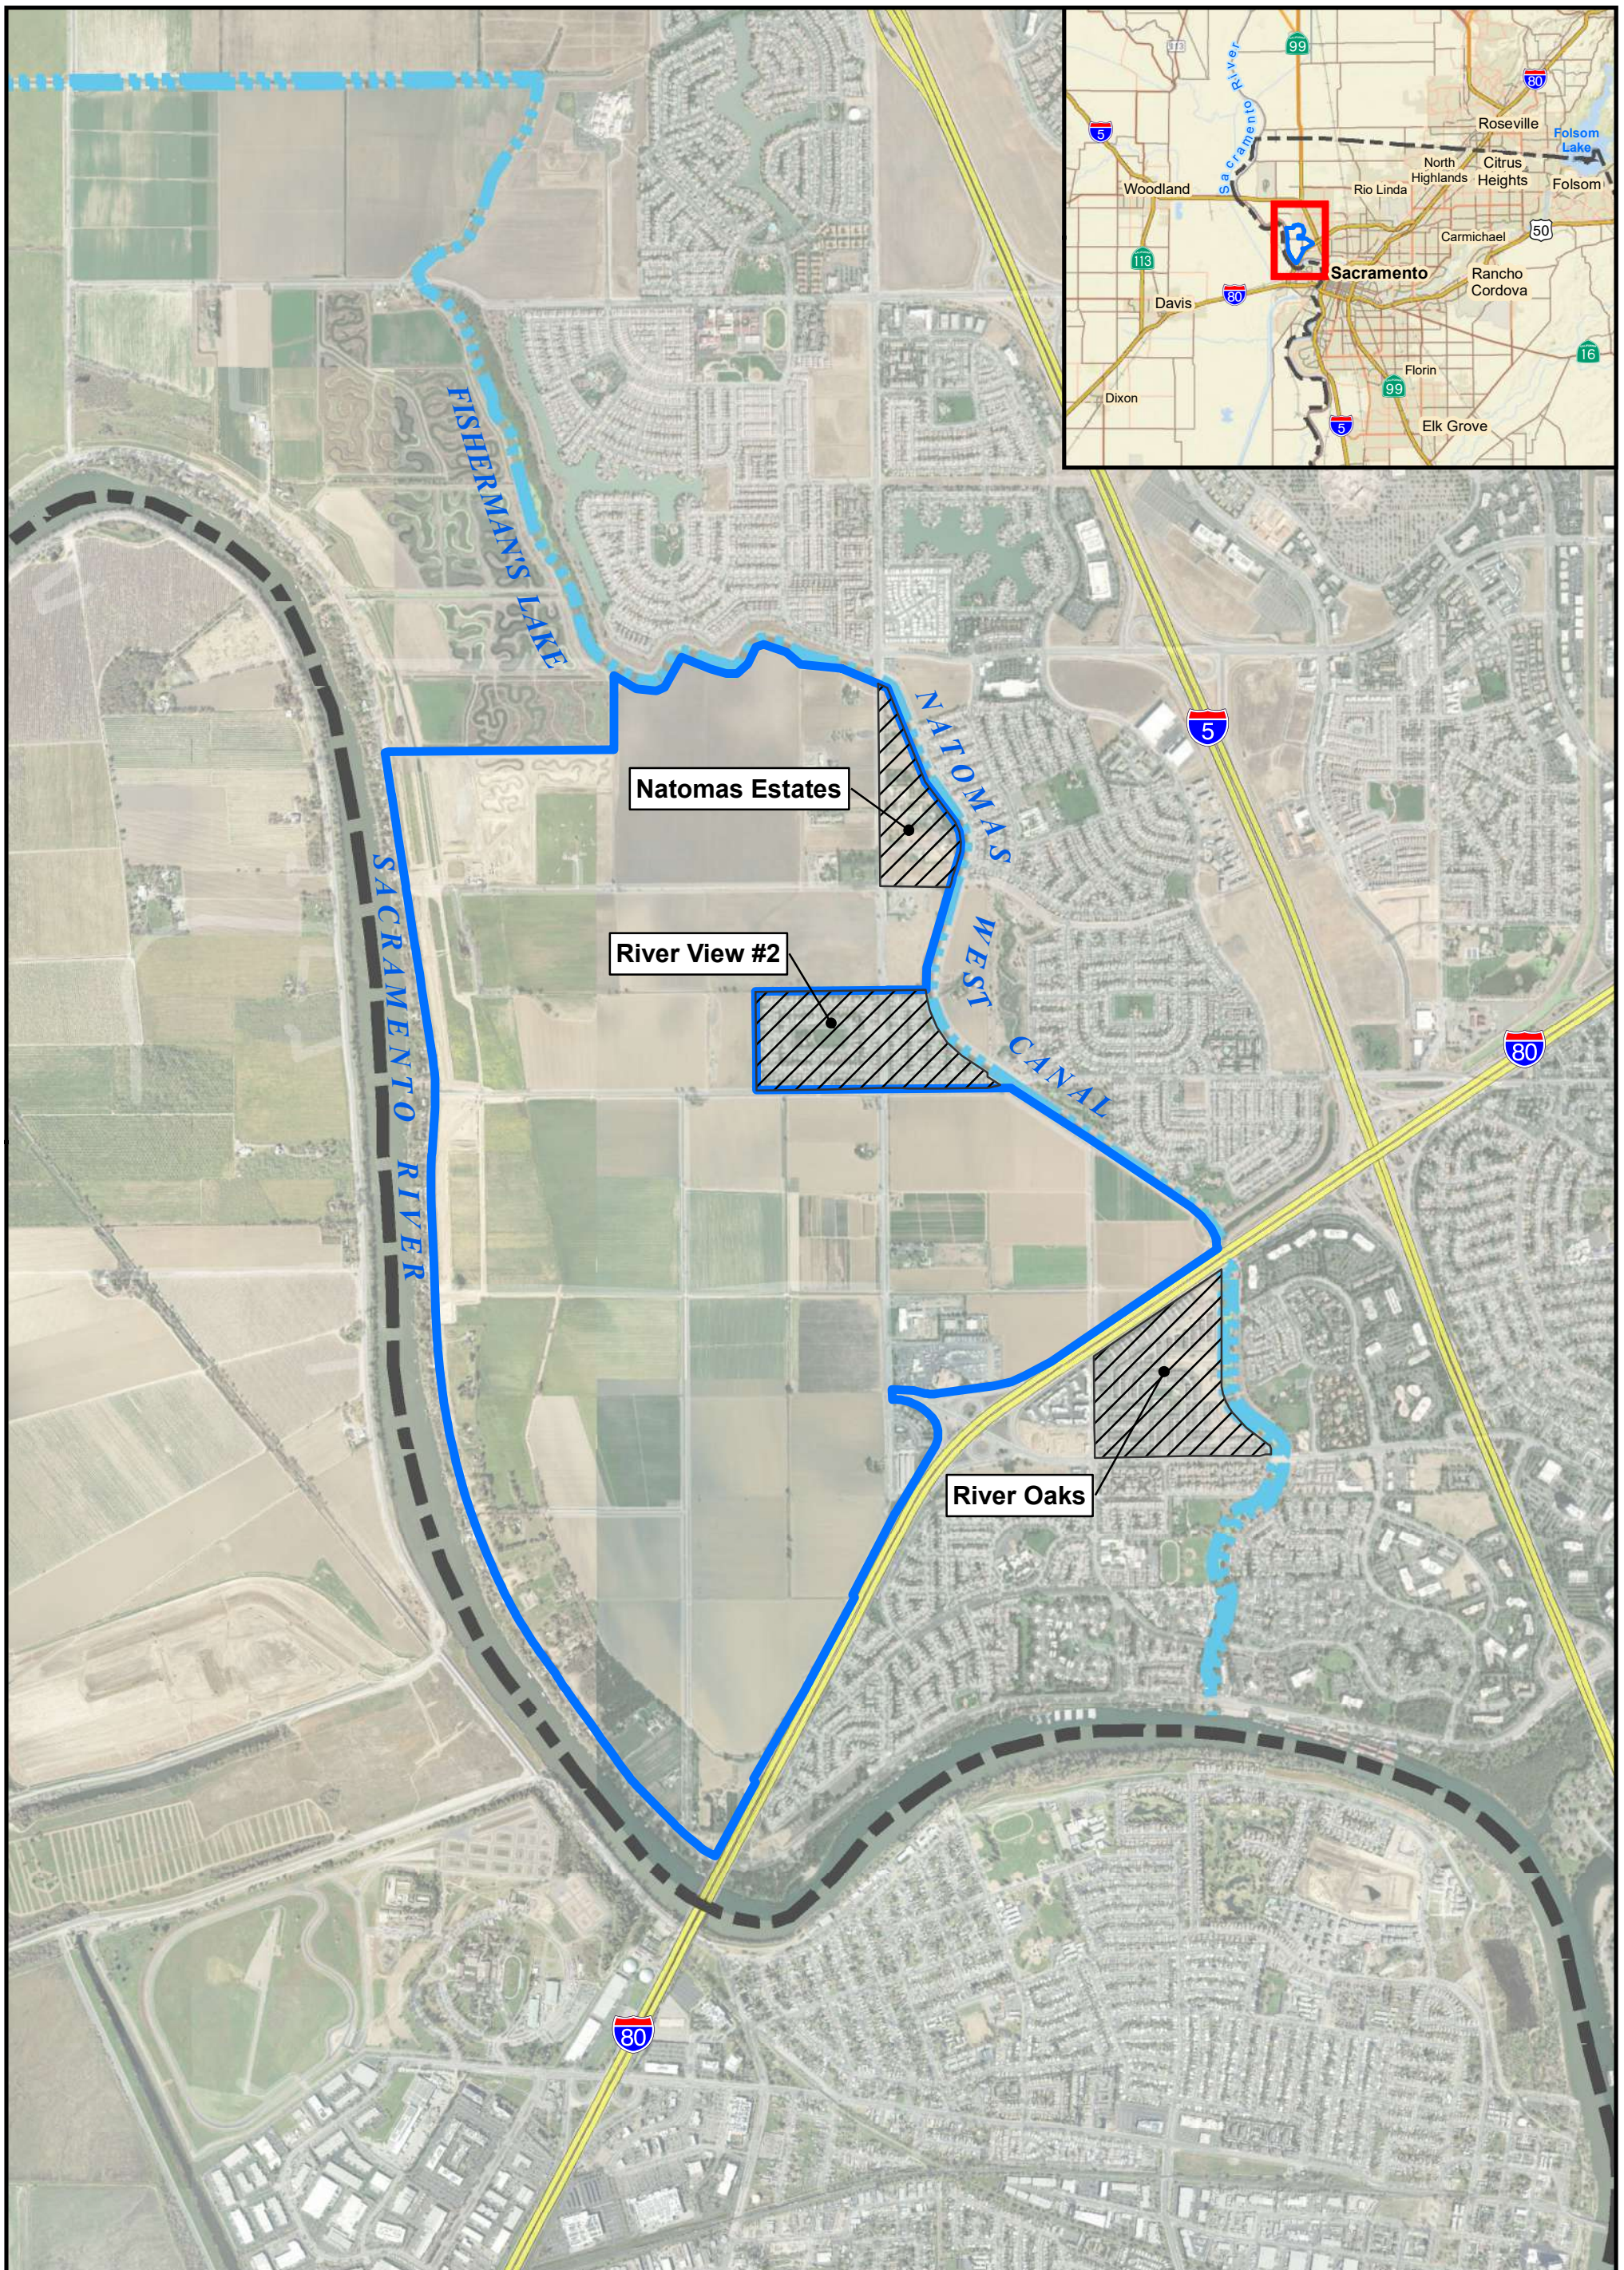
## 1.4 Objectives of Analysis

The purposes of this Study are to:

- Determine existing and proposed conditions drainage patterns and flow rates to demonstrate that the development within the Plan Area will not cause adverse impacts to adjacent properties;
- Determine detention basin sizes, including the capacity necessary to meet freeboard, and required water quality volume (WQV) storages;
- Determine preliminary backbone storm drainage trunkline and channel sizes considering freeboard requirements;
- Show no adverse impacts to RD 1000 facilities from existing to proposed conditions;
- Develop approaches to meet post-construction National Pollutant Discharge Elimination System (NPDES) requirements following the guidelines in the SQDM; and
- Comply with requirements from the SCDWR guidance for a Level 1 Master Plan.



It is important to note that all determinations made as part of this study are preliminary, with all basin sizes, pumping, channels, culverts, pipe sizes, and alignments being subject to change during future tentative map and final design efforts.

### Procedural Memorandums

Based on discussions with the SCDWR and the Sacramento County Planning Department, the Project applicant has been tasked with providing a series of four procedural memorandums related to cumulative impacts, residual flood risks, the FEMA Conditional Letter of Map Revision (CLOMR) approval process,

and the financing of capital and operation and maintenance costs[1]. These topics will be covered in the procedural memorandums which will be delivered separately and apart from this Master Drainage Study.

[1] Including the costs associated with operating and maintaining the central canal. Financing of capital drainage improvements is included as part of the project's Public Facilities Financing Plan.

**FIGURE 1.2**

# 2.0 Baseline Existing Conditions

## 2.1 Historical Land Use

The Plan Area is within the Natomas Basin, which is a reclaimed floodplain protected by levees on all sides. This area has been utilized for agricultural use for many decades. Review of historical topographic maps from 1915 and 1916 (see **Figure 2.2**) show the planning area partially inundated by Bush Lake, which is connected to Fisherman's Lake. By 1950, (see **Figure 2.3**) the West Drainage Canal had been constructed and Bush Lake had been drained. Also by 1950, the Natomas East Main Drainage Canal was constructed, which diverted Dry Creek runoff away from the Plan Area and into the American River.

RD 1000 was created as a Special District in 1911 by Act 930 as passed by the California State Legislature. RD 1000 replaced any other districts in the area and continues to be responsible for the operation and maintenance of the drainage facilities that receive and will continue to receive runoff from the Plan Area.

## 2.2 Topographic Data Sources

The existing conditions topographic mapping is based on a survey performed by Wood Rodgers in April 2019. Additional surveys identifying invert elevations and sizes of key culverts within the Plan Area were performed in August 2020 and December 2020. The Plan Area was surveyed using the National Geodetic Vertical Datum of 1929 (NGVD 29); NGVD 29 also serves as the City's vertical datum. The RD 1000 XPSWMM model developed by RD 1000 and its contractors was created using North American Vertical Datum of 1988 (NAVD 88) data. The Existing Conditions HEC-RAS model was developed in NAVD 88. The local transformation from NAVD 88 to NGVD 29 is -2.08 feet (NGVD 29 = NAVD 88 – 2.08'), per City of Sacramento benchmarks 276-H5B and 276-H6E within the Plan Area. Unless otherwise specified this study utilizes the NAVD 88 datum.

## 2.3 Offsite Drainage

Offsite Flows from Southeast

**Figure 2.4: Offsite Flows** present Offsite Drainage to the Plan Area from I-80 and areas South of I-80. The River Oaks development site (Reference 5) has historically overflowed to the north through dual 36-inch culverts under I-80 with most drainage being directed to Sump 160 to the south. The modeling provided

by the City of Sacramento was used to identify when the overflow occurs. The River Oaks development conveys 10-year flows south towards the City of Sacramento Sump 160 pump station, leaving flows greater than the 10-year storm event to flow via overland release through the existing culverts under I-80.

An existing 36-inch culvert located under I-80 and approximately 2,700 feet southwest of the El Centro interchange conveys discharge from I-80 into the Plan Area. This culvert conveys only runoff from I-80.

### River View #2 Subdivision

The River View #2 development as shown in **Figure 2.5: Offsite Drainage River View #2** is an existing development adjacent to the Plan Area located north of San Juan Road. Runoff from River View #2 drains southward towards San Juan Road where the flow is collected in a 60-inch storm drain, which conveys the 100-year runoff eastward under the West Drainage Canal and into the City of Sacramento Sump 17 Pond 7B detention basin southeast of the intersection of San Juan Road and the West Drainage Canal. In an extreme flooding event overland releases from the River View development will overflow into the existing open channels adjacent to San Juan Road and conveyed via the San Juan Pump Station into the West Drainage Canal. Figure 3B presents the on-site drainage system within the River View #2 development. Excerpts from the River View #2 drainage study are located in **Appendix A**.

The Natomas Estates development to the east of El Centro Road and north of Radio Road is mostly built out (fully developed) and currently drains by gravity directly into the West Drainage Canal.

### Riverside Canal

It is assumed for the existing condition that the Riverside Canal Phase 2 Relocation project is complete and operational. Per Reference 10, Riverside Canal has been revised to an underground pipe. The Natomas Mutual Water Company's (NMWC) Riverside Main Canal runs along the western edge of the Plan Area. The system delivers water from the Sacramento River to a series of lateral highline irrigation canals at Radio Road, Farm Road, and Parker Road that flow eastward through the plan area. The Riverside Main is open canal north of Radio Road and buried low pressure pipeline south of Radio Road. At Bryte Road the pipeline returns to open canal and serves highline canals flowing north along Bryte Road and northeast along Tree Road. The pipeline includes irrigation water services along its alignment for properties to the

east and west. The Riverside Canal alignment has been shifted westward from the Radio Road lift station to Farm Road. South of Farm Road, the Riverside Canal continues south along existing RD 1000 and Natomas Central Mutual Water Company (NCMWC) easements. The water supply ditch along Radio Road is served by a 30-inch high-density polyethylene pipe (HDPE) turnout, which conveys flows along this ditch and eventually to the Riverside Pump Station.

## 2.4 Onsite Drainage

Onsite flows originating from undeveloped agricultural lands are conveyed via drainage and irrigation canals to various RD 1000 ditches that collect field runoff and then convey the water to the West Drainage Canal. Runoff is conveyed from the existing Plan Area to the West Drainage Canal by two pump stations operated by RD 1000 and by various gravity systems including field drains, canal drains, and storm drains. **Figure 2.6: West Drainage Canal Existing Storm Drain Connections** presents the location and size of drains and pump stations that convey flows into the West Drainage Canal. The Riverside Pump Station is located just north of the existing development that is situated north of San Juan Road. The San Juan Pump Station is located along San Juan Road adjacent to the West Drainage Canal. **Figure 2.7: RD 1000 XPSWMM Conduits** shows how these connections to the West Drainage Canal are represented in the RD 1000 XPSWMM model.

Existing agricultural areas provide some floodplain storage. Agricultural areas are graded relatively flat with typical slopes less than 0.5% and are situated adjacent to berms and leveed irrigation canals. Flows in and out of the agricultural fields are typically limited by adjacent berms that usually measure two feet to three feet in height. Flows are typically controlled by 18-inch or 24-inch corrugated metal pipe (CMP) or by HDPE culverts installed under the berms, which creates some floodplain storage within the fields.

## 2.5 Hydrologic & Hydraulic Modeling Assumptions

An existing conditions HEC-RAS model using rain on grid precipitation was developed to determine baseline conditions for localized flows entering the West Drainage Canal. Examination of the RD 1000 XPSWMM model revealed that the existing culverts, storm drains, and field drains are not all individually represented, and most of the existing UWS Plan Area was represented by several large 1D storage areas. Based on discussions with Mead and Hunt and WYA on September 14, 2022, Wood Rodgers proposed to

utilize an existing conditions hydrologic and hydraulic model to determine more accurate runoff values from the existing Plan Area entering the West Drainage Canal. Rainfall was distributed across the model domain, with infiltration losses standardized to 0.014 inch/hour across the project as recommended by SCDWR and referenced from Technical Memorandum No. 3, Natomas North Precinct Flood Control & Storm Drainage Master Plan, (Reference 9). In addition, Wood Rodgers has prepared a Technical Memorandum that concludes that using a HEC-RAS rain on a grid precipitation model with a loss rate of 0.014 within the UWS Plan Area generates a total runoff value consistent with runoff values from the RD 1000 XPSWMM model. The technical memorandum is presented in **Appendix B**.

The existing conditions HEC-RAS model was run with the same (non-climate change) 100-year 10-day storm as the RD 1000 XPSWMM model in order to provide input hydrographs from the UWS Plan Area and to integrate the models. Wood Rodgers updated the evaluations with the RD 1000 provided model and RD 1000 staff will review and approve all models accordingly to establish the baseline condition for confirming that the proposed project would have no adverse impacts to the RD 1000 drainage facilities in the 100-year 10-day storm.

The existing conditions HEC-RAS model will also serve as a basis for comparison with the proposed condition to show compliance with the Sacramento County Floodplain Management Ordinance (January 13, 2017) which states that the proposed project shall result in no adverse impacts. The ordinance defines this as the following:

> *…causing increased flood stages, increased flood velocity, or increased flows in or near a special or local flood hazard area, to an extent including to but not limited to an increase in base flood elevation equal or greater than 0.1 foot on upstream, downstream, or adjacent properties.*"

The design storms are assumed to occur during winter months, when the weirs are removed and canals are free-flowing. The West Drainage Canal was not included in the HEC-RAS model domain because RD 1000 will utilize the RD 1000 XPSWMM model to evaluate the impacts of the proposed project on the existing RD 1000 drainage system. The hydraulic connection of the HEC-RAS model outflows into the XPSWMM model as inflow can be adequately defined and achieved without combining the geometry of the

RD1000 system model into the HEC-RAS model domain by using stage hydrographs as boundary conditions for HEC-RAS.

Some small culverts along roadside ditches are not included in the model. In these areas, the Digital Elevation Model (DEM) was revised to create a uniform channel representing roadside ditches. It is assumed that these DEM revisions will not have a significant impact on model results, because these ditches typically do not have large drainage areas or flows. The water supply transmission line (Riverside Canal) has been revised to the current configuration of an underground pipe.

## Description of HEC-RAS Model

The existing condition HEC-RAS model is full 2D with rain-on-grid precipitation. The model was developed using site-specific surveys including field determinations of culvert sizes and inverts, and irrigation channel cross sections. The model includes a 2D grid with internal 2D-to-2D connections representing existing culverts within the model domain. The Riverside and San Juan Pump Stations are represented with the same on/off elevations (NAVD 88) and pumping capacities as represented in the RD 1000 XPSWMM model.

The existing conditions HEC-RAS model was developed to simulate how the complexities of the terrain impact the flows going into the existing drainage system. The existing conditions models were created using the site topographic data described in Section 2.2 of this report. The models include a 2D grid with internal 2D to 2D connections representing culverts. The model domain encompasses the existing 2,066-acre Plan Area and adjacent lands south and west of the West Drainage Canal, the adjacent River View #2 Development, and the adjacent I-80 freeway. The existing River Oaks development south of the I-80 freeway influences are represented by running the XPSWMM model provided by the City of Sacramento for Sump 160. The River Oaks development overland release and the existing dual 36-inch culverts under I-80 are included in the model domain to ensure there are no adverse impacts from the proposed project on the existing development.

The Existing Condition 100-year HEC-RAS Model includes existing culverts within the existing Plan Area, the River View #2 development on-site storm drain, and the 60-inch storm drain in San Juan Road that

conveys runoff from the on-site storm drain east under the West Drainage Canal and to the City of Sacramento Sump 17 Pond 7B detention basin. One purpose of the existing condition 100-year HEC-RAS Model is to develop a baseline condition WSE for the 100-year design storms. The 100-year 24-hour, 100-year 5-day, and 100-year 10-day design storms with climate change are evaluated to show that the proposed project will not have adverse effects to peak WSE within the River View #2 development and adjacent off-site areas, as required by the County Floodplain Management Ordinance.

The RD 1000 system model is run for the 100-year 10-day storm only with a total rainfall value of 10.69 inches (without climate change), therefore the HEC-RAS model was also run with precipitation input that matches the total rainfall value used in the RD 1000 XPSWMM model to assess impacts to the RD 1000 system. Rainfall was distributed uniformly across the model domain for each storm scenario, with infiltration losses as noted above.

## Model Layout

**Figure 2.8: Existing Topography** presents the project topography and existing culverts used to develop the existing conditions model. **Figure 2.9: Existing Conditions HEC-RAS Model** presents a schematic layout of the existing conditions HEC-RAS model.

## Software Application and Version

HEC-RAS version 6.3 was used for the existing conditions hydrologic and hydraulic analysis.

## Limits of Study

The limits of study are the Plan Area and adjacent areas west and south of the West Drainage Canal, the adjacent tributary roadway areas along I-80, the influences of the River Oaks development (located south of I-80), and the River View #2 development.

The River Oaks development conveys runoff for events larger than the 10-year event north through an existing dual 36-inch reinforced concrete pipe (RCP) culvert under I-80. Existing runoff from these culverts is conveyed to the existing San Juan Pump Station via existing earthen canals. The proposed Project will convey flows from these culverts to the proposed East Detention Basin via an earthen channel and dual 60-inch RCP pipe. The River Oaks development and the existing dual 36-inch culverts under I-80 were

modeled in a combined 1D XPSTORM model with The CORE development provided by the City of Sacramento, and the precipitations were modified to include climate change. The 24-hour storm scenarios for the 100-year, 200-year, and 500-year reached the existing dual 36-inch RCP culverts and flowed into the plan area.

The River View #2 development conveys runoff via a 60-inch storm drain in San Juan Road east under the West Drainage Canal to the City of Sacramento Sump 17 Pond 7B detention basin. The River View development is included in the 2D model domain to compare the impacts of the proposed project on the existing development and verify that these projects are hydraulically separated and do not influence each other.

See **Appendix A** for referenced information from the River Oaks Drainage Study, River View #2 drainage study, and for Improvement plans for the City of Sacramento Sump 17 Pond 7B detention basin.

## Soils

**Figure 2.10: Hydrologic Soils Groups Map** presents soils with hydrologic soils group (HSG) values as determined by the U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) Soil Survey Geographic (SSURGO) Database. Soils in the project area are composed primarily of HSG C and D soils, with some HSG A soils in the undeveloped area along the Sacramento River Levee. The HSG values are provided as background but were not a factor in the analysis due to the alternative basis for the infiltration rate that was used.

## Land Use

**Figure 2.11: Existing Condition Land Use** presents existing condition land uses for the UWS. These land uses include Agricultural-Residential, Agricultural, Wetlands, Park, Very Low Density Residential, Low Density Residential, High Density Residential, Very High Density Residential, and Commercial.

## Infiltration

In lieu of watershed and runoff hydrograph calculations, rainfall was distributed evenly across the two-dimensional flow areas within the Plan Area. Infiltration losses were standardized to 0.014 inch/hour (for

pervious areas only) across the project, consistent with the analysis performed by Civil Solutions in Reference 9 and verified in the Technical Memorandum provided by Wood Rodgers in **Appendix B**.

## Routing

Routing was accomplished using culverts, canals and 2D areas in the HEC-RAS model. No hydrologic flood routing was needed because rainfall was applied to the ground surface and all routing was performed using hydraulic routing.

## Storage

Two existing detention basins are present in the existing Plan Area. They are located next to the freeway and represented in the existing conditions DEM. To account for the effective migration of floodplain storage within agricultural fields, the project DEM was first modified to cut small channels near the locations where pipe culverts convey flows from agricultural fields into and out of adjacent irrigation canals to represent field drains. Due to the field culverts contributing to attenuation within the fields, culverts and small berms were added back to the enhanced topography to represent the limited conveyance capacities of the field culverts. Culvert locations through adjacent berms were determined from inspection of the topographic data, aerial imagery, and from site visits performed by Wood Rodgers.

## Boundary Conditions

Boundary conditions in the West Drainage Canal for pump stations were determined from information provided by WYA from the RD 1000 XPSWMM model. Stage hydrographs were set in the West Drainage Canal at the existing Riverside and San Juan Pump Stations. **Figure 2.1: 100-year, 10-day Stage Hydrograph** represents the updated RD 1000 XPSWMM model that utilizes the existing conditions HEC-RAS model outputs to the West Drainage Canal. The figure represents the 100-year 10-day stage hydrograph in the West Drainage Canal at the existing Riverside and San Juan Pump Stations.

The Existing Condition 100-year HEC-RAS Model includes the on-site storm drain system within the River View #2 development as well as the connecting 60-inch storm drain within San Juan Road that conveys runoff east under the West Drainage Canal and to the City of Sacramento Sump 17 Pond 7B detention basin. It is assumed that the starting WSE in the Sump 17 Pond 7B Detention Basin is 7.1 feet NAVD 88,

which corresponds to the peak 100-year WSE in Pond B from the RD1000 XPSWMM model less one foot to account for peak flow timing preceding peak detention levels.

Pump On/Off data for the Riverside and San Juan pump stations was also obtained from the RD 1000 XPSWMM model and is shown below in **Table 2.1: Existing Pump On / Off and Flow Capacity**. Please note that pump curve data was not available in the RD 1000 XPSWMM model. It is understood that pump flow rates may vary with the total dynamic head, and subsequent studies will require specific pump curve data for design of the proposed pump stations. The existing Riverside and San Juan pump stations currently pump one-way from onsite to the West Drainage Canal.

**Table 2.1: Existing Pump On / Off and Flow Capacity**

| Off elevation (feet NAVD) | 9.17 | 10.42 | 6.42 | 7.67 |

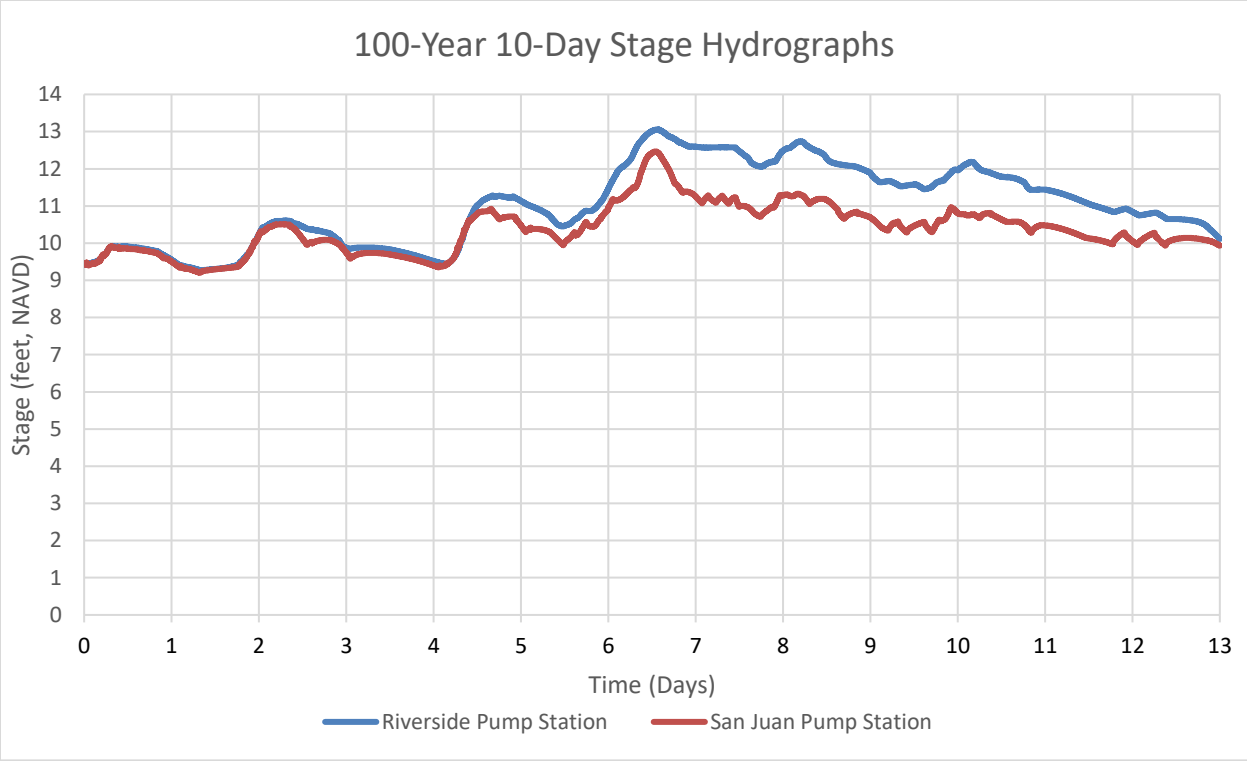

**Figure 2.1: 100-year, 10-day Stage Hydrograph**
*Source: Updated RD-1000 XPSWMM System Wide Model by Wood Rodgers*

## Manning's "n" Values and Local Losses

Manning's "n" values for CMP culverts were assumed to be 0.024. Manning's 'n' values for concrete culverts were assumed to be 0.013. Entrance and exit losses were calculated within HEC-RAS for existing culverts. Entrance loss coefficients for existing culverts are typically 0.5 and exit loss coefficients are typically 1.0. Manning's "n" values for drainage canals were assumed to be 0.035. Manning's "n" values for 2D flow areas are based on land use as shown in **Figure 2.11: Existing Condition Land Use**, and developed based on a combination of suggested values from various literature sources such as the HEC-RAS 2D user's manual (Reference 12) and on engineering judgement. **Table 2.2: Manning's Roughness Coefficient for 2D Flow Areas** presents Manning's 'n' values corresponding to existing land use values used in the Existing Condition HEC-RAS model.

**Table 2.2: Manning's Roughness Coefficient for 2D Flow Areas**

| Land Use Description | Roughness Coefficient |
|---|---|
| Agricultural | 0.04 |
| Agricultural-Residential | 0.04 |
| Roadway | 0.025 |
| Wetlands | 0.04 |
| Park | 0.04 |
| Very Low Density Residential | 0.06 |
| Low Density Residential | 0.08 |
| High Density Residential | 0.12 |
| Very High Density Residential | 0.12 |
| Commercial | 0.16 |

## 2.6 Summary of Discharges and Stages

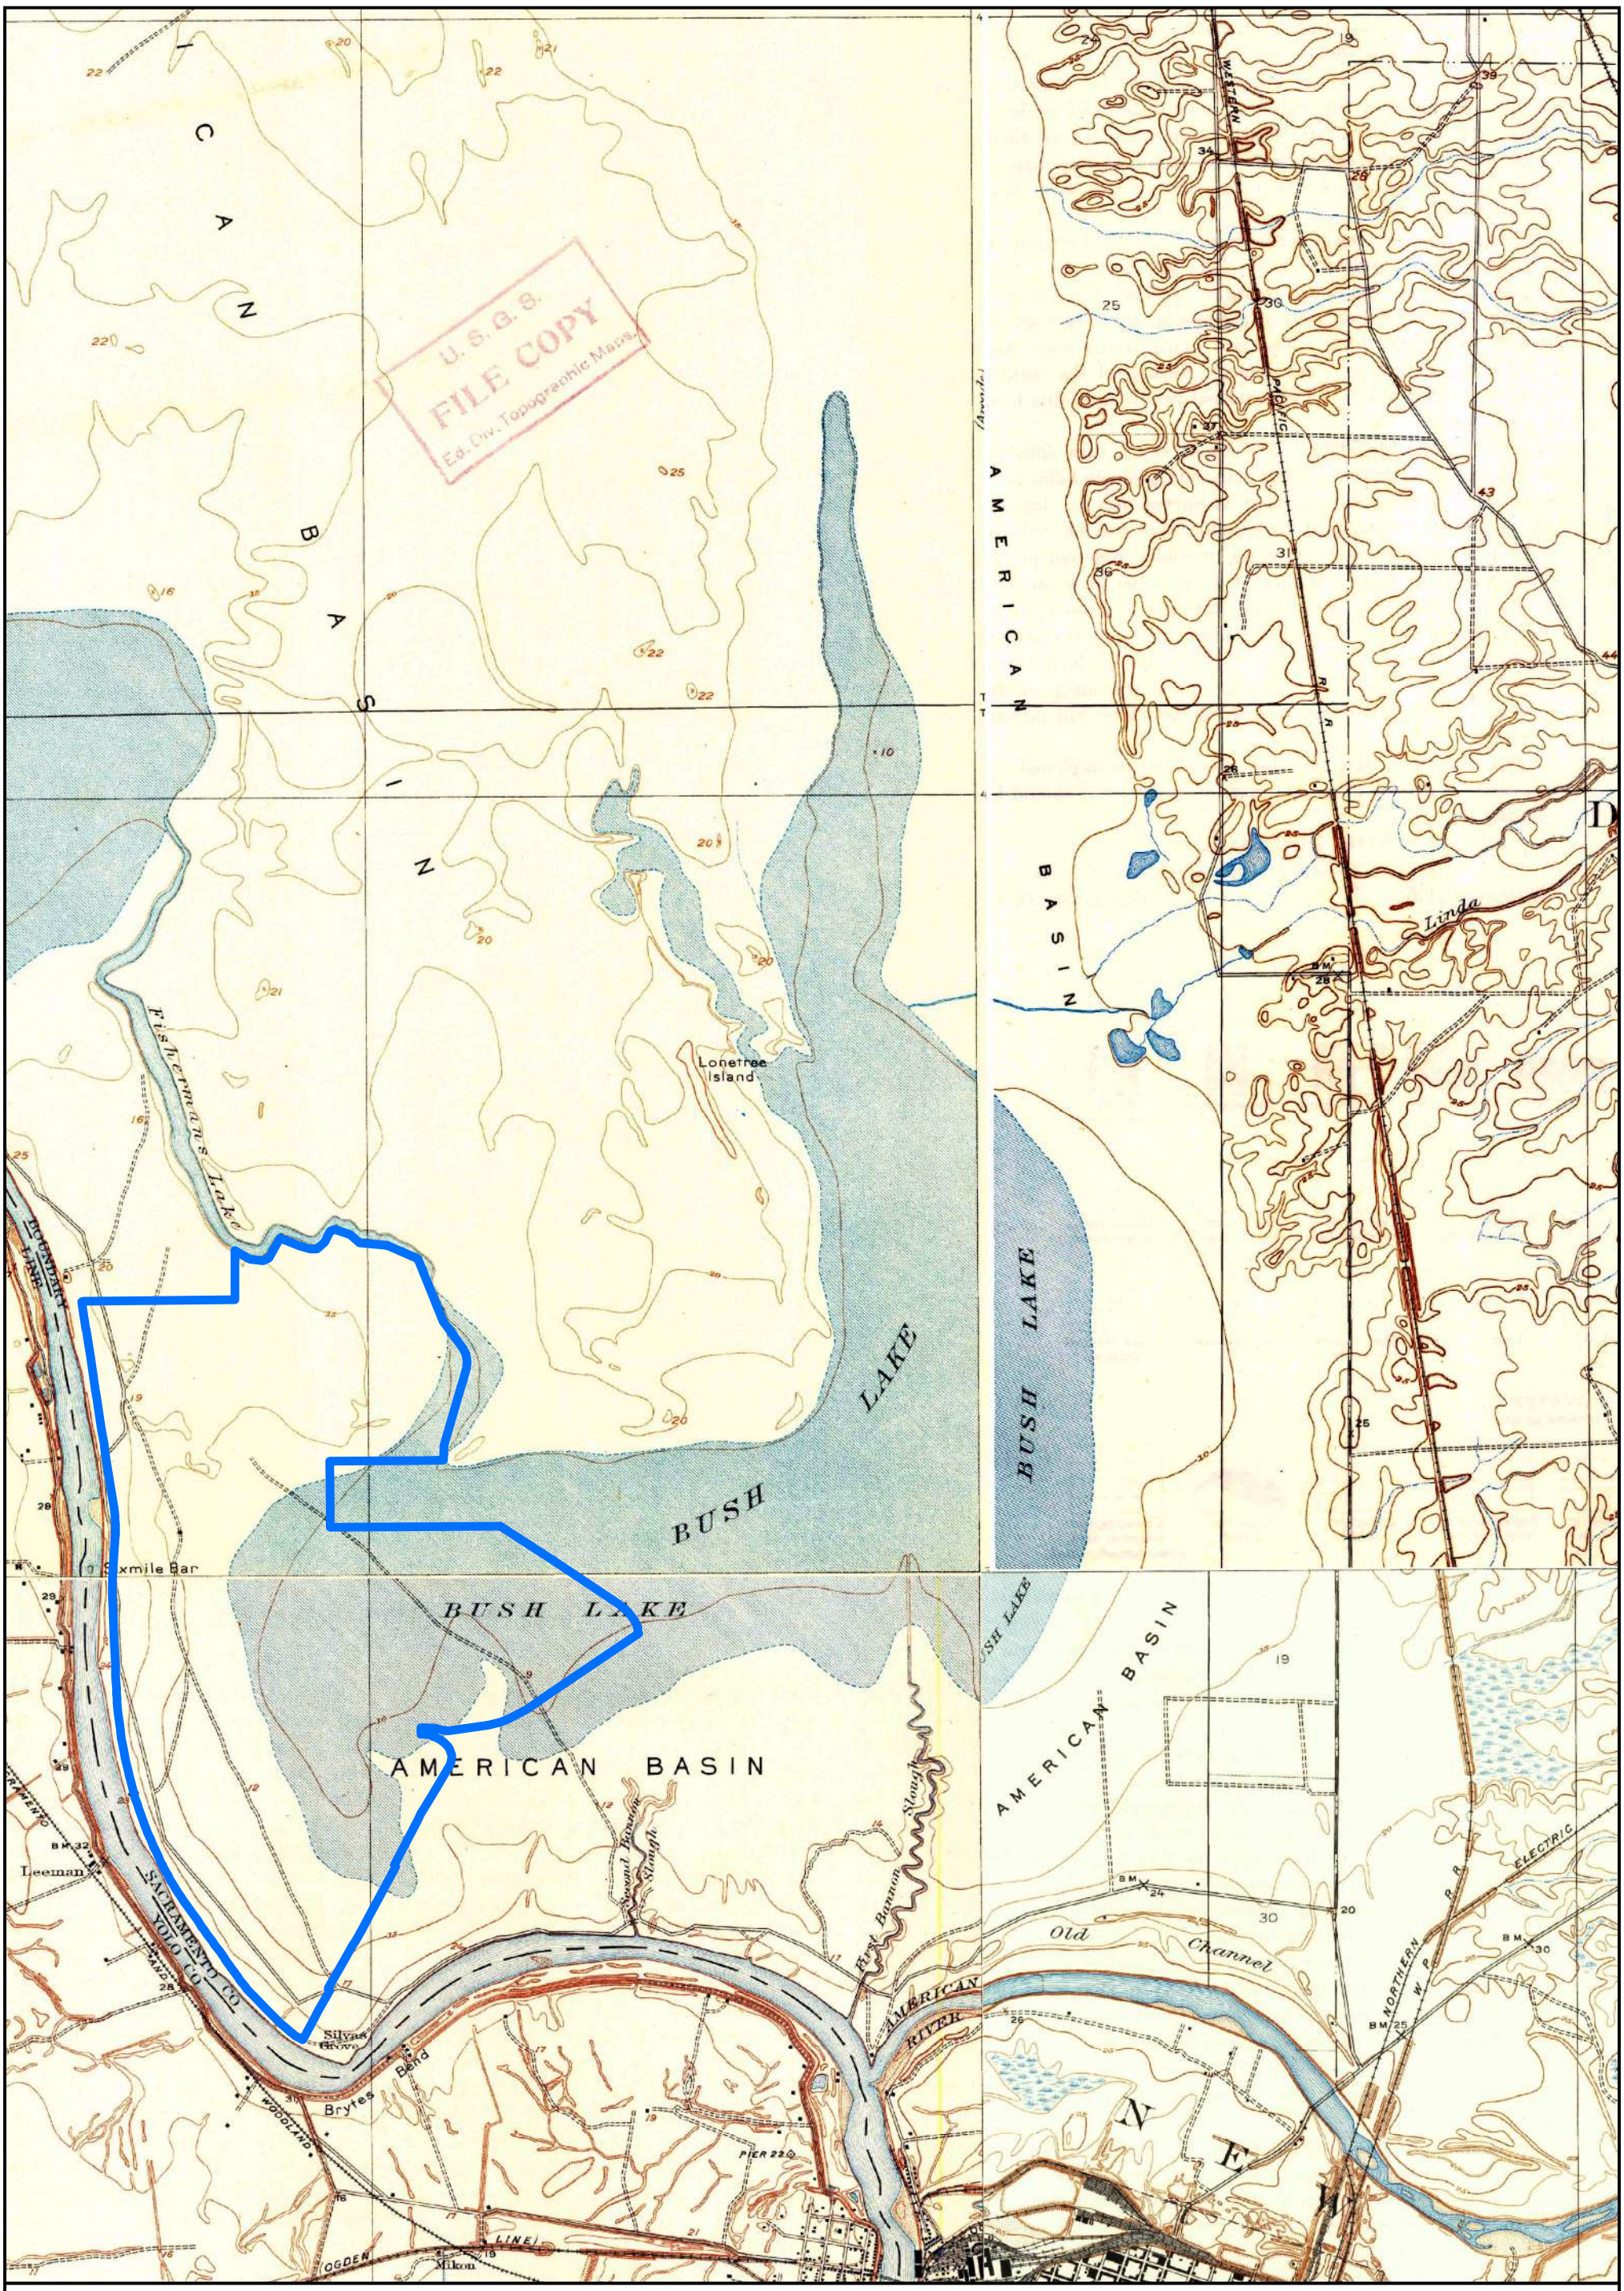
Model results for all storm events in the existing conditions HEC-RAS model are presented in **Appendix C**. Please note that all existing condition flows discharge into the West Drainage Canal. The existing conditions HEC-RAS model was run with the same 100-year 10-day storm as was the RD 1000 XPSWMM model in order to provide updated input hydrographs from the UWS Plan Area. Inflow hydrographs from the existing conditions HEC-RAS modeling will be input into the RD 1000 XPSWMM model to demonstrate that the project will have no adverse impacts on the RD 1000 drainage facilities. It is assumed that RD 1000 and its consultants will review the HEC-RAS model and input hydrographs and Wood Rodgers updated RD1000 XPSWMM model to confirm that the proposed project would have no adverse impacts on the RD 1000 drainage facilities in the 100-year 10-day storm. County DWR is not expected to review and approve models meant to satisfy RD-1000.

### Profiles

No profiles for existing facilities were prepared for the existing conditions analysis. The existing drainage system of irrigation canals and culverts will be replaced in the proposed condition with storm drain systems designed to meet SCDWR criteria.

### Floodplain Extents

**Figure 2.12** thru **Figure 2.15** presents the existing conditions floodplain extents as determined by the existing conditions HEC-RAS model for the 100-year 24-hour, , 100-year 5-day and 100-year 10-day storm



events with climate change factors applied. **Figure 2.16: Existing Conditions Maximum Floodplain Depth, 100-year, 10-day No Climate Change** is also provided to represent the 100-year 10-day storm event without climate change for consistency with RD1000 modeling. Floodplain depths measuring over two feet were common within existing fields, as floodwater backs up from existing drainage canals due to existing pump station capacity limitations and existing berms delaying ponded water from reaching the canals.

## 2.7 RD1000 XPSWMM System Model Modifications

The onsite baseline conditions modeling using HEC-RAS (described above) produces runoff estimates that enter and influence the RD1000 canal and pumping system. The RD1000 system is modeled separately using XPSWMM. The interface between the HEC-RAS model domain and the RD1000 system model is the West Drainage Canal. There are two types of hydraulic connections; gravity and pumping. Culverts which drain by gravity into the West Drainage Canal must be evaluated consistently in both models, with the tailwater system conditions being defined in the XPSWMM model based on the gravity inflow estimates from the HEC-RAS model. Both models require a hand-off approach, where output from each model is used as the input for the other at these culvert locations, iteratively. This approach was performed until the XPSWMM output stages using HEC-RAS inflow (based on XPSWMM tailwater) converged to within 0.1 feet. Pumped connections do not require this hand-off approach as pumping rates are not influenced by tailwater conditions in the West Drainage Canal.

The RD1000 system model previously defined the watershed areas that define the Upper Westside plan area (north of I-80 and west of the West Drainage Canal) using XPSWMM hydrology. Wood Rodgers replaced the XPSWMM results for the Plan Area with the results from the existing conditions HEC-RAS model (100-year 10-day without climate change influences). The final baseline modeling for onsite uses HEC-RAS estimated inflows at each of the locations shown on **Figure 2.6: West Drainage Canal Existing Storm Drain Connections**. There is not a unique node in the XPSWMM model for each of the small culvert inflow locations, therefore smaller locations have been clustered together as inflow into the XPSWMM model at the nearest adjacent location. The RD1000 system model with updated inflows from the

undeveloped Upper Westside plan area establishes the baseline condition in the RD1000 system for assessing proposed conditions impacts.

**FIGURE 2.16**

# 3.0 Mitigated Project / Proposed Conditions

## 3.1 Proposed Land Use

**Figure 3.2: Proposed Conditions Land Use Plan** presents proposed land uses in the Plan Area. The proposed project envisions five distinct planning districts as defined in the Specific Plan, including the central Town Center District, the residential West "C" District, the residential and commercial East Triangle District, the educational and residential Young Scholars District, and the Ag-Buffer District that will sit outside of the 1,566-acre Developable Area. **Table 3.1: Proposed Land Use Summary** below contains a summary of the proposed land uses.

The Town Center District is the urban core of the Plan Area and is set on a pedestrian friendly street grid system. The Town Center will feature a main street along West El Camino Avenue and a north-south recreational canal which also provides for drainage conveyance. The West "C" District will predominantly consist of residential neighborhoods that surround the Town Center to the north, west and south. The East Triangle District will feature Employment / Highway Commercial uses near the I-80 and West El Camino Avenue interchange. The Young Scholar's District will be centered around three educational facilities: a high school, a K-8 school, and a satellite campus for the Los Rios Community College District. The Ag-Buffer District will preserve the existing Ag-Cropland (AG – 421.6 acres) and Ag-Residential (AR – 93.3 acres) land uses.

**Table 3.1: Proposed Land Use Summary**
*Source: Wood Rodgers, Preliminary Land Use Plan – Missing Middle Density Bonus, dated September 1, 2023.*

| Land Use District | Area (acres) | Estimated Dwelling Units | Estimated Square Footage |
|---|---|---|---|
| Very Low Density Residential | 166.7 | 168 | |
| Low Density Residential | 390.8 | 2,149 | |
| Low / Medium Density Residential | 134.9 | 1,079 | |
| Medium Density Residential | 61.9 | 743 | |
| High Density Residential | 36.4 | 910 | |
| Very High Density Residential | 22.6 | 791 | |
| Commercial Mixed Use | 83.6 | 3,216 | 2,184,970 |
| Employment / Highway Commercial | 52.9 | | 921,730 |
| School | 124.2 | | |
| Park | 79.1 | | |
| Green Belt / Urban Farm | 44.1 | | |
| Open Space (Basins & Channels) | 167.9 | | |
| Open Space (Ag Buffer) | 36.6 | | |
| Ag Cropland | 414.3 | | |
| Ag Residential | 86.1 | | |
| Open Space Water (Canal) | 15.0 | | |
| Landscape Corridor | 27.8 | | |
| Major Roads A | 115.9 | | |
| Major Roads B (Within Ag Buffer) | 5.4 | | |
| Missing Middel Density Bonus | | 300 | |
| **Total** | **2066.2** | **9,356** | **3,106,700** |

## 3.2 Grading Plan

**Figure 3.3: Proposed Conditions Conceptual Grading Plan** presents the proposed Conceptual Grading Plan for the Plan Area. The site was graded to balance cut and fill areas and to direct flows towards one of four detention basins that are proposed to provide sufficient storage to eliminate adverse impacts in RD 1000 facilities (to meet RD 1000 requirements) and in adjacent properties (to meet the County Floodplain Management Ordinance). The proposed detention basins, or a portion of the basin, would be excavated to an elevation of minus three (-3) feet (NAVD 88) to provide the necessary earth fill material. Preliminary geotechnical investigations and a review of historical groundwater levels indicate groundwater as high as elevation 10 feet. Therefore, the detention basins will be equipped with dedicated groundwater pumps to evacuate groundwater to elevation five (5) feet for the proposed condition hydraulic analysis, and to ensure

sufficient flood mitigation storage during periods of high seasonal groundwater. **Appendix D** presents the Preliminary Grading Exhibit for the Project Site.

The detention basin excavations will not encroach within the limits established for protection of the levee integrity. The limits are described as a no excavation within a 50-foot corridor from the levee toe and below a projected plane of 10 horizontal to 1 vertical beyond the 50-foot levee setback corridor. Upon completion of the site specific subsurface geotechnical investigations and analysis, further setback or other remediation measures may be warranted.

## 3.3 Offsite Considerations

No offsite drainage improvements are proposed, except as discussed below. It is not anticipated that offsite improvements to meet embankment freeboard, geometry and other criteria for the West Drainage Canal will be necessary. It is presumed that RD 1000 and its contractors will review the developed conditions RD 1000 XPSWMM model with included input hydrographs from the developed Planning Area in order to confirm that no adverse impacts occur at existing RD 1000 facilities.

The Riverside Water Supply Pump Station operated by NCMWC would remain operational during and after development of the proposed project in order to serve adjacent areas. The water supply transmission line (Riverside Canal) has been revised to an underground pipe per the Riverside Canal Phase 2 Relocation Project design plans (Reference 10). The water supply ditch along Radio Road is served by a 30-inch HDPE turnout. Any runoff generated from irrigated lands along the Radio Road ditch would eventually be drained via the on-site storm drain into the North Detention Basin following existing drainage patterns. South of Farm Road, the Riverside Canal continues south along existing RD 1000 and NCMWC easements.

The River View #2 development has been evaluated and Wood Rodgers has determined that the 100-year storm conditions within River View #2 are hydraulically separate from land outside of River View #2, as it is directed to drain under the West Drainage Canal to existing the existing Sump 17 Pond 7B Detention Basin.

### El Centro Road West Drainage Canal Crossing

El Centro Road south of Arena Boulevard will require widening to accommodate the ultimate roadway section and a right turn pocket at Arena Boulevard. This will result in replacing or extending the existing

72-inch corrugated metal pipe culverts to account for the roadway widening. The sizing, type, and whether the culverts can be extended will be determined with future design efforts. Hydraulic analysis will be performed such that the hydraulic conditions in the canal are consistent with or better than pre-project conditions. The County will consult with RD1000 on the details of modifying the culvert encroachments on the West Drainage Canal, the condition of existing features, and the potential impacts to adjacent features.

## 3.4 Onsite Improvements

Onsite improvements are presented in **Figure 3.4: Proposed Conditions Onsite Improvements Map**. Runoff directed to the West Detention Basin will be detained and pumped into a proposed earthen channel flowing east towards the East Detention Basin. Runoff directed to the South Detention Basin will be detained and pumped into the Central Canal. This canal will be used primarily as a water feature but will have available conveyance capacity to direct flows from the South Detention Basin north to a proposed earthen channel along San Juan Road that will discharge into the East Detention Basin. The Central Canal will be drained via a 20-foot wide weir at elevation 12.0 and a low flow outlet (8-inch diameter orifice) at elevation 8.0, which will allow for a permanent pool in the canal below elevation 8.0 to be used as a water feature. The starting water surface elevation of the Central Canal has been set to 10-ft to match the high groundwater level.

Runoff directed to the North Detention Basin and East Detention Basin will be pumped into the West Drainage Canal via a proposed pump station at each basin. It is important to note that the existing development known as Natomas Estates is considered more than 50% built out and is assumed to continue to drain by gravity directly into the West Drainage Canal. There is no mechanism for forcing the existing developed parcels within Natomas Estates to drain into the North Basin and be pumped when they already drain by gravity or forcing the remnant parcels to build a separate drainage system and be responsible for paying for the entire subdivision drainage improvements and pumping in perpetuity. In the future tentative map analysis the North Basin will be modeled as two cells, and the connecting culvert between the cells will be evaluated in greater detail.

The onsite drainage system is designed to include reserved storage in the West Detention Basin that would be utilized once water surface elevations in the adjacent channels reach 9.5 feet in elevation. An equalization conveyance structure (such as an RCB culvert with a weir) at elevation 9.5 from the West Detention Basin to the adjacent outfall channel will allow flows to enter the West Drainage Basin instead of the East Detention Basin during times of extreme high flows.

## Ag-Buffer Drainage

Several drainage canals are proposed to be built on the boundary of the proposed development and in areas within the Plan Area that will not be graded or developed (e.g., remaining agricultural areas). These proposed drainage canals would drain existing irrigation canals located within the remaining agricultural areas during winter months when no irrigation water supply is present in the system. The system configuration would allow for continued agricultural production after development of the Plan Area is completed by maintaining proper drainage. The channel improvements constructed with the Riverside Canal Phase 2 Relocation Project design plans (Reference 10) would be maintained. Where required to facilitate ag-buffer runoff, channel and storm drain improvements would be constructed primarily within existing easements dedicated to RD 1000 and to the Natomas Central Mutual Water Company but not in conflict with their facilities. Drainage improvements that are subject to County jurisdiction will require quitclaim by RD1000. These proposed channels will be sized to convey the 100-year design storm event with one foot of freeboard per Sacramento County standards. They will also be designed to provide enough capacity to reduce increases in peak water surface elevations to no more than 0.1 foot for the remaining agricultural areas (as per the Sacramento County Floodplain Management Ordinance).

**Figure 3.1: Ag-Buffer Urban Interface** below depicts the typical condition of a cut-off channel to intercept the Ag Buffer runoff and collect that runoff intermittently at Type F Drop Inlets. The drainage is then conveyed via drainage pipes to the North, West and South detention basins. This drainage report assesses all Ag Buffer runoff being conveyed within the Ag Buffer corridor consistent with the first cross section, draining directly into detention basins. A potential alternative section has also been presented depicting conveyance of the Ag Buffer runoff through the local street drainage system at intermittent locations. As an option, the alternative section can be studied during tentative map submittal reviews once streets and

lots have been located. Drainage facilities along the ag-buffer constructed to convey runoff per County Standards will be operated and maintained by the County.

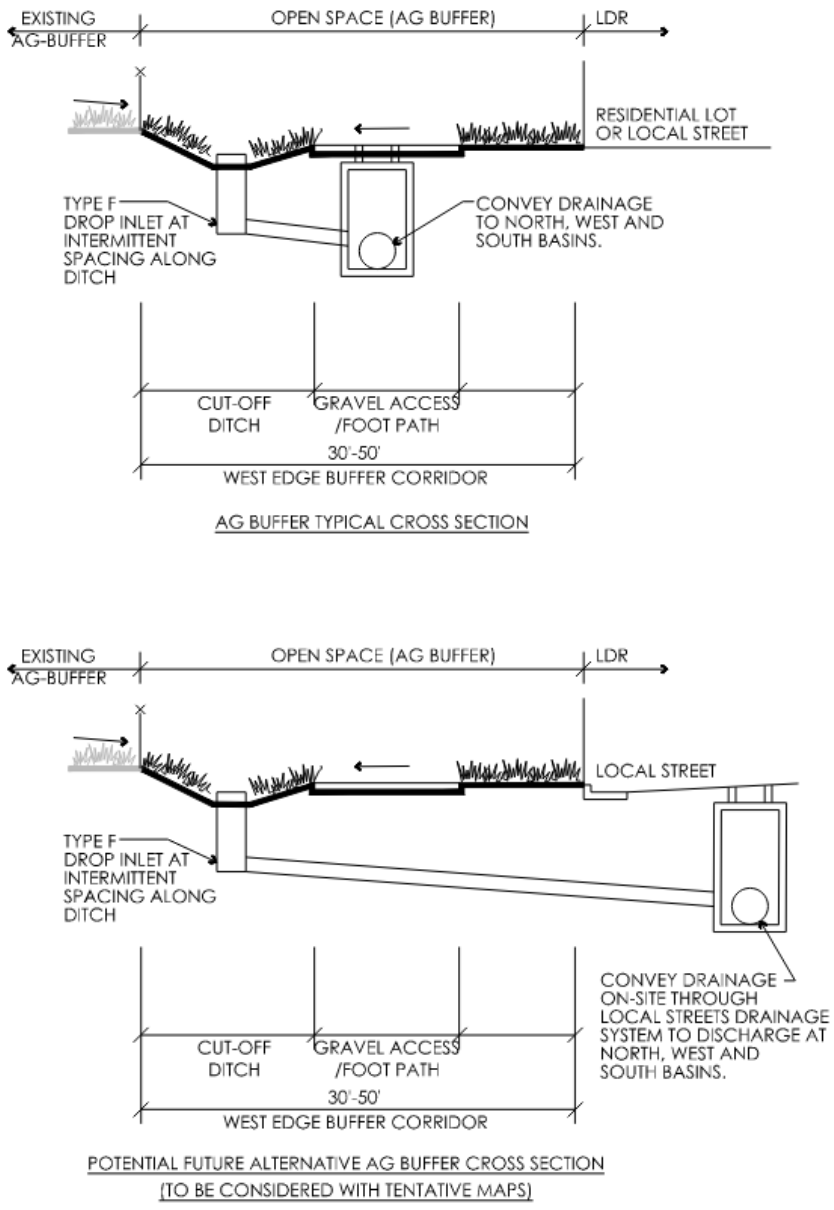

**Figure 3.1: Ag-Buffer Urban Interface**

### Onsite Channels

All proposed channels will be designed to have the required freeboard relative to graded conditions immediately proximate to the channel banks (landscape corridors and/or access roads directly adjacent to channels). All proposed channels are anticipated to be operated and maintained by the County, except for the Central Canal feature. Final ownership and operation / maintenance responsibilities are expected to be determined in the future under Specific Plan implementation or Tentative Map efforts.

### Natomas Mutual Company Irrigation Water

Phasing within the development will have to account for the continued operation of the Riverside Canal as well as all canals that are left to serve the remaining agricultural areas. While existing agricultural channels may be repurposed to convey drainage flow in the future, it is not the intent of this plan area to convey irrigation water supply flows through underground (newly constructed) storm drainage systems that fall under the operation and maintenance responsibility of SCDWR. All storm drainage facilities operated by SCDWR will be dedicated to drainage. Separate water supply facilities will be constructed as needed for phasing. Phasing is to be determined during the Tentative Map and improvement plan efforts, as discussed in Section 4.7 below. Additionally, sufficient analyses showing adherence to the Sacramento County Floodplain Management Ordinance will be provided during the Tentative Map process and with grading plans.

## 3.5 Hydrologic & Hydraulic Modeling Assumptions

The proposed condition XPSWMM model is intended to:

1. Determine the total runoff to the west drainage canal for the 100-year 10-day storm event;
2. Show that the proposed condition is in compliance with the Sacramento County Floodplain Management Ordinance;
3. Show that the proposed detention basins meet freeboard requirements per SCDWR Pump Station and Detention Basin Design Criteria; and

4. Show the peak floodplain water surface elevations in the 200-year design storm within the West Drainage Canal.

The proposed condition XPSWMM model is also intended to evaluate proposed trunk storm drains per the Nolte Method and street ponding, and to show compliance with 50% pump operating criteria as required by the SCDWR Pump Station and Detention Basin Design Criteria.

The proposed condition XPSWMM model has been developed to determine proposed condition flows into the West Drainage Canal using the 100-year 10-day design storm consistent with what was used in the RD 1000 XPSWMM model to evaluate the impacts of the proposed project on the existing RD 1000 drainage system. It is assumed that RD 1000 will review the XPSWMM models and input hydrographs and the Wood Rodgers updated RD 1000 XPSWMM model to confirm that the proposed project would have no adverse impacts to the RD 1000 drainage facilities in the 100-year 10-day storm.

The proposed condition XPSWMM model will also serve as a basis of establishing compliance with the County Floodplain Management Ordinance which states that the proposed project shall result in no adverse impacts. This is defined as:

> *…causing increased flood stages, increased flood velocity, or increased flows in or near a special or local flood hazard area, to an extent including to but not limited to an increase in base flood elevation equal or greater than 0.1 foot on upstream, downstream, or adjacent properties*.

The West Drainage Canal was not included in the model domain because RD 1000 will continue to utilize the RD 1000 XPSWMM system model to evaluate the impacts of the proposed project on the existing RD 1000 drainage system. The pump stations were modeled using single-flow pumps instead of pump curves. Subsequent studies advancing the design of the pump stations will require pump curves that are specific to each selected motor/pump configuration.

Most of the culverts shown on **Figure 2.6: West Drainage Canal Existing Storm Drain Connections** are in areas that are not participating in this development and will not be modified by this project and will continue to drain into the West Drainage Canal. Culverts C-6, C-5, C-15, F-17A, and F-17 will be removed as this project develops in those locations.

The water supply transmission line (Riverside Canal) has been revised to an underground pipe. The existing conditions HEC-RAS 2D models include the new geometry for the Riverside Canal and associated culverts, as well as ditches per the Riverside Canal Phase 2 Relocation Project design plans (Reference 10).

## 3.6 Description of XPSWMM Model

An on-site 1D hydrologic and hydraulic XPSWMM model was developed to model estimated pipes using the Nolte method and to show compliance with the SCDWR Pump Station and Detention Basin Design Criteria for 50% of pumps not operating scenario as shown in **Figure 1.1: Maximum WSE Exhibit, Street Section**.

The proposed conditions XPSWMM model utilizes 1D hydrology to represent areas that are modified and unmodified by the project. Project areas that are proposed to be graded are represented by 1D model elements, with watersheds delineated based on proposed grading. Infiltration losses are standardized to 0.014 inch/hour across the project, and a backbone trunk storm drainage system including proposed pipes and drainage channels are designed to meet SCDWR criteria. Detention basins and pump stations were designed to meet the criteria presented in **Table 1.1: Pump Station Design Criteria**. The backbone storm drain system was evaluated using the Nolte method and a starting WSE in the downstream detention basin set to the maximum 10-year WSE from subsequent model runs.

The remaining agricultural areas within the Plan Area that are located adjacent to proposed graded areas are represented by 1D hydrology, with infiltration losses standardized to 0.014 inch/hour.

## 3.7 Watershed Delineation

**Figure 3.5: Proposed Conditions Watershed Map** presents the proposed condition watershed map. Watersheds were delineated based on the general drainage patterns developed with the conceptual grading plan to facilitate development of the backbone storm drain system. The average watershed size is approximately 25 acres. Runoff from the watersheds was directed to each adjacent trunk drainage system or drainage channel represented as 1D links in the proposed condition XPSWMM model.

## Model Layout

**Figure 3.6: Proposed Conditions XPSWMM Model** presents the proposed conditions XPSWMM model layout. Runoff hydrograph calculations were performed for the watersheds shown on **Figure 3.5** with infiltration losses standardized to 0.014 inch/hour across the project, and injected to the hydraulic network shown on **Figure 3.6**.

The trunk drainage system within the Plan Area is represented using the multi-link option within XPSWMM. With the multi-link option, multiple parallel conveyances, such as a pipe and the street above it, can be represented with a single model link. Street sections are based on the preliminary street sections provided from the Upper Westside Specific Plan Administrative Draft dated July 20, 2023.

## Software Application and Version

XPSWMM version 17.1 with the Sacramento method module were used for the proposed conditions hydrologic and hydraulic analysis. The historical storm option was utilized to account for climate change precipitation factors.

## Limits of Study

The limits of study are the Plan Area and adjacent areas west and south of the West Drainage Canal, the adjacent tributary roadway areas along I-80, the River Oaks development located south of I-80, and the River View #2 development.

## Climate Change Precipitation Factors

Precipitation factors were provided by the County for the proposed condition analysis in order to account for potential increases in precipitation due to climate change. Climate change precipitation factors are currently under development by the County and have not been finalized. **Table 3.2: Climate Change Scaling Factors used in Proposed Conditions Model** presents climate change factors used for proposed conditions models for UWS. For design storms with a duration of 24 hours, the scaling factors were applied to each individual value within the hyetograph ranging from the 5-minute precipitation value to the 24-hour precipitation value. For design storms with a duration longer than 24 hours, the scaling factors were applied

to the total design storm precipitation values. These factors were used in the preliminary design of the proposed drainage facilities.

These interim climate change factors are provided by the County. It is understood that, once approved and adopted, all future studies within the Plan Area will be subject to the County's final version of the climate change analysis and methodology.

**Table 3.2: Climate Change Scaling Factors used in Proposed Conditions Model**
*Source: Sacramento County, Department of Water Resources*

| Duration | Recurrence Interval (year) | | | | |
|---|---|---|---|---|---|
| | 10 | 50 | 100 | 200 | 500 |
| 5-min | 1.30 | 1.36 | 1.47 | 1.59 | 1.72 |

| 15-min | 1.30 | 1.36 | 1.47 | 1.59 | 1.72 |
| 30-min | 1.30 | 1.36 | 1.47 | 1.59 | 1.72 |
| 1-hour | 1.30 | 1.36 | 1.47 | 1.59 | 1.72 |
| 3-hour | 1.22 | 1.34 | 1.44 | 1.55 | 1.69 |
| 6-hour | 1.20 | 1.38 | 1.43 | 1.56 | 1.68 |
| 12-hour | 1.20 | 1.30 | 1.36 | 1.39 | 1.42 |
| 24-hour | 1.16 | 1.25 | 1.30 | 1.31 | 1.33 |
| 36-hour | 1.15 | 1.17 | 1.17 | 1.21 | 1.23 |
| 5-day | 1.15 | 1.17 | 1.17 | 1.16 | 1.16 |
| 10-day | 1.08 | 1.07 | 1.09 | 1.09 | 1.10 |

## Soils

**Figure 2.10: Hydrologic Soils Groups Map** presents soils with HSG values as determined by the USDA NRCS SSURGO Database. Soils in the project area are composed primarily of HSG C and D soils, with some HSG A soils in the undeveloped area along the Sacramento River Levee. The HSG values are provided as background but were not a factor in the analysis due to the alternative basis for the infiltration rate that was used.

## Land Use

**Table 3.3: Proposed Conditions Land Use** below presents the various land uses within the Plan Area for proposed conditions along with the corresponding Sacramento County land use (SacCalc) code. Corresponding published impervious area percentages are listed. Infiltration rates were standardized to

0.014 inch/hour across the project consistent with the RD 1000 Natomas Basin-wide modeling as presented in Reference 9 and **Appendix B**.

**Table 3.3: Proposed Conditions Land Use**

## Lag Transformation Method

Lag transformation was calculated using the Basin "n" method as described in the *"Sacramento City/County Drainage Manual Volume 2: Hydrology Standards"*, Chapter 7 – Basin Lag. The formula for lag transformation is:

$$L_g = Cn\langle LL_c|S^{0.5}\rangle^{0.33}$$

Where:
$L_g$ = Lag time, minutes
$C =$ 1,560

[2] The Central Canal impervious percentage is 95%.

[3] At the request of SCDWR the impervious percentage for detention basins is to be 95%.

$n =$ Basin "n"
$L =$ Length of longest watercourse, miles
$L_c =$ Length along the watercourse to a point close to the centroid of basin, miles
$S =$ Slope of longest watercourse, feet/mile

**Table 3.4: Lag Parameters, Proposed Condition** presents the Basin "n" values for proposed land uses within the Plan Area. The "Developed Pipe/Channel" channelization description values were chosen for the proposed buildout condition. Composite Basin "n" calculations were performed for each watershed by the Sacramento module for the XPSWMM program.

**Table 3.4: Lag Parameters, Proposed Condition**
*Source: Table 7-1 of City/County of Sacramento Drainage Manual, Volume 2*

| Land Use Designation | Basin "n" |
|---|---|
| AG | 0.07 |

| VLDR | 0.053 |
| W | 0.03 |
| WTLND | 0.075 |

## Routing

Routing was accomplished hydraulically using the proposed drainage system and proposed detention basins in the XPSWMM model. Runoff will drain by gravity through a combination of storm drain pipes, streets, and open channels into four detention basins. **Figure 3.5: Proposed Conditions Watershed Map** identifies the areas tributary to each of the four basins: East, West, North and South.

## Water Quality Volume

For each detention basin, a preliminary water quality volume (WQV) based on pre-LID requirements was calculated at the request of SCDWR. **Table 3.5: Preliminary (Pre-LID) Water Quality Volume Calculations** presents the results of hypothetical WQV calculations based on the tributary area to each detention basin and the weighted impervious area for each tributary area. The contributions of I-80 were accounted for in both the southern and eastern detention basins. The detentions basins will be designed consistent with Table DB-1 of the SQDM.

**Table 3.5: Preliminary (Pre-LID) Water Quality Volume Calculations**

| Basin Location | Basin Shed Area (acre) | Impervious Area (acre) | Impervious Percentage | $P_0$ | Pre-LID WQV (ac-ft) | 1.25 Pre-LID WQV (ac-ft) |
|---|---|---|---|---|---|---|
| **North** | 431.4 | 151.8 | 35.2 | 0.27 | 10 | 12 |
| **South** | 517.9 | 225.8 | 43.6 | 0.33 | 14 | 18 |
| **West** | 524.7 | 176.9 | 33.7 | 0.25 | 11 | 14 |
| **East** | 508.1 | 323.3 | 63.6 | 0.46 | 20 | 24 |
| **Combined to East Basin** | 1550.8 | 726.0 | 46.8 | 0.35 | 45 | 57 |

## Detention Basin Storage & Pumping

Stage storage definitions for proposed detention basins are provided below in **Table 3.6: Proposed Detention Basin Stage Storage**. The detention basin pumps are configured to allow for the flexibility of use as water quality detention basins as well as regional detention basins. The determination of the number of pumps and the sizes of pumps as well as the detention basin sizes was accomplished iteratively by checking for impacts in the RD 1000 system and within the plan area under various storm scenarios.

**Table 3.6: Proposed Detention Basin Stage Storage**

| | North Basin | | West Basin | | South Basin | | East Basin | |
|---|---|---|---|---|---|---|---|---|
| **Maximum Allowable WSE[4]:** | **14.6 ft** | | **13.3 ft** | | **13.0 ft** | | **13.3 ft** | |
| **Elevation** | **Area (acres)** | **Volume[5] (ac-ft)** | **Area (acres)** | **Volume[5] (ac-ft)** | **Area (acres)** | **Volume[5] (ac-ft)** | **Area (acres)** | **Volume[5] (ac-ft)** |
| -3 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 5 | 21.2 | 0 | 28.3 | 0 | 21.4 | 0 | 28.2 | 0 |
| 6 | 21.9 | 21.5 | 28.8 | 28.6 | 21.8 | 21.6 | 28.6 | 28.4 |
| 7 | 22.7 | 43.8 | 29.3 | 57.6 | 22.2 | 43.6 | 29.1 | 57.3 |
| 8 | 23.5 | 66.9 | 29.8 | 87.1 | 22.7 | 66.1 | 29.6 | 86.6 |
| 9 | 24.2 | 90.8 | 30.3 | 117.2 | 23.1 | 89 | 30.1 | 116.5 |
| 10 | 25.0 | 115.4 | 30.7 | 147.6 | 23.5 | 112.3 | 30.6 | 146.8 |
| 11 | 25.8 | 140.8 | 31.2 | 178.6 | 23.9 | 136 | 31.1 | 177.7 |
| 12 | 26.6 | 167.0 | 31.7 | 210.0 | 24.4 | 160.1 | 31.6 | 209 |
| 13 | 27.4 | 194.1 | 32.2 | 242.0 | 24.8 | 184.7 | 32 | 240.8 |
| 14 | 28.4 | 222.0 | - | - | - | - | - | - |

Basin pump station capacities for the proposed pumps are presented below in **Table 3.7: Proposed Pump Stations.** To control groundwater and nuisance flows, a low-flow pump will be required. For the purposes of this study, the low-flow and redundant pump is not considered in hydraulic calculations. Subsequent studies will determine the rate of infiltration and size of low-flow pumps at each basin location.

The first three pump's on/off elevations are determined based on *"City of Sacramento Design and Procedure Manual"*, Section 12, Storm Drainage Design Standards. Calculations specific to Section 12.6.1.4. "Pump Calculations in Natomas" were not included in this analysis and will be performed to these standards in a future analysis.

The Pump 1 "on elevation" for each detention basin was assumed to account for the volume of water quality storage and estimated at 6-inches above the water quality permanent pool. The Pump 2 "on elevation" is set at one foot above the assumed water quality storage volume. The Pump 3 "on elevation" is set at the

[4] The maximum allowable water surface elevation is estimated using the 100-year storm event, reflecting climate change influences, while not exceeding one-foot of flooding at the gutter flow line anywhere in the system.

[5] Storage not considered for wet portion of detention basin. Starting water surface elevation assumed at elevation 5 feet.

maximum WSE for the 10-year storm event, requiring a separately modeled 10-year scenario with only two pumps running to determine the peak value without the third pump. Subsequent pumps are added as needed to balance storage and freeboard requirements to meet SCDWR Pump Station and Detention Basin Design Criteria including under climate change scenarios.

The simulation of the 100-year 24-hour storm with climate change was extended to capture the drawdown time back to the permanent pool elevation for the on-site detention basins. The resilience of the on-site detention systems was also analyzed using Sacramento County standardized 100-year 10-day and 100-year 5-day storms while not exceeding the maximum allowable water quality elevation. The longest drain time (from peak to permanent pool elevations) occurs in the East Detention Basin, taking several days to drain the storage volume to starting conditions. The analysis of the hydraulic behavior of the basins during long duration storm simulations is considered sufficient to establish the reliability of the proposed basins under multiple cloudburst conditions (successive storm events) using determined peak pumping rates.

**Table 3.7: Proposed Pump Stations**

| Location | North | South | West | East |

[6] Redundant pumps and low-flow pump to be provided at each detention basin. These are not included in the hydraulic modeling or the above table.

[7] NAVD 88 vertical datum.

[8] East basin WQV alone is 21 acre-feet. Value shown is a cumulative value of the South, West, and East basins combined.

## Boundary Conditions

The Proposed Conditions XPSWMM analysis assumes that areas that are not changing their development levels and that are draining by gravity to the West Drainage Canal will continue to drain. Some of these culverts will operate with reduced drainage areas due to implementation of development within Upper Westside. It is the intent of this preliminary layout and analysis to route undeveloped areas directly to the RD1000 system under gravity flow conditions, without creating increases, to limit treatment and pumping. Significant areas along the western (ag buffer) boundary must be collected and routed through the plan area facilities to prevent offsite impacts.

Each RD1000 XPSWMM model node adjacent to the project is further described below.

### *Model Node 11011*

The gravity outfalls into the West Drainage Canal west of El Centro Road are represented as two remnant watersheds being combined and injected into the RD 1000 model at node 11011 using peak stage as backwater. These watersheds are discussed below:

- Watershed OFFN02: Models simple upstream attenuation using storage node capacity before the flows are routed through the existing drainage channels that drain to C-10.
- Watershed OFFN03: Watershed is applied directly into the existing culvert C-9.

### *Model Node 11010*

- Watershed NORT09C: Watershed is applied directly to existing culvert S-18 and injected at the RD1000 model node 11010.

### *Model Node 170*

The following water sheds outflows are combined and injected into the RD1000 Model at node 170.

- Watershed NORT09A: Watershed flows to existing culvert S-16
- Watershed NORT09B: Watershed flows to existing culvert S-17.

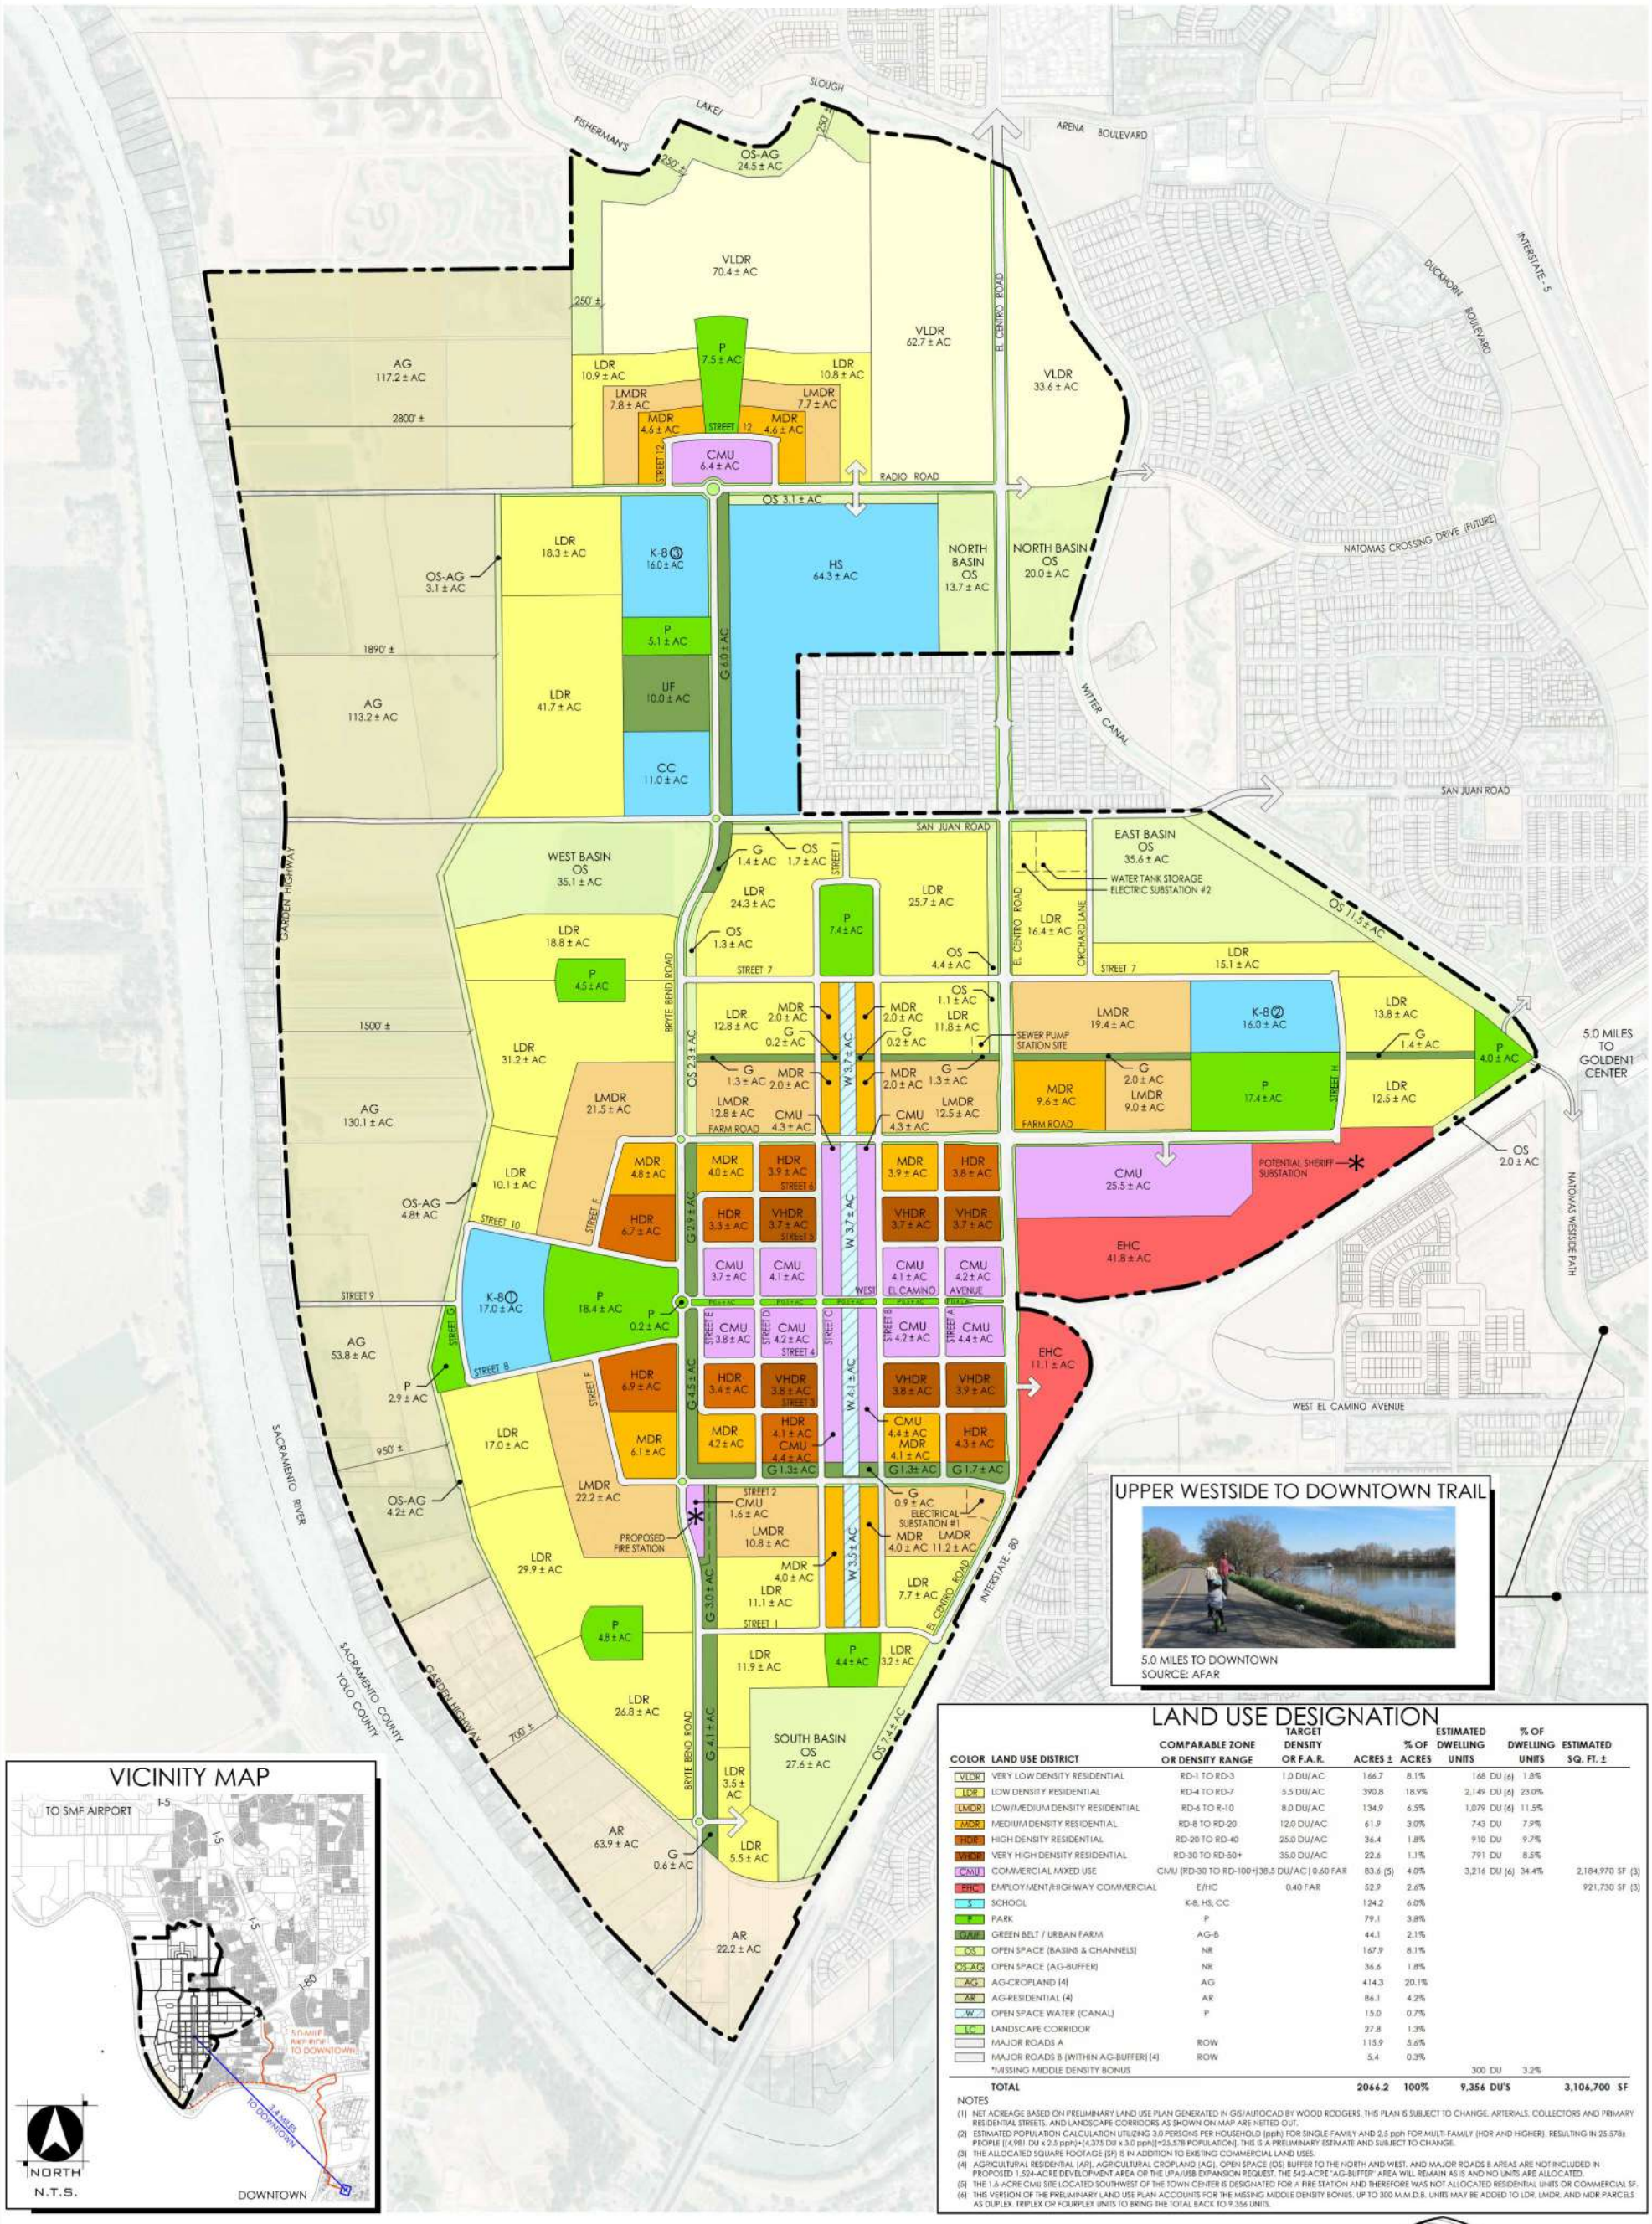
### *Model Node 11577*

For the proposed condition, the constructed wetland areas to the northwest of the plan area remain unchanged from baseline conditions. They continue to be defined by the baseline conditions HEC-RAS model as separate drainage. The watershed is injected to the RD1000 system near Pump Station 3 at the model node labeled 11577.

### *River View #2 Subdivision*

Also, for the proposed conditions, no runoff from the Upper Westside project is connected / interacting with the River View #2 project area. All hydrologic inputs from the River View #2 area are assumed to be accounted for in the Sump 17A watershed within the RD1000 XPSWMM model. The hydraulic boundary conditions for baseline conditions was set at 7.1 feet elevation as cited above for River View #2 draining to Sump 17A.

### *Boundary Routing Contributions*



The modeled outfalls from the proposed conditions XPSWMM model to the West Drainage Canal are configured to align with the existing gravity culverts C-9 C-10, S-18, S-17, and S-16 (shown on **Figure 2.6**), with the East and North Pump Stations being pumped outfalls. The existing gravity culvert labeling is consistent with the North Natomas Levee Project documentation, provided by Mead & Hunt. The flow results were combined to the nearest RD1000 model nodes as the model does not separately define every small culvert entering the system. Boundary conditions within the West Drainage Canal will not have any effect on the proposed condition hydraulic analysis for the pumped basins.

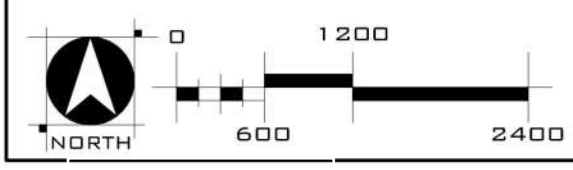
NOTES

(1) NET ACREAGE BASED ON PRELIMINARY LAND USE PLAN GENERATED IN GIS/AUTOCAD BY WOOD RODGERS. THIS PLAN IS SUBJECT TO CHANGE. ARTERIALS, COLLECTORS AND PRIMARY RESIDENTIAL STREETS, AND LANDSCAPE CORRIDORS AS SHOWN ON MAP ARE NETTED OUT.



(2) ESTIMATED POPULATION CALCULATION UTILIZING 3.0 PERSONS PER HOUSEHOLD (pph) FOR SINGLE-FAMILY AND 2.5 pph FOR MULTI-FAMILY (HDR AND HIGHER). RESULTING IN 25,578± PEOPLE [(4,981 DU x 2.5 pph)+(4,375 DU x 3.0 pph)]=25,578 POPULATION). THIS IS A PRELIMINARY ESTIMATE AND SUBJECT TO CHANGE.

(3) THE ALLOCATED SQUARE FOOTAGE (SF) IS IN ADDITION TO EXISTING COMMERCIAL LAND USES.

(4) AGRICULTURAL RESIDENTIAL (AR), AGRICULTURAL CROPLAND (AG), OPEN SPACE (OS) BUFFER TO THE NORTH AND WEST, AND MAJOR ROADS B AREAS ARE NOT INCLUDED IN PROPOSED 1,524-ACRE DEVELOPMENT AREA OR THE UPA/USB EXPANSION REQUEST. THE 542-ACRE "AG-BUFFER" AREA WILL REMAIN AS IS AND NO UNITS ARE ALLOCATED.

(5) THE 1.6-ACRE CMU SITE LOCATED SOUTHWEST OF THE TOWN CENTER IS DESIGNATED FOR A FIRE STATION AND THEREFORE WAS NOT ALLOCATED RESIDENTIAL UNITS OR COMMERCIAL SF.

(6) THIS VERSION OF THE PRELIMINARY LAND USE PLAN ACCOUNTS FOR THE MISSING MIDDLE DENSITY BONUS. UP TO 300 M.M.D.B. UNITS MAY BE ADDED TO LDR, LMDR, AND MDR PARCELS AS DUPLEX, TRIPLEX OR FOURPLEX UNITS TO BRING THE TOTAL BACK TO 9,356 UNITS.

# 4.0 Proposed Project Discharges and Stages

Model results for all storm events in the proposed conditions XPSWMM model are presented in **Appendix B**. Detailed conduit profiles from proposed condition XPSWMM model runs are provided in **Appendix E**.

## 4.1 Onsite Watershed Summary

### Floodplain Extents

The onsite floodplain extents were not mapped given the proposed conditions flooding was modeled using XPSWMM 1D modeling of pipes and streets. Tabular output data is provided in **Appendix E**. No adverse impacts to offsite properties are allowed for peak 100-year water surfaces outside of the plan area.

### Storm Drain Trunk Line Results

**Figure 4.1: 100-year 24-hour Design Storm Freeboard** and **Figure 4.2: 100-year 10-day Design Storm Freeboard** show the freeboard values form the proposed condition XPSWMM model for the 100-year 24-hour and 10-day storm events, respectively. The exhibits show that the water surface elevation is no greater than 1-foot above the gutter flow line elevations. The project is located within the Sacramento Method (Sacramento City and County Rainfall) Hydrology Zone 2.

**Figure 4.3: Nolte Design Storm Freeboard** presents freeboard values from the proposed condition XPSWMM model for the Nolte Design storm. A minimum of 6-inches of freeboard measured from the gutter flow line is provided for each run of pipe in this scenario. The project area is located with the Nolte Hydrologic Zone 3.

### Detention Basin & Pump Station Summary

**Table 4.1: WSE for Storm Events in Proposed Condition XPSWMM Model** presents water surface elevations for various storm events in the proposed condition at the detention basins. The results in **Table 4.1** include the use of climate precipitation factors as described in **Section 3.7** and **Table 3.2: Climate Change Scaling Factors used in Proposed Conditions Model**. A minimum freeboard of 1.0 foot to the lowest adjacent gutter flow line was met in all the model scenarios up to the 100-year storm event.

**Table 4.1: WSE for Storm Events in Proposed Condition XPSWMM Model**

| | East Basin | | North Basin | | South Basin | | West Basin | |
|---|---|---|---|---|---|---|---|---|

| 500-yr 10-day | 14.2 | -0.4 | 12.4 | 2.3 | 13.1 | -0.1 | 14.1 | -0.3 |

## 50% Pumps Not Operating

For this scenario, 50% of the pumps (including redundant pumps) for each pump station are turned off (see **Table 3.7**), and the 50-percent requirement is met because a redundant pump assumed to be included at each pump station which will also not be operating in this event. Because of the multi-pump configurations in all the onsite basins, multiple combinations of inactive pumping were tested to find the configuration of inactive pumps that yielded the highest water surface elevations. It was consistently found that the highest water surface elevations resulted when the bottom two pumps were left off in all four basins.

The maximum water surface criteria for the 100-year 10-day storm event with 50 percent of the pumps not operating is one foot above the gutter flow line, as shown in **Figure 1.1**. To meet freeboard criteria in the East Basin, an additional redundant pump must be installed to allow for the operation of four pumps during the 50% pumps no operating scenarios. The analysis shows that the maximum water surface standard of

1.0 foot above the gutter flow line is met at all locations for the 100-year 24-hour and 100-year 10-day storm events. The results from the proposed condition XPSWMM model are shown in **Figure 4.4: 100-year 24-hour Design Storm Freeboard, 50% Pumps Not Operating** and **Figure 4.5: 100-year 10-day Design Storm Freeboard, 50% Pumps Not Operating.**

## 4.2 River View & I80 Discharges to Plan Area

**Table 4.2: Peak Stage Comparison Draining Existing Across Interstate 80** presents a comparison of existing and proposed condition stages at the downstream headwall of the dual 36-inch RCP under I-80. The existing River Oaks development only conveys runoff for storms exceeding the 10-year event north into the existing dual 36-inch RCP culverts. The 100-year peak flow information for all three storm durations was calculated using the XPSWMM model provided by the City of Sacramento and adding climate change factors to the rainfall. The 24-hour storm scenarios for the 100-year, 200-year, and 500-year reached the existing dual 36-inch RCP culverts and flowed into the plan area.

**Table 4.2** shows the proposed condition peak stages are lower than the corresponding existing condition peak stage in all 100-year storm events at the downstream headwall of the dual 36-inch RCP. This lowers the tailwater below existing conditions and allows all runoff from River Oaks to travel north as it does today, without worsening the hydraulic conditions within River Oaks. Therefore, it is assumed the proposed project will not result in adverse impacts to the existing River Oaks development because of the decreased peak stages in all design storms in the 100-year storm events.

Additionally, a similar comparison of existing and proposed water surface elevations downstream of the I-80 culverts discharging into the South Detention Basin is provided in **Table 4.2.** The results show that drainage along I-80 is not adversely impacted. **Figure 2.4** provides a graphical representation of the I-80 crossings onto the Plan Area.

**Table 4.2: Peak Stage Comparison Draining Existing Across Interstate 80**

| Storm Event | Peak Water Surface Elevation | | | | | |
|---|---|---|---|---|---|---|
| | River Oaks Crossing | | I-80 Dual 18-inch Crossing | | I-80 Single 36-inch Crossing | |
| | Existing Condition | Proposed Condition | Existing Condition | Proposed Condition | Existing Condition | Proposed Condition |
| 100-year 24-hour | 13.8 | 13.4 | 16.1 | 15.0 | 14.8 | 12.4 |
| 100-year 5-day | 13.6 | 12.1 | 15.7 | 14.0 | 14.7 | 11.5 |
| 100-year 10-day | 13.5 | 12.2 | 15.7 | 14.0 | 14.7 | 11.5 |

## 4.3 Ag-Buffer Discharges

The proposed ditches along the boundary between the Ag and Ag Res properties to the west of the project provide adequate conveyance and depth to prevent the outflows in all 100-year scenarios from spilling out of the channels and impacting the existing properties. **Table 4.3: Peak Stage Comparison At the Ag Res Buffer** shows that the proposed conditions peak stages are lower than the corresponding peak existing condition peak stages in all 100-year storm events.

**Table 4.3: Peak Stage Comparison At the Ag Res Buffer**

| Storm Event | Peak Water Surface Elevation | | | | | |
|---|---|---|---|---|---|---|
| | OFFN02 | | OFFW03 | | OFFS02 | |
| | Existing Condition | Proposed Condition | Existing Condition | Proposed Condition | Existing Condition | Proposed Condition |
| 100-year 24-hour | 20.8 | 20.3 | 17.4 | 11.4 | 18.0 | 15.7 |
| 100-year 5-day | 20.7 | 19.7 | 17 | 12.5 | 17.4 | 11.6 |
| 100-year 10-day | 20.7 | 20.0 | 17 | 12.2 | 17.5 | 11.6 |

## 4.4 Natomas Estates Discharges

**Table 4.4: Peak Stage Comparison At Natomas Estates** contains the peak stage comparison at the interface between the proposed development and Natomas Estates. The water surface elevations were taken at the existing culverts that the offsite sheds drain through in both existing and proposed conditions.

**Table 4.4: Peak Stage Comparison At Natomas Estates**

| Storm Event | Peak Water Surface Elevation | | | | | |
|---|---|---|---|---|---|---|
| | NORT09C | | NORT09B | | NORT09A | |
| | Existing Condition | Proposed Condition | Existing Condition | Proposed Condition | Existing Condition | Proposed Condition |
| 100-year 24-hour | 14.9 | 14.2 | 14.4 | 13.9 | 14.0 | 13.4 |
| 100-year 5-day | 14.4 | 13.2 | 13.7 | 13.1 | 13.5 | 13.1 |
| 100-year 10-day | 14.0 | 13.2 | 13.6 | 13.0 | 13.5 | 13.2 |

## 4.5 West Drainage Canal Summary

**Table 4.5: Peak WSE Comparison, RD 1000 XPSWMM Model** presents the peak WSEs in the West Drainage Canal from the preliminary RD 1000 XPSWMM model, utilizing input hydrographs from the existing conditions HEC-RAS and proposed conditions XPSWMM models for the 100-year 10-day event (without climate change) as these models were specifically created to assess RD 1000 impacts. **Table 4.5** shows the proposed project will not result in increased peak stages in the West Drainage Canal at any location adjacent to the UWS Plan Area. A comparison of peak flows entering the West Drainage Canal in the Wood Rodgers created existing conditions and the conditions this project proposes including onsite drainage improvements yield lower peak runoff entering the canal. The peak flow entering in the existing conditions is 269.7-cfs (190.7 cfs upstream of San Juan Road and 79 cfs downstream of San Juan Road) and the peak flow entering in the proposed conditions is 132.1-cfs (72.1 cfs upstream of San Juan Road and 60 cfs downstream of San Juan Road. It is assumed RD 1000 and its contractors will verify these values using the RD 1000 XPSWMM model. County DWR is not expected to review and approve models meant to satisfy RD-1000.

**Table 4.5: Peak WSE Comparison, RD 1000 XPSWMM Model**

| Location (XPSWMM NODE) | Existing Condition | Proposed Condition | Change in WSE (feet) |
|---|---|---|---|
| | Peak WSE[9] (feet) | Peak WSE[9] (feet) | |
| 169 | 13.404 | 13.355 | -0.049 |
| 11011 | 13.392 | 13.344 | -0.048 |
| 11010 | 13.077 | 13.014 | -0.063 |
| 170 | 13.056 | 12.988 | -0.068 |
| 171 | 13.049 | 12.98 | -0.069 |
| 11008 | 13.023 | 12.947 | -0.076 |
| 172 | 12.203 | 12.151 | -0.052 |
| 11509 | 12.18 | 12.132 | -0.048 |
| 11520 | 12.148 | 12.112 | -0.036 |
| 173 | 12.138 | 12.099 | -0.039 |
| 1914 | 11.87 | 11.833 | -0.037 |
| 11558 | 11.542 | 11.511 | -0.031 |
| 11511 | 11.457 | 11.424 | -0.033 |
| 174 | 11.125 | 11.09 | -0.035 |

Complete Model results for all storm events in the proposed conditions XPSWMM model, including XPSWMM modeling without climate change for assessing RD1000 impacts as well as onsite modeling including climate change for County requirements are presented in **Appendix E**.

## 4.6 Onsite 200-year Analysis

The project is designed such that the proposed pads will be above the 200-year, 10-day storm event water surface elevation within the West Drainage Canal. The best available data at the time of this study is the preliminary maximum water surface elevations of the West Drainage Canal, provided by Civil Solutions in 2021, ranging from an elevation of 14.17 in the north at Fisherman's Lake to 13.26 at I80. **Figure 4.6: Maximum Floodplain Depth Assuming Full Levee Failure 200-year, 10-day Event** shows the areas of the proposed project site that are below a hypothetical water surface plane that extends from the West Drainage Canal. This conservative approach assumes no containment of the West Drainage Canal to show that the proposed land uses will be above the 200-year, 10-day water surface elevation. The figure does show inundation in the proposed project detention basins, drainage channels, and existing low-lying areas of parcels currently improved.

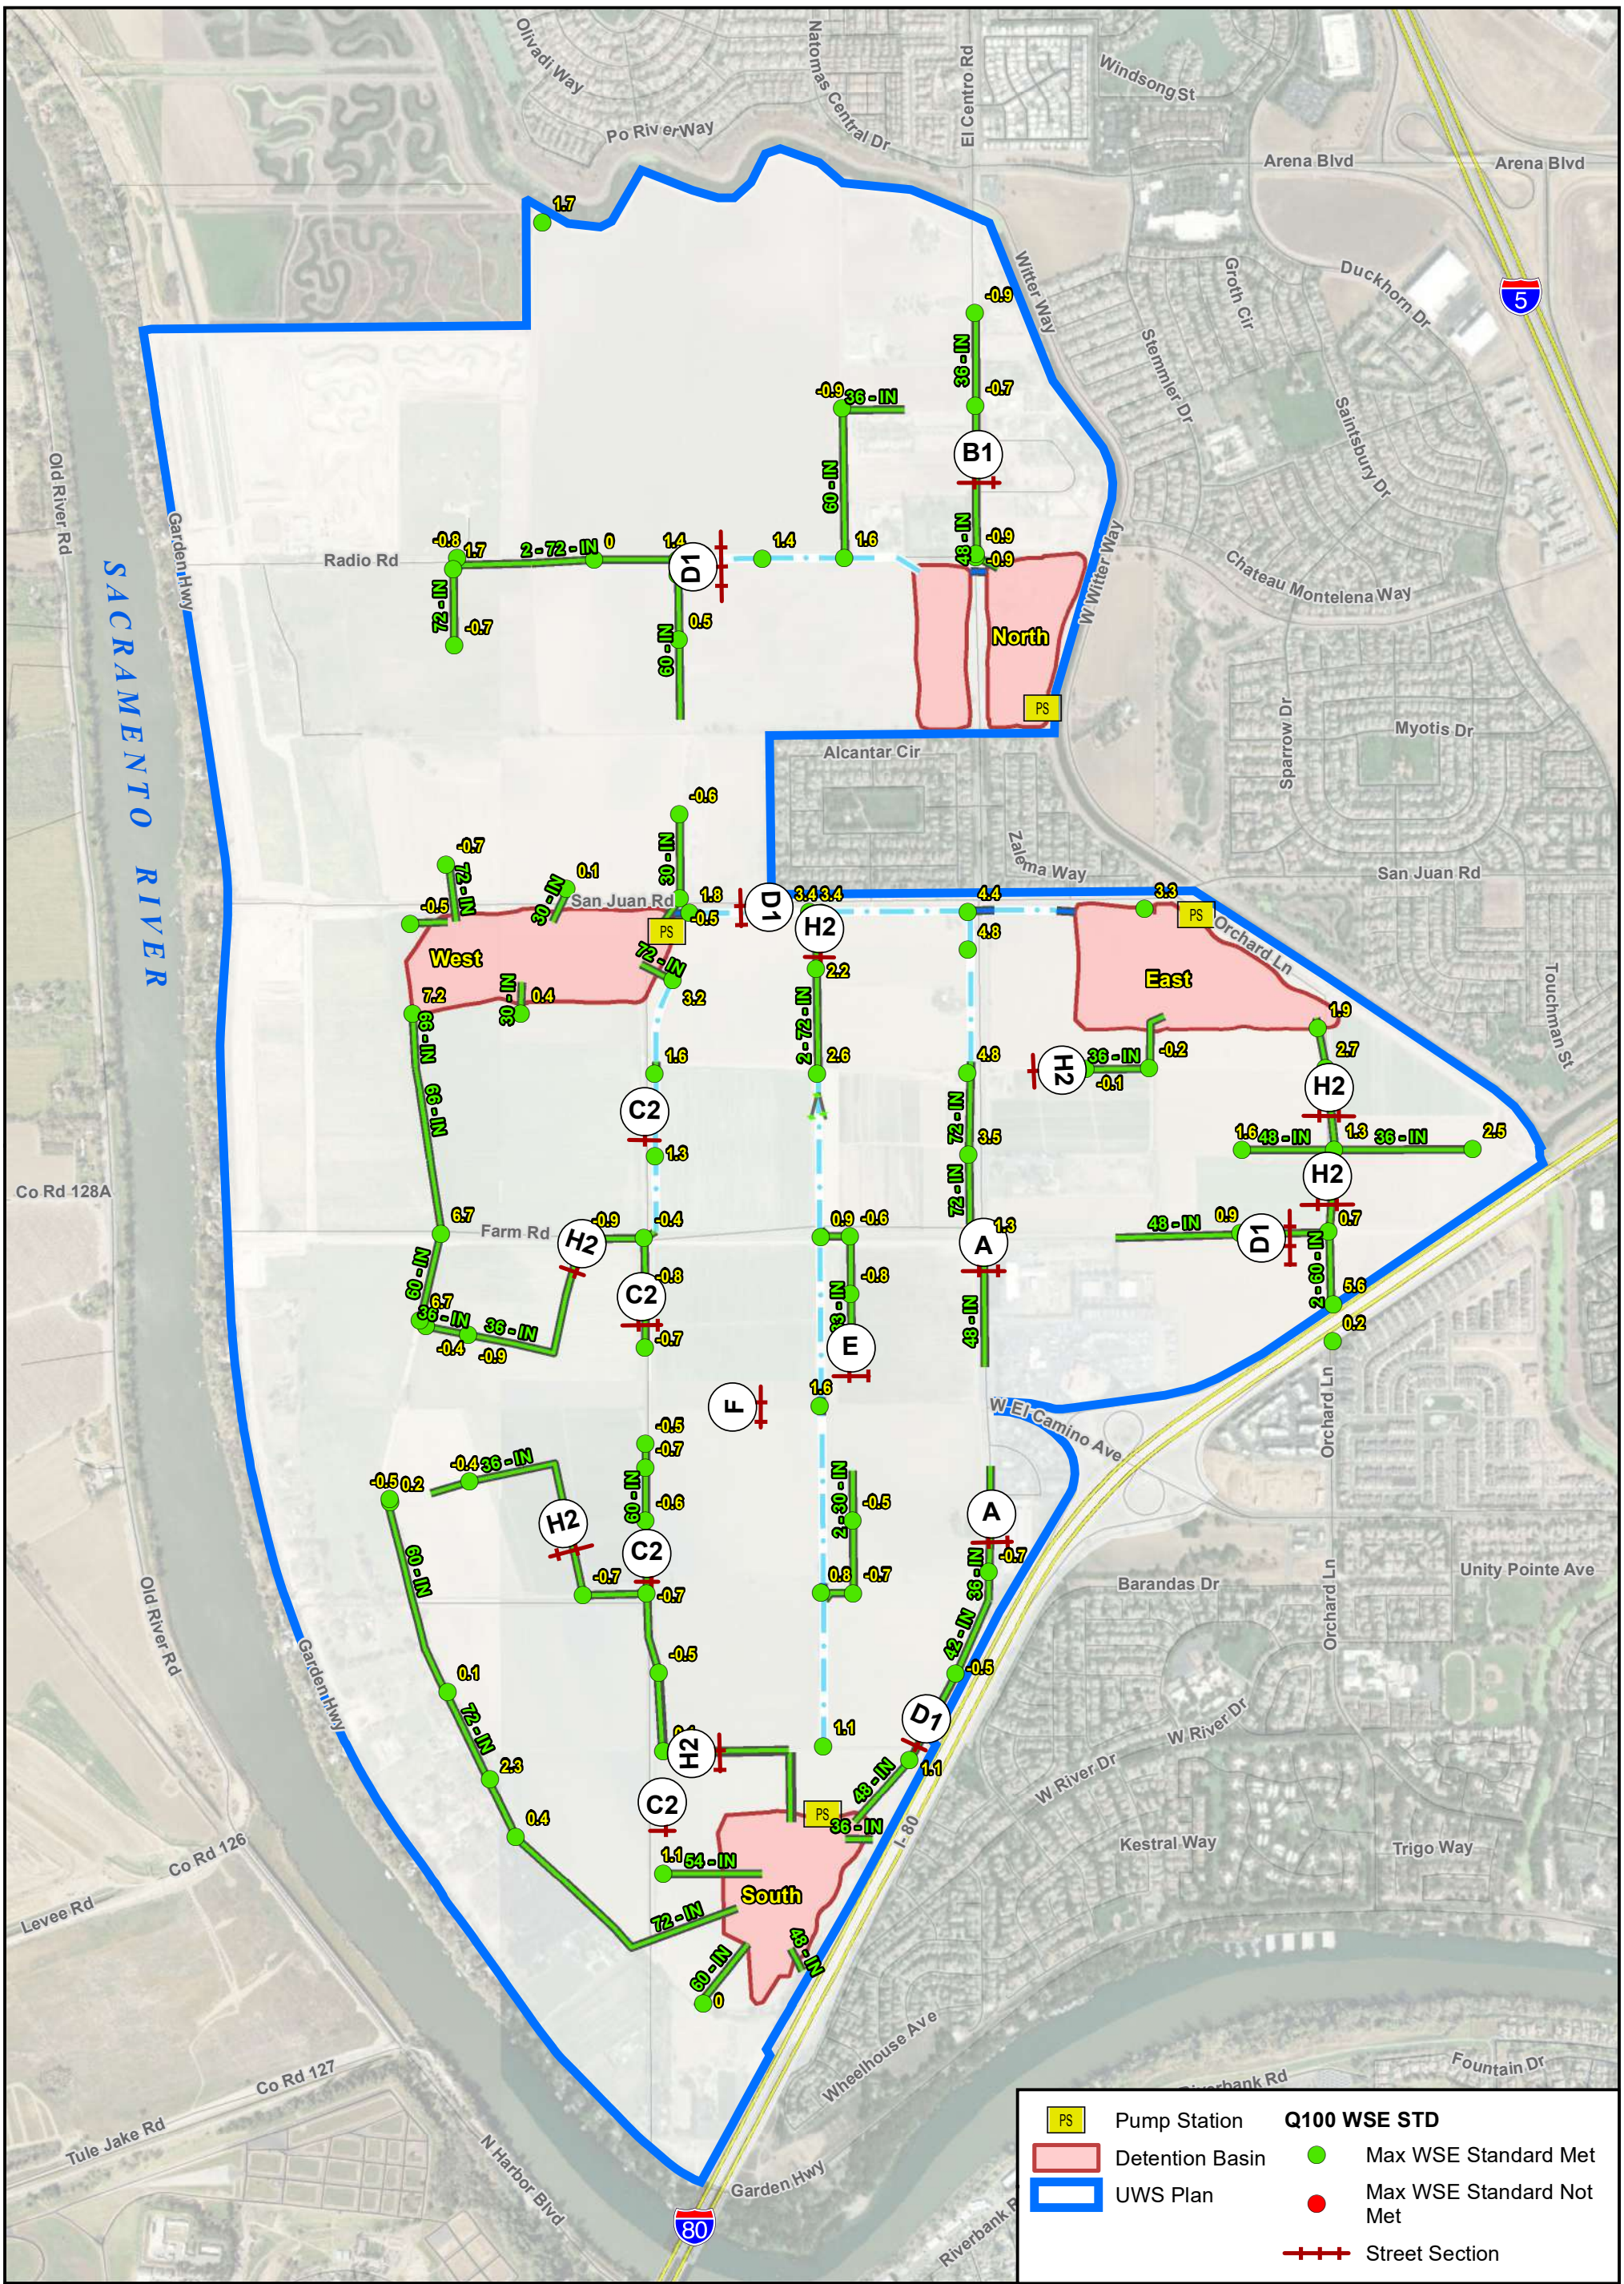
[9] NAVD 88 vertical datum.

While the project does not rely on the containment of the West Drainage Canal to protect pads, the project will be designed to maintain the West Drainage Canal within its banks. The project will not increase the 200-year, 10-day water surface elevations in the West Drainage Canal and therefore does not increase the extent of mapped inundation. This can be accomplished by maintaining the containment conditions that exist under pre-project conditions and limiting developed outflow to not exceed existing maximum water surface elevations in the RD1000 system. Wood Rodgers does not anticipate any modifications will be required to the existing containment features. The analysis will be confirmed during Tentative Map and/or subsequent design level efforts.

## 4.7 Project Phasing

Conceptual project phasing has been identified in **Figure 4.7: Conceptual Phasing Plan** for purposes of the Public Facilities Financing Plan. In general, each of the four detention basins correspond to an assumed project phase. The deeper excavation of the detention basins is intended to produce material for the proposed development and generally corresponds to the project phasing.

Actual phasing will be dependent on the timing of development and improvements necessary to avoid adverse impacts. Subsequent entitlement applications (tentative map) or grading plan submission should address interim or phased improvements to support the specific proposal. Each project should address at a minimum the following phasing topics:



- Detention and pump station phasing (including anticipated interim and permanent locations).
- Earthwork / mass grade phasing.
- Natomas Mutual Water Company is phasing of facilities to convey irrigation water.
- Interim drainage of parcels that will develop in subsequent phases and are tributary to the developing parcel.
- The need for downstream / offsite improvements.
- How the phasing complies with the County's Floodplain Management Ordinance.

Prior to grading and/or improvement plan submittals a pump station design report will be required for each of the detention basins. Additionally, a geotechnical report will be necessary to anticipate the rate at which groundwater will infiltrate into the detention basins and to determine appropriate slope stability measures. Prior to construction of downstream improvements, the developing property owner will need to obtain easements and construction access to offsite properties requiring infrastructure improvements.

While some property owners are overburdened with specific plan infrastructure, including drainage infrastructure and detention basins, the Public Facilities Financing Plan provides for the costs and fees associated with constructed the backbone infrastructure. These costs include a component for land acquisition.

## 4.8 Wildlife Management Plan

It is anticipated that a wildlife management plan will be required at the time of grading plan submittal. The purpose of the wildlife mitigation plan is to deter wildlife that may present hazards to aircraft approaching and departing Sacramento International Airport. The wildlife management plan will articulate specific design features for the canal and detention basins that will deter wildlife. It will also include operation recommendations. The plan will require review and approval by Sacramento County Airports.

## 5.0 Low Impact Development

The Project will be required to comply with the Sacramento Area-wide NPDES Municipal Stormwater Permit (Order No. R5-2008-0142). This Level 1 Master Drainage Study (MDS) addresses post-construction flow reduction and treatment requirements. The requirements for urban development are detailed in the SQDM. The SQDM provides instructions for how to plan a project to comply with the stormwater quality requirements, how to prepare calculations to support detailed design of flow reduction and treatment control measures, and how to document the plan and analysis to support it.

According to Table 3-2 in the SQDM, the project is required to incorporate source control measures, Low Impact Development (LID) control measures, and treatment controls throughout the site. Full trash capture control measures are required in areas with more than 10 dwelling units per acre, and in commercial areas and parking lots. In subsequent phases of design, trash capture loading rates will be calculated, and regional trash capture methods will be determined. At this time the plan assumes capture of trash at the detention basins as flows enter the pump stations. Table 3-3 in the SQDM provides a matrix of stormwater quality control measures that can be applied to meet the requirements for the various land use categories. Hydromodification management will not be required as discussed below.

The final determination of LID measures and implementation will be determined as the project's design evolves. Information presented in this MDS is provided to demonstrate that LID criteria can be achieved; however, the quantities presented may change or other Best Management Practices (BMPs) may be selected with the final design.

LID measures are typically integrated into site landscaping (including open space, yards, streetscapes, road medians, and parking lot and sidewalk planters) or into the design of paved and other impervious areas, such as building rooftops. Small-scale runoff controls integrated into the project design and located close to the source of the water and pollutants can help reduce the need to convey water and treat it in the large, end-of-pipe facilities that would be located at the downstream end of drainage areas.

Each priority, new development or redevelopment project is required to earn a minimum of 100 points based upon the LID measures selected and implemented. The computational procedure for residential projects

differs somewhat from commercial projects. Compliance with LID principles is required at all stages of approval, including master planning and final improvement or grading plans for individual projects.

LID is intended to reduce the increase in runoff volume that would otherwise be expected from a development by at least 50 percent. Reducing runoff using LID measures reduces the amount of runoff that needs to flow into treatment BMPs.

For this Master Drainage Study, a "high level" plan that explains how the project could achieve the required 100 points of LID credit is required. The Level 1 MDS needs to demonstrate an understanding of the quantity of LID measures that will be required. The SQDM includes detailed submittal requirements (Appendix A of the SQDM) and worksheets (Appendix D of the SQDM) to demonstrate compliance of specific projects that are in the design phase. This Level 1 MDS used the worksheets to assess the effectiveness of LID options. Overall project area land use information was used to identify the number of LID and treatment measures that might be needed to meet the requirements. For this initial evaluation, two "watersheds" (not actual topographic watersheds) were evaluated for the contributing areas to each detention basin, one for the areas that could use the form for residential development and one for the remainder of the project using the form for commercial development. Based on Table D-1a on the Residential calculation spreadsheet, the spreadsheet only applies to residential areas with no more than 20 dwelling units per acre. As detailed plans for project areas are developed, the actual measures that will be implemented will be determined and the appropriate forms and calculations will be provided.

If early phases of the project include more LID than required, future phases can incorporate less LID as long as the required LID credits up to any point in time have been implemented. In other words, future planned work cannot be used to meet the LID credit requirements, but previously completed measures can be counted toward future requirements.

## 5.1 Hydromodification

Per the Sacramento Stormwater Quality Partnership, Hydromodification Management Plan (HMP), the City of Sacramento's North Natomas Basin and unincorporated Metro Air Park are considered Special Drainage Areas and are exempt from hydromodification. This is primarily because the drainage facilities within North

Natomas are engineered to limit post-development discharges and drain to engineered canals that are maintained and operated by RD 1000. The UWS project shares the same drainage discharge characteristics as the City's North Natomas Basin and unincorporated area of Metro Air Park. The project will not increase water surface elevations in the West Drainage Canal which is an engineered canal operated and maintained by RD 1000. Therefore, the project will be exempt from hydromodification.

## 5.2 LID Evaluation / Open Space Credit

Open space is defined as "non-impervious area within the project that is subtracted from the total project area to reduce the area used in sizing treatment BMPs". Because of this benefit, open space is awarded LID credit points. The percentage of open space is translated directly into LID points on a 1:1 ratio (one (1) LID point for each one percent (1%) of open space in relation to the total project area).

For LID implementation, open space includes, but is not limited to, natural storage reservoirs, drainage corridors, buffer zones for natural water bodies, stream setbacks and buffers, and flood control detention basins.

For the purpose of this analysis, the total area of the Project is 2,066 acres. The schools will cover approximately 146 acres and are considered as commercial development in the appropriate LID spreadsheets. Areas designated for agricultural uses (including Urban Farm, landscape corridors, parks, open channels and basins) cover approximately 807 acres, or 42 percent of the net project area. Therefore, the project's open space is expected to provide 42 LID points overall.

**Table 5.1: Land Use Summary for LID Evaluations** provides a summary of the land uses[10], areas and dwelling units used as a basis for the LID evaluation. **Table 5.2** and **Table 5.3** provide land use and open space areas for the residential and commercial area LID evaluations, respectively, for the North Basin as an example of the methodology used for all four basins. The residential and commercial LID worksheets are included in **Appendix F**.

[10] Land uses and acreages may differ from those presented in Section 3.7 due to iterating of the land use plan. Differences produce negligible results at this scale and will be confirmed with subsequent studies.

The columns in **Table 5.2** and **Table 5.3** under the Residential and Commercial Open Space heading correspond to the LID credit calculations forms for the rows in Section 1b, “Project Drainage Shed” for distinguishing the categories of “Project-Specific Open Space (In-project, communal**).” The categories indicated by “b,” “c,” “d” and “e” correspond to “Buffer zones for natural water bodies,” “Natural areas including existing trees, other vegetation and soil,” “Landscape area/park,” and “Flood control/Drainage basins,” respectively.

## 5.3 Runoff Reduction

Projects receive one (1) LID point for every one percent (1%) of the project area managed through impervious area disconnection and interceptor trees.

Disconnected pavement can be used with a ratio of an impervious-to-pervious surface of 2:1 or less. Impervious surfaces can drain to landscaped areas or to pervious pavement with an area of 50 percent of the tributary impervious area.

Disconnected roof drains can be a highly effective tool to reduce runoff within the Low Density Residential land use areas including VLDR, LDR and LMDR categories. However, disconnected roof drains require detailed planning of minimum travel distance across vegetation and may involve the use of pop-up emitters.

Evergreen trees count for 200 square feet of managed project area and deciduous trees count for 100 square feet of managed project area. The project will include extensive tree plantings. This MDS makes conservative assumptions to estimate the minimum number of trees that will be in areas that count for runoff reduction.

## 5.4 Disconnected Impervious Areas

Disconnected impervious areas can be readily integrated into low- and medium-density lots. A preliminary estimate is that on-lot imperviousness for VLDR, LDR, LMDR and MDR could have an average efficiency factor of 0.45 for 60 percent of the roof drains. The project is calling for extensive use of separated sidewalks in the residential areas. For this MDS it has been assumed that 80 percent of the sidewalks in the residential areas will be separated.

## 5.5 Trees

Trees will be planted along most streets throughout the project area. On average, trees will be planted 30 feet on-center. An average of one tree every 35 feet was assumed to account for locations without trees, such as driveways. On arterials and major collectors that have a 20-foot landscape setback with a separated walk, it has been assumed that there will be two rows of trees: one row of deciduous trees and one row of evergreens. For primary residential streets, it has been assumed that there will be one row of deciduous trees. Our assumptions for tree planting also include trees at 30 feet on-center along the medians with two rows where a plaza is planned. An average tree spacing of 50 feet was assumed to account for areas without trees. For in-tract residential streets, it has been assumed that there would be four trees per VLDR lot, three trees per LDR lot, two trees per LMDR lot and one tree per MDR lot, all deciduous. Although many other trees will be planted, only trees within 25 feet of ground level impervious areas count for flow reduction.

For the MDS, is has been assumed that 3,000 evergreen trees and 7,700 deciduous trees will be planted for LID credit in the residential areas. Estimates for roadway corridor trees in the areas included in the commercial area LID evaluation are for 1,575 evergreen trees and 7,748 deciduous trees. It is likely that additional trees will ultimately be included in some parking areas and other locations. The current estimates

are thought to be conservative, but higher estimates for trees would not be expected to significantly impact the requirements for other BMPs.

## 5.6 Runoff Management

Projects receive 2 LID points for every 1 percent of project area effectively managed though the following runoff management measures:

- Porous Pavement
- Alternative Driveways
- Green Roof
- Capture and Re-Use
- Compost-Amended Soil – 25% of tributary impervious area
- Bioretention BMPs (which may be located in the detention basins, above the permanent pool elevation)

## 5.7 Limitations

Shallow groundwater may limit specific on-the-ground runoff management strategies, such as porous pavement which can only be used where the depth to high groundwater is at least 10 feet. Porous pavement also requires consideration of soil permeability, need for an underdrain and local County permitting. Similarly, compost-amended soil is allowed in areas where the water table is more than 10 feet from the surface. Use of dispersion trenches requires a 10-foot separation to groundwater below trench. Based upon initial groundwater elevation monitoring at the site we anticipate a majority of the plan area to be able to use these methods as solutions toward runoff management.

Local capture and use by rain barrels or cisterns is not expected to be a practical means to achieve significant flow reduction due to the relatively high cost of small rainfall storage tanks. One acre of treatment credit was assumed because it is likely that some demonstration projects will use these types of systems.

Some buildings may incorporate green roofs, but at this preliminary stage no green roofs have been assumed.

It may be feasible to provide stormwater capture and use on a larger scale by providing some landscape irrigation flows from the regional stormwater basins. The feasibility of such systems may be explored in the future, but they have not been included at this stage.

## 5.8 Runoff Management Credits

It is anticipated that bioretention planters will need to be used to manage roadway runoff from the other impervious surfaces. After all other measures were estimated, the area required for bioretention to meet 100 points was determined in the residential areas and in the commercial areas for each detention basin watershed. It is assumed that bioretention planters will be configured with underdrains to meet the design criteria specified in Table BP-1, Bioretention Planter Design Criteria and located in a benched area within the flood detention basins, above the permanent pool elevation. Based on these assumptions, both the residential and commercial areas would achieve 100 LID credits.

The LID measures that would provide the required LID credits do not eliminate the need for supplemental water quality treatment. The worksheets indicate that WQV with a 48-hour drawdown time would be needed to meet the water quality treatment requirements. Numerous options are available to meet the stormwater quality treatment requirement. Options include:

- Providing additional LID measures;
- Providing distributed flow-based or volume-based treatment BMPs; and
- Operating the regional stormwater basins to function as wet stormwater quality detention basins in addition to meeting high flow requirements.

Use of the regional basins for water quality treatment would require a maximum treatment volume of 55 acre-feet (North basin 12 acre-feet, East basin 21 acre-feet, South basin 11 acre-feet, and West basin 10 acre-feet) based on the sum of the volume-based treatment. The method utilizes the same basic assumptions of weighted percent imperviousness and area in establishing the watershed depth and

calculating the required volume as found in Appendix E of the SQDM. The analysis uses the equation WQV = $P_0$ x A/12, as already described in **Table 3.5: Preliminary (Pre-LID) Water Quality Volume Calculations**. If the East Basin were to incorporate all such water quality treatment for the East Basin, the West Basin and the South Basin, the combined volume would be 43 acre-feet.

The design volume would be 1.25 times the treatment volume to meet the wet basin design criteria. Therefore, the design volume, or minimum permanent pool, would be 61.16 acre-feet for water quality distributed over the planned basins. Considering that there are over 100 acres dedicated to the regional drainage basins and that the basins within these areas are planned to have deep (4-8 feet), permanent pools, the design details necessary to meet the minimum requirements for water quality wet basins are not expected to be complex and can be developed at basin improvement plan design, providing a minimum of 400 acre-feet of treated storage. With LID measures accounted for the volume required would be reduced. Additional information for how the water quality treatment requirements will be met will be determined when the Project advances to more detailed planning phases. Water balancing calculations will be required in the next level of analysis to ensure the permanent pool will be maintained in the dry season. Also, a supplemental source of water may be required to maintain the permanent pool during the dry season. The requirement for makeup water will be determined during detention basin design to meet SCDWR requirements.

# 6.0 Quality Assurance / Quality Control

## 6.1 Model Calibration

Model calibration was not performed for the existing or proposed condition models. However, Wood Rodgers prepared a TM to verify the loss rate of 0.014 which is presented in **Appendix B**.

GEI Consultants has been retained by the Sacramento County Department of Water Resources to perform detailed reviews of all modeling efforts.

## 6.2 Model Warnings and Errors Have Been Addressed

All warnings were investigated and changes to the model have been made as necessary.

# 7.0 Future Considerations

In accordance with SCDWR drainage study requirements, subsequent drainage studies will be required as the project moves forward. Level 2 studies will be required to be submitted with tentative subdivision map applications. Level 3/4 drainage studies are required before approval of improvement plans and construction drainage facilities. Subsequent studies will further refine the infrastructure to serve the project.

The following items are assumed to be required as part of subsequent drainage studies:

## 7.1 Low Impact Development

Low impact development design to be evaluated during tentative map design efforts.

## 7.2 Trunk Storm Drain Infrastructure Design

The onsite storm drainage systems conveying runoff into the proposed detention basins, including storm drains and overland release paths, will be evaluated and refined as appropriate to meet requirements under Nolte, 10-year, 100-year, and 200-year conditions under the Tentative Map level and subsequent analyses. This evaluation includes overland release. Drainage inlets will be sized, and overland release estimates will account for 50% clogging, in accordance with County standards.

As previously discussed, climate change was accounted for in the development of this study. SCDWR is expected in the near future to approve the climate change hydrology presented in this report. However, there are no design standards relating to the trunk storm drain infrastructure design under climate change. It is important to note that this report designed storm drain infrastructure utilizing current design standards but with flows resulting from climate change. Therefore, the trunk conveyance infrastructure presented in this report is likely oversized.

Absent of climate change design standards, further discussion with SCDWR will be required to define the appropriate design standards when utilizing climate change hydrology. As a result, it is anticipated that the infrastructure presented in this report will be downsized. This is anticipated to be assessed during subsequent Level 2 drainage studies.

## 7.3 Detention Basin & Pump Station Design

### Geotechnical Considerations

Basin design will require a geotechnical report which discusses the following geotechnical considerations:

- Groundwater and required low-flow pumping
- Proximity to the West Drainage Canal embankments
- Proximity to the Regional San Northwest Sewer Interceptor

### Final Configuration

The final configurations of detention basin design will fully account for all design features affecting the sizes of facilities. Design features include but are not limited to basin ramps (where required), setbacks, side slopes, easements, buffers, inlet structures, outlet structures, walls, and all other features deemed necessary by SCDWR.

For areas tributary to the North Detention Basin, modeling will separately consider the proposed two-cell basin design based on final design considerations.

### Water Quality

The Level 3-4 study shall include a full and detailed explanation of the water quality volumes and LID features proposed within the basins. It is important to note that with the implementation of permanent pools in the bottoms of detention basins, the water quality treatment volume requirements can be easily achieved. This is because the permanent pool provides volumes that far exceed the requirements, as further discussed in **Section 5.0 Low Impact Development**.

Per SCDWR direction, the future Level 3/4 flood assessment is anticipated to discount the volume of the dead storage within LID features. The dead storage provides limited localized temporary storage that relies on infiltration to evacuate otherwise trapped runoff.

### Submerged Pipes

The plan area is anticipated to contain trunk drainage conduits that contain flow lines below the permanent pool elevations of the detention basins. This is due to the relatively flat topography of the Plan Area.

Additionally, State domestic water requirements, relating to utility separation requirements, result in deeper storm drain systems that operate below the domestic water system. Submerged pipes are expected to occur, however submergence of storm drains within the system will be evaluated and eliminated where possible to optimize operation and maintenance concerns.

### Wildlife Management Plan

As previously discussed in Section 4.8 a wildlife management plan will be required concurrent with Level 3/4 drainage studies.

### Number of Pumps including Redundant Pumps

Wood Rodgers recognizes that the SCDWR is in the process of considering changes to its current standards, which may result in modifications with respect to how pumping, redundancy, and flood resiliency are evaluated. This would include how 50% pumping capacity is defined, how modeled failure of pumps is determined, and the maximum flooding associated with such a scenario. Wood Rodgers will continue to collaborate with SCDWR in identifying the design challenges associated with storm drain pump stations standards, to determine the most efficient and cost-effective means of achieving the intent of the standards. Wood Rodgers will work collaboratively with SCDWR to meet the final approved standards, in whatever form they take, at the time of implementation,

## 7.4 500-year Design Storm

The 500-year storm event will be evaluated at the Tentative Map level to ensure building pad elevation requirements are met. The 500-year storm event requirement will only be applicable to the internal watershed and onsite runoff. It will not be based on offsite watersheds including the West Drainage Canal and Sacramento River.

## 7.5 Basin Wide HEC-RAS Model

As discussed in Section 1.3, once the new Natomas Basin 2D HEC-RAS model is adopted, it will be utilized accordingly in subsequent study and modeling efforts.

## 7.6 Ownership, Operation & Maintenance of Facilities

It is anticipated that ownership, operation, and maintenance of Plan Area drainage facilities will be determined during Specific Plan implementation. Further discussion of the varies fundings sources is discussed in the project's Urban Services Plan.

# 8.0 Summary & Conclusions

## 8.1 Summary

The resultant floodplain elevation summary showed that the proposed project resulted in no impacts to the existing floodplain depths. The proposed Project is in compliance with the Sacramento County Floodplain Management Ordinance.

The Mitigated Project includes detention and pump stations to reduce runoff so that no impacts to peak water surface elevations are shown in the West Drainage Canal. Preliminary analysis of the RD 1000 XPSWMM model using input hydrographs generated from the Plan Area for the existing and proposed conditions shows no increase in all areas of the RD 1000 drainage system.

The maximum WSE at the upstream headwall of the dual 36-inch reinforced concrete pipe under I-80 accepting flows from the existing River Oaks development is lower than existing conditions in all 100-year modeling scenarios, with only one of the 100-year scenarios generating overflow and spilling into the Plan Area with climate change factors applied. Therefore, the proposed project will not have adverse impacts on the existing River Oaks development. Other culvert crossings under I-80 draining to the South Basin were analyzed and found to have no adverse impacts. Existing River View development was also analyzed and found to be hydraulically separate from the Plan Area, as it fully drains under the West Drainage Canal in the 100-year storm as originally designed.

Agricultural and Agricultural/Residential properties to the west of the plan area and areas along the I-80 corridor will be modeled at tentative map levels and improvement plans to verify the intent of having no adverse impacts once onsite grading and storm drainage facilities are more defined.

## 8.2 Conclusions

This Level 1 Master Drainage Study identifies the improvements required in the Plan Area to meet SCDWR and other applicable standards. Drainage improvements include a backbone trunk system including drainage channels and pipes, detention basins, and pump stations to discharge flows to the West Drainage Canal.

Based on the analysis performed with this Study, the proposed project:

- Will not deviate from existing drainage patterns;
- Will not cause adverse impacts to the West Drainage Canal or RD 1000 facilities;
- Will not cause adverse impacts to the existing River View #2 development;
- Will not cause adverse impacts to culverts crossing under I-80
- Will not cause adverse impacts to the existing River Oaks Development; and
- Will not cause increases to WSEs and floodplain extents for Remaining Agricultural Areas within the Plan Area and, therefore, is in compliance with Sacramento County Floodplain Management Ordinance.

The Study has also developed approaches to meet post-construction NPDES requirements following the guidelines in the Sacramento Stormwater Quality Manual.

**Subject:** Upper Westside Specific Plan (PLNP2018-00284) – County DWR Comments on the Flood Inundation Propagation Procedural Memorandum Dated 05/31/2024.

County DWR has no further comments on the subject procedural memorandum. Review by County DWR was limited to the overall content of the procedural memorandum and did not include technical review of the modeling used for the inundation analysis, emergency and evacuation procedures, or the criteria used to deem flooding as "not to be material from a public safety or flood damages perspective." A technical review of the flood inundation analysis was conducted by GEI and any comments from their review should be addressed.

Please feel free to call if you have any questions.

# PROCEDURAL/TECHNICAL MEMORANDUM

To: Nick Avdis
From: Ken Giberson
Cc: Todd Taylor – Sacramento County Planning Dept.
Date: May 31, 2024
Job No.: 27035.000
Subject: Upper Westside – Flood Inundation Propagation

---

## 1. INTRODUCTION

Sacramento County Planning and Environmental Review Department requested Upper Westside (Project) prepare a Procedural/Technical Memorandum (PM) and supporting maps that show the cumulative inundation propagation in the Natomas Basin (Basin) in the event of a Natomas Basin levee failure. **Exhibit 1** shows the location of Upper Westside within the Basin. Staff requested the Procedural/Technical Memorandum include the depth of potential flooding, timing of potential flooding and flow direction.

Specifically, on September 15, 2020, Staff requested the Applicant to provide, among other items, the following information to support Staff's analysis of the project:

> *"Technical memorandum and supporting maps that show the cumulative inundation propagation in the Natomas Basin in the event of Sacramento River failure or NEMDC levee failure. This should include the depth of potential flooding, timing of potential flooding, and flow direction. Cumulative development assumptions should include Sutter Point [sic], Grandpark, Metro Air Park, Sacramento International Airport, and City of Sacramento development."*

This PM is being submitted to Sacramento County Office of Planning and Environmental Review in response to this request.

The intent of these requests was to determine whether development of the Upper Westside Specific Plan would trigger a need to update the "2015 City/County of Sacramento Flood Evacuation Plan for the Natomas Study Area" (2015 City/County Evacuation Plan) or the County of Sacramento, Sacramento County Multi-jurisdictional

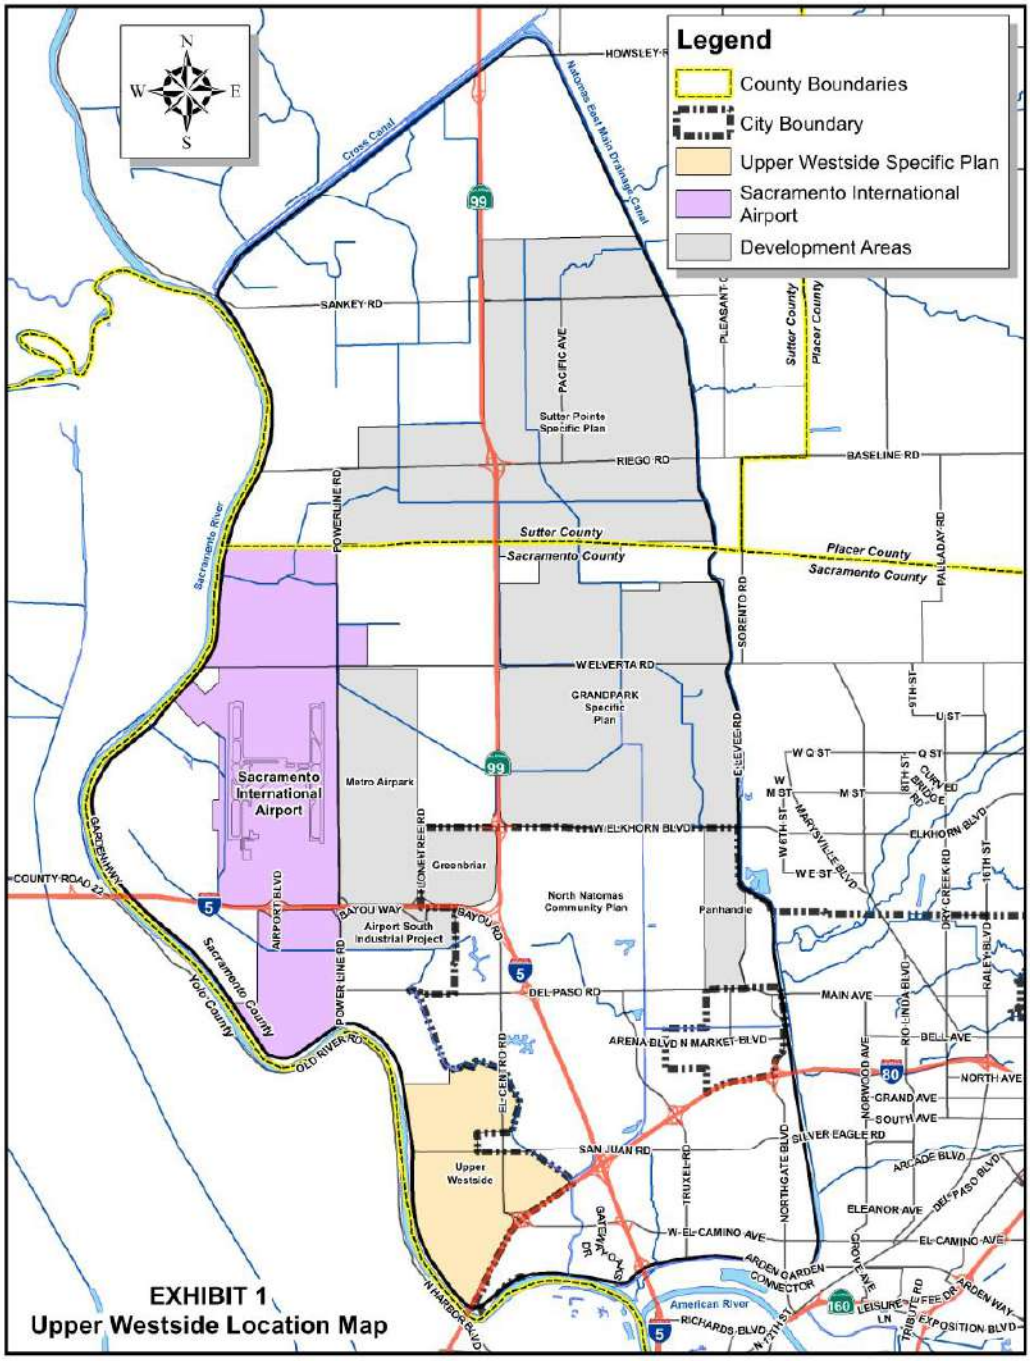

**Exhibit 1**
**Upper Westside Location Within Natomas Basin**

Local Hazard Mitigation Plan Updated in 2021 (2021 LHMP).[1] Any changes that may be needed in the 2015 City/County Evacuation Plan or the 2021 LHMP resulting from the development of Upper Westside will be identified in this PM.

Therefore, this PM was prepared in response to the Staff's request for technical information that would be needed to update the County's evacuation planning documents. These documents would need to be updated to reflect emergency response operational and/or tactical changes that may be needed over time as Upper Westside is developed.

Accordingly, this PM is a planning level study to assist County flood management emergency response professionals to plan for and evaluate the flooding affects within the Basin for Cumulative Plus Project Conditions (C+P). The cumulative conditions are more particularly described in Section 5 of this PM.

The analysis and modeling prepared to support this PM did not create the levee breach modeling that was used during the preparation of the 2015 City/County Evacuation Plan. Rather, the analysis and modeling prepared for this PM merely updated the 2015 modeling (e.g., updating the breach modeling using the current modeling software and correcting minor modeling errors) along with using the best available topographic mapping information. The 2015 modeling incorporated basic assumptions (e.g., levee breach formation assumptions) from an earlier prepared model of the Sacramento and American River systems that included predetermined river stage/flow assumptions.

Levees can fail in a number of ways. The most frequent and dangerous form of levee failure is a breach. A levee breach is when part of the levee actually breaks away, leaving a large opening for water to flood the land protected by the levee.

A levee breach can be a sudden or gradual failure that is caused either by overtopping from excessive flows and wave actions in the adjoining rivers and canals, or by a subsurface failure of the levee. Either mode of failure can quickly lead to incipient instability and rapid rupture of a levee.

Failure of a levee can result in catastrophic consequences within a relatively brief period of time after initiation of the breach – perhaps suddenly or within a small number of hours. In compliance with the requirements of the State of California's ULOP (Urban Level of

[1] The 2015 City/County Evacuation Plan includes a series of flood evacuation route maps which deal with potential levee breach scenarios. These maps are meant to assist emergency officials, first responders and the general public on how to evacuate from the Basin in the event of a flood emergency. Emergency officials, first responders and the general public should not assume that the evacuation routes shown on the maps will necessarily be the best way to evacuate from the community during a flood event. These evacuation routes could be affected by localized flooding, traffic accidents, and different flooding situations occurring at the same time. Emergency officials should monitor roadway conditions and advise the public through radio stations and other media if alternate routes should be taken. This caution applies equally to the various maps and exhibits presented in this PM.

Flood Protection) and ULDC (Urban Levee Design Criteria), SAFCA and the U.S. Army Corps of Engineers, though their joint Natomas Levee Improvement Project (NLIP), have designed and are continuing to strengthen the levee system surrounding the Basin to address the potential for levee failure from both overtopping and subsurface failure.

The design and construction of the levee system surrounding the Basin includes measures that are intended to prevent failure of the levee in the event of overtopping and subsurface failure. Notwithstanding the design and construction of this levee system to withstand these forces resulting in a levee breach, it is theoretically possible for a breach to occur.

Accordingly, this PM summarizes the results of rigorous technical analysis of the effects of flooding within the Basin should a levee breach actually occur in the levee system surrounding the Basin. Based on the above-mentioned analysis, with a few very minor exceptions, the analysis performed for this PM indicate that the development of Upper Westside will not have a material effect on either:

1. The time to inundation of 1-foot depth of flooding over critical roadway locations along the regional evacuation routes within the Basin during a catastrophic levee breach, or
2. The maximum depth of flooding within the Basin during a catastrophic flooding event.

The very minor exceptions noted in this Procedural Memorandum are neither individually nor cumulatively remarkable, and therefore not particularly notable. As they are de minimis in nature, they are deemed not material for the purposes of this PM.

Further, based on the analysis provided in this PM, the 2015 City/County Evacuation Plan will require only nominal changes resulting from development of Upper Westside, and the 2021 LHMP will not require any changes resulting from development of Upper Westside.

## 2. UPDATE OF 2015 GEI FLOOD MAPPING

This evaluation is based upon the 2015 GEI levee breach analyses of the Natomas Basin as a part of the 2015 City/County Evacuation Plan. The 2015 City/County Evacuation Plan identified seven (7) hypothetical locations around the Basin where levee failures might potentially occur. These locations are typified by significant differences in the water surface elevations in the adjoining river or stream during peak flood events and the elevation of the existing ground at the landside toe of the levee at that location. Under these conditions, the hydrostatic pressure on the levee is relatively high when compared with other locations around the levee system where the elevation of the ground at the landside toe of the levee is higher (e.g., along the levee on the east side of the Basin northerly of Del Paso Road).

It is these locations, where the hydrostatic pressures on the levees are relatively high, where levee failures are more likely to occur, and if they were to fail, they would likely result in the potential for catastrophic flooding of the Basin. These seven (7) locations were evaluated in the 2015 City/County Evacuation Plan for their potential to flood the Basin in the event of a levee breach.

The 2015 GEI levee breach analysis upon which the 2015 City/County Evacuation Plan was modeled utilized HEC-RAS Version 4.1.3 – which was then state-of-the-art flood plain modeling software. The 2015 modeling was updated for this PM in 2022 using the following newer state-of-the-art version of the HEC-RAS (Version 6.2) hydraulic modeling software utilizing Two-Dimensional (2D) terrain modeling techniques. This version of the updated modeling software allows for a more advanced and better analysis of the duration of time for the levee breach flood wave to propagate across terrain.[2]

While the previous levee breach analysis utilized modeling software that was state-of-the-art at the time, the newer version of the modeling software includes several enhanced modeling techniques that do a superior job of estimating overland flow rates and durations utilizing two-dimensional algorithms. This enhanced technology was not available in the earlier version of the software. Therefore, the engineering community widely uses the updated software because it produces more accurate and reliable results.

This updated analysis also improves and/or corrects several mapping and modeling deficiencies that existed in the previous modeling. As such, this analysis provides a current and more accurate estimate of the potential flooding conditions that could have occurred in 2015 and that could occur with implementation of the Upper Westside Specific Plan and the other reasonably foreseeable projects (i.e., under cumulative conditions) in comparison to earlier analyses.

## 3. NATOMAS BASIN FLOOD SETTING

The Basin is surrounded by 42± miles of flood control levees. This levee system protects the Basin from flooding from the Sacramento and American Rivers, the Natomas Cross Canal, and the North East Main Drainage Channel (NEMDC).

The Basin encompasses 55,000± acres of urban and agricultural land uses. The Basin is crossed by two (2) interstate freeways (I-80 and I-5), State Route 99, and several major arterials and throughfares. One of the Sacramento region's most important transportation assets, the Sacramento International Airport, is located within the Basin.

[2] This version of HEC-RAS utilizes the Shallow Water Equation to solve two-dimensional flow problems.

The exact location of future potential levee failures cannot be predicted with certainty. However, the location of potential failures could hypothetically include the Cross Canal Levee, the Sacramento River Levee, the American River Levee, and the NEMDC Levee.

In 2015, at the request of the City of Sacramento and the County of Sacramento, GEI Consultants, Inc., (GEI) performed levee breach (levee failure) analyses for seven (7) hypothetical locations along different reaches of the Natomas Basin Levee System that have the hydrostatic condition described above. These locations are shown on **Exhibit 2** as well as listed below:

1. **Breach 1**: Natomas Cross Canal at River Mile 1.35 (approximately 1.3± miles east of the confluence with the Sacramento River)
2. **Breach 2**: Sacramento River at River Mile 77.584 (approximately 0.8± miles north of the Riego Road/Garden Highway Intersection)
3. **Breach 3**: Sacramento River at River Mile 74.0 (approximately 0.8± miles south of the Elkhorn Blvd./Garden Highway Intersection)
4. **Breach 4**: Sacramento River at River Mile 66.924 (approximately 0.1± miles east of the Power Line Road/Garden Highway Intersection)
5. **Breach 5:** Sacramento River at River Mile 64.104 (approximately 0.5± miles north of the Sacramento Weir)
6. **Breach 6:** American River at I-5 Bridge (approximately 0.2± miles east of the confluence with the Sacramento River)
7. **Breach 7:** NEMDC at I-80 Bridge (approximately 0.2± miles south of the I-80 Bridge)

In the event of a levee failure, flood waters will enter the Basin and flow to the lowest points within the Basin. Over time, as these flood waters continue to fill the Basin, evacuations will likely occur to allow people in the most vulnerable locations to move to high ground and/or leave the Basin by one of many evacuation routes. With regard to evacuations, the most critical measure of safety is the duration of time for the flood waters to fill the lowest locations along the evacuation routes.[3]

In addition to a potential levee failure, the Basin is susceptible to flooding from the “Sankey Gap.” The Sankey Gap is a low point in the Basin’s east levee where Sankey Road crosses

[3] When considering the rapidity of flooding, the concept of “duration of time” is sometimes incorrectly referred to as “velocity”. For example, when someone asks, “How fast does the flooding occur?”, they are concerned about the duration of time until flooding occurs, and not necessarily the velocity at which the flood waters travel across the ground.

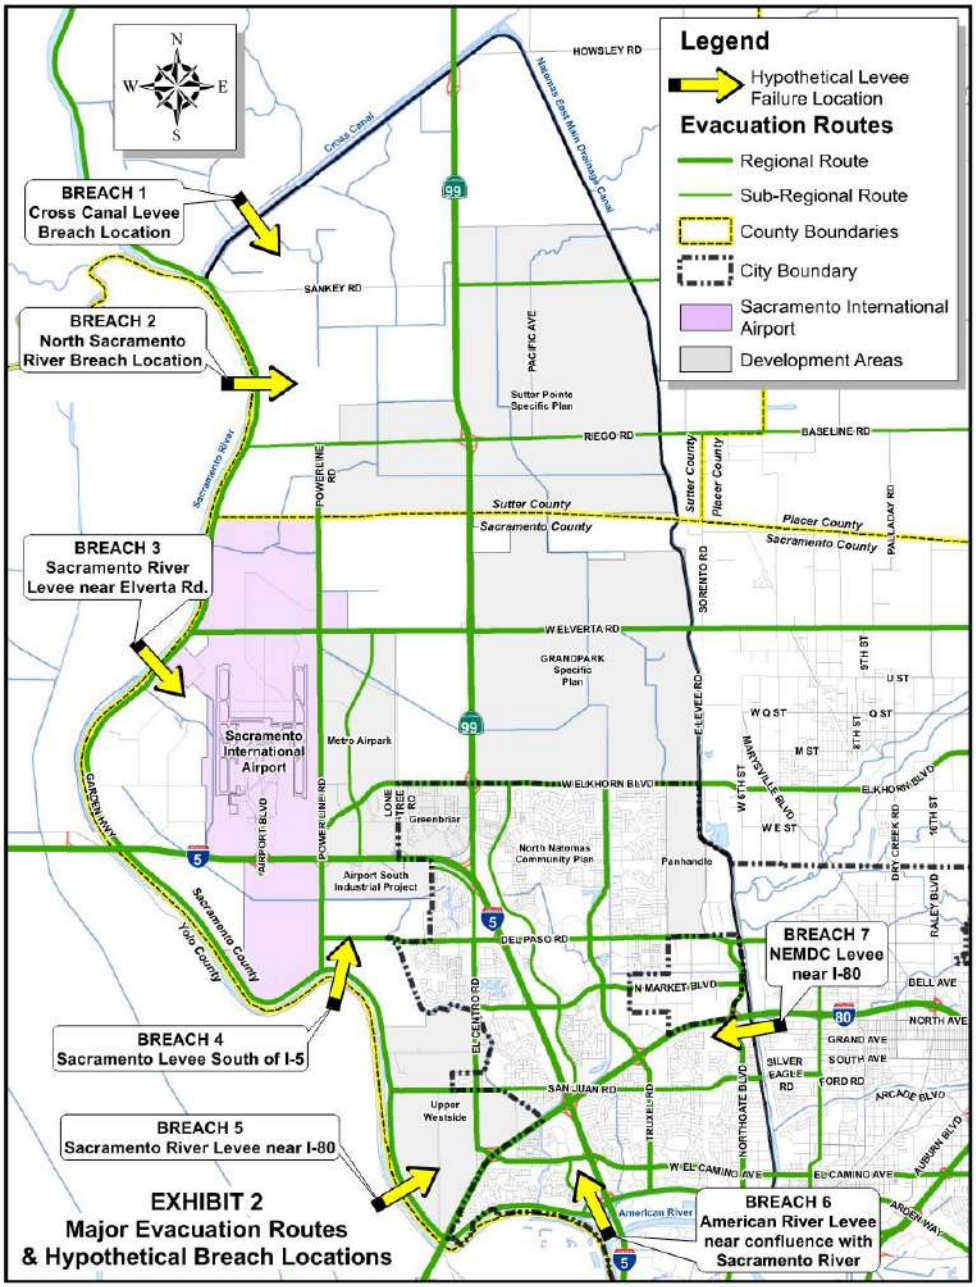

**Exhibit 2**
**Major Evacuation Routes & Hypothetical Levee Breach Locations**

the levee.[4] During periods of high flows in the Sacramento River, the runoff from eastern Sutter County and western Placer County back up in the Natomas Cross Canal and NEMDC (a.k.a., Steelhead Creek).

In the absence of future flood protection improvements along the Sacramento River upstream of the Natomas Cross Canal (e.g., widening of the Fremont Wier), the peak water surface elevations in the Sacramento River will create high stages in the Natomas Cross Canal and Steelhead Creek during peak flood events, and as a result, flood waters may spill through the Sankey Gap and enter the Basin.

The levee system protecting the Natomas Basin is being strengthened and improved by the Sacramento Area Flood Control Agency (SAFCA) to meet 200-year levels of flood protection.[5] SAFCA has a stated goal to improve the overall level of flood protection for the greater Sacramento metropolitan area, including the Basin, beyond the 200-year levels, with a longer-term goal of achieving 500-year level of flood protection for the region.

In summary, SAFCA has a stated goal to get the region to the highest level of flood protection possible. Of course, in order for SAFCA to meet the goal of 500-year level of flood protection, formal approval of additional flood protection improvements by the SAFCA Board of Directors will be required.

In improving the levee system, SAFCA and its partners are required to comply with local, State and Federal design standards and requirements that ensure the levee system can withstand a wide range of design events. Included in these design standards is a requirement that the levees do not experience a catastrophic failure when overtopped by flood events that exceed their nominal design capability. In essence, these design standards and requirements result in levee systems, that once certified, are unlikely to fail even if overtopped.[6]

In conjunction with this anti-catastrophic design standard, SAFCA has developed and implemented several levee operation and maintenance programs and associated long-term financing vehicles that are designed to prevent flooding of the Basin. These programs and financing vehicles provide for the long-term operation and maintenance of the levee system and the ability to meet these types of standards as they evolve over time.

---

[4] This low point is a legacy feature left over from the earliest days of reclamation of the Basin. The “gap” protected upstream lands within eastern Sutter County and western Placer County from additional flooding than would have otherwise occurred after construction of the levee system around the Basin in the early decades of the twentieth century but for the creation of a “gap” in the levee.

[5] SAFCA has several local, State, and Federal partners that are working together to protect the Sacramento region from flooding.

[6] Overtopping of a levee, while a serious event in itself, results in significantly less flood water volumes entering the Basin when compared to a structural failure and washout of a levee as analyzed in this PM.

Nonetheless, it is theoretically possible that the levee system could experience a catastrophic failure. However, the design standards and requirements described above, along with (1) the continuing efforts of SAFCA to reach its long-term goal to get the region to the highest level of flood protection possible, and (2) the long-term operation and maintenance programs being used by SAFCA, effectively reduce the probability of a catastrophic levee failure for the Basin to an extremely low level.

## 4. EVACUATION ROUTES

The principle of evacuation is to move citizens from a place of relative danger to a place of relative safety via a route that does not pose significant danger. There are ten (10) major roadways within the Basin that can be considered regional evacuation routes in the event of a flood. There are several other sub-regional evacuation routes that are available to the driving public during a flooding event.

Several of these roadways have more than one low point that could potentially pose a significant barrier to the driving public if a regional evacuation route were flooded.

In total, there are eighteen (18) critical locations along the ten (10) regional evacuation routes where flooding of these evacuation routes should be considered to pose an evacuation limitation for the driving public if flooding were more than one (1) foot in depth.[7] These critical locations are shown graphically on **Exhibit 3**.

These eighteen (18) critical locations are summarized as follows:

1. Del Paso Road
    a. Del Paso Road approximately 0.1± miles east of Natomas Road
2. El Camino Avenue
    a. El Camino Avenue approximately 0.1± miles east of Truxel Road
3. Elkhorn Boulevard
    a. Elkhorn Boulevard approximately 1.0± miles west of Natomas Road
    b. Elkhorn Boulevard West approximately 0.8± miles east of Power Line Road
4. Elverta Road
    a. Elverta Road approximately 1.8± miles east of State Route 99
    b. Elverta Road West approximately 0.5± miles east of Power Line Road

[7] This standard was established in the 2015 GEI levee breach analysis for the Natomas Basin as a part of the City/County of Sacramento Flood Emergency Evacuation Plan for the Natomas Study Area (dated December 2015).

5. Interstate 5 (I-5)
    a. I-5 Central approximately 0.6± miles south of Del Paso Road
    b. I-5 Junction approximately 1.2± miles east of Power Line Road
    c. I-5 West approximately 0.6± miles west of Airport Boulevard
6. Interstate 80 (I-80)
    a. I-80 Central approximately 0.8± miles west of Interstate 5 (I-5)
    b. I-80 East approximately 0.4± miles east of Truxel Road
    c. I-80 West approximately 1.0± miles east of the Sacramento River Bridge
7. Natomas Road
    a. Natomas Road approximately 0.4± miles south of Elkhorn Boulevard
    b. Power Line Road approximately 0.5± miles south of Elverta Road
8. San Juan Road
    a. San Juan Road approximately 0.5± miles east of Truxel Road
9. State Route 99 (SR-99)
    a. SR-99 approximately 1.0± miles north of Elverta Road
    b. SR-99 North approximately 0.1± miles south of Sankey Road
    c. SR-99 South approximately 0.7± miles south of Elkhorn Boulevard
10. Power Line Road
    a. Power Line Road approximately 0.2± miles south of Elverta Road

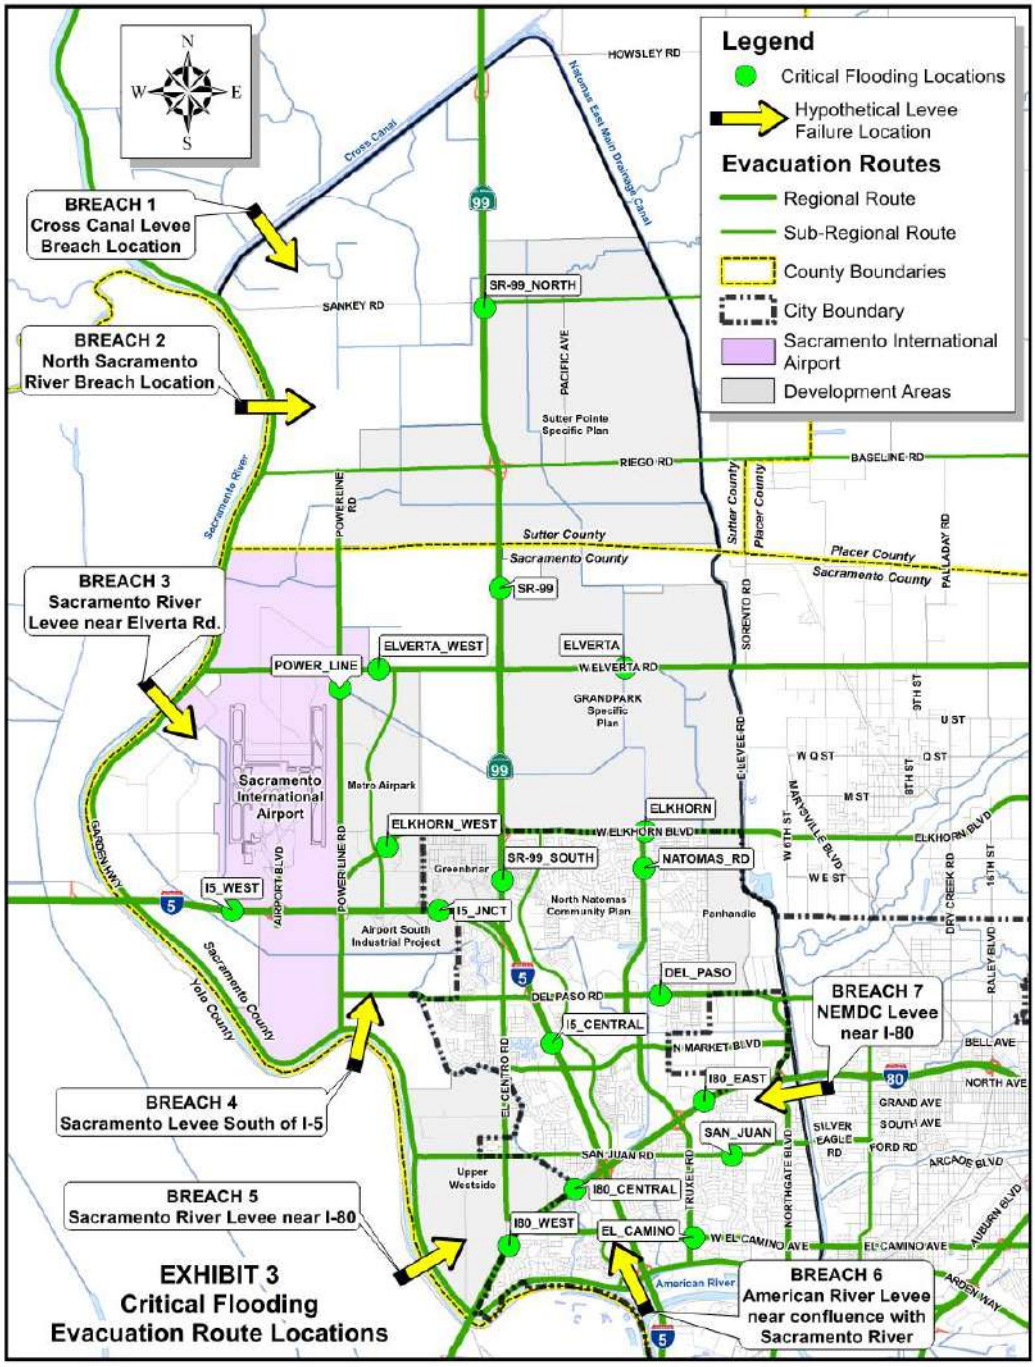

**Exhibit 3**
**Critical Flooding Evacuation Route Locations**

## 5. METHODOLOGY

The 2015 levee breach HEC-RAS hydraulic models and analysis were obtained from GEI by Civil Engineering Solutions, Inc. (CESI). The 2015 levee breach modeling evaluated levee breaches at the seven (7) theoretical locations described above and shown on Exhibit 2. CESI updated these models as described below to better estimate the projected rate of inundation and the maximum depth of flooding within the Basin post development of Upper Westside.[8] CESI coordinated its modeling effort with GEI to ensure the updated modeling was performed correctly and that the resulting output of the updated modeling yielded comparable results to the 2015 GEI models.[9]

The 2015 levee breach model was updated as follows:

1. **Updated HEC-RAS Software**. CESI updated the 2015 GEI flood modeling to HEC-RAS Version 6.2 (One-Dimensional (1D)) modeling from HEC-RAS Version 4.1.3 (1D) modeling. GEI used HEC-RAS Version 4.1.3 (1D) in the preparation of the 2015 mapping effort. Once the conversion was complete, CESI checked for error messages. The newer version of the software detected several errors in the geometry file that were not evident in the previous version of the software (e.g., a Htab parameter error in the geometric files in the HEC-RAS model noted a point where the starting elevation of a water surface is set lower than the invert of a channel). CESI corrected the errors by making modifications in the geometry file.
2. **Verification**. Prior to making any adjustments to the model to reflect the best available topographic and development information, CESI ran the updated HEC-RAS Version 6.2 1D models for each breach scenario to determine if it produced results that were generally consistent with the 2015 GEI models. In each case, CESI found the results from the HEC-RAS Version 6.2 (1D) modeling was similar to the published HEC-RAS Version 4.1.3 (1D) modeling results of the 2015 GEI models for both durations in time to 1-foot depth of inundation at the critical locations along regional evacuation routes and for the maximum depth of flooding

[8] The results of the CESI modeling were reported in CESI's Technical Memorandum No. 0040 which are included in Appendix B of this PM.

[9] The GEI models were based upon river modeling of the Sacramento and American Rivers prepared by SAFCA and/or the California State Department of Water Resources (or by consultants working for one of both of these agencies). In 2015, GEI further developed these HEC-RAS 1D models for the Natomas Basin Levee Breach analysis. That analysis resulted in the flood maps contained in the 2015 City/County Evacuation Plan. For the 2015 analysis, the City & County of Sacramento determined the locations of the seven (7) perimeter levee breach locations. The 2015 GEI models do not include allowances for the effects of climate change. Nonetheless, the rate of flood inundation propagation of the Basin during a climate change influenced catastrophic levee breach would not measurably differ from the results shown in this PM.

within the Basin. [10] This comparison of the time to inundation of 1-foot depth of flooding over the critical roadway locations and the maximum depth of flooding within the Basin verified that the updated model was sufficiently accurate to provide dependable and reliable results during the subsequent model runs.

Upon completion of this effort, CESI consulted with GEI wherein GEI and CESI mutually agreed that the updated modeling provided comparable results to the 2015 GEI modeling when utilizing similar assumption sets. In essence, this consultation process provided a form of peer review of the updated modeling effort.

3. **Updated Terrain Modeling**. CESI updated the terrain modeling to 2-Dimensional terrain modeling (2D Modeling) from the 1D terrain modeling (1D Modeling) used in the 2015 modeling effort. The HEC-RAS Version 6.2 2D modeling algorithms are superior to HEC-RAS Version 4.1.3 1D modeling algorithms when evaluating flood storage volumes and duration of time for flooding to occur. The HEC-RAS Version 6.2 is recognized by the engineering community for its superior capabilities to analyze flooding using 2D terrain surfaces more accurately as compared to HEC-RAS Version 4.1.3 that only utilized 1D terrain models.

   Since no terrain model was available from the previous modeling effort, CESI produced a current existing conditions topographic model that was used to produce a current digital terrain model for all 2D modeling analyses. It should be noted that Staff from the County Department of Water Resources requested the updated terrain model include an assumption of a fully developed grading plan for Metro Air Park for the existing conditions terrain model. This was added to all models.

4. **Breach Depth Correction**. The updated software detected errors not evident in the previous modeling relating to the depth of the breach at some locations. The previous model included adjacent ground elevations at some breach locations where the specified minimum elevation of the breach was below the adjacent ground elevations within the Basin at the landside toe of the levee (e.g., inaccurate spot elevations representing channel elevations near the levee). Specifically, this situation was observed for Breach 6, and to a lesser degree for Breach 3.

   In these cases, the lower ground elevations resulted in more excessive breach depths and formation size than were reasonable given the adjacent levee toe elevations. CESI noticed that HEC-RAS Version 6.2 automatically made the necessary corrections thereby eliminating the prediction of greater flood volumes surging through the breach than could be reasonably anticipated. Also, this

[10] The durations of time to 1- foot depth of flooding reported in this PM represents the times at the respective data points that were reported throughout the duration of the modeling period.

correction affected the timing and ability of flood waters to move through the breach, and therefore throughout the Basin.

These corrections allowed for a better estimate of flood water volumes entering the Basin. When these changes were made, CESI found that the updated models projected a lower rate of flow being conveyed through the affected breaches (i.e., through Breach 6 and to a lesser degree through Breach 3), and into the Basin. CESI found that this change resulted in a lower total volume of flood water entering the Basin (and the aerial extent of flooding).[11] Additionally, the smaller breach sizes resulted in a longer duration of time until 1-foot depth of flooding occurred at the critical locations along the evacuation routes.

5. **In-Situ Storage Correction**. The updated HEC-RAS Version 6.2 software utilizes 2D Modeling to estimate overland flow storage volumes and durations of time while transmitting the flows to downstream conveyance facilities and storage areas. The previous model did not have this capability. Typically, this change increases the accuracy of the modeling effort and results in better estimations of duration of flooding until critical flood levels are achieved (e.g., at critical locations along regional evacuation routes). This correction in the models was an automatic result of CESI's decision to convert the modeling from HEC-RAS Version 4.1.3 (1D) to HEC-RAS Version 6.2 (2D).

## 6. LEVEE BREACH & RIVER STAGE ASSUMPTIONS

The 2015 GEI modeling included a number of preset levee breach and river stage assumptions. A review of these preset assumptions provides insight into the level of accuracy and precision that should rightfully be implied when reviewing and interpreting the modeling results presented in this PM.

### 1. Levee Breach Assumptions

The 2015 GEI modeling contained preset assumptions regarding the mode of levee breach failures that might be expected to occur on the levee system protecting the Basin. California DWR originally developed these theoretical assumptions from generalizations based on historical levee breaches, These

[11] The elevation of natural ground on the inland side of a breach has a significant effect on the rapidity and total volume of flow passing through the breach. While a scour hole at the breach location can occur, for the purposes of this modeling exercise, scour was not assumed to occur. This assumption is consistent with the assumption used in the 2015 breach analysis.

assumptions, which relate to the size, shape, width, and timing of formation of levee breaches, were not changed in the modeling performed for this PM.

However, in all probability, if one of the Basin's levees were ever breached, the actual size, shape, width, and timing of formation will likely deviate from the theoretical assumptions included in the models – perhaps unpredictably. That is, in the unlikely event of a levee breach, the rapidity of failure and the resulting rate of inundation propagation will likely vary from the results projected by the modeling prepared to support this PM.[12]

This is important from a flood evacuation planning perspective. The durations of time to 1-foot depth of flooding at the eighteen (18) critical locations along the regional evacuation routes predicted in this PM may seem readily predictable. However, given the inherent uncertainties in the predictability of the variability and mode of levee failures, these durations of time should be considered a guide rather than a certitude from an evacuation planning perspective.

**2. River Stage Assumptions**

Similar to the levee breach assumptions mentioned above, the 2015 GEI model included preset assumptions regarding the flood flows and stages (the water level in the river) of the surrounding rivers and canals, and the timing of a breach occurrence. These assumptions were not changed in the modeling performed for this PM.

The stage of the river directly affects the rate of flow through a levee breach, and the resulting rapidity of flooding and the maximum depth of flooding behind the levee. Since the stage of the river varies over time during a flood event, the timing of a breach vis-à-vis the river stage at the moment of breach occurrence will determine the rate and depth of flooding behind the levee.

Accordingly, like the levee breach assumptions, in all probability, the actual timing of levee failure will deviate from the theoretical assumptions included in the models – perhaps unpredictably. That is, in the unlikely event of a levee breach, the rapidity of failure and the resulting rate of inundation propagation will likely vary from the results projected by the modeling prepared to support this PM.

[12] Typically, when a levee breaches, the breach opens relatively slowly at first. Then, as the breach widens and deepens, flood flows from the breach will radically increase within a brief time period after initiation of the breach event. This phenomenon, breach initiation to full breach conditions, can occur within a matter of a few hours.

Again, this is important from a flood evacuation planning perspective. The actual durations of time to 1-foot depth of flooding at the eighteen (18) critical locations along the regional evacuation routes identified in this PM will likely deviate from those values reported due to the uncertainties associated with river stages at the time of breach occurrence. The uncertainty of the stage of the surrounding rivers and canals surrounding the Basin's levees needs to be taken into consideration. The durations of time reported in this PM should be used as a guide rather than a certitude from an evacuation planning perspective.

## 7. FLOOD MODELING

### A. Existing Conditions

Substantial urbanization exists with the southern and southeastern portions of Basin. These existing urbanized areas are generally described as follows:

#### 1. City of Sacramento

a. **I-80/I-5 Northeast Quadrant** – Generally bounded by Elkhorn Blvd. on the north, the NEMDC on the east, I-80 on the south, and the I-5/SR-99 corridor on the west.

b. **I-80/I-5 Southeast Quadrant** – Generally bounded by I-80 on the north, the NEMDC on the east, the American River on the south, and the I-5/SR-99 corridor on the west.

c. **I-80/I-5 Southwest Quadrant -** Generally bounded by I-80 on the north, the I-5/SR-99 corridor on the east, the American River on the south, and the Sacramento River on the west.

d. **I-80/I-5 Northwest Quadrant** – Generally bounded by Arena Blvd. on the north, the I-5/SR-99 corridor on the east, I-80 on the south, and El Centro Road on the west.

e. **I-5/SR-99 Southwest Quadrant** – Generally bounded by I-5 on the north, the I-5/SR-99 corridor on the east, Arena Blvd. on the south, and Fisherman's Lake on the west.

f. **I-5/SR-99 Northwest Quadrant** – Generally bounded by Elkhorn Blvd. on the north, the I-5/SR-99 corridor on the east, I-5 on the south, and Metro Air Park on the west.

2. **Sacramento County**

    a. **Sacramento International Airport** – Generally bounded by Pritchard Lake on the north, Power Line Road on the east, I-5 on the south, and the Teal Bend agricultural area on the west.

    b. **Metro Air Park** – Generally bounded by Elverta Road on the north, Lone Tree Rad on the east, I-5 on the south, and Power Line Road and the Sacramento International Airport on the west

    c. **Teal Bend Golf Club** – Generally located on the east side of the Garden Highway southerly of Reservoir Road and westerly of the Sacramento International Airport.

    d. **Garden Highway River Frontage** – Generally consisting of rural residential estate properties along the east and west side of the Garden Highway as it parallels the Sacramento River south of the Sacramento/Sutter County line to I-80.

3. **Sutter County**

    a. **Pacific Avenue Industrial Area** – Generally bounded by Pacific Avenue on the west, and between Sankey Road on the north, agricultural lands on the east, and Riego Road on the south.

    b. **Garden Highway River Frontage** – Generally consisting of rural residential estate properties along the east and west side of the Garden Highway as it parallels the Sacramento River north of the Sacramento/Sutter County line to the Natomas Cross Canal.

The above-described urbanized areas, plus the assumption of full buildout of Metro Air Park, constitute the "existing conditions" assumption for the purposes of this PM.

**Cumulative Conditions**

There are several other Natomas Basin development projects that are reasonably foreseeable to occur in the future. These future projects, when combined with existing conditions represent the cumulative scenario for purposes of this PM. The Upper Westside land use plan is shown in **Exhibit 4**.

In addition to Upper Westside, the reasonably foreseeable projects that make up the cumulative scenario are as follows:

1. Grandpark (north of Elkhorn Blvd, east of SR-99, south of the Sacramento/Sutter County line, and west of the NEMDC)
2. Northlake (Greenbriar) (Northwest quadrant of I-5/SR-99 Interchange)

3. Panhandle (South of Elkhorn Blvd. at NEMDC)
4. Sacramento International Airport (Runway Expansion)
5. SAFCA "Preferred Alternative Plan" for Storage of Sankey Gap Spills"[13]
6. Sutter Pointe (Sutter County just north of Sacramento County line)
7. Airport South Industrial Project (South of I-5 opposite Metro Air Park and Greenbriar)

Except for the Airport South Industrial Project, the preliminary grading plans reflecting developed conditions for each of these future projects were obtained and added to the existing conditions terrain model utilized in the updated HEC-RAS model to create a cumulative conditions terrain model for the C+P analysis. The Airport South Industrial Project is a relatively new land use entitlement application pending review by the City of Sacramento.

At this time there is no readily available engineering information for the Airport South Industrial Project. For the purposes of this PM, it has been assumed that developed conditions grading of this project will closely resemble the existing terrain on the project site. Based on this assumption, the Airport South Industrial Project will have neither a substantive effect on the results of the flood inundation and propagation modeling nor on the depth of flooding results reported in this PM.

However, the Airport South Industrial Project may be located within a local floodplain and may require significant grading to allow for future development. As such grading of the site may impact the flood inundation propagation and depth of flooding beyond that analyzed in this Procedural Memorandum.

It is important to note that the developed conditions grading for the cumulative conditions analysis represented finish grade surface only and did not include any fences or structures which will be built within the cumulative conditions. These future condition items cannot be included in the current modeling as their locations and makeup are still unknown.

---

[13] SAFCA does not intend to close the "Sankey Gap" until the Fremont Weir is widened sometime in the future. Extension of the weir will result in lower stages in the Sacramento River during major flooding events which in turn will lower the depth of flooding in the Natomas Cross Canal and for areas upstream of the Sankey Gap. Rather, SAFCA Staff reports that SAFCA is currently focusing on implementing the "Preferred Alternative Plan" as described in the May 22, 2018 "Sankey Road Gap Closure Project Basis of Design Report" (personal conversation with Gary Bardini, Director of Planning at SAFCA on July 21, 2022). This project will store the flood flows that pass through the "Sankey Gap", enter the Natomas Basin and be stored in detention basins to be located interior to the Natomas Basin. These flood waters will flow into two (2) large detention basins (one (1) located on the north side of Sankey Road at the east levee of the Basin, and another located west of SR-99 south of Sankey Road). These two (2) basins will be connected by an open channel and culvert system. Each basin will be surrounded by earthen embankments to contain the flood waters. These detention basins are planned to be located within the interior flood plain of the Natomas Basin. Their embankments will therefore usurp a portion of the storage capacity of the interior flood plain.

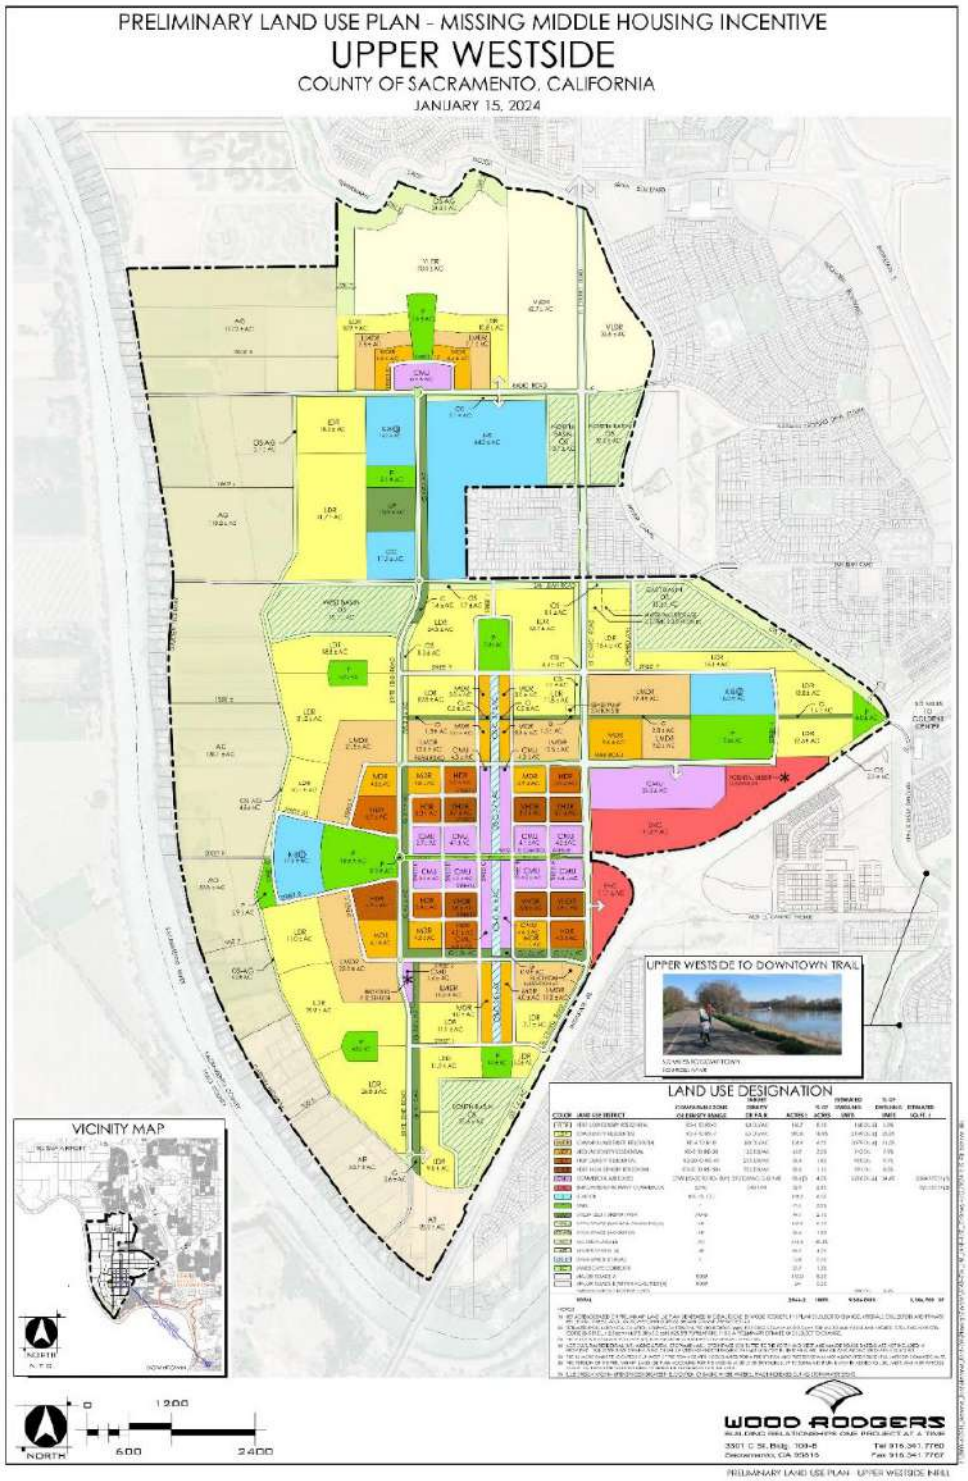

**Exhibit 4**
**Upper Westside Land Use Plan**

Additionally, adjustment for resistance to flood flows that may occur post development from these fences and structures (increases in Manning's "n" friction values) were not included in the analysis performed for this analysis.

Accordingly, the results reported in this PM are somewhat conservative in nature. That is to say that the durations in time to 1-foot depth of flooding at the critical locations along the regional evacuation routes in the Basin may be marginally shorter in duration than may actually occur during a flooding event as a result of flood flows being retarded by future fences and structures.

Except for updating the terrain model to simulate cumulative conditions for all of the above-described future projects (excluding the Airport South Industrial Project), the C+P modeling exercise utilized the same assumptions as the existing conditions modeling.

When Upper Westside is added to the above-described cumulative scenario, the resulting combined scenario represents the Cumulative Conditions Plus Project scenario, the C+P Scenario.

**Cumulative Conditions + Project (C+P) Flood Modeling**

In terms of model runs, three (3) separate model runs each were performed for the seven (7) levee breach locations. For each breach location, the eighteen (18) roadway locations listed above were evaluated in each modeling run for the duration of time until a flooding depth of one (1) foot was reached.

The three (3) modeling runs are briefly described below:

1. **Existing Conditions (1D Analysis)**. After adjustments to the model were complete, CESI updated and ran the models to compare the results of the updated model run as a 1D model to those found in the 2015 1D model runs to determine the time to inundation of 1-foot depth of flooding over the critical roadway locations under existing conditions. This comparison allowed for verification that the updated model provided comparable results to the prior modeling notwithstanding the use of the updated HEC-RAS Software (Version 6.2 v Version 4.1.3).
2. **Existing Conditions (2D Analysis)**. CESI then ran the updated models as 2D models to determine the time to inundation of 1-foot depth of flooding over the critical roadway locations under existing conditions. CESI used these modeling results to establish the baseline that was used for comparison to the C+P modeling analysis.
3. **Cumulative Plus Project Conditions (2D Analysis)**. CESI then ran the updated 2D model to determine the time to inundation of 1-foot depth of flooding over the critical roadway locations under C+P Conditions. CESI used these modeling results

to estimate the effects of developing Upper Westside along with the other reasonably foreseeable projects within the Basin in the "Cumulative Plus Project" Conditions (C+P).

The projected changes in hours until critical depths occurred along the regional evacuation routes were then calculated by CESI, comparing Cumulative Plus Project Conditions (C+P) to Existing Conditions (EC). The differences, plus or minus, were measured in terms of the number of hours of change in time until a 1-foot depth of flooding over the critical roadway locations under C+P Conditions was reached.

## 8. LEVEL OF CONSEQUENCE

There does not appear to be a set of objective standards for the definition of material effects as it relates to flooding. A survey of local public agencies in the greater Sacramento region did not reveal the existence of these types of objective standards.

Such standards, if they exist at all, will likely vary widely depending upon local conditions and the specifics of the flooding event. To establish an objective standard, consideration should include:

- Substantial technical analysis,
- Careful and objective evaluation of the effects that flooding may have:
    - In the Basin,
    - On the safety of the general public and,
    - On surrounding properties within the Basin.
- The exercise of substantial professional judgement and experience.

Upon review of the above considerations, we developed a working definition of flooding effects that are deemed not to be material for the purposes of this PM.

In the case of critical locations along regional evacuation routes that may be susceptible to rapid inundation, alternative local evacuation routes will be essential for the safe evacuation of the public from these local areas. Because these local areas will not contain a sizable number of people, these alternative local evacuation routes will not require large capacity roadways to safely accommodate their evacuation needs. Based on our experience and professional judgment, it is reasonable that a minimum of six (6) alternative local evacuation routes should be sufficient to facilitate a safe and orderly evacuation from areas subject to rapid evacuation.

For purposes of illustration, and without limitation, the following flooding effects were deemed not to be material from a public safety or flood damages perspective:

1. A reduction in the duration of time after a catastrophic levee breach occurs until a particular evacuation route is no longer safe for the general public to travel when at least six (6) alternative local evacuation routes from the same general area are available and those alternative routes offer adequate time for the safe evacuation of the affected area,
2. An increase in the depth or rapidity of catastrophic flooding when that effect does not impose substantial additional flood hazards on the general public, public or private properties, or environmental resources in the area,
3. An increase in the depth or rapidity of catastrophic flooding that is not great enough in magnitude to be noticeable or merit considering (e.g., a “de minimis” increase in the depth of flooding), and
4. Development of future growth areas within the Basin where balanced on-site earthwork can be reasonably anticipated to occur and, as a result, have negligible or de minimis consequences on the duration of time until evacuation routes are adversely affected and/or on the depth or rapidity of flooding during a catastrophic levee breach scenario.

Any flood effects that exceed the above-described level of consequences were deemed material and are reported as such in this PM.

## 9. EVACUATION ROUTE FLOOD MODELING RESULTS

### Cumulative + Project Conditions Results

The results of the C+P modeling runs described above are summarized in **Tables 1 through 7**. Again, it should be noted that all adverse changes of less than 1-hour change in time to a 1-foot depth of flooding at the critical locations along the evacuation routes are less than the accuracy of the model. Accordingly, only changes in time to the critical depth of flooding greater than one (1) hour were deemed a material change.

A review of **Tables 1 through 7** reveals those evacuation route locations where the time until flooding to critical depth (one (1) foot depth of flooding) is affected for each breach scenario under C+P Conditions. **Table 8** is a summary of the locations where the duration in time is materially changed under C+P Conditions.

## 10. ANALYSIS OF EVACUATION ROUTE FLOOD MODELING RESULTS

Analysis of the modeling results has been grouped into two (2) categories: General Observations and Specific Observations. These observations are described below:

**a. General Observations**

Generally, the C+P evacuation flood modeling results from the conversion of HEC-RAS Version 4.1.3 to Version 6.2 indicate there are nominal changes in the average duration of time until a 1-foot depth of flooding occurs at the critical evacuation route locations under all seven (7) levee breach scenarios on a basin-wide basis. These changes are summarized as follows:

| **Modeling Scenario** | **Average Change** |
|---|---|
| Existing Conditions (EC) | +8 Hours |
| Cumulative + Project Conditions (C+P) | +3 Hours |

While the magnitude of these changes varies by location and levee breach scenario, the magnitude of these changes generally indicates that the public has the same amount of time, or more, to evacuate as originally projected in the 2015 GEI modeling effort.

The movement of citizens from a place of relative danger to a place of relative safety can be realized by traveling various evacuation routes. Since there are no locations within the Basin that cannot be evacuated by more than one (1) evacuation route, the flooding of an individual location is not deemed to be crucial for the safe evacuation of citizens to a place of relative safety. Accordingly, while some of the locations on the evacuation routes may flood relatively quickly, there are alternative routes that offer sufficient time for an orderly evacuation to occur.

**b. Specific Observations**

There are a number of instances where the duration of time to 1-foot depth of flooding at the critical locations along the regional evacuation routes is reduced from the times indicated in the 2015 GEI modeling.[14] The most notable of those are discussed below:

[14] The change in modeling software, from HEC-RAS Version 4.1.3 to Version 6.2, resulted in a greater level of accuracy in terms of the duration of time until a 1-foot depth of flooding over the critical evacuation routes occurs. In particular, newer versions of HEC-RAS utilize the Shallow Water Equation to solve two-dimensional flow problems across broad and shallow flood storage areas such as across the farm fields and rice checks that cover so much of the Basin. These notable changes are reasonable when one considers the fact that the lag time due to in-situ storage of flood flows across farmland is included in the newer versions of HEC-RAS, which the earlier version of the software did not calculate.

1. **Immaterial Reductions in Duration of Time.**

   Seemingly material changes in the duration of time to 1-foot depth of flooding under Cumulative Plus Project (C+P) Conditions were observed for several of the levee breach scenarios. These changes are summarized in **Table 8** for C+P Conditions.

   While measurable, the majority of these changes are not deemed material because of the amount of time remaining that is projected to be available to the public to evacuate. The movement of citizens from a place of relative danger to a place of relative safety can be realized by traveling various evacuation routes.

   Since there are no locations within the Basin that cannot be evacuated by more than one (1) route, and often by several different routes, the flooding of an individual location is not deemed to be crucial for the safe evacuation of citizens to a place of relative safety. Accordingly, while some of the locations on the evacuation routes may flood relatively quickly, there are alternative routes that offer sufficient time for an orderly evacuation to occur.

2. **Rapid Inundation of Regional Evacuation Routes.**

   Existing Conditions

   The 2015 GEI 1D modeling identified several critical locations where rapid inundation of the evacuation routes within the Basin were projected to occur in the event of a levee breach. The duration of time to 1-foot depth of flooding at these critical locations of less than twelve (12) hours duration after occurrence of a breach are of particular importance.

   The rapid durations of time at these locations should not be interpreted literally. Rather, these brief time frames should be considered in the context of the limitations of the modeling given the theoretical assumption sets relating to levee breach formation and river stages contained in the 2015 GEI modeling.

   Good evacuation planning dictates that the identified “rapid duration” locations should be closed to public traffic prior to or contemporaneously with the occurrence of a levee breach. Because of the uncertainties in the modeling, this planning principle is true whether the estimated duration of time to 1-foot depth of flooding is one (1) hour or ten (10) hours.

   From a practicable perspective, the logistics associated with the closing of a roadway (including the response time to make the decision to close a

roadway, and the amount of time required by first responders to sign, barricade, and close an evacuation route to public traffic) can take several hours to accomplish. This fact, in and of itself, indicates that evacuation routes subject to rapid inundation should be closed as soon as practical after a levee breach occurs.

Proposed Conditions

Generally, the updated 2D modeling prepared for this PM identified the same locations where rapid inundation of the evacuation routes were projected to occur in the 2015 GEI 1D modeling. These rapid inundation locations for Existing Conditions and under C+P Conditions in Tables 1 through 7 (under the Updated 2D Model columns). It should be noted that the rapid inundation locations are projected to occur in relatively the same time frames under Existing Conditions (2D) and C+P Conditions (2D) modeling. That is to say, the development of Upper Westside does not adversely affect the rapidity of flooding of these critical locations.

Associated with four (4) of the levee breach locations, there are a total of nine (9) locations that are prone to rapid inundation during a levee breach. They are summarized in the table below.

Logically, the public will want to evacuate away from a levee breach instead of trying to use evacuation routes that lead towards a breach. Further, it is reasonable to assume that first responders will direct the public away from areas of concern and towards areas of relative safety.

However, when one or more locations along the regional evacuation routes identified above (e.g., El Camino Avenue, I-5, or I-80) are unsafe for travel by the general public due to rapid inundation, alternative evacuation routes to move people from areas of concern and toward areas of safety need to be identified. **Exhibit 5** depicts four (4) areas of concern where it is highly likely that rapid inundation is projected to occur during the first twelve (12) hours after a levee breach. breach – see the dashed colored lines surrounding areas where rapid inundation is likely to occur.

| **Breach No.** | **Breach Description** | **Critical Locations** |
|---|---|---|
| 1 | Natomas Cross Canal Levee | None |
| 2 | North Sacramento River Levee | None |
| 3 | Sacramento River Levee Near Elverta Road | Elkhorn West<br>I-5 West<br>Powerline |
| 4 | Sacramento River Levee South of I-5 | Elkhorn West<br>I-5 Junction<br>I-5 West |
| 5 | Sacramento River Levee Near I-80 | I-80 Central<br>I-80 West |
| 6 | American River Near Confluence with Sacramento River | None |
| 7 | NEMDC Levee Near I-80 | El Camino Avenue<br>I-80 East<br>San Juan Avenue |

Each of these four (4) areas of concern are associated with a nearby hypothetical levee breach location. (i.e., one area of concern each near Breach Nos. 3, 4, 5, and 7). Depending upon the location of an actual breach, the affected roadways should be closed to the traveling public prior to or immediately following the occurrence of a levee breach.

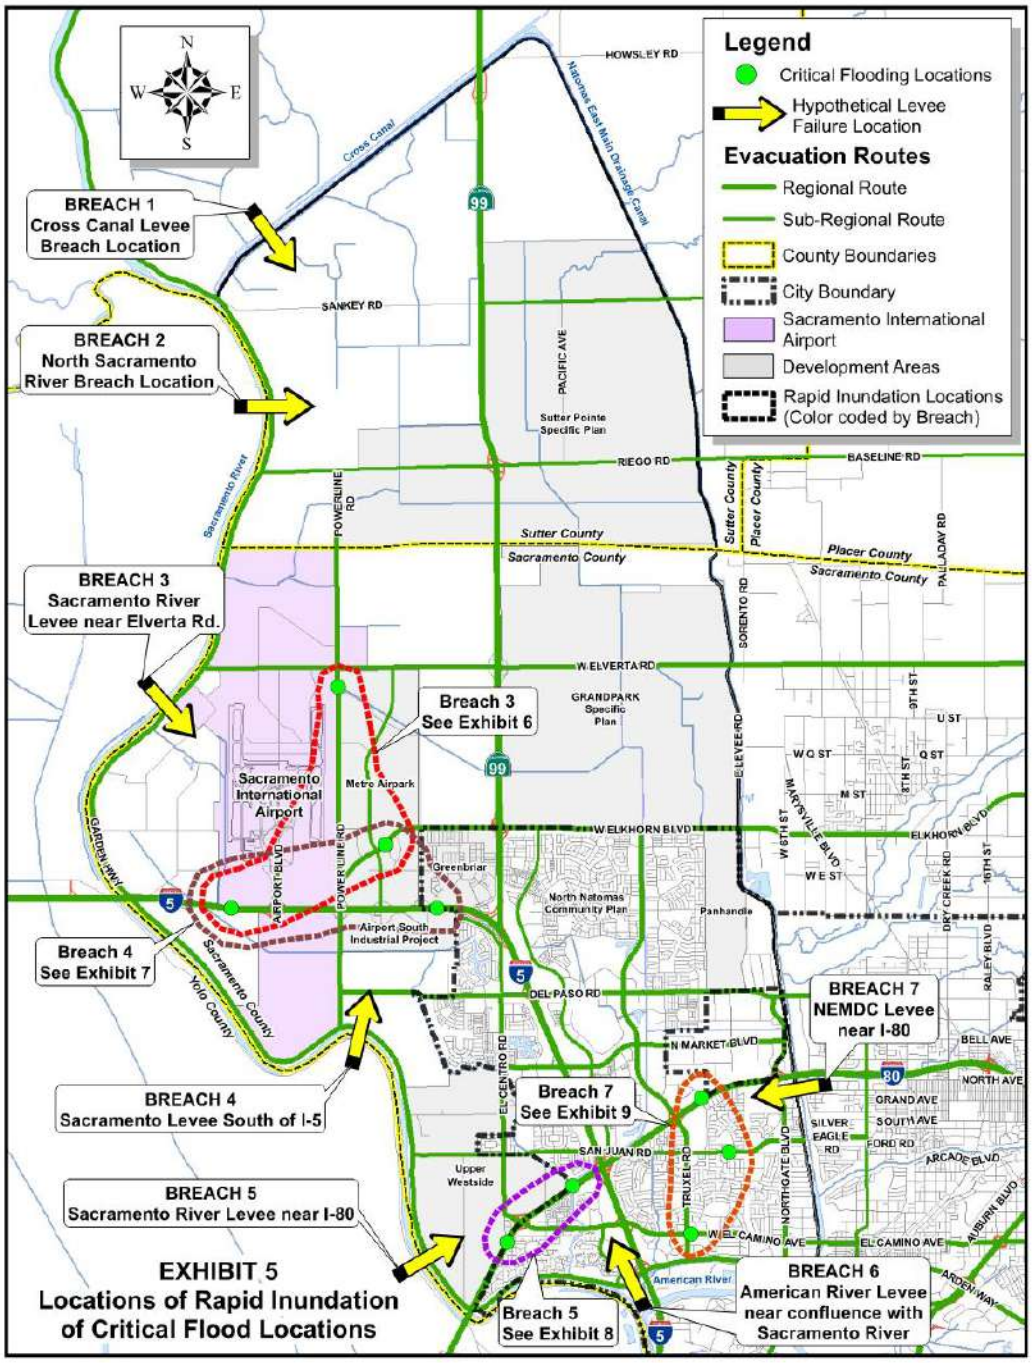

**Exhibit 5**
**Locations of Rapid Inundation of Critical Flood Locations**

**Exhibits 6, 7, 8 and 9** each depict in greater detail the four (4) areas of concern for rapid inundation of regional evacuation routes during a levee breach in the vicinity of Breach 3, Breach 4, Breach 5, and Breach 7, respectively. In total, there are nine (9) locations in these four (4) areas of concern that are subject to rapid inundation. These exhibits show alternative local evacuation routes that are available for evacuation during the first few hours after a breach occurrence.

In each of the four (4) areas of concern, there are at least nine (9) alternative routes that are available for evacuation during the early hours of a catastrophic flood resulting from the respective levee breach locations. Accordingly, safe evacuation of the public from areas of rapid flooding can still occur using the alternative routes identified in Exhibits 6, 7, 8, and 9.

Additionally, during periods of high river stages, the entities responsible for flood watch patrols should be able to identify seeps and sand boils on the land side of the levees and the loss of freeboard on the water side of the levees that are typically precursors to potential levee failures. Once these precursors are spotted, the flood watch patrol officials should notify the appropriate public safety and evacuation entities who should then initiate pre-planned flood evacuation procedures, including the closure of roadways, including roadways that may be in threat of rapid inundation during a catastrophic levee failure, prior to or immediately after the occurrence of a levee breach.

Finally, the identification of those critical locations along regional evacuation routes that are prone to early inundation should provide evacuation planners with a clearer picture of which of the regional evacuation routes are not prone to early inundation. This finding should allow evacuation planners to prioritize their roadway closures plans to allow for early evacuations from the Basin regardless of the location of a levee breach.

Therefore, notwithstanding the rapid inundation of these four (4) critical flooding locations during the first twelve (12) hours post-occurrence of their respective levee breaches, the alternative evacuation routes presented in Exhibits 6 through 9 show that the public can evacuate from these critical flooding locations by a minimum of nine (9) different evacuation routes. In our professional opinion, the existence of such a large number of alternative evacuation routes indicates that early evacuation of these areas can safely occur notwithstanding the rapid inundation of the critical locations.

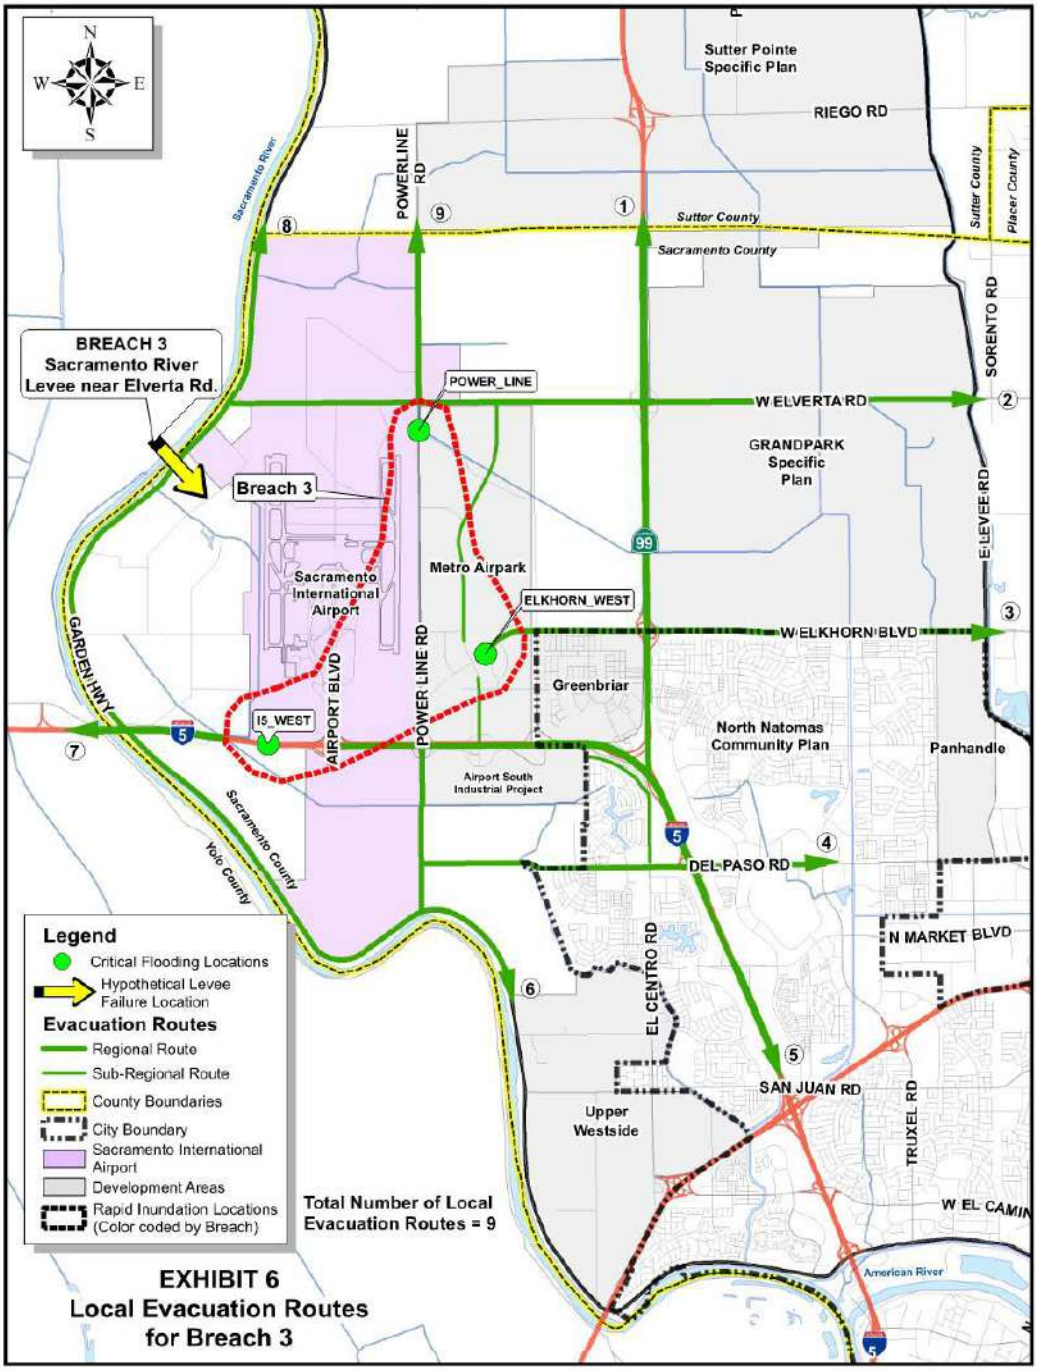

**Exhibit 6**
**Local Evacuation Routes for Breach 3**

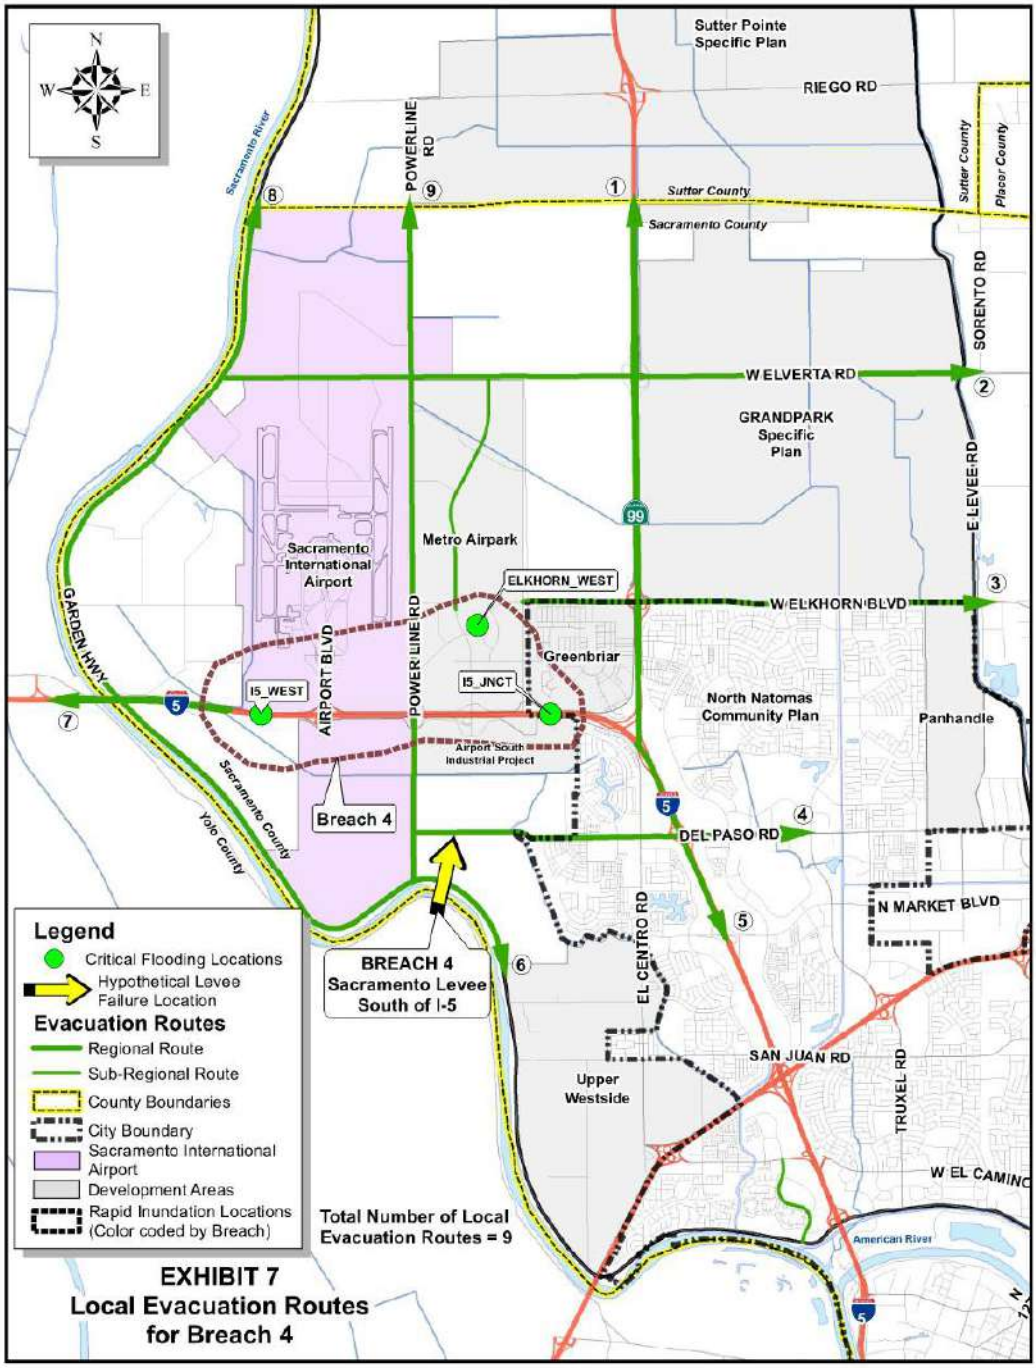

**Exhibit 7**
**Local Evacuation Routes for Breach 4**

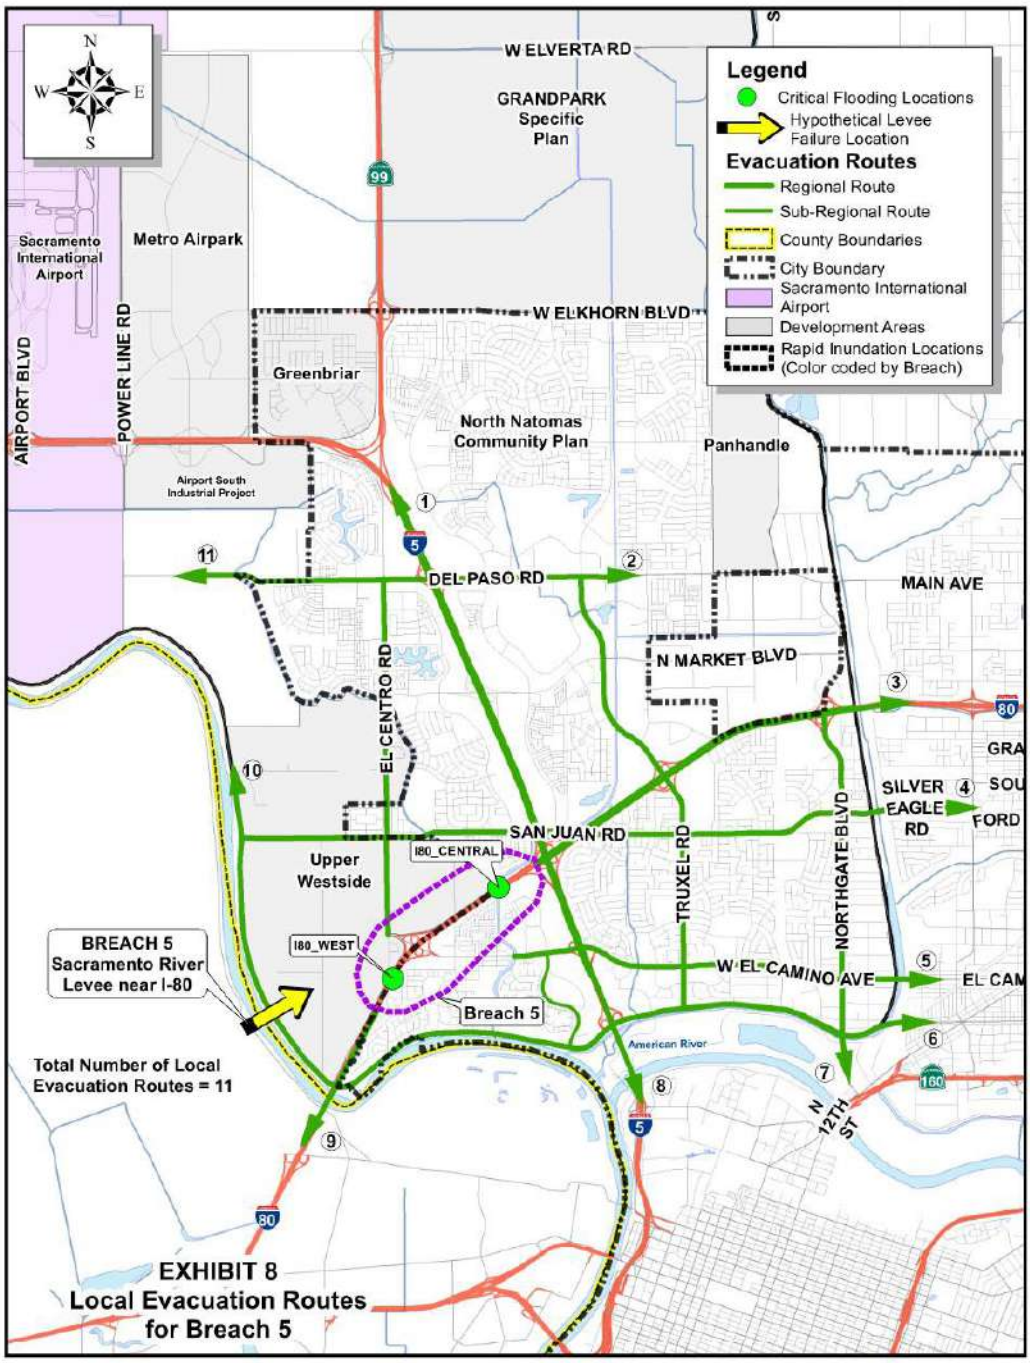

**Exhibit 8**
**Local Evacuation Routes for Breach 5**

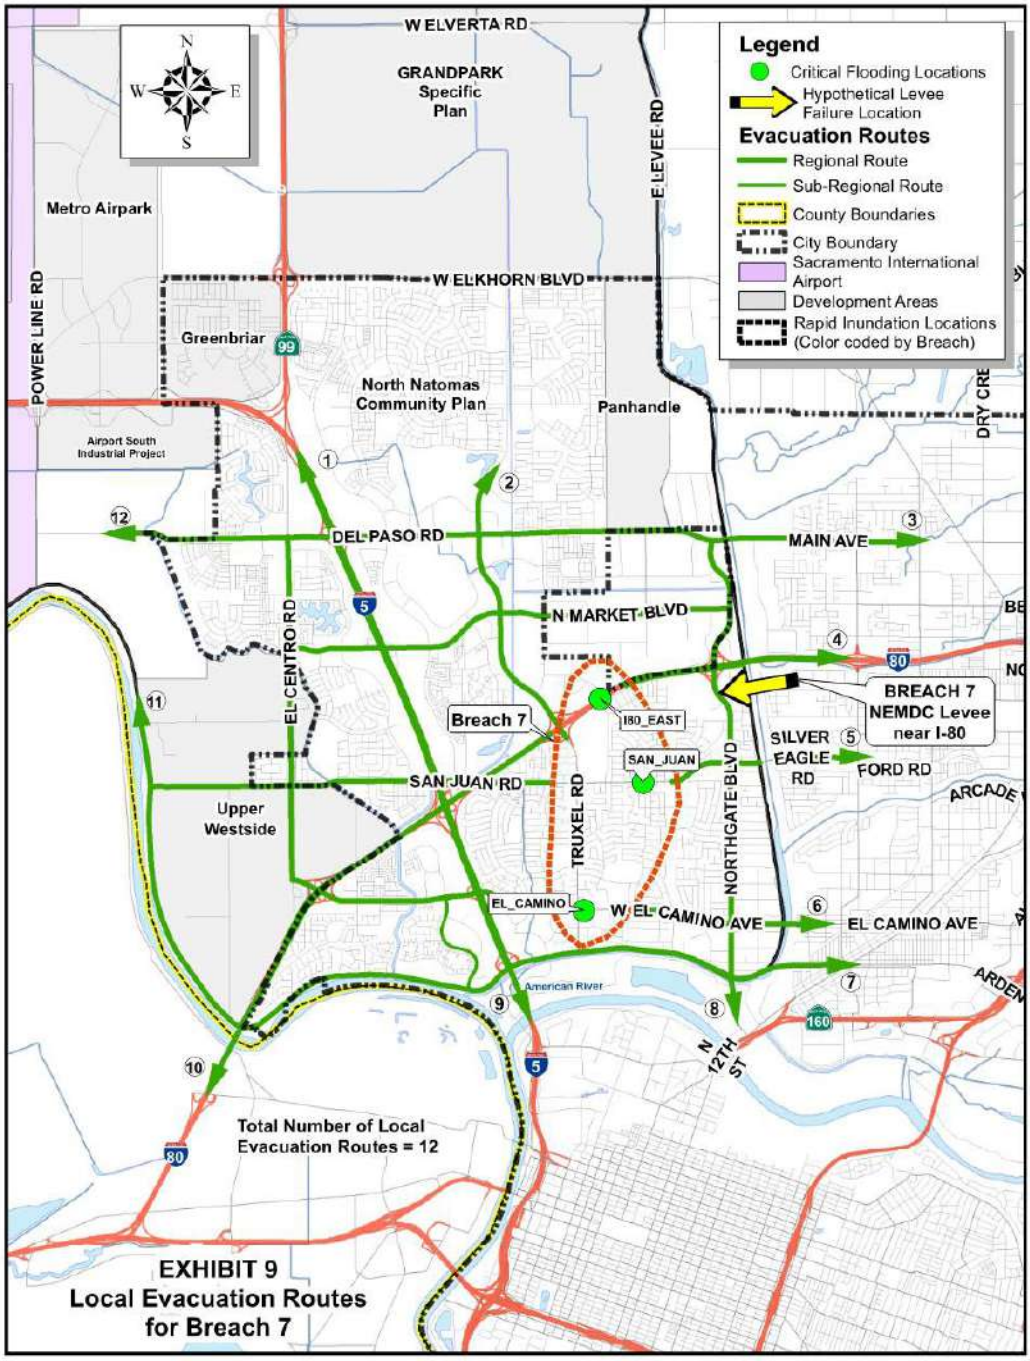

**Exhibit 9**
**Local Evacuation Routes for Breach 7**

### 3. Numerically Large Reductions in Duration of Time

The modeling revealed a small number of instances under C+P Conditions where numerically large reductions in the duration of time to 1-foot depth of flooding were observed. While numerically large, these reductions of time were not deemed material from an evacuation perspective. These instances and the reasoning for them being immaterial are explained below:

A. Cumulative Plus Project Conditions

In five (5) cases, the total duration of time to 1-foot depth of flooding of a regional evacuation route under C+P Conditions were found to have decreased by a large number of hours when compared to existing conditions:

| Breach | Location | Reduction | Remaining Time |
|---|---|---|---|
| 1 | SR-99 | -31 Hours | 62 Hours |
| 1 | SR-99 North | -59 Hours | 39 Hours |
| 2 | Elkhorn West | -16 Hours | 36 Hours |
| 2 | Elverta West | -19 Hours | 14 Hours |
| 7 | Power Line | -13 Hours | 123 Hours |

Similarly, in these limited number of cases, there either remains adequate time to evacuate and/or several other alternative evacuation routes are available for the public to utilize to reach a location of relative safety. Accordingly, these decreases in evacuation time do not appear to be material from a safety perspective.

## 11. MAXIMUM DEPTH OF FLOODING MODEL RESULTS

### Methodology

The 2015 GEI modeling also evaluated the maximum depth of flooding within the Basin that would likely result from a levee breach at each of the seven (7) levee breach locations under existing conditions. Based on this analysis, a series of “maximum flood depth maps” were prepared for the 2015 City/County Evacuation Plan.

The 2015 mapping effort depicted the aerial extent of maximum flooding in 4-foot increments projected to occur within seven (7) days post levee breach. This mapping was prepared to a level of accuracy that was deemed appropriate by the City and County for flood evacuation planning.

The updated levee breach modeling performed for this PM provided sufficient data to allow updating of those 2015 maximum flood depth maps. For purposes of evaluating the resulting material changes related to development of Upper Westside under cumulative conditions, the 2015 maps were updated utilizing the new modeling results.

Similar to the evacuation route analysis described above, analysis of the maximum depth of flooding was performed for the following scenarios:

1. Existing Conditions (1D Analysis).
2. Existing Conditions (2D Analysis).
3. Cumulative Plus Project Conditions (2D Analysis).

The results of these analyses were then plotted in aerial view over the HEC-RAS 6.2 Terrain Model prepared by CESI for Existing Conditions and for Cumulative Plus Project Conditions. The results of this exercise were then compared side-by-side to provide a visual comparison of the maximum flooding depths projected to occur under Existing Conditions and C+P Conditions as a result of the seven (7) different levee breach scenarios. The resulting series of maximum depth of flooding maps for Existing Conditions (1D), Existing Conditions (2D), and Cumulative Plus Project Conditions (2D), all utilizing the latest HEC-RAS software, are included in **Appendix A**.

**Maximum Depth of Flooding**

By visual inspection of the maximum flood depth maps in **Appendix A**, it is evident that for all breach locations (Breaches 1-7), the results of the updated mapping effort for C+P Conditions are similar to the updated 2D Existing Conditions (EC) maximum depth of flooding maps.

The following observations are self-evident after visually inspecting the updated maximum depth of flooding maps.

1. A comparison of the results from the 1D and 2D modeling for C+P scenarios indicate a high degree of consistency between the 2015 depth of flooding maps and the updated depth of flooding maps.
2. The Sankey Gap spill path is not apparent in the Existing Conditions 1D Analysis.
3. The estimated maximum depth of flooding resulting from the new 2D Analysis is less than that based on the 1D Analysis.
4. The aerial extent of the maximum depths of flooding from the new 2D Analysis is less than that based on the previous 1D Analysis. This is especially evident for Breach 6, and to a lesser degree for Breach 3.

5. Grading within the reasonably foreseeable projects under C+P Conditions shows some nominal differences in the maximum depths of flooding. However, the lower depths occur where embankments are proposed, and the greater depths occur at the locations where detention basins are proposed. These differences were not deemed material.

A comparison of Maximum Flooding Water Surface Elevations for Upper Westside under C+P Conditions for each breach scenario is shown in **Table 10**. The point of reference for this comparison is the north-south mid-point within the Upper Westside Project.

Therefore, the differences in maximum water surface elevations between the Existing Conditions (2D) analysis and the Cumulative Plus Project Conditions (2D) analysis are deemed nominal and not material from a flooding perspective. The maximum depth of flooding under Existing Conditions 2D as compared with the Existing Conditions Plus Upper Westside 2D would be nearly identical to the water surface elevations and changes thereto shown in Table 17 (the C+P results).

This conclusion can be easily reached when one considers that, for all intents and purposes, rough grading of all urban and non-urban sites within the Natomas Basin is accomplished on a “net-zero” basis. That is to say, rough grading of nearly all sites within the Natomas basin have been and will continue to be the result of “balanced” on-site

grading plans – with little or no import or export of dirt from or into the Basin.[15]

Generally, the Basin will fill to a single-pool elevation under each breach scenario. The maximum depth of flooding under each scenario, the single-pool elevation, is a function of the water surface elevation in the river at the time equilibrium is reached with the water surface elevation within the Basin.

Accordingly, flood storage volumes and their aerial distribution within the Natomas Basin have and will remain relatively unchanged over time. While localized, minor changes in

[15] SAFCA has imported fill material and may continue to import fill material as a part of the levee improvement project to protect the Natomas Basin from the threat of external flooding. The volumes of import material used to strengthen the levee system and to create the future detention basin to capture Sankey Gap spills (the SAFCA “Preferred Alternative Plan for Storage of Sankey Gap Spills”) are relatively minor and should be considered de minimis when compared to the overall flood storage volume within the Natomas Basin. Accordingly, the volume of fill material imported into the Natomas Basin for flood protection purposes is not deemed material during a catastrophic flooding event.

the aerial extent of catastrophic flooding may occur on a project-by-project basis, the distribution of flooding on a basin-wide basis will not vary measurably over time.[16]

## 12. CITY/COUNTY EVACUATION PLANS

Sacramento County Office of Emergency Services [17]

The Sacramento County Office of Emergency Services (SacOES) coordinates the overall Sacramento Countywide response to large scale incidents and disasters. SacOES is responsible for alerting and notifying appropriate agencies when disaster strikes; coordinating all agencies that respond, ensuring resources are available and mobilized in times of disaster; developing plans and procedures in response to and recovery from disasters; and developing and providing preparedness materials for the public.

SacOES staffs the Operational Area Emergency Operations Center (EOC), a central facility responsible for carrying out the principles of emergency preparedness and emergency management, or disaster management functions at a strategic level in an emergency situation and ensuring the continuity of operation in the County. The EOC is responsible for the strategic overview, or "big picture," of the disaster, and does not normally directly control field assets, instead making operational decisions and leaving tactical decisions to lower commands. These commands include various County departments, cities, schools and special districts, business and industry, volunteer organizations, individuals, and state and federal government agencies.

Emergency plans and associated functional annexes are developed and maintained by SacOES. These plans address extraordinary emergency situations associated with human-caused disasters, natural disasters, technological incidents and/or emergencies, and national security incidents and/or emergencies affecting or within Sacramento County. Responding agencies may include public and non-government organizations.

In the event of an emergency that requires citizens to evacuate to a safe area, SacOES has developed a set of agreed-upon strategies and responses already in place to ensure the evacuation process is managed as smoothly and effectively as possible. This set of agreed-upon strategies and responses also accounts for the many people with disabilities, the elderly, and others with access and functional needs who may need additional support in an evacuation.

The tactical commands for flood related emergencies within the Sacramento County portions of the Basin are the City of Sacramento, Reclamation District No. 1000 (RD 1000),

[16] The maximum depth of flooding may be different than those shown in the PM when the effects of climate change are considered.

[17] Much of the text of this section of the PM was obtained from the SacOES website on September 9, 2022.

and the County Departments of Water Resources (County DWR) and Transportation (County DOT). The County of Sutter is responsible for the development of tactical commands for flood related emergencies in the Sutter County portion of the Basin. These tactical commands are responsible for the development of operational evacuation plans in their respective portions of the Basin. These operational evacuation plans provide a framework to guide a local government response during times of emergency.[18]

Based on a review of the SacOES emergency response plans relating to flooding and the analysis contained in this PM, the development of Upper Westside does not trigger the need for any modifications to the various SacOES emergency planning documents mentioned in this PM. Similarly, based on the same document review and the analysis contained in this PM, the development of Upper Westside does not require any modifications to the operational evacuation plans of the various tactical commands mentioned above.

2015 City/County Evacuation Plan

Based on a review of the 2015 City/County Evacuation Plan and the analysis contained in this PM, only minor changes are required to modify the 2015 City/County Evacuation Plan to address the effects of developing Upper Westside. These changes will be required to reflect the current estimated durations of time until the critical locations along the regional evacuation routes studied in this PM are inundated to a 1-foot depth within 1-hour after a catastrophic levee breach.[19]

2021 Local Hazard Mitigation Plan

SacOES partnered with the Cities of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt, Isleton, Rancho Cordova, and several special districts to update their countywide 2016 Local Hazard Mitigation Plan (2016 LHMP). The 2016 LHMP was approved by FEMA. FEMA requires a LHMP to be updated every five (5) years to incorporate any changes in local conditions and requirements.

While natural hazards such as flooding cannot be prevented, a LHMP forms the foundation for a community's long-term strategy to reduce disaster losses. Communities with a FEMA-

[18] It is recommended that these operational evacuation plans identify the roadways that are prone to rapid inundation in the event of a levee breach. This should allow evacuation planners to identify alternative local evacuation routes and to prioritize their roadway closure plans to allow for early evacuations from the Basin regardless of the location of a levee breach. To hasten the roadway closure response time, it is recommended these plans include pre-event stockpiling of roadway closure materials (e.g., barricades, traffic control and detour signs, traffic cones, flares, and warning lights) at strategic locations near those areas prone to rapid inundation.

[19] These changes are highlighted in the Technical Memorandum included in Appendix C of this PM.

approved LHMP are eligible for FEMA pre- and post-disaster grant funding and for lower costs of flood insurance to residents through the National Flood Insurance Program's (NFIP) Community Rating System (CRS).

The 2021 Local Hazard Mitigation Plan (2021 LHMP) served to update the 2016 FEMA approved 2016 LHMP. The purpose of hazard mitigation is to reduce or eliminate long-term risk to people and property from hazards. Sacramento County, along with 31 incorporated communities and special districts within the County, prepared the 2021 LHMP in order to make the County and its residents less vulnerable to future hazard events, including flood events. Based on a review of the 2021 LHMP and the analysis contained in this PM, the development of Upper Westside does not require any modifications to the 2021 LHMP.

## 13. SUPPLEMENTAL MODELING ANALYSIS

### A. GEI Peer Review

During the County's review of an earlier draft of this Procedural Memorandum, the County retained GEI Consultants to perform a peer review of the flood modeling portions of the technical analyses contained therein. Specifically, the County asked GEI to review the modeling changes described in Appendices C & D – the 2022 levee breach analyses prepared by CESI – to independently determine whether the 2015 City/County Evacuation Plan and the 2021 LHMP needed to be updated as a result of the development of Grandpark and Upper Westside.

The comments received from GEI's peer review were mostly confirmational and advisory in nature with regards to the modeling changes that were prepared by CESI with one minor exception. The exception related to the difference between the assumption sets for breach length and scour pit formation in GEI's 2015 modeling effort and CESI's 2022 modeling effort. GEI suggested that it would be interesting to determine what differences in modeling results would occur if the two sets of analyses used the same breach and scour pit assumptions.

Even though GEI did not identify any meaningful issues with the 2022 modeling effort, as their findings indicated the 2022 modeling effort was technically adequate, the difference in breach length and scour pit formation assumption sets were deemed to be interesting enough to warrant further investigation.

Accordingly, in response to the comment regarding breach lengths and scour pits formation, the applicants directed CESI to perform a supplemental analysis using the updated 2022 modeling work with the 2015 breach and scour pit assumption set to

facilitate identification of material differences in modeling results between 2015 and the 2022 modeling effort, if any.

**B. Supplemental Analysis Results**

The results of this supplemental analyses are presented in Appendix E (CESI Technical Memorandum 0040A). The general finding of the supplemental analysis brings about consistency in levee breach assumptions when using the improved modeling software. This modeling effort demonstrated slightly greater elapsed times to one foot of flooding at a majority of critical locations along the evacuation routes identified earlier in this Procedural Memorandum. In general, the 2024 supplemental analysis found that the resulting timing for flood inundation propagation from each of the seven breach locations were relatively consistent with those found in the 2015 flood mapping analysis.

Specifically, the key observations from this supplemental analysis are listed below:

1. The 2015 assumption set for breach length and scour pit formation allowed the levee breaches and scour pits to form to the full depth and height in all seven simulated locations regardless of the landside toe elevations. However, this change in the modeling assumption did not increase the amount of flow significantly to the interior of the basin.
2. The landside elevations that the breaches could flow to as an exit from the breach weir location did contribute to some higher flow rates into the Natomas Basin in a few of the analyses.
3. However, the addition of a full depth scour pit delayed some flow delivery and reduced overall peak flows. This is likely due to the fact that during the breach formation, the scour pit operated at a water surface elevation below the exterior river water surface elevation as there are head losses for the flow passing through the breach. The lower water surface elevation of the scour pit delivering water to the landside terrain therefore had less potential energy to drive the flood waters to spill over the terrain. Also, because the scour pit flood elevation is above the terrain elevations, the head to drive flood waters through which the breach operates was less when the near submergence.
4. The changes in breach length and scour pit formation assumptions generally resulted in less flooding depths and longer flood timings for all seven breach locations studied. This suggests that for total flow and timing, the importance of the breach formation depths was not as significant as the elevations of the

landside terrain the flood waters eventually must pass over after passing through the breach and scour pit.

5. Finally, the changes in timings in the two 2D models (Existing Conditions and Cumulative Conditions) stayed similar to the previous analysis and was not sensitive to the issues raised in the GEI Comments.

## C. Additional Findings

There were several additional findings from the supplemental analysis that are worth noting:

1. Breach 6

   Based on the results of the supplement analysis contained in TM 0040A, Breach 6 is another place where rapid inundation is possible. The three locations where rapid inundation is possible for Breach 6 are (a) Elkhorn, (b) I-80 Central, and (c) I-80 West.

   Two of these three locations were previously identified as rapid inundation locations: (b) I-80 Central, and (c) I-80 West. These two locations are subject to rapid inundation and should be treated as such in any emergency planning activities.

   However, while the Elkhorn location was identified as a possible rapid inundation location, inspection of the developed conditions topographic mapping used in the supplemental analysis reveals that the roadway in this vicinity was incorrectly mapped at its existing elevation in the cumulative analysis. In reality, the conceptual rough grading plan for this roadway is shown to be raised to elevation 21.5 feet – well above the developed conditions 200-year flood plain – and significantly above the elevation that will be subject to rapid inundation. Accordingly, this location can be eliminated from the list of rapid inundation locations.

   The table on Page 27 is hereby amended to show Breach 6 (American River Near Confluence with Sacramento River) with two critical locations: (1) I-80 Central, and (2) I-80 West. A new table of critical locations along major evacuation routes where rapid inundation is projected to occur is presented below:

| Breach No. | Breach Description | Critical Locations |
|---|---|---|
| 1 | Natomas Cross Canal Levee | None |
| 2 | North Sacramento River Levee | None |
| 3 | Sacramento River Levee Near Elverta Road | Elkhorn West<br>I-5 West<br>Powerline |
| 4 | Sacramento River Levee South of I-5 | Elkhorn West<br>I-5 Junction<br>I-5 West |
| 5 | Sacramento River Levee Near I-80 | I-80 Central<br>I-80 West |
| 6 | American River Near Confluence with Sacramento River | I-80 Central<br>I-80 West |
| 7 | NEMDC Levee Near I-80 | El Camino Avenue<br>I-80 East<br>San Juan Avenue |

Further, Exhibit 10 shows the location of the two rapid inundation locations associated with Breach 6 and hereby replaces Exhibit 5 above for the purposes of the 2024 analyses. Finally, Exhibit 11 shows the two locations of rapid inundation for Breach 6. Exhibits 10 and 11 are shown below.

2. Immaterial Reduction in Duration of Time

   Similar to the results of the 2022 analyses, the results of the 2024 analyses revealed several locations where insignificant reductions in duration of time to 1-foot depth of flooding at critical locations along evacuation routes occur. For the same reasons as explained earlier in this Procedural Memorandum, these reductions were deemed immaterial in the supplemental analysis.

3. Numerically Large Reductions in Duration of Time

   Again, similarly to the results of the 2022 analyses, the results of the 2024 analyses revealed several locations where numerically large reductions in duration of time to 1-foot depth of flooding at critical locations along evacuation routes occur. For the same reasons as explained earlier in this Procedural Memorandum, these large reductions were deemed immaterial in the supplemental analysis.

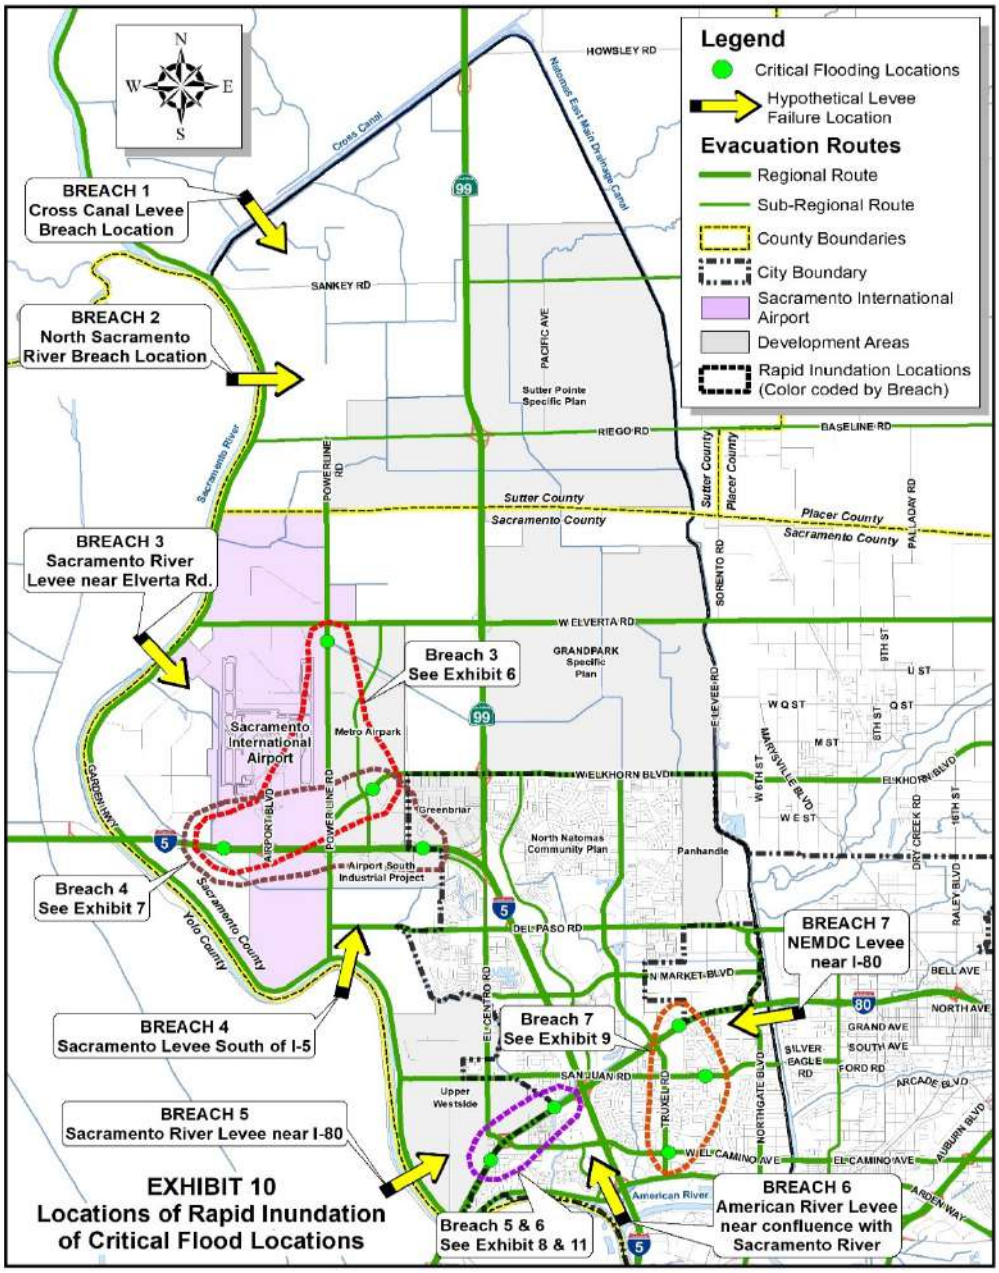

**Exhibit 10**
**Locations of Rapid Inundation of Regional Evacuation Routes**

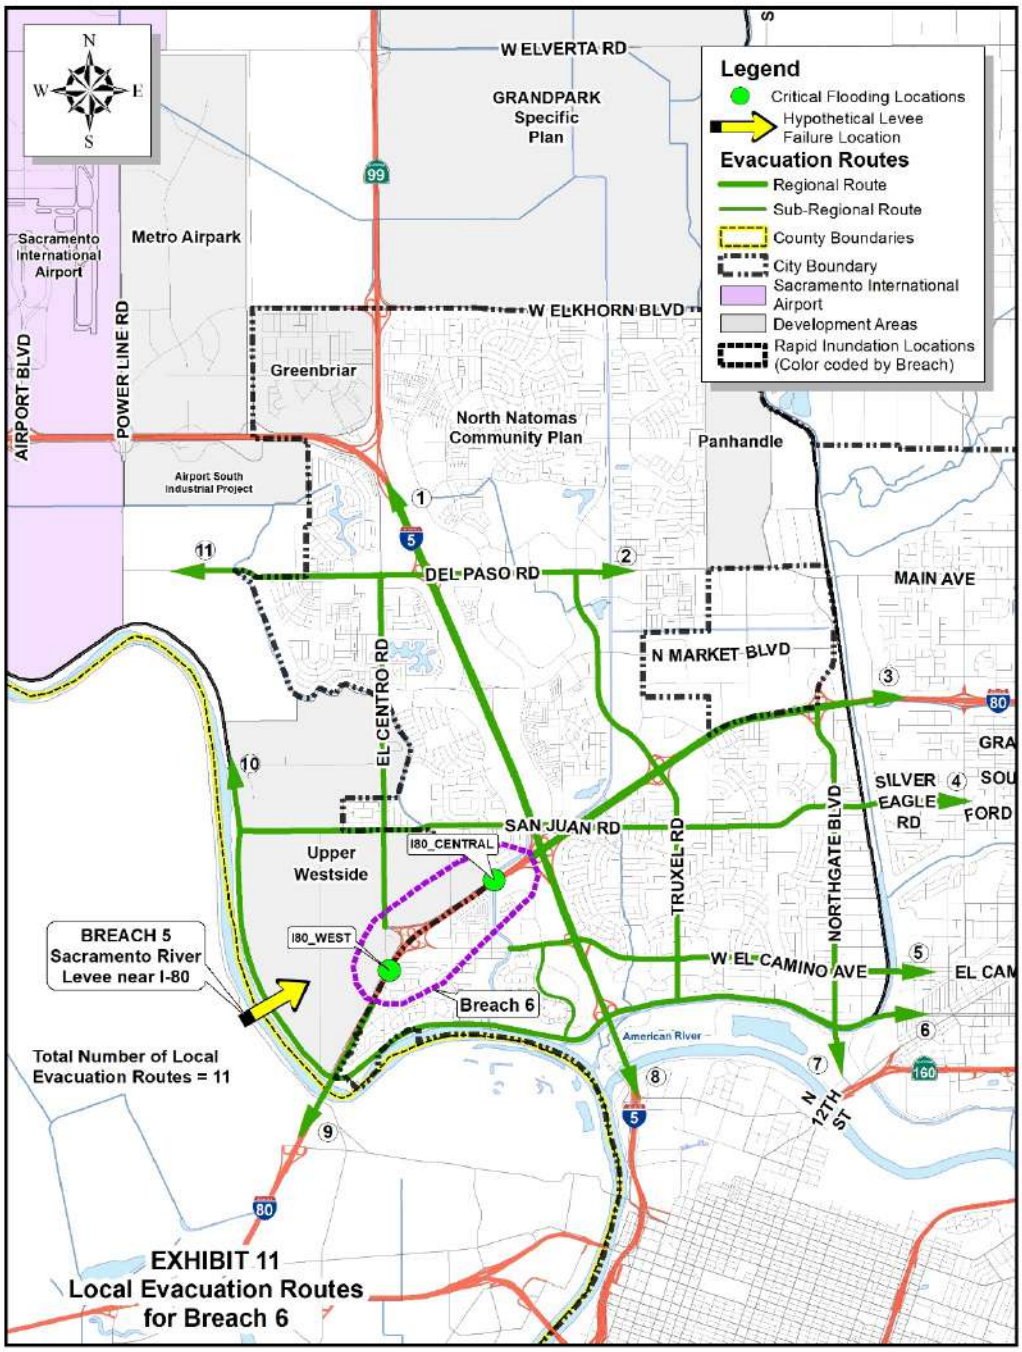

**Exhibit 11**
**Local Evacuation Routes for Breach 6**

4. Time to 1-Foot Depth of Flooding

   Inspection of the results of the supplemental analysis contained in Appendix C reveals that the duration of time to 1-foot of flooding depth at the critical locations along the major evacuation routes has generally increased. In addition to the decrease volumes of flow passing through the theoretical breach locations as a result of the use of the 2015 breach formation assumptions, the decrease in the durations of time to 1-foot of flooding depth is a result of the way the newer version of the HEC-RAS software calculates the overland flow time.

   The 2015 version of the HEC-RAS software used a “basin” approach that did not include overland flow durations. In reality, water does not instantaneously flow from one location to another as was calculated in the 2015 version of HEC--RAS. Rather, it takes time for flows spilling through a breach to reach distant locations with the Natomas Basin. It is primarily for this reason that the duration of time to 1-foot of flooding depth at the critical locations generally increases at the critical locations along the major evacuation routes.

5. Maximum Depth of Flooding

   The table below indicates the maximum flooding water surface elevations under Existing and under Cumulative Plus Project Conditions (C+P) for each of the seven breach locations. Generally, the supplemental analysis revealed that the maximum water surface elevation of flooding within the Natomas Basin is projected to be lower than that shown on the 2015 City/County Evacuation Plan.

   The reasoning behind this finding is principally the result of two differences between the modeling performed in 2015 and 2024:

   a. Lower rates and volumes of flood waters entering the Natomas Basin as revealed by the 2024 modeling, and

   b. The longer period of time required to reach stabilized levels of flooding with the external rivers and streams. As more time passes, the external rivers and streams are experiencing a falling of flood stages.

Notes:

| Supplemental Analysis<br>Maximum Flooding Water Surface Elevations<br>(Existing and C+P Conditions) | | | | | | |
|---|---|---|---|---|---|---|
| **Breach Scenario** | **GEI 1D Existing** | **UWS Existing** | **UWS Cumulative** | **Grandpark Existing** | **Grandpark Cumulative** | **Approximate WSE Change** |
| 1 Natomas Cross Canal | 37.56’ | 31.66’ | 31.66’ | 31.66’ | 31.66’ | <6.0 Feet> |
| 2 Sac. River North | 31.80’ | 23.81’ | 23.84’ | 23.81’ | 23.84’ | <8.0 Feet> |
| 3 Sac River North (Central) | 29.19’ | 24.95’ | 24.96’ | 24.95’ | 24.96’ | <4.2 Feet> |
| 4 Sac River Central | 32.28’ | 29.60’ | 29.61’ | 29.60’ | 29.61’ | <2.7 Feet> |
| 5 Sac River South | 26.29’ | 20.64’ | 20.91’ | 20.61’ | 20.91’ | <5.4 Feet> |
| 6 American River | 27.06’ | 18.21’ | 18.38’ | 18.21’ | 18.38’ | <8.7 Feet> |
| 7 NEMDC | 23.16’ | 23.29’ | 23.31’ | 23.29’ | 23.31’ | +0.1 Feet |

1. All elevations are based on the North American Vertical Datum of 1988 (NAVD 88). Horizontal Datum is CA State Plane Zone II Projection.
2. The Approximate Water Surface Elevation (WSE) Change reflects differences between the results of the GEI 1D Existing Conditions modeling performed in 2015 and the Cumulative Conditions modeling completed in 2024 supplemental analysis by CESI.
3. This table supersedes Table 17 mentioned above for the results of the supplemental analysis.

### D. Summary

In summary, with the exception of longer durations of time to 1-feet depth of flooding and a lower depth of maximum flooding, a review of Technical Memorandum 0040A (Appendix C) indicates that the findings of this supplemental analysis are generally consistent with both the 2015 City/County Evacuation Plan, and the analysis and findings of the 2022 modeling results presented earlier in this Procedural Memorandum. The longer durations of time and the lower maximum depths of flooding are positive findings that resulted from the use of the newer version of HEC-RAS flood modeling software and better topographic mapping.

Therefore, it is evident that neither the 2015 City/County Evacuation Plan nor the 2021 LHMP will require any changes as a result of the development of Upper Westside. That is, the supplemental analysis did not result in a finding that flooding in the Natomas Basin as a result of a catastrophic levee breach is projected to be an adverse impact from the development of Upper Westside.

## 14. REGIONAL FLOOD PROTECTION IMPROVEMENTS AND CLIMATE CHANGE[20]

There have been several changed conditions in the regional flood protection system since the City/County Evacuation Plan was prepared in 2015. The following narrative provides a layperson's explanation of these changed conditions that are intended to help the reader understand the conservative nature of the analysis contained in this Procedural Memorandum.

There are eight (8) principal changes in circumstances that one can logically reason that the analysis used to prepare the 2015 City/County Evacuation Plan and the analyses presented in this Procedural Memoranda is conservative in nature. These changes in circumstances are as follows:

1. **Improved Natomas Basin Levees**. The 2015 levee breach analysis was prepared based on the assumption that the condition of the levees in the modeling reflected the physical state of the levees as they existed in 2015. Since that time, many of the most critically weak levees have been improved (e.g., slurry walls, raising of the top heights, sub-excavated out sand lenses, reconstructed the levees as engineered structures, and/or buttressed). Accordingly, the 2015 modeling assumed weak levees that were susceptible to rapid failure, wide and deep breaches, and large volumes of water entering the Natomas Basin.

[20] The text for this section of the PM was developed from the content of a personal conservation between Ken Giberson (MacKay & Somps) and Chris Ferrari (GEI Consultants) on August 10, 2023.

Neither the 2024 analysis nor the supplemental analyses prepared for this Procedural Memorandum reflected the ongoing improvements to the Natomas Basin. These improvements, both those completed to date and those projected to be completed in the next few years, has, and will continue to significantly strengthen these levees over the levels that existed in 2015 when the City/County flood mapping exercise was completed. Today's levees are now much stronger and less susceptible to rapid failure and very wide levee breaches than they were in 2015.

Because of these improvements, significantly lower volumes of water could enter the Natomas Basin than suspected in 2015. Additionally, longer durations of time for the flood waters to reach the critical depth flooding threshold of one foot of depth at critical locations along the major evacuation routes with the Natomas Basin are reasonably anticipated to occur. Therefore, intuitively, it can be concluded that evacuation times would be longer than those predicted in this Procedural Memorandum.

2. **Better Weather Forecasting**. Today's weather forecasting models are highly accurate in their ability to provide advanced weather forecasts 7-10 days in advance of a storm event; much more advanced and accurate than the models that were available in 2015. These weather forecasting tools provide valuable information to the operators of the valley's reservoirs and rivers to aid in long-term flood forecasting – as much as 10-15 days advanced warning.

3. **Better River Flow Forecasting**. Current river forecasting models are much better today than existed in 2015. Additionally, these models have been calibrated to a degree of accuracy that they closely mimic real time river flows such as occurred during the storms of the winter of 2022/2023. Therefore, together with the better weather forecasting tools, today's river forecasting models provide more reliable flood forecasts.

4. **Better Operation of Reservoirs and Rivers**. These modern weather and flood forecasting tools allow the operators of the valley's reservoirs and streams to anticipate reservoir inflows and water levels a week or more in advance of the occurrence of major storms. This allows more time for the operators to plan for the impending flood flows and to release stored water in the reservoirs far in advance of a major storm event. This allows the reservoir system to create more flood storage

and the river system to convey those initial release flows to safely flow through the river system and out to the ocean. [21]

5. **Improved Bypass Facilities**. Currently underway are various efforts to widen local weirs and bypasses to convey a larger portion of the flood flows than historically possible. These weirs and bypass improvements will lessen the flows and water surface elevations in the Sacramento and American Rivers and lessen the pressure on the levee system protecting the Natomas Basin.

   There are efforts underway at this time with the construction work to widen the Sacramento Weir and Bypass, and the planning work that should lead to the widening of the Fremont Weir and the Yolo Bypass. The net effect of these improvements would be to lower the maximum stage in the Sacramento and American Rivers along the length of the Natomas Basin by about 1-foot.

   This lowering in river stages will reduce the pressures on the Natomas Levee system and reduce the potential for a levee breach. With lower stages in the river, not as much water will flow through a breach if it were to occur, and the time to critical depth of flooding of evacuation routes within the basin will increase.

6. **Additional Storage at and Upstream of Folsom Dam**. SAFCA and its flood protection partners have provided and are planning to provide additional storage in the American River watershed over time. These storage projects include:

   a. The recent construction of the auxiliary spillway which allows early and greater lowering of storage levels in the reservoir in anticipation of receiving peak inflows from the American River watershed during peak storm events,

   b. The on-going effort to increase in the height of Folsom Dam,

   c. The reoperation of Folsom Lake to create more storage for winter-time storm events (see Item 4 above), and

   d. The possibility of creating more flood storage farther up in the Folsom Reservoir watershed.

   These improvements will increase the level of flood protection for the Natomas Basin through lowering the maximum river stage in the Sacramento and American Rivers

[21] Advanced reservoir operations forecasting is referred to as Forecast Informed Reservoir Operations (FIRO). FIRO is a reservoir operations strategy that better informs decisions to retain or release water stored in the reservoir by integrating additional flexibility in operation policies and rules with enhanced monitoring and improvement weather and runoff forecasts. Source: American Meteorological Society; 2020).

during major flood events. This will help to reduce the pressure on the Natomas Bain levee system and decrease the potential for, and the severity of, flooding within the basin during a levee breach, thereby increasing the time to critical depth of flooding and increasing the evacuation time within the basin.

7. **Prior Lack of Evacuation Planning**. The 2015 modeling effort focused on time to critical depth of flooding of evacuation routes, not on emergency planning in the event of a levee breach. While some discussion about emergency planning occurred in 2015, it was not a major emphasis of the 2015 City/County Evacuation Plan.

   Additionally, the lack of definitive plans for evacuation of the Natomas Basin have not been prepared by the responsible emergency agencies and first responders. The suggestion in the Memoranda that emergency response agencies and first responders should formerly plan for immediate response to the threat of a levee breach (e.g., first responders focusing on the areas of early and rapid flooding, the pre-staging of evacuation route management[22]) will increase the safety of the general public during a flooding event.

8. **Effects of Climate Change**. Regional flood protection experts believe that current climate change modeling suggests that the resulting increase of peak flows in the river system from climate change will result in about a 1-foot increase in the maximum stage of the Sacramento River near the Natomas Basin. This, however, does not consider the reductions in the maximum river stage because of the current and future flood control and management improvements discussed above (e.g., improved levees, increased bypass capacities, storm and river forecasting leading to improved operations of reservoirs and river flows, etc.).

   When these two sets of factors are considered together, one can reasonably conclude that the effects of climate change, in and of itself, will not significantly increase the likelihood of levee breach occurrences of the Natomas Basin levee system. To a large degree, and perhaps totally, the effects of climate change will be offset by the benefits that will result from weather and river forecasting, reservoir system reoperations (FIRO), and the construction of additional flood control improvements (e.g., Natomas Basin levee, Folsom Dam improvements, and flood bypass improvements).

[22] For example, portable road barricades, warning lights and signs, and detour signs could be stored at staging areas near the critical locations along regional evacuation routes.

## 13. FINDINGS & CONCLUSIONS

A major finding of the analysis presented in this PM is that the improved modeling capabilities of the newer versions of HEC-RAS resulted in a more accurate analysis of the effects of catastrophic flooding that might occur within the Basin in the event of a levee breach. The use of newer HEC-RAS modeling software allowed for the development of a more accurate representation of the projected effects of a catastrophic levee breach in terms of flood evacuation planning and in terms of the maximum depth of flooding during a catastrophic levee breach.

Under C+P Conditions, the duration of time to 1-foot depth of flooding at critical locations along the regional evacuation routes within the Basin were generally found to be longer than projected in the 2015 GEI analysis under existing conditions.

Another major finding of this PM is that the development of Upper Westside will not have a material effect on the existing rate of flood inundation propagation or the maximum depth of flooding within the Basin in the hypothetical event of a levee breach. This finding applies to C+P Conditions.

The 2022 modeling effort identified nine (9) locations where rapid inundation of a regional evacuation route is projected to occur under one (1) or more of the hypothetical levee breach scenarios. For example, under the Breach No. 3 scenario, there are three (3) locations where rapid inundation is projected to occur. Breach No. 4 has three (3) locations, Breach No. 5 has two (2) locations, and Breach No. 7 has three (3) locations. Breach Nos. 3 and 4 both affect two (2) common locations out of the three (3) locations mentioned above.

In addition to the same nine (9) locations where rapid inundation of regional evacuation routes were identified in the 2022 flood modeling, the 2024 supplemental analysis revealed that Breach 6 has the same type of rapid inundation effects as mentioned above for Breach 5. Both Breach 5 and 6 affect two (2) common locations: (I-80 Central and I-80 West).

Due to the modeling limitations explained earlier in this PM, any rapid inundation time frames under twelve (12) hours are deemed to occur “immediately”, or nearly so after a levee breach. Rapid inundation of these critical locations is projected to occur in the same relative time frames under Existing Conditions and C+P Conditions regardless of the levee breach assumption set used in the flood modeling analysis. That is to say, the development of Upper Westside does not adversely affect the rapidity of flooding of these critical locations.

Depending upon the location of an actual breach, the affected roadways should be closed to the traveling public prior to or immediately following the occurrence of a levee breach in their respective locations. The affected roadways most prone to rapid inundation are located in the vicinity of Breach Nos. 3, 4, 5, 6, and 7, respectively.

Further, the identification of the roadways that are prone to rapid inundation in the event of a levee breach provides evacuation planners with a clear picture of which evacuation routes are not prone to rapid inundation. This finding should allow evacuation planners to prioritize their roadway closure plans to allow for early evacuations from the Basin regardless of the location of a levee breach, including the use of alternative local routes (as necessary). Accordingly, it is concluded that post development of Upper Westside, there will be adequate time to allow movement of citizens to a place of relative safety via a route that does not pose significant danger. Further, it is concluded that the maximum depth of flooding within the Basin in the event of a levee breach is not materially changed from existing conditions under C+P Conditions.

Further, using the 2022 breach assumption set it is concluded that the maximum depth of flooding within the Basin in the event of a levee breach is not materially changed from existing conditions under both E and C+P Conditions. However, when using the 2015 breach assumption set it is concluded that the maximum depth of flooding within the Basin is significantly reduced under C+P Conditions as compared to the depths of flooding determined in the 2015 flood modeling effort that supported the 2015 City/County Evacuation Plan. This difference indicates that the depth of flooding from a levee breach is somewhat variable, and it will depend on the location, the length of the levee breach, and the depth of scour pits that are really formed during an actual levee breach scenario.

Finally, based on the findings of the analysis presented in this PM, it is evident that the development of Upper Westside will not require any changes to the SacOES plans and the 2021 LHMP. A few minor changes in the 2015 City/County Evacuation Plan may be advisable to reflect the different durations of time until the critical locations along the regional evacuation routes studied in this PM are inundated to a 1-foot depth within 1-hour after a catastrophic levee breach.

## 14. LIMITATIONS

This PM, prepared in support of the Upper Westside project, was prepared to the best of our knowledge and judgement to satisfy our understanding of its intended purposes. It was prepared in a manner consistent with that level of care and skill ordinarily exercised by other members of MacKay & Somps' profession practicing in the same locality, under similar conditions, and on the date the services are provided. The conclusions, opinions, and recommendations contained within this PM are based on our professional judgement and experience in the general geographic area in which the project is located. Some data may have been prepared using information from outside sources that have varying degrees of reliability.

The use or misuse of this information contained in this PM, other than for its intended purposes, as noted, is at the sole risk of the party using the information. MacKay & Somps

makes no other representations, guarantees, or warranties, express or implied, regarding its instruments of professional services, communications (oral or written), estimates or reports, and/or opinions contained herein.

This report presents the results of an engineering analysis relating to the duration of time to 1-foot depth of flooding at critical locations along regional evacuation routes and the maximum depth of flooding within the Basin in the event of a catastrophic breach of the levee system protecting the Basin. It is possible that conditions could vary between the location, mode, and rapidity of an actual levee breach as compared to the assumptions contained in this PM. Accordingly, the effect that these changes may result in the need for different evacuation responses than those described in this PM.

This report is based on upon technical analysis by CESI wherein CESI updated the 2015 GEI modeling that was used for the 2015 City/County Evacuation Plan. With the exception of the changes described in this PM, the assumption sets contained in the 2015 GEI models were not changed. The idealized analytical models developed for this PM are based on considerable engineering and hydraulic judgement and experience, and they are intended to be reasonable representations of the conditions and anticipated performance of the levee breach scenarios envisioned herein.

This is particularly true as it relates to the assumption sets contained in the 2015 GEI models as they relate to assumptions on the modes of levee failures and the stages and timing of river flows in the rivers and streams in the vicinity of the Basin. Any errors contained in the 2015 GEI models are the responsibility of others.

If changes occur in these assumption sets, the findings and recommendations contained in this PM should be reviewed and MacKay & Somps should be provided an opportunity to provide additional recommendations and/or to modify the recommendations contained herein, as appropriate. The conclusions and recommendations contained in this report are solely professional opinions and they are subject to potential revision from changes in available data and applicable regulatory criteria. No warranty is expressed or implied.

| | I-80 Central | -2 Hours | 6 Hours | Rapid Inundation (See Note 2) |
| | I-80 West | -3 Hours | 3 Hours | Rapid Inundation (See Note 2) |
| | Natomas Road | -2 Hours | 27 Hours | Adequate Evacuation Time |
| | San Juan Ave. | -2 Hours | 16 Hours | Adequate Evacuation Time |
| | SR-99 South | -2 Hours | 97 Hours | Adequate Evacuation Time |

| Breach Location (Table No.) | Critical Evacuation Route Location | Reduction in Time (Hours) | Remaining Evacuation Time (Hours) | Comment (See Note 1) |
|---|---|---|---|---|
| 6 (Table 6) | None | N/A | N/A | N/A |
| 7 (Table 7) | Elkhorn | -5 Hours | 25 Hours | Adequate Evacuation Time |
| | Elkhorn West | -8 Hours | 76 Hours | Adequate Evacuation Time |
| | I-5 Junction | -3 Hours | 90 Hours | Adequate Evacuation Time |
| | I-5 West | -6 Hours | 80 Hours | Adequate Evacuation Time |
| | I-80 Central | -7 Hours | 30 Hours | Adequate Evacuation Time |
| | I-80 West | -9 Hours | 39 Hours | Adequate Evacuation Time |
| | Power Line | -13 Hours | 123 Hours | Adequate Evacuation Time |

Note:

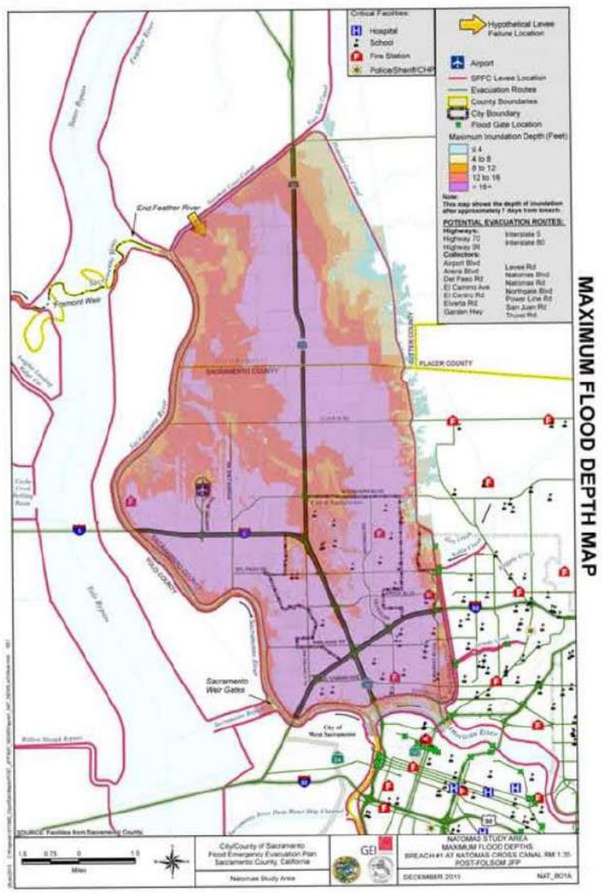
1. The findings in the Comment column denoted “Adequate Evacuation Time” indicate that the remaining evacuation time (in hours) is significantly greater than a reasonable evacuation time allowance in the event of a levee breach. Additionally, this finding also recognizes that for each location shown there are numerous additional alternative evacuation routes available to the driving public during a flood emergency.
2. While this location is subject to rapid inundation, there are several alternative evacuation routes available to the driving public to relocate from areas of relative danger to areas of relative safety.

**Table 9**

**Upper Westside Maximum Flooding Water Surface Elevations**

**Under C+P Conditions**

| Breach Location | Existing Conditions (2D) | Cumulative Plus Project Conditions (2D) | Difference in Flooding Elevations | Comment |
|---|---|---|---|---|
| 1 | 36.85 Feet | 36.76 Feet | -0.09 Feet | Slight Decrease In Flooding |
| 2 | 31.77 Feet | 31.78 Feet | +0.01 Feet | Slight Increase In Flooding |
| 3 | 29.22 Feet | 29.23 Feet | +0.01 Feet | Slight Increase In Flooding |
| 4 | 32.23 Feet | 32.24 Feet | +0.01 Feet | Slight Increase In Flooding |
| 5 | 25.15 Feet | 25.14 Feet | -0.01 Feet | Slight Decrease In Flooding |
| 6 | 16.15 Feet | 15.82 Feet | -0.33 Feet | Slight Decrease In Flooding |
| 7 | 23.23 Feet | 23.28 Feet | +0.05 Feet | Slight Increase In Flooding |



Note: All elevations shown are related to the NAVD 88 Datum. These differences in flooding depth are within the inherent accuracy of the model. Therefore, they are not considered material for the purposes of this PM.

## ELEVATION DATUM

All Elevations shown in this TM are in NAVD 88 Vertical Datum.

## USE OF "SACRAMENTO-COMBINED" HEC-RAS MODEL FROM GEI

GEI provided CESI the 2015 HEC-RAS One-Dimensional (1D) modeling that the existing Natomas Basin Levee Breach analysis was performed with for the seven (7) perimeter levee breach locations previously chosen by the City and County of Sacramento for the GEI analysis in 2015. The updated modeling is run for the same total duration of analysis as the original GEI model. This modeling was used for this analysis except for changes described below.

The results of the previous Breach Analysis are posted at the following link:

https://waterresources.saccounty.net/stormready/Pages/Natomas-Area-Flood-Map.aspx

The results presented in this Technical Memorandum focus on two analyses:

1. Time to Fill to 1-foot of depth at Evacuation Route locations, and
2. Maximum Depth of Inundation measured in the modeling.

The previous Breach Analysis Maps were published by the County at the link above to present the results of the GEI modeling.

The original model was performed in HEC-RAS version 4.1.3. In consultation with Chris Ferrari of GEI Consultants, CESI updated the 2015 modeling. Specifically, CESI updated the model to HEC-RAS 6.2 and further modified the model as described below. This required modification for errors in the geometry file detected by the current version of HEC-RAS that were not evident in the previous version. Typically, these errors occurred where HTAB table definitions started below the invert of a channel, or storage area starting elevations below the lowest elevation in the storage area.

Version 6.2 of HEC-RAS generates a warning at some breach locations that the specified minimum elevation of the breach is below the adjacent ground elevations. When this occurs, HEC-RAS Version 6.2 will limit the breach weir formation elevation to the adjacent lowest ground elevation.

The original model analyzed flood distribution within the basin by including a set of storage areas connected by weirs and culverts. This method discounts the impact of local ground features and the time it takes for flood waters to cross the storage areas, as HEC-RAS views a storage area as equally distributing the inflow to the entirety of the storage area instantaneously.

CESI decided for the current analysis, it would be better to analyze the breach flooding over Two Dimensional (2D) surfaces using the Version 6.2 capabilities of HEC-RAS. Digital terrain models

(topographic models) of the Natomas Basin were not provided by GEI when the original model was transferred to CESI.

Accordingly, CESI generated a cumulative conditions topographic model for the Natomas Basin and utilized HEC-RAS Version 6.2 to generate a digital terrain model surface for the existing conditions. CESI then developed digital terrain models based on the current land use plans and drainage plan documents (where available – See TM 0039) and then added these terrain models for the reasonably foreseeable development projects for the Cumulative Conditions modeling.[1]

The following development areas were included in the Cumulative Conditions:

- GRANDPARK (Conceptual Grading Plan – April 20, 2022).[2]
- SUTTER POINTE (Appendix E Drainage Master Plan and Appendix B Land Use and Development Code).
- SAFCA "Sankey Road Gap Closure Project Basis of Design Report".
- GREENBRIAR (used land use plan and documentation from the January 5, 2017, Environmental Checklist (online version)).
- PANHANDLE (Preliminary Grading Plan by MacKay & Somps).
- UPPER WESTSIDE (land use plan from Staff Presentation February 2022).
- SACRAMENTO INTERNATIONAL AIRPORT (Master Plan January 2017), including Airport South Industrial project (using the layout included in the Airport Master Plan)

It should be noted that the ultimate buildout of Metro Airpark is included in the Existing Conditions terrain models.

It's important to note that the grading input for all of the projects added in the Cumulative conditions models is for the finished grade surfaces only and does not include any structures which will be built.

[1] For this analysis, a version 6.05 terrain surface was created for the Cumulative development scenario. The 6.04 and 6.05 Terrains were based on 2 feet by 2 feet pixel size, and, at locations where the terrain did not include hydraulic reinforced data (invert data at bridge and culvert crossings, this data was added by interpolating a section from upstream grades to downstream grades in the LiDAR data set).

[2] The 2022 Grandpark Conceptual Grading Plan was used in this analysis. This conceptual grading plan is an update of the conceptual grading plan used in TM 0007 (Grandpark Land Use Plan 08F) as it reflects the elimination of the "Lennar" parcels as a development site and instead leaves this property as an undeveloped open space parcel. Additionally, the 2022 Conceptual Grading Plan reconfigured the Grand Parkway from a water feature intensive open space plan into a more natural floodplain with a central drainage channel and overbank flood storage areas without significant water features. Lastly, the 2022 Conceptual Grading Plan redistributed the required flood storage volumes within the Grand Parkway in order to (1) meet County design standards relating to avoiding water surface level impacts to upstream and downstream properties, (2) achieve a condition where post development peak flow rates do not exceed predevelopment levels upstream and downstream of Grandpark, and (3) achieve an equitable allocation of flood storage volumes between the various property owners within the area of the Grandpark Specific Plan.

Additionally the friction is not adjusted at these locations for the resistance to flows that may occur post development from fences and structures.

CESI then prepared 4 different analyses for each breach location as follows:

- **GEI Existing Conditions 1D Analysis.** The GEI existing conditions 1-dimensional (1D) storage-area based analysis was re-run in HEC-RAS 6.2.[3] Based on a visual comparison of the results from this re-run of the GEI existing conditions 1D in 2D analysis with the GEI published 1D results, the two sets of results were found to be similar.

  Upon completion of this modeling exercise, CESI again consulted with GEI to report on the efforts to update the 2015 model and the results from this modeling existing conditions analysis when using the newer HEC-RAS software. During this consultation, both GEI and CESI agreed the updated model was producing results similar to those obtained from the 2015 model in terms of the duration of time to 1-foot depth of flooding over the critical locations along the major evacuation routes, and the maximum depth of flooding within the Basin.

- **Existing Conditions Analysis with Storage Areas Converted to 2D**. HEC-RAS limited the breach weir formation elevations to the lowest grade in the adjacent 2D mesh elements. As a result, where higher ground was adjacent to the weir location, less flow was transmitted through the breach. This is a better solution than the original analysis, as it considers the local ground elevations. In particular, this applies to Breach 3 and Breach 6, where changes to the amount and timing of inflows are noted.

  Compared to the GEI 1D modeling which fills each storage area with flood volumes from the lowest elevation upward regardless of the distance, terrain and flow impediments within the storage area, the 2D analysis models the water flowing from the breach location through overland paths before entering into the main system of canals.

- "**With Grandpark" Analysis (also using 2D)**. This alternative is discussed in TM 0039.

- **Cumulative Conditions Analysis (also using 2D)**. This alternative is discussed in this TM 0040.

Remainder of Page Intentionally Left Blank

[3] The HEC-RAS Version 6.2 is recognized by the engineering community for its superior capabilities to more accurately analyze flooding using 2D terrain surfaces as compared to HEC-RAS Version 4.1.3 that only utilized 1D terrain models.

**TIME TO FILL TO 1-FOOT DEPTH AT EVACUATION ROUTE LOCATIONS:**

Oversized exhibits are included at the end of this technical memorandum which present the results of these analyses for each of the 4 alternatives studies for each breach location. They are plotted on top of the original GEI exhibits from the original Study.

For each Evacuation Route location identified in the original mapping, CESI identified the location where the depth would reach 1 foot of inundation depth earliest (the lowest point of the roadway stretch) and retrieved the time to 1-foot of inundation depth for each scenario and breach in hours. The results are summarized in the following tables (Tables 1 through 7) for each of the seven breach locations. These results are also shown on the oversized exhibits included with this TM (Note: On the oversized exhibits, if flooding to a depth of 1 foot over the roadway was not demonstrated in the analysis, the point was removed from the exhibit).

| EL CAMINO | 36 | 52 | 63 | +11 |
| I-80 CENTRAL | 58 | 73 | 74 | +1 |
| NATOMAS RD | 28 | 36 | 47 | +11 |

1D to 2D model:

In general the change from 1D to 2D modeling had little effect on the result of the flood depth timing to 1 foot, and for most of the points reviewed there was an increase in the time to the flood depth. The ELVERTA location shows a reduction in time to 1 foot depth as a result of the 2D model predicting increased overland and system flows at this location in the 1st 48 hours of the event.

2D to 2D Cumulative Model Changes:

In general, most of the data points show that there is an increased delay in the propagation of the breach flood wave timing as a result of the Cumulative Conditions improvements in the Natomas Basin for Breach 1.

The following four points identify reductions in timing to the depth of 1 foot:

1. SR-99: SR-99 is located near a low point in SR-99 near the northern boundary of the proposed Grandpark project. A reduction in flood depth timing at this location of 31 hours is identified in the modeling (93 hours to 62 hours). The reduction in flood time results from the reduced flood volumes in the northern part of the basin due to the embankments placed for the Sankey Gap storage basin proposed by SAFCA to be constructed with the Sutter Pointe project.

   Also, the proposed culvert crossings within the Grandpark development under Elverta Road restrict how fast flows lower than the street overtopping levels can progress from north of the Grandpark project to south of the project. These culverts are sized for properly reducing potential flooding changes both downstream and upstream of the Grandpark project in the 100-year, 200-year design storms with and without Climate Change being factored, in order to meet Sacramento County and RD-1000 peak flood mitigation requirements.

2. I-80 WEST: A 1 hour reduction is shown, but this is within the rounding estimates of the model results. We would not expect any changes in this area of the basin for this breach location.

3. SR-99 NORTH: A reduction in 1 foot flood depth timing at this location of 59 hours is identified in the modeling (98 hours to 39 hours). This roadway low point is at a slightly lower elevation than surrounding data points, so it sees flooding sooner in the Cumulative Event analysis as a result of the Sankey Gap Storage Facility Embankments and Grandpark proposed project culverts under Elverta Road at its crossing of the East Drainage Canal.

4. ELVERTA WEST. A reduction in 1 foot flood depth timing at this location of 5 hours is identified in the modeling (116 hours to 111 hours). This data point is affected by the Sankey Gap storage facility embankments.

The three data points noting a meaningful change in 1 foot flood depth arrival time are in the Northwest quadrant of the basin, where the breach occurs.

Also, adverse timing of 1-hour (-1 hour) is less than the accuracy of this model and, therefore, this reduction in timing to 1-feet depth of flooding is not considered material.

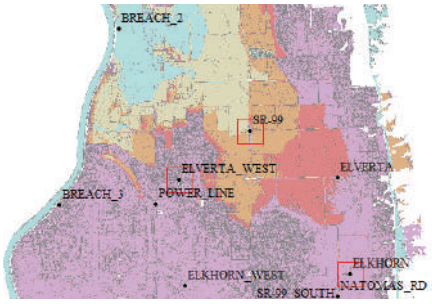
## BREACH 2



The results of the modeling exercise for Breach 2 are summarized in Table 2 and the text following the table.

**Table 2**
***BREACH 2 (North Sacramento River Breach Location)***

| Evacuation Route Location: | Time to 1ft for 1D GEI Exist Cond. Model (hrs) | Time to 1 ft for 2D Existing Cond. Model (hrs) | Time to 1ft for 2D Cumulative Model (hrs) | Improvement in Timing of 1ft Depth (hrs) |
|---|---|---|---|---|
| SR-99 | 35 | 22 | 19 | -3 |
| ELVERTA | 25 | 18 | 21 | +3 |
| ELKHORN | 20 | 20 | 24 | +4 |
| DEL PASO | 14 | 22 | 26 | +4 |
| I-80 EAST | 18 | 25 | 32 | +7 |
| I-5 CENTRAL | 53 | 56 | 57 | +1 |
| I-5 JUNCTION | 47 | 55 | 58 | +3 |
| I-5 WEST | 44 | 52 | 55 | +3 |
| I-80 WEST | 32 | 39 | 40 | +1 |
| ELKHORN WEST | 45 | 52 | 36 | -16 |
| SR-99 NORTH | 12 | 15 | 14 | -1 |
| SR-99 SOUTH | 87 | 88 | 88 | 0 |
| POWER LINE | 55 | 63 | 65 | +2 |
| ELVERTA WEST | 43 | 33 | 14 | -19 |
| SAN JUAN | 22 | 28 | 32 | +4 |
| EL CAMINO | 22 | 29 | 33 | +4 |
| I-80 CENTRAL | 34 | 39 | 38 | -1 |
| NATOMAS RD | 17 | 20 | 24 | +4 |

1D to 2D model:

In general the change from 1D to 2D modeling had little effect on the result of the flood depth timing to 1 foot, and for most of the points reviewed there was an increase in the time to the flood depth.

Three locations show a reduction in flood depth response timing, SR-99, ELKHORN and ELVERTA WEST. For these three locations the flood waters passing through the breach area conveyed overland before they enter the system, in the direction of these locations, and the flood waters have not yet fully filled some of the storage downstream of these locations. As a result the 2D model more accurately predicts that there is potential for these locations to become overtopped to a depth of 1 foot in a shorter duration of the time than the 1D model predicts.

2D to 2D Cumulative Model Changes:

This breach analysis identifies 3 locations where moderate adverse changes to the timing of 1 foot inundation of the evacuation routes would occur at: SR-99, ELKHORN WEST, and ELVERTA WEST.

The breach location is similar to the location of Breach 1, discharging into the Northwest Quadrant of the basin. As a result, the Sankey Gap storage area reduces available storage in this area below the embankment overtopping elevations. Proposed project culverts in Grandpark also slow the progression of the initial flood wave below Elverta Road overtopping elevations, resulting in a modest acceleration of the flood timing within the northwest quadrant. These culverts are sized for properly reducing potential flooding changes both downstream and upstream of the Grandpark project in the 100-year, 200-year design storms with and without Climate Change being factored, in order to meet Sacramento County and RD-1000 peak flood mitigation requirements.

Also, adverse timing of 1-hour (-1 hour) is less than the accuracy of this model and, therefore, this reduction in timing to 1-feet depth of flooding is not considered material.

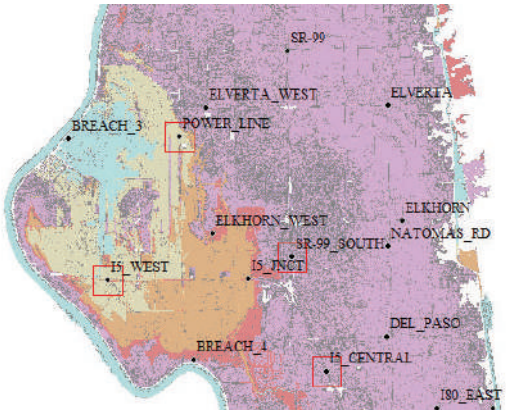
## BREACH 3



The results of the modeling exercise for Breach 3 are summarized in Table 3 and the text following the table.

**Table 3**
***BREACH 3(Sacramento River Levee Near Elverta Road)***

| Evacuation Route Location: | Time to 1ft for 1D GEI Exist Cond. Model (hrs) | Time to 1 ft for 2D Existing Cond. Model (hrs) | Time to 1ft for 2D Cumulative Model (hrs) | Improvement in Timing of 1ft Depth (hrs) |
|---|---|---|---|---|
| SR-99 | 66 | 71 | 73 | +2 |
| ELVERTA | 47 | 53 | 61 | +8 |
| ELKHORN | 43 | 48 | 46 | -2 |
| DEL PASO | 33 | 37 | 37 | 0 |
| I-80 EAST | 40 | 40 | 37 | -3 |
| I-5 CENTRAL | 67 | 48 | 46 | -2 |
| I-5 JUNCTION | 10 | 13 | 13 | 0 |
| I-5 WEST | 9 | 7 | 6 | -1 |
| I-80 WEST | 23 | 28 | 27 | -1 |
| ELKHORN WEST | 4 | 9 | 9 | 0 |
| SR-99 NORTH | 75 | 80 | 84 | +4 |
| SR-99 SOUTH | 129 | 127 | 125 | -2 |
| POWER LINE | 17 | 6 | 5 | -1 |
| ELVERTA WEST | 79 | 82 | 81 | -1 |
| SAN JUAN | 30 | 36 | 36 | 0 |
| EL CAMINO | 30 | 36 | 36 | 0 |
| I-80 CENTRAL | 17 | 24 | 25 | +1 |
| NATOMAS RD | 38 | 44 | 44 | 0 |

1D to 2D model:

In general the change from 1D to 2D modeling had little effect on the result of the flood depth timing to 1 foot, and for most of the points reviewed there was an increase in the time to the flood depth.

Four locations show a reduction in flood depth response timing, I-5 CENTRAL, I-5 WEST, SR-99 SOUTH and POWER LINE. The four locations are highlighted on the figure to the right. For these locations, in the 2D model, a greater portion of the breach flood waters stay in the west side of the basin and flow easterly and southerly overland as compared to the 1D model. The POWERLINE location is near the breach

and receives overland flow earlier than it would fill from the system flows. I-5 WEST is the next point in the flood propagation which gets overtopped as a result of this overland flow path of the flood waters in a southerly direction. The changes at I-5 CENTRAL and SR-99 SOUTH are small changes which occur much later in the event, as these points are higher in elevation. Similarly though these changes result from differences in how the 2D model fills the overland areas by filling areas connected by terrain, and not filling areas that are separated by terrain for given flood elevations, which the 1D model cannot handle

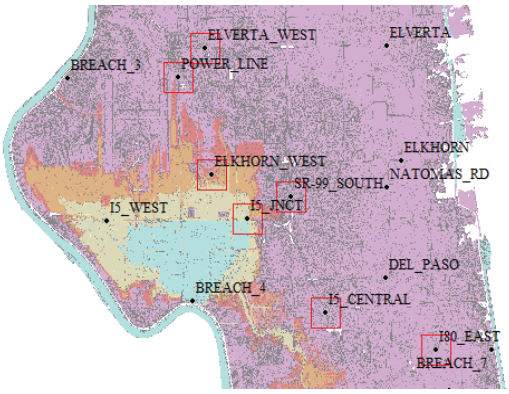
2D to 2D Cumulative Model Changes:

For this breach location scenario, the Cumulative Condition produces similar results to the Existing Conditions model at all locations. The largest reduction in time to flood 1 foot is at I-80 EAST where a 3-hour reduction occurs (40 to 37 hours). This is in an area near the breach location, in which flood storage volumes are reduced by the Sankey Gap storage area embankments.

All other minor changes noted by the analysis are less than 1 hour, which is approximately the rounding error in the results.

Also, adverse timing of 1-hour (-1 hour) is less than the accuracy of this model and, therefore, this reduction in timing to 1-feet depth of flooding is not considered material.

## BREACH 4



The results of the modeling exercise for Breach 4 are summarized in Table 4 and the text following the table.

**Table 4**
***BREACH 4 (Sacramento River Levee South of I-5)***

| Evacuation Route Location: | Time to 1ft for 1D GEI Exist Cond. Model (hrs) | Time to 1 ft for 2D Existing Cond. Model (hrs) | Time to 1ft for 2D Cumulative Model (hrs) | Improvement in Timing of 1ft Depth (hrs) |
|---|---|---|---|---|
| SR-99 | 70 | 75 | 78 | +3 |
| ELVERTA | 52 | 56 | 65 | +9 |
| ELKHORN | 47 | 51 | 49 | -2 |
| DEL PASO | 38 | 38 | 37 | -1 |
| I-80 EAST | 44 | 42 | 39 | -3 |
| I-5 CENTRAL | 69 | 55 | 53 | -2 |
| I-5 JUNCTION | 9 | 8 | 8 | 0 |
| I-5 WEST | 6 | 6 | 6 | 0 |
| I-80 WEST | 24 | 28 | 26 | -2 |
| ELKHORN WEST | 9 | 8 | 8 | 0 |
| SR-99 NORTH | 78 | 83 | 85 | +2 |
| SR-99 SOUTH | 101 | 99 | 97 | -2 |
| POWER LINE | 21 | 19 | 19 | 0 |
| ELVERTA WEST | 80 | 78 | 77 | -1 |
| SAN JUAN | 33 | 37 | 37 | 0 |
| EL CAMINO | 33 | 37 | 37 | 0 |
| I-80 CENTRAL | 18 | 23 | 24 | +1 |
| NATOMAS RD | 42 | 46 | 47 | +1 |

1D to 2D model:

In general the change from 1D to 2D modeling had little effect on the result of the flood depth timing to 1 foot, and for most of the points reviewed there was an increase in the time to the flood depth.

Seven locations show a reduction in flood depth response timing, ELVERTA WEST, POWERLINE, ELKHORN WEST, SR-99 SOUTH, I-5 JNCT, I-5 CENTRAL and I80 EAST.

The I-5 JNCT and ELKHORN WEST locations show in the 2D model a larger overland flow component fanning out to the north than the 1-D model shows. This overland flow reaches

these sites before the in system flow would overtop them, and as a result a reduction in timing to a depth of 1 foot is reported. Similarly the POWERLINE location is also impacted by the 2D models identification of the overland flow to the north. These three locations show an impact early in the event.

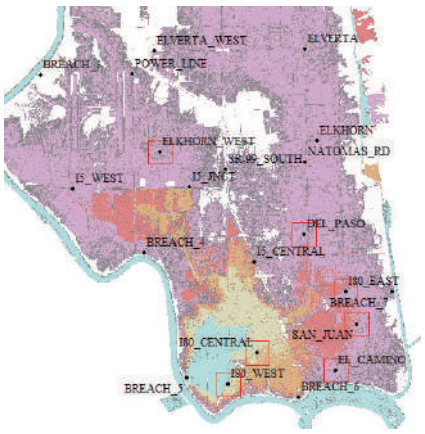
Later in the event, The ELVERTA WEST, SR-99 SOUTH, I5 CENTRAL, and I-80 EAST locations show a reduction resulting from differences in how the 2D model fills the overland areas by filling areas connected by terrain, and not filling areas that are separated by terrain for given flood elevations, which the 1D model cannot handle

2D to 2D Cumulative Model Changes:

For this breach location scenario, the Cumulative Conditions produce similar results to the Existing Conditions model at all locations. The largest reduction in time to flood 1 foot is at I-80 EAST where a 3-hour reduction occurs (42 to 39 hours). This is in an area near the breach location, in which flood storage volumes are reduced by the Sankey Gap storage area embankments.

All other minor changes noted by the analysis are less than 1 hour, which is approximately the rounding error in the results.

Also, adverse timing of 1-hour (-1 hour) is less than the accuracy of this model and, therefore, this reduction in timing to 1-feet depth of flooding is not considered material.



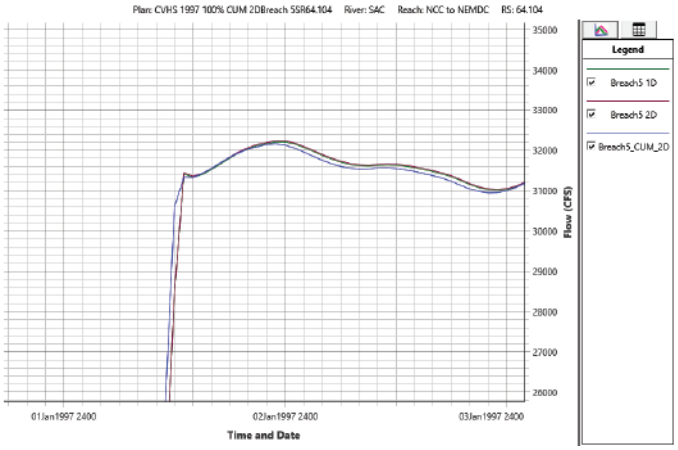
## BREACH 5

The results of the modeling exercise for Breach 5 are summarized in Table 5 and the text following the table.

**Table 5**
***BREACH 5 (Sacramento River Levee Near I-80)***

| Evacuation Route Location: | Time to 1ft for 1D GEI Exist Cond. Model (hrs) | Time to 1 ft for 2D Existing Cond. Model (hrs) | Time to 1ft for 2D Cumulative Model (hrs) | Improvement in Timing of 1ft Depth (hrs) |
|---|---|---|---|---|
| SR-99 | 84 | 83 | 83 | 0 |
| ELVERTA | 50 | 46 | 60 | +14 |
| ELKHORN | 39 | 36 | 30 | -6 |
| DEL PASO | 21 | 19 | 18 | -1 |
| I-80 EAST | 21 | 19 | 18 | -1 |
| I-5 CENTRAL | 100 | 96 | 90 | -6 |
| I-5 JUNCTION | 27 | 30 | 34 | +4 |
| I-5 WEST | 19 | 23 | 25 | +2 |
| I-80 WEST | 9 | 6 | 3 | -3 |
| ELKHORN WEST | 57 | 25 | 26 | +1 |
| SR-99 NORTH | 22 | 98 | 102 | +4 |
| SR-99 SOUTH | 99 | 99 | 97 | -2 |
| POWER LINE | 46 | 51 | 55 | +4 |
| ELVERTA WEST | 112 | 110 | 113 | +3 |
| SAN JUAN | 19 | 18 | 16 | -2 |
| EL CAMINO | 19 | 18 | 16 | -2 |
| I-80 CENTRAL | 9 | 8 | 6 | -2 |
| NATOMAS RD | 30 | 29 | 27 | -2 |

1D to 2D model:



For Breach 5 a number of locations show a reduction in timing to 1 foot depth. For this Breach location, the 2D model allows higher flow rates through the breach due to the low ground elevations adjacent to the breach. As a result we would highlight the changes at the point identified in the image to the right. For the 1st impacted points of the I-80 WEST and I-80 CENTRAL locations the increased breach flows and overland flooding paths which are computed in the 2D model show these points to be at risk of flooding even sooner than the 1D model. Other points which are shown to be closed early in the event Such as the EL CAMINO, SAN JUAN, I-80 EAST and DEL PASO points, an increase in flows early in the event through the eastern flow paths accounts for the

roughly 2 hours of reduced timing between the 2D and 1D models.

2D to 2D Cumulative Model Changes:

The Breach location near the I-80 crossing of the Sacramento River generally shows a small reduction in response time to a 1-foot depth along the I-80 corridor within the southern areas of the basin (Data Points: ELKHORN, DEL PASO, I-80 EAST, I-5 CENTRAL, I-80 WEST, SR-99 SOUTH, SAN JUAN, EL CAMINO, I-80 CENTRAL and NATOMAS RD).

Of note would be the low points in Interstate 80 at I-80 WEST, and I-80 central where the response time to flood 1 foot reduces from 6-hours to a 3-hours, and 8 hours to 6-hours respectively, between the 1D and 2D models. The models show there are 2 reasons for the reduction in timing. The most important is that for the 2D Cumulative Condition, the model shows the full breach formation 1 hour and 10 minutes sooner than in the 1D and 2D conditions per the graph to the right. This generally affects all points and accounts for the general reduction between 1 and 2 hours seen in many of the data point locations.

The second portion which additionally affects the 2 I-80 points nearest the breach appears to result from the proposed grading at the Upper Westside project. The breach flows would spread out from the breach through the generally flat grades proposed and through the streets which are at lower grades. The result is an overland flooding path to these locations sooner in the event. The Breach 5 location just happens to be directly adjacent to the southern end of the Upper Westside project. The 2D Cumulative Models do not account for the resistance to the flow spreading effect that would occur due to the construction of buildings, fences and the planting of vegetation and trees. An average friction value is applied over the surface. These future condition items cannot be included in the current modeling as they are still unknown. It is likely that if structures, fences and vegetation are built similar to other developments, they would slow the spread effect.

## BREACH 6

The results of the modeling exercise for Breach 6 are summarized in Table 6 and the text following the table.

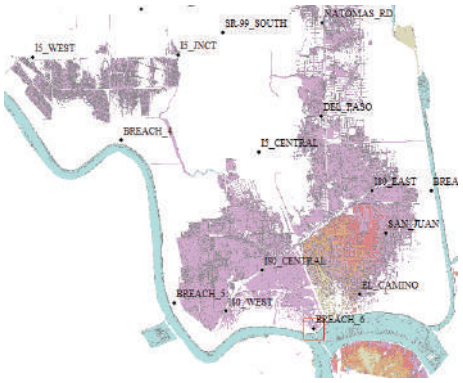


**Table 6**
***BREACH 6 (American River Levee Near Confluence With Sacramento River)***

| Evacuation Route Location: | Time to 1ft for 1D GEI Exist Cond. Model (hrs) | Time to 1 ft for 2D Existing Cond. Model (hrs) | Time to 1ft for 2D Cumulative Model (hrs) | Improvement in Timing of 1ft Depth (hrs) |
|---|---|---|---|---|
| SR-99 | 53 | No Flood | No Flood | No Flood |
| ELVERTA | 29 | No Flood | No Flood | No Flood |
| ELKHORN | 21 | No Flood | No Flood | No Flood |
| DEL PASO | 10 | 76 | 118 | +42 |
| I-80 EAST | 6 | 40 | 42 | +2 |
| I-5 CENTRAL | 57 | No Flood | No Flood | No Flood |
| I-5 JUNCTION | 17 | No Flood | No Flood | No Flood |
| I-5 WEST | 11 | No Flood | No Flood | No Flood |
| I-80 WEST | 141 | 148 | 162 | +14 |
| ELKHORN WEST | 14 | No Flood | No Flood | No Flood |
| SR-99 NORTH | 61 | No Flood | No Flood | No Flood |
| SR-99 SOUTH | 133 | No Flood | No Flood | No Flood |
| POWER LINE | 31 | No Flood | No Flood | No Flood |
| ELVERTA WEST | 65 | No Flood | No Flood | No Flood |
| SAN JUAN | 4 | 30 | 31 | +1 |
| EL CAMINO | 4 | 31 | 32 | +1 |
| I-80 CENTRAL | 137 | 143 | 156 | +13 |
| NATOMAS RD | 16 | No Flood | No Flood | No Flood |

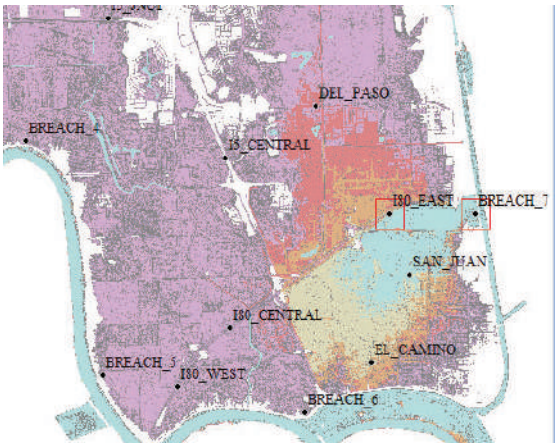
Note: "No Flood" means that the breach event did not report flooding in excess of 1 foot at the data point throughout the model event duration (typical for all Tables).

1D to 2D model:

For Breach 6, in the 2D versions of the model, flooding will not reach the 1-foot depth for the duration of the model. This results from the fact that the ground elevations directly downstream of the breach location are higher ground, and as a result flows passing through the breach are significantly limited in quantity passing beyond this high ground.

2D to 2D Cumulative Model Changes:

No reductions in flood response time to 1 foot depth were noted for this analysis.



## BREACH 7

The results of the modeling exercise for Breach 7 are summarized in Table 7 and the text following the table.

**Table 7**
***BREACH 7 (NEMDC Levee Near I-80)***

| Evacuation Route Location: | Time to 1ft for 1D GEI Exist Cond. Model (hrs) | Time to 1 ft for 2D Existing Cond. Model (hrs) | Time to 1ft for 2D Cumulative Model (hrs) | Improvement in Timing of 1ft Depth (hrs) |
|---|---|---|---|---|
| ELVERTA | 56 | 57 | 159 | +102 |
| ELKHORN | 29 | 30 | 25 | -5 |
| DEL PASO | 14 | 15 | 15 | 0 |
| I-80 EAST | 6 | 2 | 3 | +1 |
| I-5 JUNCTION | 88 | 93 | 90 | -3 |
| I-5 WEST | 82 | 86 | 80 | -6 |
| I-80 WEST | 27 | 48 | 39 | -9 |
| ELKHORN WEST | 80 | 84 | 76 | -8 |
| POWER LINE | 140 | 136 | 123 | -13 |
| SAN JUAN | 4 | 4 | 3 | -1 |
| EL CAMINO | 5 | 6 | 6 | 0 |
| I-80 CENTRAL | 26 | 37 | 30 | -7 |
| NATOMAS RD | 20 | 22 | 22 | 0 |

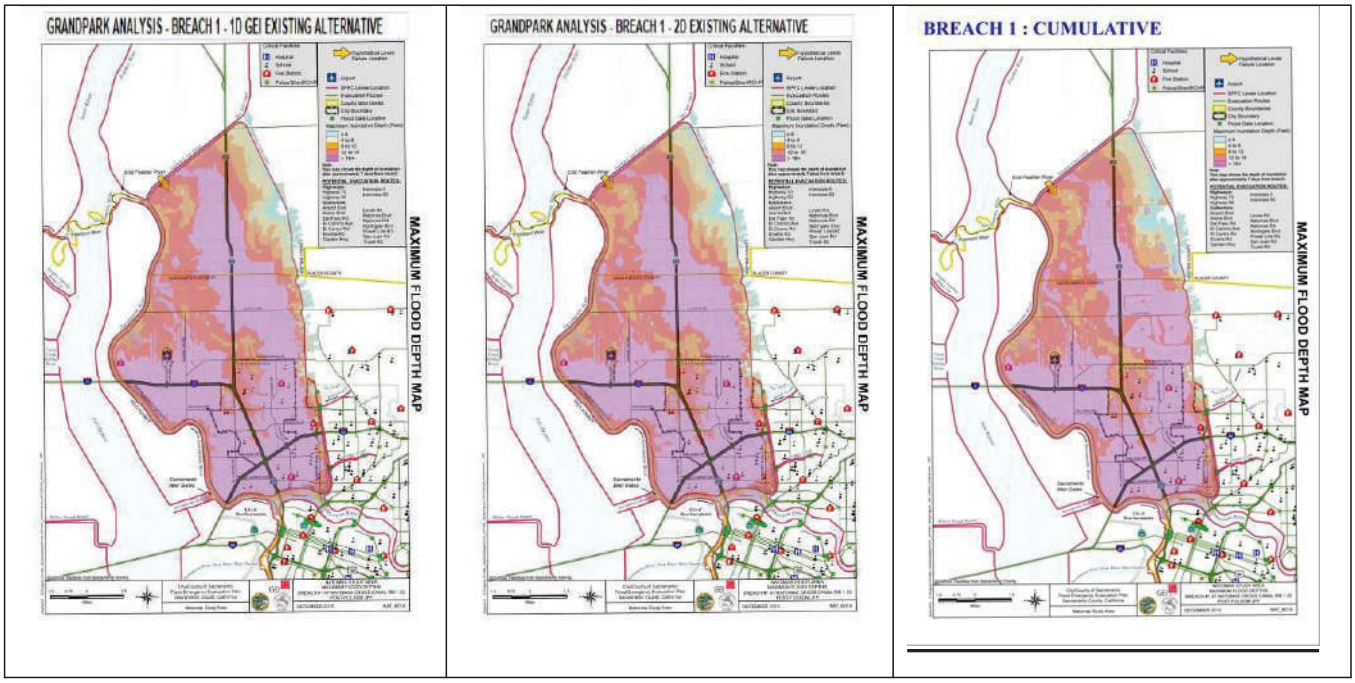
1D to 2D model:

For Breach 7, most points report similar or delayed timing. However, the data point for I-80 West shows a reduction from 6 hours to 2 hours. The figure to the right shows that the I-80 WEST point is directly downstream of the Breach 7 location, and how the overland flow path of the waters passing through the breach would be directed at this location before they could reach any main system conveyance paths. The 1D model simply models the area downstream of this breach as a storage area with 1 set of stage-storage values for the whole area which simply fills from the lowest elevation upwards. The 2D model allows the flood waters to spill over the terrain, and be redirected by high and low terrain. The 1D model could not accurately model the timing of flooding of this data point location.

2D to 2D Cumulative Model Changes:

This beach location is located along the Natomas East Main Drainage Canal Levee, north of the American River.

In general, the Cumulative analysis shows a reduction in flood response timing to a depth of 1 foot in the southern areas of the basin. Along the I-80 corridor, for example, reductions of 86 to 80 hours (I-5 West), 48 to 39 hours (I-80 WEST) and 37 to 30 hours(I-80 CENTRAL) are estimated by the modeling.

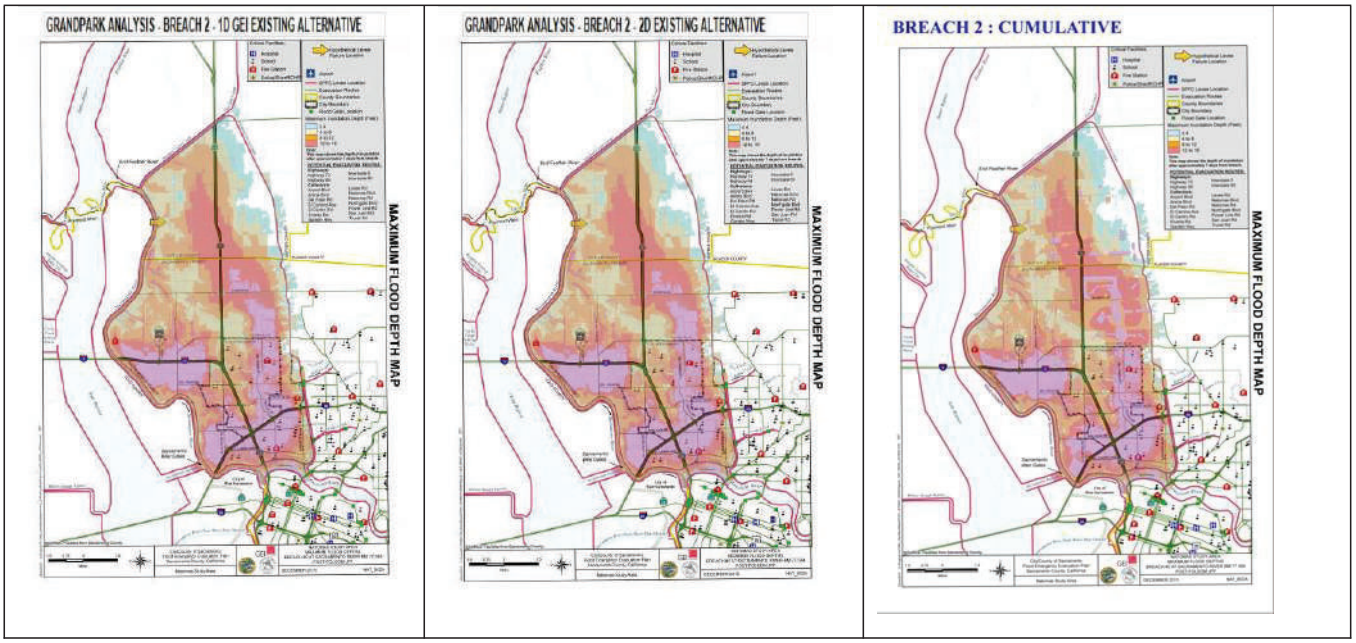


These changes result from the proposed Grandpark project culverts under Elverta Road restricting low flows below their roadway overtopping elevations along the East Drainage Canal in a South to North direction  These culverts are sized for properly reducing potential flooding changes both downstream and upstream of the Grandpark project in the 100-year, 200-year design storms with and without Climate Change being factored, in order to meet Sacramento County and RD-1000 peak flood mitigation requirements.

Also, adverse timing of 1-hour (-1 hour) is less than the accuracy of this model and, therefore, this reduction in timing to 1-feet depth of flooding is not considered material.

## MAXIMUM INUNDATION DEPTH:

Following is a comparison of the Maximum Inundation Depth computed for each breach scenario under each analysis. Oversized versions of these exhibits are presented at the end of this Technical Memorandum.



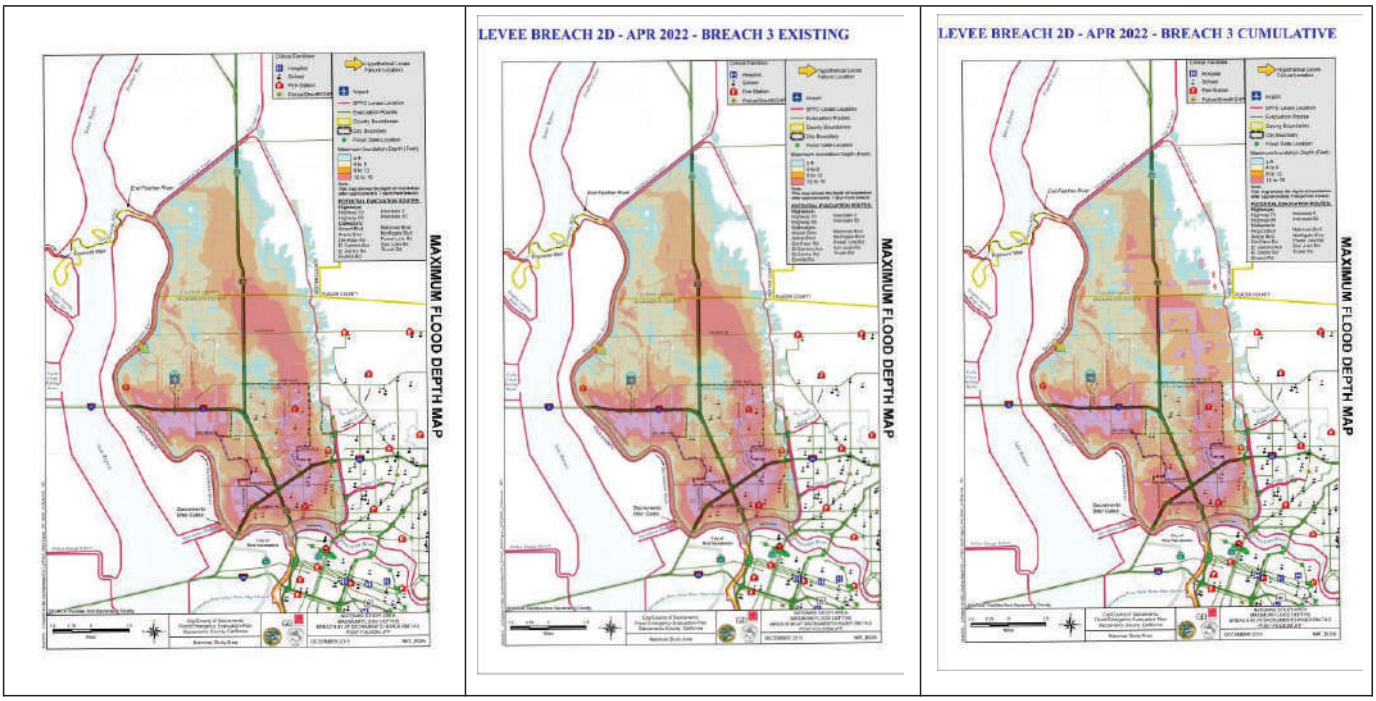
### BREACH 1: (Cross Canal Levee Breach Location)

For the Breach 1 scenario, the results are similar except as follows:

- The 1D analysis floods to a greater depth than the 2D analysis.
- The existing conditions 1D analysis does not show the Sankey gap spill path. This is because of how storage areas are represented in the 1D model.
- Grading for the embankments at the Sankey Gap flood storage facility block the flood progression until the embankments are overtopped. This causes the northwest quadrant to have less flood volume initially than the existing conditions analysis.
- Grading within the Cumulative developments shows some differences, such as lower depths where embankments are proposed and higher depths at proposed detention basins.

**BREACH 2: (North Sacramento River Breach Location)**

For the Breach 2 scenario, all results report a similar final flooding depth with the exception of:



- The existing conditions 1D analysis does not show the Sankey gap spill path. This is because of how storage areas are represented in the 1D model.

- Grading for the embankments at the Sankey Gap flood storage facility block the flood progression until the embankments are overtopped. This causes the northwest quadrant to have less flood volume initially than the existing conditions analysis.

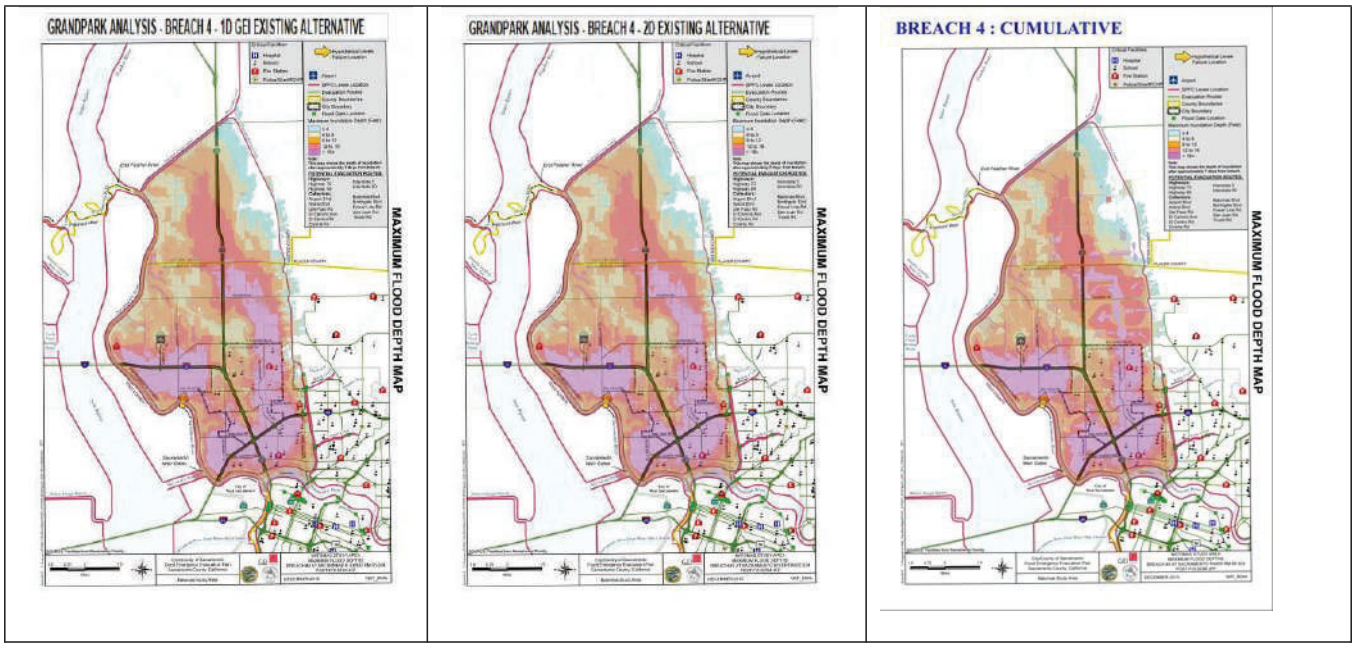
- Grading within the Cumulative developments shows some differences, such as lower depths where embankments are proposed and higher depths at detention basins.

Remainder of Page Intentionally Left Blank

**BREACH 3: (Sacramento River Levee Near Elverta Road)**

For the Breach 3 scenario, all results report a similar final flooding depth with the exception of:

- The existing conditions 1D analysis showed a much higher maximum flooding depth than the 2D analysis: This is result of greater breach flows being allowed in this model resulting from the differences between storage areas and 2D analysis.



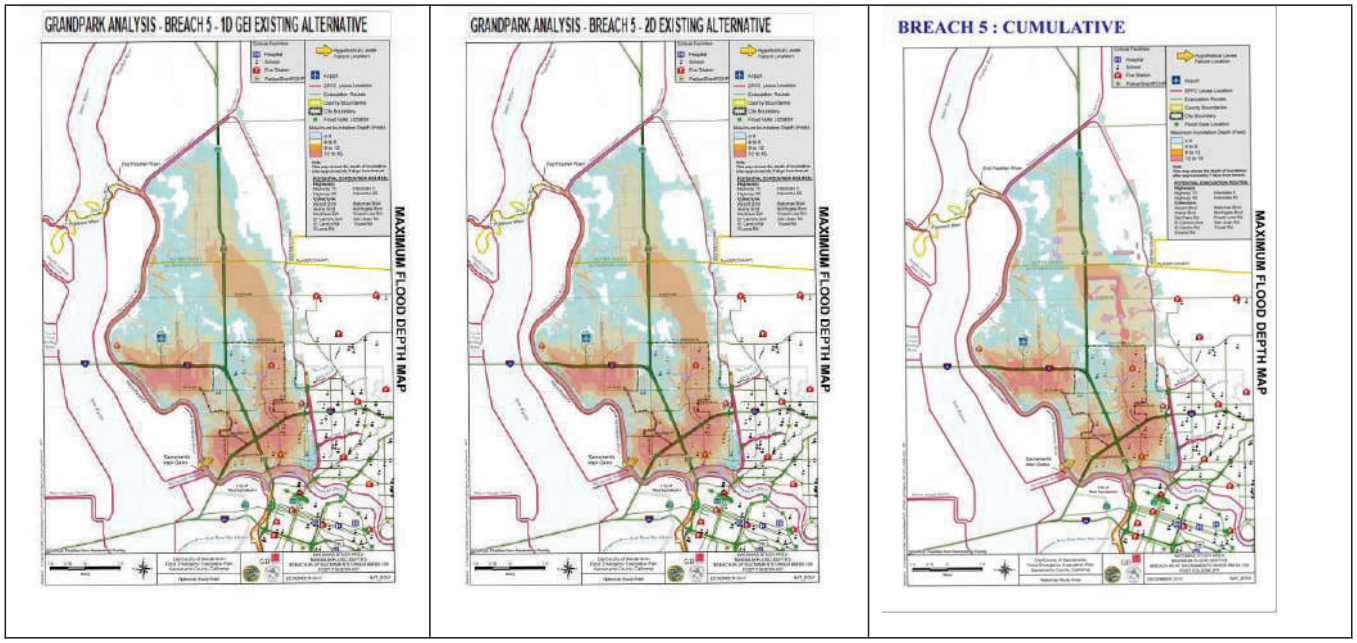
- The existing conditions 1D analysis does not show the Sankey gap spill path. This is because of how storage areas are represented in the 1D model.

- Grading for the embankments at the Sankey Gap flood storage facility block the flood progression until the embankments are overtopped. This causes the northwest quadrant to have less flood volume initially than the existing conditions analysis.

- Grading within the Cumulative Developments shows some differences, such as lower depths where embankments are proposed and higher depths at detention basins.

Remainder of Page Intentionally Left Blank

**BREACH 4: (Sacramento River Levee South of I-5)**



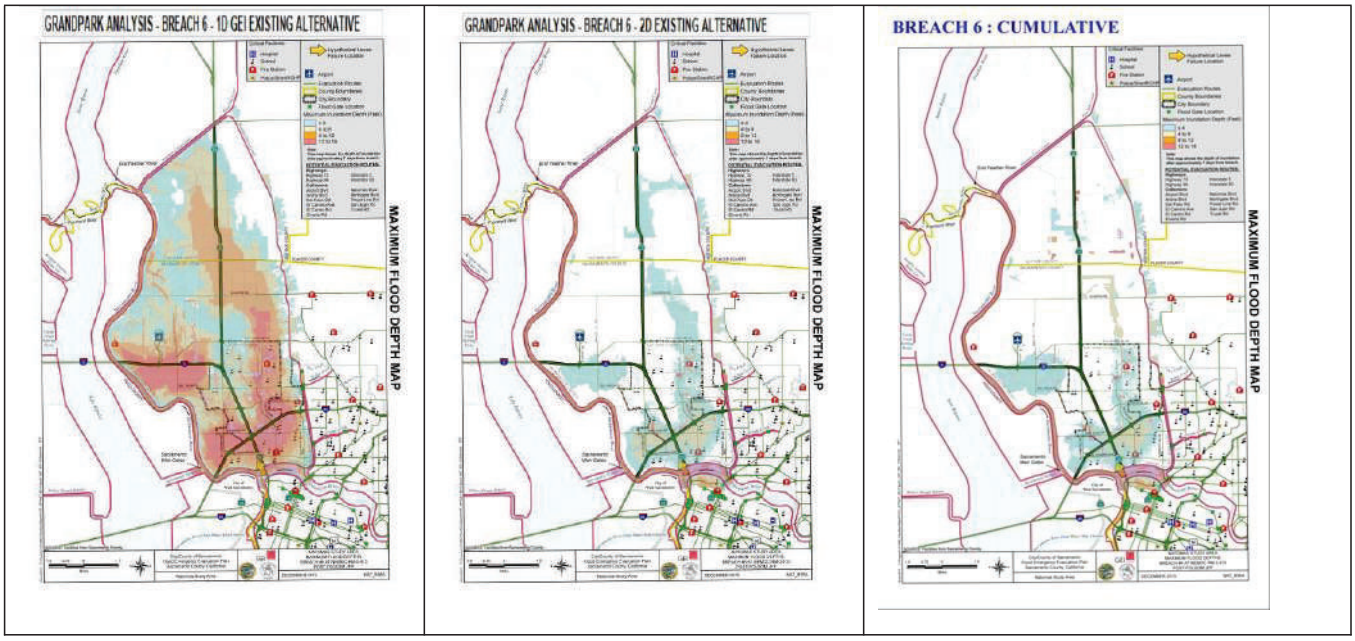
For the Breach 4 scenario, all results report a similar final flooding depth with the exception of:

- The existing conditions 1D analysis does not show the Sankey gap spill path. This is because of how storage areas are represented in the 1D model.

- Grading within the Cumulative developments shows some differences, such as lower depths where embankments are proposed and higher depths at detention basins.

Remainder of Page Intentionally Left Blank

**BREACH 5: (Sacramento River Levee Near I-80)**



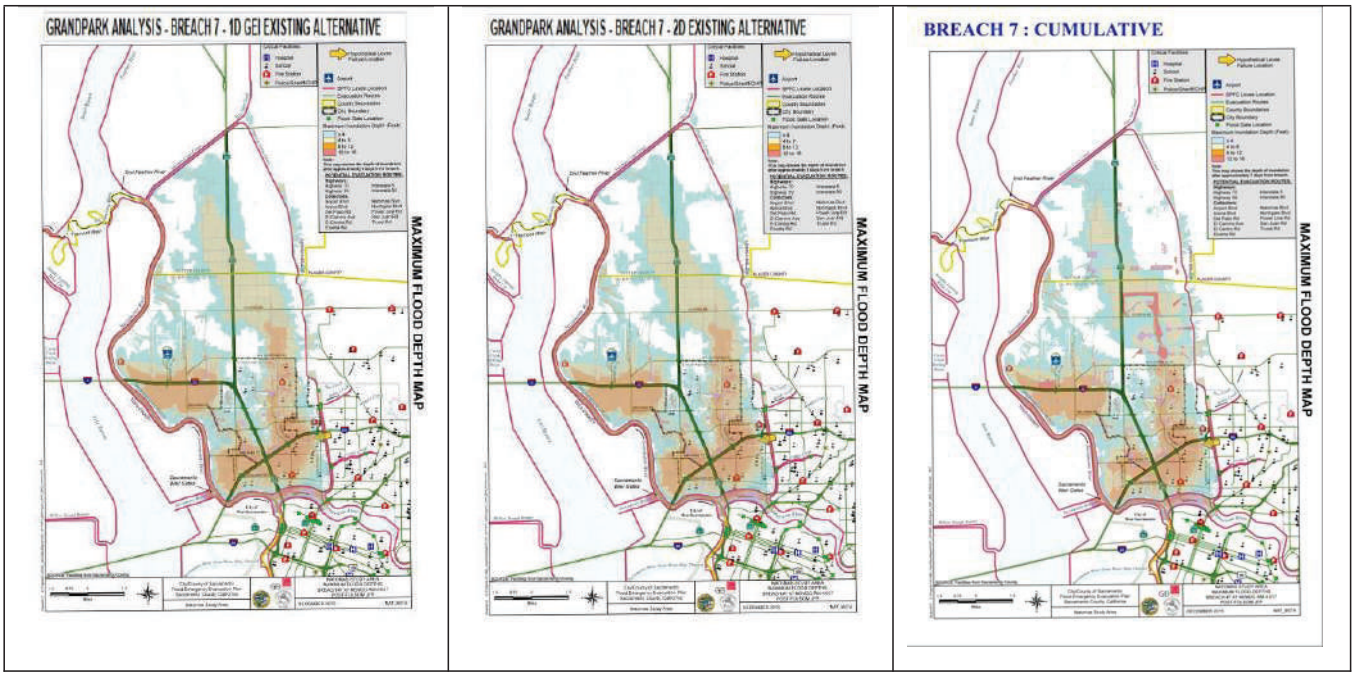
For the Breach 5 scenario, all results report a similar final flooding depth with the exception of:

- The existing conditions 1D analysis does not show the Sankey gap spill path. This is because of how storage areas are represented in the 1D model.

- Grading within the Cumulative developments shows some differences, such as lower depths where embankments are proposed and higher depths at detention basins.

Remainder of Page Intentionally Left Blank

**BREACH 6 (American River Levee Near Confluence With Sacramento River):**



For the Breach 6 scenario, for the 2D analyses report a similar final flooding depth. However:

- The existing conditions 1D analysis showed a much higher maximum flooding depth than the 2D analysis. This is result of greater breach flows being allowed in this model resulting from the differences between storage areas and 2D analysis.
- The existing conditions 1D analysis does not show the Sankey gap spill path. This is because of how storage areas are represented in the 1D model.
- Grading within the Cumulative developments shows some differences, such as lower depths where embankments are proposed and higher depths at detention basins.
- Due to available flood capacity within the Grand Parkway, lower maximum flood depths occur within the southwestern areas and areas north of Elkhorn Blvd.

Remainder of Page Intentionally Left Blank

## BREACH 7 (NEMDC Levee Near I-80)

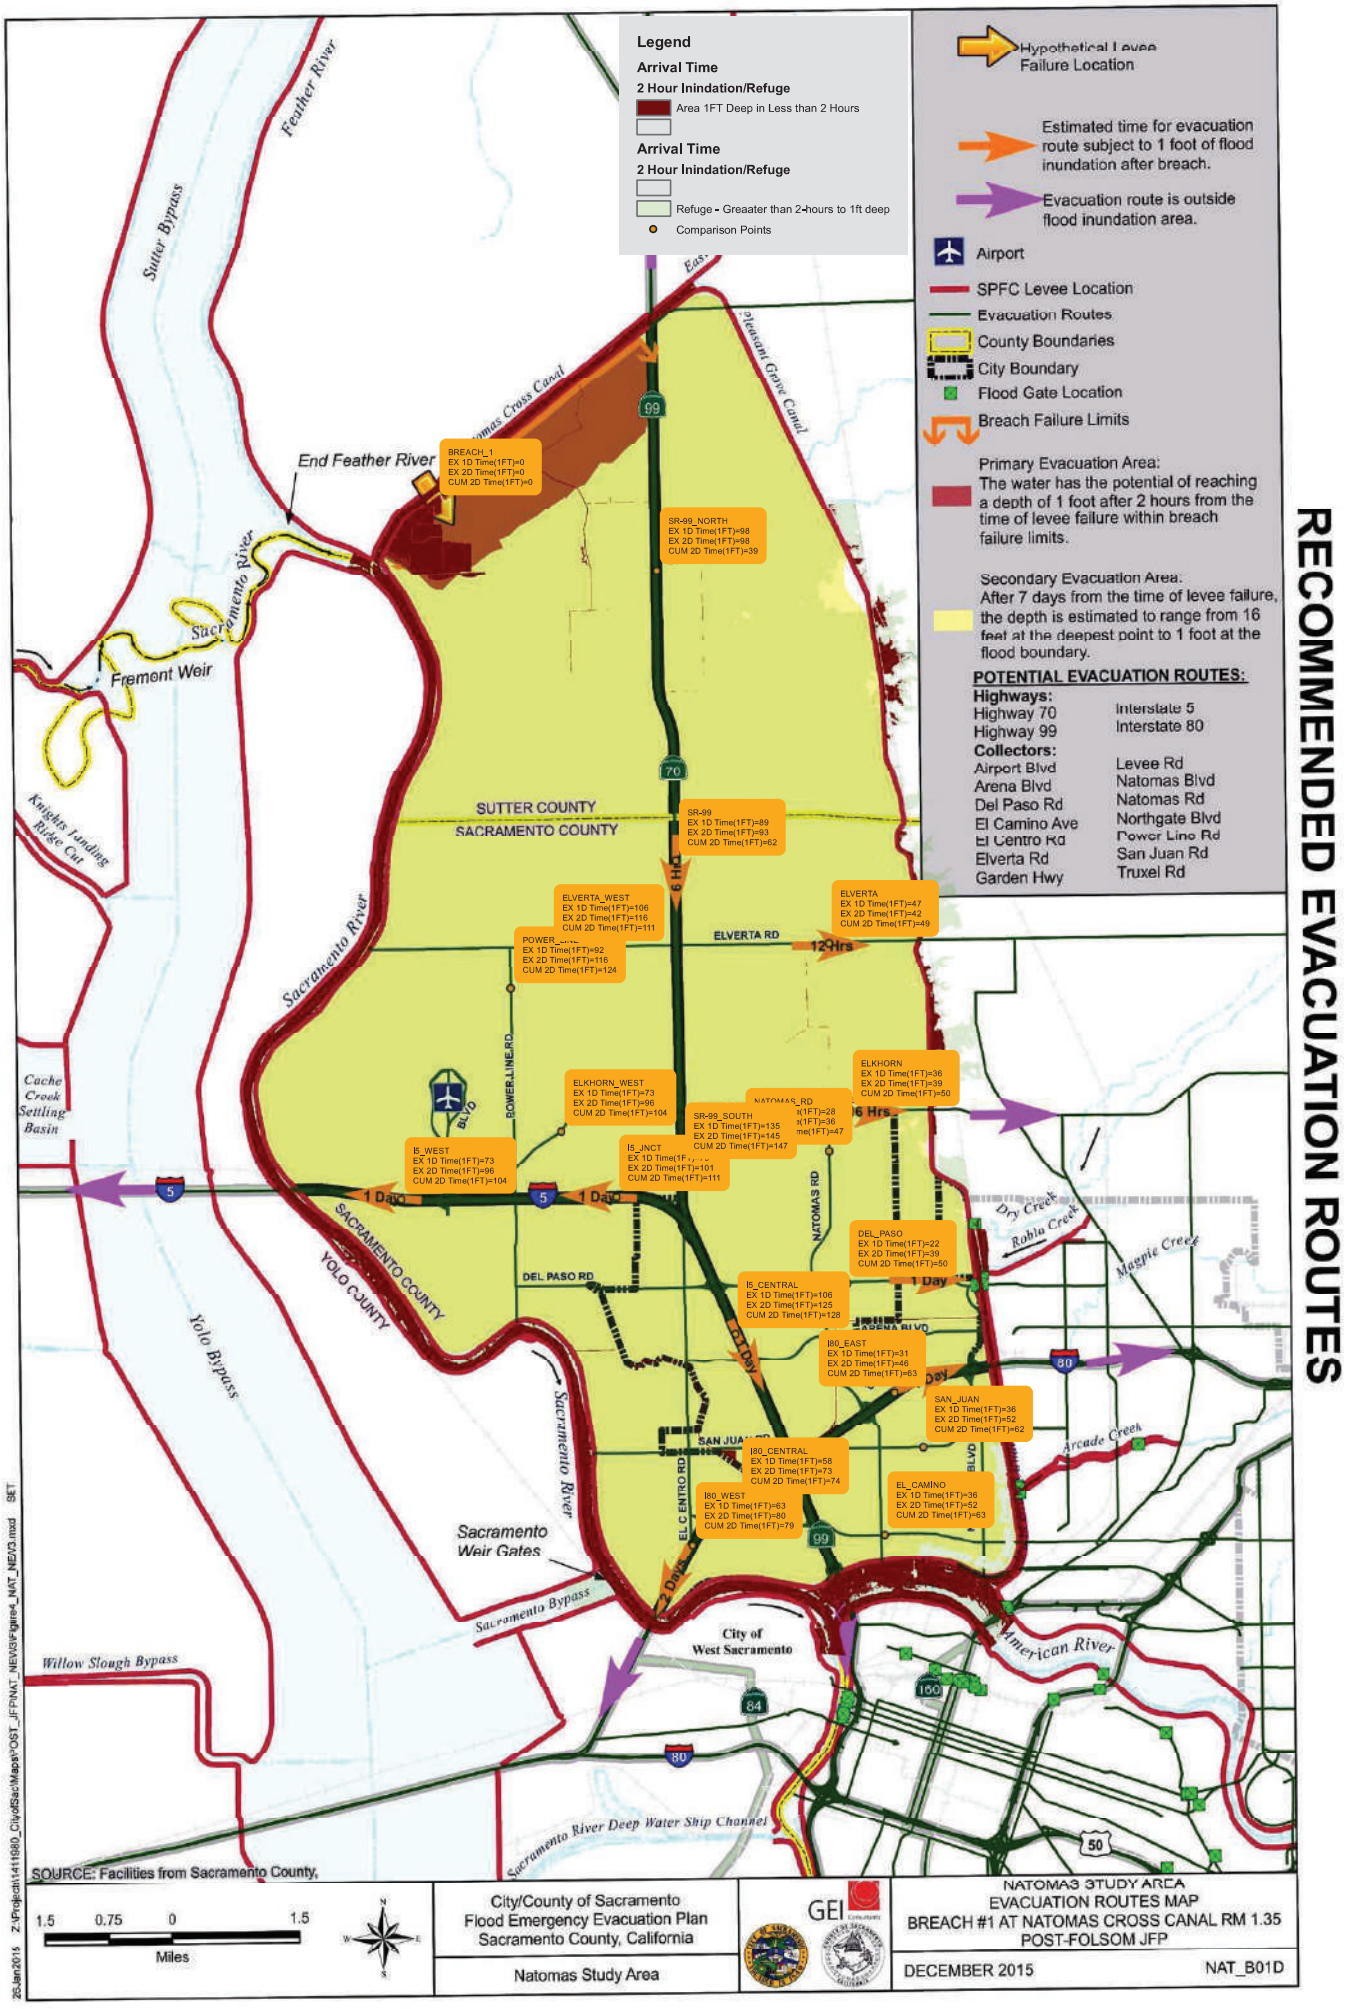
For the Breach 7 scenario, all results report a similar final flooding depth with the exception of:

- The existing conditions 1D analysis does not show the Sankey gap spill path. This is because of how storage areas are represented in the 1D model.

- Grading within the Cumulative developments shows some differences, such as lower depths where embankments are proposed and higher depths at detention basins.

Remainder of Page Intentionally Left Blank

## MAXIMUM DEPTH OF FLOODING COMPARISON



A comparison of Maximum Flooding Water Surface Elevations for the Grandpark and Upper Westside Development Areas, by breach scenario is shown in Table 8. For this table the location of the East Drainage Canal Crossing of Elverta Road was selected for the Grandpark project, and a central point within the Upper Westside project was selected.

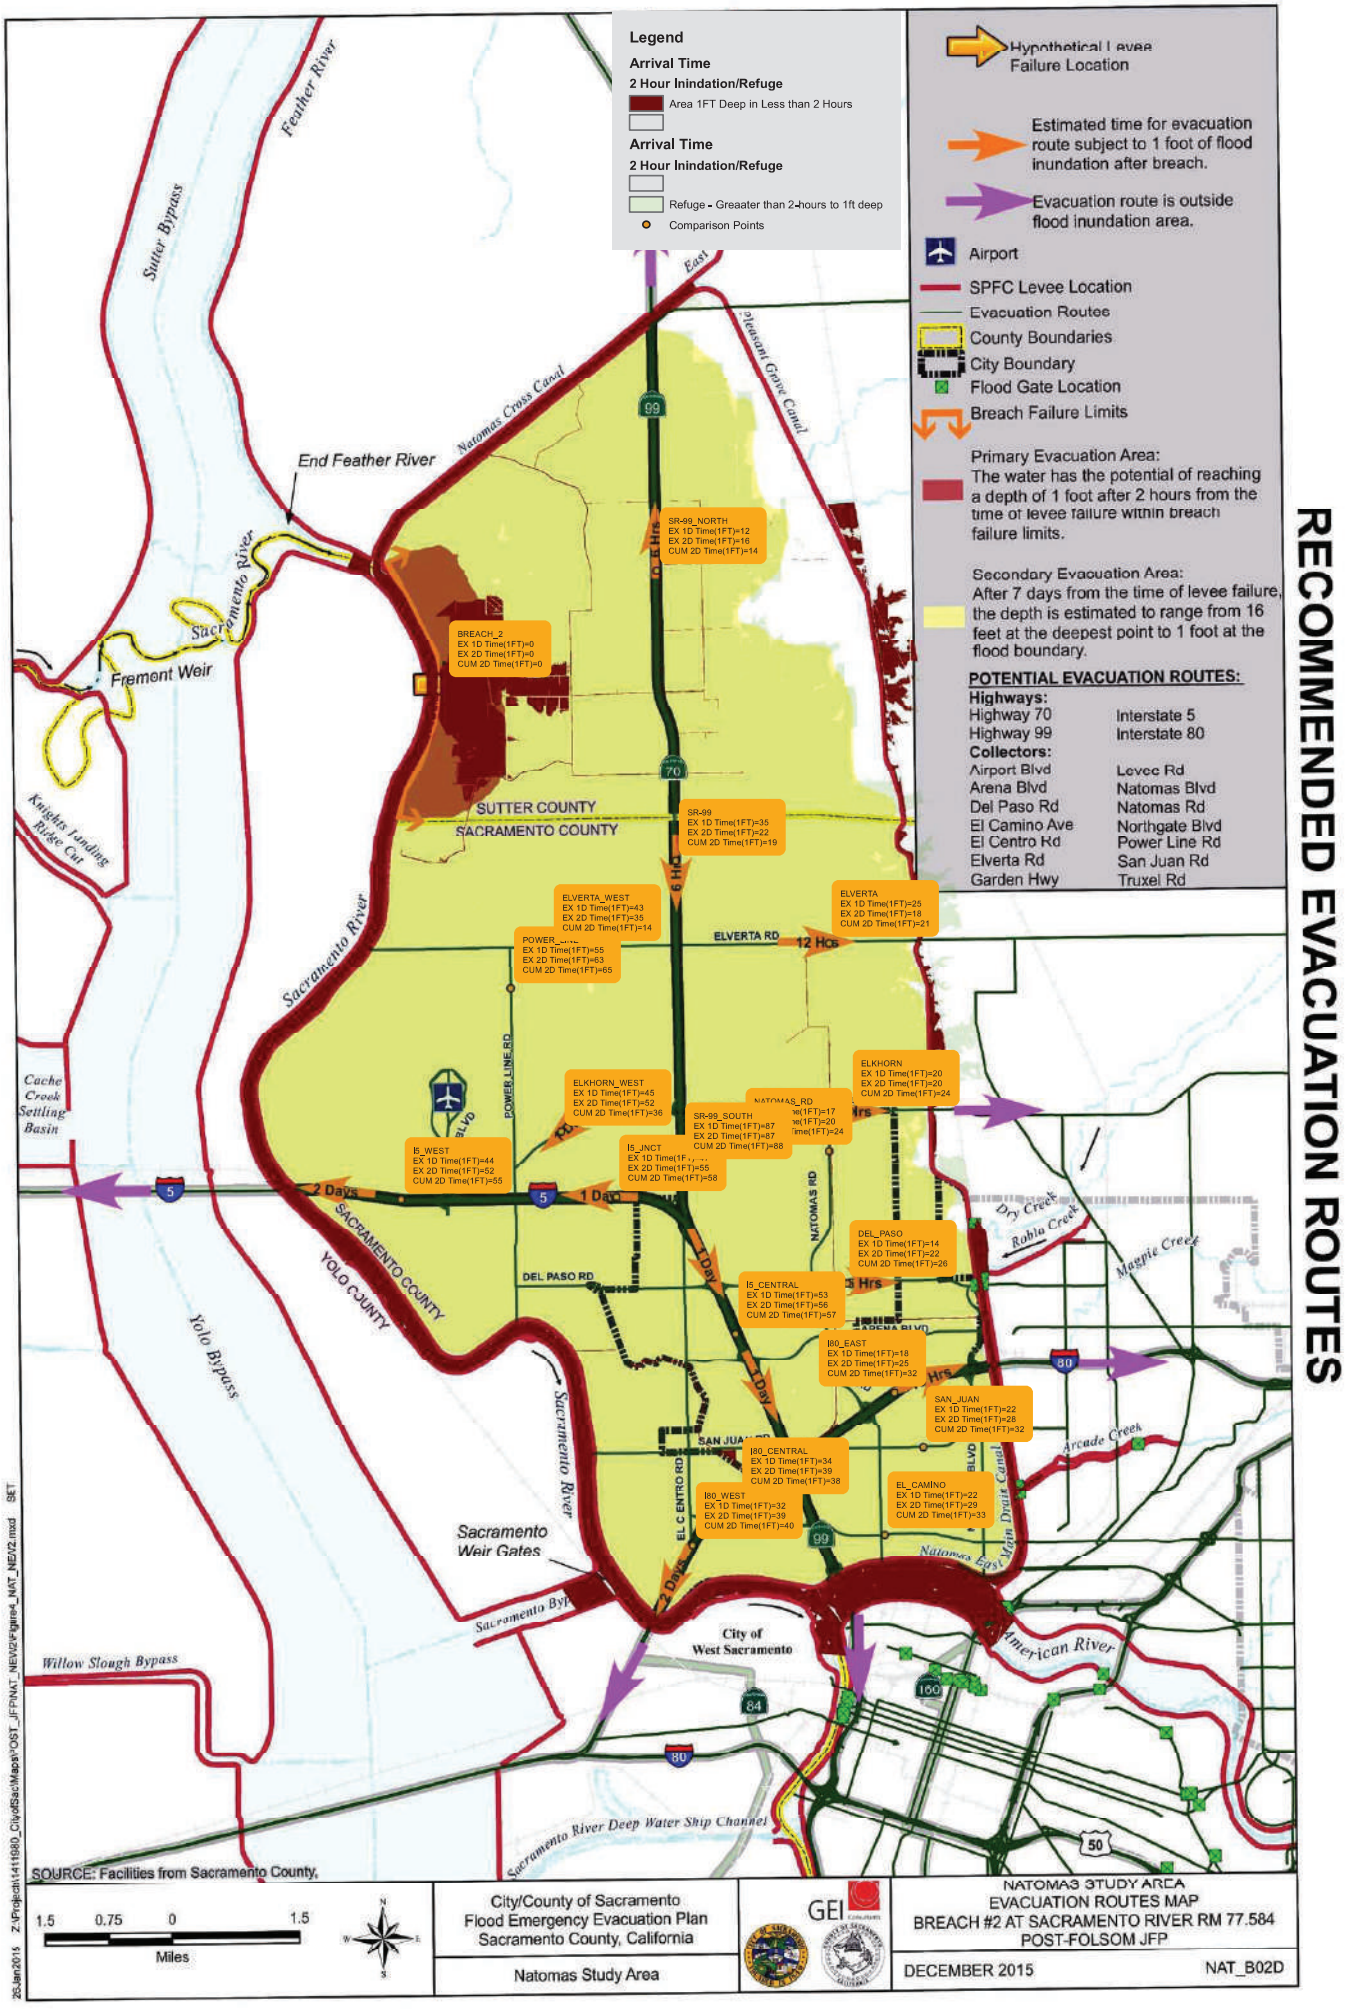


**TABLE 8**
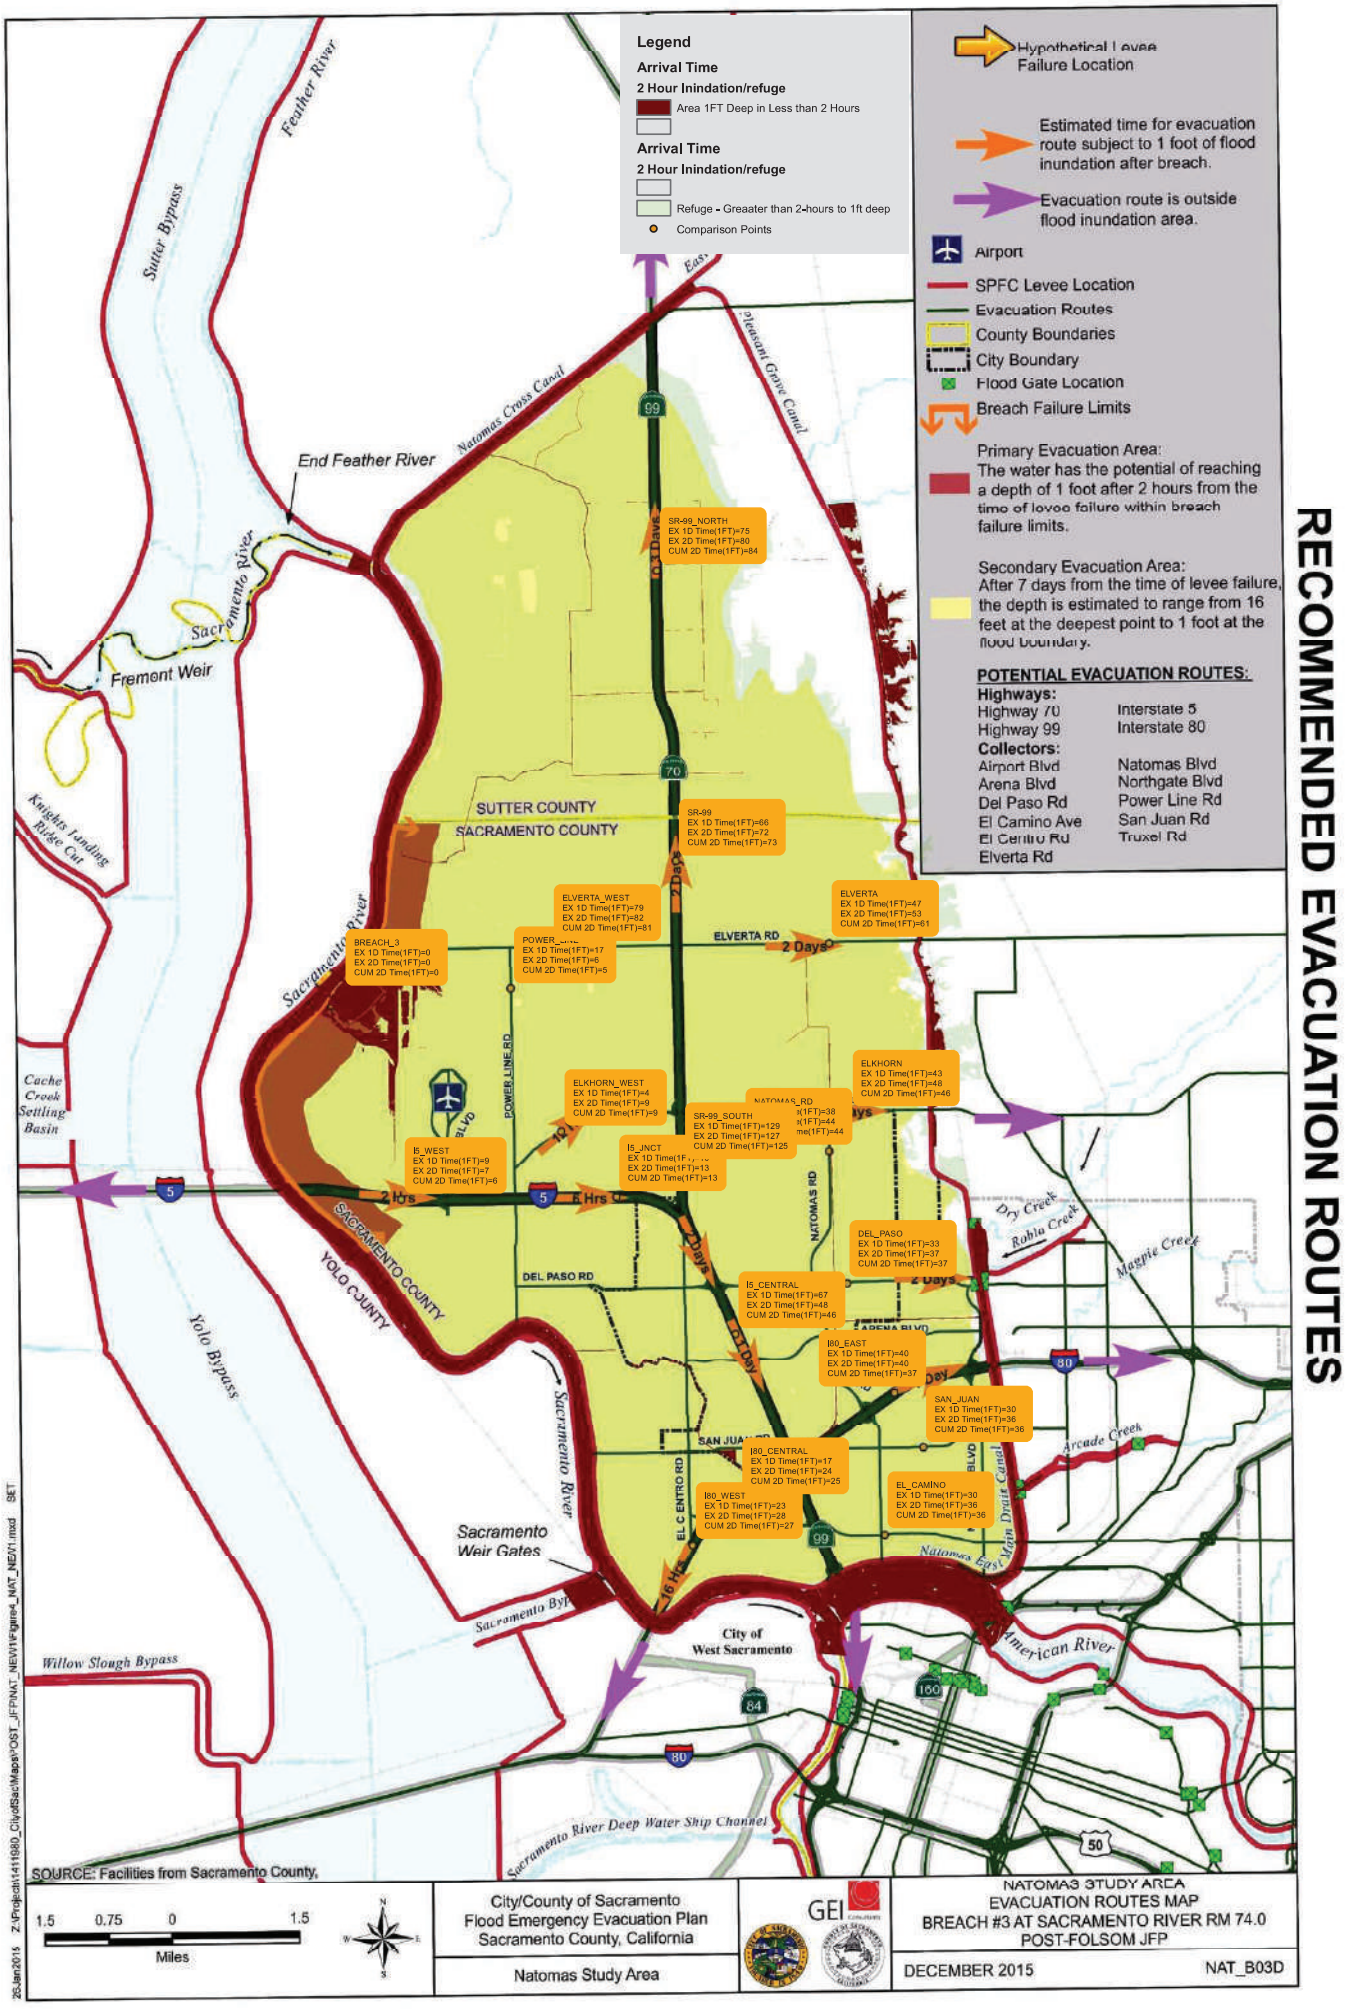
**Maximum Flooding Water Surface Elevations**
(Existing v. Cumulative Conditions)



| BREACH SCENARIO | UWS Existing | UWS Cumulative | Grandpark Existing | Grandpark Cumulative |
|---|---|---|---|---|
| 1 – Natomas Cross Canal | 36.85 | 36.76 | 36.85 | 36.76 |
| 2 – Sac. River North | 31.77 | 31.78 | 31.77 | 31.79 |
| 3 – Sac River Northcentral | 29.22 | 29.23 | 29.22 | 29.23 |
| 4 – Sac River Central. | 32.23 | 32.24 | 32.23 | 32.24 |
| 5 – Sac River South | 25.15 | 25.14 | 25.15 | 25.14 |
| 6 – American River | 16.15 | 15.82 | 15.86 | 15.51 |
| 7 – NEMDC | 23.23 | 23.28 | 23.23 | 23.28 |

Breach Failure Limits
Primary Evacuation Area:
The water has the potential of reaching a depth of 1 foot after 2 hours from the time of levee failure within breach failure limits.
Secondary Evacuation Area:
After 7 days from the time of levee failure, the depth is estimated to range from 16 feet at the deepest point to 1 foot at the flood boundary.

## EXECUTIVE SUMMARY

### Background

This supplemental analysis was prepared to respond to the County's November 2, 2023 comments on the following Procedural Memoranda:

- *Grandpark Flood Inundation Propagation Procedural/Technical Memorandum* prepared by MacKay & Somps (dated November 10, 2022), and
- *Upper Westside Flood Inundation Propagation Procedural/Technical Memorandum* prepared by MacKay & Somps (dated November 10, 2022).

These Procedural Memoranda were prepared based on the flood modeling technical work prepared by CESI in 2022. This technical work included HEC-RAS modeling of the same seven (7) theoretical levee breach locations that the City of Sacramento selected for modeling by GEI Consultants in preparation of the 2015 City/County Evacuation Plan (2015 Evacuation Plan), and the 2021 Sacramento County Multi-Jurisdictional Local Hazard Mitigation Plan (2021 LHMP).
As explained below, the technical analysis prepared for the Procedural Memoranda utilized a newer version of HEC-RAS modeling software (ver. 6.2) than the modeling performed in 2015. This newer work effort took into consideration three principal considerations:

1. Better and more accurate topographic mapping,
2. Two Dimensional (2D) Flood Hydraulic Analysis Landside of the Breach Formation
3. More realistic breach formation determinations (within HEC-RAS) based on the more accurate landside topographic mapping.

### County Comments

The County's comments on the two Procedural/Technical Memoranda mentioned above did not require formal responses as they were advisory in nature. However, the County's comments suggested that it would be appropriate to review modeling results that used modeling assumptions that were identical in nature to those used for the 2015 Evacuation Plan to facilitate identification of material differences in modeling results between 2015 and the current modeling effort. Notwithstanding the technical adequacy of the prior modeling effort and the conclusions contained in the 2022 Procedural Memoranda, it was for this reason that Grandpark and Upper Westside chose to update the modeling performed for the 2022 Procedural/Technical Memoranda using the same set of modeling assumptions that were used in the 2015 modeling effort. The differences in modeling assumptions are summarized in this Technical Memorandum.

### Findings of TM 0040A

Bringing about consistency in levee breach assumptions when using the improved modeling software resulted in slightly greater elapsed time to one-foot of flooding at critical locations along the evacuation routes. Basically, the 2024 modeling analysis performed for this Technical Memorandum found that the resulting timing for flood inundation propagation from each of the seven breach

locations were relatively consistent with those found in the 2015 flood mapping analysis.

Specifically, the key findings of this supplemental analysis are listed below:

1. The addition of a scour pit allowed the levee breach to form to the full depth and height in all simulated locations. However, this change in the modeling assumption did not increase the amount of flow significantly to the interior of the basin.

2. The review of landside nearby lowest elevations that the breach could flow to as an exit from the weir location did contribute to some higher flow rates in a few of the analysis.

3. The addition of a scour pit delayed some flow delivery and reduced overall peak flows. This is likely because during the breach formation, the scour pit would form at a water surface below the exterior river water surface as there are head losses for the flow passing through the breach. The lower water surface elevation of the scour pit delivering water to the landside terrain would have less potential energy to drive the flood waters to spill over the terrain. Also, because the scour pit flood elevation is above the terrain elevations, the head to drive flood waters through which the breach operates was less when the breach is near submergence.

4. The changes to the model generally resulted in less flooding depths and longer flood timings for all breach locations studied. This suggests that for total flow and timing, the importance of the breach formation depths was not as significant as the elevations of the landside terrain the flood waters eventually must pass over after passing through a breach and scour pit.

5. Finally, the changes in timings in the two 2D models (Existing Conditions and Cumulative Conditions) stayed similar to the previous analysis and was not sensitive the issues raised in the GEI Comments.

**RESPONDING TO:**

GEI Consultants prepared a review of Technical Memorandum's 39 and 40 for the Grandpark and Upper Westside projects on November 2, 2023. The purpose of their review was "to provide a third party review of the reports regarding inundation floodplain mapping from hypothetical levee failures in the Natomas Basin". These Technical Memorandum's included analysis for 7 levee breach locations along the Natomas levee protection system, under different project circumstances.

**GEI Concluded:**

> *1) The full Sacramento River system model geometry and hydrology used for the GP/UWS evaluation is acceptable. The water levels in the surrounding river system (Sacramento River, American River, Cross Canal, NEMDC) are acceptable and do not need adjusting for the levee failure evaluation.* ***Figure 1*** *shows the full system model and* ***Figure 2*** *shows the proposed Natomas basin breach locations for this evaluation.*
>
> *2) A notable change between the 2015 GEI hypothetical levee breach openings and the 2022 GP/UWS hypothetical levee breach opening was assuming if scour would occur for longer duration flood events. For the 27 levee failure maps dated 2015, the city and county requested each of the levee failures to*

*assume an extra scour hole depth below the levee toe of approximately 10-20 feet because of unknown soil conditions. The deeper scour hole depth assumption causes a wider opening which increases the breach flow entering into the Natomas Basin. The breach open criteria (Width = 50 x Distance from water level to land toe) is based on recommendations from the Corps of Engineers and the State of California Department of Water Resources (CADWR).*
*Because there have been no actual levee failures in the Sacramento River levee systems, the breach opening assumptions provided by the GP and UWS evaluations are not unreasonable.*

*3) Breach 6 showed a significantly reduced floodplain in the Natomas basin for both the GP and UWS evaluation compared to the 2015 city inundation maps. The GP/UWS maps are reasonable, but the 2015 maps are more conservative because the evaluation assumed a deep scour hole could form which would increase breach flows. The scour hole assumption was based on a request from the City.*

*4) The inundation mapping dated 2015 does not include flows from the Sankey Gap. This was discussed with the City and County of Sacramento but was decided only to include breach flows from the adjacent streams.*

*5) A significant change between the 2015 and the 2022 analysis was the new Corps of Engineers Hydraulics Program (HEC-RAS) version 6.0 which includes a new approach for routing overland flows.*

*a. The new program improves the overland flow routing by using two-dimensional grids which uses the physical terrain as opposed to storage areas which occurred with the previous program developing the 2015 maps. Storage areas in the hydraulic model are lake like regions which fill as a bowl.*

*b. As shown in the GP and UWS TMs, the updated 1D/2D HEC-RAS program showed there was not a significant change in the travel time between the two model program approaches. However, using the updated 1D/2D HEC-RAS program is recommended.*

## PURPOSE OF RESPONSE

The purpose of this Technical Memorandum is to respond to GEI's conclusions numbers 2 and 3 with additional technical analysis. In this technical memorandum we have revised the technical analysis for all 7 breach locations to include a scour pit formation to occur adjacent to the existing levee where the breach would form. This would allow the full breach shape to form, rather than only the partial breach depth formed in a few locations in our previous analysis. In addition, we re-assessed land side elevations of the weir connection from the scour pit to the 2D model areas inside the basin.

By performing this additional investigation, we intend to address any concerns that different conclusions might occur if these modeling changes were performed.

## DESCRIPTION OF MODELING CHANGES:

At each breach location, a storage area was added to represent a scour pit formation on the land side of the levee breach location. The flows entering the breach would spill into the scour pit, and have to fill it before these flows would connect to the 2D flood areas. The scour pit was set to be 16 feet

deep, and roughly 6 acres at the landside ground level[1]. The scour pit depth allows the full formation in depth and width of each levee breach[2]. Previously, the scour pit depth of formation was limited to the landside existing ground elevations directly adjacent to the levee breach.

Connecting each scour pit to the 2D Natomas floodplain is a lateral weir set based on the landside existing ground elevations near the levee breach. These were re-evaluated with this analysis to try and find the lowest near adjacent grades, to permit the maximum flood flow exchange.

All other model development assumptions remain the same as described in the applicable sections of TM 0039 and TM 0040. Some instabilities did occur when attempting to run this version of the models, which were addressed by adding a 10 cfs base flow in the NEMDC, which was consistently added in all of the analysis.

## ELEVATION DATUM

All Elevations shown in this TM are in NAVD 88 Vertical Datum.

## USE OF "SACRAMENTO-COMBINED" HEC-RAS MODEL FROM GEI

GEI provided CESI the 2015 HEC-RAS One-Dimensional (1D) modeling that the existing Natomas Basin Levee Breach analysis was performed with for the seven (7) perimeter levee breach locations previously chosen by the City and County of Sacramento for the GEI analysis in 2015. The updated modeling is run for the same total duration of analysis as the original GEI model. This modeling was used for this analysis except for changes described below.

The results of the previous Breach Analysis are posted at the following link:

https://waterresources.saccounty.net/stormready/Pages/Natomas-Area-Flood-Map.aspx

The results presented in this Technical Memorandum focus on two analyses:

1. Time to Fill to 1-foot of depth at Evacuation Route locations, and
2. Maximum Depth of Inundation measured in the modeling.

The previous Breach Analysis Maps were published by the County at the link above to present the results of the GEI modeling.

The original model was performed in HEC-RAS version 4.1.3. In consultation with Chris Ferrari of GEI Consultants, CESI updated the 2015 modeling. Specifically, CESI updated the model to HEC-RAS 6.2 and further modified the model as described below. This required

[1] These dimensions are based on State DWR analyses of empirical data from several historical levee breach events in the Sacramento-San Joaquin Delta. Based on DWR analysis, these dimensions appear to be typical of the levee breaches that would form within the vicinity of the Natomas Basin. Scour Pits are typically 6 acres in surface area and 16-feet deep. Levee breach widths are typically 50 times the distance from the water level in the external river to the land side toe elevation.

[2] Full formation of breach size (width and height) as defined in the original 2016 analysis for each formation location.

modification for errors in the geometry file detected by the current version of HEC-RAS that were not evident in the previous version. Typically, these errors occurred where HTAB table definitions started below the invert of a channel, or storage area starting elevations below the lowest elevation in the storage area.

Version 6.2 of HEC-RAS generates a warning at some breach locations that the specified minimum elevation of the breach is below the adjacent ground elevations. When this occurs, HEC-RAS Version 6.2 will limit the breach weir formation elevation to the adjacent lowest ground elevation.

The original model analyzed flood distribution within the basin by including a set of storage areas connected by weirs and culverts. This method discounts the impact of local ground features and the time it takes for flood waters to cross the storage areas, as HEC-RAS views a storage area as equally distributing the inflow to the entirety of the storage area instantaneously.

CESI decided for the current analysis, it would be better to analyze the breach flooding over Two Dimensional (2D) surfaces using the Version 6.2 capabilities of HEC-RAS. Digital terrain models (topographic models) of the Natomas Basin were not provided by GEI when the original model was transferred to CESI.

Accordingly, CESI generated a cumulative conditions topographic model for the Natomas Basin and utilized HEC-RAS Version 6.2 to generate a digital terrain model surface for the existing conditions. CESI then developed digital terrain models based on the current land use plans and drainage plan documents (where available – See TM 0039) and then added these terrain models for the reasonably foreseeable development projects for the Cumulative Conditions modeling.[3]

The following development areas were included in the Cumulative Conditions:

- GRANDPARK (Conceptual Grading Plan – April 20, 2022).[4]

[3] For this analysis, a version 6.05 terrain surface was created for the Cumulative development scenario. The 6.04 and 6.05 Terrains were based on 2 feet by 2 feet pixel size, and, at locations where the terrain did not include hydraulic reinforced data (invert data at bridge and culvert crossings, this data was added by interpolating a section from upstream grades to downstream grades in the LiDAR data set).

[4] The 2022 Grandpark Conceptual Grading Plan was used in this analysis. This conceptual grading plan is an update of the conceptual grading plan used in TM 0007 (Grandpark Land Use Plan 08F) as it reflects the elimination of the "Lennar" parcels as a development site and instead leaves this property as an undeveloped open space parcel. Additionally, the 2022 Conceptual Grading Plan reconfigured the Grand Parkway from a water feature intensive open space plan into a more natural floodplain with a central drainage channel and overbank flood storage areas without significant water features. Lastly, the 2022 Conceptual Grading Plan redistributed the required flood storage volumes within the Grand Parkway in order to (1) meet County design standards relating to avoiding water surface level impacts to upstream and downstream properties, (2) achieve a condition where post development peak flow rates do not exceed predevelopment levels upstream and downstream of Grandpark, and (3) achieve an equitable allocation of flood storage volumes between the various property owners within the area of the Grandpark Specific Plan.

- SUTTER POINTE (Appendix E Drainage Master Plan and Appendix B Land Use and Development Code).
- SAFCA "Sankey Road Gap Closure Project Basis of Design Report".
- GREENBRIAR (used land use plan and documentation from the January 5, 2017, Environmental Checklist (online version)).
- PANHANDLE (Preliminary Grading Plan by MacKay & Somps).
- UPPER WESTSIDE (land use plan from Staff Presentation February 2022).
- SACRAMENTO INTERNATIONAL AIRPORT (Master Plan January 2017), including Airport South Industrial project (using the layout included in the Airport Master Plan)

It should be noted that the ultimate buildout of Metro Airpark is included in the Existing Conditions terrain models per the request of Sacramento County DWR Staff.

It's important to note that the grading input for all of the projects added in the Cumulative conditions models is for the finished grade surfaces only and does not include any structures which will be built. Additionally, the friction is not adjusted at these locations for the resistance to flows that may occur post development from fences and structures.

CESI then prepared 4 different analyses for each breach location as follows:

- **GEI Existing Conditions 1D Analysis.** The GEI existing conditions 1-dimensional (1D) storage-area based analysis was re-run in HEC-RAS 6.2.[5] Based on a visual comparison of the results from this re-run of the GEI existing conditions 1D in 2D analysis with the GEI published 1D results, the two sets of results were found to be similar.

  Upon completion of this modeling exercise, CESI again consulted with GEI to report on the efforts to update the 2015 model and the results from this modeling existing conditions analysis when using the newer HEC-RAS software. During this consultation, both GEI and CESI agreed the updated model was producing results similar to those obtained from the 2015 model in terms of the duration of time to 1-foot depth of flooding over the critical locations along the major evacuation routes, and the maximum depth of flooding within the Basin.

- **Existing Conditions Analysis with Storage Areas Converted to 2D**. The addition of a scour pit landside of the levee allowed the full formation of the breach width and depth to match the specifications of the original GEI analysis. From the scour pit flows are spread over the existing ground grades and dispersed into the 2D domains for the interior areas of the Natomas Basin.

[5] The HEC-RAS Version 6.2 is recognized by the engineering community for its superior capabilities to more accurately analyze flooding using 2D terrain surfaces as compared to HEC-RAS Version 4.1.3 that only utilized 1D terrain models.

Compared to the GEI 1D modeling which fills each storage area with flood volumes from the lowest elevation upward regardless of the distance, terrain and flow impediments within the storage area, the 2D analysis models the water flowing from the breach location through overland paths before entering into the main system of canals.

- "**With Grandpark" Analysis (also using 2D)**. This alternative is discussed in TM 0039 and is specific to the Grandpark project, and not part of this Cumulative Analysis.
- **Cumulative Conditions Analysis (also using 2D)**. Similar to the Existing Conditions 2D analysis: The addition of a scour pit landside of the levee allowed the full formation of the breach width and depth to match the specifications of the original GEI analysis. From the scour pit flows are spread over the existing ground grades and dispersed into the 2D domains for the interior areas of the Natomas Basin.

  Compared to the GEI 1D modeling which fills each storage area with flood volumes from the lowest elevation upward regardless of the distance, terrain and flow impediments within the storage area, the 2D analysis models the water flowing from the breach location through overland paths before entering into the main system of canals.

## TIME TO FILL TO 1-FOOT DEPTH AT EVACUATION ROUTE LOCATIONS:

As explained in TM 0039 and TM 0040, the duration of time to inundation of 1-foot of flooding over critical roadway locations along the regional evacuation routes within the Natomas Basin during a catastrophic levee breach is analyzed in each breach model. The criteria of 1-foot of inundation is considered the critical factor in moving the public from places of relative danger to locations of relative safety during a flooding event. Using the 2015 assumption set for levee breach formation, this analysis reevaluated the timing to 1-foot of inundation at the eighteen (18) critical evacuation routes within the Natomas Basin that were evaluated in TMs 0039 and 0040.

Oversized exhibits are included at the end of this technical memorandum which present the results of these analyses for each of the 4 alternatives studies for each breach location. They are plotted on top of the original GEI exhibits from the original Study.

For each Evacuation Route location identified in the original mapping, CESI identified the location where the depth would reach 1 foot of inundation depth earliest (the lowest point of the roadway stretch) and retrieved the time to 1-foot of inundation depth for each scenario and breach in hours. The results are summarized in the following tables (Tables 1 through 7) for each of the seven breach locations. These results are also shown on the oversized exhibits included with this TM (Note: On the oversized exhibits, if flooding to a depth of 1 foot over the roadway was not demonstrated in the analysis, the point was removed from the exhibit).

## LEVEE BREACH ANALYSIS RESULTS

In general, the change from 1D to 2D modeling was to provide a more accurate estimate of the timing and depths of flows arriving. The 2D modeling requires the flood flows to travel overland spatially in order to move throughout the basin, whereas the storage area based previous models do not physically model the movement of the flood, except through the connections of the storage areas.

Below are the individual results for the levee breach analyses using the same breach and scour pit assumptions used in the preparation of the 2015 City/county Evacuation Plan.

Remainder of Page Intentionally Left Blank

## BREACH 1

The results of the modeling exercise for Breach 1 are summarized in Table 1 and the text following the table.

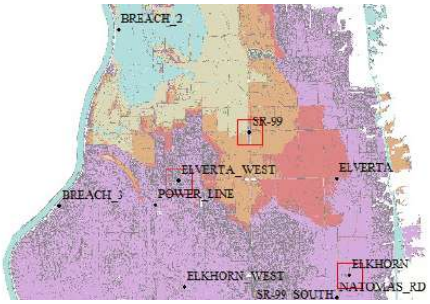

**Table 1**

***BREACH 1: (Natomas Cross Canal Levee Breach Location – C+P Conditions)***

| Evacuation Route Location: | Time to 1ft for 1D GEI Exist Cond. Model (hrs) | Time to 1 ft for 2D Existing Cond. Model (hrs) | Time to 1ft for 2D Cumulative Model (hrs) | Improvement in Timing of 1ft Depth (hrs) |
|---|---|---|---|---|
| SR-99 | 89 | 140 | 127 | -13 |
| ELVERTA | 47 | 99 | 121 | +22 |
| ELKHORN | 38 | 74 | 90 | +16 |
| DEL PASO | 22 | 60 | 69 | +9 |
| I-80 EAST | 31 | 82 | 99 | +17 |
| I-5 CENTRAL | 106 | 170 | 172 | +2 |
| I-5 JUNCTION | 79 | 147 | 155 | +8 |
| I-5 WEST | 73 | 141 | 149 | +8 |
| I-80 WEST | 63 | 112 | 123 | +11 |
| ELKHORN WEST | 73 | 139 | 147 | +8 |
| SR-99 NORTH | 98 | 138 | 115 | -23 |
| SR-99 SOUTH | 135 | 208 | 209 | +1 |
| POWER LINE | 92 | 161 | 167 | +6 |
| ELVERTA WEST | 106 | 157 | 149 | -8 |
| SAN JUAN | 36 | 80 | 115 | +35 |
| EL CAMINO | 36 | 81 | 97 | +16 |
| I-80 CENTRAL | 58 | 103 | 115 | +12 |
| NATOMAS RD | 28 | 55 | 67 | +12 |

1D to 2D model:

For all of the points reviewed there was an increase in the time to the flood depth of 1 foot. The addition of storage contained within the "Scour Pit" directly adjacent to the breach location alters some timing as the scour pit needs to be filled before flooding of the remainder of the Natomas Basin will occur. This filling of the scour pits act to dampen the flow propagation from the levee breach to the land side terrain.

2D to 2D Cumulative Model Changes:

In general, most of the data points show that there is an increased delay in the propagation of the breach flood wave timing as a result of the Cumulative Conditions improvements in the Natomas Basin for Breach 1.

The following three points identify reductions in timing to the depth of 1 foot:

1. SR-99: SR-99 is located near a low point in SR-99 near the northern boundary of the proposed Grandpark project. A reduction in flood depth timing at this location of 13 hours is identified in the modeling (140 hours to 127 hours). The reduction in flood time results from the reduced flood volumes in the northern part of the basin due to the embankments placed for the Sankey Gap storage basin proposed by SAFCA to be constructed with the Sutter Pointe project.

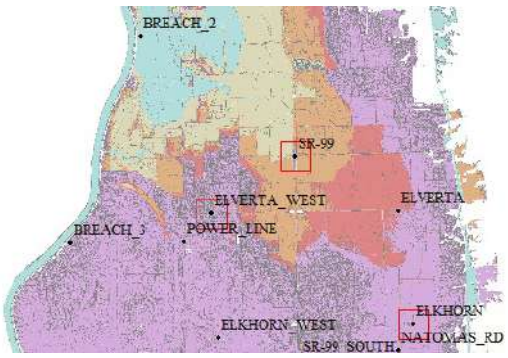
   Also, the proposed culvert crossings within the Grandpark development under Elverta Road restrict how fast flows lower than the street overtopping levels can progress from north of the Grandpark project to south of the project. These culverts are sized for properly reducing potential flooding changes both downstream and upstream of the Grandpark project in the 100-year and 200-year design storms with and without Climate Change being factored, in order to meet Sacramento County and RD-1000 peak flood mitigation requirements.

2. SR-99 NORTH: A reduction in 1 foot flood depth timing at this location of 23 hours is identified in the modeling (138 hours to 115 hours). This roadway low point is at a slightly lower elevation than surrounding data points, so it sees flooding sooner in the Cumulative Event analysis as a result of the Sankey Gap Storage Facility Embankments and Grandpark proposed project culverts under Elverta Road at its crossing of the East Drainage Canal.
3. ELVERTA WEST. A reduction in 1 foot flood depth timing at this location of 8 hours is identified in the modeling (157 hours to 149 hours). This data point is affected by the Sankey Gap storage facility embankments.

The three data points noting a meaningful change in 1 foot flood depth arrival time are in the Northwest quadrant of the basin, where the breach occurs.

Remainder of Page Intentionally Left Blank

## BREACH 2



The results of the modeling exercise for Breach 2 are summarized in Table 2 and the text following the table.

**Table 2**
***BREACH 2 (North Sacramento River Breach Location C+P Conditions)***

| Evacuation Route Location: | Time to 1ft for 1D GEI Exist | Time to 1 ft for 2D Existing Cond. Model (hrs) | Time to 1ft for 2D Cumulative Model (hrs) | Improvement in Timing of 1ft Depth (hrs) |
|---|---|---|---|---|
| SR-99 | 3 | 169 | 65 | -104 |
| ELVERTA | 2 | 39 | 45 | +6 |
| ELKHORN | 2 | 36 | 46 | +10 |
| DEL PASO | 1 | 37 | 47 | +10 |
| I-80 EAST | 1 | 50 | 59 | +9 |
| I-5 CENTRAL | 5 | 166 | 166 | 0 |
| I-5 JUNCTION | 4 | 99 | 111 | +12 |
| I-5 WEST | 4 | 93 | 102 | +9 |
| I-80 WEST | 3 | 66 | 75 | +9 |
| ELKHORN WEST | 4 | 91 | 98 | +7 |
| SR-99 NORTH | 1 | 41 | 41 | 0 |
| SR-99 SOUTH | 8 | 70 | 70 | 0 |
| POWER LINE | 5 | 124 | 136 | +12 |
| ELVERTA WEST | 4 | 187 | 187 | 0 |
| SAN JUAN | 2 | 49 | 58 | +9 |
| EL CAMINO | 2 | 49 | 59 | +10 |
| I-80 CENTRAL | 3 | 61 | 59 | -2 |
| NATOMAS RD | 1 | 33 | 49 | +16 |

1D to 2D model:

For all of the points reviewed there was an increase in the time to the flood depth of 1 foot The addition of storage contained within the "Scour Pit" directly adjacent to the breach location alters some timing as the scour pit needs to be filled before flooding of the remainder of the Natomas Basin will occur. This filling of the scour pit acts to dampen the flow propagation from the levee breach to the land side terrain.

2D to 2D Cumulative Model Changes:

This breach analysis identifies 2 locations where moderate adverse changes to the timing of 1 foot inundation of the evacuation routes would occur at: SR-99 and I-80 CENTRAL.

The breach location is similar to the location of Breach 1, discharging into the Northwest Quadrant of the basin. As a result, the future Sankey Gap storage area reduces available storage in this area below the embankment overtopping elevations. This is demonstrated in the "SR-99" reduced timing to 1 foot of depth. Proposed project culverts in Grandpark also slow the progression of the initial flood wave below Elverta Road overtopping elevations, resulting in a modest acceleration of the flood timing within the northwest quadrant. This is demonstrated in the "I-80 Central" reduced timing to 1ft of depth. The proposed Grandpark project culverts are sized for properly reducing potential flooding changes both downstream and upstream of the Grandpark project in the 100-year and 200-year design storms with and without Climate Change being factored, in order to meet Sacramento County and RD-1000 peak flood mitigation requirements.

Also, adverse timing of 1-hour (-1 hour) is less than the accuracy of this model and, therefore, this reduction in timing to 1-feet depth of flooding is not considered material.

Remainder of Page Intentionally Left Blank

**BREACH 3**

The results of the modeling exercise for Breach 3 are summarized in Table 3 and the text following the table.

**Table 3**

***BREACH 3(Sacramento River Levee Near Elverta Road – C+P Conditions)***

| Evacuation Route Location: | Time to 1ft for 1D GEI Exist Cond. Model (hrs) | Time to 1 ft for 2D Existing Cond. Model (hrs) | Time to 1ft for 2D Cumulative Model (hrs) | Improvement in Timing of 1ft Depth (hrs) |
|---|---|---|---|---|
| SR-99 | 66 | 137 | 137 | 0 |
| ELVERTA | 47 | 78 | 105 | 27 |
| ELKHORN | 43 | 72 | 70 | -2 |
| DEL PASO | 33 | 51 | 53 | +2 |
| I-80 EAST | 40 | 82 | 83 | +1 |
| I-5 CENTRAL | 67 | 170 | 170 | 0 |
| I-5 JUNCTION | 10 | 19 | 19 | 0 |
| I-5 WEST | 9 | 9 | 9 | 0 |
| I-80 WEST | 23 | 37 | 40 | 3 |
| ELKHORN WEST | 4 | 12 | 12 | 0 |
| SR-99 NORTH | 75 | 169 | 167 | -2 |
| SR-99 SOUTH | 129 | 74 | 74 | 0 |
| POWER LINE | 17 | 7 | 7 | 0 |
| ELVERTA WEST | 79 | 191 | 194 | +3 |
| SAN JUAN | 30 | 36 | 54 | +18 |
| EL CAMINO | 30 | 53 | 54 | +1 |
| I-80 CENTRAL | 17 | 36 | 36 | 0 |
| NATOMAS RD | 38 | 64 | 65 | +1 |

1D to 2D model:

POWERLINE And SR-99 SOUTH are the only 2 points with reductions in time to 1 foot for the change from the original 1-D modeling of the existing conditions, to using a 2-D model. These reductions result from flow from the scour location traveling faster to these points than the 1D model showed it took for the storage areas at these locations to fill to above the elevations near these locations.

For all of the remaining points reviewed there was an increase or no change in the time to the flood depth. The addition of storage contained within the "Scour Pit" directly adjacent to the breach location alters some timing as the scour pit needs to be filled before flooding of the remainder of the Natomas Basin will occur. This filling of the scour pit acts to dampen the flow propagation from the levee breach to the land side terrain.

2D to 2D Cumulative Model Changes:

For this breach location scenario, the Cumulative Condition produces similar results to the Existing Conditions model at all locations. The largest reduction in time to flood 1 foot is at ELKHORN and SR-99 NORTH where a 2-hour reduction occurs (72 to 70 hours, and 169 to 167 respectively).

Also, adverse timing of 1-hour (-1 hour) is less than the accuracy of this model and, therefore, this reduction in timing to 1-feet depth of flooding is not considered material.

**BREACH 4**

The results of the modeling exercise for Breach 4 are summarized in Table 4 and the text following the table.

**Table 4**
***BREACH 4 (Sacramento River Levee South of I-5- C+P Conditions)***

| Evacuation Route Location: | Time to 1ft for 1D GEI Exist | Time to 1 ft for 2D Existing Cond. Model (hrs) | Time to 1ft for 2D Cumulative Model (hrs) | Improvement in Timing of 1ft Depth (hrs) |
|---|---|---|---|---|
| SR-99 | 7 | 102 | 102 | 0 |
| ELVERTA | 5 | 75 | 88 | +13 |
| ELKHORN | 4 | 66 | 65 | -1 |
| DEL PASO | 3 | 46 | 48 | +2 |
| I-80 EAST | 4 | 49 | 51 | +2 |
| I-5 CENTRAL | 6 | 93 | 88 | -5 |
| I-5 JUNCTION | 9 | 13 | 14 | +1 |
| I-5 WEST | 6 | 8 | 8 | 0 |
| I-80 WEST | 2 | 32 | 34 | +2 |
| ELKHORN WEST | 9 | 11 | 10 | -1 |
| SR-99 NORTH | 7 | 110 | 115 | +5 |
| SR-99 SOUTH | 1 | 144 | 143 | -1 |
| POWER LINE | 2 | 29 | 28 | -1 |
| ELVERTA WEST | 8 | 112 | 112 | 0 |
| SAN JUAN | 3 | 31 | 30 | -1 |
| EL CAMINO | 3 | 47 | 49 | +2 |
| I-80 CENTRAL | 1 | 31 | 30 | -1 |
| NATOMAS RD | 4 | 58 | 60 | +2 |

1D to 2D model:

For all of the points reviewed there was an increase in the time to the flood depth from the original 1D based analysis to the 2-D based analysis. The increase in timing is the result of the flow having to travel overland to fill areas, as opposed to instantly filling storage areas. The addition of storage contained within the "Scour Pit" directly adjacent to the breach location alters some timing as the scour pit needs to be filled before flooding of the remainder of the Natomas Basin will occur. This filling of the scour pit acts to dampen the flow propagation from the levee breach to the land side terrain.

2D to 2D Cumulative Model Changes:

For this breach location scenario, the Cumulative Conditions produce similar results to the Existing Conditions model at all locations. The largest reduction in time to flood 1 foot is at I-5 CENTRAL

where a 5-hour reduction occurs (93 to 88 hours). This is in an area near the breach location, in which flood storage volumes are reduced by the Sankey Gap storage area embankments.

All other minor changes noted by the analysis are less than 1 hour, which is approximately the rounding error in the results. Also, adverse timing of 1-hour (-1 hour) is less than the accuracy of this model and, therefore, this reduction in timing to 1-feet depth of flooding is not considered material.

## BREACH 5

The results of the modeling exercise for Breach 5 are summarized in Table 5 and the text following the table.

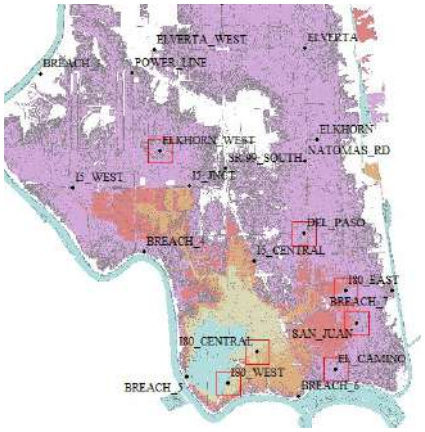


**Table 5**
***BREACH 5 (Sacramento River Levee Near I-80 – C+P Conditions)***

| Evacuation Route Location: | Time to 1ft for 1D GEI Exist Cond. Model (hrs) | Time to 1 ft for 2D Existing Cond. Model (hrs) | Time to 1ft for 2D Cumulative Model (hrs) | Improvement in Timing of 1ft Depth (hrs) |
|---|---|---|---|---|
| SR-99 | 84 | 282 | 282 | 0 |
| ELVERTA | 50 | 123 | 147 | +24 |
| ELKHORN | 39 | 81 | 67 | -14 |
| DEL PASO | 21 | 32 | 30 | -2 |
| I-80 EAST | 21 | 43 | 39 | -4 |
| I-5 CENTRAL | 100 | N/A | N/A | N/A |
| I-5 JUNCTION | 27 | 57 | 67 | +10 |
| I-5 WEST | 19 | 47 | 53 | +6 |
| I-80 WEST | 9 | 12 | 5 | -7 |
| ELKHORN WEST | 57 | 42 | 45 | +3 |
| SR-99 NORTH | 22 | N/A | N/A | N/A |
| SR-99 SOUTH | 99 | N/A | N/A | N/A |
| POWER LINE | 46 | 111 | 111 | 0 |
| ELVERTA WEST | 112 | N/A | N/A | N/A |
| SAN JUAN | 19 | 34 | 34 | 0 |
| EL CAMINO | 19 | 39 | 34 | -5 |
| I-80 CENTRAL | 9 | 12 | 11 | -1 |
| NATOMAS RD | 30 | 55 | 51 | -4 |

N/A= These points do not flood to a depth of 1 foot within the model analysis duration.

1D to 2D model:

For the location of "ELKHORN WEST", the difference in timing of the 1 foot of depth was from 57 hours in the original 1-D analysis to 42 hours in the 2-D analysis. The reduction results from the proximity of the breach to this location, and that flows overland reach this point before all areas within the storage area/2D domain are filled to the elevation that produces 1 foot of depth at this location.

For all of the remaining points reviewed there was an increase in the time to the flood depth. The addition of storage contained within the "Scour Pit" directly adjacent to the breach location alters some timing as the scour pit needs to be filled before flooding of the remainder of the Natomas Basin will occur. This filling of the scour pit acts to dampen the flow propagation from the levee breach to the land side terrain.

2D to 2D Cumulative Model Changes:

The Breach location near the I-80 crossing of the Sacramento River generally shows a small reduction in response time to a 1-foot depth along the I-80 corridor within the southern areas of the basin (Data Points: ELKHORN, DEL PASO, I-80 EAST, I-80 WEST, EL CAMINO, I-80 CENTRAL and NATOMAS RD).

Of note would be the low points in Interstate 80 at I-80 WEST, and I-80 CENTRAL where the response time to flood 1 foot reduces from 12-hours to a 5-hours, and 12 hours to 11-hours respectively, between the 2D Existing and 2D Cumulative Conditions models. The models show there are 2 reasons for the reduction in timing. The most important is that for the 2D Cumulative Condition, the model shows the full breach formation 1 hour and 10 minutes sooner than in the 2D Existing and the 2D Cumulative Conditions per the graph to the right. This generally affects all points and accounts for the general reduction between 1 and 2 hours seen in many of the data point locations.

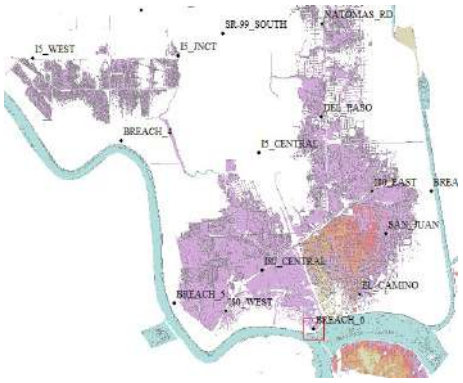
The second reason which additionally affects the 2 I-80 points nearest the breach (I-80 EAST and I-80 CENTRAL) appears to result from the proposed grading at the Upper Westside project. The breach flows would spread out from the breach through the generally flat grades proposed and through the streets which are at lower grades. The result is an overland flooding path to these locations sooner in the event. The Breach 5 location just happens to be directly adjacent to the southern end of the Upper Westside project.

The 2D Cumulative Models do not account for the resistance to the flow spreading effect that would occur due to the construction of buildings, fences and the planting of vegetation and trees. An average friction value is applied over the surface. These future condition items cannot be included in the current modeling as they are still unknown. It is likely that if structures, fences and vegetation are built similar to other developments, they would slow the spread effect.

## BREACH 6

The results of the modeling exercise for Breach 6 are summarized in Table 6 and the text following the table.

**Table 6**



***BREACH 6 (American River Levee Near Confluence With Sacramento River- C+P Conditions)***

| Evacuation Route Location: | Time to 1ft for 1D GEI Exist Cond. Model (hrs) | Time to 1 ft for 2D Existing Cond. Model (hrs) | Time to 1ft for 2D Cumulative Model (hrs) | Improvement in Timing of 1ft Depth (hrs) |
|---|---|---|---|---|
| SR-99 | 53 | 279 | 279 | 0 |
| ELVERTA | 29 | 144 | 144 | 0 |
| ELKHORN | 21 | 9 | 9 | 0 |
| DEL PASO | 10 | 53 | 50 | -3 |
| I-80 EAST | 6 | 72 | 64 | -8 |
| I-5 CENTRAL | 57 | N/A | N/A | N/A |
| I-5 JUNCTION | 17 | 110 | 110 | 0 |
| I-5 WEST | 11 | 76 | 86 | +10 |
| I-80 WEST | 141 | 8 | 8 | 0 |
| ELKHORN WEST | 14 | 67 | 68 | +1 |
| SR-99 NORTH | 61 | N/A | N/A | N/A |
| SR-99 SOUTH | 133 | N/A | N/A | N/A |
| POWER LINE | 31 | 108 | 108 | 0 |
| ELVERTA WEST | 65 | N/A | N/A | N/A |
| SAN JUAN | 4 | 55 | 51 | -4 |
| EL CAMINO | 4 | 57 | 52 | -5 |
| I-80 CENTRAL | 137 | 5 | 4 | -1 |
| NATOMAS RD | 16 | 100 | 88 | -12 |

Note: "N/A" means that the breach event did not report flooding in excess of 1 foot at the data point throughout the model event duration (typical for all Tables).

1D to 2D model:

Three points show reduced timing changes in model for the time to the 1 foot depth. ELKHORN[6] from 21 hours to 9 hours, I-80 WEST from 141 hours to 8 hours, and I-80 CENTRAL from 137 hours to 5 hours. The proximity of the breach location to these locations shows that flooding to a depth of 1 foot would occur due to flood waters propagating to these locations overland before the volumes of the entire storage area/2-D domain fill to the required

[6] ELKHORN as a critical evacuation route appears to have a significantly shorter time to 1 foot than previously analyzed by GEI, Note that this is based on the existing conditions roadway elevations low point. The Grandpark project intends to raise the elevation of this roadway with the project construction such that it would continue to provide adequate evacuation timing.

depth as was analyzed in the original 1-D analysis.

For all of the remaining points reviewed there was an increase in the time to the flood depth. The addition of storage contained within the "Scour Pit" directly adjacent to the breach location alters some timing as the scour pit needs to be filled before flooding of the remainder of the Natomas Basin will occur. This filling of the scour pit acts to dampen the flow propagation from the levee breach to the land side terrain.

2D Existing to 2D Cumulative Model Changes:

For this breach location scenario, the Cumulative Conditions produce similar results to the Existing Conditions model at all locations. The largest reduction in time to flood 1 foot is at NATOMAS ROAD where a 12-hour reduction occurs (100 to 88 hours). This is in an area near to and north of the breach location. All points which show reductions in timing to 1 foot depth are in the south area of the basin, and near where the breach location overland flooding controls the timing to the 1 foot depth instead of the timing to fill all of the storage area/2-D area up to the elevation.

All other minor changes noted by the analysis are less than 1 hour, which is approximately the rounding error in the results.

Also, adverse timing of 1-hour (-1 hour) is less than the accuracy of this model and, therefore, this reduction in timing to 1-feet depth of flooding is not considered material.

**BREACH 7**

The results of the modeling exercise for Breach 7 are summarized in Table 7 and the text following the table.

**Table 7**
***BREACH 7 (NEMDC Levee Near I-80 – C+P Conditions)***

| Evacuation Route Location: | Time to 1ft for 1D GEI Exist Cond. Model (hrs) | Time to 1 ft for 2D Existing Cond. Model (hrs) | Time to 1ft for 2D Cumulative Model (hrs) | Improvement in Timing of 1ft Depth (hrs) |
|---|---|---|---|---|
| SR-99 | 53 | 280 | 295 | +15 |
| ELVERTA | 29 | 57 | 160 | +103 |
| ELKHORN | 21 | 30 | 25 | -5 |
| DEL PASO | 10 | 15 | 15 | 0 |
| I-80 EAST | 6 | 3 | 3 | 0 |
| I-5 CENTRAL | 57 | 31 | N/A | N/A |
| I-5 JUNCTION | 17 | 93 | 89 | -4 |
| I-5 WEST | 11 | 86 | 80 | -6 |
| I-80 WEST | 141 | 48 | 40 | -8 |
| ELKHORN WEST | 14 | 83 | 76 | -7 |
| SR-99 NORTH | 61 | 58 | N/A | N/A |
| SR-99 SOUTH | 133 | 86 | N/A | N/A |
| POWER LINE | 31 | 134 | 124 | -10 |
| ELVERTA WEST | 65 | 55 | N/A | N/A |
| SAN JUAN | 4 | 4 | 3 | -1 |
| EL CAMINO | 4 | 6 | 6 | 0 |
| I-80 CENTRAL | 137 | 36 | 30 | -6 |
| NATOMAS RD | 16 | 22 | 22 | 0 |

Note: "N/A" means that the breach event did not report flooding in excess of 1 foot at the data point throughout the model event duration (typical for all Tables).

This beach location is located along the Natomas East Main Drainage Canal Levee, north of the American River.

1D to 2D model:

Seven points show reduced timing changes in model for the time to the 1 foot depth. I-80 EAST (6 to 3 hours), I-5 CENTRAL(57 to 31 hours), I-80 WEST(141 to 48 hours), SR-99 NORTH(61 to 58 hours), SR-99 SOUTH (133 to 86 hours), ELVERTA WEST(65 to 55 hours), and I-80 CENTRAL(137 to 36 hours).

The I-80 EAST location is close to the model breach location and the difference can be

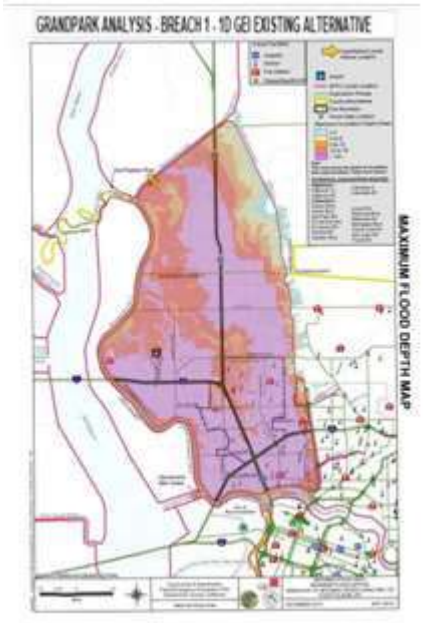
explained by the previous use of storage areas methodology compared to the overland 2D flooding methodology. In the previous methodology all of the above ground storage within a storage area has to be filled by the breach flows to a certain elevation. In the 2D model, the flood propagates overland, and the flood flows themselves have depth as the flood wave is spread throughout the basin. In this case the breach flows themselves achieve the 1 foot depth at these locations well before low areas in this quadrant are filled.

The other locations are similarly showing changes as a result of improved flow path analysis of the 2D model v. the storage fills from the bottom up previous methodology.

For all of the remaining points reviewed there was an increase in the time to the flood depth. The addition of storage contained within the "Scour Pit" directly adjacent to the breach location alters some timing as the scour pit needs to be filled before flooding of the remainder of the Natomas Basin will occur. This filling of the scour pit acts to dampen the flow propagation from the levee breach to the land side terrain.

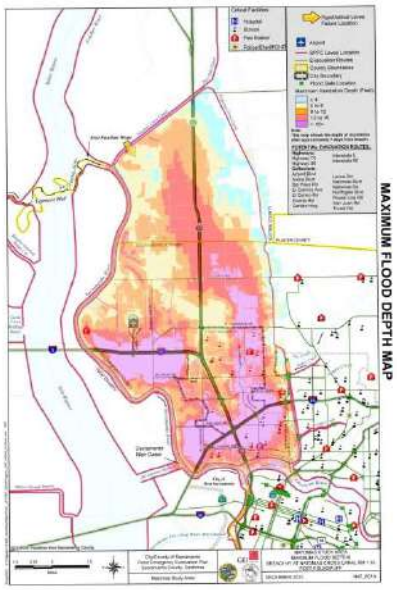
2D to 2D Cumulative Model Changes:

In general, the Cumulative analysis shows a reduction in flood response timing to a depth of 1 foot in the southern areas of the basin. Along the I-80 corridor, for example, reductions of 86 to 80 hours (I-5 WEST), 48 to 40 hours (I-80 WEST) and 36 to 30 hours(I-80 CENTRAL) are estimated by the modeling. Later in the event, points ELKHORN, I-5 JCNT, ELKHORN WEST, POWER LINE and SAN JUAN ROAD show similar reductions in timing.



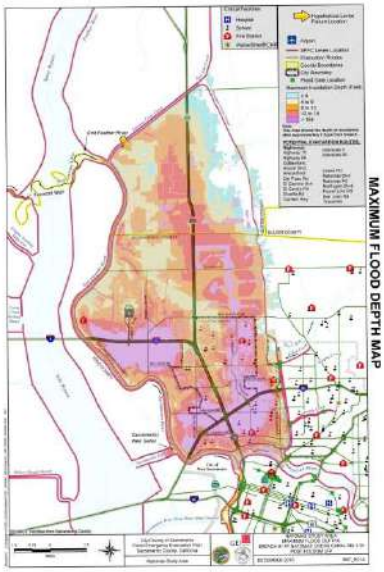
These changes result from the proposed Grandpark project culverts under Elverta Road restricting low flows below their roadway overtopping elevations along the East Drainage Canal in a South to North direction These culverts are sized for properly reducing potential flooding changes both downstream and upstream of the Grandpark project in the 100-year, 200-year design storms with and without Climate Change being factored, in order to meet Sacramento County and RD-1000 peak flood mitigation requirements.

Also, adverse timing of 1-hour (-1 hour) is less than the accuracy of this model and, therefore, this reduction in timing to 1-feet depth of flooding is not considered material.



## MAXIMUM INUNDATION DEPTH:

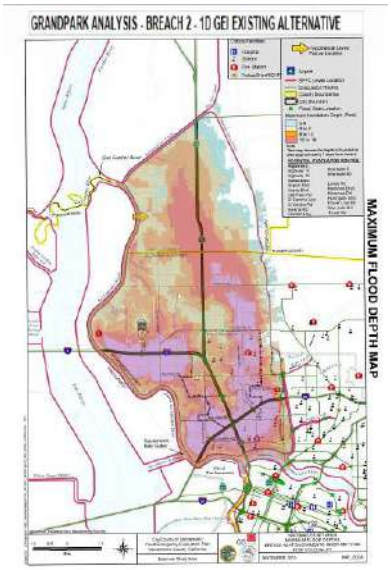
Following is a comparison of the Maximum Inundation Depth computed for each breach scenario under each analysis. Oversized versions of these exhibits are presented at the end of this Technical Memorandum.



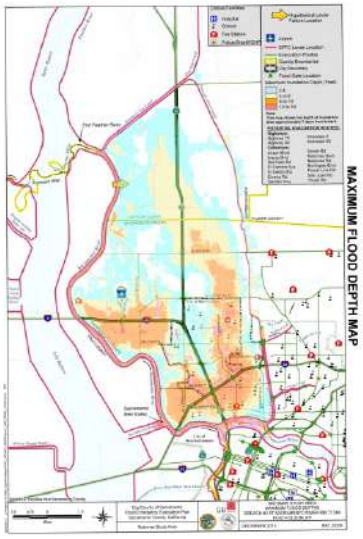
### BREACH 1: (Cross Canal Levee Breach Location- C+P Conditions)

BREACH 1 – 1D EX MAX DEPTH

BREACH 1 – 2D EX MAX DEPTH

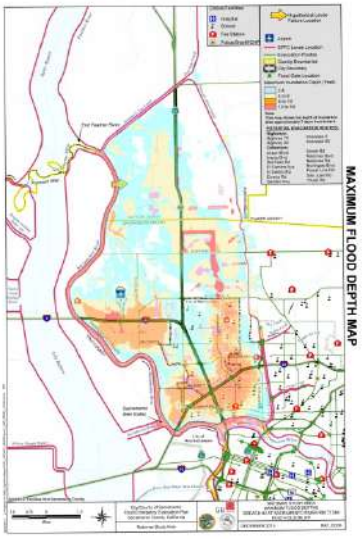


BREACH 1 – 2D CUMUL MAX DEPTH



For the Breach 1 scenario, the results are similar except as follows:

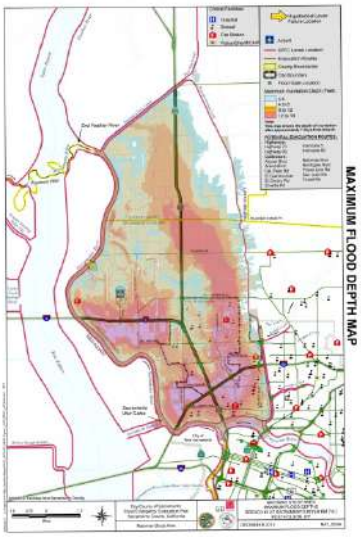
- The 1D analysis floods to a greater depth than the 2D analysis.
- The existing conditions 1D analysis does not show the Sankey Gap spill path. This is because of how storage areas are represented in the 1D model.
- Grading for the embankments at the Sankey Gap flood storage facility block the flood progression until the embankments are overtopped. This causes the northwest quadrant to have less flood volume initially than the existing conditions analysis.
- Grading within the Cumulative developments shows some differences, such as lower depths where embankments are proposed and higher depths at proposed detention basins.



**BREACH 2: (North Sacramento River Breach Location- C+P Conditions)**

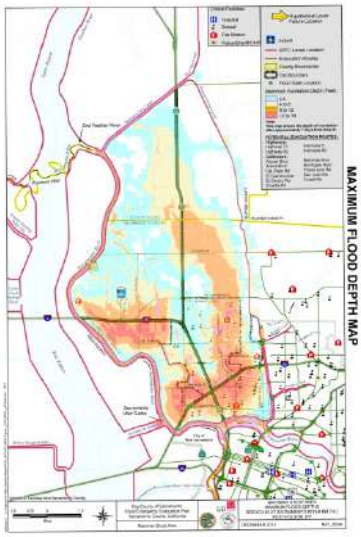
BREACH 2 – 1D EX MAX DEPTH

BREACH 2 – 2D EX MAX DEPTH



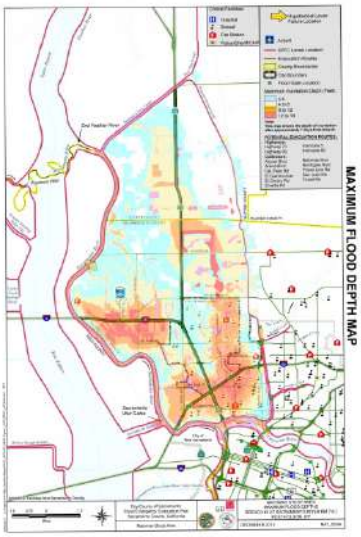
BREACH 2 – 2D CUMUL MAX DEPTH

For the Breach 2 scenario, all results report a similar final flooding depth with the exception of:



- The 1D analysis floods to a greater depth than the 2D analysis
- The existing conditions 1D analysis does not show the Sankey Gap spill path. This is because of how storage areas are represented in the 1D model.
- Grading for the embankments at the Sankey Gap flood storage facility block the flood progression until the embankments are overtopped. This causes the northwest quadrant to have less flood volume initially than the existing conditions analysis.
- Grading within the Cumulative developments shows some differences, such as lower depths where embankments are proposed and higher depths at proposed detention basins.

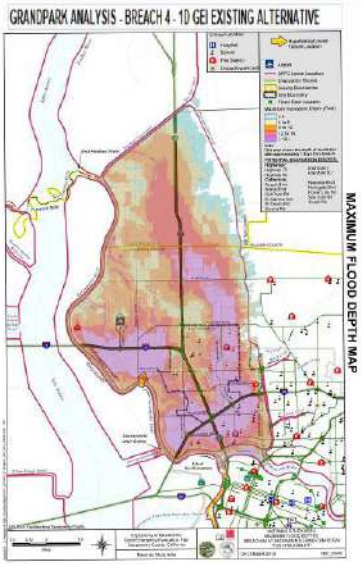
Remainder of Page Intentionally Left Blank

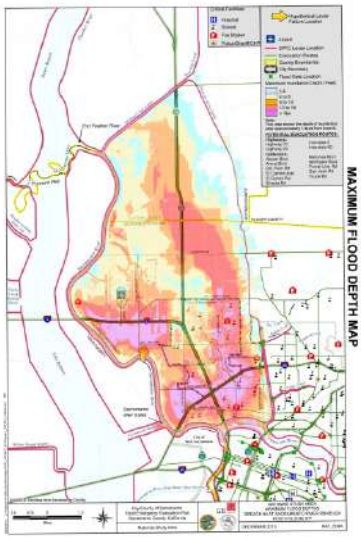


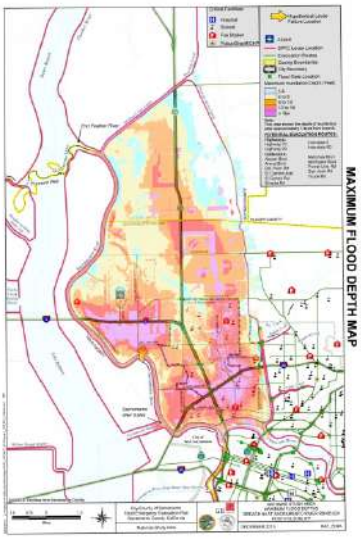
**BREACH 3: (Sacramento River Levee Near Elverta Road- C+P Conditions)**

BREACH 3 – 1D EX MAX DEPTH

BREACH 3 – 2D EX MAX DEPTH





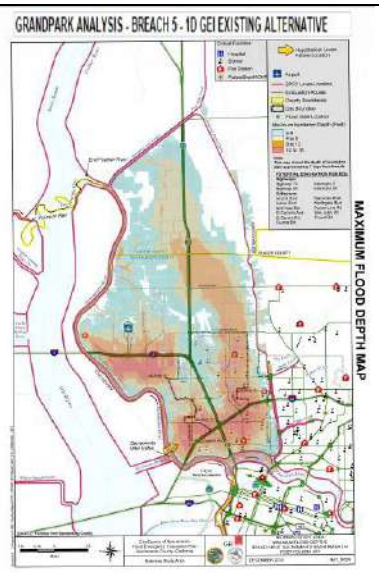


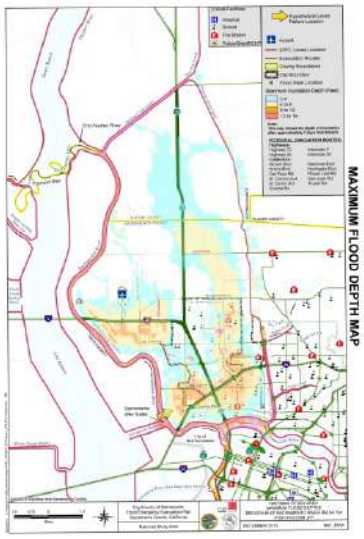
BREACH 3 – 2D CUMUL MAX DEPTH

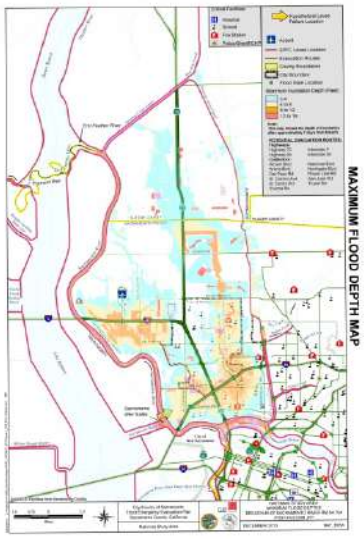
For the Breach 3 scenario, all results report a similar final flooding depth with the exception of:

- The 1D analysis floods to a greater depth than the 2D analysis.
- The existing conditions 2D analysis showed similar maximum flooding depth as shown in the 1D analysis. Since the depth of the breach in the 2D analysis is somewhat less than that shown in the 1D analysis, the resulting breach flows are not materially less than those shown in the 2D analysis, and the resulting maximum depth of flooding is relatively unchanged from the 1D to the 2D analysis.
- The existing conditions 1D analysis does not show the Sankey Gap spill path. This is because of how storage areas are represented in the 1D model.
- Grading for the embankments at the Sankey Gap flood storage facility block the flood progression until the embankments are overtopped. This causes the northwest quadrant to have less flood volume initially than the existing conditions analysis.
- Grading within the Cumulative Developments shows some differences, such as lower depths where embankments are proposed and higher depths at proposed detention basins.

**BREACH 4: (Sacramento River Levee South of I-5- C+P Conditions)**







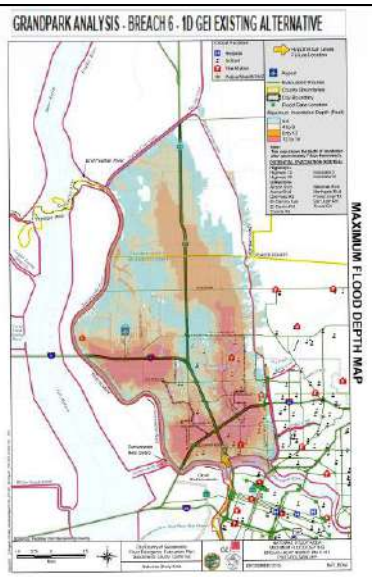
| | | |
|---|---|---|
|  |  |  |
| BREACH 4 – 1D EX MAX DEPTH | BREACH 4 – 2D EX MAX DEPTH | BREACH 4 – 2D CUMUL MAX DEPTH |

For the Breach 4 scenario, all results report a similar final flooding depth with the exception of:

- The 1D analysis floods to a greater depth than the 2D analysis.
- The existing conditions 1D analysis does not show the Sankey Gap spill path. This is because of how storage areas are represented in the 1D model.
- Grading within the Cumulative developments shows some differences, such as lower depths where embankments are proposed and higher depths at proposed detention basins.

Remainder of Page Intentionally Left Blank

**BREACH 5: (Sacramento River Levee Near I-80 - C+P Conditions)**



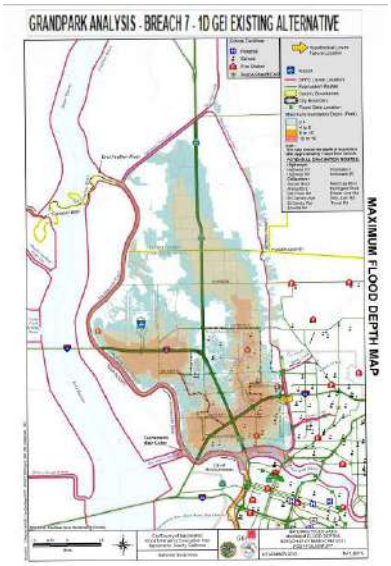
| | | |
|---|---|---|
|  |  |  |
| BREACH 5 – 1D EX MAX DEPTH | BREACH 5 – 2D EX MAX DEPTH | BREACH 5 – 2D CUMUL MAX DEPTH |

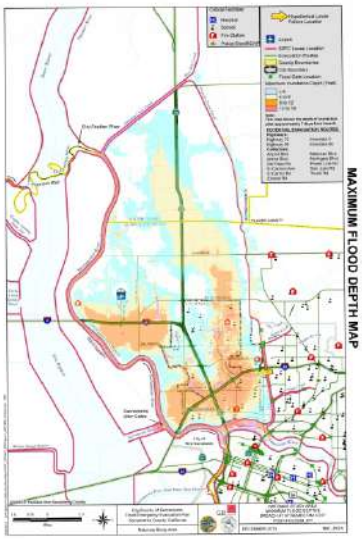
For the Breach 5 scenario, all results report a similar final flooding depth with the exception of:

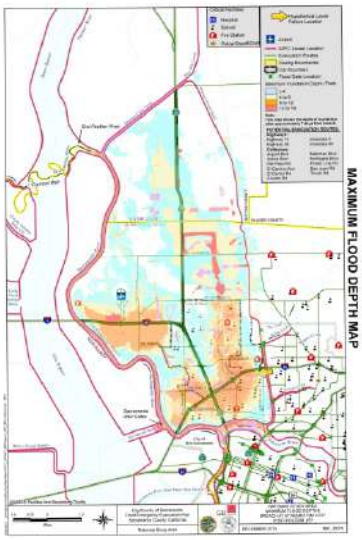
- The 1D analysis floods to a greater depth than the 2D analysis
- The existing conditions 1D analysis does not show the Sankey Gap spill path. This is because of how storage areas are represented in the 1D model.
- Grading within the Cumulative developments shows some differences, such as lower depths where embankments are proposed and higher depths at proposed detention basins.

Remainder of Page Intentionally Left Blank

**BREACH 6 (American River Levee Near Confluence With Sacramento River – C+P Conditions):**







| | | |
|---|---|---|
|  |  |  |
| BREACH 6 – 1D EX MAX DEPTH | BREACH 6 – 2D EX MAX DEPTH | BREACH 6 – 2D CUMUL MAX DEPTH |

For the Breach 6 scenario, for the 2D analyses report a similar final flooding depth. However:

- The 1D analysis floods to a greater depth than the 2D analysis.
- The existing conditions 1D analysis showed a much higher maximum flooding depth than the 2D analysis. This is result of greater breach flows being allowed through a deeper breach in the 1D model as compared to the 2D model resulting in the reduced maximum depth of flooding from the 2D analysis.
- The existing conditions 1D analysis does not show the Sankey Gap spill path. This is because of how storage areas are represented in the 1D model.
- Grading within the Cumulative developments shows some differences, such as lower depths where embankments are proposed and higher depths at proposed detention basins.
- Due to available flood capacity within the Grand Parkway, lower maximum flood depths occur within the southwestern areas and areas north of Elkhorn Blvd.

Remainder of Page Intentionally Left Blank

## BREACH 7 (NEMDC Levee Near I-80 – C+P Conditions)

| | | |
|---|---|---|
|  |  |  |
| BREACH 7 – 1D EX MAX DEPTH | BREACH 7 – 2D EX MAX DEPTH | BREACH 7 – 2D CUMUL MAX DEPTH |

For the Breach 7 scenario, all results report a similar final flooding depth with the exception of:

- The 2D analysis floods to a slightly greater depth than the 1D Analysis (0.10 feet to 0.15 feet greater depth depending upon location within the Natomas Basin. This slight increase is within modeling tolerances and is not deemed material for purposes of this analysis).
- The existing conditions 1D analysis does not show the Sankey Gap spill path. This is because of how storage areas are represented in the 1D model.
- Grading within the Cumulative developments shows some differences, such as lower depths where embankments are proposed and higher depths at proposed detention basins.

Remainder of Page Intentionally Left Blank

## MAXIMUM STAGE OF FLOODING COMPARISON

A comparison of Maximum Flooding Water Surface Elevations for the Grandpark and Upper Westside Development Areas, by breach scenario is shown in Table 8. For this table the location of the East Drainage Canal Crossing of Elverta Road was selected for the Grandpark project, and a central point within the Upper Westside project was selected.

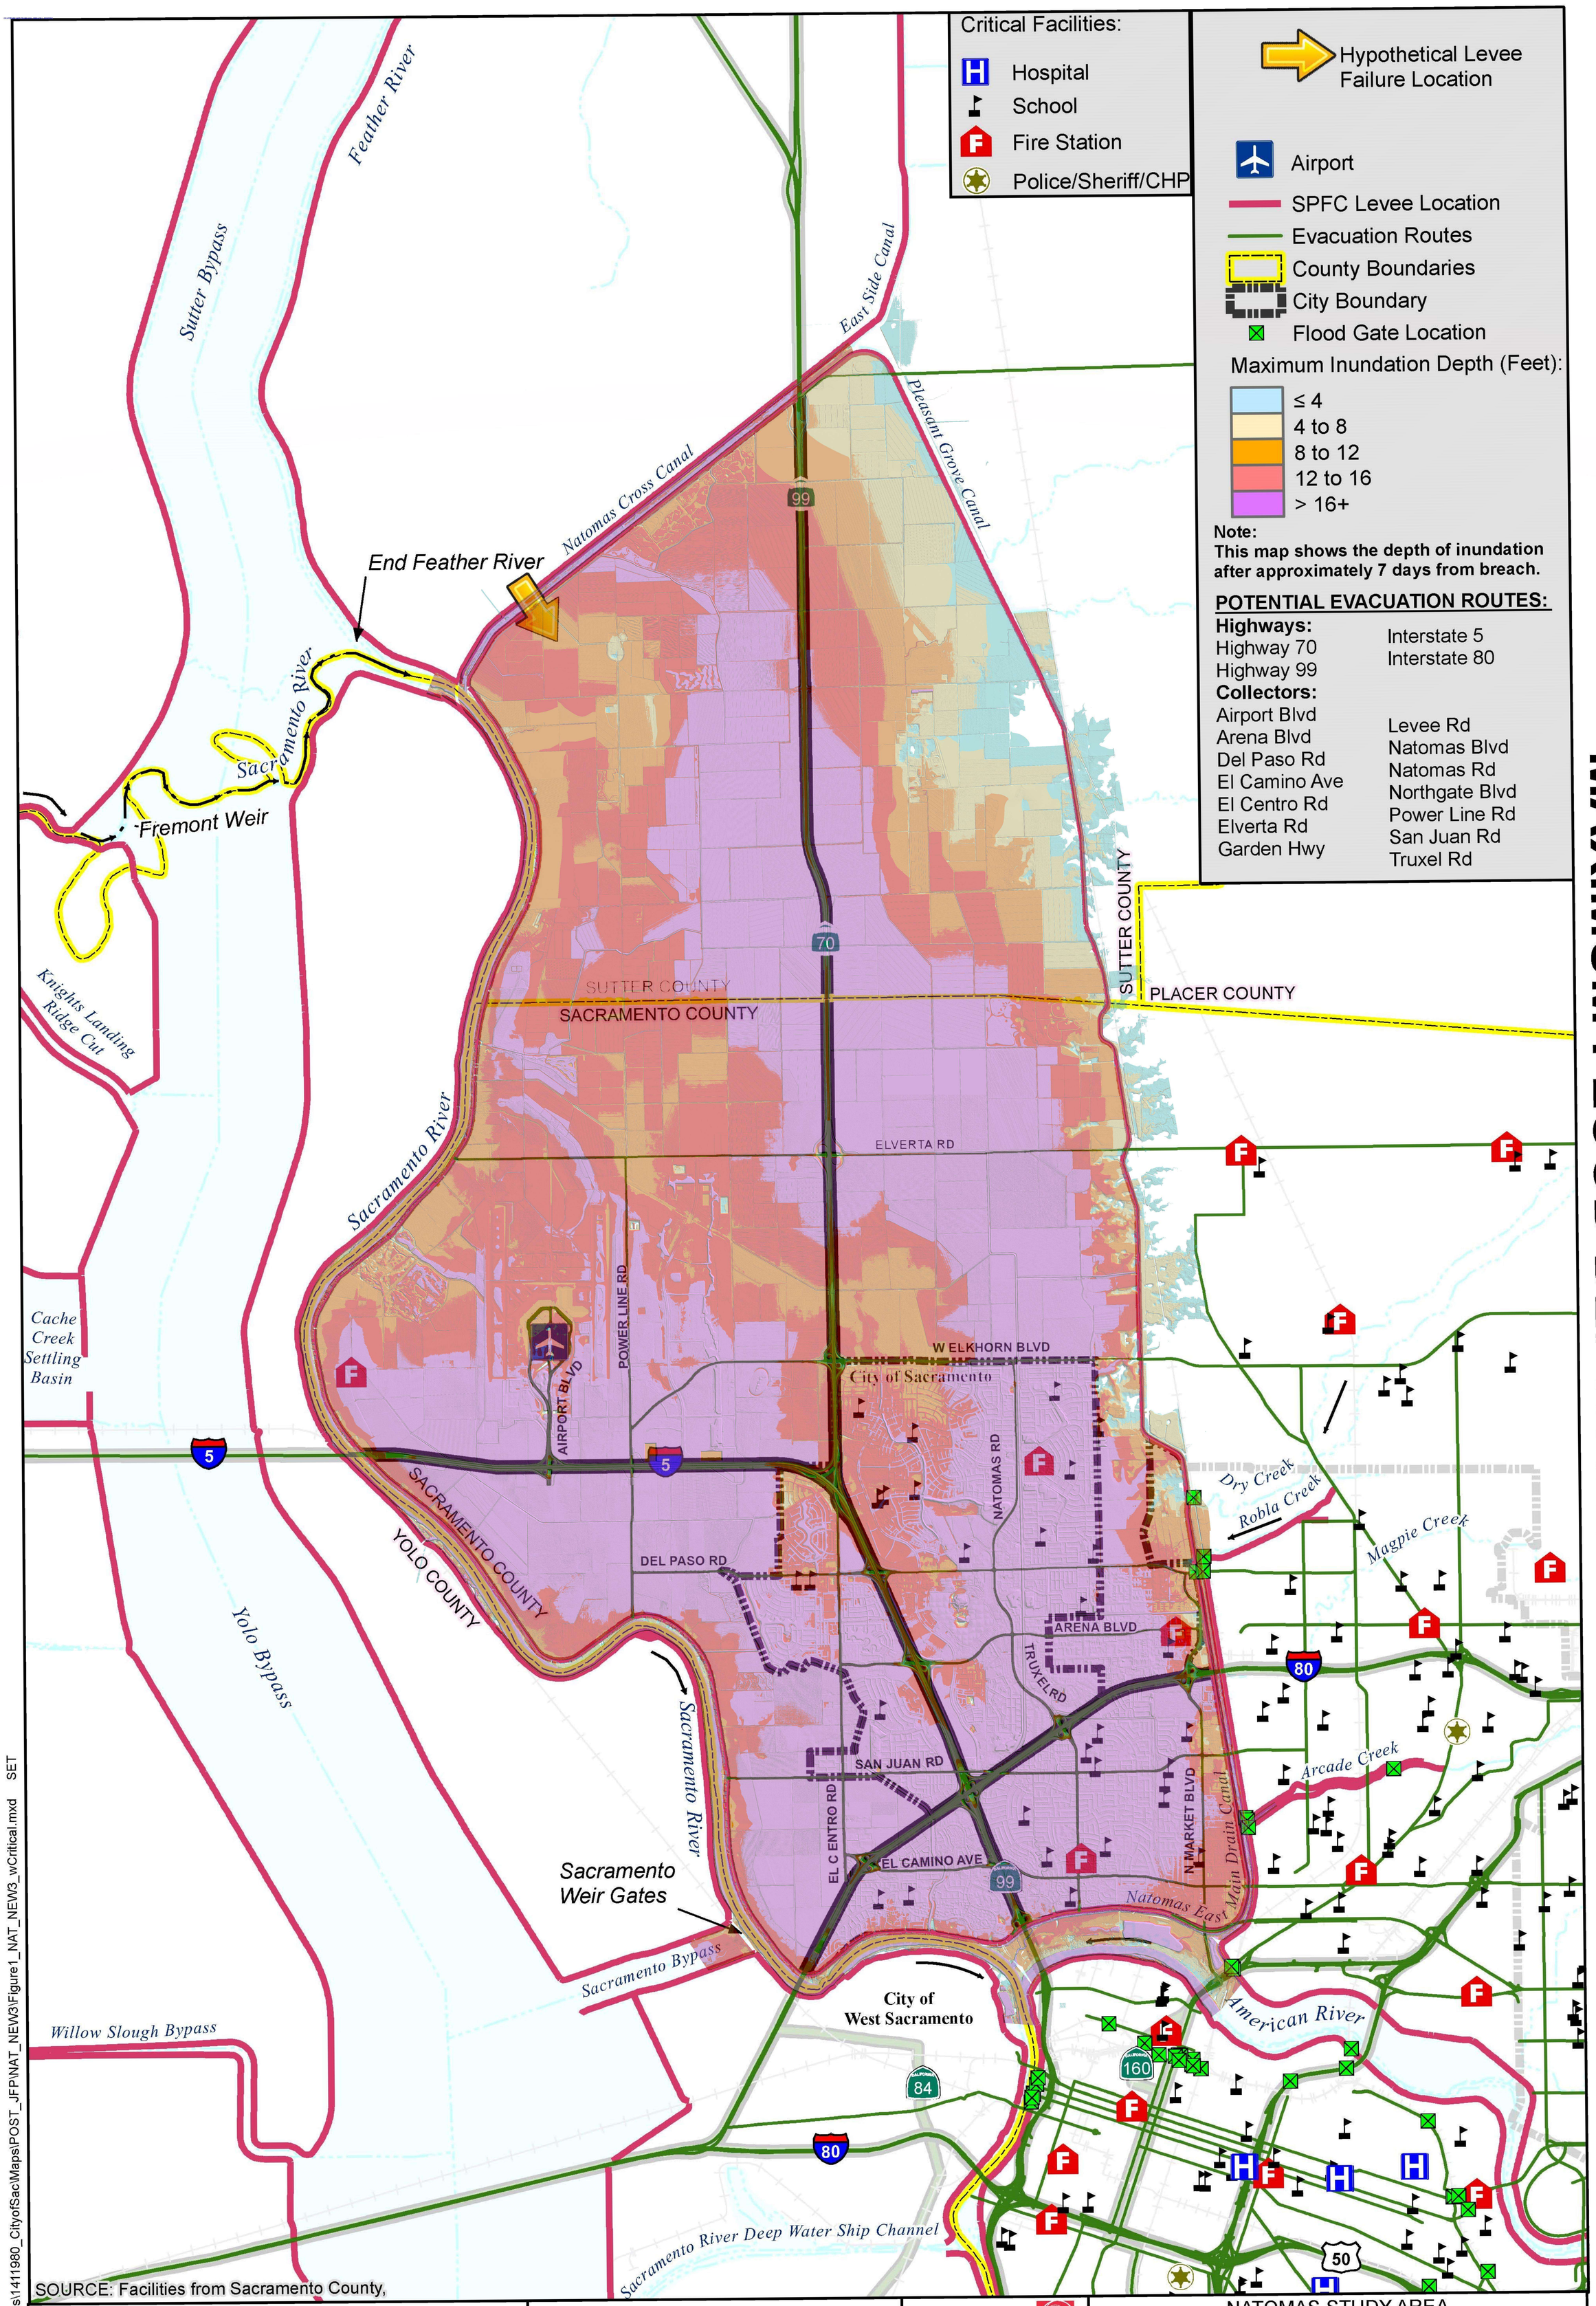
**TABLE 8**
**Maximum Flooding Water Surface Elevations**
(Existing v. Cumulative Conditions)

| BREACH SCENARIO | GEI 1D Existing | UWS Existing | UWS Cumulative | Grandpark Existing | Grandpark Cumulative |
|---|---|---|---|---|---|
| 1 – Natomas Cross Canal | 37.56 | 31.66 | 31.66 | 31.66 | 31.66 |
| 2 – Sac. River North | 31.80 | 23.81 | 23.84 | 23.81 | 23.84 |
| 3 – Sac River North Central | 29.19 | 24.95 | 24.96 | 24.95 | 24.96 |
| 4 – Sac River Central. | 32.28 | 29.60 | 29.61 | 29.60 | 29.61 |
| 5 – Sac River South | 26.29 | 20.64 | 20.91 | 20.64 | 20.91 |
| 6 – American River | 27.06 | 18.21 | 18.38 | 18.21 | 18.38 |
| 7 – NEMDC | 23.16 | 23.29 | 23.31 | 23.29 | 23.31 |

As shown in Table 8, one can easily conclude that, for all intents and purposes, grading of the Upper Westside and Grandpark projects (and other Cumulative projects included in the analysis) is generally accomplished on a "net-zero" impact basis to total potential flooding in a levee breach. That is to say, grading of the project will result in "balanced" on-site grading plans – with little or no import or export of dirt from or into the Natomas Basin thus having minimal adverse effect on the maximum flood stage within the Natomas Basin.

Accordingly, flood storage volumes and their aerial distribution within the Natomas Basin have and will remain relatively unchanged over time. While localized, minor changes in the aerial extent of catastrophic flooding may occur on a project-by-project basis, the distribution of maximum depth of flooding on a basin-wide basis will not vary measurably over time.

The peak timing of the maximum depth of flooding within the basin will sometimes occur at a time closer to the peak timing of the flood outside the basin. Sometimes, these two peaks will occur at times more distant. The peak flooding of the all breach scenarios occurs after the peak flooding in the exterior river system in all breach scenarios studied herein. Thus when the timing becomes shorter, a higher peak stage in the basin will occur and when the peak timing within the basin is more delayed the peak stage inside the basin at equilibrium with the exterior rivers will show as being reduced.



Remainder of Page Intentionally Left Blank

**CONCLUSIONS:**

1. The addition of a scour pit did allow the levee breach to form to the full depth and height. However, this change in the model did not increase the amount of flow significantly to the interior of the basin.
2. The review of landside nearby lowest elevations that the breach could flow to as an exit from the weir location did contribute to some higher flow rates in a few areas.
3. The addition of a scour pit delayed some flow delivery and reduced overall peak flows. This is likely because during the breach formation, the scour pit would form at a water surface below the exterior river water surface as there are head losses for the flow passing through the breach. The lower water surface elevation of the scour pit delivering water to the landside terrain therefore had less potential energy to drive the flood waters to spill over the terrain. Also because the scour pit flood elevation is above the adjacent terrain elevations, the head differential from outside the basin to the inside basin (at the Scour Pit) is reduced (less than the difference from the outside water surface to the lowest elevation in the storage area. Also, because the scour pit flood elevation is above the terrain elevations, the head to drive flood waters through which the breach operates was less than when near submergence was modeled
4. The changes to the model generally resulted in less flooding depths and longer flood timings for all breach locations studied. This suggests that for total flow and timing, the importance of the breach formation depths was not as significant as the elevations of the landside terrain the flood waters eventually have to pass over after passing through a breach and scour pit.
5. Finally the changes in timing in the two 2D models, Existing Conditions and Cumulative Conditions stayed similar to the previous analysis and was not sensitive the issues raised in the GEI Comments.

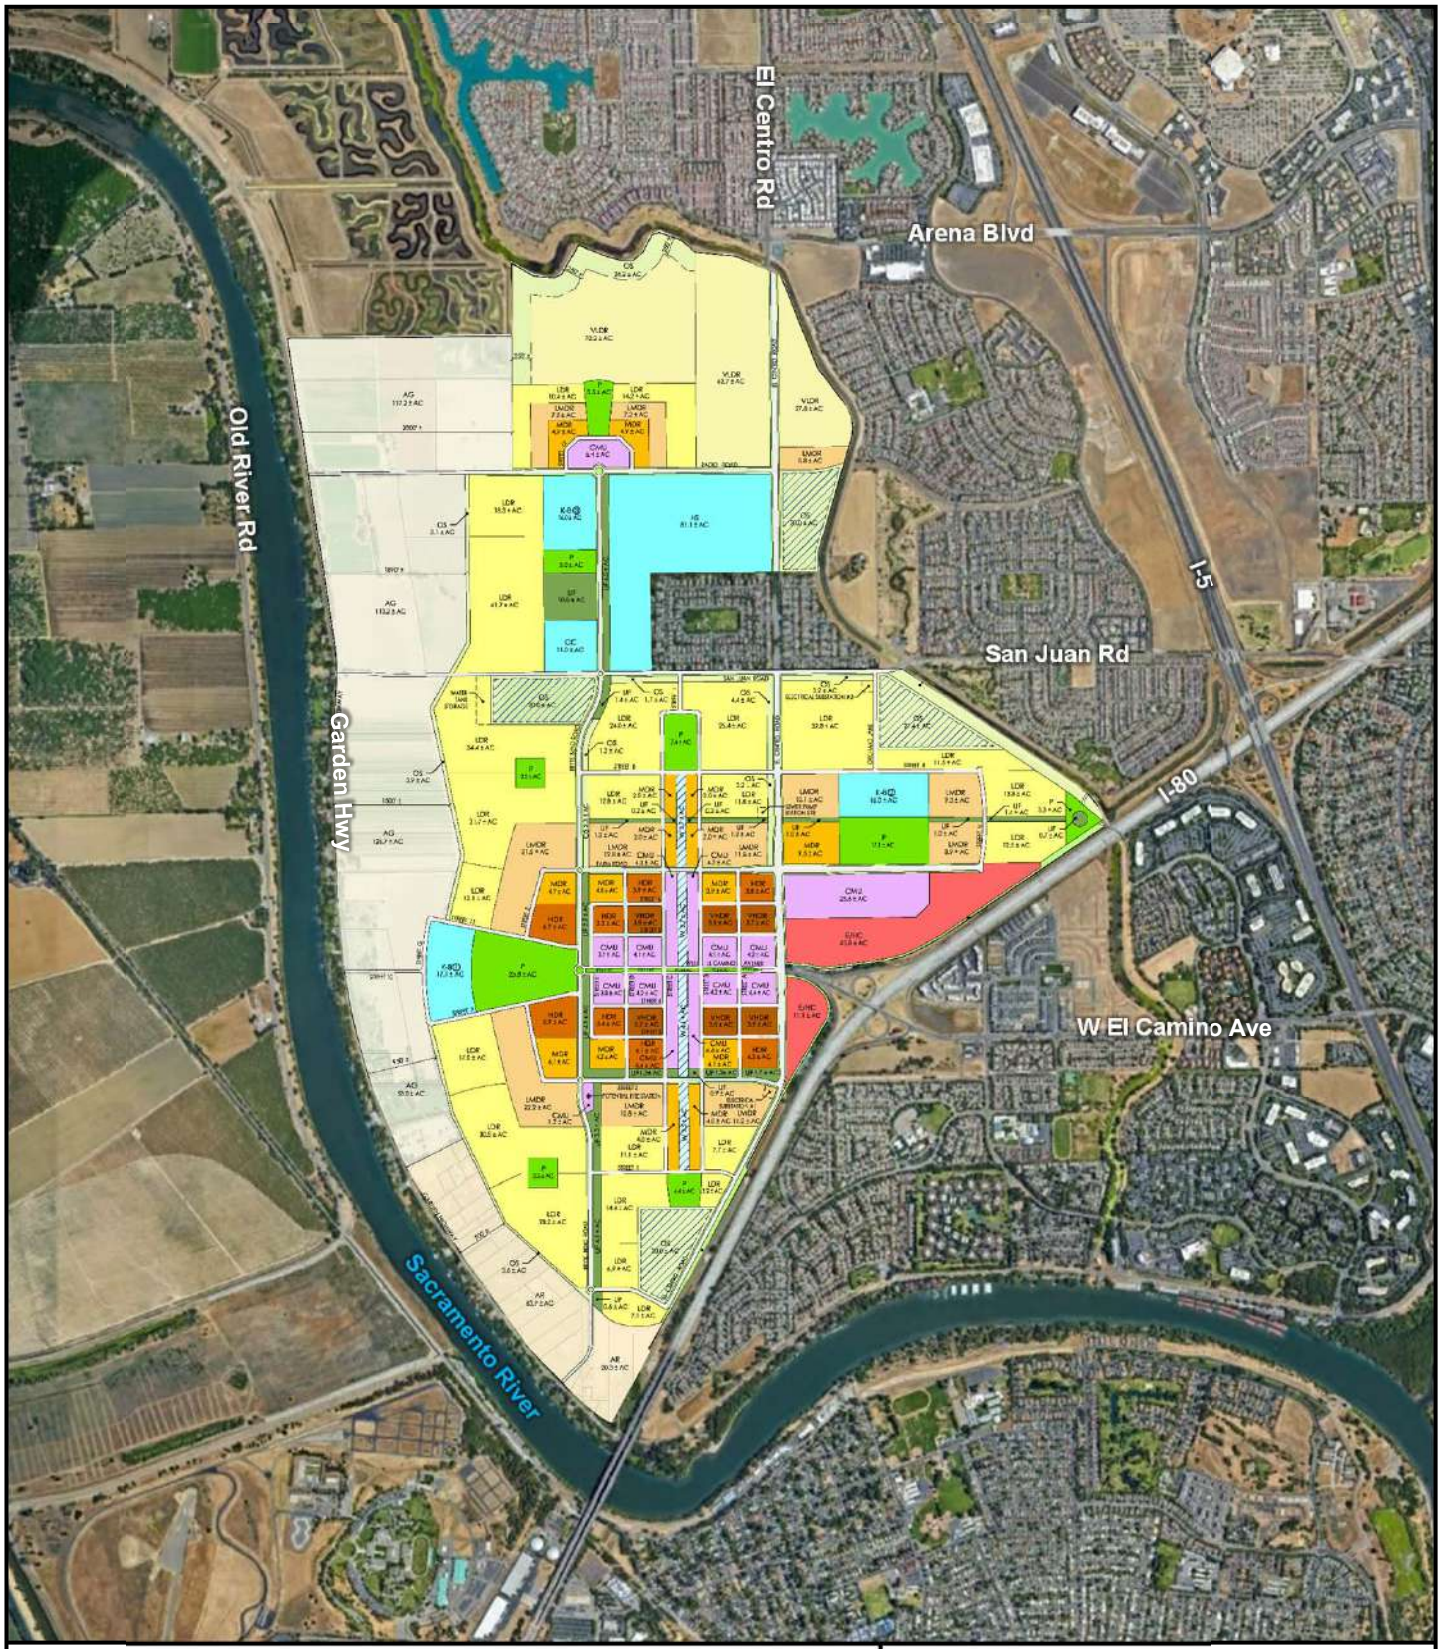
# Introduction

The Upper Westside Specific Plan (Project) area encompasses approximately 2,066 acres adjacent to and directly west of the communities of North and South Natomas in Sacramento County, California. The Project area is bounded by Interstate 80 (I-80) to the south and east, Witter Canal and Fisherman's Lake/Slough to the northeast, and Garden Highway to the west. The Project area is currently zoned primarily for agricultural uses. The project consists of the rezoning and development of a mixed-use community containing residential uses of various densities, commercial, commercial/residential mixed-use, school, park, agricultural and open space uses. The project area location and preliminary project land use plan are shown on Figures 1 and 2, respectively.

Bollard Acoustical Consultants, Inc. (BAC) was retained by the project applicant to prepare this noise and vibration evaluation for the project. The specific objectives of this evaluation are provided in the following section.

# Objectives of This Analysis

The objectives of this analysis are as follows:



- To provide background information pertaining to the effects of noise & vibration.
- To identify existing sensitive land uses in the project area vicinity.
- To quantify existing ambient noise levels and identify ambient sources of vibration at those nearest noise-sensitive land uses.
- To identify the Sacramento County noise & vibration standards which would be most applicable to this project.
- To predict project-related noise & vibration levels at off-site sensitive areas, and to compare those levels against the applicable noise & vibration standards per California Environmental Quality Act (CEQA) guidelines.
- To evaluate consistency of the sensitive land proposed uses within the project area with Sacramento County General Plan noise and vibration standards.
- To recommend mitigation, as necessary, to ensure compliance with the applicable project noise & vibration standards.
- To summarize the results of this analysis into a report for eventual use in the development of the project environmental documents.

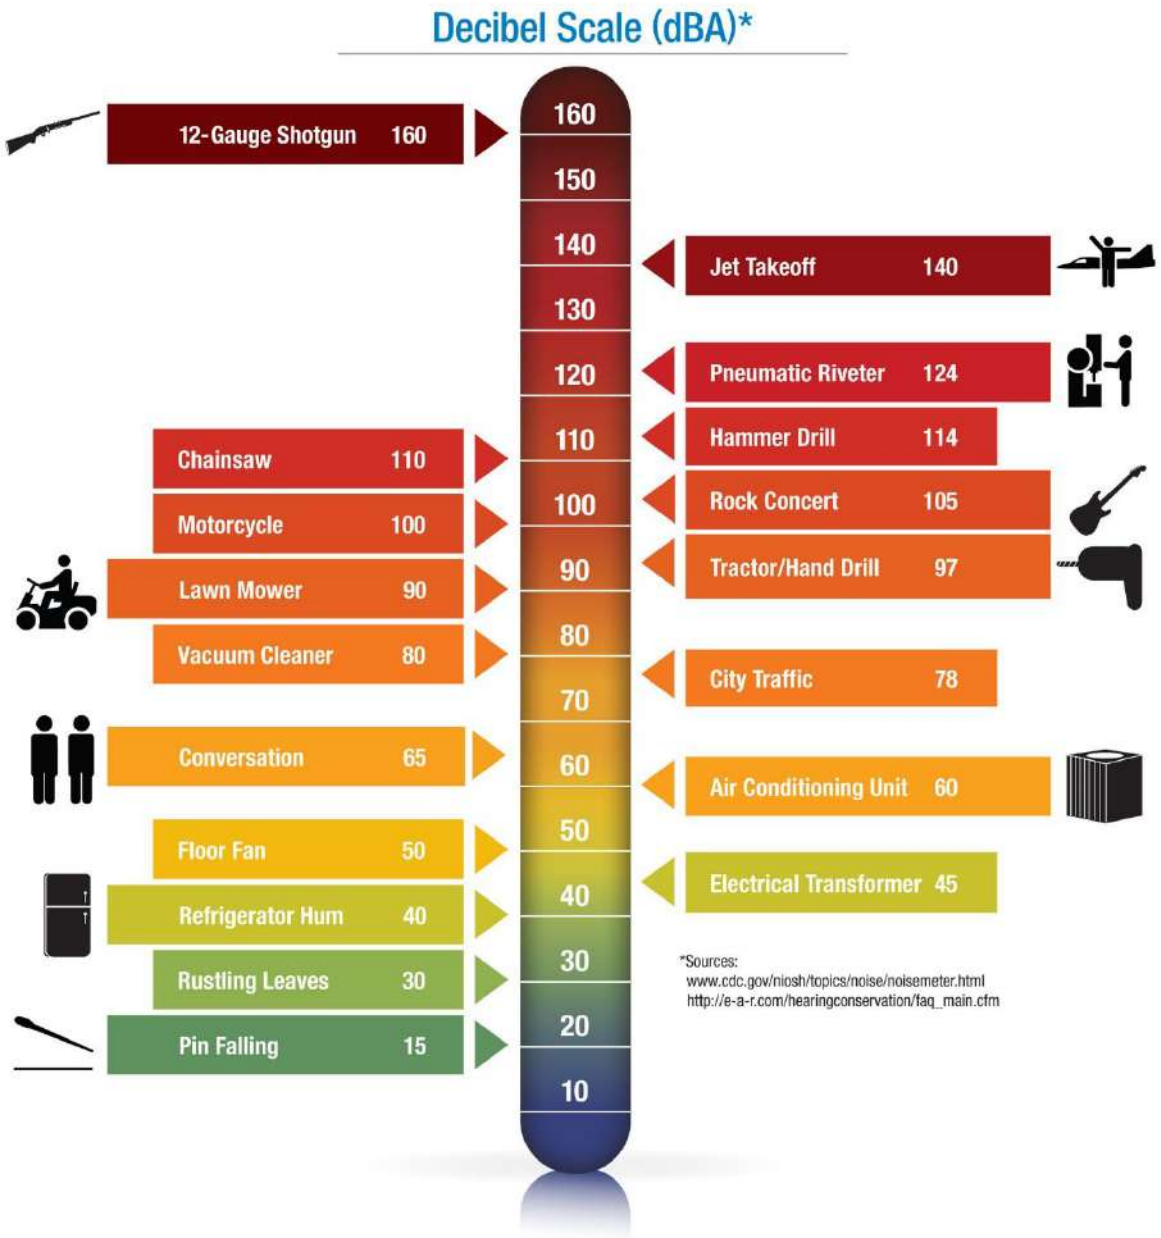
# Noise Fundamentals & Terminology

## General

Noise is often described as unwanted sound. Sound is defined as any pressure variation in air that the human ear can detect. If the pressure variations occur frequently enough (at least 20 times per second), they can be heard and are designated as sound. The number of pressure variations per second is called the frequency of sound and is expressed as cycles per second, or Hertz (Hz). Definitions of acoustical terminology are provided in Appendix A.



Measuring sound directly in terms of pressure would require a very large and awkward range of numbers. To avoid this, the decibel scale was devised. The decibel scale uses the hearing threshold (20 micropascals of pressure) as a point of reference, defined as 0 dB. Other sound pressures are then compared to the reference pressure, and the logarithm is taken to keep the numbers in a practical range. The decibel scale allows a million-fold increase in pressure to be expressed as 120 dB. Another useful aspect of the decibel scale is that changes in decibel levels correspond closely to human perception of relative loudness. Noise levels associated with common noise sources are provided in Figure 3.

## A-Weighting and Noise Metrics

The perceived loudness of sounds is dependent upon many factors, including sound pressure level and frequency content. However, within the usual range of environmental noise levels, perception of loudness is relatively predictable and can be approximated by filtering the frequency response of a sound level meter by means of the standardized A-weighting network. There is a strong correlation between A-weighted sound levels (expressed as dBA) and community response to noise. For this reason, the A-weighted sound level has become the standard tool of environmental noise assessment. All noise levels reported in this section are in terms of A-weighted levels.

Community noise is commonly described in terms of the ambient noise level, which is defined as the all-encompassing noise level associated with a given noise environment. A common statistical tool to measure the ambient noise level is the average, or equivalent, sound level ($L_{eq}$). The $L_{eq}$ is the foundation of the day-night average noise descriptor, DNL (or $L_{dn}$), and shows very good correlation with community response to noise. DNL is based on the average noise level over a 24-hour day, with a +10-decibel weighting applied to noise occurring during nighttime (10:00 PM to 7:00 AM) hours. The nighttime penalty is based on the assumption that people react to nighttime noise exposures as though they were twice as loud as daytime exposures. Because DNL represents a 24-hour average, it tends to disguise short-term variations in the noise environment.

**Figure 3**
**Noise Levels Associated with Common Noise Sources**

The Sacramento County General Plan utilizes DNL for the assessment of noise generated by traffic and railroad noise sources. For aircraft, the County General Plan utilizes the Community Noise Equivalent Level (CNEL), to describe noise exposure. For non-transportation noise sources, the County General Plan utilizes both median (L50) and single-event maximum ($L_{max}$) metrics.

In addition to applying the applicable County noise standards to this Project, the California Environmental Quality Act (CEQA) requires that noise impacts be assessed relative to ambient noise levels that are present without the project. As a result, ambient noise surveys were conducted, and comparisons of Project to No-Project noise levels were used to assess noise

impacts. Specifically, in additional to evaluating changes in traffic noise levels in terms of $L_{dn}$, single-event maximum ($L_{max}$) noise levels and hourly median ($L_{50}$) noise levels were compared for non-transportation noise sources, both with and without the project.

It should be noted that audibility is not a test of significance according to CEQA. If this were the case, any project which added any audible amount of noise to the environment would be considered unacceptable according to CEQA. Because every physical process creates noise, whether by the addition of a single vehicle on a roadway, or by a tractor in an agricultural field, the use of audibility alone as significance criteria would be unworkable. Under CEQA, a significant impact may occur when there is a substantial increase in noise levels, not simply an audible change. The discussion of what constitutes a substantial change in noise environments, both existing and cumulative, is provided in the Regulatory Setting section of this report.

## Effects of Noise on People

The effects of noise on people can be divided into three categories:

1. Subjective effects of annoyance, nuisance, dissatisfaction;
2. Interference with activities such as speech, sleep, and learning; and
3. Physiological effects such as hearing loss or sudden startling.

Environmental noise typically produces effects in the first two categories. Workers in industrial plants can experience noise in the third category. There is no completely satisfactory way to measure the subjective effects of noise, or the corresponding reactions of annoyance and dissatisfaction. A wide variation in individual thresholds of annoyance exists, and different tolerances to noise tend to develop based on an individual's past experiences with noise.

Generally, most noise is generated by transportation systems, primarily motor vehicles, aircraft, and railroads. Prominent sources of indoor noise are office equipment, factory machinery, appliances, power tools, lighting hum, and audio entertainment systems. An important way of predicting a human reaction to a new noise environment is the way it compares to the existing environment (or ambient noise) to which one has adapted. In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will be judged by those hearing it. With regard to increases in A-weighted noise levels, the following relationships occur (Caltrans, 2013):

- Under controlled conditions in an acoustics laboratory, the trained healthy human ear is able to discern changes in sound levels of 1 dBA;

- Outside such controlled conditions, the trained ear can detect changes of 2 dBA in normal environmental noise;

- It is widely accepted that the average healthy ear, however, can barely perceive noise level changes of 3 dBA;

### Noise Attenuation over Distance

Stationary "point" sources of noise, including stationary mobile sources such as idling vehicles, attenuate (lessen) at a rate of approximately 6+ dBA per doubling of distance from the source, depending upon environmental conditions (i.e., atmospheric conditions and noise barriers, either vegetative or manufactured, etc.). Widely distributed noises, such as a large industrial facility, spread over many acres or a street with moving vehicles (a "line" or "moving point" source), would typically attenuate at a lower rate, approximately 4 to 6 dBA per doubling distance from the source (also dependent upon environmental conditions) (Caltrans, 2013). Noise from large construction sites (with heavy equipment moving dirt and trucks entering and exiting the site daily) would have characteristics of both "point" and "line" sources, so attenuation would generally range between 4.5 and 7.5 dBA per doubling of distance. Atmospheric absorption of sound varies depending on temperature and relative humidity, as well as the frequency content of the noise source. In general, "average day" atmospheric conditions result in attenuation at a rate of approximately 1.5 dB per thousand feet of distance (SAE ARP 866A, 1975).

## Vibration Fundamentals & Terminology

Vibration is like noise in that it involves a source, a transmission path, and a receiver. While vibration is related to noise, it differs in that noise is generally considered to be pressure waves transmitted through air, while vibration is usually associated with transmission through the ground or structures. As with noise, vibration consists of an amplitude and frequency. A person's response to vibration will depend on their individual sensitivity as well as the amplitude and frequency of the source.

Vibration can be described in terms of acceleration, velocity, or displacement. A common practice is to monitor vibration in terms of velocity in inches per second peak particle velocity (IPS, PPV) or root-mean-square (VdB, RMS). Standards pertaining to perception as well as damage to structures have been developed for vibration in terms of peak particle velocity as well as RMS velocities. In terms of RMS velocities, vibration levels below approximately 65 VdB are typically considered to be below the threshold of perception.

As vibrations travel outward from the source, they excite the particles of rock and soil through which they pass and cause them to oscillate. Differences in subsurface geologic conditions and distance from the source of vibration will result in different vibration levels characterized by different frequencies and intensities. In all cases, vibration amplitudes will decrease with increasing distance.

According to the Transportation and Construction-Induced Vibration Guidance Manual (Caltrans, April 2020), operation of construction equipment and construction techniques generate ground vibration. Traffic traveling on roadways can also be a source of such vibration. At high enough amplitudes, ground vibration has the potential to damage structures and/or cause cosmetic damage. Ground vibration can also be a source of annoyance to individuals who live or work close to vibration-generating activities. However, traffic, rarely generates vibration amplitudes high enough to cause structural or cosmetic damage.

# Existing Ambient Noise Environment

## Land Uses in the Project Vicinity

Noise-sensitive land uses are generally defined as locations where people reside or where the presence of unwanted sound could adversely affect the primary intended use of the land. Places where people live, sleep, recreate, worship, and study are generally considered to be sensitive to noise because intrusive noise can be disruptive to these activities.

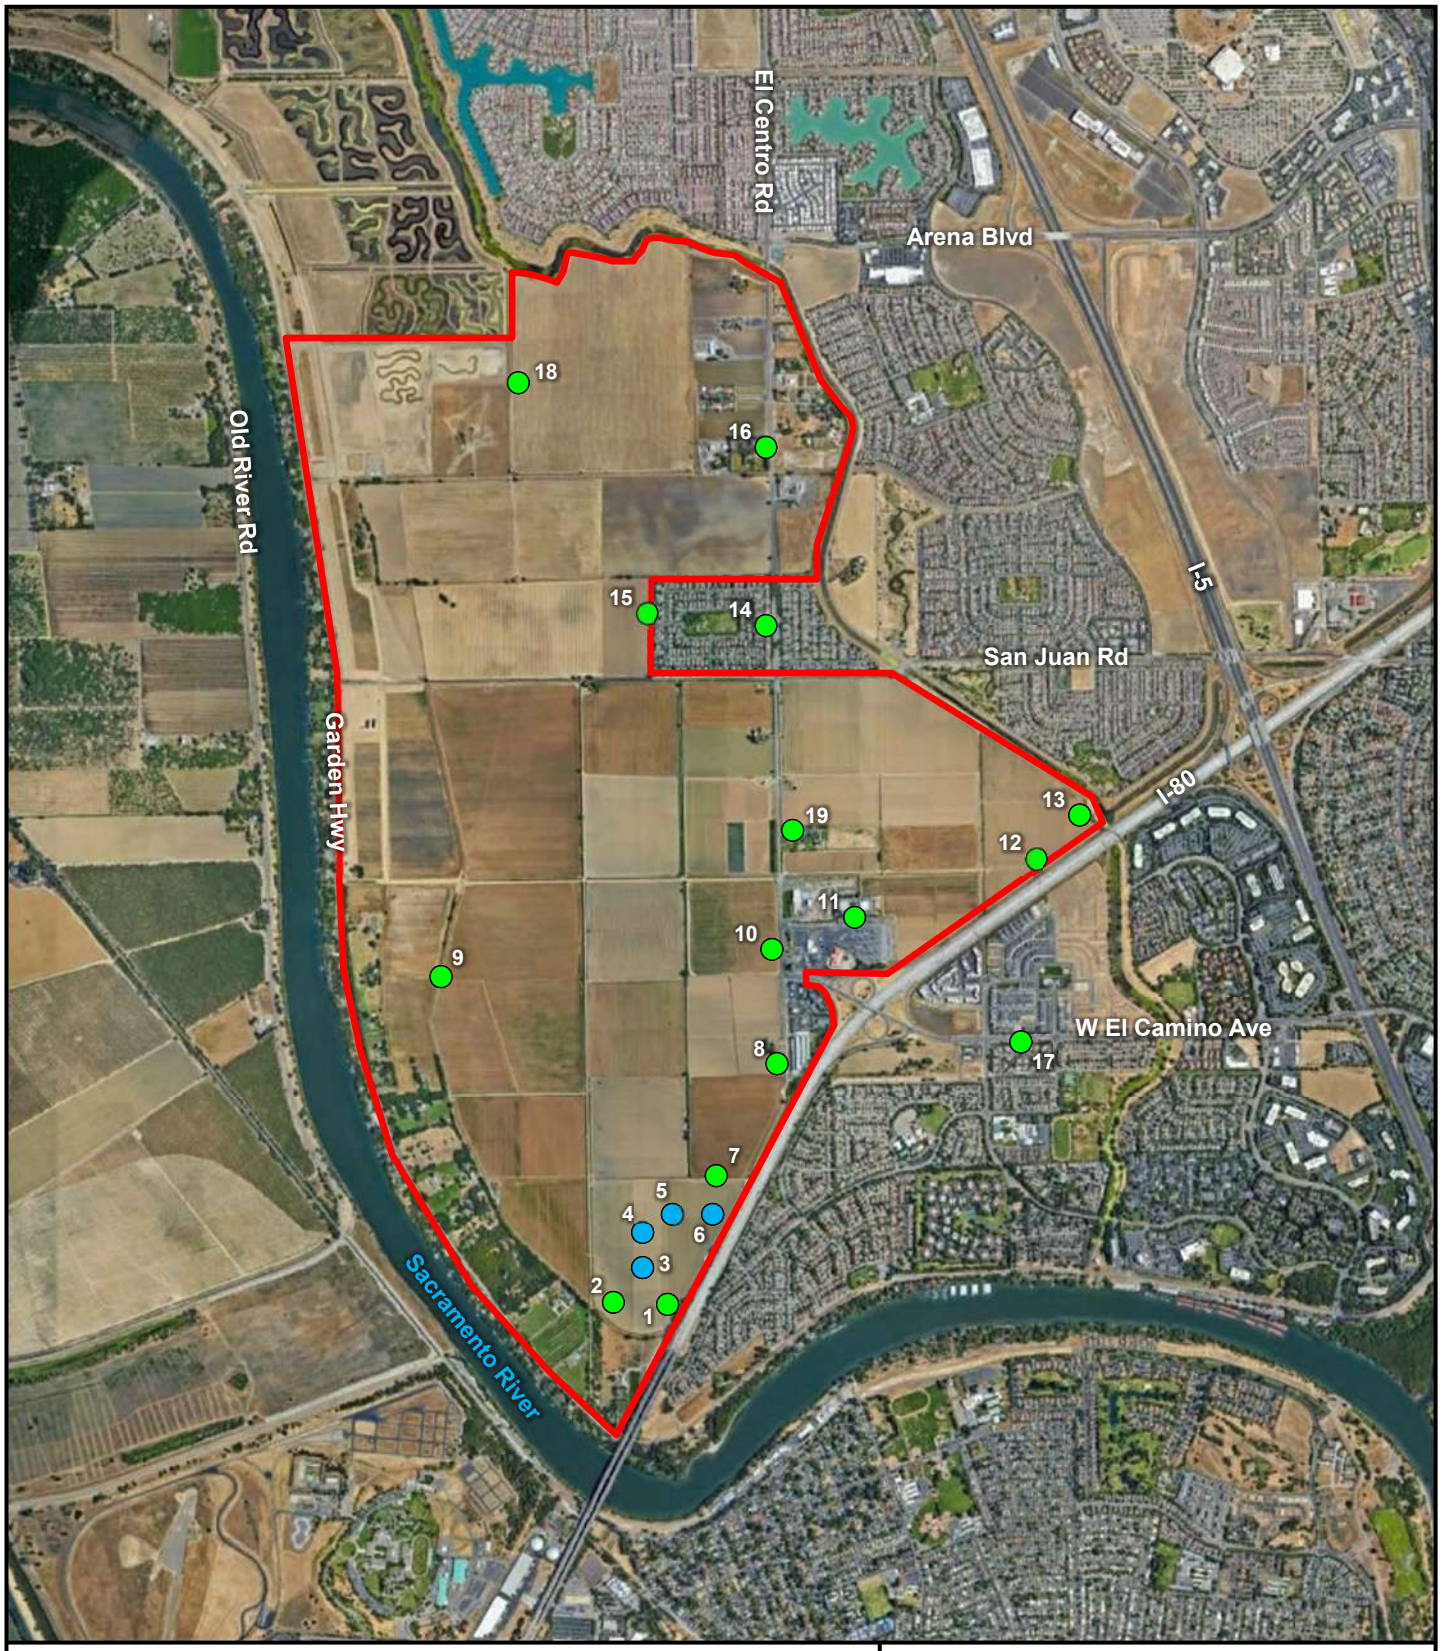
The nearest sensitive receptors to the project area consist primarily of residential uses to the north, east and south. However, with the exception of the existing residential development located at the intersection of San Juan and El Centro Roads, the project area is generally insulated from those areas by agricultural setbacks, Interstate 80, canals/waterways, and open space. Figure 2 illustrates the relationship of the project area to existing residential developments.

With the exception of seasonal agricultural activities, noise-generating uses located within the Plan area consist primarily of the 49er Travel Center (truck stop) at the intersection of West El Camino Avenue and El Centro Road, and heavy equipment storage yards to the immediate north of the 49er Travel Center. Other uses located within the project area consist of a hotel, fast-food restaurants, and a mini-storage facility. These uses are all located in the immediate vicinity of the intersection of West El Camino Avenue and El Centro Road.

## Noise Sources Affecting the Project Vicinity

Due to the large size of the project area the ambient noise environment in the immediate project vicinity varies considerably. Near the southern boundary of the Plan area the ambient noise environment is dominated by Interstate 80 traffic noise. The central and northern portions of the project area are affected by local surface traffic on El Centro and San Juan Roads. Aircraft operations associated with Sacramento International Airport also contribute to the ambient noise environment within the project area, but on a more intermittent basis than the more continuous traffic noise environment. Noise generated at the 49er Travel Center also contributes to the ambient noise environment in the immediate vicinity of that use, but has little effect on the majority of the project area. Finally, the project area is not appreciably affected by railroad noise. Evaluations of each of the major noise sources affecting the project vicinity and the overall ambient noise environment within the project vicinity from all sources are evaluated below.

## Existing Overall Ambient Noise Environment within the Plan area Vicinity



To quantify existing ambient noise environment within the Plan area and project vicinity, BAC conducted long-term (continuous) ambient noise level measurements at fifteen (15) locations between September 21-23 and September 28-30, 2021 for a 5-day monitoring period of Monday-Friday at each location. The long-term noise survey sites are shown on Figure 4. Photographs of the noise survey locations are provided in Appendix B.

Larson Davis Laboratories (LDL) Model 820 and LxT precision integrating sound level meters were used to complete the noise level measurements. The meters were calibrated immediately before and after use with an LDL Model CA200 acoustical calibrator to ensure the accuracy of the measurements. The equipment used meets all specifications of the American National Standards Institute requirements for Type 1 sound level meters (ANSI S1.4).

The results of the long-term ambient noise survey are shown graphically in Appendix C and are summarized in Table 1.

Upon analysis of the long-term ambient measurement data, it was determined that measured noise levels were anomalously high at some sites during a portion of the monitoring period due to local agricultural activities occurring in very close proximity to the sound level meters. As a result, the periods of time containing the anomalously elevated data were omitted from the summaries provided in Table 1. Nonetheless, ongoing agricultural operations in the Project vicinity will continue to affect the ambient noise environment on an intermittent basis.

After exclusion of the anomalous ambient noise level data as described above, the Table 1 data indicate that measured day-night average noise levels (DNL) did not vary appreciably from day to day at each site, but did vary by location within the Plan area as expected. The Table 1 data also indicate that measured day-night average noise levels were highest at sites 12 and 13, which was due to those sites having the closest proximity to I-80.

## Existing Traffic Noise Levels along Plan area Roadway Network

To predict traffic noise levels along existing roadway networks with multiple segments, modelling is commonly used rather than monitoring. Because 45 roadway segments were evaluated in this assessment, conducting noise monitoring along each segment would be impractical. In addition, because future traffic noise levels must be modelled to predict the increases in off-site traffic noise levels which result from a project, the modelling of existing levels allows a more accurate comparison to project levels.

The FHWA Traffic Noise Model (FHWA-RD-77-108) was used to quantify existing traffic noise levels at the existing sensitive land uses nearest to the project area roadway network. The Model was also used to quantify the distances to the 60, 65 and 70 dB DNL traffic noise contours for these roadways. The FHWA Model predicts hourly $L_{eq}$ values for free-flowing traffic conditions. Estimates of the hourly distribution of traffic for a typical 24-hour period were used to develop DNL values from $L_{eq}$ values.

Traffic data in the form of average daily traffic volumes (ADT) were obtained from the project transportation impact study prepared by Fehr & Peers. Other inputs were obtained from published Caltrans traffic counts, SACOG, and BAC observations and file data. The existing traffic noise levels at the distances representing the nearest sensitive land uses to the project area roadways and distances from the centerlines of selected roadways to the 60 dB, 65 dB and 70 dB DNL contours are summarized in Table 2. Appendix F contains the FHWA Model inputs for existing conditions.

In most cases, the actual distances to noise level contours may vary from the distances predicted by the FHWA Model. Factors such as roadway elevation, curvature, grade, and shielding from local topography or structures, or elevated receivers may affect actual sound propagation. Along roadways segments where existing noise barriers are present, the degree of shielding provided by those barriers was estimated and included in the Table 2 results.

## Existing Aircraft Noise Environment

Sacramento International Airport is located approximately 2.5 miles northwest of the project area near I-5 and the Sacramento River. The airport is mostly surrounded by agricultural uses, but development of the Metro Air Center is underway to the immediate east of the airport, as is development of commercial and residential uses in the North and South Natomas areas. According to the County's General Plan the airport has about 160 scheduled daily flights at current passenger levels, serving about 20,000 passengers per day. Although the majority of the flights occur during daytime hours (7 am – 10 pm), nighttime flights do occur.

Aircraft departure heading (north or south), is primarily dependent on wind speed and direction. During south departure conditions, many aircraft either directly overfly the Plan area or occur in reasonably close proximity to the Plan area.

Ambient noise monitoring Site 18 (see Figure 4 for location) was positioned near the northern portion of the Plan area with the closest proximity to Sacramento International Airport. As indicated in Table 1, measured ambient noise levels at this location ranged from 52-57 dB DNL with maximum noise levels averaging 63-71 dB $L_{max}$ during daytime hours.

Figure 5 shows the noise contours for Sacramento International Airport. Figure 5 indicates that the Plan area is located outside of the Sacramento International Airport 60 dB CNEL noise contours, meaning that aircraft noise exposure within the Plan area is below 60 dB CNEL. This is consistent with the ambient noise monitoring results from monitoring Site 18 which also indicate aircraft noise exposure at that location as below 60 dB $L_{dn}$ ($L_{dn}$ and CNEL are essentially equivalent).

# Existing Ambient Vibration Environment

During multiple site visits conducted by BAC staff, vibration levels within the Plan area were subjectively evaluated as being below the threshold of perception. Nonetheless, to generally quantify existing vibration levels at representative locations within the project site, BAC conducted short-term (10-minute) vibration measurements at six (6) locations within the Plan area. The locations are Sites 1, 9, 10, 12, 18 and 19 shown on Figure 4. Photographs of the vibration survey locations are provided in Appendix E.

A Larson-Davis Laboratories Model LxT precision integrating sound level meter equipped with a vibration transducer was used to complete the measurements. The system was calibrated in the field prior to use to ensure the accuracy of the measurements. The ambient vibration monitoring results are summarized in Table 3.

**Table 3**
**Summary of Ambient Vibration Monitoring Results – November 29, 2021**

| Site[1] | Time | Average Measured Vibration Level, VdB ()[1] |
|---|---|---|
| 1 | 12:44 PM | 49 |
| 9 | 1:17 PM | 35 |
| 10 | 2:52 PM | 49 |
| 12 | 2:03 PM | 52 |
| 18 | 2:28 PM | 32 |
| 19 | 1:41 PM | 54 |

[1]Vibration measurement sites are the same sites used for the ambient noise surveys shown in Figure 4.
*Source: Bollard Acoustical Consultants, Inc. (2021)*

The Table 3 data indicate that measured average vibration levels at the project area were below the 65 VdB threshold of perception, which is consistent with the BAC staff observations.

# Criteria for Acceptable Noise and Vibration Exposure

## Federal

There are no federal noise or vibration criteria which would be directly applicable to this project. However, because the Sacramento County General Plan does not currently have a policy for assessing noise impacts associated with increases in ambient noise levels from project-generated noise sources, recommendations made by the Federal Interagency Commission on Noise (FICON) are provided.

Federal Interagency Commission on Noise (FICON)

FICON has developed a graduated scale for use in the assessment of project-related noise level increases. The criteria shown in Table 4 was developed by FICON as a means of developing thresholds for impact identification for project-related noise level increases. The FICON standards have been used extensively in recent years in the preparation of the noise sections of Environmental Impact Reports that have been certified in many California cities and counties.

The use of the FICON standards is considered conservative relative to thresholds used by other agencies in the State of California. For example, the California Department of Transportation (Caltrans) requires a project-related traffic noise level increase of 12 dB for a finding of significance, and the California Energy Commission (CEC) considers project-related noise level increases between 5 to 10 dB significant, depending on local factors. Therefore, the use of the FICON standards, which set the threshold for finding of significant noise impacts as low as 1.5 dB, provides a very conservative approach to impact assessment for this project.

**Table 4**
**Significance of Changes in Cumulative Noise Exposure**

| Ambient Noise Level Without Project (DNL) | Change in Ambient Noise Level Due to Project |
|---|---|
| <60 dB | +5.0 dB or more |
| 60 to 65 dB | +3.0 dB or more |
| >65 dB | +1.5 dB or more[1] |

*Source: Federal Interagency Committee on Noise (FICON)*

1. It should be noted that FICONs Federal Agency Review of Selected Airport Noise Analysis Issues (1992) report does not identify a 1.5 dBA increase as a threshold of significance, but rather, an increase that warrants further analysis. However, for purposes of this analysis, a 1.5 dB threshold is utilized to assess the significance of project-related noise increases at sensitive locations currently exposed to ambient noise environments exceeding 65 dB DNL.

Based on the FICON research, as shown in Table 4, a 5 dB increase in noise levels due to a project is required for a finding of significant noise impact where ambient noise levels without the project are less than 60 dB DNL. Where pre-project ambient conditions are between 60 and 65 dB DNL, a 3 dB increase is applied as the standard of significance. Finally, in areas already exposed to higher noise levels, specifically pre-project noise levels in excess of 65 dB DNL, a 1.5 dB increase is conservatively used as the threshold of significance. It should be noted that the use of these thresholds is consistent with Sacramento County General Plan Noise Element Policy NO-9, which applies to capacity enhancing roadway improvement projects.

Federal Transit Administration

Sacramento County does not currently have adopted standards for groundborne vibration. As a result, the vibration impact criteria developed by the Federal Transit Administration (FTA) were applied to the project. The FTA criteria applicable to damage and annoyance from vibration typically associated with construction activities are presented in Tables 5 and 6.

**Table 5**
**FTA Criteria for Assessing Vibration Damage to Structures**

| Building Category | Level, VdB[1] |
|---|---|
| I. Reinforced-concrete, steel or timber (no plaster) | 102 |
| II. Engineered concrete and masonry (no plaster) | 98 |
| III. Non-engineered timber and masonry buildings | 94 |
| IV. Buildings extremely susceptible to vibration damage | 90 |

[1.] RMS velocity in decibels (VdB) re 1 micro-inch/second

*Source: Federal Transit Administration (FTA) Noise and Vibration Manual, Table 12-3*

**Table 6**
**Groundborne Vibration Impact Criteria for General Assessment**

| Land Use Category | Impact Levels (VdB) | | |
|---|---|---|---|
| | Frequent Events[a] | Occasional Events[b] | Infrequent Events[c] |
| Category 1: Buildings where vibration would interfere with interior ops. | 65[d] | 65[d] | 65[d] |
| Category 2: Residences and buildings where people normally sleep | 72 | 75 | 80 |
| Category 3: Institutional land uses with primarily daytime uses | 75 | 78 | 83 |

Vibration levels are measured in or near the vibration-sensitive use.

**a.** "Frequent Events" is defined as more than 70 vibration events of the same source per day.
**b.** "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day.
**c.** "Infrequent Events" is defined as fewer than 30 vibration events of the same source per day.
**d.** This criterion limit is based on levels that are acceptable for most moderately-sensitive equipment such as optical microscopes. Vibration-sensitive manufacturing or research will require detailed evaluation to define the acceptable vibration levels.

*Source: Federal Transit Administration, Transit Noise Impact and Vibration Assessment, May 2006.*

## State of California

California Environmental Quality Act (CEQA)

The State of California has established regulatory criteria that are applicable to this assessment. Specifically, Appendix G of the State of California Environmental Quality Act (CEQA) Guidelines are used to assess the potential significance of impacts pursuant to local General Plan policies, Municipal Code standards, or the applicable standards of other agencies. According to Appendix G of the CEQA guidelines, a significant noise or vibration impact may occur if the Project results in:

A. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or other applicable standards of other agencies.

B. Generation of excessive groundborne vibration or groundborne noise levels.

C. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels.

It should be noted that audibility is not a test of significance according to CEQA. If this were the case, any project which added any audible amount of noise to the environment would be considered significant according to CEQA. Because every physical process creates noise, the use of audibility alone as significance criteria would be unworkable. Under CEQA, a significant impact may occur when there is a substantial increase in noise levels, not simply an audible change.

## Local

Sacramento County General Plan

The Noise Element of the Sacramento County General Plan contains the County's noise-related policies. The specific policies which are generally applicable to this project are reproduced below:

**Traffic and Railroad Noise**

**Policy NO-1** The noise level standards for noise-sensitive areas of new uses affected by traffic or railroad noise sources in Sacramento County are shown in Table 7. Where the noise level standards of Table 7 are predicted to be exceeded at new uses proposed within Sacramento County which are affected by traffic or railroad noise, appropriate noise mitigation measures shall be included in the project design to reduce projected noise levels to a state of compliance with the Table 7 standards.

**Aircraft Noise**

**Policy NO-2** Proposals for new development within Sacramento County which may be affected by aircraft noise shall be evaluated relative to General Plan Noise Element Table 4 (*Land Use Compatibility for Aircraft Noise)* except in the following case. Development proposals which may be affected by aircraft noise from Sacramento International Airport shall be evaluated relative to the Land Use Compatibility Plan prepared for Sacramento International Airport dated December 12, 2013.

**Policy NO-3** New residential development within the 60 CNEL noise contours adopted by the County for land use planning purposes at any airport or Helipad within

Sacramento County shall be prohibited. This policy is not applicable to Executive Airport.

**Policy NO-4** New residential development within adopted Airport Policy Area boundaries, but outside the 60 CNEL, shall be subject to the following conditions:

A. Provide minimum noise insulation to 45 dB CNEL within new residential dwellings, including detached single family dwellings, with windows closed in any habitable room.

B. Notification in the Public Report prepared by the California Department of Real Estate disclosing the fact to prospective buyers that the parcel is located within an Airport Policy Area.

C. An Avigation Easement prepared by the Sacramento County Counsel's Office granted to the County of Sacramento, recorded with the Sacramento County Recorder, and filed with Department of Airports. Such Avigation Easement shall acknowledge the property location within an Airport Planning Policy Area and shall grant the right of flight and unobstructed passage of all aircraft into and out of the subject Airport.

Exceptions: New accessory residential dwellings on parcels zoned Agricultural, Agricultural Residential, Interim Agricultural, Interim General Agricultural, or Interim Limited Agricultural and between the 60 and 65 CNEL contours, shall be permitted within adopted Airport Policy Area boundaries, but would be subject to the conditions listed above.

**Non-Transportation Noise**

**Policy NO-5** The interior and exterior noise level standards for noise-sensitive areas of new uses affected by existing non-transportation noise sources in Sacramento County are shown by Table 8. Where the noise level standards of Table 8 are predicted to be exceeded at a proposed noise-sensitive area due to existing non-transportation noise sources, appropriate noise mitigation measures shall be included in the project design to reduce projected noise levels to a state of compliance with the Table 8 standards within sensitive areas.

**Policy NO-6** Where a project would consist of or include non-transportation noise sources, the noise generation of those sources shall be mitigated so as not exceed the interior and exterior noise level standards of Table 8 at existing noise-sensitive areas in the project vicinity.

**Policy NO-7** The "last use there" shall be responsible for noise mitigation. However, if a noise generating use is proposed adjacent to lands zoned for uses which may have sensitivity to noise, then the noise generating use shall be responsible for mitigating its noise generation to a state of compliance with the Table 8

standards at the property line of the generating use in anticipation of the future neighboring development.

**Construction Noise**

**Policy NO-8** Noise associated with construction activities shall adhere to the County Code requirements. Specifically, Section 6.68.090(e) addresses construction noise within the County.

**Other General Plan Noise Policies**

**Policy NO-12** All noise analyses prepared to determine compliance with the noise level standards contained within this Noise Element shall be prepared in accordance with Table 9.

**Policy NO-13** Where noise mitigation measures are required to satisfy the noise level standards of this Noise Element, emphasis shall be placed on the use of setbacks and site design to the extent feasible, prior to consideration of the use of noise barriers.

**Policy NO-14** Noise analyses prepared for multi-family residential projects, town homes, mixed-use, condominiums, or other residential projects where floor ceiling assemblies or party-walls shall be common to different owners/occupants, shall be consistent with the State of California Noise Insulation standards.

**Policy NO-15** The County shall have the flexibility to consider the application of 5 dB less restrictive exterior noise standards than those prescribed in Tables 7 and 8 in cases where it is impractical or infeasible to reduce exterior noise levels within infill projects to a state of compliance with the Table 7 or 8 standards. In such cases, the rational for such consideration shall be clearly presented and disclosure statements and noise easements shall be included as conditions of project approval. The interior noise level standards of Tables 7 and 8 would still apply. The maximum allowable long-term noise exposure permissible for non-industrial uses is 75 dB.

**Exemptions**

**Policy NO-16** The following sources of noise shall be exempt from the provisions of this Noise Element:

A. Emergency warning devices and equipment operated in conjunction with emergency situations, such as sirens and generators which are activated during power outages. The routine testing of such warning devices and equipment shall also be exempt provided such testing occurs during daytime hours.

B. Activities associated with events for which a permit has been obtained from the County.

**Table 7**
**Noise Standards for New Uses Affected by Traffic and Railroad Noise**

| Receiving Land Use | Outdoor Areas[a] dBA (DNL/CNEL) | Interior Areas[b] dBA (DNL/CNEL) | Notes |
|---|---|---|---|
| Residential | 65 | 45 | 5 |
| Transient lodging | 65 | 45 | 3, 5 |
| Hospitals, nursing homes | 65 | 45 | 3, 4, 5 |
| Theaters & auditoriums | -- | 35 | 3 |
| Churches, schools, libraries | 65 | 40 | 3 |
| Office buildings | 65 | 45 | 3 |
| Commercial buildings | -- | 50 | 3 |
| Playgrounds, parks | 70 | -- | |
| Industry | 65 | 50 | 3 |

[1] Sensitive areas are defined in acoustic terminology section.
[2] Interior noise level standards are applied within noise-sensitive areas of the various land uses, with windows and doors in the closed positions.
[3] Where there are no sensitive exterior spaces proposed for these uses, only the interior noise level standard shall apply.
[4] Hospitals are often noise-generating uses. The exterior noise level standards for hospitals are applicable only at clearly identified areas designated for outdoor relaxation by either hospital staff or patients.
[5] If this use is affected by railroad noise, a maximum ($L_{max}$) noise level standard of 70 dB shall be applied to all sleeping rooms to reduce the potential for sleep disturbance during nighttime train passages.

*Source: Sacramento County General Plan, Noise Element, Table 1 (2011)*

**Table 8**
**Non-Transportation Noise Standards – Median ($L_{50}$) / Maximum ($L_{max}$)[1]**

| Receiving Land Use | Outdoor Area | | Interior[2] | Notes |
|---|---|---|---|---|
| | Daytime (7am-10pm) | Nighttime (10pm to 7am) | Day & Night | |
| Residential | 55 / 75 | 50 / 70 | 35 / 55 | -- |
| Transient lodging | 55 / 75 | -- | 35 / 55 | 3 |
| Hospitals, nursing homes | 55 / 75 | -- | 35 / 55 | 4,5 |
| Theaters & auditoriums | -- | -- | 30 / 50 | 5 |
| Churches, schools, libraries | 55 / 75 | -- | 35 / 60 | 5 |
| Office buildings | 60 / 75 | -- | 45 / 65 | 5 |
| Commercial buildings | -- | -- | 45 / 65 | 5 |
| Playgrounds, parks | 65 / 75 | -- | -- | 5 |
| Industry | 60 / 80 | -- | 50 / 70 | 5 |

[1] The Table 8 standards shall be reduced by 5 dB for sounds consisting primarily of speech or music, and for recurring impulsive sounds. If the existing ambient noise level exceeds the standards of Table 8, then the noise level standards shall be increased at 5 dB increments to encompass the ambient.

[2] Interior noise level standards are applied within noise-sensitive areas with windows and doors in the closed positions.

[3] Outdoor activity areas of transient lodging facilities are not commonly used during nighttime hours.

[4] Hospitals are often noise-generating uses. The exterior noise level standards for hospitals are applicable only at clearly identified areas designated for outdoor relaxation by either hospital staff or patients.

[5] The outdoor activity areas of these uses (if any) are not typically utilized during nighttime hours.

-Where median (L50) noise level data is not available for a particular noise source, average (Leq) values may be substituted for the standards of this table provided the noise source in question operates for at least 30 minutes of an hour. If the source in question operates less than 30 minutes per hour, then the maximum noise level standards shown would apply.

*Source: Sacramento County General Plan, Noise Element, Table 2 (2011)*

**Table 9**
**Requirements for Acoustical Analyses Prepared in Sacramento County**

An acoustical analysis prepared pursuant to the Noise Element shall:

1. Be the responsibility of the applicant.
2. Be prepared by qualified persons experienced in the fields of environmental noise assessment and architectural acoustics.
3. Include representative noise level measurements with sufficient sampling periods and locations to adequately describe local conditions.
4. Estimate projected future (20 year) noise levels in terms of the Standards of Tables 7 and 8 and compare those levels to the adopted policies of the Noise Element.
5. Recommend appropriate mitigation to achieve compliance with the adopted policies and standards of the Noise Element.
6. Estimate interior and exterior noise exposure after the prescribed mitigation measures have been implemented.

*Source: Sacramento County General Plan, Noise Element, Table 3 (2011)*

Sacramento Area Council of Governments (SACOG)

The Upper Westside Specific Plan area is located approximately 3 miles from the Sacramento International Airport. Pursuant to Policy NO-2 of the Sacramento County General Plan Noise Element, proposals for new development within Sacramento County which may be affected by aircraft noise from Sacramento International Airport shall be evaluated relative to the Sacramento International Airport Land Use Compatibility Plan prepared by the Sacramento Area Council of Governments (SACOG) dated December 12, 2013. The Land Use Plan's noise compatibility criteria is reproduced in Table 10.

**Table 10**
**Sacramento International Airport Noise Compatibility**

| Land Use Category[1]<br>› Multiple land use categories and compatibility criteria may apply to a project<br>› Land uses not specifically listed shall be evaluated using criteria for similar uses | Exterior Noise Exposure (CNEL dB) | | | | | Criteria for Conditional Uses<br>› Interior CNEL limits in yellow cells apply in addition to other listed conditions (see Policy 3.2.3)<br>› Acoustical study may be required for noise-sensitive uses proposed in areas exposed to CNEL 60 dB or greater (see Policy 3.2.3(d)) |
|---|---|---|---|---|---|---|
| | ≤ 60 | 60-65 | 65-70 | 70-75 | > 75 | |
| ***Legend*** *(see last page of table for interpretation)* | ***Normally Compatible*** | | | ***Conditional*** | | ***Incompatible*** |
| *Outdoor Uses (limited or no activities in buildings)* | | | | | | |
| Natural Land Areas: woods, brush lands, desert | | | | | | Compatible at levels indicated, but noise disruption of natural quiet will occur |
| Water: flood plains, wetlands, lakes, reservoirs | | | | | | |
| Agriculture (except residences and livestock): crops, orchards, vineyards, pasture, range land | | | | | | |
| Livestock Uses: feed lots, stockyards, breeding, fish hatcheries, horse stables | | | | | | Exercise caution with uses involving noise-sensitive animals [2] |
| Outdoor Major Assembly Facilities (capacity ≥1,000 people): spectator-oriented outdoor stadiums, amphitheaters, fairgrounds, zoos | | | | | | Exercise caution if clear audibility by users is essential |
| Group Recreation (limited spectator stands): athletic fields, water recreation facilities, picnic areas | | | | | | Exercise caution if clear audibility by users is essential |
| Small/Non-Group Recreation: golf courses, tennis courts, shooting ranges | | | | | | Exercise caution if clear audibility by users is essential |
| Local Parks: children-oriented neighborhood parks, playgrounds | | | | | | Exercise caution if clear audibility by users is essential |
| Camping: campgrounds, recreational vehicle/motor home parks | | | | | | |
| Cemeteries (excluding chapels) | | | | | | Compatible at levels indicated, but noise disruption of outdoor activities will occur |
| *Residential and Lodging Uses* | | | | | | |
| Single-Family Residential (<8 d.u./acre): detached dwellings, townhouses, mobile homes, bed & breakfast inns | | * | | | | * Within CNEL 60-65 dB, new dwellings allowed on existing parcels (see Policy 1.4.3) |
| Multi-Family Residential (≥8 d.u./acre): condominiums, apartments, agricultural-related housing | | | | | | |
| Long-Term Lodging (>30 nights): extended-stay hotels, dormitories | | 45 | | | | |
| Short-Term Lodging (≤ 30 nights): hotels, motels, other transient lodging(except conference/assembly facilities) | | 45 | 45 | | | |
| Congregate Care: retirement homes, assisted living, intermediate care facilities | | 45 | | | | |
| *Educational and Institutional Uses* | | | | | | |
| Family day care homes (≤14 children) | | 45 | | | | |
| Children's Schools: K-12, day care centers (>14 children); school libraries | | 45 | | | | New schools incompatible above CNEL 60 dB unless special circumstances exist (see Policies 3.2.2(a) and 4.1.5) |

**Table 10 continued**
**Sacramento International Airport Noise Compatibility**

| Land Use Category[1] | Exterior Noise Exposure (CNEL dB) | | | | | Criteria for Conditional Uses |
|---|---|---|---|---|---|---|
| › Multiple land use categories and compatibility criteria may apply to a project<br>› Land uses not specifically listed shall be evaluated using criteria for similar uses | ≤ 60 | 60-65 | 65-70 | 70-75 | > 75 | › Interior CNEL limits in yellow cells apply in addition to other listed conditions (see Policy 3.2.3)<br>› Acoustical study may be required for noise-sensitive uses proposed in areas exposed to CNEL 60 dB or greater (see Policy 3.2.3(d)) |
| ***Legend*** *(see last page of table for interpretation)* | ***Normally Compatible*** | | ***Conditional*** | | ***Incompatible*** | |
| Adult Education classroom space: adult schools, colleges, universities | | 45 | 45 | | | Applies only to classrooms; offices, laboratory facilities, gymnasiums, outdoor athletic facilities, and other uses to be evaluated as indicated for those land use categories |
| Community Libraries | | 45 | | | | |
| Indoor Major Assembly Facilities (capacity ≥1,000 people): auditoriums, conference centers, concert halls, indoor arenas | | 45 | 45 | | | |
| Indoor Large Assembly Facilities (capacity 300 to 999 people): movie theaters, places of worship, cemetery chapels, mortuaries | | 45 | 45 | | | |
| Indoor Recreation: gymnasiums, club houses, athletic clubs, dance studios | | | 50 | | | |
| In-Patient Medical: hospitals, mental hospitals, nursing homes | | 45 | | | | |
| Out-Patient Medical: health care centers, clinics | | 45 | 45 | 45 | | |
| Penal Institutions: prisons, reformatories | | 45 | 45 | | | |
| Public Safety Facilities: police, fire stations | | | 50 | 50 | | |
| *Commercial, Office, and Service Uses* | | | | | | |
| Major Retail: regional shopping centers, 'big box' retail | | | 50 | 50 | | Outdoor dining or gathering places incompatible above CNEL 70 dB |
| Local Retail: community/neighborhood shopping centers, grocery stores | | | 50 | 50 | | Outdoor dining or gathering places incompatible above CNEL 70 dB |
| Eating/Drinking Establishments: restaurants, fast-food dining, bars | | | 50 | 50 | | Outdoor dining or gathering places incompatible above CNEL 70 dB |
| Limited Retail/Wholesale: furniture, automobiles, heavy equipment, lumber yards, nurseries | | | 50 | 50 | | |
| Offices: professional services, doctors, finance, civic; radio, television & recording studios, office space associated with other listed uses | | | 50 | 50 | | |
| Personal & Miscellaneous Services: barbers, car washes, print shops | | | 50 | 50 | | |
| Vehicle Fueling: gas stations, trucking & transportation terminals | | | | 50 | 50 | |
| *Industrial, Manufacturing, and Storage Uses* | | | | | | |
| Hazardous Materials Production: oil refineries, chemical plants | | | | | | |
| Heavy Industrial | | | | | | |
| Light Industrial, High Intensity: food products preparation, electronic equipment | | | | 50 | 50 | |
| Light Industrial, Low Intensity: machine shops, wood products, auto repair | | | | 50 | 50 | |
| Research & Development | | | 50 | 50 | | |

**Table 10 continued**
**Sacramento International Airport Noise Compatibility**

| Land Use Category[1] | Exterior Noise Exposure (CNEL dB) | | | | | Criteria for Conditional Uses |
|---|---|---|---|---|---|---|
| › Multiple land use categories and compatibility criteria may apply to a project<br>› Land uses not specifically listed shall be evaluated using criteria for similar uses | ≤ 60 | 60-65 | 65-70 | 70-75 | > 75 | › Interior CNEL limits in yellow cells apply in addition to other listed conditions (see Policy 3.2.3)<br>› Acoustical study may be required for noise-sensitive uses proposed in areas exposed to CNEL 60 dB or greater (see Policy 3.2.3(d)) |
| ***Legend*** *(see last page of table for interpretation)* | ***Normally Compatible*** | | | ***Conditional*** | | ***Incompatible*** |
| Indoor Storage: wholesale sales, warehouses, mini/other indoor storage, barns, greenhouses | | | | | | |
| Outdoor Storage: public works yards, automobile dismantling | | | | | | |
| Mining & Extraction | | | | | | |
| *Transportation, Communication, and Utilities* | | | | | | |
| Airport Terminals: airline, general aviation | | | | 50 | 50 | |
| Rail & Bus Stations | | | | 50 | 50 | |
| Transportation Routes: road & rail rights-of-way, bus stops | | | | | | |
| Auto Parking: surface lots, structures | | | | | | |
| Communications Facilities: emergency communications, broadcast & cell towers | | | | | | |
| Power Plants (primary, peaker, alternative energy) | | | | | | |
| Electrical Substations | | | | | | |
| Wastewater Facilities: treatment, disposal | | | | | | |
| Solid Waste Disposal Facilities: landfill, incineration | | | | | | |
| Solid Waste Transfer Facilities, Recycle Centers | | | | | | |

| Land Use Acceptability | Interpretation/Comments |
|---|---|
| *Normally Compatible* | *Indoor Uses:* Either the activities associated with the land use are inherently noisy or standard construction methods will sufficiently attenuate exterior noise to an acceptable indoor community noise equivalent level (CNEL); for land use types that are compatible because of inherent noise levels, sound attenuation must be provided for associated office, retail, and other noise-sensitive indoor spaces sufficient to reduce exterior noise to an interior maximum of CNEL 50 dB<br>*Outdoor Uses:* Except as noted in the table, activities associated with the land use may be carried out with minimal interference from aircraft noise |
| *Conditional* | *Indoor Uses:* Building structure must be capable of attenuating exterior noise to the indoor CNEL indicated by the number in the cell (either 45 or 50)<br>*Outdoor Uses:* Caution should be exercised with regard to noise-sensitive outdoor uses; these uses are likely to be disrupted by aircraft noise events; acceptability is dependent upon characteristics of the specific use [1] |
| *Incompatible* | *Indoor Uses:* Unacceptable noise interference if windows are open; at exposures above CNEL 65 dB, extensive mitigation techniques required to make the indoor environment acceptable for performance of activities associated with the land use<br>*Outdoor Uses:* Severe noise interference makes the outdoor environment unacceptable for performance of activities associated with the land use |

Sacramento County Municipal Code

The provisions of the Sacramento County Municipal Code which would be most applicable to this project are reproduced below. For residential uses affected by non-transportation noise sources, the County Municipal Code standards are effectively identical to the County's General Plan standards shown in Table 8.

**6.68.070 Exterior Noise Standards.**

A. The following noise standards, unless otherwise specifically indicated in this chapter, shall apply to all properties within a designated noise area.

| Noise Area | County Zoning Districts | Time Period | Exterior Noise Standard |
|---|---|---|---|
| 1 | RE-1, RD-1, RE-2, RD-2, RE-3, RED-3, RD-4, R-1-A, RD-5, R-2, RD-10, R-2A, RD-20, R-3, RD-30, RD-40, RM-1, RM-2, A-1-B, AR-1, A-2, AR-2, A-5, AR-5 | 7:00 a.m. to 10:00 p.m. | 55 dBA |
| | | 10:00 p.m. to 7:00 a.m. | 50 dBA |

B. It is unlawful for any person at any location within the County to create any noise which causes the noise levels on an affected property, when measured in the designated noise area, to exceed for the duration of time set forth following, the specified exterior noise standards in any one hour by:

| Cumulative Duration of the Intrusive Sound | Allowance Decibels |
|---|---|
| 1. Cumulative period of 30 minutes per hour | 0 |
| 2. Cumulative period of 15 minutes per hour | +5 |
| 3. Cumulative period of 5 minutes per hour | +10 |
| 4. Cumulative period of 1 minute per hour | +15 |
| 5. Level not to be exceeded for any time per hour | +20 |

C. Each of the noise limits specified in subdivision (B) of this section shall be reduced by five dBA for impulsive or simple tone noises, or for noises consisting of speech or music.

D. If the ambient noise level exceeds that permitted by any of the first four noise limit categories specified in subdivision (B), the allowable noise limit shall be increased in five dBA increments in each category to encompass the ambient noise level. If the ambient noise level exceeds the fifth noise level category, the maximum ambient noise level shall be the noise limit for that category.

**6.68.090 Exemptions.**

The following activities shall be exempted from the provisions of this chapter:

A. School bands, school athletic and school entertainment events;

B. Outdoor gatherings, public dances, shows and sporting and entertainment events, provided said events are conducted pursuant to a license by a public entity or private school;

C. Activities conducted on parks, public playgrounds and school grounds, provided such parks, playgrounds and school grounds are owned and operated by a public entity or private school;

D. Any mechanical device, apparatus or equipment related to or connected with emergency activities or emergency work;

E. Noise sources associated with construction, repair, remodeling, demolition, paving or grading of any real property, provided said activities do not take place between the hours of eight p.m. and six p.m. on weekdays and Friday commencing at eight p.m. through and including seven a.m. on Saturday; Saturdays commencing at eight p.m. through and including seven a.m. on the next following Sunday and on each Sunday after the hour of eight p.m. Provided, however, when an unforeseen or unavoidable conditions occurs during a construction project and the nature of the project necessitates that work in process be continued until a specific phase is completed, the contractor or owner shall be allowed to continue work after eight p.m. and to operate machinery and equipment necessary until completion of the specific work in progress can be brought to conclusion under conditions which will not jeopardize inspection acceptance or create undue financial hardships for the contractor or owner;

F. Noise sources associated with agricultural operations, provided such operations do not take place between the hours of eight p.m. and six a.m.;

G. All mechanical devices, apparatus or equipment which are utilized for the protection or salvage of agricultural crops during periods of adverse weather conditions or when the use of mobile noise sources is necessary for pest control;

H. Noise sources associated with maintenance of residential area property, provided said activities take place between the hours of six a.m. and eight p.m. on any day except Saturday or Sunday, or between the hours of seven a.m. and eight p.m. on Saturday or Sunday.

**6.68.110 Schools, Hospitals and Churches.**

It is unlawful for any person to create any noise which causes the noise level at any school, hospital or church, while the same is in use, to exceed the noise standards specified in Section 6.68.070 or to create any noise which unreasonably interferes with the use of such institution or unreasonably disturbs or annoys patients in the hospital. In any disputed case, interfering noise which is ten dBA or more, greater than the ambient noise level at the building, shall be deemed excessive and unlawful.

**6.68.120 Machinery, Equipment, Fans and Air Conditioning.**

A. It is unlawful for any person to operate any mechanical equipment, pump, fan, air conditioning apparatus, stationary pumps, stationary cooling towers, stationary compressors, similar mechanical devices, or any combination thereof installed after July 1, 1976, in any manner so as to create any noise which would cause the maximum noise level to exceed:

    1. Sixty dBA at any point at least one foot inside the property line of the affected residential property and three to five feet above ground level;

    2. Fifty-five dBA in the center of a neighboring patio three to five feet above ground level;

    3. Fifty-five dBA outside of the neighboring living area window nearest the equipment location. Measurements shall be taken with the microphone not more than three feet from the window opening but at least three feet from any other surface.

B. Equipment installed five years after July 1, 1976, must comply with a maximum limit of fifty-five dBA at any point at least one foot inside the property line of the affected residential property and three to five feet above ground level.

C. Equipment installed before December 17, 1970, must comply with a limit of sixty-five dBA maximum in sound level at any point at least one foot inside the affected property line and three to five feet above ground level by January 1, 1977. Equipment installed between December 16, 1970, and July 1, 1976, must comply with a limit of sixty-five dBA maximum sound level at any point at least one foot inside the property line of the affected residential property and three to five feet above ground level.

# Impacts and Mitigation Measures

## Thresholds of Significance

Appendix G of the CEQA Guidelines asks whether the project would result in any of the following to determine whether a significant noise or vibration impact would occur:

- Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or other applicable standards of other agencies; or

- Generation of excessive groundborne vibration or groundborne noise levels; or

- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels.

For the purposes of this assessment, a noise or vibration impact may be considered significant if the project would result in exceedance of the following criteria based on standards established by the Federal Interagency Commission on Noise (FICON), California Department of Transportation (Caltrans), Sacramento Area County of Governments (SACOG), Sacramento County General Plan and Municipal Code:

- A significant noise impact would be identified if the project would expose persons to or generate noise levels that would exceed applicable noise standards presented in the Sacramento County General Plan, Municipal Code, or SACOG's Sacramento International Airport Land Use Compatibility Plan.

- A significant impact would be identified if off-site traffic noise exposure or on-site activities generated by the project would substantially increase noise levels at existing sensitive receptors in the vicinity. For operational noise, a substantial increase would be identified relative to the Federal Interagency Commission on Noise (FICON) noise level increase significance criteria presented in Table 4. This criterion is applied because CEQA requires evaluation of noise impacts relative to conditions present without the project (i.e., project-generated noise increases), not just compliance with the adopted, absolute, noise standards. For project construction activities, a substantial increase is considered to occur when project construction would result in a 10 dBA increase over baseline ambient conditions (an approximate doubling of loudness). This higher threshold is applied due to the fact that construction activities are temporary and will be limited to daytime hours to the maximum extent practical.

- A significant impact would be identified if project construction activities or proposed on-site operations would expose noise-sensitive receptors to excessive groundborne vibration levels. Specifically, an impact would be identified if groundborne vibration levels due to these sources would exceed the FTA vibration impact criteria for damage to engineered structures (98 VdB).

## Noise Impacts Associated with Project-Generated Increases in Off-Site Traffic

With development of the project, traffic volumes on the local roadway network will increase. Those increases in daily traffic volumes will result in a corresponding increase in traffic noise levels at existing sensitive uses located along those roadways. The FHWA Model was used with traffic input data from the transportation impact analysis prepared by Fehr & Peers, Inc. to predict project traffic noise level increases relative to Existing (2020) and Cumulative 2040 project and no project conditions.

### Impact 1: Increases in Existing Traffic Noise Levels due to the Project

The FHWA Traffic Noise Model (FHWA-RD-77-108) was used to quantify increases in existing traffic noise levels at the existing sensitive land uses nearest to the project area roadway network. The FHWA Model predicts hourly $L_{eq}$ values for free-flowing traffic conditions. Estimates of the hourly distribution of traffic for a typical 24-hour period were used to develop DNL values from $L_{eq}$ values.

Traffic data in the form of average daily traffic volumes (ADT) were obtained from the project transportation impact study prepared by Fehr & Peers. Other inputs were obtained from published Caltrans traffic counts, SACOG, and BAC observations and file data. The existing and existing plus project traffic noise levels at the distances representing the nearest sensitive land uses to the project area roadways are summarized in Table 11. Table 11 also shows the thresholds for determination of a significant traffic noise increase, whether the roadway segment contains sensitive uses, and whether or not significant noise impacts are identified for each segment. Appendix D contains the FHWA Model inputs for existing and existing plus project conditions.

Factors such as roadway elevation, curvature, grade, and shielding from local topography or structures, or elevated receivers may affect actual traffic noise propagation. Along roadways segments where existing noise barriers are present, the degree of shielding provided by those barriers was estimated and included in the Table 11 results.

*Notes:*

1. Significance threshold derived from Table 4.
2. Sensitive receptors were considered to be residences of all densities, schools, & transient lodging facilities.
3. A significant impact is identified only along segments where the project-related traffic noise level increase would exceed the significance threshold AND where sensitive receptors are present along the roadway segment.

*Source: FHWA-RD-77-108 with inputs from project traffic impact study. Appendix D contains FHWA Model inputs.*

The data in Table 11 indicate that project-generated traffic noise level increases would result in significant noise impacts along eight (8) existing roadway segments along which sensitive receptors are currently located.

Based on the analysis presented above, off-site traffic noise impacts related to increases in traffic resulting from the implementation of the project (existing vs. existing plus project conditions) are identified as being ***significant***.

Mitigation for Impact 1:

The mitigation of impacts at existing sensitive receptors resulting from significant project-related traffic noise increases is frequently challenging because of a combination of limited mitigation options, constraints upon implementation of certain options, cost of implementation, and limited effectiveness of some options. Nonetheless, the following specific options for mitigation of off-site traffic noise impacts at existing noise sensitive receptors should be considered to the extent reasonable and feasible:

A. **Reduction in Traffic Volumes:** Because one of the most important factors in traffic noise generation is daily vehicle volume, a reduction in traffic noise levels can be increased by reducing the overall volume of traffic which would be generated by the project. It should be noted, however, that a 3 dB reduction in traffic noise levels would require a 50% reduction in projected traffic volumes. So, this measure would require a substantial decrease in traffic volume to achieve an appreciable decrease in traffic noise levels. As a result, it is unlikely that this measure would be a feasible means of fully mitigating this noise impact.

B. **Reduction in Vehicle Speeds:** Another factor in the generation of traffic noise is vehicle speed. Higher speeds translate to higher traffic noise levels. However, vehicle speed limits are set based on speed surveys, safety considerations, and other factors, and cannot be arbitrarily reduced to achieve lower traffic noise levels. As a result, this measure would not likely be a feasible means of mitigating this noise impact.

C. **Construction of Noise Barriers:** As noted in the discussion of noise mitigation fundamentals in the beginning of this report, appreciable reductions in traffic noise levels can be achieved through the construction of traffic noise barriers. However, at locations where openings or gaps in the barriers would be required for driveway openings or to maintain safe sight distances, the effectiveness of noise barriers is severely compromised. In addition, this measure would typically require construction of noise barriers on the property of the impacted receptor, rather than within a public right-of-way, so there is no guarantee the impacted receptor would agree to the construction of such barriers. Furthermore, the construction of off-site traffic noise barriers could be extremely costly per benefitted receptor, potentially rendering this measure infeasible.

D. **Use of Setbacks:** A 4.5 dB decrease in traffic noise levels can be achieved for each doubling of distance between the roadway centerline and affected residences. However, because the locations of existing residences which would be impacted by project-generated increases in traffic noise are fixed, as are the roadways of concern, this measure is not viable for existing residences.

E. **Noise-Reducing Pavement:** Noise-reducing pavement types, such as rubberized asphalt, have been shown to provide an appreciable noise level reduction relative to other pavement types (approximately 3-4 dB over conventional asphalt overlays). However, because the project-related increase in existing traffic noise levels exceeds 4 dB along two of the roadway segments analyzed in Table 11, the benefits of noise-reducing paving materials, even if feasible, would be insufficient to fully mitigate this impact. Nonetheless, at roadway segments where a 3-4 dB decrease in traffic noise levels would be sufficient to reduce this impact to a less than significant level, this mitigation alternative would be effective, if feasible.

Some of the aforementioned noise mitigation measures may be utilized to provide appreciable traffic noise level decreases. However, because such measures may be infeasible from a cost, engineering or safety standpoint, may not fully mitigate noise impacts, or could require the consent of the impacted receptor, the successful implementation of these measures cannot be guaranteed. As a result, this impact is considered significant and unavoidable.

**Significance of Impact 1 after Mitigation:** ***Significant and Unavoidable***

**Impact 2: Increases in Cumulative Traffic Noise Levels due to the Project**

The FHWA Traffic Noise Model (FHWA-RD-77-108) was used to quantify increases in future (cumulative) traffic noise levels at the nearest existing sensitive land uses to the project area roadway network. This analysis first assesses whether a cumulative roadway noise impact would occur by comparing the cumulative with project conditions to existing conditions. If a cumulative roadway noise impact is identified, it is further evaluated to assess whether the proposed project would make a cumulatively considerable contribution to the cumulative impact. This process is completed through a comparison of the roadway noise associated with the cumulative with project scenario against the cumulative no project scenario.

The FHWA Model predicts hourly $L_{eq}$ values for free-flowing traffic conditions. Estimates of the hourly distribution of traffic for a typical 24-hour period were used to develop DNL values from $L_{eq}$ values. Traffic data in the form of average daily traffic volumes (ADT) were obtained from the project transportation impact study prepared by Fehr & Peers. Other inputs were obtained from published Caltrans traffic counts, SACOG, and BAC observations and file data. The existing and cumulative plus project traffic noise levels at the distances representing the nearest sensitive land uses to the project area roadways are summarized in Table 12. Table 12 also shows the thresholds for determination of a significant traffic noise increase, whether the roadway segment contains sensitive uses, and whether or not a significant cumulative noise impact is identified for each segment.

Table 13 compares the cumulative with project traffic noise levels against the cumulative no project traffic noise levels and includes a determination regarding whether the project's contribution to an identified cumulative noise impact is considerable.

Appendix D contains the FHWA Model inputs for existing, cumulative and cumulative plus project conditions.

Factors such as roadway elevation, curvature, grade, and shielding from local topography or structures, or elevated receivers may affect actual traffic noise propagation. Along roadway segments where existing noise barriers are present, the degree of shielding provided by those barriers was estimated and included in the Table 12 and 13 results.

The data in Table 12 indicate that the increase in traffic noise levels between cumulative with project conditions and existing conditions would be significant along 18 roadway segments containing noise-sensitive uses. Table 13 indicates that the project's contribution to the identified significant cumulative noise impacts would be considerable along 8 roadway segments containing noise-sensitive land uses.

Based on the analysis presented above, off-site traffic noise impacts related to increases in traffic resulting from the implementation of the project (existing vs. cumulative with project conditions) are identified as being ***significant***.

*Notes:*

1. If the cumulative increase is greater than 3 dBA (from Table 12), then a 1.5 dBA threshold is applied to represent a cumulatively considerable contribution from the project.
2. Sensitive receptors were considered to be residences of all densities, schools, & transient lodging facilities.
3. A significant impact is identified only along segments where the project-related traffic noise level increase would exceed the significance threshold AND where sensitive receptors are present along the roadway segment.

*Source: FHWA-RD-77-108 with inputs from project traffic impact study. Appendix D contains FHWA Model inputs.*

Mitigation for Impact 2:

The mitigation of impacts at existing sensitive receptors resulting from significant project-related traffic noise increases is frequently challenging because of a combination of limited mitigation options, constraints upon implementation of certain options, cost of implementation, and limited effectiveness of some options. Nonetheless, the following specific options for mitigation of off-site traffic noise impacts at existing noise sensitive receptors should be considered to the extent reasonable and feasible:

A. **Reduction in Traffic Volumes:** Because one of the most important factors in traffic noise generation is daily vehicle volume, a reduction in traffic noise levels can be increased by reducing the overall volume of traffic which would be generated by the project. It should be noted, however, that a 3 dB reduction in traffic noise levels would require a 50% reduction in projected traffic volumes. So, this measure would require a substantial decrease in traffic volume to achieve an appreciable decrease in traffic noise levels. As a result, it is unlikely that this measure would be a feasible means of fully mitigating this noise impact.

B. **Reduction in Vehicle Speeds:** Another factor in the generation of traffic noise is vehicle speed. Higher speeds translate to higher traffic noise levels. However, vehicle speed limits are set based on speed surveys, safety considerations, and other factors, and cannot be arbitrarily reduced to achieve lower traffic noise levels. As a result, this measure would not likely be a feasible means of mitigating this noise impact.

C. **Construction of Noise Barriers:** As noted in the discussion of noise mitigation fundamentals in the beginning of this report, appreciable reductions in traffic noise levels can be achieved through the construction of traffic noise barriers. However, at locations where openings or gaps in the barriers would be required for driveway openings or to maintain safe sight distances, the effectiveness of noise barriers is severely compromised. In addition, this measure would typically require construction of noise barriers on the property of the impacted receptor, rather than within a public right-of-way, so there is no guarantee the impacted receptor would agree to the construction of such barriers. Furthermore, the construction of off-site traffic noise barriers could be extremely costly per benefitted receptor, potentially rendering this measure infeasible.

D. **Use of Setbacks:** A 4.5 dB decrease in traffic noise levels can be achieved for each doubling of distance between the roadway centerline and affected residences. However, because the locations of existing residences which would be impacted by project-generated increases in traffic noise are fixed, as are the roadways of concern, this measure is not viable for existing residences.

E. **Noise-Reducing Pavement:** Noise-reducing pavement types, such as rubberized asphalt, have been shown to provide an appreciable noise level reduction relative to other pavement types (approximately 3-4 dB over conventional asphalt overlays). However, because the project-related increase in existing traffic noise levels exceeds

4 dB along two of the roadway segments analyzed in Table 11, the benefits of noise-reducing paving materials, even if feasible, would be insufficient to fully mitigate this impact. Nonetheless, at roadway segments where a 3-4 dB decrease in traffic noise levels would be sufficient to reduce this impact to a less than significant level, this mitigation alternative would be effective, if feasible.

Some of the aforementioned noise mitigation measures may be utilized to provide appreciable traffic noise level decreases. However, because such measures may be infeasible from a cost, engineering or safety standpoint, may not fully mitigate noise impacts, or could require the consent of the impacted receptor, the successful implementation of these measures cannot be guaranteed. As a result, this impact is considered significant and unavoidable.

**Significance of Impact 2 after Mitigation: *Significant and Unavoidable***

## Noise Impacts from Proposed Plan area Components at Existing Sensitive Uses

According to the land use plan, the Plan area will contain new residential (various densities), commercial, commercial mixed-use, school, park and open space uses. However, the specific uses to be developed within those areas have yet to be determined. It should be noted that the Plan area will also contain existing agricultural uses, but agricultural uses are not proposed. The locations of the proposed and existing uses with the Plan area are shown on Figure 2.

Commercial Mixed-Use Operations

The Commercial Mixed-Use components of the Plan area will provide a mix of residential and commercial uses. In a vertically integrated situation within the urban town center and adjacent to the West El Camino Avenue, this could allow four-story apartments or offices over ground floor commercial. In a horizontally integrated situation, away from West El Camino Avenue, a one-story restaurant might be located adjacent to a five-story hotel, office building or apartment building. Primary noise sources associated with the non-residential uses of commercial mixed-use components typically consist of parking lot movements (cars arriving and departing, engines starting, car doors closing, etc.), commercial deliveries (vans, medium/heavy duty trucks), and mechanical equipment (rooftop heating, ventilating and air conditioning systems).

Employment/Highway Commercial Operations

The Employment/Highway Commercial components of the Plan area will focus on uses such as four or five-story office buildings, but could allow hotels, restaurants and retail uses. Primary noise sources associated with the commercial uses identified above typically consist of parking lot movements (cars arriving and departing, engines starting, car doors closing, etc.), commercial deliveries (vans, medium/heavy duty trucks), mechanical equipment (rooftop heating, ventilating and air conditioning systems), and drive-through speakers and vehicles. Although not specifically proposed, if a gas station were to be proposed within the Employment/Highway Commercial areas, noise sources associated with such uses would consist primarily of intermittent heavy truck fuel deliveries and smaller retail deliveries. Many gas stations include car washes which, if

developed in the Employment/Highway Commercial areas, would also introduce noise associated with car wash dryers and vacuums.

School Activities

The School components of the Plan area will consist of three K-8 schools, one high-school, and a community college. Primary noise sources associated with school uses typically consist of parking lot movements (cars arriving and departing, engines starting, car doors closing, etc.), children playing on play structures, participants and spectators at outdoor sport playing fields and facilities, and outdoor public address (PA) systems associated with playing fields/stadiums.

Section 6.68.090(a) of the Sacramento County Municipal Code provides an exemption for noise from school bands, school athletic and school entertainment events. In addition, Section 6.68.090(c) exempts noise from activities conducted on school grounds provided the grounds are owned and operated by a public entity or private school. For the purposes of this assessment, it is reasonably assumed that future school uses within the Plan area would be owned and operated by a public entity or private school. As a result, an impact discussion for project-generated school activity noise at existing noise-sensitive uses relative to the Sacramento County Municipal Code noise level criteria is not included in this assessment. Rather, this assessment provides an analysis of school activity noise at existing off-site uses relative to the applicable Sacramento County General Plan noise level limits. For the purposes of this analysis, it is reasonable to assume that school activities within the Plan area would likely be restricted to daytime hours (7:00 a.m. to 10:00 p.m.).

Park Activities

The Park components of the Plan area are distributed throughout the Plan area and have been sized to meet local neighborhood and larger community-wide needs. Primary noise sources associated with park uses typically consist of children playing on play structures, and participants and spectators at outdoor sport playing fields and facilities.

Section 6.68.090(c) of the Sacramento County Municipal Code exempts noise from activities conducted on parks and public playgrounds provided the uses are owned and operated by a public entity. For the purposes of this assessment, it is reasonably assumed that future park uses within the Plan area would be owned and operated by a public entity. As a result, an impact discussion for project-generated park activity noise at existing noise-sensitive uses relative to the Sacramento County Municipal Code noise level criteria is not included in this assessment. Rather, this assessment provides an analysis of park activity noise at existing off-site uses relative to the applicable Sacramento County General Plan noise level limits. For the purposes of this analysis, it is reasonable to assume that park activities within the Plan area would likely be restricted to daytime hours (7:00 a.m. to 10:00 p.m.).

Applicable Noise Level Criteria

As noted in the Regulatory Setting section of this report, the Sacramento County General Plan establishes exterior noise level standards of 55 dB $L_{50}$ / 75 dB $L_{max}$ (daytime) and 50 dB $L_{50}$ / 70

dB $L_{max}$ (nighttime) for residential uses. In addition, the General Plan establishes interior noise level standards of 35 dB $L_{50}$ / 55 dB $L_{max}$ (daytime and nighttime) for residential uses. The Sacramento County Municipal Code also establishes acceptable exterior noise level limits for residential uses. However, the relevant Municipal Code noise level criteria are consistent with that established in the General Plan. As a result, compliance with the General Plan's exterior noise level criteria identified above would ensure for satisfaction of the Municipal Code's exterior noise level limits.

Finally, although the preliminary land use plan contains the general locations of the planned land use components within the Plan area (Figure 2), detailed plans illustrating locations of specific uses within those components have not yet been developed. It is expected that detailed development plans for all land use components within the Plan area will be reviewed at a future date as part of the County's project approval process. As a result, the following section provides generalized analyses of land use operations noise exposure at existing noise-sensitive uses.

**Impact 3: Commercial Mixed-Use Parking Noise at Existing Sensitive Uses**

As a means of determining potential noise exposure due to Commercial Mixed-Use parking lot activities, Bollard Acoustical Consultants, Inc. (BAC) utilized specific parking lot noise level measurements conducted by BAC. Specifically, a series of individual noise measurements were conducted of multiple vehicle types arriving and departing a parking area, including engines starting and stopping, car doors opening and closing, and persons conversing as they entered and exited the vehicles. The results of those measurements revealed that individual parking lot movements generated mean noise levels of 65 dB SEL at a reference distance of 50 feet.

For a conservative assessment of Commercial Mixed-Use parking area noise generation, it was assumed that individual parking areas (of which there could be more) could accommodate up to 300 vehicles. This estimate of vehicle capacity was based on review of the preliminary land use plan shown in Figure 2 and the use types envisioned within the commercial mixed-use areas. It was also assumed that a parking area could fill or empty during any given peak hour of business operations. However, during hours of operation, it is likely that parking area activity would be more spread out. Parking area noise exposure was determined using the following equation:

$$Peak\ Hour\ L_{eq} = 65+10*log\ (N) - 35.6$$

Where 65 is the SEL for a single automobile parking operation at a reference distance of 50 feet, N is the number of parking area operations in a peak hour, and 35.6 is 10 times the logarithm of the number of seconds in an hour. Using BAC parking lot noise measurement data and the equation provided above, noise exposure from an individual parking area having 300 vehicle stalls computes to approximately 49 dB $L_{50}$ and 65 dB $L_{max}$ at a distance of 50 feet from the effective noise center of the area.

The nearest identified existing noise-sensitive uses to proposed Commercial Mixed-Use components have been identified as residential receivers located on the south side of I-80, which maintain a separation of approximately 800 feet. When projected to a distance of 800 feet, parking noise exposure from a Commercial Mixed-Use component is calculated to be

approximately 25 dB $L_{50}$ and 41 dB $L_{max}$. The predicted noise levels exclude consideration of shielding that would be provided by existing 12-foot-tall solid traffic noise barriers constructed along I-80, which are estimated to provide a minimum of 12 dB of noise level reduction. Thus, it is expected that Commercial Mixed-Use parking lot noise levels will satisfy the Sacramento County General Plan daytime and nighttime exterior and interior noise level limits at the nearest existing noise-sensitive (residential) uses. It is further expected that Commercial Mixed-Use parking area noise levels would be well below ambient noise level conditions at the nearest existing residential uses. As a result, this impact is identified as being ***less than significant.***

**Impact 4: Commercial Mixed-Use Delivery Truck Noise at Existing Sensitive Uses**

It is expected that portions of the businesses proposed within the Commercial Mixed-Use areas will receive deliveries of product from heavy and/or medium-duty trucks. It is further expected that those uses will typically generate light semi-trailer truck activity once initial store stocking has been completed. BAC file data for commercial uses such as those envisioned within the Commercial Mixed-Use areas can have up to three (3) regular weekly heavy truck deliveries of product to the businesses. These deliveries would occur on different days and times throughout the week. Depending on the design of the use, truck unloading could occur at loading dock areas or in front of the retail use. In addition to occasional heavy truck deliveries, medium-duty vendor trucks and side-step vans could also deliver products to the other commercial businesses of the parcel, which would typically occur at the storefronts.

For the purposes of this analysis, it was assumed that 1 heavy truck and 3 medium duty truck deliveries could occur within a Commercial Mixed-Use parcel / area during a busy hour. Truck deliveries are expected to be relatively brief in duration. BAC file data indicate that heavy truck deliveries produce an average Sound Exposure Level (SEL) of approximately 85 dB at a distance of 100 feet, with medium duty trucks (including sidestep vans), producing a SEL of approximately 76 dB. Based on these levels, and 1 semi-trailer delivery and 3 medium duty truck deliveries during any given hour, the resulting noise levels are calculated to be 46 dB $L_{50}$ and 74 dB $L_{max}$ at a distance of 100 feet.

The nearest identified existing noise-sensitive uses to proposed Commercial Mixed-Use components have been identified as residential receivers located on the south side of I-80, which maintain a separation of approximately 800 feet. When projected to a distance of 800 feet, delivery truck activity noise exposure from a Commercial Mixed-Use component is calculated to be approximately 28 dB $L_{50}$ and 56 dB $L_{max}$. The predicted noise levels exclude consideration of shielding that would be provided by existing 12-foot-tall solid traffic noise barriers constructed along I-80, which are estimated to provide a minimum of 12 dB of noise level reduction. Thus, it is expected that Commercial Mixed-Use truck delivery noise levels will satisfy the Sacramento County General Plan daytime and nighttime exterior and interior noise level limits at the nearest existing noise-sensitive (residential) uses. It is further expected that Commercial Mixed-Use truck delivery noise levels would be well below ambient noise level conditions at the nearest existing residential uses. As a result, this impact is identified as being ***less than significant.***

**Impact 5: Commercial Mixed-Use HVAC Equipment Noise at Existing Sensitive Uses**

The HVAC systems within future buildings in the Commercial Mixed-Use areas will likely consist of packaged rooftop air conditioning systems. Such HVAC units, which typically stand about 4-5 feet tall, would be shielded from view of nearby sensitive uses by the building parapets. The noise generation of packaged rooftop HVAC units is related to the cooling capacity of the system. A typical 10-ton packaged rooftop system generates an A-weighted sound power level of approximately 93 dBA (Noise Control for Buildings and Manufacturing Plants, Hoover & Keith, equation 7-10). At a distance of 100 feet, the noise generation of the packaged rooftop system would be approximately 53 dBA. After considering the noise attenuation provided by the building and building parapet (estimated to be approximately 10 dBA), the resulting noise level would be approximately 45 dB $L_{eq}/L_{50}$ at a reference distance of 100 feet from the building facade.

The nearest identified existing noise-sensitive uses to proposed Commercial Mixed-Use components have been identified as residential receivers located on the south side of I-80, which maintain a separation of approximately 800 feet. When projected to a distance of 800 feet, HVAC equipment noise exposure from a Commercial Mixed-Use component is calculated to be approximately 27 dB $L_{50}$. The predicted noise level excludes consideration of shielding that would be provided by existing 12-foot-tall solid traffic noise barriers constructed along I-80, which are estimated to provide a minimum of 12 dB of noise level reduction. Thus, it is expected that Commercial Mixed-Use HVAC equipment noise levels will satisfy the Sacramento County General Plan and Municipal Code (Section 6.68.120) daytime and nighttime exterior and interior noise level limits at the nearest existing noise-sensitive (residential) uses. It is further expected that Commercial Mixed-Use HVAC equipment noise levels would be well below ambient noise level conditions at the nearest existing residential uses. As a result, this impact is identified as being ***less than significant.***

**Impact 6: Employment/Highway Commercial Use Parking Noise at Existing Sensitive Uses**

An analysis of commercial parking area noise exposure was presented in **Impact 3**. The results from that analysis indicate that noise exposure from an individual parking area having 300 vehicle stalls computes to approximately 49 dB $L_{50}$ and 65 dB $L_{max}$ at a distance of 50 feet from the effective noise center of the area.

The nearest identified existing noise-sensitive uses to proposed Employment/Highway Commercial components have been identified as residential receivers located on the south side of I-80, which maintain a separation of approximately 400 feet. When projected to a distance of 400 feet, parking lot noise levels are calculated to be approximately 31 dB $L_{50}$ and 47 dB $L_{max}$. The predicted noise levels exclude consideration of shielding that would be provided by existing 12-foot-tall solid traffic noise barriers constructed along I-80, which are estimated to provide a minimum of 12 dB of noise level reduction. Thus, it is expected that Employment/Highway Commercial parking area noise levels will satisfy the Sacramento County General Plan daytime and nighttime exterior and interior noise level limits at the nearest existing noise-sensitive (residential) uses. It is further expected that Employment/Highway Commercial parking area

noise levels would be well below ambient noise level conditions at the nearest existing residential uses. As a result, this impact is identified as being ***less than significant.***

**Impact 7: Employment/Highway Commercial Use Delivery Truck Noise at Existing Sensitive Uses**

An analysis of commercial delivery truck activity noise exposure was presented in **Impact 4**. The results from that analysis indicate that noise exposure from commercial delivery truck activities was calculated to be 46 dB $L_{50}$ and 74 dB $L_{max}$ at a distance of 100 feet.

The nearest identified existing noise-sensitive uses to proposed Employment/Highway Commercial components have been identified as residential receivers located on the south side of I-80, which maintain a separation of approximately 400 feet. When projected to a distance of 400 feet, delivery truck activity noise levels are calculated to be approximately 34 dB $L_{50}$ and 62 dB $L_{max}$. The predicted noise levels exclude consideration of shielding that would be provided by existing 12-foot-tall solid traffic noise barriers constructed along I-80, which are estimated to provide a minimum of 12 dB of noise level reduction. Thus, it is expected that Employment/Highway Commercial delivery truck activity noise levels will satisfy the Sacramento County General Plan daytime and nighttime exterior and interior noise level limits at the nearest existing noise-sensitive (residential) uses. It is further expected that Employment/Highway Commercial delivery truck activity noise levels would be well below ambient noise level conditions at the nearest existing residential uses. As a result, this impact is identified as being ***less than significant.***

**Impact 8: Employment/Highway Commercial Use HVAC Equipment Noise at Existing Sensitive Uses**

An analysis of commercial HVAC equipment noise exposure was presented in **Impact 5.** The results from that analysis indicate that noise exposure from commercial HVAC equipment was calculated to be 45 dB $L_{50}$ at a distance of 100 feet.

The nearest identified existing noise-sensitive uses to proposed Employment/Highway Commercial components have been identified as residential receivers located on the south side of I-80, which maintain a separation of approximately 400 feet. When projected to a distance of 400 feet, HVAC equipment noise level exposure is calculated to be approximately 33 dB $L_{50}$. The predicted noise level excludes consideration of shielding that would be provided by existing 12-foot-tall solid traffic noise barriers constructed along I-80, which are estimated to provide a minimum of 12 dB of noise level reduction. Thus, it is expected that Employment/Highway Commercial HVAC equipment noise levels will satisfy the Sacramento County General Plan and Municipal Code (Section 6.68.120) daytime and nighttime exterior and interior noise level limits at the nearest existing noise-sensitive (residential) uses. It is further expected that Employment/Highway Commercial HVAC equipment noise levels would be well below ambient noise level conditions at the nearest existing residential uses. As a result, this impact is identified as being ***less than significant.***

**Impact 9: Employment/Highway Commercial Use Drive-Through Restaurant Noise at Existing Sensitive Uses**

As mentioned previously, specific uses within the land use components have not yet been determined. However, it is possible that the Employment/Highway Commercial components could contain drive-through restaurant businesses.

To quantify the noise emissions of a restaurant drive-through speaker and vehicle passages, BAC utilized noise measurement data collected for drive-through operations in the greater Sacramento area in recent years. According to BAC file data, drive-through menu speaker boards have measured noise levels of approximately 63 dB L50 and 67 dB $L_{max}$ at a distance of 10 feet. BAC file data further indicates that vehicle passbys in drive-throughs have measured levels of approximately 60 dB L50 and 70 dB $L_{max}$ at 5 feet.

The nearest identified existing noise-sensitive uses to proposed Employment/Highway Commercial components have been identified as residential receivers located on the south side of I-80, which maintain a separation of approximately 400 feet. When projected to a distance of 400 feet, combined drive-through operations noise level exposure is calculated to be approximately 31 dB $L_{50}$ and 37 dB $L_{max}$. The predicted noise levels exclude consideration of shielding that would be provided by existing 12-foot-tall solid traffic noise barriers constructed along I-80, which are estimated to provide a minimum of 12 dB of noise level reduction. Thus, it is expected that Employment/Highway Commercial drive-through operations noise levels will satisfy the Sacramento County General Plan daytime and nighttime exterior and interior noise level limits at the nearest existing noise-sensitive (residential) uses. It is further expected that Employment/Highway Commercial drive-through operations noise levels would be well below ambient noise level conditions at the nearest existing residential uses. As a result, this impact is identified as being ***less than significant.***

**Impact 10: Employment/Highway Commercial Use Car Wash Operations Noise at Existing Sensitive Uses**

As mentioned previously, specific uses within the land use components have not yet been determined. However, it is possible that the Employment/Highway Commercial components within the Plan area could contain gas station uses with car wash operations.

Based on the experience of Bollard Acoustical Consultants, noise levels generated by car washes are primarily due to the drying portion of the operation. To quantify the noise levels from car wash drying assemblies, BAC utilized file data for equipment commonly used in gas station/car wash tunnel combination uses. Specifically, noise level data for a Ryko 3-Fan Slimline Drying System was used in this analysis. In addition, it is the experience of BAC that many gas station/ car wash combination uses also have vehicle vacuum systems. To quantify the noise generation from vacuum systems, BAC utilized file data for equipment commonly used in gas station/car wash tunnel combination uses. Specifically, noise level data for a JE Adams Super Vac (2-motor) Model 9200 series vacuum system was used in this analysis.

The nearest identified existing noise-sensitive uses to proposed Employment/Highway Commercial components have been identified as residential receivers located on the south side of I-80, which maintain a separation of approximately 400 feet. When projected to a distance of 400 feet, car wash drying assembly noise level exposure is calculated to be approximately 52 dB $L_{50}$. In addition, vacuum system noise level exposure is calculated to be approximately 48 dB $L_{50}$ at a distance of 400 feet. The predicted noise level excludes consideration of shielding that would be provided by existing 12-foot-tall solid traffic noise barriers constructed along I-80, which are estimated to provide a minimum of 12 dB of noise level reduction. Thus, it is expected that Employment/Highway Commercial car wash operations noise levels will satisfy the Sacramento County General Plan daytime and nighttime exterior and interior noise level limits at the nearest existing noise-sensitive (residential) uses. It is further expected that Employment/Highway Commercial car wash operations noise levels would be well below ambient noise level conditions at the nearest existing residential uses. As a result, this impact is identified as being ***less than significant.***

**Impact 11: School Use Parking Noise at Existing Sensitive Uses**

An analysis of commercial parking area noise exposure was presented in **Impact 3**. The results from that analysis indicate that noise exposure from an individual parking area having 300 vehicle stalls computes to approximately 49 dB $L_{50}$ and 65 dB $L_{max}$ at a distance of 50 feet from the effective noise center of the area.

The nearest identified existing noise-sensitive uses to a proposed School use have been identified as residential receivers located adjacent to the proposed high school within the Plan area, which maintain a separation of approximately 50 feet. However, due to typical spatial requirements of typical parking areas, it is not likely that a 300-stall parking area would have an effective noise center 50 feet from its edge. When conservatively projected to a distance of 200 feet, parking lot noise levels are calculated to be approximately 37 dB $L_{50}$ and 53 dB $L_{max}$. Nonetheless, because future configurations of parking lots within the School use areas are currently not known, and based on the proximity to nearby sensitive uses, it is possible that parking area noise exposure could exceed the General Plan's exterior and interior daytime noise level standards at nearby existing residential uses. Further, noise levels from School parking areas could potentially exceed existing ambient conditions at nearby residential uses. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 11:

To satisfy applicable Sacramento County General Plan exterior and interior noise level standards at nearby existing noise-sensitive uses, the following noise mitigation measure should be implemented:

**MM-11:** A site specific noise impact study that addresses School use parking area activities shall be completed by a qualified noise consultant once site-specific development plans are completed. The noise impact study shall include an analysis of School use parking noise exposure at the nearest existing noise-sensitive uses (residential). The analysis shall include associated mitigation measures (as

appropriate) to reduce school-related parking lot noise levels to a state of compliance with the County Code standards of 55 dBA $L_{50}$ and 75 dBA $L_{max}$ at nearby existing sensitive receptors. Specific mitigation measures could include, but are not limited to, increasing setbacks between parking areas and nearby sensitive receptors (6 dBA decrease per doubling of distance), and the construction of solid noise barriers (5-10 dBA reduction depending on barrier height and geometry).

**Significance of Impact 11 after Mitigation: *Less than Significant***

**Impact 12: Elementary School Use Playground and Playing Field Noise at Existing Sensitive Uses**

For the assessment of playground noise impacts, noise level data collected by BAC staff at various outdoor play areas in recent years was utilized. The primary noise source associated with play area use is shouting children. BAC file data indicate that noise levels of outdoor play areas containing approximately 50 children are measured to be 55 dB $L_{eq}$ and 75 dB $L_{max}$ at a distance of 50 feet from the focal point of the play area during school recess.

Because activities within School components of the Plan area would consist of human speech (i.e., shouting children), noise associated with school playground and playing field activities would be subject to the Sacramento County General Plan's more restrictive daytime and nighttime noise level standards (the criteria contain a 5 dB penalty for noise consisting primarily of speech). However, it is reasonable to assume that activities occurring on school grounds within the Plan area would likely be restricted to daytime hours (7:00 a.m. to 10:00 p.m.). As a result, the General Plan noise level standards applicable to school playground activities would be exterior daytime noise level standards of 50 dB $L_{50}$/70 dB $L_{max}$ and interior noise level limits of 30 dB $L_{50}$/50 dB $L_{max}$ (anytime) for residential uses.

The distance between the nearest identified existing noise-sensitive use (residence) and proposed Elementary School (K-8) has been identified as being approximately 800 feet. When projected to a distance of 800 feet, school playground noise exposure is calculated to be approximately 31 dB $L_{50}$ and 51 dB $L_{max}$. The predicted noise levels exclude consideration of shielding that would be provided by proposed intervening structures (e.g., residences, sound walls, etc.) which would further reduce those levels. Based on the information above, it is expected that Elementary School use playground activity noise levels will satisfy the Sacramento County General Plan daytime exterior and interior noise level limits at the nearest existing noise-sensitive (residential) uses. It is further expected that Elementary School use playground noise levels would be well below ambient noise level conditions at the nearest existing residential uses. As a result, noise impacts associated with Elementary School playgrounds and playing fields affecting existing noise-sensitive land uses are identified as being ***less than significant.***

**Impact 13: High School Use Sports Fields and Stadium Noise at Existing Sensitive Uses**

The most significant noise sources associated with High School outdoor sports fields and stadiums consist of public address (PA) system usage and crowd noise. BAC used a combination

of BAC file data for similar noise sources and published acoustical literatures to predict the noise generation associated with an outdoor sports stadium within the Plan area. Specifically, BAC utilized noise level measurements conducted by BAC staff during football games and playing fields held at outdoor facilities in the Sacramento area in recent years (which included crowd noise and PA system usage), and published noise level data for crowd noise, to assess the noise generation of Plan area sports stadium noise. From this data, BAC developed reference noise levels which were utilized in this analysis. Specifically, reference noise levels of 70 dB $L_{50}$ and 85 dB $L_{max}$ at 100 feet were used for PA system noise during a stadium event. Additionally, reference noise levels of 75 dB $L_{50}$ and 90 dB $L_{max}$ at 100 feet were used for crowd noise in bleachers during a stadium event. For less intensive (non stadium) activities on the High School playing fields with no public address system usage, BAC file data indicate that noise levels would typically be 55 dB $L_{eq}$ and 75 dB $L_{max}$ at a distance of 50 feet from the focal point of the playing field areas.

The nearest identified existing noise-sensitive uses to the proposed High School use have been identified as residences located in the northwest quadrant of San Juan Road and El Centro Road, immediately adjacent to the proposed High School Site. Depending upon the High School site design, intervening shielding, locations of playing fields and stadium, and PA system configuration, noise exposure associated with High School activities could exceed the General Plan's daytime exterior and interior noise level standards at nearby existing residential uses. Further, noise levels from stadium sporting events could potentially exceed existing ambient conditions at nearby residential uses. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 13:

To satisfy applicable Sacramento County General Plan exterior and interior noise level standards at nearby existing noise-sensitive uses, the following noise mitigation measure should be implemented:

**MM-13:** A noise impact study that addresses School sports stadium noise shall be completed by a qualified noise consultant once site-specific development plans are completed. The noise impact study shall include an analysis of stadium noise exposure at the nearest existing noise-sensitive uses (residential). If stadium-generated noise levels exceed the County Code standards of 55 dBA L50 or 75 dBA $L_{max}$ at nearby sensitive receptors, the analysis shall include associated mitigation measures (as appropriate) to reduce stadium noise levels, including crowd and PA system noise, to a state of compliance with those standards at nearby existing sensitive receptors.

Specific mitigation measures could include but are not limited to the following:

- The construction of solid noise barriers that effectively attenuate sports playing field and/or stadium noise exposure to a state of compliance with the applicable noise limits at existing sensitive receptors. Noise barriers can typically provide

a 5-10 dBA reduction in sound levels depending on barrier height and geometry.

- A site design that integrates intervening shielding, setbacks, and restrictions on equipment configurations and settings. Increased setbacks will provide a decrease in noise at a rate of approximately 6 dBA per each doubling of distance between noise sources and sensitive receptors.

**Significance of Impact 13 after Mitigation: *Less than Significant***

**Impact 14: Park Activity Noise at Existing Sensitive Uses**

Noise generated by parks vary depending on whether the parks are intended for passive or active use. Passive use includes picnic and sitting areas whereas active use incudes playing fields and play structures. Although the preliminary land use plan contains the general locations of the planned Park uses within the Plan area (Figure 2), detailed plans containing park activities (i.e., active or passive use) have not yet been developed. For the purposes of this analysis, it was conservatively assumed that the proposed Park uses would contain active uses. According to BAC file data, parks consisting of active uses (playing fields/playgrounds) have noise levels of approximately 60 dB $L_{50}$ and 70 dB $L_{max}$ at a distance of 50 feet.

Because activities within Park components of the Plan area would likely consist of human speech (i.e., shouting and cheering during activities), noise associated with park activities would be subject to the Sacramento County General Plan's more restrictive daytime and nighttime noise level standards (the criteria contain a 5 dB penalty for noise consisting primarily of speech). However, it is reasonable to assume that park hours within the Plan area would likely be restricted to daytime hours (7:00 a.m. to 10:00 p.m.). As a result, the General Plan noise level standards applicable to park activities would be exterior daytime noise level standards of 50 dB $L_{50}$/70 dB $L_{max}$ and interior noise level limits of 30 dB $L_{50}$/50 dB $L_{max}$ (anytime) for residential uses.

The nearest identified existing noise-sensitive uses to a proposed Park component have been identified as residential receivers located west of the Plan area, which maintain a separation of approximately 700 feet. When projected to a distance of 700 feet, park (active use) noise levels are calculated to be approximately 37 dB $L_{50}$ and 47 dB $L_{max}$. Thus, it is expected that noise levels from activities occurring within Park uses will satisfy the applicable Sacramento County General Plan daytime exterior and interior noise level limits at the nearest existing noise-sensitive (residential) uses. It is further expected that Park use noise levels would be well below ambient noise level conditions at the nearest existing residential uses. As a result, no adverse noise impacts are identified for typical activities that will occur at parks proposed within the Plan area.

It should be noted, however, that the 25.8 acre park proposed in the west-central portion of the Plan area will include an outdoor pavilion area where amplified music events may occur. Although specific designs for this park have yet to be developed, the pavilion area would likely be located approximately ½ mile from the nearest residences to the west along Garden Highway. Given this setback distance, the County's daytime noise standard of 50 dBA $L_{50}$ (after application of the 5 dBA adjustment for sound consisting of music) would not be exceeded provided amplified sound

levels do not exceed 80 dBA $L_{50}$ at a reference distance of 100 feet from the music generation location (i.e., speakers). Because it is possible that amplified music sound levels could exceed 80 dBA at 100 feet from the amplified music sound source, this impact is identified as being ***potentially significant.***

Mitigation for Impact 14:

To satisfy applicable Sacramento County General Plan and Noise Ordinance standards at nearby existing noise-sensitive uses, the following noise mitigation measure should be implemented for events held at the 25.8 acre park which include amplified speech or music:

**MM-14:** If a pavilion for use in hosting events with amplified speech or music components is constructed within the 25.8 acre park proposed in the west-central portion of the Plan area, the following specific measures shall be incorporated into the design and operation of such a pavilion:

- The sound generation area of the pavilion shall be located as close as feasible to the eastern park boundary at Bryte Bend Road, and ideally at least 2,500 feet from the nearest residence to the west.
- All activities held at the pavilion consisting of amplified speech or music shall be limited to daytime hours of 7 am to 10 pm.
- Amplified speech or music levels shall be maintained at or below a median level of 80 dBA $L_{50}$ at a distance of 100 feet from the sound source (i.e., speakers).
- Noise monitoring shall be required during the first year of park usage for events utilizing amplified speech or music to ensure the County Code noise standards of 50 dBA L50 and 70 dBA $L_{max}$ are satisfied at the nearest sensitive receptors. In the event that such measurements reveal that the County Code standards are being exceeded at this location during events with amplified speech or music, implementation of additional noise control measures would be required to achieve compliance. Such measures would include further reducing the output of the sound amplification system or physical modification of speaker locations and orientations.

**Significance of Impact 14 after Mitigation: *Less than Significant***

## Noise Impacts Associated with Project On-Site Construction Activities

### Impact 15: On-Site Construction Noise Levels at Existing Sensitive Uses

During project construction, heavy equipment would be used for grading excavation, paving, and building construction, which would increase ambient noise levels when in use. Noise levels would vary depending on the type of equipment used, how it is operated, and how well it is maintained.

Noise exposure at any single point outside the project work area would also vary depending on the proximity of equipment activities to that point. The property boundaries of the nearest existing residential uses are located approximately 25 feet away from where construction activities would occur within the Plan area.

Table 14 includes the range of maximum noise levels for equipment commonly used in general construction projects at full-power operation at a distance of 50 feet. Not all of these construction activities would be required of this project. The Table 14 data also include predicted maximum equipment noise levels at the boundary of the nearest sensitive use located approximately 25 feet away, which assume a standard spherical spreading loss of 6 dB per doubling of distance.

**Table 14**
**Construction Equipment Reference Noise Levels and Predicted Noise Levels at 25 Feet**

| Equipment Description | Maximum Noise Level at 50 Feet (dBA) | Predicted Maximum Noise Level at 25 feet (dBA) |
|---|---|---|
| Air compressor | 80 | 86 |
| Backhoe | 80 | 86 |
| Ballast equalizer | 82 | 88 |
| Ballast tamper | 83 | 89 |
| Compactor | 82 | 88 |
| Concrete mixer | 85 | 91 |
| Concrete pump | 82 | 88 |
| Concrete vibrator | 76 | 82 |
| Crane, mobile | 83 | 89 |
| Dozer | 85 | 91 |
| Generator | 82 | 91 |
| Grader | 85 | 88 |
| Impact wrench | 85 | 91 |
| Loader | 80 | 91 |
| Paver | 85 | 86 |
| Pneumatic tool | 85 | 91 |
| Pump | 77 | 91 |
| Saw | 76 | 83 |
| Scarifier | 83 | 82 |
| Scraper | 85 | 89 |
| Shovel | 82 | 91 |
| Spike driver | 77 | 88 |
| Tie cutter | 84 | 83 |
| Tie handler | 80 | 90 |
| Tie inserter | 85 | 86 |
| Truck | 84 | 91 |

*Source: Federal Transit Administration Noise and Vibration Impact Assessment Manual, Table 7-1 (2018)*

Based on the equipment noise levels in Table 14, worst-case on-site project construction equipment maximum noise levels at the nearest existing residential uses located 25 feet away are expected to range from approximately 82 to 91 dB. As indicated in Table 1, baseline maximum ambient noise levels at existing residences represented by noise monitoring Site 15 ranged from 58-64 dBA during the noise survey period. Thus, a portion of the construction equipment used within the Plan area could result in short-term noise level increases in excess of 10 dBA over existing ambient noise levels at the nearest existing sensitive uses. Further, it is possible that those noise levels could exceed the applicable Sacramento County General Plan and Municipal Code noise level limits applicable to construction noise. As a result, this impact is considered **potentially significant**.

**Mitigation for Impact 15**: On-Site Construction Noise Control Measures

Policy NO-8 of the Sacramento County General Plan states that noise associated with construction activities shall adhere to the requirements established in Municipal Code Section 6.68.090(e), which offers an exemption for construction noise provided that the activities occur during specified hours and days of the week. The complete text of Municipal Code Section 6.68.090(e) is provided in the Regulatory Setting of this report. Provided construction

activities within the Plan area occur pursuant to Municipal Code Section 6.68.090(e), project construction activities would be exempt. However, construction activities occurring during these hours would not be exempt from the Municipal Code requirements and noise levels generated by construction activities could exceed applicable General Plan and Municipal Code noise level standards at nearby existing residential uses.

MM-15: The following measures shall be incorporated into the project on-site construction operations:

- Noise-generating construction activities within the Plan area shall occur pursuant to the hours and days outlined in Municipal Code Section 6.68.090(e).
- All noise-producing project equipment and vehicles using internal-combustion engines shall be equipped with manufacturers-recommended mufflers and be maintained in good working condition.
- All mobile or fixed noise-producing equipment used on the project site that are regulated for noise output by a federal, state, or local agency shall comply with such regulations while in the course of project activity.
- Electrically powered equipment shall be used instead of pneumatic or internal-combustion-powered equipment, where feasible.
- Material stockpiles and mobile equipment staging, parking, and maintenance areas shall be located as far as practicable from noise-sensitive uses.
- Project area and site access road speed limits shall be established and enforced during the construction period.
- Nearby residences shall be notified of construction schedules so that arrangements can be made, if desired, to limit their exposure to short-term increases in ambient noise levels.
- In the event that unusual circumstances or emergencies prevent certain project construction activities from complying with the Municipal Code Section 6.68.090(e) then a noise control plan shall be developed to ensure that sufficient mitigation is implemented during project construction to ensure adverse noise impacts are avoided.

Although the mitigation measures cited above would decrease the potential for adverse public reaction to noise generated during construction activities, it cannot be determined with certainty that these measures would reduce construction-related noise levels to both a state of compliance with County Code requirements and to levels less than 10 dBA above ambient conditions. As a result, this impact is considered **significant and unavoidable**.

**Significance of Impact 15 after Mitigation: *Significant and Unavoidable***

## Vibration Impacts Associated with Project Activities

### Impact 16: Vibration Generated by Project Construction and On-Site Operations

During project construction, heavy equipment would be used for grading, excavation, paving, and building construction, which would generate localized vibration in the immediate vicinity of the construction. The nearest identified existing structures (newer engineered residences which are not highly susceptible to damage by vibration) are located approximately 25 feet from where construction activities would occur within the Plan area.

Table 15 includes the range of vibration levels for equipment commonly used in general construction projects at a distance of 25 feet. The Table 15 data also include predicted equipment vibration levels at a distance of 100 feet from proposed construction activities.

**Table 15**
**Vibration Source Levels for Construction Equipment and Predicted Levels at 50 Feet**

| Equipment | Maximum Vibration Level at 25 feet, VdB (rms) | Predicted Maximum Vibration Level at 100 feet, VdB (rms) |
|---|---|---|
| Vibratory Roller | 94 | 76 |
| Hoe Ram | 87 | 69 |
| Large bulldozer | 87 | 69 |
| Loaded trucks | 86 | 68 |
| Jackhammer | 79 | 61 |
| Small bulldozer | 58 | 40 |

[1] PPV = Peak Particle Velocity

Source: 2018 FTA Transit Noise and Vibration Impact Assessment Manual and BAC calculations

As shown in Table 15, vibration levels generated from on-site construction activities are predicted to be below thresholds for damage to engineered residential structures (98 VdB) at a distance of 25 feet from those activities. In addition, construction-related vibration levels are generally predicted to be below levels considered to be annoying (75 VdB) at a distance of 100 feet from the construction activity.

The project proposes a mixed-use community containing residential, commercial, commercial mixed-use, school, park, agricultural and open space uses. It is the experience of BAC these uses do not typically have equipment that generates appreciable off-site vibration. Because vibration levels due to both project construction and activities related to proposed developments within the Plan area are expected to be satisfactory relative to the applicable vibration criteria for damage to structures and annoyance, this impact is considered to be ***less than significant***.

## Noise Impacts Upon Sensitive Uses Proposed within the Plan area

The California Supreme Court issued an opinion in *California Building Industry Association v. Bay Area Air Quality Management District (2015)* holding that CEQA is primarily concerned with the impacts of a project *on* the environment and generally does not require agencies to analyze the impact of existing of future conditions on a project's future users or residents. Nevertheless, Sacramento County has General Plan policies that address existing/future conditions affecting future uses of the proposed Plan area. As a result, noise and vibration impacts upon the project are evaluated for General Plan consistency in the following sections.

## On-Site Noise Impacts from Traffic

### Impact 17: Future Exterior Traffic Noise Levels at Proposed Sensitive Uses

The project proposes extensive development of residential uses of varying densities throughout the Plan area, including areas located adjacent to major roadways. While the interior spaces of residential uses share the same noise-sensitivity regardless of density, the noise-sensitivity of exterior areas varies according to the type of proposed residential use. For example, in low-density residential developments, the noise-sensitive exterior spaces where the County's exterior noise standards are applied are commonly considered to be backyards. Within higher density residential developments, such as apartments, the County's exterior noise standards are applied at common outdoor usage areas such as pool or park spaces rather than individual patios or balconies. For mixed use developments that include a residential component, it is not unusual for no outdoor use areas to be proposed.

Because specific plans for individual developments were not available as of the time of this study, potential traffic noise impacts are assessed through prediction of distances to future traffic noise contours along the roadways that would potentially affect Plan area development. Where noise contours exceeding the General Plan standards shown in Table 7 (65 dB DNL for residential uses and 70 dB DNL for parks and playgrounds), would extend into areas proposed for such uses, potentially significant noise impacts are identified and consideration of exterior noise mitigation measures would be necessary.

The FHWA Model was used with future plus project traffic data to predict distances to future traffic noise contours for the roadways that would affect development within the Plan area. Detailed FHWA Model inputs for the internal roadways and existing roadways that would affect project development are provided in Appendix F. Ambient noise monitoring results were used to calibrate the FHWA Model for predicting future traffic noise levels within the Plan area. Cross-sections of future roadways proposed within the Plan area were used to determine the distances from the roadway centerlines to the nearest potential outdoor activity areas along each roadway segment.

Table 16 shows the predicted future plus project (cumulative) traffic noise exposure at those locations along each roadway segment, a comparison of those predicted levels against the applicable Sacramento County exterior noise standards, and the distances to the future 65 and 70 dB DNL traffic noise contours. Figure 6 shows a graphical representation of the roadway segments where future traffic noise levels at proposed residential land uses are predicted to exceed 65 dB DNL and, therefore, require mitigation.

1. The distance from the roadway segment centerline to the nearest potential location for an outdoor activity area based on proposed roadway cross-sections.
2. The Day/Night Average Level (DNL) computed at the distance cited in the “Distance” column.
3. If the predicted DNL at the nearest potential outdoor activity areas exceeds the County’s 65 dBA exterior noise level standard this column is flagged as “Yes”.
4. The level above 65 dBA DNL represents the degree of sound attenuation which would be required to reduce traffic noise levels to 65 dBA DNL if the outdoor activity area were located at the distance from the centerline shown under the “Distance” column.
5. The contour distances represent the distance from the roadway segment centerline to the indicated contours.

As indicated in Table 16, predicted future traffic noise level exposure could exceed 65 dBA DNL at the nearest potential outdoor activity areas of proposed residential uses along 14 roadway segments affecting the Plan area. However, no residential uses are proposed along West El Camino Avenue between El Centro and Interstate 80, so the actual number of affected segments where projected future traffic noise exposure would exceed 65 dBA DNL at proposed residential uses is 12.

Table 16 also indicates that, with the exception of Interstate 80, traffic noise attenuation ranging from 1 to 5 dB would be required to reduce future traffic noise levels to a state of compliance with the County's 65 dBA DNL exterior noise standard. This degree of attenuation is relatively low and could be achieved through a variety of noise mitigation options. Such options are discussed below under the mitigation measures for this impact statement.

Although the project site plans contain the general locations of the proposed residential uses, the specific locations of the individual residences and outdoor activity areas are currently unknown. However, because residential outdoor activity areas could be located in areas where future traffic noise exposure is predicted to exceed 65 dBA DNL, this impact is identified as being **potentially significant**.

Figure 6 shows a graphical representation of the roadway segments where future traffic noise levels at proposed residential land uses within the Plan Area are predicted to exceed 65 dB DNL and, therefore, require consideration of noise mitigation.

***Legend***

Mitigation for Impact 17:

To satisfy the Sacramento County General Plan 65 dB DNL exterior noise level standard at the outdoor activity areas of future residential uses proposed within the Plan area, the following noise mitigation measures should be considered either singularly or in combination during project design, depending on the level of sound attenuation required. At proposed residential locations adjacent to Interstate 80 it is probable that a combination of the following measures would be required:

**MM-17A:** Residential outdoor activity areas shall be located beyond the 65 dBA DNL noise contour distances shown in Table 16. This includes individual backyards of single-family residences and common outdoor use areas of multi-family residences.

**OR**

**MM-17B:** Residential outdoor activity areas proposed within the 65 dBA DNL noise contour distances shown in Table 16 shall be screened from view of the roadway by intervening structures or sound barriers. If sound barriers are proposed, project-specific grading plans shall be reviewed to determine the location and heights of barrier necessary to achieve compliance with the County's noise standards. With the exception of residences proposed in proximity to Interstate 80, noise barriers along other roadways would not need to exceed 6 feet in height to provide the required traffic noise attenuation.

If noise barriers are to be constructed within the Plan area, the traffic noise barriers shall take the form of a masonry wall, earthen berm, or combination of the two, or, if reviewed and approved by an acoustical consultant as providing comparable performance prior to construction, other materials may be acceptable (i.e., wood or wood composite fence with overlapping slat construction).

**OR**

**MM-17C:** Single-family residences shall be oriented such that the front of the residence faces the roadway segment where levels exceeding 65 dBA DNL would occur, thereby using the residence to shield the backyard from the roadway and creating a larger setback between the roadway centerline and backyard outdoor activity area.

**OR**

**MM-17D:** Roadways where future traffic noise levels are predicted to exceed the County's noise standards by 4 dBA or less shall be paved with noise-reducing asphalt.

**Significance of Impact 17 after Mitigation:** ***Less than Significant***

### Impact 18: Future Interior Traffic Noise Levels at Proposed Sensitive Uses

Based upon years of experience and testing conducted by BAC, standard building construction (stucco siding, STC-27 windows, door weather-stripping, exterior wall insulation, composition plywood roof), typically results in an exterior to interior noise reduction of at least 25 dBA with windows closed and approximately 15 dB with windows open. Therefore, provided predicted future traffic noise exposure at residential building facades does not exceed 70 dBA DNL, standard construction would be adequate to reduce interior noise levels to a state of compliance with the County's 45 dBA DNL interior noise level standard.

As indicated in Table 16, future traffic noise levels are not predicted to exceed 70 dBA DNL adjacent to the majority of the project-area roadways where residential and other noise-sensitive land uses are proposed. However, at residential uses proposed adjacent to El Centro Road and in the vicinity of Interstate 80, it is probable that future traffic noise exposure would exceed the County's 45 dBA DNL interior noise level standard without mitigation, particularly at upper floor locations which would not likely be shielded from view of roadways by sound walls. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 18:

**MM-18:** At locations where residential building facades are proposed in future noise environments exceeding 70 dBA DNL, project plans shall be reviewed by a qualified acoustical consultant to ensure that appropriate construction upgrades (typically higher-rated STC values for windows) are specified to ensure compliance with the County's interior noise standard.

**Significance of Impact 18 after Mitigation: *Less than Significant***

## Noise Impacts from Plan area Components at Proposed Uses

### Impact 19: Commercial Mixed-Use Parking Noise at Proposed Sensitive Uses

An analysis of commercial parking area noise exposure was presented in **Impact 3**. The results from that analysis indicate that noise exposure from an individual parking area having 300 vehicle stalls computes to approximately 49 dB $L_{50}$ and 65 dB $L_{max}$ at a distance of 50 feet from the effective noise center of the area.

The nearest proposed sensitive uses (residential) would be located with the Commercial Mixed-Use components themselves. However, future configurations and sizes of parking areas and related distances to residential uses within those components are currently not known at this time. Thus, it is possible that Commercial Mixed-Use parking area noise exposure could exceed the General Plan's exterior and interior daytime and nighttime standards at nearby proposed residential uses. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 19:

To satisfy applicable Sacramento County General Plan exterior and interior daytime and nighttime noise level standards at nearby proposed noise-sensitive uses, the following noise mitigation measure should be implemented:

**MM-19:** A site specific noise impact study that addresses Commercial Mixed-Use parking area activities shall be completed by a qualified noise consultant once site-specific development plans are completed. The noise impact study shall include an analysis of Commercial Mixed-Use parking noise exposure at the nearest proposed noise-sensitive uses (residential). The analysis shall include associated mitigation measures (as appropriate) to reduce parking area noise levels to a state of compliance with applicable Sacramento County General Plan exterior and interior noise level limits at nearby proposed sensitive receptors. Such measures could include, but are not limited to, increasing setbacks between sensitive uses and parking areas, construction of noise barriers where appropriate, and incorporation of upgraded building construction.

**Significance of Impact 19 after Mitigation: *Less than Significant***

**Impact 20: Commercial Mixed-Use Delivery Truck Noise at Proposed Sensitive Uses**

An analysis of commercial delivery truck activity noise exposure was presented in **Impact 4**. The results from that analysis indicate that noise exposure from commercial delivery truck activities was calculated to be 46 dB $L_{50}$ and 74 dB $L_{max}$ at a distance of 100 feet from the unloading area.

The nearest proposed sensitive uses (residential) would be located with the Commercial Mixed-Use components themselves. However, future locations of delivery unloading areas and related distances to residential uses within those components are currently not known at this time. Thus, it is possible that Commercial Mixed-Use delivery truck activity noise exposure could exceed the General Plan's exterior and interior daytime and nighttime standards at nearby proposed residential uses. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 20:

To satisfy applicable Sacramento County General Plan exterior and interior daytime and nighttime noise level standards at nearby proposed noise-sensitive uses, the following noise mitigation measure should be implemented:

**MM-20:** A site specific noise impact study that addresses Commercial Mixed-Use truck delivery activities shall be completed by a qualified noise consultant once site-specific development plans are completed. The noise impact study shall include an analysis of Commercial Mixed-Use delivery truck noise exposure at the nearest proposed noise-sensitive uses (residential). The analysis shall include associated mitigation measures (as appropriate) to reduce Commercial Mixed-Use truck delivery noise levels to a state of compliance with applicable Sacramento County

General Plan exterior and interior noise level limits at nearby proposed sensitive receptors. Specific mitigation measures could include but are not limited to shielding from features integrated into site design, and/or restrictions on hours for commercial deliveries within the Commercial Mixed-Use areas.

**Significance of Impact 20 after Mitigation: *Less than Significant***

**Impact 21: Commercial Mixed-Use HVAC Equipment Noise at Proposed Sensitive Uses**

An analysis of commercial HVAC equipment noise exposure was presented in **Impact 5.** The results from that analysis indicate that noise exposure from commercial HVAC equipment was calculated to be 45 dB $L_{50}$ at a distance of 100 feet from the building facade.

The nearest proposed sensitive uses (residential) would be located with the Commercial Mixed-Use components themselves. However, future locations of buildings and related distances to residential uses within those components are currently not known at this time. Thus, it is possible that Commercial Mixed-Use HVAC equipment noise exposure could exceed the General Plan's exterior and interior daytime and nighttime standards at nearby proposed residential uses. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 21:

To satisfy applicable Sacramento County General Plan exterior and interior daytime and nighttime noise level standards at nearby proposed noise-sensitive uses, the following noise mitigation measure should be implemented:

**MM-21:** A site specific noise impact study that addresses Commercial Mixed-Use HVAC equipment shall be completed by a qualified noise consultant once site-specific development plans are completed. The noise impact study shall include an analysis of Commercial Mixed-Use HVAC equipment noise exposure at the nearest proposed noise-sensitive uses (residential). The analysis shall include associated mitigation measures (as appropriate) to reduce Commercial Mixed-Use HVAC equipment noise levels to a state of compliance with applicable Sacramento County General Plan exterior and interior noise level limits at nearby proposed sensitive receptors. Such measures could include, but are not limited to, the use of building parapets to screen HVAC equipment from nearby sensitive uses, locating HVAC equipment within isolated mechanical equipment rooms, or relocating HVAC equipment as far as feasible from proposed noise-sensitive receptors.

**Significance of Impact 21 after Mitigation: *Less than Significant***

**Impact 22: Employment/Highway Commercial Parking Noise at Proposed Sensitive Uses**

An analysis of commercial parking area noise exposure was presented in **Impact 3**. The results from that analysis indicate that noise exposure from an individual parking area having 300 vehicle stalls computes to approximately 49 dB $L_{50}$ and 65 dB $L_{max}$ at a distance of 50 feet from the effective noise center of the area.

The nearest proposed sensitive uses (residential) are located adjacent to Employment/Highway Commercial components. However, future configurations and sizes of parking areas and related distances to adjacent residential uses within the Plan area are currently not known at this time. Thus, it is possible that Employment/Highway Commercial parking area noise exposure could exceed the General Plan's exterior and interior daytime and nighttime standards at nearby proposed residential uses. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 22:

To satisfy applicable Sacramento County General Plan exterior and interior daytime and nighttime noise level standards at nearby proposed noise-sensitive uses, the following noise mitigation measure should be implemented:

**MM-22:** A site specific noise impact study that addresses Employment/Highway Commercial parking activities shall be completed by a qualified noise consultant once site-specific development plans are completed. The noise impact study shall include an analysis of Employment/Highway Commercial parking area noise exposure at the nearest proposed noise-sensitive uses (residential). The analysis shall include associated mitigation measures (as appropriate) to reduce Employment/Highway Commercial parking noise levels to a state of compliance with applicable Sacramento County General Plan exterior and interior noise level limits at nearby proposed sensitive receptors. Such measures could include, but are not limited to, increasing setbacks between sensitive uses and parking areas, construction of noise barriers where appropriate, and incorporation of upgraded building construction.

**Significance of Impact 22 after Mitigation: *Less than Significant***

**Impact 23: Employment/Highway Commercial Delivery Truck Noise at Proposed Sensitive Uses**

An analysis of commercial delivery truck activity noise exposure was presented in **Impact 4**. The results from that analysis indicate that noise exposure from commercial delivery truck activities was calculated to be 46 dB $L_{50}$ and 74 dB $L_{max}$ at a distance of 100 feet from the unloading area.

The nearest proposed sensitive uses (residential) are located adjacent to an Employment/Highway Commercial component. However, future locations of delivery unloading areas and related distances to adjacent residential uses are currently not known at this time. Thus, it is possible that Employment/Highway Commercial delivery truck activity noise exposure could exceed the General Plan's exterior and interior daytime and nighttime noise level standards at nearby proposed residential uses. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 23:

To satisfy applicable Sacramento County General Plan exterior and interior daytime and nighttime noise level standards at nearby proposed noise-sensitive uses, one of the following noise mitigation measures should be implemented:

**MM-23a:** Future truck delivery unloading areas within Employment/Highway Commercial components shall maintain a minimum setback of 150 feet from proposed residential boundaries within the Plan area. When projected to a distance of 150 feet, commercial delivery truck noise levels are calculated to be 42 dB $L_{50}$ and 70 dB $L_{max}$, which would satisfy the General Plan's exterior nighttime noise level standards of 50 dB $L_{50}$ and 70 dB $L_{max}$. After consideration of the exterior to interior noise reduction provided by standard residential construction (approximately 25 dB with windows closed and approximately 15 dB with windows open), the predicted delivery truck noise levels at a distance of 150 feet would also satisfy the General Plan's interior (anytime) noise level standards of 35 dB $L_{50}$ and 55 dB $L_{max}$.

OR

**MM-23b:** Should delivery unloading areas of Employment/Highway Commercial components be proposed within 150 feet from residential boundaries within the Plan area, a noise impact study that addresses parking activities shall be completed by a qualified noise consultant once site-specific development plans are completed. The noise impact study shall include an analysis of Employment/Highway Commercial parking area noise exposure at the nearest proposed noise-sensitive uses (residential). The analysis shall include associated mitigation measures (as appropriate) to reduce Employment/Highway Commercial parking noise levels to a state of compliance with applicable Sacramento County General Plan exterior and interior noise level limits at nearby proposed sensitive receptors.

Specific mitigation measures could include but are not limited to the following:

- The construction of solid noise barriers that effectively attenuate delivery truck noise exposure to a state of compliance with the applicable noise limits at existing sensitive receptors.

- A site design that integrates intervening shielding, setbacks, and/or restrictions on hours for truck deliveries.

**Significance of Impact 23 after Mitigation: *Less than Significant***

**Impact 24: Employment/Highway Commercial HVAC Equipment Noise at Proposed Sensitive Uses**

An analysis of commercial HVAC equipment noise exposure was presented in **Impact 5.** The results from that analysis indicate that noise exposure from commercial HVAC equipment was calculated to be 45 dB $L_{50}$ at a distance of 100 feet from the building facade.

The nearest proposed sensitive uses (residential) are located adjacent to an Employment/Highway Commercial component. However, future locations of buildings and related distances to adjacent residential uses are currently not known at this time. Thus, it is possible that Employment/Highway Commercial HVAC equipment noise exposure could exceed the General Plan's exterior and interior daytime and nighttime standards at nearby proposed residential uses. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 24:

To satisfy applicable Sacramento County General Plan exterior and interior daytime and nighttime noise level standards at nearby proposed noise-sensitive uses, one of the following noise mitigation measures should be implemented:

**MM-24a:** Future buildings within Employment/Highway Commercial components shall maintain a minimum setback of 55 feet from proposed residential boundaries within the Plan area. When projected to a distance of 55 feet, commercial HVAC equipment noise level exposure is calculated to be 50 dB $L_{50}$, which would satisfy the General Plan's exterior nighttime noise level standard of 50 dB $L_{50}$. After consideration of the exterior to interior noise reduction provided by standard residential construction (approximately 25 dB with windows closed and approximately 15 dB with windows open), the predicted HVAC equipment noise level at a distance of 55 feet would also satisfy the General Plan's interior (anytime) noise level standards of 35 dB $L_{50}$.

OR

**MM-24b:** Should buildings of Employment/Highway Commercial components be proposed within 55 feet from residential boundaries within the Plan area, a noise impact study that addresses HVAC equipment shall be completed by a qualified noise consultant once site-specific development plans are completed. The noise impact study shall include an analysis of Employment/Highway Commercial HVAC equipment noise exposure at the nearest proposed noise-sensitive uses (residential). The analysis shall include associated mitigation measures (as appropriate) to reduce Employment/Highway Commercial HVAC equipment noise levels to a state of compliance with applicable Sacramento County General Plan exterior and interior noise level limits at nearby proposed sensitive receptors. Such measures could include, but are not limited to, the use of building parapets to screen HVAC equipment from nearby sensitive uses, locating HVAC equipment within isolated mechanical equipment rooms, or relocating HVAC equipment as far as feasible from proposed noise-sensitive receptors.

**Significance of Impact 24 after Mitigation:** ***Less than Significant***

**Impact 25: Employment/Highway Commercial Drive-Through Restaurant Noise at Proposed Sensitive Uses**

An analysis of commercial drive-through restaurant noise exposure was presented in **Impact 9.** As indicated in that analysis, noise exposure from commonly used drive-through menu speaker boards have measured noise levels of approximately 63 dB $L_{50}$ and 67 dB $L_{max}$ at 10 feet. That analysis further indicates that vehicle passbys in drive-through lanes have measured levels of approximately 60 dB $L_{50}$ and 70 dB $L_{max}$ at 5 feet.

The nearest proposed sensitive uses (residential) are located adjacent to an Employment/Highway Commercial component. However, future locations of restaurants and associated distances to adjacent residential uses are currently not known at this time. Thus, it is possible that Employment/Highway Commercial restaurant drive-through operations noise exposure could exceed the General Plan's exterior and interior daytime and nighttime standards at nearby proposed residential uses. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 25:

To satisfy applicable Sacramento County General Plan exterior and interior daytime and nighttime noise level standards at nearby proposed noise-sensitive uses, one of the following noise mitigation measures should be implemented:

**MM-25a:** Future restaurant drive-through lanes within Employment/Highway Commercial components shall maintain a minimum setback of at least 85 feet from proposed residential boundaries within the Plan area. When projected to a distance of 85 feet, combined restaurant drive-through operations noise levels are calculated to be 45 dB $L_{50}$ and 50 dB $L_{max}$, which would satisfy the General Plan's downward adjusted exterior nighttime noise level standards of 45 dB $L_{50}$ and 65 dB $L_{max}$.

After consideration of the exterior to interior noise reduction provided by standard residential construction (approximately 25 dB with windows closed and approximately 15 dB with windows open), predicted drive-through operations noise levels at a distance of 85 feet would also satisfy the General Plan's downward adjusted interior (anytime) noise level standards of 30 dB $L_{50}$ and 50 dB $L_{max.}$

OR

**MM-25b:** Should restaurant drive-through operations of Employment/Highway Commercial components be proposed within 85 feet from residential boundaries within the Plan area, a noise impact study that addresses drive-through operations shall be completed by a qualified noise consultant once site-specific development plans are completed. The noise impact study shall include an analysis of Employment/Highway Commercial drive-through operations noise exposure at the nearest proposed noise-sensitive uses (residential). The analysis shall include associated mitigation measures (as appropriate) to reduce Employment/Highway Commercial drive-through operations noise levels to a state of compliance with applicable Sacramento County General Plan exterior and interior noise level limits at nearby proposed sensitive receptors.

Specific mitigation measures could include but are not limited to the following:

- The construction of solid noise barriers that effectively attenuate drive-through operations noise exposure to a state of compliance with the applicable noise limits at existing sensitive receptors.

- A site design that integrates intervening shielding, setbacks, and/or restrictions on hours for drive-through operations.

**Significance of Impact 25 after Mitigation:** ***Less than Significant***

**Impact 26: Employment/Highway Commercial Car Wash Operations Noise at Proposed Sensitive Uses**

The nearest proposed sensitive uses (residential) are located adjacent to an Employment/Highway Commercial component. However, future (potential) locations of car wash tunnels, vacuum systems, and associated distances to adjacent residential uses are currently not known at this time. Thus, it is possible that car wash operations within Employment/Highway Commercial components could exceed the General Plan's exterior and interior daytime and nighttime standards at nearby proposed residential uses. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 26:

To satisfy applicable Sacramento County General Plan exterior and interior daytime and nighttime noise level standards at nearby proposed noise-sensitive uses, the following noise mitigation measure should be implemented:

**MM-26:** Should car wash uses be proposed within Employment/Highway Commercial components, a noise impact study that addresses car wash operations shall be completed by a qualified noise consultant once site-specific development plans are completed. The noise impact study shall include an analysis of Employment/Highway Commercial car wash drying assembly and vacuum equipment operations noise exposure at the nearest proposed noise-sensitive uses (residential). The analysis shall include associated mitigation measures (as appropriate) to reduce Employment/Highway Commercial car wash and vacuum system operations noise levels to a state of compliance with applicable Sacramento County General Plan exterior and interior noise level limits at nearby proposed sensitive receptors.

Specific mitigation measures could include but are not limited to the following:

- The construction of solid noise barriers that effectively attenuate car wash and vacuum system equipment operations noise exposure to a state of compliance with the applicable noise limits at existing sensitive receptors.
- A site design that integrates intervening shielding, setbacks, and/or restrictions on hours for car wash and vacuum system equipment operations.

Significance of Impact 26 after Mitigation: Less than Significant

**Impact 27: School Parking Noise at Proposed Sensitive Uses**

An analysis of school parking area noise exposure was presented in **Impact 11**. The results from that analysis indicate that noise exposure from an individual parking area having 300 vehicle stalls computes to approximately 49 dB $L_{50}$ and 65 dB $L_{max}$ at a distance of 50 feet from the effective noise center of the area.

The nearest proposed sensitive uses (residential) are located adjacent to School components. However, future configurations and sizes of parking areas and related distances to adjacent residential uses within the Plan area are currently not known at this time. Thus, it is possible that School parking area noise exposure could exceed the General Plan's exterior and interior daytime standards at nearby proposed residential uses. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 27:

To satisfy applicable Sacramento County General Plan exterior and interior daytime noise level standards at nearby proposed noise-sensitive uses, the following noise mitigation measure should be implemented:

**MM-27:** A site specific noise impact study that addresses School component parking activities shall be completed by a qualified noise consultant once site-specific development plans are completed. The noise impact study shall include an analysis of School component parking area noise exposure at the nearest proposed noise-sensitive uses (residential). The analysis shall include associated mitigation measures (as appropriate) to reduce School component parking noise levels to a state of compliance with applicable Sacramento County General Plan exterior and interior noise level limits at nearby proposed sensitive receptors. Such measures could include, but are not limited to, increasing setbacks between sensitive uses and school parking areas, construction of noise barriers where appropriate, and incorporation of upgraded building construction for sensitive receptors located in close proximity to school parking areas.

**Significance of Impact 27 after Mitigation: *Less than Significant***

**Impact 28: School Playground Noise at Proposed Sensitive Uses**

An analysis of school playground noise exposure was presented in **Impact 12**. As indicated in that analysis, outdoor play areas containing approximately 50 children are measured to be 55 dB $L_{eq}$ and 75 dB $L_{max}$ at a distance of 50 feet from the focal point of the play area during school recess.

The nearest proposed sensitive uses (residential) are located adjacent to School components. However, future locations, sizes, and associated related distances to adjacent residential uses within the Plan area are currently not known at this time. Thus, it is possible that School playground activity noise exposure could exceed the General Plan's exterior and interior daytime standards at nearby proposed residential uses. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 28:

To satisfy applicable Sacramento County General Plan exterior and interior daytime noise level standards at nearby proposed noise-sensitive uses, one of the following noise mitigation measures should be implemented:

**MM-28a:** The center of future playgrounds within School components shall maintain a minimum setback of 90 feet from proposed residential boundaries within the Plan area. When projected to a distance of 90 feet, playground activity noise levels are calculated to be 50 dB $L_{50}$ and 70 dB $L_{max}$, which would satisfy the General Plan's downward adjusted exterior daytime noise level standards of 50 dB $L_{50}$ and 70 dB

$L_{max}$. After consideration of the exterior to interior noise reduction provided by standard residential construction (approximately 25 dB with windows closed and approximately 15 dB with windows open), predicted playground activity noise levels at a distance of 90 feet would also satisfy the General Plan's downward adjusted interior (anytime) noise level standards of 30 dB $L_{50}$ and 50 dB $L_{max}$.

OR

**MM-28b:** Should playgrounds be proposed within 90 feet from a residential boundary within the Plan area, a noise impact study that addresses School playground noise shall be completed by a qualified noise consultant once site-specific development plans are completed. The noise impact study shall include an analysis of School playground noise exposure at the nearest proposed noise-sensitive uses (residential). The analysis shall include associated mitigation measures (as appropriate) to reduce School playground noise levels to a state of compliance with applicable Sacramento County General Plan exterior and interior noise level limits at nearby proposed sensitive receptors.

Specific mitigation measures could include but are not limited to the following:

- The construction of solid noise barriers that effectively attenuate playground noise exposure to a state of compliance with the applicable noise limits at existing sensitive receptors.

- A site design that integrates intervening shielding and setbacks.

**Significance of Impact 28 after Mitigation: *Less than Significant***

**Impact 29: School Sports Stadium Noise at Proposed Sensitive Uses**

The nearest proposed sensitive uses (residential) are located adjacent to a School component. However, future locations and sizes of outdoor playing fields/sports stadiums, PA system configurations, and associated distances to adjacent residential uses are currently not known at this time. Thus, it is possible that noise from events at school sports stadiums could exceed the General Plan's exterior and interior daytime standards at nearby proposed residential uses. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 29:

To satisfy applicable Sacramento County General Plan exterior and interior daytime noise level standards at nearby proposed noise-sensitive uses, the following noise mitigation measure should be implemented:

**MM-29:** A noise impact study that addresses School sports stadium noise shall be completed by a qualified noise consultant once site-specific development plans are completed. The noise impact study shall include an analysis of stadium noise exposure at the nearest proposed noise-sensitive uses (residential). The analysis shall include associated mitigation measures (as appropriate) to reduce stadium noise levels, including crowd and PA system noise, to a state of compliance with applicable Sacramento County General Plan exterior and interior noise level limits at nearby proposed sensitive receptors.

Specific mitigation measures could include but are not limited to the following:

- The construction of solid noise barriers that effectively attenuate sports stadium noise exposure to a state of compliance with the applicable noise limits at existing sensitive receptors.
- A site design that integrates intervening shielding, setbacks, and restrictions on equipment configurations and settings.

**Significance of Impact 29 After Mitigation:** ***Less than Significant***

**Impact 30: Park Activity Noise at Proposed Sensitive Uses**

An analysis of park activity noise exposure was presented in **Impact 14**. As indicated in that analysis, parks consisting of active uses (playing fields/playgrounds) have noise levels of approximately 60 dB $L_{50}$ and 70 dB $L_{max}$ at a distance of 50 feet from the area's focal point.

The nearest proposed sensitive uses (residential) are located adjacent to Parks components. However, future locations of playing fields/playgrounds and associated distances to adjacent residential uses are currently not known at this time. Thus, it is possible that noise from park activities could exceed the General Plan's exterior and interior daytime standards at nearby proposed residential uses. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 30:

To satisfy applicable Sacramento County General Plan exterior and interior daytime noise level standards at nearby proposed noise-sensitive uses, one of the following noise mitigation measures should be implemented:

**MM-30a:** The center of future active uses within Parks components (i.e., playing fields/playgrounds) shall maintain a minimum setback of 150 feet from proposed residential boundaries within the Plan area. When projected to a distance of 150 feet, park activity noise levels are calculated to be 50 dB $L_{50}$ and 60 dB $L_{max}$, which would satisfy the General Plan's downward adjusted exterior daytime noise level standards of 50 dB $L_{50}$ and 70 dB $L_{max}$. After consideration of the exterior to interior noise reduction provided by standard residential construction (approximately 25 dB with windows closed and approximately 15 dB with windows open), predicted park activity noise levels at a distance of 150 feet would also satisfy the General

Plan's downward adjusted interior (anytime) noise level standards of 30 dB $L_{50}$ and 50 dB $L_{max}$.

**MM-30b:** Should the centers of future active uses within Parks components be proposed within 150 feet from a residential boundary within the Plan area, a noise impact study that addresses park activities shall be completed by a qualified noise consultant once site-specific development plans are completed. The noise impact study shall include an analysis of park activity noise exposure at the nearest proposed noise-sensitive uses (residential). The analysis shall include associated mitigation measures (as appropriate) to reduce park noise levels to a state of compliance with applicable Sacramento County General Plan exterior and interior noise level limits at nearby proposed sensitive receptors.

Specific mitigation measures could include but are not limited to the following:

- The construction of solid noise barriers that effectively attenuate park activity noise exposure to a state of compliance with the applicable noise limits at existing sensitive receptors.

- A site design that integrates intervening shielding and setbacks.

**Significance of Impact 30 After Mitigation:** ***Less than Significant***

## Noise Impacts from Existing Commercial Operations at Proposed Uses

### Impact 31: Existing Commercial Noise at Proposed Plan area Uses

An existing Travel Plaza is located within the Plan area on the east side of El Centro Road adjacent to the westbound I-80 off-ramp. The primary noise sources associated with the Travel Plaza are heavy truck traffic on El Centro Road and West El Camino Avenue, and on-site truck circulation activities.

Noise measurement site 10 was selected to be representative of the ambient noise level environment at the portion of the Plan area proposed for commercial/mixed-use and very high-density residential uses. The noise level data collected at Site 10 includes vehicle passby noise on El Centro Road, including heavy truck passbys associated with the Travel Plaza, but also includes background noise from Interstate 80. Noise measurement Site 11 was specifically selected to be representative of noise generated at the Travel Plaza, but it was not possible to exclude noise from Interstate 80 in the data collected at Site 11. Analysis of the measured ambient noise data at these sites indicate that noise levels associated with the Travel Plaza were elevated. Based on the measured ambient noise level data, it is possible that noise from activities at the Travel Plaza could exceed the General Plan's exterior and interior daytime and nighttime standards at noise-sensitive areas of residential uses proposed in the immediate vicinity of the Travel Plaza. As a result, this impact is identified as being **potentially significant**.

Mitigation for Impact 31:

To satisfy applicable Sacramento County General Plan exterior and interior daytime and nighttime noise level standards at nearby proposed Plan area uses, the following noise mitigation measure should be implemented:

**MM-31:** A noise impact study that addresses Travel Plaza noise generation shall be completed by a qualified noise consultant once site-specific development plans are completed for the residential components of the project located adjacent to either El Centro Road near the Travel Plaza or on properties immediately adjacent to the Travel Plaza. The noise impact study shall include an analysis of existing Travel Plaza noise exposure at the nearest proposed uses within the Plan area. The analysis shall include associated mitigation measures (as appropriate) to reduce Travel Plaza noise levels to a state of compliance with applicable Sacramento County General Plan exterior and interior noise level limits at nearby proposed uses. Specific mitigation measures could include but are not limited to the following:

- The construction of solid noise barriers that effectively attenuate Travel Plaza noise exposure to a state of compliance with the applicable noise limits at existing sensitive receptors.

- A site design that integrates intervening shielding and setbacks.

**Significance of Impact 31 After Mitigation:** ***Less than Significant***

## Noise Impacts from Existing Airport Operations at Proposed Uses

### Impact 32: Airport Operations Noise at Proposed Plan area Uses

The Upper Westside Specific Plan area is located approximately 3 miles from the Sacramento International Airport. Pursuant to Policy NO-2 of the Sacramento County General Plan Noise Element, proposals for new development within Sacramento County that may be affected by aircraft noise from Sacramento International Airport shall be evaluated relative to the Sacramento International Airport Land Use Compatibility Plan (ALUCP) prepared by the Sacramento Area Council of Governments (SACOG) dated December 12, 2013. The Land Use Plan's noise compatibility criteria is reproduced in Table 10 of this report.

According to Map 1 of the Sacramento International Airport ALUCP (Compatibility Policy Map: Airport Influence Area), the Upper Westside Specific Plan area is geographically located within Referral Area 2 of the Airport Influence Area. According to ALUCP Policy 1.3.3 (Referral Areas), Referral Area 2 includes locations where airspace protection (other than wildlife hazards) and/or overflight are compatibility concerns, but not noise or safety. As indicated in Figure 5, the Plan area is located outside of the 60 dB CNEL noise contours.

Based on the information above, analysis of the BAC long-term noise level survey results within the Plan area, and after consideration of the exterior to interior noise level reduction achieved within standard building construction (at least 25 dB with windows closed and approximately 15 dB with windows open), noise generated from normal aircraft operations at the Sacramento International Airport is not predicted to exceed the applicable land use compatibility noise criteria established in the Sacramento International ALCUP within the Plan area. As a result, this impact is considered to be ***less than significant***.

## Appendix A
## Acoustical Terminology

**Acoustics** The science of sound.

**Ambient Noise** The distinctive acoustical characteristics of a given space consisting of all noise sources audible at that location. In many cases, the term ambient is used to describe an existing or pre-project condition such as the setting in an environmental noise study.

**Attenuation** The reduction of an acoustic signal.

**A-Weighting** A frequency-response adjustment of a sound level meter that conditions the output signal to approximate human response.

**Decibel or dB** Fundamental unit of sound. A Bell is defined as the logarithm of the ratio of the sound pressure squared over the reference pressure squared. A Decibel is one-tenth of a Bell.

**CNEL** Community Noise Equivalent Level. Defined as the 24-hour average noise level with noise occurring during evening hours (7 - 10 p.m.) weighted by a factor of three and nighttime hours weighted by a factor of 10 prior to averaging.

**Frequency** The measure of the rapidity of alterations of a periodic signal, expressed in cycles per second or hertz.

**IIC** Impact Insulation Class (IIC): A single-number representation of a floor/ceiling partition's impact generated noise insulation performance. The field-measured version of this number is the FIIC.

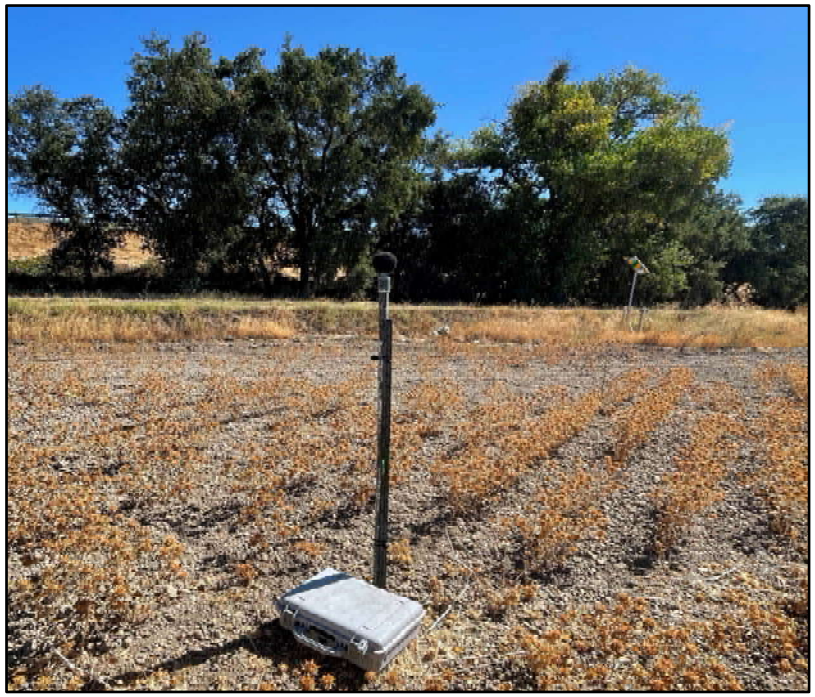
**$L_{dn}$** Day/Night Average Sound Level. Similar to CNEL but with no evening weighting.

**$L_{eq}$** Equivalent or energy-averaged sound level.

**$L_{max}$** The highest root-mean-square (RMS) sound level measured over a given period of time.

**Loudness** A subjective term for the sensation of the magnitude of sound.

**Masking** The amount (or the process) by which the threshold of audibility is for one sound is raised by the presence of another (masking) sound.



**Noise** Unwanted sound.

**Peak Noise** The level corresponding to the highest (not RMS) sound pressure measured over a given period of time. This term is often confused with the "Maximum" level, which is the highest RMS level.

**$RT_{60}$** The time it takes reverberant sound to decay by 60 dB once the source has been removed.

**STC** Sound Transmission Class (STC): A single-number representation of a partition's noise insulation performance. This number is based on laboratory-measured, 16-band (1/3-octave) transmission loss (TL) data of the subject partition. The field-measured version of this number is the FSTC.

# 1. INTRODUCTION

This chapter describes the purpose of this report and presents an overview of the proposed Upper Westside Specific Plan ("Proposed Project").

## Study Purpose

In September 2020, Sacramento County released updated guidance, known as *Transportation Analysis Guidelines* (TAG), for the preparation of transportation analysis studies. The update was necessary to incorporate changes to the way that transportation impacts are measured under the California Environmental Quality Act (CEQA) that resulted from the passage of Senate Bill 743 (SB 743) in 2013. As of July 1, 2020, automobile delay and level of service (LOS) may no longer be used as the performance measure to determine the transportation impacts of land development and transportation projects under CEQA. This requirement did not modify the discretion lead agencies have to develop their own methodologies or guidelines, or to analyze impacts to other components of the transportation system, such as walking, bicycling, transit, and safety. Although SB 743 did not specify the use of a specific metric for transportation analysis, the use of vehicle miles traveled (VMT) has been recommended by the Governor's Office of Planning and Research (OPR).

The County's TAG specifies that the following two distinct types of studies be prepared for proposed land development projects:

- Part I – CEQA Transportation Impact Analysis
- Part II – Local Transportation Analysis (LTA)

This report, which represents Part I of the TAG requirement, focuses on the project's impacts to the transportation system based on its Vehicle Miles Traveled (VMT). It also addresses project impacts to the bicycle/pedestrian systems, transit systems, and safety. However, first, the project's land use and proposed circulation system are presented along with its anticipated travel characteristics. Technical calculations and other supporting information are provided in a separately bound technical appendix.

Part II analyzes project effects on traffic operations at nearby roadways and intersections. Part II is included as a separate report.

# Project Description

The Upper Westside Specific Plan would be situated on approximately 2,066 acres north of Interstate 80 (I-80) and west of Interstate 5 (I-5) in unincorporated Sacramento County. **Figure 1** shows the regional setting and the location of the Upper Westside Specific Plan.

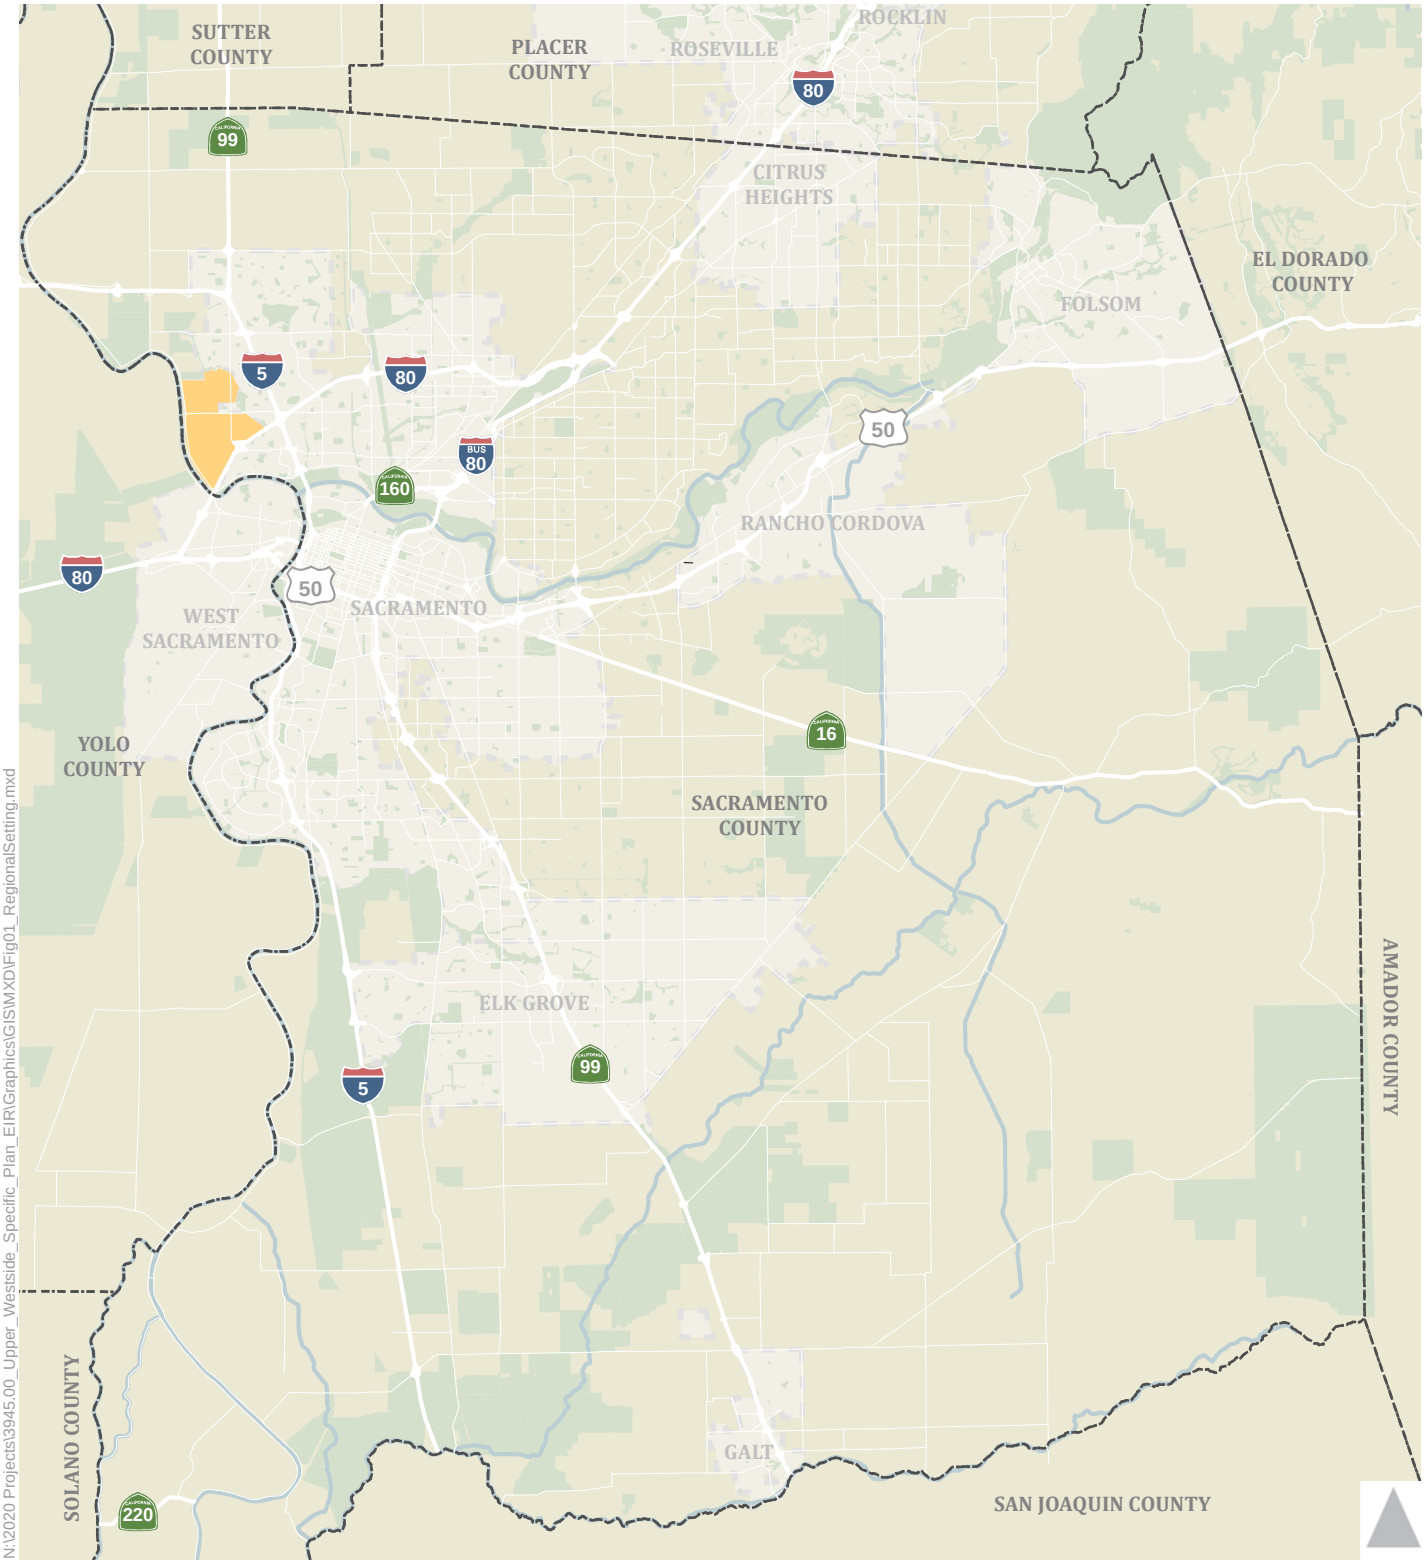

**Figure 2** shows the project site plan (*Upper Westside*, Wood Rodgers, May 2021). **Table 1** presents the proposed project land uses based on this site plan. As shown, the proposed project would include 9,356 dwelling units, 3.1 million square feet of business professional/commercial, schools, parks, and various open space elements. Chapter 2 provides a more detailed breakdown of land use types.

As shown on Figure 2, the project would be accessed via several existing roadways including:

- West El Camino Avenue at I-80
- San Juan Avenue west of I-5
- Arena Boulevard west of I-5 via El Centro Road
- Del Paso Boulevard west of I-5 via El Centro Road
- Garden Highway via four connections (existing San Juan Road, improvements to existing Radio Road, and two new connections in the southwest portion of the site)

**Figure 3** shows the project's internal roadway network. As shown, West El Camino Avenue would extend westerly from El Centro Road as the main street of the Town Center, which would be a dense, mixed-use environment consisting of a grid-based street system. Other key project roadways include: El Centro Road, Bryte Bend Road, Farm Road, San Juan Road, and Radio Road.

The Town Center would consist of a grid-based street system. North-south streets are labeled Street A through E (from right to left) from West El Camino Avenue to Bryte Bend Road. East-west streets are labeled Street 1 through 7 (from bottom to top) starting south of West El Camino Avenue to San Juan Road. The project would widen parts of El Centro Road and West El Camino Avenue from their current two lanes to the number of lanes shown on Figure 3. Additionally, it is assumed that project buildout would be supported by (and required to help fund) a reconstructed I-80/West El Camino Avenue interchange to provide increased roadway capacity and a more bicycle/pedestrian friendly design. Additional right-of-way would be necessary to support the interchange's reconstruction.

## LAND USE DESIGNATION

| COLOR | LAND USE DISTRICT | COMPARABLE ZONE OR DENSITY RANGE | TARGET DENSITY OR F.A.R. | ACRES ± | % OF ACRES | ESTIMATED DWELLING UNITS | % OF DWELLING UNITS | ESTIMATED SQ. FT. ± |
|---|---|---|---|---|---|---|---|---|
| VLDR | VERY LOW DENSITY RESIDENTIAL | RD-1 TO RD-3 | 1.2 DU/AC | 166.4 | 8.1% | 204 DU | 2% | |
| LDR | LOW DENSITY RESIDENTIAL | RD-4 TO RD-7 | 5.5 DU/AC | 431.5 (6) | 20.9% | 2,351 DU | 25% | |
| LMDR | LOW/MEDIUM DENSITY RESIDENTIAL | RD-4 TO R-10 | 8.0 DU/AC | 132.8 (6) | 6.4% | 1,063 DU | 11% | |
| MDR | MEDIUM DENSITY RESIDENTIAL | RD-10 TO RD-15 | 12.0 DU/AC | 62.5 | 3.0% | 750 DU | 8% | |
| HDR | HIGH DENSITY RESIDENTIAL | RD-15 TO RD-30 | 25.0 DU/AC | 36.4 | 1.8% | 910 DU | 10% | |
| VHDR | VERY HIGH DENSITY RESIDENTIAL | RD-30 TO RD-50+ | 35.0 DU/AC | 22.6 | 1.1% | 791 DU | 8% | |
| CMU | COMMERCIAL MIXED USE | C-1(A) (RD-30 TO RD-50+) | 40.0 DU/AC \| 0.60 FAR | 93.2 (5)(6) | 4.5% | 3,388 DU | 35% | 2,176,513 SF (3) |
| E/HC | EMPLOYMENT/HIGHWAY COMMERCIAL | E/HC | 0.40 FAR | 52.9 | 2.6% | | | 921,730 SF (3) |
| P | PUBLIC/QUASI-PUBLIC | K-8, HS, CC | | 141.1 | 6.8% | | | |
| OS | OPEN SPACE (BUFFERS & BASINS) (4) | NR | | 141.8 | 6.9% | | | |
| AG | AG-CROPLAND (4) | AG | | 410.2 | 19.9% | | | |
| AR | AG-RESIDENTIAL (4) | AR | | 84.2 | 4.1% | | | |
| UF | URBAN FARM/ GREENBELT | AG-B | | 43.0 | 2.2% | | | |
| PARK | PARK | P | | 78.1 | 3.8% | | | |
| W | WATER (CANAL) | P | | 13.0 | 0.7% | | | |
| LC | LANDSCAPE CORRIDOR | | | 33.6 | 1.7% | | | |
| | MAJOR ROADS A | ROW | | 121.8 | 5.9% | | | |
| | MAJOR ROADS B (WITHIN AG-BUFFER) (4) | ROW | | 5.1 | 0.2% | | | |
| | TOTAL | | | 2064.2 ± AC. | 100% | 9,356 DU'S | | 3,096,245 SF |

NOTES
(1) NET ACREAGE BASED ON PRELIMINARY LAND USE PLAN GENERATED IN GIS/AUTOCAD BY WOOD RODGERS MAY 2021. THE PLAN IS SUBJECT TO CHANGE. ARTERIAL AND COLLECTOR ROADS AS SHOWN ON MAP ARE NETTED OUT.
(2) ESTIMATED POPULATION CALCULATION UTILIZING 3.0 PERSONS PER HOUSEHOLD (pph) FOR SINGLE-FAMILY AND 2.5 pph FOR MULTI-FAMILY (HDR AND HIGHER), RESULTING IN 25,574± PEOPLE ((4,367 DU x 3.0 pph)+(4,989 DU x 2.5 pph))=25,574 POPULATION). THIS IS A PRELIMINARY ESTIMATE AND SUBJECT TO CHANGE.
(3) THE ALLOCATED SQUARE FOOTAGE (SF) IS IN ADDITION TO EXISTING COMMERCIAL LAND USES TO ALLOW INTENSIFICATION.
(4) AGRICULTURAL RESIDENTIAL (AR), AGRICULTURAL CROPLAND (AG), OPEN SPACE (OS) BUFFER TO THE WEST AND NORTH, AND MAJOR ROADS B AREAS ARE NOT INCLUDED IN PROPOSED 1,552-ACRE DEVELOPMENT AREA OR THE UPA/USE EXPANSION REQUEST. IT IS ASSUMED THE "AG-BUFFER" AREA WILL REMAIN AS IS AND NO UNITS ARE ALLOCATED.
(5) THE 1.2-ACRE CMU SITE LOCATED SOUTHWEST OF THE TOWN CENTER IS INTENDED FOR A SPECIAL USE (e.g. FIRE STATION, ELECTRIC SUBSTATION, ETC.) AND THEREFORE WAS NOT ALLOCATED RESIDENTIAL UNITS.
(6) 6.3 ACRES NOT INCLUDED IN TARGET DENSITY CALCULATION DUE TO FOR 3.0 AC. WATER TANK STORAGE SITE, 3.0 AC. SEWER PUMP STATION, AND 1.0 AC. FOR TWO ELECTRICAL SUBSTATION SITES NOT INCLUDED IN TARGET DENSITY CALCULATION.

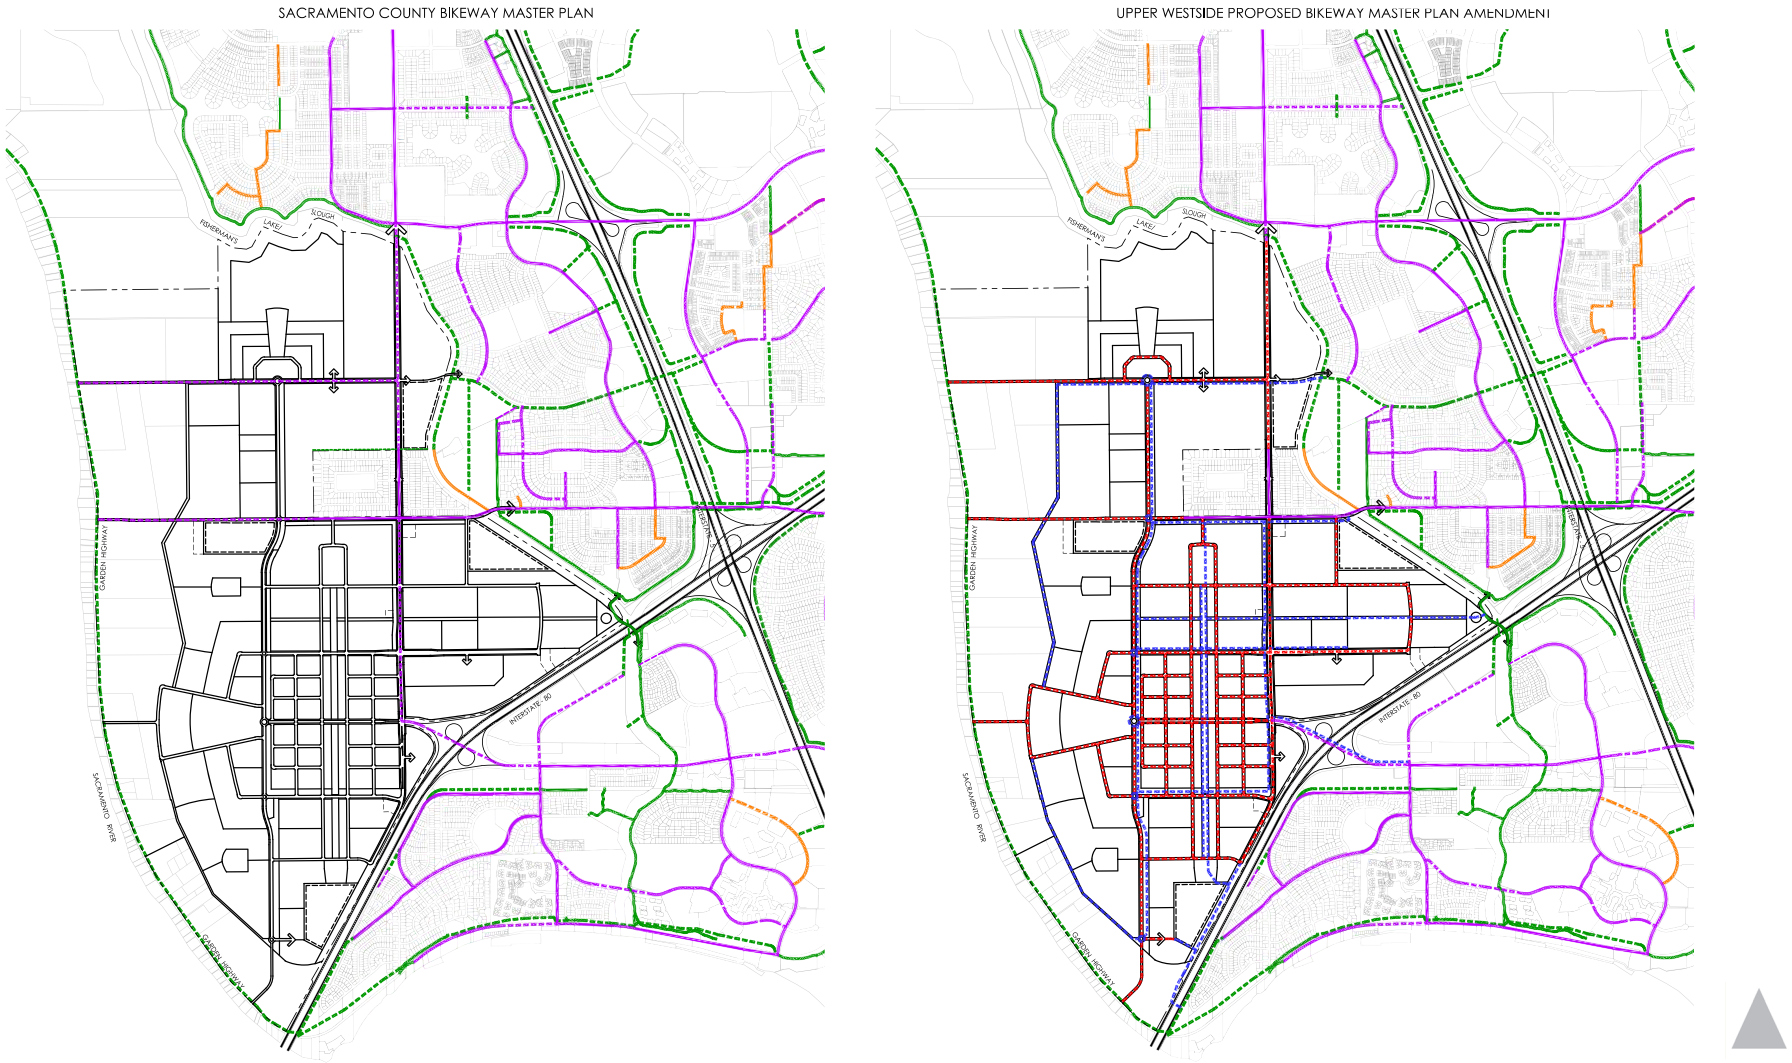
## Project Roadway Network

**Table 1:**
**Upper Westside Specific Plan Land Use Summary**



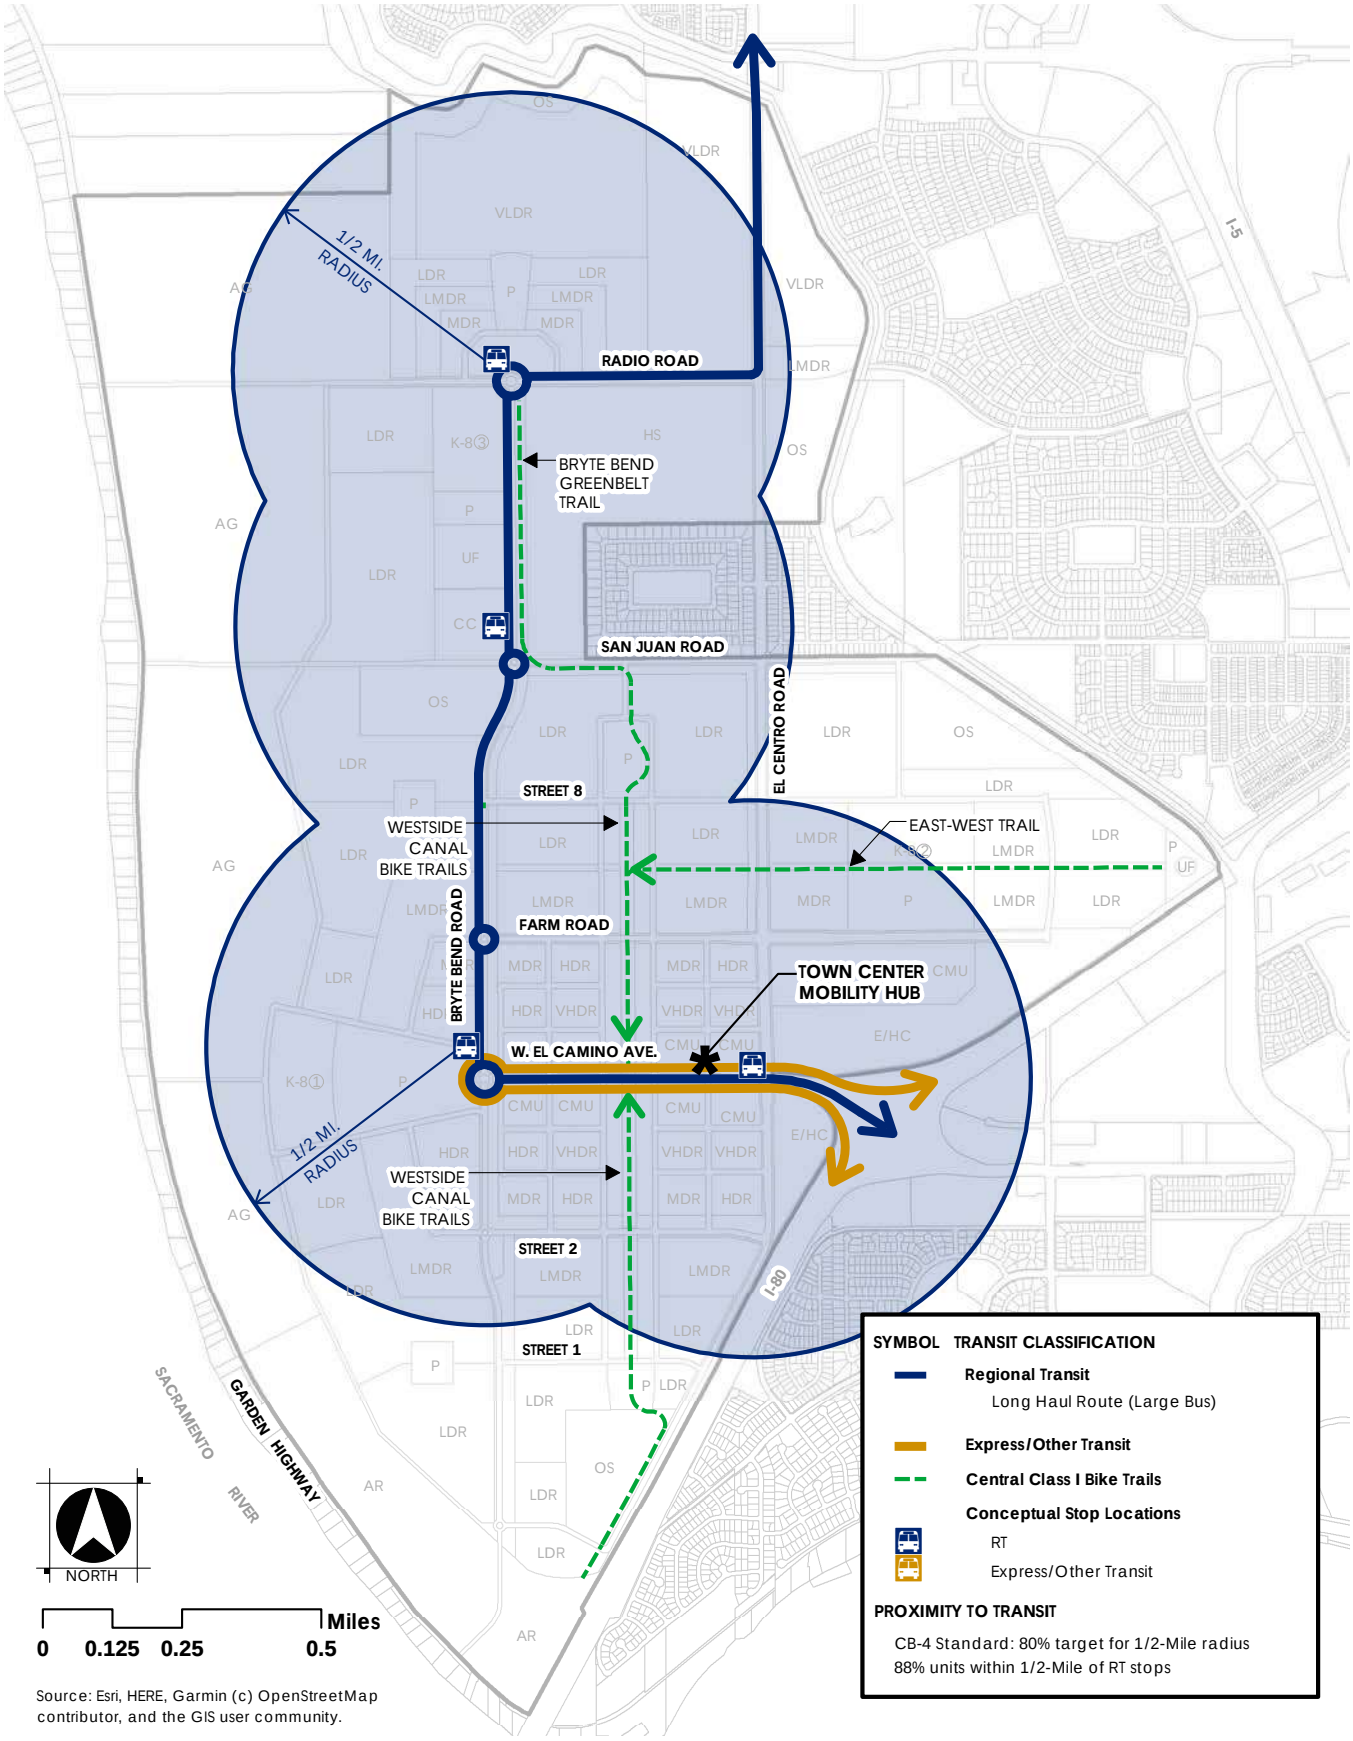
| Land Use | Acres | Percent of Project | Dwelling Units | Square Feet |
|---|---|---|---|---|
| Very Low Density Residential | 166.1 | 8.1% | 204 | - |
| Low Density Residential | 431.5 | 20.9% | 2,351 | - |
| Low/Medium Density Residential | 132.8 | 6.4% | 1,062 | - |
| Medium Density Residential | 62.5 | 3.0% | 750 | - |
| High Density Residential | 36.4 | 1.8% | 910 | |
| Very High Density Residential | 22.6 | 1.1% | 791 | - |
| Commercial Mixed Use | 83.2 | 4.0% | 3,288 | 2,174,515 |
| Employment / Highway Commercial | 52.9 | 2.6% | - | 921,730 |
| Community College, High School, K-8 School | 141.1 | 6.8% | - | - |
| Parks, Urban Farm/Greenbelt, and Canal | 136.1 | 6.5% | | |
| Open Space / Agriculture, | 674.1 | 32.6% | | |
| Proposed Major Circulation | 126.9 | 6.1% | | |
| **Total Upper Westside Specific Plan** | **2,066.2** | **100%** | **9,356** | **3,096,245** |

Source: *Upper Westside Site Plan*, Wood Rodgers, May 2021.

**Figure 4** shows the project's planned bicycle network. Key components of the bicycle network include:

- A set of north-south and east-west Class I (off-street) bicycle/pedestrian paths would be constructed. The north-south path would extend southerly from San Juan Road through the Town Center to Garden Highway. The east-west path would extend parallel and north of Farm Road from Bryte Bend Road easterly to connect to an existing Class I network (near Peregrine Park), which includes an overcrossing of I-80 that can be used to walk or bike to South Natomas and Downtown Sacramento.
- Class I and/or Class II bike lanes (on-street with appropriate signs and pavement markings) would be provided throughout the plan area.

**Figure 5** shows the project's planned transit system, which includes an on-site shuttle that would operate along key roadways during peak periods.



This side-by-side comparison depcits how the Upper Westside Specific Plan would modify the Sacramento County Bikeway Master Plan.

## Project Transit System

# 2. PROJECT TRAVEL CHARACTERISTICS

This chapter presents the proposed project's anticipated travel characteristics. This information helps inform the project's VMT analyses (presented in Chapter 3) and is used directly in the separate LTA report.

## Detailed Project Land Use Assumptions

Table 1 displayed the amount of proposed non-residential development, expressed in terms of total square feet of office or commercial, and school acreage. This section refines those land use totals (based on information provided by the project applicant) to reflect the expected mix and quantity of specific non-residential uses.

The retail component of the Commercial Mixed-Use (CMU) parcels would be developed with 50 percent business professional and 50 percent general retail, entertainment, grocery stores, restaurants, institutional/religious, and specialized uses (e.g., vocational schools, medical-office, etc.). These parcels would be integrated mixed-use properties developed at high densities (i.e., 60 percent floor-to-area ratio and 40 dwelling units per acres).

The two Employment/Highway Commercial (E/HC) parcels would be developed with 60 percent business professional and 40 percent general retail, entertainment, grocery stores, restaurants, institutional/religious, and specialized uses (e.g., vocational schools, medical-office, etc.). These two parcels would develop at a 40 percent floor-to-area ratio.

The project applicant has indicated that the CMU and E/HC parcels will typically provide sufficient on-site parking to meet projected demands. This implies, given the proposed densities, that structured parking will be required, though surface parking may also be provided in some areas. It also means that all parcels are assumed "to park themselves"; meaning trips generated by the parcel are assigned to that parcel (versus a nearby public garage).

# Project Trip Generation

The proposed project's trip generation was estimated using the Mixed-Use Trip Generation Model (MXD+), which was originally developed for the US Environmental Protection Agency (EPA) to estimate internal trip-making and external trips made by non-auto travel modes. This model, which was originally developed by consultants and academic researchers based on empirical evidence at 240 mixed-use projects located across the U.S, has been used in numerous EIRs throughout California. The model considers various built environment variables such as land use density, regional location, proximity to transit, and various design variables when calculating the project's internal trips and external trips made by non-auto modes. In Fall 2019, the model underwent a revalidation that confirmed it is still applicable to current (non-COVID) conditions. Moreover, the model was found to validate well against large mixed-use projects such as Upper Westside. Refer to separately bound appendix for that revalidation report.

## Trip Generation Rates

MXD+ begins by estimating gross trips generated by project land uses based on data included in *Trip Generation Manual, 10th Edition* (Institute of Transportation Engineers, 2017), which is the most recent version of the manual. It then estimates internal trips and external trips made by non-auto modes of travel. **Table 2** presents the unadjusted vehicular trip generation rates for each project land use category. In most instances, weighted average trip rates were applied due to the absence of fitted curve equations that estimate trips based on land use quantity. At the time the analysis was performed, the 11th Edition of the *Trip Generation Manual* (September 2021) had not yet been released.

Rates chosen for several specific land uses in Table 2 warrant further explanation as described below:

- Trip generation for single-family and multi-family residential units was estimated based on weighted average trip rates. Use of fitted curve equation rates would have led to differing (and unreasonable) trip rates for adjacent residential areas based solely on their differing unit counts.
- Trip generation for professional office and shopping center land use categories[1] was estimated using fitted curve equations based on guidance from the *Trip Generation Handbook* (Institute of Transportation Engineers, 2017). Retail and office land use quantities within the Town Center and

[1] A variety of retail-type uses were assumed on retail parcels including supermarkets, sit-down restaurants, fast-food restaurants, and health/fitness clubs, in addition to general shopping center uses. This approach, which emphasizes the variety of likely retail uses, results in greater total trips, but also more internalization of traffic and an overall more accurate trip estimate (versus using exclusively the shopping center category).

employment/Highway Commercial zone (east of El Centro Road) were estimated separately based on the square footages proposed.

**Table 2:**
**Unadjusted Trip Generation Rates by Land Use Type**

| Land Use | ITE Code | Unit Type | Daily Trip Rate [1] | AM Peak Hour [1] | | PM Peak Hour [1] | |
|---|---|---|---|---|---|---|---|
| | | | | Trip Rate | %in/ %out | Trip Rate | %in/ %out |
| Single-Family Detached Housing [2] | 210 | du's | 9.44 | 0.74 | 25%/75% | 0.99 | 63%/37% |
| Multi-Family Housing Mid-Rise [3,4] | 221 | du's | 5.44 | 0.36 | 26%/74% | 0.99 | 61%/39% |
| Professional Office [3,5] | 710 | ksf | 9.74 – 10.25 | 0.99 – 1.16 | 86%/14% | 1.05 – 1.15 | 16%/84% |
| Medical Office [2] | 720 | ksf | 36.32 | 2.45 | 78%/22% | 3.44 | 28%/72% |
| Hotel [2] | 310 | rooms | 8.36 | 0.47 | 59%/41% | 0.60 | 51%/49% |
| Business Hotel [2] | 312 | rooms | 4.02 | 0.39 | 42%/58% | 0.32 | 55%/45% |
| Government Office [2] | 730 | ksf | 22.59 | 3.33 | 75%/25% | 1.72 | 26%/74% |
| Shopping Center [3] | 820 | ksf | 50.64 – 66.26 | 1.39 – 2.56 | 62%/38% | 4.73 – 5.88 | 48%/52% |
| Health/Fitness Club [2] | 492 | ksf | 26.67 | 1.33 | 50%/50% | 3.47 | 58%/42% |
| Supermarket [3] | 850 | ksf | 95.14 – 106.8 | 3.80 – 3.82 | 60%/40% | 9.27 – 9.32 | 51%/49% |
| High-Turnover (Sit-Down) Restaurant [2] | 932 | ksf | 112.18 | 9.94 | 55%/45% | 9.77 | 62%/38% |
| Fast-Food Restaurant with Drive-Through Window [2] | 934 | ksf | 471.00 | 40.22 | 51%/49% | 32.67 | 52%/48% |
| Recreational Community Center [2,3] | 495 | ksf | 28.80 – 28.83 | 1.77 – 3.85 | 66%/34% | 2.31 – 3.60 | 47%/53% |
| Middle School/Junior High School [2] | 522 | students | 2.13 | 0.58 | 54%/46% | 0.17 | 49%/51% |
| High School [2] | 530 | students | 2.03 | 0.52 | 67%/33% | 0.14 | 48%/52% |
| Vocational School | 540 | ksf | 20.25 | 2.07 | 77%/23% | 1.86 | 50%/50% |
| Junior/Community College | 540 | students | 1.15 | 0.11 | 81%/19% | 0.11 | 56%/44% |

Note:
1. All rates derived from the *Trip Generation Manual, 10th Edition* (Institute of Transportation Engineers, 2017).
2. Weighted average trip rate applied.
3. Fitted curve equation applied.
4. Multi-Family Mid-Rise category chosen given densities proposed (i.e., buildings will range between 3 and 10 floors, which meets the definition of this use type).
5. Range of trip rates shown because varying sized facilities are proposed in different areas of the plan and fitted curve equations yield different trip rates by size.

ksf = thousand square feet. du's = dwelling units.

Source: Fehr & Peers, 2021.

## Project Trip Generation

**Table 3** presents the project's expected trip generation (prior to any consideration of existing land uses whose trips would be eliminated with the project). The following trip summaries are shown:

1. Gross Project Trips – represents total amount of project travel assuming all trips would be made by vehicle and that no internalization of trips would occur.

2. Net External Vehicular Project Trips – accounts for internal trips between complementary on-site land uses (e.g., residential and retail), and external trips made by walking, biking and transit to estimate external vehicle trips.

3. Net New External Vehicular Trips – further refines external vehicle trip estimate by removing vehicle trips that are "pass-by"[2] from the adjacent street and "diverted-link"[3] from I-80 or I-5.

4. Net New External and Diverted Link Vehicular Trips – adds diverted link trips to the above estimate.

Item #3 above represents the number of new project vehicle trips that would be assigned to study intersections/roadways throughout the study area (based on the expected spatial distribution of those trips). Item #4 above represents the approximate total number of vehicle trips the project would add to its gateway streets (i.e., West El Camino Avenue north of I-80, Arena Boulevard west of I-5, Del Paso Road west of I-5, Garden Highway north of Radio Road and under I-5, and San Juan Road under I-5) including those trips that would be diverted off I-5 and I-80.

As shown in Table 3, the proportion of project trips that would remain internal to the site would vary between 23 and 35 percent depending on the time period. Internalization is greatest during the AM peak hour due to the effect of matched trips between the residences and schools.

[2] A "pass-by" trip to a retail use is made by a motorist already on the adjacent street while en route to a different primary destination. Pass-by trips do not add traffic to the adjacent street, but contribute trips to the driveway(s) serving the retail center. Checks were performed to ensure that primary adjacent roadways (i.e., El Centro Road and West El Camino Avenue) would have sufficient volumes of traffic under "plus project" conditions, from which pass-by trips could be taken.

[3] A "diverted-link" trip (in this context) is made by a motorist traveling on a nearby freeway who chooses to exit the freeway to access a retail use. Diverted-link trips are added both to the freeway on/off ramps, surface streets, and driveway(s) serving the retail center.

| Table 3:<br>Proposed Project Trip Generation | | | | |
|---|---|---|---|---|
| **Land Use** | **Quantity [1]** | **Trips** | | |
| | | **Daily** | **AM Peak Hour** | **PM Peak Hour** |

**Table 3:**
**Proposed Project Trip Generation**

| Land Use | Quantity [1] | Trips | | |
|---|---|---|---|---|
| | | Daily | AM Peak Hour | PM Peak Hour |

Note:
1. Does not account for eliminated trips due to removal of existing uses. See following tables.
2. Internal trips estimated to be 22.5 percent on a daily basis, 34.9 percent during the AM peak hour, and 25.6 percent during the PM peak hour.
3. Estimated proportion of total external trips made by transit ranges from 2.0 to 2.3 percent depending on time period.
4. Estimated proportion of total external trips made by walking or biking ranges from 0.4 to 0.6 percent depending on time period.
5. Pass-by trips are made to retail uses from the adjacent street. Pass-by percentages are based on the Trip Generation Handbook (Institute of Transportation Engineers, 2017).
6. Diverted link trips come from I-80 or I-5. Percentages are from the Trip Generation Handbook (Institute of Transportation Engineers, 2017).

Source: Fehr & Peers, 2021.

According to this table, use of transit for travel to external destinations is estimated at two percent for the proposed project. It should be noted that a modest amount of transit use is already built into the default ITE trip generation rates that form the starting point of the project trip generation estimate. Thus, this transit estimate represents an increased level of transit use beyond the "base" level that is typically associated with suburban settings, free parking, and modest levels of bus service. A more geographically focused evaluation determined that the Town Center, Employment/Highway Commercial Zone, and adjacent high-density residential would have a combined four percent transit mode split. This is reasonable given that transit use is typically greater for employees versus residents, and in mixed-use urban areas versus suburban settings.

According to this table, selection of walking or biking for travel to external destinations is estimated at 0.5 percent for the proposed project. Again, this represents a modest increase above the default ITE estimate. The project would provide a direct linkage to the multi-use path east of the project site (near Peregrine Park) that connects to the bike/pedestrian bridge over I-80. From that bridge, a number of different destinations in South Natomas can be reached within a 10 to 15 minute bike ride. Downtown Sacramento can be reached by bike in about 25 to 30 minutes depending on travel speed.

Overall, the complementary nature of land uses within the project site, combined with the availability of transit and walking/biking, would result in a combined 25 percent reduction in gross daily vehicle trips. During the AM and PM peak hours, this reduction would increase to 37 percent and 28 percent, respectively.

When retail trips that are pass-by or diverted-link are also considered, the overall reduction percentages climb to 32 percent on a daily basis, 42 percent during the AM peak hour, and 41 percent during the PM peak hour. After these adjustments are made, the project would generate approximately 105,400 new daily vehicle trips, 7,900 new AM peak hour vehicle trips, and 8,500 new PM peak hour vehicle trips.

The above trip totals do not consider potential changes in travel associated with the current COVID-19 pandemic or the next phase "COVID Endemic" condition. In all likelihood, reductions in travel will occur for certain land uses, such as offices, though specific details and estimates of those changes are not known at this time. This analysis is therefore reasonably conservative because it did not consider those changes.

## Trip Generation of Existing Land Uses to be Removed

The trip generation estimates in Table 3 do not consider the removal of existing trip generating land uses on the project site. Those trips are shown in **Table 4.** As shown, elimination of these existing land uses would remove 4,568 new daily vehicle trips, 375 new AM peak hour vehicle trips, and 316 new PM peak hour vehicle trips (after considering reductions for pass-by and diverted-link trips to the uses).

## Net Increase in Vehicle Trips Generated by the Proposed Project

**Table 5** shows the net increase in vehicle trips generated by the proposed project during all three study time periods. This represents the total project trips minus the trips associated with the existing uses that would be removed.

This table indicates that the proposed project would result in a net increase in approximately 100,800 new daily vehicle trips, with 7,530 occurring during the AM peak hour and 8,200 occurring during the PM peak hour. During both peak hours, a fairly equal distribution of inbound versus outbound traffic is expected (i.e., 50 percent inbound/50 percent outbound during the AM peak hour, and 52 percent inbound/48 percent outbound during the PM peak hour).

**Table 4:**
**Existing Trip Generating Land Uses to be Removed**

| Land Use | Quantity [1] | Trips | | |
|---|---|---|---|---|
| | | Daily | AM Peak Hour | PM Peak Hour |
| Single-Family Detached Housing | 20 du's | 189 | 15 | 20 |
| Professional Office | 40 ksf | 390 | 46 | 46 |
| Self-Storage Facility | 70 ksf | 98 | 6 | 7 |
| Business Hotel (2) | 145 rooms | 583 | 57 | 46 |
| High-Turnover (Sit-Down) Restaurant | 9 ksf | 965 | 85 | 84 |
| Fast-Food Restaurant with Drive-Through | 3 ksf | 1,507 | 129 | 105 |
| Gas station with Convenience Market | 12 fueling positions | 2,464 | 150 | 168 |
| Light Industrial | 45 ksf | 223 | 31 | 29 |
| Golf Driving Range | 12 tee positions | 164 | 5 | 15 |
| Truck Stop [1] | Fueling area, conv. market | 3,373 | 172 | 213 |
| **Net External Vehicular Project Trips** | | **9,956** | **696** | **733** |
| Pass-by Trips [2] | | 1,773 | 118 | 156 |
| Diverted Link Trips [3] | | 3,615 | 203 | 261 |
| Net New External Vehicular Trips | | 4,568 | 375 | 316 |
| **Net New External and Diverted Link Vehicular Trips** | | **8,183** | **578** | **577** |

Note:

1. Trip rates estimated based on data from *Trip Generation Manual* (Institute of Transportation Engineers, 2017), with exception of 49er Truck Stop located at corner of West El Camino Avenue/El Centro Road whose AM and PM peak hour vehicle trips were estimated in early December 2020. Daily trips for that use was estimated by factoring up peak hour trip rates for the Gas Station with Convenience Market land use category from *Trip Generation Manual*.
2. Pass-by trips are made to retail uses from the adjacent street. Pass-by percentages are based on the *Trip Generation Handbook* (Institute of Transportation Engineers, 2017).
3. Diverted link trips come from I-80 or I-5. Percentages are from the *Trip Generation Handbook* (Institute of Transportation Engineers, 2017).

# 3. VMT ANALYSIS

This chapter analyzes the proposed project's VMT impacts.

## Regulatory Background

***Senate Bill 743***

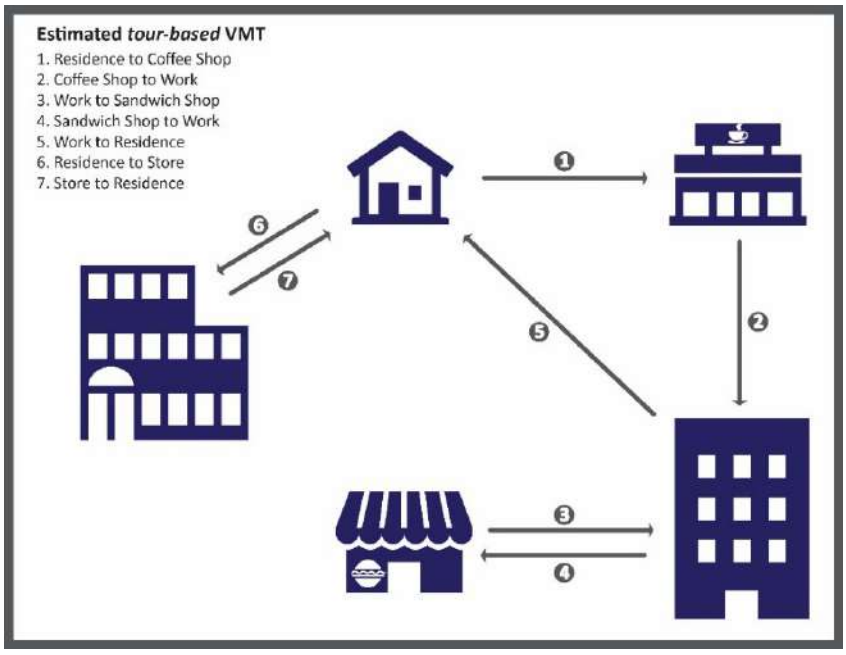
SB 743, passed in 2013, required the California Governor's Office of Planning and Research (OPR) to develop new CEQA guidelines that address traffic metrics under CEQA. As stated in the legislation, upon adoption of the new guidelines, "automobile delay, as described solely by level of service or similar measures of vehicular capacity or traffic congestion shall not be considered a significant impact on the environment pursuant to this division, except in locations specifically identified in the guidelines, if any." In December 2018, OPR published *Technical Advisory on Evaluating Transportation Impacts in CEQA ("Technical Advisory")*, which provided guidance for implementing SB 743. On December 28, 2018, the Resources Agency adopted CEQA Guidelines Section 15064.3. Under this guideline, VMT is the primary metric used to identify transportation impacts. On July 1, 2020, the provisions of Section 15064.3 became effective statewide.

***Sacramento County TAG***

This document provides considerable guidance regarding the County's preferred methods for analyzing the VMT of land use and transportation projects. The TAG incorporates various elements of the *Technical Advisory*, OPR, but refinements and clarifications have been added to reflect local conditions. Technical guidance from the TAG is referenced throughout this chapter.

## Analysis Methodology

By definition, one VMT occurs when a vehicle is driven one mile. A given VMT value is representative of the amount of travel during an entire weekday. VMT is calculated in different ways for different purposes as described below.



Per the TAG, VMT analysis is performed using the Sacramento Area Council of Government's (SACOG) SACSIM19 tour-based travel demand model. The version of the model that was used is similar to what was used as the basis for SACOG's 2020 MTP/SCS, but has been improved upon by considering the length of trips generated by land uses within the SACOG region that have an origin or destination outside the region.

SACSIM19 simulates people's activities on a typical weekday and tracks travel of individuals throughout the day in trip tours. The model allocates household and employment at a parcel level, which allows the model to capture smaller-scale land use changes and demographic differences. SACSIM19 is sensitive to the local physical environment, including the presence (or absence) of pedestrian and bicycle facilities, the patterns of local street networks (e.g., grid vs. cul-de-sacs), and the density, proximity and mix of surrounding land uses (i.e. employment destinations, schools, retail, parks, etc.). SACSIM19 forecasts automobile, transit, bicycle, and walk trips. SACSIM19 requires a detailed definition of household characteristics, population/demographics and employment by type at a parcel-level of geography.

Key metrics from SACSIM19 used in the VMT analysis include the following (though other types of VMT are analyzed later in this chapter):

- VMT per Capita – includes all vehicle tours (both work/commute vehicle tours and non-work vehicle tours) that start and end at residential units. Tours made by a household resident that do not begin or end at home (e.g., mid-day travel from a worksite for lunch or personal business) are not included in the VMT per Capita estimates. Per the TAG, Household VMT includes trip types #1, 2, 5, 6 & 7 from the figure below. It excludes work-based subtours (Trips #3 and #4).

- VMT per Employee – applies to office/business professional and industrial employment projects and includes all work/commute vehicle tours that start and end at the worksite (including intermediate stops). Per the TAG, Household VMT includes trips #1, 2, and 5 from the figure below.

## Significance Thresholds

Table 3-3 of the TAG identifies significance thresholds for various types of land development projects. The following thresholds are utilized in this study:

- Project VMT per capita exceeds 85 percent of the regional average VMT per capita.
- Project VMT per employee exceeds 85 percent of the regional average VMT per employee.
- The project's regional retail land uses causes a net increase in regional VMT.
- The project's proposed widening of "regional roadways" is expected to result in an increase in regional VMT.

When reviewing the project's VMT effects for the above thresholds, it is important to consider the project's overall VMT efficiency. In other words, the broader view of VMT properly considers the net effect, for instance, of a slight exceedance of one threshold versus a "substantially below threshold" outcome for another.

## VMT per Capita and per Employee

The TAG describes the specific analytical process to be used to calculate both VMT per capita and VMT per employee both for the project and for the regional average. This process was followed, and the results are shown in **Table 6** for baseline conditions, which is represented by the base (Year 2016) SACSIM19 travel demand model. Refer to separately bound appendix for technical calculations.

As indicated in the table, the project's VMT per capita and VMT per employee would be below (i.e., perform better than) the 85 percent threshold of the regional average.

**Table 6:**
**VMT per Capita and per Employee – Baseline Conditions**

| Measure | Work Tour VMT Per Employee [1] | Household VMT per Capita [1] |
|---|---|---|
| Regional Average [2] | 18.48 | 17.44 |
| Threshold [3] | 15.70 | 14.83 |
| Project [4, 5, 6] | 15.31 | 14.34 |

1 Calculated per Sacramento County TAG.

2 Regional Average is from Existing No Project Model run. VMT includes the entire length of trips outside of SACOG Region, whereas Sacramento County TAG threshold didn't include trip length outside SACOG Region; hence, values are slightly different.

3 85% of Regional Average per Sacramento County TAG.

4 Project was added to the base year MTP/SCS model. Average trip distance outside of SACOG region for the project was estimated using the average of nearby TAZs.

5 SACSIM estimated that 15.4% of home-based household trips would be internal to the project site, which is low given the diversity and proximity of on-site land uses. In contrast, the MXD+ mixed-use trip generation model estimated 22.9% of home-based trips being internal. Because SACSIM is a regional travel demand model, while MXD+ was developed to more accurately estimate internal trips associated with mixed-use projects, the household VMT estimate from SACSIM was adjusted to reflect this expected level of internal resident trips.

6 Adjustments were not made to work tour VMT per employee because results appeared reasonable and this VMT represents a relatively small (i.e., about 20%) component of the project's total VMT.

Source: Fehr & Peers, 2021.

## Project Regional Retail Effect on VMT

The project's regional retail consists of the retail component of land uses proposed on the east side of El Centro Road both north and south of West El Camino Avenue. These retail uses are considered regional-serving because they are situated nearest to and visible from I-80. In contrast, the retail uses that are part of the CMU parcels within the Town Center would not have the same type of regional retail orientation.

The SACSIM model was run without and with the Regional Retail (but with the remainder of Upper Westside assumed to be developed). The results are shown in **Table 7**. As shown, the proposed project without its regional retail generates more VMT than the project with the regional retail added.

Regional retail is situated at the I-80/Truxel Road interchange in the City of Sacramento and at the I-80/Reed interchange in the City of West Sacramento. These uses are about five miles apart. There is a substantial number of households situated in North and South Natomas, and west of I-5 (north of I-80), many whom visit these regional retail destinations. The project would introduce an additional 9,356 units to this total. Placing regional retail at the I-80/West El Camino Avenue interchange (i.e., between the two existing regional retail destinations) decreases the travel distance for many of residents who are traveling to a regional retail destination. Hence, the conclusion that the project's regional retail would reduce VMT makes sense.

| Table 7:<br>Effect of Project's Regional Retail on VMT – Baseline Conditions | | |
|---|---|---|
| **Measure** [1] | **Base Year SACSIM Model Plus Project** | **Base Year SACSIM Model Plus Project Without Regional Retail** |
| Total Regional VMT | 42,992,142 | 43,014,069 |

1 Calculated using Daysim trip tables, which is a step within the overall SACSIM model.
Source: Fehr & Peers, 2021.

## Project Roadway Widening Effect on VMT

The proposed project would construct new roadways and widen existing roadways. These capacity expansions could induce more VMT due to changes in background travel demand, route choice, and other factors. The following specific roadway widenings, which are considered regional in nature, are proposed as part of the project:

- Approximate 2,150-foot widening of West El Camino Avenue from two to six lanes from El Centro Road to just east of I-80.
- 1,375-foot widening of El Centro Road from two to six lanes from West El Camino Avenue to just north of Farm Road.
- 1.5-mile widening of El Centro Road from two to four lanes from just north of Farm Road to just south of Arena Boulevard.

The above widenings represent an addition of 5.7 lane-miles to the County's roadway network. According to the TAG, secondary roadways (e.g., Bryte Bend Road, Farm Road, Radio Road, etc.) are normally not expected to induce more travel due to their local-serving nature and are therefore not considered in the induced travel VMT analysis.

The SACSIM model was run without and with the aforementioned regional roadway widenings (but with all other components of the Upper Westside project included). The net change in VMT is shown in **Table 8**. As shown, the isolated effect of widening these three segments would be a net increase in 1,800 VMT. Review of the model runs indicated that the roadway widenings would eliminate "out of way" travel that would otherwise occur on roadways such as San Juan Road and Garden Highway. But by virtue of providing more roadway capacity to access I-80, the widenings also contribute to longer trip lengths, which more than offsets the eliminated "out of way" travel.

| Table 8:<br>VMT Effects of Project Roadway Widening - Baseline Conditions | |
|---|---|
| **Scenario [1]** | **VMT [2]** |
| With Roadway Widenings | 57,062,857 |
| Without Roadway Widenings | 57,061,058 |
| Difference | + 1,799 |

1 See above text for description of regional roadway widening projects.

2 VMT is calculated for the entire model network. TAZ connectors and gateways are excluded.

Source: Fehr & Peers, 2021.

## Project Overall Effect on VMT

The prior analyses have utilized both efficiency metrics (i.e., VMT per capita and per employee) and absolute VMT value changes (i.e., due to regional retail and roadway widenings) when evaluating various elements of the project's VMT. To allow for the project's overall effect on VMT to be evaluated, the VMT efficiency metric results were translated into absolute VMT values. The translation process shown in **Table 9** calculates how much VMT is saved by virtue of the project's VMT per capita and employee being less than the applicable thresholds.

| Table 9: Project Employee and Resident VMT Savings – Baseline Conditions | | |
|---|---|---|
| **Measure [1]** | **Work Tour VMT Budget** | **Household VMT Budget** |
| Project VMT [1] | 87,594 | 351,276 |
| Number of Employees | 5,722 | - |
| Work Tour VMT Savings [2] | 2,231 | - |
| Number of Residents | - | 24,491 |
| Household VMT Savings [3] | - | 12,000 |

1 Source: SACSIM model.

2 Per Table 6, Work Tour VMT per employee could increase from 15.31 to 15.70 while remaining under the 85% regional average threshold. The VMT savings is calculated as VMT saved per employee multiplied by number of employees (i.e., 0.39 x 5,722= 2,231).

3 Per Table 6, Household VMT per capita could increase from 14.34 to 14.83 while remaining under the 85% of regional average threshold. The VMT savings is calculated as VMT saved per resident multiplied by number of residents. (i.e., 0.49 x 24,491= 12,000).

Source: Fehr & Peers, 2021.

**Table 10** provides a reconciliation of the project's VMT budget, noting both savings and exceedances. This table indicates that the project's net increase in VMT due to roadway widenings (1,799 VMT) is more than offset by its beneficial land use efficiency and regional retail VMT saving benefits, which represent a combined savings of 36,158 VMT. The net result is that the project represents 34,359 VMT less than the VMT budgets established by the significance thresholds.

**Table 10:**
**Project VMT Budget Reconciliation – Baseline Conditions**

| Metric | VMT Saved / Exceeded |
|---|---|
| VMT Savings by Project Land Use Efficiency [1] | - 14,231 |
| VMT Savings by Placement of Regional Retail 2 | - 21,927 |
| VMT Added by Regional Roadway Widenings [3] | +1,799 |
| Net VMT | -34,359 |

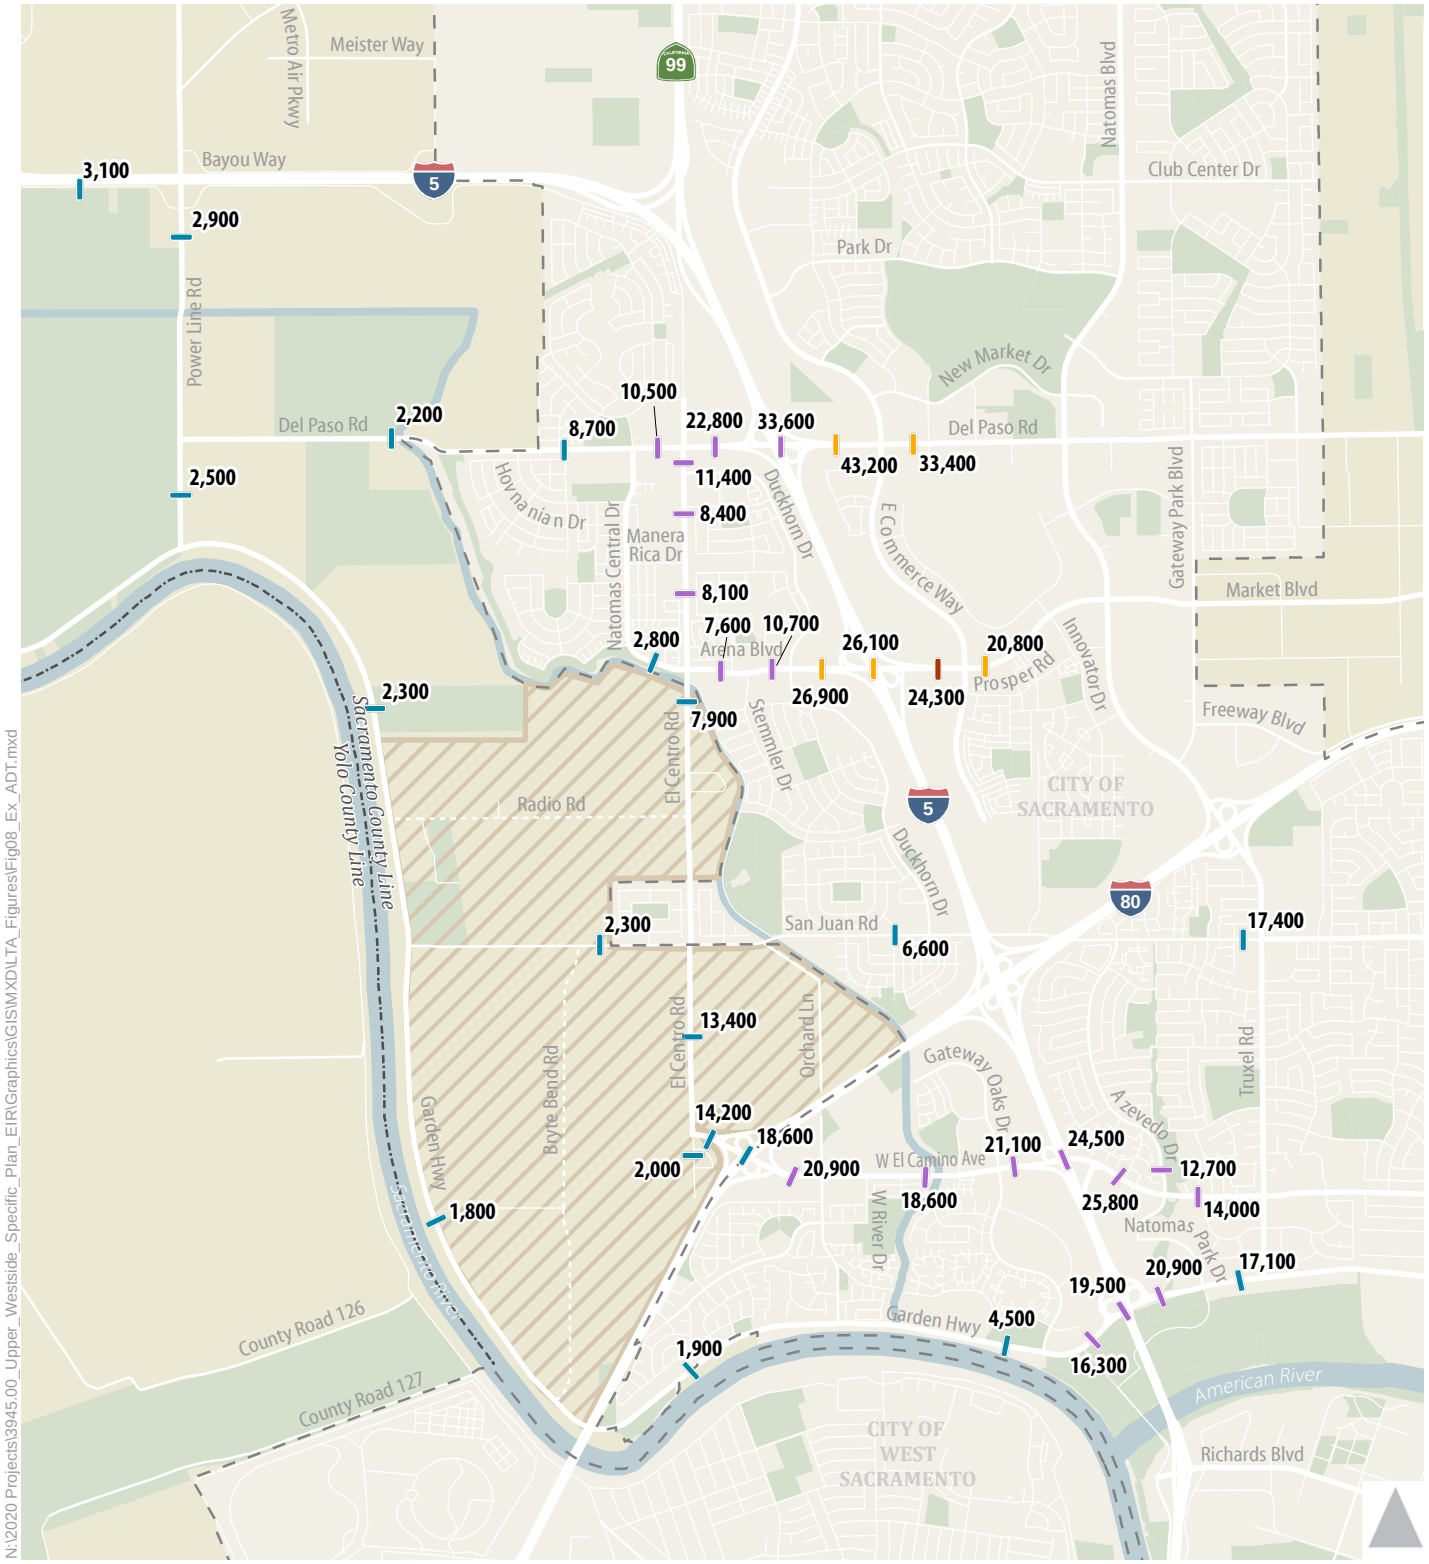
# 4. ROADWAY TRAFFIC FORECASTS

This chapter presents average daily traffic forecasts within the study area under various scenarios. This information is presented for informational purposes only so that reviewers may understand existing levels of traffic and the amount of traffic the project would add to nearby project roadways.

## Analysis Scenarios

Average daily traffic (ADT) forecasts are presented for the following scenarios:



- Existing Conditions – represents conditions in 2018-2019, prior to the beginning of the COVID-19 pandemic in March 2020.
- Existing Plus Proposed Project conditions – presents ADT forecasts for a hypothetical scenario consisting of buildout of the proposed project under existing conditions.
- Cumulative (2040) No Project Conditions – presents ADT forecasts for Year 2040 assuming the project site remains in its current state.
- Cumulative (2040) Plus Proposed Project conditions – presents ADT forecasts assuming buildout of the proposed project under cumulative conditions.

## Existing and Existing Plus Project ADT Forecasts

**Figure 6** displays the existing ADT on roadways in the project vicinity including facilities under the jurisdiction of Sacramento County, City of Sacramento, and Caltrans.

**Figure 7a** shows the ADT on the same roadways under existing plus project conditions. **Figure 7b** shows the ADT on the roadways within the Specific Plan area for this scenario. These forecasts were derived from the same SACSIM travel demand model used in the previous chapter. Consistent with standard industry practice, trip matrix adjustments were made for certain traffic analysis zones (TAZs) to ensure that the external vehicle trips estimated by the model for the proposed project matched the values in Table 5.

The values shown in **Table 11** represent the project's effect on travel at each of the project gateways. It comprises both new trips generated by the project that use a given roadway, but also trips currently being made through the project area that reroute as a result of the project construction. Each rerouted trip subtracts two trip ends (i.e., the trip entering the project site area and the trip exiting the project site area).

## Average Daily Traffic Volumes and Number of Lanes - Existing Plus Project Conditions

**Table 11:**
**Change in Daily Traffic at Project Gateways – Existing Plus Project Conditions**

| Segment | Existing ADT [1] | Existing Plus Project ADT [1] | Increase (% of Total) |
|---|---|---|---|
| West El Camino Avenue west of I-80 | 14,200 | 83,300 | 69,100 (69%) |
| San Juan Road west of Duckhorn Drive | 6,600 | 14,300 | 7,700 (8%) |
| El Centro Road south of Arena Boulevard | 7,900 | 27,000 | 19,100 (19%) |
| Garden Highway north of Radio Road | 2,300 | 4,200 | 1,900 (2%) |
| Garden Highway under I-80 | 1,900 | 4,200 | 2,300 (2%) |
| Total | 32,900 | 133,000 | 100,100 (100%) |

Notes:
1. Based on Figures 6 and 7A.
ADT = Average Daily Traffic volume; ADT values are rounded to the nearest 100 vehicles.
Source: Fehr & Peers, 2021

The model's estimate of a net increase in 100,100 daily trips is only slightly lower than the predicted 100,840 net increase in daily trips generated by the project (see Table 11). This implies that the analysis was somewhat conservative because there is likely that more than just 370 daily vehicle trips (i.e., half of 100,840 minus 100,100 daily trips) that rerouted due to increased travel time caused by the project.

# Cumulative and Cumulative Plus Project ADT Forecasts

## Land Use Assumptions

The cumulative version of SACSIM travel demand model already includes partial or full buildout of a number of planned and pending projects within the study area. At the direction of Sacramento County DOT and PER staff, full buildout of each of the projects listed below was assumed:

- Downtown Specific Plan (City of Sacramento)
- Metro Air Park (Sacramento County)
- Grandpark Specific Plan (Sacramento County)
- Northlake (formerly Greenbriar) (City of Sacramento)
- Panhandle (City of Sacramento)
- West Broadway Specific Plan (City of Sacramento)
- Railyards Specific Plan (City of Sacramento)

- River District Specific Plan (City of Sacramento)

In addition to these large projects, buildout of a number of other individual projects located within the City of Sacramento and Sacramento County was assumed. These include currently vacant properties along portions of Arena Boulevard, El Centro Road, Duckhorn Drive, Del Paso Road, and East Commerce Way. Per City of Sacramento staff, no assumptions were made for the reuse of the Sleep Train Arena because at the time the analysis was performed, development plans had not progressed to the point where a reasonable land use assumption could be made.

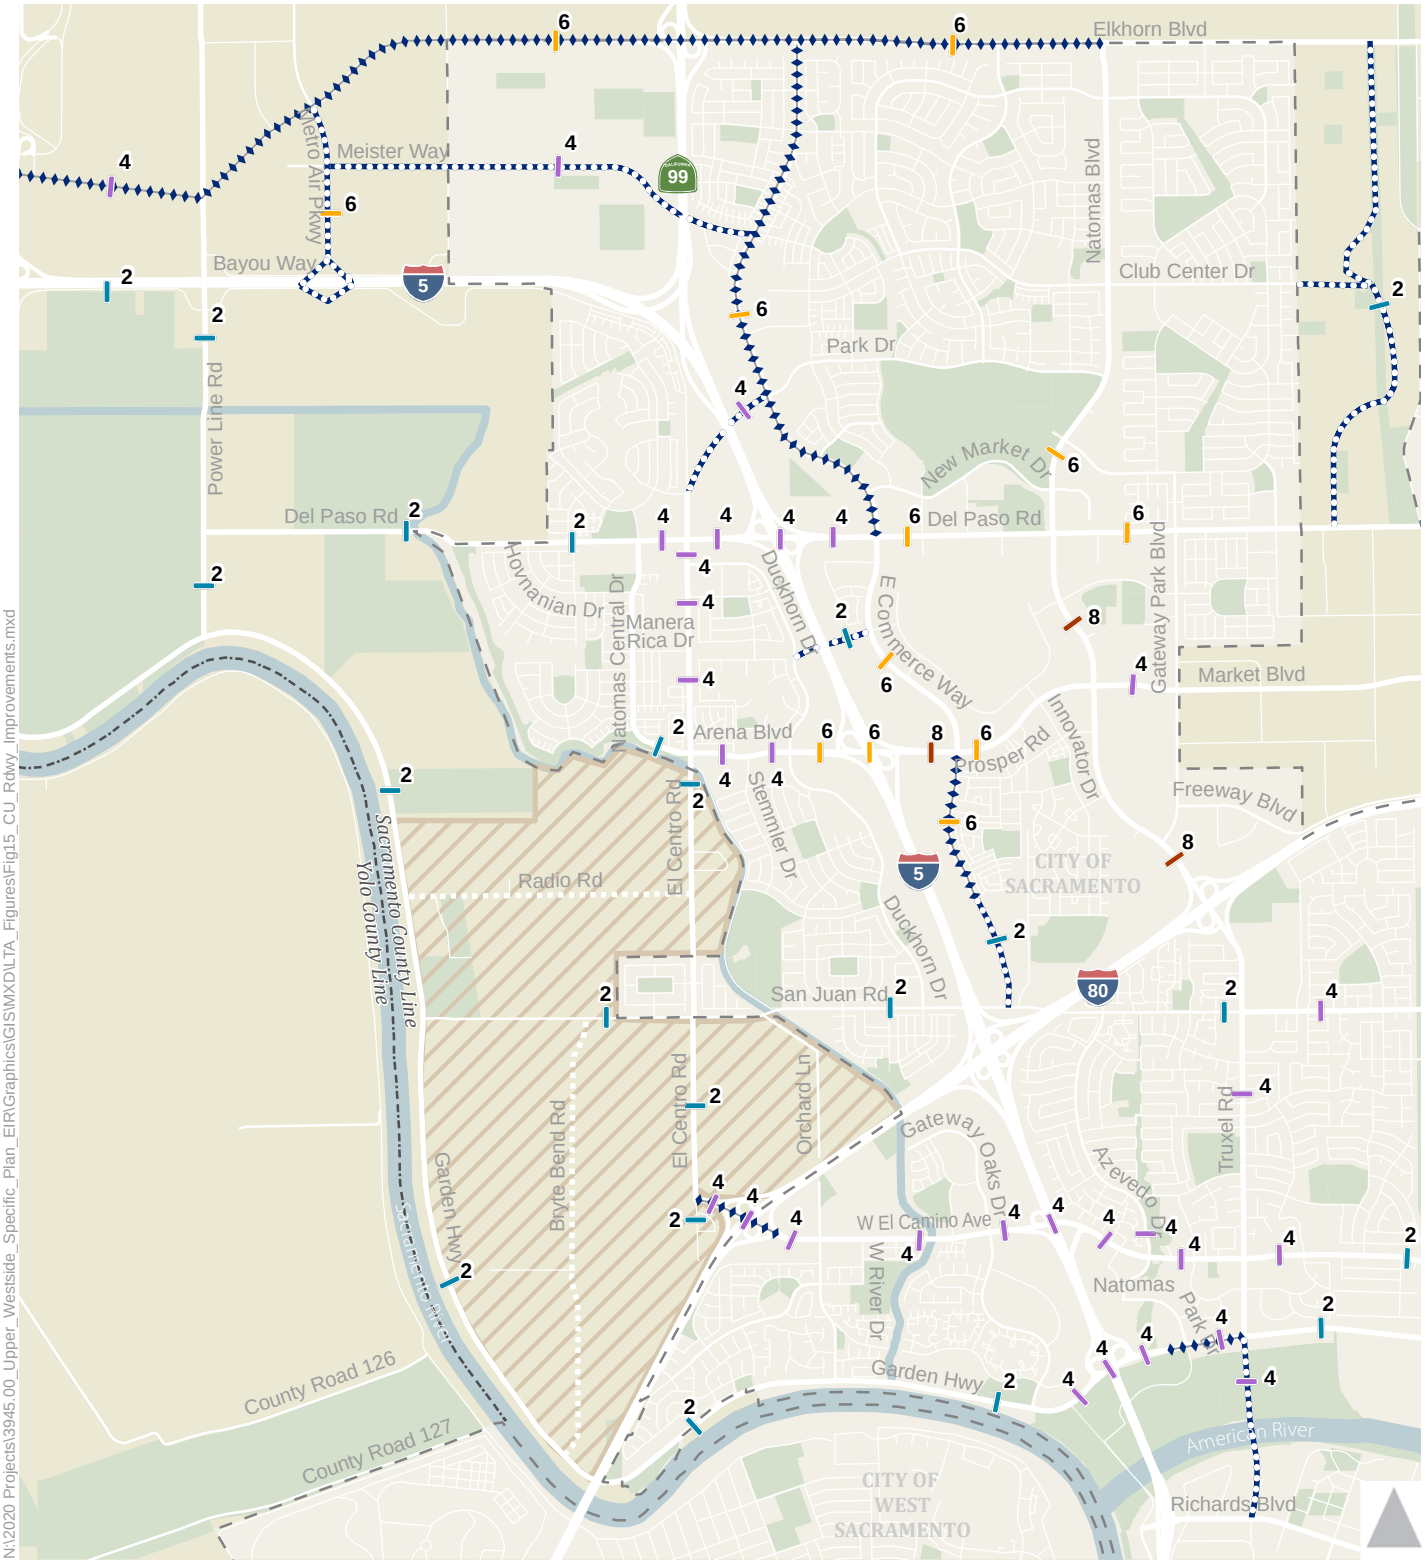

**Figure 8** displays the roadway network assumed in place under cumulative conditions. This list is based primarily on the City of Sacramento General Plan Mobility Element. As shown, several roadways in the study area are assumed to be widened or extended. This includes two new overcrossings of I-5, one new overcrossing of State Route 99, and a new interchange on I-5. Note that the extension of Natomas Crossing Drive was not assumed (either across I-5 or connecting between Duckhorn Drive and El Centro Road, per City of Sacramento direction).

**Figure 9** displays the cumulative no project average daily traffic (ADT) on roadways in the project vicinity. **Figure 10a** shows the ADT on the same roadways under cumulative plus project conditions. **Figure 10b** shows the ADT on the roadways within the Specific Plan area for this scenario.

A comparison of the existing and cumulative no project volumes indicates substantial traffic growth on a number of roadways including the following:

- El Centro Road – volume north of West El Camino Avenue increases from 13,400 ADT under existing conditions to 23,700 ADT under cumulative no project conditions.
- El Centro Road – volume north of Arena Boulevard increases from 8,100 ADT under existing conditions to 20,400 ADT under cumulative no project conditions.
- Arena Boulevard – volume east of I-5 increases from 24,300 ADT under existing conditions to 48,900 ADT under cumulative no project conditions.

This growth is caused by several factors including new land use growth north of I-80 on both sides of I-5 and new roadway connections, particularly the four-lane North Park Drive overcrossing of I-5 between El Centro Road and East Commerce Way, which carries 19,200 ADT. The addition of project trips both adds traffic to numerous roadway segments, but also causes a redistribution of background trips (due to increased congestion along roadways within the project site as well as providing new shopping and employment attractions).

# 5. ROADWAY SAFETY ASSESSMENT

This chapter presents an assessment of roadway safety, focusing primarily on freeway interchanges under the jurisdiction of Caltrans.

## Background

Caltrans' October 29, 2020 comment letter on the Notice of Preparation for the Upper Westside Specific Plan EIR did not make any reference to the need for safety analysis. Prior to issuing that letter, Sacramento County had met (virtually) on two separate occasions with Caltrans staff to discuss the scope of work.

In December 2020, Caltrans published the *Interim Local Land Development and Intergovernmental Review (LDIGR) Safety Review Practitioners Guidance*. This document provides guidance for conducting safety reviews of land use projects and plans that may affect the State Highway System. Although it stops short of including specific thresholds of significance or providing specific recommendations for how safety evaluations should be included in CEQA documents, it does clearly indicate the State's expectation that, when appropriate, CEQA studies of land use projects should include safety investigations of the State Highway System. Appendix A of that document provides practitioners with specific guidance on analysis of project effects on freeway off-ramp queuing. That information along with supplemental explanations provided by Caltrans staff in a webinar on January 20, 2021 is used as the basis for the freeway off-ramp queuing analysis presented in this chapter.

Inter-agency coordination continued between Sacramento County and Caltrans in 2021. On August 6, 2021, Caltrans issued a comment letter based on their staff review of an administrative draft of this report and the LTA report. The following key points related to safety were raised or requested in that letter:

1. Potential safety issues related to the I-80 / W. El Camino Avenue interchange from the Sacramento 49er Travel Plaza Truck Stop driveway(s) should be analyzed.
2. Caltrans will provide an analysis of the current collision patterns on the SHS relative to the project for the use in the County's Safety Analysis in the TIA/DEIR. Two to three years prior to the start of construction for Phase 1 of the project, Caltrans will provide an updated collisions patterns analysis to the County to ensure the current operational and safety conditions are represented.
3. Safety analysis should be conducted to demonstrate that safety impacts are being feasibly mitigated by discussing implementation of the "Four Pillars of Traffic Safety".
4. Cumulative safety impacts should be evaluated on the segment of West El Camino Avenue between the I-80 and I-5 interchanges so that the full safety impact can be examined, and improvements can be proposed when local/state projects are proposed in the area.

Each of the above items is addressed directly in this chapter. The August 6, 2021 comment letter also included reference to specific impacts and mitigation measures and responsibilities. Those comments and responses are included in Chapter 6 (Impacts and Mitigation Measures).

Potential Safety Issues at I-80/West El Camino Avenue Interchange Associated with Sacramento 49er Travel Plaza Truck Stop

This truck stop is located in the northeast corner of the West El Camino Avenue/El Centro Road intersection. As shown in Table 4, it was measured to generate about 175 AM peak hour trips and 215 PM peak hour trips, most of which are trucks. The site is accessed by a right-turn only driveway on West El Camino Avenue and three full-service driveways on El Centro Road. At project buildout, this use would be replaced by commercial mixed-use. However, it would likely remain in place for a period of time while the project begins developing.

The short segment of westbound West El Camino Avenue from the I-80 WB Ramps and El Centro Road features a short (about 150-foot) weaving area. The free-flowing off-ramp from westbound I-80 merges into its own lane, which becomes the right-turn lane at El Centro Road. A Class II bike lane and sidewalk are also present on this segment. During the PM peak hour (which is busier than the AM peak hour), 150 vehicles exit this off-ramp, many of which weave with the 910 vehicles (in a single lane) that continue straight from the freeway overcrossing.

The Transportation Injury Mapping System (TIMS) was developed by the University of California Berkeley's Safe Transportation Research & Education Center (SafeTREC) to map and document California crash data from the Statewide Integrated Traffic Records System (SWITRS). TIMS data was pulled for this area for the seven-year period from 2014 through 2020 inclusive. The data revealed only two collisions between the westbound ramps and El Centro Road, both resulting in complaint of pain, but not being severe or fatal. One was a broadside collision and the other involved a collision with a fixed object. Given the volume of traffic on this segment (14,200 daily trips), this is not considered an above average collision rate. There were six reported collisions on El Centro Road along the 49er Travel Plaza frontage. These collisions included broadside, rear-end, and head-on types.

Notwithstanding the above, it is recommended that the following collision monitoring, access management strategies, and phasing of interchange improvements be a project requirement:

1. *Eliminate the 49er Travel Plaza Driveway on West El Camino Avenue*. Removal of this driveway would reduce the number of conflict points involving passenger vehicles, trucks, bicyclists, and pedestrians.
2. *Replace the Free-Flowing Right-Turn Off-Ramp Movement with a Signal-Controlled Movement*. This would eliminate the weaving movement and also slow travel speeds on westbound West El Camino Avenue approaching El Centro Road.

Analysis of Current Collision Patterns on Adjacent Segments of I-80 and I-5

Caltrans provided collision statistics from June 1, 2018 through May 31, 2021 for two segments of I-5 and one segment of I-80 that would be used to the greatest degree by project trips. **Table 12** summarizes the results for the three-year period including the total number of reported collisions, collision rates, primary collision factors, and most common collision type.

Table 12 indicates that collision rates (total, fatal, and fatal/injury) are greater on the two segments of I-5 versus the segment of I-80. This is expected because the segments of I-5 generally feature more recurring congestion, lane changing, and other travel behaviors that may contribute to these collision patterns. On all segments speeding was the most common primary collision factor and rear-end collisions were most commonly reported. The collision rate (0.95 collisions per million vehicle miles of travel) on I-5 is slightly greater than the average rate for similar facilities (0.90 collisions per million vehicle miles of travel).

While the project would add the most trips to the I-80/West El Camino Avenue interchange on-ramps, it would also reconstruct the interchange to include ramp metering. With ramp metering in place, more orderly traffic flow from these on-ramps onto I-80 would be achieved, which may reduce collision rates.

**Table 12: I-5 and I-80 Collision Statistics in Study Area**

| Segment | Postmile Range | Total Number of Reported Collisions | Collision Rates (per MVM) | | | Most Common Primary Collision Factors | Most Common Type of Collision |
|---|---|---|---|---|---|---|---|
| | | | Total | Fatal | Fatal + Injury | | |
| I-80 from 0.85 miles to the west to 0.45 miles to the east of the I-80/West El Camino Avenue Interchange | M0.5 – M1.8 | 80 | 0.73 | 0.006 | 0.27 | Speeding (51%), Improper Turn (20%) | Rear End (51%), Hit Object (20%) |
| I-5 from 0.5 miles to the north of the I-5/Del Paso Road interchange to 0.55 miles to the south of the I-5/Arena Blvd Interchange | 27.5 – 29.5 | 224 | 0.95 | 0.009 | 0.36 | Speeding (51%), Other Violations (32%) | Rear End (50%), Side Swipe (29%) |
| I-5 from 0.15 miles to the north of the I-5/West El Camino Avenue interchange to 0.25 miles to the south of the I-5/Garden Highway Interchange | 25.0 – 26.0 | 204 | 0.95 | 0.009 | 0.36 | Speeding (46%), Other Violations (24%) | Rear End (47%), Side Swipe (26%) |

Notes:

MVM = Million Vehicle Miles

Implementation of the Four Pillars of Traffic Safety

Caltrans's *2020-2024 Strategic Plan*[4] lists "Safety First" as its top goal through 2024. The screenshot on the following page summarizes the goals of "Safety First" and lists the actions and strategies to achieve that goal. The *2020 Caltrans Annual Accomplishments Report* describes the Four Pillars of Traffic Safety, which will help guide the department toward the ultimate goal of zero deaths or severe injuries on California roads by 2050. The Four Pillars of Traffic Study are:

1. *Double Down on What Works*
2. *Accelerate Advanced Technology*
3. *Lead Safety Culture Change*
4. *Integrate Equity*

Each of these pillars, including their applicability to the proposed project, are described below.

1. *Double Down on What Works*

This pillar focuses on implementing applicable countermeasures from FHWA's Proven Safety Countermeasures program (https://safety.fhwa.dot.gov/provencountermeasures/). This program contains 20 types of countermeasures including several crosscutting strategies that address multiple safety focus areas. Refer to separately bound appendix for a complete list of these countermeasures and overview of their effectiveness.

The proposed project and Sacramento County design standards already include many of these treatments including: roadway design improvements at horizontal curves, reduced left-turn conflicts at intersections, median barriers, traffic signals with retroreflective backplates, corridor access management, dedicated left/right turn lanes at intersections, roundabouts, medians/pedestrian crossing islands, road diets, and walkways. Other treatments from the FHWA program that could be considered for the proposed project include systemic application of low-cost countermeasures at stop-controlled intersections (e.g., advanced warning signs), leading pedestrian intervals (i.e., pedestrians receive WALK indication before motorists to enhance visibility), USLIMITS2 (a free, web-based tool designed to help practitioners assess and establish safe, reasonable, and consistent speed limits for specific segments of roadway), horizontal curve enhanced delineation and pavement friction, and pedestrian hybrid beacons.

2. *Accelerate Advanced Technology*

This pillar refers to increased and proactive usage of advanced technologies known to improve safety. Examples at traffic signals include vehicle queue spillback detection, coupled with a fixed Changeable Message Sign (CMS) sign upstream to alert drivers of either slowed or stopped traffic ahead. Other examples include extinguishable / blankout signs placed on traffic signal poles to advise travelers of

[4] Caltrans 2020-2024 Strategic Plan

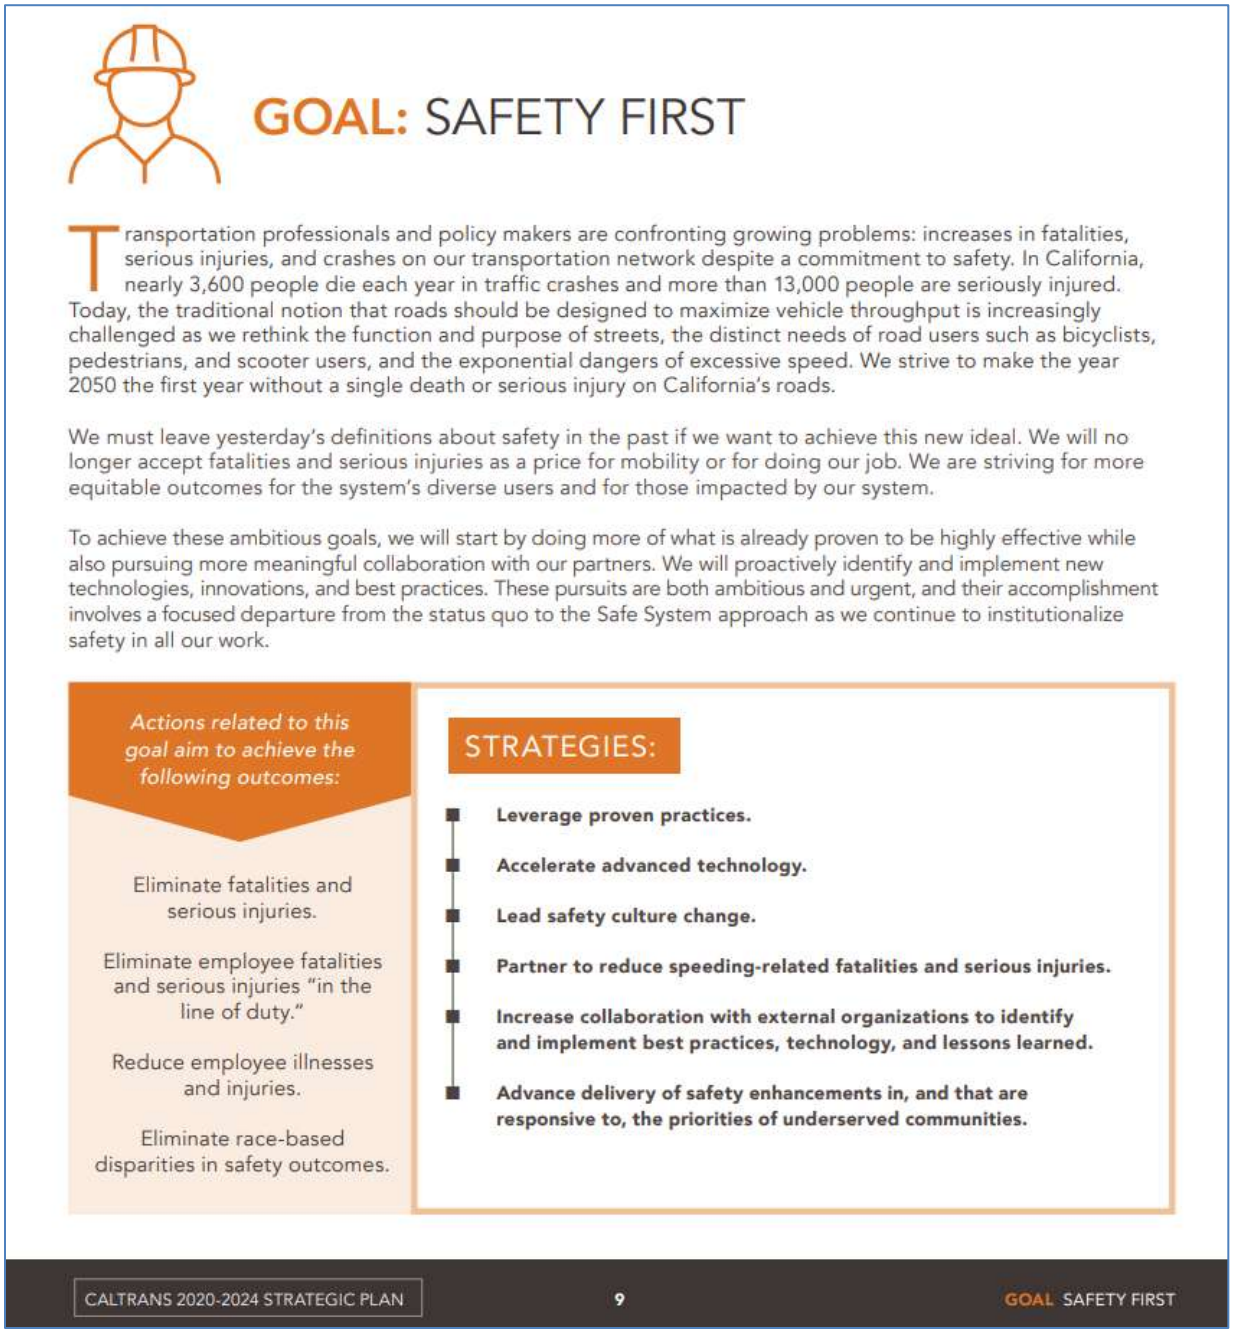
regulatory or advisory conditions (e.g., no right-turn on red, look left for vehicles, etc.). Additionally, adaptive traffic signal systems are now being implemented in a number of corridors in urban areas. These systems can update their traffic signal timings in real-time, in responsive to changes in traffic flows, to better serve travelers (source: Adaptive Traffic Management: SCOOT | Traffic Management | Siemens Mobility USA).

Many of the above technologies are particularly well-suited to the West El Camino Avenue and El Centro Road corridors within and adjacent to the proposed project. Appropriate technologies can be evaluated and deployed at the high-profile West El Camino Avenue/El Centro Road intersection.

3. *Lead Safety Culture Change*

The Safe System approach represents a paradigm shift in roadway safety philosophy. Whereas previously the focus of roadway safety was on preventing collisions, now it is on preventing fatal and severe collisions. Before, the emphasis was on improving human behavior to reduce collision frequency, but now it is recognized that humans make mistakes and are vulnerable, and that roadway design must consider these factors. The Safe System approach refocuses transportation system design and operation on anticipating human mistakes and lessening impact forces to reduce crash severity and save lives. In the Safe System approach, the principles related to prevention of collision-related deaths and serious injuries are:

- Reduce System Kinetic Energy/Control Speeding
- Coordinate and Share Responsibility
- Proactively Address Risks



Some of these Safe System principles (e.g., reduce system kinetic energy) can be employed as part of the project design and mitigation. Others are more regional and programmatic in nature, requiring leadership and commitment by regional and state agencies and other stakeholders. Through preparation of a Local Roadway Safety Plan (LRSP), Sacramento County is proactively addressing risks through a systemic approach to safety (versus simply reacting to high collision locations).

4. *Integrate Equity*

The *2020-2024 Strategic Highway Safety Plan* (Caltrans, March 2021) lists "Integrate Equity" as one of its four guiding principles and a way to address institutional and systemic biases. This principle supports a better understanding of the effects of socioeconomic and demographic influences on fatal and serious injury crashes. Understanding these effects includes use of data related to race, income, population density, and other demographic, socioeconomic, and location-based information. Equity in safety may also relate to disparate treatment of different modes of travel.

The proposed project has been designed to accommodate all modes of travel. As described in this report, comprehensive systems are provided for bicyclists and pedestrians. In many cases, facilities supporting

these modes of travel are physically separated from the roadway system to provide greater levels of protection to these vulnerable users.

## GOAL: SAFETY FIRST

Transportation professionals and policy makers are confronting growing problems: increases in fatalities, serious injuries, and crashes on our transportation network despite a commitment to safety. In California, nearly 3,600 people die each year in traffic crashes and more than 13,000 people are seriously injured. Today, the traditional notion that roads should be designed to maximize vehicle throughput is increasingly challenged as we rethink the function and purpose of streets, the distinct needs of road users such as bicyclists, pedestrians, and scooter users, and the exponential dangers of excessive speed. We strive to make the year 2050 the first year without a single death or serious injury on California's roads.

We must leave yesterday's definitions about safety in the past if we want to achieve this new ideal. We will no longer accept fatalities and serious injuries as a price for mobility or for doing our job. We are striving for more equitable outcomes for the system's diverse users and for those impacted by our system.

To achieve these ambitious goals, we will start by doing more of what is already proven to be highly effective while also pursuing more meaningful collaboration with our partners. We will proactively identify and implement new technologies, innovations, and best practices. These pursuits are both ambitious and urgent, and their accomplishment involves a focused departure from the status quo to the Safe System approach as we continue to institutionalize safety in all our work.

*Actions related to this goal aim to achieve the following outcomes:*

Eliminate fatalities and serious injuries.

Eliminate employee fatalities and serious injuries "in the line of duty."

Reduce employee illnesses and injuries.

Eliminate race-based disparities in safety outcomes.

### STRATEGIES:

- **Leverage proven practices.**
- **Accelerate advanced technology.**
- **Lead safety culture change.**
- **Partner to reduce speeding-related fatalities and serious injuries.**
- **Increase collaboration with external organizations to identify and implement best practices, technology, and lessons learned.**
- **Advance delivery of safety enhancements in, and that are responsive to, the priorities of underserved communities.**

CALTRANS 2020-2024 STRATEGIC PLAN 9 GOAL SAFETY FIRST

Cumulative Safety Impacts on West El Camino Avenue between I-5 and I-80

Since this segment is located entirely within the Sacramento City limits, the City would take the lead on approving and implementing any improvements on it. Sacramento is a Vision Zero City, which means they are committed to working together with partners to create safer streets.[5] The City has completed a Top Five Corridors study that identifies collision trends and recommends countermeasures on segments considered part of a high-injury network. The nearest Top Five corridor facility to the project site is El Camino Avenue between Northgate Boulevard and Del Paso Boulevard. Additionally, the City regularly undertakes corridor transportation planning studies such as recent/ongoing efforts along Northgate Boulevard, Stockton Boulevard, Pocket Greenhaven, and Freeport Boulevard.[6] The City also regularly evaluates and prioritizes corridors for study and improvement. Since West El Camino Avenue between I-5 and I-80 has continuous bicycle lanes, sidewalks, and median treatments to manage turning movements, it may not rate as high as other less improved city facilities. However, should collision rates increase, the City would presumably prioritize this corridor for study and potential improvements.

[5] Vision Zero - City of Sacramento

[6] Transportation Planning & Projects - City of Sacramento

# 6. IMPACTS AND MITIGATION MEASURES

This chapter identifies project-specific and cumulative impacts of the proposed project. Impact statements are provided for the topics of VMT and roadway safety, which are the criteria used to evaluate roadway system impacts. Impact statements are also provided for the bicycle, pedestrian, and transit systems. Mitigation measures are recommended for significant impacts.

## Thresholds of Significance

The following thresholds of significance are used to evaluate the significance of project impacts to the roadway, bicycle, pedestrian, and transit systems. This report does not reach any conclusions regarding whether mitigation measures would lessen the significant impact to a less than significant level. Sacramento County staff will make that determination at the time the DEIR is being prepared.

### Roadway Network VMT

The project would cause a significant impact if:

- Project VMT per capita exceeds 85 percent of the regional average VMT per capita.
- Project VMT per employee exceeds 85 percent of the regional average VMT per employee.
- The project's regional retail land uses cause a net increase in regional VMT.
- The project's proposed widening of "regional roadways" is expected to result in an increase in regional VMT.

When reviewing the project's VMT effects for the above thresholds, it is important to consider the project's overall VMT efficiency. In other words, the broader view of VMT properly considers the net effect, for instance, of a slight exceedance of one threshold versus a "substantially below threshold" result for another.

### Roadway Safety / Design Standards

The project would cause a significant impact if it would:

- Cause a substandard rural roadway (i.e., less than 24 feet of pavement width and less than six a foot shoulder) to exceed an average daily traffic volume of 6,000 daily vehicles;

- Add 600 or more new daily vehicle trips to a substandard rural roadway that already carries 6,000 or more daily vehicles;
- Cause the maximum queue length at a freeway off-ramp to extend beyond the gore point onto the mainline (or exacerbate a current or future condition by increasing the maximum queue by one or more vehicles); or
- Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).

## Bicycle and Pedestrian Facilities

The project would cause a significant impact if it would:

- Eliminate or adversely affect an existing bikeway or pedestrian facility in a way that would discourage its use;
- Interfere with the implementation of a planned bikeway as shown in the Bicycle Master Plan, or be in conflict with the Pedestrian Master Plan; or
- Fail to provide adequate access for bicyclists and pedestrians, resulting in unsafe conditions, including unsafe bicycle/pedestrian, bicycle/motor vehicle, or pedestrian/motor vehicle conflicts.

## Transit Services and Facilities

The project would cause a significant impact if it would:

- Eliminate or adversely affect existing transit access, service, or operations;
- Interfere with the implementation of transit service as planned in the Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS); or
- Substantially increase transit demand and fail to provide adequate transit service.

# Project-Specific Impacts

## Roadway Network VMT

The project's effect on VMT was analyzed in a comprehensive manner that considered its relative VMT efficiency per capita and per employee, its VMT effect by adding regional retail, and its VMT effect caused by widening regional roadways. Table 10 showed a reconciliation of the project's VMT budget, noting both savings and exceedances. This table indicated that the project's net increase in VMT due to roadway widenings (1,799 VMT) is more than offset by its beneficial land use efficiency and regional retail VMT saving benefits, which represent a combined savings of 36,158 VMT. The net result is that the project generates 34,359 VMT less than the VMT budgets established by the significance thresholds. Therefore, project impacts to roadway network VMT are considered **less than significant,** and no mitigation is required.

## Roadway Safety / Design Standards:

The project would not cause a substandard rural roadway to exceed an ADT of 6,000 vehicles and would not add 600 or more vehicle trips to a substandard rural roadway that already carries 6,000 or more daily vehicles: Therefore, project impacts to rural roadway compatibility is considered **less than significant,** and no mitigation is required.

Impact TR-1: Freeway Off-Ramp Queues Exceed Available Storage

**Table 13** presents the AM and PM peak hour maximum queues on freeway off-ramps under Existing Plus Project conditions. Refer to separately bound appendix for technical calculations. As shown, all study freeway off-ramps would continue to have sufficient storage to accommodate the maximum queue under existing plus project conditions with the exception of the I-80 eastbound and westbound off-ramps at West El Camino Avenue (during one or both peak hours) despite the interchange's assumed expansion with the project and I-5 southbound off-ramp at J Street (during the AM peak hour).

Appendix A to the *Interim Local Land Development and Intergovernmental Review (LDIGR) Safety Review Practitioners Guidance (Caltrans, December 2020)* specifies that the speed differential between the off-ramp queue and the adjacent travel lane is an important criterion that should be considered when determining significance of freeway off-ramp impacts. The guidance specifically cites 30 miles per hour as a threshold beyond which collision severity increases. Because the I-80 mainline at West El Camino Avenue operates in a free-flow condition during weekday AM and PM peak hours, there would be a greater than a 30 mph speed differential between queued off-ramp traffic and freeway mainline traffic. In contrast, the travel lane on southbound I-5 at the J Street off-ramp is frequently congested during the AM peak hour as a result of

queue spillback from the I-80/US 50/SR 99 interchange. Hence, there would not be a 30 mph speed differential at this off-ramp. Thus, project impacts to off-ramp queuing at the I-80 eastbound and westbound off-ramps at West El Camino Avenue would be considered **significant**.

Mitigation TR-1: *The project applicant shall construct the geometric improvements shown on Figure 11 (or an equivalent or more effective set of alternate improvements subject to the determination of the environmental coordinator) at the I-80/West El Camino Avenue interchange and at the West El Camino Avenue/El Centro Road intersection*.

As noted in the project description, project buildout would be supported by a reconstructed I-80/West El Camino Avenue interchange to accommodate the project's travel needs and provide for a more bicycle/pedestrian friendly design (i.e., by removing the free-flow westbound I-80 off-ramp right-turn movement, for instance). Although the initial proposed project improvements include a traffic signal with additional lanes at the West El Camino Avenue/El Centro Road intersection, the resulting network would not have sufficient capacity to accommodate inbound travel to the project during peak hours. As a result, vehicles queues at each off-ramp would spill onto I-80.

The geometric improvements shown on Figure 11 were analyzed to determine how off-ramp queuing would be affected at the I-80/West El Camino Avenue interchange. The results indicated that the maximum queue with the improvements in place at the eastbound off-ramp would be 1,050 feet during the more critical PM peak hour, which can be accommodated in a standard interchange design. At the westbound off-ramp, the maximum queue would be 475 feet during the AM peak hour and 600 feet during the PM peak hour (see separately bound appendix for technical calculations). Since this is less than the existing storage of 1,500 feet, the improvements on Figure 11 would not cause traffic to spill onto the I-80 mainline under existing plus project conditions.

To implement the improvements shown on Figure 11, a subsequent Intersection Control Evaluation (ICE) process will need to be undertaken in conjunction with Caltrans to identify the proper interchange design to address both operational capacity and safety issues.

**Table 13:**
**Peak Hour Freeway Off-Ramp Queuing – Existing Plus Project Conditions**

| Freeway Off-Ramp | Ramp Length[1] | Peak Hour | Average Maximum Queue (feet)[2] | |
|---|---|---|---|---|
| | | | Existing | Existing Plus Project |
| I-80 EB Off-Ramp at West El Camino Avenue | 1,500 feet [3] | AM | 250 | 700 |
| | | PM | 500 | **>1 mile** |
| I-80 WB Off-Ramp at West El Camino Avenue | 1,500 feet [3] | AM | 700 | **>3,900** |
| | | PM | 250 | **>1 mile** |
| I-5 NB Off-Ramp at Arena Blvd. | 1,475 feet | AM | 100 | 450 |
| | | PM | 200 | 950 |
| I-5 SB Off-Ramp at Arena Blvd. | 1,425 feet | AM | 100 | 125 |
| | | PM | 100 | 300 |
| I-5 NB Off-Ramp at Del Paso Rd. | 1,300 feet | AM | 375 | 425 |
| | | PM | 500 | 525 |
| I-5 SB Off-Ramp at Del Paso Rd. | 1,150 feet | AM | 175 | 1,025 |
| | | PM | 175 | 200 |
| I-5 NB Off-Ramp at West El Camino Ave. | 1,000 feet | AM | 325 | 425 |
| | | PM | 225 | 450 |
| I-5 NB Off-Ramp at Garden Highway | 1,275 feet | AM | 275 | 275 |
| | | PM | 325 | 875 |
| I-5 SB Off-Ramp at Garden Highway | 1,425 feet | AM | 175 | 175 |
| | | PM | 200 | 375 |
| I-5 SB Off-Ramp at Richards Boulevard | 1,050 feet | AM | 625 | 625 |
| | | PM | 400 | 400 |
| I-5 SB Off-Ramp at J Street | 1,525 feet | AM | 1,400 | **1,830** |
| | | PM | 325 | 400 |

Notes:
1. The ramp length is estimated by measuring the distance from the gore point where the off-ramp departs from the mainline to the limit line at the ramp terminal intersection with the local street, as measured from aerial imagery.
2. Maximum queue, as calculated using the average of 10 SimTraffic microsimulation runs. Queue is expressed on a "per lane" basis.
3. Presumed storage to be provided with reconstructed interchange.

Bolded cells indicated that maximum queue exceeds available storage.

Feb 23, 2022

Impact TR-2: Freeway On-Ramp Ramp Meter Queues Exceed Available Storage

**Table 14** presents the AM and PM peak hour queues at freeway on-ramp ramp meter locations that would be used by the project. Refer to separately bound appendix for technical calculations. As shown, most freeway ramp meter on-ramp locations would continue to have sufficient storage for queues except for the I-5 southbound diagonal on-ramp at West El Camino Avenue and I-5 southbound loop on-ramp and I-5 northbound diagonal on-ramp at Garden Highway. Project impacts to freeway on-ramp ramp metering queuing would be considered **significant**.

**Table 14:**
**Peak Hour Freeway On-Ramp Ramp Meter Queuing – Existing Plus Project Conditions**

| Freeway Off-Ramp | Ramp Type | Ramp Length[1] | Peak Hour | Average Maximum Queue[2] | |
|---|---|---|---|---|---|
| | | | | Existing | Existing Plus Project |
| I-80 WB Diagonal On-Ramp at West El Camino Avenue | 2 GP Lane + 1 HOV Lane | 1,000 feet | AM | 350 | 200 |
| | | | PM | 250 | 150 |
| I-80 EB Loop On-Ramp at West El Camino Avenue | 1 GP Lane + 1 HOV Lane | 700 feet | AM | 250 | 375 |
| | | | PM | 125 | 375 |
| I-5 NB Loop On-Ramp at Arena Blvd. | 1 GP Lane + 1 HOV Lane | 625 feet | AM | 200 | 200 |
| | | | PM | 100 | 125 |
| I-5 SB Diagonal On-Ramp at Arena Blvd. | 1 GP Lane + 1 HOV Lane | 1,200 feet | AM | 325 | 475 |
| | | | PM | 325 | 575 |
| I-5 SB Diagonal On-Ramp at Del Paso Rd. | 1 GP Lane | 1,100 feet | AM | 375 | 475 |
| | | | PM | 300 | 300 |
| I-5 SB Diagonal On-Ramp at West El Camino Ave. | 1 GP Lane | 750 feet | AM | 325 | 525 |
| | | | PM | 300 | **3,325** |
| I-5 SB Loop On-Ramp at Garden Highway | 1 GP Lane | 625 feet | AM | **775** | **1,075** |
| | | | PM | **1,450** | **1,525** |
| I-5 NB Diagonal On-Ramp at Garden Highway | 1 GP Lane | 725 feet | AM | Not Operational | |
| | | | PM | **900** | **900** |

Notes:
1. The ramp meter storage is measured from the ramp meter stop line to the upstream intersection or roadway ramp departure gore point., as measured from aerial imagery. Storage rounded to the nearest 25 feet.
2. Maximum queue, as calculated using the average of 10 SimTraffic microsimulation runs. Queue is expressed on a "per lane" basis.
3. Presumed storage to be provided with reconstructed interchange.

GP = General Purpose. HOV = High Occupancy Vehicle (Carpool).
Bolded cells indicated that maximum queue exceeds available storage.

Source: Fehr & Peers, 2021.

Mitigation TR-2: *The project applicant shall pay its proportionate fair share percentage toward improvements at the I-5 SB on-ramp at West El Camino Avenue and I-5 SB and NB on-ramps at Garden Highway.*

All three on-ramps feature a single general purpose metered lane with storage (625 to 750 feet) that is less than is typically provided at new interchanges. Queuing could be reduced at each on-ramp by widening it to include a second lane (either general purpose or carpool). Caltrans indicated in their August 6, 2021 comment letter that there is a planned project at the I-5 southbound on-ramp at West El Camino Avenue, but nothing planned at the I-5 on-ramps at Garden Highway. It is further noted that the Garden Highway on-ramp queuing is an existing operational issue, caused in part by Caltrans' decision to apply metering rates of about 800 vehicles per hour (due to congestion along I-5). Since adding increased on-ramp capacity could contribute to increased traffic flows on I-5 during peak hours, one option would be to reduce metering rates in conjunction with the on-ramp capacity increase so as to avoid adding more peak hour traffic onto I-5.

Impact TR-3: Increased Hazards at Project Access Intersections on Garden Highway

The project would construct new or expanded intersections on Garden Highway, which along the project frontage is a two-lane undivided roadway featuring horizontal curvature, a 45-mph posted speed limit, and limited to no shoulders. New/improved intersections would be at Radio Road, San Juan Road, Street 9, and Bryte Bend Road. The addition of project trips to these new/improved intersections could increase design hazards due to their geometric features. This impact would be considered **significant**.

The Bryte Bend Road intersection with Garden Highway would be relocated approximately 600 feet north of its current location to a tangential section of Garden Highway. The appendix contains an exhibit showing that motorists exiting Bryte Bend Road (looking to the left, which is the more critical direction) would have adequate sight distance based on the new location and Sacramento County design standards.

Mitigation TR-3: *The project applicant shall construct the following improvements at project access intersections along Garden Highway:*

- Garden Highway/San Juan Road (#4) – Construct exclusive southbound left-turn lane.
- Garden Highway/Bryte Bend Road (#5) – Construct exclusive northbound right-turn lane.
- Garden Highway/Radio Road (#42) – Construct exclusive southbound left-turn lane.
- Garden Highway/Street 9 (#108) – Side-street stop-control with a single lane on all approaches is recommended based on the projected traffic volumes.

The above recommendations are based on the forecast traffic volume and geometric conditions at each intersection.

## Bicycle and Pedestrian Facilities

Impact TR-4: Inadequate Bicycle/Pedestrian Access on West El Camino Avenue

The project would not eliminate or adversely affect an existing bikeway or pedestrian facility in a way that would discourage its use. It would also not interfere with the implementation of any planned bikeways in the project vicinity. According to the *Sacramento County Bicycle Master Plan* (2011), Class II bike lanes are planned along portions of El Centro Road, San Juan Road, and Radio Road, both within and adjacent to the project site. According to Figure 4, the project would construct bicycle facilities on each of these streets that would match or exceed (in terms of quality or quantity of facilities) what is planned in the Bikeway Master Plan.

As shown on Figure 4, the project would construct a Class II facility southerly along Bryte Bend Road to Garden Highway, where a Class I facility is planned. The project would also construct a Class I facility along existing El Centro Road south of West El Camino Avenue parallel to I-80 to allow for a future connection under I-80 to a planned Class I facility near West River Drive. A bicycle facility connection from the project site to the existing Class II bike lane to the east on Garden Highway (within the City of Sacramento) would be a multi-agency effort because the facility would traverse both Sacramento County, City of Sacramento, and also need to be coordinated with improvements to the levee being made by the Sacramento Area Flood Control Authority (SAFCA). The *Sacramento County Pedestrian Master Plan* (2007) does not show any priority pedestrian projects within the project's immediate vicinity. The proposed project would fail to provide adequate access for bicyclists/pedestrians along West El Camino Avenue and El Centro Road and along West El Camino Avenue easterly to its I-80 interchange. This impact would be considered **significant**.

Mitigation TR-4a: *Implement Mitigation Measure TR-1 (Geometric Modifications at El Centro Road/West El Camino Avenue intersection and I-80/West El Camino Avenue interchange).*

Mitigation TR-4b: *The project applicant shall implement the bicycle/pedestrian improvements shown on Figure 12 at the El Centro Road/West El Camino Avenue intersection and I-80/West El Camino Avenue interchange.*

Specific amenities shown on **Figure 12** to support biking include:

- Class I multi-use path allowing two-way bicycle travel on the north side of West El Camino Avenue that would extend from El Centro Road to the signalized Orchard Lane intersection (within the City of Sacramento) east of I-80. Additional studies during the interchange design phase will be necessary to determine its exact alignment and how/whether it intersects the three on/off ramps at-grade or not.

- Class I multi-use path on the west side of El Centro Road both north and south of West El Camino Avenue.
- Class II bike lanes in both directions of El Centro Road both north and south of West El Camino Avenue.
- Class II bike lanes in both directions of West El Camino Avenue west of El Centro Road (including an eastbound bike lane that would be located between the left and through lanes at the signal). This bike lane would operate with the eastbound left-turn phase, providing bicyclists with the ability to reach the triangular island to access the Class I multi-use path on the north side of West El Camino Avenue.
- A Class II bike lane is currently shown in the eastbound direction of West El Camino Avenue from El Centro Road extending across the interchange. Bicyclists in this lane need to navigate the merging area with vehicles desiring to travel onto the westbound I-80 diagonal on-ramp. Additional discussion with Caltrans will be necessary during the design phase of the interchange to determine whether this bike lane is desirable or not.

Pedestrian amenities include sidewalks along El Centro Road and West El Camino Avenue west of El Centro Road. It is not known whether a sidewalk would also be provided on the south side of West El Camino Avenue east of El Centro Road across the interchange, as pedestrians using it would encounter three on/off ramps carrying considerable levels of traffic. An alternate route for pedestrians would be the Class I path on the north side. Crosswalks would be provided on three of the four legs at the West El Camino Avenue/El Centro Road intersection. The east leg does not have a crosswalk because it would have adversely affected overall traffic operations in the area.

## Transit Services and Facilities

Impact TR-5: Inadequate Transit Service to Meet Demand

Consistent with Sacramento County's General Plan Policy LU-120, the Town Center component of the proposed project would consist of a mix of complementary land uses built at high densities to support transit use. However, existing fixed-route transit service is not provided to the project site. To determine compliance with Policy LU-120, a transit network and frequency analysis needs assessment was performed. This evaluation determined that the area should be served by fixed-route bus service operating on 15-minute headways from approximately 6 AM to 8 PM. Figure 5 displays the recommended route en which buses use portions of Bryte Bend Road and West El Camino Avenue through the Town Center to travel between El Centro Road on the north and I-80 on the east. Since the project would be phased over time, it is anticipated that transit service levels will also increase over time as ridership increases.

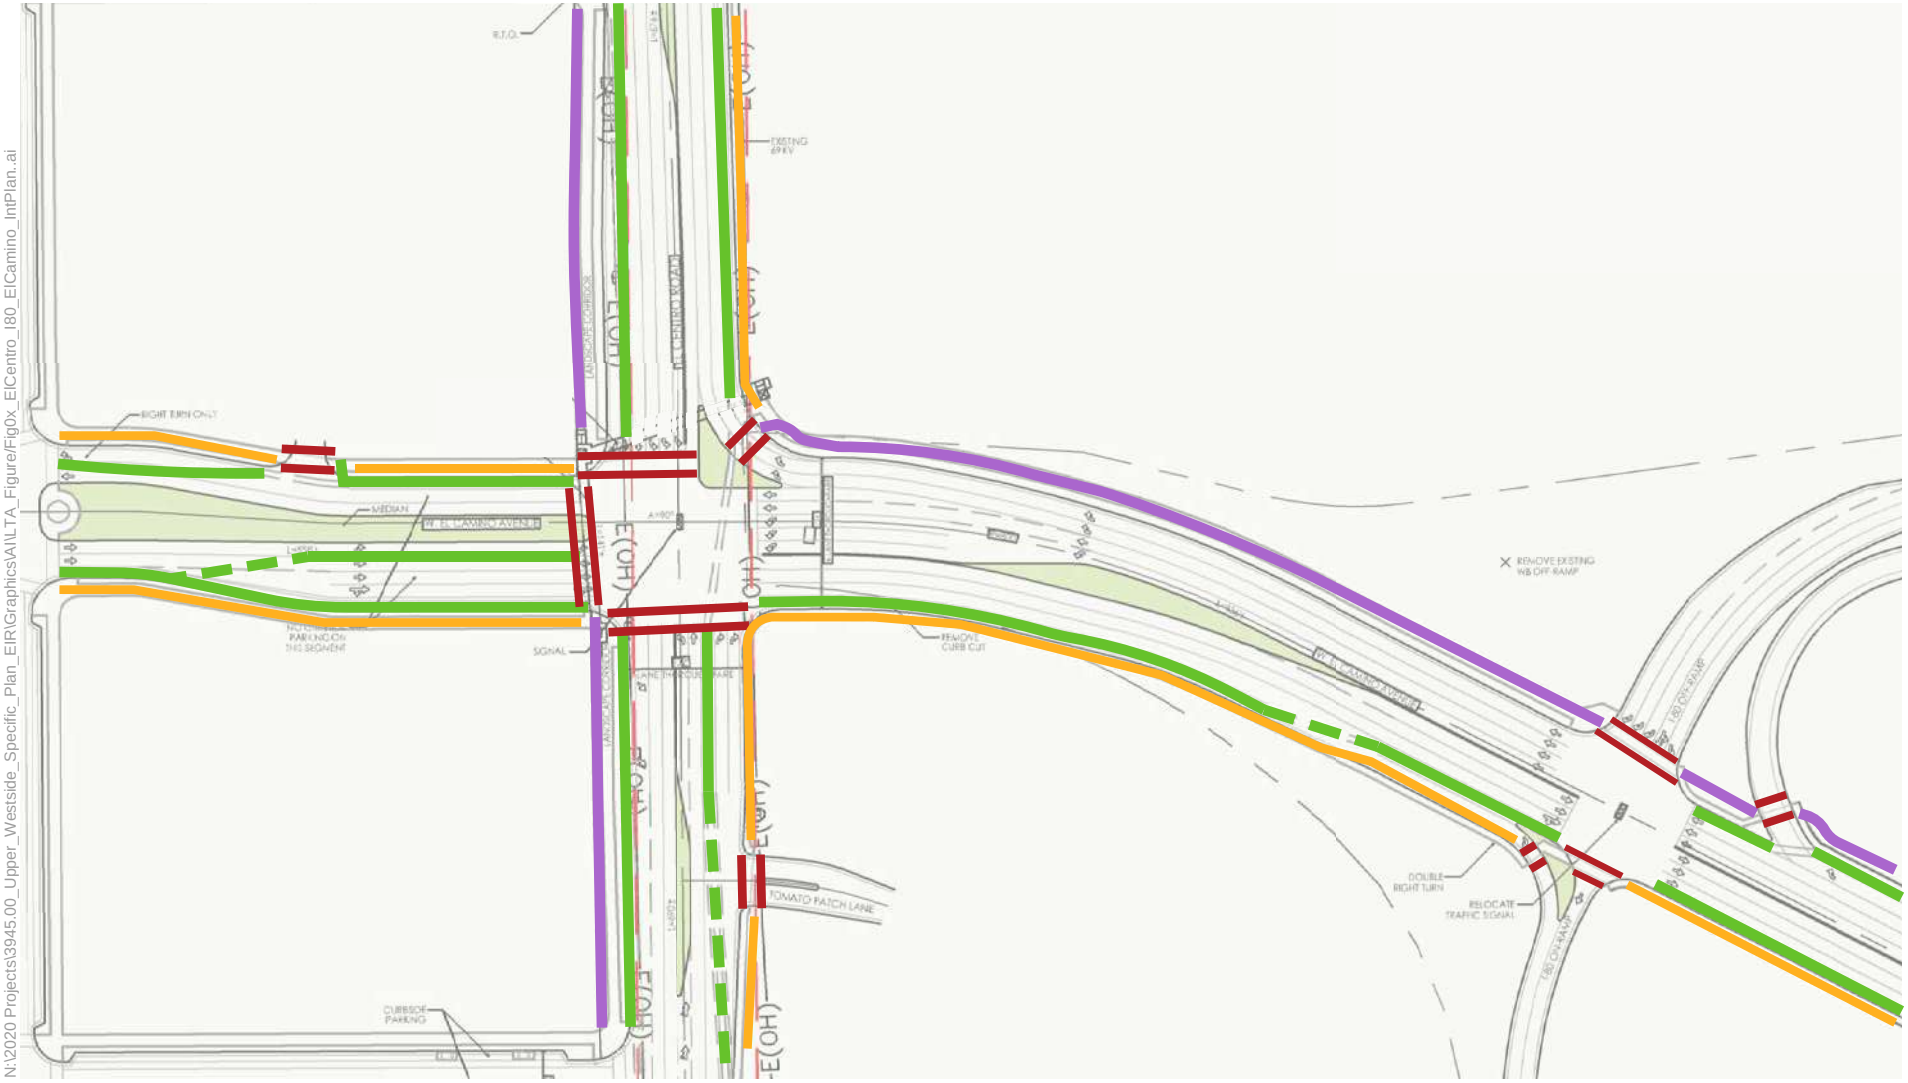

Figure 12

Bicycle and Pedestrian Facilities

El Centro Rd/I-80 WB Ramps/West El Camino Ave Improvements

The project would not eliminate or adversely affect existing transit access, service, or operations, because no service is provided in the immediate project vicinity. The project would not interfere with implementation of transit services as planned in SACOG's MTP/SCS. However, the project would substantially increase transit ridership demand and fail to provide adequate transit service, despite the transit plan that has been prepared for the Specific Plan. Specifically, severe congestion along El Centro Road between West El Camino Avenue and Farm Road would cause substantial delays to planned bus service to operate along this route. Additionally, the lack of planned fixed-route bus service may lead to an unmet demand for transit service. This impact would be considered **significant**.

Mitigation TR-5a: *Implement Mitigation Measure TR-1 (Geometric Modifications at El Centro Road/West El Camino Avenue intersection and I-80/West El Camino Avenue interchange).*

Mitigation TR-5b: *Consistent with General Plan Policy LU-120, the project applicant shall coordinate with Sacramento County and Sacramento Regional Transit District (or other transit operators) to provide the additional transit facilities and services assumed in the transportation analysis, or a cost-effective equivalent level of transit facilities and services. Equivalent transit services may include, but is not limited to buses, vanpools, shuttles, or dial-a-ride service. Ultimate transit service shall include 15-minute headways or equivalent during peak hours (Monday through Friday from 7-9 a.m. and 4-6 p.m.) and 30-minute headways during non-peak hours (Monday through Friday). The implementation of the transit routes and service frequency must be phased with development buildout of the Project. This shall be accomplished through the annexation to County Service Area 10, formation of a transportation services district, or other secured funding mechanism. Such annexation or formation shall occur prior to recordation of any final small lot subdivision map for the project.*

The specified physical improvements would substantially reduce queuing, delays, and congestion on West El Camino Avenue and El Centro Road near the Town Center. They would also decrease average delays at the El Centro Road/West El Camino Avenue, El Centro Road/Farm Road, and two I-80 ramp intersections during peak hours. Operations would generally improve to a level similar to other key corridors in Sacramento County (e.g., Watt Avenue, Arden Way, etc.) that feature high-quality bus service.

# Cumulative Project Impacts

## Roadway Network VMT

According to the TAG, projects that do not demonstrate a significant VMT impact under baseline conditions can be presumed to also be less than significant in the cumulative year. This guidance is aligned with the *Technical Advisory* (at page 6), which states:

> "*A project that falls below an efficiency-based threshold that is aligned with long-term environmental goals and relevant plans would have no cumulative impact distinct from the project impact. Accordingly, a finding of a less-than-significant project impact would imply a less than significant cumulative impact*."

Page 55 of the SACOG MTP/SCS states that average VMT per capita in the region is expected to decrease by 10 percent relative to current conditions by the Year 2040. This result is due to improved multi-modal transportation choices and planned land use growth in "low VMT areas". Thus, the SACOG region planning principles and projections are aligned with the *Technical Advisory* in terms of long-term environmental goals to reduce VMT and greenhouse gas emissions. Therefore, based on the above, cumulative project impacts to roadway network VMT are considered **less than significant,** and no mitigation is required.

## Roadway Safety / Design Standards

Impact TR-6: Degraded Conditions on Substandard Sacramento County Rural Roadways Under Cumulative Conditions

The proposed project would cause the following substandard Sacramento County rural roadways (i.e., less than 24 feet of pavement width and less than a six foot shoulder) to carry over 6,000 daily vehicles:

- Powerline Road: Bayou Way to Del Paso Road
- Powerline Road: Del Paso Road to Garden Highway
- Garden Highway: Powerline Road to Radio Road
- Garden Highway: Radio Road to San Juan Road

Under cumulative no project conditions, they would carry between 3,300 and 4,700 ADT. Under cumulative plus project conditions, they would carry between 7,000 and 9,500 ADT. The project adds considerably more trips to these segments under cumulative conditions versus existing conditions. This is likely due to new employment uses contained within Metro Air Park, which attract home-based work trips from the project.

It is also possible that some of these trips are using the new I-5/Metro Air Park interchange to travel to/from the north on I-5. This impact would be considered **significant** under cumulative conditions.

Mitigation TR-6: The project applicant shall pay their fair share cost of improving the following roadways to conform with current County design standards:

- Powerline Road from Bayou Way to Garden Highway
- Garden Highway from Powerline Road to San Juan Road

The County's TAG indicates that when deficient operations (i.e., volume exceeding 6,000 ADT) are identified on substandard roadways, they should be upgraded to the current rural roadway standard, which consists of two 12-foot travel lanes and 6-foot paved shoulders. The fair share recommendation reflects the fact that the impact is cumulative in nature, and partially driven by other land development and roadway improvements within the County.

Impact TR-7: Freeway Off-Ramp Queues Exceed Available Storage Under Cumulative Conditions

**Table 15** presents the AM and PM peak hour maximum queues on freeway off-ramps under cumulative no project and plus project conditions. Refer to separately bound appendix for technical calculations. Under cumulative no project conditions, both off-ramps at the I-5/Del Paso Road and I-5/Garden Highway interchanges and the northbound off-ramp at the I-5/Arena Boulevard interchange would have maximum queues during one or both peak hours that would exceed available storage. This is most often being caused by downstream surface street congestion (primarily at intersections within the City of Sacramento such as Garden Highway/Truxel Road, Del Paso Road/El Centro Road, and Arena Boulevard/East Commerce Way) that causes traffic to spill back to the interchange, thereby hindering the flow of off-ramp traffic. Under cumulative plus project conditions, all study freeway off-ramps would have maximum queues that exceed the available storage. Improvements at the surface street intersection bottlenecks were aimed at reducing vehicle queues that spill back to each interchange. Improvements such as lane restripings, adding lanes, or modifying signal phasing were either found to not be effective or could also cause the need for additional right-of-way. Further, these improvements are outside the control of Sacramento County or Caltrans since they are located within the City of Sacramento. Project impacts to freeway off-ramp queuing would be considered **significant** under cumulative conditions.

This study did not evaluate freeway operations. Therefore, it was not possible to determine whether freeway mainline conditions would be degraded under cumulative conditions to the point that the speed differential between the off-ramp and mainline would be 30 mph or less.

**Table 15:**
**Peak Hour Freeway Off-Ramp Queuing – Cumulative Plus Project Conditions**

| Freeway Off-Ramp | Ramp Length[1] | Peak Hour | Average Maximum Queue[2] | |
|---|---|---|---|---|
| | | | Cumulative No Project | Cumulative Plus Project |
| I-80 EB Off-Ramp at West El Camino Avenue | 1,500 feet [3] | AM | 375 | **4,850** |
| | | PM | 325 | **> 1 mile** |
| I-80 WB Off-Ramp at West El Camino Avenue | 1,500 feet [3] | AM | 250 | **> 1 mile** |
| | | PM | 175 | **> 1 mile** |
| I-5 NB Off-Ramp at Arena Blvd. | 1,475 feet | AM | 475 | **> 1 mile** |
| | | PM | **2,525** | **> 1 mile** |
| I-5 SB Off-Ramp at Arena Blvd. | 1,425 feet | AM | 200 | **2,525** |
| | | PM | 125 | **1,475** |
| I-5 NB Off-Ramp at Del Paso Rd. | 1,300 feet | AM | 250 | 275 |
| | | PM | **4,200** | **5,025** |
| I-5 SB Off-Ramp at Del Paso Rd. | 1,150 feet | AM | 275 | **1,600** |
| | | PM | **4,500** | **4,525** |
| I-5 NB Off-Ramp at West El Camino Ave. | 1,000 feet | AM | 350 | 525 |
| | | PM | 250 | **1,200** |
| I-5 NB Off-Ramp at Garden Highway | 1,275 feet | AM | **1,775** | **3,950** |
| | | PM | **4,450** | **4,950** |
| I-5 SB Off-Ramp at Garden Highway | 1,425 feet | AM | **3,525** | **1,575 [4]** |
| | | PM | **3,525** | **3,625** |

Notes:
1. The ramp length is estimated by measuring the distance from the gore point where the off-ramp departs from the mainline to the limit line at the ramp terminal intersection with the local street, as measured from aerial imagery.
2. Maximum queue, as calculated using the average of 10 SimTraffic microsimulation runs. Queue is expressed on a "per lane" basis.
3. Presumed storage to be provided with reconstructed interchange.
4. This queue is shorter than cumulative no project conditions because vehicles attempting to access the southbound on-ramp block the northbound off-ramp. This in turn, results in more green time for eastbound through, thereby reducing the southbound off-ramp queue.

Bolded cells indicated that maximum queue exceeds available storage.

Source: Fehr & Peers, 2021.

Mitigation TR-7a: *Implement Mitigation Measure TR-1 (Geometric Modifications at El Centro Road/West El Camino Avenue intersection and I-80/West El Camino Avenue interchange).*

Mitigation TR-7b: *The project applicant shall construct or pay their fair share cost for the following improvements*:

- *At the Arena Boulevard/El Centro Road intersection, construct second westbound left-turn lane, second southbound through lane, restripe eastbound right-turn lane to a shared through/right, and lengthen northbound right-turn lane to 400 feet with right-turn overlap arrow.*
- *Pay fair share cost of installing an eastbound right-turn overlap phase at Arena Boulevard/East Commerce Way intersection.*

**Table 16** illustrates the effectiveness of the above improvements on freeway off-ramp queuing under cumulative plus project conditions. Refer to separately bound appendix for technical calculations as well as an exhibit showing improvements at the Arena Boulevard/El Centro Road intersection. As shown, the recommended mitigation measures would result in maximum queues at freeway off-ramps remaining within the available storage at the I-80/West El Camino Avenue, I-5/West El Camino Avenue, and I-5/Arena Boulevard interchanges. Queues would exceed the available storage at the I-5/Del Paso Road and I-5/Garden Highway interchanges. As noted previously, no known improvements are planned at either interchange. Further, some of the queue spillbacks are due to surface street congestion, which could likely not be fully resolved by interchange reconstruction.

In early 2022, Sacramento County, Fehr & Peers, and Caltrans met to discuss whether the identified geometric improvements at the I-80/West El Camino Avenue interchange would result in vehicle queues on the westbound off-ramp that would spill back onto I-80. As noted previously, the reported maximum queues in this report are the average of the maximum queues from 10 SimTraffic microsimulation runs. To better illustrate the effectiveness of these improvements during the more critical PM peak hour, the separately bound appendix include screen captures of 20 SimTraffic model runs at the end of each run's peak hour. As shown, 18 of the 20 runs had queues that were within the off-ramp storage (only Runs 7 and 18 show queues that slightly exceed the ramp storage). Since the reported maximum queue is the average of the ten SimTraffic runs, it follows that the reported queue would not exceed the available storage. Detailed review of the simulation indicates that the westbound left-turn movement at the West El Camino Avenue/El Centro Road intersection contributes to westbound off-ramp queuing. Additional model runs were conducted to test the effects of increasing this left-turn's maximum green time from 19 to 23 seconds. The separately bound appendix includes screen captures of 20 SimTraffic model runs at the end of each run's peak hour with this timing modification in place. As shown, all 20 runs had queues within the off-ramp storage. In conclusion, this analysis has demonstrated that the identified geometric improvements would not cause vehicle queues to spill back onto I-80 under cumulative plus project conditions.

**Table 16:**
**Peak Hour Freeway Off-Ramp Queuing – Cumulative Plus Project Conditions with Improvements**

| Freeway Off-Ramp | Ramp Length[1] | Peak Hour | Average Maximum Queue (feet)[2] | | |
|---|---|---|---|---|---|
| | | | | Cumulative Plus Project | |
| | | | Cumulative No Project | Without Improvements | With Improvements |
| I-80 EB Off-Ramp at West El Camino Avenue | 1,500 feet [3] | AM | 375 | **4,850** | 950 |
| | | PM | 325 | **> 1 mile** | 975 |
| I-80 WB Off-Ramp at West El Camino Avenue | 1,500 feet [3] | AM | 250 | **> 1 mile** | 525 |
| | | PM | 175 | **> 1 mile** | 1,025 |
| I-5 NB Off-Ramp at Arena Blvd. | 1,475 feet | AM | 475 | **> 1 mile** | 150 |
| | | PM | **2,525** | **> 1 mile** | 275 |
| I-5 SB Off-Ramp at Arena Blvd. [4] | 1,425 feet | AM | 200 | **2,525** | 200 |
| | | PM | 125 | **1,475** | 150 |
| I-5 NB Off-Ramp at Del Paso Rd. [4] | 1,300 feet | AM | 250 | **275** | - |
| | | PM | **4,200** | **5,025** | **-** |
| I-5 SB Off-Ramp at Del Paso Rd. | 1,150 feet | AM | 275 | **1,600** | **-** |
| | | PM | **4,500** | **4,525** | **-** |
| I-5 NB Off-Ramp at West El Camino Ave. | 1,000 feet | AM | 350 | 525 | 775 |
| | | PM | 250 | **1,200** | 425 |
| I-5 NB Off-Ramp at Garden Highway [5] | 1,275 feet | AM | **1,775** | **3,950** | **-** |
| | | PM | **4,450** | **4,950** | **-** |
| I-5 SB Off-Ramp at Garden Highway [5] | 1,425 feet | AM | **3,525** | **1,575** | **-** |
| | | PM | **3,525** | **3,625** | **-** |

Notes:
1. The ramp length is estimated by measuring the distance from the gore point where the off-ramp departs from the mainline to the limit line at the ramp terminal intersection with the local street, as measured from aerial imagery.
2. Maximum queue, as calculated using the average of 10 SimTraffic microsimulation runs. Queue is expressed on a "per lane" basis.
3. Presumed storage to be provided with reconstructed interchange.
4. Bottlenecks exist at both Del Paso Road/El Centro Road and Del Paso Road/East Commerce Way that contribute to lengthy off-ramp queues. Feasibility of improvements at those locations is unknown at this time.
5. Off-ramp queuing caused both by ramp storage limitations and also the Truxel Road/Garden Highway/New American River bridge intersection. Feasibility of improvements at those locations is unknown at this time.

Bolded cells indicated that maximum queue exceeds available storage.

Source: Fehr & Peers, 2021.

Impact TR-8: Freeway On-Ramp Ramp Meter Queues Exceed Available Storage Under Cumulative Conditions

**Table 17** presents the AM and PM peak hour maximum queues under cumulative conditions at freeway on-ramp ramp meter locations that would be used by the project. Refer to separately bound appendix for technical calculations. As shown, most freeway ramp meter on-ramp locations would continue to have sufficient storage for queues. However, the project would cause the maximum queue at the metered on-ramps at the I-5 southbound diagonal on-ramp (PM peak hour) at West El Camino Avenue and I-5 southbound loop on-ramp at Garden Highway (AM peak hour) to exceed their available storage. It should be noted that the "plus project" scenario assumed a second metered lane at the I-5 southbound on-ramp at Del Paso Road in order to avoid severely over-capacity conditions along Del Paso Road and El Centro Road. This, along with worsening bottlenecks elsewhere in the system, explains why maximum queues at this on-ramp are reduced under plus project conditions. Project impacts to freeway on-ramp ramp metering queuing would be considered **significant**.

Mitigation TR-8: *The project applicant shall pay its proportionate fair share percentage toward improvements at the I-5 SB diagonal on-ramp at West El Camino Avenue, I-5 SB loop on-ramp at Garden Highway, and I-5 SB diagonal on-ramp at Del Paso Road.* Queuing could be reduced at each on-ramp by widening it to include a second metered lane (either general purpose or carpool).

A variety of constraints are present at the I-5/Garden Highway interchange, which could preclude any additional improvements. However, improvements to the I-5 southbound on-ramp at West El Camino Avenue would indirectly benefit the Garden Highway southbound loop on-ramp by redirecting some trips away from it.

**Table 17:**
**Peak Hour Freeway On-Ramp Ramp Meter Queuing – Cumulative Plus Project Conditions**

| Freeway Off-Ramp | Ramp Type | Ramp Length[1] | Peak Hour | Average Maximum Queue (feet)[2] | |
|---|---|---|---|---|---|
| | | | | Cumulative No Project | Cumulative Plus Project |
| I-80 WB Diagonal On-Ramp at West El Camino Avenue | 2 GP Lane + 1 HOV Lane | 1,000 feet | AM | 450 | 125 |
| | | | PM | 350 | 125 |
| I-80 EB Loop On-Ramp at West El Camino Avenue | 1 GP Lane + 1 HOV Lane | 700 feet | AM | 325 | 325 |
| | | | PM | 200 | 275 |
| I-5 NB Loop On-Ramp at Arena Blvd. | 1 GP Lane + 1 HOV Lane | 625 feet | AM | 150 | 175 |
| | | | PM | 125 | 125 |
| I-5 SB Diagonal On-Ramp at Arena Blvd. | 1 GP Lane + 1 HOV Lane | 1,200 feet | AM | 950 | 425 |
| | | | PM | 500 | 275 |
| I-5 SB Diagonal On-Ramp at Del Paso Rd. | 1 GP Lane / 2 GP Lanes [4] | 1,100 feet | AM | **1,950** | 200 |
| | | | PM | 475 | 225 |
| I-5 SB Diagonal On-Ramp at West El Camino Ave. | 1 GP Lane | 750 feet | AM | 425 | 450 |
| | | | PM | 675 | **1,350** |
| I-5 SB Loop On-Ramp at Garden Highway | 1 GP Lane | 625 feet | AM | **900** | **1,575** |
| | | | PM | 400 | 450 |
| I-5 NB Diagonal On-Ramp at Garden Highway | 1 GP Lane | 725 feet | AM | 175 | 175 |
| | | | PM | **950** | **950** |

Notes:
1. The ramp meter storage is measured from the ramp meter stop line to the upstream intersection or roadway ramp departure gore point., as measured from aerial imagery. Storage rounded to the nearest 25 feet.
2. Maximum queue, as calculated using the average of 10 SimTraffic microsimulation runs. Queue is expressed on a "per lane" basis.
3. Presumed storage to be provided with reconstructed interchange.
4. Assumed to be widened to two lanes under plus project conditions. See discussion on previous page for rationale.

GP = General Purpose. HOV = High Occupancy Vehicle (Carpool).
Shaded cells represent maximum queues that exceed available storage.

Source: Fehr & Peers, 2021.

Impact TR-10: Increased Hazards at Project Access Intersections on Garden Highway Under Cumulative Conditions

The project would construct new or expanded intersections on Garden Highway, which along the project frontage is a two-lane undivided roadway featuring horizontal curvature, a 45-mph posted speed limit, and limited to no shoulders. New/improved intersections would be at Radio Road, San Juan Road, Street 9, and Bryte Bend Road. The addition of project trips to these new/improved intersections could increase design hazards due to their geometric features. Under cumulative conditions, additional background travel is expected at these intersections, which should be considered in their design. This impact would be considered **significant** under cumulative conditions.

Mitigation TR-10: *Implement Mitigation Measure TR-3 (Physical Improvements at Intersections Along Garden Highway):*

The recommended mitigation measures in Mitigation Measure TR-3 are also suitable for cumulative conditions based on the cumulative traffic forecasts and geometric conditions at each intersection.

## Bicycle and Pedestrian Facilities

Impact TR-11: Inadequate Bicycle/Pedestrian Access on West El Camino Avenue

The project would not eliminate or adversely affect a planned bikeway or pedestrian facility in a way that would discourage its use. According to the *Sacramento County Bicycle Master Plan* (2011), Class II bike lanes are planned along portions of El Centro Road, San Juan Road, and Radio Road. Both within and adjacent to the project site. According to Figure 4, the project would construct bicycle facilities on each of these streets that would match or exceed (in terms of quality or quantity of facilities) what is planned in the Bikeway Master Plan. The *Sacramento County Pedestrian Master Plan* (2007) does not show any priority pedestrian projects within the project's immediate vicinity.

The proposed project would fail to provide adequate access for bicyclists/pedestrians along West El Camino Avenue and El Centro Road and along West El Camino Avenue easterly to its I-80 interchange. This impact would be considered **significant**.

Mitigation TR-11a: *Implement Mitigation Measure TR-1 (Geometric Modifications at El Centro Road/West El Camino Avenue intersection and I-80/West El Camino Avenue interchange).*

Mitigation TR-11b: *Implement Mitigation Measure TR-4b (Bicycle/pedestrian improvements at El Centro Road/West El Camino Avenue intersection and I-80/West El Camino Avenue interchange).*

## Transit Services and Facilities

Impact TR-12: Inadequate Transit Service to Meet Demand

Consistent with Sacramento County's General Plan Policy LU-120, the Town Center component of the proposed project would consist of a mix of complementary land uses built at high densities to support transit use. However, existing fixed-route transit service is not provided to the project site. To determine compliance with Policy LU-120, a transit network and frequency analysis needs assessment was performed. This evaluation determined that the area should be served by fixed-route bus service operating on 15-minute headways from approximately 6 AM to 8 PM. Figure 5 displays the recommended route en which buses use portions of Bryte Bend Road and West El Camino Avenue through the Town Center to travel between El Centro Road on the north and I-80 on the east. Since the project would be phased over time, it is anticipated that transit service levels will also increase over time as ridership increases.

Mitigation TR-12a: *Implement Mitigation Measure TR-1 (Geometric Modifications at El Centro Road/West El Camino Avenue intersection and I-80/West El Camino Avenue interchange).*

Mitigation TR-12b: *Implement Mitigation Measure TR-5B*

The specified physical improvements would substantially reduce cumulative queuing, delays, and congestion on West El Camino Avenue and El Centro Road near the Town Center.

# EXECUTIVE SUMMARY

## STUDY PURPOSE

This study represents Part II of the Sacramento County *Transportation Analysis Guidelines* (TAG) study requirement for proposed land developments. Part II consists of an analysis of a proposed project's effects on traffic operations at potentially affected roadways and intersections. This document, which is known as a Local Transportation Analysis (LTA), is separate and distinct from Part I of the TAG requirement that focuses on the project's impacts to the transportation system based on its Vehicle Miles Traveled (VMT).

Part I also includes detailed analysis of bicycle/pedestrian facilities, transit facilities and services, freeway off-ramp queuing and on–ramp queuing, and non-standard roadway design, all of which are considered areas of potentially significant impacts under the California Environmental Quality Act (CEQA). The Part I report (*CEQA Transportation Impact Analysis for Upper Westside Specific Plan* Fehr & Peers, March 2022) is available at County offices and online.

## PROJECT DESCRIPTION

The Upper Westside Specific Plan would be situated on approximately 2,066 acres north of Interstate 80 (I-80) and west of Interstate (I-5) in unincorporated Sacramento County. Figure 1 shows the regional setting and the location of the Upper Westside Specific Plan. Figure 2 shows the project site plan. The proposed project includes 9,356 dwelling units, 3.1 million square feet of business professional/commercial, schools, parks, and various open space elements. The project would be accessed via several different existing roadways including:

- West El Camino Avenue at I-80
- San Juan Road west of I-5
- Arena Boulevard west of I-5 via El Centro Road
- Del Paso Road west of I-5 via El Centro Road
- Garden Highway via four connections (existing San Juan Road, improvements to existing Radio Road, and two new connections in the southwest portion of the site)

Figure 3 shows the project's internal roadway network. As shown, West El Camino Avenue would extend westerly from El Centro Road as the Main Street of the Town Center, which would be a dense, mixed-use environment with a grid-street system.

## STUDY OVERVIEW

This study analyzes project effects at 43 existing study roadways and 41 existing study intersections located in Sacramento County, City of Sacramento, and under the jurisdiction of Caltrans. It includes five existing freeway interchanges, though freeway analysis is not performed based on guidance contained in the *Vehicle Miles Traveled-Focused Transportation Impact Study Guide (TISG) (Caltrans, 2020)*.

The following scenarios are analyzed in this report:

- Existing Conditions – represents conditions in 2018-2019, prior to the beginning of the COVID-19 pandemic in March 2020.
- Existing Plus Proposed Project conditions – analyzes the study area assuming buildout of the proposed project under existing conditions.
- Cumulative (2040) No Project Conditions – analyzes the study area in 2040 assuming the project site remains in its current state.
- Cumulative (2040) Plus Proposed Project conditions – analyzes the study area assuming buildout of the proposed project under cumulative conditions.

Roadways in Sacramento County are analyzed for Level of Service (LOS). The City of Sacramento also has applicable LOS policies and goals in its 2035 General Plan, though they are not typically applied on a project-level basis (and therefore not applied here). Caltrans does not have applicable LOS thresholds for roadways. Intersections in all three jurisdictions are analyzed for weekday AM and PM peak hour conditions. Sacramento County has General Plan policies pertaining to LOS goals for locations both within its Urban Service Boundary and beyond it. In contrast, Caltrans and the City of Sacramento are transitioning away from use of LOS thresholds, instead focusing on more holistic transportation reviews that consider all modes of travel, excess queuing, and other transportation policies (e.g., VMT reduction).

As a consequence of Senate Bill 743, which precluded use of LOS as a means of analyzing roadway system impacts under CEQA, "operational deficiencies" are used in this report (versus "significant impacts") to describe substantially degraded conditions caused or exacerbated by the project.

## EXISTING CONDITIONS

Due to the effects of the COVID-19 pandemic on travel behavior, recent counts (2017-February 2020) were used to establish a pre-COVID existing condition. All 11 Sacramento County study roadway segments operate acceptably, with 10 segments operating at LOS C or better. One segment, West El Camino Avenue

between El Centro Road and the I-80 WB Ramps, has an average daily traffic (ADT) of 14,200 and operates at LOS E.

A review of intersection LOS results indicates that all but two of the 41 study intersections currently operate at LOS D or better during the AM peak hour. All study intersections operate at LOS D or better during the PM peak hour.

## PROJECT TRAVEL CHARACTERISTICS

The density and complementary nature of land uses within the project site, combined with the availability of transit and walking/biking to external destinations, would result in an estimated 25 percent reduction in gross daily vehicle trips when compared to a condition with no internal trip-making and all external trips made by vehicle. During the AM and PM peak hours, this reduction would increase to 37 percent and 28 percent, respectively. The proposed project would result in a net increase (over trips generated by existing land uses that would be removed) of approximately 100,800 new daily vehicle trips, with 7,530 occurring during the AM peak hour and 8,200 occurring during the PM peak hour.

Approximately 69 percent of project trips would use the I-80/West El Camino Avenue interchange. This large percentage makes sense given that 73 percent of the project's total vehicle trips are generated by uses located south of Farm Road. The interchange's close proximity to those uses, combined with its assumed capacity increase in conjunction with the project, explains its heavy utilization. Parallel routes such as Garden Highway or San Juan Road are more circuitous and/or do not provide access to the same level of complementary land uses, though the project would still add trips to them.

## EXISTING PLUS PROJECT CONDITIONS

All Sacramento County roadway segments would continue to operate at an acceptable level with the exception of the West El Camino Avenue from El Centro Road to I-80 WB Ramps, which would operate at LOS F despite being widened from two to six lanes.

The project would add considerable volumes of traffic to the following surface streets owned and operated by Caltrans or the City of Sacramento (top six corridors shown in descending order of traffic added):

- West El Camino Avenue directly west of I-80: 14,200 to 83,300 ADT (69,100 ADT increase)
- West El Camino Avenue directly east of I-80: 20,900 to 43,800 (22,900 ADT increase)
- El Centro Road south of Arena Boulevard: 7,900 to 27,000 ADT (19,100 ADT increase)
- Arena Boulevard east of El Centro Road: 7,600 to 17,600 ADT (10,000 ADT increase)
- Del Paso Road east of El Centro Road: 22,800 to 31,100 ADT (8,300 ADT increase)

- San Juan Road east of Orchard Lane: 6,600 to 14,300 ADT (7,700 ADT increase)

During the AM peak hour, the project would cause the number of (existing) study intersections operating at LOS F to increase from two to five. During the PM peak hour, the project would cause the number of (existing) study intersections operating at LOS F to increase from zero to eight. The vast majority of the 65 additional study intersections within the project site would operate acceptably.

## CUMULATIVE CONDITIONS

The cumulative version of SACOG's SACSIM travel demand model was used to develop cumulative (Year 2040) travel demand forecasts in the study area. The model was modified to reflect full buildout of a number of large projects or specific plans such as: Metro Air Park, Grandpark Specific Plan, Downtown Specific Plan (City of Sacramento), Northlake (formerly Greenbriar) (City of Sacramento), Panhandle, and others. The model also includes several important infrastructure improvements, which are shown on Figure 15.

Under cumulative no project conditions, two Sacramento County roadway segments would operate unacceptably. Under cumulative plus project conditions, 12 Sacramento County roadway segments would operate unacceptably including segments along San Juan Road, El Centro Road, Powerline Road, Garden Highway, Radio Road, and West El Camino Avenue.

Among 34 (existing) signalized or all-way stop study intersections, the project would cause the number that would operate at LOS F under cumulative conditions to increase from 8 to 18 during the AM peak hour and to increase from 10 to 22 during the PM peak hour. Conversely, all but two signalized or all-way stop study intersections within the project site would operate at LOS E or better.

## RECOMMENDED IMPROVEMENTS

The initial improvements assumed on El Centro Road and West El Camino Avenue near I-80 and the Town Center resulted in severe congestion. A set of geometric modifications to this area is recommended to accommodate the heavy vehicular travel demand (see Figure 20 for illustration of improvements). Key elements include various added travel lanes and other geometric treatments. Improvements to the bicycle and pedestrian facilities in the area are also required (see Figure 21) and include the following:

- Class I (off-street) multi-use path allowing two-way travel on the north side of West El Camino Avenue that would extend from El Centro Road to the Orchard Lane intersection east of I-80.
- Class I multi-use path on the west side of El Centro Road north and south of West El Camino Avenue. Class II (on-street) bike lanes on various portions of El Centro Road and West El Camino Avenue.
- Crosswalks on the north, south, and west legs of W. El Camino Avenue/El Centro Road intersection.

The proposed geometric modifications were found to substantially benefit traffic operations along the portions of El Centro Road and West El Camino Avenue near the Town Center. While operations would remain at LOS F at the El Centro Road/West El Camino Avenue and El Centro Road/Farm Road intersections, delays are considered more tolerable, and the overall percent demand served is much better with the proposed geometric improvements alone.

**Table ES-1** displays a set of recommended operational enhancements that would address many of the operational deficiencies identified throughout the study area under existing plus project conditions.

**Table ES-1: Recommended Improvements to Address Operational Deficiencies – Existing Plus Project Conditions**

| Facility | Lead Agency | Description of Improvement(s) |
|---|---|---|
| Powerline Road/Bayou Way (#1) | Sacramento County | Install traffic signal |
| El Centro Road and West El Camino Avenue Corridors | Sacramento County | Construct Proposed Geometric Modifications (see Figure 20) |
| I-80/West El Camino Avenue Interchange [1] | Caltrans | Install two metered lanes on the I-80 WB diagonal on-ramp |
| Arena Boulevard/El Centro Road (#15) | City of Sacramento | Construct second WB left-turn lane, second SB through lane, restripe EB right-turn lane to a shared through/right, and lengthen NB right-turn lane to 400 feet with right-turn overlap arrow.<br><br>Pay fair share cost for constructing Natomas Crossing Drive as a two-lane street from Duckhorn Drive to El Centro Road. |
| I-5/West El Camino Avenue Interchange [1] | Caltrans | Widen the I-5 SB diagonal on-ramp to consist of two ramp-metered lanes |
| Radio Road/Street 12 (E) (#45) | Sacramento County | Install traffic signal |
| Farm Road/Street A (#60) | Sacramento County | Install raised median on Farm Road at Street A to restrict turn movements on Street A to right-turn only. |
| Farm Road/MDR Access (#62) | Sacramento County | Install raised median on Farm Road at Medium Density Residential Access to restrict turn movements to right-turn only. |
| Farm Road/Orchard Lane/CMU Driveway (#63) | Sacramento County | Expand northbound approach to consist of two left-turn lanes and a shared left/right lane. |

Notes:
1. Identified improvements derived from the ramp metering analysis whose results are contained in the *CEQA Transportation Impact Analysis for Upper Westside Specific Plan* (Fehr & Peers, March 2022).

Source: Fehr & Peers, 2021.

During the AM peak hour, the project would cause the number of (existing) study intersections operating at LOS F to increase from two to five. With the proposed improvements listed above, all but two intersections (West El Camino Avenue/El Centro Road and Arena Boulevard/Stemmler Drive) would be restored to LOS E or better. During the PM peak hour, the project would cause the number of (existing) study intersections operating at LOS F to increase from zero to eight. With the proposed improvements listed above, five of the eight LOS F intersections would be restored to LOS E or better. The three intersections that would remain at LOS F would be at Gateway Oaks Drive/West El Camino Avenue (City of Sacramento), I-5 SB Ramps/Garden Highway (Caltrans), and West El Camino Avenue/El Centro Road (Sacramento County).

It should be noted that the *CEQA Transportation Impact Analysis for Upper Westside Specific Plan* (Fehr & Peers, March 2022) includes several improvements that are required to address safety and design standards related impacts.

**Table ES-2** displays a set of recommended operational enhancements that would address the operational deficiencies identified within the study area under cumulative plus project conditions. See **Figure ES-1** for illustration of recommended improvements.

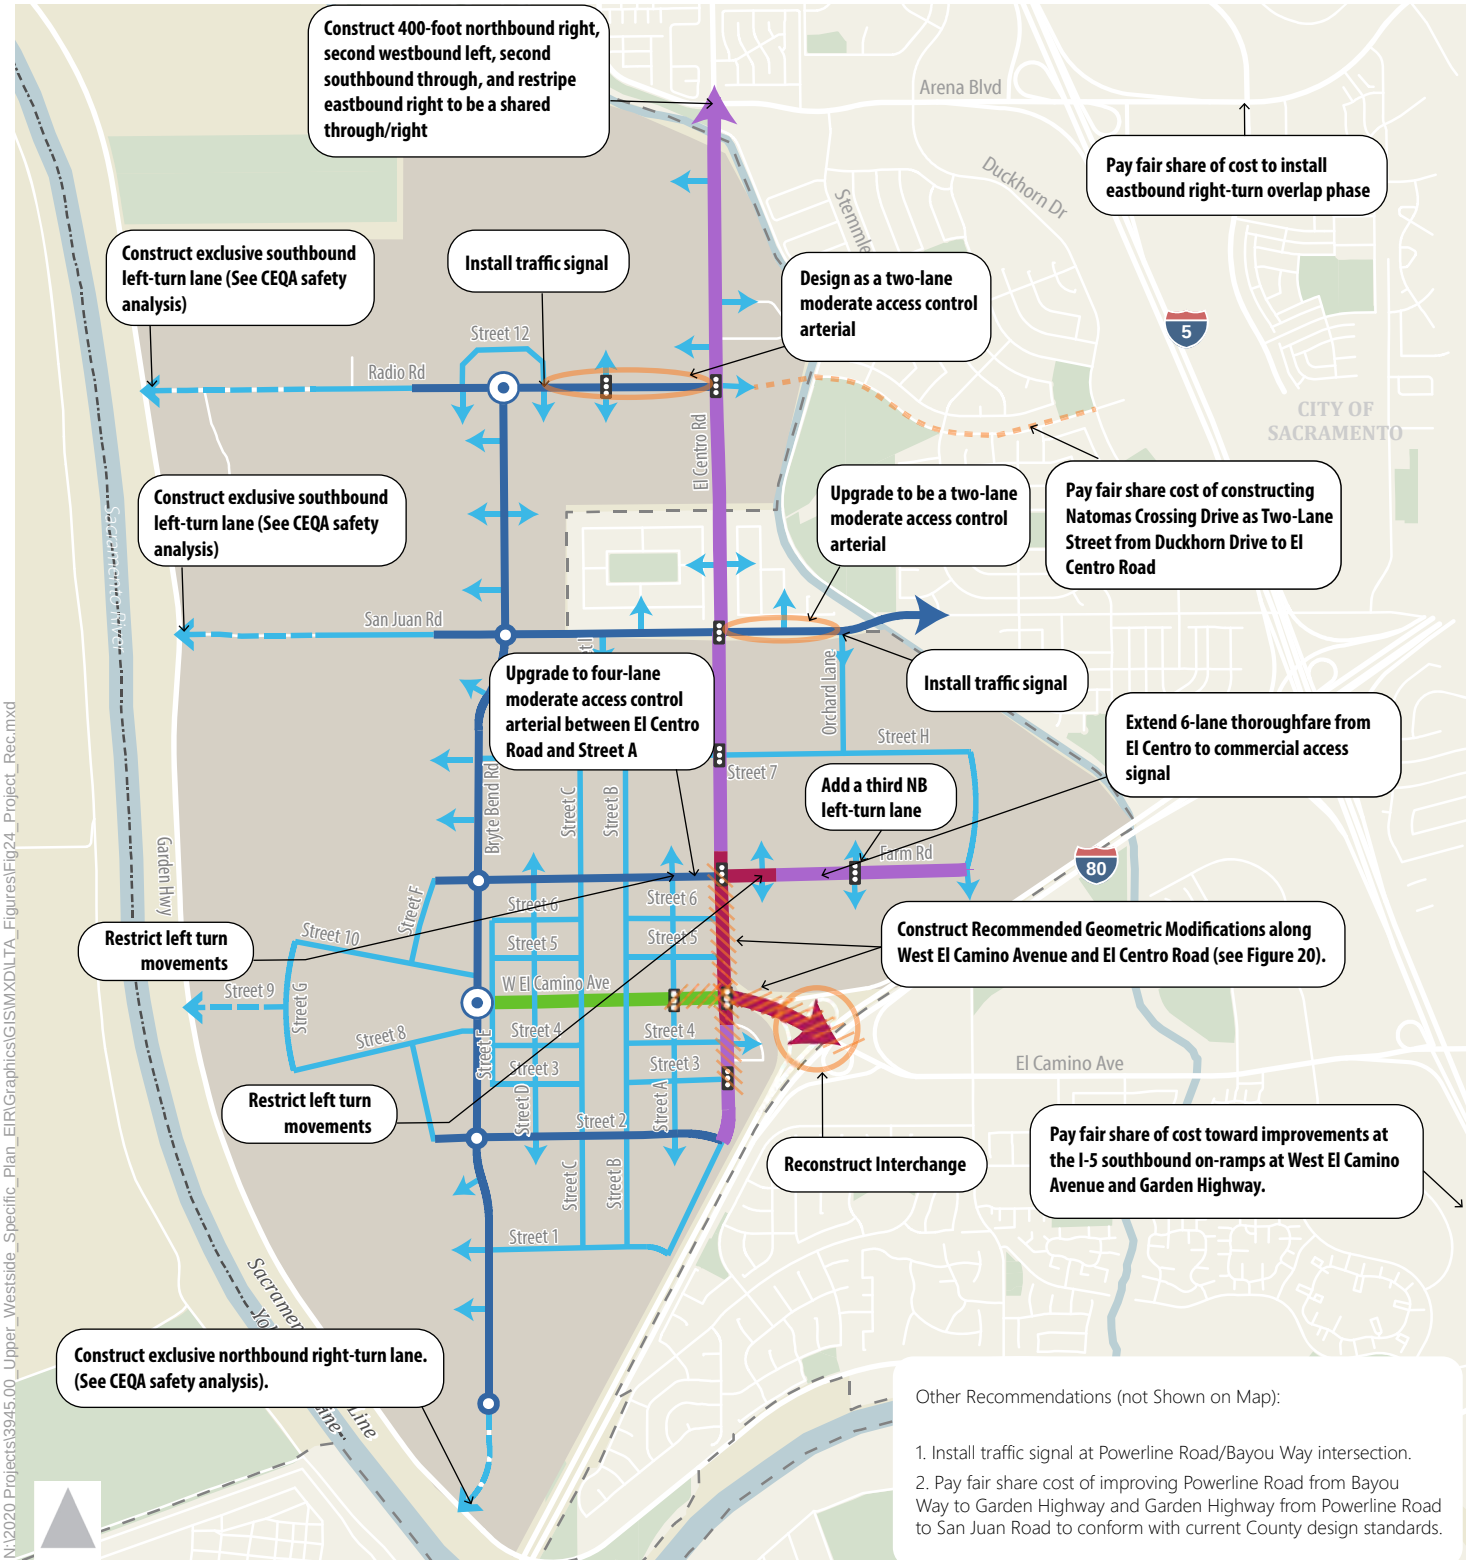
**Table ES-2: Recommended Improvements to Address Operational Deficiencies – Cumulative Plus Project Conditions**

| Facility | Lead Agency | Description of Improvement(s) |
|---|---|---|
| Powerline Road/Bayou Way (#1) | Sacramento County | Install traffic signal |
| El Centro Road and West El Camino Avenue Corridors | Sacramento County | Construct Proposed Geometric Modifications (see Figure 20) and reoptimize signal timings |
| I-80/West El Camino Avenue Interchange [1] | Caltrans | Install two metered lanes on the I-80 WB diagonal on-ramp |
| Arena Boulevard/El Centro Road (#15) | City of Sacramento | Construct second WB left-turn lane, second SB through lane, restripe EB right-turn lane to a shared through/right, and lengthen NB right-turn lane to 400 feet with right-turn overlap arrow.<br>Pay fair share cost for constructing Natomas Crossing Drive as a two-lane street from Duckhorn Drive to El Centro Road.<br>Increase the ramp metering rate at the I-5 SB loop on-ramp |
| Arena Boulevard/East Commerce Way (#28) | City of Sacramento | Install an EB right-turn overlap phase. |
| I-5/West El Camino Avenue Interchange [1] | Caltrans | Widen the I-5 SB diagonal on-ramp to consist of two ramp-metered lanes |
| Street 12 (East)/Radio Road (#45) | Sacramento County | Install traffic signal |

**Table ES-2: Recommended Improvements to Address Operational Deficiencies – Cumulative Plus Project Conditions**

| Facility | Lead Agency | Description of Improvement(s) |
|---|---|---|
| San Juan Road/Orchard Lane (#50) | Sacramento County | Install traffic signal |
| Street A/Farm Road (#60) | Sacramento County | Install raised median on Farm Road at Street A to restrict turn movements on Street A to right-turn only. |
| Farm Road/Street A (#62) | Sacramento County | Install raised median on Farm Road at Medium Density Residential Access to restrict turn movements to right-turn only. |
| Farm Road/Orchard Lane/CMU Driveway (#63) | Sacramento County | Expand northbound approach to consist of two left-turn lanes and a shared left/right lane. |

Notes:
1. Identified improvements derived from the ramp metering analysis whose results are contained in the *CEQA Transportation Impact Analysis for Upper Westside Specific Plan* (Fehr & Peers, March 2022).



Source: Fehr & Peers, 2021.

During the AM peak hour, the project would cause the number of (existing) study intersections operating at LOS F under cumulative conditions to increase from eight to 18. The number of intersections operating at LOS F would be reduced to 11 with the proposed improvements in place.

During the PM peak hour, the project would cause the number of (existing) study intersections operating at LOS F under cumulative conditions to increase from ten to 22. The number of intersections operating at LOS F would be reduced to 14 with the proposed improvements in place.

The following are recommended to improve cumulative plus project operations on various Sacramento County roadway segments to acceptable levels:

- Design Radio Road between Street 12 (East) and El Centro Road as a two-lane moderate access control arterial. Resulting operations would improve from LOS F to E.
- Upgrade San Juan Road between El Centro Road and Orchard Lane to be a two-lane moderate access control arterial. Resulting operations would improve from LOS F to E.
- Upgrade Farm Road between El Centro Road and the CMU Driveway to a six-lane thoroughfare.
- The project applicant shall pay their fair share cost of improving the following roadways to conform with current County design standards (two 12-foot travel lanes and 6-foot paved shoulders):
    - Powerline Road from Bayou Way to Garden Highway
    - Garden Highway from Powerline Road to San Juan Road

N:\2020 Projects\3945.00_Upper_Westside_Specific_Plan_EIR\Graphics\GIS\MXD\LTA_Figures\Fig24_Project_Rec.mxd

Note:
The on-site improvements would be constructed by the project as development occurs. The timing of construction (or fair share payments) for off-site improvements will vary depending on the location and type of improvement.

Figure ES-1

# Cumulative Plus Project Recommendations

# 1. INTRODUCTION

This chapter describes the study purpose, provides an overview of the proposed project, presents the study area, analysis scenarios, and methods, and lists applicable transportation-related policies that may pertain to the proposed project.

## Study Purpose

In September 2020, Sacramento County released updated guidance, known as *Transportation Analysis Guidelines* (TAG), for the preparation of transportation analysis studies. The update was necessary to incorporate changes to the way that transportation impacts are measured under the California Environmental Quality Act (CEQA) that resulted from the passage of Senate Bill 743 (SB 743) in 2013. Per SB 743, automobile delay and level of service (LOS) may no longer be used as the performance measure to determine the transportation impacts of land development and transportation projects under CEQA. This requirement did not modify the discretion lead agencies have to develop their own methodologies or guidelines, or to analyze impacts to other components of the transportation system, such as walking, bicycling, transit, and safety. Although SB 743 did not specify the use of a specific metric for transportation analysis, the use of vehicle miles traveled (VMT) has been recommended by the Governor's Office of Planning and Research (OPR).

The County's TAG specifies that the following two distinct types of studies be prepared for proposed land development projects:

- Part I – CEQA Transportation Impact Analysis
- Part II – Local Transportation Analysis (LTA)

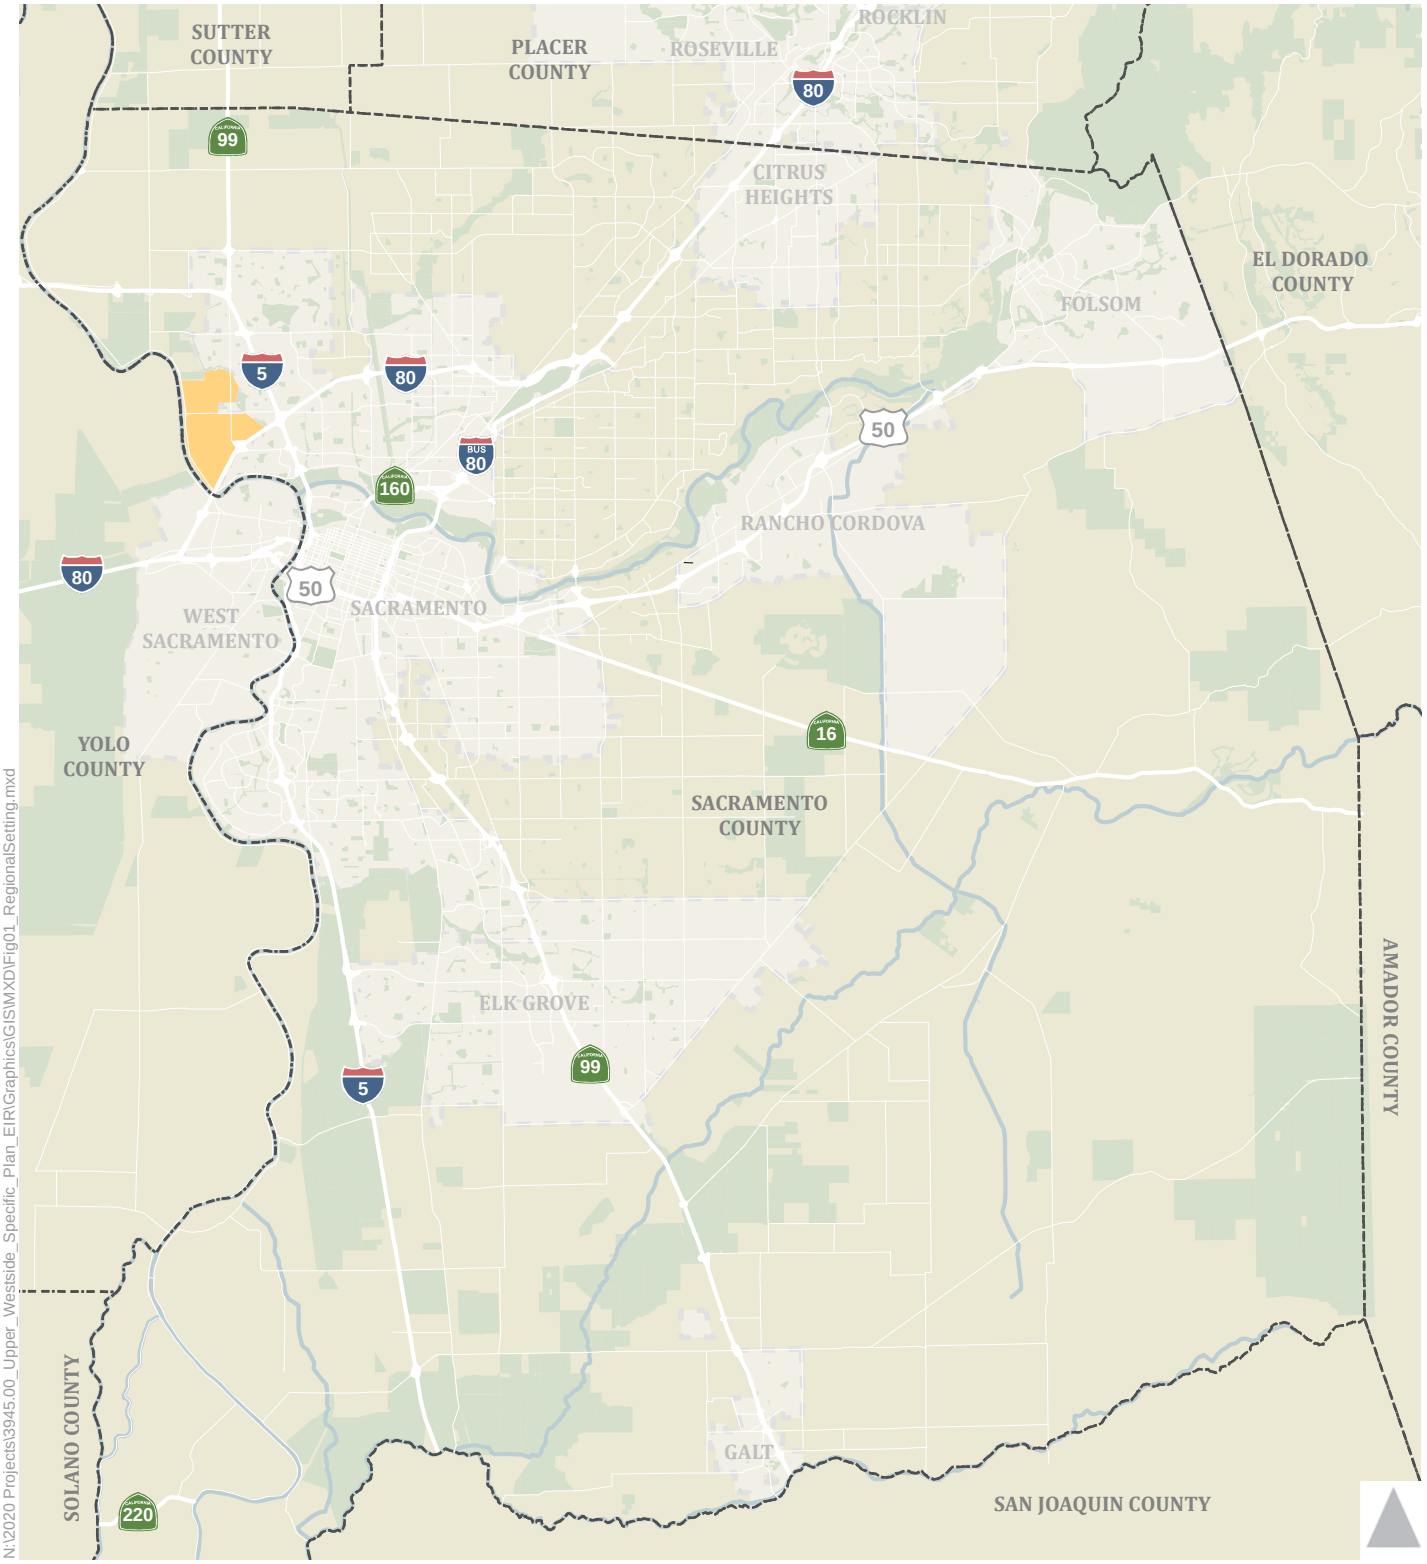
This report, which represents Part II of the TAG requirement, analyzes project effects on traffic operations at nearby roadways and intersections. The LTA assists transportation engineers and planners in both the development community and public agencies when making land use, infrastructure planning, and other development decisions. The LTA quantifies the expected changes in transportation conditions and evaluates the efficacy of potential improvements, if warranted. All technical calculations prepared for this report are contained in a separate technical appendix available at County offices and online.

Part I is a separate report, focusing on the project's impacts to the transportation system based on its VMT. It also evaluates impacts to bicycle/pedestrian facilities, transit facilities and services, and roadway safety-related impacts including freeway off-ramp queuing, storage at freeway on-ramp ramp meters, and nonstandard design features, all of which are evaluated for significant impacts under CEQA.

# Project Description

The Upper Westside Specific Plan ("Proposed Project") would be situated on approximately 2,066 acres north of Interstate 80 (I-80) and west of Interstate 5 (I-5) in unincorporated Sacramento County. **Figure 1** shows the regional setting and the location of the Upper Westside Specific Plan.

**Figure 2** shows the project site plan (*Upper Westside*, Wood Rodgers, May 2021). **Table 1** presents the proposed project land uses based on this site plan. As shown, the proposed project would include 9,356 dwelling units, 3.1 million square feet of business professional/commercial, schools, parks, and various open space elements. Chapter 2 provides a more detailed breakdown of land use types.



As shown on Figure 2, the project would be accessed via several different existing roadways including:

- West El Camino Avenue at I-80
- San Juan Road west of I-5
- Arena Boulevard west of I-5 via El Centro Road
- Del Paso Road west of I-5 via El Centro Road
- Garden Highway via four connections (existing San Juan Road, improvements to existing Radio Road, and two new connections in the southwest portion of the site)

**Figure 3** shows the project's internal roadway network. As shown, West El Camino Avenue would extend westerly from El Centro Road as the Main Street of the Town Center, which would be a dense, mixed-use environment. Other key project roadways include: El Centro Road, Bryte Bend Road, Farm Road, San Juan Road, and Radio Road.

The Town Center would consist of a grid-based street system. North-south streets are labeled Street A through E (from right to left) from West El Camino Avenue to Bryte Bend Road. East-west streets are labeled Street 1 through 7 (from bottom to top) starting south of West El Camino Avenue to San Juan Road.

The project would widen parts of El Centro Road and West El Camino Avenue from a current two lanes to the number of lanes shown in Figure 3. Additionally, it is assumed that project buildout would be supported by a reconstructed I-80/West El Camino Avenue interchange to provide increased roadway capacity and a more bicycle/pedestrian friendly design. Additional right-of-way would be necessary to support the interchange's reconstruction.

| HDR | HIGH DENSITY RESIDENTIAL | RD-15 TO RD-30 | 25.0 DU/AC | 36.4 | 1.8% | 910 DU | 10% | |
| VHDR | VERY HIGH DENSITY RESIDENTIAL | RD-30 TO RD-50+ | 35.0 DU/AC | 22.6 | 1.1% | 791 DU | 8% | |
| CMU | COMMERCIAL MIXED USE | C-1(A) (RD-30 TO RD-50+) | 40.0 DU/AC \| 0.60 FAR | 93.2 (5)(6) | 4.5% | 3,388 DU | 35% | 2,176,513 SF (3) |
| E/HC | EMPLOYMENT/HIGHWAY COMMERCIAL | E/HC | 0.40 FAR | 52.9 | 2.6% | | | 921,730 SF (3) |
| P | PUBLIC/QUASI-PUBLIC | K-8, HS, CC | | 141.1 | 6.8% | | | |
| OS | OPEN SPACE (BUFFERS & BASINS) (4) | NR | | 141.8 | 6.9% | | | |
| AG | AG-CROPLAND (4) | AG | | 410.2 | 19.9% | | | |
| AR | AG-RESIDENTIAL (4) | AR | | 84.2 | 4.1% | | | |
| UF | URBAN FARM/ GREENBELT | AG-B | | 43.0 | 2.2% | | | |
| PARK | PARK | P | | 78.1 | 3.8% | | | |
| W | WATER (CANAL) | P | | 13.0 | 0.7% | | | |
| LC | LANDSCAPE CORRIDOR | | | 33.6 | 1.7% | | | |
| | MAJOR ROADS A | ROW | | 121.8 | 5.9% | | | |
| | MAJOR ROADS B (WITHIN AG-BUFFER) (4) | ROW | | 5.1 | 0.2% | | | |
| | TOTAL | | | 2064.2 ± AC. | 100% | 9,356 DU'S | | 3,096,245 SF |

NOTES
(1) NET ACREAGE BASED ON PRELIMINARY LAND USE PLAN GENERATED IN GIS/AUTOCAD BY WOOD RODGERS MAY 2021. THE PLAN IS SUBJECT TO CHANGE. ARTERIAL AND COLLECTOR ROADS AS SHOWN ON MAP ARE NETTED OUT.
(2) ESTIMATED POPULATION CALCULATION UTILIZING 3.0 PERSONS PER HOUSEHOLD (pph) FOR SINGLE-FAMILY AND 2.5 pph FOR MULTI-FAMILY (HDR AND HIGHER), RESULTING IN 25,574± PEOPLE ((4,367 DU x 3.0 pph)+(4,989 DU x 2.5 pph))=25,574 POPULATION). THIS IS A PRELIMINARY ESTIMATE AND SUBJECT TO CHANGE.
(3) THE ALLOCATED SQUARE FOOTAGE (SF) IS IN ADDITION TO EXISTING COMMERCIAL LAND USES TO ALLOW INTENSIFICATION.
(4) AGRICULTURAL RESIDENTIAL (AR), AGRICULTURAL CROPLAND (AG), OPEN SPACE (OS) BUFFER TO THE WEST AND NORTH, AND MAJOR ROADS B AREAS ARE NOT INCLUDED IN PROPOSED 1,552-ACRE DEVELOPMENT AREA OR THE UPA/USE EXPANSION REQUEST. IT IS ASSUMED THE "AG-BUFFER" AREA WILL REMAIN AS IS AND NO UNITS ARE ALLOCATED.
(5) THE 1.2-ACRE CMU SITE LOCATED SOUTHWEST OF THE TOWN CENTER IS INTENDED FOR A SPECIAL USE (e.g. FIRE STATION, ELECTRIC SUBSTATION, ETC.) AND THEREFORE WAS NOT ALLOCATED RESIDENTIAL UNITS.
(6) 6.3 ACRES NOT INCLUDED IN TARGET DENSITY CALCULATION DUE TO FOR 3.0 AC. WATER TANK STORAGE SITE, 3.0 AC. SEWER PUMP STATION, AND 1.0 AC. FOR TWO ELECTRICAL SUBSTATION SITES NOT INCLUDED IN TARGET DENSITY CALCULATION.

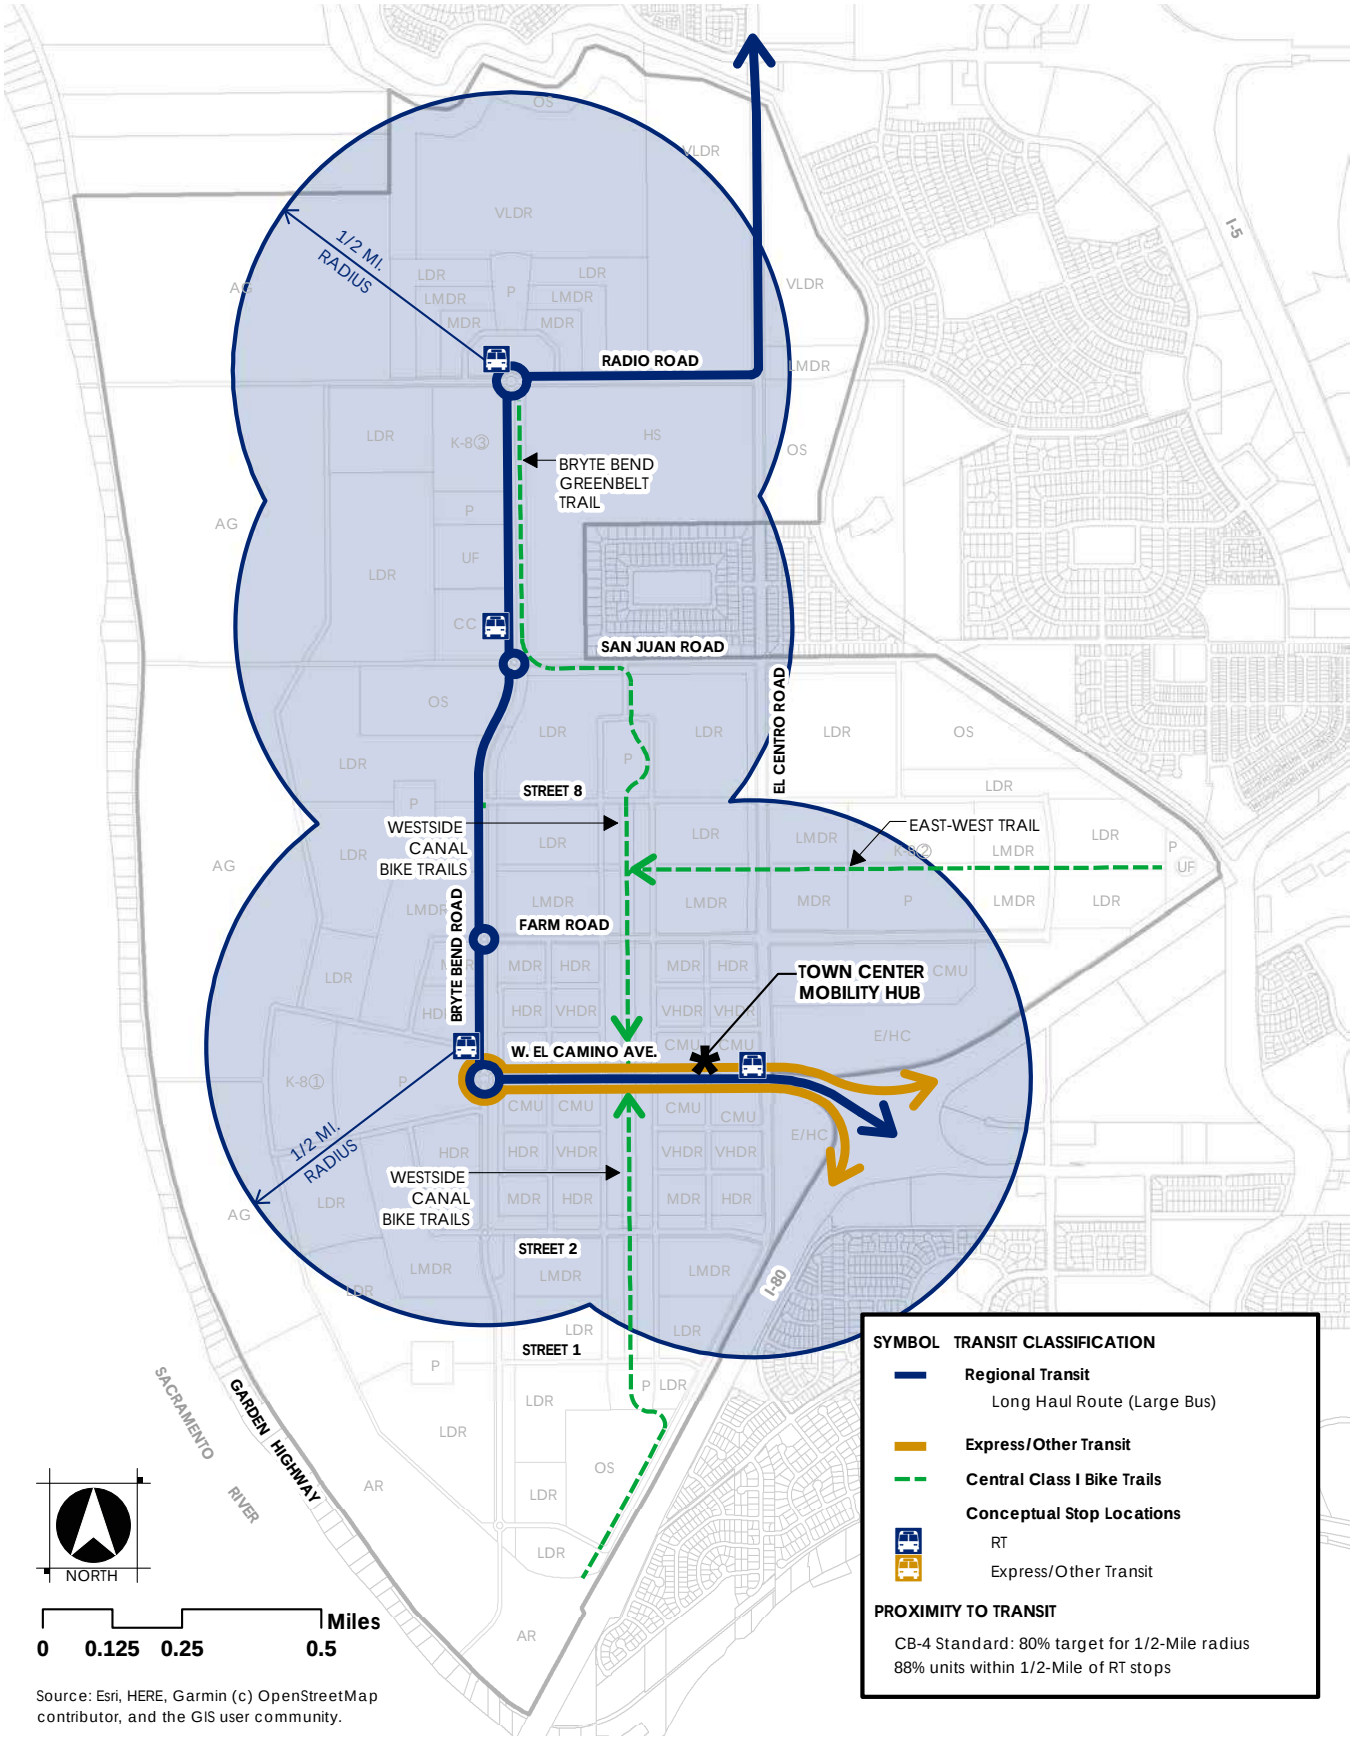
**Figure 4** shows the project's planned bicycle network. Key components of the bicycle network include:

- A set of north-south and east-west Class I (off-street) bicycle/pedestrian paths would be constructed. The north-south path would extend southerly from San Juan Road through the Town Center to Garden Highway. The east-west path would extend parallel and north of Farm Road from Bryte Bend Road easterly to the Natomas Westside Class I Path, which includes an overcrossing of I-80.
- Class I and/or Class II bike lanes (on-street with appropriate signs and pavement markings) would be provided throughout the plan area.

**Figure 5** shows the project's planned transit system, which includes an on-site shuttle that operates along key roadways during peak periods.



This side-by-side comparison depcits how the Upper Westside Specific Plan would modify the Sacramento County Bikeway Master Plan.

Figure 5

## Project Transit System

## Study Area

This study analyzes various roadway facilities under the jurisdiction of Sacramento County, City of Sacramento, and Caltrans. The study area was chosen based on the project's size, type of land uses, and susceptibility of specific facilities being adversely affected. This study area also includes bicycle, pedestrian, and transit facilities in the project vicinity.

The suitability of the study area was confirmed early in the study process by adding the proposed project to the Sacramento Area Council of Governments (SACOG) travel demand model and tracking project trips through the network. This process led to the identification for several additional study intersections beyond those originally chosen.

**Figure 6** illustrates the 43 study roadways selected for analysis under existing weekday (daily) conditions. **Figure 7** illustrates the 41 study intersections selected for analysis under existing weekday AM and PM peak hour conditions. As shown, most of the study facilities are within the City of Sacramento.

The study area includes five existing freeway interchanges. At each interchange, operations of each ramp terminal intersection are evaluated. Freeway ramp meter queuing is also analyzed with the results included in the Part I report (*CEQA Transportation Impact Analysis for Upper Westside Specific Plan* Fehr & Peers, March 2022). At the City of Sacramento's request, the study area also includes the southbound I-5 off-ramps at Richards Boulevard and J Street.

In May 2020, the California Department of Transportation (Caltrans) published the *Vehicle Miles Traveled-Focused Transportation Impact Study Guide (TISG)*, which replaced its *Guide for the Preparation of Traffic Impact Studies* (2002). The TISG indicates that Caltrans intends to "transition away from requesting LOS or other vehicle operations analyses of land use projects", instead placing the focus on VMT and safety. For this reason, the study area does not include traffic operations analysis of freeway facilities.

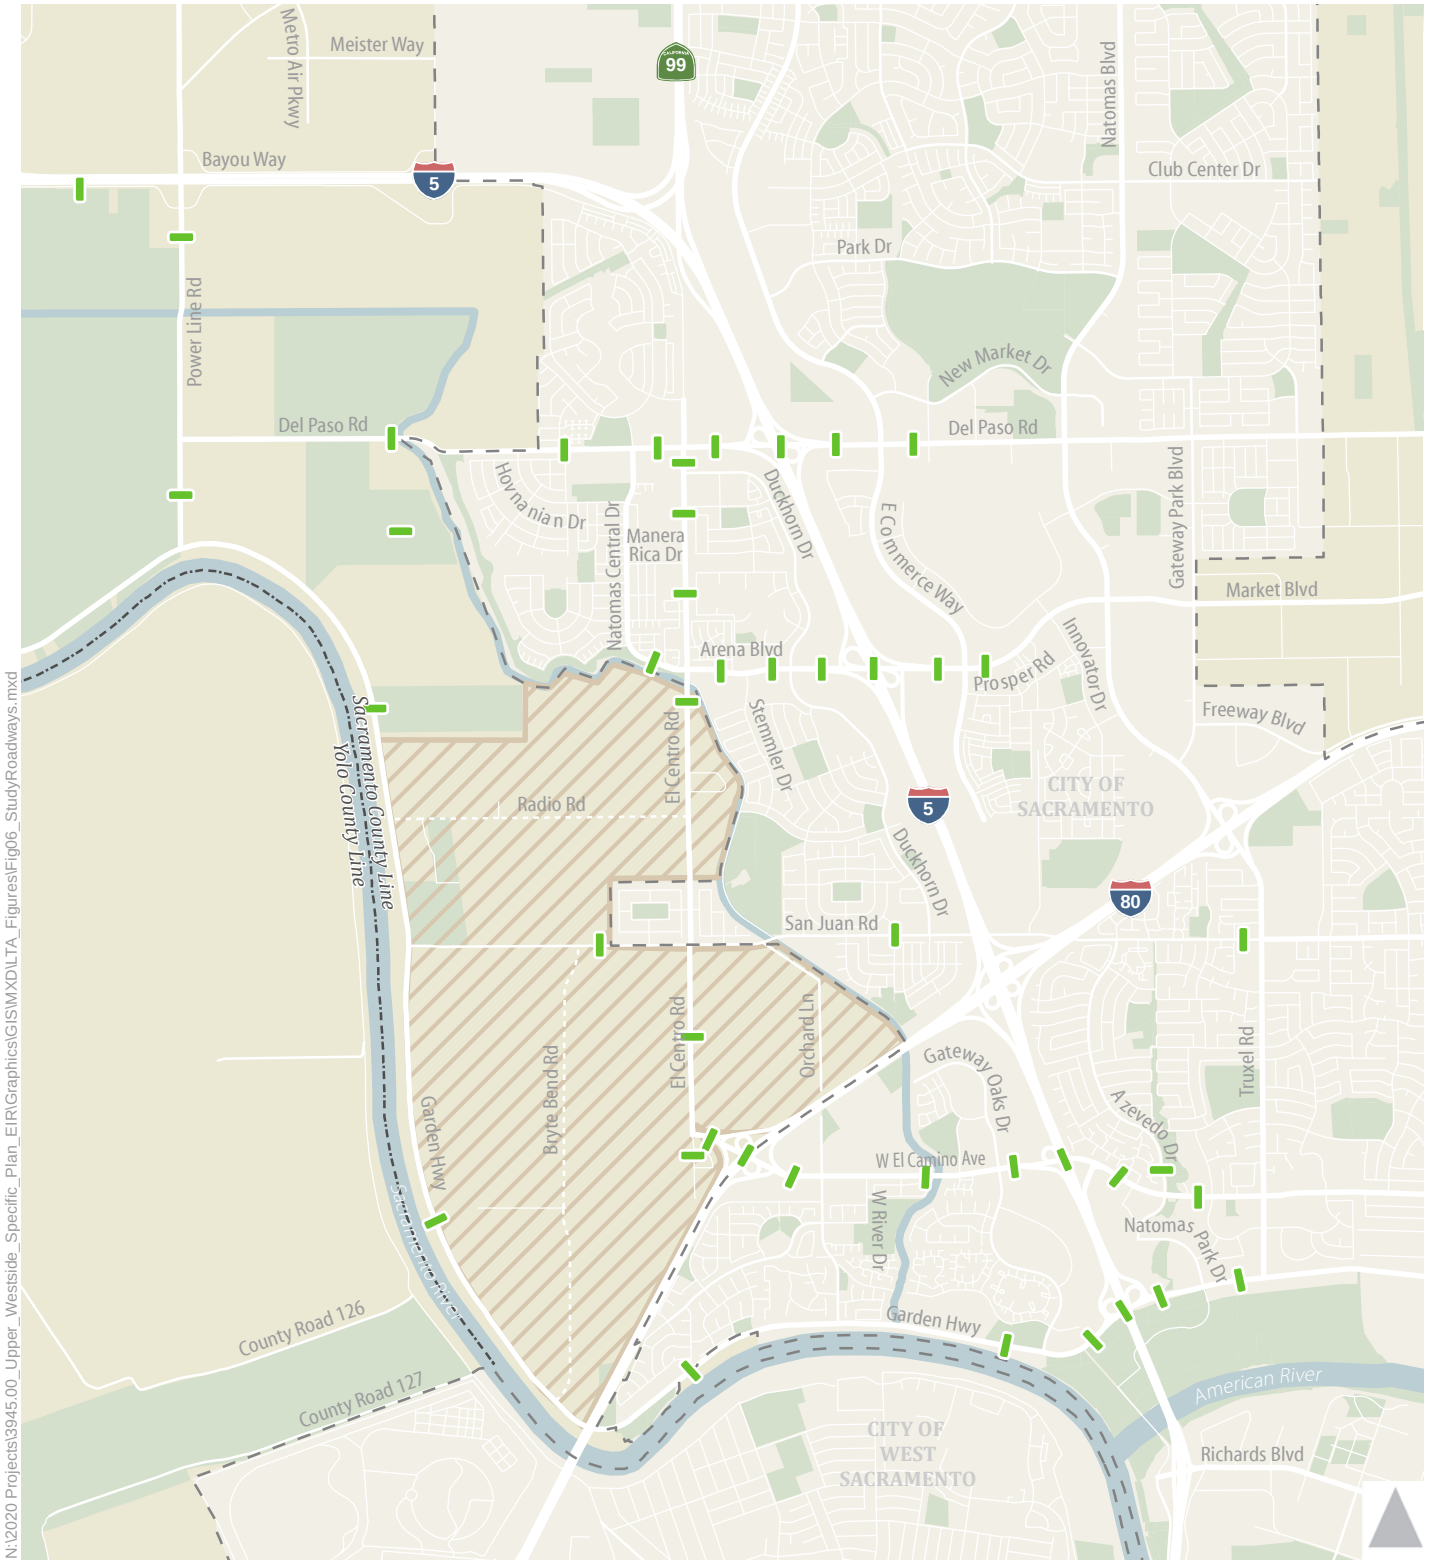

Figure 6

## Existing Study Roadway Segments

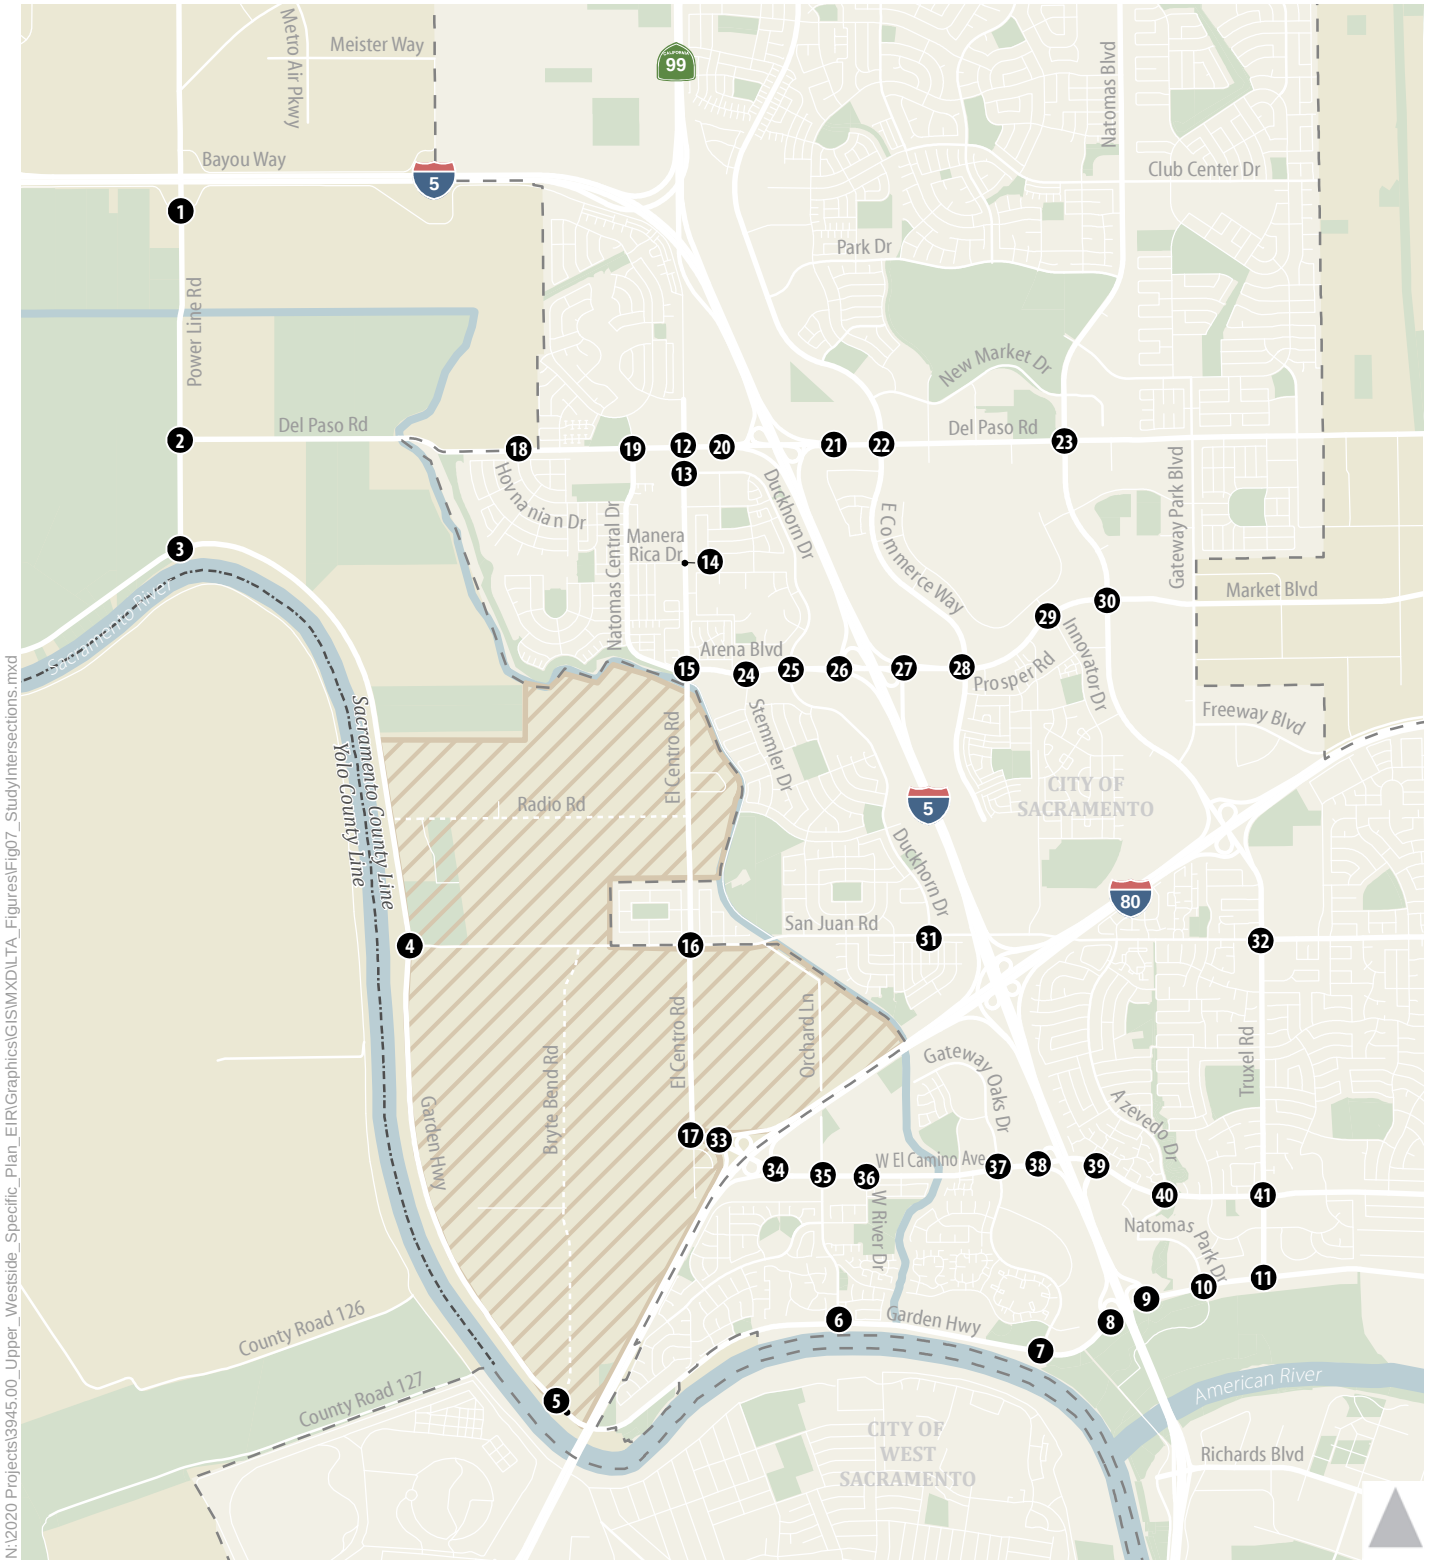

Figure 7

## Existing Study Intersections

# Analysis Scenarios

The LTA consists of the following scenarios:

- Existing Conditions – represents conditions in 2018-2019, prior to the beginning of the COVID-19 pandemic in March 2020.
- Existing Plus Proposed Project conditions – analyzes the study area assuming buildout of the proposed project under existing conditions.
- Cumulative (2040) No Project Conditions – analyzes the study area in 2040 assuming the project site remains in its current state.
- Cumulative (2040) Plus Proposed Project conditions – analyzes the study area assuming buildout of the proposed project under cumulative conditions.

# Analysis Methods

This section presents the various analysis methods used to quantify operations at study intersections and roadways, and to develop traffic forecasts for future year scenarios.

## Intersection Operations Analysis

This study analyzes traffic operations using delay and LOS as the primary measure of performance. Automobile LOS is a qualitative description of traffic flow from the perspective of motorists. The *Highway Capacity Manual (HCM) 6th Edition* (Transportation Research Board, 2016) defines six levels of service from LOS A representing the least congested traffic conditions to LOS F representing the most congested traffic conditions. These grades represent the perspective of drivers and are an indication of the comfort and convenience associated with driving, as well as speed, travel time, traffic interruptions, and freedom to maneuver.

Intersections are analyzed according to methods described in the HCM. This study uses the Synchro and SimTraffic software programs to conduct the HCM 6th Edition analyses. The Sidra software program is used to analyze roundabouts consistent with the TAG.

Intersection LOS at signalized and all-way stop controlled intersections is based on the weighted average control delay measured in seconds per vehicle for all motorists traveling through the intersection. For side-street stop-controlled intersections, this study reports the average control delay for the lane group or movement with the greatest delay, and for the intersection as a whole.

**Table 2** presents the control delay range for each LOS for signalized and unsignalized intersections. As shown, the delay ranges for signalized intersections are different from unsignalized intersections. The HCM anticipates that motorists expect signalized intersections to carry higher traffic volume that result in greater delay than an unsignalized intersection and roundabout. Unsignalized intersections are associated with more uncertainty as delays are less predictable, which can reduce users' delay tolerance.

**Table 2:**
**Levels of Service Definitions – Intersections**

| Level of Service | Description | Average Control Delay[1] | |
|---|---|---|---|
| | | Signalized Intersections | Unsignalized Intersections and Roundabouts |
| A | Volume-to-capacity ratio is low and either progression is exceptionally favorable, or cycle length is very short. Most vehicles arrive during the green phase and travel through the intersection without stopping. | ≤ 10 | ≤ 10 |
| B | Volume-to-capacity ratio is low and either progression is highly favorable, or the cycle length is short. More vehicles stop than with LOS A. | >10 to 20 | >10 to 15 |
| C | Progression is favorable or the cycle length is moderate. Individual cycle failures (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping. | >20 to 35 | >15 to 25 |
| D | Volume-to-capacity ratio is high and either progression is ineffective, or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable. | >35 to 55 | >25 to 35 |
| E | Volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent. | >55 to 80 | >35 to 50 |
| F | Volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue. | >80 | >50 |

Notes:
1. Average control delay presented in seconds per vehicle. Delay values are rounded to the nearest second and evaluated for LOS based on the above thresholds (i.e., 10 seconds per vehicle = LOS A)

Source: *Highway Capacity Manual 6th Edition*, Transportation Research Board, 2016.

This study analyzes intersections using either the Synchro software program or Synchro's SimTraffic micro-simulation module to apply the methodologies presented in the *HCM*. Synchro considers traffic volumes, lane configurations, signal timings, and other parameters. SimTraffic additionally considers interactions between adjacent intersections, turn lane spillbacks, coordinated signal timing, and upstream/downstream bottlenecks. SimTraffic is preferable to use when operating conditions are near or over capacity, turn lane storage exceedance is common, and/or intersections are spaced closely together. Outside of these conditions, Synchro is generally appropriate for use. In this study, given the above guidance, SimTraffic was used to analyze all freeway interchanges including their adjacent intersections. Additionally, SimTraffic was used to analyze the segments of West El Camino Avenue and El Centro Road near the Town Center (given the level of traffic projected and intersection spacing). Of the 41 study intersections, 26 were analyzed using the SimTraffic microsimulation model, with the remainder analyzed using the Synchro software program. Chapter 2 describes which intersections were analyzed using each program including the rationale for the approach taken.

Field observations and aerial imagery confirm that most study on-ramps are metered. Ramp metering could affect adjacent surface street intersections during peak hours under plus project or cumulative conditions. Therefore, ramp meters were included in the operations analysis to inform the need to potentially widen on-ramps or change ramp meter timings.

This study may recommend the installation of traffic signals at some existing unsignalized study intersections to address deficient traffic operations (i.e., unacceptable LOS conditions). Prior to making any recommendations, this study evaluated the peak hour volume warrant, as described in the *California Manual on Uniform Traffic Control Devices* (*MUTCD*, Caltrans, 2014). In instances where this study recommends a traffic signal, this warrant is satisfied. It should be noted that while the peak hour signal warrant indicates when traffic conditions *may* warrant a signal, the MUTCD states that the satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal. The MUTCD recommends an engineering study of traffic conditions, pedestrian characteristics, and physical characteristics of a specific intersection to determine if a traffic signal is justified.

## Roadway Segment Operations

Roadway segments in Sacramento County were analyzed by comparing the average daily traffic volume to daily volume thresholds to determine the LOS. **Table 3** displays the Sacramento County daily volume thresholds for various roadway facility types (obtained from Table F-2 of the TAG). The City of Sacramento has applicable LOS policies and goals in its 2035 General Plan, though they are not typically applied on a project-level basis (and therefore not applied here). Caltrans does not have daily volume LOS thresholds.

Roadway segment volumes are reported at City of Sacramento roadways and at Caltrans interchange overcrossings for informational purposes.

**Table 3:**
**Sacramento County Daily LOS Roadway Segment Thresholds**

| Roadway Type | | Daily Two-Way Volume Thresholds | | | | |
|---|---|---|---|---|---|---|
| | | LOS A | LOS B | LOS C | LOS D | LOS E |
| Rural, 2 lane road, <24' of pavement, <6' shoulders | | 1,000 | 2,100 | 3,400 | 6,000 | 12,800 |
| Rural, 2 lane road, 24' of pavement, 6' shoulders | | 2,200 | 4,300 | 7,100 | 12,200 | 20,000 |
| Arterial – Low Access Control [1] | 2 lanes | 9,000 | 10,500 | 12,000 | 13,500 | 15,000 |
| | 4 lanes | 18,000 | 21,000 | 24,000 | 27,000 | 30,000 |
| | 6 lanes | 27,000 | 31,500 | 36,000 | 40,500 | 45,000 |
| Arterial – Moderate Access Control [2] | 2 lanes | 10,800 | 12,600 | 14,400 | 16,200 | 18,000 |
| | 4 lanes | 21,600 | 25,200 | 28,800 | 32,400 | 36,000 |
| | 6 lanes | 32,400 | 37,800 | 43,200 | 48,600 | 54,000 |
| Arterial – High Access Control [3] | 2 lanes | 12,000 | 14,000 | 16,000 | 18,000 | 20,000 |
| | 4 lanes | 24,000 | 28,000 | 32,000 | 36,000 | 40,000 |
| | 6 lanes | 36,000 | 42,000 | 48,000 | 54,000 | 60,000 |
| Residential | | 600 | 1,200 | 2,000 | 3,000 | 4,500 |
| Residential Collector with frontage | | 1,600 | 3,200 | 4,800 | 6,400 | 8,000 |
| Residential Collector without frontage | | 6,000 | 7,000 | 8,000 | 9,000 | 10,000 |

Notes:
1. Road generally has frequent driveways and speeds of 25 to 35 mph.
2. Road generally has limited driveways and speeds of 35 to 45 mph.
3. Road generally has no driveways and speeds of 45 to 55 mph.

Source: Table F-2 of *Transportation Analysis Guidelines* (County of Sacramento, 2020)

## Ramp Meter Analysis

Many of the study interchange on-ramps consist of ramp meters that are operational during peak periods. The ramp meters operate with real-time signal timings that vary depending on conditions on the adjacent freeway facility they feed. This study was initiated after the COVID-19 pandemic had begun. It was therefore not possible to measure existing metering rates or vehicle queues. Historic observations from Fehr & Peers staff were necessarily used instead. Additionally, it is noted that SimTraffic is not able to model traffic responsive ramp meters. Therefore, for metered on-ramps that are known not to have queuing issues, a 900 vehicle per hour flow rate was assumed. Through conversations with Caltrans, it was determined that

an 800 vehicle per hour metering rate should be assumed for the southbound I-5 loop on-ramp and northbound diagonal on-ramp at Garden Highway. Where ramp meters are operational, they are coded into SimTraffic so that their effects on interchange and adjacent street operations is modeled.

### LOS Standards

The County of Sacramento defines the minimum acceptable operating level for its roadways and intersections to be LOS D for rural areas and LOS E for urban areas. The rural areas are those areas that are either outside the Urban Service Boundary or are dominated with rural type land uses and transportation infrastructure. All Sacramento County study facilities are currently classified as being in rural areas. However, many of them would be reclassified as urban if the project were constructed and are evaluated accordingly.

Although the City of Sacramento does have a set of LOS policies, those policies are typically not applied in impact analysis reviews. Instead, the City examines expected conditions in a holistic manner, considering whether capacity constraints or excess vehicle queuing could cause bottlenecks that would interfere with a number of different transportation-related policies.[1]

Per the Caltrans' *TISG*, which emphasizes use of VMT over LOS, a specific LOS threshold is not used to evaluate adequacy of operations at state highway intersections.

## Thresholds of Significance

The following thresholds of significance have been used to determine whether implementing the proposed project would result in an operational deficiency at a study roadway segment or intersection. These thresholds of significance are derived from the TAG. As a consequence of SB 743, the thresholds below utilize the term "operational deficiencies" versus significant impacts to describe substantially degraded conditions.

### Roadway Segments

The project would cause deficient operations or contribute to already deficient operations if it would:

- Result in a roadway segment in Sacramento County operating at an acceptable LOS to deteriorate to an unacceptable LOS; or

[1] Source: email from Pelle Clarke, City of Sacramento, December 10, 2020.

- Increase the volume-to-capacity (v/c) ratio by more than 0.05 at a roadway segment in Sacramento County that is currently operating (or projected to operate) at an unacceptable LOS without the project.

## Signalized Intersections

The project would cause deficient operations or contribute to already deficient operations if it would:

- Result in a signalized intersection in Sacramento County operating at an acceptable LOS to deteriorate to an unacceptable LOS; or
- Increase the average delay by more than 5 seconds at a signalized intersection in Sacramento County that is currently operating (or projected to operate) at an unacceptable LOS without the project.

## Unsignalized Intersections

The project would cause deficient operations or contribute to already deficient operations if it would:

- Result in an unsignalized intersection movement/approach in Sacramento County operating at an acceptable LOS to deteriorate to an unacceptable LOS, and also cause the intersection to meet a traffic signal warrant; or
- Meet a traffic signal warrant and increase the delay by more than 5 seconds at the highest delay movement/approach at an unsignalized intersection in Sacramento County that is operating at an unacceptable LOS without the project.

Refer to the TAG Part I report (*CEQA Transportation Impact Analysis for Upper Westside Specific Plan* Fehr & Peers, March 2022) for significance thresholds and conclusions related to the following transportation topics:

- Bicycle/pedestrian facilities
- Transit facilities and services
- Freeway off-ramp queuing
- Freeway on-ramp ramp meter queuing
- Non-standard roadway design

## Sacramento County General Plan Policies

The following summarizes various policies from the Sacramento County General Plan (Amended 2020) that relate to the transportation analysis of the proposed project:[2]

- CI-7: Plan and construct transportation facilities as delineated on the Transportation Plan of the Sacramento County General Plan.
- CI-8: Maintain and rehabilitate the roadway system to maximize safety, mobility, and cost efficiency.
- CI-9: Plan and design the roadway system in a manner that meets Level of Service (LOS) D on rural roadways and LOS E on urban roadways.
- CI-10: Land development projects shall be responsible to mitigate the project's adverse impacts to local and regional roadways.
- CI-11: To preserve public mobility, freeways and thoroughfares should have limited access and maintain functional characteristics that predominantly accommodate through traffic.
- CI-12: To preserve public safety and local quality of life on collector and local roadways, land development projects shall incorporate appropriate treatments of the Neighborhood Traffic Management Program.
- CI-13: Collaborate with regional transportation planning agencies and neighboring jurisdictions to provide cross jurisdictional mobility.
- CI-19: Collaborate with transit service providers to provide transit services within the County that are responsive to existing and future transit demand.
- CI-32: Develop a comprehensive, safe, convenient and accessible bicycle and pedestrian system that serves and connects the County's employment, commercial, recreational, educational, social services, housing and other transportation modes.
- CI-35: The applicant/developer of land development projects shall be responsible to install bicycle and pedestrian facilities in accordance with Sacramento County Improvement Standards and may be responsible to participate in the fair share funding of regional multi-use trails identified in the Sacramento County Bicycle Master Plan.

[2] General Plan (saccounty.net). Accessed on June 11, 2021.

- CI-39: Plan and implement intelligent transportation system (ITS) strategies within the County's high-demand travel corridors and support efforts to deploy ITS strategies on a regional level.
- CI-40: Whenever possible, the applicant/developer of new and infill development projects shall be conditioned to fund, implement, operate and/or participate in TSM programs to manage travel demand associated with the project.
- CI-43: The County shall promote transit-supportive programs in new development, including employer-based trip-reduction programs (employer incentives to use transit or nonmotorized modes), "guaranteed ride home" for commute trips, and car-share or bikeshare programs.
- LU-120: The County shall only consider approval of a proposed UPA expansion and/or Master Plan outside of the existing UPA if the Board finds that the proposed project is planned and will be built in a manner that:
    - meets all of the requirements per PC-1 through PC-10, and;
    - meets ONE of two alternative performance metrics:
        - Alternative #1- Criteria-Based
        - Alternative #2 - VMT/ Greenhouse Gas Emissions Reduction Metric

*Only those Performance Criteria (PC) directly addressed in this report are described below (as the list is extensive and primarily relates to land use).*

- PC-1: Vision for connection to other adjacent existing and potential future development areas.
  Required: Include a vision of how the development will connect to other adjacent existing and potential future development areas.

- PC-5: Pedestrian- and transit-oriented design.
  Required: Pedestrian- and transit-oriented design, including:
    - Sidewalks and bike routes along interconnected streets with short block lengths and a high intersection density,
    - Prominent pedestrian and bicycle network,
    - Few if any cul-de-sacs, and
    - Pedestrian and bike connections at the ends of all cul-de-sacs unless infeasible due to topography or similar impediments inherent in the project site.

*Alternative #1 – Criteria-Based*

To satisfy this alternative, the Board must find that the proposed project is planned and will be built in a manner that:

- meets all of the requirements per the criteria below, and;
- qualifies for a minimum of 18 points (out of a possible 24) per the criteria below

*Most criteria-based policies are land use related and thus not listed here. However, the one criterion related to transportation is CB-4, which is described below:*

*CB-4* Requires at least 65 percent of all residential units to be located within ½ mile of existing or planned transit service, which consists of light rail, streetcars, buses, vanpools and/or shuttles that connects with regional public transit service.

As indicated on page 146 of the Land Use Element, points are assigned for the proportion of the dwelling units situated within ½ mile of existing or planned transit service. Points are also assigned depending on whether transit service headways are 60, 30, or 15 minutes during weekday peak periods.

*Alternative #2 – Vehicle Miles Travelled (VMT)/Greenhouse Gas (GHG) Emission Metrics*

To satisfy this alternative, the Board must find that the proposed project is planned and will be built in a manner that results in:

- ≤14 vehicle miles travelled (VMT) per resident per day (or the equivalent VMT per household per day); OR
- ≤Equivalent GHG per capita per day from cars, light trucks, and medium trucks (less than 8,500 Gross Vehicle Weight)

Discussion: While consistency with the criteria in Alternative #1 provides a level of certainty that a proposed project will achieve particular outcomes, measuring the County of Sacramento General Plan actual projected outcome(s) of the project is a viable alternative. These projected outcomes can be compared against pre-defined metrics to determine the project's "performance". VMT and greenhouse gas (GHG) emissions are logical metrics because a project's performance in these areas is directly correlated to the project's ability to achieve the same goals and mandates (relative to air quality, transportation, land use, infrastructure, and GHG emissions) as the criteria in Alternative #1. Additionally, VMT and GHG are very closely related; the mix of vehicles that residents use for their daily travel has a relatively narrow range of GHG emissions per mile traveled. Given the direct correlation between improved VMT and associated reductions in GHG emissions, this alternative directly addresses

goals and mandates relative to recent state laws aimed at reducing GHG emissions, including AB 32, SB 375 and SB 97.

VMT is easily measured using standard travel demand analysis methods. Multiple traffic models exist for conducting such analysis. Given the long-range nature of the General Plan and the ever-evolving nature of traffic models, it does not make sense to require use of a specific model to determine compliance with this alternative. However, to ensure that a credible model is employed, the project proponent and County staff (including SACDOT, Planning and Environmental Review, etc.) will discuss the merits of available models and determine which will be used to determine compliance with this alternative prior to starting the analysis.

The 14 VMT per capita can be translated into a 13 pounds of GHG per capita by using the same assumptions that SACOG is required to use for calculating SB 375 GHG targets. These assumptions are that this travel will use cars, light trucks, and medium trucks (less than 8,500 Gross Vehicle Weight), and that vehicle and fuel improvements are not included. If the technology improvements are included (fuel economy increases and a 10 percent reduction in the carbon content of gasoline), then the GHG metric would be 8 pounds of GHG per capita.

At the time this report was being prepared, there were no known plans to annex this project into the City of Sacramento. Therefore, design standards and level of service requirements of the City were not applied to new project roadways. Instead, those roadways are being designed to and reviewed against applicable Sacramento County standards.

## Project Consistency Review

The following presents an assessment of the project's consistency with many of the policies described above.

Consistent with Policy CI-9, the project's roadway system has been designed in a manner that meets LOS D on rural roadways and LOS E on urban roadways with just a few exceptions. In those instances, further widening (e.g., eight lanes on El Centro Road) is deemed undesirable or infeasible, particularly since intersection operations will govern overall system performance.

Consistent with Policy CI-10, the project's adverse effects to local and regional roadways were studied, and improvement options were recommended at a number of different locations.

Consistent with Policy CI-13, the project team has collaborated frequently with neighboring jurisdictions and affected agencies including the City of Sacramento, SacRT, and Caltrans.

Consistent with Policy CI-32, the project includes a comprehensive set of on-street and off-street bicycle facilities that accommodates riders of all ages and abilities. This includes special treatments within and along the eastern edge of the Town Center and at the I-80/West El Camino Avenue interchange.

The project design appears generally consistent with Performance Criteria 1 and 2, which relate to connectivity to any existing and potential future development areas and pedestrian/transit-oriented design. However, deciding overall consistency with Policy LU-120 is beyond the scope of this particular study. However, the project does appear substantially consistent with the circulation policies described above.

# 2. EXISTING CONDITIONS

This chapter describes the existing transportation system and traffic conditions within the study area, including the roadway, bicycle, pedestrian, and transit networks, and traffic operations at study intersections and roadway segments. Refer to separately bound **Appendix A** for technical calculations.

## Roadway Network

The following roadways provide access to the project site.

- **Interstate 80 (I-80)** – is a major east-west freeway that connects Sacramento westerly to the Bay Area and easterly to Nevada and beyond. It is a six-lane freeway at the Yolo/Sacramento County Line, widening to add a carpool lane in each direction approaching the West El Camino Avenue interchange. Between this interchange and I-5 (one mile further east), it consists of three general purpose lanes, one carpool lane, and one auxiliary/weaving lane in each direction. The posted speed limit is 65 miles per hour (mph).
- **Interstate 5 (I-5)** – is California's major north-south freeway that connects California to the Pacific Northwest. It also serves interstate and interregional travel for commerce, commute, and recreational purposes. Between Del Paso Road and Arena Boulevard, it consists of three general purpose lanes and one auxiliary/weaving lane in each direction. Between Arena Boulevard and I-5, it consists of four general purpose lanes and one auxiliary/weaving lane in each direction. The posted speed limit is 65 mph.
- **West El Camino Avenue** – is a four-lane east-west, median-divided arterial for its 1.25-mile distance between I-80 and I-5. This segment, which is within the City of Sacramento limits, has a posted speed limit of 40 mph. West of I-80, West El Camino Avenue is within unincorporated Sacramento County and extends for a short distance, terminating at El Centro Road and serving various retail, hotel and industrial uses (including the Sacramento 49er Travel Plaza Truck Stop).
- **El Centro Road** – is a north-south arterial that begins a short distance south of West El Camino Avenue, extending about 3.5 miles to where it connects with Bayou Way near the I-5/SR 99 interchange. Between West El Camino Avenue and Arena Boulevard, it is situated primarily within unincorporated Sacramento County and is a two-lane moderate access arterial with a 50 mph posted speed limit. North of Arena Boulevard, it widens to a four-lane arterial within the City of Sacramento limits.

- **Arena Boulevard** – is an east-west four to eight lane arterial within the City of Sacramento limits. It begins at El Centro Road, and extends easterly to its interchange with I-5 and along the southern boundary of the SleepTrain Arena property. West of I-5, it has four lanes and a posted speed limit of 40 mph.
- **Del Paso Road** – is an east-west street that parallels Arena Boulevard approximately one mile to the north. Between El Centro Road and its interchange with I-5, it is a four-lane arterial within the City of Sacramento limits. It continues east of I-5 as a four to six lane arterial. About 0.85 miles west of El Centro Road, it becomes a rural road within unincorporated Sacramento County, terminating one mile to the west at Powerline Road.
- **San Juan Road** – begins at Garden Highway in unincorporated Sacramento County as a two-lane rural road with a posted speed limit of 55 mph. East of El Centro Road, it becomes a two-lane arterial within the City of Sacramento. Continuing easterly, it features an undercrossing of I-5, followed by an overcrossing of I-80.
- **Garden Highway** – is a two-lane rural road that parallels the Sacramento River within unincorporated Sacramento County west and south of the project site. This segment has a posted speed limit of 45 mph. East of its undercrossing of I-80, the speed limit is reduced to 40 mph west of Orchard Lane where the roadway is within the City of Sacramento limits. It continues easterly with an interchange at I-5.

There are currently no designated Surface Transportation Assistance Act (STAA) truck routes west of I-5 or north of I-80 within the study area. Such routes allow for operation of large trucks, which are longer than California legal trucks. However, there is an STAA Service Access route on West El Camino Avenue at I-80 and on El Centro Road a short distance north of West El Camino Avenue. This route designation is provided where food, fuel, lodging, and/or truck repair is provided (i.e., from the Sacramento 49er Travel Plaza).

## Existing Traffic Volumes

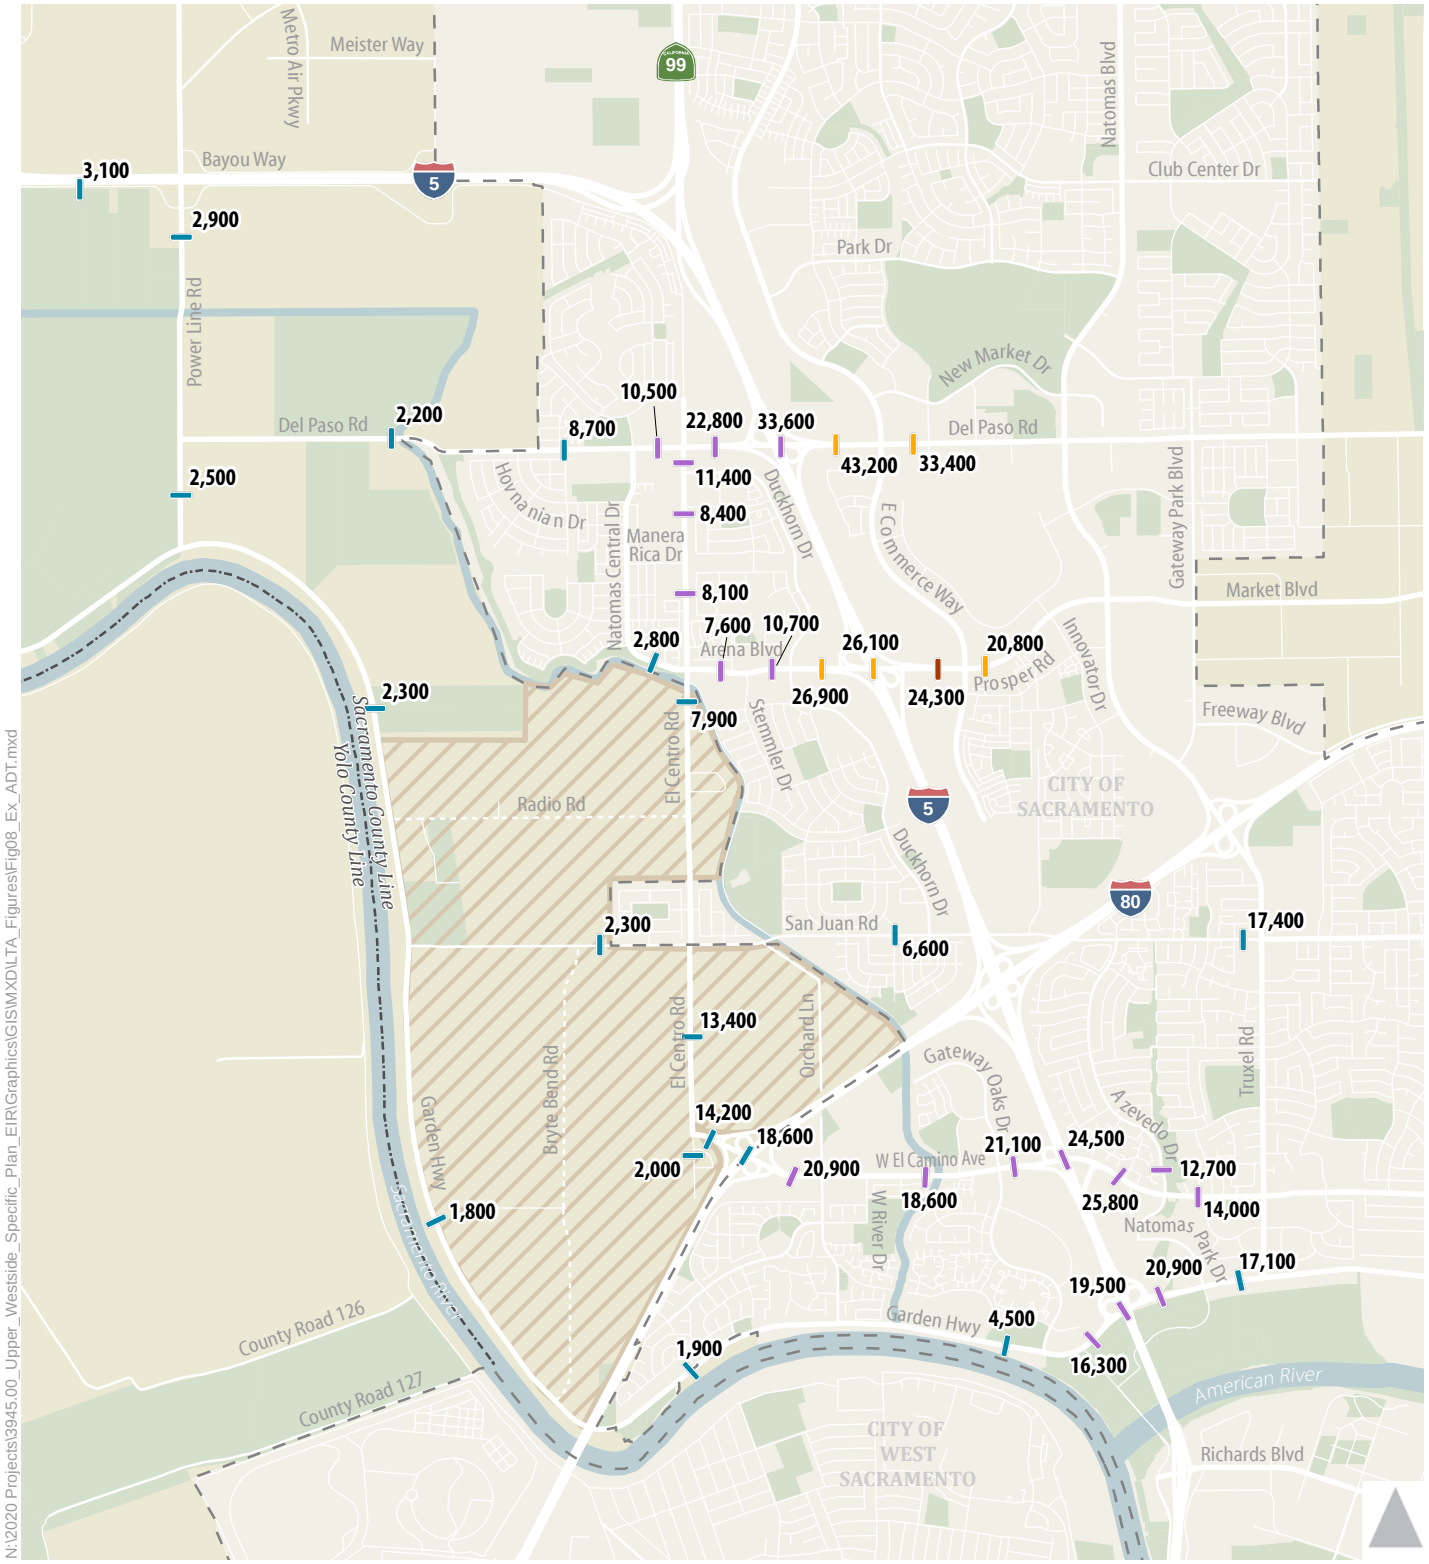
Due to the effects of the COVID-19 pandemic on travel behavior, recent counts (2017-February 2020) were used to establish a pre-COVID existing condition. The following sources of data were used to compile the existing counts:

- Historical counts from count vendors such as National Data Services and Quality Counts.
- Counts conducted for other ongoing studies (e.g., Grandpark, I-80 and I-5 Managed Lanes Studies, City of Sacramento General Plan Update, etc.).
- Counts provided by City of Sacramento from their traffic count database.

- Purchase of StreetLight Data volume estimates for conditions at intersections and roadways in Fall 2019.

Through this data collection process, traffic counts were assembled for all 41 study intersections and 41 study roadways for a pre-COVID existing condition.

**Figure 8** displays the existing average daily traffic (ADT) at all 41 study roadways along with the number of through lanes at each location. **Figures 9A and 9B** display the existing AM and PM peak hour intersection traffic volumes, traffic controls, and lane configurations at the 41 study intersections. As shown, 31 of the 41 study intersections are controlled by traffic signals.



In December 2021, Caltrans provided a set of 2018 on-ramp and off-ramp AM and PM peak hour volumes at the study interchanges. **Appendix A** of this report contains a Technical Memorandum that compares those traffic volumes against volumes used in this study. This comparison identified four specific ramps in which existing volumes in this study were considerably lower than the Caltrans' 2018 volumes. The Technical Memorandum evaluated each of these four ramps. At three locations, logical reasons for differences in volumes were identified, or it was concluded that the volume change would not alter any study findings. But one ramp (I-5/West El Camino NB Slip Off-ramp) did warrant a sensitivity test as described in the memo. That sensitivity test determined if the off-ramp volume were changed, it would not affect study results.

## Roadway Segment Operations

**Table 4** displays the v/c ratio and LOS for the eleven (11) Sacramento County study roadway segments. This table indicates that 10 of the 11 segments currently operate at LOS C or better, which is considered acceptable. One segment, West El Camino Avenue between El Centro Road and the I-80 WB Ramps, has an average daily traffic (ADT) of 14,200 and operates at LOS E, which is also considered acceptable.

## Intersection Operations

**Table 5** shows the average delay and LOS at all existing study intersections for AM and PM peak hour conditions. This table also shows the agency to which each intersection belongs. In the few instances in which the facility overlaps with both the City and County, the County was shown as the lead agency given that the proposed project is being processed by the County.

Notes:
1. AWSC = all-way stop controlled intersection; SSSC = side-street stop controlled intersection
2. The overall average intersection control delay is reported in seconds per vehicle for signalized and all-way stop controlled intersections. For side-street stop controlled intersections, the average control delay/LOS for the movement with the greatest delay is shown in parentheses, while the average delay/LOS for the entire intersection is shown not in parentheses.

Source: Fehr & Peers, 2021.

The SimTraffic model requires a single peak hour to be chosen for the network to ensure proper balancing of traffic volumes between intersections. Four separate SimTraffic networks were developed, which allowed for separate peak hours to be used for each. The AM and PM peak hours for each network, which are shown below, are based on the overall busiest 60 minutes in each corridor:

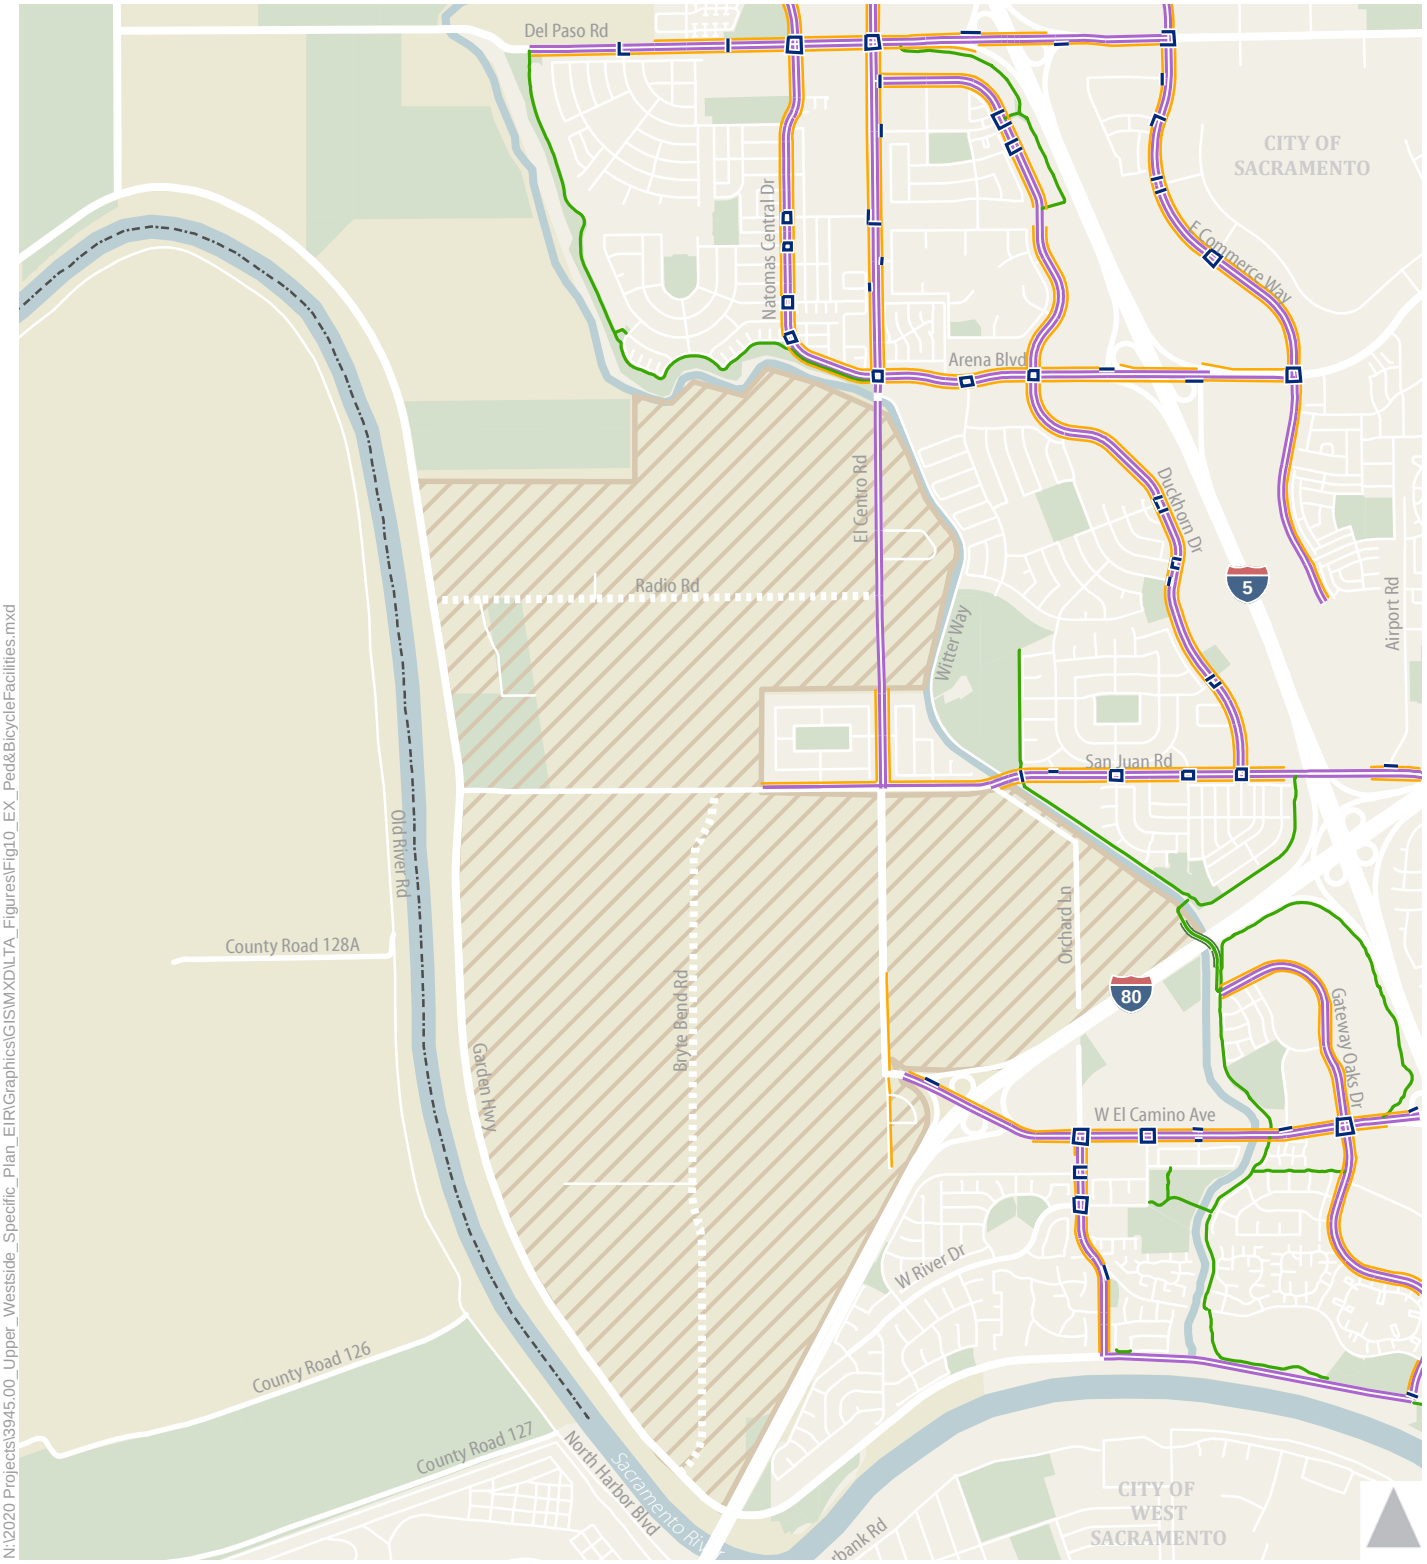
- I-5/Del Paso Road Corridor: 7:15 – 8:15 AM and 4:45 – 5:45 PM
- I-5/Arena Boulevard Corridor: 7:15 – 8:15 AM and 4:45 – 5:45 PM
- I-5/Garden Highway Corridor: 7:30 – 8:30 AM and 4:30 – 5:30 PM
- I-80/West El Camino Avenue and I-5/West El Camino Avenue Corridor: 7:15 – 8:15 AM and 4:30 – 5:30 PM

At Synchro intersections, the peak hour of that individual intersection was chosen for analysis. For all intersections, current signal timings were used as were any ramp metering plans. Consistent with both Sacramento County and City of Sacramento practices, a peak hour factor (PHF) of 1.0 was applied at all study intersections. Because the SimTraffic networks include both ramp terminal and surface street intersections, a systemwide PHF of 1.0 was applied. It should be noted that due to the random entry of vehicles in SimTraffic, volumes vary over the hour. The effective PHF in SimTraffic is about 0.98.

Heavy truck classification counts and pedestrian and bike volumes were obtained from the data sources described above. For intersections where the existing data was absent, a 2 percent heavy truck was assumed along with an estimation of pedestrian and bike volumes. Higher pedestrian and bike volumes were assumed where justified by an existing or future developments, such as intersections that are adjacent to a school or the proposed town center of the project. The SimTraffic models were validated against known operating conditions in the area. Results were reported based on the average of ten model runs.

A review of the LOS results from this table reveals that all study intersections currently operate at LOS D or better during the AM peak hour with the following two exceptions:

- **El Centro Road/San Juan Road (#16).** This all-way stop controlled intersection operates at LOS F with an average delay of 84 seconds per vehicle. Heavier delays are experienced by motorists traveling southbound or westbound. A portion of this directional AM peak hour demand are trips using El Centro Road to bypass congestion on the parallel segment of southbound I-5.
- **El Centro Road/West El Camino Avenue (#17).** The worst-case LOS F condition is experienced by 85 vehicles turning left from the stop-controlled westbound West El Camino Avenue approach. These vehicles experience considerable delays due to the lack of adequate gaps caused by the more than 1,000 vehicles (who have priority right-of-way) on southbound El Centro Road that either turn left or continue straight.



All intersections operate at LOS D or better during the PM peak hour.

## Bicycle/Pedestrian Facilities

**Figure 10** displays the existing bicycle and pedestrian facilities in the project vicinity. As shown, various facility types such as Class I multi-use bike/pedestrian paths, Class II on-street bicycle lanes, sidewalks, and crosswalks exist. Bicycle and pedestrian facilities are present at all three of primary freeway interchanges that would serve the project (i.e., I-80/West El Camino Avenue, I-5/Del Paso Road, and I-5/Arena Boulevard).

## Transit Facilities and Routes

**Figure 11** displays the existing transit facilities and routes in the project vicinity. Fixed-route bus service is provided within the study area by Sacramento Regional Transit (SacRT) as well as the Natomas Jibe Express As shown, no routes currently operate within the specific plan area. However, bus routes do operate on a number of study roadways including portions of El Centro Road, Del Paso Road, Arena Boulevard, San Juan Road, West El Camino Avenue, and Garden Highway.

## Existing Bicycle & Pedestrian Facilities

*Note: Regional transit routes are not shown on I-80, I-5, and highway 99.*
*Natomas Jibe routes reflect operating conditions as of Fall 2019.*

Figure 11

## Existing Transit Facilities

# 3. EXISTING PLUS PROJECT CONDITIONS

This chapter presents the proposed project's anticipated travel characteristics. It then analyzes the effects of the addition of these trips on the surrounding transportation system.

## Detailed Project Land Use Assumptions

Table 1 displayed the general amount of proposed non-residential development, expressed in terms of total square feet of office or commercial, and school acreage. This chapter refines those land use totals (based on information provided by the project applicant) to reflect the expected mix and quantity of specific non-residential uses.

The Commercial Mixed-Use (CMU) parcels would be developed with 50 percent business professional (i.e., office) and 50 percent consisting of general retail, entertainment, grocery stores, restaurants, institutional/religious, and specialized uses (e.g., vocational schools, medical-office, etc.). These parcels would be integrated mixed-use properties developed at high densities (i.e., 60 percent floor-to-area ratio and 40 dwelling units per acre).

The two E/HC parcels would be developed with 60 percent business professional (i.e., office) and 40 percent consisting of general retail, entertainment, grocery stores, restaurants, institutional/religious, and specialized uses (e.g., vocational schools, medical-office, etc.). These two parcels would develop at a 40 percent floor-to-area ratio.

The project applicant has indicated that the CMU and E/HC parcels would generally provide sufficient on-site parking to meet projected demands. This implies, given the proposed densities, that structured parking will be required, though surface parking may also be provided in some areas.

Approximately 53 percent of residential uses would be multi-family attached, with the remainder being single-family detached. Specific types and quantities of non-residential land use are described later in this chapter.

## Project Trip Generation

The proposed project's trip generation was estimated using the Mixed-Use Trip Generation Model (MXD+), which was originally developed for the US Environmental Protection Agency (EPA) to estimate internal trip-making and external trips made by non-auto travel modes. This model, which was originally developed by consultants and academic researchers based on empirical evidence at 240 mixed-use projects located across

the U.S, has been used in numerous EIRs throughout California. The model considers various built environment variables such as land use density, regional location, proximity to transit, and various design variables when calculating the project's internal trips and external trips made by non-auto modes. In Fall 2019, the model underwent a revalidation that confirmed it is still applicable to current (non-COVID) conditions. Moreover, the model was found to validate well against large mixed-use projects such as the proposed project. Refer to separately bound **Appendix B** for that revalidation report.

## Trip Generation Rates

MXD+ begins by estimating gross trips generated by project land uses based on data included in *Trip Generation Manual, 10th Edition* (Institute of Transportation Engineers, 2017). It then estimates internal trips and external trips made by non-auto modes of travel. **Table 6** presents the unadjusted vehicular trip generation rates for each project land use category. In most instances, the weighted average trip rates were applied due to the lack of fitted curve equations that estimate trips based on land use quantity. At the time the analysis was performed, the 11th Edition of the Trip Generation Manual (September 2021) had not yet been released.

Rates chosen for several specific land uses in **Table 6** warrant further explanation as described below:

- Trip generation for single-family and multi-family residential units was estimated based on weighted average trip rates. Use of fitted curve equation rates would have led to differing (and unreasonable) trip rates for adjacent residential areas based solely on their differing unit counts.
- Trip generation for professional office and shopping center land use categories[3] was estimated based on fitted curve equations based on guidance from the *Trip Generation Handbook* (Institute of Transportation Engineers, 2017). Retail and office land use quantities within the Town Center and Employment/Highway Commercial (E/HC) zone located east of El Centro Road were estimated separately based on the square footages proposed in each parcel.

[3] A variety of retail-type uses were assumed on retail parcels including supermarkets, sit-down restaurants, fast-food restaurants, and health/fitness clubs, in addition to general shopping center uses. This approach, which represents a realistic mix of likely retail uses, results in greater total trips, but also more internalization of traffic and an overall more accurate trip estimate (versus using exclusively the shopping center category).

**Table 6:**
**Unadjusted Trip Generation Rates by Land Use Type**

| Land Use | ITE Code | Unit Type | Daily Trip Rate [1] | AM Peak Hour [1] | | PM Peak Hour [1] | |
|---|---|---|---|---|---|---|---|
| | | | | Trip Rate | %in/ %out | Trip Rate | %in/ %out |
| Single-Family Detached Housing [2] | 210 | du's | 9.44 | 0.74 | 25%/75% | 0.99 | 63%/37% |
| Multi-Family Housing Mid-Rise [3,4] | 221 | du's | 5.44 | 0.36 | 26%/74% | 0.99 | 61%/39% |
| Professional Office [3,5] | 710 | ksf | 9.74 – 10.25 | 0.99 – 1.16 | 86%/14% | 1.05 – 1.15 | 16%/84% |
| Medical Office [2] | 720 | ksf | 36.32 | 2.45 | 78%/22% | 3.44 | 28%/72% |
| Hotel [2] | 310 | rooms | 8.36 | 0.47 | 59%/41% | 0.60 | 51%/49% |
| Business Hotel [2] | 312 | rooms | 4.02 | 0.39 | 42%/58% | 0.32 | 55%/45% |
| Government Office [2] | 730 | ksf | 22.59 | 3.33 | 75%/25% | 1.72 | 26%/74% |
| Shopping Center [3] | 820 | ksf | 50.64 – 66.26 | 1.39 – 2.56 | 62%/38% | 4.73 – 5.88 | 48%/52% |
| Health/Fitness Club [2] | 492 | ksf | 26.67 | 1.33 | 50%/50% | 3.47 | 58%/42% |
| Supermarket [3] | 850 | ksf | 95.14 – 106.8 | 3.80 – 3.82 | 60%/40% | 9.27 – 9.32 | 51%/49% |
| High-Turnover (Sit-Down) Restaurant [2] | 932 | ksf | 112.18 | 9.94 | 55%/45% | 9.77 | 62%/38% |
| Fast-Food Restaurant with Drive-Through Window [2] | 934 | ksf | 471.00 | 40.22 | 51%/49% | 32.67 | 52%/48% |
| Recreational Community Center [2,3] | 495 | ksf | 28.80 – 28.83 | 1.77 – 3.85 | 66%/34% | 2.31 – 3.60 | 47%/53% |
| Middle School/Junior High School [2] | 522 | students | 2.13 | 0.58 | 54%/46% | 0.17 | 49%/51% |
| High School [2] | 530 | students | 2.03 | 0.52 | 67%/33% | 0.14 | 48%/52% |
| Vocational School | 540 | ksf | 20.25 | 2.07 | 77%/23% | 1.86 | 50%/50% |
| Junior/Community College | 540 | students | 1.15 | 0.11 | 81%/19% | 0.11 | 56%/44% |

Note:
1. All rates derived from the *Trip Generation Manual, 10th Edition* (Institute of Transportation Engineers, 2017).
2. Weighted average trip rate applied.
3. Fitted curve equation applied.
4. Multi-Family Mid-Rise category chosen given densities proposed (i.e., buildings will range between 3 and 10 floors, which meets the definition of this use type).
5. Range of trip rates shown because varying sized facilities are proposed in different areas of the plan and fitted curve equations yield different trip rates by size.

ksf = thousand square feet. du's = dwelling units.

Source: Fehr & Peers, 2021.

## Project Trip Generation

**Table 7** presents the project's expected trip generation (prior to any consideration of existing land uses whose trips would be eliminated with the project). As shown, the proportion of project trips that would remain internal to the site would vary between 23 and 35 percent depending on the time period. Internalization is greatest during the AM peak hour due to the effect of matched trips between residences and schools. Refer to separately bound **Appendix B** for detailed calculations.

**Table 7:**
**Proposed Project Trip Generation**

| Land Use | Quantity [1] | Trips | | |
|---|---|---|---|---|
| | | Daily | AM Peak Hour | PM Peak Hour |
| Single-Family Detached Housing | 4,367 du's | 41,224 | 3,232 | 4,323 |
| Multi-Family Housing Mid-Rise | 4,989 du's | 27,140 | 1,796 | 2,195 |
| Professional Office | 1,573 ksf | 15,669 | 1,689 | 1,730 |
| Medical Office | 41.6 ksf | 1,511 | 102 | 143 |

| Government Office | 74 ksf | 1,681 | 248 | 128 |
| Shopping Center | 245 ksf | 13,549 | 426 | 1,242 |
| Health/Fitness Club | 65 ksf | 1,730 | 86 | 225 |
| Supermarket | 65 ksf | 6,359 | 248 | 605 |
| High-Turnover (Sit-Down) Restaurant | 104 ksf | 11,644 | 1,032 | 1,014 |
| Fast-Food Restaurant with Drive-Through | 24 ksf | 11,303 | 965 | 784 |
| Recreational Community Center | 72 ksf | 2,075 | 169 | 192 |
| Middle School/Junior High School | 3,000 students | 6,390 | 1,740 | 510 |
| High School | 1,500 students | 3,045 | 780 | 210 |
| Vocational School & Junior College | 208 ksf & 2,500 students | 7,087 | 706 | 662 |
| | **Gross Project Trips** | **155,483** | **13,572** | **14,340** |
| | *Trip Adjustments* | | | |
| | Internal Trips [2] | -34,890 | -4,724 | -3,664 |
| | External Transit Trips [3] | -3,576 | -271 | -315 |
| | Walk/Bike Trips [4] | -622 | -81 | -72 |

**Table 7:**
**Proposed Project Trip Generation**

| Land Use | Quantity [1] | Trips | | |
|---|---|---|---|---|
| | | Daily | AM Peak Hour | PM Peak Hour |
| **Net External Vehicular Project Trips** | | **116,395** | **8,495** | **10,289** |
| Pass-by Trips [5] | | -6,614 | -366 | -1,048 |
| Diverted Link Trips [6] | | -4,372 | -221 | -726 |
| **Net New External Vehicular Trips** | | **105,409** | **7,908** | **8,515** |
| **Net New External and Diverted Link Vehicular Trips** | | **109,781** | **8,129** | **9,241** |

Note:
1. Does not account for eliminated trips due to removal of existing uses. See following tables.
2. Internal trips estimated to be 22.5 percent on a daily basis, 34.9 percent during the AM peak hour, and 25.6 percent during the PM peak hour.
3. Estimated proportion of total external trips made by transit ranges from 2.0 to 2.3 percent depending on time period.
4. Estimated proportion of total external trips made by walking or biking ranges from 0.4 to 0.6 percent depending on time period.
5. Pass-by trips are made to retail uses from the adjacent street. Pass-by percentages are based on the *Trip Generation Handbook* (Institute of Transportation Engineers, 2017).
6. Diverted link trips come from I-80 or I-5. Percentages are from the *Trip Generation Handbook* (Institute of Transportation Engineers, 2017).

ksf = thousand square feet. du's = dwelling units.
Source: Fehr & Peers, 2021.

The analysis presumes that at project buildout, the site would be served with fixed-route transit (with overall service levels complying with County Policy LU-120). Based on this level of transit service, **Table 7** shows the use of transit for travel to external destinations at two percent. It should be noted that a modest amount of transit use is already built into the default ITE trip generation rates that form the starting point for the project trip generation estimate. Thus, this transit estimate represents an increased level of transit use beyond the "base" level which is typically associated with suburban settings, free parking, and modest levels of bus service.

A more geographically focused evaluation determined that the Town Center, Employment/Highway Commercial Zone, and adjacent high-density residential would have a combined four percent transit mode split. This is reasonable given that transit use is typically greater for employees versus residents, and in mixed-use urban areas versus suburban settings.

According to this table, use of walking or biking for travel to external destinations is estimated at 0.5 percent for the proposed project. Again, this represents a modest increase above the default ITE estimates. The

project would provide a direct linkage to the multi-use path east of the project site (near Witter Canal) that connects to the bike/pedestrian bridge over I-80. From that bridge, several destinations in South Natomas can be reached within a 10 to 15 minute bike ride. Downtown Sacramento can be reached by bike in about 20 to 30 minutes depending on travel speed. However, walk/bike destinations within a one-mile radius from the edge of the project site are generally limited, which helps explain the low walk/bike mode split.

Overall, the complementary nature of land uses within the project site, combined with the availability of transit and walking/biking to external destinations, would result in a combined 25 percent reduction in gross daily vehicle trips. During the AM and PM peak hours, this reduction would increase to 37 percent and 28 percent, respectively.

When retail trips that are pass-by or diverted-link are also considered, the overall reduction percentages climb to 32 percent on a daily basis, 42 percent during the AM peak hour, and 41 percent during the PM peak hour. After these adjustments are made, the project would generate approximately 105,400 new daily vehicle trips, 7,900 new AM peak hour vehicle trips, and 8,500 new PM peak hour vehicle trips.

The above trip totals do not consider potential changes in travel associated with the current COVID-19 pandemic or the next phase "COVID Endemic" condition. In all likelihood, reductions in travel will occur for certain land uses, such as offices, though specific details and estimates of those changes are not known at this time. This analysis is therefore reasonably conservative because it did not consider those changes.

## Trip Generation of Existing Land Uses to be Removed

The trip generation estimates in Table 7 do not consider the removal of existing trip generating land uses on the project site. Those trips are shown in **Table 8.** As shown, elimination of these existing land uses would remove approximately 4,550 new daily vehicle trips, 375 new AM peak hour vehicle trips, and 315 new PM peak hour vehicle trips (after considering reductions for pass-by and diverted-link trips to the retail uses).

**Table 8: Existing Trip Generating Land Uses to be Removed**

| Land Use | Quantity [1] | Trips | | |
|---|---|---|---|---|
| | | Daily | AM Peak Hour | PM Peak Hour |
| Single-Family Detached Housing | 20 du's | 189 | 15 | 20 |
| Professional Office | 40 ksf | 390 | 46 | 46 |
| Self-Storage Facility | 70 ksf | 98 | 6 | 7 |
| Business Hotel (2) | 145 rooms | 583 | 57 | 46 |
| High-Turnover (Sit-Down) Restaurant | 9 ksf | 965 | 85 | 84 |
| Fast-Food Restaurant with Drive-Through | 3 ksf | 1,507 | 129 | 105 |
| Gas station with Convenience Market | 12 fueling positions | 2,464 | 150 | 168 |
| Light Industrial | 45 ksf | 223 | 31 | 29 |
| Golf Driving Range | 12 tee positions | 164 | 5 | 15 |
| Truck Stop [1] | Fueling area, conv. market | 3,373 | 172 | 213 |
| **Net External Vehicular Project Trips** | | **9,956** | **696** | **733** |
| Pass-by Trips [2] | | 1,773 | 118 | 156 |
| Diverted Link Trips [3] | | 3,615 | 203 | 261 |
| **Net New External Vehicular Trips** | | **4,568** | **375** | **316** |
| **Net New External and Diverted Link Vehicular Trips** | | **8,183** | **578** | **577** |

Note:

1. Trip rates estimated based on data from *Trip Generation Manual* (Institute of Transportation Engineers, 2017), with exception of 49er Truck Stop located at corner of West El Camino Avenue/El Centro Road whose AM and PM peak hour vehicle trips were measured in early December 2020. Daily trips for that use was estimated by factoring up peak hour trip rates for the Gas Station with Convenience Market land use category from Trip Generation Manual.
2. Pass-by trip percentages are based on the *Trip Generation Handbook* (Institute of Transportation Engineers, 2017).
3. Diverted link trips come from I-80 or I-5. Percentages are from the *Trip Generation Handbook* (Institute of Transportation Engineers, 2017).

ksf = thousand square feet. du's = dwelling units.

## Net Increase in Vehicle Trips Generated by the Proposed Project

**Table 9** shows the net increase in vehicle trips generated by the proposed project (over the existing uses to be removed) during all three study time periods. The bottom of the table includes several summary trip statistics that warrant further explanation as provided below:

1. Net External Vehicular Project Trips – accounts for internal trips between complementary on-site land uses (e.g., residential and retail), and external trips made by walking, biking and transit to estimate external vehicle trips.

2. Net New External Vehicular Trips – further refines external vehicle trip estimate by removing vehicle trips that are "pass-by"[4] from the adjacent street and "diverted-link"[5] from I-80 or I-5. **This is the number of new project vehicle trips that would be assigned to study intersections/roadways throughout the study area.**

3. Net New External and Diverted Link Vehicular Trips – adds diverted link trips to the above estimate. **This is the number of vehicle trips the project would add to its gateway streets.**

This table indicates that the proposed project would result in a net increase in approximately 100,800 new daily vehicle trips, with 7,530 occurring during the AM peak hour and 8,200 occurring during the PM peak hour. During both peak hours, a fairly equal distribution of inbound versus outbound traffic is expected (i.e., 50 percent inbound/50 percent outbound during the AM peak hour, and 52 percent inbound/48 percent outbound during the PM peak hour).

[4] A "pass-by" trip to a retail use is made by a motorist already on the adjacent street while en route to a different primary destination. Pass-by trips do not add traffic to the adjacent street, but contribute trips to the driveway(s) serving the retail center. Checks were performed to ensure that primary adjacent roadways (i.e., El Centro Road and West El Camino Avenue) would have sufficient volumes of traffic under "plus project" conditions, from which pass-by trips could be taken.

[5] A "diverted-link" trip (in this context) is made by a motorist traveling on a nearby freeway who chooses to exit the freeway to access a retail use. Diverted-link trips are added both to the freeway on/off ramps, surface streets, and driveway(s) serving the retail center.

**Table 9:**
**Net Increase in Vehicle Trips Generated by Proposed Project**

| Scenario | Vehicle Trips | | | | | | |
|---|---|---|---|---|---|---|---|
| | Daily | AM Peak Hour | | | PM Peak Hour | | |
| | | Inbound | Outbound | Total | Inbound | Outbound | Total |
| *Net New External Vehicular Trips* | | | | | | | |
| Proposed Project | 105,409 | 3,953 | 3,955 | 7,908 | 4,410 | 4,107 | 8,515 |
| Existing Uses To be Removed | 4,568 | -214 | -161 | -375 | -137 | -179 | -316 |
| **Difference** | **100,841** | **3,740** | **3,794** | **7,534** | **4,273** | **3,929** | **8,199** |
| *Net New External and Diverted Link Vehicular Trips* | | | | | | | |
| Proposed Project | 109,781 | 4,076 | 4,053 | 8,129 | 4,796 | 4,448 | 9,241 |
| Existing Uses To be Removed | -8,183 | -318 | -260 | -578 | -272 | -305 | -577 |
| **Difference** | **101,598** | **3,758** | **3,793** | **7,551** | **4,524** | **4,143** | **8,664** |

Note:
1. Refer to Table 7 for proposed project trips and Table 8 for existing uses trips.
2. Some volumes may not sum perfectly due to rounding.

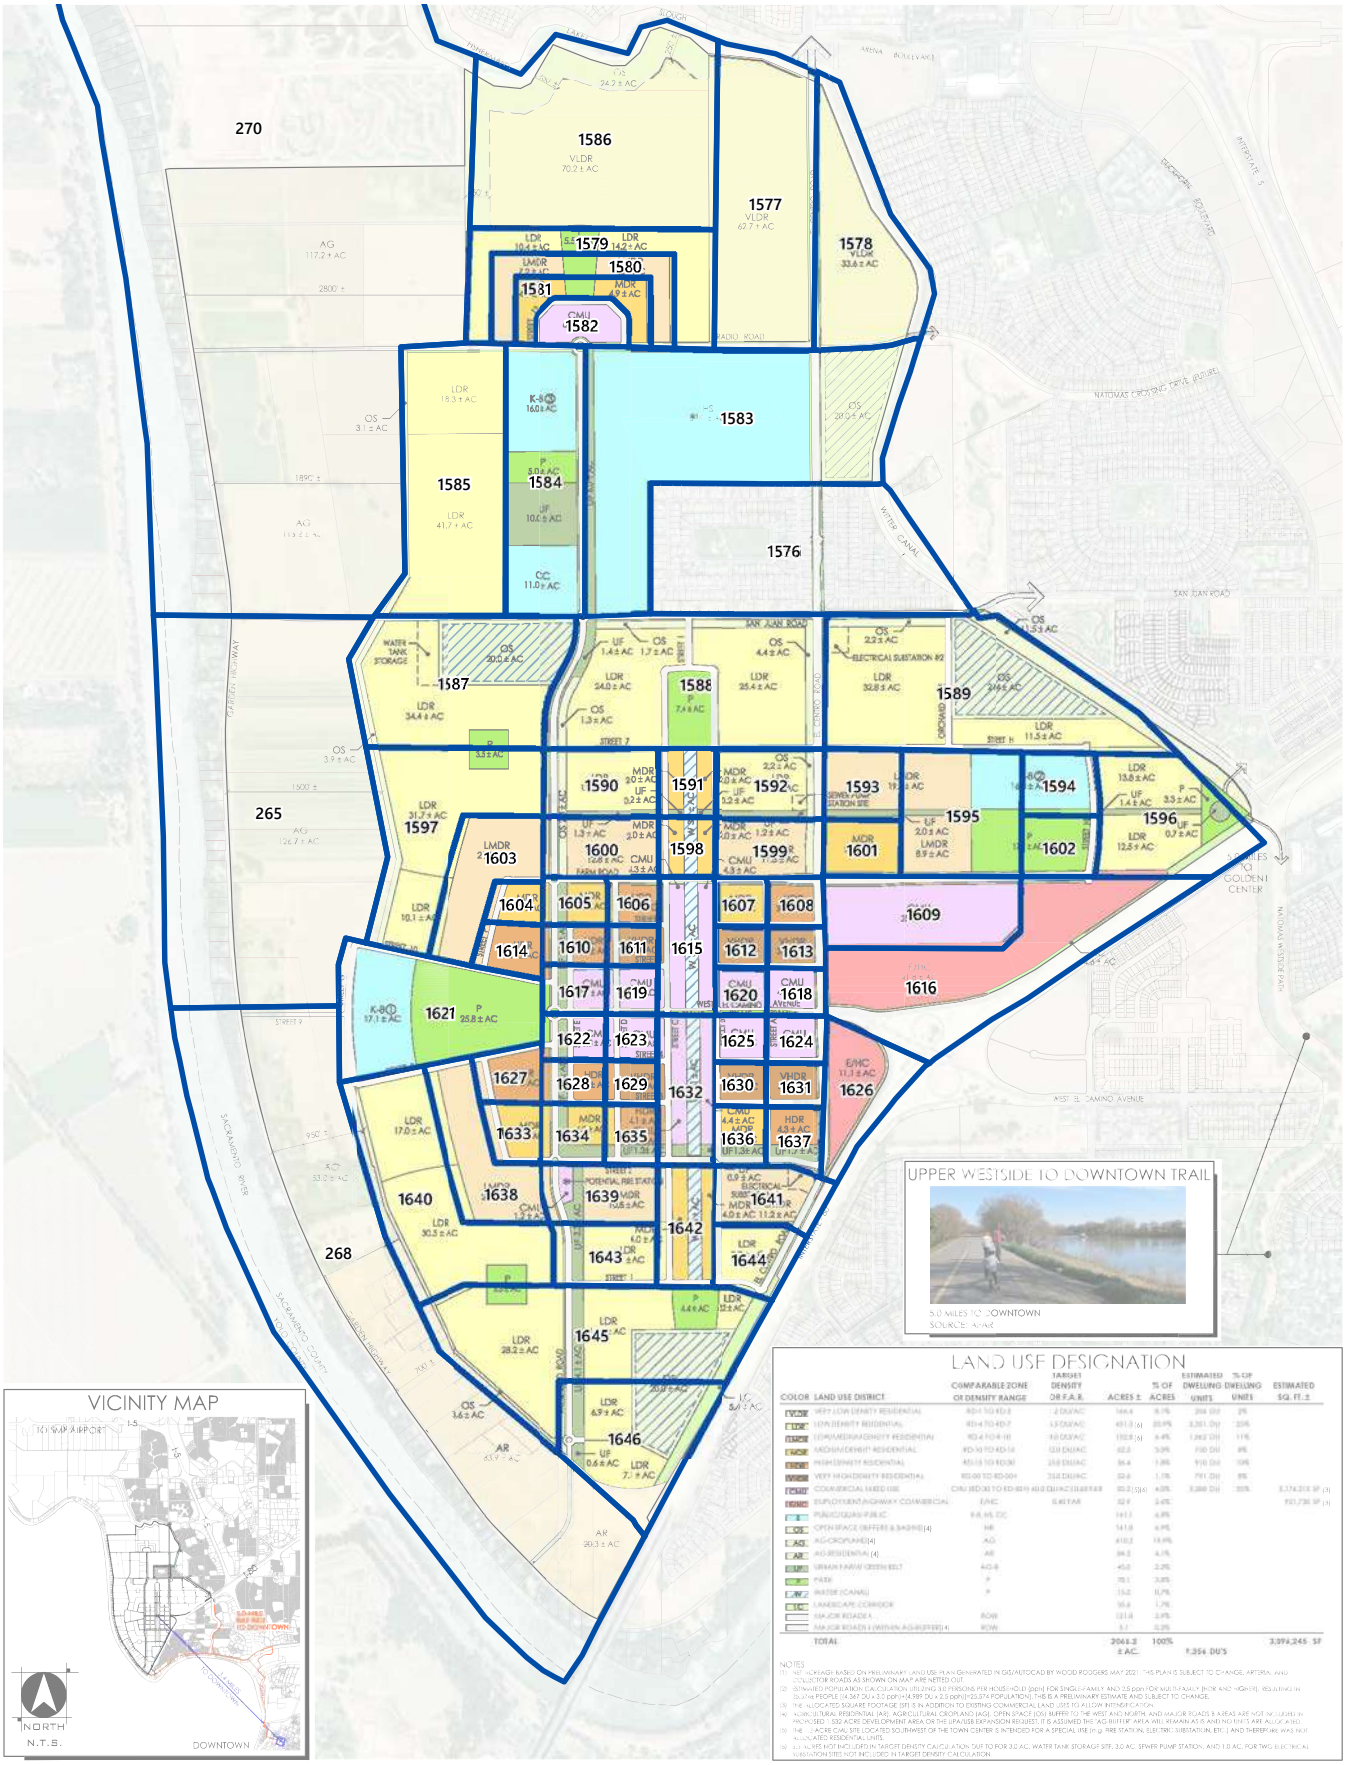
# Travel Demand Forecasts



The four steps below were followed to develop traffic forecasts for the four scenarios analyzed in this study.

*Step 1 – Development of Traffic Analysis Zone (TAZ) Structure for Proposed Project*

The project was disaggregated into 70 distinct TAZs within the base year version of the SACSIM19 activity-based travel demand model. Each TAZ included the number of persons and employees within that particular zone based on the project's site plan. **Figure 12** shows the project's TAZ map.

*Step 2 – Addition of Project Roadways*

The project's roadway network (including planned street widenings) was added to the model. This included TAZ centroid connectors that load trips onto public streets from TAZs. The TAZ centroid connectors also included turning penalties where certain movements would be prohibited. Notably, through interim analyses, it was determined that the CMU and E/HC parcels located north of West El Camino Avenue and east of El Centro Road would be limited to one or two driveways on El Centro Road that are restricted to right-turns only.

N:\2020 Projects\3945.00_Upper_Westside_Specific_Plan_EIR\Graphics\AI\LTA_Figure\Fig12_TAZ_Map.ai

Figure 12

# TAZ Map

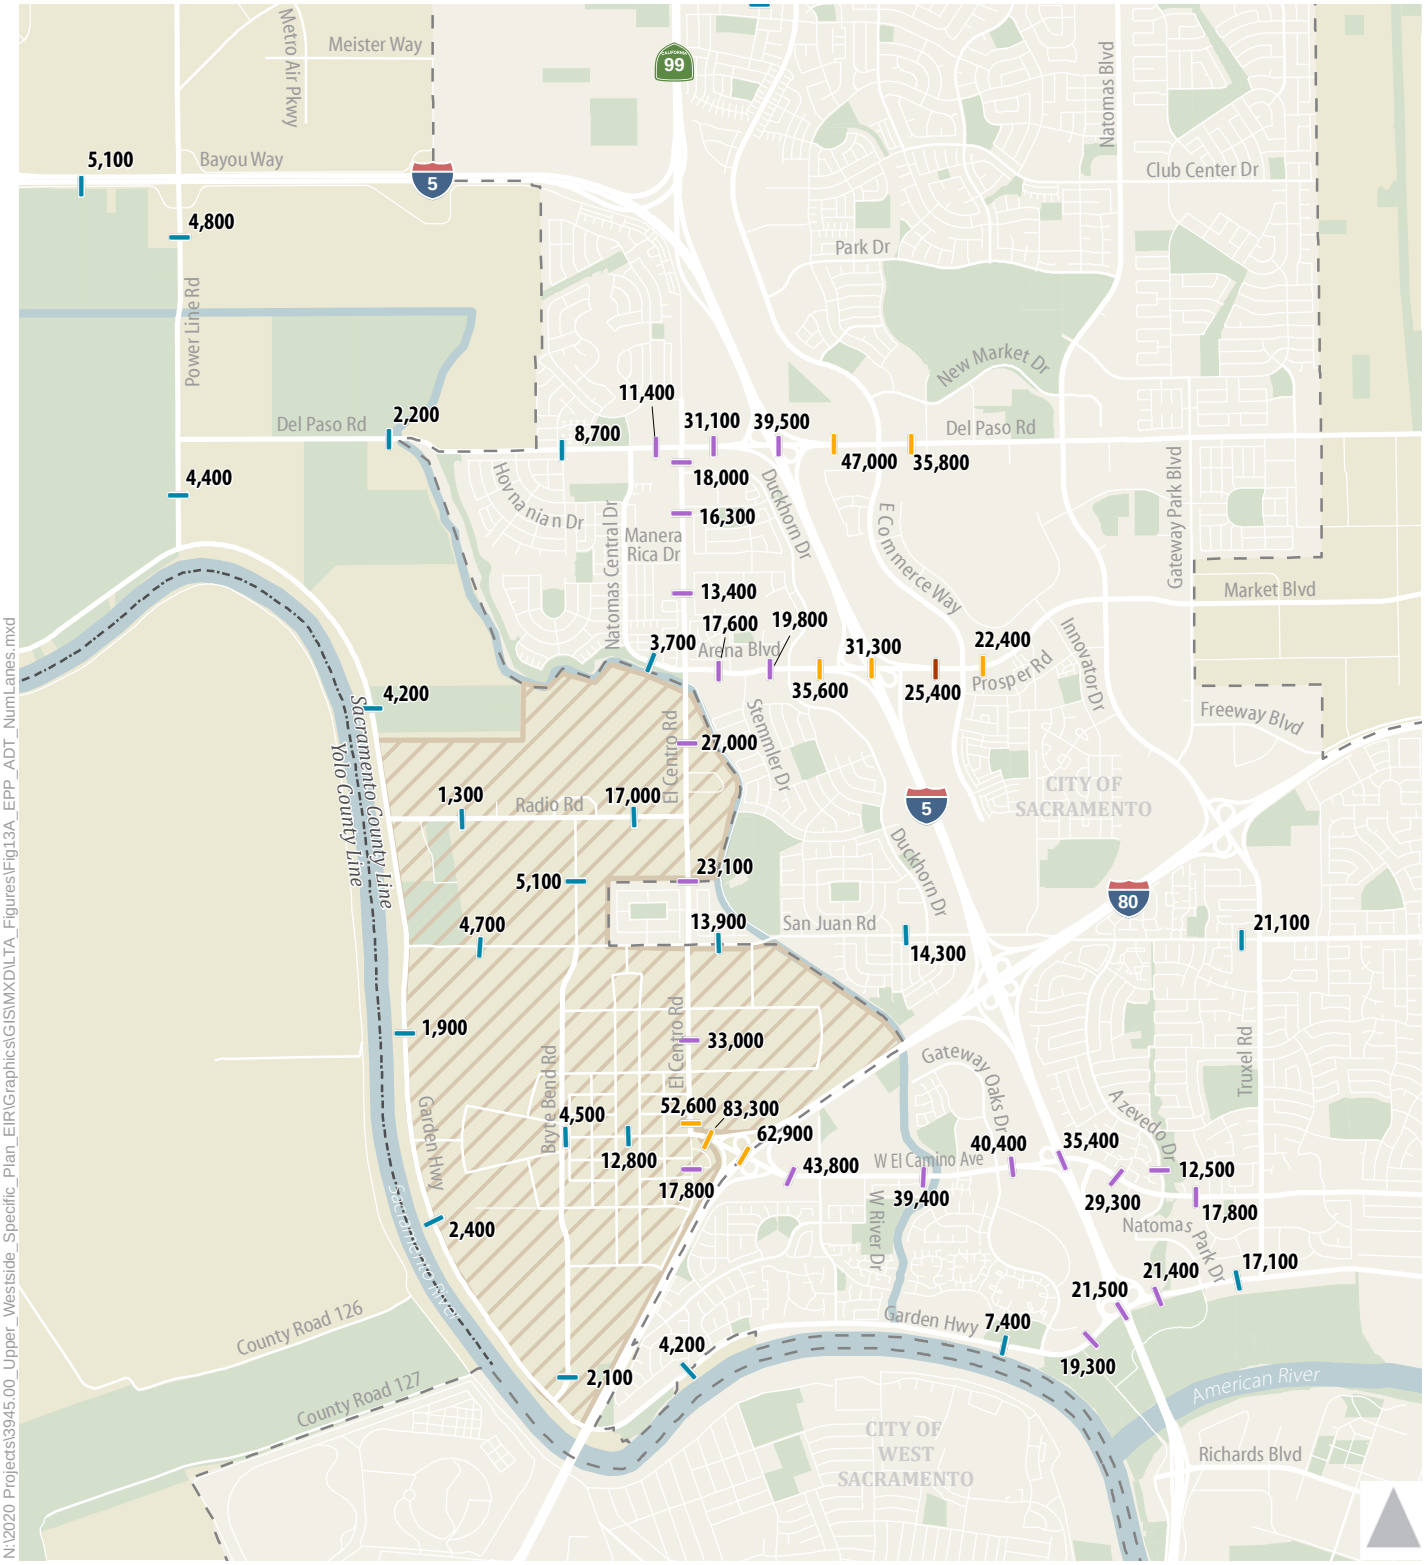
*Step 3 – Review of Trip Table Outputs*

The trip table outputs from the model for the project's TAZs were reviewed to determine if any adjustments were necessary to better match the expected number of external project vehicle trips shown in Table 9.

*Step 4 – Traffic Forecasting*

A traffic forecasting adjustment procedure known as the "difference method" was utilized to develop existing plus project traffic forecasts. This method corrects any potential anomalies within the model and assures a more accurate forecast. This forecasting procedure is calculated as follows:

*Existing Plus Project Forecast = Existing Traffic Count +*
*(Base Year Plus Project Model Forecast – Base Year No Project Model Forecast)*



In instances where the roadway currently does not exist, like on-site roadway facilities, the direct model forecast is used.

It should be noted that the project not only includes new trip generating land uses, but also introduces new street connections that would cause a redistribution of background traffic. Additionally, the project would alter trip-making behaviors of existing land uses by virtue of introducing new regional retail, employment, etc. Therefore, when comparing existing and existing plus project forecasts, it is expected that certain turning movements, for instance those not in the direction of the project, could either increase or decrease as a result of changes in background travel behavior (i.e., a non-project resident changing a commute pattern or preference for shopping).

**Figure 13A** shows the ADT on existing study roadways under existing plus project conditions. **Figure 13B** shows the ADT on the roadways within the Specific Plan area.

**Figures 14A – 14F** show the existing plus project weekday AM and PM peak hour forecasts at the existing and new project study intersections. These figures indicate that the project would create 65 new internal study intersections[6]. Lane configurations and traffic controls at each of those locations were developed based on proposed typical street-sections, peak hour traffic volumes, professional engineering judgment (including coordination with Sacramento County DOT), and preliminary traffic operations analysis results.

[6] Project roadway modification removed extension of El Centro Road southwesterly from Street 1 to Bryte Bend Road. Hence, two project intersections were removed from the analysis, leaving 65 new project study intersections.

# Peak Hour Traffic Volumes and Lane Configurations - Existing Plus Project Conditions

The values shown in **Table 10** represent the project's effect on travel on each of the external project gateways. The totals are comprised of both new trips generated by the project that use a given roadway and also trips currently being made through the project area that reroute as a consequence of the project construction. Each existing rerouted trip subtracts two trip ends (i.e., the trip entering the project site area and the trip exiting the project site area) from the gateway total.

**Table 10: Change in Daily Traffic at Project Gateways – Existing Plus Project Conditions**

| Segment | Existing ADT [1] | Existing Plus Project ADT [1] | Increase (% of Total) |
|---|---|---|---|
| West El Camino Avenue west of I-80 | 14,200 | 83,300 | 69,100 (69%) |
| San Juan Road west of Duckhorn Drive | 6,600 | 14,300 | 7,700 (8%) |
| El Centro Road south of Arena Boulevard | 7,900 | 27,000 | 19,100 (19%) |
| Garden Highway north of Radio Road | 2,300 | 4,200 | 1,900 (2%) |
| Garden Highway under I-80 | 1,900 | 4,200 | 2,300 (2%) |
| Total | 32,900 | 133,000 | 100,100 (100%) |

Notes:
1. Based on Figures 8 and 13A.
ADT = Average Daily Traffic volume; ADT values are rounded to the nearest 100 vehicles.
Source: Fehr & Peers, 2021

The model's estimate of a net increase in 100,100 daily trips is only slightly lower than the predicted 100,840 net increase in daily trips generated by the project (see Table 9). This implies that the analysis was somewhat conservative because there would almost certainly be more than just 370 daily vehicle trips (i.e., half of 100,840 minus 100,100 daily trips) that would reroute the area due to increased travel time (e.g., along El Centro Road) caused by the project.

Table 10 indicates that 69 percent of the net increase in daily trips would use the I-80/West El Camino Avenue interchange. This large percentage makes sense given that 73 percent of the project's total vehicle trips are generated by uses located south of Farm Road. Hence, the interchange's close proximity to those uses, combined with its assumed capacity increase, results in the large predicted percentage increase. Parallel routes such as Garden Highway or San Juan Road are more circuitous and/or do not provide access to the same level of complementary land uses, though the project would still add trips to them.

A trip distribution figure (with fixed percentages for each segment) was not provided because the project would add new roadways and alter background travel behavior. These effects are not well represented by a fixed set of trip distribution percentages. The data in Table 10 provides a better sense of how the project would affect travel on various corridors serving the site.

## Roadway Segment Operations

**Table 11** displays the v/c ratio and LOS for the Sacramento County study roadway segments under existing plus project conditions. This table includes both existing study roadways and numerous new County roadways that would be constructed with the project. Because project construction would transform the project site area into an urbanized environment, the County's urban service boundary standard of LOS E was applied for all new roadways constructed by the project or existing roadways improved by the project. Functional classifications of new/widened roadways were based on the proposed project street cross-sections and discussions with DOT staff.

This table indicates that all Sacramento County roadway segments would operate at an acceptable level with the exception of West El Camino Avenue from El Centro Road to I-80 WB Ramps, which would operate at LOS F despite being widened from two to six lanes.

The vast majority of new streets constructed by the project would operate at LOS A. However, operations would be at LOS D on West El Camino Avenue within the Town Center (i.e., west of El Centro Road). El Centro Road north of West El Camino Avenue, despite being widened to six lanes, would operate at LOS E with a v/c ratio of 0.97 (i.e., close to LOS F).

Notes:
1. LOS D / E = Existing LOS Standard / Existing Plus Project LOS Standard (due to study area becoming urbanized).
2. ADT = average daily traffic volume; ADT values are rounded to the nearest 100 vehicles.
3. V/C = volume-to-capacity ratio

Bolded cells represent unacceptable operations.

Source: Fehr & Peers, 2021.

## Intersection Operations

**Table 12** shows the average delay and LOS at all existing and new project study intersections under existing plus project conditions. At off-site intersections, no changes in signal timings were assumed. Thus, the only change in operating conditions at these locations would be the addition of project trips. Refer to separately bound **Appendix C** for technical calculations.

Table 12 indicates that a number of intersections would experience degradations of one or more service levels. This includes multiple intersections along the West El Camino Avenue, El Centro Road, Garden Highway, and Arena Boulevard corridors. The majority of new project intersections operate acceptably. Refer to Chapter 6 for a complete list of intersections to which the project would cause deficient operations or contribute to already deficient operations.

The following page contains a screenshot image from the SimTraffic model of the West El Camino Avenue and El Centro Road corridors during AM peak hour conditions.

A traffic signal warrant analysis was performed at unsignalized study intersections located in Sacramento County. The list of study locations was further refined (per the Thresholds of Significance) to only include locations whose side-street worst movement would operate at LOS F (if within Urban Service Boundary) or LOS E or F (if outside the Urban Service Boundary). The results are shown in **Table 13** for the seven study intersections that satisfy the above criteria. See separately bound **Appendix C** for technical calculations.

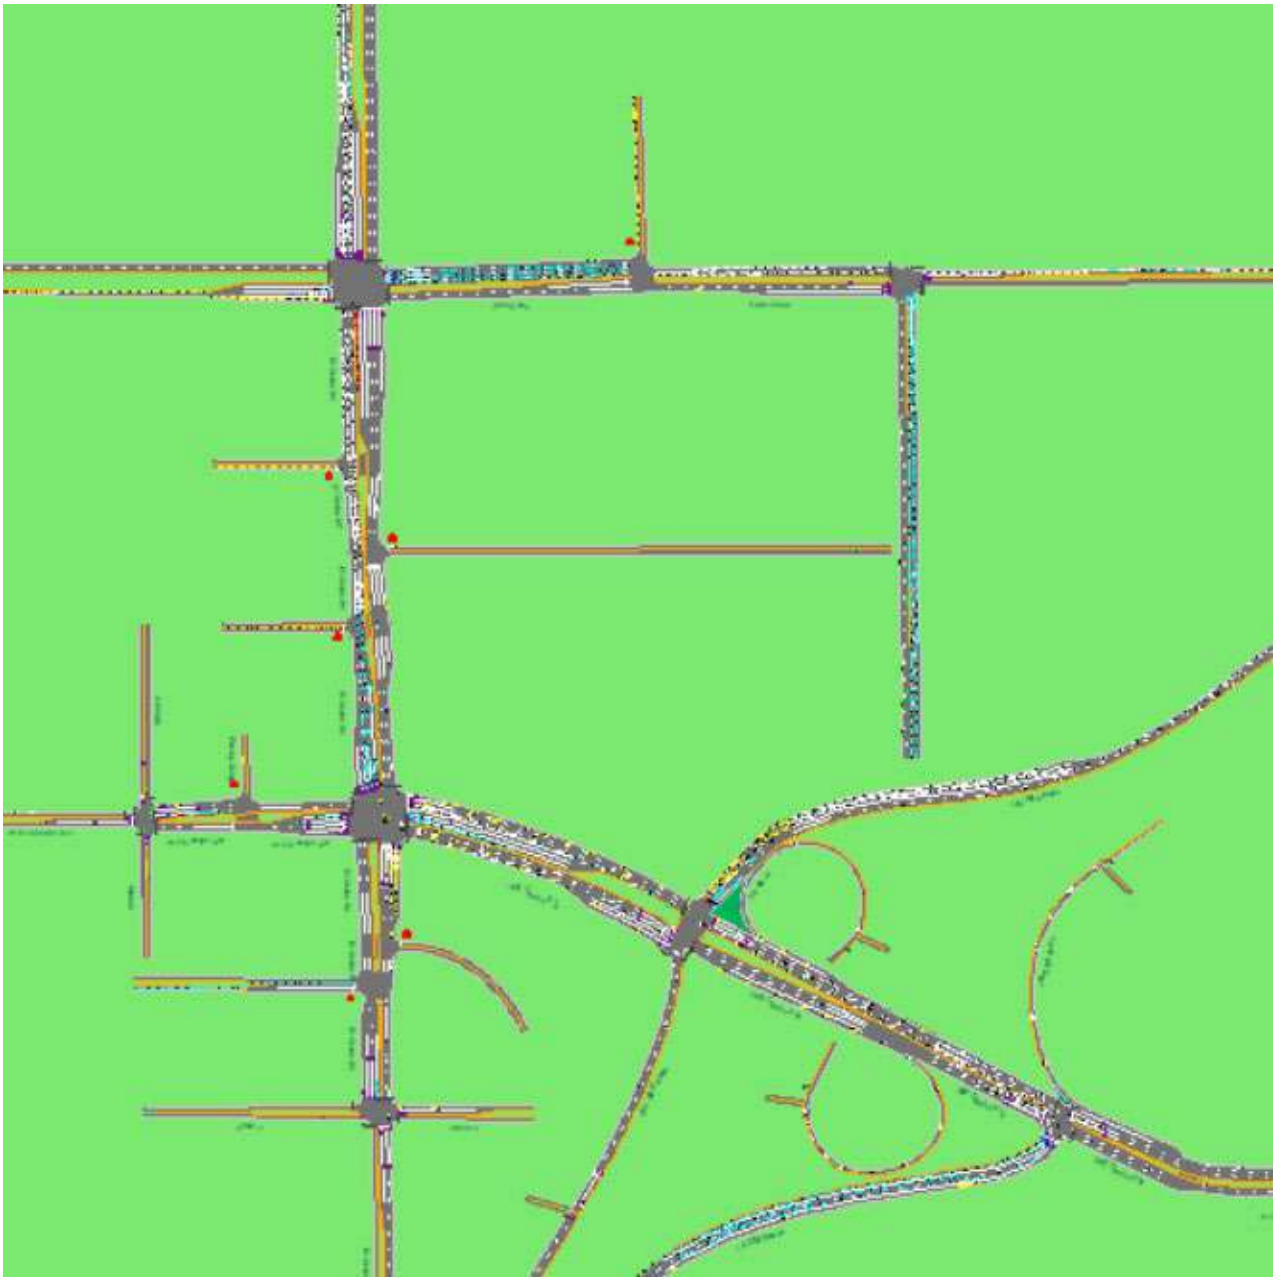

**Image of congested conditions during the AM peak hour based on SimTraffic modeling. Key observations include:**

- **Southbound queue on El Centro Road extends back from West El Camino Avenue to beyond Farm Road.**
- **Westbound queue on West El Camino Avenue spills back from El Centro Road to I-80, causing queue off-ramp spillbacks onto the freeway.**

| 108. Street 9/Bryte Bend Road | SSSC | Sac Co | | | | | 6 (9) | A (A) | 4 (9) | A (A) |

Notes:
1. AWSC = all-way stop controlled intersection; SSSC = side-street stop controlled intersection. RAB = Roundabout.
2. The overall average intersection control delay is reported in seconds per vehicle for signalized and all-way stop controlled intersections and roundabouts. For side-street stop controlled intersections, the average control delay/LOS for the movement with the greatest delay is shown in parentheses, while the average delay/LOS for the entire intersection is shown not in parentheses.
3. Project roadway modification removed extension of El Centro Road southwesterly from Street 1 to Bryte Bend Road. Hence, these intersections no longer exist.

Bolded cells represent unacceptable operations, based on the County's Level of Service policy. Side-street stop controlled intersections exceeding the Level of Service policy are considered acceptable if signal warrants are not met or signals are not considered feasible. See Table 13.

Source: Fehr & Peers, 2021.

**Table 13:**
**Unsignalized Intersection Traffic Signal Warrant Analysis – Existing Plus Project Conditions**

| 89. El Centro Road/Street 4 | SSSC | Sac Co | 18 (124) | C(F) | Met | Met | 5 (35) | A (D) | Not Met | Not Met | No |

Notes:
1. Only a subset of unsignalized study intersections selected for analysis. Refer to prior page for selection criteria, which relates to Sacramento County thresholds of significance for unsignalized intersections.
2. SSSC = side-street stop controlled intersection.
3. For side-street stop controlled intersections, the average control delay for the movement with the greatest delay is shown in parentheses in seconds per vehicle.
4. Warrant 3A is the "Peak Hour Delay" warrant and Warrant 3B is the "Peak Hour Volume" warrant as described in the California MUTCD (2014).
5. Recommendation changes under cumulative plus project conditions (see Table 17).

Source: Fehr & Peers, 2021.

Four of the seven intersections would satisfy either Warrant 3A or 3B during the AM and/or PM peak hours. The El Centro Road/Street 6 (#68), El Centro Road/CMU/EHC Driveway (#69), and El Centro Road/Street 4 (#89) intersections each satisfy the warrant and are situated along the segment of El Centro Road near the Town Center in which a detailed access plan has already been developed. Traffic signals are not considered viable solutions at these three intersections due to their proximity to other signalized intersections. The other remaining intersection that meets the warrant is Powerline Road/Bayou Way South (#1), in which both warrants 3A and 3B are met during the PM peak hour. A traffic signal is recommended at this location.

# 4. CUMULATIVE CONDITIONS

This chapter describes anticipated transportation conditions under cumulative conditions, which corresponds to the Year 2040.

## Travel Demand Forecasts

Cumulative traffic forecasts were developed for the following two scenarios:

- Cumulative No Project Conditions – assumes the project site remains in its current state.
- Cumulative Plus Project Conditions – assumes the full buildout of the proposed project.

The following describes the land use and roadway network assumptions under cumulative conditions.

### Land Use Assumptions

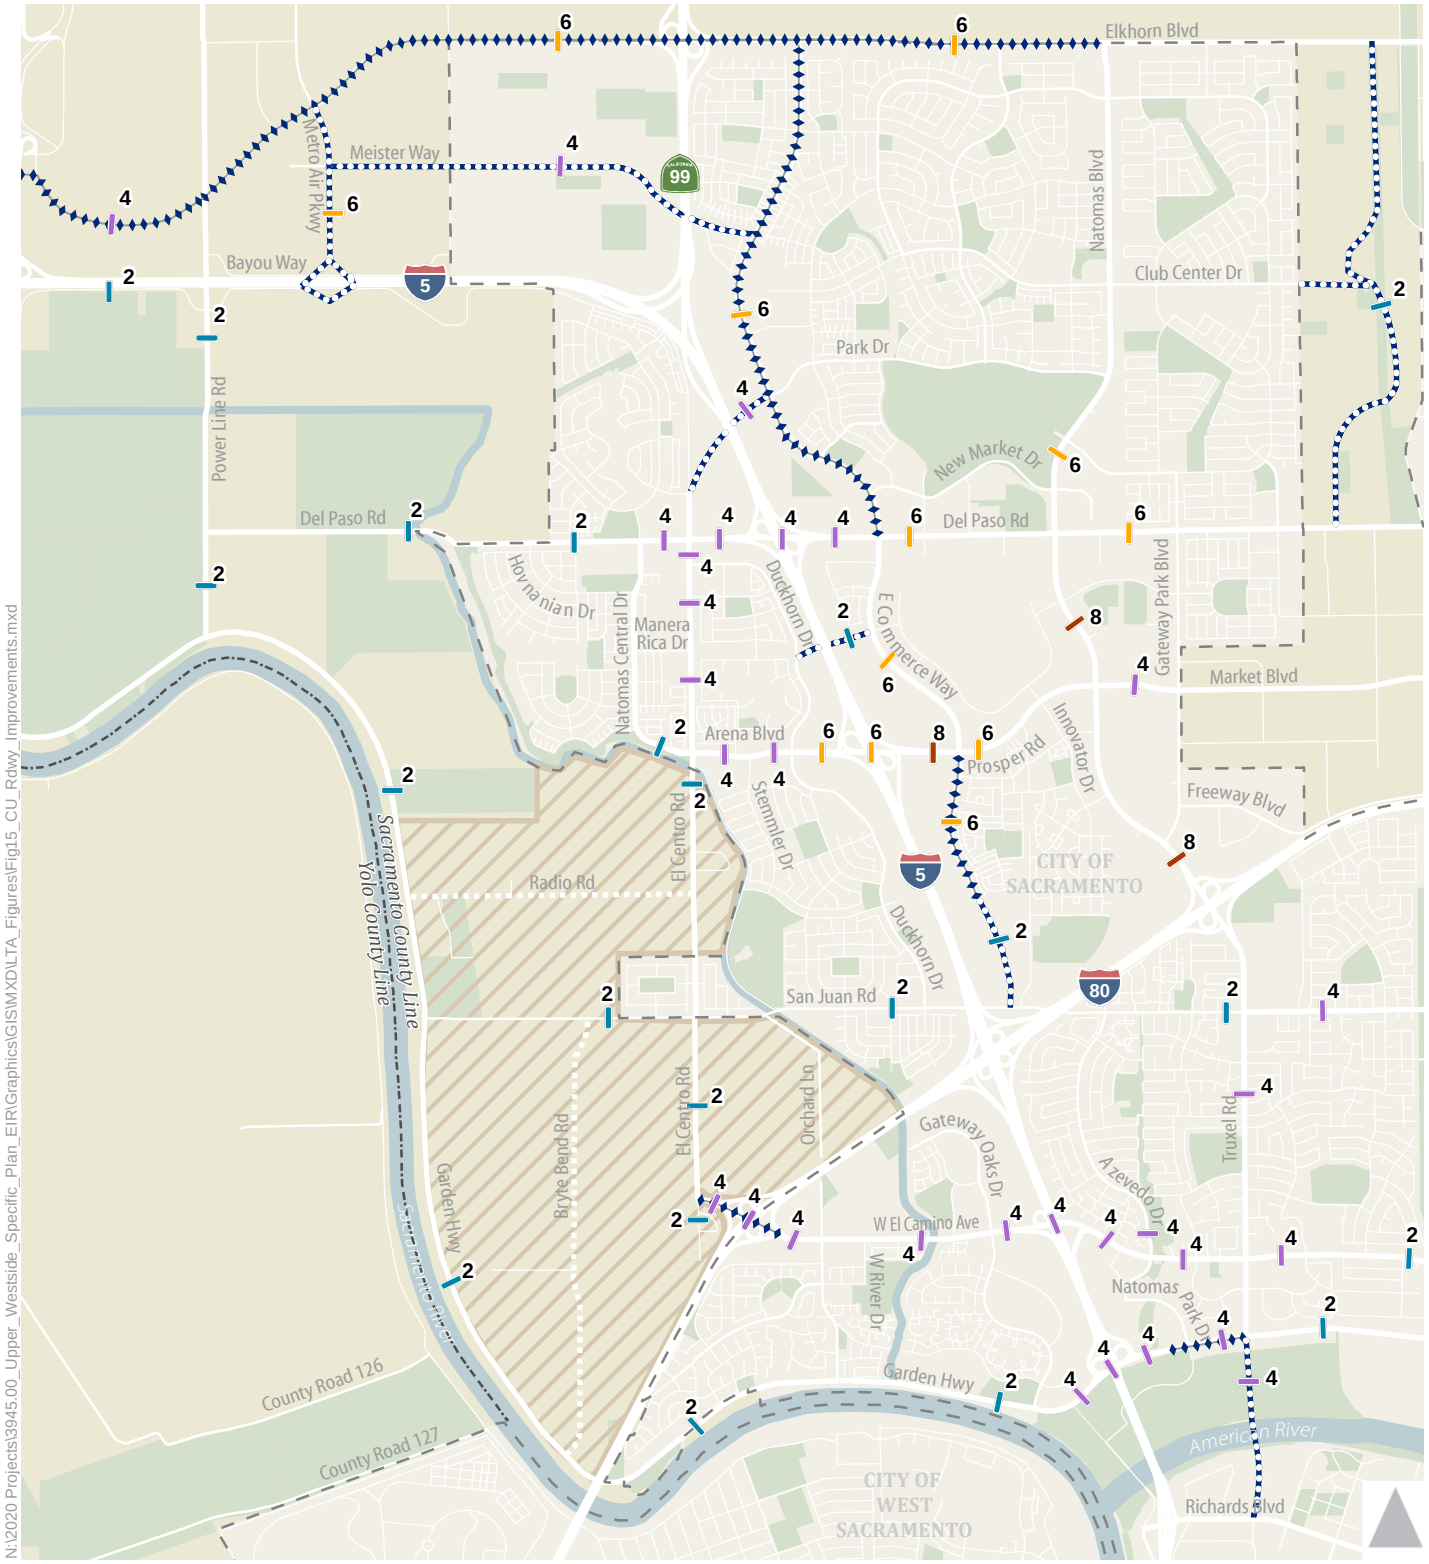
The cumulative version of SACSIM travel demand model already includes partial or full buildout of a number of planned and pending projects within the study area. At the direction of Sacramento County DOT and PER staff, full buildout of each of the projects listed below was assumed:

- Metro Air Park (Sacramento County)
- Grandpark Specific Plan (Sacramento County)
- Downtown Specific Plan (City of Sacramento)
- Northlake (formerly Greenbriar) (City of Sacramento)
- Panhandle (City of Sacramento)
- West Broadway Specific Plan (City of Sacramento)
- Railyards Specific Plan (City of Sacramento)
- River District Specific Plan (City of Sacramento)

In addition to these large specific plans / projects, buildout of the following individual projects located within the City of Sacramento was assumed:

- Natomas Crossing Quad B Office Buildings (Centene Campus), Quad C office/retail, and Quad D Medical along East Commerce Way
- West El Camino Avenue Residential (directly east of I-80)
- Department of General Services (DGS) Office Complex on Richards Boulevard

The model's land use inputs were also reviewed (and modified as necessary) to ensure that it assumes development of the following currently vacant parcels within the City of Sacramento located west of I-5 in the study area:



- Southeast quadrant of Arena Boulevard/El Centro Road – multi-family assumed per existing zoning
- Northeast quadrant of Arena Boulevard/Duckhorn Drive – employment center assumed per existing zoning
- East of Duckhorn Drive between Arena Boulevard and San Juan Road – employment center assumed per existing zoning
- West of El Centro Road between Del Paso Road and Manera Rica Drive – multi-family assumed per existing zoning
- Paso Verde School located north of Del Paso Road opposite Hovnanian Drive

Land use information for these projects was derived from a variety of sources including the City of Sacramento and Sacramento County websites, City of Sacramento General Plan Update land use database, and other land use data identified through internet searches.

At the time that the cumulative traffic forecasts were being developed in Spring 2021, City of Sacramento staff indicated that there was no reasonable land use assumption to make for the reuse of the Sleep Train Arena. However, it is now recognized that planning for that project has continued with the proposed Innovation Park being approved by the City Council in February 2022. However, the EIR process for this project has been underway for a considerable period, with the Notice of Preparation (NOP) of an EIR released in October 2020. The NOP establishes the baseline setting and timeframe for making assumptions for subsequent project analysis. At that time, no land use assumptions were available for Sleep Train Arena.

## Roadway Network Assumptions

**Figure 15** displays the planned cumulative roadway network improvements on surface streets within the study area. This figure shows several extended roadways, widened roadways, and new roadways that are planned for construction by 2040. The cumulative version of the SACSIM model was reviewed and modified as necessary to reflect these improvements.

- Private and/or Gated, Partially Paved/ Unpaved Rural Road
- Public Roadway

Figure 15

# Cumulative Roadway Improvements

The following noteworthy roadway connections within the study area were assumed under cumulative conditions:

1. Northpark Drive overcrossing of I-5 between East Commerce Way and El Centro Road
2. Snowy Egret Drive overcrossing of I-5 between East Commerce Way and Duckhorn Drive
3. I-5/Metro Air Parkway interchange (north access only)
4. Improvements to the I-80/West El Camino Avenue interchange including widening of the interchange and modifications to the ramps.
5. New Truxel Road American River bridge from Garden Highway to Richards Boulevard
6. Extension of East Commerce Way southerly to San Juan Road
7. Meister Way overcrossing of SR 99
8. Extension of Elkhorn Boulevard westerly to Crossfield Drive

The enhanced connectivity associated Improvements 1 and 2, in combination with increased background land development, result in increased travel on El Centro Road. Improvement 3, in combination with assumed development in Metro Air Park, results in increased travel on roadways such as El Centro Road, San Juan Road, Garden Highway, and Powerline Road. Improvement 4 adds one lane in each direction of the West El Camino Avenue overcrossing at I-80, better accommodating expected traffic increases. Improvements 4 through 7 result in substantial changes in traffic volumes in the areas where the improvements are being made.

Per communications with the City of Sacramento, it was agreed that Natomas Crossing Drive would not be assumed (as a background assumed roadway network improvement) to extend westerly from East Commerce Way across I-5 to Duckhorn Drive, and would also not extend from Duckhorn Drive to El Centro Road. The 2020 MTP/SCS also lists a variety of transit improvements throughout the region. This includes the extension of SacRT's Green Line light rail service from Township 9 northerly to North Natomas Town Center. Five bus rapid transit (BRT) line and 20 enhanced bus routes are also planned. However, cumulative levels of transit service in the project vicinity are anticipated to be similar to current levels.

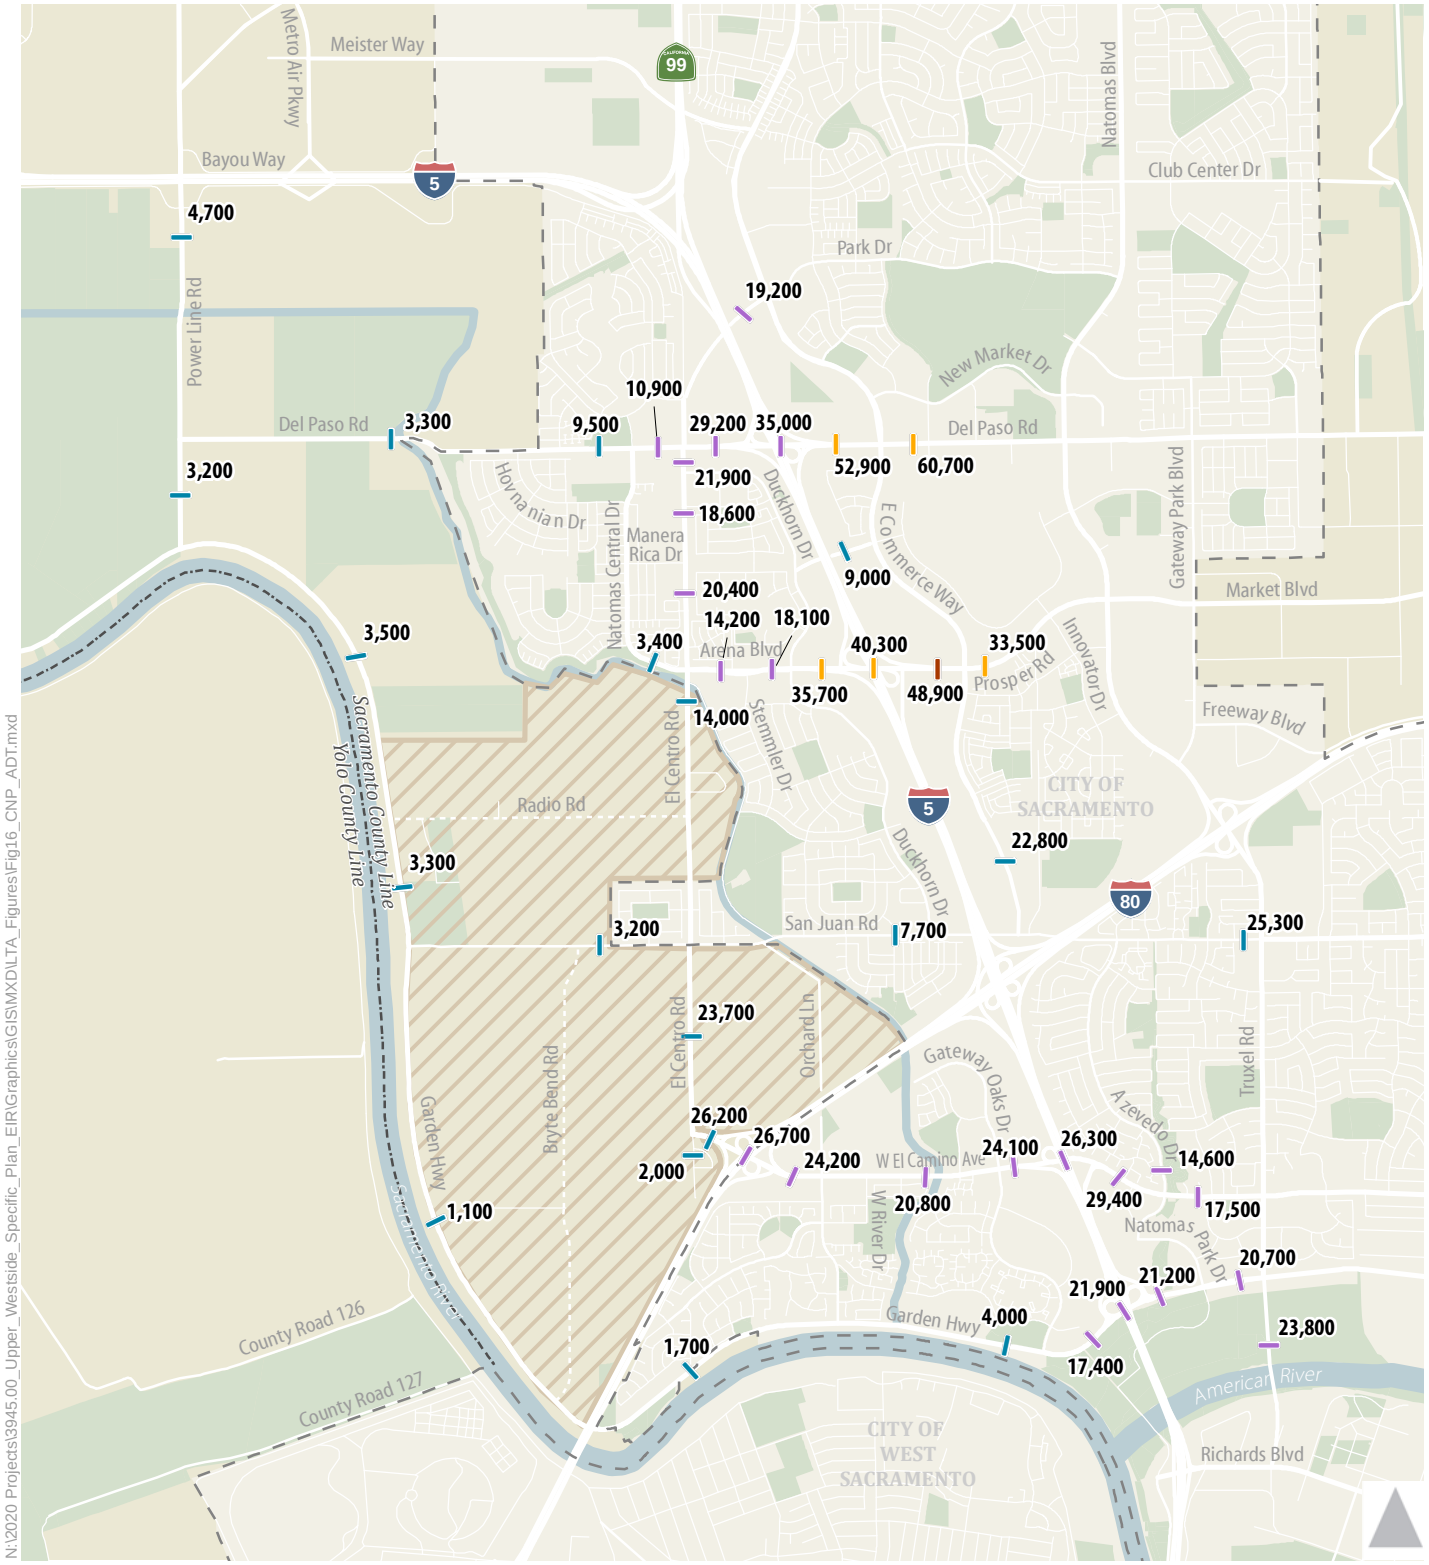
Various improvements were also assumed in the model on portions of I-5 and I-80 within the study area including auxiliary (weaving) lanes on I-5 at Del Paso Road and Arena Boulevard and improvements at the I-5/I-80 interchange including direct connector ramps and ramp metering. These projects are listed in the financially-constrained list of projects included in the 2020 MTP/SCS. It should be noted that the Managed Lanes projects for I-5 and I-80 were not assumed in place under cumulative conditions. This is because studies of the type of managed lane facilities (i.e., express toll lanes, carpool lanes, etc.) are ongoing. It would have been speculative to have assumed a particular configuration.

For cumulative no project conditions, the following forecasting adjustment procedure known as the "difference method" was utilized:

*Cumulative No Project Forecast = Existing Traffic Count +*
*(Cumulative Model Forecast – Base Year Model Forecast)*

In instances where the roadway currently does not exist the direct model forecast is used.

**Figure 16** shows the ADT on study roadways under cumulative no project conditions. **Figures 17A – 17B** show the cumulative no project weekday AM and PM peak hour traffic forecasts at the study intersections. Under cumulative conditions, additional through lanes were added to intersections planned to be widened as shown on Figure 15.



The following key findings are derived from these figures:

- Traffic volumes on the two-lane segment of El Centro Road north of West El Camino Avenue are expected to increase from 13,400 ADT today to 24,600 ADT under cumulative no project conditions. This nearly doubling of traffic is caused by several factors including additional land development west of I-5 and the aforementioned new street connections to El Centro Road (i.e., North Park Drive and Snowy Egret Drive). Traffic increases are also caused by additional through travel demand, likely caused by new land development in Metro Air Park.

- Traffic volumes on the eight-lane segment of Arena Boulevard east of I-5 are expected to increase from 24,300 ADT today to 48,900 ADT under Cumulative No Project conditions. This doubling of traffic growth is caused by substantial levels of new development along East Commerce Way (both north and south of Arena Boulevard) as well as the East Commerce Way connection to San Juan Road.

- Traffic volumes on the six-lane segment of Del Paso Road east of East Commerce Way are expected to increase from 33,400 ADT today to 60,700 ADT under Cumulative No Project conditions. This 82 percent increase is caused by both new development as well as new street connections in the area.

- Traffic growth is moderate (ranging from a 33 to 67 percent increase) on segments such as San Juan Road east of El Centro Road, Powerline Road south of Bayou Way, and Garden Highway south of Powerline Road. The growth on the rural roads is partially attributable to increased development in Metro Air Park and the new I-5/Metro Air Parkway interchange.

Figure 17b

# Peak Hour Traffic Volumes and Lane Configurations - Cumulative No Project Conditions

- Traffic growth is modest (less than 33 percent increase) on segments such as West El Camino Avenue east of I-80, Garden Highway east and west of I-5, and Azevedo Drive south of San Juan Road. This is to be expected as that area is mostly built out.

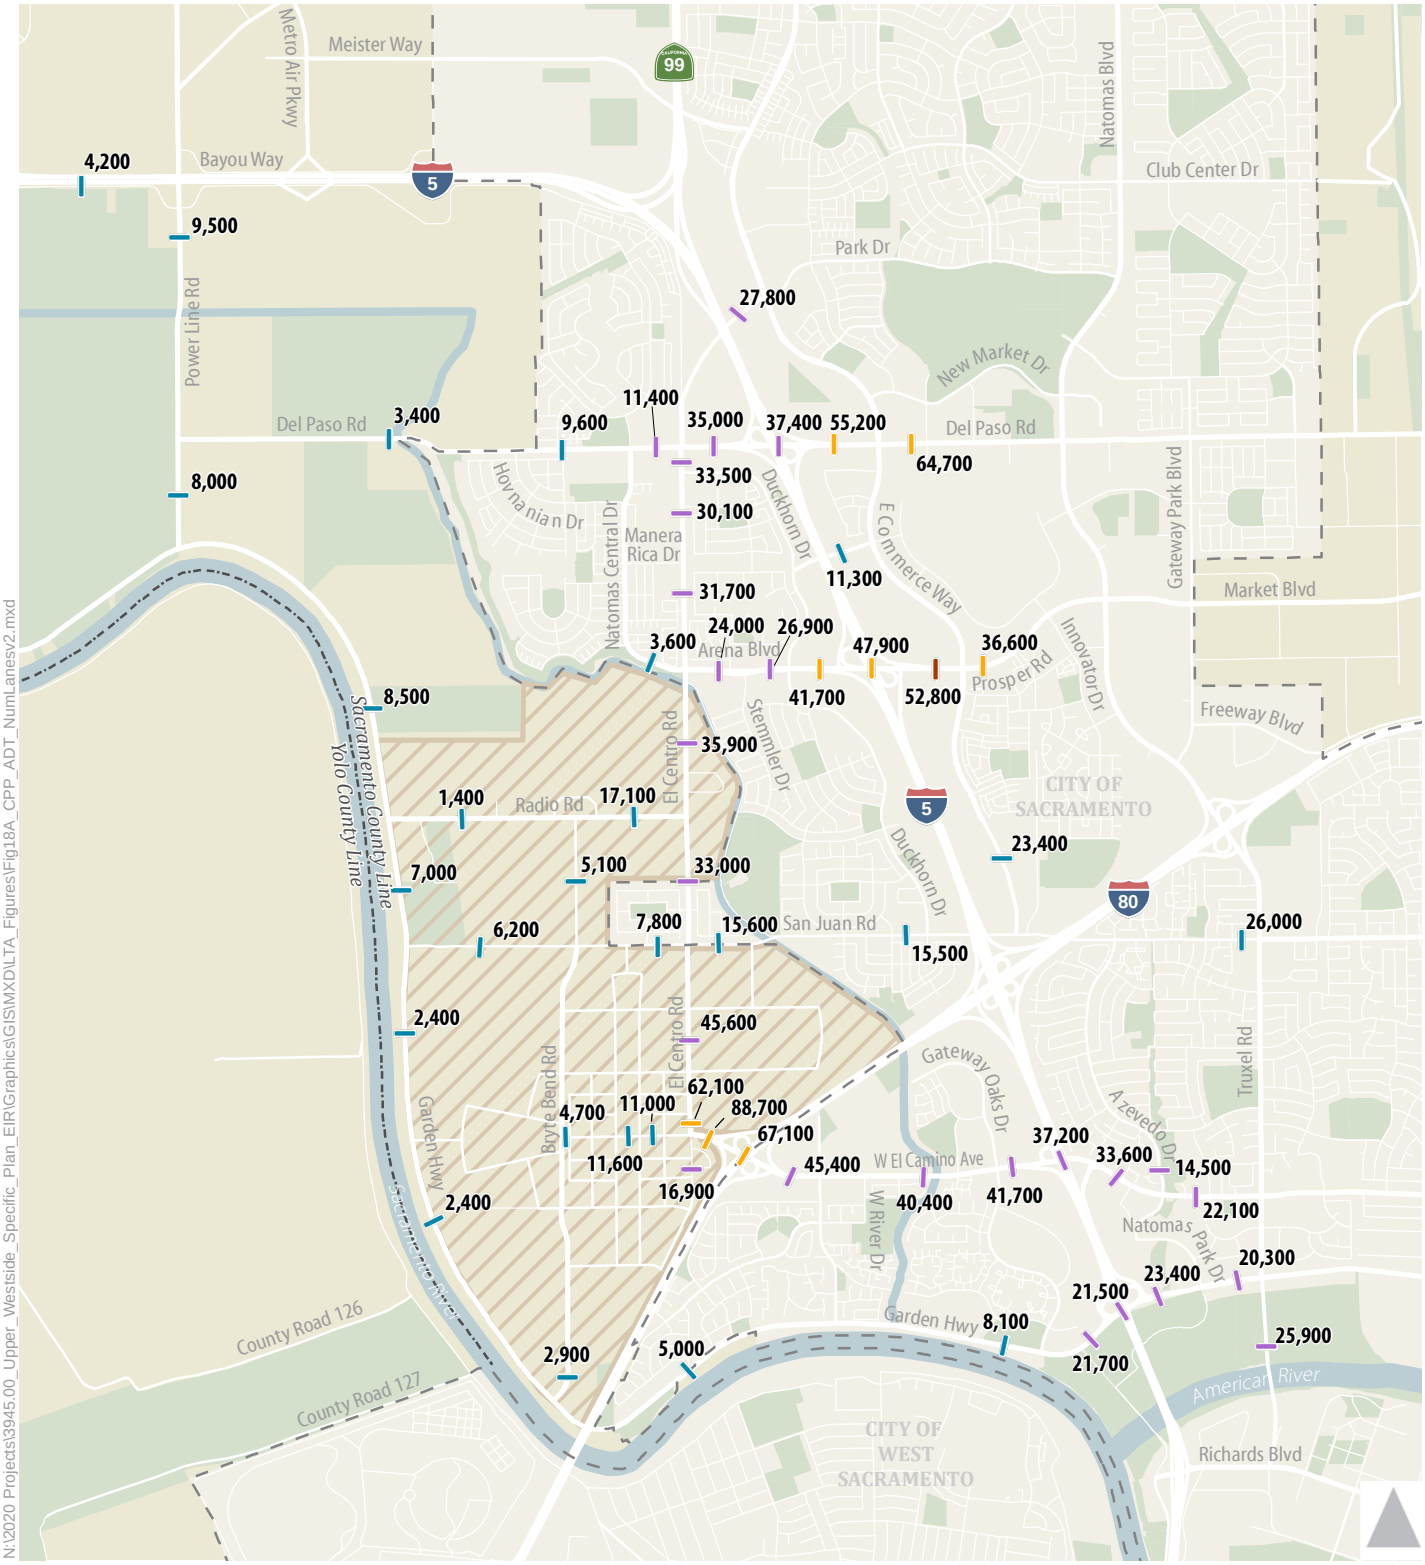

**Figure 18A** shows the ADT on study roadways under cumulative plus project conditions. **Figure 18B** shows the cumulative ADT on the roadways within the Specific Plan area.

**Figures 19A – 19F** show the cumulative plus project weekday AM and PM peak hour traffic forecasts at the existing and new project study intersections.

The southbound left-turn and westbound right-turn movements at the El Centro Road/West El Camino Avenue intersection have a major effect on overall traffic operations along the two corridors. The following compares the AM and PM peak hour forecasts for each movement under existing plus project and cumulative plus project conditions:

| *El Centro Road/West El* | *Existing Plus Project* | | *Cumulative Plus Project* | |
|---|---|---|---|---|
| *Camino Avenue* | *AM Peak Hour* | *PM Peak Hour* | *AM Peak Hour* | *PM Peak Hour* |
| Southbound Left-Turn | 1,947 | 1,652 | 2,002 (+3%) | 2,090 (+27%) |
| Westbound Right-Turn | 1,285 | 2,126 | 1,877 (+46%) | 2,241 (+5%) |

Under existing plus project conditions, the peak-travel, peak-directional movements are southbound left-turn during the AM peak hour and westbound right-turn during the PM peak hour. The cumulative plus project forecasts show a very modest five percent or less growth in these movements, which is reasonable since they are nearly at capacity. In contrast, growth of 27 percent and 46 percent is expected in the non-peak directions, reflecting the introduction of new employment uses, which attract trips (i.e., hence the 600 added AM peak hour trips turning right onto northbound El Centro Road). From this analysis, it is concluded that the travel demand model is sensitive to peak-hour, peak-direction roadway capacity limitations and reflects those conditions in its trip assignment.

## Roadway Segment Operations

**Table 14** displays the v/c ratio and LOS for the Sacramento County study roadway segments under cumulative conditions, without and with the project. Under cumulative no project conditions, two Sacramento County roadway segments would operate unacceptably. Under cumulative plus project conditions, 12 Sacramento County roadway segments would operate unacceptably (i.e., LOS E or F depending on segment location) including segments along San Juan Road, El Centro Road, Powerline Road, Garden Highway, Radio Road, and West El Camino Avenue.

**Table 14:**
**Sacramento County Roadway Segment Operations – Cumulative Conditions**

| Segment | LOS [1] Standard | Cumulative No Project Conditions | | | | Cumulative Plus Conditions | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | Classification | ADT [2] | V/C [3] | LOS | Classification | ADT [2] | V/C [3] | LOS |

Notes:
1. D / E = Cumulative No Project Standard / Cumulative Plus Project Standard (due to study area becoming urbanized).
2. ADT = average daily traffic volume; ADT values are rounded to the nearest 100 vehicles.
3. V/C = volume-to-capacity ratio.

Bolded cells represent unacceptable operations.

Source: Fehr & Peers, 2021.

## Intersection Operations

The substantial growth in background traffic in the study area contributes to degraded operations at a number of currently existing study intersections under cumulative conditions. Implementation of the proposed project would substantially worsen conditions at many of those locations and also worsen conditions to unacceptable levels at other locations. **Table 15** summarizes the number of existing study intersections (operating either as signals, roundabout or all-way stop) that would operate at LOS F during each peak hour under both cumulative scenarios.

**Table 15:**
**Intersection LOS Summary – Cumulative Conditions**

| Metric | Cumulative No Project | | Cumulative Plus Project | |
|---|---|---|---|---|
| | AM Peak Hour | PM Peak Hour | AM Peak Hour | PM Peak Hour |
| *Currently Existing Study Intersections (Operated with a Traffic Signal or All-Way Stop)* [1] | | | | |
| Intersections Operating at LOS D or better | 21 | 18 | 15 | 7 |
| Intersections Operating at LOS E | 5 | 6 | 1 | 4 |
| Intersections Operating at LOS F | 8 | 10 | 18 | 23 |
| Total Intersections | 34 | 34 | 34 | 34 |
| Percent Operating at LOS F | 24% | 29% | 53% | 68% |
| *Project Site Study Intersections (Operated with a Traffic Signal, All-Way Stop, or Roundabout)* [1] | | | | |
| Intersections Operating at LOS E or better | Do Not Exist | | 14 | 14 |
| Intersections Operating at LOS F | | | 2 | 2 |
| Total Intersections | | | 16 | 16 |
| Percent Operating at LOS F | | | 13% | 13% |

Notes:
1. Side-street stop intersections excluded because LOS F on a side-street is not as meaningful (i.e., volume could be low, downstream queuing effects, etc.).

Source: Fehr & Peers, 2021

This table indicates that among existing 34 signalized or all-way stop study intersections, the project would cause the number that would operate at LOS F under cumulative conditions to more than double, resulting in slightly more than half of all intersections operating at LOS F during the AM peak hour and nearly 70 percent operating at LOS F during the PM peak hour. Conversely, all but two study intersections within the site would operate at LOS E or better.

**Table 16** shows the average delay and LOS at all study intersections under cumulative conditions, without and with the project. Under cumulative no project conditions, traffic signal timings were reoptimized to

accommodate changes in travel demands. Under cumulative plus project conditions at off-site intersections, signal timings were assumed to remain the same as cumulative no project conditions. Thus, the only change in operating conditions at these locations would be the addition of project trips. Refer to separately bound **Appendix D** for technical calculations.

Notes:
1. AWSC = all-way stop controlled intersection; SSSC = side-street stop controlled intersection. RAB = Roundabout.
2. The overall average intersection control delay is reported in seconds per vehicle for signalized and all-way stop controlled intersections. For side-street stop controlled intersections, the average control delay/for the movement with the greatest delay is shown in parentheses, while the average delay/for the entire intersection is shown not in parentheses.
3. Project roadway modification removed extension of El Centro Road southwesterly from Street 1 to Bryte Bend Road. Hence, these intersections no longer exist.

Bolded cells represent unacceptable operations, based on the County's Level of Service policy. Side-street stop controlled intersections exceeding the Level of Service policy are considered acceptable if signal warrants are not met or signals are not considered feasible. See Table 17.

Source: Fehr & Peers, 2021.

A traffic signal warrant analysis was performed at unsignalized study intersections located in Sacramento County. The list of study locations was further refined (per the Thresholds of Significance) to only include locations whose side-street worst movement would operate at F (if within Urban Service Boundary) or E or F (if outside the urban Service Boundary). Warrants 3A (Peak Hour Delay) and 3B (Peak Hour Volume) were evaluated using the criteria described in the *California Manual of Uniform Traffic Control Devices* (MUTCD) (2014). The results are shown in **Table 17** for the ten study intersections that satisfy the above criteria.

Six of the ten intersections would satisfy either Warrant 3A or 3B during the AM and/or PM peak hours. Of those that satisfy the warrant, Farm Road/Street A (#60), El Centro Road/Street 6 (#68), and El Centro Road/CMU/EHC Driveway (#69) are situated along and adjacent to the segment of El Centro Road near the Town Center in which a detailed access plan has already been developed. Traffic signals are not considered viable solutions at these intersections due to their proximity to other signalized intersections. The Street 12E/Radio Road intersection was further analyzed using micro-simulation under cumulative plus project conditions to determine if eastbound queues from it would spill back into the Bryte Bend Road/Radio Road roundabout, which is spaced 435 feet to the west (measured from centerline to centerline). The analysis concluded that the 95$^{th}$ percentile eastbound approach queue lengths (assuming a signal with an eastbound left-turn lane and through lane) would not spill back to the roundabout. Therefore, a traffic signal is recommended at the Street 12E/Radio Road (#45) intersection.

The other remaining intersections that satisfy the peak hour signal warrants are Powerline Road/Bayou Way South (#1) and San Juan Road/Orchard Lane (#50). Traffic signals are recommended at each location.

At the El Centro Road/MDR Access intersection (#62), the heavy side street delay is being caused by westbound Farm Road queue spillback from the El Centro Road/Farm Road signalized intersection. Side-street movements are therefore recommended to be restricted to right-turns only at the El Centro Road/MDR Access intersection (#62),

Additionally, given the heavy westbound queues on Farm Road described above, the segment of Farm Road east of El Centro Road is recommended to be extended as a six-lane thoroughfare from El Centro Road to the CMU signalized driveway.

**Table 17:**
**Unsignalized Intersection Traffic Signal Warrant Analysis – Cumulative Plus Project Conditions**

| Intersection [1] | Traffic Control[2] | Agency | AM Peak Hour | | | | PM Peak Hour | | | | Signal Recommended? |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | Delay[3] | LOS | Warrant 3A [4] | Warrant 3B [4] | Delay[3] | LOS | Warrant 3A [4] | Warrant 3B [4] | |

# 5. SITE ACCESS CONSIDERATIONS

The prior chapters concluded that highly congested traffic conditions would be expected along portions of El Centro Road and West El Camino Avenue near I-80 and the Town Center. This chapter evaluates the effectiveness of a set of geometric modifications to this area that would better accommodate the heavy vehicular travel demand. Additionally, a concept for improving the bicycle and pedestrian networks is proposed.

## Proposed Geometric Modifications

The proposed modifications to El Centro Road and West El Camino Avenue would maintain the same overall roadway alignments but modify lane configurations and add other important elements. **Figure 20** illustrates the proposed geometric modifications including I-80/West El Camino Avenue interchange improvements. The following specific modifications would be made (relative to the assumed geometrics under existing plus project conditions):

El Centro Road/West El Camino Avenue Intersection

- *Construct two channelized westbound" right-turn lanes (i.e., two approach lanes, triangular corner raised median, and two receiving lanes).*

  Rationale: The need for this configuration is driven by the projected 2,125 vehicles performing this movement under existing plus project conditions during the PM peak hour. These turn lanes would generally flow freely with a green signal indication, as there are no conflicts with motorized traffic However, as described in the next bullet, a signalized crosswalk is required to enable pedestrians and bicyclists to cross between the triangular raised median island and the adjacent Class I multi-use path.

- *Construct at-grade crosswalks on the north, south, and west legs (including a signalized crosswalk in the westbound right-turn lanes). Prohibit pedestrian travel on the east leg.*

  Rationale: Preliminary analysis investigated the benefits and drawbacks of at-grade crosswalks versus pedestrian overcrossings. Through operations analysis and a variety of other considerations, the at-grade crosswalks were ultimately chosen as the preferred means for accommodating non-motorized travel at the intersection. The following considerations informed this decision:

- The pedestrian WALK interval for the lengthy west leg crosswalk would operate concurrently with the lengthy southbound left-turn vehicle phase, meaning the crosswalk phase would not unnecessarily lengthen the overall intersection cycle length during peak periods.
- Similar to the west leg, the pedestrian WALK interval for the north leg crosswalk would operate concurrently with the heavy westbound left-turn vehicle phase followed by the east-west through movement phase. Through operations analysis, it was determined this crosswalk would not adversely affect overall intersection operations.
- The south leg crosswalk would operate concurrently with the moderate levels of east-west through traffic. The crosswalk would cross seven traffic lanes. If accommodated in a single pedestrian WALK interval, this would considerably lengthen overall intersection cycle length and contribute to worsened queuing and delays. Accordingly, this crosswalk is recommended to be a "two-stage crossing", whereby pedestrians cross half the lanes, wait in a median refuge area, and then cross the remaining half of the lanes during the next signal phase. Through operations analysis, it was determined this crosswalk configuration would not adversely affect overall intersection operations.

Refer to next section "Accommodation of Bicyclists and Pedestrians" for how these modes of travel would be accommodated at the intersection.

Figure 20

Geometric Improvements at West El Camino Avenue and El Centro Road

CONCEPTUAL - NOT FOR CONSTRUCTION. ADDITIONAL DETAILED ANALYSIS AND ENGINEERING DESIGN REQUIRED.

CADD FILE: \\Fpsd03.fpdinc.local\Data\2020 Projects\3945.00_Upper_Westside_Specific_Plan_EIR\CAD\VC Concept.dwg
Feb 23, 2022

- *Modify the eastbound approach to consist of a single left-turn lane and the northbound approach to consist of a single through lane.*

  Rationale: These movements (maximum of 80 eastbound left-turns per hour and 280 northbound through vehicles per hour) can each be accommodated by single lanes. Moreover, they would only require one northbound receiving lane, which would be adjacent to the two westbound-to-northbound right-turn receiving lanes.

- *Construct a third westbound left-turn lane.*

  Rationale: This movement would serve 830 vehicles under existing plus project conditions during the PM peak hour, which is substantial for a dual left-turn lane. By adding a third lane, queue spillback on westbound West El Camino Avenue is reduced.

- *Modify the eastbound right-turn lane to become a shared through/right lane.*

  Rationale: This modification would increase the capacity for the eastbound through movement of 730 vehicles, which would otherwise be accommodated in two through lanes. Although this is typically not considered an excessive "per lane" volume, the extremely heavy southbound left-turn would benefit by reducing the amount of green time required for other critical intersection movements, for which this is one. This modification would not adversely affect the modest right-turn movement of 10 vehicles per hour or less.

I-80 WB Ramps/West El Camino Avenue Intersection

- *Construct a third westbound right-turn lane on the off-ramp.*

  Rationale: The reconstructed signal-controlled off-ramp was assumed to have two left-turn lanes and two right-turn lanes. The left-turn demand of 690 AM peak hour vehicles requires two exclusive lanes. The right-turn demand of 1,000 AM peak hour vehicles and 1.070 PM peak hour vehicles under existing plus project conditions would function better with three right-turns.

- When warranted, operate the signal with a phasing plan that would include a signal phase in which the eastbound West El Camino Avenue through movement operates concurrently with the I-80 westbound off-ramp right-turn. Through operations analysis, it was determined that this phasing plan (which is in operation at several intersections along the US 50 corridor) would reduce vehicle queue spillbacks onto westbound I-80.

West El Camino Avenue Between I-80 WB Ramps and El Centro Road

- *In the westbound direction, construct four travel lanes departing the WB Ramps intersection.*

  Rationale: This configuration would allocate two-thirds of the right-turn capacity into the two outside travel lanes, which would become "trap" lanes onto northbound El Centro Road. This configuration is optimal during the critical PM peak hour, as 56 percent of the westbound demand approaching the intersection turns right onto northbound El Centro Road.

- *In the eastbound direction, construct three receiving lanes departing El Centro Road that laterally transition and then widen to four lanes approaching the WB Ramps intersection (see Figure 20).*

  Rationale: This configuration is necessary such that both the outside and middle lanes of the southbound triple left-turn movement can be used to access the I-80 WB diagonal on-ramp without requiring a lane change. This is accomplished via the lateral transition shown on Figure 20 and lane assignments at the WB Ramps intersection. A dedicated right-turn lane and an optional through/right lane would provide needed capacity to accommodate the 1,560 right-turning vehicles during the AM peak hour.

El Centro Road/Farm Road

- *Construct a northbound u-turn only lane.*

  Rationale: During the PM peak hour, approximately 100 vehicles are projected to perform a u-turn at this location. Much of this demand will be exiting traffic from the CMU and E/HC parcels on the east side of El Centro Road. The dual left-turns currently proposed at this location are not sufficient to handle the left-turn demand (650 PM peak hour vehicles) plus the 100-vehicle u-turn demand.

CMU and E/HC Driveways

- *Construct two right-turn only driveways with deceleration lanes on El Centro Road (north of West El Camino Avenue) to serve the CMU and E/HC parcels.*

Rationale: Two driveways are recommended given the expected volume of entering and exiting traffic. The signalized El Centro Road/West El Camino Avenue and El Centro Road/Farm Road intersections are situated about one-quarter mile (1,320 feet) apart. The following driveway placements are recommended:

  - Southerly driveway is situated at least 600 feet north of West El Camino Avenue (to provide adequate distance to accommodate weaving movements from the eastbound left-turn and northbound through movements at the West El Camino Avenue signal.

- Northerly driveway is situated at least 250 feet from the southerly driveway and 400 feet from the Farm Road signal. This spacing will reduce conflicts between turning movements at each driveway, while also providing adequate distance from the northerly driveway to access the u-turn lane.

CMU Driveway/Farm Road Signalized Intersection

- *Construct a third northbound left-turn lane.*

Rationale: During the PM peak hour, 1,535 vehicles are projected to perform this movement. Although east-west travel demand is modest (meaning considerable green time can be provided to this outbound movement), three lanes are nonetheless required for vehicle storage and overall egress considerations.

All Signalized Intersections Serving Transit Vehicles

- *Provide transit signal priority (TSP) equipment.*

Rationale: Low-priority TSP can extend the green phase or provide an early return to green, in order to speed up transit vehicles. This increases person throughput and provides for a higher degree of travel time reliability for transit trips.

It should be noted that grade-separated pedestrian overcrossings at the north and west legs of the West El Camino Avenue/El Centro Road intersection were also considered as potential design solutions. Their effectiveness (in place of the above recommended at-grade crosswalks) was tested using micro-simulation analysis and found to perform similarly to results shown above. However, the at-grade crossing solution is recommended because it reduces pedestrian inconvenience (due to less out of the way travel), is more intuitive, provides improved aesthetics, and reduces costs.

## Average Delay and Percent Demand Served

The effectiveness of the above strategies was tested using the SimTraffic model for existing plus project AM and PM peak hour conditions. The results are shown in **Table 18** (see separately bound **Appendix E** for calculations).

**Table 18:**
**Site Access Intersection Operational Improvements – Existing Plus Project Conditions**

Notes:
1. SSSC = side-street stop controlled intersection.
2. The overall average intersection control delay is reported in seconds per vehicle for signalized intersections. For side-street stop controlled intersections, the average control delay/for the movement with the greatest delay is shown in parentheses, while the average delay/for the entire intersection is shown not in parentheses.
3. Refer to Figure 14 for assumed lane configurations.
4. Refer to Figure 20 for assumed lane configurations.

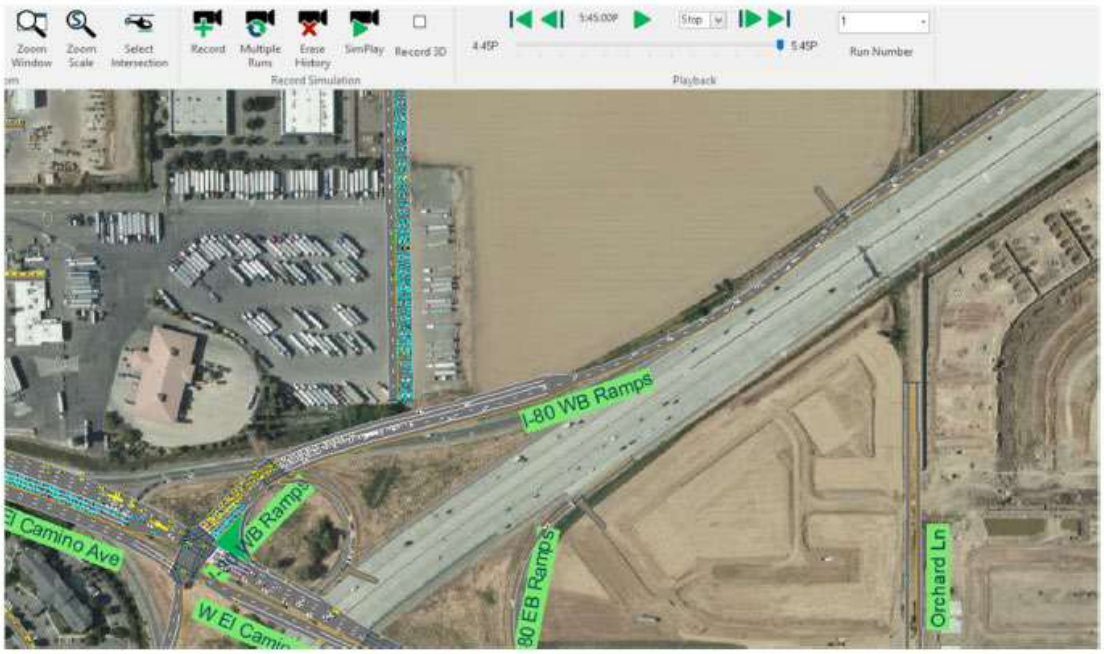
Source: Fehr & Peers, 2021.

The proposed geometric modifications would reduce the average delay across the El Centro Road/West El Camino Avenue, El Centro Road/Farm Road, and two I-80 ramp intersections from 169 to 97 seconds per vehicle during the AM peak hour. During the PM peak hour, a decrease in average delay for the four intersections from 200 to 72 seconds per vehicle would occur.

A metric known as "percent demand served" is valuable when comparing the capacity provided by alternative geometric treatments for an over-saturated condition. Percent demand served, which is an output from the SimTraffic microsimulation model, represents the percentage of the hourly vehicle demand able to pass through a given intersection in that time period. When percent demand served drops below 80 to 90 percent, it is an indication that the demand for travel exceeds the system's capacity. For large, heavily traveled networks such as the SimTraffic model built for the West El Camino Avenue (i.e., from west of I-80 to I-5) and El Centro Road (i.e., south of the Town Center to north of Farm Road) corridors, 100 percent demand served is rare because of the travel distance required to traverse the entire length of the network (i.e., some vehicles enter but do not pass entirely through within the hour).

Charts 1 and 2 show how the proposed geometric modifications would increase the percent demand served at the El Centro Road/West El Camino Avenue, El Centro Road/Farm Road, and two I-80 ramp intersections. At the El Centro Road/West El Camino Avenue bottleneck location, the percent demand served would increase substantially (from 73 to 87 percent during the AM peak hour and from 66 to 92 percent during the PM peak hour). Much of the increase is due to more capacity being provided for the heavy southbound left-turn and westbound right-turn movements whose percent demand served rises dramatically with the geometric modifications.

**Table 19** and the SimTraffic screen captures on the following two pages display the effectiveness of the proposed geometric modifications under cumulative plus project AM and PM peak hour conditions. Refer to Appendix E for technical calculations. This table indicates that the proposed geometric modifications provide similar operational benefits under cumulative conditions, as under existing plus project conditions. Notably, the El Centro Road/West El Camino Avenue intersection remains at LOS F during both peak hours, but has substantially less delay and greater percent demand served with the geometric modifications in place.



In summary, the proposed geometric modifications were found to substantially benefit traffic operations along the portions of El Centro Road and West El Camino Avenue near the Town Center. While operations would remain at LOS F at the El Centro Road/West El Camino Avenue and El Centro Road/Farm Road intersections, delays are considered more tolerable, and the overall percent demand served is much better with the proposed geometric improvements.

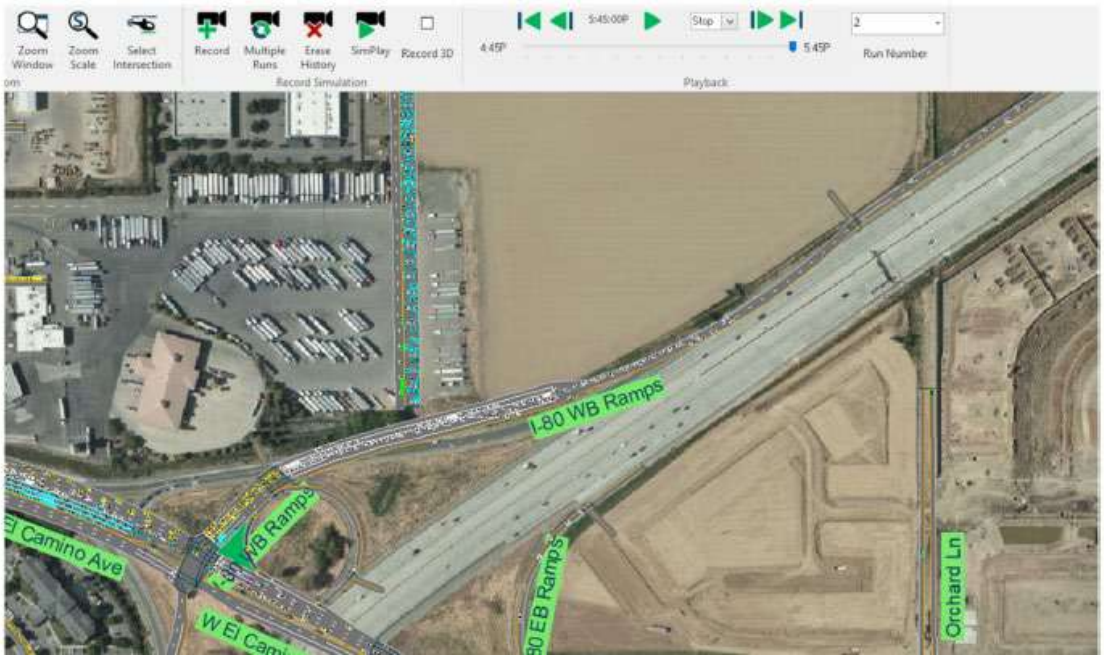


**Image of traffic conditions during the AM peak hour based on SimTraffic modeling with proposed improvements in place. Key observations include:**

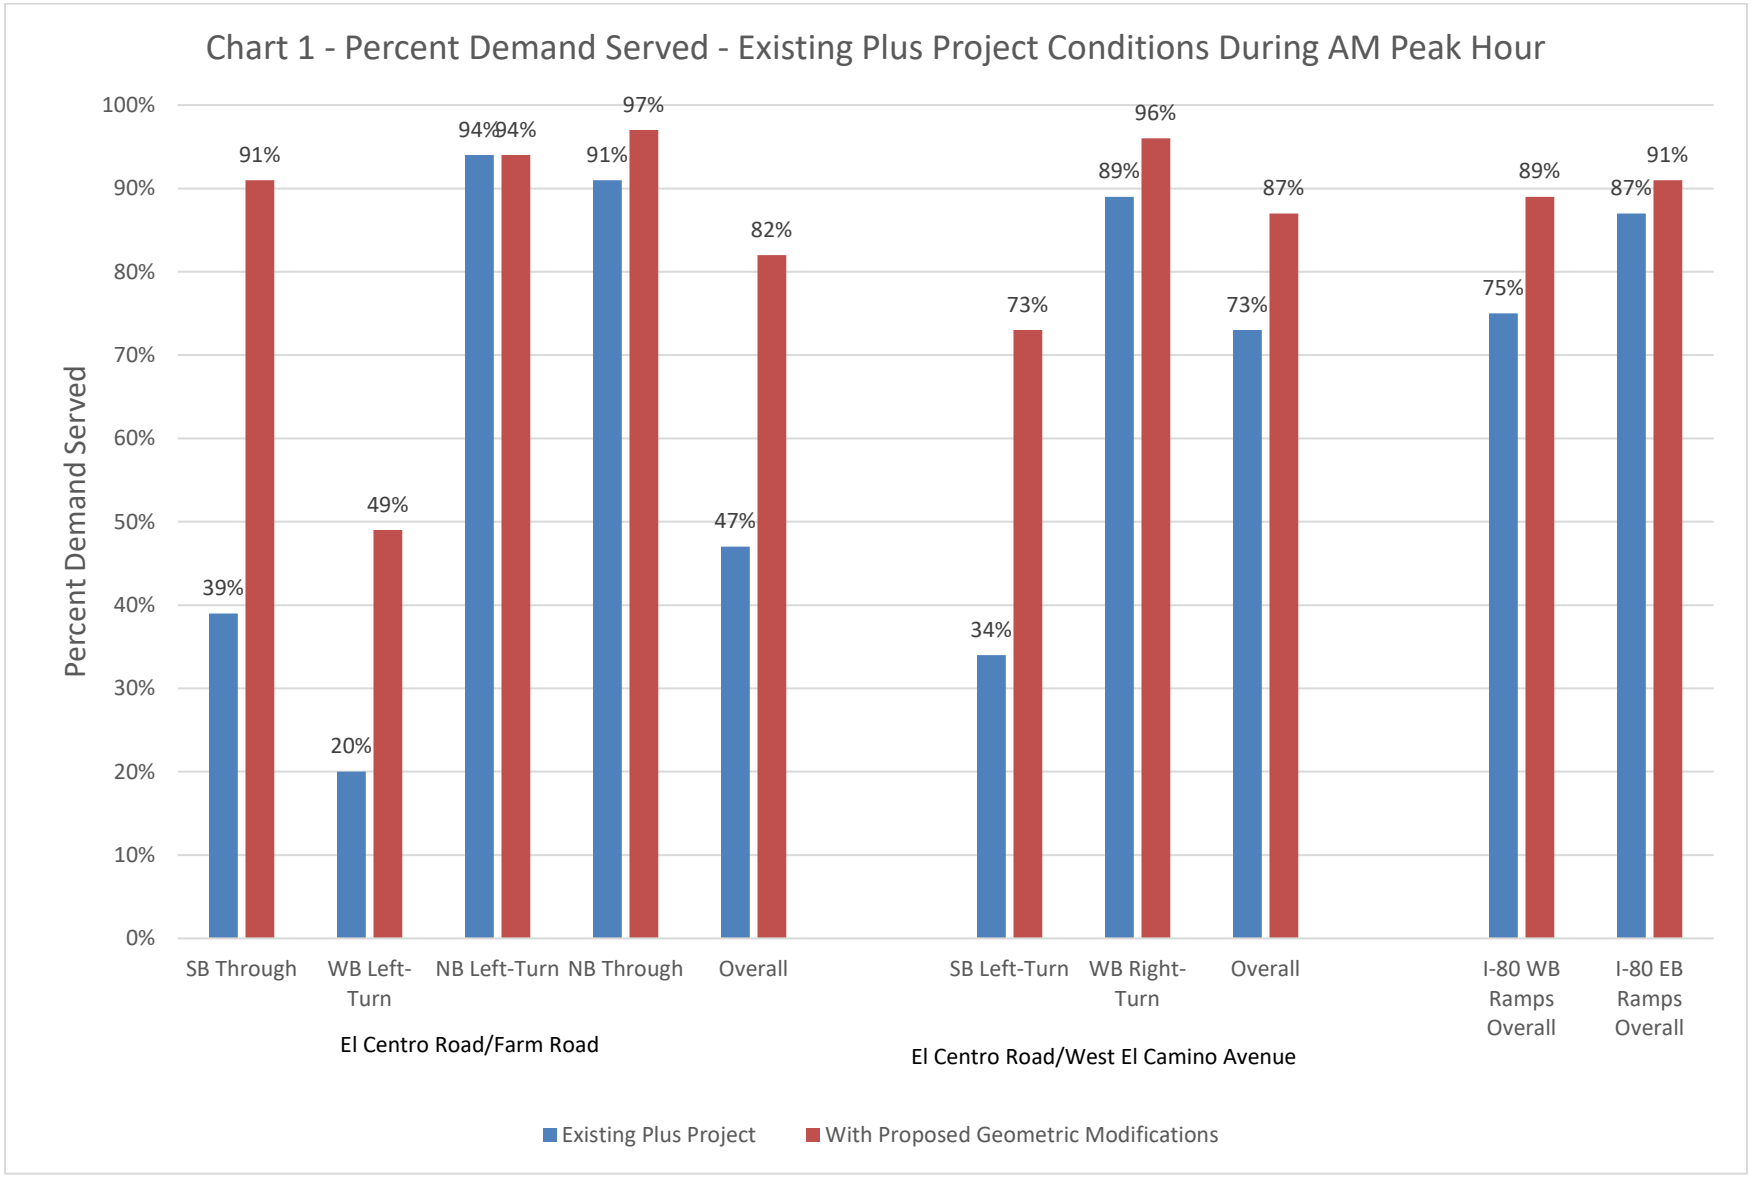
- **Southbound queue on El Centro Road continuing to extend back from West El Camino Avenue to beyond Farm Road, though the ultimately length of the queue is shorter with the improvements.**
- **Westbound queue on West El Camino Avenue no longer causes traffic on the freeway off-ramps to spill back onto the freeway.**



**Run 1**

**Run 2**

**SimTraffic screen capture at end of PM peak hour for two of ten runs (under cumulative plus project with improvements). Results indicate that westbound off-ramp queue does not spill back onto freeway mainline.**

Source: Fehr & Peers, 2021.

# Accommodation of Bicyclists and Pedestrians

The previous section described how the proposed geometric modifications would benefit vehicular travel (including buses that would otherwise incur substantial delays during peak periods). It is equally important that the improvements also accommodate bicyclists and pedestrians traveling along El Centro Road and West El Camino Avenue.

**Figure 21** displays bicycle and pedestrian facilities that would be part of these proposed improvements. Specific amenities to support biking include:

- Class I multi-use path allowing two-way bicycle travel on the north side of West El Camino Avenue that would extend from El Centro Road to the signalized Orchard Lane intersection (within the City of Sacramento) east of I-80. Additional studies during the interchange design phase will be necessary to determine its exact alignment and how/whether it intersects the three on/off ramps at-grade or not.
- Class I multi-use path on the west side of El Centro Road both north and south of West El Camino Avenue.
- Class II bike lanes in both directions of El Centro Road both north and south of West El Camino Avenue.
- Class II bike lanes in both directions of West El Camino Avenue west of El Centro Road (including an eastbound bike lane that would be located between the left and through lanes at the signal). This bike lane would operate with the eastbound left-turn phase, providing bicyclists with the ability to reach the triangular island to access the Class I multi-use path on the north side of West El Camino Avenue.
- A Class II bike lane is currently shown in the eastbound direction of West El Camino Avenue from El Centro Road extending across the interchange. Bicyclists in this lane need to navigate the merging area with vehicles desiring to travel onto the westbound I-80 diagonal on-ramp. Additional discussion with Caltrans will be necessary during the design phase of the interchange to determine whether this bike lane is desirable or not.

Pedestrian amenities include sidewalks along El Centro Road and West El Camino Avenue west of El Centro Road. It is not known whether a sidewalk would also be provided on the south side of West El Camino Avenue east of El Centro Road across the interchange, as pedestrians using it would encounter three on/off ramps carrying considerable levels of traffic. An alternate route for pedestrians would be the Class I path on the north side. Crosswalks would be provided on three of the four legs at the West El Camino Avenue/El Centro Road intersection. The east leg would not have a crosswalk because it would have adversely affected overall traffic operations in the area.

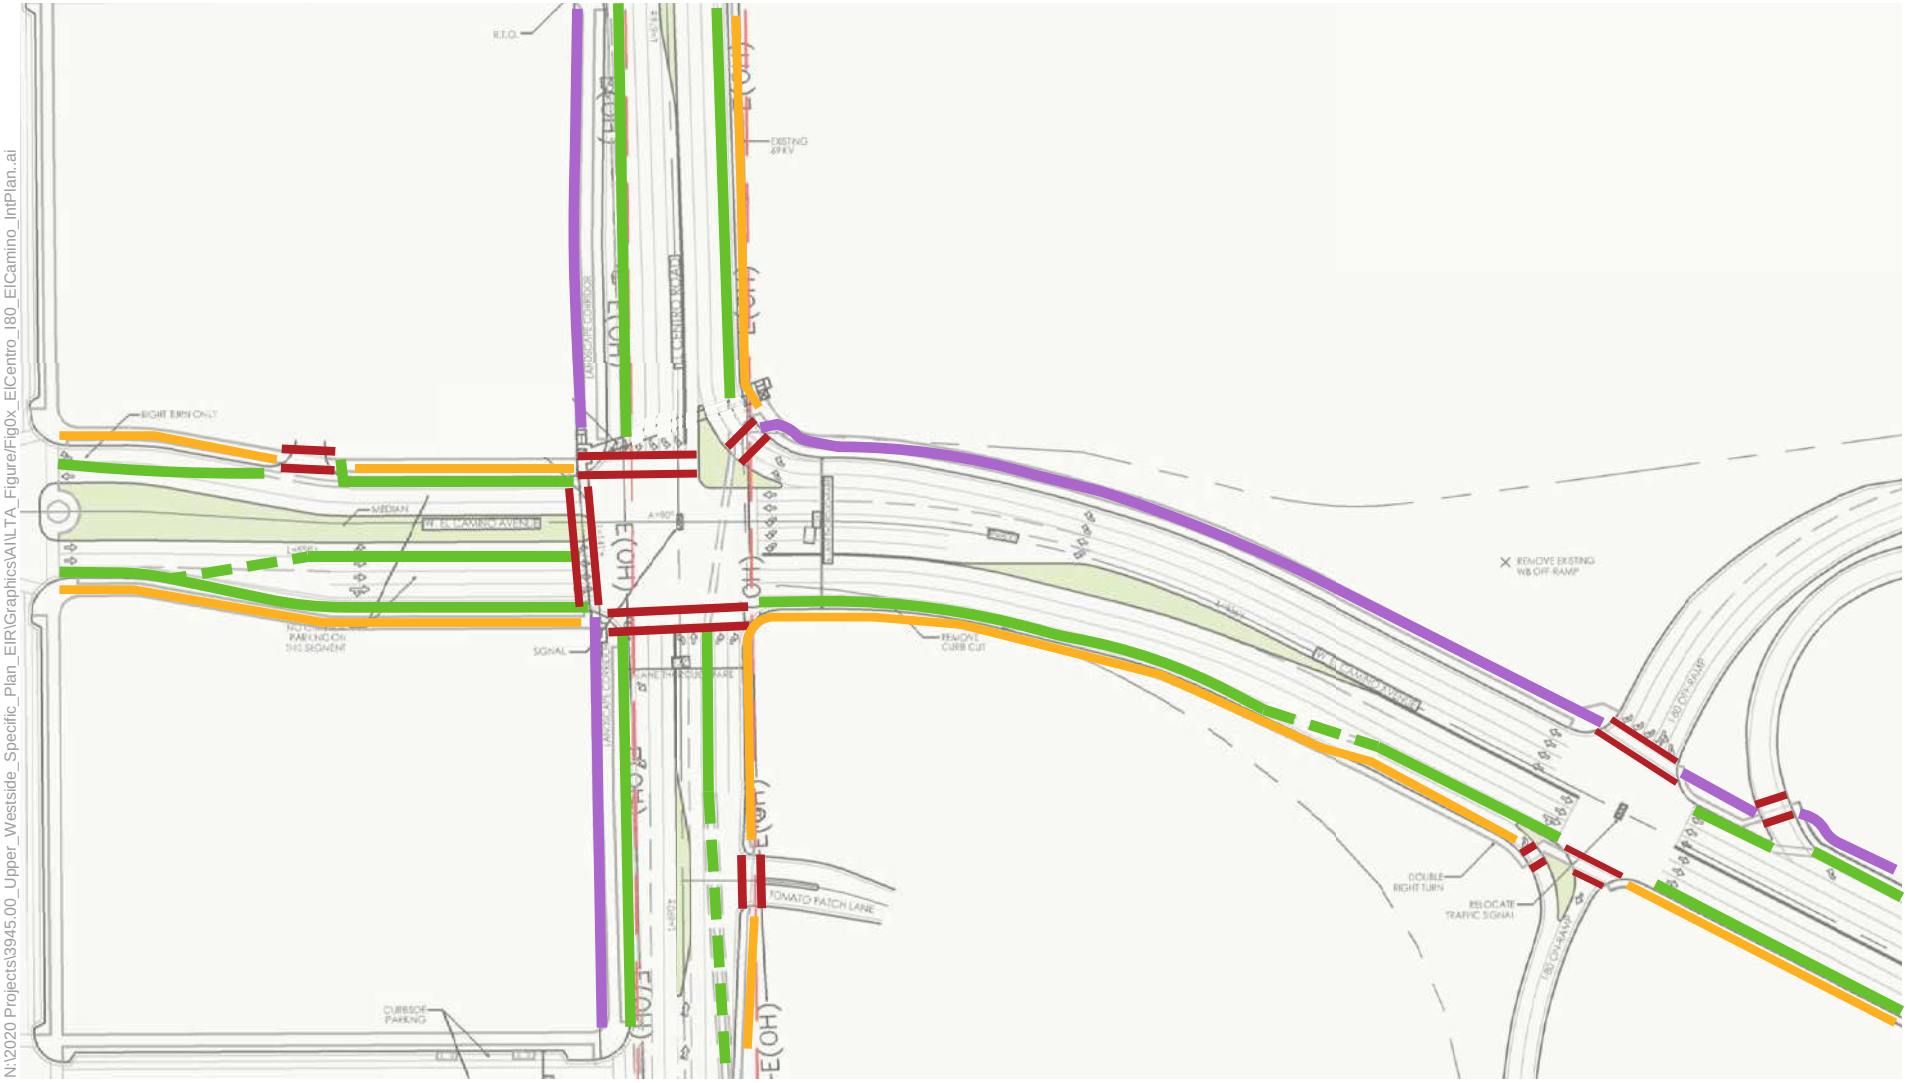

Figure 21

Bicycle and Pedestrian Facilities

El Centro Rd/I-80 WB Ramps/West El Camino Ave Improvements

Below are relevant design standards and guidance from Caltrans related to treatment of bicycle and pedestrian facilities at freeway interchanges is presented. The following passages from the *Highway Design Manual* (HDM) (Caltrans, 2020) are relevant to the proposed bicycle and pedestrian facilities shown on Figure 21 at the I-80/West El Camino Avenue interchange. [7]

**CHAPTER 500 (TRAFFIC INTERCHANGES)**

1. No longer are freeway interchanges designed with only the needs of motorists in mind. Pedestrian and bicycle traffic needs are to be considered along with the motorized traffic.
2. Local road interchanges ramp termini should be perpendicular to the local road. The high speed, shallow angle, ramp termini of the past are problematic for pedestrians and bicyclists to navigate. Vehicle speeds are reduced by the right angle turn, allowing drivers to better respond to bicycle and pedestrian conflicts.
3. Class II bikeways designed through interchanges should be accomplished considering the mobility of bicyclists and should be designed in a manner that will minimize confusion by motorists and bicyclists. Designs which allow high speed merges at on- and off-ramps to local streets and conventional highways have a large impact on bicycle and pedestrian mobility and should not be used.
4. A solution on how to best provide for bicycle travel to connect both sides of the freeway should be developed in consultation with the Local Agency and community as well as with the consideration of the local bicycle plan.

**CHAPTER 1000 (BICYCLE TRANSPORTATION DESIGN)**

1. Another common application of Class I facilities is to close gaps to bicycle travel caused by construction of freeways or because of the existence of natural barriers (rivers, mountains, etc.).
2. Alternating segments of Class I to Class II (or Class III) bikeways along a route are generally incompatible, as street crossings by bicyclists is required when the route changes character.
3. The minimum paved width of travel way for a two-way bike path shall be 8 feet, 10-foot preferred. Where heavy bicycle volumes are anticipated and/or significant pedestrian traffic is expected, the paved width of a two-way bike path should be greater than 10 feet, preferably 12 feet or more.
4. Development of a one-way bike path should be undertaken only in rare situations where there is a need for only one-direction of travel.

[7] Source: Highway Design Manual (HDM) | Caltrans. Accessed June 4, 2021.

5. Class I bikeways, unless adjacent to an adequate pedestrian facility (see Index 1001.3(n)) are for the exclusive use of bicycles and pedestrians; therefore, any facility serving pedestrians must meet accessibility requirements, see DIB 82. However, experience has shown that if regular pedestrian use is anticipated, separate facilities for pedestrians may be beneficial to minimize conflicts.
6. Where motor vehicle cross traffic and bicycle traffic is heavy, grade separations are desirable to eliminate intersection conflicts. Where grade separations are not feasible, assignment of right of way by traffic signals should be considered.

With regard to the applicable guidance in Chapter 500 (Traffic Interchanges), the westbound on- and off-ramps would be realigned to replace the high-speed, free-flow movements with slower-speed, right-angle signal-controlled movements.

With regard to the applicable standards and guidance in Chapter 1000 (Bicycle Transportation Design), the two-way multi-use path is consistent with many of the principles described in this chapter. Design details such as the width of the Class I path, specific treatments at its easterly terminus at Orchard Lane, and means for crossing ramps (i.e., at-grade or grade-separated, like at the US 50/Watt Avenue interchange) have not been finalized. However, it is apparent that a dedicated two-way multi-use path would be constructed to enable bicyclists and pedestrians to travel from the Upper Westside Specific Plan across I-80 via West El Camino Avenue.

# 6. OPERATIONAL DEFICIENCIES AND RECOMMENDED IMPROVEMENTS

This chapter identifies project-specific and cumulative operational deficiencies caused by the project and then recommended improvements to restore operations to acceptable levels.

## Operational Deficiencies – Existing Plus Project Conditions

This section discusses the effects of the proposed project on the roadway system. Recall that as a consequence of SB 743, operational deficiencies (versus significant impacts) are used to describe degraded operations at roadways and intersections. Refer to the *CEQA Transportation Impact Analysis for Upper Westside Specific Plan* (Fehr & Peers, March 2022) for freeway off-ramp queuing and ramp meter storage analysis, as well as impacts to other modes of travel.

### Roadway Segments

The proposed project would not cause deficient operations or contribute to already deficient operations at any Sacramento County study roadway segments. The proposed project would also not cause a substandard Sacramento County rural roadway (i.e., less than 24 feet of pavement width and less than six a foot shoulder) to carry over 6,000 daily vehicles or add 600 or more vehicles to a facility already carrying this level of traffic.

The project would add considerable volumes of traffic (above existing levels) to the following surface streets immediately adjacent to interchanges owned and operated by Caltrans (in descending order of traffic added):

- West El Camino Avenue directly west of I-80: 14,200 to 83,300 ADT (69,100 ADT increase)
- West El Camino Avenue directly east of I-80: 20,900 to 43,800 (22,900 ADT increase)
- West El Camino Avenue directly west of I-5: 21,100 to 40,400 ADT (19,300 ADT increase)
- Arena Boulevard directly west of I-5: 26,900 to 35,600 ADT (8,700 ADT increase)
- Del Paso Road directly west of I-5: 22,800 to 31,100 ADT (8,300 ADT increase)
- Garden Highway directly west of I-5: 16,300 to 19,300 ADT (3,000 ADT increase)

The project would also add considerable volumes of traffic (above existing levels) to the following surface streets within the City of Sacramento (in descending order of traffic added):

- West El Camino Avenue between Orchard Lane and Gateway Oaks Drive: 18,600 to 39,400 ADT (20,800 ADT increase)
- El Centro Road south of Arena Boulevard: 7,900 to 27,000 ADT (19,100 ADT increase)
- Arena Boulevard east of El Centro Road: 7,600 to 17,600 ADT (10,000 ADT increase)
- Del Paso Road east of El Centro Road: 22,800 to 31,100 ADT (8,300 ADT increase)
- San Juan Road east of Orchard Lane: 6,600 to 14,300 ADT (7,700 ADT increase)
- El Centro Road south of Del Paso Road: 11,400 to 18,000 ADT (6,600 ADT increase)
- Del Paso Road west of East Commerce Way: 43,200 to 47,000 ADT (3,800 ADT increase)
- San Juan Road west of Truxel Road: 17,400 to 21,100 (3,700 ADT increase)
- West El Camino Avenue east of I-5: 25,800 to 29,300 ADT (3,500 ADT increase)
- Garden Highway west of I-5: 16,300 to 19,300 ADT (3,000 ADT increase)
- Garden Highway east of I-5: 1,900 to 4,200 ADT (2,300 ADT increase)

Since Caltrans and the City of Sacramento do not utilize roadway segment daily volume thresholds for project-level evaluations, no corresponding LOS is provided for these segments. However, the effect of this added traffic is reflected in intersection operations along these corridors and the need for improvements, which are discussed later.

## Intersections

The project would cause deficient operations or contribute to already deficient operations at the following Sacramento County intersections:

- Powerline Road/Bayou Way (#1): Operations for worst side-street movement degrade from LOS C to F during PM peak hour and traffic signal warrant would be met.
- West El Camino Avenue/El Centro Road (#17): New signalized intersection would operate at LOS F during AM and PM peak hours.
- Farm Road/El Centro Road (#61): New signalized intersection would operate at LOS F during AM and PM peak hours.
- Orchard Lane/Farm Road/CMU Driveway (#63): New signalized intersection would operate at LOS F during AM and PM peak hours.
- El Centro Road/Street 6 (#68): Operations for worst side-street movement would be LOS F during PM peak hour and traffic signal warrant would be met.

- El Centro Road/CMU/EHC Driveway (#69): Operations for worst side-street movement would be LOS F during PM peak hour and traffic signal warrant would be met.
- El Centro Road/Street 4 (#89): Operations for worst side-street movement would be LOS F during AM peak hour and traffic signal warrant would be met.

Based on the results in Table 12, the following corridors within the City of Sacramento would experience considerable increases in traffic flows, queuing, and delays as a result of the proposed project.

- Arena Boulevard Corridor West of I-5 – During the AM and PM peak hours, operations on Arena Boulevard at El Centro Road (#15), Stemmler Drive (#24), and Duckhorn Drive (#25) would degrade from LOS D or better to F. This is due to the introduction of a substantial increase in project-related traffic (between 400 to 540 vehicles per hour added in each direction). In the eastbound direction, the lack of capacity at Arena Boulevard/El Centro Road is an issue along with imbalanced lane utilization approaching I-5. In the westbound direction, the lack of a dual left-turn lane at El Centro Road to accommodate 600 PM peak hour vehicles causes substantial queue spillbacks that adversely affect upstream intersections.
- West El Camino Avenue Between I-80 and I-5 – The project would add approximately 450 vehicles in the eastbound direction during the AM peak hour and 700 vehicles in the westbound direction during the PM peak hour. Operations degrade to LOS F at the West El Camino Avenue/Gateway Oaks Drive intersection (#37) during the PM peak hour. This is caused by vehicle queue spillback from the I-5 southbound diagonal on-ramp ramp meter (see section below for details). Operations on West El Camino Avenue at Orchard Lane (#35) and West River Drive (#36) remain at LOS D or better despite the substantial increases in traffic.

Although the project would add considerable levels of traffic to a number of other corridors within the City of Sacramento (see list above), resulting operations would generally not degrade to a level where operational improvements should be considered.

Review of Table 12 also indicated several Caltrans ramp terminal intersections that would experience LOS F operations with the addition of project trips. These include:

- Arena Boulevard/I-5 NB Ramps – operations would worsen from LOS B to F during the PM peak hour. The project would cause the NB off-ramp left-turn movement to increase from 587 to 960 vehicles.
- Garden Highway/I-5 SB Ramps – operations would worsen to LOS F during the PM peak hour, primarily because of the southbound loop on-ramp ramp meter queue spillback. West El Camino Avenue/I-80 WB and EB Ramps – despite the assumed widening of the existing interchange,

operations would be at LOS F during both peak hours at the WB ramps intersection and at LOS F during the PM peak hour at the EB Ramps intersection. This is caused by queue spillbacks from the El Centro Road/West El Camino Avenue intersection.

**Table 20** displays a set of recommended operational enhancements that would address many of the operational deficiencies identified under existing plus project conditions. Recommended improvements within Sacramento County are described in detail below:

- Powerline Road/Bayou Way (#1) – all approaches currently include a shared left/through/right lane. As part of the signal installation, minor widening would occur to enable all approaches to consist of a dedicated left and a shared through/right lane.
- Radio Road/Street 12 (E) (#47) – installation of a traffic signal with protected eastbound left-turn phasing is recommended. Analysis showed that under cumulative plus project conditions with a traffic signal at this location, the maximum queue in the eastbound direction would not spill back to the roundabout on Radio Road at Bryte Bend Road, which is situated 430 feet to the west.
- Farm Road/Street A (#60) – As part of the improvements, the second westbound travel lane departing El Centro Road would extend beyond this intersection, terminating just to the west. Restricted left-turn movements from Street A are recommended, as those movements could instead use alternate parallel routes including Street B and Street 6.
- Farm Road/MDR Access (#62) – Side-street movements are recommended to be restricted to right-turns only.
- Farm Road/CMU Driveway (#63) – The third left-turn lane, which would serve over 1,530 vehicles during the PM peak hour, is required for vehicle storage and overall egress considerations.

Note that modification to the El Centro Road/Radio Road intersection would also be required at some point as a result of the extension of Natomas Crossing Drive to this location. The geometrics and resulting traffic operations at this intersection with this extension in place are discussed under the cumulative improvements section (along with fair share calculations).

**Table 20:**
**Recommended Improvements to Address Operational Deficiencies – Existing Plus Project Conditions**

| Facility | Lead Agency | Description of Improvement(s) |
|---|---|---|
| Powerline Road/Bayou Way (#1) | Sacramento County | Install traffic signal |
| El Centro Road and West El Camino Avenue Corridors | Sacramento County | Construct Proposed Geometric Modifications (see Figure 20) |
| I-80/West El Camino Avenue Interchange [1] | Caltrans | Install two metered lanes on the I-80 WB diagonal on-ramp |
| Arena Boulevard/El Centro Road (#15) | City of Sacramento | At Arena Boulevard/El Centro Road, construct second westbound left-turn lane, second southbound through lane, restripe eastbound right-turn lane to a shared through/right, and lengthen northbound right-turn lane to 400 feet with right-turn overlap arrow.<br><br>Pay fair share cost for constructing Natomas Crossing Drive as a two-lane street from Duckhorn Drive to El Centro Road. |
| I-5/West El Camino Avenue Interchange [1] | Caltrans | Widen the I-5 SB diagonal on-ramp to consist of two ramp-metered lanes |
| Radio Road/Street 12 (E) (#45) | Sacramento County | Install traffic signal |
| Farm Road/Street A (#60) | Sacramento County | Install raised median on Farm Road at Street A to restrict turn movements on Street A to right-turn only. |
| Farm Road/MDR Access (#62) | Sacramento County | Install raised median on Farm Road at MDR Access to restrict turn movements to right-turn only. |
| Farm Road/Orchard Lane/CMU Driveway (#63) | Sacramento County | Expand northbound approach to consist of two left-turn lanes and a shared left/right lane. |

Notes:
1. Identified improvements derived from the ramp metering analysis whose results are contained in the *CEQA Transportation Impact Analysis for Upper Westside Specific Plan* (Fehr & Peers, March 2022).

Source: Fehr & Peers, 2021.

Table 20 also includes improvements under the jurisdiction of Caltrans and the City of Sacramento. Although ramp meter analysis results were not presented in this report, Table 20 identifies the need for two specific ramp meter modifications in order to address ramp meter queue spillback onto surface streets. Additional studies involving Caltrans are required to further define each of these improvements. Improvements are recommended at the Arena Boulevard/El Centro Road intersection in the City of Sacramento (see separately bound **Appendix E** for geometric drawing). Coordination between staff from the City and County occurred to reach agreement on the improvements shown in that drawing.

**Table 21** illustrates the effectiveness of the above measures at study intersections influenced by each improvement. See separately bound **Appendix E** for calculations.

Notes:
1. AWSC = all-way stop controlled intersection; SSSC = side-street stop controlled intersection.
2. The overall average intersection control delay is reported in seconds per vehicle for signalized and all-way stop controlled intersections. For side-street stop controlled intersections, the average control delay/for the movement with the greatest delay is shown in parentheses, while the average delay/for the entire intersection is shown not in parentheses.
3 Operational improvements are listed in Table 20.
Source: Fehr & Peers, 2021.

**Table 22** shows the number of existing study intersections (operating with a traffic signal or all-way stop) that would operate at LOS D or better, LOS E, and LOS F under existing and existing plus project conditions, and existing plus project conditions with recommended improvements. Key findings from this table are:

- During the AM peak hour, the project would cause the number of (existing) study intersections operating at LOS F to increase from two to five. With the proposed improvements, LOS F operations at Arena Boulevard/El Centro Road would be restored to LOS D, and LOS F operations at the I-80 WB Ramps/West El Camino Avenue intersection would be improved to LOS C. Although delays at the West El Camino Avenue/El Centro Road, Arena Boulevard/Stemmler Drive, and Arena Boulevard/Duckhorn Drive intersections would be reduced with the improvements, operations would not be improved to LOS D or better at these locations.

- During the PM peak hour, the project would cause the number of (existing) study intersections operating at LOS F to increase from zero to eight. With the proposed improvements, five of the eight LOS F intersections, would be restored to LOS D or better. These intersections are: Arena Boulevard/El Centro Road, Arena Boulevard/Stemmler Avenue, I-5 NB Ramps/Arena Boulevard, I-80 WB Ramps/West El Camino Avenue, and I-80 EB Ramps/West El Camino Avenue. The three that would remain at LOS F (along with an explanation of their operations) would be:

    - West El Camino Avenue / El Centro Road – Although operations remain at LOS F, conditions are much improved with the proposed geometric modifications described in the previous chapter.

    - Gateway Oaks Drive / West El Camino Avenue – Operations improve slightly by adding a second southbound I-5 on-ramp lane. However, the modeling assumed no change in the number of hourly vehicles entering the freeway (by virtue of decreasing the ramp meter rate). Thus, further decreases in delay could be achieved if the metering rate was increased.

    - I-5 SB Ramps/Garden Highway – Caltrans has indicated that there is not a physical improvement planned at this interchange. The tight spacing of the interchange and its proximity of businesses, Discovery Park, and other constraints would make any improvements difficult to complete. It is noted that the source of the congestion is the southbound loop on-ramp ramp meter. By virtue of the project improving the southbound diagonal on-ramp at West El Camino Avenue, some existing trips at this interchange may be diverted to that on-ramp, thereby this interchange's operations.

| Total Intersections | 34 | 34 | 34 | 34 | 34 | 34 |

Notes:
1. Side-street stop intersections excluded because LOS F on a side-street is not as meaningful (i.e., volume could be low, downstream queuing effects, etc.). List includes West El Camino Avenue/El Centro Road intersection, which would be signalized with the project.

Source: Fehr & Peers, 2021.

# Operational Deficiencies – Cumulative Plus Project Conditions

This section discusses the cumulative effects of the proposed project on the roadway system.

## Roadway Segments

The proposed project would cause deficient operations at the following Sacramento County study roadway segments:

- Powerline Road: Bayou Way to Del Paso Road – LOS D to E
- Powerline Road: Del Paso Road to Garden Highway – LOS C to E
- Garden Highway: Powerline Road to Radio Road – LOS D to E
- Garden Highway: Radio Road to San Juan Road – LOS C to E
- Radio Road: Street 12 (E) to El Centro Road – new roadway operating at LOS F with project
- San Juan Road: El Centro Road to Orchard Lane – LOS C to F

The first four segments listed above are rural two-lane roads with a LOS D standard. Hence, the degradation to LOS E is considered unacceptable.

The segment of Radio Road between Street 12 (East) and El Centro Road is proposed as a two-lane, low access control arterial. Under cumulative plus project conditions, it would carry 17,100 ADT and have a 1.14 v/c ratio. Under existing plus project conditions, it would carry 14,700 ADT and operate at LOS E. The cumulatively worsened operations are caused by planned land development assumed under the cumulative scenario. The following is recommended to improve operations on this segment to an acceptable level:

- Design Radio Road between Street 12 (East) and El Centro Road as a two-lane moderate access control arterial. Resulting operations would be at LOS E.

The segment of San Juan Road between El Centro Road and Orchard Lane is classified as a two-lane, low access control arterial. It would carry 15,600 ADT under cumulative plus project conditions. The following is recommended to improve operations on this segment to an acceptable level:

- Upgrade San Juan Road between El Centro Road and Orchard Lane to be a two-lane moderate access control arterial. Resulting operations would be at LOS E.

It should be noted that under "plus project" conditions, there are five distinct segments of El Centro Road: between San Juan Road to West El Camino Avenue. Each segment would operate at LOS F as either a four or six lane moderate access control arterial, with v/c ratios ranging from 1.01 to 1.27. Under cumulative no project conditions, this same segment would operate at LOS F (v/c ratio of 1.32) as a two-lane low access control arterial. Since this project would not increase the roadway's v/c ratio, it would not exacerbate projected unacceptable conditions despite the corridor operating at LOS F conditions with the project. This same conclusion holds true for the short segment of West El Camino Avenue between El Centro Road and I-80.

The proposed project would cause the following substandard Sacramento County rural roadways (i.e., less than 24 feet of pavement width and less than a six foot shoulder) to carry over 6,000 daily vehicles:

- Powerline Road: Bayou Way to Del Paso Road
- Powerline Road: Del Paso Road to Garden Highway
- Garden Highway: Powerline Road to Radio Road
- Garden Highway: Radio Road to San Juan Road

Under cumulative no project conditions, they would carry between 3,300 and 4,700 ADT. Under cumulative plus project conditions, they would carry between 7,000 and 9,500 ADT. The project would add considerably more trips to these segments under cumulative conditions versus existing conditions. This is likely due to new employment uses contained within Metro Air Park, which attract home-based work trips from the project. It is also possible that some of these trips are using the new I-5/Metro Air Park interchange to travel to/from the north on I-5.

The County's TAG indicates that when deficient operations (i.e., volume exceeding 6,000 ADT) are identified on substandard roadways, they should be upgraded to the current rural roadway standard, which consists of two 12-foot travel lanes and 6-foot paved shoulders. The following is therefore recommended:

- The project applicant shall pay their fair share cost of improving the following roadways to conform with current County design standards:
    - Powerline Road from Bayou Way to Garden Highway
    - Garden Highway from Powerline Road to San Juan Road

The fair share recommendation reflects the fact that the degraded condition occurs in the cumulative setting and is partially driven by other land development and roadway improvements within the County.

The project would add considerable volumes of traffic (beyond the cumulative no project levels shown) to the following surface streets immediately adjacent to interchanges owned and operated by Caltrans (in descending order of traffic added):

- West El Camino Avenue directly west of I-80: 26,200 to 86,700 ADT (60,500 ADT increase)
- West El Camino Avenue directly east of I-80: 24,200 to 45,400 ADT (21,200 ADT increase)
- West El Camino Avenue directly west of I-5: 24,100 to 41,700 ADT (17,600 ADT increase)
- Arena Boulevard directly west of I-5: 35,700 to 41,700 ADT (6,000 ADT increase)
- Del Paso Road directly west of I-5: 29,200 to 35,000 ADT (5,800 ADT increase)
- Garden Highway directly west of I-5: 17,400 to 21,700 ADT (4,300 ADT increase)

The project would also add considerable volumes of traffic (beyond the cumulative no project levels shown) to the following surface streets within the City of Sacramento (in descending order of traffic added):

- El Centro Road south of Arena Boulevard: 14,000 to 35,900 ADT (21,900 ADT increase)
- West El Camino Avenue between Orchard Lane and Gateway Oaks Drive: 20,800 to 40,400 ADT (19,600 ADT increase)
- El Centro Road south of Del Paso Road: 21,900 to 33,500 ADT (11,600 ADT increase)
- Arena Boulevard east of El Centro Road: 14,200 to 24,000 ADT (9,800 ADT increase)
- San Juan Road east of Orchard Lane: 7,700 to 15,500 ADT (7,800 ADT increase)
- Del Paso Road east of El Centro Road: 29,200 to 35,000 ADT (5,800 ADT increase)
- Del Paso Road west of East Commerce Way: 60,700 to 64,700 ADT (4,000 ADT increase)
- Garden Highway west of Gateway Oaks: 4,000 to 8,100 ADT (4,100 ADT increase)

Since Caltrans and the City of Sacramento do not utilize roadway segment daily volume thresholds, no corresponding LOS is provided for these segments.

## Intersections

The project would cause deficient operations or contribute to anticipated cumulatively deficient operations at the following Sacramento County intersections:

- Powerline Road/Bayou Way (#1): LOS F operations at the worst side-street movement would be exacerbated by more than five seconds during the PM peak hour and traffic signal warrant would be met.
- West El Camino Avenue/El Centro Road (#17): New signalized intersection would operate at LOS F during AM and PM peak hours.
- Street 12 (East)/Radio Road (#45): New unsignalized intersection would have LOS F operations at the worst side-street movement during the AM peak hour and traffic signal warrant would be met.
- San Juan Road/Orchard Lane (#50): New unsignalized intersection would have LOS F operations at the worst side-street movement during the AM peak hour and traffic signal warrant would be met.
- Farm Road/Street A (#60): New unsignalized intersection would have LOS F operations at the worst side-street movement during the PM peak hour and traffic signal warrant would be met.
- Farm Road/El Centro Road (#61): New signalized intersection would operate at LOS F during AM and PM peak hours.
- Orchard Lane/Farm Road/CMU Driveway (#63): New signalized intersection would operate at LOS F during AM and PM peak hours.
- El Centro Road/Street 6 (#68): New unsignalized intersection would have LOS F operations for worst side-street movement during AM peak hour and traffic signal warrant would be met.
- El Centro Road/CMU/EHC Driveway (#69): New unsignalized intersection would have LOS F operations for worst side-street movement during AM and PM peak hours and traffic signal warrant would be met.

According to Table 16, numerous study intersections under the jurisdiction of Caltrans or the City of Sacramento would operate at LOS F during the AM and/or PM peak hours under cumulative no project conditions. The project would exacerbate congested conditions at many of those locations and also cause added delays at many other intersections. Project-related degradations in traffic operations would be particularly pronounced at the following intersections/corridors:

- Arena Boulevard Corridor at I-5 – During the AM and PM peak hours, operations on Arena Boulevard at El Centro Road (#15), Stemmler Drive (#24), and Duckhorn Drive (#25) would degrade from LOS D or better to LOS F. Similar operational issues identified under existing plus project conditions (i.e., heavy project-related increases in the northbound right-turn and westbound left-turn movements) occur under cumulative plus project conditions. As a result of increased congestion located both west and east of the interchange, both interchange ramp intersections (#26 and #27) would worsen to LOS F conditions during both peak hours.

- West El Camino Avenue at I-5 – Similar to existing plus project conditions, the project would degrade conditions at the West El Camino Avenue/Gateway Oaks Drive intersection (#37) from LOS D to F during the PM peak hour. This is caused by vehicle queue spillback from the I-5 southbound diagonal on-ramp ramp meter, as well as heavy project-related increases in westbound through travel (500 vehicles added during the PM peak hour). Queue spillback in the westbound direction from this intersection would extend through the interchange, causing the NB off-ramp intersection (#39) to worsen from LOS A to F during the PM peak hour.

- West El Camino Avenue at I-80 – despite the assumed widening of the existing interchange, operations would be at LOS F during both peak hours at both interchange ramp intersections (#34 and #35). This is caused both by queue spillbacks from the El Centro Road/West El Camino Avenue intersection as well as heavy travel demands at the interchange itself.

**Table 23** displays a set of recommended operational enhancements to address the operational deficiencies identified under cumulative plus project conditions. See **Figure 22** for illustration of recommended improvements.

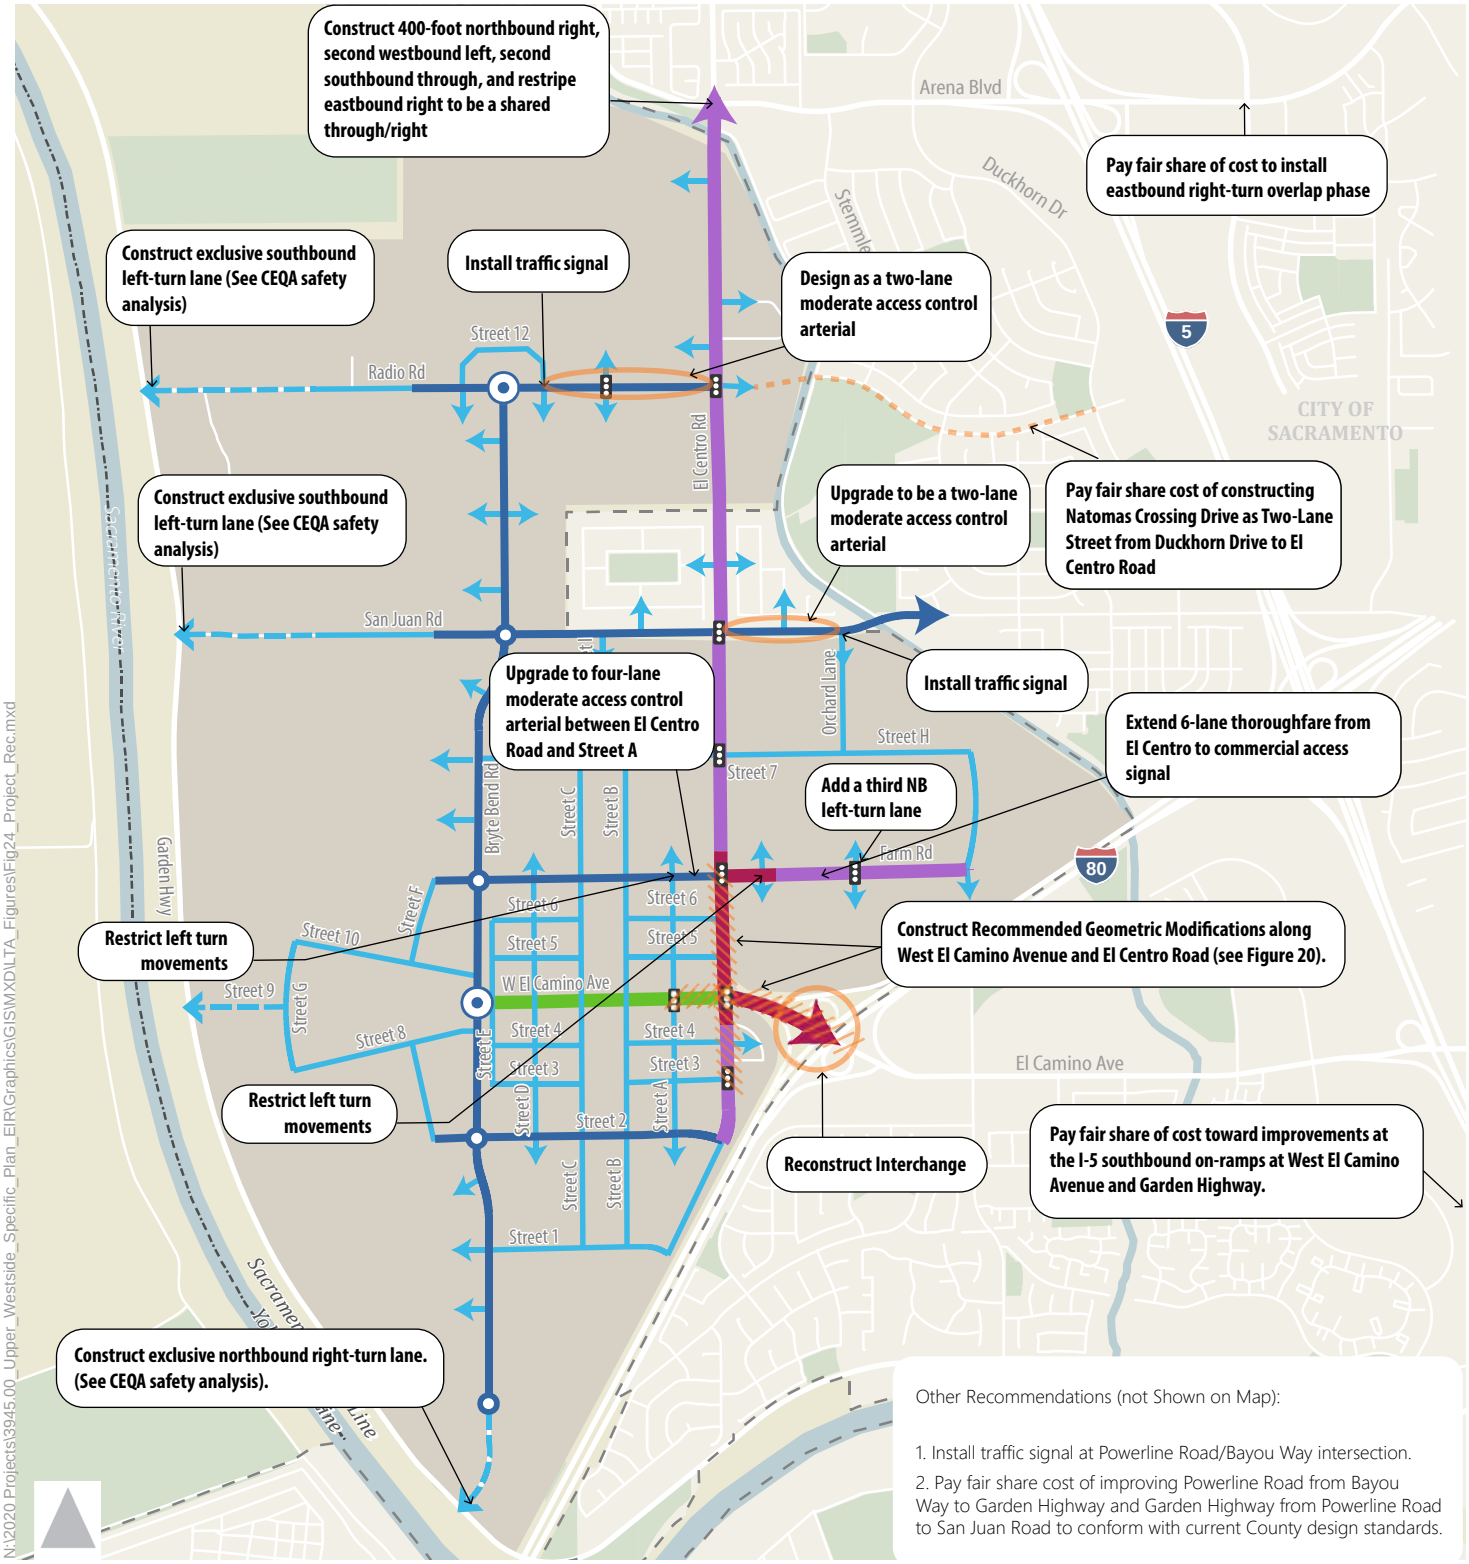

Table 23 recommends that the project make a fair share payment for construction of Natomas Crossing Drive as a two-lane roadway for 0.8 miles between Duckhorn Drive and El Centro Road. This improvement would offset worsening conditions on Arena Boulevard between El Centro Road and I-5. The recommendation for a fair share payment is driven by the fact that the improvement would benefit a number of existing and future land uses, and project benefits would be largely indirect. Secondly, much of the improvement would be situated within the City of Sacramento and therefore under their jurisdiction to approve and oversee construction. As evidenced by aerial imagery, right-of-way has been dedicated within the developed residential area for this improvement. The portion of the improvement within Sacramento County would include a bridge over Witter Slough. Natomas Crossing Drive would form the fourth leg to the El Centro Road/Radio Road intersection, which is planned to be signalized.

**Table 23:**
**Recommended Improvements to Address Operational Deficiencies – Cumulative Plus Project Conditions**

| Facility | Lead Agency | Description of Improvement(s) |
|---|---|---|
| Powerline Road/Bayou Way (#1) | Sacramento County | Install traffic signal |
| El Centro Road and West El Camino Avenue Corridors | Sacramento County | Construct Proposed Geometric Modifications (described in detail in previous chapter) and reoptimize signal timings |
| I-80/West El Camino Avenue Interchange [1] | Caltrans | Install two ramp-metered lanes on the I-80 WB diagonal on-ramp |
| Arena Boulevard/El Centro Road (#15) | City of Sacramento | At Arena Boulevard/El Centro Road (#15), construct second westbound left-turn lane, second southbound through lane, restripe eastbound right-turn lane to a shared through/right, and lengthen northbound right-turn lane to 400 feet with right-turn overlap arrow.<br>Pay fair share cost for constructing Natomas Crossing Drive as a two-lane street from Duckhorn Drive to El Centro Road.<br><br>Increase the ramp metering rate at the I-5 SB loop on-ramp |
| Arena Boulevard/East Commerce Way (#28) | City of Sacramento | Install an eastbound right-turn overlap phase |
| I-5/West El Camino Avenue Interchange [1] | Caltrans | Widen the I-5 SB diagonal on-ramp to consist of two ramp-metered lanes |
| Street 12 (East)/Radio Road (#45) | Sacramento County | Install traffic signal |
| San Juan Road/Orchard Lane (#50) | Sacramento County | Install traffic signal |
| Street A/Farm Road (#60) | Sacramento County | Install raised median on Farm Road at Street A to restrict turn movements on Street A to right-turn only. |
| Farm Road/MDR Access (#62) | Sacramento County | Install raised median on Farm Road at MDR Access to restrict turn movements to right-turn only. |
| Farm Road/Orchard Lane/CMU Driveway (#63) | Sacramento County | Expand northbound approach to consist of two left-turn lanes and a shared left/right lane. |

Notes:
1. Identified improvements derived from the ramp metering analysis whose results are contained in the *CEQA Transportation Impact Analysis for Upper Westside Specific Plan* (Fehr & Peers, March 2022).

Source: Fehr & Peers, 2021.

N:\2020 Projects\3945.00_Upper_Westside_Specific_Plan_EIR\Graphics\GIS\MXD\LTA_Figures\Fig24_Project_Rec.mxd

Note:
The on-site improvements would be constructed by the project as development occurs. The timing of construction (or fair share payments) for off-site improvements will vary depending on the location and type of improvement.

Figure 22
# Cumulative Plus Project Recommendations

The circulation effects of the Natomas Crossing Drive roadway connection were tested using the cumulative plus project version of the SACSIM travel demand model. Separately bound **Appendix E** includes a plot showing the net change in traffic resulting from the inclusion of the street. This plot indicates the following:

- Traffic levels of Natomas Crossing Drive would gradually increase from 1,700 vehicles per day west of Duckhorn Drive to 3,900 vehicles per day at El Centro Road.
- The new connection would enable more efficient travel routes. This is evidenced by a net decrease of 1,600 daily trips on El Centro Road south of Arena Boulevard, and 1,600 fewer daily trips on Arena Boulevard east of El Centro Road, and 1,300 fewer daily trips on San Juan Road east of El Centro Road.
- Intersections that would benefit from this new connection would be: El Centro Road/San Juan Road, El Centro Road/Arena Boulevard, Arena Boulevard/Stemmler Drive, and Arena Boulevard/Duckhorn Drive. While the El Centro Road/Radio Road/Natomas Crossing Drive intersection would experience more traffic due to a busier east leg, it would operate at an acceptable LOS D during the AM and PM peak hours under cumulative plus project conditions.

The project's fair share is estimated at 51 percent (see separately bound **Appendix E** for detailed calculations). This is based on its proportionate share of growth in traffic on the following roadways between existing and cumulative plus project conditions:

- San Juan Road east of El Centro Road
- San Juan Road east of Duckhorn Drive
- Arena Blvd east of Duckhorn Drive

These roadways were selected because they represent gateway links to various land uses whose trips could benefit (either directly or indirectly) from the roadway connection.

Table 23 includes improvements under the jurisdiction of Caltrans, City of Sacramento, and Sacramento County. Ramp meter analysis was performed as part of this study and is documented in the *CEQA Transportation Impact Analysis for Upper Westside Specific Plan* (Fehr & Peers, March 2022). Mitigation Measure TR-8 of that report requires the project applicant to pay its fair share percentage toward improvements at the I-5 SB diagonal on-ramp at West El Camino Avenue, I-5 on-ramps at Garden Highway, and I-5 SB diagonal on-ramp at Del Paso Road.

**Table 24** illustrates the effectiveness of the measures shown in Table 23 at study intersections influenced by each improvement. See Appendix E for calculations.

**Table 24:**
**Intersection Level of Service – Cumulative Plus Project Conditions with Operational Improvements**

| Intersection | Traffic Control[1] | Agency | Cumulative No Project Conditions | | | | Cumulative Plus Project Conditions | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | Without Improvements | | | | With Improvements [3] | | | |
| | | | AM Peak Hour | | PM Peak Hour | | AM Peak Hour | | PM Peak Hour | | AM Peak Hour | | PM Peak Hour | |
| | | | Delay[2] | LOS | Delay[2] | LOS | Delay[2] | LOS | Delay[2] | LOS | Delay[2] | LOS | Delay[2] | LOS |
| 81. Street A/W. El Camino Avenue | Signal | Sac Co | | | | | 19 | B | 58 | E | 21 | C | 71 | E |
| 83. El Centro Road/Tomato Patch Lane N | SSSC | Sac Co | Does Not Exist | | | | 2 (20) | A (C) | 6 (37) | A (E) | 19 (546) | C (F) | 16 (709) | C (F) |
| 89. El Centro Road/Street 4 | SSSC | Sac Co | | | | | 10 (53) | A (F) | 7 (52) | A (F) | 36 (411) | E (F) | 28 (413) | D (F) |
| 95. El Centro Road/Street 3/Tomato Patch Lane S | Signal | Sac Co | | | | | 15 | B | 13 | B | 19 | B | 14 | BC |

Notes:
1. AWSC = all-way stop controlled intersection; SSSC = side-street stop controlled intersection.
2. The overall average intersection control delay is reported in seconds per vehicle for signalized and all-way stop controlled intersections. For side-street stop controlled intersections, the average control delay/for the movement with the greatest delay is shown in parentheses, while the average delay/for the entire intersection is shown not in parentheses.
3 Operational improvements are listed in Table 23.
Source: Fehr & Peers, 2021.

**Table 25** shows the number of existing study intersections (operating with a traffic signal or all-way stop) that operate at LOS D or better, LOS E, and LOS F under cumulative no project and cumulative plus project conditions (both without and with recommended improvements). Key findings from this table are:

- During the AM peak hour, the project would cause the number of (existing) study intersections operating at LOS F to increase from eight under cumulative no project conditions to 18 under cumulative plus project conditions. The number of intersections operating at LOS F would be reduced to 11 with the proposed improvements in place.
- During the PM peak hour, the project would cause the number of (existing) study intersections operating at LOS F to increase from ten under cumulative no project conditions to 22 under cumulative plus project conditions. The number of intersections operating at LOS F would be reduced to 14 with the proposed improvements in place.

**Table 25:**
**Intersection LOS Summary – Cumulative Plus Project Conditions with Operational Improvements**

| Intersection Operations | Cumulative No Project Conditions | | Cumulative Plus Conditions | | | |
|---|---|---|---|---|---|---|
| | | | Without Improvements | | With Improvements | |
| | AM Peak Hour | PM Peak Hour | AM Peak Hour | PM Peak Hour | AM Peak Hour | PM Peak Hour |
| *Currently Existing Study Intersections (Operated with a Traffic Signal or All-Way Stop)* [1] | | | | | | |
| LOS D or Better | 21 | 18 | 15 | 8 | 19 | 16 |
| LOS E | 5 | 6 | 1 | 4 | 4 | 4 |
| LOS F | 8 | 10 | 18 | 22 | 11 | 14 |
| Total Intersections | 34 | 34 | 34 | 34 | 34 | 34 |

Notes:
1. Side-street stop intersections excluded because LOS F on a side-street is not as meaningful (i.e., volume could be low, downstream queuing effects, etc.). List includes West El Camino Avenue/El Centro Road intersection, which would be signalized with the project.

Source: Fehr & Peers, 2021.

## Potential Limitations to Travel Demand Forecasts (Emerging Technology)

While the SACSIM model represents ranges from state-of-practice to advanced-practice in travel modeling, travel behavior and the transportation systems are changing quickly in response to emerging trends, new technologies, and different preferences. Some of the new travel options and technologies emerging in the SACOG region are discussed below. Additionally, information about how technology is affecting travel is accumulating over time. Some of these emergent changes that could influence future travel forecasts include:

- Substitution of internet shopping and home delivery for some shopping or meal-related travel.
    - The 2018 SACOG Household Travel Survey (SHTS) showed that adults reported receiving a home delivery of a package on 17 percent of the travel days in the survey—and additional 4 percent received packages at work, food deliveries at home, etc. How these percentages compared to earlier years is not known.
    - National Household Travel Survey (NHTS) showed the number of online purchases with home delivery doubling between 2009 and 2017, from about 2.5 to 4.9 per household per month (FHWA 2018).
    - Comparisons of 2017 to 2009 NHTS data show that nationally, non-work trips per household declined by 11 percent. Most of that decline is attributed to lower rates of shopping trips and other family-related errands (FHWA 2018).
- New travel modes and choices
    - Transportation Network Companies (TNCs), car share, bike share, scooter share, and on-demand micro transit have increased the travel options available to travelers in the SACOG region and have contributed to changes in traditional travel demand relationships. The current share of resident trips served by TNCs is less than one-quarter percent, based on the 2018 SACOG Household Travel Survey (SHTS), and future growth depends on TNCs developing a sustainable business model.
- Automation of vehicles
    - Both passenger vehicles and commercial vehicles and trucks are evolving to include more automation. Research, development, and deployment testing is proceeding on fully Autonomous Vehicles (AV), for which no human driver would be required, and the vehicle itself can navigate the roadways to take people or goods where they need to go. Forecasts of how quickly research, development, and deployment testing will transition to full deployment and

marketing of fully AV vary widely both on the pace of the transition, and the market acceptance of fully autonomous operation. More uncertainty exists for the behavioral response to AVs. In terms of impact on the transportation system and the environment, a scenario of concern would be one in which AVs are privately owned, like most are at present, but the automated function of the vehicles would entice users to travel more. Examples of this phenomenon could include:

- Vehicles are repositioned to serve different members of a household (e.g., have a car drop a worker at their workplace, then drive back home empty to serve another trip, such as a student going to school). The repositioning of driverless vehicles could add significantly to traffic volumes and VMT.
- The time spent in a vehicle is reevaluated by travelers, resulting in an increase in the willingness to make longer trips. For example, if a person could read or do work in a vehicle instead of focusing on driving, they might be willing to commute longer to work. Conversely, a worker who prefers to live in a rural area, but is unwilling to drive far enough to act on that preference in a conventional vehicle, may be willing to do so in an AV.
- There may be an increasing willingness to drive more to avoid parking costs or tolls. For example, a person going to a sporting event in an area that charges for parking may use an AV to be dropped off at the venue, with the AV repositioning to an area that does not charge for parking.

SACSIM does not explicitly capture the above-mentioned new modes of travel and emerging trends in travel behavior. Through validation of the model to 2016 conditions, the cumulative effect of the new modes and changes are reflected in the resulting travel demand estimates, but the underlying behavioral impact of the modes are not modeled. Significant uncertainties exist at the present time that prevent explicit modeling of these new modes and emerging trends.

Additionally, future deployment levels for new modes of travel are unknown. For example, Uber and Lyft have both significantly increased trips, but both continue to run large operating losses and are reliant on investors to cover losses. A sustainable business model may require significant changes to services and/or fares, both of which could affect the trajectory of use and impact on travel behavior. Similar issues apply to bike share and other micro-mobility services.

The impact of new modes on individual and household travel behavior also is not fully understood and is the subject of ongoing research. Limitations on accessing utilization data directly from TNC vendors, in particular, constrains the ability to fully understand the impact of those services. Regulatory and legislative efforts to address the limits on access are underway in California and elsewhere, but these efforts will take

time. Only a few household travel surveys, including the 2018 SHTS, have surveyed TNC use in detail, and the e-assist JUMP bikes were introduced partway through the 2018 SHTS. Other major research studies focused on TNC use, and TNC driver behavior, are just being launched in California, and data collection and analysis has not yet started. Until this research is completed, there is no effective way to incorporate even the known new modes into travel demand models.

## Potential Limitations to Travel Demand Model and Forecasts (COVID-19)

Transportation and mobility are being transformed through a number of forces ranging from new technologies, different personal preferences, and the unique effects caused by the COVID-19 pandemic, the combination of which could alter traditional travel demand relationships in the near- and long-term future.

The COVID-19 pandemic and subsequent actions by federal, state, and local governments to curtail mobility and encourage physical distancing (i.e., limit in-person economic and social interactions) profoundly changed travel conditions. While travel activity will likely return to some form of normality after government shelter-in-place orders are lifted and the pandemic has concluded, it is likely that some of these temporary changes will influence people's travel choices into the future, including either accelerating or diminishing some of the emerging trends in transportation that were already underway prior to the pandemic.

The traffic counts collected for the transportation analysis pre-date any response to the pandemic. In addition, the travel demand forecasts developed for the transportation of the proposed project do not account for the potential short-term or long-term behavioral changes that may be instituted to reduce the general public's exposure level to this or other viruses moving forward. Although such measures (e.g. shifting to more telecommuting and virtual meetings) would tend to result in fewer average daily trips for most land uses, the degree that the changes would be implemented and their resilience over time is not known and cannot be predicted with a high degree of confidence.

# APPENDIX UT-1

## WATER SUPPLY ANALYSIS

☐ Press to clear form

**City of Sacramento**
**SB 610/SB 221 Water Supply Assessment and Certification Form**

This form may be used to complete water supply assessments for projects located in an area covered by the City's most recent Urban Water Management Plan.

Note: Please do not use this form if the projected water demand for your project area was not included in the City's latest Urban Water Management Plan. To review the City's Urban Water Management Plan, please visit: https://www.cityofsacramento.org/Utilities/Reports

**Project:** Upper Westside Specific Plan

**Date:** June 21, 2022

**Project Applicant (Name of Company):** Upper Westside, LLC

**Applicant Contact (Name of Individual):** Nick Avdis (Thomas Law Group on behalf of applicant)

**Phone Number:** (916) 287-9292

**E-mail:** navdis@thomaslaw.com

**Address:** 455 Capital Mall, Suite 801, Sacramento, California 95814

---

**Project Applicant to fill in the following:**

1. Does the project include:

| Type of Development | Yes | No |
|---|---|---|
| A proposed residential development of 500 or more dwelling units | ✔ | |
| A shopping Center employing more than 1,000 persons or having more than 500,000 square feet? | | ✔ |
| A Commercial Office building employing more than 1,000 persons or having more than 250,000 square feet? | ✔ | |
| A proposed hotel or motel, or both, having more than 500 rooms | ✔ | |
| A proposed industrial, manufacturing, or processing plant or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area | | ✔ |
| A mixed use project that includes one or more of the projects specified above | ✔ | |
| A project that would demand an amount of water equivalent to, or greater than, the water required by a 500 dwelling unit project | ✔ | |

If the answer is no to all of the above, a water supply assessment is not required for the project.

2. Is the projected water demand for the project location included in the City's 2020 Urban Water Management Plan, adopted June 29, 2021?

Yes: ✔ No: ☐

If the answer is no, you cannot use this form. Please refer to the requirements of SB 610 for preparing a water supply assessment.

3. Please fill in the project demands below:

| **Type of Development** | **Land Use Category** | **Demand Factor** | | **Proposed Development** | | | **Current Zoning** | | |
|---|---|---|---|---|---|---|---|---|---|
| | | Residential Water Use Factor, afy/dwelling unit | Non-Residential Water Use Factor, afy/employee | Number Dwelling Units | Number Employees | Total Demand | Number Dwelling Units | Number Employees | Total Demand |
| Residential - Low | Rural Residential (RR) | .61 | .09 | 197 | | 120 AF | | | |
| | Suburban Neighborhood Low Density (SNLD) | | | 2366 | | 1443 AF | | | |
| | Traditional Neighborhood Low Density (TLDR) | | | 1063 | | 649 AF | | | |
| Residential - Medium | Suburban Neighborhood Medium Density (SMDR) | .39 | .09 | | | | | | |
| | Urban Neighborhood Low Density (ULDR) | | | 749 | | 292 AF | | | |
| Residential - High | Suburban Neighborhood High Density (SHDR) | .12 | .04 | | | | | | |
| | Traditional Neighborhood Medium Density (TMDR) | | | 911 | | 109 AF | | | |
| | Urban Neighborhood Medium Density (UMDR) | | | | | | | | |
| | Traditional Neighborhood High Density (THDR) | | | | | | | | |
| Mixed Use | Employment Center Mid Rise (ECMR) | .19 | .09 | | | | | | |
| | Suburban Center (SCnt) | | | | | | | | |
| | Suburban Corridor (Scor) | | | | | | | | |
| | Traditional Center (TCnt) | | | 791 | | 151 AF | | | |

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Mixed Use - Higher Density | Urban Center High (UCntHigh) | .15 | .04 | 3279 | | 492 AF | | | |
| | Urban Center Low (UcntLow) | | | | | | | | |
| | Urban Corridor High (UCorHigh) | | | | | | | | |
| | Urban Corridor Low (UCorLow) | | | | | | | | |
| Central Business District | Central Business District (CBD) | .15 | .02 | | | | | | |
| | Urban Neighborhood High Density (UHDR) | | | | | | | | |
| Commercial | Regional Commercial (RC) | .15 | .09 | | | | 47.1 ac | @1.5 AF/ac | 70.7 AF |
| | Employment Center Low Rise (ECLR) | | | | | | | | |
| Industrial | Industrial (IND) | | .14 | | | | | | |
| Public | Public/Quasi-Public (PUB) | .37 | .17 | 141.1 ac | @2.0 AF/ac | 282 AF | | | |
| Park | Parks and Recreation (PRK) | .37 | .17 | 120.5 ac | @3.0 AF/ac | 362 AF | | | |
| Open Space | Open Space (OS) | 0 | 0 | 154.2 ac | | 0 AF | | | |
| Other | Agricultural (AR, AG) | 0 | 0 | | | | 2018.9 ac | | 0 AF |
| Other | | | | | | | | | |
| Other | Add'l demand per project's WMP | | | | | 342 AF | | | |
| **Total Demand (AFY)** | | | | | | 4,242 AF | | | 71 AF |

4. Required Elements of Water Supply Assessment (Water Code § 10910)

A. Water supply entitlements, water rights or water service contracts (Water Code § 10910(d)):

The City's water supply entitlements, water rights and water service contract are identified and discussed in the Urban Water Management Plan, Chapters 3, 6, and 7.

All infrastructure necessary to deliver a water supply to the project is in place, excepting any distribution facilities required to be constructed and financed by the project applicant: Yes: ✔ No: ☐

B. Identification of other sources of water supply if no water has been received under City's existing entitlements, water rights or water service contracts (Water Code § 10910(e)):

Not applicable.

C. Information and analysis pertaining to groundwater supply (Water Code § 10910(f)):

Addressed by Urban Water Management Plan, Chapters 3, 6, and 7.

**Verification of Water Supply**
**(for residential development of more than 500 dwelling units)**

Based on the City's most recent Urban Water Management Plan, are there sufficient water supplies for the project during normal, single dry and multiple dry years over a 20 year period?

Yes: ✔ No: ☐

# APPENDIX UD-1

## URBAN DECAY ANALYSIS

May 13, 2024

Todd Smith
Planning Director
County of Sacramento

Todd:

The County of Sacramento (County) is the lead agency preparing an Environmental Impact Report (EIR) for the proposed Upper Westside Specific Plan (UWSP), located just north of the City of Sacramento, in the unincorporated portion of the County. The plan area is envisioned to accommodate a range of land uses, including single-family and multifamily housing units; employment-generating uses, including retail, office, and hotel uses; educational uses; and recreation, open space, and other public/quasi-public land uses.

As part of the EIR, Economic & Planning Systems, Inc. (EPS) evaluated the potential for urban decay resulting from proposed retail development in the UWSP. The Urban Decay Analysis (UDA) report was completed in September 2022 and defined a Market Area for the purpose of evaluating the potential impacts of new retail in the UWSP and the cumulative impacts of UWSP and other new retail outlets in the Market Area. The defined Market Area includes portions of the Cities of Sacramento and West Sacramento and the County and is a thriving submarket in the Sacramento Region. The Market Area is estimated to accommodate substantial growth through 2052, and the analysis indicated support for new retail and retenanting of existing vacant space.

The UDA concluded that the projected impact of new retail development in the UWSP is unlikely to result in conditions conducive to urban decay. Further, the cumulative impacts of new retail development in the UWSP and other planned and proposed projects in the Market Area are unlikely to result in conditions conducive to urban decay. In the unlikely event existing retail establishments close, related to the cumulative impacts of new retail planned in the Market Area, conditions related to urban decay are not estimated to occur as retail market dynamics will continue to function to keep the new retail supply in line with the evolving nature of retail market demand. In addition, the Market Area exhibits strong market fundamentals, and property owners and tenants will have an economic incentive to maintain their properties and businesses.

Recently, the County inquired about the potential changes to the UDA findings, given the time that has passed and the development that has occurred since completion of the study.

The UDA projects population, household, and employment growth in the Market Area from 2022 to the estimated buildout at the time of the report of 2052. In response to the County's inquiry regarding the 2 years that have passed, EPS estimates that updating the study period from 2024 to 2054 would not significantly change the UDA's key findings.

EPS's cumulative retail analysis projected an addition of about 849,400 square feet of retail by 2052, reflecting an annual average of 28,300 square feet of new retail space added to the Market Area, excluding the UWSP. Since 2022, the Market Area experienced net new absorption of 197,272 square feet of retail, reflecting an average of 84,545 square feet per year. However, more than 80 percent of this new retail space comprises a new Costco, a unique community-serving bulk-retail establishment that will not compete with most of the existing or new neighborhood- and community-serving retail establishments in the Market Area, and the remainder includes small retail stand-alone strip-center developments with a median square footage of 2,700 square feet. Further, there has been significant residential growth in the Market Area, bolstering continued demand for retail space in the Market Area.

In the previous decade (including the most recent development in the last 2 years), the Market Area added an average of about 26,000 net new square feet of retail space. EPS estimates it is reasonable to assume over the long-term, 30-year study period, average annual retail absorption will likely follow historical trends as residential development absorbs similar to historical trends. In response to the County's inquiry regarding new retail space constructed in the Market Area between 2022 and 2024, although the specific tenants in the retail space recently constructed in the Market Area were not identified in the UDA, EPS concludes it is reasonable to assume the recent retail space constructed in the Market Area is accounted for in the cumulative portion of the analysis.

Sincerely,

ECONOMIC & PLANNING SYSTEMS, INC. (EPS)

Amy Lapin

# 1. EXECUTIVE SUMMARY

## Introduction

The County of Sacramento (County) is the lead agency preparing an Environmental Impact Report (EIR) for the proposed Upper Westside Specific Plan (hereafter, referred to as Upper Westside, UWSP, or the Project), located just north of the City of Sacramento in the unincorporated portion of the County. The plan is envisioned to accommodate a range of land uses, including single-family and multifamily housing units; employment-generating uses, including retail, office, and hotel uses; educational uses; and recreation, open space, and other public/quasi-public land uses. As part of the EIR, the Landowners, Upper Westside, LLC (Landowners), retained Economic & Planning Systems, Inc. (EPS) to evaluate the potential for urban decay resulting from proposed retail development in Upper Westside.

Based on State of California (State) case law and precedent established in previous urban decay analyses, urban decay relates to the impact of new retail development on existing retail development and is defined as the substantial and prolonged physical deterioration of properties or structures, resulting in discontinued use and investment, and adversely affecting the health, safety, and welfare of the surrounding community. It is important to note that case law establishes that urban decay is not defined as the closing of one specific or even multiple stores, and new development does not trigger an automatic presumption of urban decay.[1] However, courts have found that lead agencies have an obligation to consider whether land use decisions may cause a chain reaction of store closures, long-term vacancies, and physical manifestations of urban decay, which has the potential to destroy existing neighborhoods.[2] Manifestations of urban decay may include various signs of physical blight such as abandoned buildings, boarded storefronts, litter, uncontrolled vegetation, vandalism, and graffiti.

This Urban Decay Analysis (Study) estimates the extent to which new retail development in Upper Westside would have competitive impacts on existing retail outlets in the defined Market Area and consequently cause or contribute to urban decay (Project-Specific Impacts).

In addition, in accordance with California Environmental Quality Act (CEQA) Guidelines Section 15130, this Study examines the effects of retail development in Upper Westside *and* other proposed projects in the defined Market Area on existing retail outlets and estimates the likelihood this cumulative development will cause or contribute to urban decay (Cumulative Impacts).[3] The Cumulative Impacts analysis is based on the assumption that a portion of planned retail space in the defined Market Area will develop within the defined Study period.

[1] Bakersfield Citizens for Local Control v. City of Bakersfield (2004), 124 Cal. App. 4th 1184.

[2] Ibid.

[3] Title 14 of the California Code of Regulations, Chapter 3, Guidelines for the CEQA Article 9, Section 15130, clarifies that, "cumulative impacts are created as a result of the combination of the project being evaluated in the [EIR] together with other projects causing related impacts."

However, new retail space requires adequate market support and, depending on continued changes in the retail market, may not actually develop to the extent estimated in this Study.

## Project Overview

Upper Westside is a new mixed-use community covering nearly 2,000 acres located in the County west of the City of Sacramento (City), north of Interstate 80, southwest of Interstate 5, east of the Sacramento River, and south of the Sacramento International Airport. See **Map 1-1**.

The Project is intended as a sustainable self-contained suburban community with the feel of an urban location provided by a dense, vertical, mixed-use town center, including a one-mile-long recreational canal as the focal point connecting the town center with surrounding suburban-like development including single-family residential uses, park space, and educational facilities. Development is anticipated to occupy about 1,500 acres with about 500 acres allocated as open space/agricultural buffer zone between development and the Sacramento River. Planning for the Project has been underway since 2019 and requires General Plan amendments to move the Urban Services Boundary (USB) and Urban Policy Area (UPA). The most recent iteration of the Project Land Use Plan was prepared in January 2022, as described in more detail below.

### Project Land Uses and Study Period

Upper Westside is estimated to comprise approximately 9,356 residential units. About 47 percent of these units will comprise single-family dwelling units, including Very Low, Low, Low/Medium, and Medium Density housing units. The remaining 53 percent of the residential portion of the Project comprises 4,981 multifamily units (including High and Very High density and Mixed-Use housing units).

Upper Westside is also being planned to include about 3.1 million gross building square feet of nonresidential space, including approximately 575,800 square feet of retail, 1.9 million square feet of office, 464,400 square feet of hotel space, and 154,800 square feet of institutional space. Refer to **Figure 1-1** below for a summary of proposed Project land uses, which are used to estimate supply and demand characteristics in this Study.

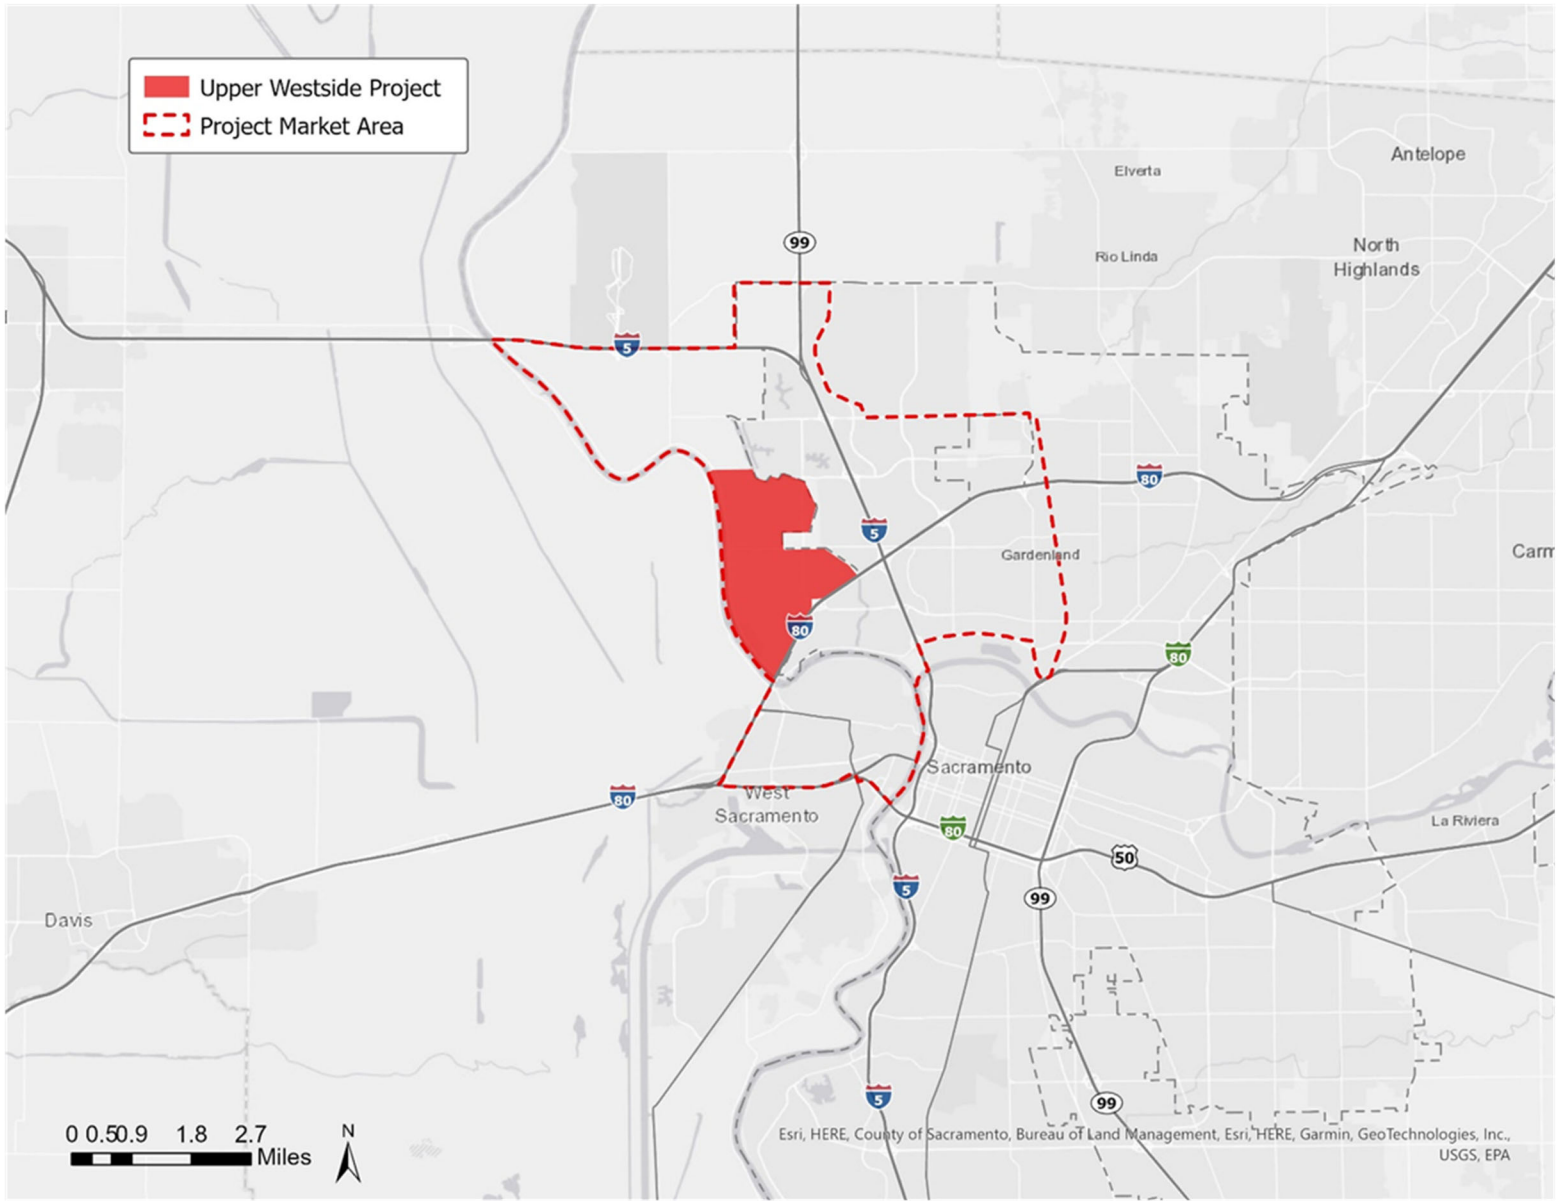

**Figure 1-1. Gross Land Use Summary**

| Land Use | Total | % of Total |
|---|---|---|
| **Residential Units** | | |
| Single Family | 4,375 | 47% |
| Multifamily | 4,981 | 53% |
| **Total Units** | **9,356** | **100%** |
| **Nonresidential Sq. Ft. [1]** | | |
| Office | 1,901,200 | 61% |
| Retail | 575,800 | 19% |
| Hotel | 464,400 | 15% |
| Institutional | 154,800 | 5% |
| **Total Sq. Ft.** | **3,096,200** | **100%** |

Source: Table 2-1.

[1] Figures rounded.

**Map 1-1. Upper Westside Specific Plan Regional Context**

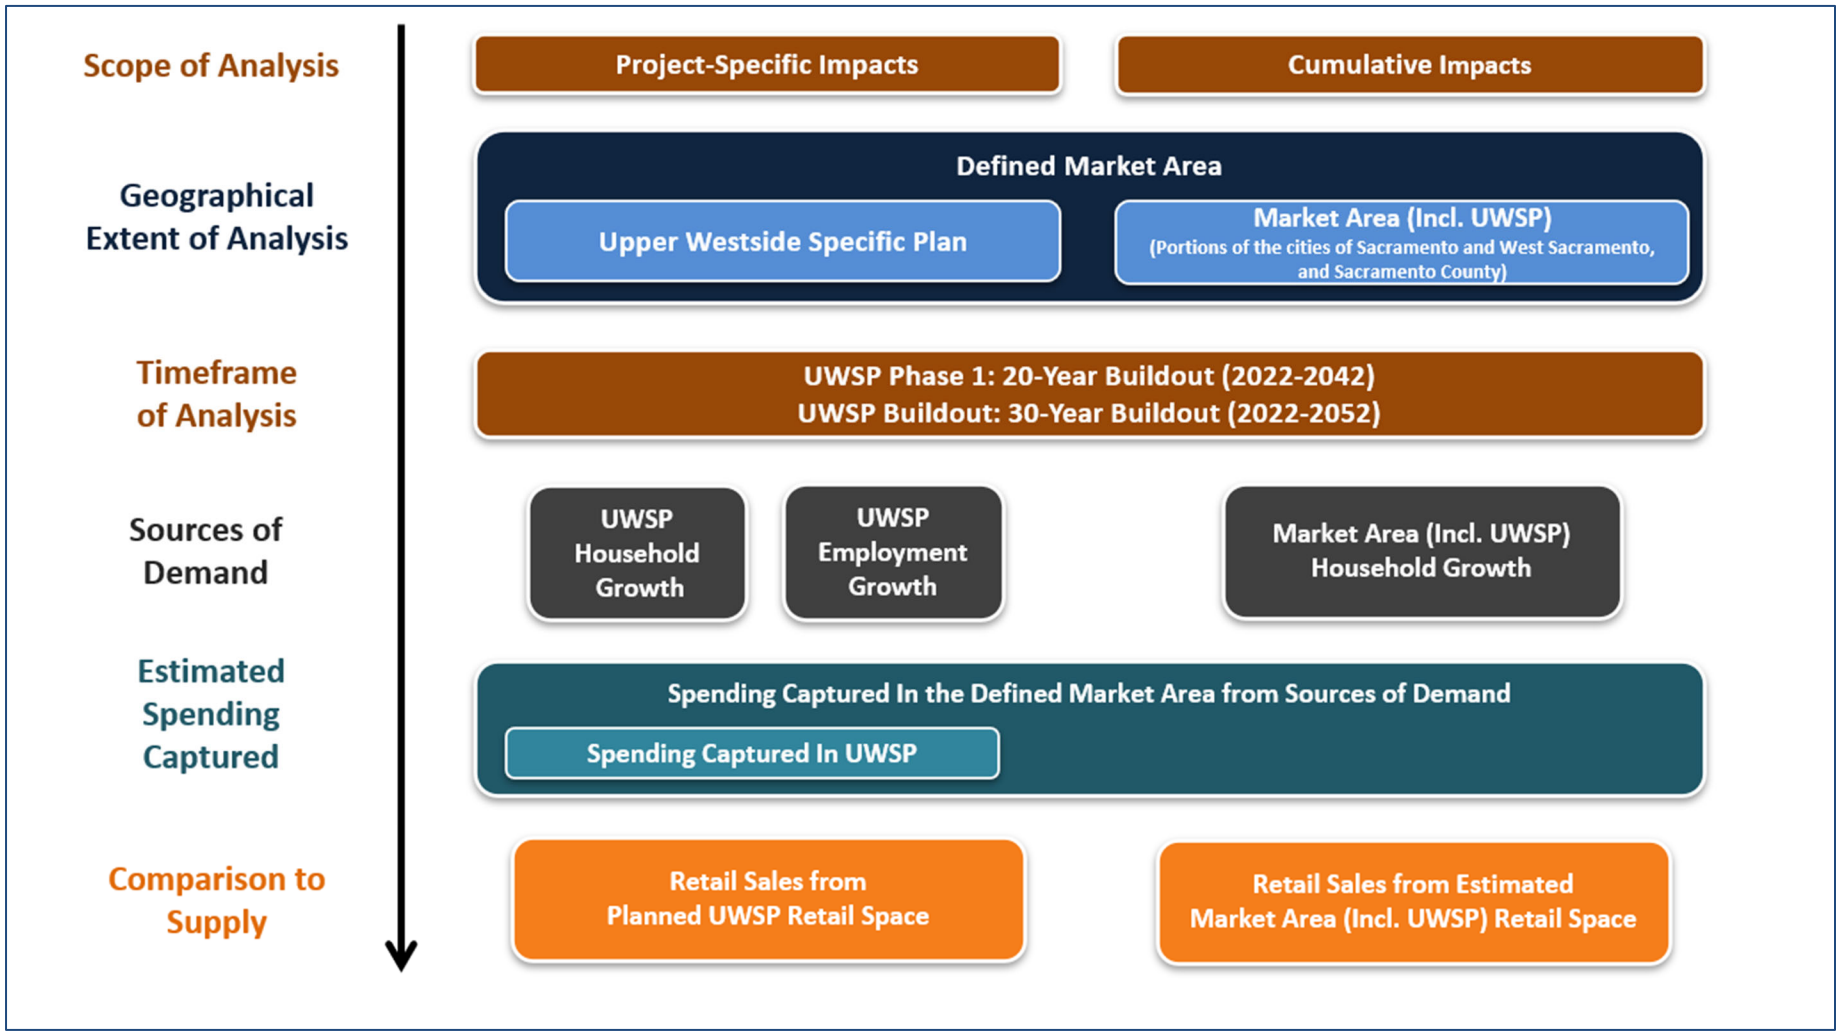
Development of Upper Westside is assumed to occur over an extended period. This Study evaluates the impacts of development for an estimated buildout period from 2022 to 2052.

## Study Overview

The sections below concisely describe this Study's methodology and key resources used in the analysis.

### Study Methodology

The following tasks were involved in evaluating the potential for urban decay from the development of Upper Westside (Project-Specific Impacts), and Upper Westside in combination with other planned projects in the Market Area (Cumulative Impacts):



- Estimated gross and occupied land uses and demographic characteristics for the Project.
- Defined a retail market area (Market Area), which encompasses portions of the cities of Sacramento and West Sacramento, and Sacramento County.
- Identified the analytical timeframe of the Study, which extends through the buildout of the Project (2022 to 2052).
- Assessed the existing retail market conditions in the cities of Sacramento and West Sacramento, Sacramento County, and the Market Area.
- Estimated existing and projected Market Area retail demand from sources outside and inside the Project.
- Estimated the potential impact of proposed retail in the Project on existing retail outlets in the Market Area (Project-Specific Impacts).
- Identified planned and proposed retail projects in the Market Area greater than 20,000 square feet (in addition to retail in the Project) and estimated total sales.
- Estimated the potential impact of cumulative retail projects, including the Project, estimated to be absorbed within the Study period, on existing retail outlets in the Market Area (Cumulative Impacts).
- Assessed market supportability and identified the potential for urban decay associated with retail development in the Project and other projects in the Market Area.

The technical analyses for the above tasks are exhibited in the report tables and appendices in this report. Refer to **Figure 1-2** for a graphical representation of the retail analysis methodology.

### Study Resources

EPS used many resources for urban decay analysis; these resources are documented in the technical analysis tables and the report and summarized below.

**Figure 1-2. Analysis Methodology Flow Chart**

***Government Resources***

EPS used information provided by the cities of Sacramento and West Sacramento; Sacramento County; the California Department of Finance; the Sacramento Area Council of Governments; the California Department of Tax and Fee Administration; the 2020 U.S. Economic Census; the U.S. Census; the U.S. Bureau of Labor Statistics; and the U.S. Census of Retail Trade.

***Other Technical Analyses***

Additional technical analyses referenced include Wood Rodger's Upper Westside Land Use Summary, received January 14, 2022; Title V: Special Planning Areas and Neighborhood Preservation Areas Chapter 5 Article 3—Metro Air Park Special Planning Area (Amended November 16, 2018); Sutter Pointe Specific Plan Chapter 3: Land Use; and North Natomas Infill Redevelopment Planned Unit Development, dated November 8, 2018.

***Third-Party Resources***

Other third-party resources used include data from CoStar; The Gregory Group; shopping center broker Web sites; the Sacramento Business Journal; the Sacramento Bee; Esri Business Analyst Online; International Council of Shopping Centers, "U.S. Shopping Center Classification and Typical Characteristics," April 2017; BizMiner 2016; eMarketer 2017; various retail corporation annual 10-K reports; and the Urban Land Institute.

# Summary of Findings

## Market-Based Findings

- **The national retail market has continued to adapt to a high degree of volatility.** Since 2009 and with the onset of the COVID-19 Pandemic in 2019/2020, the national retail market has continued to experience turbulence and a high degree of uncertainty regarding tenanting and absorption forecasting. It is widely acknowledged that an oversupply of retail space exists nationally and with an increasing market share of online shopping (e-commerce) and changing consumer preferences, the amount of retail building square footage supportable by the market may decline in the future. The digital shift fast-forwarded by the Pandemic set off a "retail reset" causing retailers to rethink their shopping models. Retailers that survived the Pandemic did so by bolstering their digital presence, providing increased e-commerce options such as "click and collect," reducing the amount of in-store inventory, and decreasing the number of physical stores.[4]

  Since the earliest days of retail trade, the retail sector has adapted, with new retail tenants, concepts, and formats continuing to emerge and establish their presence. The large volume of store bankruptcies, closures, and consolidations from the economic downturn and the effects of the Pandemic paved the way for retail-sector adaptations, as well as provided opportunities for replacing retail space with other land uses, including residential, medical office, self-storage, religious institutions, public uses, and experiential uses.

[4] "Click and collect" is defined as an e-commerce model in which people purchase or select items online and pick them up in-store or at a centralized collection point.

- **Despite changing dynamics in the national retail market, Market Area retail exhibits strong market fundamentals.** The cities of Sacramento and West Sacramento and Sacramento County, portions of which are contained in the Market Area defined in this Study, have maintained a healthy equilibrium since the last economic downturn and during the Pandemic. Supported by population growth and rising household incomes, the retail market has remained stable, in particular for retail development in well-located centers near growing neighborhoods. Retail vacancy in the surrounding jurisdictions has not surpassed 10 percent since emerging from the Great Recession. Vacancy rates in the Market Area have been below or at 5 percent since 2013. A healthy vacancy rate is considered to fall between 5 percent and 10 percent to allow for natural ebbs and flows of the market. A vacancy rate below 5 percent reveals a tight market and indicates the potential for additional supply. Despite the disruptions in the national retail market environment, with continued retail store closures and consolidations, increasing e-commerce market share, and changing consumer preferences, the retail in the three jurisdictions continues to strengthen, showing positive net absorption over the past 5 years.

### Market Area Findings

- **The Market Area, composed of portions of the cities of Sacramento and West Sacramento, and Sacramento County, is a thriving submarket in the Sacramento Region.** As of 2022, the Market Area contains an estimated total of 37,700 households, a population of about 100,000 residents, and almost 55,300 jobs. The Market Area contains a total of 5.2 million square feet of neighborhood-, community-, and regional-serving retail predominantly dispersed to the east of Interstate 5 in North and South Natomas and near Interstate 80 in the City of West Sacramento. The Market Area has a retail benchmark of about 52 square feet per capita, consistent with the retail benchmark for the Sacramento Region (Region), which includes Sacramento, El Dorado, Placer, Sutter, Yuba, and Yolo Counties, as a whole.[5] In comparison, the Project contains a benchmark of 22 retail square feet per capita, aligned with the neighborhood- and community-serving retail benchmark (excluding regional-serving retail space) in the Region.

- **The Market Area and adjacent areas are estimated to accommodate substantial growth through 2052.** In addition to the Project, other major projects in the Market Area include Northlake, Innovation Park & CNU Medical Campus, NorthPointe, and other smaller projects in the City of West Sacramento. Adjacent to the Market Area, other major projects include Metro Air Park, Sutter Pointe, Grandpark, and the buildout of the North Natomas CPA. These projects are estimated to accommodate significant residential and employment growth; by 2052, the Market Area alone is estimated to add about 31,500 households, with 28 percent of these households in the Project and 72 percent in the remainder of the Market Area. This level of growth represents an increase in households of about 84 percent over the current number of households in the Market Area.

[5] The benchmark survey includes data as of 2020 from the California Department of Finance and CoStar.

The Market Area is also anticipated to add nearly 32,500 new jobs, with about 27 percent of those jobs contained in Upper Westside, and the remaining 73 percent located in the balance of the Market Area. This level of growth equates to an increase in jobs of about 60 percent over existing employment in the Market Area.

The Project is envisioned to contain 575,800 gross square feet of community- and highway-serving retail development. Development of the gross square footage of the planned and proposed projects, including both the Project (**Table 2-1**) and all proposed commercial retail supply in the Market Area (**Table 5-3**), would equate to 1.5 million square feet of new retail development in the Market Area, which represents a 29 percent increase over current retail inventory. Total existing and new retail inventory (about 6.6 million square feet) would result in a benchmark of 53 square feet per capita in the Market Area, an increase of 1 square foot per capita over the current retail benchmark. At the time of this Study, planned and proposed projects elsewhere in the Market Area, excluding the Project, are estimated to contain an additional 912,000 gross square feet of retail development. Because of the significant amount of retail development, EPS has discounted the amount that could be absorbed in the Study period and potentially supported by Market Area residents for the Cumulative Impact analysis, estimating 639,000 square feet will be absorbed through the Study period (though 2052) as described in more detail later in this report (**Table 5-4**).

- **The Market Area retail market fundamentals indicate support for additional retail and the ability to fill existing vacant space.** Current vacancy in the Market Area is estimated at 3.4 percent, indicating a tight market with limited available space. The available space comprises only two spaces larger than 20,000 square feet. One space comprises a former 34,860-square-foot Safeway, vacant since 2018, in the West Capitol Plaza, a 125,700-square-foot community-oriented shopping center built in 2002 located in the central business district adjacent to the City of West Sacramento City Hall in West Sacramento. This area is slowly revitalizing with a recently built hotel, multifamily housing project, and roadway and streetscape infrastructure improvements. The other space is a 28,7200-square-foot former Big Lots, vacant since 2014, in the older, but well-maintained Northgate Shopping Center, a 119,700-square-foot community-oriented shopping center build in 1979 in South Natomas on the outskirts of an established residential area adjacent to other retail centers built in the 2000s.[6] The outlook for re-tenanting these vacant spaces looks favorable as these centers and areas have very little vacancy, the centers are in good condition and the vacant space is actively being marketed, and the Market Area has demonstrated positive net absorption over the past 3 years as area retail continues to evolve with the changing market and a history of re-tenanting activity as described later in this section.[7] A 4-mile radius containing the Market Area saw over 70 lease transactions since the beginning of 2019, with 7 transactions greater than 12,000 square feet, as North Natomas continues to grow.[8]

[6] Data obtained from CoStar, accessed in February 2022.

[7] Ibid.

[8] Ibid.

## Project-Specific Urban Decay Impacts

- **New retail development in Upper Westside is unlikely to result in conditions conducive to urban decay.** As described in this Study, captured spending from new Project households and Project employees are anticipated to fully support Project retail space planned in Phase I. Spending captured at Project buildout is estimated to require additional sources of demand beyond the Project's estimated capture of internal sources of demand from households and employees. This Study estimates approximately $65.8 million would be required from external sources to support the Project at buildout, representing approximately 4.6 percent of existing retail sales in the Market Area.

  The Project-specific analysis excludes other new sources of demand that will certainly offset the estimated Project sales not captured by new households and employees in the Project. Notably, the project-specific analysis excludes estimates of sales from pass-by traffic for the Project's highway-oriented retail along Interstate 5 and Interstate 80. In addition, the analysis excludes market support from the incremental growth in households and employees in the Market Area, outside of the Project, which will patronize existing and new retail establishments in the Market Area, including the mixed-use retail uses in the Project town center.

  In EPS's professional opinion, new retail outlets in the Project are not likely to lead to conditions conducive to urban decay (substantial and prolonged physical deterioration of properties or structures resulting in discontinued use and investment). Although there is no absolute rule, most establishments usually can withstand a short-term sales shift of 5 percent to 7 percent over a 3- to 5-year timeframe, as this typically represents a business cycle downturn.[9] The percentage shift away from existing retail establishments at buildout is well below the threshold at which an otherwise healthy retail sector could recover and is expected to be offset with other sources of demand conservatively excluded from this Study. The percentage shift of sales from existing retail outlets is estimated to decline as population and employment growth continue in the Market Area.

  With the Market Area exhibiting strong market fundamentals, property owners and tenants will have an economic incentive to maintain their properties and businesses as demonstrated by the existing physical conditions of retail centers in and adjacent to the Market Area, which appear clean and well-maintained as shown in **Appendix B**.

[9] This metric is based on decades of retail market research conducted by EPS, including an evaluation of retail sales and total establishment data collected from the California State Board of Equalization and Department of Tax and Fee Administration.

## Cumulative Urban Decay Impacts

- **All new planned and proposed retail development in the Market Area is unlikely to absorb within this Study's period of analysis (2022-2052) and may not ever develop.** EPS estimates that all of the cumulative projects will absorb by 2052, except for the NorthPointe project, which is in its early planning stages but is still assumed to be 50 percent developed by 2052. Using the same method of Market Area capture estimated for the Project, EPS estimates that 80 percent of planned retail sales will be captured by households in the Market Area, with the remaining 20 percent drawn from consumers outside of the defined Market Area. All that considered, the amount of future cumulative planned retail assumed in this Study may represent a conservatively high estimate of supportable retail space in the Market Area, given trends occurring in the retail sector.

  It is also important to note that some of the other projects in the Market Area included in the Cumulative Impacts analysis have not yet achieved full project entitlement, have speculative development timelines, or may be in the process of submitting applications to change land uses. Planned and proposed retail space may not ever develop or may develop at a lower density and intensity than currently planned. Therefore, conclusions regarding the Cumulative Impacts analysis should be considered conservative.

- **The Cumulative Impacts of new retail development in Upper Westside and other planned and proposed projects in the Market Area are unlikely to result in conditions conducive to urban decay.** The Cumulative Impact analysis examines the estimated impact of retail development in Upper Westside and other planned and proposed projects in the Market Area, through the buildout of the Project, on existing retail outlets. Identification of the retail supply pipeline indicates there is a large amount of retail planned in the Market Area (about 912,000 square feet), although approximately 70 percent of this potential supply is anticipated to be absorbed through 2052 (about 639,000 square feet). This estimated amount of retail absorption is commensurate with estimated residential absorption in planned and proposed projects in the Market Area. This Study also applies an adjustment factor to the amount of estimated retail space absorbed through 2052 to account for the estimated proportion of supportable retail space from Market Area households and Project employment. That is, other sources of demand are not estimated in this analysis that will support new community- and highway-serving retail development (e.g., new employees in the Market Area outside the Project, residents outside the Market Area).

  With these adjustments and an average retail market vacancy rate, the Cumulative Impacts of retail development in the Project and other planned and proposed projects in the Market Area are estimated to provide an estimated 4.1 percent increase in demand to support existing Market Area retailers in Phase 1 and essentially break even at buildout, with an estimated 0.3 percent increase in demand for existing Market Area retailers. Thus, it is EPS's professional opinion that the estimated increase in available demand is unlikely to lead to conditions conducive to urban decay. With the Market Area exhibiting strong market fundamentals, property owners and tenants will have an economic incentive to maintain their properties and businesses. Furthermore, retail market dynamics will continue to function to keep the new retail supply in line with the evolving nature of retail market demand.

- **Conditions conducive to urban decay are not estimated to occur in the unlikely event existing retail establishments close related to the cumulative impacts of new retail planned in the Market Area.** Property owners and tenants have an economic incentive to maintain their businesses and properties if long-term market conditions are expected to be favorable. Even during the lengthy economic downturn, when vacancy rates rose higher than 13 percent over 3 years in the Market Area, the retail sector did not experience conditions related to urban decay because of the expectation that market conditions would improve. The retail sector is inherently very competitive and dynamic with tenants adapting formats to meet changing consumer preferences or other market trends. In the event vacancies occur, either as a result of new retail space or other changing market dynamics, vacated spaces have the potential to be re-tenanted or repositioned with another retail or nonretail specialization or use, such as the former 25,000-square-foot Borders (North Natomas) and the 20,740-square-foot Big Lots (West Sacramento), both of which were re-tenanted by a Planet Fitness, the 19,991-square-foot OfficeMax (North Natomas) filled by Boot Barn, and the former 155,000-square-foot Fry's (North Natomas), which is being redeveloped as industrial space. Furthermore, jurisdictions in the Market Area have ordinances and code enforcement tools to address blight and signs of deferred property maintenance that assist in mitigating conditions that lead to urban decay.

## Report Organization

This report contains 6 chapters. Following this initial introductory chapter and summary of findings, **Chapter 2** provides an overview of the Project. **Chapter 3** assesses the existing retail market conditions and socio-economic characteristics in the Market Area. **Chapter 4** estimates projected new retail demand. **Chapter 5** identifies the cumulative retail supply in the Market Area and the estimated sales. **Chapter 6** evaluates the potential impacts of the Project on the existing retail market, as well as the potential impacts of the cumulative retail projects, including the Project, on existing retail and the potential for urban decay.

# 2. *Introduction and Project Description*

The County is the lead agency preparing an EIR for the proposed Project, located in the northwest unincorporated County area. The approximately 1,530-acre Project is envisioned to accommodate a range of land uses, including single-family and multifamily housing; employment-generating uses including retail, office, and hotel uses; educational uses; and recreation, open space, and other public/quasi-public land uses. As part of the EIR, the Landowners retained EPS to evaluate the potential for urban decay resulting from the retail component of Upper Westside.

This Study estimates the extent to which new retail development in Upper Westside would have competitive impacts on existing retail outlets in the defined Market Area and consequently cause or contribute to urban decay (Project-Specific Impacts). This Study also examines the effects of other proposed retail projects in the defined Market Area, in conjunction with Upper Westside, on existing retail outlets and estimates the likelihood this cumulative development will cause or contribute to urban decay (Cumulative Impacts).[10]

Following an overview of the definition of urban decay, the remainder of this chapter provides an overview of the Project, including proposed land uses and estimated demographic characteristics of the Project. Subsequent chapters assess existing retail market conditions and evaluate Project-Specific Impacts and Cumulative Impacts.

## Overview of Urban Decay

Based on State case law and precedent established in previous urban decay analyses, urban decay is defined as the substantial and prolonged physical deterioration of properties or structures, resulting in discontinued utilization and investment, and adversely affecting the health, safety, and welfare of the surrounding community. It is important to note that case law establishes that urban decay is not defined as the closing of one specific or even multiple stores, and new development does not trigger an automatic presumption of urban decay.[11] However, courts have found that lead agencies have an obligation to consider whether land use decisions may cause or contribute to a chain reaction of store closures, long-term vacancies, and physical manifestations of urban decay, which has the potential to destroy existing neighborhoods.[12] Manifestations of urban decay may include various signs of physical blight such as abandoned buildings, boarded storefronts, litter, uncontrolled vegetation, vandalism, and graffiti. Additional information regarding the case law underpinning urban decay is described in **Chapter 6**.

---

[10] Title 14 of the California Code of Regulations, Chapter 3, Guidelines for the California Environmental Quality Act (CEQA) Article 9, Section 15130, clarifies that, "cumulative impacts are created as a result of the combination of the project being evaluated in the [Environmental Impact Report] together with other projects causing related impacts."

# Project Overview

## Upper Westside Specific Plan

Planning for development in the northwest County, in which the Project is located, has been underway for more than 20 years. In the late 1990s, the City and the County endeavored to urbanize a substantial portion of the Natomas Basin, which spans from the American River to the south, the Sacramento River to the west, Steelhead Creek to the east, and the Cross Canal to the north, extending into Sutter County.

In 2001, the City and the County coordinated efforts and initiated the Joint Vision for Natomas (now called the Natomas Vision Plan), which focused on the unincorporated County portion of the Natomas Basin. The Natomas Vision Plan was a comprehensive planning process that integrated urban planning and design, open space and habitat preservation, agricultural preservation, municipal service delivery, and environmental sustainability considerations.

## Project Description

The Project Administrative Draft Specific Plan, prepared in February 2021, proposes a new mixed-use community in the Natomas Vision Plan area. The Project encompasses a little over 1,530 acres west of Highway 99, south of Interstate 5, and is bordered by Interstate 80 to the south, and the Sacramento River to the west. There is existing freestanding retail within the Project located near the Interstate 80 interchange at W. El Camino Avenue comprising highway-oriented retail with a couple of gas stations, fast food, diners, a truck stop, and a hotel.[13] The Project is connected directly to the regional transportation network along Interstate 80 as well as indirect access to Interstate 5, providing direct access to key proximate employment, service, and retail centers along Interstate 5 and Interstate 80 such as the Sacramento International Airport, North and South Natomas, West Sacramento, and Downtown Sacramento. Further, the Project is located near major development projects—both proposed and in progress—including the Grandpark Specific Plan to the north; Metro Air Park and the Northlake development project, both about 3 miles to the north above Interstate 5; the Northpointe development project located less than 3 miles north from the Project below Interstate 5; The Innovation Park and CNU development located east of the Project; the Highway 99-Interstate 5 Interchange; the dense Railyards development north of Downtown Sacramento; and West Sacramento's Bridge District. **Map 1-1** displays the Upper Westside area within the context of the greater Sacramento Region.

The Project is intended to develop as a sustainable self-contained suburban community with the feel of an urban location provided by a dense, vertical, mixed-use town center, including a one-mile-long recreational canal as the focal point connecting the town center with surrounding suburban-like development including single-family residential uses, park space, and educational facilities. Overall, the Project will provide a range of housing choices, employment opportunities, schools, parks, shopping, and services. The Project is expected to provide residential and retail

[13] The retail sales for the existing development are assumed to be accounted for in the analysis within existing Market Area sales and is therefore excluded from the retail square footage of the Project and corresponding sales estimates.

land uses to accommodate growth in a location adjacent to existing and planned infrastructure, urban services, transportation corridors, and regional job centers. The Project is planned to maintain flexibility to adapt and adjust to changing economic and market conditions, given the Project's long-term buildout period.

#### *Study Period*

This Study is based on an estimated 30-year Project buildout period, commencing in 2022 and ending in 2052. The analysis includes an examination of Phase 1 of the Project, which comprises a 20-year buildout. These timeframes are generally consistent with buildout assumptions used in the EIR. Note that demand from future development outside the Project within the defined Market Area commences from the time of this Study (2022) and ends in the same year as the proposed Project buildout, 2052.

## Land Use Summary

The full urban uses in the Specific Plan include housing units with a range of types and densities, retail and general commercial uses, mixed-use, and substantial open space and recreational uses. Based on the Specific Plan land use summary, prepared by Upper Westside LLC in October 2021, the Project is planned for approximately 9,356 residential units and 3.1 million square feet of nonresidential uses, including 575,760 square feet of retail space. The proposed land uses are summarized in **Table 2-1**. **Table 2-2** provides the estimated residential and employee populations for the Project. Additional information regarding residential and nonresidential development in the Project is provided below.

### Upper Westside Residential Uses

#### *Total and Occupied Residential Units*

The Project is envisioned to include about 9,356 residential units, comprising about 4,375 single-family homes (including Very Low, Low, Low/Medium, and Medium Density housing units) and 4,981 multifamily units (including High and Very High density and Mixed-Use housing units). Overall, planned housing in the Project reflects a proportion of 47 percent single-family units and 53 percent multifamily units, as reflected in **Table 2-1**.

To account for normal fluctuations in the market, this Study applies a 3 percent vacancy rate to total single-family residential units and an 8 percent vacancy rate to total multifamily residential units. Based on these vacancy rates, the Project is estimated to contain a total of 8,830 occupied residential units.

*pop emp*

Source: Wood Rodgers; EPS.

[1] EPS applied standard frictional vacancy rate assumptions to gross development totals.
[2] Population density assumptions provided by the UWSP, employment density assumptions per EPS based industry standards. The UWSP estimated population figures do not match EPS's estimates due to an updated mix of residential units by type.
[3] Residential Commercial Mixed-Use acreage and Commercial Square Footage included in the nonresidential portion.

### *Residential Households and Population*

Project residential population is included for informational purposes but is not used; this Study estimates demand for retail space based on households and household spending on retail goods and services. In this analysis, EPS assumes that housing units serve as a proxy for households. Based on population density assumptions for each residential land use type, this analysis estimates that the Project's 8,830 occupied housing units will house approximately 24,200 residents.[14] Refer to **Table 2-2** for details regarding total and occupied housing units and the estimated residential population in the Project.

## Upper Westside Nonresidential Uses

### *Total and Occupied Nonresidential*

Upper Westside includes 3.1 million gross building square feet of nonresidential land uses on approximately 137 gross developable acres, as shown in **Table 2-1**. Nonresidential development includes retail, office, hotel, and institutional land uses.

Total retail development is estimated to comprise 575,760 gross square feet while the remaining nonresidential development (office, hotel, and institutional) is planned for 2.5 million square feet. This Study applies a 6 percent frictional vacancy rate to account for normal fluctuations of occupied space in the real estate market.[15] As such, total occupied nonresidential development is estimated to equal about 2.9 million building square feet, with about 541,200 square feet of occupied retail development. **Table 2-2** details both total and occupied nonresidential building square feet proposed in the Project.

The estimate of 541,200 square feet of occupied retail in the Project is composed of the following assumed types of occupied space:

- Approximately 367,900 square feet of Commercial Mixed-Use Retail.
- Approximately 173,300 square feet of Employment/Highway Commercial Retail.

The Mixed-use retail development is estimated to include a combination of neighborhood- and community-serving retail comprising restaurants, shops, services, entertainment uses, and a small grocery store to provide convenience goods and personal services for the daily needs of the immediate neighborhood. The Employment/Highway Commercial-serving retail development services the immediate neighborhood as well as pass-by freeway traffic with envisioned tenants comprising a conventional grocery store, drive-thru fast food restaurants, fast-casual restaurants, specialty stores, movie theater, and/or fitness. The Project is not envisioned to

[14] Total residential population differs from the UWSP dated February 2021 because EPS used an updated land use plan from Wood Rodgers with a different mix of residential units by type, however the density remains the same as the SP.

[15] Frictional vacancy is the amount of vacant space needed in a market for its orderly operation. In a stabilized market, where supply and demand are in balance, frictional vacancy allows for short-term changes in occupancy, the 6 percent vacancy is also the average vacancy rate for the Market Area from 2010 through 2021.

contain any Regional-Serving retail development, which contains a greater amount of building square footage and comprises multiple general merchandise stores, home furnishings, and apparel anchors. Refer to **Table A-1** in **Appendix A** for more details regarding general retail centers type.

***Nonresidential Employee Population***

The Project's nonresidential land uses are assumed to have varying employee density assumptions (occupied building square feet per employee). Based on these assumptions, the total employee population for Upper Westside at buildout is estimated to be approximately 8,900. About 13 percent of these employees will be employed at the Project's retail development, while the remainder will be employed in the Project's office, hotel, and institutional uses. **Table 2-2** exhibits the employee density assumptions, as well as the estimated Project employee population, based on occupied nonresidential land uses.[16]

[16] EPS's employment density assumptions are based on average industry standards and differ from the employment density assumptions provided in Fehr & Peer's traffic analysis. The square feet per employee assumptions in the traffic analysis are generally lower than EPS's assumptions and therefore provide a higher estimate of 11,857 total employees generated by the Project compared to EPS's estimate of 8,912 employees. EPS's employment density assumptions provide a more conservative analysis as the traffic study's higher employment count would increase estimated demand from new Project employees reducing the overall impacts of the Project.

# 3. EXISTING RETAIL CONDITIONS

This chapter provides a detailed overview of the defined Upper Westside Market Area used to examine current and proposed estimates of supply and consumer demand.

## Market Area Description

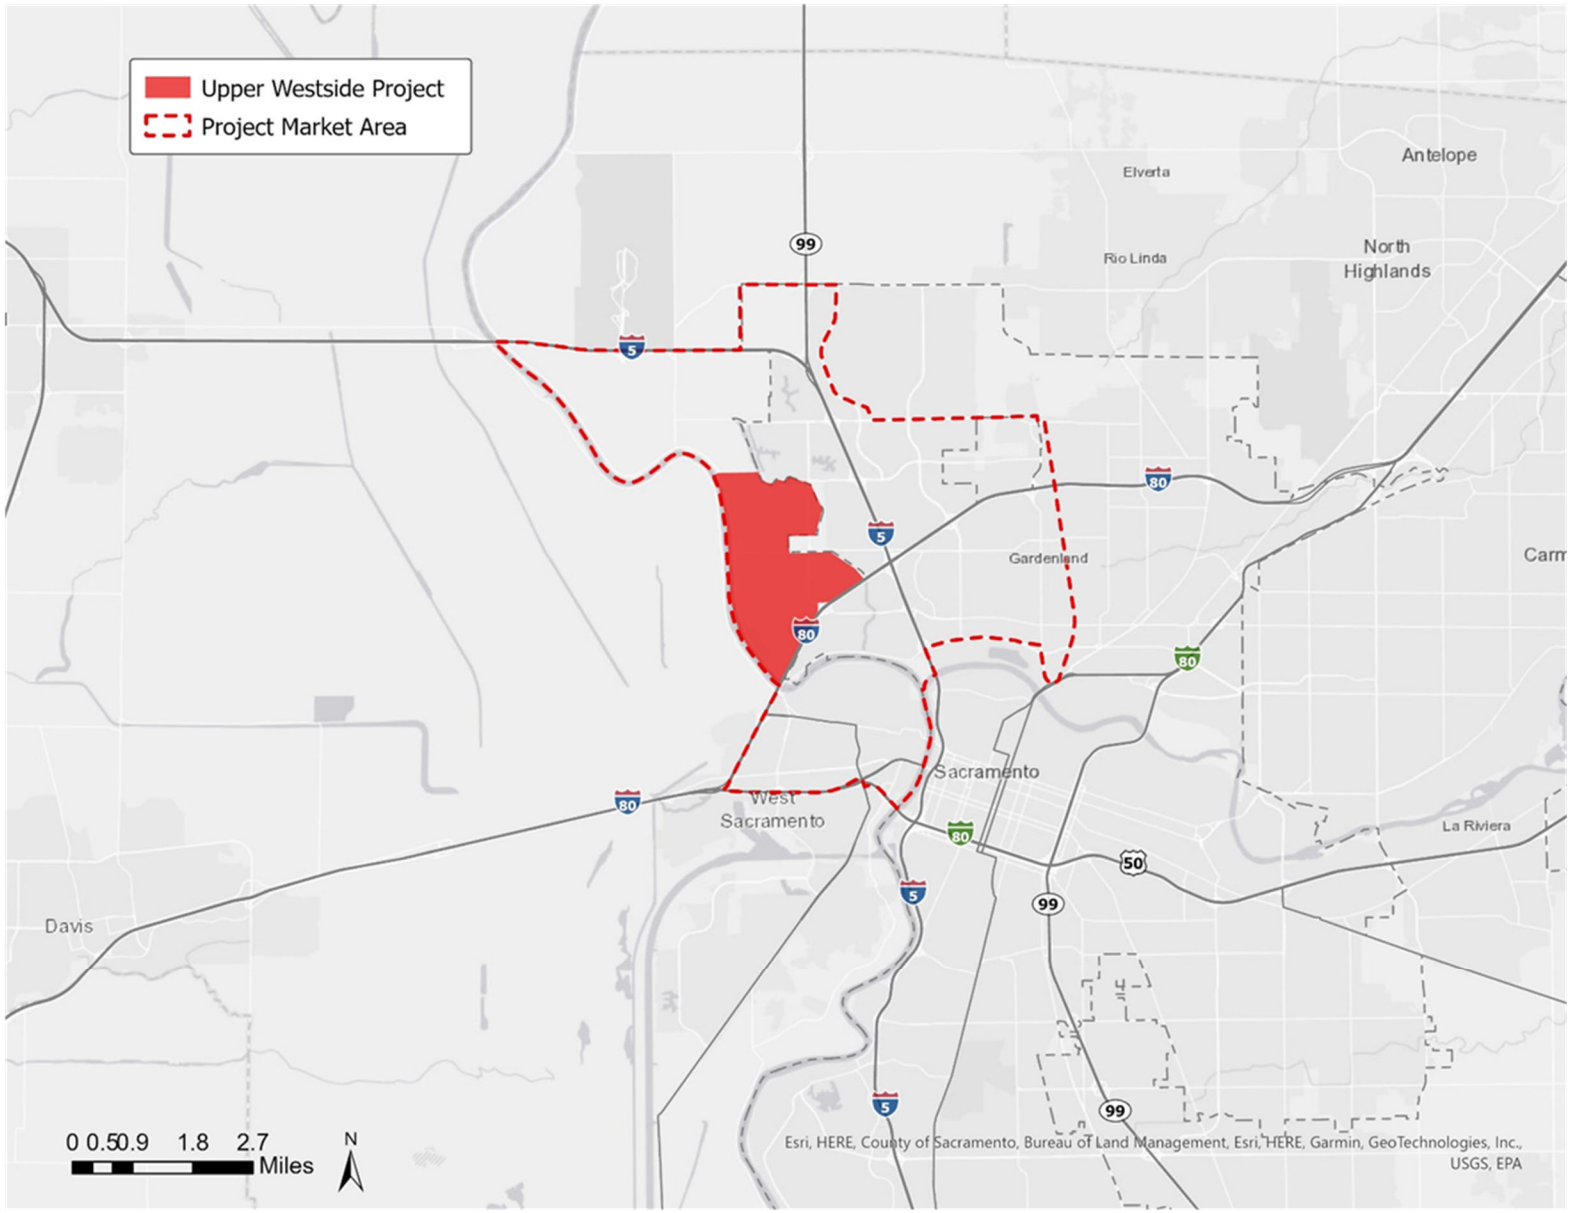
A retail market area represents the area surrounding proposed retail uses from *which the majority of* customer patronage is expected to be drawn. A retail market area is influenced by a variety of factors, including the location and density of the targeted residential population, the location of key competitors, the relative distance or travel time for each of the above, geographic and psychological barriers, and existing commute and shopping patterns. Retail establishments outside a given retail market area are not considered to be at risk of urban decay from development in the retail market area based on a nominal set of overlapping supply and demand dynamics.[17] The defined Market Area, the boundaries of which are shown in **Map 3-1**, corresponds with Sacramento Area Council of Government (SACOG) Traffic Analysis Zones (TAZ), located in the following subareas:[18]

- North Natomas (County).
- NW Vision Area.
- South Natomas
- West Sacramento (Yolo County).

The boundaries of the Market Area were defined based on an evaluation of existing population density within TAZ boundaries surrounding the Project, a maximum of 10-minute drive times to and from the center of the Project during high traffic times to the boundaries, existing retail centers as provided in **Table 3-1** and **Map 3-2**, the physical barrier of the Sacramento River, and perceived barriers of major highways including Interstate 5 and Interstate 80 as shown in **Map 3-1**.[19] [20]

A complete list of TAZs and their associated subarea in the defined Market Area can be found in **Appendix A**, **Table A-2**.

---



[17] More information regarding the rationale for excluding the impacts to retail outlets adjacent but outside of the Market Area defined for this Study is provided later in this chapter under the section entitled "Retail Market Performance Indicators."

[18] A TAZ is a unit of geography used in transportation planning models.

[19] The EPS analysis generally concurs with the traffic study data prepared by Fehr & Peers.

[20] A 10-minute drive time is reflective of the estimated time it would take to drive within the typical trade area mileage size defined by the International Council of Shopping Centers specific to the type of retail within the Project. Neighborhood-serving retail space has a typical trade area boundary of about 3 miles and the community commercial has a typical trade area of approximately 3 to 6 miles.

**Map 3-1. Upper Westside Specific Plan Defined Retail Market Area**

Source: CoStar; EPS.

NOTE: This list reflects data available through a subscription-based resource, CoStar as of March 2022. All shopping center and freestanding retail space within the Market Area may not be depicted.

[1] The list of tenants is not exhaustive, it is given to provide insight into center type.
[2] The Market Area is depicted in Map 3-2. This area follows a radius ranging from about 3 to 4 miles from the center of the UWSP area.
[3] Park Place I and II are not geographically in the Market Area; however they are included because they are located along the Market Area boundary. Park Place II is categorized as a Regional Shopping Center because of the tenant types.
[4] Includes freestanding retail locations including existing retail within the Project Specific Plan. Freestanding retail is not included in Map 3-2.
[5] The list of Market Area shopping centers is not exhaustive as it excludes many small retail types less than 4,500 square feet.
[6] This list of other retail near the Market Area includes retail outside of the Market Area boundaries, but within an approximate 6-mile radius from the center of the UWSP. This list excludes retail with less than 20,000-square-feet and freestanding retail.

**Map 3-2. Market Area Existing Shopping Center Retail Supply**

[1] See Table 3-1 for detail on each shopping center based on the corresponding number.

# Retail Market Conditions

## National Retail Market Conditions

The retail market has been continuously adapting to change over the past 10 to 15 years, adjusting to shifts in economic, social, and environmental conditions, first with the effects of the 2009 economic downturn, consistent advancements in online and omnichannel shopping, also known as e-commerce, and most recently the global effects of the COVID-19 Pandemic.

The economic downturn, which spread across national and global markets beginning in 2009, had a significant effect on the retail sector. At the national level, the combination of increased unemployment rates, reduced consumer credit, and an oversupply of retail space resulted in bankruptcies, store closures, and consolidations among a wide range of formerly successful retail chains, including Mervyn's, Sharper Image, and KB Toys (bankruptcy); Linens 'N Things, Circuit City, Office Depot, Home Expo, and Starbucks (closures); and CVS's acquisition of Long's Drugs (consolidation). Almost 6,700 stores announced closures in 2017, including national retailers such as JCPenney, Sears, Kmart, Gap, RadioShack, Macy's, and Staples.[21] Thousands more closures occurred in 2018, vacating a record 145 million square feet of retail space nationwide, and the trend continued in 2019 and 2020 with the closure of an estimated 17,600 stores.[22] [23]

At the beginning of 2020, the COVID-19 Pandemic caused abrupt and severe economic impacts, including mass unemployment and major disruptions to retail and office markets with many state and local governments instilling stay-at-home orders, and companies allowing non-essential employees to work remotely from home. The switch to remote work during the Pandemic drove many households in expensive urban areas to search for housing in the more affordable suburbs of these same regions, which was a factor in the shuttering of many urban amenities, such as restaurants, theaters, and museums. With much of the population stuck at home, the Pandemic caused a surge in e-commerce sales, with a corresponding positive shift for brick-and-mortar retailers with store openings finally outpacing closures in 2021.[24]

Businesses that survived the Pandemic shifted their model with online options, delivery, and curbside pickup models.[25] With a switch to more online ordering, the Pandemic accelerated e-commerce growth by a few years, but also led to a deviation in spending patterns. The trend that was occurring pre-Pandemic according to retail research group, Cowen and Company, as well as the Urban Land Institute (ULI), reflected buyers purchasing less material items and spending more on experiential retail, such as restaurants, grooming services, and health and wellness services.[26] After the Pandemic hit and the stay-at-home orders were put into place, the opportunity for experiential retail was no longer an option and consumers converted their expenditures to improve and occupy their time at home, including spending money to fix up their homes, increasing sales in Building Materials and Garden Equipment and Supplies and Home Furnishings and Appliances Stores, as well as Food and Beverage Stores with more consumers eating at home.[27]

According to the Bureau of Labor Services, nationwide e-commerce sales surpassed 10 percent of total retail sales in 2019 increasing to 14 percent in 2020 with an estimate of 13 percent for 2021.[28] "One-stop-shops" such as online retail giants, Amazon, Target, and Walmart were experiencing growth pre-Pandemic with consumers already increasingly opting for online purchases and in-store pickup options, only to see sales skyrocket during the Pandemic with Target reporting a 195 percent increase in online sales from 2019 to 2021, Walmart reported a 90 percent increase in online sales for the same period, and Amazon reported a 95 percent increase in their North American sales, also for the same period. Despite a changing retail market landscape and the effects of a recession, the number of shopping centers in the United States grew by more than 20 percent and gross leasable area (GLA) grew by almost 30 percent from pre-recession 1995 to post-recession 2015, while the population increased by less than 14 percent.[32] This is primarily a result of investor expectations and demands of shareholders outpacing the growth of the real economy.[33] Despite initial concern, the Pandemic is helping to rectify the retail market by causing retailers to consolidate their merchandise and store inventory, reducing the number of stores and associated debt from money-losing locations.[34] As of 2019, there was close to 25 square feet of retail space per capita in the United States (about 50 square feet per capita, if small shopping centers and independent retailers are added). In contrast, Canada has about 16 retail square feet per capita, Australia has about 11 square feet per capita, and Europe has about 2.5 retail square feet per capita.[35] [36] The retail reset may help the United States reduce the overcapacity of retail space, including obsolete buildings such as Class B and Class C space, which have the potential to be repurposed now or in the near future with nonretail uses.

The national retail market continues to experience turbulence and a high degree of uncertainty regarding tenanting and absorption forecasting. Although, it should be noted that retail has adapted and persisted since the earliest days of commerce. Artisans were disrupted by merchants, who were disrupted by open-air bazaars. The Sears Roebuck catalog of 1893 disrupted the first era of brick-and-mortar retail. Malls disrupted the town square; superstores and category-killers disrupted the local five-and-dime. And now, off-price, dollar stores, fast-fashion, and online players are shaking up the industry.[37] As new retail tenants, concepts, and formats continue to emerge and establish their presence, it remains to be seen how future demand for retail space will evolve.

## Retail Market Conditions in Market Area

### *Retail Market Inventory*

As of the end of 2021, the Market Area had an estimated 5.1 million square feet of retail space. **Table 3-1** details retail supply in the Market Area. See **Map 3-2** for the location of existing retail centers in the Market Area. Refer to **Appendix B** for documentation of physical conditions of existing retail centers in the Market Area.

[37] The New York Times, "Why We Should Be Optimistic About Retail," dated April 13, 2018, New York Times Web Site (accessed February 2019).

The northern portion of the Project Market Area is located in the North Natomas area of the County and contains the largest concentration of retail space. This segment of the Market Area boasts a sizable mixture of neighborhood-, community-, and regional-serving retail shopping centers with major shopping destinations such as the Promenade at Sacramento Gateway, Natomas Marketplace, Park Place II regional centers, Park Place I, Natomas Town Center, and Market West Shopping Center community centers. Most of these centers are concentrated along Del Paso Road, Truxel Boulevard, and Arena Boulevard and were built between 14 and 19 years ago, except for Natomas Marketplace, which was built in 1997, about 22 years ago. Many of the neighborhood-oriented shopping centers are located along Northgate Boulevard, W. El Camino Avenue, and tend to be older, built in the 1980s.

The southern portion of the Market Area, comprising the northern portion of the City of West Sacramento in southeast Yolo County, also contains a smaller mixture of neighborhood-, community-, and regional-serving retail shopping centers with major shopping destinations such as the Riverpoint Marketplace and West Capitol Plaza. There are several neighborhood-serving shopping centers concentrated on W. Capitol Avenue, Jefferson Boulevard, and Harbor Boulevard on the southern edge of the defined Market Area.

In addition to shopping center retail, the Market Area includes approximately 1.1 million square feet of freestanding retail buildings. The majority of this square footage comprises food and beverage tenants, gas stations, and service retail such as daycare centers and car rental businesses. Two of the larger spaces include a former Fry's Electronics, which is in the process of being converted into an industrial park, and a California Family Fitness.

Note that total estimated retail sales used to estimate Project-specific and cumulative urban decay impacts in this Study comprise all reported sales from both shopping centers and freestanding retail tenants in the Market Area (discussed further in **Chapter 4** and **Appendix A**).

***Retail Market Performance Indicators***

The Market Area's current estimated retail supply of about 5.1 million leasable square feet is dominated by existing inventory located in Sacramento County (70 percent), with the remaining 30 percent located in the West Sacramento portion of the Market Area. The Market Area contains about 1.4 million square feet of neighborhood-serving retail, 630,900 square feet of community-serving retail, 2.0 million square feet of regional-serving retail, and 1.1 million square feet of freestanding retail as shown in **Table 3-1** and **Map 3-2**. While the Park Place I and II shopping centers are not physically in the Market Area, they are included as part of the Market Area since they land just outside of the boundary. **Table 3-1** and **Map 3-2** also show other retail outlets outside the periphery of the defined Market Area for informational purposes only. EPS determined that the retail centers located outside the defined Market Area within downtown Sacramento, North Sacramento, and the southern portion of West Sacramento below Interstate 5 are not likely directly competitive with the Project. The neighborhood—serving retail space in these areas is located beyond the typical neighborhood/community trade area boundary of 3 to 6 miles. In addition, the community commercial and regional commercial shopping centers in these areas are dissimilar to the type of retail estimated to locate within the Project and are separated by both physical and psychological barriers that may prevent consumers from

shopping at both locations. These retail outlets are located approximately 4 to 6 miles from the Project and serve residents to the east in the Del Paso Heights, Robla, downtown Sacramento, and south City of West Sacramento areas.

**Table 3-2** presents current and historical retail trends for the Market Area, the cities of Sacramento and West Sacramento, and Sacramento County. The bulk of the Market Area is located in the City of Sacramento. The Market Area comprises almost 13 percent of the City of Sacramento's retail inventory and less than 1 percent of the County's total retail supply and has increased by only about 91,400 square feet over the past 11 years, an average addition of about 8,300 square feet per year. Vacancy rates have experienced declines since 2010 in the Market Area, the City, and County with a sharp decline in the Market Area between 2012 to 2013 from 9.2 percent down to 5.5 percent, and current rates reflect very little vacancy around 3.4 percent compared to 7 percent within the City and 6.5 percent within the County. A vacancy rate of 3.4 percent reveals a tight market with very little room for movement for existing and new businesses indicating the potential for additional supply. The retail market in the Market Area is relatively healthy as evidenced by market performance indicators noted above, corroborated by information obtained from real estate broker reports, and examples of re-tenanting as shown below in **Table 3-3**.[38]

In the County, more than 4.8 million square feet of new retail has come to market over the past 11 years, and the City contributed to almost a quarter of the new supply. The County has shown strong positive net absorption since 2010 in conjunction with the market rebounding from the Great Recession with a total of almost 7.5 million square feet; the Market Area has had positive net absorption over the past 3 years and a total positive net absorption of more than 337,000 square feet since 2010 with only 3 years of negative net absorption, all under 65,000 square feet. Average annual lease rates for the Market Area have fluctuated from a low of $17.00 per square foot up to $21.88 per square foot (over the past 11 years) and fell to around $19.89 per square foot for 2021. Lease rates for the City and County have fluctuated as well and fall a little more than $2.00 less per square foot than in the Market Area, achieving rates around $17.90 and $17.40 in 2021.[39]

Overall the Market Area also appears to maintain a healthy, but tight retail market with only 2 available spaces comprising more than 20,000 square feet, including a former 34,860-square-foot Safeway in West Capitol Plaza (vacant since 2018) and a 28,700-square-foot former Big Lots (vacant since 2014) in the Northgate Shopping Center.[40] The re-tenanting outlook for these vacant spaces looks favorable as the Market Area has demonstrated positive net absorption over the past 3 years, as area retail continues to evolve with the changing market.[41]

*retail lease*

Source: CoStar; EPS.

[1] Data reflect lease transactions that occurred between 01/01/2019 and 03/08/2022 for a 4-mile radius that generally follows the Market Area boundary around the Project site.

A survey of retail lease transactions within a 4-mile radius from the Project found about 70 lease transactions from the beginning of 2019 through March 2022. The 70 lease transactions reflect an equivalent to about 22 transactions per year, with a cumulative total of more than 297,000 square feet, or about 92,840 square feet per year.[42] The majority of the transactions occurred in the Natomas area; however, the largest transactions were a 27,400-square-foot Ross occupying a space in the City of West Sacramento and a 25,000-square-foot Planet Fitness in Natomas. The average-size transaction was approximately 4,200 square feet. See **Table 3-3**.

The consistent low vacancy rates, positive net absorption, and steady lease rates in the Market Area indicate a healthy retail market with the ability to sustain new retail growth commensurate with new household growth and additional sources of demand, such as new employees.

## Socioeconomic Conditions in the Market Area

The following section provides background information on the estimated existing (as of 2022) and projected demographic conditions for the subareas based on TAZ in the Market Area. The demographic projections discussed below encompass future development in the Market Area, excluding the proposed Project.

### Demographic Trends and Projections

Population and household characteristics play a vital role in determining the type and amount of retail demand in a particular area. Assuming average household incomes remain constant or improve over time, a growing population base generally will result in increased retail demand, providing additional market support for existing and new establishments.

Historical population, household, and employment trends are shown in **Appendix A Table A-2** with estimated existing conditions and projections shown in **Table 3-4** using estimates and projections from SACOG.[43] As previously discussed, the Market Area is made up of 4 Market Subareas: North Natomas, NW Vision Area, South Natomas, and West Sacramento. Projected development in each of these Market Subareas is described below. Additional information regarding projected retail development in the Market Area (outside of the Project) will be discussed in detail in **Chapter 5**.

[42] This period includes the onset of the Pandemic.

[43] SACOG "ZIP Code Tabulation Areas (ZCTA) and Traffic Analysis Zone (TAZ) level Summary 2016 Estimate and 2040 Projections." SACOG provides population, household, and employment data for years 2016 and 2040; SACOG data are not available beyond 2040. However, buildout of the Project is anticipated to be completed in 2052. Thus, EPS used the average annual growth rate between 2016 and 2040 to interpolate the base year of 2022. EPS estimated growth through Project buildout (2052), using the average annual growth rate from 2016 to 2040 from SACOG's projections, with adjustments, as necessary, based on the land use programs of approved and planned development projects in the Market Area.

Source: Sacramento Area Council of Governments (SACOG) MTP/SCS, "ZIP Code Tabulation Areas (ZCTA) and Traffic Analysis Zone (TAZ) level Summary 2016 Estimate and 2040 Projections"; State of California Department of Finance (DOF), Table E-5 2021; EPS.

[1] Based on SACOG projections at the Traffic Analysis Zone (TAZ)-level geography between 2022-2040 and extrapolated growth between 2040-2052, estimated by EPS. See Table A-2 for more details.
[2] Households are determined by applying an estimated vacancy rate to the housing units based on the 2021 rate for Sacramento County per DOF (5.4%). See Table A-2 for housing unit totals.
[3] The NW Vision Area estimates and projections are minimal and thus have been combined into the totals for North Natomas, see Table A-2 for details.

### *Demographic Methodology and Projections*

As shown in **Table 3-4**, the Market Area as a whole currently contains about 100,000 residents, almost 37,700 households, and 55,300 jobs (as of 2022). SACOG provides residential and employment projection data through 2040. EPS used SACOG's TAZ-level growth rates between 2016 and 2040 to extrapolate projections through 2042. To remain conservative while extrapolating growth between 2040 and 2042, EPS adjusted development totals to align with the projected and historical average for the TAZs projected by SACOG to have significant amount of growth. In addition, EPS applied a conservative 0.5 percent average annual growth rate to

project growth in population, household, and employment between 2042 and 2052, excluding TAZs that are mostly built out.[44]

With these adjustments, the Market Area is estimated to add more than 51,100 new residents, 22,700 new households, and 23,600 new jobs by 2052. This level of growth is estimated to increase the Market Area population by almost 51 percent, households by about 60 percent, and jobs by about 43 percent. The majority of the projected residential and employment growth is in the North Natomas area and occurs over a 30-year span between 2022 and 2052. See below for more detailed information on major growth areas within the Market Area. These growth projections do not account for any growth from the Project. Projected household and employment growth in the Project is estimated separately (refer to **Chapter 2** for Project population and household estimates).

***North Natomas***

The North Natomas portion located north of Interstate 80 in the Market Area contains about 27 percent of the estimated 2022 households. This portion of the Market Area includes future growth areas in the City, including the Northlake Specific Plan, NorthPointe Specific Plan (formerly Greenbriar), and the Innovation Park and CNU project. There are also many projects adjacent including the Panhandle Planned Unit Development (PUD), Metro Air Park Specific Plan, Grandpark Specific Plan, and continued buildout of the North Natomas CPA, which includes North Natomas Town Square and Town Center East. All development outlined below is assumed to be absorbed in the Market Area through the period of this analysis (2052).

Northlake is a master-planned community with an estimated 2,275 single-family residential units, 500 multifamily units, a 295,119-square-foot regional commercial center, a 16,335-square-foot neighborhood commercial center, community center, light rail station, and an elementary school.[45] Because portions of the Northlake project are under construction this project is estimated to be fully absorbed by 2052.

The Innovation Park & California Northstate University (CNU) Medical Center Campus comprises a hospital campus with a 14-story, 730,000-square-foot teaching hospital, 2,017 residential units, and 1.2 million square feet of gross commercial space. EPS assumes full absorption of the project by 2052.

NorthPointe south of the Sacramento International Airport is proposed to annex into the City of Sacramento and will comprise up to 6.6 million square feet of industrial and 250,470 square feet of commercial space. EPS assumes 50 percent absorption of the project's commercial space by 2052.

[44] EPS assumes the TAZ with less than 1.0 percent of growth projected between 2016 and 2040 are mostly built out and therefore projected no additional growth in order to remain conservative.

[45] Per the Greenbriar Development Project Environmental Checklist dated January 6, 2017. Project is now known as Northlake.

***South Natomas***

The South Natomas portion in the Market Area includes the largest share of the current 2022 Market Area population, containing almost half of the 2022 households. This area is already mostly built out and contains only about 10 percent of projected household growth in the Market Area.

***NW Vision Area***

The NW Vision Area portion of the Market Area falls in the northwest corner of the Market Area boundary below the airport. There is very little existing development and no proposed future growth projects within this area. As shown in **Appendix A Table A-2**, SACOG projects that housing units will remain static between 2016 to 2040 and that there will be a decrease in population. Because of the minimal amount of Market Area housing units, population, and jobs within this area, the demographics have been combined with the North Natomas figures in **Table 3-4**.

***West Sacramento***

The West Sacramento portion of the Market Area comprises 27 percent of current 2022 Market Area households. The waterfront of this Market Area portion has been experiencing growth and contains two major projects. All development outlined below is assumed to be absorbed in the Market Area through the period of this analysis (2052).

Raley's Landing is a partially built project that at buildout is anticipated to include approximately 900 multifamily residential units, 845,000 gross square feet of office space, 102,000 square feet of commercial/retail uses, and possibly 100–300 hotel rooms with a 7,000- to 15,000-square-foot conference center; it would provide between 4,351 and 4,651 on-site parking spaces, including surface and multilevel parking spaces.

The 681 West Capitol project is located in the Bridge District of West Sacramento and as proposed comprises a 6-story, 27,000-square-foot building with office and retail.

# 4. MARKET ANALYSIS

This chapter reviews retail sales trends in the Market Area, including an examination of retail supply and demand conditions, to estimate supportable retail in the Market Area. The Study estimates that the Project has the ability to capture demand from the following demographic elements:

- Projected Market Area household growth (excluding Project households).
- Estimated Project-generated demand, including demand from households and employees.

The Market Area is projected to capture a certain percentage of each of the above elements of demand. This Study applies a uniform assumption of 80 percent of spending captured in the defined Market Area to each element of demand. This capture rate is based on the existing relationship between household spending and retail sales (i.e., current household spending on retail goods and services is about 80 percent of total retail sales in the Market Area). This relation serves as a proxy for a reasonable capture of future spending for each element of demand.

Of the captured Market Area demand, Upper Westside is estimated to capture a certain percentage of retail spending. Upper Westside capture-rate assumptions are intended to be conservative but reasonable and are based on the type of retail that may locate in the Project, as well as the relative proportion of Project retail to total Market Area retail space. The capture rates also take into account the retail options located directly adjacent to the Market Area, as well as the greater Sacramento Region. The actual capture rate will be based on numerous factors including the specific tenant mix, local and broader economic conditions, and continued trends in the retail sector.

## Projected Incremental New Retail Demand

The Project is estimated to capture newly created demand from residential growth in the Market Area.[46] Two components of residential growth in the Market Area are estimated separately: Project households and households outside of the Project. In addition, the Project will generate new retail demand from Project employees. These components of net new demand are described in further detail below.

[46] To remain conservative, this Study does not estimate demand from the growth of Market Area employees (outside of the Project) with the assumption that demand for retail space already may be accounted for in household demand projections.

## Project-Generated Demand

### *Demand from Occupied Households*

An estimated 8,830 new occupied Project households will generate demand for retail development in the Project itself, as well as in and outside the Market Area. In this analysis, occupied housing units are assumed to be a proxy for households. To estimate retail spending from new Project households, EPS estimated average household income by unit type based on the estimated assessed value of the unit. See **Table 4-1**. EPS applied an estimated percentage of income spent on retail based on income levels to each of the different household/income types and then multiplied that by the estimated occupied households. This resulted in total estimated annual spending by occupied Project households of $204.4 million.

**Table 4-2** estimates how much Project household spending will be captured in the Market Area and by the Project itself. This Study is based on estimates that 80 percent of Project household expenditures will occur inside the Market Area ($163.5 million). Of the $163.5 million spent in the Market Area, a portion of Project household spending is estimated to be captured by retail outlets in Upper Westside, which is estimated by applying capture rates based on each retail category to estimate how much will be spent at retail establishments located in Upper Westside. EPS estimates that Project households will spend $104.6 million within retail outlets in the Project, representing 64 percent of spending in the Market Area and 51 percent of total Project household spending on all retail goods and services (e.g. spending at any retail outlet in or outside of the Market Area including e-commerce outlets). See **Table 4-2**.

### *Demand from Project Employees*

The Project is estimated to generate demand from new Project employees who work in the proposed nonresidential uses. Upper Westside is anticipated to generate jobs for approximately 6,802 office employees and 2,110 employees at the other nonresidential uses at buildout. To avoid overcounting employees who also may reside in the Project, this Study assumes nonresident employees comprise 85 percent of the Upper Westside employee population.[47] See **Table 4-3**. Based on a 48-week per year work schedule and average weekly spending of $153 per office employee, derived from data on office-worker retail spending from the International Council of Shopping Centers (ICSC), Project office employees will generate an estimated $34.0 million in demand for retail space at buildout. Total estimated spending by Project employees is then broken down by retail category, also based on office-worker spending data from the ICSC.[48]

---

[47] This assumption is based on Census-based research through OnTheMap, a web-based mapping and reporting application that shows where workers are employed and where they live. EPS examined the percentage of employees that live in the North Natomas and northern portion of West Sacramento areas. This area offers a reasonable proxy for the Project based on similarities in land uses and based on its location relative to the Project and other employment centers in the Sacramento Region. OnTheMap data revealed that about 13 percent of workers both lived and worked in the above areas in 2019, the most recent data available. As a conservative approach, this study rounds up the potential for Project employees who also reside in the Project.

[48] Refer to **Appendix A**, **Table A-3** for worker spending calculations.

## Table 4-1. Total Retail Demand Generated from Occupied Project Households (2022$)

| Item | PROJECT RESIDENT RETAIL DEMAND<br>Per Household Spending<br>Single-Family Units<br>Very Low Density Residential (VLDR) | Low Density Residential (LDR) | Low / Medium Density Residential (LMDR) | Medium Density Residential (MDR) | Multifamily Units<br>High Density Residential (HDR) | Very High Density Residential (VHDR) | Commercial Mixed Use (CMU) | Total Estimated Annual Spending by Occupied Project HH [1] |

Source: The Gregory Group; EPS.

[1] Totals equal the sum of spending per household for each housing type and retail category.
[2] Average assessed values are based on research obtained from the Gregory Group and Costar as of February 2022.
[3] Market Rate household income assumptions:
Assumes that annual mortgage payments, plus property taxes and insurance are 30% of income. Mortgage payments assume a 20% down payment, 30-year term, 4% fixed interest. Taxes and insurance are assumed to equal 2% of home value. Includes a $150/month estimate for HOA dues. Estimated household income for the market rate high density units is based on a third of income being spent on rent.
[4] Estimated percentage of income spent on retail based on data from the Bureau of Labor Statistics for the U.S, see Table A-4. Excludes spending on e-commerce retail goods and services.
[5] See Table 2-2 for occupied Project households.
[6] The estimated percentage of income spent per retail category is based on average retail spending by category for the State of California, see Table A-5.

[1] See Table 4-1. All Project households are estimated to develop in Phase 1.
[2] This analysis assumes 80% of Market Area household spending will be captured by retail within the Market Area. Conversely 20% will be captured by retail outside of the Market Area.
[3] Capture rate assumptions reflect the portion of retail spending leakage the Market Area and Upper Westside retail may be able to capture and are based on the type of retail that may locate in the Market Area and Project as well as the relative proportion of Project retail to total Market Area retail space.

Source: U.S. Census OnTheMap 2019; EPS.

[2] Estimates are for Office workers only. See Table 2-2.
[2] See Table A-3 for estimated office worker spending.
[3] Average annual spending per employee is calcuated by multiplying the average weekly spending per new employee by the number of work weeks per year.
[4] This analysis assumes nonresident employees comprise 85% of the Upper Westside employee population based on Census-based research through OnTheMap for North Natomas and the northern portion of West Sacramento, which had less than 15% of all workers both living and working in the area in 2019.
[5] This analysis assumes 80% of Market Area household spending will be captured by retail within the Market Area, conversely 20% will be captured by retail outside of the Market Area.

Given the size of the Market Area, the location of competitive retail, and the amount of planned retail in the Project, it is estimated that Project employees likely will stay close to their place of employment for their weekly spending. EPS estimates the Market Area will capture 80 percent of Upper Westside office employee demand, and Upper Westside retail will capture a portion of this office employee spending in the Market Area. After applying the capture rates by category, the Project is estimated to capture $30.5 million of Project-generated new office employee spending, equating to about 90 percent of spending captured in the Market Area and 72 percent of total office employee spending as shown in **Table 4-3.**[49]

Spending by employees at the other nonresidential land uses in the Project including retail, hotel, and institutional is estimated by benchmarking these employees' salaries to office employee salaries.[50] Other nonresidential land use Project employees will generate an estimated $5.2 million in demand for retail space at buildout. See **Table 4-4**. Total estimated spending by Project other nonresidential employees is then broken down by retail category, also based on office-worker spending data from the ICSC.[51]

Similar to Project office employees, it is estimated that other nonresidential Project employees will likely stay close to their place of employment for their weekly spending. EPS estimates the Market Area will capture 80 percent of Upper Westside other nonresidential employee demand, and Upper Westside retail will capture a portion of this employee spending in the Market Area. After applying the capture rates by category, the Project is estimated to capture $3.8 million of Project-generated new other nonresidential employee spending, equating to about 90 percent of spending captured in the Market Area and 72 percent of total employee spending as shown in **Table 4-4**.[52]

As mentioned previously in the Study, EPS's employment density assumptions are based on average industry standards and differ from the employment density assumptions provided in the traffic analysis. The square feet per employee in the traffic analysis are generally lower than EPS's assumptions and therefore provide a higher estimate of 11,857 total employees compared to EPS's estimate of 8,912 employees generated by the Project. EPS's employment density assumptions provide a more conservative analysis as the traffic study's higher employment count increases estimated demand from new Project employees. Applying the traffic study assumptions reflects that an estimated $43.6 million in spending from new Project office and other nonresidential employees will be captured by the Project at buildout compared to the $34.3 million estimated by EPS.

---

[49] EPS estimates that 90 percent of weekly spending by net new Project office employees will occur within the Market Area.

[50] Refer to **Appendix A**, **Table A-6** for estimated other nonresidential employee salaries benchmarked to office worker salaries. Other nonresidential employee spending are based on office worker spending patterns as there are no readily available data on retail, hotel, and institutional worker spending.

[51] Refer to **Appendix A**, **Table A-3** for worker spending calculations.

[52] EPS estimates that 90 percent of weekly spending by net new other nonresidential Project employees will occur within the Market Area.

## Summary of Project-Generated Retail Demand

As shown in **Table 4-5**, the total Project-generated demand for Project retail at buildout is $139.0 million for Upper Westside. This amount of retail spending is based on estimated demand from new Project households and employees. Project-generated demand in the remainder of the Market Area is $58.5 million. The total Project-generated demand for retail space in the Market Area (including the Project) is estimated to be $197.4 million.

## Existing Retail Demand

### Existing Household Spending in the Market Area

In addition to demand from incremental Project households, the Project can capture demand from existing household spending within the Market Area. To quantify the retail demand of existing Market Area households, EPS developed an analytical model that relies on current Market Area households, household income, and consumer spending patterns.[53] Assumptions underlying each component of existing Market Area household demand can be found in **Appendix A**.[54] Similar to the estimate for Project households from **Table 4-2**, **Table 4-6** shows expenditure estimates per Market Area household. EPS estimates that, on average, Market Area households have a household income of approximately $82,000 and spend about 24 percent of their income on retail goods and services (approximately $19,600 per year).[55] The total annual retail spending estimate from existing Market Area households is $444.4 million.

### Project Capture of Market Area Demand (Excluding Project-Based Sources)

The Project is estimated to be built over a 30-year time frame, from 2022 to 2052. During this time, the Market Area will experience residential growth outside of the Project as described in **Chapter 3** (refer to **Table 3-4**). As shown in **Table 4-7**, this Study is based on estimates there will be about 22,700 new households in the Market Area, excluding new households in the Project, through 2052. Using average estimated Market Area spending per household of approximately $19,600, new households in the Market Area are estimated to add $444.4 million in spending power by 2052. Existing and new retail development in the Market Area is estimated to capture 80 percent of incremental new Market Area household spending for a total of $355.6 million at buildout. Of the $355.5 million spent in the Market Area, a portion of Market Area household spending is estimated to be captured by retail outlets in Upper Westside.

---

[53] Consumer spending patterns exclude spending on e-commerce retail goods and services, which are, as a conservative assumption, not anticipated to contribute to demand for physical retail space. This analysis subtracts the estimated "click and collect" e-commerce sales from total e-commerce as these sales are local and do contribute to demand for physical retail space.

[54] **Table A-7** calculates the projected weighted average household income for the Market Area. **Table A-4** estimates the household retail expenditures based on income level. **Table A-5** estimates the percentage of spending at retail stores by retail category.

[55] Includes retail spending on physical retail outlets only; excludes spending on e-commerce retail goods and services.

Source: EPS.

[1] See Table 4-6.
[2] The demand from Market Area household growth is derived by multiplying total households by the amount of spending per household for each retail category.
[3] Capture rate assumptions reflect the portion of retail spending leakage the Market Area and Upper Westside retail may be able to capture and are based on the type of retail that may locate in the Market Area and Project as well as the relative proportion of Project retail to total Market Area retail space.
[4] See Table 3-4.
[5] This analysis assumes 80% of Market Area household spending will be captured by retail within the Market Area. Conversely 20% will be captured by retail outside of the Market Area.

Applying a 37 percent capture rate, which is the average of the estimated capture rates by retail category, the total estimated new Market Area household spending captured by the Project is $130.0 million, equating to about 29 percent of new Market Area household spending (excluding Project households).

# 5. COMPETITIVE RETAIL SUPPLY

This chapter provides an overview of the existing and proposed supply of competitive retail outlets in the Market Area.

## Existing Competitive Retail Supply

As discussed in **Chapter 3**, the Market Area has a current estimated retail supply of nearly 5.2 million leasable square feet. See **Table 3-1** and **Map 3-2** in **Chapter 3**. The Market Area contains about 1.4 million square feet of neighborhood-serving retail, 879,000 square feet of community-serving retail, 2.0 million square feet of regional-serving retail, and 1.1 million square feet of freestanding retail.

### Existing Retail Sales in the Market Area

EPS obtained estimated total retail sales as of 2017 for the Market Area boundary from Esri Business Analyst Online (BAO).[56] Esri BAO data were used in lieu of publicly available sources of data such as the California Department of Tax and Fee Administration (CDTFA) because data from Esri could be aligned with the defined Market Area boundary, whereas CDTFA data are consistent with broader jurisdictional boundaries only (i.e., City of Sacramento, City of West Sacramento, and Sacramento County).[57] EPS validated the Esri BAO retail sales data by estimating and comparing total retail sales per capita with data from CDTFA.[58] This comparison revealed consistency across the two data sources, supporting the usage of BAO data in this Analysis.[59]

Total retail sales for the Market Area were allocated to each retail category based on the proportion of estimated retail sales by retail category in the County, based on data from the most recently available taxable sales report for the County from CDTFA including 4th quarter 2020 through 3rd quarter 2021. Specific retail categories, including Food and Beverage Stores, General Merchandise, and the Health and Personal Care Stores portion of the Other Retail Stores

[56] **Table A-18** and **Table A-9** comprise Esri BAO sales estimates by category for 2017 for the Market Area portion of the cities of Sacramento and West Sacramento.

[57] The CDTFA took over the management of the State of California's taxable sales data in 2016 from the State of California Board of Equalization (BOE).

[58] Note that the two data sources differ in the data reflected: BAO data reflects total retail sales whereas CDTFA data reflects taxable retail sales (omitting nontaxable retail sales). EPS compared the two data sources after adjusting CDTFA data to include estimated nontaxable retail sales, as described in the following paragraph of this section.

[59] Following a thorough review of BAO and CDTFA data sources, EPS determined that BAO data, which reflect retail sales in the Market Area, and CDTFA data, which reflect an estimate of Market Area retail sales based on Sacramento County data, resulted in no material difference in the conclusions of this Study.

category, are estimated to sell a significant portion of nontaxable goods. Thus, the taxable sales in these categories were adjusted to account for nontaxable items using the countywide

proportional difference between taxable and total sales from CDTFA (taxable sales) and the U.S. Economic Census (total sales). EPS used the approach of allocating the proportion of adjusted retail sales by retail category from County-level CDTFA data in lieu of using Esri's estimated retail sales by retail category based on an evaluation of both data sources. Calculations supporting this methodology for estimating retail sales in the Market Area can be found in **Appendix A**.[60]

As shown in **Table 5-1**, after escalating the 2017 estimated retail sales to 2022 dollars using the Bureau of Labor Statistics (BLS) Consumer Price Index for the West Urban Region between 2017 and 2022, total retail sales in the Market Area are estimated at approximately $1.4 billion.

## Projected Project Sales

The Project as planned is anticipated to comprise approximately 338,900 occupied retail square feet in Phase 1 and a remaining 179,300 occupied retail square feet at buildout for a total of 518,200 square feet of occupied retail space, as shown in **Table 2-2**. **Table 5-2** estimates sales for the Project by assigning each retail shopping center type an estimated sales-per-square-foot figure in 2022 dollars based on information from BizMiner, eMarketer, corporation annual 10-K reports, and ULI, which can be found in **Appendix A**.[61] The total projected sales for the Project at buildout are approximately $263.3 million. These projected sales are anticipated to increase existing Market Area retail sales by about 18 percent.

## Estimated Pipeline Supply

The identified competitive Market Area projects are listed and classified by shopping center type based on the project square footage in **Table 5-3**. These include Northlake located along the north boundary of the Market Area near the Highway 99-Interstate 5 Interchange; Northpointe located southwest of Northlake below Interstate 5; Innovation Park and CNU Campus located east of the Project on the other side of Interstate 5; and 681 W. Capitol Ave and Raley's Landing located south of the Project and Intestate 80 in West Sacramento as shown in **Map 5-1**. Projects located outside of the Market Area are included to reflect the continued expansion of the City's North Natomas CPA including Metro Air Park, Grandpark, the Panhandle, Town Center East, and North Natomas Square, as well as Sutter Pointe located within Sutter County just north of the Sacramento County boundary as shown in **Map 5-1** and **Table 5-3**.[62]

---

[60] **Table A-10** and **Table A-11** reflect calculations made to estimate total retail sales data for the Market Area based on data obtained from Esri BAO, CDTFA (formerly accessible through the BOE), and the U.S. Economic Census.

[61] **Table A-12** estimates 2022 retail sales per square foot based on retail categories and shopping center types.

[62] The Panhandle is excluded form **Table 5-3** as this project proposes residential units only; no commercial retail uses are proposed at this time.

## Table 5-1. Estimated Market Area Total Retail Sales (2022$)

| Item | Total Market Area Retail Sales | | |
|---|---|---|---|
| | Market Area (2017$) [1] [2] | Market Area (2022$) [3] | % of Total |

*retail sales*

Source: Esri BAO Retail MarketPlace Profile 2017, accessed February 2022; California Department of Tax and Fee Administration; Labor Statistics Consumer Price Index for the West Urban Region; EPS.

[1] Represents estimated total retail sales in the Market Area based on the most recent available sales data from Esri BAO, calendar year 2017. Only a small fraction of retail was added to the supply comprising less than 1 percent of the total inventory between 2017 and 2021. The method for estimating Market Area sales is provided in Table A-10 through Table A-14.
[2] See Table A-10 for the calculation of retail sales for the portion of the Market Area that falls in the City and County of Sacramento and Table A-11 for the portion of the Market Area that is in the City of West Sacramento.
[3] The 2017 estimated retail sales have been escalated to 2022 dollars using the Bureau of Labor Statistics Consumer Price Index for the West Urban Region for annual year-end 2017 and annual year-end 2021 of 12.9%.
[4] Sales estimates for Motor Vehicles and Parts Dealers pertains to motor vehicle parts only (omits sales at new and used vehicle dealers).

[1] Identified projects comprising 20,000 or more square feet of commercial space organized by classification of center based on square footage, see Table A-1 for commercial space that has not been classified by project descriptions.
[2] Project information per the Sacramento Business Journal and the Wood Rodgers Public Facilities Financing Plan dated May 2017.
[3] For projects that give only acreage for development size, square footages are calculated based on maximum Floor-Area-Ratios or Lot Coverage from the respective jurisdiction's municipal code.
[4] EPS assumes a 50/50 split between Community and Neighborhood Commercial for the retail portion of the project.
[5] For projects with ambiguous commercial designations, EPS assumes that 50% will comprise retail and 50% will comprise office.
[6] Project information per the Sutter Pointe Specific Plan Chapter 3: Land Use, Table 3-4, page 3-22.
[7] EPS assumes Regional Commercial comprises 500,000 square feet and Community and Neighborhood Commercial split the remainder 50/50 with an applied FAR of 0.25 per the Specific Plan.
[9] Metro Air Park applied the County-given .26 FAR to the maximum Retail, Sales, and Services uses square footage.
[9] EPS assumes a 50/50 split between Regional and Community Commercial for the retail portion of the project.
[10] Project information per EPS's Grandpark Specific Plan Urban Decay Analysis Draft Report, October 2020, including shopping center type designations.
[11] Project information per the City of Sacramento, Natomas Town Center II (East) Intimal Study/Mitigated Negative Declaration for Anticipated Subsequent Projects under the 2035 General Plan Master EIR.

**Map 5-1. Proposed Commercial Retail Supply**

Many approved and proposed projects contain broad project descriptions that provide a gross amount of commercial or retail acreage. The provided commercial retail acreage generally is shown as the maximum allowable square footage and also includes other land uses beyond the building square footage such as parking, landscaping, etc. To better estimate the amount of commercial retail space for these projects, EPS applied the project's respective jurisdictional FAR or Maximum Lot Coverage from their municipal code to the total acreage to estimate potential future development square footage. In addition, many of the projects include a large amount of commercial retail square footage located in large geographic areas, which are likely to comprise a multitude of shopping center types in different locations within the plan boundary. To better estimate retail buildout, EPS applied an estimated allocation of commercial retail space between regional, community, and neighborhood designations based on project descriptions and locations (as shown in **Table 5-3**) using shopping center classifications as shown in **Appendix A**.[63] For projects with ambiguous commercial designations, EPS assumed a 50 percent split between retail and office space. Detailed assumptions for each project can be found in **Table 5-3**.

The commercial retail supply pipeline is projected to total almost 912,000 square feet of retail in the Market Area, excluding proposed retail development in the Project. This amount of retail space, which includes 472,200 square feet of community retail and 440,000 square feet of neighborhood retail, would increase the existing retail supply in the Market Area (5.2 million square feet) by about 18 percent. It is important to note that some of these projects have not been approved or have speculative development timelines and the buildout of all proposed acreage will be dependent on a variety of factors, including the dynamic retail sector, the pace and extent of various sources of demand, and other future market conditions. EPS assumes the projected square footage of the planned retail in Northlake, Invocation Park & CNU Medical Campus, Raley's Landing, and 681 West Capitol will be fully developed by 2052 and that approximately 50 percent of the NorthPointe project will be developed as this is a newly proposed project, see **Table 5-4**.

The community-serving projects of Northlake and Innovation Park & CNU will likely have other sources of demand beyond project households and employees and Market Area households beyond the defined Upper Westside Market Area (e.g., pass-by traffic, including airport patrons; employees outside of the Project but within the Market Area; households outside of the Market Area). EPS applied a market adjustment factor of 80 percent to account for external sources of demand outside of the Market Area. Following these adjustments, as well as a 6 percent frictional vacancy rate assumption, the total proposed retail supply in the Market Area estimated to be absorbed by 2052 is 638,800 square feet—or an increase of about 13 percent in occupied retail space—with 355,100 square feet of community retail and 283,700 square feet of neighborhood retail.

[63] Shopping center classifications given by the ICSC can be found in **Table A-11**.

## Table 5-4. Proposed Commercial Retail Supply Summary

[1] See Table 5-3 for retail square feet.
[2] It is important to note that some of these projects have not been approved or have speculative development timelines and buildout of all proposed acreage will be dependent on a variety of factors, including the dynamic retail sector, the pace and extent of various sources of demand, and other future market conditions. Square footaged estimated to build and absorb by 2042, and therefore by 2052.
[3] The Market Adjustment Factor reflects the estimated percentage of retail demand from households and other sources of demand within the defined Market Area. The remaining sources of demand will be derived from other sources not accounted for in this analysis (e.g., pass-by traffic from business and airport travel; households outside of the defined Market Area).
[4] The vacancy rate assumption applied to gross development totals is based on the average vacancy rate in the Market Area since 2010, as well as a standard frictional vacancy rate.
[5] Estimated using retail sales information from BizMiner, ULI's Dollars & Cents of Shopping Centers, and other sources listed in detail in Table A-12. Values inflated to 2018 dollars using the CPI for the West urban region, All Urban Consumers.
[6] The Northpointe project is anticipated to only partially absorb by 2052 as this project in the very early planning stages compared to the other projects that have been entitled or have infrastructure under construction.

### Pipeline Sales

**Table 5-4** estimates sales for estimated new retail projects in the Market Area, excluding the Project. To project total sales, each retail shopping center type is assigned an estimated sales-per-square-foot figure in 2022 dollars based on information from BizMiner, eMarketer, corporation annual 10-K reports, and ULI, which can be found in **Appendix A**.[64] The total projected sales for cumulative retail projects are approximately $273.2 million. These projected sales, excluding the Project, are anticipated to increase existing Market Area retail sales by about 17 percent.

[64] **Table A-12** estimates 2018 retail sales per square foot based on retail categories and shopping center types.

# 6. URBAN DECAY IMPLICATIONS OF PROPOSED RETAIL

This chapter defines urban decay, describes the analysis methodology and assumptions, and evaluates the potential impact of the retail portion of the proposed Upper Westside, as well as other known major retail projects planned in the defined Market Area. The results of this analysis are used to evaluate the degree to which the potential impacts might result in the physical deterioration of the environment in the Market Area and to examine whether Project retail has the potential to start an economic chain reaction that leads to physical deterioration and urban decay.

## Urban Decay Description

Urban decay is defined as the substantial and prolonged physical deterioration of properties or structures, resulting in discontinued use and investment, and adversely affecting the health, safety, and welfare of the surrounding community. Manifestations of urban decay may include various signs of physical blight such as abandoned buildings, boarded storefronts, litter, uncontrolled vegetation, vandalism, and graffiti.

State case law has determined that environmental documents must consider the potential for "urban decay" for projects that include retail development, "when there is evidence suggesting that the economic and social effects caused by the proposed shopping center ultimately could result in urban decay or deterioration, then the lead agency is obligated to assess this indirect impact".[65] In *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004), experts warned "about land use decisions that cause a chain reaction of store closures and long-term vacancies, ultimately destroying existing neighborhoods and leaving decaying shells in their wake."[66] It is important to note that case law establishes that urban decay is not defined as the closing of one specific or even multiple stores, and new development does not trigger an automatic presumption of urban decay; many factors are relevant, including the size of the project, the type of retailers and their market areas, and the proximity of other retail shopping opportunities.[67]

The primary impetus of urban decay often stems from financial conditions faced by the individual property owners; if a landlord is unable to collect rent on a vacant property with minimal likelihood that it can be leased again, the landlord may lose the incentive to maintain it. The effect can spread to adjacent properties and become a self-fulfilling prophecy as customers start to avoid an area and other property owners or tenants perceive an area as no longer vital or safe. Urban decay can be reinforced by a reduction in the fiscal resources of local governing entities because of declining sales and property revenue.

---

[65] *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004), 124 Cal. App. 4th 1184.

[66] Ibid.

[67] Ibid.

The urban decay process generally takes several years to fully materialize and is reinforced by declining economic conditions in a broader area. It is generally not the result of a single property standing vacant for 1 or 2 years in an otherwise vibrant market.

## Estimated Project-Specific Retail Impacts

As described previously, the Project is estimated to add more than 8,800 households (roughly 24,200 residents) from now until the anticipated buildout of the Project (2022 through 2052). This household growth, as well as new Project employment, will generate demand for retail space both in and outside the Project and Market Area. The Project is anticipated to add about 541,200 occupied building square feet of retail space at buildout, comprising community- and highway-serving retail.

This Study estimates the proposed additional occupied space in Upper Westside will contribute approximately $170.0 million in annual retail sales to the Market Area for Phase 1 and $263.3 million at buildout.[68] Estimated Upper Westside retail sales represent an approximate 12 percent increase over the existing normalized supply for Phase 1, increased to 18 percent at buildout, measured in terms of sales. Of projected sales in Upper Westside, this Study estimates that about $127.4 million (75 percent of UWSP retail sales) in Phase 1 and $139.0 million (53 percent of UWSP retail sales) at buildout represent the estimated Project's capture of the new Project development spending (from new households and employees within the Project).

The remaining Project sales that will need to be captured by external sources of demand outside of the Upper Westside are $42.2 million in Phase 1 and $124.3 million at buildout. The Market Area is estimated to capture $61.4 million in Phase 1, and $58.5 million at buildout, of the new Upper Westside household spending, excluding the spending captured within the Project itself.

There is an estimated surplus of demand from Project households and new Market Area households of $19.1 million (1.3 percent of current Market Area sales) for Phase 1, stemming from the projected total buildout of residential units within the Project during Phase 1. The addition of the remainder of the nonresidential development at buildout creates an estimated deficit of about $65.8 million in sales (4.6 percent of current Market Area sales) that will need to be captured from households and other sources of demand outside of the Market Area. The remaining $65.8 million of total retail sales generated by Upper Westside would be attributable to a shift of sales from existing retail establishments in the Market Area. The estimated impact of retail development proposed in Upper Westside on total retail sales in the Market Area through Phase 1 (2042) and at Project buildout (2052) is shown in **Table 6-1**.

The Project-specific analysis excludes other new sources of demand that will certainly offset the estimated Project sales not captured by new households and employees in the Project. Notably, the project-specific analysis excludes estimates of sales from pass-by traffic for the Project's highway-oriented retail along Interstate 5 and Interstate 80. In addition, the analysis excludes market support from the incremental growth in households and employees in the Market Area, outside of the Project, which will patronize existing and new retail establishments in the Market Area, including the mixed-use retail uses in the Project town center.

---

[68] Refer to **Table 5-2** for information on estimated Project sales.

## Table 6-1. Project-Specific Impacts on Existing Retail Supply

*impact*

Source: EPS.

[1] Excludes retail sales of existing uses in the Project, which are captured in current Market Area retail sales.

As shown, while Upper Westside would capture most of the incremental new demand, it would also result in a nominal sales deficit of about 4.6 percent from existing establishments in the Market Area. Although there is no absolute rule, most establishments usually can withstand a short-term sales shift of 5 percent to 7 percent over a 3- to 5-year timeframe, as this typically represents a business cycle downturn.[69] EPS estimates this nominal sales shift will decline as population and employment growth continues in the Market Area.

In EPS's professional opinion, the estimated nominal shift from existing retail establishments is unlikely to create conditions in the Market Area conducive to urban decay, defined as the substantial and prolonged physical deterioration of properties or structures resulting in discontinued use and investment. This is because the degree to which the market would be affected does not exceed thresholds in which a healthy retail sector could recover. In other words, property owners and tenants are likely to have an economic incentive to maintain their businesses (and properties) with the expectation that longer-term market trends are likely to be favorable. As mentioned, EPS estimates the sales shift will continue to decline as demand in the Market Area continues to expand based on population growth.

That being said, there are uncertainties regarding how the retail sector will continue to respond to changing dynamics, as discussed in **Chapter 3**. The retail sector has a history of dynamism and flexibility but the technological changes in the sector are unprecedented. EPS estimates that any impacts related to the long-term health of the retail sector in and outside the Market Area will be based on structural sector changes rather than the introduction of new Project retail.

## Estimated Cumulative Retail Impacts

There is a moderate amount of retail space in future planned and proposed projects located in the Market Area. As described in **Chapter 5**, planned and proposed projects in the Market Area (excluding the Project) are estimated to comprise 912,000 gross building square feet of retail space. Approximately 93 percent of this retail space (849,400 gross building square feet) is anticipated to absorb by 2052, concurrent with buildout of the Project. Applying a Market Area adjustment rate to the community- and neighborhood-oriented shopping centers and the same vacancy rate applied to Project retail space, this Study estimates that about 638,800 square feet of cumulative occupied space, excluding the Project, is planned to serve Market Area households by 2052. Adding in the estimated occupied retail space in the Project, the total net new occupied retail space planned by 2052 is 1.2 million square feet. The 1.2 million square feet of net new absorbed space, including the Project, represents an approximate 23 percent increase relative to existing inventory in the Market Area. In comparison, total households in the Market Area, including the Project, are estimated to increase by about 84 percent.

In estimating the cumulative impacts of the Project and other future planned retail in the Market Area on existing retail outlets, this Study applies a similar methodology used to examine Project-specific impacts. In addition to the Upper Westside retail sales estimate of approximately $263.3 million at buildout (2052), other future planned retail space in the Market Area will add

[69] This metric is based on decades of retail market research conducted by EPS, including an evaluation of retail sales and total establishment data collected from the California BOE and Department of Tax and Fee Administration.

approximately $285.3 million in annual retail sales to the Market Area, for total new retail sales of nearly $548.6 million annually with Upper Westside accounting for 48 percent of the future pipeline supply at buildout in the Market Area. The Market Area is estimated to capture $327.0 million in Phase 1 (2042) and $355.5 million at buildout (2052) of net new Market Area spending, excluding net new Upper Westside household and employee spending. Retail within Upper Westside is estimated to capture Project-generated household and employee spending of $186.0 million in phase 1 and $197.4 million at buildout. Total estimated net new spending in the Market Area is estimated to be $513.0 million in Phase 1 and $553.0 million at buildout. After accounting for the net new spending captured in the Market Area for the Project and the other cumulative Market Area retail projects there is an estimated surplus of demand available to support existing Market Area retailers from Project households and new Market Area households of $58.1 million (4.1 percent of current Market Area sales) for Phase 1 and $4.4 million at buildout (0.3 percent of current Market Area sales) as shown in **Table 6-2**.

The small percentage of available spending for Market Area retailers after the absorption of the Project and the cumulative projects indicates an appropriate amount of retail planned for future household growth. As the Sacramento Region, including the Market Area, continues to experience residential and employment growth, this percentage is expected to increase over time and indicates that development within the Market Area is unlikely to result in existing retail outlets becoming vacant or remaining vacant for a sustained period. Thus, it is EPS's professional opinion that this percentage of available spending is unlikely to lead to conditions conducive to urban decay. With the Market Area exhibiting strong market fundamentals, property owners and tenants will have an economic incentive to maintain their properties and businesses.

Further, with much of the existing supply of retail space in the Market Area being relatively new and well maintained as shown in **Appendix B**, there is no evidence to suggest that the existing retail space would be susceptible to vacancies based on the sole introduction of new retail space elsewhere in the Market Area.

The character of new retail space planned in the Market Area, including the Project, primarily is either community- (61 percent of total) or neighborhood-serving (25 percent of total), with the remainder identified as highway-serving (14 percent of total). New neighborhood-serving retail is developed to serve proximate new residents and will be financed and developed only when sufficient surrounding residential support exists, ensuring that impacts on existing retail outlets in the Market Area are minimal. With the plentiful inventory of existing community- and regional-serving retail in the Market Area and adjacent jurisdictions and the larger Sacramento Region, new community- and regional-serving retail also will be financed and developed only if sufficient net new market support exists. This type of retail space will require differentiation from the existing community and regional retail outlets in and beyond the Market Area to successfully attract sufficient consumer demand. With the Market Area exhibiting strong market fundamentals, it is unlikely existing retail space would be susceptible to vacancies based on the sole introduction of identified new retail space elsewhere in the Market Area.

[1] Excludes retail sales of existing uses in the Project, which are captured in current Market Area retail sales.

Further, it is important to note that the estimate of net new sales excludes other sources of demand for retail space in the Market Area, including demand from employment growth in the Market Area outside of the Project, and demand from residents and pass-by trips originating from outside the Market Area. These additional sources of demand would bolster the estimated demand for existing retail businesses in the Market Area.

## Urban Decay Conclusions

This Study evaluates whether the proposed Upper Westside has the potential to cause or contribute to urban decay, defined as the substantial and prolonged physical deterioration of properties or structures, resulting from extended vacancy, deferred maintenance, and abandonment.

**This analysis concludes that the prospects for urban decay are unlikely based on development of the Project or the cumulative development of the Project *and* other planned retail projects in the Market Area, based on the level of absorption estimated in this Study.** The conclusions drawn in this Study rely on current retail market conditions in the Market Area, findings regarding the capture of and demand for sales, the ability of landowners to adapt to changing market conditions, and jurisdictions' ability to address any instances of physical deterioration stemming from discontinued use and investment. These factors are discussed further below.

**Existing Conditions of Retail Sector.** All other things being equal, a weak or faltering retail sector will be more susceptible to urban decay. Conversely, a new competitive retail project is less likely to precipitate urban decay if existing market conditions are strong. Based on market performance indicators and corroborated with information obtained from real estate broker reports, the retail market in the Market Area is relatively healthy, with a consistently expanding inventory and a 3.4 percent vacancy rate, as described in detail in **Chapter 3**.[70]

**Extent of Demand.** Urban decay is more likely if a new competitive project results in a relatively large quantity of oversupplied retail space in the affected market area, which can contribute to increased vacancy. It is noteworthy that during the Great Recession, the Market Area experienced higher than usual year-over-year vacancy rates—reaching about 9 to 10 percent over three years (2010-2012). During economic recovery from the Great Recession (2013-2018), vacancy rates declined, and the retail market never experienced a long-standing chain reaction of store closures, long-term vacancies, or other physical manifestations of urban decay as evidenced by re-tenanting activity (see **Table 6-3**) and stabilized vacancy rates within 4 to 5 percent (see **Table 3-2**). The vacancy rates since 2019 have fallen below the healthy range of 5 to 10 percent, higher vacancy rates provide prospective renters and buyers with more options when searching for space, helping to stabilize prices. Below this 5.0 percent rate, those looking for space have fewer options, allowing landlords to charge higher prices. Research has consistently found that a vacancy rate below this 5.0 percent threshold leads to increasing rents and sales prices. To that end, the current vacancy rate of 3.4 percent and the estimated

[1] The length of vacancy ranges from less than one year up to 11 years.

remaining additional cumulative demand to support existing Market Area retailers of 0.3 percent indicate enough retail demand in the Market Area to support the cumulative projects, including the Project and thus not estimated to result in conditions conducive to urban decay.

**Reuse Options of Affected Properties.** Retail is a highly competitive and adaptable sector that is affected by a variety of evolving trends, including consumer preferences, demographics, travel patterns, technology, and innovation (e.g., e-commerce), as well as commodity production and distribution markets. Individual tenants or property owners will respond to these trends with varying degrees of success, depending on their entrepreneurial skills, local planning, business development efforts, and other factors. In the event vacancies occur in the market, either as a result of new retail space in the market or changing market dynamics, vacated spaces have the potential to be re-tenanted or repositioned with another specialization or use, see **Table 6-3** for examples of re-tenanting in and adjacent to the Market Area.

**Regulatory Controls.** Commercial property owners ordinarily want to maintain their property in a state that will attract and retain tenants. In addition, most municipalities have regulations that require private property owners to maintain their properties to prevent signs of disrepair. In the Market Area, both cities and Sacramento County require property owners to maintain their

properties by preventing poor property conditions and nuisances that may lead to blight. In addition, both the cities of Sacramento and West Sacramento have municipal ordinances to address the myriad physical manifestations related to urban decay.

The City of Sacramento's relevant ordinances include Municipal Code Chapters 8.04 Nuisances Generally, 8.04.060 Responsibility for proper property maintenance, 8.16 Abatement Procedure for Abandoned, Wrecked, Dismantled or Inoperative Vehicles, 8.04.360—Summary abatement of graffiti., 8.28 Weed and Rubbish Abatement, 8.76 Securing Unimproved or Unoccupied Real Property, 8.136 Registration of Vacant Lots, 12.32 Sidewalk Repair, Maintenance and Liability, and 8.96 Dangerous Buildings Code.[71] In particular, the City of Sacramento's Nuisance Code Ordinance is intended to prevent anything that "constitutes visual blight or reduces the aesthetic appearance of the neighborhood, is offensive to the senses, or is detrimental to nearby real property or property value." Sacramento's Code Enforcement Division comprises the Code and Housing Enforcement Chief, 2 Supervising Building Inspectors, 1 Principal Building Inspector, 3 Senior Code Enforcement Offices, 1 Code Enforcement Manager, 2 Code Liaisons, 1 Program Manager, and 1 Customer Service Supervisor. City staff process around 4,200 cases per year for the Natomas-area zip codes (95833, 95834, and 95835). Approximately 99 percent of the opened cases are resolved each year. Commercial complaints typically include development standards and signage.[72] The regulations in place would ameliorate any potential physical impacts leading to urban decay.

The City of West Sacramento's relevant ordinances includes Municipal Code Chapter 19 Nuisance Abatement Code which includes Section 19.05 Property Maintenance, and 19.10 Abandoned, Wreck, Dismantled, or Inoperative Vehicles.[73] In particular, the City of West Sacramento's Nuisance Code Ordinance is intended to "Provide for the protection of life, limb, health, safety, property or welfare of the general public and occupants of, and neighbors to, properties or conditions constituting public nuisances," and, "Provide the citizens of the city with an attractive community and protect property values."[74] West Sacramento's Code Enforcement Division comprises a Code Enforcement Manager, 4 Code Enforcement Officers, and 1 administrative support staff. The City of West Sacramento staff processes around 1,200 cases per year with an average of about 60 days to resolve the cases. [75] The regulations in place would ameliorate any potential physical impacts leading to urban decay.
