1 SUMMARY

This report summarizes the results of a biological resources assessment Rocks Biological Consulting (RBC) conducted for the Olive Avenue Development Project (project) in the City of Rialto, San Bernardino County, California (Figures 1, 2). The approximately 34.27-acre project site is a largely disturbed area composed of disked roadways, patches of non-native grassland, and disturbed Riversidean sage scrub (Figure 5). None of these habitat types are considered to be rare. The site does not provide habitat expected to support special-status plant species, nor have special-status plant species been observed in floristic surveys conducted previously (DEIR 2010).

The site supports suitable foraging habitat for one California Department of Fish and Wildlife (CDFW) Species of Special Concern (SSC), burrowing owl (*Athene cunicularia*), and has moderate potential to support breeding of the species. The site has low potential to support the San Bernardino kangaroo rat (*Dipodomys merriami parvus;* federally and state-listed as endangered) and the coastal California gnatcatcher (*Polioptila californica californica*; federally listed as threatened). The site has no potential to support the Delhi Sands flower-loving fly (*Raphiomidas terminatus abdominalis*; federally listed as endangered).

The site does not support riparian habitat types, waters, or non-wetland waters that could be considered to be jurisdictional by the United States Army Corps of Engineers (Corps), Santa Ana Regional Water Quality Control Board (RWQCB), or the CDFW.

The proposed project would permanently impact approximately 31.34 acres through the construction of buildings and associated parking. Impacts on biological resources would be less-than significant with implementation of pre-construction surveys for burrowing owl and avoidance of vegetation clearing and ground disturbing activities during the nesting season (February 1 to August 31), as outlined in this report.

2 INTRODUCTION

2.1 PROJECT LOCATION

The approximately 34.27-acre project site is located in the City of Rialto, San Bernardino County, California (Figure 1). The site is bounded by Base Line Road to the south, Cactus Avenue to the east, Fitzgerald Avenue to the west and Jerry Eaves Park to the north (Figure 2).

2.2 PROJECT OVERVIEW

PR/CHI Olive Grove, LLC (Owner) is proposing to develop an existing vacant property (location as referenced above) that would include the construction of a campus oriented industrial project with two primary, divisible buildings consisting of approximately 10,000 square feet of office/mezzanine space, 866 square feet for exterior building sprinkler fire pumps, and 668,741 square feet of warehouse space for a total of 679,607 square feet on approximately 31.08 net acres. The Owner is proposing to split the existing property (referenced as Assessor Parcel No. (APN) 0264-213-18) from one large lot into two lots to allow for each of the two proposed buildings to each have their own legal parcel. Building 1 (west building) and Building 2 (east building) have been architecturally

designed to allow for multiple units in various increments based on tenant demand. Building 1 can be divided into 4 or more units and Building 2 can be divided into 3 or more units, each with a separate point of entry into the buildings.

The City requires that based on the uses being proposed by the Owner, the project would require 414 automobile parking spaces. The project proposes 505 automobile parking spaces, as well as 122 total trailer parking spaces. Table 1, Buidling Site Summary, summarizes the automobile and loading docks required by the City and proposed for each building.

Table 1. Building Site Summary

Building	Warehouse (sf)	Office Mezzanine (sf)	Fire Pump	Total Building (sf)	Automobile Parking Stalls		Loading Docks Required	Loading Docks Provided
					Required	Provided		
Building 1	425,148	5,000	433	430,581	256	308	7	48
Building 2	243,593	5,000	433	249,026	158	197	5	31

The proposed buildings are currently planned as “speculative buildings”, meaning that there are not business uses identified for the buildings. Without knowing the specifics in terms of the future tenants or buyers, the project is mandated to provide the parking (auto and trailer parking) as shown in Table 1. Therefore, the Environmental Impact Report (EIR) and associated technical reports will use the City approved numbers of the approximate potential on-site employees, hours of operation, and vehicular traffic generation based on the project’s proposed square footage and use as warehouse buildings as dictated by the City guidelines.

2.3 SCOPE OF WORK

This report provides and analysis of impacts on biological resources associated with the proposed project in the context of County of San Bernardino (County) Land Use Regulations, the California Environmental Quality Act (CEQA; Public Resources Code § 21000 et seq.), and state and federal regulations such as the federal Endangered Species Act (ESA; 16 U.S. Code [USC] § 1531 et seq.), Clean Water Act (CWA; 33 USC § 1252 et seq.), and the California Fish and Game Code (CFGC). A Draft Environmental Impact Report (DEIR) was previously prepared for the project (Golder Associates, Inc. 2010).

For this analysis, the following tasks were performed: (1) General biological surveys; (2) Vegetation mapping; (3) Habitat assessments for special-status species, including coastal California gnatcatcher and Delhi Sands flower-loving fly; and (4) Focused surveys for burrowing owl surveys; (5) United States Fish and Wildlife Service (USFWS) protocol surveys for San Bernardino kangaroo rat; and (6) A reconnaissance-level assessment for aquatic resources that are potentially jurisdictional under the Corps pursuant to Section 404 of the CWA, under the RWQCB pursuant to section 401 of the CWA and the Porter-Cologne Water Quality Control Act (Porter-Cologne Act; Water Code Section 13000 et seq.), and under CDFW pursuant to Section 1602 of the CFGC.

2.4 EXISTING CONDITIONS

The project site was previously disked along disturbed roadways and is composed of hard-packed soil, gravel, and cobble (Figure 5). Remaining areas are composed of non-native grassland habitat dominated by filaree (*Erodium botrys*), ripgut brome (*Bromus diandrus*), red brome (*Bromus rubens*), and slender wild oats (*Avena barbata*). The site also supports areas of disturbed Riversidean sage scrub dominated by California sagebrush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), and deerweed (*Acmispon glaber*). Site photographs are presented in Appendix B.

2.5 REGULATORY FRAMEWORK

Several regulations, listed below, have been established by federal, state, and local agencies to protect and conserve biological resources. Detailed descriptions of agency regulations that may be applicable to the project are provided in Appendix A.

Federal Regulations

- Federal Endangered Species Act
- Migratory Bird Treaty Act (MBTA), note proposed rule change January 30, 2020
- Rivers and Harbors Appropriation Act of 1899
- Clean Water Act

State Regulations

- California Endangered Species Act
- California Environmental Quality Act
- Native Plant Protection Act and Natural Community Conservation Planning Act
- California Fish and Game Code Sections 1600-1602
- California Fish and Game Code Sections 3503, 3511, 3513, 3800, 4700, 5050, and 5515
- Porter-Cologne Water Quality Control Act

Regional and Local Plans

- County of San Bernardino Land Use Services, Planning Division

3 METHODS

RBC visited the project site on April 15, 2019 to conduct general biological surveys, vegetation mapping, habitat assessments for special-status plant and wildlife species including the burrowing owl, coastal California gnatcatcher, Delhi Sands flower-loving fly, and the San Bernardino kangaroo rat, and examine the potential for jurisdictional wetlands/waters of the U.S. The biological study area includes the entire 34.27-acre project site plus a 100-foot buffer around the site.

3.1 BIOLOGICAL RESOURCE DATABASE REVIEW

RBC queried the CDFW's California Natural Diversity Database (CNDDB) (CDFW 2019) and the database of threatened/endangered USFWS species (USFWS 2019) for a one-mile radius around

the project site. RBC queried the California Native Plant Society (CNPS) Electronic Inventory (CNPS 2019) for the nine USGS 7.5-minute quadrangles surrounding the project site for the elevation range of 1,100 to 1,500 feet above median sea level. RBC also queried the Natural Resources Conservation Service (NRCS) (USDA 2019) for the soils present within the project site and consulted the County of San Bernardino's Biotic Resources Overlay Map (County of San Bernardino 2012) for biotic resources overlay zones within the project site and biological resources with potential to occur within the project site. Lastly, RBC reviewed the Manual of California Vegetation Online (CDFW, https://wildlife.ca.gov/Data/VegCAMP/Related accessed January 2020) to determine ranking of the natural communities present on-site.

3.2 VEGETATION MAPPING AND GENERAL PLANT AND WILDLIFE SURVEYS

RBC conducted a general field survey on April 15, 2019 by walking transects spaced 7-10 meters (20-30 feet) through the project area and a 100-foot buffer. Binoculars (10 x 42) were used to aid in the observation of avian species during the survey. Plants were identified using The Jepson Manual 2nd Edition (Baldwin et al. 2012) and local botanical knowledge. All plant and wildlife species observed on the project site are presented in Appendix C.

Vegetation mapping took place directly on a 150-scale (1" = 150') aerial photograph following *Preliminary Descriptions of the Terrestrial Natural Communities of California* (Holland 1986). RBC mapped vegetation within the project site and identified flora and fauna for inclusion in plant and wildlife compendia for the project site. We also compared our results to current CDFW lists of Natural Communities to determine if any communities present are classified as sensitive.

3.3 BURROWING OWL HABITAT ASSESSMENT AND SURVEYS

RBC assessed burrowing owl (BUOW) habitat in accordance with the *Staff Report on Burrowing Owl Mitigation* (CDFW 2012; referred to herein as the Guidelines). Suitable burrowing owl habitat can be found in annual and perennial grasslands, deserts, and scrublands characterized by low-growing vegetation (Zarn 1974). Suitable owl habitat may also include trees and shrubs if the canopy covers less than 30 percent of the ground surface. Burrows are the essential component of burrowing owl habitat; both natural and artificial burrows provide protection, shelter, and nests for burrowing owl (Henny and Blus 1981). Burrowing owls typically use burrows made by rodents, such as ground squirrels, or badgers but may also use human-made structures, such as concrete culverts; concrete, asphalt, or wood debris piles; or openings beneath concrete or asphalt pavement.

In accordance with the Guidelines, RBC conducted four protocol presence/absence burrowing owl surveys during the breeding season (February 1 to August 31). RBC conducted the surveys at least three weeks apart with one survey conducted between February 15 and April 15, and one survey conducted after June 15. RBC did not conduct surveys during rain, dense fog, or in winds greater than 20 miles per hour.

RBC walked transects spaced 7-20 meters (20-60 feet) apart through the project site searching for BUOW, active and potential burrows, and/or BUOW sign. RBC examined all suitable burrows for

sign, including feathers, pellets, whitewash, and/or prey remains. RBC considered a burrow active if evidence of recent sign was present.

3.4 COASTAL CALIFORNIA GNATCATCHER HABITAT ASSESSMENT AND SURVEYS

Coastal California gnatcatchers are year-round residents of southern California found in the six southernmost California counties (Ventura, Los Angeles, Orange, Riverside, San Bernardino, and San Diego) located within the coastal plain. The species typically occur in coastal sage scrub communities dominated by California sagebrush and California buckwheat. This species is typically found in stands of sage scrub that have moderate shrub canopy cover, generally greater than 50 percent (Beyers and Wirts 1997). Gnatcatcher will use sparsely vegetated sage scrub as long as perennial shrubs are available, although there appears to be a minimum cover threshold below which the habitat becomes unsuitable (USFWS 2007). RBC conducted a habitat assessment by surveying for suitable sage scrub habitat on-site.

On September 9, 2019, RBC sent a pre-survey notification letter to the Carlsbad USFWS field office stating the intent to conduct coastal California gnatcatcher surveys for the proposed project. Survey methodology followed the USFWS protocol for non-NCCP areas, which requires nine protocol surveys during the non-breeding season (September 1 to February 14), spaced at least two weeks apart (USFWS 1997).

RBC biologists Ian Hirschler (authorized under TE-063230-5.4) and Sarah Krejca (TE-99413B-0) conducted nine surveys between September 12, 2019 and January 2, 2020 within all suitable habitat within the project site. RBC used taped vocalizations to elicit a gnatcatcher response.

3.5 DELHI SANDS FLOWER-LOVING FLY HABITAT ASSESSMENT

Delhi Sands flower-loving fly is most commonly observed in sandy areas composed of Delhi fine sand with sparse cover of native shrubs (USFWS 2008). The primary nectar source for the Delhi Sands flower-loving fly is California buckwheat (USFWS 1997). Since several historical occurrences occur within one mile of the project site, RBC conducted a habitat assessment by surveying for suitable Delhi fine sand soil and potential Delhi Sands flower-loving fly nectar sources within the project site. No focused surveys for Delhi Sands flower-loving fly were conducted.

3.6 SAN BERNARDINO KANGAROO RAT HABITAT ASSESSMENT AND SURVEYS

San Bernardino kangaroo rat (SBKR) is most commonly associated with alluvial fan scrub habitat (USFWS 2009). Alluvial fan scrub is a subtype of Riversidean sage scrub, though with more riparian species (Holland 1986). The habitat type generally occurs on xeric sites with severely drained soils. Since SBKR has multiple historic occurrences within one mile of the project site, RBC conducted a habitat assessment by surveying for suitable habitat, suitable burrows, and SBKR sign (e.g., tail drags, scat, or seed caches).

On September 11, 2019, RBC sent a pre-survey notification letter to the Carlsbad USFWS field office stating the intent to conduct SBKR surveys for the proposed project. A live-trapping survey

was carried out over five consecutive nights from September 22-27, 2019. The live trapping effort used large (3 x 3.75 x12") Sherman live-traps with doors shortened to avoid tail damage. RBC set 200 traps throughout potential SBKR habitat. Traps were open and baited with bird seed within one hour of sunset and checked in the morning. Any animals caught were identified and immediately released. RBC accrued a total of 1,000 trap-nights during the field survey. A trap-night is defined as the number of traps set multiplied by the number of daily trap periods (Hoffmann et al. 2010). Dr. Phil Brylski (TE-148555-2) conducted the trapping.

3.7 INITIAL AQUATIC RESOURCE ASSESSMENT

RBC conducted a reconnaissance-level assessment to identify potential areas that may be considered jurisdictional under the Corps pursuant to Section 404 of the CWA; jurisdictional under the RWQCB pursuant to Section 401 of the CWA and the Porter-Cologne Act; and streambed and riparian habitats under the CDFW pursuant to CFGC 1602. No formal jurisdictional delineation was conducted as part of this effort.

4 RESULTS

4.1 VEGETATION MAPPING AND GENERAL PLANT AND WILDLIFE SURVEY RESULTS

The study area is approximately 34.27 acres and is composed of developed land (2.74 acres), disturbed land (7.83 acres), disturbed Riversidean sage scrub (17.09 acres), eucalyptus woodland (0.27 acres), non-native grassland (3.79 acres), and ruderal habitat (2.55 acres). The six vegetation communities/land uses that occur within the project site or its adjacent buffer are detailed below and shown on Figure 5.

DEVELOPED

Developed areas within the study area are composed of sidewalk and portions of Base Line Road.

DISTURBED

Disturbed habitat is present throughout the project site. Disturbed areas have been physically altered and are no longer recognizable as a native or naturalized vegetation association. Disturbed habitat on-site includes the disked roadways between patches of vegetation.

DISTURBED RIVERSIDEAN SAGE SCRUB

Riversidean sage scrub on-site is fairly open, dominated by low-growing shrubs. The dominant species observed included California sagebrush, with sparse inclusions of California buckwheat and brittlebrush (*Encelia farniosa*). All Riversidean sage scrub within the project site shows evidence of past disturbance, including related fire break maintenance.

EUCALYPTUS WOODLAND

Eucalyptus woodland is typically characterized by dense stands of gum trees (*Eucalyptus* spp.) that are native to Australia. The eucalytpus woodland within the survey area consists primarily of

canopy cover and occurs along the northern boundary of the project site bordering Jerry Eaves Park, located within the buffer to the project site.

NON-NATIVE GRASSLAND

Non-native grassland generally occurs on fine-textured loam or clay soils that are moist during winter rainy season and very dry during the summer and fall (Holland 1986). Non-native grassland habitat within the project site is dominated non-native, invasive grasses including red brome, ripgut brome, and slender wild oat, as well as noxious, invasive weeds such as long-beak filaree and short-pod mustard (*Hirschfeldia incana*).

RUDERAL HABITAT

Ruderal vegetation is typically found in areas with previous disturbance from vegetation clearing, development, or agricultural activities, and which contain vegetative cover that is comprised of more than 50 percent broad-leaved, non-native species. Ruderal areas are dominated by short pod mustard, tocalote (*Centaurea melitensis*), and tumbleweed (*Salsola australis*).

4.2 SPECIAL-STATUS SPECIES HABITAT ASSESSMENTS, FOCUSED SPECIES SURVEY, AND DATABASE REVIEW RESULTS

The CNDDB results included historical occurrences of three special-status plant species, eight special-status wildlife species, and one record of a historically mapped sensitive vegetation community within one mile of the project site (Figure 3A; Table 1). The USFWS results included a historical occurrence of one additional special-status plant species and two additional special-status wildlife species within one mile of the project site (Figure 3B). The CNPS electronic inventory search results included an additional 46 plant species with a California Rare Plant Ranking (CRPR).

Based on database review results, habitat assessments and select focused species surveys, five CRPR listed plant species have a moderate potential to occur on-site. One CDFW species of special concern, the burrowing owl, and one CDFW watch list species, the horned lark, were observed on-site (Table 1). No federally or state-listed endangered species were detected on site or have a moderate or high potential for occurrence on-site. A list of plant and wildlife species observed within the project site is included as Appendix C.

Table 2: Special-Status Plant and Wildlife Species – Potential for Occurrence

Species	Status	Habitat Description	Potential for Occurrence Within Project Site
Plants			
Brand's star phacelia (*Phacelia stellaris*)	CRPR 1B.1	Annual herb. Blooms Mar-Jun. Coastal strand, coastal sage scrub. Elev. 0-230 ft.	None. Suitable habitat not present on-site.

Species	Status	Habitat Description	Potential for Occurrence Within Project Site
California muhly (*Muhlenbergia californica*)	CRPR 4.3	Perennial rhizomatous grass. Blooms Jun-Sep. Chaparral, yellow-pine forest, coastal sage scrub, wetland/riparian.	Low. Suitable habitat minimal on-site.
California satintail (*Imperata brevifolia*)	CRPR 2B.1	Perennial grass. Blooms Sep-May. Chaparral, coastal sage scrub, creosote bush scrub, wetland/riparian.	Low. Suitable habitat minimal on-site.
Catalina mariposa-lily (*Calochortus catalinae*)	CRPR 4.2	Perennial bulbiferous herb. Blooms Mar-Jun. Chaparral, cismontane woodlands, coastal scrub, valley/foothill grasslands. Elev 49-2,296 ft.	Moderate. Suitable scrub habitat occurs on-site.
Chaparral ragwort (*Senecio aphanactis*)	CRPR 2B.2	Annual herb. Blooms Jan-Apr. Foothill woodland, northern coastal scrub, coastal sage scrub. Elev 425-2,165 ft.	Low. Suitable habitat minimal on-site.
Chaparral sand-verbena (*Abronia villosa* var. *aurita*)	CRPR 1B.1	Annual herb. Blooms Jan-Sep. Creosote bush scrub. Elev 50-4,985 ft.	None. Suitable habitat not present on-site.
Coulter's matilija poppy (*Romneya coulteri*)	CRPR 4.2	Perennial rhizomatous herb. Blooms Mar-Jul. Chaparral, coastal sage scrub. Elev 50-3,020 ft.	None. Suitable habitat not present on-site.
Little mousetail (*Myosaurus minimus* ssp. *apus*)	CRPR 3.1	Annual herb. Blooms Mar-Jun. Valley grassland, coastal sage scrub, freshwater wetland, wetland/riparian. Elev 100-5,250.	None. Mesic habitats necessary for this species do not exist on-site.
Many-stemmed dudleya (*Dudleya multicaulis*)	CRPR 1B.2	Perennial herb. Blooms Apr-Jul. Chaparral, valley grassland, coastal sage scrub. Elev 50-855 ft.	Low. Project site outside elevation range.
Mesa horkelia (*Horkelia cuneata* var. *puberula*)	CRPR 1B.1	Found in sandy or gravelly soils in maritime chaparral, cismontane woodland, and coastal scrub.	None. Suitable habitat not present on-site.

Species	Status	Habitat Description	Potential for Occurrence Within Project Site
Nevin's barberry (*Berberis nevinii*)	FE, SE, CRPR 1B.1	Perennial evergreen shrub. Blooms Feb-Jun. Chaparral, cismontane woodland, coastal scrub, and riparian scrub. Elev 230-2,705 ft.	None. Would have been observed if present.
Ocellated Humboldt lily (*Lilium humboldtii* ssp. *ocellatum*)	CRPR 4.2	Perennial bulbiferous herb. Blooms Mar-Jul. Chaparral, foothill woodland, yellow pine forest. Elev 1,050-5,545 ft.	None. Suitable habitat not present on-site.
Parish's bush mallow (*Malacothamnus parishii*)	CRPR 1A	Found in chaparral and sage scrub.	None. Suitable habitat not present on-site.
Parish's desert-thorn (*Lycium parishii*)	CRPR 2B.3	Found in creosote bush scrub and coastal sage scrub.	None. Suitable habitat not present on-site.
Parry's spineflower (*Chorizanthe parryi* var. *parryi*)	CRPR 1B.1	Annual herb. Blooms Apr-Jun. Chaparral, cismontane woodland, coastal scrub, and valley/foothill grassland. Elev 900-4,000 ft.	Moderate. Suitable scrub habitat present on-site.
Peninsular spineflower (*Chorizanthe leptotheca*)	CRPR 4.2	Annual herb. Blooms May-Aug. Chaparral, coastal scrub, lower montane coniferous forest. Elev 984-6,233 ft.	Moderate. Suitable scrub habitat present on-site.
Plummer's mariposa-lily (*Calochortus plummerae*)	CRPR 4.2	Perennial bulbiferous herb. Blooms May-Jul. Chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, valley/foothill grassland. Elev 330-5,580 ft.	Moderate. Suitable scrub habitat present on-site.
Pringle's monardella (*Monardella pringlei*)	CRPR 1A	Annual herb. Blooms May-Jun. Coastal scrub (sandy). Elev 980-1,310 ft.	None. Known from only two locations near Colton, CA, last seen in 1941.
Prostrate vernal pool navarretia (*Navarretia prostrata*)	CRPR 1B.1	Annual herb. Blooms Apr-Jul. Coastal sage scrub, wetland/riparian. Elev 65-490 ft.	None. No vernal pools on-site.

Species	Status	Habitat Description	Potential for Occurrence Within Project Site
Robinson's pepper-grass (*Lepidium virginicum* var. *robinsonii*)	CRPR 4.3	Annual herb. Blooms Jan-Jul. Chaparral and coastal sage scrub. Elev 3-2,905 ft.	Low. Suitable habitat minimal on-site.
Salt spring checkerbloom (*Sidalcea neomexicana*)	CRPR 2B.2	Perennial herb. Blooms Mar-Jun. Creosote bush scrub, chaparral, yellow pine forest, coastal sage scrub, alkali sink, wetland/riparian.	None. Suitable alkaline meadows not present on-site.
Santa Ana River woolly star (*Eriastrum densifolium* ssp. *sanctorum*)	FE, SE, CRPR 1B.1	Found in chaparral and coastal sage scrub.	None. Suitable habitat not present on-site.
Short-joint beavertail (*Opuntia basilaris* var. *brachyclada*)	CRPR 1B.2	Stem succulent shrub. Blooms Apr-Jun. Creosote bush scrub, chaparral, Joshua Tree woodland, pinyon-juniper woodland. Elev 1,870-5,380 ft.	None. Would have been observed if present.
Singlewhorl burrobrush (*Ambrosia monogyra*)	CRPR 2B.2	Perennial shrub. Blooms Aug-Nov. Sandy chaparral, Sonoran Desert scrub. Elev 32-1,640 ft.	None. Would have been observed if present.
Slender-horned spineflower (*Dodecahema leptoceras*)	FE, SE, CRPR 1B.1	Annual herb. Blooms Apr-Jun. Sandy soils in chaparral, cismontane woodland, alluvial fan coastal scrub. Elev 655-2,490 ft.	None. Suitable habitat not present on-site.
Smooth tarplant (*Centromadia pungens* ssp. *laevis*)	CRPR 1B.1	Annual herb. Blooms Apr-Sep. Chenopod scrub, meadows and seeps, playas, riparian woodland, valley/foothill grassland. Elev 0-2,100 ft.	Moderate. Suitable scrub habitat present on-site.
Southern California black walnut (*Juglans californica*)	CRPR 4.2	Tree. Blooms Mar-Jun. Southern oak woodland, wetland/riparian. Elev 245-4,890 ft.	None. Would have been observed if present.

Species	Status	Habitat Description	Potential for Occurrence Within Project Site
Thread-leaved brodiaea (*Brodiaea filifolia*)	FT, SE, CRPR 1B.1	Perennial bulbiferous herb. Blooms Mar-Jun. Valley grassland, foothill woodland, coastal sage scrub, freshwater wetland, wetland/riparian. Elev 130-3,640 ft.	Low. Suitable habitat minimal on-site.
Western spleenwort (*Asplenium vespertinum*)	CRPR 4.2	Perennial rhizomatous herb. Visible Feb-Jun. Chaparral, cismontane woodland, coastal scrub. Elev 590-3,280 ft.	None. Suitable habitat not present on-site.
White-bracted spineflower (*Chorizanthe xanti* var. *leucotheca*)	CRPR 1B.2	Annual herb. Blooms Apr-Jun. Creosote bush scrub, pinyon-juniper woodland. Elev 1,805-2,985 ft.	None. Suitable habitat not present on-site.
Woolly chaparral-pea (*Pickeringia montana* var. *tomentosa*)	CRPR 4.3	Shrub. Blooms May-Aug. Chaparral, coastal sage scrub. Elev 655-4,165 ft.	None. Would have been observed if present.
Wildlife			
Invertebrates			
Delhi Sands flower-loving fly (*Rhaphiomidas terminatus abdominalis*)	FE	Found in sandy areas composed of Delhi Fine Sands, stabilized by sparse native vegetation.	None. Delhi Fine Sands are not present on-site.
Reptiles			
Coast horned lizard (*Phrynosoma blainvillii*)	SSC	Inhabits open areas of sandy soil and low vegetation in grasslands, coniferous forests, woodlands, and chaparral. Often found in sandy washes and along dirt roads.	Low. Suitable habitat is minimal on-site.
Silvery legless lizard (*Anniella pulchra pulchra*)	SSC	Found in moist warm loose soil with plant cover. Occurs in sparsely vegetated areas of beach dunes, chaparral, pine-oak woodlands, desert scrub, sandy washes, and stream terraces.	None. Suitable habitat not present on-site.

Species	Status	Habitat Description	Potential for Occurrence Within Project Site
Southern rubber boa (*Charina umbratica*)	ST	Found in oak-conifer and mixed-conifer forests at elevations between 5,000 to 8,200 feet.	None. Suitable habitat not on-site.
Birds			
Burrowing owl (*Athene cunicularia*)	SSC	Found in grasslands and open scrub from coast to foothills. Strongly associated with California ground squirrel and other fossorial mammal burrows.	Present. Single owl wintering on-site. Moderate nesting potential occurs on-site.
California horned lark (*Eremophila alpestris*)	WL	Found from coastal deserts and grasslands to alpine dwarf-shrub habitat above treeline. Also seen in coniferous or chaparral habitats.	Present. Species documented foraging on-site.
Coastal California gnatcatcher (*Polioptila californica californica*)	FT, SSC	Inhabits sage scrub dominated by California sagebrush and flat-top buckwheat.	Low. Riversidean sage scrub on-site is disturbed and low quality. Not observed during protocol surveys.
Least Bell's vireo (*Vireo bellii pusillus*)	FE, SE	Found primarily in riparian forests and woodlands; also found in oak woodlands and mesquite brushlands often near water.	None. Suitable riparian habitat not present on-site.
Mammals			
Los Angeles pocket mouse (*Perognathus longimembris brevinasus*)	SSC	Found in Riversidean sage scrub, alluvial fan scrub, desert scrub or grassland on sandy soils, generally adjacent to sandy washes or windblown sand.	Low. Suitable habitat minimal on-site.
Pocketed free-tailed bat (*Nyctinomops femorosaccus*)	SSC	Found in pinyon-juniper woodlands, desert scrub, desert riparian, desert wash, Joshua tree, and palm oasis. Roosts in cave, rock crevices in cliff faces, and man-made structures.	None. Suitable habitat not present on-site.

Species	Status	Habitat Description	Potential for Occurrence Within Project Site
San Bernardino kangaroo rat (*Dipodomys merriami parvus*)	FE; SSC	Found on the gentle slopes of alluvial fans, on flood plains, along washes, and on adjacent upland areas, including alluvial sage scrub, coastal sage scrub, and chaparral.	Low. Suitable habitat minimal on-site. Not observed during protocol surveys.

California Rare Plant Rank (CRPR) Definitions		
California Rare Plant Rank (CRPR)	1A	presumed extirpated in California and rare or extinct elsewhere
	1B	rare, threatened, or endangered in California and elsewhere
	2A	presumed extirpated in California but more common elsewhere
	2B	rare, threatened, or endangered in California but more common elsewhere
	3	plants for which more information needed
	4	plants of limited distribution
CRPR Threat Ranks	0.1	Seriously threatened in California (over 80% of occurrences threatened/high degree and immediacy of threat)
	0.2	Moderately threatened in California (20-80% occurrences threatened/moderate degree and immediacy of threat)
	0.3	Not very threatened in California (<20% of occurrences threatened/low degree and immediacy of threat or no current threats known)
Endangered Species Act (ESA)		
FE: Endangered Species Act Federally Endangered Species FT: Endangered Species Act Federally Threatened Species		
California Endangered Species Act (CESA)		
SE: California Endangered Species Act State Endangered Species ST: California Endangered Species Act State Threatened Species		
California Department of Fish and Wildlife (CDFW)		
SSC: California Department of Fish and Wildlife Species of Special Concern WL: California Department of Fish and Wildlife Watch List Species		

4.2.2 BURROWING OWL SURVEY RESULTS

No burrowing owl individuals or burrowing owl sign were observed within the project site during protocol presence/absence surveys conducted between April 15, 2019 and June 17, 2019 (Appendix D); however, a single burrowing owl was flushed from a burrow on-site during a coastal California gnatcatcher survey on December 19, 2019. The individual has been documented on-site several times following its initial discovery.

The project occurs within the San Bernardino's Burrowing Owl Overlay Zone (Biotic Resources Overlay Map, County of San Bernardino 2012) and an individual burrowing owl utilizing the project site. As such, the potential for future burrowing owl nesting on-site is moderate.

4.2.3 COASTAL CALIFORNIA GNATCATCHER SURVEY RESULTS

No coastal California gnatcatchers were documented during the nine non-breeding season protocol surveys conducted between September 12, 2019 and January 2, 2020. USFWS protocol (1997) allows for coastal California gnatcatcher surveys during the breeding or the non-breeding season; additional surveys are required outside the breeding season to help increase the probability of detection during this less active period. Complete survey results are presented in the coastal California gnatcatcher survey report (Appendix E).

4.2.4 DELHI SANDS FLOWER-LOVING FLY HABITAT ASSESSMENT RESULTS

Based on the NRCS soils map (Figure 4) and field investigation, Delhi fine sands are not present on the project site. As such, there is no potential for this species to occur on-site. Further, the Riversidean sage scrub on-site is disturbed and dominated by California sagebrush and supports limited nectar sources for the Delhi Sands flower-loving fly.

4.2.5 SAN BERNARDINO KANGAROO RAT SURVEY RESULTS

No San Bernardino kangaroo rats were captured during the trapping survey on-site between September 22, 2019 and September 27, 2019. Complete survey results are presented in the project San Bernardino kangaroo rat survey report (Appendix F).

4.3 RECONNAISSANCE-LEVEL AQUATIC RESOURCE ASSESSMENT RESULTS

No areas with depressions, drainage patterns, defined channels, and/or wetland vegetation were observed during the reconnaissance level aquatic resource assessment and no USGS blue line streams (USGS 2019) or NWI wetlands (USFWS 2019) are mapped on the project site. A small quarry does occur to the east of the site, with a constructed channel from the quarry to the southeast of the project site; however, these features are entirely outside the proposed project boundaries. As such, no potential federal-, or state-jurisdictional aquatic resources are expected to occur on-site.

5 IMPACTS

Direct impacts refer to any alteration, disturbance, or destruction of biological resources caused by and occurring at the same time and place as the project. Examples include direct losses to native habitats, potential jurisdictional waters, wetlands, and special-status species; the crushing of adult plants, bulbs, or seeds; the diversion of natural surface water flows; injury, death, and/or harassment of listed and/or special-status species; and the destruction of habitats necessary for species breeding, feeding, or sheltering.

Indirect impacts may occur later in time or at a place that is farther removed in distance from the project than direct impacts, but indirect impacts are still reasonably foreseeable and attributable to project-related activities. Examples include habitat fragmentation; elevated noise, dust, and lighting levels; changes in hydrology, runoff, and sedimentation; decreased water quality; soil compaction; increased human activity; and the introduction of invasive wildlife (domestic cats and dogs) and plants.

Cumulative impacts are the direct and indirect impacts of a proposed project which, when considered alone, would not be deemed substantial, but when considered in addition to the impacts of related projects in the area, would be considered potentially significant. 'Related projects' refers to past, present, and reasonably foreseeable future projects which would have similar impacts on the proposed project.

CEQA Guidelines Form J thresholds of significance have been used to determine whether project implementation would result in a significant direct, indirect, and/or cumulative impact. These thresholds are based on Appendix G of the CEQA Guidelines (California Code of Regulations 15000 *et seq.*). A significant biological resources impact would occur if the project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by CDFW or USFWS;
- Have a substantial adverse effect on federal protected wetlands (including, but not limited to, marshes, vernal pools, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy, or ordinance;
- Conflict with the provisions of an adopted Habitat Conservation Plan; Natural Community Conservation Plan; or other approved local, regional, or state habitat conservation plan.

5.1 NATIVE HABITAT IMPACT ANALYSIS

The project will impact six habitats or land uses as outlined in Table 2 and shown on Figure 6. The project will impact one native vegetation community, disturbed Riversidean sage scrub. Impacts on this habitat will occur in areas that were previously disturbed; as such, impacts on native habitats would be less-than-significant as this natural community is ranked globally and state secure. Impacts on non-native vegetation communities or habitats would be less-than-significant, as these habitat types are locally and regionally abundant and the species that utilize these habitat types are generally adapted to disturbance.

Table 3. Potential Project Impacts on Vegetation Communities/Land Uses

Land Use (Map Code)	Project Site (Acres)
Developed Land (DEV)	2.74
Disturbed Habitat (DIST)	7.83

Disturbed Riversidean Sage Scrub (D-RSS)	17.09
Eucalyptus Woodland (EUC)	0.27
Non-native Grassland (NNG)	3.79
Ruderal (RUD)	2.55
Total	34.27

5.2 SPECIAL-STATUS PLANTS IMPACT ANALYSIS

There are five special-status plant species with moderate potential to occur on the project site: Catalina mariposa-lily (*Calochortus catalinae*, CRPR 4.2); Parry's spineflower (*Chorizanthe parryi* var. *parryi*, CRPR 1B.1); Peninsular spineflower (*Chorizanthe leptotheca*, CRPR 4.2); Plummer's mariposa-lily (*Calochortus plummerae*, CRPR 4.2); and Smooth tarplant (*Centromadia pungens* ssp. *laevis,* CRPR 1B.1). Given the high level of site disturbance and absence of these species from the site during previously conducted floristic surveys, extensive populations of special-status plant species are not anticipated to occur on-site. If present, impacts to these species would be relatively minor, measured in individual plants. Further, because the site is surrounded by development, any populations (if present) would be isolated and would not contribute to any larger population or long-term perpetuation of the species; as such, impacts on special-status plants would be less-than-significant. No pre-construction surveys or other measures are recommended.

5.3 SPECIAL-STATUS ANIMALS IMPACT ANALYSIS

An individual burrowing owl (CDFW Species of Special Concern) has been documented on the project site and has a moderate potential to nest on-site. As such, impacts on this species are potentially significant.

The CDFW Watch List species California horned lark was also observed on-site. Compliance with the nesting bird minimization measure outlined in Section 6.2 would avoid direct take of California horned lark. As such, potential impacts on this species would be less than significant.

5.4 NESTING BIRD IMPACT ANALYSIS

The project site has the potential to impact active bird nests if vegetation is removed or ground-disturbing activities occur during the nesting season (February 1 to August 31). Impacts on nesting birds are prohibited by the MBTA and CFGC. However, there is currently a proposed rule change for the MBTA (January 30, 2020), which may impact the implementation of measures under Section 6.2.

Under existing regulations, a project-specific minimization and avoidance measure that will reduce potential impacts on nesting birds is identified in Section 6.2 of this report. However, there is currently a proposed rule that would change requirements under the MBTA that should be revisited prior to implementation of measures outlined under Section 6.2. Under current regulations, implementation of this measure would reduce impacts on nesting birds to less-than-significant.

5.5 JURISDICTIONAL RIPARIAN AREAS IMPACT ANALYSIS

The project will not impact riparian areas or vernal pools as such features do not occur on-site based on the initial aquatic resource assessment.

5.6 JURISDICTIONAL WATERS IMPACT ANALYSIS

The project will not impact jurisdictional aquatic resources as such features do not occur on-site based on the initial aquatic resource assessment.

5.7 CONFORMANCE WITH LOCAL BIOLOGICAL POLICIES, ORDINANCES, AND PLANS

5.7.1 COUNTY OF SAN BERNARDINO LAND USE SERVICES, PLANNING DIVISION

As stated above, the project site occurs within the County of San Bernardino Burrowing Owl Overlay Zone. Through compliance with the project-specific mitigation measure in Section 6.1, project activities will avoid impacts on burrowing owls.

5.7.2 CITY OF RIALTO GENERAL PLAN

The project site has no potential to support the federally endangered Delhi Sands flower-loving fly due to the lack of both suitable Delhi Sands soils and suitable dune habitat on site.

5.8 INDIRECT IMPACT ANALYSIS

In the context of biological resources, indirect impacts are secondary effects associated with development activities. Examples of indirect effects include water quality impacts from drainage into adjacent open space/downstream aquatic resources; lighting effects; noise effects; invasive plant species from landscaping; and effects from human access into adjacent open space, such as recreational activities (including off-road vehicles and hiking), pets, dumping, etc. Since the project is surrounded by developed or disturbed areas, and will comply with stormwater regulations, the project will not result in significant indirect effects to biological resources.

5.9 CUMULATIVE IMPACT ANALYSIS

Due to the level of disturbance on the project site, the adjacent developed land, and the minimization and avoidance measures outline in Sections 6.1 and 6.2 of this report, the project will not result in any significant cumulative impacts to biological resources.

6 MITIGATION, MINIMIZATION, AND AVOIDANCE MEASURES

The following section provides project-specific mitigation, minimization and avoidance measures for potential impacts on special-status resources.

6.1 BURROWING OWL

As noted above, burrowing owls, active burrows, or burrowing owl sign were not observed during the protocol breeding season surveys conducted April – June 2019. However, an individual

burrowing owl was observed wintering on-site since December 19, 2019. Due to the presence of California ground squirrel burrows on-site and the utilization of these burrows by an individual burrowing owl, the potential for nesting on-site is moderate. In accordance with the Guidelines, two pre-construction surveys should be conducted 14 days and 24 hours prior to any ground-disturbing activities or vegetation clearing on-site.

Based on the confirmed presence of an owl on-site, early consultation with CDFW may be warranted to avoid construction delays.

MM-1: A qualified biologist(s) will conduct a pre-construction presence/absence survey for burrowing owls at 14 days prior to ground disturbing activities and within 24 hours immediately before ground disturbing activities. If burrowing owls are documented on-site, a plan for avoidance or passive exclusion shall be made in coordination with CDFW. If the survey is negative, the project may proceed without further restrictions related to burrowing owls.

6.2 NESTING BIRDS

As noted above, the project site has the potential to support nesting birds. To avoid impacts on nesting birds the following mitigation measure is recommended:

MM-2: Vegetation clearing and ground disturbing activities should be conducted outside of the nesting season (February 1 to August 31). If construction activities occur during the nesting season, a qualified biologist will conduct a nesting bird survey within seven days prior to any disturbance of the site, including tree and shrub removal, disking, demolition activities, and grading. If active nests are identified, the biologist shall establish suitable buffers around the nests depending on the level of activity within the buffer and species observed, and the buffer areas shall be avoided until the nests are no longer occupied and the juvenile birds can survive independently from the nests. Raptor species will have an avoidance buffer of 500 feet and other bird species will have an avoidance buffer of 300 feet. These buffers may be reduced in consultation with the CDFW. If active nests are not identified, vegetation clearing and ground disturbing activities may commence. If ground disturbing activities are scheduled outside of the nesting season, a nesting bird survey will not be required.

7 CONCLUSION

The project will not result in significant impacts on biological resources with the implementation of MM-1 and MM-2 outlined in Section 6. The project site has been historically disturbed and the native Riversidean sage scrub on-site is disturbed and of low quality. The potential for burrowing owl to nest on-site is moderate based on the presence of a wintering owl on-site and suitable burrows. Pre-construction burrowing owl surveys should be conducted to determine presence or absence of burrowing owl on-site immediately prior to construction (see recommended MM-1), and early consultation with CDFW is advisable based on the presence of an owl on-site. A pre-construction clearance survey for nesting birds should be conducted to ensure there are no impacts on nesting birds (see recommended MM-2). With these measures in place, project impacts on biological resources would be less than significant.

ATTACHMENT A

REGULATORY FRAMEWORK

REGULATORY FRAMEWORK

Federal, state, and local agencies have established several regulations to protect and conserve biological resources. The descriptions below provide an overview of the agency regulations that may be applicable to the project. The final determination as to what types of permits are required will be made by the regulating agencies.

FEDERAL REGULATIONS

Federal Endangered Species Act

The ESA provides for the listing of endangered and threatened species of plants and animals and the designation of critical habitat for these listed species. ESA regulates the "taking" of any endangered fish or wildlife species, per Section 9. As development is proposed, the responsible agency or individual landowner is required to consult with the U.S. Fish and Wildlife Service (USFWS) to assess potential impacts on listed species (including plants) or the critical habitat of a listed species, pursuant to Sections 7 and 10 of the ESA. USFWS is required to determine the extent a project would impact a particular species. If USFWS determines that a project is likely to potentially impact a species, measures to avoid or reduce such impacts must be identified. Following consultation and the issuance of a Biological Opinion, USFWS may issue an incidental take statement which allows for the take of a species if it is incidental to another authorized activity and will not adversely affect the existence of the species. Section 10 of the ESA provides for issuance of incidental take permits to non-federal parties in conjunction with the development of a habitat conservation plan (HCP). Section 7 of the ESA provides for permitting of projects where interagency cooperation is necessary to ensure that a federal action/decision does not jeopardize the existence of a listed species.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA; 16 USC § 703 et seq.) is a federal statute that implements treaties with several countries on the conservation and protection of migratory birds. The number of bird species covered by the MBTA is extensive and is listed at 50 Code of Federal Regulations (CFR) 10.13. USFWS enforces the MBTA, which prohibits "by any means or in any manner, to pursue, hunt, take, capture, [or] kill" any migratory bird, or attempt such actions, except as permitted by regulation.

Rivers and Harbors Appropriation Act of 1899

The Rivers and Harbors Appropriation Act of 1899 (Rivers and Harbors Act; 33 USC § 403) prohibits the discharge of any material into navigable waters of the United States, or tributaries thereof, without a permit. The act also makes it a misdemeanor to excavate, fill, or alter the course, condition, or capacity of any port, harbor, or channel; or to dam navigable streams without a permit.

Many activities originally covered by the Rivers and Harbors Act are now regulated under the CWA, discussed below. However, the 1899 act retains relevance and created the structure under which the Corps oversees permitting under CWA § 404.

Clean Water Act

Pursuant to Section 404 of the CWA, the Corps is authorized to regulate any activity that would result in the discharge of dredged or fill material into waters of the U.S. (including wetlands), which includes those waters listed in 33 CFR 328.3 (as amended at 80 Federal Register [FR] 37104, June 29, 2015). The Corps, with oversight from the U.S. Environmental Protection Agency (EPA), has the principal authority to issue CWA Section 404 permits. The Corps would require a Standard Individual Permit (SIP) for more than minimal impacts to waters of the U.S. as determined by the Corps. Projects with minimal individual and cumulative adverse effects on the environment may meet the conditions of an existing Nationwide Permit (NWP).

A water quality certification or waiver pursuant to Section 401 of the CWA is required for all Section 404 permitted actions. The RWQCB, divisions of the State Water Resources Control Board (SWRCB), provides oversight of the 401-certification process in California. The RWQCB is required to provide "certification that there is reasonable assurance that an activity that may result in the discharge to waters of the United States will not violate water quality standards." Water Quality Certification must be based on the finding that a proposed discharge will comply with applicable water quality standards.

The National Pollutant Discharge Elimination System (NPDES) is the permitting program for discharge of pollutants into surface waters of the U.S. under Section 402 of the CWA.

STATE REGULATIONS

State of California Endangered Species Act

CESA, in combination with the California Native Plant Protection Act of 1977 (NPPA; CFGC § 1900 et seq.), regulates the listing and take of plant and animal species designated as endangered, threatened, or rare within the state. California also lists SSC based on limited distribution, declining populations, diminishing habitat, or unusual scientific, recreational, or educational value. CESA defines an endangered species as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease." CESA defines a threatened species as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by this chapter. Any animal determined by the commission as rare on or before January 1, 1985 is a threatened species." Candidate species are defined as "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that the commission has formally noticed as being under review by the department for addition to either the list of endangered species or the list of threatened species, or a species for which the commission has published a notice of proposed

regulation to add the species to either list." Candidate species may be afforded temporary protection as though they were already listed as threatened or endangered at the discretion of the California Fish and Game Commission. Unlike the federal ESA, CESA does not list invertebrate species.

Sections 2080 through 2085 of CESA address the take of threatened, endangered, or candidate species by stating "no person shall import into this state, export out of this state, or take, possess, purchase, or sell within this state, any species, or any part or product thereof, that the commission determines to be an endangered species or a threatened species, or attempt any of those acts, except as otherwise provided." Under CESA, "take" is defined as to "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." Exceptions authorized by the state to allow "take" require permits or memoranda of understanding and can be authorized for endangered species, threatened species, or candidate species for scientific, educational, or management purposes and for take incidental to otherwise lawful activities. CFGC §§ 1901 and 1913 provide that notification is required prior to disturbance. CDFW is responsible for assessing development projects for their potential to impact listed species and their habitats. State-listed special-status species are addressed through the issuance of a 2081 permit (Memorandum of Understanding).

California Environmental Quality Act

CEQA was established in 1970 as California's counterpart to the National Environmental Policy Act (NEPA; 42 USC § 4321 et seq.). This statute requires state and local agencies to identify significant environmental impacts related to their actions and to avoid or mitigate those impacts, where feasible.

A public agency must comply with CEQA when it undertakes an activity defined by CEQA as a "project." A project is an activity undertaken by a public agency or a private activity that must receive some discretionary approval (meaning that the agency has the authority to deny the requested permit or approval) from a government agency that may cause either a direct physical change in the environment or a reasonably foreseeable indirect change in the environment.

Natural Community Conservation Planning Act

In 1991, the California Natural Community Conservation Planning Act (NCCP Act; CFGC § 1900 et seq.) was approved and the NCCP Coastal Sage Scrub program was initiated in Southern California. California law (CFGC § 2800 et seq.) established the NCCP program "to provide for regional protection and perpetuation of natural wildlife diversity while allowing compatible land use and appropriate development and growth." The NCCP Act encourages preparation of plans that address habitat conservation and management on an ecosystem basis rather than one species or habitat at a time.

California Fish and Game Code Sections 1600-1602

Pursuant to Division 2, Chapter 6, Section 1602 of the CFGC, CDFW regulates all diversions, obstructions, or changes to the natural flow or bed, channel or bank of any river, stream, or lake that supports fish or wildlife. A Notification of Lake or Streambed Alteration must be submitted to

CDFW for "any activity that may substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake." CDFW has jurisdiction over riparian habitats associated with watercourses and wetland habitats supported by a river, lake, or stream. Jurisdictional waters are delineated by the outer edge of riparian vegetation (i.e., drip line) or at the top of the bank of streams or lakes, whichever is wider. CDFW jurisdiction does not extend to tidal areas or isolated resources. CDFW reviews the proposed actions and, if necessary, submits (to the applicant) a proposal that includes measures to protect affected fish and wildlife resources. The final proposal that is mutually agreed upon by CDFW and the applicant is the Lake or Streambed Alteration Agreement.

California Fish and Game Code Sections 3503, 3511, 3513, 3800, 4700, 5050, and 5515

Within California, fish, wildlife, and native plant resources are protected and managed by CDFW. The California Fish and Game Commission and/or CDFW are responsible for issuing permits for the take or possession of protected species. The following sections of the CFGC address protected species: Section 3511 (birds), Section 4700 (mammals), Section 5050 (reptiles and amphibians), and Section 5515 (fish). In addition, the protection of birds of prey is provided for in Sections 3503, 3513, and 3800 of the CFGC.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Act provides for statewide coordination of water quality regulations. The SWRCB was established as the statewide authority and nine separate RWQCBs were developed to oversee water quality on a day-to-day basis.

The SWRCB is the primary agency responsible for protecting water quality in California. As discussed above, the RWQCBs regulate discharges to surface waters under the CWA. In addition, the RWQCBs are responsible for administering the Porter-Cologne Act.

Pursuant to the Porter-Cologne Act, the state is given authority to regulate waters of the state, which are defined as any surface water or groundwater, including saline waters. As such, any person proposing to discharge waste into a water body that could affect its water quality must first file a Report of Waste Discharge if Section 404 of the CWA is not required for the activity. "Waste" is partially defined as any waste substance associated with human habitation, including fill material discharged into water bodies.

REGIONAL AND LOCAL PLANS

County of San Bernardino Land Use Services, Planning Division

According to the County's Biotic Resources Overlay Map the project site is located within the County of San Bernardino's Burrowing Owl Overlay Zone (County of San Bernardino 2012). The burrowing owl is listed as an SSC by CDFW.

Appendix A. Site Photographs
Appendix B. Bird Species Observed During Breeding Season Burrowing Owl Surveys - April 15, 2019 to June 17, 2019

1 SUMMARY

This report summarizes surveys Rocks Biological Consulting (RBC) conducted for burrowing owl (*Athene cunicularia*; BUOW) at the Olive Grove Industrial Project (project) in the City of Rialto, San Bernardino County, California. RBC conducted four protocol breeding season BUOW surveys between April 15, 2019 and June 17, 2019. No BUOW, active burrows, or BUOW sign were documented on the project site or within the 500-foot buffer.

2 INTRODUCTION

2.1 PROJECT LOCATION

The 38.91-acre project area is located in the City of Rialto, San Bernardino County, California. The site is bounded by Baseline Road to the south, N. Cactus Avenue to the east, N. Fitzgerald Avenue to the west, and Jerry Eaves Park to the north (Figure 1).

2.2 BURROWING OWL NATURAL HISTORY

The BUOW is listed by the California Department of Fish and Wildlife (CDFW) as a Species of Special Concern (SSC). Suitable habitat for the BUOW in California is typified by short, sparse vegetation with few shrubs, level to gently sloping topography, and well-drained soils (CDFW 2012). Grassland, shrub steppe, and desert are naturally occurring habitat types used by BUOW. In addition, BUOW may occur in some agricultural areas, ruderal fields, vacant lots, and pastures if the vegetation structure is suitable and there are burrows and foraging habitat in proximity (Gervais et al. 2008). Because suitable burrows are usually dug by other species, particular attention to California ground squirrel (*Otospermophilus beecheyi*) burrows or activity is important in assessing BUOW occupation of a site. Natural rock cavities, debris piles, culverts, and pipes are also used by BUOW for nesting and roosting (Rosenberg et al. 1998).

3 METHODS

In accordance with the CDFW *Staff Report on Burrowing Owl Mitigation* (2012), RBC conducted four BUOW surveys during the breeding season (February 1 to August 31). RBC conducted the surveys at least three weeks apart with one survey conducted between February 15 and April 15, and one survey conducted after June 15. Surveys were conducted between morning civil twilight and 1000. No surveys were conducted during rain, dense fog, or in winds greater than 20 miles per hour. Survey dates and conditions are presented in Table 1.

Table 1. Burrowing Owl Survey Dates and Conditions

Survey Number	Date	Time (Start-End)	Temperature (F) (Start-End)	Cloud Cover (%) (Start-End)	Wind Range (mph) (Start; End)
1	4/15/19	0815-1000	62-64	40-50	0-2; 1-3
2	5/6/19	0815-1000	55-58	90-80	0-2; 0-2
3	5/30/19	0815-1000	65-69	0-0	0-2; 0-2
4	6/17/19	0815-0950	63-66	100-100	1-4; 0-2

RBC walked transects spaced 7-30 meters (20-100 feet) apart through potential BUOW habitat within the survey area searching for BUOW, active and potential burrows, and/or sign of BUOW. RBC examined all suitable burrows for sign, including feathers, pellets, whitewash, and/or prey remains. RBC considered burrows to be active if a BUOW was observed at or near the entrance or if evidence of recent sign was present. RBC used binoculars (10x42) to aid in the identification of avian species.

4 RESULTS

The project site is regularly disked and on-site soils are composed primarily of hard-packed soil, gravel, and cobble. Site habitats are primarily non-native grassland dominated by filaree (*Erodium botrys*), ripgut brome (*Bromus diandrus*), red brome (*Bromus rubens*), and slender wild oats (*Avena barbata*). The site also supports areas of Riversidian sage scrub dominated by California sagebrush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), and deerweed (*Acmispon glaber*). Site photographs are presented in Appendix A.

During the four protocol surveys, RBC did not observe any BUOWs, active burrows, or fresh burrowing owl sign within the project site or the surrounding buffer. RBC documented several burrows of suitable size for BUOW. Most of these burrows are associated with active ground squirrel colonies on site. It should be noted that a majority of potentially suitable BUOW habitat was disked between survey 3 (May 30, 2019) and survey 4 (June 17, 2019). RBC observed 27 avian species during the four surveys. All bird species observed during the surveys are presented in Appendix B.

5 CONCLUSION

RBC did not observe any burrowing owls, active burrows, or BUOW sign during the four protocol breeding season surveys conducted April 15 to June 17, 2019.

At this time, the development of the project site would not impact BUOW. In order to comply with the CDFW Guidelines, a pre-construction BUOW survey must be conducted within 30 days prior to ground disturbance to ensure that BUOW have not colonized the site. If burrowing owls are documented on site, then a plan for avoidance or passive exclusion shall be made in coordination with CDFW. If the survey is negative, the project may proceed without further restrictions related to burrowing owls.

45-DAY REPORT FOR COASTAL CALIFORNIA GNATCATCHER SURVEYS FOR THE OLIVE AVENUE DEVELOPMENT PROJECT

February 10, 2020

U.S. Fish and Wildlife Service
Attn: Ms. Stacey Love
Carlsbad Fish and Wildlife Office
2177 Salk Ave., Ste. 250
Carlsbad, CA 92008

Subject: 45-Day Report for Coastal California Gnatcatcher Surveys for the Olive Avenue Development Project, City of Rialto, San Bernardino County, California

Ms. Love:

This letter is a summary of the coastal California gnatcatcher (*Polioptila californica californica*; CAGN) protocol presence/absence surveys Rocks Biological Consulting (RBC) conducted for the proposed Olive Avenue Development Project (project) in the City of Rialto, San Bernardino County, California. Survey results were negative for CAGN.

Introduction

The proposed project would develop an existing vacant property that would include the construction of two industrial warehouse buildings and include approximately 10,000 square feet of office/mezzanine space, 866 square feet for exterior building sprinkler fire pumps, and 668,131 square feet of warehouse space for a total of 678,997 square feet. The remainder of the project site would be comprised of associated auto parking and landscaping.

The approximately 34.57-acre project site is located in the City of Rialto, San Bernardino County, California (Figure 1). The site is bounded by Base Line Road to the south, Cactus Avenue to the east, Fitzgerald Avenue to the west, and Jerry Eaves Park to the north (Figure 2).

Methods and Results

RBC conducted protocol presence/absence CAGN surveys throughout the approximately 34.57-acre project site and a 100-foot buffer between September 12, 2019 and January 2, 2020. The project site was previously disked within disturbed habitat (7.83 acres) and is composed of hard-packed soil, gravel, and cobble (Figure 3). Vegetation on-site was primarily non-native grassland and disturbed Riversidean sage scrub. Non-native grassland (3.79 acres) on-site is dominated by filaree (*Erodium botrys*), ripgut brome (*Bromus diandrus*), red brome (*Bromus rubens*), and slender wild oats (*Avena barbata*). On-site disturbed Riversidean sage scrub (17.09 acres) is dominated by

California sagebrush (*Artemisia californica*), sparse California buckwheat (*Eriogonum fasciculatum*), and deerweed (*Acmispon glaber*). Representative site photographs are presented in Attachment A.

Survey methods followed the United States Fish and Wildlife Service (USFWS) presence/absence protocol (USFWS 1997) for non-NCCP areas. RBC conducted nine CAGN surveys at least two weeks apart during the non-breeding season (August 1 to March 15). RBC surveyed all suitable CAGN habitat by using taped vocalizations to elicit a response from CAGN. Table 1 presents all survey dates, times, and conditions. A list of 19 bird species observed during the surveys is included as Attachment B. Surveyor field notes are presented in Attachment C.

12/5/19	7	0915-1015	62-63	25-25	1-4; 1-4	Ian Hirschler (authorized under TE-063230-5.4)
12/19/19	8	1000-1115	59-61	0-0	0-2; 4-7	Ian Hirschler (authorized under TE-063230-5.4)
1/2/20	9	0855-1045	52-61	5-5	5-10; 5-10	Sarah Krejca (TE-99413B-0)

Conclusion

RBC did not observe nor hear any CAGN within the project site or 100-foot buffer during the nine protocol surveys. Riversidean sage scrub habitat on the project site is disturbed and of low quality.

Please do not hesitate to contact me at (714) 345-8619 if you have any questions or concerns regarding this report.

We certify that the information in this survey report and attached exhibits fully and accurately represent our work.

RESULTS OF A TRAPPING SURVEY FOR THE FEDERALLY AND STATE-ENDANGERED SAN BERNARDINO KANGAROO RAT

November 25, 2019

Ms. Stacey Love
Recovery Permit Coordinator
Carlsbad Fish and Wildlife Office
2177 Salk Avenue, Suite 250
Carlsbad, CA 92008

Subject: Results of a trapping survey for the federally and state-endangered San Bernardino kangaroo rat (*Dipodomys merriami parvus)* on the approximately 31.4-acre Olive Grove Industrial Project Site in Rialto, San Bernardino County, California.

Dear Ms. Love,

This report presents the results of a trapping survey for the federally endangered San Bernardino kangaroo rat (*Dipodomys merriami parvus*; SBKR*)* on the site of the proposed Olive Grove Industrial Project site north of Baseline Rd in Rialto, San Bernardino County. The project site is on the Fontana USGS 7.5-minute topographic map (T1N, R5W, $SE^{1/4}$ of Section 34). The UTM coordinates of the approximate center of the site are 11S 463977E/ 3775855N (NAD 83). Figure 1, *Vicinity Map*, shows the location of the project site. Appendix A contains site photos.

INTRODUCTION

The project would build two warehouses (409,725 and 251,002 square feet) on the approximately 31.4-acre site and widen Base Line Road along the southern border of the site. The project site is located on vacant, upland habitat approximately 1.3 miles west of Lytle Creek wash. The site is bordered by Base Line Rd to the south, a flood control basin to the east (two of four basins in the Cactus Basin facility), a small community park (Jerry Eaves Park) to the north, and a light industrial park and North Fitzgerald Ave to the west.

SBKR was emergency listed under the Federal Endangered Species Act (USFWS 1998a) and then confirmed as "endangered" in 1998 by the U.S. Fish and Wildlife Service (USFWS 1998b). The Final Critical Habitat designation for this species (USFWS 2008) includes portions of the Cajon Wash and Lytle Creek alluvial systems, a major part of the eastern portion of the Santa Ana River, and eastern sections of the San Jacinto River. SBKR is a designated candidate for listing under the California Endangered Species Act (California Fish and Game Commission, 2019).

SBKR occur mainly on Riversidean alluvial fan sage scrub habitat (RAFSS), which is a plant community with coastal sage scrub and chaparral elements on alluvial terraces and braided river channels in southern California (McKernan 1997). SBKR can also occur in abandoned agricultural fields and orchards, but usually only when such habitats are in proximity to suitable natural habitats. SBKR generally occur in habitats associated with active stream channels. SBKR abundance is greatest where there is sandy substrate with low-to- moderate perennial vegetative cover (less than 30 to 50 percent), and without dense cover of non-native annual plants (McKernan 1997). Root's (2010, 2008a, b) analysis of SBKR occurrence in the Wooly Star Preserve Area of the Santa Ana River wash found that SBKR occupancy is negatively correlated with dense cover of non-native grasses and areas where boulders and rocks dominate the surface.

SBKR occurrence was positively correlated with sandy sparse ground cover and the perennial bush scalebroom (*Lepidospartum squamatum*).

METHODS

Prior to the field survey, the literature was reviewed for SBKR records in the project region. The literature included the California Natural Diversity Database (CDFW 2019), museum records (Vertnet.org 2019), and SBKR survey reports. The project site was surveyed on foot on September 22, 2019 to assess SBKR habitat potential based on vegetation, soil, and slope characteristics. The habitat assessment concluded that the project site had low potential to support SBKR due to the dense shrub and non-native grass cover across much of the site.

A live-trapping survey was carried out over five consecutive nights from September 22-26, 2019. The live-trapping survey covered all potentially suitable SBKR habitat on the site, emphasizing open areas along the dirt roads and openings within the dense Riversidean sage scrub and non-native grassland cover. A total of 200 large (3 x 3.75 x 12") Sherman live-traps was set nightly. Traps were opened and baited with bird seed within one hour of sunset and checked at night and in the morning. All trapped animals were identified and released immediately at the point of capture. A total of 1,000 trap-nights was accrued during the field survey. Trapping was conducted by Phil Brylski, Ph.D. (USFWS permit TE148555-2 and CDFW MOU). Figure 2, *Trap Transects*, shows the trap transects and locations on an aerial photo.

RESULTS

Site Description

The site is vacant and flat (slope < 1% to the southeast) with an elevation of approximately 1,350 to 1,390 feet. The soils on the site are Tujunga gravelly loamy sand and Hanford coarse sandy loam (NRCS 2019), which are suitable for SBKR.

The dominant plant communities on the project site are Riversidean Sage Scrub and non-native grassland. Disturbed habitat is common in the dirt roads that cross the site. The plant communities on the site are shown in Figure 3, *Plant Communities*, and are described as follows:

Riversidean sage scrub (Photos 1-5). The Riversidean sage scrub on the project site is dominated by California buckwheat (*Eriogonum fasciculatum*) and coastal sagebrush (*Artemisia californica*), with scattered holly-leaved cherry (*Prunus ilicifolia*). Other plants include deerweed (*Acmispon glaber*), California croton (*Croton californicus*), short pod mustard (*Hirschfeldia incana*), and tocalote (*Centaurea melitensis*). The understory is dominated by non-native grasses such as ripgut brome (*Bromus diandrus*) and red brome (*Bromus rubens*). The Riversidean sage scrub on the project site is largely dense, with over 85% cover. However, two relatively small patches of open scrub habitat occur in the northwestern and northeastern corners of the site (Photos 4 and 5).

Non-native grassland (Photos 6-8). The non-native grassland on the project site consists of dense cover of red brome, ripgut brome, slender wild oat (*Avena barbata*), and long-beak filaree (*Erodium botrys*). Also present are short pod mustard, tocalote, common fiddleneck (*Amsinckia menziesii*), and Russian thistle (*Salsola tragus*).

Disturbed (Photo 9-11). A major habitat feature of the site are the graded dirt roads that cross the site in north-south and east-west directions (see Figure 3, *Trap Locations*).

Ruderal (Photo 12). The ruderal plant community on the site occurs in patches between the sage scrub and non-native grassland habitats. Common species include short pod mustard, tocalote, long beaked filaree, and dove weed, and the non-native grasses ripgut brome and red brome.

Eucalyptus Woodland. The eucalytpus (*Eucalyptus* spp.) woodland occurs along the northern boundary of the project site within Jerry Eaves Park.

Developed. Developed areas within the study area are composed of sidewalk and portions of Base Line Road and Fitzgerald Avenue, and the concrete lined Cactus channel, located in the southeastern corner of the project site. The developed areas are largely devoid of vegetation. Photo 13 shows the southern-most Cactus Basin percolation basin at the time of the SBKR survey.

Project Site in Relation to SBKR Historical Range, Habitat, and Critical Habitat

The Rialto area is within historic suitable habitat for SBKR in the northern San Bernardino Valley (McKernan 1997). The project site is approximately 1.3 miles west of Lytle Creek wash, one of the four habitat subunits important for SBKR recovery with numerous records in the California Natural Diversity Database (CNDDB; CDFW 2019). The online database of museum mammal specimens (Vertnet.org 2019) does not contain any museum records in the project vicinity. The project site is separated from Lytle Creek by dense residential and commercial development, which lack habitat value for SBKR. The project site is not within designated critical habitat for SBKR (FWS 1998, 2008, http:// criticalhabitat.fws.gov/ crithab/).

The dense Riversidean sage scrub and non-native grassland habitats that dominate the site are generally unsuitable for SBKR. Areas with open cover occur mainly along the graded dirt roads that cross the site. The site is considered to have low potential for SBKR at the time of the live-trapping survey. No kangaroo rat (SBKR or Dulzura kangaroo rat, *D. simulans*) sign (burrows, scat, tail drag) was observed anywhere on the site.

Previous SBKR Surveys in the Project Vicinity

The project site is in the southeast corner of a rectangular patch of land around the old Rialto Municipal Airport that had been agricultural and rural residential land uses, and vacant lands with upland habitats. Since the closing of the airport in 2014, the area has developed with warehouses and light industry. Four SBKR surveys were carried out in this area from 2009 to 2017 with the following results:

- SBKR surveys carried out along the western side of the old Rialto Municipal Airport in 2009 and 2012 yielded no SBKR captures (Brylski, 2009; Montgomery, 2012). These surveys occurred in disturbed California buckwheat scrub habitat, ruderal, and senescent alluvial fan sage scrub approximately 1.15 to 1.3 miles west/northwest of the project site.

- SBKR surveys carried in 2012 and 2017 north and west of the old Rialto Municipal Airport in 2009 and 2012 yielded no SBKR captures (O'Farrell, 2010; Montgomery, 2017). These surveys occurred in disturbed California buckwheat scrub, senescent alluvial fan sage scrub, and non-native grassland habitats approximately 0.4 miles to 1.6 miles north/northwest of the project site.

The project site is bordered to the east and northeast by the Cactus Basin, a flood control facility comprised of four percolation basins. Four SBKR surveys carried out in the basins between 2001 and 2012 (Natural Resource Associates, 2001, 2006, 2009, 2012) yielded no SBKR in 2001 and 2009 and one SBKR occurrence in 2006 and in 2012, in open sage scrub habitats within the basins. The 2006 SBKR capture was approximately 250 feet east of the proposed project's eastern boundary. The 2012 SBKR occurred in the northeastern corner of the Cactus Basin, approximately 0.57 miles north of the proposed project site's northern boundary. These results indicate that SBKR occurred in trace densities in the Cactus Basin in the 2001 to 2012 survey period. Gravel mining and flood control infrastructure works (San Bernardino County Flood Control District, 2012) have reduced scrub habitats in the Cactus Basin, and may have reduced the potential for SBKR occurrence there (Photo 13 shows the southern Cactus Basin immediately east of the project site at the time of the current SBKR survey).

SBKR Survey Results

Although there was low expectation of SBKR at the project site based on the predominantly dense vegetation, the site is within the historical range of the species and contains scrub vegetation, which SBKR has the potential to utilize. Therefore, a live-trapping survey was carried out to address SBKR presence/absence on the site.

Weather conditions were mild during the survey. Air temperatures ranged from 61 to 75°F and wind speeds were low (0 to 6 mph). Cloud cover ranged from 0-100%. No precipitation occurred during the survey. Table 1 summarizes the weather during the survey.

Table 1. Weather Conditions

Date	Temperature (F)*	Cloud Cover (%)	Wind (mph)
9-23	75/70	0	0-2
9-24	70/72	0	3-6
9-25	70/70	0	0
9-26	69/63	100	2-3
9-27	67/61	100	0

* night-time/morning temperatures

The survey yielded no SBKR captures and low numbers of three other small mammal species: the deer mouse (*Peromyscus maniculatus*), harvest mouse (*Reithrodontomys megalotis*), and house mouse (*Mus musculus*). Table 2 summarizes the captures.

Table 2. Summary of Small Mammal Captures

Date	Species		
	PMAN	RMEG	MMUS
9-23			3
9-24		1	2
9-25	2		3
9-26	2	1	1
9-27	1	1	
Total	**5**	**3**	**9**

PMAN: deer mouse, *Peromyscus maniculatus*
RMEG, harvest mouse (*Reithrodontomys megalotis*)
MMUS: house mouse (*Mus musculus*)

DISCUSSION

No SBKR were captured in the trapping survey of the project site. The absence of SBKR captures is attributable to the low quality of habitat. The sage scrub and non-native grassland habitats on the site provide dense ground coverage, which makes them generally unsuitable for SBKR.

The project site is an upland area with dense vegetative cover without seasonal alluvial disturbance, and in this regard is similar to other upland habitats around the old Rialto Airport that yielded no SBKR captures in surveys between 2009 to 2017. SBKR occurrence in the Cactus Basins east/northeast of the project site are likely related to the disturbances associated with flooding and gravel mining, which are lacking on the project site.

CONCLUSION

No SBKR were captured in the trapping survey of the project site. The absence of SBKR captures is attributable to the low quality of habitat. The absence of SBKR in the current trapping survey indicates that there would be no impacts to SBKR as a result of the proposed project.

Of the three small mammals captured, none are listed by state or federal agencies as threatened or endangered or as California Species of Special Concern, as follows:

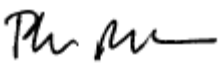
State or Federally Listed Species
- None

California Species of Special Concern
- None

Non-Status Species
- deer mouse (*Peromyscus maniculatus*)
- harvest mouse (*Reithrodontomys megalotis*)
- house mouse (*Mus musculus*) Introduced

I certify that the information in this survey report and attached exhibits fully and accurately represents my work. Please contact me if you have any questions regarding this survey report.

Sincerely,



Phil Brylski

Archaeology • History • Ethnography • Architectural History

May 13, 2021

Davie Cowan, P.E.
Kimley-Horn
401 B Street, Suite 600
San Diego, California 92101

Re: Cultural Resource Study Findings Memo for the Olive Avenue Development Project, City of Rialto, San Bernardino County, California

Dear Mr. Cowan,

This letter report documents the results of the cultural resource study conducted by ASM Affiliates, Inc. (ASM) for the Olive Avenue Development Project (Project). The study was completed in support of Kimley-Horn's preparation of a Subsequent EIR to address the potential environmental impacts of the proposed project pursuant to the required provisions of the California Environmental Quality Act (CEQA), Public Resources Code Section 21000 *et seq*., and State CEQA Guidelines Section 15063. The City of Rialto (City) is the lead agency for the Project.

The study included a records search at the South Central Coastal Information Center (SCCIC), a search of the Sacred Lands File of the California Native American Heritage Commission (NAHC), and a pedestrian survey of accessible portions of the Project area to determine the presence or absence of historical resources as defined by CEQA.

PROJECT DESCRIPTION AND LOCATION

The proposed Project site is located in the central portion of the City, north of Baseline Road, east of Fitzgerald Avenue, and southeast of Rialto Municipal Airport within the Rialto Airport Specific Plan Area in the City of Rialto, San Bernardino County, California (APN 0264-213-18). The Project site is currently vacant and is bounded by Jerry Eaves Public Park to the north, vacant land and single-family residential uses to the east, West Baseline Road and single-family residential uses to the south, and vacant land and industrial uses to the west. The overall Project site is approximately 31.60 acres / 31.08 net acres. The Project area is shown on the USGS 7.5-minute Fontana, Calif. topographic quadrangle in Section 34, Township 1 North, Range 5 West (Figure 1).

Historically, from at least the 1930s to the late 1960s, the site was used for agricultural purposes, with the possibility of vineyard operations and associated structures. During the 1950s until the late 1960s, extensive sand and gravel mining was done on the eastern portion of the project site. From at least 1967 to present, the land has been vacant and has returned to natural conditions. The heavy growth of vegetation was disced in 1991 to form a pattern of rectangles and squares. In recent years, the site has been rough graded and currently a few random, winding dirt trails are evident in the northwest portion of the project site.

The proposed project provides for the existing property of approximately 31.60 acres / 31.08 net acres to be divided into two separate lots with an individual industrial warehouse building on each lot, allowing each of the two proposed buildings to have its own legal parcel. These industrial buildings will be ±430,581 square feet on the western lot and ±248,809 square feet on the eastern lot, with truck parking lying between the two. Each facility consists of dock-high loading doors, trailer storage parking, and

employee parking. In addition, Baseline Road will be widened per the City of Rialto General Plan along the southerly property line of the project.

CULTURAL AND ENVIRONMENTAL SETTING

Natural Setting

The City of Rialto located approximately 40 mi. east of the City of Los Angeles, situated in the San Bernardino Valley and northwest of the Santa Ana River channel. The Project site lies in the central portion of Rialto. Elevations range from approximately 1,390 ft. above mean sea level at the northwestern corner to 1,360 ft. at the southeastern corner. The City is largely urbanized and surrounded by other developed cities; the setting surrounding the Project area is primarily business/industrial.

Prehistoric Cultural Setting

The following brief overview of the prehistory of the region is adapted from Moratto (1984), Warren (1984), and Warren and Crabtree (1986).

Lake Mojave Period (Paleo-Indian and Early Archaic; ca. 12,000 – 7000 B.P.

The Lake Mojave complex represents the earliest human occupation in the Mojave Desert region, beginning at about 12,000 B.P. (Grayson 1993; Wallace 1962). Considered a Paleo-Indian assemblage, it is thought to be ancestral to the Early Archaic cultures of the subsequent Pinto period (Warren and Crabtree 1986:184). Claims for archaeological assemblages dating to periods earlier than Lake Mojave period, such as those made for Tule Springs (Harrington and Simpson 1961), China Lake (Davis 1978), and Manix Lake (Simpson 1958, 1960, 1961), are controversial and, even if eventually proven to be authentic, these manifestations appear to have no relationship to later cultural developments in the region (Warren and Crabtree 1986). This era, at the close of the Pleistocene, was a time of extreme environmental change as the relatively cool and moist conditions of the terminal Wisconsin glacial age were gradually replaced by the warmer and drier conditions of the Holocene (Spaulding 1990). Desertification continued throughout the period with mesquite appearing by ca. 8000 B.P. (DuBarton et al. 1991).

Cultural materials characteristic of the Lake Mojave Complex include Lake Mojave, Parman, Silver Lake, and rare fluted projectile points (Clovis). Other artifacts typically found in these assemblages include lunate and eccentric crescents, small flake engravers, technical scrapers, leaf-shaped knives, drills, and heavy choppers or hammer stones. Milling stones are generally absent in the Lake Mojave Complex (Campbell et al. 1937; Warren and Crabtree 1986).

In the Mojave Desert and southern Great Basin, this assemblage is typically (but not exclusively) found in association with Late Pleistocene/Early Holocene lake stands and outwash drainages, although the role of the lakes in the overall adaptation remains in dispute (e.g., Bedwell 1970, 1973; Davis 1978; Warren 1967; Willig 1988). Some researchers have argued that lacustrine resources were the subsistence focus, while others suggest that grasslands suitable for the grazing of Late Pleistocene megafauna would have surrounded the lakes, and that these were the primary subsistence focus of the Lake Mojave cultures. Warren (1967) postulated that the assemblages are the remains of a widespread, generalized hunting adaptation found throughout the western Great Basin. Bedwell (1970, 1973), Hester (1973), and others interpret the same assemblages as indicating a specialized exploitation of the lacustrine resources of the pluvial lakes and call the complex the "Western Pluvial Lakes Tradition." Jonathan O. Davis (1978) proposes a combination of these models positing a generalized hunting and collecting economy, in which lakeside sites represent the seasonal exploitation of marsh resources.

This complex represents Early Man in the Mojave Desert, and exhibits similarities to sites in the western Great Basin and to the San Dieguito complex of the southern California culture area (Warren and

Crabtree 1986). Alternate designations for the manifestation of the complex in the interior desert area include: Lake Mojave Culture (Campbell et al. 1937; Wallace 1962), San Dieguito Complex (Warren 1967) and Western Pluvial Lakes Tradition (Bedwell 1970; Moratto 1984). Establishing strong temporal definition of the period is also hampered by the shortage in datable sites throughout the Great Basin and Mojave Desert. Few sites dating to the early portion of the Lake Mojave period have been excavated and little direct evidence of subsistence practices has been reported. When sites do contain datable materials, artifacts are generally found on the surface with no stratigraphic separation. Unlike sites in the Southwest, no early Great Basin projectile point types have been found in undisputed association with the large mega-fauna known to have existed during that time (Warren and Crabtree 1986:184). Characterization of this period of prehistory in California is extremely complex due to the large number of competing models. For detailed discussions of the Lake Mojave period, see Moratto (1984), Warren and Crabtree (1986), and Warren's contributions in Blair et al. (2004).

Pinto Period (Middle Archaic; ca. 7000 - 4000 B.P.)

The transition from pluvial to arid conditions at the end of the early Holocene appears to have been the most extreme environmental change in the southern Great Basin during post-Pleistocene times. Increasingly arid conditions prevailed throughout the region between about 7500 and 5000 B.P. (Hall 1985; Spaulding 1991). Woodland environments reached their approximate modern elevations and the modern desert scrub communities appeared with the migration of plant species such as creosote bush into the area.

Warren (1984) sees the cultural manifestations of this period as indicative of adaptation to increasing aridity. As the Pleistocene lakes and rivers dried up and plant and animal life changed, human populations adapted or withdrew to more desirable areas. Pinto populations appear to have withdrawn to desert margins and scattered oases, undergoing the changes as the Pinto Basin Complex assemblages gradually replace those of the preceding Lake Mojave period (Warren 1984:414). As in the Lake Mojave period, Pinto period sites are usually found in open settings in relatively well-watered locales representing isolated oases of high productivity. Artifacts dating to the Pinto period include Pinto series projectile points, leaf-shaped points and knives, domed and elongated keeled scrapers, and occasional Lake Mojave and Silver Lake points. Simple flat milling stones, occasional shallow-basined milling stones, and hand stones also occur in Pinto period sites (Warren and Crabtree 1986:184-187). Warren (1990) attributes the latter development to the exploitation of hard seeds, which is seen as part of a process of subsistence diversification brought on by increased aridity and reduced ecosystem carrying capacity. Big-game hunting probably continued as an important focus during this time, but the economic return of this activity likely decreased as artiodactyl populations declined in response to increased aridity (Warren and Crabtree 1986).

The appearance of Pinto projectile points in the archaeological record denote this period in the Mojave Desert, although their dating remains controversial (Lyneis 1982:176; Schroth 1994; Warren 1984). Warren and Crabtree (1986) and Warren (1984:414) postulate that the Pinto Complex represents a continuation and evolution from the hunting complexes of the Lake Mojave period. During this period, small, mobile populations continued to be dependent upon hunting and gathering. The use of grinding implements is expanded; however, these were poorly developed as might be expected in a newly acquired technology. This development suggests that the processing of hard seeds was becoming more important in the subsistence system, although it is believed that Pinto period people maintained a mobile subsistence strategy focused primarily on the hunting of highly ranked large game (Elston 1982).

The question of how people adjusted to environmental change is central to varying interpretations of the Pinto period (Warren 1984:410-411). Some (Donnan 1964; Kowta 1969; Wallace 1962) argue the desert was essentially abandoned between 7000 and 5000 B.P., while others (Susia 1964; Tuohy 1974; Warren 1980) argue that no evidence of an occupational hiatus of such magnitude exists in the archaeological

record. The ongoing debate revolves around the definition and dating of Pinto projectile points (Schroth 1994; Warren and Crabtree 1986:184).

Gypsum Period (Late Archaic; ca. 4000 - 1500 B.P.)

Gradual improvement of the climate began by around 5000 B.P. culminating in the Neoglacial at about 3600 B.P. A period of greater effective moisture emerged in the latter part (by 3000-4000 B.P.) of the middle Holocene (for an overview of Neoglacial and Little Ice Age environments in the Mojave Desert, see Enzel et al. 1989, 1992; Spaulding 1995). At this time, the barren pans in the Mojave Sink intermittently held perennial water (Enzel et al. 1992), although it is not known if this was the case for other closed basins in the region.

The Gypsum period is characterized by population increases and broadening economic activities as technological adaptation to the changing environment evolved. Hunting continued to be an important subsistence activity, but the increase in the occurrence and diversity of ground stone artifacts indicate that plant foods were becoming a more important subsistence item. The reduction in the size of projectile points about 1350 B.P. marks the introduction of the bow and arrow (Bettinger and Eerkins 1999), increasing the efficiency of hunting and possibly indicating a shift from larger to smaller game. Perhaps as a result of these new adaptive mechanisms, the increase in aridity during the late Gypsum period (after ca. 2500 B.P.) seems to have had relatively little consequence on the distribution and increase in human populations (Warren 1984:418-420; Warren and Crabtree 1986:189).

The use of rock shelters appears to have increased at this time although the occupation of open sites continues. Base camps with extensive midden development are a prominent site type in well-watered valleys and near concentrated subsistence resources (Warren and Crabtree 1986). Additionally, several types of special purpose sites in upland settings begin to appear during this period. Considerable evidence is present indicating increased contact with the California coast and the Southwest, and the presence of split-twig figurines and zoomorphic petroglyphs, thought to date to this period, suggest a rich ritual life was present (Fowler and Madsen 1986). Evidence of this increased ritual life is clearly seen in the archaeological record at Newberry Cave (Davis and Smith 1981), where split-twig figurines, ritual bows, arrows, pictographs, and what was interpreted as a wand were recovered supporting what was interpreted as ritual hunting magic.

Gypsum period artifact assemblages are characterized by medium- to large-stemmed and notched projectile points (i.e., Elko series, Humboldt Concave Base, and Gypsum types). The assemblages also include rectangular-based knives, flake scrapers, infrequently large scraper planes, choppers, and hammer stones. Milling equipment becomes more common and the mortar and pestle appear for the first time.

Sites dated to the Gypsum period are well represented in the mountains and in adjoining areas toward the coast. The Siphon site in Summit Valley, characterized by Sutton et al. (1993) as a middle to late Millingstone horizon base camp, has been dated to about 1550 B.C. Other sites in the area from this period include those at Yucaipa (Grenda 1998) and at Prado Basin (Grenda 1995). In general, the Gypsum period was a time of intensified settlement and exploitation of the desert valley floor and surrounding mountains.

Saratoga Springs Period (ca. 1500 - 750 B.P.)

During the Saratoga Springs period, marked regional diversification in artifact and site types is evidenced throughout the region (Warren and Crabtree 1986). The primary projectile point types of the southern Mojave Desert—and by extension, the San Bernardino Mountains—are Cottonwood and Desert Side-notched points. The Rose Spring types common to the north are rarer in the San Bernardino Mountains but have found around Baldwin Lake, while Eastgate and Rose Spring points began to dominate assemblages in other parts of the Mojave Desert and southern Great Basin (Lyneis 1982). These regional

variations might have been the result of intensified contact with neighboring groups along the coast, in the mountains, and in the southwest. Evidence from the Oro Grande site on the Mojave River below the northern slopes of the San Bernardino Mountains indicates trade with coastal groups during this period and a more structured settlement hierarchy centered on large village sites (Rector et al. 1983). Cultural developments south of the Mojave River and Providence Mountains diverge from those in the northern area during this period, reflecting influence from Hakataya developments along the lower Colorado.

Ceramics were likely introduced into the region during this period, though evidence is scarce. Lower Colorado Buff Ware and Tizon Brown Ware ceramics are often associated with Cottonwood and Desert Side-notched points and likely date from the very end of the Saratoga Springs period and into protohistoric times. Unlike some communities farther to the north who were using Anasazi-inspired pottery as early as A.D. 500 (Warren 1984:421–422), the southern desert and mountain groups seem to have concentrated on contacts with coastal communities. For example, marine shell beads are much more common at Saratoga Springs period sites, suggesting trade with the southern California coast, probably along the Mojave River valley route later known as the Mojave Trail (Warren 1984).

Evidence for Ancestral Puebloan influence or occupation is limited to the occurrence of pottery, which has been found as far west as the Halloran Spring (Blair 1985; Blair and Winslow 2004; Leonard and Drover 1980; Rogers 1929; Warren 1980) and the Cronise Basin in California (Larson 1981; Rogers 1929). It is unclear whether the pottery was left by small foraging or hunting parties (Berry 1974:83-84; Fowler and Madsen 1986:180; James 1986:114-115; Rafferty 1984:30-35; Shutler 1961:7; Warren and Crabtree 1986:191), the result of Ancestral Puebloan people working the turquoise mines near Halloran Springs (Blair 1985:2-4; Blair and Winslow 2004; Leonard and Drover 1980:251; Rogers 1929:12-13; Warren 1980:81-84), or if it was being traded along the Mohave trading route along with shells, obsidian and salt (Harrington 1927:238-239; Heizer and Treganza 1944; Hughes and Bennyhoff 1986; Morrissey 1968; Pogue 1915:46-51; Ruby 1970; Shutler 1961:58-66). Overall, the nature of the Ancestral Puebloan presence in the Mojave Desert is poorly understood at this time and warrants future research. In contrast, a strong Ancestral Puebloan influence is seen in the northeastern Mojave, where this horticultural people (termed the Lowland Virgin Branch Anasazi) resided in residential communities along the Muddy and lower Virgin rivers in southeastern Nevada and adjacent portions of Utah and Arizona (Fowler and Madsen 1986:175-181; Lyneis 1982, 1995; Lyneis et al. 1978:178-179; Warren and Crabtree 1986:191; Winslow 2003a, 2003b).

In the remainder of the Mojave Desert region, sites of this period seem to exhibit general continuity with the Gypsum pattern. One of the most conspicuous changes from the earlier period is the reduction in size of projectile points. Rose Spring and Cottonwood series points dominate assemblages of this period and are morphologically similar to Gypsum period points with the exception of their smaller size, and milling equipment (i.e., metates, manos, mortars and pestles) continues to be in use (Warren and Crabtree 1986).

Late in prehistory (approximately 1000 B.P.), it is theorized, groups of people speaking Numic languages expanded from somewhere in the Death Valley area across the Great Basin. The Numic Expansion hypothesis gained widespread support in the years following its introduction by Sydney Lamb in 1958 (Lamb 1958). Bettinger and Baumhoff (1982:485) believe that the Numa were able to displace the previous inhabitants because of low-cost adaptive strategies oriented around the exploitation of diverse plant resources. This hypothesis is supported by similarities in artifact types and glottochronological theory advanced by Lamb (1958:99). Young and Bettinger (1992:85), supporting Bettinger and Baumhoff (1982), propose that a competitive interaction existed between the Numic and pre-Numic groups in the Great Basin. In recent years, however, the hypothesis has been challenged and remains controversial.

Protohistoric Period (750 B.P. to Contact)

The Protohistoric era, a transitional period between the prehistoric and the historic/ethnohistoric, dates from ca. 750 B.P. and continues until first contact with Euro-Americans (Warren 1980; Warren and Crabtree 1986). Cultural developments established earlier during the Saratoga Springs period continue with some modifications. Numerous sites dating to this most recent period of prehistory are located along the Mojave River (Altschul et al. 1989; Schneider 1988; Smith 1963), in the San Bernardino Mountains (Simpson et al. 1972; White and Reeder 1970), and in the inland valleys to the south of the mountains (Grenda 1998). Diagnostic artifacts for this period are Desert Side-notched points and various poorly defined types of brown ware pottery. Most archaeologists agree that trade along the Mojave Trail was steady throughout this period, accounting for much of the coastal and Colorado River influences in the San Bernardino Mountains (Warren 1984).

Regional diversity continued during this period (Warren and Crabtree 1986:191). South of the Mojave River, the influence of the Yuman-speaking Hakataya continued. It is clear that by around A.D. 600, Hakatayan groups occupied a wide area in western Arizona, southeastern California, and southern Nevada (Schroeder 1979). The Hakataya were centered primarily on the lower Colorado River, however, and their assemblages, characterized by brown, buff, and red-on-buff pottery, and Desert Side-notched and Cottonwood Triangular points, are found along the length of the Mojave River to the Mojave Sinks (Drover 1979; Rogers 1929; Smith 1963). These ceramics, along with the continued use of coastal artifacts such as shell beads, suggest fairly long-distance trade contacts and possibly more extensive seasonal rounds.

North of the Mojave River, the Saratoga Springs artifact assemblage continued, with the addition of Desert Side-notched and Cottonwood Triangular points and Great Basin Brown Ware pottery. Also present in these assemblages are steatite beads, large triangular knives, unshaped manos and milling stones, mortars and pestles, incised stones, slate pendants, and shell beads (Warren and Crabtree 1986). Bettinger (1975, 1976, 1977) attributes the beginning of regular pinyon exploitation to this period, as shown by the appearance of camps in the pinyon-juniper woodland (Warren 1984:424-427; Warren and Crabtree 1986:191-192). Warren and Crabtree (1986:191-192) note that the initial occurrence of this assemblage is linked with the ancestors of the historic Southern Paiute and is roughly contemporaneous with the terminal date for the Ancestral Puebloan occupation of the region. Virgin Anasazi development and influence had been curtailed in the eastern Mojave Desert by the Protohistoric period (Warren 1984:427). Occupation by the hunter-gatherer groups present earlier, however, appears to have continued relatively unchanged.

Ethnohistoric Background

The major ethnographic group associated with the Project area was the Serrano (Bean and Smith 1978; Benedict 1924; Kroeber 1925:611-619; Strong 1929:5-35). The following summary is closely drawn from a recent ethnography by Lerch and Ciolek-Torrello (2007). Details concerning other aspects of Serrano culture, such as social organization and religion, may be found in a number of sources, including Benedict (1924), Gifford (1918), Kroeber (1907, 1925), Strong (1929), Bean and Smith (1978) and Bean et al. (1981). The Serrano were so called by the Spanish because they lived in and around the San Bernardino Mountains (*serrano*, from sierra, means "mountain dweller" in Spanish). The Serrano's own general name for themselves was *Takhtam*, or "people," although most individuals were identified by the name of their particular clan or village, and these names are frequently referred to as "tribes."

The Serrano language is part of the Takic subfamily of the larger Uto-Aztecan language family (Ergle 1999; Moratto 1984:534), which includes a wide variety of language groups extending as far south as the Basin of Mexico. Closer to home, the culture groups neighboring the Serrano to the south of the San Bernardino Mountains—the Gabrielino, Luiseño, and Cahuilla—were also Takic-language speakers. The Serrano appear to have been most closely linguistically aligned with the Cahuilla people, the easternmost

of the three. In the Mojave Desert, to the west, north, and east, were the Kawaiisu, Panamint, and Chemehuevi, who spoke Numic languages, another subfamily of the Uto-Aztecan language family. Although these language group names are often understood as some sort of tribal identity reflecting politically unified groups, this was clearly not the case. Designations such as Serrano and Chemehuevi are purely linguistic labels that, when applied to a geographic region, simply refer to the total territory inhabited by a number of independent bands who spoke a common language. Very often, significant cultural interactions crosscut language groups as a result of topography or other factors. The Serrano, in particular, seem to have maintained close ties with peoples on both sides of the mountains, regardless of linguistic affiliation.

The Serrano, and many neighboring language groups, were organized into independent but interconnected village communities. Each of these villages consisted of one or more patrilineal clans that belonged to one of two exogamous moieties, named coyote or wildcat. The clan-based villages and the larger moiety groups maintained complex ceremonial relationships with one another (Gifford 1918; Strong 1929). Frequently, a number of communities would combine to celebrate important festivals, harvest cycles, and other ceremonial events, occasionally inviting distant, linguistically unrelated groups.

Prior to European contact, the Serrano were hunters and gatherers who exploited a wide variety of resources from the mountains, the desert, and the Mojave River, including both large and small game, as well as numerous plant resources. Large game—such as deer, mountain sheep, and pronghorn—was hunted with bow and arrow, and smaller animals such as rabbits, rodents, and reptiles were taken with throwing sticks, nets, and snares. Acorns, pinyon nuts, and mesquite beans were among the staple foods, which were seasonally supplemented by chia and ricegrass seeds, roots, tubers, and various fresh greens (Bean and Smith 1978; Lerch 2002).

The presence of a perennial water source was the determining factor in the nature, duration, and distribution of Serrano villages (Benedict 1924:368). Most Serrano village-hamlets “were in the foothill Upper Sonoran life-zone while a few were out on the desert floor (near permanent water sources) or in the forest Transition zone” (Bean and Smith 1978:570). Small villages were more common, although there were larger villages in the Summit Valley and the Cajon Pass. Small special purpose sites, such as temporary camps, food processing stations, and lithic procurement areas, were located as needed. The Serrano who inhabited the San Bernardino Mountains would inhabit the milder areas of Apple Valley and Lucerne Valley during the winter and the area in and around Baldwin Lake during the summer.

In the early literature, there are only occasional references to the Project study area and the Native Americans who once lived there (Beattie and Beattie 1951:421; Brown and Boyd 1922:21-25; Pierson 1970:110-111; Smith et al. 1978), although contact with Europeans may have occurred as early as 1771. By 1806, the Serrano were recruited into the mission systems and most of them were removed from their homelands to the missions (Beattie and Beattie 1939:366). Missionization led to the loss of their native lifeways; although, northeast of the San Gorgonio Pass, Serrano culture survived.

By 1975, most Serrano lived on two southern California reservations (Morongo and San Manuel), where with other native Californians, they participated in ceremonial and political affairs on a pan-reservation. According to Bean and Smith (1978:543), at the time of the writing, only slightly over 100 people claimed Serrano descent, reduced from a pre-contact figure between 1,500 (Kroeber 1925:617) and 2,500 (Bean 1962-1972), and even fewer speak their native language; however, all recall with pride their history. Ethnic identity is strong and they remain a readily identifiable cultural entity.

Brief History of Rialto

In 1769, Spanish explorers established Mission San Gabriel in what is presently eastern Los Angeles County. The area that is now known as Rialto was under Spanish rule as part of the Mission San Gabriel lands until 1822, when Mexico gained its independence from Spain. After independence, Mexican land grants further divided the land into ranchos. Rancho San Bernardino (37,700 acres), granted to the Lugo family, encompassed present-day Rialto (Dice 2006). In 1848, the United States took over the Mexican rancho land in California.

The Project is situated north of the historic community of Agua Mansa (Spanish for gentle waters), which originated from a large land grant owned by Juan Bandini which was located near the modern city of Riverside, called Rancho Jurupa. A portion of this land was donated to Spanish-speaking settlers from New Mexico and they named it Agua Mansa. The original settlement extended from Slover Mountain to the vicinity of the Riverside-San Bernardino county 1ine (Patterson 1964:28). The Agua Mansa settlers subsisted on animal husbandry and farming, and at first were relatively successful. However, in 1862, a disastrous flood destroyed most of the community. New homes were built, but Agua Mansa never regained its former prosperity. The residents eventually lost control of the land to large property owners through court battles late in the nineteenth century (Patterson 1964:28).

Typical of many San Bernardino County towns, the area that would one day become Rialto was a fertile agricultural area, due to the warm, dry climate. The beginnings of southern California's citrus culture can be traced to the Mission San Gabriel; an orange grove encompassing 6 acres was planted on mission lands in 1804. In 1841, William Wolfskill used seedlings from the San Gabriel orchard to plant his own larger orchard. Wolfskill is credited with establishing citrus commercially (Pronin 1989). Small ranching operations were established in the Rialto area in the mid-nineteenth century (City of Rialto 2017). In 1887, the first railroad connection was established, and the land that now comprises Rialto was purchased by the Semi Tropic Land and Water Company (City of Rialto 2017). The company named the community Rialto and began development in the area. Shortly thereafter, a group of midwestern Methodists immigrated to Rialto and furthered its development (City of Rialto 2017). By the late nineteenth century, Rialto was a typical small southern California agricultural community for which citrus was the main crop. In 1893, the community contained approximately 35 homes with 250 residents, a few local businesses, and a three-story Hotel del Rialto (City of Rialto 2017). The first citrus packing house was built in 1894, and a citrus association was established (City of Rialto 2017).

Rialto was officially incorporated in 1911 by the Chamber of Commerce, with 1,500 residents and 40 businesses comprising the small town (Stoebe 1965). The area on Riverside Avenue between Santa Fe station and First Street housed most businesses. Those businesses included the bank, four real estate agencies, a few grocery stores, two meat markets, two department stores, two barbershops, a weekly newspaper (Rialto Record), two garages, and two telephone companies. On the southeast corner of Riverside Avenue and First Street stood the J. H. Crowder Building occupied by a grocery store, which has since been demolished. On the west side of Riverside Avenue stood the offices of the Lytle Creek Water and Improvement Company. The First National Bank of Rialto opened its new building in February 1908 on the northwest corner of Riverside and Rialto avenues. In 1913, Rialto's Light and Power Company was sold to California Electric Power Company.

Citrus agriculture was the most important industry to Rialto in the twentieth century. Connections to improved transportation resulted in steady growth, as the small agricultural community was able to expand the markets for their local product. In addition to the Santa Fe railroad connection, in 1914 Los Angeles' Pacific Electric Railway completed the San Bernardino Line through the City of Rialto. Improved transportation through Rialto not only included the rail line but also the repaving of Foothill Boulevard (the main east-west transportation route) in 1913, which eventually became part of U.S. Highway 66, better known as the transnational Route 66 (City of Rialto 2017). With these improved

transportation connections, small local agricultural operations developed into a robust citrus packing industry with at least seven citrus packing houses located along the Santa Fe railroad tracks. A fire in the 1920s destroyed many of the buildings in downtown Rialto.

As a result of post-World War II expansion and the general population boom in southern California, Rialto also became a bedroom/commuter community to larger cities in the county and region. Between 1950 and 1980, the population of Rialto grew tenfold from 3,156 to 330,500 (City of Rialto 2017). Today, with a population of around 100,000, only a few acres of the original citrus land are in active use, and Rialto is supported by several large retail distribution centers.

STUDY METHODS

Methods used to assess the presence of and potential for cultural resources within the property included a search of existing records and a pedestrian field survey.

The records search was conducted by the SCCIC and included the Project area and a radius of 1 mi. around it, and a request was made for a search of the NAHC's Sacred Lands Files. Historic aerial photographs and historic USGS topographic maps of the Project area were consulted from historicaerials.com.

The field survey was conducted on October 17, 2019, by ASM Senior Archaeologist Sherri Andrews and Assistant Archaeologist Enadina Lozano. Field methods consisted of a pedestrian survey of the proposed Project site using transects spaced at 15-m intervals.

STUDY RESULTS

Records Search Results

The SCCIC records search was completed on September 27, 2019. The search identified 28 previous studies that had been conducted within or addressed resources within a 1-mi. radius of Project area (Table 1). Five of these studies (bolded below) were linear studies that abut the south and east edges of the Project area. No resources associated with the Project area were documented as a result of any of these studies. The summary letter provided by the SCCIC is provided in Appendix A.

A total of 19 historical-period resources have been previously recorded within the 1-mi. records search radius, none of which have been documented within the Project area (Table 2). Eight of these resources were listed within the standard records search results and include refuse scatters, irrigation features, water tanks, single-family homes, the Art Scholl Municipal Airport, and Base Line Road. The other 11 resources that were identified within the 1-mi. radius comprise architectural resources on file with the Office of Historic Preservation (OHP), all of which are more than 0.5 mi. away from the Project area.

Table 2. Previously Recorded Cultural Resources within the 1-mi. Records Search Radius

Primary # (P-36-)	Trinomial or OHP #	Date (Recorded by)	Description	Attribute Codes (from DPRs)	NRHP Status Code*	Relationship to Project Area
006780	CA-SBR-6780	1990 (Mark T. Swanson, Research Associates)	Reservoir, refuse scatter	AH4. Privies/dumps/trash scatters	-	0.55 mi NNW
010659	CA-SBR-10659H	2002 (Richard Shepard, Chambers Group); 2003	Refuse scatter	AH4. Privies/dumps/trash scatters	-	0.85 mi. W

Primary # (P-36-)	Trinomial or OHP #	Date (Recorded by)	Description	Attribute Codes (from DPRs)	NRHP Status Code*	Relationship to Project Area
-	181991	-	982 N. Verde Av. (1959)	-	6Y	0.6 mi. ESE
-	181992	-	615 W. Morgan St. (1955)	-	6Y	0.7 mi. SE
-	182451	-	1030 N. Gardena Av. (1956)	-	6Y	0.8 mi. ESE

*3S: Appears eligible for NRHP individually through survey evaluation
6L: Determined ineligible for local listing or designation through local government review process; may warrant special consideration in local planning
6Y: Determined ineligible for NR by consensus through Section 106 process – Not evaluated for CR or local listing

Historical Imagery Review

Historic aerials from 1938, 1948, 1959, 1966, 1967, 1968, 1977, 1980, 1994, 1995, 2002, 2005, 2009, 2010, 2012, 2014, and 2016 were analyzed on historicaerials.com, as were historic topographic maps dated 1896, 1898, 1901, 1905, 1909, 1913, 1926, 1929, 1936, 1938, 1941, 1943, 1946, 1955, 1959, 1960, 1963, 1965, 1968, 1969, 1974, 1975, 1980, 1985, 1988, 1999, 2012, and 2015.

No structures or land use are depicted within proximity the Project area on any of the topographic maps between 1896 and 2015, and the area does not appear on Sanborn maps. Aerial photographs reveal that the site was in agricultural use from 1938 possibly through 1968. In the 1980 image, the land appears unused with an informal trail trending roughly north/south running through it. The 1994 image shows the area covered with a large cleared grid pattern, a configuration that is largely consistent through the 2016 image.

NAHC Sacred Lands File Search

On September 4, 2019, ASM sent a request to the NAHC to search their Sacred Lands File (SLF) to determine whether their files contained any information relating to the presence of Native American cultural resources within the Project parcel. Response from the NAHC was received on September 23, 2019, indicating a positive result and suggesting that the Gabrieleno Band of Mission Indians – Kizh Nation be contacted for additional information. A list of 11 tribal contacts who may have interest in the Project area was provided with the NAHC response. Letters were sent to each of these parties, inquiring as to their knowledge of the Project site; the NAHC response and contact list, an example of the contact letter, and responses received to date are provided with this report as Appendix B.

Jessica Mauck representing the San Manuel Band of Mission Indians responded that while it was earlier believed that a village site might have once been located where the current Project is situated, the Tribe has since determined that the village is much more likely located further east such that this area is of much less concern. This earlier concern may account for the positive result indicated by the NAHC response.

Pedestrian Survey Results

The Project area has undergone a significant amount of surface disturbance (Figures 2-5). The entire parcel is currently fenced, effectively limiting access to the area. As such, modern refuse is found primarily around the edges of the parcel where the fence is adjacent Jerry Eaves Public Park on the north and Baseline Road on the south. Some apparently older dumping of construction materials is found within the parcel as well, presumably having been done when the roads that crisscross the parcel were more readily accessible prior to being fenced. Various berms and push piles are found throughout the parcel. Vegetation across the parcel varied from sparse to very dense. As a result, ground surface visibility was excellent over approximately 20 percent of the Project parcel, with fair visibility over 60 to 70 percent, with poor visibility in the remaining 10 to 20 percent. All areas with adequate ground surface visibility

were carefully inspected for any sign of the presence of cultural materials. No previously undocumented cultural resources were encountered during the pedestrian survey.

RECOMMENDATIONS

No cultural resources were found as a result of the records search or during the current survey within the Project parcel. The results of the records search indicate a low archaeological sensitivity for the Project area. The Project area has been previously disturbed and there is no surface indication of any archaeological materials within the parcel. As such, no historical resources were identified within the Project area that would require further consideration under CEQA.

While the SLF results were positive, information provided by the San Manuel Band of Mission Indians explains that while it was once believed that a village site might have been located in this area, subsequent research has revealed that the site in question is situated further to the east and not in this location. However, it is possible that government-to-government consultation under AB 52 in support of the Project may result in a recommendation that archaeological and Native American monitoring take place during ground-disturbing activities.

In the event that any archaeological materials are encountered during future development activities, all activities must be suspended in the vicinity of the find until the deposits are recorded and evaluated by a qualified archaeologist. If evaluated as eligible for the CRHR and if impacts to the resource cannot be avoided, mitigation would be necessary. In addition, if significant subsurface prehistoric resources are encountered that will be subject to impacts from the project, Tribes with historic and cultural ties to the area shall be contacted.

If human remains of any kind are found during construction, the requirements of CEQA Guidelines Section 15064.5(e) and AB 2641 shall be followed. According to these requirements, all construction activities must cease immediately and the San Bernardino County Coroner and a qualified archaeologist must be notified. The Coroner will examine the remains and determine the next appropriate action based on his or her findings. If the coroner determines the remains to be of Native American origin, he or she will notify the NAHC. The NAHC will then identify the most likely descendants (MLD) to be consulted regarding treatment and/or reburial of the remains. If an MLD cannot be identified, or the MLD fails to make a recommendation regarding the treatment of the remains within 48 hours after gaining access to the remains, the property owner shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance.

Should you have any questions regarding this study, please do not hesitate to contact me.

Respectfully submitted,

Sherri Andrews, M.A., RPA
Senior Archaeologist

APPENDIX F

GEOTECHNICAL REPORT

GEOTECHNICAL PROFESSIONALS INC.

October 2, 2019

Oakmont Rialto Olive Grove, LLC
c/o Crow Holdings Industrial
527 W. 7th Street, Suite 308
Los Angeles, California 90014

Attention: Mr. Jared Riemer

Subject: Planning-Level Preliminary Geotechnical Investigation
Proposed Olive Grove Business Park
North Side of Baseline Road, ¼ mile East of N. Ayala Drive
Rialto, California
GPI Project No. 2963.I

Dear Mr. Riemer:

In accordance with your request, this report presents the results of our planning-level preliminary geotechnical investigation for the proposed business park at the subject site. The purpose of our investigation was to characterize the geotechnical conditions at the site with respect to the feasibility of the development and to provide preliminary recommendations for earthwork and design of foundations, floor slabs and pavements.

INTRODUCTION

The project site is a 31.6 acre parcel located on the north side of Baseline Road, ¼ mile east of North Ayala Drive, in Rialto, California. The location of the site is shown on the Site Location Map, Figure 1. The approximate limits of proposed development are shown on the Site Plan, Figure 2.

The proposed project will consist of two industrial warehouse buildings approximately 416,106 and 235,896 square feet in size. The buildings are anticipated to be tall one-story buildings of concrete tilt-up construction and will likely include some office areas with mezzanines. Column loads are not available at this time; however, we anticipate typical maximum column loads of 80 to 100 kips and wall loads of 6 to 8 kips per foot (dead plus live). Floor slabs will be supported on-grade with dock-high construction.

The finish floor elevation of the west building will slope downward from north to south at about 0.5% from approximate elevation 1383 feet to 1379 feet. The finish floor elevation of the east building will slope downward from north to south at the same gradient from approximate elevation 1378 feet to 1375 feet. We anticipate site grading to include cuts and fills on the order of approximately 10 feet to develop the two building pads.

5736 Corporate Avenue • Cypress, CA 90630 • (714) 220-2211 , FAX (714) 220-2122

Site improvements will also include asphalt and concrete pavements for automobiles, truck and trailer traffic, and fire access lanes, site walls and underground utilities. Stormwater infiltration basins are currently being evaluated and may consist of small open basins or subterranean chamber basins below paved areas.

SCOPE OF WORK

Our scope of work included review of published information, subsurface exploration, field infiltration testing, laboratory testing, engineering evaluations, and preparation of this planning-level preliminary geotechnical letter report.

Our field exploration program for this study consisted of four hollow stem auger borings, ten exploratory test pits, and two infiltration test wells. The borings were performed to depths of approximately 21½ to 36½ feet below existing grade. The test pits were performed to depths of approximately 5 feet below existing grade, and the percolation wells were installed at depths of approximately 16 and 17 feet below existing grades. A description of field procedures and logs of the borings and test pits are presented in the attached Appendices A and B. The procedures and results of the infiltration tests are discussed in this report. The approximate locations of the subsurface explorations and infiltration test wells are shown on the Site Plan, Figure 2.

Laboratory soil tests were performed on selected representative samples as an aid in soil classification and to evaluate the engineering properties of the soils. The geotechnical laboratory testing program included determinations of moisture content and dry density, fines content, shear strength, corrosivity and maximum density. Corrosivity screening tests were performed by HDR under subcontract to GPI. The results of the laboratory testing by GPI and HDR are presented in Appendix C.

Engineering evaluations were performed to provide planning-level recommendations and an assessment of seismic hazards. The results of our evaluations are presented in the remainder of the report.

SURFACE CONDITIONS

The project site is currently unoccupied and covered with short grass, bushes, and weeds. Scatter cobbles and boulders are visible at the ground surface. Historic aerial photographs indicate that the site has been previously used for agriculture prior to 1966. From 1966 to current, the site has been vacant. The site is bounded on the north by Jerry Eaves Park, to the east by a stormwater detention basin, to the west by a series of commercial buildings along North Fitzgerald Avenue, and to the south by Base Line Road.

The ground surface gently slopes downward from about elevation 1390 feet at the northwest corner of the site to elevation 1360 in the southeast corner of the site.

SUBSURFACE CONDITIONS

Our field investigation disclosed a subsurface profile consisting of undocumented fills overlying natural soils. Detailed descriptions of the subsurface conditions encountered in our boring and test pit explorations are provided in Appendix A and B. A brief summary of the subsurface conditions is provided below.

Undocumented fills were encountered to approximately 3½ feet below existing grade in one of the ten test pit explorations (Test Pit TP-7). Approximately 2 to 3 feet of fill was noted in each of the four borings drilled at the site; however, it was difficult to distinguish between the fill and underlying natural soils as they were very similar in material makeup. As such, we conclude that localized shallow fills should be anticipated. The fill materials encountered consisted of silty sands with varying amounts of gravels and few cobbles. The fills were generally medium dense and dry.

The natural soils consist predominately of sand and silty sand with varying amounts of gravel and cobbles, and gravels with varying amounts of sand and silt. Scattered boulders, up to 22 inches in diameter, were also encountered. In general, the native soils were medium dense to very dense and dry to slightly moist. Drilling was performed with small diameter equipment, making it difficult to identify potential cobbles and boulders. The natural soils have moderate to high strength and low to medium compressibility characteristics.

Groundwater was not encountered in our current explorations drilled to a maximum depth of 36 feet below ground surface. Published data by the California Department of Water Resources indicates groundwater is deeper than 400 feet below the ground surface.

CONCLUSIONS AND PRELIMINARY RECOMMENDATIONS

General

Based on the results of our investigation and experience with nearby, similar projects, it is our opinion that from a geotechnical engineering viewpoint, it is feasible to develop the site as proposed. We anticipate the proposed buildings and any appurtenant structures may be supported on shallow foundations underlain by engineered fill. The most significant geotechnical issues that will affect the design and construction of the proposed structures are summarized below:

- Undocumented fills were encountered to depths of up to 3½ feet below existing grade at the site. The fill soils are not considered to be suitable for direct support of foundations or floor slabs. If not removed in the planned excavations, we recommend removal and recompaction of the fill materials to provide uniform support of the planned improvements.

- The fill and native materials encountered had significant amounts of gravel, varying amounts of cobbles, and occasional boulders. The cobbles were generally up to 5 inches in diameter and occasionally up to 12 inches in diameter. The boulders encountered were up to 22 inches in diameter. On-site materials greater than 8 inches in diameter can be exported, crushed, or disposed of in windrows outside of the building pads.

- To provide uniform support for the planned buildings, the soils should be removed to a depth of at least 4 feet below the planned finished pad grade, 2 feet below the base of foundations, or 3 feet below existing grade, whichever is greater. Foundations for minor structures, such as site walls, should be underlain by at least 1 foot of properly compacted fill. Deeper removals may be required were unsuitable fill soils extend below the recommended overexcavation depth.

- Deeper overexcavation in the area of deep cuts may be desirable during rough grading in utility corridors to aid in excavating utility trenches with conventional equipment.

- The undisturbed native materials may be suitable for direct support of building foundations but may be undesirable for future excavations of footings or utility trenches. The recommendation for removals to extend to a depth of at least 4 feet below the finished pad grade for building pads materials is provided so that future excavations for utilities and footings can be made with conventional equipment.

- Because of the likely presence of cobbles and boulders, oversize material (greater than 8-inches) should be anticipated to be generated from site cuts. Special handling and/or crushing of oversize material will be required in order to use the material as compacted fill. On-site placement of the boulders in compacted fills will depend on the final site grades.

- Fills placed within 3 feet of the finished pad grade should not contain particles greater than 3 inches in diameter.

- The in-place fill and native soils are generally dry to slightly moist with moisture contents near or below optimum. These soils will require processing and moisture conditioning prior to replacement as properly compacted fill.

Our preliminary recommendations related to the geotechnical aspects of the development of the site are presented in the subsequent sections of this report.

Seismic Considerations

There are no known faults crossing or projecting through the site. The development does not lie within an Alquist-Priolo Earthquake Fault Zone as designated by the California Geologic Survey (CGS), which would require further studies of the fault. Therefore, ground rupture due to faulting is considered unlikely at this site. The closest fault to the site is the San Jacinto fault, which is mapped about 1.6 miles to the northeast.

The buildings are anticipated to be designed in accordance with the 2019 California Building Code (CBC) which will be in effect as of January 1, 2020. The available data indicates that Site Class D, (Stiff Soil) and possibly Site Class C (Very Dense Soil and Soft Rock), would likely be appropriate for use in design of structures. Site specific field testing, which can be performed during final design, should be performed to determine the Site Class.

Typical of Southern California, there is a potential that the site development will be subjected to strong ground motion during its life. The peak ground acceleration used in design for CBC 2019 will be based on the final determination of the Site Class during final design. For a magnitude 8.1 earthquake, we computed that the site could be subjected to a site modified peak ground acceleration (PGA_M) of 0.939g for Site Class D (determined with field testing) and 1.025g for Site Class C. These accelerations were computed using the mapped Maximum Considered Geometric Mean peak ground acceleration from ASCE 7-16 (ASCE, 2016) and the appropriate site coefficient (F_{PGA}). The predominant earthquake magnitude (8.1) was determined using a 2 percent probability of exceedance in a 50-year period, or an average return period of 2,475 years. The structural design will need to incorporate measures to mitigate the effects of strong ground motion.

The site is not located in a Seismic Hazards Zone for liquefaction nor earthquake induced landslide zones. Due to the dense nature of the natural soils, the potential for seismic induced dry-sand settlement is not expected to impact site development.

Foundations

The proposed buildings and minor structures, such as free standing walls and trash enclosures, may be supported on spread footings underlain by engineered fill. We anticipate an allowable net bearing capacity for spread footings on the order of 4,000 pounds per square foot (psf) for building foundations and 2,500 psf for minor structure foundations underlain properly compacted fill. Settlement of the foundations underlain by engineered fill are anticipated to be within tolerable limits.

For preliminary design, a coefficient of friction of 0.40 may be used for frictional resistance and an allowable lateral bearing pressure equal to an equivalent fluid weighing of 300 pounds per cubic foot may be used for the compacted fill soils; these values may be used in combination without reduction.

Earthwork

General

The earthwork anticipated at the project site will consist of clearing and grubbing, excavation of undocumented fills and loose natural or disturbed soils, cuts and fills to grade, subgrade preparation including moisture conditioning, and placement and compaction of fill.

Overexcavation and Placement of Fill

To provide uniform support for the planned buildings, the soils should be removed to a depth of at least 4 feet below the planned finished pad grade, 2 feet below the base of foundations, or 3 feet below existing grade, whichever is greater. Foundations for minor structures, such as site walls, should be underlain by at least 1 foot of properly compacted fill. Deeper removals may be required were unsuitable fill soils extend below the recommended overexcavation depth. If not removed in the planned excavations, we recommend removal and recompaction of the fill materials to provide uniform support of the planned improvements.

Deeper overexcavation in the area of deep cuts may be desirable during rough grading utility corridors to aid in excavating utility trenches with conventional equipment.

The fill and native materials encountered had significant amounts of gravel, varying amounts of cobbles and occasional boulders. The cobbles were generally up to 5 inches in diameter and occasionally up to 12 inches in diameter. The boulders encountered were up to 22 inches in diameter. On-site materials greater than 8 inches in diameter can be exported, crushed, or disposed of in windrows outside of the building pads.

Because of the likely presence of cobbles and boulders, oversize material (greater than 8-inches) should be anticipated to be generated from site cuts. Special handling and/or crushing of oversize material will be required in order to use the material as compacted fill. On-site placement of the boulders in compacted fills will depend on the final site grades.

The undisturbed native materials may be suitable for direct support of building foundations but may be undesirable for future excavations of footings or utility trenches. The recommendation for removals to extend to a depth of at least 4 feet below the finished pad grade for building pads materials is provided so that future excavations for utilities and footings can be made with conventional equipment.

Fills placed within 3 feet of the finished pad grade should not contain particles greater than 3 inches in diameter.

After the recommended removals are complete, the exposed subgrade soils should be scarified to a depth of 8 inches, moisture-conditioned, and compacted to at least 90 percent

of the maximum dry density in accordance with ASTM D 1557. If the subgrade is evaluated by our field representative to consist of relatively undisturbed and dense native materials containing gravel and cobbles, scarification of the subgrade may be waived.

Fill soils should be placed in horizontal lifts, moisture-conditioned, and mechanically compacted to at least 90 percent of the maximum dry density in accordance with ASTM D1557.

The moisture content of the existing near surface soils was dry to slightly moist and generally below optimum. Moisture conditioning will be required during grading and consideration should be given to prewatering the site prior to starting earthwork. The moisture content of the fill materials should be between optimum and 2 percent over optimum moisture conditions at the time of compaction and the soils should not be allowed to dry out prior to covering with concrete or additional fill.

Materials for Fill

The on-site soils are, in general, suitable for use as compacted fill, with the exception of oversized materials. Existing on-site soils to be used as fill should be free of debris and any pieces larger than 8 inches in greatest dimension. Imported material and fills placed within 3 feet of the finished building pad grades should not contain particles greater than 3 inches in diameter. On-site materials greater than 8 inches in diameter can be exported, crushed, or disposed of in windrows outside of the building pads.

Soils used as retaining wall backfill should be granular (contain no more than 40 percent fines - portion passing No. 200 sieve) and non-expansive (E.I. less than 20). Such materials are anticipated to be available on-site. Imported fill material should be predominately granular and non-expansive as defined above.

Walls Below Grade

Although permanent retaining walls are not anticipated, preliminary lateral earth pressures for use in conceptual design of walls below grade are provided below:

Wall Condition	Equivalent Fluid Pressure
Cantilever walls with level, drained backfill comprised of granular soils or the undisturbed natural soils (Static Active Pressure Condition)	40 pcf (1)
Restrained basement walls with drained conditions (Static At-Rest Pressure Condition)	60 pcf (1)
Additional lateral pressure increases for seismic loading Active Pressure Condition: At-rest Pressure Condition:	 33 pcf 13 pcf
Surcharge Pressures	See below.

Note (1) does not include hydrostatic pressures or seismic earth pressures.

Walls subject to surcharge loads should be designed for an additional uniform lateral pressure equal to one-third and one-half the anticipated surcharge pressure for unrestrained and restrained walls, respectively. In addition to the recommended earth pressure, the upper 10 feet of the walls adjacent to the streets should be designed to resist a uniform lateral pressure of 100 pounds per square foot, acting as a result of an assumed 300 pound per square foot surcharge behind the shoring due to normal street traffic.

Concrete Floor Slabs

Concrete floor slabs supported at grade are anticipated to be underlain by engineered fill following overexcavation and recompaction or near surface unsuitable fill and natural soils. A moisture vapor retarder should be placed under slabs that are to be covered with moisture-sensitive floor coverings.

Pavements

Based on an assumed R-value of 45 and using the California Division of Highways Design Method, the following preliminary pavement sections have been developed for various levels of traffic.

PAVEMENT AREA	TRAFFIC INDEX	SECTION THICKNESS (inches)	
		ASPHALT CONCRETE	AGGREGATE BASE COURSE
Asphalt Concrete			
Auto Parking Stalls	4	3	4
Circulation Drives	5	3	4
Truck Drives	6	3	6
Heavy Truck Drives	7	4	6
Portland Cement Concrete		**PCC(1)**	
Auto Parking Stalls	4	6	0
Circulation Drives	5	6.5	0
Truck Drives	6	7	0
Heavy Truck Drives	7	7	0
	8	7.5	0

(1) Note: PCC pavement section can be reduced by ½ inch if underlain by 4 inches of aggregate base.

The pavement subgrade and the base course material should be compacted to at least 95 percent of the maximum dry density (ASTM D 1557). Testing of the subgrade soils should be performed during design and following rough grading to confirm and update the recommended pavement sections based on Traffic Indexes provided by the Civil Engineer.

Corrosion

Based on laboratory testing by HDR (included in Appendix C of this report) the site soils are considered to be mildly corrosive to concrete and ferrous metals. Based on the test results, foundation concrete and other concrete in contact with site soils should conform to the requirements outlined in ACI 318-14, Section 19.3 for a negligible level of soluble sulfate exposure for soil (Exposure Class S0). According to the American Concrete Institute (ACI) 318-14, Table 19.3.1.1, the Exposure Class for corrosion protection of reinforcement are "C0" if "concrete is dry or protected from moisture", and "C1" if "concrete is exposed to moisture but not to an external sources of chlorides".

The provided preliminary corrosion tests are only an indicator of potential soil corrosivity for the sample tested. GPI's scope of work did not include corrosion engineering. A corrosion engineer should be retained to evaluate the corrosion potential of the site to proposed improvements, to recommend further testing as required, and to provide specific corrosion mitigation methods appropriate for the project. Additional testing should be conducted during final design.

Percolation Test Wells

Test wells, P-1 and P-2 were, were installed in boreholes drilled using truck-mounted hollow-stem auger drill equipment at two of the preliminary infiltration basin locations. The locations of the test wells are shown on Figure 2. The wells consisted of 2-inch diameter PVC casing installed in an 8-inch diameter borehole. The casing was perforated in the lower 2 feet of the wells. Packing material around the slotted sections of the well casing consisted of #3 sand. The test wells P-1 and P-2 were constructed to depths of approximately 17½ and 16 feet, respectively, below existing grade in order to test the soils near the bottom elevations for two basins that were being considered at the time our field work was conducted. The percolation testing was performed in general accordance with the San Bernardino County guidelines for borehole infiltration tests.

The test wells were filled with water the day before testing and presoaked at least 15 hours. Prior to running the tests in the wells, we conducted the Sandy Soil Criteria Test by filling the test holes as described in the guidelines and taking measurements of the water levels. The Sandy Soil Criteria were achieved in both wells P-1 and P-2. Two consecutive measurements showed that at least 6 inches of water seeped away in less than 25 minutes, therefore the test was continued for at least 1 hour as described in the criteria. The results of the Sandy Soil Criteria Tests are shown on the table below.

The percolation testing was conducted as outlined in the Reference for 'sandy soils' for at least six consecutive 10-minute readings. The tests were performed in each well, measuring the drop in water level over the designated time increment, as appropriate for each location. The initial water heights in the test wells were on the order of 3 feet above the bottom of the test well. After each reading, the water level was raised to approximately the same height. Details of the percolation tests are presented in the attached Table 1, Borehole Infiltration Test Results.

The measured infiltration rates were calculated using the drop in water level over the test increment time and corrected using the Porchet Method. The final measured rates for each well, corrected as indicated above are presented in the following table and should be used with an appropriate factor of safety.

Infiltration Test Results Summary

TEST WELL	APPROXIMATE DEPTH OF TEST WELL (feet)	CORRECTED INFILTRATION RATE (in./hr.)
P-1	17.6	4.4
P-2	16.2	4.9

After completion of the infiltration testing, the well casings were removed, and the holes were backfilled with the on-site soils.

Based on the results of the tests, storm water disposal by infiltration into the shallow subsurface soils is anticipated to be technically feasible. The subsurface conditions encountered in the explorations across the site appear to be relatively uniform and comparable infiltration rates are anticipated in other areas of the site. During final design, additional explorations and infiltration testing should be conducted at the specific locations and depths of planned stormwater infiltration.

The Civil Engineer should evaluate the feasibility of surface infiltration using the rates provided above. Additional factors of safety in computing the design infiltration rate of the proposed infiltration BMP should be determined by the project Civil Engineer.

It should also be noted that the infiltration rates are for clean, clear water and do not include effects of sediment, fines, dissolved solids or other debris, as these materials will significantly reduce the infiltration rates of the subsurface soils. Prior to infiltration, water should be cleaned of sediment or other deleterious materials to help reduce the potential for clogging and reduced percolation rates. Should fines or suspended solids be permitted to enter the basin, reduced infiltration rates will result.

LIMITATIONS

The geotechnical investigation reported herein was performed for the exclusive use by Oakmont Rialto Olive Grove LLC and their consultants in evaluating the feasibility of constructing the proposed improvements. This report should not be used for evaluating the feasibility of developing the site for other uses or for the detailed design of the proposed project, because this report does not contain sufficient or appropriate information for such use.

Soil deposits may vary in type, strength, and many other important properties between points of exploration due to non-uniformity of the geologic formations or to man-made cut and fill operations. While we cannot evaluate the consistency of the properties of materials in areas not explored, the conclusions drawn in this report are based on the assumption that the data obtained in the field are reasonably representative of field conditions and are conducive to interpolation and extrapolation.

As noted previously, additional geotechnical investigations will be needed for design and construction. Furthermore, our recommendations were developed with the assumption that a proper level of field observation and construction review will be provided by a qualified geotechnical consulting firm during grading, excavation, and foundation construction. If design- and construction-phase geotechnical services are performed by others they must accept full responsibility for all geotechnical aspects of the project.

Our investigation and evaluations were performed using generally accepted engineering approaches and principles available at this time and the degree of care and skill ordinarily exercised under similar circumstances by reputable Geotechnical Engineers practicing in this area. No other representation, either express or implied, is included or intended in our report.

Respectfully submitted,
Geotechnical Professionals Inc.

APPENDIX A

APPENDIX A

EXPLORATORY BORINGS

The subsurface conditions for the site were investigated by drilling and sampling four exploratory borings. The borings were advanced to depths of 21½ to 36½ feet below the existing ground surface. The approximate locations of the explorations are shown on the Site Plan, Figure 2.

The exploratory borings were drilled using truck-mounted hollow-stem auger drill equipment. Relatively undisturbed samples were obtained using a brass-ring lined sampler (ASTM D 3550). The brass-rings have an inside diameter of 2.42 inches. The ring samples were driven into the soil by a 140-pound hammer dropping 30 inches. The number of blows needed to drive the sampler into the soil was recorded as the penetration resistance.

At selected locations, disturbed samples were obtained using a split-spoon sampler by means of the Standard Penetration Test (SPT, ASTM D 6066). The spoon sampler was driven into the soil by a 140-pound hammer dropping 30 inches, employing the “free-fall” hammer described above. After an initial seating drive of 6 inches, the number of blows needed to drive the sampler into the soil a depth of 12 inches was recorded as the penetration resistance. These values are the raw uncorrected blow counts.

The field explorations for the investigation were performed under the continuous technical supervision of GPI's representative, who visually inspected the site, maintained detailed logs of the borings, classified the soils encountered, and obtained relatively undisturbed samples for examination and laboratory testing. The soils encountered in the borings were classified in the field and through further examination in the laboratory in accordance with the Unified Soils Classification System. Detailed logs of the borings are presented in Figures A-1 through A-4 in this appendix. Upon completion of the sampling of hollow-stem auger borings, the holes were backfilled with the excavated soils.

The boring locations were laid out in the field by measuring from existing site features. Ground surface elevations at the exploration locations were estimated from an A.L.T.A./N.S.P.S. Land Title Survey Sheet 1 of 1, dated 5/13/19, by Madole and Associates, Inc., and should be considered approximate.

APPENDIX B

EXPLORATORY TEST PITS

The subsurface conditions at the site were investigated by excavating and sampling ten exploratory test pits. The excavations were advanced to depths of approximately 5 feet below the existing ground surface using a backhoe. The locations of the explorations are shown on the Site Plan, Figure 2.

The field exploration for the investigation was performed under the continuous technical supervision of GPI's representative, who visually inspected the site, maintained detailed logs of the test pits, and classified the soils encountered. The soils encountered in the test pits were classified in the field and through further examination in the laboratory in accordance with the Unified Soils Classification System. Detailed logs of the explorations are presented in Figures B-1 to B-10 in this appendix.

The test pit locations were laid out in the field by measuring from existing site features. Ground surface elevations at the exploration locations were estimated from an A.L.T.A./N.S.P.S. Land Title Survey Sheet 1 of 1, dated 5/13/19, by Madole and Associates, Inc., and should be considered approximate.

APPENDIX C

APPENDIX C

LABORATORY TESTS

INTRODUCTION

Representative undisturbed soil samples and bulk samples were carefully packaged in the field and sealed to prevent moisture loss. The samples were then transported to our Cypress office for examination and testing assignments. Laboratory tests were performed on selected representative samples as an aid in classifying the soils and to evaluate the physical properties of the soils affecting foundation design and construction procedures. Detailed descriptions of the laboratory tests are presented below under the appropriate test headings. Test results are presented in the figures that follow.

MOISTURE CONTENT AND DRY DENSITY

Moisture content and dry density were determined from a number of the ring and SPT samples from the borings. The samples were first trimmed to obtain volume and wet weight and then were dried in accordance with ASTM D 2216. After drying, the weight of each sample was measured, and moisture content and dry density were calculated. Moisture content and dry density values are presented on the boring logs in Appendix A.

PERCENTAGE PASSING NO. 200 SIEVE

Select soil samples were dried, weighed, soaked in water until individual soil particles were separated, and then washed on the No. 200 sieve. That portion of the material retained on the No. 200 sieve was oven-dried and weighed to determine the percentage of the material passing the No. 200 sieve. For select samples, the retained material was then run through a standard set of sieves in accordance with ASTM D 422 to classify the coarse fraction of representative sample. A summary of the percentages passing the No. 200 sieve is presented below. The grain size distribution data obtained from the full sieve analyses are presented in Figure C-1.

BORING NO.	DEPTH (ft)	SOIL DESCRIPTION	PERCENT PASSING No. 200 SIEVE
B-1	0-5	Silty Sand (SM)	45
B-3	15	Sand with Silt (SP-SM)	7
B-3	20	Sand with Silt (SP-SM)	5
B-4	0-5	Silty Gravel with Sand (GM)	16
B-4	15	Sand with Silt (SP-SM)	6

DIRECT SHEAR

A direct shear test was performed on undisturbed samples in accordance with ASTM D 3080. The sample was placed in the shear machine, and pre-selected normal loads were applied. The samples were inundated, allowed to consolidate, and then were sheared to failure at a strain rate of 0.002 inches per minute. The tests were repeated on additional test specimens under increased normal loads. Shear stress and sample deformation were monitored throughout the test. The results of the direct shear test are presented in Figure C-2.

COMPACTION TEST

A maximum dry density/optimum moisture test was performed in accordance with ASTM D1557 on a representative bulk sample of the surficial soils. The test results are as follows.

BORING NO.	DEPTH (ft)	SOIL DESCRIPTION	OPTIMUM MOISTURE (%)	MAXIMUM DRY DENSITY (pcf)

Attention: Mr. Jeff Hill

Subject: Addendum 1 to Planning-Level Preliminary Geotechnical Investigation
Proposed Olive Grove Business Park
North Side of Baseline Road, ¼ mile East of N. Ayala Drive
Rialto, California
GPI Project No. 2963.I

Dear Jeff:

In accordance with your request, this addendum letter presents supplemental information and conclusions to our Planning-Level Preliminary Geotechnical Investigation report dated October 2, 2019 (GPI, 2019) to support the Environmental Impact Report (EIR) being prepared by others. The additional information requested is presented below by the individual topic.

Liquefaction – The site is not located within a zone identified as having a potential for liquefaction by the California Geological Survey (CGS), as the quadrangle has not yet been assessed. The site is not located in a zone identified as having a potential for liquefaction by the County of San Bernardino (County, 2007). Published groundwater elevation maps (CDMG, 1976) indicate that groundwater is at a depth of approximately 400 feet below ground surface, as previously mentioned in our report based on California Department of Water Resources data (DWR website, 2019). In addition, the site is underlain by coarsely granular alluvial fan deposits with high penetration resistance [N] values. Accordingly, the potential for liquefaction at the site is remote.

Additional references that support the conclusions regarding liquefaction in our October 2, 2019 are presented in the attached list of references and include Geological Survey Bulletin 1898 (USGS, 1991), DMG Special Publication 102 (DMG, 1993) and Miscellaneous Field Studies Map, Contour Map Showing Minimum Depth to Groundwater, Upper Santa Ana River Valley, California (USGS, 1985)

Landslides - Published landslide maps (CDMG, 1976) indicate that the site is in Valley Floor slope conditions and is not susceptible to landsliding. The site is not located in a zone identified as being susceptible to landslides by the County of San Bernardino (County, 2007).

Lateral Spreading - For lateral spreading to occur, a sloping site with an open face within or at some distance from the site typically exists and there is a potential for liquefaction to occur near the base of the open face. Because the potential for liquefaction to occur at the site is remote, the potential for lateral spreading is remote.

5736 Corporate Avenue • Cypress, CA 90630 • (714) 220-2211 , FAX (714) 220-2122

Soil Expansion - The natural soils consist predominately of sand and silty sand with varying amounts of gravel and cobbles, and gravels with varying amounts of sand and silt. Although not tested, theses soils are considered to have a very low expansion potential.

Subsidence - The site is located within a widespread area of recorded subsidence due to groundwater withdrawal/pumping - historical and current - across California (USGS website, accessed 2021). Subsidence is a potential hazard in areas where there are significant thicknesses of alluvial soils and where groundwater withdrawal is anticipated. Published maps (CDMG,1976) indicate that the site is underlain by approximately 900 feet of alluvium and groundwater is at a depth of approximately 400 feet. Based on the depth to groundwater, if groundwater were lowered, subsidence would occur over a regional area and the effects would not cause potentially damaging differential settlement on local structures.

Erosion - The site gently slopes from the northeast corner to the southwest corner. The near surface natural soils consist predominately of sand and silty sand with varying amounts of gravel and cobbles, and gravels with varying amounts of sand and silt. These materials have a relatively low to moderate potential for erosion depending on drainage patterns. The project is not anticipated to require significant cuts and fills thereby reducing the potential for such erosion. The finished project is also anticipated to be relatively flat and substantially covered with pavements and buildings, thereby reducing the potential for erosion. The construction phase of the project may result in soil erosion depending on temporary draining patterns during construction. A Storm Water Pollution Prevention Program (SWPPP) will be required to identify and implement erosion control measures to prevent substantial topsoil erosion.

CLOSURE

The conclusions and recommendations presented in this letter are subject to the same limitations presented in our October 2, 2019 report. Please contact us if you have any questions or comments.

Respectfully submitted,
Geotechnical Professionals Inc.

Justin J. Kempton, G. E. 2385

1 INTRODUCTION

This report documents the results of a Greenhouse Gas (GHG) Emissions Assessment completed for the Olive Avenue Development (Project). The purpose of this GHG Emissions Assessment is to evaluate the potential construction and operational emissions associated with the Project and determine the level of impact the Project would have on the environment.

1.1 Project Location

The Project site is located north of Baseline Road and east of Fitzgerald Avenue in the City of Rialto, in San Bernardino County. The project site is located southeast of Rialto Municipal Airport and south of Jerry Eaves Park. The project site is currently vacant and is bounded by Jerry Eaves Public Park to the north, vacant land and single-family residential uses to the east, West Baseline Road and single-family residential uses to the south, and vacant land and industrial uses to the west. The 31.6-acre site is located approximately one-mile south the Foothill Freeway (SR-210), Seven miles east of Interstate 15 (I-15), One mile north of Route 66 (RTE-66), and Five miles west of San Bernardino Freeway (SR-215); refer to Exhibit 1: Regional Location Map and Exhibit 2: Project Vicinity Map**.**

1.2 Project Description

The Project is proposing to develop an existing vacant property (location as referenced above) that would include the construction of a campus oriented industrial project with two primary, divisible, buildings consisting of approximately 10,000 square feet of office/mezzanine space, 866 square feet for exterior building sprinkler fire pumps, and 668,741 square feet of warehouse space for a total of 679,607 square feet on approximately 31.08 net acres. The Owner is proposing to split the existing property (referenced as Assessor Parcel No. (APN) 0264-213-18) from one large lot into two lots to allow for each of the two proposed buildings to each have their own legal parcel.

As shown in Exhibit 3: Conceptual Site Plan, Building 1 (west building) and Building 2 (east building) have been architecturally designed to allow for multiple units in various increments based on tenant demand. Exhibit 3 shows that Building 1 can be divided into 4 or more units and Building 2 can be divided into 3 or more units, each with a separate point of entry into the buildings.

Existing General Plan Land Use and Zoning Designations

The Project site is zoned for Industrial Park land Use. Adjacent properties to the north are zoned for open space resources and open space recreation uses. Properties to the west are zoned for a specific site plan: Renaissance site. The properties to the south are zoned for residential and open space resources. Properties zoned for residential and Community commercial are due east of the Project site.

Warehouse Facility

The proposed Project consists of two warehouse buildings for a total of 679,390 square feet; refer to Table 1: Building Summary. Building “1” would include 425,148 square feet of warehouse area, 5,000 square feet of office space, and 433 feet designated for a fire pump. Building “2” would include 243,376 square feet of warehouse area, 5,000 square feet of office space, and 433 feet designated for a fire pump.

Table 1: Building Summary

Building	Warehouse (sf)	Office Mezzanine (sf)	Fire Pump (sf)	Total Building (sf)	Parking			Landscaping (sf)
					Automobiles	Truck/Trailer Stalls	Loading Docks	
1	425,148	5,000	433	430,581	308	64	48	97,826
2	243,593	5,000	433	249,026	197	58	31	79,031

Notes: sf = square feet

Site Access

Vehicular access provisions for the project site would consist of three driveways on Baseline Road. Passenger vehicles would access the site via all three driveways. The center driveway would be signalized and would provide truck and passenger vehicle ingress/egress to the site. The eastern and western driveways would be right-in right-out and would be dedicated to passenger and emergency vehicles. Street improvements to Baseline Road may consist of the following: sidewalk, parkway landscaping, curb and gutter, median improvements, bike lanes, dry utility undergrounding, streetlights, fire hydrants, traffic signal equipment (center driveway intersection), rehabilitation of existing asphalt pavement, offsite utility connections, and signing and striping, as required by the City. Off-site improvements would include construction of a new signalized intersection at Idyllwild Avenue and Baseline Road to provide signalized access to the residences south of Baseline Road and construction of a new signalized intersection at the center of the Project along Baseline Road to allow for direct truck access into and out of the Project.

Parking

The Project provides 505 automobile parking stalls, exceeding the requirement of 414 automobile parking stalls. Additionally, 122 trailer parking spaces and 79 loading docks are provided.

Landscaping

Landscaping is required by City code to cover 10% of each lot and based on the proposed Project would cover approximately 12.27% (97,826 square feet) on Parcel 1 and 14.17% (79,031 square feet) on Parcel 2 of the site. Landscaping would be installed in all areas not devoted to buildings, parking, traffic and specific user requirements, in accordance with the City's Municipal Code Section 18.61.250 and Section 18.61.270 which specify landscape design guidelines for industrial districts.

2 ENVIRONMENTAL SETTING

2.1 Greenhouse Gases and Climate Change

Certain gases in the earth's atmosphere classified as GHGs, play a critical role in determining the earth's surface temperature. Solar radiation enters the earth's atmosphere from space. A portion of the radiation is absorbed by the earth's surface and a smaller portion of this radiation is reflected back toward space. This absorbed radiation is then emitted from the earth as low-frequency infrared radiation. The frequencies at which bodies emit radiation are proportional to temperature. Because the earth has a much lower temperature than the sun, it emits lower-frequency radiation. Most solar radiation passes through GHGs; however, infrared radiation is absorbed by these gases. As a result, radiation that otherwise would have escaped back into space is instead "trapped," resulting in a warming of the atmosphere. This phenomenon, known as the greenhouse effect, is responsible for maintaining a habitable climate on earth.

The primary GHGs contributing to the greenhouse effect are carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). Fluorinated gases also make up a small fraction of the GHGs that contribute to climate change. Examples of fluorinated gases include chlorofluorocarbons (CFCs), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3); however, it is noted that these gases are not associated with typical land use development. Human-caused emissions of GHGs exceeding natural ambient concentrations are believed to be responsible for intensifying the greenhouse effect and leading to a trend of unnatural warming of the Earth's climate, known as global climate change or global warming.

GHGs are global pollutants, unlike criteria air pollutants and toxic air contaminants (TACs), which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects have relatively short atmospheric lifetimes (about one day), GHGs have long atmospheric lifetimes (one to several thousand years). GHGs persist in the atmosphere for long enough time periods to be dispersed around the globe. Although the exact lifetime of a GHG molecule is dependent on multiple variables and cannot be pinpointed, more CO_2 is emitted into the atmosphere than is sequestered by ocean uptake, vegetation, or other forms of carbon sequestration. Of the total annual human-caused CO_2 emissions, approximately 55 percent is sequestered through ocean and land uptakes every year, averaged over the last 50 years, whereas the remaining 45 percent of human-caused CO_2 emissions remains stored in the atmosphere[1]. Table 2: Description of Greenhouse Gases describes the primary GHGs attributed to global climate change, including their physical properties.

[1] Intergovernmental Panel on Climate Change, *Carbon and Other Biogeochemical Cycles. In: Climate Change 2013: The Physical Science Basis*, *Contribution of Working Group I to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change*, 2013. http://www.climatechange2013.org/ images/report/WG1AR5_ALL_FINAL.pdf.

Table 2: Description of Greenhouse Gases

Greenhouse Gas	Description
Carbon Dioxide (CO_2)	CO_2 is a colorless, odorless gas that is emitted naturally and through human activities. Natural sources include decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic sources are from burning coal, oil, natural gas, and wood. The largest source of CO_2 emissions globally is the combustion of fossil fuels such as coal, oil, and gas in power plants, automobiles, and industrial facilities. The atmospheric lifetime of CO_2 is variable because it is readily exchanged in the atmosphere. CO_2 is the most widely emitted GHG and is the reference gas (Global Warming Potential of 1) for determining Global Warming Potentials for other GHGs.
Nitrous Oxide (N_2O)	N_2O is largely attributable to agricultural practices and soil management. Primary human-related sources of N_2O include agricultural soil management, sewage treatment, combustion of fossil fuels, and adipic and nitric acid production. N_2O is produced from biological sources in soil and water, particularly microbial action in wet tropical forests. The atmospheric lifetime of N_2O is approximately 120 years. The Global Warming Potential of N_2O is 298.
Methane (CH_4)	CH_4, a highly potent GHG, primarily results from off-gassing (the release of chemicals from nonmetallic substances under ambient or greater pressure conditions) and is largely associated with agricultural practices and landfills. Methane is the major component of natural gas, about 87 percent by volume. Human-related sources include fossil fuel production, animal husbandry, rice cultivation, biomass burning, and waste management. Natural sources of CH_4 include wetlands, gas hydrates, termites, oceans, freshwater bodies, non-wetland soils, and wildfires. The atmospheric lifetime of CH_4 is about 12 years and the Global Warming Potential is 25.
Hydrofluorocarbons (HFCs)	HFCs are typically used as refrigerants for both stationary refrigeration and mobile air conditioning. The use of HFCs for cooling and foam blowing is increasing, as the continued phase out of CFCs and HCFCs gains momentum. The 100-year Global Warming Potential of HFCs range from 124 for HFC-152 to 14,800 for HFC-23.
Perfluorocarbons (PFCs)	PFCs have stable molecular structures and only break down by ultraviolet rays about 60 kilometers above Earth's surface. Because of this, they have long lifetimes, between 10,000 and 50,000 years. Two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Global Warming Potentials range from 6,500 to 9,200.
Chlorofluorocarbons (CFCs)	CFCs are gases formed synthetically by replacing all hydrogen atoms in methane or ethane with chlorine and/or fluorine atoms. They are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at the earth's surface). CFCs were synthesized in 1928 for use as refrigerants, aerosol propellants, and cleaning solvents. The Montreal Protocol on Substances that Deplete the Ozone Layer prohibited their production in 1987. Global Warming Potentials for CFCs range from 3,800 to 14,400.
Sulfur Hexafluoride (SF_6)	SF_6 is an inorganic, odorless, colorless, and nontoxic, nonflammable gas. It has a lifetime of 3,200 years. This gas is manmade and used for insulation in electric power transmission equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas. The Global Warming Potential of SF_6 is 23,900.
Hydrochlorofluorocarbons (HCFCs)	HCFCs are solvents, similar in use and chemical composition to CFCs. The main uses of HCFCs are for refrigerant products and air conditioning systems. As part of the Montreal Protocol, HCFCs are subject to a consumption cap and gradual phase out. The United States is scheduled to achieve a 100 percent reduction to the cap by 2030. The 100-year Global Warming Potentials of HCFCs range from 90 for HCFC-123 to 1,800 for HCFC-142b.
Nitrogen Trifluoride (NF_3)	NF_3 was added to Health and Safety Code section 38505(g)(7) as a GHG of concern. This gas is used in electronics manufacture for semiconductors and liquid crystal displays. It has a high global warming potential of 17,200.

3 REGULATORY SETTING

3.1 Federal

To date, national standards have not been established for nationwide GHG reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and GHG emissions reduction at the project level. Various efforts have been promulgated at the federal level to improve fuel economy and energy efficiency to address climate change and its associated effects.

Energy Independence and Security Act of 2007

The Energy Independence and Security Act of 2007 (December 2007), among other key measures, requires the following, which would aid in the reduction of national GHG emissions:

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct the National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

U.S. Environmental Protection Agency Endangerment Finding

The U.S. Environmental Protection Agency (EPA) authority to regulate GHG emissions stems from the U.S. Supreme Court decision in *Massachusetts v. EPA* (2007). The Supreme Court ruled that GHGs meet the definition of air pollutants under the existing Federal Clean Air Act (FCAA) and must be regulated if these gases could be reasonably anticipated to endanger public health or welfare. Responding to the Court's ruling, the EPA finalized an endangerment finding in December 2009. Based on scientific evidence it found that six GHGs (CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6) constitute a threat to public health and welfare. Thus, it is the Supreme Court's interpretation of the existing FCAA and the EPA's assessment of the scientific evidence that form the basis for the EPA's regulatory actions.

Federal Vehicle Standards

In response to the U.S. Supreme Court ruling discussed above, Executive Order 13432 was issued in 2007 directing the EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011, and in 2010, the EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016.

In 2010, an Executive Memorandum was issued directing the Department of Transportation, Department of Energy, EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017–2025 light-duty vehicles. The proposed standards projected to achieve 163 grams per mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017–2021, and NHTSA intends to set standards for model years 2022–2025 in a future rulemaking. On January 12, 2017, the EPA finalized its decision to maintain the current GHG emissions standards for model years 2022–2025 cars and light trucks. It should be noted that the U.S. EPA is currently proposing to freeze the vehicle fuel efficiency standards at their planned 2020 level (37 mpg), canceling any future strengthening (currently 54.5 mpg by 2026).

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the EPA, this regulatory program will reduce GHG emissions and fuel consumption for the affected vehicles by 6 to 23 percent over the 2010 baselines.

In August 2016, the EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018 through 2027 for certain trailers, and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all types and sizes of buses and work trucks. The final standards are expected to lower CO_2 emissions by approximately 1.1 billion metric tons and reduce oil consumption by up to 2 billion barrels over the lifetime of the vehicles sold under the program.

In 2018, the President and the U.S. EPA stated their intent to halt various federal regulatory activities to reduce GHG emission, including the phase two program. California and other states have stated their intent to challenge federal actions that would delay or eliminate GHG reduction measures and have committed to cooperating with other countries to implement global climate change initiatives. On September 27, 2019, the U.S. EPA and the NHTSA published the “Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program.” (84 Fed. Reg. 51,310 (Sept. 27, 2019.) The Part One Rule revokes California’s authority to set its own GHG emissions standards and set zero-emission vehicle mandates in California. On March 31, 2020, the U.S. EPA and NHTSA finalized rulemaking for SAFE Part Two sets CO2 emissions standards and corporate average fuel economy (CAFE) standards for passenger vehicles and light duty trucks, covering model years 2021-2026.

3.2 State of California

California Air Resources Board

The California Air Resources Board (CARB) is responsible for the coordination and oversight of State and local air pollution control programs in California. Various statewide and local initiatives to reduce California’s contribution to GHG emissions have raised awareness about climate change and its potential for severe long-term adverse environmental, social, and economic effects. California is a significant emitter of CO_2 equivalents (CO_2e) in the world and produced 459 million gross metric tons of CO_2e in 2013.

In the State, the transportation sector is the largest emitter of GHGs, followed by industrial operations such as manufacturing and oil and gas extraction.

The State of California legislature has enacted a series of bills that constitute the most aggressive program to reduce GHGs of any state in the nation. Some legislation, such as the landmark Assembly Bill (AB) 32, *California Global Warming Solutions Act of 2006*, was specifically enacted to address GHG emissions. Other legislation, such as Title 24 building efficiency standards and Title 20 appliance energy standards, were originally adopted for other purposes such as energy and water conservation, but also provide GHG reductions. This section describes the major provisions of the legislation.

Assembly Bill 32 (California Global Warming Solutions Act of 2006)

AB 32 instructs the CARB to develop and enforce regulations for the reporting and verification of statewide GHG emissions. AB 32 also directed CARB to set a GHG emissions limit based on 1990 levels, to be achieved by 2020. It set a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner.

California Air Resource Board Scoping Plan

CARB adopted the Scoping Plan to achieve the goals of AB 32. The Scoping Plan establishes an overall framework for the measures that would be adopted to reduce California's GHG emissions. CARB determined that achieving the 1990 emissions level would require a reduction of GHG emissions of approximately 29 percent below what would otherwise occur in 2020 in the absence of new laws and regulations (referred to as "business-as-usual")[2]. The Scoping Plan evaluates opportunities for sector-specific reductions, integrates early actions and additional GHG reduction measures by both CARB and the State's Climate Action Team, identifies additional measures to be pursued as regulations, and outlines the adopted role of a cap-and-trade program[3]. Additional development of these measures and adoption of the appropriate regulations occurred through the end of 2013. Key elements of the Scoping Plan include:

- Expanding and strengthening existing energy efficiency programs, as well as building and appliance standards.
- Achieving a statewide renewables energy mix of 33 percent by 2020.
- Developing a California cap-and-trade program that links with other programs to create a regional market system and caps sources contributing 85 percent of California's GHG emissions (adopted in 2011).
- Establishing targets for transportation-related GHG emissions for regions throughout California and pursuing policies and incentives to achieve those targets (several sustainable community strategies have been adopted).

[2] CARB defines business-as-usual (BAU) in its Scoping Plan as emissions levels that would occur if California continued to grow and add new GHG emissions but did not adopt any measures to reduce emissions. Projections for each emission-generating sector were compiled and used to estimate emissions for 2020 based on 2002–2004 emissions intensities. Under CARB's definition of BAU, new growth is assumed to have the same carbon intensities as was typical from 2002 through 2004.

[3] The Climate Action Team, led by the secretary of the California Environmental Protection Agency, is a group of State agency secretaries and heads of agencies, boards, and departments. Team members work to coordinate statewide efforts to implement global warming emissions reduction programs and the State's Climate Adaptation Strategy.

- Adopting and implementing measures pursuant to existing State laws and policies, including California's clean car standards, heavy-duty truck measures, the Low Carbon Fuel Standard (amendments to the Pavley Standard adopted 2009; Advanced Clean Car standard adopted 2012), goods movement measures, and the Low Carbon Fuel Standard (adopted 2009).
- Creating targeted fees, including a public goods charge on water use, fees on gasses with high global warming potential, and a fee to fund the administrative costs of the State of California's long-term commitment to AB 32 implementation.
- The California Sustainable Freight Action Plan was developed in 2016 and provides a vision for California's transition to a more efficient, more economically competitive, and less polluting freight transport system. This transition of California's freight transport system is essential to supporting the State's economic development in coming decades while reducing pollution.
- CARB's Mobile Source Strategy demonstrates how the State can simultaneously meet air quality standards, achieve GHG emission reduction targets, decrease health risk from transportation emissions, and reduce petroleum consumption over the next fifteen years. The mobile Source Strategy includes increasing ZEV buses and trucks.

In 2012, CARB released revised estimates of the expected 2020 emissions reductions. The revised analysis relied on emissions projections updated in light of current economic forecasts that accounted for the economic downturn since 2008, reduction measures already approved and put in place relating to future fuel and energy demand, and other factors. This update reduced the projected 2020 emissions from 596 million metric tons of CO_2e ($MMTCO_2e$) to 545 $MMTCO_2e$. The reduction in forecasted 2020 emissions means that the revised business-as-usual reduction necessary to achieve AB 32's goal of reaching 1990 levels by 2020 is now 21.7 percent, down from 29 percent. CARB also provided a lower 2020 inventory forecast that incorporated State-led GHG emissions reduction measures already in place. When this lower forecast is considered, the necessary reduction from business-as-usual needed to achieve the goals of AB 32 is approximately 16 percent.

CARB adopted the first major update to the Scoping Plan on May 22, 2014. The updated Scoping Plan summarizes the most recent science related to climate change, including anticipated impacts to California and the levels of GHG emissions reductions necessary to likely avoid risking irreparable damage. It identifies the actions California has already taken to reduce GHG emissions and focuses on areas where further reductions could be achieved to help meet the 2020 target established by AB 32.

In 2016, the Legislature passed Senate Bill (SB) 32, which codifies a 2030 GHG emissions reduction target of 40 percent below 1990 levels. With SB 32, the Legislature passed companion legislation, AB 197, which provides additional direction for developing the Scoping Plan. On December 14, 2017 CARB adopted a second update to the Scoping Plan[4]. The 2017 Scoping Plan details how the State will reduce GHG emissions to meet the 2030 target set by Executive Order B-30-15 and codified by SB 32. Other objectives listed in the 2017 Scoping plan are to provide direct GHG emissions reductions; support climate investment in disadvantaged communities; and, support the Clean Power Plan and other Federal actions.

[4] California Air Resources Board, *California's 2017 Climate Change Scoping Plan,* https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf. Accessed May 9, 2018.

Senate Bill 32 (California Global Warming Solutions Act of 2006: Emissions Limit)

Signed into law in September 2016, SB 32 codifies the 2030 GHG reduction target in Executive Order B-30-15 (40 percent below 1990 levels by 2030). The bill authorizes CARB to adopt an interim GHG emissions level target to be achieved by 2030. CARB also must adopt rules and regulations in an open public process to achieve the maximum, technologically feasible, and cost-effective GHG reductions.

SB 375 (The Sustainable Communities and Climate Protection Act of 2008)

Signed into law on September 30, 2008, SB 375 provides a process to coordinate land use planning, regional transportation plans, and funding priorities to help California meet the GHG reduction goals established by AB 32. SB 375 requires metropolitan planning organizations to include sustainable community strategies in their regional transportation plans for reducing GHG emissions, aligns planning for transportation and housing, and creates specified incentives for the implementation of the strategies.

AB 1493 (Pavley Regulations and Fuel Efficiency Standards)

AB 1493, enacted on July 22, 2002, required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. Implementation of the regulation was delayed by lawsuits filed by automakers and by the EPA's denial of an implementation waiver. The EPA subsequently granted the requested waiver in 2009, which was upheld by the by the U.S. District Court for the District of Columbia in 2011. The regulations establish one set of emission standards for model years 2009–2016 and a second set of emissions standards for model years 2017 to 2025. By 2025, when all rules will be fully implemented, new automobiles will emit 34 percent fewer CO_2e emissions and 75 percent fewer smog-forming emissions.

SB 1368 (Emission Performance Standards)

SB 1368 is the companion bill of AB 32, which directs the California Public Utilities Commission (CPUC) to adopt a performance standard for GHG emissions for the future power purchases of California utilities. SB 1368 limits carbon emissions associated with electrical energy consumed in California by forbidding procurement arrangements for energy longer than 5 years from resources that exceed the emissions of a relatively clean, combined cycle natural gas power plant. The new law effectively prevents California's utilities from investing in, otherwise financially supporting, or purchasing power from new coal plants located in or out of the State. The CPUC adopted the regulations required by SB 1368 on August 29, 2007. The regulations implementing SB 1368 establish a standard for baseload generation owned by, or under long-term contract to publicly owned utilities, for 1,100 pounds of CO_2 per megawatt-hour.

SB 1078 and SBX1-2 (Renewable Electricity Standards)

SB 1078 requires California to generate 20 percent of its electricity from renewable energy by 2017. SB 107 changed the due date to 2010 instead of 2017. On November 17, 2008, Governor Arnold Schwarzenegger signed Executive Order S-14-08, which established a Renewable Portfolio Standard target for California requiring that all retail sellers of electricity serve 33 percent of their load with renewable energy by 2020. Executive Order S-21-09 also directed CARB to adopt a regulation by July 31, 2010, requiring the State's load serving entities to meet a 33 percent renewable energy target by 2020. CARB approved the Renewable Electricity Standard on September 23, 2010 by Resolution 10-23. SBX1-2, which codified the 33 percent by 2020 goal.

SB 350 (Clean Energy and Pollution Reduction Act of 2015)

Signed into law on October 7, 2015, SB 350 implements the goals of Executive Order B-30-15. The objectives of SB 350 are to increase the procurement of electricity from renewable sources from 33 percent to 50 percent (with interim targets of 40 percent by 2024, and 25 percent by 2027) and to double the energy efficiency savings in electricity and natural gas end uses of retail customers through energy efficiency and conservation. SB 350 also reorganizes the Independent System Operator to develop more regional electricity transmission markets and improve accessibility in these markets, which will facilitate the growth of renewable energy markets in the western United States.

AB 398 (Market-Based Compliance Mechanisms)

Signed on July 25, 2017, AB 398 extended the duration of the Cap-and-Trade program from 2020 to 2030. AB 398 required CARB to update the Scoping Plan and for all GHG rules and regulations adopted by the State. It also designated CARB as the statewide regulatory body responsible for ensuring that California meets its statewide carbon pollution reduction targets, while retaining local air districts' responsibility and authority to curb toxic air contaminants and criteria pollutants from local sources that severely impact public health. AB 398 also decreased free carbon allowances over 40 percent by 2030 and prioritized Cap-and-Trade spending to various programs including reducing diesel emissions in impacted communities.

SB 150 (Regional Transportation Plans)

Signed on October 10, 2017, SB 150 aligns local and regional GHG reduction targets with State targets (i.e. 40 percent below their 1990 levels by 2030). SB 150 creates a process to include communities in discussions on how to monitor their regions' progress on meeting these goals. The bill also requires the CARB to regularly report on that progress, as well as on the successes and the challenges regions experience associated with achieving their targets. SB 150 provides for accounting of climate change efforts and GHG reductions and identify effective reduction strategies.

SB 100 (California Renewables Portfolio Standard Program: Emissions of Greenhouse Gases)

Signed into Law in September 2018, SB 100 increased California's renewable electricity portfolio from 50 to 60 percent by 2030. SB 100 also established a further goal to have an electric grid that is entirely powered by clean energy by 2045.

Executive Orders Related to GHG Emissions

California's Executive Branch has taken several actions to reduce GHGs using executive orders. Although not regulatory, they set the tone for the State and guide the actions of state agencies.

Executive Order S-3-05. Executive Order S-3-05 was issued on June 1, 2005, which established the following GHG emissions reduction targets:

- By 2010, reduce GHG emissions to 2000 levels.
- By 2020, reduce GHG emissions to 1990 levels.
- By 2050, reduce GHG emissions to 80 percent below 1990 levels.

The 2050 reduction goal represents what some scientists believe is necessary to reach levels that will stabilize the climate. The 2020 goal was established to be a mid-term target. Because this is an executive order, the goals are not legally enforceable for local governments or the private sector.

Executive Order S-01-07. Issued on January 18, 2007, Executive Order S 01-07 mandates that a statewide goal shall be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. The executive order established a Low Carbon Fuel Standard (LCFS) and directed the Secretary for Environmental Protection to coordinate the actions of the California Energy Commission, CARB, the University of California, and other agencies to develop and propose protocols for measuring the "life-cycle carbon intensity" of transportation fuels. CARB adopted the LCFS on April 23, 2009.

Executive Order S-13-08. Issued on November 14, 2008, Executive Order S-13-08 facilitated the California Natural Resources Agency development of the 2009 California Climate Adaptation Strategy. Objectives include analyzing risks of climate change in California, identifying and exploring strategies to adapt to climate change, and specifying a direction for future research.

Executive Order S-14-08. Issued on November 17, 2008, Executive Order S-14-08 expands the State's Renewable Energy Standard to 33 percent renewable power by 2020. Additionally, Executive Order S-21-09 (signed on September 15, 2009) directs CARB to adopt regulations requiring 33 percent of electricity sold in the State come from renewable energy by 2020. CARB adopted the Renewable Electricity Standard on September 23, 2010, which requires 33 percent renewable energy by 2020 for most publicly owned electricity retailers.

Executive Order S-21-09. Issued on July 17, 2009, Executive Order S-21-09 directs CARB to adopt regulations to increase California's RPS to 33 percent by 2020. This builds upon SB 1078 (2002), which established the California RPS program, requiring 20 percent renewable energy by 2017, and SB 107 (2006), which advanced the 20 percent deadline to 2010, a goal which was expanded to 33 percent by 2020 in the 2005 Energy Action Plan II.

Executive Order B-30-15. Issued on April 29, 2015, Executive Order B-30-15 established a California GHG reduction target of 40 percent below 1990 levels by 2030 and directs CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of CO_2e (MMTCO2e). The 2030 target acts as an interim goal on the way to achieving reductions of 80 percent below 1990 levels by 2050, a goal set by Executive Order S-3-05. The executive order also requires the State's climate adaptation plan to be updated every three years and for the State to continue its climate change research program, among other provisions. With the enactment of SB 32 in 2016, the Legislature codified the goal of reducing GHG emissions by 2030 to 40 percent below 1990 levels.

Executive Order B-55-18. Issued on September 10, 2018, Executive Order B-55-18 establishes a goal to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. This goal is in addition to the existing statewide targets of reducing GHG emissions. The executive order requires CARB to work with relevant state agencies to develop a framework for implementing this goal. It also requires CARB to update the Scoping Plan to identify and recommend measures to achieve carbon neutrality. The executive order also requires state agencies to develop sequestration targets in the Natural and Working Lands Climate Change Implementation Plan.

Executive Order N-79-20. Signed in September 2020, Executive Order N-79-20 establishes as a goal that where feasible, all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035. The executive order sets a similar goal requiring that all medium and heavy-duty vehicles will be zero-emission by 2045 where feasible. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium-and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new zero emission vehicles (ZEVs) "towards the target of 100 percent." The executive order directs the California Environmental Protection Agency, the California Geologic Energy Management Division (CalGEM), and the California Natural Resources Agency to transition and repurpose oil production facilities with a goal toward meeting carbon neutrality by 2045. Executive Order N-79-20 builds upon the CARB Advanced Clean Trucks regulation, which was adopted by CARB in July 2020.

California Regulations and Building Codes

California has a long history of adopting regulations to improve energy efficiency in new and remodeled buildings. These regulations have kept California's energy consumption relatively flat even with rapid population growth.

Title 20 Appliance Efficiency Regulations. The appliance efficiency regulations (California Code of Regulations [CCR] Title 20, Sections 1601-1608) include standards for new appliances. Twenty-three categories of appliances are included in the scope of these regulations. These standards include minimum levels of operating efficiency, and other cost-effective measures, to promote the use of energy- and water-efficient appliances.

Title 24 Building Energy Efficiency Standards. California's Energy Efficiency Standards for Residential and Nonresidential Buildings (CCR Title 24, Part 6), was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions. The 2016 Building Energy Efficiency Standards approved on January 19, 2016 went into effect on January 1, 2017. The 2019 Building Energy Efficiency Standards were adopted on May 9, 2018 and took effect on January 1, 2020. Under the 2019 standards, homes will use about 53 percent less energy and nonresidential buildings will use about 30 percent less energy than buildings under the 2016 standards.

Title 24 California Green Building Standards Code. The California Green Building Standards Code (CCR Title 24, Part 11 code) commonly referred to as the CALGreen Code, is a statewide mandatory construction code developed and adopted by the California Building Standards Commission and the Department of Housing and Community Development. The CALGreen standards require new residential and commercial buildings to comply with mandatory measures under the topics of planning and design, energy efficiency, water efficiency/conservation, material conservation and resource efficiency, and environmental quality. CALGreen also provides voluntary tiers and measures that local governments may adopt that encourage or require additional measures in the five green building topics. The most recent update to the CALGreen Code went into effect January 1, 2017. Updates to the 2016 CALGreen Code took effect on January 1, 2020 (2019 CALGreen). The 2019 CALGreen standards will continue to improve upon the existing standards for new construction of, and additions and alterations to, residential and nonresidential buildings.

CARB Advanced Clean Truck Regulation

CARB adopted the Advanced Clean Truck Regulation in June 2020 requiring truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024. By 2045, every new truck sold in California is required to be zero-emission. This rule directly addresses disproportionate risks and health and pollution burdens and puts California on the path for an all zero-emission short-haul drayage fleet in ports and railyards by 2035, and zero-emission "last-mile" delivery trucks and vans by 2040. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8. The regulation has two components including a manufacturer sales requirement, and a reporting requirement:

- Zero-Emission Truck Sales: Manufacturers who certify Class 2b through 8 chassis or complete vehicles with combustion engines are required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales need to be 55 percent of Class 2b – 3 truck sales, 75 percent of Class 4 – 8 straight truck sales, and 40 percent of truck tractor sales.

- Company and Fleet Reporting: Large employers including retailers, manufacturers, brokers and others would be required to report information about shipments and shuttle services. Fleet owners, with 50 or more trucks, would be required to report about their existing fleet operations. This information would help identify future strategies to ensure that fleets purchase available zero-emission trucks and place them in service where suitable to meet their needs.

3.3 Regional

South Coast Air Quality Management District Thresholds

The South Coast Air Quality Management District (SCAQMD) formed a GHG California Environmental Quality Act (CEQA) Significance Threshold Working Group to provide guidance to local lead agencies on determining significance for GHG emissions in their CEQA documents. As of the last Working Group meeting (Meeting 15) held in September 2010, the SCAQMD is proposing to adopt a tiered approach for evaluating GHG emissions for development projects where SCAQMD is not the lead agency.

With the tiered approach, the Project is compared with the requirements of each tier sequentially and would not result in a significant impact if it complies with any tier. Tier 1 excludes projects that are specifically exempt from SB 97 from resulting in a significant impact. Tier 2 excludes projects that are consistent with a GHG reduction plan that has a certified final CEQA document and complies with AB 32 GHG reduction goals. Tier 3 excludes projects with annual emissions lower than a screening threshold. For all industrial projects, the SCAQMD has proposed a screening threshold of 10,000 metric tons of CO_2e ($MTCO_2e$) per year. During Working Group Meeting #7 it was explained that this threshold was derived using a 90 percent capture rate of a large sampling of industrial facilities. During Meeting #8, the Working Group defined industrial uses as production, manufacturing, and fabrication activities or storage and distribution (e.g., warehouse, transfer facility, etc.). SCAQMD concluded that projects with emissions less than the screening threshold would not result in a significant cumulative impact.

As the project involves the construction of a new warehouse, the 10,000 $MTCO_2e$ per year industrial screening threshold has been selected as the significance threshold, as it is most applicable to the proposed project.

Southern California Association of Governments

On September 3, 2020, the Southern California Association of Governments (SCAG) Regional Council adopted the 2020-2045 *Regional Transportation Plan/ Sustainable Communities Strategy* (RTP/SCS). The RTP/SCS charts a course for closely integrating land use and transportation so that the region can grow smartly and sustainably. The strategy was prepared through a collaborative, continuous, and comprehensive process with input from local governments, county transportation commissions, tribal governments, non-profit organizations, businesses and local stakeholders within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The RTP/SCS is a long-range vision plan that balances future mobility and housing needs with economic, environmental, and public health goals. The SCAG region strives toward sustainability through integrated land use and transportation planning. The SCAG region must achieve specific federal air quality standards and is required by state law to lower regional GHG emissions.

San Bernardino County Regional Greenhouse Gas Reduction Plan

In response to statewide GHG reduction initiatives, the San Bernardino Associated Governments (formerly SANBAG, now known as San Bernardino Council of Governments or SBCOG), cooperated to compile an inventory of GHG emissions and an evaluation of reduction measures to be adopted by the cities partnering within SBCOG. Reduction measures in the GHG Reduction Plan (GHGRP) are targeting GHG goals for the year 2020. Several of the measures and policies mentioned in the GHGRP for the City of Rialto are from the RGP. The policies listed in the GHGRP range from broadly supporting energy efficiency and sustainability to policies closely tied to specific GHG reduction measures. Application of these policies is expected to reduce local GHGs by an estimated 387,998 $MTCO_2e$ from "business as usual" levels in 2020. This would equate to a 28.0 percent reduction in GHGs from the 2008 levels of 1,238,926 $MTCO_2e$ annually.

3.4 Local

City of Rialto General Plan

The City of Rialto General Plan (RGP) is a roadmap that encompasses the hopes, aspirations, values and dreams of the community. The RGP does not mention specific standalone air quality goals and policies for the City. Instead, the RGP has goals and policies to improve air quality through transportation infrastructure. Since there are limited Project-relevant policies specific to air quality, related policies are mentioned in this section. Where inconsistencies exist, if any, they are addressed in the respective impact analysis below. RGP policies that directly address reducing and avoiding natural resources impacts include the following:

Goal 2-30: Incorporate green building and other sustainable building practices into development projects.

Policy 2.30.1: Explore and adopt the use of green building standards and Leadership in Energy and Environmental Design (LEED) or similar in both private and public projects.

Policy 2-30.2: Promote sustainable building practices that go beyond the requirements of Title 24 of the California Administrative Code, and encourage energy-efficient design elements, as appropriate.

Policy 2-30.3: Support sustainable building practices that integrate building materials and methods that promote environmental quality, economic vitality, and social benefit through the design, construction, and operation of the built environment.

Goal 2-31: Conserve energy resources.

Policy 2-31.1: Require the incorporation of energy conservation features into the design of all new construction and site development activities.

Goal 2-35: Reduce air pollution emissions from both mobile and stationary sources in the City.

Policy 2-35.2: Require that new development projects incorporate design features that encourage ridesharing, transit use, park and ride facilities, and bicycle and pedestrian circulation.

Policy 2-35.3: Establish a balanced land use pattern, and facilitate developments that provide jobs for City residents in order to reduce vehicle trips citywide.

Policy 2-35.4: Require new development and significant redevelopment proposals to incorporate sufficient design and operational controls to prevent release of noxious odors beyond the limits of the development site.

Goal 2-37: Expand public awareness regarding air pollution sources and pollutant reduction initiatives.

Policy 2-37.1: Encourage and publicly recognize innovative approaches that improve air quality.

Policy 2-37.2: Encourage the participation of environmental groups, the business community, civic groups, special interest groups, and the public in the formulation and implementation of programs that effectively reduce air pollution.

Policy 2-37.3: Provide public education to encourage local consumers to choose the cleanest paints and other non-pollutant consumer products.

Goal 2-38: Mitigate against climate change.

Policy 2-38.1: Consult with State agencies, SCAG, and the San Bernardino Council of Governments (SBCOG) to implement AB 32 and SB 375 by utilizing incentives to facilitate infill and transit-oriented development.

Policy 2-38.2: Encourage development of transit-oriented and infill development, and encourage a mix of uses that foster walking and alternative transportation in Downtown and along Foothill Boulevard.

Policy 2-38.3: Provide enhanced bicycling and walking infrastructure, and support public transit, including public bus service, the Metrolink, and the potential for Bus Rapid Transit (BRT).

Policy 2-38.4: The City shall participate in the San Bernardino Regional Greenhouse Inventory and Reduction Plan.

4 SIGNIFICANCE CRITERIA AND METHODOLOGY

4.1 CEQA Thresholds and Significance Criteria

Based upon the criteria derived from Appendix G of the CEQA Guidelines, a project normally would have a significant effect on the environment if it would:

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment, based on any applicable threshold of significance; or
- Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

Addressing GHG emissions generation impacts requires an agency to determine what constitutes a significant impact. The amendments to the CEQA Guidelines specifically allow lead agencies to determine thresholds of significance that illustrate the extent of an impact and are a basis from which to apply mitigation measures. This means that each agency is left to determine whether a project's GHG emissions will have a "significant" impact on the environment. The guidelines direct that agencies are to use "careful judgment" and "make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate" the project's GHG emissions[5].

South Coast Air Quality Management Thresholds

The SCAQMD has not announced when staff is expecting to present a finalized version of its GHG thresholds to the governing board. On September 28, 2010, the SCAQMD recommended an interim screening level numeric "bright-line" threshold of 10,000 metric tons per year of CO_2e for industrial land uses. During Meeting #8, the Working Group defined industrial uses as production, manufacturing, and fabrication activities or storage and distribution (e.g., warehouse, transfer facility, etc.). These efficiency-based thresholds were developed as part of the SCAQMD GHG CEQA Significance Threshold Working Group. This working group was formed to assist SCAQMD's efforts to develop a GHG significance threshold and is composed of a wide variety of stakeholders including the State Office of Planning and Research, CARB, the Attorney General's Office, a variety of city and county planning departments in the SCAB, various utilities such as sanitation and power companies throughout the SCAB, industry groups, and environmental and professional organizations. The numeric "bright line" was developed to be consistent with CEQA requirements for developing significance thresholds, are supported by substantial evidence, and provides guidance to CEQA practitioners in determining whether GHG emissions from a proposed project are significant. Additionally, the SCAQMD GHG Significance Threshold Stakeholder Working Group has specified that a warehouse is considered to be an industrial project.[6] Furthermore, the Working Group indicated that the 10,000 $MTCO_2e$ per year threshold applies to both emissions from construction and operational phases plus indirect emissions (electricity, water use, etc.).

The City of Rialto has not adopted project-specific significance thresholds. As the Project involves the construction of new warehouse buildings, the 10,000 $MTCO_2e$ per year industrial screening threshold has been selected as the significance threshold, as it is most applicable to the proposed Project. This threshold is selected because the proposed Project is analogous to an industrial use much more closely than any

[5] 14 California Code of Regulations, Section 15064.4a

[6] South Coast Air Quality Management District, *Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #8*, 2009.

other land use such as commercial or residential in terms of its expected operating characteristics. Typical industrial zoned areas include storage facilities, warehouses, plants, and airports, while commercial land uses are generally designated as businesses that have some kind of interaction with the public and typically include offices, retail stores, hotels, or restaurants. Additionally, the SCAQMD GHG Significance Threshold Stakeholder Working Group has specified that a warehouse is considered to be an industrial project.[7] The 10,000 $MTCO_2e$ per year threshold is used in addition to the qualitative thresholds of significance set forth below from Section VII of Appendix G to the CEQA Guidelines.

4.2 Methodology

Global climate change is, by definition, a cumulative impact of GHG emissions. Therefore, there is no project-level analysis. The baseline against which to compare potential impacts of the project includes the natural and anthropogenic drivers of global climate change, including world-wide GHG emissions from human activities which almost doubled between 1970 and 2010 from approximately 27 gigatonnes (Gt) of CO_2/year to nearly 49 $GtCO_2$/year.[8] As such, the geographic extent of climate change and GHG emissions' cumulative impact discussion is worldwide.

The project's construction and operational emissions were calculated using the California Emissions Estimator Model version 2016.3.2 (CalEEMod). Details of the modeling assumptions and emission factors are provided in Appendix A: Greenhouse Gas Emissions Data. For construction, CalEEMod calculates emissions from off-road equipment usage and on-road vehicle travel associated with haul, delivery, and construction worker trips. GHG emissions during construction were forecasted based on the proposed construction schedule[9] and applying the mobile-source and fugitive dust emissions factors derived from CalEEMod. The project's construction-related GHG emissions would be generated from off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. The project's operational-related GHG emissions would be generated by vehicular traffic, area sources (e.g., landscaping maintenance, consumer products), electrical generation, natural gas consumption, water supply and wastewater treatment, and solid waste.

It should be noted that CalEEMod emission factors incorporate compliance with some, but not all, applicable rules and regulations regarding energy efficiency and vehicle fuel efficiency, and other GHG reduction policies, as described in the CalEEMod User's Guide (November 2017). For example, RPS is not accounted for in the current version of CalEEMod. Reductions from RPS are addressed by revising the electricity emission intensity factor in CalEEMod to account for the utility complying with the 33 percent renewable mandate by 2020. As of 2018 (latest available), Southern California Edison's (SCE) power mix was at 36 percent renewable energy[10] and will be required to achieve the 60 percent renewable energy goal by 2030 established by SB 100. The CalEEMod carbon intensity factor was adjusted within the model to represent Southern California Edison's current emissions rate.

---

7 South Coast Air Quality Management District, *Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #8*, 2009.

8 Intergovernmental Panel on Climate Change, *Climate Change 2014 Mitigation of Climate Change Working Group III Contribution to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change*, 2014.

9 Project construction was modeled to start in 2021 but would commence at a later date. Emissions in future years (i.e., due to a later construction start date or operational opening year) would be lower due to phased-in emissions standards, inspection and maintenance requirements, and fleet turnover). For emissions modeling purposes, conservatively analyzing the emissions using an earlier construction start date (i.e., 2021), provides for a worst-case analysis and full disclosure of potential air quality impacts.

10 California Energy Commission, *2018 Power Content Label*, July 2019.

Energy savings from water conservation resulting from the Green Building Code Standards for indoor water use and California Model Water Efficient Landscape Ordinance for outdoor water use are not included in CalEEMod. The Water Conservation Act of 2009 mandates a 20 percent reduction in urban water use that is implemented with these regulations. Benefits of the water conservation regulations are applied in the CalEEMod mitigation component. Adjustments were also made for Project design features that would reduce GHG emissions. The proposed Project would also be constructed in conformance with CALGreen, which requires high-efficiency water fixtures for indoor plumbing and water efficient irrigation systems.

5 POTENTIAL IMPACTS AND MITIGATION

5.1 Greenhouse Gas Emissions

Threshold 5.1 Would the Project generate GHG emissions, either directly or indirectly, that could have a significant impact on the environment?

Short-Term Construction Greenhouse Gas Emissions

The Project would result in direct emissions of GHGs from construction. The approximate quantity of daily GHG emissions generated by construction equipment utilized to build the Project is depicted in Table 3: Construction-Related Greenhouse Gas Emissions.

Table 3: Construction-Related Greenhouse Gas Emissions

Category	$MTCO_2e$
Total Construction Emissions	2,161.06
30-Year Amortized Construction	72.03

Note: Construction model based on earliest possible construction date, January 2021. Delaying the start of construction would only likely reduce emissions as emission control technology will improve in the future.
Source: CalEEMod version 2016.3.2. Refer to Appendix A for model outputs.

As shown, the Project would result in the generation of approximately 2,161.06 $MTCO_2e$ over the course of construction. Construction GHG emissions are typically summed and amortized over the lifetime of the Project (assumed to be 30 years), then added to the operational emissions.[11] The amortized Project construction emissions would be 72.03 $MTCO_2e$ per year. Once construction is complete, the generation of these GHG emissions would cease.

Long-Term Operational Greenhouse Gas Emissions

Operational or long-term emissions occur over the life of the Project. GHG emissions would result from direct emissions such as Project generated vehicular traffic, on-site combustion of natural gas, and operation of any landscaping equipment. Operational GHG emissions would also result from indirect sources, such as off-site generation of electrical power, the energy required to convey water to, and wastewater from the Project, the emissions associated with solid waste generated from the Project, and any fugitive refrigerants from air conditioning or refrigerators.

Total GHG emissions associated with the Project are summarized in Table 4: Project Greenhouse Gas Emissions (Unmitigated). As shown in Table 4, the Project would generate approximately 7,486.01 $MTCO_2e$ annually from both construction and operations and the Project-related GHG emissions would not exceed the City's 10,000 $MTCO_2e$ per year threshold. Therefore, impacts would be less than significant.

[11] The project lifetime is based on the standard 30-year assumption of the South Coast Air Quality Management District (South Coast Air Quality Management District, *Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #13,* August 26, 2009).

Table 4: Project Greenhouse Gas Emissions (Unmitigated)	
Emissions Source	**$MTCO_2e$ per Year**
Area	0.03
Energy	466.01
Mobile	5,952.28
Offroad	123.19
Waste	316.72
Water	555.66
Amortized Construction Emissions	72.03
Total Annual Project GHG Emissions	**7,486.01**
Threshold	10,000
Exceeds Threshold?	**No**
Note: Total values are from CalEEMod and may not add up 100% due to rounding.	
Source: CalEEMod version 2016.3.2. Refer to Appendix A for model outputs.	

Mitigation Measures: No mitigation is required.

Level of Significance: Less than significant impact.

5.2 Greenhouse Gas Reduction Plan Compliance

Threshold 5.2 Would the Project conflict with an applicable plan, policy, or regulation of an agency adopted for the purpose of reducing GHG emissions?

San Bernardino County Regional Greenhouse Gas Reduction Plan Consistency

The City follows the 2014 GHGRP, which serves as a long-term vision for how the City, along with neighboring cities, can be more environmentally friendly and provides guidance for residents, City staff, and decision makers in the community on how to achieve future sustainability goals. The goals outlined in the GHGRP target GHG emissions in the year 2020. As shown in Table 5: San Bernardino County Regional Greenhouse Gas Reduction Plan Consistency, the Project would not conflict with the goals in the GHGRP.

Table 5: San Bernardino County Regional Greenhouse Gas Reduction Plan Consistency			
SBCOG Goals		**Compliance**	
GOAL 1:	Continue to support the regional bus system to provide intra-city service, inter-city service to major employment centers, and connect with other regional transportation transfer points.	N/A:	This is not a transportation improvement project and is therefore not applicable.
GOAL 2:	Where needed and appropriate, require new development to provide transit facilities and accommodations, such as bus shelters and turnouts, consistent with regional agency plans and existing and anticipated demands.	Consistent:	The Project is not located immediately adjacent to an existing bus route. Therefore, the new development would not need to provide transit facilities and accommodations for buses.
GOAL 3:	Continue to implement traffic signal systems and intelligent transportation systems (ITS) components (not limited to signal coordination, highway advisory radio, closed circuit television, emergency vehicle signal preemption, etc.) along arterial roadways and sub-areas, in accordance to the City's traffic Signal System Conceptual Buildout Plan and in compliance with regional and appropriate ITS Architecture Master Plans	N/A:	This is not a transportation improvement project and is therefore not applicable.
GOAL 4:	Continue to develop non-motorized trails and bicycle routes as identified in the RGP; Parks, Recreation and Trails Element and the adopted Regional Non-Motorized Transportation Plan.	N/A:	This is not a transportation improvement project and is therefore not applicable.
GOAL 5:	Require that all new development adjacent to non-motorized trails provide bicycle and pedestrian routes linked to those facilities.	Consistent:	The Project is not located adjacent to non-motorized trails. Therefore, the new development would not need to provide bicycle and pedestrian routes linked to those facilities. However, Mitigation Measure AQ-3, as required in the Project Air Quality Analysis (refer to Section 4.2) requires the implementation of a Transportation Demand Management (TDM) program to reduce single occupant vehicle trips and encourage transit.
GOAL 6:	Increase densities through transit-oriented development in the core of the city adjacent to the Metrolink and Omni-trans hub.	N/A:	This is not a project-specific policy. However, the Project is required to comply with the provisions of the California Building Energy Efficiency Standards and the Green Building Standards Code (CALGreen) and is located near existing development and transit.
GOAL 7:	Activity Centers should be linked with residential neighborhoods and be accessible by multiple modes of transportation.	N/A:	This is not a project-specific policy and is therefore not applicable.
Source: San Bernardino County Transportation Authority, *San Bernardino County Regional Greenhouse Gas Reduction Plan*, March 2014.			

Regional Transportation Plan/Sustainable Communities Strategy Consistency

The RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. The RTP/SCS embodies a collective vision for the region's future and is developed with input from local governments, county transportation commissions, tribal governments, nonprofit organizations, businesses, and local stakeholders in the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. SCAG's RTP/SCS establishes GHG emissions goals for automobiles and light-duty trucks for 2020 and 2035 as well as an overall GHG target for the Project region consistent with both the target date of AB 32 and the post-2020 GHG reduction goals of Executive Orders 5-03-05 and B-30-15.

The RTP/SCS contains over 4,000 transportation projects, ranging from highway improvements, railroad grade separations, bicycle lanes, new transit hubs and replacement bridges. These future investments were included in county plans developed by the six county transportation commissions and seek to reduce traffic bottlenecks, improve the efficiency of the region's network, and expand mobility choices for everyone. The RTP/SCS is an important planning document for the region, allowing project sponsors to qualify for federal funding.

The plan accounts for operations and maintenance costs to ensure reliability, longevity, and cost effectiveness. The RTP/SCS is also supported by a combination of transportation and land use strategies that help the region achieve state GHG emissions reduction goals and Federal Clean Air Act (FCAA) requirements, preserve open space areas, improve public health and roadway safety, support our vital goods movement industry, and utilize resources more efficiently. GHG emissions resulting from development-related mobile sources are the most potent source of emissions, and therefore Project comparison to the RTP/SCS is an appropriate indicator of whether the Project would inhibit the post-2020 GHG reduction goals promulgated by the state. The Project's consistency with the RTP/SCS goals is analyzed in detail in Table 6: Regional Transportation Plan/Sustainable Communities Strategy Consistency.

Compliance with applicable State standards would ensure consistency with State and regional GHG reduction planning efforts. The goals stated in the RTP/SCS were used to determine consistency with the planning efforts previously stated. As shown in Table 6, the proposed Project would be consistent with the stated goals of the RTP/SCS. Therefore, the proposed Project would not result in any significant impacts or interfere with SCAG's ability to achieve the region's post-2020 mobile source GHG reduction targets.

Table 6: Regional Transportation Plan/Sustainable Communities Strategy Consistency

SCAG Goals		Compliance	
GOAL 1:	Encourage regional economic prosperity and global competitiveness.	N/A:	This is not a project-specific policy and is therefore not applicable. However, the Project is located on a vacant site and development of the site would contribute to regional economic prosperity.
GOAL 2:	Improve mobility, accessibility, reliability, and travel safety for people and goods.	Consistent:	Although this Project is not a transportation improvement project, the Project is located near existing transit routes on SR-210.
GOAL 3:	Enhance the preservation, security, and resilience of the regional transportation system.	N/A:	This is not a transportation improvement project and is therefore not applicable.
GOAL 4:	Increase person and goods movement and travel choices within the transportation system.	N/A:	This is not a transportation improvement project and is therefore not applicable. However, the Project includes a warehouse use that would support goods movement.
GOAL 5:	Reduce greenhouse gas emissions and improve air quality.	Consistent:	The Project is located within an urban area in proximity to existing truck routes and freeways. Location of the Project within a developed area would reduce trip lengths, which would reduce GHG and air quality emissions.
GOAL 6:	Support healthy and equitable communities	Consistent:	With mitigation, the Project does not exceed regional thresholds, localized threshold, and is below the cancer risk threshold (refer to Air Quality Assessment and Health Risk Assessment prepared for this Project). Based on the Friant Ranch decision, projects that do not exceed the SCAQMD's LSTs would not violate any air quality standards or contribute substantially to an existing or projected air quality violation and result in no criteria pollutant health impacts.
GOAL 7:	Adapt to a changing climate and support an integrated regional development pattern and transportation network.	N/A:	This is not a project-specific policy and is therefore not applicable.
GOAL 8:	Leverage new transportation technologies and data-driven solutions that result in more efficient travel.	N/A:	This is not a project-specific policy and is therefore not applicable.
GOAL 9:	Encourage development of diverse housing types in areas that are supported by multiple transportation options.	N/A:	The Project involves development of a warehouse and does not include housing.
GOAL 10:	Promote conservation of natural and agricultural lands and restoration of habitats.	N/A:	This Project is located on previously disturbed land and is not located on agricultural lands.

Source: Southern California Association of Governments, *Connect SoCal (2020–2045 Regional Transportation Plan/Sustainable Communities Strategy)*, 2020.

California Air Resource Board Scoping Plan Consistency

The California State Legislature adopted AB 32 in 2006. AB 32 focuses on reducing GHGs (CO_2, CH_4, NO_X, HFCs, PFCs, and SF_6) to 1990 levels by the year 2020. Pursuant to the requirements in AB 32, CARB adopted the *Climate Change Scoping Plan* (CCSP) in 2008, which outlines actions recommended to obtain that goal. The CCSP provides a range of GHG reduction actions that include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, market-based mechanisms such as the cap-and-trade program, and an AB 32 implementation fee to fund the program. As shown in Table 7: Project Consistency with Applicable CARB Scoping Plan Measures, the Project is consistent with most of the strategies, while others are not applicable to the Project.

The 2017 CCSP Update identifies additional GHG reduction measures necessary to achieve the 2030 target. These measures build upon those identified in the first update to the CCSP in 2013. Although a number of these measures are currently established as policies and measures, some measures have not yet been formally proposed or adopted. It is expected that these actions to reduce GHG emissions will be adopted as required to achieve statewide GHG emissions targets. As such, impacts related to consistency with the Scoping Plan would be less than significant.

Table 7: Project Consistency with Applicable CARB Scoping Plan Measures

Scoping Plan Sector	Scoping Plan Measure	Implementing Regulations	Project Consistency
Transportation	California Cap-and-Trade Program Linked to Western Climate Initiative	Regulation for the California Cap on GHG Emissions and Market-Based Compliance Mechanism October 20, 2015 (CCR 95800)	**Consistent.** The Cap-and-Trade Program applies to large industrial sources such as power plants, refineries, and cement manufacturers. However, the regulation indirectly affects people who use the products and services produced by these industrial sources when increased cost of products or services (such as electricity and fuel) are transferred to the consumers. The Cap-and-Trade Program covers the GHG emissions associated with electricity consumed in California, generated in-state or imported. Accordingly, GHG emissions associated with CEQA projects' electricity usage are covered by the Cap-and-Trade Program. The Cap-and-Trade Program also covers fuel suppliers (natural gas and propane fuel providers and transportation fuel providers) to address emissions from such fuels and combustion of other fossil fuels not directly covered at large sources in the Program's first compliance period.
	California Light-Duty Vehicle GHG Standards	Pavley I 2005 Regulations to Control GHG Emissions from Motor Vehicles Pavley I 2005 Regulations to Control GHG Emissions from Motor Vehicles	**Consistent**. This measure applies to all new vehicles starting with model year 2012. The Project would not conflict with its implementation as it would apply to all new passenger vehicles purchased in California. Passenger vehicles, model year 2012 and later, associated with construction and operation of the Project would be required to comply with the Pavley emissions standards.
		2012 LEV III California GHG and Criteria Pollutant Exhaust and Evaporative Emission Standards	**Consistent.** The LEV III amendments provide reductions from new vehicles sold in California between 2017 and 2025. Passenger vehicles associated with the site would comply with LEV III standards.
	Low Carbon Fuel Standard	2009 readopted in 2015. Regulations to	**Consistent.** This measure applies to transportation fuels utilized by vehicles in California. The Project

Table 7: Project Consistency with Applicable CARB Scoping Plan Measures			
Scoping Plan Sector	**Scoping Plan Measure**	**Implementing Regulations**	**Project Consistency**
		Achieve GHG Emission Reductions Subarticle 7. Low Carbon Fuel Standard CCR 95480	would not conflict with implementation of this measure. Motor vehicles associated with construction and operation of the Project would utilize low carbon transportation fuels as required under this measure.
	Regional Transportation-Related GHG Targets.	SB 375. Cal. Public Resources Code §§ 21155, 21155.1, 21155.2, 21159.28	**Consistent**. The Project would provide development in the region that is consistent with the growth projections in the RTP/SCS.
	Goods Movement	Goods Movement Action Plan January 2007	**Not applicable**. The Project does not propose any changes to maritime, rail, or intermodal facilities or forms of transportation.
	Medium/Heavy-Duty Vehicle	2010 Amendments to the Truck and Bus Regulation, the Drayage Truck Regulation and the Tractor-Trailer GHG Regulation	**Consistent**. This measure applies to medium and heavy-duty vehicles that operate in the state. The Project would not conflict with implementation of this measure. Medium and heavy-duty vehicles associated with construction and operation of the Project would be required to comply with the requirements of this regulation.
	High Speed Rail	Funded under SB 862	**Not applicable**. This is a statewide measure that cannot be implemented by a project applicant or Lead Agency.
Electricity and Natural Gas	Energy Efficiency	Title 20 Appliance Efficiency Regulation	**Consistent.** The Project would not conflict with implementation of this measure. The Project would comply with the latest energy efficiency standards.
		Title 24 Part 6 Energy Efficiency Standards for Residential and Non-Residential Building	
		Title 24 Part 11 California Green Building Code Standards	
	Renewable Portfolio Standard/Renewable Electricity Standard.	2010 Regulation to Implement the Renewable Electricity Standard (33% 2020)	**Consistent**. The Project would obtain electricity from the electric utility, Southern California Edison (SCE). SCE obtained 32 percent of its power supply from renewable sources in 2017. Therefore, the utility would provide power when needed on site that is composed of a greater percentage of renewable sources.
	Million Solar Roofs Program	SB 350 Clean Energy and Pollution Reduction Act of 2015 (50% 2030)	
	Million Solar Roofs Program	Tax Incentive Program	**Consistent.** This measure is to increase solar throughout California, which is being done by various electricity providers and existing solar programs. The program provides incentives that are in place at the time of construction.
Water	Water	Title 24 Part 11 California Green Building Code Standards	**Consistent.** The Project would comply with the CalGreen standards, which requires a 20 percent reduction in indoor water use. The Project would also comply with the City's Water-Efficient Landscaping Regulations (Chapter 17.82 of the Rancho Cucamonga Municipal Code).
		SBX 7-7—The Water Conservation Act of 2009	
		Model Water Efficient Landscape Ordinance	

Table 7: Project Consistency with Applicable CARB Scoping Plan Measures

Scoping Plan Sector	Scoping Plan Measure	Implementing Regulations	Project Consistency
Green Buildings	Green Building Strategy	Title 24 Part 11 California Green Building Code Standards	**Consistent.** The State is to increase the use of green building practices. The Project would implement required green building strategies through existing regulation that requires the Project to comply with various CalGreen requirements. The Project includes sustainability design features that support the Green Building Strategy.
Industry	Industrial Emissions	2010 CARB Mandatory Reporting Regulation	**Not applicable.** The Mandatory Reporting Regulation requires facilities and entities with more than 10,000 $MTCO_2e$ of combustion and process emissions, all facilities belonging to certain industries, and all electric power entities to submit an annual GHG emissions data report directly to CARB. As shown above, total Project GHG emissions would not exceed 10,000 $MTCO_2e$. Therefore, this regulation would not apply.
Recycling and Waste Management	Recycling and Waste	Title 24 Part 11 California Green Building Code Standards AB 341 Statewide 75 Percent Diversion Goal	**Consistent.** The Project would not conflict with implementation of these measures. The Project is required to achieve the recycling mandates via compliance with the CALGreen code. The City has consistently achieved its state recycling mandates.
Forests	Sustainable Forests	Cap and Trade Offset Projects	**Not applicable.** The Project is in an area designated for urban uses. No forested lands exist on-site.
High Global Warming Potential	High Global Warming Potential Gases	CARB Refrigerant Management Program CCR 95380	**Not applicable**. The regulations are applicable to refrigerants used by large air conditioning systems and large commercial and industrial refrigerators and cold storage system. The Project would not conflict with the refrigerant management regulations adopted by CARB.
Agriculture	Agriculture	Cap and Trade Offset Projects for Livestock and Rice Cultivation	**Not applicable**. The Project site is designated for urban development. No grazing, feedlot, or other agricultural activities that generate manure occur currently exist on-site or are proposed to be implemented by the Project.

Source: California Air Resources Board, *California's 2017 Climate Change Scoping Plan*, November 2017 and CARB, *Climate Change Scoping Plan*, December 2008.

The Project is estimated to emit approximately 8,339.64 $MTCO_2e$ per year directly from on-site activities and indirectly from off-site motor vehicles, see Table 4. The GHG emissions caused by long-term operation of the Project would not exceed the SCAQMD's applicable threshold and impacts would be less than significant.

Regarding goals for 2050 under Executive Order S-3-05, at this time it is not possible to quantify the emissions savings from future regulatory measures, as they have not yet been developed; nevertheless, it can be anticipated that operation of the Project would comply with all applicable measures are enacted that state lawmakers decide would lead to an 80 percent reduction below 1990 levels by 2050.

The majority of the GHG reductions from the Scoping Plan would result from continuation of the Cap-and-Trade regulation. Assembly Bill 398 (2017) extends the state's Cap-and-Trade program through 2030 and the Scoping Plan provide a comprehensive plan for the state to achieve its GHG targets through a variety of regulations enacted at the state level. Additional reductions are achieved from electricity sector standards (i.e., utility providers to supply 60 percent renewable electricity by 2030 and 100 percent

renewable by 2045), doubling the energy efficiency savings at end uses, additional reductions from the LCFS, implementing the short-lived GHG strategy (e.g., hydrofluorocarbons), and implementing the Mobile Source Strategy and Sustainable Freight Action Plan.

Several of the State's plans and policies would contribute to a reduction in mobile source emissions from the Project. These include the CARB's Advanced Clean Truck Regulation, Executive Order N-79-20, CARB's Mobile Source Strategy, CARB's Sustainable Freight Action Plan, and CARB's Emissions Reduction Plan for Ports and Goods Movement. CARB's Advanced Clean Truck Regulation in June 2020 requiring truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024. By 2045, every new truck sold in California is required to be zero-emission. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8.

Executive Order N-79-20 establishes the goal for all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035 and all medium and heavy-duty vehicles will be zero-emission by 2045. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium-and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new ZEVs "towards the target of 100 percent."

CARB's Mobile Source Strategy which include increasing ZEV buses and trucks and their Sustainable Freight Action Plan which improves freight system efficiency, utilizes near-zero emissions technology, and deployment of ZEV trucks. This Plan applies to all trucks accessing the Project site and may include existing trucks or new trucks that are part of the statewide goods movement sector. CARB's Emissions Reduction Plan for Ports and Goods Movement identifies measures to improve goods movement efficiencies such as advanced combustion strategies, friction reduction, waste heat recovery, and electrification of accessories. While these measures are not directly applicable to the Project, any commercial activity associated with goods movement would be required to comply with these measures as adopted. As such, the Project would not interfere with their implementation.

The Project would not obstruct or interfere with efforts to increase ZEVs or state efforts to improve system efficiency. The Project would also benefit from implementation of the State programs for ZEVs and goods movement efficiencies that reduce future GHG emissions from trucks.

Mitigation Measures: No mitigation is required.

Level of Significance: Less than significant impact.

5.3 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

Climate change is a global problem. GHGs are global pollutants, unlike criteria air pollutants and TACs, which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects have relatively short atmospheric lifetimes (about 1 day), GHGs have much longer atmospheric lifetimes of 1 year to several thousand years that allow them to be dispersed around the globe.

Cumulative Impacts

It is generally the case that an individual project of this size and nature is of insufficient magnitude by itself to influence climate change or result in a substantial contribution to the global GHG inventory. GHG impacts are recognized as exclusively cumulative impacts; there are no non-cumulative GHG emission impacts from a climate change perspective. The additive effect of project-related GHGs would not result in a reasonably foreseeable cumulatively considerable contribution to global climate change. In addition, the Project as well as other cumulative related projects would also be subject to all applicable regulatory requirements, which would further reduce GHG emissions. As shown in Table 5 and Table 6, the Project would not conflict with the GHGRP, or the RTP/SCS. As a result, the Project would not conflict with any GHG reduction plans including the CARB Scoping Plan. Therefore, the Project's cumulative contribution of GHG emissions would be less than significant and the Project's cumulative GHG impacts would also be less than cumulatively considerable.

Mitigation Measures: No mitigation is required.

Level of Significance: Less than significant impact.

Appendix A

Greenhouse Gas Emissions Data

Olive Grove Business Park

San Bernardino-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	0.00	1000sqft	0.00	10,000.00	0
Unrefrigerated Warehouse-No Rail	669.61	1000sqft	15.37	669,607.00	0
Parking Lot	527.95	1000sqft	12.12	527,947.00	0
City Park	4.06	Acre	4.06	176,857.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2021
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	510.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Olive Grove Business Park - San Bernardino-South Coast County, Annual

Project Characteristics - Adjusted per the SCE 2018 Corporate Responsibility and Sustainability Report. The report provides intensity factor of CO2e, the CO2 intensity factor is calculated as 513-25*0.029-298*0.00617=510.4363 to avoid double counting.

Land Use - warehouse buildings= 425,148 sf + 243,593 sf + fire pump building 866 sf, office space = 10,000 sf, landscape shown as city park =176857sf, parking/drive aisles/off site improvements =527,947 sf

Construction Phase - anticipated construction schedule, construction duration of 10 months. Construction, Paving, and Painting to occur concurrently

Trips and VMT -

Grading - 229,748 cubic yards of export

Architectural Coating - Rule 1113 - low VOC paint

Vehicle Trips - based on traffic study: 1,183 trips/669.607k = 1.766707934654207617303881231827, trip length based on Forecasting Metropolitan Commercial and Freight Travel, average truck trip length in SCAG is 24.11 miles, rounded up to 25 miles to be conservative

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule

Energy Use -

Construction Off-road Equipment Mitigation - Rule 403

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation - Use Low VOC paint, Rule 1113

Energy Mitigation - CEC - 2019 standards will reduce nonresidential energy use by 30% over 2016 standard

Water Mitigation - consistent with CA building code

Waste Mitigation -

Operational Off-Road Equipment - Assume 1 forklifts per building unit, total 7

Fleet Mix - fllet mix Based on Traffic Study trip generation table

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2021
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	510.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Olive Grove Business Park, Mitigated 2014 trucks or newer - San Bernardino-South Coast County, Annual

Project Characteristics - Adjusted per the SCE 2018 Corporate Responsibility and Sustainability Report. The report provides intensity factor of CO2e, the CO2 intensity factor is calculated as 513-25*0.029-298*0.00617=510.4363 to avoid double counting.

Land Use - warehouse buildings= 425,148 sf + 243,593 sf + fire pump building 866 sf, office space = 10,000 sf, landscape shown as city park =176857sf, parking/drive aisles/off site improvements =527,947 sf

Construction Phase - anticipated construction schedule, construction duration of 10 months. Construction, Paving, and Painting to occur concurrently

Trips and VMT -

Grading - 229,748 cubic yards of export

Architectural Coating - Rule 1113 - low VOC paint

Vehicle Trips - based on traffic study: 1,183 trips/669.607k = 1.766707934654207617303881231827, trip length based on Forecasting Metropolitan Commercial and Freight Travel, average truck trip length in SCAG is 24.11 miles, rounded up to 25 miles to be conservative

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule, Mitigation requires use of 2014 trucks or newer

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule, Mitigation requires use of 2014 trucks or newer

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule, Mitigation requires use of 2014 trucks or newer

Energy Use -

Construction Off-road Equipment Mitigation - Mitigation requires Tier 4 equipment during grading phase, Rule 403

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation - Use Low VOC paint, Rule 1113

Energy Mitigation - CEC - 2019 standards will reduce nonresidential energy use by 30% over 2016 standard

Water Mitigation - consistent with CA building code

Waste Mitigation -

Operational Off-Road Equipment - Assume 1 forklifts per building unit, total 7

Fleet Mix - fllet mix Based on Traffic Study trip generation table

Engineering and Science, Inc.

June 17, 2021

Mr. Jefferson Hill
Crow Holdings-Industrial
527 West 7th Street, Suite 200
Los Angeles, California 90014

Subject: Phase I Environmental Site Assessment
Olive Grove
Northside of Baseline Road, West of Cactus Avenue
Rialto, California 92376
Partner Project No. 21-322623.1

Dear Mr. Hill:

Partner Engineering and Science, Inc. (Partner) is pleased to provide the results of the *Phase I Environmental Site Assessment* (Phase I ESA) report of the abovementioned address (the "subject property"). This assessment was performed in conformance with the scope and limitations as detailed in the ASTM Practice E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.

This assessment included a site reconnaissance as well as research and interviews with representatives of the public, property ownership, site manager, and regulatory agencies. An assessment was made, conclusions stated, and recommendations outlined.

We appreciate the opportunity to provide environmental services to you. If you have any questions concerning this report, or if we can assist you in any other matter, please contact me at (215) 620-9308.

Sincerely,

DRAFT

Douglas J. Newton, CPG
Relationship Manager

EXECUTIVE SUMMARY

Partner Engineering and Science, Inc. (Partner) has performed a Phase I Environmental Site Assessment (ESA) in accordance with the scope of work and limitations of ASTM Standard Practice E1527-13, the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) and set forth by Crow Holdings-Industrial for the property located at Northside of Baseline Road, West of Cactus Avenue in Rialto, San Bernardino County, California (the "subject property"). The Phase I Environmental Site Assessment is designed to provide Crow Holdings-Industrial with an assessment concerning environmental conditions (limited to those issues identified in the report) as they exist at the subject property.

Property Description

The subject property is located on the north side of Baseline Road within a mixed commercial, industrial, and residential area of San Bernardino County. Please refer to the table below for further description of the subject property.

Subject Property Data	
Address(es):	Northside of Baseline Road, West of Cactus Avenue, Rialto, California
Property Use:	Vacant
Land Acreage (Ac):	30.87 Ac
Number of Buildings:	None
Assessor's Parcel Number (APN):	0264-213-18-0000
Site Assessment Performed By:	Cheryl Manuel
Site Assessment Conducted On:	June 8, 2021

The subject property is currently unoccupied, vacant land zoned for industrial use. No onsite operations exist.

According to available historical sources, the subject property was formerly undeveloped as early as 1896 to circa 1930; developed agriculturally between 1938 and circa 1959; and vacant land from approximately 1966 to present. No tenants were identified for the subject property.

The immediately surrounding properties consist of a park to the north, a flood control basin to the northeast; residential to the south and southwest and a flood control basin to the southeast across Baseline Road; a flood control basin to the east; and a vacant parcel and commercial development to the west.

According to a subsurface investigation conducted on a nearby property (855 West Baseline Road and Case #083603976T) and topographic map interpretation, the depth to groundwater in the vicinity of the subject property approximately 300-350 feet below ground surface (bgs) and groundwater flow is inferred to be toward the southeast.

Findings

A *recognized environmental condition (REC)* refers to the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: due to release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment.

- Partner did not identify any RECs during the course of this assessment.

A *controlled recognized environmental condition (CREC)* refers to a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

- Partner did not identify any CRECs during the course of this assessment.

A *historical recognized environmental condition (HREC)* refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls.

- Partner did not identify any HRECs during the course of this assessment.

An *environmental issue* refers to environmental concerns identified by Partner, which do not qualify as RECs; however, warrant further discussion. The following concerns were identified during the course of this assessment:

- The subject property parcel was historically used for agricultural purposes from the late 1930s until sometime in the 1960s. There is a potential that agricultural related chemicals such as pesticides, herbicides, and fertilizers, may have been used and stored onsite. Future development of the subject property would likely involve either paving over or covering by building structures that minimize direct contact to any potential remaining concentrations in the soil. Additionally, during previous site development activities, near surface soils (where residual agricultural chemical concentrations would have most likely been present, if at all) would likely be mixed with fill material or be disturbed during grading. Also, during development it is common that engineered fill material is placed over underlying soils as part of the development activities. These additional activities serve to further reduce the potential for exposure to residual agricultural chemicals (if any). Based on these reasons, Partner concludes that the former use of agricultural chemicals at the subject property is not expected to represent an environmental concern at this time.
- Several piles of soil approximately 5 feet high were observed onsite, near the eastern boundary of the subject property. According to the site contact, Mr. Reuben Zepeda, the soil piles have been there since at least 2017.

- Additionally, it was reported that a homeless encampment occupied the site last year, and the occupants were digging on the site creating newer soil piles. According to the 2007 LFR Phase I ESA prepared for the subject property, the property owner had allowed a developer (Shea Homes) to dispose of excess soil on the subject property generated during their construction of a nearby residential development. The Shea Homes site was reportedly determined to be a prior agricultural site. As such, four soil samples were collected from the development site and analyzed for organochlorine pesticides. According to the report, no pesticides were detected at concentrations above the U.S. Environmental Protection Agency (EPA) Preliminary Remediation Goal (PRG) for a residential scenario. Documentation regarding the fill material was not appended to the 2007 LFR Phase I ESA or provided for Partner's review at the time of the assessment. However, based on the reported origin and quality of materials placed on the subject property, the onsite soil piles are not expected to represent an environmental concern to the subject property.
- The subject property is located within an area of groundwater contamination that originated at a 160-acre site bounded by Casa Grande Drive to the north, Summit Avenue to the south, North Locust Avenue to the east, and Alder Avenue to the west. This site is situated approximately 2 miles to the northwest (i.e., presumed upgradient) of the subject property and includes a six-mile long area of groundwater contamination downgradient of the 160-acre area. The site was previously used by defense contractors, fireworks manufacturers, and other businesses including West Coast Loading Corporation, B.F. Goodrich Corporation, Pyrotronics, Pyro Spectaculars, and American Promotional Events. These companies handled perchlorate salts and other hazardous chemicals and disposed of chemical wastes on the facility, contaminating the groundwater supply. Site investigations and cleanup in the area are ongoing.

  The California Regional Water Quality Control Board (RWQCB) led initial efforts to respond to the contamination. The EPA added the site to the Superfund program's National Priorities List (NPL) in September 2009. The Goodrich Corporation, Emhart Industries (a corporate successor to West Coast Loading Corporation), Pyro Spectaculars, American Promotional Events, and others have entered into agreements with EPA to pay for cleanup work at the site. The EPA selected the "Source Area Operable Unit" groundwater remedy in September 2010. The selected remedy is a groundwater pump-and-treat system intended to intercept and remove contaminated groundwater from the 160-acre source area. The 160-acre source area is the location where most or all of the contaminants entered the groundwater and testing has identified the highest levels of groundwater contamination. The "Source Area Operable Unit" groundwater remedy was designed in 2013 and 2014 and constructed between 2015 and 2020. It includes a new groundwater extraction well; water treatment systems that make use of liquid-phase granular activated carbon (LGAC) to remove trichloroethene (TCE) and other volatile organic compounds (VOCs) from the extracted groundwater, and ion exchange to remove perchlorate from the extracted groundwater; pipelines and pumps to convey the treated water from the treatment plant to the City of Rialto's water distribution system for use as drinking water supply; and a groundwater monitoring program.

It is expected that a second groundwater cleanup remedy will be needed to address contaminated groundwater in the "mid-basin" area which has moved past (i.e., downgradient of) the Source Area remedy. To provide information needed to support that decision, EPA completed testing between 2008 and 2012 and entered into an agreement with the Goodrich Corporation to complete additional testing and engineering evaluations as part of a second remedial investigation and feasibility study for the site. Eleven multi-level groundwater monitoring wells were installed and tested between 2013 and 2019. Testing of the groundwater is ongoing. This work is an area known as the "Mid-basin Operable Unit,". According to the EPA First Five Year Review Report (2020) for the site. The remedy has been implemented by expanding an existing water treatment system at an adjacent state-led cleanup site. A new groundwater extraction well, new liquid-phase granular activated carbon and ion exchange water treatment systems, and new pipelines were constructed. A cleanup proposal for the mid-basin groundwater is also expected in late 2020 or early 2021.

The EPA has identified the following parties as PRPs at the site: - Goodrich Corporation, Emhart Industries (on behalf of West Coast Loading Corporation), Pyro Spectaculars Inc. (PSI), Ken Thompson Inc. (current property owner), The estate of Chung Ming Wong (current property owner), Pyrotronics, Inc. (“Pyrotronics”) and Harry Hescox.

According to online information, no monitoring wells for this plume are located on the subject property and depth to groundwater is between 300 to 350 feet below ground surface. In addition, due to the fact that the EPA is currently taking action at this site and has identified the responsible parties involved, it is unlikely that the owner of the subject property would be required to financially participate in the cleanup of any subsurface contamination that originated at this NPL site. Vapor intrusion is not a concern due to the depth to groundwater. Based on the ongoing remedial actions and regulatory oversight by the EPA, the identification of responsible parties, and the depth to groundwater, this site is not expected to represent an environmental concern to the subject property at this time.

Conclusions, Opinions and Recommendations

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 of Northside of Baseline Road, West of Cactus Avenue in Rialto, San Bernardino County, California (the “subject property”). Any exceptions to, or deletions from, this practice are described in Section 1.5 of this report.

This assessment has revealed no evidence of RECs, CRECs, or HRECs in connection with the subject property; however, environmental issues were identified. Based on the conclusions of this assessment and the continued future industrial use of the subject property, no further action is warranted at this time.

1.0 INTRODUCTION

Partner Engineering and Science, Inc. (Partner) has performed a Phase I Environmental Site Assessment (ESA) in conformance with the scope and limitations of ASTM Standard Practice E1527-13 and the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) for the property located at Northside of Baseline Road, West of Cactus Avenue in Rialto, San Bernardino County, California (the "subject property"). Any exceptions to, or deletions from, this scope of work are described in the report.

1.1 Purpose

The purpose of this ESA is to identify existing or potential Recognized Environmental Conditions (as defined by ASTM Standard E1527-13) affecting the subject property that: 1) constitute or result in a material violation or a potential material violation of any applicable environmental law; 2) impose any material constraints on the operation of the subject property or require a material change in the use thereof; 3) require clean-up, remedial action or other response with respect to Hazardous Substances or Petroleum Products on or affecting the subject property under any applicable environmental law; 4) may affect the value of the subject property; and 5) may require specific actions to be performed with regard to such conditions and circumstances.

This ESA was performed to permit the *User* to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on scope of Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. §9601) liability (hereinafter, the "*landowner liability protections*," or "*LLPs*"). ASTM Standard E1527-13 constitutes "*all appropriate inquiry* into the previous ownership and uses of the *property* consistent with good commercial or customary practice" as defined at 42 U.S.C. §9601(35)(B).

1.2 Scope of Work

The scope of work for this ESA is in accordance with the requirements of ASTM Standard E1527-13. This assessment included: 1) a property and adjacent site reconnaissance; 2) interviews with key personnel; 3) a review of historical sources; 4) a review of regulatory agency records; and 5) a review of a regulatory database report provided by a third-party vendor. Partner contacted local agencies, such as environmental health departments, fire departments and building departments in order to determine any current and/or former hazardous substances usage, storage and/or releases of hazardous substances on the subject property. Additionally, Partner researched information on the presence of activity and use limitations (AULs) at these agencies. As defined by ASTM E1527-13, AULs are the legal or physical restrictions or limitations on the use of, or access to, a site or facility: 1) to reduce or eliminate potential exposure to hazardous substances or petroleum products in the soil or groundwater on the subject property; or 2) to prevent activities that could interfere with the effectiveness of a response action, in order to ensure maintenance of a condition of no significant risk to public health or the environment. These legal or physical restrictions, which may include institutional and/or engineering controls (IC/ECs), are intended to prevent adverse impacts to individuals or populations that may be exposed to hazardous substances and petroleum products in the soil or groundwater on the property.

If requested by Client, this report may also include the identification, discussion of, and/or limited sampling of asbestos-containing materials (ACMs), lead-based paint (LBP), mold, and/or radon.

1.3 Limitations

Partner warrants that the findings and conclusions contained herein were accomplished in accordance with the methodologies set forth in the Scope of Work. These methodologies are described as representing good commercial and customary practice for conducting an ESA of a property for the purpose of identifying recognized environmental conditions. There is a possibility that even with the proper application of these methodologies there may exist on the subject property conditions that could not be identified within the scope of the assessment or which were not reasonably identifiable from the available information. Partner believes that the information obtained from the record review and the interviews concerning the subject property is reliable. However, Partner cannot and does not warrant or guarantee that the information provided by these other sources is accurate or complete. The conclusions and findings set forth in this report are strictly limited in time and scope to the date of the evaluations. The conclusions presented in the report are based solely on the services described therein, and not on scientific tasks or procedures beyond the scope of agreed-upon services or the time and budgeting restraints imposed by the Client. No other warranties are implied or expressed.

Some of the information provided in this report is based upon personal interviews, and research of available documents, records, and maps held by the appropriate government and private agencies. This report is subject to the limitations of historical documentation, availability, and accuracy of pertinent records, and the personal recollections of those persons contacted.

This practice does not address requirements of any state or local laws or of any federal laws other than the all appropriate inquiry provisions of the LLPs. Further, this report does not intend to address all of the safety concerns, if any, associated with the subject property.

Environmental concerns, which are beyond the scope of a Phase I ESA as defined by ASTM include the following: ACMs, LBP, radon, and lead in drinking water. These issues may affect environmental risk at the subject property and may warrant discussion and/or assessment; however, are considered non-scope issues. If specifically requested by the Client, these non-scope issues are discussed in Section 6.3.

1.4 User Reliance

Crow Holdings-Industrial engaged Partner to perform this assessment in accordance with an agreement governing the nature, scope and purpose of the work as well as other matters critical to the engagement. All reports, both verbal and written, are for the sole use and benefit of Crow Holdings-Industrial. Either verbally or in writing, third parties may come into possession of this report or all or part of the information generated as a result of this work. In the absence of a written agreement with Partner granting such rights, no third parties shall have rights of recourse or recovery whatsoever under any course of action against Partner, its officers, employees, vendors, successors or assigns.

Any such unauthorized user shall be responsible to protect, indemnify and hold Partner, Client and their respective officers, employees, vendors, successors and assigns harmless from any and all claims, damages, losses, liabilities, expenses (including reasonable attorneys' fees) and costs attributable to such Use. Unauthorized use of this report shall constitute acceptance of and commitment to these responsibilities, which shall be irrevocable and shall apply regardless of the cause of action or legal theory pled or asserted. Additional legal penalties may apply.

1.5 Limiting Conditions

The findings and conclusions contain all of the limitations inherent in these methodologies that are referred to in ASTM E1527-13.

Specific limitations and exceptions to this ESA are more specifically set forth below:

- Interviews with past or current owners, operators and occupants were not reasonably ascertainable and thus constitute a data gap. Based on information obtained from other historical sources (as discussed in Section 3.0), this data gap is not expected to alter the findings of this assessment.
- Partner requested information relative to deed restrictions and environmental liens, a title search, and completion of the AAI User Questionnaire from the Report User. This information was not provided at the time of the assessment.
- Partner was not able to document the historical use of the subject property prior to 1896. The following sources were reviewed during the course of this assessment and found to be limited: aerial photographs were not available prior to 1930; city directories were not available for the subject property; topographic maps prior to 1896 were not reasonably ascertainable from local agencies; and other historical sources such as fire insurance maps did not provide coverage of the subject property. This data failure is not considered critical and does not change the conclusions of this report, as the 1896 topographic map revealed the subject property to be undeveloped. In addition, the adjacent and surrounding areas are also shown mostly as undeveloped.
- Partner was unable to determine the property use at 5-year intervals, which constitutes a data gap. Information concerning historical use of the subject property was unavailable from 1901 to 1930, 1930 to 1938, 1943 to 1949, 1959 to 1966, and 1995 to 2002. Except for property tax files and recorded land title records, which were not considered to be sufficiently useful, Partner reviewed all standard historical sources and conducted appropriate interviews.

2.0 SITE DESCRIPTION

2.1 Site Location and Legal Description

The subject property at Northside of Baseline Road, West of Cactus Avenue in Rialto, California is located on the north side of Baseline Road. According to the San Bernardino County Assessor, the subject property is legally described as *PTN SW ¼ SE ¼ SEC 34 TP 1N R 5W LYING S OF A T AND S F RR R/W EX ST*, and ownership is currently vested in Oakmont Rialto Olive Grove LLC since 2008.

Please refer to Figure 1: Site Location Map, Figure 2: Site Plan, Figure 3: Topographic Map, and Appendix A: Site Photographs for the location and site characteristics of the subject property.

2.2 Current Property Use

The subject property is currently unoccupied, vacant land zoned for industrial use. No onsite operations exist. The subject property is designated for industrial development by the City of Rialto. The subject property was not identified in the regulatory database report that is summarized in Section 4.2.

2.3 Current Use of Adjacent Properties

The subject property is located within a mixed commercial, industrial, and residential area of San Bernardino County. During the vicinity reconnaissance, Partner observed the following land use on properties in the immediate vicinity of the subject property:

Immediately Surrounding Properties

North: Jerry Eaves Park (1485 North Ayala Drive); northeast is San Bernardino County Flood Control District (no address)

South: West Baseline Road beyond which is residential (1191 and 1192 Glenwood Avenue); 922 to 1040 West Mesa Drive); and (908 and 1171 Idyllwild Avenue); southeast is San Bernardino County Flood Control District (no address)

East: San Bernardino County Flood Control District (no address)

West: Auto Repair, Car Audio, Custom Trailers (1245 North Fitzgerald Avenue); Dynamic Powder Coating & Sand Blasting (1265 North Fitzgerald Avenue); Fastenal Industrial & Construction Supplies (1285 North Fitzgerald Avenue); Compressor Component Part Co Inc. (1325 North Fitzgerald Avenue); Guadalajara's Auto Repair (1345 North Fitzgerald Avenue); Power Pro Plus Inc. (1375 North Fitzgerald Avenue)

The adjacent property to the east-northeast was identified as a Solid Waste Landfill (SWF/LF), the adjacent property to the west was identified as a California Environmental Reporting System Hazardous Waste (CERS HAZ WASTE) and San Bernardino County Permit site, the adjacent property to the west-northwest was identified as a Resource Conservation and Recovery Act Non Generator No Longer Regulated (RCRA NonGen/NLR) and San Bernardino Co. Permit site, the adjacent properties to the west-northwest are identified as RCRA NonGen/NLR sites, an additional adjacent property to the west-northwest was identified as a RCRA NonGen/NLR and San Bernardino Co. Permit site, the adjacent property to the west was identified as a San Bernardino Co. Permit site, two adjacent properties to the west-northwest were identified as a San Bernardino Co. Permit sites, the adjacent property to the west was identified as a San Bernardino Co. Permit site, and an additional west adjacent property was identified as an EDR Historical Auto site in the regulatory database report (see Section 4.2).

2.4 Physical Setting Sources

2.4.1 Topography

The United States Geological Survey (USGS) *Fontana, California* Quadrangle 7.5-minute series topographic map was reviewed for this ESA. According to the contour lines on the topographic map, the subject property is located at approximately 1380 feet above mean sea level (MSL). The contour lines in the area of the subject property indicate the area is sloping gently toward the southeast. The subject property is depicted on the 1980 map as undeveloped.

A copy of the most recent topographic map is included as Figure 3 of this report.

2.4.2 Hydrology

According to topographic map interpretation, the direction of groundwater flow in the vicinity of the subject property is inferred to be toward the southeast. The nearest surface water in the vicinity of the subject property is the Cajon Wash located approximately 2.89 miles east of the subject property. No settling ponds, lagoons, surface impoundments, wetlands or natural catch basins were observed at the subject property during this assessment.

According to available information, a public water system operated by the Veolia North America, under contract with Rialto Water Services (RWS), serves the subject property vicinity. The sources of public water for Rialto are 86 percent from groundwater basins and 14 percent from surface water.

According to a subsurface investigation conducted on a nearby property (855 West Baseline Road and Case #083603976T), the depth of groundwater in the vicinity of the subject property is approximately 300-350 feet below ground surface (bgs).

2.4.3 Geology/Soils

The subject property is situated within the Peninsular ranges geomorphic province of the State of California. The Peninsular Ranges are a series of ranges separated by northwest-trending valleys and traversed by several major active faults. The Whittier-Elsinore, San Jacinto, Newport-Inglewood, and San Andreas faults are major active fault systems located in the vicinity of the subject property. Major tectonic activity associated with these and other faults within this regional tectonic framework are typically right-lateral strike-slip movements. The Peninsular ranges extend into lower California, are bound to the east by the Colorado River, and extend into the Los Angeles Basin and the island group surrounding the continental shelf.

Based on information obtained from the United States Department of Agriculture (USDA) Natural Resources Conservation Service Web Soil Survey online database, the subject property is mapped as Hanford coarse sandy loam and Tujunga gravelly loamy sand. The Hanford series consists of very deep, well drained soils that formed in alluvium from granitic sources. Hanford soils are on alluvial fans and floodplains, including urban areas. Slopes range from 2 to 9 percent. Similarly, the Tujunga series consists of very deep, somewhat excessively drained soils that formed in alluvium from granitic sources. Tujunga soils are on alluvial fans and floodplains, including urban areas. Slopes range from 0 to 9 percent.

2.4.4 Flood Zone Information

Partner performed a review of the Flood Insurance Rate Map, published by the Federal Emergency Management Agency. According to Community Panel Number 06071C7920H, dated August 28, 2008, the subject property appears to be located in Zone X, an area of minimal flood hazard.

A copy of the reviewed flood map is included in Appendix B of this report.

3.0 HISTORICAL INFORMATION

Partner obtained historical use information about the subject property from a variety of sources. A chronological listing of the historical data found is summarized in the table below.

Historical Use Information		
Period/Date	**Source**	**Description/Use**
1896-1930	Aerial Photograph, Topographic Maps	Undeveloped
1938-1959	Aerial Photographs, Topographic Maps	Agricultural
1966-Present	Aerial Photographs, Topographic Maps, Onsite Observations	Vacant land

No tenants were identified for the subject property. No potential environmental concerns were identified in association with the current or former use of the subject property.

The subject property parcel was historically used for agricultural purposes from the late 1930s until sometime in the 1960s. There is a potential that agricultural related chemicals such as pesticides, herbicides, and fertilizers, may have been used and stored onsite. Future development of the subject property would likely involve either paving over or covering by building structures that minimize direct contact to any potential remaining concentrations in the soil. Additionally, during previous site development activities, near surface soils (where residual agricultural chemical concentrations would have most likely been present, if at all) would likely be mixed with fill material or be disturbed during grading. Also, during development it is common that engineered fill material is placed over underlying soils as part of the development activities. These additional activities serve to further reduce the potential for exposure to residual agricultural chemicals (if any). Based on these reasons, Partner concludes that the former use of agricultural chemicals at the subject property is not expected to represent an environmental concern at this time.

3.1 Aerial Photograph Review

Partner obtained available aerial photographs of the subject property and surrounding area from Environmental Data Resources, Inc. (EDR) on June 7, 2021. The following was observed on the subject property and adjacent properties during the aerial photograph review:

Date: 1930	*Scale: 1"=500'*
Subject Property:	Appears to be undeveloped
North:	Appears to be undeveloped
South:	Appears to be undeveloped across Baseline Road
East:	Appears to be undeveloped
West:	Appears to be undeveloped

Date: 1938	*Scale: 1"=500'*
Subject Property:	Appears to be developed agriculturally
North:	Appears to be developed agriculturally
South:	Appears to be vacant land across Baseline Road
East:	Appears to be undeveloped
West:	Appears to be developed agriculturally

Date: 1949, 1953, 1959	***Scale: 1"=500'***
Subject Property:	No significant changes visible
North:	Appears to be developed with a road, beyond which is vacant land
South:	Appears to be developed as agricultural to the south and southwest across Baseline Road
East:	Appears to be vacant land, which appears to have been excavated to the east, northeast; and to the southeast across Baseline Road
West:	Appears to be vacant land to the west and northwest

Date: 1966	***Scale: 1"=500'***
Subject Property:	Appears to be vacant land
North:	No significant changes visible
South:	Appears to be vacant land to the south-southeast and agricultural to the south and southwest across Baseline Road
East:	No significant changes visible
West:	No significant changes visible

Date: 1968	***Scale: 1"=500'***
Subject Property:	No significant changes visible
North:	No significant changes visible
South:	No significant changes visible
East:	The southeast site across Baseline Road appears to be filled in; No other significant changes are visible
West:	No significant changes visible

Date: 1975	***Scale: 1"=500'***
Subject Property:	Appears to be a dirt road running through the property north to south; No other significant changes are visible
North:	No significant changes visible
South:	No significant changes visible
East:	The southeast site across Baseline Road appears to be developed commercially; No other significant changes are visible
West:	No significant changes visible

Date: 1985	***Scale: 1"=500'***
Subject Property:	No significant changes visible
North:	Appears to be developed with several road and/or paths
South:	Appears to be vacant land to the south and south-southeast and developed as residential to the southwest across Baseline Road
East:	No significant changes visible
West:	Appears to be under construction with commercial development

Date: 1990	***Scale: 1"=500'***
Subject Property:	Appears as though unpaved roads have been added in a grid pattern, while the remaining land is vacant and undeveloped
North:	No significant changes visible
South:	Appears to be under construction with a residential tract across Baseline Road; no other significant changes are visible

Date: 1990		*Scale: 1"=500'*
East:	No significant changes visible	
West:	Appears to be developed commercially	

Date: 1994, 1995		*Scale: 1"=500'*
Subject Property:	No significant changes visible	
North:	Appears to be under development as a park	
South:	Appears to be residential to the south and southwest and commercial to the southeast across Baseline Road	
East:	Excavation appears to have stopped on the east and northeast sites, which are now vacant land	
West:	No significant changes visible	

Date: 2002, 2005		*Scale: 1"=500'*
Subject Property:	No significant changes visible	
North:	Appears to be developed with a park	
South:	No significant changes visible	
East:	No significant changes visible	
West:	No significant changes visible	

Date: 2009, 2012		*Scale: 1"=500'*
Subject Property:	No significant changes visible	
North:	The northwest site appears to have been developed as a parking lot for the north adjacent park	
South:	No significant changes visible	
East:	No significant changes visible	
West:	No significant changes visible	

Date: 2016		*Scale: 1"=500'*
Subject Property:	No significant changes visible	
North:	No significant changes visible	
South:	No significant changes visible	
East:	The east and northeast sites appear to be under development for stormwater management and flood control	
West:	No significant changes visible	

Copies of select aerial photographs are included in Appendix B of this report.

3.2 Fire Insurance Maps

Partner reviewed the collection of Sanborn Fire insurance maps from EDR on June 7, 2021. Sanborn map coverage was not available for the subject property.

3.3 City Directories

Partner reviewed historical city directories obtained from EDR on June 7, 2021 for past names and businesses that were listed for the subject property and adjacent properties. City directories were not identified for the subject property and vicinity.

Agency Phone Number:	(916) 323-2514
Date of Contact:	June 7, 2021
Method of Communication:	Online
Summary of Communication:	No records regarding hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on file with CalEPA.

Copies of pertinent documents are included in Appendix B of this report.

4.1.2 Health Department/Fire Department

Regulatory Agency Data	
Name of Agency:	San Bernardino County Fire Protection District-Hazardous Materials Division (SBCFPD-HMD)
Point of Contact:	hazmatrecords@sbcfire.org
Agency Address:	620 South E Street, San Bernardino, California 92415
Agency Phone Number:	(909) 386-8468
Date of Contact:	May 27, 2021
Method of Communication:	Email
Summary of Communication:	No records regarding hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on file with the SBCFPD-HMD.

Copies of pertinent documents are included in Appendix B of this report.

4.1.3 Air Pollution Control Agency

Regulatory Agency Data	
Name of Agency:	South Coast Air Quality Management District (SCAQMD)
Point of Contact:	https://www.aqmd.gov
Agency Address:	21865 Copley Drive, Diamond Bar, California 91765
Agency Phone Number:	(909)396-2000
Date of Contact:	June 7, 2021
Method of Communication:	Online
Summary of Communication:	No Permits to Operate (PTO), Notices of Violation (NOV), or Notices to Comply (NTC) or the presence of AULs, dry cleaning machines, or USTs were on file for the subject property with the SCAQMD.

Copies of pertinent documents are included in Appendix B of this report.

4.1.4 Regional Water Quality Agency

Regulatory Agency Data	
Name of Agency:	State Water Resources Control Board (SWRCB)
Point of Contact:	Online (Geotracker.waterboards.ca.gov)
Agency Address:	1001 I Street, Sacramento, California 95814
Agency Phone Number:	(866) 480-1028
Date of Contact:	June 7, 2021
Method of Communication:	Online
Summary of Communication:	No records regarding hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on file with the SWRCB.

Copies of pertinent documents are included in Appendix B of this report.

4.1.5 Department of Toxic Substances Control

Regulatory Agency Data	
Name of Agency:	California Department of Toxic Substances Control (DTSC) and Hazardous Waste Tracking System (HWTS)
Point of Contact:	https://dtsc.ca.gov and https://hwts.dtsc.ca.gov/
Agency Address:	5796 Corporate Avenue, Cypress, California 90630
Agency Phone Number:	(714) 484-5300
Date of Contact:	June 7, 2021
Method of Communication:	Online
Summary of Communication:	No records regarding hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on file with the DTSC or HWTS.

Copies of pertinent documents are included in Appendix B of this report.

4.1.6 Building Department

Regulatory Agency Data	
Name of Agency:	Rialto Building Division (RBD)
Point of Contact:	http://obweb.rialtoca.gov/publicaccess/
Agency Address:	150 South Palm Avenue, Rialto, CA 92376
Agency Phone Number:	(909) 820-2505
Date of Contact:	June 4, 2021
Method of Communication:	Online
Summary of Communication:	No records were on file for the subject property with the RBD.

Copies of pertinent documents are included in Appendix B of this report.

4.1.7 Planning Department

Regulatory Agency Data	
Name of Agency:	Rialto Planning Department (RPD)
Point of Contact:	https://www.yourrialto.com/265/Planning-Division
Agency Address:	150 South Palm Avenue, Rialto, CA 92376
Agency Phone Number:	(909) 820-2525
Date of Contact:	June 7, 2021
Method of Communication:	Online
Summary of Communication:	According to records reviewed, the subject property is zoned I-AR for industrial development by the City of Rialto.

Copies of pertinent documents are included in Appendix B of this report.

4.1.8 Oil & Gas Exploration

Regulatory Agency Data	
Name of Agency:	California Department of Conservation (DOC) Geologic Energy Management Division (CalGEM)
Point of Contact:	https://www.conservation.ca.gov/calgem/Pages/WellFinder.aspx
Agency Address:	5816 Corporate Avenue, Cypress, California 92630
Agency Phone Number:	(714) 816-6847
Date of Contact:	June 7, 2021
Method of Communication:	Well Finder Online Database
Summary of Communication:	According to CalGEM, no oil or gas wells are located on or adjacent to the subject property.

Copies of pertinent documents are included in Appendix B of this report.

4.1.9 Assessor's Office

Regulatory Agency Data	
Name of Agency:	San Bernardino County Property Information Management System (SBC PIMS)
Point of Contact:	http://www.sbcounty.gov/assessor/pims/PIMSINTERFACE.ASPX
Agency Address:	172 West 3rd Street, San Bernardino, CA
Agency Phone Number:	(909) 387-8307
Date of Contact:	June 4, 2021
Method of Communication:	Online
Summary of Communication:	According to records reviewed, the subject property is identified by Assessor Parcel Number (APN) 0264-213-18-0000 and is currently owned by Oakmont Rialto Olive Grove LLC since 2008. The subject property is vacant land and total(s) approximately 30.87 acres.

Copies of pertinent documents are included in Appendix B of this report.

4.2 Mapped Database Records Search

Information from standard federal, state, county, and city environmental record sources was provided by EDR. Data from governmental agency lists are updated and integrated into one database, which is updated as these data are released. The information contained in this report was compiled from publicly available sources and the locations of the sites are plotted utilizing a geographic information system, which geocodes the site addresses. The accuracy of the geocoded locations is approximately +/-300 feet.

Using the ASTM definition of migration, Partner considers the migration of hazardous substances or petroleum products in any form onto the subject property during the evaluation of each site listed on the radius report, which includes solid, liquid, and vapor.

4.2.1 Regulatory Database Summary

Radius Report Data				
Database	**Search Radius (mile)**	**Subject Property**	**Adjacent Properties**	**Sites of Concern**
Federal NPL or Delisted NPL Site	1.00	N	N	N
Federal CERCLIS Site	0.50	N	N	N
Federal CERCLIS-NFRAP Site	0.50	N	N	N
Federal RCRA CORRACTS Facility	1.00	N	N	N
Federal RCRA TSDF Facility	0.50	N	N	N
Federal RCRA Generators Site (LQG, SQG, CESQG)	0.25	N	N	N
Federal IC/EC Registries	0.50	N	N	N
Federal ERNS Site	Subject Property	N	N	N
State/Tribal Equivalent NPL	1.00	N	N	N
State/Tribal Equivalent CERCLIS	1.00	N	N	N
State/Tribal Landfill/Solid Waste Disposal Site	0.50	N	**Y**	N
State/Tribal Leaking Storage Tank Site	0.50	N	N	**Y**
State/Tribal Registered Storage Tank Sites (UST/AST)	0.25	N	N	N
State/Tribal Voluntary Cleanup Sites (VCP)	0.50	N	N	N
State/Tribal Spills (CPS-SLIC)	0.50	N	N	**Y**
Federal Brownfield Sites	0.50	N	N	N
State Brownfield Sites	0.50	N	N	N
CERS HAZ WASTE	0.25	N	**Y**	N
RCRA NonGen/NLR	0.25	N	**Y**	N
San Bernardino Co. Permit	0.25	N	**Y**	N
EDR MGP	Varies	N	N	N
EDR US Hist Auto Station	Varies	N	**Y**	N
EDR US Hist Cleaners	Varies	N	N	N

4.2.2 Subject Property Listings

The subject property is not identified in the regulatory database report.

4.2.3 Adjacent Property Listings

The adjacent property to the east-northeast is identified as a SWF/LF site in the regulatory database report, as discussed below:

- The property, identified as Cactus Dump (Rialto) at E ½, NE ¼ of S3. T1s, R5W, SBBM, is located adjacent to the east-northeast and situated hydrologically cross-gradient of the subject property. This site was identified as a solid waste landfill from the late 1940s until its closure circa 1956. The site was then excavated and reportedly used as a gravel pit until circa 1990. Based on the continuous excavation as a gravel pit for over 30 years and the inferred direction of groundwater flow, this site is not expected to represent an environmental concern to the subject property and it is unlikely that a regulatory file review for this site would alter the findings of this assessment.

The adjacent property to the west is identified as a CERS HAZ WASTE and San Bernardino Co. Permit site in the regulatory database report, as discussed below:

- The property, identified as Benchmark Inks & Coatings at 1245 North Fitzgerald Avenue, Suite 103, is located adjacent to the west and situated hydrologically up-gradient of the subject property. This site was identified with permits as a conditionally exempt small quantity generator of hazardous waste and a handler of hazardous materials. Wastes generated at the site include off-specification aged or surplus organics and unspecified organic liquid mixture. The generated wastes are reportedly transported offsite for disposal by an outside contractor. No releases were reported for this facility. Based on the regulatory oversight, the offsite removal of the generated wastes, and the absence of a documented release, this site is not expected to represent an environmental concern to the subject property and it is unlikely that a regulatory file review for this site would alter the findings of this assessment.

The adjacent property to the west is identified as an EDR Hist Auto site in the regulatory database report, as discussed below:

- The property, identified as Goolsby's Transmission at 1245 North Fitzgerald Avenue, is located adjacent to the west and situated hydrologically up-gradient of the subject property. This site was identified as an automotive transmission repair shop from approximately 2004-2008. No additional information was provided. Based on the short duration of occupancy, and the lack of a reported release or violation, this site is not expected to represent an environmental concern to the subject property and it is unlikely that a regulatory file review for this site would alter the findings of this assessment.

The adjacent property to the west is identified as a RCRA NonGen/NLR site in the regulatory database report, as discussed below:

- The property, identified as Classified Complete Auto Repair at 1285 North Fitzgerald Avenue Unit F, is located adjacent to the west and situated hydrologically up-gradient of the subject property. This site was identified with active permits as a hazardous materials handler and a small quantity generator of hazardous wastes. The facility was also identified as a non-generator of hazardous wastes as of 2018, with no violations found and no releases reported. Based on the status as a non-generator, the lack of violations and lack of a reported release, this site is not expected to represent an environmental concern to the subject property and it is unlikely that a regulatory file review for this site would alter the findings of this assessment.

The adjacent property to the west-northwest is identified as a RCRA NonGen/NLR site in the regulatory database report, as discussed below:

- The property, identified as KT Auto LLC DBA Hi Rev at 1285 North Fitzgerald Avenue, Suite I, is located adjacent to the west-northwest and situated hydrologically up-gradient of the subject property. This site was verified as a non-generator of hazardous wastes as of September 2018, with no violations found and no reported release. Based on the status as a non-generator, the absence of a documented release, and the lack of violations reported, this site is not expected to represent an environmental concern to the subject property and it is unlikely that a regulatory file review for this site would alter the findings of this assessment.

The adjacent property to the west-northwest is identified as a RCRA NonGen/NLR site in the regulatory database report, as discussed below:

- The property, identified as Compressor Component Parts Co Inc at 1325 North Fitzgerald, is located adjacent to the west-northwest and situated hydrologically up-gradient of the subject property. This site was verified as a non-generator of hazardous wastes as of September 2018, with no violations found and no reported release. Based on the status as a non-generator, the lack of a reported release, and the lack of violations reported, this site is not expected to represent an environmental concern to the subject property and it is unlikely that a regulatory file review for this site would alter the findings of this assessment.

The adjacent property to the west-northwest is identified as a RCRA NonGen/NLR, San Bernardino Co. Permit, and CERS site in the regulatory database report, as discussed below:

- The property, identified as Guadalajara's Auto Repair at 1345 North Fitzgerald Avenue, Unit A, is located adjacent to the west-northwest and situated hydrologically up-gradient of the subject property. This site was identified with permits as a conditionally exempt small quantity generator of hazardous wastes and a hazardous materials handler. According to the CERS database, violations were noted in 2014 and 2020, but were subsequently returned to compliance. The facility was also identified as a non-generator of hazardous wastes as of 2018, with no violations found and no releases reported. Based on the status as a non-generator, the lack of violations and lack of a reported release, this site is not expected to represent an environmental concern to the subject property and it is unlikely that a regulatory file review for this site would alter the findings of this assessment.

The adjacent property to the west-northwest is identified as a RCRA NonGen/NLR site in the regulatory database report, as discussed below:

- The property, identified as Si Nor Inc at 1345 Fitzgerald Avenue, Suite F, is located adjacent to the west-northwest and situated hydrologically up-gradient of the subject property. This facility was identified as a non-generator of hazardous wastes as of September 2000 with no violations reported and no documented release. Based on the status as a non-generator, the lack of violations found, and the absence of a documented release, this site is not expected to represent an environmental concern to the subject property and it is unlikely that a regulatory file review for this site would alter the findings of this assessment.

The adjacent property to the west-northwest is identified as a RCRA NonGen/NLR site in the regulatory database report, as discussed below:

- The property, identified as Auto Mission L&R at 1345 North Fitzgerald Unit B, is located adjacent to the west-northwest and situated hydrologically up-gradient of the subject property. This site was verified as a non-generator of hazardous wastes as of September 2018, with no violations found and no reported release. Based on the status as a non-generator, the lack of a reported release, and the lack of violations reported, this site is not expected to represent an environmental concern to the subject property and it is unlikely that a regulatory file review for this site would alter the findings of this assessment.

The adjacent property to the west is identified as a San Bernardino Co. Permit and CERS site in the regulatory database report, as discussed below:

- The property, identified as DFR at 1345 North Fitzgerald Ave, Unit D, is located adjacent to the west and situated hydrologically up-gradient of the subject property. This site was identified with permits as a conditionally exempt small quantity generator of hazardous wastes and a hazardous materials handler. According to the CERS database, violations were noted in 2015 and 2018, but were subsequently returned to compliance. Based on the lack of open violations and lack of a reported release, this site is not expected to represent an environmental concern to the subject property, and it is unlikely that a regulatory file review for this site would alter the findings of this assessment.

The adjacent property to the west is identified as a San Bernardino Co. Permit site in the regulatory database report, as discussed below:

- The property, identified as Unitech Auto Repair at 1345 North Fitzgerald Ave, Unit E, is located adjacent to the west and situated hydrologically up-gradient of the subject property. This site was as an inactive facility that maintained a permit as a conditionally exempt small quantity generator of hazardous wastes with no violations. Based on the lack of open violations and lack of a reported release, this site is not expected to represent an environmental concern to the subject property, and it is unlikely that a regulatory file review for this site would alter the findings of this assessment.

The adjacent property to the west is identified as a San Bernardino Co. Permit and CERS site in the regulatory database report, as discussed below:

- The property, identified as Dynamic Powder Coating at 1265 North Fitzgerald Ave, Unit A, is located adjacent to the west and situated hydrologically up-gradient of the subject property. This site was identified with a permit for hazardous materials handling which reportedly expired in 2010; however, the status is identified as active, with no releases reported. According to the CERS database, violations were noted in 2016, 2017, and 2019, but were subsequently returned to compliance. Based on the lack of open violations, regulatory oversight, and lack of a reported release, this site is not expected to represent an environmental concern to the subject property and it is unlikely that a regulatory file review for this site would alter the findings of this assessment.

The adjacent property to the west is identified as a San Bernardino Co. Permit site in the regulatory database report, as discussed below:

- The property, identified as AT&T California-LB2FA at 1243 East Fitzgerald Avenue, is located adjacent to the west and situated hydrologically up-gradient of the subject property. This site was identified with a permit as a hazardous materials handler, which reportedly expired in January 2021; however, the status is listed as active. No releases and no violations were reported. Based on the regulatory oversight and the lack of a reported release or violation, this site is not expected to represent an environmental concern to the subject property, and it is unlikely that a regulatory file review for this site would alter the findings of this assessment.

Based on the findings, vapor migration is not expected to represent an environmental concern at this time.

4.2.4 Sites of Concern Listings

The property to the east-southeast is identified as a LUST and CPS-SLIC site in the regulatory database report, as discussed below:

- The property, identified as West San Bernardino County Water District and West Valley Water District-Cactus Dump at 855 West Baseline Road, is located less than 1/8-mile to the southeast of the subject property, across West Baseline Road, in an inferred hydrologically down-gradient position. This site reported a release of hazardous levels of soluble lead on January 29, 1993, which reportedly impacted soil only. The release occurred as a result of former operations at the site as a dump and burn site. The site was over-excavated and impacted soils were transported to an approved facility for disposal. The case was granted regulatory closure on July 23, 2012. Additionally, this site reported a release of gasoline on March 12, 2003, which reportedly impacted soil only. The release was discovered during the removal of a 5,000-gallon UST. Soil sampling indicated that contamination was localized and limited in extent and did not pose a threat to groundwater, public health, or the environment. The site was granted regulatory closure on August 20, 2003. Based on the media (i.e., soil) impacted, the subsequent removal of contaminated soil, the regulatory closures, and the inferred direction of groundwater flow, this site is not expected to represent an environmental concern to the subject property.

- Although not listed in the EDR database report, the subject property is located within an area of groundwater contamination that originated at a 160-acre site bounded by Casa Grande Drive to the north, Summit Avenue to the south, North Locust Avenue to the east, and Alder Avenue to the west. This site is situated approximately 2 miles to the northwest (i.e., presumed upgradient) of the subject property and includes a six-mile long area of groundwater contamination downgradient of the 160-acre area. The site was previously used by defense contractors, fireworks manufacturers, and other businesses including West Coast Loading Corporation, B.F. Goodrich Corporation, Pyrotronics, Pyro Spectaculars, and American Promotional Events. These companies handled perchlorate salts and other hazardous chemicals and disposed of chemical wastes on the facility, contaminating the groundwater supply. Site investigations and cleanup in the area are ongoing.

  The California Regional Water Quality Control Board (RWQCB) led initial efforts to respond to the contamination. The EPA added the site to the Superfund program's National Priorities List (NPL) in September 2009. The Goodrich Corporation, Emhart Industries (a corporate successor to West Coast Loading Corporation), Pyro Spectaculars, American Promotional Events, and others have entered into agreements with EPA to pay for cleanup work at the site. The EPA selected the "Source Area Operable Unit" groundwater remedy in September 2010. The selected remedy is a groundwater pump-and-treat system intended to intercept and remove contaminated groundwater from the 160-acre source area. The 160-acre source area is the location where most or all of the contaminants entered the groundwater and testing has identified the highest levels of groundwater contamination. The "Source Area Operable Unit" groundwater remedy was designed in 2013 and 2014 and constructed between 2015 and 2020. It includes a new groundwater extraction well; water treatment systems that make use of liquid-phase granular activated carbon (LGAC) to remove trichloroethene (TCE) and other volatile organic compounds (VOCs) from the extracted groundwater, and ion exchange to remove perchlorate from the extracted groundwater; pipelines and pumps to convey the treated water from the treatment plant to the City of Rialto's water distribution system for use as drinking water supply; and a groundwater monitoring program.

  It is expected that a second groundwater cleanup remedy will be needed to address contaminated groundwater in the "mid-basin" area which has moved past (i.e., downgradient of) the Source Area remedy. To provide information needed to support that decision, EPA completed testing between 2008 and 2012 and entered into an agreement with the Goodrich Corporation to complete additional testing and engineering evaluations as part of a second remedial investigation and feasibility study for the site. Eleven multi-level groundwater monitoring wells were installed and tested between 2013 and 2019. Testing of the groundwater is ongoing. This work is an area known as the "Mid-basin Operable Unit,". According to the EPA First Five Year Review Report (2020) for the site. The remedy has been implemented by expanding an existing water treatment system at an adjacent state-led cleanup site. A new groundwater extraction well, new liquid-phase granular activated carbon and ion exchange water treatment systems, and new pipelines were constructed. A cleanup proposal for the mid-basin groundwater is also expected in late 2020 or early 2021.

The EPA has identified the following parties as PRPs at the site: - Goodrich Corporation, Emhart Industries (on behalf of West Coast Loading Corporation), Pyro Spectaculars Inc. (PSI), Ken Thompson Inc. (current property owner), The estate of Chung Ming Wong (current property owner), Pyrotronics, Inc. ("Pyrotronics") and Harry Hescox.

According to online information, no monitoring wells for this plume are located on the subject property and depth to groundwater is between 300 to 350 feet below ground surface. In addition, due to the fact that the EPA is currently taking action at this site and has identified the responsible parties involved, it is unlikely that the owner of the subject property would be required to financially participate in the cleanup of any subsurface contamination that originated at this NPL site. Vapor intrusion is not a concern due to the depth to groundwater. Based on the ongoing remedial actions and regulatory oversight by the EPA, the identification of responsible parties, and the depth to groundwater, this site is not expected to represent an environmental concern to the subject property at this time.

Based on the findings, vapor migration is not expected to represent an environmental concern at this time.

4.2.5 Orphan Listings

No orphan listings are identified in the regulatory database report.

A copy of the regulatory database report is included in Appendix C of this report.

5.0 USER PROVIDED INFORMATION AND INTERVIEWS

In order to qualify for one of the *Landowner Liability Protections (LLPs)* offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the *Brownfields Amendments*), the *User* must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. The *User* should provide the following information to the *environmental professional*. Failure to provide this information could result in a determination that *all appropriate inquiries* is not complete. The *User* is asked to provide information or knowledge of the following:

- Review Title and Judicial Records for Environmental Liens and AULs
- Specialized Knowledge or Experience of the User
- Actual Knowledge of the User
- Reason for Significantly Lower Purchase Price
- Commonly Known or *Reasonably Ascertainable* information
- Degree of Obviousness
- Reason for Preparation of this Phase I ESA

Fulfillment of these user responsibilities is key to qualification for the identified defenses to CERCLA liability. Partner requested our Client to provide information to satisfy User Responsibilities as identified in Section 6 of the ASTM guidance.

Pursuant to ASTM E1527-13, Partner requested the following site information from Crow Holdings-Industrial (User of this report).

User Responsibilities				
Item	**Provided By User**	**Not Provided By User**	**Discussed Below**	**Does Not Apply**
AAI User Questionnaire		**X**		
Title Records, Environmental Liens, and AULs			**X**	
Specialized Knowledge			**X**	
Actual Knowledge			**X**	
Valuation Reduction for Environmental Issues			**X**	
Identification of Key Site Manager	**Section 5.1.3**			
Reason for Performing Phase I ESA	**Section 1.1**			
Prior Environmental Reports		**X**		
Other				**X**

5.1 Interviews

5.1.1 Interview with Owner

The owner of the subject property since 2008, identified as Oakmont Rialto Olive Grove LLC, was not available to be interviewed at the time of the assessment.

5.1.2 Interview with Report User

Please refer to Section 5.2 below for information requested from the Report User. The information requested was not received prior to the issuance of this report. The lack of this information is not considered to represent a significant data gap.

5.1.3 Interview with Key Site Manager

A key site manager was not provided to be interviewed at the time of this assessment.

5.1.4 Interviews with Past Owners, Operators and Occupants

Interviews with past owners, operators and occupants were not reasonably ascertainable and thus constitute a data gap.

5.1.5 Interview with Others

As the subject property is not an abandoned property as defined in ASTM 1527-13, interview with others were not performed.

5.2 User Provided Information

5.2.1 Title Records, Environmental Liens, and AULs

Partner was not provided with title records or environmental lien and AUL information for review as part of this assessment.

5.2.2 Specialized Knowledge

No specialized knowledge of environmental conditions associated with the subject property was provided by the User at the time of the assessment.

5.2.3 Actual Knowledge of the User

No actual knowledge of any environmental lien or AULs encumbering the subject property or in connection with the subject property was provided by the User at the time of the assessment.

5.2.4 Valuation Reduction for Environmental Issues

No knowledge of valuation reductions associated with the subject property was provided by the User at the time of the assessment.

5.2.5 Commonly Known or Reasonably Ascertainable Information

The User did not provide information that is commonly known or *reasonably ascertainable* within the local community about the subject property at the time of the assessment.

5.2.6 Previous Reports and Other Provided Documentation

The following information was provided to Partner for review during the course of this assessment:

Phase I Environmental Site Assessment, LFR Inc. (November 14, 2007)

LFR Inc. (LFR) prepared this report on behalf of Oakmont Industrial Group. The assessment was performed in accordance with ASTM Standard E1527-05. The assessment consisted of a site reconnaissance, review of historical information, and a review of federal, state, and local regulatory databases. Pertinent information contained in this report is summarized below:

- At the time of the 2007 assessment, the subject property was vacant land.
- According to the LFR report, the subject property has been vacant land since the mid-1960s and was developed as agricultural between the mid-1930s and the mid-1960s.
- No current or former ASTs or USTs, pits, ponds, or sumps were identified by LFR on the subject property.
- LFR reported a pile of Megaplex X Grease 2 14-ounce containers near the northeast corner of the subject property, with no surface staining observed. Other non-hazardous debris was reported to be scattered throughout the site such as plastic, glass, tires, paper, fabric, and a couch.
- Additionally, LFR reportedly observed soil piles 5 to 6 feet high on the east side of the subject property boundary.
- According to the LFR report, the property owner had allowed a developer (Shea Homes) to dispose of excess soil on the subject property generated during their construction of a nearby residential development. The Shea Homes site was determined to be a prior agricultural site. As such, four soil samples were collected and analyzed for organochlorine pesticides. According to the report, "no pesticides were detected at concentrations above the U.S. Environmental Protection Agency (EPA) Preliminary Remediation Goal (PRG) for a residential scenario. Based on these analytical results, it does not appear that the onsite soil mounds represent an environmental concern for the Site."
- According to the 2007 report, no regulatory records were available for the subject property.

LFR identified no RECs and recommended no further investigation.

Copies of pertinent pages reviewed are not included in Appendix B.

6.0 SITE RECONNAISSANCE

The weather at the time of the site visit was sunny and clear. Refer to Section 1.5 for limitations encountered during the field reconnaissance and Sections 2.1 and 2.2 for subject property operations. The table below provides the site assessment details.

Site Assessment Data	
Site Assessment Performed By:	Cheryl Manuel
Site Assessment Conducted On:	June 8, 2021

No potential environmental concerns were identified during the onsite reconnaissance.

6.1 General Site Characteristics

6.1.1 Solid Waste Disposal

Partner observed the presence of general trash and debris (glass, paper, and plastic) scattered about the subject property. No evidence of environmentally sensitive debris was observed.

6.1.2 Sewage Discharge and Disposal

As the subject property has never been improved, no sewage or disposal systems are expected to be present and none were observed.

6.1.3 Surface Water Drainage

As the subject property is unimproved and unpaved vacant land, storm water percolates into the soil.

The subject property does not appear to be a designated wetland area, based on information obtained from the United States Fish & Wildlife Service; however, a comprehensive wetlands survey would be required in order to formally determine actual wetlands on the subject property. No surface impoundments, wetlands, natural catch basins, settling ponds, or lagoons are located on the subject property. No drywells were identified on the subject property.

A copy of the wetland map is included in Appendix B.

6.1.4 Source of Heating and Cooling

No heating or cooling systems are present on the subject property.

6.1.5 Wells and Cisterns

No aboveground evidence of wells or cisterns was observed during the site reconnaissance.

6.1.6 Wastewater

No domestic wastewater is generated at the subject property. No industrial process is currently performed at the subject property.

6.1.7 Septic Systems

No septic systems were observed or reported on the subject property.

6.1.8 Additional Site Observations

Several piles of soil approximately 5 feet high were observed onsite, near the eastern boundary of the subject property. According to the site contact, Mr. Reuben Zepeda, the soil piles have been there since at least 2017. Additionally, it was reported that a homeless encampment occupied the site last year, and the occupants were digging on the site creating newer soil piles. According to the 2007 LFR Phase I ESA prepared for the subject property, the property owner had allowed a developer (Shea Homes) to dispose of excess soil on the subject property generated during their construction of a nearby residential development. The Shea Homes site was reportedly determined to be a prior agricultural site. As such, four soil samples were collected from the development site and analyzed for organochlorine pesticides. According to the report, no pesticides were detected at concentrations above the U.S. Environmental Protection Agency (EPA) Preliminary Remediation Goal (PRG) for a residential scenario. Documentation regarding the fill material was not appended to the 2007 LFR Phase I ESA or provided for Partner's review at the time of the assessment. However, based on the reported origin and quality of materials placed on the subject property, the onsite soil piles are not expected to represent an environmental concern to the subject property.

6.2 Potential Environmental Hazards

6.2.1 Hazardous Substances and Petroleum Products Used or Stored at the Site

No hazardous substances or petroleum products were observed on the subject property during the site reconnaissance.

6.2.2 Aboveground & Underground Hazardous Substance or Petroleum Product Storage Tanks (ASTs/USTs)

No evidence of current or former ASTs or USTs was observed during the site reconnaissance.

6.2.3 Evidence of Releases

No spills, stains, or other indications that a surficial release has occurred at the subject property were observed.

6.2.4 Polychlorinated Biphenyls (PCBs)

No potential PCB-containing equipment (e.g., transformers, oil-filled switches, hoists, lifts, dock levelers, hydraulic elevators, etc.) was observed on the subject property during Partner's reconnaissance.

6.2.5 Strong, Pungent or Noxious Odors

No strong, pungent, or noxious odors were evident during the site reconnaissance.

6.2.6 Pools of Liquid

No pools of liquid were observed on the subject property during the site reconnaissance.

6.2.7 Drains, Sumps, and Clarifiers

No drains, sumps, or clarifiers were observed on the subject property during the site reconnaissance.

6.2.8 Pits, Ponds and Lagoons

No pits, ponds or lagoons were observed on the subject property.

6.2.9 Stressed Vegetation

No stressed vegetation, other than lack of water, was observed on the subject property.

6.2.10 Additional Potential Environmental Hazards

No additional environmental hazards, including landfill activities or radiological hazards, were observed.

6.3 Non-ASTM Services

6.3.1 Asbestos-Containing Materials (ACMs)

Due to the vacant, unimproved state of the subject property, ACMs were not considered within the scope of this assessment.

6.3.2 Lead-Based Paint (LBP)

Due to the vacant, unimproved state of the subject property, LBP was not considered within the scope of this assessment.

6.3.3 Radon

Radon is a colorless, odorless, naturally occurring, radioactive, inert, gaseous element formed by radioactive decay of radium (Ra) atoms. The US EPA has prepared a map to assist National, State, and local organizations to target their resources and to implement radon-resistant building codes. The map divides the country into three Radon Zones, according to the table below:

EPA Radon Zones		
EPA Zones	**Average Predicted Radon Levels**	**Potential**
Zone 1	Exceed 4.0 pCi/L	Highest
Zone 2	Between 2.0 and 4.0 pCi/L	Moderate
Zone 3	Less than 2.0 pCi/L	Low

It is important to note that the EPA has found homes with elevated levels of radon in all three zones, and the US EPA recommends site-specific testing in order to determine radon levels at a specific location. However, the map does give a valuable indication of the propensity of radon gas accumulation in structures.

Radon sampling was not conducted as part of this assessment. Review of the US EPA Map of Radon Zones places the subject property in Zone 2. Based upon the radon zone classification, radon is not considered to be a significant environmental concern.

6.3.4 Lead in Drinking Water

According to available information, a public water system operated by the Veolia North America, under contract with Rialto Water Services (RWS), serves the subject property vicinity. The sources of public water for Rialto are 86 percent from groundwater basins and 14 percent from surface water. According to the RWS and the 2019 Annual Water Quality Report, water supplied to the subject property is in compliance with all State and Federal regulations pertaining to drinking water standards, including lead and copper. Water sampling was not conducted to verify water quality.

6.3.5 Mold

Due to the vacant, unimproved state of the subject property, mold was not considered within the scope of this assessment.

6.4 Adjacent Property Reconnaissance

The adjacent property reconnaissance consisted of observing the adjacent properties from the subject property premises.

6.4.1 Hazardous Substances and Petroleum Products Used or Stored at the Site

Several industrial sites, including automotive repair shops, were observed adjacent west of the subject property. These sites were identified on the regulatory database report and are further discussed in Section 4.2.3.

No other items of environmental concern were identified on the adjacent properties during the site assessment, including hazardous substances, petroleum products, ASTs, USTs, evidence of releases, PCBs, strong or noxious odors, pools of liquids, sumps or clarifiers, pits or lagoons, stressed vegetation, or any other potential environmental hazards

7.0 FINDINGS AND CONCLUSIONS

Findings

A *REC* refers to the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: due to release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment.

- Partner did not identify any RECs during the course of this assessment.

A *CREC* refers to a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

- Partner did not identify any CRECs during the course of this assessment.

A *HREC* refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls.

- Partner did not identify any HRECs during the course of this assessment.

An *environmental issue* refers to environmental concerns identified by Partner, which do not qualify as RECs; however, warrant further discussion. The following concerns were identified during the course of this assessment:

- The subject property parcel was historically used for agricultural purposes from the late 1930s until sometime in the 1960s. There is a potential that agricultural related chemicals such as pesticides, herbicides, and fertilizers, may have been used and stored onsite. Future development of the subject property would likely involve either paving over or covering by building structures that minimize direct contact to any potential remaining concentrations in the soil. Additionally, during previous site development activities, near surface soils (where residual agricultural chemical concentrations would have most likely been present, if at all) would likely be mixed with fill material or be disturbed during grading. Also, during development it is common that engineered fill material is placed over underlying soils as part of the development activities. These additional activities serve to further reduce the potential for exposure to residual agricultural chemicals (if any). Based on these reasons, Partner concludes that the former use of agricultural chemicals at the subject property is not expected to represent an environmental concern at this time.
- Several piles of soil approximately 5 feet high were observed onsite, near the eastern boundary of the subject property. According to the site contact, Mr. Reuben Zepeda, the soil piles have been there since at least 2017.

- Additionally, it was reported that a homeless encampment occupied the site last year, and the occupants were digging on the site creating newer soil piles. According to the 2007 LFR Phase I ESA prepared for the subject property, the property owner had allowed a developer (Shea Homes) to dispose of excess soil on the subject property generated during their construction of a nearby residential development. The Shea Homes site was reportedly determined to be a prior agricultural site. As such, four soil samples were collected from the development site and analyzed for organochlorine pesticides. According to the report, no pesticides were detected at concentrations above the U.S. EPA PRG for a residential scenario. Documentation regarding the fill material was not appended to the 2007 LFR Phase I ESA or provided for Partner's review at the time of the assessment. However, based on the reported origin and quality of materials placed on the subject property, the onsite soil piles are not expected to represent an environmental concern to the subject property.

- The subject property is located within an area of groundwater contamination that originated at a 160-acre site bounded by Casa Grande Drive to the north, Summit Avenue to the south, North Locust Avenue to the east, and Alder Avenue to the west. This site is situated approximately 2 miles to the northwest (i.e., presumed upgradient) of the subject property and includes a six-mile long area of groundwater contamination downgradient of the 160-acre area. The site was previously used by defense contractors, fireworks manufacturers, and other businesses including West Coast Loading Corporation, B.F. Goodrich Corporation, Pyrotronics, Pyro Spectaculars, and American Promotional Events. These companies handled perchlorate salts and other hazardous chemicals and disposed of chemical wastes on the facility, contaminating the groundwater supply. Site investigations and cleanup in the area are ongoing.

  The California RWQCB led initial efforts to respond to the contamination. The EPA added the site to the Superfund program's NPL in September 2009. The Goodrich Corporation, Emhart Industries (a corporate successor to West Coast Loading Corporation), Pyro Spectaculars, American Promotional Events, and others have entered into agreements with EPA to pay for cleanup work at the site. The EPA selected the "Source Area Operable Unit" groundwater remedy in September 2010. The selected remedy is a groundwater pump-and-treat system intended to intercept and remove contaminated groundwater from the 160-acre source area. The 160-acre source area is the location where most or all of the contaminants entered the groundwater and testing has identified the highest levels of groundwater contamination. The "Source Area Operable Unit" groundwater remedy was designed in 2013 and 2014 and constructed between 2015 and 2020. It includes a new groundwater extraction well; water treatment systems that make use of LGAC to remove TCE and other VOCs from the extracted groundwater, and ion exchange to remove perchlorate from the extracted groundwater; pipelines and pumps to convey the treated water from the treatment plant to the City of Rialto's water distribution system for use as drinking water supply; and a groundwater monitoring program.

It is expected that a second groundwater cleanup remedy will be needed to address contaminated groundwater in the "mid-basin" area which has moved past (i.e., downgradient of) the Source Area remedy. To provide information needed to support that decision, EPA completed testing between 2008 and 2012 and entered into an agreement with the Goodrich Corporation to complete additional testing and engineering evaluations as part of a second remedial investigation and feasibility study for the site. Eleven multi-level groundwater monitoring wells were installed and tested between 2013 and 2019. Testing of the groundwater is ongoing. This work is an area known as the "Mid-basin Operable Unit,". According to the EPA First Five Year Review Report (2020) for the site. The remedy has been implemented by expanding an existing water treatment system at an adjacent state-led cleanup site. A new groundwater extraction well, new liquid-phase granular activated carbon and ion exchange water treatment systems, and new pipelines were constructed. A cleanup proposal for the mid-basin groundwater is also expected in late 2020 or early 2021.

The EPA has identified the following parties as PRPs at the site: - Goodrich Corporation, Emhart Industries (on behalf of West Coast Loading Corporation), PSI, Ken Thompson Inc. (current property owner), The estate of Chung Ming Wong (current property owner), Pyrotronics, Inc. ("Pyrotronics") and Harry Hescox.

According to online information, no monitoring wells for this plume are located on the subject property and depth to groundwater is between 300 to 350 feet below ground surface. In addition, due to the fact that the EPA is currently taking action at this site and has identified the responsible parties involved, it is unlikely that the owner of the subject property would be required to financially participate in the cleanup of any subsurface contamination that originated at this NPL site. Vapor intrusion is not a concern due to the depth to groundwater. Based on the ongoing remedial actions and regulatory oversight by the EPA, the identification of responsible parties, and the depth to groundwater, this site is not expected to represent an environmental concern to the subject property at this time.

Conclusions, Opinions and Recommendations

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 of Northside of Baseline Road, West of Cactus Avenue in Rialto, San Bernardino County, California (the "subject property"). Any exceptions to, or deletions from, this practice are described in Section 1.5 of this report.

This assessment has revealed no evidence of RECs, CRECs, or HRECs in connection with the subject property; however, environmental issues were identified. Based on the conclusions of this assessment and the continued future industrial use of the subject property, no further action is warranted at this time.

8.0 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

Partner has performed a Phase I Environmental Site Assessment of the property located at Northside of Baseline Road, West of Cactus Avenue in Rialto, San Bernardino County, California in conformance with the scope and limitations of the protocol and the limitations stated earlier in this report. Exceptions to or deletions from this protocol are discussed earlier in this report.

By signing below, Partner declares that, to the best of our professional knowledge and belief, we meet the definition of *Environmental Professional* as defined in §312.10 of 40 CFR §312. Partner has the specific qualifications based on education, training, and experience to assess a *property* of the nature, history, and setting of the subject *property*. Partner has developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Partner Engineering and Science, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

   THE COMPANY WILL REQUIRE, FOR REVIEW, A FULL AND COMPLETE COPY OF ANY UNRECORDED AGREEMENT, CONTRACT, LICENSE AND/OR LEASE, TOGETHER WITH ALL SUPPLEMENTS, ASSIGNMENTS AND AMENDMENTS THERETO, BEFORE ISSUING ANY POLICY OF TITLE INSURANCE WITHOUT EXCEPTING THIS ITEM FROM COVERAGE.

   THE COMPANY RESERVES THE RIGHT TO EXCEPT ADDITIONAL ITEMS AND/OR MAKE ADDITIONAL REQUIREMENTS AFTER REVIEWING SAID DOCUMENTS.

9. ANY EASEMENTS NOT DISCLOSED BY THE PUBLIC RECORDS AS TO MATTERS AFFECTING TITLE TO REAL PROPERTY, WHETHER OR NOT SAID EASEMENTS ARE VSIBLE AND APPARENT.

SURVEYOR'S CERTIFICATE:

TO: OAKMONT NATIONAL PARTNERS II, L.P., A DELAWARE LIMITED LIABILITY COMPANY, OAKMONT RIALTO OLIVE GROVE, LLC, A DELAWARE LIMITED LIABILITY COMPANY, PR OAK FUND II, LLC, A DELAWARE LIMITED LIABILITY COMPANY, CHICAGO TITLE INSURANCE COMPANY, AND EACH OF THEIR RESPECTIVE SUCCESSORS AND ASSIGNS.

THIS IS TO CERTIFY THAT THIS MAP OR PLAT AND THE SURVEY ON WHICH IT IS BASED WERE MADE IN ACCORDANCE WITH THE "MINIMUM STANDARD DETAIL REQUIREMENTS FOR ALTA/NSPS LAND TITLE SURVEYS," JOINTLY ESTABLISHED AND ADOPTED BY ALTA AND NSPS IN 2016, AND INCLUDES ITEMS 2, 3, 4, 5, 6, 8, 10, 11(A), 13, 14, 16, 17 AND 18 OF TABLE A THEREOF. PURSUANT TO THE ACCURACY STANDARDS AS ADOPTED BY ALTA AND NSPS AND IN EFFECT ON THE DATE OF THIS CERTIFICATION, THE UNDERSIGNED FURTHER CERTIFIES THAT IN MY PROFESSIONAL OPINION AS A LAND SURVEYOR REGISTERED IN THE STATE OF CALIFORNIA, THE RELATIVE POSITIONAL ACCURACY IS 0.20 FEET.

THE UNDERSIGNED FURTHER CERTIFIES, BASED ON THE INFORMATION PROVIDED BY THE TITLE COMPANY, CLIENT AND FIELD SURVEY DATA AT THE TIME OF THE SURVEY AND PLAT PREPARATION, THAT IN MY OPINION AND TO THE BEST OF MY PROFESSIONAL KNOWLEDGE, INFORMATION AND BELIEF:

THAT THIS SURVEY PLAT IS BASED ON AN ACTUAL FIELD SURVEY MADE ON THE GROUND BY MADOLE AND ASSOCIATES, INC., COMPLETED ON OCTOBER 19, 2007 AND UPDATED ON MAY 10, 2019.

(a) THIS PLAT AND THE SURVEY ON WHICH IT IS BASED, FULLY AND CORRECTLY REPRESENTS THE PROPERTY DESCRIBED BY THE LEGAL DESCRIPTION NOTED HEREON AND OTHERWISE ACCURATELY REPRESENTS THE FACTS FOUND AT THE TIME OF THE SURVEY;

(b) UNLESS OTHERWISE SPECIFICALLY NOTED HEREON, THERE ARE NO DISCREPANCIES AMONG THE BOUNDARY LINES AS SHOWN HEREON, AND AS DESCRIBED IN THE LEGAL DESCRIPTION OF RECORD, AND ALL PHYSICAL EVIDENCE OF BOUNDARY LINES AND LINES OF POSSESSION OR OCCUPANCY HAVE BEEN SHOWN;

(c) THE BOUNDARY LINE DIMENSIONS AS SHOWN HEREON FORM A CLOSED FIGURE;

(d) THE BOUNDARY LINES OF THE SUBJECT PROPERTY ARE CONTIGUOUS WITH THE ADJOINING PARCELS, ROADS, HIGHWAYS, STREETS OR ALLEYS AS THEY APPEAR TO BE DESCRIBED IN THE MOST RECENT RESPECTIVE LEGAL DESCRIPTIONS UNLESS SPECIFICALLY NOTED OTHERWISE HEREON;

(e) THE AREA INDICATED FOR THE LAND IS ACCURATE;

(f) THE PROPERTY LIES WITHIN THE FLOOD INSURANCE RATE MAP (F.I.R.M.) PANEL SHOWN HEREON UNDER FLOOD ZONE.

(g) THE IMPROVEMENTS ARE LOCATED AS SHOWN, AND EXCEPT AS SHOWN HEREON, THERE ARE NO ENCROACHMENTS BY SUCH IMPROVEMENTS ONTO ADJOINING PROPERTY, OR ADJOINING ONTO THE SUBJECT PROPERTY;

(h) THERE ARE NO EASEMENTS SPECIFICALLY REFERENCED IN THE TITLE REPORT SHOWN HEREON, ENCROACHMENTS, STREETS, ROADWAYS, PATHS, RIGHT-OF-WAY OR USES AFFECTING THE SUBJECT PROPERTY APPARENT FROM A CAREFUL INSPECTION OF THE SUBJECT PROPERTY OTHER THAN AS SHOWN OR NOTED HEREON.

THE RECORD INFORMATION ON WHICH THE SURVEY IS BASED WAS PROVIDED BY THE CHICAGO TITLE COMPANY PRELIMINARY TITLE REPORT, ORDER No. 00108438-987-OC1-K27, DATED APRIL 23, 2019 AS LAST UPDATED.

REQUEST FOR AN ENVIRONMENTAL AUDIT PHASE 1 CERTIFIED HAZARDOUS MATERIALS RECORDS SEARCH FINDING REPORT

The main focus of a REQUEST FOR AN ENVIRONMENTAL AUDIT PHASE 1 CERTIFIED HAZARDOUS MATERIALS RECORDS SEARCH FINDING REPORT is to determine whether there exists in San Bernardino County Fire Protection District (SBCFPD) any record relating to contamination or reports of spills at a particular site. An Environmental Phase 1 Certified Hazardous Materials Records Search Finding Report should reveal whether there are any facilities at the site that are subject to current or past regulatory activity by SBCFPD, such as underground storage tanks, hazardous material handlers, hazardous waste generators, and CalARP facilities, as well as any reports of spills, incidents, complaints, or cleanup activity, which can be a useful tool in providing a history of compliance or non-compliance.

Once SBCFPD has completed its records search, an Environmental Phase 1 Certified Hazardous Materials Records Search Finding Report will be prepared and issued. Such report will detail all SBCFPD records associated with a particular site by type, date, location, and status (where applicable). All files identified in an Environmental Phase 1 Certified Hazardous Materials Records Search Finding Report can be made available for copies and/or review upon request.

If the completed records search reveals no SBCFPD record of hazardous material activity at the site, an Environmental Phase 1 Certified Hazardous Materials Records Search Finding Report will be issued, noting that "no records" were identified.

Please provide a specific site address or location description. If a situs address does not exist or cannot be found, list another type of location identifier such as Assessor Parcel Number (preferable), cross streets or intersections (e.g., NWC 5th Ave. & Main St.), and/or legal description. If possible, please attach a map to this request form.

** IMPORTANT –THIS PAGE MUST BE SIGNED PRIOR TO SUBMITTAL **

DISCLAIMER: While all attempts are made to provide accurate, current, and reliable information, San Bernardino County Fire Protection District *(further referred to as SBDFPD)* recognizes the possibility of human error. Therefore, SBCFPD, its officers, employees, agents and volunteers, make no representations as to the accuracy, completeness or suitability of an Environmental Audit Phase 1 Certified Hazardous Materials Records Search Finding Report and provides an Environmental Audit Phase 1 Certified Hazardous Materials Records Search Finding Report "as is," with no warranties, express or implied, including the implied warranty of fitness for a particular purpose. In no event shall SBCFPD be liable for any damages of any nature whatsoever, arising out of the issuance of a Certified Hazardous Materials Records Search Finding Report. SBCFPD therefore assumes no liability for damages incurred directly or indirectly as a result of any errors, omissions or discrepancies in a Certified Hazardous Materials Records Search Finding Report.

RELEASE AND INDEMNIFICATION: In consideration for the issuance of an Environmental Audit Phase 1 Certified Hazardous Materials Records Search Finding Report, I hereby release and forever discharge SBCFPD, its officers, employees, agents and volunteers from any and all claims, actions, losses, damages and/or liability in connection with SBCFPD's issuance of an Environmental Audit Phase 1 Certified Hazardous Materials Records Search Finding Report, including, but not limited to, claims that may arise due to the active or passive negligence of SBCFPD, its officers, employees, agents and volunteers.

I am familiar with the provisions of California Civil Code Section 1542, which provides as follows:

"A general release does not extend to claims which the creditor does not know or suspect to exist in his or her favor at the time of executing the release, which if known by him or her must have materially affected his or her settlement with the debtor."

I hereby expressly waive any and all rights that I may have there under. I understand and acknowledge the significance and consequence of this specific waiver of California Civil Code Section 1542 and assume full responsibility for any injuries, damages, losses or liabilities that I may hereafter discover as possibly resulting from SBCFPD's issuance of an Environmental Audit Phase 1 Certified Hazardous Materials Records Search Finding Report.

In further consideration for SBCFPD's issuance of an Environmental Audit Phase 1 Certified Hazardous Materials Records Search Finding Report, I hereby agree, for myself, my heirs, administrators, executors and assigns, that I shall indemnify, defend (with counsel approved by County) and hold harmless SBCFPD, its officers, employees, agents and volunteers from any and all claims, demands, actions or suits arising out of or in connection with SBCFPD's issuance of an Environmental Audit Phase 1 Certified Hazardous Materials Records Search Finding Report brought by any third party.

I have read the above terms and conditions, including the paragraphs entitled "DISCLAIMER" and "RELEASE AND INDEMNIFICATION", and by my signature below, I affirm that I understand these terms and conditions and accept them as part of my REQUEST FOR AN ENVIRONMENTAL AUDIT PHASE 1 CERTIFIED HAZARDOUS MATERIALS RECORDS SEARCH FINDING REPORT.

I hereby request an Environmental Audit Phase 1 Certified Hazardous Materials Records Search Finding Report for the location described on Page 1 of this application.

- ❑ **I am including payment of the initial fee of $136.00, for the first hour of research, by check or money order, payable to San Bernardino County Fire Protection District, or by credit card payment taken over the phone. I understand that research exceeding one hour will be billed at the rate of $136.00 for each additional hour spent by SBCFPD in completing this request.**
- ❑ **I have faxed or emailed this request and will forward payment along with the original request form within 48 hours.**

APN #: 0264-213-18-0000, RIALTO, CALIFORNIA

This is to confirm that the OFM Hazardous Materials Division (HMD) has searched its records for any file(s) pertaining to the subject property, as described in your request, and finds that no records exist for the above site description(s).

Records maintained by OFM-HMD date back to mid-1980's. Records searched include:

- facilities with hazardous waste generator permits, hazardous materials handler permits, underground storage tank permits, universal waste permits, tiered permits, EPCRA facilities, RMP facilities, Cal ARP facilities, and/or waste recycling generators, including inactive and/or out of business records, as well as non-permitted facility actions;
- logs of permits issued for the removal, installation, and/or modification of underground storage tanks;
- records and databases pertaining to illicit dumping, spill reports and release notifications, and complaints;
- incidents responded to by the hazardous materials emergency response team;
- and sites undergoing remediation for contaminated soil and/or groundwater.

Subject: Rialto Public Records Request :: P002435-060421

Dear Cheryl :

Thank you for your interest in public records of the City of Rialto, CA.

The City of Rialto CA has received your Public Records request, dated 6/4/2021 3:05:45 PM and given it the reference number P002435-060421 for tracking purposes.

Record(s) Requested: *All demolition, building, plumbing, electrical, mechanical permits and certificates of occupancy, earliest to most recent for parcel number 0264213180000*

Your request is being forwarded to the appropriate department(s) for processing and you will be notified once the request is complete.

You can monitor request progress at the link below. Thank you for using the City of Rialto Public Records Center.

To monitor the progress or update this request please log into the Rialto Public Records Center.

Manuel, Cheryl

Torrance CA 90501

Dear Cheryl

There are no records relate to you request for:

All demolition, building, plumbing, electrical, mechanical permits and certificates of occupancy, earliest to most recent for parcel number
0264213180000

If I may be of any further service, please contact me at (909) 421-4930.

Sincerely,

Mariana Garcia
Records Coordinator

[This page is intentionally left blank.]

Executive Summary

This is the first Five-Year Review of the Rockets, Fireworks, and Flares Superfund Site (Site) located in San Bernardino County, California. The purpose of this Five-Year Review is to review information to determine if the remedy is and will continue to be protective of human health and the environment.

Most of the Site is located in the Rialto-Colton Groundwater Basin, which is an important source of drinking water to residents and businesses in the cities of Rialto, Colton, and Fontana. Located east of the city of Los Angeles, the Site consists of three operable units[1] (OUs). The Source Area Operable Unit addresses groundwater contaminated with volatile organic compounds and perchlorate at and near the source area. EPA is evaluating the need for cleanup at the Mid-Basin Operable Unit, which addresses contaminated groundwater downgradient of the Source Area Operable Unit, and the Soils Operable Unit, which addresses contaminated soil at a 160-acre source area. EPA added the Site to the National Priorities List in September 2009.

On September 30, 2010, EPA signed an Interim Record of Decision (ROD) that selected the following remedy for the Source Area Operable Unit groundwater to protect long-term human health and the environment:

- Groundwater extraction wells located downgradient of the 160-acre source area.
- Water treatment systems to reduce the concentrations of trichloroethylene (TCE) and other volatile contaminants from the extracted groundwater below levels allowed by federal and state drinking water standards.
- Water treatment systems to reduce the concentrations of perchlorate from the extracted groundwater below the level allowed by the state drinking water standard.
- Pipelines and pumps to convey the contaminated groundwater from the extraction wells to the treatment plant.
- Pipelines and pumps to convey the treated water from the treatment plant to one or more local water utilities for distribution as municipal water supply (or for aquifer replenishment); and.
- A groundwater monitoring program.

The remedy has been implemented by expanding an existing water treatment system at an adjacent state-led cleanup site. A new groundwater extraction well, new liquid-phase granular activated carbon and ion exchange water treatment systems, and new pipelines were constructed. The expanded system is referred to as the Combined Treatment Plant. Emhart Industries, Inc., a company responsible for conducting the cleanup in accordance with a 2013 Consent Decree, conducted two pilot-scale tests to demonstrate that the new ion exchange systems would adequately treat extracted Site groundwater.

[1] The term "operable unit" (OU) defines a discrete action that is an incremental step toward a comprehensive remedy for a site.

Upon regulatory and local agency approval, treated Site groundwater from the Combined Treatment Plant will be chlorinated and pumped to the city of Rialto municipal water system.

Exposure assumptions, cleanup levels, and remedial action objectives used at the time of remedy selection are still valid. No new human health or ecological routes of exposure or receptors have been identified. In addition, no new contaminants or contamination sources have been identified. No additional ecological risks have been identified. No impacts from natural disasters have affected the protectiveness or activities of the Site. Some Applicable or Relevant and Appropriate Regulations (ARARs) have changed since finalization of the 2010 Interim ROD. However, none of these changes call into question the protectiveness of the remedy.

Based on review of project-related documents and data, as well as the site inspection, the remedy is expected to function as intended by the Interim ROD. It is expected that the remedy will achieve the remedial action objectives of protecting water supply wells and groundwater resources by limiting the spread of contaminated groundwater from the 160-acre area and by removing contaminants from groundwater.

The remedy at the Rockets, Fireworks and Flares Superfund Site is expected to be protective of human health and the environment upon completion. In the interim, the remedial activities completed to date have adequately addressed all exposure pathways that could result in unacceptable risks in these areas.

1. Introduction

The purpose of a Five-Year Review is to evaluate the implementation and performance of a remedy to determine if the remedy will continue to be protective of human health and the environment. The methods, findings, and conclusions of a review are documented in Five-Year Review reports. In addition, Five-Year Review reports identify issues found during the review, if any, and document recommendations to address them.

The U.S. Environmental Protection Agency (EPA) is preparing this Five-Year Review pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act Section 121(c), 40 Code of Federal Regulation (CFR) Section 300.430(f)(4)(ii) of the National Contingency Plan and EPA policy.

This is the first Five-Year Review for the Rockets, Fireworks, and Flares Superfund Site (Site). The triggering action for this statutory review is the on-site construction start date for a remedial action on September 18, 2015. The Five-Year Review has been prepared due to the fact that hazardous substances, pollutants, or contaminants remain at the site above levels that allow for unlimited use and unrestricted exposure.

This Five-Year Review focuses on the Source Area Operable Unit, which addresses groundwater near the sources of contamination. The two operable units that are not addressed in this Five-Year Review are the Mid-Basin Operable Unit, which addresses contaminated groundwater downgradient of the Source Area Operable Unit, and the Soils Operable Unit, which addresses contaminated soil in an area known as the 160-acre area where Site contaminants are believed to have been released to the environment. EPA signed the Record of Decision (ROD) for the Source Area Operable Unit on September 30, 2010. RODs have not been finalized for Mid-Basin Operable Unit or Soils Operable Unit and therefore review of these operable units are not included in this Five-Year Review.

The Rockets, Fireworks, and Flares Superfund Site Five-Year Review was led by Wayne Praskins (EPA, Remedial Project Manager). Participants included U.S. Army Corps of Engineers staff Leanna Woods Pan (environmental engineer) and Benino McKenna (hydrogeologist). The review began on October 30, 2018.

1.1. Background

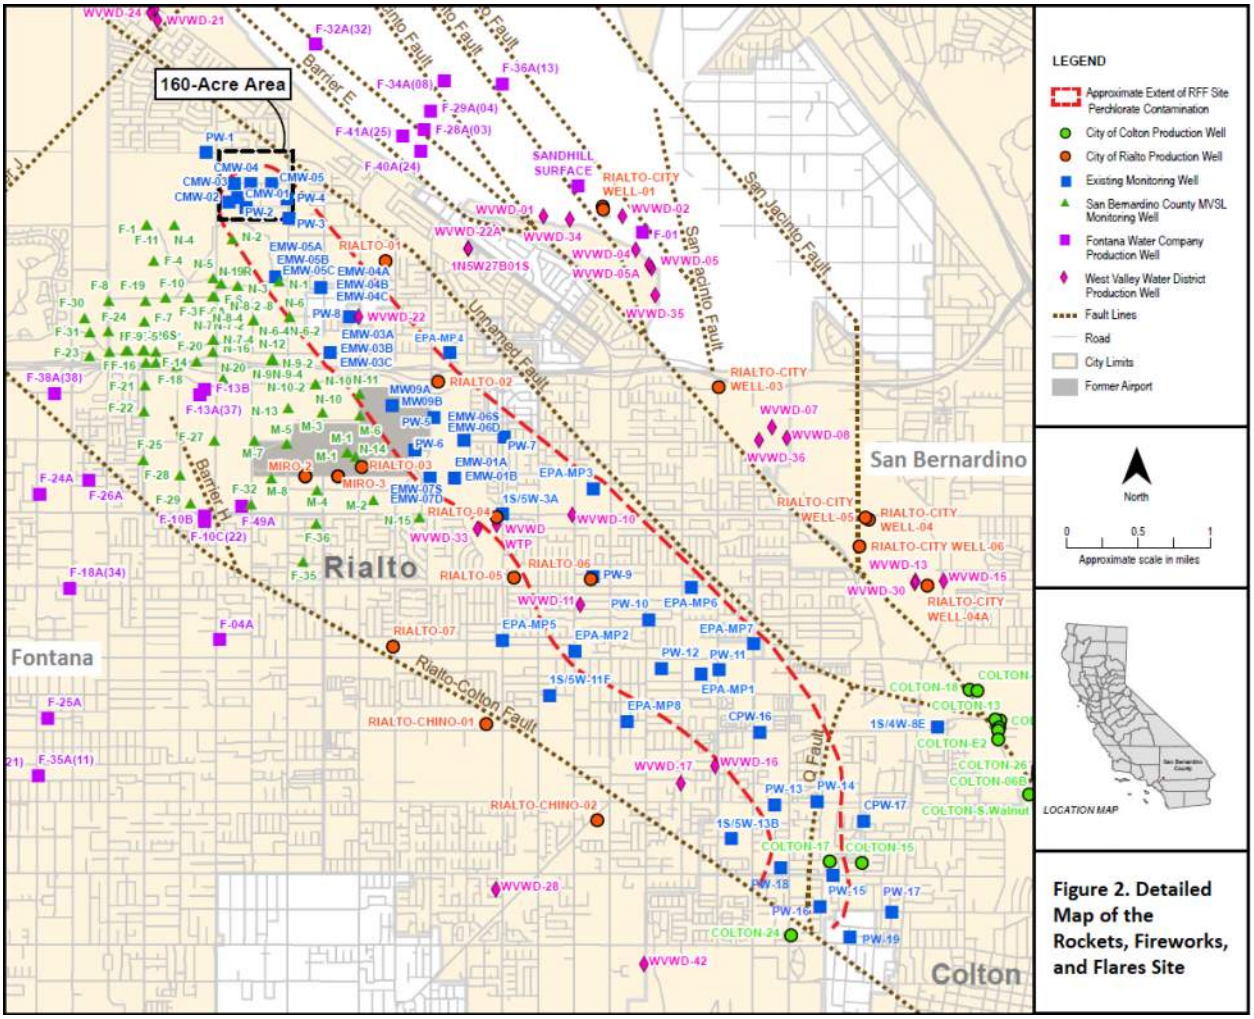
The Rockets, Fireworks and Flares Superfund Site (Site), located east of the city of Los Angeles, includes soil and groundwater contaminated with perchlorate, trichloroethylene (TCE), and other volatile organic compounds in a largely suburban area in San Bernardino County, California. The Source Area Operable Unit of the Site includes groundwater at a 160-acre source area where contaminants entered the groundwater and testing has identified the highest levels of groundwater contamination. The Source Area Operable Unit also includes contaminated groundwater that has spread as far as approximately 2.5 miles downgradient from the 160-acre area (Figure 1).

In 1942, the U.S. Army acquired and developed land that includes the 160-acre area. The property was sold in 1946 and portions of the 160-acre area have been owned or used by a variety of defense contractors, fireworks manufacturers, and others who used perchlorate salts and other chemicals in their manufacturing processes or in their products. Contaminant release mechanisms are believed to have included onsite disposal in one or more unlined pits, leakage or overflow from an onsite impoundment, airborne dispersion of material handled during manufacturing, disposal of contaminated rinse water onto unpaved areas, and one or more explosions. Releases are likely to have begun in the 1950s, and possibly earlier.

Most of the Site is located in the Rialto-Colton Groundwater Basin. Four water utilities are responsible for the majority of the groundwater pumping in the Basin: the City of Rialto, West Valley Water District, the City of Colton, and Fontana Water Company. A 1961 decree entered in San Bernardino County Superior Court restricts pumping of groundwater from the Rialto-Colton Groundwater Basin to parties to the decree.

1.2. Physical Characteristics

The 160-acre source area is square-shaped and bounded by West Casa Grande Drive on the north, Locust Avenue on the east, Alder Avenue on the west, and an extension of Summit Avenue on the south. Various buildings and structures are located throughout the 160-acre area and several roadways run through it, including West Lowell Street and several unimproved roads. Portions of the site are used for commercial or industrial purposes, and other areas are vacant or open space. The County of San Bernardino's Mid-Valley Sanitary Landfill is located immediately southwest of the 160-acre area. Some adjacent properties are developed with industrial facilities or residences.



Modified from Figure produced by Jacobs Engineering in July 2019

Figure 1. Map for the Rockets, Fireworks, and Flares Superfund Site

1.3. Hydrology

The 40-square-mile Rialto-Colton Groundwater Basin is located in western San Bernardino County, California, east of the City and County of Los Angeles. The Rialto-Colton Groundwater Basin is bounded on the northwest by the San Gabriel Mountains and southeast by the Badlands, a series of hills located at the margin of the basin. The basin is approximately 10 miles long, from 1.5 to 3.5 miles wide, and it is bounded by geologic faults on its western, northern, and eastern sides. The San Jacinto Fault forms the northeastern boundary, and the Rialto-Colton Fault forms the southwestern boundary. The Santa Ana River cuts across the southeastern part of the basin, and Warm and Lytle Creeks join the Santa Ana River near the eastern edge of the basin. Except in the southeastern part of the basin, the San Jacinto and Rialto-Colton faults appear to restrict groundwater flow into and out of the basin (USGS, 1997).

The Rialto-Colton Groundwater Basin is filled with unconsolidated alluvial material consisting of sand, gravel, and boulders interbedded with lenticular deposits of silt and clay. Alluvial sediments in much of the basin are about 500 to 1,000 feet deep. The unconsolidated alluvium is underlain by partly consolidated continental deposits formed as lenticular bodies consisting of somewhat compacted gravel, sand, silt, and clay. The basement complex consists of metamorphic and igneous rocks. The unconsolidated alluvial material contains groundwater in multiple water-bearing layers. At the Site's 160-acre area, the depth to groundwater in the first layer, known as the Intermediate Aquifer, is currently about 400 to 450 feet below ground surface. The Intermediate Aquifer is unconfined, about 50 to 100 feet thick, and is underlain by a laterally extensive aquitard. The Intermediate Aquifer is comprised of multiple thin water-bearing units separated by thin aquitards and dry intervals. The deeper water-bearing layer, known as the Regional Aquifer, is generally unconfined to partly confined, and is about 300 to 500 feet thick. Both the Intermediate and Regional Aquifers are comprised of unconsolidated alluvial material consisting of sand, gravel and boulders. Potentiometric heads are as much as 150 feet higher in the Intermediate Aquifer than in the underlying Regional Aquifer, resulting in a strong downward hydraulic gradient between the two aquifers. About one to one and half miles to the southeast of the Site's 160-acre area, the Intermediate Aquifer merges with the Regional Aquifer (Figure 2).

Groundwater flow in the Rialto-Colton Groundwater Basin is strongly influenced by the presence of several geologic faults that restrict groundwater flow. Groundwater in the Intermediate Aquifer generally flows to the southeast, parallel to two major faults, up to several feet per day. Groundwater in the Regional Aquifer generally flows to the southeast at an average rate of about one foot per day. Groundwater elevations and flow rates in the Rialto-Colton Groundwater Basin vary both seasonally and year to year. The primary cause of this variability is year to year change in precipitation and associated recharge. Seasonal and year-to-year variability in groundwater pumping also affects water levels.

Historical water level measurements from water supply wells screened in the Regional Aquifer indicate that water levels varied by more than 100 feet from 1962-2009 due to periodic drought and increased groundwater production.

The groundwater at or near the Site is a vital resource for residents of the cities of Rialto and Colton. Most of the Site lies within the Rialto-Colton Groundwater Basin, which has in recent years supplied drinking water to tens of thousands of area residents. The contamination has forced the closure of many drinking water supply wells in the basin.

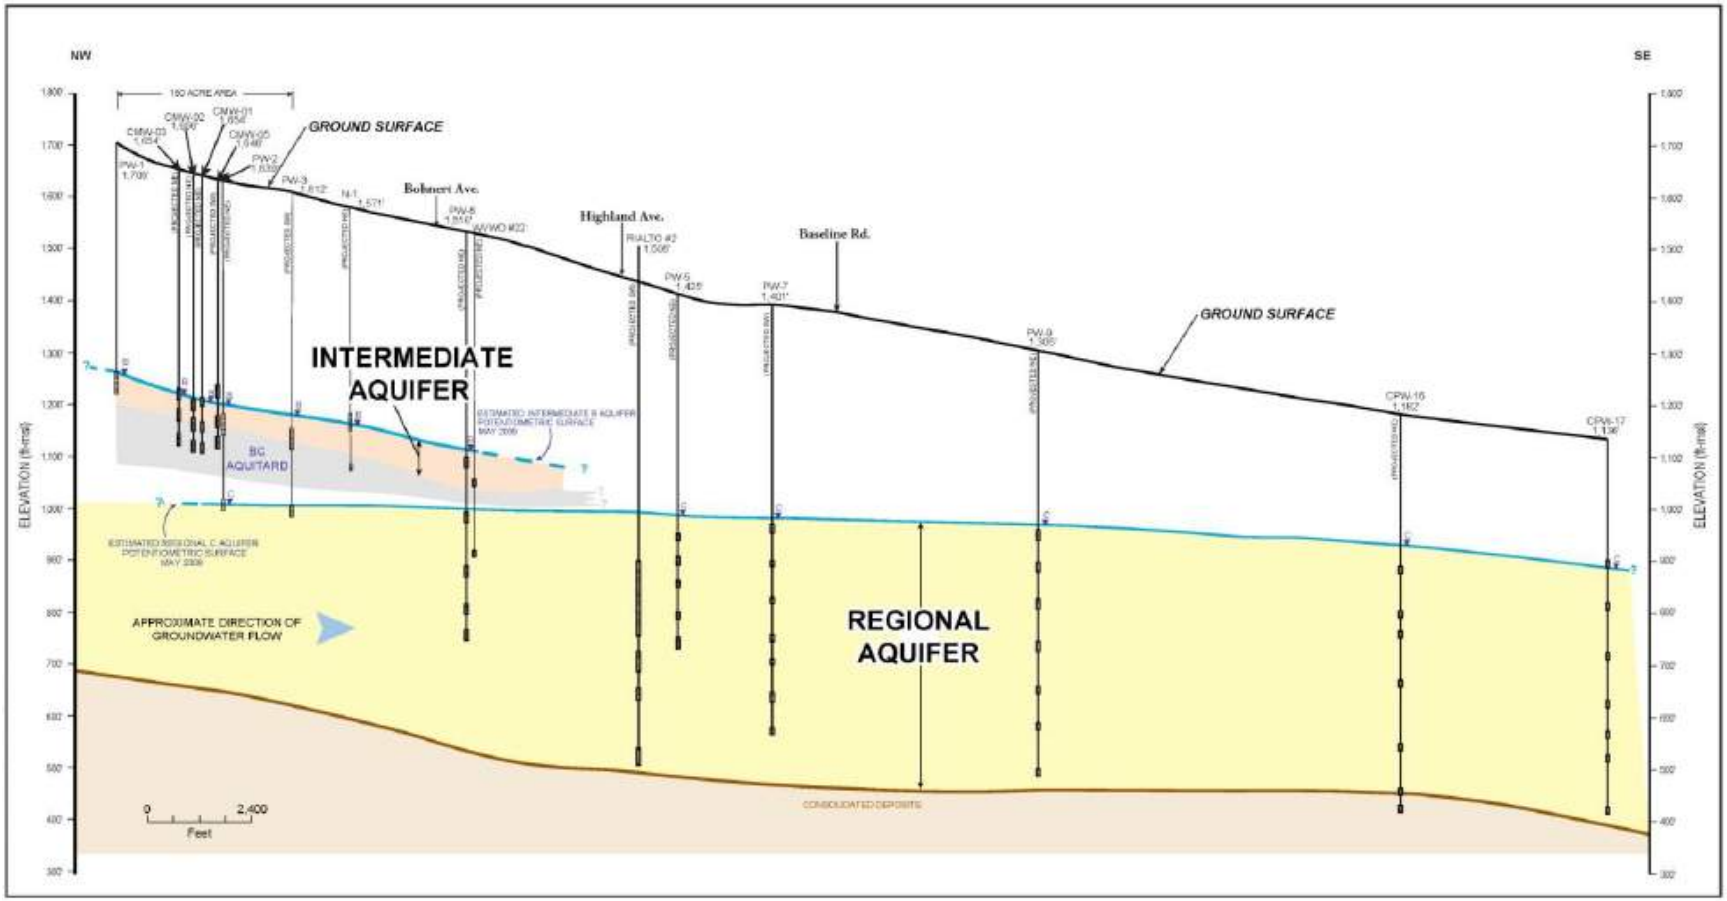


Figure 2. Rialto-Colton Groundwater Basin Aquifers

2. Remedial Actions Summary

2.1. Basis for Taking Action

The contaminants of concern in groundwater at the Site include perchlorate, TCE, carbon tetrachloride, chloroform, and methylene chloride. Perchlorate salts are inorganic chemicals used as oxidizers in rocket propellant, flares, fireworks, and other products. TCE and carbon tetrachloride are cleaning solvents used extensively in the 1950s and 1960s. Employees of businesses that operated in the Site's 160-acre area in the 1950s and 1960s have testified that perchlorate, TCE, and other solvents were handled or used at the Site. Perchlorate and TCE are the most frequently detected contaminants in groundwater at the Site and the primary contaminants of concern . Perchlorate, TCE, and carbon tetrachloride can persist in groundwater for decades.

EPA is taking action because the groundwater at the Site is a current source of drinking water to tens of thousands of residents and businesses, the levels of contamination in groundwater exceed federal or state drinking water standards, and contaminated groundwater continues to spread into uncontaminated and less contaminated portions of the groundwater aquifer.

EPA identified exposure pathways in the 2010 Remedial Investigation and Feasibility Study Report based on the Conceptual Site Model for the Site. Receptors that could potentially be exposed to the contaminated groundwater include current and future residents that receive drinking water from groundwater wells near the Site. Exposure could occur through inhalation (TCE, carbon tetrachloride, chloroform, and methylene chloride only) or ingestion (TCE, carbon tetrachloride, chloroform, methylene chloride and perchlorate) of the contaminants present in the groundwater. Inhalation of contaminants can occur during showering and other activities that enhance the movement of volatile chemicals from water to air. Exposure through dermal contact is not expected to be a significant pathway for these constituents. There is currently no known exposure pathway in which ecological receptors could be exposed to contaminated groundwater.

2.2. Remedy Selection

EPA issued the Interim ROD for the Source Area Operable Unit in September 2010.

The selected remedy is the first of at least two planned remedies to address contaminated groundwater at the Site. This interim action is necessary to stabilize the Site, prevent further environmental degradation, and achieve significant risk reduction while a final remedial solution is being developed.

The Interim ROD identified the following Remedial Action Objectives for the Source Area Operable Unit:

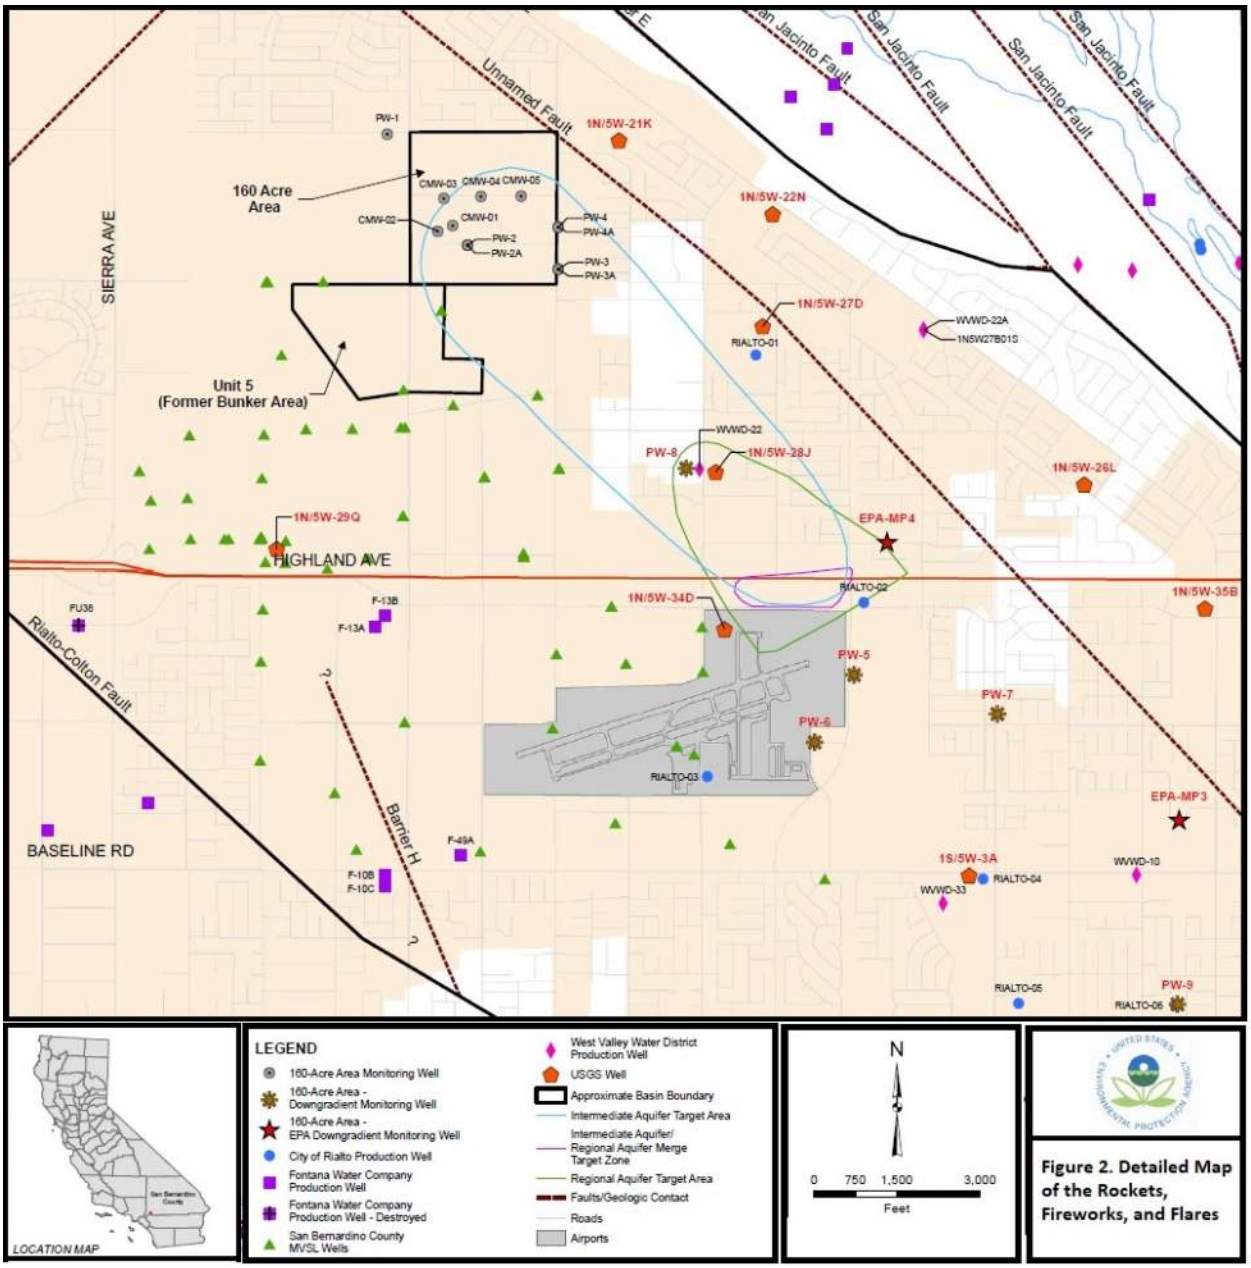
- Protect water supply wells and groundwater resources by limiting the spread of contaminated groundwater from the 160-acre area.
- Remove the contaminants from the groundwater.

EPA's selected remedy for the Source Area Operable Unit is a groundwater pump and treat system and included the following components:

- Groundwater extraction wells located no more than 1,500 feet downgradient of the Intermediate and Regional Aquifer Target Area (defined below).
- Water treatment systems to reduce the concentrations of TCE and other volatile contaminants from the extracted groundwater below levels allowed by federal and state drinking water standards.
- Water treatment systems to reduce the concentrations of perchlorate from the extracted groundwater below the level allowed by the state drinking water standard.
- Pipelines and pumps to convey the contaminated groundwater from the extraction wells to the treatment plant.
- Pipelines and pumps to convey the treated water from the treatment plant to one or more local water utilities for distribution as municipal water supply or to reinjection wells for groundwater recharge.
- A groundwater monitoring program.

The remedy is intended to intercept and provide hydraulic control of contaminated groundwater moving from the 160-acre source area in targeted areas of contamination (defined below). The targeted areas include locations where contaminants entered the groundwater and downgradient areas where high levels of groundwater contamination have been measured. The targeted area of groundwater contamination encompasses portions of the Intermediate and Regional Aquifers as described below:

- The *Intermediate Aquifer Target Area* is the portion of the aquifer within the footprint of and downgradient of the 160-acre area where contaminant concentrations in groundwater exceed chemical-specific ARARs. The upgradient boundary of the Target Area is near groundwater monitoring well CMW-3, the northernmost groundwater monitoring well on the 160-acre area where the concentrations of contaminants consistently exceeded chemical-specific ARARs. The downgradient boundary of the Target Area is where the Intermediate Aquifer is no longer present as a distinct aquifer. The downgradient boundary is in the vicinity of the 210 Freeway, approximately one and one-half miles to the southeast of the 160-acre area (Figure 3).
- The *Regional Aquifer Target Area* is the portion of the Regional Aquifer underlying the Intermediate Aquifer Target Area where the concentrations of the contaminants of concern in groundwater exceed chemical-specific ARARs. The upgradient boundary of the Regional Aquifer Target Area is at or upgradient of well WVWD-22 (Figure 3).



Modified Figure 3-2 from CH2MHILL, 2010. Remedial Investigation/Feasibility Study Report B.F. Goodrich Superfund Site Rialto, California. January 25, 2010.

Figure 3. Footprint of Intermediate and Regional Aquifer Target Areas

Compliance with EPA objectives will be evaluated based on the achievement of hydraulic control in the targeted areas of contamination and the decrease of contaminant concentrations in groundwater over time at downgradient compliance wells. The groundwater at the Site is an important source of drinking water. Limiting the spread of contaminated groundwater should reduce contaminant mass loading to downgradient areas, reducing human health risk by reducing the likelihood and magnitude of exposure.

EPA did not set numeric cleanup goals for the groundwater in the aquifer during implementation of the interim action. EPA will determine cleanup goals for the aquifer in a future action. In 2010, EPA did

select cleanup goals for each contaminant of concern in the extracted and treated groundwater in the Interim ROD (Table 2).

There are no planned or implemented institutional controls identified in the ROD for this Site.

Table 2. Treatment Cleanup Goals for Chemicals of Concern (in Extracted and Treated Groundwater)

COC	Reporting Units	Federal MCL (µg/L)	California MCL (µg/L)	Cleanup Level	Basis for Cleanup Level
Carbon Tetrachloride	µg/L	5	0.5	0.5	California MCL
Chloroform (Trichloromethane)	µg/L	80[1]	80[1]	80[1]	Federal MCL
Methylene Chloride (Dichloromethane)	µg/L	5	5	5	Federal MCL
Perchlorate	µg/L	none	6	6	California MCL
Trichloroethene (TCE)	µg/L	5	5	5	Federal MCL

Notes:
[1]The values listed for chloroform are for the combined concentration of four trihalomethanes: chloroform, dibromochloromethane, bromodichloromethane, and bromoform.

2.3. Remedy Implementation

In March 2014, EPA approved the final design for the treatment plant, which has been designed to work in conjunction with an existing treatment plant at an adjacent state-led cleanup site. The Regional Water Quality Control Board provides regulatory oversight of the adjacent cleanup site, which has similar contaminants and a similar remedy (pump and treat). As part of the remedy for the adjacent state-led site, known as the County Remedy, three extraction wells (Rialto-3, Miro-2, and Miro-3) can deliver up to 2,200 gallons extracted groundwater per minute (gpm) to the County Remedy Treatment Plant. The County Remedy Treatment Plant is located at North Linden Ave and Miro Way, adjacent to the Rialto-3 well.

The County Remedy Treatment Plant was expanded to include capacity for treatment of Site groundwater and will henceforth be referred to as the Combined Treatment Plant. The addition of one extraction well (EW-1) has increased pumping capacity to the Combined Treatment Plant by 2,040 gpm to approximately 4,200 gpm. EW-1, along with one or more of the County Remedy extraction wells, are expected to provide hydraulic control of the Target Area of the Site. Three additional fixed ion exchange resin vessels for perchlorate removal and four additional fixed bed liquid-phase granular activated carbon adsorber vessels for volatile organic contaminants removal have been constructed to treat the extracted groundwater at the Combined Treatment Plant. The ion exchange vessels will operate on a lead/mid/lag configuration. Resin change out criteria will assure effective operation without perchlorate breakthrough from the lag vessel and maximize the run time of the system.

A pilot test was conducted until late 2019. The California State Water Resources Control Board's Division of Drinking Water required demonstration of the effectiveness of the ion exchange resin and

lead/mid/lag series design in the Combined Treatment Plant prior to the amendment of the city of Rialto's domestic water supply permit, which is necessary for operation of the remedy.

A first pilot test was initiated by Emhart Industries, Inc. at the Site in early January 2017, delivering Site groundwater extracted from EW-1 at about 1 gpm to a separate, trailer-sized pilot test setup consisting of several columns filled with perchlorate-specific ion exchange resins. The initial pilot test did not perform as expected, with a brownish discoloration visible in the three ion exchange resins and perchlorate "breakthrough" occurring earlier than modeling predictions. Therefore, the initial pilot test was ended in March 2017 and the State Water Resources Control Board Division of Drinking Water advised that it could not permit the operation of the Combined Treatment Plant based on the initial pilot test alone.

An expert committee was assembled to conduct a forensic analysis of the initial pilot test to determine the cause of the observed anomalies and to recommend changes in the design of the pilot test to more closely approximate conditions during full-scale operation. The expert committee determined that the configuration of the initial pilot test, specifically exposing extracted water to atmospheric conditions in holding tanks for extended periods, led to an increase in pH and temperature of the water prior to entering the pilot test equipment. This resulted in significant calcite scaling within the ion exchange resin columns, inhibiting mass transfer, reducing the effective treatment capacity of the resin, and shortening the throughput capacity and breakthrough time.

The expert committee recommended several changes in pilot test configuration to eliminate the conditions that led to calcite scaling during the initial pilot test with the expectation that this would resolve the resin performance issues. The second pilot test was configured to more closely mimic full-scale operating conditions. Design changes made for the second pilot test include:

- Limiting residence time between extraction and treatment of the groundwater by locating the pilot test equipment at EW-1 and continuously pumping water from EW-1 through the pilot system (without storage in holding tanks).
- Constructing ion exchange columns with bed depths equivalent to the full-scale system.
- Operating the pilot system at the same flow rate per cubic foot resin as the full-scale system.

A second pilot test began in January 2018. Perchlorate breakthrough during the second pilot test followed model predictions, establishing that the resins tested in a lead/mid/lag ion exchange vessel configuration would adequately treat extracted site groundwater and provide enough time to implement resin change-outs without impacting performance. The second pilot test was concluded in December 2019. Following regulatory and local agency approval, continuous operation of the remedy is expected to begin in late 2020, with treated groundwater from the Combined Treatment Plant chlorinated and pumped to the city of Rialto municipal water system.

2.4. Operation and Maintenance

Continuous operation of the remedy is not expected to begin until late 2020. Therefore, no operation and maintenance has occurred during this review period.

3. Progress during this Five-Year Review Period

3.1. Work Completed at the Site During this Five-Year Review Period

Construction of the remedy, including expansion of the County Remedy Treatment Plant, was completed during this five-year review period, as detailed in Section 2.3. Components of the treatment plant expansion were documented during the Site Inspection (Appendix G).

Pilot testing of the ion exchange process to be employed in the expanded treatment system was also completed as described in Section 2.3.

3.2. Community Notification, Involvement and Site Interviews

A public notice was made available by newspaper posting in the *Rialto Record* on March 19, 2020 stating that there was a five-year review and inviting the public to submit any comments to the U.S. EPA. The results of the review and the report will be made available on the EPA site webpage at: http://epa.gov/superfund/rff.

During the Five-Year Review process, interviews were conducted to document any perceived problems or successes with the remedy. All comments and interviews pertaining to this Five-Year Review were completed with the understanding that at the time of this writing the remedy has not begun operation. A consultant for the County of San Bernardino participated in the Site Interviews. The consultant expressed concern over a potential lack of plume capture by the remedy as constructed and cited the need for an additional extraction well.

In addition, the County of Bernardino, Department of Public Works sent a letter to the USACE to elaborate their concerns with the potential effectiveness of the Source Area Operable Unit remedy and the impact of the Source Area Operable Unit remedy on the County remedy. The letter makes several recommendations: 1) reevaluate the boundaries of the area targeted for remediation in the ROD; 2) describe plans to monitor compliance with the ROD after the remedy begins operation; 3) and reevaluate the groundwater extraction plan for the Source Area Operable Unit remedy. The letter from the County is included in Appendix F.

3.3. Data Review

At the time of this report, the selected remedy from the 2010 Interim ROD has largely been constructed but is not yet operational. In the absence of remedy performance data, an evaluation of annual groundwater sampling data has been conducted to assess Site contaminants concentrations at and in the vicinity of the Source Area Operable Unit.

The contaminant data review is limited to carbon tetrachloride, perchlorate and TCE, because according to the Interim ROD, they are the only contaminants of concern for the Source Area Operable Unit that currently or historically exceeded the cleanup standards.

3.3.1. Groundwater Elevations

Groundwater levels in this region are influenced by annual precipitation and municipal pumping. In selected wells, contaminant concentrations have shown a correlation with groundwater levels. Figure 4 shows the relationship between perchlorate concentrations in groundwater, TCE concentrations in groundwater, and water levels in a groundwater monitoring well screened in the Intermediate Aquifer in the source area. Groundwater levels have generally been decreasing in both the Intermediate and Regional Aquifers in recent years (AECOM, 2019). The state of California has experienced extended drought conditions during the period of review for the Five-Year Review and for much of the past decade. Despite decreasing groundwater levels, the overall gradients of the Intermediate and Regional Aquifers have generally continued to trend to the southeast.

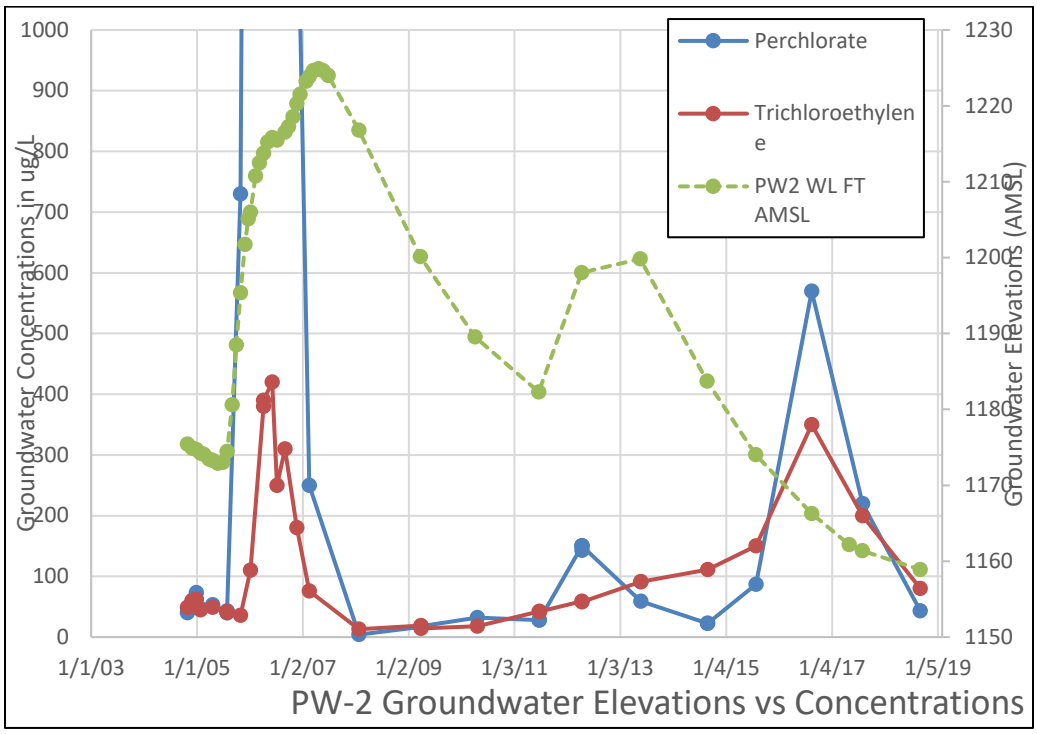


Figure 4. Well PW-2 Groundwater Elevation vs Concentration Graph

3.3.2. Groundwater Concentrations

To evaluate whether concentrations in groundwater have changed over time, U.S. Army Corps of Engineers applied a statistical test (Mann-Kendall) to data from 20 wells for the period 2008 to 2019. (Earlier data are also available for a limited number of wells.) Three contaminants of concern were evaluated: carbon tetrachloride, perchlorate and TCE. Data were taken from the annual groundwater reports prepared by Emhart Industries (AECOM, 2019) for wells and contaminants that met the minimum statistical requirements. Recently installed extraction well EW-1 had insufficient data to complete a Mann-Kendall analysis.

The trend analyses are intended to provide a baseline for future groundwater evaluations.

3.3.2.1 Intermediate Aquifer

Five groundwater monitoring wells screened in the Intermediate Aquifer were evaluated. Perchlorate concentrations showed decreasing or probably decreasing trends in three of the five wells. One well, PW-2, showed an increasing trend from about 2008 to 2016. No trend was observed in the fifth well. A clear pattern was not apparent in TCE concentrations. TCE concentrations in wells PW2 and EMW-05A increased or probably increased but the other three wells showed stable or decreasing trends.

3.3.2.2 Regional Aquifer

Fifteen groundwater monitoring wells screened in the Regional Aquifer were evaluated. The perchlorate concentrations showed stable or decreasing trends in the majority of the wells. Three wells, PW-6B, 6C, and 6D, showed increasing or probably increasing trends. In contrast, a majority of the wells screened in the Regional Aquifer showed stable or increasing trends in TCE concentrations from 2008 to 2019. Two of the 15 wells showed decreasing TCE concentrations over the same period.

Carbon tetrachloride was not detected in any of the 20 wells, with the exception of EMW-04A which showed a probable decreasing trend.

Table 3. Summary of Mann-Kendall Analysis for Perchlorate

Well	Samples (n)[1]	Number of detects	Mann-Kendall Statistic (S)[2]	Confidence in Trend [3]	Coeffiecient of Variation (COV)[4]	Concentration Trend	Maximum concentration (µg/L)	Comments

Notes:

[1] Number of samples used during the Mann-Kendall Statistic analysis.

[2] The Mann-Kendall Statistic (s) measures the trend of the data. Positive values indicate an increase of concentrations over time, whereas negative values indicate a decrease in concentrations over time.

[3] The Confidence in Trend is the statistical confidence that the constituent concentration is increasing (S-0).

[4] The coefficient of variation (COV) is a statistical measure of how the individual data points vary about the mean value. The coefficient of variation, defined as the standard deviation divided by the average. Valuies near 1 indicate that the data form a relatively close group about the mean value. Values other larger or smaller than 1.0 indicate that the data show a greater degree of scatter about the mean.

Table 4. Summary of Mann-Kendall Analysis for TCE

Notes:

[1] Number of samples used during the Mann-Kendall Statistic analysis.

[2] The Mann-Kendall Statistic (s) measures the trend of the data. Positive values indicate an increase of concentrations over time, whereas negative values indicate a decrease in concentrations over time.

[3] The Confidence in Trend is the statistical confidence that the constituent concentration is increasing (S-0).

[4] The coefficient of variation (COV) is a statistical measure of how the individual data points vary about the mean value. The coefficient of variation, defined as the standard deviation divided by the average. Valuies near 1 indicate that the data form a relatively close group about the mean value. Values other larger or smaller than 1.0 indicate that the data show a greater degree of scatter about the mean.

3.4. Site Inspection and Interviews

The site inspection was conducted by Benino McKenna from the U.S. Army Corps of Engineers Seattle District on January 14, 2020. In attendance were Wayne Praskins, EPA Remedial Project Manager; David Towell, Senior Project Manager Jacobs, Eng.; Kamran Javandel, representing Emhart Industries Inc.; Tom Crowley, Utilities Manager for the City of Rialto; David Terry, Project Manager with Veolia; Andrew Coleman, Field Supervisor with Veolia; Jerry Zimmerle, Project Manager AECOM; Tom Munoz, Construction Manager AECOM; and Diana Chacon, Geologist with Geo-Logic Consultants. The purpose of the inspection was to assess the protectiveness of the remedy.

The participants met at the Combined Treatment Plant located on North Linden Ave in the City of Rialto, then toured the groundwater treatment plant and the EW-1 well location. A summary of the site inspection, trip report, and site photos are included in Appendix G.

The portion of the Combined Treatment Plant constructed as part of County Remedy appeared to be in good condition and functioning as intended. The new equipment installed as part of Source Area Operable Unit also appeared to be in good condition but was not in service at the time of the site visit. The groundwater extraction components of the Source Area Operable Unit observed during the site inspection

that will supply the Combined Treatment Plant also appeared to be in good condition. A more complete evaluation of the remedy will be possible when the system begins operation.

4. Technical Assessment

4.1. Question A: Is the remedy functioning as intended by the decision documents?

The remedy is not yet operating, but it is in the final stages of construction and permitting. Perchlorate breakthrough during the second pilot test followed model predictions, establishing that the ion exchange resin and the vessel configuration would adequately treat extracted site groundwater. Upon permitting by the State, remedy operation is expected to commence in 2020. Based on review of project-related documents and data, as well as the site inspection, the remedy is expected to function as intended by the ROD. It is expected that the remedy will achieve the remedial action objectives of protecting water supply wells and groundwater resources by limiting the spread of contaminated groundwater from the 160-acre area and removing contaminants from groundwater.

4.2. Question B: Are the exposure assumptions, Toxicity Data, Cleanup Levels, and Remedial Action Objectives Used at the Time of Remedy Selection Still Valid?

Yes, the exposure assumptions, cleanup levels, and remedial action objectives used at the time of the remedy selection are still valid. Groundwater pumping is restricted to water utilities, which test and treat extracted groundwater as necessary. No new human health or ecological routes of exposure or receptors have been identified. In addition, no new contaminants or contamination sources have been identified. ARARs were evaluated and there were some changes to ARARs since finalization of the 2010 Interim ROD (Appendix D). However, none of these changes are substantial and therefore do not affect the protectiveness of the remedy.

4.3. Question C: Has Any Other Information Come to Light That Could Call Into Question the Protectiveness of the Remedy?

No additional information has come to light which would affect the protectiveness of the remedy.

5. Issues/Recommendations

No issues were identified in this five-year review.

5.1. Other Findings

The following are recommendations that do not affect current and/or future protectiveness and were identified during the Five-Year Review:

- EPA sampled wells Rialto-03, Rialto-06, and EW-1 in November 2017 and March 2018 for per- and polyfluoroalkyl substances (PFAS). Laboratory results show that one type of PFAS (perflourobutylsulfonate) was detected in one untreated groundwater sample from Rialto-06 at a concentration of 77.6 ng/L, which is below EPA's screening level of 400 ng/L. PFAS was not found in any other site samples at or above the reporting limits. It is recommended that this information be formalized in site documentation.

6. Protectiveness Statement

Table 5. Protectiveness Statement

Protectiveness Statement(s)	
Operable Unit:1	*Protectiveness Determination:* Will be Protective
Protectiveness Statement: The remedy at the Rockets, Fireworks and Flares Superfund Site is expected to be protective of human health and the environment upon completion. In the interim, the remedial activities completed to date have adequately addressed all exposure pathways that could result in unacceptable risks in these areas.	

7. Next Review

The next five-year review report for the Rockets, Fireworks, and Flares Superfund Site is required five years from the completion date of this review.

2019 Remedial Design Investigation Report to provide current water level measurements and contaminant concentration data for wells in the Source Area Operable Unit vicinity.	October 2019

Appendix C: Data Review

Mann-Kendall Analysis for Groundwater

The Mann-Kendall test is a non-parametric test for identifying trends in time-series data. The test compares the relative magnitudes of sample data rather than the data values themselves. One benefit of this test is that the data does not need to conform to any one distribution type. Data reported as non-detects can be included by assigning them a common value that is smaller than the lowest detected value in the dataset, although the number of non-detects should not be greater than 50 percent of the sample size (*n*). For the purposes of this evaluation Non-Detectable values are highlighted in red.

Data are evaluated as an ordered time series. Each data value is compared to all subsequent data values. If a data value from a later time is higher than a data value from an earlier time, *S* is incremented by 1. Conversely, if a data value from a later time is lower than a data value from an earlier time, *S* is decremented by 1. The net result of all such increments and decrements yields the final value of *S*. A positive value of *S* is an indicator of a potentially increasing trend. Likewise, a negative value of *S* is an indicator of a potentially decreasing trend. A very high positive *S* is an indicator of a likely significant increasing trend; however, it is necessary to compute the probability associated with *S* and the sample size, *n*, to statistically quantify the significance of the trend.

Kendall describes a normal-approximation test that may be used for datasets with more than 10 values, provided there are not many tied values within the dataset. First, *S* is determined and then the variance (VAR) of *S* is calculated based on the following equation:

$$VAR(S) = [n*(n-1)*(2n+5)]/18$$

A normalized Test Statistic (*Z*) is calculated using the following equations:

$$Z = (S-1)/\sqrt{[VAR(S)]} \quad \text{if } S>0$$

$$Z=0 \quad \text{if } S=0$$

$$Z= (S+1)/\sqrt{[VAR(S)]} \quad \text{if } S<0$$

For a trend to attain at least a 95 percent level of significance, the Test Statistic *Z* must be greater than 1.645 for a positive trend or must be less than -1.645 for a negative trend. If neither of these conditions are met, then the dataset shows no trend at that level of significance.

Appendix D: Applicable or Relevant and Appropriate Requirements Assessment

Section 121(d)(1)(A) of CERCLA requires that remedial actions at CERCLA sites attain (or justify the waiver of) any federal or state environmental standards, requirements, criteria, or limitations that are determined to be legally applicable or relevant and appropriate requirements (ARARs). Federal ARARs may include requirements promulgated under any federal environmental laws. State ARARs may only include promulgated, enforceable environmental or facility-siting laws of general application that are more stringent or broader in scope than federal requirements and that are identified by the state in a timely manner. ARARs are identified on a site-specific basis from information about the chemicals at the site, the remedial actions contemplated, the physical characteristics of the site, and other appropriate factors. ARARs include only substantive, not administrative, requirements and pertain only to onsite activities. There are three general categories of ARARs: chemical-specific, location-specific, and action-specific.

Because this remedy is an interim action that does not include restoration of the aquifer as an objective, EPA is not, at this time, establishing chemical-specific ARARs as *in situ* cleanup goals for contaminated groundwater at the Site. In situ cleanup goals will be addressed in a subsequent decision document. While chemical specific ARARs are not cleanup goals for groundwater, they are applicable to the extracted and treated water which will be utilized as drinking water. Chemical-specific ARARs identified in the ROD for the extracted and treated groundwater are shown in Table A.1.

Table A.1. Summary of Extracted and Treated Groundwater ARAR Changes

Contaminants of Concern	2010 ROD cleanup goals (µg/L)	State MCL (µg/L)	Federal MCL (µg/L)	Is the cleanup goal above the current MCL?
Carbon tetrachloride	0.5 (State)	0.5	5	No
Chloroform (Trichloromethane)	80[1] (Federal)	80[1]	80[1]	No
Methylene Chloride (Dichloromethane)	5 (Federal)	5	5	No
Perchlorate	6 (State)	6	none	No
Trichloroethene (TCE)	5 (Federal)	5	5	No

Notes: [1]There is no MCL for chloroform. The values listed for chloroform are for the combined concentration of four trihalomethanes: chloroform, dibromochloromethane, bromodichloromethane, and bromoform.

No Site contaminants of concern have cleanup levels above their respective current maximum contaminant level (MCL) and there have been no changes to State or Federal MCLs since the 2010 Interim ROD. The California Office of Environmental Health Hazard Assessment (OEHHA) published an updated public health goal (PHG) of 1 part per billion (ppb) for perchlorate in drinking water in February 2015. This updates the previous California PHG of 6 ppb perchlorate, which was set in 2004. The updated PHG is lower because it incorporates new research about the effects of perchlorate on infants.

Federal and State laws and regulations other than the chemical-specific ARARs that have been promulgated or changed over the past five years are described in A-2. There have been no revisions to laws or regulations that are pertinent to the Site which affect the protectiveness of the remedy. The table does not include those ARARs identified in the ROD that are no longer pertinent, now that the remedial design is complete. The table also does not include those ARARs identified in the ROD that have not changed since finalization of the 2010 ROD; and therefore, do not affect protectiveness.

Non-pertinent ARARs are listed below:

- National Historic Preservation Act
- Historic Site Act
- Archaeological and Historic Preservation Act
- Archaeological Resources Protection Act
- Endangered Species Act
- California Endangered Species Act
- Native Plants Protection Act
- Migratory Bird Treaty Act
- California Fish and Game Code
- Native American Graves Protection and Repatriation Act
- Executive Order Protection and Enhancement of the Cultural Environment
- Executive Order on Floodplain Management
- Executive Order Protection of Wetlands
- Executive Order Indian Sacred Sites

ARARs that have not changed since the finalization of the 2010 Interim ROD:

- Clean Air Act, South Coast Air Quality Management District (SCAQMD) Regulation XIII, Rules 1301-1304, 1305-1313, 1401 and 401-403
- RCRA Subtitle C Hazardous Waste Identification and Generator Requirements; California Hazardous Waste Regulations, Generator Requirements 22 CCR, Division 4.5, Chapter 11, Articles 2-5 and Article 1 sections 66261.1-66261.3 and sections 66261.6-66261.9.5.
- Federal SDWA Underground Injection Control (UIC) Regulations, 42 U.S.C. §300f et seq.
  - 40 CFR 144.12-144.13
- Resource Conservation and Recovery Act §3020
  - 42 U.S.C. §6939b

- California Porter- Cologne Water Quality Act, California Water Code 13240
  - Water Quality Control Plan (Basin Plan) for the Santa Ana River Basin, Chapters 2(Plans and Policies), 3(Beneficial Uses), and 4 (Water Quality Objectives)
- Federal Water Pollution Control Act 33 USC 1311, 1314(b)
- Federal Water Pollution Control Act 33 USC 1342,1344
  - 33 CFR 323.1 et seq.
- California Toxics Rule
  - 40 CFR 131.36(d)(10)(ii)
- California Land Disposal Restrictions, Requirements for Generators
  - 22 CCR 66268.1 et seq. Also 22 CCR 66268.3, 22 CCR 66268.7, 22 CCR 66268.9, 66268.40 and 22 CCR 66268.50
- California Hazardous Waste Regulations, Generator Requirements
  - 22 CCR 66262.34(a)(1)(A)
- California Hazardous Waste Regulations, Storage of Hazardous Waste
- 22 CCR 66265.170 et seq. (Article 9) 22 CCR 66265.190 et seq. (Article 10)

Table A-2. Applicable or Relevant and Appropriate Requirements Evaluation

Original ARAR	**Document and Citation**	Original ARAR requirement	Revised requirement	**Revision Date (between Sept. 2010-present)**	**Effect on Protectiveness**
Clean Air Act, South Coast Air Quality Management District (SCAQMD)	2010 Interim ROD SCAQMD Regulation XIII, comprising Rules 1301 through 1313 SCAQMD Rule 1401 SCAQMD Rule 1401.1	Rules 1301 through 1313 establish new source review requirements. Rule 1303 requires that all new sources of air pollution in the district use best available control technology (BACT) and meet appropriate offset requirements. Emissions offsets are required for all new sources that emit in excess of 1 pound per day of volatile organic compounds. SCAQMD Rule 1401.1 applies to discharges that are within 500 feet of a school and requires that the discharges from a facility do not create a cancer risk in excess of 1 in 1 million (1 × 10-6) at the school.	Rule 1304.1 requires paying fees for up to the full amount of offsets provided by SCAQMD. Rule 1401.1 requires additional direction for staff to provide a report to the stationary source committee regarding the use of historical data in health risk assessments in certain circumstances and receiving and filing the SCAQMD risk assessment procedures for preparing risk assessments for the air toxics 'hot spots' information and assessment act	Rule 1304.1 adopted September 6, 2013 Rule 1401.1 revision date June 5, 2015	None. Also, the revised requirement is not substantive to the remedy.

Original ARAR	**Document and Citation**	Original ARAR requirement	Revised requirement	**Revision Date (between Sept. 2010-present)**	**Effect on Protectiveness**
RCRA Subtitle C Hazardous Waste Identification and Generator Requirements; California Hazardous Waste Regulations, Generator Requirements	2010 Interim ROD 22 CCR, Division 4.5, Chapter 11 Identification and Listing of Hazardous Waste	A solid waste is a RCRA hazardous waste if it exhibits any of the characteristics of ignitability, corrosivity, reactivity, or toxicity identified in 22 CCR 66261.21, 66261.22(a)(1), 66261.22(a)(2), 66261.23, 66261.24(a)(1), 22 CCR 66262.11, and 22 CCR 66260.200, or if it is listed as a hazardous waste in Article 4 of Chapter 11. Under the California RCRA program, wastes can be classified as non-RCRA, state-only hazardous wastes if they exceed the soluble threshold limit concentration (STLC) or the total threshold limit concentration (TTLC) values listed in 22 CCR 66261.24(a)(2).	Chapter 11, Article 1, § 66261.4. Exclusions amends subsection (h) stating the CRT panel glass that meets the criteria in section 66273.81 of chapter 23 of this division and destined for disposal is not a hazardous waste for purposes of disposal and is exempt from the generator and hazardous waste disposal fees. Subsection (i) states the CRT panel glass that is managed in accordance with section 25143.2.5 of the Health and Safety Code is not subject to regulation by DTSC pursuant to Health and Safety code and 40 CFR Section 261.4.	Revision date October 22, 2018	None

EPA SEEKS PUBLIC INPUT ON CLEANUP WORK AT ROCKETS, FIREWORKS AND FLARES SUPERFUND SITE

The U.S. Environmental Protection Agency (EPA) is reviewing its work to clean up the Rockets, Fireworks and Flares Superfund site in and near Rialto, California. This review—called a "Five-Year Review" —will see if the cleanup plan for the site is still working as it was designed and that it still protects human health and the environment. According to the Superfund law, EPA is required to review its cleanup plan, or "remedy," every five years if either the cleanup takes more than five years to complete, or, if hazardous waste remains on site.

The Rockets, Fireworks, and Flares site includes a 160-acre industrial area in Rialto, California where the U.S. Army, defense contractors, fireworks manufacturers, and other businesses have operated since the 1940s. These companies handled perchlorate salts and/or other hazardous chemicals and disposed of chemical wastes on site, contaminating the soil and groundwater.

This is the first Five-Year Review for the site.

What Is Included in a Five-Year Review?
Five-Year Reviews include:
- an inspection of the site and cleanup technologies;
- *if available, review of monitoring data, operating data, and maintenance records;* and
- a determination if any new relevant regulatory requirements have been established since EPA's original cleanup decision was finalized.

EPA Wants to Hear from You!
EPA invites the community to learn more about the site and welcomes your input about how the site cleanup is going in an interview. If you would like to be interviewed, please contact Wayne Praskins, Remedial Project Manager for the site, at (415) 972-3181 or at praskins.wayne@epa.gov before April 30, 2020.

For more site information, visit EPA's web page at: www.epa.gov/superfund/rf

RE: County of San Bernardino's Response U.S. Army Corps of Engineers Review Questionnaire Rockets, Fireworks & Flares Superfund Site Rialto, California

Thank you for allowing the County of San Bernardino (County) to respond to the U.S. Army Corps of Engineers' interview questionnaire regarding the remedy planned by Emhart Industries Inc. (Emhart) for Source Area Operable Unit 1 (SAOU-1) for the Rockets, Fireworks and Flares Superfund Site in Rialto, California (the Remedy). The Remedy is designed to remediate contamination in the northern portion of what is known as the Eastern Perchlorate Plume in the Rialto Colton Basin. Emhart is implementing the Remedy pursuant to a 2012 Consent Decree. The County appreciates this opportunity to provide input to help ensure that the Remedy is effective and does not adversely impact the County's remedy for another, nearby plume, the Western Perchlorate Plume.

Background

Since 2005, the County has been operating a separate remedy to address the Western Perchlorate Plume under the oversight of the California Regional Water Quality Control Board. Initially, the County's system extracted water only from City of Rialto Well No. 3 (CR-3). As anticipated, data indicates that the Western Perchlorate Plume has been shifting west for a number of years, and for the last several years, the County has been gradually shifting the focus of its containment program to the west.

In 2013, Emhart completed modeling for its Remedial Design for the Eastern Perchlorate Plume. Emhart's modeling relies on two wells, EW-1 (constructed by Emhart) and CR-3 (constructed by Rialto) to capture the Eastern Perchlorate Plume target area. Emhart's Remedial Design indicates that Emhart will construct a second well (EW-2) if pumping from EW-1 and CR-3 cannot adequately contain the Eastern Perchlorate Plume as part of SAOU-1.

BOARD OF SUPERVISORS
Robert A. Lovingood, First District | Janice Rutherford, Second District | Dawn Rowe, Third District | Curt Hagman, Chairman, Fourth District | Josie Gonzales, Vice Chair, Fifth District
Gary McBride, Chief Executive Officer

The County entered into an agreement with Emhart in 2015 that allows Emhart to expand the County's existing perchlorate and VOC treatment plant at CR-3, which the County has used to address the Western Perchlorate Plume, to support the Remedy for the Eastern Perchlorate Plume. The agreement between the County and Emhart also allows Emhart to utilize CR-3 to help contain the perchlorate and VOC plume associated with the SAOU-1 even if the County shifts its remedy extraction to other wells. The County and Emhart also entered into an agreement in 2015 with the City of Colton and the City of Rialto in connection with the combined treatment system for these response actions.

Issues of Concern

The County has the following comments regarding the ongoing implementation of the SAOU-1. The County raises these issues to facilitate the implementation of the Remedy, now that it is about to become operational.

(1) **Definition of Source Area.** The Record of Decision (ROD) for the SAOU-1 provides for the refinement of the target area for the remedy during remedial design. *See* USEPA, Interim Action Record of Decision (Sept. 30, 2010) at Section 2.4.8, p. 2-15. ("It is expected that additional monitoring wells will be installed during the remedial design phase of the remedy to refine the upgradient and downgradient boundaries of the targeted area."). Emhart's 2013 Modeling Report, too, concludes that installation of additional monitoring wells is necessary to address the uncertainty regarding the northern boundary of the Target Area. *See* ERM Final Groundwater Flow Modeling Report (July 26, 2013), section 6.0, p. 36.

In June 2014 comments on the Remedial Design, USEPA requested that Emhart re-evaluate the boundaries of the Target Area "after installation and sampling of the new groundwater monitoring wells in early 2014." USEPA Response to Comments on Remedial Design, Comment #4. In response, Emhart stated that it would "re-evaluate the boundaries of the Target Area as appropriate based on monitoring data and remedy performance." Though USEPA approved Emhart's Remedial Design, it did not agree with Emhart's plan to re-evaluate the Target Area "as appropriate," and stated that Emhart needed a firm timetable for the re-evaluation. USEPA stated: "[a] re-evaluation is appropriate after sampling data are available in 2014 from the installation of the new groundwater monitoring wells. Data should be available well before the remedy becomes operational." USEPA, Approval of Preliminary Design Report (Nov. 18. 2013), Comment #2. As far as the County is aware, a re-evaluation of the boundaries of the Target Area has not yet been completed, as required by USEPA. An analysis of the Target Area will be important for evaluating the adequacy of the response action to achieve its objectives and how that response action can be optimized over time.

(2) **Measuring Containment.** It is anticipated that the Remedy will begin operating this year. It could be helpful to identify the analytical measures and well locations where containment of the Eastern Perchlorate Plume will be measured. Similarly, it could be useful to identify the metrics for determining adequate containment efficiency and a time-frame for its determination.

(3) **Pumping Rate of CR-3.** Emhart's Remedial Design considers past and potential pumping rates at CR-3, and relies on CR-3 in part for capturing the Eastern Plume. Emhart's 2013 Modeling Report relies upon CR-3 pumping at a rate of 1300 gpm if only CR-3 and EW-1 are used. *See*

BOARD OF SUPERVISORS
ROBERT A. LOVINGOOD First District | JANICE RUTHERFORD Second District | DAWN ROWE Third District | CURT HAGMAN Chairman, Fourth District | JOSIE GONZALES Vice Chair, Fifth District
Gary McBride Chief Executive Officer

ERM Final Groundwater Flow Modeling Report (July 26, 2013), section 6.0, p. 36. *See also* Preliminary Design Report (2013), section 4.2.1. As the Emhart remedy is implemented, and as the County moves the focus of its remedial pumping away from CR-3 to optimize containment of the Western Plume under oversight of the Regional Board, it may be necessary for EPA to re-evaluate the optimal strategy for the Eastern Plume containment program.

(4) **Impact of Current Groundwater Elevations**. Given current groundwater elevations (which for this water year reflect a 39% reduction in key water rights due to lower water levels in the index wells) and other data, it may be prudent to re-evaluate ways to optimize the containment program for the Remedy, including whether an additional extraction well (such as EW-2) should be installed. Emhart originally proposed that the need for a second remedy well (EW-2) will be determined *after* evaluating the performance of the planned remedy well. USEPA has indicated that EW-2 will be necessary if any of the following three conditions occur: data indicating insufficient capture of the plume, monitoring well results indicating a more westerly groundwater flow, and data indicating that the Target Area is larger than assumed in the Final Design. *See* USEPA Comments on the Preliminary Design Report (Nov. 1, 2013), Comment #8. Further, in approving the remedial design, USEPA stated that the need for a second remedy well may become apparent even before Emhart's remedy well (EW-1) begins operation. *See* USEPA, Approval of Preliminary Design Report (Nov. 18. 2013), Comment #4 (stating "As we have commented before, new data may warrant installation of a second new extraction well before the remedy begins operation."). The County believes that these conditions have been met, and that EPA should further evaluate optimization of the remedy, including the potential need for an additional extraction well.

Thank you again for the opportunity to provide comments on the SAOU-1 remedy in the context of the 5-year review. Please contact Ralph Murphy at (909) 781-9021 if you have any questions or would like to schedule a time to discuss this matter.

Respectfully,

for **DARREN J. MEEKA, P.E.**
Interim Deputy Director

Diana Chacon	Geologist, Geo-Logic	(949) 929-4279

2. SUMMARY

A site visit to the location of the groundwater treatment plant for the Rockets, Fireworks & Flares (RFF) was conducted on 14 January 2020. The participants toured the groundwater treatment plant, groundwater extraction well location and the location of the recently completed pilot study. The existing groundwater treatment plant is owned and operated by the City of Rialto but was expanded to accept water from the RFF extraction well system to be treated and discharged. The expansion portion of the treatment plant is not currently in operation but is planned to begin in 2020 pending permitting from the State of California.

3. DISCUSSION

On 13 January 2020 Benino McKenna traveled from Seattle, Washington to Ontario, California and met with the site visit participants on 14 January 2020 at the existing groundwater treatment plant owned by the City of Rialto, California. The weather was partly cloudy and cool with an approximate temperature of 56ºF. The site is accessed from North Linden Ave and is located approximately 6.5 miles west of the downtown San Bernardino.

Mr. McKenna arrived on site at 11:00am and met with the site participants. The participants were given a briefing on the purpose of the site visit by Mr. Wayne Praskins and a health and safety briefing from the plant operators from Veolia.

Mr. McKenna proceeded to inspect the existing groundwater treatment system operated by the City of Rialto. The system extracts from one well on site (Rialto 3) and receives additional influent water from offsite extraction wells.

Influent groundwater is filtered through a sand separating unit and 5-micron bag filtration before being treated by ultra-violet (UV) system. After the UV treatment groundwater is sent to a 125,000 gallon equalization tank which distributes groundwater to the existing groundwater treatment system as well as the new expansion of the system for the RFF groundwater. Both the existing treatment system and the new RFF expansion utilize ion exchange (IX) and granular activated carbon (GAC) vessels to treat groundwater before final chlorination before discharging to the municipal water system

The new expansion of the groundwater treatment system that was constructed to treat the groundwater from the RFF extraction wells was not operation at the time of inspection. The treatment vessels did not contain any GAC or IX but did have groundwater actively being cycled through them to prevent any interior corrosion or biofouling. The new expansion is anticipated to come on line in April of 2020.

A Site Inspection Checklist was completed for the existing treatment system even though the new expansion was not active to document the process that will eventually be utilized for the new expansion. All components of the treatment system were in excellent condition with clear signage and all influent, mid and effluent sample ports clearly marked and labeled.

After the groundwater treatment plant walkthrough, part of the team then drove east to an active drilling location where drill crews were installing a 70 foot deep dry well adjacent to the newly installed extraction well EW-1. The new extraction well will eventually be tied into the existing supply lines and supply groundwater to the new expansion of the treatment system. The drilling location was located adjacent to the site of the recent pilot study which was completed to facilitate the permitting of the new treatment plant expansion.

After viewing the drilling operations the majority of the team departed. AECOM Construction Manager Tom Munoz escorted Mr. McKenna into the drill site to document activities and then to existing supply wells Miro-2 and Miro-3.

The site visit concluded at approximately 1530.

4. ACTIONS

The USACE will incorporate information obtained from the site visit into the Five Year Review report.

Figure 1. Map for the Rockets, Fireworks, and Flares Superfund Site

1.3. Hydrology

The 40-square-mile Rialto-Colton Groundwater Basin is located in western San Bernardino County, California, east of the City and County of Los Angeles. The Rialto-Colton Groundwater Basin is bounded on the northwest by the San Gabriel Mountains and southeast by the Badlands, a series of hills located at the margin of the basin. The basin is approximately 10 miles long, from 1.5 to 3.5 miles wide, and it is bounded by geologic faults on its western, northern, and eastern sides. The San Jacinto Fault forms the northeastern boundary, and the Rialto-Colton Fault forms the southwestern boundary. The Santa Ana River cuts across the southeastern part of the basin, and Warm and Lytle Creeks join the Santa Ana River near the eastern edge of the basin. Except in the southeastern part of the basin, the San Jacinto and Rialto-Colton faults appear to restrict groundwater flow into and out of the basin (USGS, 1997).

FIRST FIVE-YEAR REVIEW REPORT FOR ROCKETS, FIREWORKS, AND FLARES SUPERFUND SITE SAN BERNARDINO COUNTY, CALIFORNIA

PREPARED BY

U.S. Army Corps of Engineers Seattle District

FOR

U.S. Environmental Protection Agency

Region 9

Approved by:

DANA BARTON Digitally signed by DANA BARTON Date: 2020.08.28 17:07:12 -07'00'

Date:

Executive Summary

This is the first Five-Year Review of the Rockets, Fireworks, and Flares Superfund Site (Site) located in San Bernardino County, California. The purpose of this Five-Year Review is to review information to determine if the remedy is and will continue to be protective of human health and the environment.

Most of the Site is located in the Rialto-Colton Groundwater Basin, which is an important source of drinking water to residents and businesses in the cities of Rialto, Colton, and Fontana. Located east of the city of Los Angeles, the Site consists of three operable units[1] (OUs). The Source Area Operable Unit addresses groundwater contaminated with volatile organic compounds and perchlorate at and near the source area. EPA is evaluating the need for cleanup at the Mid-Basin Operable Unit, which addresses contaminated groundwater downgradient of the Source Area Operable Unit, and the Soils Operable Unit, which addresses contaminated soil at a 160-acre source area. EPA added the Site to the National Priorities List in September 2009.

On September 30, 2010, EPA signed an Interim Record of Decision (ROD) that selected the following remedy for the Source Area Operable Unit groundwater to protect long-term human health and the environment:

- Groundwater extraction wells located downgradient of the 160-acre source area.
- Water treatment systems to reduce the concentrations of trichloroethylene (TCE) and other volatile contaminants from the extracted groundwater below levels allowed by federal and state drinking water standards.
- Water treatment systems to reduce the concentrations of perchlorate from the extracted groundwater below the level allowed by the state drinking water standard.
- Pipelines and pumps to convey the contaminated groundwater from the extraction wells to the treatment plant.
- Pipelines and pumps to convey the treated water from the treatment plant to one or more local water utilities for distribution as municipal water supply (or for aquifer replenishment); and.
- A groundwater monitoring program.

The remedy has been implemented by expanding an existing water treatment system at an adjacent state-led cleanup site. A new groundwater extraction well, new liquid-phase granular activated carbon and ion exchange water treatment systems, and new pipelines were constructed. The expanded system is referred to as the Combined Treatment Plant. Emhart Industries, Inc., a company responsible for conducting the cleanup in accordance with a 2013 Consent Decree, conducted two pilot-scale tests to demonstrate that the new ion exchange systems would adequately treat extracted Site groundwater.

[1] The term "operable unit" (OU) defines a discrete action that is an incremental step toward a comprehensive remedy for a site.

Upon regulatory and local agency approval, treated Site groundwater from the Combined Treatment Plant will be chlorinated and pumped to the city of Rialto municipal water system.

Exposure assumptions, cleanup levels, and remedial action objectives used at the time of remedy selection are still valid. No new human health or ecological routes of exposure or receptors have been identified. In addition, no new contaminants or contamination sources have been identified. No additional ecological risks have been identified. No impacts from natural disasters have affected the protectiveness or activities of the Site. Some Applicable or Relevant and Appropriate Regulations (ARARs) have changed since finalization of the 2010 Interim ROD. However, none of these changes call into question the protectiveness of the remedy.

Based on review of project-related documents and data, as well as the site inspection, the remedy is expected to function as intended by the Interim ROD. It is expected that the remedy will achieve the remedial action objectives of protecting water supply wells and groundwater resources by limiting the spread of contaminated groundwater from the 160-acre area and by removing contaminants from groundwater.

The remedy at the Rockets, Fireworks and Flares Superfund Site is expected to be protective of human health and the environment upon completion. In the interim, the remedial activities completed to date have adequately addressed all exposure pathways that could result in unacceptable risks in these areas.

1. Introduction

The purpose of a Five-Year Review is to evaluate the implementation and performance of a remedy to determine if the remedy will continue to be protective of human health and the environment. The methods, findings, and conclusions of a review are documented in Five-Year Review reports. In addition, Five-Year Review reports identify issues found during the review, if any, and document recommendations to address them.

The U.S. Environmental Protection Agency (EPA) is preparing this Five-Year Review pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act Section 121(c), 40 Code of Federal Regulation (CFR) Section 300.430(f)(4)(ii) of the National Contingency Plan and EPA policy.

This is the first Five-Year Review for the Rockets, Fireworks, and Flares Superfund Site (Site). The triggering action for this statutory review is the on-site construction start date for a remedial action on September 18, 2015. The Five-Year Review has been prepared due to the fact that hazardous substances, pollutants, or contaminants remain at the site above levels that allow for unlimited use and unrestricted exposure.

This Five-Year Review focuses on the Source Area Operable Unit, which addresses groundwater near the sources of contamination. The two operable units that are not addressed in this Five-Year Review are the Mid-Basin Operable Unit, which addresses contaminated groundwater downgradient of the Source Area Operable Unit, and the Soils Operable Unit, which addresses contaminated soil in an area known as the 160-acre area where Site contaminants are believed to have been released to the environment. EPA signed the Record of Decision (ROD) for the Source Area Operable Unit on September 30, 2010. RODs have not been finalized for Mid-Basin Operable Unit or Soils Operable Unit and therefore review of these operable units are not included in this Five-Year Review.

The Rockets, Fireworks, and Flares Superfund Site Five-Year Review was led by Wayne Praskins (EPA, Remedial Project Manager). Participants included U.S. Army Corps of Engineers staff Leanna Woods Pan (environmental engineer) and Benino McKenna (hydrogeologist). The review began on October 30, 2018.

SITE IDENTIFICATION		
Site Name: Rockets, Fireworks, and Flares Superfund Site		
EPA ID: CAN000905945		
Region: 9	**State:** CA	**City/County:** San Bernardino County
SITE STATUS		
NPL Status: Final		
Multiple OUs? Yes	**Has the site achieved construction completion?** No	
REVIEW STATUS		
Lead agency: EPA		
Author name (Federal or State Project Manager): Wayne Praskins		
Author affiliation: EPA		
Review period: 10/30/2018 - 9/18/2020		
Date of site inspection: 1/14/2020		
Type of review: Statutory		
Review number: 1		
Triggering action date: 9/18/2015		
Due date *(five years after triggering action date)*: 9/18/2020		

1.1. Background

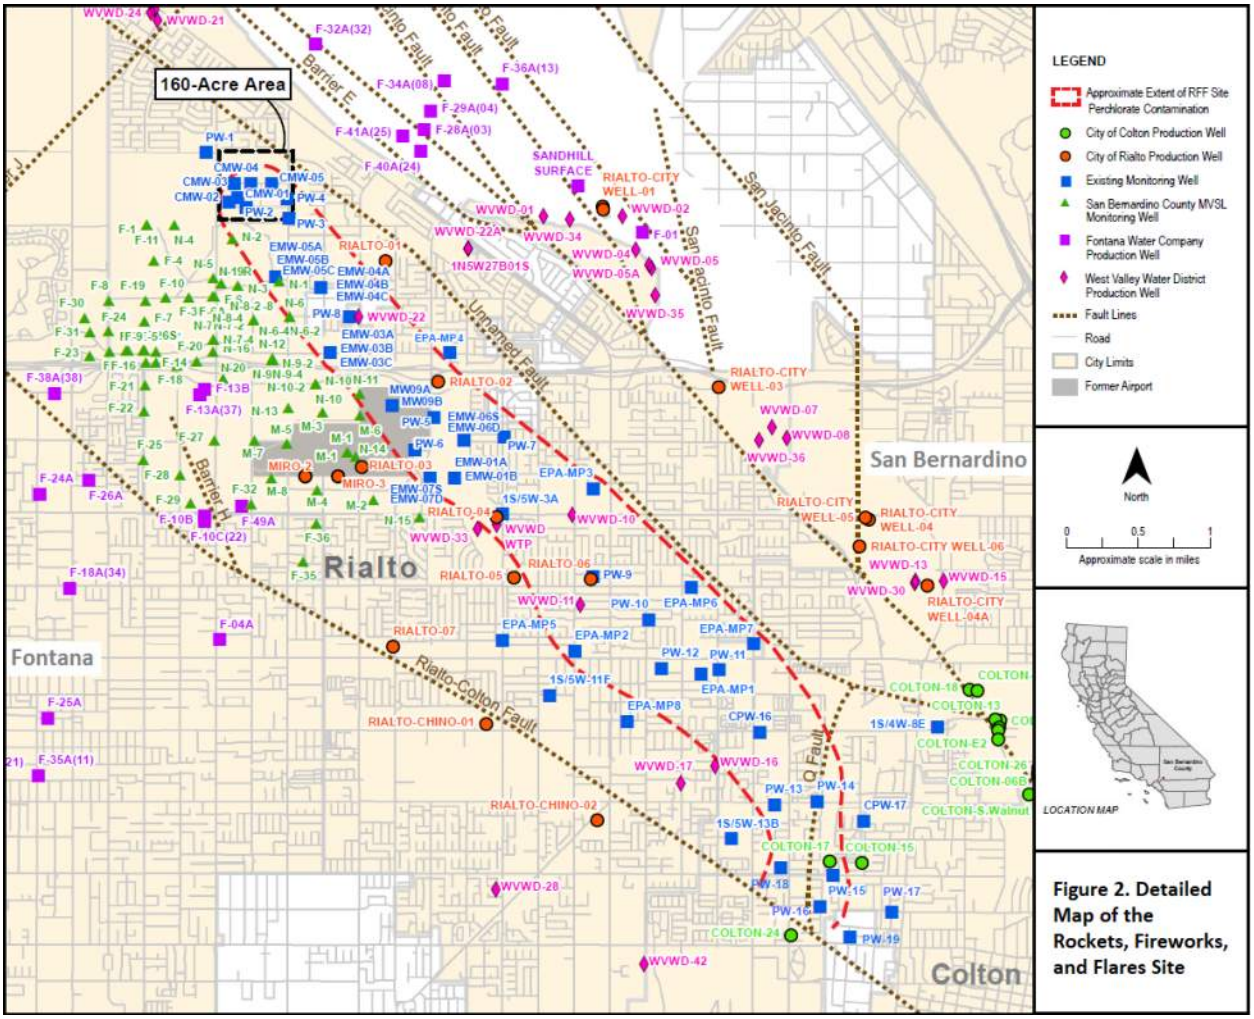
The Rockets, Fireworks and Flares Superfund Site (Site), located east of the city of Los Angeles, includes soil and groundwater contaminated with perchlorate, trichloroethylene (TCE), and other volatile organic compounds in a largely suburban area in San Bernardino County, California. The Source Area Operable Unit of the Site includes groundwater at a 160-acre source area where contaminants entered the groundwater and testing has identified the highest levels of groundwater contamination. The Source Area Operable Unit also includes contaminated groundwater that has spread as far as approximately 2.5 miles downgradient from the 160-acre area (Figure 1).

In 1942, the U.S. Army acquired and developed land that includes the 160-acre area. The property was sold in 1946 and portions of the 160-acre area have been owned or used by a variety of defense contractors, fireworks manufacturers, and others who used perchlorate salts and other chemicals in their manufacturing processes or in their products. Contaminant release mechanisms are believed to have included onsite disposal in one or more unlined pits, leakage or overflow from an onsite impoundment, airborne dispersion of material handled during manufacturing, disposal of contaminated rinse water onto unpaved areas, and one or more explosions. Releases are likely to have begun in the 1950s, and possibly earlier.

Most of the Site is located in the Rialto-Colton Groundwater Basin. Four water utilities are responsible for the majority of the groundwater pumping in the Basin: the City of Rialto, West Valley Water District, the City of Colton, and Fontana Water Company. A 1961 decree entered in San Bernardino County Superior Court restricts pumping of groundwater from the Rialto-Colton Groundwater Basin to parties to the decree.

1.2. Physical Characteristics

The 160-acre source area is square-shaped and bounded by West Casa Grande Drive on the north, Locust Avenue on the east, Alder Avenue on the west, and an extension of Summit Avenue on the south. Various buildings and structures are located throughout the 160-acre area and several roadways run through it, including West Lowell Street and several unimproved roads. Portions of the site are used for commercial or industrial purposes, and other areas are vacant or open space. The County of San Bernardino's Mid-Valley Sanitary Landfill is located immediately southwest of the 160-acre area. Some adjacent properties are developed with industrial facilities or residences.



Modified from Figure produced by Jacobs Engineering in July 2019

Figure 1. Map for the Rockets, Fireworks, and Flares Superfund Site

1.3. Hydrology

The 40-square-mile Rialto-Colton Groundwater Basin is located in western San Bernardino County, California, east of the City and County of Los Angeles. The Rialto-Colton Groundwater Basin is bounded on the northwest by the San Gabriel Mountains and southeast by the Badlands, a series of hills located at the margin of the basin. The basin is approximately 10 miles long, from 1.5 to 3.5 miles wide, and it is bounded by geologic faults on its western, northern, and eastern sides. The San Jacinto Fault forms the northeastern boundary, and the Rialto-Colton Fault forms the southwestern boundary. The Santa Ana River cuts across the southeastern part of the basin, and Warm and Lytle Creeks join the Santa Ana River near the eastern edge of the basin. Except in the southeastern part of the basin, the San Jacinto and Rialto-Colton faults appear to restrict groundwater flow into and out of the basin (USGS, 1997).

The Rialto-Colton Groundwater Basin is filled with unconsolidated alluvial material consisting of sand, gravel, and boulders interbedded with lenticular deposits of silt and clay. Alluvial sediments in much of the basin are about 500 to 1,000 feet deep. The unconsolidated alluvium is underlain by partly consolidated continental deposits formed as lenticular bodies consisting of somewhat compacted gravel, sand, silt, and clay. The basement complex consists of metamorphic and igneous rocks. The unconsolidated alluvial material contains groundwater in multiple water-bearing layers. At the Site's 160-acre area, the depth to groundwater in the first layer, known as the Intermediate Aquifer, is currently about 400 to 450 feet below ground surface. The Intermediate Aquifer is unconfined, about 50 to 100 feet thick, and is underlain by a laterally extensive aquitard. The Intermediate Aquifer is comprised of multiple thin water-bearing units separated by thin aquitards and dry intervals. The deeper water-bearing layer, known as the Regional Aquifer, is generally unconfined to partly confined, and is about 300 to 500 feet thick. Both the Intermediate and Regional Aquifers are comprised of unconsolidated alluvial material consisting of sand, gravel and boulders. Potentiometric heads are as much as 150 feet higher in the Intermediate Aquifer than in the underlying Regional Aquifer, resulting in a strong downward hydraulic gradient between the two aquifers. About one to one and half miles to the southeast of the Site's 160-acre area, the Intermediate Aquifer merges with the Regional Aquifer (Figure 2).

Groundwater flow in the Rialto-Colton Groundwater Basin is strongly influenced by the presence of several geologic faults that restrict groundwater flow. Groundwater in the Intermediate Aquifer generally flows to the southeast, parallel to two major faults, up to several feet per day. Groundwater in the Regional Aquifer generally flows to the southeast at an average rate of about one foot per day. Groundwater elevations and flow rates in the Rialto-Colton Groundwater Basin vary both seasonally and year to year. The primary cause of this variability is year to year change in precipitation and associated recharge. Seasonal and year-to-year variability in groundwater pumping also affects water levels.

Historical water level measurements from water supply wells screened in the Regional Aquifer indicate that water levels varied by more than 100 feet from 1962-2009 due to periodic drought and increased groundwater production.

The groundwater at or near the Site is a vital resource for residents of the cities of Rialto and Colton. Most of the Site lies within the Rialto-Colton Groundwater Basin, which has in recent years supplied drinking water to tens of thousands of area residents. The contamination has forced the closure of many drinking water supply wells in the basin.

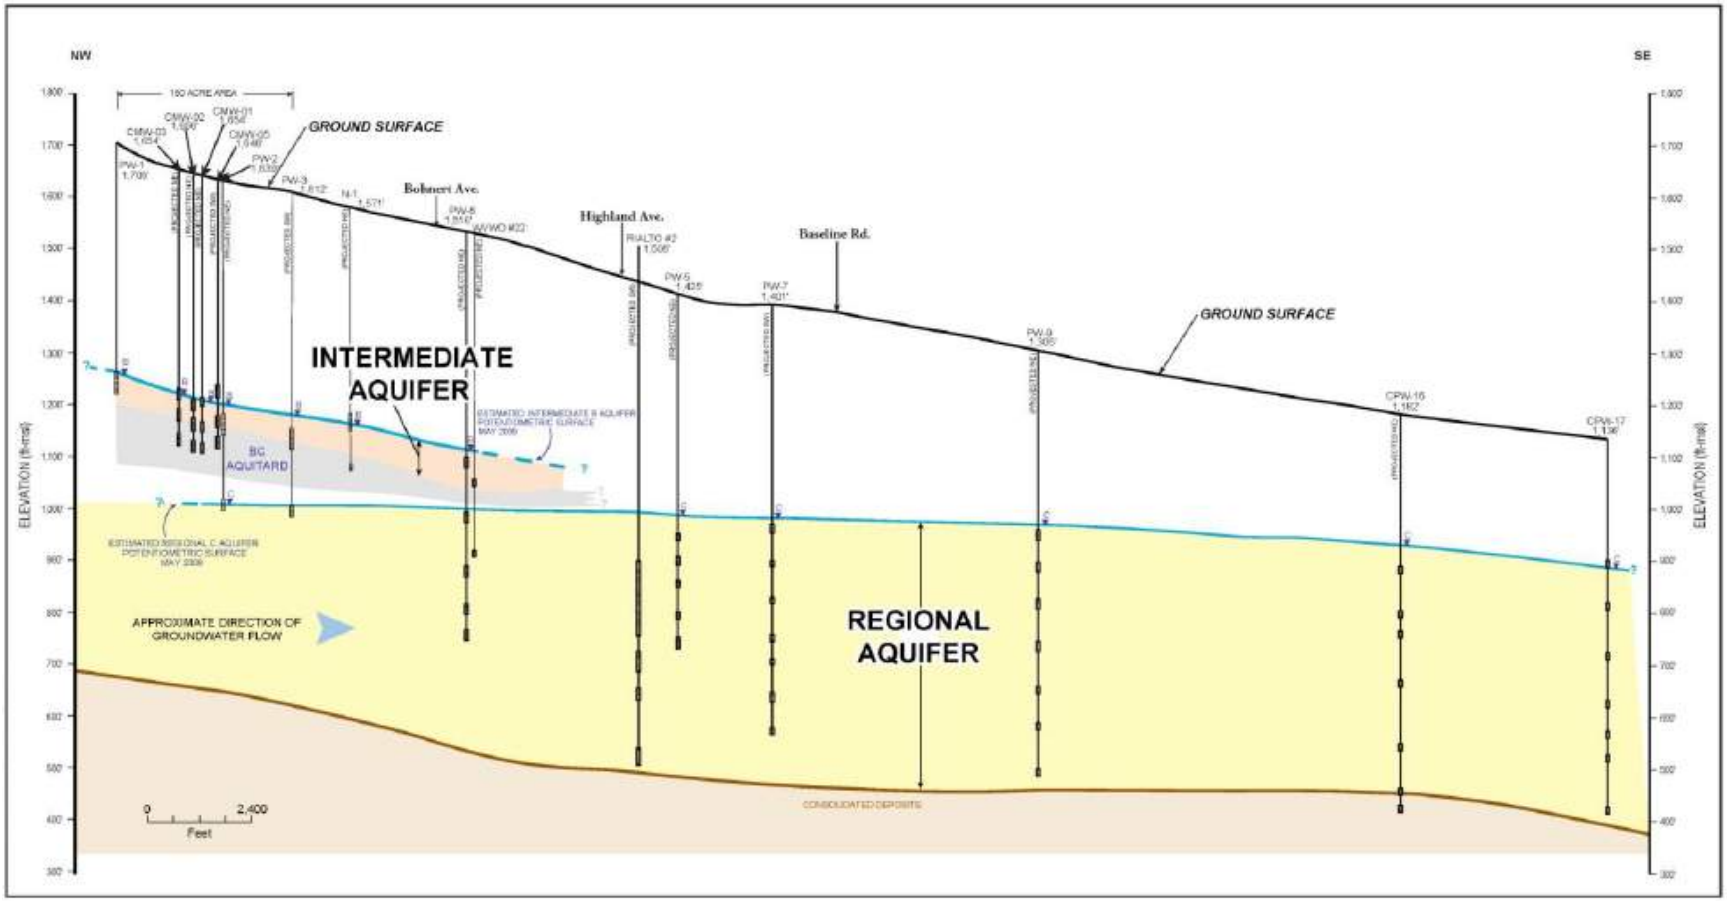


Figure 2. Rialto-Colton Groundwater Basin Aquifers

2. Remedial Actions Summary

2.1. Basis for Taking Action

The contaminants of concern in groundwater at the Site include perchlorate, TCE, carbon tetrachloride, chloroform, and methylene chloride. Perchlorate salts are inorganic chemicals used as oxidizers in rocket propellant, flares, fireworks, and other products. TCE and carbon tetrachloride are cleaning solvents used extensively in the 1950s and 1960s. Employees of businesses that operated in the Site's 160-acre area in the 1950s and 1960s have testified that perchlorate, TCE, and other solvents were handled or used at the Site. Perchlorate and TCE are the most frequently detected contaminants in groundwater at the Site and the primary contaminants of concern . Perchlorate, TCE, and carbon tetrachloride can persist in groundwater for decades.

EPA is taking action because the groundwater at the Site is a current source of drinking water to tens of thousands of residents and businesses, the levels of contamination in groundwater exceed federal or state drinking water standards, and contaminated groundwater continues to spread into uncontaminated and less contaminated portions of the groundwater aquifer.

EPA identified exposure pathways in the 2010 Remedial Investigation and Feasibility Study Report based on the Conceptual Site Model for the Site. Receptors that could potentially be exposed to the contaminated groundwater include current and future residents that receive drinking water from groundwater wells near the Site. Exposure could occur through inhalation (TCE, carbon tetrachloride, chloroform, and methylene chloride only) or ingestion (TCE, carbon tetrachloride, chloroform, methylene chloride and perchlorate) of the contaminants present in the groundwater. Inhalation of contaminants can occur during showering and other activities that enhance the movement of volatile chemicals from water to air. Exposure through dermal contact is not expected to be a significant pathway for these constituents. There is currently no known exposure pathway in which ecological receptors could be exposed to contaminated groundwater.

2.2. Remedy Selection

EPA issued the Interim ROD for the Source Area Operable Unit in September 2010.

The selected remedy is the first of at least two planned remedies to address contaminated groundwater at the Site. This interim action is necessary to stabilize the Site, prevent further environmental degradation, and achieve significant risk reduction while a final remedial solution is being developed.

The Interim ROD identified the following Remedial Action Objectives for the Source Area Operable Unit:

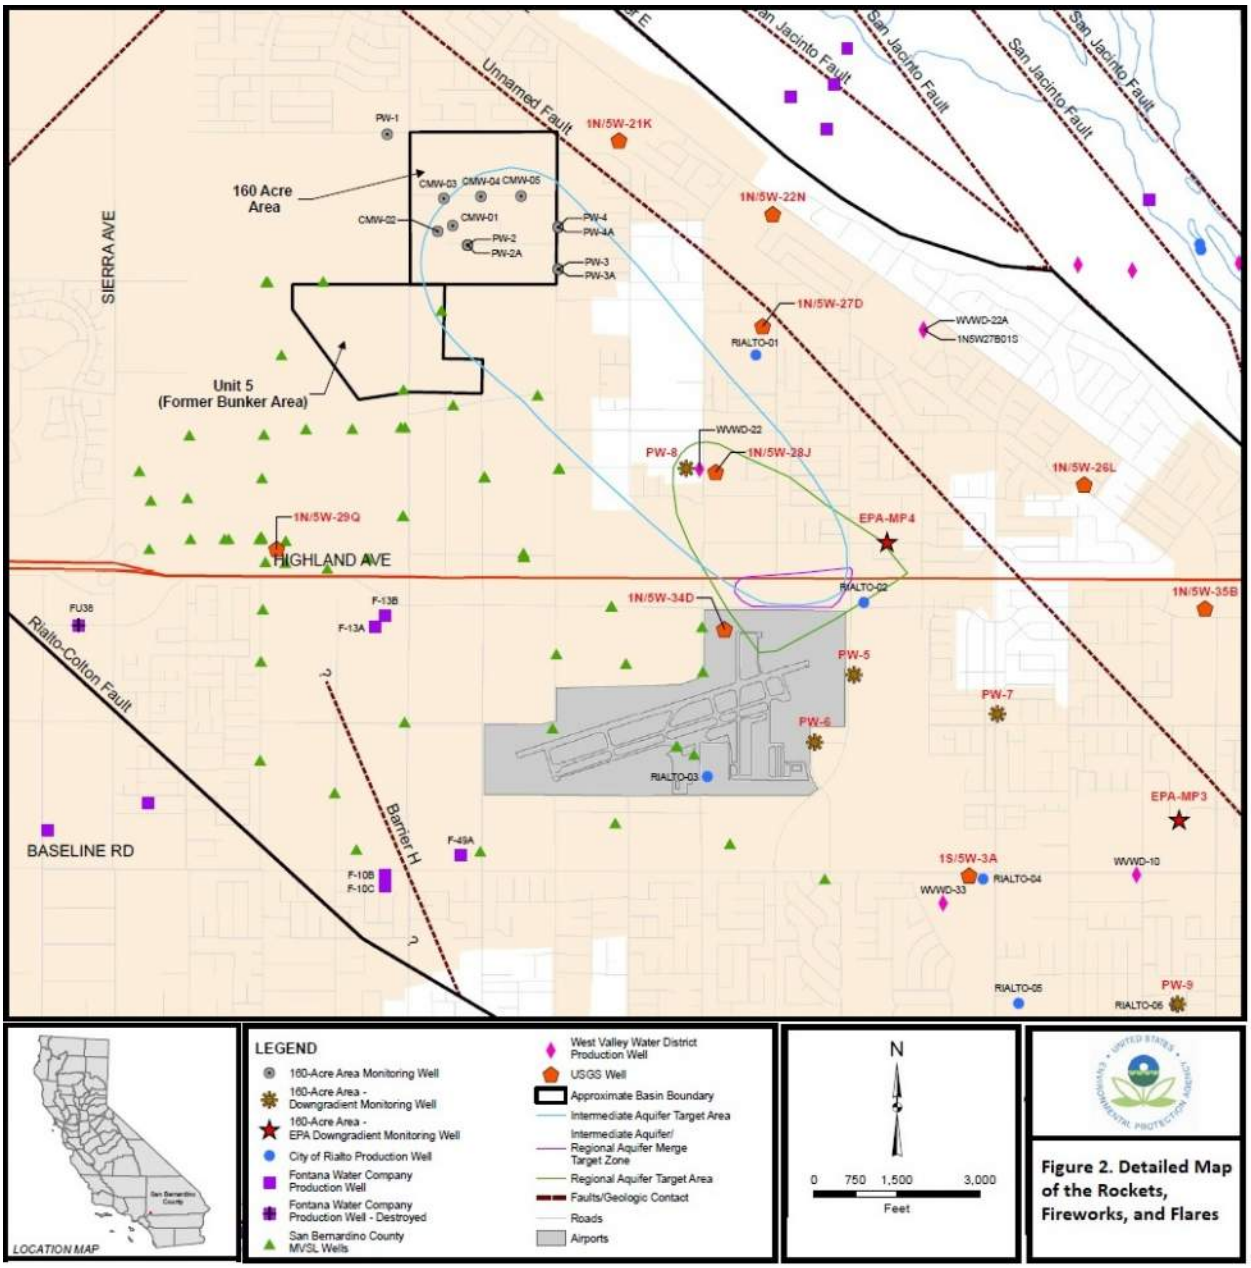
- Protect water supply wells and groundwater resources by limiting the spread of contaminated groundwater from the 160-acre area.
- Remove the contaminants from the groundwater.

EPA's selected remedy for the Source Area Operable Unit is a groundwater pump and treat system and included the following components:

- Groundwater extraction wells located no more than 1,500 feet downgradient of the Intermediate and Regional Aquifer Target Area (defined below).
- Water treatment systems to reduce the concentrations of TCE and other volatile contaminants from the extracted groundwater below levels allowed by federal and state drinking water standards.
- Water treatment systems to reduce the concentrations of perchlorate from the extracted groundwater below the level allowed by the state drinking water standard.
- Pipelines and pumps to convey the contaminated groundwater from the extraction wells to the treatment plant.
- Pipelines and pumps to convey the treated water from the treatment plant to one or more local water utilities for distribution as municipal water supply or to reinjection wells for groundwater recharge.
- A groundwater monitoring program.

The remedy is intended to intercept and provide hydraulic control of contaminated groundwater moving from the 160-acre source area in targeted areas of contamination (defined below). The targeted areas include locations where contaminants entered the groundwater and downgradient areas where high levels of groundwater contamination have been measured. The targeted area of groundwater contamination encompasses portions of the Intermediate and Regional Aquifers as described below:

- The *Intermediate Aquifer Target Area* is the portion of the aquifer within the footprint of and downgradient of the 160-acre area where contaminant concentrations in groundwater exceed chemical-specific ARARs. The upgradient boundary of the Target Area is near groundwater monitoring well CMW-3, the northernmost groundwater monitoring well on the 160-acre area where the concentrations of contaminants consistently exceeded chemical-specific ARARs. The downgradient boundary of the Target Area is where the Intermediate Aquifer is no longer present as a distinct aquifer. The downgradient boundary is in the vicinity of the 210 Freeway, approximately one and one-half miles to the southeast of the 160-acre area (Figure 3).
- The *Regional Aquifer Target Area* is the portion of the Regional Aquifer underlying the Intermediate Aquifer Target Area where the concentrations of the contaminants of concern in groundwater exceed chemical-specific ARARs. The upgradient boundary of the Regional Aquifer Target Area is at or upgradient of well WVWD-22 (Figure 3).



Modified Figure 3-2 from CH2MHILL, 2010. Remedial Investigation/Feasibility Study Report B.F. Goodrich Superfund Site Rialto, California. January 25, 2010.

Figure 3. Footprint of Intermediate and Regional Aquifer Target Areas

Compliance with EPA objectives will be evaluated based on the achievement of hydraulic control in the targeted areas of contamination and the decrease of contaminant concentrations in groundwater over time at downgradient compliance wells. The groundwater at the Site is an important source of drinking water. Limiting the spread of contaminated groundwater should reduce contaminant mass loading to downgradient areas, reducing human health risk by reducing the likelihood and magnitude of exposure.

EPA did not set numeric cleanup goals for the groundwater in the aquifer during implementation of the interim action. EPA will determine cleanup goals for the aquifer in a future action. In 2010, EPA did

select cleanup goals for each contaminant of concern in the extracted and treated groundwater in the Interim ROD (Table 2).

There are no planned or implemented institutional controls identified in the ROD for this Site.

Table 2. Treatment Cleanup Goals for Chemicals of Concern (in Extracted and Treated Groundwater)

COC	Reporting Units	Federal MCL (µg/L)	California MCL (µg/L)	Cleanup Level	Basis for Cleanup Level
Carbon Tetrachloride	µg/L	5	0.5	0.5	California MCL
Chloroform (Trichloromethane)	µg/L	80[1]	80[1]	80[1]	Federal MCL
Methylene Chloride (Dichloromethane)	µg/L	5	5	5	Federal MCL
Perchlorate	µg/L	none	6	6	California MCL
Trichloroethene (TCE)	µg/L	5	5	5	Federal MCL

Notes:
[1]The values listed for chloroform are for the combined concentration of four trihalomethanes: chloroform, dibromochloromethane, bromodichloromethane, and bromoform.

2.3. Remedy Implementation

In March 2014, EPA approved the final design for the treatment plant, which has been designed to work in conjunction with an existing treatment plant at an adjacent state-led cleanup site. The Regional Water Quality Control Board provides regulatory oversight of the adjacent cleanup site, which has similar contaminants and a similar remedy (pump and treat). As part of the remedy for the adjacent state-led site, known as the County Remedy, three extraction wells (Rialto-3, Miro-2, and Miro-3) can deliver up to 2,200 gallons extracted groundwater per minute (gpm) to the County Remedy Treatment Plant. The County Remedy Treatment Plant is located at North Linden Ave and Miro Way, adjacent to the Rialto-3 well.

The County Remedy Treatment Plant was expanded to include capacity for treatment of Site groundwater and will henceforth be referred to as the Combined Treatment Plant. The addition of one extraction well (EW-1) has increased pumping capacity to the Combined Treatment Plant by 2,040 gpm to approximately 4,200 gpm. EW-1, along with one or more of the County Remedy extraction wells, are expected to provide hydraulic control of the Target Area of the Site. Three additional fixed ion exchange resin vessels for perchlorate removal and four additional fixed bed liquid-phase granular activated carbon adsorber vessels for volatile organic contaminants removal have been constructed to treat the extracted groundwater at the Combined Treatment Plant. The ion exchange vessels will operate on a lead/mid/lag configuration. Resin change out criteria will assure effective operation without perchlorate breakthrough from the lag vessel and maximize the run time of the system.

A pilot test was conducted until late 2019. The California State Water Resources Control Board's Division of Drinking Water required demonstration of the effectiveness of the ion exchange resin and

lead/mid/lag series design in the Combined Treatment Plant prior to the amendment of the city of Rialto's domestic water supply permit, which is necessary for operation of the remedy.

A first pilot test was initiated by Emhart Industries, Inc. at the Site in early January 2017, delivering Site groundwater extracted from EW-1 at about 1 gpm to a separate, trailer-sized pilot test setup consisting of several columns filled with perchlorate-specific ion exchange resins. The initial pilot test did not perform as expected, with a brownish discoloration visible in the three ion exchange resins and perchlorate "breakthrough" occurring earlier than modeling predictions. Therefore, the initial pilot test was ended in March 2017 and the State Water Resources Control Board Division of Drinking Water advised that it could not permit the operation of the Combined Treatment Plant based on the initial pilot test alone.

An expert committee was assembled to conduct a forensic analysis of the initial pilot test to determine the cause of the observed anomalies and to recommend changes in the design of the pilot test to more closely approximate conditions during full-scale operation. The expert committee determined that the configuration of the initial pilot test, specifically exposing extracted water to atmospheric conditions in holding tanks for extended periods, led to an increase in pH and temperature of the water prior to entering the pilot test equipment. This resulted in significant calcite scaling within the ion exchange resin columns, inhibiting mass transfer, reducing the effective treatment capacity of the resin, and shortening the throughput capacity and breakthrough time.

The expert committee recommended several changes in pilot test configuration to eliminate the conditions that led to calcite scaling during the initial pilot test with the expectation that this would resolve the resin performance issues. The second pilot test was configured to more closely mimic full-scale operating conditions. Design changes made for the second pilot test include:

- Limiting residence time between extraction and treatment of the groundwater by locating the pilot test equipment at EW-1 and continuously pumping water from EW-1 through the pilot system (without storage in holding tanks).
- Constructing ion exchange columns with bed depths equivalent to the full-scale system.
- Operating the pilot system at the same flow rate per cubic foot resin as the full-scale system.

A second pilot test began in January 2018. Perchlorate breakthrough during the second pilot test followed model predictions, establishing that the resins tested in a lead/mid/lag ion exchange vessel configuration would adequately treat extracted site groundwater and provide enough time to implement resin change-outs without impacting performance. The second pilot test was concluded in December 2019. Following regulatory and local agency approval, continuous operation of the remedy is expected to begin in late 2020, with treated groundwater from the Combined Treatment Plant chlorinated and pumped to the city of Rialto municipal water system.

2.4. Operation and Maintenance

Continuous operation of the remedy is not expected to begin until late 2020. Therefore, no operation and maintenance has occurred during this review period.

3. Progress during this Five-Year Review Period

3.1. Work Completed at the Site During this Five-Year Review Period

Construction of the remedy, including expansion of the County Remedy Treatment Plant, was completed during this five-year review period, as detailed in Section 2.3. Components of the treatment plant expansion were documented during the Site Inspection (Appendix G).

Pilot testing of the ion exchange process to be employed in the expanded treatment system was also completed as described in Section 2.3.

3.2. Community Notification, Involvement and Site Interviews

A public notice was made available by newspaper posting in the *Rialto Record* on March 19, 2020 stating that there was a five-year review and inviting the public to submit any comments to the U.S. EPA. The results of the review and the report will be made available on the EPA site webpage at: http://epa.gov/superfund/rff.

During the Five-Year Review process, interviews were conducted to document any perceived problems or successes with the remedy. All comments and interviews pertaining to this Five-Year Review were completed with the understanding that at the time of this writing the remedy has not begun operation. A consultant for the County of San Bernardino participated in the Site Interviews. The consultant expressed concern over a potential lack of plume capture by the remedy as constructed and cited the need for an additional extraction well.

In addition, the County of Bernardino, Department of Public Works sent a letter to the USACE to elaborate their concerns with the potential effectiveness of the Source Area Operable Unit remedy and the impact of the Source Area Operable Unit remedy on the County remedy. The letter makes several recommendations: 1) reevaluate the boundaries of the area targeted for remediation in the ROD; 2) describe plans to monitor compliance with the ROD after the remedy begins operation; 3) and reevaluate the groundwater extraction plan for the Source Area Operable Unit remedy. The letter from the County is included in Appendix F.

3.3. Data Review

At the time of this report, the selected remedy from the 2010 Interim ROD has largely been constructed but is not yet operational. In the absence of remedy performance data, an evaluation of annual groundwater sampling data has been conducted to assess Site contaminants concentrations at and in the vicinity of the Source Area Operable Unit.

The contaminant data review is limited to carbon tetrachloride, perchlorate and TCE, because according to the Interim ROD, they are the only contaminants of concern for the Source Area Operable Unit that currently or historically exceeded the cleanup standards.

3.3.1. Groundwater Elevations

Groundwater levels in this region are influenced by annual precipitation and municipal pumping. In selected wells, contaminant concentrations have shown a correlation with groundwater levels. Figure 4 shows the relationship between perchlorate concentrations in groundwater, TCE concentrations in groundwater, and water levels in a groundwater monitoring well screened in the Intermediate Aquifer in the source area. Groundwater levels have generally been decreasing in both the Intermediate and Regional Aquifers in recent years (AECOM, 2019). The state of California has experienced extended drought conditions during the period of review for the Five-Year Review and for much of the past decade. Despite decreasing groundwater levels, the overall gradients of the Intermediate and Regional Aquifers have generally continued to trend to the southeast.

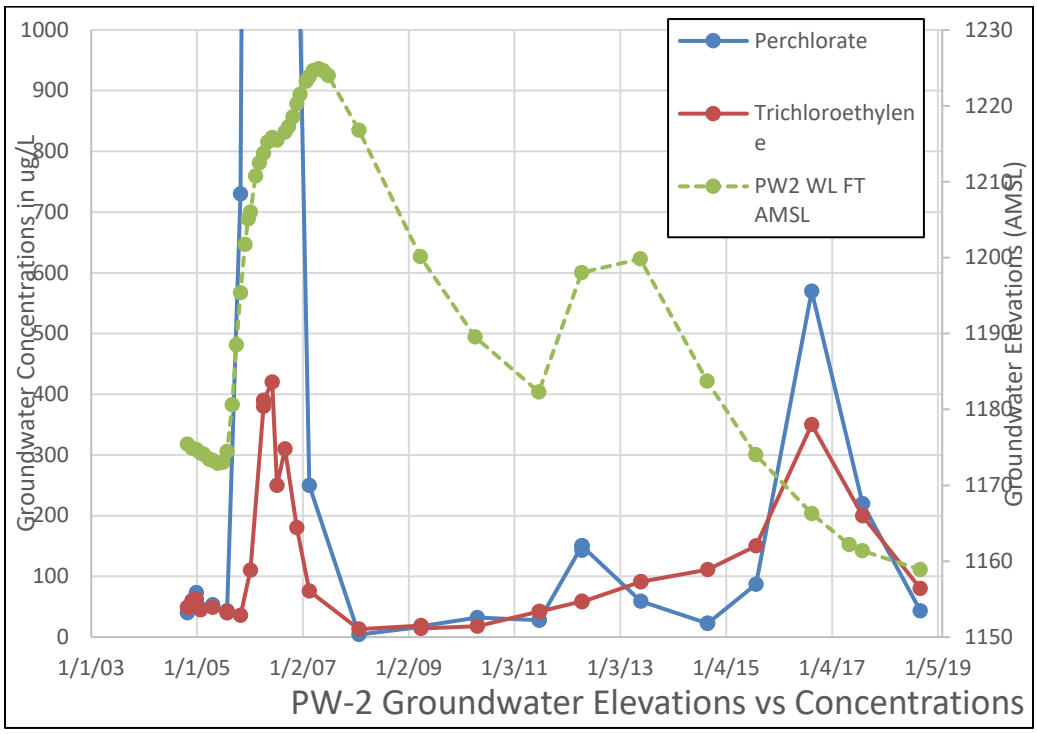


Figure 4. Well PW-2 Groundwater Elevation vs Concentration Graph

3.3.2. Groundwater Concentrations

To evaluate whether concentrations in groundwater have changed over time, U.S. Army Corps of Engineers applied a statistical test (Mann-Kendall) to data from 20 wells for the period 2008 to 2019. (Earlier data are also available for a limited number of wells.) Three contaminants of concern were evaluated: carbon tetrachloride, perchlorate and TCE. Data were taken from the annual groundwater reports prepared by Emhart Industries (AECOM, 2019) for wells and contaminants that met the minimum statistical requirements. Recently installed extraction well EW-1 had insufficient data to complete a Mann-Kendall analysis.

The trend analyses are intended to provide a baseline for future groundwater evaluations.

3.3.2.1 Intermediate Aquifer

Five groundwater monitoring wells screened in the Intermediate Aquifer were evaluated. Perchlorate concentrations showed decreasing or probably decreasing trends in three of the five wells. One well, PW-2, showed an increasing trend from about 2008 to 2016. No trend was observed in the fifth well. A clear pattern was not apparent in TCE concentrations. TCE concentrations in wells PW2 and EMW-05A increased or probably increased but the other three wells showed stable or decreasing trends.

3.3.2.2 Regional Aquifer

Fifteen groundwater monitoring wells screened in the Regional Aquifer were evaluated. The perchlorate concentrations showed stable or decreasing trends in the majority of the wells. Three wells, PW-6B, 6C, and 6D, showed increasing or probably increasing trends. In contrast, a majority of the wells screened in the Regional Aquifer showed stable or increasing trends in TCE concentrations from 2008 to 2019. Two of the 15 wells showed decreasing TCE concentrations over the same period.

Carbon tetrachloride was not detected in any of the 20 wells, with the exception of EMW-04A which showed a probable decreasing trend.

Table 3. Summary of Mann-Kendall Analysis for Perchlorate

Well	Samples (n)[1]	Number of detects	Mann-Kendall Statistic (S)[2]	Confidence in Trend [3]	Coeffiecient of Variation (COV)[4]	Concentration Trend	Maximum concentration (µg/L)	Comments

Notes:

[1] Number of samples used during the Mann-Kendall Statistic analysis.

[2] The Mann-Kendall Statistic (s) measures the trend of the data. Positive values indicate an increase of concentrations over time, whereas negative values indicate a decrease in concentrations over time.

[3] The Confidence in Trend is the statistical confidence that the constituent concentration is increasing (S-0).

[4] The coefficient of variation (COV) is a statistical measure of how the individual data points vary about the mean value. The coefficient of variation, defined as the standard deviation divided by the average. Valuies near 1 indicate that the data form a relatively close group about the mean value. Values other larger or smaller than 1.0 indicate that the data show a greater degree of scatter about the mean.

Notes:

[1] Number of samples used during the Mann-Kendall Statistic analysis.

[2] The Mann-Kendall Statistic (s) measures the trend of the data. Positive values indicate an increase of concentrations over time, whereas negative values indicate a decrease in concentrations over time.

[3] The Confidence in Trend is the statistical confidence that the constituent concentration is increasing (S-0).

[4] The coefficient of variation (COV) is a statistical measure of how the individual data points vary about the mean value. The coefficient of variation, defined as the standard deviation divided by the average. Valuies near 1 indicate that the data form a relatively close group about the mean value. Values other larger or smaller than 1.0 indicate that the data show a greater degree of scatter about the mean.

3.4. Site Inspection and Interviews

The site inspection was conducted by Benino McKenna from the U.S. Army Corps of Engineers Seattle District on January 14, 2020. In attendance were Wayne Praskins, EPA Remedial Project Manager; David Towell, Senior Project Manager Jacobs, Eng.; Kamran Javandel, representing Emhart Industries Inc.; Tom Crowley, Utilities Manager for the City of Rialto; David Terry, Project Manager with Veolia; Andrew Coleman, Field Supervisor with Veolia; Jerry Zimmerle, Project Manager AECOM; Tom Munoz, Construction Manager AECOM; and Diana Chacon, Geologist with Geo-Logic Consultants. The purpose of the inspection was to assess the protectiveness of the remedy.

The participants met at the Combined Treatment Plant located on North Linden Ave in the City of Rialto, then toured the groundwater treatment plant and the EW-1 well location. A summary of the site inspection, trip report, and site photos are included in Appendix G.

The portion of the Combined Treatment Plant constructed as part of County Remedy appeared to be in good condition and functioning as intended. The new equipment installed as part of Source Area Operable Unit also appeared to be in good condition but was not in service at the time of the site visit. The groundwater extraction components of the Source Area Operable Unit observed during the site inspection

that will supply the Combined Treatment Plant also appeared to be in good condition. A more complete evaluation of the remedy will be possible when the system begins operation.

4. Technical Assessment

4.1. Question A: Is the remedy functioning as intended by the decision documents?

The remedy is not yet operating, but it is in the final stages of construction and permitting. Perchlorate breakthrough during the second pilot test followed model predictions, establishing that the ion exchange resin and the vessel configuration would adequately treat extracted site groundwater. Upon permitting by the State, remedy operation is expected to commence in 2020. Based on review of project-related documents and data, as well as the site inspection, the remedy is expected to function as intended by the ROD. It is expected that the remedy will achieve the remedial action objectives of protecting water supply wells and groundwater resources by limiting the spread of contaminated groundwater from the 160-acre area and removing contaminants from groundwater.

4.2. Question B: Are the exposure assumptions, Toxicity Data, Cleanup Levels, and Remedial Action Objectives Used at the Time of Remedy Selection Still Valid?

Yes, the exposure assumptions, cleanup levels, and remedial action objectives used at the time of the remedy selection are still valid. Groundwater pumping is restricted to water utilities, which test and treat extracted groundwater as necessary. No new human health or ecological routes of exposure or receptors have been identified. In addition, no new contaminants or contamination sources have been identified. ARARs were evaluated and there were some changes to ARARs since finalization of the 2010 Interim ROD (Appendix D). However, none of these changes are substantial and therefore do not affect the protectiveness of the remedy.

4.3. Question C: Has Any Other Information Come to Light That Could Call Into Question the Protectiveness of the Remedy?

No additional information has come to light which would affect the protectiveness of the remedy.

5. Issues/Recommendations

No issues were identified in this five-year review.

5.1. Other Findings

The following are recommendations that do not affect current and/or future protectiveness and were identified during the Five-Year Review:

- EPA sampled wells Rialto-03, Rialto-06, and EW-1 in November 2017 and March 2018 for per- and polyfluoroalkyl substances (PFAS). Laboratory results show that one type of PFAS (perflourobutylsulfonate) was detected in one untreated groundwater sample from Rialto-06 at a concentration of 77.6 ng/L, which is below EPA's screening level of 400 ng/L. PFAS was not found in any other site samples at or above the reporting limits. It is recommended that this information be formalized in site documentation.

6. Protectiveness Statement

Table 5. Protectiveness Statement

Protectiveness Statement(s)	
Operable Unit:1	*Protectiveness Determination:* Will be Protective
Protectiveness Statement: The remedy at the Rockets, Fireworks and Flares Superfund Site is expected to be protective of human health and the environment upon completion. In the interim, the remedial activities completed to date have adequately addressed all exposure pathways that could result in unacceptable risks in these areas.	

7. Next Review

The next five-year review report for the Rockets, Fireworks, and Flares Superfund Site is required five years from the completion date of this review.

Appendix A: List of Documents Reviewed

AECOM, 2015. April 2015- Additional Groundwater Sampling Data, Source Area Operable Unit, Rockets, Fireworks, and Flares Site. April 27, 2015.

AECOM, 2016. August 2016 Remedial Design Investigation Report, Source Area Operable Unit, Rockets, Fireworks, and Flares Site. November 2016.

AECOM, 2017a. Second Pilot Test Work Plan, Source Area Operable Unit Interim Remedy, Rockets, Fireworks, and Flares Superfund Site Rialto, California. October 2017.

AECOM, 2017b. Remedial Design Investigation Report, Source Area Operable Unit, Rockets, Fireworks, and Flares Site. November 2017.

AECOM, 2018. Remedial Design Investigation Report, Source Area Operable Unit, Rockets, Fireworks, and Flares Site. November 2018.

AECOM, 2019. Remedial Design Investigation Report, Source Area Operable Unit, Rockets, Fireworks, and Flares Site. October 2019.

CH2MHILL, 2010. Remedial Investigation/Feasibility Study Report, B.F. Goodrich Superfund Site, Rialto, California. January 25, 2010.

Emhart Industries, Inc., 2014. Final Design, Source Area Operable Unit, Rockets, Fireworks, and Flares Superfund Site. June 18, 2014.

USEPA, 2010. Superfund Interim Action Record of Decision: Source Area Operable Unit, B.F. Goodrich Superfund Site, San Bernardino County, CA. September 30, 2010.

Appendix B: Site Chronology

Events	Date
EPA added the Site to the National Priorities List (NPL)	September 23, 2009
Remedial Investigation and Feasibility Study Report	January 25, 2010
Interim Action Record of Decision	September 30, 2010
Consent Decree entered by the U.S. District Court for the Central District of California in City of Colton v. American Promotional Events, Inc. et al., Case No. ED CV 09-01864 PSG (SSx) on 2 July 2013 (Doc. No. 1820).	July 2, 2013
EPA changed the name of the B.F. Goodrich site in Rialto California to Rockets, Fireworks, and Flares (RFF)	December 12, 2013
Final Design Report for expanded treatment system	June 18, 2014
Four Party Implementation Agreement	September 1, 2015
Start of On-Site Construction	September 18, 2015
2016 Remedial Design Investigation Report to provide current water level measurements and contaminant concentration data for wells in the Source Area Operable Unit vicinity.	November 2016
Initial Pilot Test performed to demonstrate the effectiveness of the ion exchange (IX) resin and lead/mid/lag series design in the Combined Treatment Plant.	December 2016 to March 2017
Second Pilot Test Work Plan	October 2017
2017 Remedial Design Investigation Report to provide current water level measurements and contaminant concentration data for wells in the Source Area Operable Unit vicinity.	November 2017
2018 Remedial Design Investigation Report to provide current water level measurements and contaminant concentration data for wells in the Source Area Operable Unit vicinity.	November 2018
Second Pilot Test performed to better simulate full-scale operations.	January 2018 to December 2019
2019 Remedial Design Investigation Report to provide current water level measurements and contaminant concentration data for wells in the Source Area Operable Unit vicinity.	October 2019

Appendix C: Data Review

Mann-Kendall Analysis for Groundwater

The Mann-Kendall test is a non-parametric test for identifying trends in time-series data. The test compares the relative magnitudes of sample data rather than the data values themselves. One benefit of this test is that the data does not need to conform to any one distribution type. Data reported as non-detects can be included by assigning them a common value that is smaller than the lowest detected value in the dataset, although the number of non-detects should not be greater than 50 percent of the sample size (*n*). For the purposes of this evaluation Non-Detectable values are highlighted in red.

Data are evaluated as an ordered time series. Each data value is compared to all subsequent data values. If a data value from a later time is higher than a data value from an earlier time, *S* is incremented by 1. Conversely, if a data value from a later time is lower than a data value from an earlier time, *S* is decremented by 1. The net result of all such increments and decrements yields the final value of *S*. A positive value of *S* is an indicator of a potentially increasing trend. Likewise, a negative value of *S* is an indicator of a potentially decreasing trend. A very high positive *S* is an indicator of a likely significant increasing trend; however, it is necessary to compute the probability associated with *S* and the sample size, *n*, to statistically quantify the significance of the trend.

Kendall describes a normal-approximation test that may be used for datasets with more than 10 values, provided there are not many tied values within the dataset. First, *S* is determined and then the variance (VAR) of *S* is calculated based on the following equation:

$$VAR(S) = [n*(n-1)*(2n+5)]/18$$

A normalized Test Statistic (*Z*) is calculated using the following equations:

$$Z = (S-1)/\sqrt{[VAR(S)]} \quad \text{if } S>0$$

$$Z=0 \quad \text{if } S=0$$

$$Z= (S+1)/\sqrt{[VAR(S)]} \quad \text{if } S<0$$

For a trend to attain at least a 95 percent level of significance, the Test Statistic *Z* must be greater than 1.645 for a positive trend or must be less than -1.645 for a negative trend. If neither of these conditions are met, then the dataset shows no trend at that level of significance.

Notes:

1. At least four independent sampling events per well are required for calculating the trend. *Methodology is valid for 4 to 40 samples.*
2. Confidence in Trend = Confidence (in percent) that constituent concentration is increasing (S>0) or decreasing (S<0): >95% = Increasing or Decreasing; ≥ 90% = Probably Increasing or Probably Decreasing; < 90% and S>0 = No Trend; < 90%, S≤0, and COV ≥ 1 = No Trend; < 90% and COV < 1 = Stable.
3. Methodology based on "MAROS: A Decision Support System for Optimizing Monitoring Plans", J.J. Aziz, M. Ling, H.S. Rifai, C.J. Newell, and J.R. Gonzales, *Ground Water*, 41(3):355-367, 2003.
