4. Project Location

The Project Site encompasses property located at 456 and 468 North Rodeo Drive, 461 through 465 North Beverly Drive, and 449, 451, and 453 North Beverly Drive in the City of Beverly Hills, California 90210. The approximately 1.277-acre (55,608 square feet) Project Site specifically consists of seven legal lots as follows: one legal lot at 456 North Rodeo Drive (Assessor's Parcel Number 4343-016-012); two legal lots at 468 North Rodeo Drive (Assessor's Parcel Number 4343-016-001); three legal lots at 461-465 North Beverly Drive (Assessor's Parcel Number 4343-016-023); and one legal lot at 449-453 North Beverly Drive (Assessor's Parcel Number 4343-016-019). The Project Site also includes a portion of the existing north-south alley located east of North Rodeo Drive and west of North Beverly Drive.

As shown in Figure 1 on page 2, the Project Site is bounded by South Santa Monica Boulevard to the north, North Beverly Drive to the east, commercial buildings to the south, and by North Rodeo Drive to the west.[1] As illustrated in Figure 2 on page 3, an existing alley bisects the Project Site. The alley runs north-south through the Project Site and currently is accessible from South Santa Monica Boulevard.

[1] *For ease of reference, these directions consider that South Santa Monica Boulevard is due north of the Project Site.*

7. Zoning

C-3 Commercial

8. Existing Project Site Conditions

The Project Site is currently occupied by commercial and institutional uses comprising approximately 56,787 square feet. Specifically, 456 North Rodeo Drive is developed with a two-story, 6,895-square-foot commercial structure and nine surface parking spaces, 468 North Rodeo Drive is currently developed with a two-story, 20,265-square-foot commercial structure and six surface parking spaces, 461–465 North Beverly Drive is currently developed with a two-story, 23,351-square-foot institutional use and five surface and 45 underground parking spaces, and 449, 451, and 453 North Beverly Drive is developed with a one-story, 6,276-square-foot commercial structure.

The existing structure at 456 North Rodeo Drive was constructed in 1948. The building has been occupied by a variety of commercial tenants over the years, including electronics retailers, art galleries, and clothing and accessories boutiques. The building at 456 North Rodeo Drive is currently occupied by luxury retailer Celine. The existing structure at 468 North Rodeo Drive was constructed in 1997 as a flagship retail store for the clothing brand Tommy Hilfiger Corp., and later served as a flagship retail store for the Brooks Brothers clothing brand. The existing structure at 468 North Rodeo Drive was recently used for a temporary, pop-up art exhibition and is currently vacant. The existing structure at 461–465 North Beverly Drive was constructed in 1994-1996 as an extensive remodel of two previously-existing structures. The building formerly housed The Paley Center for Media and is currently leased to an art exhibitor. The existing structure at 449, 451, and 453 North Beverly Drive was constructed in 1921 and appears to have been significantly expanded around 1926. This building is currently vacant.

9. Surrounding Land Uses and Setting

As previously stated, the Project Site is located within the northern portion of the Beverly Hills Business Triangle. Land uses surrounding the Project Site include a mix of retail uses and restaurants. Specifically, north of the Project Site, across South Santa Monica Boulevard are a collection of small retail stores and restaurants as well as an art gallery. Further to the north are parking structures, Santa Monica Boulevard, Beverly Gardens Park, and single-family residential neighborhoods. Beverly Gardens Park is included on the City's Local Register of Historic Properties. East of the Project Site, across North Beverly Drive, is the 9-story Bank of America Financial Center building, which primarily contains office space with a Bank of America Branch office and vacant commercial space on the ground floor fronting North Beverly Drive and South Santa Monica Boulevard. The area immediately south of the Project Site near North Beverly Drive is developed with two 2-story buildings. The building that fronts North Beverly Drive has small retail stores and restaurants on the ground floor and office space on the second floor. The building that fronts the alley contains warehouse space on the ground floor with office space on the second floor. Immediately south of the Project Site fronting North Rodeo Drive is a 3-story building, which contains Ralph Lauren and Giorgio Armani stores on floors 1-2 and a doctor's office and other commercial office tenants on the 3rd floor. To the west of the Project Site, across North Rodeo Drive, are a collection of luxury clothing stores, including Alexander McQueen, Brioni, DSquared2, Zadig & Voltaire, and Saint Laurent. The Writers and Artists Building, a historic building included on the City's Local Register of Historic Properties, is located to the northwest of the Project Site at the intersection of North Rodeo Drive and South Santa Monica.

Local access to the Project Site is provided by several local streets and avenues, including Santa Monica Boulevard and Wilshire Boulevard. The Project Site is also well served by a variety of public transit options, including local and regional bus lines. In particular, the Los Angeles County Metropolitan Transit Authority (Metro) serves several transit stops along Santa Monica Boulevard and North Beverly Drive in the vicinity of the Project Site. The Project Site is also located approximately 0.5 mile from the Metro Purple line station currently under construction along Wilshire Boulevard generally between Cañon Drive and Rodeo Drive.

10. Description of Project

The Cheval Blanc Beverly Hills Project (herein referred to as the Project) includes the development of a single 212,034-square-foot[2] multiple-use building that would include a

[2] *Per the Specific Plan, exterior walls, stair shafts, elevators, elevator lobbies less than 100 square feet per cab, parking spaces and access, maintenance equipment/machinery rooms, outdoor dining areas, decks*
(Footnote continued on next page)

luxury hotel with 109 guest rooms and a penthouse, a private club offering facilities for social and recreational purposes, restaurant and retail uses, and other appurtenant uses related to hotel and club services and functions such as a wellness center and spa. The Project also proposes the creation of the Cheval Blanc Beverly Hills Specific Plan, which would facilitate the orderly and efficient development of the Project Site by, among other things, establishing appropriate size, height, and density limits. Under the Cheval Blanc Beverly Hills Specific Plan, proposed development could include up to 220,949 square feet and up to 115 guest rooms. As such, this Initial Study and forthcoming EIR evaluates the Project's potential environmental impacts considering the maximum allowable floor area of 220,949 square feet and maximum number of guest rooms of 115 rooms. A summary of the uses proposed as part of the Project is provided in Table 1 on page 7.

To allow for development of the Project, the existing commercial and institutional uses on the Project Site comprising approximately 56,787 square feet of floor area would be removed. Additionally, the portion of the existing public alley bisecting the Project Site would be relocated as part of the tentative parcel map process. Overall, the Project could result in a net floor area increase of up to 164,162 square feet (under the Specific Plan maximums) on the Project Site. The submitted conceptual plan identifies an increase of approximately 155,247 square feet of floor area over existing conditions. The proposed Specific Plan identifies a total floor area ratio (FAR) maximum of 4.2:1 and an above ground maximum of 3.91:1. The total FAR calculation for the submitted conceptual plan is 4.03:1 and the above ground maximum is 3.75:1. The Project is anticipated to begin construction in 2022. Construction of the Project is estimated to occur over an approximate 38-month period with buildout completed in early 2026.

The proposed building would vary in height from four stories and a maximum height of 51 feet along North Rodeo Drive to nine stories with a maximum height of 115 feet along North Beverly Drive. The proposed building also includes three subterranean levels. As summarized in Table 1, the Project includes a mix of uses which would be distributed throughout the proposed building. Conceptual floor plans of the building are included in Figure 3 through Figure 9 on pages 8 through 14. As shown therein, the third and second subterranean levels would primarily include parking and building systems. The second subterranean level would also include parking for the penthouse and the penthouse lobby. The first subterranean level would include the hotel back of house area, including the central kitchen and employee facilities, as well as accessible parking, loading, and service areas. As shown in Figure 4 on page 9, the ground level of the building would include retail uses along North Rodeo Drive and South Santa Monica Boulevard and restaurant uses

and balconies, and 2,000 square feet of storage per below grade parking level are not included in the floor area calculations

Table 1
Summary of Proposed Uses

Project Uses	Proposed Conceptual Plan[a]	Specific Plan Maximum[b]
Hotel Guest Rooms	98,673 sf (109 rm)	104,400 sf (115 rm)
Hotel Lobby and Circulation	23,413 sf	24,772 sf
Wellness Center	4,924 sf	4,924 sf
Spa	12,226 sf	12,936 sf
Restaurants/Lounges/Bars/Restaurant Kitchen	20,334 sf	20,334 sf
Employee Facilities/Office/BOH (includes Central Kitchen)	19,290 sf	20,410 sf
Club Conference Room/Screening Room/Lounge	7,001 sf	7,001 sf
Club Lobby and Circulation	1,197 sf	1,197 sf
Retail Uses	24,976 sf	24,976 sf
Total Floor Area	**212,034 sf**	**220,949 sf**

ac = acres

rm = rooms

sf = square feet

[a] *Per the Specific Plan, exterior walls, stair shafts, elevators, elevator lobbies less than 100 square feet per cab, parking spaces and access, maintenance equipment/machinery rooms, outdoor dining areas, decks and balconies, and 2,000 square feet of storage per below grade parking level are not included in the floor area calculations.*

[b] *All floor areas listed are approximate and conceptual for CEQA analysis purposes. The Specific Plan maximums include the maximum number of hotel rooms and the approximate amount of floor area that may be allocated to each use in the building should the Project be built to the Specific Plan maximums. Adjustments in floor area may occur between uses up to a five percent decrease or increase as provided for in the proposed Cheval Blanc Beverly Hills Specific Plan but shall not exceed 220,949 square feet of floor area.*

along South Santa Monica Boulevard and North Beverly Drive. Also at the ground floor would be the private club's lobby with a pedestrian entrance on North Beverly Drive and additional loading and service areas accessed from the reconfigured alley. An approximately 670 to 825-square-foot pedestrian plaza would also be provided at the corner of South Santa Monica Boulevard and North Rodeo Drive. The second level of the building would include additional retail and dining options, as well as back of house uses.

As provided in Figure 5 on page 10, the third level of the building would include hotel guest rooms, private club facilities, a landscaped garden, and back of house uses. The fourth and fifth levels of the building would include additional hotel guest rooms, the proposed spa, as well as back of house uses. The sixth level of the building would include

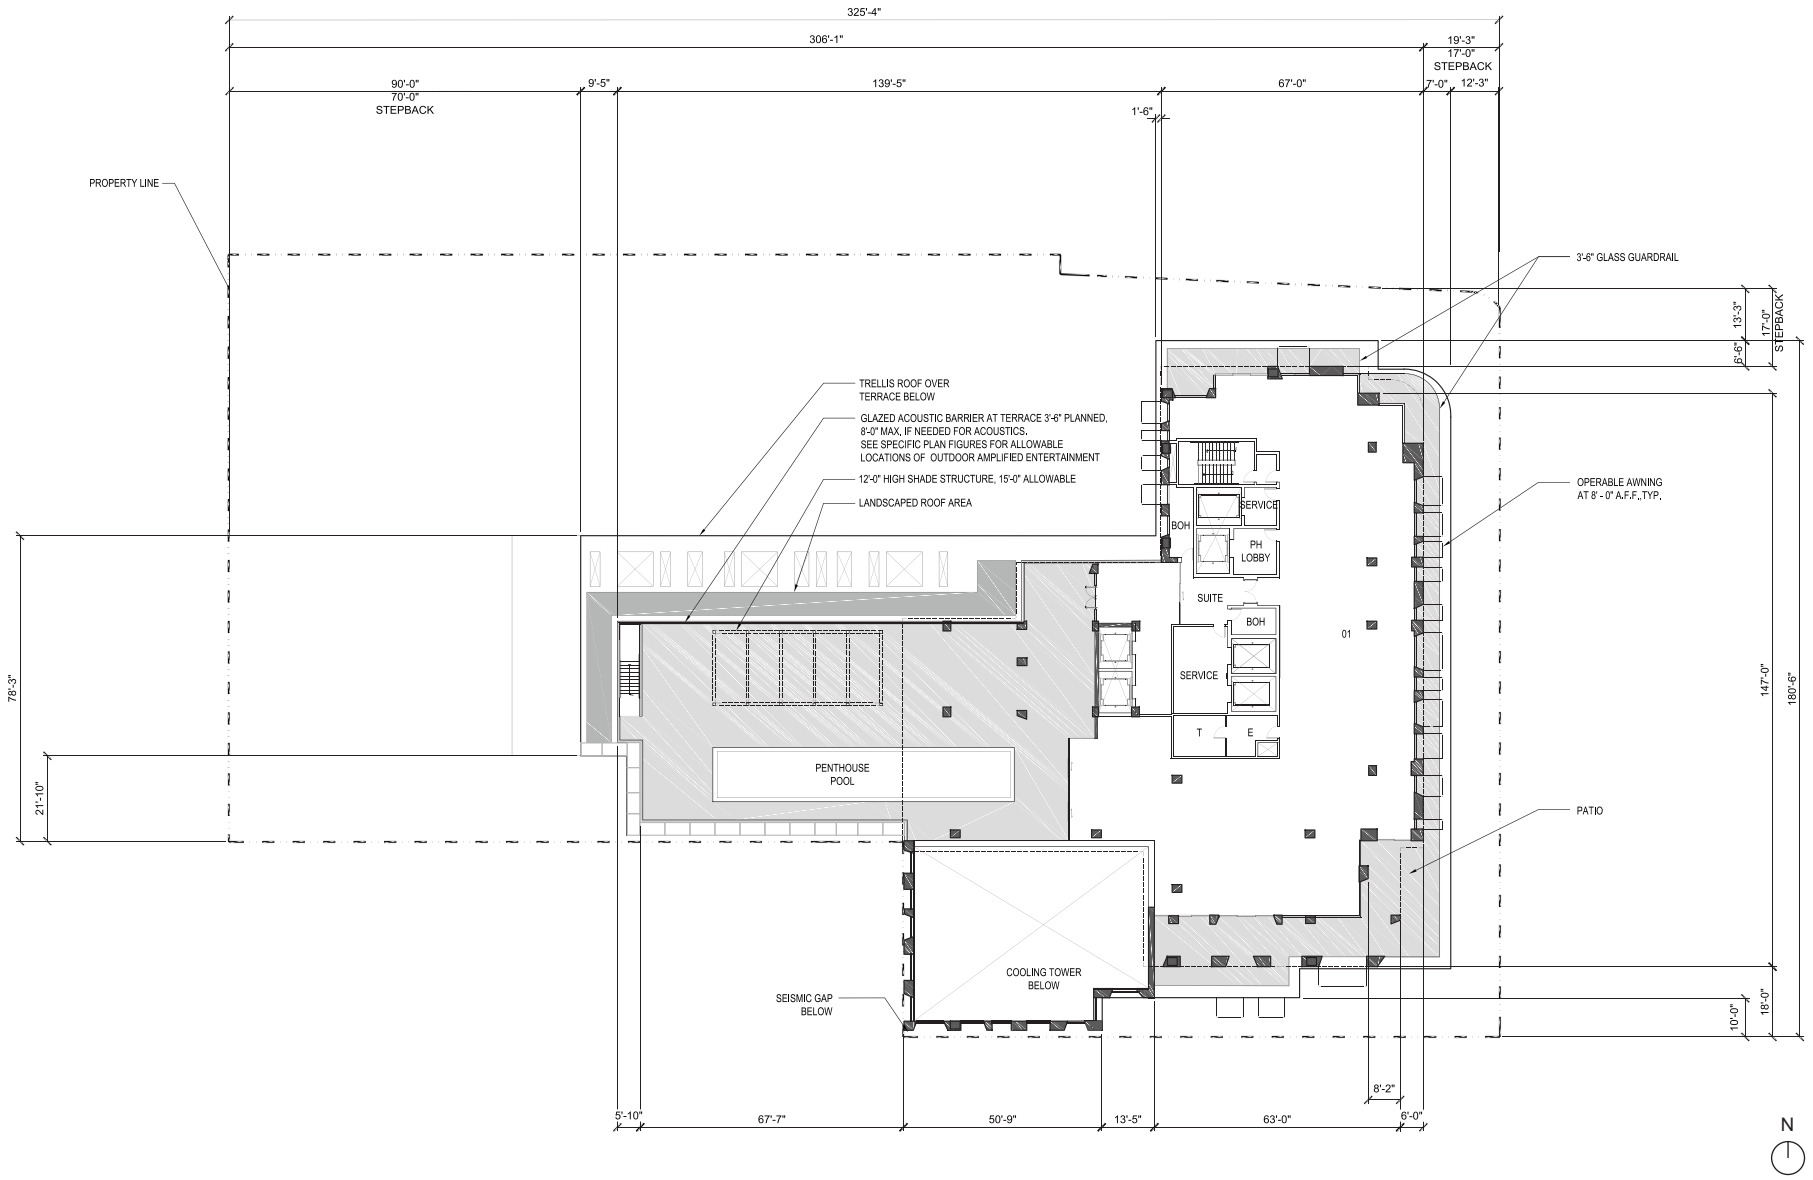

Figure 9
Conceptual Ninth Level Floor Plan

Source: Gruen Associates, 2020.

hotel guest rooms, a restaurant, kitchen/back of house area, and a pool deck featuring cabanas and seating areas. The seventh level would include additional hotel guest rooms, the private club bar, outdoor roof terrace, and back of house uses. The eighth level of the building would include hotel guest rooms, the proposed health/wellness center, and back of house areas. The ninth level of the building comprises the penthouse level, which would include penthouse suite(s) and amenities, including a penthouse pool.

The Project would incorporate modulation of building heights and massing, articulation of building façades at all elevations, and pedestrian-friendly treatments along the public right-of-ways. The heights and massing of the building specifically respond to the Project Site's location in the Golden Triangle (Business Triangle) and the character of the area. In particular, retail and lower building heights (4 stories, 51 feet in height) would be located along the North Rodeo Drive frontage, Beverly Hills' premier shopping street, and at the intersection of North Rodeo Drive with Santa Monica Boulevard. Taller building heights (up to 9 stories, 115 feet in height) would be placed along Santa Monica Boulevard and North Beverly Drive, transitioning to a similar height as the existing building located to the east across North Beverly Drive (the 110-foot tall Bank of America building). A landscaped trellis-like porte cochere covering the motor court adjacent to South Santa Monica Boulevard would further break up the massing of the Project, creating an open space/courtyard for drop-off and pick-up for patrons and guests. Building façades on all elevations are designed with recessed windows, balconies, and awnings creating shade and shadow patterns and visual interest. Landscaping would also be used throughout the Project to soften the building façades.

The Project would provide 178 vehicle parking spaces for the proposed uses in three subterranean parking levels. Primary access to the building and parking would be from South Santa Monica Boulevard from a valet motor court. The existing alley that runs north-south and is currently accessed from South Santa Monica Boulevard would be relocated to the southern portion of the Project Site as part of the Project, and the relocated alley area would be incorporated into the Project Site. The new access point to the alley would be from the west side of North Beverly Drive.

The proposed valet motor court on South Santa Monica Boulevard would be used for drop-off and pick-up for hotel guests, club members, spa, retail and restaurant patrons. Employee and valet driven vehicles would enter the Project's subterranean parking from the relocated alley off North Beverly Drive. Employees and small delivery vans would enter and exit the subterranean parking through the existing alley. Valet driven vehicles would return from the subterranean garage to the motor court via ground level on-site internal circulation. Temporary valet parking pick-up/drop-off is proposed on North Beverly Drive during peak Project Site events with access via the secondary pedestrian entrance (club entrance) on North Beverly Drive.

Primary pedestrian access to the Project Site would be provided through the hotel entrance along South Santa Monica Boulevard. A club member lobby at the ground level provides secondary pedestrian access from North Beverly Drive; however, club members arriving at the motor court by vehicle would access the club member lobby by an internal corridor accessed off the hotel lobby. Retail spaces along North Rodeo Drive would have separate pedestrian access points from the sidewalk along the street. The primary access to the ground floor restaurant would occur through the hotel lobby/motor court area. Additional ancillary pedestrian restaurant access points may be provided on South Santa Monica Boulevard and/or North Beverly Drive.

The proposed Project plans identify approximately 45,356 square feet of open space. This includes the publicly accessible 670-825-square-foot pedestrian plaza proposed at the ground floor. Additionally, 4,760 square feet of outdoor restaurant and bar spaces on levels six and seven and the 742-square-foot outdoor terrace on the seventh level would be publicly accessible by reservation only. The remaining open space area would be for private use by hotel guests and club members and would include hotel room balcony/patio areas, pool deck, wellness center outdoor area, and penthouse pool deck.

The Project would also incorporate green construction standards and design consistent with the Leadership in Energy and Environmental Design (LEED) Green Building Rating System with a minimum rating of Silver. Specific LEED features that would be incorporated into the Project include, but are not limited to:

- Recessed windows, balconies and overhangs to shade window glazing, while allowing reflected and diffuse daylight into the building to enhance the use of natural light and reduce the need for artificial light sources;
- Landscaping and exterior design utilizing subterranean parking and landscaped and shaded non-roof surfaces, light-colored, low-albedo roof surfaces to reduce local heat island effects;
- The reduction of chlorofluorocarbons (CFCs) from the building systems;
- The selection of materials, such as adhesives, sealants, paints, and carpeting, that reduce off-gassing to improve internal air quality;
- Installation of electric vehicle charging equipment and bicycle parking;
- Solar ready collectors for 15 percent of the roof area excluding skylight areas for energy efficiency;
- Recycling of a minimum of 50 percent of demolition and construction debris; and

- The use of greywater for irrigation for landscape in areas inaccessible to hotel guests, club members, their respective guests and the public.

As previously discussed, construction of the Project is anticipated to commence in 2022. Construction of the Project would occur in two phases, which would overlap in their duration. Phase 1 would involve demolition of 449 and 461 North Beverly and construction of the 449 North Beverly garage to grade and opening of the relocated alley with overhead protection. Phase 2 would include the balance of the Project. The overall duration of construction is estimated to be approximately 38 months with Project buildout in early 2026. During construction of the Project, approximately 124,920 cubic yards of earth would be removed from the Project Site, including approximately 34,564 cubic yards during Phase 1 and 90,356 cubic yards during Phase 2. The designated haul route is anticipated to be South Santa Monica Boulevard to North Beverly Drive to Wilshire Boulevard (right turns only).

11. Requested Entitlements

The following entitlements have been requested as part of the Project:

- A General Plan Amendment designating the Project Site as the "Cheval Blanc Beverly Hills Specific Plan" on the City's General Plan Land Use map and Amendment of General Plan Text.

- A Zoning Map and Zone Text Amendment to create a new Specific Plan, "Cheval Blanc Beverly Hills," and to modify the official City Zoning Maps and add text to apply the Specific Plan zoning to the Project Site.

- A Specific Plan that establishes development standards, such as size, height and density, applicable to the Project Site.

- A Development Agreement to provide for vested development rights and certain community benefits in connection with the Project.

- A Vesting Tentative Parcel Map to merge the existing contiguous lots and relocate the surface right-of-way of the public alley.

- Encroachment Permits to allow: (i) subsurface utility vaults to encroach into the public right-of-way; (ii) parking spaces and aisles to extend under the public sidewalk from ten (10) feet below grade and up to the existing curb; (iii) installation and maintenance of landscaped parkways and special paving in the public right of way along North Rodeo Drive, South Santa Monica Boulevard and North Beverly Drive.

- Amendment to the Master Plan of Streets: (i) to relocate the existing surface right-of-way for public alley purposes; (ii) to dedicate additional surface right of way for public sidewalk purposes along South Santa Monica Boulevard; and (iii) to allow the public roadway along North Rodeo Drive and South Santa Monica Boulevard to remain in their current locations.

In addition to the entitlements identified above, subsequent or additional approvals may also be required from the City for the Project, including, but not limited to, architectural review, demolition permit, haul route permit, excavation permit, shoring permit, grading permit, foundation permit, and various building permits.

12. Other Public Agencies Whose Approval is Required

None.

Environmental Factors Potentially Affected

The environmental factors checked below would be potentially affected by the Project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

☐ Aesthetics	☐ Agriculture and Forestry Resources	☒ Air Quality
☐ Biological Resources	☒ Cultural Resources	☒ Energy
☒ Geology and Soils	☒ Greenhouse Gas Emissions	☐ Hazards and Hazardous Materials
☐ Hydrology and Water Quality	☒ Land Use and Planning	☐ Mineral Resources
☒ Noise	☐ Population and Housing	☐ Public Services
☐ Recreation	☒ Transportation/Traffic	☒ Tribal Cultural Resources
☒ Utilities and Service Systems	☐ Wildfire	☐ Mandatory Findings of Significance

Determination

Based on this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions to the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☒ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect: (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards; and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. A SUPPLEMENTAL ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potential significant effects: (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards; and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Printed Name	Title

Environmental Checklist

1. Aesthetics

Current CEQA law provides that potential aesthetic impacts of certain infill projects in transit priority areas shall not be considered significant impacts on the environment. Specifically, Public Resources Code (PRC) Section 21099(d) states that "[a]esthetic and parking impacts of a residential, mixed-use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment." PRC Section 21099 defines a "transit priority area" (hereafter TPA) as an area within 0.5 mile of a major transit stop that is "existing or planned, if the planned stop is scheduled to be completed within the planning horizon included in a Transportation Improvement Program or applicable regional transportation plan." PRC Section 21064.3 defines "major transit stop" as "a site containing any of the following: (a) A site containing an existing rail or bus rapid transit station, (b) A ferry terminal served by either a bus or rail transit service, [or] (c) The intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods." PRC Section 21099 defines an "employment center project" as "a project located on property zoned for commercial uses with a floor area ratio of no less than 0.75 and that is located within a transit priority area." PRC Section 21099 defines an "infill site" as "a lot located within an urban area that has been previously developed, or on a vacant site where at least 75 percent of the perimeter of the site adjoins, or is separated only by an improved public right-of-way from, parcels that are developed with qualified urban uses."

PRC Section 21099 applies to the Project. Specifically, pursuant to PRC Section 21099, the Project is an employment center project that would be located on an infill site within a TPA. The Project is considered an employment center project because it is located on property that is zoned for commercial uses with a floor area ratio greater than 0.75. In addition, the Project Site is located on an infill site, as that term is defined in PRC Section 21099(a)(4), because the Project Site consists of lots located within an urban area that have been previously developed. The Project Site is also located within a TPA, as that term is defined in PRC Section 21099(a)(7), because it is located within 0.5 mile of an existing "major transit stop." In particular, the Project Site is located within approximately 0.5 mile of several Los Angeles County Metropolitan Transit Authority (Metro) bus routes, including Bus Routes 4, 16, 17, 704, and Rapid 720, with a service interval of 15 minutes or less during peak hours. In addition, construction of the Metro Purple (D) Line Extension,

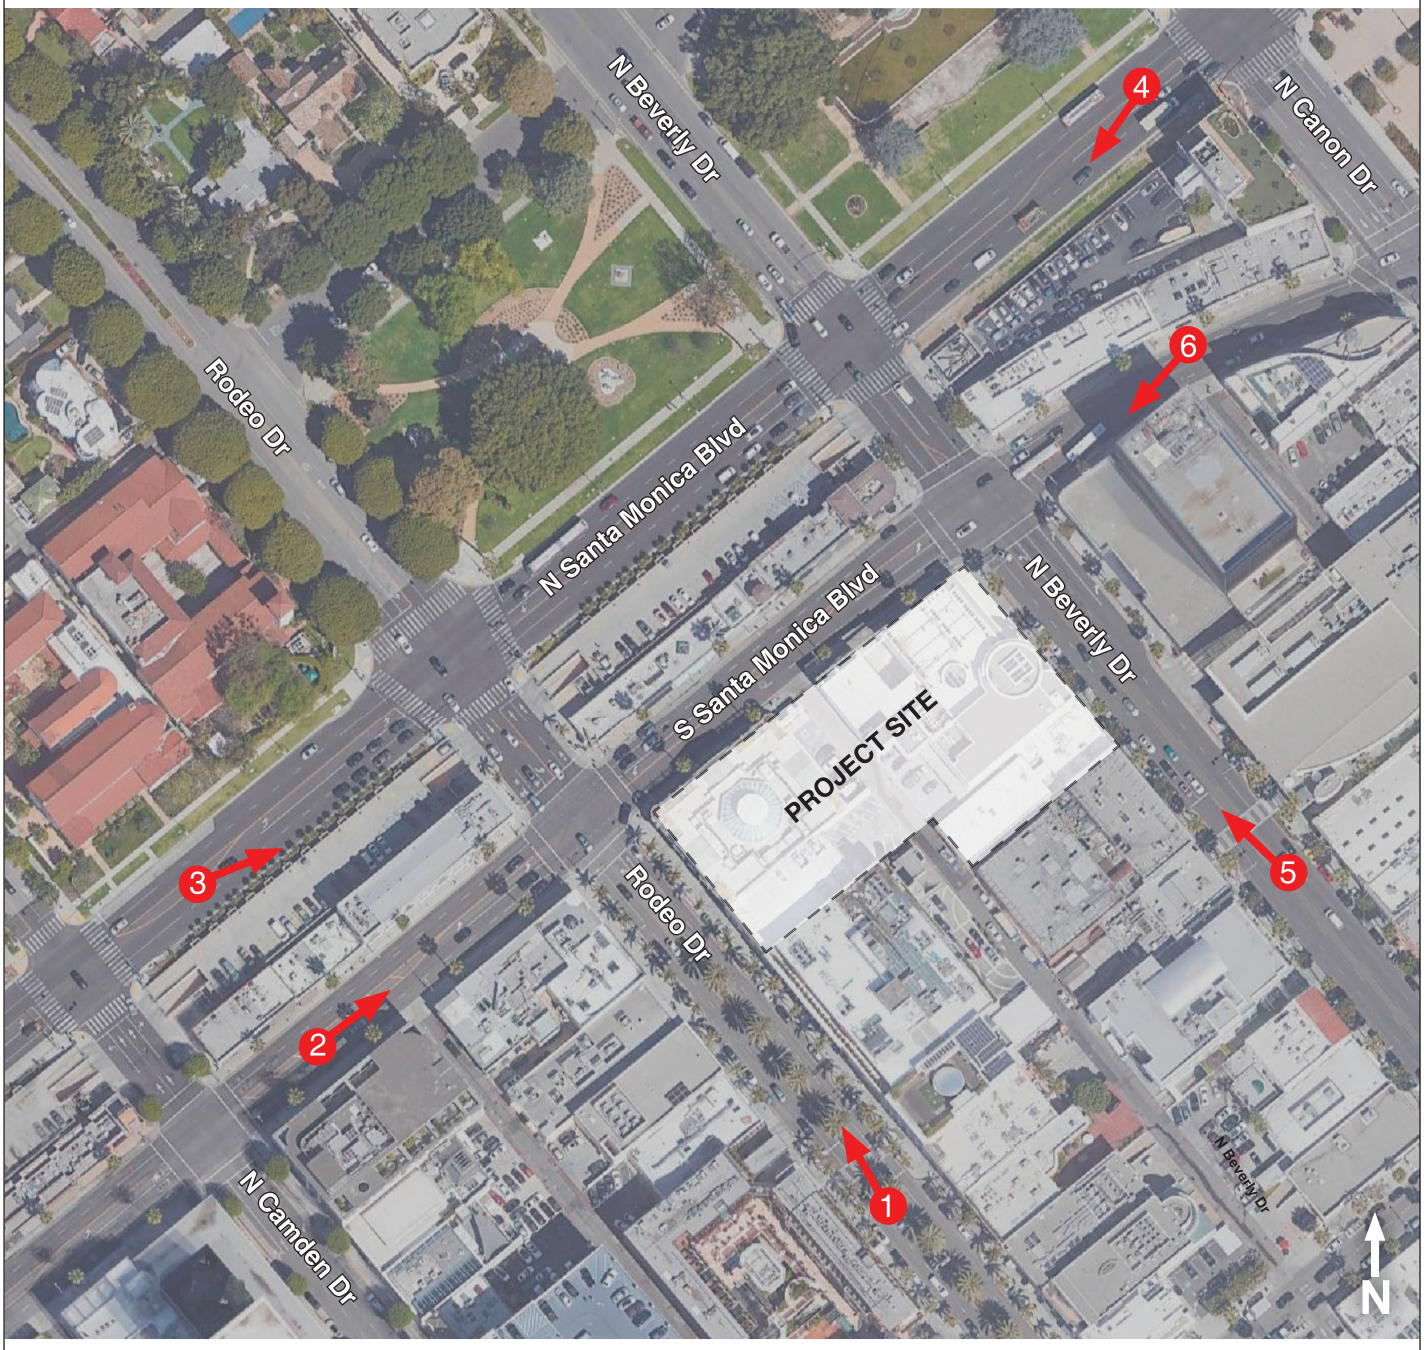
which includes a subway station at Wilshire/Rodeo, is currently underway and is anticipated to be completed in 2025.[3] The Project Site is located approximately 0.3 mile north of the proposed Wilshire/Rodeo station. Therefore, in accordance with PRC Section 21099(d)(1), the Project's aesthetic impacts shall not be considered significant impacts on the environment and therefore do not have to be evaluated under CEQA. Nonetheless, this Initial Study includes a discussion of aesthetics for informational purposes only.

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Except as provided in Public Resources Code Section 21099, would the project:				
a. Have a substantial adverse effect on a scenic vista?	☐	☐	☐	☒
b. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☐	☒
c. In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	☐	☐	☐	☒
d. Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☐	☒

a. Would the project have a substantial adverse effect on a scenic vista?

No Impact. A scenic vista is a panoramic view of a valued visual resource. Panoramic views or vistas provide visual access to a large geographic area, for which the field of view can be wide and extend into the distance. Panoramic views are typically associated with vantage points looking out over a section of urban or natural areas that provide a geographic orientation not commonly available. Examples of panoramic views include an urban skyline, valley mountain range, the ocean, or other water bodies.

As discussed above in the Description of the Project subsection of this Initial Study, the Project Site encompasses property located at 456 and 468 North Rodeo Drive, 461 through 465 North Beverly Drive, and 449, 451, and 453 North Beverly Drive in the City of



[3] *Metro. Projects, Purple Line Extension, www.metro.net/projects/westside/, accessed November 7, 2020.*

Beverly Hills, California 90210. The approximately 1.277-acre (55,608 square feet) Project Site is bounded by South Santa Monica Boulevard to the north, North Beverly Drive to the east, commercial buildings to the south, and by North Rodeo Drive to the west.[4] An existing alley, which runs north-south, currently bisects the Project Site. The Project Site is located within the northern portion of the Beverly Hills Business Triangle. Land uses surrounding the Project Site include a mix of retail uses and restaurants. Specifically, north of the Project Site, across South Santa Monica Boulevard, are a collection of small retail stores and restaurants as well as an art gallery. East of the Project Site, across North Beverly Drive, is the 9-story Bank of America Financial Center building, which primarily contains office space with a Bank of America Branch office and vacant commercial space on the ground floor fronting North Beverly Drive and South Santa Monica Boulevard. The area immediately south of the Project Site near North Beverly Drive is developed with two 2-story buildings. The building that fronts North Beverly Drive has small retail stores and restaurants on the ground floor and office space on the second floor. The building that fronts the alley contains warehouse space on the ground floor with office space on the second floor. Immediately south of the Project Site fronting North Rodeo Drive is a 3-story commercial building. To the west of the Project Site, across North Rodeo Drive, are a collection of luxury clothing stores.

As illustrated in the visual simulations of the Project Site and vicinity included in Figure 11 through Figure 16 on pages 24 through 29, due to the highly urbanized and built out surroundings, as well as relatively flat topography, no publicly available scenic vistas of any valued visual resources exist in the vicinity of the Project Site. Therefore, development of the Project would not have the potential to substantially or adversely affect a scenic vista since none currently exist.

With regard to changes in publicly available views of the Project Site and surrounding area, Figure 11 through Figure 16 illustrate visual simulations at six public viewsheds of the Project Site and vicinity. A view location map showing the locations of each vantage point is provided in Figure 10 on page 23. The visual simulations are based on an architectural 3-D digital model of the Project and are intended to generally depict the Project's building heights and massing in the context of the surrounding area. A corresponding photograph showing the existing view for comparison is also included. The following discussion summarizes the principal characteristics of each view.

[4] *For ease of reference, these directions consider that South Santa Monica Boulevard is due north of the Project Site.*

EXISTING

PROJECT

Figure 16
Visual Simulations
View 6: Looking Southwest from South Santa Monica Boulevard

Source: Peter Marino Architect 2020.

- **View 1: Looking northwest from North Rodeo Drive**. As shown in Figure 11 on page 24, only a limited portion of the Project would be visible from this location. Palm trees and shrubs feature prominently along the sidewalks and within the median of North Rodeo Drive. The Project would nevertheless appear as an extension of the existing built environment. In particular, the Project would feature similar heights along the street frontage as the adjacent Ralph Lauren clothing store and feature a retail storefront along the property line.

- **View 2: Looking northeast from South Santa Monica Boulevard**. As shown in Figure 12 on page 25, the Project gains more prominence in the viewshed than in View 1 and would increase the massing and height within the Project Site compared to existing conditions. However, the Project would introduce a unique and attractive architectural design while simultaneously appearing as an extension of the existing built environment. In particular, the Project would feature similar heights along the street frontage as the Bank of America financial center across North Beverly Drive, which can currently be seen behind the present buildings at the Project Site.

- **View 3: Looking northeast from North Santa Monica Boulevard**. As shown in Figure 13 on page 26, the Project would visually fill in the viewshed with a building of similar scale as the surrounding uses, including the Bank of America building and the mid-size commercial building between North and South Santa Monica Boulevard, the latter of which greatly dominates the viewshed, along with palm trees lining the sidewalk. The Project would narrowly appear at the western edge of this commercial building and rise above it.

- **View 4: Looking southwest from North Santa Monica Boulevard**. Similar to View 3, as shown in Figure 14 on page 27, the Project would visually fill in the viewshed with a building of similar scale as the surrounding uses, including the Bank of America building, while also offering a prominent and distinctive architectural contribution to the area. A low-rise commercial building in between North and South Santa Monica Boulevard dominates the viewshed at the forefront, with the Bank of America building and the Project rising above it from behind.

- **View 5: Looking northwest from North Beverly Drive**. As shown in Figure 15 on page 28, only a limited portion of the Project would be visible from this location consisting predominantly of the Project's upper floors. Palm trees and shrubs feature prominently along the sidewalk. While the Project would increase the height and massing within the Project Site as compared to the commercial buildings adjacent to it, it would be consistent with the Bank of America financial center across North Beverly Drive, while also offering a distinctive architectural contribution to the area, as previously described.

- **View 6: Looking southwest from South Santa Monica Boulevard**. As shown in Figure 16 on page 29, this view features the Project most prominently, offering a clear depiction of the increase in height and massing on the Project Site at the

corner of North Beverly Drive and North Rodeo Drive as compared to the buildings that surround it, while also displaying the unique and positive visual contribution that the Project's architectural design will provide. A restaurant will be featured along the street frontage at this corner.

Overall, as the area is fully developed and highly urbanized, the Project would not have a substantial adverse effect on a publicly available scenic vista. Moreover, pursuant to Public Resources Code Section 21099(d), the Project's aesthetics impact would not be considered a significant impact on the environment. Therefore, no further evaluation of this topic in an EIR is required.

b. Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

No Impact. Based on the City of Beverly Hills General Plan Update Technical Background Reports, there are no scenic highways officially designated by the state within the City of Beverly Hills.[5] Therefore, the Project Site is not located along a state scenic highway. Thus, the Project would not substantially damage scenic resources within a state designated scenic highway as there are no scenic highways along the Project Site. Furthermore, pursuant to Public Resources Code Section 20199(d), the Project's aesthetic impacts shall not be considered a significant impact on the environment. Therefore, no evaluation of this topic is required.

c. In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point.) If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

No Impact. The Project Site is located in an urbanized area. As such, this analysis focuses on whether the Project would conflict with applicable zoning and other regulations governing scenic quality.

With regard to zoning, as discussed above in the Description of the Project, the Project Site is zoned C3 (Commercial Zone) and is designated as Low-Density General

---

[5] *City of Beverly Hills, Community Development Department, Long Range Planning, City of Beverly Hills General Plan Update Technical Background Report, October 2005, Chapter 5, Environmental Resources, www.beverlyhills.org/cbhfiles/storage/files/filebank/2566--GP-TBR-Covers.pdf, accessed September 11, 2020.*

Commercial on the City's General Plan land use map. The C3 zone allows for a wide variety of land uses, including cafés, carpenter shops, churches, dancing academies, dressmaking stores, hotels, libraries, offices (except medical uses), playgrounds, schools, plumbing shops, and upholsterers. The Low-Density General Commercial land use designation has a floor area ratio (FAR) of 2.0:1 and a maximum height of 45 feet or three stories, whichever is less.

The Project includes the development of a single multiple-use building that would include a luxury hotel with a maximum floor area of 220,949 square feet, including up to 115 guest rooms and a penthouse, a private club offering facilities for social and recreational purposes, restaurant and retail uses, and other appurtenant uses related to hotel and club services and functions such as a wellness center and spa.[6] In addition, the Cheval Blanc Beverly Hills Specific Plan would facilitate the orderly and efficient development of the Project Site by, among other things, establishing appropriate size, height, and density limits. Overall, the Project, including all requested entitlements, would result in a net increase of approximately 155,247 square feet to 164,162 square feet of new floor area on the Project Site with a total FAR of 4.03:1 to 4.2:1 and an above ground FAR of 3.75:1 to 3.9:1. The proposed building would vary in height from four stories and a maximum height of 51 feet along North Rodeo Drive to nine stories with a maximum height of 115 feet along North Beverly Drive.

While the Project would exceed the existing FAR and height limits of the current C3 zone, the uses proposed would be consistent with the uses permitted in the existing C3 zone, including a hotel, restaurant, retail, club, offices, and appurtenant uses. To permit the proposed FAR and height, the Project includes a General Plan Amendment and Zone Change from C3 to Cheval Blanc Beverly Hills Specific Plan. The proposed Cheval Blanc Beverly Hills Specific Plan would allow a maximum FAR of 3.9:1 above ground and a total FAR of 4.2:1 as well as a maximum height of 115 feet as measured from the ground floor at the highest point on the adjacent sidewalk. The maximum above ground FAR of 3.75:1 and maximum height of 115 feet identified on the submitted conceptual plans would fall within the allowable FAR and height limits of the Specific Plan. In addition, the Project would incorporate modulation of building heights and massing, articulation of building façades at all elevations, and pedestrian-friendly treatments along the public right-of-ways. The heights and massing of the building specifically respond to the Project Site's location in the Business Triangle and the character of the area. In particular, retail and lower building heights (4 stories, 51 feet in height) would be located along the North Rodeo Drive frontage, Beverly Hills' premier shopping street, and at the intersection of North Rodeo Drive with Santa Monica Boulevard. Taller building heights (up to 9 stories, 115 feet in

[6] *The wellness center and spa would include services such as massages and spa treatments and would not include medical uses.*

height) would be placed along Santa Monica Boulevard and North Beverly Drive, transitioning to a similar height as the existing building located to the east across North Beverly Drive (the 110-foot tall Bank of America building). A landscaped trellis-like porte cochere covering the motor court adjacent to South Santa Monica Boulevard would further break up the massing of the Project, creating an open space/courtyard for drop-off and pick-up for patrons and guests. Landscaping would also be used throughout the Project to soften the building façades. Therefore, while the Project would exceed existing FAR and height limits of the C3 zone, as depicted in the visual simulations provided above, the massing of the Project has been designed to complement the existing massing of buildings adjacent to the Project Site on North Rodeo Drive and North Beverly Drive. As proposed, the Project's design would provide a unique architectural contribution to the streetscape within the business triangle, located at the north end of the Rodeo Drive shopping district.

With regard to the City's regulations governing scenic quality, local land use plans applicable to the Project Site also include policies governing scenic quality, including the City General Plan Land Use Element and the General Plan Open Space Element. The Project's lack of conflict with the general intent of these General Plan elements is briefly discussed below.

General Plan Land Use Element

As set forth in the Land Use Element, the underlying objective of the Land Use Element is to maintain and enhance those qualities which contribute to the long-term stability and desirability of residential and nonresidential areas of Beverly Hills. The goals and policies related to scenic quality included in the Land Use Element that are applicable to the Project include the following:

- Goal LU 2 Community Character and Quality: A built environment that is distinguished by its high level of site planning, architecture, landscape design, and sensitivity to its natural setting and history.

- Policy LU 2.1 City Places: Neighborhoods, Districts, and Corridors: Maintain and enhance the character, distribution, built form, scale, and aesthetic qualities of the City's distinctive residential neighborhoods, business districts, corridors, and open spaces.

- Policy LU 11.2 Site Planning and Architectural Design: Require that commercial and office properties and buildings are planned and designed to exhibit a high level of site and architectural design quality and excellence.

As previously described, the Project Site is located within the northern portion of the Beverly Hills Business Triangle. Land uses surrounding the Project Site include a mix of retail uses and restaurants. Specifically, north of the Project Site, across South Santa

Monica Boulevard, are a collection of small retail stores and restaurants as well as an art gallery. East of the Project Site, across North Beverly Drive, is the 9-story Bank of America Financial Center building, which primarily contains office space with a Bank of America Branch office and commercial space on the ground floor fronting North Beverly Drive and South Santa Monica Boulevard. Immediately south of the Project Site fronting North Rodeo Drive is a 3-story commercial building. The area immediately south of the Project Site on North Beverly Drive is developed with two 2-story buildings. The building that fronts North Beverly Drive has small retail stores and restaurants on the ground floor and office space on the second floor. The building that fronts the alley contains warehouse space on the ground floor with office space on the second floor. To the west of the Project Site, across North Rodeo Drive, are small commercial structures containing luxury clothing stores.

The Project would complement and enhance the character of the built environment in the surrounding area by replacing the existing buildings and surface parking areas with a high-quality hotel that features a complementary and elegant design. The Project would incorporate modulation of building heights and massing, articulation of building façades at all elevations, and pedestrian-friendly treatments along the public right-of-ways. The heights and massing of the building specifically respond to the Project Site's location in the Business Triangle and the character of the area. In particular, retail and lower building heights (4-5 stories) would be located along the North Rodeo Drive frontage, Beverly Hill's premier shopping street, and at the intersection of North Rodeo Drive with Santa Monica Boulevard. Taller building heights (up to 9 stories) would be placed along Santa Monica Boulevard and North Beverly Drive, transitioning to an existing building of similar height (the 110-foot tall Bank of America building). A landscaped trellis-like porte cochere covering the motor court on South Santa Monica Boulevard would further break up the massing of the Project, creating a courtyard for drop-off and pick-up for patrons and guests. Building façades on all elevations are designed with recessed windows, balconies, and awnings creating shade and shadow patterns and visual interest. Landscape would also be used throughout the Project to soften the building façades. Overall, the Project's design would support the City's goal and policies to maintain and enhance the character, built form, scale, and aesthetic qualities of the City as well as reflect development with a high-level of site and architectural quality that is sensitive to its setting.

Based on the above, the Project would be generally consistent with the applicable goal and policies of the Land Use Element and, therefore, would not conflict with the Land Use Element policies regarding scenic quality.

General Plan Open Space Element

The City of Beverly Hills General Plan Open Space Element is the principal guide for the maintenance and conservation of natural resources, open space, and recreation and

park lands in the City of Beverly Hills and serves two main purposes: 1) to guide the City in policy issues regarding the acquisition, control, development, and use of space and 2) to maintain an inventory of the type, location, and use patterns of the City's open space and recreation resources for future planning purposes. The policies related to scenic quality included in the Land Use Element that are applicable to the Project include the following:

- Policy OS 6.3 Landscaping: Require that new development be located and designed to visually complement the urban setting by providing accessible, landscaped entries, courtyards, and plazas.

- Policy OS 6.4 Minimize Removal of Existing Resources: Require new commercial, office, and residential development to minimize the removal of mature trees and other significant visual resources present on the site.

- Policy OS 6.5 Standards for New Development: Seek to ensure that new development does not adversely impact the City's unique urban landscape.

- Policy OS 6.6 Lighting: Minimize obtrusive light by limiting outdoor lighting that is misdirected, excessive, or unnecessary.

- Policy OS 6.7 Glare: Require that new development avoid the creation of incompatible glare through use of appropriate materials and design features.

As described above in the Description of the Project, the conceptual plans include approximately 45,356 square feet of outdoor areas. These outdoor areas include publicly accessible open space consisting of a 670-825-square-foot pedestrian plaza at the ground floor. Therefore, the Project would support City Policy OS 6.3 as the Project would include an accessible landscaped entry. The Project would also be consistent with Policy OS 6.4 and Policy OS 6.5. Specifically, the Project would not remove any mature trees within the Project Site and proposed landscaping would be implemented to complement and be consistent with the surrounding environment. In particular, 15 mature street trees to be removed as part of the Project would be replaced with new palm trees at a 1:1 ratio. The Project would also not conflict with Policy OS 6.6 and Policy OS 6.7 regarding the minimization of light and glare as the Project would include lighting sources that would be similar to other lighting sources already within the Project Site and in the vicinity of the Project Site and would not generate artificial light levels that are out of character with the surrounding area. In addition, as part of the Project, glass used in building façades would have high-performance coatings that would not be highly reflective, thereby minimizing glare from reflected sunlight. Overall, the Project would be generally consistent with the applicable policies of the Open Space Element and, therefore, would not conflict with the Open Space Element policies regarding scenic quality.

In summary, the Project would not conflict with applicable zoning and other regulations governing scenic quality. Moreover, pursuant to Public Resources Code Section 21099(d), the Project's aesthetics impact would not be considered a significant impact on the environment. Therefore, no further evaluation of this topic in an EIR is required.

d. Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

No Impact. The Project Site currently generates moderate levels of light from interior light spillage from buildings, security lighting, building-mounted lights within small surface parking areas, and vehicle headlights in the parking areas. Existing glare sources within the Project Site include glass, architectural elements, and vehicle headlights. The Project Site is in an urbanized area and is surrounded by urban infrastructure, street lighting, and low- and mid-rise buildings with sources of daytime and nighttime light and glare. The Project would introduce new sources of light and glare that are typically associated with commercial buildings, including architectural, interior, security and wayfinding light sources.

Construction

While the majority of Project construction would occur during daylight hours, there is a potential that construction could occur in the evening hours and require the use of artificial lighting, particularly during the winter season when daylight is no longer sufficient earlier in the day. Outdoor lighting sources, such as floodlights, spotlights, and/or headlights associated with construction equipment and hauling trucks, typically accompany nighttime construction activities. To the extent evening construction includes artificial light sources, such use would be temporary and would cease upon completion of Project construction. Furthermore, construction-related illumination would be used for safety and security purposes only and would occur in compliance with the light intensity requirements of the City. In addition, as part of the Project, construction lighting would be shielded to minimize light spillover. Construction lighting, while potentially bright, would also be focused on the particular area undergoing work.

Daytime glare could potentially occur during construction activities if reflective construction materials were positioned in highly visible locations where the reflection of sunlight could occur. However, any glare would be transitory and short-term, given the movement of construction equipment and materials within the construction area, and the temporary nature of construction activities. In addition, large, flat surfaces that are generally required to generate substantial glare are typically not an element of construction activities. Furthermore, temporary construction fencing would be placed along the periphery of the Project Site to screen construction activity from view at the street level

from off-site locations. Therefore, there would be a negligible potential for daytime or nighttime glare associated with construction activities to occur.

Based on the above, light and glare associated with temporary Project-related construction activities would not create a new source of substantial light or glare which would adversely affect daytime or nighttime views in the area. Furthermore, pursuant to Public Resources Code Section 21099(d), the Project's aesthetics impacts would not be considered significant. Therefore, no evaluation of this topic is required under CEQA.

Operation

Lighting on the Project Site would include architecturally-integrated exterior lights on the building, the motor court and other vehicle use areas, and along pathways for security and wayfinding purposes. In addition, low-level lighting to accent signage, architectural features, and landscaping elements would be installed throughout the Project Site. All exterior lighting would be dimmable and automatically controlled via occupancy sensors and photo sensors to allow for the appropriate control of nighttime lighting. Interior lighting would also be dimmable and would include the use of occupancy sensors. The proposed lighting sources would be similar to other lighting sources already within the Project Site and in the vicinity of the Project Site and would not generate artificial light levels that are out of character with the surrounding area. All exterior and interior lighting would meet the requirements of the California Energy Commission Building Energy Efficiency Standards—Title 24 and the National Electrical Code (NEC). Light trespass from interior spaces would be limited by blinds and/or drapery or the light fixtures would be installed in such a way as to not create light trespass off of the Project Site. Any new street and/or pedestrian lighting within the public right-of-way would comply with all applicable City regulations.

Daytime glare can result from sunlight reflecting from a shiny surface that would interfere with the performance of an off-site activity, such as the operation of a motor vehicle. Reflective surfaces can be associated with window glass and polished surfaces, such as metallic trim. In general, sun reflection that has the greatest potential to interfere with driving occurs from the lower stories of a structure. Sun reflection from the Project would occur during periods in which the sun is low on the horizon and when the point of reflection within the Project Site is in front of the driver, in the direction of travel. The Project would feature a variety of surface materials, including stone cladding, glass, concrete, timber, and metals. As part of the Project, glass would be set back from the façade and that which is used would have high-performance coatings that would not be highly reflective, thereby minimizing glare from reflected sunlight. Limited nighttime glare could result from illuminated signage and from vehicle headlights. While headlights from vehicles entering and exiting the parking garage would be visible during the evening and nighttime hours, such lighting sources would be typical for the area. Thus, nighttime glare would not result in a substantial adverse impact.

Based on the above, with adherence to regulatory requirements, Project operation would not create a new source of substantial light or glare which would adversely affect daytime or nighttime views in the area. Regardless, pursuant to Public Resources Code Section 21099(d), the Project's light and glare impact would not be considered significant. Therefore, no evaluation of this topic in an EIR is required under CEQA.

Shade/Shadow

As provided above, the threshold questions from Appendix G of the CEQA Guidelines do not address shade and shadows. Therefore, the following discussion regarding the Project's potential shading effects is provided for information purposes only and not for determining the Project's potential impacts related to aesthetics. Moreover, pursuant to Public Resources Code Section 21099(d), the Project's aesthetics impacts would not be considered a significant impact to the environment. Therefore, this shading analysis is included for informational purposes, as the current CEQA guidelines preclude a significant impact finding for shade generated by an urban infill project.

For the purposes of this informational analysis, the standards used by the City of Beverly Hills to evaluate shading impacts are discussed. A project would be considered to have a significant shading impacts if shadow-sensitive uses would be shaded by project-related structures for three or more hours between the hours of 9:00 A.M. and 3:00 P.M. during the winter solstice and for four or more hours between the hours of 9:00 A.M. and 5:00 P.M. during the spring, summer, and fall.

Figure 17 through Figure 19 on pages 39 through 41 depict the potential shadows that would be cast by the Project. Uses that may be sensitive to shading in proximity to the Project Site include Beverly Gardens Park located along North Santa Monica Boulevard and outdoor dining areas located along South Santa Monica Boulevard and North Beverly Drive. However, it is noted that outdoor dining areas typically include a variety of overhead cover such as umbrellas or partial roofs to cover patrons from the sun. Therefore, shading of these areas could be considered a beneficial effect.

Winter Solstice

Shadow impacts are typically greatest during the winter months due to the sun's low position in the sky, with the resultant longer shadows stretching roughly from the northwest to the northeast during daytime hours. As shown in Figure 17, Project shadows during the winter would extend in a northerly direction and would move from northwest to northeast across the surrounding area. Specifically, Project shadows would extend north across South and North Santa Monica Boulevard, reaching into Beverly Gardens Park and extending over the commercial uses across the Project Site along South Santa Monica Boulevard from approximately 9:00 A.M. to 1:00 P.M. By 11:00 A.M., Project shadows would

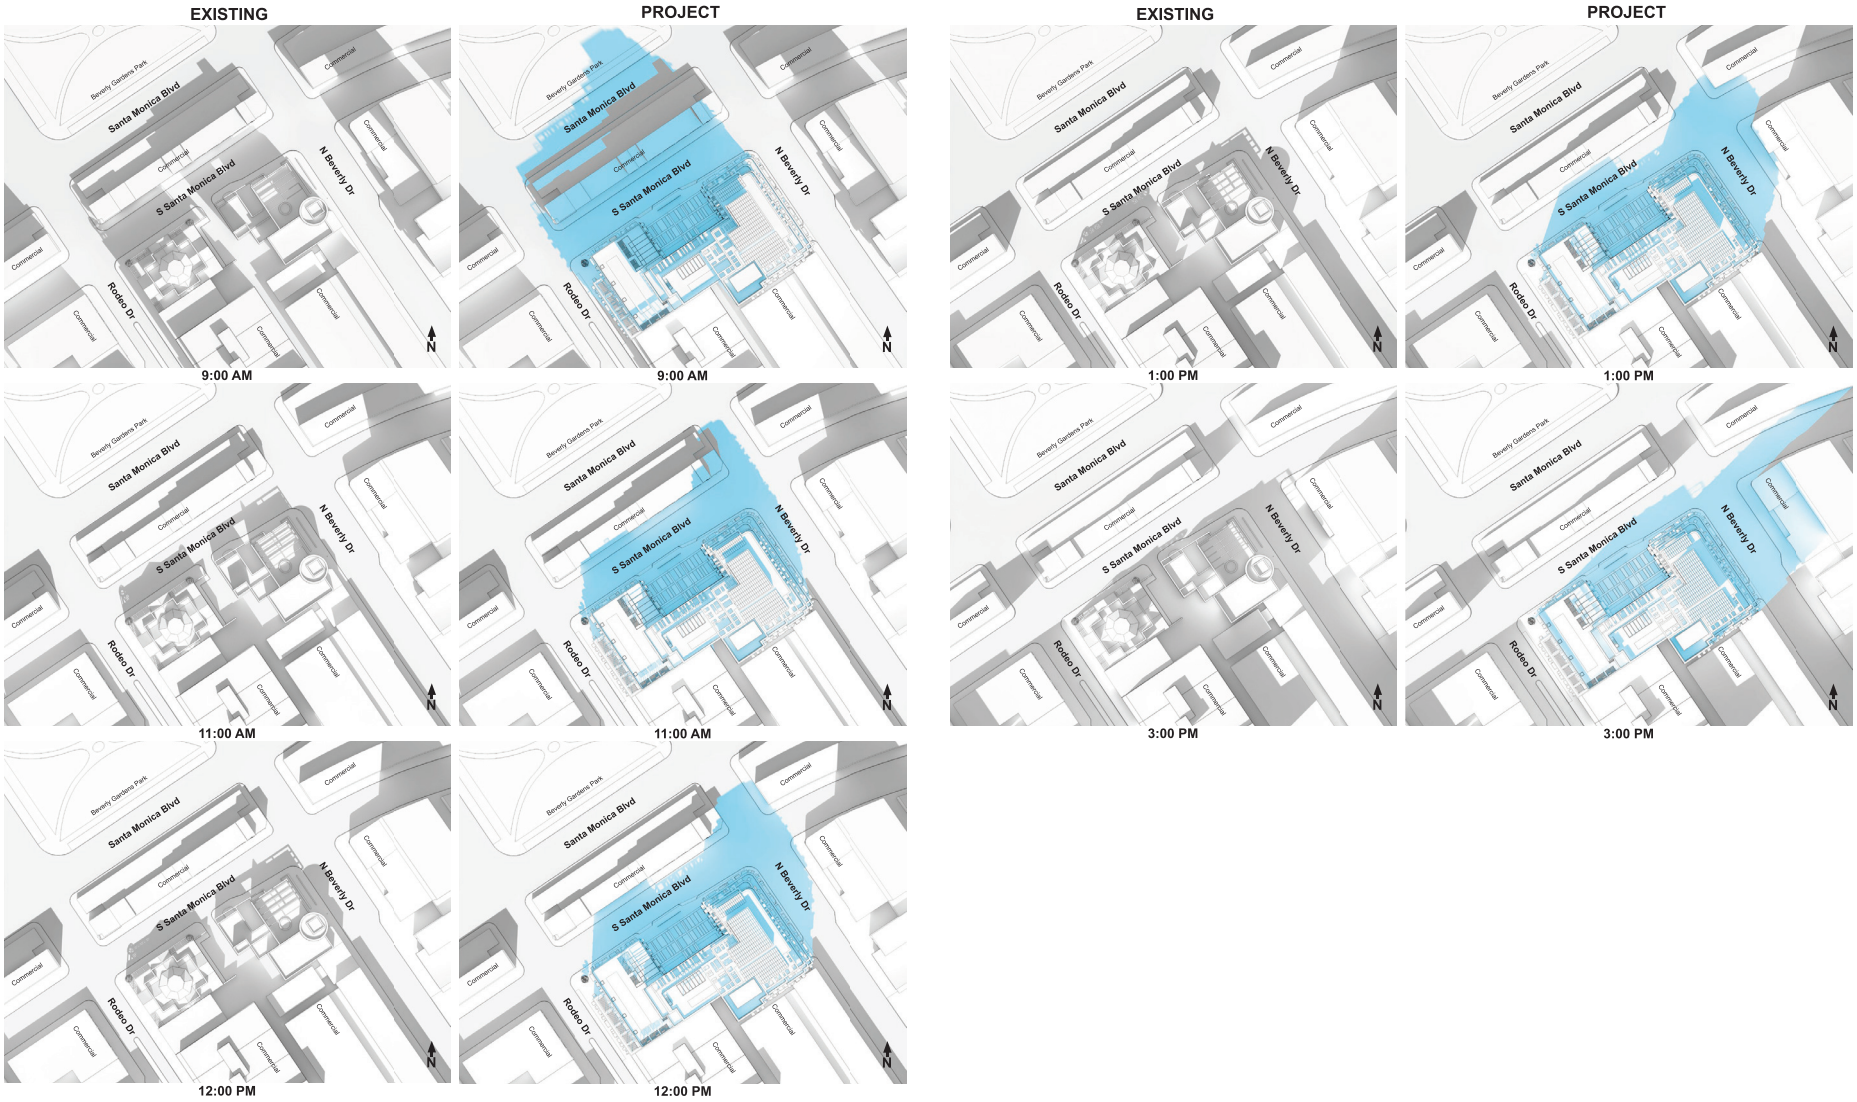

Figure 17
Project Shadows—Winter Solstice

Source: Peter Marino Architect 2020.

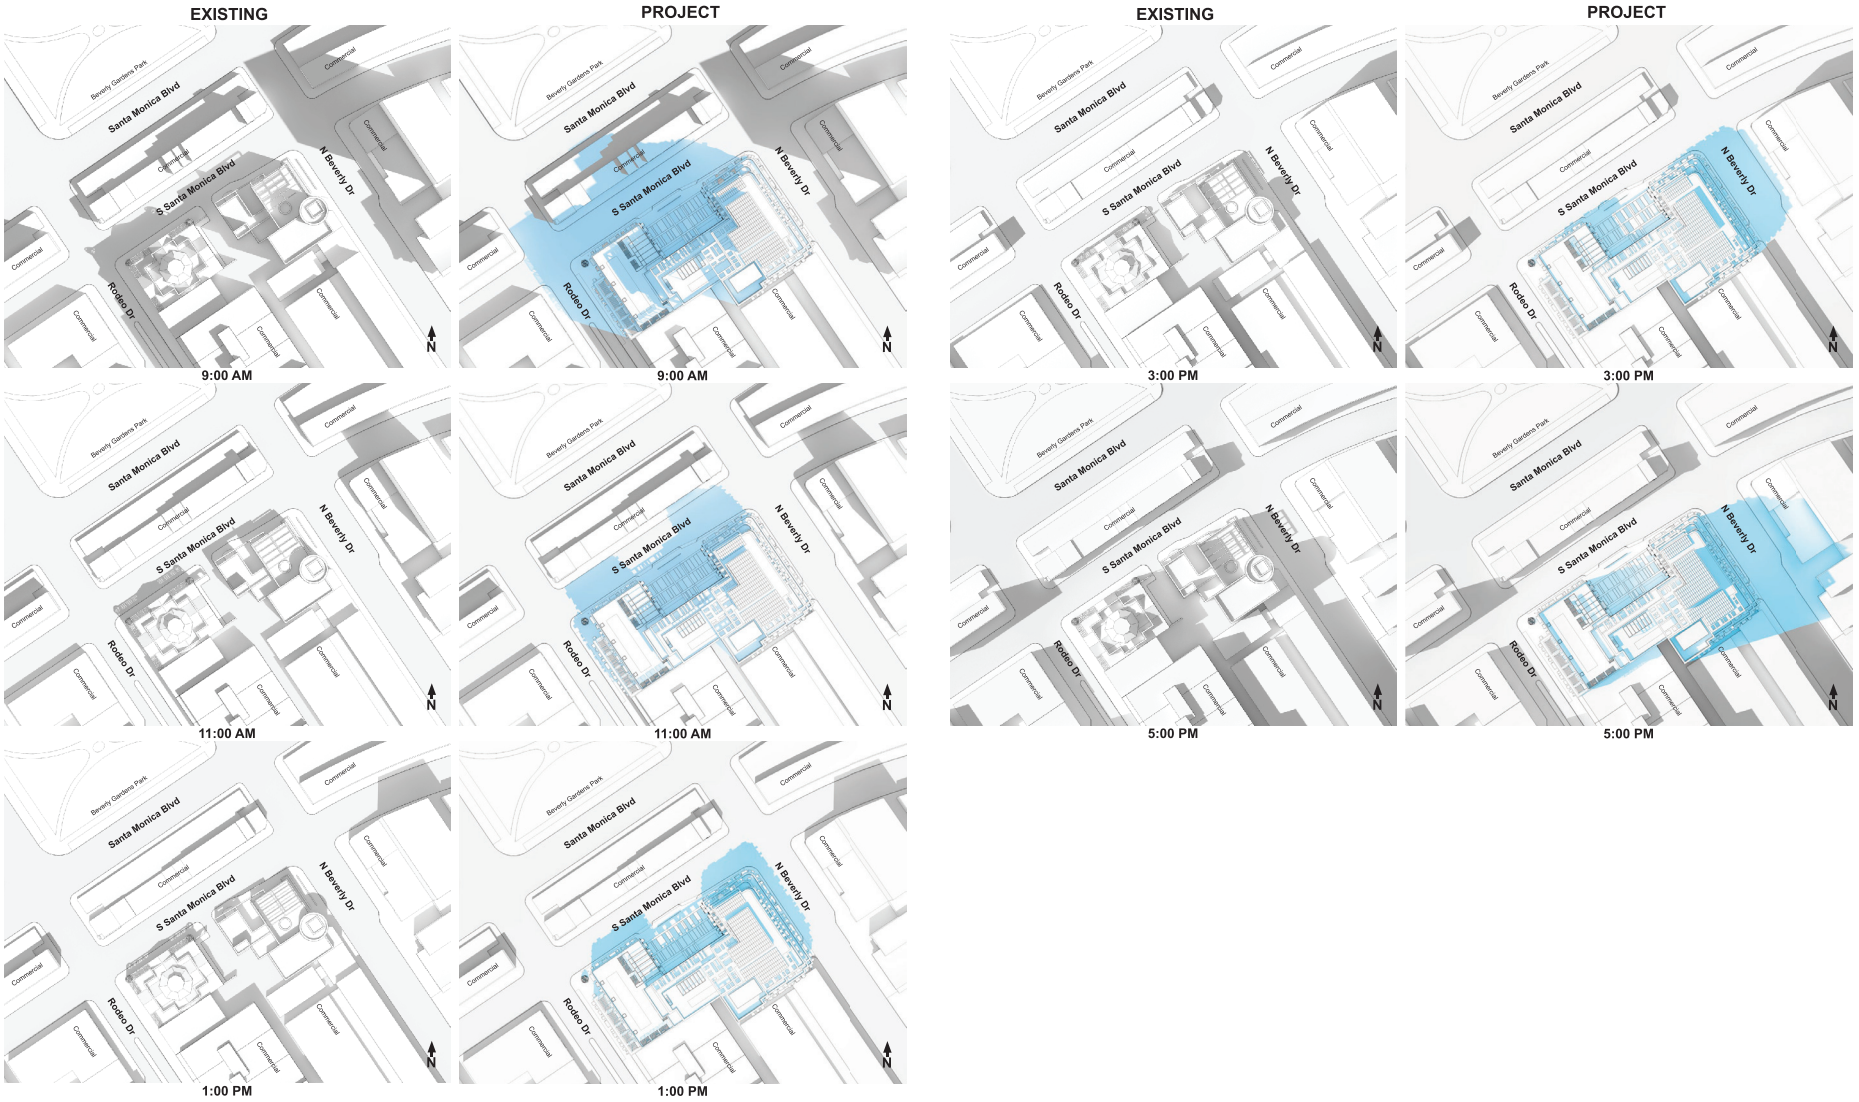

Figure 18

Project Shadows—Spring and Fall Equinoxes

Source: Peter Marino Architect 2020.

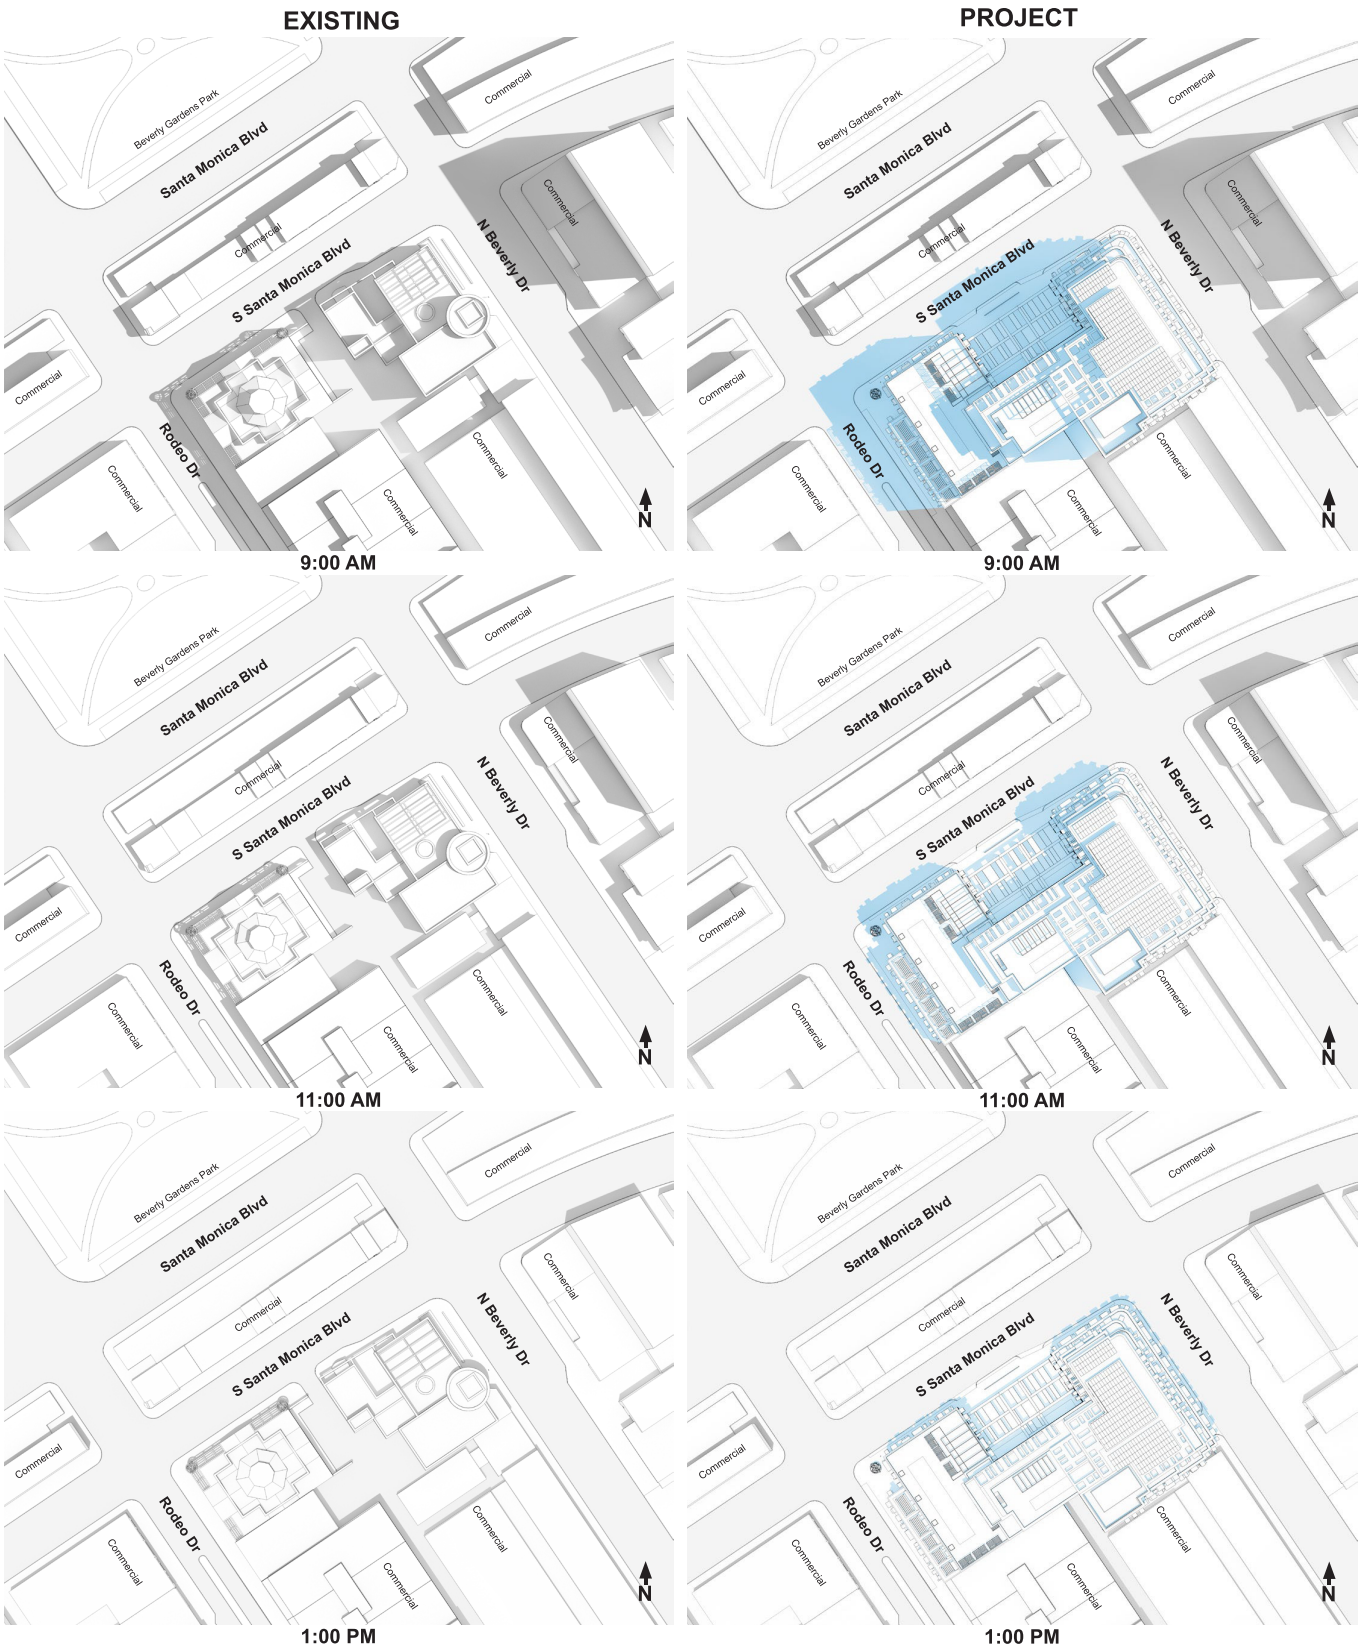

Figure 19
Project Shadows—Summer Solstice

Source: Peter Marino Architect 2020.

no longer reach Beverly Gardens Park but would continue to shade the commercial uses, including outdoor dining areas, across from the Project Site along South Santa Monica Boulevard until 1:00 P.M. From 1:00 P.M. Project shadows would extend east towards Beverly Drive and by 3:00 P.M. would shade commercial uses along Beverly Drive. As depicted in Figure 17 on page 39, the Project would potentially shade one existing outdoor dining area located at the restaurant on the northwest corner of South Santa Monica Boulevard and North Beverly Boulevard for more than three hours between 9:00 A.M. and 3:00 P.M. However, as previously indicated, shadow effects from buildings on these areas are typically considered a beneficial effect for this type of outdoor use, particularly in busy urban areas with limited vegetation and existing high sun exposure.

Spring and Fall Equinoxes

As shown in Figure 18 on page 40, Project shadows during the spring would extend in a northerly direction and would move from northwest to northeast across the surrounding area. As shown, Project shadows would extend across South Santa Monica Boulevard from approximately 9:00 A.M. to 3:00 P.M. By 11:00 A.M., Project shadows would mostly extend to South Santa Monica Boulevard and portions of sidewalks. Project shadows would not extend to any of the sensitive uses surrounding the Project Site for more than four hours between 9:00 A.M. and 5:00 P.M.

Summer Solstice

During the summer solstice, Project shadows would be the shortest due to the higher position of the sun and would move from west to east, as shown in Figure 19 on page 41. Specifically, Project shadows would primarily extend within the Project Site and into the surrounding roadways from approximately 9:00 A.M. to 5:00 P.M. The areas shaded by the Project during the summer would not include the shading of potentially routinely useable outdoor spaces for more than four hours between 9:00 A.M. and 5:00 P.M.

Based on the above, no shadow-sensitive uses would be shaded by the Project for four or more hours between the hours of 9:00 A.M. and 5:00 P.M. during the spring, summer, and fall. Additionally, while the Project would potentially shade one existing outdoor dining area located at the restaurant on the northwest corner of South Santa Monica Boulevard and North Beverly Boulevard for more than three hours between 9:00 A.M. and 3:00 P.M. during the winter solstice, as previously indicated, shadow effects from buildings on these areas are typically considered a beneficial effect for this type of outdoor use, particularly in busy urban areas with limited vegetation and existing high sun exposure.

2. Agriculture and Forestry Resources

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment Project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board.

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b. Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☒
c. Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	☐	☐	☐	☒
d. Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

a. Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

No Impact. The Project Site is located in an urbanized area of the City. As previously discussed, the Project Site is currently developed with commercial and

institutional uses. No agricultural uses or operations occur on-site or in the vicinity of the Project Site. The Project Site and surrounding area are also not mapped as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency Department of Conservation.[7] As such, the Project would not convert farmland to a non-agricultural use. No impacts would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

b. Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?

No Impact. The Project Site is currently zoned C-3 (Commercial) and is designated as Low Density Commercial in the General Plan Land Use Element. The Project Site is not zoned for agricultural use. Furthermore, no agricultural zoning is present in the vicinity of the Project Site. The Project Site and surrounding area are also not enrolled under a Williamson Act Contract.[8] Therefore, the Project would not conflict with any zoning for agricultural uses or a Williamson Act Contract. No impacts would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

c. Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

No Impact. As previously discussed, the Project Site is located in an urbanized area and is currently developed with commercial and institutional uses. The Project Site does not include any forest land or timberland. In addition, the Project Site is currently zoned for commercial uses and is not zoned for forest land and is not used as forest land.[9] Therefore, the Project would not conflict with existing zoning for, or cause rezoning of, forest land or timberland as defined by the PRC. No impacts would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

d. Would the project result in the loss of forest land or conversion of forest land to non-forest use?

---

[9] *City of Beverly Hills, General Plan Land Use Map, www.beverlyhills.org/cbhfiles/storage/files/filebank/8403--03_Map_LU1_GeneralPlanLandUseDesignations_45_reduced.pdf, accessed August 3, 2020.*

No Impact. As previously discussed, the Project Site is located in an urbanized area and does not include any forest land. Therefore, the Project would not result in the loss or conversion of forest land to non-forest use. No impacts would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

e. Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?

No Impact. As discussed above, the Project Site is located in an urbanized area of the City and does not include farmland or forest land. The Project Site and surrounding area are also not mapped as farmland or forest land, are not zoned for farmland/agricultural use or forest land, and do not contain any agricultural or forest uses.[10] As such, the Project would not result in the conversion of farmland to non-agricultural use or in the conversion of forest land to non-forest use. No impacts would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

3. Air Quality

Where available, the significance criteria established by the South Coast Air Quality Management District (SCAQMD) may be relied upon to make the following determinations.

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Conflict with or obstruct implementation of the applicable air quality plan?	☒	☐	☐	☐
b. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	☒	☐	☐	☐
c. Expose sensitive receptors to substantial pollutant concentrations?	☒	☐	☐	☐
d. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	☐	☐	☒	☐

[10] *City of Beverly Hills, General Plan Land Use Map, www.beverlyhills.org/cbhfiles/storage/files/filebank/8403--03_Map_LU1_GeneralPlanLandUseDesignations_45_reduced.pdf, accessed August 3, 2020.*

a. Would the project conflict with or obstruct implementation of the applicable air quality plan?

Potentially Significant Impact. The Project Site is located within the 6,700-square-mile South Coast Air Basin (the Basin). Within the Basin, the South Coast Air Quality Management District (SCAQMD) is required, pursuant to the federal Clean Air Act, to reduce emissions of criteria pollutants for which the Basin is in non-attainment (i.e., ozone, particulate matter less than 2.5 microns in size [$PM_{2.5}$], and lead[11]). SCAQMD's 2016 Air Quality Management Plan (AQMP) contains a comprehensive list of pollution control strategies directed at reducing emissions and achieving ambient air quality standards. These strategies are developed, in part, based on regional population, housing, and employment projections prepared by the Southern California Association of Governments (SCAG). SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino and Imperial Counties, and addresses regional issues relating to transportation, the economy, community development and the environment.[12] With regard to future growth, SCAG provides population, housing, and employment projections for cities under its jurisdiction within their Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). The growth projections in the SCAG's RTP/SCS are based on growth projections in local general plans for jurisdictions in SCAG's planning area. Construction and operation of the Project would result in an increase in stationary and mobile source air emissions. As a result, development of the Project could have a potential adverse effect on SCAQMD's implementation of the AQMP. Therefore, the EIR will provide further analysis of the Project's consistency with SCAQMD's AQMP.

b. Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Potentially Significant Impact. As discussed above, construction and operation of the Project would result in the emission of air pollutants in the South Coast Air Basin, which is currently in non-attainment of federal air quality standards for ozone, PM2.5 and lead, and State air quality standards for ozone, particulate matter less than 10 microns in size (PM10), and PM2.5. Therefore, implementation of the Project could potentially contribute to air quality impacts, which could cause a cumulative impact in the Basin. The EIR will provide further analysis of cumulative air pollutant emissions associated with the Project.

---

[11] *Partial Nonattainment designation for lead for the Los Angeles County portion of the Basin only.*

[12] *SCAG serves as the federally designated metropolitan planning organization (MPO) for the Southern California region.*

c. Would the project expose sensitive receptors to substantial pollutant concentrations?

Potentially Significant Impact. The Project could result in increased short and long-term air pollutant emissions from the Project Site during construction (short-term) and operation (long-term). Sensitive receptors located in the vicinity of the Project Site include residential uses. Therefore, the Project could expose sensitive receptors to additional pollutant concentrations and the EIR will provide further analysis of the Project's potential to result in substantial adverse impacts to sensitive receptors.

d. Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Less Than Significant Impact. No objectionable odors are anticipated as a result of either construction or operation of the Project. Specifically, construction of the Project would involve the use of conventional building materials typical of construction projects of similar type and size. Any odors that may be generated during construction would be localized and temporary in nature and would not be sufficient to affect a substantial number of people. With respect to Project operation, according to the SCAQMD *CEQA Air Quality Handbook*, land uses associated with odor complaints typically include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The Project does not propose these uses and primarily consists of retail, hotel and private club uses. The Project does include restaurant uses which have the potential to emit odors through cooking and charbroilers. However, the Project would minimize the release of odors from restaurant uses with required odor reducing equipment as necessary, including use of an exhaust system and filters. On-site trash receptacles would also be contained, located, and maintained in a manner that promotes odor control, and would not result in substantially adverse odor impacts. Good housekeeping practices would be sufficient to prevent nuisance odors.

In addition, the construction and operation of the Project would comply with SCAQMD Rules 401, 402, and 403, regarding visible emissions violations.[13] Rule 401 provides that a person shall not discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than three minutes in any one hour which is (a) as dark or darker in shade as that designated No. 1 on the Ringlemann Chart, as published by the United States Bureau of Mines, or (b) of such opacity as to obscure an observer's view to a degree equal to or greater than

[13] *SCAQMD, Visible Emissions, Public Nuisance, and Fugitive Dust, www.aqmd.gov/home/regulations/compliance/inspection-process/visible-emissions-public-nuisance-fugitive-dust, accessed November 25, 2019.*

does smoke described previously described under (a).[14] Additionally, Rule 402 provides that a person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.[15] Finally, Rule 403 requires the implementation of best available dust control measures (BACM) during active operations capable of generating fugitive dust.

Based on the above, the Project would not result in other emissions such as those leading to odors. Impacts associated with odors during construction and operation of the Project would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

4. Biological Resources

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☐	☐	☒	☐
b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☐	☐	☐	☒
c. Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☐	☒
d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	☒	☐

[14] *SCAQMD, Rule 401, Visible Emissions, adopted February 4, 1977*

[15] *SCAQMD, Rule 402, Nuisance, adopted May 7, 1976.*

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☒	☐
f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☐	☒

a. Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Less Than Significant Impact. The Project Site is located in an urbanized area and is currently developed with commercial and institutional buildings. Existing landscaping within the Project Site is limited and includes ornamental shrubs in planters. As provided in the Tree Removal and Replacement Technical Memorandum prepared for the Project by Gruen Associates in August 2020 and included in Appendix IS-1 of this Initial Study, there are no existing trees on the Project Site. There are 15 trees that line the sidewalks adjacent to the onsite buildings, including 12 palm trees and 3 Tipuana Tipu/Tipu trees. These 15 street trees would be removed as part of the Project and replaced at a 1:1 basis. Due to the urbanized and disturbed nature of the Project Site and the surrounding area, and lack of large expanses of open space in the vicinity of the Project Site, species likely to occur on-site are limited to small terrestrial and avian species typically found in urbanized developed settings. Additionally, palm trees in urban settings that are periodically maintained are not typically inhabited by bats. Based on the lack of habitat on the Project Site, it is unlikely any special status species listed by the California Department of Fish and Wildlife (CDFW)[16] or by the U.S. Fish and Wildlife Service (USFWS)[17] would be present within the Project Site. However, birds protected by the Migratory Bird Treaty Act may nest within the 15 trees adjacent to the Project Site that would be removed as part of the Project.

---

[16] *California Department of Fish and Wildlife, California Natural Diversity Database, Special Animals List, August 4, 2020.*

[17] *United States Fish and Wildlife Service, ECOS Environmental Conservation Online System, Listed species believed to or known to occur in California, https://ecos.fws.gov/ecp0/reports/species-listed-by-state-report?stateAbbrev=CA&stateName=California&statusCategory=Listed&status=listed, accessed August 4, 2020.*

The Migratory Bird Treaty Act prohibits the take, possession, import, export, transport, sell, purchase, barter, or offer for sale, purchase, or barter, of any migratory bird, or the parts, nests, or eggs of such a bird except under the terms of a valid permit issued pursuant to federal regulations. Additionally, California Fish & Game Code Section 3503 (Section 3503) states that "[i]t is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto." In accordance with the Migratory Bird Treaty Act and California Fish and Game Code, the Project Applicant would be required to conduct tree removal activities associated with the Project outside of the nesting season (February 1–August 31), to the extent feasible. Should vegetation removal activities occur during the nesting season, a biological monitor would be present during the removal activities to ensure that no active nests would be impacted. If active nests are found, a buffer would be established until the fledglings have left the nest. These measures to be implemented by the Project in compliance with the Migratory Bird Treaty Act and the California Fish and Game Code would be incorporated into the Project as Conditions of Approval as follows:

- The Project Applicant/contractor would conduct all demolition, construction, ground disturbance, and vegetation clearing activities, including removal of the existing 15 street trees adjacent to the Project Site, outside of the avian breeding and nesting season (February 1–August 31) to the extent feasible.

- If removal of the 15 street trees adjacent to the Project Site must occur during the nesting season, a qualified biologist is required to be present during the removal activities to ensure no active bird nests (those containing eggs or nestlings, or with juvenile birds still dependent on the nest) are impacted. The biologist must determine whether active nests are present within the 15 street trees before any actual removal activity takes place.

- If any active nests are present within the 15 street trees during demolition, construction, ground disturbance, and vegetation clearing activities, the nests shall be avoided until determined by the biologist to no longer be active. The biologist shall determine appropriate avoidance buffers for any active nest based on species, nest location, and types of disturbance proposed in the vicinity of the nest.

Therefore, with compliance with the Migratory Bird Treaty Act, the Project would not have a substantial adverse effect, either directly or through habitat modification, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations by the CDFW or USFWS. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

b. Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

No Impact. The Project Site is located in an urbanized area and is currently developed with commercial and institutional buildings. No riparian or other sensitive natural community exists on the Project Site or in the surrounding area.[18] Furthermore, the Project Site and surroundings are not located in or adjacent to a Significant Ecological Area as defined by the County of Los Angeles, nor a terrestrial community as defined by the City of Beverly Hills.[19,20] In addition, there are no sensitive natural communities identified by the CDFW or the USFWS.[21,22,23] Therefore, the Project would not have a substantial adverse effect on any riparian habitat or other sensitive natural community. No impact would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

c. Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

No Impact. As discussed above, the Project Site is located in an urbanized area and is currently developed with commercial and institutional buildings. In addition, the surrounding area has been fully developed. No water bodies or federally protected wetlands as defined by Section 404 of the Clean Water Act exist on or near the Project Site.[24] As such, the Project would not have an adverse effect on state or federally protected wetlands. No impact would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

d. Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Less Than Significant Impact. As described above, the Project Site is located in an urbanized area and is currently developed with commercial and institutional buildings. Existing landscaping within the Project Site is limited and includes ornamental shrubs in planters. In addition, the areas surrounding the Project Site are fully developed and there are no large expanses of open space within and surrounding the Project Site that provide linkages to natural open space areas which may serve as wildlife corridors. Furthermore, the Project Site is not located in or adjacent to a Significant Ecological Area as defined by the County of Los Angeles, nor a terrestrial community as defined by the City of Beverly Hills.[25,26]

According to the Tree Removal and Replacement Technical Memorandum prepared for the Project by Gruen Associates in August 2020 and included in Appendix IS-1 of this Initial Study, there are no existing trees on the Project Site. A total of 15 trees were observed along the sidewalks adjacent to the onsite buildings, including 12 palm trees and 3 Tipuana Tipu/Tipu trees. As previously discussed, these 15 existing street trees would be removed and replaced at a 1:1 ratio during construction of the Project. Trees to be removed could potentially provide nesting sites for migratory birds. However, the Project would comply with the Migratory Bird Treaty Act and California Fish & Game Code. The Migratory Bird Treaty Act specifically prohibits the take, possession, import, export, transport, sell, purchase, barter, or offer for sale, purchase, or barter, of any migratory bird, or the parts, nests, or eggs of such a bird except under the terms of a valid permit issued pursuant to federal regulations. Additionally, California Fish & Game Code Section 3503 (Section 3503) states that "[i]t is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto." No exceptions are provided in the code and CDFW has not promulgated regulations interpreting these provisions. In accordance with the Migratory Bird Treaty Act and California Fish and Game Code, the Project Applicant would be required to conduct tree removal activities associated with the Project outside of the nesting season (February 1–August 31), to the extent feasible. Should vegetation removal activities occur during the nesting season, a biological monitor would be present during the removal activities to ensure that no active nests would be impacted. If active nests are found, a buffer would be established until the fledglings have left the nest. These measures to be implemented by

---

[25] *City of Beverly Hills, General Plan Open Space Element, January 2010, Figure OS2, Sensitive Species and Vegetation Communities, p. 79.*

[26] *Los Angeles County, Los Angeles County General Plan, Figure 9.3 Significant Ecological Areas and Coastal Resource Areas Policy Map, October 6, 2015.*

the Project in compliance with the Migratory Bird Treaty Act would be incorporated into the Project as Conditions of Approval as follows:

- The Project Applicant/contractor would conduct all demolition, construction, ground disturbance, and vegetation clearing activities, including removal of the existing 15 street trees adjacent to the Project Site, outside of the avian breeding and nesting season (February 1–August 31).

- If removal of the 15 street trees adjacent to the Project Site must occur during the nesting season, a qualified biologist is required to be present during the removal activities to ensure no active bird nests (those containing eggs or nestlings, or with juvenile birds still dependent on the nest) are impacted. The biologist must determine whether active nests are present within the 15 street trees before any actual removal activity takes place.

- Any active nests that are present within the 15 street trees during demolition, construction, ground disturbance, and vegetation clearing activities, the nests shall be avoided until determined by the biologist to no longer be active. The biologist shall determine appropriate avoidance buffers for each nest based on species, nest location, and types of disturbance proposed in the vicinity of the nest.

With compliance with the Migratory Bird Treaty Act, the Project would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

e. Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance (e.g., oak trees or California walnut woodlands)?

Less Than Significant Impact. Beverly Hills Municipal Code Section 5-6.1001 regulates the protection of street trees while Beverly Hills Municipal Code Sections 10-3-2900 through 10-3-2906 regulate the protection of trees on private property. According to the Beverly Hills Municipal Code, protected trees on private property include any native tree, heritage tree or tree within an urban grove. A native tree is defined as a tree listed on the City's official list of local native trees, as adopted from time to time by resolution of the City Council, and which has a primary trunk circumference of twenty-four inches or more, measured at a height of four feet, six inches above natural grade. Heritage trees include any tree not listed on the City's official list of native trees with a primary trunk circumference of forty-eight inches or more, measured at a height of four feet, six inches above natural grade. Lastly, an urban grove is defined as fifty or more trees where the branches of each tree are within six feet of the branches of one of the other trees in the

grove. Individual trees in an urban grove may be of any size and are not subject to any circumference limitations. Trees included on the City of Beverly Hills official list of native trees include Big Leaf Maple, California Alder, Foothill Ash, Arizona Ash, Southern California Black Walnut, California Juniper, California Sycamore, Fremont Cottonwood, Black Cottonwood, Coast Live Oak, Blue Oak, Mesa Oak, Valley Oak, Red Willow, Mexican Elderberry, and California Bay.

Street trees are protected by Beverly Hills Municipal Code Section 5-6.1001 as follows: "It is illegal for parties who are not official representatives or authorized agents of the City of Beverly Hills to prune, remove, make attachment to, or otherwise damage a City street, park or protected tree." Regarding trees on private property, Beverly Hills Municipal Code Section 10-3.2901 states: "No person shall damage or remove, or cause to be damaged or removed, any protected tree on his or her property without a tree removal permit first being obtained in accordance with the requirements of this article." The article also requires that native trees that are removed be replaced with another native tree.

According to the Tree Removal and Replacement Technical Memorandum prepared for the Project by Gruen Associates in August 2020 and included in Appendix IS-1 of this Initial Study, there are no existing trees within the Project Site. A total of 15 street trees were observed along the sidewalks adjacent to the onsite buildings, including 12 palm trees and 3 Tipuana Tipu/Tipu trees. As detailed in the Tree Removal and Replacement Technical Memorandum, the 15 street trees inventoried are of various palm species and legume trees and are not considered protected trees. After obtaining all necessary City approvals, it is anticipated that these existing street trees would be removed during construction of the Project. However, as part of the Project, the trees to be removed would be replaced with new palm trees at a 1:1 ratio. Replacement trees would be distributed in accordance with landscape and urban design guidelines to be adopted in connection with the Project's proposed Specific Plan. Therefore, the Project would not conflict with any local policies or ordinances protecting biological resources. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

f. Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

No Impact. As described above, the Project Site is located in an urbanized area and is currently developed with commercial and institutional buildings. As also previously discussed, landscaping within the Project Site is limited, consisting of ornamental shrubs in

planters. The Project Site does not support any habitat or natural community.[27] No Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plans apply to the Project Site.[28] Thus, the Project would not conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other related plans. No impact would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

5. Cultural Resources

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Cause a substantial adverse change in the significance of a historical resource pursuant to § 15064.5?	☒	☐	☐	☐
b. Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?	☒	☐	☐	☐
c. Disturb any human remains, including those interred outside of dedicated cemeteries?	☐	☐	☒	☐

a. Would the project cause a substantial adverse change in the significance of a historical resource pursuant to § 15064.5?

Potentially Significant Impact. CEQA Guidelines Section 15064.5 generally defines a historical resource as a resource that is: (1) listed in, or determined to be eligible for listing in the California Register of Historical Resources (California Register); (2) included in a local register of historical resources (pursuant to PRC Section 5020.1(k)); or (3) identified as significant in a historical resources survey (meeting the criteria in PRC Section 5024.1(g)). Additionally, any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be a historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets the criteria for listing on the California Register. The California Register automatically includes all properties listed in the National

[27] *United States Environmental Protection Agency, NEPAssist, https://nepassisttool.epa.gov/nepassist/nepamap.aspx, accessed August 4,2020.*

[28] *California Department of Fish and Wildlife, California Regional Conservation Plans, July 2019.*

Register of Historic Places (National Register) and those formally determined to be eligible for listing in the National Register. The local register of historical resources is managed by the Beverly Hills Historic Preservation Program.

As previously described, the Project Site is currently developed with several buildings located at 456 North Rodeo Drive, 468 North Rodeo Drive, 461–465 North Beverly Drive, and 449, 451, and 453 North Beverly Drive. The existing structure at 456 North Rodeo Drive was constructed in 1948 while the existing structure at 449, 451, and 453 North Beverly Drive was constructed in 1921. Based on the age of these structures, the EIR will provide an assessment of the historical potential of the onsite buildings and the Project's effect on potential historical resources, including those nearby the Project Site.

b. Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to State CEQA Guidelines §15064.5?

Potentially Significant Impact. CEQA Guidelines Section 15064.5(a)(3)(D) generally defines archaeological resources as any resource that "has yielded, or may be likely to yield, information important in prehistory or history." Archaeological resources are features, such as tools, utensils, carvings, fabric, building foundations, etc., that document evidence of past human endeavors and that may be historically or culturally important to a significant earlier community. The Project Site is located within an urbanized area of the City of Beverly Hills and has been subject to grading and development in the past, and there is no record of the discovery of archaeological resources on the Project Site. Therefore, any surficial archaeological resources that may have existed at one time would have been previously disturbed. Nevertheless, the Project would require grading, excavation, and other construction activities in previously undisturbed soils and thus could have the potential to disturb existing but undiscovered archaeological resources. Therefore, the EIR will provide further analysis of the Project's potential impacts to archaeological resources.

c. Would the project disturb any human remains, including those interred outside of dedicated cemeteries?

Less Than Significant Impact. As discussed above, the Project Site is located within an urbanized area and has been subject to previous grading and development. Therefore, the potential for uncovering human remains on the Project Site is considered low. Nevertheless, the Project would require grading, excavation, and other construction activities that could have the potential to disturb existing but undiscovered human remains. If human remains were discovered during construction of the Project, work in the immediate vicinity of the construction area would be halted, the County Coroner, construction manager, and other entities would be notified per California Health and Safety Code Section 7050.5. In addition, disposition of the human remains and any associated

grave goods would occur in accordance with PRC Section 5097.98 and CEQA Guidelines Section 15064.5(e), which requires that work stop near the find until a coroner can determine that no investigation into the cause of death is required and if the remains are Native American. Specifically, in accordance with CEQA Guidelines Section 15064.5(e), if the coroner determined the remains to be Native American, the coroner shall contact the Native American Heritage Commission who shall identify the person or persons it believes to be most likely descended from the deceased Native American. The most likely descendent may make recommendations regarding the treatment of the remains and any associated grave goods in accordance with PRC Section 5097.98. Therefore, due to the low potential that any human remains are located on the Project Site, and because compliance with regulatory standards would ensure appropriate treatment of any potential human remains unexpectedly encountered during grading and excavation activities, the Project's impact related to human remains would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

6. Energy

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☒	☐	☐	☐
b. Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	☒	☐	☐	☐

a. Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Potentially Significant Impact. As discussed above, the Project Site is currently developed with commercial and institutional buildings comprising approximately 56,787 square feet. The Project would include a luxury hotel/retail building of up to 220,949 square feet and 115 guest rooms. Therefore, the Project would generate an increased demand for electricity and natural gas services provided by Southern California Edison (SoCal Edison) and the Southern California Gas Company, respectively. It is noted that the City participates in the Clean Power Alliance, which provides customers with an option to source all or a portion of their electricity from cleaner power sources, including 36 percent, 50 percent or 100 percent renewable energy content. The default renewable energy content provided to Beverly Hills residents is 50 percent. While development of the

Project would not be anticipated to cause wasteful, inefficient, and unnecessary consumption of energy resources, further analysis of the Project's demand on existing energy resources will be provided in the EIR.

b. Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Potentially Significant Impact. First established in 2002 under Senate Bill 1078, California's Renewable Portfolio Standard required retail sellers of electric services to increase procurement from eligible renewable energy resources to 20 percent of total retail sales by 2017.[29] The program was accelerated in 2015 with Senate Bill 350, which mandated a 50 percent Renewable Portfolio Standard by 2030. In 2018, Senate Bill 100 was signed into law, which again increased the Renewable Portfolio Standard to 60 percent by 2030 and requires all the state's electricity to come from carbon free resources by 2045. SoCal Edison provides electrical service throughout the City. In accordance with Senate Bill 100, SoCal Edison is required to procure at least 60 percent of its energy portfolio from renewable sources by 2030. Furthermore, the City participates in the Clean Power Alliance, which provides customers with an option to source all or a portion of their electricity from cleaner power sources, including 36 percent, 50 percent or 100 percent renewable energy content. The default renewable energy content provided to Beverly Hills residents is 50 percent.

Regarding energy efficiency, the California Building Energy Efficiency Standards for Residential and Nonresidential Buildings (California Code of Regulations, Title 24, Part 6) were adopted to ensure that building construction, system design, and installation achieve energy efficiency and preserve outdoor and indoor environmental quality. The current California Building Energy Efficiency Standards (Title 24 standards) are the 2019 Title 24 standards, which became effective on January 1, 2020.[30] The 2019 Title 24 standards include efficiency improvements to the residential standards for attics, walls, water heating, and lighting and efficiency improvements to the non-residential standards include alignment with the American Society of Heating and Air-Conditioning Engineers *(*ASHRAE) 90.1 2013 national standards.[31]

[31] *CEC, 2019 Building Energy Efficiency Standards for Residential and Nonresidential Buildings, ww2.energy.ca.gov/publications/displayOneReport_cms.php?pubNum=CEC-400-2018-020-CMF, accessed August 18, 2020.*

As previously described, the Project Site is currently developed with commercial and institutional buildings comprising approximately 56,787 square feet. The Project would include a luxury hotel/retail building of up to 220,949 square feet and 115 guest rooms. The Project Site does not include any renewable energy sources used by SoCal Edison. The Project has been designed and would be constructed to incorporate environmentally sustainable building features and construction protocols required by the Beverly Hills Green Building Code and CALGreen. While the Project would not be anticipated to conflict with or obstruct a state or local plan for renewable energy or energy efficiency, the Project's compliance with the renewable energy plans for SoCal Edison and the Southern California Gas Company as well as the Project's compliance with California Building Energy Efficiency Standards will be further evaluated in the EIR.

7. Geology and Soils

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☒	☐
ii. Strong seismic ground shaking?	☐	☐	☒	☐
iii. Seismic-related ground failure, including liquefaction?	☐	☐	☒	☐
iv. Landslides?	☐	☐	☐	☒
b. Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐
c. Be located on a geologic unit that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?	☐	☐	☒	☐
d. Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	☐	☐	☒	☐
e. Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☒

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
f. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☒	☐	☐	☐

The following analysis is based, in part, on the *Geotechnical Investigation for E.I.R.* (Geotechnical Investigation) prepared for the Project by Feffer Geological Consulting, dated March 5, 2020, and included as Appendix IS-2 of this Initial Study as well as the *Investigation of Potential Faulting* (Fault Investigation) conducted by Feffer Geological Consulting for each of the four parcels that comprise the Project Site. The Fault Investigations are included in Appendix IS-3 of this Initial Study.

a. Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

Less Than Significant Impact. Fault rupture occurs when movement on a fault deep within the earth breaks through to the surface. Based on criteria established by the California Geological Survey (CGS), faults can be classified as active, potentially active, or inactive. Active faults are those having historically produced earthquakes or shown evidence of movement within the past 11,000 years (during the Holocene Epoch). Potentially active faults have demonstrated displacement within the last 1.6 million years (during the Pleistocene Epoch) while not displacing Holocene Strata. Inactive faults do not exhibit displacement within the last 1.6 million years. In addition, buried thrust faults, which are faults with no surface exposure, may exist in the vicinity of the Project Site; however, due to their buried nature, the existence of buried thrust faults is usually not known until they produce an earthquake.

CGS establishes regulatory zones around active faults, called Alquist-Priolo Earthquake Fault Zones (previously called Special Study Zones). These zones, which extend from 200 feet to 500 feet on each side of a known fault, identify areas where a potential surface fault rupture could prove hazardous for buildings used for human occupancy. Development projects located within an Alquist-Priolo Earthquake Fault Zone are required to prepare special geotechnical studies to characterize hazards from any potential surface ruptures.

Based on the Geotechnical Investigation, a review of the City's General Plan Safety Element, and Fault Investigations completed for each of the four parcels, the Project Site is not within an Alquist-Priolo Earthquake Fault Zone, and no known active faults underlie the Project Site. Specifically, according to the Geotechnical Investigation and Fault Investigations, the closest known and mapped fault to the Project Site is the Santa Monica fault, located approximately 600 feet southeast of the Project Site.[32] In addition, the Project Site is located approximately 170 feet northwest of the Santa Monica Fault Zone and 80 feet northwest of the Alquist-Priolo Earthquake Fault Zone for the Santa Monica fault. As concluded in the Fault Investigations, no signs of faulting were observed on the Project Site and the Project Site is not significantly impacted by active faulting or hazards associated with fault rupture along the Santa Monica fault. As described in the Fault Investigations, the combination of continuous, unbroken late Pleistocene soil horizons and stratigraphy, and the lack of any near surface groundwater provides evidence to demonstrate the absence of active faulting beneath the entire Project Site. Additionally, no irregularities or topographic features indicative of faulting were observed in the Project Site vicinity and no faults were encountered in the subsurface exploration. The Fault Investigations prepared for the Project Site were all reviewed by the City of Beverly Hills Development Services Division and were formally accepted (refer to the last appendix in each of the Fault Investigation reports included in Appendix IS-3 of this Initial Study). While the Project would involve excavation for the subterranean parking levels, the proposed development would not involve mining operations or deep excavation into the earth, which could create unstable seismic conditions or stresses in the Earth's crust. Therefore, the Project would not directly or indirectly cause potential substantial adverse effects related to rupture of a known earthquake fault. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

ii. Strong seismic ground shaking?

Less Than Significant Impact. The Project Site is located in the seismically active Southern California region, which generally experiences moderate to strong ground shaking in the event of an earthquake on a local or regional fault. While no active faults are known to pass directly beneath the Project Site, the Project Site is located in proximity to several significant faults capable of producing strong earthquakes. Specifically, the closest known active fault strand to the Project Site is the east-west trending Santa Monica fault, which is located approximately 600 feet southeast of the Project Site. As noted in the Geotechnical Investigation, other important regional faults include the Hollywood fault, located approximately 1 mile northeast of the Project Site, and the Newport-Inglewood fault, located approximately 2 miles southeast of the Project Site. However, state and local code requirements ensure that buildings are designed and constructed in a manner that,

[32] *Geotechnical Engineering Investigation, Feffer Geological Consulting., March 5, 2020, p. 10.*

although the buildings may sustain damage during a major earthquake, would reduce the substantial risk that buildings would collapse. Specifically, the state and City mandate compliance with numerous rules related to seismic safety, including the Alquist-Priolo Earthquake Fault Zoning Act, Seismic Safety Act, Seismic Hazards Mapping Act, the City's General Plan Safety Element, and the Beverly Hills Building Code. Pursuant to those laws, the Project must demonstrate compliance with the applicable provisions of these safety requirements before permits can be issued for construction of the Project. Accordingly, the design and construction of the Project would comply with all applicable existing regulatory requirements, the applicable provisions of the Beverly Hills Building Code relating to seismic safety, and the application of accepted and proven construction engineering practices. The Beverly Hills Building Code incorporates current seismic design provisions of the 2019 California Building Code, with City amendments, to minimize seismic impacts. The 2019 California Building Code incorporates the latest seismic design standards for structural loads and materials, as well as provisions from the National Earthquake Hazards Reduction Program to mitigate losses from an earthquake and maximize earthquake safety. The Beverly Hills Development Services Division of the Community Development Department is responsible for implementing the provisions of the California Building Code, and the Project would be required to comply with the plan review and permitting requirements of the Beverly Hills Development Services Division including the recommendations provided in a final, site-specific geotechnical investigation subject to review and approval by the Beverly Hills Development Services Division. As part of this process, the Beverly Hills Development Services Division requires the completion of a Fault Rupture Hazard Investigation which undergoes a peer review and formal acceptance process culminating in the issuance of a clearance letter from the City of Beverly Hills. As previously discussed above, each of the four Fault Investigations conducted for the Project Site completed the peer review and formal acceptance process as required by the City of Beverly Hills Development Services Division and clearance letters were issued (refer to the last appendix in each of the Fault Investigation reports included in Appendix IS-3 of this Initial Study). Therefore, the Project would not directly or indirectly cause potential substantial adverse effects related to strong seismic ground shaking. Impacts related to strong seismic ground shaking would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

Iii. Seismic-related ground failure, including liquefaction?

Less Than Significant Impact. Liquefaction involves the sudden loss in strength of a saturated, cohesionless soil caused by the build-up of pore water pressure during cyclic loading, such as that produced by an earthquake. This increase in porewater can temporarily transform the soil into a fluid mass, resulting in differential settlement, and can also cause ground deformations. Typically, liquefaction occurs in shallow groundwater areas where there are loose, cohesionless, fine grained soils. Liquefaction potential is greatest where the groundwater level is shallow, and submerged loose, fine sands occur

within a depth of about 50 feet or less. Liquefaction potential decreases as grain size and clay and gravel content increase. As ground acceleration and shaking duration increase during an earthquake, liquefaction potential increases. As discussed in the Geotechnical Investigation, according to mapping by the CGS, the Project Site is not located within an area identified as having a potential for liquefaction. Although groundwater was encountered at a depth of 50 feet in one of the borings and the Project Site has a historic high groundwater level of 40 feet, submerged loose, fine sands were not found to occur within this depth. As determined in the Geotechnical Investigation, liquefaction is not considered a significant hazard at the Project Site due to the consolidated nature of the underlying geology and planned depth of construction. Therefore, the liquefaction potential for the Project Site is considered low, and the Project would not directly or indirectly cause potential substantial adverse effects related to liquefaction. Impacts associated with liquefaction would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

iv. Landslides?

No Impact. Landslides generally occur in loosely consolidated, wet soil and/or rocks on steep sloping terrain. The Project Site and surrounding area are fully developed, and the Project Site is generally characterized by relatively level topography. Large areas of exposed soil and/or rocks that could fall onto the Project Site do not exist since the Project Site is entirely covered in pavement and landscaping is confined to ornamental trees. In addition, the Project Site is not located in a landslide area as mapped by the State,[33,34] nor is the Project Site mapped as a landslide area by the City of Beverly Hills.[35] Therefore, the Project would not directly or indirectly cause potential substantial adverse effects involving landslides. As such, no impact would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

b. Would the project result in substantial soil erosion or the loss of topsoil?

Less Than Significant Impact. The Project Site is currently fully developed with buildings and parking areas. Landscaping within the Project Site is limited to small shrubs in planters. As such, there are no open spaces with exposed topsoil that could result in erosion. However, development of the Project would require grading, excavation, and

---

[33] *State of California, California Geological Survey, Seismic Hazard Zones, Burbank Quadrangle, March 25, 1999.*

[34] *State of California, California Geological Survey, Seismic Hazard Zones, Van Nuys Quadrangle, February 1, 1998.*

[35] *City of Beverly Hills, General Plan Seismic Hazards Map, www.beverlyhills.org/cbhfiles/storage/files/filebank/10285--9_Safety%2011152011.pdf, accessed August 5, 2020.*

other construction activities that have the potential to disturb existing soils underneath the Project Site and expose these soils to rainfall and wind during construction, thereby potentially resulting in soil erosion. This potential would be reduced by implementation of standard erosion controls imposed during site preparation and grading activities. Specifically, all grading activities would require grading permits from the Beverly Hills Development Services Division which would include requirements and standards designed to limit potential effects associated with erosion to acceptable levels. In addition, on-site grading and site preparation would comply with all applicable provisions of Title 8, Chapter 2 of the Beverly Hills Municipal Code, which addresses grading, excavations, and fills. Furthermore, the Project would be required to comply with the City's Urban Runoff Pollution Control Ordinance and implement standard erosion controls to limit stormwater runoff, which can contribute to erosion. Regarding soil erosion during Project operations, the potential would be negligible since the Project Site would remain fully developed. Therefore, with compliance with applicable regulatory requirements, impacts regarding soil erosion or the loss of topsoil would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

c. Would the project be located on a geologic unit that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

Less Than Significant Impact. As discussed above, the Project Site is not located near slopes or geologic features that would result in on- or off-site landsliding. Therefore, no impacts related to landslides would occur, and no mitigation measures are required.

Liquefaction-related effects include lateral spreading. As summarized above and discussed in detail in the Geotechnical Investigation, the Project Site is not susceptible to liquefaction and would not potentially result in lateral spreading. Impacts related to liquefaction and lateral spreading would be less than significant, and no mitigation measures are required.

Subsidence generally occurs when a large portion of land is displaced vertically, usually due to the withdrawal of groundwater, oil, or natural gas. No large-scale extraction of groundwater, gas, oil or geothermal energy is occurring or planned at the Project Site or in the general vicinity of the Project Site. Therefore, there is minimal to no potential for ground subsidence due to withdrawal of fluid or gas at the Project Site. Thus, impacts related to subsidence would be less than significant, and no mitigation measures are required.

Collapsible soils consist of loose, dry, low-density materials that collapse and compact under the addition of water or excessive loading. Soil collapse occurs when the land surface is saturated at depths greater than those reached by typical rain events.

According to the Geotechnical Investigation, the soils underlying the Project Site indicate medium dense to very dense silty sands, clayey sand and sandy clay. Due to the type and density of the soils underlying the Project Site, the Project Site soils would not be considered collapsible soils. Therefore, impacts associated with collapsible soils would be less than significant, and no mitigation measures are required.

Based on the above, the Project would not be located on a geologic unit or soil that is unstable or that would become unstable as a result of the Project. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

d. Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Less Than Significant Impact. Expansive soils are typically associated with clayey soils that have the potential to shrink and swell with repeated cycles of wetting and drying. As discussed in the Geotechnical Investigation, the alluvial soils at the Project Site are anticipated to be predominately gravelly, clayey sand. Based upon field soil classifications conducted as part of the Geotechnical Investigation, the on-site soil was found to possess low to medium expansive characteristics. As concluded in the Geotechnical Investigation, with implementation of the recommended foundation systems and based on the underlying soil properties, expansion/contraction is unlikely to affect the development of the Project. Notwithstanding, construction of the Project would be required to comply with the current California Building Code and supplemental requirements of the Beverly Hills Municipal Code, as enforced by the City of Beverly Hills. These requirements would include building foundation and other requirements appropriate to site-specific conditions that would be provided in accordance with the design level geotechnical evaluation required by the City. Therefore, with implementation of the recommendations set forth in the Geotechnical Investigation into the design of the Project, the Project would not create substantial risk to life or property due to expansive soils. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

e. Would the project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

No Impact. The Project Site is located within a community served by existing wastewater infrastructure. As such, the Project would not require the use of septic tanks or alternative wastewater disposal systems. Therefore, the Project would have no impact related to the ability of soils to support septic tanks or alternative wastewater disposal

systems, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

f. Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Potentially Significant Impact. Paleontological resources are the fossilized remains of organisms that have lived in a region in the geologic past and whose remains are found in the accompanying geologic strata. This type of fossil record represents the primary source of information on ancient life forms since the majority of species that have existed on earth from this era are extinct.

Grading and excavation to a maximum depth of approximately 44 feet would occur within the Project Site in order to develop the Project. Thus, the possibility exists that paleontological artifacts that were not discovered during prior more shallow construction may be present even though no such finds previously have been documented in the vicinity of the Project Site. Therefore, the EIR will provide further analysis of the Project's potential impacts to paleontological resources.

With regard to a unique geologic feature, the Project Site is currently developed with low rise buildings and parking. There are no unique geologic features on the Project Site. Therefore, the Project would not directly or indirectly destroy a unique geologic feature. No impacts would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

8. Greenhouse Gas Emissions

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☒	☐	☐	☐
b. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☒	☐	☐	☐

a. Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Potentially Significant Impact. Gases that trap heat in the atmosphere are called greenhouse gases since they have effects that are analogous to the way in which a greenhouse retains heat. Greenhouse gases are emitted by both natural processes and human activities. The accumulation of greenhouse gases in the atmosphere affects the earth's temperature. The State of California has undertaken initiatives designed to address the effects of greenhouse gas emissions, and to establish targets and emission reduction strategies for greenhouse gas emissions in California, including intensifying development near transit. Activities associated with the Project, including construction and operational activities, could result in greenhouse gas emissions that may have a significant impact on the environment. In addition, the Project would be subject to and may potentially conflict with various plans and policies adopted for the purpose of reducing GHG emissions, including the City's Sustainable City Plan (City of Beverly Hills 2009) and the Southern California Association of Governments' (SCAG) Regional Transportation Plan/Sustainable Communities Strategy. Therefore, the EIR will provide further analysis of the Project's greenhouse gas emissions.

b. Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Potentially Significant Impact. As the Project would have the potential to emit greenhouse gases, the EIR will include further evaluation of project-related emissions and associated emission reduction strategies to determine whether the Project conflicts with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases (e.g., Assembly Bill [AB] 32 and the City of Beverly Hills Green Building Code).

9. Hazards and Hazardous Materials

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☒	☐
b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☐	☒	☐
c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☒	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
d. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment?	☐	☐	☒	☐
e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☐	☐	☐	☒
f. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
g. Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	☐	☐	☐	☒

The following analysis is based, in part, on the Phase I Environmental Site Assessment (ESA) Report for 456 North Rodeo Drive prepared by Partner Engineering and Science, Inc., dated October 2017; the Phase I Environmental Site Assessment Report for 468 North Rodeo Drive prepared by Partner Engineering and Science Inc., dated July 2018; the Phase I Environmental Site Assessment and the Phase II Environmental Site Assessment Reports for 449 North Beverly Drive prepared by EFI Global, dated December 2019; and the Phase I Environmental Site Assessment Report for 461 North Beverly Drive prepared by PIC Environmental Services, dated August 2018. All specific information on historic and existing on-site conditions in the discussion below is from these reports unless otherwise noted. These reports are included as Appendix IS-4 through Appendix IS-7 of this Initial Study.

a. Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Less Than Significant Impact. The types and amounts of hazardous materials to be used for the Project would be typical of those used during construction activities and those typically used in the operation of commercial uses, as discussed in the following analysis.

Construction

The Project would not involve the routine transport of hazardous materials to and from the Project Site during construction. During demolition, excavation, on-site grading,

and building construction, hazardous materials such as fuel and oils associated with construction equipment, as well as coatings, paints, adhesives, and cleaners would be routinely used on the Project Site through the duration of construction. While some hazardous materials used during construction could require disposal, such activity would occur only for the duration of construction and would cease upon completion of the Project. As such, construction of the Project would not involve the routine disposal of hazardous materials. Notwithstanding, all potentially hazardous materials used during construction of the Project would be used and disposed of in accordance with manufacturers' specifications and instructions, thereby reducing the risk of hazardous materials use. In addition, the Project would comply with all applicable federal, state, and local requirements concerning the use, storage, and management of hazardous materials. These existing regulations are aimed at the amount of hazardous materials used, accident prevention, protection from exposure to specific chemicals, and the proper storage and disposal of hazardous materials. Consequently, Project construction activities would not create a significant hazard to the public or the environment through the use of hazardous materials during construction. Therefore, impacts related to the routine transport, use, or disposal of hazardous materials during construction would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

Operation

Operation of the Project would involve the routine use of small quantities of potentially hazardous materials typical of those used in commercial uses, including cleaning products, paints, and those used for maintenance of landscaping. Such use would be consistent with that currently occurring at other nearby developments. In addition, as with Project construction, all hazardous materials used on the Project Site during operation would be used, stored, and disposed of in accordance with manufacturer's standards and all applicable federal, State, and local requirements. Due to the type of development proposed (e.g., commercial), operation of the Project would not involve the routine transport of hazardous materials to and from the Project Site. Therefore, with compliance with manufacturer's standards and all applicable local, state, and federal laws and regulations relating to environmental protection and the management of hazardous materials, impacts associated with the routine transport, use, or disposal of hazardous materials during operation of the Project would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

b. Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Less Than Significant Impact. The current and past land uses within the Project Site were identified as part of the Phase I ESAs to assess their potential to present

concerns relative to the presence of hazards within the Project Site and/or the handling of hazardous materials. These concerns are classified as Recognized Environmental Conditions (RECs), which are defined in Section 1.1.1 of the ASTM Standard Practice as the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, past release, or material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property.

As discussed above, the Project Site encompasses property located at 456 North Rodeo Drive, 468 North Rodeo Drive, 461 through 465 North Beverly Drive, and 449, 451, and 453 North Beverly Drive. Based on the Phase I ESA for 456 North Rodeo Drive, the property was undeveloped as early as 1894 and developed with the existing structure in 1948. Since that time, various retail and office tenants have occupied the building. No environmental concerns were identified based on the historical uses of the property. However, based upon the age of the buildings, asbestos-containing materials and lead-based paint may be present, as discussed further below According to the Phase I ESA for 468 North Rodeo Drive, the property was undeveloped as early as 1884, developed with one commercial structure comprised of various commercial retail tenants between 1924 and circa 1994, and developed with the current structure in 1997. Tenants on the 468 North Rodeo Drive property have included various commercial retail tenants. No environmental concerns were identified based on the historical uses of the property. In addition, based on the age of the structure, neither asbestos-containing materials nor lead-based paint are anticipated to be present.

As described in the Phase I ESA for 461 North Beverly Drive, the property was initially developed for commercial purposes in the 1920s. Prior to the 1920s, the 461 North Beverly Drive property may have contained single-family residences. Historic documentation indicates the property has been occupied by numerous commercial tenants, including a museum, a bank, gift shops, realty offices, beauty salons, restaurants, grocery/meat markets, and hardware stores. In addition, a large former onsite building adjacent to Santa Monica Boulevard was historically occupied by several banks from about 1934 until the early 1990s. Office spaces in the former bank building were leased by numerous companies, attorneys, and businesses. The 461 North Beverly Drive property is currently developed with a two-story cultural/institutional building that was constructed between 1994–1996 as the West Coast branch of the Museum of Television and Radio (formerly the Paley Center for Media). Based on the historic uses, there are no environmental concerns at the 461 North Beverly Drive property. In addition, based upon the age of the building, neither asbestos-containing materials lead-based paint are anticipated to be present.

As discussed in the Phase I ESA for 449 North Beverly Drive, in 1921, the property was developed with two single-story commercial structures on the northeast and southwest

portions of the property connected by a canopy on the central portion of the property. The 449 North Beverly Drive property has remained in this configuration through the present and has been utilized for commercial purposes since construction, including a variety of retail stores, restaurants, cafés, offices, storage, upholstery facility with a small machine shop, and a dry cleaning facility. As concluded in the Phase I ESA for 449 North Beverly Drive, based on the small nature of the machine shop operations and limited time frames, these former operations are not expected to represent a significant environmental concern for the property. However, the Phase I ESA for 449 North Beverly Drive identified the presence of a dry-cleaning facility as a recognized environmental condition at the Project Site. Based on a review of historical information, it is estimated that dry-cleaning facilities operated at the 449 North Beverly Drive property for approximately 17 years from at least 1928 to 1944. Dry cleaning operations typically use chlorinated solvents, particularly tetrachloroethylene (PCE), during the dry-cleaning process. These solvents, even when properly stored and handled, can readily migrate into the subsurface as a result of small releases associated with onsite operations. Chlorinated solvents are highly mobile chemicals that can easily accumulate beneath a facility. As a result of this historical use, a Phase II ESA was conducted to evaluate whether the former dry-cleaning operations have significantly impacted the subsurface of the Project Site and is included in Appendix IS-6 of this Initial Study. As detailed in the Phase II ESA, volatile organic compounds (VOCs) were not detected in any of the soil vapor samples collected at the property. Therefore, the historical dry-cleaning operations did not result in significant subsurface impacts. Overall, the Phase II ESA concluded that no evidence of a significant release to the subsurface that would represent a risk to human health or groundwater was found. Based on the analytical results included in the Phase II ESA for 449 North Beverly Drive, no further investigation is warranted with respect to this REC. However, as discussed further below, based upon the age of the building, asbestos-containing materials and lead-based paint may be present.

Construction

Hazardous Waste Generation, Handling, and Disposal

During demolition, excavation, on-site grading, and building construction, hazardous materials such as fuel and oils associated with construction equipment, as well as coatings, paints, adhesives, and caustic or acidic cleaners, could be used, and therefore, would require proper handling and management and, in some cases, disposal. The use, handling, storage, and disposal of these materials could increase the opportunity for hazardous materials releases and, subsequently, the exposure of people and the environment to hazardous materials. However, as previously discussed, all potentially hazardous materials used during construction of the Project would be used and disposed of in accordance with manufacturers' specifications and instructions, thereby reducing the risk of hazardous materials use. In addition, the Project would comply with all applicable federal, state, and local requirements concerning the use, storage, and management of hazardous materials. Consequently, Project construction activities would not create a

significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of potentially hazardous materials used during construction.

As discussed above, the Phase I ESA for 449 North Beverly Drive identified a former dry-cleaning facility as a REC. While no VOCs were detected in any of the soil vapor samples, in the event that contaminated soils are encountered during construction, the nature and extent of the contamination would be determined and appropriate handling, disposal, and/or treatment would be implemented in accordance with applicable regulatory requirements, including SCAQMD Rule 1166.[36] Specifically, SCAQMD Rule 1166 requires that an approved mitigation plan be obtained from SCAQMD prior to commencing any of the following activities: the excavation of an underground storage tank or piping which has stored VOCs; the excavation or grading of soil containing VOC material including gasoline, diesel, crude oil, lubricant, waste oil, adhesive, paint, stain, solvent, resin, monomer, and/or any other material containing VOCs; the handling or storage of VOC-contaminated soil [soil which registers >50 parts per million (ppm) or greater using an organic vapor analyzer (OVA) calibrated with hexane] at or from an excavation or grading site; or the treatment of VOC-contaminated soil at a facility. SCAQMD Rule 1166 further requires that a copy of the approved mitigation plan be onsite during the entire excavation period and that the SCAQMD executive officer be notified at least 24 hours prior to excavation. In accordance with SCAQMD Rule 1166, monitoring for VOC contamination would occur at least once every 15 minutes and VOC concentration readings would be recorded. When VOC-contaminated soil is detected, the approved mitigation plan would be implemented. Therefore, compliance with existing regulations would ensure the Project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the handling and disposal of contaminated soil.

Based on the above, construction of the Project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment, and impacts associated with hazardous waste generation, handling, and disposal during construction would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

Underground and Aboveground Storage Tanks

According to the Phase I ESAs for the Project Site, no evidence of existing underground storage tanks (USTs) or aboveground storage tanks (ASTs) was observed on

[36] *South Coast Air Quality Management District, Rules and Compliance, Rule 1166, www.aqmd.gov/docs/default-source/rule-book/reg-xi/rule-1166.pdf?sfvrsn=4, accessed December 23, 2019.*

the Project Site. No other records were found that indicate the presence of any remaining USTs within the areas proposed for construction. Notwithstanding, in the unlikely event that USTs are found, suspect materials would be removed in accordance with all applicable federal, state, and local regulations. Therefore, with compliance with applicable regulations, the Project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment, and impacts related to the potential removal of USTs during construction would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

Asbestos-Containing Materials

Asbestos was widely used in the building industry starting in the late 1800s and up until the late 1970s for a variety of uses, including acoustic and thermal insulation and fireproofing, and is often found in ceiling and floor tiles, linoleum, pipes, structural beams, and asphalt. Any building, structure, surface asphalt driveway, or parking lot constructed prior to 1979 could contain asbestos or Asbestos Containing Materials (ACMs). Based on the age of the on-site buildings, ACMs may be present on-site. Specifically, ACMs may be present within the existing structure at 456 North Rodeo Drive, which was constructed in 1948, and the existing structure at 449, 451, and 453 North Beverly Drive, which was constructed in 1921. ACMs are unlikely at the existing structure at 468 North Rodeo Drive, which was constructed in 1997, and within the existing structure at 461–465 North Beverly Drive, which was constructed in 1994-1996. In accordance with SCAQMD Rule 1403, the Project Applicant would be required to conduct a comprehensive asbestos survey prior to demolition. In the event that ACMs are found within areas proposed for demolition, suspect materials would be removed by a certified asbestos abatement contractor in accordance with applicable regulations. With compliance with relevant regulations and requirements, Project construction activities would not expose people to a substantial risk resulting from the release of asbestos fibers into the environment. Therefore, with compliance with applicable regulations, the Project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. Impacts related to the removal of ACMs during demolition would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

Lead-Based Paint

Lead is a naturally occurring element and heavy metal that was widely used as a major ingredient in most interior and exterior oil-based paints prior to 1950. Lead compounds continued to be used as corrosion inhibitors, pigments, and drying agents from the early 1950s to 1972, when the Consumer Products Safety Commission specified limits on lead content in such products. Based on the age of the on-site buildings, lead-based

paint (LBP) may be present on-site. Specifically, LBP may be present within the existing structure at 456 North Rodeo Drive, which was constructed in 1948, and the existing structure at 449, 451, and 453 North Beverly Drive, which was constructed in 1921. LBP is unlikely at the existing structure at 468 North Rodeo Drive, which was constructed in 1997, and within the existing structure at 461–465 North Beverly Drive, which was constructed in 1994-1996. In the event that LBP is found within areas proposed for demolition, suspect materials would be removed in accordance with procedural requirements and regulations for the proper removal and disposal of LBP prior to demolition activities, including standard handling and disposal practices pursuant to OSHA regulations. Example procedural requirements include the use of respiratory protection devices while handling lead-containing materials, containment of lead or materials containing lead on the Project Site or at locations where construction activities are performed, and certification of all consultants and contractors conducting activities involving LBP or lead hazards. With compliance with relevant regulations and requirements, Project construction activities would not expose people to a substantial risk resulting from the release of LBP into the environment. Therefore, with compliance with applicable regulations, the Project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. Impacts related to the removal of LBP during demolition would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

Polychlorinated Biphenyls

Typical sources of polychlorinated biphenyls (PCBs) include electrical transformer cooling oils, fluorescent light fixture ballasts, and hydraulic oil. In 1976, the USEPA banned the manufacture and sale of PCB-containing transformers. According to the Phase I ESAs for the properties on the Project Site, one hydraulic motor associated with an elevator was observed at the 456 North Rodeo Drive property and one vaulted transformer and one indoor transformer were observed at the 468 North Rodeo Drive property. These appeared to be in good condition with no visible evidence of leakage. As concluded in the Phase I ESAs for these properties, based on the good condition of the equipment, this equipment is not considered to represent a significant environmental concern. Two hydraulic elevators were also observed at the 468 North Rodeo Drive property. The hydraulic fluid contained within elevator systems can potentially contain PCBs. However, based on the age of the building (post-1978), it is unlikely that the hydraulic fluid within the equipment contains PCBs. The elevator motor in closer proximity to the access door was observed with absorption pads placed underneath and minor evidence of leakage was noted. No floor drains were observed near the motor and the releases appear to be surficial in nature. Based on the small quantity and surficial nature of staining observed, this equipment is not expected to represent a significant environmental concern. No other equipment likely to contain PCBs was observed on the Project Site. In the event that PCBs are found within areas proposed for demolition, suspect materials would be removed in accordance with all

applicable federal, state, and local regulations. Therefore, with compliance with applicable regulations, the Project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment, and impacts related to the removal of PCBs during demolition would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

Oil Wells and Methane

As discussed in the Phase I ESAs for the properties on the Project Site, the Project Site is not located within any oil or gas field, and no oil or natural gas wells were located on the Project Site. The Phase I ESAs also concluded that the subject properties are not located within 1,000 feet of a landfill or 300 feet of an oil well and the presence of methane beneath the properties is therefore considered low.

Operation

Hazardous Waste Generation, Handling, and Disposal

Operation of the Project would involve the routine use of small quantities of potentially hazardous materials typical of those used in commercial uses. As stated previously, activities involving the handling and disposal of hazardous wastes would occur in compliance with all applicable federal, state, and local requirements concerning the handling and disposal of hazardous waste. Therefore, with compliance with applicable regulations and requirements, operational activities would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment, and impacts associated with hazardous waste generation, handling, and disposal during operation of the Project would be less than significant. No further analysis of this topic in an EIR is required.

Underground and Aboveground Storage Tanks

Development of the Project includes commercial uses. The Project does not propose the installation of underground or aboveground storage tanks. As such, operation of the Project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment, and impacts associated with underground and aboveground storage tanks during operation of the Project would be less than significant. No further analysis of this topic in an EIR is required.

Asbestos-Containing Materials

Development of the Project would include the use of commercially-sold construction materials that would not include asbestos or ACMs. Project operation is, therefore, not anticipated to increase the occurrence of friable asbestos or ACMs at the Project Site. Therefore, operation of the Project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment, and no impacts associated with asbestos or ACMs during operation of the Project would occur. No further analysis of this topic in an EIR is required.

Lead-Based Paint

Development of the Project would include the use of commercially-sold construction materials that would not include LBP. Project operation is, therefore, not anticipated to increase the occurrence of LBP at the Project Site. Operation of the Project would not expose people to LBP as no LBPs would be used. Thus, the Project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment, and impacts associated with LBP during operation of the Project would not occur. No further analysis of this topic in an EIR is required.

Polychlorinated Biphenyls

In accordance with existing regulations which ban the manufacture of PCBs, the new electrical systems to be installed as part of the Project would not contain PCBs. Therefore, during operation of the Project, maintenance of such electrical systems would not expose people to PCBs and operation of the Project would not expose people to any risk resulting from the release of PCBs in the environment. As such, the Project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment, and no impacts related to PCBs during Project operation would occur. No further analysis of this topic in an EIR is required.

Oil Wells and Methane

The Project does not include the installation of oil wells. As such, operation of the Project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment, and no impacts associated with oil wells during operation would occur. Therefore, there is a negligible risk of subsurface methane release. No further analysis of these topics in an EIR is required.

c. Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Less Than Significant Impact. The Beverly Hills Presbyterian Preschool and Kindergarten is located at the northwest corner of Santa Monica Boulevard and Rodeo Drive, approximately 0.2 mile from the Project Site. As discussed above, the types and amounts of hazardous materials that would be used in connection with construction of the Project would be typical of those used during construction of commercial developments and would include vehicle fuels, paints, oils, and transmission fluids. Similarly, the types and amounts of hazardous materials used during operation of the proposed commercial uses would be typical of such developments and would include cleaning solvents, pesticides for landscaping, painting supplies, and petroleum products. Although the Project would have the potential to emit and would involve the handling of hazardous materials, particularly during construction activities, all such activities involving the handling and disposal of hazardous materials and wastes would occur in compliance with all applicable federal, state, and local requirements concerning the handling and disposal of hazardous waste. Therefore, with compliance with relevant regulations and requirements, the Project would not create a significant hazard to the nearby school. Impacts regarding the Project's emission or handling of hazardous materials and wastes within 0.25 mile of a school would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

d. Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment?

Less Than Significant Impact. Section 65962.5 of the California Government Code requires the California Environmental Protection Agency (CalEPA) to develop and update annually the Cortese List, which is a "list" of hazardous waste sites and other contaminated sites. While Section 65962.5 makes reference to the preparation of a "list," many changes have occurred related to web-based information access since 1992 and information regarding the Cortese List is now compiled on the websites of multiple agencies including the Department of Toxic Substances Control (DTSC), the State Water Resources Control Board (SWRCB), and CalEPA.

The Phase I ESAs for the Project Site include the results of consultation with local agency representatives and a review of available federal, State, and local databases. Based on the Phase I ESAs for 456 North Rodeo Drive, 468 North Rodeo Drive, and 461 North Beverly Drive, the properties were not identified in any of the regulatory databases reviewed.

As discussed in the Phase I ESA for 449 North Beverly Drive, the property is listed on the Facility Index System/Facility Registry System (FINDS), Los Angeles County Hazardous Material Storage–Industrial Waste and Underground Storage Tank Sites (Los Angeles Co. HMS), and EDR Exclusive Historic Dry Cleaners (EDR Hist Cleaner) databases. According to the Phase I ESA for 449 North Beverly Drive, it is expected that the Los Angeles County Hazardous Material Storage–Industrial Waste listing relates to water discharge or storm water. The EDR Hist Cleaner listing relates to the property's former use as a dry-cleaning facility from approximately 1928 to 1944. As discussed above, dry cleaning operations typically use chlorinated solvents, particularly tetrachloroethylene (PCE), during the dry-cleaning process. These solvents, even when properly stored and handled, can readily migrate into the subsurface as a result of small releases associated with onsite operations. Chlorinated solvents are highly mobile chemicals that can easily accumulate beneath a facility. As previously discussed, based on the historical use as a dry-cleaning facility, a Phase II ESA was conducted to evaluate whether the former dry-cleaning operations have significantly impacted the subsurface of the Project Site. As detailed in the Phase II ESA included in Appendix IS-6 of this Initial Study, VOCs were not detected in any of the soil vapor samples collected at the property. Therefore, the historical dry-cleaning operations did not result in significant subsurface impacts. Overall, the Phase II ESA concluded that no evidence of a significant release to the subsurface that would represent a risk to human health or groundwater was found. Based on the analytical results included in the Phase II ESA for 449 North Beverly Drive, no further investigation is warranted with respect to this REC. Notwithstanding, as detailed above, in the event that contaminated soils are encountered during construction, the nature and extent of the contamination would be determined and appropriate handling, disposal, and/or treatment would be implemented in accordance with applicable regulatory requirements, including SCAQMD Rule 1166. Additionally, as determined in the Phase I ESA for 449 North Beverly Drive, based on the lack of evidence of a documented release and operations as restaurants, the other listings are not expected to represent a significant environmental concern for the property.

Based on the above, the Project Site's listing on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 would not create a significant hazard to the public or the environment. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

No Impact. The Project Site is not located within 2 miles of an airport or within an airport planning area. The nearest airport to the Project Site is the Santa Monica Airport

located approximately 4.4 miles southwest of the Project Site. Given the distance between the Project Site and this airport, the Project would not have the potential to exacerbate current environmental conditions that would result in a safety hazard or excessive noise. Therefore, no impact would occur, and no mitigation measures are required. No further analysis of this topic in the EIR is required.

f. Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Less Than Significant Impact. According to the Beverly Hills disaster route map, the nearest disaster routes to the Project Site are North Santa Monica Boulevard, which is approximately 150 feet to the northwest of the Project Site, and West Beverly Boulevard, which is approximately 0.7 mile northeast the Project Site to the northeast. While it is expected that the majority of construction activities for the Project would be confined to the Project Site, limited off-site construction activities may occur in adjacent street rights-of-way during certain periods of the day, which could potentially require temporary lane closures. However, if lane closures are necessary, the remaining travel lanes would be maintained in accordance with standard construction management plans that would be implemented to ensure adequate circulation and emergency access. Operation of the Project would generate traffic in the vicinity of the Project Site and would result in some modifications to existing site access. However, the Project would comply with Beverly Hills Fire Department access requirements and would not impede emergency access to and in the vicinity of the Project Site. Therefore, the Project would not cause an impediment along designated disaster routes or impair the implementation of the City's emergency response plan. Impacts would be less than significant, and no mitigation measures are required. No further analysis of this topic in the EIR is required.

g. Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

No Impact. The Project Site is located in an urbanized area and there are no wildlands in the vicinity of the Project Site. The Project Site is also not located within a City-designated Very High Fire Hazard Severity Zone. Furthermore, the Project would be developed in accordance with the requirements of the Fire Code pertaining to fire safety, as set forth in Beverly Hills Municipal Code Chapter 2. In addition, the proposed commercial uses would not create a fire hazard that has the potential to exacerbate the current environmental condition relative to wildfires. Therefore, the Project would not expose people or structures, directly or indirectly, to a significant risk of loss, injury, or death as a result of exposure to wildland fires. No impact would occur, and no mitigation measures are required. No further analysis of this topic in the EIR is required.

10. Hydrology and Water Quality

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	☐	☐	☒	☐
b. Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	☐	☐	☒	☐
c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
i. Result in substantial erosion or siltation on- or off-site;	☐	☐	☒	☐
ii. substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;	☐	☐	☒	☐
iii. create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	☐	☐	☒	☐
iv. impede or redirect flood flows?	☐	☐	☐	☒
d. In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	☐	☐	☒	☐
e. Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☐	☐	☒	☐

The following analysis is based, in part, on the *Cheval Blanc Beverly Hills Preliminary Hydrology and Hydraulics Report* (Hydrology Report) prepared for the Project by Kimley Horn dated September 10, 2020, and included as Appendix IS-8 of this Initial Study.

a. Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Less Than Significant Impact. As discussed below, the Project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.

Surface Water Quality

Construction

Construction activities such as earth moving, maintenance/operation of construction equipment, potential dewatering, and handling/storage/disposal of materials could contribute to pollutant loading in stormwater runoff. During Project construction, particularly during the grading phase, stormwater runoff from precipitation events could cause exposed and stockpiled soils to be subject to erosion and convey sediments into municipal storm drain systems. In addition, on-site watering activities to reduce airborne dust could contribute to pollutant loading in runoff. Pollutant discharges relating to the storage, handling, use and disposal of chemicals, adhesives, coatings, lubricants, and fuel could also occur. However, because Project construction would disturb more than one acre of soil, the Project would be required to obtain coverage under the National Pollutant Discharge Elimination System (NPDES) Construction General Permit.

In accordance with the requirements of the NPDES Construction General Permit, the Project would implement a Stormwater Pollution Prevention Plan (SWPPP) adhering to the California Stormwater Quality Association BMP Handbook. The SWPPP would set forth Best Management Practices (BMPs) to be used during construction to manage stormwater and non-stormwater discharges, including, but not limited to, sandbags, storm drain inlets protection, stabilized construction entrance/exit, wind erosion control, and stockpile management. The SWPPP would be carried out in compliance with State Water Resources Control Board requirements and would also be subject to review by the City for compliance with the City of Beverly Hills Stormwater and Urban Runoff Pollution Control Ordinance. In addition, Project construction activities would occur in accordance with City grading permit regulations (Title 8, Chapter 2 of the Beverly Hills Municipal Code), such as the preparation of an erosion control plan, to reduce the effects of sedimentation and erosion. Prior to the issuance of a grading permit, the Applicant would be required to provide the City with evidence that a Notice of Intent has been filed with the State Water Resources Control Board to comply with the Construction General Permit. With compliance with these existing regulatory requirements that include specific BMPs to address surface water quality, construction of the Project would not result in discharges that would violate any surface water quality standard or waste discharge requirements. Therefore, construction-related impacts on surface water quality would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

Operation

Operation of the Project would introduce sources of potential stormwater pollution that are typical of commercial uses (e.g., cleaning solvents, pesticides for landscaping, and petroleum products associated with vehicular circulation areas). Stormwater runoff from precipitation events could potentially carry urban pollutants into municipal storm drains. Anticipated and potential pollutants generated by the Project include sediment, nutrients, pesticides, metals, and oil and grease. However, the Project would implement BMPs for managing stormwater runoff in accordance with the current City of Beverly Hills Urban Runoff Pollution Control Ordinance requirements. The City's Stormwater and Urban Runoff Pollution Control Ordinance sets the order of priority for selected BMPs, which is infiltration, bioretention, and/or rainfall harvest and use in that preferred order. Based on the infiltration evaluation included in Appendix IS-8 of this Initial Study, a stormwater infiltration system is not recommended for the Project due to the distance between the groundwater encountered at the Project Site and the maximum depth of construction, which at 6 feet fails to meet the 10-foot minimum distance required. Therefore, a rainwater harvesting system is proposed for the Project. The proposed stormwater treatment system will consist of an underground rainwater harvesting cistern which will capture the stormwater runoff and then dispose of it via metered discharge to the City's system. Stormwater will be pre-treated with an approved pretreatment structure prior to entering the cistern. The implementation of the rainwater harvesting system would target the pollutants that could potentially be carried in stormwater runoff. As the Project Site currently does not have structural BMPs for the treatment of stormwater runoff from the existing impervious surfaces, implementation of the proposed BMPs would result in an improvement in surface water quality runoff from the Project Site. Therefore, with implementation of the proposed BMPs, operation of the Project would not result in discharges that would violate any surface water quality standards or waste discharge requirements. Impacts to surface water quality during operation of the Project would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

Groundwater Quality

Construction

As provided in the Geotechnical Investigation included in Appendix IS-2 of this Initial Study, groundwater beneath the Project Site was encountered at a depth of 50 feet below grade. In addition, the historically highest groundwater in the Project Site area is estimated to be 40 feet below the ground surface. Development of the Project would include excavations to a maximum depth of 44 feet below grade. Therefore, groundwater may be encountered during Project construction and dewatering operations could occur. Dewatering operations are practices that discharge non-stormwater, such as groundwater, which must be removed from a given work location to proceed with construction. Discharges from dewatering operations can contain high levels of fine sediments, which if

not properly treated, could lead to exceedance of the NPDES requirements. In the event groundwater is encountered during Project construction, a temporary dewatering system such as dewatering tanks, sand media particulate, pressurized bag filters, and cartridge filters would be utilized in accordance with NPDES requirements. Any discharge of groundwater during construction of the Project would occur pursuant to, and comply with, the applicable NPDES permit or industrial user sewer discharge permit requirements. Pursuant to such requirements, the groundwater extracted would be chemically analyzed to determine the appropriate treatment and/or disposal methods. Additionally, the Project would comply with Beverly Hills Municipal Code Section 9-4-610 which establishes a permitting process and options for dewatering properties. These options include:

- Replenish the ground water basin. The dewaterer will have to adhere to all state and federal laws to implement ground water replenishment.
- Put the water to reasonable and beneficial use on the property. A permit and an annual consumption and usage report will be required for any dewaterer that uses its ground water for beneficial use.
- Deliver the ground water to the City. An agreement will be established between the dewaterer and the City under this option.
- If the first three options are impracticable, obtain a permit and pay a replenishment fee.

As such, groundwater quality would not be impacted from these potential dewatering activities.

Other potential effects to groundwater quality could result from the presence of an underground storage tank (UST) or during the removal of a UST. While no UST or USTs are anticipated to be present within the Project Site, in the unlikely event that USTs are found, suspect materials would be removed in accordance with all applicable federal, state, and local regulations. Therefore, USTs would not pose a significant hazard on groundwater quality. There are also risks associated with contaminated soil impacting groundwater quality. As previously discussed, in the event contaminated soils are encountered during construction, the nature and extent of the contamination would be determined and appropriate handling, disposal, and/or treatment would be implemented in accordance with applicable regulatory requirements, including SCAQMD Rule 1166. Therefore, compliance with existing regulations would ensure the Project would not create a significant hazard to groundwater quality associated with potentially contaminated soil.

During on-site grading and building construction, hazardous materials, such as fuels, oils, paints, solvents, and concrete additives, could be used and would therefore require proper management and, in some cases, disposal. The management of any resultant

hazardous wastes could increase the potential for hazardous materials to be released into groundwater. Compliance with all applicable federal, state, and local requirements concerning the handling, storage and disposal of hazardous waste, would reduce the potential for the construction of the Project to release contaminants into groundwater.

Based on the above, construction of the Project would not result in discharges that would violate any groundwater quality standard or waste discharge requirements. Therefore, construction-related impacts on groundwater quality would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

Operation

The Project does not include the installation or operation of water wells, or any extraction or recharge system that is in the vicinity of the coast, an area of known groundwater contamination or seawater intrusion, a municipal supply well or spreading ground facility. Operational activities that could affect groundwater quality include spills of hazardous materials and leaking underground storage tanks. However, operation of the Project's hotel and commercial uses would not generate a significant use of hazardous materials, as previously discussed in the Hazards and Hazardous Materials section above. In addition, surface spills from the handling of hazardous materials most often involve small quantities and are cleaned up in a timely manner, thereby resulting in little threat to groundwater. Other types of risks such as leaking underground storage tanks have a greater potential to affect groundwater. No underground tanks or other potential hazardous structures are proposed as part the Project. The Project is not anticipated to result in releases or spills of contaminants that could reach a groundwater recharge area or spreading ground or otherwise reach groundwater through percolation. Therefore, operation of the Project would not result in discharges that would violate any groundwater quality standard or waste discharge requirements. The Project's potential impact on groundwater quality during operation would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

b. Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Less Than Significant Impact. As provided by the following analysis, the Project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management of the basin.

Construction

No water supply wells are located at the Project Site or within 1 mile of the Project Site that could be impacted by construction, nor would the Project include the construction of water supply wells. Development of the Project would include excavations to a maximum depth of approximately 44 feet below ground surface. As provided in the Geotechnical Investigation included in Appendix IS-2 of this Initial Study, groundwater beneath the Project Site was encountered at a depth of 50 feet below grade. In addition, the historically highest groundwater in the Project Site area is estimated to be 40 feet below the ground surface. Accordingly, groundwater may be encountered during construction and dewatering may be required. In the event dewatering is required, due to the limited and temporary nature of dewatering operations, impacts to groundwater supplies and management of the basin are not considered to be significant. Notwithstanding, the Project would comply with Beverly Hills Municipal Code Section 9-4-610 which establishes a permitting process and options for dewatering properties. These options include:

- Replenish the ground water basin. The dewaterer will have to adhere to all state and federal laws to implement ground water replenishment.
- Put the water to reasonable and beneficial use on the property. A permit and an annual consumption and usage report will be required for any dewaterer that uses its ground water for beneficial use.
- Deliver the ground water to the City. An agreement will be established between the dewaterer and the City under this option.
- If the first three options are impracticable, obtain a permit and pay a replenishment fee.

Furthermore, the Project Site is 100 percent impervious under existing conditions and no substantial groundwater recharge occurs. Therefore, construction of the Project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management of the basin. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

Operation

As provided in the Hydrology Report, the Project would decrease the amount of impervious area on the Project Site from 100 percent to approximately 87 percent as a result of additional stormwater capture that would occur on-site, resulting in a slight increase in the amount of groundwater recharge. Specifically, the Project would implement landscape planters and tree wells with substantial soil depth for incidental stormwater

treatment, which would be considered pervious areas. In addition, the Project's BMPs would control stormwater runoff with no increase in runoff resulting from the Project. Furthermore, the Project would not include the installation of water supply wells and there are no existing wells or spreading ground within 1 mile of the Project Site. Therefore, the Project would not decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management of the basin. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

c. Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i. Result in substantial erosion or siltation on- or off-site;

Less Than Significant Impact. No streams or rivers cross the Project Site. Construction activities for the Project would include demolition of existing structures and hardscape and the excavation and removal of soil. These activities have potential to temporarily alter existing drainage patterns and flows on the Project Site by exposing the underlying soils, modifying flow direction, and making the Project Site temporarily more permeable. Exposed and stockpiled soils could be subject to erosion and conveyance into nearby storm drains during storm events. In addition, on-site watering activities to reduce airborne dust could contribute to pollutant loading in runoff. However, as discussed above, the Project would be required to obtain coverage under the NPDES Construction General Permit. In accordance with the requirements of this permit, the Project would implement a SWPPP that specifies BMPs and erosion control measures to be used during construction to manage runoff flows and prevent pollution. These BMPs would be designed to contain stormwater or construction watering on the Project Site such that runoff does not impact off-site drainage facilities or receiving waters. Thus, through compliance with all NPDES Construction General Permit requirements, including preparation of a SWPPP, implementation of BMPs, and compliance with applicable City grading regulations, construction of the Project would not substantially alter the Project Site drainage patterns in a manner that would result in substantial erosion or siltation on- or off-site. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

As previously discussed, the Project Site is currently comprised of approximately 100 percent impervious surfaces under existing conditions. At buildout of the Project, the Project Site would be considered to contain approximately 87 percent impervious areas. Specifically, the Project would implement landscape planters and tree wells with substantial soil depth for incidental stormwater treatment, which would be considered pervious areas. Accordingly, similar to existing conditions, there would be a limited potential for erosion or

siltation to occur from exposed soils or large expanses of pervious areas. Therefore, the Project would not substantially alter the existing drainage pattern of the Project Site or surrounding area such that substantial erosion or siltation on-site or off-site would occur. Operational impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

ii. Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;

Less Than Significant Impact. As previously discussed, construction activities have the potential to temporarily alter existing drainage patterns and flows on the Project Site by exposing the underlying soils, modifying flow direction, and making the Project Site temporarily more permeable. As discussed above in Response to Checklist Question X.a, the Project would implement a SWPPP that specifies BMPs and erosion control measures used during construction to manage runoff flows. These BMPs are designed to contain stormwater or construction watering on the Project Site such that runoff does not impact off-site drainage facilities or receiving waters. Thus, through compliance with all NPDES General Construction Permit requirements and compliance with applicable City grading permit regulations, construction activities for the Project would not substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site. As such, construction-related impacts would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

Existing impervious surfaces include buildings and impervious pavements for pedestrian and vehicular circulation. There are no pervious areas currently on the Project Site. The Project Site is currently comprised of approximately 100 percent impervious surfaces. Development of the Project would include development of a new building, paved areas, and landscaped areas, and would result in a decrease in impervious surface area from 100 percent to approximately 87 percent as a result of additional stormwater capture that would occur on-site. Specifically, the Project would implement landscape planters and tree wells with substantial soil depth for incidental stormwater treatment, which would be considered pervious areas. Runoff would follow new discharge paths and drain to on-site storm drain infrastructure, including storm drain inlets internal to the site and within the private driveways, to convey onsite runoff to a stormwater treatment system. As detailed in the Hydrology Report, as a result of the decrease in impervious surface area, a comparison of the pre- and post-Project peak flow rates indicates that stormwater flows from the Project Site would be reduced by approximately 0.08 cubic feet per second from 3.71 cubic feet per second under existing conditions to 3.63 cubic feet per second with implementation of the Project, a 2 percent reduction. Therefore, the Project would not substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site. Operation impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

iii. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

Less Than Significant Impact. As discussed above in Response to Checklist Question 10.c.ii, the Project would result in a decrease in stormwater flows from the Project Site. Consequently, the Project would decrease the amount of stormwater runoff discharging into the existing storm drainage infrastructure. In addition, the implementation of BMPs, as described previously, would target the pollutants that could potentially be carried in stormwater runoff. Therefore, the Project would not create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

iv. Impede or redirect flood flows?

No Impact. The Project Site is not located within a 100-year flood hazard area as mapped by the Federal Emergency Management Agency (FEMA).[37] Thus, the Project would not impede or redirect flood flows. No impacts would occur, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

d. In flood hazard, tsunami, or seiche zones, would the project risk release of pollutants due to project inundation?

Less Than Significant Impact. As discussed above, the Project Site is not located within a 100-year flood hazard area as mapped by FEMA. In addition, the Project Site is located approximately 7 miles inland of the Pacific Ocean; therefore, the risk of a tsunami is negligible. The Project Site is also flat and surrounded by residential and commercial development. There are no standing bodies of water near the Project Site that may experience a seiche. Therefore, the Project Site is located in a low hazard area for a tsunami and seiche.

Earthquake-induced flooding can also result from the failure of dams or other water-retaining structures resulting from earthquakes. According to the General Plan's Safety Element, the City lies in the inundation path of the Lower Franklin Canyon Reservoir, which is located north of the City. As discussed in the General Plan's Safety Element, in the event of a breach of this reservoir, the residential area north of Carmelita Drive would be

[37] *Federal Emergency Management Agency, Flood Insurance Rate Maps, Panel Numbers 06037C1320F and 06037C1340F, effective September 26, 2008.*

exposed to immediate and severe danger. Below that point, the danger diminishes rapidly although flooding of most structures in the inundation path would occur. Dam safety regulations are the primary means of reducing damage or injury due to inundation occurring from dam failure. Dam safety regulations are enforced by various governmental agencies, including the State of California Division of Safety of Dams, the U.S. Army Corps of Engineers, and the Department of Water Resources. Dams in the state are continually monitored by these agencies to guard against the threat of dam failure. Specifically, the California Division of Safety of Dams regulates the siting, design, construction, and periodic review of all dams in the State. Inspectors would require dam owners to perform work, maintenance or implement controls if issues are found with the safety of the dam. Given the oversight by the Division of Safety of Dams, including regular inspections, the potential for seismically-induced flooding to affect the Project Site due to dam failure is low. Additionally, as discussed above, the Project would include new structural BMPs throughout the Project Site which would reduce the amount of pollutants entering the stormwater system and groundwater. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

e. Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Less Than Significant Impact. Under Section 303(d) of the Clean Water Act, states are required to identify water bodies that do not meet their water quality standards. Biennially, the Los Angeles Regional Water Quality Control Board (LARWQCB) prepares a list of impaired waterbodies in the region, referred to as the 303(d) list. The 303(d) list outlines the impaired waterbody and the specific pollutant(s) for which it is impaired. All waterbodies on the 303(d) list are subject to the development of a Total Maximum Daily Load (TMDL). As discussed in the City's General Plan Open Space Element, the City is located within the Ballona Creek Watershed. According to the State Water Resources Control Board (SWRCB), constituents of concern listed for the Ballona Creek Watershed under California's Clean Water Act Section 303(d) List include cadmium (sediment), chlordane (tissue and sediment), copper (dissolved), cyanide, lead, PCBs, silver, toxicity, trash, viruses (enteric), and zinc.

The County of Los Angeles and all other cities in watershed areas within the County of Los Angeles are responsible for the implementation of watershed improvement plans or Enhanced Watershed Management Programs (EWMP) to improve water quality and assist in meeting the TMDL milestones. The objective of the EWMP Plan for the Ballona Creek is to determine the network of control measures (often referred to as best management practices) that will achieve required pollutant reductions while also providing multiple benefits to the community and leveraging sustainable green infrastructure practices.

Potential pollutants generated by the Project would be typical of commercial uses and may include sediment, nutrients, pesticides, trash and debris, oil and grease, and metals. The implementation of BMPs would target these pollutants that could potentially be carried in stormwater runoff. Since the existing Project Site does not have any structural BMPs to treat or infiltrate stormwater, implementation of the proposed BMPs as part of the Project would result in an improvement in surface water quality runoff as compared to existing conditions. As such, the Project would not introduce new pollutants or an increase in pollutants that could conflict with or obstruct any water quality control plans for the Ballona Creek Watershed.

With respect to groundwater, as discussed above in Checklist Question X.b, the Project would not result in impacts related to groundwater recharge. Therefore, the Project would not interfere with sustainable groundwater management of the basin.

Based on the above, with compliance with existing regulatory requirements and implementation of BMPs, the Project would not conflict with or obstruct implementation of a water quality control plan or a sustainable groundwater management plan. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

11. Land Use and Planning

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Physically divide an established community?	☐	☐	☒	☐
b. Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☒	☐	☐	☐

a. Would the project physically divide an established community?

Less Than Significant Impact. The approximately 1.277-acre (55,608 square feet) Project Site encompasses property located at 468 and 456 North Rodeo Drive, 461 through 465 North Beverly Drive, and 449, 451, and 453 North Beverly Drive in the City of Beverly Hills. The Project Site is bounded by South Santa Monica Boulevard to the north, North Beverly Drive to the east, commercial buildings to the south, and by North Rodeo Drive to

the west.[38] An existing alley bisects the Project Site. The alley runs north-south through the Project Site and is accessible from South Santa Monica Boulevard. The Project Site is currently developed with commercial and institutional buildings and parking. The Project Site is located within the northern portion of the Beverly Hills Business Triangle. Land uses surrounding the Project Site include a mix of retail uses and restaurants. Specifically, north of the Project Site, across South Santa Monica Boulevard are a collection of small retail stores and restaurants as well as an art gallery. East of the Project Site, across North Beverly Drive is the 9-story Bank of America Financial Center building, which primarily contains office space and vacant commercial space on the ground floor fronting North Beverly Drive and South Santa Monica Boulevard. Immediately south of the Project Site fronting North Rodeo Drive is a 3-story building, which contains Ralph Lauren and Giorgio Armani stores on floors 1-2 and a doctor's office and other commercial office tenants on the 3rd floor. The area immediately south of the Project Site near North Beverly Drive is developed with two 2-story buildings. The building that fronts North Beverly Drive has small retail stores and restaurants on the ground floor and office space on the second floor. The building that fronts the alley contains warehouse space on the ground floor with office space on the second floor. To the west of the Project Site, across North Rodeo Drive, are a collection of luxury clothing stores. Local access to the Project Site is provided by several local streets and avenues, including Santa Monica Boulevard and Wilshire Boulevard.

The Project would demolish the existing buildings and associated parking for development of the proposed hotel, private club, and commercial uses. These uses would be consistent with other commercial developments located adjacent to and in the general vicinity of the Project Site. All proposed development would also occur within the boundaries of the Project Site. In addition, the Project does not propose a freeway or other large infrastructure that would divide the existing surrounding community. Therefore, the Project would not physically divide an established community. Impacts related to the physical division of an established community would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

b. Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Potentially Significant Impact. As discussed above in the Description of the Project, the Project requires several discretionary approvals. The Project could potentially conflict with land use plans, policies or regulations that were adopted for the purpose of

[38] *For ease of reference, these directions consider that South Santa Monica Boulevard is due north of the Project Site.*

avoiding or mitigating an environmental effect. Therefore, further evaluation of this topic in an EIR is required.

12. Mineral Resources

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☒
b. Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	☒

a. Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

No Impact. No mineral extraction operations currently occur on the Project Site. The Project Site is located within an urbanized area and has been previously disturbed by development. As such, the potential for mineral resources to occur on-site is low. In addition, the Project Site is not located within a mineral producing area as classified by the CGS.[39] The Project Site is also not located within a City-designated oil field or oil drilling area.[40] Therefore, the Project would not result in the loss of availability of a mineral resource or a mineral resource recovery site. No impact would occur, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

b. Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

No Impact. No mineral extraction operations currently occur on the Project Site. Furthermore, the Project Site is not located within a City-designated Mineral Resource Zone where significant mineral deposits are known to be present, or within a mineral producing area as classified by the CGS. The Project Site is also not located within a City

---

[39] *California Geological Survey, Aggregate Sustainability in California, Fifty-Year Aggregate Demand Compared to Permitted Aggregate Reserves, 2012.*

[40] *City of Beverly Hills, General Plan Conservation Element, January 2010, Figure CON5, Oil Fields, p. 139.*

designated oil field or oil drilling area. Therefore, the Project would not result in the loss of availability of a mineral resource or a mineral resource recovery site. No impact would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

13. Noise

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project result in:				
a. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☒	☐	☐	☐
b. Generation of excessive groundborne vibration or groundborne noise levels?	☒	☐	☐	☐
c. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒

a. Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Potentially Significant Impact. During construction activities associated with the Project, the use of heavy equipment (e.g., bulldozers, backhoes, cranes, loaders, etc.) would generate noise on a short-term basis. In addition, noise levels from on-site sources may increase during operation of the Project, including from proposed amplified outdoor music. Furthermore, traffic attributable to the Project has the potential to increase noise levels along adjacent roadways. Therefore, further evaluation of this topic will be provided in the EIR. Noise-sensitive uses in the vicinity of the Project Site include residential uses and the Beverly Gardens linear park to the north of the Project Site, north of N. Santa Monica Boulevard. The Project's noise analysis will be conducted in accordance with the City's General Plan Noise Element and associated noise policies and the City's noise regulations in the City's Municipal Code.

b. Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Potentially Significant Impact. Construction of the Project could generate groundborne noise and vibration associated with demolition, site grading and excavation, other clearing activities, the installation of building footings, and construction truck travel. As such, the Project would have the potential to generate excessive groundborne vibration and noise levels during short-term construction activities. Therefore, further evaluation of this topic will be provided in the EIR.

c. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

No Impact. The Project Site is not located within the vicinity of a private airstrip or airport land use plan, nor within 2 miles of a public airport or public use airport. The nearest airport to the Project Site is the Santa Monica Airport located approximately 4.4 miles southwest of the Project Site. Therefore, the Project would not expose people residing or working on the Project Site to excessive airport noise. No impact would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

14. Population and Housing

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☒	☐
b. Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

a. Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Less Than Significant Impact. The Project is a commercial development consisting of hotel, private club, and commercial (retail/restaurant) uses. Since the Project does not propose a housing component, it would not directly induce a new residential population that would contribute to population growth in the vicinity of the Project Site. Additionally, while construction of the Project would create temporary construction-related jobs, the work requirements of most construction projects are highly specialized so that construction workers remain at a job site only for the time in which their specific skills are needed to complete a particular phase of the construction process. Thus, Project-related construction workers would not be anticipated to relocate their household's place of residence as a consequence of working on the Project and, therefore, no new permanent residents would be generated during construction of the Project.

Operation of the Project would generate new employment positions, which could result in increased population growth in the area. This increase in employment would be a beneficial impact to the City and would not be expected to induce substantial indirect population or housing growth. Specifically, some of the employment opportunities generated by the proposed commercial uses may be filled to some extent by employees already residing in the vicinity of the Project Site. In addition, while it is also possible that some of the jobs created by the proposed uses would be filled by persons moving into the surrounding area, creating a demand for housing, it is anticipated that some of this demand would be filled by then-existing vacancies in the housing market, and some from other new units in other developments. Therefore, given that the Project would not directly contribute to population growth in the Project area and as some of the employment opportunities generated by the Project would be filled by people already residing in the vicinity of the Project Site, the potential growth associated with Project employees who may relocate their place of residence would not be substantial. As such, the Project would not result in a notable increase in demand for new housing, and any new demand, should it occur, would be minor in the context of forecasted growth for the City. Further, as the Project would be located in a highly developed area with an established network of roads and other urban infrastructure, the Project would not require the extension of such infrastructure in a manner that would indirectly induce substantial population growth.

Based on the above, the Project would not induce substantial population or housing growth. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

b. Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

No Impact. As no housing currently exists on the Project Site, the Project would not cause the displacement of any existing people or housing and therefore would not require

the construction of replacement housing elsewhere. No impact would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

15. Public Services

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Fire protection?	☐	☐	☒	☐
b. Police protection?	☐	☐	☒	☐
c. Schools?	☐	☐	☒	☐
d. Parks?	☐	☐	☒	☐
e. Other public facilities?	☐	☐	☒	☐

a. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection services?

Less Than Significant Impact. Fire protection, rescue services, and emergency medical (paramedic) services are provided by the Beverly Hills Fire Department (BHFD). The fire stations closest to the Project Site are the BHFD headquarters (Fire Station No. 1), located approximately 0.4 mile northeast of the Project Site at 445 N. Rexford Drive, and Fire Station No. 3, located at 180 S. Doheny Drive, approximately 1.1 miles southeast of the Project Site.

As previously discussed, the Project would not include housing which would result in a direct increase in the City's population that would be served by the BHFD. However, the Project would result in a net increase of approximately 155,247 square feet to 164,162 square feet (under the Specific Plan maximums) of new floor area on the Project Site and would generate transient occupants (hotel guests) and additional employees. As the Project would increase the building area and daytime and nighttime (transient occupants) population of the Project Site compared to existing conditions, the Project could increase

the demand for BHFD services. Notwithstanding, the proposed commercial uses would be expected to generate a range of fire service calls similar to what occurs under existing conditions in the vicinity of the Project Site. The Project would not include any unique or especially hazardous uses, such as industrial facilities, that use or generate large quantities of hazardous and/or toxic materials that could pose an extreme risk of serious accident or fire at the Project Site. The types of fires that could potentially occur within the Project Site would be adequately suppressed with the fire equipment found at the fire stations nearest the Project Site. Additionally, the Project would be required to comply with the California Fire Code, Universal Building Code, and BHFD standards, including specific construction specifications, access design, location of fire hydrants, and other design requirements. Compliance with applicable regulatory requirements, including BHFD's fire/life safety plan review, would ensure that adequate fire prevention features would be provided that would reduce the demand on BHFD facilities and equipment resulting from the Project.

Based on the above, the Project would not require the addition of a new fire station or the expansion of an existing facility in order to maintain service. Therefore, operation of the Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities (fire protection), the construction of which would cause significant environmental impacts, in order to maintain acceptable fire protection services. Project impacts would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

b. Would the Project result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for police protection services?

Less Than Significant Impact. Police protection is provided by the Beverly Hills Police Department (BHPD). Protection services include emergency and non-emergency police response, routine police patrols, investigative services, traffic enforcement, traffic investigation, and parking code enforcement. The station closest to the Project Site is the BHPD headquarters located at 464 North Rexford Drive, approximately 0.3 mile northeast of the Project Site.

As previously noted, the Project does not include the development of residential uses. Therefore, the Project would not directly affect the existing officer-to-resident ratio within the BHPD headquarters. However, the Project would introduce a new employee and visitor population to the Project Site, which could result in an indirect demand for police services. These employment opportunities would include a range of full-time and part-time positions, which may be filled, in part, by employees already residing in the vicinity of the Project Site and who are already included in the residential population of the BHPD

headquarters. Other positions may be filled by persons who would commute and who would not relocate their place of residence as a result of working on the Project Site. Overall, given the BHPD's metrics for evaluating service capacity based on residential population, the Project's increase in the police service population would not affect the officer-to-resident ratio for the BHPD headquarters. Additionally, the Project would incorporate security features to reduce the demand for police protection services. These features would include sufficient lighting throughout the Project Site to ensure safety and visibility and well illuminated entryways, walkways, lobbies, and parking areas to eliminate areas of concealment. In addition to the implementation of these design features, which would help offset the Project-related increase in demand for police services, the Project would generate revenues to the City's General Fund (in the form of property taxes, transient occupancy taxes, sales revenue, etc.) that could be applied toward the provision of new police facilities and related staffing in the community, as deemed appropriate. Overall, the Project would not generate a demand for additional police protection services that would exceed the BHPD's capacity to serve the Project Site. Therefore, Project operation would not necessitate the provision of new or physically altered government facilities, the construction of which would cause significant environmental impacts, in order to maintain BHPD's capability to serve the Project Site. Impacts to police protection services would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

c. Would the Project result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for schools?

Less Than Significant Impact. The Project Site is located within the boundaries of the Beverly Hills Unified School District (BHUSD). As previously discussed, the Project does not propose the development of residential uses. Therefore, implementation of the Project would not result in a direct increase in the number of students within the service area of the BHUSD from the introduction of a residential population. In addition, not all new employees of the Project would necessarily relocate to the vicinity of the Project Site, which could otherwise trigger a demand for new or expanded school facilities. Furthermore, even if there were new school facilities that would need to be built, pursuant to Senate Bill 50, the Project Applicant would be required to pay development fees for schools to BHUSD prior to the issuance of building permits. Pursuant to Government Code Section 65995, the payment of these fees is considered mitigation of Project-related school impacts. Therefore, impacts would be less than significant, and no mitigation measures are required. No further analysis of this issue in an EIR is required.

d. Would the Project result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for park services?

Less Than Significant Impact. Parks and recreational facilities in the vicinity of the Project Site are primarily operated and maintained by the Beverly Hills Department of Community Services, Recreation and Parks Division. Nearby parks and recreational facilities within an approximate 2-mile radius of the Project Site include: Beverly Gardens Park (a linear park parallel to North Santa Monica Boulevard, located approximately 315 feet west of the Project Site), Rexford Mini Park (located 0.3 mile northeast of the Project Site), Beverly Canons Park (located 0.3 mile southeast of the Project Site), and Crescent Drive Mini-Park (located 0.6 mile southeast of the Project Site).

As previously discussed, the Project does not propose the development of residential uses. Therefore, implementation of the Project would not result in on-site residents who would utilize nearby parks and/or recreational facilities. Additionally, the new employment opportunities that would be generated by the Project may be filled, in part, by employees already residing in the vicinity of the Project Site who already utilize existing parks and recreational facilities. Furthermore, while the transient occupants of the hotel may use local parks, such use would be temporary as any use of local parks would be limited to their stay at the hotel. In addition, hotel guests would be anticipated to use the various guest amenities that would be provided within the hotel. Therefore, only a fraction of the new employees generated by the Project could create a demand for parks. While it is possible that some of these employees may utilize local parks and recreational facilities, such use would be anticipated to be limited due to work obligations and the amount of time it would take for employees to access off-site local parks. In addition, Project employees would be more likely to use parks near their homes during non-work hours. Furthermore, the Project proposes on-site amenities such as employee facilities on the first basement level with seating for use by employees, reducing the likelihood they would use local parks. Therefore, the Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered parks or the need for new or physically altered parks. Impacts would be less than significant, and no mitigation measures are required. No further analysis of this issue in an EIR is required.

e. Would the Project result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for other public facilities?

Less Than Significant Impact. Other public facilities available include libraries. The Beverly Hills Public Library (BHPL) provides library services to the City of Beverly Hills through its Main Library and Roxbury Book Nook, as well as through Web-based resources.[41] The Project area is served by these two libraries, with the former located 0.4 mile from the Project Site and the latter located 1.3 miles from the Project Site.

As previously discussed, the Project does not propose the development of residential uses. Therefore, implementation of the Project would not result in a direct increase in the number of residents within the service population of the Beverly Hills Main Library of the Roxbury Book Nook. In addition, Project employees would have internet access to BHPL and other web-based resources, decreasing the demand on library facilities. Furthermore, as Project employees would be more likely to use library facilities near their homes during non-work hours and given that some of the employment opportunities generated by the Project would be filled by people already residing in the vicinity of the Project Site, Project employees and the potential indirect population generation that could be attributable to those employees would generate minimal demand for library services. Finally, any use of local libraries by the transient occupants of the hotel would be temporary and limited to the duration of their stay. Therefore, the Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered library facilities or the need for new or physically altered library facilities. Impacts would be less than significant, and no mitigation measures are required. No further analysis of this issue in an EIR is required.

16. Recreation

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☒	☐
b. Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☐	☒

[41] *Beverly Hills Public Library, Branches and Hours, www.beverlyhills.org/departments/communityservices/beverlyhillspubliclibrary/contactus/brancheshours/, accessed August 6, 2020.*

a. Would the project Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated?

Less Than Significant Impact. As described above in Response to Checklist Question 15.d, nearby parks and recreational facilities within an approximate 2-mile radius of the Project Site include Beverly Gardens Park (a linear park parallel to North Santa Monica Boulevard, located approximately 315 feet west of the Project Site), Rexford Mini Park (located 0.3 mile northeast of the Project Site), Beverly Canons Park (located 0.3 mile southeast of the Project Site) and Crescent Drive Mini-Park (located 0.6 mile southeast of the Project Site). As previously discussed, the Project does not propose the development of residential uses which would create a demand on nearby parks and/or recreational facilities. Additionally, the new employment opportunities that would be generated by the Project may be filled, in part, by employees already residing in the vicinity of the Project Site who already utilize existing parks and recreational facilities. Furthermore, any use of the local parks by the transient occupants of the hotel would be temporary and limited to the duration of their stay. Therefore, only a fraction of the new employees generated by the Project could create a demand for parks and recreational facilities. While it is possible that some of these employees may utilize local parks and recreational facilities, such use would be anticipated to be limited due to work obligations and the amount of time it would take for employees to access off-site local parks and recreational facilities. In addition, Project employees would be more likely to use parks near their homes during non-work hours.

Based on the above, the Project would not substantially increase the demand for off-site public parks and recreational facilities such that substantial physical deterioration of those facilities would occur or be accelerated. The impact on parks and recreational facilities would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

b. Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

No Impact. The Project does not include any residential uses and therefore would not result in any direct substantial population growth that would increase use of existing recreational facilities. Therefore, the Project would not necessitate construction of new recreational facilities. The Project would provide approximately 45,356 square feet of open space, including the publicly accessible 825-square-foot pedestrian plaza proposed at the ground floor. The remaining open space areas would be primarily for private use by hotel guests and club members but may also be used by restaurant guests, and would include the 4,760 square feet of outdoor restaurant and bar spaces on levels six and seven, the

742-square-foot outdoor terrace on the seventh level, hotel room balcony/patio areas, pool deck, wellness center outdoor area, and penthouse pool deck. These Project features are part of the overall Project design. The construction of these recreational amenities as part of the Project would take place at the same time as the rest of the construction processes and would have no additional adverse physical effects on the environment. Therefore, no impact would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

17. Transportation

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?	☒	☐	☐	☐
b. Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?	☒	☐	☐	☐
c. Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☒	☐
d. Result in inadequate emergency access?	☐	☐	☒	☐

a. Would the project conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?

Potentially Significant Impact. Operation of the proposed uses would generate vehicle and transit trips throughout the day. The resulting increase in the use of the area's transportation facilities could conflict with an applicable plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities. Therefore, further analysis of this issue will be provided in the EIR.

b. Would the project conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?

Potentially Significant Impact. SB 743, which went into effect in January 2014, requires the Governor's Office of Planning and Research to change the way public agencies evaluate transportation impacts of projects under CEQA. Under SB 743, the focus of transportation analysis has shifted from vehicle delay, which is typically measured

by traffic level of service (LOS), to a new measurement (vehicle miles traveled) that better addresses the state's goals on reduction of greenhouse gas emissions, creation of a multi-modal transportation, and promotion of mixed-use developments. CEQA Guidelines Section 15064.3 states that vehicle miles traveled (VMT) is the most appropriate measure of transportation impacts, replacing LOS.

On October 10, 2019, the City of Beverly Hills adopted the CEQA Transportation Analysis Update, which sets forth the revised thresholds of significance for evaluating transportation impacts as well as screening and evaluation criteria for determining impacts. The CEQA Transportation Analysis Update establishes VMT as the City's formal method of evaluating a project's transportation impacts. As part of this update, the City adopted its *Local Transportation Assessment Guidelines* (October 2019), which defines the methodology for analyzing a project's transportation impacts in accordance with SB 743.

The Project would develop new commercial uses on the Project Site. As a result, VMT would increase over existing conditions. Therefore, further analysis of this issue will be provided in the EIR.

c. Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less Than Significant Impact. The roadways adjacent to the Project Site are part of the urban roadway network and contain no sharp curves or dangerous intersections. Additionally, as concluded by the Alley Study completed by Hirsch Green on April 28, 2020, included in Appendix IS-9 of this Initial Study, the vacation and realignment of a portion of the private alley currently bisecting the Project Site would not substantially increase hazards or result in an incompatible use. Although there would be an increase of eastbound traffic traveling through the intersection of South Santa Monica Boulevard and North Beverly Drive in order to enter the alley using the newly created west alley entrance, the increase would be nominal, amounting to one or two new vehicles per signal cycle. The Alley Study also included supplemental vehicle turning movement evaluations to assess whether vehicles using the alley, as well as vehicles that are anticipated to use it such as fire trucks and other emergency vehicles, can maneuver the 90-degree turn the realignment would create. The results of these evaluations concluded that they would be able to do so, although it is recommended that the deliveries are scheduled for off-peak times. As concluded in the Alley Study, no significant impacts to vehicular access or to the operations of the alley are expected, and the location and operations of the Project's loading bays will not significantly impact the alley. In addition, the Project would not result in incompatible uses as the proposed uses are consistent with the types of commercial uses already present in the surrounding area. Thus, no impacts related to increased

hazards due to a design feature or incompatible use would occur, and no further analysis of this topic in the EIR is required.

d. Would the project result in inadequate emergency access?

Less Than Significant Impact. While it is expected that the majority of construction activities for the Project would primarily be confined on-site, limited off-site construction activities may occur in adjacent street rights-of-way during certain periods of the day for the installation or upgrading of local infrastructure. Such activities could potentially require temporary lane closures adjacent to the Project Site. However, if lane closures are necessary, the remaining travel lanes would be maintained in accordance with standard construction management plans that would be implemented to ensure adequate circulation and emergency access. With regard to operation, the Project does not propose the permanent closure of any local public streets and primary access to the Project Site would continue to be provided from the surrounding streets. In addition, the Project would comply with BHFD access requirements and applicable BHFD regulations regarding safety. In addition, as discussed above, the Alley Study completed for the Project concluded that while fire trucks and other emergency vehicles would be able to maneuver the 90-degree turn the alley realignment would create,. As concluded in the Alley Study, no significant impacts to vehicular access or to the operations of the alley are expected. Therefore, the Project would not result in inadequate emergency access to the Project Site or surrounding uses. Impacts regarding inadequate emergency access would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

18. Tribal Cultural Resources

Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	☒	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	☒	☐	☐	☐

a. Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1 (k)?

b. Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

Potentially Significant Impact (a and b). Approved by Governor Edmund G. "Jerry" Brown on September 25, 2014, AB 52 establishes a formal consultation process for California Native American Tribes to identify potential significant impacts to Tribal Cultural Resources, as defined in PRC Section 21074, as part of CEQA. As specified in AB 52, lead agencies must provide notice to tribes that are traditionally and culturally affiliated with the geographic area of a proposed project if the tribe has submitted a written request to be notified. The tribe must respond to the lead agency within 30 days of receipt of the notification if it wishes to engage in consultation on the project, and the lead agency must begin the consultation process within 30 days of receiving the request for consultation.

Additionally, California Government Code Section 65352.3 (adopted pursuant to the requirements of Senate Bill 18) requires local governments to contact, refer plans to, and

consult with tribal organizations prior to making a decision to adopt or amend a general or specific plan. The tribal organizations eligible to consult have traditional lands in a local government's jurisdiction, and are identified, upon request, by the Native American Heritage Commission (NAHC). As noted in the California Office of Planning and Research's Tribal Consultation Guidelines (2005), "The intent of SB 18 is to provide California Native American tribes an opportunity to participate in local land use decisions at an early planning stage, for the purpose of protecting, or mitigating impacts to, cultural places." As required by SB 18, the Native American Heritage Commission (NAHC) was contacted to request a Sacred Lands File (SLF) search of the Project Site and a 0.25-mile radius surrounding it. The purpose of the SLF search is to identify lands or resources important to Native Americans and to assess the potential for Project-related development to impact Native American resources. A request for a list of California Native American Tribes traditionally affiliated with the project area was submitted to the NAHC. On October 9, 2020, the NAHC provided the contact information for seven tribes culturally affiliated with the project area: Soboba Band of Luiseño Indians, Gabrielino-Tongva Tribe, Gabrielino Tongva Indians of California Tribal Council, Gabrielino/Tongva Nation, Gabrieleño/Tongva San Gabriel Band of Mission Indians, Gabrieleño Band of Mission Indians – Kizh Nation, and Santa Rosa Band of Cahuilla Indians. On October 16, 2020 the City mailed and emailed a notification letter to the seven tribes requesting consultation.

As noted above, the Project would require grading and excavations up to 44 feet below grade. These construction activities could have the potential to disturb existing but undiscovered tribal cultural resources. Therefore, the potential exists for the Project to significantly impact a site, feature, place, cultural landscape, sacred place, or object with cultural value to a California Native American Tribe. In compliance with AB 52 and SB 18, the City will notify all applicable tribes, and the City will participate in any requested consultations for the Project. Therefore, further analysis of this topic will be provided in the EIR.

19. Utilities and Service Systems

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a. Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☒	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
b. Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	☐	☐	☒	☐
c. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☒	☐
d. Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☐	☐	☒	☐
e. Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	☐	☐	☒	☐

The following analysis is based, in part, on the Utility Memorandum prepared for the Project by Kimley Horn dated October 16, 2020, and included as Appendix IS-10 of this Initial Study.

a. Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Potentially Significant Impact. The Project would not result in a potentially significant impact with respect to water, wastewater treatment, stormwater drainage, and telecommunications facilities, as discussed below. However, due to the increased floor area and type of uses, the Project would generate an increased demand for electricity and natural gas services provided by SoCal Edison and the Clean Power Alliance and the Southern California Gas Company, respectively. Therefore, further analysis of the Project's demand on existing energy resources will be provided in the EIR.

Water

Water service to the Project Site would continue to be supplied by the City's Department of Public Works for domestic and fire protection uses. As discussed in the Utility Memorandum, existing water lines in the vicinity of the Project Site include: a 12-inch water line along South Santa Monica Boulevard; a 16-inch line located within Brighton Way; and an 8-inch water line within the existing alley that bisects the Project Site, which

connects to the 12-inch line in South Santa Monica Boulevard and the 16-inch line in Brighton Way. There are seven existing water meters around the Project Site, all of which are located within the alley bisecting the Project Site and are serviced by the existing 8-inch water main line in the alley. There is one fire hydrant near the northwestern corner of the property line along South Santa Monica Boulevard. As indicated in the Utility Memorandum, based on required service size and location of firewater infrastructure within the proposed building, it is anticipated that the firewater service would connect to either the 8-inch water line in the alley or the 12-inch water line in South Santa Monica Boulevard. The Project Site would also continue to be served by the existing fire hydrant adjacent to the Project Site. As part of the Project, the existing 8-inch water line within the alley will be removed and rerouted where it is in conflict with the proposed development. This would include capping the water line at the terminus of the alley at Santa Monica Boulevard, which would not impact other properties using the water line because an existing water line already exists along Santa Monica Boulevard. Looping of the water line within the alley to tie back into the main line on Brighton Way is proposed as part of the Project. The City Public Works Water Division has preliminarily reviewed the proposed conceptual water system design and approved this component of the Project. In any event, the Project would comply with the applicable requirements of the City for installation of the final plans for relocation of the water line. Overall, as concluded in the Utility Memorandum, based on the existing infrastructure in the vicinity of the Project Site, there is sufficient capacity to serve the Project under either the proposed conceptual site plan or the Specific Plan area maximums.

Based on the above, the Project would not exceed the available capacity within the water distribution infrastructure that would serve the Project site. Accordingly, the Project would not require or result in the relocation or construction of new or expanded water facilities, except to loop the water line within the alley to tie back into the main line on Brighton Way, as previously described. Therefore, the Project's impacts on water infrastructure would be less than significant, and no mitigation measures are required. No further analysis of this issue in an EIR is required.

Wastewater

Wastewater generated by the Project would be conveyed via the existing wastewater conveyance systems for treatment at the Hyperion Water Reclamation Plant (HWRP). The HWRP has a capacity of 450 million gallons per day (mgd),[42] and current

[42] *LASAN, Water Reclamation Plants, Hyperion Water Reclamation Plant, www.lacitysan.org/san/faces/wcnav_externalId/s-lsh-wwd-cw-p-hwrp?_adf.ctrl-state=vm8qwyj80_4&_afrLoop=18606279438697733#!, accessed January 2, 2020.*

average wastewater flows are at approximately 275 mgd.[43] Accordingly, the remaining available capacity at the HWRP is approximately 175 mgd. As shown in Table 2 on page 110, the Project would generate a net increase in wastewater flow from the Project Site of approximately 55,795 gpd, or approximately 0.055 mgd. The Project's increase in average daily wastewater flow of 0.056 mgd would represent approximately 0.03 percent of the current estimated 175 mgd of remaining available capacity at the HWRP. Therefore, the Project-generated wastewater would be accommodated by the existing capacity of the Hyperion Water Reclamation Plant. Furthermore, wastewater flows would be typical of commercial developments. No industrial discharge into the wastewater system would occur. Discharge of effluent from the HWRP into Santa Monica Bay is also regulated by permits issued under the NPDES and is required to meet LARWQCB requirements.

As discussed in the Utility Memorandum, existing sewer lines in the vicinity of the Project Site include an existing 8-inch sewer main line located at the centerline of the alley that bisects the Project Site. The 8-inch sewer main connects to an 18-inch sewer main at an existing manhole within Wilshire Boulevard. Based on the Utility Memorandum, it is anticipated that the portion of the existing 8-inch sewer main line that runs beneath the Project Site would be removed and two new 8-inch sewer laterals will be proposed for the Project. One would connect to the existing 8-inch sewer line in the alley and the other to the new 8-inch line extension in South Santa Monica Boulevard to compensate for the removal of a section of the sewer line that currently flows under the Project Site. As calculated in the Utility Memorandum, the existing sewer capacity was estimated based on commercial acreage and Los Angeles County zoning coefficients for estimated average daily sewage flow (0.015 cubic feet per second for commercially zoned properties). Based on the estimated 14.0 acres of commercial development between North Rodeo Drive and North Beverly Drive that discharge to the existing 8-inch sewer main in the alley, it was determined that the total peak flow currently within the 8-inch sewer main is 0.48 cubic feet per second (310,200 gallons per day). With addition of the peak flow estimated for the Project (approximately 0.24 cubic feet per second), the flow in the existing 8-inch sewer main in the alley would increase to approximately 0.70 cubic feet per second, or approximately at 41.5 percent of its capacity. Therefore, as concluded in the Utility Memorandum, the existing 8-inch sewer main in the alley would have adequate capacity to serve the Project under either the proposed conceptual site plan or Specific Plan area maximums.

As previously described, the Project would require construction of new on-site infrastructure to serve new buildings, and potential upgrades and/or relocations of existing

[43] *LASAN, Hyperion Water Reclamation Plant, www.lacitysan.org/san/faces/wcnav_externalId/s-lsh-wwd-*

Source: Kimley Horn, 2020.

infrastructure. Construction impacts associated with wastewater infrastructure would include the installation of a new sewer line extension in South Santa Monica Boulevard as well as trenching for miscellaneous utility lines and connections to the public infrastructure. Installation of wastewater infrastructure would include on-site wastewater distribution, the installation of a new sewer line extension in Santa Monica Boulevard to compensate for the removal of the section of sewer line that currently flows under the Project Site, and minor off-site work associated with connections to the public main. Although no upgrades to the public main are anticipated, a new sewer line extension would be installed in South Santa Monica Boulevard, as previously stated, and minor off-site work would be required in order to connect the on-site distribution system to the public main. Overall, when considering impacts resulting from the installation of any required wastewater infrastructure, impacts would be of a relatively short-term duration and would cease to occur once the installation is complete.

cw-p-hwrp?_adf.ctrl-state=grj40dmqj_1780&_afrLoop=3950078628628745#!, accessed January 2, 2020.

Based on the above, the Project would not require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which would cause significant environmental effects. Therefore, impacts would be less than significant, and mitigation measures are not required. No further analysis of this topic in an EIR is required.

Stormwater Drainage

With regard to stormwater drainage, as discussed above in Response to Checklist Question 10.c.ii, the Project would result in a decrease in impervious areas and stormwater flows. As such, the Project would not require or result in the relocation or construction of new or expanded stormwater drainage. Impacts would be less than significant, and no mitigation measures are required. No further analysis of this issue in an EIR is required.

Telecommunications Facilities

With respect to telecommunications facilities, the Project would require construction of new on-site telecommunications infrastructure to serve the new building and potential upgrades and/or relocation of existing telecommunications infrastructure. Construction impacts associated with the installation of telecommunications infrastructure would primarily involve trenching in order to place the lines below surface. Such activities could involve temporary closure of portions of sidewalks or travel lanes. However, the Project would ensure vehicle and pedestrian access is maintained throughout construction. In addition, when considering impacts resulting from the installation of any required telecommunications infrastructure, all impacts are of a relatively short duration (i.e., months) and would cease to occur when installation is complete. Installation of new telecommunications infrastructure would be limited to on-site telecommunications distribution and minor off-site work associated with connections to the public system. No upgrades to main off-site telecommunications systems are anticipated. Any work that may affect services to the existing telecommunications lines would be coordinated with service providers and the City, as applicable. As such, the Project would not require or result in the relocation or construction of new or expanded telecommunications facilities. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

b. Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Less Than Significant Impact. The City's water supply consists mostly of imported water purchased from the Metropolitan Water District of Southern California, with some groundwater pumping from the Hollywood Basin. As described in the Description of the

Project above, upon completion, the Project would result in a net new floor area of approximately 155,247 square feet to 164,162 square feet (under the Specific Plan maximums) on the Project Site. As such, development of the Project would result in an increase in long-term water demand for consumption, operational uses, maintenance, and other activities on the Project Site.

As provided in Table 3 on page 113, the Project is estimated to result in a net new increase in water demand of approximately 68,090 gpd. The City's 2015 Urban Water Management Plan forecasts adequate water supplies to meet all projected water demands in the City for normal, single-dry, and multiple-dry years through the year 2040.[44] Furthermore, as outlined in the 2015 Urban Water Management Plan, the City is committed to providing a reliable water supply for the City. The 2015 Urban Water Management Plan takes into account climate change and the concerns of drought and dry weather and notes that the City will meet all new demand for water due to projected population growth through a combination of water conservation and water recycling. By focusing on demand reduction and alternative sources of water supplies, the City would further ensure that long-term dependence on MWD supplies will not be exacerbated by potential future shortages. Additionally, water conservation and recycling will play an increasing role in meeting future water demands in the City.

The 2015 Urban Water Management Plan (UWMP) utilized SCAG's 2016 RTP/SCS data that provide for reliable water demand forecasts, taking into account changes in population, housing units, and employment. As discussed above, the Project would not generate a new residential or household population on the Project Site, although the Project would result in an increase in employment opportunities. According to the UWMP, the total water use for the City of Beverly Hills is projected to increase from 10,431 acre-feet per year (afy) in 2015 to 11,428 afy in 2040 (an increase of 9.6 percent). The net increase in water demand for the Project equals 76 afy, which represents approximately 7.6 percent of the anticipated increase in water use for the City between 2015 and 2040. In addition, the Project's potential employment growth would be a beneficial aspect of the Project. Therefore, the Project would be well within SCAG's growth projections for the City.

Based on the above, the City Public Works Division would have sufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry and multiple dry years. Impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

c. Would the project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Less Than Significant Impact. As shown above in Table 2 on page 110, the Project would generate a net increase in wastewater flow from the Project Site of approximately 55,795 gpd, or approximately 0.056 mgd. The Project's increase in average daily wastewater flow of 0.056 mgd would represent approximately 0.03 percent of the current estimated 175 mgd of remaining available capacity at the HWRP. Therefore, the Project-generated wastewater would be accommodated by the existing capacity of the Hyperion Water Reclamation Plant.

Various factors, including future development of new treatment plants, upgrades and improvements to existing treatment capacity, development of new technologies, etc., will ultimately determine the available capacity of the Hyperion Water Reclamation Plant in

2026, the year by which construction of the Project is expected to be completed. It is conservatively assumed that no new improvements to the wastewater treatment plant would occur prior to 2026. Thus, based on this conservative assumption, the 2026 effective capacity of the HWRP in 2026 would continue to be 450 mgd.

Based on average flow projections for the HWRP, it is anticipated that average flows in 2026, the Project build-out year, would be approximately 267 mgd.[45] Accordingly, the future remaining available capacity in 2026 would be approximately 183 mgd. The Project's increase in average daily wastewater flow of 0.056 mgd would represent approximately 0.03 percent of the estimated future remaining available capacity of 183 mgd at the HWRP. Therefore, wastewater generated under the Project would be accommodated by the future capacity of the HWRP.

Additionally, the Project's net increase in average daily wastewater generation of 0.056 mgd plus the current average flows of approximately 275 mgd to the HWRP would represent approximately 61.1 percent of the HWRP's capacity of 450 mgd. With regard to future flows, the Project's net increase of 0.056 mgd plus the projected flows of approximately 267 mgd to the HWRP would represent approximately 59.3 percent of the HWRP's assumed future capacity of 450 mgd.

Based on the above, there is adequate treatment capacity to serve the Project's projected demand in addition to existing commitments of the HWRP. As such, the Project would result in a determination by the wastewater treatment provider, which would serve the Project, that it has adequate capacity to serve the Project's projected demand in addition to the provider's existing commitments. Impacts would be less than significant, and no mitigation measures are required. No further analysis of this topic in an EIR is required.

d. Would the project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Less Than Significant Impact. The Beverly Hills Public Works Department, Solid Waste Division is responsible for solid waste collection in the City. The City contracts with Athens Environmental Services for waste hauling and collection services. Solid waste transported is either recycled, reused, or transformed at a waste-to-energy facility, or

---

[45] *Los Angeles Department of Water and Power, One Water LA 2040 Plan-Volume 2, Table ES.1, Projected Wastewater Flows. Based on a straight-line interpolation of the projected flows for the Hyperion Water Reclamation Plant for 2020 (approximately 256 mgd) and 2030 (approximately 275 mgd). The 2026 value is extrapolated from 2020 and 2030 values: [(275 mgd – 256 mgd) ÷ 10) * 6] + 256 = ~ 267.4 mgd.*

disposed of at a landfill. Landfills within the County are categorized as either Class III or inert waste landfills. Non-hazardous municipal solid waste is disposed of in Class III landfills, while inert waste such as construction waste, yard trimmings, and earth-like waste are disposed of in inert waste landfills.[46] Nine Class III landfills and one inert waste landfill with solid waste facility permits are currently serving the County.[47] In addition, there is one solid waste transformation facility within Los Angeles County that converts, combusts, or otherwise processes solid waste for the purpose of energy recovery.

Based on the 2018 Countywide Integrated Waste Management Plan (CoIWMP) Annual Report, the most recent report available, the total remaining permitted Class III landfill capacity in the County is estimated at 163.39 million tons. The permitted inert waste landfill serving the County is Azusa Land Reclamation. This facility currently has 57.72 million tons of remaining capacity and an average daily in-County disposal rate of 1,148 tons per day.[48] Los Angeles County continually evaluates landfill disposal needs and capacity through preparation of the CoIWMP Annual Reports. Within each annual report, future landfill disposal needs over the next 15-year planning horizon are addressed in part by determining the available landfill capacity.[49]

Based on the 2018 CoIWMP Annual Report, the countywide cumulative need for Class III landfill disposal capacity through the year 2033 will exceed the 2018 remaining permitted Class III landfill capacity of 163.39 million tons. The 2018 CoIWMP Annual Report evaluated seven scenarios to increase capacity and determined that the County would be able to meet the disposal needs of all jurisdictions through the 15-year planning period with existing capacity under six of the seven scenarios. The 2018 CoIWMP Annual Report concluded that in order to maintain adequate disposal capacity, individual jurisdictions must continue to pursue strategies to maximize waste reduction and recycling; expand existing landfills; promote and develop alternative technologies; expand transfer and processing infrastructure; and use out of county disposal, including waste by rail. To this end, the City of Beverly Hills implements a number of source reduction and recycling

---

[46] *Inert waste is waste which is neither chemically or biologically reactive and will not decompose. Examples of this are sand and concrete.*

[47] *County of Los Angeles, Department of Public Works, Los Angeles County Integrated Waste Management Plan 2018 Annual Report, December 2019. The 9 Class III landfills serving the County include the Antelope Valley Landfill, the Burbank Landfill, the Calabasas Landfill, Chiquita Canyon Landfill, Lancaster Landfill, Pebbly Beach Landfill, Savage Canyon Landfill, the Scholl Canyon Landfill, and the Sunshine Canyon City and County Landfill. Azusa Land Reclamation is the only permitted Inert Waste Landfill in the County that has a full solid waste facility permit.*

[48] *County of Los Angeles, Department of Public Works, Los Angeles County Integrated Waste Management Plan 2018 Annual Report, December 2019.*

[49] *County of Los Angeles, Department of Public Works, Los Angeles County Integrated Waste Management Plan 2018 Annual Report, December 2019.*

programs such as integrated curbside recycling, composting demonstration programs, and construction and demolition debris recycling.[50,51] The City currently recycles more than 70 percent of the residential and commercial garbage and composts its green waste such as yard clippings.

The following analysis quantifies the Project's construction and operation solid waste generation.

Construction

As discussed above, the Project Site is currently developed with commercial and institutional uses. Construction of the Project would include the removal of 56,787 square-feet of commercial/institutional uses within the Project Site and the development of a luxury hotel with up to 115 guest rooms, a private club, and appurtenant uses. As shown in Table 4 on page 117, based on construction and debris rates established by the USEPA, it is anticipated that construction of the Project would generate a total of approximately 9,221 tons of demolition debris and 859 tons of construction debris, for a combined total of 10,080 tons of construction-related waste.

Pursuant to the requirements of Senate Bill 1374, the Project would implement a construction waste management plan to recycle and/or salvage a minimum of 75 percent of non-hazardous demolition and construction debris. Materials that could be recycled or salvaged include asphalt, glass, and concrete. Debris not recycled could be accepted at the unclassified landfill (Azusa Land Reclamation) within Los Angeles County. As shown in Table 4, after accounting for mandatory recycling, the Project would result in approximately 2,520 tons of construction and demolition waste. This amount of construction and debris waste would represent approximately 0.004 percent of the Azusa Land Reclamation Landfill's existing remaining disposal capacity of 57.72 million tons. Thus, the total amount of construction and demolition waste generated by the Project would represent a small fraction of the remaining capacity at this permitted inert landfill serving Los Angeles County. Given the remaining permitted capacity at the Azusa Land Reclamation facility as well as the remaining 163.39 million tons of capacity at the Class III landfills open to the City, the landfills serving the Project Site would have sufficient capacity to accommodate the Project's construction solid waste disposal needs.

Operation

As shown in Table 5 on page 118, upon full buildout, the Project would result in solid waste generation of 1,440 tons per year. The estimated solid waste is conservative because the waste generation factors used do not account for recycling or other waste diversion measures, such as compliance with AB 341, which requires California commercial enterprises and public entities that generate 4 cubic yards or more per week of waste, and multi-family housing with five or more units, to adopt recycling practices. The estimated annual increase in solid waste that would be generated by the Project of 1,440 tons per year represents approximately 0.001 percent of the remaining capacity (163.39 million tons) for the County's Class III landfills. Notwithstanding, the County will continue to address landfill capacity through the preparation of CoIWMP annual reports. The preparation of each annual report provides sufficient lead time (15 years) to address potential future shortfalls in landfill capacity. Solid waste disposal is an essential public service that must be provided without interruption in order to protect public health and safety, as well as the environment. Jurisdictions in the County of Los Angeles continue to implement and enhance the waste reduction, recycling, special waste, and public education programs identified in their respective planning directives. These efforts, together with countywide and regional programs implemented by the County and the cities, acting in

Table 5
Estimated Project Solid Waste Generation

Land Use	Waste Disposed (tons/year)	Waste Disposed (tons/day)
Hotel	1,128[a]	3.1

Source: Eyestone Environmental, 2020.

concert or independently, have achieved significant, measurable results, as documented in the 2018 Annual Report. As discussed below, the Project would be consistent with and would further City policies that reduce landfill waste streams. Such policies and programs serve to implement the strategies outlined in the 2018 Annual Report to adequately meet countywide disposal needs without capacity shortages.

Based on the above, the landfills that serve the Project Site would have sufficient permitted capacity to accommodate the solid waste that would be generated by the construction and operation of the Project. Therefore, impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

e. Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Less Than Significant Impact. Solid waste management in the State is primarily guided by AB 939, the California Integrated Waste Management Act of 1989, which emphasizes resource conservation through reduction, recycling, and reuse of solid waste. AB 939 establishes an integrated waste management hierarchy consisting of (in order of

priority): (1) source reduction; (2) recycling and composting; and (3) environmentally safe transformation and land disposal. In addition, AB 1327 provided for the development of the California Solid Waste Reuse and Recycling Access Act of 1991, which requires the adoption of an ordinance by any local agency governing the provision of adequate areas for the collection and loading of recyclable materials in development projects. Furthermore, AB 341, which became effective on July 1, 2012, requires businesses and public entities that generate 4 cubic yards or more of waste per week and multi-family dwellings with five or more units, to recycle. The purpose of AB 341 is to reduce greenhouse gas emissions by diverting commercial solid waste from landfills and expand opportunities for recycling in California. In October 2014, Governor Jerry Brown signed AB 1826, requiring businesses to recycle their organic waste[52] on and after April 1, 2016, depending on the amount of waste generated per week. Specifically, beginning April 1, 2016, businesses that generate 8 cubic yards of organic waste per week were required to arrange for organic waste recycling services. In addition, beginning January 1, 2017, businesses that generate 4 cubic yards of organic waste per week were required to arrange for organic waste recycling services.

The Project would be consistent with the applicable regulations associated with solid waste. Specifically, the Project would comply with AB 939, AB 341, AB 1826, as applicable, by providing clearly marked, source-sorted receptacles to facilitate recycling. Since the Project would comply with federal, State, and local management and reduction statutes and regulations related to solid waste, impacts would be less than significant, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

20. Wildfire

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☐	☒
b. Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☐	☒

[52] *Organic waste refers to food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste.*

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
c. Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☐	☒
d. Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☐	☒

a. Would the project substantially impair an adopted emergency response plan or emergency evacuation plan?

b. Due to slope, prevailing winds, and other factors, would the project exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

c. Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

d. Would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

No Impact (a through d). The Project Site is not located in or near state responsibility areas or lands classified as very high fire hazard severity zones. Therefore, these thresholds would not apply to the Project. As discussed above, the Project Site is located in an urbanized area, and there are no wildlands located in the vicinity of the Project Site. Therefore, no impacts regarding wildfire risks would occur, and no mitigation measures are required. No further evaluation of this topic in an EIR is required.

21. Mandatory Findings of Significance

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☒	☐	☐	☐
b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)	☒	☐	☐	☐
c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☒	☐	☐	☐

a. Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

Potentially Significant Impact. As discussed above, the Project Site is located in an urbanized area and does not serve as habitat for fish or wildlife species. No sensitive plant or animal community or special status species occur on the Project Site. However, the Project does have the potential to degrade the quality of the environment or affect important examples of California's history or prehistory. Therefore, further evaluation of this topic will be provided in the EIR.

b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Potentially Significant Impact. Located in the vicinity of the Project Site are other past, current and probable future projects, the development of which may have cumulative impacts. Potential cumulative impacts will be addressed in the EIR for the following environmental factors: air quality; cultural resources; energy; geology and soils (paleontological resources); greenhouse gas emissions; land use and planning; noise; transportation; tribal cultural resources, and utilities and service systems (electricity and natural gas).

Regarding cumulative aesthetics impacts, related projects would be reviewed on a case-by-case basis by the City to comply with Beverly Hills Municipal Code requirements regarding building heights, setbacks, massing and lighting or, for those projects that require discretionary actions, to undergo site-specific review regarding building density, design, and light and glare effects. Related projects would also be subject to the City's design review process and review for consistency with zoning and regulatory documents governing scenic quality. Regardless, pursuant to Senate Bill 743, Public Resources Code Section 21099, and Zoning Information File ZI No. 2452, the Project's aesthetics impacts cannot be considered significant. Given the Project Site's location in a transit priority area, other residential, mixed-use, and employment center development projects located in the vicinity of the Project Site are anticipated to be of similar aesthetic character and would not have incremental combined effects that could create a cumulatively considerable impact. Thus, cumulative impacts associated with aesthetics would be less than significant.

With regard to cumulative effects on agriculture and forestry resources, biological resources, and mineral resources, no such resources are located on the Project Site or in the surrounding area. Due to the urbanized and developed nature of the Project Site and surrounding area, no agriculture and forestry resources, sensitive biological species or natural communities, or mineral resources are present within the Project Site or in the surrounding area. In addition, where applicable, other developments would be required to comply with the Migratory Bird Treaty Act to avoid impacts to nesting birds. Also, similar to the Project, where the removal of onsite trees and street trees is proposed, such developments would be required to comply with City regulations regarding tree replacement. Overall, the Project would have no impact on these resources, and therefore could not combine with other projects to result in cumulative impacts. Therefore, cumulative impacts to agriculture and forestry resources, biological resources, and mineral resources would be less than significant.

As discussed above, the Project would not result in significant impacts to geology and soils (except for potential impacts to paleontological resources, which will be addressed in the EIR). Thus, the Project would not contribute to any cumulative impacts associated with geology and soils. In addition, due to their site-specific nature, geology and soils impacts are typically assessed on a project-by-project basis or for a particular localized area. Therefore, as with the Project, related projects would address site-specific

geologic hazards through the implementation of site-specific geotechnical recommendations and/or mitigation measures. While cumulative development would expose a greater number of people to seismic hazards, as with the Project, related projects would be subject to local, state, and federal regulations and standards for seismic safety. Thus, Project impacts related to geology and soils would not be cumulatively considerable and would be less than significant.

Due to their site-specific nature, hazards and hazardous materials impacts are typically assessed on a project-by-project basis. Therefore, as with the Project, related projects would address site-specific hazards through the implementation of site-specific recommendations and/or mitigation measures. In addition, as with the Project, all related development located in the vicinity of the Project Site would be subject to local, regional, State, and federal regulations pertaining to hazards and hazardous materials. Therefore, with adherence to such regulations, the Project and related projects would not result in significant cumulative impacts with regard to hazards and hazardous materials. As such, the Project's contribution would not be cumulatively considerable, and cumulative impacts would be less than significant.

Related projects could potentially result in an increase in surface water runoff and contribute point and non-point source pollutants to nearby water bodies. However, as with the Project, related projects would be subject to the City's LID requirements. In addition, construction projects greater than one acre would be subject to NPDES permit requirements, including development of a SWPPP, SUSMP requirements during operation, and other local requirements pertaining to hydrology and surface water quality. It is anticipated that related projects would also be evaluated on an individual basis by the Department of Public Works to determine appropriate BMPs and treatment measures to avoid significant impacts to hydrology and surface water quality. With respect to groundwater, as described above, no water supply wells, spreading grounds, or injection wells are located within a 1-mile radius of the Project Site. In addition, Project development would not involve the temporary or permanent extraction of groundwater from the Project Site or otherwise utilize the groundwater. Furthermore, compliance with all applicable existing regulations at the Project Site would prevent the Project from affecting or expanding any potential areas affected by contamination, increasing the level of contamination, or causing regulatory water quality standards at an existing production well to be violated. As with the Project, other future development projects would be unlikely to cause or increase groundwater contamination because compliance with existing statutes and regulations would similarly prevent the future development projects from affecting or expanding any potential areas affected by contamination, or increasing the level of contamination, or causing regulatory water quality standards at an existing production well to be violated. Thus, Project impacts related to hydrology and water quality would not be cumulatively considerable and, cumulative impacts would be less than significant.

In terms of population and housing, while the Project would not include residential uses, some related projects could include residential uses that would directly generate a new population and provide additional housing in the vicinity of the Project Site. Other related projects like the Project would not include residential uses that would directly contribute to population growth. However, as with the Project, such related projects could generate an increased demand for housing in the area due to the relocation of housing by employees in proximity to their place of work. As with the Project, such demand for housing in the area would be anticipated to be limited as some employees may already live in the area and other employees would choose to commute. To the extent employees decide to relocate to the area, such demand for housing would be met by existing vacancies and by other related projects that include residential uses. With regard to the displacement of housing or people, while the Project would not displace housing or people, other projects might displace existing housing and people residing in them. However, even if construction of replacement housing were required elsewhere, such developments would likely occur on infill sites within the City and the appropriate level of environmental review would be conducted to analyze the extent to which the related projects could cause significant environmental impacts. Overall, the Project's contribution would not be cumulatively considerable, and cumulative impacts related to population and housing would be less than significant.

With regard to BHFD facilities and equipment, the related projects and other development in the City would be required to implement all applicable City Building Code and Fire Code requirements regarding structural design, building materials, site access, fire flow, storage and management of hazardous materials, alarm and communications systems, etc. Compliance with applicable City Building Code and Fire Code requirements would be demonstrated as part of BHFD's fire/life safety plan review and BHFD's fire/life safety inspection, prior to the issuance of a building permit. Compliance with applicable regulatory requirements, including BHFD's fire/life safety plan review and BHFD's fire/life safety inspection, would ensure that adequate fire prevention features would be provided that would reduce the demand on BHFD facilities and equipment. Related projects may include the installation of automatic fire sprinklers to enhance fire safety, which would further reduce the demand placed on the BHFD facilities and equipment. The Project, as well as the related projects, would also generate revenues to the City's Municipal Fund (in the form of property taxes, sales revenue, etc.) that could be applied toward the provision of new fire station facilities and related staffing, as deemed appropriate. Through the City's regular budgeting efforts, BHFD's resource needs would be identified and allocated according to the priorities at the time. Therefore, although an increase in service may be anticipated to serve staff and transient hotel occupants, the Project and related projects would not result in significant cumulative impacts with respect to fire protection. As such, the Project's contribution would not be cumulatively considerable, and cumulative impacts would be less than significant.

With regard to BHPD protection services, the Project would not introduce a new residential population to the Project Site, although an increase in service may be anticipated to serve staff and transient hotel occupants. To help reduce any on-site increase in demand for police services, the Project and related projects would implement comprehensive safety and design features to enhance public safety and reduce the demand for police services. In addition, the Project, as well as the related projects, would generate revenues to the City's Municipal Fund (in the form of property taxes, sales revenue, etc.) that could be applied toward the provision of new facilities and related staffing, as deemed appropriate. Through the City's regular budgeting efforts, the BHPD's resource needs would be identified and monies allocated according to the priorities at the time. Therefore, the Project and related projects would not result in significant cumulative impacts with respect to police protection. As such, the Project's contribution would not be cumulatively considerable, and cumulative impacts would be less than significant.

With regard to other public services such as schools, parks and recreation, and libraries, the Project would not generate a residential population that could increase the demand for schools, parks and recreational facilities, and libraries, nor would staff and transient hotel occupants significantly impact demand. Therefore, the Project would not contribute to an increased demand for these services. Other related projects could increase the demand for these services and facilities. However, the applicants for those projects would be required to pay mitigation impact fees for identified impacts under applicable regulatory requirements. Specifically, in the case of schools, the applicants for some related projects may be required to pay school impact fees, which would offset any potential impact to schools associated with the related projects. Similarly, in the case of parks and recreation (i.e., existing neighborhood and regional parks), some related projects would be required to include open space and amenity spaces (e.g. gyms, outdoor decks with pools, etc.) and pay park in-lieu fees (as required), which would help reduce the demand on neighborhood and regional parks, thereby reducing the likelihood that there would be substantial deterioration of parks. Employees generated by the non-residential related projects would be more likely to use parks and library facilities near their homes during non-work hours, as opposed to patronizing local facilities on their way to or from work or during their lunch hours. In addition, each related project would generate revenues to the City's General Fund (in the form of property taxes, sales tax, business tax, transient occupancy tax, etc.) that could be applied toward the provision of enhancing park facilities and library services in the City, as deemed appropriate. These revenues to the City's General Fund would help offset the increase in demand for park facilities and library services as a result of the Project and the related projects. Therefore, the Project and related projects would not result in significant cumulative impacts with respect to schools, parks, libraries, and recreation. As such, the Project's contribution would not be cumulatively considerable, and cumulative impacts would be less than significant.

Due to the shared urban infrastructure, the Project and related projects would cumulatively increase water consumption, wastewater generation, and stormwater discharge. As concluded in the City's 2015 Urban Water Management Plan, projected water demand for the City would be met by the available supplies during an average year, single-dry year, and multiple-dry year through the year 2040. Further, with respect to additional growth within the service area, through the City's Urban Water Management Plan process, the City will meet all new demand for water due to projected population growth through a combination of water conservation and water recycling. Therefore, the City would be able to supply the demands of the Project and projected future growth through 2040 and beyond. In addition, in accordance with the City's Green Building Ordinance, certain water conservation measures are required to be implemented by the City. Such measures would reduce water use associated with the Project and related projects. Furthermore, certain large related projects meeting the thresholds under Senate Bill 610 would be required to prepare and receive approval of a Water Supply Assessment that demonstrates how the project's water demand will be met. Therefore, the Project and related projects would not result in significant cumulative impacts with respect to water supply. As such, the Project's contribution would not be cumulatively considerable, and cumulative impacts would be less than significant.

Development of the related projects would result in an increase in the demand for sanitary sewer service in the HWRP. As described above in Response to Checklist Question No. 19.a, the existing design capacity of the HWRP is approximately 450 mgd and current wastewater flow levels are at 275 mgd. Based on the future wastewater flow and the wastewater treatment capacity of the HWRP, sufficient wastewater treatment capacity would be available to serve the Project and related projects. In addition, the City would continue to monitor wastewater flows and update infrastructure, as necessary, to accommodate the growth within the City. New development projects occurring in the vicinity of the Project Site, including the related projects, would also be required to coordinate with the City to determine adequate sewer capacity. Therefore, the Project and related projects would not result in significant cumulative impacts with respect to the wastewater treatment systems. As such, the Project's contribution would not be cumulatively considerable, and cumulative impacts would be less than significant.

With regard to stormwater infrastructure, as with the Project, related projects would be required to comply with City requirements and implement BMPs to capture a specified amount of runoff within the Project Site and reduce the potential impact of increased runoff to existing drainage systems. Therefore, the Project and related projects would not result in significant cumulative impacts with respect to stormwater infrastructure. As such, the Project's contribution would not be cumulatively considerable, and cumulative impacts would be less than significant.

Development of the Project and related projects could require new or expanded telecommunications infrastructure. As with the Project, the installation of any required telecommunications infrastructure associated with the related projects would occur during a relatively short duration and would be limited to on-site telecommunications distribution and minor off-site work associated with connections to the public system. Therefore, the Project and related projects would not result in significant cumulative impacts with respect to telecommunication infrastructure. As such, the Project's contribution would not be cumulatively considerable, and cumulative impacts would be less than significant.

The Project in conjunction with related projects would increase the need for solid waste disposal during their respective construction periods. However, given the urbanized and built-out nature of most of the City, it is anticipated that other projects would similarly represent a minor percentage of the remaining capacity of the County's Class III landfills open to the City. Additionally, the demand for landfill capacity is continually evaluated by the County through preparation of the Countywide Integrated Waste Management Plan annual reports. Each annual Countywide Integrated Waste Management Plan report assesses future landfill disposal needs over a 15 year planning horizon. Based on the 2018 Countywide Integrated Waste Management Plan Annual Report, the County anticipates that future disposal needs can be adequately met for the next 15 years (i.e., 2033) with implementation of strategies to maximize waste reduction and recycling, expand existing landfills, promote and develop alternative technologies, expand transfer and processing infrastructure, and use out of county disposal, including waste by rail. The preparation of each annual Countywide Integrated Waste Management Plan provides sufficient lead time (15 years) to address potential future shortfalls in landfill capacity. Therefore, cumulative impacts with respect to solid waste would be less than significant.

Lastly, as discussed above, the Project Site is located in an urbanized area, and no wildlands are located in the vicinity of the Project Site. The Project Site is not located within a City-designated Very High Fire Hazard Severity Zone. Related projects would be located in the same urban environment as the Project Site and it is unlikely the projects would expose people or buildings to wildfire. Therefore, cumulative impacts with respect to wildfire would be less than significant.

c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Potentially Significant Impact. Based on the analysis contained in this Initial Study, the Project could result in potentially significant impacts with regard to the following topics: air quality; cultural resources; energy; geology and soils (paleontological resources); greenhouse gas emissions; land use and planning; noise; transportation; tribal cultural resources; and utilities and service systems (electricity and natural gas). As a result, these potential effects will be analyzed further in the EIR.

Appendix IS-1

Tree Removal and Replacement Memorandum

Memorandum

Project	Cheval Blanc Beverly Hills	*Project No.*	8404
To	Masa Alkire, Planning, City of Beverly Hills	*Memo No.*	008
From	Dean Howell, PLA, ASLA	*Date*	8/7/2020
Subject	Tree Removal and Replacement		

This Technical Memorandum provides information regarding existing trees at the site of the proposed Cheval Blanc Beverly Hills Project. This Technical Memorandum supports the Cheval Blanc Beverly Hills entitlement resubmission documents dated July 17, 2020; it catalogues the existing trees, documents that none of them are “protected” trees pursuant to the criteria set forth in the City of Beverly Hills Municipal Code (BHMC), and summarizes proposed tree replacement. The Project proposes to remove and replace the existing trees due to the infeasibility of constructing the Project while maintaining existing tree viability, and therefore this Memorandum does not evaluate the health of the existing trees or contain the input of a licensed arborist.

The Project is surrounded by three major streets; N. Rodeo Drive on the west, S. Santa Monica Boulevard on the north and N. Beverly Drive on the east. These streets have a total of fifteen (15) existing street trees planted along the back of curb, which consist of the following:

- Along N. Rodeo, five (5) Archontophoenix cunninghamiana/King Palms are planted in 48” x 48” tree wells with Phormium ‘Jack Spratt’ planted at the base of the palm. Two existing up-lights are located just outside of the tree well and directed at each palm. Palms appear well maintained and are approximately 15’-20’ Brown Trunk Height (BTH).
- Along S. Santa Monica, four (4) Washingtonia robusta/ Mexican Fan Palms are planted in 36”x varying length tree wells that have been filled to the level of the sidewalk with a permeable paving. Palms appear well maintained and are approximately 30’ BTH.
- Along N. Beverly, three (3) Washingtonia robusta/ Mexican Fan Palms are planted in 48”x96” tree wells that alternate with three (3) Tipuana Tipu/ Tipu trees planted in 48”x48” tree wells. Dietes bicolor/ Fornight Lily is planted at the base of the palms and the deciduous trees are planted in tree wells with metal tree grates. Palms appear well maintained and are approximately 30’ BTH. The Tipu trees vary in height between 12’-18’.

The existing condition is shown in the ALTA survey, which is included with the Project application and appended to this Memorandum. There are no existing trees planted within the site itself.

BHMC 10-3-2901 prohibits the removal of “protected” trees without a tree removal permit. BHMC 10-3-2900 defines a “protected” tree as “[a]ny native tree, heritage tree, or tree within an urban grove.” Such trees are defined at section 10-3-2900 as follows:

> NATIVE TREE: A tree listed on the city's official list of local native trees, as adopted from time to time by resolution of the city council, and which has a primary trunk circumference of twenty four inches (24") or more, measured at a height of four feet six inches (4'6") above natural grade.

> HERITAGE TREE: Any tree not listed on the city's official list of native trees with a primary trunk circumference of forty eight inches (48") or more, measured at a height of four feet six inches (4'6") above natural grade.
>
> URBAN GROVE: Fifty (50) or more trees where the branches of each tree are within six feet (6') of the branches of one of the other trees in the grove. Individual trees in an urban grove may be of any size and are not subject to any circumference limitations. Any reference to an urban grove in this article shall mean the entire grove or one or more trees within the grove.

The exiting tree species (Archontophoenix cunninghamiana/King Palms, Washingtonia robusta/ Mexican Fan Palms, Tipuana Tipu/ Tipu) are not included on "[t]he official list of local native trees … maintained on file in the departments of planning and community development, building and safety and recreation and parks." BMHC 10-3-2900, *see also* http://www.beverlyhills.org/departments/publicworks/citymaintenance/trees/protectedtrees/. In addition, none of the existing trees has "a primary trunk circumference of forty eight inches (48") or more, measured at a height of four feet six inches (4'6") above natural grade," and the total number of existing trees is significantly fewer than 50. BMHC 10-3-2900. Thus, none of the existing trees meets the City's criteria for "protected" trees.

The proposed design of the Project includes a below grade parking structure built in a subsurface easement that extends under the sidewalk to the back of the curb at a depth of 10 feet or more below the sidewalk. Additionally, the existing alley access is proposed to be relocated from S. Santa Monica to N. Beverly. Due to these circumstances, the Project proposes to remove all existing street trees, perform the subsurface construction, and replace trees with new Palm trees at an overall 1:1 ratio. In order to maintain the visual character of the City streets, new palms will be of the same species and height as currently planted on each street.

Drawing sheet G003 Plot Plan shows the existing and proposed new street tree locations, a copy of which is appended to this memorandum.

- Along N. Rodeo, five (5) new Archontophoenix cunninghamiana/King Palms of approximately 15'-20' BTH are proposed to be planted in a 36" wide planted parkway. Two up-lights will be installed adjacent to and directed at each palm, within the parkway.
- Along S. Santa Monica, six (6) Washingtonia robusta/ Mexican Fan Palms of approximately 30' BTH are proposed to be planted in a 36" wide planted parkway.
- Along N. Beverly, four (4) Washingtonia robusta/ Mexican Fan Palms of approximately 30' BTH are proposed to be planted in 36"x144" planted tree wells.

LEGAL DESCRIPTION
T.REPORT 30038006-987-987-CS7

THE LAND REFERRED TO HEREIN BELOW IS SITUATED IN THE CITY OF BEVERLY HILLS, IN THE COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AND IS DESCRIBED AS FOLLOWS:

LOT 21 IN BLOCK 2 OF BEVERLY, IN THE CITY OF BEVERLY HILLS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AS PER MAP RECORDED IN BOOK 11, PAGE 94 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY.

SCHEDULE B ITEMS

BASED UPON TITLE REPORT NO. 30038006-987-987-CS7, DATED NOVEMBER 12, 2019 AS PREPARED BY FIDELITY NATIONAL TITLE INSURANCE COMPANY.

1.– WATER RIGHTS, CLAIMS OR TITLE TO WATER, WHETHER OR NOT DISCLOSED BY THE PUBLIC RECORDS. (NOT PLOTTED, NOT SURVEY RELATED)

2.– INTENTIONALLY DELETED.

3.– INTENTIONALLY DELETED.

4.– INTENTIONALLY DELETED.

5.– INTENTIONALLY DELETED.

6.– INTENTIONALLY DELETED.

7.– INTENTIONALLY DELETED.

8.– A DEED OF TRUST. (NOT PLOTTED, NOT SURVEY RELATED)

9.– A DEED OF TRUST. (NOT PLOTTED, NOT SURVEY RELATED)

10.– INTENTIONALLY DELETED.

11.– A SUBSURFACE OIL AND GAS LEASE FOR THE TERM THEREIN PROVIDED, WITH CERTAIN COVENANTS, CONDITIONS AND PROVISIONS, TOGETHER WITH EASEMENTS, IF ANY, AS SET FORTH THEREIN, DISCLOSED BY DOCUMENT, ENTITLED SUBSURFACE OIL AND GAS, DATED DECEMBER 1, 1997, LESSEE STRAND RESOURCES, L.P., RECORDING NO. 98-582201 OF OFFICIAL RECORDS. (NOT PLOTTED, NOT SURVEY RELATED)

12.– INTENTIONALLY DELETED.

13.– THE EFFECT OF A DEED. (NOT PLOTTED, NOT SURVEY RELATED)

THE EFFECT OF A DEED. (NOT PLOTTED, NOT SURVEY RELATED)

14.– THE EFFECT OF A DEED. (NOT PLOTTED, NOT SURVEY RELATED)

15.– THE EFFECT OF A DEED. (NOT PLOTTED, NOT SURVEY RELATED)

16.– THE EFFECT OF A DEED. (NOT PLOTTED, NOT SURVEY RELATED)

17.– INTENTIONALLY DELETED.

18.– ANY INVALIDITY OR DEFECT IN THE TITLE OF THE VESTEES IN THE EVENT THAT THE TRUST REFERRED TO HEREIN BELOW OR PART THEREOF, FAILS TO GRANT SUFFICIENT POWERS TO THE TRUSTEE(S) OR IN THE EVENT THAT THERE IS A LACK OF COMPLIANCE WITH THE TERMS AND PROVISIONS OF SAID TRUST INSTRUMENT. IF TITLE IS TO BE INSURED IN THE TRUSTEE(S) OF A TRUST, (OR IF THEIR ACT IS TO BE INSURED), THE COMPANY WILL REQUIRE A TRUST CERTIFICATION PURSUANT TO CALIFORNIA PROBATE CODE SECTION 18100.5.
THE COMPANY RESERVES THE RIGHT TO ADD ADDITIONAL ITEMS OR MAKE FURTHER REQUIREMENTS AFTER REVIEW OF THE REQUESTED DOCUMENTATION. (NOT PLOTTED, NOT SURVEY RELATED)

19.– ANY EASEMENTS NOT DISCLOSED BY THE PUBLIC RECORDS AS TO MATTERS AFFECTING TITLE TO REAL PROPERTY, WHETHER OR NOT SAID EASEMENTS ARE VISIBLE AND APPARENT.

20.– MATTERS WHICH MAY BE DISCLOSED BY AN INSPECTION AND/OR BY A CORRECT ALTA/NSPS LAND TITLE SURVEY OF SAID LAND THAT IS SATISFACTORY TO THE COMPANY, AND/OR BY INQUIRY OF THE PARTIES IN POSSESSION THEREOF.

21.– ANY RIGHTS OF SAID PARTIES IN POSSESSION OF A PORTION OF, OR ALL OF, SAID LAND, WHICH RIGHTS ARE NOT DISCLOSED BY THE PUBLIC RECORDS.
THE COMPANY WILL REQUIRE, FOR REVIEW, A FULL AND COMPLETE COPY OF ANY UNRECORDED AGREEMENT, CONTRACT, LICENSE AND/OR LEASE, TOGETHER WITH ALL SUPPLEMENTS, ASSIGNMENTS AND AMENDMENTS THERETO, BEFORE ISSUING ANY POLICY OF TITLE INSURANCE WITHOUT EXCEPTING THIS ITEM FROM COVERAGE.
THE COMPANY RESERVES THE RIGHT TO EXCEPT ADDITIONAL ITEMS AND/OR MAKE ADDITIONAL REQUIREMENTS AFTER REVIEWING SAID DOCUMENTS.

SURVEYOR'S NOTES

- THE PROPERTY SHOWN ON THE SURVEY IS THE SAME AS THE PROPERTIES LEGALLY DESCRIBED IN THE FOLLOWING TITLE COMMITMENTS:
  TITLE REPORT NO. 30038006-987-987-CS7, DATED NOVEMBER 12, 2019 AS PREPARED BY FIDELITY NATIONAL TITLE INSURANCE COMPANY.
  TITLE REPORT NO. CA-FBSC-IMP-72306-1-18-00085879, DATED MARCH 19, 2018 AS PREPARED BY FIDELITY NATIONAL TITLE COMPANY.
  TITLE REPORT NO. NCS-917096-ONT1, DATED NOVEMBER 6, 2019 AS PREPARED BY FIRST AMERICAN TITLE INSURANCE COMPANY.
  TITLE REPORT NO. 997-30029396-1MB, DATED APRIL 26, 2019 AS PREPARED BY FIDELITY NATIONAL TITLE COMPANY.
  TITLE REPORT NO. CA-FBOM-IMP-27306-1-18-00014459, DATED SEPTEMBER 14, 2018 AS PREPARED BY FIDELITY NATIONAL TITLE COMPANY.
- NO REVIEW OF VESTING DOCUMENTS WAS DONE IN CONNECTION WITH THE ALTA SURVEY REVIEW.
- THE PROPERTY HAS ACCESS FROM SANTA MONICA BOULEVARD AND EASEMENT 2 PER TITLE REPORT NO. 997-30029396-1MB, DATED APRIL 26, 2019 AS PREPARED BY FIDELITY NATIONAL TITLE COMPANY.
- NO EVIDENCE OF CEMETERIES, BURIAL GROUND OR GRAVESITES WERE OBSERVED IN THE PROCESS OF CONDUCTING THE FIELD WORK.
- THE UTILITIES SHOWN HEREON ARE BASED ON OBSERVED EVIDENCE ONLY. THIS SURVEY WOULD NOT SHOW UTILITIES COVERED BY CARS/TRUCKS OR RECENTLY PAVED ASPHALT/CONCRETE OR OVERGROWN BRUSH, TREES AND SHRUBS.
- UNLESS THIS PLAN HAS THE SEAL AND SIGNATURE OF THE SURVEYOR AND/OR ENGINEER RESPONSIBLE FOR ITS PREPARATION, THIS IS NOT AN AUTHENTIC COPY OF THE ORIGINAL SURVEY AND SHALL NOT BE DEEMED RELIABLE.

ZONING RESTRICTIONS

NOTE: INDICATED ZONING INFORMATION IS FROM THE CITY OF BEVERLY HILLS ZONING ORDINANCES IN EFFECT AS OF THE DATE OF THIS SURVEY. ZONING AND RESTRICTIONS SHOWN HEREON WERE OBTAINED BY A GENERAL REQUEST AT THE PUBLIC COUNTER OF THE ABOVE NAMED DEPARTMENT. NO INTERPRETATION OF ZONING ORDINANCES WAS MADE BY THE SURVEYOR. THE INFORMATION SHOWN IN THIS ITEM IS NOT AN EXPERT IN THE INTERPRETATION OF COMPLEX ZONING ORDINANCES. COMPLIANCE IS BEYOND THE SCOPE OF THIS SURVEY. ANY USER OF SAID INFORMATION IS URGED TO CONTACT THE LOCAL AGENCY DIRECTLY.

ZONE:	C-3 (COMMERCIAL ZONE)
MINIMUM SETBACKS:	FRONT: NOT SPECIFIED SIDES: NOT SPECIFIED REAR: NOT SPECIFIED
HEIGHT RESTRICTIONS:	NOT SPECIFIED

POSSIBLE ENCROACHMENT NOTES

THIS IS A LISTING OF OBSERVED IMPROVEMENTS THAT CROSS PROPERTY LINES. STATEMENT OF OWNERSHIP OR POSSESSION IS NOT THE INTENT OF THIS LISTING.

- BUILDING OVERLAPS THE SOUTHERLY PROPERTY LINES
- OVERHANG OVERLAPS ON THE PROPERTY LINE

FLOOD NOTE: BY GRAPHIC PLOTTING ONLY, THIS PROPERTY IS IN ZONE "X" OF THE FLOOD INSURANCE RATE MAP, PANEL NO. 06037C1910F, PANEL DATED 9/26/2008. THIS PROPERTY IS NOT LOCATED IN AN AREA WHERE FLOOD HAZARD EXIST AS DETERMINED BY FEMA. BY TELEPHONE CALL TO THE NATIONAL FLOOD INSURANCE PROGRAM (800-638-6620) WE HAVE LEARNED THIS COMMUNITY DOES NOT CURRENTLY PARTICIPATE IN THE PROGRAM. NO FIELD SURVEYING WAS PERFORMED TO DETERMINE THIS ZONE AND AN ELEVATION CERTIFICATE MAY BE NEEDED TO VERIFY THIS DETERMINATION OR APPLY FOR A VARIANCE FROM THE FEDERAL EMERGENCY MANAGEMENT AGENCY.

UTILITY STATEMENT

RUSSELL UTILITIES AND/OR PIPELINES SHOWN HEREON ARE PER VISIBLE AND APPARENT SURFACE EVIDENCE, RECORD DRAWINGS OF THE CONSTRUCTED UTILITY LINES OBTAINED FROM RESPECTIVE AGENCY RESPONSIBLE. SOURCES NOT PROVIDED IN A SUFFICIENT MANNER. ALL UTILITIES NOT PROVIDED BY AN AGREEMENT LOCATING CONTRACTOR, NO GUARANTEE OR WARRANTY, EITHER EXPRESSED OR IMPLIED, IS MADE AS TO THE ACCURACY OR TOPOGRAPHICAL OF SUCH INFORMATION. IF MORE ACCURATE LOCATIONS OF UNDERGROUND UTILITIES OR PIPE LINES ARE REQUIRED, THE UTILITY OR PIPELINE WILL HAVE TO BE VERIFIED BY FIELD EXCAVATION. THE SURVEYOR SHALL NOT BE HELD LIABLE FOR THE LOCATION OF ANY UTILITY NOT HE HELD LIABLE FOR THE LOCATION OF OR THE FAILURE TO NOTE THE LOCATION OF NON-VISIBLE UTILITIES OR PIPELINES.

SCHEDULE B ITEMS

BASED UPON TITLE REPORT NO. 997-30029396-1MB, DATED APRIL 26, 2019 AS PREPARED BY FIDELITY NATIONAL TITLE COMPANY.

A.– PROPERTY TAXES (NOT PLOTTED, NOT SURVEY RELATED).

B.– SUPPLEMENTAL TAXES (NOT PLOTTED, NOT SURVEY RELATED).

C.– THE LIEN OF SUPPLEMENTAL OR ESCAPED ASSESSMENT OF PROPERTY TAXES (NOT PLOTTED, NOT SURVEY RELATED).

D.– THE HEREIN DESCRIBED PROPERTY LIES WITHIN THE BOUNDARIES OF A MELLO–ROSS COMMUNITY FACILITIES DISTRICT (NOT PLOTTED, NOT SURVEY RELATED).

1.– WATER RIGHTS, CLAIMS OR TITLE TO WATER, WHETHER OR NOT DISCLOSED BY THE PUBLIC RECORDS.

2 EASEMENT FOR ALLEY OF MAP RECORDED IN BOOK 11 PAGE 94 OF MAPS (PLOTTED HEREON).

3.– EASEMENT FOR ALL OF SAID LAND RECORDED IN BOOK 11 PAGE 94 OF MAPS (BLANKET IN NATURE).

4.– A COMMUNITY OIL AND GAS LEASE FOR THE TERM THEREIN PROVIDED RECORDED SEPTEMBER 23, 1964 RECORDING NO. 84–1230 AND AMENDED BY AMEND OR AMENDMENTS, IF ANY, AS SET FORTH THEREIN, DISCLOSED BY DOCUMENT RECORDED AUGUST 1, 1966 RECORDING NO. 3002 IN BOOK M2302, PAGE 1 OF OFFICIAL RECORDS, AS AMENDED BY AN AMENDMENT RECORDED APRIL 7, 1966 AS INSTRUMENT NO. 66–44803, THE EFFECT OF A RELEASE OF OIL AND GAS LEASES, RECORDED AUGUST 25, 1995 AS INSTRUMENT NO. 95–1395301 THE EFFECT OF THE FOLLOWING FOUR MINERAL DEED WAIVER AND RELEASE OF SURFACE RIGHTS AND UNDER SAID LEASE RECORDED DECEMBER 19, 2011 AS INSTRUMENT NO. 20111794403, RECORDED APRIL 18, 2012 AS INSTRUMENT NO. 20120560602, RECORDED MAY 16, 2014 AS INSTRUMENT NO. 20140550601, AND RECORDED DECEMBER 21, 2015 AS INSTRUMENT NO. 20151601546. THE EFFECT OF SAID LEASE RECORDED SEPTEMBER 14, AS INSTRUMENT NO. 20190644102 ALL OF OFFICIAL RECORDS (NOT PLOTTED, NOT SURVEY RELATED).

5.– A SUBSURFACE OIL AND GAS LEASE RECORDED AUGUST 13, 1964 RECORDING NO. 84–978523; THE EFFECT OF A RELEASE OF OIL AND GAS LEASES, RECORDED AUGUST 25, 1995 AS INSTRUMENT NO. 95–1395301 BOTH OFFICIAL RECORDS (NOT PLOTTED, NOT SURVEY RELATED).

6.– A SUBSURFACE OIL AND GAS LEASE FOR THE TERM HEREIN PROVIDED RECORDED APRIL 7, 1966 RECORDING NO. 66–44803 OFFICIAL RECORDS (NOT PLOTTED, NOT SURVEY RELATED).

7.– A COMMUNITY OIL AND GAS LEASE FOR THE TERM HEREIN PROVIDED RECORDED APRIL 7, 1966 RECORDING NO. 66–44804 OFFICIAL RECORDS (NOT PLOTTED, NOT SURVEY RELATED).

8.– ANY RIGHTS OF THE PARTIES IN POSSESSION OF A PORTION OF, OR ALL OF, SAID LAND, WICH RIGHTS ARE NOT DISCLOSED BY THE PUBLIC RECORDS (NOT PLOTTED, NOT SURVEY RELATED).

ITEMS CORRESPONDING TO TABLE A ITEMS

ITEM 14
THE NEAREST INTERSECTING STREETS TO THE PROPERTY ARE SHOWN HEREON.

ITEM 16
NO EVIDENCE OF RECENT EARTH MOVING WORK, BUILDING CONSTRUCTION OR BUILDING ADDITIONS OBSERVED IN THE PROCESS OF CONDUCTING THE FIELD WORK.

ITEM 17
NO EVIDENCE OF RECENT STREET OR SIDEWALK CONSTRUCTION OR REPAIRS OBSERVED IN THE PROCESS OF CONDUCTING THE FIELD WORK.

ITEM 18
NO EVIDENCE OF WETLANDS ON THE SUBJECT PROPERTY. NO DELINEATION MARKERS OF WETLANDS WERE OBSERVED IN THE PROCESS OF CONDUCTING THE FIELD WORK.

ITEM 20
PROFESSIONAL LIABILITY INSURANCE POLICY OBTAIN BY THE SURVEYOR IN THE MINIMUM AMOUNT OF $1,000,000 TO BE IN EFFECT THROUGHOUT THE CONTRACT TERM.

T. REPORT CA-FBSC-IMP-72306-1-18-00085879

THE LAND REFERRED TO HEREIN BELOW IS SITUATED I THE CITY OF BEVERLY HILLS IN THE COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AND IS DESCRIBED AS FOLLOWS:

LOT 21 IN BLOCK 2 OF BEVERLY, IN THE CITY OF BEVERLY HILLS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AS PER MAP RECORDED IN BOOK 11 PAGE 94 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY.

SCHEDULE B ITEMS

BASED UPON TITLE REPORT NO. CA-FBSC-IMP-72306-1-18-00085879, DATED MARCH 19, 2018 AS PREPARED BY FIDELITY NATIONAL TITLE COMPANY.

A.– PROPERTY TAXES (NOT PLOTTED, NOT SURVEY RELATED).

B.– PROPERTY TAXES (NOT PLOTTED, NOT SURVEY RELATED).

C.– THE HEREIN DESCRIBED PROPERTY LIES WITHIN THE BOUNDARIES OF A MELLO–ROSS COMMUNITY FACILITIES DISTRICT (NOT PLOTTED, NOT SURVEY RELATED).

D.– THE LIEN OF SUPPLEMENTAL TAXES (NOT PLOTTED, NOT SURVEY RELATED).

1.– WATER RIGHTS, CLAIMS OR TITLE TO WATER, WHETHER OR NOT DISCLOSED BY THE PUBLIC RECORDS.

2.– A COMMUNITY OIL AND GAS LEASE FOR THE TERM THEREIN PROVIDED, EXECUTED BY THE PARTIES HEREIN NAMED, AND OTHER PARTIES AS OWNERS OF OTHER LANDS DESCRIBED IN SAID LEASE, WITH CERTAIN COVENANTS, CONDITIONS AND PROVISIONS, TOGETHER WITH EASEMENT, IF ANY AS SET FORTH SEPTEMBER 23, 1964 RECORDING NO. 3160 OFFICIAL RECORDS (NOT PLOTTED, NOT SURVEY RELATED).

3.– A COMMUNITY OIL AND GAS LEASE FOR THE TERM THEREIN PROVIDED, EXECUTED BY THE PARTIES HEREIN NAMED, AND OTHER PARTIES AS OWNERS OF OTHER LANDS DESCRIBED IN SAID LEASE, WITH CERTAIN COVENANTS, CONDITIONS AND PROVISIONS, TOGETHER WITH EASEMENT, IF ANY AS SET FORTH APRIL 7, 1966 RECORDING NO. 66–56320 OFFICIAL RECORDS (NOT PLOTTED, NOT SURVEY RELATED).

4.– INTENTIONALLY DELETED.

5.– INTENTIONALLY DELETED.

6.– INTENTIONALLY DELETED.

7.– INTENTIONALLY DELETED.

8.– INTENTIONALLY DELETED.

9.– INTENTIONALLY DELETED.

10.– ANY FACTS, RIGHTS, INTERESTS OR CLAIMS WHICH MAY EXIST OR ARISE BY REASON OF THE FOLLOWING FACTS DISCLOSED BY AN ALTA/NSPS SURVEY, DATED OCTOBER 24, 2017, LAST REVISED ON FEBRUARY 23, 2018, BY PASCAL K. MYRVOLD, PLS 7774, FOR DRC ENGINEERING, INC., AS PROJECT NO. 17–1008
L 1358 4 15 DISCLOSED IN THE SURVEYORS NOTES AS BUILDING ENCROACHES 0.5' INTO THE PROPERTY LOCATED NORTHWESTERLY AND 0.2 TO 0.3 ONTO THE PROPERTY, LOCATED SOUTHEASTERLY AND AS DEPICTED ON SAID SURVEY DRAWING (NOT PLOTTED, NOT SURVEY RELATED).

11.– INTENTIONALLY DELETED.

LEGAL DESCRIPTION
T. REPORT NCS-917096-ONT1

THE LAND REFERRED TO IN THIS POLICY IS DESCRIBED AS FOLLOWS:

REAL PROPERTY IN THE CITY OF BEVERLY HILLS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, DESCRIBED AS FOLLOWS:

LOTS 22, 23 AND 24 IN BLOCK 2 OF BEVERLY, IN THE CITY OF BEVERLY HILLS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AS PER MAP RECORDED IN BOOK 11 PAGE 94 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY.

EXCEPT THAT PORTION OF LOT 24 IN BLOCK 2 OF BEVERLY, IN THE CITY OF BEVERLY HILLS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AS SHOWN ON MAP RECORDED IN BOOK 11 PAGE 94 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY, DESCRIBED AS FOLLOWS:

BEGINNING AT THE MOST NORTHERLY CORNER OF SAID LOT 24; THENCE SOUTH 39° 39' 29" EAST ALONG THE NORTHEASTERLY LINE OF SAID LOT 24, A DISTANCE OF 112.64 FEET; THENCE SOUTH 50° 20' 31" WEST 5.00 FEET; THENCE NORTH 39° 39' 29" WEST 5.00 FEET; THENCE NORTHWESTERLY IN THE FIRST CURVE CONCAVE SOUTHWESTERLY AND HAVING A RADIUS OF 10.00 FEET, THROUGH A CENTRAL ANGLE OF 90° 00' 00", AN ARC DISTANCE OF 15.71 FEET; THENCE NORTHEASTERLY, ALONG SAID CURVE, ARC DISTANCE OF 15.71 FEET TO THE NORTHEASTERLY LINE OF SAID LOT 24; THENCE NORTH 39° 39' 29" WEST, ALONG SAID NORTHEASTERLY LINE, 15.47 FEET TO THE POINT OF BEGINNING AS PER DEED RECORDED OCTOBER 26, 1987 AS INSTRUMENT NO. 87–1724941 AND AS PER FINAL ORDER OF CONDEMNATION RECORDED JULY 21, 1999 AS INSTRUMENT NO. 19990831201 OFFICIAL RECORDS.

SCHEDULE B ITEMS

BASED UPON TITLE REPORT NO. NCS–917096–ONT1, DATED NOVEMBER 6, 2018 AS PREPARED BY FIRST AMERICAN TITLE INSURANCE COMPANY.

1.– GENERAL AND SPECIAL TAXES (NOT PLOTTED, NOT SURVEY RELATED).

2.– GENERAL AND SPECIAL TAXES (NOT PLOTTED, NOT SURVEY RELATED).

3.– THE LIEN OF SPECIAL TAX (NOT PLOTTED, NOT SURVEY RELATED).

4.– THE LIEN OF SUPPLEMENTAL TAXES (NOT PLOTTED, NOT SURVEY RELATED).

5.– THIS ITEM HAS BEEN INTENTIONALLY DELETED.

6.– AN EASEMENT FOR PUBLIC UTILITIES AND INCIDENTAL PURPOSE RECORDED JANUARY 26, 1979 AS INSTRUMENT NO. 79–118300 OF OFFICIAL RECORDS (NOT PLOTTED, NOT SURVEY RELATED).

7.– SURVEY PREPARED BY JNN CIVIL–ENGINEERS, DATED AUGUST 13, 2018, UNDER JOB NO. 17680, SHOWS THE FOLLOWING:
A) THE FACT THAT THE BUILDING LOCATED ON SAID LAND ENCROACHES ONTO THE EASEMENT IN FAVOR OF SOUTHERN CALIFORNIA EDISON COMPANY RECORDED JANUARY 26, 1979 AS INSTRUMENT NO. 79–118300 OF OFFICIAL RECORDS.
B) THE FACT THAT THE OVERHANGS OF THE BUILDING LOCATED ON SAID LAND ENCROACH ONTO THE EASEMENT AREA ALONG THE NORTHEASTERLY LINE AND THE SOUTHEASTERLY LINE OF THE RIGHTS OF WAY OF N. BEVERLY DRIVE AND S. SANTA MONICA BOULEVARD, WHICH DIMENSIONS ARE SHOWN AS A AND B ON THE ABOVE–REFERENCED SURVEY.

8.– RIGHTS OF THE PALEY CENTER FOR MEDIA AS A TENANT ONLY UNDER UNRECORDED LEASE DATED NOVEMBER 11, 1984, THE COMPANY INSURES AGAINST LOSS ARISING IN THE EVENT SAID LEASE CONTAINS ANY RIGHTS OF FIRST REFUSAL OR OPTIONS TO PURCHASE ALL OR ANY PORTION OF THE LAND (NOT PLOTTED, NOT SURVEY RELATED).

Dear Mr. Dickinson,

Feffer Geological Consulting is pleased to submit the following preliminary Geotechnical Investigation Report for the proposed development located in the City of Beverly Hills, California. This report is prepared to supplement the draft Environmental Impact Report (EIR) for this project.

Based on our investigation, it is our opinion that construction on the site is feasible from a geotechnical standpoint. A final design level geotechnical report shall be provided by the geologist of record once final plans for the proposed development are completed. We appreciate the opportunity to be of service. Should you have any questions regarding the information contained in this report, please do not hesitate to contact us.

Sincerely,

FEFFER GEOLOGICAL CONSULTING, INC.

1.0 INTRODUCTION

1.1 Purpose

As requested, Feffer Geological Consulting has completed a preliminary Geotechnical Investigation for proposed future development. The purpose of this investigation is to evaluate the geotechnical conditions at the site in the areas of the proposed construction and provide geotechnical parameters and preliminary recommendations for future design and development. This report is prepared as a technical appendix for the project's Environmental Impact Report.

Based on our investigation, it is our opinion that the future development is feasible from a geotechnical standpoint provided the recommendations contained herein are incorporated into the project plans and specifications. This report should be reviewed in detail prior to proceeding further with the development of the site. When final plans for the proposed construction become available, they should be reviewed by the project soils engineer and engineering geologist of record and a final design level geotechnical report should be prepared.

1.2 Scope of Services

The scope of work performed during this investigation involved the following;

- Research and review of available pertinent geotechnical literature and previous reports for the project site;

- Field Exploration & Testing
  - Subsurface exploration consisting of the drilling of two borings (B1, B2);
  - Installation of one percolation well (B2);
  - Sampling and logging of the subsurface soils;
  - Laboratory testing of selected soil samples collected from the subsurface exploration to determine the engineering properties of the underlying earth materials;
  - Engineering and geologic analysis of the field and laboratory data;

- Compliance with *CEQA Appendix G* and an assessment of:
  - Rupture of a known earthquake
  - Strong seismic ground shaking
  - Seismic-related ground failure
  - Landslides
  - Soil erosion or loss of topsoil
  - Unstable geologic unit or soils
  - Expansive soils
  - Support of septic tanks or alternative waste systems

- Preparation of this report presenting our findings, conclusions, and preliminary recommendations for the proposed construction.

1.3 Site Description

The project site consists of seven developed legal parcels located on the southeast side of "little," or South Santa Monica Boulevard at the intersections of Santa Monica Boulevard, North Rodeo Drive and North Beverly Drive (Figure 1, Figure 2). 456 and 468 N. Rodeo Drive are neighboring developments that consist of two, two-story commercial retail buildings located southwest of the alley bisecting the project site. 449 and 461 N. Beverly Drive are neighboring developments located northeast of the alley bisecting the project site. 449 N. Beverly Drive consists of two single-story commercial developments, and 461 N. Beverly Drive consists of one multi-story commercial/institutional development with one subterranean level of parking. The project site gently slopes towards the southeast with an approximately 4-foot change in elevation across the site (Figure 2).

1.4 Proposed Construction

The proposed project will consist of demolishing the existing structures on each property and constructing a nine-story hotel with commercial/retail space over three subterranean parking levels. The existing alley will be redirected to exit onto N. Beverly Drive to combine the area of all seven parcels.

Final development plans including structure heights, specific building footprints, and subterranean depths are still within the planning phase and will be updated upon final project design. All recommendations within are based on estimated projects heights and subterranean depths. All findings and recommendations within this report are adequate to support the analysis of the project's potential geotechnical impacts.

1.5 Document Review

The following site-specific seismic investigation reports were completed by this firm for each of the developed lots. A summary of findings is included below.

456 N. Rodeo Drive
Feffer Geological Consulting, Investigation of Potential Faulting, dated December 18, 2018

Roy J. Shlemon & Associates, Inc., Recommendation for Acceptance, dated December 20, 2018

City of Beverly Hills, Acceptance of City's Peer Reviewed Recommendation for Acceptance, dated February 14, 2019

A Seismic Investigation Report was prepared for 456 N. Rodeo Drive, dated December 18th, 2018 (FGC, 2018). The subsurface investigation utilized the data from the same continuous borings and Cone Penetration Tests (CPT's) conducted for the projects located at 468 N. Rodeo Drive and 461 N. Beverly Drive. The investigation concluded that no faults traverse the subject property and that the underlying sediment exhibited multiple continuous stratigraphic horizons across the entire boring and CPT transect. The seismic investigation report was reviewed by Roy J. Shlemon and Associates and recommended for approval on December 20th, 2018. The City of Beverly Hills issued a formal approval for the referenced site on February 14th, 2018.

468 N. Rodeo Drive
Feffer Geological Consulting, Investigation of Potential Faulting, dated August 20, 2018

Roy J. Shlemon & Associates, Inc., Recommendation for Acceptance, dated August 29, 2018

City of Beverly Hills, Acceptance of City's Peer Reviewed Recommendation for Acceptance, dated August 29, 2018

A Seismic Investigation Report was prepared for 468 N. Rodeo Drive, dated August 20, 2018 (FGC, 2018a). The subsurface investigation consisted of a transect of 4 continuously cored borings and 11 CPT's explored to a depth of fifty feet below the ground surface. The investigation concluded that no faults traverse the subject property and that the underlying sediment exhibits multiple continuous stratigraphic horizons across the entire boring and CPT transect. The seismic investigation report was reviewed by Roy J. Shlemon and Associates and recommended for approval on August 29th, 2018. The City of Beverly Hills issued a formal approval for the referenced site on August 29th, 2018.

449 N. Beverly Drive
Feffer Geological Consulting, Investigation of Potential Faulting, dated January 16, 2020

Roy J. Shlemon & Associates, Inc., Recommendation for Acceptance, dated January 21, 2020

City of Beverly Hills, Acceptance of City's Peer Reviewed Recommendation for Acceptance, dated January 27, 2018

A Seismic Investigation Report was prepared for 449 N. Rodeo Drive, dated January 16, 2020 (FGC, 2020). The subsurface investigation consisted of drilling 1 continuously cored boring within the alley between 449 N. Beverly Drive and 439 N. Beverly Drive. The investigation also incorporated work conducted at 456 and 468 N. Rodeo Drive and 461 N. Beverly Drive. The investigation concluded that no faults traverse the subject property and that the underlying sediment exhibited multiple continuous stratigraphic horizons across the entire boring and CPT transect. The seismic investigation report was reviewed by Roy J. Shlemon and Associates and recommended for approval on January 21st, 2020. The City of Beverly Hills issued a formal approval for the referenced site on January 27th, 2020.

461 N. Beverly Drive
Feffer Geological Consulting, Investigation of Potential Faulting, dated September 20, 2018

Roy J. Shlemon & Associates, Inc., Recommendation for Acceptance, dated October 2, 2018

City of Beverly Hills, Acceptance of City's Peer Reviewed Recommendation for Acceptance, dated October 8, 2018

A Seismic Investigation Report was prepared for 461 N. Beverly Drive, dated September 20, 2018 (FGC, 2018b). The subsurface investigations consisted of a transect of 5 continuously cored borings drilled to a maximum depth of 50 feet below the ground surface, used in combination with the data gathered from the 468 N. Rodeo Drive report (above). The

investigation concluded that no faults traverse the subject property and that the underlying sediment across the site exhibits multiple continuous stratigraphic horizons across the entire boring transect. The seismic investigation report was reviewed by Roy J. Shlemon and Associates and recommended for acceptance on October 2nd, 2018. The City of Beverly Hills issued a formal approval for the referenced site on October 8th, 2018.

2.0 INVESTIGATION

2.1 General

Our field investigation was performed on July 16th and 17th, 2019 and consisted of a review of site conditions and subsurface exploration involving the drilling of two borings and soil sampling. Our investigation also includes laboratory testing of selected soil samples. Additionally, this report utilizes subsurface data from the recent site-specific seismic investigations completed by this firm at each site.

2.2 Field Exploration

The subsurface investigation performed at the site consisted of drilling two borings by use of a truck-mounted hollow-stem auger drill rig to a maximum depth of 100 feet below the existing ground surface.

The purpose of the exploratory borings was to determine the existing subsurface conditions and to collect subsurface samples in the areas of the proposed construction and throughout the site. Earth materials encountered in the borings consisted of artificial fill over alluvium.

A review of Regional Geologic Maps (Figure 3) indicate that the site is underlain by alluvium of Quaternary age (Holocene to Pleistocene) (Dibblee and Ehrenspeck, 1991).

The borings were logged by our field geologist using both visual and tactile means. Both bulk and relatively undisturbed soil samples were obtained for testing. The approximate locations of the borings are shown on the attached site map (Figure 4). Detailed boring logs are presented in Appendix A.

2.3 Laboratory Testing

Laboratory testing was performed on representative samples obtained during our field exploration. Samples were tested for the purpose of estimating material properties for use in subsequent engineering evaluations. Testing included in-place moisture and density, hydro-response-swell/collapse, consolidation, maximum density, shear strength, and chemical testing. A summary of the laboratory test results is included in Appendix B.

The physical properties of the soils were tested by Soil Labworks, LLC. Chemical testing was performed by HDR Schiff. The undersigned geologist and engineer have reviewed the data, concur, and accept responsibility and use of the data therein.

3.0 SITE GEOLOGY, SEISMICITY, POTENTIAL HAZARDS

3.1 Site Geology

Regionally, the project site is located within the northern portion of the Los Angeles Basin near the boundary between the Transverse and the Peninsular Ranges Geomorphic Provinces. This area of Beverly Hills is bound by the Santa Monica Mountains to the north, West Hollywood to the east, the Holmby Hills to the west, and the Cheviot Hills to the south.

Locally, the site is underlain by dissected and eroded Holocene to Pleistocene age alluvium and terrestrial fan deposits (Hoots and Kew, 1931, Dibblee and Ehrenspeck, 1991, Campbell et. al., 2014).

All recent subsurface explorations by Feffer Geological Consulting (2018, 2018a, 2018b, 2020) have verified regional geologic mapping and lithology. The subsurface explorations indicate that the property is underlain by a veneer of fill overlying Holocene to Pleistocene age alluvium (Qal and Qoa) (Appendix A, Figures 5 and 6). Descriptions of the materials encountered in the exploratory borings are described below.

3.1.1 Artificial Fill (Af)

Artificial fill was encountered in all borings within the upper six to nine feet below the existing ground surface. The fill consists of silty sand that is brown in color, medium dense, and contains scattered brick, asphalt, and concrete fragments. The fill is not considered suitable for the support of new foundations.

3.1.2 Holocene Alluvium (Qal)

Holocene age alluvium was encountered as deep as twenty-nine feet and consists of silty sand to silty sand with clay, and sandy clay to clayey sand that is brown in color. The alluvium is generally massive and contains fine to medium grained sub-rounded gravels with weathered fragments of slate.

3.1.3 Pleistocene Older Alluvium (Qoa)

Pleistocene age alluvium was encountered below the Holocene alluvium beginning at approximately twenty-five to twenty-nine feet. The Pleistocene age alluvium consists of gravelly clayey sand to sandy clay and sand with gravel that is brown to olive grayish brown in color. The alluvium is generally massive to interbedded and contains highly weathered fine to medium grained slate and sandstone gravels.

3.1.5 Groundwater

Groundwater was encountered at a depth of 50 feet in boring B1. A percolation well was installed in boring B2 to a depth of 40 feet for the purpose of future percolation testing.

Historically highest groundwater in this area of Beverly Hills is estimated to be 40 feet below the ground surface (Department of Conservation, 1998).

3.2 Seismicity

A risk common to all areas of Southern California that should not be overlooked is the potential for damage resulting from seismic events (earthquakes). The project site is located within a seismically active area, as is all Southern California.

The State of California enacted the Alquist-Priolo Special Studies Act of 1972 immediately following the destructive 1971 San Fernando earthquake (Department of Conservation, 2019a). The Alquist-Priolo Act is intended to prohibit the location of most structures for human occupancy across a known active fault that intersects the ground surface, thereby mitigating fault-rupture hazard. The Alquist-Priolo Act requires that the State Geologist delineate "Special Studies Zones" along active surficial faults. Development within these “Special Studies Zones” must include geologic investigation demonstrating the absence of a surface rupture threat. “Special Studies Zones” have been renamed and are now referred to as Alquist-Priolo Earthquake Fault Zones (APEFZ). The closest known and mapped faults to the project site are the Santa-Monica, Hollywood, and the Newport-Inglewood Faults. The project site is currently mapped as outside of an existing APEFZ.

According to updated mapping by the State of California and the City of Beverly Hills, the project site is located approximately 80 feet northwest of the Alquist-Priolo Earthquake Fault Zone for the Santa Monica Fault (Olson, 2018; CGS, 2018). The project site was previously investigated by Feffer Geological Consulting (FGC) (2018, 2018a, 2018b, 2020) for the presence of active faulting and each site was found to be underlain by continuous, unbroken stratigraphy and clear of Holocene-active faults. All fault investigation reports were reviewed and approved by Roy J. Shlemon and Associates and the City of Beverly Hills. Based on the accepted and approved reports provided by FGC (2018, 2018a, 2018b, 2020) the project site is not significantly impacted by active faulting or hazards associated with fault rupture along the Santa Monica Fault.

3.2.1 Seismic Hazards

The California State Legislature passed the Seismic Hazards Mapping Act of 1990 and was signed into law and became effective in 1991 (Department of Conservation, 2019b). The Seismic Hazards Mapping Act was prompted following the 1989 Loma Prieta earthquake, and is intended to reduce the threat to protect public safety and minimize the loss of life and property from the effects of strong ground shaking, liquefaction, landslides, and other earthquake-related hazards (Department of Conservation, 2019b). The Seismic Hazards Mapping Act requires that the State Geologist delineate the various "Seismic Hazards Zones." The maps depicting Seismic Hazard Zones are released by the California Geological Survey (CGS). Not all of Southern California has been mapped. Periodically, new maps are issued and existing maps are updated.

The Seismic Hazards Mapping Act requires a site investigation by a certified engineering geologist and/or civil engineer prior to development of a project sited within a hazard zone. The investigation is to include recommendations for a "minimum level of mitigation" that should

reduce the risk of ground failure during an earthquake to a level that does not cause the collapse of buildings for human occupancy. The Seismic Hazards Mapping Act does not require mitigation to a level of no ground failure and/or no structural damage.

Seismic Hazard Zones are based on correlation of a combination of factors, including: surface distribution of soil deposits and bedrock, slope steepness, depth to groundwater, bedding orientation with respect to slopes, bedrock shear strength, and occurrence of past seismic failure. Maps within the series are further designated as Reconnaissance, Preliminary, or Official. Official Seismic Hazard Zones Maps are the culmination of mapping, analysis, review and comment of the CGS, other State agencies, and the public following review and revision of the Preliminary Review Map. The Official Maps are the most rigorous and have the highest confidence level.

The CGS released an official map titled "Earthquake Zones of Required Investigation Beverly Hills Quadrangle," updated on January 11, 2018. The map delineates areas that have been subject to or are potentially subject to earthquake induced faulting, liquefaction, and landsliding.

3.2.2 Seismic Ground Shaking

The project site is located within an active tectonic area with several significant faults capable of producing strong earthquakes (Figure 7). The closest known active fault strand is the east-west trending Santa Monica fault, located approximately 600 feet southeast of the site. Other important regional faults include the Hollywood fault, located approximately one mile northeast of the site, and the Newport-Inglewood fault, located approximately two miles to the southeast of the site. The Los Angeles Basin contains several active faults that could potentially affect the project site area. These faults are discussed further below.

Santa Monica Fault

The Santa Monica fault trends east-west from the Santa Monica coastline on the west to the Hollywood area on the east (Figure 7). It is an oblique-reverse, left-lateral fault that is thought to be a surface expression of tectonic deformation related to Pliocene-Quaternary structural development of the Santa Monica Mountains. Integration of subsurface oil and gas exploration seismic data and well logs, with surficial mapping, indicate the mountains are underlain by a large southward-vergent asymmetric anticline formed over a regional north-dipping thrust ramp at a depth of 6 to 9 miles. Geophysical studies conducted at the Veteran's Administration (VA) property in West Los Angeles indicate the Santa Monica fault is a gently dipping thrust fault with secondary near-vertical faults extending from the primary basal fault toward the ground surface (Pratt et al., 1998; Dolan et al., 2000).

Hollywood Fault

The Hollywood fault consists of multiple left-lateral reverse faults which are a part of the Transverse Ranges Southern Boundary Fault System (Dolan et al. 1997) (Figure 7). Although many geomorphic features of the Hollywood fault have been obliterated or modified by urban development, the Hollywood fault is expressed along the base of the Santa Monica Mountains by scarp-like features and a steep alluvial front. Dolan et al. (1997) map the Hollywood fault as

extending 8½ miles west from the eastern end of the Santa Monica Mountains to a northwest-trending feature referred to as the west Beverly Hills Lineament which is located west of the Benedict Canyon Fan (Dolan, 2000). This lineament may represent an east-dipping normal fault at a left step between the Hollywood and Santa Monica faults or a strike-slip extension of the Newport-Inglewood fault (Dolan et al. 2000). Dibblee (1991) maps the Hollywood fault as extending farther to the west, to the 405 Freeway yielding a fault length of 11 miles.

Newport-Inglewood Fault

The Newport-Inglewood Fault is a northwest-trending strike-slip fault that consists of several discontinuous fault strands (Figure 7). The Newport-Inglewood fault is characterized by left-stepping en-echelon right-lateral faults and associated anticlinal folds and uplifted areas. The series of uplifted hills along the Newport-Inglewood fault include the Cheviot Hills, Baldwin Hills, Rosecrans Hills, Dominguez Hills, Signal Hill, and Reservoir Hill (Barrows, 1974). The onshore portion of the Newport-Inglewood fault strikes predominantly N30°W to N40°W and extends approximately 65 km from Beverly Hills southeast to Newport Beach. Individual fault strands within the Newport-Inglewood fault zone range in strike from N12°W to N62°W (Barrows, 1974). From Newport Beach, the Newport-Inglewood fault zone extends offshore paralleling the California coast to the southeast where it eventually comes back onshore again in San Diego as the Rose Canyon fault zone. A Holocene slip rate of 1.5 mm/yr was established for the Rose Canyon fault zone (Lindvall, Rockwell, and Hudnut, 1995). The slip rate of the Newport-Inglewood fault in the Los Angeles basin is not as well-constrained but is estimated to be about 0.5 – 1.5 mm/yr (Petersen et. al., 1996).

3.2.3 Liquefaction

Liquefaction is a process which occurs when saturated sediments are subjected to repeated strain reversals during a seismic event. The strain reversals cause an increase in pore water pressure such that the internal pore pressure approaches the overburden pressure and the shear strength approaches a low residual value. Liquefied soils are subject to flow, consolidation, or excessive strain. Liquefaction typically occurs in loose to medium dense sand and silty sandy soils below the groundwater table. Predominately fine-grained soils, such as silts, and clays, are less susceptible to liquefaction. According to mapping by the CGS, the site is not included within a zone of potentially liquefiable soil (CGS, 2018). Liquefaction is not considered a significant hazard at the site due to the consolidated nature of the underlying geology and planned depth of construction.

3.2.4 Lateral Spreading Hazard

Saturated soils that have experienced liquefaction may be subject to lateral spreading where located adjacent to free-faces, such as slopes, channels, and rivers. The site is remote to free-faces and the lateral spreading hazard at the site is insignificant.

3.2.5 Landsliding

According to mapping by the CGS (2018), the project site is not located within an area subject to potential seismic-induced slope instability. Since the site is not located within a mapped landslide

zone, and no slopes exist on or within the immediate site vicinity, seismic induced lansliding is not a significant hazard to the future development.

3.2.6 Secondary Ground Effects

The site is not located within an area mapped by the CGS (2018) as being potentially affected by seismic-induced liquefaction or landsliding. Due to the project site's distance from the coastline and other large bodies of water, the site will not be affected by tsunamis or seiches. Since the site has been found to be free from Holocene active faulting (FGC, 2018; 2018a; 2018b, 2020), hazards from secondary ground effects are not considered to significantly impact future development. However, considerable ground shaking may result if rupture occurs along a nearby fault.

3.3 2019 California Building Code Considerations

The proposed development may be designed in accordance with seismic considerations contained in the 2019 California Building Code. The following parameters may be considered for design (ATC, 2020):

Mapped Spectral Response Acceleration Parameters:

	S_S	:	2.115g
	S_1	:	0.756g
Site Class:	D	:	Stiff Soil
Site Coefficients:	F_a	:	1.0
	F_v	:	1.7

Maximum Considered Earthquake Spectral Response Acceleration Parameters:

	SMS	:	2.115g
	S_{M1}	:	3.595g

Design Spectral Response Acceleration Parameters:

S_{DS}	:	1.41g
S_{D1}	:	2.397g
PGA_M	:	0.999g

4.0 GEOTECHNICAL CONSIDERATIONS

4.1 Subsurface Soil Conditions

Subsurface materials at the project site consist of a thin layer of fill over alluvium. Based on laboratory testing at depths ranging from ten to one hundred feet, the alluvium at the project site is competent and capable of supporting engineered structures and appurtenances. The following sections provide a general discussion about settlement and expansive soil activity.

4.2 Settlement

Settlement, or consolidation, occurs over time as a response to changes in pressure and soils stress. Our investigation indicates that the consolidation and hydrocollapse potential of the alluvium is moderately low. The in-situ dry densities are high for the samples taken at the foundation level and it is our experience that these soils have a moderately low potential for consolidation.

4.3 Expansive Soil

Typically, soils that contain a high clay content are susceptible to expansion/contraction. Clay minerals are capable of absorbing water, which causes an increase in volume and leads to expansion. The opposite effect occurs when clay rich soils dry out, thus decreasing in volume and contracting. The on-site soil was found to possess low to medium expansive characteristics based upon field soil classifications. Based on the recommended foundation systems and the underlying soil properties, expansion/contraction is unlikely to affect the proposed development.

4.4 Soil Erosion & Loss of Topsoil

Existing structures and flatwork (i.e. pavement, concrete, brickwork) currently cover the majority of the project sites surfaces. No naturally occurring developed topsoil is exposed, and therefore is not at risk of substantially eroding due to proposed future development.

4.5 Slope Stability

The project site is not located within an area subject to potential seismic-induced slope instability. The property has less than ten feet of overall elevation change from north to south. A slope stability analysis is not required for the property due to the lack of slopes on the project site.

5.0 CONCLUSIONS AND RECOMMENDATIONS

5.1 Basis

Conclusions and recommendations contained in this report are based upon information provided, information gathered, laboratory testing, engineering, and geologic evaluations, experience, and judgment. Recommendations contained herein are consistent with industry practice.

5.2 Site Suitability

Geotechnical exploration, analyses, experience, and judgment result in the conclusion that the proposed development is suitable from a geotechnical standpoint.

It is our opinion that the project site can be developed without hazard of landslide, slippage, or settlement, and improvement can occur without similar adverse impact on adjoining properties. Safe project development will require strict adherence to good construction practices, agency and code requirements, and the recommendations in this report.

It should be realized that the purpose of the seismic design utilizing the above parameters is to safeguard against major structural failures and loss of life, but not to prevent damage altogether. Even if the structural engineer provides designs in accordance with the applicable codes for seismic design, the possibility of damage cannot be ruled out if moderate to strong shaking occurs as a result of a large earthquake. This is the case for essentially all structures in Southern California.

5.3 EARTHWORK

5.3.1 General

Grading should be done in accordance with good construction practice, minimum code requirements, and recommendations to follow. Grading criteria are included within Appendix D.

5.3.2 Site Preparation and Grading

Based on our understanding of the proposed development, laboratory testing, and experience, we recommend that new foundations for the proposed development be founded in the underlying alluvium (Qal and Qoa).

Prior to the start of grading operations, utility lines within the project area, if any, should be located and marked in the field so they can be rerouted or protected during site development. All debris and perishable material should be removed from the project site. Although currently not anticipated, all permanent cut and fill slopes should not be constructed steeper than 2:1.

If fill is to be placed, the upper six to eight inches of surface exposed by the excavation should be scarified; moisture conditioned to two to four percent over optimum moisture content and compacted to 90 percent relative compaction[1]. If localized areas of relatively loose soils prevent proper compaction, over-excavation and re-compaction will be necessary.

[1] Relative compaction refers to the ratio of the in-place dry density of soil to the maximum dry density of the same material as obtained by the "modified proctor" (ASTM D1557-14) test procedure.

5.3.3 Excavation Characteristics

Due to the proposed depth of construction, and based on the recommendations herein, deep excavation will be required to complete the development. The borings encountered competent earth material at the depth of construction and below. Caving of material may occur where loose sands and gravels are encountered during excavation. No hard earth materials are anticipated during excavations. Based on the underlying geology, excavation can be completed using standard methods and best practices.

5.4 FOUNDATION SUPPORT

5.4.1 Mat Foundation

A mat foundation will be appropriate for the project. Although structural capacities for the proposed structure are not yet available, the existing alluvium is capable of supporting the proposed structures. For preliminary design, vertical capacity, the mat may be assumed to have an allowable uniform bearing capacity of 5,000 to 10,000 psf. The bearing value shown above is for the total of dead and frequently applied live loads and may be increased by one third for short duration loading, which includes the effects of wind or seismic forces.

For computing deflection, a subgrade modulus of 125 to 300 kips/ft^3 may be assumed. Since the potential for consolation and hydro-collapse is low, the mat foundation is not expected to experience differential settlement, and a rise in the groundwater table will not reduce the bearing capacity of the soils supporting the mat.

5.4.2 Pile Foundation

Support of the mat foundation may be assisted by piles. Piles that range from 24 to 36 inches in diameter are typical. Piles can be preliminarily designed for a skin friction of 400 to 800 psf.

5.4.3 Infiltration/SUSMP/LID

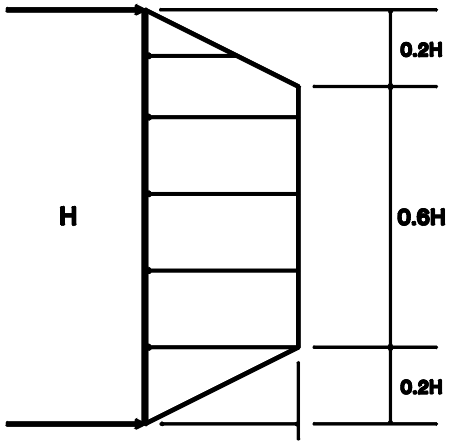
The proposed buildings will extend into the underlying alluvium to an approximate depth of 40 feet below the existing ground surface. Future testing to determine the rates of permeability should be performed for design of an infiltration system. An alternative to infiltration may be designed for the project site in order to comply with SUSMP/LID requirements.

5.4.4 Wastewater Disposal

The proposed development will not require the use of septic tanks or alternative wastewater disposal systems. Since sewers will be used for the disposal of wastewater, there will be no impact to the underlying supporting materials from the disposal of wastewater.

5.4.5 Groundwater and Associated Design

Groundwater was encountered at a depth of 50 feet in boring B1. A percolation well was installed in boring B2 to a depth of 40 feet for the purpose of future percolation testing. Historically highest groundwater in this area of Beverly Hills is estimated to be 40 feet below the ground surface (Department of Conservation, 1998). Wet conditions and actual groundwater may be encountered due to seasonal fluctuations. If groundwater is encountered, dewatering may be required and should be designed by a dewatering contractor and engineer.



5.5 RETAINING WALLS

5.5.1 Retaining Wall Design

Permanent retaining walls up to 40 feet high that support fill, alluvium, and approved retaining wall backfill, will be designed as a restrained/braced system. For preliminary design, the at-rest earth pressure on walls is 53 pcf in alluvium.

Restrained/braced retaining walls that are pinned at the top by a non-yielding floor should be for the trapezoidal pressure distribution shown on the adjacent figure of 33 H. The uniform trapezoidal pressure may be assumed over the central six tenths of the wall height. The pressure may be decreased to zero at the top and bottom of the wall.

TRAPEZOIDAL DISTRIBUTION OF PRESSURE

33 H

Retaining walls should be provided with a subdrain or weepholes covered with a minimum of 12 inches of ¾ inch crushed gravel.

Retaining walls higher than six feet need to consider a seismic surcharge from the Design Earthquake. The seismic surcharge should be calculated using a factor of safety of 1.0 with the PGA corresponding to ½ of 2/3rds of the PGA_M. The PGA_M is 0.999g and therefore the corresponding seismic design value is 0.333g. A seismic surcharge for retaining walls in alluvium designed for active conditions is considered below:

For a 40-foot-high retaining wall, the static design force is equal to 42.4 kips (40ft^2 *53 pcf /2). For a ground motion of 0.333g and a FS of 1.0, the enclosed calculations indicates that an unbalanced force under seismic conditions from the Maximum Considered Earthquake is 39.4 kips for a 40-foot-high wall. Since the static design force is more than the seismic force an additional seismic surcharge is not needed.

5.5.2 Waterproofing

Moisture affecting retaining walls is one of the most common post-construction complaints. Poorly applied or omitted waterproofing can lead to effflorescence or standing water inside the building. Effflorescence is a process in which a powdery substance is produced on the surface of the concrete by the evaporation of water. The white powder usually consists of soluble salts such as gypsum, calcite, and/or halite (common salt). Effflorescence is common to retaining walls and generally does not affect their strength or integrity.

It is recommended that retaining walls be waterproofed. Waterproofing design and inspection of its installation is not the responsibility of the geotechnical engineer. A qualified waterproofing consultant should be retained in order to recommend a product or method, which would provide protection to below grade walls.

5.6 Temporary Excavations

All vertical cuts shall be inspected to verify geologic continuity. Un-shored vertical cuts to a height of five (5') may be made in earth materials at the site. Un-shored cuts in excess of five feet (5') shall be sloped at a gradient of no steeper than 1:1 (horizontal to vertical) for the portion of the excavation above the vertical cut.

A representative of the geotechnical engineer or geologist should be present during grading to see temporary slopes. All excavations, including caissons, footings, and utility trenches, shall be properly and adequately fenced and/or covered to ensure the safety of all those working on the project. All temporary excavations shall be stabilized as soon as possible after the initial excavation.

Shoring for the project should be preliminarily designed to retain an equivalent fluid pressure of 30 PCF for excavations up to 40 feet in height. For braced restrained conditions, shoring can be designed for a trapezoidal pressure distribution of 20 H as shown on the figure in section 5.5.1. The uniform trapezoidal pressure may be assumed over the central six tenths of the wall height. The pressure may be decreased to zero at the top and bottom of the wall.

Excavation and shoring plans for temporary shore walls shall be developed during final Project design by the project shoring engineer/designer. The locations of tiebacks for, and amount of deflection permitted by excavation shoring elements should be carefully designed such that acceptable deflection at the top of the shoring adjacent to streets, property lines, and historic building foundations is maintained. If less deflection at the top of shoring is necessary, the values for lateral earth pressures on shoring may be increased. All permanent surcharge loading conditions will be evaluated by the Geotechnical Engineer during final Project design. Lateral

earth pressure, tied-back or braced shoring, soldier piles, and tie-back anchors among other practices should be used to resist lateral loads and to ensure no lateral issues with nearby structures. The shoring design should be provided by a California Registered Civil Engineer experienced in the design and construction of shoring under similar conditions. Once final excavation and shoring plans are complete, the plans and the design should be reviewed by the project soils engineer for conformance with the design intent and recommendations and submitted to the City of Beverly Hills for review and approval.

5.6.1 Shoring

Shoring may consist of cast-in-place concrete piles with wood-lagging. Shoring piles should be a minimum of 18 inches in diameter and a minimum of 8 feet into alluvium below the base of the excavation. Piles may be assumed fixed 3 feet below the base of the excavation. For the vertical forces, piles may be designed for a skin friction of 400 to 600 pounds per square foot for that portion of pile in contact with the alluvium. Shoring piles should be spaced a maximum of 10 feet on center.

The friction value is for the total of dead and frequently applied live loads and may be increased by one third for short duration loading, which includes the effects of wind or seismic forces. Resistance to lateral loading may be provided by passive earth pressure within the alluvium below the base of the excavation.

Passive earth pressure may be computed as an equivalent fluid having a density of 400 pounds per cubic foot. The maximum allowable earth pressure is 4,000 to 6,000 pounds per square foot. For design of isolated piles, the allowable passive and maximum earth pressures may be increased by 100 percent. Piles spaced more than 2½ pile diameters on center may be considered isolated.

Rakers or other forms of internal bracing designed by the structural engineer may be used to support the shoring system where tieback anchors cannot be used.

5.6.2 Earth Anchors

Where applicable tie-back anchors may be used to resist lateral loads. Pressure grouted friction anchors are recommended. For design purposes, it is assumed that the active wedge adjacent to the shoring is defined by a plane drawn at 30 degrees with the vertical through the bottom of the excavation. Friction anchors should extend at least 15 feet beyond the potential active wedge or to a greater length if necessary to develop the desired capacities.

The capacities of the anchors should be determined by testing of the initial anchors as outlined in a following section. For preliminary design purposes, it is estimated that cast-in-place gravity anchors will develop an average value of 300 pounds per square foot. Pressure grouted and post grouted anchors will develop much higher capacities. For preliminary design purposes, it is estimated that pressure grouted anchors will develop an average value of 2,500 pounds per square foot. Only the frictional resistance developed beyond the active wedge would be effective in resisting lateral loads. If the anchors are spaced at least six feet on center, no reduction in the capacity of the anchors need be considered due to group action.

The anchors may be installed at angles of 20 to 40 degrees below the horizontal. Caving and sloughing of the anchor hole should be anticipated and provisions made to minimize such caving and sloughing. To minimize chances of caving and sloughing that portion of the anchor shaft within the active wedge should be backfilled with sand before testing the anchor. This portion of the shaft should be filled tightly and flush with the face of the excavation. The sand backfill should be placed by pumping; the sand may contain a small amount of cement to facilitate pumping.

At least 10 percent of the initial anchors for a 24-hour 200 percent test and 10 percent additional anchors for quick 200 percent tests. The specific anchors selected for the 200 percent test should be representative and acceptable to the geotechnical engineer. The purpose of the 200 percent tests is to verify the friction value assumed in design. The anchors should be tested to develop twice the assumed friction value. Anchor rods of sufficient strength should be installed in these anchors to support the 200 percent test loading. Where satisfactory tests are not achieved on the initial anchors, the anchor diameter, and/or length should be increased until satisfactory test results are obtained. The total deflection during the 24-hour 200 percent test should not exceed 12 inches. During the 24-hour test, the anchor deflection should not exceed 0.75 inch measured after the 200 percent test load is applied. If the anchor movement after the 200 percent load has been applied for 12 hours is less than 0.5 inch, and the movement over the previous four hours has been less than 0.1 inch, the 24-hour test may be terminated.

For the quick 200 percent tests, the 200 percent test load should be maintained for 30 minutes. The total deflection of the anchor during the 200 percent quick tests should not exceed 12 inches; the deflection after the 200 percent test load has been applied should not exceed 0.25 inch during the 30-minute period.

All of the anchors should be pretested to at least 150 percent of the design load; the total deflection during the test should not exceed 12 inches. The rate of creep under the 150 percent test should not exceed 0.1 inch over a 15-minute period for the anchor to be approved for the design loading.

After a satisfactory test, each anchor should be locked-off at the design load. The locked-off load should be verified by rechecking the load in the anchor. If the locked-off load varies by more than 10 percent from the design load, the load should be reset until the anchor is locked-off within 10 percent of the design load.

The installation of the anchors and the testing of the completed anchors should be observed by a deputy grading inspector under the direction of the geotechnical engineer.

5.6.3 Lagging

Lagging will be required between piles. Due to arching in the soils, the pressure on the lagging will be less that on the shoring piles. It is recommended that the lagging be designed for the full design pressure but be limited to a maximum of 400 pounds per square foot. The void between the lagging and the back-cut should be slurry-filled and observed by a representative of the geotechnical engineer.

A representative of the geotechnical engineer or geologist should be present during grading to see temporary slopes. All excavations, including: caissons, footings, and utility trenches, shall

be properly and adequately fenced and/or covered to ensure the safety of all those working on the project.

All temporary excavations shall be stabilized as soon as possible after the initial excavation.

5.6.4 Deflection

It is difficult to accurately predict the amount of deflection of a shored embankment. It should be realized that some deflection will occur. The project structural engineer should design the shoring systems such that deflection is restricted to acceptable limits the top of the shored embankment.

5.6.5 Monitoring

Because of the depth of the excavation, some means of monitoring the performance of the shoring system is suggested.

A California Registered Professional Engineer or California Professional Land Surveyor shall prepare an Adjacent Structures Construction Monitoring Plan, subject to review and approval by the City of Beverly Hills Building and Safety Department prior to the initiation of any excavation, grading, or shoring activities. The Adjacent Structures Construction Monitoring Plan shall establish survey monuments and document and record the positions of adjacent structures, sidewalks, buildings, utilities, facades, surfaces feature, etc. to form a baseline for determining settlement or deformation. Upon installation of soldier piles, survey monuments shall be affixed to the tops of representative piles so that deflection can be measured. The shored excavation and adjacent structures, sidewalks, buildings, utilities, facades, cracks, etc. should be visually inspected at a minimum of one time per month. Survey Monuments should be measured at critical stages of excavation, shoring, dewatering, and construction but should not occur less frequently than once every thirty days.

Monitoring reports shall be prepared by the California Professional Land Surveyor documenting the movement monitoring results and distributed to all appropriate parties, including the shoring engineer. Appropriate parties shall be notified if movement exceeds predetermined thresholds and calculated amounts.

In the unlikely event that settlement due to excavation or construction activities cause damage requiring repairs to any adjacent historic buildings, that work shall be performed in consultation with a qualified preservation consultant and in accordance with the California Historical Building Code and the Secretary of Interior's standards, as appropriate.

5.7 Exterior Flatwork and Auxiliary Structures

Whenever planned, exterior flatwork should be placed directly on alluvium or over a two-foot blanket of approved compacted fill. Five-inch net sections with #4 bars at 18 inches o.c.e.w. are also advised. Control joints should be planned at not more than twelve foot spacing for larger concrete areas. Narrower areas of flatwork such as walkways should have control joints planned at

not greater than 1.5 times the width of the walkway. Recommendations provided above for interior slabs can also be used for exterior flatwork, but without a sand layer or Visqueen moisture barrier. Additionally, it is also recommended that at least 12-inch deepened footings be constructed along the edges of larger concrete areas.

Movement of slabs adjacent to structures can be mitigated by doweling slabs to perimeter footings. Doweling should consist of No. 4 bars bent around exterior footing reinforcement. Dowels should be extended at least two feet into planned exterior slabs. Doweling should be spaced consistent with the reinforcement schedule for the slab. With doweling, 3/8-inch minimum thickness expansion joint material should be provided. Where expansion joint material is provided, it should be held down about 3/8 inch below the surface. The expansion joints should be finished with a color matched, flowing, flexible sealer (e.g., pool deck compound) sanded to add mortar-like texture. As an option to doweling, an architectural separation could be provided between the main structures and abutting appurtenant improvements.

Auxiliary structures such as trash enclosures and garden walls can be placed directly on alluvium or on a two-foot blanket of compacted fill.

5.8 Drainage

Drainage should be directed away from structures via non-erodible conduits to suitable disposal areas. Two percent drainage is recommended directly away from structures. Building Code and Civil Engineer requirements and recommendations take precedence. All enclosed planters should be provided with a suitably located drain or drains and/or flooding protection in the form of weep holes or similar. Preferably, structures should have roof gutters and downspouts tied directly to the area drainage system.

5.9 Plan Review

When detailed grading and structural plans are developed, they should be reviewed by the project geotechnical consultant.

5.10 Agency Review

All soil, geologic, and structural aspects of the proposed development are subject to the review and approval of the governing agency(s).

5.11 Supplemental Consulting

During construction, a number of reviews by the project geotechnical consultant are recommended to verify site geotechnical conditions and conformance with the intentions of the recommendations for construction. The following site reviews are advised, some of which are required by the governing agencies.

Preconstruction/pregrading meeting ..... Advised
Cut and/or shoring observation ..... Required

Periodic geotechnical observations and testing during grading.....Required
Reinforcement for all foundations ..... Advised
Slab subgrade moisture barrier membrane ..... Advised
Slab subgrade rock placement ..... Advised
Presaturation checks for all slabs in primary structure areas.....Required
Presaturation checks for all slabs for appurtenant structures..... Advised
Slab steel placement, primary and appurtenant structures..... Advised
Compaction of utility trench backfill..... Advised

5.12 Project Safety

The contractor is the party responsible for providing a safe site. This consultant will not direct the contractor's operations and cannot be responsible for the safety of personnel other than his own representatives on site. The contractor should notify the owner if he is aware of and/or anticipates unsafe conditions. If the geotechnical consultant at the time of construction considers conditions unsafe, the contractor, as well as the owner's representative, will be notified. Within this report the terminology safe or safely may have been utilized. The intent of such use is to imply low risk. Some risk will remain, however, as is always the case.

LEGAL DESCRIPTION
T.REPORT 30038006-987-987-CS7

THE LAND REFERRED TO HEREIN BELOW IS SITUATED IN THE CITY OF BEVERLY HILLS, IN THE COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AND IS DESCRIBED AS FOLLOWS:

LOT 21 IN BLOCK 2 OF BEVERLY, IN THE CITY OF BEVERLY HILLS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AS PER MAP RECORDED IN BOOK 11, PAGE 94 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY.

SCHEDULE B ITEMS

BASED UPON TITLE REPORT NO. 30038006-987-987-CS7, DATED NOVEMBER 12, 2019 AS PREPARED BY FIDELITY NATIONAL TITLE INSURANCE COMPANY.

1 WATER RIGHTS, CLAIMS OR TITLE TO WATER, WHETHER OR NOT DISCLOSED BY THE PUBLIC RECORDS. **(NOT PLOTTED, NOT SURVEY RELATED)**

2 INTENTIONALLY DELETED.

3 INTENTIONALLY DELETED.

4 INTENTIONALLY DELETED.

5 INTENTIONALLY DELETED.

6 INTENTIONALLY DELETED.

7 INTENTIONALLY DELETED.

8 A DEED OF TRUST. **(NOT PLOTTED, NOT SURVEY RELATED)**

9 A DEED OF TRUST. **(NOT PLOTTED, NOT SURVEY RELATED)**

10 INTENTIONALLY DELETED.

11 A SUBSURFACE OIL AND GAS LEASE FOR THE TERM THEREIN PROVIDED, WITH CERTAIN COVENANTS, CONDITIONS AND PROVISIONS, TOGETHER WITH EASEMENTS, IF ANY, AS SET FORTH THEREIN, DISCLOSED BY DOCUMENT, ENTITLED SUBSURFACE OIL AND GAS, DATED DECEMBER 1, 1997, LESSEE STOKER RESOURCES, L.P., RECORDING NO. 98-563201 OF OFFICIAL RECORDS. **(NOT PLOTTED, NOT SURVEY RELATED)**

12 INTENTIONALLY DELETED.

13 THE EFFECT OF A DEED. **(NOT PLOTTED, NOT SURVEY RELATED)**

THE EFFECT OF A DEED. **(NOT PLOTTED, NOT SURVEY RELATED)**

14 THE EFFECT OF A DEED. **(NOT PLOTTED, NOT SURVEY RELATED)**

15 THE EFFECT OF A DEED. **(NOT PLOTTED, NOT SURVEY RELATED)**

16 THE EFFECT OF A DEED. **(NOT PLOTTED, NOT SURVEY RELATED)**

17 INTENTIONALLY DELETED.

18 ANY INVALIDITY OR DEFECT IN THE TITLE OF THE VESTEES IN THE EVENT THAT THE TRUST REFERRED TO HEREIN IS INVALID OR FAILS TO GRANT SUFFICIENT POWERS TO THE TRUSTEE(S) OR IN THE EVENT THERE IS A LACK OF COMPLIANCE WITH THE TERMS AND PROVISIONS OF THE TRUST INSTRUMENT. IF TITLE IS TO BE INSURED IN THE TRUSTEE(S) OF A TRUST, (OR IF THEIR ACT IS TO BE INSURED), THIS COMPANY WILL REQUIRE A TRUST CERTIFICATION PURSUANT TO CALIFORNIA PROBATE CODE SECTION 18100.5.
THE COMPANY RESERVES THE RIGHT TO ADD ADDITIONAL ITEMS OR MAKE FURTHER REQUIREMENTS AFTER REVIEW OF THE REQUESTED DOCUMENTATION. **(NOT PLOTTED, NOT SURVEY RELATED)**

19 ANY EASEMENTS NOT DISCLOSED BY THE PUBLIC RECORDS AS TO MATTERS AFFECTING TITLE TO REAL PROPERTY, WHETHER OR NOT SAID EASEMENTS ARE VISIBLE AND APPARENT.

20 MATTERS WHICH MAY BE DISCLOSED BY AN INSPECTION AND/OR BY A CORRECT ALTA/NSPS LAND TITLE SURVEY OF SAID LAND THAT IS SATISFACTORY TO THE COMPANY, AND/OR BY INQUIRY OF THE PARTIES IN POSSESSION THEREOF.

21 ANY RIGHTS OF THE PARTIES IN POSSESSION OF A PORTION OF, OR ALL OF, SAID LAND, WHICH RIGHTS ARE NOT DISCLOSED BY THE PUBLIC RECORDS.
THE COMPANY WILL REQUIRE, FOR REVIEW, A FULL AND COMPLETE COPY OF ANY UNRECORDED AGREEMENT, CONTRACT, LICENSE AND/OR LEASE, TOGETHER WITH ALL SUPPLEMENTS, ASSIGNMENTS AND AMENDMENTS THERETO, BEFORE ISSUING ANY POLICY OF TITLE INSURANCE WITHOUT EXCEPTING THIS ITEM FROM COVERAGE.
THE COMPANY RESERVES THE RIGHT TO EXCEPT ADDITIONAL ITEMS AND/OR MAKE ADDITIONAL REQUIREMENTS AFTER REVIEWING SAID DOCUMENTS.

ITEM 4 IS DISCLOSED IN THE SURVEYORS NOTES AS 'BUILDING ENCROACHES 0.1' INTO THE PROPERTY LOCATED NORTHWESTERLY AND 0.2' TO 0.3' ONTO THE PROPERTY LOCATED SOUTHEASTERLY' AND AS DEPICTED ON SAID SURVEY DRAWING **(NOT PLOTTED, NOT SURVEY RELATED)**.

11.– INTENTIONALLY DELETED.

LEGAL DESCRIPTION
T. REPORT NCS-917096-ONT1

THE LAND REFERRED TO IN THIS POLICY IS DESORBED AS FOLLOWS:

REAL PROPERTY IN THE CITY OF BEVERLY HILLS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, DESORBED AS FOLLOWS:

LOTS 22, 23 AND 24 IN BLOCK 2 OF BEVERLY, IN THE CITY OF BEVERLY HILLS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AS PER MAP RECORDED IN BOOK 11 PAGE 94 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY.

EXCEPT THAT PORTION OF LOT 24 IN BLOCK 2 OF BEVERLY, IN THE CITY OF BEVERLY HILLS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AS SHOWN ON MAP RECORDED IN BOOK 11 PAGE 94 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY, DESCRIBED AS FOLLOWS:

BEGINNING AT THE MOST NORTHERLY CORNER OF SAID LOT 24; THENCE SOUTH 50° 29' 33" WEST, ALONG THE NORTHWESTERLY LINE OF SAID LOT 24, A DISTANCE OF 112.64 FEET; THENCE SOUTH 39° 30' 27" EAST 5.00 FEET; THENCE NORTH 52° 55' 57" EAST 105.17 FEET TO THE BEGINNING OF A TANGENT CURVE CONCAVE SOUTHERLY AND HAVING A RADIUS OF 10.00 FEET; THENCE NORTHEASTERLY ALONG SAID CURVE, AN ARC DISTANCE OF 8.84 FEET TO THE NORTHEASTERLY LINE OF SAID LOT 24; THENCE NORTH 39° 31' 20" WEST, ALONG SAID NORTHEASTERLY LINE, 13.47 FEET TO THE POINT OF BEGINNING AS PER DEED RECORDED OCTOBER 30, 1987 AS INSTRUMENT NO. 87–1734961 AND AS PER FINAL ORDER OF CONDEMNATION RECORDED JULY 21, 1989 AS INSTRUMENT NO. 89116521 OF OFFICIAL RECORDS.

SCHEDULE B ITEMS

BASED UPON TITLE REPORT NO. NCS–917096–ONT1, DATED NOVEMBER 6, 2018 AS PREPARED BY FIRST AMERICAN TITLE INSURANCE COMPANY.

1.– GENERAL AND SPECIAL TAXES **(NOT PLOTTED, NOT SURVEY RELATED)**.

2.– GENERAL AND SPECIAL TAXES **(NOT PLOTTED, NOT SURVEY RELATED)**.

3.– THE LIEN OF SPECIAL TAX **(NOT PLOTTED, NOT SURVEY RELATED)**.

4.– THE LIEN OF SUPPLEMENTAL TAXES **(NOT PLOTTED, NOT SURVEY RELATED)**.

5.– THIS ITEM HAS BEEN INTENTIONALLY DELETED.

6.– AN EASEMENT FOR PUBLIC UTILITIES AND INCIDENTAL PURPOSE RECORDED JANUARY 26, 1979 AS INSTRUMENT NO. 79–116365 OF OFFICIAL RECORDS **(NOT PLOTTED, DOCUMENT NOT READABLE)**.

7.– SURVEY PREPARED BY JRN CIVIL–ENGINEERS, DATED AUGUST 13, 2018, UNDER JOB NO. 17680, SHOWS THE FOLLOWING:
A) THE FACT THAT THE BUILDING LOCATED ON SAID LAND ENCROACHES ONTO THE EASEMENT IN FAVOR OF SOUTHERN CALIFORNIA EDISON COMPANY RECORDED JANUARY 26, 1979 AS INSTRUMENT NO. 79–116365 OF OFFICIAL RECORDS.
B) THE FACT THAT THE OVERHANGS OF THE BUILDING LOCATED ON SAID LAND EXTEND NORTHWESTERLY AND NORTHEASTERLY OF THE PROPERTY LINE ONTO THE RIGHTS OF WAY OF N. BEVERLY DRIVE AND S. SANTA MONICA BOULEVARD, WHICH OVERHANGS ARE SHOWN AS A AND B ON THE ABOVE–REFERENCED SURVEY.

8.– RIGHTS OF THE PALEY CENTER FOR MEDIA AS A TENANT ONLY UNDER UNRECORDED LEASE DATED NOVEMBER 1, 1994, THE COMPANY INSURES AGAINST LOSS ARISING IN THE EVENT SAID LEASE CONTAINS ANY RIGHTS OF FIRST REFUSAL OR OPTIONS TO PURCHASE ALL OR ANY PORTION OF THE LAND **(NOT PLOTTED, NOT SURVEY RELATED)**.

ITEMS CORRESPONDING TO TABLE A ITEMS

– ITEM 14
THE NEAREST INTERSECTING STREETS TO THE PROPERTY ARE SHOWN HEREON.

– ITEM 16
NO EVIDENCE OF RECENT EARTH MOVING WORK, BUILDING CONSTRUCTION OR BUILDING ADDITIONS OBSERVED IN THE PROCESS OF CONDUCTION THE FIELD WORK.

– ITEM 17
NO EVIDENCE OF RECENT STREET OR SIDEWALK CONSTRUCTION OR REPAIRS OBSERVED IN THE PROCESS OF CONDUCTING THE FIELD WORK.

– ITEM 18
NO EVIDENCE OF WETLANDS ON THE SUBJECT PROPERTY. NO DELINEATION MARKERS OF WETLANDS WERE OBSERVED IN THE PROCESS OF CONDUCTING THE FIELD WORK.

HERSHENSON AND BRENDA ABRAMSON, CO–TRUSTEES UNDER THE WILL OF SYLVIA HERSHENSON, DECEASED, AS TO AN UNDIVIDED 1/4 INTEREST; BRENDA ABRAMSON AND ALAN ABRAMSON, CO–TRUSTEES OF THE A.S. HERSHENSON FAMILY TRUST DATED MARCH 29, 1989 AS TO AN UNDIVIDED 1/4 INTEREST AND FIDELITY NATIONAL TITLE INSURANCE COMPANY.

THIS IS TO CERTIFY THAT THIS MAP OR PLAT AND THE SURVEY ON WHICH IT IS BASED WERE MADE IN ACCORDANCE WITH THE 2016 MINIMUM STANDARD DETAIL REQUIREMENTS FOR ALTA/NSPS LAND TITLE SURVEYS, JOINTLY ESTABLISHED AND ADOPTED BY ALTA AND NSPS, AND INCLUDES ITEMS 2, 3, 4, 6(a), 7(a), 7(b)(1), 7(c), 8, 9, 10(a), 11, 13, 14, 16 AND 17 OF TABLE A THEREOF. THE FIELDWORK WAS COMPLETED ON NOVEMBER 19, 2019

DATE OF PLAT OR MAP: DECEMBER 10, 2019

ZONING RESTRICTIONS

NOTE: INDICATED ZONING INFORMATION IS FROM THE CITY OF BEVERLY HILLS ZONING ORDINANCES IN EFFECT AS OF THE DATE OF THIS SURVEY. ZONING AND RESTRICTIONS SHOWN HEREON WERE OBTAINED BY A GENERAL REQUEST AT THE PUBLIC COUNTER OF THE ABOVE NAMED DEPARTMENT. NO REPRESENTATION IS MADE FOR THE ACCURACY OR COMPLETENESS OF SAID THIRD PARTY INFORMATION. THIS FIRM IS NOT AN EXPERT IN THE REPRESENTATION OF COMPLEX ZONING ORDINANCES. COMPLIANCE IS BEYOND THE SCOPE OF THIS SURVEY. ANY USER OF SAID INFORMATION IS URGED TO CONTACT THE LOCAL AGENCY DIRECTLY.

ZONE: C–3 (COMMERCIAL ZONE)

MINIMUM SETBACKS: FRONT: NOT SPECIFIED; SIDE: NOT SPECIFIED; REAR: NOT SPECIFIED

HEIGHT RESTRICTIONS: NOT SPECIFIED

POSSIBLE ENCROACHMENT NOTES

THIS IS A LISTING OF OBSERVED IMPROVEMENTS THAT CROSS PROPERTY LINES. STATEMENT OF OWNERSHIP OR POSSESSION IS NOT THE INTENT OF THIS LISTING.

1 BUILDING OVERLAPS THE SOUTHERLY PROPERTY LINES

2 OVERHANG OVERLAPS ON THE PROPERTY LINE

LEGAL DESCRIPTION
TITLE REPORT NO. 997-30029396-1MB

THE LAND REFERRED TO HEREIN BELOW IS SITUATED IN THE CITY OF BEVERLY HILLS IN THE COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AND IS DESCRIBED AS FOLLOWS:

PARCEL 1
THAT PORTION OF THE SOUTHWESTERLY HALF OF THE ALLEY (20 FEET WIDE), IN BLOCK 2 OF BEVERLY, IN THE CITY OF BEVERLY HILLS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AS SHOWN ON THE MAP RECORDED IN BOOK 11 PAGE 94 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY, LYING NORTHEASTERLY OF AND ADJACENT TO LOTS 1 AND 2 IN BLOCK 2 OF SAID BEVERLY, THAT WOULD PASS WITH A LEGAL CONVEYANCE OF SAID LOTS.

PARCEL 2:
THAT PORTION OF THE SOUTHWESTERLY HALF OF THE ALLEY (20 FEET WIDE), IN BLOCK 2 OF BEVERLY, IN THE CITY OF BEVERLY HILLS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AS SHOWN ON THE MAP RECORDED IN BOOK 11 PAGE 94 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY, LYING NORTHEASTERLY OF AND ADJACENT TO LOT 3 IN BLOCK 2 OF SAID BEVERLY, THAT WOULD PASS WITH A LEGAL CONVEYANCE OF SAID LOT.

PARCEL 3:
THAT PORTION OF THE NORTHEASTERLY HALF OF THE ALLEY (20 FEET WIDE), IN BLOCK 2 OF BEVERLY, IN THE CITY OF BEVERLY HILLS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AS SHOWN ON THE MAP RECORDED IN BOOK 11 PAGE 94 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY, LYING SOUTHWESTERLY OF AND ADJACENT TO LOTS 22, 23 AND 24 IN BLOCK 2 OF SAID BEVERLY, THAT WOULD PASS WITH A LEGAL CONVEYANCE OF SAID LOTS.

LEGAL DESCRIPTION
T. REPORT CA-FBCM-IMP-27306-1-18-30011459

THE LAND REFERRED TO HEREIN BELOW IS SITUATED IN THE COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AND IS DESCRIBED AS FOLLOWS:

LOTS 1 AND 2 IN BLOCK 2 OF BEVERLY, IN THE CITY OF BEVERLY HILLS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AS PER MAP RECORD

Boring Logs

LOG OF EXPLORATORY BORING

Job Number: 2335-94
Project: 456,468 N. Rodeo & 449, 461 N. Beverly Dr.

Boring No: GB-1
Boring Location: See Site Map

Date Performed: 7/16/2019

Drill Type: 8” Hollow Stem Auger

Depth in Feet	Blows per 6”	Sample Type: Undisturbed	Sample Type: Bulk	Bedrock/ Soil Description	Color	Density	Moisture
				Artificial Fill (Af): Silty sand containing asphalt and concrete fragements			
5	5/6/7	R		Sandy clay with silt, few scattered gravels			
				Holocene Alluvium (Qal):			
10	3/5/5	R		Fine to medium sand with scattered rounded to sub rounded medium to coarse gravels	Brown	Weak	Slightly Moist
15	4/8/16	R		Sandy clay with silt, fine grained sand, few fine sub angular gravels	Light Brown	Moderately Hard	Slightly Moist
20	3/6/7	R		No significant change			
25	8/14/17	R		Fine to coarse sand with scattered gravels, slightly oxidized, poorly sorted rounded to angular gravels	Light Brown	Hard	Slightly Moist
				Pleistocene Older Alluvium (Qoa):			
30	14/18/20	R		Clayey sand/ sandy clay, abundant fine to medium gravels, moderately well sorted, scattered CaCO3	Light Brown, Yellowish Brown	Very Hard	Slightly Moist
35	12/18/25/6”	R		Silty clay with sand, very well sorted, slightly oxidized	Brown	Very Hard	Slightly Moist
40	10/12/13	R		Medium to coarse grained sand with clay, poorly sorted rounded to sub rounded gravels	Brown	Moderately Hard	Moist

LOG OF EXPLORATORY BORING

Job Number: 2335-94
Project: 456,468 N. Rodeo & 449, 461 N. Beverly Dr.

Boring No: GB-1
Boring Location: See Site Map

Date Performed: 7/16/2019

Drill Type: 8” Hollow Stem Auger

Depth in Feet	Blows per 6”	Sample Type: Undisturbed	Sample Type: Bulk	Bedrock/ Soil Description	Color	Density	Moisture
40	10/12/13	R		Medium to coarse grained sand with clay, poorly sorted rounded to sub rounded gravels	Brown	Moderately Hard	Moist
45	13/30/15	R		Sandy silt/ silty sand with clay, well sorted, few scattered rounded fine gravels	Brown	Hard	Moist
50	14/24/43	R	▼	Medium to coarse sand, poorly sorted sub angular to sub rounded gravels, groundwater encountered at 50’	Light Brown	Hard	Wet
55	16/27/38	R		Coarse sand with abundant sub rounded to sub angular gravels, oxidized, poorly sorted	Brown	Moderately Hard	Wet
60	20/30/36	R		Coarse grained clayey sand, abundant sub rounded to sub angular scattered gravels	Dark Brown	Hard	Wet
65	6/12/22	R		Silty clay with sand, scattered medium grained gravels, slightly oxidized, possible confining GW layer	Brown	Hard	Slightly Moist
70	7/10/16	R		Silty clay with sand, few fine gravels, mottled coloring, slightly oxidized	Dark Brown	Hard	Slightly Moist
75	17/50/3”	R		Sandy clay, few scattered angular coarse gravels, moderately well sorted	Brown	Soft	Moist
80	12/18/27	R		Sandy clay with silt, few scattered gravels	Brown	Very Hard	Slightly Moist

LOG OF EXPLORATORY BORING

Job Number: 2335-94
Project: 456,468 N. Rodeo & 449, 461 N. Beverly Dr.

Boring No: GB-1
Boring Location: See Site Map

Date Performed: 7/16/2019

Drill Type: 8” Hollow Stem Auger

Depth in Feet	Blows per 6”	Sample Type: Undisturbed	Sample Type: Bulk	Bedrock/ Soil Description	Color	Density	Moisture
80	12/18/27	R		Sandy clay with silt, few scattered gravels	Brown	Very Hard	Slightly Moist
85	15/50/6”	R		Clayey sand with silt, moderately well sorted, scattered fine gravels, slightly oxidized	Brown	Hard	Moist
90	7/29/40	R		Sandy clay with silt, scattered gravels, moderately weathered, poorly sorted	Brown	Hard	Moist
95	19/50/6”	R		Fine to coarse sand, moderately well sorted, sub angular to sub rounded medium gravels	Light Brown	Hard	Moist to Wet
100	12/25/40	R		Silty sand with clay, well sorted	Brown	Moderately Hard	Slightly Moist

APPENDIX 'B'

Laboratory Testing & Engineering

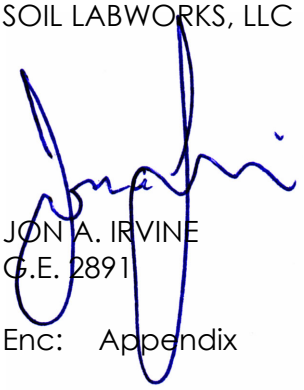
SL19.3132
August 5, 2019

Feffer Geological Consulting
1990 S. Bundy Drive
4th Floor
Los Angeles, California 90025

Attn: Joshua R. Feffer

Subject: Laboratory Testing

Site: 456 & 468 N. Rodeo Drive & 461 N. Beverly Drive
Beverly Hills, California



Job: FEFFER/LVMH (Louis Vuitton) – 2335-94

Laboratory testing for the subject property was performed by Soil Labworks, LLC., under the supervision of the undersigned Engineer. Samples of the earth materials were obtained from the subject property by personnel of Feffer Geological and transported to the laboratory of Soil Labworks for testing and analysis. The laboratory tests performed are described and results are attached.

Services performed by this facility for the subject property were conducted in a manner consistent with that level of care and skill ordinarily exercised by members of the profession currently practicing in the same locality under similar conditions.

Respectfully Submitted:

SOIL LABWORKS, LLC

JON A. IRVINE
G.E. 2891

APPENDIX

Laboratory Testing

Sample Retrieval - Drill Rig

Samples of earth materials were obtained at frequent intervals by driving a thick-walled steel sampler conforming to the most recent version of ASTM D 3550/D 3550M-17 with successive drops of the Kelly bar. The earth material was retained in brass rings of 2.416 inches inside diameter and 1.00 inch height. The central portion of the sample was stored in close-fitting, water-tight containers for transportation to the laboratory.

Moisture Density

The field moisture content and dry density were determined for each of the soil samples. The dry density was determined in pounds per cubic foot following ASTM 2937-17e2. The moisture content was determined as a percentage of the dry soil weight conforming to ASTM 2216-19. The results are presented below in the following table. The percent saturation was calculated on the basis of an estimated specific gravity. Description of earth materials used in this report and shown on the attached Plates were provided by the client.

Test Pit/Boring No.	Sample Depth (Feet)	Soil Type	Dry Density (pcf)	Moisture Content (percent)	Percent Saturation (G_s=2.65)
B1	5	Fill	105.6	17.9	84
B1	10	Alluvium	110.6	4.9	86
B1	15	Alluvium	96.5	22.4	83
B1	20	Alluvium	103.1	20.5	90
B1	25	Alluvium	118.3	7.4	49
B1	30	Alluvium	114.8	16.8	100
B1	35	Alluvium	108.9	20.0	100
B1	40	Alluvium	109.8	7.9	42
B1	45	Alluvium	112.8	14.7	84
B1	50	Alluvium	125.0	12.0	98
B1	55	Alluvium	133.5	9.5	100
B1	60	Alluvium	131.3	11.1	100
B1	65	Alluvium	110.2	20.5	100
B1	70	Alluvium	103.6	23.8	100
B1	75	Alluvium	127.8	9.8	89
B1	80	Alluvium	114.3	18.2	100

Moisture Density (continued)

Test Pit/Boring No.	Sample Depth (Feet)	Soil Type	Dry Density (pcf)	Moisture Content (percent)	Percent Saturation (G_s=2.65)
B1	85	Alluvium	121.8	15.0	100
B1	90	Alluvium	114.4	16.1	96
B1	95	Alluvium	117.6	14.8	97
B1	100	Alluvium	118.6	14.5	98
B2	10	Fill	101.8	18.5	79
B2	20	Alluvium	101.7	22.6	96
B2	30	Alluvium	111.2	13.1	71
B2	40	Alluvium	108.1	18.8	94
B2	50	Alluvium	107.4	13.6	67

Compaction Character

Compaction tests were performed on bulk samples of the earth materials in accordance with ASTM D1557-12ei. The results of the tests are provided on the table below and on the "Moisture-Density Relationship", A-Plates. The specific gravity of the fill/alluvium was estimated from the compaction curves.

Test Pit/Boring No.	Sample Depth (Feet)	Soil Type	Maximum Dry Density (pcf)	Optimum Moisture Content (Percent)
B2	0-50	Fill/Alluvium	115.5	9.0

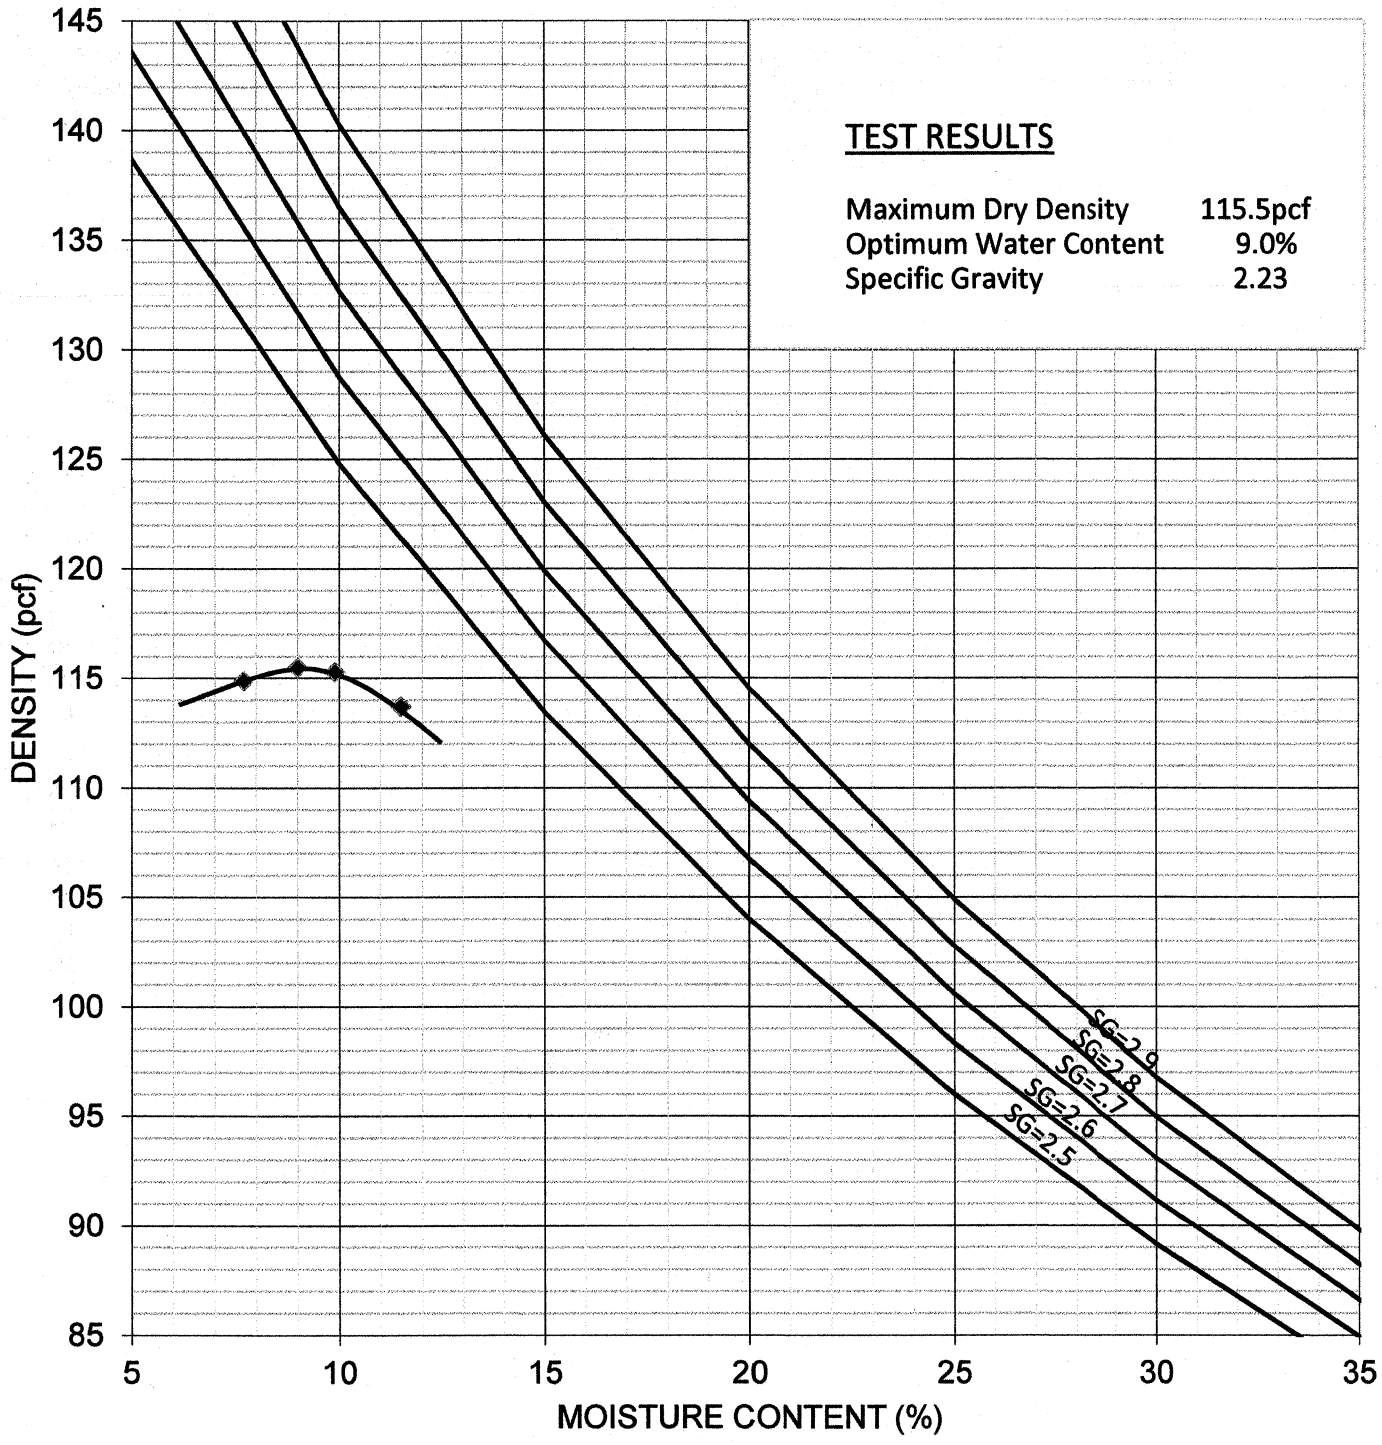
Shear Strength

The peak and ultimate shear strengths of the alluvium were determined by performing consolidated and drained direct shear tests in conformance with ASTM D3080/D3080M-11. The tests were performed in a strain-controlled machine manufactured by GeoMatic. The rate of deformation was 0.01 inches per minute. Samples were sheared under varying confining pressures, as shown on the "Shear Test Diagrams," B-Plates. The moisture conditions during testing are shown on the following table and on the B-Plates. The samples indicated as saturated were artificially saturated in the laboratory. All saturated samples were sheared under submerged conditions.

Shear Strength (continued)

Test Pit/ Boring No.	Sample Depth (Feet)	Dry Density (pcf)	As-Tested Moisture Content (percent)
B1	10	110.6	28.3
B1	20	103.1	23.3
B1	30	114.8	21.1
B1	40	109.8	19.7
B1	50	125.0	16.0
B1	60	131.3	13.5
B1	70	103.6	22.9
B1	80	114.3	17.9
B1	90	114.4	18.4
B1	100	118.6	20.5

Consolidation



One-dimensional consolidation tests were performed on samples of the alluvium in a consolidometer manufactured by GeoMatic in conformance with ASTM D2435/D2435M-11. The tests were performed on 1-inch high samples retained in brass rings. The samples were initially loaded to approximately ½ of the field over-burden pressure and then unloaded to compensate for the effects of possible disturbance during sampling. Loads were then applied in a geometric progression and resulting deformation recorded. Water was added at a specific load to determine the effect of saturation. The results are plotted on the "Consolidation Test," C-Plates.

APPENDIX ‘D’

Grading Specifications

STANDARD GRADING SPECIFICATIONS

These specifications present the usual and minimum requirements for grading operations performed under our supervision.

GENERAL

1) The Geotechnical Engineer and Engineering Geologist are the developer's representative on the project.

2) All clearing, site preparation or earth work performed on the project shall be conducted by the contractor under the supervision of the Geotechnical Engineer.

3) It is the contractor's responsibility to prepare the ground surface to receive the fills to the satisfaction of the Geotechnical Engineer and to place, spread, mix, water, and compact the fill in accordance with the specifications of the Geotechnical Engineer. The contractor shall also remove all material considered unsatisfactory by the Geotechnical Engineer.

4) It is the contractor's responsibility to have suitable and sufficient compaction equipment on the job site to handle the amount of fill being placed. If necessary, excavation equipment will be shut down to permit completion of compaction. Sufficient watering apparatus will also be provided by the contractor, with due consideration for the fill material, rate of placement and time of year.

5) A final report shall be issued by our firm outlining the contractor's conformance with these specifications.

SITE PREPARATION

1) All vegetation and deleterious materials such as rubbish shall be disposed of off-site. Soil, alluvium or rock materials determined by the Geotechnical Engineer as being unsuitable for placement in compacted fills shall be removed and wasted from the site. Any material incorporated as a part of a compacted fill must be approved by the Geotechnical Engineer.

2) The Engineer shall locate all houses, sheds, sewage disposal systems, large trees or structures on the site or on the grading plan to the best of his knowledge prior to preparing the ground surface.

Any underground structures such as cesspools, cisterns, mining shafts, tunnels, septic tanks, wells, pipe lines, or others not located prior to grading are to be removed or treated in a manner prescribed by the Geotechnical Engineer.

3) After the ground surface to receive fill has been cleared, it shall be scarified, disced or bladed by the contractor until it is uniform and free from ruts, hollows, hummocks or other uneven features which may prevent uniform compaction.

The scarified ground surface shall then be brought to optimum moisture, mixed as required, and compacted as specified. If the scarified zone is greater than twelve inches (12") in depth, the excess shall be removed and placed in lifts restricted to six inches (6").

Prior to placing fill, the ground surface to receive fill shall be inspected, tested and approved by the Geotechnical Engineer.

PLACING, SPREADING AND COMPACTION OF FILL MATERIALS

1) The selected fill material shall be placed in layers which when compacted shall not exceed six inches (6") in thickness. Each layer shall be spread evenly and shall be thoroughly mixed during the spreading to insure uniformity of material and moisture of each layer.

2) Where the moisture content of the fill material is below the limits specified by the Geotechnical Engineer, water shall be added until the moisture content is as required to assure thorough bonding and thorough compaction.

3) Where the moisture content of the fill material is above the limits specified by the Geotechnical Engineer, the fill materials shall be aerated by blading or other satisfactory methods until the moisture content is adequate.

COMPACTED FILLS

1) Any material imported or excavated on the property may be utilized in the fill, provided each material has been determined to be suitable by the Geotechnical Engineer. Roots, tree branches or other matter missed during clearing shall be removed from the fill as directed by the Geotechnical Engineer.

2) Rock fragments less than six inches (6") in diameter may be utilized in the fill, provided:

a) They are not placed in concentrated pockets.

b) There is a sufficient percentage of fine-grained material to surround the rocks.

c) The distribution of the rocks is supervised by the Geotechnical Engineer.

3) Rocks greater than six inches (6") in diameter shall be taken off-site, or placed in accordance with the recommendations of the Geotechnical Engineer in areas designated as suitable for rock disposal. Details for rock disposal such as location, moisture control, percentage of rock placed, will be referred to in the "Conclusions and Recommendations" section of the geotechnical report.

If the rocks greater than six inches (6") in diameter were not anticipated in the preliminary geotechnical and geology report, rock disposal recommendations may not have been made in the "Conclusions and Recommendations" section. In this case, the contractor shall notify the Geotechnical Engineer if rocks greater than six inches (6') in diameter are encountered. The Geotechnical Engineer will than prepare a rock disposal recommendation or request that such rocks be taken off-site.

4) Representative samples of materials to be utilized as compacted fill shall be analyzed in the laboratory by the Geotechnical Engineer to determine their physical properties. If any materials other than that previously tested is encountered during grading, the appropriate analysis of this material shall be conducted by the Geotechnical Engineer as soon as possible.

Material that is spongy, subject to decay or otherwise considered unsuitable shall not be used in the compacted fill.

5) Each layer shall be compacted to a minimum of ninety percent (90%) of the maximum density in compliance with the testing method specified by the controlling governmental agency (ASTM D-1557).

If compaction to a lesser percentage is authorized by the controlling governmental agency because of a specific land use or expansive soil conditions, the area to receive fill compacted to less than ninety percent (90%) shall either be delineated on the grading plan or appropriate reference made to the area in the geotechnical report.

6) Compaction shall be by sheeps foot roller, multi-wheeled pneumatic tire roller, or other types of acceptable rollers. Rollers shall be of such design that they will be able to compact the fill to the specified density. Rolling shall be accomplished while the fill material is at the specified moisture content. The final surface of the lot areas to receive slabs-on-grade should be rolled to a smooth, firm surface.

7) Field density tests shall be made by the Geotechnical Engineer of the compaction of each layer of fill. Density tests shall be made at intervals not to exceed two feet (2') of fill height provided all layers are tested. Where the sheeps foot rollers are used, the soil may be disturbed to a depth of several inches and density readings shall be taken in the compacted material below the disturbed surface. When these readings indicate the density of any layer of fill or portion thereof is below the required ninety percent (90%) density, the particular layer or portion shall be reworked until the required density has been obtained.

8) Buildings shall not span from cut to fill. Cut areas shall be over excavated and compacted to provide a fill mat of three feet (3').

FILL SLOPES

1) All fills shall be keyed and benched through all top soil, colluvium, alluvium, or creep material into sound bedrock or firm material where the slope receiving fill exceeds a ratio of five (5) horizontal to one (1) vertical, in accordance with the recommendations of the Geotechnical Engineer.

2) The key for side hill fills shall be a minimum of fifteen feet (15') within bedrock or firm materials, unless otherwise specified in the geotechnical report.

3) Drainage terraces and subdrainage devices shall be constructed in compliance with the ordinances of the controlling governmental agency, or with the recommendations of the Geotechnical Engineer.

4) The Contractor will be required to obtain a minimum relative compaction of ninety percent (90%) out to the finish slope face of fill slopes, buttresses, and stabilization fills. This may be achieved by either over-building

the slope and cutting back to the compacted core, or by direct compaction of the slope face with suitable equipment, or by any other procedure which produces the required compaction.

5) All fill slopes should be planted or protected from erosion by methods specified in the geotechnical report and by the governing agency.

6) Fill-over-cut slopes shall be properly keyed through topsoil, colluvium, or creep material into rock or firm materials. The transition zone shall be stripped of all soil prior to placing fill.

CUT SLOPES

1) The Engineering Geologist shall inspect all cut slopes excavated in rock, lithified, or formation material at vertical intervals not exceeding ten feet (10').

2) If any conditions not anticipated in the preliminary report such as perched water, seepage, lenticular or confined strata of a potentially adverse nature, unfavorably inclined bedding, joints, or fault planes, are encountered during grading, these conditions shall be analyzed by the Engineering Geologist and Geotechnical Engineer; and recommendations shall be made to treat these problems.

3) Cut slope that face in the same direction as the prevailing drainage shall be protected from slope wash by a non-erosive interceptor swale placed at the top of the slope.

4) Unless otherwise specified in the geological and geotechnical report, no cut slopes shall be excavated higher or steeper than that allowed by the ordinances of the controlling governmental agencies.

5) Drainage terraces shall be constructed in compliance with the ordinances of controlling governmental agencies, or with the recommendations of the Geotechnical Engineer or Engineering Geologist.

GRADING CONTROL

1) Inspection of the fill placement shall be provided by the Geotechnical Engineer during the progress of grading.

2) In general, density tests should be made at intervals not exceeding two feet (2') of fill height or every five hundred (500) cubic yards of fill placed. These criteria will vary depending on soil conditions and the size of the job. In any event, an adequate number of field density tests shall be made to verify that the required compaction is being achieved.

3) Density tests should also be made on the surface materials to receive fill as required by the Geotechnical Engineer.

4) All clean-out, processed ground to receive fill, key excavations, subdrains, and rock disposal must be inspected and approved by the Geotechnical Engineer prior to placing any fill. It shall be the Contractor's responsibility to notify the Geotechnical Engineer when such areas are ready for inspection.

CONSTRUCTION CONSIDERATIONS

1) Erosion control measures, when necessary, shall be provided by the Contractor during grading and prior to the completion and construction of permanent drainage controls.

2) Upon completion of grading and termination of inspections by the Geotechnical Engineer, no further filling or excavating, including that necessary for footings, foundations, large tree wells, retaining walls, or other features shall be performed without the approval of the Geotechnical Engineer or Engineering Geologist.

3) Care shall be taken by the contractor during final grading to preserve any berms, drainage terraces, interceptor swales, or other devices of a permanent nature on or adjacent to the property.

Investigation of Potential Faulting

Appendix IS-3.1

Investigation of Potential Faulting:
456 North Rodeo

PD EXHIBIT 11

FEFFER
GEOLOGICAL CONSULTING

December 18, 2018 File No. 2176-85

456 N. Rodeo Drive LLC,
a California limited liability company
19 E. 57th St., New York, NY 10022
Attn: Mr. Franklin Dickinson

SUBJECT: **INVESTIGATION OF POTENTIAL FAULTING**
456 North Rodeo Drive, Beverly Hills, CA 90210

Dear Mr. Dickinson,

We are pleased to submit this report summarizing our fault rupture hazard investigation for 456 N. Rodeo Drive in the City of Beverly Hills, California. This investigation assesses the potential for surface fault rupture and determines if the area of 456 N. Rodeo Drive is suitable for the construction of human-occupied structures. 456 N. Rodeo Drive is currently not mapped as being potentially affected by surface faulting and is approximately 115 feet to the northwest of the currently mapped Santa Monica Fault Zone (SMFZ).

The investigation reviewed pertinent published and unpublished reports, assessed the site geomorphology, and drilled four continuously cored borings and eleven cone penetrometer soundings (CPTs) to determine underlying stratigraphy. The combination of continuous, unbroken late Pleistocene soil horizons and stratigraphy demonstrates the absence of active faulting beneath the site.

We therefore conclude that the project site is not impacted by state-defined active faults. Accordingly, no fault setback distances or "no-build" zones impact or limit future development.

We appreciate this opportunity to be of service. Should you have any questions regarding the information contained in this report, please do not hesitate to contact us.

Sincerely,

FEFFER GEOLOGICAL CONSULTING, INC.

C.E.G. 2138

INTRODUCTION AND BACKGROUND

The project site is located on the northeast side of north Rodeo Drive and consists of a commercial lot that is currently occupied by a two-story retail building within a highly developed portion of the City of Beverly Hills, CA (Figure 1). For the purpose of description it is assumed that Rodeo Drive is oriented in a north-south direction. The site is bounded to the north by 468 N. Rodeo Drive, to the east by an alley, and to the west by north Rodeo Drive. Commercial structures and office buildings are located adjacent to the site.

The existing 456 N. Rodeo Drive structure was constructed prior to the establishment of the State-mandated Santa Monica Earthquake Fault Zone (SMFZ). As illustrated on Figure 2 and Figure 8, the subject site is entirely outside of the SMFZ and is located 2 lots and about 115 feet to the northwest from the northernmost edge of the zone (Olson, 2018). To ensure public health and safety, a fault investigation is required by the City of Beverly Hills (2018a). The surface expression of fault-related geomorphic features has been destroyed by urbanization and development within the greater Los Angeles area. Nevertheless, Dolan et al. (2000) identified the fault based on topographic scarps north of Santa Monica Boulevard in the Westwood area (Figure 7). Additional work (Olson, 2015) refined the map representation of the fault scarps, and largely replicates the work by Dolan et al. (2000).

The site is outside of the current Earthquake Zones of Required Investigation (CGS, 2018a). However, it is subject to the Alquist-Priolo Special Studies Zone Act of 1972 (California Public Resources Code, Chapter 7.5, Division 2), and an investigation is required by the City of Beverly Hills (2018a). The AP Special Studies Zone Act specifically defines a fault as active if surface or near surface displacement cannot be demonstrated as inactive within the past 11,700 years (Holocene). This investigation specifically assesses the potential for surface fault rupture at 456 N. Rodeo Drive.

SCOPE OF WORK

Trenching is the preferred method for evaluating the presence or absence of faults because it offers a continuous, direct exposure of the fault zone or near surface stratigraphy. However, in this portion of the SMFZ, trenching is difficult due to existing structures. Therefore, as accepted by the City of Beverly Hills Seismic Guidelines (2018a) this fault study consists of several strategically placed continuously cored borings in combination with cone penetrometer tests excavated to approximately 50 feet deep to address the issue of surface faulting at the site. Borings and cone penetrometer tests taken as part the investigation for 468 N. Rodeo Drive are considered part of this project (Figure 11). The scope of work for this fault investigation consists of the following tasks:

- Review of published and unpublished geotechnical data in the site vicinity;
- Analysis of topographic maps of the site vicinity;
- Obtaining drilling permits and marking of underground utilities;
- Excavating and logging a total of 4 fifty foot borings across the site;
- Pushing a total of 11 CPT soundings across the site;
- Preparation of this report.

FAULT ACTIVITY CRITERIA

In general, fault activity is based on the age of displaced and undisturbed sediment. According to the CGS (2018b), a fault can be either age-undetermined, Holocene-active, or a pre-Holocene fault (see details below). If charcoal or other numerically datable specimens are present, a numeric age can be established. If no datable material exists, then a relative age can be assigned to movement along the fault based on the relative development of buried paleosols (pedogenic profiles; Appendix B).

According to CGS Special Publication 42 (2018b), a fault is defined as the following:

> *"A shear or zone of closely associated shears across which earth materials on one side have been displaced with respect to those on the other side because of tectonic forces. A fault is distinguished from those fractures or shears caused by landsliding or other gravity-driven surficial failures.*
>
> ***age-undetermined fault:*** *A fault whose age of most recent movement is not known or is unconstrained by dating methods or by limitations in stratigraphic resolution.*
>
> ***Holocene-active fault:*** *A fault that has had surface displacement within Holocene time (the last 11,700 years).*
>
> ***pre-Holocene fault:*** *A fault whose recency of past movement is older than 11,700 years, and thus does not meet the criteria of Holocene-active fault as defined in the State Mining and Geology Board regulations (California Code of Regulations, Title 14, Division 2, Section 3601.(a)).*" (CGS, 2018b, p. 1-2)

REGIONAL AND LOCAL GEOLOGY

The site is located in the Los Angeles Basin, a part of the Transverse Ranges Geomorphic province (Figure 3). The Los Angeles Basin lies within a transitional zone between the Transverse Ranges to the north and the Peninsular Ranges (Yerkes et. al., 1965). The basin is bounded on the north by the Santa Monica Mountains, on the east by the Elysian Hills, the west by the Newport-Inglewood Uplift and the south by the La Brea high, an area of shallow bedrock.

The predominate structure in the project area is the east-west trending Malibu Coast-Santa Monica-Raymond-Cucamonga fault system (Crook et al., 1983), which extends for approximately 125 miles to form the southern boundary of the Transverse Ranges. This fault system is also referred to as the Transverse Ranges Southern Boundary fault system (TRSB) by Dolan et al. (2000). This complex system of east-west trending faults accommodates north-south shortening and uplift, and concurrent westward motion of the Western Transverse Ranges. Individual faults within the TRSB fault system exhibit varying degrees of both left-lateral strike-slip and contractional dip-slip faulting and related folding (Hill et al., 1979; Crook et al., 1983; Jones et al., 1990; Dolan et al., 2000). All faults within the system show evidence for Quaternary activity and several, including the Santa Monica and Hollywood faults, have been demonstrated by site-specific paleoseismic studies to be active during the Holocene (Jones et al., 1990; Weaver and Dolan, 2000; Dolan et al., 2000).

From a local perspective, the site is located within the uplifted and dissected Beverly Hills area. Hoots and Kew (1931) and Yerkes and Campbell (2005) mapped Holocene aged alluvium over older

Pleistocene aged alluvial and terrestrial fan deposits (Figure 4) while Dibblee and Ehrenspeck (1991) mapped younger Holocene aged alluvial gravels at the surface overlying older Pleistocene age alluvial fan sediments (Figure 5). More recent mapping (Figure 6) from Campbell (2014) indicates that the sediments exposed in the area consist of primarily lower Holocene to upper Pleistocene age alluvium near the ground surface underlain by upper to lower Pleistocene aged alluvial fan deposits, and interbedded terrestrial fan and shallow marine sediments. None of these regional geologic maps delineate the SMFZ in the vicinity of the project site area.

Santa Monica Fault Zone

The SMFZ portion of the TRSB trends east-west from the Santa Monica coastline on the west to the Hollywood area on the east (see Figure 2). It is an oblique-reverse, left-lateral fault that is thought to be a surface expression of tectonic deformation related to Pliocene-Quaternary structural development of the Santa Monica Mountains. Integration of subsurface oil and gas exploration seismic data and well logs with surficial mapping indicate the mountains are underlain by a large southward-vergent asymmetric anticline formed over a regional north-dipping thrust ramp at a depth of 6 to 9 miles. Geophysical studies conducted at the Veteran's Administration (VA) property in West Los Angeles indicate the SMFZ is a gently dipping thrust fault with secondary near-vertical faults extending from the primary basal fault toward the ground surface (Pratt et al., 1998; Dolan et al., 2000).

The surface expression of the SMFZ is limited to fault-related geomorphic features, many of which have been destroyed by urbanization and development within the greater Los Angeles area (Figure 7). This has resulted in a poor understanding of the lateral extent, location, and rupture history of the SMFZ. Nevertheless, Dolan et al. (2000) identified a probable fault location based on topographic scarps north of Santa Monica Boulevard (Figure 7). The most prominent of these scarps is located at the base of a late to middle Pleistocene fan surface in west Los Angeles that extends from approximately University High School to the Mormon Temple, juxtaposing older surficial deposits and relatively shallow bedrock to the north against younger surficial deposits and a thick expanse of old alluvium to the south. Both trenching studies and seismic reflections profiles reveal that, at the VA property, the SMFZ topographic scarp contains a series of steeply dipping to sub-vertical faults that offset late Quaternary sediments (Crook et al., 1983; Pratt et al., 1998; Dolan et al., 2000; Catchings et al., 2001). Radiometric dating of key stratigraphic horizons at the VA site indicate that five to six surface-rupturing events have occurred between approximately 50,000 and 1,000-3,000 years before present (Dolan et al., 2000).

West of the project site, the SMFZ has typically been mapped just north of and parallel to Santa Monica Boulevard, following a series of scarps at the base of late to middle Pleistocene fan surfaces (Dolan et al., 2000; Bedrossian et al., 2012; Olson, 2015). However, recent subsurface explorations and geophysical studies in Century City (e.g., Parsons, 2011) have inferred the presence of a zone of faulting that extends south of Santa Monica Boulevard as well. Parsons (2011) interpreted these faults as active, however, subsequent studies have refuted this interpretation. Kenney (2012; 2013) reviewed the data by Parsons (2011) and subsequent studies and supplemented them with his own geologic and geomorphic analysis. Kenney (2012) interpreted the data to indicate that the primary basal SMFZ actually projects far to the south of the project site, and that faulting along and south of Santa Monica Boulevard should be attributed to the newly designated "Santa Monica Boulevard Fault Zone" (SMBFZ).

Faults associated with the SMBFZ dip steeply to the north and are thought to exhibit right-lateral displacement (Kenney, 2012), although a definitive sense of slip has not been established (Kenney, 2013). These faults are interpreted to be secondary structures related to the primary basal reverse SMFZ

that is thought to underlie the Century City area at depth (Kenney, 2012; Lettis, 2013). Based on our review of the recent Century City studies (discussed in detail below), the faults subject to this investigation are part of the SMBFZ.

Both Kenney (2012) and Parsons (2011) indicate there is no direct evidence that SMBFZ faults along and south of Santa Monica Boulevard are active. To date, the only evidence of Holocene activity within the SMFZ and SMBFZ is for faults that are coincident with the topographic scarp north of Santa Monica Boulevard (e.g., Dolan et al., 2000; Geocon, 2014). Updated mapping of the SMBFZ (Figure 8) provided by the City of Beverly Hills (2018b), based on mapping by the CGS, locates the fault zone as extending from the beyond the western city boundary trending northeastward and terminating near north Maple Drive and Alden Drive (City of Beverly Hills, 2018b). Furthermore, the SMBFZ postulated by Kenney (2012) or just the SMFZ as it is commonly referred to, is approximately 115 feet south of the subject site (see Figure 2 and Figure 8).

Newport-Inglewood Fault Zone

The Newport-Inglewood fault (NIFZ) zone is mapped across the western portion of the Los Angeles Basin and generally trends north to northwest. The fault zone is topographically expressed onshore by elevated surfaces which extend from the Newport Mesa in the south to the Beverly Hills area in the north (Earth Consultants International, 2018). As currently mapped, the northern portion of the Newport-Inglewood Fault ends near Pico Boulevard south of the Beverly Hills area (see Figure 2 and Figure 8); however, the location of the northern fault strands has been debated widely in the geological literature.

Hollywood Fault Zone

The Hollywood Fault generally trends in an east to west direction and extends from the City of Beverly Hills about 10 miles towards the east. As currently mapped by the CGS (2018a) and adopted by the City of Beverly Hills (2018b) the westernmost edge of the Hollywood Fault Zone is located approximately 1 mile northeast of 456 N. Rodeo Drive and does not impact the site (see Figures 2 and 8).

TOPOGRAPHIC / GEOMORPHIC REVIEW

Existing topography was examined for recognizable scarps or breaks in slope that may suggest the location of faulting through a combined review of previous geomorphic analyses (Earth Consultants International, 2018 and Lettis, 2013 and Dolan et. al., 2000) and historical U.S. Geologic Survey topographic maps (Figures 7 and 9).

Geomorphically, the site is on a degraded Holocene-aged alluvial fan surface that has been incised by north-south to northwest-southeast trending drainages (Figures 4, 5, 6, 7, and 9). Locally, the area gently slopes to the east and southeast which is consistent with natural sedimentary and fluvial processes. To the southwest of the site a prominent southeast-facing escarpment, which has historically been used to locate the Santa Monica fault, is crosscut by multiple northwest trending drainages (e.g., Dolan et al., 2000). This scarp shown in Figure 7 is prominently expressed approximately 3 mi southwest of the site at the Mormon Temple. However, from the Mormon Temple to the site, this scarp becomes less pronounced in the landscape and unrecognizable in the vicinity of the subject site (see Figure 9) where urbanization masks geomorphic features related to faulting.

PREVIOUS INVESTIGATIONS

This firm prepared a Fault Investigation Report for 468 N. Rodeo Drive, located directly north and neighboring to the subject site, dated August 20, 2018 (FGC, 2018a). The subsurface investigation utilized the data from the same continuous borings and CPTs conducted for this report. (see Figures 10 and 11). The investigation concluded that no faults traverse the subject property and that the underlying sediment exhibited multiple continuous stratigraphic horizons across the entire boring and CPT transect. The Fault Investigation report was reviewed by Roy J. Shlemon and Associates and recommended for approval on August 29th, 2018. The City of Beverly Hills issued a formal approval for the referenced site on August 29th, 2018. Data from the approved report for 468 North Rodeo Drive are used to support the findings and conclusion of this report.

The Fault Investigation Report prepared by this firm for 461 N. Beverly Drive is located approximately 20 feet east of 456 N. Rodeo Drive dated September 20, 2018 (FGC, 2018b). The subsurface investigations consisted of a transect of 5 continuously cored borings drilled to a maximum depth of 50 feet below the ground surface (See Figure 11). The investigation was conducted far enough to the southeast to shadow southern portion of the 456 N. Rodeo site and concluded that no faults traverse the subject property and that the underlying sediment across the site exhibits multiple continuous stratigraphic horizons across the entire boring transect. The Fault Investigation report was reviewed by Roy J. Shlemon and Associates and recommended for acceptance on October 2nd, 2018. The City of Beverly Hills issued a formal approval for the referenced site on October 8th, 2018. Data from the approved report for 461 North Beverly Drive are used to support the findings and conclusion of this report.

In 2011, Parsons-Brinkerhoff (Parsons) completed a fault study for the METRO Westside Subway Extension for the purpose of locating potential subway station and tunnel alignments. Based on their interpretation of continuous-core borings, cone penetrometer tests (CPTs), and geophysical surveys, Parsons (2011) depicted two zones of faulting in the area: 1) a zone of northeast-southwest trending faults, generally parallel to and south of Santa Monica Boulevard, which they attributed to the SMFZ and 2) a zone of northwest-southeast trending faults coincident with the West Beverly Hills Lineament (WBHL). These faults were considered active based on geomorphic evidence and interpreted association with known active faults. To the west of the project site, Parsons (2011) interpreted the SMFZ to span a width from the topographic scarp north of Santa Monica Boulevard to approximately 150 feet southeast of the boulevard. Parsons (2011) interpreted additional faults immediately to the southeast of this zone, but they were unable to determine whether these faults were active.

Leighton Consultants Inc. (Leighton, 2012) performed a fault investigation at Beverly Hills High School focused on the WBHL faults interpreted by Parsons (2011). Leighton (2012) advanced borings, CPTs, and excavated trenches along Parsons' (2011) borehole and CPT transects. Based on the observation of unbroken Pleistocene age soils across the grounds of the high school, Leighton concluded that the faults identified by Parsons (2011) were not active. Furthermore, Leighton (2012) provided geologic evidence that the WHBL scarp is an erosional feature, rather than a tectonic feature. The California Geological Survey (CGS) approved the Leighton report and agreed that none of the investigated faults were active (CGS, 2013).

Feffer Geological Consulting and Geocon, (2012) prepared a fault report for the 10000 Santa Monica project located immediately north of the BHHS campus and lies immediately adjacent to the MTA Santa Monica station site and between MTA Transects 2 and 4. The 10000 investigation included a trench

across the entire site that paralleled the Leighton/MTA Transect 4 and the MTA Transect 2. The trench crossed the location of several fault strands proposed by MTA (Parsons, 2011) associated with their WBHL fault zone as well as the new WBHL fault location. No faults, active or otherwise, were found in the 10000 Santa Monica trench to depths of 30+ feet and ages of >300,000 years.

Kenney GeoScience (Kenney, 2012, 2013) performed geomorphic, structural, and stratigraphic analysis using the available subsurface data from the Metro investigation (Parsons, 2011), the Beverly Hills High School fault investigation (Leighton, 2012), and other data generated from recent fault studies in the Beverly Hills/Century City area (e.g., Feffer-Geocon, 2012; Legg, 2012). Based on these data, Kenney (2012) developed a tectonic and geologic history of the area, which included an evaluation of the location and activity of suspected faults. As discussed above, Kenney (2012, 2013) interpreted the faults along Santa Monica Boulevard as secondary upper plate structures, and referred to them as the SMBFZ. This interpretation is based on the observation that the SMBFZ faults are dominantly strike-slip (possibly right-lateral). Although individual faults within the SMBFZ may exhibit normal or reverse apparent displacement, there is little net vertical displacement across the zone (Kenney, 2013). This contrasts with the observations north of Santa Monica Boulevard, where oblique left-lateral reverse motion has produced net north-side-up displacement across the fault (e.g., Dolan et al., 2000; Geocon, 2014).

Kenney (2012) noted that multiple investigations and reevaluations of the faults first interpreted by Parsons (2011) along Santa Monica Boulevard had not produced any evidence of Holocene-age activity for the SMBFZ. In fact, the most recent data indicates that activity along these faults likely ceased approximately 40,000 to 50,000 years ago (Kenney, 2012). However, Kenney (2013) noted that additional study of these faults is needed in order to confidently assess their activity.

Subsequent to Kenney's (2012, 2013) reinterpretation of the SMFZ and the SMBFZ, Geocon West, Inc. (Geocon, 2013) conducted a fault study for Westfield at the Century City mall. This study was specifically designed to identify the evidence for Holocene activity (or lack thereof) along the SMBFZ south of Santa Monica Boulevard. Geocon's (2013) study consisted of one boring transect along Avenue of the Stars, and another boring transect along Century Park West. Geocon (2013) documented a thick section of unfaulted Pleistocene-age alluvium overlying faulted sections of Lakewood Formation sediments. Based on the apparent continuation of the Pleistocene-age geologic units overlying several faults, Geocon (2013) concluded that no active faults were present at the Westfield site, and no restrictions on future development of the Westfield Site are necessary with respect to potential faulting.

The Los Angeles County Metropolitan Transit Authority prepared a report in 2017 for Transect 9 (Figure 8) of Tunnel Reach 5 located approximately 1500 feet to the southwest of the subject site (MTA, 2017). The following is a summary from FER-259 (Olson, 2018):

"In 2017, AMEC Foster Wheeler performed a supplemental fault investigation for the planned LA Metro Westside Purple Line subway extension (Metro, 2017) to assess a strand of the Santa Monica Fault Zone encountered during the preliminary fault investigation report (Parsons Brinckerhoff, 2011), which trended northeasterly towards a section of the proposed subway alignment. To investigate for potential faulting, a series of continuous core borings and CPTs were drilled along Laskey Drive, turning east at Charleville Boulevard, and continuing north along Spaulding Drive (see Figure 14, locality 15). This was referred to as Transect 9, which continues the numbering sequence from Parsons Brinckerhoff (2011). The new subsurface profile was constructed using data collected from twenty new continuous core borings drilled from 110 to 245 feet deep and 34 CPTs advanced to depths ranging from 61 to 117

feet. Based on the subsurface data the consultants identify Holocene and Pleistocene alluvial units overlying bedrock of the Pleistocene Lakewood and San Pedro Formations." (Olson, 2018, p. 31-32)

"From their observations and interpretations of the subsurface data, AMEC Foster Wheeler identified a significant fault zone at depth between their stations 6+50 and 9+00 (Figure 19) consisting of up to three strands, which dip steeply to the north. The faults exhibited greater than 90 feet of apparent down-to-the-north vertical displacement of the contact between the older alluvium and the Lakewood Formation. From the southern end of the cross section, the depth to the Pleistocene bedrock units consistently increases to the north until they are abruptly truncated and no longer encountered north of the inferred fault zone. AMEC states these faults appear to extend up near the present-day ground surface and offset Holocene sediments dated between approximately 9,100 and 16,500 years old based on radiometric dating of charcoal samples. The locations of the fault traces in the near surface sediments is based on identifying the location where laterally persistent laminated fine-grained "sag deposits" to the north are abruptly missing in adjacent down-gradient borings. It is postulated these fine-grained silts and clays were deposited in depressions or impounded drainages formed by topographic scarps created by surface-rupturing events along faults in this zone. Additional faults were also interpreted between borings north and south of this main zone." (Olson, 2018, p. 32)

As illustrated on Figure 8, MTA Transect 9 is located approximately 0.4 miles southwest of 456 N. Rodeo Drive. The interpretation of faulting by MTA (2017) is similar to the previously identified activity of the Santa Monica Fault Zone by MTA, and has been questioned by many consultants. None of the purported active faults conclusively offset Holocene age soil.

Earth Consultants International (ECI), (2018) prepared a Fault Investigation Report for 322 N. Foothill Road in the City of Beverly Hills. The site is located entirely within the AP Fault Hazard zone. To resolve the issue of Holocene time faulting, ECI drilled two continuously cored borings, pushed 6 CPT soundings, and excavated one trench. The consultant estimated the age of subsurface paleosols and observed and documented un-broken pre-Holocene stratigraphy and concluded that the site is not impacted by faulting.

METHODOLOGY

Approach

The subsurface investigation was designed to investigate across the subject site in a northwest-southeast oriented transect within the alley adjacent to the subject site. (see Figure 10). Typically, trenching is the preferred method for evaluating the presence or absence of faults because it offers a continuous, direct exposure of the fault zone or near surface stratigraphy. However, this portion of the SMBFZ is difficult to expose in trenches due to the dense urban cover in the vicinity. Because of existing structures, underground utilities, and the extent of data collected from the neighboring sites (FGC, 2018a 2018b), this fault study consists of a transect of 4 continuously cored borings and 11 CPT soundings. The borings and CPT's are located on a 1 inch = 10 foot scale base map, and the subsurface data are plotted on a 1 inch = 10 foot scale cross section for interpretation (Figures 12 and 13).

Field Exploration

Prior to beginning the subsurface field exploration, work permits were obtained from the City of Beverly Hills. Underground Service Alert (USA) was notified to identify buried utilities in the vicinity of the proposed excavations, and an independent utility locating company was also contracted to verify "no-conflict" areas for the drilling/CPT exploration.

Subsurface exploration of the four continuously cored borings and eleven CPT soundings were completed on July 31, 2018. The borings and CPT's were excavated to a maximum depth of 50 feet beneath the existing ground surface. The boring logs and soil descriptions, and CPT report are included in Appendices A, B, and C and Tables 1 and 2 respectively.

GEOLOGIC MATERIALS

The continuity of soil (pedogenic) horizons and primary stratigraphic contacts provides data to evaluate the presence or absence of faulting. Five conformable stratigraphic units within the alluvium were encountered in each of the 4 borings and 11 CPT's (Appendix B). In general, these units consist of a basal coarse-grained sediments, fining-upward to fine sand and silt and local clays, typically capped by a buried paleosol.

Holocene Alluvial Fan Deposit 1 (Qal1)

The uppermost unit in section A-A' (Figures 12 and 13) is composed of silty sand to silty sand with clay. Gravels are generally fine, sub angular to sub rounded fragments of slate. Hues are in the 7.5YR range (brown). We interpret this unit as a late Holocene age alluvial deposit (sheet flow), and designate it as Qal1. A thin veneer of artificial fill overlies this unit across a majority of the study area. Unit Qal1 includes both a surficial alluvial deposit and a weakly-developed and truncated argillic soil.

Holocene Alluvial Fan Deposit 2 (Qal2)

The lowest Holocene unit in section A-A' (Figures 12 and 13) is composed of sandy clay to clayey sand. Localized gravels at the base of this unit are generally massive and fine to medium grained, sub rounded fragments of slate. Hues are in the 7.5YR range (brown). We interpret this unit as an early Holocene to latest Pleistocene aged alluvial deposit (axial valley deposit), and designate it as Qal2. A thin scour deposit overlies and truncates this unit across a majority of the study area. Qal2 includes alluvial deposits with a thick, diffuse (cumulic), and weakly-developed argillic soil.

Pleistocene Alluvial Fan Deposit 1 (Qoa1)

The uppermost Pleistocene unit in section A-A' (Figures 12 and 13) is composed of gravelly clayey sand to sandy clay. Gravels are generally fine to medium grained, sub angular and highly weathered fragments of slate. Hues are in the 7.5 to 5YR range (brown to reddish brown). We interpret this unit as a late Pleistocene age alluvial fan deposit (debris flow), and designate it as Qoa1. A strong scour deposit overlies this unit across the entire study area. Unit Qoa1 includes alluvial deposits that contain a well-developed and truncated argillic soil. The contact between Qal2 and Qoa1 is found at a depth of approximately 26 feet across the entire study area.

Pleistocene Alluvial Fan Deposit 2 (Qoa2)

Beneath unit Qoa1, we encountered a unit composed of silty sand with gravel to sandy clay. Gravel is interbedded within this unit, and is composed of fine, medium and coarse-grained, rounded slate and sandstone. Hues are in the 7.5YR range (brown) with localized faint mottling with 2.5YR olive to grayish brown. This unit is interpreted as a highly weathered late Pleistocene braided stream channel deposit that contains two highly truncated, thin and moderately well-developed soil remnants and we designate it as unit Qoa2. The contact between Qoa1 and Qoa2 is found at a depth of approximately 34 feet across the entire study area.

Pleistocene Alluvial Fan Deposit 3 (Qoa3)

Beneath unit Qoa2, we encountered a unit composed of sandy clay to silty sand with gravel. Gravel is interbedded within this unit, and is composed of fine and medium-grained, highly weathered and sub rounded to sub angular slate and sandstone. Hues are in the 7.5YR range (brown) with faint localized mottling with 2.5YR olive to grayish brown. This unit is interpreted as a highly weathered late Pleistocene braided stream channel deposit that contains a highly truncated, stacked and well developed soil remnant designated as Qoa3. Unit Qoa3 is the oldest unit encountered during the subsurface exploration. The contact between Qoa2 and Qoa3 is found at a depth of approximately 45 feet across the entire study area.

Soil Development/Soil Profiles

The borings (see Figures 12, 13 and Appendix A) lie across a graded (or stripped) and artificially filled surface that is geomorphically inactive. The soil profile in each boring at depth consists of a truncated sequence of multiple stacked and truncated Alfisol soils (Qoa1, Qoa2, and Qoa3). The entire section in this locality is capped by 6 to 7 feet of artificial fill. Parent materials for these soils consist chiefly of slate-rich debris flow and/ or stream terrace deposits that have most likely emanated from Benedict Canyon. The deepest exposures contain faint mottling and gleying that increases with depth and may faintly overprint or mask some of the original soil properties (mainly soil color). Soil profiles in each boring contains a surface soil and 4 buried soils to depths of approximately 50 feet below the ground surface. This stratigraphic section tracks across the entire area investigated. The individual soil profile members and relative age estimates are briefly described below.

The uppermost or surface soil on site (Qal1) is a highly truncated soil remnant that consists of one weakly developed argillic diagnostic subsurface horizon (Bt – BC). The deposit consists of a crudely stratified fining upwards sequence. This soil member is characterized by a coarse-grained deposit with 7.5YR hues and few thin thick clay films on ped faces and coating gravel and has an estimated relative age of 4 – 8 ka (Appendix B).

The lowest Holocene soil on site (Qal2) is a diffuse and cumulic soil remnant that consists of a thick and weakly developed argillic diagnostic subsurface horizon (2Bt – 2BC – 2C). The deposit consists of a crudely stratified fining upwards sequence. This soil member is characterized by basal gravel and fine-grained deposit with 7.5YR hues and common thin thick clay films on ped faces and coating gravel. Qal2 has an estimated relative age of 12 – 21 ka (Appendix B).

The youngest Pleistocene aged soil on site (Qoa1) is the remnant of a strongly developed Alfisol soil. This is a highly truncated soil that consists of two moderately well-developed argillic diagnostic

subsurface horizons (3Bt1 – 3Bt2 – 3BC). The deposit consists of a fining upwards to massive deposit and most likely represents the distal portion of a debris flow deposit. This soil member is characterized by a gravel-rich and fine-grained deposit with 5 to 7.5YR hues and many thin and common moderately thick clay films on ped faces and coating gravel. This soil member has a relative age estimate of 25 - 51 ka.

The third buried soil member on site (Qoa2) is a truncated and older cumulic soil remnant that consists of a thick and moderately well-developed argillic soil profile (4Btb – 4BC). The deposit consists of a crudely stratified fining upwards sequence. This soil member is characterized by a fine-grained deposit with 7.5YR hues locally mottled with 2.5YR hues, with common thin and few to common moderately thick clay films on ped faces and has an estimated relative age of 33 – 64 ka (Appendix B).

The oldest and lowest buried soil member on site (Qoa3) is a truncated and stacked soil remnant that consists of two moderately well-developed punctuated argillic soil profiles (5Btb – 5BC - 6Bt – 6BC). The deposit consists of two crudely stratified fining upwards sequences. This soil member is characterized by a stratified deposit with 7.5YR hues locally mottled with 2.5YR hues, with few to common thin and few moderately thick clay films. Qoa3 and the entire stratigraphic section under study has an estimated relative age of 46 – 94 ka (Appendix B).

In conclusion, the entire stratigraphic sequence exposed at the project site is estimated to be in excess of 46 ka in age. The project site contains Pleistocene-aged materials at depth. The stratigraphic units encountered provide visually and texturally distinct, mappable contacts that are overlapping across the project site area and across the transect of borings. No features or structural characteristic of faulting, such as shear zones or high angle contacts between units, were observed within the core samples. The contacts between Qoa1 and Qoa2 and between Qoa2 and Qoa3 are observed to undulate and slope gently the south as would be expected by normal sedimentary processes.

EVIDENCE FOR THE ABSENCE OF FAULTING

Several subsurface geologic relationships at 456 N. Rodeo Drive provide direct evidence that preclude Holocene faulting. When these relationships are considered together, there is compelling evidence for the absence of faulting beneath the subject site. The primary lines of evidence that support the interpretation that no faults traverse the site are:

• **Continuous, unfaulted soil horizons and primary stratigraphy across the site.** The exploration conducted on site exhibits multiple continuous stratigraphic horizons across the entire boring and CPT transect. All of the deposits encountered along the transect correlate well across the project site. If faults with a vertical component of slip were active in this area, they would have produced recognizable, vertical separations of these Pleistocene units. Similarly, active strike-slip faulting would have produced an apparent dip-slip component or truncation of units due to the juxtaposition of different Pleistocene strata or pedogenic horizons.

• **No faults were encountered in the subsurface exploration.** No features characteristic of faulting, such as shear zones or high angle contacts between units were observed within the collected continuously cored samples. Though not compelling enough to preclude the presence of faulting, it is consistent with and corroborates other lines of evidence.

• **No irregularities or topographic features indicative of faulting were observed:** Geomorphically, the project site exists on an incised and degraded Holocene-aged alluvial fan deposit. Mapping by Campbell at al., (2014), Yerkes and Campbell (2005), Dibblee and Ehrenspeck (1991) and Hoots and Kew (1931) confirm this and is further supported by the findings of this report. Moreover, the site lies north of the eastward projection of the existing Santa Monica Fault Zone, and no escarpments are apparent on historic topographic maps.

Supporting evidence from neighboring investigations: The data collected and conclusions reached within the approved accompanying reports for 468 N Rodeo Drive and 461 N. Beverly Drive reinforce the conclusions and overall findings of this report (FGC, 2018a, 2018b).

CONCLUSIONS AND RECOMMENDATIONS

The fault investigation for 456 N. Rodeo Drive documents continuous unbroken, pre-Holocene sediments across the entire site. The observed continuous and un-broken stratigraphy implies that no active faults traverse the site. The project site is not exposed to the hazard of surface fault rupture which would impact or limit future development of the site.

While the area explored in our study is not likely subject to surface faulting, a future earthquake on the Santa Monica Boulevard, Santa Monica, Hollywood, or Newport - Inglewood fault zones will likely produce very strong, near-field ground motions at the project site that must be assessed by an appropriate geotechnical evaluation of the site.

LIMITATIONS

The conclusions and recommendations presented herein are the results of an inherently limited scope. Specifically, the scope of services consisted of an assessment of whether or not active faults are present within the area explored at the site. The conclusions and recommendations contained in this report are professional opinions derived in accordance with current standards of professional practice. No warranty is expressed or implied.

This report has been prepared for the exclusive use of 456 N. Rodeo Drive LLC and applies only to potential future development at the site located at 456 N. Rodeo Drive in the City of Beverly Hills, California. In the event that significant changes in the development planning should occur, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed by Feffer Geological, and the conclusions and recommendations of this report are verified in writing.

EXPLANATION

Geomorphic surfaces which include active channels (Qa), active alluvial fan deposits (Qf), young alluvial fan deposits (Qyf), and old alluvial fan deposits (Qof). (Yerkes and Campbell, 2005)

Sedimentary Deposits

Qal — Alluvium: Coarse unconsolidated deposits in valleys and stream channels (Holocene)

Qpt — Alluvial plain, stream, and marine terrace deposits (Upper Pleistocene)

Sedimentary Rocks

Qm — Marine deposits: Marine sandstone, conglomerate, and clay shale (Upper Pleistocene).

Tml — Modelo Formation: Marine; lower member; consisting of interbedded, hard, platy siliceous shale and softer brown shale (Miocene).

Tmls — Modelo Formation: Marine; lower member; consisting of lenticular beds of coarse grained sandstone (Miocene).

Metamorphic Rocks

smss — Santa Monica Slate: Dark gray to blue-black slate (Triassic).

smsp — Santa Monica Slate: Dark gray mica schist and phyllite cut by white quartz veins (Triassic).

Igneous Rocks

g — Granite and granodorite (Jurrasic).

(DOCUMENT AFFECTS – NOTHING TO PLOT)

6. ANY INVALIDITY OR DEFECT IN THE TITLE OF THE VESTEES IN THE EVENT THAT THE TRUST REFERRED TO HEREIN IS INVALID OR FAILS TO GRANT SUFFICIENT POWERS TO THE TRUSTEE(S) OR IN THE EVENT THERE IS A LACK OF COMPLIANCE WITH THE TERMS AND PROVISIONS OF THE TRUST INSTRUMENT.

(NOT A SURVEY MATTER)

7. ANY RIGHTS, INTERESTS, OR CLAIMS WHICH MAY EXIST OR ARISE BY REASON OF THE FOLLOWING MATTERS DISCLOSED BY SURVEY, PROJECT NO.: 17-508ORC, DATED: OCTOBER 13, 2017, LAST REVISED _____, 2017 AND PREPARED BY: DRC ENGINEERING, INC.
8. ANY RIGHTS OF THE PARTIES IN POSSESSION OF A PORTION OF, OR ALL OF, SAID LAND, WHICH RIGHTS ARE NOT DISCLOSED BY THE PUBLIC RECORDS.
9. INTENTIONALLY DELETED.
10. INTENTIONALLY DELETED.

ALTA/NSPS TABLE A ITEM NOTES
ITEM 2 — THE SITE ADDRESS OBSERVED WHILE CONDUCTING THE SURVEY IS: 456 NORTH RODEO DRIVE, BEVERLY HILLS, CA 90210

ITEM 3 — THE LAND SHOWN ON THIS SURVEY LIES ENTIRELY WITHIN FLOOD ZONE "X" (UNSHADED), BEING DESCRIBED AS "AREAS DETERMINED TO BE OUTSIDE THE 0.2% ANNUAL CHANCE FLOODPLAIN." PER FLOOD INSURANCE RATE MAP (FIRM) – COMMUNITY PANEL NUMBER 06037C1585F, DATED SEPTEMBER 26, 2008

ITEM 4 — THE GROSS LAND AREA IS: 7,634 SF / 0.175 ACRES

ITEM 6(a) — THE CURRENT ZONING CLASSIFICATION IS "C-3" COMMERCIAL ZONE PER THE PLANNING & ZONING RESOURCE COMPANY ZONING VERIFICATION LETTER DATED OCTOBER 19, 2017.

BUILDING SET-BACK LINES:
FRONT/SIDE/REAR: NOT APPLICABLE / NONE SPECIFIED.

MAXIMUM BUILDING HEIGHT OR STORIES:
45 FEET OR 3 STORIES, WHICHEVER IS LESS.

ITEM 6(b) — SEE THE SURVEY PLAT FOR THE LOCATION OF SETBACK LINES.

ITEM 7(a) — SEE THE SURVEY PLAT FOR EXTERIOR DIMENSIONS OF ALL BUILDINGS AT GROUND LEVEL.

ITEM 7(b)(1) — SEE THE SURVEY PLAT FOR THE SQUARE FOOTAGE OF THE EXTERIOR FOOTPRINT OF ALL BUILDINGS AT GROUND LEVEL.

ITEM 7(c) — SEE THE SURVEY PLAT FOR THE MEASURED HEIGHT ABOVE GRADE OF ALL BUILDINGS.

ITEM 8 — SEE THE SURVEY PLAT FOR ANY SUBSTANTIAL FEATURES OBSERVED IN THE PROCESS OF CONDUCTING THE SURVEY.

ITEM 9 — SEE THE SURVEY PLAT FOR ANY PARKING STRIPING AND TYPE OF PARKING SPACE. THE PARKING COUNT IS AS FOLLOWS:

REGULAR SPACES	8
HANDICAP SPACES	1
TOTAL SPACES	9

ITEM 10(a) — (PARTY WALLS) SEE SURVEY FOR PARTY WALLS ON THE SUBJECT PROPERTY.

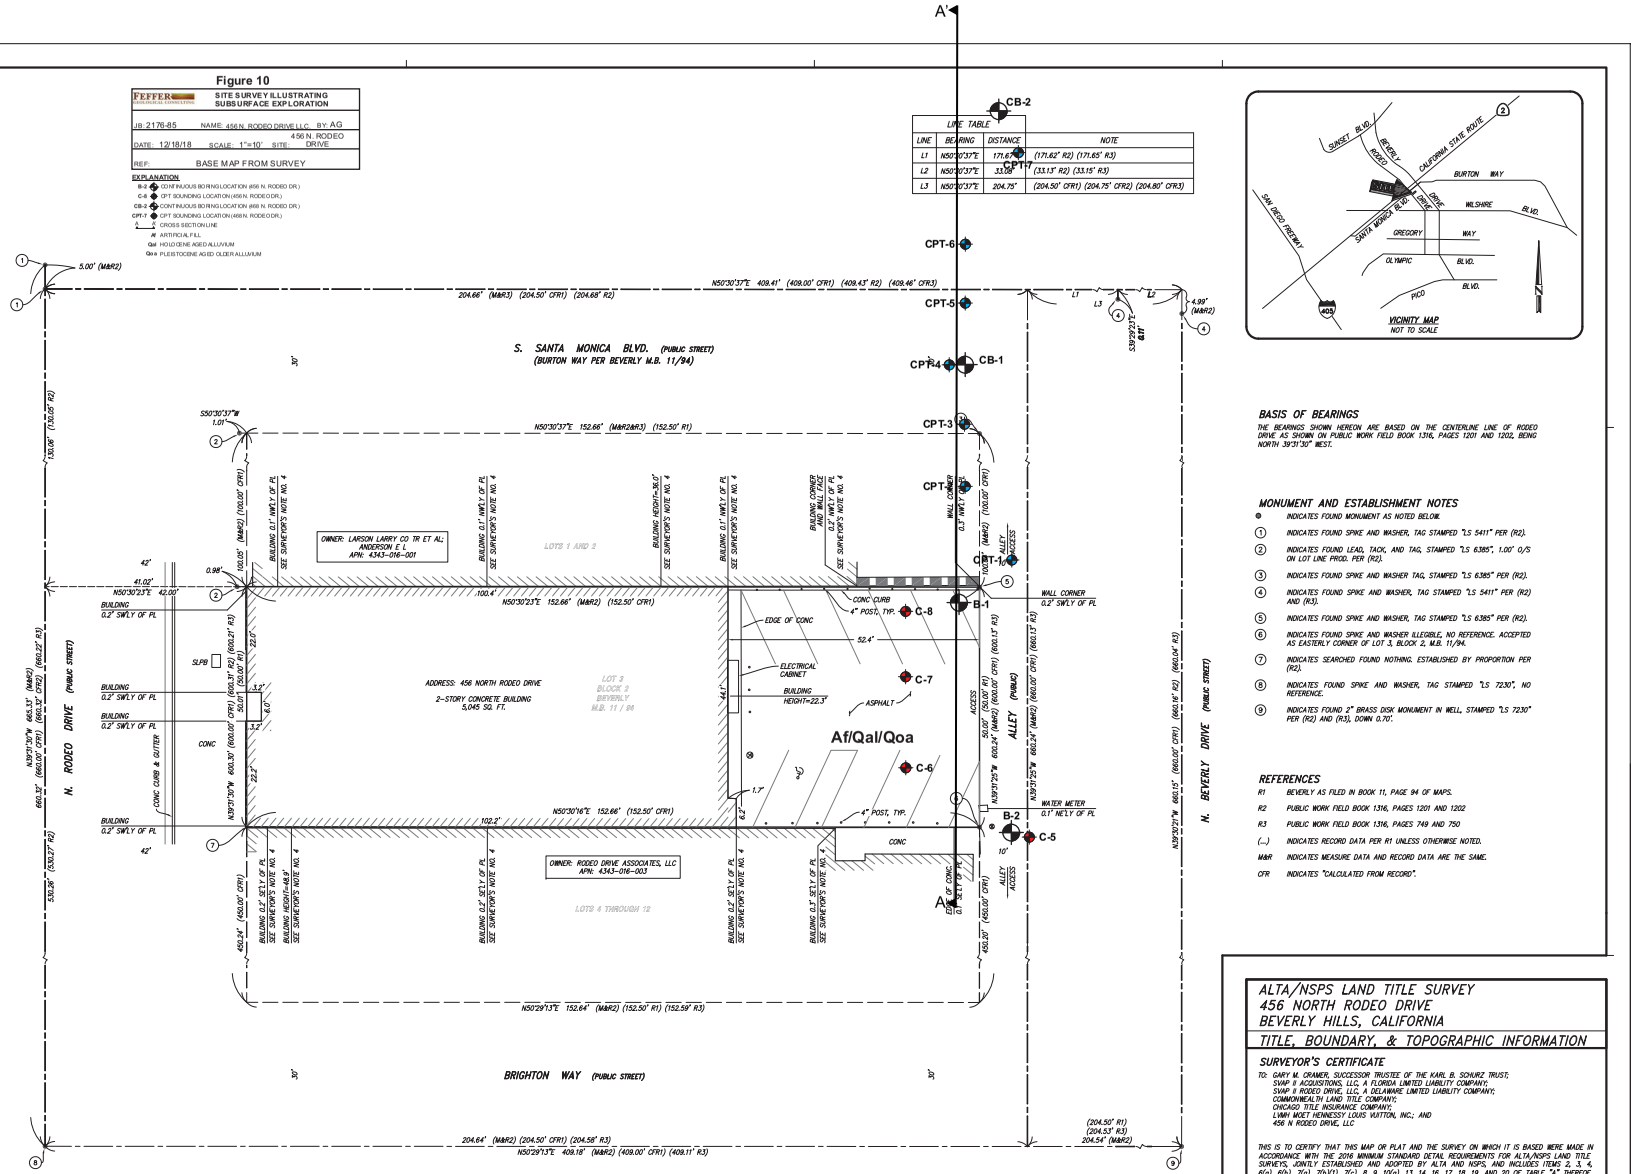
ITEM 13 — SEE THE SURVEY PLAT FOR THE NAMES OF ADJOINING OWNERS.

ITEM 14 — SEE THE SURVEY PLAT FOR THE DISTANCE TO THE NEAREST INTERSECTING STREET.

ITEM 16 — THERE WAS NO EVIDENCE OF RECENT EARTH MOVING WORK, BUILDING CONSTRUCTION, OR BUILDING ADDITIONS OBSERVED IN THE PROCESS OF CONDUCTING THE FIELDWORK.

ITEM 17 — THERE ARE NO PROPOSED CHANGES IN STREET RIGHT OF WAY LINES, OR OBSERVED EVIDENCE OF RECENT STREET OR SIDEWALK CONSTRUCTION OR REPAIRS DURING THE PROCESS OF CONDUCTING THE FIELDWORK.

ITEM 18 — THE SURVEYOR DID NOT OBSERVE ANY MARKERS DELINEATING WETLANDS ON SUBJECT PROPERTY.



ITEM 19 — (IMPROVEMENTS WITHIN OFFSITE EASEMENTS) THE COMMITMENT DID NOT LIST ANY OFFSITE EASEMENTS OR SERVITUDES BENEFITTING THE SURVEYED PROPERTY.

APPENDIX 'A'

Boring Logs

LOG OF EXPLORATORY BORING

Job Number: 2176-85
Project: 456 N. Rodeo Drive

Boring No: B-1
Boring Location: See Site Map

Date Performed: 7/11/18

Drill Type: 8” Hollow Stem / Continuous Core

Depth in Feet	Run #	Recovery Ratio	Recovery Graphic	Bedrock/ Soil Description	Color	Density	Strat/ Soil Unit
0	1			**0-7.8’:** Fill - Silty sand, scattered concrete and asphalt fragments Hand augered upper 5’ due to utilities	Brown	Medium Dense	**Af**
5	2	5/5					Af
				Holocene Alluvium (Qal1) **7.8-10’:** Clayey sand, massive, slightly well oxidized, medium to coarse grained, moderately sticky and plastic, poorly sorted sand, common thin and few moderately thick clay films	Brown 7.5 YR 4/3	Hard, friable	Bt
						Slightly Hard, friable	C
10	3	3.7 /5		**10-12.7’:** Silty sand with clay, massive, slightly well oxidized, medium to coarse grained, slightly sticky, moderately plastic, few fine to medium slate gravels, few to common thin clay films	Brown 7.5 YR 5/3	Slightly Hard, friable	BC
				Holocene Alluvium (Qal2) **12.7-23.5’:** Clayey sand, massive, slightly well oxidized, fine to medium grained moderately well sorted sand, moderate to very sticky, very plastic, few localized fine $CaCO_3$ nodules, common thin and very few moderately thick clay films	Brown 7.5 YR 5/4	Hard, firm	2Bt
15	4	5/5

LOG OF EXPLORATORY BORING

Job Number: 2176-85
Project: 456 N. Rodeo Drive

Boring No: B-1
Boring Location: See Site Map

Date Performed: 7/11/18

Drill Type: 8” Hollow Stem / Continuous Core

Depth in Feet	Run #	Recovery Ratio	Recovery Graphic	Bedrock/ Soil Description	Color	Density	Strat/ Soil Unit
20				**12.7-23.5’:** Clayey sand, massive, slightly well oxidized, fine to medium grained moderately well sorted sand, moderate to very sticky, very plastic, few localized fine $CaCO_3$ nodules, common thin and very few moderately thick clay films	Brown 7.5 YR 5/4	Hard, firm	2Bt
	5	4/5					
				23.5-25’: Silty sand with clay, massive, slightly well oxidized, coarse grained poorly sorted sand, common clay stains, slightly sticky, non-plastic	Brown 7.5 YR 5/4	Slightly Hard, friable	2BC
25				**25-27.7’:** Silty sand, massive, coarse grained poorly sorted sand, non-sticky, non-plastic	Brown 7.5 YR 5/3	Soft, friable	2C
	6	3.5 /5		**Pleistocene Older Alluvium (Qoa1)**			
				27.7 -30’: Clayey sand, massive, moderately well oxidized, slight organics, medium grained, moderately well sorted sand, common thin clay films, very sticky, very plastic	Reddish Brown 5 YR 4/3	Very Hard, firm	$3Bt_1$
30				**30-32.8’:** Sandy clay with gravel, massive, moderately well oxidized, coarse grained, poorly sorted sand, with common fine to medium highly weathered gravels, many thin and common moderately thick clay films	Reddish Brown 5 YR 4/4	Very Hard, friable	$3Bt_2$
	7	5/5		**Pleistocene Older Alluvium (Qoa2)**			
				32.8-39.5’: Clayey silt with sand - silty clay, moist, moderately oxidized, becoming fine to medium grained silty sand with clay, containing few scattered medium gravels	Strong Brown 7.5 YR 5/6	Very Hard, firm	4Bt
35							
	8	5/5					
40				**39.5-42.9’:** Becomes medium to coarse sand with scattered gravels, slightly moist	Brown 7.5 YR 5/4	Soft, friable	4BC

Subject: Soil Stratigraphy Study And Relative Age Estimates For A Fault Rupture Hazard Investigation At 456 North Rodeo Drive, Beverly Hills, CA.

Dear Mr. Feffer:

I am pleased to present to you this soil stratigraphic study and relative-age determinations to be used with your fault rupture hazard assessment of the proposed development located at 456 North Rodeo Drive in the City of Beverly Hills, California.

Feffer Geological retained John Helms CEG to describe and assist in correlations of the soil stratigraphy from continuously cored borehole samples and to assign relative age dates for the deposits identified across the site. The continuously cored bore hole samples were obtained from a single transect of borings, transect A. One borehole (CB-1) was completely described from transect A, and three additional boreholes (CB-2, B-1, and B-2) from transect A have been reviewed and summarized. The detailed soil descriptions are used to calculate various soil development indices (or SDIs). The SDI values were then compared to the SDI values from similar described soils with known ages to estimate age ranges for the soils understudy.

The attached report classifies the described soil profiles, identifies stratigraphic relationships, defines soil chronosequences, and estimates the relative ages for the two soil profiles described in detail. Calculated SDI's show strong correlations to the SDI values of other published, described, and dated soil profiles with similar parent materials.

Age estimates range from 46 to 94 ka for the stratigraphic section studied along transect A in boring CB-1. There are several distinctive buried soil units that can be correlated across the entire length of Transect A. One distinctive buried soil (buried soil 2, Qoa1) which can be correlated across the entire length of Transect A, is a truncated and well oxidized argillic soil profile that ranges in relative age from 25 – 51 ka. Please see Table 6 in the attached report for a summary listing of all of the determined relative ages at the study site.

Thank you for this opportunity to be of service. Should you have any questions or require additional information, please do not hesitate to contact me.

Sincerely,

John Helms, CEG 2272

SOIL STRATIGRAPHY STUDY AND RELATIVE AGE ESTIMATES FOR A FAULT RUPTURE HAZARD STUDY FOR A PROPOSED DEVELOPMENT AT 456 NORTH RODEO DRIVE, BEVERLY HILLS, CALIFORNIA.

INTRODUCTION

Due to a repeating sequence of stratigraphy across the entire transect of borings, one soil profile has been studied for geomorphic characteristics and relative degrees of weathering to estimate deposit relative-age. Boring CB-1 was selected for this process due to it's position being located on the subject property as well as being located near the center of the transect of borings. The relative age estimate is based on index value comparisons with other published and dated soil profile descriptions. The comparative soils are from areas with a similar climate and similar parent material to this study area. The estimated relative ages in this report will be used by Feffer Geological, Inc. to assess the recency and recurrence of faulting across the study area. Alluvial units are assessed chronostratigraphically across four borehole locations from a single transect of borings and CPT's that shadow the area proposed for development. In this study, the soil stratigraphy is defined with soil field description data, and no laboratory data. This study identifies the soil stratigraphy across the area under study and estimates the relative age of one soil profile. Continuously cored and sampled borehole CB-1 has been described in detail, and three additional continuously cored and sampled boreholes (CB-2, B-1, and B-2) has been summarized or briefly described along Transect A. Transect A is located along a graded and stripped alluvial surface.

For the Quaternary geologist, a soil can be defined as a natural body that consists of horizons of organic and/or mineral constituents which differ from its parent material in some way (Birkland, 1984). A chronosequence is a group of soils for which all soil forming factors (such as topography, parent material, vegetation, and climate) except time is relatively equal (Jenny, 1941). Past geologic studies in the coastal region of southern California provide age constraints for several deposits and geomorphic surfaces ranging in age from middle Pleistocene to recent (McFadden, 1982; Rockwell, 1988; and WLA, 1998). Often it has proven difficult to date older deposits due to changes in past climatic regimes. Studies on the impacts of glacial to interglacial climatic changes on soil development in specific regions (McFadden, 1982; Birkland, 1984; McFadden, 1988) indicate that soil development has occurred throughout the Quaternary.

This study is concerned with a section of alluvium derived from the southern range front of the Santa Monica Mountains, which is within the Transverse Ranges Geomorphic Province. A series of stacked and truncated argillic soil subsurface horizons within all of the stratigraphic sections studied indicates that the alluvial stratigraphic section across the entire study area correlates well and is significantly old. Age estimates range from 46 to 94 ka for the stratigraphic section studied near the center portion of transect A in boring CB-1.

Soil relative age estimates have broad ranges, dependent upon the pool of comparative data used. Most of the buried soils across the study area fall into the Alfisol soil order (Soil Conservation Service, 1999). The soil profile that is described in detail is from boring CB-1 in Transect A and summary descriptions were generated for borings CB-2, B-1, and B-2 from Transect A. Boring locations are shown on the geologic map that is provided with the main fault rupture hazard report.

MATERIALS AND METHODS

Continuous core samples collected from boring CB-1 by Feffer Geological, Inc. were described in detail as part of this study. The soils were described using guidelines set by the Soil Survey Staff (1991 and 1999). Specific soil properties such as soil structure and soil horizon boundaries could not be accurately described from the core sample exposures. These soil qualifiers have not been described and do not factor into the estimated soil relative age comparisons.

Soil profile field description values quantify soil properties that are used to develop a soil development index (SDI) value as outlined by Harden (1982). Points are assigned to descriptive data for each of several observed soil properties, such as dry color, moist color, texture, dry and wet consistence, and clay film content, for each soil horizon in a soil profile relative to the soil horizon's thickness, and normalized to a common depth. The maturity of a soil profile is gauged through data collected from active wash deposits (or raw alluvium).

Table 1.1 lists the detailed soil description for the studied boring in longhand format. Table 1.2 lists the soil description using soil conservation service notation and shows the SDI calculations. Table 1.2 shows the calculated SDI values, the soil profile description, and the normalization values for raw alluvium. SDI values are calculated by assigning point values to each described soil properties. The points are summed for each soil horizon and divided by the total number of descriptive properties used. This equals the mean horizon index value (HI). HI values are multiplied by the corresponding soil horizon thickness. The SDI value equals the sum of the thickness normalized horizon indices. The maximum horizon index (MHI) is the value of the horizon with the largest summed descriptive value. MHI is independent of horizon thickness, and is usually the diagnostic subsurface soil horizon for most soil profiles. Tables 1.2 lists all of the determined HI, SDI, and MHI values for the soil profile under study.

SDI and MHI values have shown significant correlations to soil age in many past studies (Harden, 1982; Rockwell *et al.*, 1983; Reheis *et al.*, 1989; Rockwell *et al.*, 1994). The soils described in this study are compared to soils described and dated by McFadden (1982 and 1988) in San Bernardino County near Mission Creek, by Rockwell (1983) in the Ventura River basin, and by William Lettis and Associates, Inc. (1998) in West Hollywood. SDI values have all calibrated to a common depth of 7 feet.

The changes in the subsurface pedogenic properties of the Alfisols soil order allows for relative age determinations by emphasizing specific soil properties (such as color and clay film content) that are most diagnostic. Soil properties that express themselves well through time are most often used in the assessment of soil relative ages through a specific soil property index such as the color or clay film index. The color index (Rockwell *et al.,* 1985, 1988) is used to quantify observed colors (in Munsell notation) of each profile in order to compare relative degrees of reddening. The color index is simply the summation of an entire profile's horizon index values for dry colors. The clay film index (Rockwell *et al.,* 1985, 1988) is used to quantify field descriptions of this soil property in order to compare relative profile maturity. The clay film index is simply the summation of an entire soil profile's horizon index values for clay films. MHI is a comparison of a soil pedons master (or diagnostic) subsurface

horizon (typically an argillic or cambic horizon). Independent of horizon thickness, the MHI directly compares the properties of the soil profiles strongest soil horizon.

SOIL RELATIVE AGE METHODS

Soil relative ages are calculated and compared independently for each soil profile described. The soil profile described for this study is located across several buried alluvial surfaces that differ in relative age, facies of deposition, and degrees of preservation. A series of stacked, buried, and truncated hard, clayey soils with illuvial clays characterize a majority of the soil profiles described on this project site.

The soil profile described in detail has a surface age that is implied by estimating the time of inception for the exposed surficial soil. The soil profile described in detail for this study also contains a series of stacked and / or buried soil profiles. In this case, deposit age assessments are obtained by identifying and isolating the different parent materials (or deposits). Then comparing a set of abridged calculated indices to an additional suite of similar soils that have been radiometrically dated yields the equivalent to a buried surface age estimate. Such burial relationships are common along the southern Santa Monica Mountains range front; especially where soils that have developed into alluvial fan deposits which commonly bury or locally truncate older soils that have developed previously in older alluvial deposits. A cumulic soil profile estimated age can assess landform age, and has potential to assess rates of erosion, rates of landform evolution, and rates of tectonic activity across the study area.

The described soil profiles have an SDI value, which is used to estimate the soil relative age. Cumuli relative age estimates for a stacked or buried soil profiles are specifically referred to as “deposit ages”. The relative age estimate for the surface profile or modern soil is referred to as the “surface age”. All of the relative age estimates given are considered minimum ages given that an unknown amount of erosion has occurred after the formation of and before the burial of each truncated surface and buried soil studied.

SOIL SUMMARY DESCRIPTIONS

Soil summary descriptions were generated for borings CB-2, B-1, and B-2 in this study. The summary descriptions record diagnostic pedogenic features for each soil horizon identified. This was done in order to assist with establishing stratigraphic correlations across the site. Relative age estimates were not generated for any of the listed soil summary descriptions. The soil summary descriptions are listed in Tables 2.1, 2.2, and 2.3.

DISCUSSION AND RESULTS

This section contains a brief write up for the continuously cored boring described in detail with designated tables for the soil profile. The attached Table 1.1 presents the soil profile description in longhand format. Table 1.2 presents the results of the calculated SDI values. Table 3 is a summary of the soil relative age estimates for the soil profile under study. Table 4 is a compilation of the comparative data in a format that compares to the data generated for this study. Table 5 is a soil abbreviation key to be used in conjunction with the SDI calculation sheets. Table 6 lists the relative ages for each designated stratigraphic unit that is shown on the geologic cross section in the fault rupture hazard report.

Soil descriptions, SDI calculations, and relative age determinations follow for the soil profile studied.

TRANSECT A BORINGS

One soil profile was described in detail out of core samples from Transect A in boring CB-1. Age estimates range from 46 to 94 ka for the alluvial section studied in boring CB-1 of transect A.

Boring CB-1

The core samples from Transect A, Boring CB-1 were reviewed at the project site on 8/7/2018 and on 8/8/2018. This boring is located near the center of Transect A, and this alluvial section is characterized by a sequence of truncated argillic soils interbedded with massive and crudely stratified scour deposits. See Table 1.1 for a complete soil description of the continuously sampled boring, Table 1.2 for the SDI index value calculations and relative age estimates, and Feffer Geological Inc.'s cross section and geologic map for both the borehole and transect location.

The surface soil (Qal1) in boring CB-1 consists of a weakly-developed Alfisol that is characterized by a severely truncated and organic rich argillic horizon and has an estimated relative age of 4 – 8 ka. The uppermost buried soil (Buried Soil 1 / Qal2) that can be correlated across the entire length of Transect A is a truncated, thick, and diffuse weakly to moderately well-developed Alfisol soil with an estimated relative age value of 12 – 21 ka. The second buried soil in this alluvial sequence is the top of the Pleistocene in this stratigraphic section. This marker bed (Qoa1) can be correlated across the entire area investigated and is a truncated and moderately well-developed Alfisol soil that has an estimated relative age value of 25 – 51 ka. The third buried soil (Buried Soil 3 / Qoa2) also can be correlated across the entire length of Transect A is a truncated, thin and weakly to moderately well-developed Alfisol soil with an estimated relative age value of 33 – 64 ka. The forth buried soil (Qoa3) in Transect A, and the entire stratigraphic section studied has an estimated age that ranges from 46 – 94 ka. This lowest buried soil in this alluvial sequence can be correlated across the entire area investigated and is a truncated and moderately well-developed Alfisol soil.

Differences in the number of soils, depths of burial and unit thicknesses due to differential erosion / truncation laterally along Transect A may cause minor variances in relative age estimates between the individual borings. In order to control for this additional soil summary descriptions were generated across this transect which assesses the same buried surfaces at differing depths of burial and in differing states of preservation.

BORING SUMMARY DESCRIPTIONS

Soil summary descriptions generated for borings CB-1, B-1 , and B-2 are listed in Tables 2.1, 2.2, and 2.3. Relative age estimates were not generated for the soil summary descriptions. The summary descriptions were generated to assist with establishing stratigraphic correlations across the site. The observations for the soil summary descriptions along Transect A were made on 8/8/2018. All of the borings along Transect A appear to contain a thin veneer of artificial fill that is in contact with a sequence of Holocene- and Pleistocene-aged truncated argillic soils and nested sour deposits. Several of the Pleistocene-aged

truncated and /stacked buried soils are maker units which can be correlated across the area investigated.

CONCLUSIONS

A majority of the soils observed across the study area are Alfisols that have developed in alluvial environments. All of the soil profiles across Transect A consist of a series of stacked, truncated, and buried argillic soil horizons. The truncated and buried soils with argillic sub surface soil horizons are weakly and moderately well developed. The Alfisol soils typically have 7.5YR to 5YR color hues with a modest amounts of secondary (pedogenic) clay in a series of argillic (Bt) diagnostic subsurface horizons.

The surface soil profile across the area investigated is laterally continuous across transect A. Lateral variability in observed in the buried soils across the site is due to localized erosion, scouring, infilling, and stacking of these materials in an alluvial environment. In this sedimentological environment surfaces that have been stable long enough to form a robust soil, can suddenly be buried by a new deposit, or scoured out (truncated) and possibly in-filled with younger material. The amount of erosion that has occurred with each truncated soil under study is unknown. Thus the relative age estimates given in this study are minimum ages.

These soil relative age determinations are consistent with the general geologic and pedogenic observations of soils in southern California. Strongly developed, well horizonated, thick, and oxidized Alfisols can be as much as 200 ka in age. Erosion tends to act as a rejuvenating aspect in soil development, by decreasing the strength of the soil development properties and the consequent age estimates are younger. In that past magnitudes and rates of erosion are difficult to assess, the soil relative age estimates are utilized as minimum ages.

The soils observed along Transect A are Holocene and Pleistocene in age. The buried and stacked soils display soil horizons that have weak to moderately strong argillic horizon development. Age estimates range from 46 to 94 ka for the entire alluvial stratigraphic section studied along transect A. The second buried soil (buried soil 2) (Qoa1) that can be correlated across the entire area investigated is a truncated and moderately well-developed argillic soil profile that ranges in relative age from 25 – 51 ka along the length of Transect A. The lowermost buried soil (buried soil 4) (Qoa4) that can be correlated across the entire area investigated is a truncated, stacked, and moderately well-developed argillic soil profile that ranges in relative age from 46 – 94 ka along the length of Transect A.

LIMITATIONS

The conclusions and recommendations presented herein are the results of an inherently limited scope. Specifically, the scope of services consisted of an assessment of relative age from core samples and did not participate in any drilling activities at the site. The conclusions and recommendations contained in this report are professional opinions derived in accordance with current standards of professional practice. No warranty is expressed or implied.

This report has been prepared for the exclusive use of Feffer Geological, Inc. and applies only to the Fault Rupture Hazard Study located at 456 North Rodeo Drive. In the event that significant changes in the interpretations of this study are made, the conclusions and

recommendations contained in this report shall not be considered valid unless the changes are reviewed by John Helms, CEG, and the conclusions and recommendations of this report are verified in writing.

CPT Reporting

8/3/18

Feffer Geological Consulting
Attn: Alexander Greene

Subject: CPT Site Investigation
468 Rodeo Drive
Beverly Hills, California
GREGG Project Number: 180590SH

Dear Mr. Greene:

The following report presents the results of GREGG Drilling & Testing's Cone Penetration Test investigation for the above referenced site. The following testing services were performed:

1	Cone Penetration Tests	(CPTU)	☒
2	Pore Pressure Dissipation Tests	(PPD)	☐
3	Seismic Cone Penetration Tests	(SCPTU)	☐
4	UVOST Laser Induced Fluorescence	(UVOST)	☐
5	Groundwater Sampling	(GWS)	☐
6	Soil Sampling	(SS)	☐
7	Vapor Sampling	(VS)	☐
8	Pressuremeter Testing	(PMT)	☐
9	Vane Shear Testing	(VST)	☐
10	Dilatometer Testing	(DMT)	☐

A list of reference papers providing additional background on the specific tests conducted is provided in the bibliography following the text of the report. If you would like a copy of any of these publications or should you have any questions or comments regarding the contents of this report, please do not hesitate to contact our office at (562) 427-6899.

Sincerely,
GREGG Drilling & Testing, Inc.

Frank Stolfi
HRSC Division Manager, Gregg Drilling & Testing, Inc.

Cone Penetration Test Sounding Summary

Cone Penetration Testing Procedure (CPT)

Gregg Drilling carries out all Cone Penetration Tests (CPT) using an integrated electronic cone system, *Figure CPT*.

The cone takes measurements of tip resistance (q_c), sleeve resistance (f_s), and penetration pore water pressure (u_2). Measurements are taken at either 2.5 or 5 cm intervals during penetration to provide a nearly continuous profile. CPT data reduction and basic interpretation is performed in real time facilitating on-site decision making. The above mentioned parameters are stored electronically for further analysis and reference. All CPT soundings are performed in accordance with revised ASTM standards (D 5778-12).

The 5mm thick porous plastic filter element is located directly behind the cone tip in the u_2 location. A new saturated filter element is used on each sounding to measure both penetration pore pressures as well as measurements during a dissipation test (*PPDT*). Prior to each test, the filter element is fully saturated with oil under vacuum pressure to improve accuracy.

When the sounding is completed, the test hole is backfilled according to client specifications. If grouting is used, the procedure generally consists of pushing a hollow tremie pipe with a "knock out" plug to the termination depth of the CPT hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole. Disruption or further contamination to the site is therefore minimized.

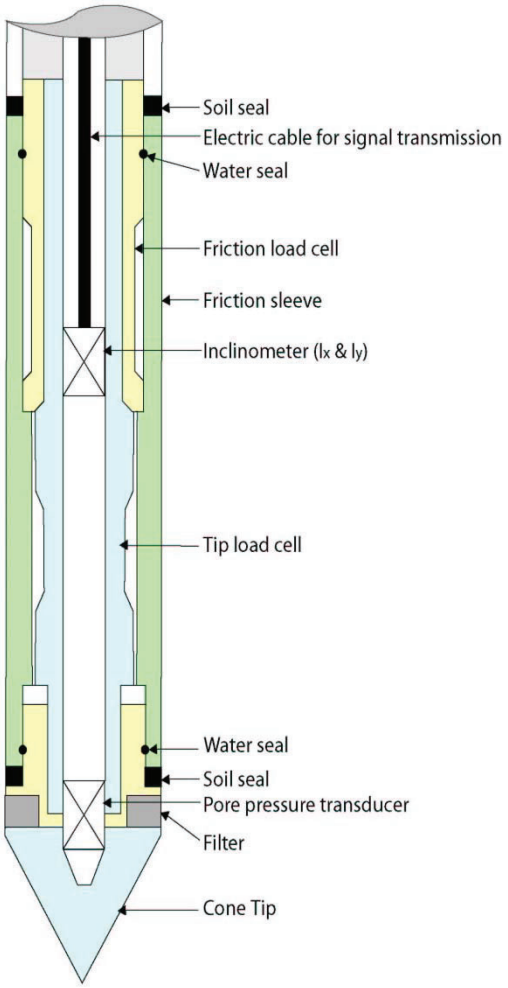

Figure CPT

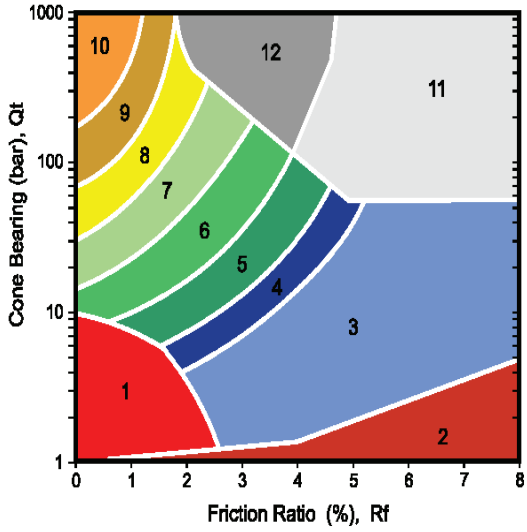
Gregg 15cm^2 Standard Cone Specifications

Dimensions	
Cone base area	15 cm^2
Sleeve surface area	225 cm^2
Cone net area ratio	0.80
Specifications	
Cone load cell	
Full scale range	180 kN (20 tons)
Overload capacity	150%
Full scale tip stress	120 MPa (1,200 tsf)
Repeatability	120 kPa (1.2 tsf)
Sleeve load cell	
Full scale range	31 kN (3.5 tons)
Overload capacity	150%
Full scale sleeve stress	1,400 kPa (15 tsf)
Repeatability	1.4 kPa (0.015 tsf)
Pore pressure transducer	
Full scale range	7,000 kPa (1,000 psi)
Overload capacity	150%
Repeatability	7 kPa (1 psi)



Note: The repeatability during field use will depend somewhat on ground conditions, abrasion, maintenance and zero load stability.

Cone Penetration Test Data & Interpretation

The Cone Penetration Test (CPT) data collected are presented in graphical and electronic form in the report. The plots include interpreted Soil Behavior Type (SBT) based on the charts described by Robertson (1990). Typical plots display SBT based on the non-normalized charts of Robertson et al (1986). For CPT soundings deeper than 30m, we recommend the use of the normalized charts of Robertson (1990) which can be displayed as SBTn, upon request. The report also includes spreadsheet output of computer calculations of basic interpretation in terms of SBT and SBTn and various geotechnical parameters using current published correlations based on the comprehensive review by Lunne, Robertson and Powell (1997), as well as recent updates by Professor Robertson (Guide to Cone Penetration Testing, 2015). The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg Drilling & Testing Inc. does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software. Some interpretation methods require input of the groundwater level to calculate vertical effective stress. An estimate of the in-situ groundwater level has been made based on field observations and/or CPT results, but should be verified by the user.

A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface.

Note that it is not always possible to clearly identify a soil type based solely on q_t, f_s, and u_2. In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the correct soil behavior type.

ZONE		SBT
1		Sensitive, fine grained
2		Organic materials
3		Clay
4		Silty clay to clay
5		Clayey silt to silty clay
6		Sandy silt to clayey silt
7		Silty sand to sandy silt
8		Sand to silty sand
9		Sand
10		Gravely sand to sand
11		Very stiff fine grained*
12		Sand to clayey sand*

*over consolidated or cemented

Figure SBT (After Robertson et al., 1986) – Note: Colors may vary slightly compared to plots

Cone Penetration Test (CPT) Interpretation

Gregg uses a proprietary CPT interpretation and plotting software. The software takes the CPT data and performs basic interpretation in terms of soil behavior type (SBT) and various geotechnical parameters using current published empirical correlations based on the comprehensive review by Lunne, Robertson and Powell (1997). The interpretation is presented in tabular format using MS Excel. The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for any use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software.

The following provides a summary of the methods used for the interpretation. Many of the empirical correlations to estimate geotechnical parameters have constants that have a range of values depending on soil type, geologic origin and other factors. The software uses 'default' values that have been selected to provide, in general, conservatively low estimates of the various geotechnical parameters.

Input:

1 Units for display (Imperial or metric) (atm. pressure, p_a = 0.96 tsf or 0.1 MPa)
2 Depth interval to average results (ft or m). Data are collected at either 0.02 or 0.05m and can be averaged every 1, 3 or 5 intervals.
3 Elevation of ground surface (ft or m)
4 Depth to water table, z_w (ft or m) – input required
5 Net area ratio for cone, a (default to 0.80)
6 Relative Density constant, C_{Dr} (default to 350)
7 Young's modulus number for sands, α (default to 5)
8 Small strain shear modulus number
  a. for sands, S_G (default to 180 for SBT_n 5, 6, 7)
  b. for clays, C_G (default to 50 for SBT_n 1, 2, 3 & 4)
9 Undrained shear strength cone factor for clays, N_{kt} (default to 15)
10 Over Consolidation ratio number, k_{ocr} (default to 0.3)
11 Unit weight of water, (default to γ_w = 62.4 lb/ft^3 or 9.81 kN/m^3)

Column

1 Depth, z, (m) – CPT data is collected in meters
2 Depth (ft)
3 Cone resistance, q_c (tsf or MPa)
4 Sleeve resistance, f_s (tsf or MPa)
5 Penetration pore pressure, u (psi or MPa), measured behind the cone (i.e. u_2)
6 Other – any additional data
7 Total cone resistance, q_t (tsf or MPa) $q_t = q_c + u\,(1-a)$

8	Friction Ratio, R_f (%)	$R_f = (f_s/q_t) \times 100\%$
9	Soil Behavior Type (non-normalized), SBT	see note
10	Unit weight, γ (pcf or kN/m^3)	based on SBT, see note
11	Total overburden stress, σ_v (tsf)	$\sigma_{vo} = \sigma\ z$
12	In-situ pore pressure, u_o (tsf)	$u_o = \gamma_w (z - z_w)$
13	Effective overburden stress, σ'_{vo} (tsf)	$\sigma'_{vo} = \sigma_{vo} - u_o$
14	Normalized cone resistance, Q_{t1}	$Q_{t1} = (q_t - \sigma_{vo}) / \sigma'_{vo}$
15	Normalized friction ratio, F_r (%)	$F_r = f_s / (q_t - \sigma_{vo}) \times 100\%$
16	Normalized Pore Pressure ratio, B_q	$B_q = u - u_o / (q_t - \sigma_{vo})$
17	Soil Behavior Type (normalized), SBT_n	see note
18	SBT_n Index, I_c	see note
19	Normalized Cone resistance, Q_{tn} (n varies with I_c)	see note
20	Estimated permeability, k_{SBT} (cm/sec or ft/sec)	see note
21	Equivalent SPT N_{60}, blows/ft	see note
22	Equivalent SPT $(N_1)_{60}$ blows/ft	see note
23	Estimated Relative Density, D_r, (%)	see note
24	Estimated Friction Angle, ϕ', (degrees)	see note
25	Estimated Young's modulus, E_s (tsf)	see note
26	Estimated small strain Shear modulus, Go (tsf)	see note
27	Estimated Undrained shear strength, s_u (tsf)	see note
28	Estimated Undrained strength ratio	s_u/σ_v'
29	Estimated Over Consolidation ratio, OCR	see note

Notes:

1 Soil Behavior Type (non-normalized), SBT (Lunne et al., 1997 and table below)

2 Unit weight, γ either constant at 119 pcf or based on Non-normalized SBT (Lunne et al., 1997 and table below)

3 Soil Behavior Type (Normalized), SBT_n Lunne et al. (1997)

4 SBT_n Index, I_c $I_c = ((3.47 - \log Q_{t1})^2 + (\log F_r + 1.22)^2)^{0.5}$

5 Normalized Cone resistance, Q_{tn} (n varies with Ic)

$Q_{tn} = ((q_t - \sigma_{vo})/pa)\ (pa/(\sigma'_{vo})^n$ and recalculate I_c, then iterate:

When $I_c < 1.64$, n = 0.5 (clean sand)
When $I_c > 3.30$, n = 1.0 (clays)
When $1.64 < I_c < 3.30$, $n = (I_c - 1.64)0.3 + 0.5$
Iterate until the change in n, $\Delta n < 0.01$

6 Estimated permeability, k_{SBT} based on Normalized SBT_n (Lunne et al., 1997 and table below)

7 Equivalent SPT N_{60}, blows/ft Lunne et al. (1997)

$$\frac{(q_t/p_a)}{N_{60}} = 8.5\left(1 - \frac{I_c}{4.6}\right)$$

8 Equivalent SPT $(N_1)_{60}$ blows/ft $(N_1)_{60} = N_{60}\, C_N$,
where $C_N = (pa/\sigma'_{vo})^{0.5}$

9 Relative Density, D_r, (%) $D_r^2 = Q_{tn} / C_{Dr}$
Only SBT_n 5, 6, 7 & 8 *Show 'N/A' in zones 1, 2, 3, 4 & 9*

10 Friction Angle, ϕ', (degrees) $\tan\phi' = \frac{1}{2.68}\left[\log\left(\frac{q_c}{\sigma'_{vo}}\right) + 0.29\right]$
Only SBT_n 5, 6, 7 & 8 *Show'N/A' in zones 1, 2, 3, 4 & 9*

11 Young's modulus, E_s $E_s = \alpha\, q_t$
Only SBT_n 5, 6, 7 & 8 *Show 'N/A' in zones 1, 2, 3, 4 & 9*

12 Small strain shear modulus, Go

a. $G_o = S_G\,(q_t\ \sigma'_{vo}\ pa)^{1/3}$ *For SBT_n 5, 6, 7*

b. $G_o = C_G\, q_t$ *For SBT_n 1, 2, 3& 4*

Show 'N/A' in zones 8 & 9

13 Undrained shear strength, s_u $s_u = (q_t - \sigma_{vo}) / N_{kt}$
Only SBT_n 1, 2, 3, 4 & 9 *Show 'N/A' in zones 5, 6, 7 & 8*

14 Over Consolidation ratio, OCR OCR = $k_{ocr}\, Q_{t1}$
Only SBT_n 1, 2, 3, 4 & 9 *Show 'N/A' in zones 5, 6, 7 & 8*

The following updated and simplified SBT descriptions have been used in the software:

SBT Zones		**SBT_n Zones**	
1	sensitive fine grained	1	sensitive fine grained
2	organic soil	2	organic soil
3	clay	3	clay
4	clay & silty clay	4	clay & silty clay
5	clay & silty clay		
6	sandy silt & clayey silt		

7	silty sand & sandy silt	5	silty sand & sandy silt
8	sand & silty sand	6	sand & silty sand
9	sand		
10	sand	7	sand
11	very dense/stiff soil*	8	very dense/stiff soil*
12	very dense/stiff soil*	9	very dense/stiff soil*

*heavily overconsolidated and/or cemented

Track when soils fall with zones of same description and print that description (i.e. if soils fall only within SBT zones 4 & 5, print ‘clays & silty clays’)

Estimated Permeability (see Lunne et al., 1997)

SBT_n	Permeability (ft/sec)	(m/sec)
1	$3x\ 10^{-8}$	$1x\ 10^{-8}$
2	$3x\ 10^{-7}$	$1x\ 10^{-7}$

Pore Pressure Dissipation Tests (PPDT)

Pore Pressure Dissipation Tests (PPDT's) conducted at various intervals can be used to measure equilibrium water pressure (at the time of the CPT). If conditions are hydrostatic, the equilibrium water pressure can be used to determine the approximate depth of the ground water table. A PPDT is conducted when penetration is halted at specific intervals determined by the field representative. The variation of the penetration pore pressure (*u)* with time is measured behind the tip of the cone and recorded.

Pore pressure dissipation data can be interpreted to provide estimates of:

- Equilibrium piezometric pressure
- Phreatic Surface
- In situ horizontal coefficient of consolidation (c_h)
- In situ horizontal coefficient of permeability (k_h)

In order to correctly interpret the equilibrium piezometric pressure and/or the phreatic surface, the pore pressure must be monitored until it reaches equilibrium, *Figure PPDT*. This time is commonly referred to as t_{100}, the point at which 100% of the excess pore pressure has dissipated.

A complete reference on pore pressure dissipation tests is presented by Robertson et al. 1992 and Lunne et al. 1997.

A summary of the pore pressure dissipation tests are summarized in Table 1.

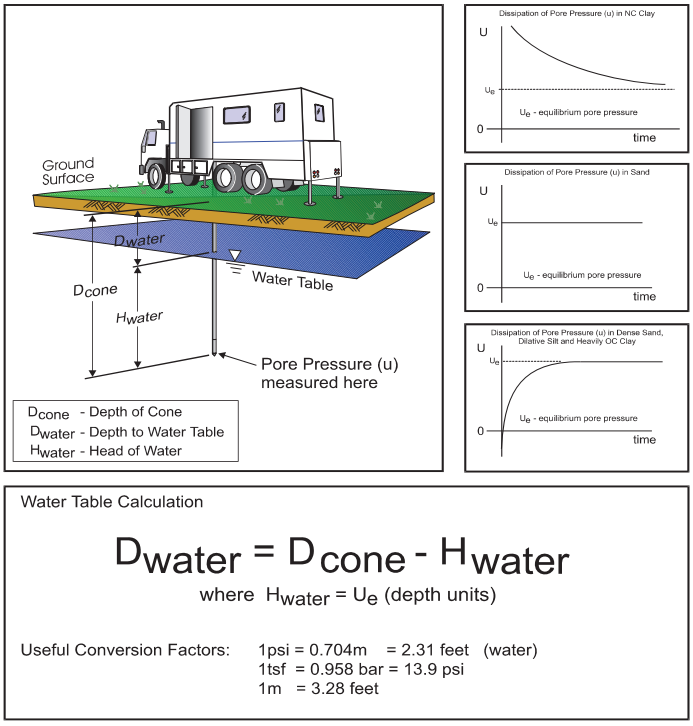

Figure PPDT

Seismic Cone Penetration Testing (SCPT)

Seismic Cone Penetration Testing (SCPT) can be conducted at various intervals during the Cone Penetration Test. Shear wave velocity (Vs) can then be calculated over a specified interval with depth. A small interval for seismic testing, such as 1-1.5m (3-5ft) allows for a detailed look at the shear wave profile with depth. Conversely, a larger interval such as 3-6m (10-20ft) allows for a more average shear wave velocity to be calculated. Gregg's cones have a horizontally active geophone located 0.2m (0.66ft) behind the tip.

To conduct the seismic shear wave test, the penetration of the cone is stopped and the rods are decoupled from the rig. An automatic hammer is triggered to send a shear wave into the soil. The distance from the source to the cone is calculated knowing the total depth of the cone and the horizontal offset distance between the source and the cone. To calculate an interval velocity, a minimum of two tests must be performed at two different depths. The arrival times between the two wave traces are compared to obtain the difference in time (Δt). The difference in depth is calculated (Δd) and velocity can be determined using the simple equation: $v = \Delta d/\Delta t$

Multiple wave traces can be recorded at the same depth to improve quality of the data.

A complete reference on seismic cone penetration tests is presented by Robertson et al. 1986 and Lunne et al. 1997.

A summary the shear wave velocities, arrival times and wave traces are provided with the report.

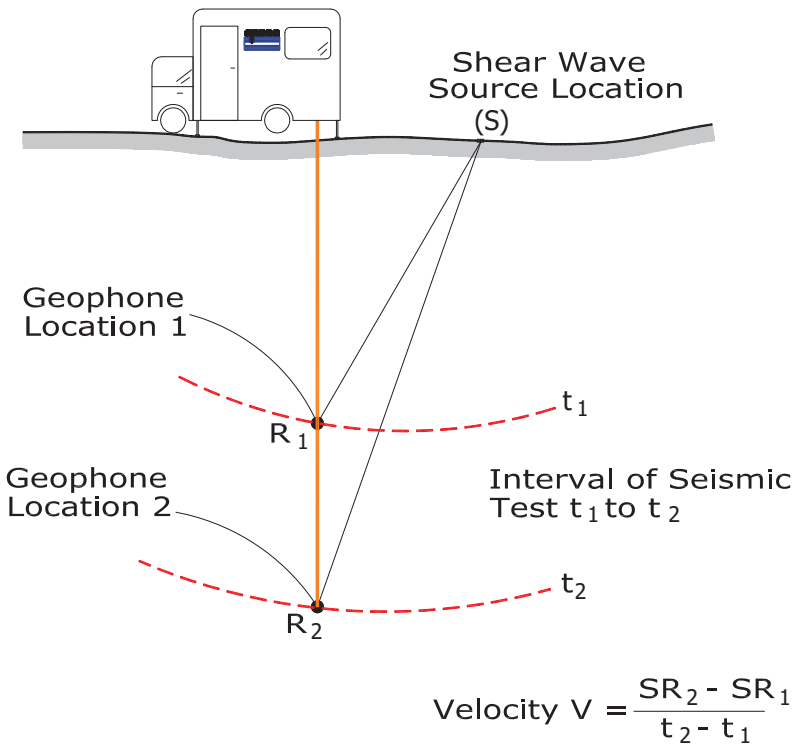

Figure SCPT

Groundwater Sampling

Gregg Drilling & Testing, Inc. conducts groundwater sampling using a sampler as shown in *Figure GWS*. The groundwater sampler has a retrievable stainless steel or disposable PVC screen with steel drop off tip. This allows for samples to be taken at multiple depth intervals within the same sounding location. In areas of slower water recharge, provisions may be made to set temporary PVC well screens during sampling to allow the pushing equipment to advance to the next sample location while the groundwater is allowed to infiltrate.

The groundwater sampler operates by advancing 44.5mm (1¾ inch) hollow push rods with the filter tip in a closed configuration to the base of the desired sampling interval. Once at the desired sample depth, the push rods are retracted; exposing the encased filter screen and allowing groundwater to infiltrate hydrostatically from the formation into the inlet screen. A small diameter bailer (approximately ½ or ¾ inch) is lowered through the push rods into the screen section for sample collection. The number of downhole trips with the bailer and time necessary to complete the sample collection at each depth interval is a function of sampling protocols, volume requirements, and the yield characteristics and storage capacity of the formation. Upon completion of sample collection, the push rods and sampler, with the exception of the PVC screen and steel drop off tip are retrieved to the ground surface, decontaminated and prepared for the next sampling event.

For a detailed reference on direct push groundwater sampling, refer to Zemo et. al., 1992.

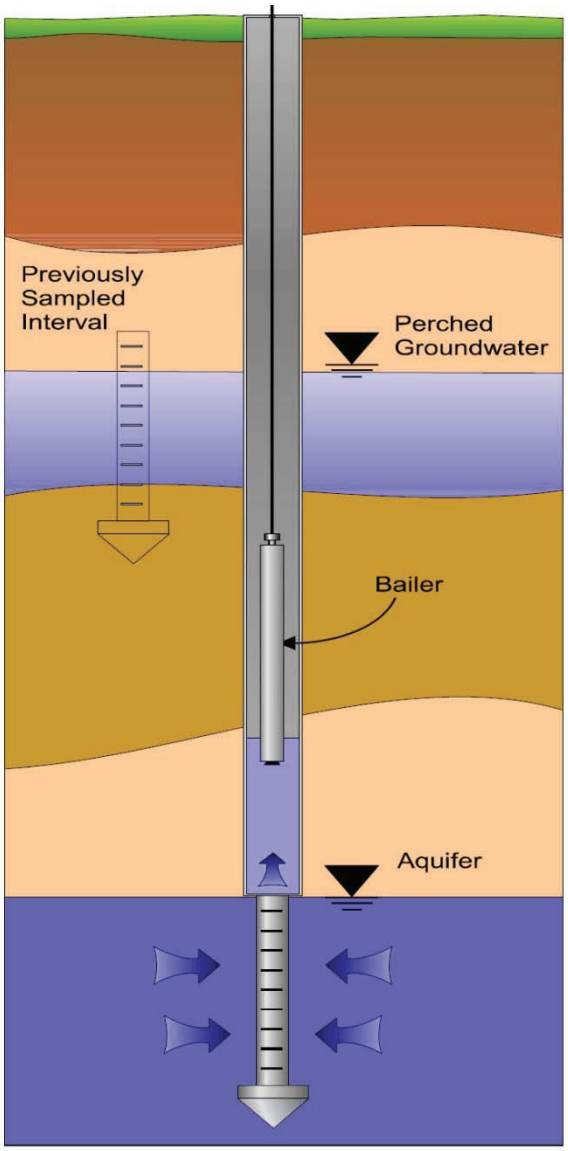

Figure GWS

Soil Sampling

Gregg Drilling & Testing, Inc. uses a piston-type push-in sampler to obtain small soil samples without generating any soil cuttings, *Figure SS*. Two different types of samplers (12 and 18 inch) are used depending on the soil type and density. The soil sampler is initially pushed in a "closed" position to the desired sampling interval using the CPT pushing equipment. Keeping the sampler closed minimizes the potential of cross contamination. The inner tip of the sampler is then retracted leaving a hollow soil sampler with inner 1¼" diameter sample tubes. The hollow sampler is then pushed in a locked "open" position to collect a soil sample. The filled sampler and push rods are then retrieved to the ground surface. Because the soil enters the sampler at a constant rate, the opportunity for 100% recovery is increased. For environmental analysis, the soil sample tube ends are sealed with Teflon and plastic caps. Often, a longer "split tube" can be used for geotechnical sampling.

For a detailed reference on direct push soil sampling, refer to Robertson et al, 1998.

SUMMARY
OF
CONE PENETRATION TEST DATA

1. INTRODUCTION

This report presents the results of a Cone Penetration Test (CPT) program carried out for the project located at 456 N. Rodeo Drive in Beverly Hills, California. The work was performed by Kehoe Testing & Engineering (KTE) on July 11-13, 2018. The scope of work was performed as directed by Feffer Geological Consulting personnel.

2. SUMMARY OF FIELD WORK

The fieldwork consisted of performing CPT soundings at seven locations to determine the soil lithology. Groundwater measurements and hole collapse depths provided in **TABLE 2.1** are for information only. The readings indicate the apparent depth to which the hole is open and the apparent water level (if encountered) in the CPT probe hole at the time of measurement upon completion of the CPT. KTE does not warranty the accuracy of the measurements and the reported water levels may not represent the true or stabilized groundwater levels.

LOCATION	DEPTH OF CPT (ft)	COMMENTS/NOTES:
CPT-5	39	Refusal, hole open to 36 ft (dry)
CPT-6	50	Hole open to 48 ft (dry)
CPT-7	50	Hole open to 46 ft (dry)
CPT-8	30	Refusal, hole open to 30 ft (dry)

TABLE 2.1 - Summary of CPT Soundings

3. FIELD EQUIPMENT & PROCEDURES

The CPT soundings were carried out by **KTE** using an integrated electronic cone system manufactured by Vertek. The CPT soundings were performed in accordance with ASTM standards (D5778). The cone penetrometers were pushed using a 30-ton CPT rig and a direct push rig anchored with an eight-inch diameter ground anchor. The direct push rig has a pushing capacity of approximately 15 tons. The cone used during the program was a 15 cm^2 cone and a 10 cm^2 was used with the direct push rig. Both recorded the following parameters at approximately 2.5 cm depth intervals:

- Cone Resistance (qc)
- Sleeve Friction (fs)
- Dynamic Pore Pressure (u)
- Inclination
- Penetration Speed

The above parameters were recorded and viewed in real time using a laptop computer. Data is stored at the KTE office for up to 2 years for future analysis and reference. A complete set of baseline readings was taken prior to each sounding to determine temperature shifts and any zero load offsets. Monitoring base line readings ensures that the cone electronics are operating properly.

4. CONE PENETRATION TEST DATA & INTERPRETATION

The Cone Penetration Test data is presented in graphical form in the attached Appendix. These plots were generated using the CPeT-IT program. Penetration depths are referenced to ground surface. The soil classification on the CPT plots is derived from the attached CPT Classification Chart (Robertson) and presents major soil lithologic changes. The stratigraphic interpretation is based on relationships between cone resistance (qc), sleeve friction (fs), and penetration pore pressure (u). The friction ratio (Rf), which is sleeve friction divided by cone resistance, is a calculated parameter that is used along with cone resistance to infer soil behavior type. Generally, cohesive soils (clays) have high friction ratios, low cone resistance and generate excess pore water pressures. Cohesionless soils (sands) have lower friction ratios, high cone bearing and generate little (or negative) excess pore water pressures.

Tables of basic CPT output from the interpretation program CPeT-IT are provided for CPT data averaged over one foot intervals in the Appendix. We recommend a geotechnical engineer review the assumed input parameters and the calculated output from the CPeT-IT program. A summary of the equations used for the tabulated parameters is provided in the Appendix.

It should be noted that it is not always possible to clearly identify a soil type based on qc, fs and u. In these situations, experience, judgement and an assessment of the pore pressure data should be used to infer the soil behavior type.

If you have any questions regarding this information, please do not hesitate to call our office at (714) 901-7270.

Sincerely,

KEHOE TESTING & ENGINEERING

Richard W. Koester, Jr.

Presented below is a list of formulas used for the estimation of various soil properties. The formulas are presented in SI unit system and assume that all components are expressed in the same units.

:: Unit Weight, g (kN/m³) ::

$$g = g_w \cdot \left(0.27 \cdot \log(R_f) + 0.36 \cdot \log(\frac{q_t}{p_a}) + 1.236 \right)$$

where g_w = water unit weight

:: Permeability, k (m/s) ::

$I_c < 3.27$ and $I_c > 1.00$ then $k = 10^{0.952-3.04 \cdot I_c}$

$I_c \leq 4.00$ and $I_c > 3.27$ then $k = 10^{-4.52-1.37 \cdot I_c}$

:: N_{SPT} (blows per 30 cm) ::

$$N_{60} = \left(\frac{q_c}{P_a} \right) \cdot \frac{1}{10^{1.1268-0.2817 \cdot I_c}}$$

$$N_{1(60)} = Q_{tn} \cdot \frac{1}{10^{1.1268-0.2817 \cdot I_c}}$$

:: Young's Modulus, Es (MPa) ::

$(q_t - \sigma_v) \cdot 0.015 \cdot 10^{0.55 \cdot I_c + 1.68}$

(applicable only to $I_c < I_{c_cutoff}$)

:: Relative Density, Dr (%) ::

$100 \cdot \sqrt{\frac{Q_{tn}}{k_{DR}}}$ (applicable only to SBT_n: 5, 6, 7 and 8 or $I_c < I_{c_cutoff}$)

:: State Parameter, ψ ::

$\psi = 0.56 - 0.33 \cdot \log(Q_{tn,cs})$

:: Peak drained friction angle, φ (°) ::

$\varphi = 17.60 + 11 \cdot \log(Q_{tn})$

(applicable only to SBT_n: 5, 6, 7 and 8)

:: 1-D constrained modulus, M (MPa) ::

If $I_c > 2.20$

$\alpha = 14$ for $Q_{tn} > 14$

$\alpha = Q_{tn}$ for $Q_{tn} \leq 14$

$M_{CPT} = \alpha \cdot (q_t - \sigma_v)$

If $I_c \leq 2.20$

$M_{CPT} = (q_t - \sigma_v) \cdot 0.0188 \cdot 10^{0.55 \cdot I_c + 1.68}$

:: Small strain shear Modulus, Go (MPa) ::

$G_0 = (q_t - \sigma_v) \cdot 0.0188 \cdot 10^{0.55 \cdot I_c + 1.68}$

:: Shear Wave Velocity, Vs (m/s) ::

$$V_s = \left(\frac{G_0}{\rho} \right)^{0.50}$$

:: Undrained peak shear strength, Su (kPa) ::

$N_{kt} = 10.50 + 7 \cdot \log(F_r)$ or user defined

$$S_u = \frac{(q_t - \sigma_v)}{N_{kt}}$$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: Remolded undrained shear strength, Su(rem) (kPa) ::

$S_{u(rem)} = f_s$ (applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: Overconsolidation Ratio, OCR ::

$$k_{OCR} = \left[\frac{Q_{tn}^{0.20}}{0.25 \cdot (10.50 \cdot +7 \cdot \log(F_r))} \right]^{1.25}$$ or user defined

$OCR = k_{OCR} \cdot Q_{tn}$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: In situ Stress Ratio, Ko ::

$K_O = (1 - \sin\varphi') \cdot OCR^{\sin\varphi'}$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: Soil Sensitivity, S_t ::

$$S_t = \frac{N_S}{F_r}$$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: Effective Stress Friction Angle, φ' (°) ::

$\varphi' = 29.5° \cdot B_q^{0.121} \cdot (0.256 + 0.336 \cdot B_q + \log Q_t)$

(applicable for $0.10 < B_q < 1.00$)

RECOMMENDATION FOR ACCEPTANCE

REPORT FOR INVESTIGATION OF POTENTIAL SURFACE FAULT RUPTURE 456 N. Rodeo Drive, Beverly Hills, California 90210

As authorized by the City of Beverly Hills, this document summarizes technical (peer) reviews for a “Fault Hazard [Ground Rupture] Investigation” for proposed redevelopment of the 456 N. Rodeo property in the City of Beverly Hills, California. The investigations were carried by Feffer Geological Consulting, Inc. (FGC), the Consultants-of-Record, on behalf of the applicant, the 456 N. Rodeo Drive, LLC. The main purpose of the FGC investigation was to determine if possible splays of the Santa Monica fault zone potentially impact the site, and if such faults were “active” (defined by the California Geological Survey [CGS] as surface or near-surface displacement within the last 11,700 years).

The site is about 115 ft from the nearest, CGS-designated Earthquake Fault Zone (EFZ), the Santa Monica, and relatively near the Hollywood EFZ that extends into the City on the northeast and the West Pico EFZ that currently “stops” at the City limits on the southeast (see FGC Figs. 2 and 8 and related enlargements given in report pocket). The City requires independent fault-activity reviews in conformance with building codes, with current requirements of the CGS (2018, Special Publication 42) and with the necessity to ensure public health, safety and welfare.

The reviews included initial telephone and email discussions with applicant representatives, the consultants and City personnel about investigation requirements and scope of work. These were followed by on-site field observation of continuous cores, interpretations of FGC preliminary cross-sections, cone penetrometer tests and site-specific soil-stratigraphic correlations. Likewise reviewed was an FGC draft report, similarly followed by discussions with FGC personnel and the applicant, and ultimately acceptance of the final report.

The FGC final report, dated 18 December 2018, documents pertinent literature and maps, summarizes field investigation procedures, provides the regional geologic framework and tectonic setting, and expounds on specific investigation procedures and technical data supporting the professional conclusions and recommendations.

In sum, the fundamental conclusions of the Consultants-of-Record are:

1. That the FGC regional assessments and site-specific investigations meet current standards-of-practice for fault-activity assessments in southern California in general and to those specifically required by the City of Beverly Hills in particular;

2. That the FGC site-specific investigations and interpretations are sufficient to identify, date and correlate subsurface stratigraphic markers, which are unbroken and generally more than 11,700 years old;

3. That, despite diligent observation, no charcoal or other materials amenable to unequivocal radiocarbon or other numeric dating methods were recovered;

4. That, although site-specific trenching is preferable, the Consultants-of-Record find that existing structures prevent trench emplacement and therefore, as permitted in City Guidelines for “non-zone” areas, opted to date sediments by means of 11 cone-penetrometer tests and extraction and interpretation of 4, 50-ft deep continuous cores. These data were supplemented by cores and CPTs previously obtained from the adjacent 468 N. Rodeo Drive site.

5. That, lacking numeric ages, the on-site sediments were dated primarily by soil-stratigraphic techniques (Appendix B). Identified were multiple moderately to strongly developed buried paleosols locally replete with common to many, moderately thick illuvial clay films all indicating a pre-11,700-yr age; and that these soils and sediments are traced across the site and, in association with CPT “signature,” are unbroken.

6. That, the 456 N. Rodeo Drive property is not subject to potential surface or near-surface displacement associated with the Santa Monica, the Hollywood, the West Pico or any other fault reasonably projected toward it.

Accordingly, based substantially on, and in reliance of their professional interpretations and conclusions, the FGC regional summaries and site-specific investigations are judged to meet current standards-of-practice for fault-activity

assessments in southern California in general and to those specifically required by the City of Beverly Hills in particular.

Please note that the FGC report focuses solely on potential surface or near-surface fault rupture and does not specifically address possible high seismic accelerations, ground deformation or other structural design and geotechnical investigations required by applicable building codes or by present professional engineering and geological standards of practice. It is therefore incumbent upon the applicant, FGC, or other consultants, to provide this information to the City of Beverly Hills for technical review and potential acceptance prior to issuance of building permits.

Recommended for Acceptance

Subject: Acceptance letter of the report for the 456 N Rodeo Drive. Report For Investigation of Potential Surface Fault Rupture: 456 N. Rodeo Drive, Beverly Hills, CA 90210

Dear 456 N. Rodeo Drive LLC:

The Fault Hazard [Ground Rupture] Investigation" for the proposed redevelopment of the 456 N. Rodeo Drive property, in the City of Beverly Hills, California, 90210 were carried out by Feffer Geological Consulting, Inc. ("FGC"), the Consultants-of-Record, on behalf of the applicant, 456 N. Rodeo Drive LLC. The main purpose of the FGC investigation was to determine if possible splays of the Santa Monica fault zone potentially impact the site, and if such faults were "active" (defined by the California Geological Survey [CGS] having a surface or near- surface displacement within the last 11,700 years). The FGC investigation has been peer reviewed by the City's consultant, Roy J. Shlemon, Ph.D., PG2867; CPG 1766; CPESC 2167, of Roy J. Shlemon & Associates, Inc. ("RSA") and has been recommended for acceptance.

The peer review included critique of the Site-Specific Fault Rupture Investigation titled "INVESTIGATION OF POTENTIAL FAULTING" 456 N. Rodeo Dr., Beverly Hills, CA 90210 (FGC Project File No. 2176-85 dated December 18, 2018 attached).

The geologic investigation followed by a peer review are required by the City in conformance with the current building codes and with current geologic-standards-of practice to ensure public health, safety and welfare.

Accordingly, in reliance on the technical documentation and assurances provided by the Consultants-of-Record, including their opinions, and conclusions, the City of Beverly Hills now formally accepts the technical "Recommendation For Acceptance" of the Reviewer (attached).

Sincerely,

D. Yelton

SUBJECT: **EVALUATION OF POTENTIAL FAULTING**
468 North Rodeo Drive, Beverly Hills, CA 90210

Dear 468 N. Rodeo Drive LLC:

We are pleased to submit this report summarizing our fault rupture hazard investigation for the subject site located on the northeast side of north Rodeo Drive at the corner of south Santa Monica Boulevard and north Rodeo Drive in the City of Beverly Hills, California. The subject site is not located within an area mapped as being potentially affected by surface faulting. Current published mapping by the State of California locates the northern edge of the Santa Monica Fault Zone approximately 170 feet to the southeast of the project site. The purpose of this investigation was to assess the potential for surface fault rupture at the site and determine if the area of the planned development is suitable for the construction of human-occupied structures.

This study consisted of a review of published and unpublished data, a geomorphic analysis, and subsurface exploration. The subsurface exploration program consisted of four continuously cored borings and eleven cone penetrometer soundings (CPTs) to check the continuity of the stratigraphy on and in the area of, the project site. The combination of continuous, unbroken late Pleistocene soil horizons and stratigraphy, and the lack of any near surface groundwater provides evidence to demonstrate the absence of active faulting beneath the entire project site.

Based on our site investigation we find no evidence of active faults traversing the project site. We therefore conclude that the project site is not exposed to the hazard of surface fault rupture. Accordingly, no fault setback distances or "no-build" zones are delineated that would impact or limit future development.

We appreciate this opportunity to be of service. Should you have any questions regarding the information contained in this report, please do not hesitate to contact us.

Sincerely,

FEFFER GEOLOGICAL CONSULTING, INC.

INTRODUCTION AND BACKGROUND

The project site is located on the northeast side of north Rodeo Drive and consists of a commercial lot that is currently occupied by a two-story retail building within a highly developed portion of the City of Beverly Hills, CA. For purposes of description for this report it is assumed that Rodeo Drive is oriented in a north-south direction. The project site is bounded to the north by south Santa Monica Boulevard, to the east by an alley, and to the west by north Rodeo Drive. Commercial structures and office buildings are located adjacent to the site. A recent aerial photograph of the site is shown as Figure 1.

The original structure and facilities on this parcel were constructed prior to the development of the effecting Earthquake Fault Zone (EFZ). Thus, this property had not previously been investigated for the hazard of surface fault rupture. Currently published mapping by the State of California locates the nearest portion of the Santa Monica Fault Zone (SMFZ) to the south of Santa Monica Boulevard. The subject site is located entirely outside of this zone. The surface expression of the SMFZ (and the recently designated Santa Monica Boulevard Fault Zone, discussed below) is limited to fault-related geomorphic features, many which have been destroyed by urbanization and development within the greater Los Angeles area. This recent development and urbanization has resulted in a poor understanding of the lateral extent, location, and rupture history of faulting. Dolan et al. (2000) identified the fault location based on topographic scarps north of Santa Monica Boulevard in the Westwood area. Preliminary mapping presented by Olson (2015) refined the map representation of the fault scarps, but largely confirms the work by Dolan et al. (2000). The mapped location of the SMFZ in relation to the subject site was also obtained from the State of California's recent Earthquake Fault Zone Map (Olson, 2018) and is shown as Figure 2.

Development of this site is located outside of the current Earthquake Zones of Required Investigation (CGS, 2018a). However, it should be noted that the site is subject to the conditions of the Alquist-Priolo Special Studies Zone Act of 1972 (California Public Resources Code, Chapter 7.5, Division 2), and an investigation is required by the City of Beverly Hills. The AP Special Studies Zone Act is designed specifically to mitigate the hazard of surface fault rupture in future earthquakes and defines a fault as active if it has demonstrated surface displacement in Holocene time (past 11,700 years). The Alquist-Priolo Act mandates that sites located within "special studies zones", which are delineated by the California Geologic Survey (CGS) along active faults, require detailed geologic investigation to preclude the construction of human-occupied structures astride active fault strands. The 1994 Seismic Hazards Mapping Act changed the name of the zones from Special Studies Zones to Earthquake Fault Zones (EFZ).

The purpose of this investigation, therefore, was to assess the potential for surface fault rupture at the site and determine if the area of the proposed commercial development is suitable for construction of human-occupied structures.

SCOPE OF WORK

Typically, trenching is the preferred method for evaluating the presence or absence of faults because it offers a continuous, direct exposure of the fault zone or near surface stratigraphy. However, in this portion of the SMFZ, trenching would be difficult due to the dense urban cover and existing structures on site. Therefore, we proposed that this fault rupture hazard study consist of a series of strategically placed continuously cored borings in combination with cone penetrometer tests excavated deep enough

to resolve the issue of surface faulting hazard at the site. The scope of work for this fault rupture hazard investigation consisted of the following tasks:

- Review of published and unpublished geotechnical data in the site vicinity;
- Analysis of topographic maps of the site vicinity;
- Geologic reconnaissance of the site;
- Excavating and logging a total of 200 vertical feet of material in 4 borings across the site;
- Pushing through a total of 550 vertical feet of material in 11 CPT soundings across the site;
- Preparation of this report.

FAULT ACTIVITY CRITERIA

The criteria used in our investigation to evaluate fault activity is the same criteria used by the California Geological Survey (CGS), which defines active faults as those that have had surface displacement within Holocene time (about the last 11,700 years). This criteria for defining an active fault is based on standards developed by the CGS for the Alquist-Priolo Earthquake Fault Zoning Program (CGS, 2018a). Faults that have not moved in the last 11,700 years are not considered active.

In general, the activity rating of a fault is determined by establishing the age of the youngest materials displaced by the fault. According to the CGS (2018b), a discovered fault can be either age-undetermined, Holocene-active, or a pre-Holocene fault (see details below). If datable material is present, a numerical absolute age can sometimes be established; if no datable material exists, then only a relative age can be assigned to movement along the fault.

As discussed in the California Geological Survey's Special Publication 42 (2018b), a fault is defined as the following:

> *"A shear or zone of closely associated shears across which earth materials on one side have been displaced with respect to those on the other side because of tectonic forces. A fault is distinguished from those fractures or shears caused by landsliding or other gravity-driven surficial failures.*
>
> ***age-undetermined fault:*** *A fault whose age of most recent movement is not known or is unconstrained by dating methods or by limitations in stratigraphic resolution.*
>
> ***Holocene-active fault:*** *A fault that has had surface displacement within Holocene time (the last 11,700 years)**.***
>
> ***pre-Holocene fault:*** *A fault whose recency of past movement is older than 11,700 years, and thus does not meet the criteria of Holocene-active fault as defined in the State Mining and Geology Board regulations (California Code of Regulations, Title 14, Division 2, Section 3601.(a)).". (CGS, 2018b, p. 1-2)*

REGIONAL AND LOCAL GEOLOGY

Regionally, the project site is located in the Los Angeles Basin, which makes up part of the Transverse Ranges Geomorphic province (Figure 3). The Los Angeles Basin lies within a transitional zone between the Transverse Ranges to the north and the Peninsular Ranges (Yerkes et. al., 1965). The basin is bounded on the north by the Santa Monica Mountains, on the east by the Elysian Hills, the west by the Newport-Inglewood Uplift and the south by the La Brea high, an area of shallow bedrock.

The predominate structure in the project site area is the east-west trending Malibu Coast-Santa Monica-Raymond-Cucamonga fault system (Crook et al., 1983), which extends for approximately 125 miles to form the southern boundary of the Transverse Ranges. This fault system is also referred to as the Transverse Ranges Southern Boundary fault system (TRSB) by Dolan et al. (2000). This complex system of east-west trending faults accommodates north-south shortening and uplift, and concurrent westward motion of the Western Transverse Ranges. Individual faults within the TRSB fault system exhibit varying degrees of both left-lateral strike-slip and contractional dip-slip faulting and related folding (Hill, 1979; Crook et al., 1983; Jones et al., 1990; Dolan et al., 2000). All faults within the system show evidence for Quaternary activity and several, including the Santa Monica and Hollywood faults, have been demonstrated by site-specific paleoseismic studies to be active during the Holocene (Jones et al., 1990; Weaver and Dolan, 2000; Dolan et al., 2000).

From a local perspective, the site is located within the uplifted and dissected Beverly Hills area. Geologic mapping of the area is fairly consistent and provides more accurate age constraints in later mapping. Yerkes and Campbell (2005) and Hoots and Kew (1931) mapped Holocene aged alluvium over older Pleistocene aged alluvial and fan deposits (Figure 4) while Dibblee (1991) mapped younger Holocene aged alluvial gravels at the surface overlying older Pleistocene age alluvial fan sediments (Figure 5). More recent mapping (Figure 6) from Campbell (2014) indicates that the sediments exposed in the area consist of primarily lower Holocene to upper Pleistocene age alluvium near the ground surface underlain by upper to lower Pleistocene aged alluvial fan deposits, and interbedded terrestrial fan and shallow marine sediments. None of these regional geologic maps show the SMFZ in the vicinity of the project site area.

Santa Monica Fault Zone

The SMFZ portion of the TRSB trends east-west from the Santa Monica coastline on the west to the Hollywood area on the east (see Figure 2). It is an oblique-reverse, left-lateral fault that is thought to be a surface expression of tectonic deformation related to Pliocene-Quaternary structural development of the Santa Monica Mountains. Integration of subsurface oil and gas exploration seismic data and well logs with surficial mapping indicate the mountains are underlain by a large southward-vergent asymmetric anticline formed over a regional north-dipping thrust ramp at a depth of 6 to 9 miles. Geophysical studies conducted at the Veteran's Administration (VA) property in West Los Angeles indicate the SMFZ is a gently dipping thrust fault with secondary near-vertical faults extending from the primary basal fault toward the ground surface (Pratt et al., 1998; Dolan et al., 2000).

The surface expression of the SMFZ is limited to fault-related geomorphic features, many of which have been destroyed by urbanization and development within the greater Los Angeles area (Figure 7). This has resulted in a poor understanding of the lateral extent, location, and rupture history of the SMFZ. Dolan et al. (2000) identified the fault location based on topographic scarps north of Santa Monica

Boulevard. The most prominent of these scarps is located at the base of a late to middle Pleistocene fan surface in west Los Angeles that extends from approximately University High School to the Mormon temple, juxtaposing older surficial deposits and relatively shallow bedrock to the north against younger surficial deposits and a thick expanse of old alluvium to the south. Both trenching studies and seismic reflections profiles reveal that, at the VA property, the SMFZ topographic scarp contains a series of steeply dipping to sub-vertical faults that offset late Quaternary sediments (Crook et al., 1983; Pratt et al., 1998; Dolan et al., 2000; Catchings et al., 2001). Radiometric dating of key stratigraphic horizons at the VA site indicate that five to six surface-rupturing events have occurred between approximately 50,000 and 1,000-3,000 years before present (Dolan et al., 2000).

To the west of the project site, the SMFZ has typically been mapped just north of and parallel to Santa Monica Boulevard, following a series of scarps at the base of late to middle Pleistocene fan surfaces (Dolan et al., 2000; Bedrossian et al., 2012; Olson, 2015). However, recent subsurface explorations and geophysical studies in Century City (e.g., Parsons, 2011) have interpreted the presence of a zone of faulting that extends south of Santa Monica Boulevard as well. Parsons (2011) interpreted these faults as active, however, a number of subsequent studies have refuted this interpretation. Kenney (2012; 2013) reviewed the data by Parsons (2011) and subsequent studies and supplemented them with his own geologic and geomorphic analysis. Kenney (2012) postulated that the data indicate that the primary basal SMFZ actually projects far to the south of the project site, and that faulting along and south of Santa Monica Boulevard should be attributed to the newly designated “Santa Monica Boulevard Fault Zone” (SMBFZ).

Faults associated with the SMBFZ dip steeply to the north and are thought to exhibit right-lateral displacement (Kenney, 2012), although a definitive sense of slip has not been established (Kenney, 2013). These faults are interpreted to be secondary structures related to the primary basal reverse SMFZ that is thought to underlie the Century City area at depth (Kenney, 2012; Lettis, 2013). Based on our review of the recent Century City studies (discussed in detail below), the faults subject to this investigation are part of the SMBFZ.

Both Kenney (2012) and Parsons (2011) indicate there is no direct evidence that SMBFZ faults along and south of Santa Monica Boulevard are active. To date, the only evidence of Holocene activity within the SMFZ and SMBFZ is for faults that are coincident with the topographic scarp north of Santa Monica Boulevard (e.g., Dolan et al., 2000; Geocon, 2014). Furthermore, it is important to reiterate that the SMBFZ postulated by Kenney (2012) or just the SMFZ as it is commonly referred to, is south of the subject site; and the subject site lies entirely outside of the newly delineated AP fault hazard zone (see Figure 2).

Newport-Inglewood Fault Zone

The Newport-Inglewood fault (NIFZ) zone is mapped across the western portion of the Los Angeles Basin and generally trends in a north to northwest direction. The Newport-Inglewood fault is topographically expressed onshore with elevated surfaces which extend from the Newport Mesa in the south to the Beverly Hills area in the north (Earth Consultants International, 2018). As it is currently mapped the northern portion of the Newport-Inglewood Fault ends near Pico Boulevard south of the Beverly Hills area (see Figure 2), however, the location of the northern fault strands has been debated widely in the geological literature. Multiple geologist have attempted to place the northern portion of the

Newport-Inglewood fault within a noticeable geomorphic break that is referred to as the West Beverly Hills Lineament (WBHL) (Earth Consultants International, 2018).

The WBHL is a north-south trending escarpment or topographic break. The WBHL has been interpreted as a tectonic feature (Dolan and Sieh, 1992), representing the northernmost step-over and expression of the Newport-Inglewood Fault Zone (NIFZ). According to this interpretation, the WBHL would connect the Santa Monica, Newport-Inglewood, and Hollywood fault zones. Distributed slip across this entire system would indicate an active fault zone of significant width. However, the relationships between these fault systems are poorly constrained at this time. In fact, the hypothesis that the WBHL is a tectonic feature had only recently been tested based on the wealth of data collected in the Century City area (discussed further below), and it is our understanding that the California Geological Survey is still evaluating whether or not the NIFZ should be zoned through Beverly Hills. In early 2018 the California Geological Survey placed a strand of the NIFZ known as the West Pico fault within an Alquist-Priolo Fault Zone. However, it is important to note that the WBHL is approximately one mile west of the subject site and the NIFZ and West Pico Fault are approximately 2 and 1.5 miles to the south-southeast of the subject site respectively (Figure 2).

TOPOGRAPHIC / GEOMORPHIC REVIEW

A combined review of previous geomorphic analyses (Earth Consultants International, 2018 and Lettis, 2013 and Dolan et. al., 2000) with a review of historical and US Geologic Survey topographic maps was performed (Figures 7 and 8). The topography was examined for recognizable scarps or breaks in slope that may suggest the location of faulting.

Geomorphically, the project site sits atop a degraded Holocene-aged alluvial fan surface that has been incised by numerous north-south to northwest-southeast trending drainages emanating from Benedict Canyon and Coldwater Canyon (Figure 8). Locally the area gently slopes to the east and southeast which is consistent with natural sedimentary and fluvial processes. The drainages to the south of the project site area are crosscut by a prominent southeast-facing escarpment, which has historically been used to locate the Santa Monica fault west of the subject site (e.g., Dolan et al., 2000). This scarp shown in Figure 7 is prominently expressed approximately 3 mi southwest of the site at the Mormon temple. However, from the Mormon temple to the site, this scarp becomes less pronounced in the landscape and unrecognizable in the vicinity of the subject site (see Figure 8), and highly urbanized which creates cover that masks geomorphic features related to faulting. Determining the location of fault related expressions through topographic analysis alone becomes increasingly difficult in the vicinity of the site due to these factors.

PREVIOUS INVESTIGATIONS

A review of previous geotechnical and fault rupture hazard investigations that have been completed in the area was conducted for any information that may be pertinent to the project site. The reports reviewed are summarized below.

In 2011, Parsons-Brinkerhoff (Parsons) completed a fault study for the METRO Westside Subway Extension for the purpose of locating potential subway station and tunnel alignments. Based on their interpretation of continuous-core borings, cone penetrometer tests (CPTs), and geophysical surveys, Parsons (2011) depicted two zones of faulting in the area: 1) a zone of northeast-southwest trending

faults, generally parallel to and south of Santa Monica Boulevard, which they attributed to the SMFZ and 2) a zone of northwest-southeast trending faults coincident with the West Beverly Hills Lineament (WBHL). These faults were considered active based on geomorphic evidence and interpreted association with known active faults. To the west of the project site, Parsons (2011) interpreted the SMFZ to span a width from the topographic scarp north of Santa Monica Boulevard to approximately 150 feet southeast of the boulevard. Parsons (2011) interpreted additional faults immediately to the southeast of this zone, but they were unable to determine whether these faults were active.

Leighton Consultants Inc. (Leighton, 2012) performed a fault investigation at Beverly Hills High School focused on the WBHL faults interpreted by Parsons (2011). Leighton (2012) advanced borings, CPTs, and excavated trenches along Parsons' (2011) borehole and CPT transects. Based on the observation of unbroken Pleistocene age soils across the grounds of the high school, Leighton concluded that the faults identified by Parsons (2011) were not active. Furthermore, Leighton (2012) provided geologic evidence that the WHBL scarp is an erosional feature, rather than a tectonic feature. The California Geological Survey (CGS) approved the Leighton report and agreed that none of the investigated faults were active (CGS, 2013).

Feffer Geological Consulting and Geocon, (2012) prepared a fault report for the 10000 Santa Monica project located immediately north of the BHHS campus and lies immediately adjacent to the MTA Santa Monica station site and between MTA Transects 2 and 4. The 10000 investigation included a trench across the entire site that paralleled the Leighton/MTA Transect 4 and the MTA Transect 2. The trench crossed the location of several fault strands proposed by MTA (Parsons, 2011) associated with their WBHL fault zone as well as the new WBHL fault location. No faults, active or otherwise, were found in the 10000 Santa Monica trench to depths of 30+ feet and ages of >300,000 years.

Kenney GeoScience (Kenney, 2012, 2013) performed geomorphic, structural, and stratigraphic analysis using the available subsurface data from the Metro investigation (Parsons, 2011), the Beverly Hills High School fault investigation (Leighton, 2012), and other data generated from recent fault studies in the Beverly Hills/Century City area (e.g., Feffer-Geocon, 2012; Legg, 2012). Based on these data, Kenney (2012) developed a tectonic and geologic history of the area, which included an evaluation of the location and activity of suspected faults. As discussed above, Kenney (2012, 2013) interpreted the faults along Santa Monica Boulevard as secondary upper plate structures, and referred to them as the SMBFZ. This interpretation is based on the observation that the SMBFZ faults are dominantly strike-slip (possibly right-lateral). Although individual faults within the SMBFZ may exhibit normal or reverse apparent displacement, there is little net vertical displacement across the zone (Kenney, 2013). This contrasts with the observations north of Santa Monica Boulevard, where oblique left-lateral reverse motion has produced net north-side-up displacement across the fault (e.g., Dolan et al., 2000; Geocon, 2014).

Kenney (2012) noted that multiple investigations and reevaluations of the faults first interpreted by Parsons (2011) along Santa Monica Boulevard had not produced any evidence of Holocene-age activity for the SMBFZ. In fact, the most recent data indicates that activity along these faults likely ceased approximately 40,000 to 50,000 years ago (Kenney, 2012). However, Kenney (2013) noted that additional study of these faults is needed in order to confidently assess their activity.

Subsequent to Kenney's (2012, 2013) reinterpretation of the SMFZ and the SMBFZ, Geocon West, Inc. (Geocon, 2013) conducted a fault study for Westfield at the Century City mall. This study was

specifically designed to identify the evidence for Holocene activity (or lack thereof) along the SMBFZ south of Santa Monica Boulevard. Geocon's (2013) study consisted of one boring transect along Avenue of the Stars, and another boring transect along Century Park West. Geocon (2013) documented a thick section of unfaulted Pleistocene-age alluvium overlying faulted sections of Lakewood Formation sediments. Based on the apparent continuation of the Pleistocene-age geologic units overlying several faults, Geocon (2013) concluded that no active faults were present at the Westfield site, and no restrictions on future development of the Westfield Site are necessary with respect to potential faulting.

The Los Angeles County Metropolitan Transit Authority prepared a report in 2017 for Transect 9 of Tunnel Reach 5 located approximately 1500 feet to the southwest of the subject site (MTA, 2017). The following is a summary from FER-259 (Olson, 2018):

"In 2017, AMEC Foster Wheeler performed a supplemental fault investigation for the planned LA Metro Westside Purple Line subway extension (Metro, 2017) to assess a strand of the Santa Monica Fault Zone encountered during the preliminary fault investigation report (Parsons Brinckerhoff, 2011), which trended northeasterly towards a section of the proposed subway alignment. To investigate for potential faulting, a series of continuous core borings and CPTs were drilled along Laskey Drive, turning east at Charleville Boulevard, and continuing north along Spaulding Drive (see Figure 14, locality 15). This was referred to as Transect 9, which continues the numbering sequence from Parsons Brinckerhoff (2011). The new subsurface profile was constructed using data collected from twenty new continuous core borings drilled from 110 to 245 feet deep and 34 CPTs advanced to depths ranging from 61 to 117 feet. Based on the subsurface data the consultants identify Holocene and Pleistocene alluvial units overlying bedrock of the Pleistocene Lakewood and San Pedro Formations." (Olson, 2018, p. 31-32)

"From their observations and interpretations of the subsurface data, AMEC Foster Wheeler identified a significant fault zone at depth between their stations 6+50 and 9+00 (Figure 19) consisting of up to three strands, which dip steeply to the north. The faults exhibited greater than 90 feet of apparent down-to-the-north vertical displacement of the contact between the older alluvium and the Lakewood Formation. From the southern end of the cross section, the depth to the Pleistocene bedrock units consistently increases to the north until they are abruptly truncated and no longer encountered north of the inferred fault zone. AMEC states these faults appear to extend up near the present-day ground surface and offset Holocene sediments dated between approximately 9,100 and 16,500 years old based on radiometric dating of charcoal samples. The locations of the fault traces in the near surface sediments is based on identifying the location where laterally persistent laminated fine-grained "sag deposits" to the north are abruptly missing in adjacent down-gradient borings. It is postulated these fine-grained silts and clays were deposited in depressions or impounded drainages formed by topographic scarps created by surface-rupturing events along faults in this zone. Additional faults were also interpreted between borings north and south of this main zone." (Olson, 2018, p. 32)

It should be noted that the interpretation of faulting by Metro, 2017 is similar to the previously identified activity of the Santa Monica Fault Zone by the MTA and has been questioned by many consultants. None of the purported active faults conclusively offset Holocene age soil. As discussed by Gath and Buresh (2014) "The interpretation of fault presence was conditioned by that paradigm: faults were expected in a certain location, so any evidence of faulting was presumed conclusive, with no effort to actually verify its presence; similarly, where faults were not anticipated, data that could be used to interpret the presence of faulting was ignored. The paradigm determined that active faulting must be

present, so almost every fault encountered was presumed to be active without any attempt at verification."

More recently Earth Consultants International (ECI), (2018) prepared a Fault Investigation Report for 322 N. Foothill Road in the City of Beverly Hills. Similar to the subject site, the site investigated by ECI was also located partially within the AP Fault Hazard zone. ECI performed an investigation by drilling two continuously cored borings, pushing 6 CPT soundings, and excavating one fault study trench. ECI performed an age assessment of the encountered soils and observed and documented un-broken pre-Holocene stratigraphy. ECI (2018) concluded that the site is not impacted by faulting and the potential for surface rupture is low.

METHODOLOGY

Approach

The subsurface investigation was designed to investigate across the subject site in a northwest-southeast oriented transect within the alley adjacent to the subject site. (see Figure 9). Typically, trenching is the preferred method for evaluating the presence or absence of faults because it offers a continuous, direct exposure of the fault zone or near surface stratigraphy. However, this portion of the SMBFZ has been difficult to expose in trenches due to the dense urban cover in the vicinity. Due to the site conditions (existing structures and dense underground utilities), it was proposed that this fault rupture hazard study consist of a transect of 4 continuously cored borings and 11 CPT soundings. The borings and CPT's are located on a 1 inch = 10 foot scale base map, and the subsurface data was plotted on a 1 inch = 10 foot scale cross section for interpretation (Figure 10).

Field Exploration

Prior to beginning the subsurface field exploration, a literature review, topographic analysis, and geologic reconnaissance of the site was performed. Following this general review, Underground Service Alert (USA) was notified to identify buried utilities in the vicinity of the proposed excavations, as required by law. An independent utility locating company was also contracted to verify "no-conflict" areas for the drilling/CPT locations.

Subsurface exploration at the subject site were completed on July 30, 2018 and included excavating and logging all four continuous borings, and the pushing of eleven total CPTs. The borings and CPT's were excavated to a maximum depth of 50 feet beneath the existing ground surface. The boring logs and soil descriptions, and CPT report are included in Appendices A, B, and C and Tables 1 and 2 respectively.

GEOLOGIC MATERIALS

The continuity of soil horizons and primary stratigraphic contacts provides essential data to evaluate the presence or absence of faulting. Five conformable stratigraphic units within the alluvium were encountered in each of the 4 borings and 11 CPT's. These units are described in detail below.

In general, these units consisted of a basal course-grained sediment, fining-upward to fine sand and silt and local clays, typically capped by a buried paleosol.

Holocene Alluvial Fan Deposit 1 (Qal1)

The uppermost unit in section A-A' (Figure 9) is composed of silty sand to silty sand with clay. Gravels are generally fine, sub angular to sub rounded fragments of slate. Hues are in the 7.5YR range (brown). We interpret this unit as a late Holocene age alluvial deposit (sheet flow), and designate it as Qal1. A thin veneer of artificial fill overlies this unit across a majority of the study area. Unit Qal1 includes both a surficial alluvial deposit and a weakly-developed and truncated argillic soil.

Holocene Alluvial Fan Deposit 2 (Qal2)

The lowest Holocene unit in section A-A' (Figure 9) is composed of sandy clay to clayey sand. Localized gravels at the base of this unit are generally massive and fine to medium grained, sub rounded fragments of slate. Hues are in the 7.5YR range (brown). We interpret this unit as an early Holocene to latest Pleistocene aged alluvial deposit (axial valley deposit), and designate it as Qal2. A thin scour deposit overlies and truncates this unit across a majority of the study area. Qal2 includes alluvial deposits with a thick, diffuse (cumlic), and weakly-developed argillic soil.

Pleistocene Alluvial Fan Deposit 1 (Qoa1)

The uppermost Pleistocene unit in section A-A' (Figure 9) is composed of gravelly clayey sand to sandy clay. Gravels are generally fine to medium grained, sub angular and highly weathered fragments of slate. Hues are in the 7.5 to 5YR range (brown to reddish brown). We interpret this unit as a late Pleistocene age alluvial fan deposit (debris flow), and designate it as Qoa1. A strong scour deposit overlies this unit across the entire study area. Unit Qoa1 includes alluvial deposits that contain a well-developed and truncated argillic soil. The contact between Qal2 and Qoa1 is found at a depth of approximately 26 feet across the entire study area.

Pleistocene Alluvial Fan Deposit 2 (Qoa2)

Beneath unit Qoa1, we encountered a unit composed of silty sand with gravel to sandy clay. Gravel is interbedded within this unit, and is composed of fine, medium and coarse-grained, rounded slate and sandstone. Hues are in the 7.5YR range (brown) with localized faint mottling with 2.5YR olive to grayish brown. This unit is interpreted as a highly weathered late Pleistocene braided stream channel deposit that contains two highly truncated, thin and moderately well-developed soil remnants and we designate it as unit Qoa2. The contact between Qoa1 and Qoa2 is found at a depth of approximately 34 feet across the entire study area.

Pleistocene Alluvial Fan Deposit 3 (Qoa3)

Beneath unit Qoa2, we encountered a unit composed of sandy clay to silty sand with gravel. Gravel is interbedded within this unit, and is composed of fine and medium-grained, highly weathered and sub rounded to sub angular slate and sandstone. Hues are in the 7.5YR range (brown) with faint localized mottling with 2.5YR olive to grayish brown. This unit is interpreted as a highly weathered late Pleistocene braided stream channel deposit that contains a highly truncated, stacked and well developed soil remnant designated as Qoa3. Unit Qoa3 is the oldest unit encountered during the subsurface

exploration. The contact between Qoa2 and Qoa3 is found at a depth of approximately 45 feet across the entire study area.

Soil Development/Soil Profiles

The borings (see Figure 9 and Appendix A) lie across a graded (or stripped) and artificially filled surface that is geomorphically inactive. The soil profile in each boring at depth consists of a truncated sequence of multiple stacked and truncated Alfisol soils (Qoa1, Qoa2, and Qoa3). The entire section in this locality is capped by 6 to 7 feet of artificial fill. Parent materials for these soils consist chiefly of slate-rich debris flow and/ or stream terrace deposits that have most likely emanated from Benedict Canyon. The deepest exposures contain faint mottling and gleying that increases with depth and may faintly overprint or mask some of the original soil properties (mainly soil color). Soil profiles in each boring contains a surface soil and 4 buried soils to depths of approximately 50 feet below the ground surface. This stratigraphic section tracks across the entire area investigated. The individual soil profile members and relative age estimates are briefly described below.

The uppermost or surface soil on site (Qal1) is a highly truncated soil remnant that consists of one weakly developed argillic diagnostic subsurface horizon (Bt – BC). The deposit consists of a crudely stratified fining upwards sequence. This soil member is characterized by a coarse-grained deposit with 7.5YR hues and few thin thick clay films on ped faces and coating gravel and has an estimated relative age of 4 – 8 ka (Appendix B).

The lowest Holocene soil on site (Qal2) is a diffuse and cumlic soil remnant that consists of a thick and weakly developed argillic diagnostic subsurface horizon (2Bt – 2BC – 2C). The deposit consists of a crudely stratified fining upwards sequence. This soil member is characterized by basal gravel and fine-grained deposit with 7.5YR hues and common thin thick clay films on ped faces and coating gravel. Qal2 has an estimated relative age of 12 – 21 ka (Appendix B).

The youngest Pleistocene aged soil on site (Qoa1) is the remnant of a strongly developed Alfisol soil. This is a highly truncated soil that consists of two moderately well-developed argillic diagnostic subsurface horizons (3Bt1 – 3Bt2 – 3BC). The deposit consists of a fining upwards to massive deposit and most likely represents the distal portion of a debris flow deposit. This soil member is characterized by a gravel-rich and fine-grained deposit with 5 to 7.5YR hues and many thin and common moderately thick clay films on ped faces and coating gravel. This soil member has a relative age estimate of 25 - 51 ka.

The third buried soil member on site (Qoa2) is a truncated and older cumlic soil remnant that consists of a thick and moderately well-developed argillic soil profile (4Btb – 4BC). The deposit consists of a crudely stratified fining upwards sequence. This soil member is characterized by a fine-grained deposit with 7.5YR hues locally mottled with 2.5YR hues, with common thin and few to common moderately thick clay films on ped faces and has an estimated relative age of 33 – 64 ka (Appendix B).

The oldest and lowest buried soil member on site (Qoa3) is a truncated and stacked soil remnant that consists of two moderately well-developed punctuated argillic soil profiles (5Btb – 5BC - 6Bt – 6BC). The deposit consists of two crudely stratified fining upwards sequences. This soil member is characterized by a stratified deposit with 7.5YR hues locally mottled with 2.5YR hues, with few to

common thin and few moderately thick clay films. Qoa3 and the entire stratigraphic section under study has an estimated relative age of 46 – 94 ka (Appendix B).

In conclusion, the entire stratigraphic sequence exposed at the project site is estimated to be in excess of 46 ka in age. The project site contains Pleistocene-aged materials at depth. The stratigraphic units encountered provide visually and texturally distinct, mappable contacts that are overlapping across the project site area and across the transect of borings. No features or structural characteristic of faulting, such as shear zones or high angle contacts between units, were observed within the core samples. The contacts between Qoa1 and Qoa2 and between Qoa2 and Qoa3 are observed to undulate and slope gently the south as would be expected by normal sedimentary processes.

EVIDENCE FOR THE ABSENCE OF FAULTING

Several subsurface geologic relationships at the 468 N. Rodeo Drive project site provide direct evidence to preclude the presence of Holocene faulting. The topographic analysis also provides indirect evidence that the site is not traversed by active faults. When these relationships are considered together, there is compelling evidence for the absence of faulting beneath the subject site. The primary lines of evidence that support the interpretation that no faults traverse the site are:

• **Continuous, unfaulted soil horizons and primary stratigraphy across the site.** The boring transect conducted on site exhibits multiple continuous stratigraphic horizons across the entire boring and CPT transect. All of the deposits encountered along the transect correlate well across the project site. If faults with a vertical slip component of slip were active in this area, they would have produced recognizable, vertical separations of these Pleistocene units. Similarly, active strike-slip faulting would have produced an apparent dip-slip component or truncation of units due to the juxtaposition of different Pleistocene strata or pedogenic horizons.

• **No faults were encountered in the subsurface exploration.** No features characteristic of faulting, such as shear zones or high angle contacts between units were observed within the collected continuously cored samples. This line of evidence by itself is not considered compelling enough to preclude the presence of faulting, but it is consistent with and corroborates the other lines of evidence.

• **No irregularities or topographic features indicative of faulting were observed in the project site area.** Geomorphically, the project site sits atop a well incised and degraded Holocene-aged alluvial fan surface. It lies north of the mapped trace of the Santa Monica Fault Zone.

CONCLUSIONS AND RECOMMENDATIONS

This fault rupture evaluation at 468 N. Rodeo Drive has observed continuous un-broken sediments aged greater than 11,700 ka (pre-Holocene) across the site. The observed continuous and un-broken stratigraphy implies that no active faults traverse the site within the limits investigated. Based on the findings of this report and the lack of supporting evidence for active faulting within the bounds of the investigation, the project site is not exposed to the hazard of surface fault rupture. Therefore, we have not delineated any ‘no-build’ zones or fault setback distances that would impact or limit future development of the site (Figure 11).

While the area explored in our study is not considered subject to the hazard of surface faulting, a future earthquake on the Santa Monica Boulevard, Santa Monica, Hollywood, or Newport - Inglewood fault zones will likely produce very strong, near-field ground motions at the project site that should be considered within a geotechnical evaluation of the site.

LIMITATIONS

The conclusions and recommendations presented herein are the results of an inherently limited scope. Specifically, the scope of services consisted of an assessment of whether or not active faults are present within the area explored at the site. The conclusions and recommendations contained in this report are professional opinions derived in accordance with current standards of professional practice. No warranty is expressed or implied.

This report has been prepared for the exclusive use of 468 N. Rodeo Drive LLC and applies only to potential future development at the site located at 468 N. Rodeo Drive in the City of Beverly Hills, California. In the event that significant changes in the development planning should occur, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed by Feffer Geological, and the conclusions and recommendations of this report are verified in writing.

EXPLANATION

Geomorphic surfaces which include active channels (Qa), active alluvial fan deposits (Qf), young alluvial fan deposits (Qyf), and old alluvial fan deposits (Qof). (Yerkes and Campbell, 2005)

Sedimentary Deposits

Qal — Alluvium: Coarse unconsolidated deposits in valleys and stream channels (Holocene)

Qpt — Alluvial plain, stream, and marine terrace deposits (Upper Pleistocene)

Sedimentary Rocks

Qm — Marine deposits: Marine sandstone, conglomerate, and clay shale (Upper Pleistocene).

Tml — Modelo Formation: Marine; lower member; consisting of interbedded, hard, platy siliceous shale and softer brown shale (Miocene).

Tmls — Modelo Formation: Marine; lower member; consisting of lenticular beds of coarse grained sandstone (Miocene).

Metamorphic Rocks

smss — Santa Monica Slate: Dark gray to blue-black slate (Triassic).

smsp — Santa Monica Slate: Dark gray mica schist and phyllite cut by white quartz veins (Triassic).

Igneous Rocks

g — Granite and granodorite (Jurrasic).

APPENDIX 'A'

Boring Logs

LOG OF EXPLORATORY BORING

Job Number: 2188-85
Project: 468 N. Rodeo Drive

Boring No: CB-1
Boring Location: See Site Map

Date Performed: 7/30/18

Drill Type: 8” Hollow Stem / Continuous Core

Depth in Feet	Run #	Recovery Ratio	Recovery Graphic	Bedrock/ Soil Description	Color	Density	Strat/ Soil Unit
0	1			**0-7.5’:** Fill - Silty sand, scattered concrete and asphalt fragments Hand augered upper 7’ due to utilities	Brown	Medium Dense	Af
5	2	3/3		**Holocene Alluvium (Qal1)** **7.5-10.5’:** Clayey sand, massive, moderate to very sticky, very plastic, medium to coarse grained, poorly sorted, common thin and fine moderately thick clay films with basal scour, of sand with silt	Brown 7.5 YR 4/3	Hard, friable	Af Bt
10						Slightly Hard, friable	C
	3	3.6 /5		**10.5-13.3’:** Silty sand with clay, slightly sticky, moderately plastic, medium to coarse grained, poorly sorted sand, slightly to well oxidized, few common thin clay films	Brown 7.5 YR 5/4	Slightly Hard, friable	BC
15	4	5/5		**Holocene Alluvium (Qal2)** **13.3’:** Sandy clay, clayey sand, very sticky, very plastic, medium to coarse grained, poorly sorted sand, common $CaCO_3$ veinlets, many thin and few moderately thick clay films	Brown 7.5 YR 5/4	Hard, firm	2Bt

Subject: Soil Stratigraphy Study And Relative Age Estimates For A Fault Rupture Hazard Investigation At 468 Rodeo Drive, Beverly Hills, CA.

Dear Mr. Feffer:

I am pleased to present to you this soil stratigraphic study and relative-age determinations to be used with your fault rupture hazard assessment of the proposed development located at 468 Rodeo Drive in the City of Beverly Hills, California.

Feffer Geological retained John Helms CEG to describe and assist in correlations of the soil stratigraphy from continuously cored borehole samples and to assign relative age dates for the deposits identified across the site. The continuously cored bore hole samples were obtained from a single transect of borings, transect A. One borehole (CB-1) was completely described from transect A, and three additional boreholes (CB-2, B-1, and B-2) from transect A have been reviewed and summarized. The detailed soil descriptions are used to calculate various soil development indices (or SDIs). The SDI values were then compared to the SDI values from similar described soils with known ages to estimate age ranges for the soils understudy.

The attached report classifies the described soil profiles, identifies stratigraphic relationships, defines soil chronosequences, and estimates the relative ages for the two soil profiles described in detail. Calculated SDI's show strong correlations to the SDI values of other published, described, and dated soil profiles with similar parent materials.

Age estimates range from 46 to 94 ka for the stratigraphic section studied along transect A in boring CB-1. There are several distinctive buried soil units that can be correlated across the entire length of Transect A. One distinctive buried soil (buried soil 2, Qoa1) which can be correlated across the entire length of Transect A, is a truncated and well oxidized argillic soil profile that ranges in relative age from 25 – 51 ka. Please see Table 6 in the attached report for a summary listing of all of the determined relative ages at the study site.

Thank you for this opportunity to be of service. Should you have any questions or require additional information, please do not hesitate to contact me.

Sincerely,

SOIL STRATIGRAPHY STUDY AND RELATIVE AGE ESTIMATES FOR A FAULT RUPTURE HAZARD STUDY FOR A PROPOSED DEVELOPMENT AT 468 RODEO DRIVE, BEVERLY HILLS, CALIFORNIA.

INTRODUCTION

Due to a repeating and consistent sequence of stratigraphy across the entire transect of borings, one soil profile has been studied for geomorphic characteristics and relative degrees of weathering to estimate deposit relative-age. Boring CB-1 was selected for this process due to it's position being located on the subject property as well as being located near the center of the transect of borings. The relative age estimate is based on index value comparisons with other published and dated soil profile descriptions. The comparative soils are from areas with a similar climate and similar parent material to this study area. The estimated relative ages in this report will be used by Feffer Geological, Inc. to assess the recency and recurrence of faulting across the study area. Alluvial units are assessed chronostratigraphically across four borehole locations from a single transect of borings and CPT's that shadow the area proposed for development. In this study, the soil stratigraphy is defined with soil field description data, and no laboratory data. This study identifies the soil stratigraphy across the area under study and estimates the relative age of one soil profile. Continuously cored and sampled borehole CB-1 has been described in detail, and three additional continuously cored and sampled boreholes (CB-2, B-1, and B-2) has been summarized or briefly described along Transect A. Transect A is located along a graded and stripped alluvial surface.

For the Quaternary geologist, a soil can be defined as a natural body that consists of horizons of organic and/or mineral constituents which differ from its parent material in some way (Birkland, 1984). A chronosequence is a group of soils for which all soil forming factors (such as topography, parent material, vegetation, and climate) except time is relatively equal (Jenny, 1941). Past geologic studies in the coastal region of southern California provide age constraints for several deposits and geomorphic surfaces ranging in age from middle Pleistocene to recent (McFadden, 1982; Rockwell, 1988; and WLA, 1998). Often it has proven difficult to date older deposits due to changes in past climatic regimes. Studies on the impacts of glacial to interglacial climatic changes on soil development in specific regions (McFadden, 1982; Birkland, 1984; McFadden, 1988) indicate that soil development has occurred throughout the Quaternary.

This study is concerned with a section of alluvium derived from the southern range front of the Santa Monica Mountains, which is within the Transverse Ranges Geomorphic Province. A series of stacked and truncated argillic soil subsurface horizons within all of the stratigraphic sections studied indicates that the alluvial stratigraphic section across the entire study area correlates well and is significantly old. Age estimates range from 46 to 94 ka for the stratigraphic section studied near the center portion of transect A in boring CB-1.

Soil relative age estimates have broad ranges, dependent upon the pool of comparative data used. Most of the buried soils across the study area fall into the Alfisol soil order (Soil Conservation Service, 1999). The soil profile that is described in detail is from boring CB-1 in Transect A and summary descriptions were generated for borings CB-2, B-1, and B-2 from Transect A. Boring locations are shown on the geologic map that is provided with the main fault rupture hazard report.

MATERIALS AND METHODS

Continuous core samples collected from boring CB-1 by Feffer Geological, Inc. were described in detail as part of this study. The soils were described using guidelines set by the Soil Survey Staff (1991 and 1999). Specific soil properties such as soil structure and soil horizon boundaries could not be accurately described from the core sample exposures. These soil qualifiers have not been described and do not factor into the estimated soil relative age comparisons.

Soil profile field description values quantify soil properties that are used to develop a soil development index (SDI) value as outlined by Harden (1982). Points are assigned to descriptive data for each of several observed soil properties, such as dry color, moist color, texture, dry and wet consistence, and clay film content, for each soil horizon in a soil profile relative to the soil horizon's thickness, and normalized to a common depth. The maturity of a soil profile is gauged through data collected from active wash deposits (or raw alluvium).

Table 1.1 lists the detailed soil description for the studied boring in longhand format. Table 1.2 lists the soil description using soil conservation service notation and shows the SDI calculations. Table 1.2 shows the calculated SDI values, the soil profile description, and the normalization values for raw alluvium. SDI values are calculated by assigning point values to each described soil properties. The points are summed for each soil horizon and divided by the total number of descriptive properties used. This equals the mean horizon index value (HI). HI values are multiplied by the corresponding soil horizon thickness. The SDI value equals the sum of the thickness normalized horizon indices. The maximum horizon index (MHI) is the value of the horizon with the largest summed descriptive value. MHI is independent of horizon thickness, and is usually the diagnostic subsurface soil horizon for most soil profiles. Tables 1.2 lists all of the determined HI, SDI, and MHI values for the soil profile under study.

SDI and MHI values have shown significant correlations to soil age in many past studies (Harden, 1982; Rockwell *et al.*, 1983; Reheis *et al.*, 1989; Rockwell *et al.*, 1994). The soils described in this study are compared to soils described and dated by McFadden (1982 and 1988) in San Bernardino County near Mission Creek, by Rockwell (1983) in the Ventura River basin, and by William Lettis and Associates, Inc. (1998) in West Hollywood. SDI values have all calibrated to a common depth of 7 feet.

The changes in the subsurface pedogenic properties of the Alfisols soil order allows for relative age determinations by emphasizing specific soil properties (such as color and clay film content) that are most diagnostic. Soil properties that express themselves well through time are most often used in the assessment of soil relative ages through a specific soil property index such as the color or clay film index. The color index (Rockwell *et al.,* 1985, 1988) is used to quantify observed colors (in Munsell notation) of each profile in order to compare relative degrees of reddening. The color index is simply the summation of an entire profile's horizon index values for dry colors. The clay film index (Rockwell *et al.,* 1985, 1988) is used to quantify field descriptions of this soil property in order to compare relative profile maturity. The clay film index is simply the summation of an entire soil profile's horizon index values for clay films. MHI is a comparison of a soil pedons master (or diagnostic) subsurface horizon (typically an argillic or cambic horizon). Independent of horizon thickness, the MHI directly compares the properties of the soil profiles strongest soil horizon.

SOIL RELATIVE AGE METHODS

Soil relative ages are calculated and compared independently for each soil profile described. The soil profile described for this study is located across several buried alluvial surfaces that differ in relative age, facies of deposition, and degrees of preservation. A series of stacked, buried, and truncated hard, clayey soils with illuvial clays characterize a majority of the soil profiles described on this project site.

The soil profile described in detail has a surface age that is implied by estimating the time of inception for the exposed surficial soil. The soil profile described in detail for this study also contains a series of stacked and / or buried soil profiles. In this case, deposit age assessments are obtained by identifying and isolating the different parent materials (or deposits). Then comparing a set of abridged calculated indices to an additional suite of similar soils that have been radiometrically dated yields the equivalent to a buried surface age estimate. Such burial relationships are common along the southern Santa Monica Mountains range front; especially where soils that have developed into alluvial fan deposits which commonly bury or locally truncate older soils that have developed previously in older alluvial deposits. A cumlic soil profile estimated age can assess landform age, and has potential to assess rates of erosion, rates of landform evolution, and rates of tectonic activity across the study area.

The described soil profiles have an SDI value, which is used to estimate the soil relative age. Cumuli relative age estimates for a stacked or buried soil profiles are specifically referred to as “deposit ages”. The relative age estimate for the surface profile or modern soil is referred to as the “surface age”. All of the relative age estimates given are considered minimum ages given that an unknown amount of erosion has occurred after the formation of and before the burial of each truncated surface and buried soil studied.

SOIL SUMMARY DESCRIPTIONS

Soil summary descriptions were generated for borings CB-2, B-1, and B-2 in this study. The summary descriptions record diagnostic pedogenic features for each soil horizon identified. This was done in order to assist with establishing stratigraphic correlations across the site. Relative age estimates were not generated for any of the listed soil summary descriptions. The soil summary descriptions are listed in Tables 2.1, 2.2, and 2.3.

DISCUSSION AND RESULTS

This section contains a brief write up for the continuously cored boring described in detail with designated tables for the soil profile. The attached Table 1.1 presents the soil profile description in longhand format. Table 1.2 presents the results of the calculated SDI values. Table 3 is a summary of the soil relative age estimates for the soil profile under study. Table 4 is a compilation of the comparative data in a format that compares to the data generated for this study. Table 5 is a soil abbreviation key to be used in conjunction with the SDI calculation sheets. Table 6 lists the relative ages for each designated stratigraphic unit that is shown on the geologic cross section in the fault rupture hazard report.

Soil descriptions, SDI calculations, and relative age determinations follow for the soil profile studied.

TRANSECT A BORINGS

One soil profile was described in detail out of core samples from Transect A in boring CB-1. Age estimates range from 46 to 94 ka for the alluvial section studied in boring CB-1 of transect A.

Boring CB-1

The core samples from Transect A, Boring CB-1 were reviewed at the project site on 8/7/2018 and on 8/8/2018. This boring is located near the center of Transect A, and this alluvial section is characterized by a sequence of truncated argillic soils interbedded with massive and crudely stratified scour deposits. See Table 1.1 for a complete soil description of the continuously sampled boring, Table 1.2 for the SDI index value calculations and relative age estimates, and Feffer Geological Inc.'s cross section and geologic map for both the borehole and transect location.

The surface soil (Qal1) in boring CB-1 consists of a weakly-developed Alfisol that is characterized by a severely truncated and organic rich argillic horizon and has an estimated relative age of 4 – 8 ka. The uppermost buried soil (Buried Soil 1 / Qal2) that can be correlated across the entire length of Transect A is a truncated, thick, and diffuse weakly to moderately well-developed Alfisol soil with an estimated relative age value of 12 – 21 ka. The second buried soil in this alluvial sequence is the top of the Pleistocene in this stratigraphic section. This marker bed (Qoa1) can be correlated across the entire area investigated and is a truncated and moderately well-developed Alfisol soil that has an estimated relative age value of 25 – 51 ka. The third buried soil (Buried Soil 3 / Qoa2) also can be correlated across the entire length of Transect A is a truncated, thin and weakly to moderately well-developed Alfisol soil with an estimated relative age value of 33 – 64 ka. The forth buried soil (Qoa3) in Transect A, and the entire stratigraphic section studied has an estimated age that ranges from 46 – 94 ka. This lowest buried soil in this alluvial sequence can be correlated across the entire area investigated and is a truncated and moderately well-developed Alfisol soil.

Differences in the number of soils, depths of burial and unit thicknesses due to differential erosion / truncation laterally along Transect A may cause minor variances in relative age estimates between the individual borings. In order to control for this additional soil summary descriptions were generated across this transect which assesses the same buried surfaces at differing depths of burial and in differing states of preservation.

BORING SUMMARY DESCRIPTIONS

Soil summary descriptions generated for borings CB-1, B-1 , and B-2 are listed in Tables 2.1, 2.2, and 2.3. Relative age estimates were not generated for the soil summary descriptions. The summary descriptions were generated to assist with establishing stratigraphic correlations across the site. The observations for the soil summary descriptions along Transect A were made on 8/8/2018. All of the borings along Transect A appear to contain a thin veneer of artificial fill that is in contact with a sequence of Holocene- and Pleistocene-aged truncated argillic soils and nested sour deposits. Several of the Pleistocene-aged truncated and /stacked buried soils are maker units which can be correlated across the area investigated.

CONCLUSIONS

A majority of the soils observed across the study area are Alfisols that have developed in alluvial environments. All of the soil profiles across Transect A consist of a series of stacked, truncated, and buried argillic soil horizons. The truncated and buried soils with argillic sub surface soil horizons are weakly and moderately well developed. The Alfisol soils typically have 7.5YR to 5YR color hues with a modest amounts of secondary (pedogenic) clay in a series of argillic (Bt) diagnostic subsurface horizons.

The surface soil profile across the area investigated is laterally continuous across transect A. Lateral variability in observed in the buried soils across the site is due to localized erosion, scouring, infilling, and stacking of these materials in an alluvial environment. In this sedimentological environment surfaces that have been stable long enough to form a robust soil, can suddenly be buried by a new deposit, or scoured out (truncated) and possibly in-filled with younger material. The amount of erosion that has occurred with each truncated soil under study is unknown. Thus the relative age estimates given in this study are minimum ages.

These soil relative age determinations are consistent with the general geologic and pedogenic observations of soils in southern California. Strongly developed, well horizonated, thick, and oxidized Alfisols can be as much as 200 ka in age. Erosion tends to act as a rejuvenating aspect in soil development, by decreasing the strength of the soil development properties and the consequent age estimates are younger. In that past magnitudes and rates of erosion are difficult to assess, the soil relative age estimates are utilized as minimum ages.

The soils observed along Transect A are Holocene and Pleistocene in age. The buried and stacked soils display soil horizons that have weak to moderately strong argillic horizon development. Age estimates range from 46 to 94 ka for the entire alluvial stratigraphic section studied along transect A. The second buried soil (buried soil 2) (Qoa1) that can be correlated across the entire area investigated is a truncated and moderately well-developed argillic soil profile that ranges in relative age from 25 – 51 ka along the length of Transect A. The lowermost buried soil (buried soil 4) (Qoa4) that can be correlated across the entire area investigated is a truncated, stacked, and moderately well-developed argillic soil profile that ranges in relative age from 46 – 94 ka along the length of Transect A.

LIMITATIONS

The conclusions and recommendations presented herein are the results of an inherently limited scope. Specifically, the scope of services consisted of an assessment of relative age from core samples and did not participate in any drilling activities at the site. The conclusions and recommendations contained in this report are professional opinions derived in accordance with current standards of professional practice. No warranty is expressed or implied.

This report has been prepared for the exclusive use of Feffer Geological, Inc. and applies only to the Fault Rupture Hazard Study located at 468 Rodeo Drive. In the event that significant changes in the interpretations of this study are made, the conclusions and recommendations contained in this report shall not be considered valid unless the changes

are reviewed by John Helms, CEG, and the conclusions and recommendations of this report are verified in writing.

CPT Reporting

8/3/18

Feffer Geological Consulting
Attn: Alexander Greene

Subject: CPT Site Investigation
468 Rodeo Drive
Beverly Hills, California
GREGG Project Number: 180590SH

Dear Mr. Greene:

The following report presents the results of GREGG Drilling & Testing's Cone Penetration Test investigation for the above referenced site. The following testing services were performed:

1	Cone Penetration Tests	(CPTU)	☒
2	Pore Pressure Dissipation Tests	(PPD)	☐
3	Seismic Cone Penetration Tests	(SCPTU)	☐
4	UVOST Laser Induced Fluorescence	(UVOST)	☐
5	Groundwater Sampling	(GWS)	☐
6	Soil Sampling	(SS)	☐
7	Vapor Sampling	(VS)	☐
8	Pressuremeter Testing	(PMT)	☐
9	Vane Shear Testing	(VST)	☐
10	Dilatometer Testing	(DMT)	☐

A list of reference papers providing additional background on the specific tests conducted is provided in the bibliography following the text of the report. If you would like a copy of any of these publications or should you have any questions or comments regarding the contents of this report, please do not hesitate to contact our office at (562) 427-6899.

Sincerely,
GREGG Drilling & Testing, Inc.

Frank Stolfi
HRSC Division Manager, Gregg Drilling & Testing, Inc.

Cone Penetration Testing Procedure (CPT)

Gregg Drilling carries out all Cone Penetration Tests (CPT) using an integrated electronic cone system, *Figure CPT*.

The cone takes measurements of tip resistance (q_c), sleeve resistance (f_s), and penetration pore water pressure (u_2). Measurements are taken at either 2.5 or 5 cm intervals during penetration to provide a nearly continuous profile. CPT data reduction and basic interpretation is performed in real time facilitating on-site decision making. The above mentioned parameters are stored electronically for further analysis and reference. All CPT soundings are performed in accordance with revised ASTM standards (D 5778-12).

The 5mm thick porous plastic filter element is located directly behind the cone tip in the u_2 location. A new saturated filter element is used on each sounding to measure both penetration pore pressures as well as measurements during a dissipation test (*PPDT*). Prior to each test, the filter element is fully saturated with oil under vacuum pressure to improve accuracy.

When the sounding is completed, the test hole is backfilled according to client specifications. If grouting is used, the procedure generally consists of pushing a hollow tremie pipe with a "knock out" plug to the termination depth of the CPT hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole. Disruption or further contamination to the site is therefore minimized.

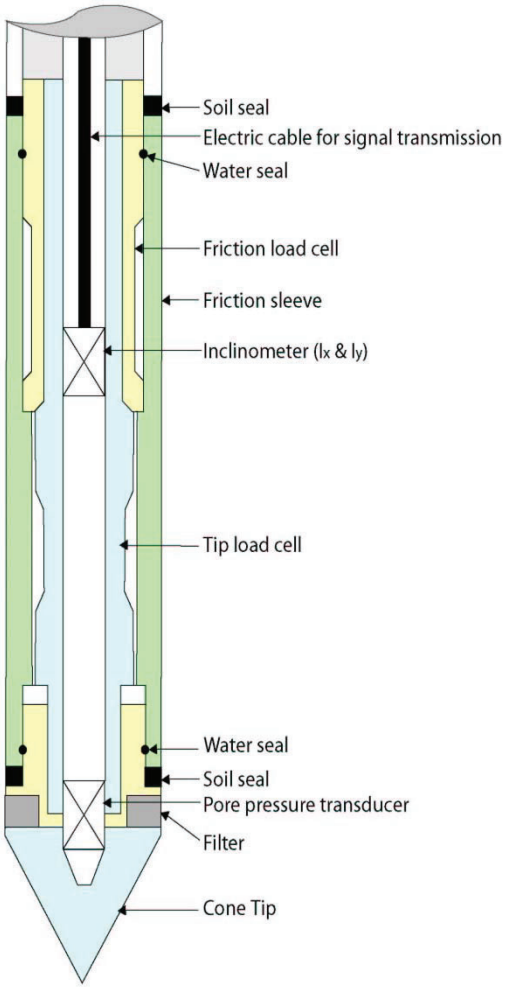

Figure CPT

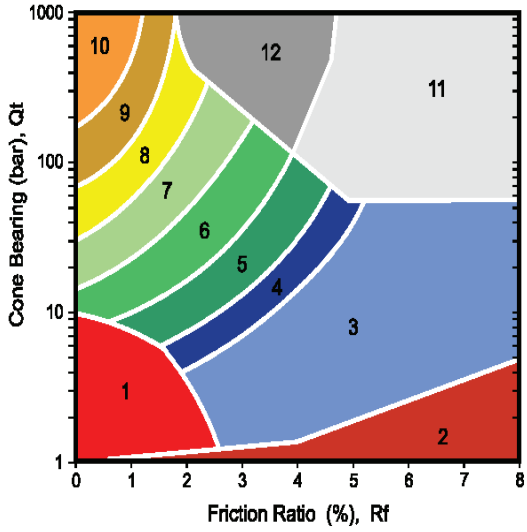
Gregg 15cm^2 Standard Cone Specifications

Dimensions	
Cone base area	15 cm^2
Sleeve surface area	225 cm^2
Cone net area ratio	0.80
Specifications	
Cone load cell	
Full scale range	180 kN (20 tons)
Overload capacity	150%
Full scale tip stress	120 MPa (1,200 tsf)
Repeatability	120 kPa (1.2 tsf)
Sleeve load cell	
Full scale range	31 kN (3.5 tons)
Overload capacity	150%
Full scale sleeve stress	1,400 kPa (15 tsf)
Repeatability	1.4 kPa (0.015 tsf)
Pore pressure transducer	
Full scale range	7,000 kPa (1,000 psi)
Overload capacity	150%
Repeatability	7 kPa (1 psi)



Note: The repeatability during field use will depend somewhat on ground conditions, abrasion, maintenance and zero load stability.

Cone Penetration Test Data & Interpretation

The Cone Penetration Test (CPT) data collected are presented in graphical and electronic form in the report. The plots include interpreted Soil Behavior Type (SBT) based on the charts described by Robertson (1990). Typical plots display SBT based on the non-normalized charts of Robertson et al (1986). For CPT soundings deeper than 30m, we recommend the use of the normalized charts of Robertson (1990) which can be displayed as SBTn, upon request. The report also includes spreadsheet output of computer calculations of basic interpretation in terms of SBT and SBTn and various geotechnical parameters using current published correlations based on the comprehensive review by Lunne, Robertson and Powell (1997), as well as recent updates by Professor Robertson (Guide to Cone Penetration Testing, 2015). The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg Drilling & Testing Inc. does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software. Some interpretation methods require input of the groundwater level to calculate vertical effective stress. An estimate of the in-situ groundwater level has been made based on field observations and/or CPT results, but should be verified by the user.

A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface.

Note that it is not always possible to clearly identify a soil type based solely on q_t, f_s, and u_2. In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the correct soil behavior type.

ZONE		SBT
1		Sensitive, fine grained
2		Organic materials
3		Clay
4		Silty clay to clay
5		Clayey silt to silty clay
6		Sandy silt to clayey silt
7		Silty sand to sandy silt
8		Sand to silty sand
9		Sand
10		Gravely sand to sand
11		Very stiff fine grained*
12		Sand to clayey sand*

*over consolidated or cemented

Figure SBT (After Robertson et al., 1986) – Note: Colors may vary slightly compared to plots

Cone Penetration Test (CPT) Interpretation

Gregg uses a proprietary CPT interpretation and plotting software. The software takes the CPT data and performs basic interpretation in terms of soil behavior type (SBT) and various geotechnical parameters using current published empirical correlations based on the comprehensive review by Lunne, Robertson and Powell (1997). The interpretation is presented in tabular format using MS Excel. The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for any use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software.

The following provides a summary of the methods used for the interpretation. Many of the empirical correlations to estimate geotechnical parameters have constants that have a range of values depending on soil type, geologic origin and other factors. The software uses 'default' values that have been selected to provide, in general, conservatively low estimates of the various geotechnical parameters.

Input:

1 Units for display (Imperial or metric) (atm. pressure, p_a = 0.96 tsf or 0.1 MPa)
2 Depth interval to average results (ft or m). Data are collected at either 0.02 or 0.05m and can be averaged every 1, 3 or 5 intervals.
3 Elevation of ground surface (ft or m)
4 Depth to water table, z_w (ft or m) – input required
5 Net area ratio for cone, a (default to 0.80)
6 Relative Density constant, C_{Dr} (default to 350)
7 Young's modulus number for sands, α (default to 5)
8 Small strain shear modulus number
  a. for sands, S_G (default to 180 for SBT_n 5, 6, 7)
  b. for clays, C_G (default to 50 for SBT_n 1, 2, 3 & 4)
9 Undrained shear strength cone factor for clays, N_{kt} (default to 15)
10 Over Consolidation ratio number, k_{ocr} (default to 0.3)
11 Unit weight of water, (default to γ_w = 62.4 lb/ft^3 or 9.81 kN/m^3)

Column

1 Depth, z, (m) – CPT data is collected in meters
2 Depth (ft)
3 Cone resistance, q_c (tsf or MPa)
4 Sleeve resistance, f_s (tsf or MPa)
5 Penetration pore pressure, u (psi or MPa), measured behind the cone (i.e. u_2)
6 Other – any additional data
7 Total cone resistance, q_t (tsf or MPa) $q_t = q_c + u\,(1-a)$

8	Friction Ratio, R_f (%)	$R_f = (f_s/q_t) \times 100\%$
9	Soil Behavior Type (non-normalized), SBT	see note
10	Unit weight, γ (pcf or kN/m^3)	based on SBT, see note
11	Total overburden stress, σ_v (tsf)	$\sigma_{vo} = \sigma\ z$
12	In-situ pore pressure, u_o (tsf)	$u_o = \gamma_w (z - z_w)$
13	Effective overburden stress, σ'_{vo} (tsf)	$\sigma'_{vo} = \sigma_{vo} - u_o$
14	Normalized cone resistance, Q_{t1}	$Q_{t1} = (q_t - \sigma_{vo}) / \sigma'_{vo}$
15	Normalized friction ratio, F_r (%)	$F_r = f_s / (q_t - \sigma_{vo}) \times 100\%$
16	Normalized Pore Pressure ratio, B_q	$B_q = u - u_o / (q_t - \sigma_{vo})$
17	Soil Behavior Type (normalized), SBT_n	see note
18	SBT_n Index, I_c	see note
19	Normalized Cone resistance, Q_{tn} (n varies with I_c)	see note
20	Estimated permeability, k_{SBT} (cm/sec or ft/sec)	see note
21	Equivalent SPT N_{60}, blows/ft	see note
22	Equivalent SPT $(N_1)_{60}$ blows/ft	see note
23	Estimated Relative Density, D_r, (%)	see note
24	Estimated Friction Angle, ϕ', (degrees)	see note
25	Estimated Young's modulus, E_s (tsf)	see note
26	Estimated small strain Shear modulus, Go (tsf)	see note
27	Estimated Undrained shear strength, s_u (tsf)	see note
28	Estimated Undrained strength ratio	s_u/σ_v'
29	Estimated Over Consolidation ratio, OCR	see note

Notes:

1 Soil Behavior Type (non-normalized), SBT (Lunne et al., 1997 and table below)

2 Unit weight, γ either constant at 119 pcf or based on Non-normalized SBT (Lunne et al., 1997 and table below)

3 Soil Behavior Type (Normalized), SBT_n Lunne et al. (1997)

4 SBT_n Index, I_c $I_c = ((3.47 - \log Q_{t1})^2 + (\log F_r + 1.22)^2)^{0.5}$

5 Normalized Cone resistance, Q_{tn} (n varies with Ic)

$Q_{tn} = ((q_t - \sigma_{vo})/pa)\ (pa/(\sigma'_{vo})^n$ and recalculate I_c, then iterate:

When $I_c < 1.64$, n = 0.5 (clean sand)
When $I_c > 3.30$, n = 1.0 (clays)
When $1.64 < I_c < 3.30$, $n = (I_c - 1.64)0.3 + 0.5$
Iterate until the change in n, $\Delta n < 0.01$

6 Estimated permeability, k_{SBT} based on Normalized SBT_n (Lunne et al., 1997 and table below)

7 Equivalent SPT N_{60}, blows/ft Lunne et al. (1997)

$$\frac{(q_t/p_a)}{N_{60}} = 8.5\left(1 - \frac{I_c}{4.6}\right)$$

8 Equivalent SPT $(N_1)_{60}$ blows/ft $(N_1)_{60} = N_{60}\, C_N$,
where $C_N = (pa/\sigma'_{vo})^{0.5}$

9 Relative Density, D_r, (%) $D_r^2 = Q_{tn} / C_{Dr}$
Only SBT_n 5, 6, 7 & 8 *Show 'N/A' in zones 1, 2, 3, 4 & 9*

10 Friction Angle, ϕ', (degrees) $\tan\phi' = \frac{1}{2.68}\left[\log\left(\frac{q_c}{\sigma'_{vo}}\right) + 0.29\right]$
Only SBT_n 5, 6, 7 & 8 *Show'N/A' in zones 1, 2, 3, 4 & 9*

11 Young's modulus, E_s $E_s = \alpha\, q_t$

The following updated and simplified SBT descriptions have been used in the software:

SBT Zones		**SBT_n Zones**	
1	sensitive fine grained	1	sensitive fine grained
2	organic soil	2	organic soil
3	clay	3	clay
4	clay & silty clay	4	clay & silty clay
5	clay & silty clay		
6	sandy silt & clayey silt		

7	silty sand & sandy silt	5	silty sand & sandy silt
8	sand & silty sand	6	sand & silty sand
9	sand		
10	sand	7	sand
11	very dense/stiff soil*	8	very dense/stiff soil*
12	very dense/stiff soil*	9	very dense/stiff soil*

*heavily overconsolidated and/or cemented

Track when soils fall with zones of same description and print that description (i.e. if soils fall only within SBT zones 4 & 5, print ‘clays & silty clays’)

Estimated Permeability (see Lunne et al., 1997)

SBT_n	Permeability (ft/sec)	(m/sec)
1	$3x\ 10^{-8}$	$1x\ 10^{-8}$
2	$3x\ 10^{-7}$	$1x\ 10^{-7}$
3	$1x\ 10^{-9}$	$3x\ 10^{-10}$
4	$3x\ 10^{-8}$	$1x\ 10^{-8}$
5	$3x\ 10^{-6}$	$1x\ 10^{-6}$
6	$3x\ 10^{-4}$	$1x\ 10^{-4}$
7	$3x\ 10^{-2}$	$1x\ 10^{-2}$
8	$3x\ 10^{-6}$	$1x\ 10^{-6}$
9	$1x\ 10^{-8}$	$3x\ 10^{-9}$

Estimated Unit Weight (see Lunne et al., 1997)

SBT	Approximate Unit Weight (lb/ft^3)	(kN/m^3)
1	111.4	17.5
2	79.6	12.5
3	111.4	17.5
4	114.6	18.0
5	114.6	18.0
6	114.6	18.0
7	117.8	18.5
8	120.9	19.0
9	124.1	19.5
10	127.3	20.0
11	130.5	20.5
12	120.9	19.0

Pore Pressure Dissipation Tests (PPDT)

Pore Pressure Dissipation Tests (PPDT's) conducted at various intervals can be used to measure equilibrium water pressure (at the time of the CPT). If conditions are hydrostatic, the equilibrium water pressure can be used to determine the approximate depth of the ground water table. A PPDT is conducted when penetration is halted at specific intervals determined by the field representative. The variation of the penetration pore pressure (*u)* with time is measured behind the tip of the cone and recorded.

Pore pressure dissipation data can be interpreted to provide estimates of:

- Equilibrium piezometric pressure
- Phreatic Surface
- In situ horizontal coefficient of consolidation (c_h)
- In situ horizontal coefficient of permeability (k_h)

In order to correctly interpret the equilibrium piezometric pressure and/or the phreatic surface, the pore pressure must be monitored until it reaches equilibrium, *Figure PPDT*. This time is commonly referred to as t_{100}, the point at which 100% of the excess pore pressure has dissipated.

A complete reference on pore pressure dissipation tests is presented by Robertson et al. 1992 and Lunne et al. 1997.

A summary of the pore pressure dissipation tests are summarized in Table 1.

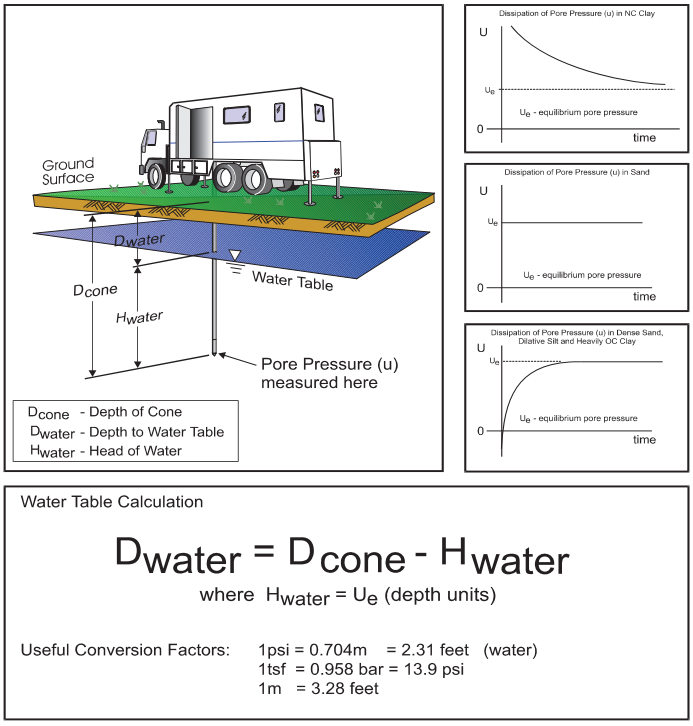

Figure PPDT

Seismic Cone Penetration Testing (SCPT)

Seismic Cone Penetration Testing (SCPT) can be conducted at various intervals during the Cone Penetration Test. Shear wave velocity (Vs) can then be calculated over a specified interval with depth. A small interval for seismic testing, such as 1-1.5m (3-5ft) allows for a detailed look at the shear wave profile with depth. Conversely, a larger interval such as 3-6m (10-20ft) allows for a more average shear wave velocity to be calculated. Gregg's cones have a horizontally active geophone located 0.2m (0.66ft) behind the tip.

To conduct the seismic shear wave test, the penetration of the cone is stopped and the rods are decoupled from the rig. An automatic hammer is triggered to send a shear wave into the soil. The distance from the source to the cone is calculated knowing the total depth of the cone and the horizontal offset distance between the source and the cone. To calculate an interval velocity, a minimum of two tests must be performed at two different depths. The arrival times between the two wave traces are compared to obtain the difference in time (Δt). The difference in depth is calculated (Δd) and velocity can be determined using the simple equation: $v = \Delta d/\Delta t$

Multiple wave traces can be recorded at the same depth to improve quality of the data.

A complete reference on seismic cone penetration tests is presented by Robertson et al. 1986 and Lunne et al. 1997.

A summary the shear wave velocities, arrival times and wave traces are provided with the report.

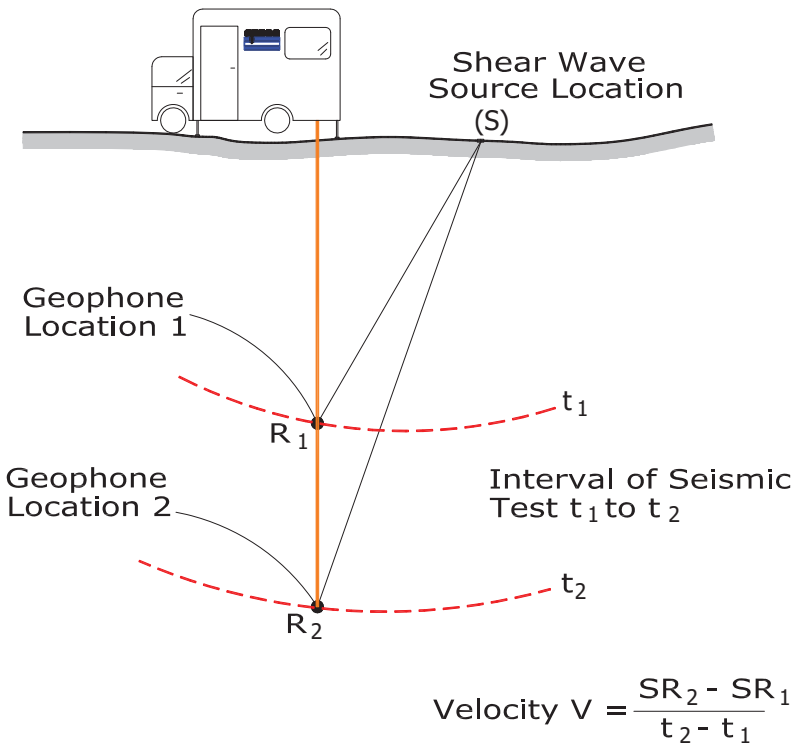

Figure SCPT

Groundwater Sampling

Gregg Drilling & Testing, Inc. conducts groundwater sampling using a sampler as shown in *Figure GWS*. The groundwater sampler has a retrievable stainless steel or disposable PVC screen with steel drop off tip. This allows for samples to be taken at multiple depth intervals within the same sounding location. In areas of slower water recharge, provisions may be made to set temporary PVC well screens during sampling to allow the pushing equipment to advance to the next sample location while the groundwater is allowed to infiltrate.

The groundwater sampler operates by advancing 44.5mm (1¾ inch) hollow push rods with the filter tip in a closed configuration to the base of the desired sampling interval. Once at the desired sample depth, the push rods are retracted; exposing the encased filter screen and allowing groundwater to infiltrate hydrostatically from the formation into the inlet screen. A small diameter bailer (approximately ½ or ¾ inch) is lowered through the push rods into the screen section for sample collection. The number of downhole trips with the bailer and time necessary to complete the sample collection at each depth interval is a function of sampling protocols, volume requirements, and the yield characteristics and storage capacity of the formation. Upon completion of sample collection, the push rods and sampler, with the exception of the PVC screen and steel drop off tip are retrieved to the ground surface, decontaminated and prepared for the next sampling event.

For a detailed reference on direct push groundwater sampling, refer to Zemo et. al., 1992.

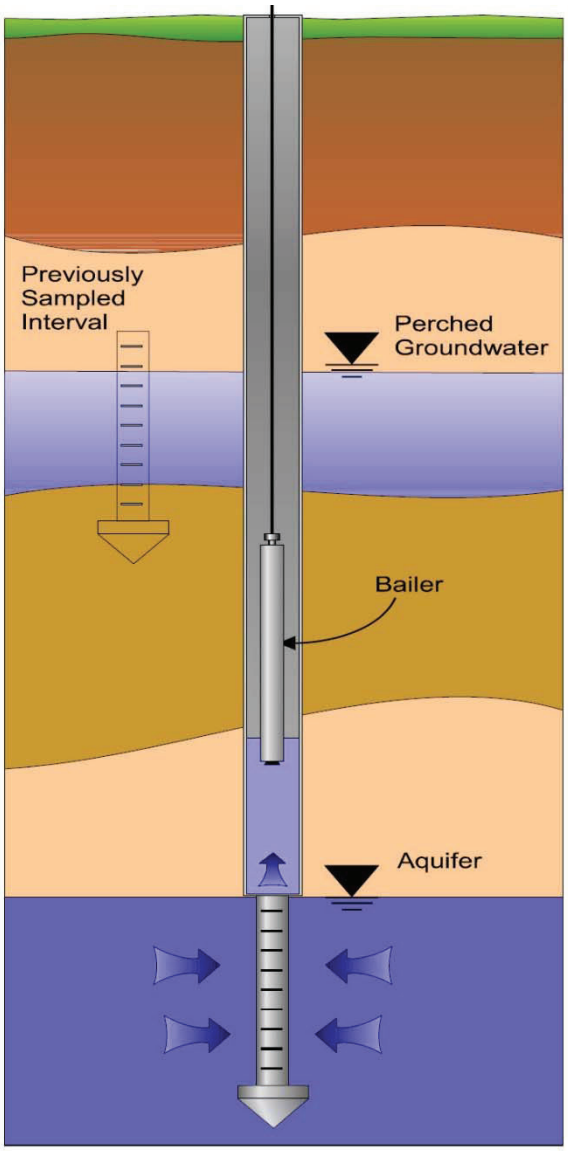

Figure GWS

Soil Sampling

Gregg Drilling & Testing, Inc. uses a piston-type push-in sampler to obtain small soil samples without generating any soil cuttings, *Figure SS*. Two different types of samplers (12 and 18 inch) are used depending on the soil type and density. The soil sampler is initially pushed in a "closed" position to the desired sampling interval using the CPT pushing equipment. Keeping the sampler closed minimizes the potential of cross contamination. The inner tip of the sampler is then retracted leaving a hollow soil sampler with inner 1¼" diameter sample tubes. The hollow sampler is then pushed in a locked "open" position to collect a soil sample. The filled sampler and push rods are then retrieved to the ground surface. Because the soil enters the sampler at a constant rate, the opportunity for 100% recovery is increased. For environmental analysis, the soil sample tube ends are sealed with Teflon and plastic caps. Often, a longer "split tube" can be used for geotechnical sampling.

For a detailed reference on direct push soil sampling, refer to Robertson et al, 1998.

SUMMARY
OF
CONE PENETRATION TEST DATA

1. INTRODUCTION

This report presents the results of a Cone Penetration Test (CPT) program carried out for the project located at 456 N. Rodeo Drive in Beverly Hills, California. The work was performed by Kehoe Testing & Engineering (KTE) on July 11-13, 2018. The scope of work was performed as directed by Feffer Geological Consulting personnel.

2. SUMMARY OF FIELD WORK

The fieldwork consisted of performing CPT soundings at seven locations to determine the soil lithology. Groundwater measurements and hole collapse depths provided in **TABLE 2.1** are for information only. The readings indicate the apparent depth to which the hole is open and the apparent water level (if encountered) in the CPT probe hole at the time of measurement upon completion of the CPT. KTE does not warranty the accuracy of the measurements and the reported water levels may not represent the true or stabilized groundwater levels.

LOCATION	DEPTH OF CPT (ft)	COMMENTS/NOTES:
CPT-5	39	Refusal, hole open to 36 ft (dry)
CPT-6	50	Hole open to 48 ft (dry)
CPT-7	50	Hole open to 46 ft (dry)
CPT-8	30	Refusal, hole open to 30 ft (dry)

TABLE 2.1 - Summary of CPT Soundings

3. FIELD EQUIPMENT & PROCEDURES

The CPT soundings were carried out by **KTE** using an integrated electronic cone system manufactured by Vertek. The CPT soundings were performed in accordance with ASTM standards (D5778). The cone penetrometers were pushed using a 30-ton CPT rig and a direct push rig anchored with an eight-inch diameter ground anchor. The direct push rig has a pushing capacity of approximately 15 tons. The cone used during the program was a 15 cm^2 cone and a 10 cm^2 was used with the direct push rig. Both recorded the following parameters at approximately 2.5 cm depth intervals:

- Cone Resistance (qc)
- Sleeve Friction (fs)
- Dynamic Pore Pressure (u)
- Inclination
- Penetration Speed

The above parameters were recorded and viewed in real time using a laptop computer. Data is stored at the KTE office for up to 2 years for future analysis and reference. A complete set of baseline readings was taken prior to each sounding to determine temperature shifts and any zero load offsets. Monitoring base line readings ensures that the cone electronics are operating properly.

4. CONE PENETRATION TEST DATA & INTERPRETATION

The Cone Penetration Test data is presented in graphical form in the attached Appendix. These plots were generated using the CPeT-IT program. Penetration depths are referenced to ground surface. The soil classification on the CPT plots is derived from the attached CPT Classification Chart (Robertson) and presents major soil lithologic changes. The stratigraphic interpretation is based on relationships between cone resistance (qc), sleeve friction (fs), and penetration pore pressure (u). The friction ratio (Rf), which is sleeve friction divided by cone resistance, is a calculated parameter that is used along with cone resistance to infer soil behavior type. Generally, cohesive soils (clays) have high friction ratios, low cone resistance and generate excess pore water pressures. Cohesionless soils (sands) have lower friction ratios, high cone bearing and generate little (or negative) excess pore water pressures.

Tables of basic CPT output from the interpretation program CPeT-IT are provided for CPT data averaged over one foot intervals in the Appendix. We recommend a geotechnical engineer review the assumed input parameters and the calculated output from the CPeT-IT program. A summary of the equations used for the tabulated parameters is provided in the Appendix.

It should be noted that it is not always possible to clearly identify a soil type based on qc, fs and u. In these situations, experience, judgement and an assessment of the pore pressure data should be used to infer the soil behavior type.

If you have any questions regarding this information, please do not hesitate to call our office at (714) 901-7270.

Sincerely,

KEHOE TESTING & ENGINEERING

Richard W. Koester, Jr.

Presented below is a list of formulas used for the estimation of various soil properties. The formulas are presented in SI unit system and assume that all components are expressed in the same units.

:: Unit Weight, g (kN/m³) ::

$$g = g_w \cdot \left(0.27 \cdot \log(R_f) + 0.36 \cdot \log(\frac{q_t}{p_a}) + 1.236 \right)$$

where g_w = water unit weight

:: Permeability, k (m/s) ::

$I_c < 3.27$ and $I_c > 1.00$ then $k = 10^{0.952-3.04 \cdot I_c}$

$I_c \leq 4.00$ and $I_c > 3.27$ then $k = 10^{-4.52-1.37 \cdot I_c}$

:: N_{SPT} (blows per 30 cm) ::

$$N_{60} = \left(\frac{q_c}{P_a} \right) \cdot \frac{1}{10^{1.1268-0.2817 \cdot I_c}}$$

$$N_{1(60)} = Q_{tn} \cdot \frac{1}{10^{1.1268-0.2817 \cdot I_c}}$$

:: Young's Modulus, Es (MPa) ::

$(q_t - \sigma_v) \cdot 0.015 \cdot 10^{0.55 \cdot I_c + 1.68}$

(applicable only to $I_c < I_{c_cutoff}$)

:: Relative Density, Dr (%) ::

$100 \cdot \sqrt{\frac{Q_{tn}}{k_{DR}}}$ (applicable only to SBT_n: 5, 6, 7 and 8 or $I_c < I_{c_cutoff}$)

:: State Parameter, ψ ::

$\psi = 0.56 - 0.33 \cdot \log(Q_{tn,cs})$

:: Peak drained friction angle, φ (°) ::

$\varphi = 17.60 + 11 \cdot \log(Q_{tn})$

(applicable only to SBT_n: 5, 6, 7 and 8)

:: 1-D constrained modulus, M (MPa) ::

If $I_c > 2.20$

$\alpha = 14$ for $Q_{tn} > 14$

$\alpha = Q_{tn}$ for $Q_{tn} \leq 14$

$M_{CPT} = \alpha \cdot (q_t - \sigma_v)$

If $I_c \leq 2.20$

$M_{CPT} = (q_t - \sigma_v) \cdot 0.0188 \cdot 10^{0.55 \cdot I_c + 1.68}$

:: Small strain shear Modulus, Go (MPa) ::

$G_0 = (q_t - \sigma_v) \cdot 0.0188 \cdot 10^{0.55 \cdot I_c + 1.68}$

:: Shear Wave Velocity, Vs (m/s) ::

$$V_s = \left(\frac{G_0}{\rho} \right)^{0.50}$$

:: Undrained peak shear strength, Su (kPa) ::

$N_{kt} = 10.50 + 7 \cdot \log(F_r)$ or user defined

$$S_u = \frac{(q_t - \sigma_v)}{N_{kt}}$$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: Remolded undrained shear strength, Su(rem) (kPa) ::

$S_{u(rem)} = f_s$ (applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: Overconsolidation Ratio, OCR ::

$$k_{OCR} = \left[\frac{Q_{tn}^{0.20}}{0.25 \cdot (10.50 \cdot +7 \cdot \log(F_r))} \right]^{1.25}$$ or user defined

$OCR = k_{OCR} \cdot Q_{tn}$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: In situ Stress Ratio, Ko ::

$K_O = (1 - \sin\varphi') \cdot OCR^{\sin\varphi'}$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: Soil Sensitivity, S_t ::

$$S_t = \frac{N_S}{F_r}$$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: Effective Stress Friction Angle, φ' (°) ::

$\varphi' = 29.5° \cdot B_q^{0.121} \cdot (0.256 + 0.336 \cdot B_q + \log Q_t)$

(applicable for $0.10 < B_q < 1.00$)

RECOMMENDATION FOR ACCEPTANCE

REPORT FOR INVESTIGATION OF POTENTIAL SURFACE FAULT RUPTURE
468 N. Rodeo Drive, Beverly Hills, California 90210

As authorized by the City of Beverly Hills, this document summarizes technical (peer) reviews for a “Fault Hazard [Ground Rupture] Investigation” for proposed redevelopment of the 468 N. Rodeo property in the City of Beverly Hills, California. The investigations were carried by Feffer Geological Consulting, Inc. (FGC), the Consultants-of-Record, on behalf of the applicant, the 468 N. Rodeo Drive, LLC. The main purpose of the FGC investigation was to determine if possible splays of the Santa Monica fault zone potentially impact the site, and if such faults were “active” (defined by the California Geological Survey [CGS] as surface or near-surface displacement within the last 11,700 years).

The site is about 170 ft from the nearest, CGS-designated Earthquake Fault Zone (EFZ), the Santa Monica, and relatively near the Hollywood EFZ that extends into the City on the northeast and the West Pico EFZ that currently “stops” at the City limits on the southeast (see various regional maps in the FGC report). The City requires independent fault-activity reviews in conformance with building codes, with current requirements of the CGS (2018, Special Pub. 42) and to ensure public health, safety and welfare.

The reviews included initial telephone and email discussions with applicant representatives, the consultants and City personnel about investigation requirements and scope of work. These were followed by on-site field observation of continuous cores, interpretations of FGC preliminary cross-sections, cone penetrometer tests and site-specific soil-stratigraphic correlations. Likewise reviewed was an FGC draft report, similarly followed by discussions with FGC personnel and the applicant, and ultimately acceptance of the final report.

The FGC final report, dated 28 August 2018, documents pertinent literature and maps, summarizes field investigation procedures, provides the regional geologic framework and tectonic setting, and expounds on specific investigation procedures and technical data supporting the professional conclusions and recommendations.

In sum, the fundamental conclusions of the Consultants-of-Record are:

1. That the FGC regional assessments and site-specific investigations meet current standards-of-practice for fault-activity assessments in southern California in general and to those specifically required by the City of Beverly Hills in particular;

2. That the FGC site-specific investigations and interpretations are sufficient to identify, date and correlated subsurface stratigraphic markers, which are unbroken and generally more than 11,700 years old;

3. That, despite diligent observation, no charcoal or other materials amenable to unequivocal radiocarbon or other numeric dating methods were recovered;

4. That the on-site sediments were dated primarily by soil-stratigraphic techniques (Appendix A). Identified were multiple moderately to strongly developed buried paleosols locally replete with common to many, moderately thick illuvial clay films all indicating a pre-11,700-yr age; and that these soils and sediments are traced across the site and, in association with CPT “signature,” are unbroken.

5. That, the 468 N. Rodeo Drive property is not subject to potential surface or near-surface displacement associated with the Santa Monica, the Hollywood, the West Pico or any other fault reasonably projected toward it.

Accordingly, based substantially on, and in reliance of their professional interpretations and conclusions, the FGC regional summaries and site-specific investigations are judged to meet current standards-of-practice for fault-activity assessments in southern California in general and to those specifically required by the City of Beverly Hills in particular.

Please note that the ECI report focuses solely on potential surface or near-surface fault rupture and does not specifically address possible high seismic accelerations, ground deformation or other structural design and geotechnical investigations required by applicable building codes or by present professional engineering and

geological standards of practice. It is therefore incumbent upon the applicant, FGC, or other consultants, to provide this information to the City of Beverly Hills for technical review and potential acceptance prior to issuance of building permits.

Recommended for Acceptance

Subject: Acceptance of City's Peer-Reviewer Recommendation For Acceptance: "Report For Investigation Of Potential Surface Fault Rupture:" 468 North Rodeo Drive, Beverly Hills, California 90210

Dear 468 N. Rodeo Drive LLC:

The "Fault Hazard [Ground Rupture] Investigation" (Investigation) for the proposed redevelopment of the 468 N. Rodeo Drive property, in the City of Beverly Hills, California. The investigations were carried out by Feffer Geological Consulting, Inc. ("FGC"), the Consultants-of-Record, on behalf of the applicant, the 468 N. Rodeo Drive LLC. The main purpose of the FGC investigation was to determine if possible splays of the Santa Monica fault zone potentially impact the site, and if such faults were "active" (defined by the California Geological Survey [CGS] as surface or near-surface displacement within the last 11,700 years). The FGC investigation has been peer reviewed by the City's consultant, Roy J. Shlemon, Ph.D., PG 2867; CPG 1766; CPESC 2167, of Roy J. Shlemon & Associates, Inc. ("RSA").

The peer review included critique of the Site-Specific Fault Rupture Investigation titled "Report on a Fault Hazard Investigation for the Property Located at 468 N. Rodeo Drive, Beverly Hills, California, 90210" (FGC Project File No. 2188-85 dated August 20, 2018 attached).

The geologic investigation and peer review are required by the City in conformance with the current building codes and with current geologic-standards-of practice that ensure public health, safety and welfare.

Accordingly, in reliance on the technical documentation and assurances provided by the Consultants-of-Record, including their opinions and conclusions, the City of Beverly Hills now formally accepts the technical "Recommendation For Acceptance" of the Reviewer (attached).

Sincerely,

D. Yelton

Investigation of Potential Faulting:
449 North Rodeo

PD EXHIBIT 13

FEFFER
GEOLOGICAL CONSULTING

January 16, 2020 File No. 2387-95

449 N. Beverly Drive LLC,
a California limited liability company
19 E. 57th St., New York, NY 10022
Attn: Mr. Franklin Dickinson

SUBJECT: **INVESTIGATION OF POTENTIAL FAULTING**
449 North Beverly Drive, Beverly Hills, CA 90210
APN: 4343-016-019

Dear Mr. Dickinson:

We are pleased to submit this report summarizing our fault rupture hazard investigation for 449 N. Beverly Drive in the City of Beverly Hills, California. This investigation assesses the potential for surface fault rupture and determines if the area of 449 N. Beverly Drive is suitable for the construction of human-occupied structures. 449 N. Beverly Drive is currently not mapped as being potentially affected by surface faulting and is approximately 75 feet to the northwest of the currently mapped Santa Monica Fault Zone (SMFZ).

The investigation consisted of reviewing pertinent published and unpublished reports, assessing the site geomorphology, and drilling one continuously cored boring to determine underlying stratigraphy. The combination of continuous, unbroken late Pleistocene soil horizons and stratigraphy demonstrates the absence of active faulting beneath the site.

We therefore conclude that the project site is not impacted by state-defined active faults. Accordingly, no fault setback distances or "no-build" zones impact or limit future development.

We appreciate this opportunity to be of service. Should you have any questions regarding the information contained in this report, please do not hesitate to contact us.

Sincerely,

FEFFER GEOLOGICAL CONSULTING, INC.

C.E.G. 2138

INTRODUCTION AND BACKGROUND

The project site is located on the southwest side of north Beverly Drive near the corner of south Santa Monica Boulevard and north Beverly Drive, and consists of a commercial lot that is currently occupied by two single-story buildings within a developed portion of the City of Beverly Hills, CA (Figure 1). For the purpose of description, it is assumed that Beverly Drive is oriented in a north-south direction. The site is bounded to the north by 461 N. Beverly Drive, to the west by an alley, and to the east by north Beverly Drive. Commercial structures and office buildings are located adjacent to the site.

The existing 449 N. Beverly Drive structure was constructed prior to the establishment of the State-mandated Santa Monica Earthquake Fault Zone (SMFZ) (Figure 2). The subject site is entirely outside of this zone and is about 75 feet to the northwest from the northernmost edge of the zone. To ensure public health and safety, a fault investigation is required by the City of Beverly Hills. The surface expression of fault-related geomorphic features has been destroyed by urbanization and development within the greater Los Angeles area which has obscured the lateral extent, location, and rupture history of faulting. Dolan et al. (2000) identified the fault based on topographic scarps north of Santa Monica Boulevard in the Westwood area. Additional work (Olson, 2015) refined the map representation of the fault scarps, and largely confirms the work by Dolan et al. (2000). The mapped location of the SMFZ in relation to the subject site was also obtained from the State of California's recent Earthquake Fault Zone Map (Olson, 2018) (Figure 2).

The site is outside of the current Earthquake Zones of Required Investigation (CGS, 2018a). However, it is subject to the Alquist-Priolo Special Studies Zone Act of 1972 (California Public Resources Code, Chapter 7.5, Division 2), and an investigation is required by the City of Beverly Hills. The AP Special Studies Zone Act specifically defines a fault as active if it demonstrates surface displacement that has occurred within the Holocene (past 11,700 years). This investigation specifically assesses the potential for surface fault rupture at 449 N. Beverly Drive.

SCOPE OF WORK

Trenching is the preferred method for evaluating the presence or absence of faults because it offers a continuous, direct exposure of the fault zone or near surface stratigraphy. However, in this portion of the SMFZ, trenching is difficult due to existing structures. Therefore, this fault rupture hazard study consists of one continuously cored boring drilled to 50 feet in depth and incorporates CPT and continuous core data collected from the adjacent sites located at 456 and 468 N. Rodeo Drive. The scope of work consists of:

- Review of published and unpublished geotechnical data in the site vicinity;
- Analysis of topographic maps of the site vicinity;
- Obtaining drilling permits and marking of underground utilities;
- Excavating and logging one fifty foot deep boring;
- Continuous core/data review with Dr. Roy J. Shlemon;
- Preparation of this report;

FAULT ACTIVITY CRITERIA

In general, fault activity is based on the age of displaced and undisturbed sediment. According to the CGS (2018b), a fault can be either age-undetermined, Holocene-active, or a pre-Holocene fault (see details below). If charcoal or other numerically datable specimens are present, a numeric age can be established. If no datable material exists, then a relative age can be assigned to movement along the fault usually based on the relative development of buried paleosols.

According to CGS Special Publication 42 (2018b), a fault is defined as the following:

> *"A shear or zone of closely associated shears across which earth materials on one side have been displaced with respect to those on the other side because of tectonic forces. A fault is distinguished from those fractures or shears caused by landsliding or other gravity-driven surficial failures.*
>
> ***age-undetermined fault:*** *A fault whose age of most recent movement is not known or is unconstrained by dating methods or by limitations in stratigraphic resolution.*
>
> ***Holocene-active fault:*** *A fault that has had surface displacement within Holocene time (the last 11,700 years)**.***
>
> ***pre-Holocene fault:*** *A fault whose recency of past movement is older than 11,700 years, and thus does not meet the criteria of Holocene-active fault as defined in the State Mining and Geology Board regulations (California Code of Regulations, Title 14, Division 2, Section 3601.(a)).*" (CGS, 2018b, p. 1-2)

REGIONAL AND LOCAL GEOLOGY

The site is located in the Los Angeles Basin, a part of the Transverse Ranges Geomorphic province (Figure 3). The Los Angeles Basin lies within a transitional zone between the Transverse Ranges to the north and the Peninsular Ranges (Yerkes et. al., 1965). The basin is bounded on the north by the Santa Monica Mountains, on the east by the Elysian Hills, the west by the Newport-Inglewood Uplift and the south by the La Brea high, an area of shallow bedrock.

The predominate structure in the project site area is the east-west trending Malibu Coast-Santa Monica-Raymond-Cucamonga fault system (Crook et al., 1983), which extends for approximately 125 miles to form the southern boundary of the Transverse Ranges. This fault system is also referred to as the Transverse Ranges Southern Boundary fault system (TRSB) by Dolan et al. (2000). This complex system of east-west trending faults accommodates north-south shortening and uplift, and concurrent westward motion of the Western Transverse Ranges. Individual faults within the TRSB fault system exhibit varying degrees of both left-lateral strike-slip and contractional dip-slip faulting and related folding (Hill, 1979; Crook et al., 1983; Jones et al., 1990; Dolan et al., 2000). All faults within the system show evidence for Quaternary activity and several, including the Santa Monica and Hollywood faults, have been demonstrated by site-specific paleoseismic studies to be active during the Holocene (Jones et al., 1990; Weaver and Dolan, 2000; Dolan et al., 2000).

From a local perspective, the site is located within the uplifted and dissected Beverly Hills area. Geologic mapping of the area is consistent and provides more accurate age constraints in later mapping.

Yerkes and Campbell (2005) and Hoots and Kew (1931) mapped Holocene aged alluvium over older Pleistocene aged alluvial and fan deposits (Figure 4) while Dibblee (1991) mapped younger Holocene aged alluvial gravels at the surface overlying older Pleistocene age alluvial fan sediments (Figure 5). More recent mapping (Figure 6) from Campbell (2014) indicates that the sediments exposed in the area consist of primarily lower Holocene to upper Pleistocene age alluvium near the ground surface underlain by upper to lower Pleistocene aged alluvial fan deposits, and interbedded terrestrial fan and shallow marine sediments. None of these regional geologic maps delineate the SMFZ in the vicinity of the project site area.

Santa Monica Fault Zone

The SMFZ portion of the TRSB trends east-west from the Santa Monica coastline on the west to the Hollywood area on the east (see Figure 2). It is an oblique-reverse, left-lateral fault that is thought to be a surface expression of tectonic deformation related to Pliocene-Quaternary structural development of the Santa Monica Mountains. Integration of subsurface oil and gas exploration seismic data and well logs with surficial mapping indicate the mountains are underlain by a large southward-vergent asymmetric anticline formed over a regional north-dipping thrust ramp at a depth of 6 to 9 miles. Geophysical studies conducted at the Veteran's Administration (VA) property in West Los Angeles indicate the SMFZ is a gently dipping thrust fault with secondary near-vertical faults extending from the primary basal fault toward the ground surface (Pratt et al., 1998; Dolan et al., 2000).

The surface expression of the SMFZ is limited to fault-related geomorphic features, many of which have been destroyed by urbanization and development within the greater Los Angeles area (Figure 7). This has resulted in a poor understanding of the lateral extent, location, and rupture history of the SMFZ. Dolan et al. (2000) identified the fault location based on topographic scarps north of Santa Monica Boulevard. The most prominent of these scarps is located at the base of a late to middle Pleistocene fan surface in west Los Angeles that extends from approximately University High School to the Mormon Temple, juxtaposing older surficial deposits and relatively shallow bedrock to the north against younger surficial deposits and a thick expanse of old alluvium to the south. Both trenching studies and seismic reflections profiles reveal that, at the VA property, the SMFZ topographic scarp contains a series of steeply dipping to sub-vertical faults that offset late Quaternary sediments (Crook et al., 1983; Pratt et al., 1998; Dolan et al., 2000; Catchings et al., 2001). Radiometric dating of key stratigraphic horizons at the VA site indicate that five to six surface-rupturing events have occurred between approximately 50,000 and 1,000-3,000 years before present (Dolan et al., 2000).

West of the project site, the SMFZ has typically been mapped just north of and parallel to Santa Monica Boulevard, following a series of scarps at the base of late to middle Pleistocene fan surfaces (Dolan et al., 2000; Bedrossian et al., 2012; Olson, 2015). However, recent subsurface explorations and geophysical studies in Century City (e.g., Parsons, 2011) have inferred the presence of a zone of faulting that extends south of Santa Monica Boulevard as well. Parsons (2011) interpreted these faults as active, however, subsequent studies have refuted this interpretation. Kenney (2012; 2013) reviewed the data by Parsons (2011) and subsequent studies and supplemented them with his own geologic and geomorphic analysis. Kenney (2012) interpreted the data to indicate that the primary basal SMFZ actually projects far to the south of the project site, and that faulting along and south of Santa Monica Boulevard should be attributed to the newly designated "Santa Monica Boulevard Fault Zone" (SMBFZ).

Faults associated with the SMBFZ dip steeply to the north and are thought to exhibit right-lateral displacement (Kenney, 2012), although a definitive sense of slip has not been established (Kenney,

2013). These faults are interpreted to be secondary structures related to the primary basal reverse SMFZ that is thought to underlie the Century City area at depth (Kenney, 2012; Lettis, 2013). Based on our review of the recent Century City studies (discussed in detail below), the faults subject to this investigation are part of the SMBFZ.

Both Kenney (2012) and Parsons (2011) indicate there is no direct evidence that SMBFZ faults along and south of Santa Monica Boulevard are active. To date, the only evidence of Holocene activity within the SMFZ and SMBFZ is for faults that are coincident with the topographic scarp north of Santa Monica Boulevard (e.g., Dolan et al., 2000; Geocon, 2014). Updated mapping of the SMBFZ (Figure 8) provided by the City of Beverly Hills, based on mapping by the CGS, locates the fault zone as extending from the beyond the western city boundary trending northeastward and terminating near north Maple Drive and Alden Drive (City of Beverly Hills, 2018). Furthermore, the SMBFZ postulated by Kenney (2012) or just the SMFZ as it is commonly referred to, is approximately 130 feet south of the subject site (see Figure 2 and Figure 8).

Newport-Inglewood Fault Zone

The Newport-Inglewood fault (NIFZ) zone is mapped across the western portion of the Los Angeles Basin and generally trends north to northwest. The faulting is topographically expressed onshore by elevated surfaces which extend from the Newport Mesa in the south to the Beverly Hills area in the north (Earth Consultants International, 2018). As currently mapped, the northern portion of the Newport-Inglewood Fault ends near Pico Boulevard south of the Beverly Hills area (see Figure 2 and Figure 8); however, the location of the northern fault strands has been debated widely in the geological literature.

TOPOGRAPHIC / GEOMORPHIC REVIEW

Existing topography was examined for recognizable scarps or breaks in slope that may suggest the location of faulting through a combined review of previous geomorphic analyses (Earth Consultants International, 2018 and Lettis, 2013 and Dolan et. al., 2000) and historical U.S. Geologic Survey topographic maps (Figures 7 and 9).

Geomorphically, the site is on a degraded Holocene-aged alluvial fan surface that has been incised by north-south to northwest-southeast trending drainages (Figures 4, 5, 6, 7, and 9). Locally, the area gently slopes to the east and southeast which is consistent with natural sedimentary and fluvial processes. To the southwest of the site a prominent southeast-facing escarpment, which has historically been used to locate the Santa Monica fault, is crosscut by multiple northwest trending drainages (e.g., Dolan et al., 2000). This scarp shown in Figure 7 is prominently expressed approximately 3 mi southwest of the site at the Mormon Temple. However, from the Mormon Temple to the site, this scarp becomes less pronounced in the landscape and unrecognizable in the vicinity of the subject site (see Figure 9) where urbanization masks geomorphic features related to faulting.

PREVIOUS INVESTIGATIONS

Three Fault Investigation Reports within the immediate vicinity of 449 N. Rodeo Drive were completed by this firm at 456 and 468 N. Rodeo Drive, and 461 N. Beverly Drive. Data from the surrounding reports have been reviewed, compared, and incorporated into this report where appropriate and used to support the conclusions herein. Figure 11 illustrates the location of each investigation completed by this

firm in relation to 449 N. Beverly Drive. A short summary of each approved report and work within the immediate area is provided below (Figure 11a, Table 3):

468 N. Rodeo Drive

This firm prepared a Fault Investigation Report for 468 N. Rodeo Drive, located approximately 50 feet northwest of the subject site, dated August 20, 2018 (FGC, 2018a). The subsurface investigation consisted of drilling 2 continuously cored borings and 7 CPT soundings within the alley to the west of 449 N. Beverly Drive (Figure 11). The investigation also incorporated 2 borings and 4 CPTs from work conducted at 456 N. Rodeo Drive (See below). The investigation concluded that no faults traverse the subject property and that the underlying sediment exhibited multiple continuous stratigraphic horizons across the entire boring and CPT transect. The Fault Investigation report was reviewed by Roy J. Shlemon and Associates and recommended for approval on August 29th, 2018. The City of Beverly Hills issued a formal approval for the referenced site on August 29th, 2018. Data from the approved report for 468 north Rodeo Drive has been utilized to support the findings and conclusion of this report.

456 N. Rodeo Drive

This firm prepared a Fault Investigation Report for 456 N. Rodeo Drive, located approximately 20 feet directly west of the subject site, dated December 18, 2018 (FGC, 2018b). The subsurface investigation consisted of drilling 2 continuously cored borings and 4 CPT soundings within the alley to the west of 449 N. Beverly Drive (Figure 11). The investigation also incorporated 2 borings and 7 CPTs from work conducted at 468 N. Rodeo Drive. The investigation concluded that no faults traverse the subject property and that the underlying sediment exhibited multiple continuous stratigraphic horizons across the entire boring and CPT transect. The Fault Investigation report was reviewed by Roy J. Shlemon and Associates and recommended for approval on December 20th, 2018. The City of Beverly Hills issued a formal approval for the referenced site on February 14th, 2018. Data from the approved report for 456 N. Rodeo Drive has been utilized to support the findings and conclusion of this report.

461 N. Beverly Drive

This firm prepared a Fault Investigation Report for 461 N. Beverly Drive, located directly adjacent to 449 N. Beverly Drive, dated September 20, 2018 (FGC, 2018c). The subsurface investigations consisted of a transect of 5 continuously cored borings drilled to a maximum depth of 50 feet below the ground surface (Figure 11). The investigation concluded that no faults traverse the subject property and that the underlying sediment across the site exhibits multiple continuous stratigraphic horizons across the entire boring transect. The Fault Investigation report was reviewed by Roy J. Shlemon and Associates and recommended for acceptance on October 2nd, 2018. The City of Beverly Hills issued a formal approval for the referenced site on October 8th, 2018. Data from the approved report for 461 N. Beverly Drive are used to support the findings and conclusion of this report.

Los Angeles County Metropolitan Transportation Authority – (Metro/MTA)

In 2011, Parsons-Brinkerhoff (Parsons) completed a fault study for the Metro Westside Subway Extension for the purpose of locating potential subway station and tunnel alignments. Based on their interpretation of continuous-core borings, cone penetrometer tests (CPTs), and geophysical surveys, Parsons (2011) depicted two zones of faulting in the area: 1) a zone of northeast-southwest trending faults, generally parallel to and south of Santa Monica Boulevard, which they attributed to the SMFZ

and 2) a zone of northwest-southeast trending faults coincident with the West Beverly Hills Lineament (WBHL). These faults were considered active based on geomorphic evidence and interpreted association with known active faults. To the west of the project site, Parsons (2011) interpreted the SMFZ to span a width from the topographic scarp north of Santa Monica Boulevard to approximately 150 feet southeast of the boulevard. Parsons (2011) interpreted additional faults immediately to the southeast of this zone, but they were unable to determine whether these faults were active.

The Los Angeles County Metropolitan Transportation Authority (Metro) prepared a report in 2017 for Transect 9 (Figure 8) of Tunnel Reach 5 located approximately 1500 feet to the southwest of the subject site (Metro, 2017). The following is a summary from FER-259 (Olson, 2018):

"In 2017, AMEC Foster Wheeler performed a supplemental fault investigation for the planned LA Metro Westside Purple Line subway extension (Metro, 2017) to assess a strand of the Santa Monica Fault Zone encountered during the preliminary fault investigation report (Parsons Brinckerhoff, 2011), which trended northeasterly towards a section of the proposed subway alignment. To investigate for potential faulting, a series of continuous core borings and CPTs were drilled along Laskey Drive, turning east at Charleville Boulevard, and continuing north along Spaulding Drive (see Figure 14, locality 15). This was referred to as Transect 9, which continues the numbering sequence from Parsons Brinckerhoff (2011). The new subsurface profile was constructed using data collected from twenty new continuous core borings drilled from 110 to 245 feet deep and 34 CPTs advanced to depths ranging from 61 to 117 feet. Based on the subsurface data the consultants identify Holocene and Pleistocene alluvial units overlying bedrock of the Pleistocene Lakewood and San Pedro Formations." (Olson, 2018, p. 31-32)

"From their observations and interpretations of the subsurface data, AMEC Foster Wheeler identified a significant fault zone at depth between their stations 6+50 and 9+00 (Figure 19) consisting of up to three strands, which dip steeply to the north. The faults exhibited greater than 90 feet of apparent down-to-the-north vertical displacement of the contact between the older alluvium and the Lakewood Formation. From the southern end of the cross section, the depth to the Pleistocene bedrock units consistently increases to the north until they are abruptly truncated and no longer encountered north of the inferred fault zone. AMEC states these faults appear to extend up near the present-day ground surface and offset Holocene sediments dated between approximately 9,100 and 16,500 years old based on radiometric dating of charcoal samples. The locations of the fault traces in the near surface sediments is based on identifying the location where laterally persistent laminated fine-grained "sag deposits" to the north are abruptly missing in adjacent down-gradient borings. It is postulated these fine-grained silts and clays were deposited in depressions or impounded drainages formed by topographic scarps created by surface-rupturing events along faults in this zone. Additional faults were also interpreted between borings north and south of this main zone." (Olson, 2018, p. 32)

Fugro (2019) completed a "Geotechnical Fault Investigation" report for Metro as part of the Westside Purple Line Section 2 Project along Wilshire Boulevard (Transect 10) (Figure 8) through the City of Beverly Hills. The investigation was conducted in order to determine if and where fault strands associated with the SMFZ cross the project tunnel alignment, and to estimate the age of fault rupture using radiocarbon age dating techniques. Based on their exploration of continuous core borings, Fugro (2019) primarily identified four nearly vertical to vertical (dipping 70° to 90°) faults associated with the SMFZ that define a 250 ft. zone of faulting. The inferred faulting by Fugro (2019) is estimated to strike between N46° and 54° E and is described as Holocene-active. Based on Fugro's (2019) investigation the defined boundaries of faulting is narrower than the SMFZ as mapped by the CGS (2018a). The 449 N.

Beverly Drive site is located well north of the 250 ft. zone of faulting inferred by Fugro (2019) and is outside of the projection of this inferred faulting zone.

Fugro (2019) identified the presence of faulting primarily based on offset of the San Pedro Formation at depths of hundreds of feet below the ground surface and structural features observed within the continuous borings. No clear evidence of near surface faulting at the Holocene/Pleistocene boundary was identified in the study. Fugro (2019) interprets Holocene fault activity based on a slight thickening of Holocene age material across the identified fault zone, and the presence of fine-grained laminated sediments that are common to sag ponds near strike-slip fault zones around the world.

Fugro (2019) states that the exact locations of the faults are not precisely constrained due to the wide spacing (42 to 95 feet) between borings, suggesting the zone of faulting could be narrower than concluded. The large spacings used in between the individual borings along the Transect 10 does not allow for the reliable assessment of lateral continuity for the underlying materials. Although Fugro (2019) conservatively interprets the inferred faults to be Holocene-active, they provide multiple Pleistocene age radiocarbon dates for the near surface soils (~25 to 35 ft. below the ground surface) without providing an interpretation of subsurface paleosols (pedogenic horizons) or primary stratigraphy at or near this critical Holocene-Pleistocene boundary depth.

10000 Santa Monica Boulevard

Feffer Geological Consulting and Geocon, (2012) prepared a fault report for the 10000 Santa Monica project located immediately north of the BHHS campus and lies immediately adjacent to the Metro Santa Monica station site and between Metro Transects 2 and 4. The 10000 investigation included a trench across the entire site that paralleled the Leighton/Metro Transect 4 and the Metro Transect 2. The trench crossed the location of several fault strands proposed by Metro (Parsons, 2011) associated with their WBHL fault zone as well as the new WBHL fault location. No faults, active or otherwise, were found in the 10000 Santa Monica trench to depths of 30+ feet and ages of >300,000 years.

Kenney GeoScience

Kenney GeoScience (Kenney, 2012, 2013) performed geomorphic, structural, and stratigraphic analysis using the available subsurface data from the Metro investigation (Parsons, 2011), the Beverly Hills High School fault investigation (Leighton, 2012), and other data generated from recent fault studies in the Beverly Hills/Century City area (e.g., Feffer-Geocon, 2012; Legg, 2012). Based on these data, Kenney (2012) developed a tectonic and geologic history of the area, which included an evaluation of the location and activity of suspected faults. Kenney (2012, 2013) interpreted the faults along Santa Monica Boulevard as secondary upper plate structures and referred to them as the Santa Monica Boulevard Fualt zone (SMBFZ). This interpretation is based on the observation that the SMBFZ faults are dominantly strike-slip (possibly right-lateral). Although individual faults within the SMBFZ may exhibit normal or reverse apparent displacement, there is little net vertical displacement across the zone (Kenney, 2013). This contrasts with the observations north of Santa Monica Boulevard, where oblique left-lateral reverse motion has produced net north-side-up displacement across the fault (e.g., Dolan et al., 2000; Geocon, 2014).

Kenney (2012) noted that multiple investigations and reevaluations of the faults first interpreted by Parsons (2011) along Santa Monica Boulevard had not produced any evidence of Holocene-age activity for the SMBFZ. In fact, the most recent data indicates that activity along these faults likely ceased

approximately 40,000 to 50,000 years ago (Kenney, 2012). However, Kenney (2013) noted that additional study of these faults is needed in order to confidently assess their activity.

Westfield - Century City Mall

Subsequent to Kenney's (2012, 2013) reinterpretation of the SMFZ and the SMBFZ, Geocon West, Inc. (Geocon, 2013) conducted a fault study for Westfield at the Century City mall. This study was specifically designed to identify the evidence for Holocene activity (or lack thereof) along the SMBFZ south of Santa Monica Boulevard. Geocon's (2013) study consisted of one boring transect along Avenue of the Stars, and another boring transect along Century Park West. Geocon (2013) documented a thick section of un-faulted Pleistocene age alluvium overlying faulted sections of Lakewood Formation sediments. Based on the apparent continuation of the Pleistocene age geologic units overlying several faults, Geocon (2013) concluded that no active faults were present at the Westfield site, and no restrictions on future development of the Westfield Site are necessary with respect to potential faulting.

Beverly Hills High School

Leighton Consultants Inc. (Leighton, 2012) performed a fault investigation at Beverly Hills High School focused on the WBHL faults interpreted by Parsons (2011). Leighton (2012) advanced borings, CPTs, and excavated trenches along Parsons' (2011) borehole and CPT transects. Based on the observation of unbroken Pleistocene age soils across the grounds of the high school, Leighton concluded that the faults identified by Parsons (2011) were not active. Furthermore, Leighton (2012) provided geologic evidence that the WHBL scarp is an erosional feature, rather than a tectonic feature. The California Geological Survey (CGS) approved the Leighton report and agreed that none of the investigated faults were active (CGS, 2013).

322 N. Foothill Road

Earth Consultants International (ECI), (2018) prepared a Fault Investigation Report for 322 N. Foothill Road in the City of Beverly Hills. The site is located partially within the AP Fault Hazard zone. To resolve the issue of Holocene time faulting, ECI drilled two continuously cored borings, pushed 6 CPT soundings, and excavated one trench. The consultant estimated the age of subsurface paleosols and observed and documented un-broken pre-Holocene stratigraphy and concluded that the site is not impacted by faulting.

Additional Investigations Within the Site Vicinity

According to the City of Beverly Hills (2020), there are numerous on-going site-specific fault investigations being performed within the City (Figure 11a, Table 3). The closest of which are located at 420, 400, 370, 319, and 315 N. Rodeo Drive, and entirely within the state defined SMFZ. However, the results of these studies remain unpublished and are not currently available for review.

METHODOLOGY

Approach

The subsurface investigation was designed to investigate across the subject site in a northwest-southeast oriented transect within the alley adjacent to the subject site (see Figure 10, 11). Typically, trenching is

the preferred method for evaluating the presence or absence of faults because it offers a continuous, direct exposure of the fault zone or near surface stratigraphy. However, this portion of the SMBFZ is difficult to expose in trenches due to dense urban cover. Because of existing structures, underground utilities, and the extent of data collected from the neighboring sites, this fault study consists of one 50 foot deep continuously cored boring. Additional borings and CPT's (Cone Penetrometer Soundings) located to the west within the adjacent alleyway (Figure 10, 11, Table 1, 2), were utilized to support the findings of this report. The evaluated transect (A-A') is located on a 1 inch = 10 foot scale base map, and the subsurface data is plotted on 1 inch = 10 foot scale cross sections for interpretation (see Figures 12 and 13).

Field Exploration

Prior to beginning the subsurface field exploration, work permits were obtained from the City of Beverly Hills. Underground Service Alert (USA) was notified to identify buried utilities in the vicinity of the proposed excavations, and an independent utility locating company was also contracted to verify "no-conflict" areas for the drilling.

The subsurface exploration of the continuously cored boring within the alley adjacent to 449 N. Beverly Drive was completed on December 2nd, 2019. The boring was excavated to a maximum depth of 50 feet beneath the existing ground surface (Table 1, 2). The boring logs, soil descriptions, and supporting CPT reports are included in Appendices A, B, and C respectively.

GEOLOGIC MATERIALS

The continuity of soil (pedogenic) horizons and primary stratigraphic contacts provides data to evaluate the presence or absence of faulting. Five conformable stratigraphic units within the alluvium were encountered in the single boring drilled at 449 N. Beverly Drive and correlate well with the borings drilled previously at 456 and 468 N. Rodeo Drive (Appendix B). Generally, these units consist of basal coarse-grained sediments, fining-upward to fine sand and silt and local clays, typically capped by a buried paleosol.

Holocene Alluvial Fan Deposit 1 and 2 (Qal 1): *4 – 8 ka*

The uppermost unit in section A-A' (Figures 12, 13) consists of a weakly developed soil profile composed of silty sand to silty sand with clay with interbedded gravels that consist of sub angular to sub rounded fragments of slate. We interpret this unit as late Holocene age alluvial deposits (sheet flows) and designate it as Qal1. An approximately 6 to 8 foot layer of artificial fill overlies this unit across the entire study area. Unit Qal1 includes a surficial soil with a basal scour deposit and is interpreted as a Holocene aged sheet flow alluvial deposit.

Holocene Alluvial Fan Deposit 2 (Qal 2): *12 – 21 ka*

The lowest Holocene unit in section A-A' (Figures 12, 13) is composed of sandy clay to clayey sand with basal gravels. The unit is generally massive with fine to medium grained sand and sub rounded fragments of slate. Soil color hues are in the 10YR to 7.5YR range (brown). We interpret this unit as a latest Pleistocene alluvial deposit (axial valley deposit), but conservatively designate it as Qal2. A scour deposit overlies and truncates this unit across the entire study area. Qal2 includes alluvial deposits with a diffuse (cumulic), and weakly- to moderately well-developed argillic soil.

Pleistocene Alluvial Fan Deposit 3 (Qoa 1): *25 – 51 ka*

The interpreted uppermost Pleistocene unit in section A-A' (Figures 12, 13) is an organic-rich truncated argillic horizon remnant over a gravelly clayey sand to sandy clay. Gravels are sub angular and highly weathered fragments of slate. Illuvial clay film hues are in the 7.5YR range (brown). We interpret this unit as a Pleistocene alluvial fan deposit (debris flow) and designate it as Qoa1. A scour deposit overlies this unit across the entire study area. Unit Qoa1 includes alluvial deposits that contain a moderately well-developed, moderately well oxidized, and truncated argillic soil. The contact between Qal2 and Qoa1 occurs at a depth of approximately 27 feet across the entire study area.

Pleistocene Alluvial Fan Deposit 4 (Qoa 2): *33 – 64 ka*

Beneath unit Qoa1, we encountered a unit composed of silty sand with gravel to sandy clay (Figures 12, 13). The interbedded gravels within this unit are composed of sub rounded slate and sandstone. Illuvial clay film hues are in the 7.5YR range (brown). This unit is interpreted as a highly weathered late Pleistocene braided stream channel deposit that contains a highly truncated, moderately well-developed soil remnant designated as unit Qoa2. The contact between Qoa1 and Qoa2 is at approximately 35 feet across the entire study area. The Qoa2 basal scour is well stratified and has incised across the northern portion of Transect A where the underlying unit Qoa3 has been eroded.

Pleistocene Alluvial Fan Deposit 5 and 6 (Qoa 3): *59 – 124 ka*

Beneath unit Qoa2, we encountered a unit composed of sandy clay to silty sand with interbedded gravel that is composed of highly weathered and sub rounded to sub angular slate and sandstone (Figures 12, 13). Soil color clay film hues are in the 7.5YR range (brown). This unit is interpreted as a stacked sequence of two strongly weathered late Pleistocene braided stream channel / alluvial fan debris flow deposits that contain two truncated, stacked, and moderately well developed soil remnants designated as Qoa3. Unit Qoa3 is the oldest unit encountered during the subsurface exploration. The contact between Qoa2 and Qoa3 occurs at a depth of approximately 45 feet across the entire study area.

Soil Development/Soil Profiles

The borings drilled at 449 N. Beverly Drive, 456 and 468 N. Rodeo Drive (see Figures 11, 12, 13 and Appendix A) are located on a graded (or stripped) and artificially filled surface that is geomorphically inactive. The soil profile in each boring at depth consists of a truncated sequence of multiple stacked and truncated Pleistocene aged soils (Qal2, Qoa1, Qoa2, and Qoa3). The entire section in this locality is capped by 6 to 8 feet of artificial fill. Parent materials for these soils originate north of the site in the Santa Monica mountains and primarily consist of slate-rich debris flow and or stream terrace deposits that have emanated from drainages to the north of the site (primarily Benedict and Coldwater Canyons). The soil profiles along section A-A' contain a surface deposit that overlies 4 to 5 buried soils to depths of approximately 50 feet below the ground surface. This stratigraphic section occurs across the entire area investigated. The individual soil profiles and relative age estimates are summarized below.

The uppermost soil on site (Qal1) consists of a highly truncated soil remnant that consists of a weakly developed cambic or juvenile argillic diagnostic subsurface horizon (Bt – BC). The deposit consists of a crudely stratified fining upwards sequence. This soil unit is characterized by a coarse-grained deposit with few clay stains on ped faces and has an estimated relative age of 4 - 8 ka (Appendix B).

The uppermost Pleistocene soil on site (Qal2) is a diffuse and cumulic soil remnant that consists of a thick and weakly developed argillic diagnostic subsurface horizon (2Bt1 – 2Bt2 – 2BC). The deposit consists of a crudely stratified fining upwards to massive deposit. This soil unit is characterized by basal gravel and fine-grained deposit with 7.5YR hues and common thin clay films on ped faces and coating gravel. Qal2 has an estimated relative age of 12 – 21 ka (Appendix B).

A conservative pick for the top of Pleistocene soil Qoa1 is the remnant of a moderately well-developed Alfisol soil. This is a truncated soil that consists of a sequence of two moderately well-developed argillic diagnostic subsurface horizons over a crudely stratified scour deposit (3Bt1 – 3Bt2 – 3BC). The deposit is a fining upwards sequence and most likely represents the distal portion of a debris flow deposit. This soil unit is characterized by a highly weathered, moderately well oxidized, gravel-rich and fine-grained deposit with 7.5 YR hues on common thin clay films on ped faces and coating gravel. This soil unit has a relative age estimate of 25 - 51 ka (Appendix B).

The third buried soil profile on site (Qoa2) is a truncated and older cumulic soil remnant that consists of a thick and moderately well-developed argillic soil profile (4Bt1 – 4Bt2 – 4BC). The deposit consists of a crudely stratified fining upwards sequence. This soil profile is characterized by a fine-grained deposit with 7.5YR hues on common thin clay films on ped faces. This deposit locally scours into the underlying unit Qoa3 across the southern portion of Transect A and has an estimated relative age of 33 – 64 ka (Appendix B).

The oldest and lowest buried soil profiles on site (Qoa3) are a series of two truncated and stacked soil remnants that consists of two moderately well-developed argillic soil profiles (5Bt - 6Bt). The deposit consists of two crudely stratified fining upwards sequences. This soil unit is characterized by a stratified deposit with 7.5YR hues on common thin and few moderately thick clay films. Qoa3 and the entire stratigraphic section under study has an estimated relative age of 59 – 124 ka (Appendix B).

In summary, the entire stratigraphic sequence examined at the project site is estimated to be greater than 59 ka in age. The stratigraphic units encountered provide visually and texturally distinct, mappable contacts that are overlapping across the project site area and across the transect of borings. No features or structural characteristic of faulting, such as shear zones or high angle contacts between units were observed. The contacts between Qoa1, Qoa2 and Qoa3 undulate and slope gently south as expected by normal sedimentary processes.

EVIDENCE FOR THE ABSENCE OF FAULTING

Several subsurface geologic relationships at 449 N. Beverly Drive provide direct evidence that preclude Holocene faulting. When these relationships are considered together, there is compelling evidence for the absence of faulting beneath the subject site. The primary lines of evidence that support the interpretation that no faults traverse the site are:

• **Continuous, un-faulted soil horizons and primary stratigraphy across the site:** The transects of borings and CPTs conducted to the east and west of the subject site (456, 468 N. Rodeo Drive and 461 N. Beverly Drive) exhibits multiple continuous and unbroken stratigraphic horizons. All deposits encountered correlate well across the project site. If faults with a vertical slip component of slip were active in this area, they would have produced recognizable, vertical separations or displacements of the Pleistocene units. Similarly, active strike-slip faulting would have produced an apparent dip-slip

component or truncation of units due to the juxtaposition of different Pleistocene strata or pedogenic horizons.

• **No faults were encountered in the subsurface exploration:** No features characteristic of faulting, such as shear zones or high angle contacts between units were observed within the collected continuously cored samples. Though not compelling enough to preclude the presence of faulting, it is consistent with and corroborates other lines of evidence.

• **No irregularities or topographic features indicative of faulting were observed:** Geomorphically, the project site exists on an incised and degraded Holocene-aged alluvial fan deposit. Mapping by Campbell at al., (2014), Yerkes and Campbell (2005), Dibblee and Ehrenspeck (1991) and Hoots and Kew (1931) also confirm this conclusion. Moreover, the site lies north of the eastward projection of the existing Santa Monica Fault Zone, and no escarpments are apparent on historic topographic maps.

• **Supporting evidence from neighboring and recent investigations:** The data collected and conclusions reached within the approved and referenced reports at 456, 468 N. Rodeo Drive and 461 N. Beverly Drive reinforce the conclusions and overall findings of this report (FGC, 2018a, 2018b, 2018c). Additionally, the 449 N. Beverly Drive site is located well north of the 250 ft. zone of faulting inferred by Fugro (2019) based on the estimated strike, and the nearly vertical to vertical dip of the identified faults.

CONCLUSIONS AND RECOMMENDATIONS

The fault investigation for 449 N. Beverly Drive documents continuous unbroken, pre-Holocene sediments across the entire site. The observed continuous and un-broken stratigraphy implies that no active faults traverse the site. The project site is not exposed to the hazard of surface fault rupture which would impact or limit future development of the site.

While the area explored in our study is not likely subject to surface faulting, a future earthquake on the Santa Monica Boulevard, Santa Monica, Hollywood, or Newport - Inglewood fault zones will likely produce very strong, near-field ground motions at the project site that must be assessed by an appropriate geotechnical evaluation of the site.

LIMITATIONS

The conclusions and recommendations presented herein are the results of an inherently limited scope. Specifically, the scope of services consisted of an assessment of whether or not Holocene-active faults are present within the area explored at the site. The conclusions and recommendations contained in this report are professional opinions derived in accordance with current standards of professional practice. No warranty is expressed or implied.

This report has been prepared for the exclusive use of 449 N. Beverly Drive LLC and applies only to potential future development at the site located at 449 N. Beverly Drive in the City of Beverly Hills, California. In the event that significant changes in the development planning should occur, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed by Feffer Geological, and the conclusions and recommendations of this report are verified in writing.

Figure 3

Regional Geomorphic Province Map

Modified from Yerkes et al., (1965)

EXPLANATION

Geomorphic surfaces which include active channels (Qa), active alluvial fan deposits (Qf), young alluvial fan deposits (Qyf), and old alluvial fan deposits (Qof). (Yerkes and Campbell, 2005)

Sedimentary Deposits

Qal — Alluvium: Coarse unconsolidated deposits in valleys and stream channels (Holocene)

Qpt — Alluvial plain, stream, and marine terrace deposits (Upper Pleistocene)

Sedimentary Rocks

Qm — Marine deposits: Marine sandstone, conglomerate, and clay shale (Upper Pleistocene).

Tml — Modelo Formation: Marine; lower member; consisting of interbedded, hard, platy siliceous shale and softer brown shale (Miocene).

Tmls — Modelo Formation: Marine; lower member; consisting of lenticular beds of coarse grained sandstone (Miocene).

Metamorphic Rocks

smss — Santa Monica Slate: Dark gray to blue-black slate (Triassic).

smsp — Santa Monica Slate: Dark gray mica schist and phyllite cut by white quartz veins (Triassic).

Igneous Rocks

g — Granite and granodorite (Jurrasic).

ZONING RESTRICTIONS

NOTE: INDICATED ZONING INFORMATION IS FROM THE CITY OF BEVERLY HILLS ZONING ORDINANCES IN EFFECT AS OF THE DATE OF THIS SURVEY. ZONING AND RESTRICTIONS SHOWN HEREON WERE OBTAINED BY A GENERAL REQUEST AT THE PUBLIC COUNTER OF THE ABOVE NAMED DEPARTMENT. NO REPRESENTATION IS MADE FOR THE ACCURACY OR COMPLETENESS OF SAID THIRD PARTY INFORMATION. THIS FIRM IS NOT AN EXPERT IN THE REPRESENTATION OF COMPLEX ZONING ORDINANCES. COMPLIANCE IS BEYOND THE SCOPE OF THIS SURVEY. ANY USER OF SAID INFORMATION IS URGED TO CONTACT THE LOCAL AGENCY DIRECTLY.

ZONE: C-3 (COMMERCIAL ZONE)

MINIMUM SETBACKS: FRONT: NOT SPECIFIED; SIDE: NOT SPECIFIED; REAR: NOT SPECIFIED

HEIGHT RESTRICTIONS: NOT SPECIFIED

POSSIBLE ENCROACHMENT NOTES

THIS IS A LISTING OF OBSERVED IMPROVEMENTS THAT CROSS PROPERTY LINES. STATEMENT OF OWNERSHIP OR POSSESSION IS NOT THE INTENT OF THIS LISTING.

⚠ OVERHANG OVERLAPS ONTO BEVERLY DRIVE RIGHT-OF-WAY

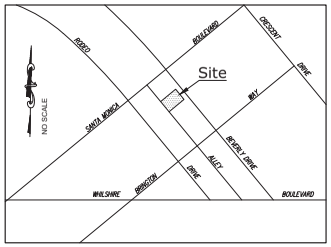
FLOOD NOTE: BY GRAPHIC PLOTTING ONLY, THIS PROPERTY IS IN ZONE "X" OF THE FLOOD INSURANCE RATE MAP, PANEL NO. 06037C1565F, PANEL DATED 09/26/2008. THIS PROPERTY IS NOT LOCATED IN AN AREA WHERE FLOOD HAZARDS EXIST AS DETERMINED BY FEMA. BY TELEPHONE CALL TO THE NATIONAL FLOOD INSURANCE PROGRAM (800-638-6620) WE HAVE LEARNED THIS COMMUNITY DOES CURRENTLY PARTICIPATE IN THE PROGRAM. NO FIELD SURVEYING WAS PERFORMED TO DETERMINE THIS ZONE AND AN ELEVATION CERTIFICATE MAY BE NEEDED TO VERIFY THIS DETERMINATION OR APPLY FOR A VARIANCE FROM THE FEDERAL EMERGENCY MANAGEMENT AGENCY.

ITEMS CORRESPONDING TO TABLE A ITEMS

– ITEM 14
THE NEAREST INTERSECTION STREET TO THE PROPERTY ARE SHOWN HEREON

– ITEM 16
NO EVIDENCE OF RECENT EARTH MOVING WORK, BUILDING CONSTRUCTION OR BUILDING ADDITIONS OBSERVED IN THE PROCESS OF CONDUCTION THE FIELD WORK.

– ITEM 17
NO EVIDENCE OF RECENT STREET OR SIDEWALK CONSTRUCTION OR REPAIRS OBSERVED IN THE PROCESS OF CONDUCTING THE FIELD WORK.



– ITEM 18
NO EVIDENCE OF WETLANDS ON THE SUBJECT PROPERTY. NO DELINEATION MARKERS OF WETLANDS WERE OBSERVED IN THE PROCESS OF CONDUCTIONG THE FIELD WORK.

SURVEYOR'S NOTES

– THE UTILITIES SHOWN HEREON ARE BASED ON OBSERVED EVIDENCE ONLY. THIS SURVEY WOULD NOT SHOW UTILITIES COVERED BY CARS/TRUCKS OR RECENTLY PAVED ASPHALT/CONCRETE OR OVERGROWN BRUSH, TREES AND SHRUBS.

– UNLESS THIS PLAN HAS THE SEAL AND SIGNATURE OF THE SURVEYOR AND/OR ENGINEER RESPONSIBLE FOR ITS PREPARATION, THIS IS NOT AN AUTHENTIC COPY OF THE ORIGINAL SURVEY AND SHALL NOT BE DEEMED RELIABLE.

VICINITY MAP

LEGAL DESCRIPTION

THE LAND REFERRED TO HEREIN BELOW IS SITUATED IN THE CITY OF BEVERLY HILLS, IN THE COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AND IS DESCRIBED AS FOLLOWS:

LOT 21 IN BLOCK 2 OF BEVERLY, IN THE CITY OF BEVERLY HILLS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, AS PER MAP RECORDED IN BOOK 11, PAGE 94 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY.

SCHEDULE B ITEMS

BASED UPON TITLE REPORT NO. 30038006–987–987–CS7, DATED NOVEMBER 12, 2019 AS PREPARED BY FIDELITY NATIONAL TITLE INSURANCE COMPANY.

1 WATER RIGHTS, CLAIMS OR TITLE TO WATER, WHETHER OR NOT DISCLOSED BY THE PUBLIC RECORDS. (NOT PLOTTED, NOT SURVEY RELATED)

2 INTENTIONALLY DELETED.

3 INTENTIONALLY DELETED.

4 INTENTIONALLY DELETED.

5 INTENTIONALLY DELETED.

6 INTENTIONALLY DELETED.

7 INTENTIONALLY DELETED.

8 A DEED OF TRUST. (NOT PLOTTED, NOT SURVEY RELATED)

9 A DEED OF TRUST. (NOT PLOTTED, NOT SURVEY RELATED)

10 INTENTIONALLY DELETED.

11 A SUBSURFACE OIL AND GAS LEASE FOR THE TERM THEREIN PROVIDED, WITH CERTAIN COVENANTS, CONDITIONS AND PROVISIONS, TOGETHER WITH EASEMENTS, IF ANY, AS SET FORTH THEREIN, DISCLOSED BY DOCUMENT, ENTITLED SUBSURFACE OIL AND GAS, DATED DECEMBER 1, 1997, LESSEE STOKER RESOURCES, L.P., RECORDING NO. 98–563201 OF OFFICIAL RECORDS. (NOT PLOTTED, NOT SURVEY RELATED)

12 INTENTIONALLY DELETED.

13 THE EFFECT OF A DEED. (NOT PLOTTED, NOT SURVEY RELATED)

THE EFFECT OF A DEED. (NOT PLOTTED, NOT SURVEY RELATED)

14 THE EFFECT OF A DEED. (NOT PLOTTED, NOT SURVEY RELATED)

15 THE EFFECT OF A DEED. (NOT PLOTTED, NOT SURVEY RELATED)

16 THE EFFECT OF A DEED. (NOT PLOTTED, NOT SURVEY RELATED)

17 INTENTIONALLY DELETED.

18 ANY INVALIDITY OR DEFECT IN THE TITLE OF THE VESTEES IN THE EVENT THAT THE TRUST REFERRED TO HEREIN IS INVALID OR FAILS TO GRANT SUFFICIENT POWERS TO THE TRUSTEE(S) OR IN THE EVENT THERE IS A LACK OF COMPLIANCE WITH THE TERMS AND PROVISIONS OF THE TRUST INSTRUMENT. IF TITLE IS TO BE INSURED IN THE TRUSTEE(S) OF A TRUST, (OR IF THEIR ACT IS TO BE INSURED), THIS COMPANY WILL REQUIRE A TRUST CERTIFICATION PURSUANT TO CALIFORNIA PROBATE CODE SECTION 18100.5.
THE COMPANY RESERVES THE RIGHT TO ADD ADDITIONAL ITEMS OR MAKE FURTHER REQUIREMENTS AFTER REVIEW OF THE REQUESTED DOCUMENTATION. (NOT PLOTTED, NOT SURVEY RELATED)

19 ANY EASEMENTS NOT DISCLOSED BY THE PUBLIC RECORDS AS TO MATTERS AFFECTING TITLE TO REAL PROPERTY, WHETHER OR NOT SAID EASEMENTS ARE VISIBLE AND APPARENT.

20 MATTERS WHICH MAY BE DISCLOSED BY AN INSPECTION AND/OR BY A CORRECT ALTA/NSPS LAND TITLE SURVEY OF SAID LAND THAT IS SATISFACTORY TO THE COMPANY, AND/OR BY INQUIRY OF THE PARTIES IN POSSESSION THEREOF.

21 ANY RIGHTS OF THE PARTIES IN POSSESSION OF A PORTION OF, OR ALL OF, SAID LAND, WHICH RIGHTS ARE NOT DISCLOSED BY THE PUBLIC RECORDS.
THE COMPANY WILL REQUIRE, FOR REVIEW, A FULL AND COMPLETE COPY OF ANY UNRECORDED AGREEMENT, CONTRACT, LICENSE AND/OR LEASE, TOGETHER WITH ALL SUPPLEMENTS, ASSIGNMENTS AND AMENDMENTS THERETO, BEFORE ISSUING ANY POLICY OF TITLE INSURANCE WITHOUT EXCEPTING THIS ITEM FROM COVERAGE.
THE COMPANY RESERVES THE RIGHT TO EXCEPT ADDITIONAL ITEMS AND/OR MAKE ADDITIONAL REQUIREMENTS AFTER REVIEWING SAID DOCUMENTS.

SURVEYOR'S CERTIFICATE

TO RENDA JOYE ABRAMSON AND SYDNEY J. DUNITZ, AS TRUSTEES UNDER THAT CERTAIN DECLARATION OF TRUST DATED AUGUST 1, 1952, AS TO AN UNDIVIDED 1/2 INTEREST; A.S. HERSHENSON AND BRENDA ABRAMSON, CO-TRUSTEES UNDER THE WILL OF SYLVIA HERSHENSON, DECEASED, AS TO AN UNDIVIDED 1/4 INTEREST; BRENDA ABRAMSON AND ALAN ABRAMSON, CO-TRUSTEES OF THE A.S. HERSHENSON FAMILY TRUST DATED MARCH 29, 1989 AS TO AN UNDIVIDED 1/4 INTEREST AND FIDELITY NATIONAL TITLE INSURANCE COMPANY:

THIS IS TO CERTIFY THAT THIS MAP OR PLAT AND THE SURVEY ON WHICH IT IS BASED WERE MADE IN ACCORDANCE WITH THE 2016 MINIMUM STANDARD DETAIL REQUIREMENTS FOR ALTA/NSPS LAND TITLE SURVEYS, JOINTLY ESTABLISHED AND ADOPTED BY ALTA AND NSPS, AND INCLUDES ITEMS 2, 3, 4, 5, 6(a), 7(a), 7(b)(1), 7(c), 8, 9, 10(a), 11, 13, 14, 16, 17 AND 18 OF TABLE A THEREOF. THE FIELD WORK WAS COMPLETED ON NOVEMBER 19, 2019

DATE OF PLAT OR MAP: DECEMBER 05, 2019

UTILITY STATEMENT

BURIED UTILITIES AND/OR PIPELINES SHOWN HEREON ARE PER VISIBLE AND APPARENT SURFACE EVIDENCE, RECORD DRAWINGS OF THE CONSTRUCTED UTILITY LINES OBTAINED FROM RELIABLE AND RESPONSIBLE SOURCES NOT CONNECTED WITH CALVADA SURVEYING, INC. OR MARKINGS PROVIDED BY AN INDEPENDENT LOCATING CONTRACTOR. NO GUARANTEE OR WARRANTY, EITHER EXPRESSED OR IMPLIED, IS MADE AS TO THE ACCURACY OR THOROUGHNESS OF SUCH INFORMATION. IF MORE ACCURATE LOCATIONS OF UNDERGROUND UTILITIES OR PIPE LINES ARE REQUIRED, THE UTILITY OR PIPELINE WILL HAVE TO BE VERIFIED BY FIELD POTHOLING. CALVADA SURVEYING, INC. AND THE SURVEYOR OF RECORD SHALL NOT BE HELD LIABLE FOR THE LOCATION OF OR THE FAILURE TO NOTE THE LOCATION OF NON-VISIBLE UTILITIES OR PIPELINES.

LOG OF EXPLORATORY BORING

Job Number: 2387-95
Project: 449 N. Beverly Drive

Boring No: FB-1
Boring Location: See Site Map

Date Performed: 12/2/19

Drill Type: 8” Hollow Stem / Continuous Core

Depth in Feet	Run #	Recovery Ratio	Recovery Graphic	Bedrock/ Soil Description	Color	Density	Strat/ Soil Unit
20				**20’:** Silty sand with clay, scattered poorly sorted medium grained gravels, slightly oxidized, slightly moist	Brown 10 YR 5/3	Hard	2Bt1
	5	4.1 /5		**21.2’:** Medium to coarse sandy clay, poorly sorted, crudely stratified, slightly weathered, gravels angular to sub-angular, minor carbonates, slightly moist, gravels consisting of weathered slate and granite, very few fine clay films on ped faces, slighlty well oxidized	Brown 7.5 YR 5/3	Hard	2Bt2
				23.5’: Fine to coarse grained sand with trace clay binders, weakly bedded to crudely stratified, poorly sorted, slightly oxidized, moderate carbonates present, slightly moist, scoured contact	Pale Brown 10 YR 6/3 Yellow Brown 10 YR 5/4	Slightly Hard to Soft	2BC/C
25	6	3.3 /5		**Pleistocene Older Alluvium (Qoa1)** **27.1’:** Fine to medium sandy clay, abundant carbonates, few scattered, weathered, fine to medium grained rounded gravels, locally gleyed and highly weathered gravel, few thin clay films on ped faces and coating clasts, slightly moist	Brown 7.5 YR 5/4	Very Hard	3Bt1
30				**30’:** Fine to coarse sandy clay, abundant carbonates, moderately weathered fine to coarse grained poorly sorted sand and gravels, locally gleyed, slightly oxidized, few thin clay films coating clasts, slightly moist	Brown 7.5 YR 4/4	Very Hard	3Bt2
	7	5/5		**32.6’:** Sandy clay, moderately well sorted, gradational loss of carbonates, slightly oxidized, common clay stains on ped faces, fine to medium grained sand with few pea gravel, slightly moist	Brown 7.5 YR 5/3	Very Hard	3BC
35				**Pleistocene Older Alluvium (Qoa2)** **35.1’:** Sandy clay/clayey sand, few scattered weathered gravels, crudely stratified, oxidized, slight organics, coarse grained poorly sorted sand with common highly weathered gravel, thin few clay films common to moderately thick on ped faces and coating clasts, slightly moist	Brown 7.5 YR 4/3	Hard to Very Hard	4Bt
	8	5/5		**39’:** Sandy clay/clayey sand, abundant scattered weathered gravels, crudely stratified, oxidized, slightly moist	Brown 7.5 YR 4/3	Hard to Very Hard	4Bt2
40

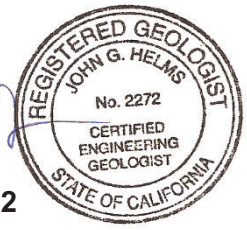
Subject: Soil Stratigraphy Study And Relative Age Estimates For A Fault Rupture Hazard Investigation At 449 North Beverly Drive, Beverly Hills, CA.

Dear Mr. Feffer:

I am pleased to present to you this soil stratigraphic study and relative-age determinations to be used with your fault rupture hazard assessment of the proposed development located at 449 North Beverly Drive in the City of Beverly Hills, California.



Feffer Geological retained John Helms CEG to describe and assist in correlations of the soil stratigraphy from continuously cored borehole samples and to assign relative age dates for the deposits identified across the site. This study builds off of previously collected continuously cored bore hole samples with one additional new boring placed at the southern end of a single transect of borings, transect A. One borehole (FB-1) was completely described from transect A for this study, and several additional boreholes (B-1, B-2, CB-1, and CB-2) from transect A were reviewed and summarized previously. The detailed soil description for this site was used to calculate various soil development indices (or SDIs). The SDI values were then compared to the SDI values from similar described soils with known ages to estimate age ranges for the soils understudy.

The attached report classifies the described soil profiles, identifies stratigraphic relationships, defines soil chronosequences, and estimates the relative ages for the soil profile described in detail. Calculated SDI's show strong correlations to the SDI values of other published, described, and dated soil profiles with similar parent materials.

Age estimates range from 59 to 124 ka for the stratigraphic section studied along transect A in boring FB-1. There are several distinctive buried soil units that can be correlated across the entire length of transect A. One distinctive buried soil (buried soil 2, Qoa1) which can be correlated across the entire length of transect A, is a well preserved and moderately well oxidized argillic soil profile that ranges in relative age from 25 – 51 ka. Please see Table 5 in the attached report for a summary listing of all of the determined relative ages at the study site.

Thank you for this opportunity to be of service. Should you have any questions or require additional information, please do not hesitate to contact me.

Sincerely,

John Helms, CEG 2272

SOIL STRATIGRAPHY STUDY AND RELATIVE AGE ESTIMATES FOR A FAULT RUPTURE HAZARD STUDY FOR A PROPOSED DEVELOPMENT AT 449 N. BEVERLY DRIVE, BEVERLY HILLS, CALIFORNIA.

INTRODUCTION

Due to a laterally continuous sequence of stratigraphy across the entire transect of borings from the subject site area (Transect A) and an adjacent site to the north (Transect B), one soil profile has been studied for geomorphic characteristics and relative degrees of weathering to estimate deposit relative-age. Boring FB-1 was the only one drilled for this study as its' location extended the existing transect of borings (Transect A) farther south. The relative age estimate is based on index value comparisons with other published and dated soil profile descriptions. The comparative soils are from areas with a similar climate and similar parent material to this study area. The estimated relative ages in this report will be used by Feffer Geological, Inc. to assess the recency and recurrence of faulting across the study area. Alluvial units are assessed chronostratigraphically across a single transect of borings that shadow the area proposed for development. In this study, the soil stratigraphy is defined with soil field description data, and no laboratory data. This study identifies the soil stratigraphy across the area under study and estimates the relative age of one soil profile. Continuously cored and sampled borehole FB-1 has been described in detail. Transect A is located along a graded and stripped alluvial surface.

For the Quaternary geologist, a soil can be defined as a natural body that consists of horizons of organic and/or mineral constituents which differ from its parent material in some way (Birkland, 1984). A chronosequence is a group of soils for which all soil forming factors (such as topography, parent material, vegetation, and climate) except time is relatively equal (Jenny, 1941). Past geologic studies in the coastal region of southern California provide age constraints for several deposits and geomorphic surfaces ranging in age from middle Pleistocene to recent (McFadden, 1982; Rockwell, 1988; and WLA, 1998). Often it has proven difficult to date older deposits due to changes in past climatic regimes. Studies on the impacts of glacial to interglacial climatic changes on soil development in specific regions (McFadden, 1982; Birkland, 1984; McFadden, 1988) indicate that soil development has occurred throughout the Quaternary.

This study is concerned with a section of alluvium derived from the southern range front of the Santa Monica Mountains, which is within the Transverse Ranges Geomorphic Province. A series of stacked and truncated argillic soil subsurface horizons within all of the stratigraphic sections studied indicates that the alluvial stratigraphic section across the entire study area correlates well and is significantly old. Age estimates range from 59 to 124 ka (Qoa3) for the stratigraphic section studied across the southern portion of transect A in boring FB-1. To the north, age estimates range from 46 to 94 ka (Qoa3) for the stratigraphic section studied near the center portion of transect A in boring CB-1. The minor difference in ages across transect A are attributed to a scour deposit at the base of buried soil 4 that pinches out to the south where an additional buried soil 5 is preserved.

Soil relative age estimates have broad ranges, dependent upon the pool of comparative data used. Most of the buried soils across the study area fall into the Entisol and Alfisol soil orders (Soil Conservation Service, 1999). The soil profile that is described in detail is from boring FB-1 in Transect A. Boring locations are shown on the geologic map that is provided with the main fault rupture hazard report.

MATERIALS AND METHODS

Continuous core samples collected from boring FB-1 by Feffer Geological, Inc. were described in detail as part of this study. The soils were described using guidelines set by the Soil Survey Staff (1991 and 1999). Specific soil properties such as soil structure and soil horizon boundaries could not be accurately described from the core sample exposures. These soil qualifiers have not been described and do not factor into the estimated soil relative age comparisons.

Soil profile field description values quantify soil properties that are used to develop a soil development index (SDI) value as outlined by Harden (1982). Points are assigned to descriptive data for each of several observed soil properties, such as dry color, moist color, texture, dry and wet consistence, and clay film content, for each soil horizon in a soil profile relative to the soil horizon's thickness, and normalized to a common depth. The maturity of a soil profile is gauged through data collected from active wash deposits (or raw alluvium).

Table 1.1 lists the detailed soil description for the studied boring in longhand format. Table 1.2 lists the soil description using soil conservation service notation and shows the SDI calculations. Table 1.2 shows the calculated SDI values, the soil profile description, and the normalization values for raw alluvium. SDI values are calculated by assigning point values to each described soil properties. The points are summed for each soil horizon and divided by the total number of descriptive properties used. This equals the mean horizon index value (HI). HI values are multiplied by the corresponding soil horizon thickness. The SDI value equals the sum of the thickness normalized horizon indices. The maximum horizon index (MHI) is the value of the horizon with the largest summed descriptive value. MHI is independent of horizon thickness, and is usually the diagnostic subsurface soil horizon for most soil profiles. Tables 1.2 lists all of the determined HI, SDI, and MHI values for the soil profile under study.

SDI and MHI values have shown significant correlations to soil age in many past studies (Harden, 1982; Rockwell *et al.*, 1983; Reheis *et al*., 1989; Rockwell *et al.*, 1994). The soils described in this study are compared to soils described and dated by McFadden (1982 and 1988) in San Bernardino County near Mission Creek, by Rockwell (1983) in the Ventura River basin, and by William Lettis and Associates, Inc. (1998) in West Hollywood. SDI values have all calibrated to a common depth of 3 feet.

The changes in the subsurface pedogenic properties of the Entisol and Alfisol soil orders allows for relative age determinations by emphasizing specific soil properties (such as color and clay film content) that are most diagnostic. Soil properties that express themselves well through time are most often used in the assessment of soil relative ages through a specific soil property index such as the color or clay film index. The color index (Rockwell *et al.,* 1985, 1988) is used to quantify observed colors (in Munsell notation) of each profile in order to compare relative degrees of reddening. The color index is simply the summation of an entire profile's horizon index values for dry colors. The clay film index (Rockwell *et al.,* 1985, 1988) is used to quantify field descriptions of this soil property in order to compare relative profile maturity. The clay film index is simply the summation of an entire soil profile's horizon index values for clay films. MHI is a comparison of a soil pedons master (or diagnostic) subsurface horizon (typically an argillic or cambic horizon). Independent of horizon thickness, the MHI directly compares the properties of the soil profiles strongest soil horizon.

SOIL RELATIVE AGE METHODS

Soil relative ages are calculated and compared independently for each soil profile described. The soil profile described for this study is located across several buried alluvial surfaces that differ in relative age, facies of deposition, and degrees of preservation. A series of stacked, buried, and truncated hard, clayey soils with illuvial clays characterize a majority of the soil profiles described on this project site.

The soil profile described in detail has a surface age that is implied by estimating the time of inception for the exposed surficial soil. The soil profile described in detail for this study also contains a series of stacked and / or buried soil profiles. In this case, deposit age assessments are obtained by identifying and isolating the different parent materials (or deposits). Then comparing a set of abridged calculated indices to an additional suite of similar soils that have been radiometrically dated yields the equivalent to a buried surface age estimate. Such burial relationships are common along the southern Santa Monica Mountains range front; especially where soils that have developed into alluvial fan deposits which commonly bury or locally truncate older soils that have developed previously in older alluvial deposits. A cumulic soil profile estimated age can assess landform age, and has potential to assess rates of erosion, rates of landform evolution, and rates of tectonic activity across the study area.

The described soil profiles have an SDI value which is used to estimate the soil relative age. Cumuli relative age estimates for a stacked or buried soil profiles are specifically referred to as “deposit ages”. The relative age estimate for the surface profile or modern soil is referred to as the “surface age”. All of the relative age estimates given are considered minimum ages given that an unknown amount of erosion has occurred after the formation of and before the burial of each truncated surface and buried soil studied.

DISCUSSION AND RESULTS

This section contains a brief write up for the continuously cored boring described in detail with designated tables for the soil profile. The attached Table 1.1 presents the soil profile description in longhand format. Table 1.2 presents the results of the calculated SDI values. Table 2 is a summary of the soil relative age estimates for the soil profile under study. Table 3 is a compilation of the comparative data in a format that compares to the data generated for this study. Table 4 is a soil abbreviation key to be used in conjunction with the SDI calculation sheets. Table 5 lists the relative ages for each designated stratigraphic unit that is shown on the geologic cross section in the fault rupture hazard report.

Soil descriptions, SDI calculations, and relative age determinations follow for the soil profile studied.

TRANSECT A BORING

One soil profile was described in detail out of core samples from boring FB-1. Age estimates range from 59 to 124 ka for the alluvial section studied.

Boring FB-1

The core samples from Transect A, Boring FB-1 were reviewed at the project site on 12/16/2019 and on 12/23/2019. This boring is located at the southern end of Transect A, and this alluvial section is characterized by a sequence of weakly developed surficial soils over a series of truncated argillic soils interbedded with massive and crudely stratified scour deposits. See Table 1.1 for a complete soil description of the continuously sampled boring, Table 1.2 for the SDI index value calculations and relative age estimates, and Feffer Geological Inc.'s cross section and geologic map for both the borehole and transect location.

The surface deposit (Qal1) in boring FB-1 consists of a weakly-developed soil that is characterized by a severely truncated cambic to juvenile argillic horizon and an estimated relative age of 4 – 8 ka. The first buried soil (Buried Soil 1 / Qal2) can be correlated across the entire length of Transect A is a truncated, thick (cumulic), and diffuse weakly to moderately well-developed Alfisol soil with an estimated relative age value of 16 – 29 ka. This correlates well with the Qal2 cumulic soil identified in Transect B to the east. The second buried soil in this alluvial sequence is a conservative top of the Pleistocene in this stratigraphic section. This marker bed (Qoa1) can be correlated across the entire area investigated (Transects A and B) and is a highly truncated, moderately well oxidized, and moderately well-developed Alfisol soil that has an estimated relative age value of 25 – 51 ka. The third buried soil (Buried Soil 3 / Qoa2) also can be correlated across the entire length of Transect B is a truncated, massive, weakly to moderately well-developed Alfisol soil with an estimated relative age value of 33 – 64 ka. The fourth and fifth buried soils (Qoa3) in Transect A, has an estimated age that ranges from 59 – 124 ka. This forth buried soil in this alluvial sequence can be correlated across a majority of the area investigated and the fifth buried soil is scoured out across the center and north end of Transect A.

Differences in the number of soils, depths of burial and unit thicknesses due to differential erosion / truncation laterally along Transect A may cause minor variances in relative age estimates between the individual borings. In order to control for this additional soil summary descriptions were generated across this transect which assesses the same buried surfaces at differing depths of burial and in differing states of preservation.

CONCLUSIONS

A majority of the buried soils observed across the study area are Alfisols that have developed in alluvial environments. All of the soil profiles across Transect A consist of a series of stacked, truncated, and buried argillic soil horizons. The truncated and buried soils with argillic sub surface soil horizons are weakly and moderately well developed. The Alfisol soils typically have 10YR to 7.5YR color hues with a modest amounts of secondary (pedogenic) clay in a series of argillic (Bt) diagnostic subsurface horizons.

Several buried soil profiles across the area investigated are laterally continuous across both Transects A and B. Localized lateral variability observed in the buried soils across the site is due to localized erosion, scouring, infilling, and stacking of these materials in an alluvial environment. In this sedimentological environment surfaces that have been stable long enough to form a robust soil, can suddenly be buried by a new deposit, or scoured out (truncated) and possibly in-filled with younger material. The amount of erosion that has occurred with each truncated soil under study is unknown. Thus the relative age estimates given in this study are minimum ages.

These soil relative age determinations are consistent with the general geologic and pedogenic observations of soils in southern California. Strongly developed, well horizonated, thick, and oxidized Alfisols can be as much as 200 ka in age. Erosion tends to act as a rejuvenating aspect in soil development, by decreasing the strength of the soil development properties and the consequent age estimates are younger. In that past magnitudes and rates of erosion are difficult to assess, the soil relative age estimates are utilized as minimum ages.

The soils observed along Transect A are Holocene and Pleistocene in age. The buried and stacked soils display soil horizons that have weak to moderately strong argillic horizon development at depth. Age estimates range from 59 to 124 ka for the entire alluvial stratigraphic section studied along transect A. Age estimates range from 37 to 72 ka for the truncated alluvial stratigraphic section studied along transect B. The third buried soil (buried soil 3) (Qoa1) in Transect B and the second buried soil (buried soil 2) (Qoa1) in Transect A can be correlated across the entire area investigated is a truncated, moderately well oxidized, and moderately well-developed argillic soil profile that ranges in relative age from 25 – 51 ka along the southern portion of Transect A. The lowermost buried soil (buried soil 4) (Qoa2) that can be correlated across the entire area investigated is a truncated, stacked, and moderately well-developed argillic soil profile that ranges in relative age from 46 – 94 ka along the southern portion of Transect A.

LIMITATIONS

The conclusions and recommendations presented herein are the results of an inherently limited scope. Specifically, the scope of services consisted of an assessment of relative age from core samples and did not participate in any drilling activities at the site. The conclusions and recommendations contained in this report are professional opinions derived in accordance with current standards of professional practice. No warranty is expressed or implied.

This report has been prepared for the exclusive use of Feffer Geological, Inc. and applies only to the Fault Rupture Hazard Study located at 449 N Beverly Drive. In the event that significant changes in the interpretations of this study are made, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed by John Helms, CEG, and the conclusions and recommendations of this report are verified in writing.

CPT Reporting

8/3/18

Feffer Geological Consulting
Attn: Alexander Greene

Subject: CPT Site Investigation
468 Rodeo Drive
Beverly Hills, California
GREGG Project Number: 180590SH

Dear Mr. Greene:

The following report presents the results of GREGG Drilling & Testing's Cone Penetration Test investigation for the above referenced site. The following testing services were performed:

1	Cone Penetration Tests	(CPTU)	☒
2	Pore Pressure Dissipation Tests	(PPD)	☐
3	Seismic Cone Penetration Tests	(SCPTU)	☐
4	UVOST Laser Induced Fluorescence	(UVOST)	☐
5	Groundwater Sampling	(GWS)	☐
6	Soil Sampling	(SS)	☐
7	Vapor Sampling	(VS)	☐
8	Pressuremeter Testing	(PMT)	☐
9	Vane Shear Testing	(VST)	☐
10	Dilatometer Testing	(DMT)	☐

A list of reference papers providing additional background on the specific tests conducted is provided in the bibliography following the text of the report. If you would like a copy of any of these publications or should you have any questions or comments regarding the contents of this report, please do not hesitate to contact our office at (562) 427-6899.

Sincerely,
GREGG Drilling & Testing, Inc.

Frank Stolfi
HRSC Division Manager, Gregg Drilling & Testing, Inc.

Cone Penetration Test Sounding Summary

-Table 1-

CPT Sounding Identification	Date	Termination Depth (feet)	Depth of Groundwater Samples (feet)	Depth of Soil Samples (feet)	Depth of Pore Pressure Dissipation Tests (feet)

Cone Penetration Testing Procedure (CPT)

Gregg Drilling carries out all Cone Penetration Tests (CPT) using an integrated electronic cone system, *Figure CPT*.

The cone takes measurements of tip resistance (q_c), sleeve resistance (f_s), and penetration pore water pressure (u_2). Measurements are taken at either 2.5 or 5 cm intervals during penetration to provide a nearly continuous profile. CPT data reduction and basic interpretation is performed in real time facilitating on-site decision making. The above mentioned parameters are stored electronically for further analysis and reference. All CPT soundings are performed in accordance with revised ASTM standards (D 5778-12).

The 5mm thick porous plastic filter element is located directly behind the cone tip in the u_2 location. A new saturated filter element is used on each sounding to measure both penetration pore pressures as well as measurements during a dissipation test (*PPDT*). Prior to each test, the filter element is fully saturated with oil under vacuum pressure to improve accuracy.

When the sounding is completed, the test hole is backfilled according to client specifications. If grouting is used, the procedure generally consists of pushing a hollow tremie pipe with a "knock out" plug to the termination depth of the CPT hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole. Disruption or further contamination to the site is therefore minimized.

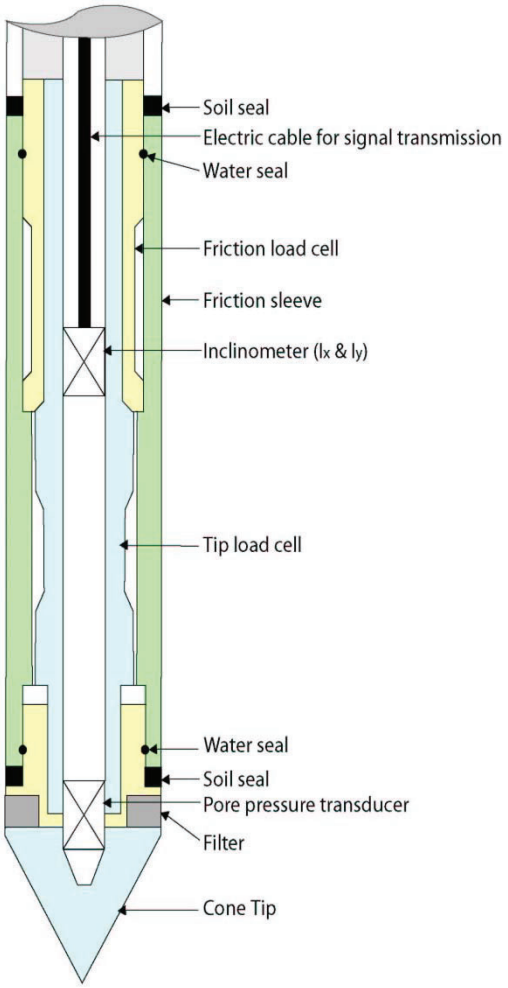

Figure CPT

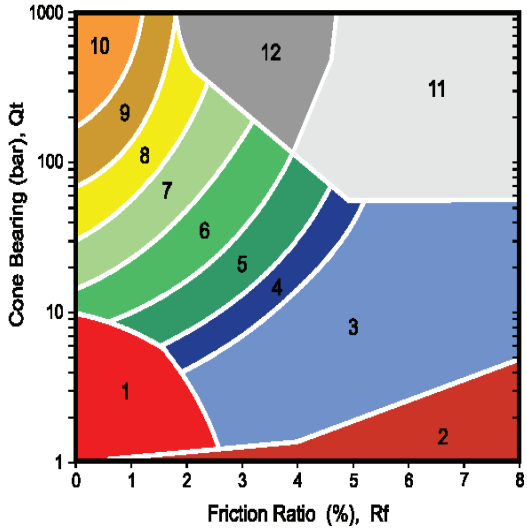
Gregg 15cm^2 Standard Cone Specifications

Dimensions	
Cone base area	15 cm^2
Sleeve surface area	225 cm^2
Cone net area ratio	0.80
Specifications	
Cone load cell	
Full scale range	180 kN (20 tons)
Overload capacity	150%
Full scale tip stress	120 MPa (1,200 tsf)
Repeatability	120 kPa (1.2 tsf)
Sleeve load cell	
Full scale range	31 kN (3.5 tons)
Overload capacity	150%
Full scale sleeve stress	1,400 kPa (15 tsf)
Repeatability	1.4 kPa (0.015 tsf)
Pore pressure transducer	
Full scale range	7,000 kPa (1,000 psi)
Overload capacity	150%
Repeatability	7 kPa (1 psi)



Note: The repeatability during field use will depend somewhat on ground conditions, abrasion, maintenance and zero load stability.

Cone Penetration Test Data & Interpretation

The Cone Penetration Test (CPT) data collected are presented in graphical and electronic form in the report. The plots include interpreted Soil Behavior Type (SBT) based on the charts described by Robertson (1990). Typical plots display SBT based on the non-normalized charts of Robertson et al (1986). For CPT soundings deeper than 30m, we recommend the use of the normalized charts of Robertson (1990) which can be displayed as SBTn, upon request. The report also includes spreadsheet output of computer calculations of basic interpretation in terms of SBT and SBTn and various geotechnical parameters using current published correlations based on the comprehensive review by Lunne, Robertson and Powell (1997), as well as recent updates by Professor Robertson (Guide to Cone Penetration Testing, 2015). The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg Drilling & Testing Inc. does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software. Some interpretation methods require input of the groundwater level to calculate vertical effective stress. An estimate of the in-situ groundwater level has been made based on field observations and/or CPT results, but should be verified by the user.

A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface.

Note that it is not always possible to clearly identify a soil type based solely on q_t, f_s, and u_2. In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the correct soil behavior type.

Cone Penetration Test (CPT) Interpretation

Gregg uses a proprietary CPT interpretation and plotting software. The software takes the CPT data and performs basic interpretation in terms of soil behavior type (SBT) and various geotechnical parameters using current published empirical correlations based on the comprehensive review by Lunne, Robertson and Powell (1997). The interpretation is presented in tabular format using MS Excel. The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for any use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software.

The following provides a summary of the methods used for the interpretation. Many of the empirical correlations to estimate geotechnical parameters have constants that have a range of values depending on soil type, geologic origin and other factors. The software uses 'default' values that have been selected to provide, in general, conservatively low estimates of the various geotechnical parameters.

Input:

1 Units for display (Imperial or metric) (atm. pressure, p_a = 0.96 tsf or 0.1 MPa)
2 Depth interval to average results (ft or m). Data are collected at either 0.02 or 0.05m and can be averaged every 1, 3 or 5 intervals.
3 Elevation of ground surface (ft or m)
4 Depth to water table, z_w (ft or m) – input required
5 Net area ratio for cone, a (default to 0.80)
6 Relative Density constant, C_{Dr} (default to 350)
7 Young's modulus number for sands, α (default to 5)
8 Small strain shear modulus number
  a. for sands, S_G (default to 180 for SBT_n 5, 6, 7)
  b. for clays, C_G (default to 50 for SBT_n 1, 2, 3 & 4)
9 Undrained shear strength cone factor for clays, N_{kt} (default to 15)
10 Over Consolidation ratio number, k_{ocr} (default to 0.3)
11 Unit weight of water, (default to γ_w = 62.4 lb/ft^3 or 9.81 kN/m^3)

Column

1 Depth, z, (m) – CPT data is collected in meters
2 Depth (ft)
3 Cone resistance, q_c (tsf or MPa)
4 Sleeve resistance, f_s (tsf or MPa)
5 Penetration pore pressure, u (psi or MPa), measured behind the cone (i.e. u_2)
6 Other – any additional data
7 Total cone resistance, q_t (tsf or MPa) $q_t = q_c + u\,(1-a)$

8	Friction Ratio, R_f (%)	$R_f = (f_s/q_t) \times 100\%$
9	Soil Behavior Type (non-normalized), SBT	see note
10	Unit weight, γ (pcf or kN/m^3)	based on SBT, see note
11	Total overburden stress, σ_v (tsf)	$\sigma_{vo} = \sigma\ z$
12	In-situ pore pressure, u_o (tsf)	$u_o = \gamma_w (z - z_w)$
13	Effective overburden stress, σ'_{vo} (tsf)	$\sigma'_{vo} = \sigma_{vo} - u_o$
14	Normalized cone resistance, Q_{t1}	$Q_{t1} = (q_t - \sigma_{vo}) / \sigma'_{vo}$
15	Normalized friction ratio, F_r (%)	$F_r = f_s / (q_t - \sigma_{vo}) \times 100\%$
16	Normalized Pore Pressure ratio, B_q	$B_q = u - u_o / (q_t - \sigma_{vo})$
17	Soil Behavior Type (normalized), SBT_n	see note
18	SBT_n Index, I_c	see note
19	Normalized Cone resistance, Q_{tn} (n varies with I_c)	see note
20	Estimated permeability, k_{SBT} (cm/sec or ft/sec)	see note
21	Equivalent SPT N_{60}, blows/ft	see note
22	Equivalent SPT $(N_1)_{60}$ blows/ft	see note
23	Estimated Relative Density, D_r, (%)	see note
24	Estimated Friction Angle, ϕ', (degrees)	see note
25	Estimated Young's modulus, E_s (tsf)	see note
26	Estimated small strain Shear modulus, Go (tsf)	see note
27	Estimated Undrained shear strength, s_u (tsf)	see note
28	Estimated Undrained strength ratio	s_u/σ_v'
29	Estimated Over Consolidation ratio, OCR	see note

Notes:

1 Soil Behavior Type (non-normalized), SBT (Lunne et al., 1997 and table below)

2 Unit weight, γ either constant at 119 pcf or based on Non-normalized SBT (Lunne et al., 1997 and table below)

3 Soil Behavior Type (Normalized), SBT_n Lunne et al. (1997)

4 SBT_n Index, I_c $I_c = ((3.47 - \log Q_{t1})^2 + (\log F_r + 1.22)^2)^{0.5}$

5 Normalized Cone resistance, Q_{tn} (n varies with Ic)

$Q_{tn} = ((q_t - \sigma_{vo})/pa)\ (pa/(\sigma'_{vo})^n$ and recalculate I_c, then iterate:

When $I_c < 1.64$, n = 0.5 (clean sand)
When $I_c > 3.30$, n = 1.0 (clays)
When $1.64 < I_c < 3.30$, $n = (I_c - 1.64)0.3 + 0.5$
Iterate until the change in n, $\Delta n < 0.01$

6 Estimated permeability, k_{SBT} based on Normalized SBT_n (Lunne et al., 1997 and table below)

7 Equivalent SPT N_{60}, blows/ft Lunne et al. (1997)

$$\frac{(q_t/p_a)}{N_{60}} = 8.5\left(1 - \frac{I_c}{4.6}\right)$$

8 Equivalent SPT $(N_1)_{60}$ blows/ft $(N_1)_{60} = N_{60}\, C_N$,
where $C_N = (pa/\sigma'_{vo})^{0.5}$

9 Relative Density, D_r, (%) $D_r^2 = Q_{tn} / C_{Dr}$
Only SBT_n 5, 6, 7 & 8 *Show 'N/A' in zones 1, 2, 3, 4 & 9*

10 Friction Angle, ϕ', (degrees) $\tan\phi' = \frac{1}{2.68}\left[\log\left(\frac{q_c}{\sigma'_{vo}}\right) + 0.29\right]$
Only SBT_n 5, 6, 7 & 8 *Show'N/A' in zones 1, 2, 3, 4 & 9*

11 Young's modulus, E_s $E_s = \alpha\, q_t$
Only SBT_n 5, 6, 7 & 8 *Show 'N/A' in zones 1, 2, 3, 4 & 9*

12 Small strain shear modulus, Go

a. $G_o = S_G\,(q_t\ \sigma'_{vo}\ pa)^{1/3}$ *For SBT_n 5, 6, 7*

b. $G_o = C_G\, q_t$ *For SBT_n 1, 2, 3& 4*

Show 'N/A' in zones 8 & 9

13 Undrained shear strength, s_u $s_u = (q_t - \sigma_{vo}) / N_{kt}$
Only SBT_n 1, 2, 3, 4 & 9 *Show 'N/A' in zones 5, 6, 7 & 8*

14 Over Consolidation ratio, OCR OCR = $k_{ocr}\, Q_{t1}$
Only SBT_n 1, 2, 3, 4 & 9 *Show 'N/A' in zones 5, 6, 7 & 8*

The following updated and simplified SBT descriptions have been used in the software:

SBT Zones		**SBT_n Zones**	
1	sensitive fine grained	1	sensitive fine grained
2	organic soil	2	organic soil
3	clay	3	clay
4	clay & silty clay	4	clay & silty clay
5	clay & silty clay		
6	sandy silt & clayey silt		

7	silty sand & sandy silt	5	silty sand & sandy silt
8	sand & silty sand	6	sand & silty sand
9	sand		
10	sand	7	sand
11	very dense/stiff soil*	8	very dense/stiff soil*
12	very dense/stiff soil*	9	very dense/stiff soil*

*heavily overconsolidated and/or cemented

Track when soils fall with zones of same description and print that description (i.e. if soils fall only within SBT zones 4 & 5, print ‘clays & silty clays’)

Estimated Permeability (see Lunne et al., 1997)

SBT_n	Permeability (ft/sec)	(m/sec)
1	$3x\ 10^{-8}$	$1x\ 10^{-8}$
2	$3x\ 10^{-7}$	$1x\ 10^{-7}$
3	$1x\ 10^{-9}$	$3x\ 10^{-10}$
4	$3x\ 10^{-8}$	$1x\ 10^{-8}$
5	$3x\ 10^{-6}$	$1x\ 10^{-6}$
6	$3x\ 10^{-4}$	$1x\ 10^{-4}$
7	$3x\ 10^{-2}$	$1x\ 10^{-2}$
8	$3x\ 10^{-6}$	$1x\ 10^{-6}$
9	$1x\ 10^{-8}$	$3x\ 10^{-9}$

Estimated Unit Weight (see Lunne et al., 1997)

SBT	Approximate Unit Weight (lb/ft^3)	(kN/m^3)
1	111.4	17.5
2	79.6	12.5
3	111.4	17.5
4	114.6	18.0
5	114.6	18.0
6	114.6	18.0
7	117.8	18.5
8	120.9	19.0
9	124.1	19.5
10	127.3	20.0
11	130.5	20.5
12	120.9	19.0

Pore Pressure Dissipation Tests (PPDT)

Pore Pressure Dissipation Tests (PPDT's) conducted at various intervals can be used to measure equilibrium water pressure (at the time of the CPT). If conditions are hydrostatic, the equilibrium water pressure can be used to determine the approximate depth of the ground water table. A PPDT is conducted when penetration is halted at specific intervals determined by the field representative. The variation of the penetration pore pressure (*u)* with time is measured behind the tip of the cone and recorded.

Pore pressure dissipation data can be interpreted to provide estimates of:

- Equilibrium piezometric pressure
- Phreatic Surface
- In situ horizontal coefficient of consolidation (c_h)
- In situ horizontal coefficient of permeability (k_h)

In order to correctly interpret the equilibrium piezometric pressure and/or the phreatic surface, the pore pressure must be monitored until it reaches equilibrium, *Figure PPDT*. This time is commonly referred to as t_{100}, the point at which 100% of the excess pore pressure has dissipated.

A complete reference on pore pressure dissipation tests is presented by Robertson et al. 1992 and Lunne et al. 1997.

A summary of the pore pressure dissipation tests are summarized in Table 1.

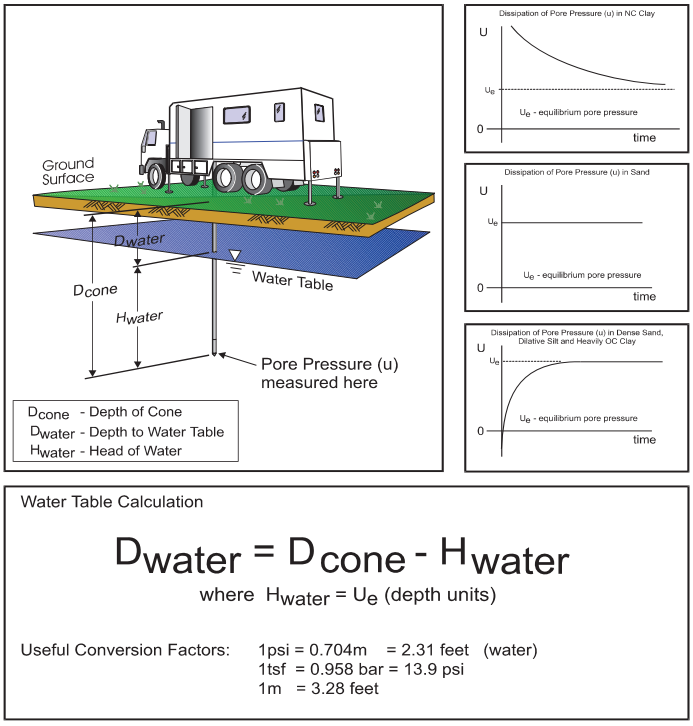

Figure PPDT

Seismic Cone Penetration Testing (SCPT)

Seismic Cone Penetration Testing (SCPT) can be conducted at various intervals during the Cone Penetration Test. Shear wave velocity (Vs) can then be calculated over a specified interval with depth. A small interval for seismic testing, such as 1-1.5m (3-5ft) allows for a detailed look at the shear wave profile with depth. Conversely, a larger interval such as 3-6m (10-20ft) allows for a more average shear wave velocity to be calculated. Gregg's cones have a horizontally active geophone located 0.2m (0.66ft) behind the tip.

To conduct the seismic shear wave test, the penetration of the cone is stopped and the rods are decoupled from the rig. An automatic hammer is triggered to send a shear wave into the soil. The distance from the source to the cone is calculated knowing the total depth of the cone and the horizontal offset distance between the source and the cone. To calculate an interval velocity, a minimum of two tests must be performed at two different depths. The arrival times between the two wave traces are compared to obtain the difference in time (Δt). The difference in depth is calculated (Δd) and velocity can be determined using the simple equation: $v = \Delta d/\Delta t$

Multiple wave traces can be recorded at the same depth to improve quality of the data.

A complete reference on seismic cone penetration tests is presented by Robertson et al. 1986 and Lunne et al. 1997.

A summary the shear wave velocities, arrival times and wave traces are provided with the report.

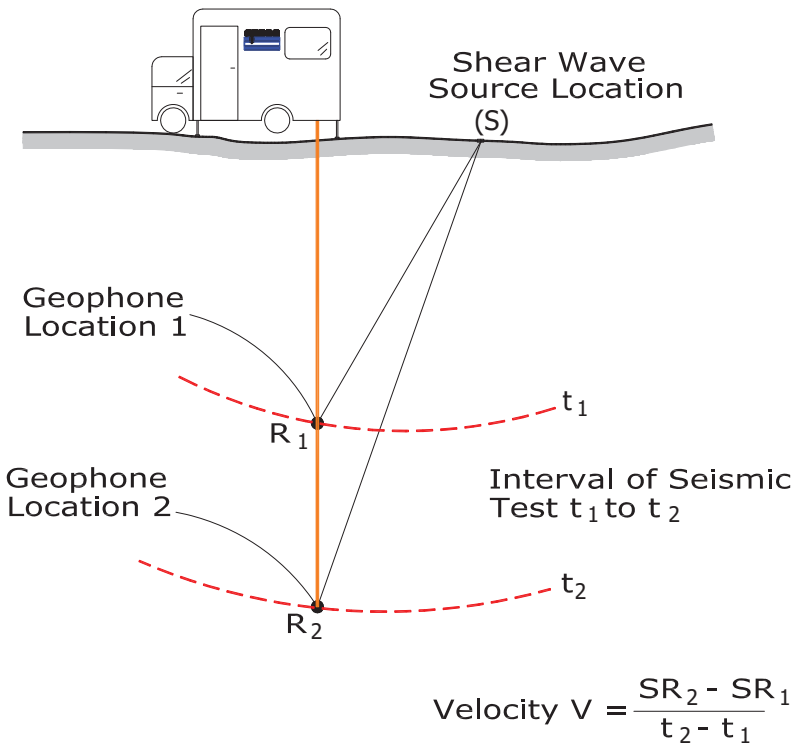

Figure SCPT

Groundwater Sampling

Gregg Drilling & Testing, Inc. conducts groundwater sampling using a sampler as shown in *Figure GWS*. The groundwater sampler has a retrievable stainless steel or disposable PVC screen with steel drop off tip. This allows for samples to be taken at multiple depth intervals within the same sounding location. In areas of slower water recharge, provisions may be made to set temporary PVC well screens during sampling to allow the pushing equipment to advance to the next sample location while the groundwater is allowed to infiltrate.

The groundwater sampler operates by advancing 44.5mm (1¾ inch) hollow push rods with the filter tip in a closed configuration to the base of the desired sampling interval. Once at the desired sample depth, the push rods are retracted; exposing the encased filter screen and allowing groundwater to infiltrate hydrostatically from the formation into the inlet screen. A small diameter bailer (approximately ½ or ¾ inch) is lowered through the push rods into the screen section for sample collection. The number of downhole trips with the bailer and time necessary to complete the sample collection at each depth interval is a function of sampling protocols, volume requirements, and the yield characteristics and storage capacity of the formation. Upon completion of sample collection, the push rods and sampler, with the exception of the PVC screen and steel drop off tip are retrieved to the ground surface, decontaminated and prepared for the next sampling event.

For a detailed reference on direct push groundwater sampling, refer to Zemo et. al., 1992.

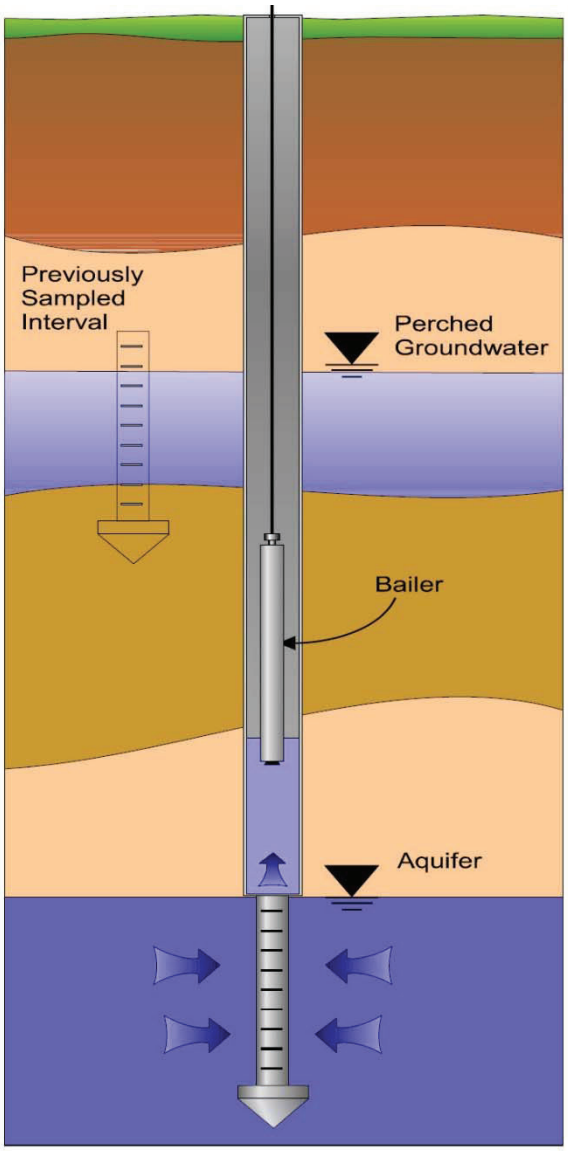

Figure GWS

Soil Sampling

Gregg Drilling & Testing, Inc. uses a piston-type push-in sampler to obtain small soil samples without generating any soil cuttings, *Figure SS*. Two different types of samplers (12 and 18 inch) are used depending on the soil type and density. The soil sampler is initially pushed in a "closed" position to the desired sampling interval using the CPT pushing equipment. Keeping the sampler closed minimizes the potential of cross contamination. The inner tip of the sampler is then retracted leaving a hollow soil sampler with inner 1¼" diameter sample tubes. The hollow sampler is then pushed in a locked "open" position to collect a soil sample. The filled sampler and push rods are then retrieved to the ground surface. Because the soil enters the sampler at a constant rate, the opportunity for 100% recovery is increased. For environmental analysis, the soil sample tube ends are sealed with Teflon and plastic caps. Often, a longer "split tube" can be used for geotechnical sampling.

For a detailed reference on direct push soil sampling, refer to Robertson et al, 1998.

- Interpretation Output (CPeT-IT)
- CPeT-IT Calculation Formulas

SUMMARY
OF
CONE PENETRATION TEST DATA

1. INTRODUCTION

This report presents the results of a Cone Penetration Test (CPT) program carried out for the project located at 456 N. Rodeo Drive in Beverly Hills, California. The work was performed by Kehoe Testing & Engineering (KTE) on July 11-13, 2018. The scope of work was performed as directed by Feffer Geological Consulting personnel.

2. SUMMARY OF FIELD WORK

The fieldwork consisted of performing CPT soundings at seven locations to determine the soil lithology. Groundwater measurements and hole collapse depths provided in **TABLE 2.1** are for information only. The readings indicate the apparent depth to which the hole is open and the apparent water level (if encountered) in the CPT probe hole at the time of measurement upon completion of the CPT. KTE does not warranty the accuracy of the measurements and the reported water levels may not represent the true or stabilized groundwater levels.

LOCATION	DEPTH OF CPT (ft)	COMMENTS/NOTES:
CPT-5	39	Refusal, hole open to 36 ft (dry)
CPT-6	50	Hole open to 48 ft (dry)
CPT-7	50	Hole open to 46 ft (dry)
CPT-8	30	Refusal, hole open to 30 ft (dry)

TABLE 2.1 - Summary of CPT Soundings

3. FIELD EQUIPMENT & PROCEDURES

The CPT soundings were carried out by **KTE** using an integrated electronic cone system manufactured by Vertek. The CPT soundings were performed in accordance with ASTM standards (D5778). The cone penetrometers were pushed using a 30-ton CPT rig and a direct push rig anchored with an eight-inch diameter ground anchor. The direct push rig has a pushing capacity of approximately 15 tons. The cone used during the program was a 15 cm^2 cone and a 10 cm^2 was used with the direct push rig. Both recorded the following parameters at approximately 2.5 cm depth intervals:

- Cone Resistance (qc)
- Sleeve Friction (fs)
- Dynamic Pore Pressure (u)
- Inclination
- Penetration Speed

The above parameters were recorded and viewed in real time using a laptop computer. Data is stored at the KTE office for up to 2 years for future analysis and reference. A complete set of baseline readings was taken prior to each sounding to determine temperature shifts and any zero load offsets. Monitoring base line readings ensures that the cone electronics are operating properly.

4. CONE PENETRATION TEST DATA & INTERPRETATION

The Cone Penetration Test data is presented in graphical form in the attached Appendix. These plots were generated using the CPeT-IT program. Penetration depths are referenced to ground surface. The soil classification on the CPT plots is derived from the attached CPT Classification Chart (Robertson) and presents major soil lithologic changes. The stratigraphic interpretation is based on relationships between cone resistance (qc), sleeve friction (fs), and penetration pore pressure (u). The friction ratio (Rf), which is sleeve friction divided by cone resistance, is a calculated parameter that is used along with cone resistance to infer soil behavior type. Generally, cohesive soils (clays) have high friction ratios, low cone resistance and generate excess pore water pressures. Cohesionless soils (sands) have lower friction ratios, high cone bearing and generate little (or negative) excess pore water pressures.

Tables of basic CPT output from the interpretation program CPeT-IT are provided for CPT data averaged over one foot intervals in the Appendix. We recommend a geotechnical engineer review the assumed input parameters and the calculated output from the CPeT-IT program. A summary of the equations used for the tabulated parameters is provided in the Appendix.

It should be noted that it is not always possible to clearly identify a soil type based on qc, fs and u. In these situations, experience, judgement and an assessment of the pore pressure data should be used to infer the soil behavior type.

If you have any questions regarding this information, please do not hesitate to call our office at (714) 901-7270.

Sincerely,

KEHOE TESTING & ENGINEERING

Richard W. Koester, Jr.
General Manager

Presented below is a list of formulas used for the estimation of various soil properties. The formulas are presented in SI unit system and assume that all components are expressed in the same units.

:: Unit Weight, g (kN/m³) ::

$$g = g_w \cdot \left(0.27 \cdot \log(R_f) + 0.36 \cdot \log(\frac{q_t}{p_a}) + 1.236 \right)$$

where g_w = water unit weight

:: Permeability, k (m/s) ::

$I_c < 3.27$ and $I_c > 1.00$ then $k = 10^{0.952-3.04 \cdot I_c}$

$I_c \leq 4.00$ and $I_c > 3.27$ then $k = 10^{-4.52-1.37 \cdot I_c}$

:: N_{SPT} (blows per 30 cm) ::

$$N_{60} = \left(\frac{q_c}{P_a} \right) \cdot \frac{1}{10^{1.1268-0.2817 \cdot I_c}}$$

$$N_{1(60)} = Q_{tn} \cdot \frac{1}{10^{1.1268-0.2817 \cdot I_c}}$$

:: Young's Modulus, Es (MPa) ::

$(q_t - \sigma_v) \cdot 0.015 \cdot 10^{0.55 \cdot I_c + 1.68}$

(applicable only to $I_c < I_{c_cutoff}$)

:: Relative Density, Dr (%) ::

$100 \cdot \sqrt{\frac{Q_{tn}}{k_{DR}}}$ (applicable only to SBT_n: 5, 6, 7 and 8 or $I_c < I_{c_cutoff}$)

:: State Parameter, ψ ::

$\psi = 0.56 - 0.33 \cdot \log(Q_{tn,cs})$

:: Peak drained friction angle, φ (°) ::

$\varphi = 17.60 + 11 \cdot \log(Q_{tn})$

(applicable only to SBT_n: 5, 6, 7 and 8)

:: 1-D constrained modulus, M (MPa) ::

If $I_c > 2.20$

$\alpha = 14$ for $Q_{tn} > 14$

$\alpha = Q_{tn}$ for $Q_{tn} \leq 14$

$M_{CPT} = \alpha \cdot (q_t - \sigma_v)$

If $I_c \leq 2.20$

$M_{CPT} = (q_t - \sigma_v) \cdot 0.0188 \cdot 10^{0.55 \cdot I_c + 1.68}$

:: Small strain shear Modulus, Go (MPa) ::

$G_0 = (q_t - \sigma_v) \cdot 0.0188 \cdot 10^{0.55 \cdot I_c + 1.68}$

:: Shear Wave Velocity, Vs (m/s) ::

$$V_s = \left(\frac{G_0}{\rho} \right)^{0.50}$$

:: Undrained peak shear strength, Su (kPa) ::

$N_{kt} = 10.50 + 7 \cdot \log(F_r)$ or user defined

$$S_u = \frac{(q_t - \sigma_v)}{N_{kt}}$$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: Remolded undrained shear strength, Su(rem) (kPa) ::

$S_{u(rem)} = f_s$ (applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: Overconsolidation Ratio, OCR ::

$$k_{OCR} = \left[\frac{Q_{tn}^{0.20}}{0.25 \cdot (10.50 \cdot +7 \cdot \log(F_r))} \right]^{1.25}$$ or user defined

$OCR = k_{OCR} \cdot Q_{tn}$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: In situ Stress Ratio, Ko ::

$K_O = (1 - \sin\varphi') \cdot OCR^{\sin\varphi'}$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: Soil Sensitivity, S_t ::

$$S_t = \frac{N_S}{F_r}$$

(applicable only to SBT_n: 1, 2, 3, 4 and 9 or $I_c > I_{c_cutoff}$)

:: Effective Stress Friction Angle, φ' (°) ::

$\varphi' = 29.5° \cdot B_q^{0.121} \cdot (0.256 + 0.336 \cdot B_q + \log Q_t)$

(applicable for $0.10 < B_q < 1.00$)

RECOMMENDATION FOR ACCEPTANCE OF INVESTIGATION AND REPORT

POTENTIAL SURFACE FAULT RUPTURE
449 N. Beverly Drive, LLC, City of Beverly Hills CA 90210

APN: 4343-016-019

As authorized by the City of Beverly Hills, this document summarizes technical (peer) reviews for a "Fault Hazard [Ground Rupture] Investigation" for proposed redevelopment of the 449 N. Beverly Drive property in the City of Beverly Hills, California. The investigations were carried by Feffer Geological Consulting, Inc. (FGC), the Consultants-of-Record, on behalf of the applicant, the 449 N. Beverly Drive, LLC. The main purpose of the FGC investigation was to determine if potential splays of the Santa Monica fault zone impact the site, and if such faults were "active" (defined by the California Geological Survey [CGS] as surface or near-surface displacement within the last 11,700 years).

The site is about 75 ft from the Santa Monica fault system, the nearest, CGS-designated Earthquake Fault Zone (EFZ), and relatively near the Hollywood EFZ that extends into the City on the northeast, and the West Pico EFZ that currently "stops" at the City limits on the southeast (see FGC Figs. 2 and 8 and related enlargements given in report pocket). The City requires independent fault-activity reviews in conformance with building codes, with current requirements of the CGS (2018, Special Publication 42) and with contemporary standards-of-practice to ensure public health, safety and welfare.

The technical reviews included initial and on-going telephone and email discussions with applicant representatives, the consultants and City personnel about investigation requirements and scope of work. These were followed by on-site field observation of continuous cores, interpretations of FGC preliminary cross-sections, cone penetrometer tests and site-specific soil-stratigraphic correlations. Also reviewed were draft reports followed by discussions with FGC personnel, sub-consultants and the permit applicant. After review of the "Final Report," this document was prepared to summarize the

fundamental technical conclusions and to submit to the City of Beverly Hills for appropriate processing.

The FGC final report, dated 16 January 2020, was received on 21 January 2020. The report provides pertinent literature and maps, recapitulates field investigation procedures, summarizes the regional geologic framework and tectonic setting, and expounds on specific investigation procedures and technical data supporting the professional conclusions and recommendations.

In sum, the fundamental conclusions of the Consultants-of-Record (FGC) are:

1. That the FGC regional assessments and site-specific investigations meet current standards-of-practice for fault-activity assessments in southern California in general and for those specifically required by the City of Beverly Hills in particular;

2. That the FGC site-specific investigations and interpretations are sufficient to identify, date and correlate subsurface stratigraphic markers, which are unbroken and generally more than 11,700 years old (Figs. 12 and 13).

3. That, despite diligent observation, no charcoal or other materials amenable to unequivocal radiocarbon or other numeric dating methods were recovered;

4. That subsurface sediment and paleosol interpretations were facilitated by interpretation of a single, on-site continuous core correlated with data from adjacent and nearby properties previously investigated by FGC (Appendix A).

5. That the on-site sediments were dated primarily by soil-stratigraphic techniques (Appendix B). Identified were multiple moderately to strongly developed buried paleosols locally replete with common to many, moderately thick illuvial clay films all indicating a pre-11,700-yr age; and that these soils and sediments, traced across the site and in association with CPT “signatures,” are unbroken.

6. That, the 449 N. Beverly Drive property is not subject to potential surface or near-surface displacement associated with the Santa Monica, the Hollywood, the West Pico or any other fault reasonably projected toward it (Fig. 11a).

Accordingly, based substantially on, and in reliance of their professional interpretations and conclusions, the FGC regional summaries and site-specific investigations are judged to meet current standards-of-practice for fault-activity assessments in southern California in general and for those specifically required by the City of Beverly Hills in particular.

Please note that the ECI report focuses solely on potential surface or near-surface fault rupture and does not specifically address possible high seismic accelerations, ground

deformation or other structural design and geotechnical investigations required by applicable building codes or by present professional engineering and geological standards of practice. It is therefore incumbent upon the applicant, FGC, or other consultants, to provide this information to the City of Beverly Hills for technical review and potential acceptance prior to issuance of building permits.

Recommended for Acceptance of Investigation and Report

Subject: Acceptance of City's Peer-Reviewer Recommendation For Acceptance:
Investigation Of Potential Faulting 449 N. Beverly Drive, Beverly Hills, California, 90210
APN: 4343-016-019

Dear 449 N. Beverly Drive LLC:

The "Fault Hazard [Ground Rupture] Investigation" (Investigation) for the 449 N. Beverly Drive property, in the City of Beverly Hills, California 90210. The investigations were carried out by Feffer Geological Consulting, Inc. ("FGC"), the Consultants-of-Record, on behalf of the applicant, 449 N. Beverly Drive LLC. The main purpose of the FGC investigation was to determine if possible splays of the Santa Monica fault zone potentially impact the site, and if such faults were "active" (defined by the California Geological Survey [CGS] as surface or near-surface displacement within the last 11,700 years). The FGC investigation has been peer reviewed by the City's consultant, Roy J. Shlemon, Ph.D., PG 2867; CPG 1766; CPESC 2167, of Roy J. Shlemon & Associates, Inc. ("RSA").

The peer review included critique of the Site-Specific Fault Rupture Investigation report provided by FGC, titled "Investigation Of Potential Faulting 449 N. Beverly Drive, Beverly Hills, California, 90210 APN: 4343-016-019" (FGC Project File No. 2387-95 dated January 16, 2020 attached).

As the lead agency, the City of Beverly Hills requires appropriate fault-activity investigations and independent technical reviews for conformance with governing local and state building codes, including Department of Conservation California Geological Survey Special Publication 42 titled, "Earthquake Fault Zones A Guide For Government Agenies, Property Owners / Developers, And Geoscience Practitioners For Assessing Fault Rupture Hazards In California," and with current geologic standards of practice that ensure public health, safety and welfare.

Accordingly, in reliance on the technical documentation and assurances provided by the Consultants-of-Record, including their opinions and conclusions, the City of Beverly Hills now formally accepts the technical "Recommendation For Acceptance" of the Reviewer (attached).

Sincerely,

D. Yelton

Attn: Mr. Franklin Dickinson

SUBJECT: **INVESTIGATION OF POTENTIAL FAULTING**
461 North Beverly Drive, Beverly Hills, CA 90210

Dear Mr. Dickinson:

We are pleased to submit this report summarizing our fault rupture hazard investigation for 461 N. Beverly Drive in the City of Beverly Hills, California. This investigation assesses the potential for surface fault rupture and determines if the area of 461 N. Beverly Drive is suitable for the construction of human-occupied structures. 461 N. Beverly Drive is currently not mapped as being potentially affected by surface faulting and is approximately 130 feet to the northwest of the currently mapped Santa Monica Fault Zone (SMFZ).

The investigation consisted of review of pertinent published and unpublished reports, assessed the site geomorphology, and drilled five continuously cored borings to determine underlying stratigraphy. The combination of continuous, unbroken late Pleistocene soil horizons and stratigraphy demonstrates the absence of active faulting beneath the site.

We therefore conclude that the project site is not impacted by state-defined active faults. Accordingly, no fault setback distances or "no-build" zones impact or limit future development.

We appreciate this opportunity to be of service. Should you have any questions regarding the information contained in this report, please do not hesitate to contact us.

Sincerely,

FEFFER GEOLOGICAL CONSULTING, INC.

INTRODUCTION AND BACKGROUND

The project site is located on the southwest side of north Beverly Drive at the corner of south Santa Monica Boulevard and north Beverly Drive, and consists of a commercial lot that is currently occupied by a multi-story building within a developed portion of the City of Beverly Hills, CA (Figure 1). For the purpose of description it is assumed that Beverly Drive is oriented in a north-south direction. The site is bounded to the north by south Santa Monica Boulevard, to the west by an alley, and to the east by north Beverly Drive. Commercial structures and office buildings are located adjacent to the site.

The existing 461 N. Beverly Drive structure was constructed prior to the establishment of the State-mandated Santa Monica Earthquake Fault Zone (SMFZ) (Figure 2). The subject site is entirely outside of this zone and is about 130 feet to the northwest from the northernmost edge of the zone. To ensure public health and safety, a fault investigation is required by the City of Beverly Hills. The surface expression of fault-related geomorphic features has been destroyed by urbanization and development within the greater Los Angeles area which has obscured the lateral extent, location, and rupture history of faulting. Dolan et al. (2000) identified the fault based on topographic scarps north of Santa Monica Boulevard in the Westwood area. Additional work (Olson, 2015) refined the map representation of the fault scarps, and largely confirms the work by Dolan et al. (2000). The mapped location of the SMFZ in relation to the subject site was also obtained from the State of California's recent Earthquake Fault Zone Map (Olson, 2018) (Figure 2).

The site is outside of the current Earthquake Zones of Required Investigation (CGS, 2018a). However, it is subject to the Alquist-Priolo Special Studies Zone Act of 1972 (California Public Resources Code, Chapter 7.5, Division 2), and an investigation is required by the City of Beverly Hills. The AP Special Studies Zone Act specifically defines a fault as active if it demonstrates surface displacement that has occurred within the Holocene (past 11,700 years). This investigation specifically assesses the potential for surface fault rupture at 461 N. Beverly Drive.

SCOPE OF WORK

Trenching is the preferred method for evaluating the presence or absence of faults because it offers a continuous, direct exposure of the fault zone or near surface stratigraphy. However, in this portion of the SMFZ, trenching is difficult due to existing structures. Therefore, this fault rupture hazard study consists mainly of five continuously cored borings drilled to 50 feet in depth and incorporated CPT and continuous core data collected from the adjacent site at 468 N. Rodeo Drive. The scope of work consisted of:

- Review of published and unpublished geotechnical data in the site vicinity;
- Analysis of topographic maps of the site vicinity;
- Obtaining drilling permits and marking of underground utilities;
- Excavating and logging five, fifty foot deep borings;
- Preparation of this report.

FAULT ACTIVITY CRITERIA

In general, fault activity is based on the age of displaced and undisturbed sediment. According to the CGS (2018b), a fault can be either age-undetermined, Holocene-active, or a pre-Holocene fault (see

details below). If charcoal or other numerically datable specimens are present, a numeric age can be established. If no datable material exists, then a relative age can be assigned to movement along the fault usually based on the relative development of buried paleosols.

According to CGS Special Publication 42 (2018b), a fault is defined as the following:

> *"A shear or zone of closely associated shears across which earth materials on one side have been displaced with respect to those on the other side because of tectonic forces. A fault is distinguished from those fractures or shears caused by landsliding or other gravity-driven surficial failures.*
>
> ***age-undetermined fault:*** *A fault whose age of most recent movement is not known or is unconstrained by dating methods or by limitations in stratigraphic resolution.*
>
> ***Holocene-active fault:*** *A fault that has had surface displacement within Holocene time (the last 11,700 years).*
>
> ***pre-Holocene fault:*** *A fault whose recency of past movement is older than 11,700 years, and thus does not meet the criteria of Holocene-active fault as defined in the State Mining and Geology Board regulations (California Code of Regulations, Title 14, Division 2, Section 3601.(a)).*" (CGS, 2018b, p. 1-2)

REGIONAL AND LOCAL GEOLOGY

The site is located in the Los Angeles Basin, a part of the Transverse Ranges Geomorphic province (Figure 3). The Los Angeles Basin lies within a transitional zone between the Transverse Ranges to the north and the Peninsular Ranges (Yerkes et. al., 1965). The basin is bounded on the north by the Santa Monica Mountains, on the east by the Elysian Hills, the west by the Newport-Inglewood Uplift and the south by the La Brea high, an area of shallow bedrock.

The predominate structure in the project site area is the east-west trending Malibu Coast-Santa Monica-Raymond-Cucamonga fault system (Crook et al., 1983), which extends for approximately 125 miles to form the southern boundary of the Transverse Ranges. This fault system is also referred to as the Transverse Ranges Southern Boundary fault system (TRSB) by Dolan et al. (2000). This complex system of east-west trending faults accommodates north-south shortening and uplift, and concurrent westward motion of the Western Transverse Ranges. Individual faults within the TRSB fault system exhibit varying degrees of both left-lateral strike-slip and contractional dip-slip faulting and related folding (Hill, 1979; Crook et al., 1983; Jones et al., 1990; Dolan et al., 2000). All faults within the system show evidence for Quaternary activity and several, including the Santa Monica and Hollywood faults, have been demonstrated by site-specific paleoseismic studies to be active during the Holocene (Jones et al., 1990; Weaver and Dolan, 2000; Dolan et al., 2000).

From a local perspective, the site is located within the uplifted and dissected Beverly Hills area. Geologic mapping of the area is fairly consistent and provides more accurate age constraints in later mapping. Yerkes and Campbell (2005) and Hoots and Kew (1931) mapped Holocene aged alluvium over older Pleistocene aged alluvial and fan deposits (Figure 4) while Dibblee (1991) mapped younger Holocene aged alluvial gravels at the surface overlying older Pleistocene age alluvial fan sediments (Figure 5). More recent mapping (Figure 6) from Campbell (2014) indicates that the sediments exposed

in the area consist of primarily lower Holocene to upper Pleistocene age alluvium near the ground surface underlain by upper to lower Pleistocene aged alluvial fan deposits, and interbedded terrestrial fan and shallow marine sediments. None of these regional geologic maps delineate the SMFZ in the vicinity of the project site area.

Santa Monica Fault Zone

The SMFZ portion of the TRSB trends east-west from the Santa Monica coastline on the west to the Hollywood area on the east (see Figure 2). It is an oblique-reverse, left-lateral fault that is thought to be a surface expression of tectonic deformation related to Pliocene-Quaternary structural development of the Santa Monica Mountains. Integration of subsurface oil and gas exploration seismic data and well logs with surficial mapping indicate the mountains are underlain by a large southward-vergent asymmetric anticline formed over a regional north-dipping thrust ramp at a depth of 6 to 9 miles. Geophysical studies conducted at the Veteran's Administration (VA) property in West Los Angeles indicate the SMFZ is a gently dipping thrust fault with secondary near-vertical faults extending from the primary basal fault toward the ground surface (Pratt et al., 1998; Dolan et al., 2000).

The surface expression of the SMFZ is limited to fault-related geomorphic features, many of which have been destroyed by urbanization and development within the greater Los Angeles area (Figure 7). This has resulted in a poor understanding of the lateral extent, location, and rupture history of the SMFZ. Dolan et al. (2000) identified the fault location based on topographic scarps north of Santa Monica Boulevard. The most prominent of these scarps is located at the base of a late to middle Pleistocene fan surface in west Los Angeles that extends from approximately University High School to the Mormon Temple, juxtaposing older surficial deposits and relatively shallow bedrock to the north against younger surficial deposits and a thick expanse of old alluvium to the south. Both trenching studies and seismic reflections profiles reveal that, at the VA property, the SMFZ topographic scarp contains a series of steeply dipping to sub-vertical faults that offset late Quaternary sediments (Crook et al., 1983; Pratt et al., 1998; Dolan et al., 2000; Catchings et al., 2001). Radiometric dating of key stratigraphic horizons at the VA site indicate that five to six surface-rupturing events have occurred between approximately 50,000 and 1,000-3,000 years before present (Dolan et al., 2000).

West of the project site, the SMFZ has typically been mapped just north of and parallel to Santa Monica Boulevard, following a series of scarps at the base of late to middle Pleistocene fan surfaces (Dolan et al., 2000; Bedrossian et al., 2012; Olson, 2015). However, recent subsurface explorations and geophysical studies in Century City (e.g., Parsons, 2011) have inferred the presence of a zone of faulting that extends south of Santa Monica Boulevard as well. Parsons (2011) interpreted these faults as active, however, subsequent studies have refuted this interpretation. Kenney (2012; 2013) reviewed the data by Parsons (2011) and subsequent studies and supplemented them with his own geologic and geomorphic analysis. Kenney (2012) interpreted the data to indicate that the primary basal SMFZ actually projects far to the south of the project site, and that faulting along and south of Santa Monica Boulevard should be attributed to the newly designated "Santa Monica Boulevard Fault Zone" (SMBFZ).

Faults associated with the SMBFZ dip steeply to the north and are thought to exhibit right-lateral displacement (Kenney, 2012), although a definitive sense of slip has not been established (Kenney, 2013). These faults are interpreted to be secondary structures related to the primary basal reverse SMFZ that is thought to underlie the Century City area at depth (Kenney, 2012; Lettis, 2013). Based on our review of the recent Century City studies (discussed in detail below), the faults subject to this investigation are part of the SMBFZ.

Both Kenney (2012) and Parsons (2011) indicate there is no direct evidence that SMBFZ faults along and south of Santa Monica Boulevard are active. To date, the only evidence of Holocene activity within the SMFZ and SMBFZ is for faults that are coincident with the topographic scarp north of Santa Monica Boulevard (e.g., Dolan et al., 2000; Geocon, 2014). Updated mapping of the SMBFZ (Figure 8) provided by the City of Beverly Hills, based on mapping by the CGS, locates the fault zone as extending from the beyond the western city boundary trending northeastward and terminating near north Maple Drive and Alden Drive (City of Beverly Hills, 2018). Furthermore, the SMBFZ postulated by Kenney (2012) or just the SMFZ as it is commonly referred to, is approximately 130 feet south of the subject site (see Figure 2 and Figure 8).

Newport-Inglewood Fault Zone

The Newport-Inglewood fault (NIFZ) zone is mapped across the western portion of the Los Angeles Basin and generally trends north to northwest. The faulting is topographically expressed onshore by elevated surfaces which extend from the Newport Mesa in the south to the Beverly Hills area in the north (Earth Consultants International, 2018). As currently mapped, the northern portion of the Newport-Inglewood Fault ends near Pico Boulevard south of the Beverly Hills area (see Figure 2 and Figure 8); however, the location of the northern fault strands has been debated widely in the geological literature.

TOPOGRAPHIC / GEOMORPHIC REVIEW

Existing topography was examined for recognizable scarps or breaks in slope that may suggest the location of faulting through a combined review of previous geomorphic analyses (Earth Consultants International, 2018 and Lettis, 2013 and Dolan et. al., 2000) and historical U.S. Geologic Survey topographic maps (Figures 7 and 9).

Geomorphically, the site is on a degraded Holocene-aged alluvial fan surface that has been incised by north-south to northwest-southeast trending drainages (Figures 4, 5, 6, 7, and 9). Locally, the area gently slopes to the east and southeast which is consistent with natural sedimentary and fluvial processes. To the southwest of the site a prominent southeast-facing escarpment, which has historically been used to locate the Santa Monica fault, is crosscut by multiple northwest trending drainages (e.g., Dolan et al., 2000). This scarp shown in Figure 7 is prominently expressed approximately 3 mi southwest of the site at the Mormon Temple. However, from the Mormon Temple to the site, this scarp becomes less pronounced in the landscape and unrecognizable in the vicinity of the subject site (see Figure 9) where urbanization masks geomorphic features related to faulting.

PREVIOUS INVESTIGATIONS

This firm prepared a Fault Investigation Report for 468 N. Rodeo Drive, located approximately 20 feet directly west of the subject site, dated August 20, 2018 (FGC, 2018). The subsurface investigation consisted of drilling of 4 continuously cored borings and 11 CPT soundings within the alley to the west of the subject site (see Figure 10). The investigation concluded that no faults traverse the subject property and that the underlying sediment exhibited multiple continuous stratigraphic horizons across the entire boring and CPT transect. The Fault Investigation report was reviewed by Roy J. Shlemon and Associates and recommended for approval on August 29th, 2018. The City of Beverly Hills issued a formal approval for the referenced site on August 29th, 2018. Data from the approved report for 468 north Rodeo Drive has been utilized to support the findings and conclusion of this report.

In 2011, Parsons-Brinkerhoff (Parsons) completed a fault study for the METRO Westside Subway Extension for the purpose of locating potential subway station and tunnel alignments. Based on their interpretation of continuous-core borings, cone penetrometer tests (CPTs), and geophysical surveys, Parsons (2011) depicted two zones of faulting in the area: 1) a zone of northeast-southwest trending faults, generally parallel to and south of Santa Monica Boulevard, which they attributed to the SMFZ and 2) a zone of northwest-southeast trending faults coincident with the West Beverly Hills Lineament (WBHL). These faults were considered active based on geomorphic evidence and interpreted association with known active faults. To the west of the project site, Parsons (2011) interpreted the SMFZ to span a width from the topographic scarp north of Santa Monica Boulevard to approximately 150 feet southeast of the boulevard. Parsons (2011) interpreted additional faults immediately to the southeast of this zone, but they were unable to determine whether these faults were active.

Leighton Consultants Inc. (Leighton, 2012) performed a fault investigation at Beverly Hills High School focused on the WBHL faults interpreted by Parsons (2011). Leighton (2012) advanced borings, CPTs, and excavated trenches along Parsons' (2011) borehole and CPT transects. Based on the observation of unbroken Pleistocene age soils across the grounds of the high school, Leighton concluded that the faults identified by Parsons (2011) were not active. Furthermore, Leighton (2012) provided geologic evidence that the WHBL scarp is an erosional feature, rather than a tectonic feature. The California Geological Survey (CGS) approved the Leighton report and agreed that none of the investigated faults were active (CGS, 2013).

Feffer Geological Consulting and Geocon, (2012) prepared a fault report for the 10000 Santa Monica project located immediately north of the BHHS campus and lies immediately adjacent to the MTA Santa Monica station site and between MTA Transects 2 and 4. The 10000 investigation included a trench across the entire site that paralleled the Leighton/MTA Transect 4 and the MTA Transect 2. The trench crossed the location of several fault strands proposed by MTA (Parsons, 2011) associated with their WBHL fault zone as well as the new WBHL fault location. No faults, active or otherwise, were found in the 10000 Santa Monica trench to depths of 30+ feet and ages of >300,000 years.

Kenney GeoScience (Kenney, 2012, 2013) performed geomorphic, structural, and stratigraphic analysis using the available subsurface data from the Metro investigation (Parsons, 2011), the Beverly Hills High School fault investigation (Leighton, 2012), and other data generated from recent fault studies in the Beverly Hills/Century City area (e.g., Feffer-Geocon, 2012; Legg, 2012). Based on these data, Kenney (2012) developed a tectonic and geologic history of the area, which included an evaluation of the location and activity of suspected faults. As discussed above, Kenney (2012, 2013) interpreted the faults along Santa Monica Boulevard as secondary upper plate structures, and referred to them as the SMBFZ. This interpretation is based on the observation that the SMBFZ faults are dominantly strike-slip (possibly right-lateral). Although individual faults within the SMBFZ may exhibit normal or reverse apparent displacement, there is little net vertical displacement across the zone (Kenney, 2013). This contrasts with the observations north of Santa Monica Boulevard, where oblique left-lateral reverse motion has produced net north-side-up displacement across the fault (e.g., Dolan et al., 2000; Geocon, 2014).

Kenney (2012) noted that multiple investigations and reevaluations of the faults first interpreted by Parsons (2011) along Santa Monica Boulevard had not produced any evidence of Holocene-age activity for the SMBFZ. In fact, the most recent data indicates that activity along these faults likely ceased approximately 40,000 to 50,000 years ago (Kenney, 2012). However, Kenney (2013) noted that additional study of these faults is needed in order to confidently assess their activity.

Subsequent to Kenney's (2012, 2013) reinterpretation of the SMFZ and the SMBFZ, Geocon West, Inc. (Geocon, 2013) conducted a fault study for Westfield at the Century City mall. This study was specifically designed to identify the evidence for Holocene activity (or lack thereof) along the SMBFZ south of Santa Monica Boulevard. Geocon's (2013) study consisted of one boring transect along Avenue of the Stars, and another boring transect along Century Park West. Geocon (2013) documented a thick section of unfaulted Pleistocene-age alluvium overlying faulted sections of Lakewood Formation sediments. Based on the apparent continuation of the Pleistocene-age geologic units overlying several faults, Geocon (2013) concluded that no active faults were present at the Westfield site, and no restrictions on future development of the Westfield Site are necessary with respect to potential faulting.

The Los Angeles County Metropolitan Transit Authority prepared a report in 2017 for Transect 9 (Figure 8) of Tunnel Reach 5 located approximately 1500 feet to the southwest of the subject site (MTA, 2017). The following is a summary from FER-259 (Olson, 2018):

"In 2017, AMEC Foster Wheeler performed a supplemental fault investigation for the planned LA Metro Westside Purple Line subway extension (Metro, 2017) to assess a strand of the Santa Monica Fault Zone encountered during the preliminary fault investigation report (Parsons Brinckerhoff, 2011), which trended northeasterly towards a section of the proposed subway alignment. To investigate for potential faulting, a series of continuous core borings and CPTs were drilled along Laskey Drive, turning east at Charleville Boulevard, and continuing north along Spaulding Drive (see Figure 14, locality 15). This was referred to as Transect 9, which continues the numbering sequence from Parsons Brinckerhoff (2011). The new subsurface profile was constructed using data collected from twenty new continuous core borings drilled from 110 to 245 feet deep and 34 CPTs advanced to depths ranging from 61 to 117 feet. Based on the subsurface data the consultants identify Holocene and Pleistocene alluvial units overlying bedrock of the Pleistocene Lakewood and San Pedro Formations." (Olson, 2018, p. 31-32)

"From their observations and interpretations of the subsurface data, AMEC Foster Wheeler identified a significant fault zone at depth between their stations 6+50 and 9+00 (Figure 19) consisting of up to three strands, which dip steeply to the north. The faults exhibited greater than 90 feet of apparent down-to-the-north vertical displacement of the contact between the older alluvium and the Lakewood Formation. From the southern end of the cross section, the depth to the Pleistocene bedrock units consistently increases to the north until they are abruptly truncated and no longer encountered north of the inferred fault zone. AMEC states these faults appear to extend up near the present-day ground surface and offset Holocene sediments dated between approximately 9,100 and 16,500 years old based on radiometric dating of charcoal samples. The locations of the fault traces in the near surface sediments is based on identifying the location where laterally persistent laminated fine-grained "sag deposits" to the north are abruptly missing in adjacent down-gradient borings. It is postulated these fine-grained silts and clays were deposited in depressions or impounded drainages formed by topographic scarps created by surface-rupturing events along faults in this zone. Additional faults were also interpreted between borings north and south of this main zone." (Olson, 2018, p. 32)

As illustrated on Figure 8, MTA Transect 9 is located approximately 0.4 miles southwest of 461 N. Beverly Drive. The interpretation of faulting by MTA (2017) is similar to the previously identified activity of the Santa Monica Fault Zone by MTA, and has been questioned by many consultants. None of the purported active faults conclusively offset Holocene age soil.

Earth Consultants International (ECI), (2018) prepared a Fault Investigation Report for 322 N. Foothill Road in the City of Beverly Hills. The site is located partially within the AP Fault Hazard zone. To

resolve the issue of Holocene time faulting, ECI drilled two continuously cored borings, pushed 6 CPT soundings, and excavated one trench. The consultant estimated the age of subsurface paleosols and observed and documented un-broken pre-Holocene stratigraphy and concluded that the site is not impacted by faulting.

METHODOLOGY

Approach

The subsurface investigation was designed to investigate across the subject site in a northwest-southeast oriented transect within north Beverly Drive, adjacent to the subject site (see Figure 10). Typically, trenching is the preferred method for evaluating the presence or absence of faults because it offers a continuous, direct exposure of the fault zone or near surface stratigraphy. However, this portion of the SMBFZ is difficult to expose in trenches due to the dense urban cover in the vicinity. Because of existing structures, underground utilities, and the extent of data collected from the neighboring site, this fault study consists of a single transect of five 50 foot deep continuously cored borings. Located to the west within the adjacent alleyway (Figure 10), an additional transect of borings and CPT's (Cone Penetrometer Soundings) was utilized to verify the findings of this report. The evaluated transects are located on a 1 inch = 10 foot scale base map, and the subsurface data is plotted on 1 inch = 10 foot scale cross sections for interpretation (see Figures 11 and 12).

Field Exploration

Prior to beginning the subsurface field exploration, work permits were obtained from the City of Beverly Hills. Underground Service Alert (USA) was notified to identify buried utilities in the vicinity of the proposed excavations, and an independent utility locating company was also contracted to verify "no-conflict" areas for the drilling.

Subsurface exploration of the five continuously cored borings within the street adjacent to 461 N. Beverly Drive were completed on August 29, 2018. The borings were excavated to a maximum depth of 50 feet beneath the existing ground surface (Table 1). The boring logs, soil descriptions, and a photographic detail of the cores are included in Appendices A, B respectively.

GEOLOGIC MATERIALS

The continuity of soil (pedogenic) horizons and primary stratigraphic contacts provides data to evaluate the presence or absence of faulting. Five conformable stratigraphic units within the alluvium were encountered in each of the 5 borings (Appendix B). These units consist of basal coarse-grained sediments, fining-upward to fine sand and silt and local clays, typically capped by a buried paleosol.

Holocene Alluvial Fan Deposit 1 and 2 (Qal 1)

The uppermost unit in section B-B' (Figure 11) consists of two weakly developed soil profiles composed of silty sand to silty sand with clay with interbedded gravels that consist of sub angular to sub rounded fragments of slate. We interpret this unit as late Holocene age alluvial deposits (sheet flows), and designate it as Qal1. An approximately 7 to 8 foot layer of artificial fill overlies this unit across the entire study area. Unit Qal1 includes both a surficial soil with a basal scour deposit and a weakly-developed and truncated buried soil for each sheet flow within this alluvial deposit.

Holocene Alluvial Fan Deposit 2 (Qal2)

The lowest Holocene unit in section B-B' (Figure 11) is composed of sandy clay to clayey sand with basal gravels. The unit is generally massive with fine to medium grained sand and sub rounded fragments of slate. Soil color hues are in the 7.5YR range (brown). We interpret this unit as a latest Pleistocene alluvial deposit (axial valley deposit), but conservatively designate it as Qal2. A scour deposit overlies and truncates this unit across the entire study area. Qal2 includes alluvial deposits with a diffuse (cumulic), and weakly- to moderately well-developed argillic soil.

Pleistocene Alluvial Fan Deposit 3 (Qoa 1)

The interpreted uppermost Pleistocene unit in section B-B' (Figure 11) is an organic-rich top soil remnant over a gravelly clayey sand to sandy clay. Gravels are sub angular and highly weathered fragments of slate. Illuvial clay film hues are in the 5YR range (reddish brown). We interpret this unit as a Pleistocene alluvial fan deposit (debris flow), and designate it as Qoa1. A scour deposit overlies this unit across the entire study area. Unit Qoa1 includes alluvial deposits that contain a well-developed, well oxidized, and truncated argillic soil. The contact between Qal2 and Qoa1 occurs at a depth of approximately 25 feet across the entire study area (See Appendix B; Continuous Core Photographic Detail).

Pleistocene Alluvial Fan Deposit 4 (Qoa 2)

Beneath unit Qoa1, we encountered a unit composed of silty sand with gravel to sandy clay. The interbedded gravels within this unit are composed of rounded slate and sandstone. Illuvial clay film hues are in the 7.5YR range (brown). This unit is interpreted as a highly weathered late Pleistocene braided stream channel deposit that contains two highly truncated, moderately well-developed soil remnants designated as unit Qoa2. The contact between Qoa1 and Qoa2 is at approximately 32 feet across the entire study area (See Appendix B; Continuous Core Photographic Detail). The Qoa2 basal scour is incised across the center portion of Transect B where the underlying unit Qoa3 has been eroded.

Pleistocene Alluvial Fan Deposit 5 (Qoa 3)

Beneath unit Qoa2, we encountered a unit composed of sandy clay to silty sand with interbedded gravel that is composed of highly weathered and sub rounded to sub angular slate and sandstone. Soil color clay film hues are in the 7.5YR range (brown). This unit is interpreted as a strongly weathered late Pleistocene braided stream channel deposit that contains a truncated, stacked, and well developed soil remnant designated as Qoa3. Unit Qoa3 is the oldest unit encountered during the subsurface exploration. The contact between Qoa2 and Qoa3 occurs at a depth of approximately 42 feet across the entire study area (See Appendix B; Continuous Core Photographic Detail).

Soil Development/Soil Profiles

The borings (see Figures 11, 12, and Appendix A) are located on a graded (or stripped) and artificially filled surface that is geomorphically inactive. The soil profile in each boring at depth consists of a truncated sequence of multiple stacked and truncated soils (Qoa1, Qoa2, and Qoa3). The entire section in this locality is capped by 6 to 7 feet of artificial fill. Parent materials for these soils originate north of the site in the Santa Monica mountains and primarily consist of slate-rich debris flow and or stream terrace deposits that have emanated from drainages to the north of the site (primarily Benedict and

Coldwater Canyons) With the exception of boring 3 (Figure 11), the soil profiles contain a surface deposit that overlies 4 buried soils to depths of approximately 50 feet below the ground surface. This stratigraphic section occurs across the entire area investigated. The individual soil profiles and relative age estimates are summarized below.

The uppermost soils on site (Qal1) consists of a pair of highly truncated soil remnants that consists of two weakly developed cambic diagnostic subsurface horizon (Bw – BC – 2Bw). The deposit consists of two nested crudely stratified fining upwards sequences. This soil unit is characterized by a coarse-grained deposit with few to common clay stains on ped faces and has an estimated relative age of 4 - 8 ka (Appendix B).

The uppermost Pleistocene soil on site (Qal2) is a diffuse and cumulic soil remnant that consists of a thick and weakly developed argillic diagnostic subsurface horizon (3Bt – 3BC). The deposit consists of a crudely stratified fining upwards to massive deposit. This soil unit is characterized by basal gravel and fine-grained deposit with 7.5YR hues and common thin clay films on ped faces and coating gravel. Qal2 has an estimated relative age of 8 – 16 ka (Appendix B).

A conservative pick for the top of Pleistocene soil Qoa1 is the remnant of a strongly developed Alfisol soil. This is a truncated soil that consists of a relic top soil horizon over two moderately well-developed argillic diagnostic subsurface horizons (4ABb - 4Bt1 – 4Bt2). The deposit is a fining upwards sequence and most likely represents the distal portion of a debris flow deposit. This soil unit is characterized by a highly weathered, well oxidized, and gravel-rich and fine-grained deposit with 5 YR hues on common thin and common moderately thick clay films on ped faces and coating gravel. This soil unit has a relative age estimate of 21 - 46 ka (Appendix B).

The third buried soil profile on site (Qoa2) is a truncated and older cumulic soil remnant that consists of a thick and moderately well-developed argillic soil profile (5Btb – 5BC). The deposit consists of a crudely stratified fining upwards sequence. This soil profile is characterized by a fine-grained deposit with 7.5YR hues on common thin and few to common moderately thick clay films on ped faces. This deposit locally scours out the underlying unit Qoa3 across the center portion of Transect B and has an estimated relative age of 29 – 59 ka (Appendix B).

The oldest and lowest buried soil profile on site (Qoa3) is a truncated and stacked soil remnant that consists of two moderately well-developed punctuated argillic soil profiles (5Btb – 5BC - 6Bt – 6BC). The deposit consists of two crudely stratified fining upwards sequences. This soil unit is characterized by a stratified deposit with 7.5 to 10YR hues on common thin and few to common moderately thick clay films. Qoa3 and the entire stratigraphic section under study has an estimated relative age of 46 – 94 ka (Appendix B).

In sum, the entire stratigraphic sequence examined at the project site is estimated to be greater than 46 ka in age. The stratigraphic units encountered provide visually and texturally distinct, mappable contacts that are overlapping across the project site area and across the transect of borings. No features or structural characteristic of faulting, such as shear zones or high angle contacts between units were observed. The contacts between Qoa2 and Qoa3 undulate and slope gently south as expected by normal sedimentary processes.

EVIDENCE FOR THE ABSENCE OF FAULTING

Several subsurface geologic relationships at the 461 N. Beverly Drive provide direct evidence that preclude Holocene faulting. When these relationships are considered together, there is compelling evidence for the absence of faulting beneath the subject site. The primary lines of evidence that support the interpretation that no faults traverse the site are:

• **Continuous, unfaulted soil horizons and primary stratigraphy across the site:** The transects of borings and CPTs conducted to the east and west of the subject site exhibits multiple continuous and unbroken stratigraphic horizons. All deposits encountered correlate across the project site. If faults with a vertical slip component of slip were active in this area, they would have produced recognizable, vertical separations or displacements of the Pleistocene units. Similarly, active strike-slip faulting would have produced an apparent dip-slip component or truncation of units due to the juxtaposition of different Pleistocene strata or pedogenic horizons.

• **No faults were encountered in the subsurface exploration:** No features characteristic of faulting, such as shear zones or high angle contacts between units were observed within the collected continuously cored samples. Though not compelling enough to preclude the presence of faulting, it is consistent with and corroborates other lines of evidence.

• **No irregularities or topographic features indicative of faulting were observed:** Geomorphically, the project site exists on an incised and degraded Holocene-aged alluvial fan deposit. Mapping by Campbell at al., (2014), Yerkes and Campbell (2005), Dibblee and Ehrenspeck (1991) and Hoots and Kew (1931) confirm this and is further supported by the findings of this report. Moreover, the site lies north of the eastward projection of the existing Santa Monica Fault Zone, and no escarpments are apparent on historic topographic maps.
• **Supporting evidence from the neighboring investigation:** The data collected and conclusions reached within the approved accompanying report reinforce the conclusions and overall findings of this report (FGC, 2018).

CONCLUSIONS AND RECOMMENDATIONS

The fault investigation for 461 N. Beverly Drive documents continuous unbroken, pre-Holocene sediments across the entire site. The observed continuous and un-broken stratigraphy implies that no active faults traverse the site. The project site is not exposed to the hazard of surface fault rupture which would impact or limit future development of the site.

While the area explored in our study is not likely subject to surface faulting, a future earthquake on the Santa Monica Boulevard, Santa Monica, Hollywood, or Newport - Inglewood fault zones will likely produce very strong, near-field ground motions at the project site that must be assessed by an appropriate geotechnical evaluation of the site.

LIMITATIONS

The conclusions and recommendations presented herein are the results of an inherently limited scope. Specifically, the scope of services consisted of an assessment of whether or not active faults are present within the area explored at the site. The conclusions and recommendations contained in this report are professional opinions derived in accordance with current standards of professional practice. No warranty is expressed or implied.

This report has been prepared for the exclusive use of 461 N. Beverly Drive LLC and applies only to potential future development at the site located at 461 N. Beverly Drive in the City of Beverly Hills, California. In the event that significant changes in the development planning should occur, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed by Feffer Geological, and the conclusions and recommendations of this report are verified in writing.

EXPLANATION

Geomorphic surfaces which include active channels (Qa), active alluvial fan deposits (Qf), young alluvial fan deposits (Qyf), and old alluvial fan deposits (Qof). (Yerkes and Campbell, 2005)

Sedimentary Deposits

Qal — Alluvium: Coarse unconsolidated deposits in valleys and stream channels (Holocene)

Qpt — Alluvial plain, stream, and marine terrace deposits (Upper Pleistocene)

Sedimentary Rocks

Qm — Marine deposits: Marine sandstone, conglomerate, and clay shale (Upper Pleistocene).

Tml — Modelo Formation: Marine; lower member; consisting of interbedded, hard, platy siliceous shale and softer brown shale (Miocene).

Tmls — Modelo Formation: Marine; lower member; consisting of lenticular beds of coarse grained sandstone (Miocene).

Metamorphic Rocks

smss — Santa Monica Slate: Dark gray to blue-black slate (Triassic).

smsp — Santa Monica Slate: Dark gray mica schist and phyllite cut by white quartz veins (Triassic).

Igneous Rocks

g — Granite and granodorite (Jurrasic).

APPENDIX 'A'

Boring Logs

LOG OF EXPLORATORY BORING

Job Number: 2196-85
Project: 461 N. Beverly Drive

Boring No: B-1
Boring Location: See Site Map

Date Performed: 8/27/18

Drill Type: 8” Hollow Stem / Continuous Core

Depth in Feet	Run #	Recovery Ratio	Recovery Graphic	Bedrock/ Soil Description	Color	Density	Strat/ Soil Unit
0	1			**0-8’ Fill:** Silty sand with gravel (Upper 7’ hand augered due to utilities)	Red Brown	Friable, Hard	Af
5	2	3/3		**Holocene Alluvium (Qal 1)** **8-11’:** Silty sand, massive, slight organics, slightly sticky, non to slightly plastic, coarse grained, few fine gravels, common clay stains, slightly moist	10 YR 5/3 (Brown)	Sl. Hard, Friable	Bw
10	3	2.9 /5		**11-12.5’:** Silty sand with gravel, massive, slightly oxidized, non to slightly sticky, non plastic, medium to coarse grained sand with common fine and medium sandstone gravel	10 YR 6/3 (Pale Brown)	Soft, Friable	BC
				12.5-15’: Silty sand with clay, massive, slightly oxidized, slightly to moderately sticky, slightly plastic, medium grained, moderately well sorted, few thin clay films	10 YR 6/4 (Light Yellow Brown)	Hard, Friable	2Bw
15	4	4.8 /5		**Holocene Alluvium (Qal 2)** **15-18.6’:** Sandy clay/ clayey silt with sand, moist, moderately to very sticky, very plastic, fine to medium grained, common thin clay films, **18.6-19.8’:** Cumulic soil, fine gravels, slightly oxidized, few fine $CaCO_3$ nodules	7.5 YR 5/3 (Lt. Brown to Brown)	Hard to Very Hard, Firm	3Bt Cumulic
20							

LOG OF EXPLORATORY BORING

Job Number: 2196-85
Project: 461 N. Beverly Drive

Boring No: B-1
Boring Location: See Site Map

Date Performed: 8/27/18

Drill Type: 8” Hollow Stem / Continuous Core

Depth in Feet	Run #	Recovery Ratio	Recovery Graphic	Bedrock/ Soil Description	Color	Density	Strat/ Soil Unit
20				**15-24’:** Sandy clay/ clayey silt with sand, moist, moderately to very sticky, very plastic, fine to medium grained, common thin clay films	7.5 YR 5/3 (Lt. Brown to Brown)	Hard to Very Hard, Firm	3Bt
	5	4.6 /5					
				24-25.5’: Silty sand with gravel, slightly well oxidized, massive, slightly sticky, slightly plastic, coarse sand with scattered angular to sub rounded gravels	7.5 YR 5/4 (Brown)	Hard, Friable	3BC
25				**25.5-27.7’:** Clayey sand, fine to medium grained, slightly oxidized, scattered gravels	7.5 YR 4/4 (Brown)	Hard, Firm	4Bt
	6	4.2 /5		**Pleistocene Older Alluvium (Qoa 1)** **27.7-28.4’:** Clayey sand, fine to medium grained, moderately well oxidized, scattered angular gravels, slightly moist, common thin clay films	5 YR 4/3 (Reddish Brown)	Slightly Hard	5AB
				28.4-33’: Sandy clay, massive, very sticky, very plastic, coarse sand with abundant angular weathered slate fragments, oxidized, CaCO3 nodules, slightly moist, common thin and moderately thick clay films	5 YR 5/4 (Reddish Brown)	Very Hard, Friable	5Bt1
30	7	5/5					
				33-34.3’: Silty sand with clay and gravel, massive, slightly well oxidized, slightly sticky, slightly plastic, common fine and medium sub angular gravel, locally faint gleying, thin clay films	7.5 YR 5/4 (Brown)	Hard, Friable	5Bt2
				Pleistocene Older Alluvium (Qoa 2) **34.3-35’:** Clayey silt/sand, fewer gravels, fine to medium grained, oxidized, slightly moist, very sticky, very plastic, common thin and thick clay films	7.5 YR 4/4 (Brown)	Very Hard, Firm	6Bt1
35				**35-36.5’:** Clayey sand with abundant angular gravels, oxidized, slightly moist, medium to coarse grains, very sticky to very plastic, scattered angular to sub rounded gravels, mottling localized yellow to gray and brown, slightly moist	7.5 YR 4/4 (Brown)	Very Hard, Friable	6Bt2
	8	5/5					
40							

LOG OF EXPLORATORY BORING

Job Number: 2196-85
Project: 461 N. Beverly Drive

Boring No: B-1
Boring Location: See Site Map

Date Performed: 8/27/18

Drill Type: 8” Hollow Stem / Continuous Core

Depth in Feet	Run #	Recovery Ratio	Recovery Graphic	Bedrock/ Soil Description	Color	Density	Strat/ Soil Unit
40				**35-43.1’:** Clayey sand with abundant angular gravels, oxidized, slightly moist, medium to coarse grains, very sticky to very plastic, scattered angular to sub rounded gravels, mottling localized yellow to gray and brown, slightly moist	7.5 YR 4/4 (Brown)	Very Hard, Friable	6Bt2
	9	5/5					
				43.1-48.4’: Silty sand with clay and gravel, coarse sand with gravles, angular to sub angular, oxidized, weakly stratified, slightly dry, granitic and slate gravels, slightly sticky, slightly plastic, crude laminations ~1’ thick spaced 1.5-2” apart	7.5 YR 5/4 (Brown)	Hard, Friable	6BC lam
45							
	10	4/5					
				Pleistocene Older Alluvium (Qoa 3) **48.4-49’:** Sandy clay with gravel, well oxidized, moist, very sticky, very plastic, medium grained, common moderately thick and thin clay films	5 YR 4/3 (Reddish Brown)	Very Hard, Dense	7Bt
50				End at 50, Fill to 7’, No Water, No Caving			
55							
60							

LOG OF EXPLORATORY BORING

Job Number: 2196-85
Project: 461 N. Beverly Drive

Boring No: B-2
Boring Location: See Site Map

Date Performed: 8/28/18

Drill Type: 8” Hollow Stem / Continuous Core

Depth in Feet	Run #	Recovery Ratio	Recovery Graphic	Bedrock/ Soil Description	Color	Density	Strat/ Soil Unit
0	1			**0-7.8’:** Sandy silt with clay, few scattered pebbles, roots, slightly moist	Brown	Dense	Af
5	2	3.9 /5		**Holocene Alluvium (Qal 1)** **7.8-10’:** Silty sand with gravel, medium to coarse grained, slightly sticky, non plastic, massive, few clay stains, slightly oxidized	10YR 5/3 (Brown)	Slightly Hard	Bw
10				**10-10.5’:** Silty sand with gravel, coarse sand, common scattered gravels, sub angular to sub rounded, non sticky, non plastic	10 YR 6/3 (Pale Light Brown)	Soft, Very Friable	BC
	3	4.3 /5		**10.5-15’:** Silty sand, massive, slight organics, slightly sticky, slightly massive, few medium to coarse grained gravels, slightly moist, CaCO3, root casts, common clay stains	10 YR 5/3 (Brown)	Slightly Hard, Friable	2Bw
15	4	5/5		**Holocene Alluvium (Qal 2)** **15’:** Silty sand with clay, massive, scattered weathered sandstone and slate gravel, medium to coarse grained, slightly moist, slightly well oxidized, clay lenses, moderately sticky, moderately plastic, few to common thin clay films	10 YR 5/4 (Yellow Brown)	Hard, Very Hard, Friable	3Bt
20							

LOG OF EXPLORATORY BORING

Job Number: 2196-85
Project: 461 N. Beverly Drive

Boring No: B-2
Boring Location: See Site Map

Date Performed: 8/28/18

Drill Type: 8” Hollow Stem / Continuous Core

Depth in Feet	Run #	Recovery Ratio	Recovery Graphic	Bedrock/ Soil Description	Color	Density	Strat/ Soil Unit
20				**Holocene Alluvium (Qal 2)** **15-24’:** Silty sand with clay, massive, scattered weathered sandstone and slate gravel, medium to coarse grained, slightly moist, slightly well oxidized, clay lenses, moderately sticky, moderately plastic, few to common thin clay films **22.4’:** Becomes coarse sand with clay, scattered angular slate gravels, slightly moist	10 YR 5/4 (Yellow Brown)	Hard, Very Hard, Friable	3Bt
	5	4.3 /5		**24-26.6’:** Silty sand, massive, non to slightly sticky, non plastic, medium to coarse sand with rounded, to sub angular gravels and pebbles, oxidized, fining upward, poorly sorted	10 YR 5/6 (Yellow Brown)	Slightly Hard to Soft, Friable	3BC/C Scour
25				**Pleistocene Older Alluvium (Qoa 1)** **26.6-27’:** Sandy clay with silt, medium sand, very plastic, massive, very sticky, moderately well oxidized	5 YR 4/3 (Reddish Brown)	Hard to Very Hard, Firm	4AB
	6	3.4 /5		**27-31.2’:** Sandy clay, massive, very sticky, very plastic, common fine to moderately thick clay films, coarse sand with few gravels, CaCO3	5 YR 5/4 (Reddish Brown)	Friable, Very Hard	4Bt
30				**31.2-32.7’:** Silty sand with clay, coarse sand with clay, few slate gravels, slightly sticky, slightly plastic, common fine clay films	5 Yr 4/4 (Mottled Gray, Brown)	Friable, Slightly Hard	4Bt2
	7	4.9 /5		**Pleistocene Older Alluvium (Qoa 2)** **32.7’:** Clayey sand to sandy clay, massive, moderately well oxidized, very sticky, very plastic, medium to coarse grained, common thin and few to common moderately thick clay films **39.6’:** Gravelly, slightly oxidized, slightly moist	7.5 YR 5/4-5/6 (Strong Brown)	Hard to Very Hard	5Bt1 Cumulic

Subject: Soil Stratigraphy Study And Relative Age Estimates For A Fault Rupture Hazard Investigation At 461 North Beverly Drive, Beverly Hills, CA.

Dear Mr. Feffer:

I am pleased to present to you this soil stratigraphic study and relative-age determinations to be used with your fault rupture hazard assessment of the proposed development located at 461 North Beverly Drive in the City of Beverly Hills, California.

Feffer Geological retained John Helms CEG to describe and assist in correlations of the soil stratigraphy from continuously cored borehole samples and to assign relative age dates for the deposits identified across the site. The continuously cored bore hole samples were obtained from a single transect of borings, transect B. One borehole (B-3) was completely described from transect B, and four additional boreholes (B-1, B-2, B-4, and B-5) from transect B have been reviewed and summarized. The detailed soil descriptions are used to calculate various soil development indices (or SDIs). The SDI values were then compared to the SDI values from similar described soils with known ages to estimate age ranges for the soils understudy.

The attached report classifies the described soil profiles, identifies stratigraphic relationships, defines soil chronosequences, and estimates the relative ages for the one soil profile described in detail. Calculated SDI's show strong correlations to the SDI values of other published, described, and dated soil profiles with similar parent materials.

Age estimates range from 29 to 59 ka for the stratigraphic section studied along transect B in boring B-3. There are several distinctive buried soil units that can be correlated across the entire length of Transect B and correlated to adjacent Transect A. One distinctive buried soil (buried soil 3, Qoa1) which can be correlated across the entire length of Transect B, is a well preserved and well oxidized argillic soil profile that ranges in relative age from 21 – 46 ka. Please see Table 6 in the attached report for a summary listing of all of the determined relative ages at the study site.

Thank you for this opportunity to be of service. Should you have any questions or require additional information, please do not hesitate to contact me.

Sincerely,

SOIL STRATIGRAPHY STUDY AND RELATIVE AGE ESTIMATES FOR A FAULT RUPTURE HAZARD STUDY FOR A PROPOSED DEVELOPMENT AT 461 N. BEVERLY DRIVE, BEVERLY HILLS, CALIFORNIA.

INTRODUCTION

Due to a repeating sequence of stratigraphy across the entire transect of borings from the subject site (Transect B) and an adjacent site to the west (Transect A), one soil profile has been studied for geomorphic characteristics and relative degrees of weathering to estimate deposit relative-age. Boring B-3 was selected for this process due to its position being located near the center of the transect of borings, and also because this boring contains a deep channel scour and would provide a minimum age for the alluvial section under study. The relative age estimate is based on index value comparisons with other published and dated soil profile descriptions. The comparative soils are from areas with a similar climate and similar parent material to this study area. The estimated relative ages in this report will be used by Feffer Geological, Inc. to assess the recency and recurrence of faulting across the study area. Alluvial units are assessed chronostratigraphically across five borehole locations from a single transect of borings that shadow the area proposed for development. In this study, the soil stratigraphy is defined with soil field description data, and no laboratory data. This study identifies the soil stratigraphy across the area under study and estimates the relative age of one soil profile. Continuously cored and sampled borehole B-3 has been described in detail, and four additional continuously cored and sampled boreholes (B-1, B-2, B-4, and B-5) have been summarized or briefly described along Transect B. Transect B is located along a graded and stripped alluvial surface.

A pedogenic soil can be defined as a natural body that consists of horizons of organic and/or mineral constituents which differ from its parent material in some way (Birkland, 1984). A chronosequence is a group of soils for which all soil forming factors (such as topography, parent material, vegetation, and climate) except time is relatively equal (Jenny, 1941). Past geologic studies in the coastal region of southern California provide age constraints for several deposits and geomorphic surfaces ranging in age from middle Pleistocene to recent (McFadden, 1982; Rockwell, 1988; and William Lettis and Associates, Inc., 1998). Often it has proven difficult to date older deposits due to changes in past climatic regimes. Studies on the impacts of glacial to interglacial climatic changes on soil development in specific regions (McFadden, 1982; Birkland, 1984; McFadden, 1988) indicate that soil development has occurred throughout the Quaternary.

This study is focusses on a section of alluvium derived from the southern range front of the Santa Monica Mountains, which is within the Transverse Ranges Geomorphic Province. A series of stacked and truncated argillic soil subsurface horizons within all of the stratigraphic sections studied indicates that the alluvial stratigraphic section across the entire study area correlates well and is significantly old. Age estimates range from 29 to 59 ka (Qoa2) for the stratigraphic section studied near the center portion of transect B in boring B-2. To the west, age estimates range from 46 to 94 ka (Qoa3) for the stratigraphic section studied near the center portion of transect A in boring CB-1 illustrated on the site map provided with the main fault hazard report.

Soil relative age estimates have broad ranges, dependent upon the pool of comparative data used. Most of the buried soils across the study area fall into the Alfisol soil order (Soil Conservation Service, 1999). The soil profile that is described in detail is from boring B-3 in

Transect B and summary descriptions are given for borings B-1, B-2, B-4, and B-5 from Transect B. Boring locations are shown on the site map that is provided with the main fault rupture hazard report.

MATERIALS AND METHODS

Continuous core samples collected from boring B-3 by Feffer Geological, Inc. were described in detail as part of this study. The soils were described using guidelines set by the Soil Survey Staff (1991 and 1999). Specific soil properties such as soil structure and soil horizon boundaries could not be accurately described from the core sample exposures. These soil qualifiers have not been described and do not factor into the estimated soil relative age comparisons.

Soil profile field description values quantify soil properties that are used to develop a soil development index (SDI) value as outlined by Harden (1982). Points are assigned to descriptive data for each of several observed soil properties, such as dry color, moist color, texture, dry and wet consistence, and clay film content, for each soil horizon in a soil profile relative to the soil horizon's thickness, and normalized to a common depth. The maturity of a soil profile is gauged through data collected from active wash deposits (or raw alluvium).

Table 1.1 lists the detailed soil description for the studied boring in longhand format. Table 1.2 lists the soil description using soil conservation service notation and shows the SDI calculations. Table 1.2 shows the calculated SDI values, the soil profile description, and the normalization values for raw alluvium. SDI values are calculated by assigning point values to each described soil properties. The points are summed for each soil horizon and divided by the total number of descriptive properties used. This equals the mean horizon index value (HI). HI values are multiplied by the corresponding soil horizon thickness. The SDI value equals the sum of the thickness normalized horizon indices. The maximum horizon index (MHI) is the value of the horizon with the largest summed descriptive value. MHI is independent of horizon thickness, and is usually the diagnostic subsurface soil horizon for most soil profiles. Tables 1.2 lists all of the determined HI, SDI, and MHI values for the soil profile under study.

SDI and MHI values have shown significant correlations to soil age in many past studies (Harden, 1982; Rockwell *et al.*, 1983; Reheis *et al*., 1989; Rockwell *et al.*, 1994). The soils described in this study are compared to soils described and dated by McFadden (1982 and 1988) in San Bernardino County near Mission Creek, by Rockwell (1983) in the Ventura River basin, and by William Lettis and Associates, Inc. (1998) in West Hollywood. SDI values have all calibrated to a common depth of 3 feet.

The changes in the subsurface pedogenic properties of the Alfisol soil order allows for relative age determinations by emphasizing specific soil properties (such as color and clay film content) that are most diagnostic. Soil properties that express themselves well through time are most often used in the assessment of soil relative ages through a specific soil property index such as the color or clay film index. The color index (Rockwell *et al.,* 1985, 1988) is used to quantify observed colors (in Munsell notation) of each profile in order to compare relative degrees of reddening. The color index is simply the summation of an entire profile's horizon index values for dry colors. The clay film index (Rockwell *et al.,* 1985, 1988) is used to quantify field descriptions of this soil property in order to compare relative profile maturity. The clay film index is simply the summation of an entire soil profile's horizon index

values for clay films. MHI is a comparison of a soil pedons master (or diagnostic) subsurface horizon (typically an argillic or cambic horizon). Independent of horizon thickness, the MHI directly compares the properties of the soil profiles strongest soil horizon.

SOIL RELATIVE AGE METHODS

Soil relative ages are calculated and compared independently for each soil profile described. The soil profile described for this study is located across several buried alluvial surfaces that differ in relative age, facies of deposition, and degrees of preservation. A series of stacked, buried, and truncated hard, clayey soils with illuvial clays characterize a majority of the soil profiles described on this project site.

The soil profile described in detail has a surface age that is implied by estimating the time of inception for the exposed surficial soil. The soil profile described in detail for this study also contains a series of stacked and / or buried soil profiles. In this case, deposit age assessments are obtained by identifying and isolating the different parent materials (or deposits). Then comparing a set of abridged calculated indices to an additional suite of similar soils that have been radiometrically dated yields the equivalent to a buried surface age estimate. Such burial relationships are common along the southern Santa Monica Mountains range front; especially where soils that have developed into alluvial fan deposits which commonly bury or locally truncate older soils that have developed previously in older alluvial deposits. A cumulic soil profile estimated age can assess landform age, and has potential to assess rates of erosion, rates of landform evolution, and rates of tectonic activity across the study area.

The described soil profiles have an SDI value, which is used to estimate the soil relative age. Cumulic relative age estimates for a stacked or buried soil profiles are specifically referred to as “deposit ages”. The relative age estimate for the surface profile or modern soil is referred to as the “surface age”. All of the relative age estimates given are considered minimum ages given that an unknown amount of erosion has occurred after the formation of and before the burial of each truncated surface and buried soil studied.

SOIL SUMMARY DESCRIPTIONS

Soil summary descriptions were generated for borings B-1, B-2, B-4, and B-5 in this study. The summary descriptions record diagnostic pedogenic features for each soil horizon identified. This was done in order to assist with establishing stratigraphic correlations across the site. Relative age estimates were not generated for any of the listed soil summary descriptions. The soil summary descriptions are listed in Tables 2.1, 2.2, 2.3, and 2.4.

DISCUSSION AND RESULTS

This section contains a brief write up for the continuously cored boring described in detail with designated tables for the soil profile. The attached Table 1.1 presents the soil profile description in longhand format. Table 1.2 presents the results of the calculated SDI values. Table 3 is a summary of the soil relative age estimates for the soil profile under study. Table 4 is a compilation of the comparative data in a format that compares to the data generated for this study. Table 5 is a soil abbreviation key to be used in conjunction with the SDI calculation sheets. Table 6 lists the relative ages for each designated stratigraphic unit that is shown on the geologic cross section in the fault rupture hazard report.

Soil descriptions, SDI calculations, and relative age determinations follow for the soil profile studied.

TRANSECT B BORINGS

One soil profile was described in detail out of core samples from Transect B in boring B-3. Age estimates range from 29 to 59 ka for the alluvial section studied.

Boring B-3

The core samples from Transect B, Boring B-3 were reviewed at the project site on 9/11/2018 and on 9/12/2018. This boring is located near the center of Transect B, and this alluvial section is characterized by a sequence of weakly developed surficial soils over a series of truncated argillic soils interbedded with massive and crudely stratified scour deposits. See Table 1.1 for a complete soil description of the continuously sampled boring, Table 1.2 for the SDI index value calculations and relative age estimates, and Feffer Geological Inc.'s cross section and geologic map for both the borehole and transect location.

The surface deposit (Qal1) in boring B-3 consists of a series of two weakly-developed soils that are characterized by severely truncated cambic horizons and each an estimated relative age of 2 – 4 ka. The second buried soil (Buried Soil 2 / Qal2) can be correlated across the entire length of Transect B is a truncated, thick (cumulic), and diffuse weakly to moderately well-developed Alfisol soil with an estimated relative age value of 8 – 16 ka. This correlates well with the Qal2 cumulic soil identified in Transect A to the west. The third buried soil in this alluvial sequence is a conservative top of the Pleistocene in this stratigraphic section. This marker bed (Qoa1) can be correlated across the entire area investigated (Transects A and B) and is a truncated, well oxidized, and moderately well-developed Alfisol soil that has an estimated relative age value of 21 – 46 ka. The forth buried soil (Buried Soil 4 / Qoa2) also can be correlated across the entire length of Transect B is a truncated, massive, weakly to moderately well-developed Alfisol soil with an estimated relative age value of 29 – 59 ka. The fifth buried soil (Qoa3) in Transect A), has an estimated age that ranges from 46 – 94 ka. This lowest buried soil in this alluvial sequence can be correlated across a majority of the area investigated and is scoured out across the center of Transect B in Boring B-3.

Differences in the number of soils, depths of burial and unit thicknesses due to differential erosion / truncation laterally along Transect B may cause minor variances in relative age estimates between the individual borings. In order to control for this additional soil summary descriptions were generated across this transect which assesses the same buried surfaces at differing depths of burial and in differing states of preservation.

BORING SUMMARY DESCRIPTIONS

Soil summary descriptions generated for borings B-1, B-2, B-4, and B-5 are listed in Tables 2.1, 2.2, 2.3, and 2.4. Relative age estimates were not generated for the soil summary descriptions. The summary descriptions were generated to assist with establishing stratigraphic correlations across the site. The observations for the soil summary descriptions along Transect B were made on 9/11/2018. All of the borings along Transect B appear to contain a thin veneer of artificial fill that is in contact with a sequence of Holocene-aged soils that overly a sequence of Pleistocene-aged truncated argillic soils and nested sour deposits. Several of the Pleistocene-aged truncated and /stacked buried soils are maker units which

can be correlated across the area investigated and across to the adjacent Transect A to the west.

CONCLUSIONS

A majority of the buried soils observed across the study area are Alfisols that have developed in alluvial environments. All of the soil profiles across Transect A consist of a series of stacked, truncated, and buried argillic soil horizons. The truncated and buried soils with argillic sub surface soil horizons are weakly and moderately well developed. The Alfisol soils typically have 7.5YR to 5YR color hues with a modest amounts of secondary (pedogenic) clay in a series of argillic (Bt) diagnostic subsurface horizons.

The surface soil profile across the area investigated is laterally continuous across both Transects A and B. Lateral variability observed in the buried soils across the site is due to localized erosion, scouring, infilling, and stacking of these materials in an alluvial environment. In this sedimentological environment surfaces that have been stable long enough to form a robust soil, can suddenly be buried by a new deposit, or scoured out (truncated) and possibly in-filled with younger material. The amount of erosion that has occurred with each truncated soil under study is unknown. Thus the relative age estimates given in this study are minimum ages.

These soil relative age determinations are consistent with the general geologic and pedogenic observations of soils in southern California. Strongly developed, well horizonated, thick, and oxidized Alfisols can be as much as 200 ka in age. Erosion tends to act as a rejuvenating aspect in soil development, by decreasing the strength of the soil development properties and the consequent age estimates are younger. In that past magnitudes and rates of erosion are difficult to assess, the soil relative age estimates are utilized as minimum ages.

The soils observed along Transect B are Holocene and Pleistocene in age. The buried and stacked soils display soil horizons that have weak to moderately strong argillic horizon development at depth. Age estimates range from 46 to 94 ka for the entire alluvial stratigraphic section studied along transect A. Age estimates range from 29 to 59 ka for the truncated alluvial stratigraphic section studied along transect B. The third buried soil (buried soil 3) (Qoa1) in Transect B and the second buried soil (buried soil 2) (Qoa1) in Transect A can be correlated across the entire area investigated is a truncated, well oxidized, and moderately well-developed argillic soil profile that ranges in relative age from 21 – 46 ka along the length of Transect B. The lowermost buried soil (buried soil 4) (Qoa2) that can be correlated across the entire area investigated is a truncated, stacked, and weakly to moderately well-developed argillic soil profile that ranges in relative age from 29 – 59 ka along the length of Transect B.

LIMITATIONS

The conclusions and recommendations presented herein are the results of an inherently limited scope. Specifically, the scope of services consisted of an assessment of relative age from core samples and did not participate in any drilling activities at the site. The conclusions and recommendations contained in this report are professional opinions derived in accordance with current standards of professional practice. No warranty is expressed or implied.

This report has been prepared for the exclusive use of Feffer Geological, Inc. and applies only to the Fault Rupture Hazard Study located at 461 N. Beverly Drive. In the event that significant changes in the interpretations of this study are made, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed by John Helms, CEG, and the conclusions and recommendations of this report are verified in writing.

CPT Reporting

8/3/18

Feffer Geological Consulting
Attn: Alexander Greene

Subject: CPT Site Investigation
468 Rodeo Drive
Beverly Hills, California
GREGG Project Number: 180590SH

Dear Mr. Greene:

The following report presents the results of GREGG Drilling & Testing's Cone Penetration Test investigation for the above referenced site. The following testing services were performed:

1	Cone Penetration Tests	(CPTU)	☒
2	Pore Pressure Dissipation Tests	(PPD)	☐
3	Seismic Cone Penetration Tests	(SCPTU)	☐
4	UVOST Laser Induced Fluorescence	(UVOST)	☐
5	Groundwater Sampling	(GWS)	☐
6	Soil Sampling	(SS)	☐
7	Vapor Sampling	(VS)	☐
8	Pressuremeter Testing	(PMT)	☐
9	Vane Shear Testing	(VST)	☐
10	Dilatometer Testing	(DMT)	☐

A list of reference papers providing additional background on the specific tests conducted is provided in the bibliography following the text of the report. If you would like a copy of any of these publications or should you have any questions or comments regarding the contents of this report, please do not hesitate to contact our office at (562) 427-6899.

Sincerely,
GREGG Drilling & Testing, Inc.

Frank Stolfi
HRSC Division Manager, Gregg Drilling & Testing, Inc.

Cone Penetration Test Sounding Summary

Cone Penetration Testing Procedure (CPT)

Gregg Drilling carries out all Cone Penetration Tests (CPT) using an integrated electronic cone system, *Figure CPT*.

The cone takes measurements of tip resistance (q_c), sleeve resistance (f_s), and penetration pore water pressure (u_2). Measurements are taken at either 2.5 or 5 cm intervals during penetration to provide a nearly continuous profile. CPT data reduction and basic interpretation is performed in real time facilitating on-site decision making. The above mentioned parameters are stored electronically for further analysis and reference. All CPT soundings are performed in accordance with revised ASTM standards (D 5778-12).

The 5mm thick porous plastic filter element is located directly behind the cone tip in the u_2 location. A new saturated filter element is used on each sounding to measure both penetration pore pressures as well as measurements during a dissipation test (*PPDT*). Prior to each test, the filter element is fully saturated with oil under vacuum pressure to improve accuracy.

When the sounding is completed, the test hole is backfilled according to client specifications. If grouting is used, the procedure generally consists of pushing a hollow tremie pipe with a "knock out" plug to the termination depth of the CPT hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole. Disruption or further contamination to the site is therefore minimized.

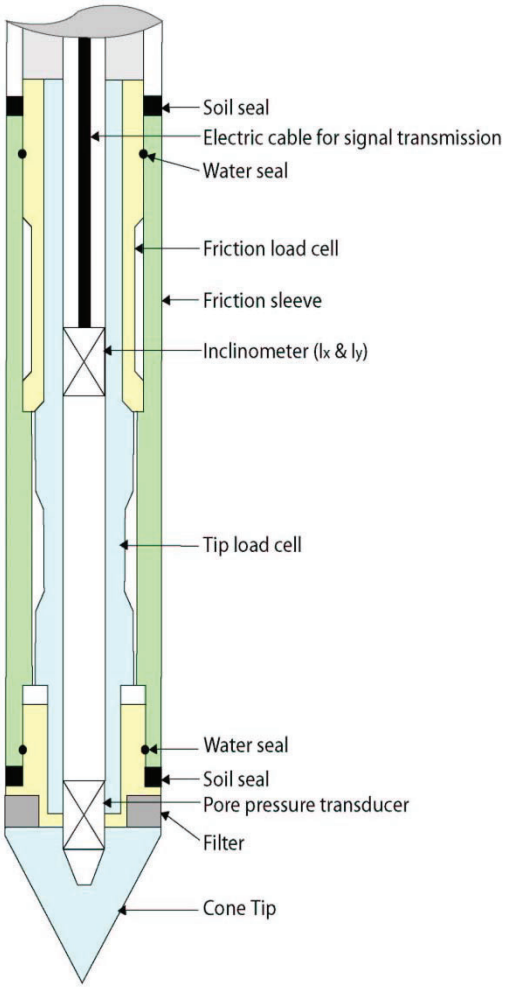

Figure CPT

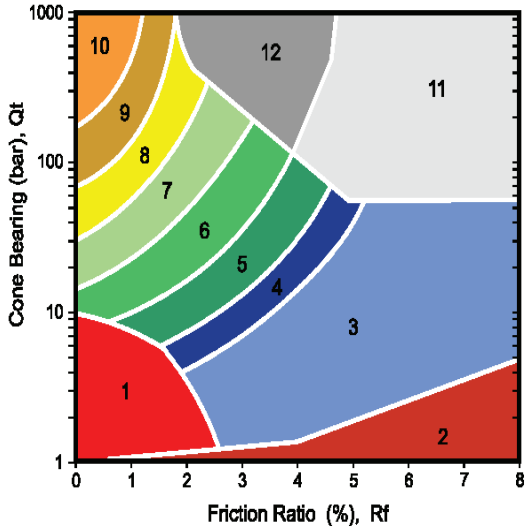
Gregg 15cm^2 Standard Cone Specifications

Dimensions	
Cone base area	15 cm^2
Sleeve surface area	225 cm^2
Cone net area ratio	0.80
Specifications	
Cone load cell	
Full scale range	180 kN (20 tons)
Overload capacity	150%
Full scale tip stress	120 MPa (1,200 tsf)
Repeatability	120 kPa (1.2 tsf)
Sleeve load cell	
Full scale range	31 kN (3.5 tons)
Overload capacity	150%
Full scale sleeve stress	1,400 kPa (15 tsf)
Repeatability	1.4 kPa (0.015 tsf)
Pore pressure transducer	
Full scale range	7,000 kPa (1,000 psi)
Overload capacity	150%
Repeatability	7 kPa (1 psi)



Note: The repeatability during field use will depend somewhat on ground conditions, abrasion, maintenance and zero load stability.

Cone Penetration Test Data & Interpretation

The Cone Penetration Test (CPT) data collected are presented in graphical and electronic form in the report. The plots include interpreted Soil Behavior Type (SBT) based on the charts described by Robertson (1990). Typical plots display SBT based on the non-normalized charts of Robertson et al (1986). For CPT soundings deeper than 30m, we recommend the use of the normalized charts of Robertson (1990) which can be displayed as SBTn, upon request. The report also includes spreadsheet output of computer calculations of basic interpretation in terms of SBT and SBTn and various geotechnical parameters using current published correlations based on the comprehensive review by Lunne, Robertson and Powell (1997), as well as recent updates by Professor Robertson (Guide to Cone Penetration Testing, 2015). The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg Drilling & Testing Inc. does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software. Some interpretation methods require input of the groundwater level to calculate vertical effective stress. An estimate of the in-situ groundwater level has been made based on field observations and/or CPT results, but should be verified by the user.

A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface.

Note that it is not always possible to clearly identify a soil type based solely on q_t, f_s, and u_2. In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the correct soil behavior type.

ZONE		SBT
1		Sensitive, fine grained
2		Organic materials
3		Clay
4		Silty clay to clay
5		Clayey silt to silty clay
6		Sandy silt to clayey silt
7		Silty sand to sandy silt

12		Sand to clayey sand*

*over consolidated or cemented

Figure SBT (After Robertson et al., 1986) – Note: Colors may vary slightly compared to plots

Cone Penetration Test (CPT) Interpretation

Gregg uses a proprietary CPT interpretation and plotting software. The software takes the CPT data and performs basic interpretation in terms of soil behavior type (SBT) and various geotechnical parameters using current published empirical correlations based on the comprehensive review by Lunne, Robertson and Powell (1997). The interpretation is presented in tabular format using MS Excel. The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for any use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software.

The following provides a summary of the methods used for the interpretation. Many of the empirical correlations to estimate geotechnical parameters have constants that have a range of values depending on soil type, geologic origin and other factors. The software uses 'default' values that have been selected to provide, in general, conservatively low estimates of the various geotechnical parameters.

Input:

1 Units for display (Imperial or metric) (atm. pressure, p_a = 0.96 tsf or 0.1 MPa)
2 Depth interval to average results (ft or m). Data are collected at either 0.02 or 0.05m and can be averaged every 1, 3 or 5 intervals.
3 Elevation of ground surface (ft or m)
4 Depth to water table, z_w (ft or m) – input required
5 Net area ratio for cone, a (default to 0.80)
6 Relative Density constant, C_{Dr} (default to 350)
7 Young's modulus number for sands, α (default to 5)
8 Small strain shear modulus number
  a. for sands, S_G (default to 180 for SBT_n 5, 6, 7)
  b. for clays, C_G (default to 50 for SBT_n 1, 2, 3 & 4)
9 Undrained shear strength cone factor for clays, N_{kt} (default to 15)
10 Over Consolidation ratio number, k_{ocr} (default to 0.3)
11 Unit weight of water, (default to γ_w = 62.4 lb/ft^3 or 9.81 kN/m^3)

Column

1 Depth, z, (m) – CPT data is collected in meters
2 Depth (ft)
3 Cone resistance, q_c (tsf or MPa)
4 Sleeve resistance, f_s (tsf or MPa)
5 Penetration pore pressure, u (psi or MPa), measured behind the cone (i.e. u_2)
6 Other – any additional data
7 Total cone resistance, q_t (tsf or MPa) $q_t = q_c + u\,(1-a)$

8	Friction Ratio, R_f (%)	$R_f = (f_s/q_t) \times 100\%$
9	Soil Behavior Type (non-normalized), SBT	see note
10	Unit weight, γ (pcf or kN/m^3)	based on SBT, see note
11	Total overburden stress, σ_v (tsf)	$\sigma_{vo} = \sigma\ z$
12	In-situ pore pressure, u_o (tsf)	$u_o = \gamma_w (z - z_w)$
13	Effective overburden stress, σ'_{vo} (tsf)	$\sigma'_{vo} = \sigma_{vo} - u_o$
14	Normalized cone resistance, Q_{t1}	$Q_{t1} = (q_t - \sigma_{vo}) / \sigma'_{vo}$
15	Normalized friction ratio, F_r (%)	$F_r = f_s / (q_t - \sigma_{vo}) \times 100\%$
16	Normalized Pore Pressure ratio, B_q	$B_q = u - u_o / (q_t - \sigma_{vo})$
17	Soil Behavior Type (normalized), SBT_n	see note
18	SBT_n Index, I_c	see note
19	Normalized Cone resistance, Q_{tn} (n varies with I_c)	see note
20	Estimated permeability, k_{SBT} (cm/sec or ft/sec)	see note
21	Equivalent SPT N_{60}, blows/ft	see note
22	Equivalent SPT $(N_1)_{60}$ blows/ft	see note
23	Estimated Relative Density, D_r, (%)	see note
24	Estimated Friction Angle, ϕ', (degrees)	see note
25	Estimated Young's modulus, E_s (tsf)	see note
26	Estimated small strain Shear modulus, Go (tsf)	see note
27	Estimated Undrained shear strength, s_u (tsf)	see note
28	Estimated Undrained strength ratio	s_u/σ_v'
29	Estimated Over Consolidation ratio, OCR	see note

Notes:

1 Soil Behavior Type (non-normalized), SBT (Lunne et al., 1997 and table below)

2 Unit weight, γ either constant at 119 pcf or based on Non-normalized SBT (Lunne et al., 1997 and table below)

3 Soil Behavior Type (Normalized), SBT_n Lunne et al. (1997)

4 SBT_n Index, I_c $I_c = ((3.47 - \log Q_{t1})^2 + (\log F_r + 1.22)^2)^{0.5}$

5 Normalized Cone resistance, Q_{tn} (n varies with Ic)

$Q_{tn} = ((q_t - \sigma_{vo})/pa)\ (pa/(\sigma'_{vo})^n$ and recalculate I_c, then iterate:

When $I_c < 1.64$, n = 0.5 (clean sand)
When $I_c > 3.30$, n = 1.0 (clays)
When $1.64 < I_c < 3.30$, $n = (I_c - 1.64)0.3 + 0.5$
Iterate until the change in n, $\Delta n < 0.01$

6 Estimated permeability, k_{SBT} based on Normalized SBT_n (Lunne et al., 1997 and table below)

7 Equivalent SPT N_{60}, blows/ft Lunne et al. (1997)

$$\frac{(q_t/p_a)}{N_{60}} = 8.5\left(1 - \frac{I_c}{4.6}\right)$$

8 Equivalent SPT $(N_1)_{60}$ blows/ft $(N_1)_{60} = N_{60}\, C_N$,
where $C_N = (pa/\sigma'_{vo})^{0.5}$

9 Relative Density, D_r, (%) $D_r^2 = Q_{tn} / C_{Dr}$
Only SBT_n 5, 6, 7 & 8 *Show 'N/A' in zones 1, 2, 3, 4 & 9*

10 Friction Angle, ϕ', (degrees) $\tan\phi' = \frac{1}{2.68}\left[\log\left(\frac{q_c}{\sigma'_{vo}}\right) + 0.29\right]$
Only SBT_n 5, 6, 7 & 8 *Show'N/A' in zones 1, 2, 3, 4 & 9*

11 Young's modulus, E_s $E_s = \alpha\, q_t$
Only SBT_n 5, 6, 7 & 8 *Show 'N/A' in zones 1, 2, 3, 4 & 9*

12 Small strain shear modulus, Go

a. $G_o = S_G\,(q_t\ \sigma'_{vo}\ pa)^{1/3}$ *For SBT_n 5, 6, 7*

b. $G_o = C_G\, q_t$ *For SBT_n 1, 2, 3& 4*

Show 'N/A' in zones 8 & 9

13 Undrained shear strength, s_u $s_u = (q_t - \sigma_{vo}) / N_{kt}$
Only SBT_n 1, 2, 3, 4 & 9 *Show 'N/A' in zones 5, 6, 7 & 8*

14 Over Consolidation ratio, OCR OCR = $k_{ocr}\, Q_{t1}$
Only SBT_n 1, 2, 3, 4 & 9 *Show 'N/A' in zones 5, 6, 7 & 8*

The following updated and simplified SBT descriptions have been used in the software:

SBT Zones		**SBT_n Zones**	
1	sensitive fine grained	1	sensitive fine grained
2	organic soil	2	organic soil
3	clay	3	clay
4	clay & silty clay	4	clay & silty clay
5	clay & silty clay		
6	sandy silt & clayey silt		

7	silty sand & sandy silt	5	silty sand & sandy silt
8	sand & silty sand	6	sand & silty sand
9	sand		
10	sand	7	sand
11	very dense/stiff soil*	8	very dense/stiff soil*
12	very dense/stiff soil*	9	very dense/stiff soil*

*heavily overconsolidated and/or cemented

Track when soils fall with zones of same description and print that description (i.e. if soils fall only within SBT zones 4 & 5, print ‘clays & silty clays’)

Estimated Permeability (see Lunne et al., 1997)

SBT_n	Permeability (ft/sec)	(m/sec)
1	$3x\ 10^{-8}$	$1x\ 10^{-8}$
2	$3x\ 10^{-7}$	$1x\ 10^{-7}$
3	$1x\ 10^{-9}$	$3x\ 10^{-10}$
4	$3x\ 10^{-8}$	$1x\ 10^{-8}$
5	$3x\ 10^{-6}$	$1x\ 10^{-6}$
6	$3x\ 10^{-4}$	$1x\ 10^{-4}$
7	$3x\ 10^{-2}$	$1x\ 10^{-2}$
8	$3x\ 10^{-6}$	$1x\ 10^{-6}$
9	$1x\ 10^{-8}$	$3x\ 10^{-9}$

Estimated Unit Weight (see Lunne et al., 1997)

SBT	Approximate Unit Weight (lb/ft^3)	(kN/m^3)

Pore Pressure Dissipation Tests (PPDT)

Pore Pressure Dissipation Tests (PPDT's) conducted at various intervals can be used to measure equilibrium water pressure (at the time of the CPT). If conditions are hydrostatic, the equilibrium water pressure can be used to determine the approximate depth of the ground water table. A PPDT is conducted when penetration is halted at specific intervals determined by the field representative. The variation of the penetration pore pressure (*u)* with time is measured behind the tip of the cone and recorded.

Pore pressure dissipation data can be interpreted to provide estimates of:

- Equilibrium piezometric pressure
- Phreatic Surface
- In situ horizontal coefficient of consolidation (c_h)
- In situ horizontal coefficient of permeability (k_h)

In order to correctly interpret the equilibrium piezometric pressure and/or the phreatic surface, the pore pressure must be monitored until it reaches equilibrium, *Figure PPDT*. This time is commonly referred to as t_{100}, the point at which 100% of the excess pore pressure has dissipated.

A complete reference on pore pressure dissipation tests is presented by Robertson et al. 1992 and Lunne et al. 1997.

A summary of the pore pressure dissipation tests are summarized in Table 1.

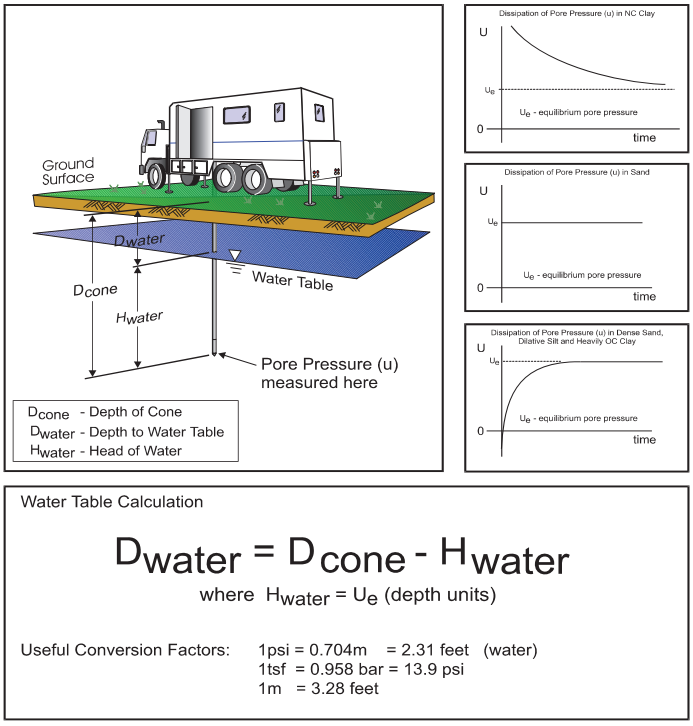

Figure PPDT

Seismic Cone Penetration Testing (SCPT)

Seismic Cone Penetration Testing (SCPT) can be conducted at various intervals during the Cone Penetration Test. Shear wave velocity (Vs) can then be calculated over a specified interval with depth. A small interval for seismic testing, such as 1-1.5m (3-5ft) allows for a detailed look at the shear wave profile with depth. Conversely, a larger interval such as 3-6m (10-20ft) allows for a more average shear wave velocity to be calculated. Gregg's cones have a horizontally active geophone located 0.2m (0.66ft) behind the tip.

To conduct the seismic shear wave test, the penetration of the cone is stopped and the rods are decoupled from the rig. An automatic hammer is triggered to send a shear wave into the soil. The distance from the source to the cone is calculated knowing the total depth of the cone and the horizontal offset distance between the source and the cone. To calculate an interval velocity, a minimum of two tests must be performed at two different depths. The arrival times between the two wave traces are compared to obtain the difference in time (Δt). The difference in depth is calculated (Δd) and velocity can be determined using the simple equation: $v = \Delta d/\Delta t$

Multiple wave traces can be recorded at the same depth to improve quality of the data.

A complete reference on seismic cone penetration tests is presented by Robertson et al. 1986 and Lunne et al. 1997.

A summary the shear wave velocities, arrival times and wave traces are provided with the report.

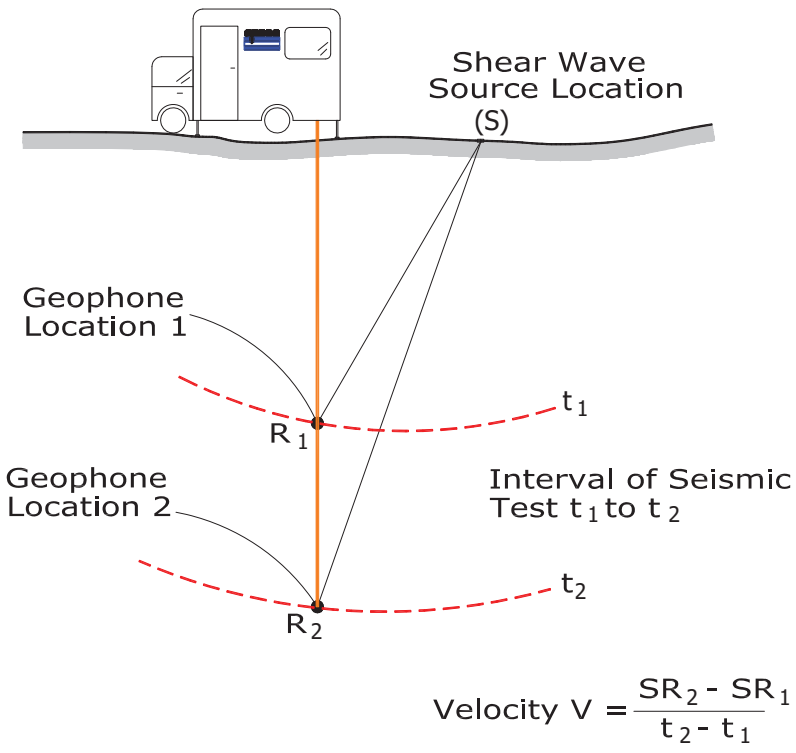

Figure SCPT

Groundwater Sampling

Gregg Drilling & Testing, Inc. conducts groundwater sampling using a sampler as shown in *Figure GWS*. The groundwater sampler has a retrievable stainless steel or disposable PVC screen with steel drop off tip. This allows for samples to be taken at multiple depth intervals within the same sounding location. In areas of slower water recharge, provisions may be made to set temporary PVC well screens during sampling to allow the pushing equipment to advance to the next sample location while the groundwater is allowed to infiltrate.

The groundwater sampler operates by advancing 44.5mm (1¾ inch) hollow push rods with the filter tip in a closed configuration to the base of the desired sampling interval. Once at the desired sample depth, the push rods are retracted; exposing the encased filter screen and allowing groundwater to infiltrate hydrostatically from the formation into the inlet screen. A small diameter bailer (approximately ½ or ¾ inch) is lowered through the push rods into the screen section for sample collection. The number of downhole trips with the bailer and time necessary to complete the sample collection at each depth interval is a function of sampling protocols, volume requirements, and the yield characteristics and storage capacity of the formation. Upon completion of sample collection, the push rods and sampler, with the exception of the PVC screen and steel drop off tip are retrieved to the ground surface, decontaminated and prepared for the next sampling event.

For a detailed reference on direct push groundwater sampling, refer to Zemo et. al., 1992.

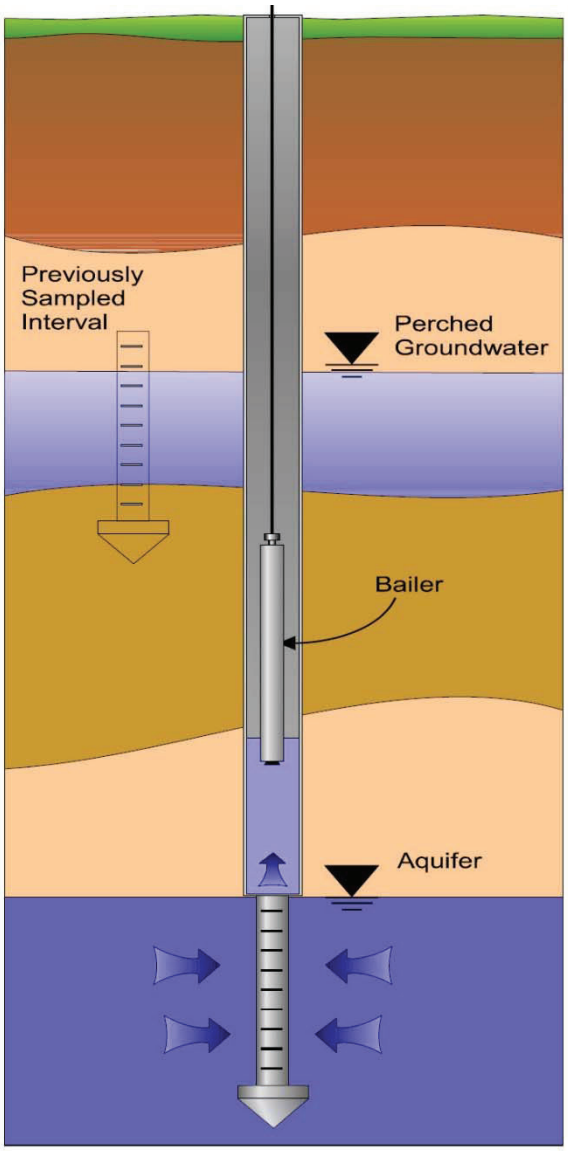

Figure GWS

Soil Sampling

Gregg Drilling & Testing, Inc. uses a piston-type push-in sampler to obtain small soil samples without generating any soil cuttings, *Figure SS*. Two different types of samplers (12 and 18 inch) are used depending on the soil type and density. The soil sampler is initially pushed in a "closed" position to the desired sampling interval using the CPT pushing equipment. Keeping the sampler closed minimizes the potential of cross contamination. The inner tip of the sampler is then retracted leaving a hollow soil sampler with inner 1¼" diameter sample tubes. The hollow sampler is then pushed in a locked "open" position to collect a soil sample. The filled sampler and push rods are then retrieved to the ground surface. Because the soil enters the sampler at a constant rate, the opportunity for 100% recovery is increased. For environmental analysis, the soil sample tube ends are sealed with Teflon and plastic caps. Often, a longer "split tube" can be used for geotechnical sampling.

For a detailed reference on direct push soil sampling, refer to Robertson et al, 1998.

SUMMARY
OF
CONE PENETRATION TEST DATA

1. INTRODUCTION

This report presents the results of a Cone Penetration Test (CPT) program carried out for the project located at 456 N. Rodeo Drive in Beverly Hills, California. The work was performed by Kehoe Testing & Engineering (KTE) on July 11-13, 2018. The scope of work was performed as directed by Feffer Geological Consulting personnel.

2. SUMMARY OF FIELD WORK

The fieldwork consisted of performing CPT soundings at seven locations to determine the soil lithology. Groundwater measurements and hole collapse depths provided in **TABLE 2.1** are for information only. The readings indicate the apparent depth to which the hole is open and the apparent water level (if encountered) in the CPT probe hole at the time of measurement upon completion of the CPT. KTE does not warranty the accuracy of the measurements and the reported water levels may not represent the true or stabilized groundwater levels.

LOCATION	DEPTH OF CPT (ft)	COMMENTS/NOTES:
CPT-5	39	Refusal, hole open to 36 ft (dry)
CPT-6	50	Hole open to 48 ft (dry)
CPT-7	50	Hole open to 46 ft (dry)
CPT-8	30	Refusal, hole open to 30 ft (dry)

TABLE 2.1 - Summary of CPT Soundings

3. FIELD EQUIPMENT & PROCEDURES

The CPT soundings were carried out by **KTE** using an integrated electronic cone system manufactured by Vertek. The CPT soundings were performed in accordance with ASTM standards (D5778). The cone penetrometers were pushed using a 30-ton CPT rig and a direct push rig anchored with an eight-inch diameter ground anchor. The direct push rig has a pushing capacity of approximately 15 tons. The cone used during the program was a 15 cm^2 cone and a 10 cm^2 was used with the direct push rig. Both recorded the following parameters at approximately 2.5 cm depth intervals:

- Cone Resistance (qc)
- Sleeve Friction (fs)
- Dynamic Pore Pressure (u)
- Inclination
- Penetration Speed

The above parameters were recorded and viewed in real time using a laptop computer. Data is stored at the KTE office for up to 2 years for future analysis and reference. A complete set of baseline readings was taken prior to each sounding to determine temperature shifts and any zero load offsets. Monitoring base line readings ensures that the cone electronics are operating properly.

4. CONE PENETRATION TEST DATA & INTERPRETATION

The Cone Penetration Test data is presented in graphical form in the attached Appendix. These plots were generated using the CPeT-IT program. Penetration depths are referenced to ground surface. The soil classification on the CPT plots is derived from the attached CPT Classification Chart (Robertson) and presents major soil lithologic changes. The stratigraphic interpretation is based on relationships between cone resistance (qc), sleeve friction (fs), and penetration pore pressure (u). The friction ratio (Rf), which is sleeve friction divided by cone resistance, is a calculated parameter that is used along with cone resistance to infer soil behavior type. Generally, cohesive soils (clays) have high friction ratios, low cone resistance and generate excess pore water pressures. Cohesionless soils (sands) have lower friction ratios, high cone bearing and generate little (or negative) excess pore water pressures.

Tables of basic CPT output from the interpretation program CPeT-IT are provided for CPT data averaged over one foot intervals in the Appendix. We recommend a geotechnical engineer review the assumed input parameters and the calculated output from the CPeT-IT program. A summary of the equations used for the tabulated parameters is provided in the Appendix.

It should be noted that it is not always possible to clearly identify a soil type based on qc, fs and u. In these situations, experience, judgement and an assessment of the pore pressure data should be used to infer the soil behavior type.

If you have any questions regarding this information, please do not hesitate to call our office at (714) 901-7270.

Sincerely,

KEHOE TESTING & ENGINEERING

Richard W. Koester, Jr.

Presented below is a list of formulas used for the estimation of various soil properties. The formulas are presented in SI unit system and assume that all components are expressed in the same units.

:: Unit Weight, g (kN/m³) ::

$$g = g_w \cdot \left(0.27 \cdot \log(R_f) + 0.36 \cdot \log(\frac{q_t}{p_a}) + 1.236 \right)$$

where g_w = water unit weight

:: Permeability, k (m/s) ::

$I_c < 3.27$ and $I_c > 1.00$ then $k = 10^{0.952-3.04 \cdot I_c}$

$I_c \leq 4.00$ and $I_c > 3.27$ then $k = 10^{-4.52-1.37 \cdot I_c}$

:: N_{SPT} (blows per 30 cm) ::

$$N_{60} = \left(\frac{q_c}{P_a} \right) \cdot \frac{1}{10^{1.1268-0.2817 \cdot I_c}}$$

$$N_{1(60)} = Q_{tn} \cdot \frac{1}{10^{1.1268-0.2817 \cdot I_c}}$$

:: Young's Modulus, Es (MPa) ::

RECOMMENDATION FOR ACCEPTANCE

REPORT FOR INVESTIGATION OF POTENTIAL SURFACE FAULT RUPTURE 461 N. Beverly Drive, Beverly Hills, California 90210

As authorized by the City of Beverly Hills, this document summarizes technical (peer) reviews for a “Fault Hazard [Ground Rupture] Investigation” for proposed redevelopment of the 461 N. Beverly Drive property in the City of Beverly Hills, California. The investigations were carried by Feffer Geological Consulting, Inc. (FGC), the Consultants-of-Record, on behalf of the applicant, the 461 N. Beverly Drive, LLC. The main purpose of the FGC investigation was to determine if possible splays of the Santa Monica fault zone potentially impact the site, and if such faults were “active” (defined by the California Geological Survey [CGS] as surface or near-surface displacement within the last 11,700 years).

The site is about 130 ft northwest of the nearest, CGS-designated Earthquake Fault Zone (EFZ), the Santa Monica, and relatively near the Hollywood EFZ that extends into the City on the northeast and the West Pico EFZ that currently terminates at the City limits on the southeast (see various regional maps in the FGC report). The City requires independent fault-activity reviews in conformance with building codes, with current requirements of the CGS (2018; Special Pub. 42) and to ensure public health, safety and welfare.

The reviews included initial telephone and email discussions with applicant representatives, the consultants and City personnel about investigation requirements, scope of work and approval for the proposed investigation plan. These were followed by on-site field observation of continuous cores, interpretations of FGC preliminary cross-sections, cone penetrometer tests and site-specific soil-stratigraphic correlations. Likewise reviewed was an FGC draft report, similarly followed by meetings and discussions with FGC personnel and the applicant, and ultimately by acceptance of the final report.

Though dated 20 September 2018, the FGC final report submitted on 2 October. It documents pertinent literature and maps, summarizes field investigation procedures, provides the regional geologic framework and tectonic setting, and expounds on specific investigation procedures and technical data supporting the professional conclusions and recommendations.

In sum, the fundamental conclusions of the Consultants-of-Record are:

1. That the FGC regional assessments and site-specific investigations meet current standards-of-practice for fault-activity assessments in southern California in general and for those specifically required by the City of Beverly Hills in particular;

2. That the FGC site-specific investigations and interpretations are sufficient to identify, date and correlated subsurface stratigraphic markers (primarily buried paleosols) observed and described from five, 50-ft onsite continuous cores. The sediments are unbroken and judged as generally more than 11,700 years old;

3. That, despite diligent observation, no charcoal or other materials amenable to unequivocal radiocarbon or other numeric dating methods were recovered;

4. That the on-site sediments were dated primarily by soil-stratigraphic techniques (Appendices A and B). Identified were multiple moderately developed buried paleosols locally replete with common to many, reddish-brown moderately thick illuvial clay films all indicating a pre-11,700-yr age; and that these soils and sediments are traced across the site and, in association with onsite and adjacent property CPT “signatures,” are unbroken.

5. That, the 461 N. Beverly Drive property is not subject to potential surface or near-surface displacement associated with the Santa Monica, the Hollywood, the West Pico or any other fault reasonably projected toward it.

Accordingly, based substantially on, and in reliance of their professional interpretations and conclusions, the FGC regional summaries and site-specific investigations are judged to meet current standards-of-practice for fault-activity assessments in southern California in general and to those specifically required by the City of Beverly Hills in particular.

Please note that the FGC report focuses solely on potential surface or near-surface fault rupture and does not specifically address possible high seismic accelerations, ground deformation or other structural design and geotechnical investigations required by applicable building codes or by present professional engineering and geological standards of practice. It is therefore incumbent upon the applicant, FGC, or other consultants, to provide this information to the City of Beverly Hills for technical review and potential acceptance prior to issuance of building permits.

Recommended for Acceptance

Subject: Acceptance of City's Peer-Reviewer Recommendation For Acceptance: "Report For Investigation Of Potential Surface Fault Rupture:" 461 North Beverly Drive, Beverly Hills, California 90210

Dear 461 N. Beverly Drive LLC:

The "Fault Hazard [Ground Rupture] Investigation" (Investigation) for the proposed redevelopment of the 461 N. Beverly Drive property, in the City of Beverly Hills, California 90210. The investigations were carried out by Feffer Geological Consulting, Inc. ("FGC"), the Consultants-of-Record, on behalf of the applicant, the 461 N. Beverly Drive LLC. The main purpose of the FGC investigation was to determine if possible splays of the Santa Monica fault zone potentially impact the site, and if such faults were "active" (defined by the California Geological Survey [CGS] as surface or near-surface displacement within the last 11,700 years). The FGC investigation has been peer reviewed by the City's consultant, Roy J. Shlemon, Ph.D., PG 2867; CPG 1766; CPESC 2167, of Roy J. Shlemon & Associates, Inc. ("RSA").

The peer review included critique of the Site-Specific Fault Rupture Investigation titled "Report on a Fault Hazard Investigation for the Property Located at 461 N. Beverly Drive, Beverly Hills, California, 90210" (FGC Project File No. 2196-85 dated September 20, 2018 attached).

The geologic investigation and peer review are required by the City in conformance with the current building codes and with current geologic-standards-of practice that ensure public health, safety and welfare.

Accordingly, in reliance on the technical documentation and assurances provided by the Consultants-of-Record, including their opinions and conclusions, the City of Beverly Hills now formally accepts the technical "Recommendation For Acceptance" of the Reviewer (attached).

Sincerely,

D. Yelton

Subject: Phase I Environmental Site Assessment
456 North Rodeo Drive
456 North Rodeo Drive
Beverly Hills, California 90210
Partner Project No. 17-195790.1

Dear Ms. Wei:

Partner Engineering and Science (Partner) is pleased to provide the results of the *Phase I Environmental Site Assessment* (Phase I ESA) report of the abovementioned address (the "subject property"). This assessment was performed in general conformance with the scope and limitations as detailed in the ASTM Practice E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.

The Phase I Environmental Site Assessment is designed to provide an assessment concerning environmental conditions (limited to those issues identified in the report) as they exist at the subject property. This assessment included a site reconnaissance as well as research and interviews with representatives of the public, property ownership, site manager, and regulatory agencies. An assessment was made, conclusions stated, and recommendations outlined.

We appreciate the opportunity to provide environmental services to Sterling Organization. If you have any questions concerning this report, or if we can assist you in any other matter, please contact me at (310) 622-8855.

Sincerely,

Debbie Stott, P.G.
Principal

EXECUTIVE SUMMARY

Partner Engineering and Science (Partner) has performed a Phase I Environmental Site Assessment (ESA) in general accordance with the scope of work and limitations of ASTM Standard Practice E1527-13, the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) for the property located at 456 North Rodeo Drive in the City of Beverly Hills, Los Angeles County, California (the "subject property"). The Scope of Services performed is in accordance with the Master Services Agreement between the Sterling Organization, LLC and Partner dated October 6, 2015.

Property Description

The subject property is located on the east side of North Rodeo Drive within a commercial and retail area of Beverly Hills, Los Angeles County, California. Please refer to the table below for further description of the subject property:

Subject Property Data	
Address:	456 North Rodeo Drive, Beverly Hills, California 90210
Historical Address:	458 North Rodeo Drive
Property Use:	Vacant retail space
Land Acreage (Ac):	0.175 Ac
Number of Buildings:	One
Number of Floors:	One with mezzanine
Date of Construction:	1948/1950
Assessor's Parcel Number (APN):	4343-016-002
Type of Construction:	Wood-Framed
Current Tenants:	Vacant
Zoning:	Commercial
Site Assessment Performed By:	Colin Donohue of Partner
Site Assessment Conducted On:	October 10, 2017

The subject property is currently occupied by a vacant retail building. In addition to the current structure, the subject property is improved with a concrete-paved parking area behind the building.

According to review of available historical data, it appears that the subject property was undeveloped as early as 1894 and developed with the existing structure in 1948. Since that time, various retail and office tenants have occupied the building.

Partner observed small quantities of paint stored onsite. Hazardous materials observed at the subject property appeared to be stored properly with no evidence of spills or leaks.

The subject property is located within a mixed commercial and retail area. During the vicinity reconnaissance, Partner observed the following land use on properties in the immediate vicinity of the subject property:

Immediately Surrounding Properties

Northwest: Brooks Brothers (468 North Rodeo Drive)
Southwest: North Rodeo Drive, beyond which Alexander McQueen (451 North Rodeo Drive), Lor Piana (445 North Rodeo Drive)
Northeast: An alley, beyond which is The Paley Center for Media (449 North Beverly Drive)
Southeast: An alley, beyond which is a vacant retail building (444 North Beverly Drive)

No environmental concerns associated with adjacent properties were identified based on visual observation from publicly accessible rights-of-way.

None of the historic addresses associated with the subject property were identified in the EDR Report.

No potential vapor intrusion concerns were identified onsite nor from offsite facilities.

According to information obtained from the State Water Resources Control Board online database, GeoTracker, for a nearby property (Case Number I-10978 – 427 Crescent Drive) and topographic map interpretation, groundwater in the vicinity of the subject property is present at a depth of at least 40 feet below ground surface (bgs) and flows toward the southeast.

Findings

A *recognized environmental condition (REC)* refers to the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: due to release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment.

- Partner did not identify recognized environmental conditions during the course of this assessment.

A *controlled recognized environmental condition (CREC)* refers to a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls. The following was identified during the course of this assessment:

- Partner did not identify controlled recognized environmental conditions during the course of this assessment.

A *historical recognized environmental condition (HREC)* refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. The following was identified during the course of this assessment:

- Partner did not identify historical recognized environmental conditions during the course of this assessment.

An *environmental issue* refers to environmental concerns identified by Partner, which do not qualify as RECs; however, warrant further discussion. The following was identified during the course of this assessment:

- Due to the age of the subject property building, there is a potential that asbestos-containing material (ACM) and/or lead-based paint (LBP) are present. Overall, all suspect ACMs and painted surfaces were observed in good condition and do not pose a health and safety concern to the occupants of the subject property at this time. Partner observed an approximately 2 square foot area of damaged ceiling drywall on the ceiling of the mezzanine level. According to Mr. Gary Gramer (the property manager), the HVAC equipment on the rooftop had leaked, but that the roof leak had been repaired. Should these materials be replaced, the identified suspect ACMs would need to be sampled to confirm the presence or absence of asbestos prior to any renovation or demolition activities to prevent potential exposure to workers and/or building occupants.

Conclusions, Opinions and Recommendations

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 and Sterling Organization of 456 North Rodeo Drive in the Town of Beverly Hills, Los Angeles County, California (the "subject property"). Any exceptions to or deletions from this practice are described in Section 1.5 of this report.

This assessment has revealed no evidence of recognized environmental conditions in connection with the subject property. Environmental issues as described above were identified. Based on the conclusions of this assessment, Partner recommends:

- An Operations and Maintenance (O&M) Program should be implemented in order to safely manage the suspect ACMs and LBP located at the subject property.

1.0 INTRODUCTION

Partner Engineering and Science (Partner) has performed a Phase I Environmental Site Assessment (ESA) in general conformance with the scope and limitations of ASTM Standard Practice E1527-13 and the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) for the property located at 456 North Rodeo Drive in the City of Beverly Hills, Los Angeles County, California (the "subject property"). Any exceptions to, or deletions from, this scope of work are described in the report.

1.1 Purpose

The purpose of this ESA is to identify existing or potential Recognized Environmental Conditions (as defined by ASTM Standard E-1527-13) affecting the subject property that: 1) constitute or result in a material violation or a potential material violation of any applicable environmental law; 2) impose any material constraints on the operation of the subject property or require a material change in the use thereof; 3) require clean-up, remedial action or other response with respect to Hazardous Substances or Petroleum Products on or affecting the subject property under any applicable environmental law; 4) may affect the value of the subject property; and 5) may require specific actions to be performed with regard to such conditions and circumstances.

This ESA was performed to permit the User to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on scope of Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. §9601) liability (hereinafter, the "landowner liability protections," or "LLPs"). ASTM Standard E-1527-13 constitutes "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined at 42 U.S.C. §9601(35)(B).

In order to qualify for one of the *LLPs* offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the *Brownfields Amendments*), the *User* must provide the following information (if available) to the *environmental professional*. Failure to provide this information could result in a determination that *all appropriate inquiry* is not complete. The user is asked to provide information or knowledge of the following:

- Environmental cleanup liens that are filed or recorded against the site.
- Activity and land use limitations that are in place on the site or that have been filed or recorded in a registry.
- Specialized knowledge or experience of the person seeking to qualify for the LLPs.
- Relationship of the purchase price to the fair market value of the *property* if it were not contaminated.
- Commonly known or *reasonably ascertainable* information about the *property*.
- The degree of obviousness of the presence or likely presence of contamination at the *property*, and the ability to detect the contamination by appropriate assessment.
- The reason for preparation of this Phase I ESA.

Fulfillment of these user responsibilities is key to qualification for the identified defenses to CERCLA liability. Partner requested our Client to provide information to satisfy User Responsibilities as identified in Section 6 of the ASTM guidance.

1.2 Scope of Work

The Scope of Services performed is in accordance with the requirements of ASTM Standard E 1527-13 and the Master Services Agreement between the Sterling Organization, LLC and Partner dated October 6, 2015.

This assessment included: 1) a property and adjacent site reconnaissance; 2) interviews with key personnel; 3) a review of historical sources; 4) a review of regulatory agency records; and 5) a review of a regulatory database report provided by a third-party vendor. Partner contacted local agencies, such as environmental health departments, fire departments and building departments in order to request for review records of current and/or former hazardous substances usage, storage and/or releases of hazardous substances on the subject property.

Partner researched information on the presence of activity and use limitations (AULs) at the appropriate agencies. As defined by ASTM E1527-13, AULs are the legal or physical restrictions or limitations on the use of, or access to, a site or facility: 1) to reduce or eliminate potential exposure to hazardous substances or petroleum products in the soil or groundwater on the subject property; or 2) to prevent activities that could interfere with the effectiveness of a response action, in order to ensure maintenance of a condition of no significant risk to public health or the environment. These legal or physical restrictions, which may include institutional and/or engineering controls (IC/ECs), are intended to prevent adverse impacts to individuals or populations that may be exposed to hazardous substances and petroleum products in the soil or groundwater on the property.

If requested by Client, this report may also include the identification, discussion of, and/or limited sampling of asbestos-containing materials (ACMs), lead-based paint (LBP), microbial growth, and/or radon.

1.3 Limitations

Partner warrants that the findings and conclusions contained herein were accomplished in accordance with the methodologies set forth in the Scope of Work. These methodologies are described as representing good commercial and customary practice for conducting an ESA of a property for the purpose of identifying recognized environmental conditions. There is a possibility that even with the proper application of these methodologies there may exist on the subject property conditions that could not be identified within the scope of the assessment or which were not reasonably identifiable from the available information. Partner believes that the information obtained from the record review and the interviews concerning the subject property is reliable. However, Partner cannot and does not warrant or guarantee that the information provided by these other sources is accurate or complete. The conclusions and findings set forth in this report are strictly limited in time and scope to the date of the evaluations. The conclusions presented in the report are based solely on the services described therein, and not on

scientific tasks or procedures beyond the scope of agreed-upon services or the time and budgeting restraints imposed by the Client. No other warranties are implied or expressed.

Some of the information provided in this report is based upon personal interviews, and research of available documents, records, and maps held by the appropriate government and private agencies. This report is subject to the limitations of historical documentation, availability, and accuracy of pertinent records, and the personal recollections of those persons contacted.

This practice does not address requirements of any state or local laws or of any federal laws other than the all appropriate inquiry provisions of the LLPs. Further, this report does not intend to address all of the safety concerns, if any, associated with the subject property.

Environmental concerns, which are beyond the scope of a Phase I ESA as defined by ASTM include the following: ACMs, LBP, radon, and lead in drinking water. These issues may affect environmental risk at the subject property and may warrant discussion and/or assessment; however, are considered non-scope issues. If specifically requested by the Client, these non-scope issues are discussed in Section 6.3.

1.4 User Reliance

Reliance on this report by the client and all authorized parties will be subject to the terms, conditions and limitations stated in the Master Services Agreement between the Sterling Organization, LLC and Partner dated October 6, 2015.

This report has been prepared for use by Sterling Organization and its lender and shall not be relied upon by or transferred to any other party, or used for any other purpose, without the express written authorization of Partner Engineering and Science, Inc.

1.5 Limiting Conditions

The findings and conclusions contain all of the limitations inherent in these methodologies that are referred to in ASTM E1527-13.

Specific limitations and exceptions to this ESA are more specifically set forth below:

- Interviews with past or current owners, operators and occupants were not reasonably ascertainable and thus constitute a data gap. Based on information obtained from other historical sources (as discussed in Section 3.0), this data gap is not expected to alter the findings of this assessment. Partner was allowed access to all areas of the building.
- An environmental cleanup lien search was not performed. However, it is Partner's opinion that the lack of the lien search does not represent a significant data gap, in that it does not impact Partner's ability to identify recognized environmental conditions at the subject property and therefore it does not alter the conclusions of this report. According to the Title Commitment and EDR Report, NPL (Superfund) and other environmental liens are not associated with the subject property. A title report provided by Sterling did not indicate environmental liens filed against the property. Based on available information, no environmental liens appear to be associated with the subject property.

- Partner was unable to determine the property use at 5-year intervals, which constitutes a data gap. Except for property tax files and recorded land title records, which were not considered to be sufficiently useful, Partner reviewed all standard historical sources and conducted appropriate interviews.
- Partner submitted Freedom of Information Act (FOIA) requests to the Los Angeles County Fire Department for information pertaining to hazardous substances, underground storage tanks, releases, inspection records, etc. for the subject property and/or adjacent properties. As of this writing, this agency has not responded to Partner's request. Based on information obtained from other historical sources, this limitation is not expected to alter the overall findings of this assessment.

2.0 SITE DESCRIPTION

2.1 Site Location and Legal Description

The subject property at 456 North Rodeo Drive in Beverly Hills, California is located on the east side of North Rodeo Drive. The subject property was inspected by Colin Donohue of Partner on October 10, 2017. The weather at the time of the site visit was sunny and in the mid 70s (degrees Fahrenheit). According to the Los Angeles County Assessor, the subject property is legally described as BEVERLY LOT 3 BLK 2, and ownership is currently vested in Karl B. Schurz Trust. Please refer to the table below for further description of the subject property.

Subject Property Data	
Address:	456 North Rodeo Drive, Beverly Hills, California 90210
Historical Address:	458 North Rodeo Drive
Property Use:	Vacant retail store
Land Acreage (Ac):	0.175 Ac
Number of Buildings:	One
Number of Floors:	One with mezzanine
Date of Construction:	1948/1950
Assessor's Parcel Number (APN):	4343-016-002
Type of Construction:	Wood-Framed
Current Tenants:	Vacant
Zoning:	Commercial
Site Assessment Performed By:	Colin Donohue of Partner
Site Assessment Conducted On:	October 10, 2017

Please refer to Figure 1: Site Location Map, Figure 2: Site Plan, Figure 3: Topographic Map, and Appendix A: Site Photographs for the location and site characteristics of the subject property.

2.2 Current Property Use

The subject property is currently occupied by a vacant retail building. The subject property consists of one one-story building with a mezzanine area located on the west side of the property. In addition to the current structure, the subject property is improved with a concrete-paved parking area behind the building.

2.3 Current Use of Adjacent Properties

The subject property is located within a commercial/retail area. During the vicinity reconnaissance, Partner observed the following land use on properties in the immediate vicinity of the subject property:

Immediately Surrounding Properties	
Northwest:	Brooks Brothers (468 North Rodeo Drive)
Southwest:	North Rodeo Drive, beyond which Alexander McQueen (451 North Rodeo Drive), Lor Piana (445 North Rodeo Drive)
Northeast:	An alley, beyond which is The Paley Center for Media (449 North Beverly Drive)
Southeast:	An alley, beyond which is a vacant retail building (444 North Beverly Drive)

No environmental concerns associated with adjacent properties were identified based on visual observation from publicly accessible rights-of-way.

2.4 Physical Setting Sources

2.4.1 Topography

The United States Geological Survey (USGS) *Beverly Hills, California* Quadrangle 7.5-minute series topographic map was reviewed for this ESA. The subject property lies at an approximate elevation of 264 feet above mean sea level (msl) with a local topographic gradient toward the southeast.

A copy of the most recent topographic map is included as Figure 3.

2.4.2 Hydrology

According to information obtained from the State Water Resources Control Board online database, GeoTracker, for a nearby property (Case Number I-10978 – 427 Crescent Drive) and topographic map interpretation, groundwater in the vicinity of the subject property is present at a depth of at least 40 feet below ground surface (bgs) and flows toward the southeast.

The nearest surface water in the vicinity of the subject property is the Franklin Canyon Reservoir located approximately 1.71 miles north-northwest of the subject property. No settling ponds, lagoons, surface impoundments, wetlands or natural catch basins were observed on the subject property during this assessment.

2.4.3 Geology/Soils

The subject property lies within the Los Angeles County Coastal Plain area of the Los Angeles Basin. The plain consists of predominantly alluvial basin-fill material deposited by meandering tributaries of the Santa Ana River system (Morton, et al., 1979). Surficial geology in the subject property vicinity consists of recent alluvium of gravel, sand, silty sand, and clayey silt with an average thickness of 200 feet (Poland, et al., 1956; California DWR, 1967). This recent alluvium is underlain by the upper Pleistocene Lakewood Formation, which averages 500 feet in thickness and consists of alternating stratigraphic zones of coarse-grained sand and clayey silt. The estimated depth to bedrock is more than 1,000 feet.

Based on information obtained from the USDA Natural Resources Conservation Service Web Soil Survey online database, the subject property is mapped as Urban land-Anthraltic Xerorthents, loamy substratum-Grommet complex, 0 to 5 percent slopes. This series consists of Human-transported material over young alluvium derived from sedimentary rock. These soils are considered to be well drained with a moderately high permeability rate and a high available water storage capacity.

2.4.4 Flood Zone Information

Partner performed a review of the Flood Insurance Rate Map, published by the Federal Emergency Management Agency. According to Community Panel Number 06037C1585F, dated September 26, 2008, the subject property appears to be located in Zone X, an area located outside of the 100-year and 500-year flood plains.

3.0 HISTORICAL INFORMATION

Partner obtained historical use information about the subject property from a variety of sources. Information regarding past land use was obtained by a review of historical aerial photographs, historical Sanborn Fire Insurance maps, city directories, and historical topographic maps of the subject property and surrounding area obtained from Environmental Data Resources (EDR). Copies of the historical resources are included in **Appendix B**. Sanborn™ Fire Insurance Maps were available. A chronological listing of the historical data found is summarized in the table below.

Date	Scale or Address	Source	Summary
1894, 1896, 1898, 1900, 1902	N/A	Topographic Maps	The subject property and surrounding properties are undeveloped
1920, 1921 1922, 1924, 1925, 1926, 1928, 1934, 1938	N/A; 1:500	Sanborn Map	The subject property and the adjacent properties to the northwest, west, and southwest across Rodeo Drive are undeveloped; offices are located across the alley to the northeast and a furniture shop is located across the alley to the east in 1922; in 1926, stores and a printer are located to the northwest and stores are located across Rodeo to the southwest
1948, 1950, 1952, 1964, 1966, 1969, 1972, 1977, 1979, 1981, 1983, 1989, 1994, 1995, 2002, 2005, 2009, 2010, 2012	456 & 458 North Rodeo Drive; 1:500	Sanborn Map, Topographic Map	The subject property is developed with the existing structure housing office and retail stores: Crawford Store Records, Television, Music (1950, 1954, 1958); Raymond Burr Galleries (1962); Eres Couture (1965, 1967, 1970, 1975, 1981); Lady Battaglia Womens Wear (1985); Mile Schon (1991); Point Care of Beverly Hills, Karl Schurz (2000); Bucceul Gems, Decorative Art, Ginori (2006); Juicy Couture (2010). The adjacent property to the northwest is developed with stores; the adjacent properties across the alley to the northeast and east are developed with stores and storage; the adjacent property to the southeast is developed with stores; the adjacent properties across Rodeo to the west and southwest are developed with stores

According to review of available historical data, it appears that the subject property was undeveloped as early as 1894 and developed with the existing structure in 1948. Since that time, various retail and office tenants have occupied the building. No environmental concerns were identified based on the historical review.

4.0 REGULATORY RECORDS REVIEW

4.1 Regulatory Agencies

4.1.1 Public Works Department

Regulatory Agency Data	
Name of Agency:	Los Angeles County Public Works Division (LACPWD)
Point of Contact:	N/A
Agency Address:	900 South Fremont Avenue, Alhambra, California
Agency Phone Number:	(626) 458-5100
Date of Contact:	September 10, 2017
Method of Communication:	Online
Summary of Communication:	

No records regarding hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on file with the LACPWD.

4.1.2 Fire Department

Regulatory Agency Data	
Name of Agency:	Los Angeles County Fire Department Public Health Investigations (LACPHI)
Point of Contact:	Records Desk; Lou A. Reyes
Agency Address:	5555 Ferguson Drive, Commerce, California
Agency Phone Number:	(323) 890-7801
Date of Contact:	September 10, 2017
Method of Communication:	Email
Summary of Communication:	

As of the date of this report, Partner has not received a response from the LACPHI for inclusion in this report. Based on the history and current use, LACPHI is not expected to have files.

4.1.3 Air Pollution Control Agency

Regulatory Agency Data	
Name of Agency:	South Coast Air Quality Management District (SCAQMD)
Point of Contact:	http://www3.aqmd.gov/webappl/fim/prog/search.aspx
Agency Address:	21865 Copley Drive, Diamond Bar, California
Agency Phone Number:	(909) 396-2000
Date of Contact:	September 10, 2017
Method of Communication:	Online Database
Summary of Communication:	

No Permits to Operate (PTO), Notices of Violation (NOV), or Notices to Comply (NTC) or the presence of AULs, dry cleaning machines, or USTs were on file for the subject property with the AQMD.

4.1.4 Regional Water Quality Agency

Regulatory Agency Data	
Name of Agency:	Regional Water Quality Control Board (RWQCB)
Point of Contact:	http://geotracker.waterboards.ca.gov/
Agency Address:	320 W 4th St #200, Los Angeles, CA 90013
Agency Phone Number:	(916) 323-2514
Date of Contact:	September 10, 2017
Method of Communication:	Online database
Summary of Communication:	

No records regarding hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on file with the RWQCB.

4.1.5 Department of Toxic Substances Control

Regulatory Agency Data	
Name of Agency:	California Department of Toxic Substances Control (DTSC)
Point of Contact:	http://www.envirostor.dtsc.ca.gov/public/ http://hwts.dtsc.ca.gov/report_search.cfm?id=5
Agency Address:	9211 Oakdale Avenue, Chatsworth
Agency Phone Number:	(877) 786-9427
Date of Contact:	September 10, 2017
Method of Communication:	Online database
Summary of Communication:	

No records regarding hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on file with the DTSC.

4.1.6 Building Department

Regulatory Agency Data	
Name of Agency:	Beverly Hills Building Department (BHBD)
Point of Contact:	N/A
Agency Address:	455 North Rexford, Beverly Hills
Agency Phone Number:	(310) 285-1124
Date of Contact:	September 10, 2017
Method of Communication:	In person
Summary of Communication:	Records were available for review, as summarized in the following table.

Building Records Reviewed for 456 North Rodeo Drive (Subject Property)		
Years	**Owner/Applicant**	**Description**
1947	Maude & Lloyd Miller	New 1-story store & mezzanine building
1949	Crawford	Music store

Additionally, numerous permits were on file for tenant improvements. No permits indicating the use of hazardous substances or USTs was on file at the BHBD.

4.1.7 Planning Department

Regulatory Agency Data	
Name of Agency:	Beverly Hills Planning Department (BHPD)
Point of Contact:	N/A
Agency Address:	455 North Rexford, Beverly Hills
Agency Phone Number:	(310) 285-1124
Date of Contact:	September 10, 2017
Method of Communication:	Email
Summary of Communication:	According to records reviewed, the subject property is zoned C-3 for commercial development by the City of Beverly Hills.

4.1.8 Oil & Gas Exploration

Regulatory Agency Data	
Name of Agency:	California Division of Oil, Gas and Geothermal Resources (DOGGR)
Point of Contact:	http://maps.conservation.ca.gov/doggr/index.html
Agency Address:	(916) 322-1080
Agency Phone Number:	September 10, 2017
Date of Contact:	Online Database
Method of Communication:	California Division of Oil, Gas and Geothermal Resources (DOGGR)
Summary of Communication:	

According to DOGGR, no oil or gas wells are located on or adjacent to the subject property.

4.1.9 Assessor's Office

Regulatory Agency Data	
Name of Agency:	Los Angeles County Assessor (LACA)
Point of Contact:	http://assessor.lacounty.gov/
Agency Address:	500 West Temple Street, Room 225, Los Angeles, California
Agency Phone Number:	(213) 974-3211
Date of Contact:	September 10, 2017
Method of Communication:	Online Database
Summary of Communication:	

According to records reviewed, the subject property is identified by Assessor Parcel Number (APN) 4343-016-002. The current building was constructed in 1948/1950 and totals approximately 5,000 square feet on a 0.175 lot.

4.2 Mapped Database Records Search

Information from standard federal, state, county, and city environmental record sources was provided by Environmental Data Resources, Inc. (EDR). Data from governmental agency lists are updated and integrated into one database, which is updated as these data are released. The information contained in this report was compiled from publicly available sources and the locations of the sites are plotted utilizing a geographic information system, which geocodes the site addresses. The accuracy of the geocoded locations is approximately +/-300 feet. Using the ASTM definition of migration, Partner considers the migration of hazardous substances or petroleum products in any form onto the subject property during the evaluation of each site listed on the radius report, which includes solid, liquid, and vapor. A copy of the EDR report is included as **Appendix C**.

4.2.1 Regulatory Database Summary

Radius Report Data

Database	Search Radius (mile)	Subject Property	Adjacent Properties	Sites of Concern
Federal NPL or Delisted NPL Site	1.00	N	N	N
SEMS	0.50	N	N	N
SEMS Archive	0.50	N	N	N
Federal RCRA CORRACTS Facility	1.00	N	N	N
Federal RCRA TSDF Facility	0.50	N	N	N
Federal RCRA Generators Site (LQG, SQG, CESQG)	0.25	N	N	N
Federal IC/EC Registries	0.50	N	N	N
Federal ERNS Site	Subject Property	N	N	N
State/Tribal Equivalent NPL	1.00	N	N	N
State/Tribal Equivalent CERCLIS	1.00	N	N	N
State/Tribal Landfill/Solid Waste Disposal Site	0.50	N	N	N
State/Tribal Leaking Storage Tank Site	0.50	N	N	N
State/Tribal Registered Storage Tank Sites (UST/AST)	0.25	N	N	N
State/Tribal Voluntary Cleanup Sites (VCP)	0.50	N	N	N
State/Tribal Spills	0.50	N	N	N
Federal Brownfield Sites	0.50	N	N	N
State Brownfield Sites	0.50	N	N	N
EDR MGP	Varies	N	N	N
EDR US Hist Auto Station	Varies	N	N	N
EDR US Hist Cleaners	Varies	N	**Y**	N

4.2.2 Subject Property

The subject property is not identified in the regulatory database report.

4.2.3 Adjacent Properties

The adjacent properties are not identified in the regulatory database report. The addresses 452, 438, and 451 Rodeo Drive were identified as EDR Historic Cleaners and Historic Autos in the regulatory database report in the years ranging from 1934 through 1939. However, based on the review of Sanborn maps, these addresses were not located adjacent to the subject property during that time frame and the historic use is not considered to be an environmental concern for the subject property.

Based on the findings, vapor migration is not expected to represent a significant environmental concern at this time.

4.2.4 Site Vicinity

Partner reviewed the EDR database report to identify offsite facilities that have suspected or documented environmental concerns or RECs that may negatively impact the subject property. Partner's criteria for further evaluating the potential impact of a listed offsite facility are summarized below:

- The listed offsite facility is documented or assumed to be hydrogeologically upgradient and a likely pathway exists for known releases of environmentally mobile contaminants to reach the subject property; or, contaminants from the listed offsite facility can reach the subject through other pathways (i.e., surface runoff); and,
- The offsite facility is listed as an open case on one of the following databases: Federal NPL, Federal CORRACTS, Federal CERCLIS, Federal ERNS, and State-Specific lists including, but not limited to State Hazardous Waste Sites, State SCL, State LUST, State Deed Restrictions, State Toxic Pits, Landfill (excluding transfer stations); or
- The facility is a known or suspected concern based on Partner's experience or observations made during the site reconnaissance. (i.e., Dry-cleaning operations that may or may not be listed as RCRA-SQG or a non-adjacent UST site that appears to have a remediation system in place).

Partner did not identify facilities that, using the criteria discussed above, appeared to be a potential concern.

4.2.5 Unmapped Sites

Partner reviewed EDR's Orphan Summary, which is a listing of sites that have not been geocoded based on lack of sufficient data regarding their exact location within the general area. The subject property was not identified as an Unmapped Site. None of the Unmapped Sites identified on the Orphan Summary appear to be located within the ASTM-designated radii of the subject property, and therefore, Partner has no reason to believe that these sites had an impact on the subject property.

4.3 Vapor Encroachment Screening

Partner reviewed the environmental database records identified in the EDR Radius Report and evaluated each reported site relative to a subsurface vapor encroachment condition, respective a known release, the chemicals of concern, the distance that contaminants are likely to migrate based on local geological and

hydrological conditions, sub-grade utility corridors and preferential pathways, structural components, mitigation devices, and other reasonable factors.

The subsurface vapor encroachment screening was completed in general conformance with ASTM International Designation: E2600-15: *Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions* ("ASTM Guide E2600-15") using Tier 1 Screening procedures.

4.3.1 On-Site Sources for a Vapor Encroachment Condition

Based on a review of previous reports, agency records, and current site observations, on-site sources with the potential to create a subsurface vapor encroachment concern to the subject property and its receptors were not identified. As such, a subsurface vapor encroachment condition on the subject property relative to an on-site contaminant source does not exist.

4.3.2 Off-Site Sources for a Vapor Encroachment Condition

Based on Partner's review of the Radius Report, no off-site properties with the potential to create a subsurface vapor encroachment concern to the subject property and its receptors were identified. No off-site properties with a documented open release of petroleum hydrocarbons were identified within the critical distance - 30 feet up-gradient, cross-gradient, or down-gradient of the subject property in the Radius Report. No off-site properties with a documented release of other contaminants of concern such chlorinated volatile organic hydrocarbons were identified within the critical distance - 100 feet up-gradient, cross-gradient, or down-gradient of the subject property in the Radius Report.

Based on the physical setting of the subject property and the findings from historical and regulatory records review, an off-site source for a subsurface vapor encroachment condition was not identified in association with the subject property. As such, a subsurface vapor encroachment condition on the subject property relative to off-site contaminant source does not exist.

5.0 USER PROVIDED INFORMATION AND INTERVIEWS

In order to qualify for one of the Landowner Liability Protections (LLPs) offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the Brownfields Amendments), the User must provide the following information (if available) to the environmental professional. Failure to provide this information could result in a determination that all appropriate inquiry is not complete. The user is asked to provide information or knowledge of the following:

- Environmental cleanup liens that are filed or recorded against the site.
- Activity and land use limitations that are in place on the site or that have been filed or recorded in a registry.
- Specialized knowledge or experience of the person seeking to qualify for the LLPs.
- Relationship of the purchase price to the fair market value of the *property* if it were not contaminated.
- Commonly known or *reasonably ascertainable* information about the *property*.
- The degree of obviousness of the presence or likely presence of contamination at the *property*, and the ability to detect the contamination by appropriate assessment.
- The reason for preparation of this Phase I ESA.

Fulfillment of these user responsibilities is key to qualification for the identified defenses to CERCLA liability. Partner requested our Client to provide information to satisfy User Responsibilities as identified in Section 6 of the ASTM guidance.

5.1 Interviews

5.1.1 Interview with Owner

The owner of the subject property since 1965, identified as Karl B Schurz Trust, was not available to be interviewed at the time of the assessment.

5.1.2 Interview with Report User

Please refer to Section 5.2 below for information requested from the Report User. Because the Report User is a buyer, it is understood that the Report User would not have knowledge of the property that would significantly impact our ability to satisfy the objectives of this assessment. The lack of this information is not considered to represent a significant data gap.

5.1.3 Interview with Key Site Manager

Mr. Gary Gramer, key site manager, indicated that he had no information pertaining to any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the subject property; any pending, threatened, or past administrative proceedings relevant to hazardous substances or petroleum products in, on, or from the subject property; or any notices from a governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products.

According to Mr. Gramer, the subject property was developed in the late 1940s for retail use. Prior to that, the subject property was undeveloped. Mr. Gramer further stated that there are no USTs, ASTs,

clarifiers, oil/water separators, groundwater monitoring wells, or hazardous substance use/storage/generation on the subject property to the best of his knowledge.

5.1.4 Interviews with Past Owners, Operators and Occupants

Interviews with past owners, operators and occupants were not conducted since information regarding the potential for contamination at the subject property was obtained from other sources.

5.1.5 Interview with Others

As the subject property is not an abandoned property as defined in ASTM 1527-13, interview with others were not performed.

5.2 User Provided Information

5.2.1 Title Records, Environmental Liens, and AULs

Partner was provided by Sterling with a Commitment for Title Insurance issued by Commonwealth Land Title Company and dated August 11, 2017. According to the Commitment for Title Insurance, the title to the subject property is currently vested in the Karl B. Schurz Separate Property Trust, under Declaration of Trust dated December 10, 1986. No apparent environmental liens or AULs were identified for the subject property based on the review of the Commitment for Title Insurance.

5.2.2 Specialized Knowledge

No specialized knowledge of environmental conditions associated with the subject property was provided by the User at the time of the assessment.

5.2.3 Actual Knowledge of the User

No actual knowledge of any environmental lien or AULs encumbering the subject property or in connection with the subject property was provided by the User at the time of the assessment.

5.2.4 Valuation Reduction for Environmental Issues

No knowledge of valuation reductions associated with the subject property was provided by the User at the time of the assessment.

5.2.5 Commonly Known or Reasonably Ascertainable Information

The User did not provide information that is commonly known or *reasonably ascertainable* within the local community about the subject property at the time of the assessment.

5.2.6 Previous Reports and Other Provided Documentation

No previous reports or other pertinent documentation was provided to Partner for review during the course of this assessment.

6.0 SITE RECONNAISSANCE

The weather at the time of the site visit was sunny and clear. Refer to Section 1.5 for limitations encountered during the field reconnaissance and Sections 2.1 and 2.2 for subject property operations. The table below provides the site assessment details:

Site Assessment Data	
Site Assessment Performed By:	Colin Donohue
Site Assessment Conducted On:	October 10, 2017

The table below provides the subject property personnel interviewed during the field reconnaissance:

Site Visit Personnel for 456 North Rodeo Drive (Subject Property)			
Name	**Title/Role**	**Contact Number**	**Site Walk* Yes/No**
Gary Gramer	Key Site Manager	(310) 477-7502	Yes

* Accompanied Partner during the field reconnaissance activities and provided information pertaining to the current operations and maintenance of the subject property.

6.1 General Site Characteristics

6.1.1 Solid Waste Disposal

Solid waste generated at the subject property is disposed in commercial dumpsters located on the northeast side of the building. An independent solid waste disposal contractor removes solid waste from the subject property. No evidence of illegal dumping of solid waste was observed during the Partner site reconnaissance.

6.1.2 Sewage Discharge and Disposal

Sanitary discharges on the subject property are directed into the municipal sanitary sewer system operated by the Town of Beverly Hills. According to building records, the subject property was connected to the municipal sanitary sewer system in 1948. No wastewater treatment facilities or septic systems are located on the subject property.

6.1.3 Surface Water Drainage

Storm water is removed from the subject property primarily by sheet flow action across the paved surfaces towards storm water drains located throughout the subject property and in the public right of way. Site storm water from roofs, landscaped areas, and paved areas is directed to on-site concrete swales, which drain to the public right of way, and to on-site storm water drains. The subject property is connected to a municipal owned and maintained sewer system.

The subject property does not appear to be a designated wetland area, based on information obtained from the United States Department of Agriculture. A comprehensive wetlands survey would be required in order to formally determine actual wetlands on the subject property. No surface impoundments, wetlands, natural catch basins, settling ponds, or lagoons are located on the subject property. No drywells were identified on the subject property.

6.1.4 Source of Heating and Cooling

Heating and cooling systems as well as domestic hot water equipment are fueled by electricity/ natural gas provided by Edison and the Gas Company.

6.1.5 Wells and Cisterns

No aboveground evidence of wells or cisterns was observed during the site reconnaissance.

6.1.6 Wastewater

Domestic wastewater generated at the subject property is disposed by means of the sanitary sewer system. No industrial process is performed at the subject property.

6.1.7 Septic Systems

No septic systems were observed or reported on the subject property.

6.1.8 Additional Site Observations

No additional general site characteristics were observed during the site reconnaissance.

6.2 Potential Environmental Hazards

6.2.1 Hazardous Substances and Petroleum Products Used or Stored at the Site

No evidence of the use of reportable quantities of hazardous substances was observed on the subject property. Small quantities of paints were found to be properly labeled and stored at the time of the assessment with no signs of leaks, stains, or spills. The storage and use of maintenance supplies does not appear to pose a significant threat to the environmental integrity of the subject property at this time.

6.2.2 Aboveground & Underground Hazardous Substance or Petroleum Product Storage Tanks (ASTs/USTs)

No evidence of current or former ASTs or USTs was observed during the site reconnaissance.

6.2.3 Evidence of Releases

No spills, stains or other indications that a surficial release has occurred at the subject property were observed.

6.2.4 Polychlorinated Biphenyls (PCBs)

Older transformers and other electrical equipment could contain PCBs at a level that subjects them to regulation by the U.S. EPA. PCBs in electrical equipment are controlled by United States Environmental Protection Agency regulations 40 CFR, Part 761. Under the regulations, there are three categories into which electrical equipment can be classified: 1) Less than 50 parts per million (ppm) of PCBs – "*Non-PCB;*" 2) 50 ppm-500 ppm – "*PCB-Contaminated;*" and, 3) Greater than 500 ppm – "*PCB-Containing.*" The manufacture, process, or distribution in commerce or use of any PCB in any manner other than in a totally enclosed manner was prohibited after January 1, 1977.

Partner observed one hydraulic motor associated with an elevator. No stains or other signs that a release of hydraulic fluid have occurred were observed. Based on the good condition of the equipment, the hydraulic elevator motor is not considered to represent a significant environmental concern.

No other potential PCB-containing equipment (interior transformers, oil-filled switches, hoists, lifts, dock levelers, balers, etc.) was observed on the subject property during Partner's reconnaissance.

6.2.5 Strong, Pungent or Noxious Odors

No strong, pungent or noxious odors were evident during the site reconnaissance.

6.2.6 Pools of Liquid

No pools of liquid were observed on the subject property during the site reconnaissance.

6.2.7 Drains, Sumps and Clarifiers

No drains, sumps, or clarifiers, other than those associated with storm water removal, were observed on the subject property during the site reconnaissance.

6.2.8 Pits, Ponds and Lagoons

No pits, ponds or lagoons were observed on the subject property.

6.2.9 Stressed Vegetation

No stressed vegetation was observed on the subject property.

6.2.10 Additional Potential Environmental Hazards

No additional environmental hazards, including landfill activities or radiological hazards, were observed.

6.3 Non-ASTM Services

6.3.1 Asbestos-Containing Materials (ACMs)

Asbestos is the name given to a number of naturally occurring, fibrous silicate minerals mined for their useful properties such as thermal insulation, chemical and thermal stability, and high tensile strength. The Occupational Safety and Health Administration (OSHA) regulation 29 CFR 1926.1101 requires certain construction materials to be presumed to contain asbestos, for purposes of this regulation. All thermal system insulation (TSI), surfacing material, and asphalt/vinyl flooring that are present in a building constructed prior to 1981 and have not been appropriately tested are "presumed asbestos-containing material" (PACM).

The subject property building was constructed in 1948/1950. Partner has conducted a limited, visual evaluation of accessible areas for the presence of suspect ACMs at the subject property. The objective of this visual survey was to note the presence and condition of suspect ACM observed. Please refer to the table below for identified suspect ACMs:

Suspect ACMs			
Suspect ACM	**Location**	**Friable Yes/No**	**Physical Condition**
Drywall Systems	Throughout Building Interior	No	Good
Floor Tiles	Elevator Equipment Room	No	Good
Floor Tile Mastic	Elevator Equipment Room	No	Good

Partner observed an approximately 2 SF area of damaged ceiling drywall on the ceiling of the mezzanine level. According to Mr. Gary Gramer, the HVAC equipment on the rooftop had leaked, but that the roof leak had been repaired.

The limited visual survey consisted of noting observable materials (materials which were readily accessible and visible during the course of the site reconnaissance) that are commonly known to potentially contain asbestos. This activity was not designed to discover all sources of suspect ACM, PACM, or asbestos at the site; or to comply with any regulations and/or laws relative to planned disturbance of building materials such as renovation or demolition, or any other regulatory purpose. Rather, it is intended to give the User an indication if significant (significant due to quantity, accessibility, or condition) potential sources of ACM or PACM are present at the subject property. Additional sampling, assessment, and evaluation will be warranted for any other use.

Partner was not provided building plans or specifications for review, which may have been useful in determining areas likely to have used ACM.

According to the US EPA, ACM and PACM that is intact and in good condition can, in general, be managed safely in-place under an Operations and Maintenance (O&M) Program until removal is dictated by renovation, demolition, or deteriorating material condition. Prior to any disturbance of the construction materials within this facility, a comprehensive ACM survey is recommended.

6.3.2 Lead-Based Paint (LBP)

Lead is a highly toxic metal that affects virtually every system of the body. LBP is defined as any paint, varnish, stain, or other applied coating that has 1 mg/cm^2 (or 5,000 ug/g or 0.5% by weight) or more of lead.

Based on the age of the subject property building (pre-1978), there is a potential that LBP is present. Interior and exterior painted surfaces were observed in good condition and therefore not expected to represent a "hazard," although the condition of the paint should be monitored and maintained to ensure that it does not become deteriorated.

Actual material samples would need to be collected in order to determine if LBP is present.

6.3.3 Radon

Radon is a colorless, odorless, naturally occurring, radioactive, inert, gaseous element formed by radioactive decay of radium (Ra) atoms. The US EPA has prepared a map to assist National, State, and local organizations to target their resources and to implement radon-resistant building codes. The map divides the country into three Radon Zones, according to the table below:

EPA Radon Zones		
EPA Zones	**Average Predicted Radon Levels**	**Potential**
Zone 1	Exceed 4.0 pCi/L	Highest
Zone 2	Between 2.0 and 4.0 pCi/L	Moderate
Zone 3	Less than 2.0 pCi/L	Low

It is important to note that the EPA has found homes with elevated levels of radon in all three zones, and the US EPA recommends site-specific testing in order to determine radon levels at a specific location. However, the map does give a valuable indication of the propensity of radon gas accumulation in structures.

Radon sampling was not conducted as part of this assessment. Review of the US EPA Map of Radon Zones places the subject property in Zone 2. Based upon the radon zone classification and commercial use, radon is not considered to be a significant environmental concern.

6.3.4 Lead in Drinking Water

According to available information, a public water system operated by the City of Beverly Hills Public Works Department (BHPWD) serves the subject property vicinity. According to a representative of the BHPWD, shallow groundwater directly beneath the subject property is not utilized for domestic purposes. The sources of public water for the City of Beverly Hills are surface water from northern California, deep groundwater and the Colorado River. According to the City of Beverly Hills and the 2015 Annual Water Quality Report, water supplied to the subject property is in compliance with all State and Federal regulations pertaining to drinking water standards, including lead and copper. Water sampling was not conducted to verify water quality.

6.3.5 Microbial Growth

Microbial growths are microscopic organisms found virtually everywhere, indoors and outdoors. Microbial growths will grow and multiply under the right conditions, needing only sufficient moisture (e.g.in the form of very high humidity, condensation, or water from a leaking pipe, etc.) and organic material (e.g., ceiling tile, drywall, paper, or natural fiber carpet padding).

Partner observed accessible, interior areas of the subject property building for significant evidence of microbial growth with the exceptions detailed in Section 1.5 of this report; however, this ESA should not be used as a microbial growths survey or inspection. This limited assessment was not designed to assess all areas of potential microbial growth that may be affected by microbial growth on the subject property. Rather, it is intended to give the client an indication as to whether or not conspicuous (based on observed areas) microbial growth is present at the subject property. This evaluation did not include a review of pipe chases, mechanical systems, or areas behind enclosed walls and ceilings.

Minor water damage was noted on the ceiling of the mezzanine. Minor impact to the floor tiles was noted in this area.

No other obvious indications of water damage were observed during Partner's visual assessment.

6.4 Adjacent Property Reconnaissance

The adjacent property reconnaissance consisted of observing the adjacent properties from the subject property premises. No items of environmental concern were identified on the adjacent properties during the site assessment, including hazardous substances, petroleum products, ASTs, USTs, evidence of releases, PCBs, strong or noxious odors, pools of liquids, sumps or clarifiers, pits or lagoons, stressed vegetation, or any other potential environmental hazards.

7.0 FINDINGS AND CONCLUSIONS

Findings

A *recognized environmental condition (REC)* refers to the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: due to release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment.

- Partner did not identify recognized environmental conditions during the course of this assessment.

A *controlled recognized environmental condition (CREC)* refers to a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls. The following was identified during the course of this assessment:

- Partner did not identify controlled recognized environmental conditions during the course of this assessment.

A *historical recognized environmental condition (HREC)* refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. The following was identified during the course of this assessment:

- Partner did not identify historical recognized environmental conditions during the course of this assessment.

An *environmental issue* refers to environmental concerns identified by Partner, which do not qualify as RECs; however, warrant further discussion. The following was identified during the course of this assessment:

- Due to the age of the subject property building, there is a potential that asbestos-containing material (ACM) and/or lead-based paint (LBP) are present. Overall, all suspect ACMs and painted surfaces were observed in good condition and do not pose a health and safety concern to the occupants of the subject property at this time. Partner observed an approximately 2 square foot area of damaged ceiling drywall on the ceiling of the mezzanine level. According to Mr. Gary Gramer, the HVAC equipment on the rooftop had leaked, but that the roof leak had been repaired. Should these materials be replaced, the identified suspect ACMs would need to be sampled to confirm the presence or absence of asbestos prior to any renovation or demolition activities to prevent potential exposure to workers and/or building occupants.

Conclusions, Opinions and Recommendations

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 and Sterling Organization of 456 North Rodeo Drive in the Town of Beverly Hills, Los Angeles County, California (the "subject property"). Any exceptions to or deletions from this practice are described in Section 1.5 of this report.

This assessment has revealed no evidence of recognized environmental conditions in connection with the subject property. Environmental issues as described above were identified. Based on the conclusions of this assessment, Partner recommends:

- An Operations and Maintenance (O&M) Program should be implemented in order to safely manage the suspect ACMs and LBP located at the subject property.

8.0 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

Partner has performed a Phase I Environmental Site Assessment of the property located at 456 North Rodeo Drive in the City of Beverly Hills, Los Angeles County, California in general conformance with the scope and limitations of the protocol and the limitations stated earlier in this report. Exceptions to or deletions from this protocol are discussed earlier in this report.

By signing below, Partner declares that, to the best of our professional knowledge and belief, we meet the definition of *Environmental Professional* as defined in §312.10 of 40 CFR §312. Partner has the specific qualifications based on education, training, and experience to assess a *property* of the nature, history, and setting of the subject *property*. Partner has developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Copies of the resumes of those involved in the preparation of this report are provided in **Appendix D**.

This report has been prepared, under the responsible charge of the Environmental Professional identified below, by:

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Partner Engineering and Science, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

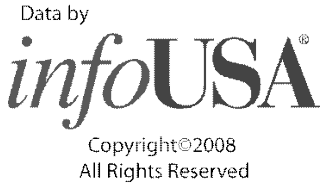
EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.



Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 332 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

EDR Historical Topo Map Report

08/30/17

Site Name:

456 North Rodeo Drive
456 North Rodeo Drive
Beverly Hills, CA 90210
EDR Inquiry # 5037798.4

Client Name:

Partner Engineering and Science, Inc.
2154 Torrance Blvd, Suite 200
Torrance, CA 90501-0000
Contact: Colleen Tubridy

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Partner Engineering and Science, Inc. were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Search Results:

P.O.# NA
Project: 17-195790.1

Coordinates:

Latitude:	34.070485 34° 4' 14" North
Longitude:	-118.403718 -118° 24' 13" West
UTM Zone:	Zone 11 North
UTM X Meters:	370471.99
UTM Y Meters:	3770860.25
Elevation:	263.80' above sea level

DEPARTMENT OF BUILDINGS

Application for the Erection of Buildings

ZONE_____ FIRE DISTRICT_____ TYPE_____ GROUP_____ DIVISION_____

TO THE CITY COUNCIL OF THE CITY OF BEVERLY HILLS:

Application is hereby made to the Council of the City of Beverly Hills, through the office of the Chief Inspector of Buildings for a permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which shall be deemed conditions entering into the exercise of the permit:

FIRST: That the permit does not grant any right or privilege to erect any building or other structure herein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

SECOND: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Beverly Hills.

THIRD: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

FOURTH: Applicant agrees to hold the City of Beverly Hills, and all officers and employees harmless from all costs and damages, per Sec. 11-206(f), Beverly Hills Municipal Code.

Lot No. 3 Block 2 Tract ~~City of Beverly Hills~~ Bev.

Description of Work New 1 Story & Mezz. Bldg.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting

the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/12/2016 has revealed that there are 3 RCRA-LQG sites within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/12/2016 has revealed that there are 14 RCRA-SQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where

environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 07/31/2017 has revealed that there are 4 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, has revealed that there is 1 SWF/LF site within approximately 0.5 miles of the target property.

SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the SLIC list, as provided by EDR, has revealed that there is 1 SLIC site within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 2 UST sites within approximately 0.25 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 8 SWEEPS UST sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 14 EDR Hist Auto sites within approximately 0.125 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 17 EDR Hist Cleaner sites within approximately 0.125 miles of the target property.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 04/05/2017
Date Data Arrived at EDR: 04/21/2017

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 04/05/2017

Next Scheduled EDR Contact: 10/16/2017
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 04/05/2017

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/07/2016

Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 02/09/2017

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.
