APPENDIX A

NOTICE OF PREPARATION AND CORRESPONDENCE

City of Rialto
California

CLERK OF THE BOARD
Received on: 12/08/2020
Remove on: 01/22/2020

Date: December 2, 2020

To: Responsible and Trustee Agents/Interested Organizations and Individuals

Subject: Notice of Preparation (NOP) of a Draft Environmental Report and Notice of a Public Scoping Meeting (Scoping Meeting) for the Olive Avenue Development Project

CLERK OF THE BOARD OF SUPERVISORS
2020 DEC -8 PM 4:36
COUNTY OF SAN BERNARDINO
CALIFORNIA

Lead Agency
City of Rialto, Planning Department
150 S. Palm Avenue
Rialto, CA 92376
Attention: Karen Peterson

Consulting Firm
Kimley-Horn and Associates, Inc.
401 B Street, Suite 600
San Diego, CA 92101
Attention: Casey Schooner

Due to the time limits mandated by State law, we request that your response to this Notice of Preparation (NOP) be sent at the earliest possible date.

Notice of Preparation Review Period: December 2, 2020 to January 21, 2021

Scoping Meeting: Wednesday, January 14, 2021 at 6:00 PM. The Scoping Meeting will be held virtually

Project Title: Olive Avenue Development (Project)

Location: The Olive Avenue Development (proposed Project) is located the City of Rialto in San Bernardino County, California. The project site is south of State Route 210 (SR-10) and west of Interstate 215 (I-215) as depicted in **Figure 1, Regional Location Map.** The Project is proposed on an existing, single lot, with an overall Project site of approximately 31.60 gross acres/31.08 net acres and located directly north of Baseline Road, approximately 325 feet east of Fitzgerald Avenue, directly south of Jerry Eaves Park, and approximately 0.25 miles west of Cactus Avenue, as depicted in **Figure 2, Project Vicinity Map.**

A. Project Overview

PR/CHI Olive Grove, LLC (Owner) is proposing to develop an existing vacant property (location as referenced above) that would include the construction of two industrial warehouse buildings with approximately 10,000 square feet of office/mezzanine space, 866 square feet for exterior building sprinkler fire pumps, and 668,524 square feet of warehouse space for a total of 679,390 square feet on approximately 31.08 net acres. The Owner is proposing to split the existing property (referenced as Assessor Parcel No. (APN) 0264-213-18) from one large lot into two lots to allow for each of the two proposed buildings to each have their own legal parcel. As shown in **Figure 3, Building Site Configuration,** Building 1 (west building) and Building 2 (east building) have been architecturally designed to allow for multiple units in various increments based on tenant demand. Figure 3 conceptually shows that Building

1 can be divided into 4 or more units and Building 2 can be divided into 3 or more units, each with a separate point of entry into the buildings.

The City requires that based on the uses being proposed by the Owner, the Project would require 420 automobile parking spaces. The Project proposes 505 automobile parking spaces, as well as 122 total trailer parking spaces. **Table 1, Building Site Summary**, summarizes the automobile and loading docks required by the City and proposed for each building.

Table 1: Building Site Summary

Building	Warehouse (sf)	Office Mezzanine (sf)	Fire Pump	Total Building (sf)	Automobile Parking Stalls		Loading Docks Required	Loading Docks Provided
					Required	Provided		
Building 1	425,148	5,000	433	430,581	258	308	7	46
Building 2	243,376	5,000	433	248,809	156	197	5	31

The proposed buildings are currently planned as "speculative buildings", meaning that there are not business uses identified for the buildings. Without knowing the specifics in terms of the future tenants or buyers, the Project is mandated to provide the parking (auto and trailer parking) as shown in **Table 1**. Therefore, the Environmental Impact Report (EIR) and associated technical reports will use City approved numbers for the approximate potential on-site employees, hours of operation, and vehicular traffic generation based on the Project's proposed square footage and use as warehouse buildings as dictated by the City guidelines.

Landscaping

Landscaping is required by City code to cover 10% of each lot and based on the proposed Project would cover approximately 13.17% (101,410 square feet) on Parcel 1 and 15.24% (85,000 square feet) on Parcel 2 of the site. Landscaping would be installed in all areas not devoted to buildings, parking, traffic and specific user requirements, in accordance with the City's Municipal Code Section 18.61.250 and Section 18.61.270 which specify landscape design guidelines for industrial districts.

Construction

Construction of the proposed Project is expected to commence in 2021 with a construction duration of approximately 9-10 months and would be completed in one phase of construction. Total excavation and fill of soils for the proposed Project is anticipated to require 250,803 cubic yards (cy) of cut and 21,055 cy of fill, with approximately 229,748 cy of exported soil.

B. Project Setting

Adjacent properties include Jerry Eaves Park to the north (City zoned for Park (R-P)) and a San Bernardino County Flood Control District (SBCFCD) basin to the east (City zoned as Cactus Basin (OS-CB) in the Rialto Airport Specific Plan. Properties to the south and across Baseline Road are zoned Single Family Residential

(R-1B), and adjacent properties to the west are zoned Employment in the Renaissance Specific Plan and currently improved as industrial buildings.

C. Requested Project Approvals

City of Rialto discretionary actions that could be approved based on the certification of the Final EIR would include the following:

- **Precise Plan of Design (PPD) (PPD 2020-0003)**: Site development of two warehouse buildings totaling approximately 679,390 square feet on two proposed parcels. Total site area consists of approximately 31.08 net acres for both buildings.
- **Tentative Parcel Map (TPM) (TPM 2020-0001)**: To divide the existing parcel into two parcels and show the required City right-of-way dedication for Baseline Road, vacations and easements. The proposed parcel reconfiguration is shown in **Figure 4, Proposed Parcels.**
- **Conditional Development Permit (CDP 2020-0002):** Conditional Development Permit for the development of a warehouse, which is a conditionally permitted use in industrial zones within the City of Rialto.

D. Project Characteristics

General Plan Designation: The Project site is designated as Business Park within the Rialto General Plan.

Zoning: The Project site is zoned as Airport Related Planned Industrial Development (I-AR) within the Rialto Airport Specific Plan.

E. Circulation and Parking

Vehicular access to the proposed Project would consist of three driveways on Baseline Road. The center driveway would be signalized and would provide truck and passenger vehicle ingress/egress to the site. The eastern and western driveways would be right-in right-out and would be dedicated to passenger and emergency vehicles. Street improvements to Baseline Road may consist of the following: sidewalk, parkway landscaping, curb and gutter, median improvements, bike lanes, dry utility undergrounding, streetlights, fire hydrants, traffic signal equipment (center driveway intersection), rehabilitation of existing asphalt pavement, offsite utility connections, and signing and striping, as required by the City. Off-site improvements would include construction of a new signalized intersection at Idyllwild Avenue and Baseline Road to provide signalized access to the residences south of Baseline Road and construction of a new signalized intersection at the center of the Project along Baseline Road to allow for direct truck access into and out of the Project. As shown in **Table 1, Building Site Summary** (above), the proposed Project would meet the parking requirements for all proposed buildings.

Environmental Issues to be Evaluated in the EIR

The City of Rialto, the lead agency for the proposed Project, is subject to specific environmental review under CEQA. CEQA Guidelines Section 15063 provides that if a lead agency determines that an EIR will clearly be required for a project, an Initial Study is not required. In this case, the City has already

determined that an EIR will need to be prepared based on the Project's potential to create short-term, long-term and cumulative impacts. Therefore, an EIR will be prepared to fully evaluate the potential impacts of the proposed Project. The EIR will be comprehensive in nature evaluating all identified issues from the 2020 CEQA Initial Study Checklist.

The following issues are anticipated to be addressed in the EIR:

• Aesthetics • Agriculture and Forestry Resources • Air Quality • Biological Resources • Cultural Resources • Energy • Geology and Soils • Greenhouse Gas Emissions • Hazards and Hazardous Materials • Hydrology and Water Quality • Land Use and Planning • Mineral Resources • Noise • Population and Housing • Public Services • Recreation • Transportation • Tribal Cultural Resources • Utilities and Service Systems • Wildfire

The EIR will address the short-term and long-term effects of the Project on the surrounding environment, including the requirements of the proposed off-site improvements. The EIR will also evaluate the potential for the Project to cause direct and indirect growth-inducing impacts, as well as cumulative impacts. Alternatives to the proposed Project will be evaluated that may reduce impacts that are determined to be significant in the EIR. Mitigation may be proposed for those impacts that are determined to be significant. A mitigation monitoring program will also be developed as required by Section 15097 of the CEQA Guidelines.

Public Review Period

The CEQA process requires a 30-day public review period for an NOP. In accordance with CEQA, should you have any comments, the City is requesting that written responses to this NOP be provided within the 30-day NOP period of December 2, 2020 to December 31, 2020. However, the City has elected to have an extended scoping period due to the holidays, and the deadline to submit is January 21, 2021.

The City is requesting comments and guidance on the scope and content of the EIR from Responsible and Trustee agencies, interested public agencies, organizations, and the general public (pursuant to CEQA Guidelines §15082). All parties that have submitted their names and mailing addresses will be notified as part of the Project's CEQA review process. If you wish to be placed on the mailing list or have any questions or need additional information, please contact the lead agency contact noted below.

Agencies: The City requests each Responsible and Trustee agency's views on the scope and content of environmental issues relevant to your agency's statutory responsibilities in connection with the proposed Project, in a manner consistent with California Code of Regulations, Title 14, Section 15082(b). Your agency may use the EIR prepared by the City when considering any permits that your agency must issue, or other approvals for the Project.

Public Comments

The City requests your careful review and consideration of this notice, and invites ***written comments*** from interested agencies, persons, and organizations regarding the preparation of the EIR. Please indicate a contact person for your agency or organization. Please send your written comments to:

City of Rialto
California

Attn: Karen Peterson
City of Rialto
Community Development Department
Planning Division
150 S. Palm Avenue
Rialto, CA 91730
Phone: 909-421-7246
Email: kpeterson@rialtoca.gov

Please include the name, phone number, email, and address of a contact person in your response.

You may also provide comments during the virtual ***Scoping Meeting*** noted below. Comments in response to this notice must be submitted to the City through close of business 6:00 PM on January 21, 2021.

Public Scoping Meeting

The City will have a Scoping Meeting to present the proposed Project and the CEQA process, and to receive public comments and suggestions regarding the scope and content of the EIR. Information regarding the virtual Scoping Meeting is as follows:

Date: Thursday, January 14, 2021

Location: City of Rialto (to be held online)

Join on your computer or mobile app: https://teams.microsoft.com/l/meetup-join/19%3ameeting_NmQxNDExYmYtYTdhNS00YjRhLTljMWMtNzYyN2NjNmI3Zm Yy%40thread.v2/0?context=%7b%22Tid%22%3a%227e220d30-0b59-47e5-8a81-a4a9d9afbdc4%22%2c%22Oid%22%3a%22231d83be-3d6f-43f1-9bc2-25376b4f3110%22%7d

December 22, 2020

Project Name: Olive Ave Development (Project) City of Rialto

Dear Karen Peterson,

Thank you for your letter dated December 2,2020 regarding AB52 consultation. The above proposed project location is within our Ancestral Tribal Territory; therefore, our Tribal Government requests to schedule a consultation with you as the lead agency, to discuss the project and the surrounding location in further detail.

Please contact us at your earliest convenience. ***Please Note:AB 52, "consultation" shall have the same meaning as provided in SB 18 (Govt. Code Section 65352.4).***

Thank you for your time,

Andrew Salas, Chairman

RE: CEQA – NOTICE OF PREPARATION FOR A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE OLIVE AVENUE DEVELOPMENT PROJECT

Dear Karen Peterson:

Thank you for allowing the San Bernardino County Department of Public Works the opportunity to comment on the above-referenced project. **We received this request on December 7, 2020** and pursuant to our review, we have the following comments:

Flood Control Planning & Water Resources Division (Michael Fam, Chief, 909-387-8120):

1. According to the most recent FEMA Flood Insurance Rate Maps, Panel 06071C8657H, dated August 28, 2008, the Project lies within Zone X (unshaded).

2. We are aware there may be storm drains in and around the site that may be affected by the proposed Project. When planning for or altering existing or future storm drains, be advised that the Project is subject to the Rialto MPD dated, February 2009 and the Renaissance Specific Plan dated, April 2011. It is to be used as a guideline for drainage in the area. Any revision to the drainage should be reviewed and approved by the City. Should construction of new, or alterations to existing storm drains be necessary as part of the Proposed Project, their impacts and any required mitigation should be discussed within the EIR before the document is adopted by the Lead Agency.

BOARD OF SUPERVISORS
Col. Paul Cook (Ret.) First District | Janice Rutherford Second District | Dawn Rowe Third District | Curt Hagman Chairman, Fourth District | Joe Baca, Jr. Fifth District
Leonard X. Hernandez Chief Executive Officer

3. From the information that was provided portions of the proposed Project are adjacent to a San Bernardino County Flood Control District (SBCFCD) facility and right-of-way (2-104-4 Cactus Basin No. 3) and encroaching upon a District easement (1974/227 OR) located along the eastern property line of the project. Be advised that any impacts on SBCFCD's right-of-way or facilities including, but not limited to: limiting District access to its facility from street improvements, grading, landscaping, utility crossing and fencing/wall installation will require a permit from the SBCFCD. The necessity for any, or all of these permits, and any impacts associated with them, should be addressed in the EIR prior to adoption and certification.

We respectfully request to be included on the circulation list for all project notices, public reviews, or public hearings. In closing, I would like to thank you again for allowing the San Bernardino County Department of Public Works the opportunity to comment on the above-referenced project. Should you have any questions or need additional clarification, please contact the individuals who provided the specific comment, as listed above.

Sincerely,

Michael Perry

Rialto, California 91730

Notice of Preparation of a Draft Environmental Impact Report for Olive Avenue Development Project (Proposed Project)

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. Our comments are recommendations on the analysis of potential air quality impacts from the Proposed Project that should be included in the Draft Environmental Impact Report (EIR). Please send a copy of the Draft EIR upon its completion and public release directly to South Coast AQMD as copies of the Draft EIR submitted to the State Clearinghouse are not forwarded. **In addition, please send all appendices and technical documents related to the air quality, health risk, and greenhouse gas analyses and electronic versions of all emission calculation spreadsheets, and air quality modeling and health risk assessment input and output files (not PDF files). Any delays in providing all supporting documentation for our review will require additional review time beyond the end of the comment period.**

CEQA Air Quality Analysis

Staff recommends that the Lead Agency use South Coast AQMD's CEQA Air Quality Handbook and website[1] as guidance when preparing the air quality and greenhouse gas analyses. It is also recommended that the Lead Agency use the CalEEMod[2] land use emissions software, which can estimate pollutant emissions from typical land use development and is the only software model maintained by the California Air Pollution Control Officers Association.

South Coast AQMD has developed both regional and localized significance thresholds. South Coast AQMD staff recommends that the Lead Agency quantify criteria pollutant emissions and compare the emissions to South Coast AQMD's CEQA regional pollutant emissions significance thresholds[3] and localized significance thresholds (LSTs)[4] to determine the Proposed Project's air quality impacts. The localized analysis can be conducted by either using the LST screening tables or performing dispersion modeling.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the Proposed Project and all air pollutant sources related to the Proposed Project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road

[1] South Coast AQMD's CEQA Handbook and other resources for preparing air quality analyses can be found at: http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook.
[2] CalEEMod is available free of charge at: www.caleemod.com.
[3] South Coast AQMD's CEQA regional pollutant emissions significance thresholds can be found at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf.
[4] South Coast AQMD's guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds.

mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips, and hauling trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers and air pollution control devices), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, such as sources that generate or attract vehicular trips, should be included in the analysis. Furthermore, emissions from the overlapping construction and operational activities should be combined and compared to South Coast AQMD's regional air quality CEQA ***operational*** thresholds to determine the level of significance.

If the Proposed Project generates diesel emissions from long-term construction or attracts diesel-fueled vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the Lead Agency perform a mobile source health risk assessment[5].

In the event that implementation of the Proposed Project requires a permit from South Coast AQMD, South Coast AQMD should be identified as a Responsible Agency for the Proposed Project in the Draft EIR. The assumptions in the air quality analysis in the Final EIR will be the basis for evaluating the permit under CEQA and imposing permit conditions and limits. Questions on permits should be directed to South Coast AQMD's Engineering and Permitting staff at (909) 396-3385.

The California Air Resources Board's (CARB) *Air Quality and Land Use Handbook: A Community Health Perspective*[6] is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process with additional guidance on strategies to reduce air pollution exposure near high-volume roadways available in CARB's technical advisory[7].

South Coast AQMD staff is concerned about potential public health impacts of siting warehouses within close proximity of sensitive land uses, especially in communities that are already heavily affected by the existing warehouse and truck activities. The South Coast AQMD's Multiple Air Toxics Exposure Study (MATES IV), completed in May 2015, concluded that the largest contributor to cancer risk from air pollution is diesel particulate matter (DPM) emissions[8]. According to the MATES IV Carcinogenic Risk interactive Map, the area surrounding the Proposed Project has an estimated cancer risk over 740 in one million[9]. Operation of warehouses generates and attracts heavy-duty diesel-fueled trucks that emit DPM. When the health impacts from the Proposed Project are added to those existing impacts, residents living in the communities surrounding the Proposed Project will possibly face an even greater exposure to air pollution and bear a disproportionate burden of increasing health risks.

Mitigation Measures

In the event that the Proposed Project results in significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize these impacts. Any impacts resulting from mitigation measures must also be analyzed. Several resources to assist the Lead Agency with identifying potential mitigation measures for the Proposed Project include South Coast AQMD's CEQA Air Quality Handbook[1], South Coast AQMD's Mitigation Monitoring and

[5] South Coast AQMD's guidance for performing a mobile source health risk assessment can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mobile-source-toxics-analysis.

Reporting Plan for the 2016 Air Quality Management Plan[10], and Southern California Association of Government's Mitigation Monitoring and Reporting Plan for the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy[11].

Mitigation measures for operational air quality impacts from mobile sources that the Lead Agency should consider in the Draft EIR may include the following:

- Require zero-emissions (ZE) or near-zero emission (NZE) on-road haul trucks such as heavy-duty trucks with natural gas engines that meet the CARB's adopted optional NOx emissions standard at 0.02 grams per brake horsepower-hour (g/bhp-hr), if and when feasible. Given the state's clean truck rules and regulations aiming to accelerate the utilization and market penetration of ZE and NZE trucks such as the Advanced Clean Trucks Rule[12] and the Heavy-Duty Low NOx Omnibus Regulation[13], ZE and NZE trucks will become increasingly more available to use. The Lead Agency should require a phase-in schedule to incentive the use of these cleaner operating trucks to reduce any significant adverse air quality impacts. South Coast AQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the Lead Agency. At a minimum, require the use of 2010 model year[14] that meet CARB's 2010 engine emissions standards at 0.01 g/bhp-hr of particulate matter (PM) and 0.20 g/bhp-hr of NOx emissions or newer, cleaner trucks. Include environmental analyses to evaluate and identify sufficient electricity and supportive infrastructures in the Energy and Utilities and Service Systems Sections in the CEQA document, where appropriate. Include the requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with project construction to document that each truck used meets these emission standards, and make the records available for inspection. The Lead Agency should conduct regular inspections to the maximum extent feasible to ensure compliance.
- Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the Final CEQA document. If higher daily truck volumes are anticipated to visit the site, the Lead Agency should commit to re-evaluating the Proposed Project through CEQA prior to allowing this higher activity level.
- Provide electric vehicle (EV) charging stations or at a minimum, provide the electrical infrastructure and electrical panels should be appropriately sized. Electrical hookups should be provided for truckers to plug in any onboard auxiliary equipment.

[10] South Coast AQMD's 2016 Air Quality Management Plan can be found at: http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2017/2017-mar3-035.pdf (starting on page 86).

[11] Southern California Association of Governments' 2020-2045 RTP/SCS can be found at: https://www.connectsocal.org/Documents/PEIR/certified/Exhibit-A_ConnectSoCal_PEIR.pdf.

[12] CARB. June 25, 2020. *Advanced Clean Trucks Rule*. Accessed at: https://ww2.arb.ca.gov/our-work/programs/advanced-clean-trucks.

[13] CARB has recently passed a variety of new regulations that require new, cleaner heavy-duty truck technology to be sold and used in state. For example, on August 27, 2020, CARB approved the Heavy-Duty Low NOx Omnibus Regulation, which will require all trucks to meet the adopted emission standard of 0.05 g/hp-hr starting with engine model year 2024. Accessed at: https://ww2.arb.ca.gov/rulemaking/2020/hdomnibuslownox.

[14] CARB adopted the statewide Truck and Bus Regulation in 2010. The Regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Newer heavier trucks and buses must meet particulate matter filter requirements beginning January 1, 2012. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent. More information on the CARB's Truck and Bus Regulation is available at: https://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm.

Mitigation measures for operational air quality impacts from other area sources that the Lead Agency should consider in the Draft EIR may include the following:

- Maximize use of solar energy by installing solar energy arrays.
- Use light colored paving and roofing materials.
- Utilize only Energy Star heating, cooling, and lighting devices, and appliances.
- Use of water-based or low VOC cleaning products that go beyond the requirements of South Coast AQMD Rule 1113.

Design considerations for the Proposed Project that the Lead Agency should consider to further reduce air quality and health risk impacts include the following:

- Clearly mark truck routes with trailblazer signs, so that trucks will not travel next to or near sensitive land uses (e.g., residences, schools, day care centers, etc.).
- Design the Proposed Project such that truck entrances and exits are not facing sensitive receptors and trucks will not travel past sensitive land uses to enter or leave the Proposed Project site.
- Design the Proposed Project such that any check-in point for trucks is inside the Proposed Project site to ensure that there are no trucks queuing outside.
- Design the Proposed Project to ensure that truck traffic inside the Proposed Project site is as far away as feasible from sensitive receptors.
- Restrict overnight truck parking in sensitive land uses by providing overnight truck parking inside the Proposed Project site.

South Coast AQMD staff is available to work with the Lead Agency to ensure that air quality, greenhouse gas, and health risk impacts from the Proposed Project are accurately evaluated and mitigated where feasible. If you have any questions regarding this letter, please contact me at lsun@aqmd.gov.

Sincerely,

Lijin Sun

RE: OLIVE AVE DEVELOPMENT-COMMERCIAL

Dear Sirs,

Thank you for forwarding the notice regarding the OLIVE AVE DEVELOPMENT project. Per the project description this plan is within the Rialto Unified School District boundary. Please keep district updated on the permit timeline of this project.

COMMERCIAL TRAFFIC

Per The project description on page-2 *"The project proposes 505 automobile parking spaces as well as 122 total trailer parking spaces"* to service the project plan. The Rialto Unified School District would like to point out that (3) blocks to the East (.5 miles) is located Eisenhower High School-1321 N Lilac. The School District would like to be assured that this increase in vicinity traffic would not interfere with the day to day operations of the high school once it is in full operation as it serves over 2,300 students with School Bus service, parent/student drivers, maintenance and food service vehicles and or that the existing school district functions will not interfere with operations of the Olive Ave Dev Project.

SAFE ROUTES

Rialto Unified School District participates in the Safe Routes to School Program and wants to make sure that this project coincides with any Safe Route improvements within the area such as fully developed safe walking patterns and biking paths to and from existing schools for all pedestrians.

MITIGATION FEES

The Rialto Unified School District requests to be notified in writing in advance of any and all notices regarding this development. The Rialto Unified School district is empowered to collect all Mitigation Fees pursuant to Board of Education Resolution. The fee must be paid prior to the issuance of any building permits. Upon payment of fees, a Certificate of Compliance will be issued.

Thank you in advance for any further communications.

If you have any questions, please call (909) 421-7555.

Respectfully,

George Palma
Facilities Planning

1 can be divided into 4 or more units and Building 2 can be divided into 3 or more units, each with a separate point of entry into the buildings.

The City requires that based on the uses being proposed by the Owner, the Project would require 420 automobile parking spaces. The Project proposes 505 automobile parking spaces, as well as 122 total trailer parking spaces. **Table 1, Building Site Summary**, summarizes the automobile and loading docks required by the City and proposed for each building.

Table 1: Building Site Summary

Building	Warehouse (sf)	Office Mezzanine (sf)	Fire Pump	Total Building (sf)	Automobile Parking Stalls		Loading Docks Required	Loading Docks Provided
					Required	Provided		
Building 1	425,148	5,000	433	430,581	258	308	7	46
Building 2	243,376	5,000	433	248,809	156	197	5	31

The proposed buildings are currently planned as "speculative buildings", meaning that there are not business uses identified for the buildings. Without knowing the specifics in terms of the future tenants or buyers, the Project is mandated to provide the parking (auto and trailer parking) as shown in **Table 1**. Therefore, the Environmental Impact Report (EIR) and associated technical reports will use City approved numbers for the approximate potential on-site employees, hours of operation, and vehicular traffic generation based on the Project's proposed square footage and use as warehouse buildings as dictated by the City guidelines.

Landscaping

Landscaping is required by City code to cover 10% of each lot and based on the proposed Project would cover approximately 13.17% (101,410 square feet) on Parcel 1 and 15.24% (85,000 square feet) on Parcel 2 of the site. Landscaping would be installed in all areas not devoted to buildings, parking, traffic and specific user requirements, in accordance with the City's Municipal Code Section 18.61.250 and Section 18.61.270 which specify landscape design guidelines for industrial districts.

Construction

Construction of the proposed Project is expected to commence in 2021 with a construction duration of approximately 9-10 months and would be completed in one phase of construction. Total excavation and fill of soils for the proposed Project is anticipated to require 250,803 cubic yards (cy) of cut and 21,055 cy of fill, with approximately 229,748 cy of exported soil.

B. Project Setting

Adjacent properties include Jerry Eaves Park to the north (City zoned for Park (R-P)) and a San Bernardino County Flood Control District (SBCFCD) basin to the east (City zoned as Cactus Basin (OS-CB) in the Rialto Airport Specific Plan. Properties to the south and across Baseline Road are zoned Single Family Residential

INLAND EMPIRE BIKING ALLIANCE

Rialto, CA 91730

Re: Olive Avenue Development Project Notice of Preparation (SCH 2020120036)

Dear Ms. Peterson,

I am writing today on behalf of the Inland Empire Biking Alliance, a local nonprofit dedicated to making the Inland Empire a safer and more convenient place for people from all rolls of life. This letter is in response to the Notice of Preparation for the Olive Avenue Development Project (Project) which has been proposed and available for public comment. After reviewing the documents made available, we are providing the following comments and concerns which we would like to see addressed in the Environmental Impact Report (EIR).

Our biggest concern that we would like to ensure is addressed in the EIR is the impact that the Project would have on the Cactus Avenue Trail (Trail) which is identified as Priority Project 11 in the Rialto Active Transportation Plan (ATP)[1]. As detailed in Figure 5-15: Cactus Avenue Trail Proposed Improvements of the ATP, that facility would be built along a portion of the east and the northern property lines as part of a larger effort to encircle the entire flood control basin in the vicinity. However, based on Figure 2: Project Vicinity Map, Figure 3: Building Site Configuration, and Figure 4: Proposed Parcels of the NOP, it is not clear that the Project would at least be leaving the space necessary for the construction of the Trail, if not just directly constructing it as part of the conditions of the Project.

Needless to say, were the Project to be constructed without at least leaving adequate space for the Trail, it would likely result in the realistic outcome of precluding the Trail in its entirety in those locations, so the EIR needs to provide clarity on how that situation would be avoided. While the ATP has not done the project-level planning of the Trail, it would be ideal to reserve 20 feet of width to provide for the Trail as that is wide enough for constructing the ideal option of a Class I path at least 11 feet in width with a separate sidewalk. Otherwise, if they would be combined, then a Class I path of 14 feet should really be a minimum practical width.

[1] City of Rialto (2020). Rialto Active Transportation Plan. Retrieved from https:/www.yourrialto.com/wp-content/uploads/2020/02/Rialto-Active-Transportation-Plan-FINAL.pdf.

We would also like to urge that the Traffic and VMT analyses take advantage of both the Trail and other in-progress bicycle facilities to leverage the ability of people to travel by bike and reduce the need for improvements which are focused on catering to car traffic. The Project's location directly adjacent the Trail means that it would be possible for people to travel to work at the facility entirely along that bikeway for those who live in communities which access it and would be a bike travel time of 15-20 minutes from the Rialto Metrolink station by bike, well below the mean travel time to work of 32.4 minutes for the city[2]. We would encourage the EIR to identify potential points of connection from the Trail to the Project itself to facilitate that option for people to reach the facilities.

Finally, we would like to ensure that if the EIR analyses identify additional mitigation measures elsewhere in the city due to this Project, that the ATP also be consulted to ascertain that those measures would not impact any improvements planned in the ATP, including reducing the usability of those facilities, both for bicyclists and pedestrians. In too many situations, active transportation users, especially pedestrians, are left holding the shortest ends of the stick as measures implemented to maintain car accessibility such as overlap phasing on traffic signals lead to the removal of a crosswalk, turning what would normally be a simple trip across the street into a three-sided ordeal taking multiple light cycles to complete.

In summary, we are hoping that this EIR can identify how this Project would improve, not hinder the plans which have been set forth in the Rialto ATP. We want to ensure that at the very least, the Project will provide the space for future construction of the Cactus Avenue Trail to top-quality standards, including through the provision of the necessary space for completing that if it is not directly conditioned on the applicant to construct. We would like to see that an actual analysis of using bicycle traffic to reach the facility is carried out. And finally, we want to know that the EIR will make sure that any proposed mitigation measures use a complete streets framework to consider all users and do not hinder the ability of the ATP to be implemented.

Thank you for your time, please feel free to reach out if there are any additional questions or comments.

Sincerely,

Marven E. Norman, Executive Director

1 INTRODUCTION

This report documents the results of an Air Quality Assessment completed for the Olive Avenue Development (Project). The purpose of this Air Quality Assessment is to evaluate the potential construction and operational emissions associated with the Project and determine the level of impact the Project would have on the environment.

1.1 Project Location

The Project site is located north of Baseline Road and east of Fitzgerald Avenue in the City of Rialto, in San Bernardino County. The project site is located southeast of Rialto Municipal Airport and south of Jerry Eaves Park. The project site is currently vacant and is bounded by Jerry Eaves Public Park to the north, vacant land and single-family residential uses to the east, West Baseline Road and single-family residential uses to the south, and vacant land and industrial uses to the west. The 31.6-acre site is located approximately one-mile south the Foothill Freeway (SR-210), Seven miles east of Interstate 15 (I-15), One mile north of Route 66 (RTE-66), and Five miles west of San Bernardino Freeway (SR-215); refer to Exhibit 1: Regional Location Map and Exhibit 2: Project Vicinity Map***.***

1.2 Project Description

The Project is proposing to develop an existing vacant property (location as referenced above) that would include the construction of a campus oriented industrial project with two primary, divisible, buildings consisting of approximately 10,000 square feet of office/mezzanine space, 866 square feet for exterior building sprinkler fire pumps, and 668,741 square feet of warehouse space for a total of 679,607 square feet on approximately 31.08 net acres. The Owner is proposing to split the existing property (referenced as Assessor Parcel No. (APN) 0264-213-18) from one large lot into two lots to allow for each of the two proposed buildings to each have their own legal parcel.

As shown in Exhibit 3: Conceptual Site Plan, Building 1 (west building) and Building 2 (east building) have been architecturally designed to allow for multiple units in various increments based on tenant demand. Exhibit 3 shows that Building 1 can be divided into 4 or more units and Building 2 can be divided into 3 or more units, each with a separate point of entry into the buildings.

Existing General Plan Land Use and Zoning Designations

The Project site is zoned for Industrial Park land Use. Adjacent properties to the north are zoned for open space resources and open space recreation uses. Properties to the west are zoned for a specific site plan: Renaissance site. The properties to the south are zoned for residential and open space resources. Properties zoned for residential and Community commercial are due east of the Project site.

Warehouse Facility

The proposed Project consists of two warehouse buildings for a total of 679,390 square feet; refer to Table 1: Building Summary. Building “1” would include 425,148 square feet of warehouse area, 5,000 square feet of office space, and 433 feet designated for a fire pump. Building “2” would include 243,376 square feet of warehouse area, 5,000 square feet of office space, and 433 feet designated for a fire pump.

Table 1: Building Summary

Building	Warehouse (sf)	Office Mezzanine (sf)	Fire Pump (sf)	Total Building (sf)	Parking			Landscaping (sf)
					Automobiles	Truck/Trailer Stalls	Loading Docks	
1	425,148	5,000	433	430,581	308	64	48	97,826
2	243,593	5,000	433	249,026	197	58	31	79,031

Notes: sf = square feet

Site Access

Vehicular access provisions for the project site would consist of three driveways on Baseline Road. Passenger vehicles would access the site via all three driveways. The center driveway would be signalized and would provide truck and passenger vehicle ingress/egress to the site. The eastern and western driveways would be right-in right-out and would be dedicated to passenger and emergency vehicles. Street improvements to Baseline Road may consist of the following: sidewalk, parkway landscaping, curb and gutter, median improvements, bike lanes, dry utility undergrounding, streetlights, fire hydrants, traffic signal equipment (center driveway intersection), rehabilitation of existing asphalt pavement, offsite utility connections, and signing and striping, as required by the City. Off-site improvements would include construction of a new signalized intersection at Idyllwild Avenue and Baseline Road to provide signalized access to the residences south of Baseline Road and construction of a new signalized intersection at the center of the Project along Baseline Road to allow for direct truck access into and out of the Project.

Parking

The Project provides 505 automobile parking stalls, exceeding the requirement of 414 automobile parking stalls. Additionally, 122 trailer parking spaces and 79 loading docks are provided.

Landscaping

Landscaping is required by City code to cover 10% of each lot and based on the proposed Project would cover approximately 12.27% (97,826 square feet) on Parcel 1 and 14.17% (79,031 square feet) on Parcel 2 of the site. Landscaping would be installed in all areas not devoted to buildings, parking, traffic and specific user requirements, in accordance with the City's Municipal Code Section 18.61.250 and Section 18.61.270 which specify landscape design guidelines for industrial districts.

2 ENVIRONMENTAL SETTING

2.1 Climate and Meteorology

The California Air Resources Board (CARB) divides the State into 15 air basins that share similar meteorological and topographical features. The Project is located within the South Coast Air Basin (SCAB), which includes the non-desert portions of Los Angeles, Riverside, and San Bernardino counties, as well as all of Orange County. The SCAB is on a coastal plain with connecting broad valleys and low hills, bounded by the Pacific Ocean on the southwest and high mountains forming the remainder of the perimeter[1]. Air quality in this area is determined by such natural factors as topography, meteorology, and climate, in addition to the presence of existing air pollution sources and ambient conditions. These factors along with applicable regulations are discussed below.

The SCAB is part of a semi-permanent high-pressure zone in the eastern Pacific. As a result, the climate is mild and tempered by cool sea breezes. This usually mild weather pattern is occasionally interrupted by periods of extreme heat, winter storms, and Santa Ana winds. The annual average temperature throughout the 6,645-square-mile SCAB ranges from low 60 to high 80 degrees Fahrenheit with little variance. With more oceanic influence, coastal areas show less variability in annual minimum and maximum temperatures than inland areas.

Contrasting the steady pattern of temperature, rainfall is seasonally and annually highly variable. Almost all annual rainfall occurs between the months of November and April. Summer rainfall is reduced to widely scattered thundershowers near the coast, with slightly heavier activity in the east and over the mountains.

Although the SCAB has a semiarid climate, the air closer to the Earth's surface is typically moist because of the presence of a shallow marine layer. Except for occasional periods when dry, continental air is brought into the SCAB by offshore winds, the "ocean effect" is dominant. Periods of heavy fog are frequent and low clouds known as high fog are characteristic climatic features, especially along the coast. Annual average humidity is 70 percent at the coast and 57 percent in the eastern portions of the SCAB.

Wind patterns across the SCAB are characterized by westerly or southwesterly on-shore winds during the day and easterly or northeasterly breezes at night. Wind speed is typically higher during the dry summer months than during the rainy winter. Between periods of wind, air stagnation may occur in both the morning and evening hours. Air stagnation is one of the critical determinants of air quality conditions on any given day. During winter and fall, surface high-pressure systems over the SCAB, combined with other meteorological conditions, result in very strong, downslope Santa Ana winds. These winds normally continue for a few days before predominant meteorological conditions are reestablished.

The mountain ranges to the east affect the diffusion of pollutants by inhibiting the eastward transport of pollutants. Air quality in the SCAB generally ranges from fair to poor and is similar to air quality in most of coastal Southern California. The entire region experiences heavy concentrations of air pollutants during prolonged periods of stable atmospheric conditions.

In addition to the characteristic wind patterns that affect the rate and orientation of horizontal pollutant transport, two distinct types of temperature inversions control the vertical depth through which air pollutants are mixed. These inversions are the marine inversion and the radiation inversion. The height of

[1] South Coast Air Quality Management District, *CEQA Air Quality Handbook*, 1993.

the base of the inversion at any given time is called the "mixing height." The combination of winds and inversions is a critical determinant leading to highly degraded air quality for the SCAB in the summer and generally good air quality in the winter.

2.2 Air Pollutants of Concern

The air pollutants emitted into the ambient air by stationary and mobile sources are regulated by state and federal laws. These regulated air pollutants are known as "criteria air pollutants" and are categorized into primary and secondary pollutants.

Primary air pollutants are emitted directly from sources. Carbon monoxide (CO), reactive organic gases (ROG), nitrogen oxide (NO_X), sulfur dioxide (SO_2), coarse particulate matter (PM_{10}), fine particulate matter ($PM_{2.5}$), and lead are primary air pollutants. Of these, CO, NO_X, SO_2, PM_{10}, and $PM_{2.5}$ are criteria pollutants. ROG and NO_X are criteria pollutant precursors and form secondary criteria pollutants through chemical and photochemical reactions in the atmosphere. For example, the criteria pollutant ozone (O_3) is formed by a chemical reaction between ROG and NO_X in the presence of sunlight. O_3 and nitrogen dioxide (NO_2) are the principal secondary pollutants. Sources and health effects commonly associated with criteria pollutants are summarized in Table 2: Air Contaminants and Associated Public Health Concerns.

Toxic Air Contaminants

Toxic air contaminants (TACs) are airborne substances that can cause short-term (acute) or long-term (i.e. chronic, carcinogenic or cancer causing) adverse human health effects (i.e. injury or illness). TACs include both organic and inorganic chemical substances. They may be emitted from a variety of common sources including gasoline stations, automobiles, dry cleaners, industrial operations, and painting operations. The current California list of TACs includes more than 200 compounds, including particulate emissions from diesel-fueled engines.

CARB identified diesel particulate matter (DPM) as a toxic air contaminant. DPM differs from other TACs in that it is not a single substance but rather a complex mixture of hundreds of substances. Diesel exhaust is a complex mixture of particles and gases produced when an engine burns diesel fuel. DPM is a concern because it causes lung cancer; many compounds found in diesel exhaust are carcinogenic. DPM includes the particle-phase constituents in diesel exhaust. The chemical composition and particle sizes of DPM vary between different engine types (heavy-duty, light-duty), engine operating conditions (idle, accelerate, decelerate), fuel formulations (high/low sulfur fuel), and the year of the engine. Some short-term (acute) effects of diesel exhaust include eye, nose, throat, and lung irritation, and diesel exhaust can cause coughs, headaches, light-headedness, and nausea. DPM poses the greatest health risk among the TACs. Almost all diesel exhaust particle mass is 10 microns or less in diameter. Due to their extremely small size, these particles can be inhaled and eventually trapped in the bronchial and alveolar regions of the lung.

Table 2: Air Contaminants and Associated Public Health Concerns

Pollutant	Major Man-Made Sources	Human Health Effects
Particulate Matter (PM_{10} and $PM_{2.5}$)	Power plants, steel mills, chemical plants, unpaved roads and parking lots, wood-burning stoves and fireplaces, automobiles and others.	Increased respiratory symptoms, such as irritation of the airways, coughing, or difficulty breathing; asthma; chronic bronchitis; irregular heartbeat; nonfatal heart attacks; and premature death in people with heart or lung disease. Impairs visibility.
Ozone (O_3)	Formed by a chemical reaction between reactive organic gases/volatile organic compounds (ROG or VOC)[1] and nitrogen oxides (NO_X) in the presence of sunlight. Motor vehicle exhaust industrial emissions, gasoline storage and transport, solvents, paints and landfills.	Irritates and causes inflammation of the mucous membranes and lung airways; causes wheezing, coughing, and pain when inhaling deeply; decreases lung capacity; aggravates lung and heart problems. Damages plants; reduces crop yield.
Sulfur Dioxide (SO_2)	A colorless gas formed when fuel containing sulfur is burned and when gasoline is extracted from oil. Examples are petroleum refineries, cement manufacturing, metal processing facilities, locomotives, and ships.	Respiratory irritant. Aggravates lung and heart problems. In the presence of moisture and oxygen, sulfur dioxide converts to sulfuric acid which can damage marble, iron and steel. Damages crops and natural vegetation. Impairs visibility. Precursor to acid rain.
Carbon Monoxide (CO)	An odorless, colorless gas formed when carbon in fuel is not burned completely; a component of motor vehicle exhaust.	Reduces the ability of blood to deliver oxygen to vital tissues, affecting the cardiovascular and nervous system. Impairs vision, causes dizziness, and can lead to unconsciousness or death.
Nitrogen Dioxide (NO_2)	A reddish-brown gas formed during fuel combustion for motor vehicles and industrial sources. Sources include motor vehicles, electric utilities, and other sources that burn fuel.	Respiratory irritant; aggravates lung and heart problems. Precursor to O_3. Contributes to global warming and nutrient overloading which deteriorates water quality. Causes brown discoloration of the atmosphere.
Lead (Pb)	Lead is a metal found naturally in the environment as well as in manufactured products. The major sources of lead emissions have historically been motor vehicles (such as cars and trucks) and industrial sources. Due to the phase out of leaded gasoline, metals processing is the major source of lead emissions to the air today. The highest levels of lead in air are generally found near lead smelters. Other stationary sources are waste incinerators, utilities, and lead-acid battery manufacturers.	Exposure to lead occurs mainly through inhalation of air and ingestion of lead in food, water, soil, or dust. It accumulates in the blood, bones, and soft tissues and can adversely affect the kidneys, liver, nervous system, and other organs. Excessive exposure to lead may cause neurological impairments such as seizures, mental retardation, and behavioral disorders. Even at low doses, lead exposure is associated with damage to the nervous systems of fetuses and young children, resulting in learning deficits and lowered IQ.

[1] Volatile Organic Compounds (VOCs or Reactive Organic Gases [ROG]) are hydrocarbons/organic gases that are formed solely of hydrogen and carbon. There are several subsets of organic gases including ROGs and VOCs. Both ROGs and VOCs are emitted from the incomplete combustion of hydrocarbons or other carbon-based fuels. The major sources of hydrocarbons are combustion engine exhaust, oil refineries, and oil-fueled power plants; other common sources are petroleum fuels, solvents, dry cleaning solutions, and paint (via evaporation).

Source: California Air Pollution Control Officers Association (CAPCOA), Health Effects, http://www.capcoa.org/health-effects/, Accessed March 18, 2020.

Ambient Air Quality

CARB monitors ambient air quality at approximately 250 air monitoring stations across the State. These stations usually measure pollutant concentrations ten feet above ground level; therefore, air quality is often referred to in terms of ground-level concentrations. Existing levels of ambient air quality, historical trends, and projections near the Project are documented by measurements made by the South Coast Air Quality Management District (SCAQMD), the air pollution regulatory agency in the SCAB that maintains air quality monitoring stations which process ambient air quality measurements.

Pollutants of concern in the SCAB include O_3, PM_{10}, and $PM_{2.5}$. The closest air monitoring station to the Project that monitors ambient concentrations of these pollutants is the Upland Monitoring Station (located approximately 1.1 miles to the northwest). Local air quality data from 2017 to 2019 are provided in Table 3: Ambient Air Quality Data, which lists the monitored maximum concentrations and number of exceedances of state or federal air quality standards for each year.

Table 3: Ambient Air Quality Data

Criteria Pollutant	2017	2018	2019
Ozone (O_3) [1]			
1-hour Maximum Concentration (ppm)	0.150	0.133	0.131
8-hour Maximum Concentration (ppm)	0.127	0.111	0.107
Number of Days Standard Exceeded

NAAQS = National Ambient Air Quality Standards; CAAQS = California Ambient Air Quality Standards; ppm = parts per million; µg/m^3 = micrograms per cubic meter; – = insufficient data available to determine value

[1] Measurements taken at the Upland Monitoring Station at 24302 4th street, San Bernardino, California (CARB# 36175)

Source: All pollutant measurements are from the CARB Aerometric Data Analysis and Management system database (https://www.arb.ca.gov/adam) except for CO, which were retrieved from the CARB Air Quality and Meteorological Information System (https://www.arb.ca.gov/aqmis2/aqdselect.php, https://www.arb.ca.gov/qaweb/siteinfo.php).

2.3 Sensitive Receptors

Sensitive populations are more susceptible to the effects of air pollution than is the general population. Sensitive receptors that are in proximity to localized sources of toxics are of particular concern. Land uses considered sensitive receptors include residences, schools, playgrounds, childcare centers, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes. Sensitive land uses surrounding the Project consist mostly of single-family residential communities. Sensitive land uses nearest to the Project are shown in Table 4: Sensitive Receptors.

Table 4: Sensitive Receptors

Receptor Description	Distance and Direction from the Project
Single-Family Residential Community	90 feet to the south
Single-Family Residential Community	800 feet to the east
Jerry Eaves Park	870 feet to the north
Single-Family Residential Community	1,600 feet to the north
Winchester Senior Home II	1,500 feet to the northeast
La Petite Academy of Rialto	1,900 feet to the east
Helen L. Dollahan Elementary School	2,100 feet to the south
Flores Park	2,400 feet to the South
Camino Nuevo Church	2,500 feet to the southeast
Eisenhower Senior High School	3,000 feet to the east
Dunn Elementary School	4,000 feet to the southeast

3 REGULATORY SETTING

3.1 Federal

Federal Clean Air Act

Air quality is federally protected by the Federal Clean Air Act (FCAA) and its amendments. Under the FCAA, the United States Environmental Protection Agency (EPA) developed the primary and secondary National Ambient Air Quality Standards (NAAQS) for the criteria air pollutants including O_3, NO_2, CO, SO_2, PM_{10}, $PM_{2.5}$, and lead. Proposed projects in or near nonattainment areas could be subject to more stringent air-permitting requirements. The FCAA requires each state to prepare a State Implementation Plan to demonstrate how it will attain the NAAQS within the federally imposed deadlines.

The EPA can withhold certain transportation funds from states that fail to comply with the planning requirements of the FCAA. If a state fails to correct these planning deficiencies within two years of Federal notification, the EPA is required to develop a Federal implementation plan for the identified nonattainment area or areas. The provisions of 40 Code of Federal Regulations Parts 51 and 93 apply in all nonattainment and maintenance areas for transportation-related criteria pollutants for which the area is designated nonattainment or has a maintenance plan. The EPA has designated enforcement of air pollution control regulations to the individual states. Applicable federal standards are summarized in Table 5: State and Federal Ambient Air Quality Standards.

3.2 State of California

California Air Resources Board

CARB administers the air quality policy in California. The California Ambient Air Quality Standards (CAAQS) were established in 1969 pursuant to the Mulford-Carrell Act. These standards, included with the NAAQS in Table 5, are generally more stringent and apply to more pollutants than the NAAQS. In addition to the criteria pollutants, CAAQS have been established for visibility reducing particulates, hydrogen sulfide, and sulfates.

The California Clean Air Act (CCAA), which was approved in 1988, requires that each local air district prepare and maintain an Air Quality Management Plan (AQMP) to achieve compliance with CAAQS. These AQMPs also serve as the basis for the preparation of the State Implementation Plan for meeting federal clean air standards for the State of California. Like the EPA, CARB also designates areas within California as either attainment or nonattainment for each criteria pollutant based on whether the CAAQS have been achieved. Under the CCAA, areas are designated as nonattainment for a pollutant if air quality data shows that a state standard for the pollutant was violated at least once during the previous three calendar years. Exceedances that are affected by highly irregular or infrequent events such as wildfires, volcanoes, etc. are not considered violations of a state standard, and are not used as a basis for designating areas as nonattainment. The applicable State standards are summarized in Table 5.

Table 5: State and Federal Ambient Air Quality Standards

Pollutant	Averaging Time	State Standards[1]	Federal Standards[2]
Ozone (O_3) [2, 5, 7]	8 Hour	0.070 ppm (137 µg/m^3)	0.070 ppm
	1 Hour	0.09 ppm (180 µg/m^3)	NA
Carbon Monoxide (CO)	8 Hour	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)
	1 Hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)
Nitrogen Dioxide (NO_2)	1 Hour	0.18 ppm (339 µg/m^3)	0.10 ppm[11]
	Annual Arithmetic Mean	0.030 ppm (57 µg/m^3)	0.053 ppm (100 µg/m^3)
Sulfur Dioxide (SO_2) [8]	24 Hour	0.04 ppm (105 µg/m^3)	0.14 ppm (365 µg/m^3)
	1 Hour	0.25 ppm (655 µg/m^3)	0.075 ppm (196 µg/m^3)
	Annual Arithmetic Mean	NA	0.03 ppm (80 µg/m^3)
Particulate Matter (PM_{10}) [1, 3, 6]	24-Hour	50 µg/m^3	150 µg/m^3
	Annual Arithmetic Mean	20 µg/m^3	NA
Fine Particulate Matter ($PM_{2.5}$) [3, 4, 6, 9]	24-Hour	NA	35 µg/m^3
	Annual Arithmetic Mean	12 µg/m^3	12 µg/m^3
Sulfates (SO_{4-2})	24 Hour	25 µg/m^3	NA
Lead (Pb) [10, 11]	30-Day Average	1.5 µg/m^3	NA
	Calendar Quarter	NA	1.5 µg/m^3
	Rolling 3-Month Average	NA	0.15 µg/m^3
Hydrogen Sulfide (H_2S)	1 Hour	0.03 ppm (0.15 µg/m^3)	NA
Vinyl Chloride (C_2H_3Cl) [10]	24 Hour	0.01 ppm (26 µg/m^3)	NA

ppm = parts per million; µg/m^3 = micrograms per cubic meter; mg/m^3 = milligrams per cubic meter; – = no information available.

1 California standards for O_3, carbon monoxide (except Lake Tahoe), sulfur dioxide (1-hour and 24-hour), nitrogen dioxide, suspended particulate matter - PM_{10}, and visibility reducing particles are values that are not to be exceeded. The standards for sulfates, Lake Tahoe carbon monoxide, lead, hydrogen sulfide, and vinyl chloride are not to be equaled or exceeded. If the standard is for a 1-hour, 8-hour or 24-hour average (i.e. all standards except for lead and the PM_{10} annual standard), then some measurements may be excluded. Measurements are excluded that CARB determines would occur less than once per year on the average. The Lake Tahoe carbon monoxide standard is 6.0 ppm, a level one-half the national standard and two-thirds the State standard.

2 National standards shown are the "primary standards" designed to protect public health. National standards other than for O_3, particulates and those based on annual averages are not to be exceeded more than once a year. The 1-hour O_3 standard is attained if, during the most recent three-year period, the average number of days per year with maximum hourly concentrations above the standard is equal to or less than one. The 8-hour O_3 standard is attained when the 3-year average of the 4th highest daily concentrations is 0.070 ppm or less. The 24-hour PM_{10} standard is attained when the 3-year average of the 99th percentile of monitored concentrations is less than 150 µg/m_3. The 24-hour $PM_{2.5}$ standard is attained when the 3-year average of 98th percentiles is less than 35 µg/m^3.

3 Except for the national particulate standards, annual standards are met if the annual average falls below the standard at every site. The national annual particulate standard for PM_{10} is met if the 3-year average falls below the standard at every site. The annual $PM_{2.5}$ standard is met if the 3-year average of annual averages spatially-averaged across officially designed clusters of sites falls below the standard. NAAQS are set by the EPA at levels determined to be protective of public health with an adequate margin of safety.

4 On October 1, 2015, the national 8-hour O_3 primary and secondary standards were lowered from 0.075 to 0.070 ppm. An area will meet the standard if the fourth-highest maximum daily 8-hour O_3 concentration per year, averaged over three years, is equal to or less than 0.070 ppm. EPA will make recommendations on attainment designations by October 1, 2016, and issue final designations October 1, 2017. Nonattainment areas will have until 2020 to late 2037 to meet the health standard, with attainment dates varying based on the O_3 level in the area.

5 The national 1-hour O_3 standard was revoked by the EPA on June 15, 2005.

6 In June 2002, CARB established new annual standards for $PM_{2.5}$ and PM_{10}.

7 The 8-hour California O_3 standard was approved by the CARB on April 28, 2005 and became effective on May 17, 2006.

8 On June 2, 2010, the EPA established a new 1-hour SO_2 standard, effective August 23, 2010, which is based on the 3-year average of the annual 99th percentile of 1-hour daily maximum concentrations. The existing 0.030 ppm annual and 0.14 ppm 24-hour SO_2 NAAQS however must continue to be used until one year following EPA initial designations of the new 1-hour SO_2 NAAQS.

9 In December 2012, EPA strengthened the annual $PM_{2.5}$ NAAQS from 15.0 to 12.0 µg/m^3. In December 2014, the EPA issued final area designations for the 2012 primary annual $PM_{2.5}$ NAAQS. Areas designated "unclassifiable/attainment" must continue to take steps to prevent their air quality from deteriorating to unhealthy levels. The effective date of this standard is April 15, 2015.

10 CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure below which there are no adverse health effects determined.

11 National lead standard, rolling 3-month average: final rule signed October 15, 2008. Final designations effective December 31, 2011.

3.3 Regional

South Coast Air Quality Management District

The SCAQMD is the air pollution control agency for Orange County and the urban portions of Los Angeles, Riverside, and San Bernardino Counties. The agency's primary responsibility is ensuring that state and federal ambient air quality standards are attained and maintained in the SCAB. The SCAQMD is also responsible for adopting and enforcing rules and regulations concerning air pollutant sources, issuing permits for stationary sources of air pollutants, inspecting stationary sources of air pollutants, responding to citizen complaints, monitoring ambient air quality and meteorological conditions, awarding grants to reduce motor vehicle emissions, conducting public education campaigns, and many other activities. All projects are subject to SCAQMD rules and regulations in effect at the time of construction.

The SCAQMD is also the lead agency in charge of developing the AQMP, with input from the Southern California Association of Governments (SCAG) and CARB. The AQMP is a comprehensive plan that includes control strategies for stationary and area sources, as well as for on-road and off-road mobile sources. SCAG has the primary responsibility for providing future growth projections and the development and implementation of transportation control measures. CARB, in coordination with federal agencies, provides the control element for mobile sources.

The 2016 AQMP was adopted by the SCAQMD Governing Board on March 3, 2017. The purpose of the AQMP is to set forth a comprehensive and integrated program that would lead the SCAB into compliance with the federal 24-hour $PM_{2.5}$ air quality standard, and to provide an update to the SCAQMD's commitments towards meeting the federal 8-hour O_3 standards. The AQMP incorporates the latest scientific and technological information and planning assumptions, including the *Regional Transportation Plan/Sustainable Communities Strategy* (RTP/SCS) and updated emission inventory methodologies for various source categories. As part of its air quality planning, SCAG has prepared the Regional Comprehensive Plan and Guide and the Connect SoCal – The 2020-2045 RTP/SCS. The 2020-2045 RTP/SCS was determined to conform to the federally mandated state implementation plan (SIP) for the attainment and maintenance of the NAAQS. The 2020-2045 RTP/SCS will be incorporated into the forthcoming 2022 AQMP. Both the Regional Comprehensive Plan and AQMP are based, in part, on projections originating with county and city general plans.

The SCAQMD has published the *CEQA Air Quality Handbook* (approved by the SCAQMD Governing Board in 1993 and augmented with guidance for Local Significance Thresholds [LST] in 2008). The SCAQMD guidance helps local government agencies and consultants to develop environmental documents required by California Environmental Quality Act (CEQA) and provides identification of suggested thresholds of significance for criteria pollutants for both construction and operation (see discussion of thresholds below). With the help of the *CEQA Air Quality Handbook* and associated guidance, local land use planners and consultants are able to analyze and document how proposed and existing projects affect air quality in order to meet the requirements of the CEQA review process. The SCAQMD periodically provides supplemental guidance and updates to the handbook on their website.

The SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties and serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. Under federal law, SCAG is designated as a Metropolitan Planning Organization and under State law as a Regional Transportation Planning Agency and a Council of Governments.

The state and federal attainment status designations for the SCAB are summarized in Table 6: South Coast Air Basin Attainment Status. The SCAB is currently designated as a nonattainment area with respect to the State O_3, PM_{10}, and $PM_{2.5}$ standards, as well as the national 8-hour O_3 and $PM_{2.5}$ standards. The SCAB is designated as attainment or unclassified for the remaining state and federal standards.

Table 6: South Coast Air Basin Attainment Status

Pollutant	State	Federal
Ozone (O_3) (1 Hour Standard)	Non-Attainment	Non-Attainment (Extreme)
Ozone (O_3) (8 Hour Standard)	Non-Attainment	Non-Attainment (Extreme)
Particulate Matter ($PM_{2.5}$) (24 Hour Standard)	–	Non-Attainment (Serious)
Particulate Matter ($PM_{2.5}$) (Annual Standard)	Non-Attainment	Non-Attainment (Moderate)
Particulate Matter (PM_{10}) (24 Hour Standard)	Non-Attainment	Attainment (Maintenance)
Particulate Matter (PM_{10}) (Annual Standard)	Non-Attainment	–
Carbon Monoxide (CO) (1 Hour Standard)	Attainment	Attainment (Maintenance)
Carbon Monoxide (CO) (8 Hour Standard)	Attainment	Attainment (Maintenance)
Nitrogen Dioxide (NO_2) (1 Hour Standard)	Attainment	Unclassifiable/Attainment
Nitrogen Dioxide (NO_2) (Annual Standard)	Attainment	Attainment (Maintenance)
Sulfur Dioxide (SO_2) (1 Hour Standard)	Attainment	Unclassifiable/Attainment
Sulfur Dioxide (SO_2) (24 Hour Standard)	Attainment	–
Lead (Pb) (30 Day Standard)	–	Unclassifiable/Attainment
Lead (Pb) (3 Month Standard)	Attainment	–
Sulfates (SO_{4-2}) (24 Hour Standard)	Attainment	–
Hydrogen Sulfide (H_2S) (1 Hour Standard)	Unclassified	–

Source: South Coast Air Quality Management District, *Air Quality Management Plan*, 2016; United States Environmental Protection Agency, *Nonattainment Areas for Criteria Pollutants (Green Book)*, 2018.

The following is a list of SCAQMD rules that are required of construction activities associated with the Project:

- **Rule 402 (Nuisance)** – This rule prohibits the discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property. This rule does not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals.

- **Rule 403 (Fugitive Dust)** – This rule requires fugitive dust sources to implement best available control measures for all sources, and all forms of visible particulate matter are prohibited from crossing any property line. This rule is intended to reduce PM_{10} emissions from any transportation, handling, construction, or storage activity that has the potential to generate fugitive dust. PM_{10} suppression techniques are summarized below.

    a) Portions of a construction site to remain inactive longer than a period of three months will be seeded and watered until grass cover is grown or otherwise stabilized.

    b) All on-site roads are paved as soon as feasible, watered regularly, or chemically stabilized.

    c) All material transported off-site will be either sufficiently watered or securely covered to prevent excessive amounts of dust.

    d) The area disturbed by clearing, grading, earthmoving, or excavation operations will be minimized at all times.

    e) Where vehicles leave a construction site and enter adjacent public streets, the streets will be swept daily or washed down following the work day to remove soil from pavement.

- **Rule 1113 (Architectural Coatings)** – This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce ROG emissions from the use of these coatings, primarily by placing limits on the ROG content of various coating categories.

- **Rule 2305 (Warehouse Indirect Source Rule)** - Rule 2305 was adopted by the SCAQMD Governing Board on May 7, 2021 to reduce NO_X and particulate matter emissions associated with warehouses and mobile sources attracted to warehouses. This rule applies to all existing and proposed warehouses over 100,000 square feet located in the SCAQMD. Rule 2305 requires warehouse operators to track annual vehicle miles traveled associated with truck trips to and from the warehouse. These trip miles are used to calculate the warehouses WAIRE (Warehouse Actions and Investments to Reduce Emissions) Points Compliance Obligation. WAIRE Points are earned based on emission reduction measures and warehouse operators are required to submit an annual WAIRE Report which includes truck trip data and emission reduction measures. Reduction strategies listed in the WAIRE menu include acquire zero emission (ZE) or near zero emission (NZE) trucks; require ZE/NZE truck visits; require ZE yard trucks; install on-site ZE charging/fueling infrastructure; install onsite energy systems; and install filtration systems in residences, schools, and other buildings in the adjacent community. Warehouse operators that do not earn a sufficient number of WAIRE points to satisfy the WAIRE Points Compliance Obligation would be required to pay a mitigation fee. Funds from the mitigation fee will be used to incentivize the purchase of cleaner trucks and charging/fueling infrastructure in communities nearby.

3.4 Local

City of Rialto General Plan

The City of Rialto General Plan (RGP) is a roadmap that encompasses the hopes, aspirations, values and dreams of the community. The RGP does not mention specific standalone air quality goals and policies for the City. Instead, the RGP has goals and policies to improve air quality through transportation infrastructure. Since there are limited Project-relevant policies specific to air quality, related policies are

mentioned in this section. Where inconsistencies exist, if any, they are addressed in the respective impact analysis below. RGP policies that directly address reducing and avoiding natural resources impacts include the following:

Goal 2-9: Protect residential, schools, parks, and other sensitive land uses from the impacts associated with industrial and trucking-related land uses, as well as commercial and retail areas.

Policy 2-9.1: Require mitigation and utilize other techniques to protect residential development and other sensitive land uses near industrial land uses or within identified health risk areas from excessive noise, hazardous materials and waste releases, toxic air pollutant concentrations, and other impacts.

Policy 2-9.2: Require all industrial development to front on an improved street with appropriate front yard setbacks, landscaping, and facade and entrance treatments.

Goal 2-30: Incorporate green building and other sustainable building practices into development projects.

Policy 2.30.1: Explore and adopt the use of green building standards and Leadership in Energy and Environmental Design (LEED) or similar in both private and public projects.

Policy 2-30.2: Promote sustainable building practices that go beyond the requirements of Title 24 of the California Administrative Code, and encourage energy-efficient design elements, as appropriate.

Policy 2-30.3: Support sustainable building practices that integrate building materials and methods that promote environmental quality, economic vitality, and social benefit through the design, construction, and operation of the built environment.

Goal 2-31: Conserve energy resources.

Policy 2-31.1: Require the incorporation of energy conservation features into the design of all new construction and site development activities.

Goal 2-35: Reduce air pollution emissions from both mobile and stationary sources in the City.

Policy 2-35.2: Require that new development projects incorporate design features that encourage ridesharing, transit use, park and ride facilities, and bicycle and pedestrian circulation.

Policy 2-35.3: Establish a balanced land use pattern, and facilitate developments that provide jobs for City residents in order to reduce vehicle trips citywide.

Policy 2-35.4: Require new development and significant redevelopment proposals to incorporate sufficient design and operational controls to prevent release of noxious odors beyond the limits of the development site.

Goal 2-36: Reduce the amount of fugitive dust released into the atmosphere.

Policy 2-36.1: Put conditions on discretionary permits to require fugitive dust controls.

Policy 2-36.2: Support programs and policies of the SCAQMD regarding restrictions on grading operations at construction projects.

Policy 2-36.3: Enforce regulations that do not allow vehicles to transport aggregate or similar material upon a roadway unless the material is stabilized or covered.

Goal 2-37: Expand public awareness regarding air pollution sources and pollutant reduction initiatives.

Policy 2-37.1: Encourage and publicly recognize innovative approaches that improve air quality.

Policy 2-37.2: Encourage the participation of environmental groups, the business community, civic groups, special interest groups, and the public in the formulation and implementation of programs that effectively reduce air pollution.

Policy 2-37.3: Provide public education to encourage local consumers to choose the cleanest paints and other non-pollutant consumer products.

Goal 2-38: Mitigate against climate change.

Policy 2-38.1: Consult with State agencies, SCAG, and the San Bernardino Council of Governments (SBCOG) to implement Assembly Bill (AB) 32 and Senate Bill (SB) 375 by utilizing incentives to facilitate infill and transit-oriented development.

Policy 2-38.2: Encourage development of transit-oriented and infill development, and encourage a mix of uses that foster walking and alternative transportation in Downtown and along Foothill Boulevard.

Policy 2-38.3: Provide enhanced bicycling and walking infrastructure, and support public transit, including public bus service, the Metrolink, and the potential for Bus Rapid Transit.

Policy 2-38.4: The City shall participate in the *San Bernardino Regional Greenhouse Inventory and Reduction Plan*.

4 SIGNIFICANCE CRITERIA AND METHODOLOGY

4.1 Air Quality Thresholds

Based upon the criteria derived from Appendix G of the CEQA Guidelines, a Project normally would have a significant effect on the environment if it would:

- Conflict with or obstruct implementation of the applicable air quality plan.
- Result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is in nonattainment under an applicable state or federal ambient air quality standard.
- Expose sensitive receptors to substantial pollutant concentrations.
- Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

SCAQMD Thresholds

The significance criteria established by SCAQMD may be relied upon to make the above determinations. According to the SCAQMD, an air quality impact is considered significant if the Project would violate any ambient air quality standard, contribute substantially to an existing or projected air quality violation, or expose sensitive receptors to substantial pollutant concentrations. The SCAQMD has established thresholds of significance for air quality during construction and operational activities of land use development projects, as shown in Table 7: South Coast Air Quality Management District Emissions Thresholds.

Table 7: South Coast Air Quality Management District Emissions Thresholds (Maximum Pounds Per Day)

Criteria Air Pollutants and Precursors	Construction-Related	Operational-Related
Reactive Organic Gases (ROG)	75	55
Carbon Monoxide (CO)	550	550
Nitrogen Oxides (NO_X)	100	55
Sulfur Oxides (SO_X)	150	150
Coarse Particulates (PM_{10})	150	150
Fine Particulates ($PM_{2.5}$)	55	55

Source: South Coast Air Quality Management District, *South Coast AQMD Air Quality Significance Thresholds,* April 2019.

Localized Carbon Monoxide

In addition to the daily thresholds listed above, development associated with the Project would also be subject to the ambient air quality standards. These are addressed though an analysis of localized CO impacts. The significance of localized impacts depends on whether ambient CO levels near the Project are above state and federal CO standards (the more stringent California standards are 20 ppm for 1-hour and 9 ppm for 8-hour). The SCAB has been designated as attainment under the 1-hour and 8-hour standards.

Localized Significance Thresholds

In addition to the CO hotspot analysis, the SCAQMD developed LSTs for emissions of NO_2, CO, PM_{10}, and $PM_{2.5}$ generated at new development sites (off-site mobile source emissions are not included in the LST analysis). LSTs represent the maximum emissions that can be generated at a project without expecting to

cause or substantially contribute to an exceedance of the most stringent state or federal ambient air quality standards. LSTs are based on the ambient concentrations of that pollutant within the Project source receptor area (SRA), as demarcated by the SCAQMD, and the distance to the nearest sensitive receptor. LST analysis for construction is applicable for all projects that disturb 5 acres or less on a single day. The City of Rialto is located within SCAQMD SRA 32. Table 8: Local Significance Thresholds for Construction/Operations, shows the LSTs for 1-acre, 2-acre, and 5-acre projects in SRA 32 with sensitive receptors located within 25 meters of the Project. LSTs associated with all acreage categories are provided in Table 8 for informational purposes. Table 8 shows that the LSTs increase as acreages increase. It should be noted that LSTs are screening thresholds and are therefore conservative. The construction LST acreage is determined based daily acreage disturbed. The operational LST acreage is based on the total area of the Project site. Although the Project site is greater than five acres, the 5-acre operational LSTs are conservatively used to evaluate the Project.

Table 8: Local Significance Thresholds for Construction/Operations (Maximum Pounds Per Day)

Project Size	Nitrogen Oxide (NO_x)	Carbon Monoxide (CO)	Coarse Particulates (PM_{10})	Fine Particulates ($PM_{2.5}$)
1 Acre	118/118	863/863	5/2	4/1
2 Acres	170/170	1,232/1,232	6/2	5/2
*4 Acres**	*237/237*	*1,466/1,466*	*12/3*	*7/2*
5 Acres	270/270	2,193/2,193	16/4	9/2

Note: * 4 acre thresholds interpolated from 2 acre and 5 acre thresholds
Source: South Coast Air Quality Management District, *Localized Significance Threshold Methodology,* July 2008.

4.2 Methodology

This air quality impact analysis considers construction and operational impacts associated with the Project. Where criteria air pollutant quantification was required, emissions were modeled using the California Emissions Estimator Model (CalEEMod). CalEEMod is a Statewide land use emissions computer model designed to quantify potential criteria pollutant emissions associated with both construction and operations from a variety of land use projects. Air quality impacts were assessed according to methodologies recommended by CARB and the SCAQMD.

Construction equipment, trucks, worker vehicles, and ground-disturbing activities associated with Project construction would generate emissions of criteria air pollutants and precursors. Daily regional construction emissions are estimated by assuming construction occurs at the earliest feasible date (i.e., a conservative estimate of construction activities) and applying off-road, fugitive dust, and on-road emissions factors in CalEEMod. Construction is conservatively assumed to occur in 2021, delaying the start of construction would only likely reduce emissions as emission control technology will improve in the future.[2]

[2] Emissions in future years (i.e., due to a later construction start date or operational opening year) would be lower due to phased-in emissions standards, inspection and maintenance requirements, and fleet turnover).Specifically, project construction was modeled to start in 2021 but would commence at a later date. As such, construction impacts would be less than those analyzed due to the use of more energy-efficient and cleaner burning construction vehicle fleet mix, pursuant to state regulations that require vehicle fleet operators to phase-in less polluting heavy-duty equipment. As a result, Project-related construction air quality impacts would be lower than the impacts disclosed herein. For emissions modeling purposes, conservatively analyzing the emissions using an earlier construction start date (i.e., 2021), provides for a worst-case analysis and full disclosure of potential air quality impacts, as required by CEQA.

Project operations were conservatively modeled assuming an opening year of 2021 and would result in emissions of area sources (consumer products), energy sources (natural gas usage and offsite electrify generation), and mobile sources (motor vehicles from Project generated vehicle trips). Project-generated increases in operational emissions would be predominantly associated with motor vehicle use. The Project vehicle trip generation was obtained from the Project's Transportation Impact Study prepared by Kimley-Horn (January 2021), which includes 971 total daily vehicle trips and 476 daily truck trips. One-way delivery trip lengths were changed from the CalEEMod default of 6.9 miles to 25 miles[3]. Emissions rates in CalEEMod have been updated with CARB SAFE Rule adjustment factors and EMFAC2017 emission rates consistent with the methodology described in Section 5.2 *Methodology for Converting EMFAC2014 Emission Rates into CalEEMod Vehicle Emission Factors* of *Appendix A: Calculation Details for CalEEMod* in the *CalEEMod User Guide.* Other operational emissions from area, energy, and stationary sources were quantified in CalEEMod based on land use activity data.

As discussed above, the SCAQMD provides significance thresholds for emissions associated with proposed Project construction and operations. The proposed Project's construction and operational emissions are compared to the daily criteria pollutant emissions significance thresholds in order to determine the significance of a Project's impact on regional air quality.

The localized effects from the Project's on-site emissions were evaluated in accordance with the SCAQMD's Localized Significance Threshold (LST) Methodology, which uses on-site mass emissions rate look-up tables and Project-specific modeling. LSTs represent the maximum emissions from a project that are not expected to cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standards and are developed based on the ambient concentrations of that pollutant for each source receptor area and distance to the nearest sensitive receptor.

[3] J. Richard Kuzmyak, *Forecasting Metropolitan Commercial and Freight Travel* (2008) Average trip lengths for heavy trucks in the SCAG region are cited as 24.1 miles. To be conservative, warehouse delivery trip lengths were rounded up to 25 miles.

5 POTENTIAL IMPACTS AND MITIGATION

5.1 Air Quality Analysis

Threshold 5.1 Would the Project conflict with or obstruct implementation of the applicable air quality plan?

As part of its enforcement responsibilities, the EPA requires each state with nonattainment areas to prepare and submit a State Implementation Plan that demonstrates the means to attain the federal standards. The State Implementation Plan must integrate federal, state, and local plan components and regulations to identify specific measures to reduce pollution in nonattainment areas, using a combination of performance standards and market-based programs. Similarly, under State law, the CCAA requires an air quality attainment plan to be prepared for areas designated as nonattainment regarding the state and federal ambient air quality standards. Air quality attainment plans outline emissions limits and control measures to achieve and maintain these standards by the earliest practical date.

The Project is located within the SCAB, which is under the jurisdiction of the SCAQMD. The SCAQMD is required, pursuant to the FCAA, to reduce emissions of criteria pollutants for which the SCAB is in nonattainment. To reduce such emissions, the SCAQMD drafted the 2016 AQMP. The 2016 AQMP establishes a program of rules and regulations directed at reducing air pollutant emissions and achieving state (California) and national air quality standards. The 2016 AQMP is a regional and multi-agency effort including the SCAQMD, the CARB, the SCAG, and the EPA.

The plan's pollutant control strategies are based on the latest scientific and technical information and planning assumptions, including SCAG's RTP/SCS, updated emission inventory methodologies for various source categories, and SCAG's latest growth forecasts. SCAG's latest growth forecasts were defined in consultation with local governments and with reference to local general plans. SCAG has the responsibility of preparing and approving portions of the AQMP relating to the regional demographic projections and integrated regional land use, housing, employment, and transportation programs, measures, and strategies and is required by law to ensure that transportation activities conform to, and are supportive of, the goals of regional and state air quality plans to attain the NAAQS. The RTP/SCS includes transportation programs, measures, and strategies generally designed to reduce VMT, which are contained in the AQMP. As part of its air quality planning, SCAG has prepared the Regional Comprehensive Plan and Guide and the Connect SoCal – The 2020-2045 RTP/SCS. The 2020-2045 RTP/SCS was determined to conform to the federally mandated state implementation plan (SIP) for the attainment and maintenance of the NAAQS. The 2020-2045 RTP/SCS will be incorporated into the forthcoming 2022 AQMP. Both the Regional Comprehensive Plan and AQMP are based, in part, on projections originating with county and city general plans.

Criteria for determining consistency with the AQMP are defined by the following indicators:

- **Consistency Criterion No. 1** – The Project will not result in an increase in the frequency or severity of existing air quality violations, or cause or contribute to new violations, or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMP.
- **Consistency Criterion No. 2** – The Project will not exceed the assumptions noted in the AQMP or increments based on the years of the Project build-out phase.

According to the SCAQMD's *CEQA Air Quality Handbook*, the purpose of the consistency finding is to determine if a project is inconsistent with the assumptions and objectives of the regional air quality plans, and thus if it would interfere with the region's ability to comply with CAAQS and NAAQS.

The violations to which Consistency Criterion No. 1 refers are CAAQS and NAAQS. As shown in Table 9, the Project would exceed the construction emission standard for NO_X and will require Mitigation Measure AQ-1 (discussed under Impact Threshold 5.2) to reduce NO_X below the SCAQMD threshold. Project operational emissions would also exceed the operational standard for NO_X as shown in Table 10. Mitigation Measures AQ-2 through AQ-5 (discussed under Impact Threshold 5.2) are required to reduce operational NO_X emissions below the SCAQMD standard. With the implementation of Mitigation Measures AQ-1 through AQ-5 construction and operation emissions will remain below SCAQMD standards. Therefore, the Project would not contribute to an existing air quality violation. Thus, the Project would be consistent with the first criterion.

Concerning Consistency Criterion No. 2, the AQMP contains air pollutant reduction strategies based on SCAG's latest growth forecasts, and SCAG's growth forecasts were defined in consultation with local governments and with reference to local general plans. The Project is consistent with the General Industrial land use designation and development density presented in the City's General Plan and therefore would not exceed the population or job growth projections used by the SCAQMD to develop the AQMP. Thus, the Project is also consistent with the second criterion.

Mitigation Measures: Mitigation Measures AQ-1 through AQ-5 (refer to Impact Threshold 5.2, below)

Level of Significance: Less than significant impact with mitigation incorporated.

Threshold 5.2 Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable state or federal ambient air quality standard?

Construction Emissions

Construction associated with the Project would generate short-term emissions of criteria air pollutants. The criteria pollutants of primary concern within the Project area include O_3-precursor pollutants (i.e. ROG and NO_X) and PM_{10} and $PM_{2.5}$. Construction-generated emissions are short term and of temporary duration, lasting only as long as construction activities occur, but would be considered a significant air quality impact if the volume of pollutants generated exceeds the SCAQMD's thresholds of significance.

Construction results in the temporary generation of emissions resulting from site grading, road paving, motor vehicle exhaust associated with construction equipment and worker trips, and the movement of construction equipment, especially on unpaved surfaces. Emissions of airborne particulate matter are largely dependent on the amount of ground disturbance associated with site preparation activities as well as weather conditions and the appropriate application of water.

The duration of construction activities associated with the Project is estimated to last approximately 10 months. Construction-generated emissions associated the Project were calculated using the CARB-approved CalEEMod computer program, which is designed to model emissions for land use development projects, based on typical construction requirements. See Appendix A: Air Quality Modeling Data for more information regarding the construction assumptions used in this analysis. Predicted maximum daily

construction-generated emissions for the Project are summarized in in Table 9: Construction-Related Emissions.

Fugitive dust emissions may have a substantial, temporary impact on local air quality. In addition, fugitive dust may be a nuisance to those living and working in the Project vicinity. Uncontrolled dust from construction can become a nuisance and potential health hazard to those living and working nearby. SCAQMD Rules 402 and 403 (prohibition of nuisances, watering of inactive and perimeter areas, track out requirements, etc.), are applicable to the Project and were applied in CalEEMod to minimize fugitive dust emissions. Standard Condition (SC) AQ-1 requires the implementation of Rule 402 and 403 dust control techniques to minimize PM_{10} and $PM_{2.5}$ concentrations. The Project would be subject to SCAQMD Rules for reducing fugitive dust, described in the Regulatory Framework subsection above and identified in Standard Conditions SC AQ-1.

Table 9: Construction-Related Emissions (Maximum Pounds Per Day)

Construction	Reactive Organic Gases (ROG)	Nitrogen Oxide (NO_x)	Carbon Monoxide (CO)	Sulfur Dioxide (SO_2)	Coarse Particulate Matter (PM_{10})	Fine Particulate Matter ($PM_{2.5}$)
Unmitigated Construction Emissions						
Maximum Daily Emissions	57.57	119.52	66.60	0.31	11.64	6.40
SCAQMD Threshold	*75*	*100*	*550*	*150*	*150*	*55*
Exceed SCAQMD Threshold?	**No**	**Yes**	**No**	**No**	**No**	**No**
Mitigated Construction Emissions						
Maximum Daily Emissions	57.22	92.39	66.81	0.31	10.22	4.58
SCAQMD Threshold	*75*	*100*	*550*	*150*	*150*	*55*
Exceed SCAQMD Threshold?	**No**	**No**	**No**	**No**	**No**	**No**

Notes: SCAQMD Rule 403 Fugitive Dust applied. The Rule 403 reduction/credits include the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces three times daily; cover stock piles with tarps; water all haul roads twice daily; and limit speeds on unpaved roads to 15 miles per hour. Reductions percentages from the SCAQMD CEQA Handbook (Tables XI-A through XI-E) were applied. Tier 4 mitigation was applied to grading phase construction equipment. Refer to Appendix A for Model Data Outputs.

Source: CalEEMod version 2016.3.2. Refer to Appendix A for model outputs.

As shown in Table 9, the Project's unmitigated construction emissions would exceed the SCAQMD threshold for NO_X. Therefore, Mitigation Measure AQ-1 would be required to reduce construction emissions to a less than significant level.

Mitigation Measure AQ-1 would require that the contractor use Tier 4 Interim equipment or better during the grading phase of construction. The EPA and CARB have adopted construction equipment emission standards that have been phased in since 1996 in four distinct tiers. Each tier establishes new and more stringent emissions standards. The tier of an engine depends on the model year and horsepower rating; generally, the newer a piece of equipment is, the greater the tier it is likely to have. Beginning in 2011, new off-road mobile engines sold that are equal to or greater than 175 horsepower and non-emergency stationary engines less than 10 liters per cylinder and equal to or greater than 175 horsepower are required to meet Tier 4 Interim. Beginning in 2014, new off-road mobile engines sold that are equal or greater than 130 horsepower are required to meet Tier 4 Final standards (40 Code of Federal Regulations, part 1039). For portable engines, the following are approximate manufacture years:

- Tier 1 engines manufactured between 1996 and 2003;
- Tier 2 engines manufactured between 2001 and 2007;
- Tier 3 engines manufactured between 2006 and 2011; and
- Tier 4 Interim engines 51 to 74 horsepower manufactured beginning in 2008, 75 to 174 horsepower manufactured after 2012, and 175 to 750 horsepower manufactured after 2011.Tier 4 final standards [went] into effect in 2015 further lowering particulate matter emissions.

Implementation of Mitigation Measure AQ-1, the maximum daily NO_X emissions would not exceed SCAQMD thresholds and impacts would be less than significant.

Operational Emissions

Project-generated emissions would be primarily associated with motor vehicle use, off-road equipment such as forklifts, and area sources. Long-term operational emissions attributable to the Project are summarized in Table 10: Long-Term Operational Emissions. As shown in Table 10**,** the Project emissions would exceed SCAQMD thresholds for NO_X.

Table 10: Long-Term Operational Emissions (Maximum Pounds Per Day)

Source	Reactive Organic Gases (ROG)	Nitrogen Oxide (NO_x)	Carbon Monoxide (CO)	Sulfur Dioxide (SO_2)	Coarse Particulate Matter (PM_{10})	Fine Particulate Matter ($PM_{2.5}$)
Unmitigated Operational Emissions						
Area Source Emissions	15.42	< 0.01	0.12	< 0.01	< 0.01	< 0.01
Energy Emissions	0.04	0.37	0.31	< 0.01	0.03	0.03
Mobile Emissions	6.30	83.32	66.82	0.38	20.62	6.47
Off-Road Emissions	0.91	8.25	8.17	0.01	0.59	0.54
Total Emissions	**22.67**	**91.95**	**75.43**	**0.39**	**21.24**	**7.04**
SCAQMD Threshold	*55*	*55*	*550*	*150*	*55*	*150*
Exceeds Threshold?	**No**	**Yes**	**No**	**No**	**No**	**No**
Mitigated Operational Emissions						
Area Source Emissions	14.53	< 0.01	0.12	< 0.01	< 0.01	< 0.01
Energy Emissions	0.03	0.26	0.22	< 0.01	0.02	0.02
Mobile Emissions	3.90	38.63	54.91	0.31	17.66	5.02
Off-Road Emissions	0.91	8.25	8.17	0.01	0.59	0.54
Total Emissions	**19.37**	**47.15**	**63.43**	**0.32**	**18.27**	**5.58**
SCAQMD Threshold	*55*	*55*	*550*	*150*	*55*	*150*
Exceeds Threshold?	**No**	**No**	**No**	**No**	**No**	**No**

Note: Total values are from CalEEMod and may not add up 100% due to rounding.

Source: CalEEMod version 2016.3.2. Refer to Appendix A for model outputs.

Project operational emissions would be associated with area sources, energy sources, mobile sources (i.e., motor vehicle use), and off-road equipment. Each of these sources are described below.

- **Area Source Emissions.** Area source emissions would be generated due to on-site equipment, architectural coating, and landscaping that were previously not present on the site.

- **Energy Source Emissions.** Energy source emissions would be generated due to electricity and natural gas usage associated with the Project. Primary uses of electricity and natural gas by the Project would be for miscellaneous warehouse equipment, space heating and cooling, water heating, ventilation, lighting, appliances, and electronics.

- **Mobile Source.** Mobile sources are emissions from motor vehicles, including tailpipe and evaporative emissions. Depending upon the pollutant being discussed, the potential air quality impact may be of either regional or local concern. For example, ROG, NO_X, PM_{10}, and $PM_{2.5}$ are all pollutants of regional concern. NO_X and ROG react with sunlight to form O_3, known as photochemical smog. Additionally, wind currents readily transport PM_{10} and $PM_{2.5}$. However, CO tends to be a localized pollutant, dispersing rapidly at the source.

  Project-generated vehicle emissions are based on the trip generation within the Project Traffic Impact Study and incorporated into CalEEMod as recommended by the SCAQMD. Per the Project Traffic Impact Study, the Project would generate 1,183 daily trips (40 percent trucks). As shown in Table 10, the anticipated mobile source emissions exceed SCAQMD thresholds for NO_X. Therefore, Mitigation Measures AQ-2 through AQ-5 would be required to reduce emissions to the maximum extent feasible. Implementation of operational Mitigation Measures AQ-2 through AQ-5 would reduce NO_X emissions by reducing the number of employee vehicles onsite, reducing the amount of time trucks spend idling, and requiring the use of 2014 truck models or newer. Mitigation Measure AQ-2 requires the implementation of a Transportation Demand Management (TDM) program to reduce single occupant vehicle trips and encourage transit. Mitigation Measure AQ-3 requires electrical hookups at all loading bays and Mitigation Measure AQ-4 prohibits idling when engines are not in use. Additionally, Mitigation Measure AQ-5 requires that the project operator's haul fleet consist of 2014 model trucks or newer.

- **Off-Road Equipment Emissions.** Because the Project is a speculative warehouse development and the final end user is not known, to be conservative it was assumed that each building unit would operate one electric powered forklift, seven in total.

As indicated in Table 10, implementation of Mitigation Measures AQ-2 through AQ-5 would reduce the Project's NO_X emissions below the SCAQMD's daily emissions thresholds. Therefore, with the implementation of Mitigation Measures AQ-2 through AQ-5 operational impacts would be less than significant.

In addition, Rule 2305 requires the Project operator to directly reduce NO_X and particulate matter emissions or to otherwise facilitate emission and exposure reductions of these pollutants in nearby communities. Alternatively, warehouse operators can choose to pay a mitigation fee. Funds from the mitigation fee will be used to incentivize the purchase of cleaner trucks and charging/fueling infrastructure in communities nearby.

Warehouse owners and operators are required to earn Warehouse Actions and Investments to Reduce Emissions (WAIRE) Points each year. WAIRE points are a menu-based system earned by emission reduction measures. Warehouse operators are required to submit an annual WAIRE Report which includes truck trip data and emission reduction measures. WAIRE points can be earned by completing actions from a menu that can include acquiring and using natural gas, Near-Zero Emissions and/or Zero-Emissions on-

road trucks, zero-emission cargo handling equipment, solar panels or zero-emission charging and fueling infrastructure, or other options. Therefore, the Project operator would be required to implement additional emission reduction strategies. Conservatively, this analysis does not take credit for these potential reductions. Compliance with Rule 2305 would reduce emissions below what is currently analyzed.

Cumulative Short-Term Emissions

The SCAB is designated nonattainment for O_3, PM_{10}, and $PM_{2.5}$ for State standards and nonattainment for O_3 and $PM_{2.5}$ for Federal standards. Appendix D of the SCAQMD White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution (2003) notes that projects that result in emissions that do not exceed the project-specific SCAQMD regional thresholds of significance should result in a less than significant impact on a cumulative basis unless there is other pertinent information to the contrary. The mass-based regional significance thresholds published by the SCAQMD are designed to ensure compliance with both NAAQS and CAAQS and are based on an inventory of projected emissions in the SCAB. Therefore, if a project is estimated to result in emissions that do not exceed the thresholds, the project's contribution to the cumulative impact on air quality in the SCAB would not be cumulatively considerable. As shown in Table 9 above, construction-related emissions would not exceed the SCAQMD significance thresholds for criteria pollutants with implementation of Mitigation Measure AQ-1. Therefore, the proposed Project would not generate a cumulatively considerable contribution to air pollutant emissions during construction.

The SCAQMD has developed strategies to reduce criteria pollutant emissions outlined in the AQMP pursuant to the FCAA mandates. The analysis assumed fugitive dust controls would be utilized during construction, including frequent water applications. SCAQMD rules, mandates, and compliance with adopted AQMP emissions control measures would also be imposed on construction projects throughout the SCAB. Compliance with SCAQMD rules and regulations would further reduce the Project construction-related impacts. Therefore, Project-related construction emissions, combined with those from other projects in the area, would not substantially deteriorate local air quality. Construction emissions associated with the Project would not result in a cumulatively considerable contribution to significant cumulative air quality impacts.

Cumulative Long-Term Impacts

The SCAQMD has not established separate significance thresholds for cumulative operational emissions. The nature of air emissions is largely a cumulative impact. As a result, no single project is sufficient in size to, by itself, result in nonattainment of ambient air quality standards. Instead, individual project emissions contribute to existing cumulatively significant adverse air quality impacts. The SCAQMD developed the operational thresholds of significance based on the level above which individual project emissions would result in a cumulatively considerable contribution to the SCAB's existing air quality conditions. Therefore, a project that exceeds the SCAQMD operational thresholds would also be a cumulatively considerable contribution to a significant cumulative impact.

As shown in Table 10, operational emissions would not exceed SCAQMD thresholds with implementation of Mitigation Measures AQ-2 through AQ-5. As a result, operational emissions associated with the Project would not result in a cumulatively considerable contribution to significant cumulative air quality impacts. Additionally, adherence to SCAQMD rules and regulations would alleviate potential impacts related to

cumulative conditions on a project-by-project basis. Project operations would not contribute a cumulatively considerable net increase of any nonattainment criteria pollutant.

Furthermore, compliance with SCAQMD Rule 2305 (Warehouse Indirect Source Rule) is required for all existing and proposed warehouses greater than 100,000 square feet. Warehouse operators are required to implement additional emission reduction strategies or pay mitigation fee to reduce emissions. Compliance with Rule 2305 would reduce project emissions below what is currently analyzed and also reduce cumulative emissions.

Standard Conditions and Requirements:

SC AQ-1 Prior to the issuance of grading permits, the City Engineer shall confirm that the Grading Plan, Building Plans and Specifications require all construction contractors to comply with South Coast Air Quality Management District's (SCAQMD's) Rules 402 and 403 to minimize construction emissions of dust and particulates. The measures include, but are not limited to, the following:

- Portions of a construction site to remain inactive longer than a period of three months will be seeded and watered until grass cover is grown or otherwise stabilized.
- All on-site roads will be paved as soon as feasible or watered periodically or chemically stabilized.
- All material transported off site will be either sufficiently watered or securely covered to prevent excessive amounts of dust.
- The area disturbed by clearing, grading, earthmoving, or excavation operations will be minimized at all times.
- Where vehicles leave a construction site and enter adjacent public streets, the streets will be swept daily or washed down at the end of the work day to remove soil tracked onto the paved surface.

Mitigation Measures:

AQ-1 The contractor shall use Tier 4 Interim or Tier 4 Final compliant construction equipment during the grading phase of construction.

AQ-2 Prior to issuance of occupancy permits, the Project operator shall prepare and submit a Transportation Demand Management (TDM) program detailing strategies that would reduce the use of single occupant vehicles by employees by increasing the number of trips by walking, bicycle, carpool, vanpool and transit. The TDM program shall include, but is not limited to the following:

- Provide a transportation information center and on-site TDM coordinator to educate residents, employers, employees, and visitors of surrounding transportation options;
- Promote bicycling and walking through design features such as showers for employees, self-service bicycle repair area, etc. around the project site.

- Provide on-site car share amenities for employees who make only occasional use of a vehicle, as well as others who would like occasional access to a vehicle of a different type than they use day-to-day;
- Promote and support carpool/vanpool/rideshare use through parking incentives and administrative support, such as ride-matching service; and
- Incorporate incentives for using alternative travel modes, such as preferential load/unload areas or convenient designated parking spaces for carpool/vanpool users.

AQ-3 Electrical hookups shall be provided at all loading bays for truckers to plug in any onboard auxiliary equipment and power refrigeration units while their truck is stopped.

AQ-4 All truck access gates and loading docks within the project site shall have a sign posted that states:

- Truck drivers shall turn off engines when not in use
- Truck drivers shall shut down the engine after five minutes of continuous idling operation once the vehicle is stopped, the transmission is set to "neutral" or "park", and the parking break is engaged.
- Telephone numbers of the building facilities manager and CARB to report Violations

AQ-5 The Project Operator(s) shall ensure, through sale or leasing agreements, that the haul fleet consist of trucks that at a minimum meet the emissions standards of a 2014 vehicle model, and as trucks are replaced, they are replaced with the newest available model.

Level of Significance: Less than significant impact with mitigation incorporated.

Threshold 5.3 Would the Project expose sensitive receptors to substantial pollutant concentrations?

Localized Construction Significance Analysis

The nearest sensitive receptors are the single-family residences located 90 feet (27 meters) to the south of the Project. To identify impacts to sensitive receptors, the SCAQMD recommends addressing LSTs for construction. LSTs were developed in response to SCAQMD Governing Boards' Environmental Justice Enhancement Initiative (I-4). The SCAQMD provided the *Final Localized Significance Threshold Methodology* (dated June 2003 [revised 2008]) for guidance. The LST methodology assists lead agencies in analyzing localized impacts associated with Project-specific emissions.

Since CalEEMod calculates construction emissions based on the number of equipment hours and the maximum daily soil disturbance activity possible for each piece of equipment, Table 11: Equipment-Specific Grading Rates, is used to determine the maximum daily disturbed acreage for comparison to LSTs. The appropriate SRA for the localized significance thresholds is the Central San Bernardino Valley (SRA 34) since this area includes the Project. LSTs apply to CO, NO_2, PM_{10}, and $PM_{2.5}$. The SCAQMD produced look-up tables for projects that disturb areas less than or equal to 5 acres in size. Project construction is anticipated to disturb a maximum of 4.0 acres in a single day. As the LST guidance provides thresholds for

projects disturbing 1-, 2-, and 5-acres in size and the thresholds increase with size of the site, the LSTs for a 4.0-acre threshold were interpolated and utilized for this analysis.

Table 11: Equipment-Specific Grading Rates

Construction Phase	Equipment Type	Equipment Quantity	Acres Graded per 8-Hour Day	Operating Hours per Day	Acres Graded per Day
Grading	Tractors	2	0.5	8	1.0
	Graders	1	0.5	8	0.5
	Dozers	1	0.5	8	0.5
	Scrapers	2	1	8	2.0
				Total Acres Graded per Day	**4.0**

Source: CalEEMod version 2016.3.2. Refer to Appendix A for model outputs.

The SCAQMD's methodology states that "off-site mobile emissions from the Project should not be included in the emissions compared to LSTs." Therefore, only emissions included in the CalEEMod "on-site" emissions outputs were considered. The nearest sensitive receptors are the single-family residences located 90 feet (27 meters) south of the Project. LST thresholds are provided for distances to sensitive receptors of 25, 50, 100, 200, and 500 meters. Therefore, LSTs for receptors located at 25 meters were conservatively utilized in this analysis. Table 12: Localized Significance of Mitigated Construction Emissions, presents the results of localized emissions during construction with the implementation of mitigation measure AQ-1. Table 12 shows emissions of these pollutants on the peak day of construction would not result in significant concentrations of pollutants at nearby sensitive receptors. Significant impacts would not occur concerning LSTs during construction.

Table 12: Localized Significance of Mitigated Construction Emissions (Maximum Pounds Per Day)

Construction Activity	Nitrogen Oxide (NO_x)		Carbon Monoxide (CO)		Coarse Particulate Matter (PM_{10})		Fine Particulate Matter ($PM_{2.5}$)	
Site Preparation	12.16		22.96		8.19		4.53	
Grading	19.27		36.72		4.13		1.74	
Construction	16.01	30.45[a]	16.79	33.26[a]	0.68	1.45[a]	0.64	1.35[a]
Paving	12.91		14.65		0.68		0.62	
Architectural Coating	1.53		1.82		0.09		0.09	
Daily SCAQMD Localized Construction Screening Threshold (adjusted for 4.0 acres at 25 meters)	*237*		*1,466*		*12*		*7*	
Exceed SCAQMD Threshold?	**No**		**No**		**No**		**No**	

Note:
a. Construction, paving, and architectural coating sub-phase emissions are combined because they would potentially all generate emissions on the same day. However, addition of overlapping phases during construction for the LST analysis is not required and considered conservative. Even though the activities may all occur on the same day, it is unlikely that they would occur as the exact same time at the exact same distance to the closest sensitive receptor. Overlapping emissions is taken into consideration for the regional analysis (Table 9).

Source: CalEEMod version 2016.3.2. Refer to Appendix A for model outputs.

Localized Operational Significance Analysis

According to the SCAQMD LST methodology, LSTs would apply to the operational phase of a project only if it includes stationary sources or attracts mobile sources that may spend long periods queuing and idling at the site (e.g. warehouse or transfer facilities). Since the Project is a warehouse, the operational phase LST protocol is conservatively applied to both the area source and all the mobile source emissions. LSTs for receptors located at 25 meters for SRA 34 were utilized in this analysis. Although the Project is 31 acres, the 5-acre LST threshold was used because the thresholds increase with the size of the site. Therefore, the 5-acre LSTs are conservative for evaluation of a 31-acre site.

The LST analysis only includes on-site sources. However, the CalEEMod model outputs do not separate on- and off-site emissions for mobile sources. Emissions shown in Table 13: Localized Significance of Mitigated Operational Emissions, conservatively include all on-site Project-related stationary sources, off-road equipment (forklifts), and 10 percent of the total Project-related mobile sources, since a portion of mobile sources could include trucks idling on-site, after the implementation of mitigation measures AQ-2 through AQ-5. Table 13 shows that the maximum daily emissions of these pollutants during operations would not result in significant concentrations of pollutants at nearby sensitive receptors. Therefore, significant impacts would not occur concerning LSTs during operational activities.

Table 13: Localized Significance of Mitigated Operational Emissions (Maximum Pounds Per Day)

Activity	Nitrogen Oxide (NO_x)	Carbon Monoxide (CO)	Coarse Particulate Matter (PM_{10})	Fine Particulate Matter ($PM_{2.5}$)
On-Site and Mobile Source Emissions	12.11	13.21	2.36	1.04
Daily SCAQMD Localized Operation Screening Threshold (5 acres at 25 meters)	*270*	*1,720*	*4*	*2*
Exceed SCAQMD Threshold?	**No**	**No**	**No**	**No**

Note: SRA Zone 34, 5-acre site, 25 meters to receptors; conservatively assumes that 10 percent of all mobile emissions occur on-site
Source: CalEEMod version 2016.3.2. Refer to Appendix A for model outputs.

In addition, SCAQMD's Rule 2305 will require the Project to directly reduce NO_X and particulate matter emissions, or to otherwise facilitate emissions and exposure reductions of these pollutants in nearby communities. The Project operator may be required to implement additional emission reduction strategies. Conservatively, this analysis is not taking credit for these potential reductions. Compliance with Rule 2305 would reduce emissions below what is currently analyzed.

Criteria Pollutant Health Impacts

On December 24, 2018, the California Supreme Court issued an opinion identifying the need to provide sufficient information connecting a project's air emissions to health impacts or explain why such information could not be ascertained (*Sierra Club v. County of Fresno* [Friant Ranch, L.P.] [2018] Cal.5th, Case No. S219783). The SCAQMD has set its CEQA significance thresholds based on the FCAA, which defines a major stationary source (in extreme O_3 nonattainment areas such as the SCAB) as emitting 10 tons per year. The thresholds correlate with the trigger levels for the federal New Source Review (NSR) Program and SCAQMD Rule 1303 for new or modified sources. The NSR Program[4] was created by the FCAA

[4] Code of Federal Regulation (CFR) [i.e. PSD (40 CFR 52.21, 40 CFR 51.166, 40 CFR 51.165 (b)), Non-attainment NSR (40 CFR 52.24, 40 CFR 51.165, 40 CFR part 51, Appendix S)

to ensure that stationary sources of air pollution are constructed or modified in a manner that is consistent with attainment of health-based federal ambient air quality standards. The federal ambient air quality standards establish the levels of air quality necessary, with an adequate margin of safety, to protect the public health. Therefore, projects that do not exceed the SCAQMD's LSTs and mass emissions thresholds would not violate any air quality standards or contribute substantially to an existing or projected air quality violation and no criteria pollutant health impacts.

NO_X and ROG are precursor emissions that form O_3 in the atmosphere in the presence of sunlight where the pollutants undergo complex chemical reactions. It takes time and the influence of meteorological conditions for these reactions to occur, so O_3 may be formed at a distance downwind from the sources. Breathing ground-level O_3 can result health effects that include: reduced lung function, inflammation of airways, throat irritation, pain, burning, or discomfort in the chest when taking a deep breath, chest tightness, wheezing, or shortness of breath. In addition to these effects, evidence from observational studies strongly indicates that higher daily O_3 concentrations are associated with increased asthma attacks, increased hospital admissions, increased daily mortality, and other markers of morbidity. The consistency and coherence of the evidence for effects upon asthmatics suggests that O_3 can make asthma symptoms worse and can increase sensitivity to asthma triggers.

According the SCAQMD's 2016 AQMP, O_3, NO_X, and ROG have been decreasing in the SCAB since 1975 and are projected to continue to decrease in the future. Although vehicle miles traveled in the SCAB continue to increase, NO_X and ROG levels are decreasing because of the mandated controls on motor vehicles and the replacement of older polluting vehicles with lower-emitting vehicles. NO_X emissions from electric utilities have also decreased due to the use of cleaner fuels and renewable energy. The 2016 AQMP demonstrates how the SCAQMD's control strategy to meet the 8-hour O_3 standard in 2023 would lead to sufficient NO_X emission reductions to attain the 1-hour O_3 standard by 2022. In addition, since NO_X emissions also lead to the formation of $PM_{2.5}$, the NO_X reductions needed to meet the O_3 standards will likewise lead to improvement of $PM_{2.5}$ levels and attainment of $PM_{2.5}$ standards.

The SCAQMD's air quality modeling demonstrates that NO_X reductions prove to be much more effective in reducing O_3 levels and will also lead to significant improvement in $PM_{2.5}$ concentrations. NO_X-emitting stationary sources regulated by the SCAQMD include Regional Clean Air Incentives Market (RECLAIM) facilities (e.g. refineries, power plants, etc.), natural gas combustion equipment (e.g. boilers, heaters, engines, burners, flares) and other combustion sources that burn wood or propane. The 2016 AQMP identifies robust NO_X reductions from new regulations on RECLAIM facilities, non-refinery flares, commercial cooking, and residential and commercial appliances. Such combustion sources are already heavily regulated with the lowest NO_X emissions levels achievable but there are opportunities to require and accelerate replacement with cleaner zero-emission alternatives, such as residential and commercial furnaces, pool heaters, and backup power equipment. The AQMD plans to achieve such replacements through a combination of regulations and incentives. Technology-forcing regulations can drive development and commercialization of clean technologies, with future year requirements for new or existing equipment. Incentives can then accelerate deployment and enhance public acceptability of new technologies.

The 2016 AQMD also emphasizes that beginning in 2012, continued implementation of previously adopted regulations will lead to NO_X emission reductions of 68 percent by 2023 and 80 percent by 2031. With the addition of 2016 AQMP proposed regulatory measures, a 30 percent reduction of NO_X from stationary sources is expected in the 15-year period between 2008 and 2023. This is in addition to significant NO_X reductions from stationary sources achieved in the decades prior to 2008.

As previously discussed, Project emissions would be potentially significant and would require mitigation measures AQ-1 through AQ-5 to reduce NO_X emissions (refer to Table 10). Localized effects of on-site Project emissions with mitigation were found to be less than significant on nearby receptors (refer to Table 12 and Table 13). The LSTs represent the maximum emissions from a project that are not expected to cause or contribute to an exceedance of the most stringent applicable state or federal ambient air quality standard. The LSTs were developed by the SCAQMD based on the ambient concentrations of that pollutant for each SRA and distance to the nearest sensitive receptor. The ambient air quality standards establish the levels of air quality necessary, with an adequate margin of safety, to protect public health, including protecting the health of sensitive populations.

Carbon Monoxide Hotspots

An analysis of CO "hot spots" is needed to determine whether the change in the level of service of an intersection resulting from the Project would have the potential to result in exceedances of the CAAQS or NAAQS. It has long been recognized that CO exceedances are caused by vehicular emissions, primarily when vehicles are idling at intersections. Vehicle emissions standards have become increasingly stringent in the last 20 years. Currently, the CO standard in California is a maximum of 3.4 grams per mile for passenger cars (requirements for certain vehicles are more stringent). With the turnover of older vehicles, introduction of cleaner fuels, and implementation of control technology on industrial facilities, CO concentrations have steadily declined. Accordingly, with the steadily decreasing CO emissions from vehicles, even very busy intersections do not result in exceedances of the CO standard.

The SCAB was re-designated as attainment in 2007 and is no longer addressed in the SCAQMD's AQMP. The 2003 AQMP is the most recent version that addresses CO concentrations. As part of the SCAQMD *CO Hotspot Analysis*, the Wilshire Boulevard and Veteran Avenue intersection, one of the most congested intersections in Southern California with an average daily traffic (ADT) volume of approximately 100,000 vehicles per day, was modeled for CO concentrations. This modeling effort identified a CO concentration high of 4.6 ppm, which is well below the 35-ppm Federal standard. The Project considered herein would not produce the volume of traffic required to generate a CO hot spot in the context of SCAQMD's *CO Hotspot Analysis*. As the CO hotspots were not experienced at the Wilshire Boulevard and Veteran Avenue intersection even as it accommodates 100,000 vehicles daily, it can be reasonably inferred that CO hotspots would not be experienced at any vicinity intersections resulting from 1,183 additional vehicle trips (40 percent trucks), with 116 trips in the morning peak hour and 129 trips in the evening peak hour attributable to the Project. Therefore, impacts would be less than significant.

Construction-Related Diesel Particulate Matter

Construction would result in the generation of DPM emissions from the use of off-road diesel equipment required. The amount to which the receptors are exposed (a function of concentration and duration of exposure) is the primary factor used to determine health risk (i.e. potential exposure to TAC emission levels that exceed applicable standards). Health-related risks associated with diesel-exhaust emissions are primarily linked to long-term exposure and the associated risk of contracting cancer.

The use of diesel-powered construction equipment would be temporary and episodic. The duration of exposure would be short and exhaust from construction equipment dissipates rapidly. Current models and methodologies for conducting health risk assessments are associated with longer-term exposure periods of 9, 30, and 70 years, which do not correlate well with the temporary and highly variable nature of construction activities. The California Office of Environmental Health Hazard Assessment has not

identified short-term health effects from DPM. Construction is temporary and would be transient throughout the site (i.e., move from location to location) and would not generate emissions in a fixed location for extended periods of time which would limit the exposure of any proximate individual sensitive receptor to TACs.

Additionally, construction is subject to and would comply with California regulations (e.g., California Code of Regulations, Title 13, Sections 2485 and 2449), which reduce diesel PM and criteria pollutant emissions from in-use off-road diesel-fueled vehicles and limit the idling of heavy-duty construction equipment to no more than five minutes. These regulations would further reduce nearby sensitive receptors' exposure to temporary and variable DPM emissions. Given the temporary and intermittent nature of construction activities likely to occur within specific locations in the Project site (i.e., construction is not likely to occur in any one location for an extended time), the dose of DPM of any one receptor is exposed to would be limited. Therefore, considering the relatively short duration of DPM-emitting construction activity at any one location and the highly dispersive properties of DPM, sensitive receptors would not be exposed to substantial concentrations of construction-related TAC emissions, however construction-related health impacts are analyzed in greater detail in the Health Risk Assessment. With implementation of Mitigation Measure AQ-1, construction health risk impacts would be less than significant.

Mitigation Measures: Mitigation Measures AQ-1 through AQ-5 (refer to Impact Threshold 5.2, above).

Level of Significance: Less than significant impact with mitigation incorporated.

Threshold 5.4 Would the Project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

The SCAQMD *CEQA Air Quality Handbook* identifies certain land uses as sources of odors. These land uses include agriculture (farming and livestock), wastewater treatment plants, food processing plants, chemical plants, composting facilities, refineries, landfills, dairies, and fiberglass molding. The Project would not include any of the land uses that have been identified by the SCAQMD as odor sources.

During construction-related activities, some odors (not substantial pollutant concentrations) that may be detected are those typical of construction vehicles (e.g. diesel exhaust from grading and construction equipment). These odors are a temporary short-term impact that is typical of construction projects and would disperse rapidly. The Project would not include any of the land uses that have been identified by the SCAQMD as odor sources. Therefore, the Project would not create objectionable odors.

Mitigation Measures: No mitigation is required.

Level of Significance: No impact.

Appendix A

Air Quality Modeling Data

Olive Grove Business Park

San Bernardino-South Coast County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	0.00	1000sqft	0.00	10,000.00	0
Unrefrigerated Warehouse-No Rail	669.61	1000sqft	15.37	669,607.00	0
Parking Lot	527.95	1000sqft	12.12	527,947.00	0
City Park	4.06	Acre	4.06	176,857.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2021
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	510.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Olive Grove Business Park - San Bernardino-South Coast County, Summer

Project Characteristics - Adjusted per the SCE 2018 Corporate Responsibility and Sustainability Report. The report provides intensity factor of CO2e, the CO2 intensity factor is calculated as 513-25*0.029-298*0.00617=510.4363 to avoid double counting.

Land Use - warehouse buildings= 425,148 sf + 243,593 sf + fire pump building 866 sf, office space = 10,000 sf, landscape shown as city park =176857sf, parking/drive aisles/off site improvements =527,947 sf

Construction Phase - anticipated construction schedule, construction duration of 10 months. Construction, Paving, and Painting to occur concurrently

Trips and VMT -

Grading - 229,748 cubic yards of export

Architectural Coating - Rule 1113 - low VOC paint

Vehicle Trips - based on traffic study: 1,183 trips/669.607k = 1.766707934654207617303881231827, trip length based on Forecasting Metropolitan Commercial and Freight Travel, average truck trip length in SCAG is 24.11 miles, rounded up to 25 miles to be conservative

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule

Energy Use -

Construction Off-road Equipment Mitigation - Rule 403

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation - Use Low VOC paint, Rule 1113

Energy Mitigation - CEC - 2019 standards will reduce nonresidential energy use by 30% over 2016 standard

Water Mitigation - consistent with CA building code

Waste Mitigation -

Operational Off-Road Equipment - Assume 1 forklifts per building unit, total 7

Fleet Mix - fllet mix Based on Traffic Study trip generation table

1.3 User Entered Comments & Non-Default Data

Olive Grove Business Park - San Bernardino-South Coast County, Winter

Project Characteristics - Adjusted per the SCE 2018 Corporate Responsibility and Sustainability Report. The report provides intensity factor of CO2e, the CO2 intensity factor is calculated as 513-25*0.029-298*0.00617=510.4363 to avoid double counting.

Land Use - warehouse buildings= 425,148 sf + 243,593 sf + fire pump building 866 sf, office space = 10,000 sf, landscape shown as city park =176857sf, parking/drive aisles/off site improvements =527,947 sf

Construction Phase - anticipated construction schedule, construction duration of 10 months. Construction, Paving, and Painting to occur concurrently

Trips and VMT -

Grading - 229,748 cubic yards of export

Architectural Coating - Rule 1113 - low VOC paint

Vehicle Trips - based on traffic study: 1,183 trips/669.607k = 1.766707934654207617303881231827, trip length based on Forecasting Metropolitan Commercial and Freight Travel, average truck trip length in SCAG is 24.11 miles, rounded up to 25 miles to be conservative

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule

Energy Use -

Construction Off-road Equipment Mitigation - Rule 403

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation - Use Low VOC paint, Rule 1113

Energy Mitigation - CEC - 2019 standards will reduce nonresidential energy use by 30% over 2016 standard

Water Mitigation - consistent with CA building code

Waste Mitigation -

Operational Off-Road Equipment - Assume 1 forklifts per building unit, total 7

Fleet Mix - fllet mix Based on Traffic Study trip generation table

1.3 User Entered Comments & Non-Default Data

Olive Grove Business Park, Mitigated 2014 trucks or newer - San Bernardino-South Coast County, Summer

Project Characteristics - Adjusted per the SCE 2018 Corporate Responsibility and Sustainability Report. The report provides intensity factor of CO2e, the CO2 intensity factor is calculated as 513-25*0.029-298*0.00617=510.4363 to avoid double counting.

Land Use - warehouse buildings= 425,148 sf + 243,593 sf + fire pump building 866 sf, office space = 10,000 sf, landscape shown as city park =176857sf, parking/drive aisles/off site improvements =527,947 sf

Construction Phase - anticipated construction schedule, construction duration of 10 months. Construction, Paving, and Painting to occur concurrently

Trips and VMT -

Grading - 229,748 cubic yards of export

Architectural Coating - Rule 1113 - low VOC paint

Vehicle Trips - based on traffic study: 1,183 trips/669.607k = 1.766707934654207617303881231827, trip length based on Forecasting Metropolitan Commercial and Freight Travel, average truck trip length in SCAG is 24.11 miles, rounded up to 25 miles to be conservative

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule, Mitigation requires use of 2014 trucks or newer

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule, Mitigation requires use of 2014 trucks or newer

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule, Mitigation requires use of 2014 trucks or newer

Energy Use -

Construction Off-road Equipment Mitigation - Mitigation requires Tier 4 equipment during grading phase, Rule 403

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation - Use Low VOC paint, Rule 1113

Energy Mitigation - CEC - 2019 standards will reduce nonresidential energy use by 30% over 2016 standard

Water Mitigation - consistent with CA building code

Waste Mitigation -

Operational Off-Road Equipment - Assume 1 forklifts per building unit, total 7

Fleet Mix - fllet mix Based on Traffic Study trip generation table

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	0.00	1000sqft	0.00	10,000.00	0
Unrefrigerated Warehouse-No Rail	669.61	1000sqft	15.37	669,607.00	0
Parking Lot	527.95	1000sqft	12.12	527,947.00	0
City Park	4.06	Acre	4.06	176,857.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2021
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	510.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Adjusted per the SCE 2018 Corporate Responsibility and Sustainability Report. The report provides intensity factor of CO2e, the CO2 intensity factor is calculated as 513-25*0.029-298*0.00617=510.4363 to avoid double counting.

Land Use - warehouse buildings= 425,148 sf + 243,593 sf + fire pump building 866 sf, office space = 10,000 sf, landscape shown as city park =176857sf, parking/drive aisles/off site improvements =527,947 sf

Construction Phase - anticipated construction schedule, construction duration of 10 months. Construction, Paving, and Painting to occur concurrently

Trips and VMT -

Grading - 229,748 cubic yards of export

Architectural Coating - Rule 1113 - low VOC paint

Vehicle Trips - based on traffic study: 1,183 trips/669.607k = 1.766707934654207617303881231827, trip length based on Forecasting Metropolitan Commercial and Freight Travel, average truck trip length in SCAG is 24.11 miles, rounded up to 25 miles to be conservative

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule, Mitigation requires use of 2014 trucks or newer

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule, Mitigation requires use of 2014 trucks or newer

Vehicle Emission Factors - EMFAC 2017 - San Bernardino SC and SAFE Rule, Mitigation requires use of 2014 trucks or newer

Energy Use -

Construction Off-road Equipment Mitigation - Mitigation requires Tier 4 equipment during grading phase, Rule 403

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation - Use Low VOC paint, Rule 1113

Energy Mitigation - CEC - 2019 standards will reduce nonresidential energy use by 30% over 2016 standard

Water Mitigation - consistent with CA building code

Waste Mitigation -

Operational Off-Road Equipment - Assume 1 forklifts per building unit, total 7

Fleet Mix - fllet mix Based on Traffic Study trip generation table

EPA	United States Environmental Protection Agency
VMT	vehicle miles traveled
VOC	volatile organic compound

1 INTRODUCTION

The purpose of this Health Risk Assessment (HRA) is to evaluate potential health risks associated with Toxic Air Contaminants (TAC) including Diesel Particulate Matter (DPM) resulting from the implementation of the proposed Olive Avenue Development ("Project" or "proposed Project"). This HRA was prepared in accordance with the requirements of the South Coast Air Quality Management District (SCAQMD) and guidance from the Office of Environmental Health Hazard Assessment (OEHHA) to determine if health risks are likely to occur from the Project. Technical data is included as see Appendix A: Modeling Data.

1.1 Project Location

The Project site is located north of Baseline Road and east of Fitzgerald Avenue in the City of Rialto, in San Bernardino County. The project site is located southeast of Rialto Municipal Airport and south of Jerry Eaves Park. The project site is currently vacant and is bounded by Jerry Eaves Public Park to the north, vacant land and single-family residential uses to the east, West Baseline Road and single-family residential uses to the south, and vacant land and industrial uses to the west. The 31.6-acre site is located approximately one-mile south the Foothill Freeway (SR-210), Seven miles east of Interstate 15 (I-15), One mile north of Route 66 (RTE-66), and Five miles west of San Bernardino Freeway (SR-215); refer to Exhibit 1: Regional Location Map and Exhibit 2: Project Vicinity Map

1.2 Project Description

The Project is proposing to develop an existing vacant property (location as referenced above) that would include the construction of a campus oriented industrial project with two primary, divisible, buildings consisting of approximately 10,000 square feet of office/mezzanine space, 866 square feet for exterior building sprinkler fire pumps, and 668,741 square feet of warehouse space for a total of 679,607 square feet on approximately 31.08 net acres. The Owner is proposing to split the existing property (referenced as Assessor Parcel No. (APN) 0264-213-18) from one large lot into two lots to allow for each of the two proposed buildings to each have their own legal parcel.

As shown in Exhibit 3: Conceptual Site Plan, Building 1 (west building) and Building 2 (east building) have been architecturally designed to allow for multiple units in various increments based on tenant demand. Exhibit 3 shows that Building 1 can be divided into 4 or more units and Building 2 can be divided into 3 or more units, each with a separate point of entry into the buildings.

Existing General Plan Land Use and Zoning Designations

The Project site is zoned for Industrial Park land Use. Adjacent properties to the north are zoned for open space resources and open space recreation uses. Properties to the west are zoned for a specific site plan: Renaissance site. The properties to the south are zoned for residential and open space resources. Properties zoned for residential and Community commercial are due east of the Project site.

Warehouse Facility

The proposed Project consists of two warehouse buildings for a total of 679,390 square feet; refer to Table 1: Building Summary. Building "1" would include 425,148 square feet of warehouse area, 5,000 square

feet of office space, and 433 feet designated for a fire pump. Building "2" would include 243,376 square feet of warehouse area, 5,000 square feet of office space, and 433 feet designated for a fire pump.

Table 1: Building Summary

Building	Warehouse (sf)	Office Mezzanine (sf)	Fire Pump (sf)	Total Building (sf)	Parking			Landscaping (sf)
					Automobiles	Truck/Trailer Stalls	Loading Docks	
1	425,148	5,000	433	430,581	308	64	48	97,826
2	243,593	5,000	433	249,026	197	58	31	79,031

Notes: sf = square feet

Site Access

Vehicular access provisions for the project site would consist of three driveways on Baseline Road. Passenger vehicles would access the site via all three driveways. The center driveway would be signalized and would provide truck and passenger vehicle ingress/egress to the site. The eastern and western driveways would be right-in right-out and would be dedicated to passenger and emergency vehicles. Street improvements to Baseline Road may consist of the following: sidewalk, parkway landscaping, curb and gutter, median improvements, bike lanes, dry utility undergrounding, streetlights, fire hydrants, traffic signal equipment (center driveway intersection), rehabilitation of existing asphalt pavement, offsite utility connections, and signing and striping, as required by the City. Off-site improvements would include construction of a new signalized intersection at Idyllwild Avenue and Baseline Road to provide signalized access to the residences south of Baseline Road and construction of a new signalized intersection at the center of the Project along Baseline Road to allow for direct truck access into and out of the Project.

Parking

The Project provides 505 automobile parking stalls, exceeding the requirement of 414 automobile parking stalls. Additionally, 122 trailer parking spaces and 79 loading docks are provided.

Landscaping

Landscaping is required by City code to cover 10% of each lot and based on the proposed Project would cover approximately 12.27% (97,826 square feet) on Parcel 1 and 14.17% (79,031 square feet) on Parcel 2 of the site. Landscaping would be installed in all areas not devoted to buildings, parking, traffic and specific user requirements, in accordance with the City's Municipal Code Section 18.61.250 and Section 18.61.270 which specify landscape design guidelines for industrial districts.

2 ENVIRONMENTAL SETTING

2.1 Climate

The general region lies in the semi-permanent high-pressure zone of the eastern Pacific. The climate is mild and tempered by cool sea breezes. The usually mild climatological pattern is interrupted infrequently by periods of extremely hot weather, winter storms, or Santa Ana winds. The extent and severity of the air pollution problem in the South Coast Air Basin (SCAB) is a function of the area's natural physical characteristics (weather and topography), as well as man-made influences (development patterns and lifestyle). Factors such as wind, sunlight, temperature, humidity, rainfall, and topography all affect the accumulation and/or dispersion of pollutants throughout the SCAB. These factors along with applicable regulations are discussed below.

The average annual temperature varies little throughout the SCAB, averaging 75 degrees Fahrenheit (°F). However, with a less-pronounced oceanic influence, the eastern inland portions of the SCAB show greater variability in annual minimum and maximum temperatures. All portions of the SCAB have had recorded temperatures over 100°F in recent years.

2.2 Meteorology

Although the SCAB has a semi-arid climate, the air near the surface is moist due to the presence of a shallow marine layer. Except for infrequent periods when dry, continental air is brought into the SCAB by offshore winds, the ocean effect is dominant. Periods with heavy fog are frequent, and low stratus clouds, occasionally referred to as "high fog," are a characteristic climate feature. Annual average relative humidity is 70 percent at the coast and 57 percent in the eastern part of the SCAB. Precipitation in the SCAB is typically nine to 14 inches annually and is rarely in the form of snow or hail due to typically warm weather. The frequency and amount of rainfall is greater in the coastal areas of the SCAB.

A temperature inversion is defined as an increase in temperature with height, or to the layer within which such an increase occurs. The height of the inversion is important in determining pollutant concentration. When the inversion is approximately 2,500 feet above sea level, the sea breezes carry the pollutants inland to escape over the mountain slopes or through the passes. At a height of 1,200 feet, the terrain prevents the pollutants from entering the upper atmosphere, resulting in a settlement in the foothill communities. Below 1,200 feet, the inversion puts a tight lid on pollutants, concentrating them in a shallow layer over the entire SCAB. Usually, inversions are lower before sunrise than during the day. Mixing heights for inversions are lower in the summer and more persistent, being partly responsible for the high levels of ozone (O_3) observed during summer months in the SCAB. Smog in southern California is generally the result of these temperature inversions combining with coastal day winds and local mountains to contain the pollutants for long periods of time, allowing them to form secondary pollutants by reacting with sunlight. The SCAB has a limited ability to disperse these pollutants due to typically low wind speeds.

The area in which the Project is located offers clear skies and sunshine, yet is still susceptible to air inversions. These inversions trap a layer of stagnant air near the ground, where it is then further loaded

with pollutants. These inversions cause haziness, which is caused by moisture, suspended dust, and a variety of chemical aerosols emitted by trucks, automobiles, furnaces, and other sources.

2.3 Toxic Air Contaminants

Toxic Air Contaminants (TACs) are airborne substances capable of causing short-term (acute) and long-term (chronic or carcinogenic, i.e. cancer causing) adverse human health effects (i.e. injury or illness). TACs include both organic and inorganic chemical substances. They may be emitted from a variety of common sources including gasoline stations, automobiles, dry cleaners, industrial operations, and painting operations. The current California list of TACs includes approximately 200 compounds, including particulate emissions from diesel-fueled engines.

Hazardous Air Pollutants (HAP) is a term used by the Federal Clean Air Act (FCAA) that includes a variety of pollutants generated or emitted by industrial production activities. Identified as TACs under the California Clean Air Act (CCAA), ten have been singled out through ambient air quality data as being the most substantial health risk in California. Direct exposure to these pollutants has been shown to cause cancer, birth defects, damage to the brain and nervous system, and respiratory disorders. The California Air Resources Board (CARB) provides emission inventories for only the larger air basins.

TACs do not have ambient air quality standards because no safe levels of TACs can be determined. Instead, TAC impacts are evaluated by calculating the health risks associated with a given exposure. The requirements of the Air Toxic "Hot Spots" Information and Assessment Act (Assembly Bill [AB] 2588) apply to facilities that use, produce, or emit toxic chemicals. Facilities subject to the toxic emission inventory requirements of the act must prepare and submit toxic emission inventory plans and reports, and periodically update those reports.

Toxic contaminants often result from fugitive emissions during fuel storage and transfer activities, and from leaking valves and pipes. For example, the electronics industry, including semiconductor manufacturing, uses highly toxic chlorinated solvents in semiconductor production processes. Sources of air toxics go beyond industry, however. Automobile exhaust also contains toxic air pollutants such as benzene and 1,3-butadiene. In California, on-road diesel-fueled engines contribute approximately 24 percent of the statewide total, with an additional 71 percent attributed to other mobile sources such as construction and mining equipment, agricultural equipment, and transport refrigeration units. Stationary sources contribute about 5 percent of total DPM. It should be noted that CARB has developed several plans and programs to reduce diesel emissions such as the Diesel Risk Reduction Plan (DRRP), the Statewide Portable Equipment Registration Program (PERP), and the Diesel Off-Road Reporting System (DOORS). The PERP and DOORS programs allow owners or operators of portable engines and certain other types of equipment can register their units in order to operate their equipment throughout California without having to obtain individual permits from local air districts.

Diesel exhaust and many individual substances contained in it (including arsenic, benzene, formaldehyde, and nickel) have the potential to contribute to mutations in cells that can lead to cancer. Long-term exposure to diesel exhaust particles poses the highest cancer risk of any TAC evaluated by OEHHA. CARB

estimates that about 70 percent of the cancer risk that the average Californian faces from breathing toxic air pollutants stems from diesel exhaust particles.

In its comprehensive assessment of diesel exhaust, OEHHA analyzed more than 30 studies of people who worked around diesel equipment, including truck drivers, railroad workers, and equipment operators. The studies showed these workers were more likely to develop lung cancer than workers not exposed to diesel emissions. These studies provide strong evidence that long-term occupational exposure to diesel exhaust increases the risk of lung cancer. Using information from OEHHA's assessment, CARB estimates that diesel particle levels measured in California's air in 2000 could cause 540 "excess" cancers in a population of 1 million people over a 70-year lifetime. Other researchers and scientific organizations, including the National Institute for Occupational Safety and Health, have calculated cancer risks from diesel exhaust similar to those developed by OEHHA and CARB.

Exposure to diesel exhaust can have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks.

Diesel engines are a major source of fine particulate pollution. The elderly and people with emphysema, asthma, and chronic heart and lung disease are especially sensitive to fine-particle pollution. Numerous studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems. Because children's lungs and respiratory systems are still developing, they are also more susceptible than healthy adults to fine particles. Exposure to fine particles is associated with increased frequency of childhood illnesses and can also reduce lung function in children. In California, diesel exhaust particles have been identified as a carcinogen.

2.4 Sensitive Receptors

Sensitive populations are more susceptible to the effects of air pollution than is the general population. Sensitive receptors that are in proximity to localized sources of toxics are of particular concern. Land uses considered sensitive receptors include residences, schools, playgrounds, childcare centers, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes. Sensitive land uses surrounding the Project consist of single-family residential communities. The nearest sensitive land uses nearest to the Project are shown in Table 2: Sensitive Receptors.

Table 2: Sensitive Receptors	
Receptor Description	**Distance and Direction from the Project**
Single-Family Residential Community	90 feet to the south
Single-Family Residential Community	800 feet to the east
Jerry Eaves Park	870 feet to the north
Single-Family Residential Community	1,600 feet to the north
Winchester Senior Home II	1,500 feet to the northeast
La Petite Academy of Rialto	1,900 feet to the east
Helen L. Dollahan Elementary School	2,100 feet to the south
Flores Park	2,400 feet to the South
Camino Nuevo Church	2,500 feet to the southeast
Eisenhower Senior High School	3,000 feet to the east
Dunn Elementary School	4,000 feet to the southeast

3 REGULATORY SETTING

3.1 Federal

Federal Clean Air Act

The FCAA was amended in 1990 to address the numerous air pollutants that are known to cause or may reasonably be anticipated to cause adverse effects to human health or adverse environmental effects. 188 specific pollutants and chemical groups were initially identified as HAPs, and the list has been modified over time. The FCAA Amendments included new regulatory programs to control acid deposition and for the issuance of stationary source operating permits.

In 2001, the United States Environmental Protection Agency (EPA) issued its first Mobile Source Air Toxics Rule, which identified 21 mobile source air toxic (MSAT) compounds as being HAPs that required regulation. A subset of six of these MSAT compounds were identified as having the greatest influence on health and included benzene, 1,3-butadiene, formaldehyde, acrolein, acetaldehyde, and DPM. More recently, the EPA issued a second MSAT Rule in February 2007, which generally supported the findings in the first rule and provided additional recommendations of compounds having the greatest impact on health. The rule also identified several engine emission certification standards that must be implemented. Unlike the criteria pollutants, toxics do not have National Ambient Air Quality Standards (NAAQS) making evaluation of their impacts more subjective.

National Emissions Standards for Hazardous Air Pollutants (NESHAPs) were incorporated into a greatly expanded program for controlling toxic air pollutants. The provisions for attainment and maintenance of the NAAQS were substantially modified and expanded. Other revisions included provisions regarding stratospheric ozone protection, increased enforcement authority, and expanded research programs.

Section 112 of the FCAA Amendments governs the federal control program for HAPs. NESHAPs are issued to limit the release of specified HAPs from specific industrial sectors. These standards are technology-based, meaning that they represent the best available control technology an industrial sector could afford. The level of emissions controls required by NESHAPs are not based on health risk considerations because allowable releases and resulting concentrations have not been determined to be safe for the general public. The FCAA does not establish air quality standards for HAPs that define legally acceptable concentrations of these pollutants in ambient air.

Federal Emissions Standards for On-Road Trucks

To reduce emissions from on-road, heavy-duty diesel trucks, the U.S. EPA established a series of increasingly strict emission standards for new engines, starting in 1988. The U.S. EPA promulgated the final and cleanest standards with the 2007 Heavy-Duty Highway Rule.[1] The PM emission standard of 0.01 gram per horsepower-hour (g/hp-hr) is required for new vehicles beginning with model year 2007. Also,

[1] United States Environmental Protection Agency (U.S. EPA), *Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards and Highway Diesel Fuel Sulfur Control Requirements*, Final Rule. 40 Code of Federal Regulations, Parts 69, 80, and 86. January 18, 2001.

the NO_X and nonmethane hydrocarbon (NMHC) standards of 0.20 g/hp-hr and 0.14 g/hp-hr, respectively, were phased in together between 2007 and 2010 on a percent of sales basis: 50 percent from 2007 to 2009 and 100 percent in 2010.

3.2 State of California

California Air Resources Board

CARB's statewide comprehensive air toxics program was established in 1983 with AB 1807 the Toxic Air Contaminant Identification and Control Act (Tanner Air Toxics Act of 1983). AB 1807 created California's program to reduce exposure to air toxics and sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an airborne toxics control measure (ATCM) for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology (T-BACT) to minimize emissions.
CARB also administers the state's mobile source emissions control program and oversees air quality programs established by state statute, such as AB 2588. Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the air quality management district or air pollution control district. High priority facilities are required to perform a health risk assessment and, if specific thresholds are exceeded, required to communicate the results to the public in the form of notices and public meetings. In September 1992, the AB 2588 was amended by Senate Bill (SB) 1731 which required facilities that pose a significant health risk to the community to reduce their risk through a risk management plan.

Diesel Risk Reduction Plan

The identification of DPM as a TAC in 1998 led CARB to adopt the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles (DRRP) in October 2000. The DRRP's goals include an 85 percent reduction in DPM by 2020 from the 2000 baseline.[2] CARB estimates that emissions of DPM in 2035 will be less than half those in 2010, further reducing statewide cancer risk and non-cancer health effects.[3] The DRRP includes regulations to establish cleaner new diesel engines, cleaner in-use diesel engines (retrofits), and cleaner diesel fuel.

Truck and Bus Regulation Reducing Emissions from Existing Diesel Vehicles

On December 12, 2008, CARB approved the Truck and Bus Regulation to significantly reduce particulate matter (PM) and oxides of nitrogen (NO_X) emissions from existing diesel vehicles operating in California. The regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Heavier trucks were required to be retrofitted with PM filters beginning January 1, 2012, and older trucks were required to be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses would need to have 2010 model year engines or equivalent.

[2] California Air Resources Board, *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles*, October 2000.
[3] California Air Resources Board, *Overview: Diesel Exhaust & Health*, available at: https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health, accessed February 17, 2020.

The regulation applies to most privately and federally-owned diesel fueled trucks and buses and to privately and publicly owned school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. Small fleets with three or fewer diesel trucks can delay compliance for heavier trucks and there are several extensions for low-mileage construction trucks, early PM filter retrofits, adding cleaner vehicles, and other situations. Privately and publicly owned school buses have different requirements.

Heavy-Duty Vehicle Idling Emission Reduction Program

The purpose of the CARB ATCM to Limit Diesel-Fueled Commercial Motor Vehicle Idling is to reduce public exposure to diesel particulate matter and criteria pollutants by limiting the idling of diesel-fueled commercial vehicles. The driver of any vehicle subject to this ATCM is prohibited from idling the vehicle's primary diesel engine for greater than five minutes at any location and is prohibited from idling a diesel-fueled auxiliary power system (APS) for more than five minutes to power a heater, air conditioner, or any ancillary equipment on the vehicle if it has a sleeper berth and the truck is located within 100 feet of a restricted area (homes and schools).

CARB Final Regulation Order, Requirements to Reduce Idling Emissions from New and In-Use Trucks, beginning in 2008, would require that new 2008 and subsequent model-year heavy-duty diesel engines be equipped with an engine shutdown system that automatically shuts down the engine after 300 seconds of continuous idling operation once the vehicle is stopped, the transmission is set to "neutral" or "park", and the parking brake is engaged.

3.3 Regional

South Coast Air Quality Management District

The CCAA provides the SCAQMD with the authority to manage transportation activities at indirect sources and regulate stationary source emissions. Indirect sources of pollution are generated when minor sources collectively emit a substantial amount of pollution. An example of this would be the motor vehicles at an intersection, a mall, and on highways. As a State agency, CARB regulates motor vehicles and fuels for their emissions.

Air Toxics Control Plan

The Air Toxics Control Plan (March 2000, revised March 26, 2004) is a planning document designed to examine the overall direction of the SCAQMD's air toxics control program. It includes development and implementation of strategic initiatives to monitor and control air toxics emissions. Control strategies that are deemed viable and are within the SCAQMD's jurisdiction will each be brought to the SCAQMD Board for further consideration through the normal public review process. Strategies that are to be implemented by other agencies will be developed in a cooperative effort, and the progress will be reported back to the Board periodically.

Multiple Air Toxics Exposure Study

The SCAQMD conducted an in-depth analysis of the toxic air contaminants and their resulting health risks for all of Southern California. The Multiple Air Toxics Exposure Study in the SCAB (MATES IV) shows that cancer risk has decreased more than 50 percent between MATES III (2008) and MATES IV (2015).

MATES IV is the most comprehensive dataset documenting the ambient air toxic levels and health risks associated with the SCAB emissions. Therefore, MATES IV study represents the baseline health risk for a cumulative analysis. MATES IV estimates the average excess cancer risk level from exposure to TACs is less than 400 in one million basin-wide. These model estimates were based on monitoring data collected at ten fixed sites within the SCAB. None of the fixed monitoring sites are near the Project site. However, MATES IV has extrapolated the excess cancer risk levels throughout the SCAB by modeling the specific grids. MATES IV modeling predicted an excess cancer risk of 427 in one million for the Project area. DPM is included in this cancer risk along with all other TAC sources. DPM accounts for 68 percent of the total risk shown in MATES IV. The SCAQMD is currently preparing MATES V, which will be the latest comprehensive study of levels of toxic air pollutants the region, MATES V will include an advanced monitoring component with a focus on refinery emissions.

4 SIGNIFICANCE CRITERIA AND METHODOLOGY

4.1 Health Risk Analysis Thresholds

Project health risks are determined by examining the types and levels of air toxics generated and the associated impacts on factors that affect air quality. While the final determination of significance thresholds is within the purview of the lead agency pursuant to the State CEQA Guidelines, the SCAQMD recommends that the following air pollution thresholds be used by lead agencies in determining whether the impacts from the Project are significant. If the lead agency finds that the Project has the potential to exceed the air pollution thresholds, the Project should be considered significant. The thresholds for air toxic emissions are as follows:

- **Cancer Risk:** Emit contaminants that exceed the maximum individual cancer risk of 10 in one million.
- **Non-Cancer Risk:** Emit contaminants that exceed the maximum hazard quotient of 1 in one million.

Cancer risk is expressed in terms of expected incremental incidence per million population. The SCAQMD has established an incidence rate of 10 persons per million as the maximum acceptable incremental cancer risk due to DPM exposure. This threshold serves to determine whether or not a given project has a potentially significant development-specific and cumulative impact. The 10 in one million standard is a health-protective significance threshold. A risk level of 10 in one million implies a likelihood that up to 10 persons, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of toxic air contaminants over a specified duration of time. This risk would be an excess cancer that is in addition to any cancer risk borne by a person not exposed to these air toxics. To put this risk in perspective, the risk of dying from accidental drowning is 1,000 in a million which is 100 times more than the SCAQMD's threshold of 10 in one million.

The SCAQMD has also established non-carcinogenic risk parameters for use in HRAs. Noncarcinogenic risks are quantified by calculating a "hazard index," (HI) expressed as the ratio between the ambient pollutant concentration and its toxicity or Reference Exposure Level (REL). An REL is a concentration at or below which health effects are not likely to occur. A hazard index of less than 1.0 means that adverse health effects are not expected. Within this analysis, non-carcinogenic exposures of less than 1.0 are considered less than significant.

4.2 Methodology

This HRA evaluates potential health risks associated with the emission of diesel particulate matter resulting from the implementation of the proposed Project. Construction equipment and associated heavy-duty truck traffic generate diesel exhaust, which is a known TAC. Diesel exhaust from construction equipment operating at the site poses a health risk to nearby sensitive receptors. Operational activities would also include the use of heavy-duty diesel trucks.

Construction Sources

Construction would generate DPM emissions from the use of off-road diesel equipment required for demolition, grading and excavation, paving, and other construction activities. For construction activity, DPM is the primary toxic air contaminant of concern. On-road diesel-powered haul trucks traveling to and from the construction area to deliver materials and equipment were included in the analysis, although they are typically less of a concern because they would not stay on the site for long durations. Diesel exhaust from construction equipment operating at the site potentially poses a health risk to nearby sensitive receptors. The closest sensitive receptors to the Project site are residences approximately 90 feet to the south and 800 feet east, and Jerry Eaves Park approximately 870 feet to the north.

Health-related risks associated with diesel-exhaust emissions are primarily linked to long-term exposure and the associated risk of contracting cancer. The use of diesel-powered construction equipment would be episodic and would occur throughout the Project site. Construction activities would limit idling to no more than five minutes, which would further reduce nearby sensitive receptors' exposure to temporary and variable DPM emissions. Furthermore, even during the most intense period of construction, emissions of DPM would be generated from different locations on the Project Site rather than in a single location because different types of construction activities (e.g., site preparation and building construction) would not occur at the same place at the same time. Construction emissions rates for PM_{10} (DPM) were calculated from the CalEEMod construction emissions modeling conducted for the project Air Quality Assessment. Construction emissions represented in the model via line volume sources occurring throughout the site. The locations of the AERMOD modeled sources and receptors are graphically shown in Appendix A.

Operational Sources

The Project is located near existing residential uses. Due to the increased truck traffic from the Project, the resulting emissions could result in pollutant concentrations at existing sensitive receptors. Average daily trips from truck traffic to the Project were determined using standard Institute of Transportation Engineers (ITE) trip generation rates for warehousing and the Traffic Impact Study. Idling emissions were represented in the model via line volume sources along each loading dock and 15 minutes of idling[4] for each truck was assumed. Truck travel emissions were represented in the model via line volume sources along local roads and inside the facility where the trucks are expected to travel. Trucking routes were determined per the Traffic Impact Study conducted for the proposed Project. For modeling purposes, the Project is assumed to operate 24 hours per day. An emission rate for PM_{10} (DPM) was calculated using trip data and a CARB 2017 EMission FACtor model (EMFAC)[5] model run for San Bernardino County; refer to Appendix A. The emissions rate was calculated using 2022 emissions factors since project construction would be completed in late-2021. This approach is conservative as it assumes no cleaner technology in future years.

[4] An idling time of 15 minutes per truck has been used per SCAQMD recommendations. Although the Project is required to comply with CARB's idling limit of 5 minutes, the SCAQMD recommends the on-site idling emissions should be estimated for 15 minutes of truck idling, which would take into account on-site idling that occurs while the trucks are waiting to pull up to the truck bays, idling at the bays, idling at check-in and check-out, etc.

[5] California Air Resources Board, *EMFAC 2017 Web Database,* www.arb.ca.gov/emfac/2017/, March 2019.

Dispersion Modeling

The construction and operational air dispersion modeling for the HRA was performed using the EPA AERMOD dispersion model. AERMOD is a steady-state, multiple-source, Gaussian dispersion model designed for use with emission sources situated in terrain where ground elevations can exceed the stack heights of the emission sources (not a factor in this case). AERMOD requires hourly meteorological data consisting of wind vector, wind speed, temperature, stability class, and mixing height. Surface and upper air meteorological data is provided by the SCAQMD. Surface and upper air meteorological data from the Fontana Monitoring Station was selected as being the most representative for meteorology based on proximity to the Project site.

The emission sources in the model are line volume sources (comprised of smaller adjacent volume sources) for construction and operations. The locations of the AERMOD modeled sources and receptors are graphically shown in Appendix A. Construction line volume sources were assigned a release height of 12 feet (3.66 meters). Operational sources include the loading dock idling areas (15 minutes for each truck), on-site truck circulation, and off-site truck routes. Heavy duty operational vehicle emissions were assigned a release height of 12 feet (3.66 meters) and a plume height of 20.4 feet (6.22 meters). A release height of 12 feet is the average stack height for trucks and the plume height is based on EPA guidance for vehicle volume sources.

AERMOD was run to obtain the peak 1-hour and annual average concentration in micrograms per cubic meter ($\mu g/m^3$) of PM_{10} at the nearby sensitive receptors. According to the SCAQMD's Supplemental Guidelines for Preparing Risk Assessments for AB 2588, air dispersion modeling is required to estimate annual average concentrations to calculate the Maximum Individual Cancer Risk (MICR), the maximum chronic HI, the zones of impact, and excess cancer burden, as well as peak hourly concentrations to calculate the health impact from substances with acute non-cancer health effects. To achieve these goals, a receptor grid was placed over the Project site to cover the zone of impact. According to the SCAQMD, in order "to identify the maximum impacted receptors (i.e. peak cancer risk and peak hazard indices) a grid spacing of 100 meters or less must be used" (see page 16 of SCAQMD's Supplemental Guidelines). Due to the size of the Project site, receptors were modeled with a 50-meter grid spacing. AERMOD regulatory defaults, the "Urban" modeling option for the County, and "Elevated" terrain were used for this analysis. In addition, National Elevation Dataset (NED) terrain data was imported into AERMOD for the Project. The modeling and analysis was prepared in accordance with the SCAQMD Modeling Guidance for AERMOD.[6]

Note that the concentration estimate developed using this methodology is conservative and is not a specific prediction of the actual concentrations that would occur at the Project site any one point in time. Actual 1-hour and annual average concentrations are dependent on many variables, particularly the number and type of vehicles and equipment operating at specific distances during time periods of adverse meteorology. A health risk computation was performed to determine the risk of developing an excess cancer risk calculated on these worst-case exposure duration scenarios. The chronic and carcinogenic

[6] South Coast Air Quality Management District, *SCAQMD Modeling Guidance for AERMOD*, http://www.aqmd.gov/home/air-quality/meteorological-data/modeling-guidance, accessed February 17, 2020.

health risk calculations are based on the standardized equations contained in the OEHHA Guidance Manual. Only the risk associated with the worst-case location of the Project was assessed.

Risk and Hazard Assessment

Cancer Risk

Based on the OEHHA methodology, residential inhalation cancer risk from annual average DPM and benzene concentrations are calculated by multiplying the daily inhalation dose, cancer potency factor, age sensitivity factor (ASF), frequency of time spent at home, and exposure duration divided by averaging time, yielding the excess cancer risk. These factors are discussed in more detail below. It is important to note that exposure duration is based on continual heavy truck operation along nearby roadways. Exposure through inhalation (Dose-air) is a function of breathing rate, exposure frequency, and concentration of substance in the air. To estimate cancer risk, the dose was estimated by applying the following formula to each ground-level concentration:

$$\text{Dose-air} = C_{air} * (BR/BW) * A * EF * 10^{-6}$$

Dose-air =	dose through inhalation (mg/kg/day)
C_{air} =	air concentration (µg/m^3) from air dispersion model
(DBR/BW) =	daily breathing rate normalized to body weight (L/kg bodyweight-day)
A =	inhalation absorption factor (unitless)
EF =	exposure frequency (approximately 350 days per year for residential)
10^{-6} =	conversion factor (micrograms to milligrams, liters to cubic meters)

OEHHA developed ASFs to consider the increased sensitivity to carcinogens during early-life exposure. In the absence of chemical-specific data, OEHHA recommends a default ASFs presented in Table 3: Age Sensitivity Factors, Fraction of Time at Home, and Daily Breathing Rates. Fraction of time at home (FAH) during the day is used to adjust exposure duration and cancer risk from a specific facility's emissions, based on the assumption that exposure to the facility's emissions are not occurring away from home. OEHHA recommends the FAH values presented in Table 3.

Table 3: Age Sensitivity Factors, Fraction of Time at Home, and Daily Breathing Rates

Age	Default Age Sensitivity Factor[1] (ASF)	Fraction of Time at Home (FAH)	Daily Breathing Rate (L/kg BW-day[2])
Third trimester	10	100%	361
0 to 2 years	10	100%	1,090
Ages 2 through 15 years	3	100%	745
Ages 16 and greater	1	73%	335

[1] Accounts for potential increased sensitivity to carcinogens during childhood.

[2] 95th percentile daily breathing rate normalized to body weight (L/kg body weight - day)

Source: California Office of Environmental Health Hazard Assessment, *Air Toxics Program Guidance Manual for the Preparation of Health Risk Assessments*, February 2015 and South Coast Air Quality Management District, Permit Application Package "N" Risk Assessment Procedures for Rules 1401, 1401.1, and 212 Version 8.1.

To estimate the cancer risk, the dose is multiplied by the cancer potency factor, the ASF, the exposure duration divided by averaging time, and the frequency of time spent at home (for residents only):

$$Risk_{inh\text{-}res} = (Dose_{air}*CPF*ASF*(ED/AT)*FAH)$$

$Risk_{inh\text{-}res}$ =	residential inhalation cancer risk (potential chances per million)
$Dose_{air}$ =	daily dose through inhalation (mg/kg-day)
CPF =	inhalation cancer potency factor ($mg/kg\text{-}day^{-1}$)
ASF =	age sensitivity factor for a specified age group (unitless)
ED =	exposure duration (years)
AT =	averaging time of lifetime cancer risk (years)
FAH =	fraction of time spent at home (unitless)

Chronic Non-Cancer Hazard

Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. The following equation was used to determine the non-cancer risk:

$$\text{Hazard Quotient} = C_i/REL_i$$

C_i =	concentration in the air of substance i (annual average concentration in $\mu g/m^3$)
REL_i =	chronic noncancer Reference Exposure Level for substance ($\mu g/m^3$)

Acute Non-Cancer Hazard

The potential for acute non-cancer hazards is evaluated by comparing the maximum short-term exposure level to an acute REL. RELs are designed to protect sensitive individuals within the population. The calculation of acute non-cancer impacts is similar to the procedure for chronic non-cancer impacts. The equation is as follows:

Acute HQ = Maximum Hourly Air Concentration ($\mu g/m^3$) / Acute REL ($\mu g/m^3$)

Health Risk Computation

A health risk computation was performed to determine the risk of developing an excess cancer risk calculated on a 30-year exposure scenario using CARB's Risk Assessment Stand Alone Tool (RAST). Health risk were analyzed at the point of maximum impact and are a conservative estimate. The pollutant concentrations are then used to estimate the long-term cancer health risk to an individual as well as the non-cancer chronic health index.

The off-site impacts would occur from the diesel trucks accessing the proposed Project. The cancer and chronic health risks are based on the annual average concentration of PM_{10} (used as a proxy for DPM). As DPM does not have short-term toxicity values, acute risks were conservatively evaluated using hourly

PM_{10} concentrations and the REL for acrolein. The chronic and carcinogenic health risk calculations are based on the standardized equations contained in the U.S. EPA *Human Health Evaluation Manual* (1991) and the OEHHA Guidance Manual (2015).

5 POTENTIAL HEALTH RISK IMPACTS

CARB identified DPM as a TAC in 1998. Mobile sources (including trucks, buses, automobiles, trains, ships, and farm equipment) are by far the largest source of diesel emissions. The exhaust from diesel engines includes hundreds of different gaseous and particulate components, many of which are toxic. Diesel exhaust is composed of two phases, either gas or particulate – both contribute to the risk. The gas phase is composed of many of the urban TACs, such as acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde, and polycyclic aromatic hydrocarbons. The particulate phase has many different types that can be classified by size or composition. The sizes of diesel particulates of greatest health concern are fine and ultrafine particles. These particles may be composed of elemental carbon with adsorbed compounds such as organics, sulfates, nitrates, metals, and other trace elements. Diesel exhaust is emitted from a broad range of on- and off-road diesel engines. As the Project is proposed near existing residences, an analysis of DPM was performed using the EPA-approved AERMOD model.

5.1 Construction Health Risk Analysis

The duration of construction activities for the Project is estimated to take approximately 9-10 months. Construction-related activities would result in Project-generated emissions of DPM from the exhaust of off-road, heavy-duty diesel equipment for site preparation (e.g., clearing, grading); paving; application of architectural coatings; on-road truck travel; and other miscellaneous activities. For construction activity, DPM is the primary toxic air contaminant of concern. On-road diesel-powered haul trucks traveling to and from the construction area to deliver materials and equipment are less of a concern because they would not stay on the site for long durations. Diesel exhaust from construction equipment operating at the site poses a health risk to nearby sensitive receptors. Sensitive receptors near the Project site include residential uses approximately 90 feet to the south and 800 feet east, and Jerry Eaves Park approximately 870 feet to the north.

PM_{10} construction emissions rates in grams per second were calculated from the total annual mitigated on-site exhaust emissions reported in CalEEMod (a maximum of 0.07 tons per year mitigated)[7] total during construction. It should be noted that although construction would span over several years, the modeling conservatively uses the year with the highest emission for each phase and an exposure duration of 10 months. Annual emissions were converted to grams per second and these emissions rates were input into AERMOD. Construction emissions represented in the model via line volume sources occurring throughout the site. The locations of the AERMOD modeled sources and receptors are graphically shown in Appendix A.

As noted above, maximum (worst case) PM_{10} exhaust construction emissions over the entire construction period were used in AERMOD to approximate construction DPM emissions. Risk levels were calculated based on the California Office of Environmental Health Hazard Assessment (OEHHA) guidance document, Air Toxics Hot Spots Program Risk Assessment Guidelines (February 2015). Results of this assessment are summarized in Table 4: Construction Risk Assessment Results.

[7] The modeled on- and off-site emissions include implementation of Mitigation Measure AQ-1 from the *Olive Avenue Air Quality Assessment* (Kimley-Horn, January 2021) requiring Tier 4 Interim or Tier 4 Final compliant construction equipment during the grading phase of construction.

Table 4: Construction Risk Assessment Results				
Exposure Scenario	**Pollutant Concentration (µg/m³)[1]**	**Maximum Cancer Risk (Risk per Million)**	**Chronic Noncancer Hazard**	**Acute Noncancer Hazard**
Construction	0.013	2.05	0.003	0.018
Threshold	*N/A*	*10*	*1.0*	*1.0*
Threshold Exceeded	**No**	**No**	**No**	**No**

Notes:
1. The modeled concentrations include implementation of Mitigation Measure AQ-1 from the *Olive Avenue Air Quality Assessment* (Kimley-Horn, January 2021) requiring Tier 4 Interim or Tier 4 Final compliant construction equipment during the grading phase of construction.

Source: Refer to Appendix A: Modeling Data.

Results of this assessment indicate that the maximum concentration of PM_{10} during construction would be 0.013 µg/m^3 and resultant cancer risk of 2.05 in one million, which would not exceed the SCAQMD threshold of 10 in one million. Non-cancer hazards for DPM would be below SCAQMD threshold of 1.0, with a chronic hazard index computed at 0.003 and an acute hazard index of 0.018. Therefore, construction risk levels would be less than SCAQMD thresholds.

5.2 Operational Health Risk Analysis

Carcinogenic Risk

Vehicle DPM emissions were estimated using emission factors for course particulate matter less than 10 microns in diameter (PM_{10}) generated with the EMFAC developed by CARB. EMFAC is a mathematical model that was developed to calculate emission rates from motor vehicles that operate on highways, freeways, and local roads in California and is commonly used by CARB to project changes in future emissions from on-road mobile sources. EMFAC, incorporates regional motor vehicle data, information and estimates regarding the distribution of vehicle miles traveled (VMT) by speed, and number of starts per day. The model includes the emissions benefits of the truck and bus rule and the previously adopted rules for other on-road diesel equipment.

For this Project, annual average PM_{10} emission factors were generated by running EMFAC for vehicles in the SCAQMD within the South Coast portion of San Bernardino County. EMFAC generates emission factors in terms of grams of pollutant emitted per vehicle activity and can calculate a matrix of emission factors at specific values of vehicle speed, temperature, and relative humidity. The model was run for heavy-duty diesel vehicles traveling along Alder Avenue and Baseline Avenue, as well as circulating the Project site and idling at proposed loading docks.

Based on the AERMOD outputs, the highest unmitigated hourly average diesel PM_{10} emission concentrations from diesel truck traffic near sensitive receptors would be 0.103 µg/m^3. The highest unmitigated annual average diesel PM_{10} emission concentrations near sensitive receptors would be 0.032 µg/m^3. The calculations conservatively assume no cleaner technology with lower emissions in future years. As shown in Table 5: Operational Risk Assessment Results, the unmitigated calculated carcinogenic risk resulting from the Project is 27.3 per million residents, which would exceed the SCAQMD threshold of 10 in one million residents. As such, mitigation is required.

Table 5: Operational Risk Assessment Results			
Exposure Scenario	**Maximum Cancer Risk (Risk per Million)[1, 2]**	**Significance Threshold (Risk per Million)**	**Exceeds Significance Threshold?**
Unmitigated - Residents	27.3	10	Yes
Mitigated – Residents[3]	2.03	10	No

1. Refer to Appendix A.
2. The maximum cancer risk would be experienced at the residences to the south of the Project site along Baseline Avenue based on worst-case exposure durations for the Project, 95th percentile breathing rates, and 30-year averaging time.

Mitigation Measure AQ-5 from the *Olive Avenue Air Quality Assessment* (Kimley-Horn, January 2021) was incorporated into the mitigated scenario shown in Table 5. Mitigation Measure AQ-5 requires through sale or leasing agreements, that the haul fleet of trucks accessing the Project site to meet emissions standards of a 2014 vehicle model (or later), and as trucks are replaced, they are replaced with the newest available model. As shown in Table 5, the maximum cancer risk at the nearest sensitive receptors would be 2.03 per million residents with implementation of Mitigation Measure AQ-5, which is below SCAQMD's threshold of 10 in one million residents. Therefore, the Project would result in a less than significant health risk impact following compliance with Mitigation Measure AQ-5.

Non-Carcinogenic Hazards

The significance thresholds for TAC exposure also require an evaluation of non-cancer risk stated in terms of a hazard index. Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. The potential for acute non-cancer hazards is evaluated by comparing the maximum short-term exposure level to an acute REL. RELs are designed to protect sensitive individuals within the population. The calculation of acute non-cancer impacts is similar to the procedure for chronic non-cancer impacts.

An acute or chronic hazard index of 1.0 is considered individually significant. The hazard index is calculated by dividing the acute or chronic exposure by the reference exposure level. The highest maximum chronic and acute hazard index associated with both DPM and acrolein emissions from the Project would be 0.006 and 0.040 (unmitigated), respectively. Therefore, non-carcinogenic hazards are calculated to be within acceptable limits and a less than significant impact would occur.

Conclusion

As described above, impacts related to cancer risk would be less than significant with implementation of Mitigation Measures AQ-5. Additionally, non-carcinogenic hazards are calculated to be within acceptable limits. It should be noted that the impacts assess the Project's incremental contribution to health risk impacts, consistent with the SCAQMD guidance and methodology. The SCAQMD has not established separate cumulative thresholds and does not require combining impacts from cumulative projects. The SCAQMD considers projects that do not exceed the project-specific thresholds to generally not be cumulatively significant.[8] Therefore, impacts related to health risk from the Project would be less than significant.

[8] South Coast Air Quality Management District, *White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution*, August 2003.

Mitigation Measures:

AQ-5 **Operational Haul Truck Requirement.** The Project Operator(s) shall ensure, through sale or leasing agreements, that the haul fleet consist of trucks that at a minimum meet the emissions standards of a 2014 vehicle model, and as trucks are replaced, they are replaced with the newest available model.

MITIGATION MEASURE OBTAINED FROM THE OLIVE AVENUE AIR QUALITY ASSESSMENT (KIMLEY-HORN, July 2021).

Level of Significance: Less than significant impact with mitigation incorporated.

 ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for  3271 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =   2035210.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
```

```
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.
         6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:   3271 Source(s);       1 Source Group(s); and     610
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:   3271 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   367.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
```

```
                  Emission Units = GRAMS/SEC                                    ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      4.9 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   Olive Grove Rialto.err

 **File for Summary of Results:   Olive Grove Rialto.sum
