¹ The 2011 GPU PEIR determined significance based on level of service (LOS). However, Section 15064.3 of the State CEQA Guidelines was adopted in December 2018 and provides that vehicle miles traveled (VMT) is the “most appropriate measure of transportation impacts” and mandated analysis of VMT impacts effective July 1, 2020. LOS, or other measures of automobile delay, are no longer considered significant environmental impacts under CEQA (Public Resources Code Section 21009[b](2)). Therefore, LOS is no longer considered an appropriate metric for analyzing transportation impacts on the environment; and thus, is not considered in this analysis.

² The 2011 GPU PEIR determined transportation hazard significance based on rural road safety. The transportation hazards analysis contained herein incorporates rural road safety. The 2011 GPU PEIR findings related to rural road safety are summarized in Section 2.15.3.5, Issue 3.

Source: Compiled by Ascent Environmental in 2023.

2.13.1 Existing Conditions

This section describes the existing roadway network, transit services, and bicycle and pedestrian facilities in the unincorporated county. Section 2.15.1 of the 2011 GPU PEIR includes a discussion of the existing conditions related to transportation and traffic in the unincorporated county based on level of service (LOS). In 2013, SB 743 was enacted, with

an implementation date of July 1, 2020, requiring public agencies to no longer use LOS for traffic analysis and instead use VMT.

2.13.1.1 Roadway Network

The County Roadway Register Report classifies the existing roadway network in the unincorporated county by seven categories: interstates, freeways or expressways, principal arterials, minor arterials, major collectors, minor collectors, and local roads (County of San Diego 2023). The General Plan groups roadways by similar types, the four groups being state highways, Mobility Element roadways, local public roads, and private roads. “Mobility Element roadways” refers to the portion of the County Mobility Element roadway system that have been constructed. The County of San Diego Department of Public Works Road Section is responsible for maintaining nearly 2,000 miles of County Mobility Element roadways and other transportation facilities, such as bridges and guardrails, signs, traffic signals and crosswalks. Within the unincorporated county, there are approximately 5 miles of principal arterial roads, 146 miles of minor arterials roads, 481 major collector roads, 198 minor collector roads, and 1,117 local roads (County of San Diego 2023).

2.13.1.2 Transit Services

The San Diego Metropolitan Transit System (MTS) and the North County Transit District (NCTD) are the two agencies responsible for providing bus, rail, and paratransit services within the San Diego region. Additionally, the Amtrak Pacific Surfliner provides intercity rail service along the Los Angeles–San Diego–San Luis Obispo Rail Corridor. Other specialized transit services are offered through the Consolidated Transportation Service Agency (CTSA) for the San Diego region.

Bus Service

MTS offers over 100 fixed bus routes throughout its service area, including traditional urban shuttle-type routes, express routes, and bus rapid transit routes, as well as paratransit services. Bus services are provided in the unincorporated county by the San Diego Transit Corporation (SDTC), which is owned by MTS. SDTC serves the Cities of San Diego, El Cajon, La Mesa, and National City, in addition to the unincorporated communities of Julian, Desert, Central Mountain, Lakeside, Alpine, Mountain Empire, Crest, Valle de Oro, Spring Valley, Sweetwater, and Otay. SDTC bus service provides connections to light and heavy rail services and offers local service and express service (MTS 2020).

NCTD operates a bus system referred to as the BREEZE, which serves the unincorporated north county. BREEZE serves eight north county cities, in addition to the unincorporated communities of Pendleton/De Luz, Fallbrook, Ramona, Pala/Pauma Valley, Valley Center, North County Metro, and San Dieguito. BREEZE operates approximately 30 different bus routes, many of which provide connections to light rail systems and tourist attractions (NCTD 2022).

Rail Service

There are five railroad providers that operate on two railroad corridors within the San Diego region. Many of these rail lines are located within the incorporated areas of the county; however, some unincorporated residents use these systems. Railroad providers for San Diego County include NCTD, MTS, BNSF, Carrizo Gorge Railway, and San Diego and Imperial Valley Railroad. The two railroad corridors that cross the county are the Los Angeles–San Diego–San Luis Obispo Rail Corridor and the San Diego & Arizona Eastern Railway Corridor.

MTS operates the San Diego Trolley, which runs along the San Diego & Arizona Eastern Railroad Corridor. The entire system encompasses 54.3 total miles (107.6 total track miles) of light rail transit on three routes serving 53 transit centers. Although the entire trolley line is located within the incorporated areas of the county, many residents from the unincorporated areas of the county use its service. Fiscal Year 2022 ridership for the MTS trolley system reached approximately 30 million trips, and bus ridership totaled approximately 28 million trips (MTS 2022).

NCTD operates the SPRINTER Light Rail system between Oceanside and Escondido on a rail line that runs approximately parallel to State Route 78. The Buena Creek SPRINTER Station is the only site in the unincorporated county that is served by high-frequency light rail transit. The SPRINTER rail line is 22 miles long and runs 455 trains every week. The NCTD COASTER rail line is 41 miles long. More than 190 COASTER trains operate each week along the coastal corridor between Oceanside and downtown San Diego.

Paratransit and Other Specialized Transit Services

MTS Access is an origin-to-destination, shared ride, advanced reservation public transit service provided in accordance with the Americans with Disabilities Act. Consistent with the Americans with Disabilities Act, MTS Access is comparable to MTS's fixed-route bus system including in terms of service characteristics (such as on-time performance and travel time) and service area (providing service within three-quarters of a mile of a regular MTS fixed bus route). The service is intended to complement the fixed bus and trolley routes and times. Similarly, NCTD LIFT provides paratransit services at a level that is comparable to NCTD's fixed-route bus service. The NCTD LIFT service is provided to areas that are within three-quarters of a mile of an NCTD BREEZE bus route and/or SPRINTER rail station.

Facilitating Access to Coordinated Transportation, operated by CTSA, provides access to transportation for seniors, persons with disabilities, veterans, and the income disadvantaged and fills gaps in existing transit services, acting as a mobility manager by referring individuals to the most appropriate transportation mode. Transportation referrals are provided in person, over the phone, and through a web-based trip planner (511 San Diego Region).

2.13.1.3 Bicycle and Pedestrian Systems

Of the roughly 2,000 miles of County-maintained roadways, less than half include sidewalks, and less than 1 percent include a bicycle route or lane.

The County of San Diego Active Transportation Plan (ATP) classifies bike lanes in the following four types:

- Class I Bike Path: A completely separated right-of-way for the exclusive use of bicycles and pedestrians with crossflow by motorists minimized.
- Class II Bike Lanes: A striped lane for one-way bike travel on a street or highway.
- Class III Bike Route: Provides for shared use with vehicular traffic within the travel lane.
- Class IV Separated Bikeway: A physically separated bikeway for the exclusive use of bicycles. The separation may include, but is not limited to, grade separation, flexible posts, inflexible posts, inflexible barriers, or on-street parking.

As of 2018, the unincorporated county had 1 mile of Class I, 145 miles of Class II, and 9 miles of Class III bicycle facilities, totaling 155 miles of existing bicycle facilities. There are currently no Class IV bicycle facilities in the unincorporated county (County of San Diego 2018: 3-3).

Pedestrian facilities in the unincorporated county include sidewalks, pathways, and trails. Results from a County Pedestrian Gap Analysis and evaluation of existing facilities revealed that roughly 53 percent, or 401 miles, of the assessment roadways have no sidewalk or pedestrian facility (County of San Diego 2018: 3-3).

2.13.2 Regulatory Framework

Section 2.15.2 of the 2011 GPU PEIR describes the regulatory framework related to transportation and is incorporated herein by reference. SB 743 was signed into effect in 2013 with an implementation date set for July 1, 2020. While the 2011 GPU PEIR included VMT numbers for the unincorporated county, it did not include analysis for VMT as currently required under SB 743. Therefore, a discussion of SB 743 is provided below. The majority of the local regulatory discussion in the 2011 GPU PEIR regarding transportation remains applicable to the proposed project; however, several legislative regulations, policy guidance documents, and funding mechanisms related to transportation have been authorized or updated since the adoption of the 2011 GPU PEIR. Therefore, a discussion of each is provided below.

2.13.2.1 Federal

Specific regulations discussed in the 2011 GPU PEIR and applicable to the CAP Update include the following:

- Americans with Disabilities Act
- Title 23, Code of Federal Regulations, Section 450.220

In addition to the above, the following regulation related to transportation has been adopted and/or updated since certification of the 2011 GPU PEIR.

Highway Capacity Manual, 7th Edition (2022)

The Highway Capacity Manual is the fundamental reference for concepts, performance measures, and analysis techniques for evaluating the multimodal operation of streets, highways, freeways, and off-street paths. The 7th edition was published in 2022 and contains new information, including new planning-level methods for connected and automated vehicles; a completely revised procedure for analyzing two-lane highways; a new procedure for evaluating systems of freeways and arterials with queue spillback; and updated methodologies for pedestrian operations at uncontrolled and signalized crossings.

2.13.2.2 State

Specific regulations discussed in the 2011 GPU PEIR and applicable to the CAP Update include the following:

- California Department of Transportation (Caltrans) Standards
- Statewide Transportation Improvement Program
- Transportation Development Act

In addition to the above, the following regulations related to transportation have been adopted and/or updated since certification of the 2011 GPU PEIR.

Senate Bill 375

Governor Arnold Schwarzenegger signed SB 375, the 2008 Sustainable Communities and Climate Protection Act, on September 30, 2008, with the purpose of reducing greenhouse gas (GHG) emissions from passenger vehicles through coordinated transportation and land use planning strategies. The legislation is two-fold requiring the California Air Resources Board (CARB) to set and regularly update per capita was a metric used extensively in the transportation industry at the time the 2011 GPU PEIR was prepared for a variety of purposes including, but not limited to highway cost allocation, determining user fee structures, and estimating air quality and GHG emissions; thus, VMT related to the build out of the general plan was a known concept at the time.

For the purpose of forecasting GHG emissions from growth anticipated under the adopted General Plan, VMT GHG emissions reduction targets by region as well as mandating each of California's 18 metropolitan planning organizations to include a Sustainable Communities Strategy in their federally mandated long-range Regional Transportation Plan to demonstrate how the region plans to meet CARB's GHG emission reduction targets.

Senate Bill 743

SB 743, passed in 2013, required OPR to develop new State CEQA Guidelines that address transportation metrics under CEQA. As stated in the legislation, upon adoption of the new guidelines, "automobile delay, as described solely by LOS or similar measures of vehicular capacity or traffic congestion shall not be considered a significant impact on the environment pursuant to this division, except in locations specifically identified in the guidelines, if any."

OPR published its proposal for the comprehensive updates to the State CEQA Guidelines in November 2017, which included proposed updates related to analyzing transportation impacts pursuant to SB 743. These updates indicated that VMT would be the primary metric used to identify transportation impacts. In December of 2018, OPR published the most recent version of the *Technical Advisory on Evaluating Transportation Impacts in CEQA* (OPR Technical Advisory) which provides guidance for VMT analysis (OPR 2018). The OPR Technical Advisory recommends that a per capita or per employee VMT that is fifteen percent below that of existing development, measured against the region or city, may indicate a less-than-significant transportation impact. As used in the OPR Technical Advisory, "regional" refers to the full geography within the jurisdictional borders of a metropolitan planning organization or a regional transportation planning agency. Comparing a project's VMT per capita or VMT per employee to that of the entire region or entire city allows a lead agency to better align with the state's climate commitments. Comparison to only a portion of the region or city could result in a less environmentally protective significance threshold, potentially disconnecting significance determinations from those commitments (OPR 2023). In December 2018, OPR and the state Natural Resources Agency submitted the updated State CEQA Guidelines to the Office of Administrative Law for final approval to implement SB 743. The Office of Administrative Law subsequently approved the updated State CEQA Guidelines, and local agencies had an opt-in period until July 1, 2020, to implement the updated guidelines. As of July 1, 2020, implementation of Section 15064.3 of the updated State CEQA Guidelines applies statewide.

Vehicle Miles Traveled-Focused Transportation Impact Study Guide

The Vehicle Miles Traveled-Focused Transportation Impact Study Guide was prepared by Caltrans to provide guidance to Caltrans districts, lead agencies, tribal governments, developers, and consultants regarding Caltrans's review of a land use project or plan's transportation analysis using the VMT metric for evaluating transportation impacts. It replaces the *Guide for the Preparation of Traffic Impact Studies* (2002) and is for use with local land use projects.

Interim Local Development and Intergovernmental Review Safety Review Practitioners Guidance

The Interim Local Development and Intergovernmental Review Safety Review Practitioners Guidance was released by Caltrans in December 2020 to provide instruction to Caltrans staff, lead agencies, and consultants regarding safety impact review expectations under CEQA and can be used as a guide at the local review level for assessing safety impacts of projects and plans on local right-of-way. It supports the implementation of SB 743 which uses VMT as a measure for transportation impact analyses over LOS with special consideration of vulnerable users and communities.

Transportation Analysis Framework: Evaluating Transportation Impacts of State Highway System Projects and Transportation Analysis under CEQA

Caltrans released the Transportation Analysis Framework: Evaluating Transportation Impacts of State Highway System Projects and Transportation Analysis under CEQA in September 2020 to serve as additional guidance in the implementation of SB 743. The Transportation Analysis Framework establishes changes to Caltrans procedures for the analysis of transportation impacts of projects on the State Highway System, primarily induced demand and provides direction for the preferred approach for analyzing the VMT attributable to proposed projects in various project settings. Transportation Analysis under CEQA provides information to support Caltrans's CEQA practitioners in making CEQA significance determinations for transportation impacts of projects on the State Highway System.

Mobile Source Strategy

The Mobile Source Strategy, updated by CARB every 5 years, demonstrates how the state can simultaneously meet air quality standards, achieve GHG emissions reduction targets, decrease health risk from transportation emissions, and reduce petroleum consumption. Statewide, the concepts in the 2020 Strategy could achieve criteria pollutant NO_x reductions of over 590 tons per day in 2037 and reduce mobile source fuel consumption by 9.5 billion gallons of gasoline and 3.0 billion gallons of diesel equivalent in 2045. This equates to a well-to-wheel GHG emissions reduction of approximately 94 million metric tons of carbon dioxide equivalent in 2045 (CARB 2021: 4).

California Transportation Plan

The 2050 California Transportation Plan, approved in February 2021, is a federal and state-mandated state transportation plan that ties several internal and external inter-related plans and programs and “provides a common framework for guiding transportation decisions and investments by all levels of government and the private sector” (Caltrans 2016). It is updated every 5 years and demonstrates how the state will achieve state targets for GHG reductions.

Active Transportation Program

Governor Jerry Brown signed legislation on September 26, 2013, creating the Active Transportation Program. The program consolidated several federal and state programs in an effort to promote biking and walking across California. The Active Transportation Program encourages increased use of active transportation through the promotion of environmental, equitable, economic, and public health-related goals. An amount of \$100,000,000 of SB 1 funding is dedicated to the Active Transportation Program annually.

Solutions of Congested Corridors Program

The Solutions of Congested Corridors Program makes \$250 million available annually to projects that implement specific transportation performance improvements and are part of a comprehensive corridor plan, by providing more transportation choices while preserving the character of local communities and creating opportunities for neighborhood enhancement. Eligible projects may include improvements to state highways, local streets, rail facilities, public transit facilities, bicycle and pedestrian facilities, and preservation of critical local habitat and open spaces.

Local Partnership Program

The Local Partnership Program supports investment by local communities by providing matching funds for voter-approved transportation tax measures. Projects under the program include road maintenance and rehabilitation efforts as well as other infrastructure improvements. Funds are allocated on both a formula and competitive basis, which helps ensure smaller jurisdictions receive funding through the program. This program is intended to balance the need to direct increased revenue to the highest transportation needs while distributing the impact of increased funding.

2.13.2.3 Local

Specific regulations discussed in the 2011 GPU PEIR and applicable to the CAP Update include the following:

- Community Plans
- County Zoning Ordinance, Parking Regulations, Sections 6750–6799
- San Diego County Public Road Standards
- San Diego County Private Road Standards
- County of San Diego Consolidated Fire Code
- County of San Diego Regulatory Ordinances, Sections 77.201–77.220, Transportation Impact Fee
- County Community Right-of-Way Development Standards

Discussed below in *County of San Diego Transportation Study Guidelines*, to comply with SB 743, the County of San Diego adopted the updated Transportation Study Guidelines

(TSG) on September 24, 2022, that identifies VMT analysis methodologies, establishes VMT thresholds for CEQA transportation impacts, and identifies initial mitigation strategies. The TSG provides guidance for the methodology and thresholds utilized to evaluate transportation-related impacts.

In addition to the above, the following regulations related to transportation have been adopted and/or updated since certification of the 2011 GPU PEIR.

San Diego Forward: The 2021 Regional Plan

The San Diego Association of Governments (SANDAG) Board of Directors adopted San Diego Forward: The 2021 Regional Plan (2021 Regional Plan) in December 2021. The 2021 Regional Plan combines the Regional Transportation Plan, Sustainable Communities Strategy, and Regional Comprehensive Plan. It anticipates the growth that will occur in the region and provides a blueprint for a regional transportation system, while also establishing the region's sustainable community strategy with the overarching vision of promoting sustainability and offering more mobility options for people and goods. The 2021 Regional Plan strategies are organized around the 5 Big Moves: Next Operating System, Complete Corridors, Transit Leap, Mobility Hubs, and Flexible Streets. The three primary goals guiding the 2021 Regional Plan are the efficient movement of people and goods; access to affordable, reliable, and safe mobility options; and healthier air and reduced GHG emissions.

2023 Regional Transportation Improvement Program

The 2023 Regional Transportation Improvement Program (2023 RTIP) is a multi-billion-dollar 5-year program of major transportation projects funded by federal, state, TransNet local sales tax, and other local and private funding covering fiscal year 2023 to fiscal year 2027. The program development process, which includes the air quality emissions analysis for all regionally significant projects, requires approval by the Federal Highway Administration and the Federal Transit Administration.

The 2023 RTIP is a prioritized program designed to implement the region's overall strategy for providing mobility and improving the efficiency and safety of the transportation system, while reducing transportation-related air pollution in support of efforts to attain federal and state air quality standards for the region. The program also incrementally implements the 2021 Regional Plan, which is the long-range transportation plan for the San Diego region. The final 2023 RTIP was adopted by the SANDAG Board of Directors on September 12, 2022, and approved by the Federal Highway Administration and the Federal Transit Administration in December 2022.

County of San Diego Transportation Study Guidelines

The County Board of Supervisors approved the updated TSG in September 2022. The TSG was developed as a guide for analyzing the transportation impacts of proposed projects in the unincorporated county addressing the manner in which transportation impacts under CEQA are measured due to SB 743, which shifts the focus from LOS to VMT. VMT is the total number of miles traveled by motor vehicles, including trips to/from

and within the planning area. The TSG provides CEQA VMT Screening Criteria for projects that are presumed to result in a less-than-significant VMT impact and are, thus, not required to perform a VMT analysis. Projects that do not meet the screening criteria are subject to a detailed evaluation of the VMT produced by the project. Typically, transportation VMT analysis for CEQA should be conducted using the SANDAG Regional Travel Demand Model; however, other tools for conducting VMT analysis may be preferred depending on the project characteristics and the sensitivity of the SANDAG model in the project location and for the project type.

The TSG provides metrics to determine whether a project surpasses the County's VMT Thresholds of Significance. The VMT generated under the current General Plan establishes the baseline in which planned development is compared to identify cumulative transportation-related impacts. The current General Plan conditions represent buildout of the land uses and mobility network assumed within the County's current General Plan.

The TSG establishes thresholds for large land use plans and states that land use plans should be compared to the region overall. Comparison to the region is appropriate because large land use plans can have an effect on regional VMT (County of San Diego 2022). The thresholds apply to large land use plans:

- **Residential:** Aggregate all residential land uses for the build-out year of the plan and compare the resulting build-out year VMT per resident to the existing regional average. The threshold is 15 percent below the existing regional average VMT per resident.
- **Employment:** Aggregate all employment land uses for the build-out year of the plan and compare the resulting build-out year VMT per employee to the existing regional average. The threshold is 15 percent below the existing regional average VMT per employee.
- **Retail/Service:** Evaluate the effect that adding these land uses has on regional VMT. The threshold is any increase in regional VMT.

County of San Diego Regulatory Ordinances, Sections 77.201–77.220, Transportation Impact Fee

The County of San Diego Regulatory Ordinances, Sections 77.201–77.220, Transportation Impact Fee program provides funding for mitigation of cumulative impacts and for proportional construction of transportation facilities needed to support traffic generated by new development to meet state law requirements. Per the County Board of Supervisors ordinance, effective December 31, 2012, the County will collect the fee at or before building permit issuance for projects that generate new trips.

County of San Diego 2020 Consolidated Fire Code

The 2020 Consolidated Fire Code (County Fire Code) includes the County amendments to the 2019 California Fire Code and the ordinances of the 13 unincorporated county fire protection districts. The County Fire Code is adopted for the protection of public health

and safety and applies to both ministerial and discretionary projects. It includes definitions, requirements for permits and inspection for installing or altering systems, regulations for the erection, construction, enlargement, alteration, repair, moving, removal, conversion, demolition, equipment use and maintenance of buildings, structures, and premises, including the installation, alteration or repair of new and existing fire protection systems and their inspection and provides penalties for violation of this code. It applies to new construction and to any alterations, repairs, or reconstruction. Section 503 of the County Fire Code includes provisions and regulations applicable to roadway design and emergency vehicle access.

San Diego County Fire Authority Emergency Vehicle Turnaround, Section 503

The San Diego County Fire Authority provides regulatory standards and design guidance regarding emergency vehicle turnaround. Fire apparatus access roads, except private residential driveways, shall be provided and maintained for purposes of rapid and reliable fire apparatus access and for unobstructed traffic circulation for evacuation or relocation of civilians during a wildfire or other emergency (San Diego County Fire Authority 2016).

County of San Diego Department of Public Works Traffic Control Permit

After obtaining an encroachment, excavation, and/or construction permit from the County, a traffic control permit is necessary for any work on a County-maintained roadway or in the County right-of-way. It is the responsibility of those performing work on or adjacent to a public road in the unincorporated area of the county to install and maintain appropriate traffic control in accordance with an approved traffic control plan. An approved traffic control plan is necessary to provide the motoring public safe passage through the construction zone, as well as to safeguard construction workers (County of San Diego Department of Public Works n.d.).

County of San Diego Active Transportation Plan

The ATP promotes active transportation through pedestrian and bicycle improvements throughout the unincorporated county. The ATP consists of an update to the County's Bicycle Transportation Plan (dated 2008) and the Pedestrian Area Plans (prepared for Alpine, Borrego Springs, Fallbrook Town Center, Lakeside Town Center and Spring Valley) into one combined ATP. The ATP was approved by the Board of Supervisors on October 31, 2018. The ATP identifies goals, objectives, and actions related to improving safety to reduce auto collisions with cyclists and pedestrians, increasing accessibility and connectivity with an active transportation network, and improving public health by encouraging walking and biking.

2011 San Diego County General Plan

The General Plan policies related to transportation that are applicable to the CAP Update include the following:

Policy LU-2.8: Mitigation of Development Impacts. Require measures that minimize significant impacts to surrounding areas from uses or operations that

cause excessive noise, vibrations, dust, odor, aesthetic impairment and/or are detrimental to human health and safety.

Policy LU-5.1: Reduction of Vehicle Trips within Communities. Incorporate a mixture of uses within Villages and Rural Villages and plan residential densities at a level that support multi-modal transportation, including walking, bicycling, and the use of public transit, when appropriate.

Policy LU-5.4: Planning Support. Undertake planning efforts that promote infill and redevelopment of uses that accommodate walking and biking within communities.

Policy LU-5.5: Projects That Impede Non-Motorized Travel. Ensure that development projects and road improvements do not impede bicycle and pedestrian access. Where impacts to existing planned routes would occur, ensure that impacts are mitigated and acceptable alternative routes are implemented.

Policy LU-6.9: Development Conformance with Topography. Require development to conform to the natural topography to limit grading; incorporate and not significantly alter the dominant physical characteristics of a site; and to utilize natural drainage and topography in conveying stormwater to the maximum extent practicable.

Policy LU-6.10: Protection from Hazards. Require that development be located and designed to protect property and residents from the risks of natural and man-induced hazards.

Policy LU-9.8: Village Connectivity and Compatibility with Adjoining Areas. Require new development within Villages to include road networks, pedestrian routes, and amenities that create or maintain connectivity; and site, building, and landscape design that is compatible with surrounding areas. *[See applicable community plan for possible relevant policies.]*

Policy LU-10.4: Commercial and Industrial Development. Limit the establishment of commercial and industrial uses in Semi-Rural and Rural areas that are outside of Villages (including Rural Villages) to minimize vehicle trips and environmental impacts.

Policy LU-11.6: Office Development. Locate new office development complexes within Village areas where services are available, in proximity to housing, and along primary vehicular arterials (ideally with transit access) with internal vehicular and pedestrian linkages that integrate the new development into the multi-modal transportation network where feasible.

Policy LU-11.8: Permitted Secondary Uses. Provide a process where secondary land uses may be permitted when appropriate and compatible with the primary commercial, office, and light industrial uses, in order to better serve the daily needs of employees and to reduce the frequency of related automobile trips. This policy is not intended for high impact industrial uses.

Policy M-1.1: Prioritized Travel within Community Planning Areas. Provide a public road network that accommodates travel between and within community planning areas rather than accommodating overflow traffic from State highways and freeways that are unable to meet regional travel demands.

Policy M-1.2: Interconnected Road Network. Provide an interconnected public road network with multiple connections that improve efficiency by incorporating shorter routes between trip origin and destination, disperse traffic, reduce traffic congestion in specific areas, and provide both primary and secondary access/egress routes that support emergency services during fire and other emergencies.

Policy M-1.3: Treatment of High-Volume Roadways. Consider narrower rights-of-way, flexibility in design standards, and lower design speeds in areas planned for substantial development in order to avoid bisecting communities or town centers. Reduce noise, air, and visual impacts of new freeways, regional arterials, and Mobility Element roads, through landscaping, design, and/or careful location of facilities.

Policy M-2.2: Access to Mobility Element Designated Roads. Minimize direct access points to Mobility Element roads from driveways and other non-through roads to maintain the capacity and improve traffic operations.

Policy M-3.1: Public Road Rights-of-Way. Require development to dedicate right-of-way for public roads and other transportation routes identified in the Mobility Element roadway network (see Mobility Element Network Appendix), Community Plans, or Road Master Plans. Require the provision of sufficient right-of-way width, as specified in the County Public Road Standards and Community Trails Master Plan, to adequately accommodate all users, including transit riders, pedestrians, bicyclists, and equestrians.

Policy M-3.2: Traffic Impact Mitigation. Require development to contribute its fair share toward financing transportation facilities, including mitigating the associated direct and cumulative traffic impacts caused by their project on both the local and regional road networks. Transportation facilities include road networks and related transit, pedestrian and bicycle facilities, and equestrian.

Policy M-3.3: Multiple Ingress and Egress. Require development to provide multiple ingress/egress routes in conformance with state law and local regulations.

Policy M-4.1: Walkable Village Roads. Encourage multi-modal roads in Villages and compact residential areas with pedestrian-oriented development patterns that enhance pedestrian safety and walkability, along with other non-motorized modes of travel, such as designing narrower but slower speed roads that increase pedestrian safety.

Policy M-4.2: Interconnected Local Roads. Provide an interconnected and appropriately scaled local public road network in Village and Rural Villages that reinforces the compact development patterns promoted by the Land Use Element and individual community plans.

Policy M-4.3: Rural Roads Compatible with Rural Character. Design and construct public roads to meet travel demands in Semi-Rural and Rural Lands that are consistent with rural character while safely accommodating transit stops when deemed necessary, along with bicyclists, pedestrians, and equestrians. Where feasible, utilize rural road design features (e.g., no curb and gutter improvements) to maintain community character. *[See applicable community plan for possible relevant policies.]*

Policy M-4.4: Accommodate Emergency Vehicles. Design and construct public and private roads to allow for necessary access for appropriately-sized fire apparatus and emergency vehicles while accommodating outgoing vehicles from evacuating residents.

Policy M-4.5: Context Sensitive Road Design. Design and construct roads that are compatible with the local terrain and the uses, scale and pattern of the surrounding development. Provide wildlife crossings in road design and construction where it would minimize impacts in wildlife corridors.

Policy M-4.6: Interjurisdictional Coordination. Coordinate with adjacent jurisdictions so that roads within Spheres of Influence (SOIs) or that cross jurisdictional boundaries are designed to provide a consistent cross-section and capacity. To the extent practical, coordinate with adjacent jurisdictions to construct road improvements concurrently or sequentially to optimize and maintain road capacity.

Policy M-5.1: Regional Coordination. Coordinate with regional planning agencies, transit agencies, and adjacent jurisdictions to provide a transportation system with the following:

- Sufficient capacity consistent with the County General Plan Land Use Map;
- Travel choices, including multiple routes and modes of travel to provide the opportunity for reducing vehicle miles traveled;
- Facilities sited and designed to be compatible with the differing scales, intensities, and characteristics of the unincorporated communities while still accommodating regional, community, and neighborhood travel demands; and
- Maximized efficiency to enhance connectivity between different modes of travel.

Policy M-5.1 Regional Coordination. Coordinate with regional planning agencies, transit agencies, and adjacent jurisdictions to provide a transportation system with the following:

- Sufficient capacity consistent with the County General Plan Land Use Map
- Travel choices, including multiple routes and modes of travel to provide the opportunity for reducing vehicle miles traveled
- Facilities sited and designed to be compatible with the differing scales, intensities, and characteristics of the unincorporated communities while still accommodating regional, community, and neighborhood travel demands
- Maximized efficiency to enhance connectivity between different modes of travel

Policy M-5.2: Impact Mitigation for New Roadways and Improvements. Coordinate with Caltrans to mitigate negative impacts from existing, expanded, or new state freeways or highways and to reduce impacts of road improvements and/or design modifications to state facilities on adjacent communities.

Policy M-8.1: Maximize Transit Service Opportunities. Coordinate with San Diego Association of Governments (SANDAG), the CTSA, NCTD, and MTS to provide capital facilities and funding, where appropriate, to:

- Maximize opportunities for transit services in unincorporated communities;
- Maximize the speed and efficiency of transit service through the development of transit priority treatments such as transit signal priority, transit queue jump lanes, and dedicated transit only lanes;
- Provide for transit-dependent segments of the population, such as the disabled, seniors, low income, and children, where possible; and
- Reserve adequate rights-of-way to accommodate existing and planned transit facilities including bus stops.

Policy M-8.2: Transit Service to Key Community Facilities and Services. Locate key County facilities, healthcare services, educational institutions, and other civic facilities so that they are accessible by transit in areas where transit is available. Require those facilities to be designed so that they are easily accessible by transit, whenever possible.

Policy M-8.3: Transit Stops That Facilitate Ridership. Coordinate with SANDAG, NCTD, and MTS to locate transit stops and facilities in areas that facilitate transit ridership, and designate such locations as part of planning efforts for Town Centers, transit nodes, and large-scale commercial or residential development projects. Ensure that the planning of Town Centers and Village Cores incorporates uses that support the use of transit, including multi-family residential and mixed-use transit-oriented development, when appropriate.

Policy M-8.4: Transit Amenities. Require transit stops that are accessible to pedestrians and bicyclists; and provide amenities for these users' convenience.

Policy M-8.5: Improved Transit Facilities. Require development projects, when appropriate, to improve existing nearby transit and/or park and ride facilities, including the provision of bicycle and pedestrian facilities, provisions for bus transit in coordination with NCTD and MTS as appropriate including, but not limited to, shelters, benches, boarding pads, and/or trash cans, and to provide safe, convenient, and attractive pedestrian connections.

Policy M-8.7: Inter-Regional Travel Modes. Coordinate with SANDAG, Caltrans, and the California High-Speed Rail Authority, where appropriate, to identify alternative methods for inter-regional travel to serve the unincorporated county residents.

Policy M-8.8: Shuttles. Coordinate with Tribal governments, the Reservation Transportation Authority, and other large employers to provide shuttles and other means of connecting transit stops with job locations, civic, and commercial uses, where appropriate.

Policy M-9.1: Transportation Systems Management. Explore the provision of operational improvements (i.e. adding turn lanes, acceleration lanes, intersection improvements, etc.) that increase the effective vehicular capacity of the public road network prior to increasing the number of road lanes. Ensure operational improvements do not adversely impact the transit, bicycle, and pedestrian networks.

Policy M-9.2: Transportation Demand Management. Require large commercial and office development to use TDM programs to reduce single-occupant vehicle traffic generation, particularly during peak periods to maximize the capacity of existing or improved road facilities.

Policy M-9.3: Preferred Parking. Encourage and provide incentives for commercial, office, and industrial development to provide preferred parking for carpools, vanpools, electric vehicles and flex cars. [Refer also to Policy COS-16.3 (Low-Emission Vehicles) in the Conservation and Open Space Element.] Encourage parking cash out programs to reimburse employees for the cost of "free" on-site parking to provide incentives to use alternate modes of travel and to reduce parking requirements (see also Policy M-10.5).

Policy M-9.4: Park-and-Ride Facilities. Require developers of large projects to provide, or to contribute to, park-and-ride facilities near freeway interchanges and other appropriate locations that provide convenient access to congested regional arterials. Require park-and-ride facilities that are accessible to pedestrians and bicyclists, and include bicycle lockers and transit stops whenever feasible.

Policy M-10.1: Parking Capacity. Require new development to:

- Provide sufficient parking capacity for motor vehicles consistent with the project's location, use, and intensity;
- Provide parking facilities for motorcycles and bicycles; and
- Provide staging areas for regional and community trails.

Policy M-10.2: Parking for Pedestrian Activity. Parking in a commercial area in Fallbrook Require the design and placement of on-site automobile, motorcycle, and bicycle parking in Villages and Rural Villages that encourages pedestrian activity by providing a clear separation between vehicle and pedestrian areas and prohibit parking areas from restricting pedestrian circulation patterns.

Policy M-10.3: Maximize On-street Parking. Encourage the use of on-street parking in commercial and/or high-density residential town center areas to calm traffic and improve pedestrian interaction. Traffic operations and pedestrian safety must not be compromised.

Policy M-10.4: Shared Parking. Support town center plans, when desired by the community, that incorporate on-street and/or shared vehicular parking facilities to reduce on-site parking requirements.

Policy M-10.5: Reduced Parking. Accommodate appropriate reductions in on-site parking requirements in situations such as:

- Development of low-income and senior housing
- Development located near transit nodes
- Employment centers that institute Transportation Demand Management programs
- Development that integrates other parking demand reductions techniques such as parking cash out, when ensured by ongoing permit conditions

Policy M-11.1: Bicycle Facility Design. Support regional and community-scaled planning of pedestrian and bicycle networks.

Policy M-11.2: Bicycle and Pedestrian Facilities in Development. Require development and Town Center plans in Villages and Rural Villages to incorporate site design and on-site amenities for alternate modes of transportation, such as comprehensive bicycle and pedestrian networks and facilities, including both on-street facilities as well as off-street bikeways, to safely serve the full range of intended users, along with areas for transit facilities, where appropriate and coordinated with the transit service provider.

Policy M-11.3: Bicycle Facilities on Roads Designated in the Mobility Element. Maximize the provision of bicycle facilities on County Mobility Element roads in

Semi-Rural and Rural Lands to provide a safe and continuous bicycle network in rural areas that can be used for recreation or transportation purposes, while retaining rural character.

Policy M-11.4: Pedestrian and Bicycle Network Connectivity. Require development in Villages and Rural Villages to provide comprehensive internal pedestrian and bicycle networks that connect to existing or planned adjacent community and countywide networks.

Policy M-11.5: Funding for Bicycle Network Improvements. Seek outside funding opportunities for bicycle and pedestrian network improvement projects, particularly those that provide safe and continuous pedestrian and bicycle routes to schools, town centers, parks, park-and-ride facilities, and major transit stops.

Policy M-11.6: Coordination for Bicycle and Pedestrian Facility Connectivity. Coordinate with Caltrans to provide alternate connections for past, existing, or planned bicycle and pedestrian routes that were or would be severed by state freeway and highway projects that intersect pathways or divide communities.

Policy M-11.7: Bicycle and Pedestrian Facility Design. Promote pedestrian and bicycle facility standards for facility design that are tailored to a variety of urban and rural contexts according to their location within or outside a Village or Rural Village.

Policy S-2.7: Evacuation Access. All development proposals are required to identify evacuation routes at the Community Plan level and identify and facilitate the establishment of new routes needed to ensure effective evacuation. Evacuation routes should be incorporated into existing Community Wildfire Protection Plans where available.

Policy S-4.5: Access Roads. Require development to provide additional access roads where feasible to provide for safe access of emergency equipment and civilian evacuation concurrently. The width, surface, grade, radius, turnarounds, turnouts, bridge construction, vegetative management and brush clearance around roadways, and lengths of fire apparatus access roads shall meet the requirements of the State and San Diego County Consolidated Fire Codes. All requirements and any deviations will be at the discretion of the Fire Code Official.

Policy S-4.6: Fire Protection Plans. Ensure that development located within fire hazard areas implement measures in a Fire Protection Plan that reduce the risk of structural and human loss due to wildfire.

Policy S-12.6: Resilient Transportation Systems. Increase the resilience of transportation systems and protect critical transportation infrastructure from climate change.

Policy S-16.1: Vehicular Access to Development. Require development to provide vehicular connections that reduce response times and facilitate access for law enforcement personnel, whenever feasible.

2011 San Diego County GPU PEIR

The following mitigation measures from the 2011 GPU PEIR are applicable to the CAP Update:

Adopted Mitigation Measure Tra-1.3: Implement the County Public Road Standards during review of new development projects. Also revise the Public Road Standards to include a range of road types according to Regional Category context.

Adopted Mitigation Measure Tra-1.4: Implement and revise as necessary the County Guidelines for Determining Significance for Transportation and Traffic to evaluate adverse environmental effects of projects and require mitigation when significant impacts are identified.

Adopted Mitigation Measure Tra-4.4: Implement and revise as necessary the Subdivision Ordinance to ensure that proposed subdivisions meet current design and accessibility standards.

2.13.3 Analysis of Effects and Significance Determinations

2.13.3.1 Significance Criteria

The significance criteria used to evaluate the project impacts to transportation under CEQA are based on Appendix G of the State CEQA Guidelines, the County of San Diego TSG, and State CEQA Guidelines Section 15064.3. Impacts to the transportation system would be significant if implementation of the project would:

- conflict with a program, plan, ordinance or policy addressing the circulation system;
- exceed threshold for VMT;
- substantially increase hazards due to a design feature;
- result in inadequate emergency access.

2.13.3.2 Approach to Analysis

Impacts related to transportation are analyzed based on a review of the CAP Update measures and actions and their potential to result in physical changes to the environment if the CAP Update is approved and implemented. Each issue area is analyzed in the context of existing laws and regulations as well as policies adopted in the General Plan, and the extent to which these existing regulations and policies adequately address and minimize the potential for impacts associated with implementation of the CAP Update. Because this SEIR tiers from the 2011 GPU PEIR, all relevant 2011 GPU PEIR mitigation

measures are applicable to the proposed project as needed to avoid or minimize project impacts and are considered part of the proposed CAP Update.

Scope of SEIR Impact Analysis

The impact analysis contained within this ~~draft~~ SEIR focuses on whether approval and implementation of the CAP Update would result in new or more severe impacts than what were disclosed in the 2011 GPU PEIR, which is herein incorporated by reference. The CAP Update identifies strategies, measures, and supporting actions (referred to herein as measures and actions) to demonstrate progress toward the established GHG reduction targets. Because these measures and actions represent the components of the CAP Update that could result in physical environmental effects within the unincorporated county, this analysis focuses on the impact of their implementation. Given the broad scope of the CAP Update (i.e., covering the entire unincorporated county) and its role as a planning document designed to guide future decision-making related to the reduction of GHG emissions within the unincorporated county, the study area for the CAP Update is the unincorporated area of the county within the County's jurisdiction (i.e., all unincorporated lands excluding tribal lands, state and federally owned lands, and military installations).

The analysis in this ~~draft~~ SEIR remains programmatic. Implementation of all CAP Update measures and actions were considered during preparation of this ~~draft~~ SEIR, to the degree specific information about implementation is known. Because future projects that would implement the CAP Update have yet to be specifically defined, this SEIR considers the types of impacts that could occur with implementation of future projects consistent with the proposed GHG reduction measures and actions. Future discretionary would be evaluated by the County to determine if they are within the scope of this SEIR or if they result in project-specific impacts additional to what is concluded in this analysis. If additional impacts would result, subsequent CEQA documentation would be required to evaluate impacts, determine mitigation, and conclude whether impacts are reduced to a less-than-significant level.

Proposed CAP Update Strategies

As described in Chapter 1, "Project Description," the overarching strategies and associated measures and actions proposed in the CAP Update (see Table 1-2) have been grouped into categories for the purpose of analysis, based on the sector they target (e.g., solid waste, water/wastewater). CAP Update actions and measures with the potential result in effects to transportation are summarized below. CAP Update measures and actions that would involve development of policies and programs that would not result in direct physical effects or those that would result in limited physical improvements to existing development are not discussed further because these actions and measures would not have potential to result in new or more severe impacts related to all transportation impact analyses except for VMT. The analysis of VMT consistent with State CEQA Guidelines Section 15064.3 considers all policies and programs that could affect VMT.

Solid Waste Measures and Actions. This category includes strategies to increase solid waste diversion and availability of sustainable solid waste facilities in County operations and within the unincorporated county. Key actions with potential to result in new or more severe impacts related to transportation include those that would result in the development of new or expanded recycling and composting facilities (Actions SW-1.1, SW-2.1, SW-4.1.a, and SW-4.1.b).

Water and Wastewater Measures and Actions. This category includes strategies to decrease potable water consumption and increase stormwater collection and reuse. Key actions with potential to result in new or more severe impacts related to transportation include those that would result in the construction of new stormwater capture and reuse infrastructure (Actions W-1.1, W-2.2, W-2.3, and W-2.4).

Agriculture and Conservation Measures and Actions. This category includes strategies to preserve natural and agricultural lands, improve land management practices, and support climate-friendly farming practices. Key actions with potential to result in new or more severe impacts related to transportation include those that would result in the construction and maintenance of restoration and conservation projects (Action A-1.2). This category also includes an action that would evaluate opportunities for the construction of farmworker housing (Action A-4.1.b).

Energy Measures and Actions. This category includes strategies to increase building energy efficiency, renewable energy, and electrification in County operations and the unincorporated county. Key actions with potential to result in new or more severe impacts related to transportation include those that would result in the construction of new infrastructure to promote renewable energy use and electrification (Actions E-1.1 and E-3.3). Action E-3.3 would require the County to develop a program to provide the unincorporated area with 100 percent renewable energy from San Diego Community Power by 2030. This action may indirectly result in the construction of large-scale renewable energy infrastructure.

Built Environment and Transportation Measures and Actions. This category includes strategies to decarbonize the County's vehicle fleet, support active transportation, and reduce single-occupancy vehicle trips. Key actions with potential to result in new or more severe impacts related to transportation include those that would result in the construction of new electric vehicle charging stations (EVCSs) (Action T-3.1), hydrogen fueling infrastructure (Action T-3.1.a), active transportation facilities (Action T-5.1), and transit-supportive roadway treatments (Action T-6.2).

2.13.3.3 Issue 1: Conflict with a Program, Plan, Ordinance or Policy Addressing the Circulation System

This section describes potential project impacts on programs, plans, ordinances, or policies addressing the circulation system with implementation of the project.

Guidelines for Determination of Significance

Based on Appendix G of the State CEQA Guidelines and the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Transportation and Traffic* (County of San Diego 2011), the project would result in a significant impact if it would:

- conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities.

Impact Analysis

2011 GPU PEIR Determination

As discussed in Section 2.15, “Transportation and Traffic,” the 2011 GPU PEIR evaluated impacts related to transit, roadway, bicycle, and pedestrian facilities with the adoption of the goals and policies contained within the General Plan and buildout of the unincorporated county at the planning horizon. The discussion of impacts can be found in Section 2.15, “Transportation and Traffic” (pages 2.15-36 through 2.15-39) and is hereby incorporated by reference. The 2011 GPU PEIR determined that there would be inconsistencies between the General Plan and existing alternative transportation plans and policies at that time, thus resulting in potentially significant impacts.

The 2011 GPU PEIR determined that the impacts to alternative transportation would be reduced through the implementation of a combination of federal, state, and local regulations; existing County regulatory processes; and adopted General Plan policies. The General Plan Policies LU-5.1, LU-6.3, LU-5.4, LU-5.5, LU-9.8, LU-11.6, M-3.1, M-3.3, M-4.3, M-8.1, M-8.2, M-8.3, M-8.4, M-8.5, M-8.6, M-8.7, M-9.2, M-9.4, M-11.2, M-11.3, M-11.4, M-11.5, M-11.6, and M-11.7 would promote provisions for alternative modes of transportation, including bike lanes, bus stops, trails, and sidewalks. Additionally, the 2011 GPU PEIR determined that the impacts to alternative transportation would be further reduced with the implementation of Mitigation Measures Tra-6.1, Tra-6.2, Tra-6.3, Tra-6.4, Tra-6.5, Tra-6.6, Tra-6.7, Tra-6.8, and Tra-6.9. Impacts to alternative transportation were determined to be less than significant with implementation of adopted General Plan policies and the 2011 GPU PEIR mitigation measures referenced above.

CAP Impact Analysis

The following sections describe the potential for implementation of the proposed CAP Update measures and actions to result in impacts to alternative transportation.

As noted above, SANDAG’s *2021 Regional Plan* combines the Regional Transportation Plan, Sustainable Communities Strategy, and Regional Comprehensive Plan. The 2021 Regional Plan anticipates the growth that will occur in the region and provides a blueprint for a regional transportation system, while also establishing the region’s sustainable community strategy with the overarching vision of promoting sustainability and offering more mobility options for people and goods. The Regional Plan provides a framework for coordinated land use and transportation planning strategies by identifying policies and

programs developed to achieve the goals of efficiently moving people and goods; providing access to affordable, reliable, and safe mobility options for everyone; and providing healthier air and reduced GHG emissions regionwide. The Regional Plan also includes recommendations for funding and implementation of transit, roadway, bicycle, and pedestrian facilities that would improve the transportation circulation system countywide. The measures and actions proposed under the CAP Update and described below are intended to further statewide and regional goals, including those of the Regional Plan, by promoting policies and actions that reduce GHG emissions by improving solid waste and water/wastewater use and management, increasing the availability of renewable sources of energy, promoting sustainable agricultural practices, and promoting transportation and built environment improvements that encourage the development of multi-modal transportation options - including bicycle and pedestrian facilities - and associated vehicular emissions reductions.

An important goal of the Regional Plan is to promote healthier air, including reduced GHG emissions, through reductions in local and regional VMT. A number of CAP Update measures and actions in support of the overall strategy of supporting active transportation and reducing single-occupancy vehicle trips would support this goal by promoting programs and policies to support alternative modes of transportation within the unincorporated county, consistent with the goal of the Regional Plan of improving the transportation circulation system countywide. The degree to which CAP Update implementation not only does not conflict with the Regional Plan but would reduce VMT-related GHG emissions, such that it would be substantially consistent with the GHG reduction strategies of the Regional Plan, is further discussed below under “Issue 2: Exceed Threshold for VMT.”

Solid Waste Measures and Actions

Implementation of the CAP Update would include implementation of measures and actions to increase solid waste diversion and availability of solid waste facilities in County operations and within the unincorporated county. Implementing CAP Update measures and actions (Actions SW-1.1, SW-2.1, SW-4.1a, and SW-4.1b) could result in potential construction of new or expanded solid waste facilities. Specific locations for new and expanded facilities have not been identified.

Construction of solid waste facilities would be localized and temporary. Although construction of solid waste facilities and associated off-site improvements could occur within the roadway or along pedestrian and bicycle facilities potentially resulting in lane closures, minor detours, and/or delays due to the movement of construction vehicles and equipment, all projects within County right-of-way would be required to develop and implement a traffic control plan during construction to maintain a safe environment for all modes of transportation.

Once constructed, these projects would not have an impact on the operation of the circulation system. Implementation of CAP Update Actions SW-1.1, SW-2.1, SW-4.1a, and SW-4.1b would not damage or alter any existing bicycle, pedestrian, or transit facilities resulting in an adverse effect to existing or planned facility usage and/or service. All

projects would be subject to review by County staff to ensure all applicable regulations are met, and individual new or expanded solid waste infrastructure projects would need to remain consistent with County policies, plans, and ordinances related to alternative transportation. Therefore, implementation of these projects would not result in conflicts with programs, plans, policies, or ordinances addressing the circulation system.

Consistent with the 2011 GPU PEIR determinations, development of new or expanded solid waste facilities would be required to implement adopted General Plan goals and policies related to alternative transportation. Policy LU-5.5 ensures development does not impede bicycle or pedestrian facilities and that if impacts to planned routes would occur, any such impacts would be mitigated. Policy LU-9.8 requires that development within Villages include connected pedestrian routes and amenities. Policy M-3.1 requires development to dedicate right-of-way to adequately accommodate all users including transit riders, pedestrians, and bicyclists. Policy M-4.3 calls for the design and construction in Semi-Rural and Rural Lands to safely accommodate transit stops when deemed necessary, along with bicyclists, pedestrians, and equestrians. Policies M-11.2 through M-11.4 require development in Villages and Rural Villages to incorporate site design and on-site amenities for alternate modes of transportation and provide comprehensive internal pedestrian and bicycle networks. Implementation of these policies would minimize impacts related to alternative transportation by ensuring that proposed improvements prioritize connectivity, safety, compatibility with surrounding uses. There are no 2011 GPU PEIR mitigation measures that are applicable to this impact.

Therefore, potential impacts to alternative transportation would be less than significant through implementation of the applicable General Plan policies and completion of subsequent project-level planning and environmental review.

Water and Wastewater Measures and Actions

The CAP Update includes strategies to decrease potable water consumption and increase stormwater collection, water pumping, and wastewater treatment in County operations and the unincorporated county. Implementation of CAP Update Actions W-1.1, W-2.2, W-2.3, and W-2.4 would involve construction of new recycled water and stormwater capture and reuse infrastructure within the unincorporated county. Specifically, these actions would require existing and new development to meet water efficiency and conservation requirements through small-scale improvements with limited physical footprints, such as installing greywater capture systems for irrigation, installing recycled water pipelines, replacing existing landscaping with water-efficient landscaping, and installing rain barrels to collect stormwater.

Construction of water and wastewater facilities would be localized and temporary. Although construction of water and wastewater facilities and associated off-site improvements could occur within the roadway or along pedestrian and bicycle facilities potentially resulting in lane closures, minor detours, and/or delays due to the movement of construction vehicles and equipment, all projects within County right-of-way would be

required to develop and implement a traffic control plan during construction to maintain a safe environment for all modes of transportation.

Once constructed, these projects would not have an impact on the operation of the circulation system. Implementation of CAP Update Actions W-1.1, W-2.2, W-2.3, and W-2.4 would not damage or alter any existing bicycle, pedestrian, or transit facilities resulting in an adverse effect to existing or planned facility usage and/or service. All projects would be subject to review by County staff to ensure all applicable regulations are met, and individual new or expanded water and wastewater infrastructure projects would need to remain consistent with County policies, plans, and ordinances related to alternative transportation. Therefore, implementation of these projects would not result in conflicts with programs, plans, policies, or ordinances addressing the circulation system.

Consistent with the 2011 GPU PEIR determinations, development of new or expanded water and wastewater facilities would be required to implement adopted and applicable General Plan goals and policies related to alternative transportation. The implementation of Policy LU-5.5 ensures development does not impede bicycle or pedestrian facilities and that if impacts to planned routes would occur, ensures that they are mitigated. There are no 2011 GPU PEIR mitigation measures that are applicable to this impact.

Therefore, potential impacts to alternative transportation would be less than significant through implementation of the applicable General Plan policies and completion of subsequent project-level planning and environmental review.

Agriculture and Conservation Measures and Actions

Implementation of CAP Update Measures A-1 through A-4 would preserve natural and agricultural lands, improve land management practices, and support climate-friendly farming practices in the unincorporated county.

Implementation of these actions, other than Action A-4.1.b, would not result in impacts to alternative transportation because no new or expanded development would be anticipated from their associated agriculture and conservation activities. However, implementation of Action A-4.1.b would have the potential to result in the construction of new farmworker housing in the unincorporated county if opportunities to increase farmworker housing in the unincorporated area are identified. It is anticipated that new farmworker housing would be low density and in proximity to existing agricultural operations, which are generally in more rural areas of the unincorporated county. The development of new farmworker housing would have the potential to result in the construction of new roadways or improvements to existing roadways, which would be required to meet local design standards. All projects would be subject to review by County staff to ensure all applicable regulations are met, and individual new or expanded roadway projects would need to remain consistent with County policies, plans, and ordinances related to alternative transportation. Therefore, implementation of these projects would not result in conflicts with programs, plans, policies, or ordinances addressing the circulation system.

Consistent with the 2011 GPU PEIR determinations, development of new or expanded roadway projects associated with increased farmworker housing would be required to implement adopted General Plan goals and policies related to alternative transportation. Policy LU-5.5 ensures development does not impede bicycle or pedestrian facilities and that impacts to planned routes would occur, ensures that they are mitigated. Policy M-3.1 requires development to dedicate right-of-way to adequately accommodate all users including transit riders, pedestrians, and bicyclists. Policy M-4.3 calls for the design and construction in Semi-Rural and Rural Lands to safely accommodate transit stops when deemed necessary, along with bicyclists, pedestrians, and equestrians. Policies M-8.3 through M-8.5 promotes the use of public transit including requiring development projects to improve existing nearby transit and/or park and ride facilities. Policy M-9.1 ensures that operational roadway improvements do not adversely impact transit, bicycle, and pedestrian networks. Policy M-11.2 through M-11.4 requires development in Villages and Rural Villages to incorporate site design and on-site amenities for alternate modes of transportation and provide comprehensive internal pedestrian and bicycle networks. There are no 2011 GPU PEIR mitigation measures that are applicable to this impact.

Therefore, potential impacts to alternative transportation would be less than significant through implementation of the applicable General Plan policies and completion of subsequent project-level planning and environmental review.

Energy Measures and Actions

Implementation of the CAP Update would involve strategies to increase building energy efficiency, renewable energy, and electrification in County operations and the unincorporated county. Implementing CAP Update Actions E-1.1 and E-3.3 would have the potential to result in construction of new infrastructure to promote renewable energy use and electrification.

Specifically, implementation of proposed CAP Update Action E-3.3 could result in the construction of new large-scale renewable energy systems, including large-scale photovoltaic (PV) solar, concentrated solar, and wind turbines. Because the amount of demand generated by such a program and the mix of renewable energy types that would be constructed to satisfy demand is unknown, this ~~draft~~ SEIR evaluates the potential for impacts at the program level. Specific locations for projects have not been identified. While the potential for the construction of large-scale renewable energy infrastructure was not evaluated in the 2011 GPU PEIR, potential wind energy impacts were evaluated in the 2012 Wind Energy EIR, and a summary of that analysis is provided below and is hereby incorporated by reference.

Large-scale renewable energy infrastructure would generally be constructed in undeveloped locations that are productive for generating renewable energy source. Specific locations that may be chosen for these large-scale utility projects are unknown; however, it is likely that suitable locations would include areas that are highly developed with residential and commercial uses because of the size, massing, coverage, and scale of this type of infrastructure which relies upon large amounts of land unencumbered by buildings or shadowed by buildings or trees. Solar fields and wind turbines typically

require large swaths of land and may require multiple access points and/or new access roads.

Construction of energy related infrastructure would be localized and temporary. Although construction of energy infrastructure facilities and associated off-site improvements could occur within the roadway or along pedestrian and bicycle facilities potentially resulting in lane closures, minor detours, and/or delays due to the movement of construction vehicles and equipment, all projects within County right-of-way would be required to develop and implement a traffic control plan during construction to maintain a safe environment for all modes of transportation.

Once constructed, these projects would not have an impact on the operation of the circulation system. Implementation of CAP Update Actions E-1.1 and E-3.3 would not damage or alter any existing bicycle, pedestrian, or transit facilities resulting in an adverse effect to existing or planned facility usage and/or service. All projects would be subject to review by County staff to ensure all applicable regulations are met, and individual energy infrastructure projects would need to remain consistent with County policies, plans, and ordinances related to alternative transportation.

Future discretionary large-scale renewable energy projects would be required to be evaluated for project-specific impacts under CEQA at the time of application and project-specific mitigation would minimize or eliminate impacts related to conflicts with plans, policies, and regulations intended to manage circulation and the functionality of pedestrian and bicycle infrastructure to the extent feasible in compliance with State CEQA Guidelines Section 15126.4. Additionally, all large-scale renewable energy projects are required to obtain a Major Use Permit (MUP) which requires projects to undergo the County's discretionary review process. Therefore, implementation of these projects would not result in conflicts with programs, plans, policies, or ordinances addressing the circulation system.

Consistent with the 2011 GPU PEIR determinations, development of new or expanded energy infrastructure projects, including large-scale renewable energy projects, would be required to implement adopted General Plan goals and policies related to alternative transportation. Policy LU-5.5 ensures development does not impede bicycle or pedestrian facilities and that impacts to planned routes would occur, ensures that they are mitigated. Policy LU-9.8 requires that development within Villages include connected pedestrian routes and amenities. Policy M-3.1 requires development to dedicate right-of-way to adequately accommodate all users including transit riders, pedestrians, and bicyclists. Policy M-4.1 encourages multi-modal roads in Villages and residential areas to enhance pedestrian safety and walkability, along with other non-motorized modes of travel. Policy M-4.3 calls for the design and construction in Semi-Rural and Rural Lands to safely accommodate transit stops when deemed necessary, along with bicyclists, pedestrians, and equestrians. Policies M-8.3 through M-8.5 promotes the use of public transit including requiring development projects to improve existing nearby transit and/or park and ride facilities. Policy M-9.1 ensures that operational roadway improvements do not adversely impact transit, bicycle, and pedestrian networks. Policy M-10.1 requires development to provide bicycle parking facilities. Policy M-11.2 through M-11.4 requires development in

Villages and Rural Villages to incorporate site design and on-site amenities for alternate modes of transportation and provide comprehensive internal pedestrian and bicycle networks. There are no 2011 GPU PEIR mitigation measures that are applicable to this impact.

Therefore, potential impacts to alternative transportation would be less than significant through implementation of the applicable General Plan policies and completion of subsequent project-level planning and environmental review.

Built Environment and Transportation Measures and Actions

Implementation of the CAP Update would involve policies and programs to increase the use of alternative forms of transportation in the unincorporated county. Implementing CAP Update Actions T-3.1, T-5.1, and T-6.2 could result in the construction of new EVCSs, transit-supportive roadway treatments, and bicycle and pedestrian facilities.

Construction of roadway infrastructure projects such as bicycle, pedestrian, and transit improvement projects would be localized and temporary. Although construction within the roadway or along pedestrian and bicycle facilities could result in lane closures, minor detours, and/or hinder the movement of bicyclists and pedestrians, all projects within County right-of-way would be required to develop and implement a traffic control plan during construction to maintain a safe environment for all modes of transportation.

Once constructed, these projects would only enhance the environment for pedestrians and bicyclists by expanding facilities for alternative modes of transportation encouraging use and increasing safety. Additionally, implementation of CAP Update Actions T-3.1, T-5.1, and T-6.2 would not damage or alter any existing bicycle, pedestrian, or transit facilities resulting in an adverse effect to existing or planned facility usage and/or service. Alternatively, the implementation of CAP Update built environment and transportation measures and actions would benefit alternative transportation. All projects would be required to meet County design standards and would be subject to review by County staff to ensure all applicable regulations are met. Therefore, implementation of these projects would not result in conflicts with programs, plans, policies, or ordinances addressing the circulation system.

Consistent with the 2011 GPU PEIR determinations, development of new or expanded EVCSs, transit-supportive roadway treatments, and bicycle and pedestrian facilities would be required to implement adopted General Plan goals and policies related to alternative transportation. Policy LU-5.5 ensures development does not impede bicycle or pedestrian facilities and that impacts to planned routes would occur, ensures that they are mitigated. Policy LU-9.8 requires that development within Villages include connected pedestrian routes and amenities. Policy M-3.1 requires development to dedicate right-of-way to adequately accommodate all users including transit riders, pedestrians, and bicyclists. Policy M-4.1 encourages multi-modal roads in Villages and residential areas to enhance pedestrian safety and walkability, along with other non-motorized modes of travel. Policy M-4.3 calls for the design and construction in Semi-Rural and Rural Lands to safely accommodate transit stops when deemed necessary, along with bicyclists,

pedestrians, and equestrians. Policies M-8.3 through M-8.5 promotes the use of public transit including requiring development projects to improve existing nearby transit and/or park and ride facilities. Policy M-9.1 ensures that operational roadway improvements do not adversely impact transit, bicycle, and pedestrian networks. Policy M-9.4 requires developers of large development projects to provide, or to contribute to, park-and-ride facilities that are accessible to pedestrians and bicyclists and include bicycle lockers and transit stops whenever feasible. Policy M-10.1 requires development to provide bicycle parking facilities. Policy M-11.2 through M-11.4 requires development in Villages and Rural Villages to incorporate site design and on-site amenities for alternate modes of transportation and provide comprehensive internal pedestrian and bicycle networks. There are no 2011 GPU PEIR mitigation measures that are applicable to this impact.

Implementation of Policy LU-5.5 of the General Plan ensures development does not impede bicycle or pedestrian facilities and that if impacts to planned routes would occur, ensures that they are mitigated. Additionally, the implementation of transit-supportive roadway treatments and bicycle and pedestrian facilities would enhance the availability, efficiency, and safety of alternative transportation facilities while increasing the comfort of users. Therefore, potential impacts to alternative transportation would be beneficial through implementation of the applicable General Plan policies and completion of subsequent project-level planning and environmental review.

Summary

Based on the discussion above, implementation of solid waste, water and wastewater, agriculture and conservation, energy, and built environment and transportation measures and actions would result in a less-than-significant impact related to alternative transportation and the circulation system. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed the 2011 GPU PEIR.

2.13.3.4 Issue 2: Exceed Threshold for VMT

This section describes the effect of the CAP Update on countywide VMT.

Guidelines for Determination of Significance

Based on Appendix G of the State CEQA Guidelines, the County TSG, and the OPR Technical Advisory, the project would result in a significant impact if it would:

- conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b).

Impact Analysis

2011 GPU PEIR Determination

Section 15064.3 of the State CEQA Guidelines was adopted in December 2018 and provides that VMT is the “most appropriate measure of transportation impacts” and mandates analysis of VMT impacts effective July 1, 2020. Given that this change to the CEQA Guidelines occurred after certification of the 2011 GPU PEIR, the 2011 GPU PEIR

did not evaluate impacts to VMT. VMT was a metric used extensively in the transportation industry at the time the 2011 GPU PEIR was prepared, but its use was generally limited to highway cost allocation, determining user fee structures, and estimating air quality and GHG emissions; thus, VMT related to the build out of the General Plan was a known concept at the time. However, it was not the metric used to assess transportation impacts.

Because VMT was not estimated for the growth in the unincorporated county under the General Plan in the 2011 GPU PEIR, the VMT modeling of anticipated growth under the adopted General Plan prepared as part of the forecasting for the CAP Update is used in this analysis to understand anticipated VMT without the proposed project. VMT was modeled using an origin-destination method of modeling that was established by a CARB-appointed Regional Targets Advisory Committee to evaluate transportation plan consistency with SB 375 requirements and is based on the premise that each jurisdiction is responsible for the air emissions within its boundaries. This methodology is used throughout California and is the ICLEI (ICLEI-Local Governments for Sustainability) recommended methodology. Total VMT produced using this methodology includes all internal VMT, half of internal to external VMT, and half of external to internal VMT. For example, all VMT originating from trips that start and end in the unincorporated area are included. One half of the VMT that originates in the unincorporated county but ends in one of the region's cities is included and one half of the VMT that originates in one of the cities but ends in the unincorporated area is included.¹ No revisions to model outputs were made to reflect potential VMT reductions that would result from implementation of policies and actions in the adopted General Plan. In addition, adjustments were made to account for military and tribal land, which is not within the County's jurisdiction.

The most recent version of the SANDAG activity-based model (SANDAG ABM 2+) was used to calculate VMT associated with anticipated growth under the General Plan for the years 2035 and 2050. Table 2.13-2 provides the forecast VMT per resident and VMT per employee in comparison to the regional average VMT per resident and VMT per employee. The VMT per population metric is a transportation efficiency metric that is used to identify potential impacts associated with implementation of the General Plan and is consistent with CARB guidance. This metric helps depict whether people are traveling more or less by vehicle over time, across different areas, or across different planning scenarios.

As detailed in the Regulatory Setting, the TSG establishes VMT thresholds for large land use plans as 15 percent below the existing regional average VMT per resident and 15 percent below the existing regional average VMT per employee for residential and employment uses, respectively. As shown in Table 2.13-2, an increase in both unincorporated county VMT per employee and VMT per resident is anticipated under the General Plan; therefore, growth consistent with the General Plan would exceed the TSG thresholds for land use plans, and would result in a significant VMT impact.

¹ Note that this methodology differs from the VMT modeling typically applied to VMT analyses based on the *Technical Advisory on Evaluating Transportation Impacts in CEQA* released by the Governor's Office of Planning and Research in December 2018. A lead agency has discretion to choose the most appropriate methodology to evaluate a project's VMT, including whether to express the change in absolute terms, per capita, per household, and whether a qualitative or quantitative analysis is appropriate.

CAP Update Impact Analysis

The following sections describe the effects to VMT that could result from the implementation of the proposed GHG reduction measures and actions.

Solid Waste Measures and Actions

Implementation of the CAP Update would include implementation of measures and actions to increase solid waste diversion and availability of solid waste facilities in County operations and within the unincorporated county. Implementing CAP Update measures and actions (Actions SW-1.1, SW-2.1, SW-4.1a, and SW-4.1b) could result in potential construction of new or expanded solid waste facilities. Specific locations for new and expanded facilities have not been identified.

As noted above, VMT is a metric used to evaluate the amount of driving that would occur in a region, either in total or on a per capita basis. The types of projects with potential to increase VMT are those that establish a regional attractant, make driving single-occupancy vehicles more convenient (i.e., roadway widening), or increase total population. Implementation of the CAP Update Solid Waste Measures and Actions would not increase the number of residents or visitors in the unincorporated county. Operations and maintenance of expanded solid waste facilities may result in some additional employment opportunities; however, the increase would be minimal and, therefore, is not expected to result in a substantial increase in employee commute VMT.

Therefore, given the nature of the CAP Update Solid Waste Measures and Actions which would not increase residential or commercial uses and only result in minimal numbers of employees, potential impacts to VMT would be less than significant.

Water and Wastewater Measures and Actions

The CAP Update includes strategies to decrease potable water consumption and increase stormwater collection, water pumping, and wastewater treatment in County operations and the unincorporated county. Implementation of CAP Update Actions W-1.1, W-2.2, W-2.3, and W-2.4 would involve construction of new recycled water and stormwater capture and reuse infrastructure within the unincorporated county. Specifically, these actions would require existing and new development to meet water efficiency and conservation requirements through small-scale improvements with limited physical footprints, such as installing greywater capture systems for irrigation, installing recycled water pipelines, replacing existing landscaping with water-efficient landscaping, and installing rain barrels to collect stormwater.

Implementation of the CAP Update Water and Wastewater Measures and Actions would not increase the number of residents or visitors in the unincorporated county. Operations and maintenance of expanded water and wastewater facilities may result in some additional employment opportunities; however, the increase would be minimal and, therefore, is not expected to result in a substantial increase in employee commute VMT.

Consistent with the 2011 GPU PEIR determinations, development of new or expanded water and wastewater facilities would be required to implement adopted and applicable General Plan goals and policies related to alternative transportation. The implementation of Policy LU-5.5 ensures development does not impede bicycle or pedestrian facilities.

Therefore, given the nature of the CAP Update Water and Wastewater Measures and Actions which would not increase residential or commercial uses and only result in minimal numbers of employees, potential impacts to VMT would be less than significant.

Agriculture and Conservation Measures and Actions

Implementation of CAP Update Measures A-1 through A-4 would preserve natural and agricultural lands, improve land management practices, and support climate-friendly farming practices in the unincorporated county.

With the exception of Action A-4.1.b, implementation of these measures and actions, would not result in impacts to VMT because no new or expanded development would be anticipated from their associated agriculture and conservation activities. However, implementation of Action A-4.1.b would have the potential to result in new farmworker housing in the unincorporated county if opportunities to increase farmworker housing in the unincorporated area are identified. Implementation of new farmworker housing would be expected to reduce VMT by locating housing on-site or near agricultural lands where those residents would work, therefore reducing the distance farmworkers commute.

Modeling was conducted to evaluate VMT reductions from the implementation of CAP Update Measures and Actions that have the potential to affect VMT within the unincorporated county. Table 2.13-3 shows the potential VMT reductions associated with the implementation of the CAP Update agriculture and conservation measures and actions over time.

New or expanded roadways may be required to accommodate future farmworker housing. Consistent with the General Plan, development of new or expanded roadway projects associated with farmworker housing would be required to implement adopted General Plan goals and policies related to alternative transportation. Policy LU-5.5 ensures development does not impede bicycle or pedestrian facilities and that impacts to planned routes would occur, ensures that they are mitigated. Policy M-3.1 requires development to dedicate right-of-way to adequately accommodate all users including transit riders, pedestrians, and bicyclists. Policy M-4.3 calls for the design and construction in Semi-Rural and Rural Lands to safely accommodate transit stops when deemed necessary, along with bicyclists, pedestrians, and equestrians. Policies M-8.3 through M-8.5 promote the use of public transit including requiring development projects to improve existing nearby transit and/or park and ride facilities. Policy M-9.1 ensures that operational roadway improvements do not adversely impact transit, bicycle, and pedestrian networks. Policy M-11.2 through M-11.4 requires development in Villages and Rural Villages to incorporate site design and on-site amenities for alternate modes of transportation and provide comprehensive internal pedestrian and bicycle networks. There are no 2011 GPU PEIR mitigation measures that are applicable to this impact.

Overall, CAP Update agriculture and conservation measures and actions would reduce VMT in the unincorporated county by locating farmworker housing on or near worksites and reducing commute distance. Any new or expanded roadways to accommodate such housing would be required to implement applicable General Plan policies and develop mitigation as necessary to minimize any related impacts. Therefore, potential impacts related to VMT would be less than significant.

Energy Measures and Actions

Implementation of the CAP Update would involve strategies to increase building energy efficiency, renewable energy, and electrification in County operations and the unincorporated county. Implementing CAP Update Actions E-1.1 and E-3.3 would have the potential to result in construction of new infrastructure to promote renewable energy use and electrification.

Implementation of the CAP Update Energy Measures and Actions would not increase the number of residents or visitors in the unincorporated county. New roadways may be necessary to access large-scale renewable energy facilities, and operations and maintenance of these systems may result in some additional employment opportunities; however, the increase would be minimal and, therefore, is not expected to result in a substantial increase in employee commute VMT.

Therefore, given the nature of the CAP Update Energy Measures and Actions which would not increase residential or commercial uses and only result in minimal numbers of employees, potential impacts to VMT would be less than significant.

Built Environment and Transportation Measures and Actions

Implementation of the CAP Update would involve policies and programs to increase the use of alternative forms of transportation in the unincorporated county. Implementing CAP Update Actions T-3.1, T-4.1, T-4.1a, T-4.2, T-5.1, T-5.1a, T-5.1b, T-5.2, T-6.1, T-6.2, T-6.2a, T-6.2b, and T-6.3 could result in the construction of new transit-supportive roadway treatments and bicycle and pedestrian facilities, the implementation of transportation demand management programs to reduce the use of single occupancy vehicles, and educational initiatives to encourage increased alternative transportation in the unincorporated county.

Once implemented, these projects and efforts would increase the use of pedestrian and bicycle facilities as well as transit service by expanding facilities for alternative modes of transportation, increasing roadway safety, and providing incentives. The benefits these measures and actions would provide to alternative transportation would result in decreased vehicular use and, thus, reduced VMT.

Modeling was conducted to evaluate VMT reductions from the implementation of the Built Environment and Transportation Measures and Actions. Table 2.13-4 shows the potential reductions associated with implementation of the CAP Update built environment and transportation measures and actions over time.

Therefore, CAP Update built environment and transportation measures and actions would help reduce VMT in the unincorporated county by constructing new transit-supportive roadway treatments and bicycle and pedestrian facilities and implementing transportation demand management programs and educational initiatives to encourage increased alternative transportation use in the unincorporated county. Thus, potential impacts related to VMT would be less than significant.

Summary

Implementation of solid waste, water and wastewater, agriculture and conservation, energy, and built environment and transportation measures and actions under the CAP Update would result in a less-than-significant impact related to VMT. Therefore, implementation of the CAP Update **would not result in any new or substantially more severe impacts** beyond what was disclosed in the 2011 GPU PEIR.

2.13.3.5 Issue 3: Substantially Increase Hazards due to a Design Feature

This section describes impacts related to hazards because of a design feature with implementation of the project.

Guidelines for Determination of Significance

Appendix G of the State CEQA Guidelines establishes the following guidelines for determining significance of effects related to transportation hazards:

- substantially increase hazards because of a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).

In addition, the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Transportation and Traffic* (County of San Diego 2011) establishes the following guidelines for determining significance of effects related to transportation hazards:

- Design features/physical configurations of access roads may adversely affect the safe movement of all users along the roadway.
- The percentage or magnitude of increased traffic on the road due to the proposed project may affect the safety of the roadway.
- The physical conditions of the project site and surrounding area, such as curves, slopes, walls, landscaping or other barriers, may result in conflicts with other users or stationary objects.
- Conformance of existing and proposed roads to the requirements of the private or public road standards, as applicable.

- Design features/physical configurations on a road segment or at an intersection that may adversely affect the visibility of pedestrians or bicyclists to drivers entering and exiting the site, and the visibility of cars to pedestrians and bicyclists.
- The amount of pedestrian activity at the project access points that may adversely affect pedestrian safety.
- The preclusion or substantial hindrance of the provision of a planned bike lane or pedestrian facility on a roadway adjacent to the project site.
- The percentage or magnitude of increased traffic on the road due to the proposed project that may adversely affect pedestrian and bicycle safety.
- The physical conditions of the project site and surrounding area, such as curves, slopes, walls, landscaping or other barriers that may result in vehicle/pedestrian, vehicle/bicycle conflicts.
- Conformance of existing and proposed roads to the requirements of the private or public road standards, as applicable.
- The potential for a substantial increase in pedestrian or bicycle activity without the presence of adequate facilities.

Impact Analysis

2011 GPU PEIR Determination

As discussed in Section 2.15, “Transportation and Traffic,” the 2011 GPU PEIR evaluated impacts related to transportation design hazards with the adoption of the goals and policies contained within the General Plan and buildout of the unincorporated county at the planning horizon. The discussion of impacts, including those related to rural road safety, can be found in Section 2.15, “Transportation and Traffic” (pages 2.15-30 through 2.15-32), and is hereby incorporated by reference.

The 2011 GPU PEIR determined that the General Plan would result in the adoption of a Mobility Element network that includes existing roadways with horizontal and vertical curves that are sharper than existing standards. Additionally, it was determined that the General Plan could pose an increased risk to pedestrians and bicyclists by increasing and/or redistributing traffic patterns and would also have the potential to result in hazards from at-grade rail crossings. Thus, 2011 GPU PEIR determined that implementation of the General Plan would result in potentially significant impacts.

The 2011 GPU PEIR determined that the impacts to transportation hazards and rural road safety would be reduced through the implementation of a combination of federal, state, and local regulations; existing County regulatory processes; and adopted General Plan policies. The General Plan includes Policies LU-2.8, LU-6.10, M-4.3, M-4.4, M-4.5, and M-9.1, which are intended to reduce hazards associated with rural roadways. Additionally, the 2011 GPU PEIR determined that the impacts to transportation hazards would be further reduced with the implementation of Mitigation Measures Tra-1.3, Tra-1.4, Tra-1.6, and Tra-3.1. However, even with these programs in place, the impacts would not be

reduced to a less-than-significant level. The 2011 GPU PEIR identified additional mitigation measures that would reduce impacts to below a level of significance; however, the County determined that their implementation would be infeasible. These infeasible mitigation measures included requiring all roadway facilities with horizontal and vertical curves that are sharper than existing standards undergo construction improvements to be brought into compliance with existing safety standards and retrofitting all transportation facilities within the unincorporated county to provide safe bicycle and pedestrian movement corridors. Mitigation rejected as infeasible within the 2011 GPU PEIR is described in detail in Section 2.15, "Transportation and Traffic," on page 2.15-49.

CAP Impact Analysis

The following sections describe the effects of transportation hazards that could result from the implementation of the proposed CAP Update measures and actions.

Solid Waste Measures and Actions

Implementation of the CAP Update would include implementation of measures and actions to increase solid waste diversion and availability of solid waste facilities in County operations and in the unincorporated county. Implementing CAP Update measures and actions (Actions SW-1.1, SW-2.1, SW-4.1a, and SW-4.1b) could result in potential construction of new or expanded solid waste facilities and associated roadway improvements.

The CAP Update would apply to the entire unincorporated county. Construction transportation impacts would be localized and temporary; however, during construction of each project, traffic operations could be degraded. For this reason, the project would be required to follow all local protocols to ensure safety and minimize traffic disturbance during construction activities including the development of a traffic control plan for any work on a County-maintained roadway or in the County right-of-way. Additionally, future discretionary projects would be subject to review by County staff to ensure hazards during construction are minimized and that all safety standards are met.

Once constructed, these projects would not exacerbate inadequate road widths, or construct new roadways with sharp curves or inadequate sight distances. All projects would be required to meet County design standards and would be subject to review by County staff to ensure all applicable regulations are met. Therefore, implementation of these projects would not result in increased design hazards across the county's roadway network during operations.

Consistent with the 2011 GPU PEIR determinations, development of new or expanded solid waste facilities would be required to implement adopted General Plan goals and policies related to transportation hazards. Policy LU-2.8 requires measures that minimize impacts that are detrimental to human health and safety. Policy LU-5.5 would ensure that development projects would not impede non-motorized forms of travel. Policy LU-6.10 requires that development be located and designed to protect property and residents from the risks of natural and man-induced hazards. Within the Mobility Element, Goal M-4 encourages roads designed to be safe for all users and compatible with their context.

Policies M-4.3, M-4.4, and M-4.5 support this goal by requiring roads to have safe and adequate emergency access. Goal M-9 encourages the effective use of the existing transportation network. Policy M-9.1 supports this goal by encouraging operational improvements that do not adversely impact the transit, bicycle, and pedestrian networks. Policy M-11.7 promotes pedestrian and bicycle facility standards for facility design that are tailored to a variety of urban and rural contexts according to their location within or outside a Village or Rural Village.

Development associated with the County CAP also would be required to implement the following applicable mitigation measure identified in the 2011 GPU PEIR: Mitigation Measures Tra-1.3 and Tra-1.4. Mitigation Measure Tra-1.3 requires the implementation of County Public Road Standards during review of new development projects. Mitigation Measure Tra-1.4 involves the implementation and revisions as necessary of the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Transportation and Traffic* to evaluate adverse environmental effects of projects and require mitigation when significant impacts are identified.

Therefore, potential impacts to transportation hazards would be less than significant through implementation of the applicable General Plan policies and 2011 GPU PEIR mitigation measures; compliance with existing federal, state, and local requirements that regulate construction activities and design standards; and completion of subsequent project-level planning and environmental review.

Water and Wastewater Measures and Actions

The CAP Update includes strategies to decrease potable water consumption and increase stormwater collection, water pumping, and wastewater treatment in County operations and the unincorporated county. Implementation of CAP Update Actions W-1.1, W-2.2, W-2.3, and W-2.4 would involve construction of new recycled water and stormwater capture and reuse infrastructure within the unincorporated county. Specifically, these actions would require existing and new development to meet water efficiency and conservation requirements through small-scale improvements with limited physical footprints, such as installing greywater capture systems for irrigation, installing recycled water pipelines, replacing existing landscaping with water-efficient landscaping, and installing rain barrels to collect stormwater.

The CAP Update would apply to the entire unincorporated county. Construction transportation impacts would be localized and temporary; however, during construction of each project, traffic operations could be degraded. For this reason, the project would be required to follow all local protocols to ensure safety and minimize traffic disturbance during construction activities including the development of a traffic control plan for any work on a County-maintained roadway or in the County right-of-way. Additionally, future discretionary projects would be subject to review by County staff to ensure hazards during construction are minimized and that all safety standards are met.

Once constructed, these projects would not exacerbate inadequate road widths, or construct new roadways with sharp curves or inadequate sight distances. All projects would

be required to meet County design standards and would be subject to review by County staff to ensure all applicable regulations are met. Therefore, implementation of these projects would not result in increased design hazards across the county's roadway network during operations.

Consistent with the 2011 GPU PEIR determinations, construction of new recycled water and stormwater capture and reuse infrastructure also would be required to implement adopted General Plan goals and policies related to transportation hazards. Policy LU-2.8 requires measures that minimize impacts that are detrimental to human health and safety. Within the Mobility Element, Goal M-4 encourages roads designed to be safe for all users and compatible with their context. Policies M-4.3, M-4.4, and M-4.5 support this goal by requiring roads to have safe and adequate emergency access.

Additionally, development associated with the County CAP would be required to implement the following mitigation measures identified in the 2011 GPU PEIR: Mitigation Measures Tra-1.3 and Tra-1.4. Mitigation Measure Tra-1.3 requires the implementation of County Public Road Standards during review of new development projects. Mitigation Measure Tra-1.4 involves the implementation and revisions as necessary of the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Transportation and Traffic* to evaluate adverse environmental effects of projects and require mitigation when significant impacts are identified.

Therefore, potential impacts to transportation hazards would be less than significant through implementation of the applicable General Plan policies and 2011 GPU PEIR mitigation measures; compliance with existing federal, state, and local requirements that regulate construction activities and design standards; and completion of subsequent project-level planning and environmental review.

Agriculture and Conservation Measures and Actions

Implementation of CAP Update Measures A-1 through A-4 would preserve natural and agricultural lands, improve land management practices, and support climate-friendly farming practices in the unincorporated county.

Implementation of these actions, other than Action A-4.1.b, would not result in impacts to alternative transportation because no new or expanded development would be anticipated from their associated agriculture and conservation activities. However, implementation of Action A-4.1.b would have the potential to result in new farmworker housing in the unincorporated county if opportunities to increase farmworker housing in the unincorporated area are identified. It is anticipated that new farmworker housing would be low density and in proximity to existing agricultural operations, which are generally in more rural areas of the unincorporated county. The development of new farmworker housing would have the potential to result in the construction of new roadways which would be required to meet local design standards. Additionally, all projects would be subject to review by County staff to ensure all applicable regulations are met.

Once constructed, these projects would not exacerbate inadequate road widths, or construct new roadways with sharp curves or inadequate sight distances. All projects would be required to meet County design standards and would be subject to review by County staff to ensure all applicable regulations are met. Therefore, implementation of these projects would not result in increased design hazards across the county's roadway network during operations.

Consistent with the 2011 GPU PEIR determinations, development of new or expanded transportation facilities would be required to implement adopted General Plan goals and policies related to transportation hazards. Policy LU-2.8 requires measures that minimize impacts that are detrimental to human health and safety. Policy LU-5.5 would ensure that development projects would not impede non-motorized forms of travel. Policy LU-6.10 requires that development be located and designed to protect property and residents from the risks of natural and man-induced hazards. Within the Mobility Element, Goal M-4 encourages roads designed to be safe for all users and compatible with their context. Policies M-4.3, M-4.4, and M-4.5 support this goal by requiring roads to have safe and adequate emergency access. Goal M-9 encourages the effective use of the existing transportation network. Policy M-9.1 supports this goal by encouraging operational improvements that do not adversely impact the transit, bicycle, and pedestrian networks. Policy M-11.7 promotes pedestrian and bicycle facility standards for facility design that are tailored to a variety of urban and rural contexts according to their location within or outside a Village or Rural Village. Additionally, all construction projects occurring within County right-of-way would be required to obtain an encroachment and traffic control permit from the County Department of Public Works to ensure proper precautions are implemented during construction to maintain safety in and around each project site for all modes of transportation.

Construction and development associated with the County CAP would also be required to implement the following mitigation measures identified in the 2011 GPU PEIR: Mitigation Measures Tra-1.3 and Tra-1.4. Mitigation Measure Tra-1.3 requires the implementation of County Public Road Standards during review of new development projects. Mitigation Measure Tra-1.4 involves the implementation and revisions as necessary of the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Transportation and Traffic* to evaluate adverse environmental effects of projects and require mitigation when significant impacts are identified.

Therefore, potential impacts to transportation hazards would be less than significant through implementation of the applicable General Plan policies and 2011 GPU PEIR mitigation measures; compliance with existing federal, state, and local requirements that regulate construction activities and design standards; and completion of subsequent project-level planning and environmental review.

Energy Measures and Actions

Implementation of the CAP Update would involve strategies to increase building energy efficiency, renewable energy, and electrification in County operations and the

unincorporated county. Implementing CAP Update Actions E-1.1 and E-3.3 would have the potential to result in construction of new infrastructure to promote renewable energy use and electrification.

The implementation of new infrastructure related to energy including associated infrastructure such as roads and accessory uses could result in transportation hazards during construction. Typical construction activities would require the use of trucks, staging areas for supplies and equipment, parking for workers, and signage and grading. Construction transportation impacts would be localized and temporary; however, during construction of each project, traffic operations could be degraded.

For this reason, the project would be required to follow all local protocols to ensure safety and minimize disturbance to the transportation system during construction activities including the development of a traffic control plan for any work on a County-maintained roadway or in the County right-of-way. Additionally, future discretionary projects would be subject to review by County staff to ensure hazards during construction are minimized and that all safety standards are met.

As described above, implementation of CAP Update Action E-3.3 could indirectly result in the construction of new large-scale renewable energy systems, including large-scale PV solar, concentrated solar, and wind turbines. Because the amount of demand generated by such a program and the mix of renewable energy types that would be constructed to satisfy demand is unknown, this ~~draft~~ SEIR evaluates the potential for impacts at the program level.

Large-scale renewable energy infrastructure would generally be constructed in undeveloped locations that are productive for generating the renewable energy source. Specific locations that may be chosen for these large-scale utility projects are unknown; however, it is likely that suitable locations would include areas that are not highly developed with residential and commercial uses because of the size, massing, coverage, and scale of this type of infrastructure which relies upon large amounts of land unencumbered by buildings or shadowed by buildings or trees. Solar fields and wind turbines typically require large swaths of land and may require multiple access points and/or new access roads. Depending on the location of future projects, it is possible that road improvements would be required, however, all roadway improvements would be implemented in accordance with existing County regulations. The projects would be prohibited from placing any incompatible uses near roadways.

As described on pages 2.9-12 through 2.9-14 of the 2012 Wind Energy EIR, construction and operation of large turbine projects would result in less-than-significant impacts with regard to roadway design hazards because projects would be mitigated through the discretionary review process.

These projects would not exacerbate inadequate road widths or construct new roadways with sharp curves or inadequate sight distances. All projects would be required to meet County design standards and would be subject to review by County staff to ensure all applicable regulations are met. Future discretionary large-scale renewable energy

projects would be required to be evaluated for project-specific impacts under CEQA at the time of application and project-specific mitigation would minimize or eliminate impacts related to emergency access to the extent feasible in compliance with State CEQA Guidelines Section 15126.4. Additionally, all large-scale renewable energy projects are required to obtain an MUP, which requires projects to undergo the County's discretionary review process.

Consistent with the 2011 GPU PEIR determinations, development of new infrastructure to promote renewable energy use and electrification would be required to implement adopted General Plan goals and policies related to transportation hazards. Policy LU-2.8 requires measures that minimize impacts that are detrimental to human health and safety. Policy LU-5.5 would ensure that development projects would not impede non-motorized forms of travel. Policy LU-6.10 requires that development be located and designed to protect property and residents from the risks of natural and man-induced hazards. Within the Mobility Element, Goal M-4 encourages roads designed to be safe for all users and compatible with their context. Policies M-4.3, M-4.4, and M-4.5 support this goal by requiring roads to have safe and adequate emergency access.

Construction and development associated with the County CAP also would be required to implement the following mitigation measures identified in the 2011 GPU PEIR: Mitigation Measures Tra-1.3 and Tra-1.4. Mitigation Measure Tra-1.3 requires the implementation of County Public Road Standards during review of new development projects. Mitigation Measure Tra-1.4 involves the implementation and revisions as necessary of the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Transportation and Traffic* to evaluate adverse environmental effects of projects and require mitigation when significant impacts are identified.

Therefore, potential impacts to transportation hazards would be less than significant through implementation of the applicable General Plan policies and 2011 GPU PEIR mitigation measures; compliance with existing federal, state, and local requirements that regulate construction activities and design standards; and completion of subsequent project-level planning and environmental review.

Built Environment and Transportation Measures and Actions

Implementation of the CAP Update would involve policies and programs to increase the use of alternative forms of transportation in the unincorporated county. Implementing CAP Update Actions T-3.1, T-5.1, and T-6.2 could result in the construction of new EVCSs, transit-supportive roadway treatments, and bicycle and pedestrian facilities.

Construction of roadway infrastructure projects such as bicycle, pedestrian, and transit improvement projects would be localized and temporary; however, travel for all modes of transportation could be degraded due to vehicular lane closures, minor detours, and/or the movement of construction equipment. All projects within County right-of-way would be required to develop and implement a traffic control plan during construction to maintain a safe environment for all modes of transportation.

Once constructed, these projects would not exacerbate inadequate road widths, or construct new roadways with sharp curves or inadequate sight distances. All projects would be required to meet County design standards and would be subject to review by County staff to ensure all applicable regulations are met. Therefore, implementation of these projects would not result in increased design hazards across the county's roadway network during operations.

Consistent with the 2011 GPU PEIR determinations, development of new or expanded transportation facilities would be required to implement adopted General Plan goals and policies related to transportation hazards. Policy LU-2.8 requires measures that minimize impacts that are detrimental to human health and safety. Policy LU-5.5 would ensure that development projects would not impede non-motorized forms of travel. Policy LU-6.10 requires that development be located and designed to protect property and residents from the risks of natural and man-induced hazards. Within the Mobility Element, Goal M-4 encourages roads designed to be safe for all users and compatible with their context. Policies M-4.3, M-4.4, and M-4.5 support this goal by requiring roads to have safe and adequate emergency access. Goal M-9 encourages the effective use of the existing transportation network. Policy M-9.1 supports this goal by encouraging operational improvements that do not adversely impact the transit, bicycle, and pedestrian networks. Policy M-11.7 promotes pedestrian and bicycle facility standards for facility design that are tailored to a variety of urban and rural contexts according to their location within or outside a Village or Rural Village. Additionally, all construction projects occurring within County right-of-way would be required to obtain an encroachment and traffic control permit from the County Department of Public Works to ensure proper precautions are implemented during construction to maintain safety in and around each project site for all modes of transportation.

Construction and development associated with the County CAP also would be required to implement the following mitigation measures identified in the 2011 GPU PEIR: Mitigation Measures Tra-1.3 and Tra-1.4. Mitigation Measure Tra-1.3 requires the implementation of County Public Road Standards during review of new development projects. Mitigation Measure Tra-1.4 involves the implementation and revisions as necessary of the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Transportation and Traffic* to evaluate adverse environmental effects of projects and require mitigation when significant impacts are identified.

Therefore, potential impacts to transportation hazards would be less than significant through implementation of the applicable General Plan policies and 2011 GPU PEIR mitigation measures; compliance with existing federal, state, and local requirements that regulate construction activities and design standards; and completion of subsequent project-level planning and environmental review.

Summary

Based on the discussion above, implementation of solid waste, water and wastewater, agriculture and conservation, energy, and built environment and transportation measures

and actions under the CAP Update would result in a less-than-significant impact with mitigation incorporated related to transportation hazards. The 2011 GPU PEIR concluded that the impact related to transportation hazards would be significant and unavoidable. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed the 2011 GPU PEIR.

2.13.3.6 Issue 4: Result in Inadequate Emergency Access

This section describes potential project impacts related to emergency access with implementation of the project.

Guidelines for Determination of Significance

Based on Appendix G of the State CEQA Guidelines and the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Transportation and Traffic* (County of San Diego 2011), the project would result in a significant impact if it would:

- result in inadequate emergency access.

Impact Analysis

2011 GPU PEIR Determination

As discussed in Section 2.15, “Transportation and Traffic,” the 2011 GPU PEIR evaluated impacts related to emergency access with the adoption of the goals and policies contained within the General Plan and buildout of the unincorporated county at the planning horizon. The discussion of impacts can be found in Section 2.15, “Transportation and Traffic” (pages 2.15-32 through 2.15-34) and is hereby incorporated by reference.

The 2011 GPU PEIR determined that the under the General Plan, existing inadequate roadway widths, dead end roads, one-way roads, and gated communities would continue to occur in the unincorporated county, all of which have the potential to impair emergency access. Thus, 2011 GPU PEIR determined that implementation of the General Plan would result in a potentially significant impact to emergency access.

The 2011 GPU PEIR determined that the impacts to emergency access would be reduced through the implementation of a combination of federal, state, and local regulations; existing County regulatory processes; and adopted General Plan policies. The General Plan includes Policies LU-2.8, LU-6.10, LU-12.2, M-1.2, M-3.3, M-4.4, S-3.4, S-3.5, and S-14.1, which are intended to reduce impacts associated with the provision of emergency access. Additionally, the 2011 GPU PEIR determined that the impacts to emergency access would be further reduced with the implementation of Mitigation Measures Tra-4.1, Tra-4.2, Tra-4.3, and Tra-4.4. Impacts to emergency access were determined to be less than significant with implementation of adopted General Plan policies and the 2011 GPU PEIR mitigation measures referenced above.

CAP Impact Analysis

The following sections describe the effects to emergency access that could result from the implementation of the proposed CAP Update measures and action.

Solid Waste Measures and Actions

Implementation of the CAP Update would include implementation of measures and actions to increase solid waste diversion and availability of solid waste facilities in County operations and in the unincorporated county. Implementing CAP Update Actions SW-1.1, SW-2.1, SW-4.1a, and SW-4.1b could result in potential construction of new or expanded solid waste facilities.

The CAP Update would apply to the entire unincorporated county. Construction transportation impacts would be localized and temporary; however, during construction of each project, traffic operations could be degraded including emergency vehicle access. For this reason, the project would be required to follow all local protocols to ensure safety and minimize traffic disturbance during construction activities including the development of a traffic control plan for any work on a County-maintained roadway or in the County right-of-way. Additionally, future discretionary projects would be subject to review by County and emergency service staff to ensure emergency access is maintained.

All projects would be required to meet County design standards and would be subject to review by County staff and applicable emergency service agencies to ensure all applicable regulations related to emergency access are met. Therefore, implementation of these projects would not result in inadequate emergency access across the county's roadway network during operations.

Consistent with the 2011 GPU PEIR determinations, development of new or expanded solid waste facilities would be required to implement adopted General Plan goals and policies related to emergency access. Policy LU-2.8 requires measures that minimize impacts that are detrimental to human health and safety. Policy LU-6.10 requires that development be located and designed to protect property and residents from the risks of natural and man-induced hazards. Policy M-1.2 calls for an interconnected road network that provides both primary and secondary access/egress routes that support emergency services during fire and other emergencies. Policy M-4.4 requires that the design and construction of public and private roads allows for access of fire apparatus and emergency vehicles while accommodating outgoing vehicles from evacuating residents. Policy S-4.5 requires development to provide additional access roads where feasible to provide for safe access of emergency equipment and civilian evacuation concurrently to meet state and San Diego County Consolidated Fire Codes. Policy S-16.1 requires development to provide vehicular connections that reduce response times and facilitate access for law enforcement personnel, whenever feasible.

Development associated with the County CAP also would be required to implement the following mitigation measures identified in the 2011 GPU PEIR: Mitigation Measures Tra-1.3, Tra-1.4, and Tra-4.4. Mitigation Measure Tra-1.3 requires the implementation of

County Public Road Standards during review of new development projects. Mitigation Measure Tra-1.4 involves the implementation and revisions as necessary of the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Transportation and Traffic* to evaluate adverse environmental effects of projects and require mitigation when significant impacts are identified. Mitigation Measure Tra-4.4 requires the implementation and revisions as necessary of the Subdivision Ordinance to ensure that proposed subdivisions meet current design and accessibility standards.

Therefore, potential impacts to emergency access would be less than significant through implementation of the applicable General Plan policies and 2011 GPU PEIR mitigation measures; compliance with existing federal, state, and local requirements that regulate construction activities and design standards; and completion of subsequent project-level planning and environmental review.

Water and Wastewater Measures and Actions

The CAP Update includes strategies to decrease potable water consumption and increase stormwater collection, water pumping, and wastewater treatment in County operations and the unincorporated county. Implementation of CAP Update Actions W-1.1, W-2.2, W-2.3, and W-2.4 would involve construction of new recycled water and stormwater capture and reuse infrastructure within the unincorporated county. Specifically, these actions would require existing and new development to meet water efficiency and conservation requirements through small-scale improvements with limited physical footprints, such as installing greywater capture systems for irrigation, installing recycled water pipelines, replacing existing landscaping with water-efficient landscaping, and installing rain barrels to collect stormwater.

The CAP Update would apply to the entire unincorporated county. Construction transportation impacts would be localized and temporary; however, during construction of each project, emergency access could be degraded due to the obstruction of roadways if not adequately planned for. For this reason, the project would be required to follow all local protocols to ensure safety and minimize traffic disturbance during construction activities including the development of a traffic control plan for any work on a County-maintained roadway or in the County right-of-way. Additionally, future discretionary projects would be subject to review by County staff to ensure emergency access is maintained during construction and that all safety standards are met.

Additionally, all projects would be required to meet County design standards and would be subject to review by County staff and applicable emergency service agencies to ensure all applicable regulations related to emergency access are met. Therefore, implementation of these projects would not result in inadequate emergency access across the county's roadway network during operations.

Consistent with the 2011 GPU PEIR determinations, development of new or expanded water and wastewater facilities would be required to implement adopted General Plan goals and policies related to emergency access. Policy LU-2.8 requires measures that

minimize impacts that are detrimental to human health and safety. Policy LU-6.10 requires that development be located and designed to protect property and residents from the risks of natural and man-induced hazards. Policy M-1.2 calls for an interconnected road network that provides both primary and secondary access/egress routes that support emergency services during fire and other emergencies. Policy M-4.4 requires that the design and construction of public and private roads allows for access of fire apparatus and emergency vehicles while accommodating outgoing vehicles from evacuating residents. Policy S-4.5 requires development to provide additional access roads where feasible to provide for safe access of emergency equipment and civilian evacuation concurrently to meet state and San Diego County Consolidated Fire Codes. Policy S-16.1 requires development to provide vehicular connections that reduce response times and facilitate access for law enforcement personnel, whenever feasible.

Development associated with the County CAP also would be required to implement the following mitigation measures identified in the 2011 GPU PEIR: Mitigation Measures Tra-1.3 and Tra-1.4. Mitigation Measure Tra-1.3 requires the implementation of County Public Road Standards during review of new development projects. Mitigation Measure Tra-1.4 involves the implementation and revisions as necessary of the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Transportation and Traffic* to evaluate adverse environmental effects of projects and require mitigation when significant impacts are identified. Implementation of these policies and mitigation measures would ensure that emergency access is maintained during construction and operation of future required to implement the CAP Update. Therefore, potential impacts to emergency access would be less than significant through implementation of the applicable General Plan policies and 2011 GPU PEIR mitigation measures; compliance with existing federal, state, and local requirements that regulate construction activities and design standards; and completion of subsequent project-level planning and environmental review.

Agriculture and Conservation Measures and Actions

Implementation of CAP Update Measures A-1 through A-4 would involve acquiring and managing conservation lands, planting and protecting trees, and providing incentives to encourage carbon farming. These measures would result in the preservation of natural and agricultural lands in the unincorporated county. Implementation of these measures would not result in impacts to emergency access because no new or expanded development would be anticipated from those agriculture and conservation activities. However, implementation of Action A-4.1.b would have the potential to result in new farmworker housing in the unincorporated county if opportunities to increase farmworker housing in the unincorporated area are identified. It is anticipated that new farmworker housing would be low density and in proximity to existing agricultural operations, which are generally in more rural areas of the unincorporated county. The development of new farmworker housing would have the potential to result in the construction of new roadways which would be required to meet local design standards. All projects would be subject to review by County staff to ensure all applicable regulations are met.

Thus, there would be no change to the existing roadway network as a result of implementing CAP Update Measures A-1 through A-4. Therefore, no impacts to emergency access would occur.

Energy Measures and Actions

Implementation of the CAP Update would involve development of policies and programs to increase building energy efficiency, increase the use of renewable energy, and increase electrification in the unincorporated county and County operations. Implementing CAP Update Actions E-1.1 and E-3.3 would have the potential to result in development of various renewable energy projects including energy efficiency retrofits on existing residential and non-residential structures and County facilities as well as new large-scale renewable energy systems including solar PV, solar concentrator, and wind turbines.

The CAP Update would apply to the entire unincorporated county. Construction transportation impacts would be localized and temporary; however, during construction of each project, traffic operations could be degraded including emergency vehicle access. For this reason, the project would be required to follow all local protocols to ensure safety and minimize traffic disturbance during construction activities including the development of a traffic control plan for any work on a County-maintained roadway or in the County right-of-way. Additionally, future discretionary projects would be subject to review by County and emergency service staff to ensure emergency access is maintained.

As described in detail above in Section 2.13.3.3, implementation of CAP Update Action E-3.3 could result in the construction of new large-scale renewable energy systems, including large-scale PV solar, concentrated solar, and wind turbines. Because the amount of demand generated by such a program and the mix of renewable energy types that would be constructed to satisfy demand is unknown, this draft SEIR evaluates the potential for impacts at the program level.

Large-scale renewable energy infrastructure would generally be constructed in undeveloped locations that are productive for generating renewable energy sources. Specific locations that may be chosen for these large-scale utility projects are unknown; however, it is likely that suitable locations would include areas that are not highly developed with residential and commercial uses because of the size, massing, coverage, and scale of this type of infrastructure which relies upon large amounts of land unencumbered by buildings or shadowed by buildings or trees. Solar fields and wind turbines typically require large swaths of land and may require multiple access points and/or new access roads.

As described on pages 2.9-14 through 2.9-15 of the 2012 Wind Energy EIR, construction and operation of large turbine projects would result in less-than-significant impacts regarding emergency access because projects would be mitigated through the discretionary review process.

Future discretionary large-scale renewable energy projects would be required to be evaluated for project-specific impacts under CEQA at the time of application and project-specific mitigation would minimize or eliminate impacts related to emergency access to the extent feasible in compliance with State CEQA Guidelines Section 15126.4. Additionally, all large-scale renewable energy projects are required to obtain an MUP which requires projects to undergo the County's discretionary review process. Therefore, implementation of these projects would not result in inadequate emergency access across the county's roadway network.

Consistent with the 2011 GPU PEIR determinations, development of new infrastructure to promote renewable energy use and electrification would be required to implement adopted General Plan goals and policies related to emergency access. Policy LU-2.8 requires measures that minimize impacts that are detrimental to human health and safety. Policy LU-6.10 requires that development be located and designed to protect property and residents from the risks of natural and man-induced hazards. Policy M-1.2 calls for an interconnected road network that provides both primary and secondary access/egress routes that support emergency services during fire and other emergencies. Policy M-4.4 requires that the design and construction of public and private roads allows for access of fire apparatus and emergency vehicles while accommodating outgoing vehicles from evacuating residents. Policy S-4.5 requires development to provide additional access roads where feasible to provide for safe access of emergency equipment and civilian evacuation concurrently to meet state and San Diego County Consolidated Fire Codes. Policy S-16.1 requires development to provide vehicular connections that reduce response times and facilitate access for law enforcement personnel, whenever feasible.

Development associated with the County CAP also would be required to implement the following mitigation measures identified in the 2011 GPU PEIR: Mitigation Measures Tra-1.3 and Tra-1.4. Mitigation Measure Tra-1.3 requires the implementation of County Public Road Standards during review of new development projects. Mitigation Measure Tra-1.4 involves the implementation and revisions as necessary of the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Transportation and Traffic* to evaluate adverse environmental effects of projects and require mitigation when significant impacts are identified.

Implementation of these policies and mitigation measures would ensure that emergency access is maintained during construction and operation of future projects required to implement the CAP Update.

Therefore, potential impacts to emergency access would be less than significant with implementation of the applicable General Plan policies and 2011 GPU PEIR mitigation measures; compliance with existing federal, state, and local requirements that regulate construction activities and design standards; and completion of subsequent project-level planning and environmental review.

Built Environment and Transportation Measures and Actions

Implementation of the CAP Update would involve policies and programs to increase the use of alternative forms of transportation in the unincorporated county. Implementing CAP Update Actions T-3.1, T-5.1, and T-6.2 could result in the construction of new EVCSs, transit-supportive roadway treatments, and bicycle and pedestrian facilities. Implementation of roadway infrastructure projects such as bicycle, pedestrian, EVCS, and transit projects may result in temporary construction-related impacts or minor detours but would not result in conflicts or impediments to emergency access within the county. These projects would also not exacerbate inadequate road widths, result in dead-end roads, one-way roads, or gated communities, nor would they result in any other obstruction to emergency access. The intent of the projects would be to provide expanded or new multi-modal transportation infrastructure that would accommodate non-automotive forms of transportation and reduce the number of vehicles on the road; therefore, fewer vehicles traveling along the roadway network may be beneficial to emergency access.

Additionally, all construction projects occurring within County right-of-way would be required to obtain an encroachment and traffic control permit from the County Department of Public Works to ensure proper precautions are implemented during construction to maintain emergency access in and around each project site. Furthermore, all development projects and associated off-site improvements would be required to meet the standards and regulations identified in the County Fire Code pertaining to the design of roadways and emergency access. All projects would be required to meet County design standards and would be subject to review by County staff and applicable emergency service agencies to ensure all applicable regulations related to emergency access are met. Therefore, implementation of these projects would not result in inadequate emergency access across the county's roadway network during operations.

Consistent with the 2011 GPU PEIR determinations, development of new transportation infrastructure would be required to implement adopted General Plan goals and policies related to emergency access. Policy LU-2.8 requires measures that minimize impacts that are detrimental to human health and safety. Policy LU-6.10 requires that development be located and designed to protect property and residents from the risks of natural and man-induced hazards. Policy M-1.2 calls for an interconnected road network that provides both primary and secondary access/egress routes that support emergency services during fire and other emergencies. Policy M-4.4 requires that the design and construction of public and private roads allows for access of fire apparatus and emergency vehicles while accommodating outgoing vehicles from evacuating residents. Policy S-4.5 requires development to provide additional access roads where feasible to provide for safe access of emergency equipment and civilian evacuation concurrently to meet state and San Diego County Consolidated Fire Codes. Policy S-16.1 requires development to provide vehicular connections that reduce response times and facilitate access for law enforcement personnel, whenever feasible.

Development associated with the County CAP also would be required to implement the following mitigation measures identified in the 2011 GPU PEIR: Mitigation Measures Tra-1.3 and Tra-1.4. Mitigation Measure Tra-1.3 requires the implementation of County Public

Road Standards during review of new development projects. Mitigation Measure Tra-1.4 involves the implementation and revisions as necessary of the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Transportation and Traffic* to evaluate adverse environmental effects of projects and require mitigation when significant impacts are identified. Implementation of these policies and mitigation measures would ensure that emergency access is maintained during construction and operation of future projects that implement the CAP Update.

Therefore, potential impacts to emergency access would be less than significant through implementation of the applicable General Plan policies and 2011 GPU PEIR mitigation measures; compliance with existing federal, state, and local requirements that regulate construction activities and design standards; and completion of subsequent project-level planning and environmental review.

Summary

Based on the discussion above, implementation of solid waste, water and wastewater, agriculture and conservation, energy, and built environment and transportation measures and actions that would be implemented under the CAP Update would result in a less-than-significant impact with mitigation incorporated related to emergency access. The 2011 GPU PEIR concluded that the impact related to emergency access would be less than significant. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed the 2011 GPU PEIR.

2.13.3.7 Cumulative Impact Analysis

The cumulative impact analysis study area for transportation in the 2011 GPU PEIR includes traffic from projects on tribal land and in adjacent cities, as well as projects proposed in the general plans of surrounding jurisdictions. The cumulative environmental setting has been updated from the 2011 GPU PEIR and is based on the development forecasts in SANDAG's 2021 Regional Plan (SANDAG 2021). Therefore, the study area for this cumulative transportation impact analysis is the SANDAG region, which encompasses the unincorporated areas and 18 incorporated cities that make up the entire County of San Diego. The scope and approach to the cumulative impact analysis are described in the "Cumulative Impact Assessment Overview" section in the introduction to this chapter.

Issue 1: Conflict with a Program, Plan, Ordinance, or Policy Addressing the Circulation System

Impacts would be cumulative in nature if construction or operational impacts associated with cumulative regional land use projects combined with the CAP Update measures and actions to conflict with plans, ordinances, or policies related to alternative transportation. The 2011 GPU PEIR concluded that cumulative development would result in less than significant cumulative impacts related to conflict with plans, ordinances, or policies related to alternative transportation.

Implementation of the projects associated with CAP Update measures and actions related to solid waste, water and wastewater, and energy would not have an impact on operation of the circulation system because they would not substantially alter or damage the existing roadway network. CAP Update measures and actions within the built environment and transportation category would enhance alternative transportation facilities; and would therefore, be beneficial to alternative transportation including bicyclists, pedestrians, and transit riders. However, during construction of each project, traffic operations could be degraded. For this reason, all projects would be required to follow local protocols to ensure safety and minimize traffic disturbance during construction activities including the development of a traffic control plan for any work on a County-maintained roadway or in the County right-of-way. Large-scale energy projects also could result in the need for new access roadways; however, design and construction of such new or expanded roadways would be compliant with relevant General Plan policies and other local regulations. Additionally, individual projects associated with the CAP Update would be required to be evaluated for project-specific impacts under CEQA at the time of application and would be required to comply with existing federal, state, and local regulations.

Further, with implementation of the applicable General Plan policies and 2011 GPU PEIR mitigation measures; compliance with existing federal, state, and local regulations that regulate transportation; and completion of subsequent project-level planning and environmental review, cumulative impacts related to alternative transportation plans, ordinances, and policies would be less than significant.

Similar to the conclusions of the 2011 GPU PEIR, implementation of the CAP Update would not result in a substantial incremental effect that would result in a new significant cumulative impact related to conflicts with plans, ordinances, or policies addressing the circulation system. The CAP Update **would not result in new or more severe impacts** compared to the 2011 GPU PEIR.

Issue 2: Exceed Threshold for VMT

Cumulative VMT was not evaluated in the 2011 GPU PEIR. As detailed in Section 2.13.3.4, although the 2011 GPU PEIR did not evaluate VMT as a CEQA impact, VMT was a known metric that was used for a variety of purposes including forecasting GHG emissions from growth anticipated under the adopted General Plan. As shown in Table 2.13-2, under cumulative conditions (2050), build out of the General Plan exceeds the County's threshold for cumulative VMT which is 15 percent below existing regional VMT per capita and per employee (County of San Diego 2022: 27).

VMT is inherently a cumulative issue; thus, if an impact is not expected to substantially affect VMT at the project level, it can be presumed to result in a less than cumulatively considerable impact. As detailed in the OPR Technical Advisory, "a project that falls below an efficiency-based threshold that is aligned with long-term environmental goals and relevant plans would have no cumulative impact distinct from the project impact. Accordingly, a finding of a less-than-significant project impact would imply a less than significant cumulative impact, and vice versa" (OPR 2018: 6). Although the general plan

modeling indicates the per capita and per employee VMT would exceed thresholds established by the County (Table 2.13-2), the CAP Update measures and actions would not contribute to regional VMT. CAP Update agriculture and conservation and built environment and transportation measures and actions would result in quantifiable reductions in VMT in the unincorporated county. Therefore, the CAP Update **would not result in new or more severe impacts** compared to the 2011 GPU PEIR.

Issue 3: Substantially Increase Hazards Due to a Design Feature

The 2011 GPU PEIR concluded that cumulative development would result in significant cumulative impacts related to transportation hazards. The 2011 GPU PEIR concluded transportation impacts related to design hazards would be significant and unavoidable even with implementation of General Plan policies and 2011 GPU PEIR mitigation measures because the county's roadway network contains roads that do not meet existing roadway standards.

As discussed above, CAP Update measures and actions would result in new or expanded development of solid waste, wastewater, energy, and transportation infrastructure. Additionally, alternative transportation projects such as bicycle, pedestrian, and transit-supportive roadway improvements would result in some construction-related impacts but would enhance the overall functionality of the transportation network. Further, with implementation of the applicable General Plan policies and 2011 GPU PEIR mitigation measures; compliance with existing federal, state, and local regulations that regulate transportation; and completion of subsequent project-level planning and environmental review, impacts from CAP Update implementation related to transportation hazards would be less than significant. Accordingly, implementation of the CAP Update would not result in a considerable contribution to cumulative transportation hazards impacts and **would not result in new or more severe impacts** compared to the 2011 GPU PEIR.

Issue 4: Result in Inadequate Emergency Access

Impacts would occur if the CAP Update, in combination with cumulative development, combined to create multiple obstructions to emergency access along the same road. The 2011 GPU PEIR concluded that cumulative impacts related to emergency access resulting from buildout of the General Plan would be less than significant with implementation of the adopted General Plan policies and 2011 GPU PEIR mitigation measures listed above.

As discussed above, CAP Update measures and actions would result in new or expanded development of solid waste, wastewater, energy, and transportation infrastructure. However, all projects related to the CAP would be required to meet state and local regulations related to emergency access and design. Additionally, all development projects would be subject to review by applicable emergency service agencies to ensure emergency access is maintained during construction and operations. Further, with implementation of the applicable General Plan policies and 2011 GPU PEIR mitigation measures; compliance with existing federal, state, and local regulations that regulate transportation; and completion of subsequent project-level planning and environmental

review, impacts related to emergency access would be less than significant. Similar to the conclusions of the 2011 GPU PEIR, implementation of the CAP Update would not result in a substantial incremental effect that would result in a new significant cumulative impact related to emergency access. The impact **would not result in new or more severe impacts** compared to the 2011 GPU PEIR.

2.13.4 Summary of New or More Severe Significant Impacts

Implementation of the CAP Update would not result in new or more severe significant impacts related to transportation.

2.13.5 Mitigation Measures

2.13.5.1 Issue 1: Conflict with a Program, plan, Ordinance or Policy Addressing the Circulation System

Implementation of solid waste, water and wastewater, agriculture and conservation, energy, and built environment and transportation measures and actions would result in a less-than-significant impact related to alternative transportation and the circulation system. No mitigation measures are required.

2.13.5.2 Issue 2: Exceed Threshold for VMT

Implementation of solid waste, water and wastewater, agriculture and conservation, energy, and built environment and transportation measures and actions under the CAP Update would result in a less-than-significant impact related to VMT. No mitigation measures are required.

2.13.5.3 Issue 3: Substantially Increase Hazards due to a Design Feature

The following adopted 2011 GPU PEIR mitigation measures are applicable to the project:

Adopted Mitigation Measure Tra-1.3: Implement the County Public Road Standards during review of new development projects. Also revise the Public Road Standards to include a range of road types according to Regional Category context.

Adopted Mitigation Measure Tra-1.4: Implement and revise as necessary the County Guidelines for Determining Significance for Transportation and Traffic to evaluate adverse environmental effects of projects and require mitigation when significant impacts are identified.

2.13.5.4 Issue 4: Result in Inadequate Emergency Access

The following adopted 2011 GPU PEIR mitigation measures are applicable to the project:

Adopted Mitigation Measure Tra-1.3: Implement the County Public Road Standards during review of new development projects. Also revise the Public Road Standards to include a range of road types according to Regional Category context.

Adopted Mitigation Measure Tra-1.4: Implement and revise as necessary the County Guidelines for Determining Significance for Transportation and Traffic to evaluate adverse environmental effects of projects and require mitigation when significant impacts are identified.

Adopted Mitigation Measure Tra-4.4: Implement and revise as necessary the Subdivision Ordinance to ensure that proposed subdivisions meet current design and accessibility standards.

2.13.6 Significance Conclusions

2.13.6.1 Issue 1: Conflict with a Program, Plan, Ordinance, or Policy Addressing the Circulation System

As described above in Sections 2.13.3.3 and 2.13.3.7, measures and actions that would be implemented under the CAP Update would result in a **less-than-significant impact** related to conflict with programs, plans, ordinances, or policies addressing the circulation system and **would not result in a considerable contribution** to a significant cumulative impact on programs, plans, ordinances, or policies addressing the circulation system. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed the 2011 GPU PEIR.

2.13.6.2 Issue 2: Exceed Threshold for VMT

As described above in Sections 2.13.3.4 and 2.13.3.7, measures and actions that would be implemented under the CAP Update would result in a **less-than-significant impact** related to the VMT and **would not result in a considerable contribution** such that a new significant cumulative impact related to VMT would occur. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed the 2011 GPU PEIR.

2.13.6.3 Issue 3: Substantially Increase Hazards Due to a Design Feature

As described above in Sections 2.13.3.5 and 2.13.3.7, measures and actions that would be implemented under the CAP Update would result in a **less-than-significant impact** related to transportation hazards and **would not result in a considerable contribution** to a significant cumulative impact related to transportation hazards. Implementation of the

CAP Update **would not result in new or more severe impacts** than disclosed the 2011 GPU PEIR.

2.13.6.4 Issue 4: Result in Inadequate Emergency Access

As described above in Sections 2.13.3.6 and 2.13.3.7, measures and actions that would be implemented under the CAP Update would result in a **less-than-significant impact** related to emergency access and **would not result in a considerable contribution** to a significant cumulative impact related to emergency access. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed the 2011 GPU PEIR.

Table 2.13-2 VMT for County General Plan

	Regional VMT per Employee	Unincorporated County VMT per Employee	Threshold (15% below Regional Average VMT)
2035	19.6	23.9	16.66
2050	19.8	24.5	16.83
	Regional VMT per Resident	Unincorporated County VMT per Resident	Threshold (15% below Regional Average VMT)

2.14 Tribal Cultural Resources

This section provides a discussion of existing conditions for tribal cultural resources (TCRs) located within the county, and the potential effects that implementation of the project may have on these resources. TCRs were established as a new class of resources under CEQA with the passage of Assembly Bill (AB) 52 in September 2014 and were added to the list of resources that require analysis under CEQA on July 1, 2015. The 2011 GPU PEIR did not evaluate TCRs, because there was no requirement to consult with tribes to identify TCRs at that time. Nevertheless, because this analysis is subsequent to the adopted 2011 GPU PEIR, the evaluation of impacts focuses on the potential for implementation of the CAP Update to result in new or substantially more severe impacts than presented in the 2011 GPU PEIR, given the changes to the General Plan proposed by the CAP Update and changes in environmental and regulatory conditions that have occurred since certification of the GPU PEIR.

Table 2.14-1 summarizes the impact conclusions reached in the 2011 GPU PEIR and identifies if a new or more severe significant impact would occur with implementation of the proposed project. As indicated below, implementation of the proposed project would result in new or more severe significant impacts related to TCRs.

Table 2.14-1 Summary of Tribal Cultural Resources–Related Impacts

Issue Number	Issue Topic	Determination from 2011 GPU PEIR	CAP Update SEIR Determination	
			New or More Severe Significant Impact Prior to Mitigation	New or More Severe Significant Impact After Mitigation
1	Tribal Cultural Resources	General Plan Only: Not Analyzed	CAP Update Only: Yes	CAP Update Only: Yes
		General Plan Cumulative Contribution: Not Analyzed	CAP Update Cumulative Contribution: Yes	CAP Update Cumulative Contribution: Yes

Notes: CAP = Climate Action Plan; GPU = General Plan Update; PEIR = Program Environmental Impact Report; SEIR = Supplemental Environmental Impact Report.

Source: Compiled by Ascent Environmental in 2023.

Two comment letters regarding cultural resources were received in response to the Notice of Preparation (NOP). The San Pasqual Band of Mission Indians and the Rincon Band of Luiseño Indians requested tribal monitoring for activities in traditional use areas. Copies of the NOP and comment letters received in response to the NOP are included in Appendix A of this draft SEIR.

2.14.1 Existing Conditions

The definition of “tribal cultural resources” in the CEQA statute (Section 21074) includes sites, features, places, cultural landscapes, sacred places, and objects of cultural value that are either included in or eligible for listing on the California Register of Historical

Resources (CRHR), included in a local register of historical resources, or determined by the lead agency to be significant based on substantial evidence. They may include:

- **Resource Collection Location:** This is a location where Native Americans have historically gone, and are known or believed to go today, to collect resources in accordance with traditional cultural rules of practice.
- **Spiritual Location:** This is a location where Native American religious practitioners have historically gone, and are known or believed to go today, to perform ceremonial activities in accordance with traditional cultural rules of practice.
- **Traditional Location:** This is a location associated with the traditional beliefs of a Native American group about its origins, its cultural history, or the nature of the world.
- **Cemetery:** A cemetery is a location that has been selected for human burial or interment.

Additionally, different types of archaeological resources may also be TCRs; they include the following features:

- **Village Site:** Village sites are locations of continuous and concentrated habitation that typically have a large, well-developed midden deposit containing abundant artifactual evidence. They may also contain burials, rock art, bedrock milling stations, or other features.
- **Burial Site:** A burial site or cemetery is a location where intentional human interments may be found in large numbers and close concentration. These locations typically lack evidence of other prehistoric activities.
- **Milling Site:** This is a boulder or group of boulders or bedrock outcrops that contain at least one modified surface (mortar, slick, or metate) caused by the processing of food or other natural resources.
- **Lithic Workshop:** A lithic workshop is a distribution of stone flakes and tool fragments reflecting purposeful modification of parent stone through percussion and/or pressure detachment.
- **Shell Middens:** Shell middens are locations with large amounts of marine shell that extend to an appreciable depth below ground surface. They are normally found in coastal contexts but have been found in the interior.
- **Rock Art:** Rock art consists of designs or design elements on rock surfaces created by surface applications (pictographs) or by etching (petroglyphs).
- **Rock Shelters:** These are natural caves or crevices in rock outcrops in which human use has left artifactual remains.

California Native American tribes culturally affiliated with the unincorporated county that had previously requested to be notified of projects subject to AB 52 consultation have been contacted for input regarding the potential impacts the project would have on TCRs. The following tribal representatives were contacted on June 21, 2021, by email and/or on June 23, 2021, by certified mail:

- Barona Group of the Capitan Grande, Art Bunce
- Campo Kumeyaay Nation, Jonathan Meza
- Jamul Indian Village, Lisa Cumper, Tribal Historic Preservation Officer
- Kwaaymii Band of Mission Indians, Carmen Lucas
- Manzanita Band of the Kumeyaay Nation, Angela Elliott-Santos, Chairperson, and Lisa Haws
- Pala Band of Mission Indians, Shasta Gaughen, Tribal Historic Preservation Officer
- Pechanga Band of Mission Indians, Juan Ochoa, Assistant Tribal Historic Preservation Officer; Michele Fahley, Counsel; and Ebru Ozdil
- Rincon San Luiseno Band of Mission Indians, Cheryl Madrigal
- San Luis Rey Band of Mission Indians, Cami Mojado
- San Pasqual Band of Mission Indians, Angelina Guitierrez
- Lipay Nation of Santa Ysabel, Virgil Perez, Chairperson
- Soboba Band of Mission Indians, Joseph Ontiveros
- Sycuan Band of the Kumeyaay Nation, Cody Martinez, Chairperson; Adam Day, Chief Administrative Officer; and Kristie Orosco
- Viejas Band of Kumeyaay Indians, Ernest Pingleton, and Ray Teran

The Viejas Band of Kumeyaay Indians and the Rincon Band of Luiseño Indians have requested consultation. Meetings with the Viejas Band of Kumeyaay Indians took place on July 28, 2021; October 27, 2021; and September 21, 2022. Meetings with the Rincon Band of Luiseño Indians took place on September 2, 2021; December 2, 2021; March 15, 2022; October 12, 2022; March 20, 2023; April 24, 2023; June 20, 2023; and August 7, 2023. Consultation has been concluded with both tribes.

Although the region is known to contain sensitive TCRs, the consultation did not result in the identification of any known TCRs.

2.14.2 Regulatory Framework

Since the certification of the 2011 GPU PEIR in August 2011, new regulations pertaining to TCRs have been adopted and are described below.

2.14.2.1 Federal

No federal regulations pertain to TCRs.

2.14.2.2 State

California Register of Historical Resources

The CRHR is a listing of State of California resources that are significant in the context of California's history. It is a statewide program with a scope and with criteria for inclusion similar to those used for the National Register of Historic Places (NRHP). In addition, properties designated under municipal or county ordinances are also eligible for listing in the CRHR.

A historical resource must be significant at the local, state, or national level under one or more of the criteria defined in the California Code of Regulations Title 15, Chapter 11.5, Section 4850 to be included in the CRHR. The CRHR criteria are tied to CEQA because any resource that meets the criteria below is considered a significant historical resource under CEQA. As noted above, all resources listed in or formally determined eligible for listing in the NRHP are automatically listed in the CRHR.

The CRHR uses four evaluation criteria:

- Criterion 1. Is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States.
- Criterion 2. Is associated with the lives of persons important to local, California, or national history.
- Criterion 3. Embodies the distinctive characteristics of a type, period, region, or method of construction; represents the work of a master; or possesses high artistic values.
- Criterion 4. Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.

Similar to the NRHP, a historical resource must meet one of the above criteria and retain integrity to be listed in the CRHR. The CRHR uses the same seven aspects of integrity used by the NRHP: location, design, setting, materials, workmanship, feeling, and associations.

California Environmental Quality Act

CEQA requires public agencies to consider the effects of their actions on "tribal cultural resources." CEQA Section 21084.2 establishes that "[a] project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment." AB 52, signed by the California Governor in September of 2014, established a new class of resources under CEQA: "tribal cultural resources," defined in CEQA Section 21074.

CEQA Section 21074 states:

- a) “Tribal cultural resources” are either of the following:
 - 1) Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:
 - A) Included or determined to be eligible for inclusion in the California Register of Historical Resources.
 - B) Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.
 - 2) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. In applying the criteria set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.
- b) A cultural landscape that meets the criteria of subdivision (a) is a tribal cultural resource to the extent that the landscape is geographically defined in terms of the size and scope of the landscape.
- c) A historical resource described in Section 21084.1, a unique archaeological resource as defined in subdivision (g) of Section 21083.2, or a “nonunique archaeological resource” as defined in subdivision (h) of Section 21083.2 may also be a tribal cultural resource if it conforms with the criteria of subdivision (a).

Pursuant to CEQA Sections 21080.3.1, 21080.3.2, and 21082.3, lead agencies undertaking CEQA review must, upon written request of a California Native American tribe, begin consultation before the release of an EIR, negative declaration, or mitigated negative declaration. CEQA Sections 21080.3.1 and 21080.3.2 state that within 14 days of determining that a project application is complete, or to undertake a project, the lead agency must provide formal notification, in writing, to the tribes that have requested notification of proposed projects in the lead agency’s jurisdiction. If it wishes to engage in consultation on the project, the tribe must respond to the lead agency within 30 days of receipt of the formal notification. The lead agency must begin the consultation process with the tribes that have requested consultation within 30 days of receiving the request for consultation. Consultation concludes when either (1) the parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a TCR, or (2) a party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached.

If the lead agency determines that a project may cause a substantial adverse change to a TCR, and measures are not otherwise identified in the consultation process, provisions under CEQA Section 21084.3(b) describe mitigation measures that may avoid or minimize the significant adverse impacts. Examples include:

- (1) Avoidance and preservation of the resources in place, including, but not limited to, planning and construction to avoid the resources and protect the cultural and natural context, or planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
- (2) Treating the resource with culturally appropriate dignity taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
 - (A) Protecting the cultural character and integrity of the resource.
 - (B) Protecting the traditional use of the resource.
 - (C) Protecting the confidentiality of the resource.
- (3) Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
- (4) Protecting the resource.

Health and Safety Code Section 7050.5

Section 7050.5 of the Health and Safety Code requires that construction or excavation be stopped in the vicinity of discovered human remains until the coroner can determine whether the remains are those of a Native American. If they are determined to be those of a Native American, the coroner must contact Native American Heritage Commission (NAHC).

California Native American Historical, Cultural, and Sacred Sites Act

The California Native American Historical, Cultural, and Sacred Sites Act (Public Resources Code Section 5097.9) applies to both state and private lands. The act requires, upon discovery of human remains, that construction or excavation activity cease and that the county coroner be notified. If the remains are those of a Native American, the coroner must notify the NAHC, which notifies (and has the authority to designate) the most likely descendants of the deceased. The act stipulates the procedures the descendants may follow for treating or disposing of the remains and associated grave goods.

Public Resources Code Section 5097

Public Resources Code Section 5097 specifies the procedures to be followed in the event of the unexpected discovery of human remains on nonfederal land. The disposition of Native American human burials falls within the jurisdiction of the NAHC. Section 5097.5 of the code states:

No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over such lands. Violation of this section is a misdemeanor.

2.14.2.3 Local

2011 San Diego County General Plan

TCRs were added to CEQA as an environmental topic in 2015; therefore, the General Plan does not contain policies that are specific to TCRs. The following cultural resources policies that were adopted as part of the General Plan are generally related to TCRs and are applicable to the CAP Update:

Policy COS-7.4: Consultation with Affected Communities. Require consultation with affected communities, including local tribes to determine the appropriate treatment of cultural resources.

Policy COS-7.6: Cultural Resource Data Management. Coordinate with public agencies, tribes, and institutions in order to build and maintain a central database that includes a notation whether collections from each site are being curated, and if so, where, along with the nature and location of cultural resources throughout the County of San Diego.

2011 San Diego County GPU PEIR

The following mitigation measures from the 2011 GPU PEIR are applicable to the CAP Update:

Adopted Mitigation Measure Cul-2.2: Facilitate the identification and acquisition of important resources through collaboration with agencies, tribes, and institutions, such as the South Coast Information Center (SCIC), while maintaining the confidentiality of sensitive cultural information.

Adopted Mitigation Measure Cul-2.4: Protect significant cultural resources through regional coordination and consultation with the NAHC and local tribal governments, including SB-18 review.

Adopted Mitigation Measure Cul-2.5: Protect undiscovered subsurface archaeological resources by requiring grading monitoring by a qualified archaeologist and a Native American monitor for ground disturbing activities in the vicinity of known archaeological resources, and also, when feasible, during initial surveys.

Adopted Mitigation Measure Cul-2.6: Protect significant cultural resources by facilitating the identification and acquisition of important resources through

regional coordination with agencies, and institutions, such as the South Coast Information Center (SCIC) and consultation with the Native American Heritage Commission (NAHC) and local tribal governments, including SB-18 review, while maintaining the confidentiality of sensitive cultural information.

Adopted Mitigation Measure Cul-4.1: Include regulations and procedures for discovery of human remains in all land disturbance and archaeological-related programs. Ensure that all references to discovery of human remains promote preservation and include proper handling and coordination with Native American groups. Apply appropriate mitigation when impacts are significant.

2.14.3 Analysis of Effects and Significance Determinations

2.14.3.1 Significance Criteria

Based on Appendix G of the State CEQA Guidelines, the project would result in a significant impact on TCRs if it would:

- cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:
 - i. Listed or eligible for listing in the CRHR, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k), or
 - ii. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

2.14.3.2 Approach to Analysis

Impacts related to TCRs are analyzed qualitatively based on a review of the CAP Update measures and actions and their potential to result in physical changes to the environment if the CAP Update is approved and implemented. Each issue area was analyzed in the context of existing laws and regulations, as well as policies adopted in the General Plan, and the extent to which these existing regulations and policies adequately address and minimize the potential for impacts associated with implementation of the CAP Update. Because this SEIR tiers from the 2011 GPU PEIR, all relevant 2011 GPU PEIR mitigation measures are applicable to the proposed project as needed to avoid or minimize project impacts and are considered part of the proposed CAP Update.

Scope of SEIR Impact Analysis

The CAP Update identifies strategies, measures, and supporting actions (referred to herein as measures and actions) to demonstrate progress toward established GHG reduction targets. Because these measures and actions represent the components of the CAP Update that could result in physical environmental effects within the unincorporated county, this analysis focuses on the impact of their implementation. The project and cumulative impact analysis study area for TCRs was not addressed in the 2011 GPU PEIR because TCRs were not identified as an environmental resource topic until 2015. For this project, the cumulative area would be the county because TCRs could be located throughout the county outside the traditionally affiliated land of the tribes requested consultation.

The analysis in this ~~draft~~ SEIR is programmatic. Implementation of all CAP Update measures and actions were considered during preparation of this ~~draft~~ SEIR, to the degree specific information about their implementation is known. Because future projects consistent with the CAP Update have yet to be specifically defined, this SEIR considers the types of impacts that could occur with implementation of future projects consistent with the proposed GHG reduction measures and actions. Future discretionary projects consistent with the CAP Update would be evaluated by the County to determine if they are within the scope of this SEIR or if they result in project-specific impacts additional to what is concluded in this analysis. If additional impacts would result, subsequent CEQA documentation would be required to evaluate impacts, determine mitigation, and conclude whether impacts are reduced to a less-than-significant level.

Proposed CAP Update Strategies

As described in Chapter 1, “Project Description,” the overarching strategies and associated measures and actions, proposed in the CAP Update (see Table 1-2) have been grouped into categories for the purpose of analysis, based on the sector they target (e.g., solid waste, water/wastewater). CAP Update actions and measures that would have the potential to affect TCRs are provided below. CAP Update actions and measures that would involve development of policies and programs that would not result in direct physical effects or those that would result in limited physical improvements to existing development are not discussed further because these actions and measures would not have potential to result in new or more severe impacts related to TCRs.

Solid Waste Measures and Actions. This category includes strategies to increase solid waste diversion and availability of sustainable solid waste facilities in County operations and within the unincorporated county. Key actions with potential to result in new or more severe impacts related to TCRs include those that could indirectly result in the development of new or expanded recycling and composting facilities (Actions SW-1.1, SW-2.1, SW-4.1a, and SW-4.1b).

Water and Wastewater Measures and Actions. This category includes strategies to decrease potable water consumption and increase stormwater collection, water pumping, and wastewater treatment in County operations and the unincorporated county. Key

actions with potential to result in new or more severe impacts related to TCRs include those that would result in the construction of new water efficiency and stormwater capture and reuse infrastructure (Actions W-1.1, W-2.2, W-2.3, and W-2.4).

Agriculture and Conservation Measures and Actions. This category includes strategies to preserve natural and agricultural lands, improve land management practices, and support climate-friendly farming practices. These measures and actions are not expected to result in new or more severe impacts related to TCRs. Rather, actions that would result in the acquisition and management of conservation lands (Actions A-1.1, A-1.2, A-1.2a, A-3.1, and A-4.1) would have potential to benefit TCRs. This category also includes an action that would evaluate opportunities for the construction of farmworker housing (Action A-4.1.b).

Energy Measures and Actions. This category includes strategies to increase building energy efficiency, renewable energy, and electrification in County operations and the unincorporated county. Key actions with potential to result in new or more severe impacts related to TCRs include those that could result in the construction of new infrastructure to meet the renewable energy use and electrification objectives of the CAP Update (Actions E-1.1 and E-3.3). Action E-3.3 would require the County to develop a program to provide the unincorporated area with 100 percent renewable energy from San Diego Community Power by 2030. This action may indirectly result in the construction of large-scale renewable energy infrastructure.

Built Environment and Transportation Measures and Actions. This category includes strategies to decarbonize the County's vehicle fleet, support active transportation, and reduce single-occupancy vehicle trips. Key actions with potential to result in new or more severe impacts related to TCRs include those that would result in the construction of new electric vehicle charging stations (Action T-3.1) and hydrogen fueling infrastructure (Action T-3.1.a).

2.14.3.3 Issue 1: Substantial Adverse Change in the Significance of Tribal Cultural Resources

Guidelines for Determination of Significance

TCRs are nonrenewable and, therefore, cannot be replaced. The project would have a significant effect if it would cause a substantial adverse change in the significance of a TCR, defined in CEQA Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe and that is:

- listed or eligible for listing in the CRHR, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k), or
- a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in Public Resources Code Section 5024.1(c). In applying the criteria set forth in Public Resources Code

Section 5024.1(c), the lead agency shall consider the significance of the resource to a California Native American tribe.

Impact Analysis

2011 GPU PEIR Determination

TCRs were added through AB 52 as a resource subject to review under CEQA, effective July 1, 2015. The 2011 GPU PEIR did not evaluate impacts to these resources because it was adopted before this requirement. Nevertheless, specific General Plan policies that are related to tribes and TCRs are listed above under Section 2.14.2, "Regulatory Framework." 2011 GPU PEIR mitigation measures that are protective of TCRs are listed below in Section 2.14.5, "Mitigation Measures."

CAP Update Impact Analysis

Solid Waste Measures and Actions

This category includes strategies to increase solid waste diversion and availability of sustainable solid waste facilities in County operations and within the unincorporated county. Key actions with potential to result in new or more severe impacts related to TCRs include those that would result in the development of new or expanded recycling and composting facilities (Actions SW-1.1, SW-2.1, SW-4.1a, and SW-4.1b).

No known TCRs have been identified during consultation with affiliated tribes. Implementation of GHG reduction measures and supporting efforts listed above would result in the implementation of a variety of measures and actions to reduce GHG emissions. Some of these measures and actions would result in the construction of new facilities and infrastructure, the placement of structures, and the excavation of earthen materials. While no TCRs have been identified through consultation with affiliated tribes, it is possible that unknown TCRs may be present and could be adversely affected by implementation of measures and strategies associated with the project. While adopted General Plan policies and mitigation measures identified in the 2011 GPU PEIR do not specifically address TCRs, they do include identification efforts, Native American monitoring, and coordination with the NAHC and local tribes (see Adopted Mitigation Measures Cul-2.2, Cul-2.4, Cul-2.5, Cul-2.6, and Cul-4.1). Additionally, tribal consultation has resulted in CAP Update Mitigation Measure TCR-1 which requires development to avoid tribal cultural resources or to mitigate impacts to tribal cultural resources pursuant to CEQA Sections 21080.3.1 and 21084.3. These mitigation measures would be applied to future projects associated with the CAP Update to avoid or minimize impacts on TCRs.

Furthermore, California law recognizes the need to identify and protect TCRs; the procedures for the treatment of Native American resources are contained in CEQA Sections 21080.3.1 and 21084.3, which states the following:

- Within 14 days of determining that a project application is complete, or to undertake a project, the lead agency must provide formal notification, in writing, to the tribes that have requested notification of proposed projects in the lead agency's jurisdiction. If it

wishes to engage in consultation on the project, the tribe must respond to the lead agency within 30 days of receipt of the formal notification. The lead agency must begin the consultation process with the tribes that have requested consultation within 30 days of receiving the request for consultation. Consultation concludes when either (1) the parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a TCR, or (2) a party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached.

- Public agencies shall, when feasible, avoid damaging effects to any TCR (CEQA Section 21084.3[a]). If the lead agency determines that a project may cause a substantial adverse change to a TCR, and measures are not otherwise identified in the consultation process, new provisions in the CEQA describe mitigation measures that, if determined by the lead agency to be feasible, may avoid or minimize the significant adverse impacts (CEQA Section 21084.3[b]). Examples include:
 - (1) Avoidance and preservation of the resources in place, including, but not limited to, planning and construction to avoid the resources and protect the cultural and natural context, or planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
 - (2) Treating the resource with culturally appropriate dignity taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
 - (A) Protecting the cultural character and integrity of the resource
 - (B) Protecting the traditional use of the resource
 - (C) Protecting the confidentiality of the resource.
 - (3) Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
 - (4) Protecting the resource.

Compliance with California CEQA Sections 21080.3.1 and 21084.3 would provide an opportunity to avoid or minimize the disturbance of TCRs through tribal consultation and CEQA review procedures. Additionally, future discretionary projects would be required to be evaluated to determine if they are within the scope of this SEIR, or if project-specific impacts would require subsequent CEQA documentation; this could also include subsequent tribal consultation under AB 52. If a determination is made during subsequent CEQA analysis that potentially significant impacts would result from the implementation of projects implemented consistent with the CAP Update, then all feasible mitigation would be required to be implemented in accordance with State CEQA Guidelines Section 15126.4. While mitigation would be recommended to reduce or avoid a project's impacts to TCRs, it may be infeasible to fully mitigate the impact to a less-than-significant level because of the location, size, and magnitude of the development associated with required measures and supporting efforts. Impacts would be potentially significant.

Water and Wastewater Measures and Actions

This category includes strategies to decrease potable water consumption and increase stormwater collection, water pumping, and wastewater treatment in County operations and the unincorporated county. Key actions with potential to result in new or more severe impacts related to TCRs include those that would result in the construction of new recycled water and stormwater capture and reuse infrastructure (Actions W-1.1, W-2.2, W-2.3, and W-2.4).

As described above, compliance with CEQA Sections 21080.3.1 and 21084.3 would provide an opportunity to avoid or minimize the disturbance of TCRs through tribal consultation and CEQA review procedures. While mitigation would be recommended to reduce or avoid a project's impacts to TCRs, it may be infeasible to fully mitigate the impact to a less-than-significant level because of the location, size, and magnitude of the development associated with required measures and supporting efforts. Impacts would be potentially significant.

Agriculture and Conservation Measures and Actions

This category includes strategies to preserve natural and agricultural lands, improve land management practices, and support climate-friendly farming practices. Therefore, the measures and actions are not expected to result in new or more severe impacts related to TCRs. Rather, actions that would result in the acquisition and management of conservation lands (Actions A-1.1, A-1.2, A-1.2a, A-3.1, and A-4.1) would have potential to benefit TCRs. Implementation of Action A-4.1b would have the potential to indirectly result in new farmworker housing in the unincorporated county; this has the potential to result in new or more severe impacts related to TCRs.

As described above, compliance with CEQA Sections 21080.3.1 and 21084.3 would provide an opportunity to avoid or minimize the disturbance of TCRs through tribal consultation and CEQA review procedures. While mitigation would be recommended to reduce or avoid a project's impacts to TCRs, it may be infeasible to fully mitigate the impact to a less-than-significant level because of the location, size, and magnitude of the development associated with required measures and supporting efforts. Impacts would be potentially significant.

Energy Measures and Actions

This category includes strategies to increase building energy efficiency, renewable energy, and electrification in County operations and the unincorporated county. Key actions with potential to result in new or more severe impacts related to TCRs include those that would result in the construction of new infrastructure to promote renewable energy use and electrification (Actions E-1.1 and E-3.3).

As described above, compliance with CEQA Sections 21080.3.1 and 21084.3 would provide an opportunity to avoid or minimize the disturbance of TCRs through tribal consultation and CEQA review procedures. While mitigation would be recommended to reduce or avoid a project's impacts to TCRs, it may be infeasible to fully mitigate the

impact to a less-than-significant level because of the location, size, and magnitude of the development associated with required measures and supporting efforts. Impacts would be potentially significant.

Built Environment and Transportation Measures and Actions

This category includes strategies to decarbonize the County's vehicle fleet, support active transportation, and reduce single-occupancy vehicle trips. Key actions with potential to result in new or more severe impacts related to TCRs include those that would result in the construction of new electric vehicle charging stations (Actions T-3.1) and hydrogen fueling infrastructure (Action T-3.1.a). Some of these measures and actions would result in the construction of new facilities and infrastructure, the placement of structures, and the excavation of earthen materials.

As described above, compliance with CEQA Sections 21080.3.1 and 21084.3 would provide an opportunity to avoid or minimize the disturbance of TCRs through tribal consultation and CEQA review procedures. While mitigation would be recommended to reduce or avoid a project's impacts to TCRs, it may be infeasible to fully mitigate the impact to a less-than-significant level because of the location, size, and magnitude of the development associated with required measures and supporting efforts. Impacts would be potentially significant.

Summary

Adopted 2011 GUP PEIR Mitigation Measures Cul-2.2, Cul-2.4, Cul-2.5, Cul-2.6, and Cul-4.1 include identification efforts, Native American monitoring, and coordination with the NAHC and local tribes. Additionally, tribal consultation has resulted in CAP Update Mitigation Measure TCR-1 which requires development to avoid tribal cultural resources or to mitigate impacts to tribal cultural resources pursuant to CEQA Sections 21080.3.1 and 21084.3. Compliance with CEQA Sections 21080.3.1 and 21084.3 would require tribal consultation and provide an opportunity to avoid or minimize project impacts to TCRs. However, because the specific location of projects associated with CAP Update implementation are not known and because they could be implemented in areas where TCRs are present; project impacts would be **significant (Impact TCR-1)**. Implementation of the CAP Update **would result in a new impact** not disclosed in the 2011 GPU PEIR.

2.14.3.4 Cumulative Impact Analysis

The cumulative impact analysis study area for TCRs was not addressed in the 2011 GPU PEIR because TCRs were not identified as an environmental resource topic until 2015. The cumulative study area for TCRs is the traditionally affiliated land for any tribe requesting consultation. For this project, the cumulative area would be the county because TCRs could have the potential to occur throughout the county outside tribal lands. The scope and approach to the cumulative impact analysis are described in the "Cumulative Impact Assessment Overview" section in the introduction to this chapter.

Issue 1: Substantial Adverse Change in the Significance of Tribal Cultural Resources

The cumulative context for TCRs is the county. Past development in the county has resulted in the conversion of undeveloped land to urban land uses, thereby changing the landscape and context in which TCRs exist and resulting in an overall reduction in TCRs. This is a significant cumulative impact in the cumulative condition.

The project in combination with cumulative development could result in new development that could result in adverse impacts to known and unknown TCRs. As described above, while compliance with CEQA Sections 21080.3.1 and 21084.3 would require tribal consultation and provide an opportunity to avoid or minimize the disturbance of TCRs, because of the location, size, and magnitude of the development associated with the proposed measures and supporting efforts, it may be infeasible to fully mitigate the impact to a less-than-significant level. The project would result in a considerable contribution to an existing cumulative effect. There would be a new **significant** impact (**Impact C-TCR-1**). Implementation of the CAP Update **would result in a new impact** not disclosed in the 2011 GPU PEIR.

2.14.4 Summary of New or More Severe Significant Impacts

The proposed project and the cumulative effects of the proposed project in conjunction with subsequent projects in the county would result in potentially significant direct and cumulative impacts to TCRs.

Impact-TCR-1: Cause a Substantial Adverse Change in the Significance of a Tribal Cultural Resource. Implementation of the CAP Update could include measures and strategies located in areas where TCRs may be present. It may be infeasible to fully mitigate the impact to a less-than-significant level because of the location, size, and magnitude of the development associated with the proposed measures and supporting efforts. This would be considered a significant impact.

Impact-C-TCR-1: Result in a Cumulatively Considerable Contribution to a Substantial Adverse Change in the Significance of a Tribal Cultural Resource. The project would have potentially significant impacts related to TCRs. Therefore, the proposed project's contribution to this impact would be cumulatively considerable.

2.14.5 Mitigation Measures

2.14.5.1 Issue 1: Substantial Adverse Change in the Significance of Tribal Cultural Resources

The following mitigation measures applicable to TCRs that were adopted as part of the 2011 GPU PEIR and are applicable to the project include the following:

Adopted Mitigation Measure Cul-2.2: Facilitate the identification and acquisition of important resources through collaboration with agencies, tribes, and institutions,

such as the South Coast Information Center (SCIC), while maintaining the confidentiality of sensitive cultural information.

Adopted Mitigation Measure Cul-2.4: Protect significant cultural resources through regional coordination and consultation with the NAHC and local tribal governments, including SB-18 review.

Adopted Mitigation Measure Cul-2.5: Protect undiscovered subsurface archaeological resources by requiring grading monitoring by a qualified archaeologist and a Native American monitor for ground disturbing activities in the vicinity of known archaeological resources, and also, when feasible, during initial surveys.

Adopted Mitigation Measure Cul-2.6: Protect significant cultural resources by facilitating the identification and acquisition of important resources through regional coordination with agencies, and institutions, such as the South Coast Information Center (SCIC) and consultation with the Native American Heritage Commission (NAHC) and local tribal governments, including SB-18 review, while maintaining the confidentiality of sensitive cultural information.

Adopted Mitigation Measure Cul-4.1: Include regulations and procedures for discovery of human remains in all land disturbance and archaeological-related programs. Ensure that all references to discovery of human remains promote preservation and include proper handling and coordination with Native American groups. Apply appropriate mitigation when impacts are significant.

The County shall incorporate the following measures into the CAP SEIR Mitigation Monitoring and Reporting Program:

CAP Update Mitigation Measure TCR-1: Require development to avoid tribal cultural resources, if feasible. If complete avoidance is not possible, require development to mitigate impacts to tribal cultural resources pursuant to Assembly Bill 52 and CEQA Sections 21080.3.1 and 21084.3.

2.14.6 Significance Conclusions

2.14.6.1 Issue 1: Substantial Adverse Change in the Significance of Tribal Cultural Resources

No other feasible project-related mitigation beyond existing federal and state permitting requirements and compliance with the above 2011 GPU PEIR mitigation is available and could be applied to individual projects under the CAP Update. Where a project complies with existing regulations and above mitigation, it would reduce its project-specific impacts to a less-than-significant level and would reduce its contribution to cumulative impacts such that it would not be considerable. However, because the reduction of impacts to a less-than-significant level cannot be guaranteed, the project would have a **significant and unavoidable impact** and **would result in a considerable contribution** to a significant cumulative impact related to TCRs.

2.15 Wildfire

This section describes the existing conditions for wildfire in the unincorporated county and evaluates the potential effects that implementation of the project may have on wildfire. Specifically, this section evaluates the potential for the CAP Update to result in impacts regarding the project's potential to interfere with emergency response/evacuation, exacerbate wildfire risks, or expose people or structures to post-fire risks. Because this analysis is subsequent to the adopted 2011 GPU PEIR, the evaluation of impacts focuses on the potential for implementation of the CAP Update to result in new or substantially more severe impacts than presented in the 2011 GPU PEIR, given the changes to the General Plan proposed by the CAP Update and changes in environmental and regulatory conditions that have occurred since the certification of the 2011 GPU PEIR.

This section incorporates by reference the wildfire setting and impact analysis from the 2011 GPU PEIR as it applies to the CAP Update and supplements with relevant setting conditions that have changed since certification of the 2011 GPU PEIR. In 2018, Appendix G of the State CEQA Guidelines was updated to include a separate section with new questions associated with evaluating a project's potential impact related to wildfire. Because the Notice of Preparation (NOP) for the 2011 GPU PEIR was released prior to the 2018 update, the PEIR does not include a separate section for wildfire. Rather, wildland fire hazards and emergency evacuation and response plans are discussed in Section 2.7, "Hazards and Hazardous Materials," of the 2011 GPU PEIR. Topics that were added to the State CEQA Guidelines in 2018 and, therefore, not addressed in the 2011 GPU PEIR include the project's potential to expose occupants to pollutants or spread of wildfire, install infrastructure that exacerbates fire risk, and expose people or structures to risks from post-wildfire hazards in or near State Responsibility Areas (SRAs) or land classified as Very High Fire Hazard Severity Zones (FHSZs).

Table 2.15-1 summarizes the wildfire impact conclusions reached in the 2011 GPU PEIR and identifies if a new or more severe significant impact would occur with implementation of the proposed project. As indicated, implementation of the proposed project would not result in new or more severe significant impacts on wildfire.

During the NOP scoping process, the County received comments regarding wildfire. The commenters recommended that the County consider wildfire and brush management strategies, quantify and identify measures to reduce carbon emissions from wildfires, and collaborate with transportation agencies regarding evacuation routes during wildfire events. A copy of the NOP and comment letters received in response to the NOP are included in Appendix A of this ~~draft~~ SEIR.

Table 2.15-1 Summary of Wildfire-Related Impacts

Issue Number	Issue Topic	Determination from 2011 GPU PEIR	CAP Update SEIR Determination	
			New or More Severe Significant Impact Prior to Mitigation	New or More Severe Significant Impact After Mitigation
1	Exacerbate Wildfire Risks	Not evaluated ¹	CAP Update Only: Yes	CAP Update Only: No
			CAP Update Cumulative Contribution: Yes	CAP Update Cumulative Contribution: No
2	Install Infrastructure That Exacerbates Fire Risk	Not evaluated ¹	CAP Update Only: Yes	CAP Update Only: No
			CAP Update Cumulative Contribution: Yes	CAP Update Cumulative Contribution: No
3	Expose People or Structures to Post-Fire Risks	Not evaluated ¹	CAP Update Only: Yes	CAP Update Only: No
			CAP Update Cumulative Contribution: Yes	CAP Update Cumulative Contribution: No

Notes: CAP = Climate Action Plan; GPU = General Plan Update; PEIR = Program Environmental Impact Report; SEIR = Supplemental Environmental Impact Report.

¹ Issues reflect updated sample questions in Appendix G of the State CEQA Guidelines.

Source: Compiled by Ascent Environmental in 2023.

2.15.1 Existing Conditions

The 2011 GPU PEIR includes a discussion of existing conditions within the unincorporated county related to wildland fire hazards and emergency response and evacuation plans in Section 2.7, “Hazards and Hazardous Materials,” on pages 2.7-14 through 2.7-16 and 2.7-18 through 2.7-20. No substantial changes have occurred to the existing conditions described in the 2011 GPU PEIR. Therefore, the existing conditions in the 2011 GPU PEIR remain applicable and are incorporated by reference. The following discussion summarizes the information in the 2011 GPU PEIR and provides supplemental discussion of recent wildfire events.

As described in the 2011 GPU PEIR, the majority of the unincorporated county is within an SRA, as identified by the California Department of Forestry and Fire Protection (CAL FIRE). Most lands within the unincorporated county are classified as High and Very High FHSZs (CAL FIRE 2007). CAL FIRE released updated maps of FHSZs within SRAs for public comment in 2022. These maps show an overall reduction in lands within High FHSZs and an increase in lands within the Very High FHSZ designation in the unincorporated county. ~~However, these These designations are proposed and have yet to be been adopted and became effective on April 1, 2024.; the 2007 maps remain the most current adopted maps at this time.~~

The unincorporated county also includes many wildland-urban interface (WUI) areas, which are areas where development is located close to lands prone to brush fires. The unincorporated county has a long history of wildland fires. The 2018 West Fire burned 505 acres within the county and the 2020 Valley Fire burned 76,067 acres of land within the county. There were 11 wildfire incidents that occurred in the county in 2021 (totaling 9,082 acres) and 10 wildfire incidents in 2022 (totaling 5,609 acres) (CAL FIRE 2023a, 2023b).

Table S-2 of the General Plan Safety Element lists the relevant fire incidents in San Diego County, including the unincorporated county.

2.15.2 Regulatory Framework

The County of San Diego General Plan Safety Element addresses natural hazards and human activities that may pose a threat to public safety, including fire protection and emergency response. The Safety Element also provides policy direction that supports laws and regulations related to safety hazards, such as wildfires. The 2011 GPU PEIR includes a summary of the regulatory framework related to hazards and hazardous materials in Section 2.7, “Hazards and Hazardous Materials,” pages 2.7-20 through 2.7-28, that is incorporated by reference. Specific regulations discussed in the 2011 GPU PEIR and the General Plan Safety Element that are applicable to the project include the following:

2.15.2.1 Federal

- International Fire Code

2.15.2.2 State

- Title 14 Division 1.5 of the California Code of Regulations (CCR)
- California Fire Code
- State fire regulations
- California Emergency Services Act

The above regulatory framework discussed in the 2011 GPU PEIR continues to apply to the unincorporated county and is incorporated into this section by reference. Additional regulations that apply to the CAP Update but were not included in the 2011 GPU PEIR are described below.

California Public Utilities Commission General Order 95: Rules for Overhead Transmission Line Construction

California Public Utilities Commission General Order 95 was initially adopted in 1941 and was most recently updated in 2009 for Southern California. General Order 95 governs the design, construction, and maintenance of overhead electrical lines. Rule 31.1 generally states that design, construction, and maintenance of overhead electrical lines should be done in accordance with accepted good practices for the given location conditions known at the time by the persons responsible for the design, construction, and maintenance of the overhead electrical lines and equipment. Rule 35 of General Order 95 (Tree Trimming) requires the following:

- four feet radial clearance for any conductor of a line operating at 2,400 volts or more, but less than 72,000 volts

- six feet radial clearance for any conductor of a line operating at 72,000 volts or more, but less than 110,000 volts
- 10 feet radial clearance for any conductors of a line operating at 110,000 volts or more, but less than 300,000 volts
- 15 feet radial clearances for any conductor of a line operating at 300,000 volts or more

California Department of Forestry and Fire Protection

CAL FIRE is responsible for enforcing State of California fire safety codes included in the CCR and California Public Resources Code. Public Resources Code Section 4291 states generally that any person operating any structure located on brush-covered lands or land covered with flammable material is required to maintain defensible space around the structure. CCR Title 14 Section 1254 identifies minimum clearance requirements required around utility poles. In SRAs within the jurisdiction of CAL FIRE, the Fire Safety Inspection Program is an important tool for community outreach and enforcement of state fire codes.

CAL FIRE also inspects utility facilities and makes recommendations regarding improvements in facility design and infrastructure. Joint inspections of facilities by CAL FIRE and the utility owner are recommended by CAL FIRE so that each entity may assess the current state of the facility and successfully implement fire prevention techniques and policies. Violations of state fire codes discovered during inspections are required to be brought into compliance with the established codes. If a CAL FIRE investigation reveals that a wildfire occurred as a result of a violation of a law or negligence, the responsible party could face criminal and/or misdemeanor charges. In cases where a violation of a law or negligence has occurred, CAL FIRE has established the Civil Cost Recovery Program, which requires parties liable for wildfires to pay for wildfire-related damages.

In the CAL FIRE SRAs, the requirement for clearances around poles and towers is contained in Public Resources Code Section 4292. This section requires clearing of flammable fuels for a minimum 10-foot radius from the outer circumference of certain poles and towers (non-exempt or subject poles and towers). The distances for clearance requirements must be measured horizontally, not along the surface of the sloping ground. More detailed descriptions of the applicable codes and regulations and images of exempt and non-exempt power line structures may be found in CAL FIRE's *California Power Line Fire Prevention Field Guide* (CAL FIRE 2021).

2.15.2.3 Local

Operational Area Emergency Operations Plan

The Operational Area Emergency Operations Plan (OA EOP), also known as the San Diego County Emergency Operations Plan, is a comprehensive emergency plan in the county. The OA EOP was updated and approved by the County Board of Supervisors in August 2022 (Unified San Diego County Emergency Services Organization and County of San Diego 2022). The OA EOP contains 16 annexes (as listed in Section 2.9.14, "Emergency Response and Evacuation Plans"). The OA EOP is used by San Diego County and all the cities within the county to respond to major emergencies and disasters.

Specifically, the OA EOP describes a comprehensive emergency management system that provides for a planned response to disaster situations associated with technological incidents, terrorism, nuclear-related incidents, and natural disasters, such as wildland fires. The OA EOP has the following five objectives:

1. To provide a system for the effective management of emergency situations.
2. To identify lines of authority and relationships.
3. To assign tasks and responsibilities.
4. To ensure adequate maintenance of facilities, services and resources.
5. To provide a framework for adequate resources for recovery operations.

The stand-alone emergency plans for the OA in the county include the following:

- San Diego County Nuclear Power Plant Emergency Response Plan
- San Diego County OA Oil Spill Contingency Element of the Area Hazardous Materials Plan
- San Diego County OA Emergency Water Contingencies Plan
- Unified San Diego County Emergency Services Organization OA Energy Shortage Response Plan
- Unified San Diego County Emergency Services Organization Recovery Plan
- San Diego County Multi-Jurisdictional Hazard Mitigation Plan
- San Diego Urban Area Tactical Interoperable Communications Plan
- San Diego County Draft Terrorist Incident Emergency Response Protocol

The OA EOP and San Diego County Multi-Jurisdictional Hazard Mitigation Plan are the primary emergency response and evacuation plans for the county. Ground transportation is the primary means of evacuation in the county. Primary evacuation routes include major ground transportation corridors.

Regulatory requirements applicable to fire protection are as follows:

- County of San Diego General Plan Safety Element policies related to wildlife hazards and Exhibit S-3: Potential Evacuation Routes
- County of San Diego Code of Regulatory Ordinances Sections 68.401-68.406, Combustible Vegetation and Other Flammable Materials Ordinance
- County of San Diego Code of Regulatory Ordinances Sections 96.1.005 and 96.1.202, Removal of Fire Hazards
- County of San Diego Consolidated Fire Code
- County Department of Planning and Land Use Fire Prevention in Project Design Standards

The regulatory framework discussed in the 2011 GPU PEIR continues to apply to the unincorporated county and is incorporated into this section by reference. Regulations that have been updated or introduced since adoption of the General Plan in August 2011 are described in the following sections.

San Diego County Multi-Jurisdictional Hazard Mitigation Plan

The Multi-Jurisdictional Hazard Plan is a countywide plan that identifies risk and ways to minimize damage by natural and human-caused disasters. The plan has been incorporated into the General Plan Safety Element. Safety Element Policy S-1.4 identifies the County's intent to review and update this plan every five years. This plan was last revised in February 2023 to reflect changes to both the hazards threatening San Diego County, as well as the programs in place to minimize or eliminate those hazards. The 2023 plan combined wildfire and structure fire as one hazard category and determined that it is highly likely for future wildfire events to occur in 75–100 percent of the planning area.

2023 Consolidated Fire Code

Effective April 13, 2023, the Consolidated Fire Code includes the County amendments to the 2022 California Fire Code and the ordinances of the 12 unincorporated county fire protection districts (County of San Diego 2023). Because of the county's changing climatic, geological, and topographical conditions, the County Fire Code is amended every 3 years when the State of California repeals, revises, and republishes the California Building Standards Code. The County Fire Code is contained in Title 24, Part 9 of the CCR. It is adopted for the protection of public health and safety and applies to both ministerial and discretionary projects. It includes definitions; requirements for permits and inspection for installing or altering systems; regulations for the erection, construction, enlargement, alteration, repair, moving, removal, conversion, demolition, equipment use, and maintenance of buildings, structures, and premises (including the installation, alteration, or repair of new and existing fire protection systems and their inspection); and provides penalties for violation of this code. The County Fire Code applies to all new construction and to any alterations, repairs, or reconstruction, except as otherwise provided for in Title 9, Division 6, Chapter 1 of the County Code.

San Diego County Fire Authority Water Tank Standards for Fire Protection

The San Diego County Fire Authority Water Tank Standards for Fire Protection provides standards for the minimum water storage needed to provide protection for dwellings and other structures where adequate public and private water supply is not available. The standards specify minimum water flow and capacity requirements based on building square footage, as well as requirements for water tank location (San Diego County Fire Authority 2018).

2011 San Diego County General Plan

The General Plan policies addressing wildfire that are applicable to the CAP Update include the following:

Policy LU-6.10: Protection from Hazards. Require that development be located and designed to protect property and residents from the risks of natural and man-induced hazards.

Policy LU-6.11: Protection from Wildfires and Unmitigable Hazards. Assign land uses and densities in a manner that minimizes development in extreme, very high and high fire threat areas or other unmitigable hazardous areas.

Policy LU-10.2: Development—Environmental Resource Relationship. Require development in Semi-Rural and Rural areas to respect and conserve the unique natural features and rural character, and avoid sensitive or intact environmental resources and hazard areas.

Policy S-1.3: Risk Reduction Programs. Support efforts and programs that reduce the risk of natural and manmade hazards and that reduce the time for responding to these hazards.

Policy S-4.1: Defensible Development. Require development to be located, designed, and constructed to provide adequate defensibility and minimize the risk of structural loss and life safety resulting from wildland fires.

Policy S-4.2: Development in Hillside and Canyons. Require development located near ridgelines, top of slopes, saddles, or other areas where the terrain or topography affect its susceptibility to wildfires to be located and designed to account for topography and reduce the increased risk from fires.

Policy S-4.3: Minimize Flammable Vegetation. Site and design development to minimize the likelihood of a wildfire spreading to structures by minimizing pockets or peninsulas, or islands of flammable vegetation within a development.

Policy S-4.4: Service Availability. Plan for development where fire and emergency services are available or planned.

Policy S-4.5: Access Roads. Require development to provide additional access roads where feasible to provide for safe access of emergency equipment and civilian evacuation concurrently. The width, surface, grade, radius, turnarounds, turnouts, bridge construction, and lengths of fire apparatus access roads shall meet the requirements of the State Fire Code and the San Diego County Consolidated Fire Codes. All requirements and any deviations will be at the discretion of the Fire Code Official.

Policy S-4.6: Fire Protection Plans. Ensure that development located within fire threat areas implement measures in a Fire Plan that reduce the risk of structural and human loss due to wildfire.

Policy S-4.7: Fire Resistant Construction. Require all new, remodeled, or rebuilt structures to meet current ignition resistance construction codes and establish and enforce reasonable and prudent standards that support retrofitting of existing structures in high fire hazards areas.

Policy S-5.1: Fuel Management Programs. Support programs and plans, such as Strategic Fire Plans, consistent with state law that require fuel management/modification within established defensible space boundaries and when strategic fuel modification is necessary outside of defensible space, balance fuel management needs to protect structures with the preservation of native vegetation and sensitive habitats.

Policy S-9.1: Landslide Risks. Direct development away from areas with high landslide, mudslide, or rock fall potential when engineering solutions have been determined by the County to be infeasible.

Policy S-9.2: Risk of Slope Instability. Prohibit development from causing or contributing to slope instability.

Policy S-10.3: Development in Floodplains. Limit development in designated floodplains to decrease the potential for property damage and loss of life from flooding and to avoid the need for engineered channels, channel improvements, and other flood control facilities. Require development to conform to federal floodproofing standards and siting criteria to prevent flow obstruction.

Policy S-10.4: Development in Flood Hazard Areas. Require development within mapped flood hazard areas to be sited and designed to minimize on and off-site hazards to health, safety, and property due to flooding.

Policy S-10.6: Development in the Floodplain Fringe. Prohibit development in the floodplain fringe when located on Semi-Rural and Rural Lands to maintain the capacity of the floodplain, unless specifically allowed in a community plan. For parcels located entirely within a floodplain or without sufficient space for a building pad outside the floodplain, development is limited to a single-family home on an existing lot or those uses that do not compromise the environmental attributes of the floodplain or require further channelization.

Policy M-1.2: Interconnected Road Network. Provide an interconnected public road network with multiple connections that improve efficiency by incorporating shorter routes between trip origin and destination, disperse traffic, reduce traffic congestion in specific areas, and provide both primary and secondary access/egress routes that support emergency services during fire and other emergencies.

Policy M-3.3: Multiple Ingress and Egress. Require development to provide multiple ingress/egress routes in conformance with state law and local regulations.

In addition, the General Plan Safety Element identifies major freeways and state routes (SRs) as potential evacuation routes within the county, including Interstate 5 (I-5), I-15, I-8, I-805, SR-52, SR-54, SR-56, SR-67, SR-75, SR-76, SR-78, SR-84, SR-125, SR-163, and SR-905.

2011 San Diego County GPU PEIR

The following mitigation measures from the 2011 GPU PEIR are applicable to the CAP Update:

Adopted Mitigation Measure Haz-3.1: Facilitate coordination between DPLU and the Office of Emergency services to implement and periodically update the Hazard Mitigation Plan.

Adopted Mitigation Measure Haz-3.2: Implement the CEQA Guidelines for Determining Significance to ensure that discretionary projects do not adversely impact emergency response or evacuation plans. Also implement the County Public Road Standards and County Private Road Standards during these reviews and ensure that road improvements are consistent with Emergency Response and Evacuation Plans. Apply appropriate mitigation when impacts are significant.

Adopted Mitigation Measure Haz-3.3: Prepare Fire Access Road network plans and include in Community Plans or other document as appropriate. Also implement the County Fire Code and require fire apparatus access roads and secondary access for projects.

Adopted Mitigation Measure Haz-4.3: Enforce and comply with Building and Fire Code to ensure there are adequate fire service levels; and require site and/or building designs that incorporate features that reduce fire hazards. Also implement the General Plan Regional Category map and Land Use Maps, which typically show lower densities in wildland areas.

Adopted Mitigation Measure Pub-1.5: Implement, and revise as necessary, Board Policy I-84 requiring that discretionary project applications include commitments from available fire protection districts. These commitments shall also demonstrate that the distance between the projects and the fire service facilities do not result in unacceptable travel times.

Adopted Mitigation Measure Pub-1.6: Maintain and use the County GIS and the County Guidelines for Determining Significant impacts in order to identify fire prone areas during the review of development projects. Once identified, ensure that development proposals meet requirements set by the FAHJ and that new/additional fire protection facilities are not required; or, if such facilities are required, that potential environmental impacts resulting from construction are evaluated along with the development project under review.

Adopted Mitigation Measure Pub-1.7: Implement the Building and Fire code to ensure there are adequate fire protections in place associated with the construction of structures and their defensibility, accessibility and egress, adequate water supply, coverage by the local fire district, and other critical issues.

2.15.3 Analysis of Effects and Significance Determinations

2.15.3.1 Significance Criteria

Based on guidance provided in Appendix G of the State CEQA Guidelines and the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Wildland Fire and Fire Protection* (County of San Diego 2022), if located in or near SRAs or lands classified as Very High FHSZ, the proposed project would result in a significant impact if it would:

- substantially impair an adopted emergency response plan or emergency evacuation plan;
- due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire;
- require the installation or maintenance of associated infrastructure (such as roads, fuel break, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment;
- expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

Impacts related to impairing an adopted emergency response plan or emergency evacuation plan are discussed in Section 2.9.3.5, “Issue 3: Impair or Interfere with Emergency Response and Evacuation Plans,” of this SEIR.

2.15.3.2 Approach to Analysis

Appendix G of the State CEQA Guidelines requires that wildfire impacts be evaluated for projects that are located in or near SRAs or lands classified as Very High FHSZ. As discussed in Section 2.15.1, “Existing Conditions,” the majority of the unincorporated county is within an SRA, and most lands within the unincorporated county are classified as ~~High and~~ Very High FHSZs in SRAs (CAL FIRE ~~2007~~2024).

Impacts related to wildfire were analyzed qualitatively based on a review of the CAP Update measures and actions and their potential to result in physical changes to the environment if the CAP Update is approved and implemented. Each issue area was analyzed in the context of existing laws and regulations, and the extent to which these existing regulations and policies adequately address and minimize the potential for impacts associated with the implementation of the CAP Update. Because this SEIR tiers

from the 2011 GPU PEIR, all relevant 2011 GPU PEIR mitigation measures are applicable to the proposed project as needed to avoid or minimize project impacts and are considered part of the proposed CAP Update.

Scope of SEIR Impact Analysis

The impact analysis contained within this ~~draft~~ SEIR focuses on whether approval and implementation of the CAP Update would result in new or more severe impacts than were disclosed in the 2011 GPU PEIR, which is herein incorporated by reference. The CAP Update identifies strategies, measures, and supporting actions (referred to herein as measures and actions) to demonstrate progress toward established greenhouse gas (GHG) reduction targets. Because these measures and actions represent the components of the CAP Update that could result in physical environmental effects within the unincorporated county, this analysis focuses on the impacts of their implementation. Given the broad scope of the CAP Update (i.e., covering the entire unincorporated county) and its role as a planning document designed to guide future decision-making related to the reduction of GHG emissions within the unincorporated county, the study area for the following analysis is the unincorporated area of the county within the County's jurisdiction (i.e., excluding tribal lands, state and federally owned lands, and military installations).

The analysis in this ~~draft~~ SEIR is programmatic. Implementation of all CAP Update measures and actions were considered during preparation of this ~~draft~~ SEIR, to the degree specific information about their implementation is known. Because future projects associated with the CAP Update have yet to be specifically defined, this SEIR considers the types of impacts that could occur with implementation of the proposed GHG reduction measures and actions. The County would evaluate future discretionary projects to determine if they are within the scope of this SEIR or if they result in project-specific impacts additional to what is concluded in this analysis. If additional impacts result, subsequent CEQA documentation would be required to evaluate impacts, determine mitigation, and conclude whether impacts are reduced to a less-than-significant level.

Impacts related to future development of wind turbine projects as a result of renewable energy demand generated by Action E-3.3 also are examined in light of the conclusions in the 2013 Wind Energy Ordinance Amendment Final EIR, which analyzes the effects of wind energy infrastructure within the unincorporated county (County of San Diego 2013). The Wind Energy Ordinance exempts small scale wind turbine projects, which could occur in Very High FHSZs within the unincorporated county, from discretionary review.

Proposed CAP Update Strategies

As described in Chapter 1, "Project Description," the overarching strategies and associated measures and actions proposed in the CAP Update (see Table 1-2) have been grouped into categories for the purpose of analysis, based on the sector they target (e.g., solid waste, water/wastewater). CAP Update measures and actions with the potential to affect wildfire risks are summarized below.

Solid Waste Measures and Actions. This category includes strategies to achieve zero solid waste in County operations and within the unincorporated county. These measures and actions would not typically increase wildfire risks. Measures and actions with potential to result in new or expanded solid waste facilities (e.g., SW-4.1) may result in new or more severe impacts related to wildfire.

Water and Wastewater Measures and Actions. This category includes strategies to decrease water consumption and increase wastewater and stormwater treatments. Measures W-1, W-2, and W-3 could result in new or more severe impacts related to wildfire.

Agriculture and Conservation Measures and Actions. This category includes strategies to preserve natural land and agricultural land. This category also includes an action that would evaluate opportunities for the construction of farmworker housing (Action A-4.1b). Through Measure A-1, the County would acquire and manage conservation lands to preserve natural lands and maximize carbon storage potential in the unincorporated area. Through Measure A-2, the County would develop a tree planting program that expands canopy across the unincorporated area. These measures and actions could result in new or more severe impacts related to wildfire.

Energy Measures and Actions. This category includes a strategy to develop policies and programs to increase energy efficiency and renewable energy use. Key measures and actions with potential to result in new or more severe impacts related to wildfire include Actions E-3, E-3.2, and E-3.3. Action E-3.3 would require the County to develop a program to provide the unincorporated area with 100 percent renewable energy from San Diego Community Power by 2030. This action may indirectly result in the construction of large-scale renewable energy infrastructure.

Built Environment and Transportation Measures and Actions. This category includes strategies to decarbonize the vehicle fleet, install electric vehicle charging stations, incentivize the use of alternative fuels and landscaping practices, and support transit and ridesharing. Generally, a shift from gas powered cars to electric engines and alternative modes of transportation would not result in increased wildfire hazard. However, actions with the potential to result in construction of new or improved facilities (e.g., Actions T-5.1 and T-6.2) may result in new or more severe impacts related to wildfire.

2.15.3.3 Issue 1: Exacerbate Wildfire Risks

This section describes potential project impacts related to exposing occupants to pollutants or spread of wildfire with implementation of the project.

Guidelines for Determination of Significance

Based on Appendix G of the State CEQA Guidelines and the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Wildland Fire and Fire Protection* (County of San Diego 2022), the project would have a significant impact if it would be located in or near an SRA or Very High FHSZ and:

- Exacerbate wildfire risks due to slope, prevailing winds, and other factors and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.

Impact Analysis

2011 GPU PEIR Determination

Impacts related to the exposure of project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire resulting from implementation of the General Plan were not addressed explicitly in the 2011 GPU PEIR because this threshold is derived from the State CEQA Guidelines Appendix G checklist, which was amended to include new questions related to wildfire subsequent to the General Plan's adoption. However, Section 2.7, "Hazards and Hazardous Materials," of the 2011 GPU PEIR addresses impact associated with wildland fire risk and is incorporated by reference. Implementation of the General Plan could result in future development in areas susceptible to wildfires, which could exacerbate wildfire risks leading to the exposure of project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. However, the General Plan policies listed in Section 2.15.2, "Regulatory Framework," would reduce these potential impacts by locating development in areas with adequate emergency services and outside of areas with higher susceptibility to wildfire hazard or spread. In addition, development would be designed and constructed to provide adequate defensibility to wildfires. Furthermore, wildfire risk and risk of pollutant exposure would be minimized by adherence to the International Fire Code, California Fire Code, the County Consolidated Fire Code, and other regulations listed in Section 2.15.2, "Regulatory Framework."

CAP Update Impact Analysis

The following sections describe the potential for implementation of CAP Update measures and actions to exacerbate wildfire risks, thereby exposing project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.

Solid Waste Measures and Actions

Implementation of CAP Update solid waste measures and associated implementing actions (e.g., Action SW-4.1) could result in potential construction of new or expanded solid waste facilities in unincorporated county. These new or expanded facilities would not be intended for occupancy. During construction and operation, there would be increased human activities and ignition sources in the new or expanded solid waste facilities, including equipment that could create a spark or be a source of heat.

As noted in Section 2.15.1, "Existing Conditions," the unincorporated county contains lands that are classified as Very High FHSZs and in SRAs. Heat or sparks have the potential to ignite adjacent vegetation and start a fire, especially during weather events that include low humidity and high wind speeds that are typically experienced in the summer and fall but could also occur year-around in the unincorporated county. However,

development of new or expanded facilities would be required to obtain an approval on a Fire Serve Availability form for fire services and would be required to conform to the adopted General Plan policies related to fire risk reduction, including the following: Policy LU-6.10 requiring development to be protected from hazards; Policy LU-6.11 minimizing development in high fire threat areas; Policy S-4.1 requiring adequate defensible development; Policy S-4.2 requiring development to be designed to account for topography to reduce fire risk; Policy S-4.3 requiring development to be designed to minimize wildfire spreading; Policy S-4.6 requiring implementation of measures to reduce wildfire risk if development is proposed within fire threat areas; and Policy S-4.7 requiring all new, remodeled, or rebuilt structures to meet current ignition resistance construction codes. Additionally, development of new or expanded facilities would be required to implement 2011 GPU PEIR Mitigation Measures Haz-4.3 and Pub-1.7, which require compliance with the Building and Fire Code and require site and/or building designs to include features that reduce fire hazards; Mitigation Measure Pub-1.5, which requires discretionary project applications to include commitments from available fire protection districts; and Mitigation Measure Pub-1.6, which identifies fire prone areas and ensures that development proposals meet the applicable fire authority's requirements. Furthermore, future discretionary projects would be subject to an environmental review process to evaluate potential fire hazards and would be required to comply with the County's Consolidated Fire Code, along with any project specific mitigation measures proposed to avoid or minimize impacts related to the exacerbation of wildfire risks. Therefore, development of new or expanded solid waste facilities would not exacerbate wildfire risks. The impact would be less than significant with implementation of adopted General Plan policies and 2011 GPU PEIR mitigation measures.

Water and Wastewater Measures and Actions

Implementation of CAP Update Measures W-1 through W-3 and associated implementing actions would involve development of policies and programs to encourage water conservation and increase water and wastewater efficiency, which would not include development of structures for human occupancy. Measures W-1 and W-2 include implementing actions to develop policies and programs to increase water efficiency. Implementation of these measures would generally result in installation of water efficient appliances, smart irrigation systems, and stormwater and grey water capture systems. Implementation of Measure W-3 would have the potential to result in installation of stormwater and wastewater treatment systems on-site, so that the stormwater and greywater would be treated and reused for landscaping. Development of the proposed water and wastewater infrastructure improvements is not likely to introduce new uses in areas of high fire risk, including uses that would bring increased population into areas of high fire risk. The impact would be less than significant.

Agriculture and Conservation Measures and Actions

Implementation of CAP Update Measures A-1 through A-2 and associated implementing actions would involve acquiring and managing conservation lands, planting and protecting trees, and providing incentive to encourage carbon farming. As noted above, the

unincorporated county contains lands that are classified as Very High FHSZs or in SRAs that could be affected by implementation of these measures and actions.

Implementation of Actions A-2.1 and A-2.2 would involve planting drought tolerant and low-fire potential trees on County-owned lands and on private property. Planting trees would result in increased fuel load in WUI areas and Very High FHSZs, which could exacerbate wildfire risks in the unincorporated county. Adopted General Plan Goal S-4 aims to create managed vegetation fuel loads in WUI areas and Policy S-4.1 supports programs consistent with state law that require fuel management/modification within established defensible space boundaries. Compliance with the adopted General Plan goals and policies would ensure that newly planted trees would not become unmanageable fuel loads in WUI areas and Very High FHSZs.

Implementation of Action A-4.1.b could result in the identification of opportunities for new farmworker housing. Humans cause the majority of wildfires, either directly or through failure of transmission lines. Introducing a new population to the WUI or in Very High FHSZs has the potential to exacerbate wildfire risk. The impact would be potentially significant. However, future development of farmworker housing would be required to conform with the adopted General Plan Policy S-4.1 to include adequate defensible space for new development, Policy S-4.2 to account for topography for development near hillsides and canyons, Policy S-4.3 to minimize flammable vegetation around development, Policy S-4.4 to locate development in areas where fire and emergency services are available, Policy S-4.5 to provide additional access roads for safe access of emergency equipment and civilian evacuation concurrently, Policy S-4.6 to implement measures to mitigate fire risk, and Policy S-4.7 to meet current ignition resistance construction codes. In addition, development of new farmworker housing would be required to implement 2011 GPU PEIR Mitigation Measures Haz-4.3 and Pub-1.7 to comply with Building and Fire Code and to require incorporation of building features into design to reduce fire hazards, Mitigation Measure Pub-1.5 to require discretionary project applications to include commitments from available fire protection districts, and Mitigation Measure Pub-1.6 to identify fire prone areas and ensure that development proposals meet applicable fire authority's requirements.

Planting trees or future development of farmworker housing within or adjacent to areas designed as Very High FHSZ or WUI areas would have the potential to exacerbate wildfire risk, particularly if these actions occur in areas with steep topography and/or prevailing winds as these conditions contribute to the spread of wildfires and make it more difficult to contain wildfires. With compliance with applicable adopted General Plan policies and implementation of applicable 2011 GPU PEIR mitigation measures, the agriculture and conservation measures and actions would not exacerbate wildfire risk due to slope, prevailing winds, and other factors or expose project occupants to pollutant concentrations from a wildfire. This impact would be less than significant with implementation of adopted General Plan policies and 2011 GPU PEIR mitigation measures.

Energy Measures and Actions

Implementation of CAP Update energy measures and actions would involve development of policies and programs to increase building energy efficiency, increase the use of renewable energy, and increase electrification in the unincorporated county and County operations. These policies and programs could have the potential to result in development of various renewable energy projects, which would not include structures for human occupancy.

Implementation of renewable energy projects have the potential to result in vegetation ignitions and wildfires from equipment failure during construction and operation. Construction activities that may result in ignition sources would include vegetation clearing and piling, grading, site preparation, soil disturbances, concrete pouring and preparation, pole and turbine placement, and construction and refueling. These construction activities may include presence of vehicles, heavy equipment, heat-generating equipment and activities, and sparks from various sources, as well as use of fuels and combustible materials during construction and infrastructure installation. Implementation of CAP Update Measures E-2 and E-3 and Actions E-2.2, E-3.2, and E-3.3 could result in small-scale energy efficiency retrofits on existing residential and non-residential structures and County facilities and large-scale renewable energy systems. The small-scale retrofits could include rooftop or ground-mounted photovoltaic (PV) solar arrays or small wind turbines, upgraded mechanical systems, energy storage systems, and other similar development. Large-scale renewable energy systems could include PV solar, concentrated solar, and wind turbines. However, based on industry standards, it is assumed that future renewable energy development would mainly involve the use of steel, aluminum, or glass, which are materials that have low potential to result in vegetation ignitions and wildfires. Additionally, compliance with adopted General Plan policies would ensure that the proposed development would not exacerbate wildfire risk and would not expose occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. These policies include Policy S-4.1, which requires development to be located, designed, and constructed to provide adequate defensibility; Policy S-4.7, which requires all new, remodeled, or rebuilt structures to meet current ignition resistance construction codes; and Policy S-5.1, which requires fuel management within established defensible space boundaries. In addition, the 2011 GPU PEIR Mitigation Measures Haz-4.3 and Pub-1.7 require compliance with Building and Fire Code and require site designs to incorporate features to reduce fire hazards; Mitigation Measure Pub-1.5 requires discretionary project applications to include commitments from available fire protection districts; and Mitigation Measure Pub-1.6 identifies fire prone areas and ensures that development proposals meet the applicable fire authority's requirements. Compliance with applicable adopted General Plan policies and implementation of 2011 GPU PEIR mitigation measure would reduce the potential for development of small-scale energy efficiency retrofits to exacerbate wildfire risks. The impact would be less than significant with mitigation.

Built Environment and Transportation Measures and Actions

Implementation of CAP Update Measures T-3 and T-5 would result in new or expanded pedestrian and bicycle improvements and electric vehicle charging stations. Future projects that implement these measures and actions would not involve the construction of new structures intended for human occupancy. Accordingly, the construction of these projects would not result in the exacerbation of wildfire risks that could expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire that were not explicitly evaluated in the 2011 GPU PEIR. The impact would be less than significant.

Summary

The CAP Update may result in development of small-scale infrastructure, large-scale renewable energy systems, and other improvements to reduce countywide GHG emissions. It is assumed that most of the new and improved structures would be small in scale and generally would not be intended for extended occupancy, except for potential farmworker housing and large-scale renewable energy systems. There is limited potential for implementation of the CAP Update to expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. Where habitable structures and large-scale renewable energy systems are constructed, they would be unlikely to exacerbate wildfire risk due to slope, prevailing winds, and other factors because all development would be consistent with adopted General Plan policies and would implement 2011 GPU PEIR Mitigation Measures Haz-4.3, Pub-1.5, Pub-1.6, and Pub-1.7 to address the potential for development to exacerbate wildfire hazards. In addition, the CAP Update would create co-benefits that reduce wildfire risk, thereby helping to make the county more adaptive and resilient to the impacts of climate change. For these reasons, the CAP Update is not expected to expose project occupants to pollutant concentrations due to exacerbation of wildfire risk. Impacts would remain less than significant with mitigation incorporated. This conclusion is consistent with the conclusions in the 2011 GPU EIR to the extent that it evaluated wildfire risk. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed in the 2011 GPU PEIR.

2.15.3.4 Issue 2: Install Infrastructure That Exacerbates Fire Risk

This section describes potential project impacts related to installation or maintenance of infrastructure that could exacerbate wildfire risk.

Guidelines for Determination of Significance

Based on Appendix G of the State CEQA Guidelines and the County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Wildland Fire and Fire Protection (County of San Diego 2022), the project would have a significant impact if it would be located in or near an SRA or Very High FHSZ and:

- Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.

Impact Analysis

2011 GPU PEIR Determination

Impacts related to the exacerbation of fire risk from the installation or maintenance of infrastructure resulting from implementation of the General Plan were not addressed explicitly in the 2011 GPU PEIR because this threshold is derived from the State CEQA Guidelines Appendix G checklist, which was amended to include new questions related to wildfire subsequent to the General Plan's adoption. However, infrastructure necessary to support buildout of the General Plan was within the scope of development evaluated in the 2011 GPU PEIR. Section 2.7, "Hazards and Hazardous Materials," of the 2011 GPU PEIR addresses impacts associated with wildland fire risk and is incorporated by reference. The General Plan could result in future development that would require the installation or maintenance of infrastructure in areas susceptible to wildfires. However, the General Plan policies listed in Section 2.15.2, "Regulatory Framework," reduce the potential impacts by ensuring that future development is located in areas with adequate emergency services and infrastructure and outside of areas with higher susceptibility to wildfire hazard or spread. Furthermore, all development would comply with applicable regulations listed in Section 2.15.2, "Regulatory Framework," including the International Fire Code, California Fire Code, State fire regulations, County of San Diego Consolidated Fire Code, and applicable County of San Diego ordinances.

CAP Update Impact Analysis

Solid Waste Measures and Actions

Implementation of the CAP Update solid waste measures and actions would result in potential development of new or expanded solid waste facilities, including expanded biogas capture and composting. The new or expanded facilities would likely be located within or near existing solid waste facilities and landfills with existing infrastructure and utilities services. It is unlikely that infrastructure such as roads, fuel breaks, emergency water sources, power lines, or other utilities would be required for the construction and operation of new or expanded solid waste facilities. If such infrastructure is required, General Plan policies would be implemented to avoid or minimize impacts. These policies include Policy LU-10.2, which ensures development avoids hazard areas; Policy S-4.4, which ensures development occurs in areas with fire and emergency services; Policy S-4.6, which ensures development located within fire threat areas includes measures to reduce risk of structural and human loss due to wildfire; and Policy S-4.7, which requires all new, remodeled, or rebuilt structures to meet current ignition resistance construction codes. 2011 GPU PEIR Mitigation Measures Haz-4.3 and Pub-1.7, which would enforce Building and Fire Code compliance, would also be implemented to reduce wildfire risk. Adopted Mitigation Measure Pub-1.5, which requires discretionary project applications to include commitments from the applicable fire protection district, and Adopted Mitigation

Measure Pub-1.6, which identifies fire prone areas and ensures that development proposals meet applicable fire authority's requirements, would ensure adequate fire services are available to serve the project area. Therefore, implementation of solid waste measures and associated implementation actions would not require construction or maintenance of infrastructure that might exacerbate fire risk. The impact would be less than significant.

Water and Wastewater Measures and Actions

Implementation of CAP Update Measures W-1 through W-3 and associated actions would involve development of policies and programs to encourage water conservation and increase water and wastewater efficiency. Implementation of CAP Update Measures W-1 and W-2 would have the potential to result in installation of water efficient appliances, smart irrigation systems, and stormwater and greywater capture systems. Implementation of CAP Update Measure W-3 would have the potential to result in installation of stormwater and wastewater treatment systems on-site, so that the stormwater and greywater would be treated and reused for landscaping. However, no infrastructure related to roads, fuel breaks, emergency water sources, power lines, or other utilities would be anticipated for the construction and operation of water efficient appliances, smart irrigation systems, stormwater and greywater capture systems, and stormwater and wastewater treatment systems. Therefore, no infrastructure that might exacerbate fire risk would need to be operated or maintained because of the implementation of water and wastewater measures and actions. The impact would be less than significant.

Agriculture and Conservation Measures and Actions

Implementation of CAP Update Measures A-1 through A-2 and associated implementing actions would involve acquiring and managing conservation lands, planting and protecting trees, and providing incentives to encourage carbon farming and transition to cleaner fuels. These measures would result in new conservation lands, preservation of existing natural and agricultural lands, new trees, identification of opportunities for new farmworker housing, and the use of cleaner fuels in the unincorporated county. No infrastructure or other substantial new structural development would be anticipated for preserving or managing conservation, natural, and agricultural lands; carbon farming; preserving trees; or the use of cleaner fuels. New trees would be planted within County-owned lands, right-of-way, and residential areas and would not require installation of roads, fuel breaks, emergency water sources, power lines, or other utilities.

Implementation of Action A-4.1.b would evaluate opportunities to increase farmworker housing, and thus may result in future development of new farmworker housing in the unincorporated county. New farmworker housing development would be required to conform to the adopted General Plan policies. These policies include Policy LU-6.10, which requires new development to be located and designed to protect property and residents from hazards; Policy LU-10.2, which requires development to avoid hazard areas; Policy S-4.1, which requires development to be located, designed, and constructed to provide adequate defensibility; Policy S-4.2, which requires development to account for topography that would affect its susceptibility to wildfires; Policy S-4.3, which requires

site and design development to minimize the likelihood of a wildfire spreading to structures; Policy S-4.4, which requires development to be planned in areas where fire and emergency services are available or planned; Policy S-4.6, which requires implementation of measures to reduce wildfire risk to structural and human loss; and Policy S-4.7, which requires all new, remodeled, or rebuilt structures to meet current ignition resistance construction codes. In addition, 2011 GPU PEIR Mitigation Measures Haz-4.3 and Pub-1.7 require compliance with Building and Fire Code to ensure adequate fire protection in place; Mitigation Measure Pub-1.5 requires discretionary project applications to include commitment from applicable fire protection districts; and Mitigation Measure Pub-1.6 requires compliance with applicable requirements from local fire authority. Compliance with applicable adopted General Plan policies and 2011 GPU PEIR mitigation measures would ensure that the farmworker housing and associated infrastructure would be located, designed, and constructed to avoid hazard areas and to minimize wildfire risk to structural and human loss. Therefore, the farmworker housing and associated infrastructure would not exacerbate fire risk or result in temporary or ongoing impacts to the environment. The impact would be less than significant.

Energy Measures and Actions

Implementation of the CAP Update could result in energy efficiency retrofits on existing residential and non-residential structures and County facilities, and the project could include rooftop or ground-mounted solar arrays or small wind turbines, modern mechanical systems, energy storage systems, large-scale PV solar, concentrated solar, and wind turbines that have potential to result in direct and indirect impacts related to wildland fire that were not explicitly evaluated within the 2011 GPU PEIR.

Energy efficiency retrofits and associated improvements would occur on existing structures and County facilities and would not require installation or maintenance of roads, fuel breaks, and emergency water sources. However, implementation of CAP Update Measure E-3, Action E-3.2, and Action E-3.3 would have the potential to result in development of new renewable energy systems, such as small-scale PV solar arrays and wind turbines and large-scale PV solar, concentrated solar, and wind turbines. These new renewable energy systems would also require connection to power lines and/or construction of new substations. Specific locations for the potential renewable energy system projects are unknown; however, they could result in placement of structures adjacent to wildland vegetation. Construction activities that may result in ignition sources would include vegetation clearing and piling, grading, site preparation, soil disturbances, concrete pouring and preparation, pole and turbine placement, and refueling. These construction activities may include presence of vehicles, heavy equipment, heat-generating equipment and activities, and sparks from various sources, as well as use of fuels and combustible materials during construction and infrastructure installation. Additionally, the projects would result in the generation and transmission of electric current which would be potentially susceptible to equipment failure. Maintenance activities also could result in additional presence of humans and equipment. Large-scale solar systems would include the use of lithium-ion batteries (typically enclosed to reduce fire risk), which would pose a risk for overheating and potential ignition of nearby vegetation. Therefore, implementation of renewable energy system project infrastructure could exacerbate fire risk.

In accordance with the County's Zoning Ordinance, small-scale solar PV systems (under 500 square feet) and up to three small wind turbines are permitted without a discretionary permit if specific zoning criteria are met in accordance with the ordinance. Even though there is a lack of discretionary oversight for small-scale renewable energy projects, all projects would be required to comply with federal, state, and local regulations to minimize or prevent wildfire. The small-scale renewable energy projects would also be required to implement the adopted General Plan policies listed in Section 2.15.2, "Regulatory Framework," which would aid in the efforts to prevent wildfire in the county by managing vegetation, preparing for the threat of wildfire based on weather conditions, and staffing fire service providers appropriately. Furthermore, implementation of 2011 GPU PEIR mitigation measures would reduce impact related to infrastructure development. These measures include Mitigation Measures Haz-4.3 and Pub-1.7, which would require compliance with the Building and Fire Code to ensure there are adequate fire service levels and would require site designs to incorporate features that reduce fire hazards, and Mitigation Measure Pub-1.6, which requires compliance with applicable requirements from the local fire authority. Compliance with existing regulations and the adopted 2011 GPU PEIR policies and implementation of Mitigation Measures Haz-4.3, Pub-1.6, and Pub-1.7 would ensure that future small-scale renewable energy projects would not exacerbate fire risk or result in temporary or ongoing impacts to the environment.

Future large-scale renewable energy projects and associated infrastructure (e.g., power lines, power poles, and battery storage systems) would result in potential ignition sources during construction and operation activities. Potential ignition sources during construction could include heat sources or sparks from power tools, heated exhaust from worker vehicles, and improper electrical connections. During operation, the primary wildfire ignition risks could include electrical shorts, employee and maintenance vehicles, collapse of supporting structures (e.g., power lines and power poles) causing electrical shorts and fire, and overgrown fuel under and around structures. Implementation of large-scale renewable energy projects could exacerbate fire risk due to installation of renewable energy systems and associated infrastructure. However, future large-scale renewable energy projects would be designed to prevent this infrastructure from exacerbating fire risk to the extent feasible. The large-scale renewable energy projects and associated infrastructure would be required to be designed and constructed in accordance with current fire codes. Defensible space and fuel management required by the California Public Utilities Commission and CAL FIRE for utilities infrastructure development would also be implemented as discussed in Section 2.15.2.2, above.

In addition, future large-scale renewable energy projects would be subject to discretionary review and would be evaluated for project-specific impacts under CEQA at the time of application. Project-specific mitigation would reduce and minimize impacts related to the exacerbation of fire risk to the extent feasible in compliance with State CEQA Guidelines Section 15126.4. Adopted General Plan Policy S-4.1, which requires development to be located, designed, and constructed to provide adequate defensibility; Policy S-4.7, which requires all new, remodeled, or rebuilt structures to meet current ignition resistance construction codes; and Policy S-5.1, which requires fuel management within established defensible space boundaries, would reduce wildfire risk. Implementation of 2011 GPU PEIR Mitigation Measures Haz-4.3 and Pub-1.7 would ensure that the Building and Fire

Code is implemented to provide adequate fire protection, Mitigation Measure Pub-1.5 would ensure that discretionary projects include commitments from the applicable fire protection district, and Mitigation Measure Pub-1.6 would ensure compliance with applicable requirements from the local fire authority. Even through implementation of large-scale renewable energy projects would introduce potential ignition sources and additional electrical equipment that do not currently exist in the county, compliance with the adopted General Plan policies and 2011 GPU PEIR mitigation measures would reduce fire risk to a less-than-significant level. The impact would be less than significant.

Built Environment and Transportation Measures and Actions

Implementation of the CAP Update built environment and transportation measures and actions could result in future infrastructure development that would result in wildfire-related impacts in the unincorporated county. More specifically, implementation of CAP Update Measures T-3 and T-5 would result in new or expanded pedestrian and bicycle improvements, electric vehicle charging stations, and other measures and actions to promote sustainable transportation options. Development of pedestrian and bicycle improvements would occur on existing roadways and electric vehicle charging stations would be installed in existing parking lots and garages. Implementation of the proposed transportation infrastructure projects would be connected to existing roadways and located within existing facilities, which would not require installation or maintenance of new infrastructure (e.g., roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk. Compliance with the adopted General Plan Policy S-4.1, which requires development to be located, designed, and constructed to provide adequate defensibility; Policy S-4.7, which requires all new, remodeled, or rebuilt structures to meet current ignition resistance construction codes; and Policy S-5.1, which requires fuel management within established defensible space boundaries, would ensure that the potential development would not exacerbate wildfire risk. Further, 2011 GPU EIR Mitigation Measures Haz-4.3 and Pub-1.7, which would enforce Building and Fire Code compliance, would be implemented to reduce wildfire risk. Therefore, implementation of CAP Update built environment and transportation measures and actions would not substantially increase wildfire risk associated with infrastructure development. The impact would be less than significant.

Summary

Federal, state, and local regulations exist to minimize or prevent wildfire. In addition, implementation of the adopted General Plan policies listed in Section 2.15.2, “Regulatory Framework,” would aid in the efforts to prevent wildfire in the county by managing vegetation, preparing for the threat of wildfire based on weather conditions, and staffing fire service providers appropriately. Implementation of the 2011 GPU PEIR Mitigation Measures Haz-4.3, Pub-1.5, Pub-1.6, and Pub-1.7 would require compliance with the Building and Fire Code, require site designs to incorporate features to reduce fire hazards, and ensure there are adequate fire service providers available to serve potential development. Therefore, impacts related to small-scale renewable energy systems would be reduced to less than significant with mitigation incorporated. This conclusion is consistent with the conclusions in the 2011 GPU PEIR to the extent that it evaluated wildfire

risk. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed in the 2011 GPU PEIR.

2.15.3.5 Issue 3: Expose People or Structures to Post-Fire Risks

This section describes potential project impacts related to exposing people to post-fire risks, such as flooding or landslides, with implementation of the project.

Guidelines for Determination of Significance

Based on Appendix G of the State CEQA Guidelines and the *County of San Diego Guidelines for Determining Significance and Report Format and Content Requirements: Wildland Fire and Fire Protection* (County of San Diego 2022), the project, if located in or near an SRA or lands classified as Very High FHSZ, would have a significant impact if it would:

- Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

Impact Analysis

2011 GPU PEIR Determination

Impacts related to the exposure of people or structures to post-fire risks resulting from implementation of the General Plan were not addressed explicitly in the 2011 GPU PEIR because this threshold is derived from the State CEQA Guidelines Appendix G checklist, which was amended to include new questions related to wildfire subsequent to the General Plan's adoption. However, Section 2.7, "Hazards and Hazardous Materials," of the 2011 GPU PEIR addresses impact associated with wildland fire risk and is incorporated by reference. The General Plan would result in development in areas susceptible to wildfires. However, several General Plan policies listed in Section 2.15.2, "Regulatory Framework," would reduce the potential impacts by limiting development in hillsides and canyons where flooding or slope instability could occur. Furthermore, post-wildfire hazard risk is also mitigated by adherence to the County of San Diego OA EP, the County Consolidated Fire Code, and other regulations listed in Section 2.15.2, "Regulatory Framework."

CAP Update Impact Analysis

Implementation of the CAP Update measures and associated implementing actions has the potential to result in future development, such as expansion of facilities, identification of opportunities for farmworker housing, and development of small-scale and large-scale renewable energy projects. These potential developments could expose people or structures to significant risks. The following sections describe the potential wildfire-related impacts that could result from implementation of CAP Update measures and actions.

Solid Waste Measures and Actions

Implementation of CAP Update solid waste measures and actions (e.g., Action SW-4.1) could result in potential construction of new or expanded solid waste facilities in the unincorporated county. Specific locations for these facilities have not been identified, though gas capture at existing landfills likely would occur at the Borrego and Otay landfills. As discussed in Sections 2.15.3.3 and 2.15.3.4, above, construction of new or expanded solid waste facilities would increase human activities and ignition sources in the area, which would have the potential to create a spark to cause fire and expose people or structures to wildfire risks and flooding or landslides resulting from post-fire slope instability or drainage changes. However, future development would be required to conform with the adopted General Plan policies related to wildfire protection. These policies include Policy LU-6.11 to direct development away from hazardous wildfire areas; Policy S-4.1 to locate, site, design, and construct new development to enhance defensibility and to minimize the risk of structural loss and life safety resulting from wildfire; Policy S-4.3 to site and design new developments to minimize the likelihood of a wildfire spreading to structures; Policy S-4.4 to locate new developments to where fire and emergency services are available; Policy S-4.6 to implement measures to mitigate wildfire risks to structures and humans; and Policy S-4.7 to require new development to meet current ignition resistance construction codes. Complying with these adopted General Plan policies would minimize wildfire risk to new development. In addition, complying with Policy LU-6.10, which protects property and residents from natural and human-induced hazards; Policy S-4.2, which requires development located on ridgelines, top of slopes, saddles or other topographic areas to be sited and designed to account for topography in wildland areas that pose a greater fire risk; Policy S-9.1, which directs development away from areas with high landslide potential; Policy S-9.2, which prohibits development from causing or contributing to slope instability; and Policies S-10.3, S-10.4, and S-10.6, which limit development in flood hazard areas, would minimize wildfire risk and reduce landslide or flooding hazards from post-fire associated with slope destabilization and drainage changes. In addition, future development would be required to implement the 2011 GPU PEIR Mitigation Measures Haz-4.3 and Pub-1.7, which require compliance with the Building and Fire Code and requires site and building designs to incorporate features that reduce fire hazards. Compliance with these policies and implementation of Adopted Mitigation Measures Haz-4.3 and Pub-1.7 would reduce the potential for projects constructed as part of CAP Update implementation to expose people or structures at new or expanded facilities to significant post-fire risks, including downslope or downstream flooding or landslides due to post-fire slope instability or drainage changes. The impact would be less than significant.

Water and Wastewater Measures and Actions

Implementation of CAP Update Measures W-1 through W-3 and associated implementing actions would involve development of policies and programs to encourage water conservation and increase water and wastewater efficiency. Measures W-1 and W-2 include implementing actions to develop policies and programs to increase water efficiency. Implementation of these measures would generally result in installation of water efficient appliances, smart irrigation systems, and stormwater and grey water

capture systems. Implementation of Measure W-3 would have the potential to result in installation of stormwater and wastewater treatment systems on-site so that the stormwater and greywater would be treated and reused for landscaping. Implementation of these measures would not result in new population growth or construction of new structures; therefore, implementation of CAP Update water and wastewater measures and actions would not expose people or structures to significant risks, including downslope or downstream flooding or landslides due to post-fire slope instability or drainage changes. The impact would be less than significant.

Agriculture and Conservation Measures and Actions

Implementation of CAP Update Measures A-1 through A-2 and associated implementing actions would involve acquiring and managing conservation lands, preserving natural and agricultural lands, planting and protecting trees, and providing incentive to encourage carbon farming. No new population growth would occur as a result of these measures and actions, and it is assumed that construction of new structures would not be required for managing and preserving conservation, natural, and agricultural lands; promoting carbon farming; and protecting and planting trees. However, implementation of Action A-4.1.b could result in the identification of opportunities to increase farmworker housing in the unincorporated county. The unincorporated county contains many WUI areas, areas classified as Very High FHSZs, and areas in SRAs. Construction of new farmworker housing in WUI areas or a Very High FHSZ would have the potential to expose people and structures to significant risks during and after a wildfire event. Specific locations for potential farmworker housing have not been identified. Future farmworker housing development that results from evaluations conducted through implementation of the CAP Update would be required to conform to the adopted General Plan policies related to wildfire protection, including Policy LU-6.11 to direct development away from hazardous wildfire areas; Policy S-4.1 to locate, site, design, and construct new development to enhance defensibility and to minimize the risk of structural loss and life safety resulting from wildfire; Policy S-4.2 to require new development located on ridgelines, top of slopes, saddles or other topographic areas to be sited and designed to account for topography in areas that pose a greater fire risk; Policy S-4.3 to site and design new developments to minimize the likelihood of a wildfire spreading to structures; Policy S-4.4 to locate new developments in areas where fire and emergency services are available; Policy S-4.6 to implement measures to mitigate wildfire risks to structures and humans; and Policy S-4.7 to require new development to meet current ignition resistance construction codes. Compliance with these adopted policies would limit risks associated with the construction of new farmworker housing in areas prone to wildfire.

Post-wildfire risks to new development would also be minimized through adherence to the General Plan Safety Element policies, which include Policy S-9.1 to direct development away from areas with high landslide potential; Policy S-9.2 to prohibit development from causing or contributing to slope instability; and Policies S-10.3, S-10.4, and S-10.6 to limit development in flood hazard areas. New development would also adhere to the following: the County's OA EOP, which includes strategies, procedures, recommendations, and organizational structures to respond to natural disasters; the Multi-Jurisdictional Hazard Mitigation Plan, which includes goals, objectives, and actions

to reduce the possibility of damage and loss due to wildfire; and other existing regulations related to wildfire protection listed in Section 2.15.2, “Regulatory Framework.” Compliance with the adopted General Plan policies and existing regulations would ensure development in or near SRAs and Very High FHSZs would not expose people or structures to substantial post-fire risks. The impact would be less than significant.

Energy Measures and Actions

Implementation of CAP Update energy measures and actions would involve implementation of policies, programs, and mechanisms to increase building energy efficiency, increase the use of renewable energy, and increase electrification in the unincorporated county and County operations. These policies and programs could have the potential to result in development of various renewable energy projects, such as new small-scale PV solar arrays and wind turbine projects and large-scale PV solar, concentrated solar, and wind turbines that could be located in downslope or downstream flood or landslide areas within the county. Impacts related to the exposure of people or structures due to post-fire slope instability were not explicitly evaluated within the 2011 GPU PEIR.

Implementation of the CAP Update would result in new small-scale PV solar arrays and small-scale wind turbine projects that could include ground-mounted infrastructure. If new renewable energy equipment is installed in areas subject to flooding or landslides within the county, there is a potential to result in the exposure of people or structures to post-wildfire risk. However, given the nature and small scale of renewable energy projects that would be implemented consistent with the CAP Update, it is unlikely that occupied structures or a substantial increase in people would be introduced into the project area. Small-scale wind and solar projects generally do not include the development of new structures and maintenance of these facilities requires limited presence of employees that could be affected by post-fire risks.

Furthermore, future wind and solar projects would be required to be constructed according to applicable fire code requirements and County ordinances that govern grading, flammable materials, and fire hazards. Additionally, small-scale wind and solar projects would be required to comply with the adopted General Plan policies listed in Section 2.15.2, “Regulatory Framework,” including Policy 4-3.1, which requires that development in areas susceptible to wildfires be designed with adequate defensibility and emergency access to minimize the risks to people and structures; Policy S-4.2, which requires development in hillsides and canyons where flooding or slope instability could occur to be designed to account for topography; and Policy S-4.4, which restricts development in areas with a high fire threat and in areas where emergency services are unavailable. In addition, the 2011 GPU PEIR Mitigation Measures Haz-4.3 and Pub-1.7 would require compliance with the Building and Fire Code and would require site designs to incorporate features to reduce fire hazards. Compliance with adopted General Plan policies and implementation of Adopted Mitigation Measures Haz-4.3 and Pub-1.7 would ensure that future small-scale wind and solar projects would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability or drainage changes.

Large-scale renewable energy infrastructure would generally be constructed in primarily undeveloped locations that are productive for generating renewable energy. Specific locations that may be chosen for these large-scale utility projects are unknown; however, it is likely that suitable locations would include areas that are not highly developed with residential and commercial uses because of the size, massing, coverage, and scale of this type of infrastructure that relies on large amounts of land unencumbered by buildings or shadowed by buildings or trees. If the large-scale renewable energy projects are located in flood zones, landslide susceptible areas, or unstable slopes, the impacts related to exposing people or structures to post-fire landslides, slope instability, or flooding could be significant. However, future large-scale renewable energy projects would be subject to discretionary review and would be evaluated for project-specific impacts under CEQA at the time of application. Project-specific mitigation would be proposed to reduce and minimize post-fire risks to the extent feasible in compliance with State CEQA Guidelines Section 15126.4.

Future large-scale renewable energy projects would also conform to design requirements associated with proper site preparation and grading practices to address erosion and runoff. In addition, future large-scale renewable energy projects would be required to comply with adopted General Plan Policy S-9.1, which directs development away from areas with high landslide, mudslide, or rock fall potential; Policy S-10.3, which requires development to conform to federal floodproofing standards; Policy S-9.2, which prohibits development from causing or contributing to slope instability; Policy S-10.4, which requires development within mapped flood hazard areas be sited and designed to minimize on-site and off-site hazards; Policy S-10.6, which allows new uses and development within the floodplain fringe (land within the floodplain outside of the floodway) only when environmental impacts and hazards are mitigated. Implementation of 2011 GPU PEIR Mitigation Measures Haz-4.3 and Pub-1.7 would ensure that the Building and Fire Code is enforced to provide adequate fire protection; Mitigation Measure Pub-1.5 would ensure that discretionary project applications would include commitment from available fire protection districts; and Mitigation Measure Pub-1.6 would identify fire prone areas and ensure development proposals meet the requirements set forth by the applicable fire jurisdiction. Compliance with State CEQA Guidelines Section 15126.4, adopted General Plan policies, and 2011 GPU PEIR mitigation measures would ensure that future large-scale renewable energy projects would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability or drainage changes. The impact would be less than significant.

Built Environment and Transportation Measures and Actions

Implementation of the CAP Update built environment and transportation measures and associated implementing actions could result in future development that would result in wildfire-related impacts in the unincorporated county.

Implementation of CAP Update Measures T-3 and T-5 would result in new or expanded pedestrian and bicycle improvements and electric vehicle charging stations. Park-and-ride facilities would be located in existing parking lots or vacant lots near existing

roadways; pedestrian and bicycle infrastructure improvements would be located on or near existing roadways; and electric vehicle charging stations would be installed in existing parking lots or parking garages. Development of pedestrian and bicycle improvements and installation of electric vehicle charging stations would not increase wildfire risk or alter slopes or drainage patterns in a manner that would increase the risk of post-fire downslopes or downstream flooding or landslides. The impact would be less than significant.

Summary

Post-wildfire risks to new development would be minimized through adherence to the County's OA EOP, which includes strategies, procedures, recommendations, and organizational structures to respond to natural disasters; the Multi-Jurisdictional Hazard Mitigation Plan, which includes goals, objectives, and actions to reduce the possibility of damage and loss due to wildfire; and other existing regulations related to wildfire protection listed in Section 2.15.2, "Regulatory Framework." Additionally, compliance with the adopted General Plan policies and existing regulations would ensure development in or near SRAs and Very High FHSZs would not expose people or structures to substantial post-fire risks. This impact would be less than significant with mitigation incorporated. This conclusion is consistent with the conclusions in the 2011 GPU PEIR to the extent that it evaluated wildfire risk. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed in the 2011 GPU PEIR.

2.15.3.6 Cumulative Impact Analysis

The cumulative impact analysis study area for the wildfire-related risks is the San Diego Association of Governments (SANDAG) region. The scope and approach to the cumulative impact analysis are described in the "Cumulative Impact Assessment Overview" section in the introduction to this chapter.

Issue 1: Exacerbate Wildfire Risks

Impacts related to the exposure of project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire resulting from implementation of the General Plan were not addressed explicitly in the 2011 GPU PEIR because this threshold was introduced to the State CEQA Guidelines subsequent to the General Plan's adoption. As discussed in Section 2.15.3.3, "Issue 1: Exacerbate Wildfire Risks," future development associated with the CAP Update would be evaluated to determine whether it is within the scope of this SEIR or if it would require subsequent CEQA review; would be required to conform with adopted General Plan policies; and would be required to implement applicable 2011 GPU PEIR mitigation measures. As indicated in Section 2.15.1, "Existing Conditions," the unincorporated county contains lands that are classified as Very High FHSZs. Because of the amount of Very High FHSZs in the unincorporated county, it is reasonable to assume that there is a significant cumulative impact related to the exacerbation of wildfire risks. However, implementation of the CAP Update would not result in the exacerbation of wildfire risks with compliance with adopted General Plan

policies and implementation of 2011 GPU PEIR Mitigation Measures Haz-4.3, Pub-1.5, Pub-1.6, and Pub-1.7.

While a significant cumulative impact related to the exacerbation of wildfire risk may result from cumulative development within the SANDAG region, it is foreseeable that future projects proposed in the unincorporated county would be required to comply with adopted General Plan policies and 2011 GPU PEIR mitigation measures, resulting in the mitigation of impacts associated with General Plan buildout; therefore, future projects would not result in a considerable contribution to an existing significant cumulative impact. Further, implementation of the CAP Update would not result in the exacerbation of wildfire risks that could expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. Therefore, the project would not result in a substantial incremental effect that would result in a new significant impact related to the exacerbation of wildfire risk. The impact would be less than significant. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed in the 2011 GPU PEIR.

Issue 2: Install Infrastructure That Exacerbates Fire Risk

Impacts related to the exacerbation of fire risk from the installation or maintenance of infrastructure resulting from implementation of the General Plan were not addressed explicitly in the 2011 GPU PEIR because this threshold was introduced to the State CEQA Guidelines subsequent to the General Plan's adoption. As discussed in Section 2.15.3.4, "Issue 2: Install Infrastructure That Exacerbates Fire Risk," impacts would be less than significant with implementation of applicable 2011 GPU PEIR mitigation measures and compliance with the General Plan policies and other applicable regulations included in Section 2.15.2, "Regulatory Framework."

Similar to Issue 1, discussed above, a significant cumulative impact related to exacerbation of wildfire risk from installation and maintenance of infrastructure would occur in the cumulative context due to the large amount of Very High FHSZs in the unincorporated county. However, while a significant cumulative impact related to the exacerbation of wildfire risk may result from cumulative development within the unincorporated county, it is foreseeable that future projects proposed in the unincorporated county would be required to comply with the same General Plan policies and 2011 GPU PEIR mitigation measures, resulting in the mitigation of impacts associated with General Plan buildout.

Further, given the nature of the projects that would be implemented consistent with the CAP Update, and the fact that impacts resulting from the proposed CAP Update measures and actions would not result in the exacerbation of wildfire risk associated with the installation of infrastructure, the project would not result in a substantial incremental effect that would result in considerable contribution to a new significant cumulative impact. The impact would be less than significant. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed in the 2011 GPU PEIR.

Issue 3: Expose People or Structures to Post-Fire Risks

Impacts related to exposing people or structures to post-fire risks from the installation or maintenance of infrastructure resulting from implementation of the General Plan were not addressed explicitly in the 2011 GPU PEIR because this threshold was introduced to the State CEQA Guidelines subsequent to the General Plan's adoption. As discussed in Section 2.15.3.5, "Issue 3: Expose People or Structures to Post-Fire Risks," impacts would be less than significant with implementation of applicable 2011 GPU PEIR mitigation measures and with compliance with the General Plan policies and other applicable regulations included in Section 2.15.2, "Regulatory Framework."

Similar to Issue 1, discussed above, a significant cumulative impact related to exposing people or structures to post-fire risks is anticipated to occur as a result of General Plan buildout due to the large amount of Very High FHSZs in the unincorporated county. However, while a potentially significant cumulative impact related to the exposure of people or structures to post-fire risks may result from cumulative development within the unincorporated county, it is foreseeable that future projects proposed in the unincorporated county would be required to comply with adopted General Plan policies and 2011 GPU PEIR mitigation measures, resulting in the mitigation of impacts associated with General Plan buildout. Further, given the nature of the projects required to implement the CAP Update, and the fact that impacts resulting from the proposed CAP Update measures and actions would not result in a significant impact related to exposing people or structures to post-fire risks, the project would not result in a substantial incremental effect that would result in a new significant cumulative impact. The impact would be less than significant. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed in the 2011 GPU PEIR.

2.15.4 Summary of New or More Severe Significant Impacts

Implementation of the CAP Update would not result in new or more severe impacts related to emergency response or evacuation plans, exacerbation of fire risk, or exposure of people or structures to post-fire risks.

2.15.5 Mitigation Measures

2.15.5.1 Issue 1: Exacerbate Wildfire Risks

The following mitigation measures adopted as a part of the 2011 GPU PEIR would reduce potential impacts related to the exacerbation of wildfire risk to less than significant. Therefore, no new mitigation measures would be required.

Adopted Mitigation Measure Haz-4.3: Enforce and comply with Building and Fire Code to ensure there are adequate fire service levels; and require site and/or building designs that incorporate features that reduce fire hazards. Also implement the General Plan Regional Category map and Land Use Maps, which typically show lower densities in wildland areas.

Adopted Mitigation Measure Pub-1.5: Implement, and revise as necessary, Board Policy I-84 requiring that discretionary project applications include commitments from available fire protection districts. These commitments shall also demonstrate that the distance between the projects and the fire service facilities do not result in unacceptable travel times.

Adopted Mitigation Measure Pub-1.6: Maintain and use the County GIS and the County Guidelines for Determining Significant impacts in order to identify fire prone areas during the review of development projects. Once identified, ensure that development proposals meet requirements set by the FAHJ and that new/additional fire protection facilities are not required; or, if such facilities are required, that potential environmental impacts resulting from construction are evaluated along with the development project under review.

Adopted Mitigation Measure Pub-1.7: Implement the Building and Fire code to ensure there are adequate fire protections in place associated with the construction of structures and their defensibility, accessibility and egress, adequate water supply, coverage by the local fire district, and other critical issues.

2.15.5.2 Issue 2: Install Infrastructure That Exacerbates Fire Risk

The following mitigation measures adopted as a part of the 2011 GPU PEIR would reduce potential impacts related to the installation of infrastructure that exacerbates fire risk to less than significant. Therefore, no new mitigation measures would be required.

Adopted Mitigation Measure Haz-4.3: Enforce and comply with Building and Fire Code to ensure there are adequate fire service levels; and require site and/or building designs that incorporate features that reduce fire hazards. Also implement the General Plan Regional Category map and Land Use Maps, which typically show lower densities in wildland areas.

Adopted Mitigation Measure Pub-1.5: Implement, and revise as necessary, Board Policy I-84 requiring that discretionary project applications include commitments from available fire protection districts. These commitments shall also demonstrate that the distance between the projects and the fire service facilities do not result in unacceptable travel times.

Adopted Mitigation Measure Pub-1.6: Maintain and use the County GIS and the County Guidelines for Determining Significant impacts in order to identify fire prone areas during the review of development projects. Once identified, ensure that development proposals meet requirements set by the FAHJ and that new/additional fire protection facilities are not required; or, if such facilities are required, that potential environmental impacts resulting from construction are evaluated along with the development project under review.

Adopted Mitigation Measure Pub-1.7: Implement the Building and Fire code to ensure there are adequate fire protections in place associated with the

construction of structures and their defensibility, accessibility and egress, adequate water supply, coverage by the local fire district, and other critical issues.

2.15.5.3 Issue 3: Expose People or Structures to Post-Fire Risks

The following mitigation measures adopted as a part of the 2011 GPU PEIR would reduce potential impacts related to the exposure of people or structures to post-fire risks to less than significant. Therefore, no new mitigation measures would be required.

Adopted Mitigation Measure Haz-4.3: Enforce and comply with Building and Fire Code to ensure there are adequate fire service levels; and require site and/or building designs that incorporate features that reduce fire hazards. Also implement the General Plan Regional Category map and Land Use Maps, which typically show lower densities in wildland areas.

Adopted Mitigation Measure Pub-1.5: Implement, and revise as necessary, Board Policy I-84 requiring that discretionary project applications include commitments from available fire protection districts. These commitments shall also demonstrate that the distance between the projects and the fire service facilities do not result in unacceptable travel times.

Adopted Mitigation Measure Pub-1.6: Maintain and use the County GIS and the County Guidelines for Determining Significant impacts in order to identify fire prone areas during the review of development projects. Once identified, ensure that development proposals meet requirements set by the FAHJ and that new/additional fire protection facilities are not required; or, if such facilities are required, that potential environmental impacts resulting from construction are evaluated along with the development project under review.

Adopted Mitigation Measure Pub-1.7: Implement the Building and Fire code to ensure there are adequate fire protections in place associated with the construction of structures and their defensibility, accessibility and egress, adequate water supply, coverage by the local fire district, and other critical issues.

2.15.6 Significance Conclusions

2.15.6.1 Issue 1: Exacerbate Wildfire Risks

Compliance with existing regulations related to wildfire protection and implementation of adopted General Plan policies and 2011 GPU PEIR Mitigation Measures Haz-4.3, Pub-1.5, Pub-1.6, and Pub-1.7 would ensure that project and cumulative impacts associated with exacerbation of wildfire risks would be **less than significant** and **would not result in a considerable contribution** such that no new significant cumulative impact would occur. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed in the 2011 GPU PEIR.

2.15.6.2 Issue 2: Install Infrastructure That Exacerbates Fire Risk

Compliance with existing regulations related to wildfire protection and implementation of adopted General Plan policies and 2011 GPU PEIR Mitigation Measures Haz-4.3, Pub-1.5, Pub-1.6, and Pub-1.7 would ensure that project and cumulative impacts associated with exacerbation of wildfire risks from installation and maintenance of new infrastructure would be **less than significant** and **would not result in a considerable contribution** such that no new significant cumulative impact would occur. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed in the 2011 GPU PEIR.

2.15.6.3 Issue 3: Expose People or Structures to Post-Fire Risks

Compliance with existing regulations related to wildfire protection and implementation of adopted General Plan policies and 2011 GPU PEIR Mitigation Measures Haz-4.3, Pub-1.5, Pub-1.6, and Pub-1.7 would ensure that project and cumulative impacts associated with exposing people or structures to post-fire risks would be **less than significant** and **would not result in a considerable contribution** such that no new significant cumulative impact would occur. Implementation of the CAP Update **would not result in new or more severe impacts** than disclosed in the 2011 GPU PEIR.

This page intentionally left blank.

CHAPTER 3 ENVIRONMENTAL EFFECTS FOUND NOT TO BE SIGNIFICANT

The County reviewed the environmental impacts and mitigation measures for each issue area addressed in the 2011 GPU PEIR to determine whether impacts associated with implementation of the proposed General Plan Amendment, CAP Update, Greenhouse Gas (GHG) Threshold, and the *County of San Diego Guidelines for Determining Significance: Climate Change* (Guidelines) (collectively referred to as the project) would fall within the scope of the General Plan, are addressed in the certified 2011 GPU PEIR, and incorporate all applicable performance standards and mitigation measures identified therein. Where any of these conditions may not occur, the resource is fully evaluated in Chapter 2, “Environmental Effects of the Project,” of this draft SEIR. Where the County concluded that implementation of the GHG reduction measures and actions in the CAP Update would not have potential to affect the conclusions of the 2011 GPU PEIR for certain topics, these topics are not analyzed further in this SEIR. Where issues will not be discussed in detail in an EIR, Section 15128 of the State CEQA Guidelines requires that an EIR “contain a statement briefly indicating the reasons that various potentially significant effects of a project were determined not to be significant and were therefore not discussed in detail in the EIR.”

This chapter includes a discussion of the reasons that various possible effects of the project were determined not to be significant and were therefore not discussed in detail in this SEIR (pursuant to State CEQA Guidelines Section 15128). As discussed below, the project would not change the conclusions relative to the analyses of geology and soils, mineral resources, population and housing, public services, recreation, and utilities and service systems, and no further detailed analysis is warranted.

3.1 Geology and Soils

In Section 2.6, “Geology and Soils,” the 2011 GPU PEIR did not identify potentially significant direct and cumulative impacts related to geology and soils. Therefore, no mitigation measures were required. As described therein, development as a matter of standard process and conditions of approval would be required to comply with all relevant federal, state, and local regulations and building standards, including the California Building Code (CBC) and County-required geotechnical reconnaissance reports and investigations which would minimize the risk of seismic, soil stability, and expansive soils hazards. Compliance with the National Pollutant Discharge Elimination System, CBC, and County Grading Ordinance would prevent potential impacts to soil erosion. Development would be required to comply with all applicable federal, state, and local regulations related to septic tanks and wastewater disposal, including County Department of Environmental Health and Quality standards to prevent water quality issues because of ineffective septic and wastewater systems. Development would also be required to follow all applicable regulatory processes, including compliance with the *County of San Diego Guidelines for Determining Significance: Geologic Hazards* (County of San Diego 2007). Therefore, potential impacts related to geology and soils would be less than significant, and no mitigation measures were required.

Existing conditions related to geology and soils have not changed substantially since certification of the 2011 GPU PEIR. Implementation of the project would require that development projects be consistent with the CAP Update and its GHG reduction measures and supporting actions. Implementation of the CAP Update is intended to reduce GHG emissions by improving multimodal transportation and ridesharing options and fuel efficiency; increasing building energy efficiency, renewable energy use and access, waste diversion, and water conservation; and reducing emissions from agriculture. Implementation of the project would not expose people or structures to adverse effects resulting from geologic hazards because the CAP Update's GHG reduction measures and supporting efforts would not amend, revise, or be inconsistent with any existing regulations related to geology and soils for development projects. These activities would be required to comply with provisions for geological stability established by the Uniform Building Code and CBC.

Any development or expansion of facilities associated with subsequent projects implemented consistent with the CAP Update would be required to comply with existing regulations intended to protect people and structures from seismic hazards, soil instability and expansive soils, and would not expose people or structures to potential substantial adverse effects involving risks related to these hazards. The project would not amend or revise any regulations in place to prevent soil erosion, water quality impacts from septic tanks and wastewater disposal, or impacts to unique geologic features or expose more people and structures to these hazards. Therefore, the project would not result in impacts not analyzed in the 2011 GPU PEIR, nor would it result in impacts that are more severe than discussed in the 2011 GPU PEIR. Therefore, the findings of the certified 2011 GPU PEIR regarding geology and soils remain valid, and no further analysis is required.

3.2 Mineral Resources

In Section 2.10, "Mineral Resources," the 2011 GPU PEIR identified potentially significant direct and cumulative impacts related to mineral resources due to the loss of availability of mineral resources that would be valuable to local and state entities.

General Plan Policies COS-10.1 through COS-10.4, COS-10.6, COS-10.8, and COS-10.9 and 2011 GPU PEIR Mitigation Measures Min-1.1 through Min-1.3 facilitate protection of mineral resource areas from incompatible land uses, require that road access to mining facilities be maintained, and provide for streamlined permitting of mining operations. The policies and measures were identified to reduce impacts but not to a less-than-significant level. Therefore, development associated with the General Plan was identified to result in direct and cumulatively significant impacts related to mineral resources availability and impacts to mineral recovery sites.

Existing conditions related to mineral resources have not changed substantially since certification of the 2011 GPU PEIR. Implementation of the project is intended to reduce GHG emissions by improving multimodal transportation and ridesharing options, improving fuel efficiency, increasing building energy efficiency, increasing renewable energy use and access, increasing waste diversion, increasing water conservation, and reducing emissions from agriculture. Potential impacts to mineral resources generally

occur when a development project permanently precludes the potential to mine the resource located within a site.

The 2011 GPU PEIR evaluated the effect of General Plan buildout on the availability of mineral resources and identified a significant impact. The activities anticipated with implementation of the CAP Update would be consistent with COS-10.1 through COS-10.4, COS-10.6, COS-10.8, and COS-10.9, as well as 2011 GPU PEIR Mitigation Measures Min-1.1 through Min-1.3, which facilitate protection of mineral resource areas from incompatible land uses.

Because of the limited footprint associated with most projects that would result from CAP Update implementation, the project would not result in new or more significant impacts related to mineral resources beyond that identified in the 2011 GPU PEIR. In addition, the CAP Update would not amend, revise, or be inconsistent with any existing regulations related to mineral resources. Further, as described above, General Plan policies related to mineral resource extraction and protection discourage development would preclude future development of mining facilities and require that development, including housing, be designed to minimize conflicts with existing and potential future mining facilities.

Smaller renewable energy projects associated with the CAP Update would not involve major grading or dredging activities that would result in the loss of a significant mineral resource. Some smaller projects would be roof mounted and would not result in any ground disturbance. Other smaller facilities may require earthwork activities consisting of minor grading at ground surface for the construction of towers and concrete foundations, which would not result in the loss of availability of a known mineral resource of value to the region. Future large-scale renewable energy projects (including solar and wind projects) would be subject to discretionary review. As part of the County's discretionary review process, all future projects would be evaluated under CEQA and would be required to implement measures to minimize impacts to mineral resources, as necessary. Potential future farmworker housing also would be subject to CEQA compliance and would be required to implement General Plan policies governing development within a mineral resource zone. As necessary, such projects would be required to implement applicable GPU PEIR mitigation measure or recommend new mitigation measures to reduce impacts on mineral resources.

The CAP Update would not result in new or more severe project or cumulative impacts not analyzed in the 2011 GPU PEIR. Therefore, the findings of the certified 2011 GPU PEIR regarding mineral resources remain valid, and no further analysis is required.

3.3 Population and Housing

In Section 2.12, "Population and Housing," the 2011 GPU PEIR did not identify any potentially significant direct or cumulative impacts related to population growth, displacement of housing, or displacement of people. Therefore, no mitigation measures were required. While implementation of the land use plans adopted as part of the General Plan would result in population growth, the General Plan includes a framework for land use and development that is intended to discourage unanticipated and inappropriate growth within the unincorporated county. Similarly, the General Plan complies with state policies

regarding the provision of housing and does not displace substantial numbers of people. Therefore, impacts related to population and housing were identified as less than significant.

Existing conditions related to population and housing have not changed substantially since the certification of the 2011 GPU PEIR. In fact, projected development is lower than anticipated in the 2011 GPU PEIR. Implementation of the CAP Update would not induce population growth directly or indirectly, because the GHG reduction measures do not propose new housing, other than potential future farmworker housing to serve the needs of existing workers by providing housing that is more proximate to work sites, nor do they propose changes to policies or regulations related to land use or residential zoning. Implementation of the project is intended to reduce GHG emissions by improving multimodal transportation and ridesharing options, improving fuel efficiency, increasing building energy efficiency, increasing renewable energy use and access, increasing waste diversion, increasing water conservation, and reducing emissions from agriculture.

GHG reduction measures that would facilitate the construction of future electric vehicle infrastructure (Action E-3.1), transit access improvements (Action T-6.2), multimodal transportation improvements (Action T-5.1), and roof- or ground-mounted solar (Action E-3.2) could require a temporary increase in the number of construction workers. These types of projects are small construction projects, which would not require a large construction crew. Furthermore, construction workers would likely be from the San Diego County area, and permanent, substantial relocation of workers would not be required.

Implementation of the project also could result in the implementation of the Purchase of Agricultural Conservation Easement Program, which could result in additional land being permanently set aside for agriculture, consistent with goals and policies of the General Plan. This could result in a small decrease in the amount of existing acreage designated for residential land use. However, it is not likely that land developed with existing housing or designated for higher densities would be converted because the land value for property that is designated for residential is higher than property designated for agricultural. Therefore, the potential loss of existing/future residential units would be nominal. Similarly, potential large-scale renewable energy projects would not induce substantial unplanned population growth or displace a substantial number of housing units or people. Typically, large-scale renewable energy development would not employ substantial numbers of people beyond project construction, and the construction activities would be temporary. Construction workers would generally be from the region and are generally not expected to relocate for temporary employment. Implementation of the project would not displace residents or induce population growth in the county.

Implementation of the CAP Update measures and actions would not induce unplanned population growth or displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere. Therefore, the project would not result in impacts not analyzed in the 2011 GPU PEIR, and there is no substantial new information indicating that an impact would be more severe than discussed in the 2011 GPU PEIR. The findings of the certified 2011 GPU PEIR pertaining to population growth remain valid, and no further analysis is required.

3.4 Public Services

In Section 2.13, “Public Services,” the 2011 GPU PEIR identified potentially significant direct and cumulative impacts related to the provision of fire, police, school, and other public services because of growth accommodated by buildout of the General Plan.

General Plan Policies LU-1.4, LU-6.4, LU-6.11, LU-12.3, LU-12.4, S-3.4, S-5.1, S-5.2, and S-6.1 through S-6.5 and 2011 GPU PEIR Mitigation Measures Pub-1.1 through Pub-1.9, as well as other measures listed in Sections 2.1 through 2.17 of the 2011 GPU PEIR related to specific resources, were identified to reduce direct and cumulative impacts related to the construction of new fire protection facilities to a less-than-significant level.

General Plan Policies LU-1.4, LU-12.3, and LU-12.4 and 2011 GPU PEIR Mitigation Measures Pub-1.1 through Pub-1.3, as well as other measures listed in Sections 2.1 through 2.17 of the 2011 GPU PEIR related to specific resources, were identified to reduce direct and cumulative impacts related to the construction of new police protection facilities to a less-than-significant level.

General Plan Policies LU-1.4, LU-9.7, LU-12.3, LU-12.4, LU-17.1 through LU-17.4, and LU-18.2 and 2011 GPU PEIR Mitigation Measures Pub-1.1 through Pub-1.3, Pub-3.1, and Pub-3.2 were identified to minimize impacts related to the construction or expansion of new school facilities. The construction of these facilities would have the potential to result in significant environmental impacts. However, the planning, design, approval, and construction of school facilities is not within the County’s jurisdiction; it is the responsibility of the individual school districts. Therefore, although the individual school districts are required to prepare plans for the accommodation of future growth in their district service areas, the County cannot guarantee that impacts associated with the development of new school facilities would not have a significant impact on the environment. Therefore, the 2011 GPU PEIR concludes that direct and cumulative impacts would remain significant and unavoidable because of the County’s limited authority to control the construction of facilities.

General Plan Policies LU-1.4, LU-9.4, LU-9.7, LU-12.3, LU-12.4, LU-18.1, and LU-18.2 and 2011 GPU PEIR Mitigation Measures Pub-1.1 through Pub-1.3, as well as other measures listed in Sections 2.1 through 2.17 of the 2011 GPU PEIR related to specific resources, were identified to reduce direct and cumulative impacts related to the construction/expansion of public libraries facilities to a less-than-significant level.

Existing conditions related to the provision of public services have not changed substantially since certification of the 2011 GPU PEIR. Implementation of the project would require that development projects be consistent with the CAP Update and its GHG reduction measures. Implementation of the project is intended to reduce GHG emissions by improving multimodal transportation and ridesharing options, improving fuel efficiency, increasing building energy efficiency, increasing renewable energy use and access, increasing waste diversion, increasing water conservation, and reducing emissions from agriculture. Implementation of subsequent projects, such as traffic-calming measures and small-scale renewable energy projects, would not directly affect the provision of public services, nor contribute to population growth that could result in an increase for demand

for public services. Similarly, large-scale renewable energy projects would not involve uses that would result in the need for significantly altered services or facilities. Furthermore, future large-scale renewable projects (including solar and wind projects) will be subject to discretionary review. As part of the County's discretionary review process, all future projects would be evaluated under CEQA and would be required to implement measures to minimize impacts to public services, as necessary. Other than the exploration of potential opportunities for the future development of farmworker housing, which would be intended to serve the needs of existing workers, these types of projects would not have a population-generating component and, therefore, no increase in demand for public services is expected.

Implementation of the CAP Update would not directly affect the provision of public services, nor contribute to population growth that could result in an increase in demand for public services. Therefore, the project would not result in impacts not analyzed in the 2011 GPU PEIR, nor would it result in impacts that are more severe than discussed in the 2011 GPU PEIR. The findings of the certified 2011 GPU PEIR pertaining to public services remain valid, and no further analysis is required.

3.5 Recreation

In Section 2.14, "Recreation," the 2011 GPU PEIR identified potentially significant direct and cumulative impacts related to the provision of parks and recreation facilities because of the growth accommodated by buildout of the General Plan. General Plan Policies LU 12.1, LU 12.2, M 12.1 through M 12.8, M 12.10, H 2.2, COS 21.1, COS 21.2, COS 22.1, COS 23.1, COS 23.2, COS 24.1, and COS 24.2 and 2011 GPU PEIR Mitigation Measures Rec-1.1 through Rec-1.12 were identified to reduce impacts associated with increased use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facilities would not occur or be accelerated. Further, General Plan Policies LU 6.4, LU 9.7, LU 18.2, M 12.5, M 12.9, M 12.10, H 2.2, COS 21.2, COS 21.3, COS 21.4, COS 23.1, and COS 23.3 and 2011 GPU PEIR Mitigation Measures Rec-1.1 through Rec-1.4, Rec-1.8, Rec-1.9, Rec-1.11, and Rec-2.1 through Rec-2.6 were identified to reduce impacts associated with the construction and operation of new parks and recreation facilities. The 2011 GPU PEIR determined that adherence to these policies and implementation of identified mitigation measures would reduce direct and cumulative impacts to less than significant.

Existing conditions related to the provision of recreational facilities have not changed substantially since the certification of the 2011 GPU PEIR. Implementation of the project is intended to reduce GHG emissions by improving multimodal transportation and ridesharing options, improving fuel efficiency, increasing building energy efficiency, increasing renewable energy use and access, increasing waste diversion, increasing water conservation, and reducing emissions from agriculture.

Implementation of the CAP Update would not directly affect the provision of park and recreation facilities, nor contribute to population growth that could increase the use of existing park and recreation facilities resulting in the physical deterioration of such facilities. While exploration of future opportunities for the development of farmworker

housing would occur with the CAP Update, this housing would be constructed to serve existing demand for housing closer to worksite locations. Such housing, along with other future projects, would be required to comply with General Plan policies and 2011 GPU PEIR mitigation measures that would effectively reduce potential impacts to less than significant, as described for buildout of the General Plan in the 2011 GPU PEIR. Therefore, the project would not result in impacts not analyzed in the 2011 GPU PEIR, nor would it result in impacts that are more severe than discussed in the 2011 GPU PEIR. Therefore, the findings of the certified 2011 GPU PEIR pertaining to park and recreation facilities remain valid, and no further analysis is required.

3.6 Utilities and Service Systems

In Section 2.16, “Utilities and Service Systems,” the 2011 GPU PEIR identified potentially significant direct and cumulative impacts related to the construction/expansion of water, wastewater, stormwater, and landfill facilities because of the growth accommodated by buildout of the General Plan. As described below, the 2011 GPU PEIR concludes that most effects on provision of utilities are adequately addressed through adherence to General Plan policies and mitigation measures identified in the 2011 GPU PEIR. Impacts related to provision of water and potential for effects on the groundwater table were determined to be significant and unavoidable.

Specifically, the 2011 GPU PEIR made the following determinations:

- Direct and cumulative impacts of General Plan implementation related to the potential for exceedance of Regional Water Quality Control Board’s wastewater treatment requirements would be reduced to less than significant through compliance with General Plan Policies LU 9.4, LU 12.1, LU 12.2, and LU 14.1 through LU 14.4 and 2011 GPU PEIR Mitigation Measures USS-1.1 through USS-1.3.
- Direct and cumulative impacts of General Plan implementation related to provision of new water or wastewater treatment facilities or the expansion of existing facilities, the construction of which could cause significant environmental effects would be reduced to less than significant through compliance with General Plan Policies LU 1.2, LU 4.3, and H 1.3 and 2011 GPU PEIR Mitigation Measures USS-2.1 through USS-2.3.
- Direct and cumulative impacts of General Plan implementation related to provision of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects, would be reduced to less than significant through compliance with General Plan Policies LU 6.5, LU 6.9, and COS 4.3 and 2011 GPU PEIR Mitigation Measures USS-3.1 through USS-3.5.
- Direct and cumulative impacts of General Plan implementation related to provision of adequate wastewater capacity to service projected demand in addition to a provider’s existing commitments would be reduced to less than significant through compliance with General Plan Policy LU 4.3 and 2011 GPU PEIR Mitigation Measures USS-1.1 through USS-1.3.
- Direct and cumulative impacts of General Plan implementation would result in significant and unavoidable impacts related to demand for water that exceeds

existing entitlements and resources, or necessitates new or expanded entitlements; and substantial depletion of groundwater supplies or interference with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level despite compliance with General Plan Policies LU 8.1, LU 8.2, LU 13.1, LU 13.2, COS 4.1 through COS 4.4, COS 5.2, and COS 5.5 and 2011 GPU PEIR Mitigation Measures USS-4.1 through USS-4.7.

- Direct and cumulative impacts of General Plan implementation would result in significant and unavoidable impacts related to landfill capacity despite compliance with General Plan Policies LU 12.1, LU 12.2, LU 16.1, LU 16.2, LU 16.3, COS 17.1 through COS 17.4, COS 17.6, COS 17.7, and COS 17.8 and 2011 GPU PEIR Mitigation Measures USS-6.1 through USS-6.8.

Existing conditions related to utilities have not changed substantially since the certification of the 2011 GPU PEIR. Implementation of the project would require that development projects be consistent with the CAP Update and its GHG reduction measures and supporting efforts. The CAP Update would not result in development proposals with a population-generating component. While the potential for future development of farmworker housing would be explored as a result of the CAP Update, such housing would be constructed to serve existing farmworker populations by providing housing closer to worksite locations. Any associated impacts related to utilities or service systems would not be new or more significant as compared to the findings of the 2011 GPU PEIR. Therefore, the CAP Update would not increase long-term demand for utilities or services.

Construction activities associated with subsequent projects required to implement the CAP Update may require temporary water, wastewater, and solid waste services. For example, a minimal amount of water may be required for dust control during construction and grading activities, portable restrooms may be required for work crews, and construction and demolition materials may be disposed of in a landfill. Depending on conditions, water use for dust control and soil stabilization could be obtained via existing on-site supplies or trucked from an alternative source. This minor, short-term use would be arranged between the contractor and water supplier and would not contribute to an exceedance of available water supplies. Similarly, portable restrooms are self-contained, and the waste would be hauled off-site to a wastewater treatment facility for disposal. This service is typically provided by an independent contractor permitted to handle, haul, and dispose of sanitary sewage. Pursuant to 40 CFR Part 403.5, hauled waste must be disposed of at a designated publicly owned treatment facility. Typically, publicly owned treatment facilities are responsible for implementing permit programs for hauled waste and ensure that adequate treatment capacity exists. Construction and demolition materials are required to be transported to a permitted solid waste facility and therefore will comply with federal, state, and local statutes and related to solid waste. An increase in operational water use also could occur if future development of farmworker housing occurs. However, the CAP Update recommends exploring opportunities for the development of such housing and does not prescribe specific sites or project sizes. Any future housing development would be required to comply with CEQA and to mitigate any potential impacts to the extent feasible. Any related impacts with respect to water use would not be new or more severe as compared to the conclusions of the 2011 GPU PEIR.

In addition, implementation of the CAP Update would promote clean energy and sustainable resource management by supporting future electric vehicle infrastructure, transit access improvements, and small-scale and large-scale renewable energy development. Development of large-scale renewable energy generation infrastructure, including energy transmission and storage infrastructure, could result in physical impacts during construction and operation. However, these projects would be required to comply with CEQA on a project level, and these impacts, such as air quality and water quality impacts that could occur during construction and operational impacts on aesthetics and biological resources are analyzed at a programmatic level in other sections of this ~~draft~~ SEIR.

Other measures and actions would improve water efficiency by formally adopting a water reduction target for new and existing buildings and replacing water-wasting equipment. Measures and actions related to solid waste disposal may have a positive impact on utilities because of implementation of measures to enhance the County's diversion rate and integrate organics into the collection process. This would result in advances in waste diversion goals and reductions in GHG emissions associated with landfill and other waste management practices. Any new facilities or programs would be required to comply with existing federal, state, and local statutes and regulations related to solid waste permitting. In addition, the County's waste diversion goals would continue to be consistent with Assembly Bill (AB) 939, which requires a 50 percent waste diversion goal, and AB 341, which requires a statewide 75 percent waste diversion for businesses.

Therefore, the project would not result in impacts not analyzed in the 2011 GPU PEIR, nor would it result in impacts that are more severe than discussed in the 2011 GPU PEIR. The findings of the certified 2011 GPU PEIR pertaining to utilities and service systems remain valid, and no further analysis is required.

This page intentionally left blank.

CHAPTER 4 OTHER CEQA SECTIONS

4.1 Growth Inducement

CEQA Section 21100(b)(5) specifies that the growth-inducing impacts of a project must be addressed in an EIR. A project can induce growth directly, indirectly, or both. Direct growth inducement would result if, for instance, a project involved construction of new housing. A project also can have indirect growth inducement potential if it would establish substantial new permanent employment opportunities (e.g., commercial, industrial or governmental enterprises) that would encourage development of new housing for employees, or if it would involve a substantial construction effort creating short-term employment opportunities. Similarly, under CEQA, a project would indirectly induce growth if it would remove an obstacle to additional growth and development, such as removing a constraint on a required public service. Infrastructure projects could also indirectly stimulate growth by enhancing access to properties or increasing their desirability for development.

Growth inducement itself is not an environmental effect but may foreseeably lead to environmental effects. If substantial growth inducement occurs, it can result in secondary environmental effects, such as increased demand for housing, demand for other community and public services and infrastructure capacity, increased traffic and noise, degradation of air or water quality, degradation or loss of plant or animal habitats, conversion of agricultural and open-space land to urban uses, and other effects.

4.1.1 Growth-Inducing Impacts

The General Plan generally shifts densities westward of the San Diego County Water Authority boundary and concentrates the highest densities around existing communities, in Village centers, to encourage a compact and efficient land use pattern. This type of land use pattern promotes efficiencies regarding the provision of infrastructure and community services and promotes the preservation of high-quality habitat in the most remote portions of the unincorporated county.

The 2011 GPU PEIR discussed the growth-inducing impacts of the General Plan in Chapter 3, “Growth Inducing Impacts” (pages 3-1 through 3-6). The detailed discussion provided in the 2011 GPU PEIR is incorporated into this ~~draft~~ SEIR by reference. As described therein, implementation of the General Plan reduces the potential for new housing units compared to the previous General Plan, but its implementation is still considered a growth accommodating action because it provides direction for the planning and management of population growth. It is also considered a growth-inducing action because it facilitates economic expansion and associated infrastructure improvements (i.e., water, sewer, and circulation systems) that could further remove existing obstacles to growth.

The General Plan, as amended, provides land use development patterns and growth policies that allow the planned and orderly expansion of development supported by adequate public services. A project that would induce unplanned growth could indirectly cause additional adverse environmental and public services impacts not previously

envisioned. To assess whether implementation of the CAP Update would result in growth-inducing effects beyond what is currently anticipated, this ~~draft~~ SEIR analyzes the degree to which the growth associated with implementation of the project would result in growth inducing impacts beyond what was anticipated for the General Plan, as amended.

4.1.1.1 Population Growth

The project is not by itself directly growth inducing because it does not increase densities or modify intensities of allowable land uses. The CAP Update, consistency modifications to the General Plan and 2011 GPU PEIR, updates to the GHG Threshold, and Guidelines for Determining Significance would implement the requirements of the General Plan and 2011 GPU PEIR to establish GHG emission reduction targets and create a plan that contains strategies and measures to achieve those targets. The project would not remove a constraint on a required public service or stimulate growth by enhancing access to properties that were previously inaccessible.

Approval and implementation of the project may result in improvements to alternative modes of transportation, including bicycle and pedestrian infrastructure, that would reduce GHG emissions by improving multimodal transportation options through increased connectivity, but would not increase wholesale access to any areas within the county in the way that constructing new roadways would. Actions that commit the County to work with partners to promote and support on-site renewable energy generation and storage are intended to increase renewable energy generation and use in the unincorporated area but would not be anticipated to substantially diminish an existing obstacle to growth. Similarly, the project would not result in the expansion of a wastewater treatment plant or eliminate any other constraint to development. To the extent that programs initiated by the CAP Update indirectly result in new or different housing (e.g., Action A-4.1.b, related to evaluating opportunities for farmworker housing), this development would be a modified expression of the growth anticipated and evaluated in the 2011 GPU PEIR.

As explained further in Chapter 1, “Project Description,” the CAP Update has been prepared consistent with the tiering and streamlining provisions of State CEQA Guidelines Section 15183.5, which allows for streamlining future project-specific GHG emissions analyses where projects considered by the County are within the buildout assumptions included in the CAP Update and can demonstrate consistency with the CAP Update measures and actions. The County has prepared a CAP Consistency Review Checklist that provides a process and evidence by which subsequent development projects would demonstrate consistency with the CAP Update. If subsequent projects are found to be consistent with the CAP Update (and within the growth projections assumed therein), then the environmental documents prepared for these projects can rely upon and incorporate by reference the cumulative GHG analysis for the CAP Update as presented in this ~~draft~~ SEIR. Evaluation of all other technical resource topics considered under CEQA would still be required.

The growth anticipated through the planning horizon for the CAP Update is within the scope of the development anticipated during preparation of the General Plan and reflected in the 2011 GPU PEIR analyses. As described above, the County has established growth management policies, which would be supported by measures and

actions in the CAP Update. The CAP Update's GHG emissions inventory and forecasts are based on predicted growth in existing demographic forecasts, including population, jobs, and household growth for the unincorporated county. The data were sourced from modeling conducted in the San Diego Association of Governments' 2021 Regional Transportation Plan. Therefore, to the extent that future projects streamline GHG analyses under the CAP, this would not result in indirect inducement of growth beyond the scope of the 2011 GPU PEIR.

The CAP Update establishes the measures necessary to address GHG emissions in a manner that achieves state and County goals. It is based on regional growth forecasts that are within the scope of the 2011 GPU PEIR and quantified forecasting that demonstrates the ability to meet established targets. The streamlining provision may reduce the need for subsequent development projects that are within the scope of projected growth to undertake project-specific analysis of GHG emissions and identify mitigation measures. However, establishing a program for addressing cumulative emissions from the community would not facilitate growth or indirectly remove obstacles to growth.

4.1.1.2 Economic Growth

Implementation of the project would likely result in some capital improvements and may result in incentivization of energy efficiency and renewable energy improvements, expansion of alternatively fueled vehicles, water conservation improvements, and expansion of waste collection services. These actions would result in a small number of new jobs, specifically related to construction and maintenance services, but are not expected to result in a substantial increase in the demand for additional housing or services. These jobs would likely be filled by the existing labor pool within the county, and are, therefore, not expected to be growth inducing.

4.1.1.3 Conclusion

The project would result in the adoption and implementation of strategies and measures that would need to be undertaken to reduce GHG emissions consistent with state legislative requirements. The project would not result in growth-inducing impacts associated with removing obstacles to growth, such as the extension of a roadway, or expansion of water and sewer services. Similarly, the project would not result in a substantial expansion of public services. The project does include a GPA to revise the General Plan and 2011 GPU PEIR to achieve consistency among the CAP Update and previous goals, policies, and mitigation measures; however, it would not result in an increase in density or change in land use. Therefore, the project would not result in direct growth inducement related to land use changes. Finally, although the project may result in a small increase in jobs related to the expansion of alternative transportation, energy, and solid waste infrastructure, it is not expected to be growth inducing because the locally available labor pool is anticipated to be able to fill any resultant positions.

4.2 Significant and Unavoidable Adverse Impacts

State CEQA Guidelines Section 15126.2(b) requires EIRs to include a discussion of the significant environmental effects that cannot be avoided if the proposed project is implemented. Because the analysis in this ~~draft~~ SEIR is intended to supplement the analysis in the 2011 GPU PEIR, the following describes the new or more severe significant and unavoidable impacts associated with the project compared to those disclosed in the 2011 GPU PEIR. Full descriptions of the new or more severe significant and unavoidable impacts of the proposed project are provided in Sections 2.1 through 2.15 of this SEIR, as applicable.

4.2.1.1 Impacts that Remain Significant and Unavoidable

Implementation of the CAP Update would result in significant and unavoidable impacts in the following issue areas; however, the magnitude of the impact would be consistent with the impacts disclosed in the 2011 GPU PEIR:

Aesthetics

- Visual Character or Quality (Project and Cumulative)
- Light and Glare (Project and Cumulative)

Agriculture and Forestry Resources

- Direct or Indirect Conversion of Agricultural Resources (Project and Cumulative)

Air Quality

- Air Quality Violations (Project and Cumulative)
- Non-Attainment Criteria Pollutants (Project and Cumulative)
- Sensitive Receptors (Project and Cumulative)

Biological Resources

- Special-Status Plant and Wildlife Species (Project and Cumulative)
- Riparian Habitat and Other Sensitive Natural Communities (Project and Cumulative)
- Wildlife Movement Corridors and Nursery Sites (Project and Cumulative)

Hazards and Hazardous Materials

- Wildland Fires (Project and Cumulative)

Hydrology and Water Quality

- Surface Water and Groundwater Quality (Project and Cumulative)
- Groundwater Supply and Recharge (Project and Cumulative)

Noise

- Excessive Noise Levels (Project and Cumulative)

Transportation

- Increase Hazards Due to a Design Features (Project and Cumulative)

4.2.1.2 New or More Severe Significant and Unavoidable Impacts

New or substantially more severe significant and unavoidable impacts are anticipated to result from implementation of the CAP Update in the following issue areas:

Aesthetics

- Scenic Vistas and Scenic Resources (Project and Cumulative)

Agriculture and Forestry Resources

- Conflict with Agricultural Zoning or Williamson Act Contract Lands (Project and Cumulative)
- Direct and Indirect Conversion or Loss of Forest Land (Project and Cumulative)

Cultural and Paleontological Resources

- Historical Resources (Project and Cumulative)
- Archaeological Resources (Project and Cumulative)
- Paleontological Resources (Project and Cumulative)
- Human Remains (Project and Cumulative)

Land Use and Planning

- Physically Divide an Established Community (Project and Cumulative)

Tribal Cultural Resources

- Tribal Cultural Resources (Project and Cumulative)

4.3 Significant Irreversible Environmental Changes

State CEQA Guidelines Section 15126.2(c) requires that an EIR evaluate the commitment of nonrenewable resources that would be considered irreversible by future generations. An example of this type of commitment may include the construction of a roadway that would provide access to previously inaccessible environmental lands. Irretrievable commitments of resources should be evaluated to ensure that such current consumption is justified. In addition, Section 15126.2(b) of the State CEQA Guidelines indicates that potentially significant energy implications of a project shall be considered in an EIR to the extent relevant and applicable to the project. This draft SEIR considers the use of energy in Section 2.6, “Energy,” which should be referred to for a comprehensive evaluation of energy use related to the project.

As previously described, the project would identify strategies and measures that would need to be undertaken to reduce GHG emissions consistent with state legislative requirements and would not result in growth-inducing impacts. As described in Section 1.2, “Project Objectives,” in Chapter 1, “Project Description,” the primary focus of the project is to reduce community and County operations’ GHG emissions to meet the County’s GHG reduction targets identified in the CAP Update. The measures encourage improvements to alternative transportation infrastructure and the built environment, energy efficiency and water conservation, agricultural conservation, and enhanced waste processing. Some of the measures may indirectly result in the construction of some improvements which would

require the use of fuel and building materials during construction; however, the result of the improvements would be a long-term reduction in energy consumption and a reduction in the use of nonrenewable energy sources. Continued operation and maintenance of some of the facilities may require the use of additional fuel and water consumption; however, such use would be insignificant compared to the overall reduction in use of these resources that would result from CAP Update implementation. Therefore, no significant irreversible environmental changes would occur.

4.4 Cumulative Effects of In-process General Plan Amendments

This section addresses the Court of Appeal decision in the *Golden Door Properties, LLC, v. County of San Diego*, 50 Cal. App. 5th 467 (Golden Door) with regard to the cumulative effects of in-process General Plan Amendments (in-process GPAs), which represent projects proposed in the unincorporated county that would require amendments to the General Plan that are in-process but have not yet been approved. The in-process GPAs are those projects that filed an application with Planning & Development Services, submitted materials for review, or have released documents for public review, but not approved by the County prior to this CAP Update SEIR Notice of Preparation (December 10, 2020). GPAs that were approved by the County Board of Supervisors prior to this CAP Update SEIR Notice of Preparation (December 10, 2020) are already included in the baseline projections for the CAP Update because they were approved prior to commencing analysis on the CAP Update SEIR.

This section includes an analysis of the potential cumulative effects of the implementation of in-process GPAs both in terms of 1) whether they would contribute to new or more significant cumulative impacts on other resources in combination with implementation of the proposed CAP Update and 2) how they affect the County's ability to meet its GHG reduction targets (see the analysis of GHG impacts below). Question 1 -- the cumulative impact of these in-process GPA projects -- is addressed separately in this Chapter below to address the County's revised approach in response to the Golden Door decision. (see Table 1-1 in Chapter 1, "Project Description," for a summary of where in this draft SEIR each of the decision holdings are addressed.) Question 2 -- whether approval of in-process GPAs could affect the County's ability to meet its GHG reduction targets -- is also addressed below.

As discussed in further detail below, the cumulative impact analyses contained in the resource sections in Chapter 2 of this SEIR utilize a projections-based approach to assessing whether the project would make a considerable contribution to a significant cumulative impact. In contrast, this analysis employs a list-based approach in response to the Court's holding that the cumulative impacts of proposed in-process GPAs should be specifically addressed. While an accurate accounting of the effects of the project in combination with the in-process GPAs is not fully achievable given that the location and other detail of future projects associated with the CAP Update is not currently known, this analysis attempts to provide a general accounting of the types of impacts that would combine to result in either a considerable contribution to an existing cumulative impact or a new significant cumulative impact.

Mitigation Measure M-GHG-1

One of the primary holdings in the Golden Door decision relates to whether a GHG mitigation measure in the 2018 SEIR, called M-GHG-1, was CEQA-compliant. Under M-GHG-1, certain GPA projects would have been allowed to mitigate their GHG emissions by purchasing carbon offsets originating outside the unincorporated County of San Diego if none were available within the unincorporated county. As part of the 2018 CAP SEIR, in-process GPAs that the County had not adopted by August 2017 were not included in the CAP's GHG projections; and, to the extent that in-process and future GPAs would increase GHG emissions above projected CAP levels, their impact would be significant (i.e., inconsistent with the CAP). In other words, in-process and future GPAs had the potential to impact the ability of the County to meet its targets. As discussed in further detail below, this draft SEIR no longer proposes M-GHG-1 or similar mitigation to mitigate for GHG impacts of in-process GPAs.

As described in Chapter 1, "Project Description," of this SEIR, the CAP Update is being prepared to serve as mitigation to reduce GHG emissions resulting from anticipated buildout of the General Plan. To the extent a project is consistent with land use allowed under the General Plan, GHG emissions are addressed with CAP Update GHG reduction measures. Because the CAP Update is a requirement of the approved General Plan, it only addresses development consistent with the General Plan. The CAP's GHG projections, therefore, do not include in-process GPA projects for which the County has received applications, but that are in some stage of processing (e.g., staff is determining what its recommendation of approval will be and what conditions are required, and/or the decision maker is determining whether it will approve, modify, or deny the project). Thus, if a project's land use is consistent with the General Plan (as amended as of December 10, 2020), then its GHG emissions are already accounted for in the CAP's projections. When a project is within the scope of the General Plan, the proposed project will help the County achieve its share of GHG reduction targets by implementing CAP Update reduction measures through the CAP Consistency Review Checklist.

When a proposed project is outside the scope of the General Plan buildout, requiring a General Plan amendment, that project must use different means to demonstrate that the project does not obstruct the County's ability to achieve its share of GHG reduction targets and have a significant impact on GHG emissions. In the 2018 CAP and SEIR, the GPAs had to demonstrate net zero GHG emissions, otherwise they would add GHG emissions beyond what would be allowable to meet GHG reduction targets. To address that problem, the 2018 SEIR allowed GPAs to use M-GHG-1 to mitigate GHG emissions by purchasing carbon offsets outside the unincorporated county.

This SEIR no longer relies on M-GHG-1, or anything equivalent, to mitigate the GHG impacts of GPAs. This SEIR contains no offsets or other mitigation measures facilitating GPAs. Rather, each in-process GPA would undergo its own project-level analysis of GHG impacts pursuant to CEQA and would develop its own threshold of significance and mitigation pathways for reducing that project's impact on GHG emissions. These in-process GPAs and future GPA applications are inconsistent with the CAP Update if they are inconsistent with the density or intensity allowed in the General Plan. They cannot use the CAP Update to streamline their GHG analysis. Therefore, depending on the in-

process GPA, they could result in a potentially significant GHG impact and would be required to mitigate those impacts to the extent feasible.

Cumulative Impacts of In-Process GPAs

As stated above, M-GHG-1 of the 2018 CAP SEIR or equivalent will not be applied to in-process GPAs. As noted above, cumulative GHG impacts related to whether the County would be able to meet its reduction targets with approval of the in-process GPAs would be considered significant, and future project-specific analyses would be required to examine the ability of these GPA projects to successfully mitigate the direct impact of the GPA projects and their cumulative impacts. However, the Golden Door decision also discusses the potential for in-process GPAs to result in other types of cumulative impacts, and identifies the need for this SEIR to more completely assess the cumulative impacts of the in-process GPAs on other environmental resources besides GHG, given their potential to contribute to an existing cumulative impact or result in a new significant cumulative impact.

As described in the Introduction to Chapter 2, “Environmental Effects of the Project,” of this SEIR, the State CEQA Guidelines identify two basic methods for establishing the cumulative environment in which the project is to be considered: (1) the use of a list of past, present, and probable future projects or (2) the use of adopted projections from a general plan, other regional planning document, or a certified EIR for such a planning document. Given the programmatic nature of the CAP Update, which is being prepared as mitigation for General Plan implementation, and the fact that this SEIR is a supplemental analysis to the 2011 GPU PEIR (a programmatic analysis of the effects of build-out of the General Plan), a projections approach is used in the resource sections of Chapter 2 of this SEIR to assess the cumulative impacts of the project. Such an approach is well suited to cumulative impacts that are the result of many individual contributors, that take place over a large impact area, or that are caused by incremental contributions over a long period of time.

While the projections-based approach has been retained in all resource sections of Chapter 2 of this SEIR to assess whether implementation of the project would either contribute considerably to or result in a new significant cumulative impact, the analysis below provides a list-based cumulative impact analysis to address the Court’s focus on the need to consider the environmental impacts of the proposed project in combination with in-process GPA projects. These projects, listed below in Table 4-1, consist of in-process GPAs that have not been approved prior to December 10, 2020 (date of Notice of Preparation of this SEIR). Consistent with the Court’s reasoning, in-process GPAs are the focus of this list-based analysis because they represent the potential for a change in the forecast conditions. The in-process GPAs considered in this analysis are shown on Figure 4-1 below.

The GPA projects listed in Table 4-1 and shown on Figure 4.1 are not included in SANDAG’s 2021 Regional Transportation Plan/Sustainable Communities Strategy, which forms the basis of the analysis in Chapter 2. The listed GPA projects are considered reasonably foreseeable for this SEIR because the detail available on the projects is sufficient to understand the changes in land use designations that are proposed (even though the GPA applications are in various stages of consideration and review, and

recommendations by staff and approval by decision makers is unknown). As noted above, in-process GPAs are not considered in the CAP Update's GHG projections, and their direct and cumulative impacts are not covered in the 2011 GPU PEIR. Although a different method is utilized to consider the resource specific cumulative impacts of the project in combination with the in-process GPAs, the overall approach is to consider whether the project, in combination with other reasonably foreseeable projects in the unincorporated county, would contribute considerably to an existing cumulative impact or result in a new or more severe cumulative impact than identified in the 2011 GPU PEIR.

4.4.1 Aesthetics

4.4.1.1 2011 GPU PEIR Determination

Cumulative impact analysis for aesthetics related to the implementation of the General Plan is discussed in Section 2.1.4 of the 2011 GPU PEIR and is summarized in Section 2.1.3.6 of this SEIR. The 2011 GPU PEIR determined that the General Plan goals and policies and 2011 GPU PEIR mitigation measures, in combination with other applicable regulations would mitigate cumulative impacts to scenic vistas and scenic resources to a less-than-significant level. The potentially significant cumulative impacts related to visual character or quality and light or glare would remain significant after implementation of General Plan goals and policies and 2011 GPU PEIR mitigation measures. Therefore, implementation of the General Plan would result in significant and unavoidable cumulative impacts related to visual character or quality and light or glare.

4.4.1.2 CAP Update Impact Analysis with In-Process GPAs

The geographic scope of the cumulative impact analysis for aesthetics is the immediate vicinity of view corridors, viewsheds, or scenic resources in the unincorporated county, including areas surrounding the two astronomical observatories. The unincorporated county contains many scenic vistas and resources, including coastlines, open space areas, historic structures, mountains, and watersheds. Future projects associated with the CAP Update could be located in rural or open areas of the unincorporated county, and therefore have the potential to result in greater visual contrast compared to existing conditions. The in-process GPAs could also occur in rural areas in the unincorporated county (e.g., Ivanhoe Ranch and Harmony Grove Village South) and could result in visual changes to the areas during construction and permanently introduce new structure that could result in impacts on scenic vistas and resources.

Scenic Vistas and Scenic Resources

Implementation of projects associated with the CAP Update could result in visual changes during construction of new facilities and as a result of the introduction of new facilities or modifications to existing facilities that could result in impacts on scenic vistas and resources and produce new sources of light or glare. Construction and operational activities of in-process GPAs also would result in visual changes within the unincorporated county resulting from activities such as the removal of trees/vegetation, development of vertical structures (e.g., buildings and utility infrastructure), and

installation of new lights or reflective materials in the unincorporated county. The incremental impacts of the CAP Update, in combination with the in-process GPAs, would cause or contribute to cumulative aesthetic conditions in the vicinity of existing view corridors, viewshed, scenic resources and areas surrounding the two astronomical observatory sites in the unincorporated county. The addition of incremental impacts from the CAP Update and in-process GPAs could result in a cumulative considerable contribution to significant cumulative impacts to scenic vistas and resources for which impacts cannot be mitigated to a less-than-significant level.

Compliance with relevant General Plan policies (Policies LU-6.6, LU-6.9, LU-10.2, LU-11.2, LU-12.4, COS-11.3, and COS-12.2) and applicable regulations related to scenic vistas and resources protection would reduce potential cumulative impacts associated with the CAP Update. Additionally, implementation of the adopted 2011 GPU PEIR Mitigation Measures Aes-1.2 and Aes-1.6 through Aes-1.9 and CAP Update Mitigation Measure Aes-1 (incorporating mitigation to reduce significant aesthetic impacts) would reduce the severity of the CAP Update's incremental contribution to cumulative impacts, but would not ensure that the CAP Update's contribution would be less than cumulatively considerable due to the uncertainty of the types, locations, and scale of future renewable energy projects that would be required to meet the GHG reduction goals of the CAP Update. Therefore, the CAP Update's contribution to these impacts would be cumulatively considerable. The cumulative impact would be significant. This is a new or more severe impact not disclosed in the 2011 GPU PEIR.

Visual Character or Quality

Cumulative projects in the unincorporated county also would contribute to a significant cumulative impact related to visual character or quality if, in combination, they would substantially degrade the existing visual character or quality of the site and its surroundings by introducing features that would detract from or contrast with existing visual character or quality. As analyzed in Section 2.1.3.4 of this SEIR, the CAP Update would further existing programs and provide new and modified infrastructure in new and established communities to reduce GHG emissions that could have an impact on visual character or quality within the unincorporated county through introduction of new uses that could alter the existing visual conditions. Implementation of adopted General Plan policies (Policies LU-6.6, LU-6.9, LU-10.2, LU-11.2, LU-12.4, COS-11.3, and COS-12.2), implementation of 2011 GPU PEIR mitigation measures (Mitigation Measures Aes-1.2, Aes-1.6 through Aes-1.9) and CAP Update Mitigation Measure Aes-1, and compliance with applicable design guidelines would reduce the impacts associated with the deterioration of visual character or quality to a less-than-significant level. However, impacts to visual character or quality resulting from implementation of large-scale renewable energy projects associated with CAP Update would remain significant after implementation of mitigation measures.

If approved, in-process GPAs would include development of residential housing, conversion of office land use to residential use, and construction of commercial uses in new or existing communities that could degrade the existing character or quality or transform the surrounding community. Therefore, the CAP Update together with the in-process GPAs would have the potential to contribute to a significant cumulative impact

related to visual character or quality. While implementation of the adopted 2011 GPU PEIR mitigation measures and CAP Update Mitigation Measure Aes-1 (incorporating mitigation to reduce significant aesthetic impacts) would reduce the severity of the CAP Update's incremental contribution to cumulative impacts, it would not ensure that the CAP Update's contribution would be less than cumulatively considerable due to the uncertainty of the types, locations, and scale of future renewable energy projects required to meet the GHG emissions reduction goals of the CAP Update. Therefore, the CAP Update's contribution to this impact would be cumulatively considerable but not more severe than disclosed in the 2011 GPU PEIR. The cumulative impact would be significant and would be consistent with the conclusion in the 2011 GPU PEIR. Implementation of the CAP Update in combination with the in-process GPAs would not result in a new or more severe significant cumulative impact not disclosed in the 2011 GPU PEIR.

Light and Glare

The incremental contribution of future projects associated with the CAP Update could result in a cumulative impact related to light or glare if one or more of the projects were to be located near other cumulative projects that are significant sources of light or glare. Discussion under Section 2.1.3.5 of this SEIR explains that at a program level it is not possible to determine that the light and glare impacts resulting from implementation of large-scale renewable energy projects would be mitigated to a less-than-significant level. Implementation of 2011 GPU PEIR adopted Mitigation Measures Aes-4.2 and Aes-4.6 through Aes-4.9, and CAP Update Mitigation Measures Aes-1 (incorporating mitigation to reduce significant aesthetic impacts), Aes-2 (preparing a Lighting Mitigation Plan), and Aes-3 (preparing a Shadow Flicker Study), would reduce the severity of the CAP Update's incremental contribution to cumulative impacts, but would not ensure that the CAP Update's contribution would be less than cumulatively considerable due to the uncertainty of the types, locations, and scale of future renewable energy projects required to meet the GHG emissions reduction goals of the CAP Update. In-process GPAs also could result in impacts to light and glare through installation of new lighting or reflective materials in new buildings in the unincorporated county. The identified in-process GPAs would be developed in accordance with applicable General Plan policies, area/community plans, and the mitigation measures and/or conditions of approval imposed as part of project-specific CEQA and permitting processes, therefore reducing the potential for them to result in significant impacts related to light and glare. However, given the extent of new development that these projects would introduce, there is an existing cumulative impact in the unincorporated county on light and glare, and it is likely that both the in-process GPAs and the CAP Update would make a considerable contribution to the cumulative impact. Accordingly, the cumulative impact related to light or glare would be significant and unavoidable. Implementation of the CAP Update would not result in a new significant cumulative impact not disclosed in the 2011 GPU PEIR.

4.4.1.3 Summary

Cumulative impacts related to visual character or quality and light or glare would be consistent with the 2011 GPU PEIR. Implementation of the CAP Update would result in a cumulatively considerable contribution to a significant cumulative impact related to scenic vistas and scenic resources. Therefore, implementation of the CAP Update, in

combination with the in-process GPAs, **would result in a new or more severe impact** related to scenic vistas and scenic resources not disclosed in the 2011 GPU PEIR.

4.4.2 Agricultural Resources

4.4.2.1 2011 GPU PEIR Determination

The cumulative impact analysis for agricultural resources related to the implementation of the General Plan is contained in Section 2.2.4 of the 2011 GPU PEIR and is summarized in Section 2.2.3.6 of this SEIR. The 2011 GPU PEIR determined that cumulative development would contribute to significant cumulative impacts related to direct and indirect conversion of agricultural resources resulting from General Plan implementation. Compliance with existing regulations would ensure that no existing significant cumulative impact exists with respect to conflicts with agricultural zoning or Williamson Act contract lands.

4.4.2.2 CAP Update Impact Analysis with In-Process GPAs

The geographic scope for cumulative analysis of agricultural resources is the San Diego region. This scope is defined by the subtropical climate conditions of southern California that optimize the production of a variety of crops in the region.

Impacts would be cumulative in nature if the CAP Update in combination with the in-process GPAs would contribute to a regional loss of agricultural resources because of direct or indirect conversion; would contribute to a regionally significant impact resulting from conflicts with agricultural zoning and Williamson Act contracts; would contribute to a regionally significant impact resulting from conflicts with forest or timberland zoning; and would contribute to a regionally substantial impact resulting from direct or indirect conversion of loss of forest resources.

Direct or Indirect Conversion of Agricultural Resources, Conflict with Zoning, or Conflict with Williamson Act Contract Lands

Implementation of the CAP Update would include measures and actions to preserve existing agricultural land and improve land management practices that generally would not result in the conversion of agricultural lands to other uses. However, implementation of CAP Update Action E-3.3 would have the potential to result in large-scale renewable energy projects, which could result in the direct or indirect conversion of agricultural resources. Although large-scale renewable energy projects would be required to obtain applicable permits, undergo discretionary review, evaluate project-specific impacts under CEQA, and mitigate those impacts to the extent feasible, it cannot be guaranteed that impacts related to direct or indirect conversion of agricultural resources would be reduced to a less-than-significant level.

The in-process GPAs also include projects that would increase housing development density in rural areas, some of which would result in conversion of agricultural lands to residential use. The in-process GPAs would be developed in accordance with the mitigation measures and/or conditions of approval imposed as part of project-specific

CEQA and permitting processes, therefore reducing the potential for them to result in significant impacts related to agricultural uses. However, given the extent of new development that these projects would introduce, it is likely that they would make a considerable contribution to a cumulative impact. Therefore, implementation of the CAP Update, in combination with the in-process GPAs, would result in a considerable contribution to an existing cumulative effect related the conversion of agricultural resources, consistent with the conclusion in the 2011 GPU PEIR. This would not be a new or more severe impact not disclosed in the 2011 GPU PEIR. Similarly, development of large-scale renewable energy projects and in-process GPAs could result in conflicts with agricultural zoning or Williamson Act contracts. The CAP Update together with the in-process GPAs would result in a considerable contribution to an adverse cumulative condition related to conflicts with agricultural zoning or Williamson Act contracts. This would be a new significant impact not disclosed in the 2011 GPU PEIR.

Direct and Indirect Conversion or Loss of Forest Land or Conflict with Forest Zoning

San Diego County does not include lands zoned specifically for forest land, timberland, or timberland production. Nor does the County does have land use authority over development in national forests. Therefore, the CAP Update and in-process GPAs in the unincorporated county would not result in conflicts with zoning for forest land or timberland. The CAP Update and in-process GPAs would not contribute to a cumulative impact related to conflicts with forest or timberland zoning. This impact would be less than significant. This would not be a new or more severe impact than disclosed in the 2011 GPU PEIR. Although the County does not contain land designated as forest land, California Public Resources Code Section 12220(g) defines “forest land” as land that can support 10 percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits. Therefore, forest land occurs in many portions of the county. Implementation of the CAP Update Action E-3.3 would have the potential to result in large-scale renewable energy projects, which could result in the siting of new facilities or infrastructure in areas with existing forest land. The in-process GPAs could occur in rural or open areas of the unincorporated county, which could require installation of new utilities infrastructure in or immediately adjacent to existing forest land. Implementation of the in-process GPAs would have the potential to convert forestland to non-forest use. Therefore, large-scale renewable energy projects in combination with the in-process GPAs could result in the loss or conversion of forest land and would result in a considerable contribution to an existing cumulative effect related to the conversion of loss of forest land. The impact would be significant and would be a new or more severe impact not identified in the 2011 GPU PEIR.

4.4.2.3 Summary

Cumulative impacts related to conversion of agricultural resources would be consistent with the 2011 GPU PEIR. Implementation of the CAP Update together with the in-process GPAs would result in a considerable contribution to cumulative impacts related to conflict

with agricultural zoning or Williamson Act contracts and the loss or conversion of forest land. The cumulative impacts related to conflict with agricultural zoning or Williamson Act contracts and the loss or conversion of forest land would be significant and were not disclosed in the 2011 GPU PEIR. Therefore, implementation of the CAP Update, in combination with the in-process GPAs, **would result in new or more severe impacts** not disclosed in the 2011 GPU PEIR.

4.4.3 Air Quality

4.4.3.1 2011 GPU PEIR Determination

The cumulative impact analysis for air quality related to the implementation of the General Plan is contained in Section 2.3.4 of the 2011 GPU PEIR and is summarized in Section 2.2.3.8 of this SEIR. The 2011 GPU PEIR concludes that implementation of the General Plan would not contribute to significant cumulative impacts related to conflict with applicable air quality plans and objectionable odors. However, the General Plan's contribution to significant cumulative impacts related air quality violations, non-attainment criteria pollutants, and sensitive receptors, would be cumulatively considerable.

4.4.3.2 CAP Update Impact Analysis with In-Process GPAs

The geographic scope of cumulative impact analysis for air quality is the entire unincorporated county and the surrounding vicinity.

Air Quality Plans

The CAP Update and the in-process GPAs would have the potential to result in a cumulative impact to air quality plans, if they would conflict with or obstruct implementation of the San Diego Regional Air Quality Strategy (RAQS) and the California State Implementation Plan (SIP). Future projects associated with the CAP Update and the in-process GPAs would be required to comply with existing federal, state, and local regulation, including the RAQS and SIP, which would ensure that conflicts with applicable air quality plans would not occur. Therefore, the CAP Update, in combination with the in-process GPAs, would not result in a cumulative impact to air quality plans. This impact would be less than significant.

Air Quality Violations

The CAP Update and the in-process GPAs would have the potential to result in a significant cumulative air quality violation if they would violate any air quality standard or contribute to an existing or projected air quality violation. As analyzed in Section 2.3.3.4 of this SEIR, implementation of the CAP Update would result in significant and unavoidable impacts related to violations of federal and state air quality standards and emissions of nonattainment criteria pollutants for particulate matter (PM₁₀ and PM_{2.5}), volatile organic compounds (VOCs), and nitrogen oxides (NO_x), primarily associated with construction activities and operational vehicle trips. Implementation of the in-process GPAs would include development projects that would involve construction activities and operational vehicle trips, which would result in emission of nonattainment criteria pollutants. Because the CAP Update does not propose changes to the land use types

identified in the General Plan, emissions of nonattainment criteria pollutants are not expected to be greater than those accounted for in the 2011 GPU PEIR. However, the in-process GPAs include projects that would increase development density and conversion of office land use to residential use in the unincorporated county. Implementation of the in-process GPAs would likely result in greater emissions of nonattainment criteria pollutants than those disclosed in the 2011 GPU PEIR. The CAP Update, in combination with the in-process GPAs, would result in a considerable contribution to existing cumulative effects related to violation of air quality standards. The cumulative impacts would be significant and would be consistent with the conclusions in the 2011 GPU PEIR.

Non-Attainment Criteria Pollutants

The CAP Update and the in-process GPAs would have the potential to result in a significant cumulative impact associated with nonattainment criteria pollutants if they would result in a net increase of any criteria pollutants for which the San Diego Air Basin (SDAB) is in nonattainment. The SDAB is in nonattainment status for NO_x, VOCs, PM₁₀, and PM_{2.5}. As discussed previously, the CAP Update together with the in-process GPAs would be likely to result in greater emissions of nonattainment criteria pollutants than those disclosed in the 2011 GPU PEIR because the in-process GPAs include projects that proposed changes to the development density and land use types identified in the General Plan. The CAP Update, in combination with the in-process GPAs, would result in a considerable contribution to an existing cumulative impact related to nonattainment criteria pollutants. The cumulative impact would be significant, consistent with the conclusion in the 2011 GPU PEIR.

Sensitive Receptors

The CAP Update and the in-process GPAs would have the potential to result in a significant cumulative impact associated with sensitive receptors if they would expose sensitive receptors to a substantial concentration of toxic air contaminants (TACs) or hazardous air pollutants. The TACs and hazardous air pollutants (carbon monoxide [CO]) effects on sensitive receptors are discussed in Section 2.3.3.6 of this SEIR. Implementation of the CAP Update would not change the land use designations outlined in the 2011 GPU PEIR. Therefore, the CAP Update would not change the potential for sensitive receptors to be located near sources of substantial pollutant concentration. Although the in-process GPAs would be required to comply with emission thresholds for TACs and CO, some projects would involve land use changes and higher density residential development that could locate more sensitive receptors near pollutant concentration. Therefore, the CAP Update in combination with the in-process GPAs would result in a considerable contribution to an existing cumulative effect. The cumulative impact would be significant and potentially more severe than disclosed in the 2011 GPU PEIR but would be consistent with the conclusion in the 2011 GPU PEIR.

Odors

The CAP Update and the in-process GPAs also would have the potential to result in a significant cumulative impact associated with objectionable odors if they would create objectionable odors or place sensitive receptors next to existing objectionable odors. Construction activities associated with the CAP Update and in-process GPAs would involve the use of equipment with diesel engines. Exhaust odors from diesel engines may

be considered offensive to some individuals. However, minor odors from the use of heavy-duty diesel equipment would be intermittent and temporary and would dissipate rapidly from the source with an increase in distance. Given the temporary nature of construction activities and the dispersion properties of odors resulting from heavy-duty diesel equipment, construction activities are not anticipated to result in an odor-related impact. As discussed in Section 2.3.3.7 of this SEIR, future projects associated with the CAP Update would include development of solid waste facilities that would create objectionable odors during operation. However, solid waste facilities would be required to comply with San Diego County Air Pollution Control District's Rule 51 (Nuisance) and County Code Sections 63.401 and 63.402 to reduce odor impacts to nearby receptors to a less-than-significant level. The in-process GPAs involve mostly residential development and planning documents update, which are not typically associated with operational odors. Therefore, the CAP Update in combination with the in-process GPAs would not result in a substantial incremental effect that would result in cumulatively considerable contribution to a cumulative impact related to emissions of odors adversely affecting a substantial number of people. The cumulative impact would be less than significant and consistent with the conclusion in the 2011 GPU PEIR.

4.4.3.3 Summary

Cumulative impacts related to conflict with applicable air quality plans and objectionable odors would be less than significant and would be consistent with the 2011 GPU PEIR. The CAP Update, in combination with the identified in-process GPAs, would have considerable contribution to existing cumulative impacts related to violation of air quality standards, net increase of nonattainment criteria pollutant emissions, and expose sensitive receptors to TACs and CO. These cumulative impacts would be significant and would be consistent with the conclusions in the 2011 GPU PEIR. Implementation of the CAP Update, in combination with the in-process GPAs, **would not result in new or more severe impacts** than disclosed the 2011 GPU PEIR.

4.4.4 Biological Resources

4.4.4.1 2011 GPU PEIR Determination

The cumulative impact analysis for biological resources related to the implementation of the General Plan is contained in Section 2.4.4 of the 2011 GPU PEIR and is summarized in Section 2.4.3.9 of this SEIR. The 2011 GPU PEIR concludes that implementation of the General Plan would result in cumulatively considerable contribution to significant cumulative impacts associated with special-status species and their habitats, riparian habitat and other sensitive communities, and wildlife movement corridors and nursery sites. Implementation of the General Plan would not contribute to significant cumulative impacts associated with federally protected wetlands, conflict with local policies and ordinances, and conflict with Habitat Conservation Plans and Natural Community Conservation Plans.

4.4.4.2 CAP Update Impact Analysis with In-Process GPAs

The geographic scope of cumulative impact analysis for biological resources is the San Diego region, including the incorporated and unincorporated areas of San Diego County and surrounding counties.

Special-Status Plant and Wildlife Species

The CAP Update and the in-process GPAs would have the potential to result in cumulative impacts to special-status plant and wildlife species if they would result in direct or indirect loss of species or their habitats. Future projects associated with the CAP Update could result in development and potentially significant construction and operation impacts to special-status species and their habitats as discussed in Section 2.4.3.3 of this SEIR. Compliance with applicable General Plan policies (Policies COS-1.3, COS-1.6, COS-1.7, COS-1.8, COS-1.9, COS-1.10, COS-1.11, COS-2.1, COS-2.2, LU-6.1, LU-6.2, LU-6.3, LU-6.4, LU-6.6, LU-6.7, LU-10.2, and M-12.9) and 2011 GPU PEIR mitigation measures (Mitigation Measures Bio-1.1, Bio-1.2, Bio-1.3, Bio-1.4, Bio-1.5, and Bio-1.6), as well as compliance with existing federal, state, and local regulations related to special-status species protection, would reduce the potential impacts. However, because the location of future projects developed to implement the CAP Update is not known, the potential exists for such projects to make a considerable contribution to a significant cumulative impact. The in-process GPAs would include development planned within rural and open areas of the unincorporated county (e.g., Ivanhoe Ranch, Warner Springs Ranch Resort, and Peppertree Park), and development of these projects would likely result in impacts to special-status species and result in loss of habitat. The identified in-process GPAs would be subject to CEQA review; potential impacts would be identified, and mitigation measures would be developed to minimize impacts. However, given the extent of new development that these projects would introduce, it is likely that they would make a considerable contribution to a cumulative impact that the CAP Update would also contribute to. The cumulative impact would be significant and potentially more severe than disclosed in conclusions in the 2011 GPU PEIR. Nevertheless, the CAP Update's overall contribution to the cumulative impact would remain significant, consistent with the conclusion in the 2011 GPU PEIR.

Riparian Habitat and Other Sensitive Natural Communities

The CAP Update and the in-process GPAs also would have the potential to result in cumulative impacts associated with riparian habitat or other natural communities through direct or indirect loss or degradation of habitats. As discussed in Section 2.4.3.4 of this SEIR, implementation of the CAP Update could result in new development and potentially significant construction and operational impacts to riparian habitat and other natural communities. Future projects associated with the CAP Update would be required to be consistent with applicable General Plan policies and the 2011 GPU PEIR mitigation measures identified above, as well as comply with existing federal, state, and local regulations that protect sensitive and natural communities. However, because the location of future projects developed to implement the CAP Update is not known, the potential exists for such projects to make a considerable contribution to a significant cumulative impact. Similarly, the in-process GPAs would include new development in rural and undeveloped areas of the unincorporated county. Construction and operation of

the in-process GPAs would have the potential to result in loss or degradation of riparian habitats or other natural communities. Although the in-process GPAs would be subject to CEQA review and would be required to incorporate mitigation measures to minimize or avoid potential impacts to the extent feasible, it is likely that they would make a considerable contribution to a cumulative impact given the extent of the projects (e.g., development of over 600 housing units in the Peppertree Park). Therefore, the cumulative impact would be significant and potentially more severe than disclosed in conclusions in the 2011 GPU PEIR. Nevertheless, the CAP Update's overall contribution to the cumulative impact would remain significant, consistent with the conclusion in the 2011 GPU PEIR.

State and Federally Protected Wetlands

Cumulative impacts associated with state and federally protected wetlands would occur if the CAP Update and the in-process GPAs could result in direct or indirect loss or degradation of wetlands. Implementation of the CAP Update and in-process GPAs would be required to comply with the adopted General Plan (Policies COS-3.1 and COS-3.2), 2011 GPU PEIR mitigation measures (Bio-1.1, Bio-1.5, Bio-1.6, Bio-1.7, Bio-2.2, Bio-2.3, and Bio-2), and applicable state and federal regulations that protect wetlands. The General Plan policies, mitigation measures, and state and federal regulations would collectively require each individual project to avoid wetland areas or fully mitigate impacts to wetlands. The impact on wetlands would be less than significant. Therefore, the CAP Update in combination with the in-process GPAs would not result in a significant cumulative impact on state or federally protected wetlands. The cumulative impact would be less than significant and would be consistent with the conclusion in the 2011 GPU PEIR.

Wildlife Movement Corridors and Nursery Sites

Cumulative impacts associated with wildlife movement corridors and nursery sites would occur if implementation of the CAP Update and in-process GPAs would block an existing wildlife movement corridor or remove habitat used as a nursery site. Construction and operational activities associated with the CAP Update could result in direct and indirect disturbances to wildlife corridors and nurseries through ground disturbance, or conversion of habitat. Although implementation of applicable General Plan policies (Policies COS-1.1 through COS-1.5) and 2011 GPU PEIR mitigation measures (Bio-1.1, Bio-1.2, Bio-1.3, Bio-1.7, Bio-1.4, Bio-1.5, Bio-1.6, Bio-1.7, and Bio-2.3) would reduce potential impacts on wildlife movement corridors and nursery sites, the impacts would remain significant because the exact location and nature of future projects associated with the CAP Update are unknown. Therefore, the CAP Update would make a considerable contribution to a cumulative impact. Implementation of the in-process GPAs would involve large development in rural and undeveloped areas of the unincorporated county. New development in rural and undeveloped areas would result in disturbances to wildlife corridors and nurseries through ground disturbance, vegetation removal, and conversion of habitat. The in-process GPAs would be developed in accordance with applicable general plans, area/community plans, municipal codes, and the mitigation measures or conditions of approval imposed as part of project-specific CEQA and permitting processes, therefore reducing the potential for them to result in significant impacts associated with wildlife movement corridors and nursery sites. However, given the extent of new development that these projects would introduce, it is likely that they would make

a considerable contribution to a cumulative impact. Therefore, implementation of the CAP Update in combination with the in-process GPAs would result in a considerable contribution to a significant cumulative impact. The cumulative impact would be significant, consistent with the conclusion in the 2011 GPU PEIR.

Local Policies and Ordinances

The CAP Update and in-process GPAs would be required to comply with applicable local policies and ordinances established to protect biological resources. All future projects associated with the CAP Update and the in-process GPAs would be required to follow County development requirements or other local jurisdiction requirements, including compliance with local policies, ordinances, and applicable permitting procedures related to protection of biological resources. Additionally, project-level planning, environmental analysis, and compliance with existing local regulations and policies would identify potentially significant conflicts with local policies; minimize or avoid those impacts through the design, siting, and permitting process; and provide mitigation for any significant effects as a condition of project approval and permitting. Therefore, implementation of the CAP Update and in-process GPAs would not conflict with any local policies or ordinances. The CAP Update in combination with the in-process GPAs would not result in a significant cumulative impact related to conflicts with local policies or ordinances protecting biological resources. The cumulative impact would be less than significant.

Habitat Conservation Plans and Natural Community Conservation Plans

The CAP Update and the identified in-process GPAs would be required to comply with applicable Habitat Conservation Plans or Natural Community Conservation Plans, such as the San Diego Multiple Species Conservation Program and the Southern California Coastal Sage Scrub Natural Community Conservation Plan. The CAP Update and the in-process GPAs would not conflict with applicable Habitat Conservation Plans or Natural Community Conservation Plans. Therefore, the CAP Update in combination with the in-process GPAs would not result in a significant cumulative impact. The cumulative impact would be less than significant.

4.4.4.3 Summary

Implementation of the CAP Update in combination with the in-process GPAs would result in a considerable contribution to significant cumulative impacts on special-status species, riparian and other sensitive natural communities, and wildlife movement corridors and nursery sites. The cumulative impacts would be significant and would be consistent with the conclusions in the 2011 GPU PEIR. Therefore, implementation of the CAP Update, in combination with the in-process GPAs, **would not result in a new or more severe impact** than disclosed in the 2011 GPU PEIR.

4.4.5 Cultural and Paleontological Resources

4.4.5.1 2011 GPU PEIR Determination

The cumulative impact analysis for cultural and paleontological resources related to the implementation of the General Plan is contained in Section 2.5.4 of the 2011 GPU PEIR

and is summarized in Section 2.5.3.7 of this SEIR. The 2011 GPU PEIR concludes that, the General Plan, in combination with cumulative projects, would have the potential to result in less than significant cumulative impacts associated with historical resources, archaeological resources, paleontological resources, and human remains with implementation of General Plan policies and 2011 GPU PEIR mitigation measures.

4.4.5.2 CAP Update Impact Analysis with In-Process GPAs

The geographic scope of cumulative impact analysis for cultural resources is the southern California region, including both incorporated and unincorporated areas of San Diego County, surrounding counties, and Mexico. The geographic scope for the cumulative analysis of paleontological resources includes the Salton Trough, Peninsular Ranges, and Coastal Plain regions within southern California.

Historical Resources

The 2011 GPU PEIR stated that cumulative destruction of significant historical resources from construction and development planned within the San Diego region would be considered to be a cumulatively significant impact. The CAP Update and the in-process GPAs would have the potential to result in a considerable contribution to the existing cumulative impact if they would result in the loss of historical resources through the physical demolition, destruction, relocation, or alteration of a resource or its immediate surroundings such that the significance of a historical resource would be materially impaired. As discussed in Section 2.5.3.3 of this SEIR, future projects associated with the CAP Update would have the potential to result in development of solar and wind projects on properties that are listed or zoned as historical resources. Therefore, the CAP Update's impacts related to historical resources would be potentially significant. The in-process GPAs would be subject to CEQA review. The potential impacts to historic resources would be identified, and mitigation measures would be developed to minimize impacts. However, given the extent of these projects, individual historical resources would still have the potential to be impacted or degraded from destruction or modification as a result of implementing the in-process GPAs. The CAP Update in combination with the in-process GPAs would result in a considerable contribution to a significant cumulative impact. The cumulative impact would be significant. This is a new or more severe impact not disclosed in the 2011 GPU PEIR.

Archeological Resources

A cumulative impact associated with archaeological resources would occur if the CAP Update and the in-process GPAs would result in the loss of archaeological resources through development activities that could cause a substantial adverse change in the significance of an archaeological resource. As discussed in Section 2.5.3.4 of this SEIR, future projects associated with the CAP Update would be required to implement applicable General Plan policies and 2011 GPU PEIR Mitigation Measures Cul-1.1, Cul-1.6, Cul-2.1, Cul-2.2, Cul-2.3, Cul-2.5, and Cul-2.6, which would ensure that most measures and actions would have a less-than-significant impact to archaeological resources. However, implementation of the CAP Update would have the potential to result in installation of small-scale wind turbines without a discretionary permit, impacts related to archaeological resources would be potentially significant. Development of the in-process GPAs also would

have the potential to result in adverse effects to previously unidentified archaeological resources. The identified in-process GPAs would be subject to CEQA review; potential impacts would be identified, and mitigation measures would be developed to minimize impacts. However, given the extent of ground disturbance that these projects would introduce, it is possible that archaeological resources would still have the potential to be damaged or destroyed. Therefore, the CAP Update, in combination with the in-process GPAs, would have the potential to result in a significant cumulative impact associated with archaeological resources. As discussed in Section 2.5.5.2, even with implementation of the adopted General Plan policies and 2011 GPU PEIR mitigation measures, and compliance with federal, state, and local regulations intended to protect archeological resources, impacts resulting from the CAP Update could remain significant and unavoidable. Therefore, the CAP Update, in combination with the in-process GPAs would result in a considerable contribution to a significant cumulative impact. This would be a new or more severe impact not disclosed in the 2011 GPU PEIR.

Paleontological Resources

The 2011 GPU PEIR stated that cumulative destruction of significant paleontological resources from construction and development planned within the San Diego region would be considered to be a cumulatively significant impact. Past projects involving development and construction have already impacted paleontological resources within the region. Future projects associated with the CAP Update could result in development of new or expanded solid waste, renewable energy, and transportation facilities in the unincorporated county, which would result in excavation and ground-disturbing activities that could damage or destroy paleontological resources. As discussed in Section 2.5.3.5 of this SEIR, future projects associated with the CAP Update would be required to implement applicable General Plan policies and 2011 GPU PEIR Mitigation Measures Cul-3.1 and Cul-3.2, which would reduce impact to paleontological resources. However, implementation of the CAP Update would have the potential to result in installation of small-scale wind turbines without a discretionary permit, it is not possible to ensure that impacts related to paleontological resources would be reduced to less-than-significant. Implementation of the in-process GPAs could result in similar construction activities that could damage or destroy paleontological resources during grading and excavation. The in-process GPAs would be regulated by state and local regulations, including CEQA and the County Grading Ordinance. However, given the extent of ground disturbance that these projects would introduce, it is possible that previously unidentified paleontological resources could be damaged or destroyed during grading or excavation activities. Therefore, the CAP Update, in combination with the in-process GPAs, would result in a considerable contribution to a significant cumulative impact. This would be a new or more severe impact not disclosed in the 2011 GPU PEIR.

Human Remains

The 2011 GPU PEIR stated that cumulative disturbance of human remains by construction and development within the San Diego region would be considered a cumulatively significant impact. Past projects involving development and construction have already impacted human remains within the region. Implementation of the CAP Update and in-process GPAs would result in new development that would have the potential to disturb human remains. As discussed in Section 2.5.3.6 of this SEIR, future

projects associated with the CAP Update applicable General Plan policies and 2011 GPU PEIR Mitigation Measure Cul-4.1, which would ensure that most projects would have a less than significant impact to human remains. However, it is possible that implementation of the CAP Update, particularly construction of large-scale wind turbines, could result in a considerable contribution to an existing cumulative impact to human remains. Given the extent of ground disturbance that the in-process GPAs would introduce, it is reasonable to assume that previously unidentified human remains could be damaged or destroyed during grading or excavation activities, making a considerable contribution to a significant cumulative impact. Therefore, the CAP Update in combination with the in-process GPAs would result in a considerable contribution to a significant cumulative impact. This is a new or more severe impact not disclosed in the 2011 GPU PEIR.

4.4.5.3 Summary

Implementation of the CAP Update, in combination with the in-process GPAs, would result in a considerable contribution to significant cumulative impacts to cultural and paleontological resources. These cumulative impacts **would be new or more severe impacts** than disclosed in the 2011 GPU PEIR.

4.4.6 Energy

4.4.6.1 2011 GPU PEIR Determination

Cumulative impact analysis for energy related to the implementation of the General Plan is not discussed in the 2011 GPU PEIR.

4.4.6.2 CAP Update Impact Analysis with In-Process GPAs

The geographic scope of cumulative impact analysis for energy is the San Diego Association of Governments (SANDAG) region, which encompasses the unincorporated areas and 18 incorporated cities that make up the entire County of San Diego.

Wasteful, Inefficient, or Unnecessary Consumption of Energy Resources

A cumulative impact would occur if the CAP Update in combination with the in-process GPA projects would result in potential significant environmental impacts due to wasteful, inefficient, or unnecessary consumption of energy and result in conflict with a state or local plan for renewable energy or energy efficiency. Implementation of the CAP Update would decrease the County's reliance on fossil fuels and would reduce energy consumption in the unincorporated area. The CAP Update includes measures and actions (e.g., Action E-3.3.) that would result in development of renewable energy projects, such as wind and solar, which would increase electricity generation to offset increases in electricity demand. The CAP Update and the in-process GPAs would be required to comply with the most current building codes, including requirements for achieving appropriate energy efficiency standards (e.g., Title 24 standards or better) and comply with general plan policies related to energy efficiency. Therefore, the CAP Update, in combination with in-process GPAs, would not result in a significant cumulative impact

associated with wasteful, inefficient, or unnecessary consumption of resources. This impact would be less than significant.

State and Local Plans for Renewable Energy or Energy Efficiency

As analyzed in Section 2.6.3.4, future projects associated with the CAP Update would support the San Diego Association of Governments' *San Diego Forward: The Regional Plan's* (2021 Regional Plan's) goal of achieving GHG emissions reduction targets and would be required to comply with newer and more efficient technology to reduce GHG emission. Similarly, the in-process GPAs would be required to demonstrate consistency with the 2021 Regional Plan during the approval process and would be required to comply with newer or more energy efficiency standards. Therefore, future projects associated with the CAP Update and the in-process GPAs would not generate a cumulative conflict with state or local plans for renewable energy or energy efficiency. Implementation of the CAP Update, in combination with the in-process GPAs, would not result in a significant cumulative impact related to conflict with applicable plans for renewable energy or energy efficiency. This impact would be less than significant.

4.4.6.3 Summary

Implementation of the CAP Update, in combination with the in-process GPAs, would have less than significant cumulative energy impacts and **would not result in a new or more severe impact** than disclosed in the 2011 GPU PEIR.

4.4.7 Environmental Justice

4.4.7.1 2011 GPU PEIR Determination

Environmental justice (EJ) direct or cumulative impacts are not discussed in the 2011 GPU PEIR.

4.4.7.2 CAP Update Impact Analysis with In-Process GPAs

The geographic scope of the cumulative impact analysis for EJ includes all the EJ communities within the cumulative study areas discussed in Sections 2.1 through 2.6 and Sections 2.8 through 2.15 of this SEIR.

Disproportionately High and Adverse Human Health or Environmental Impact on an EJ Community

Potential EJ impacts related to the implementation of the CAP Update are discussed in Section 2.7.3 of this SEIR. Implementation of the CAP Update would not cause a disproportionately high or adverse human health or environmental impact on an EJ community. Implementation of the in-process GPAs could result in a significant impact to an EJ community if any of the in-process GPAs would cause a disproportionately high or adverse human health or environmental impact on an EJ community. However, all the identified in-process GPAs would be subject to discretionary review and would be evaluated for project-specific impacts under CEQA. Project-specific mitigation would reduce and minimize adverse human health or environmental impacts. Mitigation

measures would be implemented to reduce the potential contribution of the project and to ensure that impacts are treated appropriately and with respect to all communities, including EJ communities, and the County initiatives and programs in place to address disproportionate environmental effects in EJ communities would be applied to enhance equitable outcomes throughout the unincorporated county. Therefore, impacts resulting from implementation of the in-process GPAs are generally not anticipated to be disproportionately higher on EJ communities. Therefore, the in-process GPAs and other cumulative projects in the county would not result in a significant cumulative impact to EJ. Therefore, the CAP Update would not result in a considerable contribution to a significant cumulative EJ impact. The cumulative impact would be less than significant.

4.4.7.3 Summary

The in-process GPAs in combination with other cumulative projects in the county would not result in a disproportionate impact on an EJ community. The CAP Update's contribution to the significant cumulative impact would not be cumulatively considerable. This **would not be a new or more severe impact** than disclosed in the 2011 GPU PEIR.

4.4.8 Greenhouse Gas Emissions

4.4.8.1 2011 GPU PEIR Determination

The cumulative impact analysis for climate change and GHG emissions related to the implementation of the General Plan is contained in Sections 2.17.3.1 and 2.17.3.2 of the 2011 GPU PEIR and is summarized in Section 2.8.3.5 of this SEIR. Climate change is the result of the combined, worldwide contributions of GHG to the atmosphere. Cumulative development has resulted in a cumulatively significant effect. However, implementation of the GHG-reducing policies and mitigation measures would ensure that the General Plan's contribution to cumulative impacts related to compliance with Assembly Bill (AB) 32 and global climate change to less than cumulatively considerable.

4.4.8.2 CAP Update Impact Analysis with In-Process GPAs

Because climate change is a global phenomenon which is cumulative by nature, as it is the result of combined worldwide contributions of GHG to the atmosphere over many years, the geographic scope of the cumulative impact analysis for GHG emissions is the globe. Implementation of the CAP Update would result in a considerable contribution to an existing cumulative impact related to GHG emissions if the CAP Update, in combination with the in-process GPAs, would generate GHG emissions that may have a significant impact on the environment or would result in conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

GHG Emissions That May Have a Significant Impact on the Environment

Implementation of the CAP Update would have the potential to result in construction of new or expanded solid waste facilities, renewable energy systems, and transportation facilities. As analyzed in Section 2.8.3.3 of this SEIR, construction activities associated with the CAP Update would result in GHG emissions; however, construction activities

would be sporadic and inherently short-term and would facilitate the development of projects that would ultimately reduce GHG emissions. Operation of the projects associated with the CAP Update would reduce vehicle miles traveled (VMT), encourage electric vehicles and alternate transportation uses, incentivize alternative fuel use in equipment, and increase the use and generation of renewable energy in the unincorporated county. Therefore, any temporary construction GHG emissions would be offset by the overall net benefit of GHG emissions reduction resulting from operation of projects associated with the CAP Update. Implementation of the CAP Update would result in a beneficial impact related to GHG emissions.

If approved, the in-process GPA projects would include new developments that would result in GHG emissions during construction and operation. Construction of the in-process GPAs would result in temporary generation of GHG emissions related to off-road equipment use and on-road vehicle operations. Operation of the in-process GPAs would result in mobile-source GHG emissions associated with vehicle trips to and from the project sites (i.e., project-generated VMT), landscaping equipment, electricity consumption, water consumption, and the generation of wastewater and solid waste. The in-process GPAs would be subject to CEQA review. During the CEQA review process, potential impacts would be identified, and mitigation measures would be developed to minimize or avoid potential impacts to the extent feasible. Given the nature of the in-process GPAs (e.g., mixed use, residential development), it is likely that impacts would be reduced to a less-than-significant level through implementation of measures, such as utilizing alternative fueled equipment and vehicles, utilizing advanced engine controls equipment, and replacing natural gas infrastructure with electricity. Therefore, the CAP Update, in combination with the in-process GPAs, would not result in a cumulatively considerable contribution to an existing cumulative impact related to GHG emissions that may have a significant impact on the environment. The cumulative impact would be less than significant.

Conflict with an Applicable Plan, Policy, or Regulation for Reducing the Emission of GHGs

The Final 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan) and the 2021 Regional Plan are adopted for the purpose of reducing GHG emissions and are applicable to the CAP Update and the in-process GPAs. As analyzed in Section 2.8.3.4 of this SEIR, the CAP Update measures and actions were developed to support the 2022 Scoping Plan's goal of achieving GHG reduction targets. The CAP Update measures and actions would also reduce VMT and transportation-related GHG emissions, which support the goals of the 2021 Regional Plan. Therefore, implementation of the CAP Update would not conflict with the goals of applicable GHG reduction plans. As discussed above, if approved, implementation of the in-process GPAs would result in generation of GHG emissions and would have the potential to conflict with the goals of the 2022 Scoping Plan and 2021 Regional Plan related to GHG emissions reduction. The in-process GPAs would be subject to CEQA review. During the CEQA review process, the in-process GPAs' consistency with the 2022 Scoping Plan and 2021 Regional Plan would be evaluated, potential impacts would be identified, and mitigation measures would be developed to minimize or avoid potential impacts to the extent feasible.

To evaluate the potential effects of the in-process GPA projects on the County's ability to meet the targets established in the CAP Update, the County modeled the anticipated GHG emissions of the GPAs listed in Table 4-1 based on currently available information about the proposed projects (i.e., land uses, number and type of proposed housing units, location) supplemented by default modeling assumptions. The modeling does not account for any sustainability features that may be incorporated into the proposed GPA projects to reduce GHG emissions. Modeled emissions from the in-process GPA projects were then added to the County's forecast emissions with implementation of the CAP Update to determine if the known, in-process GPAs could affect the County's ability to achieve its GHG reduction targets. As shown in Table 4-2, GHG emissions would exceed the 2030 target if all of the in-process GPAs were implemented. However, the 2045 target would be achieved under a scenario that includes approval of the in-process GPAs in addition to forecast growth. Appendix B of this SEIR provides the California Emissions Estimator Model modelling results used to determine whether the County would meet its GHG reduction targets with the in-process GPAs.

The CAP Update would reduce forecast GHG emissions by 44.5 percent in 2030 and 89.8 percent in 2045, exceeding reduction targets aligned with the 2022 Scoping Plan, and would not result in a considerable contribution to the cumulative impact. As discussed above, implementation of the in-process GPAs would likely result in a less-than-significant GHG emissions impact that may have a significant effect on the environment with implementation of mitigation measures. However, implementation of the in-process GPAs would generate GHG emissions, which would limit the County's ability to meet the GHG emission reduction target in 2030 as shown in Table 4-2. Therefore, implementation of the in-process GPAs would result in a conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions. The CAP Update, in combination with the in-process GPAs, would result in a considerable contribution to a cumulative impact related to conflict with an applicable plan policy, or regulation for reducing GHG emissions. The cumulative impact would be significant and would be a new or more severe impact not disclosed in the 2011 GPU PEIR.

4.4.8.3 Summary

Implementation of the CAP Update, in combination with the in-process GPAs, would not result in a substantial incremental effect that would result in new significant cumulative impacts related to GHG emissions. Implementation of the CAP Update, in combination with the in-process GPAs, would result in a considerable contribution to a significant cumulative impact related to a conflict with an applicable plan policy, or regulation for reducing GHG emissions. This **would be a new or more severe impact** than disclosed in the 2011 GPU PEIR.

4.4.9 Hazards and Hazardous Materials

4.4.9.1 2011 GPU PEIR Determination

The cumulative impact analysis for hazards and hazardous materials related to the implementation of the General Plan is contained in Section 2.7.4 of the 2011 GPU PEIR

and is summarized in Section 2.9.3.8 of this SEIR. The 2011 GPU PEIR concludes that implementation of the General Plan, in combination of cumulative projects, would not contribute to significant cumulative impacts related to hazardous materials and sites, airport hazards, impairment of emergency response and evacuation plans, and exposure of human to vector with compliance with applicable federal, state, and local regulations and adopted General Plan policies and implementation of 2011 GPU PEIR mitigation measures. However, implementation of the General Plan would result in new development in areas that are prone to wildland fires. Therefore, implementation of the General Plan would result in a potentially significant impact from the exposure of people or structures to a significant risk or loss, injury or death involving wildland fires. Implementation of the General Plan would result in cumulatively considerable contribution to an existing significant cumulative impact.

4.4.9.2 CAP Update Impact Analysis with In-Process GPAs

The geographic scope of the cumulative impact analysis for hazards and hazardous materials is the unincorporated county and the immediately surrounding areas.

Hazardous Materials (including Transport, Storage, Use, Disposal; Reasonably Foreseeable Accidental Release; Emitting Hazardous Materials Near to Schools; Being Within a Listed Hazardous Materials Site Pursuant to Government Code Section 65962.5)

Implementation of the CAP Update would have the potential to result in construction of new or expanded solid waste facilities, renewable energy systems, and transportation facilities. As analyzed in Section 2.9.3.3 of this SEIR, new facilities would be required to comply with the applicable federal, state, and local regulations and adopted General Plan policies and would not result in a significant impact related to transport, use, disposal, or accidental release of hazardous materials; proximity to schools; and sites containing hazardous materials. The in-process GPAs would include new developments which would result in the use, storage, disposal or transportation of hazardous materials and would potentially increase hazards to the public or the environment. Similar to the CAP Update, the in-process GPAs would be required to comply with regulations applicable to the use, disposal, transportation, accidental spill of hazardous materials, including the Resource Conservation and Recovery Act, Comprehensive Environmental Response, Compensation, and Liability Act, the Hazardous Materials Transportation Act, International Fire Code, and California Code of Regulations Title 22 and Title 27. The in-process GPAs would also be subject to CEQA review, which would require analyses of proposed projects or existing land uses associated with an existing hazardous site and would require projects to reduce the risk related to emitting hazardous materials within one-quarter mile of schools. Compliance with existing regulations would ensure that the in-process GPAs would result in a less-than-significant impact related to transport, use, disposal, or accidental release of hazardous materials; proximity to schools; and sites containing hazardous materials. Therefore, the CAP Update, in combination with the in-process GPAs, would not result in a substantial incremental effect that would result in a significant cumulative impact. The cumulative impact would be less than significant.

Public and Private Airports

A cumulative impact would also occur if the CAP Update in combination with the in-process GPAs would result in a regional increase in airport hazards to the public or the environment. As discussed in Section 2.9.3.4, compliance with existing federal, state, and local regulations and implementation of adopted General Plan policies and 2011 GPU PEIR mitigation measures (Haz-1.1, Haz-1.3, and Haz-1.5) would ensure that implementation of the CAP Update would have a less than significant related to airport hazards. The identified in-process GPAs would be subject to safety regulations, such as airport land use plans, Federal Aviation Administration standards and the State Aeronautics Act, which would reduce the potential for safety hazards to a less-than-significant level. Therefore, the CAP Update, in combination with the in-process GPAs, would not result in a significant cumulative impact related to airport hazards. The cumulative impact would be less than significant.

Emergency Response and Evacuation Plans

A cumulative impact would occur if the CAP Update in combination with the in-process GPAs would result in a regional impairment of emergency response or evacuation plans. As discussed in Section 2.9.3.5, compliance with General Plan policies (e.g., S-1.2, M-1.2, M-3.3, and M-4.3) and implementation of 2011 GPU PEIR Mitigation Measures Haz-3.1, Haz-3.2, and Haz-3.3 would ensure that implementation of the CAP Update would not impede and conflict with adopted emergency response and evacuation plans and would reduce potential impacts to less than significant. Implementation of the in-process GPAs would have the potential to impair the existing emergency and evacuation plans if authorities are not properly notified or emergency routes are blocked during construction. However, the in-process GPAs would be required to comply with applicable emergency response and evacuation policies outlined in regulations such as the Federal Response Plan, the California Emergency Services Act, and local fire codes. Compliance with the existing regulations would ensure that the in-process GPAs would not result in a significant impact. Therefore, implementation of the CAP Update, in combination of the in-process GPAs, would not result in a substantial incremental effect that would result in a significant cumulative impact related to impediments and conflicts with adopted emergency response and evacuation plans. The cumulative impact would be less than significant.

Wildland Fires

The 2011 GPU PEIR determined that there is an existing significant cumulative impact associated with wildland fires in the San Diego region because the frequent and intensive wildland fires in the areas have exposed people and structures to a potentially significant loss of life and property and many areas in the region are considered High and Very High Fire Hazard Severity Zones (FHSZs). Implementation of the CAP Update would result in future projects that could expose people or structures to significant risks of loss, injury, or death involving wildland fires. The impact would be reduced through implementing adopted General Plan policies (Policies LU-6.11, LU-10.2, S-4.1 through 4.4, S-4.6, S-4.7, S-5.1, and COS-18.3) and 2011 GPU PEIR mitigation measures (Mitigation Measures Haz-4.1 through Haz-4.4 and Pub-1.5 through Pub-1.7) but would not be reduced to a less-than-significant level. Implementation of the in-process GPAs would likely result in residential development, which would likely place people and structures within danger of wildland fires due to the widespread risk across the region. Although

regulations exist to reduce hazards associated with wildland fires, they would not reduce the risk to a less-than-significant level. Therefore, the CAP Update in combination of the in-process GPAs would result in a considerable contribution to a significant impact related to wildland fires. The cumulative impact would be significant and unavoidable but not substantially more severe than disclosed in the 2011 GPU PEIR and would be consistent with the conclusion in the 2011 GPU PEIR.

Vectors

A cumulative impact related to vectors would occur if the CAP Update in combination with the in-process GPAs would increase vector breeding sources in the unincorporated county and surrounding areas or placing a substantial number of people near an existing off-site vector breeding source. The CAP Update includes development of new or expanded composting/anaerobic digestion facilities and new stormwater and greywater capture systems that could create new vector breeding sources. However, as discussed in Section 2.9.3.7, the impact would be reduced to less than significant through compliance with existing federal, state, and local regulations and processes related to vector control. Implementation of the in-process GPAs would include residential development that would have the potential to place a substantial number of people near an existing vector breeding source and could significantly increase the potential exposure of people to vectors. However, the in-process GPAs would be required to comply with Centers for Disease Control and Prevention Division of Vector-Borne Infectious Diseases and California Health and Safety Code requirements regarding vector transmission. Compliance with existing regulations would ensure that implementation of the in-process GPAs would not have significant impacts related to vectors. Therefore, the CAP Update, in combination with the in-process GPAs, would not result in a substantial incremental effect that would result in a significant cumulative impact related to exposing humans to vectors. The cumulative impact would be less than significant.

4.4.9.3 Summary

Implementation of the CAP Update, in combination with the in-process GPAs, would not result in substantial incremental effect that would result in new significant cumulative impacts related to transport, use, disposal, or accidental release of hazardous materials; proximity to schools; sites containing hazardous materials; impediments and conflicts with adopted emergency response and evacuation plans; and exposing humans to vectors. These cumulative impacts would be less than significant. Implementation of the CAP Update, in combination with the in-process GPAs, would result in a considerable contribution to an existing significant cumulative impact related to wildland fires. The cumulative impact would be significant and unavoidable and would be consistent with the conclusion in the 2011 GPU PEIR. Therefore, implementation of the CAP Update, in combination with the in-process GPAs, **would not result in a new or more severe impact** than disclosed in the 2011 GPU PEIR.

4.4.10 Hydrology and Water Quality

4.4.10.1 2011 GPU PEIR Determination

The cumulative impact analysis for hydrology and water quality related to the implementation of the General Plan is contained in Section 2.8.4 of the 2011 GPU PEIR and is summarized in Section 2.10.3.6 of this SEIR. The 2011 GPU PEIR concludes that buildout of the General Plan would result in significant and unavoidable cumulative impacts related to surface water and groundwater quality and groundwater supplies. The cumulative impacts on surface hydrology and drainage from implementation of the General Plan would be less than significant with compliance with applicable, federal, state, and local regulations and implementation of General Plan policies and 2011 GPU PEIR mitigation measures.

4.4.10.2 CAP Update Impact Analysis with In-Process GPAs

The geographic scope of cumulative impact analysis for hydrology and water quality encompasses the drainage basins, watersheds, water bodies or groundwater basins, depending on the location of the potential impact and its tributary area.

Surface Water and Groundwater Quality

The 2011 GPU PEIR determined that cumulative development would result in a potentially significant cumulative impact on water quality. Implementation of the CAP Update includes components (e.g., construction of new or expanded solid waste facilities, potential future new farmworker housing, and renewable energy projects) that could degrade surface water and groundwater quality. As discussed in Section 2.10.3.3 of this SEIR, compliance with existing federal, state, and local regulations and implementation of adopted General Plan policies and 2011 GPU PEIR mitigation measures (Mitigation Measures Hyd-1.1 through Hyd-1.5) would reduce potential impacts. However, because the exact location and nature of projects is not known, the potential for projects implemented under the CAP Update to contribute to a cumulatively significant impact would remain. Implementation of the in-process GPAs would result in new residential development, gas station, and commercial development that could also result in pollutants entering downstream receiving waters that have the potential to degrade surface water and groundwater quality. The in-process GPAs also would be required to comply with water quality standards, including Clean Water Act, Porter-Cologne Water Quality Control Act, National Pollutant Discharge Elimination System, applicable basin plans, and location regulations. Given the extent of ground-disturbing activities the new development would introduce, it is likely that they would make a considerable contribution to a significant cumulative impact. Therefore, the CAP Update, in combination with the in-process GPAs, would result in a considerable contribution to a significant cumulative impact. The cumulative impact would be significant, consistent with the conclusion in the 2011 GPU PEIR.

Groundwater Supply and Recharge

The 2011 GPU PEIR concluded that development throughout the planning horizon of the General Plan would result in a significant cumulative impact to groundwater supplies even

with implementation of the General Plan policies and 2011 GPU PEIR mitigation measures. Implementation of the CAP Update measures would include construction of new or expanded solid waste facilities, potential future new farmworker housing, and large-scale renewable energy projects that could decrease groundwater supplies and interfere with groundwater recharge. As discussed in Section 2.10.3.4 of this SEIR, compliance with existing federal, state, and local regulations and implementation of adopted General Plan policies and 2011 GPU PEIR mitigation measures (Mitigation Measures Hyd-1.1 through Hyd-1.5 and Hyd-2.1 through Hyd-2.5) would reduce potential impacts. However, because the exact location and nature of projects is not known, the potential for projects implemented under the CAP Update to contribute to a cumulatively significant impact would remain. Implementation of the in-process GPAs would include new large residential development in rural and undeveloped areas of the unincorporated county that could decrease groundwater supplies and interfere with groundwater recharge. Although the in-process GPAs are subject to existing regulations related to groundwater protection and CEQA review, which would require projects to mitigate impacts to groundwater supplies and recharge, these projects collectively would make a considerable contribution to a significant cumulative impact related to groundwater supplies and recharge due to the magnitude of the new development (e.g., Preserve at Riverbend includes 1,330 units). Therefore, the CAP Update, in combination with the in-process GPAs, would result in a considerable contribution to a significant cumulative impact. The cumulative impact would be significant, consistent with the conclusions in the 2011 GPU PEIR.

Surface Hydrology and Drainage

A cumulative impact related to surface hydrology and drainage would occur if the CAP Update, in combination with the in-process GPAs, would contribute to altered surface hydrology and drainage within drainage basins, watershed, water bodies or groundwater basins. Implementation of the CAP Update would include construction of new or expanded solid waste facilities, potential future new farmworker housing, and renewable energy projects could result in potential impacts on surface hydrology and drainage. However, as discussed in Section 2.10.3.5 of this SEIR, compliance with federal, state, and local regulations and implementation of adopted General Plan policies and 2011 GPU PEIR mitigation measures (Adopted Mitigation Measures Hyd-1.2 through Hyd-1.3, Hyd-2.5, Hyd-3.1, Hyd-3.2, Hyd-3.3, Hyd-4.1 through Hyd-4.3, Hyd-6.1, and Hyd-8.2) would reduce potential impacts to less than significant. Implementation of the in-process GPAs would include new large residential development in rural and undeveloped areas of the unincorporated county that could alter surface hydrology and drainage systems. However, the in-process GPAs would be required to comply with the same applicable with federal, state, and local regulations and implementation of adopted General Plan policies related to protection of surface hydrology and drainage and would be subject to CEQA review. During the CEQA review process, potential impacts would be identified, and mitigation measures would be developed to reduce impacts to a less-than-significant level. Therefore, the CAP Update, in combination with the in-process GPAs, would not result in a substantial incremental effect that would result in a significant cumulative impact. The cumulative impact would be less than significant.

4.4.10.3 Summary

Implementation of the CAP Update, in combination with the in-process GPAs, would result in considerable contribution to the existing cumulative effects to surface and groundwater quality and groundwater supplies. These cumulative impacts would be significant and unavoidable and would be consistent with the conclusions in the 2011 GPU PEIR. The CAP Update, in combination with the in-process GPAs, would not result in substantial incremental effect related to surface hydrology and drainage. The impacts would be less than significant and would not result in a substantial incremental effect such that a new significant cumulative impact would occur. Therefore, implementation of the CAP Update, in combination with the in-process GPAs, **would not result in new or more severe impacts** than disclosed in the 2011 GPU PEIR.

4.4.11 Land Use and Planning

4.4.11.1 2011 GPU PEIR Determination

The cumulative impact analysis for land use and planning related to the implementation of the General Plan is contained in Section 2.9.4 of the 2011 GPU PEIR and is summarized in Section 2.11.3.5 of this SEIR. The 2011 GPU PEIR concludes that cumulative development would result in a less-than-significant cumulative impact related to the physical division of a community with implementation of mitigation measures and would result in a less-than-significant cumulative impact related to conflicts with land use plans, policies, or regulations.

4.4.11.2 CAP Update Impact Analysis with In-Process GPAs

The geographic scope of the cumulative impact analysis for land use is the San Diego region, including jurisdictions and special districts within and adjacent to the unincorporated county.

Physically Divide an Established Community

In the San Diego region, new large-scale development and transportation network improvements in undeveloped areas have resulted in, and will continue to result in, the division of established communities. Therefore, there is an existing significant cumulative impact with respect to the division of established communities from cumulative development in the region. The in-process GPAs would not include development of roadways, airports, railroad tracks, open space areas, or other features that would individually have the potential to physically divide an established community. In addition, the in-process GPAs would be required to conform to applicable land use plans, policies, and regulations in order to be approved. The in-process GPAs would not result in a considerable contribution to a significant cumulative impact. As analyzed in Section 2.11.3.3 of this SEIR, implementation of the CAP Update would not introduce new infrastructure or large open space areas that would bisect existing land uses except the potential development of large-scale renewable energy projects. Large-renewable energy projects could result in new linear infrastructure (e.g., roadways) that have the potential to physically divide an established community. Therefore, implementation of the CAP

Update would result in a considerable contribution to an existing cumulative effect related to the division of an established community. The cumulative impact would be significant and would be a new or more severe impact not disclosed in the 2011 GPU PEIR.

Conflict with Land Use Plans, Policies, or Regulations

A cumulative impact associated with conflicts with land use plans, policies, and regulations developed for the protection of the environment would occur if the CAP Update, in combination with the in-process GPAs, would conflict with existing land use plans, policies, and regulations adopted for the purpose of avoiding or mitigating an environmental impact. As discussed in Section 2.11.3.4, implementation of CAP Update would be required to comply with land use plans, policies, or regulations developed for the protection of the environment. Similarly, while in-process GPAs may not be consistent with current General Plan land use and zoning designations, these projects would be required to comply with the applicable regulations. However, it is possible that a GPA could request changes to a policy developed for the purposes of environmental protection. Therefore, implementation of the CAP Update, in combination with the in-process GPAs, would result in a substantial incremental effect that would result in a significant cumulative impact related to conflicts with land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect. The cumulative impact would be significant and would be a new or more severe impact not disclosed in the 2011 GPU PEIR.

4.4.11.3 Summary

Implementation of the CAP Update in combination with the in-process GPAs would result in a considerable contribution to an existing significant cumulative impact related to the physical division of established communities and would result in a significant cumulative impact related to conflicts with land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect. The cumulative impacts would be significant and **would be new or more severe** than disclosed in the 2011 GPU PEIR.

4.4.12 Noise

4.4.12.1 2011 GPU PEIR Determination

The cumulative impact analysis for noise related to the implementation of the General Plan is contained in Section 2.11.4 of the 2011 GPU PEIR and is summarized in Section 2.12.3.6 of this SEIR. The 2011 GPU PEIR concludes that with implementation of mitigation from the 2011 GPU PEIR and compliance with the adopted General Plan policies, the buildout of the General Plan would result in less-than-significant cumulative impacts related to excessive construction noise levels, excessive groundborne vibration, and excessive noise exposure from airports and significant and unavoidable cumulative impacts related to permanent increase in ambient noise levels.

4.4.12.2 CAP Update Impact Analysis with In-Process GPAs

The geographic scope of cumulative impact analysis for noise is limited to areas surrounding noise-generating sources, such as roadways, agricultural or industrial uses because noise impacts are localized in nature.

Excessive Noise Levels

As analyzed in Section 2.12.3.3 of this SEIR, implementation of the CAP Update would have the potential to result in development of new or expanded facilities, renewable energy infrastructure, and transportation facilities in the unincorporated county. With implementation of adopted General Plan policies (Policies LU-2.8, N-3.1, N-4.9, N-6.4, S-15.1, S-15.2, and S-15.4) and applicable 2011 GPU PEIR mitigation measures (Mitigation Measures Noi-1.1, Noi-1.3, Noi-2.1, Noi-2.4, Noi-5.1, and Noi-5.3), implementation of the CAP Update would result in less than significant impacts related to noise resulting from construction of new development. However, operational sources of low-frequency noise associated with CAP Update Action E-3.3 would be potentially significant because it is possible for a noise waiver to be granted to large wind turbines subject to specific conditions. Implementation of the in-process GPAs would include new development in rural and open areas in the unincorporated county. Construction activities associated with the in-process GPAs would be required to comply with noise standards contained in the County Municipal Code and California Code of Regulations to ensure impacts would be less than significant. However, new development in rural and open areas would permanently increase ambient noise levels in areas that are typically quiet. If the wind turbine projects associated with the CAP Update are located in the vicinity of any of the in-process GPAs, the noise associated with operation of large wind turbines could combine with low-frequency noise sources from the in-process GPAs to result in cumulative increases above ambient for low-frequency noise level. This could result in excessive noise levels over the existing environment. Therefore, the CAP Update, in combination with the in-process GPAs, would result in a considerable contribution to an existing cumulative effect related to permanent increase in ambient noise levels. The cumulative impact would be significant but not more severe than disclosed in the 2011 GPU PEIR and would be consistent with the conclusion in the 2011 GPU PEIR.

Excessive Groundborne Vibration

A cumulative impact would occur if the CAP Update or any of the in-process GPAs would exceed the Federal Transit Administration (FTA) and Federal Railroad Administration guidelines for groundborne vibration and noise. As discussed in Section 2.12.3.4 of this SEIR, implementation of 2011 GPU PEIR Mitigation Measures Noi-2.1 and Noi-2.4 and compliance with adopted General Plan Policy N-3.1 and existing regulations would ensure that vibrational noise associated with the CAP Update would be less than significant. Implementation of the in-process GPAs would have the potential to result in vibration impacts during construction through the use of heavy-duty equipment or pile driving. However, the in-process GPAs would be subject to FTA and Federal Railroad Administration guidelines for groundborne vibration and noise and CEQA review. During the CEQA review process, potential impacts would be identified, and mitigation measures would be developed to reduce impacts to a less-than-significant level. Therefore, implementation of the CAP Update, in combination with the in-process GPAs, would not

result in a substantial incremental effect that would result in a significant cumulative impact related to excessive groundborne vibration. The cumulative impact would be less than significant.

Excessive Noise from a Public or Private Airport

A cumulative impact related to excessive noise from a public or private airport would occur if the CAP Update in combination with the in-process GPAs would result in the exposure of noise sensitive land uses to excessive noise from a public or private airport. As discussed in Section 2.12.3.5 of this SEIR, excessive noise from a public or a private airport associated with implementation of the CAP Update would be less than significant with implementation of 2011 GPU PEIR Mitigation Measure Noi-5.1 and compliance with adopted General Plan Policies N-4.9, S-15.1, S-15.2, and S-15.4. Construction and operation of the in-process GPAs would have the potential to expose noise sensitive land uses (e.g., residential use) to excessive noise from an airport if a project is located near an airport. Most of the in-process GPAs are located more than 2 miles from an airport except the ~~two~~ Peppertree Park Units 9 and 10 projects that are located within 2,000 feet of Fallbrook Airpark. However, the operation of the Fallbrook Airpark would not result in significant adverse noise impact off the airport property because the 2025 65 Community Noise Equivalent Level noise contour is expected to be fully within airport property (County of San Diego Department of Public Works 2006). Therefore, the noise impacts of the aviation operation of the Fallbrook Airpark would not result in significant noise impact with respect to surrounding land uses. In addition, all in-process GPAs would be required to comply with applicable airport land use plans, which minimize the public's exposure to excessive noise within areas around airports. Therefore, implementation of the identified in-process GPAs would not result in a significant impact related to excessive noise from a public or private airport. Implementation of the CAP Update, in combination with the in-process GPAs, would not result in a substantial incremental effect that would result in a significant cumulative impact related to excessive noise from a public or private airport. The cumulative impact would be less than significant.

4.4.12.3 Summary

Implementation of the CAP Update would not result in significant impacts related to excessive groundborne vibration or excessive noise from a public or private airport. The CAP Update together with the in-process GPAs would not result in a substantial incremental effect such that new significant cumulative impacts would occur. The CAP Update together with the in-process GPAs would result in a considerable contribution to an existing cumulative impact related to permanent increases in ambient noise levels. This cumulative impact would be significant and consistent with the conclusion in the 2011 GPU PEIR. This **would not be a new or more severe impact** than disclosed in the 2011 GPU PEIR.

4.4.13 Transportation

4.4.13.1 2011 GPU PEIR Determination

A cumulative impact analysis for transportation related to the implementation of the General Plan is contained in Section 2.15.4 of the 2011 GPU PEIR and is summarized in Section 2.13.3.7 of this SEIR. The 2011 GPU PEIR concludes that implementation of the General Plan would result in cumulatively considerable contributions to a significant cumulative impact to deficient roadway segments, to a significant cumulative impact to adjacent cities' traffic and level of service levels, and to a significant cumulative impact to road safety. The General Plan's contribution to cumulative impacts related to emergency access, parking capacity, and alternative transportation would be less than cumulatively considerable with implementation of mitigation measures and General Plan policies. Section 15064.3 of the State CEQA Guidelines was adopted in December 2018 and provides that VMT is the "most appropriate measure of transportation impacts" and mandated analysis of VMT impacts effective July 1, 2020. Given that this change to the CEQA Guidelines occurred after certification of the 2011 GPU PEIR, the PEIR did not evaluate impacts to VMT.

4.4.13.2 CAP Update Impact Analysis with In-Process GPAs

The geographic scope of the cumulative impact analysis for transportation is the SANDAG region, which encompasses the unincorporated areas and 18 incorporated cities that make up the entire County of San Diego.

Conflict with a Program, Plan, Ordinance or Policy Addressing the Circulation System

A cumulative impact would occur if the CAP Update together with the in-process GPAs would conflict with plans, ordinances, or policies establishing measures of effectiveness for the performance of the circulation system. As analyzed in Section 2.13.3.3 of this SEIR, implementation of the CAP Update would not involve off-site improvements which would substantially alter or damage the existing roadway network. CAP Update built environment and transportation measures and actions would enhance alternative transportation facilities; and would therefore, be beneficial to alternative transportation including bicyclists, pedestrians, and transit riders. Although traffic operations could be degraded during construction, all construction activities would be required to follow local protocols to ensure safety and minimize traffic disturbance during construction activities including the development of a traffic control plan for any work on a County-maintained roadway or in the County right-of-way. Therefore, implementation of the CAP Update would not result in a significant impact on the operation of the circulation system. If approved, in-process GPAs would result in new development in the unincorporated county. Construction and operation of the in-process GPAs would have the potential to contribute to degraded traffic operations from the generation of vehicle trips. The in-process GPAs would be subject to CEQA review and would be required to incorporate mitigation measures to minimize or avoid potential impacts to the extent feasible. Given the nature of the in-process GPAs (e.g., residential and mixed-use development), it is likely that impacts would be reduced to a less-than-significant level through implementation of traffic

control plans and construction notification. Therefore, the CAP Update together with the in-process GPAs would not result in a substantial incremental effect that would result in a new significant cumulative impact to plans, ordinances, or policies addressing the circulation system. The cumulative impact would be less than significant.

Exceed VMT Threshold

A cumulative impact would occur if the CAP Update together with the in-process GPAs would result in VMT that is not at least 15 percent below the SANDAG regional average or otherwise not exempt from detailed analysis. As discussed in Section 2.13.4 of this SEIR, growth assumed to occur under the adopted General Plan is projected to result in VMT that exceeds the regional average. To evaluate the potential for the in-process GPA projects to increase VMT relative to the VMT included in the GHG emissions forecasts for the CAP Update, the transportation model used in forecasting development and VMT in the CAP Update (SANDAG's DS 39 model) was modified to reflect the residential buildout of the in-process GPA projects. Because only limited information on non-residential uses associated with the in-process GPAs was available, and the residential component is the major component of most of the projects, the VMT modeling for the in-process GPAs reflects the highest VMT outcomes since it does not capture the typical reductions associated with mixed-use developments and neighborhood serving retail and focuses only on growth in housing units. Denser development would likely catalyze growth in employment and mixed-use development and would result in greater VMT reductions than shown. In 2035, regional VMT per resident is forecast to be 19.7. In the unincorporated county, modeled VMT per resident would be 27.4 under the adopted General Plan and 27.5 with approval and construction of the in-process GPA projects (assuming any of the in-process GPAs are approved). Similarly, in 2050 regional VMT per resident is forecast to be 19.9. In the unincorporated county, modeled VMT per resident would be 27.7 under the adopted General Plan and 27.8 with approval and construction of the in-process GPA projects. Given the information currently available about the in-process GPAs, the GPAs are assumed to contribute to an existing cumulative impact related to VMT. The CAP Update would reduce forecast VMT, as described in Section 2.13, "Transportation," and would not result in a cumulatively considerable contribution to the impact. Given that VMT impacts were not identified in the 2011 GPU PEIR, and the in-process GPAs could contribute to a significant cumulative VMT impact, implementation of the CAP Update, in combination with the in-process GPAs, would result in a new or more severe impact. Appendix B of this SEIR includes a memorandum prepared by Fehr & Peers that explains the methodology and modeling results for the calculation of VMT associated with the in-process GPAs.

Substantially Increase Hazards Due to a Design Feature

The 2011 GPU PEIR concludes that cumulative development would result in significant cumulative impacts related to transportation hazards. A cumulatively considerable contribution to an existing significant cumulative impact would occur if the CAP Update, in combination with the in-process GPAs, would result in substantially increased hazards due to a design feature. As analyzed in Section 2.13.3.5 of this SEIR, implementation of

the CAP Update would result in development of new or expanded solid waste facilities, renewable energy systems, and transportation infrastructure. During construction, projects associated with the CAP Update would result in degraded traffic operations due to increased traffic trips. However, the construction-related impacts would be localized and temporary. In addition, implementation of the General Plan policies and 2011 GPU PEIR mitigation measures would reduce the impacts to a less-than-significant level. Once constructed, these projects would not exacerbate inadequate road widths, or construct new roadways with sharp curves or inadequate sight distances. All projects would be required to meet County design standards and would be subject to review by County staff to ensure all applicable regulations are met. Therefore, implementation of CAP Update would not result in increased design hazards across the County's roadway network. If approved, the in-process GPAs would result in new development. Construction of new development would have the potential to result in road hazards due to a design feature or physical configuration of existing or proposed roads that can adversely affect the safe transport of vehicles along a roadway. The in-process GPAs would be subject to CEQA review and would be required to incorporate mitigation measures to minimize or avoid potential impacts to the extent feasible. Given the nature of the in-process GPAs (e.g., mixed-use and residential development), it is likely that impacts would be reduced to a less-than-significant level through implementation of traffic control plans during construction. All in-process GPAs would be designed per County of San Diego Public Road Standards and Design Standards to meet applicable standards of safety, design, and sight distance. Once operational, the in-process GPAs would not substantially increase hazards and impacts would be less than significant. Therefore, the CAP Update, in combination with the in-process GPAs, would not result in a cumulatively considerable contribution to a significant cumulative impact related to transportation hazards.

Result in Inadequate Emergency Access

A cumulative impact would occur if the CAP Update together with the in-process GPAs would result in inadequate emergency access. As analyzed in Section 2.13.3.6 of this SEIR, projects associated with the CAP Update would be required to meet state and local regulations related to emergency access and design. Additionally, all projects would be subject to review by applicable emergency service agencies to ensure emergency access is maintained during construction and operations. With implementation of the relevant General Plan policies and 2011 GPU PEIR mitigation measures; compliance with existing federal, state, and local regulations that regulate transportation; and completion of subsequent project-level planning and environmental review, impacts related to emergency access would be less than significant. Similar to the CAP Update, implementation of the in-process GPAs would be required to meet federal, state, and local regulations related to emergency access and design. The relevant General Plan policies and 2011 GPU PEIR mitigation measures identified in Section 2.13.3.6 of this SEIR would also be applicable to the in-process GPAs, which would reduce impacts related to emergency access to a less-than-significant level. Therefore, the CAP Update together with the in-process GPAs would not result in a substantial incremental effect that would result in a new significant cumulative impact related to emergency access. The cumulative impact would be less than significant.

4.4.13.3 Summary

Implementation of the CAP Update together with the in-process GPAs would not result in a substantial incremental effect that would result in new significant cumulative impacts related to conflict with plans, ordinances, or policies establishing measures of effectiveness for the performance of the circulation system, emergency access, or transportation hazards. These cumulative impacts would be less than significant. Given the nature of the proposed project, which would contribute to a reduction in regional VMT, implementation of the CAP Update would not result in a considerable contribution to an existing significant cumulative impact related to VMT. However, because VMT impacts were not identified in the 2011 GPU PEIR, and the in-process GPAs could contribute to a significant cumulative VMT impact, implementation of the CAP Update, in combination with the in-process GPAs, **would result in a new or more severe impact** than disclosed in the 2011 GPU PEIR.

4.4.14 Tribal Cultural Resources

4.4.14.1 2011 GPU PEIR Determination

A cumulative impact analysis for TCRs related to the implementation of the General Plan is not included in the 2011 GPU PEIR because TCRs were not identified as an environmental resource topic until 2015.

4.4.14.2 CAP Update Impact Analysis with In-Process GPAs

The geographic scope of the cumulative impact analysis for TCRs would be the county because TCRs could have the potential to occur throughout the county outside tribal lands.

Tribal Cultural Resources

The CAP Update in combination with the in-process GPAs could result in new developments that could result in adverse impacts to known and unknown TCRs. As discussed in Section 2.14.3.3 of this SEIR, compliance with CEQA Sections 21080.3.1 and 21084.3 would require tribal consultation and provide an opportunity to avoid or minimize the disturbance of TCRs; however, because the location, size, and magnitude of the future projects associated with the CAP Update are unknown, it may be infeasible to fully mitigate the impact to a less-than-significant level. Implementation of the in-process GPAs would involve construction of new buildings and infrastructure, the placement of structures, and the excavation of earthen materials. Although all in-process GPAs would be required to consult with affiliated tribes to identify TCRs, it is possible that unknown TCRs may be present and could be adversely affected by construction activities associated with the in-process GPAs. Therefore, implementation of the in-process GPAs could result in a potential significant impact to TCRs. The CAP Update in combination with the in-process GPAs would result in a significant cumulative impact to TCRs. Implementation of the CAP Update Mitigation Measure TCR-1 would require development to avoid tribal cultural resources when feasible. However, because the exact location and nature of projects is not known, the potential for projects associated with the CAP Update to contribute to a cumulatively significant impact would remain. Therefore, the CAP

Update, in combination with the in-process GPAs, would result in a cumulative considerable contribution to a significant impact. The cumulative impact would remain significant after mitigation. Implementation of the CAP Update would result in a new impact not disclosed in the 2011 GPU PEIR.

4.4.14.3 Summary

Implementation of the CAP Update, in combination with the in-process GPAs, would result in a significant cumulative impact to TCRs. The CAP Update's contribution to the significant cumulative impact would be cumulatively considerable. The cumulative impact would be significant and **would be a new or more severe impact** than disclosed in the 2011 GPU PEIR.

4.4.15 Wildfire

4.4.15.1 2011 GPU PEIR Determination

Cumulative impact analysis for wildfire related to the implementation of the General Plan is not discussed in the 2011 GPU PEIR because wildfire impact thresholds were added to the Appendix G of the State CEQA guidelines in 2018 after the certification of the 2011 GPU PEIR.

4.4.15.2 CAP Update Impact Analysis with In-Process GPAs

The geographic scope of the cumulative impact analysis for wildfire is the SANDAG region. Cumulative impacts related to implementation of an emergency response plan or emergency evacuation plan are discussed in "Hazards and Hazardous Materials" above.

Exacerbate Wildfire Risks

As discussed in Section 2.15.1, "Existing Conditions," the unincorporated county contains lands that are classified as Very High FHSZs. Because of the amount of Very High FHSZs in the unincorporated county, it is reasonable to assume that there are existing significant cumulative impacts related to the exacerbation of wildfire risks, related to exacerbation of wildfire risk from installation and maintenance of infrastructure, and related to exposing people or structures to post-fire risks.

As analyzed in Section 2.15.3.4 of this SEIR, future projects associated with the CAP Update would result in less than significant impacts related to exacerbation of wildfire risk with implementation of adopted General Plan policies and applicable 2011 GPU PEIR mitigation measures, and other applicable regulations listed in Section 2.15.2, "Regulatory Framework," of this SEIR.

Implementation of the in-process GPAs would result in housing development in rural and open areas with high fire risk, which could exacerbate wildfire risk. Similar to the CAP Update, all in-process GPAs would be required to comply with the adopted General Plan policies and regulations listed in Section 2.15.2, "Regulatory Framework," of this SEIR to protect project occupants from wildfire hazards. Such compliance would ensure that

proper fire safety measures would be employed during project construction; that sufficient ingress, egress, and wildfire suppression equipment would be present on-site; and that building materials and design, landscape design, and vegetation management would be sufficient to reduce the risk of wildfire to project occupants. However, given the prevalence of Very High FHSZs in the unincorporated county, it is reasonable to assume that there are existing significant cumulative impacts related to the exacerbation of wildfire risks, related to exacerbation of wildfire risk from installation and maintenance of infrastructure, and related to exposing people or structures to post-fire risks, and that given the level of new development proposed under the in-process GPAs, these projects would contribute to cumulative impact. Therefore, the CAP Update in combination with the in-process GPAs would result in a considerable contribution to a significant cumulative impact. The cumulative impact would be less than significant.

Install Infrastructure That Exacerbates Fire Risk

Implementation of the CAP Update and in-process GPAs could result in installation of infrastructure, such as power lines, power poles, battery storage systems, and/or substation. Installation of this infrastructure could result in placement of structures adjacent to wildland vegetation. Construction activities associated with installation of infrastructure may result in ignition sources, including heat sources or sparks from power tools, heated exhausts from worker vehicles, and improper electrical connections. During operation of the CAP Update and in-process GPAs, the primary wildfire ignition risks could include, but are not limited to, electrical shorts, employee and maintenance vehicles, collapse of supporting structures (e.g., power lines and power poles) causing electrical shorts and fire, and overgrown fuel under and around structures. As discussed in Section 2.15.3.4 of this SEIR, implementation of the adopted General Plan policies and 2011 GPU PEIR Mitigation Measures Haz-4.3, Pub-1.5, Pub-1.6, and Pub-1.7 would ensure that the CAP Update would result in less than significant impacts related to installation of infrastructure that exacerbates fire risk. Installation of infrastructure associated with the in-process GPAs would be required to be designed and constructed in accordance with current fire and building codes. Defensible space and fuel management required by the California Public Utilities Commission and California Department of Forestry and Fire Protection for utilities infrastructure development (as summarized in Section 2.15.2.2 of this SEIR) would also be provided. In-process GPAs would be subject to discretionary review and would be evaluated for project-specific impacts under CEQA. Project-specific mitigation would reduce and minimize impacts related to the exacerbation of fire risk to the extent feasible. Therefore, the CAP Update, in combination with the in-process GPAs, would not result in a considerable contribution to a significant cumulative impact. The cumulative impact would be less than significant.

Expose People or Structures to Post-Fire Risks

Implementation of the CAP Update could result in future development, such as expansion of facilities, identification of opportunities for potential future farmworker housing, and development of small-scale and large-scale renewable energy projects. These potential developments could expose people or structures to significant risks. However, as discussed in Section 2.15.3.5 of this SEIR, post-wildfire risks to new development associated with the CAP Update would be reduced to a less-than significant level through compliance with existing regulations related to wildfire protection, the adopted General Plan

policies, and the 2011 GPU PEIR Mitigation Measures Haz-4.3 and Pub-1.5 through Pub-1.7. Implementation of the in-process GPAs would result in housing and commercial development in areas subject to high fire risks, which could also expose people and/or structures to significant post-wildfire risk. It is foreseeable that the in-process GPAs proposed in the unincorporated county would also be required to comply with the same existing regulations related to wildfire protection, the adopted General Plan policies, and the 2011 GPU PEIR mitigation measures summarized in Section 2.15.3.5 of this SEIR, resulting in the mitigation of impacts related to post-wildfire risk. Further, given the fact that impacts resulting from the proposed CAP Update and in-process GPAs would not result in a significant impact related to exposing people or structures to post-wildfire risks, the CAP Update in combination with the in-process GPAs would not result in a considerable contribution to a significant cumulative impact. The cumulative impact would be less than significant.

4.4.15.3 Summary

The CAP Update together with the in-process GPAs would not result in a considerable contribution to existing cumulative impacts related to installation of infrastructure that exacerbates fires and exposing people or structures to post-wildfire risks. However, the CAP Update, in combination with the in-process GPAs would result in a considerable contribution to an existing cumulative impact related to exacerbation of wildfire risk. This cumulative impact would be significant; and because wildfire was not analyzed as a stand-alone topic in the 2011 GPU PEIR, given the addition of this topic to the CEQA Appendix G Checklist in 2018, implementation of the CAP Update together with the in-process GPAs **would result in a new or more severe impact** than disclosed in the 2011 GPU PEIR.

Table 4-1 In-Process Projects that include General Plan Amendments

Project Name	Community Plan Area	Board District	APN(s)	Project Details
Ivanhoe Ranch	Valle de Oro	2	518-030-41, -43, -44, -45	Residential DUs: 120
Warner Springs Ranch Resort SPA	North Mountain	5	137-092-31, -33	Residential DUs: 45
Peppertree Park SPA (Units 9 + 10)	Fallbrook	5	104-350-19	Residential DUs: 685
Peppertree Park SPA (Units 7 + 8)	Fallbrook	5	106-042-01	TBD
Passerelle - Campus Park	Fallbrook	5	108-120-61	Conversion of 157,000 SF of Office Professional to 138 Detached Condo Units in the Campus Park Specific Plan.
Abdali Gas Station	Bonsall	5	126-260-21	GPA/Rezone/Site Plan of excess Caltrans ROW for the construction of a Gas Station
Labrador Lane	Lakeside	2	396-101-01, -02, 396-080-92	104 mobile home units
Rancho Librado	San Dieguito	3	268-180-01, -39, -50, -51	56 units (54 age restricted condos and 2 guest quarters)
Castle Creek	Valley Center	5	POR 172-250-04, POR 172-040-67	63 age restricted condos
Preserve at Riverbend	Pala/Pauma	5	110-072-03, -04, 110-150-24, -26, -43, -44, -45, -46, 110-361-16, 110-362-08, -09, 128-020-02, -06, -49, -50, 128-470-05-01, 128-470-05-02, 128-470-08, -09, -15, -16, -18, -19, -20	Residential DUs: 1,330 Commercial SF: TBD
Harmony Grove Village South	San Dieguito	5	235-011-06, 238-021-08, -09, -10	Residential DUs: 453 Commercial SF: 5,000
Valley Center Community Plan Update	Valley Center	5	NA	TBD
Twin Oaks Community Plan Update	North County Metro	5	NA	TBD

Table 4-2 Summary of Projected GHG Emissions from In-Process General Plan Amendments

Total Annual Emissions (MTCO ₂ e)	2030	2045
Forecast GHG Emissions with CAP Update	1,656,086	305,813
Total projected GHG Emissions from In-Process GPAs	37,310	36,285
Total Projected GHG Emissions (forecast emissions and in-process GPAs)	1,693,396	342,098
CAP Targets	1,683,156	434,185
Reductions Needed to meet Targets	10,240	(92,087)

Notes: Emissions modeled in CalEEMod using default assumptions for the in-process GPA projects identified in Table 4-1 with VMT modeled by Fehr and Peers in 2023 to include all in-process GPA projects. Refer to Appendix B for detailed model outputs. Negative values indicate surplus reductions.

MTCO₂e – metric tons of carbon dioxide equivalent

Sources: Data received from San Diego County in 2023.

Figure 4-1 Location of In-Process GPA Projects

CHAPTER 5 **ALTERNATIVES**

5.1 Introduction

Title 14 of the California Code of Regulations (CCR) Section 15126.6(a) (State CEQA Guidelines) requires EIRs to describe “... a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather, it must consider a range of potentially feasible alternatives that will avoid or substantially lessen the significant adverse impacts of a project, and foster informed decision making and public participation. An EIR is not required to consider alternatives that are infeasible. The lead agency is responsible for selecting a range of project alternatives for examination and must publicly disclose its reasoning for selecting those alternatives. There is no ironclad rule governing the nature or scope of the alternatives to be discussed other than the rule of reason.” This section of the State CEQA Guidelines also provides guidance regarding what the alternatives analysis should consider. Subsection (b) further states the purpose of the alternatives analysis is as follows:

Because an EIR must identify ways to mitigate or avoid the significant effects that a project may have on the environment (Public Resources Code [PRC] Section 21002.1), the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly.

The State CEQA Guidelines require that the EIR include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. If an alternative would cause one or more significant effects in addition to those that would be caused by the project as proposed, the significant effects of the alternative must be discussed, but in less detail than the significant effects of the project as proposed (CCR Section 15126.6[d]).

The State CEQA Guidelines further require that the “no project” alternative be considered (CCR Section 15126.6[e]). The purpose of describing and analyzing a no project alternative is to allow decision makers to compare the impacts of approving a proposed project with the impacts of not approving the proposed project. If the no project alternative is the environmentally superior alternative, CEQA requires that the EIR “...shall also identify an environmentally superior alternative among the other alternatives.” (CCR Section 15126[e][2]).

In defining “feasibility” (e.g., “... feasibly attain most of the basic objectives of the project...”), CCR Section 15126.6(f) (1) states, in part:

Among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure,

general plan consistency, other plans or regulatory limitations, jurisdictional boundaries (projects with a regionally significant impact should consider the regional context), and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site (or the site is already owned by the proponent). No one of these factors establishes a fixed limit on the scope of reasonable alternatives.

5.2 Rationale for Selection of Alternatives

In determining what alternatives should be considered in the EIR, it is important to consider the objectives of the project, the project's significant effects, and unique project considerations. These factors are crucial to the development of alternatives that meet the criteria specified in Section 15126.6(a). Although, as noted above, EIRs must contain a discussion of "potentially feasible" alternatives, the ultimate determination as to whether an alternative is feasible or infeasible is made by the lead agency's decision-making body, here San Diego County Board of Supervisors. (See PRC Sections 21081.5, 21081[a] [3].)

The project is the CAP Update, prepared as a requirement of mitigation in the adopted County General Plan. This SEIR includes evaluation of project alternatives that identify changes to the proposed GHG reduction strategy in the CAP Update that would reduce the potential for significant environmental impacts to result from implementation. In addition, an analysis is included of "smart growth" alternatives, which would propose modifications to zoning and/or the land use map in the adopted General Plan¹ to reduce the potential for development to generate GHG emissions associated with vehicle miles traveled (VMT). As discussed further below, these alternatives were developed through a 2-year process of extensive stakeholder engagement that included numerous stakeholder meetings, geospatial mapping efforts, and coordination of various planning departments.

5.2.1 Attainment of Project Objectives

As described above, one factor that must be considered in selection of alternatives is the ability of an alternative to attain most of the objectives of the Project (State CEQA Guidelines Section 15126.6[a]). Chapter 2, "Project Description," articulates the following objectives.

- Reduce community-related GHG emissions within the unincorporated county and County operations-related GHG emissions to meet and exceed the County's GHG reduction targets for 2030 and 2045, as aligned with state reduction targets (as set forth in Senate Bill (SB) 32 [2016] and Assembly Bill (AB) 1279 [2022]), that does not rely on the purchase of carbon offsets to meet emission reduction targets.

¹ Because these alternatives extend beyond the scope of the CAP Update, which is a program of measures and actions to address GHG emissions from development under the adopted General Plan and government operations, implementation of the smart growth alternatives would require subsequent planning and comprehensive stakeholder engagement, as well as subsequent CEQA analysis. For example, if the Board directs staff to implement a smart growth alternative PDS would engage stakeholders, including outreach to property owners throughout the unincorporated county.

- Incorporate feasible and effective GHG reduction strategies, measures, and actions that reduce GHG emissions from community-wide activities in the unincorporated county and from County operations to establish actions to meet a goal of net zero carbon emissions by 2045 as aligned with AB 1279.
- Implement 2011 GPU PEIR Mitigation Measure CC-1.2 to prepare a CAP to reduce GHG impacts from implementation of the General Plan, and update Mitigation Measure CC-1.2 to be consistent with changes in state law, and the State CEQA Guidelines.
- Develop a CAP that supports the sustainability principles found in the County of San Diego General Plan Guiding Principles by doing the following: support a reasonable share of projected regional growth; promote health and sustainability by locating new growth near existing and planned infrastructure, services, and jobs in compact development patterns to the extent feasible; promote environmental stewardship that protects and/or enhances natural resources and habitats; ensure development that accounts for physical constraints and natural hazards; provide and support a multi-modal transportation network that enhances connectivity; maintain environmentally sustainable communities and reduce GHG emissions; and preserve agriculture as an integral component of the region's economy, character, and open space network.
- Develop a CAP that sets clear goals and identifies metrics (i.e., co-benefits and equity-based outcomes) to guide implementation to make substantial progress toward attaining environmental justice and equity.
- Develop a CAP that includes sufficiently adaptable long-term strategies that will consider and incorporate, as feasible, additional GHG reduction strategies that embrace continued innovation, technological advances, and the creation of high-quality jobs in the County.
- Accomplish the foregoing objectives in a manner that minimizes undue and unnecessary economic impacts on businesses and property owners, and that avoids regulatory takings under the federal and state constitutions.

5.2.2 Significant Environmental Impacts

5.2.2.1 Impacts that Remain Significant and Unavoidable

Implementation of the CAP Update would result in significant and unavoidable impacts in the following issue areas; however, the magnitude of the impact would be consistent with the impacts disclosed in the 2011 GPU PEIR:

Aesthetics

- Visual Character or Quality (Project)
- Light and Glare (Project)

Agriculture and Forestry Resources

- Direct or Indirect Conversion of Agricultural Resources (Project)

Air Quality

- Air Quality Violations (Project and Cumulative)
- Non-Attainment Criteria Pollutants (Project and Cumulative)
- Sensitive Receptors (Project and Cumulative)

Biological Resources

- Special-Status Plant and Wildlife Species (Project and Cumulative)
- Riparian Habitat and Other Sensitive Natural Communities (Project and Cumulative)
- Wildlife Movement Corridors and Nursery Sites (Project and Cumulative)

Hazards and Hazardous Materials

- Wildland Fires (Project and Cumulative)

Hydrology and Water Quality

- Surface Water and Groundwater Quality (Project and Cumulative)
- Groundwater Supply and Recharge (Project and Cumulative)

Noise

- Excessive Noise Levels (Project and Cumulative)

Transportation

- Substantially Increase Hazards Due to a Design Feature (Project and Cumulative)

5.2.2.2 New or More Severe Significant and Unavoidable Impacts

New or substantially more severe significant and unavoidable impacts are anticipated to result from implementation of the CAP Update in the following issue areas:

Aesthetics

- Scenic Vistas and Scenic Resources (Project and Cumulative)
- Visual Character or Quality (Cumulative)
- Light and Glare (Cumulative)

Agriculture and Forestry Resources

- Direct or Indirect Conversion of Agricultural Resources (Cumulative)
- Conflict with Agricultural Zoning or Williamson Act Contract Lands (Project and Cumulative)

- Direct and Indirect Conversion or Loss of Forest Land (Project and Cumulative)

Cultural and Paleontological Resources

- Historical Resources (Project and Cumulative)
- Archaeological Resources (Project and Cumulative)
- Paleontological Resources (Project and Cumulative)
- Human Remains (Project and Cumulative)

Land Use and Planning

- Physically Divide an Established Community (Project and Cumulative)

Tribal Cultural Resources

- Tribal Cultural Resources (Project and Cumulative)

5.3 Alternatives Considered but Rejected

5.3.1 Alternative Locations

State CEQA Guidelines Section 15126.6(f)(2) states that the “key question and first step” in analysis of alternatives is whether any significant impacts would be avoided or substantially lessened by moving the project to an alternative location. This alternative would implement the measures and actions in the CAP Update in an alternative location.

5.3.1.1 Reasons for Rejection

The CAP Update is a programmatic approach to reduce GHG emissions within the unincorporated county in accordance with state GHG emissions reduction targets. The CAP Update accomplishes this by adopting strategies, measures, and actions that reduce GHG emissions. While these strategies, measures, and supporting actions would apply to all areas of the unincorporated county and County operations and would not be limited to one area or property, they would all be implemented within the unincorporated county. The CAP Update is required as mitigation to reduce GHG impacts of the General Plan that were identified in the 2011 GPU PEIR. Because the mitigation measure (Mitigation Measure CC-1.2 of the 2011 GPU PEIR) sets out to reduce GHG emissions from community-wide sources and County local government operations (County operations) that are consistent with the General Plan, an alternative site where the project could be implemented would not be feasible or appropriate. The County only has jurisdiction over lands within its legal boundaries. As such, consideration of an alternative location has been eliminated from further analysis in this ~~draft~~ SEIR.

5.3.2 Prohibition on Growth in Unincorporated County Alternative

Forecast GHG emissions include both the continued operation of existing structures and associated resident behavior and emissions associated with anticipated population

growth and development. This alternative would prohibit all new development in the unincorporated county (with the exception of previously approved or entitled development); all existing residential, commercial, office, industrial, public facilities, agriculture and open space, along with utilities and roadways would generally remain in their current condition. A prohibition on new development would be adopted by the County Board of Supervisors (Board) as a separate action in conjunction with the CAP Update. An alternative that prohibits all new development and does not implement the proposed CAP Update would not meet project objectives related to SB 32 and AB 1279 compliance.

5.3.2.1 Reasons for Rejection

This alternative would not accommodate the County's Regional Housing Needs Allocation (RHNA), which is the amount of new housing that the state has assigned as the fair share of new housing units to build over the next 8 years. Government Code Section 65863 (the No Net Loss Law) requires that cities and counties ensure that their general plans provide for regional housing needs. Due to inconsistency with state regulations, this alternative would be infeasible. Halting all development in the unincorporated county would impair the County's ability to grow, adapt, and remain economically viable.

A prohibition on growth in the unincorporated county may reduce some environmental impacts associated with growth under the adopted General Plan, as disclosed in the 2011 GPU PEIR, but would not affect the environmental impacts of implementing the CAP Update. This alternative would not reduce the new and more severe impacts related to aesthetics, agriculture, cultural resources, land use, and tribal cultural resources associated with CAP Update implementation. This alternative would achieve project objectives related to development of a CAP, with the exception of the project objective to accomplish the foregoing objectives in a manner that minimizes undue and unnecessary economic impacts on businesses and property owners, and that avoids regulatory takings under the federal and state constitutions. This alternative was rejected from detailed consideration because it would not meet the County's state-mandated obligations to provide its fair share of housing, making it infeasible.

5.3.3 Prohibition on Changes to the General Plan Land Use Map Alternative

This alternative would prohibit general plan amendments (GPAs) that affect the density and intensity of land uses to preserve the accuracy of the GHG forecasts in the CAP Update. Some changes in density (e.g., higher density in rural areas and lower density near urban centers) can be associated with higher VMT, which is a factor in calculations of the GHG emissions of the unincorporated community. The CAP Update would be implemented as proposed and the prohibition of GPAs that change land use density would be adopted by the BOS as a separate action.

5.3.3.1 Reasons for Rejection

General Plans, and corresponding GHG reduction plans, are prepared to express the vision of a jurisdiction and establish goals and policies that reflect community values. As

a practical matter, these are living documents that are monitored and refined in response to changing conditions. Additionally, under state law, the Board of Supervisors cannot prohibit future Boards of Supervisors from revising, modifying, or amending the County's General Plan and corresponding GHG reduction plans in the future.

GPAs that increase density are outside the scope of the CAP Update, which has been developed as mitigation for the adopted General Plan and covers only the type and level of growth that is within the scope of the General Plan. As discussed in further detail in Section 4.4 of Chapter 4, "Other CEQA Sections," any in-process or future GPAs would conduct a stand-alone CEQA analysis, including an analysis of project specific GHG emissions to determine the project's alignment with County plans and applicable state and local programs adopted to reduce GHG emissions. Moreover, this alternative would result in the same suite of measures and actions, with the same potential for new or substantially severe impacts, as the proposed CAP Update alone and would not improve alignment with the project objectives. For these reasons, this alternative has not been carried forward for detailed analysis.

5.3.4 Carbon Offset Alternative

Stakeholders suggested consideration of an alternative that allows for carbon offsets to reduce GHG emissions associated with development that is within the scope of the General Plan. Under this alternative, a carbon offset mitigation that provides objective standards to determine which carbon offset programs qualify as producing sufficiently real, permanent, quantifiable, verifiable, enforceable, and additional reductions in GHG emissions and includes quantifiable measurements such as compliance with the offset protocols approved by the California Air Resources Board (CARB) or a qualified registry could be considered on a project-specific basis.

5.3.4.1 Reasons for Rejection

As proposed, the CAP Update achieves state GHG reduction targets for forecast growth in the unincorporated county and County operations without the use of carbon offsets; therefore, incorporating the purchase of carbon offset credits to reduce GHG emissions under the General Plan is not required. The CAP Update does not prohibit the use of carbon offsets where appropriate to address the GHG emissions of projects that would require amendments to the General Plan and that would not rely on the CAP Update for GHG reductions (i.e., projects that would be outside of the scope of the General Plan and would conduct project-level GHG emissions modeling and recommend project-specific mitigation, and would not attempt to streamline evaluation of GHG emissions using the tiering and streamlining provisions of State CEQA Guidelines Section 15183.5). CEQA Guidelines Section 15126.4(c)(3) allows mitigation through "off-site measures, including offsets that are not otherwise required, to mitigate a project's emissions." Offsets are expressly allowed in CEQA and are available as a suite of mitigation measures for the reduction of GHG emissions. This alternative was rejected from further consideration both because carbon offsets would not be required for the County to achieve GHG reductions pursuant to applicable state targets under the General Plan and because the Board directed staff to develop a CAP that achieves state targets without the purchase of carbon

offsets. This direction is included in the objectives of the project and is, in fact, a key defining objective of the CAP Update. For the foregoing reasons and, because projects can still use carbon offsets if appropriate, this alternative is rejected from further consideration in this SEIR.

5.3.5 Net Negative by 2035 Alternative

Comments were received during the NOP scoping process that the County should consider an alternative that would achieve net negative emissions by 2035. This alternative would establish a target of net negative GHG emissions by 2035. To achieve this target, all measures and actions in the CAP would be revisited to ensure that all technologically feasible reductions are achieved. Because the CAP Update already includes all feasible measures and actions that would reasonably reduce emissions, this alternative would likely increase environmental impacts and the fiscal cost of CAP Update implementation. Furthermore, because the available reductions are small and not expected to achieve the target alone, this alternative is assumed to require the purchase of carbon offsets.

5.3.5.1 Reasons for Rejection

The CAP Update is aligned with the 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan) prepared by CARB. The Scoping Plan development process included evaluation of the technological feasibility, cost-effectiveness, and equity-focused pathways for the state to achieve statewide carbon neutrality prior to 2045. In the process, CARB modeled scenarios for economic GHG emission sectors and in four alternatives, including two alternatives for reaching carbon neutrality prior to 2035. The ability for natural working lands to sequester carbon was also evaluated in four separate alternatives to maximize effectiveness of natural carbon dioxide removal. Based on this information and a thorough stakeholder engagement process, CARB decided on a preferred “Scoping Plan Scenario” of achieving net zero emissions by 2045.

CARB ultimately concluded that the Scoping Plan Scenario for 2045 carbon neutrality is more cost effective and technologically feasible than the 2035 carbon neutrality alternatives and identified “several feasibility concerns” with 2035 carbon neutrality. CARB performed analysis demonstrating that 2035 carbon neutrality alternatives would have the following outcomes relative to the 2045 timeline of the Scoping Plan Scenario:

- 5 to 3 times slower job growth in 2035,
- 7 to 6 times higher direct costs in 2035, and
- 6 to 5 times slower economic growth in 2035.

The Scoping Plan Scenario shows that it is economically and technologically feasible to reduce emission to at least 85 percent below 1990 levels by 2045 as called for by AB 1279. It also shows that mitigation of 100 percent of anthropogenic emissions by 2045 is not economically and technologically feasible and that carbon dioxide removal should be

utilized to achieve California's carbon neutrality target. In addition, the Scoping Plan scenario shows that natural and working lands are projected to be a net emissions source of approximately 7 million metric tons of carbon dioxide equivalent per year (MMTCO₂e/year) in 2030 and 2040, even with actions to preserve carbon sequestration potential. The Scoping Plan compensates for residual anthropogenic emissions and net emissions from natural working lands with additional mechanical carbon dioxide removal and carbon capture and sequestration strategies, including technologies such as direct air capture with sequestration. The County does not have infrastructure to construct new facilities to capture ambient CO₂ or pipelines, wells, and other surface facilities to enable the transport and injection of CO₂ into a geologic formation for sequestration.

This alternative would have to include the purchase of carbon offsets to close the gap between the emissions reductions that can be achieved in the county and the net negative goal. As described above, the use of carbon offsets contradicts the Board's direction. Additionally, there is not an established carbon offset program in the county, and stakeholders have expressed a desire to avoid out-of-county offsets. Therefore, the Net Negative by 2035 Alternative was dismissed from detailed analysis due to infeasibility.

5.3.6 Enhanced Biological Preserve Alternative

During scoping, commenters identified open space as a source of carbon sequestration and a method of reducing development potential in the unincorporated county. The CAP Update assumes full implementation of a Carbon Farming Program by 2026 and acquisition of 11,000 acres of conservation land by 2030 (and 1,000 acres per year thereafter), as well as agriculture and conservation measures that would preserve natural lands and improve land management practices to protect habitat and increase carbon storage. These assumptions maximize the potential for land preservation under the County's current acquisition mechanisms.

There are several open space preservation tools the county could explore to implement this alternative, including further clustering development, transfer of development rights, and land acquisition. Clustering development allows for development to occur in a way that maximizes the preservation of open space without reducing a property owner's development rights. A transfer of development rights allows a developer to essentially purchase the rights from the property that the community wants to preserve and transfer those rights to another property. However, this is a complex program that is highly dependent on market dynamics and only works if there is a suitable "receiver site" that can receive density for hundreds of additional housing units and property owners or developers willing to purchase development rights for that increased density. The purchase of property by a land trust allows land to be placed under a conservation easement. Alternatively, a bond measure could allow the community to essentially tax itself to purchase the land for public open space. Each of these options present challenges requiring additional investigation.

5.3.6.1 Reasons for Rejection

The Enhanced Biological Preserve Alternative has the potential to meet all established project objectives if the legal and practical constraints discussed above could be overcome. Additionally, an alternative with increased open space may reduce environmental impacts compared to the proposed CAP Update if it would decrease the need for other measures and actions that result in environmental effects (e.g., new renewable energy infrastructure). However, implementation of this alternative would face legal and practical constraints, as explained above. Programs to transfer development rights or purchase property are outside the scope of the planning framework in the proposed CAP Update. As a result, this alternative has been rejected from further consideration.

5.3.7 Nuclear Power Alternative

Comments were received during the NOP scoping process that the County should consider an alternative that would include purchase of San Onofre Nuclear Generating Station. Under this alternative, the County would buy San Onofre Nuclear Generating Station from Southern California Edison and supply the unincorporated county with nuclear power to reduce GHG emissions associated with building energy consumption. The San Onofre Nuclear Generating Station is a permanently closed nuclear power plant located south of San Clemente. The plant was shut down in 2013 after defects were found in replacement steam generators; it is currently in the process of decommissioning.

The Nuclear Power Alternative would include a measure for the acquisition and operation of San Onofre Nuclear Generating Station in addition to the other measures and actions in the CAP Update. All other measures and actions would be included as proposed in the CAP Update.

5.3.7.1 Reasons for Rejection

Because this alternative would reduce reliance on the utility providers for renewable energy, the alternative could result in the reduction of environmental impacts anticipated to indirectly result from the development of large-scale renewable energy infrastructure. However, acquisition and operation of San Onofre nuclear power plant is not a feasible option for the County to explore. The plant is actively being decommissioned by the current owner, Southern California Edison, due to the defective status of the facility. There are technological limitations with the safe operation of the facility and the County does not have the governmental resources with the expertise or capacity to manage the operation of the plant. For these reasons, this alternative has been rejected from further consideration.

5.4 CAP Update Alternatives

5.4.1 Evaluation of CAP Update Alternatives Selected for Detailed Analysis

5.4.1.1 No Project Alternative

The No Project Alternative assumes the CAP Update would not be adopted and implemented. As a result, the County would not adopt strategies, measures, and supporting efforts to reduce GHG emissions in accordance with state-mandated reduction targets. New developments would continue to be reviewed under CEQA. This alternative would not meet any of the project objectives.

Comparison to the Effects of the CAP Update

As described above, under the No Project Alternative the CAP Update would not be implemented. As a result, the County would not have a mechanism by which to meet legislative requirements for GHG emissions. The No Project Alternative would not satisfy the County's obligation under Mitigation Measure CC-1.2 of the 2011 GPU PEIR, which requires the preparation of a CAP to achieve reduction targets. Further, the County would still be obligated to ensure that development under the General Plan would comply with legislative requirements for GHG emissions. Compliance with these requirements would be achieved through individual project-level analysis for all development projects subject to discretionary review. While GHG impacts would be assessed on a project-by-project basis, without the CAP Update in place, it may be more difficult for the County to achieve compliance and could result in inconsistencies with legislative requirements. Therefore, this alternative could result in greater GHG impacts. Transportation impacts related to VMT would also increase under the No Project Alternative. As described in Section 2.13, "Transportation," the CAP Update includes programs designed to reduce GHG emissions from the transportation sector through VMT reduction.

The environmental impacts of CAP Update implementation, and in particular those related to the construction and operation of the large-scale renewable energy infrastructure anticipated necessary to achieve the GHG reductions in the CAP Update that could affect the integrity of agricultural, biological, cultural, aesthetic, water, and tribal cultural resources, would be reduced or similar under the No Project Alternative. However, as described above, individual projects would continue to evaluate and mitigate GHG emissions on a project-by-project basis. The cumulative effect of these individual GHG reduction programs is not known at this time but may result in similar or greater effects on the environment due to a similar demand for renewable energy and infrastructure to support GHG reduction in accordance with state regulations and the absence of coordinated programs to address the necessary mitigation.

5.4.1.2 Distributed Generation Only Alternative

Comments were received during the NOP scoping process that the County should consider an alternative that would limit renewable energy generation to distributed

generation systems (i.e., a variety of small, grid-connected systems that efficiently deliver electricity near its place of origin, such as solar and wind energy generation sited on top of or adjacent to buildings and connected to a micro-grid) and that large, utility-scale energy systems should not be considered. As described in this ~~draft~~ SEIR, many of the project's significant impacts are associated with the large, utility-scale components that would be induced through implementation of CAP Update actions. Specifically, under Action E-3.3 the County would develop a program to provide 100 percent renewable energy to residents and businesses participating in San Diego Community Power by 2030. The County anticipates that private developers and utility companies would implement large-scale renewable infrastructure projects to meet the energy demand generated by this action; development of this infrastructure would require compliance with CEQA and regulatory requirements.

Under the Distributed Energy Only Alternative, Action E-3.3 would be modified to develop a program to provide 100 percent renewable energy to residents and businesses through distributed generation. The first step in establishing this program would be to prepare a feasibility study that assesses the distributed energy generation potential of the unincorporated county to determine how much energy could be generated without the need for large-scale renewable energy projects. Based on the results of the feasibility study and the types of distributed generation systems appropriate for various geographies and land uses, incentives would be identified to promote construction of these renewable energy systems. Distributed generation systems are currently allowed within the county and would be encouraged through mechanisms such as permit process improvements, and zoning and code updates, potentially including a renewable energy zoning overlay. For example, the County's Solar and EV Ready Ordinance, adopted in 2015, requires newly constructed residential dwelling to include solar-ready electrical equipment and roof space for easy installation of future solar photovoltaics. In addition, the County has offered a streamlined web-based permitting platform since 2013 which served as an example for the State permit streamlining law passed in 2014. From 2014 to 2022, 408,954 kilowatts of distributed generation solar photovoltaic systems have been installed since this platform was put into place.

The County currently allows construction of large-scale renewable energy systems (e.g., solar, wind, geothermal) subject to its ordinances, policies, and standards. This would not change under this alternative. However, this alternative would modify the County's commitment to providing renewable energy under Action E-3.3 to promote the construction of distributed generation systems. Large-scale renewable energy systems could still be developed, and their associated impacts could occur. However, this alternative would eliminate the demand for these systems induced by the CAP Update, thereby reducing the total number of systems that would be anticipated within the county. Therefore, overall impacts that are specific to the construction and operation of large-scale renewable energy projects, such as conversion of undeveloped open space to energy infrastructure, would be reduced compared to the project.

The feasibility study would determine how much renewable energy could be feasibly provided to county residents by 2030 using distributed energy infrastructure. The County anticipates that it would be more complicated and time-intensive to produce energy in this

manner than through large scale renewable projects because of the volume of projects required to establish the systems and the inherent potential for site-specific design challenges associated with the establishment of distributed energy systems that would both meet electricity demands in the unincorporated county and achieve emissions reductions equivalent to Action E-3.3 in the proposed CAP. Such challenges could add substantial time and complexity to the generation of distributed energy within the unincorporated county. For this reason, it is anticipated that the Distributed Generation Only Alternative may not meet the project objectives related to meeting the SB 32 target in 2030. However, this alternative would support the objectives of the sustainability principles in the General Plan, contribute to progress toward environmental justice and equity, include other adaptable measures and actions, and minimize undue and unnecessary economic impacts on businesses and property owners.

The CAP requires annual reporting, inventory updates at least every 2 years, and an update to the CAP at least every 5 years to track progress towards attainment of the 2030 and 2045 targets. If this alternative is selected, the County would monitor its efficacy and progress towards achieving the stated reductions under Action E-3.3. The County would be able to adapt if the Distributed Generation Only Alternative is selected and anticipated reductions are not being met.

Comparison to the Effects of the CAP Update

Aesthetics

Large-scale renewable energy infrastructure is anticipated to potentially alter the landscape of undeveloped areas in the county to accommodate renewable energy infrastructure such as PV solar arrays and wind turbines. The distributed energy only alternative would reduce or eliminate the potential for the CAP Update to induce the construction of large-scale renewable energy infrastructure. Distributed energy systems would include similar infrastructure requirements (e.g., solar panels and powerlines), but their smaller scale and proximity to development are anticipated to substantially reduce impacts related to changes or obstruction of scenic vistas and scenic resources, and degradation of visual character or quality. Impacts would be reduced compared to the proposed CAP Update.

The aesthetic impacts from implementing the Distributed Generation Only Alternative would be less than significant with mitigation and the project would not result in a considerable contribution to a significant cumulative impact. Implementation of the Distributed Generation Only Alternative would not result in a new significant impact not discussed in the 2011 GPU PEIR or a substantial increase in the severity of the previously identified significant effect.

Agriculture and Forestry Resources

The scale and magnitude of the renewable energy projects that could be constructed by utilities to meet the demand generated by the CAP Update is anticipated to result in potential conflicts with agricultural zoning and Williamson Act contracts. The Distributed

Generation Only Alternative would result in dispersed, discrete energy projects throughout the county. The additional flexibility in siting these smaller systems and their inherent proximity to areas of development is anticipated to reduce impacts to agricultural and forest resource. Impacts would be reduced compared to the proposed CAP Update.

The Distributed Generation Only Alternative would result in a less-than-significant impact related to conversion of agricultural land, conflicts with agricultural and forest zoning, and Williamson Act contracts and would not result in a new significant cumulative impact. Implementation of the Distributed Generation Only Alternative would not result in a new significant impact not discussed in the 2011 GPU PEIR or a substantial increase in the severity of the previously identified significant effect.

Air Quality

Large scale renewable energy infrastructure would not generate substantial emissions that would affect consistency with air quality plans or standards, pollution concentrations, or emission of odors. For this reason, the Distributed Generation Only Alternative would have similar impacts to the proposed CAP Update. Impacts would remain significant and unavoidable. Like the project, this alternative would result in a considerable contribution to a significant cumulative impact. This would not be a new or more severe impact than disclosed in the 2011 GPU PEIR.

Biological Resources

The Distributed Energy Generation Only Alternative would locate infrastructure more proximate to development, which may reduce impacts to biological resources. Although the Distributed Energy Only Alternative may result in impacts to biological resources, impacts are expected to be more discrete and localized than solar array fields, geothermal infrastructure, and wind turbines that typically encompass large areas. Large-scale solar and wind energy systems, which could indirectly result from implementation of the CAP Update, could result in impacts to special-status species due to construction activities, implementation of access roads and transmission lines, and conversion of large areas of land to industrial uses, resulting in habitat loss. Wildlife could potentially be displaced within the construction areas and use of access roads around the construction area has the potential to result in the direct mortality of less mobile wildlife and rare plants.

Although impacts to biological resources would be reduced compared to the proposed CAP Update, the alternative would have a significant and unavoidable impact and a considerable contribution to significant cumulative impacts. This would not be a new or more severe impact than disclosed in the 2011 GPU PEIR.

Cultural and Paleontological Resources

The Distributed Energy Generation Only Alternative would locate infrastructure more proximate to development, which may reduce impacts to cultural resources. Large-scale renewable energy systems, such as PV and wind turbines, would generally be constructed in areas that are not highly developed because of the size, massing, coverage, and scale of this type of infrastructure that relies upon large amounts of land unencumbered by

buildings or shadowed by buildings or trees. Ground disturbance, including excavation and grading have the potential to alter archaeological and paleontological resources.

Although the Distributed Energy Only Alternative may result in impacts to cultural resources, impacts are expected to be more discrete and localized than solar array fields, geothermal infrastructure, and wind turbines that typically encompass large areas. Impacts would be reduced compared to the proposed CAP Update. However, impacts from GHG reduction measures that would result in the installation of small wind turbines or solar photovoltaic facilities would remain significant and unavoidable and the project would result in a considerable contribution such that new significant cumulative impacts would occur. Under the Distributed Energy Only Alternative, this would remain a new or more severe impact not disclosed in the 2011 GPU PEIR.

Energy

Modification of CAP Update Action E-3.3 under the Distributed Energy Only Alternative to eliminate or reduce the potential to indirectly induce the development of large-scale renewable energy infrastructure would not substantially affect the potential for the CAP Update to result in wasteful, inefficient, or unnecessary consumption of energy resources because changing the source of the energy does not change the manner in which it is used. The shift in the type of renewable energy infrastructure incentivized by the County would not conflict with state and local plans for renewable energy. Therefore, the Distributed Energy Only Alternative would result in similar impacts to the CAP Update.

The Distributed Generation Only Alternative would result in a less-than-significant impact related energy demand and would not result in a new significant cumulative impact. Implementation of the Distributed Generation Only Alternative would not result in a new significant impact not discussed in the 2011 GPU PEIR or a substantial increase in the severity of the previously identified significant effect.

Environmental Justice

Modification of CAP Update Action E-3.3 under the Distributed Energy Only Alternative to eliminate or reduce the potential to indirectly induce the development of large-scale renewable energy infrastructure would not substantially affect the potential for the CAP Update to result in environmental justice impacts. For this reason, the Distributed Generation Only Alternative would have similar impacts to the proposed CAP Update.

The Distributed Generation Only Alternative would result in a less-than-significant impact related to environmental justice and would not result in a new significant cumulative impact. Implementation of the Distributed Generation Only Alternative would not result in a new significant impact not discussed in the 2011 GPU PEIR or a substantial increase in the severity of the previously identified significant effect.

Greenhouse Gas Emissions

Supplying renewable energy to San Diego Community Power customers would be the most efficient and reliable path to reducing GHG emissions associated with electricity use

in the unincorporated county. The Distributed Energy Only Alternative would require further study to determine if equivalent energy can be feasibly generated by distributed energy systems. Further, distributed energy systems to serve individual users or communities would undergo separate design, review, and construction processes. Even with the incentives included in this alternative, it is possible that there is a longer lead time for the development of distributed energy systems. During this period, it is assumed that a greater proportion of the energy demand in the unincorporated county would be met through non-renewable energy sources, which would increase GHG emissions compared to the CAP Update. For this reason, the Distributed Generation Only Alternative would have greater impacts than the proposed CAP Update on GHG emissions.

Impacts would be potentially significant due to the uncertainty regarding whether enough renewable energy could be provided through distributed energy systems to achieve the established targets and consistency with applicable plans and regulations. Implementation of the Distributed Energy Generation Only Alternative could result in new or more severe impacts than disclosed the 2011 GPU PEIR.

Hazards and Hazardous Materials

Large scale renewable energy infrastructure would not create substantial hazards, interfere with emergency response, or expose people to vectors. The Distributed Generation Only Alternative also would not create substantial hazards, interfere with emergency response, or expose people to vectors. For this reason, the Distributed Generation Only Alternative would have similar impacts to the proposed CAP Update.

As described in Section 2.9, “Hazards and Hazardous Materials,” for the CAP Update, the Distributed Generation Only Alternative would result in the development and redevelopment of infrastructure throughout the unincorporated county, including areas susceptible to wildland fires. Compliance with existing regulations related to wildfire protection and implementation of adopted General Plan policies and 2011 GPU PEIR mitigation measures would reduce the project-level and cumulative impacts but not to a less-than-significant level. Therefore, impacts associated with exposing people or structures to significant risks of loss, injury, or death involving wildland fires would be significant and unavoidable and would result in a considerable contribution to an existing significant cumulative impact. This alternative would not result in a new significant impact not discussed in the 2011 GPU PEIR or a substantial increase in the severity of the previously identified significant effect.

Hydrology and Water Quality

Large-scale renewable infrastructure would have the potential to impair water quality, groundwater recharge, and surface hydrology. This potential for effects would be addressed through the Major Use Permit process and compliance with County regulations. Because the Distributed Generation Only Alternative does not require as much acreage as large scale renewable solar, geothermal, and wind and would be located closer to where the energy is consumed, it would have less impacts to water quality, groundwater recharge, and surface hydrology. Much of the Distributed Generation

Only Alternative would require PV on rooftops or micro-grids closer to developed areas that would reduce impacts on groundwater. Therefore, the Distributed Generation Only Alternative would have less impacts than the proposed CAP Update.

However, similar to the conclusions for the CAP Update, because of the uncertainty regarding the types, locations, and scale of projects implemented, the Distributed Generation Only Alternative would have a significant and unavoidable impact and would result in a considerable contribution to a significant cumulative impact on groundwater supply and recharge. This would not be a new or more severe impact compared to the 2011 GPU PEIR.

Land Use and Planning

Large-scale renewable energy projects would be required to obtain applicable permits, undergo discretionary review, evaluate project-specific impacts under CEQA, and mitigate those impacts to the extent feasible; however, because of the uncertainty of the types, locations, and scale of future large-scale renewable energy projects impacts related to division of established communities could be significant. The Distributed Generation Only Alternative would reduce the potential for large-scale renewable energy infrastructure to disrupt existing access and circulation patterns in a manner that would have the potential to divide established communities. As a result, this alternative would have reduced impacts compared to the proposed CAP Update.

The Distributed Generation Only Alternative would result in a less-than-significant impact related to the physical division of established communities and would not result in a new significant cumulative impact related to the physical division of established communities. Under this alternative, there would not be a new or more severe impact than disclosed in the 2011 GPU PEIR.

Noise

The Distributed Energy Generation Only Alternative would result in renewable infrastructure, such as solar PV panels on rooftops and micro-grids, close to communities. This alternative would not induce the same demand for large-scale renewable infrastructure as the proposed CAP Update that, consistent with the Wind Energy EIR, would result in a significant and unavoidable impact related to low-frequency noise. However, the Distributed Energy Generation Only Alternative would result in new infrastructure closer to sensitive receptors.

Overall, the Distributed Energy Generation Only Alternative would result in similar impacts compared to the proposed CAP Update. The alternative's impact related to excessive noise levels would be significant and unavoidable and the alternative would result in a considerable contribution to a significant cumulative impact. This would not be a new or more severe impact compared to the 2011 GPU PEIR.

Transportation

The Distributed Energy Generation Only Alternative would locate infrastructure more proximate to development, which may reduce the construction traffic trip lengths anticipated for the construction of large-scale renewable infrastructure that could be located in relatively remote locations. However, once constructed, large-scale renewable energy projects would not have an impact on operation of the circulation system. Overall, the Distributed Energy Generation Only Alternative would result in similar impacts compared to the proposed CAP Update.

The Distributed Energy Generation Only Alternative would result in a less-than-significant impact related to transportation and would not result in a considerable contribution such that a new significant cumulative impact related to VMT would occur. Implementation of the Distributed Energy Generation Only Alternative would not result in new or more severe impacts than disclosed the 2011 GPU PEIR.

Tribal Cultural Resources

The Distributed Energy Generation Only Alternative would result in renewable infrastructure such as solar PV panels on rooftops and micro-grids close to communities. Construction of this infrastructure would have less potential to adversely affect Tribal Cultural Resources than the CAP Update because large-scale renewable energy projects can require expansive land area in more remote locations.

However, the Distributed Energy Generation Only Alternative would result in similar impacts compared to the proposed CAP Update overall because the specific location of projects associated with CAP Update implementation are not known and because they could be implemented in areas where TCRs are present. Because the reduction of impacts to a less-than-significant level cannot be guaranteed, the alternative would have a significant and unavoidable impact and would result in a considerable contribution to a significant cumulative impact to TCRs.

Wildfire

The Distributed Energy Generation Only Alternative reduces the fire risk associated with indirectly inducing the installation of renewable energy systems and associated infrastructure under the proposed CAP Update. However, future large-scale renewable energy projects would be designed to prevent this infrastructure from exacerbating a fire risk to the extent feasible. The large-scale renewable energy projects and associated infrastructure would be required to be designed and constructed in accordance with current fire codes. Defensible space and fuel management required by the California Public Utilities Commission and CAL FIRE for utilities infrastructure development would also be provided. Although the Distributed Energy Generation Only Alternative may slightly reduce impacts compared to the proposed CAP Update because it would limit the need for powerlines traversing undeveloped open space to deliver power to customers, implementation of adopted General Plan policies and 2011 GPU PEIR mitigation measures would ensure that project and cumulative impacts would remain less than

significant and would not result in a considerable contribution such that no new significant cumulative impact would occur, consistent with the proposed CAP Update. Implementation of the alternative would not result in new or more severe impacts than disclosed in the 2011 GPU PEIR.

5.5 Smart Growth Alternatives

5.5.1 Development of Smart Growth Alternatives

This draft SEIR also includes consideration of smart growth² alternatives that are intended to significantly reduce VMT as required by the Court of Appeal for Division One of the Fourth Appellate District (Appellate Court) in *Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467. The smart growth alternatives discussed below propose actions that, if adopted in addition to the CAP Update measures and actions, are intended to further reduce GHG emissions by reducing VMT through changes in development patterns. Note, however, that the efficacy of alternatives focused on incentives and disincentives for future development is limited because most forecast VMT in the unincorporated county is associated with existing development. Substantial reductions in countywide VMT would require changes to the travel patterns of the existing population and Board-directed land use and zoning changes. For example, siting mixed-use development and neighborhood serving retail near residential development can bring employment and shopping opportunities closer to existing residents, thus reducing VMT. Moving all household growth to specific areas along with changes to employment and commercial land uses in those areas could both minimize VMT from future growth and potentially reduce VMT associated with existing residents. Land use strategies that promote density and mixed-use development also make transit service more feasible to implement, which could shorten/replace existing vehicle trips. Other strategies to address existing VMT include either disincentivizing driving or incentivizing not driving, such as road user charges or programs that pay employees to work from home or pay residents to not make certain trips.

In addition to reducing VMT and GHG emissions, adopting and implementing a smart growth alternative in the unincorporated area could result in development outcomes aligned with previously directed policy objectives, such as increasing housing diversity and affordability levels near jobs and transit and reducing sprawling land use patterns. The General Plan, for which the CAP Update serves as a mitigation measure, was designed to achieve "smart growth" objectives including concentrating development in designated villages with integrated infrastructure and nonresidential uses. Achieving these goals reduces VMT attributable to new development. See Section 1.3 in Chapter 1, "Project Description," of this draft SEIR, regarding the County's efforts through the General Plan to focus development within village areas and closer to services in the western portion of the incorporated county. In addition, please refer to Table I-1 in the General Plan regarding sustainability policies.

² "Smart Growth" is defined in the decision as "compact, efficient, and environmentally sensitive pattern of development that focuses future growth away from rural areas and closer to existing and planned job centers and public facilities, while preserving open space and making more efficient use of existing urban infrastructure."

Adoption of a smart growth alternative would further focus development in areas close to employment centers, commercial services and amenities, and public facilities such as schools, fire stations, libraries, and parks/recreational opportunities. This approach assists in maximizing the use of existing infrastructure, preserves open space and natural resources, and reduces the distance individuals need to travel to meet their needs. Smart growth tends to create a greater range in housing and transportation options by incentivizing redevelopment of underutilized properties, thereby offering more choices and, potentially, a greater range of prices. Smart growth may also contribute to the economic development potential of existing communities by providing new investment opportunities, providing a framework for capital improvements, and supporting more efficient development patterns that allow for a wider mix of uses. A key component of smart growth as an approach to development and conservation is encouraging all stakeholders to participate in the decision-making process. Involving a broad set of stakeholders in planning for smart growth can help foster distinctive communities with a strong sense of place, resulting in increased access for a wider range of residents while creating new placemaking opportunities through the planning process. Due to each place's unique characteristics and stakeholder desires, development outcomes associated with applying new, focused, smart growth strategies in unincorporated communities would largely depend on the communities themselves and the viability of the strategies, programs, and incentives that would be implemented.

5.5.1.1 Summary of Outreach Related to Smart Growth Alternatives

The County conducted outreach on smart growth alternatives beginning in early 2021 following issuance of the Notice of Preparation for this SEIR. The County posted notification of smart growth development on the CAP Update website (<https://www.sandiegocounty.gov/content/sdc/sustainability/climateactionplan/>). Any individual or organization with interest in providing input on the development of smart growth alternatives was encouraged to reach out via the provided email link to schedule a meeting.

Following release of the NOP, the County's Department of Planning and Development Services (PDS) held five workshops on smart growth alternatives to solicit input and request involvement on development of the smart growth alternatives. After efforts to engage stakeholders, PDS held approximately 65 separate meetings with Community Planning and Sponsor Groups, environmental organizations, industry organizations, and individuals. Meetings were primarily held throughout 2021 and again in Spring of 2023.

In total, the County participated in over 70 meetings with a variety of stakeholders to better understand the community's vision for smart growth and gather suggestions for development of alternatives. In these meetings, the County asked stakeholders to identify the geographies where they thought smart growth development should occur. Based on requests from various stakeholders, the County prepared an interactive land use overlay mapping application and a series of approximately 90 static smart growth maps to

facilitate discussions with stakeholders and development of alternatives. These maps and other materials are available to the public on the CAP Update website.³

After identifying where smart growth should occur, PDS asked for input on how to incentivize growth in smart growth locations and disincentivize growth where it was less desirable (i.e., outside of smart growth locations). PDS explained during outreach that development of an overlay zone would be placed over determined smart growth locations where development could be incentivized, and that outside of that overlay zone development could be disincentivized. The results of outreach and overlay zone are discussed below.

Outreach Results

Possible incentives for smart growth development:

- Develop financial incentives, such as waiver of permit application fees, especially to encourage low-and middle-income housing.
- Create opportunities for ministerial (i.e., not requiring CEQA review) applications and processes.
- Develop a priority review process where smart growth projects get expedited “top of the line” review.
- Update zoning and other ordinances to streamline.
- Develop infrastructure studies and parcel analysis to identify service and infrastructure deficiencies.
- Create special improvement districts and programs that can provide focused funding for capital improvement projects.
- Develop economic and market studies to understand the economics of each community and how best to grow.
- Adopt design standards for streets, sidewalks, and public rights-of-way to ensure safety and mobility for all modes of transportation.
- Develop a land banking, density transfer, transfer of development rights, or similar program to assemble parcels for development.

³ PDS developed the “Land Use Overlays” mapping application to show land use information (e.g., zoning, VMT areas, fire risk areas, General Plan designations and Villages) so that the public could consider where smart growth should occur. Following extensive engagement in 2021, PDS then created Smart Growth Alternative Maps so that stakeholders could review the spatial results of their input on where smart growth should occur.

Both the Land Use Overlays platform and the Smart Growth Alternative Maps are available on the PDS CAP Update website at the following (accessed October 13, 2023): <https://www.sandiegocounty.gov/content/sdc/sustainability/climateactionplan.html>

- Provide comprehensive mitigation programs, for example, VMT and wildfire so that development can mitigate their impacts.
- Possible disincentives for smart growth development:
- Develop restrictions on General Plan amendments.
- Develop fees to make development outside of smart growth areas more difficult.
- Prohibit development in hazard areas.
- Develop a sliding scale for mitigation, where if located outside a smart growth area it becomes more expensive to develop.
- Continue the current process for development, but without any of the incentives identified above or as developed through public review and hearing processes.

PDS considered all input on the smart growth alternatives and developed a reasonable range of smart growth alternatives for evaluation in this SEIR. Incentives, disincentives, and tools to streamline development in and out of smart growth locations will be considered by the public and decision-makers and developed further through the public review and hearing processes. These lists are not exhaustive. As explained further in this chapter, future implementation would be required if the Board selects an alternative(s) and directs County staff to consider a smart growth location to incentivize and prioritize future development.

5.5.2 Implementation of Smart Growth Strategies

Implementation of smart growth alternatives that result in changes to the adopted General Plan land use map would require subsequent planning by County staff to develop tools to modify the application of the adopted General Plan. State laws facilitating housing streamlining and development (including Senate Bill 330, known as the Housing Crisis Act) also prevent the County from reducing residential capacity on a site zoned for housing in certain areas of the county without identifying replacement capacity. In addition, it is difficult to downzone higher density housing element sites identified and approved by the State as feasible sites for lower-income development. Government Code Section 65863 requires that cities and counties ensure that their general plans provide for regional housing needs. In addition, cities and counties are required to have no “net loss” of lower and moderate-income dwelling units. The County cannot take action that would reduce identified affordable housing sites for these income categories.

Because these alternatives extend beyond the scope of the CAP Update, which is a program of measures and actions to address GHG emissions from development under the adopted General Plan and government operations, implementation of the smart growth alternatives would require subsequent planning and comprehensive stakeholder engagement, as well as subsequent CEQA analysis. If the Board directs staff to prepare a smart growth alternative for adoption, potential strategies that could be employed

include mapping revisions or overlays and tools to facilitate approvals of “smart growth” projects, as described below.

- **Smart Growth Overlay:** A land use overlay is a designation added to the underlying zoning of parcels. Areas subject to the overlay would be subject to a special set of policies and/or rules for development, similar to the County’s Forest Conservation Initiative overlay. Parcels within the Smart Growth Overlay would have a designator assigned that would govern the rules, policies, and procedures (e.g., incentives) for development. Parcels outside of the Smart Growth Overlay would have a different set of rules, policies, and procedures (e.g., disincentives) for development. Possible incentives are listed above.
- **Zoning Changes:** The County may also make changes to the underlying zoning of land within the unincorporated county. This may include up-zoning parcels, establishing minimum densities, implementing duplex and lot splits, and identifying mixed use and residential designations in underutilized commercial areas. Zoning changes would require future implementing actions if the Board directs changes.
- **Tools to Make Smart Growth Development Easier:** Dense development in key locations that concentrates growth can support smart growth and implement mapping revisions. The County may develop tools that facilitate the planning application process (e.g., zone box simplification) for certain project types. Streamlining approvals with reduced costs and expedited process may encourage smart growth development patterns.
- The County may also perform infrastructure studies to find deficiencies and develop public/private partnerships to address infrastructure limitations on selected development.
- **Limit General Plan Amendments.** Based on the understanding that the General Plan already embodies “smart growth” principles as adopted, the County could explore feasible limitations on the GPAs that include changes to the General Plan land use map or density that are not aligned with the County’s smart growth goals.
- **Transfer of Development Rights Program.** A transfer of development rights program allows a developer to essentially purchase the rights from a property that the community wants to preserve and transfer those rights to another property. However, this is a complex program that is highly dependent on market dynamics and only works if there is a suitable “receiver site” that can receive density for additional housing units and property owners or developers willing to purchase development rights for that increased density. The purchase of property by a land trust allows land to be placed under a conservation easement. Alternatively, a bond measure could allow the community to essentially tax itself to purchase the land for public open space. Each of these options present challenges requiring additional investigation. Such a program could help the County limit development in areas disfavored under a smart growth analysis.

Certification of the SEIR is a necessary step in the adoption of the CAP Update. Adoption of a smart growth alternative is optional, and the Board can both certify this SEIR and adopt the CAP Update while also directing staff to prepare a smart growth alternative for Board consideration at a later date.

If the Board adopts a smart growth alternative, additional actions would be necessary during the CAP Update hearings and beyond. During the CAP Update hearings, the Board would be asked to identify a community, or communities within which to focus smart growth programs and incentives. The selection of smart growth alternatives requires the identification of areas within the unincorporated communities that could be considered “smart” places for new development for reasons including, but not limited to, compact, efficient, and environmentally friendly design that is achievable; proximity to job centers, services, amenities and infrastructure (e.g., roads, water, sewer); and/or presence of existing or plans for future transit infrastructure (e.g., sidewalks, bike lanes, bus service, new transit service). Upon the selection of one or more smart growth communities, the Board would be asked to direct staff to prepare a Smart Growth Zoning Overlay Ordinance, which would place a smart growth zoning designation on properties within the selected smart growth areas. An overlay is a new zone or “layer” that could be added on top of existing zoning. The overlay zone would identify those properties that would be eligible for future programs or process improvements that would incentivize residential, commercial, and mixed-use growth within the smart growth boundary. Depending upon the nature and extent of the regulatory framework within the Smart Growth Overlay Ordinance, additional environmental analysis may be required prior to implementation. After adopting the CAP Update and Smart Growth Zoning Overlay Ordinance, staff would conduct existing conditions analyses within the selected communities to better understand the barriers to smart growth and the opportunities that each community presents. Barriers to smart growth could include lack of critical infrastructure such as fire stations, or schools, or result from land uses or zoning not aligning with the highest-and-best use for individual parcels which may cause extra processing time and costs. The existing conditions analysis would also consider how to incentivize and create opportunities for smart growth, including a focus on identification of opportunity sites for redevelopment, market and economic incentives (e.g., fee waivers, streamlining) to encourage new mixed uses and housing diversity, and a consideration of fee structures (i.e., reduction in development fees) to support new development and supportive capital improvements. The analysis would describe where land use changes should be made, how to support future transportation infrastructure, how to incentivize diverse housing types and redevelopment of underutilized sites that support the development of low-and-middle-income housing, and how to support mixed-uses. Within the communities that were selected for smart growth, staff would align existing programs to streamline new housing at low- to middle-income levels by ensuring that smart growth areas were included in the work program. In future phases of outreach, staff would begin to concurrently advance conversations with community residents, businesses, and other interested stakeholders to better identify how they would like to see smart growth strategies implemented in their community. This would form the foundation of future policies that would guide resulting growth and future outcomes including locations for new housing, transit investments, and expanded accessibility and locations for locally serving amenities or commercial spaces and public spaces. Individual community needs and development

outcomes would vary based on the existing conditions and community identity, and programs could be considered and brought back for the Board's consideration.

In some communities, a smart growth alternative could result in proposed increases in residential density, known as "up-planning" which may require changes to the General Plan land use map, in order to achieve desired development outcomes. Similarly, subsequent changes to the County's Zoning Ordinance may be required to establish a regulatory framework that can achieve alignment across the General Plan land use map and County Zoning Ordinance which regulates development. Any changes to the General Plan land use map or Zoning Ordinance would require additional environmental analysis prior to implementation. Additionally, changes to the land use map of this extent would likely require changes to other aspects of the General Plan, including the Mobility and Conservation and Open Space Elements in order to bring those elements into conformance.

5.5.3 Evaluation of Alternatives Selected for Analysis

5.5.3.1 Fire Safe and VMT Efficient Alternative

The Fire Safe and VMT Efficient Alternative is a smart growth alternative that the County developed through stakeholder outreach. The smart growth geographies were defined as areas that are both outside of areas mapped by the California Department of Forestry as areas with High or Very High fire risk and within areas mapped by the County as at least 15 percent below the regional average for residential VMT (based on the County of San Diego SB 743 Location-Based Screening Maps developed as part of the County's Transportation Study Guidelines adopted in September of 2022).⁴

Under this alternative, future land development that is consistent with the General Plan and an accompanying proposed Smart Growth Overlay would be focused in currently urbanized areas that are identified as VMT efficient outside of High and Very High Fire Hazard Zones. Figure 5-1 indicates where future development would be encouraged. Generally, fire safe and VMT efficient areas were identified in areas of the unincorporated county that immediately border the incorporated cities of Vista, San Marcos, Escondido, El Cajon, and National City, as well as an area in the northwest of the unincorporated county in the community of Fallbrook. Figures 5-1a through 5-1j provide data considered in alternative development, including Fire Hazard Severity Zones, existing services, and employment centers. As shown, this alternative would focus future growth away from rural areas and closer to existing and planned job centers and public facilities. Because of the limited geography within this area and because the County would not prohibit development of properties outside of the fire safe and VMT efficient overlay, it is assumed for the purpose of this analysis that half of the growth that would have occurred outside of the overlay would instead be developed in these areas. Further, it is assumed that all measures and actions in the CAP Update would be implemented.

⁴ This alternative only includes VMT efficient areas that are 15 percent below the regional average. It does not include other areas or opportunities to screen from VMT analysis available in the County's Transportation Study Guide for other project types (e.g., locally serving retail and small projects).

Comparison to the Effects of the CAP Update

The intent of this alternative is to address the effects of development that is anticipated based on the land use plan in the adopted General Plan and promote a pattern of development that further reduces VMT and resultant GHG emissions. Because this alternative would not affect implementation of the CAP Update measures and actions, the effects of implementing the CAP Update relative to the topics addressed in Sections 2.1 through 2.15 of this ~~draft~~ SEIR would not be affected by implementation of this smart growth alternative, and the analysis of this alternative is focused on transportation (VMT), wildfire hazards, and GHG impacts. While the revised geographic distribution of growth under this alternative would result in other types of impacts not originally anticipated in the 2011 GPU PEIR, such as potential effects related to aesthetics, agriculture, and public services and utilities, these effects are specific to locations where development would be shifted and, other than at a large scale, the new locations of development would need to be determined. Further, the differences in land-based impacts are comparative to the 2011 GPU itself, for which the CAP Update is a mitigation. Practically, the CAP Update is not a land use plan—it imposes measures and actions on the adopted General Plan land use plan; and this alternative requires consideration of the General Plan itself. Consequently, it is speculative to consider the relative impacts of land use plans, for which the CAP Update does not control and are not the subject of the CAP Update. These impacts would need to be assessed under subsequent CEQA analysis addressing amendments to the land use plan for the General Plan. Therefore, the potential for environmental effects would be substantially similar to the proposed CAP Update and these resources are not discussed in detail below.

The proposed CAP Update includes strategies to address climate change and reduce VMT that are anticipated to result in co-benefits of reducing effects on transportation and on wildfire hazards. As described in Section 2.13, “Transportation,” and Section 2.15, “Wildfire,” in this SEIR, the CAP Update would not result in new or more severe impacts than implementation of the General Plan alone. This alternative was developed through stakeholder outreach to address effects of growth under the adopted General Plan.

Most of the VMT anticipated through 2050 in the plan area occurs under existing conditions and would be relatively unchanged by the development pattern of future growth. Only minor decreases in VMT associated with the existing population are expected due to the DS 39 modeling assumptions (see CAP Update Appendix 3). If implemented, this alternative is anticipated to reduce VMT for new development by 6.6 percent in 2035 and 3.0 percent in 2050. This represents a substantial VMT reduction for new growth. However, when viewed in conjunction with existing development, the magnitude of overall VMT reduction is relatively small because the vast majority of unincorporated county VMT under future year alternatives can be attributed to existing land uses. Overall, the Fire Safe and VMT Efficient Alternative would result in a 0.53 percent reduction in unincorporated county VMT for 2035 and a 0.41 percent reduction in unincorporated county VMT for 2050 (see Appendix C for detailed modeling results). Associated minor reductions in air and GHG emissions are also expected to occur under this alternative.

Under this alternative, VMT per employee is anticipated to be the same as forecast for development without the alternative; 23.9 in 2035 and 24.5 in 2050. VMT per resident in the unincorporated county would decrease slightly in the 2035 forecast from 27.4 to 27.2 but would be the same in 2050 (27.7). Overall, this would be a 0.53 percent reduction in VMT compared to the adopted General Plan in 2035 and a 0.41 percent reduction in VMT compared to the adopted General Plan in 2050. Therefore, although this alternative would reduce VMT from new development, the magnitude of is not expected to meaningfully reduce VMT or GHG emissions reductions in the unincorporated county would be much smaller when all VMT in the future condition is considered.

5.5.3.2 Village Support Areas Alternative

Smart growth concepts focus growth in compact areas close to jobs, services, and public facilities to maximize the use of existing infrastructure and preserve open space and natural resources. This alternative builds on the Villages established in the adopted General Plan. The Village regional category, which allows the most intensive land uses in the unincorporated county under the adopted General Plan, facilitates the use of compact development patterns. Villages that contain a mix of land uses encourage strong neighborhoods and contribute to meeting a community's daily commercial, civic, and social needs.

Through implementation of the adopted General Plan, the County has identified unforeseen barriers to redevelopment of the Villages. To spur redevelopment in the Villages and create a synergy for smart growth, this alternative would establish 0.5-mile buffers around the established Villages, referred to as Village Support Areas, wherein housing development and services to support development in the Villages would be encouraged (see Figure 5-2). New development can facilitate the achievement of these objectives and enhance the vitality and livability of existing Villages. It is important that new development in Villages be compatible with and connect to the surrounding area. The Village Support Areas Alternative would promote compatible and connected growth in the Village Support Areas to realize the planned densities in the Villages. Figures 5-2a through 5-2j illustrate the relationship between the existing Villages Village Support Areas, existing services, and planned employment centers in the county.

Because Village development will occur as infill or redevelopment, compatibility takes on a greater scope, accounting for the immediately surrounding area as well as the overall character of the Village. Connections are also important to support a Village that has vitality and mobility. Goal LU-9 and the supporting policies in the General Plan were established to realize the smart growth vision of the Village concept, and implementation of these policies was evaluated in the 2011 GPU PEIR. This alternative would also be compatible with General Plan Policy LU-1.4, which establishes that a new Village Regional Category may be developed for land that is contiguous with existing or planned Villages where such land uses are compatible with environmental constraints, accommodated by the General Plan roadway network, supported by public facilities and services, and consistent with orderly growth of the Village.

As with the other smart growth alternatives discussed in this SEIR, this alternative would be implemented through a zoning overlay and development incentives. Supporting efforts are also assumed to include transit and connectivity improvements between the Villages and Village Support Areas. Further, it is assumed that all measures and actions in the CAP Update would be implemented as proposed.

Comparison to the Effects of the CAP Update

The intent of this alternative is to address the effects of development that is anticipated based on the land use plan in the adopted General Plan and promote a pattern of development that reduces VMT and resultant GHG emissions. Because this alternative would not affect implementation of the CAP Update measures and actions, the effects of implementing the CAP Update relative to the topics addressed in Sections 2.1 through 2.15 of this ~~draft~~ SEIR would not be affected by implementation of this smart growth alternative, and the analysis of this alternative is focused on transportation (VMT) and GHG impacts. While the revised geographic distribution of growth under this alternative would result in other types of impacts that differ from those disclosed in the 2011 GPU PEIR, such as potential effects related to aesthetics, agriculture, and public services and utilities, these impacts would need to be assessed under subsequent CEQA analysis for the same reasons explained in Section 5.5.3.1. Therefore, the potential for environmental effects would be substantially similar to the proposed CAP Update and these resources are not discussed in detail below.

Most of the VMT anticipated through 2050 in the plan area occurs under existing conditions and would be relatively unchanged by the development pattern of future growth. Only minor decreases in VMT associated with the existing population are expected due to the DS 39 modeling assumptions. For the purpose of analysis, new households assumed in the CAP Update modeling were adjusted to assume location in Village Support Areas within their original Community Plan Area in randomized process weighted to ensure approximately equal growth in density across a Village Support Area. Densities within the Villages were not changed from the established assumptions for growth under the General Plan. Based on this modeling, the Village Support Areas Alternative is anticipated to reduce VMT for new development by 1.0 percent in 2035 and 0.3 percent in 2050. If the modeling were refined to assign growth into specific Village Support Areas closer to incorporated cities, greater VMT reductions would be anticipated; however, because the location of future growth under the Village Support Areas concept would be within 0.5-mile of any Village, redistribution of growth within Community Plan Areas provides a reasonable assumption to inform analysis. Further, while the change in location reduces trip lengths associated with the relocated households, it may not change the likelihood to use transit, to use alternative modes of transportation, or to commute a long distance to work using a personal vehicle. Note also that no employment changes associated with non-residential development were assumed in the modeling. Therefore, the modeling reflects the highest VMT outcomes since it does not capture the typical benefits associated with mixed-use developments and neighborhood serving retail and focuses only on growth in housing units (Fehr & Peers 2023).

When viewed in conjunction with existing development, the magnitude of overall VMT reduction is relatively small because the vast majority of unincorporated county VMT under future year alternatives can be attributed to existing land uses. Overall, the Village Support Areas Alternative would result in a 0.08 percent reduction in unincorporated county VMT for 2035 and a 0.04 percent reduction in unincorporated county VMT for 2050 (Fehr & Peers 2023).

Under this alternative, VMT per employee is anticipated to be 23.9 in 2035 and 24.5 in 2050, and VMT per resident in the unincorporated county would be 27.4 in 2035 and 27.7 in 2050. This is the same as the forecast VMT under the General Plan without implementation of the Village Support Areas Alternative. Overall, this would be a 0.08 percent reduction in VMT compared to the adopted General Plan in 2035 and a 0.04 percent reduction in VMT compared to the adopted General Plan in 2050. Therefore, this alternative is not expected to meaningfully reduce VMT or associated GHG emissions in the unincorporated county.

5.5.3.3 Sustainable Communities Strategy Alternative

In the Regional Plan, SANDAG has identified strategies that generally align with and encourage smart growth development. The Regional Plan incorporates smart growth planning concepts into a regional growth pattern focused around “Mobility Hubs.” Mobility Hubs are envisioned as places of activity where capital transportation investment will support future housing and jobs, and encompass areas that are both within incorporated city boundaries and within the unincorporated county. Future capital investment in Mobility Hubs, as identified by the Regional Plan, would include: “transit leap” (i.e., improvements on transit accessibility and efficiency); “complete corridors” (i.e., network investments to improve efficiency of all transportation types); investment in alternative transportation options that provide last-mile connections to transit centers; and improvements to technology and communication systems. The Sustainable Communities Strategy Alternative would focus growth in the portions of the Mobility Hubs that are in the unincorporated county (see Figure 5-3). The land use map established in the Regional Plan, which is the basis of the Sustainable Communities Strategy Alternative, and other data related to public services and employment are provided as Figures and 5-3a through 5-3j.

The adopted SANDAG 2021 Regional Plan assumes 9,902 new households in the unincorporated County between the base year (2016) and 2050 (with almost all of the growth occurring between the base year and 2035). Additionally, implementation of the Road User Charge is assumed in the transportation modeling currently available from SANDAG and was captured in this analysis because the 2021 Regional Plan version of the model includes the Road User Charge as a funding source for the Regional Plan. The Road User Charge directly affects auto operating costs; therefore, including the Road User Charge results in lower VMT forecasts in the Regional Plan than scenarios without the Road User Charge.

However, the SANDAG Board voted on September 22, 2023 against including the Road User Charge in the 2025 Regional Plan. On September 23, 2022 the SANDAG Board directed SANDAG staff to prepare an amendment to the 2021 Regional Plan without the

Road User Charge. The SANDAG Board of Directors adopted the proposed amendment on October 13, 2023. The 2021 Regional Plan includes other policy and transportation network assumptions beyond the Road User Charge that further result in lower VMT, and many of these assumptions rely upon public vote, funding, or SANDAG Board actions. Therefore, this scenario does not represent reasonably foreseeable land use, transportation policy/network, and VMT under the County's adopted General Plan.

If the Board were to adopt a smart growth alternative that would aspire to achieve development outcomes in alignment with the SANDAG Regional Plan Mobility Hub framework, a broader and more comprehensive set of General Plan land use map and Zoning Ordinance changes would be required that mirrors the program described in the Regional Plan because the incentives described above may not be sufficient to result in conformity. In this case, the Board would likely be considering both up-planning in areas around the SANDAG Mobility Hubs and down-planning in areas outside of those locations. This would require a more comprehensive update to the General Plan due to the large geographic scope of land use map changes and scale of community engagement required. It is assumed that all measures and actions in the CAP Update would be implemented as proposed.

Comparison to the Effects of the CAP Update

The intent of this alternative is to address the effects of development that is anticipated based on the land use plan in the adopted General Plan and promote a pattern of development that reduces VMT and resultant GHG emissions. Because this alternative would not affect implementation of the CAP Update measures and actions, the effects of implementing the CAP Update relative to the topics addressed in Sections 2.1 through 2.15 of this ~~draft~~ SEIR would not be affected by implementation of this smart growth alternative, and the analysis of this alternative is focused on transportation (VMT) and GHG impacts. While the revised geographic distribution of growth under this alternative would result in changes to other types of impacts that differ from those disclosed in the 2011 GPU PEIR, such as potential effects related to aesthetics, agriculture, and public services and utilities, these impacts would need to be assessed under subsequent CEQA analysis for the same reasons explained in Section 5.5.3.1. Therefore, the potential for environmental effects would be substantially similar to the proposed CAP Update and these resources are not discussed in detail below.

The Sustainable Community Strategy Alternative results in a reduction in VMT compared to the proposed CAP Update as a result of a much smaller growth in households in the unincorporated county, inclusion of the Road User Charge, and significant investments and policy changes related to the transportation network (such as SANDAG's 5-Big Moves which are part of the 2021 Regional Plan). The transportation network policies and network changes included in the Sustainable Community Strategy Alternative result in substantial transportation mode shifts to transit, active transportation, and reduced driving in general. Unlike the Fire Safe and VMT Efficient Alternative and the Village Support Areas Alternative, which were modeled using the same DS 39 SANDAG model as the CAP Update, the modeling for the Sustainable Communities Strategy Alternative reflects

policy assumptions that result in large shifts in the existing population's travel choices (Fehr & Peers 2023).

Under this alternative, VMT per employee is anticipated to be 20.8 in 2035 (compared to 23.9 under the General Plan without this alternative) and 20.2 in 2050 (compared to 24.5 under the General Plan without this alternative). VMT per resident in the unincorporated county would decrease from 27.4 under the General Plan without this alternative to 25.7 in 2035 and from 27.7 under the General Plan without this alternative to 25.5 in 2050. Overall, this would be a 7.71 percent reduction in VMT compared to the adopted General Plan in 2035 and a 9.48 percent reduction in VMT compared to the adopted General Plan in 2050.

As noted above, this alternative is assumed to substantially reduce GHG emissions associated with VMT in the unincorporated county compared to the General Plan. However, as discussed above, the total VMT reductions are based on the Regional Plan's premise of a distribution of growth within Mobility Hubs that encompass areas outside of the unincorporated county, which are outside the County's control. Further, the Road User Charge, which results in lower VMT forecasts in the Regional Plan than scenarios without the Road User Charge, has been removed from the Regional Plan. Therefore, the actual VMT reductions achieved under this alternative may be less than modeled for the purposes of this analysis.

5.5.3.4 General Plan Goal and Policy Edits

In addition to, or in lieu of, any of the alternatives described above, County staff have identified potential amendments to General Plan goals and policies from the Land Use, Conservation and Open Space, Mobility, and Safety Elements of the adopted General Plan that would further enhance the smart growth principles described above and embodied in the General Plan. The Board may choose some or all of these additional policy amendments and pair them with the proposed CAP Update or an alternative. These amendments would be in addition to project amendments to Goal COS-20, Policy COS-20.1, and GPU PEIR Mitigation Measures CC-1.2, CC-1.7, and CC-1.8.). See Table 5-1 below for edits to General Plan goals and policies.

Comparison to the Effects of the CAP Update

The intent of this alternative is to address the effects of development that is anticipated based on the land use plan in the adopted General Plan and promote a pattern of development that reduces VMT and resultant GHG emissions. Because this alternative would not affect implementation of the CAP Update measures and actions, the effects of implementing the CAP Update relative to the topics addressed in Sections 2.1 through 2.15 of this draft SEIR would not be affected by the proposed General Plan goal and policy edits, and the analysis of this alternative is focused on transportation (VMT) and GHG impacts, as well as other impacts such as groundwater, biological resources, and wildfire. While the revised goals and policies under this alternative would result in some impacts that differ from those disclosed the 2011 GPU PEIR because goals and policies therein would be amended, the majority of these potential amendments would result in beneficial outcomes throughout the unincorporated county. However, these impacts

would need to be assessed under subsequent CEQA analysis if the Board directs staff to return at a future date with amendments to goals and policies. The potential for environmental effects would be substantially similar to the proposed CAP Update and resources are not discussed in detail below.

In addition, this alternative includes amendments to goals and policies and addition of new goal and policies that would require certain processes and findings in order to limit impacts of General Plan amendments (e.g., Goal LU-19 and Policy LU-19.1 and LU-19.2). These amendments would reduce the potential impacts of General Plan amendments in the future if adopted.

5.6 Alternatives Evaluated in the 2011 GPU PEIR

This SEIR incorporates by reference the prior alternatives analysis in the 2011 GPU PEIR, which are additional land use alternatives aimed at achieving smart growth. Like the other smart growth alternatives evaluated in this SEIR, these alternatives would require subsequent planning efforts to implement because they would substantially change implementation of the adopted General Plan land use map. The 2011 GPU PEIR provides a detailed evaluation of alternative land use maps identified by County staff to further the discussion of smart growth principles and reduce the environmental effects of the General Plan. The Hybrid Map, Draft Land Use Map, and Environmentally Superior Map alternatives were all found to potentially reduce the global climate change-related impacts of the General Plan, although impacts are assumed to remain significant prior to mitigation. These alternatives are summarized below.

Hybrid Map Alternative. The Hybrid Map Alternative, shown in Figure 4-1 of the 2011 GPU PEIR, strikes a balance between the proposed project and the Draft Land Use Map Alternative. It includes RHNA refinements, road network land use changes, and other refinements to the proposed project. It also incorporates the proposed project changes that meet the project objectives and reflects the policy direction of the General Plan Update Elements. The Hybrid Map Alternative would decrease the countywide acreage of the following land uses, as compared to the proposed project: village residential (-487 acres); semi-rural residential (-11,717 acres); specific plan area (-683 acres); commercial (-325 acres); and industrial (-189 acres). When compared to the adopted General Plan, the Hybrid Map Alternative would increase the acreage of the rural land use designations (+13,672). The Hybrid Map Alternative would result in significantly less acres of semi-rural residential land uses and significantly more acres designated for rural lands than the adopted General Plan.

When compared to the adopted General Plan, the Hybrid Map Alternative would accommodate less growth and development in the unincorporated county, which would translate to less GHG emissions from community and government operations. Additionally, the Hybrid Map Alternative would result in less VMT than the adopted General Plan, which would translate into less GHG emissions from transportation.

Draft Land Use Map Alternative. The Draft Land Use Map Alternative, shown in Figure 4-2 of the 2011 GPU PEIR, was initially endorsed by the Board during the residential land use mapping phase in October 2003, and was subsequently endorsed after refinements were made in June 2004, May 2005, and August 2006. County staff included additional land use modifications in this alternative to achieve a road network that would better accommodate the land use map. The Draft Land Use Map Alternative transitions from the Hybrid Map Alternative with further reductions in densities and intensities for certain properties.

This alternative would decrease the acreage of the following land uses, as compared to the adopted General Plan: village residential (-514 acres); semi-rural residential (-15,313 acres); specific plan area (-683 acres); commercial (-344 acres); industrial (-266 acres); and village core mixed use (-12 acres). When compared to the proposed project, the Draft Land Use Map Alternative would increase the acreage of the following land use designations: rural lands (+17,198) and office professional (+18 acres). The Draft Land Use Map Alternative would result in significantly less acres of semi-rural residential and significantly more acres of rural lands designations, than the adopted General Plan.

The Draft Land Use Map Alternative would accommodate less growth and development in the unincorporated county, which would translate to less GHG emissions from community and government operations. Additionally, the Draft Land Use Map Alternative would result in less VMT than the adopted General Plan, which would translate to less GHG emissions from transportation.

Environmentally Superior Map Alternative. The Environmentally Superior Map Alternative, shown in Figure 4-3 of the 2011 GPU PEIR, reflects a more stringent application of the planning concepts that take into account environmental considerations and constraints, and is more aggressive in restricting growth in portions of the semi-rural residential and the rural lands designations. The Environmentally Superior Map Alternative was developed in response to the areas of significant impacts that were identified for the adopted General Plan, where changes in land use designations would have the potential to reduce or alleviate the impact. The Environmentally Superior Map Alternative would result in significantly less acres of semirural residential land uses and significantly more acres of rural lands than the proposed project. the environmental impacts under the Environmentally Superior Map Alternative would be less than Hybrid Map Alternative.

The Environmentally Superior Map Alternative would accommodate less growth and development in the unincorporated County, which would translate to less GHG emissions from community and government operations. Additionally, the Environmentally Superior Map Alternative would result in less VMT than the adopted General Plan, which would translate to less GHG emissions from transportation.

5.7 Environmentally Superior Alternative

Table 5-2 provides a qualitative summary of the environmental effects of the alternatives evaluated above in comparison to the effects of the CAP Update to identify the environmentally superior alternative. As described above, the No Project Alternative would not meet any of the project objectives of the CAP Update and would result in greater GHG emissions. Impacts to other resources are assumed to be similar or reduced for the purpose of this evaluation, but actual impacts of project-specific mitigation, which would continue to be imposed on a project-by-project basis for development consistent with the adopted General Plan to address GHG emissions, may result in impacts beyond the scope of this analysis. Therefore, the reduction in impacts under the No Project Alternative identified in Table 5-2 may not fully reflect the magnitude of cumulative impacts because future development would not be able to rely on the CAP and the County would not have a plan for reduction of GHGs to meet the state targets for 2030 and 2045. Due to this uncertainty, the No Project Alternative may not be environmentally superior to the CAP Update. CEQA Guidelines Section 15126.6(e)(2) requires that an EIR identify an environmentally superior alternative other than the No Project Alternative.

Of the smart growth alternatives, the Fire Safe and VMT Efficient Alternative, Village Support Areas Alternative, and General Plan Policy Edits Alternative would not reduce the impacts of CAP Update implementation; as such they are not considered environmentally superior to the CAP Update.

Based on available modeling, the Sustainable Communities Strategy Alternative would result in greater GHG emission reductions and less VMT than the CAP Update alone. However, as described above, this modeling assumes a shift in existing travel behavior based on a Road User Charge. SANDAG is reconsidering the feasibility of such a charge and the benefits of the Sustainable Communities Strategy Alternative may be reduced without this assumption.

Based on review of the other alternatives considered, the County has determined that the Distributed Energy Only Alternative would be environmentally superior to the project because it would reduce significant and unavoidable impacts related to the induced demand for large-scale renewable energy systems while potentially achieving both the primary objective of GHG emissions reductions consistent with SB 32, AB 1279, and all other supporting project objectives.

Table 5-1 Potential Amendments to General Plan Policies

LAND USE ELEMENT GOALS AND POLICIES
<p>Policy LU-1.2 Leapfrog Development. Prohibit leapfrog development which is inconsistent with the Community Development Model. Leapfrog Development restrictions do not apply to new villages that are designed to be consistent with the Community Development Model, that provide necessary services and facilities, and that are designed to meet the LEED-Neighborhood Development Certification or an equivalent. <u>and that do not frustrate the County's climate policies implementing General Plan Goals LU-5 (Climate Change and Land Use) and LU-6 (Sustainable Development-Environmental Balance).</u> For purposes of this policy, leapfrog development is defined as Village densities located away from established Villages or outside established water and sewer service boundaries. <i>[See applicable community plan for possible relevant policies.]</i></p>
<p>Policy LU-1.4 Village Expansion. Permit new Village Regional Category designated land uses only where contiguous with an existing or planned Village and where all of the following criteria are met:</p> <ul style="list-style-type: none"> • Potential Village development would be compatible with environmental conditions and constraints, such as topography and flooding • Potential Village development would be accommodated by the General Plan road network • Public facilities and services can support the expansion without a reduction of services to other County residents • The expansion is consistent with community character, the scale, and the orderly and contiguous growth of a Village area • The expansion would not frustrate the County's climate policies implementing General Plan Goals LU-5 (Climate Change and Land Use) and LU-6 (Sustainable Development-Environmental Balance) • Any expansion within a Very High Fire Hazard Severity Zone would not subject future residents, occupants, and structures to high levels of risk of loss of life or loss of structures
<p>Policy LU-1.5 Relationship of County Land Use Designations with Adjoining Jurisdictions. Prohibit the use of established or planned land use patterns in nearby or adjacent jurisdictions as the primary precedent or justification for adjusting land use designations of unincorporated County lands. <u>except where such adjustments would result in land use patterns consistent with the County's climate policies implementing General Plan Goals LU-5 (Climate Change and Land Use) and LU-6 (Sustainable Development-Environmental Balance).</u> Coordinate with adjacent cities to ensure that land use designations are consistent with existing and planned infrastructure capacities and capabilities.</p>

LAND USE ELEMENT GOALS AND POLICIES
<p>GOAL LU-4. Inter-jurisdictional Coordination. Coordination with the plans and activities of other agencies and tribal governments that relate to issues such as land use, community character, transportation, energy, other infrastructure, public safety, <u>climate policy</u>, and resource conservation and management in the unincorporated County and the region.</p>
<p>Policy LU-4.1 Regional Planning. Participate in regional planning to ensure that the unique communities, assets, and challenges of the unincorporated lands are appropriately addressed with the implementation of the planning principles and land use requirements, including the provisions of SB375-, <u>(Stats. 2008, ch. 728), SB 743 (Stats. 2013, ch.386, § 5), and SB32 (Stats. 2016, ch. 249).</u></p>
<p>Policy LU-4.6 Planning for Adequate Energy Facilities. Participate in the planning of regional <u>renewable</u> energy infrastructure with applicable utility providers to ensure plans are consistent with the County's General Plan and Community Plans and minimize adverse impacts to the unincorporated County.</p>
<p>Policy LU-5.1 Reduction of <u>Greenhouse Gas Emissions from Vehicle Trips within Communities- and Vehicle Miles Traveled from New and Existing Development.</u> Incorporate a mixture of uses within Villages and Rural Villages and plan residential densities at a level that supports multi-modal transportation, including walking, bicycling, and the use of public transit, when appropriate, <u>and the use of electric vehicles. Develop and implement strategies to avoid, minimize, reduce, and/or compensate for the greenhouse gas emissions associated with vehicle miles traveled from new development, including compensatory strategies that would fund reductions in greenhouse gas emissions from existing development and existing economic activities. Include in-County compensatory strategies such as improved energy and water conservation, increased reliance on large- and small-scale renewable energy, enhanced electric vehicle recharging infrastructure, reductions in propane usage in rural areas, replacement of diesel- and gasoline-powered equipment and vehicles, landscape restoration and enhancement (e.g., tree-planting), preservation and enhancement of open space and rural lands to maintain or increase carbon sequestration, and other outcomes that reduce fossil fuel usage, reduce biomass combustion, and/or sequester carbon. In unincorporated areas where new development would lead to comparatively high per capita vehicle miles traveled, maximize to the extent feasible the use of electric vehicles and require construction of electric vehicle recharging infrastructure.</u></p>
<p>Policy LU-5.2 Sustainable Planning and Design. Incorporate into new development sustainable planning and design-, <u>including measures that reduce the carbon footprint of new development to the maximum extent feasible on-site and facilitate the use of public transit and/or electric vehicles.</u></p>
<p>Policy LU-5.3 Rural Land Preservation. Ensure the preservation of existing open space and rural areas (e.g., forested areas, agricultural lands, wildlife habitat and corridors, wetlands, watersheds, and groundwater recharge areas) when permitting development under the Rural and Semi Rural Land Use Designations. <u>Consider</u></p>

LAND USE ELEMENT GOALS AND POLICIES
<p><u>strategies to use the preservation, restoration, and/or enhancement of open space and rural lands for carbon sequestration purposes. Encourage and support the management of public and private open space and rural lands so as to reduce the risk of uncontrolled wildfires with the potential to release large amounts of greenhouse gases.</u></p>
<p>Policy LU-5.4 Planning Support. Undertake planning efforts that promote infill and redevelopment of uses that accommodate walking <u>and biking, biking, transit usage, and electrical vehicle usage</u> within communities.</p>
<p>Policy LU-5.6 Develop Mechanisms for Avoiding Potential Regulatory Takings Where Development is Restricted to Achieve Greenhouse Gas Emissions Targets. <u>In consultation with SANDAG, cities within the County, the public at large, and key stakeholders such as business leaders, land developers, rural property owners, environmental organizations, and environmental justice advocates, develop and implement strategies for providing economic compensation to private landowners where the County restricts or limits the amount of development pursuant to their existing General Plan and zoning designation in order to achieve greenhouse gas emissions reductions consistent with State law and County General Plan policy. Explore the use of compensation mechanisms such as transferrable development rights, density transfers, density bonuses beyond those already permitted under State law, property tax reductions, compensated down-zonings, and subsidized permanent land conservation for carbon sequestration purposes.</u></p>
<p>GOAL LU-6. Sustainable Development-Environmental Balance. A <u>carbon neutral built environment in balance with the natural environment, scarce resources, natural hazards, and the unique local character of individual communities.</u></p>
<p>Policy LU-6.1 Environmental Sustainability. Require the protection of intact or sensitive natural resources in support of the long-term sustainability of the natural environment, <u>including achieving greenhouse gas emissions reductions consistent with State law and County General Plan policy.</u></p>
<p>Policy LU-6.2 Reducing Development Pressures. Assign lowest-density or lowest-intensity land use designations to areas with sensitive natural resources; <u>consider strategies to reduce planned density in areas in which new development would lead to comparatively high per capita vehicle miles traveled, and Very High Fire Hazard Severity Zones.</u></p>
<p>Policy LU-6.3 Conservation-Oriented Project Design. Support conservation-oriented project design. <u>This that, to the maximum extent feasible, protects sensitive biological resources, reduces on-site greenhouse gas emissions, minimizes water usage, and reduces potential losses of life and property associated with wildfires. These outcomes can be achieved with mechanisms such as, but not limited to, Specific Plans, lot area averaging, and reductions in lot size with corresponding requirements for preserved open space (Planned Residential Developments); and design strategies such as resource buffers, renewable energy, energy efficiency and/or electrification, water conservation, collection and reuse features and fire hardening.</u></p>

LAND USE ELEMENT GOALS AND POLICIES
<p>Projects that rely on lot size reductions should incorporate specific design techniques, perimeter lot sizes, or buffers, to achieve compatibility with community character. <i>[See applicable community plan for possible relevant policies.]</i></p>
<p>Policy LU-6.4 Sustainable Subdivision Design. Require that residential subdivisions be planned to <u>reduce on-site greenhouse gas emissions to the maximum extent feasible</u>, conserve open space and natural resources, protect agricultural operations including grazing, increase fire safety and defensibility, reduce impervious footprints, use sustainable development practices, and, when appropriate, provide public amenities. <i>[See applicable community plan for possible relevant policies.]</i></p>
<p>Policy LU-6.11 Protection from Wildfires and Unmitigable Hazards. Assign land uses and densities in a manner that minimizes development in extreme, very high and high fire threat areas or other unmitigable hazardous areas. <u>Require construction practices (e.g., “hardened homes”) and landscaping strategies in Very High Fire Hazard Severity Zones that minimize the possibility of loss of life and structures from wildfires consistent with the Safety Element.</u></p>
<p>Policy LU-8.1 Density Relationship to Groundwater Sustainability. Require land use densities <u>resulting from new development</u> in groundwater dependent areas to be consistent with the long-term sustainability of groundwater supplies, except. <u>Prohibit new subdivisions and other new discretionary development approvals in groundwater dependent areas when determined that long-term sustainability of groundwater supplies to the Borrego Valley development is not feasible.</u></p>
<p>Policy LU-8.2 Groundwater Resources. Require development to identify adequate groundwater resources in groundwater dependent areas, as follows:</p> <ul style="list-style-type: none"> • In areas dependent on currently identified groundwater overdrafted basins, prohibit new development from exacerbating overdraft conditions. Encourage programs to alleviate overdraft conditions in Borrego Valley. • In areas without current overdraft groundwater conditions, evaluate new groundwater-dependent development to assure a sustainable long-term supply of groundwater is available that will not adversely impact existing groundwater users. • Prior to approving any tentative subdivision map for a residential project or any discretionary regulatory approval such as a use permit for a nonresidential project, require a finding that the resulting development or use will not cause any of the following “undesirable results” as defined in the Sustainable Groundwater Management Act: <ul style="list-style-type: none"> ◦ <u>Chronic lowering of groundwater levels indicating a significant and unreasonable depletion of supply if continued over the General Plan planning horizon;</u> ◦ <u>Significant and unreasonable reduction of groundwater storage;</u>

LAND USE ELEMENT GOALS AND POLICIES
<ul style="list-style-type: none"> ◦ <u>Significant and unreasonable seawater intrusion;</u> ◦ <u>Significant and unreasonable degraded water quality, including the migration of contaminant plumes that impair water supplies;</u> ◦ <u>Significant and unreasonable land subsidence that substantially interferes with surface land uses;</u> ◦ <u>Depletions of interconnected surface water that have significant and unreasonable adverse impacts on beneficial uses of the surface water.</u>
<p>Policy LU-11.6 Office Development. Locate new office development complexes within Village areas where services are available, in proximity to housing, and along primary vehicular arterials (ideally with transit access) with internal vehicular and pedestrian linkages that integrate the new development into the multi-modal transportation network where feasible. <u>Require parking facilities to include electrical vehicle recharging stations commensurate with current and reasonably foreseeable increasing demands over time.</u></p>
<p>Policy LU-11.8 Permitted Secondary Uses. Provide a process where secondary land uses, <u>including residential uses,</u> may be permitted when appropriate and compatible with the primary commercial, office, and light industrial uses, in order to better serve the daily needs of employees and to reduce the frequency of related automobile trips. This policy is not intended for high impact industrial uses.</p>
<p>Policy LU-11.12 Plan for Mixed Uses. <u>Consider land use designations and zoning standards that allow for the conversion from office and commercial uses to residential uses where office or commercial space has become uncompetitive due to market conditions or other factors and where residential uses would be both compatible with surrounding land uses and consistent with the County's climate policies implementing General Plan Goals LU-5 (Climate Change and Land Use) and LU-6 (Sustainable Development-Environmental Balance).</u></p>
<p>GOAL LU-12. Infrastructure and Services Supporting Development. Adequate and sustainable infrastructure, public facilities, and essential services that meet community needs and are provided concurrent with growth and development. <u>Facilitate the creation and expansion of electric vehicle recharging infrastructure in response to, and anticipation of, increases in the numbers of electric vehicles being used in the County, consistent with State transportation and climate policies.</u></p>
<p>Policy LU-12.1 Concurrency of Infrastructure and Services with Development. Require the provision of infrastructure, facilities, and services needed by new development prior to that development, either directly or through fees. Where appropriate, the construction of infrastructure and facilities may be phased to coincide with project phasing. <u>Require electric vehicle recharging facilities that meet current and reasonably foreseeable demand over time as the County's vehicle fleet includes greater numbers of electric vehicles, consistent with State transportation and climate policies.</u></p>
<p>GOAL LU-4419. <u>Limit the environmental impacts, including greenhouse gas emissions, resulting from General Plan Amendments that would either allow development where it</u></p>

LAND USE ELEMENT GOALS AND POLICIES

is currently disallowed or increase the density or intensity of use beyond currently planned levels, while ensuring that the County can meet its share of the housing needed on a regional basis, as determined through the Regional Housing Needs Assessment process overseen by the San Diego Association of Governments (SANDAG).

Policy LU-19.1 Environmental Review. The environmental review for any privately-initiated development plan or project proposing a general plan amendment (GPA) that would either allow development where it is currently disallowed or increase the density or intensity of use beyond currently planned levels outside “smart growth” areas designated by the Board shall consist of an Environmental Impact Report (EIR) and shall address the following subjects, in addition to those required by the California Environmental Quality Act (CEQA):

(i) How the project would achieve net carbon neutrality compared with a scenario in which the proposed project would be disapproved (i.e., under the CEQA No Project Alternative), including the extent to which the project would:

- Minimize energy and water consumption;
- Rely on strategies such as enhancing electric vehicle recharging infrastructure, reducing propane usage in rural areas, replacing diesel- and gasoline-powered equipment and vehicles, restoring or enhancing open space or rural lands (e.g., tree-planting), preserving or enhancing open space and rural lands to maintain or increase carbon sequestration, or achieving other outcomes that reduce fossil fuel usage, reduce biomass combustion, and/or sequester carbon; and/or
- Eliminate or reduce the development potential of other lands planned for development under the General Plan through the use of conservation easements, similar measures resulting in the permanent preservation, management and enhancement of such lands, and/or compensation mechanisms such as transferrable development rights, density transfers, density bonuses beyond those already permitted under State law, property tax reductions, compensated downzonings, and/or subsidized permanent land conservation for carbon sequestration purposes;

(iv) Whether the affected public water system’s total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system’s existing and planned future uses, including agricultural and manufacturing uses;

(vi) Whether the project could cause any of the following “undesirable results” within the meaning of the Sustainable Groundwater Management Act:

- Chronic lowering of groundwater levels indicating a significant and unreasonable depletion of supply if continued over the General Plan planning horizon;

LAND USE ELEMENT GOALS AND POLICIES

- Significant and unreasonable reduction of groundwater storage;
- Significant and unreasonable seawater intrusion;
- Significant and unreasonable degraded water quality, including the migration of contaminant plumes that impair water supplies;
- Significant and unreasonable land subsidence that substantially interferes with surface land uses; or
- Depletions of interconnected surface water that have significant and unreasonable adverse impacts on beneficial uses of the surface water

(vii) Whether the project would expose its residents, occupants, or other users or visitors to a risk of potentially life-threatening wildfires;

(viii) How the project addresses, either positively or negatively, the County's need for new housing, and particularly affordable housing, consistent with the County's fair share of the housing needed on a regional basis, as determined through the Regional Housing Needs Assessment process overseen by SANDAG; or, for projects that do not produce housing, how the project would create jobs opportunities near existing housing and/ or transit.

Policy LU-19.2 Criteria for Approval. A privately-initiated development project proposing a general plan amendment (GPA) that would either allow development where it is currently disallowed or increase the density or intensity of use beyond currently allowed levels outside of "smart growth" areas designated by the Board requires the Board to make the following findings, which must each be supported by substantial evidence before the Board:

- (i) Compared with a scenario in which the proposed project would be disapproved (i.e., the CEQA No Project Alternative), the proposed project will achieve net carbon neutrality through mechanisms of the kind set forth in Policy 19.1(i);
- (ii) Compared with a scenario in which the proposed project would be disapproved (i.e., the CEQA No Project Alternative), the proposed project will contribute positively to meeting the County's housing needs by:
 - (A) Appreciably increasing the overall housing stock in the unincorporated County, consistent with the County's fair share of the housing needed on a regional basis, as determined through the Regional Housing Needs Assessment process overseen by SANDAG; and
 - (B) Providing a component of deed-restricted housing affordable to very low-income, low-income, or moderate-income households for 30 years; or
 - (C) For projects that do not include housing, creating job opportunities near existing residential areas and/ or transit.

LAND USE ELEMENT GOALS AND POLICIES
<p><u>(iii) Compared with the existing conditions baseline in the EIR for the proposed project, the proposed project will not result in significant, unavoidable effects on endangered or threatened species or on any sensitive natural community identified in a local or regional plan, policy, or regulation or by the California Department of Fish and Wildlife or US Fish and Wildlife Service;</u></p> <p><u>(iv) Compared with the existing conditions baseline in the EIR for the proposed project, the proposed project will not result in significant, unavoidable effects on Prime Farmland, Unique Farmland, or Farmland of Statewide Importance;</u></p> <p><u>(v) Compared with the existing conditions baseline in the EIR for the proposed project, the proposed project will not result in significant, unavoidable effects due to the exposure of people or structures (including project occupants or users), either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires;</u></p> <p><u>(vi) If located in or near a state responsibility area or lands classified as very high fire hazard severity zones, the proposed project has been designed to reduce and manage fire risk to the greatest degree feasible;</u></p> <p><u>(vii) The project can foreseeably be adequately supplied with water for the foreseeable future from a recognized water agency during normal, single dry, and multiple dry water years without compromising the County's ability to serve other existing and planned future land uses, including agricultural and manufacturing uses; and</u></p> <p><u>(viii) To the extent the project would rely in whole or in part on groundwater, the project will not cause an "undesirable result" as defined in the Sustainable Groundwater Management Act.</u></p>
<p>Policy COS-15.7 Develop Program to Retrofit Existing Buildings. Consistent with General Plan policies LU 5.1 and LU 19.1(i), develop greenhouse gas and vehicle miles traveled mitigation strategies for new development, in cooperation with other local jurisdictions as appropriate, such as programs that create funding for retrofitting existing buildings in order to reduce greenhouse gas emissions by improving their energy efficiency and reducing their water usage.</p>
<p>Policy COS-16.1 Alternative Transportation Modes. Work with SANDAG and local transportation agencies to expand opportunities for transit use- and electric vehicle use. Support the development of alternative transportation modes and the creation of new and expanded electric vehicle recharging infrastructure, as provided by Mobility Element policies.</p>
<p>Policy COS-16.2 Single-Occupancy Vehicles. Support transportation management programs that reduce the use of single-occupancy vehicles, especially vehicles powered by fossil fuels.</p>
<p>Policy COS-16.3 Low-Emissions Vehicles and Equipment. Require County operations and encourage private development to provide incentives (such as priority parking) for the use of low- and zero-emission vehicles and equipment, including</p>

LAND USE ELEMENT GOALS AND POLICIES
<p><u>electric vehicle recharging infrastructure</u>, to improve air quality and reduce GHG emissions. [Refer also to Policy M-9.3 (Preferred Parking) in the Mobility Element.]</p>
<p>Policy COS-16.4 Alternative Fuel Sources. Explore the potential of developing alternative fuel stations <u>and electric vehicle recharging infrastructure</u> at maintenance yards and other County facilities for the municipal fleet and general public.</p>
<p>Policy COS-18.4 Implement Community Choice Aggregation. Work with regional partners to implement a <u>Community Choice Aggregation program by which the developed portions of the unincorporated area could be served with electricity made up entirely of carbon free energy resources.</u></p>
<p>Policy COS-19.3 Rainwater Capture and Reuse. Require <u>rainwater capture and reuse in new development where feasible and consistent with the protection of downstream biological resources pursuant to Policy COS-5.3.</u></p>
<p>Policy COS-20.3 Regional Collaboration. Coordinate air quality <u>and climate</u> planning efforts with federal and State agencies, SANDAG, and other jurisdictions.</p>
<p>GOAL Policy COS-20.5 Carbon Neutrality. Pursue carbon neutrality from community-wide (i.e., unincorporated County) <u>and County Operations greenhouse gas emissions by 2045,</u> consistent with local, state, and federal law (e.g., Assembly Bill 1279).</p>
<p>COS-20.6 Carbon Neutrality Collaboration. Coordinate efforts to achieve carbon neutrality with <u>regional sustainability planning, universities, federal and State agencies, SANDAG, and other jurisdictions and organizations.</u></p>
<p>GOAL M-5. Safe and Efficient Multi-Modal Transportation System. A multi-modal transportation system that provides for the safe, accessible, convenient, <u>and efficient,</u> <u>and sustainable</u> movement of people and goods within the unincorporated County.</p>
<p>Policy M-5.1 Regional Coordination. Coordinate with regional planning agencies, transit agencies, and adjacent jurisdictions to provide a transportation system with the following:</p> <ul style="list-style-type: none"> • Sufficient capacity consistent with the County General Plan Land Use Map • Travel choices, including multiple routes and modes of travel to provide the opportunity for reducing vehicle miles traveled <u>and the use of electric vehicles</u> • Facilities sited and designed to be compatible with the differing scales, intensities, and characteristics of the unincorporated communities while still accommodating regional, community, and neighborhood travel demands • Maximized efficiency to enhance connectivity between different modes of travel
<p>Policy M-9.2 Transportation Demand Management. Require large commercial and office development to use TDM programs to reduce single-occupant vehicle traffic</p>

LAND USE ELEMENT GOALS AND POLICIES
generation,—(especially vehicles powered by fossil fuels), particularly during peak periods to maximize the capacity of existing or improved road facilities.
<u>Policy M-9.5 Electric Vehicle Recharging Infrastructure.</u> Require new development to include electric vehicle recharging facilities to meet current and reasonably foreseeable increasing demand over time as the County’s private vehicle fleet includes greater numbers of electric vehicles, consistent with State transportation and climate policies.
<u>GOAL S-3. Minimized Fire Hazards.</u> Minimize injury, loss of life, and damage to property resulting from structural or wildland fire hazards, particularly in Very High Fire Hazard Severity Zones, consistent with the Safety Element.
<u>Policy S-3.1 Defensible Development.</u> Require development to be located, designed, and constructed to provide adequate defensibility and minimize the risk of structural loss and life safety resulting from wildland fires. <u>Require new development in Very High Fire Hazard Severity Zones to employ construction practices (e.g., “hardened homes”) and landscaping strategies that minimize the possibility of loss of life and structures from wildfires.</u>
<u>Policy S-3.8 Discourage New Subdivisions in Very High Fire Hazard Severity Zones.</u> Discourage new residential subdivisions in Very High Fire Hazard Severity Zones, except as necessary to avoid regulatory takings and/or to maintain sufficient land to meet the County’s fair share of the housing needed on a regional basis, as determined through the Regional Housing Needs Assessment process overseen by SANDAG.
<u>Policy S-4.3 Forest Health.</u> Encourage <u>and support</u> the protection <u>and management</u> of woodlands, forests, and tree resources <u>on public and private lands</u> and limit fire threat through appropriate fuel management such as <u>prescribed burns, herbivory, and the removal of dead, dying, and diseased trees and excessive flammable underbrush.</u>

Table 5-2 CAP Alternatives Comparison of Impacts

CHAPTER 8 MITIGATION MEASURES

8.1 List of Mitigation Measures

8.1.1 Aesthetics

Adopted Mitigation Measure Aes-1.2: Protect sensitive biological habitats and species through regulations that require avoidance and mitigation of impacts. Existing programs include the County MSCP and associated BMOs, RPO, and California Environmental Quality Act (CEQA) Guidelines. While protecting biological resources, these programs also preserve natural open space that contributes to the quality of many of the County's scenic vistas.

Adopted Mitigation Measure Aes-1.6: Require that project approvals with significant potential to adversely affect the scenic quality of a community require community review and specific findings of community compatibility. Examples can be found in the Zoning Ordinance with the numerous special uses or exceptions allowed pursuant to Administrative and Use Permits, and Site Plans. This practice has been proven useful for reducing impacts to aesthetic resources and their usefulness will increase as community plans and design guideline are updated pursuant to Aes-1.3 and Aes-1.4.

Adopted Mitigation Measure Aes-1.7: Develop and implement programs and regulations that preserve agricultural lands. Agricultural lands are often key components of scenic vistas and community character. Therefore, preservation of these lands will help to minimize potential impacts to scenic resources.

Adopted Mitigation Measure Aes-1.8: Continue to develop and implement programs and regulations that minimize landform alteration and preserve ridgelines and steep slopes where appropriate. Examples include the County's Grading Ordinance, RPO, and CEQA Guidelines.

Adopted Mitigation Measure Aes-1.9: Work with communities and other stakeholders to identify key scenic vistas, viewsheds of County scenic road and highways, and other areas of specific scenic value. Apply Resource Conservation Area designations or other special area designators, guidelines, and tools to guide future development of parcels within these viewsheds to avoid impacts to the scenic vistas.

Adopted Mitigation Measure Aes-4.1: County to coordinate with communities and stakeholders to review light pollution controls and consider amendments or expansions to those controls as determined necessary to reduce impacts to dark skies that are important to community character. This will ensure that potential artificial lighting impacts from development are monitored and controlled as needed to preserve community character.

Adopted Mitigation Measure Aes-4.2: County to maintain light and glare regulations that minimize impacts to adjacent properties, sensitive areas, community character, observatories, and dark skies. These regulations are currently found in the Light

Pollution Code and Zoning Ordinance. Additional reviews are implemented on discretionary projects in accordance with CEQA and the County's CEQA guidelines. These efforts will help protect the existing unincorporated area and surrounding environment from excessive artificial lighting impacts.

Adopted Mitigation Measure-M-AES-1: During the environmental review process for future Major Use Permits for wind turbines, the County Guidelines for Determining Significance for Visual Resources and Dark Skies and Glare shall be applied. When aesthetic impacts are determined to be significant, feasible and appropriate project-specific mitigation measures shall be incorporated. Examples of standard mitigation measures within the County Guidelines include: siting/location considerations; minimizing development and grading of steep slopes; natural screening and landscaping; undergrounding utilities; inclusion of buffers; and lighting restrictions.

Adopted Mitigation Measure-M-AES-2: Require that a Lighting Mitigation Plan be prepared as part of the MUP discretionary review process. The Lighting Mitigation Plan would demonstrate that the design and installation of all permanent lighting for large wind turbine ancillary facilities is such that light bulbs and reflectors are not visible from public viewing areas; lighting does not cause reflected glare; and illumination of the project facilities, vicinity, and nighttime sky is minimized. The Lighting Mitigation Plan would demonstrate consistency with the Light Pollution Code (Section 59.100 et al.) and Sections 6322 and 6324 of the Zoning Ordinance to ensure outdoor light fixtures emitting light into the night sky do not result in a detrimental effect on astronomical research and to ensure reflected glare and light trespass is minimized.

Adopted Mitigation Measure-M-AES-3: Require that a Shadow Flicker Study be prepared as part of the MUP discretionary review process. The Shadow Flicker Study would utilize a shadow flicker model run to determine the potential shadow flicker that could occur at sensitive receptors within 2,000 meters (6,562 feet) of the proposed turbines. Due to the fact that some receptors may lie within 60° due north of the turbines, outside of the sun's path at any given point in the year, those receptors may be excluded from the study. Beyond 2,000 meters, the human eye would not be able to discern a shadow cast from a wind turbine. The modeling should utilize many different inputs, including:

1) Real Data

- Actual coordinates of turbines
- Actual coordinates of receptors
- Actual topographic data

2) Conservative Assumptions

- Specifications of the turbines being considered with the highest hub height and longest rotor diameter

- 100 percent turbine operation
- No vegetative screening
- Receptors can be impacted from all directions (i.e., “greenhouse mode”)

3) Realistic Features

- Actual wind data from a local meteorological tower to account for the percentage of time wind blows from each direction
- National Weather Service sunshine probability data to approximate average cloud cover.

CAP Update Mitigation Measure Aes-1: During the environmental review process for future Major Use Permits for all large-scale renewable energy projects, the County Guidelines for Determining Significance for Visual Resources and Dark Skies and Glare shall be applied. When aesthetic impacts are determined to be significant, feasible and appropriate project-specific mitigation measures shall be incorporated. Examples of standard mitigation measures within the County Guidelines include: siting/location considerations; minimizing development and grading of steep slopes; natural screening and landscaping; undergrounding utilities; inclusion of buffers; and lighting restrictions.

CAP Update Mitigation Measure Aes-2: Require that a Lighting Mitigation Plan be prepared as part of the MUP discretionary review process for all large-scale renewable energy projects. The Lighting Mitigation Plan shall demonstrate that the design and installation of all permanent lighting for large wind turbines is such that light bulbs and reflectors are not visible from public viewing areas; lighting does not cause reflected glare; and illumination of the project facilities, vicinity, and nighttime sky is minimized. The Lighting Mitigation Plan shall demonstrate consistency with the Light Pollution Code (Section 59.100 et al.) and Sections 6322 and 6324 of the Zoning Ordinance to ensure outdoor light fixtures emitting light into the night sky do not result in a detrimental effect on astronomical research and to ensure reflected glare and light trespass is minimized.

CAP Update Mitigation Measure Aes-3: Require that a Shadow Flicker Study be prepared as part of the MUP discretionary review process for large-scale wind turbine projects. The Shadow Flicker Study shall utilize a shadow flicker model run to determine the potential shadow flicker that could occur at sensitive receptors within 2,000 meters (6,562 feet) of the proposed turbines. Due to the fact that some receptors may lie within 60 degrees due north of the turbines, outside of the sun’s path at any given point in the year, those receptors may be excluded from the study. Beyond 2,000 meters, the human eye would not be able to discern a shadow cast from a wind turbine. The modeling shall utilize many different inputs, including:

1) Real Data

- Actual coordinates of turbines
- Actual coordinates of receptors
- Actual topographic data

2) Conservative Assumptions

- Specifications of the turbines being considered with the highest hub height and longest rotor diameter
- 100 percent turbine operation
- No vegetative screening
- Receptors can be impacted from all directions (i.e., “greenhouse mode”)

3) Realistic Features

- Actual wind data from a local meteorological tower to account for the percentage of time wind blows from each direction
- National Weather Service sunshine probability data to approximate average cloud cover

8.1.2 Agricultural Resources

Adopted Mitigation Measure Agr-1.1: Implement the General Plan Regional Category map and Land Use Maps which protect agricultural lands with lower density land use designations that will support continued agricultural.

Adopted Mitigation Measure Agr-1.2: Develop and implement programs and regulations that protect agricultural lands (such as the CEQA guidelines, Zoning Ordinance, Right to Farm Act, Open Space Subvention Act, Farm and Ranch Lands Protection Program, San Diego County Agricultural Enterprises and Consumer Information Ordinance, BOS Policy I-133, and the San Diego County Farming Program), as well as, those that support implementation of the Williamson Act (including the CEQA Guidelines, Zoning Ordinance, and Subdivision Ordinance).

Adopted Mitigation Measure Agr-1.3: Create a Conservation Subdivision Program that facilitates conservation-oriented project design through changes to the Subdivision Ordinance, Resource Protection Ordinance, Zoning Ordinance, Groundwater Ordinance, and other regulations as necessary with the goal of promoting conservation of natural resources and open space (including agricultural lands) while improving mechanisms for flexibility in project design so that the production of housing is not negatively impacted.

Adopted Mitigation Measure Agr-1.4: Develop and implement the PACE program which compensates landowners for voluntarily limiting future development on their land.

Adopted Mitigation Measure Agr-1.5: Revise community plans to identify important agricultural areas within them and specific compatible uses and desired buffers necessary to maintain the viability of that area. Community plans are used to review development projects (including General Plan Amendments).

Adopted Mitigation Measure Agr-2.1: Prior to the approval of any Zoning Ordinance Amendment that would result in the removal of an “A” designator from a certain property, an analysis shall be conducted to ensure that the action removing such a designation will not result in any significant direct or indirect adverse impact to a Williamson Act Contract lands.

Adopted Mitigation Measure M-AGR-1: During the environmental review process for future Major Use Permits for wind turbines, the County Guidelines for Determining Significance for Agricultural Resources shall be applied. When impacts to Farmland are determined to be significant, feasible and appropriate project-specific mitigation measures shall be incorporated. Examples of standard mitigation measures within the County Guidelines include: avoidance of agricultural resources; preservation of agriculture; and inclusion of compatibility buffers near areas intended for agricultural uses.

Adopted Mitigation Measure M-AGR-2: During the environmental review process for future Major Use Permits for wind turbines, the County Guidelines for Determining Significance for Biological Resources shall be applied. When impacts to forest land are determined to be significant, feasible and appropriate project-specific mitigation measures shall be incorporated. Examples of standard mitigation measures within the County Guidelines include: avoidance of sensitive resources; preservation of habitat; revegetation; and resource management.

CAP Update Mitigation Measure Agr-1: During the environmental review process for future Major Use Permits for all large-scale renewable energy projects, the County Guidelines for Determining Significance for Agricultural Resources shall be applied. When impacts to Important Farmland are determined to be significant, feasible and appropriate project-specific mitigation measures shall be incorporated. Examples of standard mitigation measures within the County Guidelines include: avoidance of agricultural resources; preservation of agriculture; and inclusion of compatibility buffers near areas intended for agricultural uses.

CAP Update Mitigation Measure Agr-2: During the environmental review process for future Major Use Permits for all large-scale renewable energy projects, the County Guidelines for Determining Significance for Biological Resources shall be applied. When impacts to forest land are determined to be significant, feasible and appropriate project-specific mitigation measures shall be incorporated. Examples of standard mitigation measures within the County Guidelines include: avoidance of sensitive resources; preservation of habitat; revegetation; and resource management.

8.1.3 Air Quality

Adopted Mitigation Measure Air-2.1: Provide incentives such as preferential parking for hybrids or alternatively fueled vehicles such as compressed natural gas (CNG) vehicles or hydrogen- or electric-powered vehicles. The County shall also establish programs for priority or free parking on County streets or in County parking lots for hybrids or alternatively fueled vehicles.

Adopted Mitigation Measure Air-2.2: Replace existing vehicles in the County fleet as needed with the cleanest vehicles commercially available that are cost-effective and meet vehicle use needs.

Adopted Mitigation Measure Air-2.3: Implement transportation fleet fueling standards to improve the number of alternatively fueled vehicles in the County fleet.

Adopted Mitigation Measure Air-2.4: Provide incentives to promote the siting or use of clean air technologies where feasible. These technologies shall include, but not be limited to, fuel cell technologies, renewable energy sources, and hydrogen fuel.

Adopted Mitigation Measure Air-2.5: Require that the following measures be implemented on all construction projects where project emissions are above the SLTs:

- multiple applications of water during grading between dozer/scrapper passes;
- paving, chip sealing, or chemical stabilization of internal roadways after completion of grading;
- use of sweepers or water trucks to remove “track-out” at any point of public street access;
- termination of grading if winds exceed 25 miles per hour;
- stabilization of dirt storage piles by chemical binders, tarps, fencing or other erosion control;
- use of low-sulfur fuels in construction equipment;
- use of low VOC paints; and
- projects exceeding SLTs will require 10 percent of the construction fleet to use any combination of diesel catalytic converters, diesel oxidation catalysts, diesel particulate filters and/or CARB certified Tier I, II, III, IV equipment. Equipment is certified if it meets emission standards established by the EPA for mobile non-road diesel engines of almost all types. Standards established for hydrocarbons, oxides of nitrogen (NOX), CO, and PM. Tier I standards are for engines over 50 horsepower (hp) (such as bulldozers) built between 1996 and 2000, and engines under 50 hp (such as lawn tractors) prop built between 1999 and 2000. Tier II standards are for all engine sizes from 2001 to 2006, and Tier III standards are

for engines rated over 50 hp from 2006 to 2008. Tier IV standards apply to engines of all sizes built in 2008 or later. Standards are increasingly stringent from Tier I to Tier IV.

Adopted Mitigation Measure Air-2.6: Use County Guidelines for Determining Significance for Air Quality to identify and mitigate adverse environmental effects on air quality.

Adopted Mitigation Measure Air-2.7: Implement County Air Pollution Control District regulations for air emissions from all sources under its jurisdiction.

Adopted Mitigation Measure Air-2.8: Require NSRs to prevent permitting projects that are “major sources.”

Adopted Mitigation Measure Air-2.9: Implement the Grading, Clearing, and Watercourses Ordinance by requiring all clearing and grading to be conducted with dust control measures.

Adopted Mitigation Measure Air-2.10: Revise Board Policy F-50 to strengthen the County’s commitment and requirement to implement resource-efficient design and operations for County-funded renovation and new building projects. This could be achieved by making the guidelines within the policy mandatory rather than voluntary.

Adopted Mitigation Measure Air-2.11: Implement County RAQS to attain state air quality standards for ozone.

Adopted Mitigation Measure Air-2.12: Revise Board Policy G-15 to require County facilities to comply with Silver Leadership in Energy and Environmental Design (LEED) standards or other equivalent Green Building rating systems.

Adopted Mitigation Measure Air-2.13: Revise Board Policy G-16 to require the County to:

- adhere to the same or higher standards it would require from the private sector when locating and designing facilities concerning environmental issues and sustainability, and
- require government contractors to use low-emission construction vehicles and equipment.

Adopted Mitigation Measure Air-4.1: Use the policies set forth in the CARB’s Land Use and Air Quality Handbook as a guideline for siting sensitive land uses. Implementation of this measure will ensure that sensitive land uses such as residences, schools, day care centers, playgrounds, and medical facilities are sited appropriately to minimize exposure to emissions of TACs.

CAP Update Mitigation Measure Air-2.1: Require construction contractors to reduce construction-related exhaust emissions by ensuring that all off-road equipment greater

than 50 horsepower and operating for more than 20 total hours over the entire duration of construction activities shall operate on at least an EPA-approved Tier 3 or newer engine. Exemptions can be made for specialized equipment where Tier 3 engines are not commercially available within 200 miles of the proposed project location. The construction contract must identify these pieces of equipment, document their unavailability, and ensure that they operate on no less than an EPA-approved Tier 2 engine.

8.1.4 Biological Resources

Adopted Mitigation Measure Bio-1.5: Utilize County Guidelines for Determining Significance for Biological Resources to identify adverse impacts to biological resources. Also, utilize the County's Geographic Information System (GIS) records and the Comprehensive Matrix of Sensitive Species to locate special-status species populations on or near project sites. This information will be used to avoid or mitigate impacts as appropriate.

Adopted Mitigation Measure Bio-1.6: Implement the RPO, BMO, and HLP Ordinance to protect wetlands, wetland buffers, sensitive habitat lands, biological resource core areas, linkages, corridors, high-value habitat areas, subregional coastal sage scrub focus areas, and populations of rare, or endangered plant or animal species.

Adopted Mitigation Measure Bio-1.7: Minimize edge effects from development projects located near sensitive resources by implementing the County Noise Ordinance, the County Groundwater Ordinance, the County's Landscaping Regulations (currently part of the Zoning Ordinance), and the County Watershed Protection, Storm Water Management, and Discharge Control Ordinance.

Adopted Mitigation Measure Bio-2.1: Revise the Ordinance Relating to Water Conservation for Landscaping to incorporate appropriate plant types and regulations requiring planting of native or compatible non-native, non-invasive plant species in new development.

Adopted Mitigation Measure Bio-2.2: Require that development projects obtain CWA Section 401/404 permits issued by the California Regional Water Quality Control Board and US Army Corps of Engineers for all project-related disturbances of waters of the US and/or associated wetlands. Also, continue to require that projects obtain Fish and Game Code Section 1602 Streambed Alteration Agreements from the California Department of Fish and Game for all project-related disturbances of streambeds.

Adopted Mitigation Measure Bio-2.3: Ensure that wetlands and wetland buffer areas are adequately preserved whenever feasible to maintain biological functions and values.

Adopted Mitigation Measure Bio-2.4: Implement the Watershed Protection, Storm Water Management, and Discharge Control Ordinance to protect wetlands.

Adopted Mitigation Measure M-Bio-1: During the environmental review process for future MUPs for wind turbines, the County Guidelines for Determining Significance for Biological

Resources shall be applied. When impacts on biological resources are determined to be significant, feasible and appropriate project-specific mitigation measures shall be incorporated. Examples of standard mitigation measures within the County Guidelines include: avoidance of sensitive resources; preservation of habitat; revegetation; resource management; and restrictions on lighting, runoff, access, and/or noise.

Adopted Mitigation Measure M-Bio-2: Update the County Guidelines for Determining Significance for Biological Resources to include, or incorporate by reference, recommendations from the California Department of Fish and Game, the Avian Power Line Interaction Committee, the USFWS Draft Guidance, and the California Energy Commission (e.g., California Guidelines for Reducing Impacts to Birds and Bats from Wind Energy Development). Examples of recommended mitigation measures include: site screening; pre-permitting monitoring; acoustic monitoring; buffer zone inclusion; reduction of foraging resources near turbines; specific lighting to reduce bird collisions; post-construction monitoring; and avian protection plans.

CAP Update Mitigation Measure Bio-1: During the environmental review process for future MUPs for large-scale renewable energy projects, the County Guidelines for Determining Significance for Biological Resources shall be applied. When impacts on biological resources are determined to be significant, feasible and appropriate project-specific mitigation measures shall be incorporated. Examples of standard mitigation measures within the County Guidelines include: avoidance of sensitive resources; preservation of habitat; revegetation; resource management; and restrictions on lighting, runoff, access, and/or noise.

CAP Update Mitigation Measure Bio-2: Update the County Guidelines for Determining Significance for Biological Resources to include, or incorporate by reference, recommendations from the California Department of Fish and Wildlife, the Avian Power Line Interaction Committee, the USFWS Draft Guidance, and the California Energy Commission (e.g., California Guidelines for Reducing Impacts to Birds and Bats from Wind Energy Development). Examples of recommended mitigation measures include: site screening; pre-permitting monitoring; acoustic monitoring; buffer zone inclusion; reduction of foraging resources near turbines and transmission lines; specific lighting to reduce bird collisions; post-construction monitoring; and avian protection plans.

8.1.5 Cultural and Paleontological Resources

Adopted Mitigation Measure Cul-1.1: Utilize the RPO, CEQA, the Grading and Clearing Ordinance, and the Zoning Ordinance to identify and protect important historic and archaeological resources by requiring appropriate reviews and applying mitigation when impacts are significant.

Adopted Mitigation Measure Cul-1.6: Implement, and update as necessary, the “County’s Guidelines for Determining Significance for Cultural Resources” to identify and minimize adverse impacts to historic and archaeological resources.

Adopted Mitigation Measure Cul-2.1: Develop management and restoration plans for identified and acquired properties with cultural resources.

Adopted Mitigation Measure Cul-2.2: Facilitate the identification and acquisition of important resources through collaboration with agencies, tribes, and institutions, such as the South Coast Information Center (SCIC), while maintaining the confidentiality of sensitive cultural information.

Adopted Mitigation Measure Cul-2.3: Support the dedication of easements that protect important cultural resources by using a variety of funding methods, such as grants or matching funds, or funds from private organizations.

Adopted Mitigation Measure Cul-2.5: Protect undiscovered subsurface archaeological resources by requiring grading monitoring by a qualified archaeologist and a Native American monitor for ground disturbing activities in the vicinity of known archaeological resources, and also, when feasible, during initial surveys.

Adopted Mitigation Measure Cul-2.6: Protect significant cultural resources by facilitating the identification and acquisition of important resources through regional coordination with agencies, and institutions, such as the South Coast Information Center (SCIC) and consultation with the Native American Heritage Commission (NAHC) and local tribal governments, including SB-18 review, while maintaining the confidentiality of sensitive cultural information.

Adopted Mitigation Measure Cul-3.1: Implement the Grading Ordinance and CEQA to avoid or minimize impacts to paleontological resources, require a paleontological monitor during grading when appropriate, and apply appropriate mitigation when impacts are significant.

Adopted Mitigation Measure Cul-3.2: Implement, and update as necessary, the County's Guidelines for Determining Significance for Paleontological Resources to identify and minimize adverse impacts to paleontological resources.

Adopted Mitigation Measure Cul-4.1: Include regulations and procedures for discovery of human remains in all land disturbance and archaeological-related programs. Ensure that all references to discovery of human remains promote preservation and include proper handling and coordination with Native American groups. Apply appropriate mitigation when impacts are significant.

8.1.6 Energy

None.

8.1.7 Environmental Justice

None.

8.1.8 Greenhouse Gas Emissions

None.

8.1.9 Hazards and Hazardous Materials

Adopted Mitigation Measure Haz-1.1: Implement the Guidelines for Determining Significance, Airport Hazards, when reviewing new development projects to ensure compatibility with surrounding airports and land uses and apply appropriate mitigation when impacts are significant.

Adopted Mitigation Measure Haz-1.3: Review the AICUZ when reviewing new development projects within the study area. Ensure that such development projects are consistent with the land use compatibility and safety policies therein.

Adopted Mitigation Measure Haz-1.5: Coordinate with the San Diego County Regional Airport Authority (SDCRAA) and County Airports for issues related to airport planning and operations.

Adopted Mitigation Measure Haz-3.1: Facilitate coordination between DPLU (now PDS) and the Office of Emergency services to implement and periodically update the Hazard Mitigation Plan.

Adopted Mitigation Measure Haz-3.2: Implement the CEQA Guidelines for Determining Significance to ensure that discretionary projects do not adversely impact emergency response or evacuation plans. Also implement the County Public Road Standards and County Private Road Standards during these reviews and ensure that road improvements are consistent with Emergency Response and Evacuation Plans. Apply appropriate mitigation when impacts are significant.

Adopted Mitigation Measure Haz-3.3: Prepare Fire Access Road network plans and include in Community Plans or other document as appropriate. Also implement the County Fire Code and require fire apparatus access roads and secondary access for projects.

Adopted Mitigation Measure Haz-4.1: Identify and minimize potential fire hazards for future development by using and maintaining a database that identifies fire prone areas, locating development away from Fire Hazard areas whenever practicable, and adhering to the County Guidelines for Determining Significance for Wildland Fires & Fire Protection and applying appropriate mitigation when impacts are significant.

Adopted Mitigation Measure Haz-4.2: Conduct effective and environmentally sensitive brush management measures such as: addressing habitat-specific fire controls within Resource Management Plans; implementation of the Weed Abatement Ordinance and enforcing proper techniques for maintaining defensible space around structures; coordination with the local FAHJ to ensure that district goals for fuel management and fire protection are being met; and recognizing the Memorandum of Understanding

between the wildlife agencies and fire authorities that guides the abatement of flammable vegetation without violating environmental regulations for habitat protection.

Adopted Mitigation Measure Haz-4.3: Enforce and comply with Building and Fire Code to ensure there are adequate fire service levels; and require site and/or building designs that incorporate features that reduce fire hazards. Also implement the General Plan Regional Category map and Land Use Maps, which typically show lower densities in wildland areas.

Adopted Mitigation Measure Haz-4.4: Create a Conservation Subdivision Program that facilitates conservation-oriented, fire-safe, project design through changes to the Subdivision Ordinance, Resource Protection Ordinance, Zoning Ordinance, Groundwater Ordinance, and other regulations as necessary.

Adopted Mitigation Measure Pub-1.5: Implement, and revise as necessary, Board Policy I-84 requiring that discretionary project applications include commitments from available fire protection districts. These commitments shall also demonstrate that the distance between the projects and the fire service facilities do not result in unacceptable travel times.

Adopted Mitigation Measure Pub-1.6: Maintain and use the County GIS and the County Guidelines for Determining Significant impacts in order to identify fire prone areas during the review of development projects. Once identified, ensure that development proposals meet requirements set by the FAHJ and that new/additional fire protection facilities are not required; or, if such facilities are required, that potential environmental impacts resulting from construction are evaluated along with the development project under review.

Adopted Mitigation Measure Pub-1.7: Implement the Building and Fire code to ensure there are adequate fire protections in place associated with the construction of structures and their defensibility, accessibility and egress, adequate water supply, coverage by the local fire district, and other critical issues.

8.1.10 Hydrology and Water Quality

Adopted Mitigation Measure Hyd-1.1: Update and implement the County of San Diego's Jurisdictional Runoff Management Program (JRMP).

Adopted Mitigation Measure Hyd-1.2: Implement and revise as necessary the Watershed Protection Ordinance to reduce the adverse effects of polluted runoff discharges on waters and to encourage the removal of invasive species and restore natural drainage systems.

Adopted Mitigation Measure Hyd-1.3: Establish and implement low impact development (LID) standards for new development to minimize runoff and maximize infiltration.

Adopted Mitigation Measure Hyd-1.4: Revise and implement the Stormwater Standards Manual requiring appropriate measures for land use with a high potential to contaminate surface water or groundwater resources.

Adopted Mitigation Measure Hyd-1.5: Utilize the County Guidelines for Determining Significance for Hydrology and Water Quality and Groundwater Resources to identify adverse environmental effects.

Adopted Mitigation Measure Hyd-2.1: Implement, and revise as necessary, Board Policy I-84 requiring that discretionary project applications include commitments from available water districts. Also implement and revise as necessary Board Policy G-15 to conserve water at County facilities.

Adopted Mitigation Measure Hyd-2.2: Implement the Groundwater Ordinance to balance groundwater resources with new development. Also revise the Ordinance Relating to Water Conservation for Landscaping (currently Zoning Ordinance Sections 6712 through 6725) to further water conservation through the use of recycled water.

Adopted Mitigation Measure Hyd-2.3: Establish a water credits program between the County and the Borrego Water District to provide a streamlined and consistent process for the permanent cessation of outdoor water intensive uses such as irrigated agricultural or golf course land.

Adopted Mitigation Measure Hyd-2.4: Coordinate with the San Diego County Water Authority and other water agencies to coordinate land use planning with water supply planning and implementation and enhancement of water conservation programs.

Adopted Mitigation Measure Hyd-2.5: Implement and revise as necessary the Resource Protection Ordinance and Policy I-68 Proposed Projects in Flood Plains / Floodways to restrict development in flood plains / floodways.

Adopted Mitigation Measure Hyd-3.1: Implement, and revise as necessary, ordinances to require new development to be located down and away from ridgelines, conform to the natural topography, not significantly alter dominant physical characteristics of the site, and maximize natural drainage and topography when conveying stormwater.

Adopted Mitigation Measure Hyd-3.2: Implement, and revise, as necessary the Resource Protection Ordinance to limit development on steep slopes. Also incorporate Board Policy I-73, the Hillside Development Policy, into the Resource Protection Ordinance to the extent that it will allow for one comprehensive approach to steep-slope protections.

Adopted Mitigation Measure Hyd-3.3: Implement the Grading, Clearing and Watercourses Ordinance to protect development sites against erosion and instability.

Adopted Mitigation Measure Hyd-4.1: Implement the Flood Damage Prevention Ordinance to reduce flood losses in specified areas.

Adopted Mitigation Measure Hyd-4.2: Implement the Grading, Clearing and Watercourses Ordinance to limit activities affecting watercourses.

Adopted Mitigation Measure Hyd-4.3: Implement and revise as necessary Board Policies such as: Policy I-68, which establishes procedures for projects that impact floodways; Policy I-45, which defines watercourses that are subject to flood control; and Policy I-56, which permits, and establishes criteria for, staged construction of off-site flood control and drainage facilities by the private sector when there is a demonstrated and substantial public, private or environmental benefit.

Adopted Mitigation Measure Hyd-6.1: Implement the Resource Protection Ordinance to prohibit development of permanent structures for human habitation or employment in a floodway and require planning of hillside developments to minimize potential soil, geological and drainage problems.

Adopted Mitigation Measure Hyd-8.2: Review discretionary projects for dam inundation hazards through application of the County's Guidelines for Determining Significance for Hydrology and Guidelines for Determining Significance for Emergency Response Plans.

8.1.11 Land Use and Planning

Adopted Mitigation Measure Lan-1.1: Coordinate with adjacent cities and other agencies regarding planning efforts and resource protection. This includes working with SANDAG during updates to the RTP to ensure that regional roads are properly planned, sited, and designed. Additional on-going consultations include coordination with state, federal, and local agencies regarding the high speed rail, the Sunrise Powerlink, and tribal casinos.

Adopted Mitigation Measure Lan-1.2: Coordinate with land owners, other departments, and community groups to ensure that both public and private development projects and associated infrastructure minimize impacts to established communities. This involves community input and General Plan conformance reviews on County road projects to insure that County road planning and development is consistent with the General Plan. This also includes analysis of potential environmental impacts for public and private road projects and application of mitigation measures pursuant to CEQA. DPW policies and procedures shall be evaluated to ensure that such reviews are conducted and that issues regarding potential division of communities are identified and addressed. General Plan Amendments that propose changes to the circulation network shall be kept consistent with the General Plan Goals and Policies, and such proposals will also be reviewed by the communities. In addition, Board Policy I-63 and/or department procedures will be updated to meet this standard.

Adopted Mitigation Measure Lan-1.3: Maintain plans and standards for infrastructure and roads so that divisions of communities do not occur. This will include: 1) updates to County Road Standards to ensure that roads are designed and built in a safe manner consistent with the General Plan and community context; 2) adherence to Community Plans to guide infrastructure planning in the individual and unique communities of the

County; 3) evaluation and, if necessary, revisions to the subdivision ordinance to ensure future project designs, and corresponding infrastructure designs, are consistent with the General Plan and with established community character; 4) preparation of local public road network plans to improve mobility, connectivity, and safety; and 5) preparation of community road standards that supplement the County road standards in order to recognize the unique constraints and character of different communities.

8.1.12 Noise

Adopted Mitigation Measure Noi-1.1: Require an acoustical analysis whenever a new development may result in any existing or future noise sensitive land uses being subject to on-site noise levels of 60 dBA (CNEL) or greater, or other land uses that may result in noise levels exceeding the “Acceptable” standard in the Noise Compatibility Guidelines (Table N-1 in the Noise Element).

Adopted Mitigation Measure Noi-1.3: Require an acoustical study for projects proposing amendments to the County General Plan Land Use Element and/or Mobility Element that propose a significant increase to the average daily traffic due to trips associated with the project beyond those anticipated in the General Plan.

Adopted Mitigation Measure Noi-2.1: For Land Use Designations defined in Table 2.11-14, a groundborne vibration technical study shall be required for proposed land uses within the following distances from the Sprinter Rail Line right-of-way and the property line: 600 feet of a Category 1 Land Use, 200 feet of a Category 2 Land Use, and 120 feet of a Category 3 Land Use. If necessary, mitigation shall be required for land uses in compliance with the standards listed in Tables 2 and 3 of the County of San Diego Guidelines for Determining Significance - Noise.

Adopted Mitigation Measure Noi-2.4: Require an acoustical study whenever a proposed extractive land use facility may result in a significant noise impact to existing noise sensitive land uses, or when a proposed noise sensitive land use may be significantly affected by an existing extractive land use facility. The results of the acoustical study may require a “buffer zone” to be identified on all Major Use Permit applications for extractive facilities whenever a potential for a noise impact to noise sensitive land uses may occur.

Adopted Mitigation Measure Noi-5.1: Use the applicable Airport Land Use Compatibility Plan’s (ALUCP) as guidance/reference during development review of projects that are planned within an Airport Influence Area (AIA). Any projects that are within the AIA shall be submitted to the SDCRAA for review.

Adopted Mitigation Measure Noi-5.3: Consult with the FAA standards and the County Noise Ordinance as a guide for assessing noise impacts from private airports and helipads.

8.1.13 Transportation

Adopted Mitigation Measure Tra-1.3: Implement the County Public Road Standards during review of new development projects. Also revise the Public Road Standards to include a range of road types according to Regional Category context.

Adopted Mitigation Measure Tra-1.4: Implement and revise as necessary the County Guidelines for Determining Significance for Transportation and Traffic to evaluate adverse environmental effects of projects and require mitigation when significant impacts are identified.

Adopted Mitigation Measure Tra-4.4: Implement and revise as necessary the Subdivision Ordinance to ensure that proposed subdivisions meet current design and accessibility standards.

8.1.14 Tribal Cultural Resources

Adopted Mitigation Measure Cul-2.2: Facilitate the identification and acquisition of important resources through collaboration with agencies, tribes, and institutions, such as the South Coast Information Center (SCIC), while maintaining the confidentiality of sensitive cultural information.

Adopted Mitigation Measure Cul-2.4: Protect significant cultural resources through regional coordination and consultation with the NAHC and local tribal governments, including SB-18 review.

Adopted Mitigation Measure Cul-2.5: Protect undiscovered subsurface archaeological resources by requiring grading monitoring by a qualified archaeologist and a Native American monitor for ground disturbing activities in the vicinity of known archaeological resources, and also, when feasible, during initial surveys.

Adopted Mitigation Measure Cul-2.6: Protect significant cultural resources by facilitating the identification and acquisition of important resources through regional coordination with agencies, and institutions, such as the South Coast Information Center (SCIC) and consultation with the Native American Heritage Commission (NAHC) and local tribal governments, including SB-18 review, while maintaining the confidentiality of sensitive cultural information.

Adopted Mitigation Measure Cul-4.1: Include regulations and procedures for discovery of human remains in all land disturbance and archaeological-related programs. Ensure that all references to discovery of human remains promote preservation and include proper handling and coordination with Native American groups. Apply appropriate mitigation when impacts are significant.

CAP Update Mitigation Measure TCR-1: Require development to avoid tribal cultural resources, if feasible. If complete avoidance is not possible, require development to

mitigate impacts to tribal cultural resources pursuant to Assembly Bill 52 and CEQA Sections 21080.3.1 and 21084.3.

8.1.15 Wildfire

Adopted Mitigation Measure Haz-4.3: Enforce and comply with Building and Fire Code to ensure there are adequate fire service levels; and require site and/or building designs that incorporate features that reduce fire hazards. Also implement the General Plan Regional Category map and Land Use Maps, which typically show lower densities in wildland areas.

Adopted Mitigation Measure Pub-1.5: Implement, and revise as necessary, Board Policy I-84 requiring that discretionary project applications include commitments from available fire protection districts. These commitments shall also demonstrate that the distance between the projects and the fire service facilities do not result in unacceptable travel times.

Adopted Mitigation Measure Pub-1.6: Maintain and use the County GIS and the County Guidelines for Determining Significant impacts in order to identify fire prone areas during the review of development projects. Once identified, ensure that development proposals meet requirements set by the FAHJ and that new/additional fire protection facilities are not required; or, if such facilities are required, that potential environmental impacts resulting from construction are evaluated along with the development project under review.

Adopted Mitigation Measure Pub-1.7: Implement the Building and Fire code to ensure there are adequate fire protections in place associated with the construction of structures and their defensibility, accessibility and egress, adequate water supply, coverage by the local fire district, and other critical issues.

CHAPTER 9 COMMENT RESPONSES AND SUMMARY OF REVISIONS

This chapter contains comment letters received during the public review period for the Draft SEIR, which concluded on January 5, 2024. In conformance with Section 15088(a) of the State CEQA Guidelines, written responses were prepared addressing comments on environmental issues received from reviewers of the Draft SEIR. This chapter also summarizes all revisions made to the CAP Update and SEIR since release of the draft documents.

9.1 Comments on the Draft EIR and Responses

Table 9-1 presents the list of commenters, including the numerical designation for each comment letter received, the author of the comment letter, and the date of the comment letter.

The verbal and written individual comments received on the Draft EIR and the responses to those comments are provided below. The comment letters and verbal comments made at the public hearing are reproduced in their entirety and are followed by the response(s). Where a commenter has provided multiple comments, each comment is indicated by a line bracket and an identifying number in the margin of the comment letter.

9.1.1 Master Responses

The following master responses provide clarification on topics raised in multiple comments. These master responses explain the purpose of the CAP Update and its relationship to land use changes; describe the approach to analysis of smart growth alternatives in this SEIR; and clarify that the CAP Update establishes appropriate GHG reduction targets and identifies adequate measures and actions to reduce GHG emissions to levels that achieve the targets. Responses to detailed comments are provided individually below, with references to the relevant master responses provided, as appropriate.

9.1.1.1 Master Response: CAP Update Purpose and Land Use Change

The County received public comments requesting the incorporation of land use changes into the CAP Update to reduce GHG emissions associated with vehicle miles traveled (VMT). This master response provides clarification about the relationship between the CAP Update and the General Plan and clarifies the distinction between the CAP Update as a mechanism for reducing GHG emissions and the San Diego County General Plan (General Plan) as the County's land use planning and policy document.

CAP Update and SEIR Background

The General Plan was updated and adopted in August 2011. The General Plan provides the policy framework and long-range vision for growth in the unincorporated county. It also establishes goals, policies, and programs to foster healthy, livable, and sustainable communities, and provides a guide for future land use, housing, and economic development. The probable environmental impacts of implementing the General Plan were evaluated in the *San Diego County General Plan Update Final Environmental Impact Report* (2011 GPU PEIR). Pursuant to State CEQA Guidelines Section 15126.4, Mitigation Measures CC-1.2, CC-1.7, and CC-1.8 were included in the 2011 GPU PEIR to ensure GHG emissions associated with buildout of the General Plan were reduced to a level below significance. Mitigation Measures CC-1.2, CC-1.7, and CC-1.8 require the County to prepare a CAP to achieve specified GHG emissions from community and local government operations, to modify the County's guidance on evaluating GHG emissions

impacts and determining a project's consistency with the CAP, and to adopt a threshold to reduce GHG emissions.

As discussed in Chapter 1, "Project Description," of this SEIR, the County prepared a CAP in 2012 and a revised version in 2018, but the related CEQA documents for both CAPs were litigated, and the 2018 CAP SEIR was decertified. The CAP Update that is the subject of this SEIR is intended to fulfill the mitigation measures identified in the 2011 GPU PEIR and to meet current California legislative emissions reductions targets in response to the *Golden Door Properties, LLC v. County of San Diego*, 50 Cal.App.5th 467 (2020) (hereafter Appellate Decision) and subsequent Superior Court writ of mandate. This SEIR has been prepared to provide subsequent analysis to the 2011 GPU PEIR and is intended to analyze the impacts of implementation of the CAP Update.

The Purpose of This CAP Update

The CAP Update is not a land use plan. Rather, it is a programmatic document that contains strategies, policies, and actions that would mitigate GHG emissions from existing and future development allowed under the General Plan and in County operations. Making land use planning changes to the General Plan while trying to mitigate for buildout would result in an unstable project description and a circular process. The CAP Update contains actions demonstrated to reduce emissions levels that exceed the County's 2030 reduction target of 43.6 percent below 2019 levels and 2045 reduction target of 85.4 percent below 2019 levels. The CAP Update also establishes actions to achieve a goal of net zero carbon emissions by 2045.

The CAP Update has been prepared in accordance with State CEQA Guidelines Section 15183.5(b) and Section 15126.4. These guidelines do not include changes to land use as required elements of CAPs generally or CAPs—like this one—that serve as mitigation measures.

Although the CAP Update is not the appropriate document within which to propose changes in land use in the unincorporated county, the County acknowledges that changes in land use can have the effect of reducing GHG emissions by reducing VMT through higher-density development in close proximity to transit, infrastructure, and retail and commercial services. Although the CAP Update does not include changes to General Plan land use designations or zoning, it does include measures that would support investments in multimodal transportation near development (Measure T-5 would improve County roadways to encourage walking, biking, or rolling to and from transit and destinations and increase transportation efficiency) and measures that would acquire and manage land for carbon storage (Measure A-1 would acquire and manage conservation lands to preserve natural lands and maximize carbon storage potential in unincorporated areas, and Measure A-3 would preserve agricultural lands to prioritize carbon storage and balance economic and development goals).

Furthermore, although the CAP Update does not prescribe changes in the patterns of land use development, this SEIR does evaluate how changes in the distribution of land uses could reduce GHG emissions in the unincorporated area compared to the proposed

project (existing General Plan land use map, as amended) as part of the alternatives analysis (see Chapter 5, “Alternatives,” of this SEIR). In response to the Superior Court writ, this SEIR includes smart growth alternatives that describe conceptual land use configurations that would reduce projected VMT when implemented, beyond that which the CAP Update would do alone. Please refer to Section 9.1.1.2, “Master Response: Evaluation of Smart Growth Alternatives in This SEIR,” below, for more details. These alternatives could be adopted in addition to the CAP Update.

The CAP Update’s Relationship to the County’s Other Climate Change Efforts

The County is developing and implementing other programs that would inform land use planning, reduce VMT, and reduce GHG emissions. A few of these programs include: (1) the County’s Development Feasibility Analysis (DFA) is anticipated to establish an approach to facilitating development in VMT-efficient and infill areas based on parcel-level analysis of on-the-ground development feasibility; (2) the Sustainable Land Use Framework (SLUF) identifies principles of sustainable development to inform future land use planning and helps the County balance housing production, sustainability, conservation, resiliency, and equity with respect to land use change; (3) the County’s Regional Decarbonization Framework (RDF) will generate a group of GHG reduction actions that can be voluntarily implemented by public or private entities in the county, which could move the entire San Diego region to zero-carbon emissions by midcentury in buildings, transportation, energy supply, food systems, and land use sectors; (4) the Multiple Species Conservation Program (MSCP) conserves open space and natural habitats; (5) the purchase of Agricultural Conservation Easement Program preserves land for long-term agricultural use; and (6) the County’s adopted VMT threshold and upcoming VMT mitigation program will further encourage development in low-VMT and therefore low-GHG areas. As described in Chapter 2, Project Description, of the SEIR, implementation of the CAP Update includes a combination of regulations, programs, incentives, and outreach and educational activities to reduce GHG emissions. This includes existing County initiatives such as the Multiple Species Conservation Program and the Purchase of Agricultural Conservation Easement Program, both of which promote land conservation as a means of both preserving habitat and agricultural lands while contributing toward GHG reduction.

The CAP Update has been revised to more clearly explain how the CAP Update mitigates development allowed under the General Plan and how, if land use changes were to occur as a result of these plans and programs, future iterations of the CAP would account for any changes in land use and its associated GHG (see page 9 of the CAP Update). As such, the plans and programs in the paragraph above remain separate from the CAP Update, and any reduction in GHG emissions that results from their implementation is not captured in the CAP Update emissions forecasts. As a result, CAP Update emissions forecasts for the unincorporated county may be higher—and more conservative—than would be realized with the implementation of other County programs. Because the CAP Update forecasts do not take credit for these separate actions, this approach increases the “gap” between the emissions forecasts and GHG reduction targets identified in the CAP and results in the CAP Update identifying an aggressive suite of actions, demonstrating that the County can achieve its targets independent of separate County

land use programs. Thus, any GHG reductions achieved through the County's separate land use planning efforts (e.g., DFA and SLUF) and any separately obtained GHG emissions reductions (e.g., RDF) would be in addition to what would be achieved through implementation of the CAP Update measures and actions to reach GHG reduction targets identified in the CAP.

Again, while the County acknowledges the important relationship between land use and GHG emissions, the CAP Update is not a land use plan. As articulated in this SEIR, large-scale changes to the land uses in the adopted 2011 General Plan would require additional study, public outreach, and coordination. As noted above, the CAP Update is intended to achieve the requirements set forth in GPU EIR Mitigation Measures CC-1.2, CC-1.7, and CC-1.8: to prepare a CAP to achieve specified GHG emissions from community and local government operations, to modify the County's guidance on evaluating GHG emissions impacts and determining a project's consistency with the CAP, and to adopt a threshold to reduce GHG emissions. Because the CAP Update achieves these goals through implementation of other types of measures and actions, instituting General Plan land use changes through the CAP Update, is not necessary. Further, such changes would be circular and prevent a stable project description as required by CEQA. As described below and in Chapter 5, "Alternatives," of this SEIR, the smart growth alternatives present land use focused options that the San Diego County Board of Supervisors (Board) could direct staff to implement. These alternatives, if selected, would likely require future changes to land use, zoning, and development processes.

9.1.1.2 Master Response: Evaluation of Smart Growth Alternatives in This SEIR

The County received several comments related to the evaluation of smart growth alternatives in this SEIR. This response provides an overview of the need to evaluate alternatives in this SEIR, the development and feasibility of the smart growth alternatives, and the analysis and conclusions provided in this SEIR.

EIRs are required to describe and evaluate a range of reasonable alternatives to the proposed project that would feasibly attain most of the basic objectives of the project and would avoid or substantially lessen the significant effects of the project and to evaluate the comparative merits of the alternatives (State CEQA Guidelines 15126.6[a]). Because an EIR must identify ways to mitigate or avoid the significant effects that a project may have on the environment (CEQA Section 21002.1), the discussion of alternatives is intended to focus on alternatives to the project that are capable of avoiding or substantially lessening significant effects of the project (State CEQA Guidelines 15126.6[b]). The range of potential alternatives to the proposed project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects (State CEQA Guidelines 15126.6[c]). The EIR must then include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project (State CEQA Guidelines 15126.6[d]). If an alternative would cause one or more significant effects in addition to those that would be caused by the project as proposed, the significant effects must be discussed, but in less detail than the significant effects of the project (State CEQA

Guidelines 15126.6[d]). A No-Project Alternative must be evaluated to allow decision-makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project (State CEQA Guidelines 15126.6[e]). If, in analyzing the No-Project Alternative, not approving the project is determined to be environmentally superior, “the EIR shall also identify an environmentally superior alternative among the other alternatives” (State CEQA Guidelines 15126.6[e][2]).

The Court of Appeal found the 2018 SEIR’s discussion of project alternatives to be deficient because the CAP’s objectives included reducing GHG. The Court of Appeal determined that the SEIR should have included a smart growth alternative aimed at reducing VMT. The Court of Appeal cited state and local plans linking VMT and GHG reduction as evidence that at least one project alternative in the 2018 SEIR should have been focused primarily on significantly reducing VMT and concluded that failure to do so was prejudicial in that it precluded “informed public participation and decision making” (Appellate Decision, page 106).

This SEIR includes consideration of four smart growth alternatives that, if implemented, would reduce VMT, and by extension GHG emissions, in the unincorporated county. The smart growth alternatives are conceptual land use configurations that would reduce VMT beyond the reductions that would be achieved by the CAP Update by modifying the way the unincorporated area would be built out in the future. Implementation of the smart growth alternatives would be directed in addition to approval of the CAP Update and would require additional actions by the Board, such as direction of new technical studies, program development, and extensive stakeholder and community engagement. Implementation of these alternatives also likely would require planning, zoning, and land use changes not analyzed in this CAP Update SEIR. The Draft SEIR describes the various benefits of the smart growth alternatives and their consistency with the goals of the adopted General Plan (pages 5-19 and 5-20), summarizes the County’s outreach efforts related to development of the smart growth alternatives (pages 5-19 through 5-22), and articulates potential implementation methods (pages 5-22 through 5-26).

Two of the smart growth alternatives—the Fire Safe and VMT Efficient Alternative and the Village Support Areas Alternative—could be implemented through zoning overlays. Zoning overlays were identified as the main method of implementation because they are relatively quick and easy to implement. The Sustainable Communities Strategy Alternative could also be initiated through a zoning overlay, although as noted in the Draft SEIR, “a broader and more comprehensive set of General Plan land use map and Zoning Ordinance changes would be required that mirrors the [Road User Charge] program described in the Regional Plan,” because the VMT assumed in the San Diego Association of Governments (SANDAG) modeling (and incorporated into the Draft SEIR’s analysis of the alternative’s emissions) assume VMT reductions from the Road User Charge program that was subsequently removed from the SANDAG strategy by amendment (Draft SEIR page 5-30). The fourth smart growth alternative is a series of General Plan goal and policy edits. As explained in the Draft SEIR, “[t]he Board may choose some or all of these additional policy amendments and pair them with the proposed CAP Update or an alternative” (Draft SEIR page 5-31). All the alternatives would likely require additional CEQA review before adoption.

As explained on page 5-24 of the Draft SEIR, if the Board selects the Fire Safe and VMT Efficient Alternative, the Village Support Areas Alternative, or the Sustainable Communities Strategy Alternative to move forward, staff would be directed to prepare and return to the Board with a Smart Growth Zoning Overlay Ordinance for CEQA review and adoption, which would result in the placement of a smart growth zoning designation on properties in the selected smart growth areas. The overlay zone would identify properties that would be eligible for future programs, process improvements, or land use changes that would incentivize residential, commercial, and mixed-use growth in the smart growth boundary. The County would conduct additional community outreach during development of the overlay zone to better align policies with community input.

Depending upon the nature and extent of the regulatory framework in the Smart Growth Zoning Overlay Ordinance, additional environmental analysis may be required prior to adoption. The necessity of additional outreach, analysis, and refinement does not render these alternatives infeasible, nor does it mean that they could not be implemented in a reasonable amount of time (“reasonable” is defined as being able to accommodate the community outreach and noticed public hearing processes required before adoption). The overlay process could be implemented more efficiently than wholesale changes to the General Plan land use map, which is the reason it is proposed. The County has implemented similar overlay zones in the past, for example, the County’s Forest Conservation Initiative (FCI) Overlay, with success. The FCI Overlay was placed over certain properties in the FCI zone to specify areas for certain development. A Smart Growth Zoning Overlay would function in similar way to guide incentives, for example, for development in smart growth areas.

Similarly, the County has examples of successful General Plan policy updates, such as the July 14, 2021 (1) adoption of General Plan Amendments to update the Housing, Safety, and Environmental Justice Elements. The County anticipates that elements of the General Plan Goal and Policy Edits Alternative could be returned to the Board for adoption with CEQA review in as little as 6 months. If selected by the Board, some goal and policy edits may require more detailed CEQA analysis after adoption of the CAP Update.

As demonstrated in the examples above, the identified smart growth alternatives are feasible and could be implemented within a reasonable range of time following Board direction. Furthermore, CEQA does not require alternatives to be as fully developed and implementable as the proposed project (State CEQA Guidelines Section 15126.6(d)). The Appellate Decision does not direct the County to include land use changes as GHG reduction measures in the CAP Update, nor does the decision require the Board to select a smart growth alternative for advancement.

The purpose of the alternatives analysis is to foster informed decision making focused on the comparative impacts of the project (here, the CAP Update) to those of the alternatives. Alternatives are intended to identify how a project could be adjusted to reduce the effects of its implementation. The smart growth alternatives were included in the SEIR in response to the Appellate Decision and crafted in response to feedback received during public outreach, not just to explore ways to reduce project impacts but also the

environmental impacts of these alternatives were analyzed in comparison to the proposed project, albeit at a lesser level of detail, as is anticipated in the State CEQA Guidelines.

Additionally, these alternatives were included in the full suite of alternatives carried forward for detailed analysis in the identification of the environmentally superior alternative. Table 5-2 in Chapter 5, Alternatives, of the SEIR provides a qualitative summary of the environmental effects of the alternatives evaluated in comparison to the effects of the CAP Update to identify the environmentally superior alternative. As required by Section 15126.6(e)(2) of the State CEQA Guidelines, which states “[i]f the environmentally superior alternative is the ‘no project’ alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.” Environmental superiority is based on the analysis conducted pursuant to Section 15126.6(d) of the State CEQA Guidelines and the potential for the alternative to reduce the anticipated impacts of project implementation, while achieving the basic objectives of the project and without causing additional environmental effects. The decision-making body has the discretion to select any or none of the alternatives evaluated in detail in the SEIR and is not obligated to select the environmentally superior alternative.

In sum, the alternatives analysis contained in the SEIR satisfies State CEQA Guidelines and responds to the Court of Appeal’s requirements; provides a balanced analysis of each project alternative, and the smart growth alternatives, that is backed by substantial evidence for comparing the potential impacts of the alternative with those of the proposed project; contains the appropriate level of detail pursuant to the requirements of the State CEQA Guidelines for the consideration of project alternatives; and includes sufficient detail for the public and decision-makers to understand the process by which the smart growth alternatives could be implemented.

9.1.1.3 Master Response: CAP Update GHG Reduction Targets, Measures, and Actions

The County received several comments related to elements of the CAP Update, including its GHG reduction targets; strategies, measures, and actions to reduce GHG emissions to achieve the targets; and implementation and monitoring details. For example, comments assert that the GHG reduction targets are inadequately aligned with targets set forth in state legislation (e.g., Assembly Bill [AB] 1279) and the California Air Resources Board (CARB) 2022 *Scoping Plan for Achieving Carbon Neutrality* (2022 Scoping Plan). Comments also reference additional measures and actions to reduce GHG emissions that are outside the scope of those included in the CAP Update and suggest revisions to the measures and actions included in the CAP Update. The comments related to additional and revised measures and actions to reduce emissions generally assert that these measures and actions would achieve additional or earlier GHG reductions relative to those reported in the CAP Update. Comments also assert that the CAP Update measures and actions do not include “analysis, timeline, (and) metrics” and assert that the CAP Update is “aspirational” because it does not include “defined actions” or “metrics.” Additionally, some commenters offer suggestions for how the measures and actions should be implemented or request that additional details related to implementation, such as timing and cost, be included in a Final CAP.

This master response describes the following topics:

- A. The regulatory framework for this CAP Update, including State CEQA Guidelines provisions for qualified plans for the reduction of greenhouse gas emissions (Section 15183.5[b][1]) and Board direction provided in the *Framework for Future for Bold Climate Action* (Board direction).
- B. The methodology the County used to establish GHG reduction targets that are appropriately aligned with statewide targets and Board direction.
- C. The methodologies the County used to adequately develop measures and actions to reduce emissions, achieve the established targets GHG reduction targets, and make substantial progress toward the County's aspirational goal of net zero emissions by 2045.
- D. The implementation, monitoring, and amendment mechanisms included in the CAP Update.

Regulatory Framework for This CAP Update

The State CEQA Guidelines include provisions to streamline the environmental review process of projects that are consistent with a “plan for the reduction of greenhouse gas emissions” that meets specified criteria, which are outlined in State CEQA Guidelines Section 15183.5(b)(1).

Elements of a Plan for the Reduction of Greenhouse Gas Emissions (State CEQA Guidelines Section 15183.5[B][1])

- (A) Quantify GHG emissions, both existing and projected, over a specified period of time, resulting from activities within a defined geographic area.
- (B) Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable.
- (C) Identify and analyze the GHG emissions resulting from specific actions, or categories of actions anticipated within the geographic area.
- (D) Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level.
- (E) Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels.
- (F) Be adopted in a public process following environmental review.

Under these provisions, a project that is consistent with a “plan for the reduction of greenhouse gas emissions” is eligible for streamlined analysis of its GHG emissions impacts under CEQA.

Board Direction: “Framework for Our Future for Bold Climate Action”

The Board-approved policy guidelines—the *Framework for Our Future: Actions to Achieve Bold Climate Action*—in January 2021 to, among other directives, achieve bold climate action and establish actions to meet a goal of net zero carbon emissions by 2035–2045, which is consistent with Board direction. Refer to CAP Update Section 1.1 (pages 1-3 and 1-4) for additional discussion of this Board direction. Overview of Statewide GHG Reduction Targets

The CAP Update appropriately sets GHG reduction targets and a net zero goal in alignment with state legislation (i.e., AB 1279), the 2022 Scoping Plan, and the Board’s direction.

The State has established GHG emissions reduction targets through various statewide plans, laws, and executive orders to address climate change. In 2016, Senate Bill (SB) 32 mandated that statewide GHG emissions reach 40 percent below 1990 levels by 2030. In 2022, AB 1279 mandated that statewide GHG emissions reach 85 percent below 1990 levels by 2045, and also included a policy for the state to achieve net zero emissions as soon as possible.

To implement AB 1279, CARB adopted 2022 Scoping Plan, which identifies a technologically feasible and cost-effective scenario to achieve statewide carbon neutrality, or net zero emissions, by 2045. CARB’s analysis determined that to achieve AB 1279 targets, statewide emissions reductions must exceed SB 32 requirements to reach 48 percent below 1990 levels by 2030.

CAP Update GHG Reduction Targets

The CAP Update adjusts the state-level GHG targets identified in the 2022 Scoping Plan to the County’s 2019 GHG inventory. The CAP Update’s target-setting methodology used 2019 data from the State’s emission inventory and future emissions reductions in 2030, 2035, 2040, and 2045 from the 2022 Scoping Plan. The future emissions in the 2022 Scoping Plan are 48 percent below statewide 1990 levels in 2030 and 85 percent below 1990 levels in 2045. Statewide emissions in future years from the applicable sectors were then compared to 2019 statewide emissions from applicable sectors to determine the percentage reduction for the unincorporated area. Data for 2019 were used because 1990 emissions data are not available for the unincorporated county and because 2019 is the baseline year of the GHG emissions inventory prepared for the CAP Update. The 2019 GHG inventory for the unincorporated area accounts for community-wide activities in the unincorporated area and County government operations in the unincorporated area and within incorporated cities and is consistent with State CEQA Guidelines Section 15183.5(b)(1)(A).

The methodology used to establish 2030 and 2045 GHG reduction targets for the CAP Update, including identification of statewide sectors applicable to the County of San Diego, is described in full in CAP Update Appendix 5.

The CAP Update therefore demonstrates ways to achieve the following GHG reduction targets:

- 43.6 percent below 2019 levels by 2030, and
- 85.4 percent below 2019 levels by 2045.

The CAP Update also includes potential ways to achieve an additional goal of:

- net zero emissions by 2045.

The basis for the 2030 and 2045 GHG reduction targets and the 2045 aspirational goal are presented below. Appendix 5 to the CAP Update describes in full the methodology used to adjust state-level GHG targets to the County's 2019 inventory and establish the 2030 and 2045 GHG reduction targets and the 2045 aspirational goal. By establishing 2030 and 2045 GHG emissions reduction targets in alignment with legislative targets for statewide GHG emissions reductions and the State's 2022 Scoping Plan, the CAP Update is consistent with State CEQA Guidelines Section 15183.5(b)(1)(B).

Basis for the CAP Update's 2030 GHG Reduction Target

For 2030, the CAP Update target is aligned with the 2022 Scoping Plan, which concludes that statewide GHG emissions levels need to be reduced to 48 percent below 1990 levels by 2030 for the state to stay on track to achieve net zero GHG emissions no later than 2045 (as required by AB 1279). This is a greater reduction than set forth in SB 32, which establishes a statutory limit of reducing statewide emissions to 40 percent below 1990 levels by 2030 and is in alignment with Board direction to establish actions to meet a goal of net zero emissions by 2035–2045.

Basis for the CAP Update's 2045 GHG Reduction Target

For 2045, the CAP Update's target is aligned with AB 1279, which requires that the State's target of net zero emissions by 2045 include reducing statewide anthropogenic emissions by, at minimum, 85 percent below 1990 levels by 2045. Anthropogenic emissions include the primary sources and activities in the County's GHG emissions categories: on-road transportation, electricity, natural gas, waste, agriculture, propane, off-road transportation, water, and wastewater. To go beyond an 85 percent anthropogenic emissions reduction and achieve statewide net zero emissions by 2045, the 2022 Scoping Plan relies on large-scale deployment of carbon capture and storage (CCS) technologies and mechanical carbon dioxide removal (CDR) strategies, such as direct air capture machines. Because the 2022 Scoping Plan shows that natural and working lands are projected to be a net source of emissions through 2045, additional carbon dioxide removal strategies (e.g., CCS, mechanical CDR), are required to reach net zero emissions by 2045.

The County government does not have the jurisdiction or other ability to construct and operate CCS and mechanical CDR strategies at the pace and scale needed to achieve net zero emissions by 2045. The 2022 Scoping Plan also assumes that additional reductions in anthropogenic emissions beyond 85 percent by 2045 would not be cost-

effective or technologically feasible. As a result, the CAP Update's 2045 target is aligned with the AB 1279 target of reducing anthropogenic emissions to 85 percent below 1990 levels by 2045.

Basis for the CAP Update's 2045 Aspirational Goal

The CAP Update also includes an aspirational goal to achieve net zero carbon emissions by 2045, consistent with Board direction. This goal is in addition to the 2045 target aligned with reducing anthropogenic emissions to 85 percent below 1990 levels by 2045. By including an aspirational goal for net zero carbon emissions in the CAP Update, the County demonstrates how it is going above and beyond reductions in anthropogenic emissions and working toward net zero emissions in the unincorporated area, for example through four quantified actions to increase carbon stored in natural and working (e.g., agricultural) lands, and 35 "Path to Net Zero" actions that do not result in quantified GHG reductions but contribute to achievement of the County's net zero emissions goal. The 2022 Scoping Plan concludes that achieving net zero emissions statewide by 2045 is cost-effective and technologically feasible. Because the draft 2022 Scoping Plan demonstrates that 2035 statewide carbon neutrality is not cost-effective or technologically feasible, the CAP Update's aspirational goal to achieve net zero carbon emissions is set for 2045.

Implementation: Measures and Actions to Reduce Emissions and Achieve GHG Reduction Targets

The County prepared GHG emissions projections for 2030 and 2045 to understand the scale of reductions needed to meet the 2030 and 2045 reduction targets and goal of achieving net zero emissions by 2045. The CAP Update's emissions projections estimate future emissions by considering forecasted growth in population, housing units, and employment, and the impact of adopted legislation and regulations on future emissions (CAP Update Appendix 3). The GHG emissions projections account for community-wide activities in the unincorporated area and County government operations in the unincorporated area and in incorporated cities. CAP Update GHG emissions projections are consistent with State CEQA Guidelines Sections 15183.5(b)(1)(A) and 15183.5(b)(1)(C).

Comparing the County's projected GHG emissions levels for 2030 and 2045 with the CAP reduction targets demonstrates that additional emissions reductions are needed for the County to achieve its targets (CAP Update Appendix 5, Table 6). To meet the 2030 CAP reduction target, annual GHG emissions would need to be 713,844 metric tons of carbon dioxide equivalent (MTCO_{2e}) lower than projected 2030 levels. To meet the 2045 CAP reduction target, annual GHG emissions would need to be 1,243,815 MTCO_{2e} lower than projected 2045 levels. To meet the CAP's aspirational goal of net zero emissions in 2045, annual GHG emissions would need to be 1,678,000 MTCO_{2e} lower than projected 2045 levels.

CAP Update GHG Reduction Framework

The CAP Update establishes nine strategies, 21 measures, and 70 actions that the County will take to achieve the 2030 and 2045 GHG reduction targets and make progress toward the 2045 net zero emissions goal. These actions reduce GHG emissions from five emissions reduction sectors:

- built environment and transportation,
- energy,
- solid waste,
- water and wastewater, and
- agriculture and conservation.

Each emissions reduction sector contains a net zero vision statement that describes what an equitable, net zero emissions future would look like in the unincorporated area and in County operations.

GHG Reduction Strategies, Measures, and Actions

The CAP Update identifies strategies, measures, and actions to reduce GHG emissions. The nine strategies describe the measures and actions in each sector and how they will help achieve the County's vision for net zero. The 21 measures describe the County's policy goals and include a total of 70 actions that outline the steps the County will carry out to achieve quantified GHG reductions that collectively achieve the 2030 and 2045 targets and also put the County on a path to reaching the aspirational 2045 net zero emissions goal.

The CAP Update's actions include both "implementing actions" that would achieve quantified GHG reductions and supporting, or Path to Net Zero, actions that do not result in quantified GHG reductions, but instead contribute to achievement of the sector's vision and the County's net zero emissions goal.

Criteria for Including Measures and Actions in the CAP Update

To be included in the CAP Update, the measures and implementing actions that achieve quantified GHG reductions were developed to meet each of the following criteria. Each quantified measure and action must be:

1. within the County's jurisdiction and ability to enforce,
2. able to be monitored with readily available data to demonstrate progress over time,
3. achievable within the County's regulatory framework, and
4. additional to existing regulations from the state or federal government.

Implementing Actions that Reduce Anthropogenic Emissions Would Reduce Emissions to Levels Below the 2030 and 2045 Targets

The CAP Update identifies the quantified emissions reductions that would result from the implementation of quantifiable implementing actions outlined under each GHG reduction measure (see CAP Update Section 4.4). Two types of implementing actions are quantified: (1) 31 actions that reduce GHG emissions from anthropogenic or human-caused activities, such as consuming fossil fuels, like gasoline, diesel, and natural gas; using electricity generated from fossil fuels; and generating and disposing of organic waste in landfills; and (2) four carbon storage actions that remove emissions from the atmosphere and store them in soil and vegetation. Each of the five emissions reduction sectors includes quantified actions to reduce anthropogenic emissions, and the agriculture and conservation sector also includes reductions from carbon storage actions.

The analysis presented in the CAP Update demonstrates that the quantified emissions reductions that would be collectively achieved by the implementing actions would exceed the County's 2030 and 2045 reduction targets by reducing GHG emissions to 44.5 percent below 2019 levels by 2030 ("beating" the 43.6 percent reduction target) and 89.8 percent below 2019 levels by 2045 ("beating" the 85.4 percent reduction target). (See CAP Update Table 6 and CAP Update Appendix 5.) The detailed calculations performed to determine the quantified GHG emissions reductions from each of the implementing actions are presented in CAP Update Appendix 7.

The 2030 and 2045 reduction targets are achieved solely by the 31 quantified implementing actions that reduce anthropogenic emissions. The four quantified carbon storage actions that remove emissions from the atmosphere are counted separately for their contribution toward the County's 2045 net zero emissions goal. As shown in CAP Update Appendix 5, the implementing actions that reduce anthropogenic emissions would exceed the County's 2030 and 2045 reduction targets by reducing emissions to the following levels (Table 7):

- 44.0 percent below 2019 levels by 2030 (exceeding the 2030 target of a 43.6 percent reduction below 2019 levels by 13,556 MTCO₂e)
- 85.5 percent below 2019 levels by 2045 (exceeding the 2045 target of an 85.4 percent reduction below 2019 levels by 983 MTCO₂e)

Implementing Carbon Storage Actions Reduce Emissions to Levels Further Below the 2030 and 2045 Targets and Make Substantial Progress Toward the 2045 Net Zero Emissions Goal

- The CAP Update also identifies four quantified implementing actions that increase the amount of carbon stored in soils and vegetation in the unincorporated area through habitat restoration, tree-planting, and carbon farming (CAP Update Appendix 5).
- As shown in Table 9-2, carbon storage actions would result in the annual removal of 13,711 MTCO₂e from the atmosphere in 2030 and 129,556 MTCO₂e by 2045, which would result in the County further exceeding its 2030 and 2045 reduction targets and

making substantial progress toward its 2045 net zero emissions goal (Tables 8 and 9 of CAP Update Appendix 5).

- 44.5 percent below 2019 levels by 2030 (reducing 2030 emissions to levels 27,327 MTCO₂e lower than if only implementing actions that reduce anthropogenic emissions are considered).
- 89.8 percent below 2019 levels by 2045 (reducing 2045 emissions to levels 130,539 MTCO₂e lower than if only implementing actions that reduce anthropogenic emissions are considered).

Table 9-2 GHG Emissions Removed from the Atmosphere by Carbon Storage Strategies, Measures, Actions

Carbon Storage Strategies, Measures, Actions to Remove Emissions from the Atmosphere	Annual GHG Emissions Removed from Atmosphere (MTCO ₂ e/year)	
	2030	2045
Agriculture and Conservation		
Strategy: Preserve Natural Lands and Improve Land Management Practices to Protect Habitat and Increase Carbon Storage	3,013	8,000
Measure A-1: Acquire and manage conservation lands to preserve natural lands and maximize carbon storage potential in the unincorporated area		
<i>Action A-1.2 Develop a Habitat Restoration Resource Management Framework for County-owned land and restore 480 acres by 2030 and 80 acres per year thereafter to increase carbon storage.</i>	76	1,223
Measure A-2: Develop a tree-planting program that expands canopy across the unincorporated area and prioritizes underserved communities		
<i>Action A-2.1 Expand the County's existing tree planting initiative and implement an Equity Driven Tree Planting Program to plant 70,560 trees by 2030 and 6,650 trees per year thereafter on County property and in the unincorporated area.</i>	2,498	6,029
<i>Action A-2.2 Implement the County's Landscaping Ordinance to require tree planting in new single-family residential development in the unincorporated area.</i>	439	747
Strategy: Support Climate-Friendly Farming Practices and Preserve Agricultural Land	10,758	121,556
Measure A-4: Incentivize carbon farming to expand carbon storage capacity on agricultural land and support climate-friendly farming practices in the unincorporated area		
<i>Action A-4.1 Develop a Climate Smart Land Stewardship Program by 2026 to increase carbon sequestration on 3,000 acres by 2030 and 36,214 acres by 2045.</i>	10,758	121,556
Total Carbon Storage	13,771	129,556

Note: MTCO₂e = metric tons carbon dioxide equivalent.

Source: CAP Update Appendix 5.

The detailed calculations performed to determine the quantified GHG emissions reductions from each of the quantified implementing actions are presented in CAP Update Appendix 7.

Implementing “Path to Net Zero” Actions Would Make Additional Substantial Progress Toward the 2045 Net Zero Emissions Goal

The CAP Update also contains 35 “Path to Net Zero” actions that establish steps the County will take to meet the 2045 net zero emissions goal. Although the CAP Update does not identify quantified GHG emissions reductions for “Path to Net Zero” actions, their implementation could result in quantified reductions in the future with additional data and monitoring.

Measure Implementation Would Also Achieve Co-Benefits

Co-benefits refer to the complementary benefits, in addition to the primary GHG reduction benefits, that result from measure implementation. During development of the CAP Update, the County identified a list of 18 co-benefits that are important to stakeholders and grouped them to align with the County’s five Strategic Initiatives: Sustainability, Equity, Empower, Community, and Justice.

Using a co-benefits evaluation tool, the County evaluated the level of impact that each measure and action would have on each of the five co-benefits using an ordinal ranking of low, medium, or high. The County also used this tool to identify a Community Priority Score for each measure, which, on a scale of 1–10, reflects stakeholder feedback to demonstrate which measures would have the greatest positive impact on the co-benefits that are most valued by community members. Co-benefit impacts and Community Priority Scores are identified for each measure in CAP Update Chapter 4. Refer to CAP Update Appendix 2 for details on how these impacts were determined and the scores were calculated.

Chapter 4 of the CAP Update also identifies equity-based outcomes for each measure, which are descriptions of the tangible outcomes of measure implementation for frontline communities and priority populations.

The CAP Update Identifies Performance Standards, Timelines, and Other Implementation Details for Measures and Actions

The CAP Update provides a detailed summary of implementation details for the quantified implementing and “Path to Net Zero” actions. For quantified implementing actions, the CAP Update identifies the quantified GHG reduction potential and measurable performance outcomes for 2030, 2035, 2040, and 2045. For “Path to Net Zero” actions, the CAP Update includes measurable performance outcomes the County will take to reach the 2045 net zero emissions goal. For all actions, the CAP Update also identifies the County department with lead responsibility for implementation and any County departments responsible for implementation support. Refer to CAP Update Chapter 4 (Tables 7–11) to view these implementation details for each action.

CAP Update Chapter 5 (Table 13) identifies additional implementation details for each action as part of the CAP Update’s Implementation and Monitoring Program. These additional details for each action include the implementation enforcement mechanism,

relative cost (using a qualitative, ordinal ranking of low, medium, or high) and potential funding sources for implementation.

By setting forth a package of strategies, measures, and quantified implementing actions, including measurable performance outcomes and presenting data and analysis demonstrating that their collective implementation would achieve the established 2030 and 2045 reduction targets (e.g., CAP Update Chapter 4, “GHG Emissions Reduction Measures”; CAP Update Appendix 7, “Climate Action Plan Combined Measure Workbook”; and CAP Update Appendix 8, “CAP Consistency Checklist”), the CAP Update is consistent with State CEQA Guidelines Section 15183.5(b)(1)(D).

Ongoing Monitoring: CAP Update Implementation and Monitoring Program

In Chapter 5, the CAP Update discusses how the County would implement the plan and monitor progress toward achieving its 2030 and 2045 GHG reduction targets and the 2045 net zero emissions goal. The CAP Update would be implemented through a combination of regulations, programs, incentives, and outreach and educational activities to reduce GHG emissions. Following adoption, the County’s Planning & Development Services (PDS) Department would maintain the CAP Update, support CAP Update implementation, and coordinate with other County departments to facilitate and oversee implementation and track and report on the progress of each measure and action.

The County would regularly monitor implementation progress to track the effectiveness of each measure and action, update the emissions inventory, and make adjustments, as needed, to keep the County on track toward meeting its GHG reduction targets. As part of its continuous monitoring, the County will ensure that:

- all measures include clearly defined steps necessary for implementation;
- individual measures are contributing to the 2030 and 2045 GHG reduction targets and 2045 net zero emissions goal;
- the CAP is on track to achieve its overall GHG reduction targets; and
- equity-based outcomes are attained.

Monitoring of the CAP Update would represent a continuation of the County’s CAP Annual Monitoring Reports. The County has published annual monitoring reports from 2018 through 2022, available at <https://www.sandiegocounty.gov/content/sdc/sustainability/annualmonitoringreport/>, to document the annual progress using quantitative and qualitative metrics that the County has achieved in implementing the 2018 CAP.

As part of the CAP Update’s Implementation and Monitoring Program, County staff would make recommendations to alter or amend the CAP if its ongoing evaluation and monitoring of implementation indicates that the 2030 or 2045 GHG reduction targets will not be achieved. The CAP Update would be adjusted if measures fall short of the target or additional measures become available, consistent with State CEQA Guidelines Section 15183.5(b)(1)(E).

CAP Update Monitoring and Update Schedule

The CAP Update sets forth the following schedule for monitoring and updating the CAP:

Table 9-3 CAP Monitoring and Update Schedule

2024	CAP Implementation CAP adoption by the Board of Supervisors and implementation begins.
2025	Annual Monitoring Report Staff prepares and publishes an annual monitoring report, assessing CAP annual performance in measure implementation.
2026	GHG Emissions Inventory Update Staff conducts an update to the emissions inventory at least every two years.
2030	CAP Update Based on the findings from the annual monitoring reports and inventory updates, staff prepares a CAP update at least every five years.

Source: CAP Update Table 12.

CAP Update Cost Analysis

In addition to the information on the relative cost of actions presented in the CAP Update, the County has prepared two additional reports regarding the costs of the CAP Update. The first is an implementation cost analysis that identifies the total costs to the County of San Diego to implement the CAP Update GHG reduction measures over the first 5 fiscal years (FYs) of implementation (FY2025/26 to FY2029/30). The *Implementation Cost Analysis* is available in Appendix 10 of the CAP Update.

The second cost report, *The Cost Effectiveness and Disproportionate Cost Analysis*, evaluates the effectiveness of CAP Update actions from a cost-benefit perspective and to address equity in CAP Update implementation, examines how some populations and local communities may experience disproportionate costs or impacts from CAP Update implementation. This report will be available prior to CAP Update approval here: www.sandiegocounty.gov/content/sdc/sustainability/climateactionplan/seir.

Conclusion

The CAP Update establishes 2030 and 2045 targets for the reduction of GHG emissions and an aspirational goal to achieve net zero carbon emissions by 2045. Both these targets and this goal satisfy state legislative targets for statewide GHG emissions reductions (AB 1279), the State’s 2022 Scoping Plan and Board direction. The CAP Update also identifies “Path to Net Zero” actions that would result in the County making substantial progress toward its aspirational goal of net zero emissions by 2045.

The CAP Update sets forth a package of GHG reduction measures and quantified implementing actions that would meet and exceed the established 2030 and 2045 GHG reduction targets; quantified carbon storage actions included in the CAP Update would remove emissions from the atmosphere and result in the County further exceeding its established 2030 and 2045 targets. For quantified implementing actions, the CAP Update identifies quantified GHG reduction potential and measurable performance outcomes. For all actions, the CAP Update's Implementation and Monitoring Program identifies the County departments responsible for leading and supporting implementation, the implementation enforcement mechanism, relative cost, and potential funding sources for implementation.

The CAP Update also commits the County to annual monitoring of and reporting on measure implementation performance, future emissions inventory updates at least every 2 years, and updating the CAP at least every 5 years. It also commits the County to altering or amending the CAP if ongoing evaluation and monitoring of implementation indicates that the 2030 or 2045 GHG reduction targets will not be achieved.

As explained in Section 5.4, "CEQA Streamlining and Environmental Review," the CAP Update—including the 2019 emissions inventory; emissions projections for 2030 and 2045; 2030 and 2045 reduction targets; measures and actions to reduce GHG emissions; implementation, monitoring, and amendment mechanisms addressed in this master response; and this SEIR—meets the criteria for and qualifies as a "plan for the reduction of greenhouse gas emissions" (Table 14, "CAP Compliance with Elements of a CEQA Qualified Plan for the Reduction of GHG Emissions," pages 145–146).

The suite of measures and actions identified in the CAP Update function as a whole to enable the County to meet the established GHG reduction targets described above. The County acknowledges that additional measures and actions, such as those suggested by commenters, may be available to reduce GHG emissions in the unincorporated county. However, as described in this response, the County has undergone a thorough process to develop a methodology for establishing GHG reduction targets that are appropriately aligned with statewide targets and Board direction and identifying measures and actions, through robust stakeholder engagement, to reduce GHG emissions to levels that achieve the established targets and make substantial progress toward the County's net zero emissions goal. Therefore, no additional measures have been added to the CAP Update.

9.1.2 Agency Comments and Responses

Meghan.Kelly@sdcounty.ca.gov

Re: County of San Diego Climate Action Plan - Water and Wastewater W-3: Develop programs to increase stormwater and wastewater treatment efficiency to reduce imported potable water use in the unincorporated area

Dear Ms. Kelly:

Thank you for the opportunity to review and comment on the County of San Diego's (County) Climate Action Plan (CAP) and for including the East County Advanced Water Purification (AWP) Project in the CAP. As a fellow member of the East County AWP Joint Powers Authority (JPA), Padre Dam Municipal Water District (Padre Dam) the contracted administrator and operator for the JPA, has reviewed the CAP and offers the following comments for consideration.

A1-1

The County has identified the East County AWP Project will provide a local water supply reducing GHG emissions resulting from importing water from the Colorado River and/or northern California. As part of this Project, the JPA also plans to implement an energy recovery component, AWP Package 5, further reducing GHG emissions in the region in two ways.

First, a combined heat and power (CHP) system is planned to be implemented to capture and utilize the alternative energy source found in biogas produced within the anaerobic digesters located at the AWP solids handling facility. Second, a new organic waste receiving facility will collect and distribute locally sourced food waste slurry to the anaerobic digesters to increase biogas production, assist waste management companies and local municipalities in complying with the requirements of AB 1826 (i.e. greater recycling of organics), and reduce dependence on fossil fuel-based energy purchased from San Diego Gas & Electric (SDG&E).

A1-2

Energy recovery results in reduced GHG emissions in two ways: 1) energy produced from sludge generated biogas displaces a similar amount of energy generated from fossil fuels and associated GHG emissions; and 2) processing organic waste in the anaerobic digesters results in a reduction of more harmful greenhouse gas emissions, mainly methane, from the decomposition of food waste and also reduces GHG emissions by off-setting GHGs generated from fossil fuel energy production.

 Steve Goble, City of El Cajon
 Joel Scalzitti, Helix Water District, Ex-officio

County of San Diego
Climate Action Plan - Water and Wastewater W-3
November 27, 2023
Page 2 of 2

Please consider including Package 5 (Energy Recovery Facilities) of the East County AWP Project in the CAP. Including recognition of this energy recovery component in the CAP demonstrates the County's support for the environmental benefits provided by the East County AWP Project and assists the JPA in securing specific grants and funding tied to GHG reduction. These project components could be considered in the Energy (E-1) and Solid Waste (SW-4) GHG reduction measures. Note that the JPA can supply the GHG emission reduction calculations upon request.

A1-2
cont.

As noted above, Padre Dam appreciates the opportunity to review and comment on the County's CAP. Padre Dam also requests to be notified of any modifications to the proposed CAP prior to adoption by the County. If you have any questions or need additional information, please feel free to contact me at mniemiec@padre.org.

A1-3

Sincerely,

A handwritten signature in black ink that reads "Mark Niemiec".

Mark Niemiec, PE
Director of East County AWP

Letter A1 Padre Dam Municipal Water District

Mark Niemiec, PE

November 27, 2023

Comment A1-1

The comment states that Padre Dam Municipal Water District (PDMWD) has reviewed the CAP Update and offers the following comments.

Response A1-1

The County appreciates comments from PDMWD for the CAP Update and associated Draft SEIR. The comment serves as an opening remark. No substantive comment is provided, and no further response is required.

Comment A1-2

The comment describes PDMWD's efforts to implement the East County Advanced Water Purification (ECAWP) Project and suggests that the County include the Package 5 (Energy Recovery Facilities) of the ECAWP Project as GHG emissions reduction measures in the CAP Update.

Response A1-2

As detailed in CAP Update Action W-3.1, the County would increase wastewater treatment efficiency to produce 12,900 acre-feet of water each year by 2030 through ECAWP. The description of Measure W-3 in the CAP Update has been revised to acknowledge that the ECAWP would utilize energy recovery systems to reduce the use of fossil fuel-based energy on-site. The GHG quantification methodology for Action W-3.1 has not been changed in response to this comment. This comment does not raise an environmental issue related to the adequacy of the Draft SEIR. No further response is provided here.

Comment A1-3

The comment requests the County to provide notification to PDMWD if modifications to the CAP Update are made.

Response A1-3

The PDMWD will be notified before adoption of the CAP Update and certification of the SEIR. This comment does not raise an environmental issue related to the adequacy of the Draft SEIR. No further response is provided here.

Climate Action Plan Update
DEIR/SCH#2020120204

Ms. Meghan Kelly
Project Manager
County of San Diego
5510 Overland Avenue, Suite 310
San Diego, CA 92123

Dear Ms. Kelly:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the Draft Environmental Impact Report for the County of San Diego Climate Action Plan Update located near various Interstates and State Routes. The mission of Caltrans is to provide a safe and reliable transportation network that serves all people and respects the environment. The Local Development Review (LDR) Program reviews land use projects and plans to ensure consistency with our mission and state planning priorities.

Safety is one of Caltrans' strategic goals. Caltrans strives to make the year 2050 the first year without a single death or serious injury on California's roads. We are striving for more equitable outcomes for the transportation network's diverse users. To achieve these ambitious goals, we will pursue meaningful collaboration with our partners. We encourage the implementation of new technologies, innovations, and best practices that will enhance the safety on the transportation network. These pursuits are both ambitious and urgent, and their accomplishment involves a focused departure from the status quo as we continue to institutionalize safety in all our work.

Caltrans is committed to prioritizing projects that are equitable and provide meaningful benefits to historically underserved communities, to ultimately improve transportation accessibility and quality of life for people in the communities we serve.

We look forward to working with the County of San Diego in areas where the County and Caltrans have joint jurisdiction to improve the transportation network and

A2-2

"Provide a safe and reliable transportation network that serves all people and respects the environment"

Ms. Meghan Kelly, Project Manager
December 18, 2023
Page 2

connections between various modes of travel, with the goal of improving the experience of those who use the transportation system.

A2-2
cont.

Caltrans has the following comments:

Climate Action

Caltrans supports the County's efforts to reduce greenhouse gas (GHG) emissions as per AB1279, SB 32 and others, in a way that does not rely on purchase of carbon offsets to meet emissions targets. As an environmentally conscious agency, Caltrans strives to work with partner agencies like the County of San Diego in order to reduce GHG emissions and adapt to the impacts of climate change on the state highway system. Caltrans agrees that setting clear goals and metrics is an excellent step towards planning for, and meeting, emissions reductions targets that promote environmental justice and equity. Caltrans appreciates the large array of strategies and policies utilized to reduce GHG emissions, promote energy efficiency, and improve the overall quality of the San Diego County environment found in the Climate Action Plan Update (CAP). Additionally, due to the potential uncertainty of changing climate conditions, Caltrans recognizes and supports the application of adjustable adaptation strategies and plans that can be modified to fit future conditions. This updated CAP is an excellent step forward, and great example of the strategies and plans needed to improve air quality and curb GHG emissions across San Diego County. This draft CAP will be taken into consideration while Caltrans continues to expand the zero-emission vehicle (ZEV) charging grid, reduce Vehicle Miles of Travel (VMT), and promote the use of ZEV across California. Caltrans looks forward to working with the County of San Diego in order to implement recommendations outlined in this CAP update when possible.

A2-3

For additional information regarding Caltrans' policies, plans, guidance, and strategies related to climate change impacts please refer to documents such as, but not limited to, Caltrans Climate Change Vulnerability Assessment, Caltrans Climate Change Adaptation Priorities Report, Caltrans Climate Change Adaptation Strategies Report, Caltrans Climate Change Communication Guide, and Caltrans GHG Emissions Mitigation Report. These documents and other resources can be found at: <https://dot.ca.gov/programs/transportation-planning/office-of-smart-mobility-climate-change/climate-change>.

Several other local agencies have also produced climate change adaptation guidance documents that may be helpful when finalizing the County's CAP. These documents include, but are not limited to, California's 4th Climate Change Assessment – San Diego Region Report, CalSTA's Climate Action Plan for Transportation Infrastructure (CAPTI) and various city's Climate Action Plans.

"Provide a safe and reliable transportation network that serves all people and respects the environment"

Ms. Meghan Kelly, Project Manager
December 18, 2023
Page 3

Sustainability

The County of San Diego CAP contains several actions and strategies that align with Caltrans' responsibilities and priorities. Caltrans recommends collaboration between our agency and the County of San Diego CAP on the proposed transportation related topics including adaptation strategies to help improve the County's resilience to potential climate change impacts and strategies to reduce VMT, and off-road and on-road GHG emissions.

Caltrans recognizes that transportation is a leading contributor to GHG emissions in the region and is dedicated to reducing and mitigating transportation related emissions. We recommend collaborating with Caltrans on the following measures brought up by this plan increasing the use of ZEV, installing electric vehicle (EV) charging stations, identifying Right-of-Way (R/W) areas to be used for carbon sequestration, and complete streets.

The existing climate hazards discussed in this document will have an impact of the transportation system. We recommend working with Caltrans on determining the preventative strategies the Caltrans can take to keep roadways operational and ensure their longevity against climate stressors such as increased temperatures, changes in precipitation patterns, wildfire, and flooding. Caltrans recognizes the central role that transportation planning plays in safety and ensuring that when these natural hazards do occur, citizens have a reliable evacuation route.

A2-4

Electric Vehicles

On page 5-43 it states "Policy M-9.5 Electric Vehicle Recharging Infrastructure. Require new development to include electric vehicle recharging facilities to meet current and reasonably foreseeable increasing demand over time as the County's private vehicle fleet includes greater numbers of electric vehicles, consistent with State transportation and climate policies."

Please clarify if new electric vehicle recharging infrastructure for new development will be usable by the public or is it specifically for the County of San Diego's staff vehicle fleet. It is recommended that new development include the electric vehicle recharging facilities for public usage.

A2-5

Complete Streets and Mobility Network

Caltrans views all transportation improvements as opportunities to improve safety, access, and mobility for all travelers in California and recognizes bicycle, pedestrian, and transit modes as integral elements of the transportation network. Caltrans

A2-6

"Provide a safe and reliable transportation network that serves all people and respects the environment"

Ms. Meghan Kelly, Project Manager
December 18, 2023
Page 4

supports improved transit accommodation through the provision of Park and Ride facilities, improved bicycle and pedestrian access and safety improvements, signal prioritization for transit, bus on shoulders, ramp improvements, or other enhancements that promotes a complete and integrated transportation network. Early coordination with Caltrans, in locations that may affect both Caltrans and the County of San Diego, is encouraged.

To reduce GHG emissions and achieve California's Climate Change target, Caltrans is implementing Complete Streets and Climate Change policies into State Highway Operations and Protection Program (SHOPP) projects to meet multi-modal mobility needs. Caltrans looks forward to working with the County to evaluate potential Complete Streets projects.

Bicycle, pedestrian, and public transit access during construction is important. Mitigation to maintain bicycle, pedestrian, and public transit access during construction is in accordance with Caltrans' goals and policies.

A2-6
cont.

Land Use and Smart Growth

Caltrans recognizes there is a strong link between transportation and land use. Development can have a significant impact on traffic and congestion on State transportation facilities. In particular, the pattern of land use can affect both local VMT and the number of trips. Caltrans supports collaboration with local agencies to work towards a safe, functional, interconnected, multi-modal transportation network integrated through applicable "smart growth" type land use planning and policies.

The County should continue to coordinate with Caltrans to implement necessary improvements at intersections and interchanges where the agencies have joint jurisdiction.

A2-7

System Planning

The final paragraph of the Chapter 1 Project Description introduction on page 1-2 indicates that the County is preparing a Transportation Program to address VMT mitigation measures for development within the unincorporated county. Please include Caltrans in the review process for the Transportation Program document. System Planning recommends discussing the CAP for Transportation Infrastructure (CAPTI) in Section 2.13.2.2 State (Regulatory Framework), including the CAPTI guiding principles and implementation strategies.

System Planning recommends including a high-level summary of the completed, in-progress, and upcoming Comprehensive Multimodal Corridor Plans (CMCPs) in Section

A2-8

"Provide a safe and reliable transportation network that serves all people and respects the environment"

Ms. Meghan Kelly, Project Manager
December 18, 2023
Page 5

2.13.2.3 Local (Regulatory Framework). The CMCPs complement San Diego Forward: The 2021 Regional Plan (discussed in section 2.13.2.3) and highlight possible funding opportunities for the proposed transportation solution strategies.

A2-8
cont.

Please ensure that the final paragraph on page 2.11-1 and the "Physically Divide an Established Community" issue topic in Table 2.11-1 are consistent. The last paragraph on page 2.11-1 indicates that the "implementation of the proposed project would not result in new or more significant impacts on land use and planning." Table 2.11-1 states that the CAP Update would result in a new or more significant impact, before and after mitigation, in the "Physically Divide an Established Community" topic area.

A2-9

Environmental

Caltrans welcomes the opportunity to be a Responsible Agency under the California Environmental Quality Act (CEQA), as we have some discretionary authority of a portion of the project that is in Caltrans' R/W through the form of an encroachment permit process. We look forward to the coordination of our efforts to ensure that Caltrans can adopt the alternative and/or mitigation measure for our R/W.

An encroachment permit will be required for any work within the Caltrans' R/W prior to construction. As part of the encroachment permit process, the applicant must provide approved final environmental documents for this project, corresponding technical studies, and necessary regulatory and resource agency permits. Specifically, CEQA determination or exemption. The supporting documents must address all environmental impacts within the Caltrans' R/W and address any impacts from avoidance and/or mitigation measures.

A2-10

We recommend that this project specifically identifies and assesses potential impacts caused by the project or impacts from mitigation efforts that occur within Caltrans' R/W that includes impacts to the natural environment, infrastructure including but not limited to highways, roadways, structures, intelligent transportation systems elements, on-ramps and off-ramps, and appurtenant features including but not limited to fencing, lighting, signage, drainage, guardrail, slopes and landscaping. Caltrans is interested in any additional mitigation measures identified for the project's draft Environmental Document.

Broadband

Caltrans recognizes that teleworking and remote learning lessen the impacts of traffic on our roadways and surrounding communities. This reduces the amount of VMT and decreases the amount of GHG emissions and other pollutants. The availability of affordable and reliable, high-speed broadband is a key component in supporting

A2-11

"Provide a safe and reliable transportation network that serves all people and respects the environment"

Ms. Meghan Kelly, Project Manager
December 18, 2023
Page 6

travel demand management and reaching the state's transportation and climate action goals.

A2-11
cont.

Mitigation

Caltrans endeavors that any direct and cumulative impacts to the State Highway network be eliminated or reduced to a level of insignificance pursuant to CEQA and National Environmental Policy Act (NEPA) standards.

A2-12

Right-of-Way

Per Business and Profession Code 8771, perpetuation of survey monuments by a licensed land surveyor is required, if they are being destroyed by any construction.

Any work performed within Caltrans' R/W will require discretionary review and approval by Caltrans and an encroachment permit will be required for any work within the Caltrans' R/W prior to construction.

A2-13

Additional information regarding encroachment permits may be obtained by contacting the Caltrans Permits Office at (619) 688-6158 or emailing D11.Permits@dot.ca.gov or by visiting the website at <https://dot.ca.gov/programs/traffic-operations/ep>. Early coordination with Caltrans is strongly advised for all encroachment permits.

If you have any questions or concerns, please contact Reece Allen, Climate Action Program Manager, at (858) 688-1576 or by e-mail sent to Reece.Allen@dot.ca.gov.

Sincerely,

Reece Allen
REECE ALLEN, MSTM
Climate Action Program Manager

"Provide a safe and reliable transportation network that serves all people and respects the environment"

Letter A2 California Department of Transportation

Reece Allen, MSTM, Climate Action Program Manager

December 18, 2023

Comment A2-1

The comment is an introductory statement.

Response A2-1

The County appreciates comments from California Department of Transportation (Caltrans) related to the CAP Update and associated Draft SEIR. This comment serves as an opening remark. No response is required.

Comment A2-2

The comment provides an introduction about Caltrans, including its mission, responsibilities, and goals.

Response A2-2

The County appreciates the introduction of Caltrans. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment A2-3

The comment expresses support for the CAP Update and a desire to work with the County in implementing the CAP Update measures. The comment also references other Caltrans and local agencies' efforts to address climate change.

Response A2-3

The County appreciates Caltrans's support for the CAP Update. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment A2-4

The comment recommends collaboration with Caltrans on implementing strategies related to transportation and determining preventative strategies to ensure resiliency in the transportation system and reliable evacuation in response to climate hazards.

Response A2-4

The County appreciates Caltrans's recommendation for further collaboration on CAP Update implementation. The County will continue working with Caltrans on transportation projects during implementation of the CAP Update. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment A2-5

The comment requests clarification regarding the availability of electric vehicle infrastructure for public use and recommends that new development include electric vehicle recharging for public use.

Response A2-5

Electric vehicle infrastructure for public use is incorporated in the CAP Update Action T-3.1. CAP Update Action T-3.1 would increase publicly accessible electric vehicle recharging infrastructure in the unincorporated area through the installation of 2,040 publicly available electric vehicle charging stations by 2028. In addition, the CAP Consistency Review Checklist requires that all new multifamily residential and nonresidential projects comply with the County's Code of Regulatory Ordinances as amended to require (Tier 2) California Green Building Standards Code (CALGreen) or similar electric vehicle charging infrastructure installations and preferential parking for zero-emission vehicles (ZEVs).

Comment A2-6

The comment expresses support for strategies to implement complete streets projects and encourages coordination with Caltrans.

Response A2-6

The County appreciates Caltrans's support for the CAP Update's transportation measures. The County will continue to collaborate with Caltrans to encourage alternative modes of transportation in the unincorporated area where the agencies have joint jurisdiction through implementation of the CAP Update Action T-5.1.

Comment A2-7

The comment expresses support for collaboration with local agencies regarding "smart growth" and suggests coordination with Caltrans to implement improvements at intersections and interchanges.

Response A2-7

The County appreciates Caltrans's support for local agency collaboration. The County will continue to collaborate with Caltrans to implement necessary improvements at intersections and interchanges to improve roadways to encourage multimodal transportation where the agencies have joint jurisdiction through implementation of the CAP Update Actions T-5.1 and T-6.2. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment A2-8

The comment requests that the County include Caltrans in the review process for the Transportation Program discussed on page 1-2 of the project description. The comment recommends discussing the Climate Action Plan for Transportation Infrastructure's guiding principles and implementation strategies in Section 2.13.2.2 of the SEIR and including Comprehensive Multimodal Corridor Plans and the possible funding opportunities for the proposed CAP Update transportation actions in Section 2.13.2.3 of the SEIR.

Response A2-8

As explained in Chapter 1, “Project Description” (page 1-2), the Transportation Program is separate from the CAP Update. The County acknowledges Caltrans’s offer to coordinate and review the Transportation Program.

The County has reviewed Caltrans’s recommendations related to inclusion of the Climate Action Plan for Transportation Infrastructure and Comprehensive Multimodal Corridor Plans in Section 2.13, “Transportation.” The purpose of the regulatory setting in this section is to describe the regulations that will affect the environmental analysis that follows. These two programs provide funding opportunities for transportation projects but are not regulations or policies related to environmental impact analysis. Therefore, no revision to the SEIR is required.

Comment A2-9

The comment identifies a discrepancy in the impact conclusion for issue topic “Physically Divide an Established Community” in Section 2.11, “Land Use and Planning,” of the Draft SEIR.

Response A2-9

The final paragraph on page 2.11-1 of the Draft SEIR has been revised as follows:

As indicated, implementation of the proposed project would ~~not~~ result in new or more severe significant impacts on land use and planning.

Comment A2-10

The comment states that Caltrans accepts the role as responsible agency and summarizes encroachment permit requirements for work within Caltrans right-of-way (ROW). This comment also recommends that the Draft SEIR addresses impacts within Caltrans ROW and discloses mitigation measures.

Response A2-10

The County appreciates Caltrans’s acceptance as a responsible agency for the project. As discussed in Section 2.13, “Transportation,” of the Draft SEIR, implementation of the CAP Update would result in less-than-significant impacts related to transportation with implementation of the mitigation measures identified in the Draft SEIR (see Section 2.13.5, “Mitigation Measures”).

The CAP Update would be implemented in the unincorporated areas of the County. As discussed in the Draft SEIR, specific locations for projects associated with the CAP Update are unknown. However, future discretionary projects would be required to be evaluated for project-specific impacts under CEQA and/or the National Environmental Policy Act (NEPA) at the time of application. As part of this evaluation, impacts within Caltrans ROW, including the State Highway System, will be assessed, and mitigation measures will be proposed as needed to avoid or minimize impacts.

Comment A2-11

The comment suggests that availability of high-speed broadband VMT and GHG emissions by promoting teleworking and remote learning.

Response A2-11

The County appreciates Caltrans's recommendation for promoting teleworking and remote learning. The County has a Comprehensive Broadband Plan (<https://www.sandiegocounty.gov/lueg/broadband/>) to address inadequate broadband infrastructure and access in its communities. The CAP Update expands teleworking for County staff through implementation of Action T-4.1. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment A2-12

The comment states that Caltrans endeavors to reduce or eliminate any impacts to the State Highway System in accordance with CEQA and NEPA requirements.

Response A2-12

See Response A2-10.

Comment A2-13

The comment identifies requirements, permits, and approvals needed for projects within Caltrans ROW.

Response A2-13

The County will obtain the necessary permits and approvals when specific projects associated with the CAP Update are being implemented. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Yana Garcia, CalEPA Secretary
Liane M. Randolph, Deputy Secretary

Letter
A3

January 4, 2024

Meghan Kelly, County of San Diego
Planning and Development Services
5510 Overland Avenue, Suite 310
San Diego, CA 9212

Dear Ms. Kelly:

On behalf of California Air Resources Board (CARB) staff, I am writing to provide comments on the County of San Diego's Draft 2024 Climate Action Plan (CAP) and its associated Draft Supplemental Environmental Impact Report (SEIR). These comments follow up on CARB's February 16, 2021 letter, which expressed support for the County's CAP development process.

A3-1

Local governments have an essential role to play in advancing state goals. As part of the 2022 Scoping Plan for Achieving Carbon Neutrality (Scoping Plan), CARB included recommendations in Appendix D to help jurisdictions across the state ensure that their CAPs are consistent with applicable greenhouse gas (GHG) goals and requirements. This consistency is especially important if the jurisdiction adopting a CAP intends to rely on the CAP for streamlining the GHG emissions analyses in the CEQA documents for new projects.

Overall, CARB supports the County's effort to prepare a CAP and appreciates the efforts to incorporate the priority areas highlighted in Appendix D of the Scoping Plan. However, CARB recommends a few changes to the CAP to more fully align it with the recommendations in the Scoping Plan. These changes would provide additional certainty regarding the CAP's consistency with the Scoping Plan, ensuring that future residential and mixed-use developments can use the CAP to streamline their CEQA GHG analyses.

A3-2

The County has developed the CAP and SEIR with the intent of allowing projects to tier their GHG analyses off of these documents. The appendices to San Diego County's CAP describe a process for determining whether a project is consistent with the CAP for purposes of streamlining CEQA review. To be eligible for CEQA GHG streamlining, the CAP requires new discretionary projects subject to CEQA to demonstrate consistency with the County's

arb.ca.gov

1001 I Street • P.O. Box 2815 • Sacramento, California 95812

helpline@arb.ca.gov

Ms. Meghan Kelly
January 4, 2023
Page 2

General Plan. If General Plan consistency can be demonstrated, projects then determine whether they are consistent with the measures and actions included in the CAP as “consistency requirements.” Projects that demonstrate consistency with the General Plan and the CAP’s consistency requirements are considered by the County to be consistent with the CAP overall, and therefore eligible for streamlining of the GHG emissions analysis portion of the applicable CEQA document. CARB commends the County for developing this approach to assist future land-use projects in assessing their consistency with the CAP, but recommends some changes to better ensure consistency with the Scoping Plan and therefore enable streamlining.

Table 3 of Appendix D of the Scoping Plan (“Key Residential and Mixed-Use Project Attributes that Reduce GHG’s”) lists characteristics that have been shown to reduce operational GHG emissions and allow for growth from residential and mixed-use development in a manner consistent with the state’s climate and equity goals, including those in Senate Bill (SB) 32 (Pavley, Chapter 249, Statutes of 2016). Residential and mixed-use development that incorporates all of the attributes in Table 3 would be considered consistent with the Scoping Plan.

A3-2
cont.

San Diego’s CAP’s consistency analysis for streamlining residential and mixed-use projects includes some, but not all, of the project attributes listed in Appendix D of the 2022 Scoping Plan. Immediately below we summarize the areas in which the CAP is closely aligned with these project attributes and the State’s climate goals. We then identify areas where the CAP does not incorporate the project attribute recommendations from Appendix D. New mixed-use or residential projects that incorporate all of the project attribute recommendations would be able to clearly demonstrate consistency with the Scoping Plan and State climate goals. This can provide additional certainty when these projects seek to streamline their CEQA GHG analysis.

Several aspects of the CAP currently align with Scoping Plan Appendix D Attributes

One example of an area where the CAP aligns with Appendix D of the Scoping Plan is building decarbonization. Table 3 of Appendix D identifies building decarbonization as a priority GHG reduction strategy that CARB recommends local governments take, and that the adoption of all-electric new construction reach codes for residential and commercial uses is an appropriate measure for enacting that priority. This strategy is clearly addressed in the CAP as action E-2.1 “Amend the County’s Code of Regulatory Ordinances by 2026 to require all-electric equipment in new residential, commercial and industrial construction to reduce energy emissions from new development in the unincorporated area.”

A3-3

Ms. Meghan Kelly
January 4, 2023
Page 3

In addition, Table 1 below lists other key project attributes in the Scoping Plan's Appendix D that are reflected in the County's CAP consistency requirements. CARB appreciates that the County is making an effort to incorporate these attributes in new residential and mixed-use development to help achieve State climate goals.

Table 1. Appendix D Project Attributes Required in General Plan or CAP

Project Attributes from Scoping Plan Appendix D, Table 3	SD General Plan or CAP
Does not result in loss or conversion of natural or working lands	General Plan Policy COS-6.2 ("Protection of Agricultural Operations") would limit the loss of natural or working lands in the unincorporated county.
EV charging meeting most ambitious voluntary CA Green Building Code standard	CAP Action T-3.1 requires amendment of the County Code to require installation of Tier 2 CalGreen or similar EV charging infrastructure for new multi-family residential development.
At least 20 percent of units to be affordable	The General Plan commits to development of affordable housing that is at least 20% of new housing development in future years.
No net loss of existing affordable units	The General Plan commits to increasing the number of affordable housing units in future years.
Uses all-electric appliances with no natural gas connections	CAP measure E-2.1 commits the County to amending the County Code (by 2026) to require all-electric equipment in new construction.

A3-3
cont.

Certain aspects of the CAP could be revised to more fully align with Scoping Plan Appendix D Attributes

While many aspects of the CAP reflect the attributes set forth in Appendix D of the Scoping Plan, some of the recommendations for project streamlining included in Appendix D are not reflected in the CAP. For instance, Appendix D includes several key project attributes to

A3-4

Ms. Meghan Kelly
January 4, 2023
Page 4

help residential and mixed-use projects achieve reductions in vehicle miles traveled (VMT), such as locating new development in “infill sites that are surrounded by existing urban uses and reuses or redevelops previously undeveloped or underutilized land that is presently served by existing utilities and essential public services (e.g., transit, streets, water, sewer).” The County’s General Plan includes several policies that are related to development that encourages VMT reduction. For instance, Policy LU-1.2 prohibits leapfrog development that is not consistent with the County’s Community Development Model. However, these policies do not require new residential and/or mixed-use development to be built in areas that qualify as infill areas. In order to be more aligned with the recommendations in Appendix D of the Scoping Plan, we recommend that the County apply the CAP’s provisions for CEQA streamlining of residential and mixed used projects only to projects located in infill areas.

Appendix D also recommends that VMT be reduced in residential and mixed-use development through limiting the amount of new parking and locating projects within ½ mile of existing or planned transit service. Neither the County’s General Plan nor CAP policies eliminate parking minimums or enact parking maximums. While the CAP does include some policies that would encourage transit use, there are no requirements that new residential or mixed-use development be built with transit-supportive densities or be in proximity to transit. We recommend that the County apply the streamlining provisions for residential and mixed-use projects in the CAP only to projects that are located in proximity to existing or planned transit and that limit the provision of parking, either by eliminating parking minimums or enacting parking maximums.

A3-4
cont.

Table 2 below lists the key project attributes from Scoping Plan Appendix D that the CAP currently does not require for residential and mixed-use projects seeking CEQA streamlining under the CAP. CARB recommends that the County include these project attributes into the CAP’s consistency analysis for residential and mixed-use projects seeking CEQA streamlining in order to ensure that projects are consistent with the State’s climate goals.

Table 2. Appendix D Project Attributes Not Required in General Plan Or CAP

Project Attributes from Scoping Plan Appendix D, Table 3	SD General Plan or CAP
Located on infill sites that are surrounded by existing urban uses and reuses or redevelops previously undeveloped or underutilized land that is presently served	There is no requirement in the County General Plan or the CAP that requires that residential or mixed-use development be infill to qualify for CEQA GHG streamlining.

Ms. Meghan Kelly
January 4, 2023
Page 5

by existing utilities and essential public services (e.g., transit, streets, water, sewer)	
New mixed-use or residential development includes transit supportive densities, or ; New mixed-use or residential development is in proximity to existing transit stops, or ; More stringent criteria as specified in applicable SCS	There are no requirements (either in General Plan or CAP) for minimum residential densities. The General Plan includes zoning that would allow for residential development at lower densities. There are no requirements (either in the General Plan or CAP) for new residential development to be within one half-mile of existing or planned transit.
Reduced parking requirement	There are no reduced parking requirements for residential development in either the General Plan or CAP.

A3-4
cont.

Conclusion

CARB appreciates the opportunity to review and comment on San Diego County's 2024 CAP and Draft SEIR. The CAP includes elements that are consistent with the 2022 Scoping Plan's recommendations for CAPs and for streamlining the GHG analysis of residential projects under CEQA. However, as explained above, there are also opportunities for the County to demonstrate an even more robust relationship between the CAP's recommendations for new residential and mixed-use development and the recommended key project attributes identified in Appendix D of the Scoping Plan. Strengthening the CAP to take advantage of these opportunities will assist the County with using the CAP for the purposes of CEQA streamlining of residential and mixed-use development and will help to ensure that new development in San Diego County is consistent with California's climate goals for such projects. If you have any questions, please feel free to contact Pedro Peterson at (279) 208-7367 or by email at pedro.peterson@arb.ca.gov.

Communities Division

January 4, 2024

Comment A3-1

The comment introduces the comment letter and expresses support for the CAP Update development process.

Response A3-1

The County appreciates the CARB's support for the CAP Update development process. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment A3-2

The comment notes the importance of Appendix D of the 2022 Scoping Plan for streamlining GHG emissions analyses and that the CAP Update includes some, but not all, of Appendix D's project attributes. The comment also states that changes to the CAP Update are required to provide additional certainty regarding the CAP Update's consistency with the 2022 Scoping Plan and to ensure that future residential and mixed-use development can use the CAP Update to streamline their CEQA GHG analyses.

Response A3-2

The State CEQA Guidelines Section 15183.5 recognizes the important role of CAPs in the CEQA process and sets forth a basic framework for developing a plan to reduce GHG emissions (State CEQA Guidelines Section 15183.5[b]) that allows for the streamlining of the GHG impact analysis for later projects. Pursuant to State CEQA Guidelines Sections 15064(h)(3) and 15130(d), a lead agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project complies with the requirements in a previously adopted plan or mitigation program (i.e., a qualified GHG reduction plan or CAP) under specified circumstances (State CEQA Guidelines Section 15183.5[b]), thus eliminating the need for a project-specific GHG analysis for projects that are consistent with the CAP. Therefore, when a future specific project is consistent with the CAP Update, the County may presume that the project's GHG emissions are less than significant. If there is substantial evidence that the effects of a particular project may be cumulatively considerable notwithstanding the project's compliance with the specified requirements in the CAP Update, an EIR must be prepared for the project (State CEQA Guidelines Section 15183.5[b][2]). See Table 14 of the CAP Update for a summary of how the CAP Update meets the criteria for, and qualifies as, a plan for the reduction of GHG emissions. See also Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," for further discussion of the CAP Update GHG reduction targets and consistency with the 2022 Scoping Plan.

As described in this SEIR, the County has developed a CAP Consistency Review Checklist (Checklist), Appendix 8 to the *County of San Diego Guidelines for Determining Significance: Climate Change*. For applicants choosing to streamline project-specific

GHG CEQA analyses, the Checklist would be used to determine the consistency of future projects with the CAP Update. The Checklist provides individual projects with the opportunity to demonstrate that they are reducing GHG emissions in a manner that is consistent with the requirements and assumptions in the CAP Update. If a project would be consistent with the General Plan and can demonstrate consistency with the CAP Update by completing the Checklist, the project would be considered consistent with the CAP Update and eligible for CEQA streamlining of its project-level GHG analysis.

Appendix D of the 2022 Scoping Plan, “Local Actions,” provides optional, nonregulatory and non-exhaustive guidance for local governments and lead agencies related to how local climate action planning can support the State of California’s climate goals. It includes recommendations intended to build momentum for local actions that align with the State’s climate strategies, with a focus on climate action planning and approval of new land use development projects but does not represent a binding or exhaustive list of everything local governments can or must do to support state climate goals. Therefore, it is not required that future projects consistent with a CAP include all project-specific attributes included in Appendix D. Rather, Appendix D (page 23) states the following:

*These project attributes are intended as a guide to help local jurisdictions qualitatively identify those residential and mixed-use projects that are **clearly** consistent with the State’s climate goals, since these attributes address the largest sources of operational emissions for residential projects. In general, residential and mixed-use development projects that incorporate **all** of these key project attributes are aligned with the State’s priority GHG reduction strategies for local climate action as shown in Table 1 and with the State’s climate and housing goals. As such, they are considered to be consistent with the Scoping Plan or other plans, policies, or regulations adopted for the purposes of reducing GHGs; therefore, the GHG emissions associated with such projects may result in a less-than-significant GHG impact under CEQA. Lead agencies may determine, with adequate additional supporting evidence, that projects that incorporate some, but not all, of the key project attributes are consistent with the State’s climate goals.*

Appendix D further states that residential and mixed-used projects should contain key project attributes in Table 3 (of Appendix D of the 2022 Scoping Plan) “absent consistency with an adequate, geographically specific GHG reduction plan such as a CEQA-qualified CAP.” Given the nature of Appendix D, and the fact that the County’s CAP Update will, upon adoption, serve as a CEQA-qualified CAP, CARB’s suggestion that future mixed-use and residential projects consistent with the CAP Update should be required to incorporate all the project attribute recommendations included in Appendix D to qualify for streamlining pursuant to State CEQA Guidelines Section 15183.5 is incorrect. The County is not required to include all recommended project attributes of Appendix D’s Table 3 in the Checklist to provide CEQA streamlining benefits under the CAP Checklist. And while the Checklist does not, and is not required to, replicate the Scoping Plan Appendix D, Table 3 attributes, it does demonstrate the County’s ability to meet overall GHG reduction goals.

Comment A3-3

The comment describes several aspects of the County's General Plan and CAP Update currently aligning with the 2022 Scoping Plan Appendix D attributes.

Response A3-3

The County appreciates CARB's acknowledgement of the County's efforts to incorporate Scoping Plan project attributes into the General Plan policies and CAP Update measures and actions. See Responses A3-2 and A3-4 for a discussion of CEQA requirements for a qualified CAP and the applicability of Appendix D of the 2022 Scoping Plan to the CAP Update.

Comment A3-4

The comment suggests that streamlining of residential and mixed-used projects should be limited to areas that are infill, higher density, and near transit to be more aligned with the recommendations in Appendix D of the Scoping Plan to achieve reductions in VMT. The comment also suggests reduced parking requirements for residential and mixed-use projects located in proximity to existing or planned transit. The comment provides a list of project attributes in Appendix D of the Scoping Plan that are not included in the CAP Update.

Response A3-4

The 2022 Scoping Plan states that projects that incorporate all project attributes contained in Appendix D Table 3 would be "clearly consistent" with the State's climate goals and the 2022 Scoping Plan and "may result in a less-than-significant GHG impact under CEQA." However, as described above, in Response A3-2, the Scoping Plan also states that projects that do not achieve every attribute listed in Table 3 may still be consistent with the 2022 Scoping Plan, provided there is evidence supporting this conclusion.

The CAP Update's targets align with CARB's statewide targets for 2030 and 2045, as explained in the Draft SEIR (pages 2.8-24 through 2.8-29) and Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," above. These targets represent levels below which GHG emissions would not be cumulatively considerable, pursuant to State CEQA Guidelines Section 15064.4(b)(3), stating "[i]n determining the significance of impacts, the lead agency may consider a project's consistency with the state's long-term climate goals or strategies." The CAP Update shows a quantitative pathway toward achieving these targets through implementation of its numerous strategies, measures, and actions. The CAP Update meets the requirements of State CEQA Guidelines Section 15183.5(b), thereby allowing future projects to streamline their GHG impacts evaluation pursuant to State CEQA Guidelines Section 15064.4. For additional discussion of the requirements of State CEQA Guidelines Section 15183.5(b), please refer to Response A3-2.

The County understands the connection between land use and transportation and acknowledges that promoting infill development can have the effect of reducing VMT and associated GHG emissions. The CAP Update is not a land use plan. Rather, it is a programmatic document that contains strategies, policies, and actions that would mitigate

GHG emissions from the existing and future development allowed under the General Plan and in County operations. The County is developing or implementing other programs that would change land use planning, reduce VMT, and reduce GHG emissions. See Section 9.1.1.1, “Master Response: CAP Update Purpose and Land Use Change,” for further discussion of this topic. Furthermore, as discussed in the Draft SEIR, the CAP Update serves two purposes: reflecting the County’s attempts to reduce its share of statewide GHG emissions and being a CEQA mitigation measure to reduce GHG impacts from the General Plan (Draft SEIR page 1-2). No changes to General Plan land use designations, zoning, land use, or specific projects are proposed as part of the CAP Update. However, the Draft SEIR includes consideration of four smart growth alternatives, which are conceptual land use configurations that would reduce VMT by modifying the way the unincorporated area would buildout in the future. See Section 9.1.1.2, “Master Response: Evaluation of Smart Growth Alternatives in This SEIR,” for further discussion.

The County acknowledges the suggestion to limit use of the streamlining provision to only residential and mixed-used projects that are infill, higher density, and near-transit areas. However, the County has provided substantial evidence that all future projects that demonstrate consistency with the General Plan and incorporate relevant measures and actions in the CAP Update would be consistent with the 2022 Scoping Plan. Such projects are also within the scope of the GHG emissions forecasts in the CAP Update and eligible for streamlining under the CAP Update. Limiting the function of the CAP Update’s streamlining provisions would require project-level GHG emissions analyses for more projects but may not result in additional VMT reductions and would not be required to achieve the GHG reduction targets set in the CAP Update.

Regarding the lack of reduced parking requirements in the General Plan and CAP, the County notes that reduced parking is generally not an effective GHG reduction strategy in rural and semi-rural areas because there are limited options for alternative modes of transport to induce mode shifts and there is typically ample free parking outside designated parking lots. Proposed CAP Update Measures T-5 and T-6 would work together to provide access to alternative modes of transportation, including multimodal and transit to reduce VMT and provide options for residents and businesses to reduce single occupancy vehicle trips. As part of the development of the Transportation Demand Management (TDM) ordinance under Action T-6.2.a, the County would consider reduced parking requirements as part of the overall approach to reducing single occupancy vehicle trips.

Comment A3-5

The comment provides a summary of detailed comments provided above.

Response A3-5

The County appreciates comments from CARB related to the CAP Update’s consistency with the 2022 Scoping Plan. As stated in Appendix D of the 2022 Scoping Plan, residential and mix-used projects should contain key project attributes in Table 3 (of Appendix D of the Scoping Plan) “*absent* consistency with an adequate, geographically specific GHG reduction plan such as a CEQA-qualified CAP” (emphasis added). Appendix D of the 2022 Scoping Plan also states that projects that do not achieve every attribute listed in Table 3 may still be consistent with the 2022 Scoping Plan, provided there is evidence

supporting this conclusion. As discussed in Response A3-2 above, the CAP Update and Draft SEIR demonstrate, with substantial evidence, that the CAP Update meets the requirements of State CEQA Guidelines Section 15183.5(b), thereby allowing future projects to streamline their GHG impacts evaluation pursuant to State CEQA Guidelines Sections 15064, 15064.4, and 15183.5. Therefore, the CAP Update is not required to include all project attributes contained in Appendix D of the 2022 Scoping Plan to be consistent with the Scoping Plan and to allow for streamlining of future projects. The CAP Update's targets align with statewide GHG reductions for 2030 and 2045 identified in the 2022 Scoping Plan, as explained in the Draft SEIR (pages 2.8-24 through 2.8-29) and Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," above. These targets represent levels below which GHG emissions would not be cumulatively considerable, pursuant to State CEQA Guidelines Section 15064.4(b)(3), stating "[i]n determining the significance of impacts, the lead agency may consider a project's consistency with the state's long-term climate goals or strategies." With the suite of measures and actions proposed, the CAP Update shows a quantitative pathway toward achieving these targets through implementation of its numerous strategies, measures, and actions. The Checklist identifies measures and actions that new development projects intending to streamline must implement to show consistency with the CAP Update and to contribute their fair share to the CAP Update's targets. These and other elements demonstrate that the CAP Update meets the requirements of State CEQA Guidelines Section 15183.5(b), thereby allowing future projects to streamline their GHG impacts evaluation pursuant to State CEQA Guidelines Section 15064.4. For additional discussion of the requirements of State CEQA Guidelines Section 15183.5(b), please refer to Response to A3-2.

Therefore, the CAP Update is not required to include all project attributes contained in Appendix D of the 2022 Scoping Plan to demonstrate consistency with the Scoping Plan.

San Diego, CA 92123

Electronically Sent <meghan.kelly@sdcountry.ca.gov>

Re: 2020120204, County of San Diego Climate Action Plan Update

Dear Ms. Kelly:

The California Department of Transportation, Aeronautics Program has reviewed the Draft Environmental Review for the County of San Diego Climate Action Plan Update. One of the goals of the California Department of Transportation (Caltrans), Aeronautics Program, is to assist cities, counties, and Airport Land Use Commissions or their equivalent (ALUC), to understand and comply with the State Aeronautics Act pursuant to the California Public Utilities Code (PUC), Section 21001 et seq. Caltrans encourages collaboration with our partners in the planning process and thanks you for including the Aeronautics Program in the review of the Draft EIR.

A4-1

The Aeronautics Program commends the County of San Diego for including mitigation measures regarding airport hazards and noise, and encourages the continued collaboration of the County with the San Diego County Regional Airport Authority (SDCRAA) acting as the ALUC for San Diego County, County Airports, and the FAA when applicable to ensure safety practices and land use compatibility are upheld.

Compatibility concerns regarding airport obstructions and hazards to flight (such as wildlife attractants, lighting, or glare i.e., solar, etc.) should also be considered for further review upon site specific updates or projects. Proposed structures that exceed FAA Regulations Part 77 height criteria are subject to an Obstruction Evaluation/Airspace Analysis for determination.

A4-2

Per the California Public Utilities Code Section 21001 et seq. relating to the State Aeronautics Act, Section 21676(b) prior to the amendment of a general plan...within the planning boundary established by the airport land use commission pursuant to Section 21675, the local agency shall first refer the proposed action to the commission. If the commission determines that the proposed action is inconsistent with the

"Provide a safe and reliable transportation network that serves all people and respects the environment!"

Ms. Meghan Kelly, Project Manager
January 5, 2024
Page 2

commission's plan, the referring agency shall be notified. Any proposed development in the defined safety zones or Airport Influence Area (AIA), therefore, must adhere to the safety criteria and restrictions defined in the Airport Land Use Compatibility Plan(s) formed by the ALUC pursuant to the PUC, Section 21674.

An ALUCP is crucial in minimizing noise nuisance and safety hazards around airports while promoting the orderly development of airports, as declared by the California Legislature. A responsibility of the ALUC is to assess potential risk to aircraft and persons in airspace and people occupying areas within the vicinity of the airport.

If you have any questions or need additional information, please contact me at my email address: tiffany.martinez@dot.ca.gov.

Sincerely,

Tiffany Martinez
Transportation Planner, Aeronautics Program

A4-2
cont.

"Provide a safe and reliable transportation network that serves all people and respects the environment!"

- Letter A4 Caltrans Aeronautics Program

Tiffany Martinez, Transportation Planner
January 5, 2024

Comment A4-1

The comment explains the goal of the Caltrans Aeronautics Program and commends the County for including mitigation measures regarding airport hazards and noise. The comment also encourages the continued collaboration of the County with the San Diego County Regional Airport Authority (SDCRAA).

Response A4-1

The County appreciates comments from Caltrans Aeronautics Program related to the CAP Update and associated Draft SEIR. The comment is an introductory statement and does not address the content, analysis, or conclusions in the Draft SEIR. The County will continue collaboration with SDCRAA through implementation of adopted Mitigation Measure Haz-1.5 as described in Section 2.9.5, "Mitigation Measures," of the Draft SEIR.

Comment A4-2

The comment suggests that further review upon site-specific updates or projects should consider compatibility concerns related to airport obstructions and hazards to flight. The comment references applicable regulations related to airport hazards.

Response A4-2

As discussed in Section 2.9.3.4, "Issue 2: Result in Safety Hazards or Excessive Noise from Public and Private Airports," of the Draft SEIR, future projects associated with the CAP Update would be subject to federal, state, and local regulation related to airport safety and hazards, including Federal Aviation Administration Regulations Part 77, US Department of Defense Air Installations Compatible Use Zone (AICUZ) regulations, the State Aeronautics Act, and applicable Airport Land Use Compatibility Plans. In addition, future projects associated with the CAP Update would implement mitigation measures to minimize impacts related to airport hazards as needed. Specifically, the following adopted 2011 GPU PEIR mitigation measures would be applied to the CAP Update: Mitigation Measure Haz-1.1, which requires new development projects to be reviewed in accordance with the *County of San Diego Guidelines for Determining Significance: Airport Hazards* to ensure compatibility with surrounding airports and land uses; Mitigation Measure Haz-1.3, which requires new development projects to be reviewed in accordance with the applicable AICUZ to ensure consistency with the land use compatibility and safety policies; and Mitigation Measure Haz-1.5, which requires coordination with the SDCRAA and County airports for issues that may affect airport planning and operations.

9.1.3 Organization Comments and Responses

Subject: [External] SEIR Public Comment
Date: Sunday, November 5, 2023 9:09:15 AM

Good Morning, in Oct. 2023 the EPA declared an Endangerment Finding on the leaded fuel (Av/Gas). This gas is used at all 16 airports in San Diego County. This is the beginning of the movement concerning all aviation fuels the aviation complex uses and stores at our local air airports. Right now the flying aviation industry is except to a very large degree from ant Emission standards. San Diego should accept the future of "No Exemption" for the aviation and should lead in this change. For 80 yrs San Diego Counties communities have been bombarded by toxic Leaded fuel. Please include San Diego County aviation industry in any report or study you present to the Board of Supervisors and public.

Thank for the opportunity to comment on this important topic.

O1-1

Letter O1 Citizens Against Gillespie's Expansion Low Flying Aircraft

Robert Germann

November 5, 2023

Comment O1-1

The comment expresses concern about lead fuels used and stored at local airports.

Response O1-1

The County appreciates the comment from the Citizens Against Gillespie's Expansion Low Flying Aircraft related to concern about lead fuel usage and storage. Impacts related to the use and storage of hazardous materials are discussed in Section 2.9, "Hazards and Hazardous Materials," of the Draft SEIR. Impacts related to the transport, use, disposal, or accidental release of hazardous materials are discussed in Section 2.9.3.3. Impacts related to airport hazards are discussed in Section 2.9.3.4. Future projects associated with the CAP Update would be subject to federal, state, and local regulations related to airport safety and hazards. See Response A4-2 above.

Hello County CAP Team,

Thank you so much for your dedication to ensuring the County CAP is a powerful tool for climate action! Together with IBEW Local 569, we have attached a letter including our initial feedback on the CAP draft and look forward to engaging more on this over the course of 2024.

Meghan and Claire, it was great to have a preliminary conversation with you this week via SDBEC regarding some of the recommendations - thank you for answering many initial questions. As our team will be out of office over the holidays, I was hoping to get something on the calendar for all of us to connect in January to discuss the recommendations made in the letter. Please let us know when you have availability after January 8th to connect and Cristina will confirm a date based on her and Cori's schedule.

Thanks so much - wishing everyone a healthy and happy holiday!

Our mission is simple: create a zero carbon future through effective and equitable policy action

December 15th, 2023

County of San Diego
1600 Pacific Highway
San Diego, CA 92101

Re: Climate Action Campaign & International Brotherhood of Electrical Workers Local 569 Joint Comments on County Climate Action Plan Draft

Dear County Sustainability Planning Division Team,

Climate Action Campaign has played an active role in the development of every Climate Action Plan (CAP) in the region since 2015, including the County's CAP development and implementation process. The International Brotherhood of Electrical Workers (IBEW) Local 569 represents 3,600 power professionals and union electricians in San Diego and Imperial Counties and has a history of fighting climate change while ensuring a more resilient regional economy. As we work towards a collective zero-carbon future that will improve quality of life throughout the region, it is critical that the County adopt a CAP that meets the scale and scope of the climate crisis and confirms San Diego's position as a national climate leader.

This letter identifies four key areas to strengthen the CAP and build on our previous recommendations:

- Energy
- Built Environment and Transportation
- Resiliency
- Regional Collaboration

The recommendations below ensure the County CAP will address the urgency and severity of the climate crisis through implementation benchmarks, milestones, and stronger commitments to maximize emissions reductions.

Energy

The Energy sector is the most consequential area of focus for Green House Gas (GHG) emissions reduction identified in the CAP. Thus, the associated measures and implementing actions must reflect this significance through urgent implementation dates and high prioritization. Given the safety implications associated with the energy sector, from energy

02-2

02-3

generation to transmission and delivery, this area of focus should also include strong labor standards and workforce training.

In Measure E-1, there are opportunities for emissions reductions beyond the commitments in the Zero Carbon Portfolio Plan (ZCPP) that should be harnessed. The County should update the ZCPP to **require** appliances be replaced at end of life, or sooner, with electric alternatives. Additionally, the ZCPP goal for the County to utilize 100% renewable energy by 2030 needs to reflect the urgency of the climate crisis and the CAP should identify a faster timeline for renewable energy procurement, such as 2025. This is particularly feasible given the County has control through the Direct Access program to expedite procurement of 100% renewable power or to switch to San Diego Community Power's Power100 level.

For Measures E-2 and E-3, which address electrification of new and existing buildings, the CAP must include language that ensures building electrification (BE) is woven into all aspects of County programming and operations. In particular, the CAP should include an implementing action that commits all funding provided by the County for new development and building retrofits to include an electrification requirement. For example, money that is distributed from the Innovative Housing Trust Fund for affordable housing must have an electrification requirement and such opportunities need to be identified in the CAP. Any such distribution of County funds should also require all electrical work be done by C-10 licensed contractors employing state certified general electricians.

The CAP should include a range of pathways to ensure the success of BE, and a commitment to seek additional policy pathways to move faster when possible. One key approach for consideration is a heat pump replacement policy that requires all air conditioning units to be replaced upon burnout with heat pump appliances, as was adopted in the City of San Mateo. Other examples include a high performance reach code and streamlined permitting for all-electric builds. These alternative pathways to incentivize and require electrification must be identified to ensure BE goals are met if traditional reach code pathways are unavailable. Any alternative pathways that are subsidized by County funds should require all electrical work be done by C-10 licensed contractors employing state certified general electricians.

BE is a key strategy to improve public health and quality of life in the unincorporated County. As such, the goal to electrify 90% of existing buildings should be targeted for 2035 to adequately reflect the urgency needed to protect communities from the impacts of the climate crisis, such as extreme heat. Also, all BE, energy efficiency and energy resiliency implementing actions need to include details such as their scope, scale, estimated costs, specific benchmarks for planning and implementation timelines, and outlines for community and stakeholder engagement. The County's local job training program identified in E-3 needs to be implemented with partners such as IBEW Local 569 who have a Joint Labor Management State of California Approved Apprenticeship program to ensure that opportunities to fight climate change are paired with high road green energy careers. Equitable access to electrification for underserved communities as well as new job opportunities for fossil fuel workers as identified in the County's Workforce Development Study are also critical elements that should be part of all BE strategies.

O2-3
cont.

Built Environment and Transportation

The current strategies outlined in the 2024 draft report do not reduce enough GHGs from the built environment and transportation sector. There is no clear path to achieve net zero emissions by 2045. More must be done to further reduce GHGs in this sector as it is projected to be 37.3% of overall GHG emissions in 2045 per Appendix 3.

Today, transportation remains the greatest source of GHGs in the region, at 47% for both on-road and off-road GHGs. We urge a focus on the planning and constructing of electrical infrastructure for Zero-Emission Vehicles (ZEVs). This must be done in coordination with school districts, transit agencies, water districts, waste companies, and other government agencies transitioning their fleets to ZEVs. We encourage a thoughtful, streamlined permitting process for zero-emission infrastructure for unincorporated areas if such streamlined permits require all electrical work to be done by C-10 licensed and state certified general electricians. Local dollars can thus be efficiently leveraged to build the charging and maintenance infrastructure for the rapid transition of fleets, landscaping and construction equipment, school buses, public transit, and personal ZEVs.

Missing from the draft CAP is an emphasis on producing infill housing and other smart growth strategies. Though it is hard to quantify GHG emissions reductions from land use and housing, it is necessary to mention them in the CAP as they impact GHG emissions reductions in other sectors such as transportation and energy. Currently, smart growth is buried in the appendices. This must change. We urge the inclusion of measures to prevent sprawl and advance the development of affordable, higher density, infill development near job centers, transit, and high-frequency bus lines. Such measures should be in alignment with SANDAG's Regional Transportation Plan (RTP) and the County's housing and land use plans.

The CAP should also provide clear transportation mode share goals and an implementation plan for Vehicle Miles Traveled (VMT) reduction targets for unincorporated areas. We recommend strong community engagement with unincorporated communities to identify specific areas to enhance biking, walking, and public transit accessibility. With community input, VMT reduction can improve. We recommend integrating feedback gathered from the Regional Decarbonization Framework (RDF) outreach and engagement, as many rural communities (such as Jacumba and Potrero) have already identified specific areas where they would like to see increased vehicle-free transportation accessibility.

The County's Active Transportation Plan (ATP) provides another opportunity to increase mode shift. The current ATP network is missing critical links both within and between communities. This network needs seamless, safe connections to public transit to help communities shift to more sustainable transportation options. The ATP needs updating to help plan more Class IV bikeways to meet the incoming demand of residents adopting e-bikes and other micromobility for their first/last mile transportation needs. If the infrastructure for walking, rolling, and biking is not connected and safe, residents will be hesitant to use it for their transportation needs.

O2-4

Resiliency

With 2023 the hottest year on record, communities are already facing the impacts of extreme temperatures, especially throughout East County and rural desert areas. While steps are being taken to reduce carbon emissions, the health impacts of extreme heat, drought, fire, and other climate-related issues will become more severe in the years to come. These health impacts can be addressed and mitigated by establishing an integrated and accessible framework for resiliency measures. We recommend that the County include a commitment in the CAP to integrate a Resiliency Plan that lays out specific strategies and opportunities for protecting the health of communities in the wake of extreme heat caused by climate change, using tools such as heat pumps for cooling, as the need to adjust to changing climate conditions increases. All resilience measures should be incorporated with community input and knowledge in mind.

O2-5

Regional Collaboration

To become a regional leader, the County must take stronger steps towards integrating regional collaboration in the Climate Action Plan. In general, the County CAP would be greatly improved by including a detailed plan or framework on exactly how the County plans to collaborate with other cities, jurisdictions, tribes, agencies, community organizations, and local community leaders. In particular, the County should identify where and how public transportation options require cross-jurisdictional collaboration so that efficient and accessible transit opportunities can successfully *connect* unincorporated communities to the larger cities.

Also, as SANDAG is in the process of developing a priority Climate Action Plan (p-CAP) to serve as the foundation to a regional-scale CAP, it is of utmost importance that the County CAP team connects with SANDAG. The success of a regional CAP depends on the success of all CAPs within the region, so the importance of communicating and collaborating with SANDAG now in order to maximize efficacy and efficiency is critical. This collaboration will also reveal any potential gaps, strengthening the quality of both CAPs.

O2-6

With strong, effective, collaborative, and community-driven CAPs in place, San Diego as a region has a much higher chance of securing crucial climate action funding from federal and state sources, such as the \$4.6 billion Climate Pollution Reduction Grant from the Environmental Protection Agency (due April 1st, 2024). By working together with multiple jurisdictions and SANDAG, the County can help position the San Diego region to receive the funding that it needs to implement all of the necessary climate action infrastructure and programs.

Conclusion

The County CAP offers a rare opportunity to help shape climate policy in our region and state, and model the implementation needed for a zero carbon future. We recognize and appreciate the dedicated work of the CAP team to ensure thorough community engagement efforts and the integration of traditional ecological knowledge and Indigenous wisdom and stewardship as components of the CAP. We also want to acknowledge the improvements that have been made from previous County CAP versions, particularly around the transportation sector.

O2-7

We applaud the County's commitment and tenacity to improve the CAP to ensure a meaningful plan to reduce emissions. In general, the CAP consists of strong components, but we feel its long-term success is dependent on key benchmarks, milestones and detailed pathways and plans that are currently absent and are needed for transportation mode shift, building electrification, resiliency, and regional collaboration. Without identifying detailed timelines to reduce emissions, the County will struggle to stay on track and meet stated goals. A plan by itself will not lower carbon emissions in our region, but a plan with thoughtful and intentionally laid out implementation milestones and pathways that are community driven will succeed in moving the needle toward climate resilient and healthy communities. San Diego has enormous potential in being a leader in regional collaboration—together, let's make it a reality.

Letter O2 Climate Action Campaign and International Brotherhood of Electrical Workers Local 569

Serena Pelka, Policy Advocate, Climate Action Campaign
Cristina Marquez, Environmental Organizer, IBEW Local 569
December 15, 2023

Comment O2-1

The comment provides an introduction to the comment letter and looks forward to further engagement on the development of the CAP Update.

Response O2-1

The County appreciates comments from the Climate Action Campaign and International Brotherhood of Electrical Workers (IBEW) Local 569 related to the CAP Update and associated Draft SEIR. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required.

Comment O2-2

The comment provides background information of the organizations and a summary of comments to the CAP Update.

Response O2-2

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required.

Comment O2-3

The comment provides recommendations to expand on the energy measures in the CAP Update, including increased requirements for electric appliances, renewable energy procurement, building electrification, and heat pump appliances. The comment also requests specific timelines, benchmarks, costs, and so forth for implementing measures and equitable access for underserved communities.

Response O2-3

See Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explain that the CAP Update has adequately identified measures and actions that would exceed the 2030 and 2045 GHG reduction targets and make substantial progress toward the aspirational goal of net zero emissions by 2045.

The CAP Update also identifies the following details for each action as part of the CAP Implementation and Monitoring Program (Table 13): the implementation enforcement mechanism, County department with lead and supporting responsibilities for implementation, relative cost (using a qualitative, ordinal ranking of low, medium, or high), and potential funding sources for implementation. Note that the Equity Framework detailed in Chapter 5 of the CAP Update would guide the implementation of all measures while seeking equitable outcomes. The *Implementation Cost Analysis*, with further cost information, will be made available as an appendix to the CAP Update.

Comment O2-4

The comment states that current strategies in the CAP Update do not sufficiently reduce GHG emissions from the built environment and transportation sector. The comment provides recommendations to focus on constructing ZEVs infrastructure, promoting infill housing/smart growth, and achieving VMT reduction through improving active transportation infrastructure. The comment also states that infill housing, land use, and other smart growth strategies are missing from the CAP Update and that related measures should be aligned with the Regional Transportation Plan and the County's housing and land use plans.

Response O2-4

See Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," which explain that the CAP Update has adequately identified measures and actions that would exceed the 2030 and 2045 GHG reduction targets and make substantial progress toward the aspirational goal of net zero emissions by 2045. See Section 9.1.1.1, "Master Response: CAP Update Purpose and Land Use Change," for a discussion about the CAP Update and land use change, and Section 9.1.1.2, "Master Response: Evaluation of Smart Growth Alternatives in This SEIR," for a discussion about smart growth strategies.

Comment O2-5

The comment recommends incorporating resilience measures to address community health in response to climate change/extreme heat.

Response O2-5

The recommendation to include climate change resilience measures in the CAP Update is noted. The San Diego County General Plan Safety Element includes a policy to implement the County's Vulnerability Assessment and Adaptation Report (Policy S-12.1). The Vulnerability Assessment Adaptation Report includes a comprehensive vulnerability assessment and adaptation goals and policies, which are required to be incorporated into the General Plan Safety Element, in compliance with SB 379, Government Code section 65302(g)(4). The report includes adaptation strategies for climate hazards, including extreme heat. Additionally, the CAP Update (see Chapter 1, "Introduction") includes a description of how the County's climate action planning and GHG mitigation efforts under the CAP align with other County plans and programs to address public health, climate adaptation and resilience, and workforce and housing development. The CAP Update's analysis of co-benefits considers how additional beneficial outcomes that would address community health and resiliency, among others, could be achieved through CAP Update implementation.

Comment O2-6

The comment recommends including a detailed framework for regional cross-jurisdictional collaboration (e.g., connecting unincorporated communities to larger cities through public transportation) and, specifically, coordination with SANDAG.

Response O2-6

In the process of preparing the CAP Update, the County conducted various community outreach and engagement events to solicit diverse feedback on the CAP Update, from community leaders and individuals, regional and community-based organizations, regional agencies, and local jurisdictions, among others. In 2021, the County hosted general overview and equity-focused workshops on the CAP Update process to introduce the project and create vision statements. Between the end of 2021 and 2022, the County collected feedback on conceptual measures to be included in the CAP Update. From 2022 through 2023, the County gathered feedback on co-benefits outcomes of the measures. During the community outreach and engagement process, the County held 170 community-oriented meetings and events, including meeting with residents in frontline communities, such as the County's identified Environmental Justice Communities (Spring Valley, Sweetwater, North El Cajon, and North Lemon Grove); meeting with youth through high schools outreach; meeting with older adults through the County's Aging and Independence Services; and meeting with low-income communities and communities of color through the Partner Relay Network and the Farmworker CARE Coalition. The community outreach and engagement process was intended to ensure that the CAP Update is community driven. Please see Chapter 2, "Community Outreach and Engagement," of the CAP Update for detailed discussion of the community and engagement strategies the County has facilitated during preparation the CAP Update. A summary of the public outreach strategy is also provided on pages 1–22 of the Draft SEIR. In addition, the County conducted public outreach specifically on smart growth alternatives to gather suggestions for development of alternatives. Please refer to Section 5.5.1.1, "Summary of Outreach Related to Smart Growth Alternatives," for more details regarding outreach related to smart growth alternatives development.

Additionally, Chapter 5 of the CAP Update has been revised to clarify the role that inter-agency collaboration and partnerships with other organizations will play in CAP implementation. The County has experience with participating in regional partnerships, such as through the Accelerate to Zero Emissions Collaboration, that have led to increased access to funding opportunities and investments that benefit the unincorporated area and the region as a whole, as described on page 5 of the CAP Update. The County will continue to seek and participate in regional partnership opportunities, including participation in the development and future implementation of the Priority Climate Action Plan (PCAP), as part of the CAP Update's implementation strategy.

Comment O2-7

The comment provides a summary of detailed comments provided above.

Response O2-7

See Responses O2-3, O2-4, and O2-5, regarding benchmarks, milestones, pathways related to energy, transportation, and building electrification measures. See Response O2-6, regarding regional collaboration.

[CAP 2023 SEIR Comments 19Dec2023.pdf](#)

Dear Ms. Kelly and CAP Project Staff:

Please include the attached comment letters in the CAP and CAP DSEIR project records. As described in the letters, regarding the CAP we strongly recommend certain improvements and strengthened commitments to ensure that it will meet necessary GHG emission reduction targets. Also, regarding the DSEIR, we strongly recommend that certain improvements be made, including making currently permissive/voluntary GHG emission reduction mitigation measures mandatory and selection of the Sustainable Communities Strategy Alternative as the Environmentally Superior alternative and to replace the currently Proposed Project.

Date: 19 December 2023

County of San Diego, Planning and Development Services (cap@sdcounty.ca.gov)

Attention: Meghan.Kelly@sdcounty.ca.gov

From: Environmental Center of San Diego – Pam Heatherington (pjheatherington@gmail.com) and Bill Tippetts (billtippetts@gmail.com)

Subject: Public Comments on the County of San Diego Draft Supplemental Environmental Impact Report (SEIR) for the Climate Action Plan (October 2023)

We have read and evaluated the referenced document and the Climate Action Plan (CAP) that is analyzed in the Draft SEIR. The CAP measures, if mandatory and when fully implemented, would put the County on a trajectory to meet its greenhouse gas (GHG) emission reduction targets. However, as described in the CAP, and reiterated by the SEIR analysis, the CAP does not provide the necessary mandatory measures that would fully commit the County to reach net zero emissions/carbon neutrality by 2045. The CAP's mandatory measures would only ensure attaining 85% GHG emission reductions by 2045, with the remaining 15% expected to be achieved (without specific reduction thresholds for each) by a set of permissive/voluntary compliance measures. That approach is insufficient.

O3-2

Also, a different alternative (Sustainable Communities Strategy) is more appropriate for selection as the environmentally superior alternative than the Distributed Energy Only Alternative, but the former alternative is dismissed as not feasible. The reasons for rejecting this alternative do not appear to be sufficient, even though the environmental benefits are supported in the SEIR analysis. This alternative should be reconsidered for selection not only as the environmentally superior alternative, but as the preferred project, as described later in this comment letter.

O3-3

Our specific comments follow.

SEIR Summary

Pages 3-4. We concur with the list of Project Objectives, which if fully met by the CAP Update (CAP), would be a significant improvement of the previous CAP and achieve necessary GHG emission reductions and provide co-benefits. Our comments identify several items in the CAP that must be revised to meet its objectives and targets. Contrary to the SEIR analysis/findings, and based on our assessment of the revised CAP, the CAP does not fully meet the Project Objectives and a “smart growth” alternative, combined with the revised CAP would meet those objectives. Our comments on the CAP are attached.

O3-4

19 December 2023

Page 2

Pages 5-7. The Consistency Modifications with the General Plan and 2011 GPU PEIR state that the CAP will meet the GHG emission reduction target of net zero by no later than 2045. Specifically, the SEIR states the County will revise and comply with new General Plan Goal COS-20 (Governance and Administration): “Reduction of local community-wide (i.e., unincorporated county) and County operations GHG emissions contributing to climate change that meet or exceed requirements of the Global Warming Solutions Act of 2006, as amended by Senate Bill 32 (as amended, Pavley. California Global Warming Solutions Act of 2006: emissions limit) and Assembly Bill 1279 (2022) to achieve net zero greenhouse gas emissions no later than 2045.” However, the mandatory mitigation measures only commit the County to 85% reduction by 2045; the remaining 15% reduction is to be addressed by voluntary/permissive measures to put the County on a “Path to Net Zero.” To meet the consistency modification commitment of net zero by 2045, those voluntary/permissive measures must be mandatory commitments.

O3-5

Pages 7-8. To ensure that the GHG Threshold, Guidelines for Determining Significance for Climate Change, CAP Requirements, and CAP Consistency Checklist produce the required GHG reductions, the CAP must commit to achieving net zero by 2045. As noted in the preceding comment, without making the voluntary/permissive mitigation measures mandatory (and monitored and enforced), the County cannot rely on the threshold and checklist consistency to assure net zero compliance.

Pages 11-14. The SEIR includes a reasonable range of alternatives, including at least one smart growth alternative (Sustainable Communities Strategy) that would reduce vehicle miles traveled (VMT).

O3-6

Pages 15-56 (Table S-1). Item 2.8.1. It is not clear why the SEIR concludes that the project would not cause significant GHG emissions. The Consistency Modifications incorporated the stated commitment to meet the carbon neutrality/net zero target by 2045 (i.e. complying with AB 1279), but the CAP’s committed mandatory mitigation measures only attain 85% reduction. The remaining 15% may be achieved by “Path to Net Zero” measures, but those are not mandatory and tied to specific GHG emission reduction targets/thresholds, and it is unclear whether they would be enforceable. Because achieving net zero by 2045 is the committed threshold and the mandatory mitigation measures only commit to an 85% reduction by 2045, the finding of “less than significant” impact after mitigation is not supported.

O3-7

Items 13.1.1 and 13.1.2. The CAP relies on other County plans, such as the County’s Transportation Strategy Guidelines (TSG), which implement AB 743, and are intended to enhance transportation options (e.g., reduced reliance on vehicles) and reduce VMT. However, the County’s TSG exempts some new housing within transportation opportunity areas that are not efficient (i.e., not 15% below the regional VMT average), did not fully analyze VMT (and consequent GHG emissions) effects from several other exemptions, and has not yet prepared/adopted a mitigation plan. For those reasons, the finding of “less than significant” impacts after mitigation is not supported.

O3-8

19 December 2023

Page 3

Biological Resources (Section 2.4)

Pages 2.14.14-17. As stated in the document “the potential for the construction of large-scale renewable energy infrastructure was not evaluated in the 2011 GPU PEIR,” but the SEIR focuses its analysis on potential large wind energy facilities based on the Wind Energy EIR, with little analysis of large solar facilities. Wind and solar facilities have different siting criteria (to maximize performance efficiencies) and on-the-ground (terrestrial plants and animals) and aerial (i.e., avian) impacts. The County’s Regional Decarbonization Framework (RDF) identified large solar (and wind) facilities as critical to providing needed electricity. Because the 2011 GPU PEIR did not analyze large scale renewable energy infrastructure, the SEIR must provide additional information and analysis of potential impacts from scale solar facilities on biological resources that is comparable to that for large scale wind facilities.

O3-9

Pages 2.14-17 and 18. The proposed project relies on the CAP and other County plans (e.g., General Plan policies, TSG) that direct land use and associated transportation infrastructure and resulting GHG emissions. However, the CAP assumes that rapid transitioning to EVs will produce about 85% of the Built Environment/Transportation GHG emission reductions, with the remaining 15% of reductions from transit and transportation alternatives.

O3-10

A large increase in EV use (replacing existing vehicles and accommodating new drivers) and continued development in the unincorporated area, combined with with new transportation infrastructure, could have a larger impact to biological resources compared to more compact, sustainable development. That potential for impacts is not sufficiently analyzed in the SEIR.

Greenhouse Gas Emissions (Section 2.8)

Pages 2.8. 25-29. The EIR states that the CAP Update would conform with (contribute to implementation of) the Regional Transportation Plan/Sustainable Communities Strategy, which is projected to reduce per capita GHG emissions that are consistent with State law. The RTP/SCS relies on each local jurisdiction’s planning align with its key elements. However, the County’s CAP relies disproportionately on EVs reduce Built Environment and Transportation-related GHG emissions (85% compared to 15% for land use/transportation alternatives), and does not adopt a Sustainable Communities Strategy (see subsequent comments on the Alternatives). If the CAP Update does not integrate with the RTP/SCS, that could potentially increase County GHG emissions due to conflicts with the regional approach. The significance of that potential impact must be addressed.

O3-11

Pages 2.8.31-36. As described in previous comments, the CAP commits to mandatory measures to reach 85% GHG emission reductions, but does not include all the necessary and mandatory measures to achieve carbon neutrality/net zero GHG emissions by 2045 (mandated per AB 1279). While the CAP establishes a “Path to Net Zero” goal by 2045 and identifies several non-mandatory mitigation measures (which lack GHG reduction metrics and enforcement), that is not a definitive commitment to achieve net zero by 2045. The climate crisis is worsening and climate specialists believe that the global community continues to emit GHGs that would put the global temperature rise above the “acceptable

O3-12

19 December 2023

Page 4

risk” of 1.5 C rise as soon as 2030 (<https://www.kold.com/2023/11/20/earth-smashed-warming-limit-first-time/>). Draft text from the Cop28 meeting identified serious concerns that the window is rapidly closing to limit global temperature to 1.5 C by 2030 (https://unfccc.int/sites/default/files/resource/DT.DD..SBI59.i8_SBSTA59.i5.1.pdf). And, because net zero is considered essential to limiting long term global climate change effects to “acceptable risk” levels, the CAP appears to result in a considerable contribution to a significant cumulative impact, which would be a new or more severe impact than identified in the 2011 GPU PEIR.

O3-12
cont.

Alternatives (Chapter 5)

The analysis of alternatives concludes that the Distributed Energy Only Alternative “...would be environmentally superior to the project because it would reduce significant and unavoidable impacts related to the induced demand for large-scale renewable energy systems while potentially achieving both the primary objective of GHG emissions reductions consistent with SB 32, AB 1279, and all other supporting project objectives.” However, the County’s Regional Decarbonization Framework found that utility scale renewable facilities were necessary to meet the region’s clean energy needs (net zero emissions) by 2050 (https://www.sandiegocounty.gov/content/dam/sdc/lueg/regional-decarb-frameworkfiles/RDF_Technical_Report_FINAL_2022.pdf). Infill and rooftop solar alone could not provide the necessary clean energy supplies for the region. While that regional (countywide) and County’s CAP jurisdiction energy supply and demand are not directly comparable, it isn’t clear why the SEIR selected the distributed generation alternative as the environmentally preferred one. It may not be sufficient to meet the clean energy demands within the unincorporated County, and that concern does not appear to be appropriately analyzed and discussed.

O3-13

In contrast, the SEIR discounts the Sustainable Communities Strategy because implementing it requires land use changes and the current Regional Transportation Plan/Sustainable Communities Strategy had one of its measures (Road Use Charge) removed. That measure, which would not have been implemented until 2030, will be replaced by others in the next iteration (2025) of the RTP/SCS. In all other regards, the RTP/SCS alternative, as described on the SEIR and summarized in Table 5-2 (Page 5-45), this alternative would reduce Transportation and GHG Emissions impacts compared to the proposed project, while meeting all of the other CAP objectives. As described in the section on General Plan and Policies as an alternative, which could be implemented stand-alone or in combination with another alternative, it is likely that some changes to land use policies will be necessary to implement the CAP. The objections to selecting the Sustainable Communities Strategy as the environmentally superior alternative are not credibly justified. It should be selected as the preferred project to replace the proposed project.

O3-14

As described in the preceding comments and recommendations, the CAP and SEIR must be revised to fully meet the CAP objectives, especially ensuring fully reaching net zero emissions (carbon neutrality) by 2045 per AB 1279. When making those changes, the County should give serious consideration to selecting the Sustainable Communities Strategy not just as the environmentally preferred alternative, but it should replace the currently proposed project.

Letter O3 Environmental Center of San Diego

Pam Heatherington and Bill Tippetts
December 19, 2023

Comment O3-1

The comment provides a summary of detailed comments provided below, including requesting increased GHG reductions in the CAP Update, making voluntary measures mandatory, and expressing preference for the Sustainable Communities Strategy Alternative.

Response O3-1

The County appreciates comments from the Environmental Center of San Diego related to the CAP Update and associated Draft SEIR. See responses to the detailed comments below.

Comment O3-2

The comment states that the CAP Update and Draft SEIR indicate that the CAP Update does not include “the necessary mandatory measures that would fully commit the County to reach net zero emissions/carbon neutrality by 2045.” The comment states that the CAP Update only includes mandatory measures to achieve 85 percent of the required GHG reductions by 2045 and that the remaining 15 percent is met by relying on “permissive/voluntary” measures, which, it asserts, is not sufficient.

Response O3-2

By achieving its 2030 and 2045 reduction targets, the CAP Update is aligned with state legislation and plans for achieving net zero GHG emissions by 2045. The CAP Update establishes 2030 and 2045 GHG reduction targets that are aligned with state legislation (AB 1279) and plans (the 2022 Scoping Plan) to achieve net zero GHG emissions on a statewide basis by 2045. It identifies 35 quantified implementing actions that would achieve quantified GHG reductions and demonstrates that the reductions from these actions would collectively achieve the County’s 2030 and 2045 reduction targets.

Moreover, each action included in the CAP Update is in the County’s jurisdiction and ability to enforce; able to be monitored with readily available data to demonstrate progress over time; achievable within the County’s regulatory framework; and additional to existing regulations from the state or federal government. The CAP Update does not rely on “a set of permissive/voluntary compliance measures” as asserted by the commenter.

The CAP Update also contains 35 “Path to Net Zero” actions that establish steps the County will take to meet the 2045 net zero emissions goal. Although the CAP Update does not identify quantified GHG emissions reductions for “Path to Net Zero” actions, their implementation could result in quantified reductions in the future with additional data and monitoring.

The implementation and monitoring program is described in Table 13 of the CAP Update. Measurable outcomes, implementation timeline, County department lead, enforcement

mechanism, estimated GHG reduction potential, relative cost, and potential funding sources are provided.

The County would monitor implementation of the CAP Update closely and anticipates reaching net zero through the CAP Update and other ongoing land use planning changes (e.g., Sustainable Land Use Framework, Development Feasibility Analysis, VMT threshold and forthcoming mitigation program).

Also refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explains that the CAP Update establishes GHG reduction targets that are appropriately aligned with statewide targets and adequately identifies measures and actions to reduce GHG emissions to levels that achieve the targets.

Comment O3-3

The comment states that the Sustainable Communities Strategy Alternative is more appropriate for selection as the environmentally superior alternative than the Distributed Energy Only Alternative but was “dismissed as not feasible” without sufficient evidence.

Response O3-3

The Sustainable Communities Strategy is evaluated as a smart growth alternative in the Draft SEIR. It is not dismissed as infeasible. In fact, the alternatives analysis concludes that this is the only smart growth alternative that modeling indicates “would result in greater GHG emission reductions and less VMT than the CAP Update alone.” However, the analysis does acknowledge that “this modeling assumes a shift in existing travel behavior based on a Road User Charge. SANDAG is reconsidering the feasibility of such a charge and the benefits of the Sustainable Communities Strategy Alternative may be reduced without this assumption” (Draft SEIR page 5-34). Furthermore, as summarized in Table 5-2 of the Draft SEIR, the Distributed Energy Only Alternative is anticipated to reduce the physical environmental impacts of CAP Update implementation across seven resource topics, although the alternative may impede the County’s ability to meet short-term GHG reduction targets. Based on this alternative’s potential to reduce impacts while achieving the basic objectives of the project, it was identified as environmentally superior. The Sustainable Communities Strategy Alternative, by contrast, would only reduce impacts in two resource areas (GHG emissions and transportation). Nonetheless, because the relative environmental effects of implementing this alternative are disclosed in the Draft SEIR, the Board may direct staff to implement this alternative.

See also Section 9.1.1.2, “Master Response: Evaluation of Smart Growth Alternatives in This SEIR,” for further discussion of the smart growth alternatives considered.

Comment O3-4

The comment asserts that the CAP Update does not fully meet the CEQA objectives listed on page 3-4 of the Draft SEIR or achieve the established targets. The comment states that the CAP Update in combination with a smart growth alternative would meet the project objectives. The comment generally references attached comments on the CAP Update as evidence, but no details are provided in the comment.

Response O3-4

Project objectives are a component of a project description for an EIR. As explained in Section 15124(b) of Article 9 (Contents of Environmental Impact Reports) of the State CEQA Guidelines, this statement of objectives “includes the underlying purpose of the project and may discuss the project benefits.” The objectives aid in the identification and evaluation of alternatives. As indicated in Section 15126.6(c) of the State CEQA Guidelines, the “range of potential alternatives to the proposed project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects.”

The comment does not identify any specific deficiencies in the Draft SEIR’s analysis or specify which of the project objectives would not be achieved. Furthermore, the comment does not specifically identify how the CAP Update together with a smart growth alternative would meet the project objectives. Therefore, no further response can be provided.

Refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explains that the CAP Update establishes GHG reduction targets that are appropriately aligned with statewide targets and describes how the co-benefits of measures and actions are considered in the CAP Update.

Comment O3-5

The comment states that the voluntary/permissive measures must be mandatory commitments to meet the net zero emissions target by 2045 and that without making the voluntary mitigation measures mandatory, the County cannot rely on the GHG threshold and Checklist consistency to assure net zero compliance.

Response O3-5

Refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the methodology used in the CAP Update to establish GHG reduction targets that are appropriately aligned with statewide targets and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets. See also Response O3-2 above regarding net zero compliance.

Comment O3-6

The comment expresses support for the scope of the alternatives analysis.

Response O3-6

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required.

Comment O3-7

The comment states that the finding of less-than-significant impacts related to GHG emissions is not supported by the analysis because 15 percent of the GHG emissions reduction are based on voluntary/permissive measures.

Response O3-7

This SEIR analyzes the impacts of implementation of the CAP Update, which has been developed to reduce GHG emissions associated with the buildout of the General Plan,

pursuant to 2011 GPU PEIR Mitigation Measure CC-1.2 (“Prepare a County Climate Change Action Plan”). Any future construction related to implementation of the CAP Update would be sporadic and inherently short term and would facilitate the development of projects that would ultimately reduce GHG emissions. Operation of the CAP Update measures and actions would, by design, reduce GHG emissions in the unincorporated county to the extent that the County has done its “fair share” in assisting the state in meeting its long-term GHG emissions reduction targets. Any temporary construction GHG emissions would be offset by the overall net benefit of GHG emissions reduction. Therefore, implementation of these measures and their associated actions would not generate GHG emissions that may have a significant impact on the environment. Section 2.8.3.4 of the Draft SEIR, analyzes the project impacts related to conflicts with applicable plans, policies, or regulations adopted for the purpose of reducing GHG emissions. The Draft SEIR analysis concludes that implementation for the CAP Update would achieve the state’s GHG reduction targets for 2030 and 2045 and supports, with substantial evidence, the less-than-significant conclusion.

The thresholds used in the GHG analysis in this SEIR are appropriately aligned with the CAP Updates GHG targets and the 85 percent reduction target in AB 1279. The net zero target set in the 2022 Scoping Plan is intended to apply at the state level; attainment is based on programs (i.e., direct carbon capture and mechanical carbon dioxide removal) that are not feasible at the county level. Also refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the methodology the County used in the CAP Update to establish GHG reduction targets that are appropriately aligned with statewide targets and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets. Projects, including the proposed CAP Update, do not need to quantify attainment of a net zero threshold to demonstrate that they would not 1) generate GHG emissions that would have a significant impact on the environment or 2) conflict with an adopted plan for the reduction of GHG emissions (i.e., the 2022 Scoping Plan).

Comment O3-8

The comment makes unclear reference to “Items 13.1.1 and 13.1.2.” The comment states that the CAP Update “relies on other plans” that reduce VMT and explains that certain projects may be exempt from these requirements. This is provided as evidence that the impact determinations in the Draft SEIR are not supported.

Response O3-8

The Draft SEIR does not include “Items 13.1.1 and 13.1.2.” Because of the content of the remainder of the comment, the County assumed that the comment relates to the analysis of transportation impacts in Section 2.13, “Transportation,” of the Draft SEIR. This section uses the County’s Transportation Study Guidelines (TSG) as part of the framework for determining significance criterion to evaluate the project’s VMT impacts. The TSG was developed as a guide for analyzing the transportation impacts of proposed projects in the unincorporated county and the manner in which transportation impacts under CEQA are measured due to SB 743, which shifts the focus from Level of Service to VMT. The County’s TSG identifies screening criteria for VMT analysis, including infill development in Transit Opportunity Areas. The TSG describes how infill areas in the unincorporated

county were identified and where projects can be screened from VMT analysis. In addition, as outlined in State CEQA Guidelines Section 15064.3(b)(1), new development located within 0.5 miles of a major transit stop should be presumed to cause a less than significant transportation impact, regardless of if their anticipated VMT generation.

The impact analysis in Section 2.13 describes the effect of the CAP Update on countywide VMT (See “Issue 2: Exceed Threshold for VMT” beginning on page 2.13-30 of the Draft SEIR). This analysis identifies VMT associated with anticipated growth under the General Plan for the years 2035 and 2050 based on the SANDAG activity-based model. The analysis also explains that “the TSG establishes VMT thresholds for large land use plans as 15 percent below the existing regional average VMT per resident and 15 percent below the existing regional average VMT per employee for residential and employment uses, respectively” and, based on this threshold, “growth consistent with the General Plan would exceed the TSG thresholds for land use plans” (Draft SEIR page 2.13-31). This impact analysis subsequently concludes that implementation of the CAP Update would result in a less-than-significant impact related to VMT. Specifically, the Draft SEIR includes evaluation of the VMT reductions anticipated from CAP Update Actions T-3.1, T-4.1, T-4.1.a, T-4.2, T-5.1, T-5.1.a, T-5.1.b, T-5.2, T-6.1, T-6.2, T-6.2.a, T-6.2.b, and T-6.3. These actions could result in the construction of new transit-supportive roadway treatments and bicycle and pedestrian facilities, the implementation of transportation demand management programs to reduce the use of single occupancy vehicles, and educational initiatives to encourage increased alternative transportation in the unincorporated county. Modeling was conducted to evaluate the VMT reductions from CAP Update actions (see Tables 2.13-3 and 2.13-4 in the Draft EIR). The VMT analysis included in Section 2.13 of the Draft SEIR is consistent with the provision of the County’s TSG and State CEQA Guidelines.

The VMT modeling that is used in the CAP Update forecasts is based on a SANDAG modeling scenario. Although the TSG informs the thresholds used in the SEIR analysis, the CAP Update VMT data does not reflect implementation of the TSG. The TSG are also not specifically referenced in the CAP Update measures and actions. Specific CAP Update modeling assumptions are explained in CAP Update Appendix 3 (Unincorporated County of San Diego 2019 Greenhouse Gas Emissions Inventory and Projections).

Therefore, the SEIR analysis does not inappropriately assume VMT reductions from future projects that would be exempt from the TSG and CAP Update. Implementation would not affect the implementation of those separate guidelines for future projects.

Comment O3-9

The comment states that the Draft SEIR should include additional information and analysis of potential biological impacts related to large-scale solar facilities.

Response O3-9

The comment refers to the discussion of the effects of energy measures and actions related to “Issue 1: Special-Status Plant and Wildlife Species” in the Draft SEIR pages 2.4-14 through 2.4-17. This impact analysis covers all the energy-related measures, including potential for increased demand for renewable energy to indirectly result in the

development of small- and large-scale solar facilities. The Draft SEIR does not purport to cover the entirety of the impacts from individual renewable projects, which would be designed and proposed by others as separate projects subject to separate discretionary actions that receive separate CEQA review. The purpose of the discussion in the Draft SEIR is to disclose the potential for indirect impacts due to growing demand. The discussion is appropriately informed by readily available information that is incorporated by reference. The actual impacts would depend on many factors (such as size and location of renewable energy projects) about which the County is not required to speculate.

The impact analysis in the Draft SEIR discloses that implementation of CAP Update Action E-3.3 could result in the construction of solar arrays, small wind turbines, and large-scale renewable energy infrastructure. Pages 2.4-18 and 2.4-19 explain:

Subsequent projects associated with CAP Update implementation would be required to comply with applicable existing federal, state, and local regulations, as well as with the General Plan Policies COS-1.3, COS-1.6, COS-1.7, COS-1.8, COS-1.9, COS-1.10, COS-1.11, COS-2.1, COS-2.2, LU-6.1, LU-6.2, LU-6.3, LU-6.4, LU-6.6, LU-6.7, LU-10.2, and M-12.9 that would reduce the potential for impacts to special-status species. Specifically, projects would be evaluated for their consistency with policies and regulations including County Grading Ordinance regulations, and the County RPO regulations, and the 2011 GPU PEIR Mitigation Measures Bio-1.1, Bio-1.5, and Bio-1.6. CAP Update Mitigation Measures Bio-1 and Bio-2 also would be applied to the project to further reduce impacts associated with large-scale renewable energy development. These measures would require implementation of measures to avoid sensitive biological resources; preserve habitat; requirement revegetation of disturbed areas; and restrict lighting, runoff, access and/or noise on future renewable energy development sites. Additionally, standard measures as outlined in the *County Guidelines for Determining Significance for Biological Resources* would be required to be implemented.

The Draft SEIR provides sufficient detail of the potential indirect effects of CAP Update implementation to foster informed decision making. Impacts would remain significant and unavoidable. No revisions have been made to the Draft SEIR in response to this comment.

Comment O3-10

The comment states that an increase in electric vehicle use and continued development in the unincorporated county, in combination with new transportation infrastructure, could have larger impacts to biological resources compared to more compact and sustainable development.

Response O3-10

The CAP Update is a mitigation measure for the adopted General Plan. As explained in Section 9.1.1.3, “Master Response: CAP Update GHG Targets, Measures, and Actions,” the County’s forecasts are set based on reasonably foreseeable growth under the adopted General Plan and the targets are achieved through a suite of GHG emission

reduction measures. The effects of growth and development under the adopted General Plan were evaluated in the 2011 GPU PEIR.

Section 2.4, “Biological Resources,” of this SEIR provides a detailed evaluation of the effects of implementing the CAP Update, including the proposed built environment and transportation measures and actions. The analysis concludes that impacts would not be more severe than disclosed in the 2011 GPU PEIR. Further, any transportation infrastructure (e.g., EV charging stations) constructed because of CAP Update implementation would be subject to separate CEQA review as part any subsequent discretionary action by the Board to evaluate the physical environmental effects of their construction and operation. The CAP Update does not include land use or zoning changes and would not directly allow or prohibit development. Transitioning to EVs would reduce GHG emissions from forecasted buildout of the General Plan; there is no evidence that implementing these measures as part of the CAP Update would affect the location or rate of growth in the unincorporated county. There are not, therefore, changes to the adopted land use plan that are omitted from analysis in the Draft SEIR and no evidence that implementing the CAP Update in conjunction with the adopted General Plan would result in greater effects to biological resources than implementing the adopted General Plan alone.

For a discussion of the relative impacts of the adopted General Plan and CAP Update compared to scenarios with more compact development, refer to Section 5.5, “Smart Growth Alternatives,” of the Draft SEIR and Section 9.1.1.2, “Master Response: Evaluation of Smart Growth Alternatives in This SEIR,” above. If directed by the Board, these smart growth alternatives could be implemented in conjunction with the measures and actions in the CAP Update to influence the locations of future growth in the county. Refer also to Section 9.1.1.1, “Master Response: CAP Update Purpose and Land Use Change,” for more information regarding the purpose of the CAP Update.

Comment O3-11

The comment indicates that CAP Update conflicts with the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) because it “relies disproportionately” on electrical vehicles to reduce GHG emissions in the Built Environment and Transportation sector.

Response O3-11

Under SB 375, SANDAG’s RTP/SCS must include local land use patterns and regional transportation strategies that, if implemented, would achieve CARB-established 2035 targets for the reduction of GHG emissions from passenger vehicles. The CAP Update includes several actions that would complement the RTP/SCS by reducing vehicle miles traveled by passenger vehicles to reduce GHG emissions (T-3.1, T-4.1, T-4.1.a, T-4.2, T-5.1, T-5.1.a, T-5.1.b, T-5.2, T-6.1, T-6.2, T-6.2.a, T-6.2.b, and T-6.3). In addition, the CAP Update includes actions to reduce GHG emissions through electrification of passenger vehicles and other vehicle categories (T-1.1, T-3.1, T-3.1.c, and T-4.2). The GHG emissions reductions realized by these actions of the County’s CAP Update would be additional to passenger vehicle GHG emissions reductions achieved by implementation of the RTP/SCS. Moreover, the proportion of GHG emissions reductions achieved by

VMT reduction actions relative to transportation electrification actions in the County's CAP Update has no bearing on SANDAG's ability to achieve the passenger vehicle GHG emissions reduction targets of the RTP/SCS.

The applicable GHG emissions reduction plans discussed in the Draft SEIR Section 2.8, "Greenhouse Gas Emissions," are the 2022 Scoping Plan and the Regional Plan (including the RTP/SCS). The 2022 Scoping Plan identifies three priority areas for local governments as they develop their local climate plans, measures, policies, and actions. The three priority areas include VMT reduction, electrification of transportation, and buildings decarbonization. The CAP Update has been prepared in consideration of these three priority areas. Specifically, the CAP Update includes VMT reduction actions T-3.1, T-4.1, T-4.1.a, T-4.2, T-5.1, T-5.1.a, T-5.1.b, T-5.2, T-6.1, T-6.2, T-6.2.a, T-6.2.b, and T-6.3; transportation electrification actions T-1.1, T-3.1, T-3.1.c, and T-4.2; and buildings decarbonization actions E-1.1, E-2.2, E-2.2.c, and E-3.2.a.

As discussed on pages 2.8-25 and 2.8-26 of the Draft SEIR, the Regional Plan reduces per capita GHG emissions from cars and light-duty trucks to 20 percent below 2005 levels by 2035, exceeding the region's state-mandated target of 19 percent. The 2021 Regional Plan also meets federal air quality conformity requirements. The CAP Update would align with the goals of the Regional Plan by achieving GHG reductions through reductions in anthropogenic GHG emissions through implementing measures and actions aimed at promoting multimodal transportation and reducing VMT (e.g., Actions T-4.1, T-4.2, T-4.6, T-5.1, T-5.1.a, T-5.1.b, T-5.2, T-6.1, T-6.2, T-6.2.a, T-6.2.b, and T-6.3).

Therefore, implementation of the CAP Update would not conflict with an applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of GHGs, including the RTP/SCS contained in the 2021 Regional Plan.

Comment O3-12

The comment states that the CAP Update would result in a considerable contribution to a significant cumulative impact because the CAP Update only commits to mandatory measures to reach 85 percent GHG emissions reduction compared to the net zero GHG emissions by 2045 mandated per AB 1279.

Response O3-12

As explained above in Response O3-2, AB 1279 does not establish that GHG emissions must be reduced to net zero by 2045 in order to avoid significant cumulative impacts. Rather, this legislation established a policy for the state to achieve net zero emissions as soon as possible and ensure anthropogenic emissions are reduced to at least 85 percent below 1990 levels by 2045. Also refer to Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," which describes the methodology the County used in the CAP Update to establish GHG reduction targets that are appropriately aligned with statewide targets and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets.

Global climate change is inherently cumulative. Therefore, GHG emissions related to implementation of the CAP Update discussed in Section 2.8.3.3, "Issue 1: Generate GHG

Emissions, Either Directly or Indirectly, That May Have a Significant Impact on the Environment,” of the Draft SEIR (pages 2.8-17 through 2.8-24) also serve as the cumulative impact analysis. Given the cumulative nature of the analysis of GHG impacts, the conclusion, as supported by substantial evidence, that the CAP Update would result in a less-than-significant impact related to generating GHG emissions that may have a significant impact on the environment, translates into a finding that the CAP Update would not result in a considerable contribution to a cumulative impact.

Comment O3-13

The comment quotes the conclusion in the Draft SEIR that the Distributed Energy Only Alternative would be environmentally superior to the project because it would reduce significant and unavoidable impacts related to the induced demand for large-scale renewable energy systems while potentially achieving both the primary objective of GHG emissions reductions consistent with SB 32, AB 1279, and all other supporting project objectives. The comment then cites the 2022 *San Diego Regional Decarbonization Framework Technical Report* as evidence that this alternative may not sufficiently meet clean energy demands and suggests that the concern is not adequately addressed in the Draft SEIR.

Response O3-13

As explained in the Draft SEIR, the Distributed Energy Only Alternative was identified as a potential alternative to the CAP Update in response to comments received during the NOP scoping process. CAP Update Action E-3.3 would require the County to develop a program to provide the unincorporated area with 100 percent renewable energy from San Diego Community Power by 2030. Implementation of proposed CAP Update Action E-3.3 could result in the construction of new large-scale renewable energy systems, including large-scale solar and wind turbines. As outlined in Section 5.4.1.2, “Distributed Generation Only Alternative,” of the Draft SEIR, this alternative would modify Action E-3.3, which would commit the County to developing a program to provide the unincorporated county with 100 percent renewable energy through distributed generation. The Draft SEIR indicates that the first step in implementing this alternative would be the completion of a feasibility study that would inform the types of distributed generation and potential incentives. The description also explains that the County would continue to allow the construction of large-scale renewable energy “subject to its ordinances, policies, and standards” (Draft SEIR page 5-12). However, this alternative would eliminate the assumed development of large-scale renewable energy systems as a result of implementation of CAP Update Action E-3.3.

The *San Diego Regional Decarbonization Framework Technical Report* identifies distributed energy generation as a key component of a program to reduce GHG emissions that is used in a variety of CAPs. The report notes that local jurisdictions “play an essential role in furthering distributed generation” (McCord et.al. 2022: 505). The *San Diego Regional Decarbonization Framework Technical Report* reflects energy demand for the entire region and provides examples of how, under current land use, technology, and grid conditions, the region can generate renewable energy to meet projected demand.

Although the analysis does not specifically reference the findings of the 2022 *San Diego Regional Decarbonization Framework Technical Report*, the discussion acknowledges that “it would be more complicated and time-intensive to produce energy in this manner” and that “challenges could add substantial time and complexity to the generation of distributed energy within the unincorporated county.” For this reason, the SEIR notes, “it is anticipated that the Distributed Generation Only Alternative may not meet the project objectives related to meeting the SB 32 target in 2030” (Draft SEIR pages 5-12 through 5-13). However, because the alternative would meet other project objectives (e.g., supporting the sustainability principles in the General Plan and minimizing undue and unnecessary economic impacts on businesses and property owners), it was carried forward for full analysis (See Chapter 5, “Alternatives”). Furthermore, the County would use the reporting and inventory requirements to monitor the success of the measure and adjust accordingly.

The Draft SEIR provides a clear rationale for identifying the Distributed Energy Only Alternative as environmentally superior and appropriately discloses the challenges associated with alternative implementation and the potential effect on near-term reduction goals. No changes to the Draft SEIR have been made in response to this comment.

Please also refer to Section 9.1.1.2, “Master Response: Evaluation of Smart Growth Alternatives in This SEIR,” for further discussion of the County’s obligation to evaluate alternatives to the project and an explanation of the identification of an environmentally superior alternative.

Comment O3-14

The comment indicates that the “objections to selecting” Sustainable Communities Strategy Alternative as the environmentally superior alternative are not credibly justified in the Draft SEIR and the Sustainable Communities Strategy Alternative should be “selected as the preferred project.”

Response O3-14

The Sustainable Communities Strategy Alternative is discussed in Section 5.5.3.3 of the Draft SEIR. As discussed in the Draft SEIR on pages 5-19 through 5-21, the Sustainable Communities Strategy Alternative could result in more GHG emissions reductions associated with VMT in the unincorporated county compared to the CAP. However, the anticipated VMT reductions are based on the Regional Plan’s premise of a distribution of growth in Mobility Hubs that encompass areas outside the County’s control and a pattern of growth that is inconsistent with the existing General Plan density and historical development patterns. Future development patterns that would be consistent with the Sustainable Communities Strategy would require substantial land use and zoning changes by the County. Therefore, the actual VMT reductions achieved under this alternative likely would be less than modeled for the analysis in the Draft SEIR.

As described above in Response O3-3, assuming the implementation of the Road User Charge or another equally effective measure in a future plan, the Sustainable Communities Strategy Alternative would reduce GHG emissions (which are already less than significant with implementation of the proposed CAP Update) and VMT (which is a

significant impact with implementation of the proposed CAP Update). However, the Distributed Energy Only Alternative would reduce the effects of implementing the CAP Update measures and actions across seven resource areas for which significant and unavoidable impacts are identified. Therefore, based on its ability to best reduce the effects of CAP Update implementation, the Distributed Energy Only Alternative was identified as the environmentally superior alternative.

See Section 9.1.1.2, “Master Response: Evaluation of Smart Growth Alternatives in This SEIR,” for further discussion.

Comment O3-15

The comment provides a summary of Comments O3-4 and O3-14.

Response O3-15

See Response to O3-4, regarding project objectives, and Response O3-14, regarding Sustainable Communities Strategy.

County of San Diego
ATTN: Meghan Kelly
Climate Action Plan SEIR Planning & Development Services
5510 Overland Avenue,
Suite 310 San Diego, CA 92123

Dear Ms. Kelly and County Officials:

This letter is the official response by Sierra Club San Diego to the County's latest Climate Action Plan and SEIR. This letter is provided in the spirit of collaboration between the County of San Diego (hereafter County) and Sierra Club San Diego (hereafter Sierra Club). In the past the Sierra Club brought successful court actions concerning the two prior County Climate Action Plans (CAP). We are hopeful that the County will negotiate and collaborate with us to strengthen the latest CAP and avoid the delays and substantial monetary costs that litigation has created in the past.

The latest CAP has many excellent provisions and actions. We agree that there are substantial co-benefits to the health and wellbeing of residents from reducing Greenhouse Gas (GHG) emissions and the concomitant reductions in air pollution, growing the green economy and reducing household transportation costs.

Sierra Club greatly appreciates that in the opening page of the 2024 CAP the document calls our present circumstance a "Climate Emergency." It is this emergency that requires developing the strongest County Climate Action Plan.

Similarly, Sierra Club supports a primary goal of the SEIR: "The underlying purpose of the project is to reduce GHG emissions that could be generated by development under the General Plan, and to reduce those emissions consistent with state legislative mandates and the

04-1

requirement to prepare a CAP pursuant to Mitigation Measure CC-1.2 of the 2011 GPU PEIR. This mitigation measure sets out to reduce GHG emissions from community-wide sources and County local government operations (County operations) that are consistent with the General Plan.” Likewise, Sierra Club supports: “Goal COS-20 in the San Diego County General Plan sets a target to reduce local GHG emissions to 1990 levels by 2020 to be consistent with the statewide goal established by AB 32.” Sierra Club strongly believes it is not sufficient to merely reduce GHG; the CAP must provide reduction of GHG to 1990 levels and below.

04-1
cont.

Despite Sierra Club’s support for many provisions of the CAP the CAP does not contain any apparent analyses that show the CAP’s collective plans will result in a given amount of GHG emission reduction and particularly not reduced to 1990 GHG levels or below. Sierra Club requests that such an analysis be completed with detailed action by action metrics that show how these measures would result in the desired reductions in GHG to below 1990 levels.

04-2

Similarly, the Sierra Club is surprised that the CAP is almost entirely goal oriented and therefore only aspirational in context. The CAP mostly requires subsequent legislation, programs, and actions to implement the specifics of the CAP rather than being a free-standing document that could be quickly implemented and serve as the basis for future decision-making. Sierra Club requests upgrading the CAP to a free-standing legal document.

The County’s new CAP is wedded to the 2011 General Plan. The CAP states that the: “General Plan Goal COS-20 (Governance and Administration) Reduction of community-wide (i.e., unincorporated county) and County operations GHG emissions contributing to climate change that meet or exceed requirements of the Global Warming Solutions Act of 2006, as amended by Senate Bill 32 (as amended), Pavley. California Global Warming Solutions Act of 2006: emissions limit) and Assembly Bill 1279 (2022) to achieve net zero greenhouse gas emissions no later than 2045.” Again, it is unclear if the new CAP amends the General Plan to become law or is a free-standing document that still requires other actions by the Board of Supervisors. The enforceability of the CAP needs to be clearly articulated.

04-3

This CAP appears to amend the General Plan to provide: a Climate Action Plan for the reduction of community-wide (i.e., unincorporated county) and County operations GHG emissions consistent with the California Environmental Quality Act (CEQA) Guidelines Section 15183.5 (or as amended). A revised CAP should clarify the CAP’s relationship with the General Plan.

ANALYSIS OF THE TERMS DOCUMENT

In January 2021 Sierra Club San Diego provided a Terms Document (hereafter called Terms) in response to the County’s Notice of Preparation on the CAP. In the following sections Sierra Club analyze each of the Terms and the degree to which the CAP was responsive to each term. Sierra Club began by offering five primary terms.

04-4

A. **Addressed 2021 Sierra Club Terms:**

1. **Community Choice Aggregation.** Sierra Club’s first term requested that “the County stablish Establish a Community Choice Aggregation program to provide 100% renewable energy by 2035.”

We are gratified that the SEIR contains a provision for a Community Choice Aggregation Program, that the County joined *San Diego Community Power* in 2021, and that the CAP is committed to “100 percent renewable electricity by 2030.” The SEIR states: “In 2021, the San Diego County and National City voted to join SDCP. SDCP is a Community Choice Aggregation that allows customers to enroll on a voluntary basis. San Diego Community Power (SDCP) purchases electricity from renewable resources that is then delivered to consumers through a grid infrastructure owned and maintained by San Diego Gas & Electric Company (SDGE).”

As important an aspiration that clean energy goals are stated, Sierra Club is disappointed and concerned that the CAP lacks any details on how this goal of 100% clean energy by 2030 will be achieved. A thorough search of the CAP and the SEIR reveals no details on how the County could achieve 100% renewable energy by 2030. This goal will be very hard to achieve because selecting 100% renewable energy is an option for each individual energy user enrolled in SDCP. Approximately 95% of customers in the County get their power from SDCP. However, the vast majority of customers receive 50% renewable energy not 100% renewable energy. Individual customers must opt up for Power100 which provides 100% renewable energy but only 5-10% have opted up for Power100 thus far. SDCP is striving to get more customers to opt up for Power100. Perhaps a resolution is for the CAP and SEIR to provide a provision to make Power 100 mandatory by 2030 or 2035. A final EIR should provide considerably more detail as to how this goal will be achieved. Short of such detail 100% renewable energy is still just an aspiration. The CAP could propose a mechanism to achieve its goal of “100 percent renewable electricity by 2030” but it fails to do so. For example, the County could propose to subsidize the cost difference between 50% and 100% renewable energy which is less than a percent difference in cost. Or the County could devise other incentives to meet their goal of 100% renewable energy by 2030. In summary, the revised CAP needs to include such incentives or mechanisms whereby 100% renewable energy can be achieved.

O4-5

2. The **Firesafe and low VMT program.** Sierra Club’s second term requested the County “(d)ownzone lands in Calfire’s high/highest fire risk areas and highest vehicle miles (VMT) travelled areas of the county.” Sierra Club is disappointed that

O4-6

neither the CAP nor SEIR call for such a measure as the primary alternative. In the Smart Growth section of the SEIR one of the primary alternatives calls for a “Firesafe and low VMT program” that prohibits development in the high and very high fire zone. Sierra Club is disappointed that the CAP and SEIR did not recommend the “Firesafe and low VMT program” (Firesafe), as the primary Smart Growth measure. The Firesafe program has three major advantages over the other Smart Growth alternatives.

First, according to the EIR it: “Moves half of unincorporated County household growth to unincorporated VMT efficient areas that are considered fire safe.” Sierra Club submits that permitting more building in the highest fire zones of California defies logic and common sense.

Second, the Firesafe alternative reduced the most VMT and the corresponding GHG. Sierra Club has always maintained that building closest to existing development and transit is the best way to reduce GHG. Indeed, a viable climate action plan should seek to reduce GHG as much as possible and the Firesafe plan accomplishes that goal.

Third, the Firesafe plan alternative preserves the most coastal sage scrub and chaparral. This is not just a matter of conserving open space for plants and animals; the sage scrub and chaparral habitat provide fabulous and abundant storage of GHG. In another unrelated section the CAP it does state that: “Acquisition of conservation land reduces emissions that would have occurred if the land were developed and prevents the loss of critical habitat.” However, the CAP provides no analysis for the benefits of avoided conversion nor is the GHG savings of open space ever quantified in the CAP. Sierra Club respectfully asks for a new analysis in a revised EIR of how much carbon storage will be lost in the various Smart Growth alternatives. This must be included in a viable CAP.

O4-6
cont.

3. **Bar General Plan amendments.** Sierra Club’s third term states that the CAP should: **Bar General Plan amendments for increased commercial or residential development in Calfire’s high/highest fire risk areas and highest vehicle miles (VMT) travelled areas of the county.**

O4-7

As stated above, the Firesafe and low VMT program that would bar developments from the high and very high fire areas should be the stated preferred plan advocated by the County SEIR.

In fact, the CAP maintains that land use should NOT be part of the CAP. The SEIR explicitly states that: “Because the CAP mitigates for the General Plan, it cannot and does not make land use changes (although some of those changes are analyzed as Alternatives and can be directed by the Board along with CAP approval).” The CAP goes on to say that: “Because of the limited scope of the CAP tool, the County is also simultaneously working on a range of other programs to address climate change: a Sustainable Land Use Framework to address potential land use changes; a Regional Decarbonization Framework to provide a voluntary regional framework for governments and private entities to reduce carbon emissions; and a Transportation Program that will address VMT mitigation measures for development within the unincorporated county.” Sierra Club strongly believes that land use is a vital part of the CAP and must be included and analyzed. The County Regional Decarbonization plans are laudable voluntary programs but they must be central to the CAP not peripheral programs outside of the CAP. Similarly, an auxiliary transportation program that County says will “address VMT measures” should be a central component of the County CAP. Remember, VMT produces more GHG than any other source; the CAP and SEIR must make this a central part of the carbon reduction in the county.

O4-7
cont.

In summary, this CAP update fails to deal with land use, one of the most important issues in our Sierra Clubs term sheet for settlement of our existing litigation. Land use and corresponding VMT is absolutely central to a viable CAP. The Sierra Club respectfully requests that land use be included as a central part of a revised CAP.

4. **FANITA RANCH, HARVEST HILLS, LILAC HILLS, NEWLAND SIERRA, OTAY RANCH VILLAGE 13, 14, 16, 19, RANCHO GUEJITO.** Sierra Club’s fourth term stated: “Purchase Fanita Ranch, Harvest Hills, Lilac Hills, Newland Sierra, Otay Ranch Village 13, Otay Ranch Village 14/16/19, and Rancho Guejito to avoid conversion to development and/or as a natural habitat lands GHG mitigation bank.”

Sierra Club is gratified that the CAP has a strong provision for purchase of natural habitat lands. Although the Sierra Club finds nothing in the SEIR or CAP to purchase any of these specific tracts of land, the general CAP does say: “To preserve and manage the region’s unique, native habitats and wildlife biodiversity for future generations, the County will acquire conservation land and develop a framework for restoring these lands to their natural state. Acquisition of conservation land reduces emissions that would have occurred if the land were developed and prevents the loss of critical habitat. Through 2022, 8,766 acres have been acquired. A Habitat Restoration Resource Management Framework will guide the restoration and

O4-8

management of lands to increase carbon storage within the conserved areas.” Sierra Club is supportive of the CAP’s plan to acquire substantial additional conservation land.

Similarly, Sierra Club is generally supportive of three specific provisions that have been included in the CAP.

First, the CAP promises to “Acquire 11,000 acres of conservation land by 2030 and 1,000 acres per year thereafter to preserve land in perpetuity.” Sierra Club supports this provision.

Second the CAP states that the County intends to: “Develop a Habitat Restoration Resource Management Framework for County-owned land by 2030 and restore 80 acres per year thereafter to increase carbon storage.” Sierra Club supports the concept of such a habitat restoration program but wishes it would be substantially more than 80 acres per year.

Sierra Club supports a third provision that the County will: “Partner with tribal governments to incorporate tribal ecological knowledge and apply indigenous land management practices to contribute towards habitat restoration efforts on County land.”

In a revised CAP Sierra Club requests the provisions of metrics that estimate how much GHG would be avoided by preserving the aforementioned habitats.

O4-8
cont.

5. Recycling of organic waste. Sierra Club’s fifth term is to: **Establish a program to recycle 100% of all organic waste.**

The CAP incentivizes the development of new composting/anaerobic digestion facilities and on-farm digesters to divert compostable waste from landfills in the unincorporated area. Sierra Club is supportive of this measure.

The County CAP advocates for: “Solid Waste: Increased waste diversion and improved waste management practices.” More specifically it will create a “county-wide culture of avoiding, recycling, or composting waste, where emissions associated with landfills have been eliminated, and people have equitable access to recycling and compost facilities, opportunities for economic development, and are encouraged to reuse and share materials.” Sierra Club supports avoiding, recycling, and composting waste. However, a revised CAP should provide an estimate of how much GHG emission is avoided by such measures.

O4-9

The CAP proposes to continue this program through 2025. “In 2017, the County adopted the Strategic Plan to Reduce Waste, containing over 15 individual programs and initiatives to reduce various waste types and sources, such as reducing food and other organic waste generated from residential and commercial uses, to establish a 75% waste diversion target by 2025.” Sierra Club supports this ambitious goal.

O4-9
cont.

B. Additional Sierra Club 2021 terms for County facilities:

In addition to the five primary terms the Sierra Club provided a set of *additional terms* for changes at both **County facilities** and for the unincorporated county that should be included in the County CAP. **The County should implement the following additional measures to achieve net negative 100% GHG emissions by 2035:**

1. **Electrification of Facilities:** The first Sierra Club term recommends that **the CAP should include a provision to convert natural gas or propane utilities to electric at County facilities.**

O4-10

Sierra Club is supportive of the CAP measures to phase out GHG-producing natural gas and propane at County facilities. The CAP says that “the County will ensure County facilities are reducing its energy use intensity—the power needed to operate a building per square foot—and emissions through zero net energy construction, building electrification, and on-site renewable generation. For new and existing development, the County will develop policies and programs to transition to renewable energy powered buildings.” However, no analysis, timeline, or metrics are provided to offer details as to how this will be accomplished. Sierra Club respectfully requests that these details of how and when natural gas and propane will be phased out to County buildings and how and when the County will transition to “renewable energy powered buildings.” Like some other parts of this CAP, the plan is aspirational rather than stating defined actions and providing metrics.

2. **Renewables Upgrades:** The second Sierra Club term states: **Install photovoltaic solar panels, wind turbines, and/or other onsite renewable energy and batteries at County facilities.**

O4-11

The CAP and SEIR contain provisions on renewables that the Sierra Club generally supports. The CAP states: “The County has received certification in ‘Leadership in Energy and Environmental Design’ (LEED) for 29 County facilities through 2022, equating to 1,720,015 square feet of built resource efficiency.” Sierra Club applauds the County for this substantial progress toward renewable energy at County

facilities. However, this progress has already occurred; it is not a Climate Action Plan which must adopt policies for the **future**.

The CAP also says: “To continue this forward progress, the Zero Carbon Portfolio Plan, developed in 2021, outlines steps the County will take to further reduce operational carbon emissions. This measure will implement the Zero Carbon Portfolio Plan and demonstrate leadership and best practices in County facilities.” Although details are not provided, Sierra Club will await their availability in the County’s Zero Carbon Portfolio Plan.

The CAP also pledges: “to implement the County Facilities Zero Carbon Portfolio Plan to achieve 90% reduction in operational carbon emissions by 2030 through building electrification and zero net energy construction, energy efficiency, energy management, and renewable energy use and generation.” Sierra Club supports these general provisions.”

The CAP contains no specific plans for solar, wind, or other renewable energy sources nor does the CAP provide for battery storage of renewable energy. Sierra Club would like to see more details of renewable energy at County facilities in a revised EIR and CAP.

O4-11
cont.

3. **Electric Heat Pumps:** The third Sierra Club term was recommended to: **Install electric heat pumps to provide air and water heating and cooling at County facilities.**

There is no mention of heat pumps in the CAP. However, the CAP promises: “Through implementation of measures within this sector, the County will ensure County facilities are reducing its energy use intensity—the power needed to operate a building per square foot—and emissions through zero net energy construction, building electrification, and on-site renewable generation.” Again, these are good, though vague generalities; more detail is needed in a revised CAP on specific plans for county facilities to reduce its energy use intensity.

O4-12

4. **Install improved weatherization.** Although there is nothing specific on weatherization or insulation at County facilities in the CAP, it does provide for: “Lower utility rates through reduced consumption at County facilities. Improved energy efficiency and air quality in buildings that are often accessed by frontline communities for direct services.” It is likely that the CAP’s promise of improved energy efficiency would include measures like weatherization and insulation but the current statements lack sufficient specificity to know for sure.

The CAP also promises to: “Implement the County Facilities Zero Carbon Portfolio Plan to achieve 90% reduction in operational carbon emissions by 2030 through building electrification and zero net energy construction, energy efficiency, energy management, and renewable energy use and generation.” While more specificity would be desirable in a revised CAP, Sierra Club trusts that these efficiency measures would include insulation and weatherization.

O4-12
cont.

5. **Install graywater systems at County facilities.** The Sierra Clubs fifth term for reducing GHG at County facilities is installing gray water systems at County facilities.

The CAP says: “Through implementation of measures within this sector, the County will ensure all County facilities are installing water efficiency and water reuse systems wherever feasible.”

O4-13

Additionally, the CAP pledges to decrease GHG by: “Reducing potable water use in County facilities through the implementation of water efficient improvements and retrofit projects will reduce utility consumption and costs and conserve regional water resources.”

If these provisions are consistent with Sierra Club’s call to increase graywater use at County Facilities, then Sierra Club supports this provision.

6. **EV County fleet.** The sixth Sierra Club term for reducing GHG in County operations was to **convert County vehicle fleets to electric vehicles and plug-in hybrid electric vehicles.**

The CAP includes several relevant statements on the County fleet: “Expanding previous County efforts that have reduced fleet emissions by 10% in 2022, this measure will reduce the County fleet’s fossil fuel consumption by implementing County plans that guide fleet vehicle retirement and replacement with zero-emission options, increasing the use of cleaner fuels, and establishing policies that limit vehicle and small equipment emissions from County operations.” These are great goals supported by Sierra Club but again lacking detail, metrics, and timelines.

O4-14

The CAP also states that: “The 2019 Electric Vehicle Roadmap and 2023 Green Fleet Action Plan guide the transition of over 4,300 County vehicles and off-road equipment to zero emission options and cleaner fuels.” Sierra Club is supportive of these fleet improvements but would like more specificity, timelines, and metrics in a revised CAP.

Sierra Club praises the CAP's statement that: "Through 2022, the County has planned or installed 56 EV chargers that are available for the public and an additional 203 EV chargers for County fleet vehicles."

Similarly, we support this goal: "The County will prioritize clean transportation by supporting and incentivizing access to electric vehicles and charging infrastructure, particularly in frontline communities, converting the County fleet to electric."

These goals are on the right track but Sierra Club would like more specificity and timelines in a revised CAP.

O4-14
cont.

7. **County employee dividend account parking.** The seventh Sierra Club term for improvement at County facilities was: **Provide dividend account parking for all County employees.**

Unfortunately, Sierra Club can find no evidence of a plan for dividend account parking in the CAP. Sierra Club urges the County to provide a transportation stipend for all County employees while also charging for parking. This would provide a powerful incentive for thousands of County employees to walk, cycle, carpool, or take transit on their daily commutes. Sierra Club implores the County to include such a plan in the revised CAP.

The CAP does include a provision supported by Sierra Club that states: "Expand County Benefit Program by 2026 to provide County employees with tax-free transportation benefits, alternative work schedules, and expand part-time or full-time teleworking options to reduce vehicle miles traveled from employee commutes by 40% in 2030 and 64% in 2045." Sierra club supports these provisions by would like to see dividend account parking added to these measures.

O4-15

8. **Increase diversion of solid waste and capture landfill methane.** The eighth Sierra Club term for improvement at County facilities asked to increase solid waste diversion. Sierra Club supports and supports the County for their goal Provided in the CAP to capture GHG from landfills.

The CAP plans to reduce waste by: "Integrating recycling, reusing, and composting practices into the County's operations will reduce waste generation and increase waste diversion at County facilities. In 2022, County operations had an 80% diversion rate. This measure will expand upon previous practices (e.g., recycling, organic waste collection services, food waste prevention, working with waste haulers) to achieve zero waste (90% diversion) at County facilities by 2030."

O4-16

Additionally, the CAP Vision Statement says: “county-wide culture of avoiding, recycling, or composting waste, where emissions associated with landfills have been eliminated, and people have equitable access to recycling and compost facilities, opportunities for economic development, and are encouraged to reuse and share materials.”

The CAP contains another good provision that the Sierra Club supports: “Conduct a feasibility study by 2027 and implement a landfill gas system pilot project at privately managed landfills by 2030 to exceed State requirements by 10% by 2045 in the incorporated area. SW-4.1a Incentivize the development of new composting/anaerobic digestion facilities and on-farm digesters to divert compostable waste from landfills in the unincorporated area.” Sierra Club is highly supportive of these goals; the only caveat is that the Sierra Club would like to achieve these goals substantially earlier than 2045. Perhaps a revised CAP could revisit and accelerate these goals particularly since the CAP states that we are indeed in a “climate emergency.”

O4-16
cont.

9. **Prohibit all gas-powered leaf blowers.** Consistent with the Sierra Club ninth term, the CAP states that the County will: “Amend Board policy to require 100% of landscaping equipment used on County property to be zero-emissions by 2030.”

The need for this measure is provided in the CAP. “Emissions from smaller gas and diesel-powered landscaping and off-road equipment, such as leaf blowers, lawnmowers, and other handheld equipment and vehicles used for construction and recreation (e.g., all-terrain vehicles, small boats, motorbikes), accounted for two percent of emissions in the unincorporated area in 2019. Using incentive programs and new policy, this measure will accelerate adoption of alternative fuel and zero emission options for landscaping and off-road construction equipment for both household and professional use.” Sierra Club is supportive of these goals and looks forward to specific policy details from the Board of Supervisors. We take it that these plans include off-road equipment that is used by the County.

O4-17

Additionally, the CAP plans to: “Develop a program by 2026 to provide residents and businesses incentives to purchase alternative fuel and/or zero-emission construction and landscaping equipment to reduce emissions 3% by 2030. T-2.2 Develop and adopt a landscaping equipment ordinance to require the use of zero emission landscaping equipment by 2030 and zero emission construction equipment by 2045 in the unincorporated area.” This plan is consistent with the Sierra Club Zero Waste policies and is an exemplary provision.

10. **Plant and maintain trees.** Sierra Club’s tenth term encourages and the CAP proposes to plant more trees: The CAP states: “The County’s Department of Parks and Recreation (DPR) initiated its Tree Planting Program for the unincorporated area to plant a minimum of 3,500 trees annually starting in 2017 at County parks and open space preserves. Through 2022, 30,029 trees have been planted.” Sierra club supports the County’s existing tree planting initiative and implementation of an Equity Driven Tree Planting Program to plant 70,560 trees by 2030 and 6,650 trees per year thereafter on County property and in the unincorporated area. DPR, PDS (DPW, DGS) 70,560 trees 103,810 trees 137,060 trees 170,310 trees 2,498 MTCO₂e 3,675 MTCO₂e 4,852 MTCO₂e 6,029 MTCO₂e A-2.1a Develop a program to preserve native trees in the unincorporated area. DPR (PDS) Program developed and implemented GHG reductions not quantified for “Path to Net Zero” actions A-2.1b Educate the public on the benefits and maintenance of native, fire resistant, and drought-tolerant tree plantings. PDS Educational programs implemented GHG reductions not quantified for “Path to Net Zero” actions A-2.2 Implement the County’s Landscaping Ordinance to require tree planting in new single family residential development in the unincorporated area.

O4-18

Additionally, the CAP proposes that: “Trees can be significant sources of carbon capture and storage due to their size and longevity. From 2015 to 2022, the Tree Planting Program at County Parks has planted 30,029 trees. This measure expands this effort to comprehensively focus on the preservation and expansion of tree canopy in the unincorporated area through the implementation of an Equity Driven Tree Planting Program to improve air and water quality, and community health. Tree planting also enriches local ecosystems, supports biodiversity, provides shade, prevents soil erosion, and buffers against wind and noise.” Sierra Club concurs with this analysis.

Specifically, the CAP plans to: Expand the County’s existing tree planting initiative and implement an Equity Driven Tree Planting Program to plant 70,560 trees by 2030 and 6,650 trees per year thereafter on County property and in the unincorporated area. A-2.1a Develop a program to preserve native trees in the unincorporated area. A-2.1b Educate the public on the benefits and maintenance of native, fire-resistant, and drought tolerant tree plantings. A-2.2 Implement the County’s Landscaping Ordinance to require tree planting in new single family residential development in the unincorporated area.

Additionally, the CAP includes the following provisions which are supported by the Sierra Club.

<p>a. Expand the County's existing tree planting initiative and implement an Equity Driven Tree Planting Program to plant 70,560 trees by 2030 and 6,650 trees per year thereafter on County property and in the unincorporated area.</p> <p>b. Develop a program to preserve native trees in the unincorporated area.</p> <p>c. Educate the public on the benefits and maintenance of native, fire-resistant, and drought tolerant trees.</p> <p>d. Implement the County's Landscaping Ordinance to require tree planting in new single family residential development in the unincorporated area.</p>	<p>O4-18 cont.</p>
<p>11. Collaborate with SANDAG to support and implement the Five Big Moves. Sierra Club's eleventh term requests that the County CAP to support an expanded county transportation system that extends practical, user-friendly transit into the unincorporated county. Sierra Club is disappointed that there is no mention of SANDAG "Five Big Moves" in the CAP of the EIR. However, also see the related term 12 below.</p> <p>12. Support short term extension of mass transit prior to implementation of SANDAG's "Five Big Moves." The Sierra Club is very disappointed that the CAP provides virtually no plans for extension of mass transit into the county. All that is provided in the CAP is an equivocal plan to "(e)valuate options for increasing transit service to unincorporated communities." Evaluating is not exactly a viable plan. The largest share of GHG comes from transportation. No CAP is viable if it fails to provide a transit plan that reduced driving and increase mass transit. Sierra Club respectfully requests that some real, concrete plans be provided in a revised CAP.</p> <p>The CAP establishes that "few areas served by public transportation particularly in semi-rural and rural communities." So, the need for viable public transportation in the unincorporated area is established.</p>	<p>O4-19</p>
<p>13. <u>Support construction of bicycle trails and protected lanes for bikes and scooters.</u></p> <p>The CAP incorporates a general vision that includes provisions for: "Complete communities that leverage the unique characteristics of the unincorporated area, support critical services and amenities such as local businesses, parks, and libraries, include accessible options such as sidewalks and bike lanes, and where infrastructure to support public transportation and zero-emission vehicles is widely available."</p>	<p>O4-20</p>

More specifically, the CAP seeks to: “Implement the County's Active Transportation Plan to install 345 miles of sidewalk and 315 miles of bikeways by 2030 to encourage alternative modes of transportation in the unincorporated area.” Sierra Club contends that this increase of sidewalks and bikeways is extremely inadequate across the entire county! These measures should be expanded in a revised CAP if the County is serious about people using bicycles for transportation.

O4-20
cont.

Sierra Club does support the CAP provision to: “Provide educational programs and campaigns to encourage County staff to walk, bike, and take transit.”

14. Support installation of public electrical vehicle charging stations. The CAP is supportive of this term and states: “In conformance with state law, the County’s EV charger installation permitting system is streamlined to help unincorporated residents apply online and receive same day permits for residential EV charging stations.”

Likewise, we support the CAP provision: “To reduce GHG emissions and air pollution from fossil fuel powered internal combustion engine vehicles, the County will facilitate a transition to zero emission vehicles (ZEVs) by helping to overcome drivers’ concerns about up-front ZEV purchase price and a lack of access to charging stations. Through 2022, the County has planned or installed 56 public electric vehicle chargers. This measure will continue to expand access to charging stations and increase the number of ZEVs on the road through policy changes, ZEV infrastructure improvements, and incentive programming that increases access to ZEVs for priority populations.”

O4-21

Sierra Club also supports the CAP provision to: “Increase the use of electric and other zero-emission vehicles in the unincorporated area by: - Installing 2,040 publicly available electric vehicle charging stations by 2028. - Requiring the electrification of loading docks and idling reduction in new commercial and industrial development by 2030. - Amending the County’s Code of Regulatory Ordinances by 2026 to require (Tier 2) CALGreen or similar electric vehicle charging infrastructure installations and preferential parking for ZEVs for new multi-family residential and non-residential construction. - Developing a program by 2026 to incentivize EV purchases and school bus electrification.”

“Amending the County’s Code of Regulatory Ordinances by 2026 to require (Tier 2) CalGreen or similar electric vehicle charging infrastructure installations and preferential parking for ZEVs for new multi-family residential and non-residential construction. Sierra Club supports preferred parking for ZEVs and would like it extended to all locations in the county.”

15. **Support construction of pedestrian overpasses and other pedestrian infrastructure.**

The CAP does not refer to bridges or overpasses but it does offer the following which may be consistent with the Sierra Club Term: “The Active Transportation Plan improves pedestrian and bicycle safety and identifies opportunities to create a network of interconnected sidewalks.” Likewise, the CAP says they plan to “(l)implement the County’s Active Transportation Plan to install 345 miles of sidewalks.” Sierra Club strongly recommends that the sidewalk expansion plan be dramatically increased in a revised CAP.

O4-22

16. **Support establishment of a local natural habitat lands GHG mitigation bank.** Sierra

Club’s sixteenth term provides for a local natural habitat lands GHG mitigation bank with avoided conversion to development and conservation management in perpetuity of habitat land inside or bordering existing or planned regional multiple species conservation plan preserves (e.g. City of San Diego Multiple Habitats Planning Area or County of San Diego Pre-Approved Mitigation Area) or the Cleveland National Forest inholdings.

For many years Sierra Club has advocated for a mitigation bank within the County of San Diego and discussed it in many interactions with the County. Sierra Club is disappointed that there is no provision for a within-county mitigation bank in the CAP or SEIR. Nonetheless, plans for expanding MSCP land is related. Please see subsequent detailed discussion of MSCP discussion in a later part of this letter.

O4-23

17. **Support establishment of a local disadvantaged communities GHG mitigation bank.** Sierra Club’s seventeenth term provides for establishment of a local

disadvantaged communities GHG mitigation bank with replacement of commercial or personal GHG-emitting vehicles and equipment with electric vehicles and equipment, commercial or residential electrification, and other energy efficiency improvements to businesses or residences.

Sierra Club find no provision in the cap for a mitigation bank. A private mitigation ban is already being established at the San Diego Foundation. Under this plan, GHG from construction projects that cannot mitigated on-site, would be mitigated through contributions to the San Diego Foundation mitigation bank. Funds from the mitigation bank would be used for projects to reduce GHG. Sierra Club strongly recommends including such a public or private mitigation bank in revised CAP.

C. Additional Sierra Club 2021 terms for businesses and residents.

Sierra Club provided a set of measures in our 2021 term sheet for existing businesses and residences: **The County should provide incentives and subsidies to existing businesses and residences for the following measures to achieve net negative 100% GHG emissions by 2035:**

1. **Conversion of natural gas or propane utilities to electric.** Residential power use constitutes the second largest share of GHG in San Diego County. The CAP does provide some measures to deal with this source of GHG.

The CAP does include a provision that Sierra Club generally supports to: “Increase energy efficiency and reach 30% electrification in residential and 17% electrification in non-residential existing development in the unincorporated area by 2030 by: - Amending the County’s Code of Regulatory Ordinances to require (Tier 2) CALGreen or similar energy efficiency requirements for existing development projects with qualifying improvements. - Adopting a Building Energy Performance Standard by 2026 for commercial and multi-family residential properties. - Developing a program by 2026 to incentivize building electrification and energy efficiency.” Sierra Club is generally supportive of this provision in the CAP and will await the details of the program.

One proposal in the CAP is to “Develop a program to phase out propane use for existing buildings.” Sierra Club supports this goal.

However, and most importantly, these plans need to be reconciled with the County’s plan provided in the SEIR to provide “100 percent renewable electricity by 2030” which appears to contradict this provision. In a revised CAP and a revised EIR these plans need to be consistent to provide a coherent roadmap for the County’s Climate Action Plan. We recommend the staff working on the CAP and other staff members working on the EIR collaborate to resolve these seemingly inconsistent provisions in the CAP and the SEIR.

O4-24

2. **Installation of photovoltaic solar panels and/or other onsite renewable energy and batteries.** Sierra Club strongly supports the CAP provision for “(t)ransitioning away from fossil fuels and towards clean and renewable energy sources, such as solar photovoltaics and wind generated power, is essential to reducing the unincorporated area’s GHG emissions and supporting a more sustainable future.”

The CAP points to considerable progress in permitting solar in the county. “The County has permitted residential solar power equivalent of nearly 81,000 homes through 2022. Over 90% were permitted through the County’s Online Permits platform.” It would be interesting to know what percentage of homes in the county

O4-25

have implemented Solar power as well as plans to provide regulations or incentives to increase the penetration of solar across the county.

The CAP acknowledges the need for more wind and solar power “(t)ransitioning away from fossil fuels and towards clean and renewable energy sources, such as solar photovoltaics and wind generated power, is essential to reducing the unincorporated area’s GHG emissions and supporting a more sustainable future.” What needs to be included in a revised CAP are estimates of how much GHG will be avoided through the use of these alternative energy sources. Moreover, Sierra Club would like to see a provision by the County for require solar in all new construction.

The CAP makes several proposals for the implementation of increased solar in the unincorporated county. The CAP proposes to: “E-3.2 Expand and implement the County’s streamlined solar permitting process to install 5,002 kW of renewable energy on existing development by 2030 and 12,505 kW by 2045.” Sierra Club supports any proposal in the CAP to maximize solar implementation in the county. It is unclear, however, if this is an annual kW production of renewable energy; this should be clarified in a revised cap.

The CAP plans to: “E-3.2a Develop a program to incentivize renewable energy on low-income homes.” Sierra Club believes this is an excellent goal but, greater details on these incentive programs need to be provided. Sierra Club favors subsidies to residents of low-income homes from a mitigation fund or from general revenues to create more renewable energy in low-income homes and communities.

Additionally, the CAP proposes to: “E-3.2b Work with partners to promote and support on-site renewable (wind and solar) energy generation and storage (microgrids, Site-specific and/or community scale) to increase renewable energy generation and use in the unincorporated area.” Sierra Club strongly supports the CAP proposal to support renewable energy generation and storage and will await specific plans for the implementation of this measure in a revision CAP or other measures passed by the County.

Also, the CAP will: “E-3.2c Support local job training program for solar installation to support green economy workforce development.” Again, the Sierra Club supports job training and retraining for the green economy and looks forward to specific plans to realize this goal.

Finally, the CAP seeks to: “E-3.3 Develop a program to provide 100% renewable energy to residents and businesses participating in San Diego Community Power by

O4-25
cont.

2030 in the unincorporated area.” Sierra Club strongly supports this goal but needs detail on how it will be developed and implemented.

O4-25
cont.

3. **Installation of electric heat pumps to provide air and water heating and cooling.**

Sierra Club can find nothing in the CAP that calls for installation of electric heat pumps to provide air and water heating and cooling in existing businesses or residences. This constitutes a major oversight that should be corrected in a revised CAP.

Other water programs are proposed in the CAP. “Amend the County’s Code of Regulatory Ordinances by 2026 to require (Tier 2) CALGreen or similar water efficiency requirements for existing development projects with qualifying improvements.” Additionally, the CAP proposes to “(u)pdate the Green Building Incentive program by 2026 to include incentives for water efficiency, conservation, and reuse improvements for new and existing development to reduce potable water consumption in the unincorporated area.” These are good plans but they are incomplete, aspirational, and abstract. Moreover, they fail to address efficient building electrification.

O4-26

4. **Installation of improved weatherization and insulation.** There is no specific mention of weatherization or insulation in the CAP. Specific recommendations and plans for increasing weatherization and insulation in existing businesses and residences should be included in a revised CAP.

“Supporting the transition to efficient, renewable energy powered homes and businesses creates additional co-benefits, such as improved public health,”

Increase energy efficiency and reach 30% electrification in residential and 17% electrification in non-residential existing development in the unincorporated area by 2030 by: - Amending the County’s Code of Regulatory Ordinances to require (Tier 2) CALGreen or similar energy efficiency requirements for existing development projects with qualifying improvements. - Adopting a Building Energy Performance Standard by 2026 for commercial and multi-family residential properties. - Developing a program by 2026 to incentivize building electrification and energy efficiency.

Develop a voluntary energy assessment/benchmarking program for existing development to identify opportunities for energy efficiency improvements.

5. Installation of graywater systems.

There are a couple of relevant provisions on graywater in the CAP. First, “Update the Green Building Incentive program by 2026 to include incentives for water efficiency, conservation, and reuse improvements for new and existing development to reduce potable water consumption in the unincorporated area.” And more specifically, the CAP recommends that the County needs to: “Collaborate across County departments to streamline and simplify graywater capture permitting process to reduce potable water use in the unincorporated area. DEHQ (PDS) Permitting processes streamlined GHG reductions not quantified for “Path to Net Zero” actions.” Sierra Club also supports the CAP provision to “(d)evelop and distribute materials to assist renters with implementing water efficiency and conservation improvements.” As in other sections of the CAP, this plan is overly aspirational and fails to provide for its implementation and funding.

O4-27

6. Planting and maintaining trees.

See previous detailed Sierra Club response on trees (*infra* paragraph 10). The County’s Multiple Species Conservation Program (MSCP) and Tree Planting Program help preserve and strategically grow the county’s unique, native habitats and tree canopy and ensure development happens in the right areas. Sierra Club supports an expanded tree planting program.

O4-28

7. Free mass transit passes to students and residents of disadvantaged communities.

There are relevant proposal for this term in the CAP. “Prioritize distribution of transit passes to frontline communities.” And “create incentive programs that expand transit access and affordability for children, seniors, and low-income families.” And “Develop a program to provide free transit passes and/or free trips in the unincorporated area to reduce vehicle miles traveled in the unincorporated area by 1.2% by 2030.” These are excellent provisions that Sierra Club support that will reduce VMT and GHG as well as providing co-benefits to the residents. Sierra Club recommends that in the revised CAP a more aggressive free transportation program be provided that reduces VMT by more than 1.2%. Transportation is the only area of government that expects it to pay for itself: It is never asked of schools, fire protection, or police. Sierra Club recommends free transit passes be provided to all county residents.

O4-29

Another vague, but related, measure in the CAP the Sierra Club supports, recommends that the County can partner with the region’s transit agencies (e.g., San Diego Metropolitan Transit System, North County Transit District) to support transit ridership for unincorporated area residents.

<p>There is another related provision in the CAP, EV purchases and schools bus electrification incentives are developed first and/or are bigger for frontline communities. The County appears to be complying with this Sierra Club term.</p>	<p>O4-29 cont.</p>
<p>8. <u>Carpooling.</u></p>	
<p>The CAP seeks to “remove obstacles to individuals using public transit and ridesharing for trips in the unincorporated area.” Again, because this is vague and aspirational without specific plans, the Sierra Club requests more specific plans for ridesharing.</p>	<p>O4-30</p>
<p>9. The ninth Term for existing businesses and residents advocated: <u>Purchase of electric vehicles.</u> The CAP contains the following provision which is somewhat responsive to this Sierra Club term. The County will prioritize clean transportation by supporting and incentivizing access to electric vehicles and charging infrastructure, particularly in frontline communities.” While this is an excellent goal, Sierra Club recommends that the revised CAP provide the specific regulations, subsidies, and incentives to achieve this goal.</p>	
<p>Similarly, Sierra Club supports the CAP’s provision to provide that: “EV charging installations prioritized in frontline communities. EV purchases and schools bus electrification incentives are developed first and/or are bigger for frontline communities. Reduced medium- and heavy-duty vehicles’ contribution to air pollution burdens (e.g., carbon monoxide, carbon dioxide, particulate matter, and high asthma rates) faced by frontline communities.</p>	<p>O4-31</p>
<p>10. <u>Free parking for electric vehicles.</u> The CAP contains no measure for providing free parking for electric vehicles. The CAP does recommend: “(a)mending the County’s Code of Regulatory Ordinances by 2026 to require (Tier 2) CalGreen or similar electric vehicle charging infrastructure installations and preferential parking for ZEVs for new multi-family residential and non-residential construction.” This is a good proposal that should be extended to all business and residential areas of the county.</p>	
<p>11. <u>Capture methane from agricultural facilities.</u> The CAP contains the following provisions: “Agriculture and Conservation: Increased preservation and restoration of natural and working lands and transitions to efficient and zero-emission agricultural equipment.”</p> <p>“Natural and agricultural lands are preserved, invested in, and optimally managed to capture carbon, support the local food and farming community, maintain biodiversity, and provide access to healthy outdoor spaces.”</p>	<p>O4-32</p>

“Emissions associated with this sector accounted for four percent of the total emissions in 2019. Natural and working lands are uniquely positioned to capture and store carbon in soil, plants, and crops. Total carbon stock in the unincorporated area was approximately 178 million metric tons of carbon dioxide equivalent as of 2016. Evaluating the carbon storage potential in the carbon stock estimates (Appendix 6) helped identify and calculate how improved agricultural practices and land management strategies within the County’s jurisdiction can increase the amount of carbon captured on these lands to help the County meet its net zero emission goals.”

“Support Climate-Friendly Farming Practices and Preserve Agricultural Land.”

“Incentivize the development of new composting/anaerobic digestion facilities and on-farm digesters to divert compostable waste from landfills in the unincorporated area.”

“A-4: Incentivize carbon farming to expand carbon storage capacity on agricultural land and support climate-friendly farming practices in the unincorporated area.”

“Evaluate options to incentivize voluntary alternative manure management and livestock feed projects to reduce manure management and enteric fermentation emissions in the unincorporated area.”

“Develop a Carbon Farming Program by 2026 to increase carbon sequestration on 3,000 acres by 2030 and 36,214 acres by 2045.”

Sierra Club requests that the CAP include incentives to use animals rather than off road vehicles to clear grass and brush.

However, Sierra Club supports these measure which are consistent with term 11.

12. **Avoided conversion to development of agricultural cropland.** Avoided conversion is not mentioned per se. However, the below terms speak to the preservation of agricultural land which Sierra Club supports.

“Implement the Purchase of Agricultural Conservation Easement (PACE) Program to preserve 6,058 acres of agricultural land by 2030 and 400 acres per year thereafter.”

“To maintain the County’s agricultural landscape, economy, and food source for years to come, the County will implement the Purchase of Agricultural Conservation Easements (PACE) Program, which compensates willing property owners for placing

O4-32
cont.

a perpetual easement on their property to limit its use to agriculture. This program preserves agricultural land by eliminating future development potential and making continued agricultural use more viable. Between 2015-2022, the PACE Program has preserved 2,135 acres.”

“VISION STATEMENT: Natural and agricultural lands are preserved, invested in, and optimally managed to capture carbon, support the local food and farming community, maintain biodiversity, and provide access to healthy outdoor spaces.”

“The preservation and long-term viability of agricultural working lands in the unincorporated area is critical. Climate change is threatening the ability of farmers to grow food.”

“The County will preserve natural and agricultural lands, incentivize climate-friendly farming practices, and expand tree planting across our unincorporated communities.”

O4-32
cont.

13. **Production and distribution of locally grown produce and foods.** These provisions in the CAP is consistent with this Sierra Club term. “Support the local food system through development of a food sourcing policy that prioritizes contracts with local, equitable, and sustainable food suppliers in County operations.”

“Natural and agricultural lands are preserved, invested in, and optimally managed to capture carbon, support the local food and farming community, maintain biodiversity, and provide access to healthy outdoor spaces.”

“The County’s Regional Decarbonization Framework Technical Report a science-based analysis of decarbonization pathways, and the Let’s Get There Playbook, a resource guide created to support the Regional Decarbonization Framework, consider how Food Systems, or all aspects of food production, use, and disposal, can support GHG reductions by using cleaner fuels and sustainable agricultural practices (e.g., agriculture easements, carbon- farming, urban gardens).” Sierra Club supports a regional decarbonization framework and looks forward weighing in on that plan.

The CAP also recommends to: “Develop a Carbon Farming Program by 2026 to increase carbon sequestration on 3,000 acres by 2030 and 36,214 acres by 2045.” Sierra Club is in support of a carbon farming program.

The CAP also references the fact that: “On June 8, 2021, the Board of Supervisors approved the use of \$7 million in American Rescue Plan Act funding to support the

development of community food production projects in communities disproportionately impacted by COVID-19. The \$7 million is part of \$20 million in total funding allocated to strengthening access to fresh, healthy food in the region.”

O4-32
cont.

D. Additional Sierra Club 2021 terms for future public and private commercial development

Finally, in our January 2021 Term Sheet for the County CAP, Sierra Club Proposed a set of terms to minimize GHC emissions in **future** public and private commercial development. We proposed the following terms in new construction to: Minimization of GHG Emissions – Public projects and private commercial developments shall minimize onsite GHG emissions by incorporating climate-friendly and environmental design to the maximum extent feasible with the minimum following conditions:

1. **Developments shall be electric and prohibit plumbing for natural gas.** The CAP proposes that in all residential, commercial, or industrial new construction to: “Amend the County’s Code of Regulatory Ordinances by 2026 to require all-electric equipment in new residential, commercial, and industrial construction to reduce energy emissions from new development in the unincorporated area.” This provision is consistent with term 1 and Sierra Club is extremely supportive of this provision in the CAP to require all new development to be electric.

2. **Developments shall include photovoltaic solar panels and/or other onsite renewable energy and onsite batteries to provide 100 percent of any project’s annual electricity needs.** The CAP included the following provision: “E-3.1 Amend the County’s Code of Regulatory Ordinances by 2026 to require (Tier 2) CALGreen or similar renewable energy requirements for new residential and non-residential construction to increase renewable energy generation in new development.” Sierra Club supports this amendment but suggests it be strengthened to require that all new development use 100% renewable energy.

O4-33

“Expand and implement the County’s streamlined solar permitting process to install 5,002 kW of renewable energy on existing development by 2030 and 12,505 kW by 2045.” Sierra Club is generally supportive of this measure and want the County to take steps to maximize solar energy production in the county.

Sierra Club largely supports this measure and calls for increased electrification beyond these goals. “Increase energy efficiency and reach 30% electrification in residential and 17% electrification in nonresidential existing development in the unincorporated area by 2030 by: Amending the County’s Code of Regulatory

Ordinances by 2026 to require (Tier 2) CALGreen or similar energy efficiency requirements for existing development projects with qualifying improvements. - Adopting a Building Energy Performance Standard by 2026 for commercial and multi-family residential properties. - Developing a program by 2026 to incentivize building electrification and energy efficiency.”

“Amend the County’s Code of Regulatory Ordinances by 2026 to require (Tier 2) CALGreen or similar renewable energy requirements for new residential and non-residential construction to increase renewable energy generation in new development. PDS 43,000 kW installed 97,000 kW installed 146,000 kW installed 198,000 kW installed 252 MTCO2e 69 MTCO2e 28 MTCO2e 0 MTCO2e E-3.2 Expand and implement the County’s streamlined solar permitting process to install 5,002 kW of renewable energy.”

3. **Developments shall include electric vehicle charging stations to serve all projected project-related vehicles.** Sierra Club is in support of these measures that are consistent with our third term: “T-3: Install electric vehicle charging stations and provide incentives for zero-emissions vehicles in the unincorporated area.”

O4-33
cont.

“Amending the County’s Code of Regulatory Ordinances by 2026 to require (Tier 2) CalGreen or similar electric vehicle charging infrastructure installations and preferential parking for ZEVs for new multi-family residential and non-residential construction.”

“Switching from fossil-fuel based on-road and offroad vehicles and equipment to those that are zero emission or use cleaner fuels is key to reducing GHG emissions from this sector. The County will prioritize clean transportation by supporting and incentivizing access to electric vehicles and charging infrastructure, particularly in frontline communities, converting the County fleet to electric.”

4. **Developments shall include electric heat pumps to provide one hundred percent of air and water heating and cooling.** While the CAP discussed increased energy efficiency at a number of points, there is nothing in the CAP specifically regarding heat pumps.

5. **Developments shall prohibit vehicle idling.** The CAP contains several measure that the Sierra Club supports: “Adopt a County Operations anti-idling policy to reduce emissions from vehicle idling.”

“Requiring the electrification of loading docks and idling reduction in new commercial and industrial development by 2030.”

6. **Developments shall include graywater systems.** Sierra Club support the CAP provision to “(a)mend the County’s Code of Regulatory Ordinances by 2026 to require (Tier 2) CALGreen or similar water efficiency requirements and reduced outdoor water use for landscaping requirements for new development to reduce potable water consumption from new development by 17% in the unincorporated area.”
7. **Developments shall minimize water consumption.** Happily, the CAP proposes plans to reduce water consumption in new construction. “Update the Green Building Incentive program by 2026 to include incentives for water efficiency, conservation, and reuse improvements for new and existing development to reduce potable water consumption in the unincorporated area.” Sierra Club looks forward to working with the County on strategies to minimize water consumption.
8. **Developments shall include shade trees.** The CAP proposed to implement this Sierra Club term. The CAP proposes to “(i)mplement the County’s Landscaping Ordinance to require tree planting in new single family residential development in the unincorporated area.
9. **Developments shall provide transit passes to residents.** The Sierra supports the following provisions in the CAP but calls for a substantial expansion of these two provisions.

 “Develop a program to provide free transit passes and/or free trips in the unincorporated area to reduce vehicle miles traveled in the unincorporated area by 1.2% by 2030.”

 “Prioritize distribution of transit passes to frontline communities.”

O4-33
cont.

E. Mitigation and Offsets in the SEIR

Sierra Club is grateful that the new County CAP removed the out-of-county offset mitigation measure (M-GHG-1) that was declared illegal by both the San Diego Superior Court and the California Court of Appeals. However, Sierra Club objects to the CAP’s encouragement of the use of offsets for General Plan Amendment (GPA) projects, without any direction on adequate protocols, as detailed in the letter by Chatten-Brown Law Group. (Supplemental EIR, p. 5-7.)

First and foremost, Sierra Club advocates for transit-oriented development, and opposes GPA projects that increase development in high VMT, high fire severity areas, and result in significant GHG impacts.

O4-34

But, if the County does proceed with a GPA project, it must ensure the Project is **net negative 100%, or at least** carbon neutral, so it will not impede the County's ability to achieve the CAP's GHG reduction targets. In these instances, Sierra Club advocates for an in-county mitigation program established by a third-party administrator, such as the San Diego Foundation. The in-county program should ensure rigorous and effective protocols, in compliance with *Golden Door* and the below outlined terms.

Mitigation of GHG Emissions – To the extent that onsite minimization of any public or private commercial development project's GHG emissions to net negative 100% is not feasible, offsite GHG mitigation shall be provided to achieve net negative 100% GHG emissions that is in addition to any existing laws, regulations, or plans already compelling reductions in GHG emissions. The Sierra Club term requested that new:

1. **Developments' GHG offsite mitigation shall be entirely within San Diego County and within the same disadvantaged communities as emissions.** During numerous CAP workshops conducted by the County, Sierra Club has advocated for a within-county mitigation bank.

Sierra Club is disappointed the CAP specifies that offsets can still be used for GPA projects, without providing any **legally binding** requirements or protocols to ensure compliance with *Golden Door* and in-County off-site mitigation.¹ If the CAP is going to still allow for the use of offsets for GPA projects, Sierra Club urges the revised CAP to explicitly require within-county GHG mitigation.

2. Sierra Club recommended that: **Offsite GHG mitigation may include any of the following:**

- a) Preservation of natural habitat land inside or bordering existing or planned regional multiple species conservation plan preserves (e.g. City of San Diego Multiple Habitats Planning Area or County of San Diego Pre-Approved Mitigation Area) or private holdings within Cleveland National Forest. Preservation of natural habitat land as GHG mitigation shall include private property acquisition and conservation stewardship management in perpetuity. The amount of GHG mitigation provided by preservation of natural habitat land shall be determined

O4-34
cont.

¹ The CAP does contain the following provision: "Because of the limited scope of the CAP tool, the County is also simultaneously working on a range of other programs to address climate change: a Sustainable Land Use Framework to address potential land use changes; a Regional Decarbonization Framework to provide a voluntary regional framework for governments and private entities to reduce carbon emissions; and a Transportation Program that will address VMT mitigation measures for development within the unincorporated county." We are similarly disappointed that a Sustainable Land Use Framework to address potential land use changes and a Regional Decarbonization Framework to provide a voluntary regional framework for governments and private entities to reduce carbon emissions is not incorporated in the CAP.

by calculating reduced GHG emissions on the property over one hundred years resulting from avoided conversion to development of the number of existing legally entitled or zoned units and/or square feet on the preserved property.

- b) Direct replacement of GHG-emitting vehicles and equipment (e.g. diesel generators) with electric vehicles and electric equipment including at any site under the jurisdictional authority of the Port of San Diego (including cargo and cruise ship terminals), of the Metropolitan Transit System, of the North County Transit District, and of the San Diego Airport Authority.
- c) Create environmental justice grant programs in disadvantaged communities for direct replacement of commercial or personal GHG-emitting vehicles and equipment with electric vehicles and equipment, commercial or residential electrification, and other energy efficiency improvements to businesses or residences.

O4-34
cont.

As noted earlier, it appears the Draft SEIR provides that General Plan Amendment projects could use mitigation measures or offsets. As stated in the CAP: “The CAP Update does not prohibit the use of carbon offsets where appropriate to address the GHG emissions of projects that would require amendments to the General Plan and that would not rely on the CAP Update for GHG reductions (i.e., projects that would be outside of the scope of the General Plan and would conduct project-level GHG emissions modeling and recommend project-specific mitigation, and would not attempt to streamline evaluation of GHG emissions using the tiering and streamlining provisions of State CEQA Guidelines Section 15183.5). CEQA Guidelines Section 15126.4(c)(3) allows mitigation through “off-site measures, including offsets that are not otherwise required, to mitigate a project’s emissions.”

If GPAs are allowed to utilize offsets, the offsets must be in-County, and compliant with *Golden Door*. The best approach to ensure this is for the County to establish an in-County GHG mitigation program.

Sierra Club respectfully requests that a revised CAP specify that any off-site GHG mitigation for GPA developments occur solely within San Diego County.

F. Smart Growth Alternatives

In accordance with our Golden Door victory, the SEIR was required to consider Smart Growth Alternatives that would additionally reduce GHG. These are discussed in detail in: Chapter 5, “Alternatives,” of this SEIR includes an analysis of four smart growth alternatives to the project: a Fire Safe and VMT Efficient Alternative, a Village Support Areas Alternative, an alternative consistent with the RTP/SCS, and an alternative that includes potential amendments to General

O4-35

Plan goals and policies. These alternatives were crafted based on their ability to reduce VMT and on extensive stakeholder engagement.

“This draft SEIR also includes consideration of smart growth alternatives that are intended to significantly reduce VMT as required by the Court of Appeal for Division One of the Fourth Appellate District (Appellate Court) in *Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467. The smart growth alternatives discussed below propose actions that, if adopted in addition to the CAP update measures and actions, are intended to further reduce GHG emissions by reducing VMT through changes in development patterns. Note, however, that the efficacy of alternatives focused on incentives and disincentives for future development is limited because most forecast VMT in the unincorporated county is associated with existing development.” Sierra Club and the requirements for smart growth are for future avoided development and corresponding future VMT that should be prevented if the County is to reach its goals for GHG reduction.

O4-35
cont.

Appendix C of the DEIR provides for an analysis of Smart Growth Alternatives and the impact on VMT authored by Fehr and Peers. Four alternatives were considered.

1. Project scenario – SANDAG Regional Plan EIR Alternative 2 land uses and transportation network.

This is the County’s primary recommendation in the EIR. For this scenario data used the “SANDAG Regional Plan EIR Alternative 2 (Data Set 39) that projects relative to the year 2016, growth in the unincorporated county of 14,706 new households by 2035 and 18,707 by 2050.” Sierra Club does not support this smart growth alternative for several reasons:

- a) Such a plan would produce considerably more GHG than alternatives that authorize fewer new households.
- b) This plan would result in more development in previously undisturbed land that would both reduce the carbon sink of native vegetation and would continue to threaten protected species.
- c) Such a plan would substantially increase the chance of fire; fires contribute huge amounts of GHG.
- d) Such a plan would necessarily exacerbate evacuation during wildfire. Many areas of the unincorporated county are already among the most difficult areas to evacuate in California. This plan would worsen residents’ ability to evacuate.

The land use assumptions contained in Data Set 39 are consistent with historical growth patterns in the unincorporated county and reflect expected growth consistent with the General Plan for the County.

Sierra Club believes that the County CAP should NOT be consistent with a 2011 general plan when climate change was not a primary concern. Allowing this much growth will increase VMT

and GHG, create greater fire risk and evacuation problems in the county, destroy vital conservation areas and increase traffic.

O4-35
cont.

2. One alternative Smart Growth plan is the: **2021 Regional Plan Sustainable Communities Strategy (SCS) Alternative – SANDAG 2021 Regional Plan land uses and transportation network.**

The model used the road user charge proposed by SANDAG. “The adopted SANDAG 2021 Regional Plan assumes 9,902 new households in the unincorporated County between the base year and 2050 (with almost all of the growth occurring between the base year and 2035). Additionally, the 2021 Regional Plan/SCS version of the model includes the Road User Charge as a funding source for the Regional Plan.”

However, the SANDAG Board voted on September 22, 2023, against including the “Road User Charge” in the 2025 Regional Plan. So, this alternative is either gone or unlikely to progress.

This alternative would result in the least VMT but is dependent on a road use charge that is unlikely to be adopted. Moreover, the widely unpopular road use tax may cause poor publicity for Sierra Club if we advocate for it. Moreover, nobody would have any idea how much VMT would be reduced without the road use tax.

SANDAG did a new analysis that Sierra Club provides: “The amendment removes the regional RUC (road use tax) of 3.3 cents per mile starting in 2030. The resulting decrease in the cost to operate an automobile, results in an increase in single occupancy drivers that would cause an increase in vehicle miles traveled (VMT) and an increase in GHG emissions and air pollutants from tailpipe emissions compared to the 2021 Regional Plan. The amendment results in an increase of 1.3 million VMT per day in 2035. This results in a 18.6% per capita reduction in GHG emissions in 2035 relative to 2005 levels.” Thus, this plan would not achieve the desired reductions in VMT and GHG outlined in the SEIR.

O4-36

3. **SEIR’s “Sustainable Communities Strategy Alternative”**

“The Regional Plan incorporates smart growth planning concepts into a regional growth pattern focused around “Mobility Hubs.” Mobility Hubs are envisioned as places of activity where capital transportation investment will support future housing and jobs and encompass areas that are both within incorporated city boundaries and within the unincorporated county.”

The adopted SANDAG 2021 Regional Plan assumes 9,902 new households in the unincorporated county between the base year (2016) and 2050 (with almost all of the growth occurring between the base year and 2035). Additionally, implementation of the Road User Charge is assumed in the transportation modeling currently available from SANDAG and was captured in this analysis because the 2021 Regional Plan version of the model includes the Road User Charge as a funding source for the Regional Plan.

However, the SANDAG Board voted on September 22, 2023, against including the Road User Charge in the 2025 Regional Plan. On September 23, 2022, the SANDAG Board directed SANDAG staff to prepare an amendment to the 2021 Regional Plan without the Chapter 5 Alternatives County of San Diego CAP Update Page 5-30 October 2023 Road User Charge.

O4-36
cont.

This alternative would not affect implementation of the CAP Update measures and actions, the effects of implementing the CAP update relative to the topics addressed in Sections 2.1 through 2.15 of this draft SEIR would not be affected by implementation of this smart growth alternative, and the analysis of this alternative is focused on transportation (VMT) and GHG impacts.

4. Among the alternatives provided in the SEIR Sierra Club supports the: “Fire Safe and VMT Efficient Alternative – Project scenario cumulative land use totals and transportation network. Moves half of unincorporated county household growth to unincorporated VMT efficient areas that are considered fire safe.”

Sierra Club supports this alternative. Under this alternative, growth of household in the unincorporated county above 2016 would be 8445 by 2035 and 9902 by 2050. Among the alternatives in the DEIR, Sierra Club should support this alternative for conservation, and wildfire, evacuation, VMT and GHG.

Under this scenario, compared to the Project Alternative:

- Half of all unincorporated county growth outside fire safe and VMT efficient master geographic reference areas (MGRAs) was moved to those MGRAs (MGRAs within VMT efficient TAZs and outside high and very high fire hazard areas). The other half of unincorporated county growth was not moved.
- No growth was moved from unincorporated MGRAs that are over 90% tribal, military, federal, or state land (not under County control) with growth greater than 10 households.
- All growth moved to VMT efficient MGRAs was distributed proportionally based on land area of the MGRAs (uniformly increasing the density of the MGRAs).
- Under this alternative, future land development that is consistent with the General Plan and an accompanying proposed Smart Growth Overlay would be focused in currently urbanized areas that are identified as VMT efficient outside of High and Very High Fire Hazard Zones.

O4-37

The DEIR provided an analysis of the Fire Safe and VMT Efficient Alternative. “The Fire Safe and VMT Efficient Alternative is a smart growth alternative that the County developed through stakeholder outreach. The smart growth geographies were defined as areas that are both outside of areas mapped by the California Department of Forestry as areas with High or Very High fire risk and within areas mapped by the County as at least 15 percent below the regional average for residential VMT.”

The SEIR goes on to say: "Because this alternative would not affect implementation of the CAP Update measures and actions, the effects of implementing the CAP Update relative to the topics addressed in Sections 2.1 through 2.15 of this draft SEIR would not be affected by implementation of this smart growth alternative, and the analysis of this alternative is focused on transportation (VMT), wildfire hazards, and GHG impacts."

O4-37
cont.

"If implemented, this alternative is anticipated to reduce VMT for new development by 6.6 percent in 2035 and 3.0 percent in 2050. However, when viewed in conjunction with existing development, the magnitude of overall VMT reduction is relatively small because the vast majority of unincorporated county VMT under future year alternatives can be attributed to existing land uses." Sierra Club supports this alternative in the CAP because it results in the biggest decreases in VMT and GHG.

5. **Village Support Areas Alternative** – Project scenario cumulative land use totals and transportation network. Moves all unincorporated county household growth to designated unincorporated villages or unincorporated areas within a half-mile of those villages.

The DEIR provided analysis of the Village Support Areas Alternative. "This alternative builds on the Villages established in the adopted General Plan. The Village regional category, which allows the most intensive land uses in the unincorporated county under the adopted General Plan, facilitates the use of compact development patterns. Villages that contain a mix of land uses encourage strong neighborhoods and contribute to meeting a community's daily commercial, civic, and social needs."

"To spur redevelopment in the Villages and create a synergy for smart growth, this alternative would establish 0.5-mile buffers around the established Villages, referred to as Village Support Areas, wherein housing development and services to support development in the Villages would be encouraged."

O4-38

The SEIR also states: "As with the other smart growth alternatives discussed in this SEIR, this alternative would be implemented through a zoning overlay and development incentives. Supporting efforts are also assumed to include transit and connectivity improvements between the Villages and Village Support Areas. Further, it is assumed that all measures and actions in the CAP update would be implemented as proposed."

"Because this alternative would not affect implementation of the CAP Update measures and actions, the effects of implementing the CAP Update relative to the topics addressed in Sections 2.1 through 2.15 of this draft SEIR would not be affected by implementation of this smart growth alternative, and the analysis of this alternative is focused on transportation (VMT) and GHG impacts."

Based on this modeling, the Village Support Areas Alternative is anticipated to reduce VMT for new development by 1.0 percent in 2035 and 0.3 percent in 2050. If the modeling were

refined to assign growth into specific Village Support Areas closer to incorporated cities, greater VMT reductions would be anticipated.

This plan is not the preferred plan of Sierra Club. It will create a fair amount of growth among existing villages ranging from 4486 by 2035 and 5704 by 2050. A disadvantage is that in most of these additional village residents would actually do long high VMT commutes to metro San Diego increasing traffic, VMT, and GHG. Many residents of the village work, shop, and recreate in the urbanized portions of San Diego.

O4-38
cont.

G. General Plan Goal and Policy Edits: In this section other additional alternatives to replace or pair with Smart Growth Alternative are discussed in this section.

“In addition to, or in lieu of, any of the alternatives described above, County staff have identified potential amendments to General Plan goals and policies from the Land Use, Conservation and Open Space, Mobility, and Safety Elements of the adopted General Plan that would further enhance the smart growth principles described above and embodied in the General Plan. The Board may choose some or all of these additional policy amendments and pair them with the proposed CAP Update or an alternative.”

These alternatives discussed in section 5.6 are all plans from the 2011 GPU PEIR and would require some modification of the 2011 plans. Some of the other alternatives could be combinations of other plans-the SEIR maintains that each of the other alternatives would require substantial planning. Climate change was much less of a salient issue back in 2011 than it is today. In reading this, the urgency of VMT and climate change seems to be missing.

O4-39

Here are some of the alternatives that the SEIR examined:

1. **Hybrid Map Alternative.** “The Hybrid Map Alternative would decrease the countywide acreage of the following land uses, as compared to the proposed project: village residential (-487 acres); semi-rural residential (-11,717 acres); specific plan area (-683 acres); commercial (-325 acres); and industrial (-189 acres). When compared to the adopted General Plan, the Hybrid Map Alternative would increase the acreage of the rural land use designations (+13,672). The Hybrid Map Alternative would result in significantly less acres of semirural residential land uses and significantly more acres designated for rural lands than the adopted General Plan.” Although this is not a primary alternative, Sierra Club could find this alternative acceptable.
2. **Draft Land Use Map Alternative** “This alternative would decrease the acreage of the following land uses, as compared to the adopted General Plan: village residential (-514 acres); semi-rural residential (-15,313 acres); specific plan area (-683 acres); commercial (-344 acres); industrial (-266 acres); and village core mixed use (-12 acres). When compared to the proposed project, the Draft Land Use Map Alternative would increase the acreage of the following land use designations: rural lands (+17,198) and office

- | | |
|---|------------------------|
| <p>professional (+18 acres).” Again, though not a primary alternative, Sierra Club could work with this alternative.</p> | <p></p> |
| <p>3. <u>Environmentally Superior Map Alternative</u> “reflects a more stringent application of the planning concepts that take into account environmental considerations and constraints and is more aggressive in restricting growth in portions of the semi-rural residential and the rural lands designations. The Environmentally Superior Map Alternative was developed in response to the areas of significant impacts that were identified for the adopted General Plan, where changes in land use designations would have the potential to reduce or alleviate the impact. The Environmentally Superior Map Alternative would result in significantly less acres of semirural residential land uses and significantly more acres of rural lands than the proposed project. the environmental impacts under the Environmentally Superior Map Alternative would be less than Hybrid Map Alternative. The Environmentally Superior Map Alternative would accommodate less growth and development in the unincorporated county, which would translate to less GHG emissions from community and government operations. Additionally, the Environmentally Superior Map Alternative would result in less VMT than the adopted General Plan, which would translate to less GHG emissions from transportation.” The Environmentally Superior Map Alternative is a plan that Sierra Club likes but it is not among the ones that are considered. Again, we would be happy to work with the County on this alternative if it becomes one of the proposed alternatives.</p> | <p>O4-39
cont.</p> |
| <p>4. <u>Comparison of Alternatives.</u> “Of the smart growth alternatives, the Fire Safe and VMT Efficient Alternative, Village Support Areas Alternative, and General Plan Policy Edits Alternative would not reduce the impacts of CAP Update implementation; as such they are not considered environmentally superior to the CAP Update.” Sierra Club disputes this conclusion. Sierra Club believes that the “Fire Safe and VMT Efficient Alternative” is environmentally superior.</p> | <p>O4-40</p> |
| <p>5. <u>Environmental Justice.</u> Section 2.7, “Environmental Justice, has been included in the SEIR to address the potential for disproportionate effects of CAP Update implementation on EJ communities.” Sierra Club supports measures to create increased environmental justice.</p> | <p>O4-41</p> |
| <p>6. <u>Cumulative Impacts.</u> “This SEIR includes a discrete evaluation of the effect of all known, in-process GPAs on cumulative conditions in the unincorporated county. The discussion includes quantification of GHG emissions from the identified GPAs. See Chapter 4, Other CEQA Sections.</p> | <p>O4-42</p> |
| <p>7. <u>GHG Inventory and Monitoring.</u> The CAP states: “The inventory has again been updated using a base year of 2019 to reflect current conditions in the unincorporated county.</p> | <p>O4-43</p> |

The 2019 inventory represents the most complete data available that are unaffected by COVID-19 impacts (e.g., reduced traffic patterns) and was used as the baseline for the CAP Update. The CAP Update 2019 inventory is discussed in Section 1.4.1.1.” There is not a good argument for using a baseline of 2019. The goal of the State and County is to reduce emissions back to below 1990 levels. Indeed, in 2021 the Board of Supervisors approved a framework using 1990 levels as the basis for reducing GHG. As state in the SEIR: “On January 13, 2021, the Board of Supervisors approved the Framework for the Future, “Actions to Achieve Bold Climate Action at the County of San Diego”, which created policy recommendations for the CAP Update that include achieving at a minimum Senate Bill 32 GHG emissions reductions of 40 percent below 1990 levels by 2030 and establishing actions to meet a goal of net zero carbon emission by 2035-2045.” Sierra Club supports monitoring but also needs specific provisions to reduce emissions to 40% below 1990 levels.”

According to the SEIR CEQA requires an agency to conduct regular monitoring. “Regular monitoring and performance measuring of CAP Update activities would allow the County to make timely adjustments to existing measures; replace ineffective or obsolete actions; or add new measures as technology, federal and state programs, and circumstances change.” Sierra Club would like to see specific procedures for inventory updates and monitoring.

O4-43
cont.

The CAP also call for: “Annual Monitoring Report Staff prepares and publishes an annual monitoring report, assessing CAP annual performance in measure implementation 2026 GHG Emissions Inventory Update Staff conducts an update to the emissions inventory at least every two years. 2030 CAP Update Based on the findings from the annual monitoring reports and inventory updates, staff prepares a CAP Update at least every five years.” These are all good proposals but a revised CAP need more specific details on monitoring including the method and the targets for monitoring.

The CAP states: “PDS would coordinate with other County departments to facilitate and oversee implementation, including tracking and reporting on the progress of each measure.” This is a good provision but excessively general and vague. Sierra Club requests more detail in the revised CAP.

8. **County Conservation and MSCP.** The Sierra Club beliefs that the Multiple Species Conservation Program is the cornerstone of County conservation efforts. The County Conservation section of the CAP has sections on the East County, North County, and South County MSCP. Sierra Club strongly endorses the acquisition of more MSCP land. As the CAP notes: “Acquisition of land by the County under the MSCP would reduce GHG emissions through preservation of land which can otherwise be developed. GHG emissions reductions are realized from reductions in transportation, energy use, waste, and water consumption.”

O4-44

Regrettably, the East County MSCP has failed to get off the ground. As stated in the CAP: “Unfortunately, County budget constraints and staffing reductions have caused progress of the East County Plan to slow significantly. Once the budget and staffing constraints are resolved, plan development is intended to resume.” Sierra Club urges the County to appropriate additional money and hire additional staff to move forward quickly with the East County MSCP.

Similarly, the Sierra Club is dissatisfied with the North County MSCP which staff has been directed to develop in much greater detail. We applaud to goal of creating an MSCP “to achieve many of the same environmental and economic benefits realized through the adopted South County Subarea Plan.” But progress on the North County MSCP has been painfully slow and we hope the County and various municipalities will move quickly on a strong and sustainable MSCP.

The South County MSCP that was established in 1997 is the most developed of the MSCP plans. Its goal is to protect or acquire nearly 100,000 acres. The Sierra Club urges the County to protect even more land both to conserve species and to sequester additional GHG.

The SEIR states: “The County would also acquire conservation land and develop a framework for restoring these lands to their natural state. Acquisition of conservation land reduces emissions that would have occurred if the land were developed (as assumed in the 2011 GPU PEIR) and prevents loss of the region’s unique, native habitats and wildlife biodiversity. Sierra Club supports and applauds the acquisition of more conservation land including both coastal sage scrub and chaparral that would both conserve species and provide additional absorption of carbon.

O4-44
cont.

9. **CAP Targets.** The SEIR stathe that “the CAP Update’s target is aligned with AB 1279, which requires that the State’s target of net zero emissions by 2045 include reducing statewide anthropogenic emissions by at minimum 85 percent below 1990 levels by 2045.” Given the accelerating pace of climate change, Sierra Club believes that Net Zero by 2045 is too long a timeline. Sierra Club continues to recommend much faster progress. In our legal negotiations on our successful CAP lawsuits, we provided a 2021 term sheer that recommends that: The Sierra Club urges the County to achieve net negative one hundred percent (100%) GHG emissions by 2035.

O4-45

10. **County GHG emissions.** Sierra Club appreciates that the County inventories and discussed various sources of GHG.

- a. On-Road Transportation: On-road transportation emissions associated with gasoline and diesel consumption from driving that occurs on roadways, in addition to emissions from County fleet operations and employee commute.
- b. Implement the County’s 2019 Electric Vehicle Roadmap and 2023 Green Fleet Action Plan to reduce fleet emissions 35% by 2030 and 100% by 2045.

O4-46

- c. Electricity Use: Emissions associated with electricity generation because of electricity consumption in residential, commercial, industrial, and agricultural facilities. This includes electricity consumption at local government facilities such as County buildings, streetlights, and stormwater pumps.
- d. Natural Gas Use: Emissions associated with natural gas consumption in residential, commercial, industrial, and agricultural facilities. This includes natural gas use at County facilities located outside the unincorporated areas.
- e. Solid Waste: Waste emissions associated with landfills in the county (including County operated closed landfills) and waste generated by the unincorporated county, discounting any overlap. Solid waste generated by local government facilities is also included in this category. Project Description Page 1-14 County of San Diego CAP Update October 2023 Draft SEIR. The SEIR however maintains that: "Although the County does not collect solid waste from the community, it influences and supports waste diversion through solid waste management agreements with waste collectors, zero waste policies and programs for County operations and the community, and ordinances that direct material separation and diversion."
- f. Agriculture: Agricultural emissions associated with livestock, fertilizer use, soil management, and agricultural equipment. No agricultural emissions are attributed to local government operations.
- g. Propane Use: Emissions associated with propane consumption in residential, commercial, industrial, and agricultural facilities. This includes propane use at County facilities located outside the unincorporated areas.
- h. Off-Road Transportation: Off-road vehicle and equipment emissions associated with gasoline and diesel consumption in the unincorporated areas. This includes County government operations off-road vehicle use.
- i. Water: Water-related emissions associated with energy and fuel used to convey, extract, treat, and distribute water used in the unincorporated areas for domestic, irrigation, and industrial purposes. This includes a small amount of water use at County facilities located outside the unincorporated areas.
- j. Wastewater: Wastewater treatment emissions associated with the energy consumed and emissions produced to process domestic sewage and industrial wastewater either at on-site septic systems or centralized wastewater treatment plants. This includes a small amount of wastewater generation at County facilities located outside the unincorporated county.

O4-46
cont.

It concludes with the following percentages of GHG production. a) On-road transportation (45%) b) Electricity (20%) c) Natural gas (16%) d) Solid waste (6%) e) Agriculture (4%) f) Propane (4%) g) Off-road transportation (2%) h) Water (1%) i) Wastewater (1%)

<p>The CAP states “To reach the 2030 and 2045 targets, the CAP establishes nine strategies, and 70 actions that the County must take to reduce GHG emissions from five emissions reduction sectors.” These are 70 actions that the County must take to reduce GHG emissions from five emissions reduction sectors.”</p>	<p>O4-46 cont.</p>
<p>11. Construction. The Sierra Club recognizes the need for greater housing in the county and has supported numerous housing projects of the right type in the right location.</p> <p>Sierra Club is in strong support of the County’s goal to: “Amend the County’s Code of Regulatory Ordinances by 2026 to require all-electric equipment in new residential, commercial, and industrial construction to reduce energy emissions from new development in the unincorporated area.”</p> <p>Similarly, Sierra Club support this measure: “Use alternative fuel and/or zero-emission construction equipment in county projects to reduce emissions from medium- and heavy-duty vehicles and equipment.”</p>	<p>O4-47</p>
<p>12. Energy. The CAP says, “the County will ensure all County facilities are reducing emissions through Zero Net Energy construction, building electrification, and on-site renewable generation; and develop policies and programs for new and existing development to transition to renewable energy powered buildings.” Sierra Club is in support of such a measure.</p> <p>The SEIR states: “County facilities would reduce emissions through zero net energy construction, building electrification, and on-site renewable energy generation. For new and existing development, the County would develop policies and programs to transition to renewable energy powered buildings and electrification.”</p> <p>These are good general measures that are supported by Sierra Club but more detail and metrics are needed.</p> <p>“Implement the County Facilities Zero Carbon Portfolio Plan to achieve 90% reduction in operational carbon emissions by 2030 through building electrification and zero net energy construction, energy efficiency, energy management, and renewable energy use and generation.”</p> <p>Sierra Club supports “Increased energy efficiency and reach 30% electrification in residential and 17% electrification in non-residential existing development in the unincorporated area by 2030 by: - Amending the County’s Code of Regulatory Ordinances by 2026 to require (Tier 2) CALGreen or similar energy efficiency requirements for existing development projects with qualifying improvements. - Adopting a Building Energy Performance Standard by 2026 for commercial and multi-family residential properties. - Developing a program by 2026 to incentivize building electrification and energy efficiency.”</p>	<p>O4-48</p>

“Develop a program to phase out propane use for existing buildings.”

“Develop a program to increase energy resiliency in the unincorporated area to ensure continued access to electricity and services during extreme weather events.” Sierra club would like a mandate for burying all utility lines in the county.

These are good programs for which the Sierra Club has general support.

“Expand and implement the County’s streamlined solar permitting process to install 5,002 kW of renewable energy on existing development by 2030 and 12,505 kW by 2045.”

“Develop a program to incentivize renewable energy on low-income homes.”

“Work with partners to promote and support on-site renewable energy generation and storage to increase renewable energy generation and use in the unincorporated area.”

“Develop a program to provide 100% renewable energy to residents and businesses participating in San Diego Community Power by 2030 in the unincorporated area. Construction and operation of large-scale renewable energy projects.”

O4-48
cont.

The overall conclusion in the SEIR is that the CAP could exacerbate wildfire risk but not after appropriate mitigation. The County admits that their analysis is potentially problematic and hypothetical. “Therefore, the project would not result in a substantial incremental effect that would result in a new significant impact related to the exacerbation of wildfire risk. The impact would be less than significant. Implementation of the CAP Update would not result in new or more severe impacts than disclosed in the 2011 GPU PEIR.”

O4-49

13. Water and Wastewater This goal will be achieved by the County “installing water efficiency and water reuse systems wherever feasible; new development meets certain water efficiency standards and explores reuse opportunities; existing development is mandated and/or incentivized to increase water efficiency and reuse (through building permits).”

However, Sierra Club finds: No statement about where new development will occur. And Sierra Would like to know will they do reuse from septic systems that are prevalent in the county.

O4-50

14. Wildfire The SEIR examines if the CAP would increase the risk of wildfire in section 2.15. “This section describes the existing conditions for wildfire in the unincorporated county and evaluates the potential effects that implementation of the project may have on wildfire. Specifically, this section evaluates the potential for the CAP Update to result in impacts regarding the project’s potential to interfere with emergency response/evacuation, exacerbate wildfire risks, or expose people or structures to postfire risks.”

O4-51

"This section incorporates by reference the wildfire setting and impact analysis from the 2011 GPU PEIR as it applies to the CAP Update and supplements with relevant setting conditions that have changed since certification of the 2011 GPU." The Sierra Club believes that any wildfire analysis from 2011 is hopelessly obsolete. The unincorporated county is much hotter and drier than it was 12 or 13 years ago. More recent wildfire analysis should be provided in a revised EIR.

"Table 2.15-1 summarizes the wildfire impact conclusions reached in the 2011 GPU PEIR and identifies if a new or more severe significant impact would occur with implementation of the proposed project." Again, Sierra does not put any trust in a decade-old wildfire analysis.

Indeed, the County contradicts these estimates when they say: "Because of the County's changing climatic, geological, and topographical conditions, the County Fire Code is amended every 3 years when the State of California repeals, revises, and republishes the California Building Standards Code." Then they contradict themselves again in the DEIR when they state: "No substantial changes have occurred to the existing conditions described in the 2011 GPU PEIR. Therefore, the existing conditions in the 2011 GPU PEIR remain applicable."

O4-51
cont.

The Sierra Club appreciates the opportunity to review the latest County CAP and SEIR. The Sierra Club hope that with sufficient revision we can support the new CAP and the SEIR.

December 29, 2023

Comment O4-1

The comment expresses support for the underlying CAP Update goal to reduce GHG emissions. However, the comment states that it is not sufficient to merely reduce GHG emissions; the CAP Update must provide reduction of GHG emissions to 1990 levels and below.

Response O4-1

The County appreciates Sierra Club's support for the CAP Update goal to reduce GHG emissions. The objectives of the project are described in Section 1.2, "Project Objectives," of the Draft SEIR. GHG emissions reductions targets are discussed on pages 1-15 through 1-18 of the Draft SEIR. As described on page 1-17, the adjusted reduction targets for the CAP Update are 43.6 percent below 2019 levels by 2030 and 85.4 percent below 2019 levels by 2045. Data for 2019 is used as baseline because 1990 emissions data are not available for the unincorporated county and because 2019 is the baseline year of the GHG emissions inventory prepared for the CAP Update. The CAP Update also includes an aspirational goal to achieve net zero carbon emissions by 2025. This goal is in addition to the 2045 target aligned with reducing anthropogenic emission to 85 percent below 1990 levels by 2045. See also Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," regarding the legal and regulatory framework for the GHG reduction targets and approach set forth in the CAP Update.

Comment O4-2

The comment indicates that there is no detailed analysis provided to show how the CAP Update measures would result in the desired reduction in GHG emissions to below 1990 levels.

Response O4-2

See Response O4-1, regarding the target of 1990 GHG levels, and refer to Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," which describes the methodology the County used in the CAP Update to establish GHG reduction targets that are appropriately aligned with statewide targets and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets. The calculations performed to estimate the GHG reduction potential of the CAP Update's 35 quantified implementing actions are provided in CAP Update Appendix 7.

Comment O4-3

The comment refers to the CAP Update as, "almost entirely goal oriented and therefore only aspirational in context" and in need of "upgrading...to a free-standing legal document." The comment also asserts that the "enforceability of the CAP needs to be clearly articulated" and comments that the CAP appears to amend the General Plan.

Response O4-3

The CAP Update is a free-standing document prepared as required by 2011 GPU PEIR Mitigation Measure CC-1.2 and consistent with state legislative requirements. Refer to Section 9.1.1.1, “Master Response: CAP Update Purpose and Land Use Change,” regarding the relationship of the CAP Update to the 2011 GPU PEIR. Refer also to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the methodology the County used in the CAP Update to establish GHG reduction targets that are appropriately aligned with statewide targets and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets. This Master Response also explains that the CAP Update identifies the implementation enforcement mechanism for each action.

Comment O4-4

The comment provides an introduction for the “Terms Document” and the comments provided below.

Response O4-4

The comment references a January 2021 “Terms Document” that the San Diego Chapter of Sierra Club submitted in response to the County’s NOP for the SEIR (see Appendix A to the Draft SEIR). The purpose of the NOP and early public consultation is primarily to identify a range of actions, alternatives, mitigation measures, and significant effects that should be analyzed in detail in the EIR (see State CEQA Guidelines Sections 15082 and 15083).

The County acknowledges the comments provided for the CAP Update with respect to the “Terms Document.” Comments related to the environmental review of the proposed CAP Update were considered during preparation of the Draft SEIR. See specific Responses O4-5 through O4-33.

Comment O4-5

The comment asserts that the CAP Update lacks details on how the goal of 100 percent clean energy by 2030 will be achieved.

Response O4-5

The CAP Update includes Action E-3.1, under which the County would develop a program to provide 100 percent renewable energy to residents and businesses participating in San Diego Community Power by 2030 in the unincorporated area. Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” describes, among other things, the analytical basis of the reduction calculations and implementation details for the 35 quantified implementing actions that are included in the CAP Update, which includes Action E-3.1. These include the quantified GHG reduction potential and measurable performance outcomes for 2030, 2035, 2040, and 2045. The CAP Update also identifies the following details for each action, including E-3.1, as part of the CAP Implementation and Monitoring Program (Table 13): the implementation enforcement mechanism, County department with lead and supporting responsibilities for implementation, relative cost (using a qualitative, ordinal ranking of low, medium, or high), and potential funding sources for implementation. The calculations performed to estimate

the GHG reduction potential of the CAP Update's 35 quantified implementing actions are provided in CAP Update Appendix 7.

Comment O4-6

The comment expresses disappointment that neither the CAP Update nor the SEIR propose downzoning of lands in high fire risk areas and highest VMT areas of the county. The comment cites three perceived advantages of such a measure over the other smart growth alternatives analyzed in the SEIR: "permitting more building in the highest fire zones of California defies logic and common sense"; reductions in VMT and GHG; and preservation of coastal sage scrub and chaparral.

Response O4-6

The comment notes that Sierra Club's scoping comment requested that the project include a CAP measure that would downzone land with high fire risk and with the highest VMT. No such measure is included in the CAP Update. Refer to Section 9.1.1.1, "Master Response: CAP Update Purpose and Land Use Change," for further discussion of the relationship between the CAP Update and land use planning. The CAP Update demonstrates the County's ability to achieve all established targets without changes in land use.

As noted in the comment, the Draft SEIR includes evaluation of the Fire Safe and VMT Efficient Alternative. As described in the Draft SEIR (page 5-25), this alternative would encourage future growth to be "focused in currently urbanized areas that are identified as VMT efficient outside of High and Very High Fire Hazard Zones" through a Smart Growth Overlay. As further explained in the Draft SEIR, "the County would not prohibit development of properties outside of the fire safe and VMT efficient overlay" because the Smart Growth Overlay would apply to a relatively limited geography. This is the basis for the 50 percent transfer of development used in the analysis. The opinion provided in the comment related to the merits of permitting additional growth outside the Smart Growth Overlay identified under this alternative are noted and will be provided to decision-makers for consideration.

Contrary to the statement made in the comment, the analysis of VMT and GHG emissions conducted for the Draft SEIR indicates that the Sustainable Communities Strategy Alternative, not the Fire Safe and VMT Efficient Alternative, would reduce the most VMT and associated GHG emissions (see Draft SEIR Appendix C). (Although it is noted that the analysis of the Sustainable Communities Strategy Alternative assumes application of the Road User Charge, which has been removed from the plan.) Furthermore, the standards established for a qualified CAP do not support the claim that a viable CAP must reduce GHG emissions "as much as possible" and in exceedance of established reduction targets. Refer to Response A3-2 for further discussion of the requirements for a GHG reduction plan pursuant to Section 15183.5 of the State CEQA Guidelines.

Finally, the CAP Update does quantify the GHG emissions reduction potential of preserving natural lands and agricultural lands and recommends the following measures to achieve such reductions: Measure A-1: Acquire and manage conservation lands to preserve natural lands and maximize carbon storage potential in the unincorporated area

(page 101); Measure A-3: Preserve agricultural lands to prioritize carbon storage and balance economic and development goals (page 104); and Measure A-4, Incentive carbon farming to expand carbon storage capacity on agricultural land and support climate-friendly farming practices in the unincorporated area (CAP Update Chapter 4, page 105). Quantified GHG emissions reductions potential of actions underneath these measures are presented in CAP Update Chapter 4 in Table 11 (pages 107–112).

The Draft SEIR analyzes the impacts of implementation of these measures and actions and provides a comparative analysis of the impacts of alternatives, including the Fire Safe and VMT Efficient Alternative, relative to the proposed project. The function of the requested analysis of “how much carbon storage will be lost in the various Smart Growth alternatives” is unclear. Any alternative that reduces the potential for development of natural and agricultural lands relative to the assumptions used in the CAP Update for reasonably foreseeable growth under the County’s adopted General Plan would be assumed to result in a commensurate increase in potential for carbon sequestration.

Refer also to Section 9.1.1.2, “Master Response: Evaluation of Smart Growth Alternatives in This SEIR,” for further discussion of the County’s obligation to evaluate alternatives to the project.

Comment O4-7

The comment requests that land use change should be a central part of the CAP Update and should be analyzed in the Draft SEIR. The commenter also states that the Fire Safe and Efficient VMT Alternative that would bar developments from High and Very High Fire areas should be the preferred plan.

Response O4-7

See Section 9.1.1.1, “Master Response: CAP Update Purpose and Land Use Change,” for a discussion about the CAP Update and land use change and Response O4-6, regarding the Fire Safe and Efficient VMT Alternative.

Comment O4-8

The comment expresses support for land conservation measures in the CAP Update and requests “metrics that estimate how much GHG would be avoided” through habitat preservation.

Response O4-8

The County appreciates the support for the land conservation measures included in the CAP Update. Table 13 of the CAP Update (Chapter 5) identifies the quantified GHG reduction potential and performance metrics for each measure and action in the agriculture and conservation sector, including Measure A-1 and Actions A-1.1 and A-1.2, which call for the preservation and restoration of natural lands and habitat. Additional GHG reduction quantification information can be found in CAP Update Appendix 7. Please also refer to the Response O4-6.

Comment O4-9

The comment expresses support for the CAP Update measures related to avoiding, recycling, and composting waste and requests quantifying the GHG emissions reduction associated with the solid waste measures. The comment also supports the goal to continue the Strategic Plan to Reduce Waste program.

Response O4-9

The County appreciates the support for the CAP Update solid waste measures and actions and notes the commenter's support for the Strategic Plan to Reduce Waste program. Chapter 5 of the CAP Update identifies the quantified GHG reduction potential and performance metrics for each measure and action included in the CAP Update, including those related to waste reduction. Additional GHG reduction quantification information can be found in CAP Update Appendix 7. The CAP Update also identifies the following details for each action as part of the CAP Implementation and Monitoring Program (Table 13): the implementation enforcement mechanism, County department with lead and supporting responsibilities for implementation, relative cost (using a qualitative, ordinal ranking of low, medium, or high), and potential funding sources for implementation.

Please also refer to Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," which describes the analytical basis of the reduction calculations and implementation details for quantified implementing actions that are included in the CAP Update. These include the quantified GHG reduction potential and measurable performance outcomes for 2030, 2035, 2040, and 2045.

Comment O4-10

The comment expresses support for electrification of County facilities but claims no specific action and metrics are provided.

Response O4-10

Refer to Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," which describes the methodology the County used to establish GHG reduction targets that are appropriately aligned with statewide targets and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets. This Master Response also describes the implementation details included for measures and actions in the CAP Update, which include GHG reduction potential and measure performance outcomes for 2030, 2035, 2040, and 2045. With respect to electrification of County facilities, the CAP Update presents quantified GHG reduction potential and performance outcomes for Action E-1.1 in Table 8 (pages 71–72) and additional GHG quantification information in CAP Update Appendix 7.

Comment O4-11

The comment expresses support for renewable energy development but requests that the County provide specific plans for renewable energy sources.

Response O4-11

The CAP Update is a multi-objective plan that sets policy and programmatic commitments to reduce GHG emissions through the implementation of measures and actions to reach net zero carbon emissions in the unincorporated county and in County operations. It does not include specific proposals for renewable energy development. Thus, as noted in Response O3-9, the Draft SEIR does not purport to cover the entirety of the impacts from individual renewable projects, which would be designed and proposed by others as separate projects, subject to separate discretionary actions. The purpose of the discussion in the Draft SEIR is to disclose the potential for indirect impacts due to growing demand.

Renewable energy would be obtained through the *County of San Diego: Zero Carbon Portfolio Plan* (San Diego County n.d.), which is a programmatic plan that includes timelines and details regarding the installation of renewable energy infrastructure on County facilities (see Measure M6). The purpose of this plan is to clearly articulate a path to take bold action on cutting County carbon emissions. This plan articulates clear steps, including costs, to reach as far as possible by 2030 to align with the Regional Decarbonization Framework. By testing these actions on County facilities and operations, the region will benefit from lessons learned about the implementation processes, strengthening the County of San Diego's leadership position. The measures identified in the plan will result in a 90 percent reduction in operation emissions from County occupied facilities.

Comment O4-12

The comment states that the energy efficiency measures identified in the CAP Update are too generalized and requests that County provide specific plans for recommended measures (e.g., electric heat pumps, insulation, and weatherization).

Response O4-12

The request to provide more specific measures (e.g., electric heat pumps, insulation, and weatherization) to reduce County facilities' energy use intensity is noted. The CAP Update has been revised to include heat pumps and weatherization as examples of implementation pathways. The County would reduce County facilities' energy use intensity through implementation of CAP Update Measure E-1, which would result in policies and programs to increase energy efficiency, renewable energy use, and electrification in County operations. Refer to Response O4-5 for discussion of analytical basis of the reduction calculations and implementation details for quantified implementing actions that are included in the CAP Update. Also refer to Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions."

Comment O4-13

The comment states that Sierra Club supports the wastewater measures if the measures will result in installation of graywater systems at County facilities.

Response O4-13

This comment expressing support for measures and actions in the water and wastewater sector that result in installation of graywater systems at County facilities is noted. As noted

in the comment, the CAP Update does include measures and actions to reduce potable water use, including through the installation of graywater systems, in line with the commenter's term.

Comment O4-14

The comment expresses support for the CAP Update's actions related to transitioning County vehicle fleets to zero emission options or cleaner fuel and prioritizing clean transportation in frontline communities. The comment also asks the County to provide specific details and timelines regarding how these actions would be implemented.

Response O4-14

The CAP Update includes substantial evidence of the GHG reduction potential of each recommended measure and action in several sections of the document. See Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," which describes the analytical basis of the reduction calculations and implementation details for quantified implementing actions that are included in the CAP Update, including the quantified GHG reduction potential and measurable performance outcomes for 2030, 2035, 2040, and 2045. The CAP Update also identifies the following details for each action as part of the CAP Implementation and Monitoring Program: the implementation enforcement mechanism, County department with lead and supporting responsibilities for implementation, relative cost (using a qualitative, ordinal ranking of low, medium, or high), and potential funding sources for implementation.

Comment O4-15

The comment requests that the County include a dividend account parking measure in the CAP Update.

Response O4-15

This measure was evaluated as part of the CAP Update and was not included for the reason cited below. Upon careful consideration and evaluation, the County determined that a dividend account parking system, as recommended in this comment, would be infeasible as a GHG reduction measure in the CAP Update at this time. County employees work in widely varying roles and in diverse locations where parking is either free and plentiful or expensive and scarce. The dividend account parking system would require calculating a fair parking charge and transportation stipend applicable to all County employees, which would be virtually impossible under these varied conditions. Even if calculating a fair parking charge and transportation stipend was possible, free or subsidized parking is currently a benefit provided to all County employees; therefore, to institute a dividend parking policy would affect County Employee's Terms and Conditions of Employment, which would require negotiation and agreement from each of the County's 13 labor unions, something that cannot be guaranteed at this time. Charging for parking would require both the elimination of subsidies paid to some classes of employees who park in paid lots and charging employees who park for free in lots owned by the County. This would potentially affect employee income. As discussed, the County cannot propose changes to staff income without further negotiation of collective bargaining agreements with County employees.

The bargaining agreements for each of the labor unions would need to be negotiated when they come up for review (every 3 years), and the outcome of each of the agreements is not pre-determined. Because the result of further negotiations is speculative and contingent on future negotiations with a third party, the dividend account parking system is infeasible. State CEQA Guidelines define feasible as, “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors” (State CEQA Guidelines Section 15364). In order for actions to be included for GHG reductions, they must be in the jurisdiction of the County to control. The results of negotiations toward a dividend account parking system are too uncertain to support with evidence reductions to GHG emissions. It is uncertain that negotiations could be accomplished in a successful manner within a reasonable period of time.

In addition, the proposed dividend account parking system may have a disproportionate impact on employees who work at facilities in more rural areas of the County, where there is no or limited public transportation alternatives available. It would be costly and, in many locations, be the responsibility of other public agencies to build transportation infrastructure to reach each County facility. In sum, due to the practical difficulties with calculating a fair parking charge in the context of widely varied County facility locations; the time, cost, and resources required for labor negotiations; and the lack of viable alternative transportation options for many County employees, a dividend account parking system was not ultimately included as a GHG reduction measure in the CAP Update. However, this does not preclude the ability of the County to consider the dividend account parking in the future.

A dividend accounting measure would not result in significant GHG reduction benefits due to employee commute patterns (particularly since the COVID-19 pandemic) and would be difficult to implement because of labor agreements. CAP Update Measure T-4 would reduce GHG emissions from County employee commutes using other methods that have proven success. As noted in the description of this measure in the CAP Update, the County has reduced employee commute VMT by 26 percent (through 2022) relative to 2014 levels through teleworking and alternative work schedules. Therefore, the CAP Update includes measures and actions, with demonstrated effectiveness, to reduce County employee VMT. Also refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explains that the CAP Update adequately identifies a set of measures and actions to reduce GHG emissions to levels that achieve the County’s GHG reduction targets for 2030 and 2045 and make substantial progress toward the aspirational goal of net zero emissions by 2045.

Comment O4-16

The comment expresses support for solid waste reduction measures in the CAP Update and requests that County accelerate the timeline to implement these measures.

Response O4-16

As noted in the comment, the CAP Update includes measures and actions to increase solid waste diversion in the unincorporated county. The County appreciates the commenter’s support for these measures and actions. Refer to Section 9.1.1.3, “Master

Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explains that the CAP Update adequately identifies a set of measures and actions to reduce GHG emissions to levels that achieve the County’s GHG reduction targets for 2030 and 2045 and make substantial progress toward the aspirational goal of net zero emissions by 2045.

Comment O4-17

The comment expresses support for the CAP Update Actions T-1.2, T-2.1, and T-2.2.

Response O4-17

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O4-18

The comment expresses support for the CAP Update Actions A-2.1, A-2.1.a, A-2.1.b, and A-2.2.

Response O4-18

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O4-19

The comment states that SANDAG’s Five Big Moves is not included in the CAP Update and claims that the CAP Update is not viable without a transit plan.

Response O4-19

The SANDAG’s 5 Big Moves is included in the discussion of the San Diego Forward: The 2021 Regional Plan (2021 Regional Plan) on page 2.13-10 of the Draft SEIR. The 2021 Regional Plan combines the Regional Transportation Plan, Sustainable Communities Strategy, and Regional Comprehensive Plan. The 2021 Regional Plan strategies are organized around the 5 Big Moves. As discussed in Section 2.13.3.3, “Issue 1: Conflict with a Program, Plan, Ordinance or Policy Addressing the Circulation System,” of the Draft SEIR, implementation of the CAP Update would be consistent with the 2021 Regional Plan, including the strategies associated with the 5 Big Moves. In addition, the CAP Update includes measures and actions in support of promoting transit use in the unincorporated county, including Action T-6.2.b, which would evaluate options for increasing transit service to unincorporated communities, and Action T-6.1, which would develop a program to provide free transit passes or free trips in the unincorporated area. While the County does not have control over the capital (SANDAG) or operations (MTS, NCTD) of the transit strategies identified in SANDAG’s plan, the County will continue to explore and collaborate with SANDAG on options to expand alternative modes in the unincorporated area.

Comment O4-20

The comment expresses support for the CAP Update Action T-4.1.a but suggests the implementation of Action T-5.1 is not adequate across the entire county.

Response O4-20

The County appreciates the support for the CAP Update Action T-4.1.a. Sierra Club is correct that Action T-5.1 would implement the Active Transportation Plan to install 345 miles of sidewalk and 315 miles of bikeways by 2030. As shown in Table 7 of the CAP Update, the County would install sidewalks and bikeways under this action through 2045. The CAP Update establishes the following performance outcomes for this action: install an additional 345, 360, 375, and 390 miles of sidewalks and 315, 472, 629, and 786 miles of bikeways by 2030, 2035, 2040, and 2045, respectively. Refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explains that the CAP Update adequately identifies a set of measures and actions to reduce GHG emissions to levels that achieve its GHG reduction targets for 2030 and 2045 and make substantial progress toward the aspirational goal of net zero emissions by 2045.

Comment O4-21

The comment expresses support for the CAP Update Measure T-3 and Action T-3.1.

Response O4-21

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O4-22

The comment advises the County to increase the sidewalk expansion plan.

Response O4-22

With regards to installation of sidewalks under the CAP Update, please see Response O4-20.

Comment O4-23

The comment recommends that that County include a local natural habitat lands GHG mitigation bank and/or a local disadvantaged communities GHG mitigation bank in the CAP Update.

Response O4-23

The County acknowledges the commenter’s suggestion for how to further reduce GHG emissions. The County would acquire and manage conservation lands to preserve natural lands and reduce GHG emissions through implementation of CAP Update Measure A-1 and Actions A-1.1 and A-1.2. Refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explains that the CAP Update adequately identifies a set of measures and actions to reduce GHG emissions to levels that achieve the County’s GHG reduction targets for 2030 and 2045 and make substantial progress toward the aspirational goal of net zero emissions by 2045.

Comment O4-24

The comment advises the County to provide incentives and subsidies to existing businesses and residences to convert natural gas or propane utilities to electric.

Response O4-24

The County acknowledges the suggestion for how to further reduce GHG emissions. The CAP Update includes Measures E-1 and E-2 to develop policies and programs to increase energy efficiency, renewable energy use, and electrification in County operations and in the unincorporated area. Specifically, CAP Update Action E-2.2.c would develop a program to phase out propane uses for existing buildings. Refer also to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explains that the CAP Update adequately identifies a set of measures and actions to reduce GHG emissions to levels that achieve its GHG reduction targets for 2030 and 2045 and make substantial progress toward the aspirational goal of net zero emissions by 2045.

Comment O4-25

The comment requests details about GHG emission reduction quantification of renewable energy measures identified in the CAP Update.

Response O4-25

The CAP Update includes sufficient detail regarding the implementation and GHG reduction potential of each recommended measure and action. See Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the analytical basis of the reduction calculations and implementation details for quantified implementing actions that are included in the CAP Update, including the quantified GHG reduction potential and measurable performance outcomes for 2030, 2035, 2040, and 2045. The CAP Update also identifies the following details for each action as part of the CAP Implementation and Monitoring Program (Table 13): the implementation enforcement mechanism, County department with lead and supporting responsibilities for implementation, relative cost (using a qualitative, ordinal ranking of low, medium, or high), and potential funding sources for implementation.

Comment O4-26

The comment requests that the County include additional energy efficiency measures (e.g., installation of electric heat pumps) for existing buildings.

Response O4-26

The County acknowledges the commenter’s suggestion for how to further reduce GHG emissions. The CAP Update includes Measures E-1 and E-2 to develop policies and programs to increase energy efficiency, renewable energy use, and electrification in County operations and in the unincorporated area. Implementation of CAP Update Actions E-1.1 and E-2.2 would result in building electrification in County operations and in the unincorporated area, respectively. Refer also to Response O4-5 for a discussion of the analytical and implementation details for measures and actions that are included in the CAP Update. Also refer Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions.”

Comment O4-27

The comment states that CAP Update Actions W-2.3, W-2.3.a, and W-2.3.b and the “Path to Net Zero” actions are overly aspirational and lack specific details related to implementation and funding.

Response O4-27

The CAP Update includes substantial evidence of the GHG reduction potential of each recommended measure and action in several sections of the document. See Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the analytical basis of the reduction calculations and implementation details for quantified implementing actions that are included in the CAP Update, including the quantified GHG reduction potential and measurable performance outcomes for 2030, 2035, 2040, and 2045. As explained in the Master Response, the CAP Update also contains 35 “Path to Net Zero” actions that establish steps the County will take to meet the 2045 net zero emissions goal. Although the CAP Update does not identify quantified GHG emissions reductions for “Path to Net Zero” actions, their implementation could result in quantified reductions in the future with additional data and monitoring. The CAP Update also identifies the following details for each action as part of the CAP Implementation and Monitoring Program (Table 13): the implementation enforcement mechanism, County department with lead and supporting responsibilities for implementation, relative cost (using a qualitative, ordinal ranking of low, medium, or high), and potential funding sources for implementation.”

Comment O4-28

The comment expresses support for an expanded tree-planting program.

Response O4-28

The County appreciates the support for the tree-planting program. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O4-29

The comment expresses support for the CAP Update Measure T-6 and suggests free transit passes be provided to all County residents.

Response O4-29

The County appreciates the support for the CAP Update Measure T-6. The County will develop a program to provide free transit passes or free trips in the unincorporated county through implementation of CAP Update Action T-6.1. The comment does not raise significant environmental issues related to the Draft SEIR, and no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O4-30

The comment references a statement in the CAP Update regarding removal of obstacles to using public transit and ridesharing and requests more specific plans be provided for ridesharing.

Response O4-30

Regarding public transit and ridesharing, in the built environment and transportation sector, the CAP Update includes Measure T-4: Reduce emissions from County employee commutes; Measure T-5: Improve County roadways to encourage walking, biking, rolling to/from transit and destinations and increase transportation efficiency; and Measure T-6: Support transit and transportation demand management to reduce single occupancy vehicle trips in the unincorporated area. These measures include actions to decrease vehicle miles traveled by increasing use of public transit and decreasing single occupancy vehicle trips, for example through increased ride sharing. Also refer to Response O4-5 for discussion of the analytical and implementation details for measures and actions that are included in the CAP Update and refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions.”

Comment O4-31

The comment expresses support for the CAP Update Measure T-3 and Action T-3.1. The comment also recommends that the County provide the specific regulations, subsidies, and incentives to achieve Measure T-3 and to extend the requirements of electric vehicle charging infrastructure to all business and residential areas.

Response O4-31

The County appreciates the support for the CAP Update Measure T-3 and Action T-3.1.

The CAP Update includes substantial evidence of the GHG reduction potential of each recommended measure and action in several sections of the document. See Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the analytical basis of the reduction calculations and implementation details for quantified implementing actions that are included in the CAP Update, including the quantified GHG reduction potential and measurable performance outcomes for 2030, 2035, 2040, and 2045. The CAP Update also identifies the following details for each action as part of the CAP Implementation and Monitoring Program (Table 13): the implementation enforcement mechanism, County department with lead and supporting responsibilities for implementation, relative cost (using a qualitative, ordinal ranking of low, medium, or high), and potential funding sources for implementation.

Comment O4-32

The comment expresses support for the vision statement, strategy, and net zero emissions vision for agriculture and conversion; Measures A-3 and A-4; and Actions A-3.1, A-4.1, A-4.1.a, A-4.1.c, and SW-4.1.a. The comment also requests that the CAP Update include incentives to use animals rather than off-road vehicles to clear grass and brush.

Response O4-32

The County appreciates the support for the CAP Update vision statement, strategy, and various measures and actions. The recommendation to incentivize use of animals for brush clearing could be considered as part of implementing the CAP Update strategy to decarbonize off-road vehicles in the future. It has not been included at this time due to lack of data on overall effectiveness of such a program in reducing GHG emissions. Refer

to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explains that the CAP Update has adequately identified measures and actions that would exceed the 2030 and 2045 GHG reduction targets and make substantial progress toward the aspirational goal of net zero emissions by 2045.

Comment O4-33

The comment expresses general support for the CAP Update energy, built environment and transportation, solid waste, water and wastewater, and agriculture and conservation measures. The comment advises the County to require that all new developments use 100 percent renewable energy, to take steps to maximize solar energy production in the county, and to include electric heat pumps.

Response O4-33

The County appreciates the general support for the CAP Update measures. The County acknowledges the commenter’s suggestion for how to further reduce GHG emissions. The CAP Update Actions E-3.2, E-3.2.a, E-3.2.b, and E-3.3 would result in increased renewable energy use, generation, and storage in the unincorporated area. Implementation of CAP Update Actions E-1.1 and E-2.2 would result in building electrification within County operations and in the unincorporated area, respectively.

Please also refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes how the CAP Update has adequately identified measures and actions that would exceed the 2030 and 2045 GHG reduction targets and make substantial progress toward the aspirational goal of net zero emissions by 2045.

Comment O4-34

The comment states that the Draft SEIR encourages use of offsets for General Plan Amendment (GPA) projects. The comment suggests that offsets must be in-county and an in-county GHG mitigation program should be prepared.

Response O4-34

The comment incorrectly identifies Mitigation Measure M-GHG-1 from the 2018 CAP as part of the CAP Update. As described in Table 1-1, “Summary of SEIR Response to 2020 Appellate Court Ruling,” in the Draft SEIR:

M-GHG-1 is a mitigation measure that was included in the 2018 SEIR. It provided two options for in-process and future GPAs to “ensure that CAP emission forecasts are not substantially altered such that attainment of GHG reduction targets could not be achieved”: a “No Net Increase” option and a “Net Zero” option. These options included the potential to purchase carbon offset credits after all feasible on-site design features and mitigation measures had been incorporated. No equivalent mitigation is proposed in this SEIR for in-process or future GPAs, and the CAP Update and this SEIR do not provide a pathway for GPAs to comply with the CAP Update. In-process and future GPAs will have to conduct their own GHG analysis. See Chapter 4, “Other CEQA Sections.”

The CAP Update does not, as the comment asserts, specify that offsets can be used for GPAs. The comment does not provide evidence to support the claim that the CAP encourages the use of offsets for GPAs other than a reference to page 5-7 of the Draft SEIR. On this page of Chapter 5, “Alternatives,” the County explains the reasons for rejecting the Carbon Offset Alternative from detailed analysis in the Draft SEIR. In this discussion, the County does acknowledge that the CAP Update does not prohibit use of carbon offsets for projects that are outside the scope of the General Plan and the CAP Update, for which project-level analysis and mitigation would be required. The Draft SEIR accurately summarizes State CEQA Guidelines Section 15126.4(c)(3), which allows mitigation through “off-site measures, including offsets that are not otherwise required.”

The comment proceeds to set forth detailed requirements that the County could impose upon future GPA projects, if and when they are proposed, to ensure that any such projects achieve net negative GHG emissions. The County appreciates this feedback. As articulated throughout the Draft SEIR, GPA projects are outside the scope of the CAP Update and would require their own environmental analysis, including appropriate mitigation for any significant environmental impacts, at the time of discretionary review by the County. Preparation of an off-site GHG mitigation program outlined in the comment would require direction by the Board to initiate, technical analysis for feasibility and the funding requirements of the program, public engagement, and separate evaluation and consideration by decision-makers and, therefore, cannot appropriately be added to the CAP Update. Furthermore, the development of a mitigation program for private development would not be consistent with the CAP Update’s Project Objectives. In addition, setting up an off-site GHG mitigation program as requested for GPA projects would only serve to provide a pathway for GPA projects, which this CAP Update does not propose.

Although not a component of the proposed CAP required to meet state targets, the County may consider a carbon offset program in the future. At this time, the County does not have evidence that it is feasible to establish a carbon offset program that meets established protocols. Recent academic studies have concluded that there are limited opportunities for offset credit projects using existing protocols in the San Diego region. Limitations are due in part to California’s comprehensive regulations related to GHG emissions, the number of protocols that include activities applicable to the San Diego region, and the scale of activities related to eligible project types under relevant protocols (EPIC 2021).

Similarly, the comment expresses disappointment that other County programs (e.g., Sustainable Land Use Framework to address potential land use changes and a Regional Decarbonization Framework to provide a regional framework for governments and private entities to reduce carbon emissions) were not included in the CAP Update. This is not to diminish the importance of these separate policy ideas, but to allow for independent utility of the CAP Update as a program to mitigate reasonably foreseeable growth under the adopted General Plan. The CAP Update identifies a GHG reduction program and demonstrates that the County can achieve its reduction targets. If these separate County programs are adopted, they could result in greater GHG reductions than identified in the CAP Update.

Comment O4-35

The comment states that the Draft SEIR is required to consider smart growth alternatives per the Appellate Decision and that the requirements for smart growth are for future avoided development and the prevention of corresponding future VMT to reach GHG emissions reduction goals. The comment asserts that the County CAP Update should not be consistent with the 2011 General Plan because it was adopted when climate change was not a primary concern.

Response O4-35

Please see Section 9.1.1.1, “Master Response: CAP Update Purpose and Land Use Change,” regarding the purpose of the CAP Update and its relationship with the 2011 GPU PEIR, and 9.1.1.2, “Master Response: Evaluation of Smart Growth Alternatives in This SEIR.”

The comment that the CAP Update should not be consistent with the 2011 GPU PEIR because it was adopted when climate change was not a primary concern is incorrect. Please see General Plan Chapters 1, 5, and 7, which address climate change. Table I-1 of the General Plan lists the policies with strategies to reduce GHG emissions and help prevent impacts from climate change. These policies include COS-20.1, Climate Change Action Plan. See also, Chapter 2.17, “Global Climate Change,” of the 2011 GPU PEIR for analysis, existing and regulatory setting, impact conclusions, and mitigation. The County conducted a GHG inventory as part of the 2011 GPU PEIR and developed mitigation to require a climate action plan (Mitigation Measure CC-1.2).

Comment O4-36

The comment summarizes the Draft SEIR analysis of the Sustainable Communities Strategy Alternative and states that this alternative is either gone or unlikely to progress because the SANDAG Board has voted against including the Road User Charge in the 2025 Regional Plan. The comment contains an excerpt of analysis Sierra Club provided to SANDAG and concludes that the plan would not achieve the desired reductions in VMT and GHG outlined in the SEIR.

Response O4-36

Section 5.5.3.3, “Sustainable Communities Strategy Alternative,” of the Draft SEIR (pages 5-29 through 5-31) acknowledges that the Road User Charge has been voted against by the SANDAG Board and therefore states that “this scenario does not represent reasonably foreseeable land use, transportation policy/network, and VMT under the County’s adopted General Plan.” In addition, the Draft SEIR acknowledges that this alternative may result in less VMT reductions than anticipated:

“As noted above, this alternative is assumed to substantially reduce GHG emissions associated with VMT in the unincorporated county compared to the General Plan. However, as discussed above, the total VMT reductions are based on the Regional Plan’s premise of a distribution of growth within Mobility Hubs that encompass areas outside of the unincorporated county, which are outside the County’s control. Furthermore, the Road User Charge, which results in lower VMT forecasts in the Regional Plan than scenarios without the Road User Charge, has

been removed from the Regional Plan. Therefore, the actual VMT reductions achieved under this alternative may be less than modeled for the purposes of this analysis.”

This alternative is one of the smart growth alternatives discussed in the Draft SEIR and was selected for detailed analysis based on stakeholder input. Please refer to Section 91.1.2. “Master Response: Evaluation of Smart Growth Alternatives in This SEIR,” for a discussion about the Sustainable Community Strategy Alternative in the SEIR.

Comment O4-37

The comment summarizes the Draft SEIR analysis of the Fire Safe and VMT Efficient Alternative and expresses support for this alternative.

Response O4-37

The County acknowledges the support for the Fire Safe and VMT Efficient Alternative. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O4-38

The comment summarizes the Draft SEIR analysis of Village Support Areas Alternative and states that this alternative is not the preferred alternative of Sierra Club.

Response O4-38

The County acknowledges that the Village Support Areas Alternative is not Sierra Club’s preferred alternative. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O4-39

The comment summarizes both the General Plan Goal and Policy Edits Alternative and 2011 GPU PEIR alternatives and expresses general support for these alternatives.

Response O4-39

The County acknowledges Sierra Club’s general support for the General Plan Goal and Policy Edits Alternative and 2011 General Plan EIR alternatives. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O4-40

The comment disputes the conclusion in the Draft SEIR that Fire Safe and VMT Efficient Alternative, Village Support Areas Alternative, and General Plan Policy Edits Alternative would not reduce the impacts of CAP Update implementation and expresses a belief that the Fire Safe and VMT Efficient Alternative is environmentally superior.

Response O4-40

Although the comment states that Sierra Club disputes the conclusions of the Draft SEIR, the comment provides no evidence to support the dispute. The Draft SEIR includes

substantial evidence, including VMT modeling and GHG emissions calculations, in its analysis of the impacts of the alternatives as compared to those of the proposed project. The County acknowledges that the Fire Safe and VMT Efficient Alternative is Sierra Club's preferred alternative. Refer to Section 9.1.1.2, "Master Response: Evaluation of Smart Growth Alternatives in This SEIR," and Response O3-3 for further discussion.

Comment O4-41

The comment expresses support for measures to create increased environmental justice.

Response O4-41

The County appreciates the support for environmental justice measures. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O4-42

The comment acknowledges that the SEIR includes a discrete evaluation of the effect of in-progress GPA projects on cumulative conditions and includes a quantification of GHG emissions from in-process GPA projects.

Response O4-42

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O4-43

The comment expresses support for GHG emissions monitoring but requests specific provisions to reduce emissions to 40 percent below 1990 levels. The comment also states that the use of the 2019 baseline is not fully justified in the Draft SEIR.

Response O4-43

The County appreciates the support for GHG emissions monitoring. The CAP Update includes substantial evidence of the GHG reduction potential of each recommended measure and action to achieve its GHG reduction targets for 2030 and 2045. As explained in the CAP Update and Draft SEIR, AB 1279 established a policy for the State to achieve net zero emissions as soon as possible and ensure anthropogenic emissions are reduced to at least 85 percent below 1990 levels by 2045. The County's emissions reduction target for 2045 is aligned with this legislation. The CAP Update also establishes a goal to reach net zero emissions by 2045 and outlines actions the County will take to reach this long-term goal.

See also Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," for detailed discussion related to GHG emissions targets and justification for use of the 2019 baseline included in the CAP Update.

Comment O4-44

The comment expresses support for the acquisition of conservation lands. The comment also urges the County to move forward with the East County and North County MSCPs and acquire more land in the South County MSCP.

Response O4-44

The County appreciates the commenter's support for the acquisition of conservation lands. The CAP Update includes Action A-1.1 regarding acquisition of conservation lands to preserve natural lands and maximize carbon potential in the unincorporated area. The commentary regarding the East County, North County, and South County MSCP is noted.

Comment O4-45

The comment requests that the County achieve net negative 100 percent GHG emissions by 2035.

Response O4-45

Refer to Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," which describes the methodology the County used in the CAP Update to establish GHG reduction targets that are appropriately aligned with statewide targets and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets.

Comment O4-46

The comment expresses appreciation for the inclusion of a GHG emissions inventory in the CAP Update and then offers a summary of the emissions sources included in the inventory.

Response O4-46

Sierra Club's appreciation for the GHG emissions inventory is noted. The CAP Update summarizes the GHG emissions inventory in Part 2, and the complete inventory is provided in CAP Update Appendix 3.

Comment O4-47

The comment expresses support for two CAP actions to reduce GHG emissions.

Response O4-47

Sierra Club's support for these actions is noted. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O4-48

The comment expresses support for specified energy measures and actions of the CAP Update and comments that more detail and metrics are needed.

Response O4-48

The CAP Update includes substantial evidence of the GHG reduction potential of each recommended measure and action in several sections of the document. See Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and

Actions,” which describes the analytical basis of the reduction calculations and implementation details for quantified implementing actions that are included in the CAP Update, including the quantified GHG reduction potential and measurable performance outcomes for 2030, 2035, 2040, and 2045. The CAP Update also identifies the following details for each action as part of the CAP Implementation and Monitoring Program (Table 13): the implementation enforcement mechanism, County department with lead and supporting responsibilities for implementation, relative cost (using a qualitative, ordinal ranking of low, medium, or high), and potential funding sources for implementation.”

Comment O4-49

The comment quotes the cumulative wildfire impact conclusion for Issue 1 (Exacerbate Wildfire Risks) in Section 2.15.3.6, “Cumulative Impact Analysis,” of the Draft SEIR. The comment also states that the County admits the analysis is potentially problematic.

Response O4-49

The County has not provided any statement on potentially problematic wildfire analysis. See Response O4-51 for a discussion of the wildfire analysis included in the SEIR.

Comment O4-50

The comment cites text from a CAP Update description of implementation measures for the water and wastewater sector and remarks that the quoted text does not include a “statement about where new development will occur.” Sierra Club then states that it “would like to know will they do reuse from septic systems that are prevalent in the County.”

Response O4-50

Regarding the location of new development, refer to Section 9.1.1.1, “Master Response: CAP Update Purpose and Land Use Change,” which explains that the CAP Update has been prepared to mitigate GHG emissions generated by new development under the County’s General Plan, including GHG emissions associated with water and wastewater, and does not prescribe land use changes.

Regarding septic systems, the CAP update includes the following action to reduce GHG emissions:

- W-3.1a Evaluate Waterscape Rebate Program septic system improvements for opportunities to reduce wastewater emissions in the unincorporated area.

Comment O4-51

The comment states that the County provided contradictory arguments in the wildfire analysis and requests that more recent wildfire setting and analysis should be provided in the SEIR.

Response O4-51

In 2018, Appendix G of the State CEQA Guidelines was updated to include a separate section with new questions associated with evaluating a project’s potential impact related to wildfire. The 2011 GPU PEIR was certified before the 2018 CEQA Guidelines update.

Therefore, the 2011 GPU PEIR did not include a separate section for wildfire analysis. Rather, wildland fire hazards and emergency evacuation and response plans are discussed in Section 2.7, “Hazards and Hazardous Materials,” of the 2011 GPU PEIR. Table 2.15-1 of the Draft SEIR summarizes the wildfire-related impacts and states that wildfire issues (exacerbate wildfire risks, install infrastructure that exacerbates fire risk, and expose people or structures to post-fire risks) were not evaluated in the 2011 GPU PEIR.

As discussed in Section 2.15, “Wildfire,” the Draft SEIR incorporates by reference the wildfire setting and impact analysis from the 2011 GPU PEIR only as it applies to the CAP Update and supplements with updated setting conditions that have changed since certification of the 2011 GPU PEIR. The only wildfire existing condition included in the 2011 GPU PEIR is the description of the amount of land in the unincorporated county that is within a State Responsible Area (SRA), as identified by the California Department of Forestry and Fire Protection (CAL FIRE). The County reviewed the 2007 and 2022 fire hazard severity zones maps within SRAs prepared by CAL FIRE and concluded that the wildfire existing condition identified in the 2011 GPU PEIR is still applicable to the wildfire analysis. Although the 2022 CAL FIRE maps have yet to be adopted and the 2007 maps remain the most current adopted maps at the time of preparing the Draft SEIR, the SEIR includes the 2022 maps as the most up-to-date information. Furthermore, the County provides relevant and recent fire incidents in the county in Section 2.15.1, “Existing Conditions,” which are conditions that have changed since certification of the 2011 GPU PEIR.

In Section 2.15.2, “Regulatory Framework,” the County provides a summary of the regulatory setting that is included in the 2011 GPU PEIR and is still applicable to the CAP Update. In the same section, the County provides additional recent regulations that are not included in the 2011 GPU PEIR but are applicable to the CAP Update. Therefore, the Draft SEIR incorporates by reference the wildfire setting from the 2011 GPU PEIR only as it applies to the CAP Update and supplements with relevant and recent setting conditions.

For these reasons, the existing conditions related to wildfire that are represented in the SEIR are current; and the analysis of impacts is based on the most current regulatory requirements. The wildfire analysis is current, and no contradictory arguments are made in the Draft SEIR.

Comment O4-52

The comment suggests that with sufficient revision Sierra Club can support the CAP Update and the SEIR.

Response O4-52

See Responses O4-1 through O4-51 regarding responses to suggested revisions for the CAP Update and Draft SEIR.

PEPPERTREE PARK VILLAGES 7-10

PO Box 60094
San Diego, CA 92166
(619) 405-3585

December 27, 2023

Ms. Meghan Kelly
County of San Diego, Planning and Development Services
5510 Overland Ave., Suite 310
San Diego, CA 92123
Via email to meghan.kelly@sdcountyca.gov

Dear Megan:

My name is Howard Justus. I am the owner/representative of the Peppertree Park Villages 7, 8, 9 and 10 properties in the Fallbrook Community Plan Area. The Peppertree Park Project is a Specific Plan, approved in 1991, that provided for the development of up to 274 residential units and ancillary improvements including parks and open space, roadways, utilities, etc. Since the initial approval, subsequent tentative and final maps have been processed on the areas now referred to as Villages or Units 1, 2, 3, 4, 5 and 6, and 217 homes have been constructed. The final four units remain undeveloped; however, they are all in process with PDS.

I noticed in my review of the Climate Action Plan that Appendix B-2 describes the Peppertree Park project as an "In-Process General Plan Amendment". This is at the very least, an inappropriate description for Villages 7 and 8. These projects are consistent with the density and intensity of development contemplated in the Peppertree Specific Plan, which is part of the County's General Plan. This project may propose minor changes to the Specific Plan, these certainly should not rise to the level of a "General Plan Amendment". In fact, the very nature of designating properties with long build-out horizons and providing for their orderly development through a Specific Plan is to refrain from bringing forward continual General Plan Amendments and Rezones.

Relative to Village 9, the proposal thereon is to increase the intensity of development from 1.65 to 2.24 dwelling units per acre. This proposal is consistent with the trend towards producing more housing, especially in places that are semi-rural and in or adjacent to more VMT efficient areas such as the Fallbrook Village. Relative to Village 10, the proposal is to change the zoning from Office/Professional to General Commercial.

Since 2003, the development of the Peppertree Villages has been designated by the General Plan as being governed by the Peppertree Park Specific Plan. That will not change with the approval of the current development applications.

The County's Climate Action Plan has a history of drawing criticism, in particular regarding the treatment of General Plan Amendment projects identified in the CAP. Often, these have been significant projects proposing major upzoning in rural areas. Those projects have faced severe scrutiny and a higher threshold for review and approval. While amendments to the General Plan should be thoroughly reviewed and scrutinized, implementation of the Peppertree Park Specific Plan is not such an amendment to the General Plan and should not be characterized as such.

5-2

Therefore, I am requesting that the County revise Appendix B-2 to remove the reference to Peppertree Park as an In Process GPA and delete it from the analysis contained therein. At the very least, the County should clarify which project within the greater specific plan is a General Plan Amendment.

5-2
cont.

Respectfully,

Howard Justus

cc: Chelsea Ohanesian

Letter O5 Peppertree Park Villages 7-10

Howard Justus

December 29, 2023

Comment O5-1

The comment is an introductory statement.

Response O5-1

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O5-2

The comment provides a description of Peppertree Park Project Specific Plan and current development status. The comment states that the Peppertree Park Project is mischaracterized as an in-process GPA in Appendix B-2 ("VMT Assessment") and requests its removal.

Response O5-2

Peppertree Park is a large project that includes several villages. Some of these units have been built and are accounted for in the CAP Update. Others are the subject of in-process amendments to the General Plan (through specific plan amendments) to change adopted land use densities and increase the number of potential dwelling units. Because the General Plan must be amended to incorporate amendments to a specific plan, specific plan amendments, including those proposed to the Peppertree Park Project Specific Plan, are considered General Plan Amendments.

Draft SEIR Appendix B ("In-Process General Plan Amendment Project VMT and GHG Emissions Forecasts") lists Peppertree Park as an in-process GPA with potential to add 685 residential units above the growth accounted for in the baseline or forecast to occur without amendment to the General Plan. This accounts for the portions of the larger Peppertree Park Project that were not approved as of December 10, 2020.

The commenter states that Villages 7 and 8 (also described as Units 7 and 8) should not be included because these areas are consistent with the density and intensity of development contemplated in the Peppertree Specific Plan, which is part of the County's General Plan. The commenter states, "This project may propose minor changes to the Specific Plan, these certainly should not rise to the level of a 'General Plan Amendment.'" The County agrees with removal of Villages 7 and 8 from the list of in-process GPAs as the Specific Plan amendment will not affect density or intensity, nor will it change uses contemplated in the Specific Plan inconsistent with density or intensity. The Final SEIR has been modified to remove Peppertree Park SPA Units 7 and 8 from Table 4-1, "In-Process Projects that include General Plan Amendments," and the text on page 4-35 has been modified to reflect this change.

The commenter states, "Relative to Village 9, the proposal thereon is to increase the intensity of development from 1.65 to 2.24 dwelling units per acre...[R]elative to Village

10, the proposal is to change the zoning from Office/Professional to General Commercial.” These changes in density/intensity and changes of use require a GPA. In addition, the applicant for Peppertree Park Units 9 and 10 has an in-process GPA application number PDS2003-3800-03-XX on file with Planning & Development Services (PDS). Therefore, based on the information available to PDS, Villages 9 and 10 are defined as in-process GPAs.

There is no pathway for GPAs in the CAP Update and Villages 9 and 10 will be required to analyze their GHG impacts within their CEQA documents and provide substantial evidence to support impact conclusions. If Units 9 and 10 require mitigation, then they must provide all feasible mitigation to reduce GHG impacts. Units 9 and 10 cannot streamline their GHG analysis using the CAP Update and CAP Update Consistency Review Checklist if they are increasing density or intensity above what is allowed in the Specific Plan.

Although Units 7 and 8 are removed from the Final SEIR, Appendix B, In-Process General Plan Amendment Project VMT and GHG Emission Forecast, remains unchanged. Because Units 7 and 8 are no longer listed as in-process GPAs, Appendix B overcounts the impacts of in-process GPAs and presents a conservative assessment of impacts.

Letter

From: Ron Askeland <ron.askeland@gmail.com>
Sent: Friday, December 29, 2023 11:34 AM
To: Lynch, Dahvia <Dahvia.Lynch@sdcounty.ca.gov>
Subject: [External] SD County CAP comments

Dear Dahvia,
 I'm Ron Askeland, coleader of
 SD-SEQUEL (San Diegans for Sustainable, Equitable, & Quiet Equipment in Landscaping). Our
 coalition's goal is to protect worker health and the environment by advocating for the enactment of
 an equitable ban on gas-powered leaf blowers in all jurisdictions of San Diego County. SD-SEQUEL is
 committed to securing a trade-in or buyback program before the ban takes effect to ensure an
 equitable transition from gas to electric landscaping equipment (<https://sd-sequel.org/>).

I've submitted online comments on San Diego County's Draft Climate Action Plan, but also wanted to
 contact you directly.

We are very pleased that landscaping equipment was included in the Draft CAP and suggest an
 accelerated schedule as follows:

O6-1

T-1.2 - Please accelerate the timeline to 100% of handheld, 2-stroke engine, landscaping equipment used on County property to be zero emissions by 2026 and 100% of ALL landscaping equipment used on County property to be zero emissions by 2028

T-2.1 - Please develop a program by 2025 to provide residents and businesses incentives to purchase zero emissions landscaping equipment

T-2.2 - Please develop and adopt an ordinance to require the use of zero emission handheld, 2-stroke engine, landscaping equipment by 2028 in the unincorporated area and a second ordinance to require the use of zero emission for ALL landscaping equipment by 2030 in the unincorporated area.

O6-1
cont.

On a related note, the Draft CAP doesn't mention synthetic turf. As you may know, synthetic turf contributes to climate change, contains environmentally hazardous substances and is harmful to human health. More information can be found at <https://www.safehealthyplayingfields.org>

O6-2

The County CAP should include:

1. No installation of synthetic turf on County properties.
2. A ban on synthetic turf installations in the unincorporated areas.

Thanks,

Ron Askeland

SD-SEQUEL coleader

San Diegans for Sustainable, Equitable, & Quiet Equipment in Landscaping

<https://sd-sequel.org/>

Letter O6 San Diegans for Sustainable, Equitable & Quiet Equipment in Landscaping

Ron Askeland, Coleader
December 29, 2023

Comment O6-1

The comment describes San Diegans for Sustainable, Equitable & Quiet Equipment in Landscaping's (SD-SEQUEL's) goal and efforts to ban gas-powered leaf blowers and suggests an accelerated schedule for the following CAP Update actions T-1.2, requiring use of zero-emission landscaping equipment on County property; T-2.1, regarding an incentive program for alternative fuel and/or zero-emission construction and landscaping equipment; and T-2.2, regarding an ordinance to require zero-emission landscaping and construction equipment.

Response O6-1

The measures and actions in the CAP Update adequately address GHG emissions and would achieve established GHG reduction targets as written. Refer to Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions." The commenter's suggestions to implement the specified actions earlier than identified in the CAP Update are noted and will be provided to County decision-makers for their consideration during the adoption hearings for a Final CAP Update.

Comment O6-2

The comment requests a ban on synthetic turf on County properties and in the unincorporated county.

Response O6-2

The commenter's opposition to installations of synthetic turf on County property and in the unincorporated areas is noted. The CAP Update includes the following action to reduce GHG emissions by reducing outdoor water consumption through implementation of the County's Waterscape Rebate Program; note that artificial turf is not permitted in this rebate program.

- | | |
|-------|--|
| W-2.4 | Implement the Waterscape Rebate Program to incentivize water efficiency and conservation to reduce outdoor water consumption in the unincorporated area. |
|-------|--|

ENDANGERED HABITATS LEAGUE

DEDICATED TO ECOSYSTEM PROTECTION AND SUSTAINABLE LAND USE

January 3, 2023

Meghan Kelly
County of San Diego PDS
5510 Overland Ave., Suite 310
San Diego, CA 92123
CAP@sdcounty.ca.gov

RE: Draft Climate Action Plan (CAP) Update and Draft SEIR

Dear Ms. Kelly:

Endangered Habitats League (EHL) appreciates the opportunity to comment on the CAP. EHL is a longstanding participant in the process. We recognize the progress made in this new iteration, including the elimination of unreliable carbon offsets and of the associated streamlined path to GPAs. Our comments will focus on the alternatives analysis.

07-2

Alternatives

The DSEIR discusses rejected alternatives, several Smart Growth Alternatives, planning mechanisms, and options for new General Plan policies. EHL does not have the expertise to evaluate the Distributed Energy Only Alternative, which the DSEIR concludes is the Environmentally Superior Alternative.

The DSEIR finds serious barriers to the great majority of alternatives. The Enhanced Biological Preserve Alternative was rejected because TDR is not deemed practical. For the Smart Growth Alternatives that require major land use changes, the DSEIR repeatedly stresses that many additional actions, potentially years of public outreach, and major environmental review would be necessary to implementation. The Sustainable Communities Strategy Alternative, while using SANDAG Series 9 forecasts (9,902 units until 2050) and significantly reducing VMT, would, according to the analysis, require transportation and land use actions outside of the County's control. The Village Support Areas Alternative is based on unsubstantiated premises regarding future Village development. It also not a true Smart Growth Alternative, and would destroy the decade of work and community outreach that went into General Plan and its foundational Village/Semirural/Rural components.

07-3

Unlike the other Smart Growth Alternatives, the Fire Safe and VMT Efficient Alternative has the distinct advantage that it could be implemented quickly through overlays and incentives, and not take additional years of work. Coupled with effective

8424 SANTA MONICA BLVD SUITE A 592 LOS ANGELES CA 90069-4267 • WWW.EHLLEAGUE.ORG ♦ PHONE 213.804.2750

changes in General Plan policies, it could bridge the gap between the CAP and the more comprehensive land use changes anticipated by the Sustainable Land Use Framework (SLUF). While the alternative would continue to allow development in high VMT and high fire risk locations, these trends could be tempered by a package of incentives, streamlining benefits, disincentives, and new policies. Indeed, work on this alternative has already begun with the feasibility analysis for VMT efficient and infill development for the four communities of Buena Creek, Casa de Oro, Spring Valley, and North El Cajon/Lakeside. The Fire Safe and VMT Efficient Alternative would also take advantage of work already in progress for SB 743 implementation, whose mitigation program will offer incentives and disincentives. Complementary parameters for the SLUF could also be adopted in conjunction with the CAP.

O7-3
cont.

In light of these factors, we recommend adopting the Fire Safe and VMT Efficient Alternative. Such adoption will:

- 1) Get the County *on the right track* for addressing climate through land use and transportation;
- 2) Require only overlays and incentives instead of time-consuming major land use changes;
- 3) Complement ongoing housing feasibility initiatives and SB 743 implementation: and
- 4) Act synergistically with new General Plan policies.

In regard to complementary actions for the SLUF, direction should also be given to employ the SANDAG Series 9 forecast in the SLUF. The analysis in the DSEIR demonstrates major VMT and GHG reductions with this land use scenario.¹

General Plan Goal and Policy Edits

We strongly recommend adoption of many of the General Plan and Policy Edits and suggest modification for others. These changes would have important immediate benefits and would require minimal additional environmental review. Specific recommendations are discussed below.

O7-4

Policy LU-1.2 Leapfrog Development

Strongly *support* this change. It is extremely important to update the leapfrog policy to include today's GHG and climate change considerations that were not prominent in 2011.

¹ The Alternatives Evaluated in the 2011 GPU EIR, incorporated by reference into the CAP, would also be helpful to the SLUF. These land use scenarios improve upon the 2011 General Plan in directing growth out of high fire risk and high VMT locations. Their use would allow the County to merge prior planning with newer considerations of climate change, VMT, and fire risk, all of which were not as prominent issues in 2011 as they are today.

Policy LU-1.4 Village Expansion.

Strongly *support* this change but a more appropriate level of tolerable risk should be substituted. Again, it is vital to update village expansion policies to include today's GHG and climate change considerations that were not prominent in 2011.

Any expansion within a Very High Fire Hazard Severity Zone would not subject future residents, occupants, and structures to ~~high levels more than a low level~~ of risk of loss of life or loss of structures

Policy LU-1.5 Relationship of County Land Use Designations with Adjoining Jurisdictions

Strongly *oppose* this change. The purpose of this policy is to respect urban-rural boundaries established for important purposes, such as protecting habitat, farmland, and limiting sprawl. Adding the clause, "except where such adjustments would result in land use patterns consistent with the County's climate policies implementing General Plan Goals LU-5 (Climate Change and Land Use) and LU-6 (Sustainable Development-Environmental Balance)" would eviscerate this important planning goal by allowing a wide range of secondary considerations to *override* the essential purpose of the policy.

GOAL LU-4. Inter-jurisdictional Coordination

Support

Policy LU-4.1 Regional Planning

Support

Policy LU-4.6 Planning for Adequate Energy Facilities

Support

Policy LU-5.1 Reduction of Greenhouse Gas Emissions from Vehicle Trips within Communities. and Vehicle Miles Traveled from New and Existing Development

Support with changes. The last sentence should be removed as it is unnecessary and largely redundant.

With the exception of "maximizing to the extent feasible the use of electric vehicles," the text preceding this sentence captures all the relevant actions to address vehicle trips. These actions are *broadly applicable* to any location, whether relatively low or high VMT. Second, it undermines the goal of focusing development in lower VMT locations by implying that electric vehicle use could serve as a *rationale* to sprawl into remote areas. Rather, gas-power will dominate vehicle use for decades to come. The best solution is to substitute "enhanced electric vehicle recharging infrastructure"

O7-4
cont.

with “maximized use of electric vehicles and required construction of electric vehicle recharging infrastructure.”

Policy LU-5.1 Reduction of Greenhouse Gas Emissions from Vehicle Trips within Communities, and Vehicle Miles Traveled from New and Existing Development.

Incorporate a mixture of uses within Villages and Rural Villages and plan residential densities at a level that supports multi-modal transportation, including walking, bicycling, and the use of public transit, when appropriate, and the use of electric vehicles. Develop and implement strategies to avoid, minimize, reduce, and/or compensate for the greenhouse gas emissions associated with vehicle miles traveled from new development, including compensatory strategies that would fund reductions in greenhouse gas emissions from existing development and existing economic activities. Include *in-County* compensatory strategies such as improved energy and water conservation, increased reliance on large- and small-scale renewable energy, ~~enhanced electric vehicle recharging infrastructure, maximized use of electric vehicles and required construction of electric vehicle recharging infrastructure,~~ reductions in propane usage in rural areas, replacement of diesel- and gasoline-powered equipment and vehicles, landscape restoration and enhancement (e.g., tree-planting), preservation and enhancement of open space and rural lands to maintain or increase carbon sequestration, and other outcomes that reduce fossil fuel usage, reduce biomass combustion, and/or sequester carbon. ~~In unincorporated areas where new development would lead to comparatively high per capita vehicle miles traveled, maximize to the extent feasible the use of electric vehicles and require construction of electric vehicle recharging infrastructure.~~

O7-4
cont.

Policy LU-5.2 Sustainable Planning and Design

Support

Policy LU-5.3 Rural Land Preservation

Oppose unless modified.

The actual measures that would be taken to reduce wildfire risk are not specified. Unfortunately, counterproductive landscape-level vegetation treatments are common. These convert chaparral and coastal sage scrub to flammable non-native grasses, and actually increase fire danger.² Given this state of affairs, the proposed language would be

² See “1757 Expert Advisory Committee (EAC) Recommendations for Implementation Targets for Natural and Working Lands (NWL) Sector Climate Actions,” November 2023, Shublands, page 39ff. < https://resources.ca.gov/-/media/CNRA-Website/Files/Initiatives/Expanding-Nature-Based-Solutions/1757_EAC_Recommendations_Implementation_Targets_for_NWL.pdf> Also see Syphard, A., et al, “Fire-driven vegetation type conversion in Southern California,” *Ecological Applications*, 2022, and Syphard, A., et al, “Extent and drivers of vegetation type conversion in Southern California chaparral, *Ecosphere*, 2019.

counterproductive. An alternative is to modify the policy so as avoid type conversion. Otherwise, this new policy will do more harm than good.

Encourage and support the management of public and private open space and rural lands so as to reduce the risk of uncontrolled wildfires with the potential to release large amounts of greenhouse gases with methods that do not result in the type-conversion of native habitat.

Policy LU-5.4 Planning Support.

Support

Policy LU-5.6 Develop Mechanisms for Avoiding Potential Regulatory Takings Where Development is Restricted to Achieve Greenhouse Gas Emissions Targets.

Oppose unless substantially modified.

As written, this policy would willfully undermine the County's basic police power of land use. The most problematic part regards downplanning, which does *not* require compensation unless no economic use remains. The policy would reverse the County's proper and legally-correct position used throughout the 2011 Update, that standard downplanning is *not* regulatory takings. It would chill future downplanning in the public interest and create huge financial liability. The policy could be completely re-written to remove a misplaced focus on "regulatory takings" and instead focus on *positive* steps to facilitate emissions reduction.

O7-4
cont.

Policy LU-5.6 Develop Planning Mechanisms for Avoiding Potential Regulatory Takings Where Development is Restricted to Facilitate Achieving Greenhouse Gas Emissions Targets. ~~In consultation with SANDAG, cities within the County, the public at large, and key stakeholders such as business leaders, land developers, rural property owners, environmental organizations, and environmental justice advocates, develop and implement strategies for providing economic compensation to private landowners where the County restricts or limits the amount of development pursuant to their existing General Plan and zoning designation in order to achieve greenhouse gas emissions reductions consistent with State law and County General Plan policy. Explore the use of compensation mechanisms such as transferrable development rights, density transfers, density bonuses beyond those already permitted under State law, property tax reductions, compensated down zonings, and subsidized permanent land conservation for carbon sequestration purposes. In order to achieve greenhouse gas emissions reductions consistent with State law and County General Plan policy, explore and develop land use mechanisms to help reduce GHG emissions, such as transferrable development rights, density transfers, density bonuses beyond those already permitted under State law, property tax reductions, and easement purchase for permanent land conservation for carbon sequestration purposes.~~

GOAL LU-6. Sustainable Development-Environmental Balance

Support

Policy LU-6.1 Environmental Sustainability.

Support

Policy LU-6.2 Reducing Development Pressures

Support with changes. Just “considering” strategies would accomplish little. Also, the scope of the policy should include HFHSZs. Recommend the edits below.

Policy LU-6.2 Reducing Development Pressures. Assign lowest-density or lowest-intensity land use designations to areas with sensitive natural resources.; ~~consider~~ develop strategies to reduce planned density in areas in which new development would lead to comparatively high per capita vehicle miles traveled, and in High and Very High Fire Hazard Severity Zones.

Policy LU-6.3 Conservation-Oriented Project Design.

Support though the policy should include the existing Conservation Subdivision Program, which accomplishes exactly these goals.

Policy LU-6.4 Sustainable Subdivision Design

Support

Policy LU-6.11 Protection from Wildfires and Unmitigable Hazards

Support

Policy LU-8.1 Density Relationship to Groundwater Sustainability

Support

Policy LU-8.2 Groundwater Resources

Support

Policy LU-11.6 Office Development

Support

Policy LU-11.6 Office Development

O7-4
cont.

Support

Policy LU-11.8 Permitted Secondary Uses

Support

Policy LU-11.12 Plan for Mixed Uses

Support if modified. Not all locations are appropriate for new residential development, and market forces should not be the sole reason for changing a land use.

Policy LU-11.12 Plan for Mixed Uses. ~~Within Villages, consider land use designations and zoning standards that allow for the conversion from office and commercial uses to residential uses where office or commercial space has become uncompetitive due to market conditions or other factors is no longer needed and where residential uses would be both compatible with surrounding land uses and consistent with the County's climate policies implementing General Plan Goals LU-5 (Climate Change and Land Use) and LU-6 (Sustainable Development-Environmental Balance).~~

GOAL LU-12. Infrastructure and Services Supporting Development.

Support

Policy LU-12.1 Concurrency of Infrastructure and Services with Development

Support

GOAL LU-19.

Strongly oppose. This policy is not necessary and is redundant. It also provides an unwarranted "greenlight" to GPAs. Yes, the County must meet its RHNA requirements. But given the enormous overcapacity in the current General Plan (60,000 unit capacity vs 9,000 units in Series 9), the task before the County is not up-planning but down-planning. But if a GPA is truly needed to meet RHNA or Housing Element requirements, there are ample new policies being proposed that would address the goal of limiting GHG impacts.

~~Limit the environmental impacts, including greenhouse gas emissions, resulting from General Plan Amendments that would either allow development where it is currently disallowed or increase the density or intensity of use beyond currently planned levels, while ensuring that the County can meet its share of the housing needed on a regional basis, as determined through the Regional Housing Needs Assessment process overseen by the San Diego Association of Governments (SANDAG).~~

O7-4
cont.

Policy LU-19.1 Environmental Review

Support with modification. These are important factors for environmental review for any GPA proposed outside of “smart growth” locations. However, if the Board has not yet designated such locations, then the policy becomes problematic. Thus, the text should be modified as follows:

~~outside not within a Board-designated~~ “smart growth” areas ~~designated by the Board~~

The text of the policy should clarify that out-of-county carbon offsets are an excluded mechanism for carbon neutrality. Also, for reasons described above, the reference to “compensated down-zonings” should be deleted. Finally, we note that the merits of this policy, particularly (viii), hinge on whether changes are made to LU-19.2.

Policy LU-19.2 Criteria for Approval.

Support if modified. This is an extremely important new policy. EHL strongly supports the “findings” approach to proposed GPAs. It is essential that a GPA reinforce and not undermine climate goals. *However, to be effective, the policy must also address the essential locational factors that determine the merits of a GPA.*

Preliminary comments are as follows:

- Modify the introductory text as in LU-19.1:

~~outside not within a Board-designated~~ “smart growth” areas ~~designated by the Board~~

- Change the standard for findings to reflect contrary evidence that may be brought to the Board’s attention:

which must each be supported by ~~substantial~~ a preponderance of the evidence before the Board:

Regarding the substance of the findings themselves, we *concur* with finding (i) concerning carbon neutrality and with the multiple findings (iii – viii) to ensure “no significant, unavoidable effects” occur on natural resources and public safety. However, significant improvement is critical for the housing finding (ii).

For the housing finding, we agree with using “smart growth” areas as the threshold, as these locations already meet high sustainability standards. These smart growth areas should be low VMT, low fire risk, *and within Villages*. Village designations are important to recognize as they are the *fundamental planning principal* of the General Plan, separating locations where more housing will be appropriate from rural, habitat, and agricultural lands where it is *not* appropriate. However, Village development

8

O7-4
cont.

does not necessarily reduce VMT and GHG emissions, as some are remote. For this reason, the policy is correct in using the threshold of “smart growth” areas for when findings are needed.

The crux of the problem with (ii)(A) as currently written is that the wrong question is asked. *A proposed up-planning will always increase overall housing stock; the proposed finding is therefore meaningless as it will always be successfully made. The right question is whether the up-planning is needed in the first place*, especially given the gross overcapacity in the General Plan. To answer this question, Village designations must be incorporated into the findings.

To accommodate all these considerations, we recommend introducing the concept of *necessity* into the housing findings. *A GPA is justified if it responds to a lack of housing capacity*. If so, a tiered approach should be used, which first prioritizes smart growth areas and then locations within existing Villages. We recommend the following changes:

(ii) Compared with a scenario in which the proposed project would be disapproved (i.e., the CEQA No Project Alternative), the proposed project will contribute positively to meeting the County’s housing needs by:

(A) Demonstrating under-capacity in the General Plan such that, absent the project, the County will not meet its fair share of the housing needed on a regional basis, as determined through the Regional Housing Needs Assessment process overseen by SANDAG;

(B) Demonstrating that if the proposed GPA is outside of Villages there is no land available land within Villages where the housing need can be feasibly accommodated, including by re-designating residential or commercial land within Villages;

(C) Demonstrating that land utilized outside Villages is the minimum amount necessary to accommodate the housing need after utilizing land within Villages, is adjacent to Villages consistent with the Community Development Model, and utilizes Semi-Rural rather than Rural land to the maximum extent possible.

(D) Appreciably increasing the overall housing stock in the unincorporated County, consistent with the County’s fair share of the housing needed on a regional basis, as determined through the Regional Housing Needs Assessment process overseen by SANDAG by either providing a component of deed-restricted housing affordable to very low-income, low-income, or moderate-income households for 30 years or, for projects that do not include housing, creating job opportunities near existing residential areas and/ or transit.

Policy COS-15.7 through Policy M-9.5

O7-4
cont.

Support

GOAL S-3. Minimized Fire Hazards

Support if modified. Why not also in High Fire Severity Zones?

Minimize injury, loss of life, and damage to property resulting from structural or wildland fire hazards, particularly in High and Very High Fire Hazard Severity Zones, consistent with the Safety Element.

Policy S-3.1 Defensible Development

Support if modified. Why not also in High Fire Severity Zones?

Require development to be located, designed, and constructed to provide adequate defensibility and minimize the risk of structural loss and life safety resulting from wildland fires. Require new development in High and Very High Fire Hazard Severity Zones to employ construction practices (e.g., “hardened homes”) and landscaping strategies that minimize the possibility of loss of life and structures from wildfires.

Policy S-3.8 Discourage New Subdivisions in Very High Fire Hazard Severity Zones.

O7-4
cont.

Support if modified. First, it is unclear if this policy is intended to address subdivisions under existing zoning, GPAs, or both. *Please clarify.* However, new policies should address both circumstances in relation to fire hazard.

As a guiding principle, if there is an *unavoidable* need to increase density in high fire locations, it should absolutely *not* further expand the wildland-urban interface (WUI). WUI expansion leads to *additional* areas where human-caused ignitions will start wildfires and *additional* locations that firefighters must defend in a widespread conflagration. *WUI expansion is identified by fire ecologists as the underlying cause of today’s fire crisis.*³ If new development is within a Village, even if in a high fire severity zone, at least it will not expand the WUI and is surrounded by other development that is already being defended.

EHL generally supports the approach of Los Angeles County, which *prohibits* new subdivisions outside of existing communities in VHFHSZs, and discourages subdivisions in other FHSZs. This use of existing communities is a middle ground that allows some ongoing subdivision in VHFHSZs. Importantly, Los Angeles County goes on to prohibit GPAs in all fire hazard areas unless within an existing community. (See Motion enclosed.) San Diego County’s equivalent to “existing communities” is Villages.

³ Radeloff, V. et al, “Rapid growth of the US wildland-urban interface raises wildfire risk.” PNAS, 2028 <https://www.pnas.org/doi/full/10.1073/pnas.1718850115>.

EHL recommends policies along these lines, recognizing that the prohibition against GPAs (as opposed to subdivisions) is the priority.

A major flaw in the current policy is use of the concept of “sufficient” land. This is an oversimplification that does not take into account potential up-planning to increase density in less hazardous locations. However, it is probably unreasonable for a proposed subdivision (absent a GPA) to undertake a complete analysis of land sufficiency.

Based on all these considerations, we recommend the following:

Unless within Villages and providing safe emergency egress and safe access for emergency responders as determined by the County, prohibit ~~Discourage~~ new residential subdivisions in Very High Fire Hazard Severity Zones, except as necessary to avoid regulatory takings and/or to maintain sufficient land to meet the County’s fair share of the housing needed on a regional basis, as determined through the Regional Housing Needs Assessment process overseen by SANDAG. Discourage new residential subdivisions in Very High Fire Hazard Severity Zones, except as necessary to avoid regulatory takings and/or to maintain sufficient land to meet the County’s fair share of the housing needed on a regional basis, as determined through the Regional Housing Needs Assessment process overseen by SANDAG, but if they occur, provide safe emergency egress and safe access for emergency responders as determined by the County.

O7-4
cont.

Outside of currently designated Villages, privately-initiated development projects proposing a general plan amendment (GPA) that would either allow development where it is currently disallowed or increase the density or intensity of use beyond currently allowed levels within High and Very High Fire Hazard Severity Zones are prohibited.

Policy S-4.3 Forest Health.

Support if modified. As this policy does, it is important to differentiate forests from shrublands (coastal sage scrub and chaparral) which are managed completely differently. However, fuel management techniques even within conifer forests are controversial in Southern California. Specific methods should not be listed as “appropriate” unless the County first confers with expert fire ecologists.

Encourage and support the protection and management of woodlands, forests, and tree resources on public and private lands and limit fire threat through scientifically appropriate fuel management. ~~such as prescribed burns, herbivory, and the removal of dead, dying, and diseased trees and excessive flammable underbrush.~~

Thank you for considering our views and we hope to work with you on a successful Climate Action Plan.

Yours truly,

Dan Silver
Executive Director

Enclosure

Los Angeles County Safety and Land Use Elements motion

AGN. NO.

MOTION BY SUPERVISOR KATHRYN BARGER

April 5, 2022

Update to the County's Safety Element

The Safety Element is just one component of the County's overall General Plan. The Safety Element Update factually focuses on the full range of potential hazards, with the goal of reducing the potential short and long-term risk of death, injuries, property damage, and economic and social dislocation resulting from fire, flood, droughts, earthquakes, landslides, and climate change in the County's unincorporated areas.

The Safety Element is required to be updated for two reasons. First, the State of California recently passed legislation requiring the Safety Element to address climate change and hazard risk reduction. The second reason is to integrate safety planning with our policies dealing with growth and future housing production. Recently enacted legislation (Senate Bill 1035) requires the Housing Element and Safety Element to be updated at the same time to ensure that we are not planning for new growth in hazard areas, particularly fire hazard zones. Additionally, Senate Bill 1241, enacted in 2012, requires development in fire hazard areas to have additional wildfire protections.

The Safety Element also recognizes that disadvantaged communities are uniquely vulnerable to climate-related hazards. This policy emphasis is appropriately reflected in a concerted effort to enhance the safety of existing at-risk communities through Resilience Hubs, Microgrids, Cooling Centers, and Community Wildfire Protection Plans.

Although fires are a natural part of the wildland ecosystem, development in wildland areas can potentially increase the danger of wildfires to residents, property, and the environment, which are increasing, again, in part due to climate change.

The Safety Element acknowledges the need to limit further development into the wildland-urban-interface. This acknowledgment is critical to reduce fire frequency, protect life and property, and reduce future fire-related costs to the taxpayer.

MOTION BY SUPERVISOR KATHRYN BARGER

April 5, 2022

Page 2

However, the Safety Element, in a nod to the ongoing housing and homeless crises, achieves the necessary balance with mitigating environmental hazards, while also recognizing areas that are suitable for and already committed to development. New subdivisions or general assembly uses that are generally surrounded by existing or planned development and address the need for evacuation and emergency response, can continue to be developed.

Accordingly, to meet these goals, the County should make slight revisions to Policies S4.1, S4.20, and L1.10 as identified in redline below:

Policy S 4.1: Prohibit new subdivisions in VHFHSZs unless: (1) the new subdivision is generally surrounded by existing or entitled development or is located in an existing approved specific plan or is within the boundaries of a communities facility district adopted by the County prior to January 1, 2022, including any improvement areas and future annexation areas identified in the County resolution approving such district; (2) the County determines there is sufficient secondary egress; and (3) the County determines the adjoining major highways and street networks are sufficient for evacuation as well as safe access for emergency responders under a range of emergency scenarios, as determined by the County. Discourage new subdivisions in all other FHSZs.

Policy S 4.20: Prohibit new and intensification of existing general assembly uses in VHFHSZs unless: (1) the use is located in an existing approved specific plan or (2) the County determines there is sufficient secondary egress and the County determines the adjoining major highways and street networks are sufficient for evacuation, as well as safe access for emergency responders under a range of emergency scenarios, as determined by the County. Discourage new general assembly uses in all other FHSZs

Policy L 1.10: Prohibit plan amendments that increase density of residential land uses within mapped fire and flood hazard areas unless generally surrounded by existing built development and the County determines the adjoining major highways and street networks can accommodate evacuation as well as safe access for emergency responders under a range of emergency scenarios, as determined by the County.

Understanding the need to balance environmental protection, limiting extreme hazards, and supporting the protection of existing or planned development:

MOTION BY SUPERVISOR KATHRYN BARGER

April 5, 2022

Page 3

I, **THEREFORE, MOVE** that the Board of Supervisors:

1. Indicate your intent to adopt the Negative Declaration associated with Environmental Assessment No. RPPL2021005522, finding that there is no substantial evidence that the project will have a significant effect on the environment;
2. Indicate your intent to approve the Project (Plan Amendment No. RPPL2021011001) with slight revisions to Policies S 4.1, S 4.20, and L 1.10 ;
3. Find that the Project, with these revisions, is consistent with the goals, policies, and principles of the General Plan; In the interest of public health, safety, and general welfare and in conformity with good zoning practice, and consistent with other provisions of Title 22 of the Los Angeles County Code (County Code); and
4. Instruct County Counsel to prepare the final documents for the Project and bring them back to the Board for their consideration.

Letter O7 Endangered Habitats League

Dan Silver, Executive Director

January 3, 2024

Comment O7-1

The comment is an introductory statement.

Response O7-1

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O7-2

The comment states that the detailed comments provided below will focus on the alternatives analysis.

Response O7-2

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O7-3

The comment provides a summary of the alternatives analysis in the Draft SEIR. The comment asserts that “the Fire Safe and VMT Efficient Alternative has the distinct advantage that it could be implemented quickly through overlays and incentives, and not take additional years of work.” The comment recommends adoption of the Fire Safe and VMT Efficient Alternative because such adoption would “get the County on the right track through land use and transportation,” via “overlays and incentives instead of time-consuming major land use changes,” and would complement housing feasibility initiatives, SB 743, and new General Plan policies. The comment also offers suggestions related to the SLUF.

Response O7-3

The Endangered Habitats League’s support for the Fire Safe and VMT Efficient Alternative is noted for the record and will be provided to the Board for consideration. Refer to Section 9.1.1.2, “Master Response: Evaluation of Smart Growth Alternatives in This SEIR,” for further discussion of smart growth development and implementation. The County agrees that through overlays and incentives, some of the smart growth alternatives could be implemented in a relatively short time frame, should the Board select an alternative.

As directed by the Board on February 9, 2022, County staff have embarked on a two-phased approach to identify policies to reduce VMT in the unincorporated county through the implementation of SB 743 (see https://leginfo.ca.gov/faces/billNavClient.xhtml?bill_id=201320140SB743). The SLUF will identify how and if the County should reconsider the existing 2011 General Plan principles and vision, and whether a new or revised vision should guide future land

use decisions. Comments on the County's evaluation of the separate SLUF program are acknowledged.

Comment O7-4

The comment expresses support, suggests modifications, and expresses opposition to various policies in the General Plan Goal and Policy Edits Alternative.

Response O7-4

The County appreciates and acknowledges the support, input, and refinements provided in the comment. Adoption of any part of the General Plan Goal and Policy Edits Alternative, as presented in the Draft EIR or as subsequently revised, is a question of County policy. These suggestions will be presented to the Board, which has the discretion to direct implementation of the suggested refinements as part of the alternative.

Our Children's Health and Future Depend on the Actions We Take Today!

January 4, 2024

CleanEarth4Kids.org thanks the County of San Diego staff for all the work that has gone into the Climate Action Plan (CAP).

Implementing a strong and comprehensive CAP will help protect the people of San Diego from air pollution and the impacts of climate change for a better future.

The proposed CAP is very goal-oriented and would require legislation and actions to be implemented. We ask the County to make the CAP a free-standing document that can be quickly implemented, clearly enforceable and tightly related to the General Plan. The CAP must be integral in County decision-making.

CleanEarth4Kids.org also asks the County to provide an analysis in the CAP of the proposed greenhouse gases (GHG) reduction plans with detailed action metrics, targets and dates including the measurement methodology to be used.

Our other comments and suggestions are:

1. Climate-Safe Investments
2. 100% Building Electrification for New Construction with No Exceptions
3. Clean, Renewable Energy and Electrify/Renovate Existing Buildings
4. Solar, EV Charging Stations, Microgrids and Virtual Power Plants (VPP)
5. Community and Environmental Dashboard
6. Add a Clean Air Section to the CAP
 - a. Ban Leaf Blowers
 - b. No Idling
 - c. Stop Wood Burning
 - d. Stop Smoking
 - e. Stop Leaded Aviation Gas (AVGAS)
7. Protect and Conserve Water
8. Transportation
9. No False Solutions
10. Stop Toxic Synthetic Pesticides
11. Community Gardens
12. Create Pocket Forests
13. Protect Natural Habitat, Wetlands, Lagoons and Waterways
14. Ban Synthetic Grass/Artificial Turf
15. Zero Waste and Ban Single-Use Plastics

1. Climate-Safe Investments

08-1
cont.

- Divest any investments, bank accounts, etc. that support fossil fuels. Only invest in funds, stocks, bonds, etc. that guarantee they will not invest in fossil fuels.
- Include eco-friendly choices for employee retirement fund investment options.
- Use an eco-friendly bank, preferably a B-Corp, for all County cash accounts. Do NOT support banks that invest in fossil fuel projects.
- Provide informational sessions and support for builders and property owners to obtain grants and other funding for energy efficiency and renewable energy improvements. For example, work with eco-friendly banks to provide Property Assessed Clean Energy (PACE) loans and financing.

2. 100% Building Electrification for New Construction with No Exceptions

The County must prioritize building electrification with high-efficiency appliances and insulation to move away from fossil fuels and improve air quality to protect health and the environment. Over [60 cities in California](#) have already passed electrification ordinances and others are underway.¹

Natural gas is a marketing term for methane, a [hazardous indoor air pollutant](#) and a [major contributor to climate change](#).^{2,3} The use of [gas stoves](#) in the home increases the risk of asthma and other respiratory diseases.⁴ And [gas stoves leak methane](#) even when turned off.⁵ We must completely end the use of “natural gas”.

This important action will encourage green buildings, reduce carbon emissions and air pollution, and help protect the health of children and future generations.

Burning methane creates outdoor and indoor air pollution. Around 17% of greenhouse gases (GHGs) in Oceanside come from the burning of methane, mainly for heat and hot water. [Studies](#) of human exposure to air pollutants show that “indoor levels of pollutants may be two to five times, and occasionally more than 100 times, higher than outdoor levels,” and a major source of indoor air pollution is gas stoves.⁶ Here is a [link](#) to our *Dangers of Natural Gas* video.⁷ Please go to our [Team 3: Clean Air Saves Lives](#) page for more information.⁸

3. Clean, Renewable Energy and Electrify/Renovate Existing Buildings

The CAP currently needs more details on the stated goal of 100% clean energy by 2030. There must be a clear roadmap with metrics and dates and we ask the County to set the goal of 100% renewable energy to 2025.

⁷ <https://vimeo.com/704755689>

⁸ <https://cleanearth4kids.org/clean-air#gas>

O8-1
cont.

With residential power as the 2nd largest GHG in San Diego County, the CAP must provide incentives and subsidies to encourage owners of existing buildings to electrify. The County must provide funding and assistance for owners and contractors to obtain state and federal grants to replace gas equipment as quickly as possible: installing electric heat pumps, water heaters, induction cooktops, etc. while providing energy efficiency improvements like insulated windows and LED lighting.

We ask the CAP to include all properties owned by the County, including leased, in the plans for zero emissions. We also ask all county housing policies, funding, contracts and leases to require all-electric buildings.

The CAP must also provide incentives to reduce embedded carbon in construction including the use of EV vehicles for construction projects!⁹

4. Solar, EV Charging Stations, Microgrids and Virtual Power Plants (VPP)

To maximize clean, local energy generation and grid reliability, coordinate with San Diego Community Power (SDCP) to install solar panels and wind turbines on all county-owned parking lots and buildings while integrating microgrids and VPP into the power grid. Also, greatly increase EV charging stations, especially for multi-unit housing. Engage with school districts throughout the county to do the same for all school buildings. Each city and school building will provide local power generation and fault tolerance while serving as a resilience center in case of fire, earthquake or heat wave.

The CAP must incentivize local, clean energy through microgrids for renters and subsidized housing throughout the county.

The County has to lead by upgrading all County facilities to be all-electric and use 100% clean/renewable energy including converting all County vehicles to electric. Timelines and metrics must be provided in the CAP.

O8-1
cont.

5. Community and Environmental Dashboard

Create a Climate & Environmental Dashboard to increase citizen awareness, knowledge, and participation on issues such as air pollution and energy utilization. Resources like ClimateTrace.org can be used to identify major emitters of GHG in the County and publicize who they are on the dashboard.

These dashboards should be located in libraries, schools and businesses throughout San Diego.

6. Add a Clean Air Section to the CAP

The burning of fossil fuels does much more than just release GHGs. It also dumps toxic air pollution that harms everyone's health and the environment. We ask the County to include a Clean Air section in the CAP like the City of San Diego with clean air goals and yearly targets

⁹ <https://www.sandiegocounty.gov/content/sdc/sustainability/regional-decarbonization/rdsummary.html>

¹⁰ <https://rmi.org/embodied-carbon-101/>

to reduce air pollution.¹¹

- Take Climate Action and Protect Our Air: Stop Burning Fossil Fuels

Air pollution from fossil fuels and petrochemicals has a significant detrimental impact on [human health](#),¹² particularly on the [brain](#) and the [cognitive abilities of children](#).¹³ Exposure to ambient air pollutants like PM2.5, NO2 and ozone and heavy metals like lead, arsenic and mercury have been associated with [lower academic performance](#),¹⁴ [attention deficit hyperactivity disorder \(ADHD\) symptoms](#),¹⁵ behavioral problems and [autism spectrum disorders in children](#).¹⁶ Air pollution increases the risk of neurological disorders and accelerated cognitive decline in children by causing [neuroinflammation and neurodegeneration](#).¹⁷ These pollutants have also been associated with several other indicators of poor health, including [asthma and infant mortality](#).¹⁸ Recent findings indicate that air pollution is linked to cognitive impairment through various biological processes, such as [oxidative stress and inflammation, endocrine disruption, epigenetic modifications](#), and changes in brain structure.¹⁹ Exposure to fine particulate matter is correlated with [reduced cortical thickness and thinner gray matter](#),²⁰ which may [impact learning, memory, and information processing](#).²¹

O8-1
cont.

Also causing significant harm to the brain [lowering cognitive abilities and reading and math scores are heavy metals](#) including mercury, lead, manganese, and their compounds, and petrochemicals such as isoamyl alcohol, methanol, xylene, toluene, styrene, hexane, and ethylbenzene.²²

- Fossil Fuel Air Pollution Harms Public Health

Fossil fuel combustion is a [leading cause](#) of deadly PM2.5 exposure.²³ Extended exposure to PM2.5 is responsible for 62% of all deaths from air pollution in 2019.²⁴ PM 2.5 is especially [deadly](#) because its small size allows it to enter deep into the lungs and pass into the [bloodstream](#), making it a significant contributor to cardiovascular [disease and mortality](#).^{25,26,27} PM2.5 also [increases](#) heart disease, lung cancer, COPD (chronic obstructive pulmonary disease), lower-respiratory infections, pneumonia, stroke, type 2 diabetes, and other serious conditions including [gastrointestinal illness](#).^{28,29} People with tuberculosis

O8-1
cont.

• Air Pollution is A Racial, Social, Environmental, and Climate Justice Issue

Air pollution from the burning of fossil fuels harms people of color disproportionately.⁶⁰ Due to Social Determinants of Health (SDoH) factors Black and low-income communities are disproportionately affected by air pollution in the United States.⁶¹ Annually, fossil fuel industries in the US release about 9 million tons of methane gas and other toxic chemicals into the atmosphere.⁶² Black and low-income communities are disproportionately affected by air pollution in the United States.⁶³ Exposure to poor air quality can cause numerous health problems such as emphysema and asthma.⁶⁴ Increased rates of asthma can lead to significant health disparities and reduced quality of life.⁶⁵ Approximately 13.4% of Black children suffer from asthma as compared to only 7.3% of White children.⁵³

In total, African Americans are 75% more likely than White people to live in “fence-line” communities (areas near commercial facilities that produce noise, odor, traffic, or emissions that directly affect the population).⁴⁹

6a. Ban Leaf Blowers

⁶⁰ <https://psci.princeton.edu/tips/2020/8/15/racial-disparities-and-climate-change>

⁶¹ <https://www.lung.org/clean-air/outdoors/who-is-at-risk/disparities>

⁶² <https://psci.princeton.edu/tips/2020/8/15/racial-disparities-and-climate-change>

⁶³ <https://www.lung.org/clean-air/outdoors/who-is-at-risk/disparities>

⁶⁴ <https://www.catf.us/2017/11/study-african-american-health-impacts-oil-gas-pollution/>

⁶⁵ <https://aafa.org/asthma-allergy-research/our-research/asthma-disparities-burden-on-minorities/>

Most gas-powered leaf blowers are 2 stroke engines that burn a mix of oil and gas. These engines not only put out a massive amount of pollution, but they also do not have a filter. The [pollutants](#)⁶⁶ from a single gas-powered leaf-blower are 300x more than a pickup truck with gas-powered lawn equipment using an estimated 800 million gallons of gasoline. This contributes to more air pollution in our air, and damaging ozone as these nitrous oxides contribute to the damage that occurs.

With and without a filter, the dangers of gas-powered leaf blowers are immense. Gas-powered leaf-blowers emit carbon monoxide, nitrous oxides, hydrocarbons and other [pollutants](#)⁶⁷ such as formaldehyde, benzene, fine particulate matter, and smog-forming chemicals. These pollutants are known to cause diseases that affect the heart and lungs, as well as cancer, dementia, and [headaches](#)⁶⁸. The [health effects](#)⁶⁹ linked to gas-powered leaf blowers are asthma, cardiovascular disease, lung cancer, respiratory disease, and central nervous system disorders.

6b. No Idling

Car exhaust is full of toxic chemicals like benzene and carbon monoxide. 1 minute of idling puts [more carbon monoxide](#) into the air than smoking 3 packs of cigarettes.⁷⁰ Please take action to reduce idling by parked vehicles, including purchasing only zero-emission vehicles for the city fleet. [Idling burns](#) over 3.8 million gallons of fuel every day in the US, adding 30 million tons of CO2 to the atmosphere!⁷¹ [Link](#) for more information on idling.⁷²

The CAP must adopt a no-idling policy along with requiring the electrification of loading docks and other facilities and eliminate vehicle idling. Also provide education through signs, social media and radio to bring awareness.

6c. Stop Wood Burning

We ask the County of San Diego to take action to stop wood smoke.

- a. Work with the SD APCD (San Diego Air Pollution Control District) and surrounding cities to stop wood-burning fireplaces and stoves in new construction and renovations like the [City of London](#).⁷³
- b. Implement programs and incentives to remove (not replace!) existing wood-burning fireplaces and stoves.
- c. Work with SD APCD and all city, county, and state governments and agencies to stop recreational wood fires on all public lands like beaches and parks to protect clean air and our health.
- d. Fund radio, print, TV and social media ads about the harms of wood smoke. Please see the [CleanEarth4Kids.org Stop Wood Smoke video](#) created by our youth.⁷⁴

⁶⁶ <https://sustainability.wustl.edu/rethinking-lawn-equipment-2/>

⁶⁷ <https://sustainability.wustl.edu/rethinking-lawn-equipment-2/>

⁶⁸ <https://www.quietcleanpdx.org/leaf-blowers-dangers-pollution/>

⁷⁰ <http://enginesoff.com/pdfs/CASEO-Background-Report.pdf>

⁷¹ https://afdc.energy.gov/files/u/publication/idling_personal_vehicles.pdf

⁷² <https://cleaneearth4kids.org/stop-idling>

⁷³ <https://www.theguardian.com/2023/feb/08/wood-burners-in-effect-banned-new-refurbished-homes-london>

⁷⁴ <https://vimeo.com/762477620>

O8-1
cont.

Wood smoke is a complex mixture of gases and fine particles, called particulate matter. PM2.5 is especially dangerous. These particles are 2.5 microns or smaller. By comparison, the average human hair is 50 microns wide. Researchers estimate that PM2.5 is responsible for almost 48,000 [premature deaths](#) in the US every year.⁷⁵ Particulate matter irritates the lungs and increases the risk of [serious health outcomes](#) including asthma, heart attacks, strokes, cancer, and brain conditions like Alzheimer's, Parkinson's and dementia.⁷⁶ Wood smoke also contains cancer-causing [pollutants](#) like benzene, formaldehyde, acrolein and Polycyclic Aromatic Hydrocarbons or PAHs, along with carbon dioxide, carbon monoxide and methane.⁷⁷ Burning 10 lbs. of wood in 1 hour creates the same [cancer-causing PAHs](#) as 6,000 packs of cigarettes.⁷⁸ That's like smoking a pack of cigarettes a day for 16 years...just by sitting next to a wood fire. Here is a [link](#) for information about wood smoke.⁷⁹ You can also contact [Doctors & Scientists Against Wood Smoke Pollution](#).⁸⁰

The San Diego Air Pollution Control District (SD APCD) [2021 Annual Air Quality Report](#) and [2022 Regional Air Quality Strategy \(RAQS\)](#) show residential combustion (wood burning) is tied with construction as the main source of PM_{2.5}.^{81,82} These reports show wood burning dumps almost 3.5 TONS of particulate matter into San Diego County air EVERY DAY. Data from the US Energy Information Administration (EIA) [shows](#) households with higher incomes are more likely to burn wood.⁸³ Wood burning is being done for recreation, not need.

O8-1
cont.

6d. Stop Smoking

Ban public smoking like the City of Encinitas and others. [Second](#) and [thirdhand](#) smoke is toxic and emits lead.^{84,85} Fund radio, print, TV and social media ads about the harms of second and thirdhand smoke. Also, ban [smoking in multi-family housing](#).⁸⁶

6e. Stop Leaded Aviation Gas (AVGAS)

CleanEarth4Kids.org asks the County of San Diego to stop the sale, use and storage of leaded aviation fuel at all County airports and work with local cities to do the same.

There is NO safe level of lead!

- Lead is Toxic

The [WHO \(World Health Organization\)](#),⁸⁷ [CDC \(Centers for Disease Control\)](#)⁸⁸ and the [AAP \(American Academy of Pediatrics\)](#)⁸⁹ have all stated there is no safe level of lead, a [toxic heavy](#)

⁷⁵ <https://www.lung.org/research/sota/health-risks>

⁸⁷ <https://www.who.int/news-room/fact-sheets/detail/lead-poisoning-and-health>

⁸⁸ <https://www.cdc.gov/nceh/lead/faqs/lead-faqs.htm>

⁸⁹ <https://www.aap.org/en-us/advocacy-and-policy/aap-health-initiatives/lead-exposure/Pages/default.aspx>

[metal](#).⁹⁰ Its [adverse effects](#) are particularly severe for children and unborn babies as it damages their brains and nervous systems.⁹¹

[Exposure to lead](#) lowers IQ and causes behavior problems, learning disabilities, and impaired impulse control.⁹² Children's exposure to lead is linked to [higher rates of suspension and detention](#) along with [lower reading and math test scores](#).^{93,94} Childhood exposure to lead is also linked to [higher crime rates](#).⁹⁵ According to the [CDC](#), people with prolonged exposure to lead are at higher risk of high blood pressure, heart and kidney disease, and various forms of cancer.⁹⁶

Most health impacts from lead exposure are [lifelong and irreversible](#).⁹⁷ Lead exposure is also hazardous to adults, with [18% of all deaths](#) in the US linked to lead exposure and is a significant risk factor for [cardiovascular disease](#).^{98,99} Lead is the [number one reason](#) for fatal heart attacks in the US.¹⁰⁰

Please see our [CleanEarth4Kids.org Team 5 page #GetTheLeadOut](#) for more information on the dangers of lead.¹⁰¹

- The Harm of Leaded Aviation Fuel on Communities

The EPA has issued its [public endangerment finding](#) on lead emissions from aircraft, stating it will "cause or contribute to lead air pollution."¹⁰²

The impact of lead pollution is especially damaging to children living close to these airports as they are very likely to have significantly [higher levels of lead in their blood](#).¹⁰³ In the US, over 5 million people, including over [360,000 children](#) under the age of 5, live near at least one lead-emitting airport and face a severe risk of lead poisoning.¹⁰⁴ [Communities of color](#) are most likely to be close to these sources of lead, resulting in higher blood levels on average than white children.¹⁰⁵

In the County of Santa Clara, children living within half a mile of their airport had [lead levels nearly twice](#) that of kids in [Flint, Michigan](#) at the height of their lead crisis.^{106,107} Recognizing the danger, the County of Santa Clara has stopped the sale and storage of [leaded fuel](#) at their airport which has already significantly reduced lead emissions.¹⁰⁸

¹⁰⁸ <https://countyairports.sccgov.org/pilots/aviation-fuel>

O8-1
cont.

- Stopping Leaded Aviation Fuel

Leaded aviation fuel is used by some piston-engine planes and helicopters in general aviation. According to the FAA (Federal Aviation Administration), an estimated [170,000 aircraft](#) operating from over 20,000 airports across the US use leaded aviation fuel (AVGAS).¹⁰⁹ These aircraft are responsible for almost [70% of airborne lead pollution](#), putting out around 500 tons of lead each year, and are the largest source of lead in US air.¹¹⁰

Unleaded fuel is now available. The sale and use of leaded aviation fuel must stop!

7. Protect and Conserve Water

Set water use reduction goals and develop policies, guidelines and education programs to replace ornamental grass and other landscaping with native plants while transitioning to gray water reuse. The CAP must require greywater systems and stormwater capture and conservation for new residential and commercial construction.

Create [bioretention swales](#) in medians and other areas like [Los Angeles](#) to serve as micro-reservoirs for landscaping while filtering stormwater runoff.^{111,112}

Establish other rainwater capture and storage infrastructure throughout the County including capture barrels at every residential property.

Under California law, water is a basic human right. San Diego must take action to end water shutoffs and subsidize access to water for lower-income residents.

8. Transportation

The CAP must identify methods to reduce Vehicle Miles Traveled (VMT) by encouraging the use of public and active transportation.

The County's Active Transportation Plan must:

- Collaborate with SANDAG to support and implement the [Five Big Moves](#).¹¹³
- Develop plans to extensively expand bike lanes and sidewalks throughout the County, create car-free areas and implement electric shuttles in high-traffic areas.
- Construct pedestrian overpasses and other safe pedestrian and active transportation infrastructure.
- Provide free mass transit passes to students, seniors and residents of disadvantaged communities.
- Create a transportation stipend program for all County employees while charging for parking.
- Establish practical and user-friendly public transportation in the unincorporated areas for semi-rural and rural communities.

¹⁰⁹ http://www.faa.gov/news/fact_sheets/news_story.cfm?newsId=14754

¹¹⁰ <https://earthjustice.org/news/press/2022/epa-proposes-endangerment-finding-of-leaded-aviation-gasoline>

¹¹¹ <https://nacto.org/urban-street-stormwater-guide/green-stormwater-elements/bioretention-swale/>

¹¹² <https://dpw.lacounty.gov/WMD/STWO/EastLA.aspx>

¹¹³ <https://www.sandag.org/regional-plan/5-big-moves>

O8-1
cont.

- Provide education and campaigns to encourage walking, biking, and taking public transit.

9. No False Solutions

The CAP must clearly state the County of San Diego will not use or invest in false climate solutions like synthetic carbon capture (CCS, CCUS), dirty hydrogen, methane or biomass/biofuels. These types of greenwashed “solutions” only delay real climate action.

10. Stop Toxic Synthetic Pesticides

We ask the County of San Diego to create and implement education programs and assistance to help farmers transition to climate-resilient farms, stopping the use of synthetic pesticides and synthetic fertilizers.

99% of synthetic pesticides and fertilizers come from fossil fuels and the continued use of [these petrochemicals](#) is a direct threat to the climate and our world.¹¹⁴

[Healthy soil is important for sequestering carbon](#).¹¹⁵ But pesticides destroy the microbes that make healthy soil.

By promoting sustainable farming practices that prioritize soil health, the City of Oceanside will contribute to the protection of human health, clean air, and water which will protect pollinators, and wildlife, preserve biodiversity and enhance our environment and climate.

- Pesticides Are Toxic

Pesticides are known to [increase children’s cancer risk](#) and [95% of pesticides used miss their target](#).^{116,117} There is a massive amount of scientific studies showing the damage done by the use of [synthetic pesticides](#) to the environment and human health.¹¹⁸ Pesticides are poison, they are designed to kill. That is their purpose.

California studies show 13 agricultural pesticides [elevated children’s cancer](#) up to 2.5 miles away from the application sites.¹¹⁹ Only 5 are classified as [Restricted Use by the EPA](#).¹²⁰ But 11 of the 13 are banned or not approved in other countries with 10 of them banned in at least 28 countries. The US uses [toxic pesticides banned](#) in many other countries.¹²¹ The US only bans 21 pesticides while China bans 54 and the EU bans 195. (For a list of pesticides banned in other countries, please click [here](#).)¹²² Legal does not mean safe!

The proximity to agricultural pesticides is very important because pesticides can [drift](#) miles,

¹²² <https://pan-international.org/pan-international-consolidated-list-of-banned-pesticides/>

harming children and families living [near agricultural fields](#).^{123,124} [Pesticide drift](#) settles on playgrounds, porches, laundry, toys, pools, furniture, gardens, and lawns where people and children live, learn, and play.¹²⁵ This exposes people, pollinators, and wildlife to danger from what they touch, breathe, and eat.

These toxic pesticides also contaminate our water. The [National Water Quality Assessment \(NWQA\)](#) shows [agricultural runoff](#) as the main cause of pollution in rivers and streams.^{126,127} As pesticides travel through soil and bedrock cracks, they contaminate groundwater systems which [provide 70% of the water used for public and private water supplies, irrigation, and industry](#).¹²⁸ Aquatic organisms also [absorb pesticides](#) through their skin, breathing, and mouths.¹²⁹ Long-term exposure has many negative consequences for aquatic life, such as [mortality, reproductive failure, eggshell thinning, suppression of the immune system, and other fish health complications such as excessive slime on fish scales and gills, cancers, tumors and lesions](#).¹³⁰

For more information on toxic pesticides, please see our [Team 5: Stop Toxic Pesticides page](#).¹³¹

- Organic, Regenerative Farming, Permaculture and Agroecology

Organic and **regenerative** farming practices do not use synthetic pesticides, fertilizers, or GMOs. Methods such as cover crops, manure, crop rotation, and natural pest controls like neem oil are used to repel pests and maintain soil health which is a natural carbon sink.^{132,133} They focus on biodiversity, reduced tilling and planting a wide variety of crops to **better close the carbon cycle**.¹³⁴

[Permaculture](#) and [agroecology](#) work with nature instead of against it, combining landscapes, plants, animals, and humans in a symbiotic relationship.³⁵¹³⁶

For more information on regenerative farming, permaculture, organics and healthy soils, please see our [Team 5: Farming page](#).¹³⁷

11. Community Gardens

Please create an expansive community garden program that will decrease heat islands, and increase carbon sequestration while reducing food insecurity.

12. Create Pocket Forests

¹³⁷ <https://cleaneearth4kids.org/farming-regenerative>

Identify small areas of 6 parking spaces or more and small vacant land areas for pocket forests. Engage with school districts throughout the county to plant a pocket forest on each school's grounds.

Pocket forests are small areas of native trees and plants that restore nature to the urban environment.¹³⁸ This method was adopted by Japanese botanist Akira Miyawake, the creator of Tiny Forests.¹³⁹ The Miyawake method emulates an area's native ecosystem through a dense-planting method of only native species.¹⁴⁰

These pockets forests provide vital habitats for native wildlife, attract important pollinators, provide an equitable urban landscape,¹⁴¹ improve water infiltration of the soil, decrease stormwater runoff, protect against erosion,¹⁴² provide educational opportunities to the community and absorb large amounts of carbon dioxide.¹⁴³

13. Protect Natural Habitat, Wetlands, Lagoons and Waterways

The CAP must support the establishment of local natural habitat lands for GHG sequestration and to conserve biodiversity. CleanEarth4Kids.org supports the Habitat Restoration Resource Management Framework and asks the regional Multiple Species Conservation Plans (MSCP) to be incorporated into the CAP.

The CAP must address blue carbon storage by planting kelp and other seagrasses to sequester carbon while protecting coastal areas from pollution and sea level rise. Identify ecologically sound methods to protect beaches, cliffs, coastal roads and the LOSSAN train corridor from erosion.

14. Ban Synthetic Grass/Artificial Turf

CleanEarth4Kids.org asks the County of San Diego to ban all installations of artificial grass/synthetic turf. With the signing of SB 676 by Governor Newsom on October 8th, you have the authority to stop the use of this toxic plastic carpet.¹⁴⁴ The City of Millbrae has already banned it.¹⁴⁵

Our youth, interns, and volunteers have worked hard to create videos and resources that can be found on our CleanEarth4Kids.org Team 5: Stop Synthetic Turf page.¹⁴⁶

- Synthetic Grass/Artificial Turf is Plastic Pollution

Synthetic grass/artificial turf is plastic, made from resins like polyethylene and nylon. PFAS are used in the extrusion of plastic yarn for the "grass" blades.¹⁴⁷ No synthetic grass/artificial turf manufacturer can state they are free of PFAS. PFAS, PAHS, lead, and

¹⁴⁷ <https://www.documentcloud.org/documents/6434596-Kulikov2005.html>

other toxic chemicals have been found in [synthetic grass/artificial turf](#).¹⁴⁸

The installation and use of synthetic grass/artificial turf is the intentional installation and use of [microplastics](#)¹⁴⁹ which does serious harm to the [environment](#)¹⁵⁰ and [human health](#).¹⁵¹ Recent [research](#)¹⁵² has found microplastics in placentas, infant feces, breastmilk, and even infant formula. Other studies have shown microplastics changing [lung and liver cells](#).¹⁵³ [Microplastics were banned in United States cosmetics](#)¹⁵⁴ in 2015, but the ban on microplastics should apply to all areas of life to reduce these health risks.

Plastics don't break down in the environment, simply breaking down into microplastics. [Wildlife can mistake microplastics for food](#) and marine animals have been found to consume microplastics accidentally.¹⁵⁵ Microplastics attract and carry [pollutants](#) in the water and also [release toxic chemicals](#).^{156,157} Lab studies have shown that microplastics may impact the [developmental stages](#) of animals, causing reproductive issues and their ability to fight disease.¹⁵⁸ Furthermore, since humans consume fish and other marine animals, the impacts of microplastics are passed on to humans through the food chain.

The plastic life cycle is incredibly toxic. [Research](#) shows it causes premature birth, low birth weight, decreased fertility, asthma, childhood leukemia, lymphoma, brain cancer, breast cancer, mesothelioma, cardiovascular disease, chronic obstructive pulmonary disease, neuropathy, and lung cancer.¹⁵⁹

08-1
cont.

- Synthetic Grass/Artificial Turf Hurts the Climate

Synthetic grass/artificial turf is plastic and [plastic emits methane](#), a powerful greenhouse gas (GHG).¹⁶⁰ Plastics start as fossil fuels and emit greenhouse gasses in every stage of their [lifecycle](#), from the extraction of oil/gas to the trash pile.¹⁶¹ Plastics have a [huge carbon imprint](#).¹⁶² Research showed the emissions from plastics in 2019 were nearly 1.8 billion metric tons of greenhouse gasses, and that number is [projected to continue growing](#).¹⁶³

Dr. Sarah-Jeanne Royer of the Scripps Institution of Oceanography in California wrote a [letter](#) in opposition to synthetic grass/artificial turf, citing methane as a major concern.¹⁶⁴ Dr. Royer and her colleagues found that polyethylene, used to make synthetic turf/artificial grass, [releases more methane](#) than any other plastic.¹⁶⁵

¹⁶⁵ <https://www.bbc.com/news/science-environment-45043989>

During the [breakdown of polyethylene, the release of methane gas accelerates](#) and the surface area of the plastic increases, reacting more with the sunlight and releasing more methane.¹⁶⁶ As synthetic grass/artificial turf is commonly made of polyethylene, these fields constantly release methane as it interacts with the sun and everyday use. Over a 20-year period, [methane is 80x more potent](#) at warming than carbon dioxide and is responsible for 25% of global warming.¹⁶⁷

- Synthetic Grass/Artificial Turf is Not Recycled

Used synthetic grass/artificial turf is expected to produce [1-4 million tons of plastic waste](#)¹⁶⁸ in the next ten years. The plastic carpet and rubber crumb infill from synthetic grass/artificial turf fields are often [dumped illegally or sent to landfills](#) since there are [no United States recycling facilities for synthetic turf](#).^{169,170} [Reuse is not recycling](#).¹⁷¹

- Synthetic Grass/Artificial Turf is HOT

Synthetic grass/artificial turf is 40°-70° [hotter](#) than surrounding air temperatures and has burned hands and feet.¹⁷² A [study](#) by Brigham Young found the surface temperature of synthetic grass/artificial turf was 37° higher than asphalt and 86.5° hotter than natural grass.¹⁷³ A study found that in 90° weather, the surface temperature of a natural grass field was about 98° while a synthetic grass/artificial turf field was [over 160°](#).¹⁷⁴ [Shoes have melted](#) from the heat on synthetic grass/artificial turf with players and coaches getting blisters on the bottom of their feet through their shoes.⁷⁵ [First-degree burns](#) occur at 118° with blistering and second-degree burns at 131°.⁷⁶ Several synthetic grass/artificial turf fields in the Los Angeles Unified School District are currently [closed](#) due to high heat and melting surfaces.¹⁷⁷

- Synthetic Grass/Artificial Turf is Dangerous to Athletes

Playing on synthetic grass/artificial turf can cause more injuries. According to an NFL Players Association (NFLPA) [study](#), playing and practicing on synthetic grass/artificial turf increases the chance of a lower extremity injury with a 69% higher rate of non-contact foot/ankle injuries than on natural grass.¹⁷⁸ The NFLPA has called for [all NFL fields to be natural grass](#).¹⁷⁹

A [study](#) of National Collegiate Athletic Association (NCAA) athletes found playing on synthetic grass/artificial turf greatly increased the chance of knee ligament injuries while another

O8-1
cont.

[study](#) of high school athletes found they were 58% more likely to sustain an injury playing on synthetic grass/artificial turf than natural grass.^{180,181}

The United States Men's Professional Soccer Team and other national teams only play on natural grass in the World Cup, and the [United States Women's Soccer Team sued FIFA](#) to not play on synthetic grass/artificial turf due to the increased risk of injury.¹⁸² Soccer legend [Lionel Messi](#) will only play on real grass.¹⁸³

- Natural Grass is Best

We ask the County of San Diego to follow organic land management practices, especially for managing playing fields. Training is available online through the [University of California, Riverside](#) and other [locations](#).¹⁸⁴ High-use, organically managed, natural grass fields have been in use [in many areas](#) including [Irvine, CA](#).^{185,186}

[Natural grass is the healthiest choice](#) for playing fields and parks.¹⁸⁷ [Natural grass fields are more cost-effective than synthetic grass/artificial turf fields which have higher maintenance and long-term costs](#).^{188,189} [Natural grass fields are also cheaper to install than synthetic grass/artificial turf](#).¹⁹⁰ With proper care and maintenance, a natural grass field can accommodate any amount of play as demonstrated by Marblehead, MA with [20 acres of organically managed fields](#) for over 15 years.¹⁹¹

O8-1
cont.

15. Zero Waste and Ban Single-Use Plastics

CleanEarth4Kids.org supports the development of composting/anaerobic digestion facilities to divert the majority of compostable waste from landfills. The CAP must also provide plans to reduce other waste and develop a circular economy by encouraging and incentivizing the elimination of single-use products while reducing, reusing and repurposing other items.

Take Climate Action NOW: There Is No Time To Waste

As shown in the United Nations Intergovernmental Panel on Climate Change (UN/IPCC) [report](#)¹⁹² released March 20th 2023, our climate situation is at the point of no return. Even if we start [today](#) with immediate and strong action, we only have a very moderate chance of limiting global warming to the 1.5°C threshold by the world scientific community. We are in a climate emergency!

We already see the [effects of climate change](#)¹⁹³ as predicted by scientists: droughts, heat waves, extreme weather, raging wildfires, loss of sea ice, sea level rise, etc.

CleanEarth4Kids.org

CleanEarth4Kids.org works to protect children's health & future, public health, and the health and safety of communities, workers, and indigenous peoples globally and reminds all that clean air, water, a livable future, and access to nature are human rights. Streams, rivers, oceans, public lands, forests, trees, wildlife, ecosystems, climate, soils, and organic gardens must be protected. Access to healthy safe food, playgrounds, schools, homes, communities, cities and public lands- without toxic pesticides, chemicals, plastics, lead, heavy metals and pollution- is essential for life.

At the heart of CleanEarth4Kids.org: environmental protection, children's health and future, public health, environmental, racial, social and climate justice, education and JEDI (Justice, Equity, Diversity & Inclusion). CleanEarth4Kids.org works to stop toxic chemicals, PFAS, pesticides, lead and heavy metals, plastics and microplastics, toxic toys and products, synthetic turf, PIP (Pour In Place Playgrounds), fossil fuels, pollution, environmental destruction, degradation and injustice and works to uphold human rights and justice.

Subject: [External] SanDiego350 CAP Team Comment Letter
Date: Thursday, January 4, 2024 10:09:55 PM

Hi Meghan,

Attached is the SanDiego350 comment letter for the County Climate Action Plan. Please, consider our comments.

09-1

 [County CAP Draft Comments](#)

Thank you,

Brooke Wedner
Chair, San Diego 350 Climate Action Team

January 4, 2024

County of San Diego PDS
5510 Overland Ave., Suite 310
San Diego, CA 92123

County of San Diego

RE: SanDiego350's CAP Team Comments on County Climate Action Plan Draft

Dear County Sustainability Planning Division Team,

SanDiego350 is an inclusive volunteer-led organization with more than 9,000 supporters in San Diego County. We're building a movement to prevent the worst impacts of climate change and climate injustice through education and outreach, public policy advocacy, and mobilizing people to take action.

[The Climate Action Plan Team of SanDiego350](#) tracks and reviews Climate Action Plans across San Diego County providing input in the development phases and holding jurisdictions accountable in the implementation phase. The SanDiego350 CAP Team has reviewed the San Diego County Draft Climate Action Plan (CAP) and we strongly urge you to consider the following comments as you prepare the County CAP. The recommendations below are intended to support the County in achieving its climate and equity goals and preventing the worst impacts of climate change and climate injustice through implementing the plan's measures.

09-2

Built Environment and Transportation

The following comments are from SanDiego350's Transportation Team and were also submitted separately.

While we appreciate the focus on improving access to public and active transportation to reduce single occupancy vehicle trips and improving access to EV technologies for county drivers, we would encourage you to give more attention to the reduction of sprawl, as well as the complications of hydrogen technologies.

In regards to the "Strategy: Decarbonize the On-Road and Off-Road Vehicle Fleet," reducing fleet and small equipment emissions is a good goal, especially since all-electric cars and small electric equipment are now available. Electric landscaping and off-road construction vehicles are all electric now and should replace current equipment as quickly as possible. Larger electric construction equipment does not seem to be readily available but is growing. See link: [Report: Electric Construction Equipment Vital to Cleaner, Greener Construction](#). The availability of charging stations is a crucial incentive for people to buy electric vehicles. Charging station installations by the County would make EV owners confident in buying their cars without "range anxiety", and speed up the adoption of EVs. Adaptors for Tesla charging stations are available now which makes EVs even more attractive: [Tesla Charging Adaptors](#).

09-3

SD350 does not support "the transition to hydrogen fuel for medium- and heavy-duty vehicles by increasing access to hydrogen fueling infrastructure through streamlined permitting processes and

other efforts in the unincorporated area”. While we recognize that hydrogen is often touted as a transitional technology, we are concerned that the many ways of obtaining or producing it also means that such commitments can have ambiguous outcomes. We oppose hydrogen that is produced from the chemical processing of fossil fuels. In particular, the language in the plan should stipulate a commitment to green hydrogen produced by renewable energy, but we also suggest that battery-electric vehicles are a better choice for medium- and heavy-duty vehicles and, thus, deserve greater incentive in the CAP.

Regarding “Strategy: Support Active Transportation and Reduce Single-Occupancy Vehicle Trips,” the goal to develop a program to provide free transit passes and/or free trips in the unincorporated area to reduce vehicle miles traveled in the unincorporated area by 1.2% by 2030, is an attractive idea. We have seen that the Youth Opportunity Passes provided by MTS have been very successful in increasing ridership, and we expect that free transit in the unincorporated areas would be successful as well, especially for low-income, elderly, and disabled people living closer to cities who need to commute to jobs and services in the cities of San Diego. Data from MTS shows an increase in ridership of youth of 105% from March/April 2022 to March/April 2023.

O9-3
cont.

Pre-approved development in unincorporated areas can lead to increased VMT. Therefore, SD350 urges the County to follow the Transportation Study Guide for the unincorporated county, and clearly state how any approved project would achieve VMT reduction and prevent sprawl. We particularly note that measure T-6.2a supports the use of TDM agreements as the supposed mitigation of increased VMT and GHG emissions of County land use approvals. Research has shown that TDM is not an effective or significant reducer of VMT or GHG emissions. We suggest that this measure should be removed from the final draft.

SD350 supports the goal of improving Active Transportation and Reducing Single-Occupancy Vehicle Trips. We suggest that while improving Active Transportation, all roadway improvement incorporates Vision Zero policies to improve the safety of traveling by foot, bicycle, and other small devices.

SD350 also supports increased access to first/last mile transportation services and connections (e.g., neighborhood electric vehicles, microtransit, bike/scooter-share) to reduce vehicle miles traveled by 7% within the unincorporated area by 2030.

Energy

The following comments are from SanDiego350's Building Electrification Team and were also submitted separately.

SanDiego350 is a founding member of the San Diego Building Electrification Coalition (SDBEC). SanDiego350 signed onto the letter SDBEC recently submitted and we would like to reiterate the following comments on the Energy measures below.

O9-4

Re: Energy Sector Vision (Chapter 4, Energy Sector, page 65), many measures and actions in this sector rely on electrification as well as energy efficiency to meet the targets, yet the vision does not mention electrification. We recommend a more inclusive Vision that includes things such as efficient electric buildings.

In "Measure E-1: County Operations" (Chapter 4, Energy Sector, page 67), while the County's Zero Carbon Portfolio Plan (ZCPP) reduces GHG emissions in municipal operations, we recommend adding additional actions to the CAP, in alignment with the City of San Diego's goals in their Zero Emissions Municipal Building Operation Policy ([ZEMBOP](#)). Those additional actions include: expanding the scope beyond "owned & occupied properties" to include properties owned by the County and leased to others, requiring gas equipment to be replaced at the end of life, or sooner, with electric alternatives, and accelerating the timeline for achieving 100% renewable energy to 2025.

In "Measure E-2: Unincorporated Area" (Chapter 4, Energy Sector, page 68) the County has many policies that impact new and existing buildings, that can be updated to induce electrification. We recommend that all county housing policies, funding and contracts, and leases require all-electric buildings. We recommend that the "Equity-Based Outcomes" of "Reduced utility bills for homeowners and renters" be updated to include improved air quality. We recommend the "Community" co-benefit score be increased to reflect the public cost-savings of energy efficiency and electrification. Mass electrification will enable the decommissioning of expensive and aging gas pipelines.

Re: Action E-2.1: New Buildings (Chapter 4, Energy Sector, page 68), due to ongoing litigation against all-electric mandated ordinances, we recommend that this action be supplemented to create an ordinance to highly incentivize but not require all-electric equipment, such as the High-Performance approach suggested by the State Codes and Standards group.

In "Action E-2.2: Existing Buildings" (Chapter 4, Energy Sector, page 68) we recommend the following additions to address the urgency of electrifying existing buildings:

- Require all air conditioning units to be replaced upon burnout with heat pump appliances
- Streamline the permitting process for building electrification, especially emergency replacements
- Support residents with an Electrification Retrofit Accelerator program so that information about incentives, contractors, electric equipment, etc are easily available
- Accelerate the timeline for existing building electrification
- Commit to seeking additional policy pathways to electrify faster

In addition, details for each action including estimated costs, specific benchmarks, and implementation timelines are critical and must be transparently developed and robustly funded.

Agriculture and Conservation

The following comments are from SanDiego350's Food & Soil Team and were also submitted separately.

We were very pleased to see that the intention is to make carbon farming a primary measure, with ambitious but potentially attainable goals in place for 2030 and 2045. We are also pleased to see the intention to reach out to disadvantaged farmers, prioritize County contracts with equitable food suppliers, reach out to tribal leaders to incorporate indigenous land management practices for habitat restoration, and evaluate opportunities to increase farmworker housing in the unincorporated area. All those items are in line with the environmental justice goals of SanDiego350, and we strongly encourage you to keep those as a prominent part of the CAP.

O9-4
cont.

O9-5

Incentivizing carbon farming on conventionally farmed agricultural land and implementing these techniques in organic/regenerative operations is strongly encouraged as we see great potential in both. We also strongly support the idea of an incentive program rather than mandatory, as area farmers and ranchers are facing immense pressure.

Some questions and concerns that we have include:

- How additional sequestration attributable to carbon farming will be counted toward the overall CAP reduction target? Will the reduction be based solely on projections, such as through COMET-Planner? Or will it be necessary, in addition to doing projections, to verify how much carbon is actually sequestered, such as through the use of soil organic matter testing? Perhaps these details are still being worked out, but if the answer to this is known, it seems it would be beneficial to specify within the final CAP draft.
- We found the COMET projections on P. 483 of Appendix 1 to be very illuminating, but also they raised some questions for us. In particular, is it true that you are anticipating sequestration increases of 3.1 or 4.4 MT CO₂E per acre per year as a result of compost application in different settings (cropland and rangeland, respectively)? Based on our knowledge of sequestration potential, those seem like very high expectations to achieve on a per-year basis. According to the ATTRA Sustainable Agriculture program, in a cropping context, "Compost can sequester an estimated 0.75 tonnes CO₂ equivalent per acre, per year". According to a variety of sources, such as the San Mateo RCD, Riyals and Silver's 2013 study with the Marin Carbon Project found that, in a rangeland context, "a one-time application of compost sequesters 1.49 metric tons of carbon dioxide equivalents per acre per year". These numbers seem significantly lower than 3.1 and 4.4, respectively, so we are interested to better understand what explains that discrepancy. Of course, other carbon farming techniques can be applied in addition to composting, which can result in higher sequestration potential. For example, the Institute of Agriculture and Natural Resources evaluated research on this and reported that "We found 77 multi-year experimental results measuring changes to no-till with an average carbon, sequestration benefit of 0.77 metric tons of CO₂e per acre per year. We found 189 experimental results for planting cover crops, with an average sequestration benefit of 0.76 metric tons per acre per year". Still, it seems that even if composting, cover cropping, and no-till changes were all practiced, that still may not add up to the target shown on P. 483. Nonetheless, we certainly would encourage the implementation of as many carbon farming techniques as seems practical, so that maximum sequestration and other co-benefits can be achieved.
- We have one other question related to sequestration and emissions. In Section 4 on P. 101 (according to the blue page number), it says: "A carbon farming program will incentivize a variety of techniques on natural and working lands that reduce GHG emissions and provide co-benefits such as water and land conservation". Do you mean that additional sequestration from carbon farming will, in effect, reduce GHG emissions once additional sequestration is subtracted from total emissions? Or is the focus on the actual reduction of emissions rather than sequestration? It seems like perhaps the language could be refined to better communicate the intention to the public.
- Also, we noticed a discrepancy in estimates of agricultural acreage in San Diego County. On P.99 (blue number) of Section 4, it says: "More than 5,000 farmers call the county their home and make their living on 250,000 acres". However, on P. 484 of Appendix 1 the amount of

O9-5
cont.

agricultural acreage appears to be much smaller: 114,746 acres of farmland in 2019. Without further information, there appears to be a discrepancy. Could this info be more clearly communicated in the final draft so that these numbers don't appear to be in conflict?

- We are interested in better understanding, given the \$1-10 million budget for the carbon farming program in the first six years of implementation (per Section 5), how much of that is expected to be going directly toward farmers in the form of incentives. We expect there will be some administrative costs covered by that as well, and we would like to get more info about the expected balance of farmer benefits to admin costs. In terms of marketing, it seems like a large figure could be very attractive to area farmers, and we will want to help the CAP team get the word out to area farmers about this new incentive program, so more info there would be useful.

O9-5
cont.

Implementation and General

Implementation

The CAP should include more detailed objectives, steps, and milestones, and a timeline for their implementation. It will be impossible to meet the plan's ambitious goals without clear, detailed plans that allows the County to track its progress and stay accountable to its commitments.

O9-6

Planning for Climate Resiliency

With climate impacts and disasters becoming more frequent and extreme, it is crucial that the County create a Climate Resiliency Plan to complement the Climate Action Plan. The CAP should include a commitment and timeline for the creation of that plan, and the implementation should be connected since many measures could serve dual purposes or amplify each other. The unincorporated County is already seeing these impacts, especially extreme heat, wildfires and smoke, drought, and flooding - and these impacts will all become more severe with time. It is imperative that the County plan now so that it can protect the health of residents and the economy of the unincorporated County through resiliency measures, including air filtration equipment, creating cooling and smoke-free centers (we recommend looking at utilizing existing Community Colleges and libraries for this purpose), adapting outdoor industries such as farming to changing conditions, microgrids to protect against power outages, water and energy conservation measures, etc. We recommend doing community outreach, education, and engagement to identify the most effective measures for the different communities in the unincorporated County.

O9-7

Regional Collaboration

The County of San Diego's leadership is needed to ensure that the County as a whole succeeds in meeting its climate and equity goals as rapidly and effectively as possible. Regional collaboration and integration across cities and agencies are necessary to achieve these targets, across the County and the other municipal CAPs, the Regional Decarbonization Framework, SANDAG's Regional Transportation Plan, the CAPs of large businesses, tribal nations, universities, the Port, Airport, MTS, NCTD, school districts, etc.

O9-8

This CAP should clarify how the County plans to collaborate with the municipalities, agencies, and other entities in the county, and specifically identify what that collaboration should look like. This is especially important when it comes to transportation and transit, where no City can act alone and where residents of the unincorporated County are in need of transportation solutions that connect them easily to employment centers, schools, and services.

O9-8
cont.

There are two areas the CAP should specifically address and clarify its goals and roles: 1) the Priority Climate Action Plan (PCAP) being developed by SANDAG as a region-level CAP, and take a leading role in its development and implementation, especially related to transportation and building electrification. 2) working in partnership with these entities to secure crucial federal and state funding for the necessary measures.

Question Regarding Projected Emission Reductions

Figure 10 on pages 37-8 shows the County's projected emission reductions through 2025. We wanted to learn more about why natural gas emissions, which comprise a large portion of overall emissions, are expected to grow rather than shrink over the next 25 years when the State is expected to move to limit these emissions through building and transportation electrification policies and many municipalities are already taking steps to do so. Additionally, it seems that all projected reductions are coming from only two sectors - electricity and transportation. Why are there no expected reductions based on the measures from the other sectors? Furthermore, the projected reductions in transportation and the built environment are insufficient according to the projected emissions in Appendix 3.

O9-9

The County CAP is an opportunity for the County to provide much-needed leadership in creating ambitious, accountable climate policy across our region and serving as a model for other counties. While this CAP demonstrates improvements compared to prior County CAP versions (for which we are grateful to staff), there is more to be done to truly unleash the potential for putting our communities on the path to a healthy, sustainable, equitable future.

Sincerely,

Brooke Wedner
Chair, SanDiego350 Climate Action Plan Team

Letter O9 San Diego350's Climate Action Plan Team

Brooke Wedner, Chair

January 4, 2024

Comment O9-1

The comment is an introductory statement.

Response O9-1

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O9-2

The comment provides background information about SanDiego350 and its Climate Action Plan Team.

Response O9-2

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O9-3

This comment expresses support for various CAP Update strategies, measures, and actions to reduce GHG emissions and opposition to others.

Response O9-3

These comments are noted and will be provided to County decision-makers for their consideration during the adoption hearings for a Final CAP Update. CAP Action T-3.1.a has been revised to clarify that this effort would focus on clean hydrogen sources. Also refer to Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," which explains that the CAP Update has adequately identified measures and actions that would exceed the 2030 and 2045 GHG reduction targets and make substantial progress toward the aspirational goal of net zero emissions

Comment O9-4

The comment suggests revisions to various CAP Update measures for energy.

Response O9-4

These comments are noted and will be provided to County decision-makers for their consideration during the adoption hearings for a Final CAP Update. Also refer to Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," which explains that the CAP Update has adequately identified measures and actions that would exceed the 2030 and 2045 GHG reduction targets and make substantial progress toward the aspirational goal of net zero emissions by 2045.

Comment O9-5

The comment poses questions and expresses concern about various CAP Update measures for agriculture and conservation.

Response O9-5

These comments are noted and will be provided to County decision-makers for their consideration during the adoption hearings for a Final CAP Update. Also refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explains that the CAP Update has adequately identified measures and actions that would exceed the 2030 and 2045 GHG reduction targets and make substantial progress toward the aspirational goal of net zero emissions by 2045.

With regard to the question about the CarbOn Management & Emissions Tool (COMET) projections, the rates for MTCO_{2e} sequestered per year resulting from compost application were derived from COMET-Planner for the California Department of Food and Agriculture Healthy Soils Program (CDFA HSP). COMET-Planner CDFA HSP estimates GHG reductions from Natural Resources Conservation Service (NRCS) Conservation Practices that have been identified as having GHG mitigation or carbon sequestration benefits on farms and ranches. The COMET-Planner tool is available online: <http://comet-planner-cdfahsp.com/>.

The following COMET-Planner CDFA HSP outputs for the County of San Diego were used to estimate sequestration rates for compost application practices under Action 4.1 (Table 9-4).

Table 9-4 Approximate Carbon Sequestration and GHG Reductions Associated with Selected Conservation Practices

Practice	Quantity	Unit	CO ₂ (MTCO ₂ e/yr)	N ₂ O (MTCO ₂ e/yr)	CH ₄ (MTCO ₂ e/yr)	MTCO ₂ e/yr	Proportion (Input)	Notes
San Diego, CA Compost Application (Interim CPS 808) – Compost (C/N < or = 11) Application to Annual Crops, On-farm produced compost – 4 tons/acre	1,000	Acres	2,260	(200)	6	2,066	50%	COMET-Planner CDFA HSP includes 3 payment scenarios for this practice: 3, 4, and 5 tons/acre. Payment scenario does not affect GHG reductions. GHG reductions are also the same for on-farm produced compost and compost purchased from certified composting facility.
San Diego, CA Compost Application (Interim CPS 808) – Compost (C/N > 11) Application to Annual Crops, On-farm produced compost – 6 tons/acre	1,000	Acres	4,440	(190)	11	4,261	50%	COMET-Planner CDFA HSP includes 3 payment scenarios for this practice: 6, 7, and 8 tons/acre. Payment scenario does not affect GHG reductions. GHG reductions are also the same for on-farm produced compost and compost purchased from certified composting facility.
							100%	Two practices must add up to 100%.
San Diego, CA Nutrient Management (CPS 590) – Improved N Fertilizer Management on Irrigated Croplands – Reduce Fertilizer Application Rate by 15% - Basic NM	1,000	Acres	(35)	23	-	(12)	0%	Because practice does not offer a GHG reduction benefit, proportion is set to zero.
San Diego, CA Nutrient Management (CPS 590) – Improved N Fertilizer Management on Non-Irrigated Croplands – Reduce Fertilizer Application Rate by 15% - Basic NM	1,000	Acres	(10)	22	-	12	100%	Benefit of 15% reduction in fertilizer use, on top of compost application is marginal.
							100%	Two practices must add up to 100%.
San Diego, CA Compost Application (Interim CPS 808) – Compost (C/N > 11) Application to Grazed Grassland, On-farm produced compost - 7 tons/acre	1,000	Acres	4,440	(35)	14	4,419	100%	COMET-Planner CDFA HSP includes 3 payment scenarios for this practice: 6, 7, and 8 tons/acre. Payment scenario does not affect GHG reductions. GHG reductions are also the same for on-farm produced compost and compost purchased from certified composting facility.
San Diego, CA Compost Application (Interim CPS 808) – Compost (C/N > 11) Application to Grazed Irrigated Pasture, On-farm produced compost - 7 tons/acre	1,000	Acres	4,500	(110)	12	4,402	0%	COMET-Planner CDFA HSP includes 3 payment scenarios for this practice: 6, 7, and 8 tons/acre. Payment scenario does not affect GHG reductions. GHG reductions are also the same for on-farm produced compost and compost purchased from certified composting facility. <i>Assumes no grazed irrigated pastures in San Diego County.</i>
							100%	Two practices must add up to 100%.

Notes: C/N carbon:nitrogen ratio= , CPS = Conservation Practice Standard , MTCO₂e = metric tons carbon dioxide equivalent, COMET = CarbOn Management & Emissions Tool, CDFA HSP = California Department of Food and Agriculture Healthy Soils Program.

Source: adapted from COMET Planner by Ascent, 2024.

With regards to the question about sequestration and emissions, the County has revised the description of Measure A-4 in the CAP Update to clarify that carbon farming would reduce GHG emissions and increase sequestration potential.

Regarding the amount of agricultural land in San Diego County, the SANDAG Series 14 Growth Forecast reported that there were 114,746 acres of agricultural land in the unincorporated county as of 2019. SANDAG defines agricultural as orchards, vineyards, intensive agriculture, and field crops (refer to CAP Update Appendix 3, footnote 53, page 20). The 250,000 acres referenced on page 99 of the Draft CAP is from the US Department of Agriculture 2017 Census of Agriculture. The Census of Agriculture is a complete count of US farms and ranches and the people who operate them. Even small plots of land—whether rural or urban—count if \$1,000 or more of agricultural products were produced and sold, or normally would have been sold, during the census year. This reference has been removed from the revised CAP Update to avoid confusion.

With regards to the question about the budget for carbon farming, the CAP Update includes substantial evidence supporting the implementation and GHG reduction potential of each recommended measure and action. See Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the analytical and implementation details for quantified implementing actions that are included in the CAP Update, including the quantified GHG reduction potential and measurable performance outcomes for 2030, 2035, 2040, and 2045. The CAP Update also identifies the following details for each action as part of the CAP Implementation and Monitoring Program (Table 13): the implementation enforcement mechanism, County department with lead and supporting responsibilities for implementation, relative cost (using a qualitative, ordinal ranking of low, medium, or high), and potential funding sources for implementation.”

Comment O9-6

The comment advises the County to provide more detailed objectives, steps, milestones, and timeline for the CAP Update implementation.

Response O9-6

See Response O9-5, which describes the implementation details included in the CAP Update.

Comment O9-7

The comment suggests the County prepare a Climate Resilience Plan to complement the CAP Update and to conduct outreach in different communities.

Response O9-7

The suggestion to prepare a Climate Resilience Plan is noted. The San Diego County General Plan Safety Element includes a policy to implement the County’s *Vulnerability Assessment and Adaptation Report* (Policy S-12.1). The *Vulnerability Assessment Adaptation Report* was prepared in June 2021 by the County in accordance with General Plan Policy S-12-1. The report includes a comprehensive vulnerability assessment and adaptation goals and policies, which are required to be incorporated into the General Plan

Safety Element, in compliance with SB 379, Government Code Section 65302(g)(4). Public outreach was conducted during the preparation of *Vulnerability Assessment and Adaptation Report*. The report is available on the County website at: <https://www.sandiegocounty.gov/pds/generalplan.html>. Refer to Response O2-5 for further discussion of resiliency considerations included in the CAP Update.

Comment O9-8

The comment recommends that the County provide clarification on regional collaboration in the CAP Update.

Response O9-8

The County acknowledges the importance of regional collaboration in effective GHG emissions reduction. The suggestion that the County “take a leading role” in the development and implementation of SANDAG’s forthcoming Priority Climate Action Plan (including securing funding) is noted. This effort would be independent of the County’s CAP. The CAP Update has been revised to reference the Priority Climate Action Plan as an example of regional collaboration. Refer to Response O2-6 for further discussion of regional collaboration.

Comment O9-9

This comment addresses GHG emissions projections for the unincorporated area from 2019 through 2045 (as shown in Figure 10), which account for the effects of state and federal actions to reduce emissions but do not account for actions the County would take to reduce emissions.

Response O9-9

CAP Update Figure 10 shows the CAP Update emission projections and GHG reduction targets. CAP Update Figure 13 shows GHG emission reductions from CAP implementation.

As described in the CAP Update, “The CAP’s emissions projections estimate future emissions by considering forecasted growth in population, housing units, and employment, and the impact of adopted legislation and regulations on future emissions” (Section 3.3, page 34, as shown in Figure 10). CAP Update Appendix 3 describes how the projections were developed, provides the indicators used for estimating emissions projections for each sector, and identifies the specific legislative and regulations actions accounted for in the County’s GHG emissions projections. Also refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explains that the CAP Update has adequately identified measures and actions that would exceed the 2030 and 2045 GHG reduction targets and make substantial progress toward the aspirational goal of net zero emissions by 2045.

Subject: [External] Re: SanDiego350 and County of SD - Carbon Farming
Date: Thursday, January 4, 2024 10:28:40 AM
Attachments: SanDiego350 Feedback to County Staff on CAP Draft vis-a-vis Carbon Farming.pdf

Good morning,

Our carbon farming working group within SanDiego350's Food and Soil Team greatly appreciated meeting with you all back on 12/13/22.

We also were eager to closely read the carbon farming-related aspects of the CAP draft in recent months, and we would like to provide our detailed feedback in the attached PDF.

SanDiego350 is planning to submit an organization-wide response to the CAP draft, and it's my understanding that this carbon farming feedback will be incorporated into that in some form as well. We wanted to get it directly to you all, since we previously talked in some depth about these issues. As mentioned in the letter itself, we would be available to discuss further with you in advance of the final draft, if that would be beneficial.

Thank you for all your efforts in this area.

David

O10-1
cont.

January 4, 2023

Dear CAP Staff,

SanDiego350 is an inclusive volunteer organization building a movement to prevent the worst impacts of climate change and climate injustice. We strive to create a future that supports a livable planet and just society through education and outreach, public policy advocacy, and mobilizing people to take action.

The Carbon Farming Working Group of SanDiego350's Food and Soil Team has closely studied the potential for carbon farming within San Diego County as a means of pulling down and sequestering carbon from the atmosphere. We've come to the conclusion that ramping up carbon farming efforts among area farmers and ranchers could be highly beneficial to their food production operations and greatly offset the amount of emissions that occur in unincorporated San Diego County. As such, in late 2021 we proposed that the County adopt carbon farming as a primary measure in the climate action plan (CAP) revision so this sequestration can be quantified and counted as part of the County's overall efforts to reduce emissions. We spoke in support of the Carbon Farming Pilot Program when it was proposed to the Board of Supervisors in August 2022, and we greatly appreciated meeting with CAP staff about our proposal and their efforts on the Pilot Program in December 2022.

We were eager to review the initial draft of the CAP revision that was recently released to the public, and we were very pleased to see that the intention is to make carbon farming a primary measure, with ambitious but potentially attainable goals in place for 2030 and 2045. Achieving a 10x ramp up in the 15 years between those two dates would be a remarkable achievement and of great benefit to San Diego County.

O10-2

In addition, we were heartened to see the intention to reach out to disadvantaged farmers, prioritize County contracts with equitable food suppliers, reach out to tribal leaders to incorporate indigenous land management practices for habitat restoration, and evaluate opportunities to increase farmworker housing in the unincorporated area. All those items are in line with the environmental justice goals of SanDiego350, and we strongly encourage you to keep those as a prominent part of the CAP.

We also were pleased to see that there's an interest in incentivizing carbon farming on conventionally farmed agricultural land, because there is great potential in that, in addition to implementing these techniques in organic/regenerative operations. We also strongly support the idea of an incentive program rather than anything mandatory, as area farmers and ranchers are facing enough pressures as it is.

In reading the draft, we also had some questions about how various things will work, and in some cases we had concerns about specific calculations. We would like to share these with you so you can consider this feedback as you revise this draft. If it would be helpful, we would be happy to communicate with you further on these topics before the final draft is released.

O10-3

First, we'd like to better understand how additional sequestration attributable to carbon farming will be counted toward the overall CAP reduction target. Will the reduction be based solely on projections, such as through COMET-Planner? Or will it be necessary, in addition to doing projections, to verify how much carbon is actually sequestered, such as through use of soil organic matter testing? Perhaps these details are still being worked out, but if the answer to this is known, it seems it would be beneficial to specify within the final CAP draft.

We found the COMET projections on P. 483 of Appendix 1 to be very illuminating, but also they raised some questions for us. In particular, is it true that you are anticipating sequestration increases of 3.1 or 4.4 MT CO₂E per acre per year as a result of compost application in different settings (cropland and rangeland, respectively)? Based on our knowledge of sequestration potential, those seem like very high expectations to achieve on a per year basis. According to the [ATTRA Sustainable Agriculture program](#), in a cropping context, "Compost can sequester an estimated 0.75 tonnes CO₂ equivalent per acre, per year". According to a variety of sources, such as the [San Mateo RCD](#), Riyals and Silver's 2013 study with the Marin Carbon Project found that, in a rangeland context, "a one-time application of compost sequesters 1.49 metric tons of carbon dioxide equivalents per acre per year". These numbers seem significantly lower than 3.1 and 4.4, respectively, so we are interested to better understand what explains that discrepancy. Of course, other carbon farming techniques can be applied in addition to composting, which can result in higher sequestration potential. For example, the [Institute of Agriculture and Natural Resources](#) evaluated research on this and reported that, "We found 77 multi-year experimental results measuring changes to no-till with an average carbon sequestration benefit of 0.77 metric tons of CO₂e per acre per year. We found 189 experimental results for planting cover crops, with an average sequestration benefit of 0.76 metric tons per acre per year". Still, it seems even if composting, cover cropping, and no-till changes were all practiced, that still may not add up to the target shown on P. 483. Nonetheless, we certainly would encourage the implementation of as many carbon farming techniques as seems practical, so that maximum sequestration and other co-benefits can be achieved.

O10-3
cont.

We have one other question related to sequestration and emissions. In Section 4 on P. 101 (according to the blue page number), it says: "A carbon farming program will incentivize a variety of techniques on natural and working lands that reduce GHG emissions and provide cobenefits such as water and land conservation". Do you mean that additional sequestration from carbon farming will, in effect, reduce GHG emissions once additional sequestration is subtracted from total emissions? Or is the focus on actual reduction of emissions rather than sequestration? It seems like perhaps the language could be refined to better communicate the intention to the public.

Also, we noticed a discrepancy in estimates of agricultural acreage in San Diego County. On P. 99 (blue number) of Section 4, it says: "More than 5,000 farmers call the county their home and make their living on 250,000 acres". However, on P. 484 of Appendix 1 the amount of agricultural acreage appears to be much smaller: 114,746 acres of farmland in 2019. Without

further information, there appears to be a discrepancy. Could this info be more clearly communicated in the final draft so that these numbers don't appear to be in conflict?

We are interested to better understand, given the \$1-10 million budget for the carbon farming program in the first six years of implementation (per Section 5), how much of that is expected to be going directly toward farmers in the form of incentives? We expect there will be some administrative costs covered by that as well, and we would like to get more info about the expected balance of farmer benefits to admin costs. In terms of marketing, it seems like a large figure could be very attractive to area farmers, and we will want to help the CAP team get the word out to area farmers about this new incentive program, so more info there would be useful.

And finally, we strongly support everything under the banner of A-4, but it wasn't clear to us in the executive summary whether items A-4.1a, A-4.1b, A-4.1c, and A-4.1d are all a subset of 4.1 and therefore will be administered as part of the Carbon Farming Program or whether those are additional initiatives that will support climate-friendly farming practices but are not directly related to the carbon sequestration initiative. If it's the latter, perhaps organizing those under a new A-4.2 header and making those A-4.2a, A-4.2b, A-4.2c, and A-4.2d would provide more clarity to readers.

Hopefully this feedback is helpful, and we look forward to seeing your responses to these questions, either in the final draft or, if preferable, through communication with us prior to that. We will continue keeping close tabs on these efforts, and we look forward to seeing the next iteration and providing whatever assistance we can throughout the process. Thank you very much for your time and all your efforts in this area.

David Pearl

Letter O10 SanDiego350's Food and Soil Team

David Pearl

January 4, 2024

Comment O10-1

The comment is an introductory statement.

Response O10-1

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O10-2

The comment provides background information about the Carbon Farming Working Group in the SanDiego350's Food and Soil Team and expresses support for the CAP Update carbon farming measures.

Response O10-2

The County appreciates the support for the CAP Update carbon farming measures. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O10-3

This comment is encompassed in Comment O9-5 above. The comment expresses support for the CAP Update Measure A-4 and advises the County to reorganize the structure for Action A-4.1 and Actions A-4.1.a through A-4.1.d.

Response O10-3

Refer to Response O9-5. In addition, Actions A-4.1.a, A-4.1.b, A-4.1.c, and A-4.1.d are organized under Measure A-4, which states that the County will, "Incentivize carbon farming to expand carbon storage capacity on agricultural land and support climate-friendly farming practices in the unincorporated area." These actions are organized under Measure A-4 because they are related to carbon farming and other climate-friendly farming practices.

4 January 2024

Re: **Feedback on the San Diego County draft Climate Action Plan**

Dear County Sustainability Planning Division Team,

The [San Diego Building Electrification Coalition](#) (SDBEC) is an alliance of community, business, faith, justice, and environmental organizations coming together to equitably accelerate electrification in residential and commercial buildings. Building electrification is essential to meeting California and San Diego's ambitious climate goals by reducing greenhouse gas emissions, improving air quality in our homes and buildings, and protecting public health.

We are pleased that the County's Climate Action Plan recognizes the urgency to significantly reduce and avoid GHG emissions to achieve net zero emissions by 2045. And while the plan focuses on five emission reduction sectors, the importance of the Energy sector cannot be overstated. Electrifying buildings is one of the most effective ways to cut climate pollution. Our electricity is increasingly cleaner thanks to the County's decision to join San Diego Community Power. Furthermore, the technology needed to transition from methane gas to clean electricity already exists today.

O11-1

It is in this spirit that we offer the following recommendations on the draft Climate Action Plan:

Energy Sector Vision (Chapter 4, Energy Sector, page 65)

- Many measures & actions in this sector rely on electrification as well as energy efficiency to meet the targets, yet the vision does not mention electrification.
 - We recommend a more inclusive Vision, e.g. **efficient electric buildings**

Measure E-1: County Operations (Chapter 4, Energy Sector, page 67)

- While the County's Zero Carbon Portfolio Plan (ZCPP) reduces GHG emissions in municipal operations, we recommend adding additional actions to the CAP, in alignment with the City of San Diego's goals in their Zero Emissions Municipal Building Operation Policy ([ZEMBOP](#))
 - Expand the scope beyond "owned & occupied properties" to include **properties owned by the County and leased to others**
 - **Require gas equipment be replaced at end of life**, or sooner, with electric alternatives
 - Accelerate the timeline for **100% renewable energy by 2025**

O11-2

Measure E-2: Unincorporated Area (Chapter 4, Energy Sector, page 68)

- The County has many activities that impact new and existing buildings, that can updated to include electrification
 - We recommend adding a measure that **all county housing policies, funding and contracts, leases require all-electric buildings.**

- We recommend that the "Equity Based Outcomes" of "Reduced utility bills for homeowners and renters" be updated to include **improved air quality**.
- We recommend the "Community" co-benefit score be increased to reflect the **public cost-savings of energy efficiency and electrification**. Mass electrification will enable the decommissioning of expensive and aging gas pipelines.

Action E-2.1: New Buildings (Chapter 4, Energy Sector, page 68)

- Due to on-going litigation, we recommend that this action be supplemented to create an ordinance to **encourage** all-electric equipment, until it is possible to require it.

Action E-2.2: Existing Buildings (Chapter 4, Energy Sector, page 68)

- We recommend the following additions to address the urgency of electrifying of existing buildings
 - **Require all air conditioning units to be replaced upon burnout with heat pump appliances**
 - **Streamline the permitting process for building electrification, especially emergency replacements**
 - **Support residents with an Electrification Retrofit Accelerator program**
 - **Accelerate the timeline for existing building electrification**
 - **Commit to seeking additional policy pathways to electrify faster**

O11-2
cont.

In addition, details for each action including **estimated costs, specific benchmarks and implementation timelines** are critical and must be transparently developed and robustly funded.

Our region is far behind in meeting mandated GHG reduction goals. Strong leadership at the County level must be demonstrated, leading by example, to achieve the significant results that are needed in the face of our climate emergency.

Sincerely,

Letter O11 San Diego Building Electrification Coalition

January 4, 2024

Comment O11-1

The comment is an introductory statement and provides background information about the San Diego Building Electrification Coalition.

Response O11-1

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O11-2

The comment offers recommendations related to the energy sector vision statement, Measures E-1 and E-2, and Actions E-2.1 and E-2.2.

Response O11-2

See Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explains that the CAP Update has adequately identified measures and actions that would exceed the 2030 and 2045 GHG reduction targets and make substantial progress toward the aspirational goal of net zero emissions by 2045.

RE: DRAFT Climate Action Plan

Dear Meghan:

On behalf of the undersigned coalition, we submit the following comments regarding the draft County of San Diego Climate Action Plan.

Our coalition appreciates the County's intent to adopt a climate action plan that reflects environmental priorities and changes in state law. Our coalition's members have been leaders in reducing greenhouse gas emissions from the built environment. Our members see themselves as part of the solution to addressing climate change. Our members, and for those who have business commercial or residential property, their tenants also recognize and support reasonable measures to increase energy efficiency.

It's important to note, and as the 2019 greenhouse gas inventory demonstrates, 45 percent of climate emissions are from "on-road transportation." Our coalition believes the best way to control transportation emissions is to increase jobs creation adjacent to where people live. This live-work balance is even more important in the numerous unincorporated communities in the County of San Diego.

The remaining emission reduction opportunities are spread among eight categories. As the County looks to adopt even more stringent rules, we believe the County must be careful to not harm the ability of jobs providers to create new commercial and industrial spaces, detrimentally impact existing and potential employers, as that could be counter to the important goal of reducing GHG by better co-location and balance of jobs-housing-services.

O12-1

Below are some specific comments we'd like to submit regarding the proposed draft Climate Action Plan:

- T-3.1: While we support the movement toward electric vehicles and providing the necessary charging infrastructure, we ask any mandate to construct this equipment be aligned with demand, and not an arbitrary requirement to build the infrastructure for it to not be utilized. This is an extremely expensive requirement that is not easily achieved, particularly in commercial settings. Serving those additional loads on a property-by-property basis can be challenging, and expensive, particularly in the unincorporated county. Our coalition believes the cost-benefit should be a factor in this type of decision.
- T-6.2a: Transportation demand management is a cautionary tale. In some cases, mandates under a TDM program that drive either operational changes or impact employees from a cost or convenience standpoint could harm economic development efforts, as well as conflicts with the greatest means of reducing emissions, which is having jobs adjacent to homes. Voluntary programs, coupled with financial incentives to pay for ride sharing are something to be used and expanded, as outlined in Actions T-6.1 and T-6.3. Additional analysis should also be completed. Given COVID-era driven changes in work habits, a number of employers are allowing an even greater share of work from home opportunity, which may mean that these goals are already being readily met. Focus should also be paid to improving the areas transit services, including first and last mile connections. Convenience drives behavior, so that could assist greatly in reducing auto trips. Lastly, the State of California has already mandated the phasing out of combustion vehicle sales. There should be much less concern about vehicle emissions, given the time horizons for these mandates.
- E-2.1: Our coalition has opposed building electrification mandates. Numerous examples exist of the need for a variety of clean energy production methods that cannot meet this standard. Whether its life sciences, restaurants, or other manufacturers, including the provision of services in larger buildings, some processes or equipment require natural gas. It's a relatively small amount, by comparison to other emission sources, and shouldn't be immediately discarded given the implications. It is important to note that the decision this week by the full federal 9th Circuit Court of Appeals to uphold the denial of the City of Berkeley's electrification ordinance suggests that electrification mandates are not legal and should not be pursued.
- E-2.2 and W-2.1/2.2: The State of California already has some of the most stringent energy efficiency requirements in the world. Some jurisdictions like the public relations narrative of going beyond state requirements using "reach" or "stretch" codes. Even though the State has offered additional tiers beyond the CalGreen code, they are strictly voluntary, and in our member's experience, it has been a challenge to implement those more stringent "tiers" in other jurisdictions. As such, we would strongly encourage caution in going beyond already aggressive, mandatory state standards as it creates uncertainty in the development process.

O12-2

- Incentives work: We appreciate numerous action items utilizing incentives to achieve GHG reduction targets. When incentives, like tax credits, are applied, acceptance and adoption increase exponentially. When they drop, like the recent decision by the CPUC to change net metering rules, adoption is dramatically reduced. We support the County's actions focusing on incentives for change, rather than mandates.
- Leading by example: We fully support the measures the County seeks to adopt for its own operations and properties. Leading by example is important, as many jurisdictions delay implementation of the requirements they place on the private sector citing cost concerns. We strongly encourage the County's effort to reduce its own GHG emissions through this CAP.

O12-2
cont.

In closing, the undersigned coalition would also like to note that the implementation of the County's CAP and the specific measures to be utilized are critically important to ensuring a reasonable, practical, and feasible program. As such, we will continue to be involved in these conversations and appreciate your team's willingness to engage our organizations and our members.

Thank you for your time and consideration of these thoughts. Our organizations are willing to continue to discuss these issues as you proceed with more specific update proposals.

Sincerely,

Comment O12-1

The comment includes an introductory statement and offers general commentary related to the effects of where people live relative to their jobs on transportation emissions and potential effects of CAP Update measures and actions on developers and employers.

Response O12-1

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O12-2

The comment provides specific feedback related to CAP Actions T-3.1, T-6.2.a, E-2.1, E-2.2, W-2.1, and W-2.2. The comment expresses support for the County's actions focusing on incentives for change. The comment also expresses general support for the County's effort to reduce GHG emissions through the CAP Update.

Response O12-2

The County appreciates the support for the CAP Update and the specific suggestions provided. See Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," which describes the analytical and implementation details for quantified implementing actions that are included in the CAP Update, including the quantified GHG reduction potential and measurable performance outcomes for 2030, 2035, 2040, and 2045. The CAP Update also identifies the following details for each action as part of the CAP Implementation and Monitoring Program (Table 13): the implementation enforcement mechanism, County department with lead and supporting responsibilities for implementation, relative cost (using a qualitative, ordinal ranking of low, medium, or high), and potential funding sources for implementation.

Re: Draft Climate Action Plan (CAP) Update and Draft SEIR

Dear Ms. Kelly,

These comments are submitted on behalf of the Center for Biological Diversity (the “Center”) regarding the proposed Draft Climate Action Plan (“CAP”) Update and Draft SEIR (“Draft”), for consideration to San Diego County. The Center supports the elimination of carbon offsets, but recommends that the County make a stronger commitment to sustainable land-use practices through the implementation of the Fire Safe and VMT Efficient Alternative identified in the Draft.

O13-2

The Center is a non-profit, public interest environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has over 1.7 million members and online activists throughout California and the United States. The Center and its members have worked for many years to protect imperiled plants and wildlife, open space, air and water quality, and overall quality of life for people in Los Angeles County and throughout California.

I. The County Must Center Sustainable Land-Use as a Central Component of the CAP.

As emphasized in the CAP, the climate crisis requires bold action from all levels of government to reduce GHGs. Land-use planning that prioritizes infill and transit-oriented development is an essential strategy to achieving regional GHG reductions. Not including these measures as requirements for future development would be in direct opposition to the science as described below.

O13-3

a. Sprawl Development Increases Greenhouse Gas Emissions and Harms Public Health

Arizona · California · Colorado · Florida · N. Carolina · Nevada · New Mexico · New York · Oregon · Washington, D.C. · La Paz, Mexico

BiologicalDiversity.org

Sprawl development increases the amount of truck and car trips, resulting in more climate-disrupting carbon pollution. A 2010 meta-analysis based on more than 50 surveys concluded that a region's local density, diversity and regional accessibility had a significant impact on travel behavior.¹ Specifically, population centrality, job-housing balance, shape of the city, and roadway density influences annual household vehicle miles travelled, or VMT.²

In 2021, the emissions associated with passenger vehicles in the U.S. totaled 370 million metric tons of carbon dioxide equivalent (CO₂e).³ California's annual average emissions associated with passenger vehicles between 2000 and 2020 was approximately 110 million metric tons of CO₂e.⁴

In addition to carbon pollution, increased daily vehicle trips result in emissions of NO_x, carbon dioxide (CO₂), and methane (CH₄), which can lead to premature mortality, compromised birth outcomes, heart disease and a host of respiratory illnesses.⁵

An even more direct negative impact to increased VMT is the impacts to the individual commuter. In 2019, the duration of the average commute in the United States increased to a new high of 55.2 minutes, and a record 9.8 percent of commuters reported daily commutes of at least 2 hours.⁶ These long commutes reduce time available to spend with family, friends, and community, and reduce opportunities for healthy recreation. The increase in inactivity and isolation can also lead to long-term health complications such as pre-diabetes, diabetes, obesity, asthma, isolation, stress and depression.^{7,8}

Additionally, automobile crashes are the leading cause of death among young people (15 to 19 years old) in the United States.⁹ An estimated 42,915 people died in car crashes in 2021 alone and 3.4 million people are injured each year, which costs an estimated \$473.2 billion annually as measured by wage and productivity losses, medical expenses, motor-vehicle damage, and employers' uninsured costs.^{10, 11, 12}

Continuing to approve sprawl development in the county would inevitably increase the region's GHG emissions and reduce the region's air quality, which is in direct opposition to the CAP's purpose as well as both the federal and state government emission reduction goals.

b. Sprawl Development Increases Communities' Wildfire Risk

Almost all contemporary wildfires in California, 95% to 97%, are caused by human sources such as power lines, car sparks and electrical equipment.¹³ Increasing sprawl development in highly fire-prone wildlands also increases unintentional ignitions and puts more people in danger.¹⁴

Wildfire is an important ecological process for many ecosystems. For millennia, Indigenous cultural burning and lightning strikes drove ecosystem-specific fire regimes. But the genocide of Native peoples and the criminalization of fire practices, along with 200 years of reckless land-use planning, have altered historical fire regimes.^{15,16} This, in combination with climate change causing more extreme fire weather, longer fire seasons, and larger areas burned, has made wildfires more destructive to people and communities.¹⁷

O13-3
cont.

Since 2016 more than 200 people in California have been killed in wildfires, more than 50,000 structures have been burned down, hundreds of thousands have had to evacuate their homes and endure power outages, and millions have been exposed to unhealthy levels of smoke and air pollution.¹⁸

Poor air quality from fine particulate matter (PM_{2.5}) in wildfire smoke has both acute and long-term health effects. Hospital visits for respiratory symptoms (*e.g.*, asthma, acute bronchitis, pneumonia or chronic obstructive pulmonary disease) have been shown to increase during and/or after wildfire events.¹⁹

There is also evidence that increases in all-cause mortalities and hospital visits for cardiovascular symptoms (*e.g.*, congestive heart failure, ischemic heart disease, and myocardial infarction) are also linked to wildfires.¹⁹ Epidemiologists recently found that increased exposure to wildfire smoke may also be linked to higher rates of dementia.²⁰ And wildland firefighters are suffering disproportionately high rates of cancer and other serious diseases, likely due to extreme smoke exposure,²¹ as well as mental health issues due to extended fire seasons and working extended shifts away from their families.²²

In addition to particulate matter from smoke, harmful and toxic substances from burning structures, like lead and zinc, are released in the air and can travel many miles to other communities.²³ Such impacts disproportionately affect low-income and minority communities and vulnerable members of the population, like children, the elderly, and people with pre-existing health conditions.

The economic impacts of wildfires affect residents throughout the state. Wildfires in 2018 cost Californians an estimated \$148.5 billion in capital losses, health costs related to air pollution exposure, and indirect losses due to broader economic disruption cascading along regional and national supply chains.²⁴ And the cost of emergency fire suppression continues to skyrocket year after year.

The county must stop approving new developments in wildfire severity hazards zones if they want to meet their GHG reduction targets and protect communities against the devastating impacts of unintentional human-caused wildfires.

c. Sprawl Development Decreases Nature's Carbon Sequestration Capacity

Developers cut down mature trees, pave over grasslands, and destroy native wildlife habitat. This undermines nature's ability to store carbon. Terrestrial ecosystems — including forests, woodlands, shrublands, grasslands, riparian areas, wetlands, and deserts — act as large carbon sinks, sequestering approximately 30% of anthropogenic emissions globally.²⁵ Protecting and restoring native habitats is a central component to any successful climate mitigation strategy.^{26, 27} California's Natural and Working Lands Climate Change Implementation Plan acknowledges this fact and includes natural carbon sequestration as a central strategy to reach the statewide goal of carbon neutrality by 2045.^{28, 29}

O13-3
cont.

Development threatens this goal. Every time we pave over forest, woodlands, shrublands, grasslands and other open spaces to build more sprawl, we work against our goals to build climate resiliency by releasing that area's stored carbon and losing its potential to sequester carbon.

d. Sprawl Development Destroys Habitat Vital for Regional Biodiversity and Community Health

Loss in habitat from development destroys sensitive species and has the potential to degrade or diminish entire ecosystems.^{30, 31, 32}

- **Roads** fragment habitat and cause direct mortality and genetic isolation of animals, which can drive wildlife species towards extinction. Many species, including mountain lions and desert tortoises, are often killed or injured if they attempt to cross roads.³³ Other animals, like some songbirds and lizards, avoid crossing roads altogether. Roads also facilitate the spread of non-native and invasive species, particularly plants and their seeds, which threaten the survival of native plants and animals.³⁴ Roads also facilitate more development, compounding the problem.
- **Structures and human activities** result in habitat loss, degradation and fragmentation. The presence of people can cause species to shift their behaviors and movement patterns, which can lead to genetic isolation and an increased risk of local extinctions. This is evident with struggling puma populations in California experiencing an extinction vortex due to severe habitat fragmentation caused by roads and development.³⁵ Predation and disease from domestic pets can also harm native species and erode ecosystems.³⁶
- **Fences** create another type of habitat fragmentation by reducing mobility and preventing species from accessing areas that they depend on for survival. Even worse, fences can ensnare the animals that try to cross, resulting in suffering, injury or death.³⁷
- **Chemical pollution in the form of pesticides, herbicides and rodenticides** are also a threat. Run-off pollution from roads and agriculture harms fish and amphibians that require aquatic habitats to survive.^{38, 39, 40} Rodenticides poison or kill bobcats, mountain lions, coyotes, Pacific fishers, raptors, and many others.^{41, 42}
- **Light and noise pollution** can reduce the health and reproductive rates of many birds and other wildlife.⁴³

Destruction of habitat results in greater wildlife mortality and potential extirpation.⁴⁴ The county needs to protect remaining native habitats to ensure we preserve regional biodiversity that is essential to community health and wellbeing.

O13-3
cont.

II. The County Should Adopt the Fire Safe and VMT Efficient Alternative.

The Fire Safe and VMT Efficient Alternative would attempt to achieve the goals of "smart growth" through overlays and incentives that can be implemented quickly. The Center therefore supports this alternative as an achievable framework for the County to implement immediately for all future development. This moves the County toward reaching its GHG

O13-4

reduction goals and helps to protect future communities from the risk of wildfire. However, for this framework to be effective, **the county should amend the following policies:**

- a. *Policy LU-5.3 Rural Land Preservation*: The CAP should clearly identify and articulate specific methods that reflect the best available science and prioritize preservation of native habitats.
- b. *Policy LU-6.2 Reducing Development Pressures*: Remove passive language such as “consider” and include High in addition to Very High Fire Hazard Severity Zones.
- c. *Policy S-3.8 Discourage New Subdivisions in Very High Fire Hazard Severity Zones*: increasing density in high fire locations should NEVER include the development of open space. Destruction of habitat for human development significantly increases a region’s risk to wildfire. The Center supports the policy adopted by Los Angeles County in their Safety Element, which prohibits new subdivisions outside of existing communities in VHFHSZs, and discourages subdivisions in other FHSZs. Los Angeles County goes on to prohibit GPAs in all fire hazard areas unless within an existing community. The Center recommends such policies be included in the CAP.
- d. *Policy S-4.3 Forest Health*: Specific wildfire reduction methods should not be listed as “appropriate” unless supported by fire ecologists.

O13-4
cont.

III. Conclusion

Sprawl development increases the region’s GHG emissions and significantly harms environmental and public health. Therefore, the Center requests that the County commit to sustainable land-use practices through adoption and implementation of the Fire Safe and VMT Efficient Alternative and amendment of the CAP policies to be in alignment with said alternative.

Thank you for your consideration of these comments.

Sincerely,

Elizabeth Reid-Wainscoat

Letter O13 Center for Biological Diversity

Elizabeth Reid-Wainscoat, Urban Wildlands Campaigner

January 5, 2024

Comment O13-1

The comment is an introductory statement and provides links to references cited in the comment letter.

Response O13-1

The County has received and considered the comments and reference documents provided. The comment does not raise significant environmental issues related to the Draft SEIR, and no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a). Responses to specific comments are provided below.

Comment O13-2

The comment expresses support for the Fire Safe and VMT Efficient Alternative, recommending that the County make a stronger commitment to sustainable land use practices through implementation of this alternative, and provides background information about the Center for Biological Diversity.

Response O13-2

The commenter's recommendation that the County implement the Fire Safe and VMT Efficient Alternative is noted. This suggestion will be presented to the Board, which has the discretion to direct implementation of the suggested alternative.

Comment O13-3

The comment states that the County must center sustainable land use as a central component of the CAP Update and provides a summary of the negative implications of sprawl development as it relates to GHG emissions.

Response O13-3

The information provided regarding the relationship of sprawl development to GHG emissions, wildfire risk, and carbon sequestration is noted. The CAP Update does not prescribe land use changes in the unincorporated county. Rather, such prescriptions are left to the General Plan. Refer to Section 9.1.1.1, "Master Response: CAP Update Purpose and Land Use Change," for more information regarding the purpose of the CAP Update and its relationship to the General Plan. Refer also to Section 5.5, "Smart Growth Alternatives," of the Draft SEIR and Section 9.1.1.2, "Master Response: Evaluation of Smart Growth Alternatives in This SEIR," above, which provides a discussion of the selection and evaluation of the smart growth alternatives, including the Fire Safe and VMT Efficient Alternative.

Comment O13-4

The comment supports adoption of the Fire Safe and VMT Efficient Alternative and asserts that four General Plan policies included as part of the General Plan Goal and Policy Edits Alternative should be amended and included for the framework in the Fire Safe and VMT Efficient Alternative to be effective.

Response O13-4

The comment's support for the Fire Safe and VMT Efficient Alternative is noted and will be provided to decision-makers for consideration. Importantly, the Fire Safe and VMT Efficient Alternative is feasible and could be implemented independent from any of the goal and policy edits provided in the General Plan Goal and Policy Edits Alternative. Furthermore, these edits would be made to the County's 2011 General Plan and would not be included in the CAP.

As explained on page 5-31 of the Draft EIR:

In addition to, or in lieu of, any of the alternatives described above, County staff have identified potential amendments to General Plan goals and policies from the Land Use, Conservation and Open Space, Mobility, and Safety Elements of the adopted General Plan that would further enhance the smart growth principles described above and embodied in the General Plan. The Board may choose some or all of these additional policy amendments and pair them with the proposed CAP Update or an alternative.

The County acknowledges the refinements to the potential amendments to Policies LU-5.3, LU-6.2, S-3.8, and S-4.3 that are provided in the comment. Adoption of any part of the General Plan Goal and Policy Edits Alternative, as presented in the Draft SEIR or as subsequently revised, is a question of County policy. These suggestions will be presented to the Board, which has the discretion to direct implementation of the suggested refinements as part of the alternative.

January 5, 2024

RE: Climate Action Plan Response

CleanEarth4Kids.org thanks the County of San Diego staff for their important work on the Climate Action Plan (CAP).

Implementing a strong and comprehensive Climate Action Plan (CAP) will help protect children's health and future, public health, and our birds, wildlife, ecosystems and environment. A strong comprehensive Climate Action Plan will help reduce air, water and land pollution, ensure a healthier and more sustainable future and help protect us from the impacts of climate change.

We ask the County to make the CAP a free-standing document that can be quickly implemented, clearly enforced and closely tied to the General Plan. The CAP plays a vital role in the future of San Diego and must be central to County decision-making. The proposed CAP is goal-oriented and requires legislation and actions to be implemented. Simple adjustments in the proposed CAP must be made.

Additionally, CleanEarth4Kids.org asks the County of San Diego to provide an analysis of the proposed greenhouse gases (GHG) reduction plans with detailed action metrics, targets and dates. including the measurement methodology to be used.

O14-1

Please Implement 16 CAP Recommendations

1. Climate-Safe Investments
2. 100% Building Electrification for New Construction with No Exceptions
3. Clean, Renewable Energy
4. Electrify/Renovate Existing Buildings
5. Solar, EV Charging Stations, Microgrids and Virtual Power Plants (VPP)
6. Community and Environmental Dashboard
7. Add a Clean Air Section to the CAP
 - a. Ban Leaf Blowers
 - b. No Idling
 - c. Stop Wood Burning
 - d. Stop Smoking
 - e. Stop Leaded Aviation Gas (AVGAS)
8. Protect and Conserve Water
9. Transportation
10. No False Solutions
11. Stop Toxic Synthetic Pesticides
12. Community Gardens

O14-2

13. Create Pocket Forests
14. Protect Natural Habitats, Wetlands, Lagoons and Waterways
15. Ban Synthetic Grass/Artificial Turf
16. Zero Waste and Ban Single-Use Plastics

O14-2
cont.

1. Climate-Safe Investments

- Divest any investments, bank accounts, etc. that support fossil fuels. Only invest in funds, stocks, bonds, etc. that guarantee they will not invest in fossil fuels.
- Include eco-friendly choices for employee retirement fund investment options.
- Use an eco-friendly bank, preferably a B-Corp, for all County cash accounts. Do NOT support banks that invest in fossil fuel projects.
- Provide informational sessions and support for builders and property owners to obtain grants and other funding for energy efficiency and renewable energy improvements. For example, work with eco-friendly banks to provide Property Assessed Clean Energy (PACE) loans and financing.

O14-3

2. 100% Building Electrification for New Construction with No Exceptions

The County must prioritize building electrification with high-efficiency appliances and insulation to move away from fossil fuels and improve air quality to protect health and the environment. Over [60 cities in California](#) have already passed electrification ordinances and others are underway¹.

(Natural gas is a marketing term for methane, [a hazardous indoor air pollutant](#) and a [major contributor to climate change](#)^{2,3}. The use of [gas stoves](#) in the home increases the risk of asthma and other respiratory diseases⁴. And [gas stoves leak methane](#) even when turned off⁵. We must completely end the use of “natural gas”.)

O14-4

Building electrification is an important action that will encourage green buildings, reduce carbon emissions and air pollution, and help protect the health of children and future generations, clean air and water, birds, fish, wildlife, ecosystems and the environment.

Burning methane creates outdoor and indoor air pollution. Around [33% of greenhouse gases \(GHGs\)](#) in San Diego County come from the burning of methane⁶. [Studies](#) of human exposure to air pollutants show that “indoor levels of pollutants

¹ <https://www.sandiegouniontribune.com/communities/del-mar-to-consider-building-electrification-ordinance>

⁶ <https://www.sandiegocounty.gov/GreenhouseGasEmissionsInventoryProjectionsandReductionTarget.pdf>

may be two to five times, and occasionally more than 100 times, higher than outdoor levels," and a major source of indoor air pollution is gas stoves.⁷ Here is a [link](#) to our *Dangers of Natural Gas* video.⁸

O14-4
cont.

Please go to our [Team 3: Clean Air Saves Lives](#) page for more information.⁹

3. Clean, Renewable Energy

The CAP needs more details on the stated goal of 100% clean energy by 2030. There must be a clear roadmap with metrics and dates and we ask the County to move the goal of 100% renewable energy to 2025, not 2030.

Please go to our [Team 1: Renewable Energy](#) page for more information.¹⁰

4. Electrify/Renovate Existing Buildings

With residential power as the [2nd largest GHG](#) in San Diego County, the CAP must provide incentives and subsidies to encourage owners of existing buildings to electrify.¹¹ The County must provide funding and assistance for owners and contractors to obtain state and federal grants to replace gas equipment as quickly as possible: installing electric heat pumps, water heaters, induction cooktops, etc., while providing energy efficiency improvements like insulated windows and LED lighting.

O14-5

We ask the CAP to include all properties owned by the County, including leased, in the plans for zero emissions. We also ask all county housing policies, funding, contracts and leases to require all-electric buildings.

The CAP must also provide incentives to [reduce embedded carbon](#) in construction including the use of EV vehicles for construction projects.¹²

5. Solar, EV Charging Stations, Microgrids and Virtual Power Plants (VPP)

To maximize clean, local energy generation and grid reliability, please coordinate with San Diego Community Power (SDCP) to install solar panels and wind turbines on all county-owned parking lots and buildings and please integrate microgrids and VPP into the power grid.

Also, please greatly increase EV charging stations, especially for multi-unit housing. Also, please engage and help school districts find and implement grants to add EV charging stations and solar for all school buildings and parking lots.

Help locate grants and work with each city and school district so that buildings can

⁷ <https://www.epa.gov/iaq-schools/why-indoor-air-quality-important-schools>

⁸ <https://vimeo.com/704755689>

⁹ <https://cleaneearth4kids.org/clean-air#gas>

¹⁰ <https://cleaneearth4kids.org/renewable-energy>

¹¹ <https://www.sandiegocounty.gov/content/sdc/sustainability/regional-decarbonization/rdfs/summary.html>

¹² <https://rmi.org/embodied-carbon-101/>

provide local power generation, and fault tolerance, and serve as a Resilience Center in case of fire, earthquake or heat wave.

The CAP must incentivize local, clean energy.

This is possible by giving incentives to property owners and builders to install the necessary infrastructure for microgrids for apartment buildings, multiunit housing and subsidized housing for renters throughout the county.

The County has to lead by upgrading all County facilities to be all-electric and use 100% clean/renewable energy including converting all County vehicles to electric. Timelines and metrics must be provided in the CAP.

O14-5
cont.

6. Community and Environmental Dashboard

Create a Climate & Environmental Dashboard accessible on the first page of the County website and in libraries, schools and businesses throughout San Diego to increase citizen awareness, knowledge, and participation on issues such as air pollution, any pesticides that are being used throughout San Diego, energy utilization, etc. We look forward to meeting with you to show you examples. Resources like [ClimateTrace.org](https://climate.trace.org/) can be used to identify major emitters of GHG in the County and publicize who they are on the dashboard.

O14-6

7. Add a Clean Air Section to the CAP, like the City of San Diego

The burning of fossil fuels does much more than just release GHGs. It also dumps toxic air pollution that harms everyone's health and the environment. We ask the County to include a Clean Air section in the CAP like the [City of San Diego](https://www.sandiego.gov/clean-air/) with clean air goals and yearly targets to reduce air pollution¹³.

- Take Climate Action and Protect Our Air: Stop Burning Fossil Fuels

O14-7

Air pollution from fossil fuels and petrochemicals has a significant detrimental impact on [human health](#),¹⁴ particularly on the [brain](#) and the [cognitive abilities of children](#).¹⁵ Exposure to ambient air pollutants like PM2.5, NO2 and ozone and heavy metals like lead, arsenic and mercury have been associated with [lower academic performance](#),¹⁶ [attention deficit hyperactivity disorder \(ADHD\) symptoms](#),¹⁷ behavioral problems and [autism spectrum disorders in children](#).¹⁸ Air pollution increases the risk of neurological disorders and accelerated cognitive decline in children by causing [neuroinflammation and neurodegeneration](#).¹⁹ These pollutants have also been associated with several other indicators of poor health, including

¹³ https://www.sandiego.gov/sites/default/files/san_diegos_2022_climate_action_plan_0.pdf

¹⁶ <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8663889/>

¹⁷ <https://pubmed.ncbi.nlm.nih.gov/30909100/>

¹⁸ <https://onlinelibrary.wiley.com/doi/10.1111/dmcn.14758>

¹⁹ <https://www.sciencedirect.com/science/article/abs/pii/S0278262608001747>

[asthma and infant mortality](#).²⁰ Recent findings indicate that air pollution is linked to cognitive impairment through various biological processes, such as [oxidative stress and inflammation, endocrine disruption, epigenetic modifications](#) and changes in brain structure.²¹ Exposure to fine particulate matter is correlated with [reduced cortical thickness and thinner gray matter](#),²² which may [impact learning, memory, and information processing](#).²³

Also causing significant harm to the brain [lowering cognitive abilities and reading and math scores are heavy metals](#) including mercury, lead, manganese, and their compounds, and petrochemicals such as isoamyl alcohol, methanol, xylene, toluene, styrene, *n*-hexane, and ethylbenzene.²⁴

- Fossil Fuel Air Pollution Harms Public Health

Fossil fuel combustion is a [leading cause](#) of deadly PM2.5 exposure.²⁵ Extended exposure to PM2.5 is responsible for 62% of all deaths from air pollution in 2019.²⁶ PM 2.5 is especially [deadly](#)²⁷ because its small size allows it to enter deep into the lungs and pass into the [bloodstream](#),²⁸ making it a significant contributor to cardiovascular [disease and mortality](#).²⁹ PM2.5 also [increases](#) heart disease, lung cancer, COPD (chronic obstructive pulmonary disease), lower-respiratory infections, pneumonia, stroke, type 2 diabetes, and other serious conditions including [gastrointestinal illness](#).^{30,31} People with tuberculosis exposed to PM2.5 had [increased replication](#) of the disease.³² PM2.5 impacts our most vulnerable populations, including [minorities](#),³³ the [elderly](#),³⁴ [pregnant women](#)³⁵ and [children](#).³⁶ Increased Particulate Matter reduced the health-related quality of life among the elderly, [increasing pain and discomfort, anxiety, and depression](#).³⁷

Childhood exposure to PM2.5 is linked to [asthma](#),³⁸ which is the leading cause of [school absences](#)³⁹ and the third leading cause of [hospitalizations](#) among children

O14-7
cont.

- Air Pollution is A Racial, Social, Environmental, and Climate Justice Issue

Air pollution from the burning of fossil fuels harms people of color disproportionately.⁶² Due to Social Determinants of Health (SDoH) factors Black and low-income communities are disproportionately affected by air pollution in the United States.⁶³ Annually, fossil fuel industries in the US release about 9 million tons of methane gas and other toxic chemicals into the atmosphere.⁶⁴ Black and low-income communities are disproportionately affected by air pollution in the United States.⁶⁵ Exposure to poor air quality can cause numerous health problems such as emphysema and asthma.⁶⁶ Increased rates of asthma can lead to significant health disparities and reduced quality of life.⁶⁷ Approximately 13.4% of Black children suffer from asthma as compared to only 7.3% of White children.⁵³

⁶² <https://psci.princeton.edu/tips/2020/8/15/racial-disparities-and-climate-change>

⁶³ <https://www.lung.org/clean-air/outdoors/who-is-at-risk/disparities>

⁶⁴ <https://psci.princeton.edu/tips/2020/8/15/racial-disparities-and-climate-change>

⁶⁵ <https://www.lung.org/clean-air/outdoors/who-is-at-risk/disparities>

⁶⁶ <https://www.catf.us/2017/11/study-african-american-health-impacts-oil-gas-pollution/>

⁶⁷ <https://aafa.org/asthma-allergy-research/our-research/asthma-disparities-burden-on-minorities/>

In total, African Americans are [75% more likely](#) than White people to live in “fence-line” communities (areas near commercial facilities that produce noise, odor, traffic, or emissions that directly affect the population).⁶⁹

O14-7
cont.

Please go to our [Team 3: Clean Air Saves Lives](#) page for more information.⁶⁸

7a. Ban Gas-Powered Leaf Blowers

Most gas-powered leaf blowers are 2-stroke engines that burn a mix of oil and gas. These engines not only put out a massive amount of pollution, but they also do not have a filter. The [pollutants](#)⁶⁹ from a single gas-powered leaf-blower are 300x more than a pickup truck with gas-powered lawn equipment using an estimated 800 million gallons of gasoline. This contributes to more air pollution in our air, and damaging ozone as these nitrous oxides contribute to the damage that occurs.

With and without a filter, the dangers of gas-powered leaf blowers are immense. Gas-powered leaf-blowers emit carbon monoxide, nitrous oxides, hydrocarbons and other [pollutants](#)⁷⁰ such as formaldehyde, benzene, fine particulate matter, and smog-forming chemicals. These pollutants are known to cause diseases that affect the heart and lungs, as well as cancer, dementia, and [headaches](#)⁷¹. The [health effects](#)⁷² linked to gas-powered leaf blowers are asthma, cardiovascular disease, lung cancer, respiratory disease, and central nervous system disorders.

O14-8

Please go to the stop leaf blower section on our [Team 3: Clean Air Saves Lives](#) page for more information.⁷³

7b. No Idling

Car exhaust is full of toxic chemicals like benzene and carbon monoxide. 1 minute of idling puts [more carbon monoxide](#) into the air than smoking 3 packs of cigarettes.⁷⁴ Please take action to reduce idling by parked vehicles, including purchasing only zero-emission vehicles for the city fleet. [Idling burns](#) over 3.8 million gallons of fuel every day in the US, adding 30 million tons of CO2 to the atmosphere.⁷⁵ [Link](#) for more information on idling.⁷⁶

The CAP must adopt a no-idling policy along with requiring the electrification of loading docks and other facilities and eliminate vehicle idling. Also provide education through signs, social media and radio to bring awareness. CleanEarth4Kids.org has No Idling signs with children’s art available.

Please go to our [Team 3: No Idling](#) page for more information.⁷⁷

7c. Stop Wood Burning

Burning wood emits carbon, along with toxic chemicals, lead and heavy metals. We ask the County of San Diego to take action to stop wood smoke. Please see our 6-minute video, created by Judith, on our Youth Board [CleanEarth4Kids.org Stop Wood Smoke video](#) created by our youth.

- a. Work with the SD APCD (San Diego Air Pollution Control District) and surrounding cities to stop wood-burning fireplaces and stoves in new construction and renovations like the [City of London](#).⁷⁸
- b. Implement programs and incentives to remove (not replace!) existing wood-burning fireplaces and stoves.
- c. Work with SD APCD and all city, county, and state governments and agencies to stop recreational wood fires on all public lands like beaches and parks to protect clean air and our health.
- d. Fund radio, print, TV and social media ads about the harms of wood smoke. Please promote the [CleanEarth4Kids.org Stop Wood Smoke video](#) created by our youth.⁷⁹

Wood smoke is a complex mixture of gases and fine particles, called particulate matter. PM2.5 is especially dangerous. These particles are 2.5 microns or smaller. By comparison, the average human hair is 50 microns wide. Researchers estimate that PM2.5 is responsible for almost 48,000 [premature deaths](#) in the US every year.⁸⁰ Particulate matter irritates the lungs and increases the risk of [serious health outcomes](#) including asthma, heart attacks, strokes, cancer, and brain conditions like Alzheimer's, Parkinson's and dementia.⁸¹ Wood smoke also contains cancer-causing [pollutants](#) like benzene, formaldehyde, acrolein and Polycyclic Aromatic Hydrocarbons or PAHs, along with carbon dioxide, carbon monoxide and methane.⁸² Burning 10 lbs. of wood in 1 hour creates the same [cancer-causing PAHs](#) as 6,000 packs of cigarettes.⁸³ That's like smoking a pack of cigarettes a day for 16 years...just by sitting next to a wood fire. Here is a [link](#) for information about wood smoke.⁸⁴ You can also contact [Doctors & Scientists Against Wood Smoke Pollution](#).⁸⁵

The San Diego Air Pollution Control District (SD APCD) [2021 Annual Air Quality Report](#) and [2022 Regional Air Quality Strategy \(RAQS\)](#) show residential combustion

⁸⁴ <https://cleaneearth4kids.org/team-3-no-wood-smoke>

⁸⁵ <https://woodsmokepollution.org/index.html>

(wood burning) is tied with construction as the main source of PM_{2.5}.^{86,87} These reports show wood burning dumps almost 3.5 TONS of particulate matter into San Diego County air EVERY DAY. Data from the US Energy Information Administration (EIA) [shows](#) households with higher incomes are more likely to burn wood.⁸⁸ Wood burning is being done for recreation, not need.

Please see our [CleanEarth4Kids.org Team 3: No Wood Smoke](#) page for more information.⁸⁹

7d. Stop Smoking

Ban public smoking like the City of Encinitas and others. [Second](#) and [thirdhand](#) smoke is toxic and emits lead.^{90,91} Fund radio, print, TV and social media ads about the harms of second and thirdhand smoke. Also, ban [smoking in multi-family housing](#).⁹²

Please go to our [Team 3: Smoking and Vaping Harms Your Health](#) page for more information.⁹³

O14-8
cont.

7e. Stop Leaded Aviation Gas (AVGAS)

CleanEarth4Kids.org asks the County of San Diego to stop the sale, use and storage of leaded aviation fuel at all County airports and work with local cities to do the same.

There is NO safe level of lead!

- Lead is Toxic

The [WHO \(World Health Organization\)](#),⁹⁴ [CDC \(Centers for Disease Control\)](#)⁹⁵ and the [AAP \(American Academy of Pediatrics\)](#)⁹⁶ have all stated there is no safe level of lead, a [toxic heavy metal](#).⁹⁷ Its [adverse effects](#) are particularly severe for children and unborn babies as it damages their brains and nervous systems.⁹⁸

[Exposure to lead](#) lowers IQ and causes behavior problems, learning disabilities, and impaired impulse control.⁹⁹ Children's exposure to lead is linked to [higher rates of](#)

⁸⁶ <https://www.sdapcd.org/content/dam/sdapcd/documents/community/annual-air-quality-reports>

⁹⁸ <https://www.cdc.gov/nceh/lead/prevention/health-effects.htm>

⁹⁹ <https://www.luc.edu/healthyhomes/leadsafeillinois/leadfacts/rippleeffectsofchildhoodleadpoisoning/>

[suspension and detention](#) along with [lower reading and math test scores](#).^{100,101} Childhood exposure to lead is also linked to [higher crime rates](#).¹⁰² According to the [CDC](#), people with prolonged exposure to lead are at higher risk of high blood pressure, heart and kidney disease, and various forms of cancer.¹⁰³

Most health impacts from lead exposure are [lifelong and irreversible](#).¹⁰⁴ Lead exposure is also hazardous to adults, with [18% of all deaths](#) in the US linked to lead exposure and is a significant risk factor for [cardiovascular disease](#).^{105,106} Lead is the [number one reason](#) for fatal heart attacks in the US.¹⁰⁷

- The Harm of Leaded Aviation Fuel on Communities

The EPA has issued its [public endangerment finding](#) on lead emissions from aircraft, stating it will “cause or contribute to lead air pollution.”¹⁰⁸

The impact of lead pollution is especially damaging to children living close to these airports as they are very likely to have significantly [higher levels of lead in their blood](#).¹⁰⁹ In the US, over 5 million people, including over [360,000 children](#) under the age of 5, live near at least one lead-emitting airport and face a severe risk of lead poisoning.¹¹⁰ [Communities of color](#) are most likely to be close to these sources of lead, resulting in higher blood levels on average than white children.¹¹

In the County of Santa Clara, children living within half a mile of their airport had [lead levels nearly twice](#) that of kids in [Flint, Michigan](#) at the height of their lead crisis.^{112,113} Recognizing the danger, the County of Santa Clara has stopped the sale and storage of [leaded fuel](#) at their airport which has already significantly reduced lead emissions.¹¹⁴

- Stopping Leaded Aviation Fuel

Leaded aviation fuel is used by some piston-engine planes and helicopters in general aviation. According to the FAA (Federal Aviation Administration), an estimated [170,000 aircraft](#) operating from over 20,000 airports across the US use leaded aviation fuel (AVGAS).¹¹⁵ These aircraft are responsible for almost [70% of airborne](#)

[lead pollution](#), putting out around 500 tons of lead each year, and are the largest source of lead in US air.¹¹⁶

O14-8
cont.

Unleaded fuel is now available. The sale and use of leaded aviation fuel must stop!

Please see our [Team 5: #GetTheLeadOut](#) page for more information.¹¹⁷

8. Protect and Conserve Water

Set water use reduction goals and develop policies, guidelines and education programs to replace ornamental grass and other landscaping with native plants while transitioning to gray water reuse. The CAP must require greywater systems and stormwater capture and conservation for new residential and commercial construction.

O14-9

Create [bioretention swales](#) in medians and other areas like [Los Angeles](#) to serve as micro-reservoirs for landscaping while filtering stormwater runoff.^{118,119}

Establish other rainwater capture and storage infrastructure throughout the County including capture barrels at every residential property.

Under California law, water is a basic human right. San Diego must take action to end water shutoffs and subsidize access to water for lower-income residents.

Please see our [Team 4: Water Is Life](#) page for more information.¹²⁰

9. Transportation

The CAP must identify methods to reduce Vehicle Miles Traveled (VMT) by encouraging the use of public and active transportation.

The County's Active Transportation Plan must:

- Collaborate with SANDAG to support and implement the [Five Big Moves](#).¹²¹
- Develop plans to extensively expand bike lanes and sidewalks throughout the County, create car-free areas and implement electric shuttles in high-traffic areas.
- Construct pedestrian overpasses and other safe pedestrian and active transportation infrastructure.
- Provide free mass transit passes to students, seniors and residents of disadvantaged communities.

O14-10

¹¹⁶ <https://earthjustice.org/news/press/2022/epa-proposes-endangerment-finding-of-leaded-aviation-gasoline>

¹¹⁹ <https://dpw.lacounty.gov/WMD/STWO/EastLA.aspx>

¹²⁰ <https://cleaneearth4kids.org/clean-water>

¹²¹ <https://www.sandag.org/regional-plan/5-big-moves>

- Create a transportation stipend program for all County employees while charging for parking.
- Establish practical and user-friendly public transportation in the unincorporated areas for semi-rural and rural communities.
- Provide education and campaigns to encourage walking, biking, and taking public transit.

O14-10
cont.

Please see our [Team 3: Transportation](#) page for more information.¹²²

10. No False Solutions

The CAP must clearly state the County of San Diego will not use or invest in false climate solutions like synthetic carbon capture (CCS, CCUS), dirty hydrogen, methane or biomass/biofuels. These types of greenwashed “solutions” only delay real climate action.

O14-11

Please see our [Team 1: No False Climate Solutions](#) page for more information.¹²³

11. Stop Toxic Synthetic Pesticides

We ask the County of San Diego to create and implement education programs and assistance to help farmers transition to climate-resilient farms, stopping the use of synthetic pesticides and synthetic fertilizers.

99% of synthetic pesticides and fertilizers come from fossil fuels and the continued use of [these petrochemicals](#) is a direct threat to the climate and our world.¹²⁴

[Healthy soil is important for sequestering carbon](#).¹²⁵ But pesticides destroy the microbes that make healthy soil.

O14-12

By promoting sustainable farming practices that prioritize soil health, the City of Oceanside will contribute to the protection of human health, clean air, and water which will protect pollinators, and wildlife, preserve biodiversity and enhance our environment and climate.

- Pesticides Are Toxic

Pesticides are known to [increase children’s cancer risk](#) and [95% of pesticides used miss their target](#).^{126,127} There is a massive amount of scientific studies showing the damage done by the use of [synthetic pesticides](#) to the environment and human

¹²² <https://cleaneearth4kids.org/transportation>

¹²³ <https://cleaneearth4kids.org/false-climate-solutions>

¹²⁴ <https://www.ciel.org/reports/fossil-fertilizers/>

¹²⁵ <https://www.cdca.ca.gov/healthysoils/>

¹²⁶ <https://www.sciencedirect.com/science/article/abs/pii/S1438463919306212?via%3Dihub>

¹²⁷ <https://www.scientificamerican.com/article/pesticide-drift/>

health.¹²⁸ Pesticides are poison, they are designed to kill. That is their purpose.

California studies show 13 agricultural pesticides [elevated children's cancer](#) up to 2.5 miles away from the application sites.¹²⁹ Only 5 are classified as [Restricted Use by the EPA](#).¹³⁰ But 11 of the 13 are banned or not approved in other countries with 10 of them banned in at least 28 countries. The US uses [toxic pesticides banned](#) in many other countries.¹³¹ The US only bans 21 pesticides while China bans 54 and the EU bans 195. (For a list of pesticides banned in other countries, please click [here](#).)¹³² Legal does not mean safe!

The proximity to agricultural pesticides is critical because pesticides can [drift](#) miles, harming children and families living [near agricultural fields](#).^{133,134} [Pesticide drift](#) settles on playgrounds, porches, laundry, toys, pools, furniture, gardens, and lawns where people and children live, learn, and play.¹³⁵ This exposes people, pollinators, and wildlife to danger from what they touch, breathe, and eat.

These toxic pesticides also contaminate our water. The [National Water Quality Assessment](#) (NWQA) shows [agricultural runoff](#) as the main cause of pollution in rivers and streams.^{136,137} As pesticides travel through soil and bedrock cracks, they contaminate groundwater systems which [provide 70% of the water used for public and private water supplies, irrigation, and industry](#).¹³⁸ Aquatic organisms also [absorb pesticides](#) through their skin, breathing, and mouths.¹³⁹ Long-term exposure has many negative consequences for aquatic life, such as [mortality, reproductive failure, eggshell thinning, suppression of the immune system, and other fish health complications such as excessive slime on fish scales and gills, cancers, tumors and lesions](#).¹⁴⁰

For more information on toxic pesticides, please see our [Team 5: Stop Toxic Pesticides page](#).¹⁴¹

- Organic, Regenerative Farming, Permaculture and Agroecology

[Organic](#) and [regenerative](#) farming practices do not use synthetic pesticides, fertilizers, or GMOs. Methods such as cover crops, manure, crop rotation, and natural pest controls like neem oil are used to repel pests and maintain soil health

¹²⁸ <https://www.dw.com/en/pesticide-atlas-2022>

O14-12
cont.

which is a natural carbon sink.^{142,143} They focus on biodiversity, reduced tilling and planting a wide variety of crops to **better close the carbon cycle**.¹⁴⁴

Permaculture and agroecology work with nature instead of against it, combining landscapes, plants, animals, and humans in a symbiotic relationship.¹⁴⁵¹⁴⁶

Please see our [Team 5: Regenerative Farming, Permaculture, Agroecology, Organics & Healthy Soil](#) page for more information.¹⁴⁷

12. Community Gardens

Please create an expansive community garden program that will decrease heat islands, and increase carbon sequestration while reducing food insecurity.

13. Create Pocket Forests

Identify small areas of 6 parking spaces or more and small vacant land areas for pocket forests. Engage with school districts throughout the county to plant a pocket forest on each school's grounds.

Pocket forests are small areas of native trees and plants that restore nature to the urban environment.¹⁴⁸ This method was adopted by Japanese botanist Akira Miyawake, the creator of Tiny Forests.¹⁴⁹ The Miyawake method emulates an area's native ecosystem through a dense-planting method of only native species.¹⁵⁰

These pocket forests provide vital habitats for native wildlife, attract important pollinators, provide an [equitable urban landscape](#),¹⁵¹ improve water infiltration of the soil, decrease stormwater runoff, [protect against erosion](#),¹⁵² provide educational opportunities to the community and [absorb large amounts of carbon dioxide](#).¹⁵³

14. Protect Natural Habitat, Wetlands, Lagoons and Waterways

The CAP must support the establishment of local natural habitat lands for GHG sequestration and to conserve biodiversity. CleanEarth4Kids.org supports the Habitat Restoration Resource Management Framework and asks the regional Multiple Species Conservation Plans (MSCP) to be incorporated into the CAP.

¹⁵³ <https://www.weforum.org/agenda/2020/07/tiny-urban-forests-miyawaki-biodiversity-carbon-capture/>

The CAP must address blue carbon storage by planting kelp and other seagrasses to sequester carbon while protecting coastal areas from pollution and sea level rise. Identify ecologically sound methods to protect beaches, cliffs, coastal roads and the LOSSAN train corridor from erosion.

O14-13
cont.

15. Ban Synthetic Grass/Artificial Turf

CleanEarth4Kids.org asks the County of San Diego to ban all installations of artificial grass/synthetic turf. With the signing of [SB 676](#) by Governor Newsom on October 8th, you have the authority to stop the use of this toxic plastic carpet.¹⁵⁴ The [City of Millbrae](#) has already banned it.¹⁵⁵

- Synthetic Grass/Artificial Turf is Plastic Pollution

Synthetic grass/artificial turf is plastic, made from resins like polyethylene and nylon. PFAS are used in the [extrusion of plastic yarn](#) for the “grass” blades.¹⁵⁶ No synthetic grass/artificial turf manufacturer can state they are free of PFAS. PFAS, PAHS, lead, and other toxic chemicals have been found in [synthetic grass/artificial turf](#).¹⁵⁷

O14-14

The installation and use of synthetic grass/artificial turf is the intentional installation and use of [microplastics](#)¹⁵⁸ which does serious harm to the [environment](#)¹⁵⁹ and [human health](#).¹⁶⁰ Recent [research](#)¹⁶¹ has found microplastics in placentas, infant feces, breastmilk, and even infant formula. Other studies have shown microplastics changing [lung and liver cells](#).¹⁶² [Microplastics were banned in United States cosmetics](#)¹⁶³ in 2015, but the ban on microplastics should apply to all areas of life to reduce these health risks.

Plastics don't break down in the environment, simply breaking down into microplastics. [Wildlife can mistake microplastics for food](#) and marine animals have been found to consume microplastics accidentally.¹⁶⁴ Microplastics attract and carry [pollutants](#) in the water and also [release toxic chemicals](#).^{165,166} Lab studies have shown that microplastics may impact the [developmental stages](#) of animals, causing reproductive issues and their ability to fight disease.¹⁶⁷ Furthermore, since humans

¹⁶¹ <https://www.news-medical.net/news/20220921/Microplastics-detected-in-placentas-infant-feces-breast>

¹⁶² <https://www.onegreenplanet.org/environment/microplastics-are-disrupting-metabolism-of-lung-and-liver>

¹⁶³ <https://www.fda.gov/cosmetics/cosmetics-laws-regulations/microbead-free-waters-act-faqs>

¹⁶⁴ <https://marinedebris.noaa.gov/what-marine-debris/microplastics>

¹⁶⁵ <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7924819>

¹⁶⁶ <https://link.springer.com/article/10.1007/s42452-019-1352-0>

¹⁶⁷ <https://www.frontiersin.org/articles/10.3389/ftox.2022.748912/full>

consume fish and other marine animals, the impacts of microplastics are passed on to humans through the food chain.

The plastic life cycle is incredibly toxic. [Research](#) shows it causes premature birth, low birth weight, decreased fertility, asthma, childhood leukemia, lymphoma, brain cancer, breast cancer, mesothelioma, cardiovascular disease, chronic obstructive pulmonary disease, neuropathy, and lung cancer.¹⁶⁸

- Synthetic Grass/Artificial Turf Hurts the Climate

Synthetic grass/artificial turf is plastic and [plastic emits methane](#), a powerful greenhouse gas (GHG).¹⁶⁹ Plastics start as fossil fuels and emit greenhouse gasses in every stage of their [lifecycle](#), from the extraction of oil/gas to the trash pile.⁷⁰ Plastics have a [huge carbon imprint](#).¹⁷¹ Research showed the emissions from plastics in 2019 were nearly 1.8 billion metric tons of greenhouse gasses, and that number is [projected to continue growing](#).¹⁷²

Dr. Sarah-Jeanne Royer of the Scripps Institution of Oceanography in California wrote a [letter](#) in opposition to synthetic grass/artificial turf, citing methane as a major concern.¹⁷³ Dr. Royer and her colleagues found that polyethylene, used to make synthetic turf/artificial grass, [releases more methane](#) than any other plastic.¹⁷⁴

During the [breakdown of polyethylene, the release of methane gas accelerates](#) and the surface area of the plastic increases, reacting more with the sunlight and releasing more methane.¹⁷⁵ As synthetic grass/artificial turf is commonly made of polyethylene, these fields constantly release methane as it interacts with the sun and everyday use. Over a 20-year period, [methane is 80x more potent](#) at warming than carbon dioxide and is responsible for 25% of global warming.⁷⁶

- Synthetic Grass/Artificial Turf is Not Recycled

Replaced every 7-10 years, the average artificial grass/synthetic turf soccer field produces [40,000 lbs of plastic carpeting and 400,000 lbs of infill](#) waste.¹⁷⁷

Used artificial grass/synthetic turf is not recycled. The plastic carpet and infill are often [dumped or sent to landfills](#) as there are [no recycling facilities for synthetic turf](#)

O14-14

in the US.^{178,179} [Reuse is not recycling](#)¹⁸⁰ and so-called “[chemical recycling](#)” is just greenwashing for incineration.¹⁸¹ Burning is not recycling!

- Synthetic Grass/Artificial Turf is HOT

Synthetic grass/artificial turf is 40°-70°[hotter](#) than surrounding air temperatures and has burned hands and feet.¹⁸² A [study](#) by Brigham Young found the surface temperature of synthetic grass/artificial turf was 37° higher than asphalt and 86.5° hotter than natural grass.¹⁸³ A study found that in 90° weather, the surface temperature of a natural grass field was about 98° while a synthetic grass/artificial turf field was [over 160°](#).¹⁸⁴ [Shoes have melted](#) from the heat on synthetic grass/artificial turf with players and coaches getting blisters on the bottom of their feet through their shoes.¹⁸⁵ [First-degree burns](#) occur at 118° with blistering and second-degree burns at 131°.¹⁸⁶ Several synthetic grass/artificial turf fields in the Los Angeles Unified School District are currently[closed](#) due to high heat and melting surfaces.¹⁸⁷

O14-14
cont.

- Synthetic Grass/Artificial Turf is Dangerous to Athletes

Playing on synthetic grass/artificial turf can cause more injuries. According to an NFL Players Association (NFLPA)[study](#), playing and practicing on synthetic grass/artificial turf increases the chance of a lower extremity injury with a 69% higher rate of non-contact foot/ankle injuries than on natural grass.¹⁸⁸ The NFLPA has called for [all NFL fields to be natural grass](#).¹⁸⁹

A [study](#) of National Collegiate Athletic Association (NCAA) athletes found playing on synthetic grass/artificial turf greatly increased the chance of knee ligament injuries while another [study](#) of high school athletes found they were 58% more likely to sustain an injury playing on synthetic grass/artificial turf than natural grass.^{190,191}

The United States Men’s Professional Soccer Team and other national teams only play on natural grass in the World Cup, and the [United States Women’s Soccer Team sued FIFA](#) to not play on synthetic grass/artificial turf due to the increased risk of

injury.¹⁹² Soccer legend [Lionel Messi](#) will only play on real grass.¹⁹³

- Natural Grass is Best

We ask the County of San Diego to follow organic land management practices, especially for managing playing fields. Training is available online through the [University of California, Riverside](#) and other [locations](#).¹⁹⁴ High-use, organically managed, natural grass fields have been in use [in many areas](#) including [Irvine, CA](#).^{195,196}

[Natural grass is the healthiest choice](#) for playing fields and parks.¹⁹⁷ [Natural grass fields are more cost-effective than synthetic grass/artificial turf fields which have higher maintenance and long-term costs](#).^{198,199} [Natural grass fields are also cheaper to install](#) than synthetic grass/artificial turf.²⁰⁰ With proper care and maintenance, a natural grass field can accommodate any amount of play as demonstrated by Marblehead, MA with [20 acres of organically managed fields](#) for over 15 years.²⁰¹

Please see our [Team 5: Stop Synthetic Turf](#) page for more information.²⁰²

16. Zero Waste and Ban Single-Use Plastics

CleanEarth4Kids.org supports the development of composting/anaerobic digestion facilities to divert the majority of compostable waste from landfills. The CAP must also provide plans to reduce other waste and develop a circular economy by encouraging and incentivizing the elimination of single-use products while reducing, reusing and repurposing other items.

Please see our [Team 6: Stop Plastics & Waste](#) page for more information.²⁰³

Take Climate Action NOW: There Is No Time To Waste

As shown in the United Nations Intergovernmental Panel on Climate Change (UN/IPCC) [report](#)²⁰⁴ released March 20th 2023, our climate situation is at the point of no return. Even if we start [today](#) with immediate and strong action, we only have a very moderate chance of limiting global warming to the 1.5°C threshold by the world scientific community. We are in a climate emergency!

O14-14
cont.

O14-15

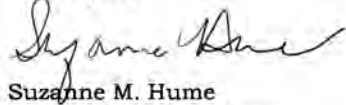

We already see the [effects of climate change](#)²⁰⁵ as predicted by scientists: droughts, heat waves, extreme weather, raging wildfires, loss of sea ice, sea level rise, etc.

If we do not greatly reduce greenhouse gases now, global temperature will continue to rise and these impacts will also increase and intensify. This is not a future problem, we are all being harmed right now.

The County of San Diego must implement a strong and enforceable CAP now.

O14-15
cont.

Thank you,

Suzanne M. Hume
S@CleanEarth4Kids.org
(760) 650-2166
CleanEarth4Kids.org

CleanEarth4Kids.org works to protect children's health & future, public health, and the health and safety of communities, workers, and indigenous peoples globally and reminds all that clean air, water, a livable future, and access to nature are human rights. Streams, rivers, oceans, public lands, forests, trees, wildlife, ecosystems, climate, soils, and organic gardens must be protected. Access to healthy safe food, playgrounds, schools, homes, communities, cities and public lands- without toxic pesticides, chemicals, plastics, lead, heavy metals and pollution- is essential for life.

At the heart of CleanEarth4Kids.org: environmental protection, children's health and future, public health, environmental, racial, social and climate justice, education and JEDI (Justice, Equity, Diversity & Inclusion). CleanEarth4Kids.org works to stop toxic chemicals, PFAS, pesticides, lead and heavy metals, plastics and microplastics, toxic toys and products, synthetic turf, PIP (Pour In Place Playgrounds), fossil fuels, pollution, environmental destruction, degradation and injustice and works to uphold human rights and justice.

Letter O14 CleanEarth4Kids

Suzanne M. Hume

January 5, 2024

Comment O14-1

The comment states the beneficial effects of implementing a strong and comprehensive CAP Update. The comment requests that the County make the CAP Update a standalone document for fast implementation and to provide an analysis with detailed action metrics, targets, and dates for the GHG reduction plans.

Response O14-1

With regards to the request to implement the CAP Update as a standalone document, please see Section 9.1.1.1, “Master Response: CAP Update Purpose and Land Use Change,” for a discussion of the purpose of the CAP Update and its relationship to the General Plan. Also refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the methodology the County used in the CAP Update to establish GHG reduction targets that are appropriately aligned with statewide targets and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets.

Comment O14-2

The comment provides a summary of detailed comments provided below.

Response O14-2

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O14-3

The comment provides recommendations for climate safety investment.

Response O14-3

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a). The comment will be provided to County decision-makers for their consideration during the adoption hearings for a Final CAP Update.

Comment O14-4

The comment requests that the County prioritize building electrification and provides links for various resources related to the adverse effects of natural gas.

Response O14-4

The County has received and reviewed the resources documents provided. The request to prioritize building electrification is noted. Refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explain that the CAP Update has adequately identified measures and actions that would exceed the 2030

and 2045 GHG reduction targets and make substantial progress toward the aspirational goal of net zero emissions by 2045.

Comment O14-5

The comment requests more details (e.g., metrics and dates) on how to achieve 100 percent clean energy by 2030 and moving the 100 percent clean energy goal to 2025. The comment requests that all County properties, housing policies, funding, and contracts require all-electric buildings. The comment also advises the County to coordinate with San Diego Community Power to install renewable energy facilities on all County parking lots and buildings.

Response O14-5

The County acknowledges the information provided regarding electrification and renewable energy. See Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the analytical and implementation details for quantified implementing actions that are included in the CAP Update, including the quantified GHG reduction potential and measurable performance outcomes for 2030, 2035, 2040, and 2045. The CAP Update also identifies the following details for each action as part of the CAP Implementation and Monitoring Program (Table 13): the implementation enforcement mechanism, County department with lead and supporting responsibilities for implementation, relative cost (using a qualitative, ordinal ranking of low, medium, or high), and potential funding sources for implementation.

Comment O14-6

The comment advises the County to develop a Climate and Environmental Dashboard.

Response O14-6

The County appreciates the suggestion to create a dashboard to increase education and awareness of climate issues in the region. The County currently maintains a website (<http://www.sandiegocounty.gov/sustainability/cap>) to provide education and awareness of the County’s implementation of the Climate Action Plan. Within this site, the County’s Climate Action Plan Dashboard currently shows how the 2018 Climate Action Plan’s 26 quantifiable, achievable, and enforceable measures are performing, and is available at: <https://www.sandiegocounty.gov/content/sdc/sustainability/dashboard.html>. This website will be updated to reflect CAP Update implementation progress as part of the CAP Update Implementation and Monitoring Program.

Comment O14-7

The comment requests a Clean Air section to be added to the CAP Update and provides links for various resources related to the adverse effects of air pollution.

Response O14-7

The County has received and reviewed the reference documents provided. Refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” for a discussion related to co-benefits of the CAP Update measures and actions, including air pollution reductions. The comment will be provided to County decision-makers for their consideration during the adoption hearings for a Final CAP Update.

Comment O14-8

The comment requests that the County ban gas-powered leaf blowers, idling, wood burning, smoking, and leaded aviation gas.

Response O14-8

Regarding gas-powered leaf blowers, the CAP Update includes Action T-1.2, which would “Amend Board policy to require 100% of landscaping equipment used on County property to be zero-emissions by 2030,” and Action T-2.1, which, in part, would, “Develop and adopt a landscaping equipment ordinance to require the use of zero emission landscaping equipment by 2030...”

Regarding vehicle idling and electrification of loading docks and other facilities, the CAP Update includes the following actions:

- T-1.1.b: Adopt a County Operations anti-idling policy to reduce emissions from vehicle idling, and
- T-3.1: Increase the use of electric and other zero-emission vehicles in the unincorporated area by:
 - Installing 2,040 publicly available electric vehicle charging stations by 2028.
 - Requiring the electrification of loading docks and idling reduction in new commercial and industrial development by 2030.
 - Amending the County’s Code of Regulatory Ordinances by 2026 to require (Tier 2) CalGreen or similar electric vehicle charging infrastructure installations and preferential parking for ZEVs for new multi-family residential and non-residential construction.
 - Developing a program by 2026 to incentivize EV purchases and school bus electrification.

The commenter’s suggestions regarding wood burning, smoking, and leaded aviation fuel will be provided to the Board for consideration. Aviation fuel standards are outside the County’s jurisdiction. See also Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the analytical and implementation details for quantified implementing actions that are included in the CAP Update.

Comment O14-9

The comment requests several measures to be added to the CAP Update to protect and conserve water.

Response O14-9

The CAP Update includes several actions related to water use reduction, replacing ornamental grass and other landscaping with native plants, reusing graywater, and capturing stormwater and rainwater, as follows:

- W-1.1: Implement the County’s Water Efficiency Plan to require water-efficiency measures in new and existing County buildings/operations to reduce potable water use intensity by 28% by 2030.
- W-1.2: Amend the County’s Code of Regulatory Ordinances by 2026 to require (Tier 2) CALGreen or similar water efficiency requirements and reduced outdoor water use for landscaping requirements for new development to reduce potable water consumption from new development by 17% in the unincorporated area.
- W-2.2: Amend the County’s Code of Regulatory Ordinances by 2026 to require (Tier 2) CALGreen or similar water efficiency requirements for existing development projects with qualifying improvements.
- W-2.3: Update the Green Building Incentive program by 2026 to include incentives for water efficiency, conservation, and reuse improvements for new and existing development to reduce potable water consumption in the unincorporated area.
- W-2.3.a: Collaborate across County departments to streamline and simplify graywater capture permitting process to reduce potable water use in the unincorporated area.
- W-2.3.b: Develop and distribute materials to assist renters with implementing water efficiency and conservation improvements.
- W-2.4: Implement the Waterscape Rebate Program to incentivize water efficiency and conservation to reduce outdoor water consumption in the unincorporated area.
- W-3.1: Increase wastewater treatment efficiency through the East County Advanced Water Purification Program to produce 12,900 acre-feet of water each year by 2030.

See also Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the analytical and implementation details for quantified implementing actions that are included in the CAP Update.

Comment O14-10

The comment requests that the County identify methods to reduce VMT and provides recommendations for the County’s Active Transportation Plan.

Response O14-10

The CAP Update includes several actions to reduce on-road transportation GHG emissions by reducing VMT, as follows (including implementation of the County’s Active Transportation Plan):

- T-4.1: Expand County Benefit Program by 2026 to provide County employees with tax-free transportation benefits, alternative work schedules, and expand part-time or full-time teleworking options to reduce vehicle miles traveled from employee commutes by 40% in 2030 and 55% in 2045.
- T-4.1.a: Provide educational programs and campaigns to encourage County staff to walk, bike, and take transit.

- T-4.2: Develop a rebate program by 2026 for County employees to purchase electric vehicles, bicycles, and scooters for commute use.
- T-5.1: Implement the County's Active Transportation Plan to install 345 miles of sidewalk and 315 miles of bikeways by 2030 to encourage alternative modes of transportation in the unincorporated area.
- T-5.1.a: Develop educational materials to encourage residents and businesses to use and provide access to alternative modes of transportation.
- T-5.2: Develop a countywide Safe Routes to Schools program to reduce vehicle miles traveled to schools by 1.2% by 2030.
- T-6.1: Develop a program to provide free transit passes and/or free trips in the unincorporated area to reduce vehicle miles traveled in the unincorporated area by 1.2% by 2030.
- T-6.2: Increase access to Transit Priority Areas by 5% in the unincorporated area and implement transit-supportive roadway treatments such as traffic signal communication and curb extensions along County-maintained roadways to optimize traffic flow for transit and pedestrians by 2030.
- T-6.2.a: Adopt a Transportation Demand Management ordinance to include pre-approved options for new development to reduce single occupancy vehicle trips in the unincorporated area.
- T-6.2.b: Evaluate options for increasing transit service to unincorporated communities.
- T-6.3: Increase access to first/last mile transportation services and connections (e.g., neighborhood electric vehicles, microtransit, bike/scooter-share) to reduce vehicle miles traveled by 7% within the unincorporated area by 2030.

See also Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," which describes the analytical and implementation details for quantified implementing actions that are included in the CAP Update.

Comment O14-11

The comment requests that the CAP Update not include "false climate solutions," such as synthetic carbon capture, "dirty" hydrogen, methane, or biomass/biofuels.

Response O14-11

The CAP Update does not include measures or actions that use or invest in synthetic carbon capture, methane, biomass, or biofuels. CAP Action T-3.1.a has been revised to clarify that this effort would focus on clean hydrogen sources.

Comment O14-12

The comment requests that the County create and implement education programs and provide assistance to farmers to stop the use of synthetic pesticides and fertilizers. The comment also summarizes the adverse effects of the use of synthetic pesticides.

Response O14-12

The CAP Update includes the following action to reduce GHG emissions from the use of synthetic fertilizers:

- A-4.1d: Evaluate options to incentivize the voluntary reduction of the use of synthetic fertilizers in the unincorporated area.

The CAP Update also includes the following actions to expand carbon storage capacity on agricultural land:

- A-4.1: Develop a Climate Smart Land Stewardship Program by 2026 to increase carbon sequestration on 3,000 acres by 2030 and 36,214 acres by 2045.
- A-4.1.a: Support the local food system through development of a food sourcing policy that prioritizes contracts with local, equitable, and sustainable food suppliers in County operations.
- A-3.1: Implement the Purchase of Agricultural Conservation Easement (PACE) Program to preserve 6,058 acres of agricultural land by 2030 and 400 acres per year thereafter.

See also Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” describes the analytical and implementation details for quantified implementing actions that are included in the CAP Update.

Comment O14-13

The comment suggests creation of an expansive community garden program and creation of “pocket forests.” The commenter also requests that the CAP Update protect natural habitat, wetlands, lagoons, and waterways and to address blue carbon storage.

Response O14-13

Refer to Response O14-12 regarding CAP Update actions that expand carbon storage capacity on agricultural lands. Regarding the creation of “pocket forests” and establishment of “local natural habitat lands,” the CAP Update includes several actions to reduce GHG emissions through preservation of natural lands and tree planting:

- A-1.1: Acquire 11,000 acres of conservation lands by 2030 and 1,000 acres per year thereafter to preserve land in perpetuity.
- A-1.2: Develop a Habitat Restoration Resource Management Framework for County-owned land by 2030 and restore 80 acres per year thereafter to increase carbon storage.
- A-1.2.a: Partner with tribal governments to incorporate tribal ecological knowledge and apply indigenous land management practices to contribute toward habitat restoration efforts on County land.
- A-2.1: Expand the County’s existing tree planting initiative and implement an Equity Driven Tree Planting Program to plant 70,560 trees by 2030 and 6,650 trees per year thereafter on County property and in the unincorporated area.

- A-2.1.a: Develop a program to preserve native trees in the unincorporated area.
- A-2.1.b: Educate the public on the benefits and maintenance of native, fire-resistant, and drought-tolerant tree plantings.
- A-2.2: Implement the County's Landscaping Ordinance to require tree planting in new single family residential development in the unincorporated area.

The commenter's suggestions regarding blue carbon storage and methods to protect beaches, cliffs, coastal roads, and the LOSSAN train corridor erosion apply to coastal areas and not to the unincorporated county. See also Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," which describes the analytical and implementation details for quantified implementing actions that are included in the CAP Update.

Comment O14-14

The comment requests the County to ban synthetic grass, artificial turf, and single-use plastics.

Response O14-14

The suggestion to ban synthetic grass, artificial turf, and single-use plastics are noted and will be provided to the Board for consideration. Note that the CAP Update includes Action W-2.4, which would "Implement the Waterscape Rebate Program to incentivize water efficiency and conservation to reduce outdoor water consumption in the unincorporated area." Artificial turf is not eligible for incentives under this program.

See also Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," describes the analytical and implementation details for quantified implementing actions that are included in the CAP Update.

Comment O14-15

The comment expresses the need to take immediate actions to address climate change.

Response O14-15

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

RE: Draft Climate Action Plan

Dear Ms. Kelly and Project Team,

At San Diego Gas & Electric Company (SDG&E), we would like to extend our compliments and congratulations to the County for your efforts developing the Draft Climate Action Plan (CAP). The County of San Diego has led the region, state and nation in many critical areas, and this body of work highlights the County's continued leadership position. Thank you for allowing SDG&E to opine and highlight areas of support and collaboration. We look forward to continuing to work with you as the draft becomes a final plan. Please see below for our detailed comments related to the CAP.

Built Environment & Transportation

The transportation sector continues to be the largest contributor of GHGs in our region, which is why SDG&E is a proud partner in the Accelerate to Zero (A2Z) Emissions Collaborative, which has developed and is working to implement a Regional EV and Transportation Electrification Strategy. To demonstrate our commitment to this effort, our SDG&E teams continue to create innovative clean transportation programs to encourage and enable the transition to driving electric.

Through our "Power Your Drive" program, we have already installed over 3,500 chargers at 308 locations and are working towards our next goals of installing charging infrastructure to support approximately 3,000 medium- and heavy-duty EVs at 300 sites, and at or near apartments and condominium complexes at about 100 locations. The Governor's executive order requiring sales of all new passenger vehicles to be zero-emission by 2035 will further accelerate the transition to driving electric and makes current investments into EV charging infrastructure even more critical.

How SDG&E can support the County CAP's Built Environment & Transportation actions:

- Position SDG&E experts with County personnel to find solutions on how best to electrify County vehicles/fleets with both decarbonization and fiscal goals in mind.
- Share research and development information on efforts and programs such as "Vehicle to Grid" and "Vehicle to Everything" solutions.

O15-1

- Gather feedback from the County on priority locations for EV infrastructure investments.
- Provide recommendations on how the County can continue to streamline permitting for transportation electrification infrastructure.

Energy

SDG&E is committed to achieving net zero GHG emissions by 2045 and in 2022 we released [“The Path to Net Zero: A Decarbonization Roadmap for California”](#) to demonstrate how we plan to accomplish this goal. While other studies have been published on how to decarbonize California’s economy through electrification of sectors such as transportation and buildings, SDG&E’s study also incorporates for the first time the utility industry standard for reliability using industry-specific planning tools to chart what we believe to be an achievable approach.

The industry standard considers an electric system to be reliable if it experiences only one power outage every ten years due to the probability of energy demand exceeding supply. Some key takeaways and learnings for our region from the study are as follows:

- California is estimated to need to decarbonize at 4.5 times the pace over the past decade to reach its carbon neutrality goal and mitigate the negative impacts of climate change.
- Electric generation capacity is estimated to need to increase to about four times the capacity that existed in 2020, in order to support transportation and building electrification. Between 2020 and 2045, electric consumption is expected to increase by 96%.
- To keep electric service reliable, California will need to complement its growing portfolio of intermittent solar and wind generation with a mix of clean, firm and flexible resources that can be dispatched at any time to meet needs. Installing 40 GW of new battery storage, as well as 20 GW of dispatchable generation from 100% clean hydrogen combustion by 2045 is projected as necessary to meet this goal. According to the California Independent System Operator, the statewide grid has interconnected about 2,600 MW of energy storage as of January 2022, but no electric generation from 100% clean hydrogen combustion.
- It is estimated that by 2045, there will be demand for 6.5 million metric tons of clean hydrogen across the economy, 80% of which is projected to be used to enhance the reliability of the electric supply.
- The implementation of the Roadmap requires regulatory and political support from four fronts to: 1) prioritize electric sector reliability; 2) maintain affordability and enhance equity; 3) incentivize innovation and adaptability; 4) and enable the deployment of decarbonization infrastructure

O15-1
cont.

We understand the enormity of the task ahead, which is why we have already begun our transition. In 2023, SDG&E completed and activated the Fallbrook Battery Energy Storage Project that includes 40 MW or 160 MWh of battery energy storage for our local grid. Our Borrego Springs Green Hydrogen project will pilot hydrogen as long duration energy storage, which is a key aspect for grid reliability during the transition away from carbon intense fuel sources. Both facilities allow excess renewable energy, typically solar and wind, to be stored for use when needed by the grid later in the day. SDG&E has approximately 335 MW of utility-owned energy storage being commissioned or that is commercially operational. An additional ~48 MW are scheduled to come online in 2024, for a total of ~383 MW by year-end 2025.

How SDG&E can support the County CAP's Energy actions:

- Conduct workshops between SDG&E experts and County staff on Reach Codes to support electrification.
- Create working group between SDG&E and the County to determine the necessity of new customer programs or changes to existing programs.
- Provide feedback on the County's permitting processes to increase "electrification readiness" for commercial and residential customers/constituencies.
- Energy information sharing and updates on SDG&E's path to decarbonization, how it impacts County constituents and where there are opportunities for the County's accounts.
- Work with the County to identify priority locations for new energy storage projects, including through the California Public Utilities Commission (CPUC)'s Microgrid Incentive Program.

Agriculture & Conservation

In 2021, SDG&E began its "Sustainable Tree" program with the goal of providing or planting a combined total of 10,000 trees annually to support local biodiversity and promote environmental stewardship. Although this program is available to both residents and local governments throughout SDG&E's service territory, partnering with local governments can be more impactful because of their ability to identify beneficial locations for tree planting in urban areas under their jurisdiction. Our strong collaboration with the County allowed us to donate 2,000 trees for placement on County parks and land. By building partnerships such as these, SDG&E and the County can help each other reach our shared goals of increasing tree canopy and reducing GHGs throughout our region.

O15-1
cont.

How SDG&E can support the County CAP's Agriculture & Conservation actions:

- Work with Department of Parks and Recreation to identify tree species suitable for planting near SDG&E infrastructure.
- Provide expertise on the appropriate trees to County departments through our "Sustainable Tree" program.
- Partner with the County to promote SDG&E's "tree rebate" program for residents in underserved communities.

SDG&E's Sustainability Goals

We've built our business model on encouraging climate reducing technologies – and this body of work is demonstrated in SDG&E's first-ever company-wide sustainability strategy, [Building A Better Future: SDG&E's Commitment to Sustainability](#). Through this sustainability plan, we have developed a series of actionable and long-term goals aligned with California's ambitious climate agenda, some of which have been discussed above. The plan calls for regional cooperation and partnerships and will likely evolve over time to reflect stakeholder feedback, regulatory changes and technological breakthroughs. We have tried to build on our strengths, focusing on the areas of environmental stewardship, clean transportation, grid modernization, community engagement, and company operations to help support economy-wide carbon neutrality. The full report and subsequent strategy and progress updates are available at sdge.com/sustainability.

In closing, we recognize the urgency to address climate change and its impacts, and we fully support the County's clean energy goals and this CAP. Our desire is that the County and all jurisdictions will look to SDG&E as a dedicated partner in the implementation of our sustainability strategies. Collectively, we can work together on solutions that result in meaningful GHG reductions.

Best Regards,

Letter O15 San Diego Gas & Electric Company

Dallin Young, Public Affairs Manager
January 5, 2024

Comment O15-1

The comment provides background information about San Diego Gas & Electric Company (SDG&E) and expresses support for the CAP Update. The comment also provides information about how SDG&E supports the CAP Update measures.

Response O15-1

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Letter
O16

Friday, January 5, 2024

Ms. Meghan Kelly
County of San Diego PDS
5510 Overland Avenue, Suite 310
San Diego, CA 92123

RE: Comments on the San Diego County Climate Action Plan (CAP) and Draft Supplemental Environmental Impact Report (SEIR) (EIR # PDS2020-ER-20-00-002; SCH # 2020120204)

Dear Ms. Kelly:

Nolen Communities, LLC (Nolen) is pleased to provide the following comments on the County of San Diego's Climate Action Plan (CAP) and the CAP Draft Supplemental Environmental Impact Report (SEIR) (EIR # PDS2020-ER-20-00-002; SCH #2020120204).

Nolen appreciates the tremendous amount of work and time County staff and your consultant team has spent preparing the CAP and Draft SEIR. We understand the importance of a certified CAP, especially for General Plan compliant projects to proceed with a legally defensible, CEQA analysis. Nolen realizes the County is operating under court-imposed requirements – which Nolen has not been able to review – resulting from litigation over previous attempts to develop a compliant Climate Action Plan. And we recognize a certified CAP is an effective mechanism to provide certainty for privately-initiated land development projects to demonstrate a less than significant CEQA impact, while ensuring the public that the region's greenhouse gas emissions (CO₂e) profile will achieve state-mandated reductions. We support efforts to reduce CO₂e emissions and adopt a certified CAP.

Our comments are therefore focused on the County's multiple, ongoing planning and policy initiatives – several of which we have commented on previously. These include the Sustainable Land Use Framework/Development Feasibility Analysis (DFA), the Phase 2 VMT Mitigation Program (VMT Fee), the Inclusionary Housing Ordinance (IHO), Communities Benefits Agreements (CBA), and the 6th Cycle Housing Element Update (HEU) Implementation Plan. In short, Nolen believes the County's piecemeal approach to these cumulative efforts does not provide the public with a clear understanding of how the County will meet state-mandated requirements under the Regional Housing Needs Allocation (RHNA), rendering the Climate Action Plan, as well as other programs, plans policies and initiatives, flawed.

Rather than combining these efforts to ensure consistency, avoid piecemealing, and provide the public and stakeholders a cumulative understanding of how these connected programs relate, the County has insisted on separate schedules with separate scopes of work while promising they are being coordinated in the background. This approach is not in the public's interest; the County must publicly align these plans to ensure they are cumulatively analyzed based on reasonably foreseeable outcomes to understand how the County will legally achieve its RHNA obligation, as well as state-mandated greenhouse gas emissions reductions.

O16-1

A. CEQA PIECEMEAL CONCERNS

Preliminarily, our comments are intended highlight ongoing County processes and the potential for undisclosed cumulative impacts that could result from the many piecemeal efforts the County is currently considering. These efforts largely aim to achieve common goals – meeting housing production obligations in the midst of a state-wide housing crisis while achieving climate goals such as reducing CO₂e emissions and vehicle miles traveled, all while furthering the County's adopted, Smart Growth-informed General Plan and the Community Development Model embodied therein. However, without considering these together, the County risks frustrating achieving any of these goals.

As described above, the County is involved in multiple ongoing efforts that are interrelated and have reasonably foreseeable combined effects. These planning, program and policy initiatives are summarized below.

1. **Climate Action Plan (CAP)** – the subject of the current Draft SEIR, the CAP is a required mitigation measure (CC-1.2) of the County's 2011 General Plan Update Program EIR (SCH #2002111067). The underlying purpose of the CAP is to "reduce GHG emissions that could be generated by development under the General Plan, and to reduce those emissions consistent with state legislative requirements..." Along with the development of a certified CAP, the County is also proposing a CAP Checklist and an update to the County of San Diego Guidelines for Determining Significance that would provide a pathway for projects to demonstrate CEQA compliance through the adoption of a new threshold of significance. The practical effect of the CAP and new significance threshold is to provide a level of certainty regarding mitigation requirements for projects to demonstrate less-than-significant effects on greenhouse gas emissions, which theoretically will support the development of privately-initiated land development projects, specifically, General-Plan compliant projects. The CAP Checklist is likely to increase development costs of housing by imposing requirements that exceed existing building code mandates. Further, due to the County's underlying geography, without an effectively mitigation strategy for VMT impacts, such projects still face significant hurdles. The County's schedule is Fall 2024 to adopt the CAP, CAP Checklist and new Thresholds for Determining Significance.
2. **Sustainable Land Use Framework/Development Feasibility Analysis (DFA)** – the Board of Supervisors (Board) directed County staff to consider ways to reduce barriers to housing in four communities – Buena Creek, Spring Valley, Winter Gardens/South Lakeside, and Campo Road/Casa de Oro. As part of this effort, the County is preparing a Programmatic EIR to cover potential impacts related to increased density/intensity of development in these areas. The practical effect is intended to facilitate the conditions precedent to spur the production of housing in these communities; however, based on the existing conditions in most of these areas, including the fractured ownership, parcelization, and existing uses or other constraints, very few if any substantive development should be anticipated. Further, by creating a limited number of eligible properties for development, residual land values in these areas are likely to increase, raising project costs. Lastly, three of these communities are largely VMT inefficient and include very few, if any, viable housing/redevelopment sites under the County's 6th Cycle HEU. The County's schedule for this program is late 2024.

O16-2

3. **Phase 2 VMT Mitigation Program** – the County is considering a Vehicle Miles Traveled (VMT) Mitigation Fee program that would provide for a programmatic approach for reducing project’s transportation effects under SB743. The practical effect of the VMT Fee is to enable privately-initiated land-development projects to mitigate VMT impacts in portions of the unincorporated County where no other mitigation exists for exceeding the regional per capita average VMT; however, the preliminary estimates of \$10,000-\$19,000 per VMT would effectively serve as a “project killer” for most, if not all, such projects – even General Plan compliant projects. Nolen understands the schedule for this program is 2025.

4. **Housing Element Update Implementation Plan** – as part of the County’s 6th Cycle HEU, the County adopted a comprehensive suite of programs to implement the policies contained therein. The County committed to completed several of these programs within the first two years of the Planning Period (2021-2029); however, many of these remain incomplete or have yet to begin. Those programs include the following:
 - a. 3.1.1.B - *By-Right Approval for Projects with 20% Affordable Units*
 - b. 3.1.1.C - *Zoning Ordinance Amendments to Achieve Maximum Density*
 - c. 3.1.1.E - *Low to Moderate Inclusionary Ordinance*
 - d. 3.1.1.F - *Objective Design Standards*
 - e. 3.1.1.J - *Lot Consolidation*
 - f. 3.1.1.K - *Expand Eligibility of Checklist Exemptions*
 - g. 3.1.1.L - *Coordination and Outreach with Developers, Builders, and Owners*
 - h. 3.1.1.M - *Addressing VMT Constraints*
 - i. 3.1.1.N - *Small Lot Subdivision Program*
 - j. 3.1.1.O - *Feasibility Analysis and Expanded By-right Approval Program*
 - k. 3.1.3.A - *Zoning Ordinance Cleanups*

O16-2
cont.

In addition, the following “ongoing” programs remain in development or have not started to our knowledge.

- l. 3.1.1.D - *Diversity of Land Use Designation and Building Type*
- m. 3.2.2.A - *Expedited Permit Processing – Affordable Housing Projects*

The schedule for items (a) through (k) above was 2023; however, several if not the majority of these programs remain incomplete. The effect of these programs should be to facilitate the production of housing, including Affordable housing, by making the entitlement process more streamlined; however, until all these programs and initiatives have been implemented, they are not supporting the County’s effort to meet its RHNA obligations.

5. **Inclusionary Housing Ordinance (IHO)** – the County is considering a program that would mandate a minimum required obligation for new residential housing projects to set aside specific amounts of subsidized affordable housing for very-low, low- or moderate-income households. Such a program would provide for the development of subsidized affordable housing to meet the County's very-low-, low- and moderate-income housing goals under the RHNA and the County's 6th Cycle Housing Element. The practical effect of the IHO is to increase development costs for residential projects by requiring these projects set aside affordable housing or pay an in-lieu fee. The County's own fiscal analysis determined the costs of this program were greater than the benefits afforded under Density Bonus, thus, it is reasonably foreseeable that the IHO will reduce the feasibility of new home production.

In addition, the proposed IHO has an excessive number of permutations (up to 1,872) which leads to an unstable Project Description. It is our understanding the Economic Analysis prepared by AECOM to support the range of in-lieu fees under the IHO does NOT include any of the CAP Checklist requirements. We understand the County is preparing to bring the IHO forward for consideration in Spring 2024.

6. **Community Benefit Agreements** – the County is developing requirements for certain types of projects that require a statement of overriding considerations to provide "Community Benefits Agreements" (CBA). It is our understanding that such agreements are being "highly encouraged" by staff prior to any public hearing on commercial/utility scale renewable energy projects, but that any project required to prepare an EIR and adopt a Statement of Overriding Considerations may be subject to providing supplemental community benefits at the sole discretion of the Board of Supervisors. The practical effect of CBA's is to increase risk and costs for any project with significant and unavoidable impacts.

O16-2
cont.

Individually, these programs, policies, initiatives and plans are likely to change the existing setting and regulatory environment under which privately initiated development projects are proposed and processed. Collectively, it is nearly impossible to understand the many potential outcomes of these plans, programs, policies and initiatives. However, it is reasonably foreseeable that at least four of these programs (the CAP, VMT Fee, IHO and CBAs) will increase development costs and frustrate compliance with the County's RHNA obligations. They may increase costs and risks so significantly that they render development infeasible, forcing builders to move investment out of San Diego, further reducing the already limited housing stock in the County. Or they may conflict in such ways or cause so much uncertainty so as to further delay project processing schedules, which are already a major impediment towards housing production. What is certain is that, without a unified approach, the public is severely deprived of the opportunity to provide meaningful input and understand the cumulative environmental impacts of these programs due to the County's piecemeal approach. The Draft SEIR must be revised to consider these cumulative programs, policies and initiatives.

B. FAILURE TO ENSURE HOUSING ELEMENT AND RHNA COMPLIANCE

Nolen believes the County is incorrectly taking credit for a significant number of new homes as very-low-, low-, and moderate-income without deed restrictions. While such an approach may have sufficed under previous housing elements, we understand and believe that the County may only reasonably rely upon deed-restricted units to demonstrate compliance with the very-low, low-, and moderate-income obligations under the 6th Cycle Housing Element Update based on direction from the California Department of Housing and Community Development (HCD). Therefore, while the County's General Plan Annual Progress Reports purport to show the County is on track to comply with its RHNA obligations, we believe the County is falling far short of these requirements.

The County's General Plan – the foundation upon which the CAP is required and the CAP Draft Supplemental EIR relies – was amended in 2021 (GENERAL PLAN AMENDMENT: HOUSING, SAFETY, AND ENVIRONMENTAL JUSTICE ELEMENTS 20-002; 19-GPA-001; AND 17-GPA-004) when the Housing Element Update was certified, along with a new Environmental Justice element and a revised Safety Element. These General Plan Elements were prepared under addenda (PDS2021-ER-21-00-001 and PDS2021-ER-21-00-002) to the County's General Plan Update EIR. Under CEQA, this represents a change in the regulatory environment which the CAP Draft SEIR must analyze, regardless of when the CAP NOP was issued. However, the CAP Draft SEIR only analyzes the CAP's consistency with the new Environmental Justice Element and does not discuss the Housing Element Update (or Safety Element).

Because the CAP is reasonably foreseeable to increase development costs due to the requirements of the CAP Checklist, and because that cost information has not been provided, as explained below, the CAP could further frustrate compliance with the County's obligations under RHNA. Therefore, the CAP must demonstrate consistency with the RHNA and the following Housing Element policies:

H-1.1 Sites Inventory for Regional Housing Needs Assessment (RHNA). Maintain an inventory of residential sites that can accommodate the RHNA throughout the Housing Element planning period, tracking the no-net-loss of sites, pursuant to state law.

H-1.2 Development Intensity Relative to Permitted Density. Encourage a development intensity of at least 80 percent of the maximum permitted gross density for sites designated at 15 to 30 dwelling units per acre in development projects.

H-1.6 Land for All Housing Types Provided in Villages. Provide opportunities for a variety of housing types, including small-lot single-family, duplex, triplex, and other multi-family building types in Villages.

H-1.7 Mix of Residential Development Types in Villages. Support the design of large-scale residential developments (generally greater than 200 dwelling units) in Villages that include a range of housing types, lot sizes, and building sizes.

H-1.8 Variety of Lot Sizes in Large-Scale Residential Developments. Promote large-scale residential development in Semi-Rural areas that includes a range of lot sizes to improve housing choice.

H-2.1 Development that Respects Community Character. Require that development in existing residential neighborhoods be well designed so as not to degrade or detract from the character of surrounding development consistent with the Land Use Element. (See applicable community plan for possible relevant policies.)

O16-3

H-2.2 Projects with Open Space Amenities in Villages. Require new multi-family projects in Villages to be well-designed and include amenities and common open space areas that enhance overall quality of life

H-3.4 Housing for Moderate-Income Families in Villages. Facilitate the production of housing for moderate-income families in Villages by permitting developments that offer affordable housing to incorporate other compatible housing types within areas zoned for single-family residential development

GOAL H-5 Constraints on Housing Development. Governmental policies or regulations that do not unnecessarily constrain the development, improvement, or conservation of market-rate or affordable housing

H-5.4 Flexibility in Regulations. Modify regulations, as appropriate, to streamline regulatory processes, remove unnecessary obstacles to planned densities, and provide flexibility so that development can respond to the unique characteristics of town center areas

GOAL H-6 Delivery of Housing Services. An institutional framework that effectively delivers housing services and programs to implement the goals, policies, and programs of this Housing Element.

H-6.1 Coordinated Delivery of Programs. Coordinate delivery of housing programs and services among various County departments and regional organizations

O16-3
cont.

C. CONSISTENCY WITH PROJECT OBJECTIVES

The CAP Draft Supplemental EIR includes a Project Objective to:

- Accomplish the foregoing objectives in a manner that minimizes undue and unnecessary economic impacts on businesses and property owners, and that avoids regulatory takings under the federal and state constitutions. (emphasis added)

During an initial outreach meeting on November 2, 2023 the County stated that staff and their consultant team are working on a fiscal study analyzing the costs of the measures contained in the CAP. To date, this study and those costs have not been made available.

Without understanding the costs of the measures contained in the CAP, in particular those related to measures in the CAP Checklist for privately-initiated development projects, the County has not provided substantial evidence the project meets this Project Objective. It has not provided the public and stakeholders with a complete picture of the proposed project and confirmed that the project will "minimize undue and unnecessary economic impacts on business and property owners". The County must, at a minimum, extend the comment period until those the fiscal study is made available to provide the public an opportunity to exercise meaningful public review to ensure the Project Objectives are achieved. Even if the County later provides this information, and claims that the fiscal analysis provides substantial evidence that the CAP achieves this Project Objective, the County must provide for public review and accept comments based on that new information.

O16-4

D. CAP CHECKLIST MISSING SPECIFIC PERFORMANCE METRICS

The CAP Checklist includes no less than six measures which require the County to develop a program or ordinance to achieve claimed reductions. Those measures include (for privately-initiated development projects):

- (1) Electrifying Loading Docks,
- (2) Installing Electric Vehicle Charging Infrastructure,
- (4) Reducing Single Occupancy Vehicle Trips,
- (5) Electrifying Buildings and Appliances,
- (6) Increasing Renewable Energy and
- (7) Increasing Water Efficiency.

O16-5

While the County includes references to other Code requirements, notably compliance with existing, voluntary CALGreen measures, the CAP does not include specific performance metrics to ensure the County's future measures will achieve the same emissions reductions. The County should consider language to ensure that the minimum emissions reductions from these measures are achieved.

Thank you for the opportunity to share our feedback on the Climate Action Plan and Draft Supplemental EIR. We look forward to reviewing the County's responses to these comments and are available to review and discuss any questions these comments may raise.

Respectfully Submitted,

A handwritten signature in black ink, appearing to read "Sean Kilkenny", written over a horizontal line.

January 5, 2024

Comment O16-1

The comment is an introductory statement. The comment also states that the County must align the CAP Update with other County ongoing planning and policy initiatives to ensure consistency, avoid piecemealing, and provide the public and stakeholders a cumulative understanding of how the County's connected programs relate.

Response O16-1

The County appreciates the commenter's perspective regarding the need to align its plans and policy initiatives. The CAP Update has been prepared as mitigation for the GHG emissions associated with implementation of the General Plan. See Section 9.1.1.1, "Master Response: CAP Update Purpose and Land Use Change," for a description of the purpose of the CAP Update and its relationship to the General Plan and other County plans and initiatives intended to help reduce GHG emissions. Section 9.1.1.1 also includes a discussion about other programs that the County is developing and implementing to reduce VMT and, by extension, GHG emissions.

Comment O16-2

The comment expresses concern about CEQA piecemealing and advises the County to incorporate ongoing plans and initiatives that are interrelated into the CAP Update cumulative analysis.

Response O16-2

The proposed project for CEQA purposes is the CAP Update. As described in Response O16-1, and noted by the commenter, the CAP Update has been prepared as mitigation for the GHG impacts associated with General Plan implementation, as identified in the 2011 GPU PEIR. Because implementation of the CAP Update could result in environmental impacts associated with implementation of adopted Mitigation Measure CC-1.2 from the 2011 GPU PEIR, this SEIR has been prepared as a Supplemental EIR to the GPU PEIR. The other plans, programs, and policy initiatives summarized by the commenter are separate, complementary mechanisms the County is employing for guiding development in the unincorporated county. These plans and initiatives are not a part of the project considered in this SEIR, which is the CAP Update, and have independent utility. Simply because these programs, policies, initiatives, and plans are not considered part of a single "project" for CEQA purposes does not mean that the County cannot consider them collectively in an effort to promote sustainable development in the unincorporated county. Please see also Section 9.1.1.1, "Master Response: CAP Update Purpose and Land Use Change," for a description of the purpose of the CAP Update and its relationship to the General Plan. See also Sections 2.1 through 2.15 of this SEIR for a discussion of the cumulative impacts of CAP Update implementation in conjunction with other reasonably foreseeable programs.

Comment O16-3

The comment states that the CAP Update fails to comply with Housing Element and Regional Housing Needs Allocation (RHNA).

Response O16-3

As noted in Response O16-2 above, the CAP Update has been prepared in response to a requirement established by adopted 2011 GPU PEIR Mitigation Measure CC-1.2. See also Section 9.1.1.1, “Master Response: CAP Update Purpose and Land Use Change,” for a description of the purpose of the CAP Update and its relationship to the General Plan.

The CAP Update proposes no new development in the unincorporated county and would not directly limit the County’s ability to meet its RHNA obligations. To the contrary, having a CAP that qualifies as a qualified GHG reduction plan pursuant to CEQA Guidelines Section 15183.5 would serve to streamline the GHG analysis of projects consistent with the General Plan and, by extension, the County’s RHNA sites.

Regarding the commenter’s assertion that implementation of the CAP Update would increase development costs and therefore “frustrate” the County’s ability to meet its housing needs obligations, the County has prepared two additional reports regarding implementation costs in addition to the information on costs presented in the CAP Update. The first is the *Implementation Cost Analysis* that identifies the total costs to the County of San Diego to implement the CAP Update GHG reduction measures over the first 5 fiscal years (FYs) of implementation (FY2025/26 to FY2029/30). The *Implementation Cost Analysis* is available in Appendix 10 of the CAP Update. The second cost report, *The Cost Effectiveness and Disproportionate Cost Analysis*, evaluates the effectiveness of CAP Update actions from a cost-benefit perspective and to address equity in CAP Update implementation, examines how some populations and local communities may experience disproportionate costs or impacts from CAP Update implementation. This report will be available prior to CAP Update approval here: www.sandiegocounty.gov/content/sdc/sustainability/climateactionplan/seir.
Comment O16-4

The comment states that achievement of the project objective to achieve the other CAP objectives in a “manner that minimizes undue and unnecessary economic impacts on businesses and property owners” cannot be confirmed without the fiscal study. The comment requests the review period to be extended until the fiscal study is available for public review.

Response O16-4

Objectives are established as part of a CEQA project description. Objectives describe the underlying goals of the project and are used to develop and evaluate alternatives to the proposed project. CEQA does not require that the project provide evidence that it will achieve the established objectives and public disclosure and review of such evidence is not a necessary component of the CEQA process. Extension of the comment period for this SEIR is not required in response to this comment.

Importantly, initial programs would be incentive-based and voluntary. Future regulatory-based code updates would be required to demonstrate program-specific cost

effectiveness at the time of development as part of the approval process under the California Energy Commission for a local jurisdiction to adopt a reach code that goes beyond statewide standards. These programs would be brought to the Board as a separate discretionary action and would be subject to applicable noticing requirements at that time. The County anticipates that undue and unnecessary economic impacts on businesses and property owners would be minimized through this process.

Refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the reports the County has prepared to address the costs of implementing the CAP Update, including the estimated costs to residential and nonresidential development. As described in Section 9.1.1, two cost reports have been prepared in addition to the information on the relative cost of actions presented in the CAP Update. These include the Implementation Cost Analysis, which identifies the total costs to the County to implement the CAP Update GHG reduction measures over the first 5 fiscal years (FYs) of implementation (FY2025/26 to FY2029/30). The *Implementation Cost Analysis* is available in Appendix 10 of the CAP Update. The second cost report, *The Cost Effectiveness and Disproportionate Cost Analysis*, evaluates the effectiveness of CAP Update actions from a cost-benefit perspective and to address equity in CAP Update implementation, examines how some populations and local communities may experience disproportionate costs or impacts from CAP Update implementation. This report will be available prior to CAP Update approval here: www.sandiegocounty.gov/content/sdc/sustainability/climateactionplan/seir. The County developed these cost reports to inform its budget as part of the Operations Plan, which consists of a budget to be approved by the Board for the first year and a second year for operational planning. The County cannot reasonably allocate the entire amount of estimated funds for the County to implement the CAP Update in one year. The budget process is a public process where the commenter and others can provide input at the appropriate time. The CAP Update also identifies the following details for each action as part of the CAP Implementation and Monitoring Program (Table 13): the implementation enforcement mechanism, County department with lead and supporting responsibilities for implementation, relative cost (using a qualitative, ordinal ranking of low, medium, or high), and potential funding sources for implementation. The County will seek available funding sources each year to support implementation and will request funds from the Board during implementation that will, in part, be guided by these cost reports.

The CAP Update, therefore, provides the program-level evidence that the CAP can be implemented and achieve the stated project objectives in a manner that minimizes undue and unnecessary economic impacts on businesses and property owners. Fiscal analysis reports are not required to prepare a reasonable implementation plan for the CAP Update.

Comment O16-5

The comment asserts that the CAP Update “does not include specific performance metrics to ensure the County’s future measures will achieve the same emissions reductions” as the consistency requirements for privately initiated projects in the CAP Consistency Checklist and comments that the County should consider language to ensure that the minimum emissions reductions from these measures are achieved.

Response O16-5

The CAP Consistency Checklist identifies a set of CAP consistency requirements for privately initiated projects (Table 1). For each CAP consistency requirement, the supporting CAP measure and action are identified. Specific implementation metrics (referred to as “outcomes”) and estimated GHG emissions reduction potential for these CAP measures and actions are identified in Part 3 of the CAP Update (Table 7, pages 57–64). Projects that incorporate CAP consistency requirements will contribute to achieving the GHG emissions reduction potential and implementation outcomes identified in the CAP Update.

Re: Draft 2024 Climate Action Plan

Dear Climate Action Plan Team,

On behalf of the San Diego Regional Chamber of Commerce (Chamber), I am writing to outline the Chamber's positions on the County of San Diego's 2024 Draft Climate Action Plan (CAP). Thank you for your continued active engagement with stakeholders such as the Chamber as we work to make the San Diego Region the best place to live and work. We are particularly pleased with the thoughtful organization of workshops by Planning and Development Services (PDS) and look forward to continued collaboration.

The Chamber developed a review framework for climate action planning in Spring of 2023 that guides our support and potential opposition of such documents and policies. Our framework includes: general support of efforts to identify funding for creating incentive or trade-in programs, encouragement of collaborative efforts with private sector and industry expertise, the necessity that policies are only mandated when proven to be economically feasible, urging municipal exploration and demonstration before mandating these changes if there is no private sector demonstration, and requirement of a real cost-benefit analysis on the impacts to job creators and industry. Upon review, we found that many of these requests have been fulfilled by PDS within the draft and we thank you for this collaboration.

The Draft CAP, in many ways, parallels state-level benchmarks which will ease collaboration between the County, State, and other local jurisdictions. The Chamber generally supports alignment with state codes and guidance but would encourage caution about some of the voluntary measures allowed under the state code, since some of these are difficult to achieve for many in the business community. Specifically, the Chamber supports these specific goals, including supporting active transportation and transportation alternatives, increased building efficiency standards for County operations facilities, commitment to increased solid waste diversion including the increase of availability of sustainable solid waste facilities, in addition to the necessary increase stormwater collection, water pumping efficiency, and wastewater treatment.

The Chamber believes the following items are in alignment with our shared goals:

- T-2: Increase the use of low-carbon and zero-emission landscaping and off-road construction equipment in the unincorporated area.
- T-3: Install electric vehicle charging stations (where feasible and reasonable) and provide incentives for zero-emissions vehicles in the unincorporated area.
- T-6: Support increased transit availability to reduce single occupancy vehicle trips in the unincorporated area.
- E-1: Develop policies and programs to increase energy efficiency, renewable energy use, and electrification in County Operations
- E-3: Develop policies and programs to increase renewable energy use, generation, and storage in the unincorporated area.

O17-1

SW-1: Achieve zero waste in County operations.

SW-3: Improve waste management practices at County-owned solid waste facilities to reduce emissions.

SW-4: Improve waste management practices in the unincorporated area to reduce emissions and increase waste diversion.

W-1: Develop policies and programs to increase water efficiency, retention, recycling, and reuse to reduce potable water consumption in County operations.

W-3: Develop programs to increase stormwater and wastewater treatment efficiency to reduce imported potable water use in the unincorporated area.

A-2: Develop a tree planting program that expands canopy across the unincorporated area and prioritizes underserved communities.

O17-1
cont.

The Chamber would also suggest caution with the stated goal of electrification mandates for new construction. A recent 9th Circuit Court of Appeals decision, reaffirmed by the full circuit earlier this week, upholds the previous decision to deny the City of Berkeley's electrification ordinance. While the Chamber supports the reduction in use of GHG causing fuels, some natural gas is needed for many business operations, in addition to equipment to serve larger residential, commercial and industrial buildings. Between our life sciences companies, restaurant entrepreneurs and other business operators, including those creating jobs and generating taxes in the County unincorporated areas, it's important that any effort to increase electrification both be consistent with the law, as well as reasonable and feasible for business operations.

O17-2

Additionally, the County of San Diego outlines the urgency of the decarbonization of County buildings and operations over requirements for private homes and businesses, which the Chamber wholeheartedly supports. While embracing the ambitious goals set forth, we believe it is crucial to ensure a pragmatic and achievable approach that aligns with the economic realities faced by our local businesses. Therefore, it is necessary that the County commit to continued partnership with industry leaders and businesses throughout the implementation process upon adoption, including the development of implementation measures to ensure that they are practical, feasible and do not work at counter purposes with the goals that we share, including ensuring a balance of jobs and housing that can help reduce vehicle trips and GHG.

The Chamber is committed to continued engagement with the County on the Draft 2024 Climate Action Plan. Thank you for the opportunity to provide input. Should you have any questions, please do not hesitate to contact Lauren Cazares, Policy Advisor, at LCazares@sdchamber.org.

Sincerely,

Jerry Sanders
President & CEO
San Diego Regional Chamber of Commerce

Letter O17 San Diego Regional Chamber of Commerce

Jerry Sanders, President and CEO

January 5, 2024

Comment O17-1

The comment includes an introductory statement. The comment expresses support for the CAP Update and outlines the CAP Update measures that align with the Chamber's goals.

Response O17-1

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O17-2

The comment expresses concern about the electrification mandates for new construction and cited a recent Ninth Circuit Court of Appeals decision to deny the City of Berkeley's electrification ordinance. The comment also expresses support for the County's urgency of decarbonization of County buildings and operations.

Response O17-2

The County appreciates the support for the decarbonization of County buildings and operations. Refer to Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," explaining that the CAP Update has adequately identified measures and actions that would exceed the 2030 and 2045 GHG reduction targets and make substantial progress toward the aspirational goal of net zero emissions by 2045.

**Re: Sierra Club's Comments on the County of San Diego Climate Action Plan
and Supplemental Environmental Impact Report**

Dear Ms. Kelly:

On behalf of the San Diego Sierra Club Chapter, we provide the below comments on the County of San Diego's ("County") October 2023 Draft Climate Action Plan ("CAP") and Supplemental Environmental Impact Report ("SEIR").

We appreciate all of the staff who worked to draft the CAP and SEIR, which has certainly improved from the previous iteration. However, we were disappointed with the CAP and SEIR's continued legal deficiencies.

The Sierra Club hopes to avoid both further delay in implementation of the CAP and additional litigation regarding the environmental review performed on the CAP. The Sierra Club seeks good faith analysis and compliance with the Court of Appeal's opinion and CEQA. Unfortunately, the CAP and SEIR do not contain a good faith analysis of the smart growth alternatives. We detail these deficiencies and necessary revisions below, and request good faith responses and revisions to the CAP and SEIR.

I. The County's Analysis Is Inadequate Due to Its Repeated Contention that the CAP Is Not A Land Use Plan, A Claim Which the Court of Appeal Previously Rejected

The County continues to insist that the CAP cannot include any land use measures, despite the Court of Appeals' requirement that the County consider land use measures to curb GHG emissions. The County claims, "Because the CAP mitigates for the General Plan, **it cannot and does not make land use changes** (although some of those changes are analyzed as Alternatives and can be directed by the Board along with CAP approval)." (SEIR, p. 102, emphasis added.)

O18-2

O18-3

Kelly
January 5, 2024
Page 2

Regarding the Smart Growth Alternatives, the County further claims “these alternatives extend **beyond the scope of the CAP Update**, which is a program of measures and actions to address GHG emissions from development under the adopted General Plan and government operations.” (SEIR, p. 5-2, emphasis added.)

The County already tried this argument before the Court of Appeal, when “the County contend[ed] that implementing a smart-growth alternative would be inconsistent with project objectives, one of which is to reduce GHG emissions from buildout of the General Plan, not an amended General Plan. (*Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467, 548 (“Golden Door”).)

The Court was unpersuaded, noting “a smart growth alternative is consistent with achieving Project objectives.” (Id. at p. 107.) The Court explained:

Further, the GPU ‘includes specific goals and policies aimed at reducing GHG emissions including growing in a compact and efficient manner, using energy more efficiently, harnessing renewable energy to power buildings, improving waste recycling, and improving access to sustainable transportation.’ The CAP, which is based on buildout under the GPU, recognizes that ‘[g]iven that the largest source of emissions in the unincorporated county is the On-Road Transportation sector, the CAP proposes several measures . . . to reduce the number and length of vehicle trips.’ Thus, **there is no conflict** among (1) buildout under the GPU, (2) the CAP, and (3) an alternative that would encourage smart growth and associated reduced VMT.

O18-3
cont.

At oral argument, **the County also asserted that the CAP is ‘not a land use plan, but an emissions reduction plan’** and, therefore, project alternatives should also be focused on emission reduction, not land development as in a smart growth plan. This argument is untenable, however, because the County overstates the purported distinction between land use and GHG emissions. GHG emission reduction targeted by Assem. Bill No. 32 and other legislation is concerned with human activities contributing to climate change. To state the obvious, the amount of GHG emissions from agricultural land and open space will be vastly different if that same land contains 14,000 homes, roads, and infrastructure. Land use often drives GHG emission levels. Therefore, a smart growth land use alternative is reasonably related to GHG emission reduction.

(*Golden Door, supra*, 50 Cal.App.5th at 549, emphasis added.)

Yet, again the County claims that “**the CAP Update is not a land use plan**—it imposes measures and actions on the adopted General Plan land use plan.” (SEIR, p. 5-25, emphasis

Kelly
January 5, 2024
Page 3

added.) As discussed in Section VI, the County fails to conduct an adequate analysis of the smart growth alternative, partly based on this incorrect assertion. The SEIR claims it “**is speculative to consider the relative impacts of land use plans, for which the CAP Update does not control and are not the subject of the CAP Update.** ... Therefore, the potential for environmental effects would be substantially similar to the proposed CAP Update and these resources are not discussed in detail below.” (Ibid, emphasis added.)

The Court of Appeal already ruled that there “is no conflict” among the General Plan buildout, the CAP, and an alternative that would encourage smart growth and associated reduced VMT. Yet, the CAP continues to mislead the public and decisionmakers by making these very same claims.

Additionally, per policy guidelines from the San Diego County Board of Supervisors, the CAP Update should be “shaped by community input and center environmental justice.” (CAP, App’x 1, p. 1.) In an effort to comply with these guidelines, the County sought input from the public and key stakeholders. (*Id.*) Poll participants repeatedly emphasized the need for land use measures as a means to achieve a net-zero emissions future. (*See, e.g., id.* at pp. 49, 58.) Despite clear public interest in land use measures as emissions reduction mechanisms, the CAP Update remains entirely absent of *any* land use measure. In neglecting to incorporate such a measure, the CAP Update neglects to consider both the Court of Appeals’ *Golden Door* ruling and the community input received during the polling process.

O18-3
cont.

Many other local governments included land use measures within their CAPs, demonstrating that it is both sensible and feasible to do so, despite the County’s contention to the contrary. The Los Angeles County CAP includes a strategy to “Increase Densities and Diversity of Land Use Near Transit.” (LA CAP Draft, Mar. 2023, pp. 3-29–3-30.) The following implementing actions are all associated with this strategy: (1) “incentivize residential and community-serving uses to be developed in high quality transit areas,” (2) “develop land use tools that will increase the production of a diversity of housing types,” and (3) “develop community plans that will increase the percentage of residence who could live and work within the same community, and that could decrease VMT.” (*Id.*) The San Francisco City and County CAP contains an entire category of strategies dedicated to transportation and land use. (SF CAP, 2021, pp. 82–93.) One measure, TLU.6, specifically includes actions to (1) “facilitate the development of neighborhoods where people live within an easy walk or roll of their daily needs” by creating a City working group for planning and designing, (2) “examine rezoning to allow for multi-family housing,” and (3) “increase the types of home-based businesses allowed.” (*Id.* at 90.)

These examples rebut the CAP’s claims that it “cannot” include any measure that affect land use. The County offers no authority for the premise that a mitigation measure cannot effectuate VMT reductions through land use changes, especially where the SEIR is the forum to study potential

Kelly
January 5, 2024
Page 4

impacts. This is especially true given that the County plans to rely on the CAP as a GHG reduction plan under CEQA Guidelines Section 15183.5.

The CAP itself claims, “Housing location and type (e.g., detached single family housing, townhome, apartment, condominium) have a significant impact on reducing GHG emissions and creating complete communities... **CAP implementation will streamline housing production** in sustainable locations.” (CAP p. 11, emphasis added.) As discussed below, the claim that the General Plan promotes sustainable development is also not accurate.

Even further, the SEIR “incorporates by reference the prior alternatives analysis in the 2011 GPU PEIR, which are additional land use alternatives aimed at achieving smart growth”:

- The Hybrid Map Alternative that would increase the acreage of the rural land use designations;
- The Draft Land Use Map Alternative that would “result in significantly less acres of semi-rural residential and significantly more acres of rural lands designations” and “accommodate less growth and development in the unincorporated county;” and
- The Environmentally Superior Map Alternative that “is more aggressive in restricting growth in portions of the semi-rural residential and the rural lands designations.”

(SEIR, p. 5-32 to 5-33.)

The General Plan already studied reductions to its projected growth. The SEIR’s repeated claims that it simply cannot study and implement a Smart Growth Alternative – even General Plan edits or overlays – absent years of additional planning are incorrect and inaccurately preclude a Smart Growth Alternative from being identified as feasible.

The CAP and SEIR must be revised to accurately reflect the Court’s ruling, remove the above noted false allegations, and provide a revised analysis that does not rely on the improper assertion that the CAP cannot make changes to land use.

II. The CAP Should Incorporate Measures to Meaningfully Reduce VMT

The Court of Appeal emphasized the importance of smart growth and reduction of Vehicle Miles Traveled (VMT), noting that a majority of emissions in the unincorporated county come from the transportation sector. (*Golden Door, supra*, at 549.)

On-road transportation emissions still account for nearly half of all County-wide emissions—the “largest contributor of all GHG emissions in the CAP emissions inventory.” (CAP, p. 48.) Despite their outsized impact, the CAP makes a minimal effort to reduce VMT. The three CAP measures that reference VMT, none of which address the Court of Appeal’s findings related to

O18-3
cont.

O18-4

Kelly
January 5, 2024
Page 5

land-use based VMT reduction goals, collectively only account **for 4.36%** of the CAP's projected emission reductions.¹

A reduction in VMT around the County, tied to increased local proximity to jobs and services, would greatly reduce overall GHG emissions. The CAP would be much more effective at reducing VMT and related emissions if it *also* utilized land-use based measures, such as zoning overlays and measures prioritizing mixed-use development.

The SEIR offers General Plan Goal and Policy edits as project alternatives and identifies opportunities for enhancing smart growth principles within the General Plan. (SEIR, p. 5-31.) As an initial matter, Sierra Club supports the adoption of these edits, subject to the revisions that are detailed in the letter by Endangered Habitats League.

Only one suggested amendment focuses on VMT reductions directly. (SEIR, p. 5-36 [Policy LU-5.1].) The policy update would emphasize VMT reductions for new development, compensatory strategies for existing development, and increased reliance on electric vehicles where VMT cannot be reduced. (*Id.*) As EHL identified, there should not be a reliance on electric vehicles to reduce VMT.

Other potential policy amendments include: the imposition of requirements beyond those necessitated by CEQA for certain General Plan Amendments;² the consideration of zoning standards that prioritize mixed use development in viable areas;³ and the development of a program to retrofit existing buildings to reduce associated GHG emissions.⁴ Notably, these are merely *suggested* amendments, and the SEIR states any such amendments would require further CEQA review should the County elect to pursue this alternative. (SEIR, Oct. 2023, p. 5-32.)

Yet, the SEIR is exactly the forum for these amendments to be reviewed. Sierra Club further emphasizes that the identified General Plan edits are all feasible measures that should have been incorporated into the CAP.

Instead, the CAP continues to make inaccurate claims that undermine the identified potential edits, including that the CAP cannot incorporate these proposed edits. This runs contrary to the Court of Appeal's ruling. And it is especially not true for more limited changes, such as limits to future proposed upzoning beyond the General Plan land use designations in high VMT and high fire areas through General Plan Amendments.

⁴ Policy COS-15.7, SEIR, Oct. 2023, p. 5-42.

Kelly
January 5, 2024
Page 6

Los Angeles County recently enacted an amendment to its General Plan that prohibits new subdivisions in Very High Fire Hazard Severity Zones. The County utilized a Negative Declaration and was able to study and implement the GPA swiftly.⁵

Several of the amendments are feasible mitigation measures that should be included in the CAP now, not considered briefly and then deferred for potential further review. Of particular importance is the amendment focused on VMT reductions: VMT reduction is paramount to GHG emissions reductions overall, as noted by the Court of Appeals, and a substantive measure modeled off of the suggested amendment would significantly further the CAP's goals.

O18-4
cont.

Finally, the CAP's refusal to include meaningful VMT reductions conflicts with the State's 2022 Scoping Plan, which the CAP repeatedly references and utilizes. The 2022 Scoping Plan relies on "VMT per capita reduced **25% below 2019 levels by 2030**, and 30% below 2019 levels by 2045" to meet State targets. (CAP, Appendix 5, *County of San Diego CAP Update: GHG Reduction Targets and Gap Analysis*, p. 4.)

III. The SEIR Provides an Inaccurate Portrayal of Takings and SB 330 Limits

The SEIR seems particularly concerned about liability for regulatory takings related to restrictions on development, repeatedly noting that it intends to accomplish its objectives in a manner that avoids such takings. (*See, e.g.*, SEIR, p. 4, 1-4, 5-3, 5-6, & 5-37.) The SEIR implies that utilizing land use measures, such as zoning amendments, will result in liability for takings.

However, this concern is misplaced. A property owner does not have a general right to a certain density zoning on their property. (*Avco Community Developers, Inc. v. South Coast Regional Com.*, 17 Cal. 3d 785 (1976) [no vested right in existing or anticipated zoning]; *Consaul v. City of San Diego* (1992) 6 Cal.App.4th 1781, 1785; *Lakeview Dev. Corp. v. City of S. Lake Tahoe*, 915 F.2d 1290, 1295 (9th Cir.1990) ["it is well established that there is no federal Constitutional right to be free from changes in the land use laws," finding that even if the special use permit met the *Avco* vested rights requirements, the developer did not subsequently develop in time.]

O18-5

Rezoning based on the adoption of a general plan does not result in a taking, because diminution in market value alone does not amount to "damages" requiring compensation. (*HFH, Ltd. v. Superior Court* (1975) 15 Cal.3d 508, 516-18.)

The California Supreme Court explained:

Plaintiffs are apparently attempting to recover profits they might have earned if they had been successful in getting their land rezoned to permit subdivision into

⁵ L.A. Cnty. Dep't Reg'l Planning, *Hearing on the General Plan Safety Element Update* (Apr. 5, 2022), <https://file.lacounty.gov/SDSInter/bos/supdocs/167379.pdf>.

Kelly
January 5, 2024
Page 7

small residential lots, but landowners have no vested right in existing or anticipated zoning ordinances. (*Anderson v. City Council* [1964] 229 Cal.App.2d 79, 88-90.) A purchaser of land merely acquires a right to continue a use instituted before the enactment of a more restrictive zoning. Public entities are not bound to reimburse individuals for losses due to changes in zoning, for within the limits of the police power, some uncompensated hardships must be borne by individuals as the price of living in a modern enlightened and progressive community.' (*Metro Realty v. County of El Dorado* [1963] 222 Cal.App.2d 508. . .)" (247 Cal.App.2d at pp. 602-603; italics added.)

(*HFH, Ltd. v. Superior Court of Los Angeles County* (1975) 15 Cal.3d 508, 516.)

A regulatory taking occurs where a land use regulation goes too far, which is evaluated based on the economic impact of the regulation and the extent to which the regulation has interfered with the property owner's "investment-backed expectations" (*Penn Cent. Transp. Co. v. City of New York* (1978) 438 U.S. 104, 124), or "the owner of real property has been called upon to sacrifice all economically beneficial uses" of his property (*Lucas v. South Carolina Coastal Council* (1992) 505 U.S. 1003, 1019, emphasis added.)

Accordingly, liability would not arise for a taking from limits to future proposed General Plan Amendments or subdivisions, the proposal of zoning overlays, or other land use measures under the CAP, unless the zoning amendment stripped a property of *all* economic value.

The SEIR's new misplaced concerns are particularly problematic where the County appears poised to wield unfounded takings concerns to absolve itself from necessary actions. For example, the SEIR has now added the following project objective: "Accomplish the foregoing objectives in a manner that minimizes undue and unnecessary economic impacts on businesses and property owners, and that avoids regulatory takings under the federal and state constitutions." (SEIR, p. 5-3.)

The SEIR further proposes the following edit to an *existing* General Plan policy that seeks reductions in vehicle trips: "develop and implement strategies for providing economic compensation to private landowners where the County restricts or **limits** the amount of development pursuant to their existing General Plan and zoning designation in order to achieve greenhouse gas emissions reductions consistent with State law and County General Plan policy." (SEIR, p. 5-36 emphasis added.)

Yet, Property Owners have no vested interest in the current zoning, or a future approval of a subdivision, except to where the County completely deprives all economic use of the land or the owner meets the high standard set out in *Avco*. The County is well within its rights to revise or

O18-5
cont.

Kelly
January 5, 2024
Page 8

reduce allowable development through land use, especially to comply with State mandates related to high VMT and fire zones.

The Sierra Club is concerned that the new focus on “potential” takings indicates the County will avoid effectuating important and direly needed land use changes based on unfounded concerns. The Sierra Club urges the CAP to remove the overly vague and unfounded references to takings, or to provide additional detail to ensure an accurate representation of the concern.

The SEIR also states that Senate Bill 330 would “prevent the County from reducing residential capacity on a site zoned for housing without identifying replacement capacity” within the context of smart growth alternatives (SEIR, p. 5-22.) This is not an entirely accurate picture.

First, section 65300, subdivision (f)(4), states that “[t]his section shall not apply to a housing development project within a very high fire hazard severity zone.” Further, this limit is applied only to “affected counties.” Affected county is defined as “a census designated place, based on the 2013-2017 American Community Survey 5-year Estimates, that is wholly located within the boundaries of an urbanized area, as designated by the United States Census Bureau.” SB 330 further specifies that “The Department of Housing and Community Development shall determine those cities and counties in this state that are affected cities and affected counties.” (Gov. Code Section 66300(a)(2).)

O18-5
cont.

There are large portions of the County where the limitations do not apply, most of which are within the urban boundary and would not be proposed for downzoning. (See **Exhibit A** [highlights over San Diego County “affected counties”]). In fact, less than 20% of the County’s Census Designated Places (“CDPs”) are subject to SB 330.⁶

Thus, it is misleading to claim that SB 330 precludes any of the smart growth alternatives, especially the VMT and High Fire Zone Overlay alternative.

The County must revise the SEIR accordingly – especially the alternative analysis – including any analysis that relied on the premise that SB 330 applies to the entire County.

⁶ See maps of all CDPs: https://www2.census.gov/programs-surveys/economic-census/2012/reference-maps/st06_ca/ec2012-0500000us06073m-san-diego.pdf; https://www2.census.gov/geo/maps/dc10map/UaUC_RefMap/ua/ua78661_san_diego_ca/DC10_UA78661.pdf; County-wide CDPs include Vista, La Presa, Fallbrook, Winter Gardens, Lakeside, Rancho San Diego, Ramona, Casa de Oro-Mount Helix, Bostonia, Alpine, Bonita, Camp Pendleton South, Valley Center, San Diego Country Estates, Camp Pendleton North, Eucalyptus Hills, Jamul, Lake San Marcos, Bonsall, Harbison Canyon, Granite Hills, Hidden Meadows, Campo, Crest, Rancho Santa Fe, Rainbow, Borrego Springs, Fairbanks Ranch, Descanso, Pine Valley, Spring Valley, Julian, Potrero, Boulevard, Jacumba, Mount Laguna.

IV. References to the County’s Implicit Approval of Offsets Should Be Removed

A. Carbon Offsets are Problematic and Ineffective

Carbon offsets have long been criticized, both domestically and abroad, for their inefficiency and general inadequacy. In fact, the U.N. recently failed to establish rules governing a global carbon offset trading framework, because the deal was ultimately blocked by critical Member States who cited a lack of stringent standards and overreliance on discretionary decision making within the oversight body.⁷ These concerns highlight some of the preeminent issues with carbon offsets: they are often too lenient and generally unenforceable. Additionally, carbon offset programs displace indigenous people globally and encourage land grabs, resulting in harm well beyond the failure to adequately offset emissions.⁸ Carbon offsets are ineffective from an economic perspective too: those involved in the offset market could potentially lose billions of dollars given new science showing that the offsets have “no environmental worth and have become stranded assets.”⁹ This hit to the offset market came on the heels of scientific research indicating that the use of previously-purchased offsets could make global heating *worse* if actually used. (Ibid.)

O18-6

In another case, a team of researchers and economists found that nearly twenty large forest-based offset projects had produced “millions of carbon credits based on calculations that greatly inflated their conservation impact,” meaning the programs only fractionally offset their impact, if at all. (Ibid.) Carbon offsets are exceedingly difficult to calculate accurately, and this often results in the overestimation of the benefit derived.

In fact, research has demonstrated that over ninety percent of rainforest-based offset credits certified by the world’s largest certifier, Verra, are merely “phantom credits,” or those that result in *no* actual reduction in carbon emissions.¹⁰ Forest-based programs are uniquely positioned to

¹⁰ Patrick Greenfield, *Revealed: More than 90% of Rainforest Carbon Offsets by Biggest Certifier Are Worthless, Analysis Shows*, THE GUARDIAN (Jan. 18, 2023),

Kelly
January 5, 2024
Page 10

be ineffective, because they are increasingly vulnerable to wildfires and any fire would release all the carbon being stored and “offset.”¹¹ Carbon offset programs further require the assumption that the offset project protects a resource that would have otherwise been demolished without that protection.¹² However, even if you protect one natural area as an offset program, that does not prevent anyone from demolishing other natural areas nearby. (Ibid.) Organizations with the disposition to exploit the resource will simply turn their sights to another area to demolish instead, and the result is that nothing is actually being protected, let alone offset.

Given the unreliability of offset programs, the Commodity Futures Trading Commission has issued guidance for potential whistleblowers, who are asked to be on the lookout for manipulative trading, ghost credits, double counting of credits, fraudulent representations about the underlying credit, and manipulation of tokenized carbon markets.¹³ The use of carbon offset programs has an uncertain future given the increasing mistrust of the certification process, as well as the economic, environmental, and human rights concerns with the industry. Relying on such programs, particularly those that may allow for international offsets, results in minimal—and often incalculable—benefit and increases the risk of exacerbating the same harms the programs seek to offset.

O18-6
cont.

In a May 2019 Harvard Kennedy School Working Paper entitled “California Compliance Offsets: Problematic Protocols and Buyer Behavior,” the author analyzed California’s compliance offset market and questioned “whether carbon offset policy can guarantee the production of legitimate offsets—those that represent additional, permanent, enforceable, real, quantifiable, and verifiable greenhouse gas emissions reductions.”¹⁴

The paper analyzed four compliance offset protocols that have supplied more than 145 million offsets to the California Compliance Market and found that all four have the potential to generate illegitimate offsets. The analysis concluded that “US Forest Projects Protocol is both the most

Page 11

productive and most problematic; so far, it has produced more than 115.6 million illegitimate offsets, 79% of California's total compliance offset supply." (Ibid.)

Other analyses and researchers have further identified significant concerns with out-of-jurisdiction carbon offsetting.¹⁵

Finally, in June 2019, the University of California San Diego and Scripps Institute of Oceanography prepared a white paper entitled "Carbon Offsets in San Diego County: An Analysis of Carbon Offset Policy Effectiveness, Best Practices, and Local Viability in the San Diego County Region" (hereinafter, "Carbon Offsets in San Diego County").¹⁶ This paper identified many of the problems with out-of-jurisdiction carbon offsets.

O18-6
cont.

B. The CAP & SEIR Should Not Express Approval of the Use of Offsets

The Court of Appeal took issue with the County's previous attempt to create a framework for offsets, noting that there were no objective standards to determine whether "offsets originating in foreign countries were permanent, verifiable, enforceable, and additional." (*Golden Door* 2020, *supra*, at 521.) Further, the County's original framework for its offset program allowed a "project applicant to offset 100 percent of its GHG emissions through offset projects originating outside of California." (*Id.* at 562.) This framework, M-GHG-1, was intended to mitigate GHG emissions related to General Plan Amendment (GPA) projects. (*Id.* at 495.) In response to these critiques, the County removed the offset program from the newest drafts of both the SEIR and the CAP.

O18-7

However, the CAP unnecessarily and vaguely allows for individual GPAs to utilize offset measures without addressing the issues raised by the Court of Appeal. The SEIR states: "projects can still use carbon offsets if appropriate." (SEIR, Oct. 2023, p. 5-8.)

There have been GPA projects since the *Golden Door* ruling that still proceeded to propose offsets that violate CEQA, similar to M-GHG-1. Thus, this will be an ongoing issue.

¹⁶ <https://escholarship.org/uc/item/2t48k6m7>.

Kelly
January 5, 2024
Page 12

Given the major concerns with carbon offsets, made even more clear by the recent studies and investigations referenced above, the CAP should not indicate an approval of the use of carbon offsets for GPAs without studying and establishing appropriate protocols, including the concerns detailed in *Golden Door*.

The SEIR later strikes down the no project alternative as infeasible on the grounds that “impacts would be assessed on a project-by-project basis, without the CAP Update in place, it may be more difficult for the County to achieve compliance and could result in inconsistencies with legislative requirements.” (SEIR, Oct. 2023, p. 5-11.) It remains unclear why the County is hesitant to assess impacts on a project-by-project basis in this context, but is willing to allow GPAs to proceed with their own individual impact analyses and offset programs without providing guidelines. Surely, allowing individual projects to create their own project-by-project offset programs will result in the same inconsistencies the County is trying to avoid.

O18-7
cont.

As detailed in Sierra Club’s December 28, 2023 comment letter on the CAP, the County should not continue to approve GPAs in high VMT areas with significant GHG impacts. However, should the County choose to consider a GPA, it must require carbon neutrality to preclude undermining its CAP. Therefore, the CAP must require carbon neutrality for any GPA projects. Further, if the CAP and County plan to allow for GPAs to use off-site GHG mitigation, the County must establish appropriate protocols, and ensure the any off-site GHG mitigation occurs within the County through a County administered in-County GHG mitigation program.

C. The Use of Non-Local Offsets Risks an Adverse Ruling

In 2018, the County removed the word “local” from General Plan Goal COS-20 and replaced it with “community-wide (i.e., unincorporated County) and County.” (Golden Door Properties LLC v. County of San Diego, No. 37-2018-00013324-CU-TT-CTL (Cal.Super. Dec. 24, 2018), at 12 [hereinafter Golden Door 2018].) The trial court noted that this change maintained the spirit of local reductions, because it still emphasized that such reductions would occur within the County. (Id.)

O18-8

The court then concluded that M-GHG-1 and any efforts to outsource offsets were inconsistent with the County’s General Plan. (Id.) Because it already found M-GHG-1 to be noncompliant with CEQA, the Court of Appeal declined to reach a decision on whether GPAs’ authorization of out-of-County offsets would be inconsistent with the General Plan. (*Golden Door*, supra at 503.) The Court of Appeal’s finding that the CAP as a whole did not violate the General Plan did not address this issue.

Because the Court of Appeal did not rule on the issue, it remains legally unsettled whether GPAs may utilize non-County offsets to mitigate the emissions from individual projects. However, the language from the trial court was very clear: the General Plan emphasizes local, county-based

Kelly

reductions. (*Golden Door 2018*, supra at 12.) Diverging from that priority is inconsistent with the trial court's guidance and risks an adverse ruling.

O18-8
cont.

V. The CAP Fails to Provide a Cumulative Impacts Analysis that Complies with the Court of Appeal Ruling

As noted earlier, the SEIR still indicates an approval of the use of offset measures for GPAs, without directly addressing the concerns raised by *Golden Door*. Further, the CAP does little to limit GPAs, fully mitigate GHG emissions from GPAs, or even identify future measures that GPAs must adhere to – carbon neutrality, among other measures – to prevent contravention of the CAP's targets.

The Court ordered an analysis of potentially significant cumulative impacts from GPAs.¹⁷ The Court of Appeal found:

Here, the 21 in-process GPAs, if constructed, would collectively add nearly 14,000 dwelling units in the unincorporated County. The EIRs for just five of these disclose they will collectively produce 139,485 MTCO₂e in construction-related GHG emissions alone. However, the SEIR does not analyze these cumulative impacts— except by stating that in-process GPAs will mitigate to zero above the CAP under M-GHG-1 if a potential cumulative impact is insignificant, the lead agency is not required to conduct "a full cumulative impacts analysis," but must **explain the basis for the finding of insignificance**. (SF Baykeeper, supra, 242 Cal.App.4th at p. 222.)

O18-9

(*Golden Door*, supra, 50 Cal.App.5th at 529-530, emphasis added.)

Yet, the CAP SEIR concludes:

Operation of the in-process GPAs would result in mobile-source GHG emissions associated with vehicle trips to and from the project sites (i.e., project-generated VMT), landscaping equipment, electricity consumption, water consumption, and the generation of wastewater and solid waste. The in-process GPAs would be subject to CEQA review. During the CEQA review process, **potential impacts would be identified, and mitigation measures would be developed** to minimize or avoid potential impacts to the extent feasible. Given the nature of the in-

¹⁷ Notably, the CAP simply assumes those GPAs are now part of the inventory, on the grounds that they were approved before the CAP analysis, without providing evidence why that means the GPAs are thus included in the inventory, as the CAP's inventory relied on SANDAG projections that did not include those GPAs.

Kelly

Page 14

process GPAs ... **it is likely that impacts would be reduced to a less-than-significant level through implementation of measures, such as utilizing alternative fueled equipment and vehicles**, utilizing advanced engine controls equipment, and replacing natural gas infrastructure with electricity. Therefore, the CAP Update, in combination with the in-process GPAs, **would not result in a cumulatively considerable contribution** to an existing cumulative impact related to GHG emissions that may have a significant impact on the environment. The cumulative impact would be less than significant.”

O18-9
cont.

(SEIR, p. 4-25, emphasis added.)

The SEIR offers no evidence to support this conclusion, much less substantial evidence.

Rather, as detailed in this letter, the evidence shows the GPAs result in substantial and significant GHG emissions that derail the CAP’s objectives. The SEIR must disclose that GPAs result in significant impacts to GHG emissions and incorporate measures to mitigate this impact.

VI. The CAP Offers a Conclusory and Inaccurate Alternatives Analysis

Sierra Club challenged the previous CAP for its failure to include a Smart Growth Alternative. The Court of Appeal found that “a project alternative based on reducing GHG emissions by implementing smart growth policies affecting GPAs is broadly consistent with CAP objectives.”

The CAP presents smart growth alternatives, which it claims complies with the court rulings and writ of mandate. Yet, instead of providing a good faith alternatives analysis, the CAP provides several straw man alternatives, and simultaneously undermines these alternatives based on unfounded claims.¹⁸

O18-10

The CAP downplays the potential VMT reductions from the smart growth alternatives, claiming, “Note, however, that the efficacy of alternatives focused on incentives and disincentives for future development is limited because most forecast VMT in the unincorporated county is associated with existing development.” (SEIR, p. 5-19.)

Sierra Club worked extensively with the County to develop the “Fire Safe and VMT Efficient Alternative.” The SEIR concludes that the Fire Safe and VMT Efficient Alternative is not efficient because the vast majority of future year VMT in the unincorporated areas “would be attributed to existing land uses.” (SEIR p. 5-25 to 5-26). This is misleading. First, the VMT reductions associated with this alternative are likely higher, as the SEIR only assumed *half* the

¹⁸ Further, the CAP erroneously included the Village Support Areas Alternative as a “Smart Growth Alternative” which Sierra Club strenuously objects to.

Kelly
January 5, 2024
Page 15

County’s growth would occur in the designated smart growth areas, whereas in contrast, the SEIR assumed that “all unincorporated County household growth” would occur in the Villages and Village Support Areas Alternative. (County of San Diego Climate Action Plan SEIR VMT Assessment, p. 1.)

Regardless, even assuming the SEIR’s calculations are correct, the SEIR concludes:

If implemented, this alternative is anticipated to reduce VMT for new development by 6.6 percent in 2035 and 3.0 percent in 2050. However, when viewed in conjunction with existing development, the magnitude of overall VMT reduction is relatively small because the vast majority of unincorporated county VMT under future year alternatives can be attributed to existing land uses. Overall, the Fire Safe and VMT Efficient Alternative would result in a 0.53 percent reduction in unincorporated county VMT for 2035 and a 0.41 percent reduction in unincorporated county VMT for 2050... Therefore, this alternative **is not expected to meaningfully reduce VMT** or GHG emissions in the unincorporated county.

(SEIR, p. 5-26 to 5-27.) The SEIR claims this is negligible. Yet, the County’s own consultants also disagree with this conclusion. Fehr & Peers concluded, “The Fire Safe and VMT Efficient alternative results in a 0.53% reduction in unincorporated County VMT for 2035 and a 0.41% reduction in unincorporated County VMT for 2050.... These changes **appear very small; however**, it is important to consider that in the base year (2016) the unincorporated County already generates approximately 8.8 million VMT.” (p. 11.)

Fehr & Peer again underscored that these percentages are impactful changes in calculating VMT from the CAP’s list of in-process GPAs: “The General Plan Amendments scenario results in a 0.84% increase in unincorporated County VMT for 2035 and a 0.76% increase in unincorporated County VMT for 2050.” Noting that while these changes “**appear very small**,” Fehr & Peers underscored that these few GPAs result in a 10.3% increase in VMT growth from new development. (*County of San Diego In-Process General Plan Amendments VMT Assessment*, pp. 4-5.)

A review of the projected VMT increases from proposed County projects in VMT inefficient areas shows that the CAP’s finding that the “this alternative is not expected to meaningfully reduce VMT” is flawed.¹⁹

O18-10
cont.

¹⁹ Further, the Harmony Grove Village South is listed as one of the GPA In-Process Projects. (SEIR, p. 4-43.) The Attorney General specifically warned as amicus curie in *Golden Door* that Harmony Grove Village South “will increase VMT by 11.5 million miles annually.” (*Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467, 539.)

Kelly
January 5, 2024
Page 16

The Preserve at Riverbend, a proposed GPA that will place 1,330 units along Pala Road, is listed in the CAP. (p. 4-43.) This project will add 19,126 average daily trips to a rural area that is **220%** of the regional average VMT.²⁰ The approval of one GPA project eradicates a substantial amount of time and resources spent under the CAP.

(SANDAG SB 743 Screening Map, Proposed Project circled in red.)

O18-10
cont.

Altogether, the pending GPAs would add nearly 28 million VMT/year. (SEIR, Appendix 2.) The total projected GHG Emissions from In-Process GPAs result in an increase in 37,310 MTCO₂e annually. (SEIR, p. 4-44.) This **more than wipes out the CAP's entire projected emission reductions** from the three VMT-related CAP measures.

Another previously approved County GPA project reported its operational emissions would result in an addition of **536,019 metric tons** to the County's GHG inventory over its lifespan.²¹ In contrast, the CAP aims to achieve 740,914 metric tons of GHG reductions by 2030. One single GPA Project in a VMT inefficient area can eliminate almost 75% of the CAP's targeted GHG reductions.

The County cannot rely on the fact it has already high VMT to claim that the Smart Growth Alternatives will not ensure lower GHG reductions. Nor can that condone digging the hole deeper. To do so is misleading, fails to prevent an accurate analysis of the alternatives, and precludes selection of the Fire Safe and VMT Efficient Alternative or Sustainable Communities Strategy Alternative ("SCS") as the true environmentally superior alternative.

Page 17

11

We take this opportunity to note that the General Plan allows for development of up to an additional 60,000 units. The CAP inventory utilizes DS39, which projects development of one-third of these units – 20,000 – which it substantiates with market reports. If the CAP utilizes lower growth projections (DS 39), and compares the Smart Growth Alternatives against DS39, rather than against the General Plan allowed growth (that does not take into account GPAs, which amounted to 14,000 units at the time of the last CAP), **then the CAP must place limits on the number of units that can utilize the CAP for streamlining and must require a CAP update when the number of units (General Plan consistent and GPAs) surpass its projections.**

O18-11

We request the CAP correct the other below misleading claims and revise the analysis accordingly.

- The SEIR notes the removal of the Road User Charge for the SCS Alternative, concluding that “this scenario does not represent reasonably foreseeable land use, transportation policy/network, and VMT under the County’s adopted General Plan.” (SEIR, p.5-31.)

SANDAG’s Amendment to the 2021 Regional Plan reported that the removal of the Road User Charge will only “result in an approximately **2 percent increase in VMT** for horizon years 2035 and 2050 compared to what was estimated for the approved Plan.”²²

O18-12

The SEIR’s appendix admits that the SCS Alternative would result in a **-95.0% change in VMT growth** for new development. (Climate Action Plan SEIR VMT Assessment, p. 11.)

Please update the SEIR Alternatives Analysis discussion to reflect that the SCS Alternative is feasible. While the Board of Supervisors does not have to select this alternative, the SEIR cannot preclude its selection by claiming it is not feasible.

- The SEIR claims that Village Support Areas will result in VMT reductions, including more VMT reductions than the VMT and Fire Alternative. (p. 5-28.)

O18-13

- 13 It is unclear how the SEIR found that the Village Support Areas result in VMT reductions. The Alpine Community Plan Update admitted that increasing density in Alpine, which is one of the

²² <https://www.sandag.org/-/media/SANDAG/Documents/PDF/regional-plan/2021-regional-plan/amendment-to-2021-regional-plan/seir-amendment-2021-regional-plan-section-5-cumulative-impact-analysis.pdf>

Kelly
January 5, 2024
Page 18

	General Plan “villages,” will increase emissions beyond the 2030 General Plan by 35,454 MTCO ₂ . ²³ Please explain this discrepancy.	
13 cont	<p>The Village Support Areas would propose densification of areas even outside of the County’s designated “villages,” and includes unequivocally high VMT areas like Jacumba, Julian, Pauma, Ramona, and Lake Morena. (SEIR, p. 5-69.) The Village Support Area must be removed as a Smart Growth Alternative. Otherwise, the CAP misleads the public and decisionmakers.</p> <ul style="list-style-type: none"> • The CAP claims that limits on GPAs is not feasible because the County cannot prohibit future Board of Supervisors from revising or amending the General Plan. (SEIR, p. 5-7.) 	O18-13 cont.
14	<p>This is only true to the extent that the County is prevented from revising the policy in the future. The Los Angeles County Board of Supervisors recently voted to approve a general plan amendment which would prohibit new subdivisions in Very High Fire Hazard Severity Zones, unless the subdivision would be surrounded by pre-existing development.²⁴ Thus, the County can certainly place limits on GPAs, especially where they present real risks to the community.</p> <ul style="list-style-type: none"> • The CAP claims that the General Plan itself is “smart growth” (SEIR p. 5-19.)²⁵ 	O18-14
15	<p>While the General Plan included some positive principles, especially for its time over ten years ago, this claim runs counter to the Senate Bill 743 screening maps, which demonstrate that the General Plan currently allows land uses and densification in areas that are not VMT efficient. (Exhibit B [SANDAG SB 743 Maps].) The SANDAG Sustainable Communities Strategy (“SCS”) underscores this as well, as the SCS focuses growth in far different areas from the General Plan.²⁶</p> <p>In fact, the CAP admits that several areas of the County feature “remote travel destinations and few areas served by public transportation particularly in semi-rural and rural communities.” (p.</p>	O18-15

²³https://www.sandiegocounty.gov/content/dam/sdc/pds/ceqa/AlpineCommunityPlanUpdate/DS_EIR/2.6_Greenhouse%20Gases.pdf, p. 2.6-25.

²⁴ L.A. Cnty. Dep’t Reg’l Planning, *Hearing on the General Plan Safety Element Update* (Apr. 5, 2022), <https://file.lacounty.gov/SDSInter/bos/supdocs/167379.pdf>.

²⁵ Similarly, it is misleading for the CAP to claim that focusing growth in the County’s “rural villages” will reduce GHG emissions. (CAP, p. 11.) This is only true in the villages on the very western edge of the County, that are considered VMT efficient.

²⁶ <https://www.sandag.org/-/media/SANDAG/Documents/PDF/regional-plan/sustainable-growth-and-development/2021-regional-plan-appendix-f-2021-12-01.pdf>, p. F-18.

Kelly
January 5, 2024
Page 19

48.) Thus, designated rural “villages” in themselves are not necessarily sustainable areas to increase development.²⁷

O18-15
cont.

VII. The CAP’s Measures Fail to Demonstrate The Plan Will Achieve the Reduction Targets

While Sierra Club applauds several of the CAP’s targets and measures, it is concerned with the aspirational nature of the CAP. Sierra Club urges the CAP to incorporate further details to demonstrate that the proposed programs are feasible, and will actually deliver the promised GHG reductions.

A. The CAP Requires an Implementation Plan Containing Feasible Measures with Mandatory Performance Standards

Measures are aspirational and not enforceable where they do not actually amount to meaningful requirements with set benchmarks for compliance. Many of the measures in the San Diego CAP merely require “promotion,” “evaluation,” or “support,” without identifying objective or mandatory metrics.

O18-16

Some examples of transportation measures that lack enforceable standards, include T-1.1a, T-1.1b, T-3.1a, T-3.1b, T-3.1c. Some examples of transportation measures that lack sufficient detail to ensure feasibility include T-2.1[EV program] and T-3.1 [program].

Please incorporate more details for deferred plans to enact programs, and incorporate objective targets.

The CAP should require the hiring of a full time CAP coordinator, to ensure accountability, as well as consistent and timely implementation of the CAP. The cities of San Diego, Chula Vista, Carlsbad, Encinitas, and Del Mar maintain full-time staff dedicated to CAP implementation and related efforts.

At this juncture, it also does not appear that the County has dedicated funding to the CAP. (See CAP, p. 116.) The County must at least require a certain percentage from its budget be dedicated to CAP implementation while it seeks additional State and federal funding. If zero funding has

²⁷ The County’s own AECOM Housing Projects Report demonstrates that several of the rural village have a very low ratio of jobs per housing unit. (Report, p. 33 [“Table 19: Jobs/Housing Unit Ratio by CPA: 2010-2020”], p. 36 [Table 21: Final Employment Growth Estimate and Jobs/Housing Unit Ratio by CPA: 2020-2050].) Therefore, most people will be commuting to the City of San Diego for work.

Kelly
January 5, 2024
Page 20

been secured or committed to the CAP, it is dubious whether the CAP's various measures and programs are feasible.

Finally, the CAP's measures must be additional. Measures are "additional" where they exceed preexisting obligations imposed either at the State level or regional level (i.e., programs a County has already agreed to undertake). Numerous CAP measures appear to require the City to implement preexisting plans or programs: A-2.2, A-3.1, T-1.1, T-5.1, E-1.1, W-1.1, W-2.4. Please explain how these measures are additional.

The CAP is a mitigation measure for the County's General Plan. An agency must implement promised mitigation measures, and where it fails to do so the public may enforce the mitigation measure under CEQA. (*Sierra Club v. County of San Diego* (2014) 231 Cal.App.4th 1152, 1166.) "Mitigating conditions are not mere expressions of hope." (*Lincoln Place Tenants Assn. v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1508). Mitigation measures must be fully enforceable to ensure that they "will actually be implemented as a condition of development, and not merely adopted and then neglected or disregarded."

CEQA Guidelines Section 15183.5 establishes the required criteria for tiering and streamlining the analysis of GHG emissions. Of particular relevance, Section 15183.5 instructs that qualified plans should:

- (D) Specify measures or a group of measures, **including performance standards, that substantial evidence demonstrates**, if implemented on a project-by-project basis, would collectively achieve the specified emissions level; and
- (E) Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels.

(Section 15183.5, subd. (b)(1)(D)-(E), emphasis added.)

The Natural Resources Agency adopted CEQA Guidelines Section 15183.5 to address concerns that agencies preparing CAPs might "erroneously rely on a plan with purely aspirational intent to determine that a later project's cumulative impact is less than significant pursuant to section 15064(h)(3)." (**Exhibit C**, [Natural Resources Agency Final Statement of Reasons for Amendments to CEQA Guidelines]). The Natural Resources Agency noted the criteria in Section 15183.5(b)(1) are intended to ensure CAPs avoid or substantially lessen a cumulative problem as required by Section 15064(h)(3), stating "Criteria (D) and (E) **are necessary** to demonstrate that the plan **will actually avoid** or substantially lessen the cumulative effects of those emissions."

The State has underscored the importance of the emission reduction measures, explaining: "The heart of a CAP is the suite of reduction measures that will ensure that the plan achieves the

O18-16
cont.

Kelly
January 5, 2024
Page 21

selected reduction targets in a transparent and replicable manner.”²⁸

Further, *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal. App. 4th 70 provides guidance on the level of detail needed in a GHG reduction plan. The Court of Appeal found a city’s GHG reduction plan inadequate given its reliance on mitigation measures that are “nonexclusive, undefined, untested and of unknown efficacy.” (Id. at 93). The Court found that to be adequate, the plan should include measures that are “known to be feasible,” “coupled with specific and mandatory performance standards.” (Id. at 94, emphasis added).

O18-16
cont.

B. The CAP Must Strengthen Its Consistency Checklist

The CAP will apply a “Consistency Checklist” to all projects seeking to rely on the CAP’s GHG analysis and mitigation. General Plan consistent projects will no longer need to independently analyze their GHG emission impacts. The CAP Consistency Checklist requires major revisions.

Several of the requirements are contingent on future Board actions in many years, far too off into the future. (CAP, p. 597.)

Of only nine requirements for privately-initiated projects, two are not yet effective and will not be effective until at least five years from now. For example, the requirement to reduce single occupancy vehicle trips (Item #4) will not be effective IF and until the TDM ordinance has been implemented.

O18-17

The TDM ordinance does not need to be implemented until 2028. (CAP p. 597). In the meantime, several projects will be approved with any individual GHG mitigation. The Checklist states: “This requirement does not apply to projects unless the TDM Ordinance has been adopted and has gone into effect.”

Further, another requirement (Item #1) that projects electrify their loading docks also fails to be effective until the County amends an ordinance. The ordinance does not need to be amended until 2030. (CAP, Appendix 8.) The Checklist likewise states: “This requirement does not apply to projects unless the Code of Regulatory Ordinances has been amended and the amendments have gone into effect.”

For Item #8, “Increase Tree Preservation,” the Checklist merely states: “If the County’s program to preserve native trees is in effect, the project must comply.

²⁸ https://opr.ca.gov/docs/OPR_C8_final.pdf, p. 229.

Kelly
January 5, 2024
Page 22

Item #9, “Increase Tree Planting,” only requires adherence to an *existing* ordinance, and only applies to single family residential uses: “Single family residential: The project must comply with the tree planting requirements of the County’s Landscaping Ordinance.”

The remaining items essentially only require adherence to Tier 2 standards of the CAL Green Code.²⁹ The Checklist, in its current form, represents an incredible missed opportunity for the County to ensure meaningful on-site GHG mitigation.

Thus, the CAP Consistency Checklist requires the following revisions:

- Require more individual level actions of projects, including suggestions in the Sierra Club letter on the Notice of Preparation and on the Draft CAP.
 - Parking de-coupling.
 - Transit, carpool, and vanpool subsidies.
 - Prohibitions or limits on natural gas fireplaces and hearths.
 - Clustering design that reduces VMT and preserves habitat.
 - Provision of on-site mixed uses that reduce the need to drive, where appropriate.
 - Provision of bicycle storage lockers, racks, or other bicycle storage facilities for residents/employees.
 - Placement of conservation or agricultural easements at a 2:1 ratio where a Project results in conversion of natural habitat or agricultural lands.
 - Measures to reduce GHG emissions from heavy-construction equipment.
 - Prohibit gas-powered landscaping equipment.
- Require a financial contribution from projects in high VMT areas to provide funding for the CAP’s measures.
- Move up the timelines for implementation of the programs and ordinances, require intermediary actions or fees to prevent contravention of the CAP’s targets, or incorporate the high level requirements from the ordinances now.

O18-17
cont.

²⁹ For County-initiated projects, the applicant must only meet three criteria, all which are vague. One merely requires that the applicant “incorporate applicable measures” from the County’s Water Plan. (CAP p. 601). Another requires electric/zero-emission vehicles and equipment for construction, but provides no minimum for how *many* of the vehicles/pieces of equipment need to be electric. (CAP p. 600).

Kelly
January 5, 2024
Page 23

VIII. Conclusion

On behalf of Sierra Club, we sincerely hope that the County will incorporate the above described comments to ensure a legally adequate CAP and SEIR.

Thank you very much for your time and consideration.

Sincerely,

Kathryn Pettit
Josh Chatten-Brown
Isabella Coye

**CALIFORNIA NATURAL RESOURCES AGENCY
FINAL STATEMENT OF REASONS FOR REGULATORY ACTION**

December 2009

INTRODUCTION

The California Natural Resources Agency ("the Resources Agency") has adopted certain amendments and additions to certain guidelines implementing the California Environmental Quality Act (Public Resources Code section 21000 *et seq.*) ("CEQA"). Specifically, these amendments implement the Legislature's directive in Public Resources Code section 21083.05 (enacted as part of SB97 (Chapter 185, Statutes 2007)). That section directs the Resources Agency to "certify and adopt guidelines prepared and developed by the Office of Planning and Research" "for the mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions[.]" (Pub. Resources Code, § 21083.05(a)-(b).)

CEQA generally requires public agencies to review the environmental impacts of proposed projects, and, if those impacts may be significant, to consider feasible alternatives and mitigation measures that would substantially reduce significant adverse environmental effects. Section 21083 of the Public Resources Code requires the adoption of guidelines to provide public agencies and members of the public with guidance about the procedures and criteria for implementing CEQA. The guidelines required by section 21083 of the Public Resources Code are promulgated in the California Code of Regulations, title 14, sections 15000-15387 (the "Guidelines" or "State CEQA Guidelines"). Public agencies, project proponents, and third parties who wish to enforce the requirements of CEQA, rely on the Guidelines to provide a comprehensive guide on compliance with CEQA. Subdivision (f) of section 21083 requires the Resources Agency, in consultation with the Office of Planning and Research ("OPR"), to certify, adopt and amend the Guidelines at least once every two years.

Section 21083.05, as noted above, requires the promulgation of Guidelines specifically addressing analysis and mitigation of the effects of greenhouse gas emissions. The Resources Agency has adopted the following changes to the Guidelines ("Amendments") to implement that directive:

Add sections: 15064.4, 15183.5 and 15364.5.

Amend sections: 15064, 15064.7, 15065, 15086, 15093, 15125, 15126.2, 15126.4, 15130, 15150, 15183, Appendix F and Appendix G.

In addition to guidelines implementing SB97, some of the amendments listed above are non-substantive corrections.

The Resources Agency considered reasonable alternatives to the Amendments. The Resources Agency has determined that no reasonable alternative would be more effective in carrying out the purpose for which the action is proposed or would be as effective as, and less burdensome to affected private persons than, the Amendments. This conclusion is based on the Resources Agency's determination that the Amendments are necessary to implement the Legislature's directive in SB97 and to update the Guidelines to reflect recent case law. Thus, the Amendments add no additional substantive requirements; rather, the Guidelines merely assist lead agencies in complying with CEQA's existing requirements. The Resources Agency rejected the no action alternative because it would not respond to the Legislature's directive in SB97. There are no alternatives available that would lessen any adverse impacts on small businesses, as any impacts are due to existing requirements of CEQA and not the Amendments.

The Resources Agency also initially determined that the Amendments would not have a significant adverse economic impact on business. The Resources Agency has determined that this action would have no impacts on project proponents. However, the Resources Agency is aware that certain of the statutory changes enacted by the Legislature and judicial decisions, described in greater detail below, that are reflected in the Amendments could have an economic impact on project proponents, including businesses. Among other things, project proponents could incur additional costs in assisting lead agencies to comply with CEQA's requirement for analysis of greenhouse gas emissions. However, the Amendments to the Guidelines merely reflect these legislative and judicial requirements, and the Resources Agency knows of no less costly alternative. The Amendments clarify and update the Guidelines to be consistent with legislative enactments that have modified CEQA, and recent case law interpreting it, but does not impose any new requirements. Therefore, the Amendments would not have a significant, adverse economic impact on business.

Some comments were submitted during the public comment period and during the public hearings on the Proposed Amendments suggesting that the adverse economic impacts could result. For example, some suggested that the addition of forestry resources to the Appendix G checklist may increase the regulatory burden on the agricultural industry. Others suggested that application of the Guidelines to renewable energy projects or those implementing AB32 may be counterproductive. Despite those suggestions, no evidence was presented to the Resources Agency supporting those claims. Moreover, those comments did not provide any rationale challenging the Resources Agency's position that the Proposed Amendments implement existing requirements. Therefore, having considered all of the comments submitted on the Proposed Amendments, the Resources Agency concludes that its initial determination that the proposed action will not have a significant adverse economic impact remains correct.

The Amendments do not duplicate or conflict with any federal statutes or regulations. CEQA is similar in some respects to the National Environmental Policy Act ("NEPA"), 42 U.S.C. sections 4321-4343. Federal agencies are subject to NEPA, which

requires environmental review of federal actions. State and local agencies are subject to CEQA, which requires environmental review before state and local agencies may approve or decide to undertake discretionary actions and projects in California. Although both NEPA and CEQA require an analysis of environmental impacts, the substantive and procedural requirements of the two statutes differ. Most significantly, CEQA requirements for feasible mitigation of environmental impacts exceed NEPA's mitigation provisions. A state or local agency must complete a CEQA review even for those projects for which NEPA review is also applicable, although Guidelines sections 15220-15229 allow state, local and federal agencies to coordinate review when projects are subject to both CEQA and NEPA. Because state and local agencies are subject to CEQA unless exemptions apply, and because CEQA and NEPA are not identical, guidelines for CEQA are necessary to interpret and make specific provisions of SB97 and do not duplicate the Code of Federal Regulations.

FINAL STATEMENT OF REASONS

The Administrative Procedure Act requires that an agency prepare a final statement of reasons supporting its proposed regulation. The final statement of reasons updates the information contained in the initial statement of reasons, contains final determinations as to the economic impact of the regulations, and provides summaries and responses to all comments regarding the proposed action. The initial statement of reasons, as updated and revised, are contained in full in this final statement of reasons. The summaries and responses to comments are included in the Natural Resources Agency's file of this rulemaking proceeding.

Below is a brief background on the science relating to the effects of greenhouse gas emissions, as well as the various initiatives that California is implementing to reduce those emissions. Following that background, OPR's public engagement process and the Natural Resources Agency's rulemaking process is briefly described. Next, this Final Statement of Reasons explains the purpose and necessity of each proposed change to the Guidelines. Finally, Thematic Responses, addressing the major themes that were raised in public comments, are provided.

BACKGROUND ON THE EFFECTS OF GREENHOUSE GAS EMISSIONS AND CALIFORNIA'S EFFORTS TO REDUCE THOSE EMISSIONS

This section provides a brief background on the potential effects of greenhouse gas emissions and California's efforts to reduce those emissions.

What Are Greenhouse Gases?

Certain gases in Earth's atmosphere naturally trap solar energy to maintain global average temperatures within a range suitable for terrestrial life. Those gases – which primarily include carbon dioxide, methane, nitrous oxide, hydrofluorocarbons,

Pages Intentionally Omitted

SECTION 15183.5. TIERING AND STREAMLINING THE ANALYSIS OF GREENHOUSE GAS EMISSIONS

Specific Purposes of the Amendment

In adopting SB375, the Legislature found that "[n]ew provisions of CEQA should be enacted so that the statute encourages ... local governments to make land use decisions that will help the state achieve its climate goals under AB 32[.]" (Statutes 2008, Ch. 728, § 1(f).) ARB's Scoping Plan similarly recognizes the important role that local governments play in reducing the State's GHG emissions. (ARB, Scoping Plan, at p. 26.) In particular, local government "[d]ecisions on how land is used will have large impacts on the GHG emissions that will result from the transportation, housing, industry, forestry, water, agriculture, electricity, and natural gas sectors." (*Ibid.*) Decision-making on urban growth and land use planning begins with local general plans. (Gov. Code, § 65030.1 ("The Legislature ... finds that decisions involving the future growth of the state, most of which are made and will continue to be made at the local level, should be guided by an effective planning process, including the local general plan, and should proceed within the framework of officially approved statewide goals and policies directed to land use, population growth and distribution, development, open space, resource preservation and utilization, air and water quality, and other related physical, social and economic development factors").)

GHG emissions may be best analyzed and mitigated at a programmatic level. "For local government lead agencies, adoption of general plan policies and certification of general plan EIRs that analyze broad jurisdiction-wide impacts of GHG emissions can be part of an effective strategy for addressing cumulative impacts and for streamlining later project-specific CEQA reviews." (OPR, Technical Advisory: CEQA and Climate Change: Addressing Climate Change Through California Environmental Quality Act (CEQA) Review, June 19, 2008, at p. 8.) Other lead agencies may also address GHG emissions programmatically in long range development plans, facilities master plans, and other long-range planning documents.

This emphasis on long-range planning is consistent with state policy expressed in CEQA. The Legislature has clearly stated its preference that lead agencies tier environmental documents wherever feasible. (Pub. Resources Code, § 21093(b).) Specifically:

The Legislature finds and declares that tiering of environmental impact reports will promote construction of needed housing and other development projects by (1) streamlining regulatory procedures, (2) avoiding repetitive discussions of the same issues in successive environmental impact reports, and (3) ensuring that environmental impact reports prepared for later projects which are consistent with a previously approved policy, plan, program, or ordinance concentrate upon environmental effects which may be mitigated or avoided in connection with the decision on each later project. The Legislature further finds and

declares that tiering is appropriate when it helps a public agency to focus upon the issues ripe for decision at each level of environmental review and in order to exclude duplicative analysis of environmental effects examined in previous environmental impact reports.

(Pub. Resources Code, § 21093(a).) The Amendments, therefore, include the addition of a new section 15183.5 to address both tiering and streamlining of GHG analyses, as well as the proper use of GHG reduction plans in CEQA analyses. Explanation of the rationale of each new subdivision is provided below.

Existing Methods of Streamlining and Tiering

Because GHG emissions raise a cumulative concern, analysis of such emissions in a long-range planning document lends itself to tiering and use in later project-specific environmental review. (Pub. Resources Code, § 21093.) The Legislature has created several tiering and streamlining methods, reflected in various provisions of the existing State CEQA Guidelines, that can reduce duplication in the analysis of GHG emissions. Subdivision (a) clarifies that existing provisions in the State CEQA Guidelines regarding tiering and streamlining may be applied to the analysis of GHG emissions.

Greenhouse Gas Emissions Reduction Plans

Many jurisdictions are beginning to address GHG emissions reductions in "climate action plans" and "gas emissions reduction plans." (OPR, Book of Lists, at pp. 92-100; see also, Scoping Plan, Appendix C, at p. C-49.) ARB's Scoping Plan specifically encourages local governments to develop such plans, and has created a local government operations protocol to assist in that effort. (Scoping Plan, at p. 26.) A community-wide emissions protocol is also under development.

Some comments raised during OPR's public involvement process expressed concern that due to a lack of legislative criteria for such plans, existing provisions in the CEQA Guidelines regarding cumulative impacts may be misused. (See, e.g., Letter from Center for Biological Diversity, et al., to OPR, February 2, 2009, at p. 2.) For example, without specific guidance, a lead agency could erroneously rely on a plan with purely aspirational intent to determine that a later project's cumulative impact is less than significant pursuant to section 15064(h)(3). The proposed subdivision (b) provides criteria to assist lead agencies in determining whether an existing greenhouse gas reduction plan is an appropriate document to use in a cumulative impacts analysis under CEQA.

The existing CEQA Guidelines allow lead agencies to rely on plans for cumulative analysis where the plan has been adopted in a public review process and contains specific requirements to avoid or substantially lessen a cumulative problem. (State CEQA Guidelines, § 15064(h)(3).) The criteria set out in proposed subdivision (b)(1) are designed to ensure that a greenhouse gas reduction plan would satisfy the

requirements described in sections 15064(h)(3) and 15130(d), for the reasons described below.

Criteria (A) and (C) are necessary to define the scope of GHG emissions within the defined geographic area and the incremental contribution of activities that will occur within that area to those emissions. (State CEQA Guidelines, § 15064(h)(3) (plan addresses cumulative impacts "within the geographic area in which the project is located").) Criterion (B) establishes a benchmark to assist the lead agency in determining whether the plan provisions will avoid or substantially lessen cumulative effects of the area's GHG emissions. (*Ibid.* (plan "provides specific requirements that will avoid or substantially lessen the cumulative problem").) Criteria (D) and (E) are necessary to demonstrate that the plan will actually avoid or substantially lessen the cumulative effects of those emissions. (*Ibid.*) Finally, criterion (F) reflects the requirement in sections 15064(h)(3) and 15130(d) that the plan be adopted through a public review process, as well as case law requiring that mitigation plans themselves undergo environmental review. (*California Native Plant Society v. County of El Dorado* (2009) 170 Cal. App. 4th 1026, 1053 (mitigation "programs may offer the best solution to environmental planning challenges, by providing some certainty to developers while adequately protecting the environment" but "in order to provide a lawful substitute for the 'traditional' method of mitigating CEQA impacts, that is, a project-by-project analysis, the fee program must be evaluated under CEQA").) Notably, the criteria provided in subdivision (b) are largely consistent with the elements that ARB recommends be included in a greenhouse gas reduction plan. (ARB, Scoping Plan, Appendix C, at p. C-49.)

Subdivision (b)(2) describes the uses and limitations of plans for the reduction of greenhouse gas emissions in a cumulative impacts analysis for later projects. Specifically, it provides a safeguard to ensure that the later activity was actually addressed in the plan for the reduction of greenhouse gas emissions, and that any applicable requirements of the plan are incorporated into the later project. This requirement is similar the requirement in case law that a lead agency determine that a particular threshold appropriately addresses the impact of concern. (*Protect the Historic Amador Waterways, supra*, 116 Cal.App.4th at 1109 ("in preparing an EIR, the agency must consider and resolve every fair argument that can be made about the possible significant environmental effects of a project, irrespective of whether an established threshold of significance has been met with respect to any given effect").) Finally, subdivision (b)(2) makes specific the requirement that, while the existence of an applicable plan for the reduction of greenhouse gas emissions may create a presumption that compliance with that plan will reduce the incremental contribution of later activities to a less than cumulatively considerable level, the existence of substantial evidence supporting a fair argument to the contrary may still require preparation of an EIR.

Special Situations

Letter O18 Chatten-Brown Law Group on behalf of Sierra Club

Kathryn Pettit, Josh Chatten-Brown, and Isabella Coye
January 5, 2024

Comment O18-1

The comment consists of the email transmittal of the formal letter that follows. No comments on the scope or content of the Draft SEIR are provided.

Response O18-1

The comment serves as an opening remark and does not raise significant environmental issues related to the Draft SEIR, and no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O18-2

The comment introduces the detailed comments submitted by the Chatten-Brown Law Group on behalf of the San Diego Sierra Club Chapter. The comment establishes that “Sierra Club hopes to avoid both further delay in implementation of the CAP and additional litigation.” The comment states that “the CAP and SEIR do not contain a good faith analysis of the smart growth alternatives.”

Response O18-2

As demonstrated in the responses provided below (specifically Responses O18-5, O18-10, O18-12, O18-13, O18-14, and O18-15), the Draft SEIR provides an accurate and honest analysis of smart growth alternatives developed through robust stakeholder outreach that complies with the Court of Appeal’s decision and CEQA. Both the Draft SEIR and these responses to comments have been prepared in good faith. Please see Section 9.1.1.2, Master Response: Evaluation of Smart Growth Alternatives in This SEIR for an explanation of the approach to the development and analysis of the smart growth alternatives.

Comment O18-3

The comment asserts that the Draft SEIR analysis is “inadequate due to its repeated contention that the CAP Update is not a land use plan.” The comment states that the Court of Appeal rejected this claim.

Response O18-3

The comment offers several arguments to support the contention that the CAP Update should include modification of the land use map in the adopted General Plan. These topics are addressed below.

Relationship to the Adopted General Plan

In describing the inconsistencies between the Court of Appeal’s decision and the County’s approach, the commenter interchanges terms that are not synonymous and, in the County’s opinion, misinterprets the direction provided by the Court of Appeal. “Land use measures” are understood to refer to measures in the CAP Update (which would be supported by a series of actions) that would recommend changes in land use patterns,

the implementation of which would necessarily occur through changes in the adopted 2011 General Plan land use map. Such measures are permissible in a CAP, consistent with what has been done in other jurisdictions, as noted by the commenter. However, actual “land use changes,” by contrast, would result in changes to the land use map in the adopted 2011 General Plan that alter the allowed uses and/or permitted densities within the unincorporated county and the assumptions upon which subsequent planning decisions are based. By extension, while the County does not disagree that measures proposing changes in the distribution of land use are permissible in a CAP, the proposed CAP Update does not include any quantified land use measures or actions because they are not needed to achieve the established targets. Additionally, changing the 2011 General Plan, which is being mitigated by this CAP Update, would change the underlying project being studied in the SEIR (which obstructs the stable project description required by CEQA needed for public participation and sufficient analysis). Please see also Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” regarding the methodology for development of the CAP Update GHG reduction targets and the measures and actions to achieve these targets.

Thus, although the County acknowledges the relationship between land use and GHG emissions, the CAP Update is not a land use plan. As articulated in the Draft SEIR, large-scale changes to the land use designations in the adopted 2011 General Plan would require substantial additional study, public outreach, and coordination to understand and balance the ramifications of those changes. Changes of this magnitude are better suited to a comprehensive planning process, which considers the balance of General Plan principles including housing needs, economic, social and health factors, environmental outcomes, community services, and infrastructure, not as part of the CAP Update in which the sole goal is to reduce GHG emissions as required by General Plan Policy COS-20.1 and GPU PEIR Mitigation Measure CC-1.2. The County believes that instituting land use changes through the CAP Update, which is intended to mitigate the GHG impacts of implementation of the General Plan, would not be a good faith application of its discretion because doing so would circumvent the General Plan update process, including associated community outreach. Changes to the County’s fundamental planning document require efforts that go beyond the scope of developing a GHG reduction program, which is intended to mitigate the effects of GHG emissions from the General Plan. See Section 9.1.1.1, “Master Response: CAP Update Purpose and Land Use Change,” for further discussion of this relationship.

Smart Growth Alternatives

The Court of Appeal did find, as noted in the comment, that the evaluation of smart growth alternatives could be consistent with the project objectives and would offer an informative means of comparing land use map configurations that could reduce GHG emissions through VMT reductions. The County agrees and has provided an analysis of each smart growth alternative’s consistency with the project objectives and, as required by CEQA, an evaluation of the impacts of these alternatives in comparison to the adopted land use map, which would not change with implementation of the proposed project. In compliance with the Appellate Decision, and in acknowledgement of the relationship of land use and GHG emissions, the Draft SEIR includes analysis of four smart growth alternatives with

the potential to reduce VMT and associated GHG emissions. The evaluation compares implementation of the smart growth alternatives and CAP Update with implementation of the Adopted General Plan and CAP Update.

Implementation of the smart growth alternatives extends beyond the scope of the CAP Update because it requires planning actions to modify the underlying land use context in addition to implementing the proposed CAP measures and actions. The evaluation of relative environmental impacts from implementing the smart growth alternatives appropriately focuses on those resource areas germane to evaluation of the CAP Update. The Draft SEIR also explains that potential impacts to environmental resources, such as aesthetics and agriculture, from implementation of smart growth alternatives would need to be assessed under subsequent CEQA analysis addressing amendments to the land use plan for the General Plan.

Public Comments

While all public comments cannot be explicitly incorporated into the CAP Update, the CAP Update was developed through extensive outreach, as described in CAP Update Chapter 2, “Community Engagement and Outreach.” Equitable stakeholder engagement has guided the CAP Update process to produce a community-informed CAP that reduces GHG emissions. The CAP Update process followed the parameters set by the Board in developing the CAP. The County is not obligated to entertain or include public input that is outside the project at hand.

Separately, the development of alternatives was also shaped and informed by public participation and outreach, including numerous meetings to develop the CAP Update and smart growth alternatives with Sierra Club and others. As described in Section 5.5.1.1, “Summary of Outreach Related to Smart Growth Alternatives,” the County considered all input on potential land use strategies and developed a reasonable range of smart growth alternatives for evaluation in this SEIR (Draft SEIR page 5-22). Two of these smart growth alternatives, the Fire Safe and VMT Efficient Alternative and the Sustainable Communities Strategy Alternative, were recommended for inclusion by petitioners, for which Sierra Club was heavily involved.

Precedent in Other CAPs

As noted above, and discussed by the commenter, other local government CAPs have elected to include “land use measures” as part of their overall strategy to reduce GHG emissions. However, the County does not interpret the function of the measures in the same way as the commenter. In the examples provided by the commenter, these land use measures do not account for GHG emissions reductions that result from new changes to land use that would result from CAP implementation. The City and County of San Francisco CAP does not appear to include any GHG reductions from land use measures in the GHG reduction calculations and Appendix B of the LA County CAP notes “The 2045 CAP does not result in any new changes to land use or transportation infrastructure than what was already analyzed in these existing plans and their CEQA documents” (see page B-18). As articulated throughout this SEIR, the CAP Update similarly acknowledges the

role that land use changes could have in GHG reduction but does not assume GHG reductions from these separate programs.

Summary

The County does not deny the important connection between land use and GHG emissions, nor does it claim that measures recommending land use changes cannot be included in a CAP. Furthermore, the Draft SEIR does not claim that smart growth alternatives cannot be studied. Pursuant to the Appellate Decision, such alternatives are included in Chapter 5 of the Draft SEIR. This discussion does not indicate that the smart growth alternatives are infeasible due to the need for additional planning. In fact, the discussion identifies five well-considered tools that could be used to implement the alternatives and a detailed discussion of the subsequent process. Zoning overlays were identified as the main means of implementation due to the relative ease and quickness with which the County could adopt them. Refer to Section 9.1.1.2, “Master Response: Evaluation of Smart Growth Alternatives in This SEIR,” for a further discussion of smart growth alternative identification and evaluation.

The CAP Update and Draft SEIR accurately reflect the Appellate Decision and do not include any false allegations. No revisions have been made to either document in response to this comment.

Comment O18-4

The comment addresses GHG emissions in the built environment and transportation sector of the CAP Update and asserts that the CAP would be more effective at reducing VMT and related emissions if it included land use–based measures. The comment also recommends that the County adopt the General Plan Goal and Policy Edits proposed in the alternatives analysis with the changes detailed in the letter submitted by the Endangered Habitats League. The comment further claims that these edits should have been incorporated into the CAP Update rather than being considered briefly and deferred for potential further review.

Response O18-4

As explained in Chapter 5, “Alternatives,” of this SEIR, although the majority of GHG emissions are a result of VMT, the majority of the forecast emissions are associated with existing development—not future growth. As a result, changing land use and development patterns has a limited influence on projected GHG emissions. Please see Response O18-3 regarding the lack of inclusion of land use measures in the CAP Update. See also Section 9.1.1.2, “Master Response: Evaluation of Smart Growth Alternatives in This SEIR,” regarding the need for and approach to analyzing smart growth alternatives in this SEIR that address mechanisms for reducing VMT, and by extension GHG emissions, through land uses changes, and Response O14-10 for a list of CAP Update actions that reduce GHG emissions by reducing VMT.

Comment O18-5

The comment indicates that the SEIR overemphasizes the potential for takings and conflict with SB 330 that could arise from the adoption and implementation of the

alternatives evaluated in Section 5.5, “Smart Growth Alternatives,” of the Draft SEIR. The comment cites case law related to adoption of a general plan to emphasize that changes to zoning and land use designations may not result in legal “taking” if all economic value is not stripped from the property. The comment identifies several locations in the Draft SEIR that mention regulatory takings and compensation, including project objectives and description of smart growth alternatives, and suggests that the County has misrepresented legal considerations to “absolve itself from necessary actions.”

Response O18-5

The CAP Update and SEIR were prepared by the County’s Department of Planning & Development Services in alignment with its adopted mission statement to “balance community, economic, and environmental interests to ensure the highest quality of life for the public of San Diego County.” The County established a suite of seven objectives for the CAP Update. Six of these objectives relate to specific GHG reduction targets, goals, metrics, and implementation; General Plan consistency; and environmental justice and equity. The final objective is to “accomplish the foregoing objectives in a manner that minimizes undue and unnecessary economic impacts on businesses and property owners, and that avoids regulatory takings under the federal and state constitutions.” The County has the discretion to determine objectives for the CAP Update. An objective that avoids regulatory takings is a natural extension of the Board’s direction to prepare a legally defensible CAP and the County’s obligation to balance community interests. Furthermore, as explained in Section 1.2, “Project Objectives,” of the Draft SEIR, “Alternatives are developed so they can potentially meet most project objectives while reducing significant effects” (Draft SEIR page 1-3). The County could, therefore, carry forward an alternative that does not meet a project objective if justified by reductions in significant impacts on the environment that would result from the project as proposed.

The comment cites five pages in the Draft SEIR as examples of the County “repeatedly noting that it intends to accomplish its objectives in a manner that avoids such takings.” The cited pages are the repeated list of the project objectives in the “Summary” (page 4), “Project Description” (page 1-4), and “Alternatives” (page 5-3) chapters. The other two mentions of the notion of takings are in providing reasons for rejection of the “Prohibition on Growth in Unincorporated County Alternative” in Section 5.3, “Alternatives Considered but Rejected,” (page 5-6) and in Policy LU-5.6, which provides a policy to develop a mechanism to avoid regulatory takings where development is restricted to achieve GHG emissions targets as one of 45 policies and goals in the General Plan Goal and Policy Edits Alternative.

The comment “urges the CAP to remove the overly vague and unfounded references to takings”; however, neither “takings” nor SB 330 are mentioned in the CAP Update. The concept of legal takings and the restrictions of SB 330 are appropriately described in the Draft SEIR as one of many real factors that must be considered when implementing land use changes or restrictions.

No part of the alternatives analysis relies on the premise that SB 330 applies to the entire county. SB 330 is mentioned once in Chapter 5, Alternatives,” of the Draft SEIR. In Section 5.5.2, “Implementation of Smart Growth Strategies,” SB 330 is listed as an

example of a state law intended to facilitate housing streamlining and development. To address the concern raised in the comment that this single mention of SB 330 provides an inaccurate picture of SB 330 implementation, the first paragraph in Section 5.5.2, “Implementation of Smart Growth Strategies,” of the Draft SEIR (page 5-22) is revised as follows:

Implementation of smart growth alternatives that result in changes to the adopted General Plan land use map would require subsequent planning by County staff to develop tools to modify the application of the adopted General Plan. State laws facilitating housing streamlining and development (including Senate Bill 330, known as the Housing Crisis Act) also prevent the County from reducing residential capacity on a site zoned for housing in certain areas of the county without identifying replacement capacity. In addition, it is difficult to downzone higher density housing element sites identified and approved by the state as feasible sites for lower-income development. Government Code Section 65863 requires that cities and counties ensure that their general plans provide for regional housing needs. In addition, cities and counties are required to have no “net loss” of lower and moderate-income dwelling units. The County cannot take action that would reduce identified affordable housing sites for these income categories.

The Draft SEIR does not “claim that SB 330 precludes any of the smart growth alternatives,” and no discussion of the individual merits of the alternatives in the Draft SEIR mentions SB 330.

The County has carefully considered the interests and concerns of multiple parties in preparation of the CAP Update. The Draft SEIR appropriately acknowledges the multiple factors that should be considered when implementing an alternative land use framework. The discussion in the Draft SEIR has been revised to refine reference to SB 330. These clarifications do not substantially modify the discussion in the Draft SEIR and do not alter the impact analysis or conclusions. Thus, pursuant to State CEQA Guidelines Section 15088.5, recirculation of the Draft EIR is not required.

To illustrate the applicability of SB 330 in the unincorporated county, the County included a mapping layer that identified the portions of the county that are subject to SB 330 as part of the early community outreach efforts described in the Draft SEIR (pages 5-20 and 5-21). These outreach efforts included Sierra Club representatives. These maps were used to illustrate the land use concerns raised by all stakeholders that wanted to engage in development of the smart growth alternatives. In total, the County created over 80 maps requested by Sierra Club and all other stakeholders (e.g., environmental groups, Community Planning/Sponsor Groups, land development groups, building industry representatives, and individuals). These maps informed subsequent meetings to develop smart growth alternatives that were included in the Draft SEIR. (Refer to <https://www.sandiegocounty.gov/content/sdc/sustainability/climateactionplan/sgamaps.html>.)

Comment O18-6

The comment expresses concern and presents research findings about carbon offsets, stating they are problematic and ineffective.

Response O18-6

The County acknowledges the information presented in the comment. The comment does not pertain to the analyses or conclusions in the Draft SEIR. As explained further in Response O18-7, below, the CAP Update does not include an offset program.

Comment O18-7

The comment notes that the Draft SEIR and CAP do not include an offset program, but states that the County's acknowledgement that future projects would be required to implement project-specific mitigation, which may include off-site mitigation including carbon offsets, amounts to an implicit endorsement of such measures. The comment reiterates previously made assertions that the CAP Update must require carbon neutrality for any GPA projects and that the County should establish an in-county GHG mitigation program if off-site mitigation could be used for future GPA projects that are not consistent with the proposed CAP Update.

Response O18-7

The Draft SEIR addresses the potential environmental impacts of implementing the CAP Update, which would allow for streamlined GHG analyses for projects consistent with the adopted General Plan. The analysis does acknowledge that, factually, there is a potential for future project applications that include amendments to the General Plan to be presented to the County. The analysis also explains that any such projects would not be able to rely on the CAP Update to mitigate their GHG impacts or provide any streamlining benefits.

The Draft SEIR includes a discussion of the cumulative effects on in-process GPAs in Chapter 4, "Other CEQA Sections." Page 4-7 of the Draft SEIR provides the following detailed explanation of the relationship between the CAP Update, the General Plan, and potential GPAs.

As described in Chapter 1, "Project Description," of this SEIR, the CAP Update is being prepared to serve as mitigation to reduce GHG emissions resulting from anticipated buildout of the General Plan. To the extent a project is consistent with land use allowed under the General Plan, GHG emissions are addressed with CAP Update GHG reduction measures. Because the CAP Update is a requirement of the approved General Plan, it only addresses development consistent with the General Plan. The CAP's GHG projections, therefore, do not include in-process GPA projects for which the County has received applications, but that are in some stage of processing (e.g., staff is determining what its recommendation of approval will be and what conditions are required, and/or the decision-maker is determining whether it will approve, modify, or deny the project). Thus, if a project's land use is consistent with the General Plan (as amended as of December 10, 2020), then its GHG emissions are already accounted for in the CAP's projections. When a project is within the scope of the General Plan, the proposed project will help the County

achieve its share of GHG reduction targets by implementing CAP Update reduction measures through the CAP Consistency Review Checklist.

When a proposed project is outside the scope of the General Plan buildout, requiring a General Plan amendment, that project must use different means to demonstrate that the project does not obstruct the County's ability to achieve its share of GHG reduction targets and have a significant impact on GHG emissions. In the 2018 CAP and SEIR, the GPAs had to demonstrate net zero GHG emissions, otherwise they would add GHG emissions beyond what would be allowable to meet GHG reduction targets. To address that problem, the 2018 SEIR allowed GPAs to use M-GHG-1 to mitigate GHG emissions by purchasing carbon offsets outside the unincorporated county.

This SEIR no longer relies on M-GHG-1, or anything equivalent, to mitigate the GHG impacts of GPAs. This SEIR contains no offsets or other mitigation measures facilitating GPAs. Rather, each in-process GPA would undergo its own project-level analysis of GHG impacts pursuant to CEQA and would develop its own threshold of significance and mitigation pathways for reducing that project's impact on GHG emissions. These in-process GPAs and future GPA applications are inconsistent with the CAP Update if they are inconsistent with the density or intensity allowed in the General Plan. They cannot use the CAP Update to streamline their GHG analysis. Therefore, depending on the in-process GPA, they could result in a potentially significant GHG impact and would be required to mitigate those impacts to the extent feasible.

As explained further in Response O4-34, the CAP Update neither "allows" nor prohibits the use of off-site carbon offsets to reduce GHG emissions from future GPA projects. Rather, consistent with the Appellate Decision, it acknowledges that there could be appropriate use of offsets, which are not disallowed under CEQA, in project-level mitigation.

The comment also attempts to draw a parallel between the potential for this future assessment of GHG emissions to occur outside the reasonable parameters of the CAP Update and the No-Project Alternative. Importantly, the Draft SEIR does not "strike down" the No-Project Alternative as infeasible because impacts would be addressed on a project-by-project basis. The cited text on page 5-11 of Chapter 5, "Alternatives," provides a comparison to the effects of the CAP Update; feasibility is not discussed. As summarized in Section 5.7, "Environmentally Superior Alternative," the No-Project Alternative "may not be environmentally superior to the CAP Update" because it "would not meet any of the project objectives" and is anticipated to "result in greater GHG emissions" (Draft SEIR page 5-34).

No revisions to the Draft SEIR have been made in response to this comment. However, the commenter's recommendation that "the County should not continue to approve GPAs in high VMT areas with significant GHG impacts," the proposed requirement for GPAs to be carbon neutral, and the idea of developing a countywide program for any off-site GHG mitigation will be passed on to the decision-makers for consideration when any such GPA

project is heard before the Planning Commission or Board. Please also see Response O4-34, regarding Sierra Club's request to develop an off-site GHG mitigation program for use by future GPAs, which provides a pathway for GPAs that this CAP Update does not propose.

Comment O18-8

The comment summarizes prior rulings related to offsets and General Plan consistency and conveys an understanding that GPAs may not be able to legally use out-of-county GHG offsets.

Response O18-8

The County notes the position presented in the comment that the General Plan emphasizes local, county-based reductions. The CAP Update includes actions to reduce emissions within the county and from government operations. No offsets are proposed. There is no pathway for GPAs in the CAP Update. County decision-makers would consider General Plan consistency and legal precedent when considering the merits of future GPA projects that may be proposed in the future.

Comment O18-9

The comment states that the CAP Update fails to provide a cumulative impacts analysis that complies with the Appellate Decision.

Response O18-9

As an initial matter, the Appellate Decision did not require that the CAP Update include a cumulative analysis of in-process GPAs. In fact, the Court of Appeal explains that 2018 SEIR mitigation measure "M-GHG-1 is not one of the CAP's GHG reduction measures" and explains that this is appropriate and consistent with the County's General Plan "because the CAP analyzes GHG emissions resulting from buildout under the GPU" (Appellate Decision page 30).

Furthermore, the CAP does not "simply assume" that the 21 GPAs that were in-process at the time the 2018 SEIR was prepared are now part of the inventory. For example, two GPAs evaluated in the 2018 SEIR, Newland Sierra and Lilac Hills Ranch, were rescinded and denied, respectively, by the Board. These projects are not in the inventory or any other assumption in the CAP Update. The baseline and population assumptions used in the CAP Update are described in detail in Appendix 3, "Unincorporated County of San Diego 2019 Greenhouse Gas Emissions Inventory and Projections," of the CAP Update. This data provides substantial evidence to support the buildout assumptions used in development of the CAP Update. Contrary to statements made in the comment, the County has not assumed any GPAs are part of an inventory or forecasts without evidence.

Court-Ordered Analysis of Potentially Significant Cumulative Impacts from GPAs

Related specifically to the 2018 SEIR's cumulative analysis, Section III of the Appellate Decision includes a discussion of in-process GPAs. Here, the Appellate Decision finds that the 21 GPA projects that were in-process at the time the 2018 SEIR's preparation were "closely related because the CAP and SEIR address GHG emissions reduction in

the unincorporated County and from County operations, and the GPAs will create GHG emissions in this same geographic area,” and that the in-process GPA projects were reasonably foreseeable based on the initiation of project-level review (Appellate Decision page 77).

The 2018 SEIR identified these projects as reasonably foreseeable in the GHG impact analysis. The analysis in the 2018 SEIR states that the CAP “would not generate a substantial amount of GHG emissions that may have a significant impact” but acknowledges that “emissions from reasonably foreseeable cumulative projects (i.e., in-process GPAs) and GPAs submitted for processing to the County in the future if approved, would increase forecasted emissions” (2018 SEIR page 2.7-36). The 2018 SEIR also outlined a mitigation measure (M-GHG-1) that could be imposed upon future GPA projects that would increase density relative to the CAP and an approach for evaluating GPA consistency with the CAP.

The Appellate Decision concludes that the 2018 SEIR’s cumulative impacts analysis should have assumed that implementation of M-GHG-1 would exacerbate other cumulative impacts, concurring with the prior Court’s decision that “cumulative impacts from adding 14,000 dwellings and related infrastructure in projects utilizing M-GHG-1 (and, therefore, using offsite carbon offsets to mitigate their in-County GHG emissions) would likely include impacts to air quality, energy, and vehicle miles traveled, among others” (Appellate Decision page 37). The Appellate Decision summarizes project-level mitigation proposed in available project-specific EIRs for in-process GPA projects that included offsets, albeit independent of the CAP, as evidence that the “County knew or reasonably should have known that these GPAs would almost certainly be purchasing out-of-County credits to offset in-County GHG emissions.” Accordingly, the court ruled that the SEIR should have considered “whether these GPAs and others like them would lead to significant cumulative impacts in combination with the Project” (Appellate Decision page 82).

Contrary to statements made in the comment, the Appellate Decision does not require that the CAP Update (or SEIR) limit GPA projects, fully mitigate GHG emissions from GPAs, or even identify future measures that GPAs must adhere to.

Cumulative Analysis in the Draft SEIR

As explained above (see Response O18-7), the CAP Update reflects the General Plan (as amended as of December 10, 2020) in the baseline inventory used to develop emissions projections. Chapter 2 of the Draft SEIR (pages 2-8 through 2-10) includes subsequent cumulative impact analyses that evaluate “whether the proposed CAP Update could result in new significant cumulative impacts or an increase in the severity of the cumulative impacts that were identified in the 2011 GPU PEIR.” In addition, the Draft SEIR includes Section 4.4, “Cumulative Effects of In-process General Plan Amendments,” which addresses the Appellate Decision in *Golden Door Properties, LLC, v. County of San Diego*, 50 Cal.App.5th, 467 (Golden Door) with regard to the cumulative effects of in-process GPAs (defined as projects proposed in the unincorporated county that would require amendments to the General Plan that are in-process but have not yet

been approved). This section includes an analysis of the potential cumulative effects of the implementation of in-process GPAs both in terms of (1) whether they would contribute to new or more significant cumulative impacts on other resources in combination with implementation of the proposed CAP Update and (2) how they affect the County's ability to meet its GHG reduction targets.

The State CEQA Guidelines (Section 15130) and the Appellate Decision require discussion of any significant cumulative condition to which the project's incremental effect is cumulatively considerable. If the project would contribute to a significant cumulative condition, an adequate discussion of the impacts "shall examine reasonable, feasible options for mitigating or avoiding the project's contribution to any significant cumulative effects" (State CEQA Guidelines Section 15030[b][5]). Thus, CEQA requires that the lead agency disclose the project's incremental contribution to a significant cumulative impact or explain the basis for a finding of insignificance, mitigate the project's contribution to any significant impact, and evaluate any indirect effects of that mitigation (State CEQA Guidelines Section 15126.4).

The County has conducted an impact evaluation of the cumulative impacts of in-process GPAs related to 15 resource topics in the Draft SEIR. This analysis discloses both the potential for a significant cumulative impact and the CAP Update's incremental contribution to any impact. As discussed in the Draft SEIR, the CAP Update would not result in significant contribution to cumulative GHG impacts, either related to the generation of emissions associated with implementation of CAP Update measures and actions or due to conflict with an applicable plan, policy, or regulations for reducing GHG emissions. Specifically, in evaluating the contribution of the CAP Update implementation to cumulative GHG emissions, the Draft EIR explains (page 4-25):

any temporary construction GHG emissions would be offset by the overall net benefit of GHG emissions reduction resulting from operation of projects associated with the CAP Update. Implementation of the CAP Update would result in a beneficial impact related to GHG emissions.

Similarly, related to conflict with the goals of applicable GHG reduction plans (including the 2022 Scoping Plan and the 2021 Regional Plan), the Draft SEIR finds, based on substantial evidence, that the CAP Update implementation would not contribute to a cumulative impact.

The SEIR does, however, disclose that the in-process GPAs could result in significant cumulative GHG impacts. The Draft SEIR acknowledges that "if approved, implementation of the in-process GPAs would result in generation of GHG emissions and would have the potential to conflict with the goals of the 2022 Scoping Plan and 2021 Regional Plan related to GHG emissions reduction" (page 4-25). Page 4-26 of the Draft SEIR explains that the County modeled the anticipated GHG emissions of the in-process GPAs to evaluate the potential effects of the in-process GPA projects on the County's ability to meet the targets established in the CAP Update. As explained therein, the County modeled emissions from the GPA projects based on default modeling parameters specific VMT modeling and without the inclusion of any sustainability features (which

could result from new standards set through CAP Update implementation) or project-level mitigation measures that may be identified.¹ Modeled emissions from the in-process GPA projects were added to the County's forecast emissions to determine if the known, in-process GPAs could affect the County's ability to achieve its GHG reduction targets. The analysis found that GHG emissions would exceed the 2030 target if all the in-process GPAs were implemented and that the 2045 target would be achieved. Because implementation of the in-process GPAs would generate GHG emissions that would limit the County's ability to meet the GHG emission reduction target in 2030, there would be a cumulative impact related to conflict with an applicable plan, policy, or regulation for reducing GHG emissions. Section 4.4.8.3, "Summary" (page 4-26), concludes that the cumulative impact would be more severe than disclosed in the 2011 GPU PEIR.

Thus, the County has fully explained the significance determination related to cumulative GHG impacts. The County is not required by either the language of the Appellate Decision or CEQA to mitigate for the contribution of other projects identified in a cumulative analysis to an anticipated cumulative effect.

Furthermore, although not required to establish a mitigation program for potential future projects that are inconsistent with the General Plan, the Draft SEIR does identify methods that the County could consider to limit the contribution of future GPAs to cumulative effects. New Policy LU-19, for example, which is described in the Draft SEIR as part of the General Plan Goal and Policy Edits Alternative, could reduce the future impacts of GPAs by requiring certain processes and findings during future environmental review.

Comment O18-10

The comment states that the CAP offers a conclusory and inaccurate alternatives analysis.

Response O18-10

As summarized in Response O18-3 above, the County acted in good faith in working with stakeholders to identify smart growth alternatives. To expedite the implementation of these alternatives and improve feasibility, the County envisioned that these alternatives would include the development of zoning overlays that correspond to a program of incentives and disincentives for development. These overlays would influence where development would occur without outright development bans or changes to the underlying planning designations.

For clarification, the statement in the Draft SEIR that "[m]ost of the VMT anticipated through 2050 in the plan area occurs under existing conditions and would be relatively unchanged by the development pattern of future growth" is valid and accurate; this is true both for the CAP Update alone and for all the smart growth alternatives. This is a function of the existing built environment in the county and the rate of projected future growth. The smart growth alternatives would only affect projected future growth.

¹ The California Emissions Estimator Model modelling results used to determine whether the County would meet its GHG reduction targets with the in-process GPAs is provided in Appendix B to the Draft SEIR.

For the Fire Safe and VMT Efficient Alternative specifically, the analysis assumed that the overlay program would have the effect of moving half the growth anticipated outside the VMT efficient and fire safe areas into those areas. This assumption was based on the limited geographic area that meets the smart growth parameters set out for this alternative. Growth in the county cannot be fully accommodated in areas that both are not designated “high” or “very high” fire hazard and have a VMT per resident of 15 percent below the SANDAG regional average. The established parameters, therefore, generate reasonably foreseeable outcomes of a potentially feasible alternative.

The Draft SEIR summarizes the VMT calculations prepared by Fehr & Peers (see Draft SEIR Appendix C), acknowledging that with the Fire Safe and VMT Efficient Alternative, VMT for new development would decrease by 6.6 percent in 2035 and 3.0 percent in 2045. Therefore, reductions in VMT for new development could be substantial. However, when considered with the 8.8 million VMT generated in the base year (i.e., VMT from existing development that would not change with the implementation of any smart growth alternative), the overall reductions in future, countywide VMT are less than 1 percent in both 2035 and 2050.

To clarify the importance of the VMT reductions from new development that could be achieved under this alternative, the last paragraph on page 5-26 under the heading “Comparison to the Effects of the CAP Update” is revised to read:

Most of the VMT anticipated through 2050 in the plan area occurs under existing conditions and would be relatively unchanged by the development pattern of future growth. Only minor decreases in VMT associated with the existing population are expected due to the DS 39 modeling assumptions (see CAP Update Appendix 3). If implemented, this alternative is anticipated to reduce VMT for new development by 6.6 percent in 2035 and 3.0 percent in 2050. This represents a substantial VMT reduction for new growth. However, when viewed in conjunction with existing development, the magnitude of overall VMT reduction is relatively small because the vast majority of unincorporated county VMT under future year alternatives can be attributed to existing land uses. Overall, the Fire Safe and VMT Efficient Alternative would result in a 0.53 percent reduction in unincorporated county VMT for 2035 and a 0.41 percent reduction in unincorporated county VMT for 2050 (see Appendix C for detailed modeling results). Associated minor reductions in air and GHG emissions are also expected to occur under this alternative.

In addition, the last sentence of the first full paragraph on page 5-27 has been revised as follows:

Therefore, although this alternative would reduce VMT from new development, the magnitude of is not expected to meaningfully reduce VMT or GHG emissions reductions in the unincorporated county would be much smaller when all VMT in the future condition is considered.

Separately, in the cumulative analysis of VMT for CAP Update implementation plus in-process GPAs (see Draft SEIR Appendix B), Fehr & Peers’s modeling indicates that there

would be an overall increase in future, countywide VMT of less than 1 percent if all GPA projects were constructed. Isolating the VMT generated by new growth, the in-process GPA projects could increase VMT from new development by 10.3 percent in 2035 and 5.7 percent in 2050. Nonetheless, Fehr & Peers expects the magnitude of overall VMT reduction “to be small since the vast majority of unincorporated County VMT under future year alternatives can be attributed to existing land uses.” This is consistent with the discussion of the potential for future growth to contribute to countywide VMT in the Draft SEIR alternatives analysis.

As explained in Appendix B to the Draft SEIR, the modeling of VMT from in-process GPAs that was conducted for the purpose of cumulative analyses started with the SANDAG Regional Plan EIR Alternative 2 (Data Set 39) model and layered 2,964 additional households in the associated master-geographic reference area (MGRA) for the model. Modeling of cumulative VMT incorporates several interrelated factors that affect VMT levels (e.g., mode choice to complete trips, distance traveled among trip origins and destinations) that would not be reflected in a cumulative VMT estimate that is based on adding the project-level VMT modeled for individual projects. Synergies in trips between proposed projects and existing development are captured through comprehensive analysis. Total projected GHG emissions from all sources (including VMT) associated with buildout of in-process GPAs would be 37,310 MTCO_{2e} in 2030 and 36,285 MTCO_{2e} in 2045. The GHG emissions from in-process GPAs are not included in the CAP Update. Similarly, the evaluation of GHG emissions that is prepared for CAP forecasting is distinct from the calculations of project-level emissions. As described in CAP Update Appendix 3, the GHG emissions inventory and projections prepared for the CAP Update include emissions from community activities and sources under County jurisdiction and from County government operations and show changes in emissions over time from anticipated population, housing, and employment growth, as well as the future impact of federal and California regulations, policies, and programs adopted as of 2022 that would reduce GHG emissions from future activities. The sources and common assumptions used for the inventory and projections and the methods used to prepare each category of the inventory and projections are described in detail in Sections 2, 4, and 6 of CAP Update Appendix 3. The CAP Update GHG emissions projections are based, in part, on growth forecast assumptions for the unincorporated area and do not reflect the specific features or details of individual development project proposals. The GHG emissions forecasts provided in the Draft SEIR analysis also do not assume the application of any project-level design features or mitigation requirements to reduce GHG emissions below modeled levels.

The comment references three GPA projects specifically. The first, Harmony Grove Village South, is mentioned in a footnote. The second is Preserve at Riverbend. These projects are listed in Table 4-1 (“In-Process Projects That Include General Plan Amendments”) of the Draft SEIR (not in the CAP Update, as stated in the comment). Both projects are included in the cumulative VMT modeling in Appendix B to the Draft SEIR. As explained above, this VMT modeling provides a realistic representation of the VMT anticipated in the cumulative scenario and is one component of the GHG emissions forecast prepared for the cumulative scenario. The analysis shows that these in-process

GPA projects could generate GHG emissions that offset some of the reductions identified in the CAP (from VMT-related CAP measures or others).

The third project is described as “previously approved” but is unnamed in the comment. The comment appears to refer to Otay Ranch Village 14 and the amendments to Planning Areas 16/19 based upon the materials referenced. The commenter includes the Otay Ranch Village 14 and Planning Areas 16 and 19 project first approved June 26, 2019, and revised and approved for a second time on June 3, 2020, to illustrate project-level GHG emissions to suggest this project would undermine the CAP Update targets. This project is not listed in Table 4-1, nor is it an in-process GPA with the County because it was approved prior to the NOP for the CAP Update SEIR. In addition, the Otay Ranch Village 14 project was purchased for conservation and would not result in any of the GHG emissions stated in the comment.² The Otay Ranch project would have no effect on the CAP’s targeted GHG reductions based on this information.

The County has prepared an evaluation of the potential for the in-process GPA projects to affect the County’s ability to meet its targets. That analysis concludes that “GHG emissions would exceed the 2030 target if all of the in-process GPAs were implemented” (Draft SEIR page 4-26). This does not mean that the CAP Update will be ineffective or undermined by future development that is inconsistent with the General Plan and forecast growth. There are two basic mechanisms in place to address this concern. First, such growth would be outside the scope of the CAP Update and would require full GHG emissions analyses and project-level mitigation to reduce impacts to be identified. Second, the CAP Update inventories and forecasts would be periodically updated; this would update baseline conditions to reflect any changes in development or growth projections and require the County to adjust measure and action implementation, if necessary, to continue to meet established emissions reductions targets.

Future projects that could amend the General Plan to change land uses and densities remain outside the scope of the General Plan and CAP Update. The prospect of cumulative projects outside the project creating an adverse cumulative condition or affecting project effectiveness is not a reasonable basis for selection of an environmentally superior alternative. It is also not appropriate for the CAP Update or SEIR to evaluate the merits of future development proposals relative to the time and resources spent to develop the CAP Update.

Furthermore, while the smart growth alternatives may affect the in-process proposals by instituting barriers to development, none of the smart growth alternatives propose a ban on GPA projects. The alternatives analysis correctly compares the smart growth alternatives to the impacts of the approved General Plan plus CAP Update. It does not, and should not, compare the smart growth alternatives to the cumulative impact analysis.

² [Attorney General Bonta Announces Permanent Conservation of San Diego Wildlands | State of California - Department of Justice - Office of the Attorney General](#)

Comment O18-11

The comment states that the CAP must place limits on the number of units that can utilize the CAP for streamlining and must require a CAP update when the number of units (General Plan consistent and GPAs) surpass its projections.

Response O18-11

General Plan land use designations and policies establish a jurisdiction's approach to managing the growth that is forecast to occur in the region; the General Plan plans for projected growth but does not change projected growth. The comment notes that the CAP Update forecasts are based upon reasonably foreseeable growth through 2045, as identified by SANDAG (DS39) and independently verified through a market study, rather than full buildout of the General Plan. These same DS39 growth projections were applied to each of the alternatives evaluated in the Draft SEIR.

Section 15183.5(b) of the State CEQA Guidelines sets forth the necessary elements of a CAP that a future project must include to allow tiering and streamlining of the analysis of its incremental contribution to cumulative GHG emissions. As explained in Section 15183.5(b)(2):

An environmental document that relies on a greenhouse gas reduction plan for a cumulative impacts analysis must identify those requirements specified in the plan that apply to the project, and, if those requirements are not otherwise binding and enforceable, incorporate those requirements as mitigation measures applicable to the project. If there is substantial evidence that the effects of a particular project may be cumulatively considerable, notwithstanding the project's compliance with the specified requirements in the plan for the reduction of greenhouse gas emissions, an EIR must be prepared for the project.

As explained further in Response O18-17 below, the County has developed a CAP Consistency Checklist to aid in the implementation of the CAP Update. The Checklist includes the attributes a future project must include and would be used to verify that the project both is within the scope of the CAP Update forecasts and would implement the CAP Update actions that apply to its implementation. One of the Checklist requirements is consistency with General Plan; because of this element of the Checklist, future projects that require General Plan amendments would not be eligible for streamlining their CEQA analysis of GHG emissions.

Additionally, the CAP Update includes requirements for monitoring and periodic updates so that adjustments can be made to allow the County to achieve its GHG reduction targets in light of deviations that could occur between forecasts and actual projects that are proposed and implemented in the unincorporated county. The County also would utilize outside monitoring programs, such as the County's Housing Production and Capacity Portal. As explained in the CAP Update, the County's Housing Production and Capacity Portal would be used to monitor the development of housing units in the unincorporated area to ensure this CAP and future CAP updates accurately mitigate for housing development consistent with the General Plan. The Portal tracks progress toward implementing the General Plan by illustrating housing production and land use capacity

since 2011. This is accomplished through close monitoring of the existing number of dwelling units, changes to land use capacity, production of housing units, and remaining dwelling unit capacity of the General Plan.

However, the number of housing units alone does not determine the total GHG emissions in the unincorporated county. Although the Portal will be an important tool for the County to use to monitor CAP implementation, it is not the key factor in demonstrating achievement of the GHG reduction targets outlined in the CAP. Section 15183.5(b) of the State CEQA Guidelines does not require that CAPs used for streamlining place limits on the number of units that can use that plan for streamlining or that a qualified plan needs to include provisions requiring an updated plan when the number of units surpasses such a limit.

As described in more detail in Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” the County would regularly monitor implementation progress to track the effectiveness of each measure and action, update the emissions inventory, and make adjustments, as needed, to keep the County on track toward meeting its GHG reduction targets.

Comment O18-12

The comment includes a request to revise the alternatives analysis in the Draft SEIR based on the understanding that the discussion identifies the Sustainable Communities Strategy Alternative as infeasible.

Response O18-12

The Draft SEIR does not identify the Sustainable Communities Strategy Alternative as infeasible. As explained further in Section 9.1.1.2, “Master Response: Evaluation of Smart Growth Alternatives in This SEIR,” the description of the alternative simply identifies that the Road User Charge, which was included in the modeling and is a source of substantial projected VMT reductions, was removed from the regional plan through amendment. In addition, the “2021 Regional Plan includes other policy and transportation network assumptions beyond the Road User Charge that further result in lower VMT, and many of these assumptions rely upon public vote, funding, or SANDAG Board actions” (Draft SEIR page 5-31). For these reasons, growth under the County’s adopted General Plan cannot be reasonably assumed to produce the same results through implementation of an overlay ordinance alone. The description of the alternative goes on to explain:

If the Board were to adopt a smart growth alternative that would aspire to achieve development outcomes in alignment with the SANDAG Regional Plan Mobility Hub framework, a broader and more comprehensive set of General Plan land use map and Zoning Ordinance changes would be required that mirrors the program described in the Regional Plan because the incentives described above may not be sufficient to result in conformity. In this case, the Board would likely be considering both up-planning in areas around the SANDAG Mobility Hubs and down-planning in areas outside of those locations. This would require a more comprehensive update to the General Plan due to the large geographic scope of land use map changes and scale of community engagement required. It is

assumed that all measures and actions in the CAP Update would be implemented as proposed.

Therefore, the Draft SEIR identifies the elements of an alternative that would achieve the outcomes identified in the SANDAG Sustainable Communities Strategy. County staff classified the alternative as potentially feasible and have prepared a CEQA-compliant analysis of comparative impacts. The final determination of feasibility will be made by the Board in their Findings of Fact. No changes have been made in the Draft SEIR in response to this comment.

Comment O18-13

The comment includes a request for clarification regarding the calculation of VMT reductions for the Village Support Areas Alternative in the Draft SEIR and suggests that it should be “removed as a Smart Growth Alternative. Otherwise, the CAP misleads the public and decisionmakers.”

Response O18-13

As explained at length in both the Draft SEIR and these responses to comments, the smart growth alternatives address the Appellate Court decision on the 2018 SEIR and were informed by public engagement. The alternatives identify land use planning actions that, if adopted by the Board, would be implemented in addition to the CAP Update. The CAP Update cannot mislead the public and decision-makers about the smart growth alternatives because the alternatives are not an element of the CAP Update, and they are not evaluated in the plan.

The VMT modeling conducted for the Village Support Areas is included in the Draft SEIR as Appendix C. As explained on page 5-28 of the Draft SEIR:

For the purpose of analysis, new households assumed in the CAP Update modeling were adjusted to assume location in Village Support Areas within their original Community Plan Area in randomized process weighted to ensure approximately equal growth in density across a Village Support Area. Densities within the Villages were not changed from the established assumptions for growth under the General Plan. Based on this modeling, the Village Support Areas Alternative is anticipated to reduce VMT for new development by 1.0 percent in 2035 and 0.3 percent in 2050. If the modeling were refined to assign growth into specific Village Support Areas closer to incorporated cities, greater VMT reductions would be anticipated; however, because the location of future growth under the Village Support Areas concept would be within 0.5-mile of any Village, redistribution of growth within Community Plan Areas provides a reasonable assumption to inform analysis. Further, while the change in location reduces trip lengths associated with the relocated households, it may not change the likelihood to use transit, to use alternative modes of transportation, or to commute a long distance to work using a personal vehicle. Note also that no employment changes associated with non-residential development were assumed in the modeling. Therefore, the modeling reflects the highest VMT outcomes since it does not capture the typical benefits associated with mixed-use developments and

neighborhood serving retail and focuses only on growth in housing units (Fehr & Peers 2023).

The comment requests explanation of the apparent discrepancy between the VMT modeling conducted for the Village Support Areas Alternative and the net change in total GHG emissions reported separately for buildout of the Alpine Community Plan Update, which was proposed in 2017 (and for which a Draft SEIR was released in 2020). There are several reasons that this comparison is neither apt nor informative. First and foremost, the evaluation of potential changes to VMT in the CAP Update SEIR looks at changes throughout the unincorporated county that would result from a redistribution of growth, whereas the Alpine Community Plan Update proposed increases to the development capacity in the community plan area and the associated SEIR evaluated the change in GHG emissions from the General Plan growth scenario to an increased development capacity. The Draft SEIR for the Alpine Community Plan Update also conservatively assumed full buildout of the plan by 2030. This portrays a maximum of potential GHG emissions—a worst-case scenario—and is not consistent with the more realistic growth projections used in the CAP Update.

“Smart growth” is defined in the Appellate Decision as “compact, efficient, and environmentally sensitive pattern of development that focuses future growth away from rural areas and closer to existing and planned job centers and public facilities, while preserving open space and making more efficient use of existing urban infrastructure.” An alternative that includes overlays and incentives that would transfer growth otherwise allowable and anticipated in more rural areas of the unincorporated county to within 0.5 miles of the established villages meets these requirements. No revisions have been made to the Draft SEIR in response to this comment.

Comment O18-14

The comment indicates that the CAP Update claims that limits on GPAs are not feasible and cites recent Los Angeles County Board of Supervisors actions as evidence of this authority.

Response O18-14

Although the comment attributes a discussion of feasibility to the CAP, text of the Draft SEIR alternatives analysis is cited. Page 5-7 of the Draft SEIR outlines a Prohibition on Changes to the General Plan Land Use Map Alternative. Of note, this is an evaluation of a conceptual alternative that would result in a complete prohibition on GPAs, not one that would limit GPAs in alignment with the Los Angeles County example provided.

The discussion that follows does cite state law related to prohibiting future Boards of Supervisors from revising, modifying, or amending the County’s General Plan as one reason for rejection of the alternative. A key reason for rejection, however, is that this alternative would not reduce the environmental impacts of the proposed CAP Update. As explained on page 5-8 of the Draft SEIR:

GPAs that increase density are outside the scope of the CAP Update, which has been developed as mitigation for the adopted General Plan and covers only the

type and level of growth that is within the scope of the General Plan. As discussed in further detail in Section 4.4 of Chapter 4, “Other CEQA Sections,” any in-process or future GPAs would conduct a stand-alone CEQA analysis, including an analysis of project specific GHG emissions to determine the project’s alignment with County plans and applicable state and local programs adopted to reduce GHG emissions. Moreover, this alternative would result in the same suite of measures and actions, with the same potential for new or substantially severe impacts, as the proposed CAP Update alone and would not improve alignment with the project objectives. For these reasons, this alternative has not been carried forward for detailed analysis.

This comment does not address any legal deficiencies with the CAP Update or Draft SEIR. No revisions to the Draft SEIR have been made in response to this comment.

Comment O18-15

The comment states that the “CAP claims that the General Plan itself is ‘smart growth.’” The comment identifies more recent mapping and planning prepared by SANDAG as evidence that “designated rural ‘villages’ in themselves are not necessarily sustainable areas to increase development.”

Response O18-15

The CAP Update does not make any statements related to whether the General Plan is smart growth. Section 5.5.1, “Development of Smart Growth Alternatives,” of the Draft SEIR (page 5-19) does describe the smart growth objectives of the General Plan in the context of establishing the consistency between smart growth alternatives and the General Plan. That discussion states:

In addition to reducing VMT and GHG emissions, adopting and implementing a smart growth alternative in the unincorporated area could result in development outcomes aligned with previously directed policy objectives, such as increasing housing diversity and affordability levels near jobs and transit and reducing sprawling land use patterns. The General Plan, for which the CAP Update serves as a mitigation measure, was designed to achieve “smart growth” objectives including concentrating development in designated villages with integrated infrastructure and nonresidential uses. Achieving these goals reduces VMT attributable to new development. See Section 1.3 in Chapter 1, “Project Description,” of this draft SEIR, regarding the County’s efforts through the General Plan to focus development within village areas and closer to services in the western portion of the incorporated county. In addition, please refer to Table I-1 in the General Plan regarding sustainability policies.

“Smart growth” is defined in the Appellate Decision as “compact, efficient, and environmentally sensitive pattern of development that focuses future growth away from rural areas and closer to existing and planned job centers and public facilities, while preserving open space and making more efficient use of existing urban infrastructure.” There is no requirement that a land use plan is consistent with SB 743 or a sustainable communities strategy be labeled “smart growth.” Indeed, each of these planning

processes serves specialized and unique purposes that inform County land use planning, and the Draft SEIR describes the relative effects and benefits of several smart growth strategies.

The comment cites the CAP Update related to the existing built environment, which states in full:

The unincorporated area's mix of village, semi-rural, and rural communities demonstrate a range of development intensities and population densities, often with remote travel destinations and few areas served by public transportation particularly in semi-rural and rural communities.

The comment also states that villages “are not necessarily sustainable areas to increase development.” This portion of the comment does not appear to be directed at the analysis or conclusions in the Draft SEIR. No further response can be provided.

Comment O18-16

The comment indicates that the CAP Update fails to demonstrate that the plan will achieve the reduction targets. The comment suggests that the plan does not contain feasible measures with mandatory performance standards. Statements are provided related to enforceability, feasibility and implementation, funding, additionality of CAP Update actions, overall CAP purpose, and the necessary elements of a CAP.

Response O18-16

The CAP Update is feasible and fully enforceable. Specific statements related to enforceability, feasibility and implementation, funding, additionality of CAP Update actions, overall CAP purpose, and the necessary elements of a CAP are discussed separately below.

CAP Update Enforceability

As explained above in Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” and Response O3-2, the CAP Update identifies measures and quantified implementing actions with sufficient GHG emission reduction potential to achieve the County’s established targets. In addition to these quantified implementing actions, “Path to Net Zero” actions are included in the CAP Update. The “Path to Net Zero” actions establish steps the County will take to meet the aspirational goal of net zero emissions by 2045. While the CAP Update does not identify quantified GHG emissions reductions for “Path to Net Zero” actions, their implementation could result in quantified reductions in the future with additional data and monitoring. The County has not relied upon these actions to achieve the 2030 and 2045 targets established in the CAP Update. The four transportation actions referenced in the comment as lacking “enforceable standards” (T-1.1a, T-1.1b, T-3.1.a, T-3.1.b, T-3.1.c.) are Path to Net Zero actions. The quantified actions within the CAP include performance standards that substantial evidence demonstrates would collectively achieve the specified emissions level, in conformance with Section 15183.5(b)(1)(D) of the State CEQA Guidelines.

CAP Update Feasibility and Implementation

The comment also indicates that Actions T-2.1 and T-3.1 “lack sufficient evidence to ensure feasibility” but provides no detail or evidence to support this claim. Also refer to Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explain that the CAP Update adequately identifies a set of measures and actions to reduce GHG emissions to levels that achieve its GHG reduction targets for 2030 and 2045. Note also that Planning & Development Services Sustainability Planning Division has nine full-time staff devoted to CAP implementation, monitoring, and updating. Appendix 10 of the CAP Update identifies staffing resources equivalent to 77 full-time staff that are required to implement the CAP, a majority of whom (90 percent) are existing staff.

CAP Update Funding

The CAP Update does include a discussion of the various potential funding sources that will be explored as part of CAP Update implementation in Chapter 5, “Implementation and Monitoring,” on page 116. CAP Update Table 13 (“CAP Implementation and Monitoring Program”) also identifies potential funding sources for each action. The CAP Update cannot dedicate funding to implementation of the CAP Update before its adoption. County budgeting and funding of programs is determined on an annual basis for the next fiscal year. An adopted CAP Update would direct County departments to budget for work related to implementing these measures, including application for grants to supplement County funds, as outlined in Appendix 10. Where new funding is required to implement measures, while not currently secured, there is evidence to support that funding sources or authority over funding decisions exist to implement those measures. The County’s annual progress reports have demonstrated the County’s success implementing existing adopted GHG reduction programs, as confirmed by the GHG emissions inventory used in the CAP Update, which confirmed that the County met the AB 32 target.

CAP Update Additionality

The comment also states that CAP actions must be “additional” by “exceed(ing) preexisting obligations imposed either at the state level or regional level.” As explained in Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” the CAP Update references the criteria used to develop the measures and implementing actions that achieve quantified GHG reductions, which includes existing and new or expanded programs that are, “Additional to existing regulations from the state or federal government.”

CAP Update Purpose

The comment accurately characterizes the CAP Update as a program to fulfill mitigation established in the County’s 2011 GPU PEIR. As explained on page 2 of the Draft SEIR:

A total of 19 separate mitigation measures were adopted to reduce the greenhouse gas (GHG) emissions of County operations and from activities within the unincorporated county to below a level of significance. One of the 19 measures,

designated CC-1.2, called for the preparation of a CAP. Mitigation Measure CC-1.2 was incorporated into the General Plan as Goal COS-20 and Policy COS-20.1. Specifically, Goal COS-20 in the Conservation and Open Space Element of the General Plan requires reduction of community and County operations GHG emissions and Policy COS-20.1 requires preparation, maintenance, and implementation of a CAP.

The comment cites case law establishing that mitigation measures must be fully enforceable and “not mere expressions of hope.” These assertions are acknowledged. The County continues to pursue full implementation and enforcement of 2011 GPU PEIR Mitigation Measure CC-1.2. See also Section 9.1.1.1, Master Response: CAP Update Purpose and Land Use Change for further discussion regarding the purpose of the CAP Update and its relationship to the General Plan.

Elements of the CAP Update

Finally, the comment quotes the State CEQA Guidelines’ criteria for plans that can be used for the tiering and streamlining of future GHG analyses and cites the *Final Statement of Reasons for Regulatory Action Amendments to the State CEQA Guidelines*. Although text related to performance standards and substantial evidence are emphasized, no comment on the CAP Update is provided. Similarly, the comment cites an unrelated legal case (*Communities for a Better Environment v. City of Richmond*, 184 Cal.App.4th 70 [2010]), wherein the court reinforced that CAP measures should be feasible and include performance standards. Again, no comment on the County’s CAP Update or the Draft SEIR is provided.

Again, as described above and in Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” the County has developed a group of measures and actions, which substantial evidence demonstrates would collectively achieve the established emissions targets if implemented on a project-by-project basis.

Comment O18-17

The comment states that the consistency Checklist for the CAP Update “requires major revisions” and remarks that “several” of the Checklist requirements are contingent on action by the Board that is “far too off into the future.”

Response O18-17

The CAP Update’s attainment of the County’s 2030 and 2045 GHG reduction targets is the result of (1) several initiatives to be directly implemented by the County and (2) incorporating GHG-reduction features into the construction and operation of development projects (including County-initiated and privately initiated projects). A purpose of the CAP Consistency Checklist is to incorporate applicable CAP measures and actions into projects when they are not otherwise binding and enforceable. The Checklist applies to discretionary projects that are subject to and not exempt from CEQA (including new development applications and expansions or renovations of existing development). To be consistent with the CAP Update, a project must demonstrate consistency with existing General Plan regional categories, land use designations, and zoning designations and

demonstrate consistency with applicable CAP Update measures and actions. The CAP Consistency Checklist sets forth two sets of CAP Consistency Requirements (one set for privately initiated projects and a second set for County-initiated projects) that project proponents are required to incorporate into their projects to demonstrate consistency with the CAP Update. If a project is not consistent with the regional categories and land use designations of the General Plan and zoning designations, then it shall not use the CAP Consistency Checklist for CEQA streamlining.

The CAP Update includes actions to reduce GHG emissions, some of which require the development and implementation of ordinances and programs that require additional study, outreach, development, and separate Board approval. Such actions are quantified in a manner that reflects these factors; that is, the estimates of GHG emissions reduction potential from quantified implementing actions are based, in part, on assumptions regarding the date by which the actions would take effect. For CAP Update actions that would be incorporated into County-initiated and privately initiated projects via the CAP Consistency Checklist, the effective dates of the Consistency Requirements in the Checklist are consistent with the effective dates assumed in the quantification of GHG reduction potential in the CAP Update as shown in Appendix 7.

The comment specifically references Consistency Requirements #1 and #4 for privately initiated projects, which have effective dates of 2028 and 2030, respectively. The calculations performed to anticipate the GHG emissions reductions from these actions in the CAP Update do not assume that these actions would take effect immediately upon adoption of the CAP Update.

The TDM ordinance (Consistency Requirement #4) is required by CAP Update Action T-6.2, which states that the County will adopt a Transportation Demand Management (TDM) Ordinance by 2028. Moreover, Action T-6.2 is not a quantified implementing action in the CAP Update. Therefore, GHG emissions reductions resulting from projects complying with the TDM ordinance, once effective, would be in addition to quantified GHG emissions reduction potential reported in the CAP Update. The effective date of this Consistency Requirement is not inconsistent with the CAP Update.

Regarding electrification of loading docks (Consistency Requirement #1), which is required by CAP Update Action T-3.1, the GHG reduction potential reported in the CAP Update reflects an effective date of 2030 for implementation of this action. The Checklist correctly identifies the requirement as not applicable until the ordinance has been amended and the amendments have gone into effect. The effective date of this Checklist requirement is not inconsistent with the CAP Update.

The comment restates and quotes from the tree planting and tree preservation requirements (Consistency Requirements #8 and #9) but does not further comment on these requirements. These Consistency Requirements would apply to privately initiated projects upon adoption of the CAP Update. Moreover, the CAP Update includes Action A-2.1, a quantified implementing action under which the County would achieve GHG emissions reductions through development and implementation of an Equity Driven Tree Planting Program that results in the planting of new trees on County property and in the

unincorporated area. As set forth in the CAP Update, GHG emissions reductions would occur under these actions as a result of actions taken by the County and do not rely on incorporating GHG reduction features into development projects.

The comment also makes a statement that “(t)he remaining items essentially only require adherence to Tier 2 standards of the CALGreen Code” without providing further detail. The Checklist includes several requirements with references to Tier 2 requirements in CalGreen, including Consistency Requirement #2, Install Electric Vehicle Charging Infrastructure; Consistency Requirement #5, Electrify Buildings and Appliances; Consistency Requirement #6, Increase Renewable Energy; and Consistency Requirement #7, Increase Water Efficiency. Each of these requirements appropriately references specified provisions of Tier 2 CALGreen requirements to substantiate how CAP Update actions will be incorporated into development projects to achieve GHG emission reductions in furtherance of the CAP Update’s attainment of its 2030 and 2045 GHG reduction targets.

The comment then asserts that the Checklist “represents an incredible missed opportunity for the County to ensure meaningful on-site GHG mitigation” without any elaboration. It then offers suggested revisions to the Checklist. The County has reviewed these suggestions considering the Checklist’s purpose of incorporating applicable CAP measures and actions into projects when they are not otherwise binding and enforceable and has the following responses:

- Regarding parking de-coupling, the CAP Update does not include any quantified implementation actions through which GHG emissions reductions are achieved from parking de-coupling. The CAP Update does include Action T-6.2.a, under which the County would adopt a TDM ordinance to include preapproved options for new development to reduce single occupancy vehicle trips in the unincorporated areas. This action is incorporated into the Checklist as Consistency Requirement #4. The County will evaluate parking de-coupling as well as other parking-related strategies as potential preapproved options during development of the TDM ordinance.
- Regarding transit, carpool, and vanpool subsidies, the CAP Update includes Action T-6.1, under which the County would develop a program to provide free transit passes or free trips in the unincorporated area to reduce VMT, and Action T-6.3, under which the County would increase access to first- and last-mile transportation services and connections to reduce VMT. As set forth in the CAP Update, GHG emissions reductions would occur under these actions as a result of actions taken by the County and do not rely on incorporating GHG reduction features into development projects. However, the County will evaluate transit, carpool, and vanpool subsidies from project proponents as potential preapproved options during development of the TDM ordinance (Action T-6.2.a; Consistency Requirement #4) and as potential elements of the programs developed under T-6.2 and T-6.3.
- Regarding clustering design that reduces VMT and preserves habitat and provision of on-site mixed uses, the CAP Update does not include any quantified

implementation actions through which GHG emissions reductions are achieved from these strategies. The CAP Update does include Action T-6.2.a, under which the County would adopt a TDM ordinance to include preapproved options for new development to reduce single occupancy vehicle trips in the unincorporated areas. This action is incorporated into the Checklist as Consistency Requirement #4. The County will evaluate clustering design that reduces VMT and preserves habitat and provision of on-site mixed uses as potential preapproved options during development of the TDM ordinance.

- Regarding prohibitions or limits on natural gas fireplaces and hearths, the CAP Update does not include any quantified implementation actions through which GHG emissions reductions are achieved through prohibitions or limits on natural gas fireplaces and hearths. However, the County will evaluate whether to prohibit or limit natural gas fireplaces and hearths as part of its implementation of CAP Update Action E-2.1, regarding amendment of the County Code of Regulatory ordinances by 2026 to require all-electric equipment in new residential, commercial, and industrial construction, and as part of its implementation of CAP Update Action E-2.2, regarding amendment of County's Code of Regulatory Ordinances, adoption of a building performance standard, and development of an incentive program by 2030 to increase energy efficiency and electrification in existing residential and non-residential development.
- Regarding provision of bicycle storage lockers, racks, and other bicycle storage facilities for residents and employees, the CAP Update does not include any quantified implementation actions through which GHG emissions reductions are achieved from bicycle parking and storage. The CAP Update does include Action T-6.2a, under which the County would adopt a TDM ordinance to include preapproved options for new development to reduce single occupancy vehicle trips in the unincorporated areas. This action is incorporated into the Checklist as Consistency Requirement #4. The County will evaluate bicycle parking and related strategies as potential preapproved options during development of the TDM ordinance.
- Regarding placement of conservation or agricultural easements at a 2:1 ratio when a project results in conversion of natural habitat or agricultural lands, the CAP Update includes Action A-1.1, under which the County would acquire conservation lands and protect them in perpetuity, and Action A-1.2, under which the County would restore County-owned lands to increase carbon storage. As set forth in the CAP Update, GHG emissions reductions would occur under these actions as a result of actions taken by the County and do not rely on incorporating GHG reduction features into development projects. Separate from any GHG streamlining benefits provided to projects under the CAP Update's Checklist, proposed discretionary projects must undergo review of agricultural and biological resources prior to permit issuance, as described on the County's website: <https://www.sandiegocounty.gov/content/sdc/pds/procguid.html>.
- Regarding measures to reduce GHG emissions from heavy-construction equipment and prohibit gas-powered landscaping equipment, the CAP Update

includes Action T-2.1, under which the County would develop a program to provide residents and businesses with incentives to purchase alternative fuel or zero-emissions construction and landscaping equipment to reduce emissions, and Action T-2.2, under which the County would develop and adopt a landscaping equipment ordinance to require the use of zero-emission landscaping equipment by 2030 and zero-emission construction equipment by 2045 in the unincorporated area. As set forth in the CAP Update, GHG emissions reductions would occur under these actions as a result of actions taken by the County and do not rely on incorporating GHG reduction features into development projects.

In summary, the CAP Checklist requirements appropriately align with relevant assumptions of the CAP Update modeling of the GHG reduction potential of quantified implementing actions. Accelerated timelines, requiring projects in “high VMT areas to provide funding for the CAP’s measures,” and other potential requirements referenced in the comment are not included in the CAP Update’s package of quantified implementing actions that would achieve the County’s 2030 and 2045 GHG reduction targets and are not necessary to avoid “contravention of the CAP’s targets” as asserted by the commenter, nor are they necessary for the CAP Consistency Checklist to fulfill its purpose of incorporating applicable CAP measures and actions into the construction and operation of development projects when they are not otherwise binding and enforceable to contribute to the CAP Update’s attainment of the County’s 2030 and 2045 GHG reduction targets.

Comment O18-18

The comment expresses a desire for the County to incorporate the comments described above.

Response O18-18

Refer to Responses O18-1 through O18-17, above. The County is confident, based on the evidence provided therein, in the legal adequacy of both the CAP Update and the Draft SEIR.

FARM BUREAU San Diego County

Letter
019

The Voice of Local Farmers

Serving San Diego agriculture since 1914

January 5, 2024

Meghan Kelly
County of San Diego
Planning & Development Services
5510 Overland Ave., Suite 310
San Diego, CA 92123

Subject: County of San Diego Draft 2024 Climate Action Plan

Dear Ms. Kelly,

The San Diego County Farm Bureau (Farm Bureau) appreciates this opportunity to comment on the County of San Diego's Draft Climate Action Plan (Draft Plan). Established in 1914, San Diego County Farm Bureau is a nonprofit supported by over 1,400 dues-paying members. Our mission is to foster San Diego agriculture through education, public relations, and public policy to promote the economic viability, sustainability, and community building of agriculture.

O19-1

As stated in the Draft Plan, the Agriculture and Conservation sector refers to emissions associated with livestock, application of fertilizer, and the use of petroleum – or diesel – powered equipment. Emissions associated with this sector accounted for only four percent of the total emissions in 2019. The Agriculture and Conservation sector includes two GHG reduction strategies comprising five measures, four of which affect agriculture directly.

A-2: Develop a tree planting program that expands canopy across the unincorporated area and prioritizes underserved communities

Farm Bureau agrees that trees are a significant source of carbon capture and storage due to their size and longevity. While it is impressive that the Tree Planting Program at County Parks has planted 30,029 trees since 2015, it is important to note that agriculture is losing thousands of trees due to the increasing economic costs of farming every single year. We ask that when developing the tree planting program, the county consider ways that they can support agriculture keeping the trees that are already planted in the ground and that will also continue to produce food for our community.

O19-2

A-3: Preserve agricultural lands to prioritize carbon storage and balance economic and development goals

Farm Bureau supports the preservation of agricultural lands in order to maintain the county's agricultural landscape, economy, and food source for years to come. We are supportive of the PACE program. However, it is important to note that just because agricultural land is preserved does not mean that it will continue to be an operational farm. Farming is a business and must remain economically viable in order for the land to continue to be farmed on. When costs such as labor, crop protection materials and water

FARM BUREAU San Diego County

The Voice of Local Farmers

Serving San Diego agriculture since 1914

are too high, and the regulatory burdens are too cumbersome, a land owner may have no choice but to abandoned their farm. Farm abandonment usually creates a bigger issue of unmaintained land, overgrown with invasive brush, and a likely wildfire hazard.

A-4: Incentivize carbon farming to expand carbon storage capacity on agricultural land and support climate-friendly farming practices in the unincorporated area

Farm Bureau is supportive of an incentive-based approach to implementing a variety of techniques on natural and working lands that reduce GHG emissions and provide co-benefits such as water and land conservation. We appreciate the work that County Staff has put into seeking Farm Bureau feedback on their Carbon Farming Program.

A-5: Reduce greenhouse gas emissions from agricultural operations

Farm Bureau supports the incentive-based approach to replacements of diesel-powered farm equipment to lower emission, or electric, equipment and energy efficiency improvements. The Draft Plan states that these improvements will also lead to a reduction in overall operational costs as cleaner equipment replacements are often more fuel-efficient and energy use reductions will lower utility costs. We must ensure that electricity capacity is sufficient to run these electric replacements. It is also important to note that if the cost of electricity continues to increase, the lower utility cost benefits will be irrelevant.

The Draft Plan attributes only four percent of greenhouse gas (GHG) emissions in the unincorporated area to farming activities. While Farm Bureau and the farming community support an incentive-based approach in reaching the County's goal of net zero emissions, we must remember that emissions created in farming our foods, fiber and flowers are largely offset by carbon sequestration in the growing crops. Farming in San Diego County is necessary to locally feed and provide oxygen to our community. Without a local food source, farming is at risk of being sourced from overseas where not only is our food security threatened, but the carbon footprint to transport produce increases dramatically and environmental practices, labor laws, and pesticide regulations are questionable.

Farm Bureau appreciates the work that County Staff has put in to seek our feedback and again, thank you for this opportunity to comment.

Sincerely,

Dana Groot
President

O19-2

Letter O19 San Diego County Farm Bureau

Dana Groot, President

January 5, 2024

Comment O19-1

The comment provides background information about the San Diego County Farm Bureau.

Response O19-1

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O19-2

The comment addresses topics related to CAP Update Measures A-2 through A-5, including suggestions for tree planting program implementation (A-2), comments on the economic viability of farming (A-3), support for incentive-based implementation (A-4 and A-5), and comments on the cost of electricity (A-5).

Response O19-2

The County appreciates the commenter's suggestion for how to further reduce GHG emissions. The CAP Update includes measures to reduce GHG emissions through preserving natural and agricultural lands. Specifically, Measure A-2 would result in a tree planting program that expands the canopy across the unincorporated area and prioritizes underserved communities; Measure A-3 would preserve agricultural lands to prioritize carbon storage and balance economic and development goals; Measure A-4 would incentivize carbon farming to expand carbon storage capacity on agricultural land; and Measure A-5 would reduce GHG emissions from agricultural operations. Please also refer to Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," regarding how the proposed CAP Update measures would collectively achieve the established GHG emissions targets.

Dear Meghan Kelly,

San Diego Community Power is proud to support the continued efforts of the County of San Diego's Sustainability Planning Division and their meaningful updates to the Climate Action Plan. The County's commitment to addressing the climate crisis and implementing ambitious benchmarks and milestones is admirable, and SDCP appreciates the significant strides being made to maximize emissions reductions in our community through the Zero Carbon Portfolio Plan.

O20-2

SDCP commends the goals of the CAP to increase energy efficiency, renewable energy use and electrification of County Operations (E-1). SDCP is eager to support the County with these efforts, whether through programmatic support or enrollment of eligible County operational accounts in our Power100 service, which provides customers who opt in with 100% carbon-free electricity. We also commend the CAP's focus on building electrification (E-2&3) – as it is a crucial step towards achieving sustainable and environmentally friendly development.

SDCP would like to recommend additional policy pathways to further advance this critical initiative. Specifically, we would support requirements for electrical work to be exclusively performed by C-10 licensed contractors. This measure ensures that qualified professionals are engaged in the electrification process, ensuring the safety and efficacy of these crucial projects.

Much like the CAP's commitments in Actions 3.2 & 3.3, SDCP is dedicated to building local renewable resources, bringing solar and other renewable opportunities to our communities of concern, and providing choice to customers in the unincorporated areas of the County. We look forward to further coordination on these points – specifically on opportunities around local generation. SDCP would welcome additional collaboration from the County on engagement with the 17 federally recognized Tribal Authorities located within the unincorporated region to ensure the Tribal Authorities have the same opportunities from SDCP for programs, development and energy choice.

O20-3

Finally, SDCP encourages inclusion of language that highlights the continued collaboration of our agencies on programs that actively support existing homeowners, renters and businesses in their efforts to electrify or otherwise reduce their energy costs. This partnership has already yielded innovative solutions through the formation of the Regional Energy Network.

SDCP recognizes the County's commitment to continuous improvement in the CAP and the notable partnership with SDCP. The collaboration between the County and SDCP has been exemplary, showcasing a shared dedication to reducing emissions and advancing renewable energy in the region.

O20-4

Thank you for your dedication to this critical cause, SDCP looks forward to supporting the updated CAP.

Sincerely,

Karin Burns (Jan 5, 2024 17:03 PST)

Letter O20 San Diego Community Power

Karin Burns

January 5, 2024

Comment O20-1

The comment states that the letter of support from the San Diego Community Power for the CAP Update is attached.

Response O20-1

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O20-2

The comment includes an introductory statement and commends the County's efforts in preparing the CAP Update. The comment also commends the goals of the CAP Update to increase energy efficiency, renewable energy use, and electrification of County operations.

Response O20-2

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment O20-3

The comment recommends that electrical work be exclusively performed by C-10 licensed contractors. The comment encourages further collaboration with the County.

Response O20-3

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a). The comment will be provided to County decision-makers for their consideration during the adoption hearings for a Final CAP Update.

Comment O20-4

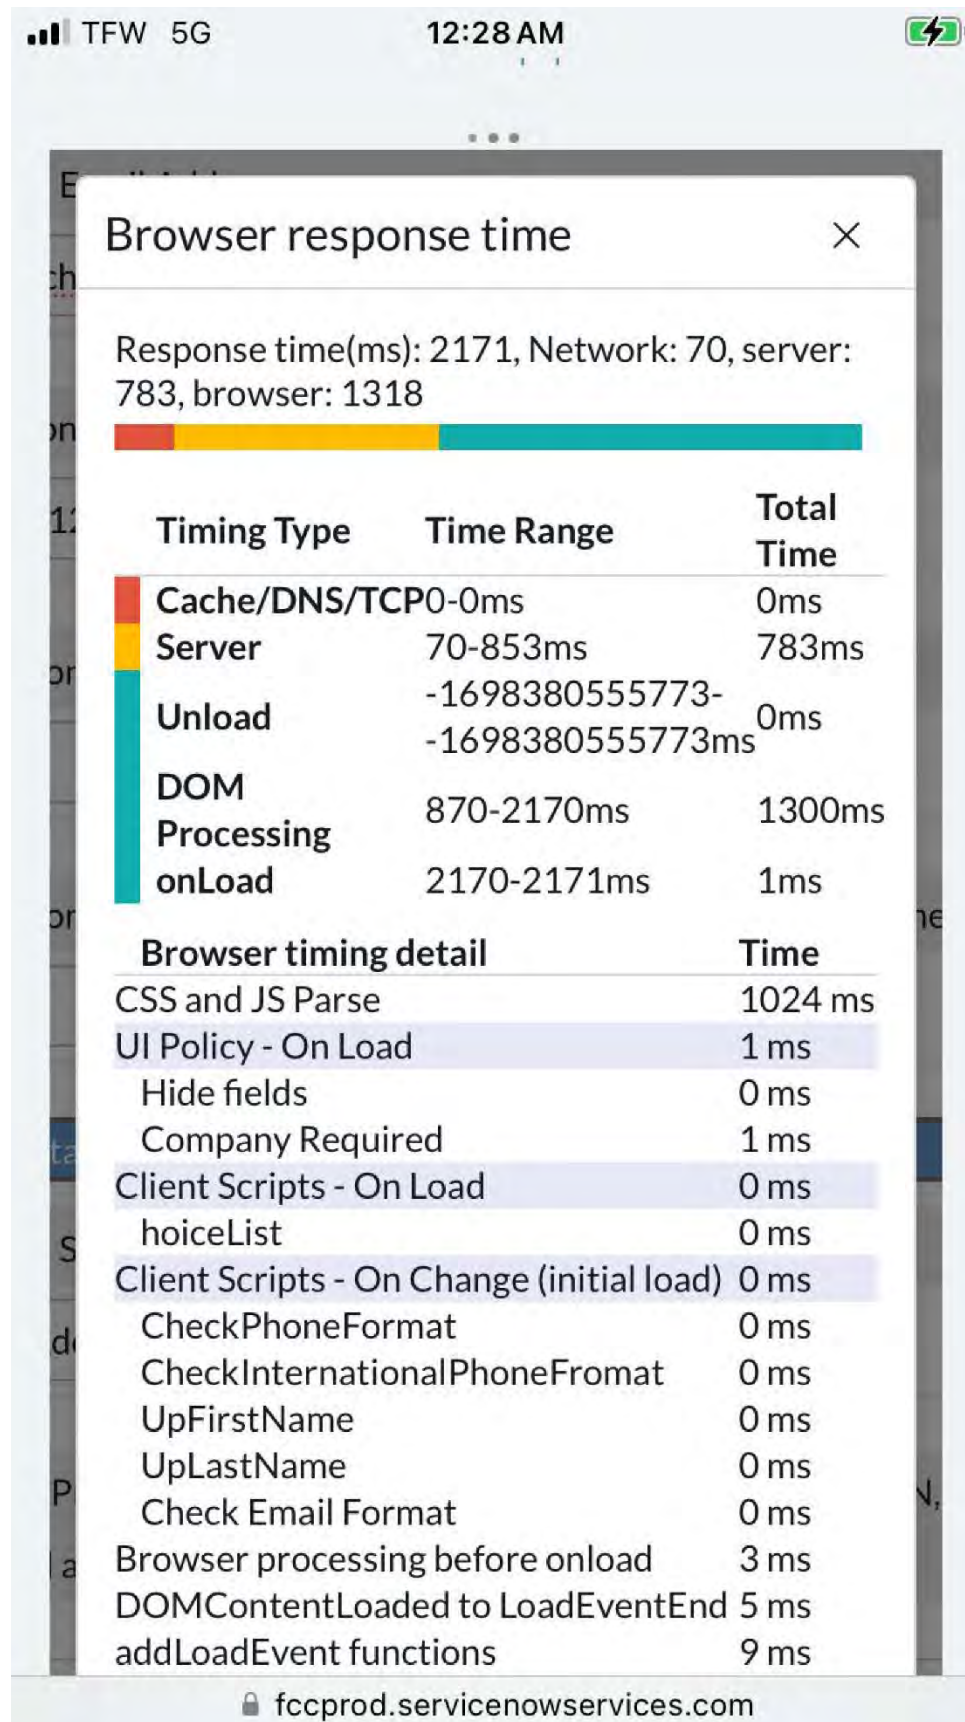

The comment recognizes the County's dedication to improve the CAP Update and continued collaboration with San Diego Community Power.

Response O20-4

The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment I1-1

The comment consists of an online comment form, which indicates that the comment is applicable to the following resource topics: air quality, energy, environmental justice, GHG emissions, hazards and hazardous materials, hydrology and water quality, and noise. However, no specific comment is provided.

Response I1-1

The listed resources are evaluated in the Draft SEIR. See Sections 2.3, 2.6, 2.7, 2.8, 2.9, 2.10, and 2.12 for impacts analysis related to air quality, energy, environmental justice, GHG emissions, hazards and hazardous materials, hydrology and water quality, and noise, respectively.

Comment I2-1

The comment requests evidence to prove climate change.

Response I2-1

As described on pages 1 through 4 of the Draft SEIR, the County's preparation of the CAP Update is intended to fulfill the County's obligation under Mitigation Measure CC-1.2 of the 2011 GPU PEIR to prepare a CAP and to reduce GHG emissions consistent with state legislative requirements. The Draft SEIR has been prepared to analyze the environmental impacts of the proposed CAP Update. The scientific basis of climate change and the sources of GHG emissions as primary contributors to climate change are summarized in Section 2.8.1.1 of the Draft SEIR. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Q4. Enter your comment here

Dear County of San Diego CAP SEIR, On page 5-67, Figure 5-1i, there was a map of area "H" that included the unincorporated community of Spring Valley, CA 91977. Please amend the map provided by Ascent to include the overlapping federal open space for the San Diego National Wildlife Refuge Complex. The current Ascent map marks "parks and open space" for the County of San Diego Parks & Recreation, but omits the state and national parks and national refuges. Please also check the legend or map key for the number and location of the schools, especially in area "H". For example, there seems to be more "stars" marking schools than there are public schools currently existing in the La Mesa-Spring Valley School District, and the Grossmont Union High School District. Cuyamaca Community College is a "college" rather than a "school". Is the map including other private schools? The map is not clear, since each school was not individually named. Lastly, the fire hazard markings of yellow for "high" risk and red for "very high" risk overlapped onto my residential street and onto the local, neighborhood elementary school property. Are these fire hazard areas related to the interface between the suburban and open space areas? The current map does not explain why these colors included single-family homes and public institutions, such as La Presa Elementary School, that are beyond the defensible space minimum, and are across a street with another row of houses between my home and the open space. Respectfully, Daphne H. Galang, Spring Valley, CA 91977 P.S.-Thank you for the printed copy of the draft County of San Diego CAP SEIR available in the Rancho San Diego Public Library on Tuesday, November 14, 2023.

Q5. Upload your files here not answered

IS-1

Letter I5 Daphne Galang

November 15, 2023

Comment I5-1

The comment requests Figure 5-1i to be revised to include the San Diego National Wildlife Refuge Complex. The comment states that national and state parks and open space are not included in the figure. The comment requests clarification on what schools (e.g., private schools, public schools, and colleges) are labeled on the figure. The comment also seeks clarification on the fire hazard severity zones shown in the figure.

Response I5-1

The comment refers to a submap prepared for the Fire Safe and VMT Efficient Alternative. The purpose of the map is to identify the portions of the unincorporated county where growth would be incentivized under the smart growth alternative. Services and parks are provided for reference but are not integral to the mapping or analysis provided in the Draft SEIR.

The fire hazard severity zones depicted on Figure 5-1i are based on information prepared by the California Department of Forestry and Fire Protection. These maps are developed to inform planning decisions and are not intended to be indicative of fire risk on any particular property. No revisions have been made to the Draft SEIR in response to this comment.

I 16-1

Letter I6 Jarrod Caswell
November 20, 2023

Comment I6-1

The comment recommends that the County should provide community free shuttle service.

Response I6-1

The County appreciates the commenter's suggestion for how to further reduce GHG emissions. Please see Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," which describes the methodology the County used to establish GHG reduction targets that are appropriately aligned with statewide targets and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets.

Note that the CAP Update includes Measure T-6: Support transit and transportation demand management to reduce single occupancy vehicle trips in the unincorporated area. As articulated in the CAP Update (page 56), "the County can partner with the region's transit agencies (e.g., San Diego Metropolitan Transit System, North County Transit District) to support transit ridership for unincorporated area residents." Measure T-6 will also use TDM policies that include shuttle service and transit subsidies and increase access to transportation services (e.g., neighborhood electric vehicles, microtransit, bike and scooter share).

Letter
17

From: [Bridgett Ross](#)
To: [CAP](#)
Subject: [External] Climate Action plan
Date: Thursday, December 21, 2023 10:51:40 PM

Hi,

I am writing to comment/ask about two aspects of the plan:

1. **Car charging in multi-occupancy buildings** (eg, condos, apartments): I didn't see any legal requirements or financial support for these buildings to allow residents to charge at their building. Many older buildings do not have places for people to charge their cars and have no plans to make car-charging accessible unless required by law. Often these buildings cannot afford to do more than the bare minimum to stay up to code. It is hard for people to purchase an EV car if they cannot charge it at home. Charging stations across San Diego are often broken. Personally, I would love an electric car, but cannot buy one because I have nowhere to charge it and I cannot depend on unreliable public charging stations.

17-1

2. **Bike lanes:** I couldn't understand the specific plans from the document. I request that attention be given to linking up existing bike lanes so that there are not "mostly" safe routes. Consider riding from the beach to downtown. There is always an incredibly dangerous mile. While not in San Diego, my dear friend Sarah Langenkamp died on a short stretch off road that was the only unsafe segment of her bike route in Washington D.C. There have been similar deaths here. I mention her name because her death is tragic and received National attention. Additionally, please create SAFE bike lines. Do not install temporary bike lanes and then leave them for years assuming they are good enough. Or assume that their failure somehow reflects the inadequacy of bike lanes.

17-2

Thank you for taking the time to read this email. And thank you for your effort on the climate action plan.

Thank you,
Bridgett

Sent from my iPhone

Letter I7 Bridgett Ross

December 21, 2023

Comment I7-1

The comment includes an introductory statement and expresses concern about accessibility to car charging stations in multi-occupancy buildings.

Response I7-1

The County appreciates the commenter's concern for equitable access to car charging infrastructure. This comment aligns with key themes heard during community outreach conducted during CAP Update preparation. Incentivizing access to electric vehicles and charging infrastructure, particularly in frontline communities, is a key element of the County's strategy to decarbonize the on-road vehicle fleet. In addition, the County has several separate initiatives related to electric vehicle charging. For example, as explained on page 5 of the CAP Update:

Since 2020, the County has collaborated with regional partners to advance zero-emission vehicles (ZEV) in the region as a founding member of the Accelerate to Zero Emissions (A2Z) Collaboration. Comprised of local and regional governments, industry, academia, and local community-based organizations in the San Diego region, the A2Z Collaboration is developing a vision for and implementing a San Diego Regional Electric Vehicle (EV) Strategy that will accelerate investment in ZEVs and EV infrastructure to reduce air pollution and GHG emissions and address climate change. The A2Z Collaboration brings together key stakeholders in the region to attract public and private investment and advance equitable access to EVs and charging stations across the region.

The CAP Update includes Measure T-3: Install electric vehicle charging stations and provide incentives for zero-emissions vehicles in the unincorporated area, which would increase the accessibility of electric vehicle charging infrastructure at publicly accessible locations, including multi-occupancy buildings. Through Action T-3.1, the County would install 2,040 publicly available electric vehicle charging stations by 2028 and require vehicle charging infrastructure installations and preferential parking for zero-emission vehicles for multi-family residential and non-residential construction projects.

Comment I7-2

The comment expresses concern about bike lane safety.

Response I7-2

The CAP Update establishes a vision for a net zero future that includes improved bike lanes. Specifically, the CAP Update includes Measure T-5: Improve County roadways to encourage walking, biking, rolling to/from transit and destinations and increase transportation efficiency. As described on page 55 of the CAP Update, this measure includes roadway enhancements that protect all users and create a more comfortable and safer experience for pedestrians and bicyclists to reduce single occupancy automobile trips and encourage active transportation. This measure will implement infrastructure improvements (e.g., sidewalks, bike lanes) using improved materials and

designs and create education safety programs that support shifting transportation modes to walking, biking, rolling, carpooling, and public transit. However, specific plans related to bike lane layout and linkages are established through the County's Active Transportation Plan, which was approved by the Board in 2018. Additionally, the County uses Chapter 1000, "Bikeway Planning and Design," of the Caltrans publication *California Highway Design Manual*, as amended as the bikeway standard on County public roads.

The County acknowledges the commenter's concern regarding bike lane safety. Please see Section 9.1.1.1, "Master Response: CAP Update Purpose and Land Use Change," which explains the purpose of the CAP Update, and see Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," which describes the methodology the County used to establish GHG reduction targets that are appropriately aligned with statewide targets and adequately identifies measures and actions to reduce GHG emissions to levels that achieve the targets.

From: [Michelle Baca](#)
To: [CAP](#)
Subject: [External] The San Diego Climate Action Plan
Date: Monday, January 1, 2024 10:03:04 PM

I urge you to vote against the The San Diego Climate Action Plan

- 1) the cost benefit analysis doesn't pan out - other countries such as China has more than doubled it's carbon output. Locally, our reduction will be miniscule while being costly.
- 2) the plan is racist and offensive - CAP authors assume indigenous peoples and persons of color are harmed more implying they are not enjoying the benefits of modern society and living are living a pre-industrial existence
- 3) there is no scientific evidence that the measures will make any difference as most CO2 is produced in the ocean
- 4) the policies lead to fascism with government/corporate partnerships
- 5) there is no climate emergency according to scientists and meteorologists - "Flawed modelling and overblow rhetoric drowning out scientific reality for the sake of money and power, experts say." Epoch Times 9/27/2023
- 6) huge intrusion on individual freedom and choice

18-1

To: Kelly, Meghan <Meghan.Kelly@sdcounty.ca.gov>
Subject: [External] County's Draft Climate Action Plan

The Draft Action Plan will do little to achieve the goals for protecting the climate. There is an alternative that will achieve the outcome that is hoped for. The Count's unincorporated areas offer the greatest potential for improving the climate.

Adopt the recommendations presented in the Wolford Brief that will enable 12 million Californians to live in new cities without being dependent on owning and operating an automobile. 310.871.1113

I9-1

Letter I9 Albert Perdon

January 1, 2024

Comment I9-1

The comment states that the CAP Update “will do little to achieve the goals for protecting the climate.” The comment recommends adoption of the recommendations in the Wolford Brief to accommodate growth without dependency on automobiles.

Response I9-1

The County acknowledges the commenter’s concern regarding the effectiveness of the CAP Update measures and actions in achieving climate protection goals. Please see Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explains the methodology the County used to established GHG reduction targets that are appropriately aligned with statewide targets and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets.

The commenter has not provided said brief for reference. Therefore, no further response is provided.

To whom it may concern:

It is already too expensive to live in San Diego CA - I am holding on by the skin of my teeth, but with these new plans to control virtually all San Diego spending in that every action implemented locally will have to be Climate Action Plan (CAP) friendly to be approved is **not a good idea** and will have more people and businesses leaving the State, this is a huge intrusion on individual freedom and choice.

Reasons why:

1) the cost benefit analysis doesn't pan out - other countries such as China has more than doubled it's carbon output. Locally, our reduction will be miniscule while being costly. 2) the plan is racist and offensive - CAP authors assume indigenous peoples and persons of color are harmed more implying they are not enjoying the benefits of modern society and living are living a pre-industrial existence 3) there is no scientific evidence that the measures will make any difference as most CO2 is produced in the ocean 4) the policies lead to fascism with government/corporate partnerships.

From Elena Baker, an American Citizen who has lived in CA for over 37 yrs. I pay my taxes but am considering moving out of State because cost of living is already too high.

I13-1

Letter I13 Elena Baker

January 3, 2024

Comment I13-1

The comment expresses opposition to the CAP Update and disagreement about climate change.

Response I13-1

As described on pages 1 through 4 of the Draft SEIR, the County's preparation of the CAP Update is intended to fulfill the County's obligation under Mitigation Measure CC-1.2 of the 2011 GPU PEIR to prepare a CAP and to reduce GHG emissions consistent with state legislative requirements. The Draft SEIR has been prepared to analyze the environmental impacts of the proposed CAP Update. The scientific basis of climate change and the sources of GHG emissions as primary contributors to climate change are summarized in Section 2.8.1.1 of the Draft SEIR. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Subject: [External] SEIR public comment
Date: Wednesday, January 3, 2024 12:47:22 PM

We can all agree we want housing to be more heat and cool efficient, and we can all agree we want open spaces, parks and farms. However, I am against excessive spending to implement new infrastructure for which we don't have the money. We don't need more regulations; CA has too many as is. We don't need more emission-control strategies that take away our financial ability to support ourselves.

I disagree with the Net Zero plans because they are not sustainable to human life, to the economy or to common sense or reason. It is a rash idea to disregard human life and to be willing to sacrifice human life for the fake "climate emergency." Green House Gases (GHG) are not killing us. We can adapt to them better than the Net Zero proposals! Those proposals are pure coercion and eventual totalitarian top-down government tactics against "We The People." In America, this is not how we get things done.

I'm against any vehicle miles-traveled-coercion by toll roads or 15 or 20-minute cities that put limitations on one's ability to travel by personal vehicle. Solar and Electrical Vehicles (EV's) are not sustainable. They have toxic chemicals; they use foreign resources like rare-earth metals, that we do not mine for in the US as we should if we really want those products. Our energy power grid infrastructure cannot sustain more EV's. Renewable Energy technologies are not equivalent to current energy creation and are not sustainable for the population here. We are setting ourselves up for more rolling black outs and higher costs of energy which are not sustainable for the average person. EV fires are extremely hot and hard to put out which put us at much higher risk for the spread of wildfires. This is toxic hazardous waste, and it is insane to pave the way for more of these vehicles here in San Diego.

114-1

Building more High Density Housing (HDH) is not a solution to pollution. Teaching people how to farm and encouraging people to be farmers is. We need more farmers more than we need more dense housing and public transportation.

Will you make exceptions to new regulations when, "construction related to implementation of the GHG reduction measures and their associated actions could result in exceedances of local criteria air pollutant thresholds?" What an oxymoron. You, the elite, are making "Rules for me, but not for thee."

I disapprove of the Water Efficiency Plan as it can limit people's water consumption to unsustainable levels. People should not be having to weigh if they can shower that day or if they do laundry, and that is where this plan will be leading.

I see lot of vague visions in this report. I see very little numbers showing the plan of action and how this will actually make a difference in lowering any substantial average temperatures locally. What is the goal? What is the achievable number you are wanting? Is there any proof these changes will accomplish the goal? I recommend removing from the language anything about Net zero, zero carbon, zero emission, or zero GHG. These are unrealistic, unattainable, unreasonable goals. A lot of it is like cheating on your taxes and trying to come up with ways that you are able to write-off your emissions.

Summer Boger
San Diego Resident since birth

Letter I14 Summer Boger

January 3, 2024

Comment I14-1

The comment expresses concern about government spending and regulations associated with the CAP Update. The comment questions the effectiveness of the CAP Update measures and disagrees with the net zero emissions target. The comment states that the existing infrastructure cannot sustain more electrical vehicles and renewable energy technologies are not sustainable.

Response I14-1

As described on pages 1 through 4 of the Draft SEIR, the County's preparation of the CAP Update is intended to fulfill the County's obligation under Mitigation Measure CC-1.2 of the 2011 GPU PEIR to prepare a CAP and to reduce GHG emissions consistent with state legislative requirements. The Draft SEIR has been prepared to analyze the environmental impacts of the proposed CAP Update. The scientific basis of climate change and the sources of GHG emissions as primary contributors to climate change are summarized in Section 2.8.1.1 of the Draft SEIR. The comment does not provide support for the statement that renewable energy technology is unsustainable. Renewable energy would be obtained from San Diego Gas & Electric through San Diego Community Power, which has an established renewable energy portfolio. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Subject: [External] Opposition to the CAP
Date: Wednesday, January 3, 2024 9:29:57 AM

I am opposed to the CAP proposed by San Diego County.
There is no climate emergency according to scientists and meteorologists - "Flawed modelling and overblown rhetoric drowning out scientific reality for the sake of money and power, experts say." Epoch Times 9/27/2023.
Plus there is no scientific evidence that the measures will make any difference as most CO2 is produced in the ocean.
The policies will lead to fascism with government/corporate partnerships and be a huge waste of money.
The plan reads very racist and offensive and is a huge intrusion on individual freedom and choice.
I vote no.

Once again you are trying to control with this idea,(CAP) rather than enhance our way of life.
 You should be giving encouragement , rather than commands, especially since your reports are biased.

Why would we think you have any better ideas for us environmentally, when you allow waste to accumulate from homeless and illegal migrants, when you do nothing environmentally to cleanup riverbeds polluted wit drug needles, feces, trash, when you spend millions on ineffective mass transit that few utilize?
 The pollution from Tijuana into the ocean that flows onto our beaches has continued for years. Why don't you solve that?
 The citizens don't want any of the above, but you allow it!

The citizens are responsible to recycle. Every time you mandate a new law for the environment, you charge them. This is totally discriminatory, as it places more of an economic burden on lower income families, unless you charge others more to compensate!

How much did you spend on those compost buckets that few will utilize for that? Do you know what they will be used for???? i.e mop buckets, pet waste, lunch bucket, beer cooler, etc..
 Oh, you are going to pay for "compost bucket police" to fine offenders?

Have you ever been so busy following the rules and laws , that you forget to live?
 That will be your citizens....robots with no independent brains, not required to think.

We evolve or die off. That is evolution. Don't kill us off financially overnight with new rules and fines.
 Your goal of a healthy environment should evolve gradually, not because you want it now.

I respectfully suggest that you get out of the "boardroom" and mingle with the citizens, look at all of the scientific data, before you vote on a comprehensive package.

Patti K.

I17-1

Letter I17 Patti Kirchwehm

January 3, 2024

Comment I17-1

The comment expresses opposition to the CAP Update and concern regarding the CAP Update's effects related to quality of life and financial burden on lower income families.

Response I17-1

As described on pages 1 through 4 of the Draft SEIR, the County's preparation of the CAP Update is intended to fulfill the County's obligation under Mitigation Measure CC-1.2 of the 2011 GPU PEIR to prepare a CAP and to reduce GHG emissions consistent with state legislative requirements. The Draft SEIR has been prepared to analyze the environmental impacts of the proposed CAP Update. The scientific basis of climate change and the sources of GHG emissions as primary contributors to climate change are summarized in Section 2.8.1.1 of the Draft SEIR.

With regards to the disproportionate economic burden on lower income families, please see Section 2.7, "Environmental Justice," for a discussion related to the potential for disproportionate impacts on environmental justice communities to occur as a result of the project. Implementation of the CAP Update includes a combination of regulations, programs, incentives, and outreach and educational activities to reduce GHG emissions. To address equity in CAP Update implementation, a cost analysis (Appendix 12) was prepared to understand how some populations or local communities may experience disproportionate costs or impacts from climate change and CAP implementation, and an Equity Implementation Framework (Appendix 9) was developed to prioritize climate action in frontline communities and ensure equity-based outcomes and co-benefits are realized equitably throughout the unincorporated area.

Subject: [External] Climate action plan
Date: Wednesday, January 3, 2024 3:07:26 PM

We are writing to express our extreme opposition to the San Diego Climate Action Plan (CAP). Climate change has been occurring since the earth was formed and there is zero evidence that man can do anything to substantially affect it. The earth has been warmer than it is now and it has been much colder. God is in charge, not man.

Here are some other reasons why anyone in their right mind would dismiss this cockeyed proposal:

- 1) the cost benefit analysis doesn't pan out - other countries such as China have more than doubled their carbon output. Locally and nationally, our reduction will be miniscule while being costly.
- 2) the plan is racist and offensive - CAP authors assume indigenous peoples and persons of color are harmed more, implying they are not enjoying the benefits of modern society and living are living a pre-industrial existence
- 3) there is no scientific evidence that the measures will make any difference as most CO2 is produced in the ocean
- 4) the policies lead to fascism with government/corporate partnerships
- 5) there is no climate emergency according to scientists and meteorologists - "Flawed modelling and overblow rhetoric drowning out scientific reality for the sake of money and power, experts say." Epoch Times 9/27/2023
- 6) huge intrusion on individual freedom and choice

Subject: [External] NO on the San Diego Climate Action Plan
Date: Wednesday, January 3, 2024 5:18:55 PM

NO on the San Diego Climate Action Plan. You can learn from [this article](#):

"The idea is, well, fossil fuels are causing climate catastrophe, but this is just false. Fossil fuels impact the climate, but they're not causing a catastrophe. The fact is that fossil fuel development isn't causing a climate crisis. It's actually making humanity far safer from climate. And one fact that I've been stressing for years, which we're finally hearing now in the US and around the world and from our presidential candidates is actually if you look at what's happening, don't just look at rhetoric or anecdotes about, "Hey, this flood killed this many people." But if you look at how many people are dying overall from climate-related disasters like floods and storms and heat and cold, that's not something that's getting worse. That's something that's getting much better.

The rate of climate disaster death has gone down by a factor of 50. So it's gone down 98% in the last 100 years. Why? Because whatever warming impact we've had on climate is trivial compared to our ability to neutralize climate danger to what I call master climate. If you have a lot of energy to power irrigation systems and to power crop transport and to heat and to cool, and to build sturdy infrastructure and to have storm warning systems to tap evacuation, you're going to be incredibly safe from climate. So climate change doesn't matter compared to climate mastery. And the way you get climate mastery is having cheap energy. And the only way you can get cheap energy on a large scale right now and for the foreseeable future is fossil fuels."

January 4, 2024

Comment I25-1

The comment expresses opposition to the CAP Update and states that the cost does not justify the benefit for implementing the CAP Update.

Response I25-1

Please see Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which explains the cost reports that support the CAP Update.

As described on pages 1 through 4 of the Draft SEIR, the County’s preparation of the CAP Update is intended to fulfill the County’s obligation under Mitigation Measure CC-1.2 of the 2011 GPU PEIR to prepare a CAP and to reduce GHG emissions consistent with state legislative requirements. The Draft SEIR has been prepared to analyze the environmental impacts of the proposed CAP Update. The scientific basis of climate change and the sources of GHG emissions as primary contributors to climate change are summarized in Section 2.8.1.1 of the Draft SEIR. The CAP Update also includes a cost analysis (Appendix 12), which was prepared to understand how some populations or local communities may experience disproportionate costs or impacts from climate change and CAP implementation. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Letter
I26

From: [Richard Newton](#)
To: [CAP](#)
Subject: [External] PLEASE OPPOSE Climate Action Plan
Date: Thursday, January 4, 2024 11:22:40 AM

Dear San Diego County Climate Action Plan Representative:

Please register my opposition to the CAP for the following reasons:

1. The plan fails to meet the utilitarian threshold of cost/benefit analysis. Climate change, to the extent it is caused by excess carbon dioxide, is a global problem. Countries such as China- a major manufacturer and polluter, has doubled its CO2 emissions in the recent past. India has also increased its CO2 emissions. San Diego County produces a minuscule amount of global CO2, and as a result, any such reductions will have negligible impact on the global problem, yet the financial costs and other burdens to be borne by San Diego County residents are massive and significant.
2. The CAP is racist and offensive. The implications are that indigenous and "of-color" people do not benefit from the conveniences of the modern world, as we all do, yet bear disproportionate burdens from it. Economic disparities exist because of differing levels of wealth, that is not racist. Further, "social-justice" as an objective of CAP is not relevant to a climate and environmental plan reducing carbon emissions.
3. These policies lead to micromanagement of residents and impacts on their freedoms as Americans. Such fascism must always be rejected. It places a huge burden on personal and economic freedom.
4. There is no climate emergency according to scientists and meteorologists - "Flawed modelling and overblown rhetoric [is] drowning out scientific reality for the sake of money and power, experts say," Epoch Times 9/27/2023. See attached picture. Yes, it is quite possible that we are being lied to for political and other reasons. Again, I note that "social justice" is not relevant to climate concerns, but included as a goal. Tell me it isn't political. This wouldn't be the first time in history that the powers-that-be lie to justify what they profit from. Think of all those profitable contracts politicians will control, and their buddies that will get them. All on the backs of the residents of San Diego County.

Thank you for your attention to this matter.

Best regards,

Richard Newton

Meteorologists, Scientists Say 'There Is No Climate Emergency'

By Katie Spence

Flawed modeling and overblown rhetoric drowning out scientific reality for the sake of money and power, experts say

There's no climate emergency. And the alarmist messaging pushed by global elites is purely political. That's what 1,609 scientists and informed professionals stated when they signed the Global Climate Intelligence Group's "World Climate Declaration."

"Climate science should be less political, while climate policies should be more scientific," the declaration begins. "Scientists should openly address uncertainties and exaggerations in their predictions of global warming, while politicians should dispassionately count the real costs as well as the imagined benefits of their policy measures."

The group is an independent "climate watchdog" founded in 2019 by emeritus professor of geophysics Guus Berkhout and science

Letter I26 Richard Newton

January 4, 2024

Comment I26-1

The comment expresses opposition to the CAP Update and states that that plan fails to meet the utilitarian threshold of cost-benefit analysis. The comment claims that the CAP Update is racist and will place burden on personal freedom and finance. The comment also claims that social justice is not relevant to climate change.

Response I26-1

As described on pages 1 through 4 of the Draft SEIR, the County's preparation of the CAP Update is intended to fulfill the County's obligation under Mitigation Measure CC-1.2 of the 2011 GPU PEIR to prepare a CAP and to reduce GHG emissions consistent with state legislative requirements. The Draft SEIR has been prepared to analyze the environmental impacts of the proposed CAP Update. The scientific basis of climate change and the sources of GHG emissions as primary contributors to climate change are summarized in Section 2.8.1.1 of the Draft SEIR.

Implementation of the CAP Update includes a combination of regulations, programs, incentives, and outreach and educational activities to reduce GHG emissions. To address equity in CAP Update implementation, a cost analysis (Appendix 10) was prepared to understand how some populations or local communities may experience disproportionate costs or impacts from climate change and CAP implementation, and an Equity Implementation Framework (Appendix 9) was developed to prioritize climate action in frontline communities and ensure equity-based outcomes and co-benefits are realized equitably throughout the unincorporated area. Please also see Section 2.7, "Environmental Justice," for a discussion related to the potential for impacts associated with CAP Update implementation to disproportionately affect environmental justice communities.

San Diego County Supervisors,

We do not need a Climate Action Plan. It is a huge waste of OUR money.

The cost benefit analysis doesn't pan out - other countries such as China has more than doubled their carbon output. Locally, our reduction will be miniscule while being extremely costly. There is no climate emergency according to scientists and meteorologists - "Flawed modelling and overblown rhetoric drowning out scientific reality for the sake of money and power, experts say." Epoch Times 9/27/2023 .

You represent the people and we do not want or need this.

NO ON CLIMATE ACTION PLAN

Subject: [External] Opposition to Climate Action Plan
Date: Thursday, January 4, 2024 7:14:52 AM

To Whom it May Concern,

I have carefully reviewed the Climate Action Plan and I must oppose the plan. There are many areas that are quite concerning. The areas of most concern for me are the following three:

- 1) The distraction from real environmental issues that focusing on CO2 causes. We face the more important ecological issues of pollution and soil deterioration. These issues are actually impacting our food chain and the interconnectedness of life on the planet. This plan will further aggravate these issues not only by putting funds primarily on CO2 but, the actions, will increase microplastics and other toxic components through large scale production mechanisms and production of bio-synthetic products.
- 2) None of the actions in the plan have ever been shown to achieve the purported outcomes. If you have actually engaged in reading the verified evidence regarding these actions, you'll understand that these actions will not have any significant impact on global climate. The majority of CO2 is produced from our oceans - approximately 96% of all CO2 on on the planet.
- 3) Other nations such as China and India double their carbon emissions regularly and they have no plans to change. Al Gore's 2006 movie "An Inconvenient Truth" erroneously stated that China was taking action to reduce vehicle emissions. That citing has been shown to be vastly incorrect. In fact China has significantly increased emissions. Even if these actions were to work here, which there is no proof that they will, they would have zero impact on global climate.

Regards,
 Sam Smith

Letter I28 Sam Smith

January 4, 2024

Comment I28-1

The comment expresses opposition to the CAP Update based on three primary areas of concern: increases in microplastics and other toxic components “through large scale production of mechanisms” and focusing funding on carbon dioxide reductions; lack of evidence to support significant impacts on global climate from CAP Update measure implementation; and the contribution of other nations to global climate change.

Response I28-1

As described on pages 1 through 4 of the Draft SEIR, the County’s preparation of the CAP Update is intended to fulfill the County’s obligation under Mitigation Measure CC-1.2 of the 2011 GPU PEIR to prepare a CAP and to reduce GHG emissions consistent with state legislative requirements. The Draft SEIR has been prepared to analyze the environmental impacts of the proposed CAP Update. The scientific basis of climate change and the sources of GHG emissions as primary contributors to climate change are summarized in Section 2.8.1.1 of the Draft SEIR. The comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a). See also Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the analytical basis of the reduction calculations and implementation details for quantified implementing actions that are included in the CAP Update, including actions that would increase carbon storage, and a description of the evaluation of complimentary benefits included in the CAP Update.

To whom it may concern-

I'm a resident of Carlsbad and do not want you to approve CAP. Here are my reasons why you need to NOT APPROVE.

- 1) the cost benefit analysis doesn't pan out - other countries such as China has more than doubled it's carbon output. Locally, our reduction will be miniscule while being costly.
- 2) the plan is racist and offensive - CAP authors assume indigenous peoples and persons of color are harmed more implying they are not enjoying the benefits of modern society and living are living a pre-industrial existence
- 3) there is no scientific evidence that the measures will make any difference as most CO2 is produced in the ocean
- 4) the policies lead to fascism with government/corporate partnerships
- 5) there is no climate emergency according to scientists and meteorologists - "Flawed modelling and overblow rhetoric drowning out scientific reality for the sake of money and power, experts say," Epoch Times 9/27/2023
- 6) huge intrusion on individual freedom and choice

Thank you,
 Mrs. Wolter

Subject: Comments in Response to San Diego County's Draft CAP Supplemental EIR and CAP

Dear CAP Project Manager Kelly:

I appreciate the opportunity to comment on the important subject documents.

Personal Introduction

I have a BSEE, an MSE and worked as a Satellite Systems Engineer for 36 years at Lockheed Martin. My title was Senior Staff Systems Engineer. After retiring, I continued my systems engineering work, with a focus on climate change and transportation policy. Since retiring from Lockheed Martin, I have presented papers at technical conferences in Calgary, San Francisco (virtually), Long Beach, Chicago, a suburb of Chicago, New Orleans, the DC metro area, San Diego, and Guadalajara, Mexico. I also present on Climate and Transportation to political organizations and individual political candidates and/or office holders.

I have been involved in the San Diego County's CAP process from the beginning. However, my Sierra Club work ended after Reference 1, which is the Sierra Club letter regarding the Appellate Court appeal for the 2nd CAP. Doing a "Find", on my last name, in Reference 1 shows that it occurs 29 times. "Parking" occurs 511 times. Reference 1 shows that a good car-parking system was the primary mitigation measure proposed by the Sierra Club, for both lawsuits. There are good reasons for this, as will be shown.

It must also be pointed out that the proposed mitigation measure to increase economic fairness and reduce single occupancy commuting for County employees by implementing a car parking system that generated earnings for employees has fallen on deaf ears, at the County. It was defined in detail for both County attempts to create a legal CAP. It has been dubbed Dividend Account Parking. It was requested in the Sierra Club letter on the NOP and in their letter on this Draft CAP and Draft SEIR. It is defined in this letter.

130-2

Bullock to San Diego County, Re: Draft CAP and SEIR

1 of 20

Focus on Light-Duty Vehicles & the Need to Stabilize Anthropogenic Climate Change

Cars and light-duty trucks are the category that emits, by far, the most GHG emissions in the US, in California, and in San Diego County. This letter is primarily focused on this overwhelmingly important category and its potentially devastating impact on the environment. *Humanity must stabilize our anthropogenic climate change.* That is humanity's top-level requirement. That requirement flows down to subsystems, including cars and light-duty trucks in San Diego County. These statements need to appear in any significant documentation associated with any project (discretionary project,) under CEQA law impacting transportation outcomes. California's (CA's) 2030 and 2045 CA Climate Mandates (SB 32 and AB 1279) do not conform to the unambiguous statement by James Hasen, this country's most respected climate scientist, regarding the required reduction in 2030 of industrialized nations, to avoid climate stabilization. This is also shown in detail below.

I30-3

There is a good reason that the Secretary General of the UN has said that we are dangerously close to the point of no return.

Legal Requirements

Explain the Discrepancies Between CA's Plan to Achieve Its CA Climate Mandate of 2030 and the Draft CAP, and Why It is Important (Climate Stabilization)

As shown on Page 30 of Reference 2, one of the reasons the Court ruled against the County was that its CAP failed to achieve the California (CA) Climate mandate of that time, S-3-05. Today, CA's first-occurring Climate Mandate is quantified in SB 32. As you know, SB 32 calls for CA GHG emissions to be at least 40% below 1990 levels by 2030. CA's official plan to achieve it is the CARB Scoping Plan, which, for example, specifies "priced parking", which would be accomplished with the car parking system that has been dubbed "Dividend Account Parking" and has been proposed as a feasible mitigation measure to the County many times, over the years, going back to 2009 or so. The County's CAP must conform to the official CA Plan to achieve CA's climate mandate. This is shown in Reference 3. Dividend Account Parking is defined below.

I30-4

On Page 10 of Reference 3, AG Harris wrote, "In order to stabilize the climate and avoid the most catastrophic outcomes of climate change, we must substantially reduce our annual GHG emissions over time, achieving a low carbon future by midcentury."

She is expressing and thus exposing our requirement to stabilize the climate. The Draft SEIR does not mention such a requirement. Please understand that what the industrialized nations must do to support climate stabilization is much larger than the overall average. The industrialized nations must do more, so that the developing countries can do much less. The "40% less" and the "48% less" that you mention ("48

percent reduction in 1990 emission levels by 2030”) on Page 2.8-1 are not enough, since CA is part of an industrialized nation.

Your legal duty is not to minimize our predicament. Let’s be clear. “Stabilization” is the avoidance of destabilization, where we have warmed the earth enough to set in motion a process that we are then powerless to stop.

Here is one example. Melting the permafrost causing large amounts of methane to go into the atmosphere that will warm the atmosphere more, melting more permafrost. This helps to explain the Secretary General’s statement that we are dangerously close to the point of no return.

On Page 10 of Reference 3, in the footnote, the AG writes (paraphrasing) that the CA climate mandates cannot be ignored because they are about climate stabilization, which is the objective of CEQA. I would have written that it is the most important objective of CEQA, by far. However, by calling climate stabilization the objective, the AG made that point very well.

130-4
cont.

Enforceable Measures to Achieve Meaningful Results

A set of measures that, taken together, are not enough to achieve climate stabilization, is not a meaningful set of measures. The climate will destabilize if we do nothing. Doing too little does not change that terrible outcome. Meaningful must mean successful, in terms of doing our part to achieve climate stabilization. Mitigation measures must be climate stabilizing, taken together.

130-5

Reporting Environmental Outcomes

The environmental impacts that are likely if all municipal governments adopt a CAP and SEIR such as those being currently proposed (the two drafts) must be described, or “reported.” This follows from the legal need to consider *cumulative impacts*. So far, the County’s efforts have failed to fully explain what climate failure, or climate *destabilization* looks like. I realize that municipal governments have followed the lead of California’s Office of Policy Research (OPR) in trying to explain the impacts of climate change. But these attempts have been woefully inadequate. Climate destabilization will most likely result in the loss of most forms of life on our planet (ignoring microbiology.) Climate destabilization would include a devastating collapse of our human population. Most people will starve to death, because anthropogenic climate change will destroy our habitat, which equates to our ability to produce food. Put another way, the resulting climate will limit our ability to produce food, leading to our extinction or near-extinction. Warming will accelerate processes that will increase warming. These warming feed-back processes are not limited by anything that is useful to us. This is important information. To hide it from decision makers and the public violates CEQA law. Climate destabilization is a very important environmental impact, and it needs to be described.

130-6

If the climate scientists have taught us anything, it is that we must reduce our GHG emissions significantly by 2030. 2030 is the first climate stabilization requirement. 2045 is the second. If we fail on the 2030 requirement, destabilization will result. The 2045 climate stabilization requirement will not matter. This also needs to be explained.

Thanks to many EIRS poorly explaining our climate crisis, many people are confused. A good example is the County Board's "Regional Decarbonization Framework" (RDF). It uses 2035 as if it is an important year. It is not. It is a "throwback" to the 2005 CA Climate Mandate of Executive Order S-3-05, which had the target years of 2010, 2020, and 2050. We know much more than we knew in 2005. Also, things have not worked out as we had hoped and assumed, back in 2005. About 15 years ago, 2035 was selected for SB 375 because it was halfway between the last two targets. Spreading the misinformation that 2035 matters is extremely dangerous. 2030 is five years sooner. Our current job is to greatly reduce our emissions by 2030, not 2035. No one should be thinking about 2035.

I30-6
cont.

Need for Enforceable Measures that Include Those in the CA Plan to Achieve CA's 2030 Climate Mandate

Reference 2 shows a need for *enforceable* measures and then the question is if the enforceable measures will achieve climate-stabilizing targets, given the concept of cumulative impacts, including the impacts of all municipal governments doing their general plan updates and CAPs no better than what San Diego County is currently proposing.

From Page 26 of Reference 2:

As a plan-level document, the CAP is required by CEQA to incorporate mitigation measures directly into the CAP (extra emphasis added by both bold and underlining):

I30-7

*"A public agency shall provide the measures to mitigate or avoid **significant effects** on the environment are **fully enforceable** through permit conditions, agreements, or other measures. Conditions of project approval may be set forth in referenced documents which address required mitigation measures or, in the case of the adoption of a plan, policy, regulation, or other public project, by incorporating the mitigation measures into the plan, policy, regulation, or project design." (Pub. Resources Code, § 21081.6, subd. (b), italics added.)*

Note that climate destabilization is the most significant of all possible "significant effects on the environment" that could be imagined. So of course, the outcome (that particularly bad environmental impact) of climate destabilization should be avoided, most reasonable people would agree, if they value life. Therefore, the outcome of the enforceable measures is critical. From Page 28 of Reference 2 (emphasis added):

The County's failure to comply with Mitigation Measure CC-1.2 and Assembly Bill No. 32 and Executive Order [No.] S-3-05, supports the conclusion that the CAP and Thresholds project will have significant, adverse environmental impacts that have not been previously considered, mitigated, or avoided.

AB 32 and S-3-05 are no longer CA's Climate Mandates. SB 32 and AB 1279 are. Accomplishing SB 32 may not be enough. It is the "floor" of what must be done. Clearly then, the Draft must at least comply with both SB 32 and the Plan to achieve it, which is the CARB Scoping Plan. The SEIR repeatedly mentions the Scoping Plan, without going into some of the most important details. That is unfortunate. The details show that San Diego County, with both SANDAG and the municipal governments ignoring the details of the Scoping Plan including its most important mitigation measures, will not achieve SB 32, unless CA decides to legislate that a car parking system (such as Dividend Account Parking) must be used everywhere and legislates all the other mitigation measures described.

The Draft CAP and SEIR provide the OPR-recommended discussion of state mandates S-3-05, AB 32, AB 1279, and SB 32. But discussion is not enough. The Draft CAP must adopt the detailed mitigation measures in the Scoping Plan. That means it must implement those that can reasonably be done by the County. And it must strongly advocate for the others, justifying the assumption that they will get done.

130-7
cont.

The Climate Stabilization Requirement for 2030

Mitigation Measures Necessary to Achieve Climate Stabilization

CARB's 2022 Scoping Plan is about achieving California's Climate Mandates. The Climate Mandate for 2030 is to emit GHG at no more than 40% below our 1990 GHG emission value, by 2030. Sadly, this falls significantly below the science-based 2030 climate-stabilization requirement that can be derived from an unambiguous statement by James Hansen, as follows.

Reference 4 (the 5th attached file in the email with this letter as the 1st attached file) statement on Page 14 is that the required rate of reduction, if commenced in 2020, would be 15%. That rate means that the factor of 0.85 must be achieved, year after year. If done for 10 years, the factor would be $(0.85)^{10} = 0.2$, by 2030. This reduction of 80% down from the 2020 value matches the 2050 target requirement of Executive Order S-3-5, which is 80% below the 1990 value. According to S-3-05, the 2020 emission value should be the same as the 1990 emission value. The S-3-05 emission of 2050 was designed to support capping atmospheric CO₂ at 450 PPM. "Capping" means that the sum of the Earth's emissions (anthropogenic and natural) equals the sum of all of the Earth's sequestration (mostly photosynthesis.) Therefore, the Reference 4 statement shows that the author (Dr. James Hansen) wanted the world to achieve the third target of S-3-05, to get the atmospheric CO₂ to stop going up, 20 years sooner (2030 instead of 2050) than what S-3-05 was written to achieve. Part of the problem with S-3-05 is that it was written in 2005 and humanity has not reduced their emissions as much as was hoped and we have learned more about our climate predicament.

130-8

To put this in focus, it is helpful to view the 2030 climate stabilization requirement against our state climate mandates. This is shown in Figure 1.

The California climate mandate for 2030 is only 40 percent below the 1990 value. However, Reference 5, the CARB Scoping Plan, which is the 6th attached file, makes it clear that significant driving reductions are needed to achieve the 40% reduction value, because we cannot possibly phase out the internal combustion engine LDVs fast enough. For example, on Page 100 of Reference 5, it says we must reduce VMT. On Page 117 of Reference 5, it says that we are failing, and we must therefore “double down” on our VMT reduction.

Figure 1 The 2030 Climate Stabilization Target Compared to State Mandates, Noting That Executive Order (EO) B-55-18 Has Been Replaced by AB 1279

130-8
cont.

What the CARB Scoping Plan Says, Regarding Vehicle Miles Travelled and the Needed Mitigation Measures, Including Those That Are About Car Parking

Page 192 of Reference 5 says, “VMT reductions will play an indispensable role in reducing overall transportation energy demand and achieving the state’s climate, air quality, and equity goals.”

Page 194 of Reference 5 says, “The pace of change to reduce VMT must be accelerated.”

Page 192 of Reference 5 says, “Appendix E (Sustainable and Equitable Communities) elaborates on reasons for reducing VMT and identifies a series of policies that, if

130-9

implemented by various responsible authorities, could help to achieve the recommended VMT reduction trajectory included in this Scoping Plan (and related mode share increases for transit and active transportation).” It must be noted that clearly, San Diego County is not a responsible authority since it is choosing so-called “free parking” for their employees over human survival, despite over 10 years of being provided a proposed mitigation measure to implement Dividend Account Parking for its employees.

The 7th attached file in the email with this letter is Appendix E of the 2022 Scoping Plan. It is Reference 6 for this email.

On Page 4 of Reference 6 the truth (which CARB analysts have correctly computed) is stated about our need to reduce VMT:

2.1 Zero-emission vehicles are not enough to solve the climate crisis.

Contrary to popular belief, zero-emission vehicles (ZEV) alone are not enough to solve the climate crisis. The 2022 Scoping Plan illustrates that despite cleaner vehicles and low-carbon fuels, the path to carbon neutrality by 2045 also depends on reducing per capita VMT (the total passenger vehicle miles driven by an average person in California on any given day). To meet the carbon neutrality goal, the Scoping Plan proposes reducing VMT from 24.6 miles per day in 2019 to 18.4 miles by 2030 (a 25 percent reduction) and to 17.2 miles per day by 2045 (a 30 percent reduction).

Note the large per-capita driving reduction that is needed by 2030, just to achieve the 2030 State Mandate, which is only half of what is needed, according to Dr. James Hansen, who wants to avoid climate catastrophe.

On its Page 16, Reference 6 advocates for “parking fees.”

On its Page 18, Reference 6 states that “free parking” incentivizes driving alone; and that for the State to meet its climate goals, parking cash-out is needed. Reference 6 also states that a state measure is to end its subsidies to car parking for its 200,000 employees. Would the County do the same for its employees? This letter shows a painless way to make that happen. Painless in the sense that even employees that drive every day will not lose any money.

In Reference 6, on Page 27, the Scoping plan says the State should take this action, with reasons then added, as follows:

Reduce or eliminate parking requirements (and/or enact parking maximums, as appropriate) and promote redevelopment of excess parking, especially in infill locations. Building parking for infill development makes construction costs more prohibitive, considering parking can cost up to \$100,000 per stall, which takes away both physical space and budget from the construction of housing and other needed services and amenities.

Reference 7 is Appendix D of the CARB Scoping Plan. It is the 8th attached file in the email with this letter. It has a focus on local actions.

From Page 9 of Reference 7:

130-9
cont.

Local jurisdictions should focus on these three priority areas when preparing a CEQA-qualified CAP:

- *Transportation electrification*
- *VTM reduction*
- *Building decarbonization*

By prioritizing climate action in these three priority areas, local governments can address the largest sources of GHGs within their jurisdiction.

130-9
cont.

Table 1 of Reference 7 says, “pricing parking” is a priority GHG Reduction Strategy.

Table 3 of Reference 7 says, “For multifamily residential development, requiring parking costs to be unbundled from costs to rent or own a residential unit” is a key project attribute that reduces GHG.

Footnote 54 of Reference 7 states that, “AB 2097, adopted by the Legislature and signed by the Governor in September 2022 eliminates parking requirements for residential and commercial development within a half-mile of transit”.

Why the CARB Scoping Plan Comments About Parking Beyond Employee Parking Is Important

The County has direct control over how it operates its parking for its employees. It can also amend its off-street parking ordinances that set policy regarding on-street parking on roads in unincorporated areas.

Reference 8 shows that Dividend Account Parking is a system that works in all cases, not just employee parking.

Here is the Abstract, from Reference 8:

ABSTRACT

Bundled-cost and bundled-benefit car-parking systems (generally called “free parking”) are defined, showing that they are not free and that they increase the drive-alone mode, since non-drivers lose just as much money as those that use the parking.

130-10

Dividend-Account Parking (DAP) is defined as a parking system in which the parking spaces are *shared* by all drivers that are driving a car that is registered in the system. “Registered” means that the car can be associated with a person having an *account* in the system. Car parking is *value-priced*, with an option for a *congestion pricing overlay*. The critical final feature is that the earnings (*dividends*) are given to the people for whom parking is built, such as employees, shoppers, residents of apartments or condominiums, students, or train riders. It is stated that this system is defined in the California Democratic Party (CDP) Platform, making it the official policy of the largest political, environmental, and public-policy-advocacy organization in California. It is also at the center of the Sierra Club’s lawsuit against the San Diego County’s Climate Action Plan (CAP). The court has found in multiple rulings that DAP is feasible mitigation.

Motivations for change are provided, mostly based on an Air and Waste Management Association paper, *Climate-Stabilizing California Light-Duty-Vehicle (LDV) Requirements*. The following is shown:

1. Parking reform is needed, since fleet electrification, while critically needed (ASAP), cannot, under even the most wildly optimistic assumptions, achieve the needed GHG emission reduction, for light-duty vehicles (LDVs), soon enough to achieve climate-stabilizing targets.
2. Per-capita driving must be reduced.

It is asserted that parking reform has a large role to play.

DAP is presented as a feasible, enforceable, mitigation measure for any Climate Action Plan or for any application where sustainability is a goal.

The way to get DAP (Dividend Account Parking) designed, installed, and operated for County Employees is to use a car-parking vendor that would then want to spread the system as widely as possible, ASAP. Although the same system works for all types of parking, the equations used to distribute the earnings vary for different types of applications.

For County employees, here is how earnings are computed for a hypothetical employee called "Joe".

Over the time- period used, like a week, for example:

"Joe's Earnings" = "Total Money Earned by the Employee Parking"
multiplied by **"Joe's Time at Work"**, with that product then divided by
"Total of the Time Spent at Work, for All Employees."

The ideal is for people to be tied to accounts and for cars to be tied to accounts and then for there to be absolutely nothing to do except what is done now: find a spot, and park. The only thing left to do is to drive away, when desired. The money flows automatically, as it should. Note that all cars with license plates can be associated with an address and that system can be used when a car parked is not registered in the DAP system.

The County would not design this. The County would produce a Requirements Document to support an RFP process. The Requirements Document could refer to documents such as Reference 8 or cut and paste from them. The County should be able to get a grant to do this work. Alternatively, the County could obey CEQA Law and use the money it spends on lawsuits to do this work.

To comply with the CARB Scoping Plan (no "free" parking), the County should proceed in this way:

1. The County should not use the CARB Scoping Plan phrase "priced parking" but instead announce that it is proceeding with managed parking and point out that so-called "free parking" is not free, because such a scheme lowers wages,

I30-10
cont.

increases rent, and increases the cost of many items, including food. And that instead of “free parking” we need managed parking, with these features:

2. Parking should be managed so that it earns money for those for whom the car-parking is built or for those who are losing money because the parking is being provided. Opening an account, for easy deposit, would be encouraged. Employees would get an “add-in” payment, if that is needed, so they break even. The data needed to compute earnings would also be collected automatically. For example, employees might be required to carry a FOB when they go to work to facilitate computing the time an employee is at the work location. If a train system has car parking, it would be helpful to have all riders carry a FOB, which would also make it easy to automatically charge the fare, besides making it easy to compute the train station, car parking earnings.
3. All parking is shared. That means that it is available to everyone with a license plate, so they can be billed. Opening an account that associates the license plate with an account would be encouraged, for the easy flow of money.
4. Parking is value priced, with the exception being on-street, when the occupancy is lower than an agreed-upon threshold, such as, for example, 50%. When occupancy is below the threshold, on-street parking could be free.
5. Parking pricing would include congestion pricing algorithms, to keep the occupancy rate from exceeding an agreed-upon value.
6. Parking is fully automated, so there is no more to do than for so-called “free” parking.
7. Data collection to support the earnings calculations is fully automated, such as being at a work site, or spending money at a store.
8. The entire system is provided (designed, installed, and operated) by a vendor, selected in an RFP (Request for Proposal) process.
9. The best place to have the first system is at a place of employment, noting that a municipal government is an employer, and that the system should not cost the employer any money. (ACE Parking, for example, is willing to do the system at no cost. They would take a small percentage of the revenue, leaving earnings for those for whom the DAP system parking is built.)
10. The vendor would be skilled at monetizing unused parking and monetizing data.
11. Privacy would be protected, as it should likewise be specified for a Road Use Charge system.

I30-10
cont.

12. The vendor would be skilled at providing solar canopies, providing charging stations, and buying and selling electricity.

I have explained this system to the CEO of ACE Parking. He is anxious to supply the solution. He would submit a proposal. That is documented in Reference 9. The CEO understands that Dividend Account Parking (DAP) is the car parking system of the future if we humans are going to have a future.

To be clear, the CEO of ACE parking would like ACE Parking to be the car parking vendor that designs, implements, and operates, in accordance with an agreed-upon contract or understanding, an automated, value-priced car parking systems that will increase economic fairness and choice while it decreases the choice to drive.

Parking is expensive to provide. Its "value price" is based on that cost. An employee that has a reasonable option to not drive to work and chooses that option will get the car parking earnings with no need to pay for the use of their parking. The same earnings would be paid to employees that make the minimum wage as those make the largest salaries at the employment location. The earnings to those making a low wage might put food on the table.

The problem is that people that hold office and are in positions of authority in government make so much money that they can't understand that a car parking system that increases economic fairness and choice would matter. Everyone says they empathize with low-income workers, but that empathy, if it really exists, does not cause decision makers to think that so-called "free parking" is a problem. However, what we call "free parking" decreases pay and increases the cost of goods and services, including food and rent.

The goal here is more than to just reduce the Single-Occupancy Vehicle (SOV) mode of commuting to work at the County and to just allow the employees to have more freedom to choose how they want to spend their earnings. Given our climate emergency, the horror of climate destabilization, and the fact that LDVs emit the most GHG (by far), it is important to have this improved car-parking system spread to all employees that are suffering under the bundled-benefit car parking system (erroneously called "free") and furthermore to have this system spread to other types of car parking. This disruptive economic change, in which bad systems of parking are replaced with a good system of parking, will best be done by the private sector, although the County needs to start the process.

Step 1 is for the County to produce a Requirements Document that will define, in an unambiguous way, the DAP system. The County then needs to use that Requirements Document to conduct a Request for Information (RFI) or a Request for Proposal (RFP) process to identify the best possible 3rd party vendor to design, install, implement, and run its DAP Car-Parking system. Like Uber and Lyft were to taxicabs, the winner of this competition will have its eye on spreading their better system, without limits.

I30-10

County Operations Strategic Sustainability Plan (Sustainability Plan) Oversight

On Page 2-8-4 it is written, regarding this Sustainability Plan:

The County's 2020–2030 County Operations Strategic Sustainability Plan (Strategic Plan) supersedes the previously implemented 2015 Strategic Energy Plan. The Strategic Plan sets goals to promote sustainability in four key sectors of County operations: energy, water, waste, and transportation. The goals outlined in the Strategic Plan relating to GHG emissions are as follows:

- *reduce energy use and GHG emissions,*
- *promote clean energy production,*
- *provide sound facility energy management,*
- *achieve cost savings,*
- *reduce fleet vehicle miles traveled (VMT),*
- *eliminate underutilized vehicles to decrease size of fleet,*
- *electrify the fleet where possible, and*
- *expand EV charging infrastructure on County sites for both public and fleet.*

The Strategic Plan is intended to consolidate the sustainability planning efforts of other County planning documents under a single County operations purpose (i.e., mission statement).

I30-11

This "Strategic Sustainability Plan (Strategic Plan)" is supposed to be adequate out to 2030. It does not include a single statement about car parking, thus contradicting the official CA Plan to achieve CA's 2030 climate mandate. The County seems determined to provide "free parking", even though that system directly contradicts the finding of CARB in its CARB Scoping Plan that "priced parking" is needed. Again, the CARB Scoping Plan is the official CA Plan to achieve SB 32, which is the official 2030 Climate Mandate of 2030. The County seems to be living on a planet that has no climate change problem and in a state that has no climate mandates and no plan to achieve that mandate.

County leadership has been failing, regarding getting a legal CAP for nearly 15 years. No one apologizes and no one is accountable. Senior management have been continually praised for their performance. Those doing CAPs seem to understand that their real mission is to do as little as possible.

It is well known that the County has one of the largest workforces in the County. What they do would matter. This would be particularly true if they pioneered a new way to operate employee parking, that was favored by a super majority of the employees and any unions that are representing the employees. This would happen because every employee would earn more money, as shown in the peer-reviewed presentation slides in Reference 10.

Bullock to San Diego County, Re: Draft CAP and SEIR

12 of 20

Economic Development Features of Dividend-Account Car Parking

As the process begins to work towards the implementation of DAP, the media, the environmental world, and the political world will take full notice. DAP will become like Community Choice Energy districts: at first controversial but then universally accepted. There can only be one first implementer. It could be San Diego County. The notoriety will be noticed by those working in technology and especially those starting new technology companies. Young, well-educated workers know full well that we have an anthropogenic climate change crisis. They want to be part of the solution.

The third-party vendor will need to earn money from parking that is not being used by employees. They therefore have a strong economic interest in getting more drivers to get their cars associated with a DAP account. They will want the system to be easy to use. Cities will want their on-street parking to be both "parking-meter" parking and DAP, to be more convenient to use. Likewise, they will want their "pay-station" parking to also be DAP parking. There will undoubtedly be a phone app to quickly register a car and driver in the system and another app to report on vacancy rates for each space. If a space has a high vacancy rate, it might be time to convert the space to some other use. The third-party implementer will be motivated to promote every event and every attraction in locations where they have vacant parking that they want to sell. To park cheap, some will be shown how to park some distance away and use transit to get to the parking-impacted locations.

130-12

Significance, Due to Being in Conflict with Applicable Plans

Page 2.8-13 of the Draft SEIR shows that under Appendix G of the State CEQA Guidelines, implementing a project, such as the draft CAP being considered here, would result in a cumulatively considerable contribution to climate change if it is in conflict with an applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs. The applicable plan is the CARB Scoping Plan. The proposed CAP and the SEIR conflict with that plan for many reasons, including that they cling to the notion that so-called "free parking" does not need to be replaced.

130-13

On the bottom of Page 2.8-15 and the top of Page 2.8-16 these words appear:

Built Environment and Transportation Measures and Actions. This category includes strategies to decarbonize the vehicle fleet, install EV charging stations, incentivize the use of alternative fuels and landscaping practices, and to promote and support transit and ride sharing to reduce single-occupancy vehicle use. Key actions with potential to result in new or more severe impacts related to GHG emissions include Actions T-3.1 and T-3.1.a, which would support new hydrogen fueling infrastructure and installation of EV charging stations, as well as Action T-5.1 2 which would result in the implementation of transit-supportive roadway treatments and bicycle and pedestrian infrastructure

This shows that the County does not believe the CARB Scoping Plan is correct when it says that the needed reduction in driving will need pricing measures. This violates CEQA law because it obscures the work of CARB from the decision makers and the public.

On Page 2.8-22 there is a reference to, with the “such as” qualifier, “transportation demand management.” The “such as” qualifier means that the County may not have any Transportation Demand Management (TDM) mitigation measures. Cities sometimes have Transportation Demand Management Ordinances, as part of their CAP. These ordinances sound like reasons for hope. However, they only require that companies that move into the city, after the ordinance is adopted, have a TDM Plan to reduce single occupancy vehicle (SOV) commuting. Since this is a very small percentage of the companies in the city, the ordinance is not likely to have a significant effect. Companies that are required to have a TDM are likely to do as little as possible because their main concern is their business. No city has ever done a TDM Plan for their own employees, hoping that no one notices their hypocrisy. CAPs are designed to sound like they are doing a lot while doing very little.

Section 2.8.2.4 on Page 2.8-24 again considers the possibility that the CAP and SEIR conflict with an applicable plan, such as the Scoping Plan. It says the SANDAG RTP will reduce Vehicle Miles Travelled (VMT) 20 percent, when only 19 is required. There are serious problems with that statement. The SANDAG Board removed the RUC from the 2021 RTP (and all future RTPs), which conflicts with the CARB Scoping Plan’s statement that pricing strategies are needed. They are therefore only reducing VMT by 18.6%, which they claim they can round up to 19%, meeting the letter of SB 375. The much larger problem is that SANDAG is insisting that it is acceptable to *ignore* the CARB Scoping Plan with its call for a 25% reduction in VMT with respect to 2018 levels, by 2030. The Scoping Plan’s 25% reduction is approximately a third larger than the 19% reduction required by SB 375. However, the much larger difference between the Scoping Plan and SB 375 is that the SB 375 reduction is to be achieved by 2035; the Scoping Plan tells us that the 25% reduction is required 5 years sooner, in 2030. Rose colored glasses are nice, but the SEIR is overlooking CEQA law and precedent that applicable laws and plans, such as the Scoping Plan, cannot be ignored.

130-13
cont.

The inadequate RTP is called out again in a misleading manner on Page 2.8-29.

Table 2.8-4 shows T-4, claiming that it will reduce County Commutes. However, there is no TDM measure for County Employees that complies with the CARB Scoping Plan assertion that the only way to achieve success is with pricing and the use of what CARB calls “priced parking”. Note that if CARB needed to function in our political world of political demagoguery, they would call this “managed parking” and proceed as stated above.

Table 2.8-6, in its “VMT Reduction” category says, “Implement parking pricing or transportation demand management pricing strategies”. However, there is nothing to suggest that the County is serious about this. They do not admit that plaintiffs have been working for Dividend Account Parking for 15 years and the

County has spent large amounts of legal fees to try to avoid this. Car parking policy is a serious matter. We are running out of time. We need details and serious commitments. 2030 is soon.

130-13
cont.

Impossible Assertions

The Table of 2.8-5 conflicts with the CARB findings. CARB was clear that pricing of roads, pricing of parking, and a doubling of transit service was needed by 2030. The SEIR and the draft CAP do not accomplish those things, with enforceable measures or with a commitment to work for the policies that it can't enact. The County work does not tell us how the pricing can simply be assumed or is not really needed to get the outcome asserted in Table 2.8-5.

130-14

Comments on Measures Either in the Draft or Need to Be In the Draft

Measure: Improve Roadway Segments as Multi-Modal

This measure will take time and what needs to be measured or estimated is the resulting driving reduction and there is no information on that. This policy is valuable, but we should understand that the urgency of our crisis means that the "Pricing" strategies are much more important. The pricing strategies are the DAP system for parking and the RUC system, for road use. Traffic calming, road diets, good shoulders, sidewalks, and roundabouts to replace stop signs and signalized intersections will reduce GHG, energy use (no traffic lights) and traffic fatalities and serious injuries.

130-15

Never increase roadway capacity for cars. Our knowledge of *Induced Traffic Demand* informs us that more capacity will never reduce congestion. Instead, an increase in capacity will induce enough additional driving to fill the added capacity. Always make streets safer for all users, especially those using active transportation modes. Signalized intersections kill people. A recent red-light runner in Oceanside killed 3 people at the intersection of Coast Highway and Oceanside Blvd. These types of accidents are well known to occur. Replace these killer intersections with traffic-calming roundabouts, ASAP. Starting and stopping at signalized intersections requires more energy and emits more GHG, compared to roundabouts.

More Information on Enforceable Measures to Reduce Driving

Good Bicycle Projects and Bicycle Traffic Skills Education

The best criterion for spending money for bicycle transportation is the estimated reduction in driving divided by the amount spent (VMT-Reduction per dollar spent). It is hoped that the following strategies will come close to maximizing this important parameter.

130-16

1.) Projects to Improve Bicycle Access

The Smart-Growth (VMT-Reducing Growth) neighborhoods, central business districts, and other high trip destinations or origins, both existing and planned, should be checked to see if bicycle access could be substantially improved with either a traffic calming

project, a “complete streets” project, more shoulder width, or a project to overcome some natural or made-made barrier. One Oceanside example is to build a Vista Way bicycle bridge over I-5 in Oceanside, to allow those walking or biking to travel between the South Oceanside coastal neighborhood and the regional shopping center, which contains such large stores as Wal-Mart and Best Buy. Currently, those walking or biking from the Vista Way area West of I-5 must travel much further and travel over a steep hill (Cassidy Street). There are no large stores in the Coastal region of Oceanside, west of I-5. Vista Way was connected for bike riders and pedestrians before the construction of I-5. Given that the design and construction of the I-5 highway has caused this problem, funding should come from highway funds, for this mitigation measure.

League of American Bicyclist Certified Instruction of “Traffic Skills 101”

Most serious injuries to bike riders occur in accidents that do not involve a motor vehicle. Most car-bike accidents are caused by wrong-way riding, riding on sidewalks, and errors in intersections; the hit-from-behind accident is rare.

After attending *Traffic Skills 101*, students that pass a rigorous written test and demonstrate proficiency in riding in traffic and other challenging conditions could be paid for their time and effort.

As an example of what could be done in San Diego County, if the average class size was 3 riders per instructor and each rider passes both tests and earns \$100 and if the instructor, with overhead, costs \$500 dollars, for a total of \$800 for each 3 students, that would mean that \$160M could teach $\$160M/\$800 = 200,000$ classes of 3 students, for a total of 600,000 students. This is approximately 20% of the population of San Diego County. If a significant percentage of the graduates become frequent, utilitarian riders, this program will be a very cost-effective mitigation measure. It is certainly technologically feasible.

If SANDAG is uninterested in doing this program countywide, the County could do this for those that work for the County or live in the unincorporated areas. If the program is successful, cities will want to participate in the program.

The Final EIR Should Include Plots and Explanations of the Plots, in the EIR, to Leave No Doubt About the Validity and Grave Nature of Anthropogenic Climate Change

Readers need to understand how much trouble we are in and how we got where we are.

The parameters of humanity’s Code Red Climate Emergency need to be explained. Therefore, at the front of any EIR, the information shown in Figures 2 through 4 should be included and explained.

Figure 2 shows the rise of the world’s atmospheric CO2 over the last 50 years.

Figure 3 shows both the

- atmospheric temperature (averaged over a year and averaged over the earth, derived from an isotope analysis) and
- atmospheric CO2 (from air bubbles in ice-core samples),

I30-16
cont.

I30-17

over 800,000 years. It should be noted that our species is thought to be only around 300,000 years old. The Red line is the temperature, and the Blue Line is the atmospheric CO₂, in the units of parts per million (ppm.)

Figure 3 shows that when climate deniers say that our Earth's climate is always changing, and so therefore climate change is natural, they are correct, except for one important fact. There is nothing natural about the outrageous, recent run-up of atmospheric CO₂, to over 420 ppm, in such a short time, shown on the far-right side of Figure 4. The slope is so steep that it appears to be an instantaneous spike, on the far-right side of Figure 3.

Figure 3 shows just 1% (which is 1,000 years) of the distance on Figure 3, from current time to the first 100,000 years into the past. For Figure 4, the color conventions are switched, from what they are in Figure 3. The red line is the earth's atmospheric CO₂ and temperature is the blue line. Figure 4 shows that the CO₂ spike is the result of our combustion of fossil fuels, because its beginning coincides with the start of our industrial revolution. Figure 4 covers the time of the development of our civilization. It shows that temperature and atmospheric CO₂ were normal, until about 150 years ago, which is the start of our industrial revolution, when we started to burn fossil fuels. By doing extensive calculations, we know how much CO₂ we have produced from the combustion of fossil fuels. Then, by directly measuring the atmospheric CO₂ and the acidity of the oceans, we know where that CO₂ currently resides. We also know that atmospheric CO₂ traps heat. There is no doubt that we have an Anthropogenic Global Warming (AGW) catastrophe in the making. We are living in a spike of CO₂. Neither the magnitude (around 420 ppm) nor the slope (around 3 ppm per year) have occurred in millions of years. Achieving climate-stabilizing requirements ("targets") is our only hope.

130-17
cont.

Figure 2 Atmospheric CO₂, Increasing Over Recent Decades

Figure 3 Atmospheric CO₂ and Mean Temperature, from 800,000 Years Ago, with Current CO₂ Spike

Figure 4 Atmospheric CO₂ and Mean Temperature, Over the Last 1,000 Years

130-17
cont.

It should also be clearly stated that cars and light-duty trucks (Light-Duty Vehicles, or LDVs), by far, emit more GHG than any other category of emission. Electricity emits the 2nd most. However, there is a good chance that California can achieve the 2030 climate-stabilization requirement that is derived above (80% below our 1990 value), for the category of electricity. By approximating the renewable content of our electricity as zero, in 1990, the 2030 climate-stabilization requirement for electricity is to have its renewable content be 80%. Many cities in California have stated in their Climate Action Plans (CAPs) that their electricity will be 100% renewable by 2035. Unfortunately, such optimism cannot be expressed for LDVs. Our only hope is the implementation of enforceable plans, containing enforceable mitigation measures, that will, taken together, do these two things, in sufficient magnitude:

- cause the cars on the road in 2030 to be more efficient and
- reduce our per-capita driving (VMT).

The CARB Scoping Plan is the official CA Plan to achieve our official 2030 Climate Mandate. Its measures need to be fully implemented.

In Closing

Thank you for performing your critical work. Thank you for reading this material. Please let me know if you would like to meet to discuss this letter or related topics.

Respectfully submitted,

Letter I30 Mike Bullock

January 5, 2024

Comment I30-1

The comment is an introductory statement and indicates that references to the letter are provided.

Response I30-1

The County has received and considered the comments and references provided. Responses to specific comments are provided below.

Comment I30-2

The comment provides background information about the commenter and states that the prior request for a car-parking system to reduce single occupancy commuting for County employees has not been addressed.

Response I30-2

Please see Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the methodology the County used to establish GHG reduction targets that are appropriately aligned with statewide targets and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets.

Regarding the car-parking system proposed by Sierra Club, the Appellate Decision determined that the County’s response to not include the proposed car-parking system is adequate. As explained in Response O4-15, the County re-evaluated the appropriateness of a parking reduction program and determined that a dividend accounting measure would not result in significant GHG reduction benefits due to employee commute patterns (particularly since the COVID-19 epidemic) and would be difficult to implement because of labor agreements. Therefore, the car-parking system has not been incorporated into the CAP Update. The Court’s decision on the County’s response to Sierra Club’s proposed car-parking system is as follows:

This response is adequate because it explains why the lead agency’s position disagrees with the recommendations and objection raised in the comment. (Guidelines, § 15088, subd. (c).) The response contains factual assertions (e.g., free or subsidized parking already provided; majority of County employees under a collective bargaining agreement; unbundling parking would affect employee compensation) and analysis based on those facts. The trial court erred in determining that this response was too conclusory.

Comment I30-3

The comment introduces the comments provided below and states that emissions related to cars and light-duty trucks are the focus of the comments.

Response I30-3

The comment is an introductory statement and does not raise significant environmental issues related to the Draft SEIR, and no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment I30-4

The comment states that meeting the GHG emissions goals mandated by SB 32 is not adequate to stabilize climate change. The comment also states that climate stabilization should be the objective of CEQA.

Response I30-4

Please see Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the methodology the County used to establish GHG reduction targets that are appropriately aligned with statewide targets (including the 2022 Scoping Plan) and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets. As described throughout this SEIR, the purpose of the CEQA analysis is to identify and reduce, to the extent feasible, the environmental impacts of implementing the proposed CAP Update.

Comment I30-5

The comment implies that the CAP Update measures are not meaningful and therefore cannot achieve climate stabilization.

Response I30-5

Please see Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the methodology the County used to establish GHG reduction targets that are appropriately aligned with statewide targets and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets.

Comment I30-6

The comment states that the County fails to describe the environmental impacts of climate destabilization and describes some of these effects. It also notes that hiding the impacts of climate stabilization is a violation of CEQA, and that given these impacts, the GHG emissions reduction target year should be 2030 not 2035.

Response I30-6

The County appreciates the commenter’s knowledge of the importance of addressing the potential effects of climate change. However, contrary to the commenter’s assertion, the charge of the SEIR is not to describe all the potential effects of climate change nor, as referenced by the commenter, climate destabilization. Rather, pursuant to CEQA, the SEIR analyzes the impacts of implementation of the CAP Update, which is intended to reduce GHG emissions to meet state-defined targets. The most current legislation and regulatory setting related to GHG emissions reduction are discussed in Section 2.8, “Greenhouse Gas Emissions,” of the Draft SEIR (pages 2.8-4 through 2.8-12). See Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” for more information regarding GHG emissions reduction targets.

Comment I30-7

The comment claims that CEQA requires mitigation measures to be incorporated into the CAP Update and that the CAP Update will have significant adverse environmental impacts related to climate destabilization. The comment also states that the state climate mandates discussed in the CAP Update and the SEIR are insufficient and that the CAP Update must adopt 2022 Scoping Plan mitigation measures.

Response I30-7

As noted above in the response to comment I30-6, pursuant to CEQA, the SEIR analyzes the impacts of implementation of the CAP Update, which is intended to reduce GHG emissions to meet state-defined targets. The CAP Update's potential impacts related to climate change are discussed in Section 2.8, "Greenhouse Gas Emissions," of the Draft SEIR. As discussed in the Draft SEIR, implementation of the CAP Update would not generate significant GHG emissions and would not conflict with applicable plans, policies, or regulations adopted for the purpose of reducing GHG emissions. Therefore, mitigation measures are not required. See pages 2.8-13 through 2.8-36 of the Draft SEIR for a detailed discussion GHG emissions impacts related to implementation of the CAP Update.

The applicable state mandates related to GHG emissions reduction are discussed in Section 2.8.2.2, "State," of the Draft SEIR. Section 2.8.2.3.4, "Issue 2: Conflict with an Applicable Plan, Policy, or Regulation of an Agency Adopted for the Purpose of Reducing the Emissions of GHGs," of the Draft SEIR discusses how the CAP Update would not conflict with applicable plans, policies, and regulations, including the 2022 Scoping Plan, SB 32, and AB 1279. See Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," for detailed discussion on how the CAP Update would meet the applicable GHG emissions reduction targets and additional measures are not required.

Comment I30-8

The comment claims that the California climate mandate for 2030 is insufficient to meet the science-based 2030 climate stabilization requirement based on references provided. The comment also states that the Scoping Plan indicates that we cannot phase out the internal combustion engine light-duty vehicles fast enough and we must "double down" on VMT reduction.

Response I30-8

The CAP Update has been prepared pursuant to the current state legal and regulatory framework for achieving GHG reduction. The County notes the commenter's perspective on whether the State's current GHG reduction targets are adequate; it is not the charge of either the CAP Update or this SEIR to recommend different targets. The CAP Update is consistent with the 2022 Scoping Plan as discussed in Section 2.8.2.3.4, "Issue 2: Conflict with an Applicable Plan, Policy, or Regulation of an Agency Adopted for the Purpose of Reducing the Emissions of GHGs," of the Draft SEIR. Implementation of the CAP would put the County on a path to carbon neutrality ahead of SB 32's 2030 target. See Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," for detailed discussion on how the CAP Update would meet the

applicable GHG emissions reduction targets. See Section 9.1.1.1, “Master Response: CAP Update Purpose and Land Use Change,” which explains the purpose of the CAP Update. The CAP Update includes Action T-3.1 to increase the use of electric and other zero-emissions vehicles in the unincorporated county and Actions T-5.2 and T-6.3 to reduce VMT.

Comment I30-9

The comment provides excerpts of text from the 2022 Scoping Plan and indicates that transportation electrification, VMT reduction, building decarbonization, and pricing parking should be priority GHG reduction strategies for local jurisdictions.

Response I30-9

The County has received and reviewed the reference documents provided. See Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” for a discussion of the measures and actions included in the CAP Update to reduce GHG emissions.

Comment I30-10

The comment provides excerpts of text from the Scoping Plan related to dividend-account parking. The comment explains the need for and features of managed parking and how the County should proceed to provide managed parking for its employees.

Response I30-10

The County appreciates the commenter’s suggestion for how to further reduce GHG emissions through the use of managed parking. While the County has not adopted this strategy as part of the CAP Update, it has proposed other measures and actions to encourage multimodal transportation options and discourage use of single occupancy vehicles. Please see Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the methodology the County used to establish GHG reduction targets that are appropriately aligned with statewide targets and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets. Refer to Response O4-15 and Response I30-2 for discussion of dividend account parking.

Comment I30-11

The comment quotes text from the *2020–2023 County Operations Strategic Sustainability Plan* (Strategic Plan) and claims that the plan does not discuss car parking and thus contradicts the 2022 Scoping Plan.

Response I30-11

The County appreciates the commenter’s perspective on the shortcomings of the Strategic Plan; however, the comment does not address the content, analysis, or conclusions in the Draft SEIR. Therefore, no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a).

Comment I30-12

The comment explains the economic development features of a dividend-account car parking system.

Response I30-12

The economic development features described in the comment are noted. The comment does not raise significant environmental issues related to the Draft SEIR, and no further response is required on this issue pursuant to State CEQA Guidelines Section 15088(a). See also Response I30-2.

Comment I30-13

The comment states that the CAP Update and SEIR conflict with the 2022 Scoping Plan because they do not address free parking and claims that this is a CEQA violation. The comment also states that the County may not have any TDM mitigation measures and that a TDM is not likely to have a significant effect. The comment claims that the SANDAG RTP/SCS conflicts with the 2022 Scoping Plan. The comment also expresses support for the dividend account parking system.

Response I30-13

The 2022 Scoping Plan provides nonregulatory and non-exhaustive guidance for local governments and lead agencies related to how local climate action planning can support the State of California's climate goals. It includes recommendations intended to build momentum for local actions that align with the State's climate strategies, with a focus on climate action planning and approval of new land use development projects but does not represent an exhaustive list of everything local governments can do to support state climate goals. Therefore, it is not required that a CAP include all potential GHG reduction measures included in the 2022 Scoping Plan to be consistent with the plan. For further discussion of consistency with the 2022 Scoping Plan, refer to Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," and Responses A3-2, A3-4, and A3-5.

The CAP Update does include a measure that requires the County to "support transit and transportation demand management to reduce single occupancy vehicle trips in the unincorporated area" (CAP Update Measure T-6). As described on page 56 of the CAP Update, this measure is supported by a series of actions focused on reducing vehicle trips, including one that would adopt a TDM ordinance that would aim to reduce the number of vehicle trips associated with new development.

While the commenter may have misgivings as to the consistency of the RTP/SCS with the 2022 Scoping Plan, as described on pages 2.8-24 to 2.8-29 of the SEIR, the CAP Update is consistent with both the 2022 Scoping Plan and the RTP/SCS. The CAP Update would result in decreased GHG emissions compared to the baseline and would achieve the GHG reduction targets for 2030 and 2045. All GHG-related measures in the CAP Update would support the 2022 Scoping Plan goal of achieving GHG reduction targets because the CAP Update is intended to reduce GHG emissions generated within the unincorporated area and from County operations. Additionally, CAP Update measures

and actions that reduce VMT and transportation-related GHG emissions would also support the goals of the RTP/SCS.

Comment I30-14

The comment claims Table 2.8-5 in the SEIR conflicts with CARB findings and states that the CAP Update and SEIR do not accomplish pricing of roads, pricing of parking, and doubling of transit, which are required by CARB.

Response I30-14

The County does not have jurisdictional control of transit. Priced parking for County employees was considered but does not result in meaningful GHG emissions reduction due to telecommuting patterns. See Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” for a discussion of the GHG emissions reduction targets, measures, and actions included in the CAP Update to reduce GHG emissions.

Comment I30-15

The comment expresses support for measures to improve roadway segments as multimodal, but notes that pricing strategies are more important, and cautions against increasing roadway capacity for cars.

Response I30-15

The County acknowledges the support for multimodal transport. CAP Update Action T-5-1 would make multimodal improvements on County roads, Action T-5.1.a would develop education program to encourage and provide access to alternative modes of transportation and increase safety, Action T-5.2 would develop the Safe Routes to School program, and Action T-6.2 would include roadway treatments that would support transit and optimize traffic flow that could improve safety for multimodal transport. The CAP Update does not include measures or actions to increase roadway capacity. CAP Update Actions T-5.1, T-5.2, and T-6.2 would support the use of alternative modes of transportation and reduce single occupancy vehicle trips in the unincorporated area. See also Response I30-14 regarding the use of pricing strategies.

Comment I30-16

The comment suggests projects to improve bicycle access and implementation of a certified education program for bicyclists to reduce accidents. The comment also states that the funding for bicycle access projects should come from highway funds.

Response I30-16

The County acknowledges the commenter’s suggestion for how to further reduce GHG emissions. The CAP Update includes actions to improve bicycle access and safety. Specifically, Action T-4.1.a would provide educational programs and campaigns to encourage County staff to walk, bike, and take transit, Action T-5.1 would install 315 miles of bikeways by 2030 to encourage alternative modes of transportation, and Action T-5.1.a would develop educational materials to increase bicycle use, access, and safety. Please also see Section 9.1.1.3, “Master Response: CAP Update GHG Reduction Targets, Measures, and Actions,” which describes the methodology the County used to establish

GHG reduction targets that are appropriately aligned with statewide targets and adequately identify measures and actions to reduce GHG emissions to levels that achieve the targets.

Comment I30-17

The comment provides informative graphics related to the atmospheric temperature and carbon dioxide emission and requests that these graphics and associated information are included in the Final SEIR. The comment requests that the County state that cars and light-duty trucks emit more GHG emissions than any other category of emission. The comment states also that the 2022 Scoping Plan's measures need to be fully implemented.

Response I30-17

The County has received and reviewed the provided informative graphics related to the atmospheric temperature and carbon dioxide emission. Incorporation of these graphics and associated information would not change the impact analyses presented in Section 2.8, "Greenhouse Gas Emissions," of the Draft SEIR. Therefore, no revision to the SEIR is required. The SEIR provides GHG emissions inventory by section and indicates that transportation is the largest GHG emissions sector in California in Table 2.8-2 and that on-road transportation is the largest GHG emission sector in the unincorporated area in Table 2.8-3. See Section 9.1.1.3, "Master Response: CAP Update GHG Reduction Targets, Measures, and Actions," for a discussion of the GHG emissions reduction measures and actions included in the CAP Update to reduce GHG emissions. The SEIR has been prepared to address the potential effects of the CAP Update implementation, not to analyze the impacts of climate change. See Response I30-6 above.

Comment I30-18

The comment contains references five through 10 mentioned in Comments I30-8 through I30-11.

Response I30-18

The County has reviewed the attached references and has considered them in responding to Comments I30-8 through I30-11.

Letter

From: [Paul Hannesh](#)
To: [CAP](#)
Subject: [External] SEIR public comment
Date: Sunday, January 7, 2024 8:14:13 PM

I agree we want housing to be more heat and cool efficient, and we can all agree we want open spaces, parks and farms. However, I am against excessive spending to implement new infrastructure for which we don't have the money. We don't need more regulations; CA has too many as is. We don't need more emission-control strategies that take away our financial ability to support ourselves.

I disagree with the Net Zero plans because they are not sustainable to human life, to the economy or to common sense or reason. It is a rash idea to disregard human life and to be willing to sacrifice human life for the fake "climate emergency." Green House Gases (GHG) are not killing us. We can adapt to them better than the Net Zero proposals! Those proposals are pure coercion and eventual totalitarian top-down government tactics against "We The People." In America, this is not how we get things done.

I'm against any vehicle miles-traveled-coercion by toll roads or 15 or 20-minute cities that put limitations on one's ability to travel by personal vehicle. Solar and Electrical Vehicles (EV's) are not sustainable. They have toxic chemicals; they use foreign resources like rare-earth metals, that we do not mine for in the US as we should if we really want those products. Our energy power grid infrastructure cannot sustain more EV's. Renewable Energy technologies are not equivalent to current energy creation and are not sustainable for the population here. We are setting ourselves up for more rolling black outs and higher costs of energy which are not sustainable for the average person. EV fires are extremely hot and hard to put out which put us at much higher risk for the spread of wildfires. This is toxic hazardous waste, and it is insane to pave the way for more of these vehicles here in San Diego.

Building more High Density Housing (HDH) is not a solution to pollution. Teaching people how to farm and encouraging people to be farmers is. We need more farmers more than we need more dense housing and public transportation.

Will you make exceptions to new regulations when, "construction related to implementation of the GHG reduction measures and their associated actions could result in exceedances of local criteria air pollutant thresholds?" What an oxymoron. You, the elite, are making "Rules for me, but not for thee."

I disapprove of the Water Efficiency Plan as it can limit people's water consumption to unsustainable levels. People should not be having to weigh if they can shower that day or if they do laundry, and that is where this plan will be leading.

I31-1

I see a lot of vague visions in this report. I see very little numbers showing the plan of action and how this will actually make a difference in lowering any substantial average temperatures locally. What is the goal? What is the achievable number you are wanting? Is there any proof these changes will accomplish the goal? I recommend removing from the language anything about Net zero, zero carbon, zero emission, or zero GHG. These are unrealistic, unattainable, unreasonable goals. A lot of it is like cheating on your taxes and trying to come up with ways that you are able to write-off your emissions.

I31-1

From: [Spoon, Steven \(Chad\)](#)
To: [CAP](#)
Subject: FW: [External] County Draft CAP and DEIR
Date: Wednesday, February 7, 2024 8:37:19 AM

From: Bill Tippetts <billtippetts@gmail.com>
Sent: Tuesday, February 6, 2024 9:44 PM
To: Kelly, Meghan <Meghan.Kelly@sdcounty.ca.gov>
Cc: Slovic, Mark <Mark.Slovick@sdcounty.ca.gov>; Farmer, Tyler <Tyler.Farmer@sdcounty.ca.gov>; Talleh, Rami <Rami.Talleh@sdcounty.ca.gov>
Subject: [External] County Draft CAP and DEIR

Hi Meghan,

I was re-reading portions of the CAP and DEIR with particular interest in the Built Environment and Transportation section and associated GHG emission reduction measures.

In reviewing public comments made regarding those documents, and now that public comment period has closed, it occurred to me that several pieces of information and clarification would be useful to have as the process moves ahead.

I assume the County can provide information and clarifications related to the material it has already presented or used in developing the CAP and DEIR.

One request is to get clarification on what housing projections the CAP/DEIR used. The documents incorporated previous SB 375 and SB 743 analysis, and SANDAG growth projections. There are several housing unit projections or potentials (2016-2050) ranging from the GPU maximum allowable per zoning (~60,000 units?) to the SB 743 number (~30,000), and then the recent RHNA allocation (~7,600 for 2021-2029) - and up to 9,500-10,000 out to 2050)? Where in the documents can we find the specific number of projected housing units that the CAP/DEIR used in its analysis?

Related to that, and because the County asserts that the CAP cannot include land use/zoning change measures (it uses the GPU measures), but has an approved VMT plan that is supposed to induce development to VMT efficient (and the infill locations you've identified), how does that affect the projected distribution of future housing compared to what the GPU would have produced?

Also, would the County produce a map that overlays the DEIR alternative analysis locations of the LowVMT/Infill areas and the Mobility Hub areas? And then overlay the likely distribution of housing based on the current GPU land use/zoning?

I realize that you have a lot of work to prepare for the next phase of the CAP/DEIR effort. Even so, getting more clarity on these items would greatly help me and presumably others to evaluate the next set of documents.

Best regards,

Bill Tippetts

"However beautiful the strategy, you should occasionally look at the results" - Winston Churchill

I32-1

I32-2

I32-3

Letter I32 Bill Tippetts

January 7, 2024

Comment I32-1

The comment acknowledges that the public comment period for the Draft SEIR has closed. The comment requests clarification on the housing projections used in the CAP Update and SEIR analysis.

Response I32-1

The CAP Update's emissions projections estimate future emissions by considering forecasted growth in population, housing units, and employment, and the impact of adopted legislation and regulations on future emissions. The population, housing, and employment forecast for the CAP Update was based on San Diego Association of Governments' 2021 Regional Plan EIR Alternative 2 growth assumption (land use data set "DS" 39 scenario). Please see pages 2-3 to 2-5 of the Draft SEIR for a discussion of buildout assumptions for the SEIR analysis and Cap Update Appendix 3 (Tables 5 and 6) for the specific unit projections.

Comment I32-2

The comment states that the County has an approved VMT plan that is supposed to guide development to be VMT efficient and asks how the VMT plan affects the projected distribution of future housing compared to what the General Plan would have produced.

Response I32-2

The comment seems to reference the County's Transportation Study Guidelines, which is a program separate from the CAP Update. For clarification, the County's VMT threshold does not directly regulate development. Although the threshold and forthcoming VMT mitigation program may indirectly influence where development occurs, growth was distributed evenly across the unincorporated area in the VMT modeling performed for the CAP Update. As a result, the estimate is conservative compared to what could occur with the influence of the County's Transportation Study Guide (i.e., VMT generation and the GHG reductions necessary to address VMT may be overestimated).

As noted by the commenter, the CAP Update does not include land use or zoning changes to the General Plan. It does, however, include measures and actions to reduce VMT, including Actions T-3.1, T-4.1, T-4.1.a, T-4.2, T-5.1, T-5.1.a, T-5.1.b, T-5.2, T-6.1, T-6.2, T-6.2.a, T-6.2.b, and T-6.3. Additionally, in response to the Appellate Decision, the SEIR includes an analysis of four smart growth alternatives. These alternatives, which were crafted based on their ability to reduce VMT and on extensive stakeholder engagement, would result in changes to the adopted General Plan land use map. Please see Chapter 5, "Alternatives," of the Draft SEIR, for a description of these alternatives and their impacts, along with an explanation of the subsequent planning requirements for implementation of these alternatives. See also Section 9.1.1.2, "Master Response: Evaluation of Smart Growth Alternatives in This SEIR," for a discussion of the smart growth alternatives considered.

Comment I32-3

The comment requests a map that overlays the likely distribution of housing based on General Plan land use and zoning on the locations of the low-VMT/infill areas and the Mobility Hub areas evaluated in the Draft SEIR alternative analysis.

Response I32-3

The County acknowledges the mapping request. Extensive mapping was prepared as part of the outreach associated with the development of the smart growth alternatives. All stakeholders were given an opportunity to provide input on where smart growth should be located. As described on pages 5-20 and 5-21 of the Draft SEIR:

Based on requests from various stakeholders, the County prepared an interactive land use overlay mapping application and a series of approximately 90 static smart growth maps to facilitate discussions with stakeholders and development of alternatives. These maps and other materials are available to the public on the CAP Update website.

The Land Use Overlays map application includes the current General Plan land use, fire hazards severity zones, and the established villages in the county. The Land Use Overlays application is located on the County website at: <https://gis-portal.sandiegocounty.gov/arcgis/apps/webappviewer/index.html?id=8be6380b8f024460862f1c9334e999a0>. In addition, the locations of the low-VMT areas, infill areas, and Mobility Hub areas are shown in Figures 5-1 through 5-3 of the Draft SEIR (pages 5-47 through 5-111).

Because the utility of the requested map is unclear in the context of the analysis and conclusions in the Draft SEIR, additional mapping has not been performed in response to this comment.

9.2 Summary of Changes

9.2.1 Changes to the CAP Update Since Release of the Draft SEIR

Table 9-5 below summarizes the changes made to the CAP Update since release of the Draft SEIR in October of 2023. As shown below, these updates clarify the content of the CAP Update. As appropriate, these changes are reflected in this Final EIR; however, they do not affect the analysis or conclusions in the to the Draft SEIR.

Table 9-5 Changes to the CAP Update

Section	Page	Updates to Public Draft
Global		Changed implementation supplemental information name of “Cost Benefit Analysis” and “Disproportionate Impact to Communities” to “Cost Effectiveness and Disproportionate Cost Analysis”
		Changed name of “Carbon Farming Program” and “Carbon Farming Pilot Program” to “Climate Smart Land Stewardship Program”
		Minor formatting updates and grammatical corrections
		Edited Energy sector vision statement
		T-3.1a: Edited action description
		T-5.1a: Edited action description
		E-2.2: Edited action description
		E-2.2b: Edited action description
		E-2.2c: Edited action description
		E-3.2c: Edited action description
		W-1.1: Edited action description
		W-3.1: Edited action outcomes
Preface: Acknowledgements		Added acknowledgements
Chapter 1: Introduction	4	Added additional examples of regional collaboration
	9	Added and clarified the role of the County’s Sustainable Land Use Framework project on future land use changes and impacts to the CAP
	13	Added discussion on how the Safety Element increases climate resiliency
	14	Added discussion on career training and licensing/certification
Chapter 2: Community Outreach and Engagement	18	Updated photo of CAP cover page
	19	Changed “free rain barrels” to “free/discounted rain barrels”

Section	Page	Updates to Public Draft
Chapter 3: GHG Emissions Inventory, Projections, and Reduction Targets	38	Added footnote to Figure 10 (County GHG Emissions Projections and Targets) to reference Figure 13 (Greenhouse Gas Emissions Reductions from CAP Implementation)
Chapter 4: GHG Emissions Reduction Measures	44	Clarified monitoring occurs as part of the CAP's Annual Monitoring Report
	46	Added footnote to Figure 13 (Greenhouse Gas Emissions Reductions from CAP Implementation) to reference Figure 10 (County GHG Emissions Projections and Targets)
	47	Updated photo of CAP measure page
	49	Strategy: Decarbonize the On-Road and Off-Road Vehicle Fleet: Edited strategy description
	52	T-3: Edited measure description
	53	Strategy: Support Active Transportation and Reduce Single-Occupancy Vehicle Trips: Edited strategy description
	56	T-6: Edited measure description
	65	Edited Energy sector description
	66	Strategy: Increase Building Energy Efficiency, Renewable Energy, and Electrification in the Unincorporated Area and County Operations: Edited strategy description
	67	E-1: Edited measure description
	68	E-2: Edited measure description and equity based outcomes
	78	Strategy: Increase Solid Waste Diversion in the Unincorporated Area and in County Operations: Edited strategy description
	79	SW-1: Edited measure description
	89	Edited Water and Wastewater sector description
	90	Strategy: Decrease Potable Water Consumption In the Unincorporated Area and County Operations: Edited measure description
	93	Strategy: Increase Stormwater Collection, Water Pumping, and Wastewater Treatment Efficiency: Edited strategy description
	94	W-3: Edited measure description
	99	Edited Agriculture and Conservation sector description
	100	Strategy: Preserve Natural Lands and Improve Land Management Practices to Protect Habitat and Increase Carbon Storage: Edited strategy description
	102	A-2: Edited measure description
	105	A-4: Edited measure description

Section	Page	Updates to Public Draft
Chapter 5: Implementation and Monitoring	115	Added and clarified description of implementation supplemental information
	116	Added discussion of regional collaboration in CAP implementation
	117	Added and clarified how measures will be monitored
	143	Table 13: Added note about funding sources
	146	Table 14: Corrected appendix name, updated text to add clarification, and added hyperlink
Chapter 6: Glossary	147	Added glossary
Back Cover Page		Added photo of skate park at Lindo Lake County Park

9.2.2 Changes to the Draft SEIR

Table 9-6 below summarizes the changes made to this SEIR since release of the Draft SEIR in October of 2023. As shown below, these revisions clarify, amplify, or otherwise make insignificant modifications to the Draft SEIR.

Table 9-6 Changes to the Draft SEIR

Section (Page)	Summary of Change	Reason for Revision
Section S.1.2.5 (p. 9)	Consistency with the CAP Update would be the only threshold of significance general use for County projects (State CEQA Guidelines Section 15064.7(b)).	Clarification
Section 2.4 (p. 2.4-5)	<u>Policy COS-1.4: Collaboration with Other Jurisdictions. Collaborate with other jurisdictions and trustee agencies to achieve well-defined common resource preservation and management goals.</u>	Update
Section 2.4 (p. 2.4-6)	Policy COS-1.5: Regional Funding. Collaborate with other jurisdictions and federal, state, and local agencies to identify regional, long-term funding mechanisms that achieve common resource management goals. Policy COS-1.10: Public Involvement. Ensure an open, transparent, and inclusive decision-making process by involving the public throughout the course of planning and implementation of habitat conservation plans and resource management plans. Policy COS-1.11: Volunteer Preserve Monitor. Encourage the formation of volunteer preserve managers that are incorporated into each community planning group to supplement professional enforcement staff.	Update
Section 2.4 (p. 2.4-7)	<u>Policy LU-6.4: Sustainable Subdivision Design. Require that residential subdivisions be planned to conserve open space and natural resources, protect agricultural operations including grazing, increase fire safety and defensibility, reduce impervious footprints, use sustainable development practices, and, when appropriate, provide public amenities. [See applicable community plan for possible relevant policies.]</u> <u>Policy M-12.9: Environmental and Agricultural Resources. Site and design specific trail segments to minimize impacts to sensitive environmental resources, ecological system and wildlife linkages and corridors, and agricultural lands. Within the MSCP preserves, conform siting and use of trails to County MSCP Plans and MSCP resource management plans.</u>	Update
Section 2.9 (p. 2.9-10)	<u>Policy M-1.2: Interconnected Road Network. Provide an interconnected public road network with multiple connections that improve efficiency by incorporating shorter routes between trip origin and destination, disperse traffic, reduce traffic congestion in specific areas, and provide both primary and secondary</u>	Update

Section (Page)	Summary of Change	Reason for Revision
	<p><u>access/egress routes that support emergency services during fire and other emergencies.</u></p> <p><u>Policy M-3.3: Multiple Ingress and Egress. Require development to provide multiple ingress/egress routes in conformance with state law and local regulations.</u></p> <p><u>Policy M-4.3: Rural Roads Compatible with Rural Character. Design and construct public roads to meet travel demands in Semi-Rural and Rural Lands that are consistent with rural character while safely accommodating transit stops when deemed necessary, along with bicyclists, pedestrians, and equestrians. Where feasible, utilize rural road design features (e.g., no curb and gutter improvements) to maintain community character.</u></p>	
Section 2.9 (p. 2.9-13)	<p><u>Policy S-17-3: Airport Operational Plans. Require operational plans for new public/private airports and heliports, as well as future operational changes to existing airports, to be compatible with existing and planned land uses that surround the airport facility.</u></p>	Update
Section 2.10 (p. 2.10-15)	<p><u>Policy COS-5.4: Invasive Species. Encourage the removal of invasive species to restore natural drainage systems, habitats, and natural hydrologic regimes of watercourses.</u></p>	Update
Section 2.10 (p. 2.10-43)	<p>Policy S-9-310.4, which requires development within mapped flood hazard areas be sited and designed to minimize on-site and off-site hazards; Policy S-9-410.5, which allows new uses and development within the floodplain fringe (land within the floodplain outside of the floodway) only when environmental impacts and hazards are mitigated; Policy S-9-510.6, which prohibits development in the floodplain fringe when located on Semi-Rural and Rural Lands to maintain the capacity of the floodplain; Policy S-9-610.7, which prohibits development in dam inundation areas that may interfere with the County's emergency response and evacuation plans; Policy S-40-411.1, which limits new or expanded uses in floodways to agricultural, recreational, and other such low-intensity uses and that do not meet certain criteria identified in the policy; Policy S-40-211.2, which would require the use of natural channels for County flood control facilities; Policy S-40-311.3, which would require flood control facilities to be adequately sized, constructed, and maintained to operate effectively; Policy S-40-411.4, which would require new development to incorporate measures to minimize storm water impacts; Policy S-40-511.5, which would require new development to provide necessary on-site and off-site improvements to storm water runoff and drainage facilities; and Policy S-40-611.6, which would ensure new development maintains the existing hydrology of the area.</p>	Correction

Section (Page)	Summary of Change	Reason for Revision
Section 2.10 (p. 2.10-45)	New farmworker housing would also be required to implement adopted General Plan goals and policies related to surface hydrology and drainage, including Policies LU-6.5, LU-6.10, LU-6.12, COS-5.1, S-8.1, S-8.2, S-9.1, S-9.2, S-9.3, S-9.4, S-9.5, S-9.6, S-10.1, S-10.2, S-10.3, S-10.4, S-10.5, and S-10.6, and 11.1 through 11.6 , as described above.	Correction
Section 2.10 (p. 2.10-47)	Additionally, new renewable energy projects would be required to implement adopted General Plan goals and policies related to surface hydrology and drainage, including Policies LU-6.5, LU-6.10, LU-6.12, COS-5.1, S-8.1, S-8.2, S-9.1, S-9.2, S-9.3, S-9.4, S-9.5, S-9.6, S-10.1, S-10.2, S-10.3, S-10.4, S-10.5, and S-10.6, and 11.1 through 11.6 , as described above.	Correction
Section 2.11 (p. 2.11-1)	As indicated, implementation of the proposed project would not result in new or more severe significant impacts on land use and planning.	Correction
Section 2.12 (p. 2.12-7)	Policy S-45.417.2: Land Use Compatibility. Require land uses surrounding airports to be compatible with the operation of each airport. <u>Policy S-17.3: Airport Operational Plans. Require operational plans for new public/private airports and heliports, as well as future operational changes to existing airports, to be compatible with existing and planned land uses that surround the airport facility.</u> <u>Policy S-17.5: Private Airstrip and Heliport Location. Locate private airstrips and heliports outside of safety zones and flight paths for existing airports where they are compatible with surrounding established and planned land use, and in a manner to avoid impacting public roadways and facilities.</u>	Correction and Update
Section 2.12 (p. 2.12-28)	Future projects associated with implementation of the CAP Update would be required to comply with adopted General Plan Policy N-4.9, which requires noise compatibility of any projects that may be affected by noise from public or private airports, and Policy S- 45.417.2 , which requires land uses surrounding airports to be compatible with the operation of each airport.	Correction
Section 2.12 (p. 2.12-29)	Development of new farmworker housing associated with CAP Update would be required to comply with adopted General Plan Policy N-4.9, which reduces potential noise impacts to noise-sensitive land uses, and Policies S-45.1, S-45.2, and S-45.4 S-17.2, S-17.3 and S-17.5, which require land uses surrounding airports to be compatible with airport operations.	Correction
Section 2.12 (p. 2.12-30)	Although the locations of most projects that would be constructed to achieve the targets of the CAP Update are unknown, it is reasonable to assume that development would be consistent with applicable Airport Land Use	Correction

Section (Page)	Summary of Change	Reason for Revision
	Compatibility Plans (ALUCPs), would be subject to compliance with adopted General Plan Policies N-4.9, S-15.1, S-15.2, and S-15.4 <u>S-17.2, S-17.3, and S-17.5</u> , and would be required to implement 2011 GPU PEIR Mitigation Measures Noi-5.1 through Noi-5.3.	
Section 2.12 (p. 2.12-32)	As discussed in Section 2.12.3.5, "Issue 3: Excessive Noise Exposure from a Public or Private Airport," above, excessive noise from a public or a private airport associated with implementation of the project would not be significant with implementation of 2011 GPU PEIR Mitigation Measure Noi-5.1 and compliance with adopted General Plan Policies N-4.9, S-15.1, S-15.2, and S-15.4 <u>S-17.2, S-17.3, and S-17.5</u> .	Correction
Section 2.15.1 (p. 2.15-2)	CAL FIRE released updated maps of FHSZs within SRAs for public comment in 2022. These maps show an overall reduction in lands within High FHSZs and an increase in lands within the Very High FHSZ designation in the unincorporated county. However, these <u>These</u> designations are proposed and have yet to be <u>been</u> adopted <u>and became effective on April 1, 2024.</u> ; the 2007 maps remain the most current adopted maps at this time.	Update
Section 2.15.3.2 (p. 2.15-10)	As discussed in Section 2.15.1, "Existing Conditions," the majority of the unincorporated county is within an SRA, and most lands within the unincorporated county are classified as High and Very High FHSZs in SRAs (CAL FIRE 2007 <u>2024</u>).	Update
Section 4.4 (p. 4-35)	Most of the in-process GPAs are located more than 2 miles from an airport except the two Peppertree Park <u>Units 9 and 10</u> projects that are located within 2,000 feet of Fallbrook Airpark.	Correction
Table 4-1 (p. 4-43)	The fourth row for "Peppertree Park SPA (Units 7 + 8)" has been deleted.	Correction
Section 5.5.2 (p. 5-22)	Implementation of smart growth alternatives that result in changes to the adopted General Plan land use map would require subsequent planning by County staff to develop tools to modify the application of the adopted General Plan. State laws facilitating housing streamlining and development (including Senate Bill 330, known as the Housing Crisis Act) also prevent the County from reducing residential capacity on a site zoned for housing <u>in certain areas of the county</u> without identifying replacement capacity. In addition, it is difficult to downzone higher density housing element sites identified and approved by the state as feasible sites for lower-income development. Government Code Section 65863 requires that cities and counties ensure that their general plans provide for regional housing needs. In addition, cities and counties are required to have no "net loss" of	Clarification

Section (Page)	Summary of Change	Reason for Revision
	lower and moderate-income dwelling units. The County cannot take action that would reduce identified affordable housing sites for these income categories.	
Section 5.5.3.1 (p. 5-26)	If implemented, this alternative is anticipated to reduce VMT for new development by 6.6 percent in 2035 and 3.0 percent in 2050. <u>This represents a substantial VMT reduction for new growth.</u> However, when viewed in conjunction with existing development, the magnitude of overall VMT reduction is relatively small because the vast majority of unincorporated county VMT under future year alternatives can be attributed to existing land uses.	Clarification
Section 5.5.3.1 (p. 5-27)	Therefore, <u>although</u> this alternative <u>would reduce VMT from new development, the magnitude of is not expected to meaningfully reduce VMT or GHG emissions reductions in the unincorporated county would be much smaller when all VMT in the future condition is considered.</u>	Clarification
Section 5.7 (p. 5-45)	The “CAP Significance Determination” for the “Issue Area” Environmental Justice in Table 5-2 is revised as follows: <u>SU-LTS</u>	Correction
Chapter 6 (p. 6-15)	<u>———. 2024. <i>Fire Hazard Severity Zones in State Responsibility Areas</i>. September 29, 2023 – Effective April 1, 2024. Available: https://calfire-forestry.maps.arcgis.com/apps/webappviewer/index.html?id=988d431a42b242b29d89597ab693d008. Accessed May 20, 2024.</u>	Update

NOTICE OF PREPARATION DOCUMENTATION

DATE: **REVISED** December 23, 2020

PROJECT NAME: COUNTY OF SAN DIEGO CLIMATE ACTION PLAN UPDATE

PROJECT NUMBER(S): PDS2020-POD-20-016 and PDS2020-GPA-20-004

PROJECT APPLICANT: County of San Diego – Planning & Development Services

ENV. REVIEW NUMBER: PDS2020-ER-20-00-002

This Notice of Preparation has been revised to extend the public review period and the date of the scoping meeting, as indicated on page 6. There are no other changes to this Notice of Preparation.

PURPOSE OF THE NOTICE OF PREPARATION:

The County of San Diego (County) is sending notice that a Supplemental Environmental Impact Report (Supplemental EIR) will be prepared for the Climate Action Plan (CAP) Update (hereafter, "CAP" or "project"). The County is seeking input from the public and agencies on potential environmental impacts of the CAP, ways to mitigate those impacts, and alternatives that may lessen those impacts. The County is also seeking input on potential GHG reduction strategies and measures to be included in the CAP. To review the impacts, mitigation measures, and alternatives from the 2018 CAP Supplemental EIR (2018 CAP SEIR), please see the following link: [2018 CAP SEIR](#).

The overall objective of the CAP is to reduce GHG emissions generated from activities within the unincorporated County (community) and GHG emissions generated by County facilities and operational activities throughout the County, including facilities and operations located within incorporated cities (County operations) to meet or exceed GHG reduction goals under State laws.

The County will conduct stakeholder outreach for the CAP. This Notice of Preparation is the first step in the CEQA process.

PROJECT BACKGROUND:

The County Climate Action Plan (2018 CAP) was adopted and the Final 2018 CAP SEIR was certified by the County Board of Supervisors on February 14, 2018. The 2018 CAP was adopted to comply with the County's 2011 General Plan Conservation and Open Space (COS) Goal COS-20, Policy COS-20.1, and 2011 General Plan Update Program Environmental Impact Report (2011 GPU PEIR) Mitigation Measures CC-1.2, CC-1.7, and CC-1.8. The General Plan Goal COS-20 requires reduction of community and County operations greenhouse gas emissions and Policy COS-20.1 requires preparation, maintenance, and implementation of a CAP. To review the Conservation and Open Space Element of the General Plan, see the following link: [General Plan](#). The 2018 CAP required a General Plan Amendment (GPA) to update COS-20 and COS-20.1 to comply with existing State law. The 2018 CAP SEIR project included the 2018 CAP, this associated GPA to the County's 2011 General Plan and revision to the associated Mitigation Monitoring and Reporting Program, a threshold of significance for greenhouse gases (GHGs), and revised County Guidelines for Determining Significance for Climate Change.

After the County adopted the 2018 CAP and certified the 2018 CAP SEIR, the Sierra Club, Center for Biological Diversity, Cleveland National Forest Foundation, Climate Action Campaign, Endangered Habitats League, Environmental Center of San Diego, and Preserve Wild Santee filed a petition challenging the 2018 CAP as violating the California Environmental Quality Act (CEQA). In a separate action, Golden Door Properties, LLC, also challenged the 2018 CAP as violating CEQA. On December 24, 2018, the Superior Court ruled that the 2018 CAP approval did not comply with CEQA. The Superior Court ordered the County to set aside and vacate the February 14, 2018, approvals and the certification of the 2018 CAP SEIR. This decision was later affirmed in part by the California Court of Appeal, Fourth Appellate District (Appellate Court), on June 12, 2020, in *Golden Door Properties, LLC, v. County of San Diego*, 50 Cal. App. 5th 467. As a result, the County Board of Supervisors rescinded the 2018 CAP and 2018 CAP SEIR, and associated approvals, on September 30, 2020.

In addition to requiring rescission of the 2018 CAP and related approvals, the Superior Court ordered the County to submit an estimated schedule to prepare a new CAP and Guidelines for Determining Significance for Climate Change ("Guidelines"), and comply with CEQA and the State Planning and Zoning Law. The Superior Court has retained jurisdiction to determine compliance. In response to the court's decision, the County will prepare a CAP Update, Guidelines, and Supplemental EIR to address the court's opinion.

The County will continue implementing sustainability measures to reduce GHGs as part of its ongoing commitment to the environment and to progress towards accomplishment of statewide reduction targets. Information on the County's sustainability efforts and 2018 CAP and 2018 CAP SEIR documents are available at the following link: [2018 CAP](#).

PROJECT DESCRIPTION:

The CAP will include preparation of an updated GHG Emissions Inventory and Projections and preparation of updated GHG Emissions Targets to determine if additional or revised measures are needed. The Appellate Court struck down the 2018 CAP SEIR but did not find fault with the 26 GHG reduction measures in the 2018 CAP. The County may revise, expand, or replace the 2018 CAP GHG reduction measures and may prepare new GHG reduction measures for the project.

To incorporate GHG reduction goals under new State laws adopted since 2011, the project will include amendments to Goal COS-20 and Policy COS-20.1 of the General Plan and 2011 GPU PEIR Mitigation Measures CC-1.2, CC-1.7, and CC-1.8, similar to the 2018 CAP. Policy COS-20.1 was also amended in 2018 so that the CAP could be used in the analysis of cumulative GHG impacts of projects covered by the CAP (e.g., projects consistent with density allowed in the General Plan), pursuant to CEQA Guidelines section 15183.5. The amendments to Goal COS-20 and Policy COS-20.1, a threshold of significance for GHGs, and a revised Guidelines will be required. These actions, analysis of GHG reduction measures, and any other action necessary to comply with CEQA will be analyzed in the Supplemental EIR for the project. In addition to amendments to Goal COS-20 and Policy COS-20.1, refinements or additions to General Plan policies may be required as part of the project or a project alternative, which may require additional amendments to the General Plan. The Appellate Court also determined that the County was required to identify and analyze a “smart growth” alternative to reduce vehicle miles travelled and associated GHG impacts. The project will include at least one “smart growth” alternative and other alternatives as part of a reasonable range to reduce significant impacts from the project.

The Supplemental EIR for the project will serve two discrete purposes:

1. The Supplemental EIR will provide a program-level analysis of the project and actions described therein; and
2. The Supplemental EIR will address the court’s ruling and will supplement the 2011 GPU PEIR.

The CAP may consider strategies and reduction measures, and supporting efforts organized under the same five categories as the 2018 CAP:

1. Built Environment and Transportation;
2. Energy;
3. Solid Waste;
4. Water and Wastewater; and
5. Agriculture and Conservation.

CEQA REQUIREMENTS:

The California Environmental Quality Act (CEQA) requires that public agencies consider the potentially significant adverse environmental effects of projects over which they have discretionary approval authority before taking action on those projects (Public Resources Code [PRC] Section 21000 et. seq.). According to California Code of Regulations (CCR) Title 14, Section 15064(f)(1), preparation of an EIR is required whenever a project may result in a significant adverse environmental effect. An EIR is an informational document used to inform public agency decision makers and the general public of the significant environmental effects of a project, identify possible ways to mitigate or avoid the significant effects, and describe a range of reasonable alternatives to the project that could feasibly attain most of the basic objectives of the project while substantially lessening or avoiding any of the significant environmental impacts. Public agencies are required to consider the information presented in the EIR when determining whether to approve a project.

The CAP is a comprehensive plan for the County to identify the strategies, measures, and actions that would need to be undertaken to reduce GHG emissions consistent with legislative requirements. As such, consistent with the requirement of CEQA Guidelines Section 15168, the County is preparing a program EIR that evaluates the scope of actions proposed under the CAP.

The project will supplement the 2011 GPU PEIR. CEQA Guidelines sections 15162 through 15164 set forth the requirements for additional environmental review when there is a previously certified EIR covering the project for which a subsequent discretionary action is required. CEQA Guidelines, Sections 15162(a) and 15163, state that when an EIR has been certified for a project, no subsequent or supplement to an EIR shall be prepared for that project unless the lead agency determines, on the basis of substantial evidence in light of the whole public record, one or more of the following:

1. Substantial changes are proposed in the project which will require major revisions of the previous EIR or Negative Declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or
2. Substantial changes occur with respect to the circumstances under which the project is undertaken which will require major revisions of the previous EIR or Negative Declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or
3. New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete or the Negative Declaration was adopted, shows any of the following:
 - a. The project will have one or more significant effects not discussed in the previous EIR or Negative Declaration; or
 - b. Significant effects previously examined will be substantially more severe than shown in the previously adopted Negative Declaration or previously certified EIR; or
 - c. Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of

- the project, but the project proponents decline to adopt the mitigation measure or alternative; or
- d. Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

The project will require a Supplemental EIR pursuant to CEQA Guidelines section 15163 because the CAP updates and implements the General Plan Goal COS-20 and Policy COS-20.1; and Mitigation Measures CC-1.2, CC-1.7, and CC-1.8 of the 2011 GPU PEIR.

The CAP will also be used for future project-specific environmental documents by being prepared consistent with the tiering and streamlining provisions of CEQA Guidelines section 15183.5. The Supplemental EIR will provide the appropriate level of environmental review to allow future projects that are within the activities covered by the CAP (e.g., projects consistent with density allowed in the General Plan) to tier from and streamline their analysis of GHG emissions pursuant to CEQA Guidelines section 15183.5(b)(2).

PROJECT LOCATION:

The County of San Diego is located in the southwestern corner of the State. The County is bordered by the Pacific Ocean to the west, Riverside County to the north, Imperial County to the east, Orange County at the northwest corner, and the Republic of Mexico to the south (Exhibit 1).

The planning area for the CAP is the same planning area considered for the 2011 General Plan, which encompasses all unincorporated land in the County of San Diego (Exhibit 2). The unincorporated County is composed of 3,570 square miles and represents 84 percent of the total land area in the County.

PROBABLE ENVIRONMENTAL EFFECTS:

The County may utilize some or all of the 26 measures in the 2018 CAP as GHG reduction measures for the project, or other measures. The 2018 CAP SEIR identified significant impacts from implementation of these 26 measures for Aesthetics; Agricultural Resources; Air Quality; Biological Resources; Cultural, Historic, and Paleontological Resources; Energy; Greenhouse Gas Emissions; Hazards and Hazardous Materials; Hydrology and Water Quality; Land Use and Planning; Noise; Transportation and Traffic; and Tribal Cultural Resources. The Final 2018 CAP SEIR and potentially significant effects can be found here: [2018 CAP SEIR](#).

The following is a list of the subject areas to be analyzed in the Supplemental EIR:

Aesthetics	Agriculture and Forestry Resources
Air Quality	Biological Resources
Cultural Resources	Energy

Geology and Soils	Greenhouse Gas Emissions
Hazards and Hazardous Materials	Hydrology and Water Quality
Land Use and Planning	Mineral Resources
Noise	Population and Housing
Public Services	Recreation
Transportation	Tribal Cultural Resources
Utilities and Service Systems	Wildfire

PUBLIC SCOPING MEETING:

Consistent with Section 21083.9 of the CEQA Statutes, a public scoping meeting will be held to solicit comments regarding the scope and analysis of the Supplemental EIR. On March 17, 2020, California Governor Gavin Newsom issued Executive Order N-29-20, relating to the convening of public meetings in the State of California in response to the COVID-19 pandemic. The Executive Order outlined requirements for public meetings to take place telephonically or electronically without the need for the public or agencies to attend in person. This meeting will be held virtually on January 28, 2021, 6:00 p.m. to 8:00 p.m. Please follow this link for instructions on how to participate in this virtual scoping meeting: [CAP Update](#).

Comments on this Notice of Preparation document will be accepted for 57 days following the issuance of the first notice on December 10, 2020, and must now be received no later than February 4, 2021. The County is providing 27 extra days. Comments on the Notice of Preparation document must be sent to Planning & Development Services (PDS) via email or to the address listed below and should reference the project numbers (PDS2020-POD-20-016 and PDS2020-GPA-20-004, and PDS2020-ER-20-00-002) and project name (County of San Diego Climate Action Plan Update).

Comment letters may be submitted electronically via e-mail at: CAP@sdcounty.ca.gov. Due to the COVID-19 pandemic and State orders, non-essential County staff are working remotely. The County requests that all comments be provided electronically. If a hard copy submittal is necessary, it may be submitted to:

Subject: question about crossover with the Renewable Energy Overlay Project
Date: Wednesday, December 23, 2020 2:24:05 PM

Hello,

I just received the notice of an update to the Climate Action Plan for SD County and there is a notice on the same web page about Land Use Overlays. Is the Renewable Energy Overlay Project one of those that will be part of this update?

That project has been the subject of comment from the Borrego Springs Community Sponsor Group and so if it is part of this update or will be considered during the update, I'd like to be informed of that.

Thank you,

Rebecca Falk, Chair
Borrego Springs Community Sponsor Group

Date: Wednesday, January 6, 2021 8:19:13 AM

Hello Chairperson Falk,

Thank you for the email. The Renewable Energy Overlay Options project will not be a part of the Climate Action Plan Update process. That project is on a separate track and more information can be found on the Renewable Energy Overlay Options project website.

- <https://www.sandiegocounty.gov/content/sdc/pds/advance/renewableenergyoverlay.htm>

I hope this answers your inquiry. Please let us know if you have any additional questions.

Thank you and have a good one.

Subject: CAP NOP EIR comments
Date: Friday, January 22, 2021 12:16:16 PM
Attachments: [Climate Action Plan NOP Comments.pdf](#)

The Descanso Community Planning Group (DCPG) is submitting a comment letter regarding the County of San Diego Climate Action Plan Notice of Preparation of an Environmental Impact Report.

Please see the attachment.

We are urging the Planning and Development Services staff to think outside the box and consider our comments seriously. The DCPG considers the miss management of our local forests and wilderness areas to be significant sources of air pollution when they are ON FIRE. With proper tree mortality management and underbrush clearances as practiced in the Cleveland National Forest the Rancho Cuyamaca State Park's wildfire risks can be mitigated to a lower impact on our local communities, such as Descanso, Pine Valley, Alpine and Julian.

Regards,

Kerry Forrest, Chair
DCPG

Seat 5:
Mark Gassert

Seat 6:
William Bauer

Seat 7:
Terry Gibson

The Descanso Community Planning Group (DCPG) are providing their comments regarding the County of San Diego Climate Action Plan (CAP) Notice of Preparation (NOP) of an Environmental Impact Report (EIR).

“The 2018 CAP identifies 11 strategies and 26 measures plus numerous supporting efforts to reduce GHG emissions in the largely rural, unincorporated San Diego County as well as within County government operations. The 2018 CAP's strategies and measures are designed to reduce GHG emissions and achieve multiple secondary benefits including energy and water conservation, cleaner air, community health, biological resource conservation, cost savings, and job creation. 2018 CAP strategies and measures were selected based upon a review of potential available measures, their effectiveness in reducing GHG emissions, and their applicability to the unincorporated area “

The DCPG is providing these comments on the CAP Update. Planning and Development Services (PDS) is urged to “think outside of the box”. Not just man-made sources of air pollution including GHG emissions should be addressed in the CAP. Forest Best Management Practices should be included within the proposed San Diego County Climate Action Plan. Specifically, the Cuyamaca State Park which is within the Cleveland National Forest. The State park consists of 26,000 acres. Approximately half is designated “Wilderness” and the rest is managed under the California State Park regulations.

Background:

Wildfires are a proven source of significant air pollution. The Cedar Fire of October 2003 included the burning of many homes within the Descanso Community as well as homes in the rest of the County. This fire emitted Carbon Dioxide, Sulfur Dioxide, Methane, Nitrous Oxide, Carbon Monoxide, and over 300,000 tons of particulate material into the atmosphere. We believe a large part of this was and is due to the mismanagement of the Cuyamaca State Park.

Specifically, regarding fuel management, California State Park and United States Forest Service forest management practices run in conflict with each other. The Cuyamaca State Park is within San Diego County, the Cleveland National Forest and borders the community of Descanso. The DCPG has an obligation to address this ongoing failure to responsibly manage the Cuyamaca State Forest.

Solution:

The 26,000 acres of the Cuyamaca State Park must apply the same forest management/tree morbidity control practices as the rest of the Federally controlled 465,000-acre Cleveland National Forest. Through the proper management of a healthy forest the impact of wildfires to air, water and land quality can be reduced significantly. The proper management of our local State Park ties in with the Climate Action Plan to reduce wildfire caused air pollution, carbon emissions, enhance water quality and protect our community from the impacts of Global Warming.

The DCPG urges PDS to use the CAP EIR process to look at the reduction of GHG's and Air Pollution through proper management of our State Forests. Through Best Management Practices by the State of California and possibly even the County Park Services, where tree morbidity and overgrowth is addressed and managed the goal of reducing air pollution, achieving clean water and safer communities can be achieved.

We look forward to the CAP EIR process and wish to be kept in contact with PDS regarding this especially important impact to our community.

Regards,

Kerry Forrest, Chair DCPG

Hello,

Thank you for your email and interest in the County of San Diego Climate Action Plan Update. This email is to confirm that your comment has been received and will be reviewed during the update process.

The virtual Project Public Scoping Meeting will be held January 28, 2021 from 6:00 pm to 8:00 pm. Visit this [website](#) for more information.

You can continue to receive updates on the Climate Action Plan Update by visiting our website (<https://www.sandiegocounty.gov/content/sdc/sustainability/cap.html>) and signing up for email updates.

Thank you again for your interest. Please let us know if you have additional questions or comments.

Best,
County of San Diego, Sustainability Team

To Whom It May Concern,

I am writing to you as a local resident and owner of a small regenerative design-build cooperative called Corona Enterprises to urge you to make immediate and significant updates to the CAP. De-carbonizing San Diego will yield extremely minor changes in terms of the severity of climate change impacts this region experiences, due to the global nature of the greenhouse effect. The CAP would certainly yield benefits to resiliency by creating more local renewable energy production. good green jobs, improvements to infrastructure, etc., but if the rest of the world fails to act on GHGs this region will still experience catastrophic climate change. Furthermore, climate change is just one of the many [planetary systems](#) that needs to be functioning well for life to thrive on this planet, and according to the last assessment by the Stockholm Resilience Centre climate change was ranked 5th in terms of how far outside the "safe operating space" we are after biodiversity, disruptions to the N and P cycles, and land system change. Furthermore, we can address **all** our failing planetary systems more effectively, including climate change, if we address them at the same time, not in siloes.

Another question to consider when deciding how to move forward with regard to climate change: Why does the IPCC say that wetter soil decreases the severity of heat waves (with high scientific confidence) and that increased vegetation reduces regional warming (medium confidence) yet these potential pressure points for stabilizing regional climate don't seem to be making it into local climate action plans? And these are just two of the non-GHG pressure points mentioned in the IPCC report to keep the question somewhat digestible, but there are several others.

Source: https://www.ipcc.ch/site/assets/uploads/2019/08/Edited-SPM_Approved_Microsite_FINAL.pdf. The IPCC makes it quite clear that there are other human climate forcings besides just greenhouse gas emissions, and a Climate Action Plan that does not address these other forcings does a disservice to both the human and non-human inhabitants of this region.

I am always open to new information and try to stay away from "beliefs" but I am becoming more and more convinced that our strategy focused almost entirely on GHG mitigation is extremely sub-optimal. Even the small bit of climate change

adaptation work that is happening fails to take advantage of the mechanisms we have for stabilizing regional climate and creating resiliency to disturbance. Something to consider, when Jimmy Carter allegedly asked Charles Keeling for advice in 1978 on what the government should do about climate change, Keeling said that the problem was far too complicated for people to understand, so focus on greenhouse emissions. Is that the stance you want San Diego County to take as well? Or do you want to be world leaders in how to address this crisis in a way that is actually effective and acts on the best information science can offer us?

Warm Regards,
Cody Harrison

Subject: Question
Date: Friday, December 11, 2020 9:03:38 AM

In 1959 or 1960, I clearly remember the "SCIENCE" being taught in my 3rd grade class: It had been taught back then there had been SIX ICE AGES over Billions of years. According to these same SCIENTIST, there were no humans populating the planet back then. Not surprisingly, humans were never blamed for these life-altering global events.

Over the years, as recent as the 1970s, SCIENCE warned us about OVER-POPULATION was going to kill the planet. Of course, man was responsible for THIS condition. Immediately after that came the SCIENTISTS warning of "GLOBAL WARMING" in the 1990s and early 2000's. Man, again, was responsible. Today, these same "SCIENTISTS" call it "CLIMATE CHANGE", and of course, man is responsible for this too. The actual word for ALL of these global conditions is called "WEATHER" and it changes daily - with or without the presence of man (i.g.: see the first paragraph).

There's NO DOUBT man has some responsibility to make it sure he isn't damaging its environment but until the largest populations on the planet, accounting for three quarters of the world population: Communist China, India and Pakistan adhere to ANY level of reduction of "Green House Gases", any government in the United States of America is merely a pawn in the environmentalists game of hating America for which it stands - successful and fruitful living.

Are there problems? Of course. Adding taxes (which NEVER go to the claimed reason) on this country, especially this community, for things it isn't creating, is ludicrous and another shameful attempt to exploit money from the very taxpayers it is charged with the fiduciary responsibility in protecting!

Shame of the San Diego County Board of Supervisors for even considering taking this seriously while our roads are falling apart and the homelessness population increases daily.

Subject: Reducing energy transmission losses
Date: Monday, December 14, 2020 7:55:27 AM

Greetings,

I was reading that up to 13% of electrical energy is lost in distribution and transmission. The transmission of electricity has significant environmental impacts when one also considers the maintenance of the infrastructure and risk of wildfires.

The risk of wildfires pushes SDG&E to shut off power in East County for days and residents have to use small inefficient generators even if they have solar due to loss of grid synchronization.

Advances in batteries now permit high round trip efficiencies, safety, and 20+ year life expectancies.

Has the CAP program investigated the feasibility and possibility of permitting/encouraging off grid construction, particularly in rural San Diego to meet the CAP?

Thank you.

Mike

Subject: Re: Manure management
Date: Wednesday, December 16, 2020 2:15:38 PM

I believe a large portion of the manure concern involves horse manure. It's different than that from cattle, and is easily recycled and transformed into a beneficial agriculture product. There were, not long ago several small worm farms in a co-op that used horse manure exclusively. Most went out of business due to marketing issues and participants creating issues, selling outside the Co-op. A few businesses still exist. All it requires is the manure be set aside, wet to reduce urine, and then semi-dry (to avoid heat buildup, and be palatable to the worms). Then feed the product to the worms with occasional wetting to keep the conditions livable.

How is this a benefit? Worm castings (poop) are a natural fertilizer used in organic farming. They are like grains of sand, and naturally encapsulated, making them time released food for the plants. They are also a natural, harmless insecticide that not only promotes growth, but also protects some plants from many harmful insects.

You could mandate that stables of a certain size, recycle their manure in this manner. They could do it themselves if they can find an outlet, or have it removed by the worm farms that need the manure.

I had one of these farms, but had to abandon it due to a combination of health issues and others not doing their share of harvesting. It was easy to set up, and would have been easier with larger equipment to move it. One small farm produced two truckloads of castings. I set my farm up in one day, and it only needed about five hours a week with a shovel to feed the worms until harvest.

I know this proposal sounds of the wall, but it has been done, and it would have been successful without the issues of packaging and distribution after some members went rogue. I've seen truck loads of this coming out of Mexico, being delivered into the US for organic farms, so a market still viably exists.

I hope this was helpful, Les Ferguson highlanderiam@aol.com

Re: green building requirements.

I see that a goal is to reduce costs for energy by building more smart homes that consume less energy.

You state: "Some of the key benefits are:

- Lower electric and water utility costs."

This does not reduce energy costs for the district, but actually increases them for the general population. It forces SDG&E to increase their energy pricing to recover lost revenues due to any private solar installations.

Therefore you are only benefiting those who occupy new homes meeting your goal.

Even if these are considered new homes that SDG&E has no contract with, they will still have to be outfitted with a new power grid, costing a substantial amount that will likely never be recovered by utility usage.

Though I think the requirement to reduce non-renewable energy in new construction is a good thing, you are misrepresenting its outcome to the general public as lowering electrical costs, when in fact we are being forced to pay substantially higher prices per KWH than ever before. Even SDG&E has stated they had to increase their prices to cover their losses in sales due to solar installations.

Perhaps more clarity in the goal would be in line to promote transparency in these efforts.

Thank you, Les Ferguson

Hi,

For as long as I can remember there has been a, so called, trail system in the county. Very little has ever been done to build the system even through County owned lands. Very little has been done to build bike lanes along roadways except for a few disconnected white lines. In places where bikes work they have separate dedicated bike/pedestrian pathways. Why is this not included in your plan? All I see is more lip service to the idea with no intent to use this option. Where are the details if I am wrong?

Subject: CAP - Energy Efficiency
Date: Thursday, December 24, 2020 2:32:14 PM

Hi,

I would think that retrofitting older structures would produce very effective (and cost-effective) results. I do not see any measures to help people retrofit their buildings. Am I missing this or is this not part of the plan? While I do not need help, I know many would be willing to make their structures more energy efficient and comfortable, they simply don't have the resources to do that. How can the Cuntty help those in need?

Re: Submittal in Response to the Notice of Preparation, Project Numbers: PDS2020-POD-20-016 and PDS2020-GPA-20-004; Environmental Review Number: PDS2020-ER-20-00-002 - Supplemental Environmental Impact Report (Supplemental EIR) for the Climate Action Plan Update project

This submittal is made for the record in response to the County's issued Notice of Preparation for this CAP update. Immediately below in synopsis are key points of this submittal, but these do not exclude from the record the entirety of this submittal further below:

- This new update of the County's Climate Action Plan must include assessment of the pattern of land use approvals by the County, including "sprawl" land use approvals, on the generation of climate-change causing GHGs as well as other pollutants.
- The supplemental EIR must thoroughly assess how differing patterns of land use approval affect production of GHGs and other pollutants across a full range of environmental concerns.
- The supplemental EIR must assess how differing patterns of land use approval will comply or not comply with SB 743's intent of reducing vehicle miles traveled, VMT.
- The supplemental EIR must have as the preferred proposed project, a CAP which expressly prohibits County land use sprawl development approvals. Should the County fail to do this in the supplemental EIR, there must be a fully developed project alternative which does so, and this alternative must be assessed for environmental impacts and reductions as fully as the preferred project.
- The supplemental EIR must fully assess growth-inducement from differing patterns of land use approvals by the County, looking especially at the full range of environmental impacts created by induced sprawl development.
- Any CAP, supplemental EIR and/or statement of overriding considerations attempting to justify allowing County sprawl development on additional housing production need, must take into assessment *all* regional jurisdiction housing production approvals above and beyond previously-planned limits since the 2011 County General Plan Amendment.
- The County's study of land use alternatives in this CAP revision must address how different land use development patterns, notably sprawl, affect racial, social and economic segregation – the real phenomenon of "white flight" in creating school and community segregation, and social, economic and political disparity in older communities, especially those historically "red-lined." The supplemental EIR must include this consideration and its relationship to the full range of environmental impacts.

The heart of this submittal is recognition that the County cannot hope to, and will not, have an adequate climate action plan and will not adequately control emissions of GHGs (greenhouse gases) or comply with SB 743 *unless the County prohibits and ceases to approve sprawl development*: urban/suburban land development in rural, outlying, agricultural, and/or biologically sensitive lands throughout the county region. The updated CAP must incorporate a policy for such ban and prohibition as a central piece of its enforceable provisions; and the

preferred, proposed project in this supplemental EIR must be one which includes this prohibition without exceptions or loopholes.

In the updated CAP, the baseline land use plan for the County against which to allow and prohibit development, must be the *San Diego County General Plan update of 2011*. The reason for this is, the 2011 County general plan update was adopted *for the express purpose of establishing environmental impact limits to continued County land development*. This was after grueling review, and environmental review of the 2011 update establishing its impact limit measures and obligations. To illustrate, in the 2011 General Plan Update EIR, to assess impacts related to air quality, the County made this obligation:

General Plan Update EIR, Page 2.3-28

[https://www.sandiegocounty.gov/content/dam/sdc/pds/gpupdate/docs/BOS_Aug2011/EIR/FEIR_2.03 - Air Quality 2011.pdf](https://www.sandiegocounty.gov/content/dam/sdc/pds/gpupdate/docs/BOS_Aug2011/EIR/FEIR_2.03_-_Air_Quality_2011.pdf)

Ref. the third sentence from the bottom:

2.3.4 Cumulative Impacts

The geographic scope of cumulative impact analysis for air quality includes the County and surrounding vicinity. This includes the San Diego region or the airshed for reactive air pollutants and surrounding vicinity for nonreactive or less reactive pollutants.

2.3.4.1 Issue 1: Air Quality Plans

Cumulative projects located in the San Diego region would have the potential to result in a cumulative impact to air quality plans if, in combination, they would conflict with or obstruct implementation of the RAQS and/or applicable portions of the SIP. Projects that are inconsistent with the regional planning documents that the RAQS and SIP are based on would have the potential to result in cumulative impacts if they would include development beyond regional projections. For example, the proposed Meadowood Development in Fallbrook, included in Table 1-11, Projects Not Included in the Proposed General Plan Update Land Use Map, would construct 1,200 new residential units. The project would require an amendment to the existing General Plan, and therefore may propose development beyond what is accounted for in the RAQS and SIP, which is based on General Plan projections. However, cumulative projects shown in Table 1-11, Projects Not Included in the Proposed General Plan Update, such as the Meadowood project, are still required to show compliance with applicable air quality plans during CEQA review and prior to project approval. Cumulative projects located in adjacent jurisdictions, including incorporated cities, adjacent counties, and State-managed lands, would be required to comply with the SIP, and the RAQS or other applicable regional air quality plan. Projects in Mexico and on tribal lands and federally managed lands would not be subject to the SIP or the RAQS. Therefore, cumulative projects in the region would not result in a significant cumulative impact associated with conflicts with air quality plans. The proposed project would ultimately be used as the basis for future updates to applicable air quality plans. Development in the County would be required to comply with the General Plan Update or would not be approved. Additionally, cumulative projects not included in the proposed General Plan Update would be required to show compliance with applicable air quality plans or would not be approved. Therefore, the proposed General Plan Update would not contribute to a significant cumulative impact.

This promise and obligation was made to meet State CEQA regulations, in order to approve the 2011 Update. It constitutes a legally enforceable promise and obligation to avoid significant unmitigable impacts. Beyond air quality, the same linkage can be made between limiting land use sprawl and avoiding a myriad range of other environmental impacts (water/hydrography runoff impacts to water quality, biological/wildlife impacts, energy use impacts, archeological/cultural resources, public services and safety re: fire protection, schooling, police; and more) - *all of which also must be freshly addressed and assessed for this new project in this new supplemental EIR.*

Notwithstanding its 2011 promise and obligation, County staff, Planning Commission and Board of Supervisors have subsequently been approving land use element changes and developments which clearly violate this obligation, constitute sprawl, and “bust” the 2011 General Plan. In doing so, the County has not only violated

its legal obligation opening itself to litigation; it also has violated its moral obligation to the citizens of our region to stick to its promise and reduce the full range of resulting environmental and social impacts. Not only does sprawl create and exacerbate the range of environmental sectors noted above; it also fuels racial, social and economic community segregation – noted as “white flight” and including a broader range of class/economic separation – which has not only negative social and economic impacts, but also negative impacts in the cost and efficiency of school, fire, and police services; and the cost of infrastructure maintenance. Such sprawl developments include, but are not limited to, the following:

- “Newland Sierra,” approved by Board of Supervisors October 2018; allowing up to 2,199 housing units and 1,777,684 square feet of commercial space; instead of the 2011 General Plan allowance of up to 99 housing units and up to 2,000,000 square feet of commercial space. Subsequently forced to go to public referendum, in the March 2020 election residents rejected Newland Sierra slated for Merriam Mountain reversing the Board’s approvals.
- “Otay Ranch Village 14,” approved by Board of Supervisors June 26, 2019; for approximately 1,100 new homes and 10,000 square feet of commercial space in the remote unincorporated area, notwithstanding wildland fire hazard and loss of crucial environmental habitat; and with prices expected to start in the half million dollar range, the project would do nothing to alleviate the need for affordable housing.
- “Valiano and Harmony Grove Village South,” approved by Board of Supervisors July 25, 2018; Valiano for 326 plus houses, Harmony Grove Village South for 4453 dwellings; both projects granted General Plan Amendments breaking the 2011 General Plan. Approvals set aside by court ruling on Feb. 20, 2020, the judge ruling that the county should set aside the Board of Supervisors’ July 25, 2018, approvals because they were granted based on inadequate environmental documentation that failed to address key issues, including greenhouse gas emissions mitigation and fire evacuation concerns.
- “Otay Ranch Resort Village,” approved by Board of Supervisors November 19 2020; allowing 1937 dwelling units (1881 single family, 57 multifamily) and 40,000 sq. ft. of commercial/office using 779.6 acres; instead of its EIR-identified environmentally-preferred development alternative of 465 dwelling units using 224 acres
- “Lilac Hills Ranch,” first proposed in 2005, in 2009 county staff planners rejected the project, saying it was out of step with the county’s plan to concentrate housing development in village areas, rather than maintaining the county’s patterns of sprawl; the developer appealed that determination to the county Planning Commission, and won; then in 2015, county staff planners recommended approving the same project notwithstanding its inconsistency with the 2011 General Plan, the Planning Commission voted to approve, but it never went for a full vote after Supervisor Bill Horn recused himself due to financial conflicts of interest from developable land he owned nearby; the project then went before voters in 2016 and was rejected by a wide margin. When the developer came back yet again, and the Planning Commission determined to not change its 2015 approval, in August 2020 the Board of Supervisors rejected the proposal. Lilac Hills would have allowed over 1700 dwelling units plus commercial, instead of the 2011 General Plan allowance of 110 dwelling units.

In the event that the County’s revised CAP, the supplemental EIR, and/or any CEQA statement of overriding considerations, cites a need for additional housing production to address housing and affordable housing needs as a justification for not prohibiting sprawl development, the County’s assessment of such must include and take into consideration *all San Diego regional jurisdiction’s* development and land use approvals since the 2011 General Plan Update, which have expanded the allowance of number of housing units over previously-allowed limits; expressly for the purpose of demonstrating that housing production approvals above previously-planned limits, notably those within already-urbanized areas, have provided substantial and significant additional housing opportunities to meet need. The County’s compendium of such approvals must contain, but certainly is not limited to, the following:

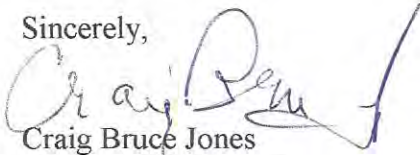

- “Riverwalk San Diego,” approved by San Diego City Council Nov. 2020; located at 1150 Fashion Valley Road (Mission Valley) will turn the Riverwalk Golf Club into a neighborhood while also restoring the part

of the San Diego River that runs through it. Out of the 4,300 units of housing, 430 of the units will be affordable housing at 65% of the median area income. There will also be a 47 acre river park, a trolley station, and the current golf course clubhouse will be turned into a community center.

- “SDCCU Stadium Project,” approved by San Diego City Council May 29 2020; voters approved the sale Nov. 2018; the \$3.5 billion project would include 4,600 housing units with 10 percent of them set aside for low-income households
- Pending City of Escondido, “Palomar Heights” project; proposal to demolish the old Palomar Hospital facility in central Escondido and replace it with 510 apartment and townhome dwellings with approx. 10,000 sq. ft. commercial. This replacement of the previous hospital campus is a net increase of this number of dwelling units in an already-urbanized core.
- “Ulric Street Apartments,” City of San Diego Housing Commission/Community Housing Works; under construction; 95 affordable apartment units guaranteed for 55 years for households 30%-60% of area median income.
- The total of accessory housing unit/”granny flat” projects completed throughout the San Diego region, pursuant to State legislation; this information will be available from all jurisdictions in the region, the County and all cities.

Please put me on the County’s notification list for all upcoming meetings and hearings regarding the supplemental EIR and the CAP.

Sincerely,

Craig Bruce Jones

RE: Climate Action Plan Update

Sent via E-mail- Due to COVID -19

Dear Ms. Bray,

The San Pasqual Band of Mission Indians Tribal Historic Preservation Office has received your notification of the project referenced above. This letter constitutes our response on behalf of David L. Toler THPO Officer.

We have consulted our maps and determined that the project as described is not within the boundaries of the recognize San Pasqual Indian Reservation. The project is within the boundaries of the territory that the tribe considers its Traditional Use Area (TUA). Therefore, we request to be kept in the information loop as the project progresses and would appreciate being maintained on the receiving list for project updates, reports of investigations, and/or any documentation that might be generated regarding previously reported or newly discovered sites. Further, we may recommend archaeological monitoring pending the results of site surveys and records searches associated with the project. If the project boundaries are modified to extend beyond the currently proposed limits, we request updated information and the opportunity to respond to your changes. Also, San Pasqual Band of Mission Indians can provide Native American monitoring if needed for this project.

We appreciate involvement with your initiative and look forward to working with you on future efforts. If you have questions or need additional information, please do not hesitate to contact me by telephone 760-651-5142 or by e-mail at

Thpo@sanpasqualtribe.org please CC: Angelinag@sanpasqualtribe.org thank you.

Re: Climate Action Plan Update; PDS2020-POD-20-016, PDS2020-GPA-20-004, LOG NO. PDS2020-ER-20-00-002

Dear Ms. Bray,

This letter is written on behalf of the Rincon Band of Luiseño Indians (“Rincon Band” or “Band”), a federally recognized Indian Tribe and sovereign government. We have received your Notice of Preparation of an Environmental Impact Report for Climate Action Plan and we thank you for the opportunity to consult on the project. The identified affected location is within the Traditional Use Area (TUA) of the Luiseño people and within the Band’s specific Area of Historic Interest (AHI). As such, Rincon is traditionally and culturally affiliated to the project area.

The Band would like to discuss the draft EIR and we kindly ask to be provided with dates and times of your availability. If you have additional questions or concerns, please do not hesitate to contact our office at your convenience at (760) 297-2635 or via electronic mail at cmadrigal@rincon-nsn.gov. We look forward to working together to protect and preserve our cultural assets.

Sincerely,

Cheryl Madrigal

Hi Cheryl,

Nice to meet you and thanks for reaching out about the CAP Update project. Please do plan to attend the NOP Scoping Meeting and submit your comments in writing (we will submit those that you have already attached to this email as well).

We are still in the process of selecting an EIR consultant for the project and will be happy to meet and discuss the project in detail with you once we have executed the contract.

We look forward to working with you on this important project!

Kelly

County of San Diego Climate Action Plan Update
NOP/Supplemental EIR/SCH #2020120204Ms. Kelly Bray
Sustainability Project Manager
County of San Diego
5510 Overland Avenue, Suite 310
San Diego, CA 92123

Dear Ms. Bray:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the County of San Diego Climate Action Plan (CAP) Update Notice of Preparation/Supplemental Environmental Impact Report (NOP/Supplemental EIR) (SCH #2020120204) located throughout various routes in the County of San Diego. The mission of Caltrans is to provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability. The Local Development-Intergovernmental Review (LD-IGR) Program reviews land use projects and plans to ensure consistency with our mission and state planning priorities.

Caltrans has the following comments:

Caltrans recommends collaboration between our agency and the County of San Diego on the proposed transportation related strategies, measures, and actions outlined in the CAP Update, and SEIR.

Transportation projects within the County pose excellent opportunities to employ strategies, measures, and actions outlined in the CAP Update that are also consistent with Caltrans Sustainability initiatives. Additionally, Caltrans and the County of San Diego may be able to collaborate on a local and regional level regarding emergency preparedness and evacuation routes (such as extreme weather and wildfires).

Caltrans D11 Vulnerability Assessment Summary and Technical Report (<https://transplanning.onramp.dot.ca.gov/climate-change-vulnerability-assessments-0>) are available for the County to utilize in their CAP Update implementation.

Consider addressing the impacts on housing affordability within the strategies in the CAP Update.

Traffic Engineering Analysis

- Caltrans agrees with the proposed Policy M-5.2 under Section 2.12.2 that the County coordinate with Caltrans to mitigate negative impacts.
- Caltrans agrees with the proposed CAP Update Mitigation Measure M-TRAF-1 under Section 7.1.12 Transportation and Traffic that mitigation measures for project-specific shall be incorporated during the environmental review process for future Major Use Permit.
- Caltrans recommends considering the addition of teleworking discussions with regard to VMT reduction.

Complete Streets and Mobility Network

Caltrans views all transportation improvements as opportunities to improve safety, access and mobility for all travelers in California and recognizes bicycle, pedestrian and transit modes as integral elements of the transportation system. Caltrans supports improved transit accommodation through the provision of Park and Ride facilities, improved bicycle and pedestrian access and safety improvements, signal prioritization for transit, bus on shoulders, ramp improvements, or other enhancements that promote a complete and integrated transportation system.

Early coordination with Caltrans, in locations that may affect both Caltrans and the County of San Diego is encouraged. To reduce greenhouse gas emissions and achieve California's Climate Change target, Caltrans is implementing Complete Streets and Climate Change policies into State Highway Operations and Protection Program (SHOPP) projects to meet multi-modal mobility needs.

Caltrans looks forward to working with the County to implement Complete Streets concepts and evaluate potential Complete Streets projects.

Land Use and Smart Growth

Caltrans recognizes there is a strong link between transportation and land use. Development can have a significant impact on traffic and congestion on State transportation facilities. In particular, the pattern of land use can affect both local vehicle miles traveled and the number of trips. Caltrans supports collaboration with local agencies to work towards a safe, functional, interconnected, multi-modal transportation system integrated through applicable “smart growth” type land use planning and policies.

The County should continue to coordinate with Caltrans to implement necessary improvements at intersections and interchanges where the agencies have joint jurisdiction, as well as coordinate with Caltrans as development proceeds and funds become available to ensure that the capacity of on-/off-ramps is adequate.

Environmental

Caltrans appreciates the opportunity to comment on this Draft Program Environmental Impact Report (EIR) for the General Plan. The analysis presented may impact on Caltrans R/W in the future.

Should future projects based upon the changes enacted from the Program EIR have elements and/or mitigation measures change to effect Caltrans R/W, Caltrans would welcome the opportunity to be a Responsible Agency under the California Environmental Quality Act (CEQA) and to the continued coordination of our efforts.

Right-of-Way

- Per Business and Profession Code 8771, perpetuation of survey monuments by a licensed land surveyor is required, if they are being destroyed by any construction.

Ms. Kelly Bray
February 3, 2021
Page 4

- Any work performed within Caltrans R/W will require discretionary review and approval by Caltrans and an encroachment permit will be required for any work within the Caltrans R/W prior to construction.

Additional information regarding encroachment permits may be obtained by contacting the Caltrans Permits Office at (619) 688-6158 or by visiting the website at <http://www.dot.ca.gov/trafficops/ep/index.html>. Early coordination with Caltrans is strongly advised for all encroachment permits.

If you have any questions, please contact Kimberly Dodson, of the Caltrans Development Review Branch, at (619) 985-1587 or by e-mail sent to Kimberly.Dodson@dot.ca.gov.

Sincerely,

electronically signed by

**Subject: CITY OF SAN DIEGO COMMENTS ON THE NOTICE OF PREPARATION OF A
DRAFT SUPPLEMENTAL ENVIRONMENTAL IMPACT REPORT FOR THE
COUNTY OF SAN DIEGO CLIMATE ACTION PLAN UPDATE (ENV. REVIEW
NUMBER PDS2020-ER-20-00-002)**

Dear Ms. Bray:

The City of San Diego (City) Planning Department has received the Notice of Preparation (NOP) of a Draft Supplemental Environmental Impact Report (EIR) prepared by the County of San Diego (County) and distributed it to applicable City departments for review. The City, as a Responsible Agency under CEQA, has reviewed the NOP and appreciates this opportunity to provide comments to the County.

The effects of climate change have major regionwide implications and will require a comprehensive effort from multiple stakeholders to identify climate change vulnerabilities and provide resiliency and adaptation strategies. Measures such as reducing vehicle miles traveled, converting fleets and equipment to electric, expanding renewable energy sources, increasing solid waste diversion, and innovative carbon sequestration methods should be evaluated in the Supplemental EIR and potentially positive and complementary co-benefits of such methods should also be considered.

The City is in the process of updating its Climate Action Plan and is developing Climate Resilient SD, a comprehensive climate adaptation and resiliency plan which will increase the City's capacity to adapt, recover, and thrive in a changing climate. Continued coordination between the City, the County, and other local, regional, state, and federal agencies will be essential as the County updates its Climate Action Plan to ensure that the City and County's efforts align with and complement each other.

Thank you for the opportunity to provide comments on the NOP. Please contact myself, or Rebecca Malone, Senior Planner, at RMalone@sandiego.gov or 619-446-5371 directly if you

Page 2
Ms. Bray
February 4, 2021

would like additional information regarding the City's efforts that could inform and benefit the County's efforts. We look forward to continued coordination as the County develops its Climate Action Plan.

Sincerely,

A handwritten signature in blue ink, appearing to read "Heidi Vonblum".

County of San Diego Planning & Development Services
Attention: Kelly Bray
CAP Project Manager
5510 Overland Avenue, Suite 310
San Diego, CA 92123
CAP@sdcounty.ca.gov

Dear Ms. Bray:

County of San Diego Climate Action Plan Update (PROJECT)
NOTICE OF PREPARATION (NOP) OF A DRAFT SUPPLEMENTAL ENVIRONMENTAL IMPACT
REPORT (SEIR)
SCH# 2020120204

The California Department of Fish and Wildlife (CDFW) received a Notice of Preparation (NOP) of a Draft Supplemental Environmental Impact Report (SEIR) from the County of San Diego (County) for the Project pursuant the California Environmental Quality Act (CEQA) and CEQA Guidelines.¹

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code.

CDFW ROLE

CDFW is California's **Trustee Agency** for fish and wildlife resources and holds those resources in trust by statute for all the people of the state. (Fish & G. Code, §§ 711.7, subd. (a) & 1802; Pub. Resources Code, § 21070; CEQA Guidelines § 15386, subd. (a).) CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species. (*Id.*, § 1802.) Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources.

CDFW also administers the Natural Community Conservation Planning (NCCP) program, a California regional habitat conservation planning program. The County participates in the NCCP program through implementation of its approved Multiple Species Conservation Program (MSCP) Subarea Plan for southwestern San Diego County (South County MSCP (SC MSCP)), and development of its draft North and East County Subarea Plans (NC MSCP and EC MSCP).

¹ CEQA is codified in the California Public Resources Code in section 21000 et seq. The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

Kelly Bray
County of San Diego
February 4, 2021
Page 2

PROJECT DESCRIPTION SUMMARY

Proponent: County of San Diego

Project Description/Objective: The overall objective of the County's Climate Action Plan (CAP) is to reduce Greenhouse Gas (GHG) emissions generated from activities within the unincorporated County (community) and GHG emissions generated by County facilities and operational activities throughout the County, including facilities and operations located within incorporated cities (County operations) to meet or exceed GHG reduction goals under State laws.

The CAP was adopted and the Final 2018 CAP SEIR was certified by the County Board of Supervisors on February 14, 2018. The 2018 CAP was adopted to comply with the County's 2011 General Plan Conservation and Open Space (COS) Goal COS-20, Policy COS-20.1, and 2011 General Plan Update Program Environmental Impact Report (2011 GPU PEIR) Mitigation Measures CC-1.2, CC-1.7, and CC-1.8. The General Plan Goal COS-20 requires reduction of community and County operations greenhouse gas emissions and Policy COS-20.1 requires preparation, maintenance, and implementation of a CAP. The 2018 CAP required a General Plan Amendment (GPA) to update COS-20 and COS-20.1 to comply with existing State law. The 2018 CAP SEIR project included the 2018 CAP, the associated GPA to the County's 2011 General Plan, and revision to the associated Mitigation Monitoring and Reporting Program, a threshold of significance for greenhouse gases (GHGs), and revised County Guidelines for Determining Significance for Climate Change.

CDFW provided comments on the November 2016 NOP for the draft SEIR in a letter dated November 21, 2016. To facilitate the adoption of CEQA significance thresholds and to facilitate project tiering, CDFW recommended that the SEIR establish a checklist of considerations for evaluating future projects and their potential to affect GHG emissions, or be affected by GHG emissions, in a manner that results in impacts to natural resources. Acknowledging that the field of climate science continues to evolve, CDFW encouraged the County to acknowledge the evolution by continuously updating the SEIR with the best available science. In the November 21, 2016 letter, CDFW provided a preliminary checklist with a sampling of recommendations that encouraged the County to include in their SEIR's final checklist with the intention that the checklist would evolve with the SEIR over time.

On December 24, 2018, the San Diego Superior Court ruled that the 2018 CAP approval did not comply with CEQA. The Superior Court ordered the County to set aside and vacate the February 14, 2018 approvals and the certification of the 2018 CAP SEIR. This decision was later affirmed in part by the California Court of Appeal, Fourth Appellate District (Appellate Court), on June 12, 2020 (Golden Door Properties, LLC, v. County of San Diego, 50 Cal. App. 5th 467). As a result, the County Board of Supervisors rescinded the 2018 CAP and 2018 CAP SEIR, and associated approvals, on September 30, 2020.

In addition to requiring rescission of the 2018 CAP and related approvals, the Superior Court ordered the County to submit an estimated schedule to prepare a new CAP and Guidelines for Determining Significance for Climate Change ("Guidelines"), and to comply with CEQA and the State Planning and Zoning Law. The Superior Court has retained jurisdiction to determine compliance. In response to the court's decision, the County will prepare a CAP Update, Guidelines, and SEIR to address the court's opinion.

Kelly Bray
County of San Diego
February 4, 2021
Page 3

The draft SEIR will function as a supplement to the 2011 GPU Programmatic EIR (PEIR). The document will address whether the CAP, GPA, Guidelines, and GHG threshold would result in any new or substantially more severe environmental impacts than those previously evaluated in the certified 2011 GPU PEIR. The draft SEIR will identify a range of potential effects resulting from implementation of the project. The draft SEIR will also identify mitigation measures to reduce potentially significant effects, as needed.

The Draft EIR functions as a PEIR under CEQA Guidelines Section 15168(c) for streamlining future projects. The CAP is intended to be used for future project-specific GHG emissions analyses by being prepared consistent with the tiering and streamlining provisions of Section 15183.5 of the CEQA Guidelines. The Draft SEIR is intended to provide the appropriate level of environmental review to allow future projects to tier from and streamline their analysis of GHG emissions pursuant to CEQA Guidelines Section 15183.5(a) and (b)(2). Consistent with CEQA Guidelines 15168, because the SEIR does not provide project-level review of any specific development projects within the County, subsequent activities in the County that involve individual projects must be examined considering the SEIR to determine whether any additional environmental review is necessary.

Timeline: December 2020 Draft SEIR circulation and public review was extended from an end date of January 22, 2021 to February 4, 2021.

Location: The County of San Diego is located in the southwestern corner of the California. The County is bordered by the Pacific Ocean to the west, Orange County at the northwest corner and Riverside County to the north, Imperial County to the east, and the U.S. International Border with Mexico to the south.

The planning area for the CAP is the same planning area considered for the 2011 General Plan, which encompasses all unincorporated land in the County of San Diego. The unincorporated County is composed of 3,570 square miles and represents 84 percent of the total land area in the County.

Biological Setting: Vegetation communities and habitats within the County, as described in the 2011 GPU PEIR, include the following: chaparral, coastal sage scrub, coniferous forests, desert chaparral, desert dunes, desert scrub, dry wash woodlands, grasslands, marshes, meadows and seeps, oak forest, other woodlands, pinyon juniper woodland, playas/badlands/mudhill forbs, riparian forest, riparian scrub, riparian woodland, southern foredunes, beach, saltpan, mudflats, urban, disturbed habitat, agriculture, *Eucalyptus* woodland, and water. A total of 115 special-status animal species and 214 special-status plant species are currently listed as potentially occurring within the boundaries of the County.

CDFW's primary concerns with respect to climate change in San Diego County are the effects on biodiversity, special status plant and wildlife species, natural vegetation communities, and connections which maintain viable movement corridors between blocks of conserved habitat. Because climate change may impact species directly or indirectly by altering the distribution of vegetation types, promoting non-native species, duration and severity of drought, and increased frequency or magnitude of fires, CDFW considers the use of regional scale, multiple species conservation plans to be a valuable tool to guard against the effects of climate change.

Kelly Bray
 County of San Diego
 February 4, 2021
 Page 4

COMMENTS AND RECOMMENDATIONS

CDFW offers the comments and recommendations below to assist the Lead Agency in adequately identifying and/or mitigating the Project's significant, or potentially significant, direct, and indirect impacts on fish and wildlife (biological) resources. Based on the potential for the Project to have a significant impact on biological resources, CDFW agrees that a SEIR is appropriate for the Project. CDFW makes the following comments and recommendations for review of projects tiering from the SEIR and analysis of potential impacts to biological resources. Proposed projects should consider climate variability and change, as well as species' adaptations throughout all phases of the project (i.e., initial project design through operations and maintenance). We encourage the County to incorporate these recommendations into the SEIR's final checklist.

1. CDFW strongly encourages and supports the County's efforts to complete both the NC and EC MSCP planning efforts. The regional conservation and management of large blocks of natural habitat will consequently provide protection to a broad suite of species. The modeling effort associated with this planning, which targets conservation of special status species, will further protect the most important remaining populations of such species, and ensure the means for movement between conserved areas. The NC and EC MSCP efforts are further expected to account for changes in the distribution of vegetation communities over time in response to a changing climate. This allows species to change in distribution along with their requisite habitat. In the absence of approved NC or EC MSCP plans, interim policies identified in the associated Planning Agreement, which is presently on track for renewal, should be used to guide review of development projects. As individual development projects are brought forward for County review, the County should continue to analyze these proposals using their 'Guidelines for Determining Significance – Biological Resources' and ensure that impacts are avoided, minimized, or appropriately mitigated. To this end, CDFW recommends that the SEIR reference the intention to be consistent with the County's adopted MSCP, and when renewed and applicable, the Planning Agreement (PA) for the NC and EC MSCP (including interim policies).
2. Planning for transportation projects should incorporate wildlife passage into early design. Transportation retrofit projects should be supported where feasible. Road designs should incorporate bridges or large culverts as well as smaller-scale design features and directional fencing to facilitate safe movement for both large and small animal species. Specific information to improve wildlife corridor usage has been developed by the U.S. Geological Survey (USGS), San Diego Management and Monitoring Program, and others through funding provided under San Diego Association of Governments (SANDAG) Transnet Environmental Mitigation Program. Project design should further consider information in wildlife corridor databases found in existing approved NCCP plans, and draft plans including the NC MSCP. The San Diego Management and Monitoring Program also has considerable local information in this regard.
3. Species occurrence data, road mortality data, linkage designs, and adjacent suitable habitat should inform the CEQA analysis, specifically regarding potential for impacts and the development of mitigation measures to improve or enhance wildlife movement impacted by projects tiering off the SEIR. In weighing the impacts of such projects on wildlife movement, beyond regional wildlife "corridors", analysis should address other common movement patterns. Projected climate-driven faunal movement routes and changes to existing vegetation types over time should be considered. Food sources, water sources, migration routes, and breeding and sheltering areas that may be disconnected as a result of climate projects should be considered when developing mitigation concepts.

Kelly Bray
County of San Diego
February 4, 2021
Page 5

4. Review of future proposed large-scale wind or solar projects should consider potential harmful impacts to birds and bats that might result from a variety of causes, such as: injury and mortality from collision with wind turbines, solar panels or mirrors, guy wires, and fencing. The potential effects of project features such as roadways and fences on predator avoidance should be analyzed. Project plans should incorporate established standards for setbacks, height restrictions to minimize impacts to avian and bat species in locations in proximity to sensitive habitat lands including wildlife concentration points. Projects should consider strategies for deterrence of birds and bats from the area, such as anti-perching mechanisms, sound deterrents, and modification of night lighting to be less attractive to insects and thus foraging birds and bats. Proposed wind projects should consider the California Energy Commission and CDFW's "California Guidelines for Reducing Impacts to Birds and Bats from Wind Energy Development".²

ENVIRONMENTAL DATA

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a data base which may be used to make subsequent or supplemental environmental determinations. (Pub. Resources Code, § 21003, subd. (e).) Accordingly, please report any special status species and natural communities detected during Project surveys to the California Natural Diversity Database (CNDDDB). The CNDDDB field survey form can be found at the following link:
http://www.dfg.ca.gov/biogeodata/cnddb/pdfs/CNDDDB_FieldSurveyForm.pdf. The completed form can be mailed electronically to CNDDDB at the following email address: CNDDDB@wildlife.ca.gov. The types of information reported to CNDDDB can be found at the following link:
http://www.dfg.ca.gov/biogeodata/cnddb/plants_and_animals.asp.

FILING FEES

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying Project approval to be operative, vested, and final. (Cal. Code Regs, tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089.)

CONCLUSION

CDFW appreciates the opportunity to comment on the NOP of a SEIR to assist the County in identifying and mitigating Project impacts on biological resources.

Questions regarding this letter or further coordination should be directed to Meredith Osborne, environmental scientist at (858) 636-3163 or Meredith.Osborne@wildlife.ca.gov.

Hello Chris,

My name is Tyler Farmer. I am a Planning Manager for the Sustainability Team, which is within the Planning & Development Services department.

I believe you are referring to the ordinance that was approved on October 29, 2019. On this date, the County's Board of Supervisors adopted an ordinance electing to implement a Community Choice Aggregation Program. You can find the details of this action at the following location under item #27.

- <https://www.sandiegocounty.gov/content/sdc/cob/bosa/bos-calendar-meetings.html?date=10/29/2019&meetingtype=BOARD%20OF%20SUPERVISORS>

If the link does not work or if you have any additional questions, please let us know.

Thank you, Chris.

Subject: Comments to consider and questions
Date: Thursday, December 10, 2020 10:56:51 AM

Please limit evaluation of net carbon impact to the unincorporated portions of San Diego County for analysis. Each City within San Diego County needs to evaluate separately so projects in the County can be evaluated independently.

San Diego County Farm Bureau would like to have their production of crops, groves and container plants be evaluated for carbon reduction and credits as their activities are not required and is a choice that should not be part of any baseline studies. The Farm Bureau can be a simple one stop shop for obtaining credits through an approved Protocol Program.

The San Diego County Farm Bureau desires a seat at the table for major stakeholders.

Thanks for your consideration of these items as you develop the CAP.

Subject: Climate Action Plan Input
Date: Wednesday, December 23, 2020 2:25:18 PM
Attachments: [Urban Tree Policy.docx](#)

Hello there,

My name is Michael Palat and I am the Chairman of the San Diego Regional Urban Forests Council. I noticed that you are seeking input on the county's Climate Action Plan. I am deeply involved in the county's management of its urban forests both as a tree maintenance contractor for all of the cities in the county and also the public works department of San Diego County. With that said, I have been working with several cities, counties and other public agencies involved with climate action planning. We have been working with them to consider adopting an Urban Tree Policy with consideration of salvaging the wood carbon for reutilization. The attached urban tree policy document has been vetted and approved by CALFIRE as a good program for agencies to consider adopting. The City of Carlsbad recently adopted a version of it. Additionally, the City of Vista, San Diego, Chula Vista, Santee and La Mesa are also in early adoption phase. This is a great supplement to any and all climate action plans.

There are multiple urban wood recycling programs that are out there currently salvaging the urban wood. These include: www.streettreerevival.com and www.lumbercycle.org to name a few. Also, of note locally is an initiative locally where Taylor Guitars is using urban trees to make guitars. The story was featured in Rolling Stone Magazine. <https://www.rollingstone.com/pro/features/taylor-guitars-highway-trees-989888/>

I am happy to discuss this further with any stake holders that are out there.

Michael Palat

Appendix C

Sample Urban Tree Recycling Policy

This is a suggested template that may be utilized or edited based on your community's needs. This suggested template has been endorsed by the California Department of Forestry and Fire Protection Urban and Community Forestry Program.

This policy supports the City of _____'s Sustainability Plan, Climate Action Plan, and/or Urban Forest Management Plan to ensure the sustainability of the urban forest. The goal is to optimize ecosystem services, including greenhouse gas reduction, and to utilize trees that must be removed in the most efficient way possible.

Such removed trees shall be used for the highest and best use possible. Environmental benefits are realized by diverting wood that would otherwise populate landfills and produce greenhouse gas emissions which are released through traditional disposal processes. Co-benefits include sourcing local raw materials for construction, maximizing benefit from trees being removed, and displaying urban wood products in the community. This tells the story of the City in which the trees matured and added to the community character. With this policy adoption, the City of _____ will be at the forefront in the nationwide effort to certify urban wood usage within City projects.

Tree Removal Utilization Plan.

- Any trees that are removed for reasons such as failure, disease, or decline or other reasons stated within the City of _____'s management plan are subject to be repurposed for their highest use. This includes, but is not limited to, being milled into lumber, left in public spaces as natural architecture including wildlife habitat or crafted into usable products such as benches, picnic tables, new construction elements and / or other wood crafts/projects.
- Suggested resources for wood processing can be found at urbansalvagedwoods.com, urbanwoodnetworkwest.org, usrwcertified.org, & urbanwoodnetwork.org.
- The selection criteria for urban wood shall be made at the discretion of the city arborist or other designated city representative using current industry standards.
- Should wood not be eligible for repurposing into product, trees may be mulched or converted into other biomass products for use in the community.

Desirable Species Replacement Plan.

- Tree replacement criteria should include consideration of the full suite of benefits that may be provided throughout the life of the tree, including a consideration for end of life uses, such as high quality lumber.
- It is recommended that these replacement species be selected in collaboration with local experts based upon the unique region and climate.

- Species information may be found at <https://selecttree.calpoly.edu/about>: SelecTree is a Tree Selection Guide. Should consultation be needed for suitable species, West Coast Arborists, Inc. may be utilized as a resource.

Urban Wood Utilization in New or Modified Public Construction Projects Plan.

- Use of the USRW North American Standards for Certification and Chain of Custody for Urban, Salvaged and Reclaimed Woods as set by USRW Certified Woods and endorsed by the Urban Wood Network is recommended to ensure quality. <https://usrwcertified.org/>
- Urban wood should be considered in all city projects. To gain the maximized benefits of repurposed lumber from city trees, it is recommended that any new or modified public construction development that takes place within the city limits should include an urban wood element that is at a minimum cost of 1% of the overall project. This 1% is not in addition to project budget but can be included in items that would be necessary despite urban wood policy (i.e. locally sourced urban wood table vs harvested lumber table).
- This measure assures that the market for the City of _____'s urban wood is local (local being defined as within 500 miles or less per USRW certification, with lesser distance traveled preferred) and sustainable, maximizing the benefit of repurposed lumber from urban trees.
- It is suggested that urban wood utilization plans be approved by the City of _____'s planning department, if applicable.
 - When approval is required, all project scope details shall be in accordance with all municipal construction and / or building code standards.
- Other means of quantifying urban wood usage in public/private projects are acceptable, such as incentive programs for contractors.

Subject: CAP UPDATE SUPPLEMENTAL EIR
Date: Saturday, January 23, 2021 11:33:01 AM
Attachments: [Sierra Club CAP Document 01-12-2021.docx](#)

Dear County Staff,

Please find attached the CAP recommendations and Terms from Sierra Club San Diego for the upcoming scoping meeting on the EIR.

Dr. Peter Andersen
Sierra Club San Diego

**SIERRA CLUB –
COUNTY OF SAN DIEGO 2021 CLIMATE ACTION PLAN
January 12, 2021**

I. Introduction

This document is to present a list of Sierra Club terms for the County of San Diego's upcoming revised Climate Action Plan.

First and foremost, the County must immediately declare a climate emergency. The County must also do more than just neutralize greenhouse gas emissions by seeking to achieve current standards of "net zero" emissions. Rather, the County should be working to greatly reduce GHG emissions below the 1990 baseline with net negative emissions to help reverse global climate destruction.

The document includes a number of other positions on how the County should reduce greenhouse gas emissions through County programs and public projects, commercial business and residential projects, and private residential projects. The document addresses findings of significance for projects undergoing CEQA review, calculations of GHG emissions that reflect the true life span of projects, and many possible measures to minimize or mitigate GHG emissions.

In particular, the County must emphasize reducing emissions in disadvantaged communities, locate GHG mitigation in the same disadvantaged communities in which emissions occur, and establish a GHG mitigation bank directly benefiting disadvantaged communities. Other GHG mitigation must occur entirely within the County. And existing multiple species conservation programs should be utilized to establish a natural habitat land mitigation bank for GHG emissions.

The following is a list of Sierra Club terms for the County's Climate Action Plan.

II. County Programs

- a. Due to the serious nature of the climate crisis globally and locally, San Diego County should declare a climate emergency.

- b. The County shall achieve net negative one hundred percent (100%) GHG emissions¹ by 2035.
- c. The County shall implement the following measures to achieve net negative 100% GHG emissions by 2035:
 - 1. Establish a Community Choice Aggregation program to provide 100% renewable energy by 2035.
 - 2. Downzone lands in Calfire’s high/highest fire risk areas and highest vehicle miles (VMT) travelled areas of the county.
 - 3. Bar General Plan amendments for increased commercial or residential development in Calfire’s high/highest fire risk areas and highest vehicle miles (VMT) travelled areas of the county.
 - 4. Purchase Fanita Ranch, Harvest Hills, Lilac Hills, Newland Sierra, Otay Ranch Village 13, Otay Ranch Village 14/16/19, and Rancho Guejito to avoid conversion to development and/or as a natural habitat lands GHG mitigation bank.
 - 5. Establish a program to recycle 100% of all organic waste.
- d. The County should implement the following additional measures to achieve net negative 100% GHG emissions by 2035:
 - 1. Convert natural gas or propane utilities to electric at County facilities.
 - 2. Install photovoltaic solar panels, wind turbines, and/or other onsite renewable energy and batteries at County facilities.
 - 3. Install electric heat pumps to provide air and water heating and cooling at County facilities.

¹ The term “net negative 100% GHG emissions” is intended to articulate a stronger goal for GHG emission reductions than is currently practiced by the County. The term “net negative 100% GHG emissions” is equivalent to a 2:1 mitigation ratio and originates from the County’s term “net zero GHG emissions” (i.e. 1:1 mitigation) that is commonly cited as a goal or requirement in the current County CAP and CEQA documents. The Sierra Club’s stronger term means that the sum of GHG emissions from any County activity should not just be neutral (i.e. “net zero”), they should actually be reduced by at least 100% from baseline (i.e. “net negative 100%” or 2:1 minimization and mitigation). For comparison, development projects impacting wetlands are required under the County’s Resource Protection Ordinance to mitigate impacts at a 3:1 ratio (i.e. net negative 200%).

4. Install improved weatherization and insulation at County facilities.
 5. Install graywater systems at County facilities.
 6. Convert county vehicle fleets to electric vehicles and plug-in hybrid electric vehicles.
 7. Provide dividend account parking for all County employees.
 8. Increase diversion of solid waste and capture landfill methane.
 9. Prohibit all gas-powered leaf blowers.
 10. Plant and maintain trees. Priority should be given to native trees when possible.
 11. Collaborate with SANDAG to support and implement the Five Big Moves.
 12. Support short term extension of mass transit prior to implementation of the Five Big Moves.
 13. Support construction of bicycle trails and protected lanes for bikes and scooters.
 14. Support installation of public electrical vehicle charging stations.
 15. Support construction of pedestrian overpasses and other pedestrian infrastructure.
 16. Support establishment of a local natural habitat lands GHG mitigation bank with avoided conversion to development and conservation management in perpetuity of habitat land inside or bordering existing or planned regional multiple species conservation plan preserves (e.g. City of San Diego Multiple Habitats Planning Area or County of San Diego Pre-Approved Mitigation Area) or the Cleveland National Forest inholdings.
 17. Support establishment of a local disadvantaged communities GHG mitigation bank with replacement of commercial or personal GHG-emitting vehicles and equipment with electric vehicles and equipment, commercial or residential electrification, and other energy efficiency improvements to businesses or residences
- e. The County should provide incentives and subsidies to existing businesses and residences for the following measures to achieve net negative 100% GHG emissions by 2035.
1. Conversion of natural gas or propane utilities to electric.

2. Installation of photovoltaic solar panels and/or other onsite renewable energy and batteries.
3. Installation of electric heat pumps to provide air and water heating and cooling.
4. Installation of improved weatherization and insulation.
5. Installation of graywater systems.
6. Planting and maintaining trees.
7. Free mass transit passes to students and residents of disadvantaged communities.
8. Carpooling.
9. Purchase of electric vehicles.
10. Free parking for electric vehicles
11. Capture methane from agricultural facilities.
12. Avoided conversion to development of agricultural cropland.
13. Production and distribution of locally grown produce and foods.

III. Regulation of GHG Emissions from Public & Private Commercial Development

The County shall implement the following measures to achieve net negative 100% GHG emissions from new public projects and private commercial developments² (developments) by 2035:

- a. **CEQA Significance** – Public projects and private commercial developments’ GHG emissions shall be considered “significant” under CEQA for any public project and any commercial development project exceeding [THRESHHOLDS TBD].
- b. **CEQA Overriding Considerations** – CEQA findings of overriding considerations shall not be provided for public projects and private commercial developments with significant GHG emissions/impacts.

² Private commercial developments include commercial business and residential development developments.

- c. **GHG Emissions Threshold** – Public projects and private commercial developments shall achieve net negative 100% GHG emissions through onsite minimization and offsite mitigation.
- d. **Developments' GHG Emissions Lifespans** – Public projects and private commercial developments' life spans shall be a minimum of 100 years for calculation of: a) GHG emissions; b) onsite project design to minimize GHG emissions; and c) any offsite mitigation.
- e. **Minimization of GHG Emissions** – Public projects and private commercial developments shall minimize onsite GHG emissions by incorporating climate-friendly and environmental design to the maximum extent feasible with the minimum following conditions:
 - 1. Developments shall be electric and prohibit plumbing for natural gas.
 - 2. Developments shall include photovoltaic solar panels and/or other onsite renewable energy and onsite batteries to provide 100 percent of any project's annual electricity needs.
 - 3. Developments shall include electric vehicle charging stations to serve all projected project-related vehicles.
 - 4. Developments shall include electric heat pumps to provide one hundred percent of air and water heating and cooling.
 - 5. Developments shall prohibit vehicle idling.
 - 6. Developments shall include graywater systems.
 - 7. Developments shall minimize water consumption.
 - 8. Developments shall include shade trees.
 - 9. Developments shall provide transit passes to residents.
- f. **Mitigation of GHG Emissions** – To the extent that onsite minimization of any public or private commercial development project's GHG emissions to net negative 100% is not feasible, offsite GHG mitigation shall be provided to achieve net negative 100% GHG emissions that is in addition to any existing laws, regulations, or plans already compelling reductions in GHG emissions.

1. Developments' GHG offsite mitigation shall be entirely within San Diego County.
2. Developments' GHG offsite mitigation shall be entirely within the same disadvantaged communities³ as emissions.
3. Offsite GHG mitigation may include any of the following:
 - a) Preservation of natural habitat land inside or bordering existing or planned regional multiple species conservation plan preserves (e.g. City of San Diego Multiple Habitats Planning Area or County of San Diego Pre-Approved Mitigation Area) or private holdings within Cleveland National Forest. Preservation of natural habitat land as GHG mitigation shall include private property acquisition and conservation stewardship management in perpetuity. The amount of GHG mitigation provided by preservation of natural habitat land shall be determined by calculating reduced GHG emissions on the property over one hundred years resulting from avoided conversion to development of the number of existing legally entitled or zoned units and/or square feet on the preserved property.
 - b) Direct replacement of GHG-emitting vehicles and equipment (e.g. diesel generators) with electric vehicles and electric equipment including at any site under the jurisdictional authority of the Port of San Diego (including cargo and cruise ship terminals), of the Metropolitan Transit System, of the North County Transit District, and of the San Diego Airport Authority.
 - c) Create environmental justice grant programs in disadvantaged communities for direct replacement of commercial or personal GHG-emitting vehicles and equipment with electric vehicles and equipment, commercial or residential electrification, and other energy efficiency improvements to businesses or residences.
 - d) Direct reductions in water consumption.

IV. Regulation of GHG Emissions from Personal Residential Development

The County shall implement the following measures to minimize GHG emissions from new private residential development projects:

³ California Office of Environmental Health Hazard Assessment CalEnviroScreen
<https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-30>

- a. Personal residential remodelling and addition projects shall achieve net zero GHG emissions through onsite minimization with incorporation of climate-friendly and environmental design with the following conditions:
 - 1. All Projects shall be electric and prohibit plumbing for natural gas.
 - 2. Projects shall include electric heat pumps to provide one hundred percent of air and water heating and cooling.
 - 3. Projects shall minimize water consumption.
 - 4. Projects should include photovoltaic solar panels and/or other onsite renewable energy and onsite batteries.
 - 5. Projects should include electric vehicle charging stations to serve all projected project-related vehicles.
 - 6. Projects should include graywater systems.
 - 7. Projects should include tree planting.

Subject: SD County Climate Action Plan (CAP) Greenhouse Gas Reduction
Date: Monday, January 25, 2021 2:52:24 PM

Good afternoon,

My name is Austin Jones and I am a resident of San Diego County (specifically Alpine). I receive the regular County of San Diego Planning & Development Services email updates.

In the most recent email with the subject "Notice of Preparation Scoping Meeting Invite: CAP Update (Planning & Development Services)" there was a specific note that the county is seeking new strategies on how to reduce the greenhouse gas emissions within the county.

This immediately stuck out to me and I hope that I can find the right individual to speak with. We have produced a Concrete pavement product that eliminates over 50% of the greenhouse gas associated with traditionally produced and placed concrete products.

We do this through the use of less cement, better admixtures, and volume taken by air. In addition, we place the rock on its own without the cement meaning that heavy water and pre-mixed cement does not need to be transported to the job sites. After the rock is placed, the cement-based slurry is sprayed over the rock, soaks in and binds the entire section together into concrete.

If whoever receives this email would be willing to give me a call or put me in touch with the appropriate individual regarding how we could work together to help reduce greenhouse gas emissions associated with pavement and erosion control systems it would be greatly appreciated. I would appreciate the opportunity to help San Diego meet and exceed its goals outlined in our climate action plan.

Thank you in advance!

--

Austin Jones

County of San Diego
Planning & Development Services Attention: Kelly Bray
CAP Project Manager
5510 Overland Avenue, Suite 310 San Diego, CA 92123

Dear Ms Bray:

**RE: Comments on NOP for County of San Diego Climate Action Plan Update
(PDS2020-POD-20-016, PDS2020-GPA-20-004, PDS2020-ER-20-00-002)**

Dear Ms. Bray:

For the updated Climate Action Plan (CAP), Endangered Habitats League is most interested in reducing emissions in the transportation sector. For this reason, we recommend developing one or more “smart growth” alternatives with *low vehicle miles traveled (VMT)*. Such alternatives would reduce long commutes to jobs and activity centers.

In these alternatives, intensification of uses beyond the current General Plan in high VMT locations would be effectively prohibited through criteria or other mechanisms. Current capacity in the current General Plan within high VMT locations would be selectively down-planned or limited through other planning mechanisms, and where possible, redirected to low VMT locations. Complementary financial incentives and disincentives, such as a substantial VMT mitigation fee, should also be developed to redirect development away from high VMT locations.

As wildfire is a contributor to GHG emissions, and fire ignitions occur at the urban-wildland interface (WUI), expansion of the WUI should also be restricted. In one or more of the “smart growth”/low VMT alternatives, development in high and very high fire hazard severity zones would be subject to the same measures (no intensification, selective down-planning, other planning mechanisms, incentives and disincentives). To a great extent, high fire and high VMT locations will coincide.

Native habitat and farmland sequester carbon, and their preservation contributes to climate goals. The alternatives described above will help spare natural and working lands. In addition, EHL urges the development of funding sources directed to acquisition and easements, such as the use of land protection as a *mitigation measure* for carbon emissions from new development. In lieu fees (e.g., VMT mitigation fee) and VMT mitigation banks are two options. The State of California Sustainable Agricultural Lands

Conservation (SALC) program provides an example that is already in use. Many co-benefits are associated with this approach.

Thank you for considering our views and we look forward to working with you on an updated CAP.

Yours truly,

A handwritten signature in blue ink, appearing to read "Dan Silver", with a stylized flourish at the end.

***Golden Door’s January 27, 2021 Feedback on Framework for
County’s 2021 Climate Action Plan (CAP)***

During the course of our prior CAP litigation with the County, Golden Door identified the following problems that must be resolved to develop a workable and legally defensible program

1. **Problem: The CAP is required as mitigation for the climate change impacts of the 2011 General Plan. The original mitigation measure (CC-1.2) for the 2011 General Plan may not be substantially changed without re-evaluating impacts of the 2011 General Plan.**
 - a. **Solution: Any** CAP must comply with the text and spirit of the original General Plan Mitigation Measure CC-1.2 and CEQA. The new CAP and related approvals (e.g., significance threshold) (collectively, the “CAP”) must include, at least, an updated baseline inventory of GHG emissions from all sources, reconciliation with other GHG inventories in San Diego County disregarded in prior inventories (e.g., SANDAG’s RTP/SCS GHG emissions inventories and forecasts), detailed GHG emissions reduction targets and deadlines, and comprehensive and enforceable GHG emission reduction measures for the reduction of community emissions.
2. **Problem: The defective 2018 CAP improperly veered from and went beyond its mandated objective to mitigate the climate change impacts of the 2011 General Plan; for example, the loose and unenforceable GHG offsets program became a vehicle for expedited approval of all post-2018 General Plan Amendment projects in the County.**
 - a. **Solution:**
 - i. The CAP and its related approvals (e.g., threshold and checklist) should focus on mitigating impacts on the current General Plan, not providing a vehicle for shortcut analysis and expedited approval of every single possible change to the General Plan in the future.
 - ii. Mitigation for future GPA projects should be addressed by limiting those GPA projects that increase density beyond General Plan requirements to either SANDAG-designated smart growth areas and/or census-designated places located wholly within the boundaries of an urbanized area, per SB 330.
3. **Problem: The CAP was supposed to have been developed nearly 10 years ago as part of mitigation for the 2011 General Plan. Yet meanwhile, the County continued to process large-scale GPA projects without having completed an effective and legally valid CAP, including approving large-scale GPA projects that used the same mitigation strategies that multiple courts ultimately found violated CEQA. Even after the County approved the 2018 CAP, the County asserted in court, contrary to the text of the CAP approvals themselves, that in-process projects considered after the approval of the CAP were not necessarily required to comply with the CAP.**
 - a. **Solution:** The County should suspend further processing of large-scale GPA projects (500 units or greater) until it completes an effective and legally valid CAP; all in-process GPA projects considered for approval after the new CAP’s adoption must be required to comply with the CAP. Any argument that a CAP cannot be applied because no CAP was applied in the last 10 years is unsustainable.
4. **Problem: The defective 2018 CAP relied too heavily on carbon offsets, and such offsets were unverifiable, unenforceable, and otherwise violated the law (e.g., the General Plan’s requirement for the reduction of “community emissions”).**
 - a. **Solution:**
 - i. Use of offsets should be minimized and should be allowed only when all feasible, on-site reduction measures are exhausted or found to be infeasible based on substantial evidence.
 - ii. Offsets should be a limited component of any project’s GHG mitigation efforts, like in the State Cap-and-Trade system or the Newhall Ranch GHG mitigation plan.
 - iii. Offsets should be local (i.e., within the County), with priority/preference for offset projects within the vicinity of the project, and they should be verifiable and enforceable by the County and comply with all applicable laws (for example, the General Plan, which requires a

reduction in the County's "community emissions").

- iv. The approval of specific offset projects should be subject to public notice and comment.
- v. The public should be allowed to monitor the issuance, transfer, and retirement process of offsets to confirm compliance against defined and legally adequate performance standards.
- vi. The use of offsets as proxy mitigation for VMTs must be evaluated for its impact on regional plans (e.g., SANDAG RTP/SCS), as well as state and General Plan goals/targets.
- vii. Offsets should be required for a sufficient duration, i.e., longer than 30 years. Impacts from residential development projects do not cease to exist after 30 years. The South Coast AQMD 30-year project life applies to equipment and facilities with a useful life that must be replaced or re-permitted (and subject to mitigation) or cease operating after 30 years, and so it is not broadly applicable, especially not to all residential development projects.
- viii. The approval of non-local offsets in projects like Lake Jennings Marketplace and Sweetwater Place must be disclosed and incorporated into the CAP EIR's analysis.

5. Problem: The defective 2018 CAP did not have meaningful consideration and analysis of VMT and improperly assumed that generic GHG emissions were the same as VMT based on erroneous reasoning.

a. Solution:

- i. Work meaningfully with SANDAG on the development of the CAP.
- ii. Meaningful consideration and analysis of VMT reduction from new residential development as a separate GHG reduction measure, for example, through improved infrastructure for bicycles, car-sharing or car-pooling, shuttle services, transit subsidies, new public transit and/or access to existing transit, etc.
- iii. Use the most recent model to analyze VMTs as required by SB 743 (currently, Series 14). Do not use outdated models.
- iv. Good faith, in-depth evaluation of a smart growth alternative that focuses on areas identified by urban area transit boundaries on SANDAG's Smart Growth Concept Map.
- v. Acknowledgement and robust discussion of co-benefits of local GHG reduction, particularly with respect to environmental justice. Do not dismiss the benefits of and the impacts of the loss of local GHG emissions reduction because "GHG emissions are a global phenomenon."
- vi. Reasonable, evidence-based assumptions regarding the adoption of electric vehicles as a method of quantifying GHG emissions from VMTs.

6. Problem: The defective 2018 CAP did not adequately evaluate energy impacts and environmental justice impacts and mitigation, especially with respect to the use of offsets.

a. Solution:

- i. If offset projects for new development are going to be sited near economically disadvantaged communities, those impacts must be disclosed and analyzed.
- ii. CAP measures should be evaluated for these impacts and incorporate the required mitigation.

7. Problem: The County's 60-day document preservation/destruction policy with respect to CEQA project documentation has been found by the court to violate the law.

a. Solution:

- i. The County must preserve all CAP-related emails and correspondence, including those with all internal and external stakeholders, members of the public, and consultants, and make it available to the public upon request under the California Public Records Act.
- ii. The County should create and disclose a privilege log for all such public records that it anticipates withholding from the public.

Thank you for your quick response.

What I failed to mention is that our process is actually permeable as well with up to 1,200 inches per hour infiltration rate. Please visit our website to see examples of our installations.

www.ecoscapepavement.com

We have recently completed a multi-faceted installation for the new County building in Oceanside if anyone would like to do a job walk.

Thank you in advance!

Subject: SD County Climate Action Plan (CAP) Greenhouse Gas Reduction

Good afternoon,

My name is Austin Jones and I am a resident of San Diego County (specifically Alpine). I receive the regular County of San Diego Planning & Development Services email updates.

In the most recent email with the subject "Notice of Preparation Scoping Meeting Invite: CAP Update (Planning & Development Services)" there was a specific note that the county is seeking new strategies on how to reduce the greenhouse gas emissions within the county.

This immediately stuck out to me and I hope that I can find the right individual to speak with. We have produced a Concrete pavement product that eliminates over 50% of the greenhouse gas associated with traditionally produced and placed concrete products.

We do this through the use of less cement, better admixtures, and volume taken by air. In addition, we place the rock on its own without the cement meaning that heavy water and pre-

mixed cement does not need to be transported to the job sites. After the rock is placed, the cement-based slurry is sprayed over the rock, soaks in and binds the entire section together into concrete.

If whoever receives this email would be willing to give me a call or put me in touch with the appropriate individual regarding how we could work together to help reduce greenhouse gas emissions associated with pavement and erosion control systems it would be greatly appreciated. I would appreciate the opportunity to help San Diego meet and exceed its goals outlined in our climate action plan.

Thank you in advance!

Ref: Support for Adoption of an Aggressive Climate Action Plan to Achieve No New Greenhouse Gases in the County by 2035; to Reduce Such Gases Thereafter; and Adoption of a Smart Growth Program for the County

Honorable Supervisors:

Congratulations to the Board for adopting a goal of zero greenhouse gases (GHGs) by 2035; moving as soon as possible to decarbonize San Diego County; committing to adoption of a Sustainability Plan that will be a critical element in achieving the objectives of the Climate Action Plan; and stating an intent to initiate collaborative action with other jurisdictions within the County.

The San Diego Chapter of the Climate Reality Project (CRPSD) intends to actively participate in efforts to engage the community in preparation of the Draft Climate Action Plan (CAP), and in reviewing and commenting on the Draft once it has been released. Suffice it to say at this point that CRPSD supports the adoption of a CAP that is specific and enforceable and can achieve the goal of no new GHGs by 2035, and to reduce GHGs in the atmosphere after that date.

A study published by research scientists at UCSD in Nature Communications on January 14th of this year reports on potential ways of actually removing GHGs from our atmosphere.¹ The County should work with the San Diego Air Pollution Control District, which will shortly be reconstituted, the California Air Resources Board, and others in exploring the feasibility of this option.

In the new CAP, we urge the County to focus particularly on methods to reduce the so-called "super pollutants", such as hydrochlorofluorocarbons (HCFCs), perfluorocarbons (PFCs), and

¹ Hanna, Ryan, et al. "Emergency deployment of direct air capture as a response to the climate crisis." A Climate in Crisis Calls for Investment in Direct Air Capture, New Research Finds, Nature Communications, 14 January 2021, <https://www.nature.com/articles/s41467-020-20437-0>. Accessed 27 01 2021.

hydrofluorocarbons (HFCs), methane (CH₄), and black carbon (BC) that have particular potency. We note that Dr. Veerabhadran Ramanathan, Distinguished Professor of Climate and Atmospheric Sciences at Scripps Institution of Oceanography at UCSD is one of the leading experts on black carbon, and his expertise, as well as others at the University, may be very useful in developing the CAP.

Diesel combustion is a major source of black carbon. Although Governor Newsom's Executive Order (N-79-20) does not call for the elimination of diesel combustion in California until 2045, the Bay Area has committed to going diesel-free by 2033. San Diego County should pursue a similar course.

Converting sustainable and sustainably produced biofuels to energy could reduce a massive amount of very potent GHGs and could be used in a variety of forms of transportation.

In addition to preparing a legally adequate, enforceable, and comprehensive CAP, the County is required to analyze a smart-growth alternative in the Environmental Impact Report (EIR) on this action. This is extremely important because, in the past, the County has repeatedly approved amendments to the General Plan in order to allow sprawl projects that result in a tremendous increase in GHGs and increase the likelihood of wildfires. Numerous sources have reported that the emissions from wildfires in California have offset all the reductions of GHGs achieved by the State. For example, one report states that "The 2018 wildfires in California are estimated to have produced more than nine times greater emissions than were reduced across the entire state's economy between 2016 and 2017—with wildfires contributing more than the commercial, residential or agriculture sectors did in 2017."² Therefore, it is extremely important to avoid development in high fire hazard areas and assure the health of the County's forests, coastal sage scrub, chaparral, and other vegetation which plays a critical role in storing GHGs.

CRPSD believes that it is essential that the County consider alternatives that focus on future residential growth, including for low and very low-income housing, in or near existing cities that have transit and nearby jobs. Other criteria that should weigh heavily in any future development in the County is avoiding development in high and very high fire areas and reducing vehicle miles traveled.

CRPSD looks forward to actively participating in the development, adoption, and implementation of these critical documents.

Respectfully yours,

Marie Chen

San Diego County Board of Supervisors

RE: San Diego County Climate Action Plan Update

Dear Chair Fletcher and Members of the Board:

Thank you for the opportunity to comment on the Climate Action Plan (CAP) Update to revise the 2018 CAP. New Leaf Biofuel has been a member of the San Diego business community since 2006. Our company collects used cooking oil from local restaurants and converts it to ultra-low carbon biodiesel at our plant in Barrio Logan. We believe that the use of low carbon biodiesel made locally should be highlighted in the updated CAP as a strategy to reduce greenhouse gas emissions, support local green jobs and to promote climate resiliency.

"Fossil fuel-based transportation is the largest emission sector in the County's inventory," responsible for 55% of GHG emissions in the region. Strategy T-3 of the CAP mentions several technologies available for reducing GHG emissions in transportation including electric cars, Compressed Natural Gas (CNG) for municipal fleets as well as Renewable Diesel (RD). Notably absent is Biodiesel, a sustainable, affordable renewable fuel that is plentiful in California. Biodiesel's benefits include:

- Biodiesel made from used cooking oil made locally is one of the lowest carbon fuels available, achieving a reduction in carbon of 85-90% compared to petroleum diesel. It also reduces particulate matter (PM) by 58%, total hydrocarbons (THC) by 57% and carbon monoxide (CO) by 34%.
- Biodiesel made locally from used cooking oil is a renewable fuel source, providing an upcycling opportunity for the waste cooking oil to be converted to a valuable product without depleting any resources.
- Biodiesel made locally supports local, green jobs.
- Biodiesel can be blended with RD at an R80/B20 blend which results in 100% displacement of fossil fuel.
- Since RD, a relatively new product, is in short supply globally, blending 20% biodiesel, which is plentiful, can extend the possibility for local San Diego area fleets to maintain a 100% renewable fuel profile for their heavy-duty transportation applications.

The County uses approximately 500,000 gallons of diesel per year in its own operations. **If the County transitioned its diesel usage to a R80/B20 blend, the 500,000 gallons of diesel displaced would result in a reduction of 4014 MT GHG per year!** *(Note that since RD has a higher carbon intensity (CI) score than locally produced Biodiesel, a straight RD blend would result in a lower GHG savings of 3762).* Compare this GHG savings to San Diego County's goal of transitioning 501 gasoline-powered fleet vehicles to Electric Vehicles (EVs) by 2027. This achievement will displace about 160,000 gallons per year of gasoline and only 1700 MT GHG per year. Transitioning to R80/B20 is almost a 2.5x improvement in GHG emissions reduction and can be accomplished today. These benefits will be even greater if biodiesel use can be expanded in other fleets across the county.

For more information on the benefits of blending Renewable Diesel and Biodiesel, please see the White Paper produced by the California Advanced Biofuels Alliance.

Subject: Biological Resources Impacts in the SD County CAP

Hi Jessica,

I am a member of the San Diego Audubon Society Conservation Committee. There are concerns about the impacts to sensitive species, habitats, ecosystems, wetlands, and natural resources identified as Significant and Unavoidable in the CAP SEIR. These are not aligned with conservation measures and policy in the GPU such as NCCP and MSCP and others identified in the SEIR. Natural untouched ecosystems are wonderful Carbon sinks and plans that cause significant impacts to these habitats to address climate change is not the correct course of action. When projects become more defined and have to attend to the CEQA process, will Biological Resources be evaluated at the project level instead of tiering of this SEIR which comes to the conclusion that Biological Resources impacts are unavoidable? Thanks

San Diego, CA 92123

Subject: Farm Bureau Comments on County Climate Action Plan

Dear Mrs. Bray,

Carbon sequestration in soils and vegetation is one of the few ways in which communities can simultaneously address climate mitigation and climate resilience. In a community in which agriculture is the 5th largest contributor to the economy, we cannot afford to ignore an opportunity to reduce our climate impacts in ways that strengthen food security, regenerate natural resources, and boost our agricultural sector. The County of San Diego must seize the opportunity to become a national leader in Carbon Farming by crafting a Climate Action Plan that both increases and encourages agriculture within the region while solving the climate crisis.

Carbon farming is a suite of farming and ranching practices that hold the potential for delivering multiple benefits: 1) reducing GHG's 2) building soil health, and 3) strengthening climate resilience. They include numerous practices that sequester stable soil carbon, sequester carbon in living vegetation, and reduce emissions from conventional practices such as fertilizer application. Practices include new plantings, composting, riparian restoration, cover cropping, reduced tillage, silvopasture, and several others that are already well-known as part of Natural Resource Conservation Service list of conservation practices. Compost application on cropland and rangeland has high GHG removal potential (1.5 – 4 MTCO₂e /acre/year), and has resulted in remarkable increases in plant growth, and water holding capacity improvements, among several other co-benefits. Similarly, riparian restoration has GHG reduction potential of 1 MTCO₂e/acre/year, and several important co-benefits including water quality improvements and habitat conservation.

The San Diego County Farm Bureau requests the following items be incorporated into the text of the Climate Action Plan and associated CEQA analysis:

- **Stop the Decline of Agriculture:** The County must conserve the existing agricultural carbon storage and sequestration in the existing agricultural community by addressing root drivers behind the decline in local agricultural lands. From 2000–2015, approximately 10,000 acres of orchards, estimated to contain one million trees, were taken out of production by farmers in the greater San Diego County, decisions largely attributed to rising, prohibitive water costs, along with some fire losses. The estimated GHG emissions value of these losses amount to a total 375,125 MTCO₂e, which is the sum of lost carbon stored in the trees, and the foregone cumulative sequestration over a 15-year period. In a single year snapshot of 2014, tree losses amounted to 89,321 MTCO₂e, which is over half of the entire estimated agricultural emissions for the unincorporated county that year.

FARM BUREAU San Diego County

The Voice of Local Farmers

Serving San Diego agriculture since 1914

These numbers are noteworthy for several reasons. First, the contributions of sequestration in orchards, and the loss thereof, are significant. Secondly, the economic pressure of changing climate conditions are apparently already resulting in accelerated GHG emissions. And most importantly, investments in halting the attrition of existing perennial croplands will have significant impacts on climate mitigation for decades to come⁽¹⁾.

- **Local Mitigation Banks:** GHG mitigation is a source of significant resources for carbon farming implementation and must be implemented by the County during the Climate Action Plan process. The San Diego agricultural community stands ready to create and implement cutting edge local, agricultural carbon sequestration banks that not only provide much needed sequestration credits but also bolsters our local economy and regional food security. Existing mitigation banks for sensitive habitats can serve as a model for how to implement GHG mitigation banks through partnerships with the local agricultural community.
- **Data Analysis and Usage:** Methodologies exist that enable us to estimate net carbon sequestration in agricultural lands. The County's past Climate Action Plans have used faulty data to analyze baseline conditions related to agriculture and to analyze the carbon sequestration potential from agricultural practices. There must also be a common set of metrics by which we measure our impacts and make corrections where needed.
- **Stakeholder Engagement:** The County of San Diego is home to a wide variety of agriculture experts that can assist the County in navigating the GHG sequestration potential for Carbon Farming, including University of California Cooperative Extension, San Diego Farm Bureau, the California Avocado Commission. The CAP process must include as part of their advisory group experts on carbon farming so that we can develop and advance climate friendly agricultural strategies in the region.
- **Voluntary Compliance:** Any CAP measures related to agriculture must be voluntary, not regulatory, and must encourage the economic viability of the local agricultural industry. The Climate Action Plan cannot diminish the value of land or private property rights. Although San Diego farmers and ranchers have tremendous potential to make a positive impact on managing excess carbon in our environment, they do not have the financial resources to carry that burden alone and the County needs to offer considerable investments in financial incentives for these programs.

Sincerely,

Hannah Gbeh
Executive Director
San Diego County Farm Bureau

Save Our Community

COUNTY OF SAN DIEGO 2021 CLIMATE ACTION PLAN INPUT
January 30, 2021

StopCottonwoodSandMine.org supports recommendations made by the San Diego Sierra Club which includes the following:

First and foremost, the County must immediately declare a climate emergency. The County must also do more than just neutralize greenhouse gas emissions by seeking to achieve current standards of "net zero" emissions. Rather, the County should be working to greatly reduce GHG emissions below 1990 baseline with net negative emissions to help reverse global climate destruction.

The County must emphasize reducing emissions in disadvantaged communities, locate GHG mitigation in the same disadvantaged communities in which emissions occur, and establish a GHG mitigation bank directly benefiting disadvantaged communities. Other GHG mitigation must occur entirely within the County. And existing multiple species conservation programs should be utilized to establish a natural habitat land mitigation bank for GHG emissions.

The County should implement the following measures to achieve net negative 100% GHG emissions by 2035:

1. Establish a Community Choice Aggregation program to provide 100% renewable energy by 2035.
2. Downzone lands in Calfire's high/highest fire risk areas and highest vehicle miles (VMT) travelled areas of the county.
3. Bar General Plan amendments for increased commercial or residential development in Calfire's high/highest fire risk areas and highest vehicle miles (VMT) travelled areas of the county.
4. Purchase Fanita Ranch, Lilac Hills, Newland Sierra, Otay Ranch Village 13, Otay Ranch Village 14/16/19, Rancho Guejito, and/or Harvest Hills to avoid conversion to development and/or as a natural habitat lands GHG mitigation bank.
5. Establish a program to recycle 100% of all organic waste.

The County should implement the following additional measures to achieve net negative 100% GHG emissions by 2035:

1. Convert natural gas or propane utilities to electric at County facilities.
2. Install photovoltaic solar panels, wind turbines, and/or other onsite renewable energy and batteries at County facilities.

3. Install electric heat pumps to provide air and water heating and cooling at County facilities.
4. Install improved weatherization and insulation at County facilities.
5. Install graywater systems at County facilities.
6. Convert county vehicle fleets to electric vehicles and plug-in hybrid electric vehicles.
7. Provide dividend account parking for all County employees.
8. Increase diversion of solid waste and capture landfill methane.
9. Prohibit all gas-powered leaf blowers.
10. Plant and maintain trees. Priority should be given to native trees when possible.
11. Collaborate with SANDAG to support and implement the Five Big Moves.
12. Support short term extension of mass transit prior to implementation of the Five Big Moves.
13. Support construction of bicycle trails and protected lanes for bikes and scooters.
14. Support installation of public electric vehicle charging stations.
15. Support construction of pedestrian overpasses and other pedestrian infrastructure.
16. Support establishment of a local natural habitat lands GHG mitigation bank with avoided conversion to development and conservation management in perpetuity of habitat land inside or bordering existing or planned regional multiple species conservation plan preserves (e.g. City of San Diego Multiple Habitats Planning Area or County of San Diego Pre-Approved Mitigation Area) or the Cleveland National Forest inholdings.
17. Support establishment of a local disadvantaged communities GHG mitigation bank with replacement of commercial or personal GHG-emitting vehicles and equipment with electric vehicles and equipment, commercial or residential electrification, and other energy efficiency improvements to businesses or residences.

The County should provide incentives and subsidies to existing businesses and residences for the following measures to achieve net negative 100% GHG emissions by 2035.

1. Conversion of natural gas or propane utilities to electric.
2. Installation of photovoltaic solar panels and/or other onsite renewable energy and batteries.
3. Installation of electric heat pumps to provide air and water heating and cooling.

4. Installation of improved weatherization and insulation.
5. Installation of graywater systems.
6. Planting and maintaining trees.
7. Free mass transit passes to students and residents of disadvantaged communities.
8. Carpooling.
9. Purchase of electric vehicles.
10. Free parking for electric vehicles
11. Capture methane from agricultural facilities.
12. Avoided conversion to development of agricultural cropland.
13. Production and distribution of locally grown produce and foods.

The County shall implement the following measures to achieve net negative 100% GHG emissions from new public projects and private commercial developments²(developments) by 2035:

- a. **CEQA Significance** – Public projects and private commercial developments’ GHG emissions shall be considered “significant” under CEQA.
- b. **CEQA Overriding Considerations** – CEQA findings of overriding considerations shall not be provided for public projects and private commercial developments with significant GHG emissions/impacts.
- c. **GHG Emissions Threshold** – Public projects and private commercial developments shall achieve net negative 100% GHG emissions through onsite minimization and offsite mitigation.
- d. **Developments’ GHG Emissions Lifespans** – Public projects and private commercial developments’ lifespans shall be a minimum of 100 years for calculation of: a) GHG emissions; b) onsite project design to minimize GHG emissions; and c) any offsite mitigation.
- e. **Minimization of GHG Emissions** – Public projects and private commercial developments shall minimize onsite GHG emissions by incorporating climate-friendly and environmental design to the maximum extent feasible with the minimum following conditions:
 1. Developments shall be electric and prohibit plumbing for natural gas.
 2. Developments shall include photovoltaic solar panels and/or other onsite renewable energy and onsite batteries to provide 100 percent of any project’s annual electricity

needs.

3. Developments shall include electric vehicle charging stations to serve all projected project-related vehicles.
4. Developments shall include electric heat pumps to provide one hundred percent of air and water heating and cooling.
5. Developments shall prohibit vehicle idling.
6. Developments shall include graywater systems.
7. Developments shall minimize water consumption.
8. Developments shall include shade trees.
9. Developments shall provide transit passes to residents.

f. **Mitigation of GHG Emissions** – To the extent that onsite minimization of any public or private commercial development project’s GHG emissions to net negative 100% is not feasible, offsite GHG mitigation shall be provided to achieve net negative 100% GHG emissions that is in addition to any existing laws, regulations, or plans already compelling reductions in GHG emissions.

1. Developments’ GHG offsite mitigation shall be entirely within San Diego County.
2. Developments’ GHG offsite mitigation shall be entirely within the same disadvantaged communities as emissions.
3. Offsite GHG mitigation may include any of the following:

a) Preservation of natural habitat land inside or bordering existing or planned regional multiple species conservation plan preserves (e.g. City of San Diego Multiple Habitats Planning Area or County of San Diego Pre-Approved Mitigation Area) or private holdings within Cleveland National Forest. Preservation of natural habitat land as GHG mitigation shall include private property acquisition and conservation stewardship management in perpetuity. The amount of GHG mitigation provided by preservation of natural habitat land shall be determined by calculating reduced GHG emissions on the property over one hundred years resulting from avoided conversion to development of the number of existing legally entitled or zoned units and/or square feet on the preserved property.

b) Direct replacement of GHG-emitting vehicles and equipment (e.g. diesel generators) with electric vehicles and electric equipment including at any site under the jurisdictional authority of the Port of San Diego (including cargo and cruise ship terminals), of the Metropolitan Transit System, of the North County Transit District, and of the San Diego Airport Authority.

c) Create environmental justice grant programs in disadvantaged communities for direct replacement of commercial or personal GHG-emitting vehicles and

equipment with electric vehicles and equipment, commercial or residential electrification, and other energy efficiency improvements to businesses or residences.

d) Direct reductions in water consumption.

The County shall implement the following measures to minimize GHG emissions from new private residential development projects:

Personal residential remodelling and addition projects shall achieve net zero GHG emissions through onsite minimization with incorporation of climate-friendly and environmental design with the following conditions:

1. All Projects shall be electric and prohibit plumbing for natural gas.
2. Projects shall include electric heat pumps to provide one hundred percent of air and water heating and cooling.
3. Projects shall minimize water consumption.
4. Projects should include photovoltaic solar panels and/or other onsite renewable energy and onsite batteries.
5. Projects should include electric vehicle charging stations to serve all projected project related vehicles.
6. Projects should include graywater systems.
7. Projects should include tree planting.

Subject: County of San Diego Climate Action Plan (PDS2020-POD-20-016 and PDS2020-GPA-20-004, and PDS2020-ER-20-00-002)

Dear Kelly Bray,

The San Diego Audubon Society is a 3,000+ member non-profit organization with a mission to foster the protection and appreciation of birds, other wildlife, and their habitats, through education and study, and to advocate for a cleaner, healthier environment. We have been involved in conserving, restoring, managing, and advocating for wildlife and their habitat in the San Diego region since 1948. Our work has included invasive plant removal and revegetation events, training community scientists, advocating for developments and park management, educating school children about the importance of natural habitats, and many other projects. Over the years we have partnered with thousands of volunteers to carry out these goals. We endorse progressive action in the Climate Action Plan (CAP) to navigate climate change by embracing protection, enhancement, and rehabilitation of the region's natural resources. Within that framework, we suggest the following in regards to the CAP Notice of Preparation.

Strategy A-2 Increase Carbon Sequestration: The ordinance will include water conservation strategies to minimize water use, which could include planting drought-tolerant and native trees and prioritizing tree plantings in areas served by recycled water and greywater infrastructure. The SEIR should provide data about which native trees and other vegetation are most effective in storing carbon and in which habitat they would be appropriate as defined in 2.4.1.1 Terrestrial Communities and Habitats. Studies reveal a variety of trees prove to be more effective in carbon sequestration. A profile of which variety of native trees or other plants for each habitat should be provided for project level guidance. No trees or plants on the CAL-IPC list should be used or encouraged. The carbon required to provide the water needed for each type of vegetation should be deducted from its nominal sequestration value.

Strategy T-4 Invest in Local Projects to Offset Carbon Emissions: Included in this list is wetland creation among others. Wetland creation in the Fiesta Island Amendment and The ReWild Mission Bay proposal to the Mission Bay Master Plan are excellent examples for using natural resources for carbon sequestration. Cutting edge research through local institutions are quantifying the value of coastal wetlands, including the ReWild Mission Bay study, for carbon sequestration. Undisturbed, natural coastal wetlands have been shown to be very effective at sequestering carbon and should have a more robust profile in the CAP instead of mitigation of impacts to natural resources. As sea level rise occurs, much of our wetlands and shallow subtidal habitats will lose their sequestration value as the depth increases. So the tabulations of wetlands and shallow subtidal habitats should either identify enhancement programs that would keep them at optimum depths for sequestration, or identify the sequestration value as a function of time as the depths change.

Strategy A-2 Increase County Tree Planting: Prepare and adopt a tree planting program for the unincorporated county to plant a minimum of 3,500 trees annually starting in 2017. Description: This

measure is a County initiative. This details the carbon capture potential of trees and we reiterate that native tree guidance be provided in the SEIR as they are paramount to the health of local wildlife and native plants within the ecosystem. The Heritage Tree Preservation Program should be expanded with more data driven guidelines and properly linked into the CAP for better implementation. Again, the carbon expended to water these trees should be deducted from the nominal sequestration value of these trees.

Bio-2.1 Revise the Ordinance Relating to Water Conservation for Landscaping to incorporate appropriate plant types and regulations requiring planting of native or compatible non-native, non-invasive plant species in new development. This is a project that SDAS has been advocating for in partnership with the California Native Plant Society. We suggest the SEIR provide more details of which native plants would be appropriate within the different habitats across the county. Local home owners associations should provide educational content to the public as a resource to native plants for their residences.

Many of the Strategies in the SEIR state that the construction and operation of technology that could affect special-status species, riparian habitat or other sensitive natural communities; federally protected wetlands; wildlife movement corridors or nursery sites; or conflict with local policies or ordinances, and adopted habitat conservation plans or NCCPs. This is in direct conflict with the adopted 2011 GPU Policies including: Policy COS-1.2: Minimize Impacts, Policy COS-1.3: Management, Policy COS-2.2: Habitat Protection through Site Design, Policy COS-3.2: Minimize Impacts of Development, Policy LU-6.1: Environmental Sustainability. We urge that such strategies be eliminated or modified to avoid these substantial negative impacts.

There are 10 mitigation measures from Bio-1.2 to Bio-2.4 to address impacts to biological resources, but the SEIR is not detailed enough to provide adequate cover to project level impacts found to be significant. It should be applied in this SEIR that discretionary projects provide a project level biological resources impact study instead of using the broad conclusions in this SEIR as coverage for impacts found to be significant. There is a broad acknowledgment that mitigation measures to biological resources are implemented within the county if feasible. Also, the mitigation measures are transparent, enforceable and demonstrably effective. Beyond the updates to mitigation measures CC-1-2, CC-1.7 and CC-1.8, we request all measures CC-1.1 to CC-1.8 be reviewed for updates.

Strategy E-2 Increase Renewable Energy describes Implementation of this measure could result in construction of small-scale distributive energy renewable systems, large-scale photovoltaic solar, photovoltaic concentrator technology or wind turbines. We urge that concentrator technology not be implemented unless it is improved so that it will not vaporize passing birds. If it is used, on-site radar detection systems should be implemented to identify bird mortality to allow adequate on-going mitigation. Such systems should have a permitted mortality limit. When the limit is exceeded the plant would be shut down until its next permit cycle. The Strategy also describes potential impacts to wildlife movement corridors or nursery sites. Important bird habitat and corridors need to be fully understood and wind turbines must be kept from these areas. Terrestrial wildlife corridors also need to be avoided. It is noted in the SEIR that impacts related to special-status species resulting from small wind turbines would be a potentially significant impact (Impact BIO-4). This strategy should be expanded to emphasize photovoltaic systems mounted on buildings with large roofs, large parking lots, reservoirs, etc. to avoid environmental damage and the need and cost to mitigate.

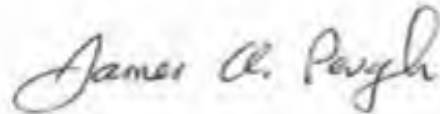

Mitigation for Strategy E-2 refers to the 2012 Wind Energy EIR, Mitigation Measure CAP M-BIO-1 and M-BIO 2 specifically. It is also noted that further mitigation was rejected as infeasible. As large-scale photovoltaic solar, photovoltaic concentrator technology, or wind turbines are going to be prominent in the CAP program, a more robust and coherent mitigation strategy has to be formulated for effective protections of vital biological resources. If adequate mitigation is not feasible, strategies should be

changed so the impacts will be reduced so that mitigation is feasible and adequate. The California Desert and Recreation Act of 2019 keeps natural resources protected and considers infrastructure described herein. A policy following this Act implementation provides protections of natural resources and wildlife habitat while allowing for CAP infrastructure.

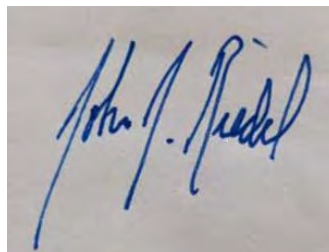

Section 2.4.4.3 and 2.4.4.4 of the SEIR describes impacts to federally protected wetlands and wildlife corridors, and that beyond implementation of 2011 GPU PEIR mitigation measures, there could be site degradation and significant impacts. Beyond project level mitigation measures, there should be CAP mitigation measures to protect against impacts to these natural resources which serve as a backbone to natural resource carbon sequestration in addition to protections afforded to federal and state protected species and their habitats. One of the strategies in the CAP is enhancement of wetlands as a tool for carbon capture, so it follows that these habitats that exist should be fully protected and enhanced to maintain their sequestration value for the future

Conclusively, we fully support progressive action to reduce climate change with implementation of the CAP. We also strongly support as a tool protecting, enhancing and rehabilitating natural resources as an effective carbon sequestration strategy instead of causing significant impacts to these resources at the expense to build infrastructure to address climate change. We believe these two goals that can exist concurrently. We also urge that this CAP modify its Strategies so that we can aggressively lower our greenhouse gas emissions in ways that will protect, or at least fully mitigate for impacts to, our native wildlife and habitats. Thank you for the opportunity to comment on the CAP Notice of Preparation and we look forward to being engaged in this process moving forward.

Sincerely,

Re: COUNTY OF SAN DIEGO CLIMATE ACTION PLAN UPDATE
Supplemental Environmental Impact Report - Project Numbers: PDS2020-POD-20-016 and
PDS2020-GPA-20-004; Environmental Review Number: PDS2020-ER-20-00-002

Dear Ms. Bray:

Please accept this submission in response to the County's NOP for this CAP update. SanDiego350 is an inclusive volunteer organization building a movement to prevent the worst impacts of climate change and climate injustice. We strive to create a future that supports a livable planet and just society. SanDiego350 achieves its goals through education and outreach, public policy advocacy, and mobilizing people to take action.

SanDiego350 supports the County's newly adopted climate action goal which was approved by the Board of Supervisors on 1/27/21. This ambitious goal is to drastically reduce greenhouse gas (GHG) emissions and achieve zero carbon in the San Diego region by 2035. To accomplish this goal, the County needs to establish more aggressive targets in its Climate Action Plan (CAP) update to reduce emissions from three sectors: transportation (45% of GHGs), energy (24% of GHGs), and natural gas in buildings (9%).

Below are our Public Policy Team recommendations for the County's CAP Update SEIR:

Section 1. Built Environment and Transportation

Land Use Decisions- The County makes land use decisions for all unincorporated communities, agricultural zones, and backcountry areas of San Diego County. The County should prohibit urban and suburban residential and commercial development in all agricultural zones and low-density zoned rural areas. Any General Plan Amendment that proposes increasing the density above the levels established in the County's 2011 General Plan should be soundly rejected. Instead, the County should consider providing density bonuses and other development incentives for infill projects along major transit corridors in the County's already-urbanized communities.

Mode Share Goals- The County needs to adopt aggressive transportation mode share targets in the already-urbanized areas of the County and promote the development of safer bike lanes, complete streets, and convenient and affordable rapid transit.

[SB 743 CalTrans Report](#)- Passed by the State legislature and signed into law SB 743 with the intent to “more appropriately balance the needs of congestion management with statewide goals related to infill development, promotion of public health through active transportation, and reduction of greenhouse gas emissions.” The Governor’s Office of Planning and Research (OPR) has issued new metrics for identifying and mitigating transportation impacts within CEQA. For land use projects, OPR identified Vehicle Miles Traveled (VMT) per capita, VMT per employee, and net VMT as new metrics for transportation analysis. Implementation of SB 743 began in July, 2020, but the County’s adopted guidelines are inconsistent with the law and with the State OPR Guidelines. (The County is currently being sued by the Sierra Club and the Cleveland National Forest Foundation over these guidelines). Therefore, the County should amend its guidelines to comply with State law, as soon as possible; and recognize this step in the new CAP and its sEIR.

Telecommuting- Since the pandemic began last March, an increasing number of businesses have allowed employees to work from home. This has significantly reduced traffic on local roads and freeways during commute hours, and thus reduced carbon emissions. The County should encourage telecommuting by collaborating with businesses to devise incentives that encourage employees to work from home.

Support the planning effort to create a world class transportation system- The 2021 Regional Transportation Plan, currently under development by SANDAG, will synchronize “5 Big Moves” to deliver a fully integrated transportation system for the San Diego region. The 5 Big Moves include complete corridors, transit leap, mobility hubs, flexible fleets, and the next Operating System (OS) for transportation coordination (the “brain” of the entire system that coordinates the full range of transportation options). SANDAG’s framework promises to enhance connectivity, increase safety, and reduce GHG emission from vehicles by providing real alternatives for commuters. The County should support SANDAG’s RTP planning process, build community and business support for a massive expansion of public transit, prioritize transit over roadway expansion projects, and increase funding for complete streets and safe bike lanes.

Section 2. Renewable Energy

Community-based Microgrids- In the updated CAP, encourage the development of microgrid energy and battery storage projects, with a focus on communities of concern that have not yet benefited from the green energy revolution.

Building Electrification- Adopt a reach code that requires all new residential and commercial development projects to be all-electric. Develop incentives for homeowners and businesses to retrofit existing buildings with all-electric heating systems and appliances. Promote heat pumps to replace existing space and water heating systems.

Section 3. Agriculture and Conservation

Sustainable Food Supply- Adopt a set of strategies focusing on the importance of food in both consumption and production:

- 1) adopt a procurement plan (e.g. the Good Food Purchasing Program) for County operations that encourages the purchasing of less carbon-intensive foods
- 2) develop an education and outreach program that promotes the adoption of healthier and low-carbon diets in households and institutions
- 3) incentivize carbon-farming practices and use technology such as COMET-farm to quantify additional carbon sequestered in vegetation and soils so the GHG reduction can be included in the CAP's overall mitigation numbers.
- 4) Adopt the recommendations from the [1/28/2021 comment letter from the San Diego County Farm Bureau](#).

Section 4. County Operations

Consumption-based GHG Inventory

Adopt a method for assessing the lifecycle greenhouse gas emissions caused by the consumption of goods and services associated with activities originating from within the County (e.g. Consumption-Based Emissions Inventory). This involves recognizing that relying solely on a sector-based emissions inventory underestimates the emissions that the County is responsible for and that consumption is a central driver for greenhouse gas emissions associated with lifecycle carbon footprint of goods and services occurring within the County.

Section 5. Social Equity

Climate Equity Index- Include an environmental justice component in the CAP Update that provides equity in the implementation of CAP measures and activities. As the County transitions away from fossil fuels in the energy and transportation sectors, it should ensure that underserved communities share in the benefits of clean renewable energy, will have access to skilled training programs for new green jobs, and access to capital to start or expand green economy businesses.

Thank you for inclusion of SanDiego350's submittal for elements of the CAP update, and analysis in the SEIR. If you have any questions, please email me at davidh@sandiego350.org

Re: Comments on Notice of Preparation (NOP) for an Environmental Impact Report for the County of San Diego Climate Action Plan (CAP)

Climate Action Campaign (CAC) is an environmental nonprofit organization based in San Diego and Orange County with a simple mission: to stop the climate crisis through effective policy action.

The 2018 UN IPCC report, *Global Warming of Degrees Celsius*, warns that in order to stave off climate catastrophe, we must limit global warming to 1.5°C above pre-industrial levels, citing drought, floods, extreme heat and poverty for hundreds of millions of people if temperatures rise above 1.5°C. To remain within this threshold, we must cut global emissions by 45% by 2030 and entirely eliminate emissions by 2050. This critical moment in history demands that at every level of government, we must take unprecedented action to significantly reduce greenhouse gas emissions and ensure a safe, livable, and dignified future for all.

In order for the County to do its part to slash greenhouse gas emissions and create sustainable, equitable, and prosperous communities, we recommend the following Draft EIR components and emissions reduction measures:

CEQA Requires Enforceable Measures with Detailed Deadlines

CEQA is clear about what is required for a qualified CAP. For a CAP to function meaningfully as a roadmap to its reduction target, the measures in the plan must be enforceable — which means

they must be specific, unambiguous, and contain clear requirements. Voluntary measures violate these CEQA guidelines.

In *California Riverwatch v. County of Sonoma et. al* (2017), the court stated that in CAPs used for tiering, “any measures or requirements imposed [must] be sufficiently defined to be enforceable.” This means that for the CAP as a whole to be legally binding, the measures that comprise it must be enforceable. The measures within the CAP must be specific, evidence-based, and contain mandatory requirements, all of which serve to make the CAP as a whole meaningfully enforceable.

Significance Thresholds In Line With State Targets

The thresholds of significance for GHGs should be any level of emissions that will cause a violation of the state’s GHG emission targets, which include:

- SB 32, which mandates statewide GHG emissions reductions of 40 percent below 1990 levels by 2030.
- Executive Order S-3-05, which mandates statewide GHG emissions reductions of 80 percent below 1990 levels by 2050. Compliance with S-3-05 should be of particular legal concern given the precedent set in the SANDAG RTP lawsuit.
- Executive Order B-55-18, which mandates statewide carbon neutrality as soon as possible, and no later than 2045, and net negative emissions thereafter.

Local targets that would contribute to emissions above these levels should be considered to have a significant impact.

Recommended Greenhouse Gas Emissions Reduction Strategies

In order to meet state greenhouse gas goals, including the Board’s recent direction to align the CAP with Executive Order B-55-18, the County should include the following policies and strategies:

- **Zero Carbon:** As a long-term planning document, we urge you to ensure the CAP horizon year is extended to 2045 or later, and that the emissions reduction target commits to zero carbon by 2045 or sooner. To stave off the most devastating impacts of climate change, we must entirely eliminate greenhouse gas emissions as soon as possible.

Additionally, the County should align the CAP’s emissions reduction target and strategies in support of the forthcoming Regional Sustainability Plan and its goal to achieve zero carbon by 2035.

- **100% Clean Energy:** Not only is 100% Clean Energy the nation-leading standard, it is also necessary to meet California GHG targets. Accordingly, eight cities in the San Diego region have committed to 100% clean and renewable electricity by 2030 or 2035. Shifting to clean and renewable energy not only reduces greenhouse gas emissions, but it also spurs local investment and family-sustaining jobs from clean energy technologies. A 100% clean energy goal would be consistent with the goals of other Climate Action Plans in the region.
- **Community Choice Energy (CCE):** Community Choice is the single most powerful emissions reductions strategy at the local level, and it is the only viable pathway to 100% clean energy. The County should commit to and integrate Community Choice Energy into its CAP as a way to help steeply reduce carbon emissions, and provide choice and competitive energy rates.
- **Building Electrification:** Even as our cities work to achieve 100% clean electricity, natural gas remains one of the most significant sources of emissions in our region, so to fully transition away from fossil fuels, we must reduce and ultimately eliminate natural gas consumption. Because appliances last several decades, it is critical that we start building electrification today by incorporating key building electrification measures in the CAP. We recommend requiring all newly constructed or renovated buildings to be all-electric, as well as providing incentives and streamlining to electrify existing buildings. We also recommend centering equity in any building electrification plan to protect our most vulnerable from being stranded with this dangerous asset, and developing an inclusive community engagement process to gather feedback from communities of concern about their needs, and share how building electrification can improve their lives.
- **Energy and Water Efficiency:** The CAP should set targets for water conservation and energy efficiency for single-family, multifamily, commercial, and municipal buildings, as well as plan for ordinances to help reach those targets.
- **Zero Emissions Vehicles:** The County should include a strategy to transition to a fully electric municipal fleet.
- **Transit, Walking, Biking:** The CAP should include mode share targets that define the percent of commuters who will walk, bike, and take transit to work by the plan's horizon year. Mode share goals help jurisdictions facilitate a shift away from car-centric growth, advocate for assistance for better transit infrastructure, and help communities plan for

anticipated or desired health outcomes. The CAP should include a detailed roadmap with specific and actionable strategies to meet the mode share targets. Strategies to increase mode share include fostering safe and convenient biking, walking, and transit opportunities. These infrastructure investments also provide numerous co-benefits that create safer, healthier, more prosperous communities.

- **Smart Growth Land Use Policies with Affordable Housing Near Transit:** With 45% of the County's emissions currently come from on-road transportation, the CAP should include a goal to reduce vehicle miles travelled (VMT) to be achieved through smart growth policies that increase mixed-use density and affordable housing near job centers and transit. Building affordable housing near transit is a necessary strategy to reduce VMT and reduce GHG emissions.¹ Building housing in high-VMT, high fire hazard areas far away from jobs and transit remains one of our region's greatest sources of skyrocketing emissions, threatens our natural and working lands, and increases the likelihood and severity of fatal wildfire events.

The CAP and SEIR's project alternatives should further specify where smart growth and density should be targeted and what transportation mode share, VMT, and land use goals should be set for specific communities throughout the unincorporated County, so there is clarity for the public and staff. The City of San Diego's ongoing struggle to ensure that community plan updates in urban, transit-priority communities are aligned with CAP targets, and to agree upon what goals each community is responsible for meeting, highlights the importance of including both neighborhood-level specificity and a jurisdiction-wide approach in the CAP.

The 2018 CAP's SEIR Mitigation Measure GHG-1 permitted General Plan Amendments (GPAs) projects to find no significant impacts based only on the purchase of overseas offsets credits. Proposed amendments to the 2011 GPU are typically sprawl projects in rural areas without adequate access to transit. These General Plan Amendment projects would necessarily add VMT and increase emissions, but could still comply with the CAP's offset requirements.

However, the County has land use authority and should ensure that all projects, including GPAs, are not reliant on international offset schemes, and are located in areas that have direct access to transit and that reduce VMT.

¹ Center for Neighborhood Technology, California Housing Partnership Corporation. (2016). *Location Matters: Affordable Housing and VMT Reduction in San Diego County*. Retrieved from: <https://static1.squarespace.com/static/5a6bd016f9a61e52e8379751/t/5a80f33bec212d81181be01d/1518400319715/Climate+Action+-+Affordable+Housing+And+VMT+Reduction.pdf>

- **Urban Tree Canopy and Climate Resilience:** With proper management and appropriate choice in tree variety, trees help sequester carbon, filter the air, and provide much needed shade in a warming environment. The CAP should commit to a specific urban tree canopy coverage goal and a roadmap to achieving that goal.
- **Zero Waste:** Waste decaying in landfills emits methane, a potent greenhouse gas. The CAP should analyze the impact of achieving zero waste through strategies such as eliminating single-use materials, composting and capturing landfill gas.
- **Social Equity & Environmental Justice:** Climate change hits hardest in communities that are disproportionately burdened by multiple sources of pollution and face health and socioeconomic challenges. California’s Environmental Health Screening Tool, CalEnviroScreen 3.0, identifies communities most vulnerable to pollution and climate impacts so that the state and local governments can direct attention and resources toward the pursuit of environmental justice in those places. However, we also recognize that there are historically underinvested communities in San Diego County that are not adequately represented via this tool, and we encourage you to develop metrics that specifically identify the most vulnerable unincorporated County residents.

The CAP should explicitly define how the communities most impacted by the climate crisis and environmental injustices will be prioritized in the implementation of GHG reduction strategies, including affordable housing development and investments in urban forestry, active transportation, renewable energy, and energy efficiency measures.

The development and implementation of these strategies and benchmarks should take place in consultation with a diverse set of stakeholders and organizations that represent low-income communities of color who are disproportionately harmed by a fossil fuel economy and are hurt first and worst by the impacts of a warming climate.

For examples of Climate Action Plans that integrate equity and jobs, we recommend referencing the [King County 2020 Strategic Climate Action Plan](#), [Oakland Equitable Climate Action Plan](#), the [“Planning for a Boston Green New Deal and Just Recovery” Plan](#), and the [Los Angeles’s Sustainability Plan “LA’s Green New Deal.”](#)

Focus on Direct Emissions Reductions, Not Offset Schemes

Finally, while the 2018 CAP called for the establishment of a “Local Direct Investment Program” to fund and implement GHG offset projects, it did not provide substantial evidence that these projects would help achieve progress towards the County’s emissions reduction targets. The CAP must focus on real emissions reductions, not offset schemes that allow for continued pollution, to achieve its overall goals.

The CAP is required by Mitigation Measure CC-1.2 of the 2011 General Plan Update’s (GPU) environmental impact report (EIR) as mitigation for climate change impacts from land uses designated in the General Plan. Therefore, all GHG reduction measures must be specifically laid out in the CAP so they are enforceable as mitigation under CEQA.

Conclusion

We appreciate the opportunity to provide comments on the NOP of the Draft Environmental Impact Report for the County of San Diego Climate Action Plan, and we are available as a resource throughout the process of CAP development.

Sincerely,

A handwritten signature in black ink, appearing to read "Noah Harris". The signature is fluid and cursive, with the first name "Noah" and last name "Harris" clearly distinguishable.

RE: Comments on Notice of Preparation for County of San Diego Climate Action Plan Update

Dear Ms. Bray:

Thank you for this opportunity to provide input and recommendations on the Notice of Preparation (NOP) for the County of San Diego's Climate Action Plan Update. The Building Industry Association of San Diego County represents over 650-member companies comprising a workforce of 35,000 men and women in the San Diego region. We are hopeful that the third time will be the charm for the County's CAP efforts, as the County, impacted industry sectors, and interested constituents will benefit from a stable platform from which to tackle GHG reduction in the County's unincorporated region.

The BIA strives to represent and support the efforts of its member companies to build all types of residential and commercial projects in the region. The BIA also recognizes and embraces its role in pursuing and implementing sustainable land use design as a strategy to address climate change. As such, we remain committed to partnering with the County to identify feasible pathways to achieve meaningful and proportional reductions in GHG emissions from new development. It is imperative that any such actions not impede the ability to provide housing in the unincorporated area.

At this early time in the CAP Update process and following our review of the NOP, we offer the following comments:

1. On January 13, 2021, the County Board of Supervisors directed County staff to "not rely on the purchase of carbon offsets to meet emission reduction targets" in the CAP Update. (See County of San Diego Board of Supervisors, Wednesday, January 13, 2021, Minute Order No. 5.) We view this Board directive as a pre-decisional action directly affecting the content, substance, and parameters of the CAP Update; that pre-decision was made without CEQA analysis or compliance, and outside the context of any sufficiently noticed or transparent public process. Further, this action was taken after release of the CAP Update's NOPs issued on December 10 and December 23, 2020 and, therefore, is not disclosed in the NOPs. The consequence of this timeline is that, absent participation in the

County's virtual scoping meeting on January 28, 2021, interested stakeholders likely do not know of this significant pre-decisional policy direction on the CAP Update.

In addition to the above concerns, the meaning of Minute Order No. 5 itself is vague and ambiguous because of its abbreviated length and the absence of any discussion regarding whether this direction is limited to the four corners of the CAP Update or also extends to the CEQA analysis prepared for any proposed project under the County's jurisdiction. For example, does the Board order limit the GHG reduction strategies that will be identified in its CAP Update (and any subsequent projects that tier from or streamline their environmental analysis pursuant to the CAP)? Does the Board's order mean that the County will not allow the purchase of carbon offsets as an acceptable tool for reducing GHG emissions, even though authorized by CEQA and other laws and regulations? Will this new policy direction be applied in an expansive context outside of the CAP framework, such that the applicants of ministerial and discretionary projects processed by the County will be prohibited from purchasing carbon offsets? How will previously approved projects with certified EIRs specifying carbon offsets as their GHG mitigation be handled in light of this new Board policy? **We need to understand whether the County is eliminating the purchase of carbon offsets as a tool from the toolbox of acceptable GHG mitigation strategies set forth in CEQA Guidelines section 15126.4(c). If so, we need the CAP Update and Draft Supplemental EIR to thoroughly explain the basis for such a decision.**

As such, **we specifically request that the County articulate its reasoning for pursuing this policy direction in the CAP Update, as Minute Order No. 5 is not accompanied by any substantive basis for or elaboration on its direction.** We note that the Fourth District Court of Appeal, when issuing its decision on the County's last CAP, expressly admonished that its "decision is not intended to be, and should not be construed as [a] blanket prohibition on using carbon offsets — even those originating outside of California — to mitigate GHG emissions under CEQA." Further, there has been no change in course from the California Air Resources Board, which continues to permit the use of carbon offsets: (i) under its Cap-and-Trade Program for regulated, stationary source entities; and (ii) when reviewing proposed AB 900 projects for CEQA streamlining purposes. CARB also affirmed the purchase and use of carbon offsets for the Newhall Ranch project in Los Angeles County in 2017, and identified the use of carbon offsets in its Scoping Plan as a complementary means to reduce GHG emissions from new development when coupled with other feasible on-site reduction strategies. In light of this legal context, please provide the Board's substantive basis for precluding the use of carbon offsets. We also would prefer that this explanation be provided and publicly distributed for public comment before completing the Draft Supplemental EIR for the CAP Update.

In lieu of arbitrarily directing the wholesale elimination of carbon offset use, we request the County focus on developing criteria and standards for their use. Carbon offsets have a well-established history of environmental integrity and effectiveness and provide meaningful opportunities to achieve GHG reductions that benefit the global balance sheet of GHGs outside of the limited geography of the County's unincorporated areas. No evidence has been presented that purchased carbon offsets are systemically

failing when the underlying activities are implemented pursuant to scientifically-vetted and registry-approved quantification protocols and methodologies. As such, there is no “stigma” associated with purchased carbon offsets, despite the insinuations of the County Board of Supervisors’ Minute Order No. 5.

Moreover, this direction — which appears to be a matter of an undisclosed and unsubstantiated policy preference — has environmental, economic and planning ramifications that have not been subject to any transparent form of analysis prior to the January 13, 2021 action. As such, **we request that the CAP Update and its Draft Supplemental EIR evaluate all environmental, economic, and planning implications of eliminating carbon offsets as a GHG reduction strategy.** Some related, preliminary questions that come to mind and need to be answered include those that follow:

- Will the County be able to meet its own GHG reduction targets for the CAP Update in the absence of carbon offsets? In a *Voice of San Diego* article published on January 12, 2021 (“County’s New Climate Plan Could Use the System That Doomed the Old Plan”), when asked whether the County will need to use carbon offsets to achieve its GHG targets, Ms. Bray’s commentary indicates that the decision to prohibit the purchase of carbon offsets at this very early juncture in the CAP Update process, at the very least, was premature. We agree that it is premature to eliminate carbon offsets as a GHG reduction tool and ask that the Board rescind Minute Order No. 5.
- Will it be feasible for proposed development projects to achieve net zero GHG reduction targets, which have been supported by the California Air Resources Board and others (including the County), in the absence of carbon offsets and after accounting for all existing and reasonably foreseeable constraints?
- What is the cost per metric ton of GHG reduction achieved through the use of carbon offsets as compared to other strategies that are identified by the County for implementation in its CAP Update? If the cost of other strategies is substantially higher, how will this impact the cost of housing?
- Does prohibiting the use of carbon offsets interfere with or obstruct the County’s ability to deliver the requisite number of housing units?

Also, because the policy decision to eliminate carbon offsets was made outside of the CAP Update process and with no notice or opportunity for meaningful input, **we request that the Draft Supplemental EIR for the CAP Update include an alternative that permits the continued use of carbon offsets as a GHG reduction strategy.**

We also strongly encourage the County to consult with carbon offset registries as important stakeholders in this process. We particularly encourage consultation and outreach to Craig Ebert, President of the Climate Action Reserve. While the rhetoric around the critique of carbon offsets has been fervent in the San Diego region, the science to support the critique has not. The County Board of Supervisors should fully educate itself on carbon offsets before writing them off.

2. To the extent that the County proceeds with the wholesale elimination of purchased carbon offsets as a matter of policy, **we request that the County commit to developing an agency-administered plan or program to achieve the Board of Supervisors' GHG reduction objectives.** This plan or program must be supported by a fair-share and nexus study that is prepared prior to or concurrent with adoption of the CAP Update, so that the CAP Update is defined with sufficient specificity and supported by evidence establishing it will be a workable approach subject to successful implementation. In other words, we implore you to take this opportunity to develop a GHG mitigation program for use by individual projects that is akin to the way jurisdictions tackle school, park, and transportation impacts (by way of example), whereby projects can provide fair-share funding to the County for the off-site reduction of GHG emissions through improvements, activities, and programs administered by the County.

We underscore that it is not feasible to assign individual landowners or developers with the burden of establishing and implementing in-County GHG reduction activities that are not located on their project sites. Such activities cannot be accomplished by landowners/developers in a successful manner within a reasonable period of time, and after accounting for economic, social, and legal factors. The complexity of such an endeavor is illustrated by the following, preliminary recitation of steps that would have to be undertaken by each individual landowner/developer in connection with each individual land use project:

- Identify potential off-site locations in the County that are likely under different ownership, and survey such locations for potential GHG reduction opportunities;
- Evaluate the constraints of each off-site location and the preliminary magnitude of GHG reduction potential;
- Negotiate the legal rights necessary to make GHG reduction improvements at such off-site locations;
- Work with GHG reduction project developers to utilize existing and/or create new types of reduction activities;
- Create quantification methodologies and protocols for the specific type of reduction activity that are scientifically vetted and supported by substantial evidence;
- Negotiate contractual terms required to implement such reduction activities;
- Administer and fund such activities;
- Accomplish each of the steps outlined herein prior to issuance of grading and building permits to ensure that the GHG emission reduction is timely and not late; and
- Undergo administrative review, CEQA review, public hearings, and approval by an agency with jurisdiction over the off-site GHG reduction activity location(s).

This onerous process is one of the reasons that traditional carbon offsets have proven to be such a useful mitigation tool when reducing project-related GHG emissions. Purchased carbon offsets allow for individual projects to address their GHG emissions in a real and

effective manner while recognizing that landowners and developers are just that — landowners and developers and not off-site GHG reduction project developers.

3. At a time when the San Diego region and the State of California at large are in the midst of a well-documented housing crisis, it is critical that the CAP Update set forth an approach to GHG reduction that is compatible with achievement of the County's housing targets, including those set forth by SANDAG's RHNA, and the approved land use framework of the County's existing General Plan. Therefore, **please confirm — in the evidentiary record for the CAP Update — that the GHG reduction strategies and approaches set forth therein will not interfere with the timely delivery of all types of housing for all income levels in the County.**
4. **Please confirm that the modeling parameters for the GHG inventories and forecasts accurately reflect the land use framework of the General Plan's Land Use Element.** To facilitate this confirmation exercise, and in addition to the County's own independent review, all applicants of approved (but not yet fully built) and proposed land use development projects should be notified by the County of the CAP Update process and solicited to review and provide input on the "Land Use Overlays" posted at <https://www.sandiegocounty.gov/content/sdc/sustainability/climateactionplan.html>. The GHG inventories and forecasts being developed for the CAP Update only are as credible as the assumptions that go into them. Shortcuts must not be taken with respect to identifying the correct land use inputs.
5. As shown on Slide 10 of the County's Virtual Scoping Meeting presentation, GHG emissions from on-road transportation sources were 45% of the baseline inventory in the last CAP. During the January 28, 2021 scoping meeting, County staff indicated that a similar percentage is expected in conjunction with the CAP Update's inventory work. In proceeding with this CAP Update, **we request that the County use modeling assumptions for on-road transportation sources that are consistent with and based on achievement of California's zero emission vehicle (ZEV) penetration targets.** A host of statewide policy and programming has been developed to facilitate ZEV turnover, and this CAP Update should not rely on outdated assumptions regarding the type of vehicle utilized to meet the San Diego region's passenger vehicle demand. We believe this is a reasonable approach, particularly when considering the policy agenda of the Biden Administration and its clear focus on combatting climate change and pursuing green innovation.
6. **We request that the CAP Update process establish CEQA review criteria for both General Plan consistent projects and General Plan amendment projects.** While it is our understanding that the primary purpose of the CAP Update is to mitigate the GHG emissions of the General Plan-approved land use framework, the County should be forward-looking and establish a workable framework for General Plan Amendment (GPA) projects that allows such projects to demonstrate consistency with the CAP Update upon certain conditions being met. The foreseeability of GPA projects is affirmed by the Planning and Zoning Law, which recognizes that the passage of time and changing conditions necessitate amendments to the approved land use framework. Conversely,

effectively locking the County's General Plan land use framework in stone and precluding GPAs by policy or outright is not only a violation of state law, it would impede the County's ability to address existing infrastructure and public service deficiencies, causing significant socioeconomic harm to many of the County's unincorporated communities.

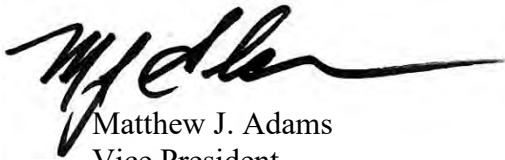

7. **It also is imperative that the CAP Update be accompanied by an economic impact analysis and cost-benefit analysis that study the ramifications of the policy choices made therein on every impacted business sector, including housing.** We must carefully balance the need to combat climate change with the avoidance of unbearable impact to the economy, so as to ensure that the San Diego region remains strong and vibrant while aggressively pursuing important environmental policy.
8. **The CAP Update should also demonstrate consistency with the County General Plan's Guiding Principles, Goals and Policies, and other General Plan Elements.** Specific to the Housing Element and affordable housing policy, if the County will also be developing a strategy for creating affordable housing (e.g., an inclusionary housing or workforce housing program) and updating the Housing Element as a result, it is essential that the CAP Update, specifically the GHG mitigation strategies, can be shown to not impede or preclude implementation of the County's affordable housing objectives.
9. During yet another recent meeting of the County Board of Supervisors, staff was directed to "develop a framework for a regional zero carbon sustainability plan in partnership with [UCSD] which shall include strategies and initiatives to achieve zero carbon in the region by 2035." (County of San Diego Board of Supervisors, Wednesday, January 27, 2021, Minute Order No. 3.) **The County must provide further information and clarity on the relationship between this regional sustainability planning effort and the CAP Update.**
 - For example, Minute Order No. 3 on the regional sustainability plan refers to achievement of "zero carbon in the region by 2035." However, Minute Order No. 5 on the CAP Update discussed above refers to "net zero carbon emissions by 2045." Are "zero carbon" and "net zero carbon" the same thing? If not, how are they different? If the same, why are two different calendar years referenced?
10. As with any planning effort, we request that the County **continue to process existing applications for land use development.** The CAP Update should not trigger limbo for pending projects, which should continue to be processed and reviewed per existing, applicable rules and standards. This is especially the case because, as reflected on Slide 16 of the County's Virtual Scoping Meeting presentation, the County's CAP Update process likely will not be completed until the end of the 2022 calendar year.

We also underscore the importance of continuing to honor and uphold the use of carbon offsets by previously County-approved projects. It appears that the County Board of Supervisors is in the midst of pursuing a policy shift, but not one based on evidence or analysis showing that carbon offsets are ineffective at or fail to reduce GHG emissions. As such, pre-existing approvals cannot be abandoned or thrown under the bus.

In closing, the BIA is conceptually supportive of a CAP Update that provides: (i) for the equitable and meaningful reduction of GHG emissions under the County's jurisdiction, and (ii) workable mechanisms to streamline the environmental review of proposed development projects, while simultaneously creating a flexible framework that recognizes the site-specific constraints and opportunities of land use development. To that end, we look forward to partnering with the County as it proceeds with the CAP Update and request that the County engage with the building industry as it proceeds to evaluate the feasibility of different GHG reduction strategies and measures.

Thank you for your consideration of this letter.

Very truly yours,

Matthew J. Adams

County of San Diego -

Attached are comments from the Southwest Wetlands Interpretive Association (SWIA) to be included in the public comments/record for the NOP.

Because the previous CAP and its EIR were found to be inadequate by the courts, we strongly urge the County to incorporate the recommendations in our and other environmental groups' letters regarding the NOP.

Sincerely,

Bill Tippetts (Secretary, SWIA Board of Directors)

Subject: Notice of Preparation for a Supplemental EIR for the County of San Diego Climate Action Plan, Environmental Review Number PDS2020-ER-20-00-002

Dear Ms. Bray and County Planning:

The Southwest Wetlands Interpretive Association (SWIA) is an environmental organization established over 40 years ago whose mission is to conserve wetlands and other sensitive natural habitats, primarily in San Diego County and southern California. We are submitting these comments on the County's proposed Climate Action Plan (CAP) and associated amendments General Plan Update. Our organization is extremely concerned about how jurisdictions are addressing climate change and in particular how they plan to reduce greenhouse gas (GHG) emissions, which exacerbate sea level rise that threatens coastal shorelines and wetlands and have overall negative impacts on many natural habitats and species.

INTRODUCTION AND BACKGROUND

SWIA has actively engaged in and supported the preparation of Climate Action Plans (CAPs) throughout San Diego County. We commented on the earlier versions of the CAP and provided

recommendations to make them consistent with state requirements and 2011 GPU obligations (our letter dated February 8, 2018, addressed the now-rescinded 2018 CAP and SEIR).

As the County prepares its new CAP to comply with CEQA, we believe that our previous recommendations regarding establishing a credible GHG emissions baseline, inventory, and projections; additional or revised mitigation measures that will be implemented and achieve their intended outcomes; as well as the need to clarify and commit to effective monitoring (with concomitant adaptive management to address identified failings to achieve the mitigation and targets) are relevant and should be addressed.

Our comments are consistent with concerns and recommendations provided by numerous other environmental groups, in particular the Sierra Club San Diego Chapter's letter of January 12, 2021.

SPECIFIC COMMENTS

GHG Baseline, Inventory, Projections, and Targets

It is essential that the CAP acknowledge and apply the most current state (and relevant regional and federal) laws, regulations, policies and practices to establish the GHG baseline, inventory, projections and targets. In particular, the CAP must incorporate the goals of Executive Order B-55-18 to Achieve Carbon Neutrality by 2045, and SB 32 and EO S-3-05, which set statewide emissions reductions targets at 40% below 1990 levels by 2030 and 80% below 1990 levels by 2050. And the County CAP should achieve, wherever relevant and feasible as a mitigation requirement, "net negative 100% GHG emissions," as described in the Sierra Club letter.

The County must not rely on inappropriate data sets and assumptions when preparing its baseline, inventory or projections, which has been identified to be a problem for the City of San Diego (<https://www.sandiegouniontribune.com/opinion/editorials/story/2020-12-31/editorial-heres-glorias-first-misstep-as-mayor-using-bogus-data-for-greenhouse-emissions>). And it must use the most appropriate (and legally required) GHG reduction targets - and preferably the carbon neutrality goal- as the basis for preparing its GHG avoidance, minimization and mitigation measures. GHG emissions have both short-term as well as long-term effects on many of the to-be-analyzed subject areas listed in the NOP, so the County must establish clear and well-justified thresholds of significance.

Transportation

Transportation constitutes the largest sector of GHG emissions and poses the greatest potential complication to preparing and implementing a credible CAP. As we noted for the previous CAP, the County's previous approaches have not sufficiently altered vehicle use and reduced vehicle-based GHG emissions. Furthermore, the County in 2020 adopted a seriously flawed SB 743 VMT reduction plan that would potentially allow over 50% of its future development to avoid VMT analysis – and that has serious GHG emission consequences (SWIA letter dated June 8, 2020). In addition, SANDAG is preparing its 2021 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) that purportedly will establish a higher SB 375 GHG reduction target (30%) compared to the 19% that it had previously established. The County's CAP must describe how it will align with and be consistent with that new target. Finally, the County has almost without exception approved major subdivision projects using the GPA process, although those projects do not conform to the 2011 General Plan Update, generate vast amounts of transportation-based GHG emissions (predominantly from single occupancy vehicles), and all of them have relied on and required the purchase of unproven/unjustified offsite mitigation credits (from essentially anywhere in the world). Because GPAs are not consistent with the 2011 GPU nor are their impacts known, how will the County ensure conformance to the CAP? All of these concerns must be fully addressed and all potential impacts avoided or appropriately mitigated to a level of not significant in the CAP.

Energy

The energy used in commercial, industrial and residential buildings is the second-largest GHG emissions sector. While the County included many reasonable and feasible GHG emission reduction measures in its 2018 CAP, GHG emissions from the built environment (buildings) and future development still pose a significant potential impact. A primary commitment of the CAP should be the adoption of Community Choice Aggregation/Energy program, whether a stand-alone or a part of the emerging CCA that the City of San Diego and other cities are pursuing, to maximize the use of 100% clean energy (zero carbon emissions) by existing, redeveloped, and new buildings by 2035.

As noted in the preceding section, the location of building(s) can have a significant transportation GHG emission footprint effect. The vehicle/transportation-related GHGs for buildings, as well as their inherent GHG emissions (construction and operation/use), calculated over the anticipated life of the building/residence (e.g., 50-100 years), must incorporate and fully analyze their impacts.

The County should also establish and implement a program for energy audits for all buildings that are sold or significantly modified to ensure that their GHG emissions are fully known and appropriate emission reductions are required to align with meeting the County's GHG emission reduction targets for the sector.

Other Concerns

The County previously identified "Direct Investments" as a mitigation measure for County operations. This was essentially a list of possible GHG reduction projects the County would invest in to offset a share of County operations' GHG emissions. Speculative, non-specific (in terms of both the scale of projects and their locations) actions pose a significant problem in terms of how to analyze their potential impacts if/when implemented. The CAP must provide more clarity (and perhaps a decision chart) to adequately address potential impacts.

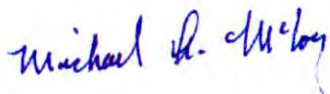

As a conservation organization whose primary purpose is to advocate and implement (primarily wetland) habitat preservation, enhancement and restoration, we would strongly oppose CAP elements/measures that impact sensitive habitats and species – and in particular, any existing or identified future conservation lands. However, if the CAP chooses to propose GHG emission reduction measures that rely on natural lands, such as enhancing carbon capture or establishing carbon credit banks, then the balance of impacts and benefits must be clearly and quantitatively evaluated and found to be a net benefit (e.g., net negative GHG emissions) and not to impact habitat values and species.

The CAP should avoid reliance on offsite, out-of-County carbon credits, except where no other on-site/in-County alternatives exist. Even then, use of out-of-County credits should be limited to a small percentage (e.g., less than 10%) of any project's mitigation.

Climate change has been demonstrated, repeatedly, to disproportionately affect disadvantaged communities. The CAP must ensure that those communities are a priority for GHG emission reductions and utilize the most effective and implementable mitigation measures.

Our contact to discuss these comments and recommendations is Bill Tippetts (billtippetts@gmail.com).

Sincerely,

Michael A. McCoy, President

Dear Ms. Bray,

Attached are the CNPSSD comments on the CAP NOP. Please let me know if you can open and read them. Please also keep CNPSSD informed of developments on this program, at conservation@cnpssd.org.

I look forward to a working Climate Action Plan. Best of luck!

Stay safe,

RE: San Diego County Climate Action Plan Notice of Preparation PDS2020-POD-20-016 and PDS2020-GPA-20-004

Dear Ms. Bray,

We appreciate the opportunity to comment on San Diego County's Climate Action Plan (CAP), Notice of Preparation (NOP). The San Diego Chapter of the California Native Plant Society (CNPSD) works to protect California's native plant heritage and preserve it for future generations. CNPS promotes sound plant science as the backbone of effective natural areas protection. We work closely with decision-makers, scientists, and local planners to advocate for well informed and environmentally friendly policies, regulations, and land management practices.

The comments provided here have four bases:

- CNPS policy that climate change is an existential problem for native plants
- My (Landis) background as a botanist and environmental scientist,
- Our organizational experience with planning stretching to well before the current General Plan update was adopted, and
- Experience with the last attempt at a CAP, and with commenting on EIRs written under its aegis.

To that end, we have grouped these comments into a discussion of issues to consider when creating the CAP, and material we want to see in the CAP. Our goal is for the County to not just to create a document entitled "Climate Action Plan," but for San Diego County to physically go carbon neutral by 2035, 2045 at the latest, and sequester more greenhouse gases than it produces thereafter.

Currently we as a culture are following the worst case model for carbon emissions, Without radical action to stem greenhouse gas emissions, San Diego County, if it still survives as an entity by 2100, will likely house considerably fewer people than it does now, due to infrastructure breakdown caused by climate change. Only nihilists want such a future, and that category does not include us.

Dedicated to the preservation of California native flora

Creating the Climate Action Plan

The following comments are presented in no particular order.

First, extend the timeline for the CAP from 2050 to at least 2100, or for the lifespan of all projects permitted under it, whichever is longer. The reason for this is that most of the building projects now under County consideration implicitly or explicitly have at least 50 year lifespans. If they are permitted now (2021) and take a decade to build (until 2031), their expected end of service is 2081. The Otay Hills Aggregate Mine, currently under consideration, explicitly plans petroleum-based operations until 2115.

The CAP needs to be in force for the lifespan of the projects permitted under it. To do otherwise, as shown in some EIRs in the last five years, is to have projects put off issues until after the end of the CAP as a way to avoid mitigating for them. It is simpler for everyone, and cheaper for the County, to insist that any development plan for the lifespan of the project be covered by this Climate Action Plan or its successors.

Second, insure that the Climate Action Plan is consistent with other plans and projects at the local, regional, state, and federal levels. This is especially important with regards to the North and East County MSCPs, the County Sustainability Plan, and efforts to streamline renewable energy projects, because these are all being developed more-or-less concurrently. Planning should take care to insure these are all completely consistent with each other.

But do not stop there. The CAP needs to work with a number of other plans and processes. A partial list of plans follows:

- The County Sustainability Plan should be completely consistent with the CAP. They need to share common goals, timelines, and actions.
- The MSCPs. Since the County requires every useful carbon sink it can obtain and protect, it may be worth considering whether wetlands, riparian areas, woodlands, and forests all deserve protection under both the CAP and MSCP. Equally important, neither program should require efforts that damage the other. For example, carbon sinks should not blindly be destroyed in restoration efforts for sensitive species, nor should efforts to sequester carbon put species at further risk of extinction.
- Efforts to streamline renewable energy projects should not impede CAP goals. While renewable energy is needed, this is not carte blanche to destroy carbon sinks or impede other CAP goals.
- Any updates to the Resource Protection Ordinance and the Grading Ordinance also need to take into account the County and State goals of achieving carbon neutrality. In particular, riparian and wetland features need to be protected, due to their value as carbon sinks.
- Local, state, and federal wildfire control plans. Wildfires are increasingly a threat, partially due to climate change, so one part of dealing with the threat is decreasing greenhouse gas concentrations in the air. However, vegetation often needs to be cleared to make buildings and people safer. Therefore, the CAP writers and regulators need to work with CalFire, Fire safe districts, and fire ecologists to make sure that both fire safety and greenhouse gas reductions are met.
- Community Plan Updates. As an example, the Alpine Community Plan Update SEIR predicts substantial and unmitigable impacts to climate as part of the community's growth. Why should any community be allowed to cause this impact, when all communities are being required to avoid and mitigate it? This is contrary to the *Newhall Ranch* ruling. All

community plans should be required to meet the goals of the CAP and the Sustainability Plans. Climate change is an existential threat to San Diego County. Any gains that increase emissions are at best temporary.

- Plans for expanding carbon-farming by the farm board and others in the agricultural industry.

Third, train all planners, consultants, Planning Commissioners and Supervisors to read calendars and add and subtract dates. My apologies for being snarky, but as a “watchdog” activist who reads many EIRs, I am appalled at the widespread inability of planners to read calendars and add years. EIRs have been passed on all levels (right into litigation) that use an achronological calendaring, where, among other things, carbon emitted now is dealt with decades after it should be naturally taken into the ocean, projects simultaneously take a decade or more to build and are ready the next year, and so forth. Planners need to create a multi-decade calendar with CAP deadlines to meet. Project proponents need to be required to be explicit and honest about the planned lifetime of their projects, and project life cycles and impacts need to be explicitly described on calendars to determine if they will help or hinder the County’s ability to meet its climate goals.

Fourth, establish boilerplate language for EIRs that contains all the federal, state, and local laws, regulations, and plans, and litigation consequences that apply to any County projects. It is frustrating to me as an EIR commenter when I can add pages of comments on an EIR by simply copying and pasting the climate change regulation section from another EIR, then asking why this material was not included in an EIR, especially when the two EIRs are written by the same firm and both overseen by County Planning. This strongly suggests that County Planning does not have a consistent set of regulations or a timeline under which it works with project proponents to meet climate action goals.

That master regulatory framework needs to be constructed and regularly updated, because consultants are not doing the job well enough. Such a framework will actually simplify everybody’s job (planners, consultants, commenters, and decision makers), because a well-constructed regulatory framework means that everybody has reason to agree what goals need to be met when, and why, and projects can be planned and judged accordingly. I suggest that the first version of it be included in the Climate Action Plan itself.

Fifth, the CAP should analyze and ideally help provide for the cost of controlling invasive non-native pests that affect carbon sequestration project. The current example are the shothole borers (*Euwallacea* spp.) that can infest dozens of tree and shrub species. Due to their peculiar biology, they are prime candidates for biological control. Entomologists spent over a year seeking the \$10 million needed to test and release three bio-control species, but struggled because the shothole borers were not clearly covered by any existing program. Meanwhile, Los Angeles County estimated that it would take billions of dollars to properly dispose of all the trees killed by the borers.

This is not an isolated problem, as APHIS (the US Animal and Plant Health Inspection Service) estimates that a new pest or pathogen shows up a US ports every week. Although most fail to establish, occasionally one does, and by 2050, one estimate is that international trade will have moved every possible pest to every possible host.

Since the success of the CAP will depend in large part on sequestering carbon in plants or soil and keeping it out of the atmosphere for at least a century, protecting the plant and soil health is vital. The costs of things like biological controls are far, far cheaper than the cost of losing sequestered carbon to pests and then having to pay to properly dispose of the mess.

Therefore, as a cost and project-saving measure, we strongly urge the County to consider pest control as part of the CAP, as a way to protect carbon sequestration.

Sixth, work with the Farm Bureau and San Diego agriculture community to develop carbon farming as a viable strategy for the CAP. Theoretically, carbon farming is probably the biggest carbon sink in the County. Unfortunately, its potential is not known, nor are its requirements for scarce resources like water. The CAP must create a system for developing this sector and generating realistic data and projections for how much carbon can be sequestered for decades to centuries by area agriculture.

This is an iterative, developmental process, and we strongly recommend that the CAP treat it such, as a system to be developed through adaptive management and regular CAP updates.

Seventh, make it clear to every project proponent that they are not special, and do not deserve an exemption from the CAP any more than anyone else does. Too many project proponents appear to think that their project is too special or necessary to be limited in the greenhouse gases they produce. Unfortunately, the County has limited facilities for carbon sequestration, and the only way to achieve the goal of carbon neutrality is for everyone to do their part. It should also be obvious that it will be easier for new projects to create carbon-neutral designs than it will be for existing buildings and infrastructure to rebuild and retrofit. Therefore, new projects, per the *Newhall Ranch* ruling, need to be required to shoulder a greater share of emissions reductions and sequestration.

Within the Climate Action Plan

First, we believe that the NOP was overly restrictive in the following statement: “the project will include amendments to Goal COS-20 and Policy COS-20.1 of the General Plan and 2011 GPU PEIR Mitigation Measures CC-1.2, CC-1.7, and CC-1.8, similar to the 2018 CAP. Policy COS- 20.1 was also amended in 2018 so that the CAP could be used in the analysis of cumulative GHG impacts of projects covered by the CAP.” **All of these can be usefully updated. We make suggestions on how to do this below.**

Goal COS-20 Governance and Administration. Reduction of local GHG emissions contributing to climate change that meet or exceed requirements of the Global Warming Solutions Act of 2006. This should be changed to be consistent with either the County Sustainability Goal of being carbon neutral by 2035, and the Executive order B-55-18 statewide goal of being carbon neutral by 2045.

Policy COS-20.1 Climate Change Action Plan. Prepare, maintain, and implement acclimate change action plan with a baseline inventory of GHG emissions from all sources; GHG emissions reduction targets and deadlines, and enforceable GHG emissions reduction measures. This proved contentious in the previous CAP. We suggest focusing on working towards carbon neutrality (e.g. zero) rather than as a percentage of past emissions. With that goal, current and updating inventories is more useful than arguing about past emissions.

CC-1.1 Update the County Green Building Program to increase effectiveness of encouraging incentives for development that is energy efficient and conserves resources through incentives and education. Two updates might be useful. One is to find ways to incentivize retrofitting

existing buildings to be greener. A more important update is to help developers understand how to use site planning (such as lot shape and subdivision), building orientation, and building and landscaping design combined to maximize solar energy gain and minimize energy requirements. The latter comment reflects the unfortunate reality that, although both architects and landscape architects are taught to do this, developers seldom use these talents. They obviously need guidance to do so. We suggest promoting a paradigm of buildings designed to be sustainable whose aesthetic appeal is then enhanced by the architects' talents, rather than the current paradigm of aesthetically-designed homes where sustainability is mostly an afterthought.

CC-1.2 Prepare a County Climate Change Action Plan with an update baseline inventory of greenhouse gas emissions from all sources, more detailed greenhouse gas emissions reduction targets and deadlines; and a comprehensive and enforceable GHG emissions reduction measures that will achieve a 17% reduction in emissions from County operations from 2006 by 2020 and a 9% reduction in community emissions between 2006 and 2020. Once prepared, implementation of the plan will be monitored and progress reported on a regular basis. As noted above, the CAP should be a plan for how the County goes carbon neutral, with net zero emissions. It needs regular emissions inventories and air chemistry measurements to help it meet this goal.

CC-1.3 Work with SANDAG to achieve regional goals in reducing GHG emissions associated with land use and transportation. This should be updated in line with SANDAG's current proposals.

CC-1.4 Review traffic operations to implement measures that improve flow and reduce idling such as improving traffic signal synchronization and decreasing stop rate and time. This is a short-term measure. The longer-term measure is to enable the conversion to an electric vehicle fleet, and to incentivize and help build the infrastructure needed. This includes changes to the power grid, changing regulations to favor more charging stations and batteries, and helping gas stations switch away from gas as technologies become available.

CC-1.5 Coordinate with the San Diego County Water Authority and other water agencies to better link land use planning with water supply planning with specific regard to potential impacts from climate change and continued implementation and enhancement of water conservation programs to reduce demand. Also support water conservation pricing (e.g., tiered rate structures) to encourage efficient water use. In addition, we note that riparian areas, wetlands, and seagrass meadows are probably the best carbon sinks available in the County. Therefore water resources, from reservoirs to stormwater outflows, need to be managed so that these scarce areas are restored and expanded, not further degraded.

CC-1.6 Implement and expand County-wide recycling and composting programs for residents and businesses. Require commercial and industrial recycling. While this needs to be done, there are complexities that must be addressed in the handling of compost. One issue is where the mulch currently goes, especially if it is used for daily or alternative daily cover on local landfills. If mulch is diverted from this use, something else (which is likely more expensive) needs to take the place of mulch as landfill cover. Without it, dust and odors coming off the landfills become a more serious problem.

Second, about one-third of California counties, including San Diego, are under agricultural quarantine by the State Department of Agriculture for serious pests, some of which survive hot composting. If County-scale composting facilities are planned, great care must be taken that these facilities don't turn into pest and pathogen superspreader stations, where infected material comes in and gets spread throughout San Diego or other fields. Therefore, the County needs to work with the agricultural community and CDFA to beef up quarantine and compost procedures as compost processing ramps up, to maintain good sanitary practices and not accidentally destroy the San Diego's agricultural industry, or further spread pests that will wipe out native oaks and other species.

CC-1.7 Incorporate the California ARB's recommendations for a climate change CEQA threshold into the County Guidelines for Determining Significance for Climate Change. These recommendations will include energy, waste, water, and transportation performance measures for new discretionary projects in order to reduce GHG emissions. Should the recommendation not be released in a timely manner, the County will prepare its own threshold. We recommend ongoing collaboration with the ARB to reach net zero greenhouse gas emissions.

CC-1.8 Revise County Guidelines for Determining Significance based on the Climate Change Action Plan. The revisions will include guidance for proposed discretionary projects to achieve greater energy, water, waste, and transportation efficiency. These should also include guidance for achieving net zero emissions over the lifespan of the project.

CC-1.9 Coordinate with APCD, SDG&E, and the California Center for Sustainable Energy to research and possibly develop a mitigation credit program. Under this program, mitigation funds will be used to retrofit existing buildings for energy efficiency to reduce GHG emissions. It is worth updating this list of partners and perhaps the entire concept of mitigation schemes to reach net zero emissions.

CC-1.10 Continue to implement the County Groundwater Ordinance, Watershed Protection Ordinance (WPO), Resource Protection Ordinance (RPO), MSCP and prepare MSCP Plans for North and East County in order to further preserve wildlife habitat and corridors, wetlands, watersheds, groundwater recharge areas and other open space that provide carbon sequestration benefits and to restrict the use of water for cleaning outdoor surfaces and vehicles. The WPO also implements low-impact development practices that maintain the existing hydrologic character of the site to manage storm water and protect the environment. (Retaining storm water runoff on-site can drastically reduce the need for energy-intensive imported water at the site.). Agreed. These plans all need to be consistent and work together.

CC-1.11 Revise the Ordinance Relating to Water Conservation for Landscaping to further water conservation to:

- Create water-efficient landscapes and use water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls.*
- Use reclaimed water for landscape irrigation.*
- Restrict watering methods (e.g., prohibit systems that apply water to non-vegetated surfaces) and control runoff.*
- Provide education about water conservation and available programs and incentives.*

We strongly suggest adding water-efficient native plants to the mix. If properly chosen, these also provide food and nesting habitat for birds, pollinators, and other beneficial wildlife, and some can be more fire resistant than non-native dryland plants. CNPS has had great success with bringing in water-smart native plants to commercial and residential landscapes in Orange and Los Angeles Counties, and we would be happy to discuss bringing the program to San Diego.

Other suggestions include:

First, please include the California Solar Shade Act of 1974 (PRC Div. 15, Sec 12, 25980-25986) in the CAP. The point here is that trees shouldn't be planted on the south side of solar panels, especially when they are big enough to grow to block the sun, and most especially in new developments. While this sounds trivial, in the sprawl developments I reviewed over the last few years, almost all had street trees planted south of solar panels somewhere. What happened was that neither streets nor property lines were laid out to maximize roof exposure to south or west (for optimal solar energy generation), roofs were not designed to maximize solar energy uptake, and worst of all, landscape architects and building architects obviously did not communicate, for street trees inevitably blocked some solar arrays.

This gets to a fundamental point: developments of any size that generate their own energy have to be designed for this purpose from the ground up, and the design has to include the landscaping. This *requires* that the developer insure that all the architects and engineers talk with each other, and together work to design properties that emit no greenhouse gases. All the professions are trained to deal with these issues, but without a manager making sure they work together, they do not. This has to change, and the CAP needs to make this a priority.

Second and in the same vein, greenhouse gas reduction must be compatible with wildfire threat mitigation. This goes for both wildfire evacuation and brush management.

As noted in the previous comment, experts need to be required to work with each other. I have seen multiple instances where wildfire evacuation plans assume that cars can move at fairly high speeds to evacuate during wildfires. In the same document, greenhouse gas mitigations call for multiple "traffic calming" measures, like speed bumps, narrow streets, and curving lanes, to slow down traffic and thereby curb GHG emissions. These requirements are mutually exclusive, but not only did no one catch them, no one was willing to fix them and the issues are now in litigation.

So far as brush management goes, a development cannot set aside vegetation as a carbon bank and simultaneously clear it annually as a fire break. The experts working to sequester carbon, the experts working to conserve species, and the experts working on fire safety have to be mandated to work together on projects, because there is ample evidence that they are rarely asked to do so by developers, planners, or decision-makers. This has to change.

Third, the carbon already stored in standing vegetation and undisturbed soils needs to be accounted for prior to any construction or landscaping. Wildlands normally store carbon in stems, roots, and soil. If a site is bulldozed and the soil is heavily disturbed, all of that carbon will eventually become airborne through decomposition. This site is net emitting carbon, and at best, landscaping will recapture some of what was lost. Some EIRs have claimed that landscaping a bulldozed wildland site counts as sequestering additional carbon. It does not.

The best way the County can work with this is to regularly help fund LIDAR flights that quantify the amount of vegetation in the County and estimate the amount of carbon stored. These numbers should be made publicly available, so that the impacts of developments, droughts, and disasters can be assessed, as can progress towards carbon neutrality.

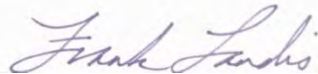

Fourth, realize that rapid tree growth is not the same thing as superior carbon sequestration. It is also popular to bulldoze old trees because they do not grow as fast as young ones, on the theory that young trees are better at carbon sequestration. This is a simple math failure. For example, a sapling that contains one kilogram of carbon and grows at 100% per year will sequester 1 kilogram of carbon per year. A mature tree that contains 1,000 kilograms of carbon and grows at 2% per year will sequester 2 kilograms of carbon per year. Cutting the mature tree down in favor of a sapling decreases the amount of carbon sequestered by 50%. Rapid growth rate is not the same as optimizing carbon sequestration in each plant. This is why it is so important that the County acquire and maintain biomass and carbon sequestration data on its existing vegetation. This needs to be included in the CAP.

Fifth, make natural gas an option that has to be justified and mitigated for. The base assumption should be that natural gas will not be piped into any project unless there is a pressing need. There are three reasons for this. One is that in residential and most commercial projects, there are already electric equivalents for natural gas appliances, some of which are cheaper and/or better than gas. Second, natural gas, which contains methane, is a more potent greenhouse gas than carbon dioxide. Natural gas emissions are typically the second-highest greenhouse gas emission source in projects after automobiles. Getting rid of natural gas by design is the easiest thing any developer can do to decrease GHG emissions. Third, the County faces a problem of stranded and degrading infrastructure with natural gas. To oversimplify, as people electrify homes and other buildings, they will cut off natural gas at the meter. Increasingly, aging natural gas infrastructure will support fewer users who are more and more scattered. This means there will be less money to repair aging and leaking pipes, and it is highly likely the County will be called on to maintain or remove them, as happened in Detroit and in New Orleans after hurricane Katrina. This is a major future cost for the County. Taking active measures now to limit further installation of natural gas will help ameliorate this cost and decrease GHG emissions.

Sixth, a minor but critical note: incentivize or require home designers to make room for house batteries near main circuit breaker panels. This is a trivial design change, but without it, making room to install a large wall battery can require a major and expensive remodel. In cases where batteries cannot be installed during construction, designing for their future installation saves future costs and incentivizes their later installation. This can be as simple as moving a garage door over a few feet and arranging electrical plugs on a wall so that there is space for a battery.

Thank you for taking these suggestions. Please keep CNPSSD informed of all developments with this project and associated documents and meetings, at conservation@cnpssd.org and franklandis03@yahoo.com.

Re: San Diego County Climate Action Plan (“CAP”) Update and Affordable and Middle-Income Housing Study

Dear Ms. Bray and Ms. Easland,

We submit this cover letter and its attached document on behalf of the Cleveland National Forest Foundation (“CNFF”) to provide comments on the County’s issued Notice of Preparation for the latest CAP update and the County’s Housing Study. Both of these interrelated subjects—the Housing and Climate Plans—result in great social and environmental costs when done improperly. These systemic failures occur at both the regional and local community plan level and thus reinforce the problem rather than solve it. On the flipside, the County has tremendous opportunity to achieve climate and housing goals by directing housing towards already urbanized areas.

A perfect example of this compound difficulty is found in the County’s recent draft Alpine Community Plan Update (“CPU”). By focusing growth toward undeveloped, rural areas that are not served by transit, the County promotes sprawl and climate disasters. If the County continues to draft community plans like the draft Alpine CPU, it will be literally impossible to meet climate and sustainable growth targets.

Unless the County can contain run-away urbanization with some form of urban boundary by which housing is both concentrated in village centers with increased bike and walk mode share and transfers excess General Plan Housing Units to cities under the San Diego Association of Governments (“SANDAG”) Regional Housing Needs Assessment (“RHNA”), the sustainable growth problem remains insoluble.

By all accounts, the San Diego Region is experiencing both a climate and housing emergency. Fortunately, with SANDAG’s RHNA, you have a model of what to do for the right reasons and with the Draft Alpine CPU, you have a model of what not to do in this planning emergency.

Please review and consider the following documents as they are integral to our arguments:

- [Cleveland National Forest Foundation's Comment Letter on SANDAG's Transportation Network Scenarios for the 2021 Regional Transportation Plan](#)
- [Cleveland National Forest Foundation's Comment Letter on Alpine Community Plan Update and Draft Supplemental Environmental Impact Report](#)

Good morning Kelly,

In response to the County's NOP, our SDG&E team has developed a series of suggested GHG reduction strategies for the CAP. The attached letter includes the latest strategies and initiatives on the topic.

As always, we would be happy to set up a virtual meeting to discuss our recommendations and support your efforts. Please let me know if our have any questions.

RE: Response to Notice of Preparation – Supplemental EIR (SEIR)

Dear Ms. Bray,

San Diego Gas & Electric Company (SDG&E) appreciates the opportunity to provide feedback on the County of San Diego's Notice of Preparation – Supplemental EIR. County staff's SEIR presentation last Thursday was enlightening. SDG&E is committed to supporting the County in this process.

In 2020, SDG&E delivered around 45% renewable energy, which is among the highest in the nation. SDG&E is a recognized leader in innovation and excellence, as evidenced by winning the ReliabilityOne® Award for 'Outstanding Reliability Performance' among utilities in the West. This honor was the 15th consecutive time that SDG&E received this highly coveted award.

To reduce Green House Gas (GHG) emissions, SDG&E would suggest the following strategies and tactics be included in your SEIR and Climate Action Plan:

Set specific goals and requirements

With current regulations and executive orders, goals should look to 2045 and include air quality (i.e. NOx, PM, etc.) as well as GHG emissions. Goals should include specific targets, metrics, and dates.

- Develop an overall county-wide plan/blueprint for Zero Emission Vehicle (ZEV) stations and vehicles
 - Set EV adoption goals for light-duty, medium-duty, and heavy-duty vehicles
 - Consider specific goals for beachhead/key segments (i.e. school buses and transit)
 - Set EV ZEV station goals:
 - Light-duty vehicles (level 2 and Direct Current Fast Chargers (DCFC) for public, workplace, and multi-unit dwellings)
 - Set specific goals for ZEV governmental and public stations at county facilities
 - Medium- and heavy-duty vehicles
- Set Vehicle Miles Travelled (VMT) reduction goals for the region and county fleets
 - Identify and facility Mobility Hubs support, i.e., EV shared vehicles, etc.

- County vehicles and projects
 - Accelerate the County fleet ZEV replacement/purchasing plan
 - Require a % of construction vehicles to be ZEV; when not ZEV require CARB-approved low carbon fuel
 - Underpin with GHG and air quality reduction targets
- Set ZEV requirements for building segments and new developments
 - ZEV parking preferences
 - ZEV stations installations and/or ZEV station readiness (i.e. panel upgrades, conduit runs, etc.)
- As the County increases its focus on renewable energy generation, streamlined permitting for solar farms, microgrids, battery storage and fuel cell facilities will be important.

Develop incentives and plans

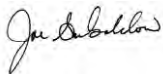

- Commit county funds:
 - Transitioning county fleets and installing ZEV stations at county facilities
 - Develop incentive programs to stimulate ZEV adoption and ZEV station goals i.e., Continue to permit fees for residential and commercial EV charging stations and inspections
 - Develop a residential energy efficiency program that includes window replacement, ceiling insulation, etc. Rollout should prioritize environmental justice communities.
 - Business energy efficiency programs should be initiated and enhanced
 - Our SDGE.com/LG website helps local governments with Energy Efficiency and other energy programs.
 - Increase tree canopy cover through rebates and support Arbor Day. SDG&E will support the effort with Right Tree Right Place (RTRP) information, which helps residents determine where the tree will grow. Attached is a link to our brochure:
<https://www.sdge.com/safety/tree-planting-guide>
- Pursue grant federal and state grant opportunities to bring additional funds to the region

Marketing, Education, & Outreach and Supporting Partnerships

- Develop a marketing, education, & outreach strategy and materials for key stakeholders
 - EV charging station maps, education about existing programs, benefits about ZEVs, etc.
- Facilitate public-private partnerships where possible to support goals
- Develop an EV ambassador program promoting the benefits of EV ownership to County employees. SDG&E has a successful program and would be happy to share best practices.

We value our relationship with the County's CAP team and we would be happy to discuss these suggestions in greater detail. If you have any questions or require additional information, please let me know.

Sincerely,

Joe Gabaldon

February 3, 2021

County of San Diego Planning & Development Services
Attn: Kelly Bray, CAP Project Manager
5510 Overland Ave, Suite 310
San Diego, CA 92123

Thank you for the invitation to comment on scoping for the County of San Diego's new Climate Action Plan (CAP) Update, and your excellent presentation for the public on January 28th.

The League of Women Voters is a 100-year-old national organization that promotes informed participation of citizens in government, and advocates for policy positions that have been adopted by our membership. Our positions include support for action to mitigate and adapt for climate change. In San Diego County, there are two local leagues: the San Diego League and the North County San Diego League.

The League of Women Voters in San Diego County supports the board's directive to update the CAP with bold action to fight climate change. While there were many positive ideas in the 2018 CAP, we shared the disappointment of many that the 2018 version depended on carbon offset credits and did not show consistency with the SANDAG Regional Plan. Following are concerns we wish to raise at this time.

Carbon Offsets. We applaud the board's commitment to not use out-of-county carbon offset programs to meet mandated greenhouse-gas reductions. As the climate crisis has intensified even in the years since the 2018 CAP, we have come to see the urgency of preparing for various consequences of climate change, and ask that the new CAP give more attention to offset strategies that help our region adapt and build resilience.

Transportation and Land Use. The new CAP should relate to and coordinate with the County's General Plan in recognizing the importance of encouraging compact growth in order to reduce Vehicle Miles Traveled (VMT) and in supporting alternate modes of transportation. Reducing VMT is vital to reducing greenhouse-gas emissions. To that end we also urge consistency with and support for SANDAG's regional policies, especially the "5 Big Moves" as they relate to VMT.

Carbon Sequestration. We encourage the county to implement regenerative soil practices that result in carbon sequestration on county-held land in line with the California Healthy Soils Initiative and the Natural and Working Lands Climate Goal. Additionally, we encourage supporting climate-friendly agriculture throughout San Diego County as an essential tool for carbon sequestration.

Building Electrification. We support requiring that new residential developments be all-

electric, and that all-electric is the default for all new construction. We support programs to subsidize older homes' transition from gas to electric appliances, along with onsite solar power generation and electricity storage. Eliminating natural gas has co-benefits in protecting public health and safety. Distributed generation and storage can provide safety during power outages caused by storms or as precaution during wildfire conditions.

Regional Coordination. League positions urge regional agencies to coordinate intergovernmental policies and services such as transit and water supply. We encourage the County's close cooperation with the San Diego County Water Authority to support conservation efforts at all levels, and study use of local water resources. We commend the Board of Supervisors' commitment to a goal of zero carbon emissions in the region by 2035 by way of a Regional Sustainability Plan. We hope that one result of this effort would be more in-region offset opportunities.

Both LWWSD and LWWNCSD look forward to following the county's work on the CAP Update. We thank you for your work on this important policy that will deeply affect the future of our region.

--

Attention: Kelly Bray
CAP Project Manager
5510 Overland Avenue, Suite 310
San Diego, California 92123
CAP@sdcountry.ca.gov

Dear Ms. Bray:

On behalf of California Air Resources Board (CARB) staff, I am writing to support the new San Diego County climate action plan (CAP) development process. I am encouraged by the Board of Supervisors' new direction to County staff to update the County's CAP, and look forward to additional engagement with the County during the CAP development process. Helping San Diego meet its climate targets in the near term is essential to supporting California's ability to meet our State targets. Further, developing this document, while prioritizing community input and environmental justice and equity, is key to ensuring local concerns and interests are addressed, and unintended impacts avoided or mitigated.

At the January 28, 2021, CAP Update Supplemental Environmental Impact Report (EIR) Virtual Scoping Meeting, San Diego County staff presented the County Board of Supervisors' direction for the new CAP, which included:

- No purchase of carbon offsets to meet emission reduction targets
- Emphasizes environmental justice and equity
- Shaped by community input
- Exceeds Senate Bill 32 greenhouse gas emissions reductions
- Meets net zero carbon emissions by 2035-2045

We support the County's efforts to pursue these goals in updating the CAP and I look forward to collaborating with County staff throughout the process. I hope that local governments across the State can learn from San Diego County's experience developing a CAP that is shaped by community input and meets net zero carbon emissions. If you have any questions, please feel free to contact Neil Matouka at (916) 440-8206 or by email at neil.matouka@arb.ca.gov.

Sincerely,

EDFZ	12
Electric Utility	San Diego Gas & Electric
Gas Utility	San Diego Gas & Electric
App Version	2022.1.1.20

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
------------------	------	------	-------------	-----------------------	------------------------	--------------------------------	------------	-------------

Single Family Housing	2,743	Dwelling Unit	891	5,348,850	32,128,367	—	7,653	—
Condo/Townhouse	117	Dwelling Unit	7.31	124,020	0.00	—	326	—
Mobile Home Park	104	Dwelling Unit	13.1	135,200	0.00	—	290	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Un/Mit.	CO2e
Daily, Summer (Max)	—
Unmit.	21,370
Daily, Winter (Max)	—
Unmit.	20,735
Average Daily (Max)	—
Unmit.	14,630
Annual (Max)	—
Unmit.	2,422

2.2. Construction Emissions by Year, Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Year	CO2e
Daily - Summer (Max)	—
2025	6,814
2026	21,370

2027	21,002
2028	20,612
2029	20,201
2030	19,797
2031	19,351
2032	18,863
2033	18,525
2034	2,020
Daily - Winter (Max)	—
2025	6,803
2026	20,735
2027	20,384
2028	20,002
2029	19,607
2030	19,219
2031	18,789
2032	18,401
2033	17,982
2034	1,913
Average Daily	—
2025	4,567
2026	14,065
2027	14,630
2028	14,399
2029	14,075
2030	13,796
2031	13,484

2032	13,243
2033	11,620
2034	1,283
Annual	—
2025	756
2026	2,329
2027	2,422
2028	2,384
2029	2,330
2030	2,284
2031	2,232
2032	2,193
2033	1,924
2034	212

2.4. Operations Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Un/Mit.	CO2e
Daily, Summer (Max)	—
Unmit.	205,825
Daily, Winter (Max)	—
Unmit.	202,885
Average Daily (Max)	—
Unmit.	110,231
Annual (Max)	—
Unmit.	18,250

2.5. Operations Emissions by Sector, Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Sector	CO ₂ e
Daily, Summer (Max)	—
Mobile	53,275
Area	120,751
Energy	27,091
Water	940
Waste	3,729
Refrig.	40.2
Total	205,825
Daily, Winter (Max)	—
Mobile	50,786
Area	120,300
Energy	27,091
Water	940
Waste	3,729
Refrig.	40.2
Total	202,885
Average Daily	—
Mobile	51,183
Area	27,249
Energy	27,091
Water	940
Waste	3,729
Refrig.	40.2
Total	110,231

Annual	—
Mobile	8,474
Area	4,511
Energy	4,485
Water	156
Waste	617
Refrig.	6.65
Total	18,250

3. Construction Emissions Details

3.1. Site Preparation (2025) - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Location	CO2e
Onsite	—
Daily, Summer (Max)	—
Off-Road Equipment	5,314
Dust From Material Movement	—
Onsite truck	0.00
Daily, Winter (Max)	—
Off-Road Equipment	5,314
Dust From Material Movement	—
Onsite truck	0.00
Average Daily	—
Off-Road Equipment	1,150
Dust From Material Movement	—
Onsite truck	0.00

Annual	—
Off-Road Equipment	190
Dust From Material Movement	—
Onsite truck	0.00
Offsite	—

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	CO2e
Daily, Summer (Max)	—
Single Family Housing	369
Condo/Townhouse	10.6
Mobile Home Park	10.7
Total	390
Daily, Winter (Max)	—

Single Family Housing	369
Condo/Townhouse	10.6
Mobile Home Park	10.7
Total	390
Annual	—
Single Family Housing	61.0
Condo/Townhouse	1.75
Mobile Home Park	1.77
Total	64.6

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	CO2e
Daily, Summer (Max)	—
Single Family Housing	25,139
Condo/Townhouse	773
Mobile Home Park	789
Total	26,701
Daily, Winter (Max)	—
Single Family Housing	25,139
Condo/Townhouse	773
Mobile Home Park	789
Total	26,701
Annual	—
Single Family Housing	4,162
Condo/Townhouse	128
Mobile Home Park	131

Total	4,421
-------	-------

4.3. Area Emissions by Source

4.3.1. Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Source	CO2e
Daily, Summer (Max)	—
Hearths	120,300
Consumer Products	—
Architectural Coatings	—
Landscape Equipment	451
Total	120,751
Daily, Winter (Max)	—
Hearths	120,300
Consumer Products	—
Architectural Coatings	—
Total	120,300
Annual	—
Hearths	4,474
Consumer Products	—
Architectural Coatings	—
Landscape Equipment	36.8
Total	4,511

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	CO2e
Daily, Summer (Max)	—
Single Family Housing	875
Condo/Townhouse	34.4
Mobile Home Park	30.6
Total	940
Daily, Winter (Max)	—
Single Family Housing	875
Condo/Townhouse	34.4
Mobile Home Park	30.6
Total	940
Annual	—
Single Family Housing	145
Condo/Townhouse	5.70
Mobile Home Park	5.06
Total	156

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	CO2e
Daily, Summer (Max)	—
Single Family Housing	3,421
Condo/Townhouse	163

Mobile Home Park	145
Total	3,729
Daily, Winter (Max)	—
Single Family Housing	3,421
Condo/Townhouse	163
Mobile Home Park	145
Total	3,729
Annual	—
Single Family Housing	566
Condo/Townhouse	27.0
Mobile Home Park	24.0
Total	617

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	CO ₂ e
Daily, Summer (Max)	—
Single Family Housing	38.3
Condo/Townhouse	0.89
Mobile Home Park	0.97
Total	40.2
Daily, Winter (Max)	—
Single Family Housing	38.3
Condo/Townhouse	0.89
Mobile Home Park	0.97

Total	40.2
Annual	—
Single Family Housing	6.34
Condo/Townhouse	0.15
Mobile Home Park	0.16
Total	6.65

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Equipment Type	CO2e
Daily, Summer (Max)	—
Total	—
Daily, Winter (Max)	—
Total	—
Annual	—
Total	—

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Equipment Type	CO2e
Daily, Summer (Max)	—

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	23.3	annual days of extreme heat
Extreme Precipitation	6.25	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	30.9	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	N/A	N/A	N/A	N/A
-------------------------	-----	-----	-----	-----

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—

AQ-Ozone	78.2
AQ-PM	4.79
AQ-DPM	0.47
Drinking Water	62.6
Lead Risk Housing	48.8
Pesticides	0.00
Toxic Releases	10.9
Traffic	1.46
Effect Indicators	—
CleanUp Sites	71.6
Groundwater	22.1
Haz Waste Facilities/Generators	0.00
Impaired Water Bodies	12.5
Solid Waste	70.4
Sensitive Population	—
Asthma	17.9
Cardio-vascular	11.4
Low Birth Weights	67.2
Socioeconomic Factor Indicators	—
Education	36.9
Housing	0.08
Linguistic	0.00
Poverty	18.2
Unemployment	60.6

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	63.31322982
Employed	14.53868857
Median HI	78.01873476
Education	—
Bachelor's or higher	52.99627871
High school enrollment	100
Preschool enrollment	73.96381368
Transportation	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	13.0
Healthy Places Index Score for Project Location (b)	64.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	Only CO2e intensity factor is available from the project, hence CH4 and N2O EF are zeroed out.
Construction: Construction Phases	No demolition required

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
------------------	------	------	-------------	-----------------------	------------------------	--------------------------------	------------	-------------

Single Family Housing	2,743	Dwelling Unit	891	5,348,850	32,128,367	—	7,653	—
Condo/Townhouse	117	Dwelling Unit	7.31	124,020	0.00	—	326	—
Mobile Home Park	104	Dwelling Unit	13.1	135,200	0.00	—	290	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Un/Mit.	CO2e
Daily, Summer (Max)	—
Unmit.	21,370
Daily, Winter (Max)	—
Unmit.	20,735
Average Daily (Max)	—
Unmit.	14,630
Annual (Max)	—
Unmit.	2,422

2.2. Construction Emissions by Year, Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Year	CO2e
Daily - Summer (Max)	—
2025	6,814
2026	21,370

2027	21,002
2028	20,612
2029	20,201
2030	19,797
2031	19,351
2032	18,863
2033	18,525
2034	2,020
Daily - Winter (Max)	—
2025	6,803
2026	20,735
2027	20,384
2028	20,002
2029	19,607
2030	19,219
2031	18,789
2032	18,401
2033	17,982
2034	1,913
Average Daily	—
2025	4,567
2026	14,065
2027	14,630
2028	14,399
2029	14,075
2030	13,796
2031	13,484

2032	13,243
2033	11,620
2034	1,283
Annual	—
2025	756
2026	2,329
2027	2,422
2028	2,384
2029	2,330
2030	2,284
2031	2,232
2032	2,193
2033	1,924
2034	212

2.4. Operations Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Un/Mit.	CO ₂ e
Daily, Summer (Max)	—
Unmit.	199,430
Daily, Winter (Max)	—
Unmit.	196,749
Average Daily (Max)	—
Unmit.	104,042
Annual (Max)	—
Unmit.	17,225

2.5. Operations Emissions by Sector, Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Sector	CO ₂ e
Daily, Summer (Max)	—
Mobile	46,880
Area	120,751
Energy	27,091
Water	940
Waste	3,729
Refrig.	40.2
Total	199,430
Daily, Winter (Max)	—
Mobile	44,651
Area	120,300
Energy	27,091
Water	940
Waste	3,729
Refrig.	40.2
Total	196,749
Average Daily	—
Mobile	44,994
Area	27,249
Energy	27,091
Water	940
Waste	3,729
Refrig.	40.2
Total	104,042

Annual	—
Mobile	7,449
Area	4,511
Energy	4,485
Water	156
Waste	617
Refrig.	6.65
Total	17,225

3. Construction Emissions Details

3.1. Site Preparation (2025) - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Location	CO2e
Onsite	—
Daily, Summer (Max)	—
Off-Road Equipment	5,314
Dust From Material Movement	—
Onsite truck	0.00
Daily, Winter (Max)	—
Off-Road Equipment	5,314
Dust From Material Movement	—
Onsite truck	0.00
Average Daily	—
Off-Road Equipment	1,150
Dust From Material Movement	—
Onsite truck	0.00

Annual	—
Off-Road Equipment	190
Dust From Material Movement	—
Onsite truck	0.00
Offsite	—

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	CO2e
Daily, Summer (Max)	—
Single Family Housing	369
Condo/Townhouse	10.6
Mobile Home Park	10.7
Total	390
Daily, Winter (Max)	—

Single Family Housing	369
Condo/Townhouse	10.6
Mobile Home Park	10.7
Total	390
Annual	—
Single Family Housing	61.0
Condo/Townhouse	1.75
Mobile Home Park	1.77
Total	64.6

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	CO2e
Daily, Summer (Max)	—
Single Family Housing	25,139
Condo/Townhouse	773
Mobile Home Park	789
Total	26,701
Daily, Winter (Max)	—
Single Family Housing	25,139
Condo/Townhouse	773
Mobile Home Park	789
Total	26,701
Annual	—
Single Family Housing	4,162
Condo/Townhouse	128
Mobile Home Park	131

Total	4,421
-------	-------

4.3. Area Emissions by Source

4.3.1. Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Source	CO ₂ e
Daily, Summer (Max)	—
Hearths	120,300
Consumer Products	—
Architectural Coatings	—
Landscape Equipment	451
Total	120,751
Daily, Winter (Max)	—
Hearths	120,300
Consumer Products	—
Architectural Coatings	—
Total	120,300
Annual	—
Hearths	4,474
Consumer Products	—
Architectural Coatings	—
Landscape Equipment	36.8
Total	4,511

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	CO2e
Daily, Summer (Max)	—
Single Family Housing	875
Condo/Townhouse	34.4
Mobile Home Park	30.6
Total	940
Daily, Winter (Max)	—
Single Family Housing	875
Condo/Townhouse	34.4
Mobile Home Park	30.6
Total	940
Annual	—
Single Family Housing	145
Condo/Townhouse	5.70
Mobile Home Park	5.06
Total	156

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	CO2e
Daily, Summer (Max)	—
Single Family Housing	3,421
Condo/Townhouse	163

Mobile Home Park	145
Total	3,729
Daily, Winter (Max)	—
Single Family Housing	3,421
Condo/Townhouse	163
Mobile Home Park	145
Total	3,729
Annual	—
Single Family Housing	566
Condo/Townhouse	27.0
Mobile Home Park	24.0
Total	617

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	CO ₂ e
Daily, Summer (Max)	—
Single Family Housing	38.3
Condo/Townhouse	0.89
Mobile Home Park	0.97
Total	40.2
Daily, Winter (Max)	—
Single Family Housing	38.3
Condo/Townhouse	0.89
Mobile Home Park	0.97

Total	40.2
Annual	—
Single Family Housing	6.34
Condo/Townhouse	0.15
Mobile Home Park	0.16
Total	6.65

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Equipment Type	CO2e
Daily, Summer (Max)	—
Total	—
Daily, Winter (Max)	—
Total	—
Annual	—
Total	—

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Equipment Type	CO2e
Daily, Summer (Max)	—
Total	—
Daily, Winter (Max)	—

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	23.3	annual days of extreme heat
Extreme Precipitation	6.25	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	30.9	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	N/A	N/A	N/A	N/A
-------------------------	-----	-----	-----	-----

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—

AQ-Ozone	78.2
AQ-PM	4.79
AQ-DPM	0.47
Drinking Water	62.6
Lead Risk Housing	48.8
Pesticides	0.00
Toxic Releases	10.9

Climate Change Adaptive Capacity	—
Impervious Surface Cover	95.6
Traffic Density	0.7
Traffic Access	23.0
Other Indices	—
Hardship	35.2
Other Decision Support	—
2016 Voting	96.8

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	13.0
Healthy Places Index Score for Project Location (b)	64.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Utility Information	Only CO2e intensity factor is available from the project, hence CH4 and N2O EF are zeroed out.
Construction: Construction Phases	No demolition required

Memorandum

Date: October 2, 2023
To: Meghan Kelly, County of San Diego
From: Katy Cole and Andrew Scher, Fehr & Peers
Subject: **County of San Diego In-Process General Plan Amendments VMT Assessment**

SD21-0394

This memorandum provides of the results of the transportation/Vehicle Miles Traveled (VMT) modeling completed for the County of San Diego in process General Plan Amendments. This memorandum summarizes the study scenarios, land use changes, travel demand model procedures, and vehicles miles traveled (VMT) calculations.

The SANDAG ABM 2+ model using land use data set ("DS") 39 for 2035 and 2050 was used to determine the VMT estimates for the General Plan Amendment scenario. This is consistent with the model version and procedures used for the Climate Action Plan (CAP) Supplemental Environmental Report (SEIR).

Scenarios

The following scenarios were modeled/analyzed:

- Project scenario – SANDAG Regional Plan EIR Alternative 2 land uses and transportation network.
- General Plan Amendment scenario – Project scenario cumulative land use totals and transportation network with the addition of new households associated with current General Plan Amendment projects.

Project Scenario

The SANDAG Regional Plan EIR Alternative 2 (Data Set 39) model version, land uses, and VMT results are used to represent the proposed Project for the CAP SEIR. The land use assumptions contained in Data Set 39 are consistent with historical growth patterns in the unincorporated County and reflect expected growth consistent with the General Plan for the county. Additionally, the transportation network and policy inputs consist of "transportation projects with

environmental clearance, that have full funding, are under construction, or are otherwise reasonably foreseeable based on current plans..." (SANDAG 2021 Regional Plan EIR, Chapter 6 Alternatives Analysis, Page 6-3).

Table 1 shows the housing totals and growth modeled within the county for the Project.

Table 1: DS 39 Unincorporated Land Use Totals by Model Year

Year	Total Households	Growth from Base Year
Base Year (2016)	180,543	-
2035	195,249	14,706
2050	199,250	18,707

Source: SANDAG, Fehr & Peers.

General Plan Amendment Scenario

This scenario adds households associated with current General Plan Amendment project to the Project scenario. The following changes were made to model land uses compared to the Project scenario:

- Residential growth for any given general plan amendment project was added to the MGRA(s) overlapping the project's estimated location/size.
- All growth was distributed proportionally based on land area of the MGRAs (uniformly increasing the density of the MGRAs) for projects overlapping more than one MGRA.
- Household characteristics (single family, multifamily, income, size, etc) were sampled based on household characteristics in similar MGRAs nearby.

This scenario assumes 2,964 additional households compared to the Project scenario. This includes 2,743 single family homes, 117 multi-family homes, and 104 mobile homes. These additional households were assumed for both 2035 and 2050.

Table 2 shows the list of General Plan Amendment projects considered and the households associated with each project.

Table 2: General Plan Amendment Project Land Use Totals

Year	Total Households
Ivanhoe Ranch	120
Warner Springs Ranch Resort	45
Peppertree Park	685
Passerelle-Campus Park	138
Abdali Gas Station	-
Labrador Lane	104
Rancho Librado	56
Castle Creek	63
Preserve at Riverbend	1,300
Harmony Grove Village South	453
Total:	2,964

Source: SANDAG, Fehr & Peers.

Methodology for Determining Total VMT

Fehr & Peers utilized the model outputs for the model scenarios evaluate changes in VMT for the unincorporated County. Total VMT and transportation metrics were evaluated for 2035 and 2050 conditions using the “CAP” method¹ as follows:

- Total VMT produced using the “CAP” method includes all internal VMT, ½ of internal to external VMT, and ½ of external to internal VMT. For example, all VMT originating from trips that start and end in the unincorporated area are included. One half of the VMT that originates in the unincorporated County but ends in one of the region’s cities is included AND one half of the VMT that originates in one of the cities but ends in the unincorporated area is included.

Total VMT Generated (CAP)	All vehicle-trips are traced to the zone or zones of study. This includes internal to internal (II), 1/2 internal to external (IX), and 1/2 external to internal (XI) trips. May use final assignment origin-destination (OD) trip tables or production (P) and attraction (A) estimates multiplied by distance skims. When the model has multiple assignment periods, OD trip tables and congested skims from each period should be used.	
---------------------------------	--	---

¹ “The “CAP” method for estimating total VMT is used throughout California and is the ICLEI (ICLEI-Local Governments for Sustainability) recommended methodology. In addition, it is documented in the SANDAG Regional Climate Action Planning Framework (ReCAP), December 2020, Appendix I, Pages 18-21.

In addition, adjustments were made to account for military and tribal land, which is not within the County's jurisdiction. The *Military and Tribal VMT Adjustment for the San Diego County CAP Model Scenarios* (Fehr & Peers, February 2023) describes the process for the adjustment.

Results

Table 3 shows base year CAP VMT as well as 2035 CAP VMT for the Project and General Plan Amendments scenario². **Table 4** shows 2016 CAP VMT as well as 2050 CAP VMT for the Project and the General Plan Amendments scenario.

Table 3: 2035 Total VMT

Alternative	Unincorporated County Total Weekday VMT ¹	Change from Project Alternative	Percent Change

Notes: ¹ CAP VMT = II VMT + 1/2*IE VMT + 1/2*EI VMT

Source: SANDAG, Fehr & Peers.

The General Plan Amendments scenario results in a 0.84% increase in unincorporated County VMT for 2035 and a 0.76% increase in unincorporated County VMT for 2050. These changes appear very small; however, it is important to consider that in the base year (2016) the unincorporated County already generates approximately 8.8 million VMT. Only minor decreases in VMT associated with the existing population are expected due to the assumptions in the DS 39 version of the model. Therefore, Fehr & Peers expects the magnitude overall VMT reduction

² VMT results for the General Plan Amendments alternative were calibrated to be consistent with results published for the County's CAP GHG Inventory sourced from model results provided directly from SANDAG. Each model run performed produces varied results since travel demand modeling is a simulation; therefore, the calibration was made to allow for direct comparison to the County's CAP GHG Inventory.

between the Project and these two alternatives to be small since the vast majority of unincorporated County VMT under future year alternatives can be attributed to existing land uses.

Another way to understand the VMT outcomes of additional land use within the County is to evaluate the VMT associated with the land use growth. For example, assuming the VMT associated with existing residents is held constant at the 2016 base year levels, the change in VMT from 2016 base year levels for the Project and the General Plan Amendments scenario would represent the VMT associated with new development beyond base year. This is shown in **Table 6** and **Table 7** for 2035 and 2050 respectively.

Table 6: 2035 Change in VMT compared to Project Growth in VMT

Alternative	County Total VMT ¹	Change in VMT from Base Year	Percent of Project Growth in VMT	Change in VMT Growth
Base Year (2016)	8,853,215	-	-	-
Project	9,635,081	781,866	100.0%	0.0%
General Plan Amendments	9,715,536	862,321	110.3%	10.3%

Notes: ¹ CAP VMT = II VMT + 1/2*IE VMT + 1/2*EI VMT

Source: SANDAG, Fehr & Peers.

Table 6: 2050 Change in VMT compared to Project Growth in VMT

Alternative	County Total VMT ¹	Change in VMT from Base Year	Percent of Project Growth in VMT	Change in VMT Growth
Base Year (2016)	8,853,215	-	-	-
Project	10,216,009	1,362,794	100.0%	0.0%
General Plan Amendments	10,293,826	1,440,611	105.7%	5.7%

Notes: ¹ CAP VMT = II VMT + 1/2*IE VMT + 1/2*EI VMT

Source: SANDAG, Fehr & Peers.

Focusing on the growth in VMT since 2016, growth in VMT due to General Plan Amendment projects is 10.3% higher than the Project for 2035 and 5.7% higher for 2050. VMT is not reduced because the General Plan Amendments as modeled (including only additional households in the model) do not provide closer retail, schools, and other destinations for existing households, therefore having a limited effect on reducing commute distances and other trip distances for existing residents.

Note that no employment changes associated with the General Plan Amendment projects assumed in the modeling. Many of the General Plan Amendment projects have limited information on non-residential uses and the residential component is the major component of most of the projects. The modeling therefore reflects the highest VMT outcomes since it does not capture the typical benefits associated with mixed-use developments and neighborhood serving

retail and focuses only on growth in housing units. Denser development would likely catalyze growth in employment and mixed-use development and would result in greater VMT benefits than shown.

Additional reductions in VMT could also occur if transportation network changes were made compared to the Project model scenario to encourage transit and active transportation.

Smart Growth Alternative VMT Forecast

Memorandum

Date: October 2, 2023
To: Meghan Kelly, County of San Diego
From: Katy Cole and Andrew Scher, Fehr & Peers
Subject: **County of San Diego Climate Action Plan SEIR VMT Assessment**

SD21-0394

This memorandum provides of the results of the transportation/Vehicle Miles Traveled (VMT) modeling completed for the County of San Diego Climate Action Plan (CAP) Supplemental Environmental Impact Report (SEIR). This memorandum summarizes the project study scenarios, land use changes, travel demand model procedures, and vehicles miles traveled (VMT) calculations.

The SANDAG ABM 2+ model using land use data set ("DS") 39 for 2035 and 2050 was used to determine the VMT estimates for the CAP SEIR. As a cross-reference, the "County of San Diego Climate Action Plan Inventory Transportation Modeling Overview" Memorandum (Fehr & Peers, October 2023) documents that the DS 39 land use data set is appropriate to use as the basis for CAP SEIR model scenarios. It also documents that the SANDAG ABM 2+ is the appropriate tool for analyzing existing and future VMT at a regional scale for the unincorporated county.

Alternatives

The following CAP alternatives scenarios were modeled/analyzed:

- Project scenario – SANDAG Regional Plan EIR Alternative 2 land uses and transportation network.
- 2021 Regional Plan Sustainable Communities Strategy (SCS) Alternative – SANDAG 2021 Regional Plan land uses and transportation network.
- Fire Safe and VMT Efficient Alternative – Project scenario cumulative land use totals and transportation network. Moves half of unincorporated County household growth to unincorporated VMT efficient areas that are considered fire safe.
- Village Support Areas Alternative – Project scenario cumulative land use totals and transportation network. Moves all unincorporated County household growth to

designated unincorporated villages or unincorporated areas within a half-mile of those villages.

Project Scenario

The SANDAG Regional Plan EIR Alternative 2 (Data Set 39) model version, land uses, and VMT results are used to represent the proposed Project for the CAP SEIR. The land use assumptions contained in Data Set 39 are consistent with historical growth patterns in the unincorporated County and reflect expected growth consistent with the General Plan for the county. Additionally, the transportation network and policy inputs consist of “transportation projects with environmental clearance, that have full funding, are under construction, or are otherwise reasonably foreseeable based on current plans...” (SANDAG 2021 Regional Plan EIR, Chapter 6 Alternatives Analysis, Page 6-3).

Table 1 shows the housing totals and growth modeled within the county for the Project.

Table 1: DS 39 Unincorporated Land Use Totals by Model Year

Year	Total Households	Growth from Base Year
Base Year (2016)	180,543	-
2035	195,249	14,706
2050	199,250	18,707

Source: SANDAG, Fehr & Peers.

2021 Regional Plan/SCS Alternative

The adopted SANDAG 2021 Regional Plan assumes 9,902 new households in the unincorporated County between the base year and 2050 (with almost all of the growth occurring between the base year and 2035). Additionally, the 2021 Regional Plan/SCS version of the model includes the Road User Charge as a funding source for the Regional Plan. The Road User Charge directly affects auto operating costs; including the Road User Charge results in lower VMT forecasts than scenarios without the Road User Charge. On September 23, 2022 the SANDAG Board directed SANDAG staff to prepare an amendment to the 2021 Regional Plan without the Road User Charge. The amendment is expected to be brought to the SANDAG Board of Directors for consideration on October 27, 2023. In addition, the SANDAG Board voted on September 22, 2023 against including the Road User Charge in the 2025 Regional Plan.

Table 2 shows the number of households in the county by model year for the SCS alternative.

Table 2: SCS Alternative Unincorporated Land Use Totals by Model Year

Year	Total Households	Growth from Base Year
2016	180,543	-
2035	188,988	8,445
2050	190,445	9,902

Source: SANDAG, Fehr & Peers.

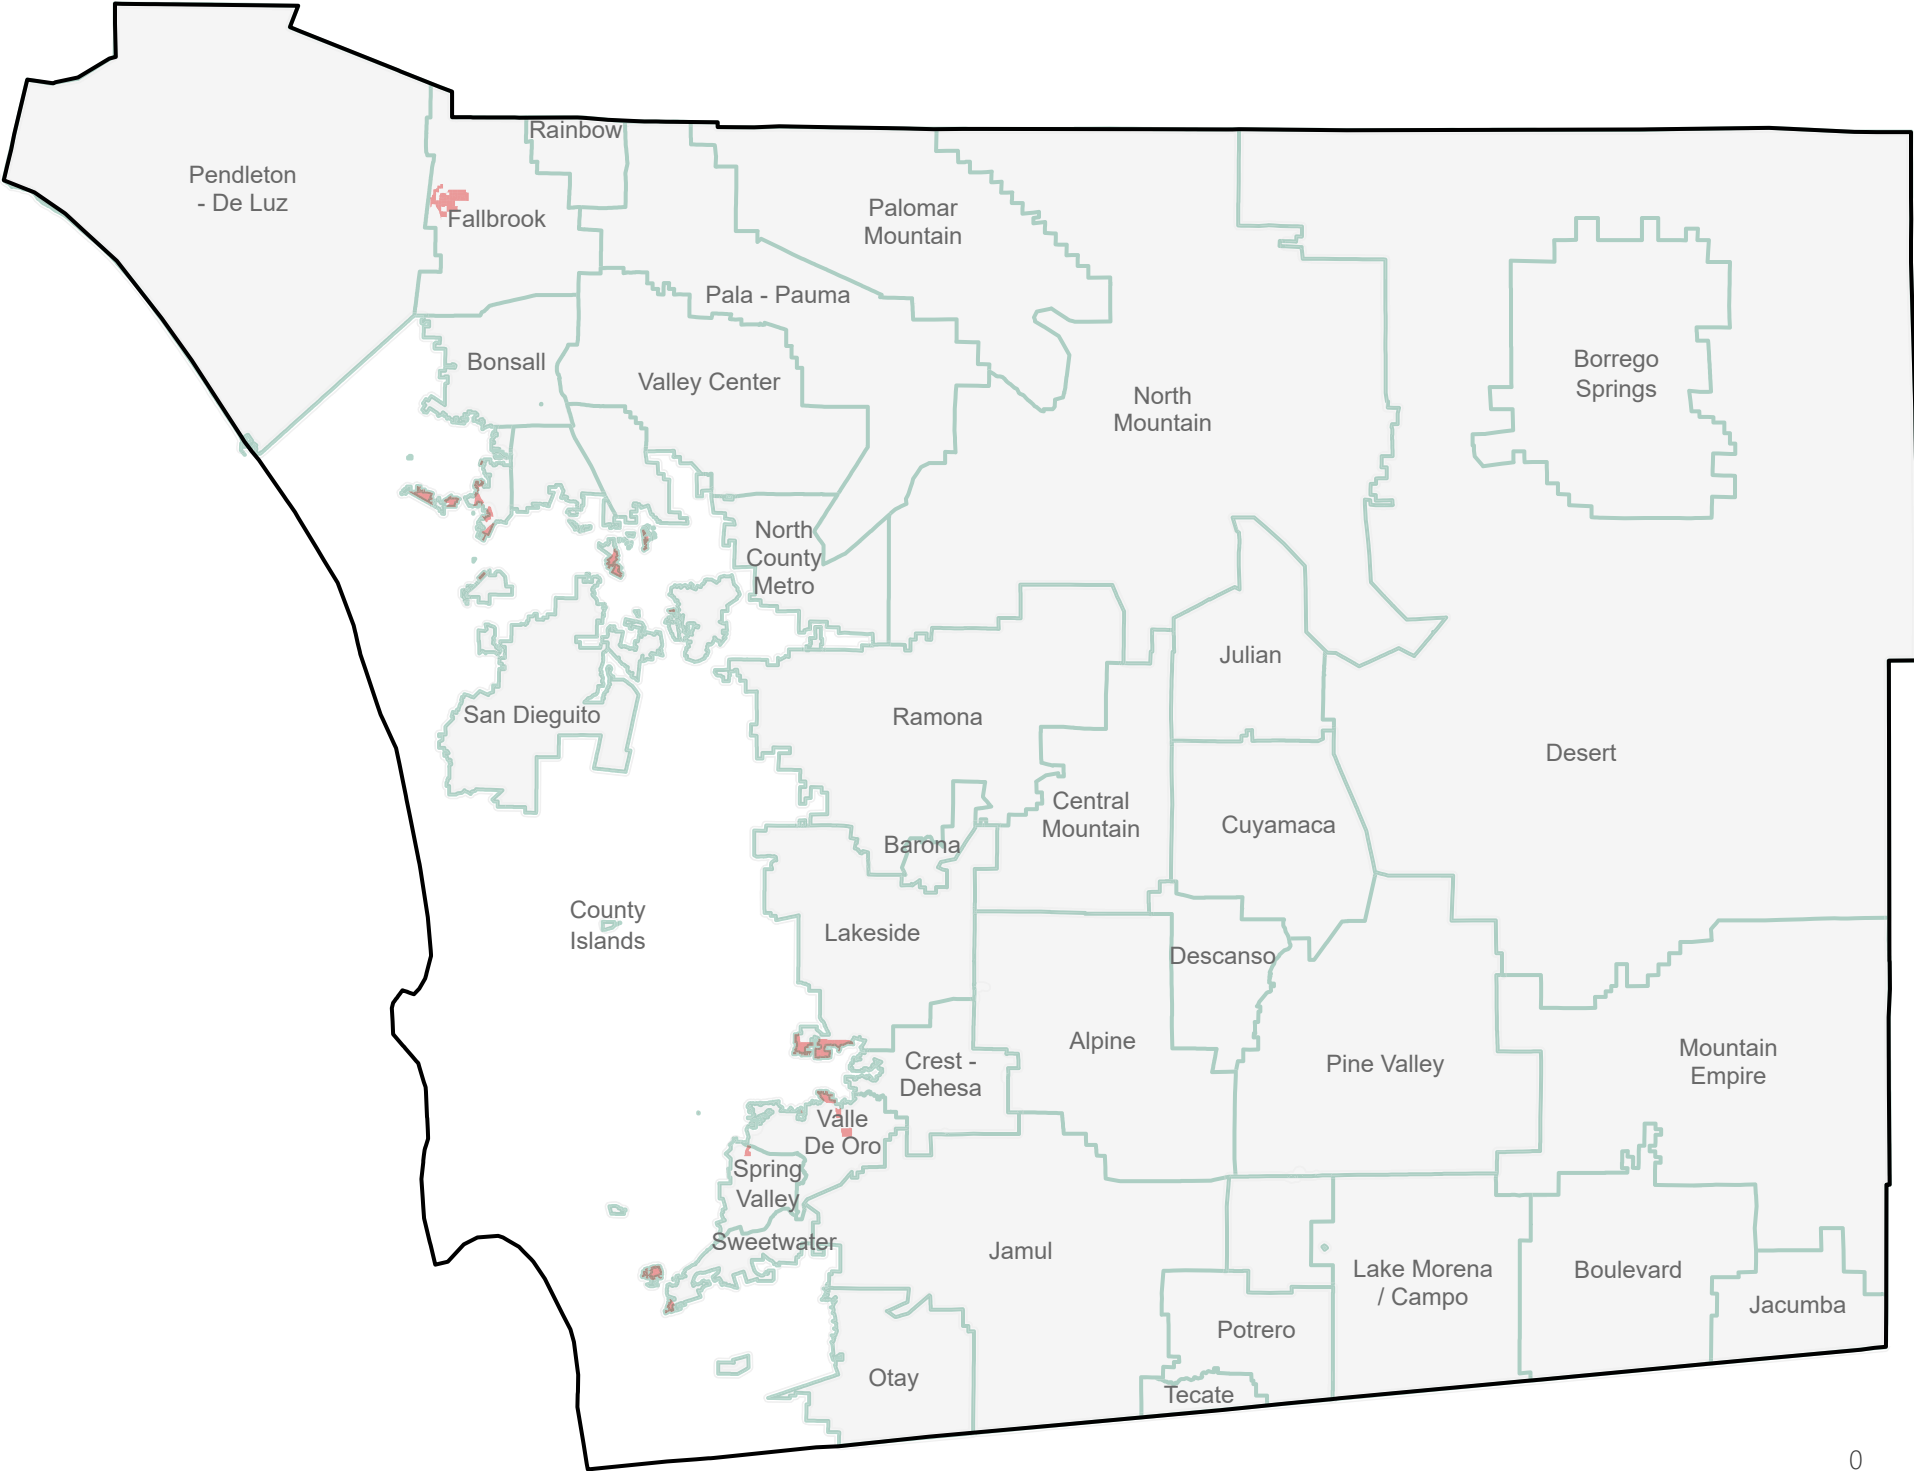

Fire Safe and VMT Efficient Alternative

This alternative reassigns housing growth from the Project scenario to VMT efficient areas that are considered fire safe. Specifically, half the housing growth in units in the unincorporated County would occur in areas designated as fire safe and VMT efficient. These areas are shown on **Figure 1** and represent areas that are both not designated “high” or “very high” fire and that have a VMT per resident of 15% below the SANDAG regional average.

The following changes were made to model land uses compared to the Project alternative:

- Half of all unincorporated County growth outside fire safe and VMT efficient master geographic reference areas (MGRAs) was moved to those MGRAs (MGRAs within VMT efficient TAZs and outside high and very high fire hazard areas). The other half of unincorporated County growth was not moved.
- No growth was moved from unincorporated MGRAs that are over 90% tribal, military, federal, or state land (not under County control) with growth greater than 10 households.
- All growth moved to VMT efficient MGRAs was distributed proportionally based on land area of the MGRAs (uniformly increasing the density of the MGRAs).

Table 3 shows the number of households moved to fire safe and VMT efficient areas by Community Plan Area (CPA).

Village Support Areas Alternative

This alternative assumes that all growth in housing in the unincorporated County will occur within designated villages or within a half-mile of those villages (collectively referred to as Village Support Areas). These areas are shown on **Figure 2**. The following changes were made to model land uses compared to the Project alternative:

- All unincorporated county growth was allocated to MGRAs which have centers in the Village Support Areas.
- No growth was moved to MGRAs in the Village Support Areas that are over 80% tribal, military, federal, or state land (not under County control).
- No growth was moved from unincorporated MGRAs that are over 90% tribal, military, federal, or state land (not under County control) with growth greater than 10 households.
- All growth was kept within the Community Plan Area where feasible. For example, growth outside the Village Support Areas in the Ramona CPA was moved to Village Support Areas within the Ramona CPA.
- Only the Barona, Desert, County Islands, and Pendleton – De Luz CPAs contained no Village Support Areas. Growth in these areas was manually assigned to the nearest Village Support Area.
- All growth moved to Village Support Area MGRAs within a given CPA was distributed proportionally based on land area of the MGRAs (uniformly increasing the density of the MGRAs).

Table 2 shows the number of households moved to Village Support Areas by CPA.

Methodology for Determining Total VMT

Fehr & Peers utilized the model outputs for the CAP SEIR alternatives evaluate changes in VMT for the unincorporated County resulting from the alternatives. Total VMT and transportation metrics were evaluated for 2035 and 2050 conditions using the “CAP” method¹ as follows:

- Total VMT produced using the “CAP” method includes all internal VMT, ½ of internal to external VMT, and ½ of external to internal VMT. For example, all VMT originating from trips that start and end in the unincorporated area are included. One half of the VMT that originates in the unincorporated County but ends in one of the region’s cities is included AND one half of the VMT that originates in one of the cities but ends in the unincorporated area is included.

Total VMT Generated (CAP)	All vehicle-trips are traced to the zone or zones of study. This includes internal to internal (II), 1/2 internal to external (IX), and 1/2 external to internal (XI) trips. May use final assignment origin-destination (OD) trip tables or production (P) and attraction (A) estimates multiplied by distance skims. When the model has multiple assignment periods, OD trip tables and congested skims from each period should be used.	
---------------------------	--	--

In addition, adjustments were made to account for military and tribal land, which is not within the County’s jurisdiction. The *Military and Tribal VMT Adjustment for the San Diego County CAP Model Scenarios* (Fehr & Peers, February 2023) describes the process for the adjustment.

¹ “The “CAP” method for estimating total VMT is used throughout California and is the ICLEI (ICLEI-Local Governments for Sustainability) recommended methodology. In addition, it is documented in the SANDAG Regional Climate Action Planning Framework (ReCAP), December 2020, Appendix I, Pages 18-21.

Results

Table 4 shows base year CAP VMT as well as 2035 CAP VMT for the Project and three alternatives². **Table 5** shows 2016 CAP VMT as well as 2050 CAP VMT for the Project and three alternatives.

Table 4: 2035 Total VMT

Alternative	Unincorporated County Total Weekday VMT ¹	Change from Project Alternative	Percent Change

2016	8,853,215	-	-
Project	10,216,009	0	0.0%
RTP SCS	9,247,568	-968,441	-9.48%
Fire Safe and VMT Efficient	10,174,451	-41,558	-0.41%
Village Support Areas	10,212,348	-3,661	-0.04%

Notes: ¹ CAP VMT = II VMT + 1/2*IE VMT + 1/2*EI VMT

Source: SANDAG, Fehr & Peers.

The SCS Alternative results in the greatest reduction in VMT compared to the project. This is a result of a much smaller growth in households in the unincorporated County, inclusion of the Road User Charge, and significant investments and policy changes related to the transportation network (such as SANDAG's 5-Big Moves³ which are part of the 2021 Regional Plan). These transportation network policies and network changes included in the SCS alternative result in

² VMT results for the Fire Safe and VMT Efficient alternative and Village Support Areas alternatives were calibrated to be consistent with results published for the County's CAP GHG Inventory sourced from model results provided directly from SANDAG. Each model run performed produces varied results since travel demand modeling is a simulation; therefore, the calibration was made to allow for direct comparison to the County's CAP GHG Inventory.

³ [SANDAG - 5 Big Moves](#)

significant transportation mode shifts to transit, active transportation, and reduced driving in general.

The Fire Safe and VMT Efficient alternative results in a 0.53% reduction in unincorporated County VMT for 2035 and a 0.41% reduction in unincorporated County VMT for 2050. The Village Support Areas alternative results in a 0.08% reduction in total VMT in 2035 and a 0.04% reduction in total VMT in 2050. These changes appear very small; however, it is important to consider that in the base year (2016) the unincorporated County already generates approximately 8.8 million VMT. Only minor decreases in VMT associated with the existing population are expected due to the assumptions in the DS 39 version of the model, which is not the case under the SCS alternative since the policy assumptions result in large shifts in the existing population's travel choices. Therefore, Fehr & Peers expects the magnitude overall VMT reduction between the Project and these two alternatives to be small since the vast majority of unincorporated County VMT under future year alternatives can be attributed to existing land uses.

Another way to understand the VMT outcomes of moving land use within the County is to evaluate the VMT associated with the land use growth. For example, assuming the VMT associated with existing residents is held constant at the 2016 base year levels, the change in VMT from 2016 base year levels for the Project and each alternative would represent the VMT associated with new development beyond base year. This is shown in **Table 6** and **Table 7** for 2035 and 2050 respectively.

Focusing just on the growth in VMT since 2016, changes in VMT associated with the Fire Safe and VMT Efficient Areas alternative are more apparent. Growth in VMT is 6.6% lower than the Project for 2035 and 3.0% lower than the Project for 2050.

Table 6: 2035 Change in VMT compared to Project Growth in VMT

Alternative	Unincorporated County Weekday Total VMT ¹	Change in VMT from Base Year	Percent of Project Growth in VMT	Change in VMT Growth
Base Year (2016)	8,853,215	-	-	-
Project	9,635,081	781,866	100.0%	0.0%
RTP SCS	8,892,653	39,438	5.0%	-95.0%
Fire Safe and VMT Efficient	9,583,847	730,632	93.4%	-6.6%
Village Support Areas	9,627,226	774,011	99.0%	-1.0%

Notes: ¹ CAP VMT = II VMT + 1/2*IE VMT + 1/2*EI VMT

Source: SANDAG, Fehr & Peers.

Table 6: 2050 Change in VMT compared to Project Growth in VMT

Alternative	Unincorporated County Total Weekday VMT ¹	Change in VMT from Base Year	Percent of Project Growth in VMT	Change in VMT Growth
Base Year (2016)	8,853,215	-	-	-
Project	10,216,009	1,362,794	100.0%	0.0%
RTP SCS	9,247,568	394,353	28.9%	-71.1%
Fire Safe and VMT Efficient	10,174,451	1,321,236	97.0%	-3.0%
Village Support Areas	10,212,348	1,359,133	99.7%	-0.3%

Notes: ¹ CAP VMT = II VMT + 1/2*IE VMT + 1/2*EI VMT

Source: SANDAG, Fehr & Peers.

Growth in VMT for the Village Support Areas alternative is 1.0% lower than the Project for 2035 and 0.3% lower for 2050. While it may move households closer to retail, school, and other destinations, keeping the household growth in its respective CPA (or nearest CPA with a Village support area) likely has a limited effect on reducing commute distances.

For purposes of the analysis presented herein, households were moved to Village Support Areas within their original Community Plan Area in randomized process weighted to ensure approximately equal growth in density across a Village Support Area. Greater VMT benefits would likely occur if new households were concentrated in specific Village Support Areas, specifically in areas closer to incorporated areas. Growth in the Fire Safe and VMT Efficient alternative is concentrated closer to incorporated areas and the reduction in VMT compared to the project scenario is clear. A similar conclusion could be drawn if development was concentrated only in Village Support Areas overlapping VMT efficient areas that are fire safe.

Note that, while households were moved, socioeconomic data associated with those households was not changed. These household characteristics may vary from existing households in Fire Safe and VMT Efficient areas as well as Village Support Areas. While the change in location reduces trip lengths associated with the relocated households, it may not change the likelihood to use transit, to use alternative modes of transportation, or to commute a long distance to work using a personal vehicle.

Note that no employment changes associated with non-residential development were assumed in the modeling. The modeling reflects the highest VMT outcomes since it does not capture the typical benefits associated with mixed-use developments and neighborhood serving retail and focuses only on growth in housing units. Denser development for both the Fire Safe and VMT Efficient alternative as well as the Village Support Areas alternative would likely catalyze growth in employment and mixed-use development and would result in greater VMT benefits than shown.

Additional reductions in VMT could also occur if transportation network changes were made compared to the Project model scenario to encourage transit and active transportation.

World Climate Declaration

THERE IS NO CLIMATE EMERGENCY

GLOBAL CLIMATE INTELLIGENCE GROUP

WWW.CLINTEL.ORG

There is no climate emergency

Climate science should be less political, while climate policies should be more scientific. Scientists should openly address uncertainties and exaggerations in their predictions of global warming, while politicians should dispassionately count the real costs as well as the imagined benefits of their policy measures

Natural as well as anthropogenic factors cause warming

The geological archive reveals that Earth's climate has varied as long as the planet has existed, with natural cold and warm phases. The Little Ice Age ended as recently as 1850. Therefore, it is no surprise that we now are experiencing a period of warming.

Warming is far slower than predicted

The world has warmed significantly less than predicted by IPCC on the basis of modeled anthropogenic forcing. The gap between the real world and the modeled world tells us that we are far from understanding climate change.

Climate policy relies on inadequate models

Climate models have many shortcomings and are not remotely plausible as policy tools. They do not only exaggerate the effect of greenhouse gases, they also ignore the fact that enriching the atmosphere with CO₂ is beneficial.

CO₂ is plant food, the basis of all life on Earth

CO₂ is not a pollutant. It is essential to all life on Earth. More CO₂ is favorable for nature, greening our planet. Additional CO₂ in the air has promoted growth in global plant biomass. It is also profitable for agriculture, increasing the yields of crops worldwide.

Global warming has not increased natural disasters

There is no statistical evidence that global warming is intensifying hurricanes, floods, droughts and suchlike natural disasters, or making them more frequent. However, there is ample evidence that CO₂-mitigation measures are as damaging as they are costly.

Climate policy must respect scientific and economic realities

There is no climate emergency. Therefore, there is no cause for panic and alarm. We strongly oppose the harmful and unrealistic net-zero CO₂ policy proposed for 2050. Go for adaptation instead of mitigation; adaptation works whatever the causes are.

OUR ADVICE TO THE EUROPEAN LEADERS IS THAT SCIENCE SHOULD STRIVE FOR A SIGNIFICANTLY BETTER UNDERSTANDING OF THE CLIMATE SYSTEM, WHILE POLITICS SHOULD FOCUS ON MINIMIZING POTENTIAL CLIMATE DAMAGE BY PRIORITIZING ADAPTATION STRATEGIES BASED ON PROVEN AND AFFORDABLE TECHNOLOGIES.

To believe the outcome of a climate model is to believe what the model makers have put in. This is precisely the problem of today's climate discussion to which climate models are central. Climate science has degenerated into a discussion based on beliefs, not on sound self-critical science. Should not we free ourselves from the naive belief in immature climate models?

50. Nick Franey MSc Mineral Exploration, Mineral Exploration Management Consultant
51. Dr. Rodney Fripp, Mining Geologist and Chemist by education, lifetime experience in the fields of Mining and Exploration Geology, Analytical Chemistry and Physics of the Earth
52. Michael Fry PhD, retired Professor, ex Head of School and Dean of IT
53. Christopher J.S. Game, Retired Neurophysiologist
54. Robin George, Geologist, Canterbury
55. David Gibson, Experimental Physicist
56. Andrew Gillies, Geologist
57. Gavin Gillman, Former Senior Principal Research Scientist with SCIRO Australia, Founding Director of the IITA Ecoregional Research Centre in Cameroon for the International Institute for Tropical Agriculture (IITA)
58. Paul R.C. Goard BSc Sydney University, Physics & Maths, + Two years geology, one year Chemistry, member of the Australian Meteorological & Oceanographic Society
59. Brendan Godwin, Weather Observations and General Meteorology, Radio (EMR and Radar) Technical Officer; Retired from Bureau of Meteorology
60. Hamish Grant, MR Spectroscopy & Imaging Consultant, Victoria
61. Dr. Kesten C. Green, Leading Researcher on forecasting Methods and Applications, University of South Australia, first author of "Validity of Climate Change forecasting for public policy decision making"
62. Jeffrey R. Grimshaw MSc Information Technology specialising in computer modelling, prediction, optimisation and advanced AI, Author of Trigger Warming, Everything You Wanted To Know About Global Warming But Were Afraid To Ask
63. Guy Grocott MSc Engineering Geology, Retired Consulting Engineering Geologist/ Geotechnical Engineer
64. Lindsay Hackett BSc, Author of the paper "Global Warming Misunderstood" (<https://www.scribd.com/document/383385011/>) and the paper "The Impact of Greenhouse Gases on Earth's Spectral Radiance" (<https://www.scribd.com/document/529064626/>), Founding Member of the Saltbush Club in Australia
65. Maureen Hanisch PhD, Biochemistry, Medical Research 1997, Australian National University, Retired
66. Erl Happ, Managing Director at Happs
67. John Happs, Geoscientist, Retired University Lecturer
68. Peter J.F. Harris, Retired Engineer (Electronic), now Climate Researcher
69. Paul Leonard Harrison, Geophysicist with an M.Sc in Geology and Geophysics, over 45 years experience in research and exploration for the geo-energy industry
70. Jarvis Hayman, Retired Surgeon, Recently retired Archaeologist and Visiting Fellow at the Australian National University
71. Mark Henschke, Retired Geologist in Mining, Oil and Gas

72. Stewart Hespe, Consulting Civil and Forensic Engineer, Critic of Government Policy on Climate Related Matters
73. Gerhard Hofmann, Geologist and Palaeontologist, Former Director of the Geological Survey of Queensland
74. Robert Ian Holmes PhD in Climate Science/Mitigation, University Lecturer (retired) and Climate Scientist
75. Selwyn Hopley, MSSSI, Retired Land and Engineering Surveyor
76. Antonia Howarth-Wass, Mathematician
77. Geraint Hughes, Climate Researcher, Mechanical Building Engineer, Climate Researcher
78. Douglas Hutchison BSc and MSc degrees in geology, consulting geologist in the mining industry, member of the Australian Institute of Geoscientists
79. David Hyde MEnvSt, Environmental Biology, Former Scientific Chairman of Australian Underwater Federation (NSW)
80. Paul Ingram, Qualified Geologist, Member of the Australian Institute of Mining and Metallurgy, studying Palaeoanthropology and Human Evolution
81. Mr. Anthony Jackson, Bachelor of Arts degree, Bachelor of Laws degree, retired
82. Ian Johnson, Bachelor of Engineering, consultant
83. Mike Jonas, IT consultant, retired, frequent contributor to Watts Up With That?
84. Prof. Aynsley Kellow, Professor emeritus of Government, College of Arts, Law and Education, University of Tasmania
85. Alison Kelsey PhD, Palaeoclimatologist and Archaeologist University of Queensland
86. Kevin Kemmis, Climate Researcher, Expert in Information Technology
87. Neil Killion, MA in Psychology, active in the climate debate, member of the Saltbush club
88. Bill Kininmonth BSc (UWA), MSc (CSU), M. Admin. (Monash), Former Superintendent of the Bureau of Meteorology National Climate Center
89. David Knox, IT professional, bachelors in business (Uni of South Australia) and a Masters degree in business administration (Charles Sturt University)
90. Rosemarie Kryger PhD, Biochemistry, Retired, University of Queensland, Brisbane
91. Hugh H. Laird, Retired Tropical Agriculture Executive
92. John Leisten OBE, Expert in Physical Chemistry
93. Brian Levitan, Worked for NASA, now Technology Consultant to Multinationals
94. Ian Levy, CEO Australian Bauxite Ltd.
95. Matthew David Linn, Fellow of the Institution of Engineers of Australia
96. Ian Longley, Geologist, BSc (Hons) Petroleum Geologist, Fellow of the Geological Society
97. Kevin A. Loughrey, LtCol(Ret'd) BAppSc, BE Mech(hons), psc, jssc, Grad Dip Strategic Studies
98. Finlay MacRitchie, Professor Emeritus in the Department of Grain Science and Industry at Kansas State University USA
99. John Ross May BSc, Adip, Cres., Management of Forests and National Parks in Victoria
100. Gerard McGann, Technical Director Eon NRG
101. Rodney McKellar, Retired Geologist, Queensland
102. John McLean, Author of First Major Review of HadCRUT 4 Climate Temperature Data, Member of New Zealand Climate Science Coalition
103. Toby McLeay, General Medical Practitioner AM, MBBS, FRACGP, FACRRM
104. Ross McLeod, Retired Environmental Health Officer
105. Peter R. Meadows, Agricultural Scientist
106. Paul Messenger PhD, Earth Science
107. John Micheltmore, Retired Industrial Chemist
108. Des Moore, Former Deputy Secretary of the Federal Treasury, Founder and Leader of the Institute for Private Enterprise
109. Alan Moran, Contributor and Editor of the Mark Steyn Compilation: "Climate Change, the Facts", Author of Climate Change: "Treaties and Policies in the Trump Era"
110. Hugh Morgan, Prominent Australian Mining Executive, Fellow of the Australian Academy of Technology, Science and Engineering (FTSE)
111. Peter Murphy PhD, Adjunct Professor, Social Sciences, La Trobe University (Melbourne) and the Cairns Institute, James Cook University
112. John Edward Nethery, Consultant Geologist, Bachelor of Science Fellow of Australasian Institute of Mining and Metallurgy (Chartered Professional), Fellow

- Australian Institute of Geoscientists, Fellow Society of Economic Geologists, Member of Geological Society of Australia
113. John Nicol PhD, Retired Senior Lecturer Physics and one time Dean of Science, James Cook University, North Queensland
 114. Clifford David Ollier DSc, Geologist, Emeritus Professor of Geology and Honorary Research Fellow at the School of Earth and Geographical Sciences, University of Western Australia
 115. Paul John O’Keeffe, MB, BS, FRCS, FRACS, Retired Surgeon
 116. David Parsons B.E Mech. FIE Aust CPEng NER, Principal Design Engineer, specialised in boiler design and gas radiation analysis
 117. M. Louise Petrick MSc Applied Science, Materials and Welding Engineer
 118. Alistair Pope PSc, CM, Sceptical Scientific Contrarian in the Climate Debate
 119. Robert Pyper, Geologist and Director of Minnelex Pty Ltd.
 120. Tom Quirk, Nuclear Physicist
 121. Art Raiche PhD, Mathematical Geophysics, Retired CSIRO Chief Research Scientist
 122. Campbell Rankine, Barrister and Solicitor
 123. Peter Ridd, Oceanographer and Geophysicist
 124. Tim Riley, Mining Geologist
 125. John Cameron Robertson, Author of CO2 Feeds the World and The Climate Change Delusion
 126. Philip Lance Robinson, Chemical Engineer, lifetime experience in the aluminium and steel industry
 127. Nigel Rowlands, Retired from Mining and Exploration Industry
 128. George (Rob) Ryan, Professional Geologist
 129. Judy Ryan, Editor Principia Scientific Institution Australia
 130. Robert Sambell PhD, Physics, Professional Geophysicist
 131. Tony Schreck, Managing Director, 35 yrs experienced geologist, Member of the Australian Institute of Geoscientists, Member of the Australian Institute of Company Directors
 132. Pasquale Seizis, Mechanical Engineer, climate critic
 133. Jim Simpson, Retired from Managing Positions in different International Telecommunications Firms, nowadays Convenor of ‘The Climate Realists of Five Dock’, Sydney Australia.”
 134. Case Smit, Physicist, Expert in Environmental Protection, Co-Founder of the Galileo Movement
 135. Edward Smith, Chartered Chemist, member of the Royal Australian Institute of Chemistry (RACI), lifetime of experience in the Pharmaceutical industry
 136. Lee Smith, University Lecturer in Spatial Technology, Responsible for State Government Precise Monitoring of Sea Level and International Sea Boundaries
 137. Peter Smith, Geologist (Retired), New South Wales
 138. Darren Speirs, Independent Business Owner, Rangeland NRM Consultants
 139. Geoffrey Stocker, Professor and Head of Department of Forestry, PNG University of Technology, Director of PNG Forest Research Institute
 140. John Stone, Former Head of the Australian Treasury and Executive Director of both the IMF and the World Bank, Former Senator for Queensland in the Australian Parliament and Leader of the National Party in the Senate, Principal Founder of The H.R. Nicholls Society and the Principal Founder of The Samuel Griffith Society
 141. Dr. Nancy Enid Stone, B.Sc (Hons), University of Western Australia. (1950), Ph.D Cantab. (1956), Retired Research Biochemist
 142. Rodney R. Stuart, Retired Expert in Energy Industry, Tasmania
 143. Roger Symons, Professional Engineer, Expert in Temperature Control of Industrial Buildings
 144. James Taylor, Electrical Aerospace and Astrophysics Engineer, Computer Modelling Researcher
 145. Rustyn Wesley Thomas, Retired Aircraft Engineer
 146. Tony Thomas MA, BEc, journalist and author for more than 60 years
 147. Baki M. Top, Senior Agricultural Scientist, Freelance Consultant Agricultural and Food Production & Agribusiness
 148. John W. Turner, Science Educator, Noosa Heads
 149. Ralph J. Tyler, Retired Senior Principal Research Chemist, CSIRO, expert in conversion of coal and natural gas to liquid fuel
 150. Peter Tyrer, Project Controls Engineer in Mining Industry

151. Dr. Julian Vearncombe PhD, Geologist, Fellow Australian Institute of Geoscientists
152. Terrence Vincent, Security Engineer, Small Business Adviser AIST, ASIAL, SMBE
153. John Vucko, Bachelor of Electrical Engineering (Hons)
154. James Walter, Medical Doctor
155. John Warnock, Astro Economist
156. Chris Warren, Retired Engineer, Design and Construction of Dams and feasibility of Coal Mines
157. Alan C. Watts, Medical Practitioner specialized in Effects of Infrasound on Human Health
158. Colleen J. Watts, Retired Environmental Scientist with specialization in Aquatic Chemistry and Environmental Consequences of Renewable Energy
159. Glyn Weatherall, Energy Resources Advisor
160. Neil Wilkins, Retired Geologist
161. Richard Willoughby, retired electrical engineer with thirty years experience in the Australian mining and mineral processing industry
162. Lawrence A. Wilson, Professional Chemical Engineer, Melbourne
163. Michael Wilson PhD, DSc, Emeritus Professor, former Executive Dean UWS, Former Chief Research Scientists CSIRO, Low Emissions Transport Fuels Leader
164. P.C. Wilson, Former Journalist with the A.B.C. Queensland
165. Philip Wood, Qualified Lawyer in four Jurisdictions (Australia, New York, UK and Hong Kong), CEO of two ASX-listed Companies operating in the Mining and Minerals Processing Fields
166. Michael Wort, BSc Mining Geology, MSc Mineral Process Design, PhD Mineral Technology, Geologist interested in impact of high levels of atmospheric levels of CO₂ as trigger for formation of limestone deposits

SCIENTISTS AND PROFESSIONALS FROM AUSTRIA

1. Dr. Gerhard Kirchner, Berg Ingenieur, Climate Realist
2. Dipl Ing, Dr rer techn Heribert Martinides, European Space Agency, retired
3. Rudolf Posch PhD, Retired Software Engineer of a Technical Multinational, Expert in Nonlinearities and Feedbacks
4. Dr. Eike Roth, retired physicist, author of several climate books, latest one in press: "Das große Klimarätsel: Woher kommt das viele CO₂?"
5. Hans Dirk Struve, Dipl. Ing., Mechanical Engineer with large experience in business
6. Konrad Falko Wutscher, Doctor of Engineering Sciences, specialist in treatment of water and wastewater

SCIENTISTS AND PROFESSIONALS FROM BANGLADESH

1. Aftab Alam Khan PhD, Active Professor Geological Oceanography, BSMR Maritime University, Retired Professor of Geology and Geophysics of Dhaka University

SCIENTISTS AND PROFESSIONALS FROM BARBADOS

1. Fred Corbin, Director of CSW Engineering 2000, a company that is leading the Caribbean Region in Sustainable Economic Project Design, and co-founder of The FREEWINDS organization that is aiming at the enhancement of the economic opportunities of the 18 Caricom Territories

SCIENTISTS AND PROFESSIONALS FROM BELGIUM

1. *Henri A. Masson, Professor Emeritus Dynamic System Analysis and Data Mining, University of Antwerp, French speaking Belgium; WCD Ambassador*
2. *Ferdinand Meeus, Retired Dr. Sc (Chemistry, photophysics, photochemistry), IPCC Expert Reviewer AR6; WCD Ambassador*
3. Rudy Berkvens, Information Security and Quality Management Auditor in ICT and Aviation, Commercial Pilot, Flight Instructor
4. Eric Blondeel, Retired Civil Engineer
5. Emiel van Broekhoven †, Emeritus Professor of Economics, University of Antwerp
6. Christophe de Brouwer MD, Honorary Professor of Environmental and Industrial Toxicology, Former President of the School of Public Health at the Université Libre de Bruxelles

7. Alexandre G. Clauwaert, Brussels polytechnic, civil engineer AiBr and Insead Cedep general management program, Former VP marketing & communication nv AGM sa Antwerp, VP customer relations Electrabel distribution, VP group strategy & development Suez Tractebel sa Brussels & Paris, VP strategy Suez/Engie, Corporate auditor Engie
8. Rudi Creemers, Eur. Ing. MSc Electronics-ICT, Network engineer/manager
9. Benjamin Damien, Docteur en Biologie et Entrepreneur en Biotechnologie
10. Ferdinand Engelbeen, Former Chemical Process Automation Engineer, Akzo Nobel Chemicals
11. Samuel Furfari, Professor of Energy Geopolitics at the Free University of Brussels
12. Georges Geuskens, Emeritus Professor of Chemistry, Free University of Brussels and Expert Publicist on Climate Science
13. Drieu Godefridi PhD, Law, Author of several books
14. Jan Goffa, Civil Engineer Applied Mechanics, Retired lecturer in thermo- and aerodynamics
15. Dr. Volkmar Hierner, degree in business administration and economy, retired coach of companies in increasing the effectiveness of their organization
16. Jan Jacobs, Science Journalist specializing in Climate and Energy Transition
17. Guy Janssen MSc Applied Sciences (civil engineer electromechanics), MSc Nuclear Engineering, Reactor Sciences, experienced conventional electric power expert
18. Raymond Koch, Retired Research Director at Lab. Plasma Physics, RMA Brussels and Fellow Lecturer at Umons
19. Rob Lemeire, Publicist on Environmental and Climate Issues
20. Jean Meeus, Retired Meteorologist, Brussels Airport, Author of the Best Seller Astronomical Algorithms
21. Ernest Mund, Honorary Research Scientist, Honorary Research Director, FNRS, Nuclear Engineering
22. Bart Ooghe, Geologist & Geophysicist, Independent Scientist
23. Luc Opdecamp, "The agronomist-philosopher" (independent researcher), Agronomist (Soil science)
24. Jaak Peeters, Psychologist and Writer
25. Eric Perpète, Microcomputed Tomography Scientist, FNRS Senior Research Associate in Chemical Physics
26. Dr. Hugo Poppe, Emeritus hoogleraar, Weer- en Klimaatkunde, KU-Leuven, 1966-2002
27. Alain R. Pr  at PhD in Geology, Emeritus Professor at Universit   Libre de Bruxelles
28. Phil Salmon, Computer Tomography Scientist, Kontich
29. Jozef Verhulst PhD, Chemistry, Author
30. Jean van Vliet, Retired Specialist in Space Weather
31. Dr. Marc Wathelet, PhD in Molecular Biology, Free University of Brussels
32. Appo van der Wiel, Senior Development Engineer

SCIENTISTS AND PROFESSIONALS FROM BOLIVIA

1. Ambassador Jose Brechner, retired Congressman and Ambassador for the Bolivian Government, Chair of the Foreign Affairs Committee, currently Syndicated Columnist and Senior Political Analyst

SCIENTISTS AND PROFESSIONALS FROM BRAZIL

1. *Dr. Thiago Maia, Nuclear Physicist, PhD in Astrophysics; WCD Ambassador*
2. Dr. Peter Brian Bayley PhD, lifetime experience in Aquatic Ecology and Fisheries, retired from Dep. Fisheries & Wildlife, Oregon State University
3. Jose Nestor Cardoso, Professor on first oceanography course in Latin America, Pioneer on Brazilian expedition to Antarctic, First scientific diver for Brazil from CMAS
4. Mario de Carvalho Fontes Neto, Agronomist, Editor of 'The Great Global Warming Swindle'
5. Jos   Bueno Conti, Geographer and Professor of Climatology, Full Professor of the Geography Department at the University of Sao Paulo (USP)
6. Dr. Johnson Delibero Angelo, Master and PhD in Material Science, Industrial Chemist, Emeritus Collaborating Professor of Postgraduate Studies in Mechanical Engineering at UFABC

7. Prof. Dr. Ricardo Augusto Felicio BSc Meteorology - USP, MSc Antarctic Meteorology and Satellites - INPE, PhD in Climatology - Physical Geography - USP
8. Richard Jakubazsko, Executive Editor of Agro DBO Magazine and Co-Author of the Book 'CO2, Warming and Climate Change: Are you kidding us?'
9. Dr. George Lentz Cesar Fruehauf, BSc Doctor of Sciences – USP, MSc Meteorology – SJSU, expert in environmental engineering
10. Agnaldo Martins, professor and researcher at the Department of Oceanography and Ecology at the Federal University of Espírito Santo
11. Luiz Carlos Badicero Molion, Emeritus Professor of the Federal University of Alagoas (UFAL), Formerly of the National Institute of Space research (INPE)
12. Prof. Marcos José de Oliveira, Environmental Engineer, Master in Climatology, Author of research articles about climate cycles and natural causes of climate change
13. Fernando Paiva PhD Animal Science, Full professor at the Federal University of Mato Grosso do Sul
14. José Carlos Parente de Oliviera, Physicist, Professor at the Federal Institute of Education, Science and Technology of Ceará (IFCE), Retired Associate Professor of the Federal University of Ceará (UFC)
15. Guilherme Polli Rodrigues, Geographer, Master in Climatology, Environmental Consultant
16. Adelino De Santi Júnior, BSc Biology and Ecology, MSc Applied Ecology, Biologist, works with environmental education, licensing, restoration, sustainability management and staff supervision
17. Geraldo Luis Saraiva Lino, Geologist, Author of 'How a Natural Phenomenon Was Converted into a False Global Emergency'
18. Marcello Silva Sader, Graduated in Veterinary Medicine and Computer Sciences
19. Daniela de Souza Onca, Professor of the Geography Department of the State University of Santa Catarina (UDESC)
20. Igor Vaz Maquieira, Biologist, Specialist in Environmental Management

SCIENTISTS AND PROFESSIONALS FROM BULGARIA

1. Ivan Daraktchiev MSc Applied Science (Electronics engineering, Chemistry, Physics), Independent Researcher
2. Fabrice Toussaint, lifetime of experience in the Geo-Energy Industry, expert in complex numerical modelling

SCIENTISTS AND PROFESSIONALS FROM CANADA

1. *Dr. Patrick Moore, Ecologist, Chair CO2 Coalition, Co-Founder Greenpeace; WCD Ambassador*
2. *Reynald Du Berger, Retired Professor of Geophysics, Université du Québec a Chicoutimi, French Canada; WCD Ambassador*
3. Steven Ambler PhD, Full Professor University of Quebec, Dept. of Economics
4. John Andersen BSc, Honours, University of Alberta
5. Dr. Grant Armstrong, Leadership development and coaching
6. Russ Babcock, retired biochemist, lifetime experience in the mining and smelting industry with emphasis on pollution abatement
7. Tim Ball †, Emeritus Professor Geography, University of Winnipeg and Advisor of the International Science Coalition
8. Ron Barmby M.Eng in Engineering with major in Geoscience, Author of 'Sunlight in Climate Change: A Heretic's Guide to Global Climate Hysteria
9. Timothy J. Barrett PhD, Geochemical Researcher, Ore Systems Consulting
10. Callum Beck PhD in Religious Studies, Sessional Professor in Religious and University Studies
11. Mario Blais, Science and Mathematics Teacher
12. Kevin Burke MSc in Marine Biology, high school teacher, author/co-author of 2 technical reports with the Departement of Fisheries and Oceans and 2 scientific articles published in the Journal of Shellfish Research
13. Robert Douglas Bebb, Professional Engineer (Mechanical), MBA
14. Rick Beingessner, BSc, BA and LLB University of Alberta, lifetime experience in the Geo-Energy Industry, recently involved in researching Climate Change Matters
15. Jean Du Berger, Ingénieur Retraité, Bell
16. Alain Bonnier PhD, Physique, INRS-Centre de Recherche en Énergie, Montréal

17. Andrew Bonvicini, Professional Geophysicist, President of Friends of Science Society
18. Jacques Brassard, Minister of Recreation (1984), Minister of Environment (1994), Minister of Transport and Intergovernmental Affairs of Canada (1996), Minister of Natural Resources (incl. Hydro-Québec) and House Leader
19. Chris Carr, BSc (Hons) Engineering Geology and Geotechnics, retired Geoscientist
20. Michel Chapdelaine MSc, Géologie, Montréal
21. Henry Clark, Thermal/Power Engineer
22. Ian Clark, Professor of Earth and Environmental Sciences, University of Ottawa
23. Edmond (Ted) Clarke MSc, Engineering, Member of Friends on Science Society
24. Paulo N. Correa, Biophysicist and Oncologist, Inventor, Author of numerous books and research papers, Director of Research at Aurora Biophysics Research Institute
25. Hortense Côté, Ingénieur Géologue, Goldminds
26. Susan Crockford, Zoologist and Polar Bear Expert, Former Adjunct Professor University of Victoria
27. Norman Curry, Technical College, Design Engineering-Mechanical Engineering, President of National Zephyr Research
28. Ronald Davison, Professional Chemical Engineer
29. Dr. E. David Day BSc, PhD, Chemistry
30. A.E. (Ted) Dixon PhD, Emeritus Professor of Physics, University of Waterloo
31. Eric Ducharme MSc, Géologie, Abitibi
32. Michel Dumais, Ingénieur Civil Retraité, Université d'Ottawa
33. Dr. George Duncan PhD, retired Environmental Consultant from A&A Environmental Consultants Inc.
34. Claude Duplessis BSc, Géologie, Ingénieur Géologue, Goldminds
35. Craig A. Elliott MSc Mechanical Engineering, Design Consultant, President at CAElliott Inc
36. Ashton Embry, Research Geologist, Embry Holdings
37. David Fermor, Anaesthesiologist, B.A., M.D., FRCPC
38. Jeffrey Foss †, Professor of Philosophy of Science, University of Victoria
39. Joseph Fournier PhD, Expert in Physical Chemistry
40. Paul M. Gagnon, Professional Engineer
41. Thomas P. Gallagher, Earth Scientists, life-long career in the study of paleoclimate, geology and earth ocean systems, see <https://www.youtube.com/watch?v=pj-lu1i317E>
42. J. Claude Gobeil BSc, Geology
43. Douglas Goodman, Life of time experience in the geo-energy industry
44. Kenneth B. Gregory, Professional Engineer, Director Friends of Science Society
45. Dr. Paul Hamblin, Retired Research Scientist Environment Canada, Advisor to the Georgian Bay Association
46. Mark T. Hohm, Professional Engineer registered with the Association of Professional Engineers and Geoscientists of Alberta (APEGA)
47. R.G. Holtby, profesional agrologist
48. Patrick Hunt, former member of the Royal Canadian Navy, former member of the Legislative Assembly of Nova Scotia, retired entrepreneur in the high-tech field (35 Years)
49. Rick Ironside, Director Fortress ESG, provides specialized expertise to help clients map out their journey to attempt to achieve the goal of net zero by 2050
50. Eric Jelinski M. Eng. P. Eng., Alumni and Contract Lecturer, University of Toronto, Department of Chemical Engineering and Applied Chemistry, CHE568 Lecturer, Nuclear Plant Engineering
51. Paul A. Johnston, Associate Professor, Paleontology, Paleoecology, Department of Earth and Environmental Sciences, Mount Royal University, Calgary, Alberta
52. Richard T. Jones, experimental physicist, researched in the field of fission energy
53. E. Craig Jowett, Geologist and Environmental Researcher PhD University of Toronto
54. Andre Julien, MSc Mechanical Engineering, Thermodynamics Expert, over 40 patents published
55. Klaus L.E. Kaiser, Retired Research Scientist, National Water Research Institute, Author of Numerous Press Articles
56. Bogdan Kasprzak, Professional Geoscientist, life time experience in data modelling, data analysing and data interpretation
57. Madhav Khandekar, Expert Reviewer IPCC 2007 AR4 Report
58. David Koop BSc, Analytical Chemist

59. Kees van Kooten, Professor of Economics and Canada Research Chair in Environmental Studies and Climate, University of Victoria
60. Emil Koteles PhD in solid state physics, Max Planck Institute for Solid State Research in Stuttgart, GTE Labs in Waltham (Massachusetts), National Research Council of Canada in Ottawa (Ontario), visiting professor at Zhejiang University in Hangzhou, retired
61. Jean Laberge, Professeur Retraité de Philosophie, CEGEP du Vieux Montréal
62. Sherri Lange, CEO North American Platform Against Wind Power, Great Lakes Wind Truth
63. M.J. Lavigne MSc, Professional Geologist
64. Douglas Leahey PhD, Meteorology, past President of Friends of Science
65. Professor Denis Leahy, PhD in Astrophysics, Full Professor in the Department of Physics and Astronomy, University of Calgary
66. Robert Ledoux PhD, Professeur Retraité en Géologie, Université Laval
67. Dick Leppky, Retired businessman and Independent Truth Seeker
68. Richard Lewanski BSc (Hons) in Geophysics from the university of Manitoba, lifetime experience as an exploration geophysicist, founder and CEO of several exploration and production companies in the oil industry, as well as several private companies
69. H. Douglas Lightfoot, Research Engineer in the Chemical Industry, Co-Founder of the Lightfoot Institute, papers on Alternative Energy and Atmospheric CO2
70. Gerald Machnee, Retired Meteorologist, Environment Canada
71. Allan M.R. MacRae, Retired Engineer
72. Paul MacRae, Independent Climate Researcher
73. J. David Mason, Applied Geologist, B.A.Sc, Applied Geology, M.Eng, Mining
74. Stuart McDonald, Retired Canadian Insurance Broker
75. Dwight McIntosh, degree in physics and geology at the University of Alberta, lifetime of experience in the geo-energy industry, advisor on GHG quantification and regulation
76. Norman Miller, Former P.Eng, now Retired
77. Ron Mills, Geologist/geochemist Emeritus NS Geological Survey
78. Randall S. Morley, veterinary epidemiologist, retired
79. Dr. Thomas F. Moslow PhD, P. Geol., President Moslow Geoscience Consulting Ltd., Adjunct Professor Department of Geoscience, University of Calgary
80. Roland Moutal, Teacher Physics and Chemistry at Vancouver Community College
81. Prof. Frank Mucciardi, retired Professor in the Department of Mining and Materials Engineering at McGill University in Montreal, my research was focused primarily on energy, heat transfer, fluid mechanics and modeling
82. Christian Olivier, former Postdoc @ UC Berkeley
83. Robert Orr, Historical Linguist
84. Scott Patterson, Professional Geologist
85. Andy Pattullo, Associate Professor of Medicine at the University of Calgary
86. Prof. David A. Penny PhD, Former Associate Professor, Dept. of Computer Science, University of Toronto, veteran Software Industry Executive
87. Jozinus Ploeg, retired Vice-President, Engineering and Technology, National Research Council, Field of expertise Energy transfer from atmosphere to surface of ocean, wave mechanics
88. Joe Postma, Research Analyst, Physics & Astronomy, University of Calgary
89. Brian R. Pratt, Professor of Geological Sciences, University of Saskatchewan
90. Michael Priaro, BSc Chem.Eng, P.Eng, Member of Association of Professional Engineers and Geoscientists of Alberta
91. Gerald Ratzer, Professor Emeritus, Computer Science McGill University, Montreal
92. John Angus Raw, aerospace engineer, specialised in aerodynamics, life time career in the international aerospace industry
93. Dr. Michael Raw PhD in Mechanical Engineering, specialization in computer modelling of fluid flow and heat transfer, current field of work in technology management
94. Robert James Reid, BSF degree, Registered Professional Forester, lifetime experience in the forestry industry
95. Norman Reilly, Professor Emeritus of Mathematics, Simon Fraser University, British Columbia
96. Gérald Riverin PhD, Géologie, Géologue Retraité
97. John Robson, Historian, Journalist, Documentary Filmmaker
98. Peter Salenius, Retired Research Scientist, Natural Resources

99. Marcelo C. Santos, Professor of Geodesy, University of New Brunswick
100. Paul R. Schmidt BSc, Professional Engineer Ontario, Research Scientist, Author/ Lecturer 'Review & Analysis of Climate Change', Member Friends of Science
101. Ian de W. Semple, Retired Exploration Geologist and Mining Investment Analyst of McGill University
102. Afshin Shahzamani, Retired professional (Medical Science Liaison) pharmaceutical industry
103. Élie Shama, Ingénieur Retraité en Électromécanique, Président d'Éconoden, Montréal
104. Wayne Shephard MSc Geology, Retired oil and gas explorer
105. H.F. (Gus) Shurvell, Emeritus Professor of Chemistry, Queen's University
106. Brian Slack, Distinguished Professor Emeritus, Concordia University Montreal, Department of Geography, Planning and Environment
107. Rodolfo (Rudy) Spatzner, graduated from Environmental/Civil Engineering Technology, Humber College, Ontario, lifetime experience in wireless networks across North America
108. Michelle Stirling, Writer/Researcher with focus on 'consensus' social proofs, Top 10% downloaded author on SSRN, Communications Manager, Friends of Science Society
109. Mary Taitt PhD Zoology, MSc Ecology, retired
110. Graydon Tranquilla, BScEE, Electrical Power, Senior Electrical Engineer (retired), now an energy advisory consultant
111. Marc Vallée PhD, Geophysicien
112. Petr Vaníček Dr. Sc, Professor Emeritus of Geodesy, University of New Brunswick
113. Duncan Veasey, psychiatrist with a particular interest in mass hysteria, authoritarianism and social compliance
114. Prof. Dr. Ir. Frank C.J.M. van Veggel, Full Professor at the University of Victoria, M.Eng and PhD in Chemical Technology, University of Twente, The Netherlands, Since 2015 Fellow of the Royal Society of Canada
115. Jean-Joel Vonarburg PhD, Professeur Ingénieur, Université du Québec à Chicoutimi
116. Dr. Ronald Voss PhD Chemistry, lifetime career in the environment department of a research consortium
117. Robert Wager, BSc and MSc, Microbiological Sciences and Immunology, Biochemistry and Molecular Biology, Retired
118. Dr. Helen Warn PhD in Fluid Dynamics from McGill University
119. Dr. Thorpe W. Watson, material science, lifetime career in the mining industry with focus on intellectual property protection
120. Larry Weiers, energy engineer, retired, author of "Sustainability of the Modern Human Economy"
121. William van Wijngaarden, Professor of Physics, York University
122. Ken Wilson, Professional Engineer (retired)

SCIENTISTS AND PROFESSIONALS FROM CHILE

1. Douglas Pollock, Civil Industrial Engineer, University of Chile; WCD Ambassador
2. Rafael Muñoz Canessa, Part time Academic University of Talca, Economics and strategic management
3. Juan Luis Edwards Velasco, Civil engineer in hydraulics, Universidad Católica de Chile, Master in hydraulic engineering, Universidad de Santander, Spain
4. Carlos Varea, Energy Engineer

SCIENTISTS AND PROFESSIONALS FROM CHINA / HONG KONG

1. Dr. Robert Hanson, PhD, BA (Hons), MA, LL.M, PGCE, CPE, Barrister
2. Wyss Yim, Retired Professor, Department of Earth Sciences, The University of Hong Kong, Deputy Chairman Climate Change Science Implementation Team, UNESCO International year for Planet Earth 2007-2009, Expert Reviewer IPCC AR2
3. NG Young, Principal Geoscientist, Danxia Shan Global Geopark of China

SCIENTISTS AND PROFESSIONALS FROM COSTA RICA

1. Eugenio G. Araya, Theoretical Physicist, Researcher, former scientist at University of Costa Rica

SCIENTISTS AND PROFESSIONALS FROM REPUBLIC OF CROATIA

1. Dušan Bižić MSc, Meteorologist; WCD Ambassador
2. Zorislav Gerber MSc, Meteorologist

SCIENTISTS AND PROFESSIONALS FROM CYPRUS

1. Darko Krstic, editor of <https://philosophyofgoodnews.com/>

SCIENTISTS AND PROFESSIONALS FROM CZECH REPUBLIC

1. Pavel Dudr, Ing, Independent publicist and climatologist / Pravy prostor, EP Shark/
2. Marek Eiderna, Agricultural Engineer and graduated in General Biology
3. Tomas Furst PhD, teacher of mathematics at Palacky University in Olomouc and a proponent of correct, i.e. Bayesian inference
4. Vaclav Hubiner, Retired Ambassador, Anthropologist, Climate Policy Commentator for www.forum24.cz
5. Pavel Kalenda PhD, CSc., Coal Expert
6. Václav Klaus, Former President of the Czech Republic, Professor of Economics, Founder of the Václav Klaus Institute
7. Lubos Motl PhD, former Harvard faculty, high energy theoretical physicist, co-author of the 2009 NIPCC report
8. Ivan Spicka, Professor of Internal Medicine at Charles University with speciality in Hemato-Oncology, Prague
9. Dalibor Štys, professor of Applied physics, Faculty of Fisheries and Protection of Waters, University of South Bohemia in České Budějovice
10. Gary M. Vasey PhD, Geology, Managing Partner and Analyst in Commodity Technology Advisory llc
11. Ing. Miroslav Žáček PhD, applied geochemistry, been working on the climate for more than 10 years as a geochemist

SCIENTISTS AND PROFESSIONALS FROM DENMARK

1. Jens Morten Hansen PhD, Geology, Professor at Copenhagen University, Former Vice Managing Director for the Geological Survey of Denmark and Greenland, Former Director General for the Danish National Research Agency and National Research Councils, Former President of the Nordic Research Council under Nordic Council; WCD Ambassador
2. Bjarne Andresen, Professor of Physics, Niels Bohr Institute, University of Copenhagen
3. Dr. Hans Götzsche, Emeritus Associate Professor, Linguistics and Philosophy of Science, President Nordic Association of Linguists (NAL), Director, Center for Linguistics, Aalborg University
4. Frank Hansen, Emeritus Professor, Department of Mathematics, University of Copenhagen
5. Niels Harrit PhD, Emeritus Associate Professor of Chemistry, Dept. Chemistry, University of Copenhagen
6. Sören Kjærsgaard, Professional Chemical Engineer
7. Johannes Krüger, Emeritus Professor, Dr. Scient, Department of Geosciences and Natural Resource Management, University of Copenhagen
8. Knud Larsen PhD, Natural Sciences
9. Peter Loch, Senior Lecturer, Business Academy Aarhus (statistics)
10. Peter Kjær Poulsen, Metering Engineer
11. Steen Rasmussen Bsc in Electrical Engineering from Denmark Technical University, lifetime career at IBM Denmark Aps
12. Niels Schrøder, Geophysist/Geologist, Associate Professor Institute of Nature and Environment, Roskilde University
13. Pavel Svennerberg, Master of engineering, Technology of oil and gas processing

SCIENTISTS AND PROFESSIONALS FROM ESTONIA

1. Andres Saukas, Diploma Electrical Engineer, Estonian Society of Moritz Hermann Jacobi

SCIENTISTS AND PROFESSIONALS FROM ECUADOR

1. Fernando Villon MSc, Industrial Engineer, Lifetime Experience in the Geo-Energy Industry

SCIENTISTS AND PROFESSIONALS FROM FINLAND

1. Simo Mykkanen, Ba Econ, small business owner, retired
2. Dr. Antero Ollila, Emeritus Adj. Ass. Professor Aalto University, expert in atmospheric modeling
3. Simo Ruoho, President Ilmastofoorumi ry Finland, Signature of association <https://ilmastofoorumi.fi> including its scientists and professional members
4. Boris Winterhalter, Retired Marine Geology, Geological Survey of Finland

SCIENTISTS AND PROFESSIONALS FROM FRANCE

1. *Benoît Rittaud, Assistant Professor of Mathematics at University of Paris-Nord, President of the French Association des climato-réalistes; WCD Ambassador*
2. Jean-Charles Abbé, Former Research Director at CNRS, Labs Director (Strasbourg, Nantes) in Radiochemistry, Expert at NATO and IAEA
3. Pascal Acot, Centre National de la Recherche Scientifique, Paris
4. Bertrand Alliot, Environmentalist
5. Frédéric Antoine, graduated from Sciences Politiques in France
6. Charles Aubourg, Full Professor at the University of Pau, Geophysicist
7. Hervé Azoulay, Engineer (CNAM), Specialist of Networks and Systemics, CEO and President of several Associations
8. Guy Barbey, Alumnus of Harvard Business School, Retired Investment Banker, Founder and President of 'Climate et Vérité'
9. Jean-Pierre Bardinnet, Ingénieur ENSEM, Publicist on Climate Issues
10. Yorik Baunay, Geographer (Master 2) specialized in the natural risk and crisis management, CEO of Ubyrisk Consultants (firm specialized on natural hazard mitigation)
11. Bernard Beauzamy, University Professor (Ret.), Chairman and CEO, Société de Calcul Mathématique SA (Paris)
12. Serge Bellotto PhD, Geology
13. Guy Bensimon, Retired Associate Professor of Economics at Institute of Political Studies of Grenoble (SciencesPo Grenoble)
14. Jean-Claude Bernier, Emeritus Professor (University of Strasbourg), Former Director of the Institute of Chemistry of the CNRS
15. Pierre Beslu, Former Researcher and Head of Department in the French Nuclear Energy Commission (CEA)
16. Michel Bouillet PhD, Human Geography, Emeritus Professor, Former Associate Researcher at the MMSH (Aix-en-Provence)
17. Christian Buson PhD, Agronomy, Director of Research in a Company (impact studies in Environmental Issues, Sewage Treatment)
18. Jean-Louis Butré, Head of Laboratory at Grenoble Nuclear Research Center, Chief Executive Officer of the Pharmacie Centrale de France, President of Procatalse, President of the Fédération Environnement Durable and the European Platform Against Windfarms, Knight of the National Order of Merit
19. Emmanuel Camhi MSc in Physics, life time experience in Complex Systems Modeling and Data Analysis in the Aerospace industry
20. Bernard Capai, Retired Chemistry Engineer, Specialist of Industrial Processes avoiding the use of Carcinogenic Solvents
21. Patrick de Casanove, Doctor of Medicine, Chairman of the Cercle Frédéric Bastiat
22. Philippe Catier, Medical Doctor
23. Vincent Chaplot PhD Soil Science, Senior Research Scientist
24. Bruno Chaumontet, Engineer ENSEA, specialized in Feedback Systems
25. Pascal Chondroyannis, Forest Engineer, Retired Director of the National Alpine Botanical Conservatory (2008-2013)
26. Jean Michel Colin PhD, Retired Chemist Engineer, Expert for the French Academic Evaluation Agency (AERES)
27. Philippe Colomban, CNRS Research Emeritus Professor, Former Head of Laboratory at Université Pierre-et-Marie Curie, Expert in Hydrogen-based Energy Storage

28. Jacques Colombani, Former Research Director ORSTOM-IRD, numerous Studies in Hydrology and Climatology and Specialist in Fluid Mechanics, Member of the Board of ORSTOM for twenty years
29. Christian Coppe PhD, Organic & Analytical Chemistry
30. Philippe Costa, Energy Engineer at ENSEM Nancy, specialist in Industrial Process and Energy Saving
31. Vincent Courtillot, Geophysicist, Member of the French Academy of Sciences, Former Director of the Institut de Physique du Globe de Paris
32. Pierre Darriulat, Professor of Physics, Member of the French Academy of Sciences
33. Jean Davy, Engineer (ENSAM), Digital Modeling Software Developer
34. Dr. Stephen John Dearden, Retired Research Chemist, lifetime R&D experience in the general chemical, pharmaceutical and photographic industries
35. Pierre Delarboulas, CEO of a Robotics Company, Former R&D Director at Partnering Robotics, Silver Medal at the 2016 Lépine contest of the Ministry of Foreign Affairs and International Development
36. Jean-Pierre Desmoulins, Retired Professor of Thermal and Energy Engineering at the "Institut Universitaire de Technologie, Université-Grenobles-Alpes"
37. Gérard Douhet PhD, Nuclear Physics, Retired Engineer at CERN, Technical Manager on Digital Transmission and Video Encoding
38. Hubert Dulieu, Emeritus Professor Applied Ecology, Formerly Senior Researcher in the CNRS, President of the National Scientific Research Committee, Vegetal Biology Section (XXVII)
39. Doctor Denis Dupuy, Urologist, climate realist
40. Bruno Durieux, Economist, Former Minister of Health and of Foreign Trade, Ancient Administrator of the French National Institute of Statistics and Economic Studies (INSEE)
41. Ralph Ellis, Bsc in Aviation, ATPL
42. Max Falque, International Consultant in Environmental Policy
43. Serge Ferry PhD, Retired Teacher-Researcher (MCF), University of Lyon
44. Patrick Fischer, Associate Professor in Applied Mathematics, University of Bordeaux
45. Michel Frenkiel, Engineer (Arts et Métiers), Former Researcher at NCAR in Boulder
46. Francis le Gaillard PhD, Natural Sciences and Pharmaceutical Sciences, Emeritus Professor of Biochemistry at the Faculty of Pharmaceutical Sciences of Toulouse
47. François Gauchenot, Governance Specialist, Founder of Saint George Institute
48. Jean Gergelé, Engineer Graduate from the Ecole Centrale de Lyon, R&D Director, Freelance Consultant, mainly in the Li-ion battery development
49. Christian Gerondeau, Former Advisor of several French Prime Ministers, Formerly responsible for the Road Traffic Safety Policy for France and the European Union
50. Francois Gervais, Emeritus Professor of Physics and Material Sciences, University of Tours
51. Philippe Giraudin, Ecole Polytechnique Paris, Geographic Sciences
52. Bernard Grandchamp, Agronomic Engineer and Environment & Plant Defense Expert, Managing Director of Famoux Chateaux Viticoles in Bordeaux
53. Gilles Granereau, Former Meteorologist, currently Project Manager Environment and Tourism in a Public Institution, Worked on Coastal Risks, Marine Erosion, Sand Dune Fixation, Hydraulics, Forest Management, Botany
54. Maximilian Hasler, Associate Professor in Mathematics, University of French West Indies
55. Charles Hazan, Retired Chemist (ENSCP) and Chemical Engineer (UMIST) Former Technical Director Nosolor
56. Manfred Horst, MD, PhD, MBA, lifetime career in healthcare and pharmaceuticals
57. Yvon Jarny, Emeritus Professor in Thermal and Energy Sciences, Nantes University
58. Claude Jobin, Retired A&M Engineer specialized in Microwave Communication
59. Vladimir Klein, lifetime career in renewable energy projects, patent holder in aerobic composting of organic waste
60. Alexandre Krivitzky, Psychoanalyst, Member of the International Psychoanalytical Association
61. Roger Lainé, Retired Geological Engineer
62. Philippe de Larminat, Professor at École Centrale de Nantes, specialist of Business Process Modeling
63. Jacques Laurentie, Aeronautical Engineer, and CEO of a software publishing company
64. René Laversanne, Researcher at the CNRS, 16 patents

65. Christian Liegeois PhD Physics, patent holder in photonics
66. Jean-Marie Longin, Engineer (Saint-Cyr), Chief of the Pole Operations of Security Inventory Management
67. Guy Lucazeau, Emeritus Professor (Institut Polytechnique de Grenoble) in Material Sciences and Spectroscopy
68. Philippe Malburet, Emeritus Associated Professor of Mathematics, Founder of the Planetarium of Aix-en-Provence, Member of the Academy of Aix-en-Provence
69. Christian Marchal, Astronomer and Mathematician, Former Research Director at the French National Office for Aerospace Studies and Research
70. Dr. Yves G. Maria-Sube PhD in Geosciences Montpellier University, lifetime career in the geo-energy industry
71. Paolo Martinengo, Applied Physicist, Senior Staff Member in the Experimental Physics Department, Detector Technologies Group, CERN
72. Patrick Mellett, Architect and CEO
73. Marc le Menn PhD, Head of Metrology-Chemistry Oceanography Lab, Brest
74. Henri Mertz, Ingénieur Civil de l'école de la Métallurgie et des Mines de Nancy, Chef d'Entreprises
75. Serge Monier, former manager of various multinational companies, at present Co-founder and Treasurer of 'Climat et Vérité'
76. Jean-Laurent Monnier, Emeritus Research Director, CNRS-Université de Rennes, Research Worker at the CNRS from 1973 to 2013, speciality in Pleistocene Geology in Western Europe
77. Jacques-Marie Moranne, Retired Engineer (Ecole Centrale de Lille), Specialist in Air and Water Purification, Chemical and Nuclear Engineering
78. Serge Morin, Emeritus Professor Geography at Université Michel de Montaigne, Bordeaux, Honorary Mayor of Branne
79. Cédric Moro, Geographer on Natural Hazards Management, Co-Founder of Visov, a NGO in Civil Defense
80. Philippe Morvan, Engineer ENSTA and Génie Maritime, specialist in Software Development
81. Charles Naville, R&D Exploration Geophysicist, IFP Energies Nouvelles
82. Michel le Normand, Emeritus Professor of Botany and Plant Pathology and Chairman of Plant Production Department, National Superior School of Agronomy, Rennes
83. Ludovic Penin, former Senior Executive - Chief Information Officer (IT) and former Entrepreneur/Investor, Co-founder and Vice-president of 'Climat et Vérité', member of 'Association des Climato-réalistes'
84. Dr Patrice Poyet, Graduated at Ecole des Mines de Paris as a geochemist and defended a D.Sc. (1986) at Nice University / INRIA, author of 'The Rational Climate e-Book'
85. Rémy Prud'homme, Emeritus Professor in Economics at University of Paris-Est, Former Deputy-Director, Environment Directorate, OECD
86. Jean Marie Ravier, Engineer of ECOLE CENTRALE DE PARIS, and diplomed SCIENCES POLITIQUES PARIS, recently retired MD of small industrial company
87. Pierre Richard, Engineer ESPCI Paris, Former Research Geochemist at Institut de Physique du Globe de Paris (IPGP)
88. Pierre Ripoche, Engineer INSA in Chemistry, Retired Project Manager in R&D, Expert in High Temperature Plasma for Optical Fiber Process
89. Isabelle Rivals, Associate Professor in Statistics at ESPCI Paris
90. Bertrand Rouffiange, Doctor of Medicine, specialized in Radiology
91. Jean Rouquerol, Emeritus Research Director at CNRS Marseille, Expert in Gas Adsorption and Calorimetry
92. Georges de Sablet, Retired Associate Professor at University of Paris Descartes, Formerly in charge of Operating Systems and Networks at IUT Paris
93. François Simonet PhD, Biology, Former Director for Planning and Foresight in a State Agency for Water and Aquatic Ecosystems Management
94. Luc C. Tartar, mathematician, corresponding member of Académie des Sciences in Paris (since 1987), University Professor of Mathematics emeritus at CMU (Carnegie Mellon University, Pittsburgh, PA)
95. Marcel Terrier, Ex Engineers in Industry, Former Teacher at the Douai School of Mines
96. Michel Thizon, Chemical engineer, ACR (Association des Climato-Réalistes, France) member, former researcher at the Ecole Polytechnique, consultant, retired
97. David Uzal PhD philosophy of technics and PhD of practical philosophy

98. Etienne Vernaz, Former Director of Research of CEA (Commissariat à l'Énergie Atomique) in France, Professor at INSTN (Institut National des Sciences et Techniques Nucléaires)
99. Camille Veyres, Retired Engineer at École des Mines, specialist in Telecommunications and Broadband Networks
100. Brigitte van Vliet-Lanoë, Geoscientist, Emeritus Research Director (CNRS, Université de Bretagne Occidentale), Stratigraphy and Palaeoenvironments, Quaternary and Holocene
101. Théa Vogt, Retired CNRS Searcher, Géomorphology, Quaternary Palaeoenvironments, Soil and Desertification Remote Sensing
102. Henry Voron, Retired Civil Chief Engineer, specialized in Water Management

SCIENTISTS AND PROFESSIONALS FROM GERMANY

1. Fritz Vahrenholt, Professor (i.R.) am Institut für Technische und Makromolekulare Chemie der Universität Hamburg; WCD Ambassador
2. Detlef Ahlborn PhD, Expert on German Energy Transition (Energiewende)
3. Hans-Jürgen Bandelt, Emeritus Professor of Mathematics, University of Hamburg
4. Dietrich Bannert, Professor Honoris Causa, University of Marburg
5. Graham George Baumber, former Agronomist & Irrigation Crop Specialist, Business Man & Investor
6. Lars Birlenbach, Dr. in Chemistry, University of Siegen
7. Michael Bockisch, Emeritus Professor Chemistry at the Technical University of Berlin
8. Klaus-Dieter Böhme, Dipl. Physicist, professional experience in X-ray spectroscopy
9. Thomas Brey, PhD in Natural Sciences (Dr. rer. nat), Marine Ecological Researcher
10. Stephan Bujnoch, Wirtschaftsingenieur (i.e. a combination of Economics and Engineering), Retired Manager with the Automotive Industry
11. Eike-Mattias Bultmann, Geoscientist
12. Eberhard Burkel, Prof. (i.R.) Dr.rer.nat, Physics of New Materials, University of Rostock
13. Dr. Arthur Chudy, Agricultural Chemist OT Warsaw
14. Günter Dedié, Physicist
15. Dr. Ing. Rolf Diederichs, Studie Eisenhüttenkunde in Clausthal-Zellerfeld, climate realist
16. Prof. Dr. Klaus D. Döhler, Professor of Pharma sciences, University of Hannover
17. Wolf Doleys, Retired teacher (high school, college) and writer (essay, poetry, novel)
18. Joerg Dornemann Msc in Geology, lifetime career in the Geo-Energy Industry
19. Jörg Eichner, Specialist in situational awareness in crises and risk management
20. Friedrich-Karl Ewert, Emeritus Professor Geology, University of Paderborn
21. Ludwig E. Feinendegen, Emeritus Professor Medicine
22. Dr. Dieter Freundlieb, Retired Senior Lecturer Griffith University, School of Humanities, Brisbane, Australia
23. Gerhard Gerlich, Emeritus Professor of Mathematical Physics, TU Braunschweig
24. Axel Robert Göhring, Doctor of Natural Sciences, EIKE e.V.
25. Dr. Klaus-Jürgen Goldmann, worldwide experienced petroleum geologist
26. Christian Habermann, Dr. in Economics, Investment Manager
27. Eberhard Happe, Eisenbahningenieur
28. Hermann Harde, Emeritus Professor of Experimental Physics and Materials Science, Helmut Schmidt-University, Hamburg
29. Prof. Dr. Bernd Hartke, Professor in Theoretical Chemistry, Expert Knowledge in Computer Modelling, University of Kiel
30. Manfred Hauptreif, Natural Scientist
31. Dennis J. Hendricks, Graduated Engineer of Environmental Technologies, Technischen Hochschule Ostwestfalen-Lippe, University of Applied Sciences and Arts
32. Dietmar Hildebrand PhD Biophysics and Nuclear Physics, patent holder in fuzzy logic based surveillance, IT expert and development manager
33. Dr. Andreas Hoppe, Systems biologist, Institute for Bee Research
34. Prof. Axel Janke PhD, professor of evolutionary genomics
35. André Karutz, Chemist, Dr. rer. nat. expert in environmental matters
36. Professor Dr. Gerhard Kehrer, Retired Physician, Internist and Physiologist
37. Dr. Udo Kienle, Agricultural Scientist at University of Hohenheim
38. Werner Kirstein, Emeritus Professor of Climatology, University of Leipzig

39. Bernhard Kleinhenz, Collage teacher of Biologie, Chemistry and Physics
40. Gunther Klessinger, Physicist, University at Regensburg Germany and Boulder Colorado
41. Stefan Kröpelin, Dr. in Geosciences, Free University of Berlin and University of Cologne (Retired), specialized in Climate Change of the Sahara
42. Dr. rer. nat Gunter Kümel, lifetime career in virus research in the natural sciences
43. Max Kupillas, Dipl.-Ing. Masch.-Bau, retired Prod.Ltr.
44. Ulrich Kutschera, Professor of Plant Physiology & Evolutionary Biology at the University of Kassel and Visiting Scientist in Stanford USA
45. Wolfgang Laub, Physics (J.W.Goethe University, 1977-1986), Medicine (Physiology-Biomechanics, Max-Planck Institute, 1980-1986), patent holder in different areas
46. Michael Limburg, Vice-President EIKE (Europäisches Institute für Klima und Energie)
47. Martin Lindner PhD in Chemistry, Dipl. in Chemistry, President of the Bürger für Technik
48. Prof. Dr. Kai van de Loo, Dr. rer. oec. Honorarprofessor der THGA und Senior Consultant im Forschungszentrum Nachbergbau
49. Dr. Stephan Lorenzen PhD Theoretical Biology, Bioinformatician, worked with nonlinear modelling
50. Professor Dr. Knut Löschke, studied crystallography, chemistry, physics, mathematics and computer science. He is an honorary professor at the University of Technology, Economics and Culture in Leipzig. As part of his work at the university, he deals with the energy industry and climate change
51. Horst-Joachim Lüdecke, Professor of Operations Research (i.R.) HTW of Saarland, Saarbrücken
52. Wolfgang Merbach, Professor Dr. Agrar. Habil. at Institut für Agrar Ernährungswissenschaften
53. Lothar W. Meyer, Emeritus Professor of Material Engineering, Chemnitz University of Technology, Saxony Entrepreneur 'Nordmetall GmbH', Member of the Board of 'Vernunftkraft Niedersachsen'
54. Jens Möller, Graduate Economist, Climate Realist
55. Wolfgang Monninger PhD, lifetime career in Petroleum Geology (Exploration, Petrophysics)
56. Werner Mormann, Emeritus Professor of Macromolecular Chemistry, Universität Siegen
57. Dipl. Phys. Raimund Müller, education in physics and thermodynamics, climate realist
58. Holger Neulen, Retired Mechanical Engineer
59. Prof. Dr.rer.nat Dr.med Peter Nielsen, retired Biochemist and Physician from the Universital Hospital Hamburg-Eppendorf, medical faculty of the University of Hamburg
60. Rainer Olzem, Diplom-Geologe, Aachen
61. Hans Penner PhD, Dipl.-Chem. Dr. rer. nat., Linkenheim-Hochstetten
62. Dr. Dr. Wätzold Plaum, Physicist and YouTuber
63. Michael Principato MSc in Electrical Engineering, specialised in Control Engineering and Modeling
64. Dieter Ramcke, retired geophysicist
65. Siegfried Reiprich, Dipl.-Ing. Geoscientist and Oceanography
66. Andreas Salzman, Dr. rer. nat., Diplom Chemiker
67. Dr. Hendrik Schlesing, Environmental Expert and Consultant
68. Dr. Jens-Christoph Schneider PhD in Isotope Chemistry, life time career in palaeoclimate and atmospheric geochemistry
69. Dr. rer. nat. Michael Schnell, Retired chemist
70. Prof. Dr. Dr. Karl-Heinz Schulz, Germany, University Hospital Hamburg-Eppendorf, interdisciplinary research in Medicine, Psychology and exercise science (<https://www.researchgate.net/profile/Karl-Heinz-Schulz-2>)
71. Dipl. Psych. Ulrike Schwan, Professional Psychotherapist, Psychotherapist look at the IPCC Organization
72. W.H. Eugen Schwartz, Emeritus Professor of Theoretical Chemistry, Universitaet Siegen
73. Dr.-Ing. Christian Singewald, Dipl.-Geologist, PhD Mining Engineering
74. Attila Sonal, Dipl.-Ing. der Elektrotechnik, Retired am Technischen Universität Kaiserslautern, Stadtratsmitglied Kaiserslautern, Preisträger Ansaldo Ricerche Price
75. Dr. Fritz Sontheimer, Retired Physicist, PhD in Condensed Matter Physics

76. Dr. Wolfgang Strehlau, Phys. Chemist, Technology Fellow in Johnson Matthey Plc, UK
77. Lothar Streng, strategy and concept developer, full time writing on a large SF project
78. Manuel Tacanho, founder and president of the Afrindependent Institute
79. Matthias Thiermann, Parliamentary adviser in the Bavarian Parliament
80. Dr. Holger Thuss, President EIKE Institute
81. Jost Trier PhD, Retired Experimental Physicist at the Federal Institute in Braunschweig, Dept. of Atomic Physics
82. Ralf D. Tscheuschner PhD in Physics
83. Helmut Waniczek Dr. Dipl. Ing., Scientist, working 40 years in chemical industry
84. Thomas Weimer, Process Engineer (Dr.-Ing.), worked on CO2 capture from atmosphere and during hydrogen generation
85. Carl-Otto Weiss, Emeritus Professor in Non-linear Physics, Advisor to the European Institute for Climate and Energy, Former President of the German Meteorological Institute, Braunschweig
86. Peter Willingmann, Dr. rer.nat

SCIENTISTS AND PROFESSIONALS FROM GREECE

1. *Stavros Alexandris, Associate Professor Agricultural University of Athens, Dept. of Natural Resources and Agricultural Engineering, Sector of Water Resources ; WCD Ambassador*
2. Costas Fasseas, Emeritus Professor of Plant Anatomy & Electron Microscopy, Department of Crop Science, Agricultural University of Athens
3. Anthony Foscolos, Emeritus Professor of Mineral Resources at the Technical University of Crete, Energy Consultant for the United Nations Development Program (UNDP)
4. r. Vassilios C. Kelessidis, former Professor at Khalifa University, Texas A&M at Qatar and Technical University of Crete Greece, Lifetime of Experience in Petroleum Engineering
5. Christos J. Kolovos PhD, Mining & Metallurgy Engineer, Former Director of Mine Planning & Contractor Works Dept., Public Power Corporation of Greece
6. Emmanouil Kopanakis, Mechanical Engineer, Teacher at the Environmental Education Center of Karpenisi
7. Demetris Koutsoyiannis, Professor of Hydrology and Analysis of Hydrosystems at the National Technical University of Athens
8. Aristotelis Liakatas, Emeritus Professor of the Agricultural University of Athens on Agrometeorology, Member of the Greek Agricultural Academy
9. Nikos Mamassis, Associate Professor of Engineering Hydrology and Hydrometeorology at the National Technical University of Athens
10. Charilaos Markopoulos MSc in Waste Management
11. Spyridon Nikiforos, Economist, MBA
12. Sonia Perez † PhD, Biology/Immunology, Scientific Coordinator Cancer Immunology and Immunotherapy Center Saint Savas Cancer Hospital, Athens
13. G.-Fivos Sargentis, Dr Engineer-Sculptor, Dept. of Water Resources; School of Civil Engineering, National Technical University of Athens

SCIENTISTS AND PROFESSIONALS FROM GUATEMALA

1. Christopher Lingle PhD Economics Universidad Francisco Marroquín

SCIENTISTS AND PROFESSIONALS FROM HUNGARY

1. *Laszlo Szarka, Geophysicist, O.M.; WCD Ambassador*
2. Dr. Dezso Csejtei, retired professor of philosophy at the University of Szeged
3. Dr. Endre Fuggerth, Chemist, lifelong experience in gas-chromatography
4. István Héjjas PhD, Retired R&D Electrical Engineering
5. József Király, Chemical Engineer and one of the Authors of the Hungarian site www.klimarealista.hu
6. Dr. József Majer, Senior Professor of Ecology and Environment Protection at University of Pecs
7. Gábor Simon MSc Chemical Engineering, University teacher General, Anorganic, Environmental and Analytic Chemistry

8. Dr. Gábor Szász, Professor Emeritus, College Professor Dennis Gabor College
Department of Economics and Engineering

SCIENTISTS AND PROFESSIONALS FROM INDIA

1. Dr. M.M. Ali, MSc in Meteorology and Oceanography with a PhD in Meteorology, Center for Ocean-Atmospheric Prediction Studies, Florida State University, USA
2. Dornadula Chandrasekharam, retired professor from Indian Institute of Technology Bombay, currently working in Izmir Institute of Technology as TUBITAK Professor working on geothermal energy systems
3. Vijay Jayaraj, Research Associate at CO2 Coalition, Contributor to Cornwall Alliance
4. Prem raj Pushpakaran, PhD in BioTechnology, Professor
5. Sanjeev Sabhlok, Economist with focus on Climate and Energy Policy

SCIENTISTS AND PROFESSIONALS FROM INDONESIA

1. Purwono Wahyudi, Entrepreneur and informed climate realist

SCIENTISTS AND PROFESSIONALS FROM IRELAND

1. *Jim O'Brien, Founder of the Irish Climate Science Forum, Expert Reviewer of IPCC AR6; WCD Ambassador*
2. Tom Baldwin, Electrical Engineer, specialist in Power System Security
3. Dr Timothy Dunne, DPsych, MSc, BA, ASFBPS, AFPSI, Consultant Clinical Psychologist, full member of the Psychological Society of Ireland and of the British Psychological Society
4. Gerald Fitzgibbon, Physical Chemist specializing in Electrochemistry and Thermodynamics
5. David Horgan, MA (Cambridge), MBA (Harvard), Resource Company Director
6. Seamus Hughes, BAgricSc, Specialist in Genetics
7. Mark Gerard Keenan, Former Science Advisor, Department of Energy and Climate Change, U.K., Former Environmental Affairs Officer, United Nations Environment Division, Geneva, Switzerland
8. Ultan Murphy, BSc (Hons) Chemistry, Industry Science Professional
9. Owen O'Brien, Business Founder and Entrepreneur, MBA, DBA
10. Patrick L O'Brien, MSc, MPhil, Senior International Environmental Consultant
11. Donal O'Callaghan, electrical engineer, retired food industry research scientist
12. J. Phillip O'Kane, Emeritus Professor, School of Engineering, University College Cork
13. Peter O'Neill, Retired, School of Engineering, University College Dublin, Expert Reviewer of IPCC AR6
14. Fintan Ryan, Retired Senior Airline Captain, Fellow Royal Aeronautical Society
15. Christian Schaffalitzky, FIMMM, Founder Institute of Geologists of Ireland, EurGeol
16. Norman Stewart PhD, former astrophysicist and meteorologist
17. Brian N. Sweeney, Founding Chairman of Science Foundation Ireland
18. Pat Swords, BE, CEng, FICHEME, PPSE, CEnv, MIEA, Challenger of Over-Reach in Environmental Legislation
19. Sean Tangney, Business Entrepreneur, Former Technical Director, CRH plc
20. David Thompson, BAgricSc, MA, Animal Nutritionist
21. Edward Walsh, Former Chairman, Irish Council for Science, Technology and Innovation, Former Director Energy Research Group, Virginia Tech, USA

SCIENTISTS AND PROFESSIONALS FROM ISRAEL

1. Dr. Gaby Avital PhD in Aerospace, member of the Israeli forum for rational environmentalism
2. Uriel Cohen, MSc in Computer Science from Technion - Israel Institute of Technology
3. Prof. Yonatan Dubi PhD, Professor of Theoretical Physics and Chemistry at Ben-Gurion University, co-founder of the Israeli Forum For Rational Environmentalism
4. Yakov Itenberg, BSc of Meteorology and Climatology, MSc of Physics Education, 25 years reserve meteorological officer of Israeli Defense Forces Home Front Command
5. Micha Klein PhD, Emeritus Professor, The Department of Geography and Environmental Studies

6. Nir J. Shaviv PhD in Physics at the Israel Institute of Technology, Professor of Physics at the Racah Institute at the The Hebrew University of Jerusalem

SCIENTISTS AND PROFESSIONALS FROM ITALY

1. *Alberto Prestininzi, Professore di Rischi Geologici, Honorary Cherman NHAZCA Università of Rome Sapienza, già Scientific Editor in Chief della Rivista Internazionale IJEGE e Direttore del Centro di Ricerca, Previsione, Prevenzione e Controllo dei Rischi Geologici (CERI); WCD Ambassador*
2. Pietro Agostini, Ingegnere, Associazione Scienziati e Tecnologi per la Ricerca Italiana
3. Aldo Aluigi, Nuclear Engineer, Consultant in Power Plants, Cogeneration end District Heating
4. Piero Baldecchi, Lettore
5. Achille Balduzzi, Geologo, Agip-Eni
6. Antonio Ballarin, Fisico, “Chief Artificial Intelligence Officer” di una pubblica amministrazione
7. Cesare Barbieri, Professore Emerito di Astronomia, Università di Padova
8. Donato Barone, Ingegnere
9. Sergio Bartalucci, Fisico, Presidente Associazione Scienziati e Tecnologi per la Ricerca Italiana
10. Giuseppe Basini, Astrofisico, Deputato, già dirigente di Ricerca dell’INFN
11. Franco Battaglia, Professore di Chimica Fisica, Università di Modena, Movimento Galileo 2001
12. Marco Benini, Ingegnere Idraulico, Libero Professionista
13. Eliseo Bertolasi, Dottore di Ricerca in Antropologia Culturale
14. Giorgio Bertucelli, Ingegnere, già Dirigente Industriale, ALDAI
15. Alessandro Bettini, Professore Emerito (Fisica) Università di Padova
16. Antonio Bianchini, Professore di Astronomia, Università di Padova
17. Luciano Biasini, Professore Emerito, già Docente di Calcoli Numerici e Grafici, Direttore dell’Istituto Matematico e Preside della Facoltà di Scienze Matematiche, Fisiche e Naturali dell’Università di Ferrara
18. Paolo Blasi, Professore Emerito (Fisica) e già Rettore dell’Università di Firenze, già Presidente della Conferenza dei Rettori delle Università Italiane
19. Enrico Bongiovanni, Dottore Commercialista
20. Paolo Bonifazi, Ex Direttore dell’Istituto di Fisica dello Spazio Interplanetario (IFSI) dell’Istituto Nazionale Astrofisica (INAF)
21. Roberto Bonucchi, Insegnante in Pensione
22. Giampiero Borrielli, Ingegnere
23. Francesca Bozzano, Professore di Geologia Applicata, Università di Roma La Sapienza, Direttore del Centro di Ricerca Previsione, Prevenzione e Controllo Rischi Geologici (CERI)
24. Antonio Brambati, Professore di Sedimentologia, Università di Trieste, Responsabile Progetto Paleoclima-mare del PNRA, già Presidente Commissione Nazionale di Oceanografia
25. Gianfranco Brignoli, Geologo
26. Marcello Buccolini, Professore di Geomorfologia, Università di Chieti-Pescara
27. Paolo Budetta, Professore di Geologia Applicata, Università di Napoli
28. Antonio Maria Calabrò, Ingegnere, Ricercatore, Consulente
29. Monia Calista, Ricercatore di Geologia Applicata, Università di Chieti-Pescara
30. Massimo Canali, Associate Professor of Agricultural Economics and Policy, Department of Agriculture and Food Sciences, University of Bologna
31. Cristiano Carabella, Geologo, Borsista presso l’Università di Chieti
32. Giovanni Carboni, Professore di Fisica, Università di Roma Tor Vergata, Movimento Galileo 2001
33. Peppe Caridi
34. Franco Casali, Professore di Fisica, Università di Bologna e Accademia delle Scienze di Bologna
35. Dr. Agronomo Fausto Cavalli, Agronomist, specialisation in meteorology
36. Giuliano Ceradelli, Ingegnere e Climatologo, ALDAI
37. Augusta Vittoria Cerutti, Membro del Comitato Glaciologico Italiano
38. Franco Di Cesare, Dirigente, Agip-Eni

39. Alessandro Chiaudani PhD, Agronomo, Università di Chieti-Pescara
40. Luigi Chilin, Dirigente in Pensione
41. Claudio Ciani, Relazioni Internazionali, Scienza Politica, Università di Roma La Sapienza
42. Edoardo Cicali, Membro del C.I.R.N (Comitato Italiano Rilancio del Nucleare) e dell'associazione "Atomi per la pace", ex Dipendente di un Centro Medico Radiologico ed Attualmente Impiegato nel Settore dell'Informatica
43. Pino Cippitelli, Geologo Agip-Eni
44. Carlo Colomba
45. Enrico Colombo, Chimico, Dirigente Industriale
46. Vito Comencini, Onorevole, Membro della Camera dei Deputati Italiana dal 2018
47. Enrico Conti, Physicist, Istituto Nazionale di Fisica Nucleare (INFN)
48. Ferruccio Cornicello, Fotografo e Lettore di Studi sul Clima
49. Domenico Corradini, Professore di Geologia Storica, Università di Modena
50. Carlo Del Corso, Ingegnere Chimico
51. Uberto Crescenti, Professore Emerito di Geologia Applicata, Università di Chieti-Pescara, già Magnifico Rettore e Presidente della Società Geologica Italiana
52. Fulvio Crisciani, Professore di Fluidodinamica Geofisica, Università di Trieste e Istituto Scienze Marine, Cnr, Trieste
53. Salvatore Custodero
54. Francesco Dellacasa, Ingegnere, Amministratore di Società nel settore Energetico
55. Alessandro Demontis, Perito Chimico Industriale, Tecnico per la Gestione delle Acque e delle Risorse Ambientali, Pomezia
56. Serena Doria, Ricercatore di Probabilità e Statistica Matematica, Università di Chieti-Pescara
57. Roberto d'Arielli, Geologo, Borsista presso l'Università di Chieti
58. Carlo Esposito, Professore di Rischi Geologici, Università di Roma La Sapienza
59. Gianluca Esposito, Geologo
60. Prof. Stefano Falcinelli PhD, Professor of Chemistry and Materials Technology, Department of Civil and Environmental Engineering, University of Perugia
61. Antonio Mario Federico, Professore di Geotecnica, Politecnico di Bari
62. Aureliano Ferri, Vicepresidente Associazione Piceno Tecnologie
63. Maurizio Fiorelli, Sommelier Professionale, studioso dell'evoluzione nella Coltivazione delle Vigne
64. Mario Floris, Professore di Telerilevamento, Università di Padova
65. Gianni Fochi, Chimico, Ricercatore in Pensione della Scuola Normale Superiore, Giornalista Scientifico
66. Sergio Fontanot, Ingegnere
67. Luigi Fressoia, Architetto Urbanista, Perugia
68. Mario Gaeta, Professore di Vulcanologia, Università di Roma La Sapienza
69. Stefano Galli MSc in Chemical Engineering, retired researcher
70. Sabino Gallo, Ingegnere Nucleare e Scrittore Scientifico
71. Stefano Gallozzi, Degree in Physics (old italian rules), Researcher at the INAF, Italian Institute for Astrophysics, Astronomical Observatory of Rome and presidente of the Safeguarding Astronomical Sky Foundation
72. Giuseppe Gambolati, Fellow della American Geophysical Union, Professore di Metodi Numerici, Università di Padova
73. Alessio Del Gatto, Liceo Scientifico, Collaboratore Attività Solare.it
74. Rinaldo Genevois, Professore di Geologia Applicata, Università di Padova
75. Umberto Gentili, Fisico dell'ENEA, Climatologo per il Progetto Antartide, ora in pensione
76. Enrico Ghinato, Perito Fisico
77. Mario Giaccio, Professore di Tecnologia ed Economia delle Fonti di Energia, Università di Chieti-Pescara, già Preside della Facoltà di Economia
78. Daniela Giannessi, Primo Ricercatore, IPCF-CNR, Pisa
79. Roberto Grassi, Ingegnere, Amministratore G&G, Roma
80. Roberto Graziano, Ricercatore di Geologia Stratigrafica e Paleoclimatologia/ Paleocceanografia, Università di Napoli, già Geologo presso il Servizio Geologico d'Italia
81. Alberto Guidorzi, Agronomo
82. Roberto Habel, Professore di Fisica Medica, Università di Cagliari
83. Thomas Kukovec, Tropical Agronomist and Subtropical Field Biologist in the private sector; specialised in semi-arid agriculture, ecophysiology and phytogeography of

Sahelian and Saharan plants. Scientific adviser and consultant in research-projects and learned societies

84. Nicola Iacovone, Physicist
85. Alberto Lagi, Ingegnere, Presidente di Società Ripristino Impianti Complessi Danneggiati
86. Dr Francesco Lamberti PhD in Material Science of the University of Padova, working on next generation PV
87. Luciano Lepori, Ricercatore IPCF-CNR, Pisa
88. Carlo Lombardi, Professore di Impianti Nucleari, Politecnico di Milano
89. Walter Luini, Geometra
90. Roberto Madrigali, Meteorologo
91. Angelo Maggiore PhD, INFN Senior Researcher, more than 40 years experience in research at CERN, Saclay, Dubna and Frascati
92. Franco Maloberti, Emeritus Professor, expert on microelectronics and modelling
93. Ettore Malpezzi, Ingegnere
94. Vania Mancinelli, Geologo, Borsista presso l'Università di Chieti
95. Ludovica Manusardi, Fisico Nucleare e Giornalista Scientifico, UGIS
96. Luigi Marino, Geologo, Centro Ricerca Previsione, Prevenzione e Controllo Rischi Geologici (CERI), Università di Roma La Sapienza
97. Maurizio Marsigli, Graduated in Geological Sciences and science author on the Sun and Space Meteorology
98. Alessandro Martelli, Ingegnere, già Dirigente ENEA
99. Francesco Martelli, Professor Emeritus of University of Florence, Former President of European Turbomachinery Society
100. Paolo Martini, consultant petroleum geologist with 30+ years of experience
101. Salvatore Martino, Professore di Geologia Applicata all'Ingegneria al Territorio ed ai Rischi, Università di Roma "Sapienza"
102. Maria Massullo, Tecnologa, ENEA-Casaccia, Roma
103. Enrico Matteoli, Primo Ricercatore, IPCF-CNR, Pisa
104. Paul P.A. Mazza, Associate Professor of Quaternary Geology and Paleontology and of Archeozoology, University of Florence
105. Paolo Mazzanti, Professore di Interferometria Satellitare, Università di Roma La Sapienza
106. Adriano Mazzarella, Professore di Meteorologia e Climatologia, Università di Napoli
107. Marcello Mazzoleni, Docente e imprenditore nel settore della formazione, fondatore del sito web MeteoSincero
108. Carlo Merli, Professore di Tecnologie Ambientali, Università di Roma La Sapienza
109. Enrico Miccadei, Professore di Geografia Fisica e Geomorfologia, Università di Chieti-Pescara
110. Gabriella Mincione, Professore di Scienze e Tecniche di Medicina di Laboratorio, Università di Chieti-Pescara
111. Umberto Minopoli, Presidente dell'Associazione Italiana Nucleare
112. Alberto Mirandola, Professore di Energetica Applicata e Presidente Dottorato di Ricerca in Energetica, Università di Padova
113. Aurelio Misiti, Professore di Ingegneria sanitaria-Ambientale, Università di Roma La Sapienza, già Preside della Facoltà di Ingegneria, già Presidente del Consiglio Superiore ai Lavori Pubblici
114. Maurizio Montuoro, Medico
115. Maria Luisa Moriconi, CNR researcher at Institute of Atmospheric Physics (retired) and associate to INAF until 2020
116. Renzo Mosetti, Professore di Oceanografia, Università di Trieste, già Direttore del Dipartimento di Oceanografia, Istituto OGS, Trieste
117. Daniela Novembre, Ricercatore in Georisorse Minerarie e Applicazioni Mineralogiche-petrografiche, Università di Chieti-Pescara
118. Francesco Oriolo, Professore di Impianti Nucleari, Università di Pisa
119. Paolo Emmanuele Orrù, Professore di Geografia Fisica e Geomorfologia, Università di Cagliari
120. Sergio Ortolani, Professore di Astronomia e Astrofisica, Università di Padova
121. Alessandro Pagano, Geologist
122. Giorgio Paglia, Geologo, Borsista presso l'Università di Chieti
123. Massimo Pallotta, Primo Tecnologo, Istituto Nazionale Fisica Nucleare

124. Antonio Panebianco, Ingegnere
125. Giuliano Panza, Professore di Sismologia, Università di Trieste, Accademico dei Lincei e dell'Accademia Nazionale delle Scienze, detta dei XL, vincitore nel 2018 del Premio Internazionale dell'American Geophysical Union
126. Prof. Andrea Pardini PhD, University of Florence
127. Antonio Pasculli, Ricercatore di Geologia Applicata, Università di Chieti-Pescara
128. Ernesto Pedrocchi, Professore Emerito di Energetica, Politecnico di Milano
129. Davide Peluzzi, Ambasciatore del Parco Nazionale del Gran Sasso e dei Monti della Laga nel Mondo nel 2017
130. Corrado Penna, Docente di Matematica
131. Enzo Pennetta, Professore di Scienze Naturali e Divulgatore Scientifico
132. Gianni Pettinari, Impiegato Amministrativo, Fondatore del gruppo Facebook: "Falsi allarmismi sul riscaldamento globale"
133. Alessandro Pezzoli, Ricercatore Universitario e Professore aggregato in Weather Risk Management, Politecnico di Torino e Università di Torino
134. Tommaso Piacentini, Professore di Geografia Fisica e Geomorfologia, Università di Chieti-Pescara
135. Stefano De Pieri, Ingegnere Energetico e Nucleare
136. Paolo M.J. Pilli, Pensionato
137. Massimo Pilolli PhD Physics, Physicist, Meteorologist, Teacher
138. Mirco Poletto, Geologo libero professionista, registered at 'Ordine dei geologi del Veneto'
139. Andrea Pomozi, Presidente Associazione Piceno Tecnologie
140. Guido Possa, Ingegnere Nucleare, già Viceministro del Ministero dell'Istruzione, Università e Ricerca con delega alla Ricerca
141. Alfonso Pozio PhD, Senior Researcher, ENEA CR Casaccia, Rome
142. Giorgio Prinzi, Ingegnere, Direttore Responsabile della Rivista "21mo Secolo Scienza e tecnologia"
143. Franco Prodi, Professore di Fisica dell'Atmosfera, Università di Ferrara
144. Franco Puglia, Ingegnere, Presidente CCC, Milano
145. Francesca Quercia, Geologo, Dirigente di Ricerca, Ispra
146. Nunzia Radatti, Chimico, Sogin
147. Arnaldo Radovix, Geologo, Risk Manager in Derivati Finanziari
148. Maurizio Rainisio, Mathematician, Lifetime career in Clinical Development and Epidemiology
149. Mario Luigi Rainone, Professore di Geologia Applicata, Università di Chieti-Pescara
150. Mario Rampichini, Chimico, Dirigente Industriale in Pensione, Consulente
151. Arturo Raspini, Geologo, Ricercatore, Istituto di Geoscienze e Georisorse (IGG), Consiglio Nazionale delle Ricerche, Firenze
152. Renato Angelo Ricci, Professore Emerito di Fisica, Università di Padova, già Presidente della Società Italiana di Fisica e della Società Europea di Fisica, Movimento Galileo 2001
153. Marco Ricci, Fisico, Primo Ricercatore, Istituto Nazionale di Fisica Nucleare
154. Renzo Riva, Comitato Italiano Rilancio Nucleare (C.I.R.N.), Buja
155. PierMarco Romagnoli, Ingegnere, Milano
156. Vincenzo Romanello, Ingegnere Nucleare, Ricercatore presso il Centro di Ricerca Nucleare di Rez, Repubblica Ceca
157. Piergiorgio Rosso, Ingegnere Chimico
158. Stefano Rosso, Insegnante di Geografia, Storia e Italiano, Scuola Secondaria, Modena
159. Alberto Rota, Ingegnere, Ricercatore presso CISE ed ENEL, Esperto di Energie Rinnovabili
160. Ettore Ruberti, Ricercatore ENEA, Docente di Biologia Generale e Molecolare
161. Giancarlo Ruocco, Professore di Struttura della Materia, Università di Roma La Sapienza
162. Sergio Rusi, Professore di Idrogeologia, Università di Chieti-Pescara
163. Massimo Salleolini, Professore di Idrogeologia Applicata e Idrogeologia Ambientale, Università di Siena
164. Nicola Scafetta, Professore di Fisica dell'Atmosfera e Oceanografia, Università di Napoli
165. Emanuele Scalcione, Responsabile Servizio Agrometeorologico Regionale ALSIA, Basilicata

166. Nicola Sciarra, Professore di Geologia Applicata, Università di Chieti-Pescara
167. Francesco Sensi, Generale di Divisione Aerea (R)
168. Massimo Sepielli, Direttore di Ricerca, ENEA, Roma
169. Leonello Serva, Geologo, Accademia Europa delle Scienze e delle Arti, Classe V, Scienze Tecnologiche e Ambientali, già Direttore Servizio Geologico d'Italia
170. Roberto Simonetti, Geologo, R&D c/o Azienda S.I.I.
171. Elio Sindoni, Professore Emerito dell'Università di Milano Bicocca
172. Enzo Siviero, Professore di Ponti, Università di Venezia, Rettore dell'Università e-Campus
173. Rinaldo Sorgenti, Deputy Chairman of ASSOCARBONI
174. Ugo Spezia, Ingegnere, Responsabile Sicurezza Industriale, Sogin, Movimento Galileo 2001
175. Luigi Stedile, Geologo, Centro di Ricerca Previsione, Prevenzione e Controllo Rischi Geologici (CERI), Università di Roma La Sapienza
176. Emilio Stefani, Professore di Patologia Vegetale, Università di Modena
177. Flavio Tabanelli, Fisico
178. Maria Grazia Tenti, Geologo
179. Umberto Tirelli, Visiting Senior Scientist, Istituto Tumori d'Aviano, Movimento Galileo 2001
180. Giorgio Trenta, Fisico e Medico, Presidente Emerito dell'Associazione Italiana di Radioprotezione Medica, Movimento Galileo 2001
181. Roberto Vacca, Ingegnere e Scrittore Scientifico
182. Gianluca Valensise, Dirigente di Ricerca, Istituto Nazionale di Geofisica e Vulcanologia, Roma
183. Prof. Paolo Sebastiano Valvo PhD - Associate Professor of Solid and Structural Mechanics, University of Pisa
184. Corrado Venturini, Professore di Geologia Strutturale, Università di Bologna
185. Flavio Vetrano, Honorary Professor of General Physics, DiSPeA, University Carlo Bo, Urbino
186. Benedetto De Vivo, Professore di Geochimica in Pensione dall'Università di Napoli, ora Professore Straordinario presso Università Telematica Pegaso, Napoli
187. Andrea Zaccone, Geologo, Dirigente Protezione Civile Regione Lombardia
188. Luigi Zanotto, Docente in Pensione
189. Franco Zavatti, Ricercatore di Astronomia, Università di Bologna
190. Antonino Zichichi, Professore Emerito di Fisica, Università di Bologna, Fondatore e Presidente del Centro di Cultura Scientifica Ettore Majorana di Erice

SCIENTISTS AND PROFESSIONALS FROM JAPAN

1. Masayuki Hyodo, Professor of Earth Science, Kobe University
2. Yoshihiro Muronaka, Professional Engineer, PE Office President, Energy & Environment
3. Mototaka Nakamura, Atmospheric and Oceanic Scientist (ScD in Meteorology, MIT)
4. Dr. Hiroshi L. Tanaka, Professor in Atmospheric Science, Centre for Computational Sciences, University of Tsukuba

SCIENTISTS AND PROFESSIONALS FROM KUWAIT

1. Mohammad A. AlKhamis, DVM, MPVM, PhD, Assistant Professor of Epidemiology, Department of Epidemiology and Biostatistics, Faculty of Public Health, Health Sciences Center, Kuwait University

SCIENTISTS AND PROFESSIONALS FROM MALAYSIA

1. Chris Schoneveld, Earth Scientist and Retired Shell Exploration Geophysicist

SCIENTISTS AND PROFESSIONALS FROM MALTA

1. Joseph Attard, Retired Scientist, PhD chemical engineering MSc Electronics Communication

SCIENTISTS AND PROFESSIONALS FROM MEXICO

1. Rubén Coronal Méndez, Master degree in Applied Economics, Industrial Engineer
2. Luis Frausto, Chemical Engineer
3. Armando Páez PhD, Urbanism, Expert in Sustainability and Energy Transitions
4. Victor Manuel Velasco Herrera PhD, Space Engineer

SCIENTISTS AND PROFESSIONALS FROM NAMIBIA

1. Dr Simon Idris Beshir, Cardiologist, currently involved in Green Project in Kalahari Desert

SCIENTISTS AND PROFESSIONALS FROM THE NETHERLANDS

1. *Prof. Dr. Ir. Guus Berkhout, Emeritus Professor of Geophysics, Delft University of Technology, Member of the Royal Netherlands Academy of Arts and Sciences; WCD Ambassador*
2. *Dr. Cornelis le Pair, Physicist, Former CEO Physics & Technology Research Organisations; WCD Ambassador*
3. Jan H. Akkerman MSc, Structural Geology, worked 19 years with Billiton in Mining and Geology and the last 20 years with DGA van Akkerman Exploration BV
4. Maarten van Andel, Author of the 'Groene Illusie'
5. Jan Asselbergs, Mechanical Engineer who started his career with IHC. Since 1990 he is active in revitalizing medium sized companies
6. Dries Ausems MSc, Earth Sciences, Lifetime Experience as Geologist in the Geo-Energy Industry
7. René Bakers, Former Lawyer and Attorney Liability and Insurance
8. Dr. Thomas W. Bakker, Lifetime Experience in the Geo-energy Industry, Founder and former (or retired) CEO of Well Engineering Partners BV
9. Robert Becht, Lifetime R&D Experience in Water Management with emphasis on water management in East Africa
10. Frans van den Beemt, Nuclear Physicist, Former Program Director Technology Foundation STW
11. Drs. A (Toine) J. A. Beukering, Bgen (b.d.), Member of the Provincial Council of Zuid Holland, Member of the Senate (Eerste Kamer) of the Dutch Parliament (the States General)
12. Jim van Beusekom, Retired Captain B747-400 with KLM, 35 years observational knowledge of the Earth's atmosphere
13. Maarten Biesheuvel MSc and PhD Chemical Technology, University of Twente, Senior Scientist Chemical Engineering and Water Technology, Wetsus
14. Andre Bijkerk, Retired Officer Royal Dutch Air Force, now Climate Researcher
15. Dr. Frans Bijlaard, professor-emeritus steel constructions, TU Delft
16. Dr. Ruud Binnekamp Msc. Integral Design and Management, teacher and researcher in design and decision systems at TU Delft
17. Peter Bloemers, Emeritus Professor of Biochemistry, Radboud University, Nijmegen
18. Albert F.T. de Booij †, Founder Speakers Academy Int. BV, Founder en CEO World of Consciousness.com
19. Hans Bouman MSc, Chemistry, Professional in Production Technology and Asset Management
20. Dr. Ir. Arnold Bovy, retired, former Director Energy Transmission Company MEGALIMBURG
21. Ben Braam Msc in Physics, lifetime career in space instrumentation
22. Paul M.C. Braat, Emeritus Professor of Pulmonary Physics, University of Amsterdam
23. Solke Bruin, Emeritus Professor of Product-driven Process Technology, University of Eindhoven and Former Member Management Committee Unilever Research, Vlaardingen
24. Dr. Theo Claassen, Aquatic Ecologist
25. Paul Cliteur, Professor of Legal Sciences, Member of the Senate of The Netherlands
26. Albert J.H.G. Cloosterman, Retired Chemical Engineer, Publicist on Climate and Cosmological Matters
27. Charles Coleman, former executive Olivetti Group International
28. Marcel Crok, Climate Researcher and Science Journalist

29. Gerhard Diephuis MSc, Geosciences, specialized in Geophysics, Lifetime Experience in the Geo-Energy Industry, Guest Lecturer TU Delft
30. Henck van Dijck, Sculptor, designer and innovator
31. David E. Dirkse, Former Computer Engineer and Teacher Mathematics
32. Dr. Tjibbe Dokter MBA, Expert in Scenario Analysis and Risk Assessment, retired from AkzoNobel
33. Marco Draaisma, ICT Process Coördinator
34. Vincent van Driel, MSc Mechanical Engineering TU Delft, Design and Construction of gas/oil processing plants, Retired
35. Dr. Jan W. Drukker, Emeritus Professor Industrial Design Delft University of Technology, University of Twente and (Visiting Professor) Tsinghua University (Beijing PRC). Elected Member Regional Parliament of the Dutch Province Drenthe
36. Arjan Duiker, Process Technologist at Tata Steel, specialist on Thermodynamics and Fluid Mechanics
37. Louw Feenstra, Emeritus Professor Erasmus University and Philosopher, Rotterdam
38. Arnold Fellendans, Physics at TU Delft, 40 years at Unilever (retired), www.omdearde.nl
39. Frans Galjee, Mechanical Engineer, Retired Researcher at ECN
40. Jan van Gils, Teacher in Physics
41. Henk Goemans MSc, Geosciences, specialized in Reservoir Engineering
42. Frans H Gortemaker, Former Vice president Unilever Global R&D
43. W. J. Evert van de Graaff, Consulting Geologist, 50+ years Global Experience
44. Ton J.T. Grimberg, Oil & Gas Professional, Finance Adviser
45. Katharina Grimm Msc Agroecology and Sustainable Food Systems, Project Leader energy transition at the municipality of Epe
46. Kees de Groot, Former Director Upstream Research Lab. Shell
47. Paul de Groot PhD, Geoscience, Manager dGB Earth Sciences
48. Lex A. van Gunsteren, Marine propulsion expert, former director of Corporate Planning and R&D of the Royal Boskalis Westminster Group, former professor of Technology at TU Delft and Erasmus University
49. Leo Halvers, Former Director Billiton Research Arnhem and Former Director Technology Foundation STW
50. Hans Hamaker, University Degree in Phonetic Sciences, expert in biomechanics of speech, supporter of plasma cosmology, former wireless communication officer
51. Maarten Hardon BSc, Civil Engineering, Lifetime Experience in Offshore Industry, Director Venty BV
52. Eduard Harinck, Former Logistics Expert, Nedlloyd Group/KPMG Consulting
53. Godard Hazeu MSc, Geosciences, specialized in Geology, past Technical Director of the Dutch State Oil and Gas Company EBN
54. Edward Heerema Msc in Civil Engineering TU Delft, President of Allseas, worldwide active in offshore pipelaying and platform lifting
55. J.R Hetzler, Retired WUR Engineer Forestry Economics
56. Dr. Tom van der Hoeven, Energy Transport Modeling Expert
57. Dr. Martijn Hoevenaar, Independent Researcher, Physics, Education, Medicine
58. Jan F. Holtrop †, Emeritus Professor of Petroleum Engineering, Delft University of Technology
59. Hans Hombroek MSc, Geoscience, Lifetime Experience in the International Geo-Energy Industry
60. Tom Hoornstra, Air-conditioning Engineer
61. Jan Horstink, Earth Scientist, Exploration Projects Oil & Gas ME & FE
62. A. Huijser, Physicist and Former CTO Royal Philips Electronics
63. Jan de Jager, emeritus professor Geology (VU University Amsterdam, University of Utrecht)
64. Jan C. de Jong Msc Process Engineering TU Delft, expert in energy-and thermal process engineering, lifetime career in the oil and gas industry
65. Jan de Jong, former director Sampo Industrial Insurance NV. Benelux and Electraris Verzekeringsmaatschappij N.V.
66. Wouter J. Keller, Emeritus Professor of Statistical Methods, Former Member Board of Directors, Central Bureau of Statistics (CBS)
67. Jacques van Kerchove, Economist and Marketeer, Former CFO Rabobank, now Climate and Environment Researcher

68. Henri G. Kerkdijk-Otten, Msc History, University of Nijmegen (graduated in 1998), Founder and chairman of Restoring Africa's Wildlife Foundation, Founder and former chairman (until august 2017) of True Nature Foundation <https://truenaturefoundation.org/>
69. Rob de Kok, Principal Geophysicist, researching Influence of CO2 on Atmospheric Temperatures
70. Hans Kolmschate, Chemical Engineer, University of Twente
71. Henk de Koning MSc, former Principal Management Consultant Atos Consulting with specialisation Logistics, IT and Information Security
72. Rob W.J. Kouffeld †, Emeritus Professor of Energy Conversion, Delft University of Technology
73. Hans H.J. Labohm, Former Expert Reviewer IPCC
74. Arjan Lenoir, MSc Industrial Sciences
75. B.G. Linsen, Former Director Unilever Research Vlaardingen
76. Jaap M. van Luijk, Msc. Petroleum Engineering, lifetime experience in the international geo-energy industry
77. Pieter Lukkes, Emeritus Professor of Economic and Human Geography, University of Groningen
78. Hugo Matthijssen, Former Teacher Meteorology, now Publicist on Climate Matters
79. Leo D. Minnigh, retired scientist in structural geology, lecturer/speaker for non-professionals
80. Dr. Rob Mooij, PhD in Nuclear Physics at University of Utrecht, MS Computer Science at Drexel University, Philadelphia, Retired as Medical Physicist from University of Pennsylvania
81. Ir. J.M. Mulderink, Former General Director Akzo-Nobel
82. Rob Nijssen, Radar Engineer and Publicist on Climate Matters
83. Rutger van den Noort PhD, Advisor in Innovation Processes, CEO Newcalf
84. Dr. Chris Oldenhof PhD in Photochemistry, Retired from the Dutch chemical company DSM
85. Peter Oosterling, Former Scientist E & P Shell, now active as Climate Researcher
86. Daan Osinga, Geologist
87. Kees Pieters, Mathematician, Former Operational Research and ICT manager at Shell
88. Robert J van der Plas MSc Applied Physics, MSc Development Studies, Sustainable Energy Management and Development Specialist
89. Reynier Pronk, Former IT Manager, Accredited Project Management Consultant and Trainer
90. Paul Ras Msc Geophysics TU Delft, Geophysical Consultant, climate realist
91. Ir B. Peter Rauwerda Msc. in nuclear engineering, TU Delft
92. Louis M.P.T. van den Reek, PharmD, Member of 'De Groene Rekenkamer'
93. Jan C. Reinoud, retired CEO Dutch chain of Supermarkets
94. A.G. Reitsma, MSc in Social technology, planned change (University of Groningen 1978) Social Technician
95. Kees Remi, Electrical Engineer, lifetime experience in Energy Distribution and Industrial Automation
96. Joseph Reynen, Finite Element Modeling Expert, Retired from EU Joint Research Centre in Ispra, Emeritus Associate professor TU Delft
97. G.T. Robillard, Emeritus Professor of Biochemistry and Biophysics
98. Jaap Romijn Msc in Civil Engineering TU Delft, lifetime experience in water management projects
99. Kees Roos, Emeritus Professor of Optimization Technology, Delft University of Technology
100. Rutger van Santen, Emeritus Professor of Anorganic Chemistry and Catalysis, Former Rector Magnificus, Eindhoven University
101. Don Schäfer, Former Director Shell Exploration & Production and New Business, Shell
102. Juleon Schins PhD in Molecular Physics, specialist in near infrared spectroscopy
103. Dr. Rob Schoevaart, Biocatalist, Co-founder and Managing Director of ChiralVision, being specialised in making chemical processes greener
104. Frans Schrijver, Strategy Consultant and Climate Publicist
105. Bert Sigmond, Geologist, Founder of EuGeNe Company in Geothermal Energy
106. Hendrick Smit, Chemical Engineer, specialised in Environmental Instrumentation
107. Jos de Smit, Emeritus Professor of Stochastic Operations Research and Former Rector Magnificus of the University of Twente

108. Barend-Jan Smits, Geologist, Former Director of Wintershall Nederland, BASF Group
109. Jack van Soest BSc, Geography teacher (retired)
110. Dr. Engel van Spronsen PhD in Physics, Lifetime career in Shell as researcher, reservoir engineer, and technical manager. After Shell he also worked for Maersk Oil, IMPaC Engineering, and Eneco
111. Albert Stienstra †, Emeritus Professor of Computer Simulation and Micro-Electronics, Delft University of Technology
112. P.J. Strijkert, Former Member Board of Directors of DSM, Delft
113. Hans van Suijdam, Former Executive Vice President Research and Development DSM
114. Dick Swart, MSc; worldwide drilling expert, lifetime of experience in the geo-energy industry
115. Dr. Harry C. M. de Swart, Emeritus Professor of Logic and Language Analysis, University of Tilburg and Erasmus University Rotterdam, Author of the book 'Philosophical and Mathematical Logic'
116. Peter van Toorn, Former Research Geophysicist Shell
117. Fred Udo, Emeritus Professor of Nuclear Physics, Vrije Universiteit Brussels
118. Ir. Arnold Uijlenhoet, retired electrical engineer with degree from Technical University Delft and postgraduate studies at the University of Pittsburgh (U.S.A). Lifetime international experience in power generation, transmission, and distribution
119. Maarten Vasbinder MD, specialized in prion theories and practice
120. J.F. van de Vate, Former Director ECN, Petten, Former UN Delegate IPCC
121. Jan Verheij, Retired Scientist Applied Physics at TNO Delft, Emeritus Professor of Noise Control Engineering at Eindhoven University of Technology
122. Hans Verschuur MSc, Geosciences, specialized in Mining
123. H. Verveer, Civil Engineer, lifetime experience in maritime infrastructure and building services
124. Jannes. J. Verwer, Former Director ECN and Former Chairman Supervisory Board State Owned Radio Active Waste Storage Facilities
125. Dr Koen Vogel, Geologist and Geostatistician, lifetime experience in numerical modelling, proficient in evaluating and developing global energy projects
126. Henk van der Vorst, Emeritus Professor of Numerical Mathematics, University of Utrecht
127. Bart Vos, Msc Petroleum Engineering, Lifetime of Experience in the Geo-energy Industry
128. Rob de Vos, Geographer and Editor of "Klimaatgek"
129. Henk de Vries, lifetime experience in organised crime, expert in digital forensics
130. Jaap van der Vuurst de Vries, Emeritus Professor of Petroleum Engineering, Former Dean Faculty of Applied Earth Sciences, Delft University of Technology
131. Dr. Jules de Waart PhD in Physical Geography, Exploration Geologist in Africa, Past-member of the Dutch Parliament, author of the book on Climate Change and Energy Transition "Don't believe everything"
132. Dr. André Wakker, energy expert, lifetime experience in nuclear energy, speaker and writer on energy transition
133. Karel Wakker, Emeritus Professor of Astrodynamics & Geodynamics, Delft University of Technology
134. Robert N. Walter MSc E.E., Member Advisory Board 'De Groene Rekenkamer'
135. Cyril Wentzel, Multi-Physics Engineer and Chairman of Environmental Think Tank 'Groene Rekenkamer'
136. Frans A. van der Werf, Master of Law, Owner of an International Business for Management, Consultancy and Finance
137. Dolf van Wijk, Formerly AkzoNobel Environmental Research Laboratory and Former Executive Director Cefic-Euro Chlor, Brussels
138. Jaap Wijsman, Mechanical Engineer, active in the offshore industry
139. Jan Winkel MSc, Chemical Engineering, specialization in Natural Gas Projects, Lifetime Experience in the Geo-Energy Industry
140. Theo te Winkel, Geo Scientist and International Health Care Specialist
141. W.J. Witteman, Professor of Applied Physics and CO2 Lasers, University of Twente
142. Dr. Hans Wolkers PhD in Dierfysiologie en natuurbeheer en ruim 20 jaar onderzoekservaring, onder andere in arctische ecotoxicologie, nu actief als wetenschapsjournalist en universitair docent in 'Schrijven over Wetenschap'
143. Theo Wolters, Chairman Environment, Science & Policy Foundation, Co-founder 'Groene Rekenkamer' and 'Climategate.nl'

144. Govert Zijderfeld, MSc Mining Engineering, Consultant for all Drilling, Mining and Naval Engineering activities
145. Dr. E.J. (Ed) Zuiderwijk, Retired Astrophysicist and Data Manager
146. Diederik Zwager MSc Petroleum Engineering, CEO Air Drilling Associates

SCIENTISTS AND PROFESSIONALS FROM NEW ZEALAND

1. *Barry Brill OBE, Previously Minister of Science and Technology; WCD Ambassador*
2. Deborah Alexander, Agricultural Scientist
3. Jock Allison, Retired Agricultural Scientist, Ministry of Agriculture
4. Paul A. Catchpole, Qualified Land Surveyor & Fellow of New Zealand Institute of Surveyors, Retired Ex Commissioner of the New Zealand Environment Court
5. Roger High Dewhurst, Retired, Geologist/Hydrogeologist
6. Terry Dunleavy † MBE, Co-Founder (2006) and Honorary Secretary New Zealand Climate Science Coalition
7. Geoffrey G. Duffy, Professor Emeritus, University of Auckland
8. Doug Edmeades, Managing Director agKnowledge Ltd.
9. Professor Michael J Kelly, MA, PhD, SCD, MAE, Emeritus Prince Philip Professor of Technology at the University of Cambridge, Fellow of the Royal Society, Fellow of the Royal Academy of Engineering, Fellow of the Institute of Physics, Fellow of the Institution of Engineering and Technology, Senior Member of the Institute of Electronic and Electrical Engineering
10. Joe Fone, CAD Engineer, Enatel Ltd.
11. Gary Kerkin, Retired Chemical Engineer, Upper Hutt. Executive member New Zealand Climate Science Coalition
12. Brian Leyland, Power Systems Engineer and Experienced Renewable Energy Specialist
13. Gerrit J. van der Lingen, Geologist and Paleoclimatologist, New Zealand, Author of the Book "The Fable of Stable Climate"
14. Dr. John Maunder, Climate Scientist, President of the WMO Commission for Climatology 1989-1996
15. Dr Richard Reaney, Climate Researcher, Post Graduate Qualification in Antarctic Studies, University of Canterbury New Zealand
16. Darag S. Rennie MBChB, Lifetime explorer of truth
17. John Scarry ME (Civil), Structural Engineer, Member of the New Zealand Climate Science Coalition
18. John Sexton, Member of the New Zealand Climate Coalition
19. David Shelley, Emeritus Associate Professor Geology and latterly Dean of Postgraduate Studies, University of Canterbury, Christchurch
20. David Steward, Electronic Engineer, Supporter of truth seeking in climate change
21. Philip Strong, Science Research Leader & Member of the New Zealand Climate Coalition
22. Richard Treadgold, Executive Member NZ Climate Scienc Coalition, Convenor Climate Conversation Group
23. Ian Wright, Professional Geologist

SCIENTISTS AND PROFESSIONALS FROM NORWAY

1. *Ivar Giaever, Nobel Laureate Professor, Nobel Prize Winner in Physics, Emeritus Professor of the Rensselaer Polytechnic Institute, Chief Technology Officer of Applied Biophysics Inc., Fellow of the American Physical Society; Honorary WCD Ambassador*
2. *Jan-Erik Solheim, Professor Emeritus Astrophysics, University of Tromsø – The Arctic University of Norway; WCD Ambassador*
3. Gunnar Abrahamsen, Professor Emeritus Soil Science, University of Life Sciences
4. Knut Åm, retired geoscientist, holding positions at the Geological Survey of Norway, the Norwegian Petroleum Directorate, Statoil (R&D Manager), several positions with Phillips Petroleum Company both in Norway and the United States and adjunct Professor of Geophysics at the University of Bergen, Norway. Knut Åm is Honorary member of The Norwegian Academy of Technological Sciences
5. Egil Bergsager MSc of UCLA, and also University of Oslo, Petroleum Geologist, Director Norwegian Petroleum Directorate, President Rogaland Science Park. Board member of many advanced technology companies

6. Stein Sorlie Bergsmark, Physicist, Former Head of Renewable Energy Studies Programmes, University of Agder
7. Einar R. Bordewich, multidiscipline Engineering
8. Dr. Hans Borge, Associate Professor in Mathematics, University of Stavanger
9. Reidar Borgstrøm, Professor Emeritus in Fishbiology and Nature Conservation, University of Life Sciences
10. Ole Henrik Ellestad, Physical Chemist. Former Research Director and Professor in Petrochemistry at the Centre for Industrial Research and University of Oslo. Former Managing Director of Norwegian Computer Centre. Former Division Director of Norwegian Research Council. Previous Chairman of the Board, Klimarealistene
11. Jon Gulbrandsen PhD, Biologist, Associate Professor NOFIMA and NOAA (USA)
12. Arve Gleissner Gustavsen, Msc in Cybernetics, Lifelong Experience in Design and Engineering
13. Rögnvaldur Hannesson, Professor Emeritus, Norwegian School of Economics
14. Geir Hasnes, Adjunct Associate Professor, Institute of applied Cybernetics, Norwegian University of Science and Technology
15. Martin Torvald Hovland, Geophysical and Geological Advisor, Former Lecturer at University of Tromsø
16. Ole Humlum, Professor Emeritus in Physical Geography, University of Oslo
17. Morten Jødal †, Biologist, Former Employee of the Norwegian Research Council and the Centre for the Development and Environment at the University of Oslo
18. Dr. Ing. Hans Konrad Johnsen, Dr. Ing.
19. Olav Martin Kvalheim, Emeritus Professor, Chemistry, Bergen University
20. Arnfinn Langeland, Professor Emeritus Biology, Norwegian University of Science and Technology
21. Mikael Lindgren, MS Applied Physics and electronics, PhD Chemical Physics, Prof Applied Physics (Optics) and Biophysics (spectroscopy)
22. Willy Nerdal, Professor of Chemistry, University of Bergen
23. Johannes Oraug, Landscape Architect, Researcher for 11 years at the Norwegian Institute for Urban and Regional Research
24. Egil Pedersen, Dr. Eng. and Professor of Technology at UiT The Arctic University of Norway
25. Elen Roaldset, Emeritus Professor in Geology, University of Oslo, Former Director of Natural History Museum Oslo, Professor at Norwegian University of Science and Technology
26. Ulf Torgny Rock, Master of Chemical Engineering, Norsk Hydro
27. Håkon Gunnar Rueslåtten, Geological Researcher, Trondheim
28. Tom V. Segalstad, Associate Professor Emeritus of Geochemistry, University of Oslo
29. Einar Sletten PhD, Professor in the Dept of Chemistry, University of Bergen
30. Jørgen Stenersen, Professor Emeritus Eco-Toxicology, University of Oslo

SCIENTISTS AND PROFESSIONALS FROM PARAGUAY

1. Albrecht Glatzle, Retired Director Research of INTTAS (Iniciativa para la Investigación y Transferencia de Tecnología Agraria Sostenible)

SCIENTISTS AND PROFESSIONALS FROM THE PHILIPPINES

1. Melanchthon Bernil, Professional Chemical Engineer

SCIENTISTS AND PROFESSIONALS FROM POLAND

1. Marek Boinski, Chairman of the National Section of Energy Workers' Union NSZZ
2. Zbigniew Gidzinski, Advisor to the Chairman of the Silesian Region of the Solidarity Union in charge of the climate policy as well as a former Secretary of the National Energy Security Team of the Chancellery of the President of Poland
3. Jaroslaw Grzesik, Chairman of the National Secretariat of Mine and Energy Workers' Union NSZZ
4. Dominik Kolorz, Chairman of the Slasko-Dabrowski Region of NSZZ

SCIENTISTS AND PROFESSIONALS FROM PORTUGAL

1. Demétrio Carlos Alves, Chemical Engineer, specialized in Processes and Systems, Postgraduate in Legal Issues of Urban Planning, University of Lisbon
2. Rui Cruz, Pharmaceutical Development Scientist, PhD In Chemical and Biological Engineering (Material Science Focus for Solar Energy Applications)
3. Pieter IJzerman, entrepreneur in modern energy solutions and electric mobility
4. J.M.S. Martins, retired agrarian researcher
5. Pamela Matlack-Klein, Member of Portuguese Sea Level Project, USA
6. Dr. Peter Stallinga, Professor Associado com Agregação, Universidade do Algarve, Portugal, Faculty of Sciences and Technology, Department of Electronic Engineering and Informatics
7. João Tilly, Mechanical Engineer and Maths teacher

SCIENTISTS AND PROFESSIONALS FROM ROMANIA

1. Marius Bratu, Senior Meteorologist, short and medium range weather forecast

SCIENTISTS AND PROFESSIONALS FROM RUSSIAN FEDERATION

1. Habibullo Abdussamatov, Head of the Space Research Sector of the Sun, Pulkova Observatory RAS and Head of the Lunar Observatory Project on Monitoring of the Climate
2. Prof. Vladimir N. Bashkin, DrSc (biol), Professor in Biogeochemistry and Risk Assessment in Moscow State University, Cornell University, Seoul National University, Bangkok King Mongkut Technological University; vice-chairperson of WG of UN Convention on Long-Range Transboundary Air Pollution and PR in the Institute of Physico-chemical and Biological Problems of Soil Sciences RAS, Pushchino, Russia
3. Pavel Bizyukov PhD in Metallurgical Engineering, faculty member at Moscow State Institute of Steel and Alloys
4. Gleb I. Evgenev, Professor of Environment, Moscow State Technical University (MADI)
5. Vladimir G. Kossobokov, Chief Scientist, Professor Expert, Russian Academy of Sciences Past Vice-Chair, IUGG "GeoRisk" Commission (IUGG Commission on Geophysical Risk and Sustainability) Core Member, ISSO (International Seismic Safety Organization)
6. Eugene Nagibin, MA in Economics, CIR, Territorial Development and Management Consultant
7. Henni Ouerdane, Assistant Professor, Manager of the Energy Systems PhD Programme, Skolkovo Institute of Science and Technology, Moscow Region
8. Dr. Michael Petelin, professor of the University of Nizhny Novgorod, head researcher of the Institute of Applied Physics, Nizhny Novgorod

SCIENTISTS AND PROFESSIONALS FROM SAUDI ARABIA

1. Christopher M. Fellows PhD, physical chemist

SCIENTISTS AND PROFESSIONALS FROM SERBIA

1. Ivan Stefanovic, Curator of collection, Faculty of Mining and Geology, University of Belgrade

SCIENTISTS AND PROFESSIONALS FROM SINGAPORE

1. Andrew Frazer, offshore drilling, earth sciences and renewables
2. Dr. Lars Schernikau, Energy Economist, Entrepreneur & Author

SCIENTISTS AND PROFESSIONALS FROM SLOVENIA

1. Borut Bohanec, Emeritus Professor of Biotechnology, active to explain major missinterpretations of scientific discoveries
2. Ján Lakota MD, PhD molecular biology
3. Rafael Mihalič, Professor of Electrical Engineering, University of Ljubljana

SCIENTISTS AND PROFESSIONALS FROM SOUTH AFRICA

1. Rosemary Falcon, Emeritus Professor Clean Coal Technology Research Group at the University of Witwatersrand, Director Fossil Fuel Foundation
2. Dennis Shaun Garisch BSc (Civil) Eng, Professional Engineer registered with Engineering Council of South Africa (ECSA), over 30 years of practice, inclusive of many storm water management designs
3. Dr Hans Hofmann-Reinecke, nuclear physicist, author of several books “Grün und Dumm”, articles and videos on global warming and alternative energies for the general public
4. Rob Jeffrey, Economic Risk Consultant: Senior Economist and Managing Consultant, leading expert in energy and electricity
5. Kelvin Kemm PhD, Nuclear Physicist, CEO Nuclear Africa, Pretoria
6. Dr. John Ledger PhD, Visiting Associate Professor at the University of the Witwatersrand, Energy and Environmental Consultant, Consulting Editor, Freelance Writer, Editor and Lecturer
7. Prof. Richard Meissner, Associate Professor, Department of Political Sciences, University of South Africa
8. Don Mingay, Retired Professor of Nuclear Physics
9. Dr. Henrique J.S. de Barros Pinheiro, Geologist, Invited Associate Professor, Universidade Fernando Pessoa, Porto, Portugal
10. Professor Martin R. Sharpe, PhD from University of Exeter, retired Geologist, Geochemist, Analyst and Field Mapper at University of Pretoria, Founder of geological consulting and exploration companies in Southern Africa

SCIENTISTS AND PROFESSIONALS FROM SOUTH KOREA

1. *Dr. Seok Soon Park, Professor of Environmental Science and Engineering, Ewha Womans University, Seoul, Founder of the Climate Truth Forum; WCD Ambassador*
2. Zonghie Han, economist at Daegu University

SCIENTISTS AND PROFESSIONALS FROM SPAIN

1. *Blanca PargaLanda PhD, Modelling Expert, specialist in Environmental Law; WCD Ambassador*
2. Dr. Saúl Blanco, Associate Professor of Ecology at the University of León
3. Ferran Brunet, Professor on the European Economy, Unniversitat Autònoma de Barcelona
4. Maria Teresa Estevan Bolea, Ingeniero Laureado 2019 Royal Spanish Academy of Engineering. World Award 2018 In Engineering WFEO (World Federation of Engineering Organizations), National Prize in Industrial Engineering 2019.
5. José Carlos González Hidalgo, Professor of Physical Geography, teaching more than 20 years on Climatology and doing Research on the Topic, University of Zaragoza, Dep. Geografía
6. Antonio J. Huertas, Engineer with 35 years experience in Energy Politics and Operation, and Environmental Care
7. Isabel López García PhD on Chemical Engineering, Assistant Professor of Physical Chemistry and applied Thermodynamics, University of Córdoba
8. Alexander Keith Martin PhD Geology and Geophysics, Consultant geologist
9. Antonio Jesús Muñoz Cobo Doctor in Environmental Sciences from the University of Jaén member of the research group TEP-233 (Environmental Technologies) of the Department of Chemical, Environmental and Materials Engineering
10. Luis Pomar, Emeritus Professor of the University of the Balearic Islands, Spain, Sedimentologist specialized in the study of Carbonate Rocks which the Impact of CO₂ and Paleoclimate are essential to understand the origin of these rocks
11. Javier Vinós PhD, Scientist and independent climate researcher
12. Wynn Williamson, co-founder and managing partner of real estate developer BWRE

SCIENTISTS AND PROFESSIONALS FROM SWEDEN

1. *Ingemar Nordin, Emeritus Professor Philosophy of Science, Linköping University; WCD Ambassador*

2. Michael Andersson BSc in biology, medical doctor, retired Chief Medical Officer at a battalion of the Swedish Airforce
3. Leif Åsbrink PhD, Technology at KTH in Molecular Physics, Stockholm
4. Sture Åström MSc, Technology, Professional in Climate Issues, Secretary of the Swedish Network Klimatsans
5. Erik Axelkrans MSc in physics and physical oceanography, University of Gothenburg
6. Rolf Bergman, Emeritus Professor of Physical Chemistry, Uppsala University
7. Dr. Lars Bern, Member of The Royal Swedish Academy of Sciences, Retired CEO in Incentive AB
8. Joakim Blomqvist, Sr. Design Manager for design and energy solutions within a larger construction company
9. Magnus Cederlöf, Software Specialist, Stockholm
10. Tore Dalväg MSc, Physics, Research Engineer in Hydrodynamics and Thermodynamics, Senior Advisor in Environmental Standards, Author of 'CO₂ a source of life or a threat'
11. Hans Eklund PhD, Technology, Acting Professor at the Department of Laser-and Electro-optics, Chalmers University of Technology, Gothenburg
12. Per-Olof Eriksson, Physicist, Former CEO of Sandvik Group
13. Dr. Anders Flodin PhD, Mechanical Engineering, NC, USA
14. David D. Gee, Professor Emeritus Orogen Dynamics, Uppsala University
15. Anders Grufman MSE, MA Economics, Industrial and Environmental Economics
16. Jan Hagberg PhD, Statistics, Stockholm
17. Björn Hammarskjöld MD, PhD in Biochemistry, Assistant Professor in Pediatrics
18. Lars Hässler PhD, Rock and Soil Mechanics, BSc Chemistry and Biology, MSc Civil Engineering
19. Eilif Hensvold PhD, Mathematics, Associate Professor of Mathematics (Retired), Simulation of Large-scale Industrial Systems, Uppsala University, Luleå Technical University
20. Gunnar Holmgren PhD, Space Physics, Retired Head of Dept. of Engineering Sciences, Uppsala University
21. Mats Janson MSc, Electrical Engineering, KTH Royal Institute of Technology, Stockholm
22. Hans Jelbring, Climate Researcher
23. Göran Johansson, Specialist in Energy Systems
24. Claes Johnson, Emeritus Professor of Mathematics at Royal Institute of Technology, Stockholm
25. Gunnar Juliusson, Professor of Hematology, Lund University, Senior Consultant, Skåne, University Hospital, Lund
26. Sten Kaijser, Emeritus Professor of Mathematics, Uppsala University
27. Johnny Kronvall Mah, Emeritus Professor in Building Physics, Malmö University and Lund University
28. Lars E. Linder, Associate Professor of Medicine, Gothenburg
29. Rune Lundgren MSc, Helsinki University of Technology, Energy System Expert
30. Johan Montelius, Associate Professor of Computer Science at the Royal Institute of Technology, Stockholm
31. Jacob Nordangård PhD, Technology and Social Change at the University of Linköping, Researcher on Climate Change History
32. Gabriel Oxenstierna PhD, retired, currently author for Klimatupplysningen.se
33. Gösta Pettersson, Emeritus Professor in Biochemistry, University of Lund
34. Marian Radetzki, Emeritus Professor of Economics, Luleå University of Technology
35. Mats Rosengren, Mathematics, Space Flight Trajectory Specialist
36. Torsten Sandström, Professor Emeritus, Department of Law, University of Lund
37. Rabbe Sjöberg PhD, Geology, Member of Paleogeophysics & Geodynamics Institute
38. Peter Stilbs, Emeritus Professor of Physical Chemistry, Royal Institute of Technology (KTH), Stockholm
39. Prof. Jan-Olov Strömberg, Emeritus Professor of Mathematics at Royal Institute of Technology, Stockholm
40. Tege Tornvall, Member of Klimatrealisterna and of its election committee, active in network Klimatsans
41. Lars H. Thylen, Professor Emeritus in Photonics, Dept. of Theoretical Chemistry and Biology, Royal Institute of Technology, Stockholm, specializing in Low Power Nanophotonics Technology

42. Gösta Walin, Professor Emeritus in Oceanography at University of Gothenburg
43. Elsa Widding, Consultant, Author on Climate Change, Stockholm
44. Lech Wosinski, Researcher Emeritus, Associate Professor, Royal Institute of Technology, Stockholm
45. Örjan Wrangé PhD, Emeritus professor in Molecular Genetics

SCIENTISTS AND PROFESSIONALS FROM SWITZERLAND

1. Dr. Denis Bednyagin, researcher specialised in integrated (Energy-Economy-Environment) assessment modelling
2. Thomas Binder, Cardiologist and Internist
3. Majed Chergui, Emeritus Professor of Chemistry and Physics
4. Helmut Elben PhD in Physics, working as Strategy, Technology and IT Consultant
5. Dr. Michael Esfeld, full professor of philosophy of science, University of Lausanne
6. Ferruccio Ferroni, Dipl.Ing. ETH, Energy Consultant
7. Rene Funk, Software engineer, specialized in Analysing Satellite, Sea and land Temperature
8. Werner Furrer MSc, Mathematics and Physics, President of the Climate Realistic Group in Switzerland
9. Christian Jacot, Pharmacist
10. Markus D. Knecht, chemist, 15 years research on climate change
11. Joseph Ongena, Member of the Permanent Monitoring Panel for World Energy, World Federation of Scientists, Geneva
12. Dr. Jean-Claude Pont, Dr. Math., Emeritus Professor of The History of Philosophy of Sciences, University of Genève
13. Dr. Franz-Karl Reinhart, Emeritus Professor of Physics, Lausanne
14. Claude Roessiger, Entrepreneur and Author of several Books on Organizational Management and Public Policy, Organiser and Chairman of the Portsmouth Conference 2018 on Climate Policies
15. Heinz Schmid, Dipl. Ing. Agr ETH, more than 10 years involvement in climate science and climate communication
16. Dr. Ralf Lorenz Schmitt PhD in Chemistry, Product Manager
17. Thomas Stadler MSc in Physics, ETH Zürich, Geophysics, Specialty in Geothermics
18. Prof. Dr. Eric P. Verrecchia, Full professor at the University of Lausanne, Chair of Biogeochemistry at the Institute of Earth Surface Dynamics; expert in the terrestrial carbon cycle of the tropical and temperate zones
19. Dr. Eric Vieira retired PhD (organic chemistry), 27 years at Roche Pharmaceuticals (Principal Scientist)

SCIENTISTS AND PROFESSIONALS FROM TURKEY

1. Prof. Kerem Cankocak, Professor in Particle Physics at Istanbul Technical University
2. Ufuk Cosgun, columnist at Milat Newspaper

SCIENTISTS AND PROFESSIONALS FROM UKRAINE

1. Vsevolod Lozitsky, DrSci, Astronomical Observatory of Taras Shevchenko National University of Kyiv, expert in area of solar physics, solar activity and magnetic field, as well as solar-terrestrial connections
2. Irina Vasiljeva CSC, Research Fellow at the Main Astronomical Observatory of National Academy of Science of Ukraine, research interests include solar physics

SCIENTISTS AND PROFESSIONALS FROM UK

1. *Christopher The Viscount Monckton of Brenchley, Peer of the Realm and Author of several reviewed papers on Climate; WCD Ambassador*
2. Neils C. Arveschoug, Geophysicist, Private start-up Oil E&P Company
3. Nigel Banks PhD Geology, Petroleum Geologist
4. Andrew P. Barker, Biological Chemist
5. John Anthony Barney, Retired Scientist and Technologist
6. Nik Bartley, Mechanical Engineer

7. Nigel Beckwith, professional graduate Podiatrist, Post Grad. in Sports Science, Post Grad. in Science Education
8. Alan Richard Belk, retired Mechanical Engineer with a 40+ year international career in energy, industrial gas and chemical industries
9. Roshan Bhunnoo, Mathematics and Statistics, former Climate Data Analyst at the Meteorological Office
10. Paul Binns, Former Research Geoscientist and Climate Researcher
11. David Bodecott, Geologist/Geophysicist, Fellow of the Geological Society of London
12. Dr. Richard Booth, retired Special Merit mathematician in the UK Civil Service
13. D.Q. Bowen, Emeritus Professor of Earth and Ocean Sciences, Fellow International Union for Quaternary Research, Cardiff University
14. Dr Phillip A. W. Bratby, Physicist, Member of the Institute of Nuclear Engineers, retired energy consultant
15. Michael Brown, Expert in Large Scale Thermal Fluid Dynamic Models
16. Paul Burgess, BSc, MSc, C.eng retures, Retired water resources engineer
17. Derrick Byford BSc (Hons) holder of 10 patents, previously Deputy Director Research & Statistics Inner London Education Authority
18. Gerry Byron BSc in Physics, MBA which included modules on statistical anylysis
19. Peter Cale, Solicitor, co founder and fund raiser for wave energy research project as Director of Staithe Energy Products (1988 1995)
20. George Carey, BSc Hons. Physics and Geology, Lifetime Physics teacher and amateur astronomer
21. Brian R. Catt, Physicist, Electrical Engineer, Retired, publishing papers on Energy and Climate Change
22. Arthur Champion, retired European Environmental Coordinator and CofE Diocesan Environmental Adviser
23. John Church, Earth Science Professional, Retired from Energy Sector
24. David Coe, MA(Oxon) in physics, Retired after a lifetime in industry working on gaseous absorption spectroscopy, Lead author of the paper "The Impact of CO2, H2O and Other Greenhouse Gases on Equilibrium Earth Temperatures"
25. John C.W. Cope, Professor of Geology, National Museum Wales, Cardiff
26. Richard Courtney, Retired Material Scientist, Expert Peer Reviewer of the IPCC
27. Chas Cowie, GDE Mining Engineering, Wits University, Retired IT Professional worked primarily in Mining and Logistics Industries
28. Dr. David Critchley, Senior Clinical Pharmacologist, mathematical modelling of complex systems
29. Michael Cross, Chemical Engineer
30. Peter Cunningham, Expert in Mathematical Modelling of Complex Physical Phenoma
31. Isabel Davies, Geophysicist and Entrepreneur
32. Dr Philip George Davies, Principal Lecturer in the Department of Computing and Informatics at Bournemouth University
33. Robert Davies BSc Airline pilot
34. Dr. Keith P. Dawson, Environmental and Agricultural Researcher
35. Jeremy Dawson, retired Chartered Engineer with a career in the oil and gas industries
36. John Dewey, Emeritus Professor of Geology at the University College Oxford, Distinguished Emeritus Professor University of California, Member of the US National Academy of Sciences, Fellow of the Royal Society
37. Howard Dewhirst FGS, Geologist, Initiator Open Letter to the Geological Society of London
38. James Dillon BSc Physics, DPhil Nuclear Physics, Former research physicist
39. Gregor Dixon FGS, Geologist, Former Member Geological Society of London
40. Peter Dorey BSc Physics, Senior Project Manager, (and unpaid educator & Climate Scientist)
41. Timothy (Tim) C. Duckworth, Retired Mechanical Engineer in the Oil & Gas industry, Senior Auditor in Management/Facility/HSE
42. Dr. Michael Earle, international earth scientist, energy professional, author
43. Dr. John S. Easterby, Retired Senior Lecturer in Biochemistry University of Liverpool, Research area: Protein chemistry, Enzymology, Metabolic Modelling
44. Roderick Paul Eaton, MBA FIET MCMI, Retired Consultant Energy Industry Analyst/Management Consultant
45. Debra Eddy, Entrepreneur and Guest Lecturer in Business Management

46. Dr Andrew Edmonds, data scientist with a strong background in AI, past CTO of a publicly traded US tech company, currently CEO of a private US company, ThinkBase LLC
47. Peter Etherington-Smith, Geologist/Oceanographer, Coral Reef Researcher, MSc Petroleum Engineering (Imperial), life-time international experience in developing countries, retired from BG
48. Kevin Foo MSc, DIC, Dip. Met, AusIMM, IOM3, SME, Ch.Eng., President Tianshan Jade (UK) Ltd
49. Sean Galbally, Project Manager Water and Wastewater Systems
50. Kalghatgi Gauram PhD Aeronautical Engineering, Consultant Professor, 50 Years' experience in R&D in combustion, fuels and energy
51. Gil Gilchrist, Geophysicist
52. Alan Gill, Retired Engineer in South Wales
53. Peter Gill, Physicist, Ex Chair Institute of Physics Energy Group, Ex London Branch Chair & Fellow of EI
54. Paul R. Goddard, retired Professor of Radiology, University of the West of England
55. John D. Goss-Custard PhD Ecology, University of Aberdeen, Visiting Professor in the Department of Life and Environmental Sciences, Bournemouth University
56. Alastair Gray, retired geologist, 50 years in oil exploration, production and asset evaluation
57. Delphine Gray-Fisk, Former airline pilot, and parliamentary candidate for both the UK Independence Party and Brexit Party
58. Mick Greenway, specialized in Research and Development of Flight Control Systems for Modern Civil and Military Aircraft, Retired Head of Research and Development within a Multi-Million-Dollar Company
59. David P. Gregg, retired Unilever Research group leader and scientist, former visiting professor in control engineering, book author on studies of historical climate time series based on modern spectral analysis techniques
60. Brian Gregory, MA. in Natural Sciences, MSc. in Business Studies, Lifetime Career in the UK Chemical Industry, currently Policy Director of the Alliance of British Drivers
61. Jimmy Haigh, Independent Geological Consultant
62. Stephen Hardcastle, Retired Electronics Engineer, 10 years experience in the design of NDIR gas detectors, for gases including CFC's CO₂, CH₄ and N₂O
63. Tim Harper, Geomechanics Consultant and Researcher, previous Recipient of the Royal Academy of Engineering MacRobert Award for Engineering Innovation
64. John Harrison, Former Chartered Physicist and Chartered Engineer
65. Ken Harrison, Retired Chartered Physicist
66. Peter Harvey, Project Manager – Renewable offshore wind industry
67. Raymond Hayes, BA (Lond) M.Litt (Oxon) FRGS Solicitor Hong Kong and England and Wales
68. Robert Heath, Retired Geophysicist, Honorary member of the Indian Society of Petroleum Geologists
69. Alex Henney, Formerly London Electricity Board, Consultant on Electricity Matters
70. Roger Higgs, DPhil (Oxon), Independent Geological Consultant, Geoclastica Ltd.
71. Tatiane Melchior Stefanello Hodson, Oceanographer, author, undertaking a Master's degree in International Public Policy at Queen Mary University of London
72. Dr Sinclair Holland, MBChB(Edin) Medical Doctor
73. Paul Homewood, Climate & Energy Policy Analyst
74. Keith H. James PhD, Consultant Geologist
75. Anthony Janio PhD in Physics, Independent Elected Councillor in Brighton and Hove
76. David A.L. Jenkins, Geologist, Director Hurricane Energy plc
77. Dr. Chris Jesshope, Emeritus Professor University of Amsterdam, Director Techné Consulting Ltd.
78. David Jessop C.Eng., M.I.C.E., lifetime career in the water industry
79. Robert Jones, BSc and PhD Mining Engineering, Director at Warwick Energy
80. Stephen Latimer Jones BA Chemistry, IT professional
81. Zana Juppenlatz, Consultant in environment, environmental law and sustainability, including renewable energy projects
82. John L.D. Kerr B.A. (Hons) in Environmental Science & Technology; B.Sc. (Hons) in Chemistry, active as Environmental Consultant
83. David A. Kirkwood MSc MIET, Professional engineer working in IT, Deputy Chairman of Reform UK Scotland

84. Geoffrey W. Lane, retired Marine Engineer and Technical Author
85. Roger Longstaff, Experimental Space Physicist and Company Director
86. Anthony Lowe BSc Hons Polymer Chemistry and Physics, Consultant Polymer Solutions
87. Peter Justin Lunt MSc Geology London, adjunct lecturer in geology (stratigraphy) at Universiti Teknologi Petronas and Shandong University of Science and Technology (SDUST) Qiangdao
88. Tom Mackay BSc, Geologist, Fellow of the Geological Society (FGS) of London
89. Chris MacKenzie MSc, Director and Geological & Environmental Consultant at Peak Minerals Ltd.
90. Stephen Martin, retired exploration geophysicist
91. CJ Matchatte-Downes, Geologist and Geochemist, particularly involved in studies about past Climates including Glaciation
92. William James McAuley MSc from Imperial College and an M.B.A. from Lehigh University, retired Chemical Engineer with a 40+ year international career in energy, industrial gas and chemical industries
93. Dr. Niall McCrae PhD in Mental Health
94. Krov Menuhin, Expert on ocean life, underwater filmmaker, professional diver, pilot and writer, explored the Earth's extremities, experiencing the oceans and the atmosphere first-hand
95. Geoffrey Middleton, Chartered Architect, Social Science
96. Terence Mordaunt, Accomplished businessman, Self taught climate scientist mentored by Professor David Bellamy
97. Dr. William Morgan, Retired Clinician
98. Dr Ian Mortimore BSc, PhD, MB, BS, FRCP, retired Consultant Respiratory Physician in the NHS with research affiliations to Edinburgh and Newcastle Universities
99. Philip Mulholland, Geoscientist, Life time experience in the Geo-Energy Industry, co-author of the DAET climate model
100. Stuart Munro, Exploration Geologist and Geophysicist
101. Edward Nealon, Geologist Member of the Australian Institute of Mining & Metallurgy
102. Alex Nichols, BSc Geography, MSc Environmental Assessment, 27 years in sustainability consultancy, programmes and projects
103. Blair Nimmo, Electronic Engineer, working in Computer Networking and Optical Surface Metrology and Fibre Optics
104. Gerard O'Donovan, Entrepreneur, Business Owner, career in building international and multinational organisations
105. Michael John Oates, Geologist, Lifetime Experience in the Geo-Energy Industry, Fellow of the Geological Society of London
106. Peter Owen FGS, Fellow of the Geological Society of London
107. Jonathan R. Partington, Emeritus Professor of Mathematics, University of Leeds
108. Dennis Paterson, Geologist, Retired
109. Dr. James Petch, Physical Geographer, formerly Reader in Environmental Science at MMU and Head of Distributed Learning at the University of Manchester
110. Peter Phillips BSc Hons Mechanical Engineering, lifetime experience in the geo-energy industry
111. Graeme Phipps, geologist and geophysicist, Jersey Channel Islands
112. Dr. James Pindell, Geologist, specialised in plate tectonics and palaeographic evolution, Director of Tectonic Analysis Ltd (UK), Adjunct Professor at Rice University (USA)
113. Gerry A. Quinn, Research Scientist, Ulster University, lifetime career in microbiology, biochemistry and environmentalism
114. Clive Randle, Geologist, Fellow of the Geological Society of London
115. Michael J. Rath, Professional Forrester
116. Jonathan Charles Read, Honours degree in Physics from the University of Durham, member of the Institute of Physics (MInstP), Fellow of the Chartered Association of Certified Accountants (FCCA)
117. Dr. Colin Richard Reeves, Emeritus Professor of Operational Research, Expert in Mathematical Modelling
118. Ceri Reid, PhD Electrical and Electronic Engineering, Sonar Specialist
119. Steven Andrew Richards MSc, Retired Chartered Engineer, Retired Lecturer from Portsmouth University and Southampton Solent University
120. Michael F. Ridd, Geologist, Fellow of the Geological Society of London

121. Anthony Robb PhD, Retired Chemist
122. Salmaan Saleem, Family Medicine Doctor
123. Richard Saumarez, Biomedical Engineer from Imperial College
124. Robert M. Schneider MSCE, retired Civil Engineer
125. Michael Seymour, Geologist, Fellow of the Geological Society of London
126. Mike Sluman, Retired teacher with an honours Degree in Environmental Biology
127. Dr. Ian Smith, MSc Maritime Archaeology, PhD Chemistry
128. Mike Stigwood, Environmental Researcher
129. Stephen Taylor PhD, Infra-Red Physicist and Tidal Hydrographer, MD Geomatix Ltd., Member of Inst. of Physics, Member of Inst. of Electrical and Electronic Engineers, Associate Fellow of Royal Institute of Navigation, Member of the Hydrographic Society
130. Leslie Thomson, Retired Vice President Operations, BP Exploration, Aberdeen
131. Derek Tipp, BSc honours degree in chemistry, former research chemist and retired science teacher, currently councillor on New Forest District Council
132. David Todd, retired Associate Member of the Institute of Bankers, Post Graduate Certificate in Business and Management
133. Edwin Thwaites, Retired Principal Lecturer in Organisational Analysis and Crisis Management, University of Central Lancashire, Preston
134. Matthew D. Waggener, Financial professional, strategic consultant on business investments
135. Dr. Glenn K. Wakley, Emeritus Associate Professor Biological Science, Fellow of the Royal Society of Biology and member of The Anatomical Society
136. Professor David Wastell, Emeritus Professor of Information Systems at the University of Nottingham
137. Philip Linden Wilkes, Life time Experience in Marine Biology
138. Jay Willis, Marine Scientist, Associate of the OxNav Group of Oxford University
139. Paul White, BSc Physics, Durham University, Retired, Former Higher Scientific Officer Marine Climatology
140. Matt Wood, BSc in Metallurgy & Materials Science, Retired Airline Pilot, Patent holder
141. Valentina Zharkova, Professor of Mathematics and Astrophysics, Northumbria University, Newcastle upon Tyne
142. Ivor Zoefftig, International communications coach specialised in chaodynamics and NLP LP

SCIENTISTS AND PROFESSIONALS FROM USA

1. *Dr. John F. Clauser, Nobel Laureate Physicist; WCD Ambassador*
2. *Richard Lindzen, Emeritus Professor Atmospheres, Oceans and Climate, MIT; WCD Ambassador*
3. Edward Abbott MD, Retired obstetrician, BSc in math and chemistry
4. Dr. Syun-Ichi Akasofu, Professor of Geophysics, Founding Director of the International Arctic Research Center of the University of Alaska Fairbanks from 1998 until 2007. Previously, prof. Akasofu had been director of the University's Geophysical Institute
5. Ralph B. Alexander, Emeritus Professor of Physics, Science Writer
6. Michael Antonetti P.G., Professional geologist for 35+ years in Pennsylvania with Ms in glacial geomorphology
7. Anthony J. Armini, Retired Founder and CEO Implant Sciences Corp.
8. Dr. Malgorzata Askanas, Senior R&D Associate at the Aurora Biophysics Research Institute
9. Hans-Peter Bähr, Emeritus Professor of Pharmacology, Canada and Former Dean of Basic Medical Sciences, American University of Barbados, Barbados
10. Jeffrey Baldwin, petrophysicist and rock physicist specialist
11. Lynne Balzer, certification in Biology, Chemistry and Physics, founder of Faraday Science Institute, retired high school teacher (chemistry, physics and biology), adjunct college science professor
12. Donna Barr, lifetime career as investigative journalist worldwide
13. Bryan Barrilleaux, MD, Physician of Internal Medicine
14. Joe Bastardi, chief meteorologist Weatherbell.com, Author of Amazon weather/ climate best sellers: The Climate Chronicles: Inconvenient Revelations you Won't Hear from Al Gore and others; 2nd Book: The Weaponization of Weather in the Phony Climate War

15. Captain Walter Bates, flew virtually all of United Airline's aircraft all over the world, including everything from the old DC-6 up through the largest Boeings such as the B-777 and the B 747-400; from his lifetime of experience he knows that the so-called man-made Mid-Troposphere Hot Zone just does not exist
16. Charles G. Battig, Climate Adviser, Heartland Institute
17. Eric Baum PhD in Theoretical Physics, Princeton University
18. Scott Beattie, Juris Doctor Degree (Law), studied history of science for 25 years and climate science for ten years
19. Dr. Ernest Calvin Beisner, Expert on the Ethics and Economics of Climate and Energy Policy, Founder and Spokesman of The Cornwall Alliance for the Stewardship of Creation
20. Larry Bell, Endowed Professor of Space Architecture, University of Houston
21. Frank X. Bellini, Geologist and Environmental Scientist, lifetime experience in the nuclear power industry
22. Dr. Shmuel Ben-Shmuel PhD in Aerospace & Mechanical Engineering, retired aerospace engineer, worked on the Space Shuttle, doing Computational Fluid Dynamics simulations
23. David J. Benard, Chemical Physicist & Co-inventor of the Oxygen-iodine Chemical Laser
24. Haym Benaroya, Distinguished Professor of Mechanical and Aerospace Engineering, Rutgers University
25. Edward X. Berry PhD, Atmospheric Physicist, American Meteorological Society, Author, Climate Physics LLC
26. Ronald Berti, lifetime career in the semiconductor industry
27. Brent J. Bielema, studied Economics at Northern Illinois University, professional nutritional counselor
28. Dr. David L. Black, Clinical and Forensic Toxicologist (Microbiology, Immunology, Pathology, Pharmacology), Vanderbilt University Nashville, currently adjunct and member of Department of Medicine Board of Visitors
29. Jared L. Black, Numerical Analysis Consultant, ScD
30. Thomas Lindsay Blanton PhD in Tectonophysics, Texas A&M University, Over 40 years experience as an advisor and consultant in geomechanics specializing in compaction, subsidence, and lithospheric stress determination
31. Elliott D. Bloom, Emeritus Professor of Particle Physics and Astrophysics, KIPAC-SLAG, Stanford University
32. David Boleneus, Professional Geologist
33. Daniel Botkin, Emeritus Professor of Biology, Climate Researcher, Author of the Book: Twenty-five Myths That Are Destroying the Environment
34. Robert L. Bradley jr., CEO and Founder of the Institute for Energy Research
35. Dr. William Briggs, Alumnus Cornell University, Writer and Philosopher
36. Daniel Brimhall, MS Extractive Metallurgy, University of Utah, retired Vice President Operations, American Chemet, East Helena, MT, now active as consultant
37. Clare Livingston (Bud) Bromley III, BS Natural Sciences, scientific instruments executive
38. Joel M.G. Brown, retired petroleum engineer
39. Dr. Larry Frank Brown PhD in Range Plant Ecology (Ecophysiology) from Colorado State University (1974), President of L.F. Brown & Assoc. Inc.
40. Gerald Brunetto, Retired after lifetime career in engineering & building nuclear & fossil fuel fired steam power plants
41. James W. Buell PhD, Aquatic Biologist, Consultant
42. Robert Bugiada, Senior Process Engineer at R.C. Costello & Assoc. Inc
43. Dr. H. Sterling Burnett PhD, Applied Philosophy with a specialization in Environmental Ethics, past Senior Fellow of the National Center for Policy Analysis, now Senior Fellow Heartland Institute
44. David Burton, System and Computer Scientist, Expert Reviewer of AR5 and AR6, Member of the CO2 Coalition, and Creator of the SeaLevel.info website
45. Mark Shane Butler, MA in mathematics, lifetime career in data science
46. Roger Caiazza, Pollution Meteorologist, life time experience in the electric generating business, retired Director of the Environmental Energy Alliance of New York, currently managing the blog Pragmatic Environmentalist of New York
47. Ron Cakebread, mechanical engineer with 35 years in the industrial automation business; experience in modeling, simulation, and analysis of very complex systems
48. Sharon R. Camp PhD, Retired Analytical Chemist and Environmental Scientist

49. Nick Capaldi PhD, Author Books on Logic, the Scientific Method and the Philosophy of Science
50. John M. Cape, P.E. former military officer and economics instructor at West Point, Licensed Professional Engineer, Energy Consultant - Upstream Oil and Gas, now writing Net Zero themed novels
51. John Carr, Electronic Engineer, specialised in antenna and satellite installations
52. Marion G. Ceruti PhD Chemistry, Retired Research Scientist, Space and Naval Warfare Systems Center Pacific
53. Dr. Francis Cheng, Professor of Chemistry with specialties in carbon materials, batteries and energy conversion, University of Idaho
54. Mitchell R. Childress, Archaeologist and Cultural Resource Environmental Compliance Specialist, Commonwealth Heritage Group
55. Prof. Krishnan Chittur, emeritus-professor in chemical engineering and biotech, Univ of Alabama Huntsville, cofounder of medical diagnostics startup (genecapture)
56. Terigi Ciccone, Engineer, author of "A Hitchhiker's Journey Through Climate Change," and a proud former Sierra Club member
57. Dr. Claudio Cioffi-Revilla, PhD, DSc Pol, University Professor Emeritus at George Mason University, Jefferson Science Fellow of National Academy of Sciences, Fellow of AAAS American Association for the Advancement of Science, Member of AMS American Mathematical Society
58. Roy Clark, Climate Researcher, Retired Engineer, California
59. Bob Cohen, Certified Consulting Meteorologist (CCM), MS in (physical) oceanography from Texas A&M University and a BS in meteorology from Penn State University, I have been working with weather data and applications of this data for over 40 years
60. Dr. Richard Collingham PhD in Engineering, Professor for 16 years teaching Graduate Level Heat Transfer and Fluid flow courses
61. Sabin W. Colton PhD, Biochemist and Marine Biologist
62. Gary Cooke MSc Geophysical Sciences, Laboratory analyst and manager, studied sea level curves since the 1980s
63. Martin Cornell, Retired Senior Scientist, Dow Chemical Company
64. David T. Cramer, MS, Instructor of Sociology and Psychology, Pratt Community College
65. Daniel Clyde Cummings, M.D. University of Utah School of Medicine, B.A. mathematics, political advocate against all treaties and most legislative proposals to limit use of fossil fuels
66. John Curtin Msc in Economics, lifetime experience in strategic planning and forecasting
67. Joseph S. D'aleo, Professor of Meteorology and Climatology at Lyndon Stage College, Founder of Icecap.us, First Director of meteorology of the Weather Channel
68. Raphael D'Alonzo, Analytical Chemist, Retired Associate Director, the Proctor & Gamble Company
69. George Davey, Physicist, University of Iowa
70. Donn Dears, GE Company Engineer, and Senior Executive, Retired, Author of 'Net-zero Carbon, The Climate Policy Destroying America'
71. Ken DeGraaf, MSc Engineering Mechanics, Structural Dynamics, Colorado House of Representatives, USAF pilot, Instructor: USAFA AP Calc; weather for pilots, Environmental Manager, Michigan ANG
72. James DeMeo PhD, Retired Expert in Earth and Atmospheric Science, Oregon
73. David Deming, Professor of Arts & Sciences, University of Oklahoma
74. William Robert Detzner, retired special education teacher, fighter against the continuing reduction of personal freedom
75. David Dilley MSc, Meteorologist-Climatologist-Paleoclimatologist, CEO Global Weather Oscillations Inc.
76. Robert G. Dillon, retired physician and astronomist
77. Robert G. Dodge, Attorney
78. Terry Donze, BS-Geological Engineering, Lifetime Career in Geophysical Consulting
79. Michael Down, Petroleum Engineer, lifetime experience in the geo-energy industry
80. Jack D. Downing, Geologist and Geophysicist
81. Gordon A. Dressler MSc, 36-year professional career as a rocket and spacecraft propulsion engineer, awarded six patents in the field of rocket propulsion
82. Paul Driessen, Senior Policy Advisor, Committee for a Constructive Tomorrow (CFACT) and Congress of Racial Equality (CORE)
83. John Droz jr., Physicist, Founder of AWED Alliance

84. Dr. William DuBroff PhD Metallurgy, Former Director of Research Inland Steel, Former Asst. Professor Clemson University
85. John Dueker, MBA University of Houston, BSEE University of Notre Dame, 45 years of experience in environmental permit compliance
86. Murray Duffin, BScEE, MBA, former Corporate Vice President for Total Quality and Environmental Management, Retired
87. John Dale Dunn MD, JD, Lecturer Carl R. Darnall Army Medical Center, Fort Hood, Texas
88. Prof. James E. Enstrom PhD, MPH, FFACE, Retired UCLA Research Professor in Epidemiology, President of the Scientific Integrity Institute, Los Angeles
89. Richard G. Eramian, BA in MPthematics and physics
90. Willis Eschenbach, Generalist and Author of many (peer-reviewed) critical Climate Articles with numerous Citations
91. Vincent Esposito, Adjunct Professor University of Pittsburg, PA, Doctor of Science in Nuclear Engineering (Un. FoViginia), Retired Manager fromWestinghouse Electric Company
92. Douglas Fairbent, Retired Physicist trained in Condensed Matter Theory, PhD (Physics), University of Michigan, 1978
93. Peter Farrell, Fellow of the US National Academy of Engineering
94. Ralph English Fisler, Professional Aerospace Engineer
95. Edward Patrick Flaherty, American lawyer based in Geneva, litigating against the UN, WMO, WIPO and other IOs on behalf of staff members, whistleblowers and injured third parties
96. Rex Fleming, Research Scientist, Author of Book on Carbon Dioxide Fallacy, Retired President Global Aerospace
97. Jim Folcik, Geosciences Manager Extraction Oil & Gas
98. James Forensky B.S.E.E., M.D. with background in Physics, Engineering and Medicine
99. Dr. Geoffrey Q. Fox, Retired neuroscientist, PhD in Anatomy and Physiology from the University of California, Berkeley in 1973, post doctorate fellowship in the Department of Neuroscience at Albert Einstein College of Medicine, Wissenschaft Assistant in the Department of Neurochemistry at the Max Planck Institut für biophysikalische Chemie in Göttingen Germany, 1975
100. Dr. Neil Frank, Lifetime of Experience in Research and Forecasting in Tropical Meteorology, Former Director National Hurricane Center
101. Patrick Frank PhD, SLAC National Accelerator Laboratory, Stanford University
102. Robert S. (Steve) Friberg, Trend Resources LLC, Resources Exploration Geologist with +55 years of experience in the geological sciences field
103. Gordon J. Fuls, Astrophysicist, Board of Directors CO2 Coalition, Co-founder Global Warming Realists
104. S. Fuller Hunt, Biology Teacher at Preparatory High School of Mathematics, Science, Technology and Careers, Calabash, North Carolina
105. Lynn Warren Funk, accelerator physicist, climate realist
106. Terry Gannon, Physicist, Retired Semiconductor Executive
107. Dr. Philip Garrou PhD Chemistry 1974 Indiana Univ. Retired Director of Technology at Dow Chemical's electronics division. Serves DARPA and the DoD as a microelectronics subject matter expert (SME)
108. Louis Genevie PhD, Epidemiologist, www.LitStrat.com
109. Nicholas De Gennaro PhD, PE, Coastal Engineer, Southport North Carolina
110. Prof. Lee C. Gerhard PhD in Geology, Retired Getty Professor of Geological Engineering from the Colorado School of Mines and Retired Director and State Geologist of the Kansas Geological Survey
111. Ulrich H. Gerlach, Professor of Mathematics, Ohio State University
112. Ivar Giaever, Nobel Laureate Professor, Nobel Prize Winner in Physics, Emeritus Professor of the Rensselaer Polytechnic Institute, Chief Technology Officer of Applied Biophysics Inc., Fellow of the American Physical Society; Honorary WCD Ambassador
113. Thomas A. Gilliam PhD, Professor of Accounting, Retired
114. Alan Glabe PhD Organic Chemistry, University of California, Retired
115. Dr. William Glassco, PhD in Medicinal Chemistry, former researcher, currently Instructor
116. Curtis Fred Goddard, Retired Geologist
117. Dr. Indur M. Goklany, Science policy advisor in the United States Department of the Interior; Helped develop the work plan for the IPCC's First, Second and Fourth Assessment Reports, and served as expert reviewer for several IPCC reports,

- Leader of the U.S. delegation to, and Executive Secretary of the IPCC Resource Use and Management Subgroup (1988-90)
118. Dr. J.D. Gold, lifetime experience in Clinical Psychology; worked in the frontlines of the war against the madness of terrifying people
 119. Leo Goldstein, MSc in Mathematics, lifetime experience in computer software, computer networks and cyber security. He is also a successful author and start-up founder
 120. Derek Gordon, CEO HTS Engineering
 121. Timothy W. Gordon, Retired USAF/USN Veteran, Independent Researcher
 122. Steve Goreham, Executive Director, Climate Science Coalition of America
 123. Laurence I. Gould, Professor of Physics, University of Hartford, Past Chair, New England Section of the American Physical Society
 124. Jim Granato, Dean of the Hobby School of Public Affairs, University of Houston, lifetime career in research methodology
 125. Charles F. Gritzner PhD, Professor Emeritus of Geography, author of the book "Changing Climates" (2010)
 126. Mike Gruntman, Professor of Astronautics, Space Physics and Space Technology, Space and Rocket History University of Southern California
 127. Thomas Gyrog, P.E., Project Manager and Designer of transportation infrastructure projects
 128. Kenneth Haapala, President of the Science and Environmental Policy Project (SEPP), compiler of The Week That Was newsletter, and contributor to the NPCC reports. He is an energy and economics modeler and past president of the oldest science society of Washington
 129. Stephen Hallin, Retired from Atmospheric Science (BA 81 MS 91)
 130. Dale B. Halling, BSEE, MS Physics, JD, Retire Patent Attorney
 131. Lyle W. Hancock, Professional Mathematician
 132. Kip Hansen, Independent Science Research Journalist
 133. Dr. William Happer, Professor Emeritus in the Department of Physics at Princeton University
 134. Brett T. Harding, Materials Scientist in Sustainable Technology, over 20 granted patents in nanoceramics, OLED, photocatalyst, optical devices, and related materials
 135. Steven Harford PhD chemistry and lifetime career in renewable energy and aerospace research
 136. Richard Harris PhD atmospheric physics and chemistry as applied to radiation transport modeling, laser propagation, high power microwave propagation
 137. Korbi Hart, Marketing Director Inland Crude Purchasing
 138. Peter J. Hatgelakas, Masters in Petroleum Engineering, petroleum geologist, geophysicist, and petroleum engineer at Hatgelakas Consulting
 139. Bryan Haycock PhD, Adjunct Faculty at a University in the state of Utah
 140. Howard C. Hayden, Emeritus Professor of Physics, University of Connecticut
 141. David Heald, Retired Electrical Engineer
 142. Donald R. Healy, BS Degree in Forest Management from Oregon State University, Participated in Anthony Watts' first Surface Station Project
 143. Dennis E. Hedke, Lifetime Career in Earth Sciences, Consulting Geophysicist; in 2018 Hedke was co-presenter of the testimony on Sea Level Rise before the Committee on Environmental protection of the New York City Council
 - 144. Tony Heller, Geologist, electrical engineer, climate communicator at realclimatescience.com 1500th signee**
 145. Edward G. Helmig, Environmental Engineering Professional in the field of Industrial Water Treatment and Environmental Protection
 146. Oliver Hemmers, Retired Executive Director of the Harry Reid Center at the University of Nevada, Las Vegas
 147. James D. Henry, Consulting Geologist, BS Geology, U Texas Austin, 1970, founder of Old Aulacogen, L.P. in 1991
 148. Glenn C. Hiram, Big Data Architect/Scientist
 149. Gary L. Hoe P.E., Retired Colonel USAF, Technical Director of several Nuclear Weapon Effects Tests at the Nevada Test Site, Member Scientists for Accurate Radiation Information (SARI)
 150. Jim Hollingworth, Social Scientist, Book: 'Climate Change: A Convenient Truth'
 151. Dr. Gary M. Hoover, Geophysicist, Lifetime Experience in the Geo-Energy Industry, Retired Member Board of Directors Geo-Service Company

152. Christopher Paul Horger, lifetime experience in optical network design
153. Walter Horsting, leads national and international teams in high-profile projects, including Clean Energy, Entertainment Venues, Governmental Headquarters, Performance Centers, Resorts, Stadia, and Theme Parks. He is advocate of 4th generation Molten Salt Reactors
154. Captain Thomas C. Houghton USNR (Rtd), Qualified Nuclear Engineering Officer; Sr. Director, Reactor Programs, Nuclear Energy Institute
155. J. Stephen Huebner PhD, Retired Research Geologist, U.S. Geological Survey
156. Edward Huff PhD, Retired NASA Senior Scientist
157. Kanzan Inoue, MS & PhD in Physics, President & Physicist of Exponential Future LLC
158. Jim Janota, Developing and improving petroleum based Chemicals, Plastics and applications
159. Laurence N. Johnson, Lt Col, USAF (Ret), MS in meteorology, MSE in aerospace engineering
160. Dr. Thomas J. Karr, PhD physicist, Retired Principal Director in the U. S. Office of the Undersecretary of Defense for Research & Engineering
161. James Kelly PhD Physics, data science executive
162. Kathryn E. Kelly, President Delta Toxicology
163. Kerry Kelly, Geology degree. Energy and Environment Professional
164. Michael L. Kelly, US Navy, BS, Tool Design Engineer (retired)
165. Hugh Kendrick PhD, Retired Director Plans and Analysis, Office of Nuclear Reactor Research, US Dept. of Energy, Fellow American Physical Society
166. Kevin T. Kilty, Adjunct Prof. Mechanical Engineering at University of Wyoming
167. Fred Kinsley, Retired Geologist (MSc)
168. Kevin Kirchman, Editor of the Climate Science Journal, more than a decade in renewable energy engineering
169. Floyd Lee Knapp BSc, Portland State University, 300 level Geography and Climatology
170. Stephen C. Knowles, Marine Scientist and Geologist, Beacon, New York
171. Kenneth D. Kok, retired Nuclear Engineer, ASME Fellow, Past Chair of the ASME Nuclear Engineering Division and the ASME Energy Committee
172. Alex Kozinski, Retired Judge on the US Court of Appeals
173. Wayne P. Kraus, Member American Institute of Chemical Engineers (AIChE)
174. Kirk Laird, retired. Oceanographer and Meteorologist (US Navy), Geologist with US Bureau of Land Management
175. Prof. Donald Langmuir PhD in Geological Sciences from Harvard University, Emeritus Professor of Chemistry and Geochemistry at the Colorado School of Mines, served on and chaired multiple committees related to water quality, and nuclear waste disposal; held also a US Presidential appointment to the US Nuclear Waste Technical Review Board
176. David R. Legates PhD, Retired Professor of Climatology in the Department of Geography and Spatial Sciences at the University of Delaware, Cornwall Alliance for the Stewardship of Creation
177. Jay Lehr † PhD, Senior Policy Analyst for the International Climate Science Coalition, Former Science Director of the Heartland Institute
178. David P. Lentini, Chemist and Patent Attorney, New Hampshire
179. Dr. David H. Lester, PhD in Chemical Engineering, Advisor to allaboutenergy.net
180. James M. Leverentz, Instructor UCI, Manager, California
181. Ulf Lindqwister, PhD theoretical particle physics, Princeton University, Business executive with 30+ years of industry experience
182. Howard R. Lowe, Prof. Eng., Geologist
183. Dean Lusby, IT professional, business owner, Pennsylvania
184. Jeffrey Mahn, Retired Nuclear Engineer Sandia National Laboratories (New Mexico), Member Scientists for Accurate Radiation Information (SARI), Member Nuclear Society (ANS)
185. Matt Malkan PhD, Distinguished Professor of Physics and Astronomy, UCLA
186. Wally Manheimer, Retired from the US Naval Research Lab and life fellow of APS and IEEE
187. Prof. Paul Manner MD FRCSC, Joint Replacement/Hip and Knee Arthritis, Department of Orthopaedics and Sports Medicine, University of Washington
188. James A. Marsh, Emeritus Professor of Immunology, Cornell University, Dept. of Microbiology and Immunology

189. David Martinovich, General Science Teacher, grades K-12, United States, China, and Belize
190. John Mauer PhD in Atomic and Molecular Physics, 20 years experience as a physicist, currently business owner in statistical analysis and software
191. Kirk Maxey, BS Organic Chemistry, MD, President and Founder of Cayman Chemical Inc
192. Andy May, Writer and Retired Petrophysicist
193. Gene McCall, Consultant to the Defense Science Board, Former Consultant to the Department of Energy on Issues related to Inertial Fusion, Former Member and Chairman of the USAF SAB, Former Member of the Senior Review Group to the Defense Airborne, Airborne Reconnaissance Office (DARO) and Former Chairman of the Technology Assistance panel fir DARO
194. William McCann PhD Seismology, lifetime career in Earthquake Hazard modeling and analysis
195. Dr. Neil J. McCarthy, Financial Consultant at N J Mc Carthy & Assoc, PhD in Organic Chemistry Cornell University
196. Craig McCluskey PhD, Physics
197. Richard McFarland, Retired NASA Physicist
198. Sean McGrew, Analytical Chemist, lifetime career in Chromatography/Mass Spectrometry, applications to semi-volatile organic compounds in the environment
199. Edward P. McMahon PhD in Systems Science, has been involved with atmospheric physics at General Research
200. Mark Meier PhD, Professor of Physics, University of Houston
201. Samuel Melfi, Emeritus Professor of Physics, UMBC, Retired NASA Scientist
202. Kenneth Melvin MD, Retired Professor of Medicine, Portland, Oregon
203. Dr. Daniel M. Merfeld, systems engineer (BSME U Wisconsin-Madison; MSE Princeton; PhD MIT), neuroscientist/neuroengineer by vocation, former Professor at the Harvard Medical School, Professor at the Ohio State University
204. Dr. Peter B. Merkle, Associate Professor in the School of Engineering at Benedictine College, educator in the area of environmental science and engineering, previously served in the U.S. government in an advisory role with respect to modeling and simulation of catastrophic events
205. Patrick J. Michaels †, Competitive Enterprise Institute, Washington DC
206. Michelle Michot Foss PhD, fellow in energy, minerals and materials at Rice University's Baker Institute
207. Steven Milloy, MHS, JD, LLM, Publisher
208. Ference M. Miskolczi, Retired NASA/AS&M Senior Scientist, Foreign Associate Member of the Hungarian Academy of Sciences
209. Michael J. Mitchell, Mechanical Engineer
210. Guy K. Mitchell Jr., graduate mechanical engineer and physicist with extensive research in the field of anthropogenic global warming
211. Brian Moody, Former GET Specialist for SMS Equipment in Ft McMurray
212. James Moore, Commercial Fisherman, President Alaska Trawlers Association, Executive Committee Northern Southeast Regional Aquaculture Association, Board member Amstrong Keta Inc.
213. James R. Morris, Geophysical Exploration Oil & Natural Gas
214. Thomas L. Moser, Retired NASA Senior Executive - Program Manager of the Space Station and Space Shuttle, Chief Engineer at NASA Johnson Space Center, Fellow of the AIAA, Founder of the "Right Climate Stuff", a group of former NASA Engineers & Scientists
215. David R. Motes, Chemical Engineer, lifelong experience in the geo-energy industry
216. James F. Mundy, Retired Meteorologist
217. Daniel W. Nebert, Professor Emeritus, Department of Environmental Medicine and Center for Environmental Genetics, University of Cincinnati
218. Prof. Eric L. Nelson PhD, Assistant Clinical Professor, Department of Public Health Sciences, University of California
219. Danny L. Newton, Retired from Federal Aviation Administration (FAA), Experience in Working with NOAA with respect to Experimental Weather Data Collection
220. Richard Nicholson, MD University Of South Alabama 1988, Family Medicine
221. Ned Nikolov PhD, Physical Scientist at the USFS Rocky Mountain Research Station in Fort Collins CO, Managing a Fire-Weather Intelligence Project
222. Paul Noel, Research Scientist (retired)

223. Thomas O'Connor, Member American Association of Petroleum Geologists, Washington
224. Kenton Oma, Retired PE Chemical Engineer, Environmental Engineering, Environmental Consultant, R&D at DOE Nuclear Facility
225. Jane M. Orient, President of Doctors for Disaster Preparedness
226. Tench C. Page, MSc & BSc in Geology including study of causes and effects of earth's climatic history
227. Charlie Pappis, retired Semiconductor Industry Executive
228. Trueman D. Parish, Retired Director of Engineering Research Eastman Chemical Company
229. Arvid Pasto PhD, Ceramics, Retired from the Oak Ridge National Laboratory, TN
230. Chad M. Paton PhD, Associate Professor at University of Georgia
231. Bill Pekny, MS Physics, Retired atmospheric physicist and soldier scientist, specializing in battlefield atmospherics. Former U.S. Navy Meteorologist and Hurricane Hunter during "Project Stormfury-1969." Author of the book: A Tale of Two Climates—One Real, One Imaginary
232. Charles W. Pennington, Senior Vice President of Engineering NAC International (Retired), Secretary, XLNT Foundation, Board of Directors
233. Jeffrey S. Philbin, Retired Nuclear Engineer Sandia National Laboratories (New Mexico), Independent Consultant in Nuclear Facility Design and Safety Analysis, Nuclear Criticality Safety and Weapon Response
234. Dr. Robert B. Phillips, retired from radio astrophysics, specialised in calibration and validation of orbital IR and visible sensors (GOESS, STSS-1 and -2)
235. James Richard Poirier, BS degree in Meteorology, Lifetime Career in Atmospheric Science
236. James M. Policelli, Registered Professional Engineer
237. Herman A. Pope, Retired Aerospace Engineer NASA-JSC
238. Willem Post, Independent Researcher regarding Energy and Environment
239. Darrell Potter, Retired Geologist/Environmental Hydrogeologist
240. Dr. William H. Pound PhD Major in Industrial Engineering with Minor in Materials Science, lifetime experience in the manufacturing industry with focus on technical, engineering, environmental, and quality assurance
241. Dr. Victor Privalsky PhD, ScD in physics and mathematics, UT Oceanographer and specialised in random processes, retired from Space Dynamics Laboratory, Logan
242. Kenneth L. Purdy, Management Consultant, Retired Naval Officer in Operational Intelligence
243. Brian D. Ray PhD in science education from Oregon State University, Salem
244. Dr. George Rebane, Scientist with degrees from UCLA in Physics (BS) and Engineering (MSE and PhD), lectured at UCLA and California State University as an Adjunct Professor
245. Edward A. Reid, lifetime experience in the US energy industry in technical research and development, market development, marketing and consulting
246. Fred A. Reitman, career as petrochemical toxicologist, retired
247. Forrest J. Remick, Commissioner (Retired), US Nuclear Regulatory Commission
248. David K. Rogers, PE, CEG MS, Geological Engineering, Member of the Boards of Consultants for the Federal Energy Regulatory Commission
249. Dr. Jennifer Runquist PhD from Northwestern Univ, Evanston IL related to photosynthesis
250. Marius Russo, IT expert
251. James H. Rust, Emeritus Professor of Nuclear Engineering, Georgia Institute of Technology
252. Charles L. Sanders, Retired Radiobiologist, Author of Radiobiology and Radiation Hormesis: New Evidence and Its Implications for Medicine and Society (Springer)
253. Rick Sanders M.A., Scientists for Accuracy in Radiation Information (SARI), Associate Editor, 21st Century Science and Technology Magazine
254. Kent Satterlee, Executive Director at Gulf Offshore Research Institute (GORI)
255. Dana H. Saylor Sr., a lifelong agriculturalist, retired, article "Living a lifetime of climate change"
256. Jesse Schilling, Certified Management Accountant
257. Mike Schimmelpfennig, Degreed Mining Engineer with more than 40 years of experience

258. Brian Schmidt, Co-Founder and Chief Visionary Officer of Primary Ocean Aquaculture division and Primary Bio Agriculture - Agriculture division
259. Harold Grant Scoggins, retired IT professional
260. Edwin T. Sewall, Retired BS Electrical Engineering, Southern Methodist University 1960 Dallas Texas
261. Mark W. Sellers, PhD Systems Science, Modeling and Analysis of Complex Systems
262. John A. Shanahan, Civil Engineer with career in Nuclear Power, Public Education about Fossil Fuels (including question of man-made Global Warming) and Nuclear Power through website: allaboutenergy.net
263. Roscoe M. Shaw, meteorologist and portfolio manager
264. Dr. Thomas P. Sheahan, PhD in Physics at MIT, Chairman, Science & Environmental Policy Project, involved in energy-related research for 45 years
265. Dr. Roger Sheley, Ecologist, USDA-Agricultural Research Service; Editor-in-Chief of the international journal-Rangeland Ecology and Management
266. John D. Sheppard MD, MMSc, FACS, Professor of Ophthalmology, Microbiology & Immunology, Eastern Virginia Medical School
267. John Shewchuk, Meteorologist (CCM) and Atmospheric Researcher
268. Stephen W. Shipman, Institutional Investor
269. Ryan Shrout, Environmental Attorney with a Masters of Law in Environmental Law practicing in the air emissions field
270. Dr. Matthew Eric Shultz, University of Delaware, Dept. of Physics & Astronomy, specialised in Stellar Astrophysics, Annie Jump Cannon Fellow
- 271. David Siegel, author, entrepreneur, critical thinker, communicator (1000th signee)**
272. Elliot Smith, airline pilot, climate realist, 30+ years of studying AGW data
273. Robert J. Smith, Bachelor of Physics, Aircraft test and evaluation engineer
274. Robert P. Smith PhD, P.E., Environmental Scientist and Professional Engineer'
275. Professor William H. Smith, Professor of Earth & Planetary Sciences; Astronomer and Planetary & Atmospheric Scientist; most recently involved in the Analysis of the Earth's Climate and Renewable Energy Systems
276. Willie Soon, Independent Scientist
277. Prof. George Sowers PhD, Space Resources, Colorado School of Mines
278. Prof. Rick Bernard Spielman, Senior Scientist & Professor of Physics, University of Rochester, Laboratory for Laser Energetics
279. Robert M. St. Louis MSc in geology, owner of Mine Water Consulting LLC
280. Kirk Douglas Stahnke, MS Educ. Prof of Design Tech (Retired), Independent Climate Researcher
281. Walter Starck PhD, Marine Science, Pioneer in Coral Reef Studies, Policy Advisor to The Heartland Institute
282. Jess L. Stark, Founder and CEO of Stark Industries, Houston, Texas
283. Jim Steele, Emeritus Director Sierra Nevada Field Campus, San Francisco State University
284. Phil Stegemoeller, Professional Forester, Partnership with the Quinault Indian Nation, a BS in forest management at the University of Minnesota, 1979
285. Ronald Stein, Professional Engineer
286. Kenneth S. Stevens PhD, Professor, University of Utah, Electrical and Computer Engineering Dept
287. Brent K. Stewart PhD, Professor Emeritus, Radiology, University of Washington School of Medicine
288. Gerald M. Sulzer, MS Chemical Engineer, Retired Director of Technology, Albemarle Corporation
289. Soames Summerhays, Marine Biologist, Film Maker
290. Dr. Daniel P. Taggart PhD in Experimental Plasma Physics, life time career in Controlled Thermonuclear Research and Radiation Protection at Los Alamos National Laboratory
291. Tomer D. Tamarkin, Physicist, Founder and President/CEO of Energycite Inc., President and Chairman of ClimateCite Inc.

**Re: Comments on San Diego Climate Action Plan (PDS2015-POD-15-002)
and Draft Supplemental Environmental Impact Report (PDS2016-ER-
16-00-003)**

Dear Ms. Soffel:

The law firm of Chatten-Brown & Carstens represents the Sierra Club on matters relating to the County's preparation of its revised Climate Action Plan ("Revised CAP") and Supplement to the 2011 General Plan Update Program Environmental Impact Report ("Supplemental Environmental Impact Report," or "SEIR").

As described more fully below, the Revised CAP and SEIR are legally inadequate by modifying or effectively deleting Mitigation Measure CC-1.2 without additional analysis; erroneously claiming that 2014 is the first year data was available for a greenhouse gas (GHG) inventory; allowing out-of-County offsets; failing to require a reduction in vehicle miles traveled (VMT's) for housing projects; providing only a token annual reduction of VMT's for County employees; and failing to exercise its influence to encourage the San Diego Airport Authority to reduce GHG emissions reductions from airport ground operations, increasing public transit to the airport, and reducing emissions from vehicles serving the airport. Of great importance, no open lands should be annexed or rezoned for greater development until there is an adequate CAP that actually achieves the 2020 emission reduction goals the County agreed to in its 2011 General Plan Update.

In addition to this letter addressing legal issues, we also incorporate herein the September 25, 2017 Sierra Club San Diego comment letter prepared by Mike Bullock, Chair of the Sierra Club San Diego's Transportation Subcommittee. The Sierra Club San

Diego's comment letter, attached as **Exhibit A**, has detailed strategies that must be evaluated to assure a legally adequate Revised CAP and SEIR.

We request the County perform additional analysis of the issues described below and those set forth in Mr. Bullock's letter. Once additional analysis has been performed, this analysis, along with additional enforceable and effective mitigation measures, must be set forth in a Revised SEIR. The SEIR must then be recirculated so that the public and public agencies may comment on this information, as required by CEQA.

I. The Revised CAP and SEIR Eliminates the Specified Greenhouse Gas Emissions Reductions from 2006 Levels by 2020.

Mitigation Measure CC-1.2 of the County's 2011 General Plan Update required the County to:

Prepare a County Climate Change Action Plan with an update[d] baseline inventory of greenhouse gas emissions from all sources, more detailed greenhouse gas emissions reductions targets and deadlines; and a comprehensive and enforceable GHG emissions reduction measures that will achieve a 17% reduction in emissions from County operations from 2006 by 2020 and a 9% reduction in community emissions between 2006 and 2020.

(SEIR, p. 1-14.)

However, the Revised CAP and SEIR eliminate this requirement and replace it with general reductions of GHG emissions "consistent with state-legislative targets." (SEIR, p. 1-16.) This action is proposed even though Judge Taylor specifically rejected a proposed Supplemental Writ that would have allowed the County to amend or delete GHG mitigation measures adopted in 2011.

While generally mitigation conditions can be modified or deleted, the County made a firm commitment to reducing GHG emissions by 2020 when it adopted the 2011 General plan Update. Further, measures generally can only be deleted if they have become impractical or unworkable and the conclusion that they are is supported by substantial evidence. (*Lincoln Place Tenants Ass'n v. City of Los Angeles* (2007) 155 Cal. App. 4th 425, 449.) If the County continues to seek to modify or effectively delete Mitigation Measure CC-1.2, the SEIR must analyze why this measure has become impractical or unworkable. If the County does not demonstrate that Mitigation Measure CC-1.2 is impractical or unworkable, the County must show that the pro rata share of Mitigation Measure CC-1.2's GHG reductions have been achieved for County operations and community emissions.

II. The County's Claim It Does Not Have Baseline Data for Its GHG Inventory Prior to 2014 Is Belied By Its 2012 CAP, Which States the County Prepared Inventories With Baseline Years of 2005 and 2006.

In preparing its GHG inventory for the Revised CAP, the County uses baseline data from 2014. The County argues, "The County's base inventory of GHG emissions evaluated activities within the unincorporated county in the year 2014, the most recent year data is available." (SEIR, p. 1-6.) However, this conflicts with the 2012 CAP, which states the County prepared inventories with baseline years of 2005 and 2006. The 2012 CAP provides:

The County prepared baseline inventories at the community-wide and local government levels. The community-wide inventory has a baseline year of 2005, and emissions are limited to the County's unincorporated communities. The local government inventory has a baseline year of 2006 and only includes emissions related to County government operations. Each inventory is used to establish a baseline level of emissions, which then serves as the starting point for forming emissions reduction targets and as a tool to gauge the performance of emissions-reduction measures.

(2012 CAP, p. 14, emphasis added.) The SEIR must explain why the County did not use the 2005 and 2006 GHG inventories, as well as provide an analysis of how the 2014 GHG inventory compares to the previously prepared inventories.

The County's decision to use 2014 as the baseline year from which it will establish the 2020 and 2030 CAP targets and 2050 goal must demonstrate that using this baseline will result in reductions that are equal or greater to reductions using a 1990 benchmark. In the event the County argues that data prior to 2014 is inadequate, the County should address the 1990 GHG emissions inventory estimate for San Diego County that has been prepared. That estimate is discussed in the document entitled, "An Analysis of Regional Emissions and Strategies to Achieve AB 32 Targets Revised and Updated to 2010." (Available at <http://catcher.sandiego.edu/items/usdlaw/EPIC-GHG-2013.pdf>). Presumably, the County's share of the total 1990 San Diego County GHG emissions could be developed from that data.

III. The Allowance of Offsets From Outside the County of San Diego Is Inconsistent with the County General Plan's Requirement to Achieve Specified Greenhouse Gas Emissions Reductions in the County.

Mitigation Measure CC-1.2 of the County's General Plan Update requires the County to "achieve a 17% reduction in emissions from County operations from 2006 by 2020 and a 9% reduction in community emissions between 2006 and 2020."

The Revised CAP and SEIR authorize the use of offsets from outside the County of San Diego. The Draft EIR identifies the County's "priority" list for consideration of GHG reduction features as follows:

1) project design features/on-site reduction measures; 2) off-site within the unincorporated areas of the County of San Diego; 3) off-site within the County of San Diego; 4) off-site within the State of California; 5) off-site within the United States; and 6) off-site internationally.

(DEIR, 2.7-48.) These offset priorities, which allow offsets outside of the County, outside of the state, and even outside of the United States, only have to be considered "to the satisfaction of the Director of Planning Development Services." (SEIR, p. 2.7-38.) This provision would impermissibly purport to give the County wide latitude to allow essentially unrestricted use of international credits to balance out local GHG emissions created by County projects. The use of offsets is inconsistent with the County's Mitigation Measure CC-1.2 to reduce GHG emissions *within the County of San Diego* by specified reduction amounts.

IV. The CAP Lacks A Requirement to Reduce VMT's from Newly Planned Housing Projects.

The CAP identifies Strategy T-1, which is intended to "Reduce Vehicle Miles Traveled." The CAP contains three measures designed to reduce achieve Strategy T-1: Measure T-1.1 - Acquire Open Space Conservation Land; Measure T-1.2 - Acquire Agricultural Easements; and Measure T-1.3 - Update Community Plans.

The CAP's strategy is an important one. The CAP purports to focus on density in the county villages. (CAP, p. 3-9.) "Focusing new development in and around existing unincorporated communities allows the County to maximize existing infrastructure ... By not developing housing in the more remote areas, the county will avoid GHG emissions from transportation ..." (*Ibid.*) The Sierra Club fully supports this goal.

However, none of the three measures the County identifies contains any enforceable requirements to locate residential housing closer to major sources of employment and transit. Mitigation Measure CC-1.15 does not include anything about limiting VMT's from newly planned housing projects. In fact, as discussed below, by allowing developers to purchase "carbon offsets" instead – which may even be based upon GHG emission reductions outside of the United States – the CAP actually facilitates sprawl.

The County may argue that Measure T-1.3 – Update Community Plans will assist in locating residential housing closer to jobs and transit. However, updating Community Plans does not address residential housing on a countywide basis. Additionally, the

County improperly passes responsibility for something that is clearly within its control – land use planning in the County – to individual communities.

The CAP's failure to address VMT's from newly planned housing projects is inconsistent with the Sustainable Communities and Climate Protection Act of 2008 (Sustainable Communities Act, SB 375, Chapter 728, Statutes of 2008), which supports the State's climate action goals to reduce GHG emissions through coordinated transportation and land use planning with the goal of more sustainable communities. The County should use its power to establish land use planning priorities for residential housing development in order to reduce VMT's.

Pursuant to SB 375, Metropolitan Planning Organizations, including the San Diego Association of Governments (SANDAG), are required to adopt strategies that show prescribed land use allocation in their regional transportation plans. SANDAG's Regional Plan (available at http://www.sdforward.com/pdfs/RP_final/The Plan - combined.pdf; October 2015) states, "More than 80 percent of new housing in the region will be attached multifamily" (p. 34). The plan also states, "By 2050, 87 percent of the region's new housing and 79 percent of new jobs will be situated within a half-mile of public transit." (p.75) "The projected increase in new housing capacity is generally higher for areas with densities above 20 dwelling units per acre." (Appendix C, Table C.3.) The County should analyze how SANDAG's estimates are impacted by the County's land use planning.

V. The CAP's 1.5% Annual Reduction of VMT's for County Employees Is Inadequate.

The County is one of the largest employers in San Diego County, and thus, the County has a huge amount of leverage to make significant GHG emissions reductions by taking actions to reduce VMT's for its employees. For example, San Luis Obispo County found that "two-thirds of the county government's greenhouse gas emissions are caused by employees commuting to and from work." ("SLO County Supervisors Approve Flex-time, Telecommuting Policies," available at <http://www.sanluisobispo.com/news/local/article39123279.html>.)

The CAP proposes Mitigation Measure T-2.3 to "[r]educe County employee commute Vehicle Miles Traveled (VMT) by 20% by 2030." However, this amounts to an annual reduction of VMT's of merely 1.5%. Facing a huge challenge to achieve significant GHG emissions reductions, a 1.5% annual reduction of VMT's is minimal and additional reductions of VMT's are feasible and necessary. Please see additional analysis of this issue in the Sierra Club San Diego's comment letter attached as **Exhibit A**.

VI. The Revised CAP and SEIR Must Account for GHG Emissions from County Airport Ground Operations.

San Diego International Airport is owned and operated by the San Diego County Regional Airport Authority. (<http://www.san.org/Airport-Authority/About-the-Authority>.) The Board of Supervisors appoints a representative to that Board. (<http://www.sandiegocounty.gov/dpw/airports.html>.)

Cities and counties that have an airport and an adopted CAP, frequently include the GHG generation of the airports' ground operations. Examples include the County of Sacramento, the City/County of San Francisco, and the cities of Fullerton and Livermore. These emissions are often significant. Sacramento County Airport, owned and operated by the Sacramento County Airport System, provides a useful comparison to San Diego County. The County of Sacramento prepared a CAP that included GHG emissions from airport ground operations in the GHG inventory. (http://www.ca-ilg.org/sites/main/files/file-attachments/sac_030843.pdf, p. 26.) The Sacramento County CAP concluded that 31% of total government emissions in the County came from operation of the Sacramento International Airport, including ground support equipment, roadways, and parking (but excluding aircraft emissions).

San Diego County should include airport ground operations in its GHG inventory, and provide an analysis of what percentage of total government emissions in the County stem from airport ground operations and work with the Airport Authority to reduce those emissions.

VII. The County Should Show Compliance with the 2011 General Plan Update's Mitigation Measures Prior to Annexations or Rezoning of Open Lands.

Finally, until a valid, legally adequate CAP is in place that demonstrably will achieve the 2020 emission reduction goals set out in the 2011 General Plan Update, no lands that are currently "greenfields" should be annexed and no General Plan Amendment should be authorized that would allow more intense development of those lands.

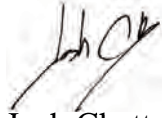

CONCLUSION

The SEIR must be revised with this new information and then recirculated for public comment. (CEQA Guidelines section 15088.5.) Pursuant to Public Resources Code section 21092.2, we request all notifications regarding this Project.

Thank you for your consideration.

Subject: COUNTY OF SAN DIEGO CLIMATE ACTION PLAN (PDS2015-POD-15-002),
GENERAL PLAN AMENDMENT (PDS2016-GPA-16-007), DRAFT SEIR (LOG NO.
PDS2016-ER-16-00-003)

Land Use/Environmental Planner Soffel,

We appreciate the opportunity to comment on this project. At the same time, we regret that the County failed in its first effort to produce an acceptable set of CAP and CEQA documentation. We also regret that our efforts to provide feasible mitigation measures are still being ignored. We are also disappointed that your current efforts seems to plan for and thus enable sprawling, vehicle-miles-travelled-inducing (VMT-inducing) development, beyond what is allowed in the current General Plan.

In your Notice of Preparation (NOP) for this project, the Appellate Court ruling is properly identified. The precedent-setting, published ruling is Reference 1 of this letter.

Your NOP properly stated that the

Fourth District Court of Appeal held that the 2012 CAP did not meet the description set forth in the adopted mitigation measure (GPU PEIR Mitigation Measure CC-1.2) and that an EIR was needed for the plan.

However, there was much more to the ruling. For example, the ruling also said:

The Sierra Club provided feasible mitigation measures. The County rejected these mitigation measures without substantial evidence for doing so.

The County must admit this error and devise a strategy to ensure that it is not repeated. To our knowledge, the County has not admitted this error and is once again ignoring the feasible mitigations we proposed, in detail, during the last effort to produce an acceptable

CAP. We have proposed these mitigations, over and over, since that failed effort. Ignoring measures that might offend the political sensitivities of the Board of Supervisors, for example, is understandable but is also a path to CEQA violation.

Chapter 1 Project Description

On Page 1-1 the Project Description says, “The fundamental purpose of the project is to reduce County GHG emissions consistent with state legislative requirements”.

This stated fundamental purpose is incongruent with CEQA and the anthropogenic climate crisis humanity must confront and solve.

CEQA requires an analysis which uncovers and clearly describes the physical-world results to expect, from doing the project, considering the well-established concept of cumulative impacts of other such projects. The primary question posed by our anthropogenic climate crisis is whether humanity can stabilize the climate at a livable level or whether our greenhouse gas (GHG) emissions will cause our planet’s climate system to destabilize, causing a devastating collapse of the human population, leading to our extinction and the loss of most of the other life forms currently living on our planet. There is nothing provided in the SEIR Documents linking state legislative requirements with the climate stabilization question.

We will now show that the state legislative requirements will not result in avoiding climate destabilization.

From

http://www.arb.ca.gov/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf (with excerpts shown in Reference 2) comes the following ominous information:

1. Scientific research indicates that an increase in the global average temperature of 2°C (3.6°F) above pre-industrial levels, which is only 1.1°C (2.0°F) above present levels, poses severe risks to natural systems and human health and well-being.
2. To have a good chance (not a guarantee) of avoiding temperatures above those levels, studies focused on a goal of stabilizing the concentration of heat-trapping gases in the atmosphere at or below the 450 parts per million (ppm) CO₂-equivalent (CO₂e, a metric that combines the climate impact of all well-mixed GHGs, such as methane and nitrous oxide, in terms of CO₂).
3. The CO₂e target is a somewhat approximate threshold, and the exact level of CO₂e is not precisely known because the sensitivity of the climate system to GHGs has uncertainty. Different models show slightly different outcomes within this range. An example of a pre-IPCC assessment study (Meinshausen et al. 2009)¹⁵ which has synthesized many studies on climate sensitivities, concluded that we would need to stabilize at about 400 ppm CO₂e

Item 3 should bring shivers of fear and tears of regret. We are already at 410 PPM and we are far from reducing our emissions enough to stop atmospheric CO₂e from going up. To do that, the industrial countries would need to reduce their emissions to 80% below their 1990 emission levels, which is the basis for California’s Executive Order S-3-05 (“S-3-05”), which is an order to achieve the 80% below 1990 emission levels by the year of 2050. The problem is that the S-3-05 target is for year 2050 and that is obviously far too late, based on the 3 items above.

Humanity might have a chance to stabilize the climate at a livable level if we achieve emissions that are 80% below our 1990 emission levels by 2030. However, our current state mandate, SB 32, is to reduce our emissions to 40% below our 1990 levels by 2030. To support the achievement of climate-stabilizing targets, California must double its SB 32 mandate, from 40% to 80% or, stated another way, achieve its S-3-05 target 20 years sooner.

Project Background

The section leaves out fact that the County ignored the primary San Diego Sierra Club mitigation measure of installing a car-parking system that gives its employees more choice over how they spend their wage, while significantly reducing the frequency of the choice of arriving at work in a single-occupancy vehicle (SOV). The current project again ignores that mitigation measure, in clear violation of CEQA law, as has been established in the last lawsuit.

We also disagree with the premise of the third purpose stated on Page 1-4. Given that the earth's atmospheric CO₂ is at the outrageous value of 410 parts per million (PPM) and going up significantly every single year, there can be no "GHG Threshold" below which there is some reason that the emission can be deemed "insignificant". Every project must be shown to fall within the General Plan and the Climate Action Plan and the public must be invited to suggest mitigation measures to reduce emissions further. This means all projects must go through a CEQA evaluation. As stated in CARB scoping plan documentation, in all cases, mitigation measures must be adopted if they are "technologically feasible and cost effective".

GHG Emissions Inventory

We thank you for this information and point out that On Road Transportation category, at 45%, is larger than the next three categories of Electricity (24%), Solid Waste (11%) and Natural Gas (9%). Cars and Light duty trucks, or "light duty vehicles" or "LDVs" emit most of the On Road GHG and deserve significant focus. For electricity the achieved target must be 100% renewable by 2035 and we are severely disappointed that the Board recently decided to not participate in a feasibility study of establishing a Community Choice Energy District, under California Community Choice Aggregation (CCA) law.

General Plan Amendment

We appreciate your documentation about what you are proposing. However, it is unfortunate that you are undermining CEQA, or at least making the task of advocates much more difficult, by emitting the important words, "enforceable measures". By doing that you may make the plan a useless exercise, with nothing guaranteed. If measures are not enforceable what good are they? Why leave out those critically important words?

Here is the existing (2011) Goal, with highlights added:

GPU Policy COS-20.1 (Climate Change Action Plan)

Prepare, maintain, and implement a climate change action plan with a baseline inventory of GHG emissions from all sources; GHG emissions reduction targets and deadlines, and **enforceable** GHG emissions reduction **measures**.

Here is what you are proposing:

GPU Policy COS-20.1 (Climate Change Action Plan)

Prepare, maintain, and implement a Climate Action Plan for the reduction of community-wide (i.e., unincorporated County) and County-Operations greenhouse gas emissions consistent with the California Environmental Quality Act (CEQA) Guidelines Section 15183.5.

Guidelines Section 15183.8, which states, “Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level”.

This “substantial evidence demonstrates” standard is much more difficult than the previous “enforceable” standard. This is no time to make climate action plans weaker or more difficult to evaluate.

As we have stated above, the point of CAPs should be ensuring that municipal governments are doing their part to help humanity achieve climate stabilization, not some artificial goal like a state mandate that may not be related to climate stabilization.

In order to comply with CEQA, which is about the physical world (and correct the grammar since “meet or exceed” is for a plural noun), the following new words (shown in ***bold italics***) must be added to COS-20:

GPU Goal COS-20 (Governance and Administration)

Reductions of community-wide (i.e., unincorporated County) and County Operations greenhouse gas emissions contributing to climate change that ***meet or exceed*** requirements of the Global Warming Solutions Act of 2006, as amended by Senate Bill 32 (as amended, Pavley. California Global Warming Solutions Act of 2006: emissions limit) ***and that meet or exceed targets for the industrialized countries of the world that are shown by climate scientists to, with reasonable assurance, stabilize the earth’s climate at a livable level, meaning that there would be no devastating collapse of the human population.***

Likewise:

GPU PEIR Mitigation Measure (MM) CC-1.2

Prepare a Climate Action Plan for the reduction of community-wide (i.e., unincorporated County) and County Operations greenhouse gas emissions consistent with both state-legislative ***and current climate science specified, climate-stabilizing*** targets, as described in General Plan Goal COS-20, and consistent with CEQA Guidelines Section 15183.5 or as amended, as referenced in General Plan Policy COS-20.1. As described in Section 15183.5, the key elements of the Climate Action Plan would include:

“CEQA Guidelines Section 15183.5(b)(1):

(1) Plan Elements. A plan for the reduction of greenhouse gas emissions should:

(A) Quantify greenhouse gas emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area;

(B) Establish a level, based on substantial evidence, below which the contribution to greenhouse gas emissions from activities covered by the plan would not be cumulatively considerable;

- (C) Identify and analyze the greenhouse gas emissions resulting from specific actions or categories of actions anticipated within the geographic area;
- (D) Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;
- (E) Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels;
- (F) Be adopted in a public process following environmental review."

Once prepared, implementation of the Climate Action Plan will be monitored and progress reported on a regular basis, as follows:

- o Implementation Monitoring Report – prepared annually;
- o Greenhouse Gas Emissions Inventory – updated every two years; and
- o Climate Action Plan – updated every five years.

Guidelines for Determining Significance for Climate Change

Given the nature of our anthropogenic climate crisis, there is no such thing as a GHG emission that is insignificant. All GHG reduction measures must be implemented if they are technologically feasible and cost effective. Our best hope of identifying all such mitigation measures is to subject all projects to the CEQA process.

2.6 Energy

We appreciate your statement that Notice-of-Preparation (NOP) comments received showed "concern" (your word) for a Community Choice Energy (CCE) program and the impacts and location of large-scale renewable energy projects. We believe that support for CCE districts under California Community Choice Aggregation (CCA) law is widespread, for good reason. We understand that there will be concern about any large scale project to generate energy.

The transportation-related measures appear in

2.7 Greenhouse Gas Emissions

This section starts by purporting to summarize the NOP comments you received on this critical topic. However, that summary is contradicted by your Appendix A, which shows comment letters numbered 1 and 18 that point out the need for achieving climate-stabilizing targets. Your summary says nothing about the need to define, explain, and achieve climate-stabilizing targets. Comment letter 18 has significant details on this topic. This topic is the most important in all of our earth's history, because life is sacred and most of it is under threat, by a crisis that humanity can either chose to solve or ignore. The fact that you think that topic (again, whether we will stabilize the climate at a livable level) is so unimportant that it should be ignored is significant.

We agree with the NOP's first paragraph and especially these words, in that paragraph: "significant environmental impacts". "Environmental impacts" are in the physical world, not in the world of laws or executive orders. In this case, the primary negative impact or outcome, that should be avoided, is climate destabilization. Therefore, the term, "climate destabilization" must be defined and also described.

In the first paragraph of the NOP, it is written that the EIR must identify possible ways to mitigate or avoid the significant effects. Again, the “effects” are environmental in nature. This means that what will happen in the physical world must be considered. Besides this, how to avoid what would happen in the physical world must be considered.

What is needed is a description of climate destabilization and how to avoid the catastrophe of climate destabilization. CEQA and common sense require that negative environmental impacts be described, including the negative impact of climate destabilization.

General Plans and CAPs must first describe the difference between stabilizing the climate at a livable level and destabilization, where warming-system-feedbacks, such as methane gas leaking from melting permafrost, a process which is both driven by warming and creates more warming, become dominant. If they become too large, humanity will lose control, and the climate will transition to one which will no longer support most life forms on the planet, including our own species. Failing to provide this description is a CEQA violation. One authoritative source says, “the Earth is on a trajectory to warm by more than 4 degrees Celsius [and this] would be ***incompatible with continued human survival.***”

Avoidances of significant environmental impacts need to be described. Therefore, a discussion of “Greenhouse Gas Emissions” needs to state that there is a need for the EIR to have a description of how a climate is stabilized at a livable level.

We would like to help in this regard. Climate stabilization Step 1 is to get the earth’s atmospheric CO₂_e to stop increasing. This Step is shown in Figure 1.

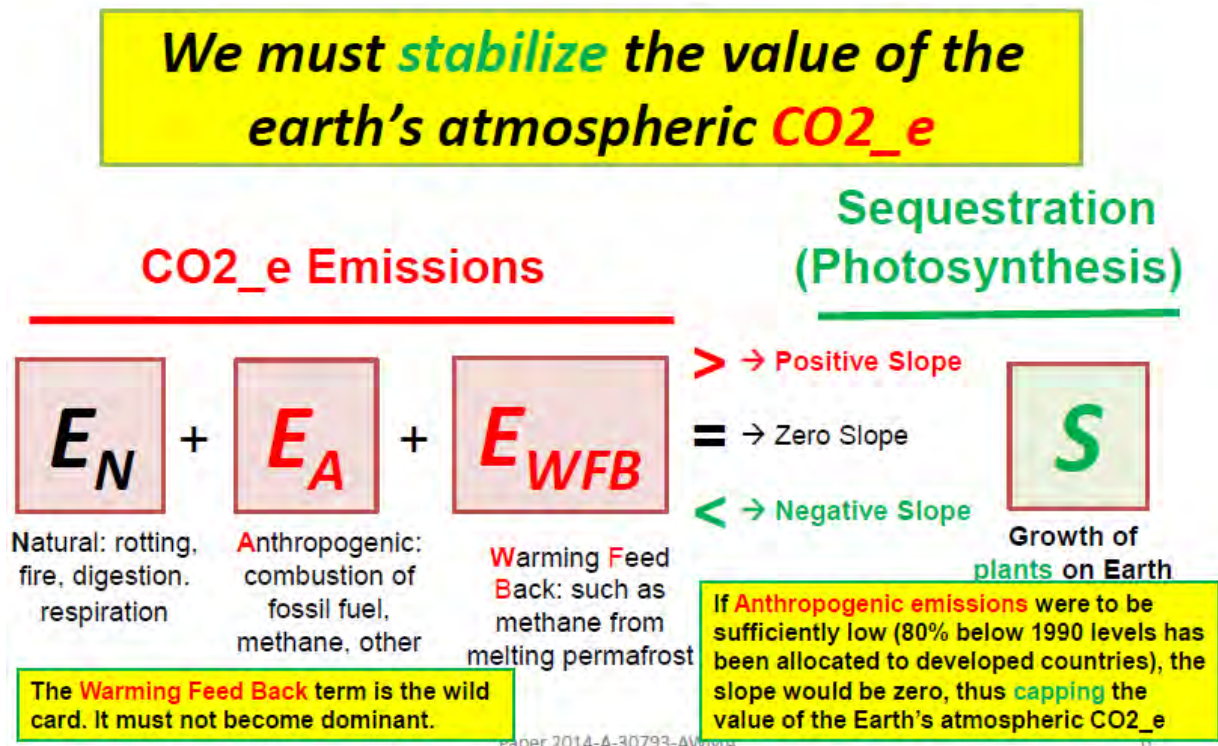

Figure 1 Stabilizing Atmospheric CO₂_e

It has been written that the industrial world must get its emissions down to a level that is 80% below 1990 levels to achieve the equality sign, which is one of the three possibilities

shown in Figure 1. It was thought that to achieve climate stabilization, humanity could do this as late as 2050 and that the atmospheric level of CO₂_e would then be at 450 PPM, corresponding to a 2 degree Celsius increase. However, it is now known that it is dangerous to allow a 2 degree Celsius change and that, even worse, an earth's atmospheric level of only 400 PPM of CO₂_e corresponds to a 2 degree Celsius change. As we all know, the earth's atmosphere is already at 410 PPM CO₂_e. This information about climate stabilization is shown in References 2 and 3.

In Figure 1, the zero slope condition will cap atmospheric CO₂_e, meaning that it will not go up and not go down. Currently, we have a positive slope condition, because our anthropogenic emissions are too high. We will require a negative slope to return our atmospheric CO₂_e to a safe level. The "wild card" in this problem is the warming feedback term. If it gets too large, we will have no hope of avoiding catastrophe.

You therefore must identify a climate-stabilizing target and then define enforceable measures to achieve that target. The principle of cumulative effects is being used here, as it must. The County must do its part. If it doesn't, it must assume that other municipal governments (around the world) will do the same and destabilization will result.

Besides this, to comply with CEQA, the CAP and its SEIR must describe destabilization's impact to our environment, to see if that is the outcome the decision makers want. During the process of destabilization, the earth will lose most of its life forms. This will not be pleasant for us or the animals, from aardvarks to zebras. We will all starve to death. This may take decades. The low-income people will starve first; the billionaires last. Of course there will be food riots; we will need to become a police state; and so on. Mass suicide and cannibalism may occur. A majority of the Board of Supervisors would rather avoid this, I assume. It is your job to make sure they understand this situation. The SEIR covers all of this up by not mentioning it. There is no excuse since it was described in NOP response Letter 18.

To achieve the CAP's identified climate-stabilizing targets, California state actions will be needed, driven by legislation and implemented by such entities as CARB, Caltrans, and the California Road User Charge Technical Advisory Committee (SB 1077.)

However, the County must also take strong actions. The County must show how climate-stabilizing targets can be achieved in each of the categories that emit greenhouse gas (GHG), assuming reasonable California actions, according to reasonable plans. These plans need to be either identified or written.

Cars and light-duty trucks emit the most GHG of any category in the County. Therefore, one thing that is needed to support the EIR is described in Reference 4, which is a sub-plank of the 2016 California Democratic Party (CDP) Platform:

[A] state plan showing how cars and light-duty trucks can hit climate-stabilizing targets, by defining enforceable measures to achieve the needed fleet efficiency and per-capita driving

To show that this is not impossible, as well as to offer a plan that the County may wish to use, we have included Reference 5, *Climate-Stabilizing, California Light-Duty Vehicle Requirements, Versus Air Resource Board Goals*.

Reference 5 shows that a climate stabilizing target is 80% below the 1990 level, by year 2030. Note that this is 20 years sooner than the final target of Executive Order S-3-05 and is double the drop from the 1990 level specified in SB 32, for 2030.

The SEIR, CAP, and GPU are proposing to only achieve legislative requirements, sometimes referred to as our “state mandates”.

However, where is it stated that “consistent with legislative requirement” is enough to avoid climate destabilization? The fact is that it is not stated. It is almost as if the authors hoped the reader won’t notice this.

It is true that the EIR needs to show how to achieve the “legislative requirement” but nowhere is it acknowledged that this is not enough to avoid catastrophe. Laws that happen to pertain to climate change, such as SB 32, do not replace or amend CEQA. CEQA may be humanity’s most important law, given our climate crisis. We must stop ignoring its most important set of requirements, related to climate: The environmental impacts of climate destabilization must be described and avoidance measures must be devised and implemented.

Effects of Climate Change on the Environment (Page 2.7-3)

This section violates CEQA. Your list of effects is incomplete. You fail to mention the fact that this crisis is essentially unbounded in the harm it can and probably will produce to humans and other life forms. This letter has already spelled that out. It shows exactly what needs to be said.

Governor Brown, in the week before the start of the *Paris Climate Talks*, said to the Pope these seven words, “Humanity must reverse course or face extinction”. Governor Brown was not exaggerating. He simply told the truth. CEQA requires the truth.

Executive Order S-3-05 (Page 2.7-5)

The Court ruled that S-3-05 was grounded in science. That is true. However, it is 2005 science. We now know much more. S-3-05 is now known to be too little too late. This was explained above, in this letter.

Assembly Bill 32 Climate Change Scoping Plan and Updates (Page 2.7-6)

This section leaves out the 3 items listed on Page 2 of this letter, showing that our climate crisis is much more urgent than we thought.

Senate Bill 375 (Page 2.7-7)

What this section fails to state is that when CARB assigned driving-reduction targets to the San Diego Association of Governments (SANDAG) and the other Metropolitan Planning Organizations (MPOs), they did not bother to make the targets part of an overall plan to ensure that cars and light-duty vehicles (LDVs) will achieve climate-stabilizing targets. If they had done that, the 2035 targets would have been about a 32% reduction in per-capita driving, with respect to 2005 levels (the SB 375 baseline), even assuming a rapid conversion to zero-emission vehicles (ZEVs). The basis for this is shown in Reference 5.

Proposed GHG Reduction Measures (Page 2.7-17)

These will be discussed in our comments regarding Chapter 3 of the Draft CAP.

CAP Impact Analysis (Page 2.7-22)

We note the words:

As climate change science and policy continues to advance, the County will be able to apply new reductions toward meeting the long-term 2050 GHG emissions reduction goal in future CAP updates, as outlined in Chapter 5 of the CAP.

However, climate science may also find that they have underestimated the reductions needed and/or underestimated the warming feedback of some effect. To comply with CEQA, the County must have a plan that contains a sufficient list of enforceable measures to achieve climate-stabilizing targets.

2.7.5.1 Issue 1: Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment (Page 2.7-36)

These words concern us:

There are no additional feasible mitigation measures available to mitigate this impact based on information currently known. Therefore, this impact would be significant and unavoidable.

As we have stated and as we will state with more detail in this letter, we have been suggesting a feasible car-parking-system mitigation measure that was ignored during the CEQA process of the last CAP and is being ignored during the CEQA process of this CAP. Also, energy-efficient zoning (not approving more sprawl development) is another mitigation measure that we repeatedly suggest. Again, the County ignores this suggestion by acting as if approving more sprawl development is not particularly harmful to efforts to achieve climate state mandates and climate-stabilizing targets.

It says on Page 2.7-37:

CARB recommends that “lead agencies prioritize on-site design features and direct investments in GHG reductions in the vicinity of the project” (CARB 2017). CARB also recognizes that “[w]here further design or regional investments are infeasible or not proved to be effective, it may be appropriate and feasible to mitigate project emissions through purchasing and retiring carbon credits issued by a recognized and reputable accredited carbon registry” (CARB 2017).

The County is taking the odd position that it might approve additional sprawl developments and offset the additional GHG emissions that will come with the additional driving through purchasing and retiring carbon credits issued by a recognized and reputable accredited carbon registry. But the key on-site design feature, as described by CARB above, is to not approve the additional sprawl development. Obviously, the General Plan Update design is, to a large degree, zoning. Said another way, zoning is a fundamental design parameter. To follow the CARB recommendation is to select a design, primarily zoning, which does not result in a significant increase in GHG emissions. There is nothing infeasible about selecting the design feature of not approving more sprawl development. In fact, the 2016 San Diego County Measure B ballot measure lost, even though a developer outspent the project opposition by over a 10-1 margin. The Measure B ballot measure was to approve a large additional sprawl development. This is an indication that the voters do not favor the approval of an additional sprawl development. We understand that developers who want to get their sprawl developments approved are often big contributors to candidates for the Board of Supervisors. However, casting a vote that will disappoint a big campaign

contributor is not infeasible, however painful it might be to some San Diego County Supervisors.

The discussion on Pages 2.7-37 through 2.7-40 shows a failure to understand that General Plan Updates (GPUs, or zoning changes, or additional sprawl developments) are project design features and they do not have to be approved. They in no way justify purchasing and retiring carbon credits issued by a recognized and reputable accredited carbon registry or any other such off site measure. It is true that CARB recognized if no local design feature is possible it might be acceptable to justify purchasing and retiring carbon credits issued by a recognized and reputable accredited carbon registry or any other such off site measure. However, that is not the case because GPUs do not have to be approved.

If a developer wanted an approval that required a GPU and it was going to pioneer a method of operation that would reduce emissions in a way that could be widely adopted, then it may be reasonable and conform to CEQA to allow it.

Table 2.7-1 County Greenhouse Emissions by Category (2014) (Page 2.7-42)

We note that on-road vehicles are 57% of the total. We know from the work (available on line) of our friends at the Energy Policy Initiatives Center (EPIC) that most of the on-road emissions are from LDVs. For this reason there needs to be a rigorous treatment of LDVs.

Table 2.7-2 County Emissions Forecasts, Reduction Targets and CAP Reductions (MTCO_{2e}/year) (Page 2.7-42)

Often municipal governments have no records of GHG emissions for year 1990, which is a baseline year for S-3-05. S-3-05 requires that 1990 levels are achieved in 2020. The table says that the target for year 2030 is 40% below the 2014 level, which means, since SB 32 calls for a 40% reduction from 1990 levels, that the 2014 level is coincidentally equal to what is being assumed to be the 1990 level. However, if this is true, the -2% in the 2020 column should be 0% and the -77% in the 2050 column should be -80%, to match the S-3-05 target. Please explain the discrepancies.

2.12 Transportation and Traffic (Page 2.7-12-1)

This section attempts to summarize the impacts of the transportation-related measures. We will comment on the measures as described in Chapter 3 of the CAP itself, because it seems to have the most detail. We find much of the discussion of transportation off base because it fails to recognize the overriding need to improve the methods by which we pay for the use of roads and parking.

Section 3 of the CAP

Built Environment and Transportation

Strategy T-1 is described as reducing VMT. It only has 3 measures, which would:

- acquired open space,
- acquire agricultural easements and
- update Community Plans

The first two would only “reduce VMT” in the sense that they would stop additional sprawl development which would increase VMT. If all we do is “hold the line” we have no hope of stabilizing the climate at a livable level. Updating Community Plans could be important.

We will comment on T-2 through T-4 below.

T-1.1 Acquire Open Space

It is clear that this is an on-going program that would happen in any case. The claim is made that it prevents a total of 491 homes. We agree it might, if the Supervisors were so unconcerned about climate change that they would approve additional sprawl development, without this acquisition of land. We understand this to be legitimate if the “baseline” or what is sometimes called the “business as usual” case included these homes. Is that correct or are these savings not real? To compute the GHG savings, what is the average number of trips per year per household and what is the average mileage (MPG) and trip length assumed?

T-1.2 Acquire Agricultural Easements

It looks like this is an on-going program. It is a Purchase of Agriculture Conservation Easement (PACE) Program and it is said to be an acquisition of 443 acres of agricultural easements by 2020 and an additional 4,430 acres between 2021 and 2030. The claim is made that it prevents a total of 198 homes. We agree it would, if the Supervisors were so unconcerned about climate change that they would approve additional sprawl development, without this purchase of land. We understand this to be legitimate if the “baseline” or what is sometimes called the “business as usual” case included the homes that could be approved on this land. Is that correct or are these savings not real? To compute the GHG savings, what is the average number of trips per year per household and what is the average mileage (MPG) and trip length assumed?

T-1.3 Update Community Plans

How do you compute the anticipated GHG Reduction? How do you know that the future Board of Supervisors will take this action? If they take this action, what allows you to assume how useful it will be? How do you quantify “Transit Oriented Development”? Many times the Sierra Club Transportation Chair has urged the San Diego Association of Government to replace “Smart Growth” with “VMT-Reducing Growth”. This would be far better because “VMT-Reducing Growth” can be quantified but “Smart Growth” cannot be quantified. Not one member of SANDAG’s Board or Staff gave any notice of the suggestion. Likewise, it may be that “Transit Oriented Development” has no definition and is not quantifiable in any way.

If a Community Plan has transit service is there any standard for that service to qualify it as being good enough to serve a so-called TOD? If so, what is that standard?

In an attempt to perhaps help you quantify VMT reductions, we offer the following Figure 2.

Are there any standards of density increase or maximum height increase that you are looking for in making these communities a better “TOD”, or, expressed in a more realistic way, more ‘VMT-Reducing”? Is there a metric for improving the jobs-housing balance or are you operating free of any numerical standards for that consideration?

Why does the County constantly assume that how drivers pay for parking is inconsequential? Every study of the matter finds that if, for example, all employees pay for parking with a reduced wage, whether they drive or not, many more people will drive than if the payment for parking is associated with the choice to drive.

Figure 2 VMT Reductions from Increased Density

Reference 6 describes the modern round-a-bout. It includes a definition, how they improve traffic flow, how they improve air quality and reduce GHG, how they improve safety, and how much they cost. They should be part of any effort to do traffic calming or complete streets. As shown, each round-a-bout can eliminate 189 metric tons of CO₂_e per year. Will you replace stop lights in Community Plans with round-a-bouts?

The *Supporting Efforts* table on Page 3-15 is not encouraging. Those are simple things that should have been done years ago. To “study, collaborate, and promote” are not enforceable and show that the County has not yet realized the urgency of our climate crisis. Enforceable changes in policy regarding density, height, car parking, and round-a-bouts should have been done by now.

Your “Performance Metric” table means almost nothing since your “Supporting Efforts” mean almost nothing.

Strategy T-2 Shift Toward Alternative Modes of Transportation (Page 3-17)

We agree with words written on Page 3-17.

T-2.1 Improve Roadway Segments as Multi-modal

There is an insufficient definition of the “multi-modal enhancements” that are being considered and how much this would reduce VMT. We know of no definition for “bikeway”. Would this be Class 1 (separated from cars), 2 (bike lanes), or 3 (marked routes)? There may be a place for all 3 and you may have data showing that each of these 3 can encourage riding and thereby reduce VMT. However, your lack of specificity suggests that you know little of this topic.

We believe in well-maintained roads. Since we must convert rapidly to a fleet of cars that no longer burns gasoline, the answer to having enough money to perform timely road maintenance is to design and implement an environmentally-sound road-use charge (RUC) pricing and payout system. A road user charge (RUC), has been proven feasible by the work of SB 1077. Currently, the gas tax rate, although improved by SB 1, is still too low to

pay the full cost of road maintenance. Besides this, the gas tax has a poor future. How do you propose to pay for whatever improvements are being considered? We oppose raising general taxes, such as a sales tax, to pay for roads. We should not be making it artificially cheap to drive cars. What is the County's position on this issue? We fully support "complete streets". Please explain how you computed the 2030 and 2050 GHG reductions of 604 and 1292. Why did you not mention "road diet" and round-a-bouts? Cycle tracks are controversial among bicyclists. How did you decide you favor them?

T-2.2 Reduce New Non-residential Development Vehicle Miles (Page 3-20)

There is a claim of a 15% reduction by 2030. This may be based on SANDAG's Regional Transportation Plan's VMT reduction as required by SB 375. If so, the County is doing nothing to claim this reduction. Is this based on SANDAG's Regional Transportation Plan's VMT reduction as required by SB 375? If so, there may be a mismatch because SB 375 is for 2035 but the County is claiming a reduction in 2030. Please explain this mismatch in target year. There is a mention of a Transportation Demand Management (TDM) ordinance. Why has the County not passed a TDM ordinance by now? Where can we read the proposed ordinance? Can we see the calculations of the driving reduction based on the imagined ordinance? We notice that the County is still unaware that "free" parking at work is really not free because it reduces everyone's wages, even those that never drive to work. We have repeatedly explained this issue and it discourages us that the County is still unaware that so-called "free" parking is unfair to those that drive less and that it increases the mode split of single-occupancy vehicle (SOV) driving.

The county's performance metric of a 15% reduction is too low to support light-duty vehicles achieving a reasonable climate-stabilizing target, as will be shown later in this letter. Is that value per-capita? Is it with respect to the SB 375 baseline year of 2005? If it is with respect to 2014, please show how you convert an SB 375 target for year 2035 to a value with a different target year and a different baseline year.

T-2.3 Reduce County Employee Vehicle Miles Travelled (Page 3-22)

In the original Sierra Club letter to San Diego County, regarding its first effort to produce a CAP, we proposed a car-parking-pricing-and-payout system that would increase fairness and reduce the choice of driving to work. That letter, dated March 19, 2012, is Reference 7. Throughout that lawsuit we stressed this mitigation measure as a policy that could be implemented for County employees. We were very specific in our proposal.

This feasible mitigation was ignored by the County in their legally-deficient Climate Action Plan (CAP) which they subsequently rescinded under court order. This is the mitigation measure that was described during oral arguments in Appellate Court, when a Justice asked the Club lawyer to describe a feasible mitigation measure that was ignored by the County.

After hearing the description, the Justice commented, "That sounds like feasible mitigation to me."

Here is a brief description of this feasible mitigation measure. This strategy would be a "game-changer", not only for the County, but for improving our prospects for achieving climate-stabilizing targets, wherever driving is a significant source of GHG emissions and so-called "free parking" at work is common.

Demonstration Project to Eliminate the Harm of Bundled-Benefit Parking at Work

San Diego County (“County”) would develop a Demonstration Project to, in effect, Unbundle the Benefit of Parking (“Demonstration Project”) where County employees work (“Proposed Location”).

BACKGROUND: Currently, County employees do not have the ability to choose between earnings and driving – employees effectively pay for parking out of their salary, whether or not they use the parking. The Demonstration Project will provide the opportunity for the employees to choose between earnings and driving. This is functionally equivalent to the implementation of the California Air Pollution Control Officers Association (CAPCOA) measure of unbundling the cost of parking.

PROJECT: Parking would be charged at a given rate (for example \$0.02/min – roughly \$10.80/day, considering 8 hours of work and 1 hour for lunch). Funds generated from these parking charges would be distributed as earnings to all employees working at the proposed location in proportion to each employee’s time spent at work, at the proposed location. Those who decide not to drive will not be charged for parking but will still receive earnings based on their time spent at work at the location. Implemented correctly, this free-market approach will substantially reduce vehicle miles traveled (VMT) and greenhouse gas (GHG) emissions, by reducing the drive-alone mode.

For employees whose parking charges are greater than their parking-lot earnings, an “add-in” may be included so that no employee loses money, compared to “free parking”. (Some documentation of this method refers to this payment as a “must-drive bonus”.) With such “add-in” payments, there could be an “Opt in” or “Opt out” choice. This would mean that, if the charges and payments associated with this system were included on employee pay checks, those that “Opt out”, would see no changes on their pay check, relative to how their pay check looked during the days of “free parking”. If the charges and payments associated with this system were shown on a separate, mailed statement, those that opt out would receive no such statement.

This project may be helped by receiving a grant to pay the development and installation cost, as well as the “add in” payments, for some specified number of years. The County would need to apply for such a grant.

This feasible and sensible mitigation measure is actually a demonstration project of an overall system that would operate all types of parking, as described in Reference 8. Reference 9 is a more detailed description of this demonstration project.

Based on Table 1 of Reference 8, the driving reduction could be 25%, at places of employment. Table 1 shows driving reductions resulting from introducing a new price differential for parking, for 10 cases. Its average reduction in driving is 25% and its smallest, single-case reduction is 15%. Again, these systems can be set up so that no driver loses money. Grant possibilities include the California Air Resources Board’s *Low Carbon Transportation* program and the Strategic Growth Council’s (SGC’s) *Transformative Climate Community* program.

T-2.4 Shared and Reduced Parking in New Non Residential Development (Page 3-22)

The system we are proposing as a demonstration project (shown in the T-2.3 section, in this letter, just above this section) is a sub-system of an overall system of parking we are currently calling a “Dividend-Account Parking” system. The “Dividend” word denotes that

some people receive parking lot earnings. The “Account” word denotes that the cars parked are associated with an account, of a person responsible to pay the cost of the parking. “Account” also denotes that the cost of parking is being taken into account, instead of being ignored and hidden, as is often the case. It is documented in Reference 8. It is a system where all parking is naturally shared.

Ultimately, based on the system we are proposing, we see no reason to restrict this to either New” or to “Non Residential”, as is suggested in the County’s title of this section. The system we are proposing was peer reviewed in 2010, when it was accepted for presentation at an Air and Waste Management Association (AWMA) Conference, in Calgary, Canada. The presentation received two standing ovations: once upon the conclusion of the presentation and again at the conclusion of the question and answer portion of the presentation. The system is hosted by the National Sierra Club: <http://sierraclub.typepad.com/files/mike-bullock-parking-paper.pdf>. The County received this paper as a reference to the Reference 7 letter, back in 2012. We have never been given any indication that anyone at the County has read the paper. The T-2-4 section, which is about parking, gives no indication that anyone at the County has read the paper. We have certainly received no criticism of the paper from the County. Since there has been no criticism, we wonder why its ideas are being ignored. Is there any County employee working for the County on the CAP and its SEIR that is aware of the Sierra Club’s submittals to the County regarding car-parking? If so, what is their opinion of the proposals? Why has the County ignored the Sierra Club’s car parking proposals for over 5 years? Could you please show us how you compute the 1454 and the 2508 GHG reductions shown? How would you handle the sharing in terms of enforcement?

T-3 Decarbonize On-road and Off-road Vehicle Fleet (Page 3-27)

We support efforts to decarbonize vehicles. This includes the efforts shown in your sections T-3.1, T-3.2, T-3.3, and T-3.4. Beyond what is shown in these subsections, we have asked the SANDAG Board to put electrifying the Coaster train into their “Unconstrained” (unconstrained by money) Regional Transportation Plan, for example. We are joining with other groups to push for purchasing only Battery Electric busses. We have not heard that the County is interested in these efforts.

We appreciate your efforts to make construction less polluting. As far as retiring old model cars that get poor gas mileage, we would like to see the County join us in advocating for a plan of enforceable measures, whereby light-duty vehicles (LDVs) achieve a climate-stabilizing target. This would require actions such as what is described in T-3.3. We would like to see the County become a force for climate stabilization at SANDAG. Could you show us how you computed the GHG reduction of 866, shown on Page 3-32? Is the County supportive of electric transit vehicles and if so, what is your plan to help bring that about?

T-3.4 Reduce the County’s Fleet Emissions (Page 3-34)

We are disappointed that the County’s goal is only 50% of new vehicle purchases. We have a climate crisis. Would you please change that to 100%?

T-4 Invest in Local Projects to Offset Carbon Emissions (Page 3-37)

We accept that many of the projects named are worthwhile. However, the car parking system that we describe above is also a worthy project. Once that system is designed, other employers will want to use it, because it increases fairness while it decreases driving.

It can spread to other types of parking because it supports the sharing of parking. It will need to spread to all types of parking, in one unified system, if we are going to have a chance to achieve climate-stabilizing targets.

Energy (Page 3-40)

We appreciate the target of 90% renewable energy in the County by 2030. This will require the measures you named, which we want to be made enforceable, and more.

San Diego is conducting a study of feasibility of CCE. Carlsbad and other cities to its South are joining together to investigate the feasibility of forming a Community Choice Energy (CCE) District, under California Community Choice Aggregation (CCA) law. In the last three years, the rise of Community Choice Energy in California has been dramatic. The first Community Choice Agency (CCA), [Marin Clean Energy](#), launched in 2010, and was the only one for four years until [Sonoma Clean Power](#) launched in 2014, followed soon after by [Lancaster Choice Energy](#) in 2015. By mid-2015 a critical mass of information-sharing and proof-of-concept had spread throughout California and by late 2016 nearly half the counties in the state and over 300 cities were either operational or at some stage of evaluation of Community Choice. The CAP and SEIR should include, as a recommended mitigation measure, joining a CCE. To do this, the County needs to act to determine the feasibility of this measure and its effectiveness in moving towards your stated goal of 90% clean energy by 2030. This target is certainly a strength of your effort.

In 2014, Lancaster started to require all new residential construction project to include solar power. There is a minimum average solar generating capability of 0.5 to 1.5 kW per unit, depending on lot size and location. Are you willing to meet or exceed that standard?

The Need for a Concerted Effort to Ensure that Light-Duty Vehicles Will Achieve a Realistic Climate-Stabilizing Target

First, You Need a Plan:

The well-known and well-respected Energy Policy Initiative Center reported that 41% of the GHG emitted in San Diego County comes from cars and light-duty trucks, denoted as “LDVs” in this report. This is larger than the sum of the next two largest emitters: electricity, at 25% and natural gas, at 9%. Because LDVs are so important, there needs to be a plan showing a set of enforceable measures ensuring that LDVs will achieve a climate-stabilizing target. The first step is to show how a reasonable climate-stabilizing target is derived. As has been shown in the letter, there are strong indications that state mandates, such as SB 32 are not good enough.

This is not just understood by us. The California Democratic Party (CDP) has come to the same conclusion, as shown in its 2016 Platform. This bullet is from that platform (Reference 4) (<http://www.cadem.org/our-california/platform/2016-platform-energy-and-environment>).

- ***Demand a state plan showing how cars and light-duty trucks can hit climate-stabilizing targets, by defining enforceable measures to achieve the needed fleet efficiency and per-capita driving***

CARB should probably do this but so far, they have issued no such plan, perhaps because they have no such plan. However, CEQA requires that decision makers understand the

environmental consequences of what they may approve. What does the state need to do, which has the primary responsibility for fleet efficiency requirements and how much it will cost to drive on the road and how will this fit with what local and regional government may do, understanding that they do RTPs, zoning, and other transportation-related policies such as complete streets, transit, and parking policies. Therefore, such a plan is required for any project that will have a significant impact on the LDV sector. This means that most EIRs have been approved in violation of CEQA law. This should come as no surprise because there are few systems engineers in the ranks of those that might challenge an EIR. Some things take time.

Reference 5 is an example of a state plan that is being requested by the CDP. It may not be perfect but it is an honest attempt and it may be the only such example on the planet. It is included to show that such a report is not impossible. The County or any other government could accept the plan as their own, if they find no errors. What the County cannot do is to take the position that no such plan is required. The County could modify the Plan if it thinks it could improve upon its methods or its assumptions.

Enforceable and Feasible Mitigation Measures to Achieve Driving Reductions

The following numbered mitigation measures must be implemented unless you can prove that they are either not “technologically feasible” or they are not “cost effective”. When considering how cost effective the measures are, keep in mind that climate destabilization, which is where humanity is currently headed, will result in a devastating collapse of the human population, which is very expensive, in many ways.

1.) Reallocate SANDAG Funds Earmarked for Highway Expansion to Transit and Consider Transit-Design Upgrades

It is well-known that the induced traffic demand resulting from adding highway lanes will cause traffic congestion to remain constant. This is true, even if the new lanes are HOV (High Occupancy Vehicle) lanes; HOT (High Occupancy Toll) lanes; or Managed Lanes, which give priority to moving transit vehicles. Any project (or other change, such as autonomous vehicles that can travel at high speeds with very little distance between vehicles) that temporarily creates space on a freeway will induce enough traffic to fill that space, returning congestion to the level it was before the project (or other change.) Therefore, additional lanes will not reduce congestion one iota. The money spent to add lanes is not just a waste of money. With more lanes and the same level of congestion as before, the result is always more frustrated drivers, more air pollution, and more GHG emissions.

The sales tax measure called “Trans-Net” allocates approximately one-third for highway expansion, one-third for transit, and one-third for road maintenance. It has a provision that allows for a reallocation of funds, if supported by at least two-thirds of SANDAG Board members, including a so-called weighted vote, where governments are given a portion of 100 votes, proportional to their population. This feasible mitigation measure is to reallocate the Trans-Net amount, earmarked for all highway expansions, to transit. It is noted that perceived political risk for decision makers does not constitute infeasibility, for a suggested mitigation measure. SANDAG needs to help educate the public about the futility of adding lanes because of induced traffic demand, as well as our responsibility to have a plan showing how cars and light-duty trucks can achieve climate-stabilizing targets. This will reduce political risk.

This money could be used to fund additional transit systems; improve transit operations; and/or redesign and implement the redesign of an existing transit system. A redesign could be

the electrification and automation, or even a wholesale technology upgrading of the Coaster/AMTRAK and Sprinter rail lines. These systems need to be frequent and operate 24/7.

The money could also be used to implement a fixed-guideway connection between the San Diego Airport and both the Santa Fe Train Station and the Old Town Transit Center. A trade-off study is needed to find out if this should be done with a trolley extension or an automated system, perhaps using the technology that connects the Oakland Airport to the Coliseum BART station.

The County needs to assume this mitigation measure and then do everything it its power to convince the SANDAG Board that it must be done. (AB 805 would help.)

2.) A Comprehensive Road-Use Charge (RUC), Pricing-and-Payout System to Improve the Way We Pay for the Use of Roads

Comprehensive means that, for example, pricing, overall, is sufficient to cover all costs, including road maintenance and externalities such as harm to the environment and health; privacy is defined and achieved; the economic interests of low-income drivers doing necessary driving would be protected; that the incentive to drive fuel-efficient cars would be at least as large as it is under the current fuels-excise tax; and, as good technology becomes available, congestion pricing is used, if needed, to protect critical driving from congestion.

The word “*payout*” means that some of the money collected would go to people that are losing money under the current system.

Currently, user fees (gas taxes and tolls) are not enough to cover road costs. Even though general-fund money is being used to operate and maintain roads, California is not doing maintenance with enough frequency to minimize cost. It is well understood that deferred maintenance will cost more than timely maintenance. Besides this, the improved mileage of the Internal Combustion Engine vehicles (ICEs) and the large number of Zero-Emission Vehicles (ZEVs), both of which are needed to have the fleet efficiency required to achieve climate mandates, mean that gas-tax revenues will drop precipitously over the coming years. In view of these facts, California has passed and is implementing SB 1077, which creates a pilot project road user charge (RUC). The Road User Charge Technical Advisory Committee (RUC TAC) has twice visited San Diego. The first time, they met in the SANDAG Board Room. The second time, they met at the CALTRANS District 4 office. SANDAG Board Members and SANDAG staff were conspicuously absent from these meetings. SANDAG staff did not inform its Board of these meetings. This is unfortunate because a RUC is the future of road funding. Unfortunately, the SANDAG Board Majority seems to think that a new sales tax can be used to expand roads. The recent defeat of Measure A suggests that this is not true.

Both SANDAG and the County need to support California in its efforts to create an effective RUC pricing-and- payout system. As the pilot project finishes, legislation is needed to get the design and implementation moving. SANDAG and the County should lobby for a good system and then, in their EIRs, they should assume a good system. Such a system will play a useful role in reducing per-capita driving.

3.) Improving the Way We Pay for the Use of Car Parking

Bundled-cost parking increases the cost of everything, from rent to food; bundled-benefit parking reduces wages. These unsustainable practices are economically unfair to those that drive less or might like to drive less, if they could receive the fair, market-priced compensation for their effort, considering the high cost of providing parking. Surface parking only provides spaces at a rate of 120 car-spaces per acre of land. Parking garage construction costs are over \$20,000 per space. Underground parking costs from \$60,000 to \$100,000 per space. The fourth bullet of the Transportation Sub-plan of the 2016 California Democratic Party Platform (Reference 4) calls for *“shared, convenient and value-priced parking, operated with a system that provides earnings to those paying higher costs or getting a reduced wage, due to the cost of providing the parking.”*

This feasible mitigation was ignored by the County in their legally-deficient Climate Action Plan (CAP) which they subsequently rescinded under court order. This is the mitigation measure that was described during oral arguments in Appellate Court, when a Justice asked the Club to describe a feasible mitigation measure that was ignored by the County. It is described in this letter in Section **T-2.3 Reduce County Employee Vehicle Miles Travelled (Page 3-22)** on Page 13 of this letter.

4.) Good Bicycle Projects and Bicycle Traffic Skills Education

The best criterion for spending money for bicycle transportation is the estimated reduction in driving per the amount spent. It is hoped that the following strategies will come close to maximizing this important parameter.

a.) Projects to Improve Bicycle Access

All of the smart-growth neighborhoods, central business districts, and other high trip destinations or origins, both existing and planned, should be checked to see if bicycle access could be substantially improved with either a traffic calming project, a “complete streets” project, more shoulder width, or a project to overcome some natural or made-made barrier. One example is to build a Vista Way bicycle bridge over I-5 in Oceanside, to allow those walking or biking to travel between the South Oceanside coastal neighborhood and the regional shopping center, which contains such large stores as *Wal-Mart* and *Stator Brothers* grocery store. Currently, those walking or biking from the Vista Way area West of I-5 must travel much further and travel over a steep hill (Cassidy Street). There are no large grocery stores in the Coastal region of Oceanside, west of I-5. Vista Way was connected for bike riders and pedestrians before the construction of I-5.

b.) League of American Bicyclist Certified Instruction of “Traffic Skills 101”

Most serious injuries to bike riders occur in accidents that do not involve a motor vehicle. Most car-bike accidents are caused by wrong-way riding, riding on sidewalks, and errors in intersections; the clear-cut-hit-from-behind accident is rare.

After attending *Traffic Skills 101*, students that pass a rigorous written test and demonstrate proficiency in riding in traffic and other challenging conditions could be paid for their time and effort.

As an example of what could be done in San Diego County, if the average class size was 3 riders per instructor and each rider passes both tests and earns \$100 and if the instructor, with overhead, costs \$500 dollars, for a total of \$800 for each 3 students, that would mean that \$160M could teach $\$160\text{M}/\$800 = 200,000$ classes of 3 students, for a total of 600,000 students. This is approximately 20% of the population of San Diego

County. If a significant percentage of the graduates become every-day, utilitarian riders, this program will be a very cost-effective mitigation measure. It is certainly technologically feasible.

If SANDAG is unwilling to do this program countywide, the County could scale the program described above down to a County-run program. Members of Oceanside's Bicycle-Pedestrian Committee and others in the County are already teaching League-Certified classes, as described above.

5.) Eliminate or Greatly Increase the Maximum Height and Density Limits Close to Transit Stops that Meet Appropriate Service Standards

As sprawl is reduced, more compact, transit-oriented development (TOD) will need to be built. This strategy will incentivize a consideration of what level of transit service will be needed, how it can be achieved, and what levels of maximum height and density are appropriate. Having no limits at all is reasonable if models show that the development can function without harming the existing adjacent neighborhoods, given the level of transit service and other *supporting transportation policies*. One such *supporting transportation policy* would be the use of car-parking systems described in References 8 and 9, which support the full sharing of parking, less driving, and less car ownership. These are reasons that the County Supervisors and Staff need to weigh in on the redesign and rezoning of the area around its downtown San Diego location. This is probably not applicable in other locations under County control because the transit service is either nonexistent or it is insufficient.

6.) Work for Installing a “Dividend-Account” Parking System at Train Stations in the County

We understand it is difficult for the County to influence SANDAG and the North County Transit District (NCTD), which runs the Coaster. We are hopeful that AB 805 will reform the decision-making of the NCTD so that it will become open to progressive change and more responsible regarding the fact of our anthropogenic climate change crisis. We would like to see the County to develop a Plan to help the NCTD adopt the same sort of Dividend-Account Parking system at the Transit Centers as what we hope will be installed at your County offices downtown. In this case, the earnings or dividend are paid to adult train riders in proportion to the time they spend on round trip train rides. These beneficiaries are selected because the car parking is being provided for adult (driving age) train riders making round-trip train rides. The parking would be available to anyone driving a car that is in the Dividend-Account Parking system, meaning that there is an account with a person responsible for paying for the parking of the car being parked. This system would allow the parking to be used by any driver with an account, including non-train riders. Fully-shared parking is generally better than parking that is not shared or is less shared. “Free parking” at train stations maximizes driving to the station. A Dividend-Account parking system would maximize ridership. Currently, a person that could easily walk or bike to the station may drive. However, this is less likely to happen after the installation of a Dividend-Account parking system. The net cost (fare minus parking dividend) to ride will be reduced. This will increase ridership. This system will also ensure that someone that drives to the station can be assured of finding a parking place, because it will not be difficult to set the price of the parking to ensure vacancy, as is described in the paper shown here: <http://sierraclub.typepad.com/files/mike-bullock-parking-paper.pdf> (Reference 8). Note that the paper provides a dynamic pricing system

to guarantee a selected minimum vacancy rate. If a person drives to the station but does not find a parking place, they may become discouraged from riding the train.

Summary of the Six Mitigation Measures Described

Do you agree that Measure 3 above is feasible and if not, why not? Do you agree that Item 4 is feasible? Do you see the value in working for Mitigation Measures 1, 2, 5, and 6?

Need to Include Plots and Explanations of the Plots, in the EIR, to Leave No Doubt About the Cause and Grave Nature of Anthropogenic Climate Change

The SEIR must fully explain the urgency and danger of humanity's anthropogenic climate change crisis, sometimes referred to as simply "climate".

The best way to do this is to include plots and explanations of the plots, that leave no doubt about the validity and grave nature of climate.

Figure 3 shows the rise of the world's atmospheric CO₂ over the last 50 years.

Figure 3 Atmospheric CO₂, Increasing Over Recent Decades

Figure 4 shows both atmospheric temperature (averaged over a year and averaged over all of the earth, derived from an isotope analysis) and atmospheric CO₂, over 800,000 years. (Our species is only around 300,000 years old.) Figure 4 shows that when climate deniers say that climate is always changing and so therefore climate change is normal, they are correct, except for one important consideration. There is nothing normal about the outrageous run up of atmospheric CO₂, to over 400 PPM, in such a short time that it appears to be an instantaneous spike, on Figure 4. There is no doubt that the spike is the result of our combustion of fossil fuels. The spike is clearly anthropogenic climate change.

Figure 4 Atmospheric CO₂ and Mean Temperature, from 800,000 Years Ago, with Current CO₂ PPM Shown

Figure 5 covers all of the time of the development of our civilization. By focusing on just 1000 years, the spike's shape, in red, is revealed. Everything was normal until about 150 years ago, which is the start of our industrial revolution, when we started to burn fossil fuels. The ominous increase in temperature (in blue) is also shown. By doing extensive calculations we know how much CO₂ we have produced from the combustion of fossil fuels. Then, by directly measuring the atmospheric CO₂ and the acidity of the oceans, we know where all of that CO₂ currently resides. We also know that atmospheric CO₂ traps heat. There is no doubt that we have an Anthropogenic Global Warming (AGW) catastrophe in the making. Achieving climate-stabilizing targets is our only hope.

Figure 5 Atmospheric CO2 and Mean Temperature Over the Last 1,000 Years

Conclusion

We offer these words from Reference 10, which is the Superior Court Ruling, against the County (emphasis added):

*There is no time for "building strategies" or "living documents;" as the PEIR quite rightly found, enforceable mitigation measures are necessary **now**.*

We need to keep in mind the following:

- climate change has the potential to end most life forms on the planet and
- our own species could be headed towards a "devastating collapse" of our population, to quote the June 2008 issue of *Scientific American*

We would like to meet with County representatives to discuss our concerns and our proposed mitigation measures. Thank you for doing this critical and challenging work.

Respectfully submitted,

COURT OF APPEAL, FOURTH APPELLATE DISTRICT

DIVISION ONE

STATE OF CALIFORNIA

SIERRA CLUB,

Plaintiff and Respondent,

v.

COUNTY OF SAN DIEGO,

Defendant and Respondent.

D064243

(Super. Ct. No. 37-2012-00101054-  
CU-TT-CTL)

APPEAL from a judgment of the Superior Court of San Diego County, Timothy Taylor, Judge. Affirmed.

Thomas E. Montgomery, County Counsel, and C. Ellen Pilsecker, Chief Deputy County Counsel, for Defendant and Appellant.

Law Office of Malinda R. Dickenson, Malinda R. Dickenson; Chatten-Brown & Carstens, Douglas P. Carstens and Josh Chatten-Brown for Plaintiff and Respondent.

This action arises out of the County of San Diego's (County's) 2011 general plan update, wherein the County issued a program environmental impact report (PEIR), and adopted various related mitigation measures. In this action the Sierra Club sought, in a

petition for writ of mandate, to enforce one mitigation measure adopted by the County: the Climate Change Mitigation Measure CC-1.2 (Mitigation Measure CC-1.2). With Mitigation Measure CC-1.2, the County committed to preparing a climate change action plan with "more detailed greenhouse gas [GHG] emissions reduction [GHG] targets and deadlines" and "comprehensive and enforceable GHG emissions reductions measures that will achieve" specified quantities of GHG reductions by the year 2020.

However, the Sierra Club alleged that instead of preparing a climate change action plan that included comprehensive and enforceable GHG emission reduction measures that would achieve GHG reductions by 2020, the County prepared a climate action plan (CAP) as a plan-level document that expressly "does not ensure reductions." The County also developed associated guidelines for determining significance (Thresholds).

According to the Sierra Club, review of the CAP and Thresholds project under the California Environmental Quality Act (CEQA) (Pub. Resources Code, § 21000 et seq.) was performed after the fact, using an addendum to the general plan update PEIR, without public review, without addressing the concept of tiering, without addressing the County's failure to comply with the express language of Mitigation Measure CC-1.2, and without a meaningful analysis of the environmental impacts of the CAP and Thresholds project.

The court granted the petition, concluding that the County's CAP did not comply with the requirements of Mitigation Measure CC-1.2 and thus violated CEQA. The court found that the CAP did not contain enforceable GHG reduction measures that would achieve the specified emissions reductions.

The County appeals, asserting (1) the statute of limitations bars the claim that the mitigation measures are not enforceable; (2) the CAP met the requirements of Mitigation Measure CC-1.2; and (3) that the trial court erred in finding that a supplemental EIR was required. We affirm.

## FACTUAL AND PROCEDURAL BACKGROUND

### *A. Executive Order S-3-05*

In 2005 then-California Governor Arnold Schwarzenegger issued Executive Order No. S-3-05,<sup>1</sup> which acknowledged California's vulnerability to the effects of climate change and established targets for reducing GHG emissions in California over time. Specifically, Executive Order No. S-3-05 set statewide targets for three points in time: 2010, 2020, and 2050. The target for 2010 (2010 Target) was to reduce emissions to the levels they were at in the year 2000. The target for 2020 is to reduce emissions to the levels they were at in 1990 (2020 Target). The target for 2050 is that emissions be 80 percent below the levels they were at in 1990 (2050 Target).

Executive Order No. S-3-05 was based on then-available climate science and represented California's share of worldwide GHG reductions necessary to stabilize climate. As the Attorney General explained, "Executive Order [No.] S-3-05 is an official policy of the State of California, established by gubernatorial order in 2005, and designed to meet the environmental objective that is relevant under CEQA (climate stabilization)."

---

<sup>1</sup> On March 24, 2014, the County requested that we take judicial notice of Executive Order No. S-3-05. We grant that request.

*B. The Legislature Addresses the Need for GHG Emission Reductions*

In response to Executive Order No. S-3-05, the California Legislature enacted the California Global Warming Solutions Action of 2006, Assembly Bill No. 32. (Health & Saf. Code, § 38500 et seq.) Consistent with Executive Order No. S-3-05, Assembly Bill No. 32 required the California State Air Resources Board (CARB) to determine 1990 levels of GHG emissions and then to establish "a statewide greenhouse gas emissions limit that is equivalent to that level, to be achieved by 2020." (Health & Saf. Code, § 38550.) Assembly Bill No. 32 also stated that GHG reductions must continue after 2020, requiring that the statewide greenhouse gas emissions limit established by CARB "remain in effect unless otherwise amended or repealed" (Health & Saf. Code, § 38551, subd. (a)) and further that "[i]t is the intent of the Legislature that the statewide greenhouse gas emissions limit continue in existence and be used to maintain and continue reductions in emissions of greenhouse gases beyond 2020." (Health & Saf. Code, § 38551, subd. (b).) Assembly Bill No. 32 also required that CARB "prepare and approve a scoping plan [for] achieving the maximum technologically feasible and cost-effective reductions in greenhouse gas emissions by 2020." (Health & Saf. Code, § 38561, subd. (a).)

In December 2008 CARB approved the scoping plan. The scoping plan "identifies California's cities and counties as 'essential partners' within the overall statewide effort, and recommends that local governments set a GHG reduction target of 15% below 2005-2008 levels by 2020." Thus, it was acknowledged that CARB would accept this target as a substitute for the 1990 level referenced in Assembly Bill No. 32 and Executive Order No. S-3-05.

### *C. The County's General Plan Update PEIR*

The County acknowledged in the general plan update PEIR that it needed to "reduce GHG emissions to 1990 levels by 2020" and that changes were required both in the community and in the County's operations, buildings, vehicle fleet, and with respect to its employee commutes, water, and waste.

A GHG emissions inventory was prepared as a special appendix (Appendix K). Appendix K set forth projected emissions reductions and assumptions then-available, and promised that the "Greenhouse Gas Reduction/Climate Action Plan, which will be prepared as an implementation strategy, will further detail the County's GHG emissions and how those reductions will occur."

There was extensive public comment on the general plan update, including from the California Attorney General:

"[W]e encourage the County to (1) commit in the General Plan to adopt by a date certain a CAP with defined attributes (targets, enforceable measures to meet those targets, monitoring and reporting, and mechanisms to revise the CAP as necessary) that will be integrated into the General Plan; (2) incorporate into the General Plan interim policies to ensure that any projects considered before completion of the CAP will not undermine the objectives of the CAP; and (3) for all GHG impacts the County has designated as significant, adopt feasible mitigation measures that can be identified today and that do not require further analysis." (Fn. omitted.)

### *D. Mitigation Measures*

The County thereafter promised to take a series of additional actions. These promises took the form of a group of climate change-related mitigation measures: Mitigation Measures CC-1.1 through CC-1.19 (the Mitigation Measures). The Mitigation

Measures included requirements to update, review, and implement County programs; implement a strategic energy plan; revise the zoning ordinance; coordinate with other entities; educate the public; reduce vehicle miles traveled and encourage alternative modes of transportation; and, based thereon, to revise the County guidelines for determining significance.

The County made the following finding with regard to Mitigation Measure CC-1.2:

"[Mitigation Measure] CC-1.2 requires the preparation of a County Climate Change Action Plan within six months from the adoption date of the General Plan Update. The Climate Change Action Plan will include a baseline inventory of greenhouse gas emissions from all sources and *more detailed greenhouse gas emissions reduction targets and deadlines*. The County Climate Change Action Plan *will achieve comprehensive and enforceable GHG emissions reduction* of 17% (totaling 23,572 MTC02E) from County operations from 2006 by 2020 and 9% reduction (totaling 479,717 MTC02E) in community emissions from 2006 by 2020. Implementation of this Climate Change Action Plan will contribute to meeting the [Assembly Bill No.] 32 goals, in addition to the State regulatory requirements noted above." (Italics added.)

Mitigation Measure CC-1.2 formed the basis for Mitigation Measure CC-1.8, which required "revision of the County Guidelines for Determining Significance based on the Climate Change Action Plan."

Mitigation Measure CC-1.8, in turn, formed the basis for Mitigation Measure CC-1.7, which required that the County guidelines for determining significance anticipated by Mitigation Measure CC-1.8 incorporate CARB's recommendation for a threshold for determining significance of impacts on climate change. Should the recommendation "not be released in a timely manner," the County would "prepare its own threshold."

As required by CEQA (Pub. Res. Code, § 21081.6), the County incorporated a mitigation monitoring and reporting program (MMRP) into the general plan update PEIR.

Included in the MMRP was a promise to achieve GHG reductions by 2020 through comprehensive and enforceable GHG emission reduction measures. In addition to committing to the 2020 Target, the County also committed to compliance with the Executive Order No. S-3-05 trajectory. The County found "significant impacts associated with substantial climate-related risks" such as those "on water supply, wildfires, energy needs, and impacts to public health" would occur as a result of its general plan update. However, as a result of its commitment to adopt a CAP and Thresholds, and other mitigation measures, the County was able to make a finding that the climate change impacts anticipated by the general plan update PEIR would be avoided or substantially lessened.

#### *E. The CAP and Thresholds Project*

According to the County, the CAP was prepared for the following purposes:

1. To mitigate the impacts of climate change by achieving meaningful greenhouse gas (GHG) reductions within the County, consistent with Assembly Bill No. 32, the governor's Executive Order S-3-05, and CEQA guidelines (Cal. Code Regs., tit. 14, § 15000 et seq. [CEQA Guidelines]).
2. To allow lead agencies to adopt a plan or program that addresses the cumulative impacts of a project.
3. To provide a mechanism that subsequent projects may use as a means to address GHG impacts under CEQA.

4. To comply with the 2011 adopted County General Plan Environmental Impact Report (EIR) Mitigation Measure CC-1.2, Preparation of a Climate Action Plan.

Although compliance with Mitigation Measure CC-1.2 was one purpose of the CAP, two of the four purposes relate to preparation of the CAP as a plan-level document so that environmental review could be avoided on future projects that were determined to be below specified "thresholds." (CEQA Guidelines, § 15183.5.) However, the CAP did not mitigate climate change impacts consistent with Assembly Bill No. 32 and Executive Order No. S-3-05, did not satisfy the plan-level requirements of CEQA Guideline 15183.5, and it did not meet the requirements of Mitigation Measure CC-1.2

Instead, the CAP expressly acknowledged the possibility that "communitywide inventories will indicate that the community is not achieving its reduction targets" and admitted that the CAP "does not ensure reductions." Further, the CAP did not include a meaningful analysis of "measures that extend beyond the year 2020." Rather, the County documented that instead of continuing to reduce GHG emissions after 2020, GHG emissions allowed as a result of the general plan update were anticipated to *increase* after 2020.

The CAP and Thresholds were presented to the planning commission and the board of supervisors as "the project." The Thresholds, like the CAP, purport to expressly facilitate post-2020 development that would have significant adverse climate change impacts, without any consideration of post-2020 climate science as required by Assembly Bill No. 32 and Executive Order No. S-3-05.

#### *F. The Comment Period*

The Sierra Club submitted extensive comments to the County. In particular, the Sierra Club commented on the need to take action consistent with climate science and achieve the Assembly Bill No. 32 and Executive Order No. S-3-05 GHG emissions reductions targets. The Sierra Club also provided specific examples of feasible GHG Reduction measures that would actually reduce GHG emissions and could be adopted without delay. The Sierra Club submitted additional comments and testified at the planning commission hearing, attempted to appeal the planning commission's decision, and testified at the board of supervisors hearing.

#### *G. Proceedings Before the Planning Commission*

The final agenda for the April 27, 2012 regular meeting of the County Planning Commission Regulation Meeting made no reference to the associated Thresholds, which were also presented to the planning commission. Despite acknowledging the significant climate change effects as well as the requirements of Assembly Bill No. 32 and Executive Order No. S-3-05, staff took the position that no additional environmental review was required. The planning commission voted to adopt staff's recommendation with one addition relating to installation of electric vehicle recharging stations.

#### *H. Proceedings Before the Board of Supervisors*

The Project was placed on the agenda for the June 20, 2012 board of supervisors meeting as "County of San Diego Climate Action Plan (District: All)." The staff report and supporting documents presented to the board of supervisors included (1) the CAP, (2) the Thresholds, (3) the environmental documentation, and (4) public documentation.

The environmental documentation included a memorandum referencing "CEQA Guidelines Section 15164 Addendum to the County of San Diego General Plan Update [PEIR] (SCH 2002111067)" (Addendum) which was dated the same day as the hearing, June 20, 2012. The addendum defined the project as "the CAP and Significance Guidelines." The addendum included attachments entitled "Environmental Review Update Checklist Form" (environmental checklist) and "Environmental Review Update Checklist for County of San Diego Climate Action Plan." The environmental checklist included a determination by staff that the "new information included in the CAP and Significance Guidelines represent minor technical additions to the previously certified EIR."

At the board of supervisors hearing, staff acknowledged that "[s]tate and local measures in the climate plan are insufficient to achieve our target in 2035" and explained that the CAP measures were not required, but rather that staff "believe[d]" that "education and incentives" might produce a result.

The County also documented that GHG emissions were anticipated to *increase*, not decrease, after 2020. Staff explained that the County would not comply with Executive Order No. S-3-05 because "the State's plan right now goes out to 2020." Staff further explained to the Board of Supervisors that the Thresholds would result in a less than significant finding for greenhouse gas emissions for future development projects.

Ultimately, the board of supervisors took the following actions:

1. Adopted environmental findings including in attachment C.

2. Adopted the plan titled "County of San Diego Climate Action Plan (Attachment A)."

The only findings made by the County were the following:

1. The environmental impact report (EIR) dated August 3, 2011 on file with the Department of Planning and Land Use (DPLU) as Environmental Review Number SCH 2002111067 was completed in compliance CEQA and the State and County CEQA Guidelines and that the Board of Supervisors has reviewed and considered the information contained therein and the Addendum thereto dated June 20, 2012 on file with DPLU and attached thereto; and
2. There were no changes in the project or in the circumstances under which the project was undertaken that involved significant new environmental impacts which were not considered in the previously certified EIR dated August 3, 2011, that there was no substantial increase in the severity of previously identified significant effects, and that no information of substantial importance had become available since the EIR was certified as explained in the environmental checklist dated June 20, 2012 and attached thereto.

*I. The Sierra Club Files Suit*

The Sierra Club filed a petition for writ of mandate, challenging the June 20, 2012 approval of the CAP and Thresholds project, including the associated environmental review. The Sierra Club alleged that the CAP did not meet the requirements of Mitigation Measure CC-1.2, the Thresholds were not adopted pursuant to the requirements of CEQA Guideline section 15064.7, and that an EIR should have been prepared.

*J. The Trial Court's Decision*

The trial court determined that the CAP did not comply with the requirements for a CAP as set forth in Mitigation Measure CC-1.2, and thus violated CEQA. The trial court found that the CAP neither contained enforceable GHG reduction measures that

will achieve the specified emissions reductions, nor detailed deadlines for GHG emission reductions.

The trial court further found that the approval process violated CEQA, noting: "There is no showing that the County properly considered whether the CAP is within the scope of the PEIR" and that "environmental review is necessary to ascertain whether the CAP met the necessary GHG emission reductions when considering the CAP is merely hortatory and contains no enforcement mechanism for reducing GHG emissions."

Further, the trial court determined that whether or not the Thresholds were adopted was a subsidiary issue that did not need to be reached in light of the trial court's decision on the CAP (which formed the basis for the Thresholds) and the process by which it was approved.

## DISCUSSION

### I. *STANDARD OF REVIEW*

The Sierra Club and the County agree as to the applicable standards of review.

In reviewing the County's actions under CEQA, we must determine whether there was "a prejudicial abuse of discretion." (Pub. Resources Code, § 21168.5.) "Abuse of discretion is established if the agency has not proceeded in a manner required by law, or if the determination or decision is not supported by substantial evidence." (*Mira Mar Mobile Community v. City of Oceanside* (2004) 119 Cal.App.4th 477, 486.)

"[A] reviewing court must adjust its scrutiny to the nature of the alleged defect." (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 435 (*Vineyard*).) Challenges to an agency's failure to proceed in the

manner required by CEQA are subject to a significantly different standard of review than challenges that an agency's decision is not supported by substantial evidence. (*Ibid.*)

Where the challenge is that the agency did not proceed in the manner required by law, a court must "determine de novo whether the agency has employed the correct procedures, 'scrupulously enforc[ing] all legislatively mandated CEQA requirements.'" (*Ibid.*)

Furthermore, when a prior environmental impact report has been prepared and certified for a program or plan, the question for a court reviewing an agency's decision not to use a tiered EIR for a later project "is one of law, i.e., 'the sufficiency of the evidence to support a fair argument.'" (*Sierra Club v. County of Sonoma* (1992) 6 Cal.App.4th 1307, 1318.) "[I]f there is substantial evidence in the record that the later project may arguably have a significant adverse effect on the environment which was not examined in the prior program EIR, doubts must be resolved in favor of environmental review and the agency must prepare a new tiered EIR, notwithstanding the existence of contrary evidence." (*Id.* at p. 1319, fn. omitted.) The court "must set aside the decision if the administrative record contains substantial evidence that a proposed project might have a significant environmental impact; in such a case, the agency has not proceeded as required by law." (*Id.* at 1317.)

## II. OVERVIEW OF CEQA

"The fundamental goals of environmental review under CEQA are information, participation, mitigation, and accountability." (*Lincoln Place Tenants Assn. v. City of Los Angeles* (2007) 155 Cal.App.4th 425, 443-444 (*Lincoln Place II*).) As the California Supreme Court has explained: "If CEQA is scrupulously followed, the public will know

the basis on which its responsible officials either approve or reject environmentally significant action, and the public, being duly informed, can respond accordingly to action with which it disagrees. [Citations.] The EIR process protects not only the environment but also informed self-government." (*Laurel Heights Improvement Assn. v. Regents of the University of California* (1988) 47 Cal.3d 376, 392 (*Laurel Heights*).)

CEQA requires a public agency to prepare an environmental impact report (EIR) before approving a project that may have significant environmental effects. (Pub. Resources Code, § 21100.) The EIR is "'the heart of CEQA' . . . an 'environmental alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return.'" (*Laurel Heights, supra*, 47 Cal.3d at p. 392.)

CEQA authorizes the preparation of various kinds of environmental impact reports depending upon the situation, such as the subsequent EIR, a supplemental EIR, and a tiered EIR. (Pub. Resources Code, §§ 21166, 21068.5, 21093, 21094.) Whereas the subsequent EIR and supplemental EIR are used to analyze modifications to a particular project, a tiered EIR is used to analyze the impacts of a later project that is consistent with an EIR prepared for a general plan, policy, or program. (CEQA Guidelines, § 15385; compare Pub. Resources Code, § 21166 & CEQA Guidelines §§ 15162, 15163 & 15164 [referencing "the project"] with Pub. Resources Code, § 21093 [stating that later projects may use tiering].)

CEQA requires that "environmental impact reports shall be tiered whenever feasible." (Pub. Resources Code, § 21093, subd. (b).) Tiering means "the coverage of

general matters in broader EIRs (such as on general plans or policy statements) with subsequent narrower EIRs . . . incorporating by reference the general discussions and concentrating solely on the issues specific to the EIR subsequently prepared." (CEQA Guidelines, § 15385; Pub. Resources Code, § 21068.5.) In the context of program and plan-level EIR's, the use of tiered EIR's is mandatory for a later project that meets the requirements of Public Resources Code section 21094, subdivision (b). (Pub. Resources Code, § 21094, subd. (a).)

Another requirement of CEQA is that public agencies "should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects." (Pub. Resources Code, § 21002.) "A 'mitigation measure' is a suggestion or change that would reduce or minimize significant adverse impacts on the environment caused by the project as proposed." (*Lincoln Place II, supra*, 155 Cal.App.4th at p. 445.)

If the agency finds that mitigation measures have been incorporated into the project to mitigate or avoid a project's significant effects, a "public agency shall adopt a reporting or monitoring program for the changes made to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment. The reporting or monitoring program shall be designed to ensure compliance during project implementation." (Pub. Resources Code, § 21081.6, subd. (a)(1).)

If a mitigation measure later becomes "impracticable or unworkable," the "governing body must state a legitimate reason for deleting an earlier adopted mitigation

measure, and must support that statement of reason with substantial evidence." (*Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1509 (*Lincoln Place I*)).

### III. ANALYSIS

#### A. Statute of Limitations Defense

The County asserts that the Sierra Club's claim that the mitigation measures it adopted are not enforceable is barred by the statute of limitations because the Sierra Club should have challenged the County's approval of the general plan update EIR, not the CAP. We reject this contention.

The petition was filed 30 days after the County's June 20, 2012 approval of the CAP. In addition, the lawsuit was filed 29 days after the County filed a notice of determination (NOD). The Sierra Club's July 20, 2012 petition was timely filed 29 days after. Thus, the County triggered the 30-day statute of limitations set forth in Public Resources Code section 21167, subdivisions (b) and (e).

The Sierra Club is not challenging the validity of the general plan update PEIR or the enforceability of the mitigation measures provided in that document. Rather, the Sierra Club is challenging the project before the Board of Supervisors on June 20, 2012, and seeks to enforce a key mitigation measure set forth in the EIR and MMRP - Mitigation Measure CC-1.2.

Further, the Court of Appeal in *Lincoln Place II*, *supra*, 155 Cal.App.4th 425 rejected a similar argument to that made by the County. In that case, a tenants' association sought to compel the City of Los Angeles to enforce mitigation measures

contained in a vesting tentative tract map issued by the city. The city argued that the 180-day statute of limitations contained in Public Resources Code section 21167 for challenges to approval of projects without determining whether they have a significant effect on the environment barred the plaintiffs' action. In rejecting that action, the Court of Appeal held "[t]he statute's plain language demonstrates it has no application to this case seeking to *enforce mitigating conditions*." (*Lincoln Place II*, at p. 453, fn. 23, italics added.)

Moreover, the cases cited by the County in support of its position are inapposite. The County cites *River Valley Preservation Project v. Metropolitan Transit Development Bd.* (1995) 37 Cal.App.4th 154 and *Friends of Davis v. City of Davis* (2000) 83 Cal.App.4th 1004 for the proposition that because the time period within which to challenge the general plan update EIR has expired, the EIR is conclusively presumed to have complied with CEQA. Here, however, the Sierra Club is not challenging the general plan update EIR, but the CAP and Thresholds project, and is seeking to enforce Mitigation Measure CC-1.2.

The County's reliance upon *Environmental Council of Sacramento v. City of Sacramento* (2006) 142 Cal.App.4th 1018 and *Mount Shasta Bioregional Ecology Center v. County of Siskiyou* (2012) 210 Cal.App.4th 184 is also unavailing. The petitioners in those actions were challenging the adequacy of the mitigation measures themselves. Here, the Sierra Club does not attack the adequacy of the mitigation measure in the general plan update PEIR. To the contrary, the Sierra Club's lawsuit is in *support* of the County's past findings and promises to achieve GHG Reductions.

*B. Failure To Proceed in a Manner Required by Law*

As detailed, *ante*, implementation of Mitigation Measure CC-1.2 was only one of the purported purposes of the CAP and Thresholds project. The CAP and Thresholds project also purports to be a plan-level document for use in review of later projects.

As we shall explain, *post*, with respect to the CAP as mitigation for a plan-level document, the County failed to proceed in the manner required by CEQA by proceeding with the CAP and Thresholds project in spite of the express language of Mitigation Measure CC-1.2 that the CAP "include . . . more detailed greenhouse gas emissions reduction targets and deadlines" and that the CAP "will achieve comprehensive and enforceable GHG emissions reduction" by 2020. With respect to the CAP as a plan-level document itself, the County failed to proceed in the manner required by law by failing to incorporate mitigation measures into the CAP as required by Public Resources Code section 21081.6.

*1. The County failed to adopt a CAP that complied with the requirements of Mitigation Measure CC-1.2*

"Mitigating conditions are not mere expressions of hope." (*Lincoln Place I, supra*, 130 Cal.App.4th at p. 1508.) Once incorporated, mitigation measures cannot be defeated by ignoring them or by "attempting to render them meaningless by moving ahead with the project in spite of them." (*Lincoln Place II, supra*, 155 Cal.App.4th at p. 450.) This is true even where subsequent approvals are ministerial. (*Katzeff v. California Department of Forestry & Fire Protection* (2010) 181 Cal.App.4th 601, 614 [public agency "may not authorize destruction or cancellation of the mitigation—whether or not

the approval is ministerial—without reviewing the continuing need for the mitigation, stating a reason for its actions, and supporting it with substantial evidence"].) If a mitigation measure later becomes "impractical or unworkable," the "governing body must state a legitimate reason for deleting an earlier adopted mitigation measure, and must support that statement of reason with substantial evidence." (*Lincoln Place I, supra*, 130 Cal.App.4th at p. 1509.)

a. *The CAP does not include enforceable GHG emissions required by Mitigation Measure CC-1.2*

When it adopted the general plan PEIR, the County promised to achieve specified GHG reductions by 2020. However, when it approved the CAP and Thresholds project, the County stated that the CAP does not ensure the required GHG emissions reductions. Rather, the County described the strategies as recommendations.

Until this litigation was initiated, the County described the CAP as the most critical component of the County's climate change mitigation efforts. The CAP was intended to "provide[] the specific details associated with [the General Plan] strategies and measures for greenhouse gas (GHG) emissions reduction *that were not available* during the program-level analysis of the General Plan." (Italics added.)

The County agreed to the mitigating requirement of a CAP containing "comprehensive and enforceable GHG emissions reduction measures that will achieve" the specified GHG Reductions by 2020. This is because, as the County acknowledges, Executive Order No. S-3-05 requires consistent emissions reductions each year from

2010 through 2020 and then a greater quantity of emissions reductions each year from 2020 through 2050.

The County asserts that "[f]ive of the reduction measures incorporated into the CAP are also embodied in state or federal law" and that "CEQA permits reliance on existing regulatory standards as mitigation when it is reasonable to believe compliance will occur."

However, the County acknowledges that these measures will not, alone, achieve the specified GHG emissions reductions by 2020. In fact, the record shows that without local measures the requirements of Assembly Bill No. 32 will not be met.

Further, the record demonstrates that many of the mitigation measures set forth in the MMRP are not likely to achieve GHG emissions reductions by 2020 as promised by Mitigation Measure CC-1.2 because they are not currently funded. The record show that the County has not funded essential programs like replacing its own vehicle fleet, implementing water conservation programs, preparing town center plans, and reducing water demand. The County cannot rely on unfunded programs to support the required GHG emissions reductions by 2020, as Mitigation Measure CC-1.2 requires.

Transportation is a major concern, which the County concedes is the largest source of community GHG emissions. The Sierra Club presented evidence below that driving reductions needed to achieve Assembly Bill No. 32 and Executive Order No. S-3-05 targets are not met. The County did not dispute this evidence. The record shows that transit-related measures are either unfunded, that the County is not making meaningful

implementation efforts, and in some instances that the County is acting contrary to mitigation measures incorporated into the general plan update PEIR.

For example, two of the four transportation measures, T1 (increase transit use) and T2 (increase walking & biking), rely on at least one unfunded program. In addition, measures T1 and T2, as well as T3 (increase ridesharing), also rely on "coordination" with SANDAG and/or other entities.

In response to Sierra Club's comments relating to the effectiveness of these measures as a result of current SANDAG (San Diego Association of Governments) priorities, the County did not request funds based on the fact that it does not control how SANDAG spends its money. As the County stated, "The County does not control regional plans or allocation of regional transportation funding." This position was rejected by the Supreme Court in *City of Marina v. Board of Trustees of the California State University* (2006) 39 Cal.4th 341, 367 [holding respondent could not disclaim responsibility for making payments without first asking for funds].

The CAP's transportation section also does not include an analysis of the County's own operations, and the record appears to include contradictions even over programs over which the County has exclusive control, such as replacement of its own vehicle fleet with alternatively fueled vehicles. Although the County suggests it will implement "1 % greater efficiency per year", the County has not formally bound itself to do so. Indeed, there is no mention of potential funding sources with respect to reductions related to County operations.

b. *The CAP contains no detailed deadlines for reducing GHG emissions*

As the trial court found, the CAP contained no detailed deadlines. The County argues on appeal that the 2020 goal and the timeframes set forth in the MMRP are sufficient to meet the requirement of "more detailed . . . deadlines." However, Mitigation Measure CC-1.2 expressly required that the CAP provide more detailed deadlines. If the County did not intend for the CAP to do anything further with respect to deadlines than already set forth, the County would not have used the word "more." Indeed, in addition to not providing the promised deadlines, the CAP acknowledges that it will not be effective unless it is updated.

c. *The evidence cited by the County*

The County asserts that CAP measures will be effective because "[p]articipation rates were discussed and modified," and the "feasibility of attaining reduction targets was assessed." However, the County does not cite any evidence in the record to support its belief that people will participate in the various programs to the extent necessary to achieve the reductions asserted, or even assert that feasible measures will actually be implemented.

Rather, the County cites to entire appendices and chapters of the CAP. However, information contained in appendices are "not a substitute for "a good faith reasoned analysis."" (*Vineyard, supra*, 40 Cal.4th at p. 442.) "The audience to whom an EIR must communicate is not the reviewing court but the public and the government officials deciding on the project." (*Id.* at p. 443.)

The County also asserts that the CAP "demonstrates a [GHG emissions] reduction of 19%." However, the CAP expressly states that it does not ensure reductions. Instead, the County's evidence relates to quantification of the respective measures. Quantifying GHG reduction measures is not synonymous with implementing them. Whether a measure is effective requires more than quantification, but an assessment of the likelihood of implementation. There is no evidence in the record that the above-referenced mitigation measures will make any contribution to achieving GHG emissions reductions by 2020.

*2. The County's failure to make findings regarding the environmental impact of the CAP and Thresholds project*

Instead of analyzing and making findings regarding the environmental effects of the CAP and Thresholds project, the County made an erroneous assumption that the CAP and Thresholds project was the same project as the general plan update. (*Sierra Club, supra*, 6 Cal.App.4th at p. 1320 ["section 21166 and its companion section of the [CEQA] Guidelines appear to control only when the question is whether more than one EIR must be prepared for what is essentially the same project"].) As a result, the County failed to render a "written determination of environmental impact" before approving the CAP and Thresholds project. (*No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal.3d 68, 81; Pub. Resources Code, § 21151.) This constitutes a failure to proceed in the manner required by law. (*No Oil, supra*, 13 Cal.3d at p. 81.)

By inaccurately assuming the CAP and Thresholds project was the same project as the general plan update, the County failed to analyze the environmental impacts of the

CAP and Thresholds project itself. (*Natural Resources Defense Council, Inc. v. City of Los Angeles* (2002) 103 Cal.App.4th 268, 283 [holding CEQA violated where "no evidence that the [County] formally addressed whether or not the [] project fell within the concept of a 'tiered' EIR"].) As a result, the County never made the required findings that the effects of the CAP and Thresholds project were examined, mitigated, or avoided. (Pub. Resources Code, § 21094, subd. (a).)

The facts of the present case, as the trial court found, are similar to *Center for Sierra Nevada Conservation v. County of El Dorado* (2012) 202 Cal.App.4th 1156 (*CSNC*). In *CSNC*, the county prepared a general plan and PEIR. (*Id.* at p. 1162.) In the PEIR, one of the mitigation measures was the preparation of a management plan, including a fee program, to mitigate the general plan's impacts on oak woodland habitat. (*Id.* at p. 1163.) The initial study concluded that the project was merely an implementation of the county's general plan. (*Id.* at p. 1176.)

The Court of Appeal rejected this argument, holding that a tiered EIR was required to examine the management plan since the PEIR did not include sufficient details, rejecting the argument that the management plan was merely an implementation of the general plan. (*CSNC, supra*, 202 Cal.App.4th at pp. 1176, 1184-1185.)

The County attempts to distinguish *CSNC* by asserting the general plan update PEIR analyzed the same environmental issue addressed in the CAP. However, the record reveals that the necessary details were not available to the County at the time the general plan update PEIR was certified. Indeed, no component of the project, the CAP or the Thresholds, had even been created at the time of the general plan update.

As the Court of Appeal in *CSNC* explained:

"That the preceding 2004 program EIR contemplated adverse environmental impacts resulting from development under the 2004 General Plan does not remove the need for a tiered EIR for the oak woodland management plan. . . . Here, the specific project—the oak woodland management plan (including Option B fee program)—required a tiered EIR to examine its specific mitigation measures and fee rate." (*CSNC, supra*, 202 Cal.App.4th at p. 1184.)

The general plan update anticipated implementation of mitigation measures—CC-1.2, CC-1.7, and CC-1.8—as mitigating conditions to mitigate the adverse climate change environmental impacts of the general plan update. Those measures were analyzed in the PEIR. However, the PEIR never considered the use of the CAP and the Thresholds as a plan-level program. Thus, the environmental impacts of its use needed to be considered in an EIR. (*NRDC, supra*, 103 Cal.App.4th at p. 281 [project did not arise until after PEIR and thus was not contemplated therein].)

The County contends that the Board of Supervisors made an "implied finding" that the CAP complied with Mitigation Measure CC-1.2 and that finding is "entitled to great deference." However, "such an 'implicit finding' does not satisfy CEQA's requirement of express findings." (*Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d 1011, 1037.) "[T]he board of supervisors must make findings . . . to permit a reviewing court to bridge the analytic gap between the evidence and the ultimate decision." (*People v. County of Kern* (1976) 62 Cal.App.3d 761, 777; see *Citizens for Quality Growth v. City of Mt. Shasta* (1988) 198 Cal.App.3d 433, 442 ["passing references to the mitigation measures are insufficient to constitute a finding, as nothing in City's resolutions binds it to follow these measures"].)

Moreover, even if "implied findings" were permissible, there can be no "interpretation" of Mitigation Measure CC-1.2 contrary to its express terms. (*Southern Cal. Edison Co. v Public Utilities Com.* (2000) 85 Cal.App.4th 1086, 1105 ["an agency's interpretation of a regulation or statute does not control if an alternative reading is compelled by the plain language of the provision"]; see *Santa Clarita Organization for Planning the Environment v. City of Santa Clarita* (2011) 197 Cal.App.4th 1042, 1062 [agency's "view of the meaning and scope of its own ordinance" does not enjoy deference when it is "clearly erroneous or unauthorized"].)

3. *The County failed to proceed in the manner required by law by failing to incorporate mitigation measures directly into the CAP*

As discussed, *ante*, one of the major differences between the climate change action plan anticipated by Mitigation Measure CC-1.2 in the general plan update PEIR and the CAP and Thresholds project as prepared, is that the general plan update PEIR did not analyze the CAP as a plan-level document that itself would facilitate further development. As a plan-level document, the CAP is required by CEQA to incorporate mitigation measures directly into the CAP:

"A public agency *shall provide the measures to mitigate or avoid significant effects on the environment are fully enforceable through permit conditions, agreements, or other measures.* Conditions of project approval may be set forth in referenced documents which address required mitigation measures or, *in the case of the adoption of a plan*, policy, regulation, or other public project, *by incorporating the mitigation measures into the plan*, policy, regulation, or project design." (Pub. Resources Code, § 21081.6, subd. (b), italics added.)

As authority for the assertion that it did not need to incorporate enforceable mitigation measures into the CAP directly, the County cites *Twain Harte Homeowners Assn. v. County of Tuolumne* (1982) 138 Cal.App.3d 664, 689-690. However, *Twain Harte* was decided before enactment of Public Resources Code section 21081.6, subdivision (b), which, as discussed, *ante*, requires "in the case of the adoption of a plan" that mitigation measures be fully enforceable "by incorporating the mitigation measures into the plan . . . ."

"The purpose of CEQA is not to generate paper, but to compel government at all levels to make decisions with environmental consequences in mind." (*Bozung v. Local Agency Formation Com.* (1975) 13 Cal.3d 263, 283.) By failing to consider environmental impacts of the CAP and Thresholds project, the County effectively abdicated its responsibility to meaningfully consider public comments and incorporate mitigating conditions. In addition to the example discussed, *ante*, related to transportation impacts, the Sierra Club also provided examples of mitigation implemented by other regions to mitigate the effects of climate change in the energy sector. The County neither implemented nor responded to these examples which have already been implemented elsewhere.

#### 4. *The trial court's finding that the County must prepare an EIR*

As set forth in *Lincoln Place I*, a supplemental EIR must be prepared when a public agency determines a previously adopted mitigation measure is infeasible. (*Lincoln Place I, supra*, 130 Cal.App.4th at pp. 1508-1509.) In addition, CEQA guidelines,

section 15183.5, subdivision (b)(1)(F) provides that a plan for the reduction of GHG emissions should "[b]e adopted in a public process following environmental review."

The County's failure to comply with Mitigation Measure CC-1.2 and Assembly Bill No. 32 and Executive Order No. S-3-05 supports the conclusion that the CAP and Thresholds project will have significant, adverse environmental impacts that have not been previously considered, mitigated, or avoided.

*a. Substantial evidence supports the court's finding preparation of an EIR was required*

The County asserts that the substantial evidence standard of review applies to the question of whether a supplemental EIR was required, under which deference is given to an agency's determination. (*Latinos Unidos de Napa v. City of Napa* (2013) 221 Cal.App.4th 192, 200-202.) The Sierra Club, on the other hand asserts that the "fair argument" test applies, under which "deference to the agency's determination is not appropriate and its decision not to require an EIR can be upheld only when there is no credible evidence to the contrary." (*Sierra Club, supra*, 6 Cal.App.4th at p. 1318.) We conclude that under either standard, the trial court did not err in finding a supplemental EIR was required.

The fair argument versus substantial evidence test is of no moment because, here, there is no substantial evidence in the record supporting the County's erroneous conclusion that "activities associated with the CAP and Significance Guidelines are within the scope of the General Plan Program EIR."

The County does not dispute that "to avoid serious climate change effects, atmospheric GHG concentrations need to be stabilized as quickly as possible." In fact, the County warns that expected local adverse effects of climate change include "higher temperatures, [¶] a greater number of extremely hot days, [¶] changes in the pattern and amount of precipitation, [¶] decreased water supplies accompanied by increased demand, [¶] increased wildfire risk, [¶] changes in ecosystems, and [¶] decline or loss of plant and animal species." However, the CAP and Thresholds project was approved without the appropriate environmental analysis to avoid or mitigate these consequences. As the trial court found, "environmental review is necessary to ascertain whether the CAP met the necessary GHG emission reductions when considering the CAP is merely hortatory and contains no enforcement mechanism for reducing GHG emissions."

Moreover, as the County acknowledges, the details of the CAP "were not available during program-level analysis of the General Plan." For example, the general plan update PEIR did not provide a "baseline GHG emissions inventory; detailed GHG-reduction targets and deadlines; comprehensive and enforceable GHG emissions-reduction measures; and implementation, monitoring, and reporting of progress toward the targets defined in the CAP." In 2011 the County found that implementation of mitigation measures, including CC-1.2, CC-1.7, and CC-1.8, were part of the mitigation imposed to mitigate the climate change impacts of the general plan update. It cannot be said that failing to comply with Mitigation Measure CC-1.2, Assembly Bill No. 32, and Executive Order No. S-3-05 does not change the environmental conclusions in the general plan update PEIR.

Further, the general plan update PEIR did not contemplate that preparation of the CAP and Thresholds project was at the "plan-level." As a plan-level document, the CAP and Thresholds project was required to undergo environmental review as a matter of law. (CEQA Guidelines, § 15183.5, subd. (b)(1)(F).) The general plan update PEIR also did not contemplate that as a result of the CAP, "[m]ore projects will fall below the bright line threshold, and will not have to conduct detailed analysis", much less study the environmental impact of such. County staff, the planning commission, and the board of supervisors were all aware that approving the CAP and Thresholds project would allow more projects to avoid a climate change analysis, including projects with post-2020 climate change impacts without post-2020 environmental review.

Furthermore, in 2011, the County found that climate change impacts were mitigated not only by implementation of mitigation measures, but also by "compliance with applicable regulations" including Assembly Bill No. 32 and Executive Order No. S-3-05.

By contrast, the CAP and Thresholds project now acknowledges it does not comply with Executive Order No. S-3-05. Instead of maintaining a constant rate of GHG emissions reductions after 2020, as required by Executive Order No. S-3-05, the County admits that GHG emissions will instead increase after 2020. Thus, the County's own documents demonstrate that the CAP and Thresholds project will not meet the requirements of Assembly Bill No. 32 and Executive Order No. S-3-05 and thus will have significant impacts that had not previously been addressed in the general plan update PEIR.

The explanation given to the board of supervisors for failing to address the post-2020 impacts facilitated by the CAP and Thresholds project was that "the State's plan doesn't go out that far, and it would be speculative for us to do that."

However, contrary to the County's argument that it would be "speculative" to consider the environmental impacts of the CAP, the County has acknowledged that other agencies have, in fact, been able to do so. It is an abuse of discretion to reject alternatives or mitigation measures that would reduce adverse impacts without supporting substantial evidence. (CEQA Guidelines, §§ 15043, 15093, subd. (b).) The County's assumption that considering post-2020 impacts is "speculative" is not supported by substantial evidence. (Pub. Resources Code, § 21082.2, subd. (c) ["Argument, speculation, unsubstantiated opinion or narrative, evidence which is clearly inaccurate or erroneous . . . is not substantial evidence. Substantial evidence shall include facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts."].)

The Sierra Club provided feasible mitigation measures. The County rejected these mitigation measures without substantial evidence for doing so.

In sum, the CAP does not fulfill the County's commitment under CEQA and Mitigation Measure CC-1.2, to provide detailed deadlines and enforceable measures to ensure GHGF emissions will be reduced.

DISPOSITION

The judgment is affirmed. The Sierra Club shall recover its costs on appeal.

### **B. Achieving Climate Stabilization**

Scientific research indicates that an increase in the global average temperature of 2°C (3.6°F) above pre-industrial levels, which is only 1.1°C (2.0°F) above present levels, poses severe risks to natural systems and human health and well-being. Considering knowledge from the paleo-climate record with changes currently observed in the Greenland and Antarctic ice sheets, we can expect substantial sea level rise, 0.4 to 0.8 meters, with upper end uncertainties approaching one meter above present day during the 21st Century and continued substantial increase after 2100 even with stringent mitigation of emissions to achieve 2°C stabilization. Increased climate extremes, already apparent at present day climate warming (~0.9°C), will no doubt be more severe. **To have a good chance (not a guarantee) of avoiding temperatures above those levels, studies focused on a goal of stabilizing the concentration of heat-trapping gases in the atmosphere at or below the 450 parts per million (ppm) CO<sub>2</sub>-equivalent (CO<sub>2</sub>e, a metric that combines the climate impact of all well-mixed GHGs, such as methane and nitrous oxide, in terms of CO<sub>2</sub>).**

The CO<sub>2</sub>e target is a somewhat approximate threshold, and the exact level of CO<sub>2</sub>e is not precisely known because the sensitivity of the climate system to GHGs has uncertainty. Different models show slightly different outcomes within this range. **An example of a pre-IPCC assessment study (Meinshausen et al. 2009)<sup>15</sup> which has synthesized many studies on climate sensitivities, concluded that we would need to stabilize at about 400 ppm CO<sub>2</sub>e (Bullock note: We have already exceeded 400 PPM!!!!!!!) in order to likely avoid exceeding the 2°C threshold (even at that stabilization target, there is still about a 20 percent chance of exceeding the temperature target).** Further, a recent paper by an international team of scientists (Hansen et al. 2013)<sup>16</sup> asserts that the **widely accepted target of limiting human-made global climate warming to 2°C above preindustrial levels is likely too high and may subject future generations and nature to irreparable harm. Recognizing this fact, the international community agreed in meetings in Cancun in 2012 to review, by 2015, progress to the 2°C target and consider whether it should be strengthened to a 1.5°C threshold.**

What is important to recognize in these studies of warming thresholds is the critical importance of non-CO<sub>2</sub> gases, particularly the short-lived climate pollutants. For example, to avoid 2°C warming at a 66 percent confidence level, total carbon emissions (as CO<sub>2</sub>e) must be kept to 1000 GtC. Considering that we have already emitted about 500 GtC, which leaves 500 GtC to be divided up among nations. If the non-CO<sub>2</sub> gases are included then

the total CO<sub>2</sub>e emissions are at 790 GtC, leaving only 210 GtC to be emitted. Thus, there is a compelling case to reduce the short-lived climate pollutants.

In early May 2013, the Mauna Loa monitoring station, which has been shown to provide excellent measurements of CO<sub>2</sub> throughout the global atmosphere, recorded atmospheric CO<sub>2</sub> of 400 ppm,<sup>17</sup> substantially higher than the 316 ppm recorded when the station made its first measurements in 1958. The monitoring station offers the longest-running record of atmospheric CO<sub>2</sub> measured directly from the air. This recent reading will take a few years to become the international average; however, reaching 400 ppm at Mauna Loa is significant and has surpassed a worrisome milestone.

Although stabilizing atmospheric GHG concentration below 450 ppm CO<sub>2</sub>e is important, it does not mean that once that level is reached, temperatures will immediately level off. Because of time lags inherent in the Earth's climate, the initial warming that occurs in response to a given increase in the concentration of CO<sub>2</sub> ("transient climate change") reflects only about half the eventual total warming ("equilibrium climate change").

Observational data reveal that, in recent decades, some climate extremes are already increasing in response to relative modest warming; these extremes would likely increase considerably with warming of 2°C or more. While the findings suggest that even at relatively low levels of global warming the world will have to face significant sea level rise, the studies also demonstrate that the potential impacts are substantially greater if we allow warming to reach a level as high as 2°C. If they occur, changes such as these would not rapidly reverse, as even if the atmospheric CO<sub>2</sub> amount declines, it would take many centuries for the deep ocean to cool.

To prevent exceeding 450 ppm CO<sub>2</sub>e, developed countries must substantially reduce their emissions in the near term. The 2008 World Energy Outlook suggests that Organization for Economic Co-operation and Development (OECD) countries must reduce emissions by about 40 percent below 2006 levels by 2030.<sup>18</sup> The Union of Concerned Scientists has suggested a 2030 emissions target for the United States of 56 percent below 2005 levels (44 percent below 1990 levels).<sup>19</sup> A governmental study from the Netherlands finds that Europe would have to reduce emissions by 47 percent below 1990 levels and the United States would have to reduce emissions by 37 percent below 1990 levels by 2030.<sup>20</sup> The International Energy Agency comes to a similar conclusion, finding that the United States would have to reduce emissions by about 38 percent below 1990 levels by 2030.<sup>21</sup> Note that percent reductions by 2030 depend on the assumed overall trajectory of emissions, including the amount after 2030.

Because of the cumulative effects of GHG emissions and resultant changes to the earth's energy balance and the inertia in the climate system, delaying efforts to reduce emissions will likely mean that global average temperature will increase by more than 2°C, increasing the costs associated with combatting climate change. Reducing the global concentration to 450 ppm CO<sub>2</sub>e after delaying mitigation actions for ten more years is estimated to cost an additional \$3.5 trillion, compared to levels of investment needed now if low-carbon strategies were to be adopted immediately.<sup>22</sup>

**Re: Comments on Survey of CEQA Documents on Greenhouse Gas Emissions  
Draft Work Plan and Development of GHG Threshold of Significance for  
Residential and Commercial Projects**

This letter provides comments from the Center for Biological Diversity (“the Center”) on the “Survey of CEQA Documents on Greenhouse Gas Emissions Draft Work Plan” as well as SCAQMD’s continuing efforts to develop a greenhouse gas (GHG) threshold of significance for residential and commercial projects.

SCAQMD’s survey of the GHG emissions from residential, commercial, and mixed-use projects should yield valuable data on the range of emissions resulting from these types of Projects in the South Coast air basin. Under the Work Plan, SCAQMD will use this data “to determine the level of GHG emissions for residential and commercial projects that constitute the 90th percentile ... or other percentile desired.” (Work Plan at 1.) According to SCAQMD, a threshold based on the 90% capture of sector emissions is consistent with the long-term emission reduction objectives set by Executive Order S-3-05, which calls for emission reductions to 80% below 1990 levels by 2050, or 90% below current levels. (SCAQMD Interim GHG Significance Threshold Staff Proposal (revised), at 3-2.) Compliance with Executive Order S-3-05 targets is presumed to be sufficient “to contribute to worldwide efforts to cap GHG concentrations at 450 ppm, thus, stabilizing the climate.” (*Id.*)

While the Center appreciates SCAQMD’s recognition that a GHG threshold must be based on long-term climate stabilization objectives, the best available scientific data now indicates that the threats posed by even small increases in temperature are far greater than previously thought. Stabilization of greenhouse gas emissions at 450 ppm as contemplated under Executive Order S-3-05 is insufficient to minimize the risk of catastrophic outcomes. Therefore, the capture of 90% of emissions from the residential and commercial sectors, which is based on compliance with Executive Order S-3-05, is

not a sufficiently stringent capture rate to sufficiently contribute to preventing dangerous climate change.

Importantly, while the emission reduction targets embodied in AB 32 and Executive Order S-3-05 can inform a significance determination, it is only to the extent that these targets accurately reflect scientific data on needed emissions reductions. Under CEQA, regulatory standards can serve as proxies for significance where they accurately reflect the level at which an impact can be said to be less than significant. *See, e.g., Protect the Historic Amador Waterways v. Amador Water Agency*, 116 Cal. App. 4th 1099, 1109 (2004).

To ensure that an adopted threshold of significant is an accurate reflection of scientific and factual data, this letter sets for the best available science on climate change. As set forth below, the best available science most strongly support a threshold of zero. The further a threshold is from zero, the more tenuous the evidence to support a determination that the threshold is effective at meeting the environmental objective of avoiding dangerous climate change. Framed in the context of SCAQMD's methodology, the further a threshold is from a 100% capture rate, the more tenuous the evidence to support a determination that the threshold is effective. Accordingly, in the event SCAQMD is unwilling to set a zero threshold, SCAQMD should consider increasing the capture rate beyond 90% and also require projects with emissions less than this threshold to adopt measures to reduce their GHG emissions before reaching a determination that project impacts are less-than-significant. A non-zero quantitative threshold – assuming it is sufficiently stringent – coupled with performance standards that projects under this threshold must adopt recognizes that all projects must be part of the solution to global warming and would seem to be more equitable and defensible than a bright-line non-zero threshold alone.<sup>1</sup>

Finally, with regard to the Work Plan itself, it would be helpful to included data on emissions from categorically exempt projects. In the debate over an appropriate threshold of significance for GHGs, arguments have been forwarded that a low threshold would eliminate the application of categorical exemptions. Whether or not this is the case, actual data on the emissions typically resulting from projects invoking a categorical exemption would better inform this discussion.

# **1. A GHG Threshold That Purports to Be Consistent with Executive Order S-3-05 Emission Reduction Targets Is Insufficient to Prevent Dangerous Climate Change**

CEQA calls for the identification of “any critical thresholds for the health and safety of the people of the state.” Pub. Res. Code § 21000(d). With regard to GHGs, this

---

<sup>1</sup> Were the District to adopt a non-zero threshold, a quantitative threshold that does not require projects under this threshold to take any action to reduce GHGs may also create an improper *de minimis* exception. *See, e.g., Communities for Better Env't v. California Resources Agency*, 103 Cal. App. 4th 98, 121 (2002) (“Focusing on the de minimis effect in absolute terms isolates the effect individually, and this runs counter to the combined approach that CEQA cumulative impact law requires.”).

critical threshold is avoiding dangerous anthropogenic interference (DAI) with the climate system. Article 2 of the United Nations Framework Convention on Climate Change (UNFCCC) calls for “stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference (DAI) with the climate system.”<sup>2</sup> With the United States and over 180 other countries as signatories, the UNFCCC’s objective of avoiding DAI with the climate is widely viewed as the international regulatory standard for protecting the global climate. The environmental objective of avoiding DAI is recognized in ARB’s Draft GHG Threshold Guidance. (ARB Preliminary Draft Staff Proposal, Recommended Approaches for Setting Interim Significance Thresholds for Greenhouse Gases under the CEQA (“ARB Draft GHG Threshold”), Oct. 24, 2008 at 3.) In its Policy Objective for the Interim GHG Threshold for Industrial Projects, SCAQMD seems to set a roughly analogous objective of “reducing GHG emissions to stabilize climate change.” (SCAQMD Interim GHG Significance Threshold Staff Proposal (revised), at 3-2.)

The policy objectives of both ARB and SCAQMD’s threshold proposals both state that reaching the emission reduction targets set forth by Executive Order S-3-05, whereby emissions are reduced to 80% below 1990 levels by 2050, would contribute to avoiding dangerous climate change because these reductions are consistent with a pathway to the stabilization of atmospheric concentrations of GHG emissions at 450 ppm. (ARB Draft GHG Threshold at 3; SCAQMD Interim Threshold Proposal at 3-2.) Stabilization of GHGs at 450 ppm provides a 50/50 chance of limiting mean temperature rise to 2°C above pre-industrial levels.<sup>3</sup>

A pathway toward stabilization of GHGs at 450 ppm presents two serious concerns. First, the best available scientific evidence now indicates that a warming of 2°C is not “safe” and would not prevent dangerous interference with the climate system. Second, because the consequences of overshooting a 2°C threshold could include the displacement of millions due to sea level rise, irreversible loss of entire ecosystems, and the triggering of multiple climactic “tipping points” wherein climate change begins to feed on itself and spin rapidly out of control, the risk tolerance for overshooting a 2°C temperature rise should be extremely low. Yet a stabilization target of 450 ppm seems content to, at best, flip a coin in the hopes that future generations are not left with few choices beyond mere survival. While the emission reduction targets set forth under Executive Order S-3-05 is a significant improvement from business-as-usual, because these targets are insufficient to adequately minimize the risk of DAI, compliance with Executive Order S-3-05 is not a sufficiently stringent objective from which to develop a threshold of significance.

<sup>3</sup> Union of Concerned Scientists, *How to Avoid Dangerous Climate Change: A Target for U.S. Emissions* 3 (Sept. 2007); Malte Meinshausen, *What Does a 2°C Target Mean for Greenhouse Gas Concentrations? A Brief Analysis Based on Multi-Gas Emission Pathways and Several Climate Sensitivity Uncertainty Estimates* in AVOIDING DANGEROUS CLIMATE CHANGE 268 (Cambridge Univ. Press 2006).

Projected risks and damages from global warming are more serious than believed even a few years ago. In 2001, the Intergovernmental Panel on Climate Change (IPCC) used five Reasons For Concern (RFCs) in its Third Assessment Report (TAR) to illustrate the temperature range at which impacts may be considered dangerous.<sup>4</sup> Relationships between the impacts reflected in each RFC and increases in global mean temperature were portrayed in a “burning embers” diagram, which reflected the severity of risk from rising temperature through gradations in color from white (no or little risk) to yellow (moderately significant risk) to red (substantial or severe risk).<sup>5</sup> Depending on the RFC, substantial impacts or risks (transition from yellow to red) occurred with a temperature rise from 1°C to 4°C from current levels.<sup>6</sup>

Since the release of the TAR, scientific understanding of the vulnerability of the climate to temperature rise has evolved considerably.<sup>7</sup> Based on new findings in the growing scientific literature since the TAR was released, the burning embers diagram was revised in 2008 to reflect the dangerous risks posed by smaller increases in temperature than originally identified in the TAR.<sup>8</sup> In the updated burning embers diagram, substantial impacts or risks now occur at or near current temperature levels for a number of RFCs.<sup>9</sup> As reflected in the updated RFCs, a 2°C temperature increase from pre-industrial levels (or 1.4°C increase from 1990 levels) is well past the point where severe and irreversible impacts will occur.<sup>10</sup>

It is now estimated that a mean global temperature increase of 1.5°C above pre-industrial levels has the potential to trigger irreversible melting of the Greenland ice sheet, a process that would result in an eventual 7m sea level rise over and above that caused by thermal expansion of the oceans, and potentially causing an additional sea level rise of 0.75m, as soon as 2100.<sup>11</sup> Specific consequences of a 2°C temperature rise from pre-industrial levels include the loss of 97% of the world’s coral reefs and the transformation of 16% of global ecosystems.<sup>12</sup> At a 2°C temperature rise, approximately one to three

---

<sup>4</sup> IPCC, CLIMATE CHANGE 2001: SYNTHESIS REPORT, SUMMARY FOR POLICYMAKERS 11 (2001). The five RFCs identified in the TAR are: 1) Risks to Unique and Threatened Systems; 2) Risks of Extreme Weather Events; 3) Distribution of Impacts; 4) Aggregate Impacts; and 5) Risks of Large Scale Discontinuities. *Id.*

<sup>5</sup> *Id.*; Joel B. Smith et al., *Assessing Dangerous Climate Change Through an Update of the Intergovernmental Panel on Climate Change (IPCC) “Reasons for Concern,”* PNAS- PROCEEDINGS OF THE NATIONAL ACADEMY OF SCIENCES USA EARLY EDITION 1 (2008), available at <http://www.pnas.org/cgi/doi/10.1073/pnas.0812355106>.

<sup>6</sup> IPCC, *supra* note 4, at 11. The RFC’s assessed impacts from a baseline of 1990 temperature levels rather than pre-industrial levels. Because pre-industrial warming until 1990 was 0.6°C, an impact resulting from a temperature rise of 1°C equates to a 1.6°C rise from pre-industrial levels.

<sup>7</sup> Smith, *supra* note 5, at 1, 5.

<sup>8</sup> *Id.*

<sup>9</sup> *Id.* at 5.

<sup>10</sup> *Id.* 3.

<sup>11</sup> Rachel Warren, *Impacts of Global Climate Change at Different Annual Mean Global Temperature Increases* in AVOIDING DANGEROUS CLIMATE CHANGE 95 (Cambridge Univ. Press, 2006). Unlike the IPCC’s RFC, Warren assessed impacts from temperature rise from pre-industrial levels, not 1990 levels.

<sup>12</sup> *Id.* Indeed, given increased confidence that 1°C to 2°C increase poses significant risks to many unique and threatened systems, including many biodiversity hotspots, the updated burning embers diagram indicates substantial impacts and/or moderate risks from warming that has already occurred. Smith, *supra* note 5, at 5.

billion people would experience an increase in water stress, sea level rise and cyclones would displace millions from the world's coastlines and agricultural yields would fall in the developed world.<sup>13</sup> In the Arctic, ecosystem disruption is predicted upon expectations of a complete loss of summer sea ice, with only 42% of the tundra remaining stable. This would destroy the Inuit hunting culture, cause the extinction of the polar bear and result in large losses in global bird populations. Moreover, because Arctic ice functions to reflect heat back into the atmosphere, its loss would allow more sunlight to heat the Arctic Ocean and further accelerate the buildup of heat and the melting of the Greenland ice sheet. As the devastating and irreversible impacts resulting from a 2°C mean global temperature rise are far in excess of any reasonable definition of DAI, limiting mean temperature rise to 2°C above pre-industrial levels is not a sufficient environmental objective for the purposes of developing a GHG significance threshold.

Specific impacts to California are also more dire than previously estimated. For example, in its most recent report, the Climate Action Team determined that the latest scientific findings indicate that “prior estimates [of sea-level rise] likely have been too low.”<sup>14</sup> Based on two recent models, “[b]y 2050, sea-level rise could range from 30-45 cm (11 to 18 inches) higher than in 2000, and by 2100, sea-level rise could be 60 to 140 cm (23 to 55 inches) higher than in 2000. As sea level rises, there will be an increased rate of extreme high sea-level events, which can occur when high tides coincide with winter storms and there are associated high wind wave and beach run-up conditions.”<sup>15</sup> Moreover, the rise in sea-level may be much higher than even these models predict because they do not account for the ice-melt contributions from the Greenland and Antarctic ice sheets and assume medium to medium high emissions scenarios.<sup>16</sup>

Not only are the climate impacts expected from a 2°C temperature increase far in excess of what should be considered “safe”, but policies which propose greenhouse gas stabilization levels of 450 ppm CO<sub>2</sub>eq present substantial risks of overshooting this target, thus exacerbating the problem. Equating a particular atmospheric concentration of greenhouse gases with a specific temperature increase involves a significant degree of uncertainty. This is because climate sensitivity – the extent to which temperatures will rise as a result of increasing concentrations of heat-trapping gases – depends on Earth’s response to certain physical processes that are not fully understood.<sup>17</sup> Thus, due to uncertainty in climate sensitivity, scientists estimate that the mean probability of exceeding 2°C where stabilizing greenhouse gases at a CO<sub>2</sub>eq level of 450 ppm is 54% with a 30% probability that global average temperature would rise more than 3°C.<sup>18</sup> At

---

<sup>13</sup> Warren, *supra* note 11 at 98.

<sup>14</sup> California Action Team, Draft Biennial Report (Mar. 2009) at 1.9.

<sup>15</sup> *Id.* at 1.10.

<sup>18</sup> Malte Meinshausen, *What Does a 2°C Target Mean for Greenhouse Gas Concentrations? A Brief Analysis Based on Multi-Gas Emission Pathways and Several Climate Sensitivity Uncertainty Estimates* in AVOIDING DANGEROUS CLIMATE CHANGE (Cambridge Univ. Press) (2006) at 268-69. Meinshausen operates under assumptions that do not roughly equate CO<sub>2</sub> eq with CO<sub>2</sub> concentrations. In *What Does a*

400 ppm CO<sub>2</sub>eq, the mean probability of exceeding 2°C is 28%.<sup>19</sup> If greenhouse gas emissions were stabilized at 350 ppm CO<sub>2</sub>eq, the mean probability of exceeding 2°C would be reduced to 7%.<sup>20</sup>

Properly accounting for climate sensitivity in climate policy is critical because, as dire as the projected impacts resulting from a 2°C mean temperature increase, increases above 2°C would result in impacts of apocalyptic proportions. If a 2-3°C increase in mean global temperature occurred, feedbacks in the climate system would cause a shift in the terrestrial carbon cycle. Currently, land-based carbon acts as a sink for CO<sub>2</sub>, buffering the effects of anthropogenic climate change. If CO<sub>2</sub> concentrations continue to rise, this sink will become a source, owing to increased soil respiration, further exacerbating climate change. The most dramatic impacts will be a widespread loss of forests and grassland, including the Amazon rainforest, which would undergo a transition to savannah, triggering wide spread implications for local population, global biodiversity, and the global carbon cycle.<sup>21</sup> At a global increase in temperature of 3°C above pre-industrial levels, many additional impacts in human and natural systems would occur in ways exponentially more devastating than those predicted for a 2°C temperature increase. Few ecosystems can adapt to such a large temperature rise: 22% would be transformed losing 7% to 74% of their extent.<sup>22</sup> An additional 25 to 40 million people would be displaced from coasts due to sea level rise, an additional 1200 to 3000 million would suffer an increase in water stress and 65 countries would lose 16% of their agricultural GDP.<sup>23</sup>

Based on the severe impacts already observed as well as future impacts and risks posed by additional warming to which we are committed due to inertia in the climate system, climatologists are increasingly concluded that current climate conditions already constitute DAI and that greenhouse gas emissions ultimately must be drawn down to net negative levels through the rapid phase-out of coal and improved forest and agricultural management.<sup>24</sup> Atmospheric concentrations of CO<sub>2</sub> have risen from a pre-industrial

---

*2°C Target Mean for Greenhouse Gas Concentrations?*, Meinshausen notes that 550 CO<sub>2</sub> eq roughly corresponds to a stabilization of 475 ppm CO<sub>2</sub> only. *Id.* at 269. In a second paper that appears to utilize the same assumptions, Meinshausen notes that 500 CO<sub>2</sub> eq is approximately equivalent to 450 ppm CO<sub>2</sub> stabilization, 450 CO<sub>2</sub> eq is approximately equivalent to 400 ppm CO<sub>2</sub> stabilization, and 400 CO<sub>2</sub> eq is approximately equivalent to 350-375 ppm CO<sub>2</sub> stabilization; Union of Concerned Scientists, *How to Avoid Dangerous Climate Change: A Target for U.S. Emissions* (Sept. 2007) at 3.

<sup>22</sup> *Id.* at 99.

<sup>23</sup> *Id.* at 96-97.

<sup>24</sup> James Hansen et al., *Target Atmospheric CO<sub>2</sub>: Where Should Humanity Aim?* 2 OPEN ATMOSPHERIC SCIENCE J. 217, 226-27 (2008); see also Matthews H.D. & Caldeira, K., *Stabilizing the Climate Requires Near-Zero Emissions*, 35 GEOPHYSICAL RESEARCH LETTERS L04705 (2008) (“future anthropogenic emissions would need to be eliminated in order to stabilize global-mean temperature.”).

concentration of 280 ppm to 383 ppm in 2007.<sup>25</sup> Annual mean global temperature has increased by 0.76°C relative to pre-industrial times and is increasing at a rate of 0.17°C/decade.<sup>26</sup> Impacts from this anthropogenic interference with the climate has already resulted in tens of thousands of climate-related deaths, species extinction, ocean acidification and loss of coral reefs, and the significant retreat of glaciers and sea ice. In addition to the impacts already observed, additional warming “in the pipeline” due to inertia in the climate system and their feedback loops will result in further increases in temperature posing significant risks of severe and irreversible impacts.<sup>27</sup> The climate is locked into anywhere from 0.3 to 0.7°C additional warming relative to late 20th century levels due to the eventual impacts of past historical emissions.<sup>28</sup> On account of additional warming to which we are committed, Ramanathan and Feng found that there is a “high probability that the DAI threshold is already in our rearview mirror.”<sup>29</sup> Similarly, on the basis of paleoclimate evidence and ongoing climate change, James Hansen and other leading climate scientists concluded the present CO<sub>2</sub> levels of 385 ppm are “already in the dangerous zone” and that “[i]f humanity wishes to preserve a planet similar to that on which civilization developed and to which life on Earth is adapted, paleoclimate evidence and ongoing climate change suggest that CO<sub>2</sub> will need to be reduced from its current 385 ppm to at most 350 ppm, but likely less than that.”<sup>30</sup> In looking at dangerous climate change through the lens of risk tolerance, Harvey concluded that, at a 10% risk tolerance, atmospheric CO<sub>2</sub> concentrations close to present levels “violates the UNFCCC” for a range of assumptions of climate sensitivity.<sup>31</sup> Accordingly, as the climate change to which we are committed is already dangerous, there is little scientific basis to conclude that any new source of emissions is innocuous.

## 2. Conclusion

The Center appreciates SCAQMD’s continued work to develop a threshold of significance for GHGs. The Center urges SCAQMD to apply the data derived from the Work Plan in a manner that is consistent with the scientific and factual data on the emission reductions necessary to avoid DAI. *See* Guidelines § 15064(h). Given the

severe and irreversible impacts resulting from a 2°C mean global temperature rise and the significant risk that this temperature would increase beyond 2°C at GHG levels of 450 ppm, a stabilization objective of 450 ppm CO<sub>2</sub>eq is far in excess of what can be considered safe. Accordingly, setting a threshold based on consistency with a 450 ppm stabilization target is inconsistent with CEQA's purpose to "identify any critical thresholds for the healthy and safety of people of the state." Pub. Res. Code § 21000(d). Because the 90% capture rate is based on the outdated presumption that compliance with Executive Order S-3-05 targets is sufficient to avoid dangerous climate change, SCAQMD should adopt a threshold for residential and commercial projects that captures a higher percentage of emissions and requires projects with emissions below this threshold to comply with performance standards.<sup>32</sup>

Thank you for your consideration. Please do not hesitate to contact Matthew Vespa at (415) 436-9682 x309 [mvespa@biologicaldiversity.org](mailto:mvespa@biologicaldiversity.org) if you have any questions or concerns.

Michael Krause

---

<sup>32</sup> The 90% capture rate used for SCAQMD's industrial threshold purportedly reflected the practical concern that minimal mitigation was available for the types of projects (such as boilers) that fell under this threshold. These concerns do not apply to residential and commercial structures, where any number of mitigation measures are available for all sizes of projects to reduce GHG emissions.

## **From the 2016 California Democratic Party (CDP) Platform**

### **Transportation**

- Support vehicle regulations to provide healthier air for all Californians, support strong and workable low-emission and zero-emission vehicle standards that will continue to be a model for the country, support Clean Vehicle Incentive programs to include the installation of charging infrastructure, and provide assistance to small businesses to meet the low-emission standards;
- Demand Regional Transportation Plan (RTP) driving-reduction targets, shown by science to support climate stabilization;
- Work for equitable and environmentally-sound road and parking operations; Support strategies to reduce driving, such as smart growth, “complete streets”; teaching bicycling traffic skills; and improving transit, from local systems to high speed rail
- Work for shared, convenient and value-priced parking, operated with a system that provides earnings to those paying higher costs or getting a reduced wage, due to the cost of providing the parking; and,
- Demand a state plan showing how cars and light-duty trucks can hit climate-stabilizing targets, by defining enforceable measures to achieve the needed fleet efficiency and per-capita driving;
- Support policies, including tax policies and the use of Greenhouse Gas Reduction Fund (GGRF) grants, that empower business owners, especially small business owners, to make investments in transportation infrastructure to ensure that freight moves by lower-emission local, short-line freight railroads, instead of adding to highway congestion and pollution.

# Climate-Stabilizing, California Light-Duty Vehicle Requirements, Versus Air Resource Board Goals

Paper 881

**Mike R. Bullock**

Retired Satellite Systems Engineer, 1800 Bayberry Drive, Oceanside, CA 92054

## ABSTRACT

An Introduction is provided, including the importance of light-duty vehicles (LDVs: cars and light duty trucks) and a definition of the top-level LDV requirements to limit their carbon dioxide (“CO<sub>2</sub>”) emissions.

Anthropogenic climate change fundamentals are presented, including its cause, its potential for harm, California mandates, and a greenhouse gas (GHG) reduction road map to avoid disaster.

A 2030 climate-stabilizing GHG reduction target value is calculated, using statements by climate experts. The formula for GHG emissions, as a function of per-capita driving, population, fleet CO<sub>2</sub> emissions per mile, and the applicable low-carbon fuel standard (LCFS) is given. The ratio of the 2015 value of car-emission-per-mile to the 2005 value of car-emission-per-mile is obtained.

Internal Combustion Engine (ICE) mileage values from 2000 to 2030 are identified, as either mandates or new requirements. A table is presented that estimates 2015 LDV fleet mileage.

Zero Emission Vehicle (ZEV) parameters are given. A table is shown that uses 2030 ZEV and ICE (ICE LDVs) requirements, named the “Heroic Measures” case, to compute the LDV fleet-equivalent mileage. That equivalent fleet mileage is used, with population and the required emission reduction, to compute a required per-capita driving reduction, with respect to 2005. Measures to achieve this per-capita driving reduction are described, with reductions allocated to each measure. The energy used per year for the Heroic Measures case is estimated

The “Heroic Measures” set of fractions of ZEV’s purchased, as a function of year, is compared to the California Air Resources Board (CARB) goals.

## INTRODUCTION

Within the context of working the anthropogenic-climate-change problem and from a systems engineering perspective, the top-level requirement is to reduce greenhouse gas (GHG) emissions enough to support stabilizing our climate at a livable level. This top-level requirement must flow down to the subsystem of LDVs, especially due to the magnitude of their emissions. (As an example, LDVs emit 41% of the GHG in San Diego County<sup>1</sup>.)

More specifically, LDV requirements will be identified that, taken together, will result in GHG emission reductions sufficient to “support climate stabilization”. “Support climate stabilization” means that the LDV emission level will be equal to a climate-stabilizing target. Such a target is expressed as an emission level in some target year. The target is based on climate science.

From a systems engineering perspective, at the top level, the needed LDV requirements are

- LDV fleet efficiency, meaning the greenhouse gas (GHG) emissions per mile driven, applicable to the entire fleet, on the road in the year of interest and
- an upper bound on per-capita driving, given the derived fleet efficiency and the predicted population growth.

The fleet efficiency requirement will be developed as a function of lower-level requirements, such as Corporate Average Fuel Efficiency (CAFÉ) requirements, requirements on how fast Battery Electric Vehicles (BEVs) must be added into the fleet each year, and requirements to get low-efficiency vehicles off the roads. The second top-level requirement, the upper bound on per-capita driving, will spawn transportation-system requirements designed to result in less driving, such as better mass transit. This paper will derive a formulae to compute the required per-capita driving levels, based on fleet efficiency, predicted population growth, and the latest, science-based, climate-stabilizing GHG emission target.

In this work, three categories of LDV emission-reduction strategies will be considered: cleaner cars, cleaner fuels, and less driving.

## **BACKGROUND: OUR ANTHROPOGENIC CLIMATE CHANGE PROBLEM**

### **Purpose of This Section**

Before going to work to solve a systems-engineering problem, it is important to understand the nature of the problem. How complex is the problem? How much is at stake if the problem is not solved? Is it reasonable to take a chance and only solve the problem with a reasonably high probability or is there too much at stake to gamble? This section is an attempt to answer these questions.

### **Basic Cause**

Anthropogenic climate change is driven by these two processes<sup>2</sup>: First, our combustion of fossil fuels is adding “great quantities” of CO<sub>2</sub> into our atmosphere. Second, that additional atmospheric CO<sub>2</sub> is trapping additional heat.

### **California’s First Three Climate Mandates**

California’s Governor’s Executive Order S-3-05<sup>3</sup> is similar to the Kyoto Agreement and is based on the greenhouse gas (GHG) reductions that were recommended by climate scientists for industrialized nations back in 2005. In 2005, many climate scientists believed that the reduction-targets of S-3-05 would be sufficient to support stabilizing Earth’s climate at a livable level, with a reasonably high level of certainty. More specifically, this executive order aims for an average, over-the-year, atmospheric temperature rise of “only” 2 degree Celsius, above the preindustrial temperature. It attempts to do this by limiting our earth’s level of atmospheric CO<sub>2</sub>\_e to 450 PPM by 2050 and then reducing emissions further, so that atmospheric levels would come down to more tolerable levels in subsequent years. The S-3-05 emission targets are 2000 emission levels by 2010, 1990 levels by 2020, and 80% below 1990 levels by 2050.

It was thought that if the world achieved S-3-05, there might be a 50% chance that the maximum temperature rise will be less than 2 degrees Celsius, thus leaving a 50% chance that it would be larger than 2 degrees Celsius. A 2 degree increase would put over a billion people on the planet into a condition described as “water stress” and it would mean a loss of 97% of the earth’s coral reefs.

There would also be a 30% chance that the temperature increase would be greater than 3 degrees Celsius. A temperature change of 3 degree Celsius is described in Reference 3 as being “exponentially worse” than a 2 degree Celsius increase.

The second California climate mandate is AB 32, the *Global Warming Solutions Act of 2006*. It includes provisions for a cap and trade program, to ensure meeting S-3-05’s 2020 target of the 1990 level of emissions. It continues after 2020. AB 32 requires CARB to always implement measures that achieve the maximum *technologically feasible and cost-effective* (words taken from AB 32) greenhouse-gas-emission reductions.

In 2015 Governor Brown signed Executive Order B-30-15. This Executive Order established a mandate to achieve an emission level of 40% below 2020 emissions by 2030, as can be seen by a Google search. If Executive Order S-3-05 is interpreted as a straight line between its 2020 target and its 2050 target, then the B-30-15 target of 2030 is the same as S-3-05’s implied target of 2035, because 2035 is halfway between 2020 and 2050 and 40% down is halfway to 80% down.

California is on track to achieve its S-3-05 second (2020) target. However, the world emission levels have, for most years, been increasing, contrary to the S-3-05 trajectory. In part because the world has been consistently failing to follow S-3-05’s 2010-to-2020 trajectory, if California is still interested in leading the way to stabilizing the climate at a livable level, it must do far better than S-3-05, going forward, as will be shown.

## **Failing to Achieve these Climate Mandates**

What could happen if we fail to achieve S-3-05, AB 32, and B-30-15 or if we achieve them but they turn out to be too little too late and other states and countries follow our example?

It has been written<sup>4</sup> that, “A recent string of reports from impeccable mainstream institutions-the International Energy Agency, the World Bank, the accounting firm of PricewaterhouseCoopers-have warned that the Earth is on a trajectory to warm by at least 4 Degrees Celsius and that this would be incompatible with continued human survival.”

It has also been written<sup>5</sup> that, “Lags in the replacement of fossil-fuel use by clean energy use have put the world on a pace for 6 degree Celsius by the end of this century. Such a large temperature rise occurred 250 million years ago and extinguished 90 percent of the life on Earth. The current rise is of the same magnitude but is occurring faster.”

## **Pictures That Are Worth a Thousand Words**

Figure 1 shows (1) atmospheric CO<sub>2</sub> (in blue) and (2) averaged-over-a-year-then-averaged-over-the-surface-of-the-earth world atmospheric temperature (in red). This temperature is with respect to a recent preindustrial value. The data starts 800,000 years ago. It shows that the current value of atmospheric CO<sub>2</sub>, which is now over 400 PPM, far exceeds the values of the last 800,000 years. It

also shows that we should expect the corresponding temperature to eventually be about 12 or 13 degrees above preindustrial temperatures. This would bring about a human disaster<sup>3,4,5</sup>.

Figure 2 shows the average yearly temperature with respect to the 1960-to-1990 baseline temperature (in blue). It also shows atmospheric levels of CO<sub>2</sub> (in red). The S-3-05 goal of 450 PPM is literally “off the chart”, in Figure 2. Figure 2 shows that, as expected, temperatures are starting to rise along with the increasing levels of CO<sub>2</sub>. The large variations in temperature are primarily due to the random nature of the amount of solar energy being received by the earth.

## **FURTHER BACKGROUND: CALIFORNIA’S SB 375 AND AN IMPORTANT DATA SET**

As shown in the Introduction, LDVs emit significant amounts of CO<sub>2</sub>. The question arises: will driving need to be reduced or can cleaner cars and cleaner fuels arrive in time to avoid such behavioral change? Steve Winkelman, of the Center for Clean Air Policy (CCAP), worked on this problem.

### **SB 375, the *Sustainable Communities and Climate Protection Act of 2008***

Under SB 375, the California Air Resources Board (CARB) has given each Metropolitan Planning Organization (MPO) in California driving-reduction targets, for the years 2020 and 2035. “Driving” means yearly, per capita, vehicle miles travelled (VMT), by LDVs, with respect to 2005. The CARB-provided values are shown at this Wikipedia link, [http://en.wikipedia.org/wiki/SB\\_375](http://en.wikipedia.org/wiki/SB_375). It is important to note that although this link and many other sources show the targets to be “GHG” and not “VMT”, SB 375 clearly states that the reductions are to be the result of the MPO’s Regional Transportation Plan (RTP), or, more specifically, the Sustainable Communities Strategy (SCS) portion of the RTP. Nothing in the SCS will improve average mileage. That will be done by the state and federal government by their Corporate Average Fleet Efficiency (CAFE) standards. The SCS can only reduce GHG by reducing VMT. The only way an SCS can reduce GHG by 12%, for example, is to reduce VMT by 12%.

Under SB 375, every Regional Transportation Plan (RTP) must include a section called a Sustainable Communities Strategy (SCS). The SCS must include driving reduction predictions corresponding to the CARB targets. Each SCS must include only *feasible* transportation, land use, and transportation-related policy data. If the SCS driving-reduction predictions fail to meet the CARB-provided targets, the MPO must prepare an Alternative Planning Strategy (APS). An APS uses *infeasible* transportation, land use, and transportation-related policy assumptions. The total reductions, resulting from both the SCS and the APS, must at least meet the CARB-provided targets.

### **Critical Data: Useful Factors from Steve Winkelman’s Data**

Figure 3<sup>6</sup> shows 6 variables as a percent of its 2005 value. The year 2005 is the baseline year of SB 375. The red line is the Caltrans prediction of VMT. The purple line is California’s current mandate for a Low Carbon Fuel Standard (LCFS). As shown, by 2020, fuel in California must emit 10% less per gallon than in 2005. The turquoise line is the 1990 GHG emission in California. As shown, it is 12% below the 2005 level. This is important because S-3-05 specifies that in 2020, state GHG emission levels must be at the

1990 level. The green line is the CO<sub>2</sub> emitted per mile, as specified by AB 1493, also known as “Pavley 1 and 2” named after Senator Fran Pavley. The values shown do not account for the LCFS. The yellow (or gold) line is the S-3-05 mandate, referenced to 2005 emission levels. The blue line is the product of the red, the purple, and the green line and is the percentage of GHG emissions compared to 2005. Since VMT is not being adequately controlled, the blue line is not achieving the S-3-05 line. Figure 3 shows that driving must be reduced. For this reason, Steve Winkelman can be thought of as the true father of SB 375.

**Figure 1. Atmospheric CO<sub>2</sub> and Mean Temperature from 800,000 Years Ago**

**Figure 2. Atmospheric CO<sub>2</sub> and Mean Temperature, Over the Last 1,000 Years**

This table provides inspiration for a road map to climate success for LDVs. Climate stabilization targets must be identified and achieved by a set of requirements to define fleet efficiency and per-capita driving.

**Figure 3**      **The S-3-05 Trajectory (the Gold Line) AND the CO<sub>2</sub> Emitted from Personal Driving (the Blue Line), where that CO<sub>2</sub> is a Function (the Product) of the California-Fleet-Average CO<sub>2</sub> per Mile (the Green Line), The Predicted Driving (VMT, the Red Line), and the Low-Carbon Fuel Standard (the Purple Line)**

## THE DEVELOPMENT OF CALIFORNIA'S TOP-LEVEL LDV REQUIREMENTS TO SUPPORT CLIMATE STABILIZATION

It is also clear that cleaner cars will be needed and can probably be achieved. As will be seen, much cleaner cars will be needed if driving reductions are going to remain within what many people would consider achievable. Mileage and equivalent mileage will need to be specified. A significant fleet-fraction of Zero-Emission Vehicles (ZEVs, either Battery-Electric LDVs or Hydrogen Fuel Cell LDVs) will be needed. Since mileage and equivalent mileage is more heuristic than emissions per mile, they will be used instead of CO<sub>2</sub> per mile driven.

Since the SB-375 work used 2005 as the reference year, it will remain the reference year here.

## GHG Target to Support Climate Stabilization

The primary problem with S-3-05 is that California's resolve and actions have been largely ignored by other states, our federal government, and many countries. Therefore, rather than achieving 2000 levels by 2010 and being on a track to achieve 1990 levels by 2020, world emission have been increasing. Reference 7 states on Page 14 that the required rate of reduction, if commenced in 2020,

would be 15%. That rate means that the factor of 0.85 must be achieved, year after year. If this were done for 10 years, the factor would be  $(0.85)^{10} = 0.2$ . We don't know where world emissions will be in 2020. However, it is fairly safe to assume that California will be emitting at its 1990 level in 2020, in accordance with S-3-05. This situation shows that the correct target for California is to achieve emissions that are reduced to 80% below California's 1990 value by 2030. Note that if the reductions start sooner, the rate of reduction of emissions can be less than 15% and the 2030 target could be relaxed somewhat. However, it is doubtful that the world will get the reduction rate anywhere near the needed 15% by 2020. Therefore, the target, of 80% below 1990 levels by 2030 is considered to be correct for California. Reference 7 also calls into question the advisability of aiming for a 2 degree Celsius increase, given the possibilities of positive feedbacks that would increase warming. This concern for positive feedbacks is another reason that this paper will work towards identifying LDV requirement sets that will support achieving 80% below 1990 values by 2030.

## Notes on Methods

The base year is 2005. An intermediate year of 2015 is used. The car efficiency factor of 2015 with respect to 2005 is taken directly from Figure 3. The car efficiency factor of 2030 with respect to 2015 is derived herein, resulting in a set of car-efficiency requirements. It is assumed that cars last 15 years.

## Primary Variable Used

Table 1 defines the primary variables that are used.

**Table 1 Variable Definitions**

| <b>Variable Definitions</b> |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| $e_k$                       | LDV Emitted CO <sub>2</sub> , in Year “ $k$ ”                                                                                         |
| $L_k$                       | Low Carbon Fuel Standard (LCFS) Factor that reduces the Per-Gallon CO <sub>2</sub> emissions, in Year “ $k$ ”                         |
| $C_k$                       | LDV CO <sub>2</sub> emitted per mile driven, average, in Year “ $k$ ”, not accounting for the Low Carbon Fuel Standard (LCFS) Factor  |
| $c_k$                       | LDV CO <sub>2</sub> emitted per mile driven, average, in Year “ $k$ ”, accounting for the Low Carbon Fuel Standard (LCFS) Factor      |
| $p_k$                       | Population, in Year “ $k$ ”                                                                                                           |
| $d_k$                       | Per-capita LDV driving, in Year “ $k$ ”                                                                                               |
| $D_k$                       | LDV Driving, in Year “ $k$ ”                                                                                                          |
| $M_k$                       | LDV Mileage, miles per gallon, in Year “ $k$ ”                                                                                        |
| $m_k$                       | LDV Equivalent Mileage, miles per gallon, in Year “ $k$ ” accounting for Low Carbon Fuel Standard (LCFS) Factor, so this is $M_k/L_k$ |
| N                           | Number of pounds of CO <sub>2</sub> per gallon of fuel but not accounting for the Low Carbon Fuel Standard (LCFS) Factor              |

## Fundamental Equations

The emissions are equal to the CO2 per mile multiplied by the per-capita driving multiplied by the population, since per-capita driving multiplied by the population is total driving. This is true for any year.

$$\text{Future Year } k: \quad e_k = c_k * d_k * p_k \quad (\text{Eq. 1})$$

$$\text{Base Year } i: \quad e_i = c_i * d_i * p_i \quad (\text{Eq. 2})$$

Dividing both sides of Equation 1 by equal values results in an equality. The terms on the right side of the equation can be associated as shown here:

$$\frac{e_k}{e_i} = \frac{c_k}{c_i} * \frac{d_k}{d_i} * \frac{p_k}{p_i} \quad (\text{Eq. 3})$$

Since carbon dioxide emitted per gallon is just a constant (about 20 pounds per gallon), the constant cancels out of the ratio of emissions per mile, leaving the following relationship.

$$\text{To work with mileage:} \quad \frac{m_i}{m_k} = \frac{c_k}{c_i} \quad (\text{Eq. 4})$$

Putting Equation 4 into Equation 3 results in the following equation:

$$\frac{e_k}{e_i} = \frac{m_i}{m_k} * \frac{d_k}{d_i} * \frac{p_k}{p_i} \quad (\text{Eq. 5})$$

Showing the base year of 2005, the future year of 2030, introducing the intermediate year of 2015 and the year of 1990 (since emissions in 2030 are with respect to the 1990 value) results in Equation 6.

$$\frac{e_{2030}}{e_{1990}} * \frac{e_{1990}}{e_{2005}} = \frac{c_{2030}}{c_{2015}} * \frac{c_{2015}}{c_{2005}} * \frac{d_{2030}}{d_{2005}} * \frac{p_{2030}}{p_{2005}} \quad (\text{Eq. 6})$$

The ratio on the far left is the climate-stabilizing target, which is the factor of the 2030 emission to the 1990 emission. It is shown to be 0.20 or 80% less. The next ratio is the emission of 1990 compared to 2005. It is the turquoise line of Figure 3, which is 0.87. The first ratio on the right side of the equation is the fleet emission per mile in 2030 compared to the value in 2015. This ratio will be derived in this report and it will result in a set of car efficiency requirements. Moving to the right, the next ratio is the car efficiency in 2015 compared to 2005. It can be obtained by multiplying the purple line 2015 value times the green line 2015 value, which is 0.90 \* 0.93. The next term is the independent variable. It is the driving reduction required, compared to the 2005 level of driving. The final term on the far right is the ratio of the population in 2030 to the population in 2005. Reference 8 shows that California's population in 2005 was 35,985,582. Reference 9 shows that California's population in 2030 is predicted to be 44,279,354. Therefore,

$$\frac{p_{2030}}{p_{2005}} = 44279354 \div 35985582 = 1.2305 \quad (\text{Eq. 7})$$

Putting in the known values results in Equation 8:

$$0.20 * 0.87 = \frac{c_{2030}}{c_{2015}} * 0.90 * 0.93 * \frac{d_{2030}}{d_{2005}} * 1.2305 \quad (\text{Eq. 8})$$

Combining the values, solving for the independent variable (the per-capita driving ratio), and changing from emission-per-mile to equivalent-miles-per-gallon results in the following:

$$\frac{d_{2030}}{d_{2005}} = 0.1689 * \frac{m_{2030}}{m_{2015}} \quad (\text{Eq. 9})$$

With the coefficient being so small, it is doubtful that we can get the equivalent mileage in 2030 to be high enough to keep the driving ratio from falling below one. The mileage of the 2005 fleet will be based on the best data we can get and by assuming cars last 15 years. The equivalent mileage in 2030 will need to be as high as possible to keep the driving-reduction factor from going too far below 1, because it is difficult to reduce driving too much. The equivalent mileage will be dependent on the fleet-efficiency requirements in the near future and going out to 2030. Those requirements are among the primary results of this report.

### Internal Combustion Engine (ICE) Mileage, from Year 2000 to Year 2030

The years from 2000 to 2011 are taken from a plot produced by the PEW Environment Group, [http://www.pewenvironment.org/uploadedFiles/PEG/Publications/Fact\\_Sheet/History%20of%20Fuel%20Economy%20Clean%20Energy%20Factsheet.pdf](http://www.pewenvironment.org/uploadedFiles/PEG/Publications/Fact_Sheet/History%20of%20Fuel%20Economy%20Clean%20Energy%20Factsheet.pdf)

The plot is shown here as Figure 4. The “Both” values are used.

The values from 2012 to 2025 are taken from the US Energy Information Agency (EIA) as shown on their website, [http://www.eia.doe.gov/federal/executive/vehicle-standards#ldv\\_2012\\_to\\_2025](http://www.eia.doe.gov/federal/executive/vehicle-standards#ldv_2012_to_2025). They are the LDV Corporate Average Fleet Efficiency (CAFE) values enacted into law in the first term of President Obama. From 2025 to 2030, it is assumed that the yearly ICE improvement in CAFE will be 2.5 MPG.

### Mileage of California’s LDV Fleet in 2015

Table 2 uses these values of the Internal Combustion Engine (ICE) LDV mileage to compute the mileage of the LDV fleet in 2015. It assumes that the fraction of ZEVs being used over these years is small enough to be ignored. The 100 miles driven, nominally, by each set of cars, is an arbitrary value and inconsequential in the final calculation, because it will divide out. It is never-the-less used, so that it is possible to compare the gallons of fuel used for the different years. The “f” factor could be used to account for a set of cars being driven less. It was decided to not use this option by setting all of the values to 1. The Low Carbon Fuel Standard (LCFS) values are taken from Figure 3. The gallons of fuel are computed as shown in Equation 10, using the definition for  $L_k$  that is shown in Table 1.

**Table 2 Calculation of the Fleet MPG for 2015**

| LDV Set                       | Years Old | Model Year | CAFE MPG | LCFS Factor $L_{Year}$ | Factor Driven f | Gallons Used Per f*100 Miles |
|-------------------------------|-----------|------------|----------|------------------------|-----------------|------------------------------|
| 1                             | 14-15     | 2001       | 24.0     | 1.0                    | 1.0             | 4.17                         |
| 2                             | 13-14     | 2002       | 24.0     | 1.0                    | 1.0             | 4.17                         |

| Sum of Gallons:               |           |            |          |                        |                 | 54.29                        |
| Miles = 100*Sum(f's):         |           |            |          |                        |                 | 1500                         |
| MPG = Miles/(Sum of Gallons): |           |            |          |                        |                 | 27.63                        |

$$\text{Gallons Used per } f * 100 \text{ miles} = \frac{f \times 100}{(CAFE \text{ MPG}) / L_k} \quad (\text{Eq. 10})$$

**How ICE Mileage Values Will Be Used with ZEV Equivalent Mileage Values**

As will be seen, after 2015, the net (computed using both ICEs and ZEVs) mileage values for each year are assumed to greatly improve by having a significant fraction of ZEVs. The ICE CAFÉ standards are used in this report as just the ICE contribution to fleet MPG. The ICE MPG values are inadequate by themselves and will therefore need to become less important because ZEVs will need to quickly take over the highways.

Federal requirements will need to change dramatically. Currently, federally-mandated corporate average fuel efficiency (CAFÉ) standards have been implemented, from 2000 to 2025. These standards require that each corporation produce and sell their fleet of cars and light-duty trucks in the needed proportions, so that the combined mileage of the cars they sell, at least meet the specified mileage.

The car companies want to maximize their profits while achieving the required CAFÉ standard. In California, the car companies will already be required to sell a specified number of electric vehicles, which have a particularly-high, equivalent-value of miles-per-gallon. If the laws are not changed, this will allow these companies to sell more low-mileage, high profit cars and light-duty trucks, and still achieve the federal CAFÉ standard.

It will be better to apply the CAFÉ standards to only the ICEs and then require that the fleet of LDVs sold achieve some mandated fraction of ZEVs. The ZEVs will get better and better equivalent mileage, as our electrical grid is powered by more renewable sources of energy. Therefore, their equivalent mileage is not fixed, but will improve over the years. Requirements developed here are for 2030. Therefore a high percentage of all the electricity generated in the state, including both the “in front of the meter” (known as the “Renewable Portfolio Standard” or “RPS”) portion and the “behind the meter” portion is assumed to come from sources that do not emit CO<sub>2</sub>. More specifically, the value of 80% is assumed. This therefore becomes a fleet-efficiency requirement.

## ZEV Equivalent Mileage Values

To calculate the mileage of the 2030 fleet of LDVs, it is necessary to derive a formula to compute the equivalent mileage of ZEVs, as a function of the percent of electricity generated without emitting CO<sub>2</sub>, the equivalent ZEV mileage if the electricity is from 100% fossil fuel, and the equivalent ZEV mileage if the electricity is from 100% non-CO<sub>2</sub> sources. The variables defined in Table 3 are used.

The derivation of the equation for equivalent ZEV mileage is based on the notion that the ZEV can be imagined to travel “r” fraction of the time on electricity generated from renewables and “(1-r)” fraction of the time on fossil fuel. If the vehicle travels “D” miles, then, using the definitions shown in Table 3, the following equation can be written.

$$G = \frac{r \times D}{m_{zr}} + \frac{(1-r) \times D}{m_{zf}} \quad (\text{Eq. 11})$$

$$m_z = D/G = D / \left( \frac{r \times D}{m_{zr}} + \frac{(1-r) \times D}{m_{zf}} \right) \quad (\text{Eq. 12})$$

Dividing the numerator and the denominator by D and multiplying them both by the product of the two equivalent mileage values results in Equations 13.

$$m_z = m_{zr} \times m_{zf} / (r \times m_{zf} + (1-r) \times m_{zr}) \quad (\text{Eq. 13})$$

Again, using the definitions in Table 3 results in the following.

$$m_z = \text{Num}/(\text{Den}) \quad (\text{Eq. 14})$$

**Table 3 Variables Used in the Calculation of ZEV Equivalent Mileage**

| <b>Variable</b> | <b>Definition</b>                                                      |
|-----------------|------------------------------------------------------------------------|
| $m_z$           | <b>ZEV Equivalent mileage</b>                                          |
| $m_{zr}$        | <b>ZEV Equivalent mileage if the electricity is from renewables</b>    |
| $m_{zf}$        | <b>ZEV Equivalent mileage if the electricity is from fossil fuels</b>  |
| $r$             | <b>fraction of electricity generated from sources not emitting CO2</b> |
| $G$             | <b>Gallons of equivalent fuel used</b>                                 |
| $D$             | <b>Arbitrary distance travelled</b>                                    |
| $Num$           | $m_{zr} \times m_{zf}$                                                 |
| $Den$           | $r \times m_{zf} + (1 - r) \times m_{zr}$                              |

Table 4 shows an assignment of assumed values and the result of a calculation, using Equations 13, 14, and the definitions in Table 3, to produce a ZEV equivalent mileage.

**Table 4 Variable Assignment and the Resulting ZEV Mileage**

| $m_{zr}$    | $m_{zf}$  | $r$        | $1-r$      | Num              | Den            | $m_z$         |
|-------------|-----------|------------|------------|------------------|----------------|---------------|
| <b>5000</b> | <b>70</b> | <b>0.8</b> | <b>0.2</b> | <b>350000.00</b> | <b>1056.00</b> | <b>331.44</b> |

### Computing an LDV Fleet Mileage Assuming Heroic Measures (HM)

Table 5 shows the additional definitions that will be used in this calculation. Table 6 computes the 2030 LDV mileage, assuming “Heroic Measures” to reduce the miles driven in poor-mileage ICE’s, in building and selling a significant fraction of ZEVs, and in getting the Low Carbon Fuel Standards to continue to improve beyond the Figure 3 minimum of 0.90.

**Table 5 Additional Variables Used in the Calculation of 2030 LDV Mileage**

| <b>Variable</b> | <b>Definition</b>                                      |
|-----------------|--------------------------------------------------------|
| $D_i$           | <b>Distance travelled by ICE vehicles</b>              |
| $D_z$           | <b>Distance travelled by ZEVs</b>                      |
| $G_i$           | <b>Gallons of Equivalent fuel used by ICE vehicles</b> |
| $G_z$           | <b>Gallons of Equivalent fuel used by ZEVs</b>         |

As shown by the values for “f”, government policies must be adopted, in 2030, to reduce the miles driven by the ICE’s, from model years 2016 to 2023. The 2016 model ICE’s are driven only 30% as much as the nominal amount. The 2017 year ICE’s can be driving 10% more. This rate of change continues up to 2023, when the ICE’s are doing less damage, due to the large fraction of ZEVs on the road.

**Table 6 Calculation of 2030 LDV Mileage Assuming Heroic Measures**

| Year                                                             | ICE Parameters and Calculations |       |         |     |       |        | ZEVs |       |       | Yearly Totals |               |          |
|------------------------------------------------------------------|---------------------------------|-------|---------|-----|-------|--------|------|-------|-------|---------------|---------------|----------|
|                                                                  | CAFÉ MPG                        | LCFS  | Eq. MPG | f   | $D_i$ | $G_i$  | z    | $D_z$ | $G_z$ | Total Miles   | Total Gallons | 2030 MPG |
| 2016                                                             | 34.3                            | .9267 | 37.01   | .3  | 30.0  | .8105  | .04  | 4     | .012  | 32.8          | .7901         | 41.51    |
| 2017                                                             | 35.1                            | .9200 | 38.15   | .4  | 40.0  | 1.0484 | .07  | 7     | .021  | 44.2          | .9962         | 44.37    |

| 2030                                                             | 61.2                            | .8000 | 76.50   | 1.0 | 5.0   | .0654  | .99  | 99    | .299  | 100.0         | .3118         | 320.75   |
| Sum of Miles and then Gallons of Equivalent Fuel:                |                                 |       |         |     |       |        |      |       |       | 1259.00       | 11.34         |          |
| Equivalent MPG of LDV Fleet in 2030:                             |                                 |       |         |     |       |        |      |       |       | 111.03        |               |          |
| Sum of ZEV Miles = 865. Fraction of Miles Driven by ZEVs = 68.7% |                                 |       |         |     |       |        |      |       |       |               |               |          |

As shown, the ZEV fraction of the fleet assumes the value of 12%, just 2 years from now (shown in the green field.) It then proceeds upward, to 18% in 2019; 24% in 2020; 34% in 2021; and so on, until it reaches 99% by 2028.

Achieving these fractions of ZEVs might be compared to what was done during World War II, when automobile productions lines were rapidly converted to produce tanks. This reduced the new cars that could be purchased. Besides this, rationing gasoline made it difficult to drive at times and, due to shortages of leather, which was being used to produce boots for soldiers, some citizens found it hard to even buy shoes. These rapid and inconvenient changes were tolerated, because most people agreed that the war needed to be won. The heroic measures assumed here may not be possible unless citizens and the political leaders they elect understand the dire consequences of climate destabilization and therefore accept, and even demand, the measures that are needed to support climate stabilization.

The equivalent miles per gallon of the LDV fleet in 2030, specifically 111.03 miles per gallon, will be considered as a potential 2030 LDV requirement.

## Computing the Heroic-Measures (HM) Case Per-Capita and Net Driving Factor Requirements, Based on the Result Shown in Table 6

Plugging the

- equivalent MPG of the LDV fleet in Year 2030, taken from the bottom of Table 6, which is 111.03 MPG ( $m_{2030}$ ), and
- the MPG of the LDV fleet in Year 2015, taken from the bottom of Table 2, which is 27.63 MPG ( $m_{2015}$ ),

into Equation 9, gives the following result:

$$\frac{d_{2030}}{d_{2005}} = 0.1687 * \frac{m_{2030}}{m_{2015}} = 0.1687 * \frac{111.03}{27.63} = 0.68 \quad (\text{Eq. 14})$$

This means that the per-capita driving in 2030 will need to be about 32% less than in year 2005. The net driving can be computed by multiplying the per-capita driving, 0.68, by the population factor of 1.2305, computed in Equation 7, resulting in 0.84 (since  $0.68 \times 1.2305 = 0.84$ .) This means that, even with the 23% increase in California's population, the net driving will have to drop by 16%. If this LDV requirement set is selected, all of California's transportation money can be used to improve transit, improve active transportation (mainly walking and biking), and maintain, but not expand, roads. The good news is that there can be little or no congestion because highway capacity now is larger than it was in 2005. Policies will be needed to achieve the required reduction in driving.

## Case 2: Computing LDV Requirements that Support Climate Stabilization but Still Allow 2005 Per-Capita Driving

The first step is to use Equation 9 and the value of the mileage in 2015 to compute the needed LDV equivalent fleet mileage for 2030 if the left side of the equation is equal to 1.0.

$$m_{2030} = 1.0 \times m_{2015} / 0.1689 = 27.63 / 0.1689 = 163.59 \text{ MPG} \quad (\text{Eq. 15})$$

Table 7 is constructed, with the fraction of ZEVs selected to achieve the needed equivalent fleet mileage of about 163.59 MPG. Since its ZEV fractions are larger and sooner than in the "Heroic Measures" table, Table 7 is showing what has been called the "Extra-Heroic Measures" (EHM) case. The ICE "f" values are unchanged; as are the LCFS values. The EHM ZEV differences from the HM case are the highlighted "z" values.

This means that with the 23% increase in California's population, computed in Equation 7, the net driving would also increase by 23%. If this LDV requirement set were to be implemented, a lot of California's transportation money would be needed to expand the highway system, leaving less to improve transit, improve active transportation (mainly walking and biking), and maintain roads.

**Table 7 Calculation of 2030 LDV Mileage Assuming Extra-Heroic Measures**

| Year                                              | ICE Parameters and Calculations |       |         |     |       |       | ZEVs |       |       | Yearly Totals |               |          |
|---------------------------------------------------|---------------------------------|-------|---------|-----|-------|-------|------|-------|-------|---------------|---------------|----------|
|                                                   | CAFÉ MPG                        | LCFS  | Eq. MPG | f   | $D_i$ | $G_i$ | z    | $D_z$ | $G_z$ | Total Miles   | Total Gallons | 2030 MPG |
| 2016                                              | 34.3                            | .9267 | 37.01   | .3  | 30.0  | .8105 | .04  | 0     | .012  | 32.8          | .7901         | 41.51    |
| 2017                                              | 35.1                            | .9200 | 38.15   | .4  | 36.0  | .9436 | .10  | 10    | .030  | 46.0          | .9738         | 47.24    |
| 2018                                              | 36.1                            | .9133 | 39.53   | .5  | 35.0  | .8855 | .25  | 25    | .075  | 62.5          | 1.024         | 61.02    |
| 2019                                              | 37.1                            | .9000 | 40.92   | .6  | 30.0  | .7332 | .40  | 40    | .121  | 76.0          | 1.000         | 75.96    |
| 2020                                              | 38.3                            | .8500 | 42.56   | .7  | 21.0  | .4935 | .65  | 65    | .196  | 89.5          | .7718         | 115.96   |
| 2021                                              | 40.3                            | .8000 | 47.41   | .8  | 8.0   | .1687 | .90  | 90    | .272  | 98.0          | .4403         | 222.59   |

| Sum of Miles and then Gallons of Equivalent Fuel: |                                 |       |         |     |       |       |      |       |       | 1304.30       | 7.97          |          |
| Equivalent MPG of LDV Fleet in 2030:              |                                 |       |         |     |       |       |      |       |       | <b>163.59</b> |               |          |

### Comparing the ZEV Fraction Values of the “Heroic-Measures” (HM) Case to the “Extra-Heroic Measures” (EHM) Case

Table 8 shows the direct comparison of the ZEV fractions that are ZEV requirements for the HM Case and the EHM Case. The largest differences are highlighted. The EHM case does not appear to be achievable.

**Table 8 HM Case and the EHM Case Which Supports 2005 Per-Capita Driving**

| Cases | 2016 | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | 2023 | 2024 | 2025 | 2026 | 2027 | 2028 | 2029 | 2030 |
|-------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| HM    | .04  | .07  | .12  | .18  | .24  | .34  | .48  | .62  | .76  | .90  | .95  | .98  | .99  | .99  | .99  |
| EHM   | .04  | .10  | .25  | .40  | .65  | .90  | .95  | .95  | .98  | .98  | .99  | .99  | .99  | .99  | .99  |

## **ACHIEVING THE REQUIRED DRIVING REDUCTION OF THE HEROIC-MEASURES (HM) CASE**

As shown in Equation 14, in 2030, the per-capita driving will need to at least 32% below the 2005 value. As shown in this link, [http://en.wikipedia.org/wiki/SB\\_375](http://en.wikipedia.org/wiki/SB_375), California's Metropolitan Planning Organizations (MPOs) are adopting Region Transportation Plans (RTPs) that will achieve reductions in year 2020 and 2035. As also shown there, the targets, for year 2035, range from 0% for Shasta to 16% for Sacramento Area Council of Governments. Since this is for 2030 instead of 2035, and to be reasonably conservative, it is assumed here that the state will achieve a 10% reduction in per-capita driving, in 2030, compared to 2005. This leaves 22% to be achieved by new programs.

The title of each of the following subsections contains the estimated per-capita driving reduction each strategy will achieve, by 2030.

### **Reallocate Funds Earmarked for Highway Expansion to Transit and Consider Transit-Design Upgrades (3%)**

San Diego County has a sales tax measure called "TransNet", which allocates one-third for highway expansion, one-third for transit, and one-third for road maintenance. It has a provision that allows for a reallocation of funds, if supported by at least two-thirds of SANDAG Board members, including a so-called weighted vote, where governments are given a portion of 100 votes, proportional to their population. It is hereby proposed to reallocate the TransNet amount, earmarked for highway expansion, to transit and to do similar reallocations throughout California.

This money could be used to fund additional transit systems; improve transit operations; and/or the redesign and implementation of the redesign of existing transit systems. The redesign could include electrification and automation or even upgrading to a different technology.

### **A Comprehensive Road-Use Fee Pricing and Payout System to Unbundle the Cost of Operating Roads (7.5%)**

*Comprehensive* means that pricing would be set to cover all costs (including road maintenance and externalities such as harm to the environment and health); that privacy and the interests of low-income drivers doing necessary driving would be protected; that the incentive to drive fuel-efficient cars would be at least as large as it is under the current fuels excise tax; and, as good technology becomes available, that congestion pricing is used to protect critical driving from congestion.

The words *payout* and *unbundle* mean that some of the money collected would go to people that are losing money under the current system.

User fees (gas taxes and tolls) are not enough to cover road costs<sup>10</sup> and California is not properly maintaining its roads. Reference 10 shows that in California user fees amount to only 24.1% of what is spent on roads. Besides this, the improved mileage of the ICEs and the large number of ZEVs needed mean that gas tax revenues will drop precipitously.

This system could be used to help reduce the ICE LDV miles driven in 2016 to 2022, as shown in the "f" column of Tables 6 and 7. This system could probably be implemented in less than 5 years.

## **Unbundling the Cost of Car Parking (7.5%)**

Unbundling the cost of car parking<sup>11</sup> throughout California is conservatively estimated to decrease driving by 7.5%, based on Table 1 of Reference 11. That table shows driving reductions resulting from introducing a price for parking, for 10 cases. Its average reduction in driving is 25% and its smallest reduction is 15%.

## **Good Bicycle Projects and Bicycle Traffic Skills Education (3%)**

The best criterion for spending money for bicycle transportation is the estimated reduction in driving per the amount spent. The following strategies may come close to maximizing this parameter.

### ***Projects to Improve Bicycle Access***

All of the smart-growth neighborhoods, central business districts, and other high trip destinations or origins, both existing and planned, should be checked to see if bicycle access could be substantially improved with either a traffic calming project, a “complete streets” project, more shoulder width, or a project to overcome some natural or made-made obstacle.

### ***League of American Bicyclist Certified Instruction of “Traffic Skills 101”***

Most serious injuries to bike riders occur in accidents that do not involve a motor vehicle<sup>12</sup>. Most car-bike accidents are caused by wrong-way riding and errors in intersections; the clear-cut-hit-from-behind accident is rare<sup>12</sup>.

After attending *Traffic Skills 101*, students that pass a rigorous written test and demonstrate proficiency in riding in traffic and other challenging conditions could be paid for their time and effort.

As an example of what could be done in San Diego County, if the average class size was 3 riders per instructor and each rider passes both tests and earns \$100 and if the instructor, with overhead, costs \$500 dollars, for a total of \$800 for each 3 students, that would mean that \$160M could teach  $\$160\text{M}/\$800 = 200,000$  classes of 3 students, for a total of 600,000 students. The population of San Diego County is around 3 million.

## **Eliminate or Greatly Increase the Maximum Height and Density Limits Close to Transit Stops that Meet Appropriate Service Standards (2%)**

As sprawl is reduced, more compact, transit-oriented development (TOD) will need to be built. This strategy will incentivize a consideration of what level of transit service will be needed, how it can be achieved, and what levels of maximum height and density are appropriate. Having no limits at all is reasonable if models show that the development can function without harming the existing adjacent neighborhoods, given the level of transit service and other supporting transportation policies (such as car parking that unbundles the cost and supports the full sharing of parking<sup>11</sup>) that can be assumed.

## **Net Driving Reduction from All Identified Strategies**

By 2030, the sum of these strategies should be realized. They total 23%, resulting in a 1% margin over the needed 22% (which is added to the existing 10% to get the needed 32%).

## ADDITIONAL ELECTRICITY REQUIRED

The URL [http://www.energy.ca.gov/2013\\_energypolicy/documents/2013-06-26\\_workshop/presentations/09\\_VMT-Bob\\_RAS\\_21Jun2013.pdf](http://www.energy.ca.gov/2013_energypolicy/documents/2013-06-26_workshop/presentations/09_VMT-Bob_RAS_21Jun2013.pdf) shows that Californians drove about 325 Billion miles per year, from 2002 to 2011. This value can be multiplied by the 0.84 factor reduction of driving, computed right after the calculation shown in Equation 14, and the fraction of miles driven by ZEVs, shown at the bottom of Table 6, of 0.687 (from 68.7%), to give the 2030 miles driven by ZEVs = 325 Billion x 0.84 x 0.687 = 188 Billion miles per year.

Using the Tesla information here [http://en.wikipedia.org/wiki/Tesla\\_Roadster](http://en.wikipedia.org/wiki/Tesla_Roadster), it is assumed that 21.7 kW-h is used per 100 miles, or 0.217 kW-h per mile. The total energy used per year is therefore 188 Billion miles x 0.217 kW-h = 40,699 GW-h.

<http://www.cpuc.ca.gov/cfaqs/howhighiscaliforniaselectricitydemandandwheredoesthepowercomefrom.htm>, shows that California is using about 265,000 GW-h per year. Therefore the electricity needed to power California's HM ZEV LDF fleet in 2030 is 100% x 40,648/265,000 = 15.34% of the amount of electricity California is currently using. Table 4 shows that 80% (r = 0.80, with "r" defined in Table 3) of electricity must be generated without producing CO<sub>2</sub>. This estimated 15.34% increase in demand should help the California Public Utilities Commission (CPUC) and the California Energy Commission (CEC) with their planning.

## COMPARISON WITH CALIFORNIA AIR RESOURCES BOARD (CARB) PLANNING

The following quote<sup>13</sup> allows us to compare the CARB plan for LDVs with what would be required to stabilize the climate at a livable level, in the form of the Heroic Measures case:

*Regulations on the books in California, set in 2012, require that 2.7 percent of new cars sold in the state this year be, in the regulatory jargon, ZEVs. These are defined as battery-only or fuel-cell cars, and plug-in hybrids. The quota rises every year starting in 2018 and reaches 22 percent in 2025. Nichols wants 100 percent of the new vehicles sold to be zero- or almost-zero-emissions by 2030*

Table 9 shows the values implied by this statement and compares them to the HM values. Table 10, which is similar to Tables 6 and 7, computes the overall mileage of the 2030 fleet, using the CARB values.

### Computing the Heroic-Measures (HM) Case Per-Capita and Net Driving Factor Requirements, Based on the Result Shown in Table 10

Plugging the

- equivalent MPG of the LDV fleet in Year 2030, taken from the bottom of Table 10, which is 74.25 MPG, and
- the MPG of the LDV fleet in Year 2015, taken from the bottom of Table 2, which is 27.63 MPG,

into Equation 8, gives the following result:

$$\frac{d_{2030}}{d_{2005}} = 0.1687 * \frac{m_{2030}}{m_{2015}} = 0.1687 * \frac{74.25}{27.63} = 0.45 \quad (\text{Eq. 16})$$

**Table 9 Zero Emission Vehicle (ZEV) % of Fleet, for Two Cases**

| Year | CARB  | Heroic Measures | Year | CARB   | Heroic Measures |
|------|-------|-----------------|------|--------|-----------------|
| 2016 | 2.7%  | 4.0%            | 2024 | 19.6%  | 76.0%           |
| 2017 | 2.7%  | 7.0%            | 2025 | 22.0%  | 90.0%           |
| 2018 | 5.1%  | 12.0%           | 2026 | 37.6%  | 95.0%           |
| 2019 | 7.5%  | 18.0%           | 2027 | 53.2%  | 98.0%           |
| 2020 | 9.9%  | 24.0%           | 2028 | 68.8%  | 99.0%           |
| 2021 | 12.4% | 34.0%           | 2029 | 84.4%  | 99.0%           |
| 2022 | 14.8% | 48.0%           | 2030 | 100.0% | 99.0%           |
| 2023 | 17.2% | 62.0%           |      |        |                 |

This means that the per-capita driving will need to be about 55% less in 2030 than in year 2005. The net driving can be computed by multiplying the per-capita driving, 0.45, by the population factor of 1.2305, computed in Equation 7, resulting in 0.55. This means that, even with the 23% increase in California's population, the net driving will have to drop by 45%. If CARB wants the LDV sector to achieve a reasonable climate-stabilizing target, it will need to require ZEV adoption profile closer to the Heroic Measures Case. The adoption profile they have now will required a reduction in driving that will probably be very difficult to achieve.

## CONCLUSION

A requirement set named "Heroic Measures" (HM) is quantified. Table 8 shows that the HM LDV efficiency requirements are much easier to achieve than those needed to allow per-capita driving to remain close to its 2005 level, which has been quantified as the "Extra Heroic Measures Case". Strategies to achieve the required HM driving reductions are also allocated and described. They are perhaps about as difficult as achieving the HM LDV fleet efficiency. It is computed that the 2030 fleet of LDV HM ZEVs would require an amount of electricity which is equal to about 15% of what California is using today. The current CARB plan for ZEV adoption is shown to require a very large reduction in driving if LDVs are to achieve a climate-stabilizing target.

# Modern Roundabouts

Reduce congestion and improve safety on main roads

## What is a “Modern Roundabout?”

A modern roundabout is a circular intersection in which vehicles travel counterclockwise around a center island. Unlike large traffic circles or rotaries of the past, modern roundabouts are easy to navigate, environmentally friendly, attractive, and safe. Raised “splitter islands” induce arriving drivers to slow down prior to entering the intersection, and provide a refuge island for crossing pedestrians. Entering vehicles yield to traffic already in the roundabout.

Photo: SANDAG

## Why are roundabouts so much safer?

Roundabouts reduce both speed and the number of “conflict points,” from 32 to 8 (see figure).<sup>4</sup> Crashes in roundabouts are also less severe; converting intersections from signals to roundabouts reduces injury crashes by 80% and all crashes by 50%.<sup>4</sup> Severe injuries are rare; a study of 23 conversions found a 76% decrease in injury crashes and an 89% reduction in fatalities.<sup>5</sup> Bicyclists and pedestrians of different skills levels are safely accommodated in roundabouts, although visually impaired pedestrians may require special treatments.<sup>6</sup>

## How do roundabouts improve traffic flow?

Unlike signals, roundabouts keep traffic moving. Since the capacity of a street is greatly influenced by its intersections, reducing the number of stops increases road capacity, which improves traffic flow. As a result, fewer lanes are required, which has multiple safety, capacity, and cost benefits. On La Jolla Blvd. in San Diego (photos), five roundabouts allowed the City to shrink the street and widen the sidewalks, providing outdoor dining and meeting places, with less traffic noise.

## How do roundabouts improve air quality?

By reducing vehicle idling, roundabouts significantly decrease fuel consumption and emissions.

- On La Jolla Blvd. each roundabout is estimated to annually save 20,000 gallons of gasoline,<sup>1</sup> avoiding 9.9 lbs. of particulate pollution.<sup>2</sup>
- One roundabout can eliminate 189 metric tons of CO<sub>2</sub>e emissions annually, equivalent to 37 cars.<sup>1,3</sup>
- Installing 320 roundabouts in San Diego could reduce CO<sub>2</sub>e emissions by 60,480 metric tons annually — equal to the annual emissions of 10,900 cars.<sup>1,2</sup>

## How much do roundabouts cost?

As of 2014, the installation cost of a roundabout was around \$1 million, while traffic signals typically cost \$600,000. However, long-term costs for roundabouts are lower since little maintenance and no electricity are required. Costs of traffic crashes are also greatly reduced.

## Do drivers prefer roundabouts?

Until recently, roundabouts were unfamiliar to Americans. But drivers favor roundabouts once they become familiar with them. A 2002 study of roundabout conversions in three communities found that only 36% of drivers supported roundabouts before they were constructed, but 70% favored them one year after construction.<sup>8</sup>

# Traffic Circles

Reduce harmful emissions while improving neighborhoods

## What is a traffic circle?

Traffic circles (or “mini-roundabouts”) are circular intersection islands similar to modern roundabouts, usually installed in **2-lane streets**. Unlike with roundabouts, the approach islands (“splitter islands”) are painted rather than raised.<sup>1</sup>

Large vehicles such as buses and fire trucks can comfortably navigate traffic circles, improving safety and reducing noise on residential streets.

## How much do traffic circles improve safety?

The Institute of Transportation Engineers found traffic circles reduce intersection collisions 70%.<sup>5</sup> Similarly, the City of Seattle studied 130 sites and found a 73% decrease.<sup>6</sup> These results stem from the sideways routing (“horizontal deflection”) of the travel path, which eliminates dangerous crash types such as head-on, left turn, and right angle crashes,<sup>7</sup> and discourages speeding. In Portland, traffic circles virtually eliminated speeds over 35 mph, where before, 15% or more of traffic exceeded 35 mph.<sup>8</sup> Traffic circles are unexpected, so proper signage and markings are important.

Old and new traffic circles, in Del Mar and North Park, respectively.

## What are the main advantages of traffic circles?

Traffic circles are a relatively low-cost intervention to reduce traffic speeds and intersection crashes.<sup>2</sup> Although the geometry of the center island reduces speeds, it need not reduce the access of large trucks and emergency vehicles (above photo). To handle especially long trucks and busses, the center island typically includes a mountable “apron” less than four inches high that rear wheels can pass over.<sup>3</sup> However, the island must be large enough to prevent vehicles from making left turns in front of it. In addition to increasing safety, traffic circles provide a space for vegetation, public art, or a neighborhood identity sign.<sup>2</sup> However, It is important to consider how ongoing watering or maintenance costs will be funded.

**Cost:** On average \$10,000 — \$25,000, excluding costs of landscaping.<sup>4</sup>

## How do traffic circles reduce auto emissions?

One gallon of gasoline burned by an average San Diego vehicle produces 17.5 lb CO<sub>2</sub>, 45.4g CO, 11.3g NO<sub>x</sub>, and 4.5g VOC.<sup>9</sup> Like roundabouts, traffic circles used in place of stop signs or signals reduce these emissions two ways:

(1) Reducing starts and stops: In one study, small roundabouts were found to reduce CO by 29%, NO<sub>x</sub> by 21% and greenhouse gases by 28%.<sup>10</sup> The town of Carmel, Indiana, has converted over half its intersections to roundabouts or traffic circles, with an estimated average savings of 24,000 gallons of fuel (and accompanying emissions) per intersection per year.<sup>11</sup>

(2) Calming neighborhood traffic: Data show residents walk<sup>12</sup> or bike more — replacing some vehicle trips — when cars drive slower in their neighborhood.

Re: Comments Regarding the Draft Climate Action Plan and Related Documents

Dear Ms. Lowe:

The San Diego & Imperial Counties Chapter of the Sierra Club (the “Sierra Club” or the “Chapter”) respectfully requests that the Draft County of San Diego Climate Action Plan (“Draft CAP”), the Draft Guidelines for Determining Significance: Climate Change (“Draft Significance Thresholds”), and the Draft Report Format and Content Requirements: Greenhouse Gas Analyses and Reporting (“Draft GHG Report Requirements”) be returned to staff for revisions and subsequent recirculation before presentation to the Board of Supervisors for consideration at a public hearing.

In failing to require greenhouse gas (“GHG”) reductions past 2020 projections, the County Draft CAP, Draft Significance Thresholds, and Draft GHG Report Requirements, if adopted, will themselves contribute to the ultimate human catastrophe: climate destabilization.

Additionally, the County has failed to keep its own promises to the people – promises made just last year in the 2011 County of San Diego General Plan Update Environmental Impact Report (“General Plan EIR”).

As set forth below, the Draft CAP does not meet its stated goals of (1) complying with General Plan EIR Mitigation Measure CC-1.2 or Assembly Bill 32 (“AB 32”); or (2) mitigating the impacts of climate change consistent with the reduction requirements contained in Executive Order S-3-05 (“the Executive Order”).<sup>1</sup>

To make matters worse, and instead of contributing to the solution, the Draft Significance Thresholds and the Draft Report Requirements serve to further exacerbate the devastating impacts of climate change by purporting to limit California Environmental Quality Act (“CEQA”) review – and therefore consideration of mitigation measures and alternatives – based on thresholds that do nothing to avoid dangerous anthropogenic interference (“DAI”) within the climate system.

---

<sup>1</sup> In addition, the Draft CAP does not mitigate the impacts of climate change consistent with the California Environmental Quality Act (“CEQA”) Guidelines, allow lead agencies to adopt a plan or program that addresses the cumulative impacts of a project, or provide a mechanism that subsequent projects may use as a means of addressing GHG impacts under CEQA.

For this reason, adoption of the Draft Significance Thresholds and the Draft Report Requirements themselves would have adverse environmental impacts that have not been analyzed by the County as required by CEQA.

**I. THE DRAFT CAP DOES NOT COMPLY WITH THE REQUIREMENTS OF MITIGATION MEASURE CC-1.2 OR AB 32.**

The General Plan EIR identified significant impacts related to GHG emissions and was adopted based on findings that the mitigation measures identified and described therein would be implemented. Specifically, in certifying the General Plan EIR, the Board of Supervisors made findings that Mitigation Measure CC-1.2 would mitigate potentially significant climate change impacts to a level below significance:

**CC-1.2 requires the preparation of a County Climate Change Action Plan within six months from the adoption date of the General Plan Update. The Climate Change Action Plan will include a baseline inventory of greenhouse gas emissions from all sources and more detailed greenhouse gas emissions reduction targets and deadlines. The County Climate Change Action Plan will achieve comprehensive and enforceable GHG emissions reduction of 17% (totaling 23,572 MTCO<sub>2</sub>E) from County operations from 2006 by 2020 and 9% reduction (totaling 479,717 MTCO<sub>2</sub>E) in community emissions from 2006 by 2020. Implementation of the Climate Action Plan will contribute to meeting the AB 32 goals, in addition to the state regulatory requirements...**

General Plan EIR, Finding A-37, Attachment H-1, p. 71-72. Mitigation Measure CC-1.2 states as follows, and requires the County to:

**Prepare a County Climate Change Action Plan with an update baseline inventory of greenhouse gas emissions from all sources, more detailed greenhouse gas emissions reduction targets and deadlines; and a comprehensive and enforceable GHG emissions reduction measures that will achieve a 17% reduction in emissions from County operations from 2006 by 2020 and a 9% reduction in community emissions between 2006 and 2020. Once prepared, implementation of the plan will be monitored and progress reported on a regular basis.**

General Plan EIR, p. 7-80.

The Draft CAP is not the County Climate Change Action Plan contemplated by Mitigation Measure CC-1.2. As set forth below, the Draft CAP: (A) does not provide an updated baseline inventory; (B) does not provide detailed reduction targets and deadlines; (C) does not contain “comprehensive and enforceable GHG emissions reduction measures”; (D) does not “achieve a 17% reduction in emissions from County operations from 2006 by 2020 and a 9% reduction in community emission between 2006 and 2020”; and (E) precludes meaningful monitoring and reporting.

**A. THE DRAFT CAP DOES NOT PROVIDE AN UPDATED BASELINE INVENTORY.**

Mitigation Measure CC-1.2 required that County “Prepare a County Climate Change Action plan with an update baseline inventory of greenhouse gas emissions from all sources...” but the Draft CAP does not provide such an updated inventory. Instead, the Draft Cap appears to use 2005 and 2006 baselines that were already in existence at the time Mitigation Measure CC-1.2 was adopted.

**B. THE DRAFT CAP DOES NOT PROVIDE MORE DETAILED REDUCTION TARGETS AND DEADLINES.**

Mitigation Measure CC-1.2 required that the County “Prepare a County Climate Change Action plan with...more detailed greenhouse gas emissions reduction targets and deadlines...” but the Draft CAP in fact provides *less* detailed targets and deadlines than provided in AB 32 and the Executive Order.

The Draft CAP appears to ignore certain requirements of AB 32 as interpreted by the County’s own data. For example, the County’s position is that, “To achieve AB 32’s 2020 target, community-wide emissions would have to be reduced by 479,717 MT CO<sub>2</sub>e from 2006 levels. **A 9% reduction from 2006 levels is necessary to achieve 1990 levels...**” General Plan EIR, CEQA Findings Regarding Significant Effects, Attachment A, p.2. The Draft CAP does not distinguish between community emissions reductions and County emissions reductions and omits any reference to the 9% community reductions set forth in Mitigation Measure CC-1.2.

Instead, the entirety of the established targets and deadlines appears to be “15% below 2005 levels by 2020.” Draft CAP, p. 20. The Draft CAP in fact recognizes that to be on track to meet the goals of the Executive Order emissions reductions would have to be 49% below 2005 levels by 2035; and that the Draft CAP does not meet that goal. Draft CAP, p. 49.

As if an excuse, the Draft CAP states that only “current technology and existing state and federal regulations” are considered. Draft CAP, p. 49. Notwithstanding that there is no excuse for contributing to climate destabilization, the Draft CAP makes inaccurate assumptions and statements with respect to currently available solutions. For example, in assuming it cannot meet the Executive Order requirements, the Draft CAP must be presuming it will not meet the regulatory goals already established by the California Public Utilities Commission. If the County were to meet the already established California Energy Efficiency Strategic Plan goals for 2020, GHG emissions from stationary electricity usage would drop 50% by 2020 compared to a 2008 baseline year. See Attachment 1. The GHG reduction would exceed 80% by 2030 if the same pace of zero net energy building retrofits is assumed in the 2020-2030 timeframe. See Attachment 2. Currently available transportation related GHG reduction solutions are presented in the Appendix. See also Attachments 5-7.

**C. THE DRAFT CAP DOES NOT PROVIDE COMPREHENSIVE AND ENFORCEABLE GHG EMISSIONS REDUCTION MEASURES.**

It was no mistake that Mitigation Measure CC-1.2 used language like “comprehensive,” “enforceable,” and “will achieve.” Proposed mitigation measures are required by law to be “fully enforceable.” Cal. Pub. Res. Code § 21081.6(b); Guidelines § 15126.4(a)(2). Mitigation measures must be definite and defined so that their effectiveness is ascertainable. See, e.g., *San Franciscans for Reasonable Growth v. City & County of San Francisco*, 151 Cal.App.3d 61, 79 (1984).

Instead of “achieving” the reductions set forth in Mitigation Measure CC-1.2 and required by law, the Draft CAP concedes that it “does not ensure reductions...” Draft CAP, p. 69. In addition, the Draft CAP uses language such as “addressing,” “informing and inspiring meaningful GHG reductions,” and “Allow lead agencies to adopt a plan or program that addresses the cumulative impacts of a project.” These vague statements should be replaced with mandatory requirements that actually produce results.

The CAP provides seventeen GHG reduction measures that the drafters conclude will allow the County to achieve the goal of reducing emissions to 15% below 2005 levels by 2020. Draft CAP, p. 22. However, the measures do not explain the strategies that will be implemented, they do not provide cost breakdowns, they do not describe any incentives, they do not set forth specific mechanisms for monitoring each measure, and they do not explain the role of each implementation partner listed.

For example, measure E1, Energy-Efficient New Development, states that the County will “use incentives to encourage builders to exceed current energy efficiency standards by 15%.” Draft CAP, p. 29. What incentives? It then states there are also educational programs that “will create the educated and experienced workforce that is needed to take advantage of the County’s Green Building Incentive program.” *Ibid.* Where is the description of the County’s Green Building Incentive program? Who will participate in the educational program? How will the program be implemented or monitored? E1 also neglects to explain the likelihood of securing funding from the listed “Potential Funding Sources” and how instrumental are each to the success of the measure. *Ibid.* In addition, the measure does not indicate the roles of each implementation partner. *Ibid.* Without this important information, how could the County accurately determine the GHG reductions anticipated from this measure or the participation rate? All these things must be considered in order to provide full information and demonstrate enforceability to achieve acceptable mitigation under CEQA.

The Draft CAP concedes that some of the strategies provided in will not yield quantifiable emissions reductions. Draft CAP, p. 22. The strategies that will not yield quantifiable emissions reductions are not, and must be, identified. There is no information about the percentage of reductions that do not yield quantifiable emissions reductions, and there is therefore no way to analyze their effect on the requirements of Mitigation Measure CC-1.2.

In summary, the Draft CAP does not provide comprehensive and enforceable mechanisms that will actually reduce GHG emissions. With inadequate reduction measures it is far from clear whether or not the Draft CAP will achieve the County GHG emissions reduction target of 15% below 2005 levels by 2020. Further, with an ambiguous reduction target, it is not possible to determine that such a target will be sufficient even to comply with AB 32.

**D. THE DRAFT CAP DOES NOT PROVIDE COMPREHENSIVE REDUCTION MEASURES THAT WILL ACHIEVE A 17% REDUCTION IN EMISSIONS FROM COUNTY OPERATIONS AND A 9% REDUCTION IN COMMUNITY EMISSIONS.**

Mitigation measure CC-1.2 requires the CAP to achieve a 17% reduction in emissions from County operations from 2006 by 2020 and a 9% reduction in community emissions between 2006 and 2020. As set forth above, the Draft CAP does not actually achieve *any* emission reductions. In addition, the CAP only gives one emissions reduction target - 15% below 2005 levels by 2020.

Nowhere in the Draft CAP is there a reference to reducing “9% community emissions between 2006 and 2020.” Moreover, the terms “County” and “community” are used in the General Plan EIR, “municipal” and “community” are used in Attachment A to General Plan EIR Attachment H-1 (“Attachment A”), and just “County” is used in the Draft CAP. See e.g. Attachment A, p. 3. The inventory update in Attachment A says the *community* baseline year is changed to 2005, however, the 2005 baseline year used in the Draft CAP is for the *County*. No explanation is provided for the absence of the “9% reduction between 2006 and 2020” requirement of Mitigation Measure CC-1.2 in the Draft CAP.

#### **E. THE CAP MONITORING PROGRAM PRECLUDES EFFECTIVE IMPELEMENTATION.**

The Draft CAP also fails to provide for effective implementation. Mitigation Measure CC-1.2 requires that, “Once prepared, implementation of the plan will be monitored and progress reported on a regular basis.” The inadequate Draft CAP itself concedes that, “it is imperative to monitor progress toward the goals set in CAP and to revisit and update the CAP periodically.” Draft CAP, p. 69. However, the proposed monitoring tool that can “track progress between inventories and examine effectiveness of specific measures” and is contemplated to be “revisited periodically to reflect any changes in emissions projections or reduction potential,” neglects to define “periodically.” *Ibid.* In addition, the monitoring section of the CAP does not explain how the County will “coordinate monitoring efforts at the community and local government levels,” which seems to be the key to the success of the program. *Ibid.* Without full participation and information from those implementing the Draft CAP, as well as those affected by the Draft CAP measures, the monitoring system will not receive the necessary and relevant information to make an assessment about the progress of implemented measures.

### **II. THE DRAFT CAP DOES NOT COMPLY WITH THE EXECUTIVE ORDER**

The Governor’s Executive Order S-3-05 states:

**[T]he following greenhouse gas emission reduction targets are hereby established for California: by 2010, reduce GHG emissions to 2000 levels; by 2020, reduce GHG emissions to 1990 levels; by 2050, reduce GHG emissions to 80 percent below 1990 levels**

The CAP acknowledges the targets established in the Executive Order and the developed emissions forecasts for 2035 necessary to reach 2050 GHG emissions reductions. Draft CAP, p. 20. The Draft CAP explains that reductions “would need to reach 49% below 2005 levels by 2035, based on emissions forecasts for 2035 and 2050 under BAU conditions, to meet the 2050 goal.” *Ibid.* However, after expressing dedication to meeting legislative goals and the need to look beyond 2020 deadlines, and determining reduction targets for 2035 and 2050, the CAP stops short. Draft CAP, p. 49, 52. The Draft CAP utilized the same measures developed for 2020 scenario for the 2035 scenario, with the only change being an increase in rates of participation. Draft CAP, p. 49. This planning only yields a potential reduction of 13.7% below 2005 levels by 2035 and “does not achieve the 49% reduction target.” *Ibid.*

The scientific community recognizes that DAI within the climate system will not be avoided by 2020 reductions alone. See Attachments 3, 4. As set forth above, the Draft CAP inaccurately states that “current technology and existing state and federal regulations” are considered. Draft CAP, p. 49. Regulatory goals already established by the California Public Utilities Commission provide current solutions and guidance to achieve 2035 and 2050

reductions. See Attachments 1, 2. Similarly, currently available transportation related GHG reduction solutions are presented in the Appendix, in which specific comments are provided and inadequacies explained. See also Attachments 5-7.

**III. THE DRAFT SIGNIFICANCE THRESHOLDS AND THE DRAFT REPORT REQUIREMENTS, AS DRAFTED, WILL CONTRIBUTE TO CLIMATE DESTABILIZATION AND ARE SUBJECT TO CEQA.**

Instead of trying to avoid DAI within the climate system, the Draft Significance Thresholds and Draft Report Requirements serve to further exacerbate the devastating impacts of climate change.

The CEQA Guidelines explained that lead agencies may adopt thresholds of significance for use in environmental review but that the thresholds must be supported by substantial evidence:

- (a) Each public agency is encouraged to develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects. A threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant.
- (b) Thresholds of significance to be adopted for general use as part of the lead agency's environmental review process must be adopted by ordinance, resolution, rule, or regulation, and developed through a public review process and be supported by substantial evidence.
- (c) When adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.

CEQA Guidelines § 15064.7. Here, there is no substantial evidence that supports adoption of the Draft Significance Thresholds and Draft Report Requirements which do not even purport to provide for emissions reductions past 2020 targets. The scientific of climate change reveals that 2020 targets are insufficient to avoid DAI within the climate system. Adoption of the Draft Significance Thresholds and/or the Draft Report Requirements will therefore themselves adversely impact the environment. An EIR would be required before either or both could be adopted.

CEQA Guideline section 15064.4, entitled, Determining the Significance of Impacts from Greenhouse Gas Emissions, provides additional guidance for determining GHG impact significance:

- (a) The determination of the significance of greenhouse gas emissions calls for a careful judgment by the lead agency consistent with the provisions in section 15064. A lead agency should make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project. A lead agency shall have discretion

to determine, in the context of a particular project, whether to:

(1) Use a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use. The lead agency has discretion to select the model or methodology it considers most appropriate provided it supports its decision with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use; and/or  
(2) Rely on a qualitative analysis or performance based standards.

(b) A lead agency should consider the following factors, among others, when assessing the significance of impacts from greenhouse gas emissions on the environment:

(1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;

(2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.

(3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

Again, as set forth above, there has been no effort based on existing scientific and factual data to calculate the GHG emissions that would result from adoption of the Draft Significance Thresholds or the Draft Report Requirements. To the contrary, existing scientific and factual data reveals that thresholds that do not meet 2035 requirements are insufficient. See Attachment 3, Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group Meeting #15, p. 2. As set forth and referenced in the attached letter from the Center for Biological Diversity, not even compliance with the Executive Order will avoid dangerous anthropogenic interference with the climate system. See Attachment 4. Failing to address emissions reductions past 2020 necessarily renders the Draft Significance Thresholds and Draft Report Requirements insufficient.

I have attached an appendix and seven (7) documents, which are incorporated by reference as part of our comments on the County's proposed plan. This letter, its appendix and the incorporated documents must be included in any review of your plan. We request written responses to each and every comment made in this submission. Please notice our organization at the above address of any further processing of this plan or meetings on this plan.

Thank you for your fine staff work and including us in this process.

Respectfully submitted,

/s/ John Stump

---

The San Diego Chapter of the Sierra Club is San Diego's oldest and largest grassroots environmental organization, founded in 1948. Encompassing San Diego and Imperial Counties, the San Diego Chapter seeks to preserve the special nature of the San Diego and Imperial Valley area through education, activism, and advocacy. The Chapter has over 14,000 members. The National Sierra Club has over 700,000 members in 65 Chapters in all 50 states, and Puerto Rico.

## **APPENDIX**

### **Summary**

Improvements to Chapters 1 and 2 are given. Chapter 2 suggestions include computing the driving reductions needed to achieve the S-3-05's trajectory by 2035. Feasible mitigation measures would eliminate congestion, improve air quality, increase social equity, and empowering people to make meaningful decisions both about methods of transit and how to spend their hard earned dollars.

### **Qualifications**

Understanding the relationship between global warming and transportation requires mathematics. The Chapter Transportation Chair, Mike Bullock, a contributor to this letter and drafter of this Appendix, has a BSEE degree and a Masters of Science, Engineering (MSE) degree. He worked for 36 years at Lockheed Martin, in Sunnyvale. For the last 20 years there, he worked as a satellite-systems engineer. One of his responsibilities was to develop equations and methods to measure and then compensate out, through satellite database upload, the misalignments of the key antennas on the MILSTAR communication satellite.

### **Specific Comments on the Draft CAP**

#### **1.1 Comments on the Draft CAP's Purpose**

The Attorney General Office's (AG's) excellent letter found at [http://ag.ca.gov/cms\\_attachments/press/pdfs/n2056\\_santa\\_clarita\\_letter.pdf](http://ag.ca.gov/cms_attachments/press/pdfs/n2056_santa_clarita_letter.pdf) compels a high standard of specificity. This CAP must identify the needed GHG reductions and show how those needed reductions will be achieved.

The words, "informing and inspiring meaningful GHG reductions" should be replaced with "achieving meaningful GHG reductions."

The first sentence on the top of the right column should include the *regional* level. SANDAG's RTP2050 is a \$214B dollar plan, with direct impacts on GHG emissions. SANDAG's work should not be ignored.

Table 1.1 should be labeled so the reader understands the year of the reductions. If the year is 2020, a similar table is needed for 2035.

#### **1.3 Comments on the Greenhouse Effect**

This section fails to inform the reader of the urgency and extreme danger posed by our climate crisis. The June 2008 issue of *Scientific American* (*The Ethics of Climate Change*, by Professor John Broome) reports that the levels of GHG expected in 20 years will result in a 5% chance of a 14.4 degree Fahrenheit increase in the earth's temperature and this would be an "utter catastrophe" and create the possibility of a "devastating collapse of the human population, perhaps even to extinction".

The plot shown on Page 6 fails to show the historic temperature profile. For that information, it is necessary to also show Figure 1 and 2. They are well known. Note that the 450 PPM value is shown. That would be the peak level of atmospheric CO<sub>2</sub>, if the world achieves the S-3-05 trajectory. That peak value would occur in year 2050 and then the atmospheric level of CO<sub>2</sub> would gradually be brought down to less-dangerous levels.

Figure 1 shows that the CO<sub>2</sub> levels shown on your Page-6 plot, which are 400 PPM up to 1000 PPM, correspond to temperatures of well over 10 degrees Centigrade. Such temperatures would risk a catastrophic collapse of the human population, to include the eventual extinction of our species. There are no adaptation strategies that could deal with such an event.

Figure 2 clearly shows that, although the temperature rise is somewhat masked by solar activity, underneath that relatively high frequency temperature variation, the temperature rise, which is due to the trapped heat caused by the higher-than-normal CO<sub>2</sub>, is already taking place. The trapped heat's effect on our atmosphere will be delayed as it melts ice and warms the ocean. We must at least achieve the S-3-05 trajectory.

**Figure 1**                      **Atmospheric CO<sub>2</sub> and Mean Temperature, 800,000 Years Ago, with 450 PPM CO<sub>2</sub> Shown**

**Figure 2 Atmospheric CO2 and Mean Temperature, Over the Last 1,000 Years**

Attachment 3, also available at <http://www.aqmd.gov/ceqa/handbook/GHG/2009/april22mtg/CBDcomments.pdf>, has descriptions of the likelihoods of various S-3-05 outcomes, first in terms of temperature rise. Even if we achieve S-3-05, there is a 50% chance that the temperature rise will exceed 2 Degrees Centigrade. A 2 degree Centigrade rise in temperature would have very serious negative consequences, as described. There is a 30% chance that the temperature change would exceed 3 Degrees Centigrade, which is described as “exponentially worse” than the 2-Degrees-Centigrade outcome. And so on. Going above 500 PPM is unthinkable and yet that seems to be exactly what we are doing.

On Page 6 the Draft CAP, failing to meet S-3-05 is described by saying that “climate change will threaten our economic well-being, public health, and environment”. The dangerous and currently out-of-control predicament in fact threatens human extinction. A bullet on Page 7 states that local effects could include “the decline or loss of species”, but does not reveal that our own species is at risk. This sort of over sight continues throughout Pages 8 and 9.

On Page 9 it says, “The extent to which these changes produce negative impacts will depend on actions taken today to ensure resilience in the face of climate change and, where necessary, adaptation to its impacts”. This ignores our responsibility to limit our GHG emissions and the fact that without sufficient and timely limitations, adaptation will not be possible.

#### **1.4 Comments on the “Local Effects of Climate Change” and “Potential Climate Change Health Effects” Sections**

These sections do not describe the severity of our climate crisis.

#### **1.5 Comments on the “Relationship to Other State and County Documents”**

It is crucial that the Draft CAP require strategies that will reduce emissions to levels at least as low as the S-3-05 trajectory.

Table 1.2 is valuable but must be improved in at least the following ways.

The description of S-3-05 needs to contain the following additional sentence: “These targets must be considered as points that define straight-line trajectories. It should also be understood that world-wide emission levels must at least stay beneath these straight lines. The net emissions, over the years, must be limited. The net emission is proportional to the area under these straight lines. Any year that emissions are above the lines creates a surplus that then requires years beneath the lines. The world is currently emitting at levels well above the line between the first two points.

The SB 375 description is incorrect because what the Metropolitan Planning Organization (MPOs) must achieve is GHG reductions that do not include reductions from state programs of cleaner cars and cleaner fuels. This means that the reductions can only be achieved by driving reductions, or, in other words, reducing vehicle miles travelled (VMTs). Therefore, it would be more accurate to simply change the “GHG emissions” words to “VMTs”, to say “VMTs from passenger vehicles must be reduced . . .”

#### **1.6 Comments on the “Scope and Content of the CAP”**

The bullet “Community Measures and Actions” should identify Table 3.2, since it provides the estimated GHG emissions. For example, T2, shown on Page 41, gives the results as a “50% increase in bicycle and pedestrian facilities”; T3 gives “50% of employers using TDM. It is not until Table 3.2 that the reader learns of the GHG reductions. Besides this, the estimated GHG reductions (only from VMT reductions, for cars and light-duty trucks) need to be for years 2035 and 2050, not just 2020 as stated in that bullet.

#### **2.1 Comments on the Draft CAP’s Chapter 2**

#### **2.2 Comments on the “Business-as-Usual Projections”**

Regarding the transportation sector; cleaner cars, cleaner fuels, and other state-transportation programs are out of the County’s direct control but the County can play an important role by seeking improved legislation and rule making. The County’s primary role, in terms of transportation, however, is to reduce VMT. Table 2.3’s BAU should therefore assume the state’s transportation programs will perform as currently estimated but assume VMT will be “BAU”, meaning as currently projected with no county or regional programs to reduce driving.

#### **2.3 Comments on the “GHG Emissions-Reduction Targets”**

We appreciate your recognition of the critical need to meet S-3-05. Given the dire predictions as set forth in Attachment 3 and reference materials therein <http://www.aqmd.gov/ceqa/handbook/GHG/2009/april22mtg/CBDcomments.pdf>, compliance with S-3-05 should be stated as the *minimum* to be accomplished.

The computation of the critical value of 49% below the 2005 value by 2035 should be set forth. This value means that the 2035 emissions need to be  $(.51) \times (2005 \text{ emissions})$ . In Attachment 5, letter from Sierra Club to SANDAG, April 20, 2011, *California Air Resources Board (CARB)*

*Greenhouse Gas (GHG) Reduction Targets, Issued to SANDAG, in Accordance with SB 375, for the Year 2035*) the computation was .525, instead of .51.

Driving reductions needed to achieve 2020 or 2035 reductions are not met. This calculation can only be done by assuming some achieved improvement from cleaner cars and cleaner fuels. The work shown here will repeat the process shown in Attachment 5.

### Overview of Relationships and Derivation of Key Formula

The S-3-05 net reduction in GHG emissions, from cars and light-duty trucks, expressed as a fraction of 2005 emissions, is obtained by multiplying four factors together. The definitions of Table 1 apply.

**Table 1** Factor Definitions, with Respect to Year 2005

| <b>Factor Definitions</b>                                                                                                                         |                                                                          |
|---------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| <i>All are for for the year of interest, with respect to year 2005 values.<br/>Except for Population, all are for cars and light-duty trucks.</i> |                                                                          |
| <b>f</b>                                                                                                                                          | <b>net factor of the emissions of Greenhouse Gas</b>                     |
| <b>f_Pavley</b>                                                                                                                                   | <b>factor of the average statewide mileage</b>                           |
| <b>f_Fuel</b>                                                                                                                                     | <b>factor of the reduction of GHG due to fuels that burn less carbon</b> |
| <b>f_Population</b>                                                                                                                               | <b>factor of the population in the region of interest</b>                |
| <b>f_PerCapitaVMT</b>                                                                                                                             | <b>factor of per capita driving</b>                                      |

The following equations apply.

$$\text{Eq. 1} \quad f = f_{\text{Pavley}} \times f_{\text{Fuel}} \times f_{\text{Population}} \times f_{\text{PerCapitaVMT}}$$

Eq. 2 is derived from Eq. 1.

$$\text{Eq. 2} \quad f_{\text{PerCapitaVMT}} = f / (f_{\text{Pavley}} \times f_{\text{Fuel}} \times f_{\text{Population}})$$

Figure 3 is from <http://www.nrdc.org/globalWarming/sb375/files/sb375.pdf>, a widely-respected report on SB 375. Note that all of its values are in the units of factors (same as fraction) of their values in year 2005. Figure 3 will supply all of the needed values, except for the factor of population. (Neither the red line nor the blue line are used.) Its gold line is the S-3-05 trajectory. (CARB ignored this line when it issued the MPO driving-reduction values for year 2035.)

**Figure 3** GHG Reductions from Pavley (AB 1493, in Green); the Low Carbon Fuel Standard (in Purple); the Predicted Driving (VMT, in Red); the Net Result of GHG (CO<sub>2</sub>, in Blue); and the S-3-05 Trajectory (in Gold)

### Getting the Net Factor of the Emissions of Greenhouse Gas in 2035, with Respect to 2005 Values

To get the net factor of the emissions of GHG, for year 2035, with respect to year 2005, it is necessary to extrapolate the Governor's Executive Order target values (the gold line of Figure 1), out to year 2035. The gold line shows that this factor is 0.87 in 2020 and is 0.64 in 2030. Therefore, in year 2035, the factor will be

$$0.64 + [(.64 - .87) / (2030-2020)] * (2035-2030) = 0.525$$

However, as stated above, the value of .51 will be used, to correspond to your ".49 down" value.

### Getting the Factor of the Average Statewide Mileage in 2035, with Respect to the 2005 Value

To get the Pavley reduction factor, for Year 2035, it is necessary to extrapolate the average statewide mileage factor data, which is Figure 1's green line, out to Year 2035. It is 0.82 in 2020 and it is 0.73 in 2030. Therefore, in year 2035 the statewide mileage factor data will be

$$0.73 + [(.73 - .82) / (2030-2020)] * (2035-2030) = 0.685$$

Pavley 1 ends in Year 2017. It is widely assumed that it will be replaced by what is often called "Pavley 2". The extrapolation computed here is based on the assumption made by the author of Figure 1, as shown in the slope of the green line from year 2020 to 2030. Based on the authoritative credentials of the authors of Figure 1, this is the best assumption that can be made. Assuming that the California fleet will continually get

more efficient, in terms of CO<sub>2</sub> per mile driven, relies on an assumption that a significant fraction of our car owners will be able to purchase newer-model cars.

### **Getting the Factor of the Reduction of GHG Due to Fuels that Burn Less Carbon**

Looking at the purple line of Figure 1, it is clear that this factor will be 0.9 in 2035.

### **Getting the Factor of the Increase in Population**

The factor for population in San Diego County is computed using the populations estimated in CARB's <http://arb.ca.gov/cc/sb375/mpo.co2.reduction.calc.pdf>, namely 3,034,388 people in 2005 and 3,984,753 people in 2035. So the factor, from 2005 to 2035 is  $3,984,753/3,034,388 = 1.313$ . Note that this number will be different for the unincorporated area. If the unincorporated value is larger, the per-capita factor will be smaller and so the needed per-capita reduction in driving will be larger. If the unincorporated value is smaller, the per-capita factor will be larger and so the needed per-capita reduction in driving will be smaller. The net driving change compared to 2005 will be unchanged, regardless of what population growth is assumed.

### **Computing the Required Driving Reduction, for 2035**

The 4 values computed above are used in Eq. 2 to compute the required factor.

$$\text{Eq. 3} \quad f_{\text{PerCapitaVMT}} = .51 / (.685 \times 0.9 \times 1.313)$$

Therefore,  $f_{\text{PerCapitaVMT}} = .630$ . **This corresponds to a 37.0% reduction in per-capita driving, in year 2035, compared to year 2005.**

It is also important to compute the net driving factor and the net driving reduction. The net driving factor is the per-capita driving reduction factor (.630) multiplied by the population factor (1.313).

$$\text{Eq. 4} \quad f_{\text{netDriving}} = .630 \times 1.313 = .827.$$

**This means that even with more efficient cars, cleaner fuels, and a larger population; the net driving in San Diego County will have to be 17.3% less than in year 2005.**

Therefore, there is absolutely no reason to add highway capacity. The only rational course of action is to shift all the currently-allocated-highway-expansion money to transit expansion.

Please add these important calculations and conclusions to your GHG Emissions-Reduction Targets section.

## **3.0 Comments on the Draft CAP's Chapter 3 Land Use and Transportation Community Measures and Actions, for Year 2035**

Given the large role that the driving of cars and light-duty trucks plays in emitting GHG, the CAP must achieve the year 2035 driving reductions shown at the end of this letter's Section 2.0. This is a per-capita driving reduction of 37.0% and a net driving reduction of 17.3%. Both of these values are with respect to year 2005. Given the large change needed, LU1, T1, T2, and T3 will be insufficient. At least two more transportation "Measures and Actions" will be required.

### **3.1 Comments on LU 1**

This section should be improved. "Near existing and planned transit corridors" should say "Within walking distance of existing and funded transit stops on transit lines with service at or above levels shown to significantly reduce driving reductions and car ownership for those living

within walking distance of its stops.” The “25% of new development” shown in Table 3.2 should be at least 75%. As soon as possible, California needs to implement an equitable and environmentally-sound road use fee pricing system that will unbundle the costs of building roads, of maintaining roads, and of the external economic losses road use imposes on society in general, such as environmental and health costs. This will cause the market to support so-called “smart growth”, mixed-use development over urban sprawl. The County needs to seek legislation to help make this happen.

“Smart” should be defined as “VMT-reducing”. This will allow strategies that are proposed or required at such developments to be evaluated for value. Unbundling the cost of parking should also be developed and required, as described in Reference 3 (Reference 3 was presented by our Transportation Chair in Calgary, Canada, at the Sustainable Land Use and Transportation Session of the Air and Waste Management Association's 103rd Conference and Exposition, in the summer of 2010. It is therefore published and peer reviewed.) This will give consumers, residents and employees more control over their money. It will also reduce driving, as shown in Reference 3's Table 1.

Zoning within the qualifying areas should eliminate density and height limitations, as well as minimum parking requirements. Investors will respect the market limitations as there will be poor demand for developments that don't work for those that buy, rent or lease in such developments. Besides this, when projects are proposed, good modeling will determine functionality. Meeting the relaxed zoning does not have to mean automatic approval. The political process will litigate the tension between neighborhood concerns and the need to reduce driving. The off-street parking ordinance should require that the parking costs are unbundled, using either the method of parking operating as its own profit center or using the methods describe in Reference 3.

### **3.2 Comments on T 1, “Increase Transit Use”**

Many of the comments of Section 3.1 apply. Given that the CAP must achieve the year 2035 driving reductions shown at the end of this letter's Section 2.0; in particular, a net driving reduction of 17.3%, compared to year 2005; the TransNet tax money allocated to highway expansion needs to be reallocated to transit. Although this is a SANDAG Board decision, it should be pointed out by our County Board at every opportunity. However, it is still doubtful that great transit service can be expanded out to cover all of the unincorporated areas, and the unbundling proposals are important.

### **3.3 Comments on T 2, “Increase Walking and Biking”**

Most of this section is valuable. However, its reliance on the regional plans, including the Regional Bicycle Plan, should be reduced and the need to improve those plans should be stated. The primary problem with these plans stems from the reluctance of the SANDAG Board to require that expenditures be ranked on their estimated ability to decrease driving. The ranking should be based on driving reduction per dollar spent. This point has been made many times by our Transportation Chair and it has been ignored by the SANDAG's Board and Executive Director.

### **Education and Projects to Support Bicycle Transportation**

As stated, the criteria for spending money for bicycle transportation should be to maximize the resulting estimated reductions in driving. The following strategies will probably do this.

## Projects

Each of SANDAG's smart growth place types, both existing and planned, shown on SANDAG's well-documented Smart-Growth Concept Map, should be checked to see if bicycle access could be substantially improved with either a traffic calming project, a "complete streets" project, more shoulder width, or a project to overcome some natural or made-made obstacle. These projects should be prioritized using a cost/benefit ratio metric.

It is hereby assumed that 80% of the money available for the Regional Bicycle Plan (over a billion dollars) should be used to fund the projects. They should be selected for implementation, from top of the list (lowest cost/benefit ratio) down, until the money is used up. An example of one of these projects, for the proposed town center near the corner of I-5 and SR-78, is to devise a method to restore the shortest-distance route from Vista Way to Vista Way, which is currently broken by Interstate 5. This would connect a large South Oceanside coastal neighborhood with a regional shopping center, which includes a large grocery store, avoiding a circuitous and hilly current route.

Building recreational bike paths is generally not a cost-effective expenditure. It sends a message that bikes do not belong on the road.

## Education

The remaining 20% of the money should be used to do the following.

1.) Teach interested adults about bicycle accident statistics (most serious injuries occur to cyclists in accidents that do not involve a motor vehicle), car-bike accident statistics (most are caused by wrong-way riding and errors in intersections; clear cut hit-from-behind is rare), and how to ride in all conditions, to minimize problems.

2.) Teach riding-in-traffic skills and how to ride in other challenging conditions, by having the class members and instructor go out and ride in real conditions, until proficiency is achieved.

Students that pass a rigorous written test and demonstrate proficiency in traffic and other challenging conditions are paid for their time and effort.

These classes should be based on the curriculum developed by the League of American Bicyclists and taught by instructors certified by the League.

Assuming a class size of 3 riders per instructor and that each rider passes both tests and earns \$100 and that the instructor, with overhead, costs \$500 dollars, for a total of \$800 for each 3 students, means that \$200M (computed as 20% of \$1B) could educate  $\$200M/\$800 = 250,000$  classes of 3 students, for a total of 750,000 students, out to year 2050. This is about 20% of the population of San Diego County.

### **3.4 Comments on T3, "Increase Ridesharing"**

By taking the position that transportation demand management must only be programs that reduce driving, the CAP is helping to foster the widespread belief that driving levels are the result of free economic choice, and that this free choice must be made less likely by offering some new incentive to not drive or causing drivers to suffer some sort of punitive measure when they insist on driving. That approach to TDM is conventional but it is also misleading.

To engender objectivity, please generalize the concept and go beyond the conventional. More specifically, please state that TDM is the adoption of policies that affect the amount of driving. These 3 classifications of TDM are suggested in Reference 3:

- "Positive", which reduces driving, such as charging for parking at a higher rate than what is justified by its cost,
- "Zero", which is neutral in its effect on driving, such as charging for parking at the rate which is justified by its cost, and
- "Negative", which increases driving, such as charging for parking at a lower rate than what could be justified by its cost.

It should then be pointed out that so called "free parking" is a widespread form of a (significantly) negative TDM. The only way to make this TDM more negative would be to pay people for parking their car.

This treatment will increase objectivity towards the idea of "TDM". After all, who really wants their demand for anything to be "managed". However, many current policies manage demand for driving by encouraging driving. If we could just get all the "levers" adjusted to "Zero TDM", all of our congestion and driving-related climate destabilization problems would be greatly reduced. Besides this, there is a basic fairness issue. Having at least "Zero TDM" should be the law of the land. This is true, even without the challenge and mandate of climate stabilization. One of the best TDM measures would be to unbundle the cost of parking in all locations, as explained in Reference 3. After these systems are installed, it would be possible to adjust the charge above the zero TDM level. It is important to note that the earnings go back to those for whom the parking is built. This makes the positive TDM more popular since everyone likes getting monthly earnings.

### **3.5 Comments on T4, "Alternative Fuel Vehicles"**

This is a state program. The county should urge CARB to take actions to increase the GHG reductions it can achieve. It is also correct to work for enough charging stations. However, the estimate derived from Figure 3's green line is all that can be assumed at this time. If at some later time CARB believes that it can do better than Figure 3's green line, then at that time, perhaps the calculation shown in Section 2.2 can be updated. However, there is nothing wrong with achieving more GHG reductions than what is required by the S-3-05 trajectories. Most of the driving reductions will come from increased equity, in any case.

### **3.6 Comments on an Additional "Community Measure and Action"**

In Section 2.2 it was shown that the per-capita driving needs to be at least reduced by 37.0% by 2035. Reforming transportation to increase economic equity should not wait. For these reasons, LU-1, T-1, T-2, and T-3 are insufficient. This measure is needed as soon as it can be developed and instituted.

### **Unbundling the Cost of Car Parking**

For the vast majority of destinations in California, the cost of car parking is hidden within other costs. This has serious consequences. For example, at most places of employment, parking costs reduce the wages that can be paid to all the employees, even those that never use the parking. Similarly, at most apartment complexes, bundled parking costs increase the rent and this is true, even for families that do not own a car. Bundled parking costs routinely increase the costs of goods, such as groceries, for all customers. Again, this is even true for those that do not drive. Since governments require businesses to provide minimum levels of parking, they are involved in this economic discrimination towards those that drive less.

Driving less is, to some degree, a lifestyle choice. Since government has no valid reason to encourage driving, the lifestyle choice of less driving deserves constitutional, or at least legal,

protection from any practices that discriminate against it, economically. So far, the County has not taken an active role in educating its citizens on how parking policy effects economic fairness or how parking policies that are more fair could reduce driving.

On June 22<sup>nd</sup> 2010, our Transportation Chair presented a paper on how parking could be operated to unbundle parking costs in a way that supports the sharing of parking. This was at the 101<sup>st</sup> Conference and Exhibit of the Air and Waste Management Association, in Calgary, Canada. The session, *Sustainable Land Use and Transportation*, included the paper, *A Plan to Efficiently and Conveniently Unbundle Car Parking Costs*. The paper was extremely well received. It was published as a proceeding of the Conference. See Attachment 6.

The following points, taken from Attachment 6, apply.

- Vehicle miles traveled (VMT) are a major cause of global warming and pollution.
- California's Metropolitan Planning Organizations (MPOs) need to adopt strategies that reduce vehicle miles traveled (VMT), in order to at least meet the S-3-05 trajectory, for years 2020 and 2035.
- The appropriate pricing of parking is one of the least costly tools documented to reduce VMT.
- New technologies, such as sensors feeding computer-generated billing, offer the potential to efficiently bill drivers for parking and alert law enforcement of trespassers.
- Reformed parking policies can increase fairness, so that, for example, people who use transit or walk do not have to pay higher prices or suffer reduced wages, due to parking.
- Methods to unbundle parking cost are inefficient, unless they support the spontaneous sharing of parking spaces. Shared parking, with unbundled cost, would ultimately allow the county to require significantly less parking.
- Typical current systems of timed parking and metered parking are far from ideal. Such parking has no automated record keeping, so it is difficult to know where there is too much or too little parking.
- Good policies will eventually let cities and the county to turn parking minimums into parking maximums.

Less land and resources devoted to parking will support mixed use and make "smart growth" more economically viable. It should therefore be a key ingredient supporting the CAP's LU-1.

Here is a copy of the abstract of Attachment 6.

The *Introduction* shows documented driving reductions due to the pricing of parking. It notes that although the benefits of priced and shared parking are known, such parking has not been widely implemented, due to various concerns. It states that a solution, called "*Intelligent Parking*," will overcome some of these concerns, because it is easy to use and naturally transparent. It asserts that this description will support a "Request for Proposal" (RFP) process. Eight background information items are provided, including how priced parking would help California achieve greenhouse gas reduction targets. A story demonstrates some of the key features of *Intelligent Parking*. Arguments for less parking, shared parking, and priced parking are made. Barriers to progress are identified. The fair pricing of parking is described. New ways to characterize transportation demand management are presented. Seven goals of

*Intelligent Parking* are listed. Eleven definitions and concepts, that together define *Intelligent Parking*, are described. This includes a method to compute a baseline price of parking and how to adjust that price instantaneously to keep the vacancy above 15% ("Congestion Pricing"). An implementation strategy is described.

This abstract aroused enough interest among those responsible for A&WMA's *Sustainable Land Use and Parking* session that they requested that a manuscript, which was ultimately selected to become part of the written Conference Proceedings and for presentation.

The County could also play a pivotal role by helping to find a demonstration project, probably at a school or an office. Attachment 7 sets forth specific solutions. Attachment 6 describes an implementation strategy in its Implementation Section, on Page 16. The County has the authority, in its off-street parking ordinances, to require cooperation with an agency implementing unbundling and this would be the correct action, after a sufficient number of successful demonstrations have been achieved. "Successful" would need to mean that nearly all stakeholders would be pleased with the program.

If fully implemented, this strategy, by itself, would probably decrease driving throughout California by between 15% and 25%. This is shown in Table 1 of Attachment 6.

Below is an email indicating that the basic features of enforcement, charging, distributing earnings, and sending out monthly statements would not be difficult.

**Email Showing that the Basic Required Technology Could Be Easily Developed**

**Subject:** RE: RFID\_ParkingNewCalsbadHS

Dear Carlsbad School Board,

I wanted to send a quick note discussing the technical feasibility of tracking cars into a lot without impacting students or requiring the need for gates. Mike Bullock and I have discussed this project; it can be accomplished straightforwardly by utilizing Radio Frequency Identification and/or Video Cameras integrated with automated license recognition systems. The cars would need to register with the system at the start, but it would be fairly painless for the users after the initial installation. The back end database system can also be implemented both straightforwardly and at a reasonable price.

This is not necessarily a recommendation of the proposal for unbundled parking. Rather it is strictly an unbiased view of the technical feasibility of the proposal to easily and unobtrusively track cars, both registered and unregistered, into a fixed lot.

Best regards,

David R. Carta, PhD  
CEO Telaeris Inc.

### **3.7 Comments on an Additional State-Wide “Community Measure and Action”, Unbundling the Costs of Driving and a Summary of Results of All Additions**

This measure would require a state and/or federal government action. Therefore, like advocating for cleaner cars, the role of the County would be to understand the value and then advocate for this measure, at the state and federal level.

#### **Unbundling**

“Unbundling”, in the heading above, denotes that the money collected should be paid out to those that are losing money under the current system. This means, for example, that the money collected to account for increased health-care costs, caused by the air pollution the public must breathe, would go to reduce the cost of health care, not to build or even maintain roads.

#### **3.7.1 A Comprehensive Road-Use-Fee Pricing System**

**Abstract** This section contains a listing of road pricing principles. It provides an example of a road-use fee structure that supports the listed principles. Useful background information is provided. Arguments in favor of the presented example are presented.

**Initial Note** For many reasons, including the climate crisis, a comprehensive road-use fee pricing system is needed. It would be optimal for the state to implement the type of system described in this section. However, the state has a long history of irresponsibility in pricing road use. It is hoped that global warming will change this. Certainly, all the MPO's in the state should be urging our state government to wake up and take action. If these efforts fail, the MPO's will have to proceed as best they can to implement as much of these road-use pricing system components as possible.

#### **Road-Use Fee Principles**

1. The first principle is that of “full-cost pricing”. Driving has enjoyed a favored status in this state and in this country, resulting in sprawl, health-damaging pollution, global warming emissions, and congestion. We should advocate for the elimination of that favoritism in California, primarily by adopting this first principle.
2. Secondly, the current economic rewards for good mileage vehicles must not be eroded. Due to global warming, motorists need to “go electric” as soon as possible.
3. In addition, road-wear factors (primarily weight), the noise generated, and the pollution generated by each individual vehicle must be taken into account. This will increase fairness and support a shift to lighter, cleaner, and quieter vehicles.
4. The time and place of travel must be incorporated to reduce congestion.
5. Any road-use fee structure must do no economic harm to low-income drivers.
6. As road-use fee technologies evolve, privacy must be protected at each step.

#### **An Example of a Conforming Road-Use Fee Structure**

##### **Condition 1**

100% of the funding for all of the expenses of public roads, *excluding* those costs associated with future expansion (covered in Condition 3), comes from a road-use fee (that may include a fuel excise tax), that ultimately (as affordable technology can support) would contain the following **Features**:

**1. VMT Fee** A base, per-mile (VMT) component fee paid by all motorized vehicles for road construction and maintenance. It would vary by model so that the incentive to drive efficient vehicles is at least as large as for our current fuel excise tax. This means that a Prius would be much cheaper, per mile, than a Hummer.

**2. Carbon Fee** An additional per-mile carbon component part is computed using an effective fee per gallon that is equal or larger than the fuel tax that this per-mile carbon fee might replace, to correlate with the amount of CO<sub>2</sub> emitted. This could either be charged at the pump, as it is now done, or could be added to the VMT fee by using a price per mile computed by dividing the effective price per gallon by the charged vehicle's (year and model) average mileage, in the units of mile per gallon.

**3. Road Wear Fee** An additional per-mile component part that is proportional to the vehicle's (year and model) average weight, or other road-wear variable of the vehicle being charged.

**4. Air Pollution Fee** An additional per-mile component part proportional to the charged vehicle's (year and model) average pollution level, to be used to compensate people, schools, businesses, governments, and corporations harmed by pollution, with this rate set for full compensation.

**5. Noise Pollution Fee** An additional per-mile component part proportional to the average noise pollution level of the charged vehicle, to compensate people, schools, businesses, governments, and corporations harmed by noise pollution, with the rate set for full compensation.

**6. Congestion Fee** An additional per-mile component part or, alternatively a multiplier, to account for either time and place, or instantaneous traffic flow rate, to reduce or eliminate congestion, with the proceeds of this fee (collection minus collection cost) used for either the expansion or the operation of transit systems that would tend to reduce this congestion.

**7. Low Income Relief** A fractional multiplier that would reduce the total per-mile cost for drivers with a sufficiently low income and a sufficiently high need to drive, but only available for a period of calendar time sufficient for the driver to change their circumstance creating the need to drive, unless this is impossible. Section V's Section 7 has more detail.

**8. Privacy** Privacy protections so that where and when people drive, the vehicle they drive, and any Feature 7 advantage, is fully protected, unless a warrant is issued by a judge in response to substantiated allegations of a serious, felony crime.

## **Condition 2**

The per-mile charges of Condition 1 must be large enough to fund yearly payments to the municipalities having large, limited access roads (AKA "freeways") within their boundaries (thereby keeping land off of their property-tax rolls), with these yearly payments equal to the average yearly property tax per acre of the adjacent land, multiplied by the total acreage covered by the road's right of way, including frontage roads.

## **Condition 3**

No expansion of the system of public roads should be done unless market research and traffic modeling show that the net revenue of the proposed road or additional lanes will fund all the expenses identified in Conditions 1 and 2.

## **Condition 4**

No expansion of the system of public roads should be done unless it is shown that the expansion will not negatively impact the state's AB32 and S-3-05 goals and responsibilities.

### **Condition 5**

The sales tax on gasoline and diesel fuel should remain. Its revenue can be used as is the revenue from any other sales tax that is collected on consumer items.

### **Background Material**

This section provides information about the current level of the fuel tax, the difficulty of raising the fuel tax, the use of the fuel *sales* tax, lane performance during times of high demand, demand under the condition of “full cost pricing”, political “push back” to full cost pricing, other opinions that a pure fuel tax is becoming obsolete, and finally, information indicating that a road-use fee could be raised by a simple majority in the state legislature.

#### **1. Current Level of Fuel Excise Tax**

A full accounting of the fuel excise tax and what it currently pays for is not our responsibility. A significant segment of the population probably believes that current fuel tax rates are high enough. However, a San Diego County newspaper, the North County Times (NCT), in a February 9, 2009 article, reported that the Chair of the California Transportation Commission (CTC) recently wrote that the fuel tax currently contributes nothing to road construction **and only provides half of the money needed annually for repairs:**

<http://www.nctimes.com/articles/2009/02/09/news/columnists/downey/z8591536f3e7332da882575510076fa1e.txt>

Increasing the state gas and diesel taxes, unchanged at 18-cents per gallon since 1994—when the final one-cent increase mandated by Proposition 111 (June, 1990 that doubled the nine-cent excise fuel tax over a 5-year period) was added, is long overdue.

#### **2. The Difficulty of Raising the Fuel Tax**

To raise the fuel tax would require a 2/3<sup>rd</sup> majority vote of the legislature. In addition, according to a CNN report, <http://www.cnn.com/2009/POLITICS/02/20/driving.tax/>

“Officials including [Secretary of Transportation] LaHood have opposed raising the national gas tax, particularly in the current recession, and have said a new system is needed.”

#### **3. Use of the Fuel Sales Tax**

California has a sales tax on all consumer items sold in the state, except food and medicine. The revenues from sales taxes are generally placed in our state's general fund. However, an exception to the general rule has been made for the sales tax on gasoline and diesel. By the conditions of a successful ballot measure, the sales tax on fuel must be used to support roads, which supplements the excise tax on fuel (also known as the “gas tax”), allowing the excise tax to be lower than necessary.

#### **4. Lane Performance During Times of High Demand**

From the DOT's Freeway Management and Operations Handbook:

[http://ops.fhwa.dot.gov/freewaymgmt/publications/frwy\\_mgmt\\_handbook/fmoh\\_complete\\_all.pdf](http://ops.fhwa.dot.gov/freewaymgmt/publications/frwy_mgmt_handbook/fmoh_complete_all.pdf), Page 1-18, comes the following:

As flow increases from zero, density also increases, since more vehicles are on the roadway. When this happens, speed declines because of the interaction of vehicles.

This decline is negligible at low and medium densities and flow rates. As the density further increases, these generalized curves suggest that speed decreases significantly just before capacity is achieved, with capacity being defined as the product of density and speed resulting in the maximum flow rate. This condition is shown as optimum speed  $S_o$  (often called critical speed), optimum density  $D_o$  (sometimes referred to as critical density), and maximum flow  $V_m$ . (7). In general, this maximum flow (i.e. capacity) occurs at a speed between 35 and 50 mph.

Efficient freeway operation depends on the balance between capacity and demand. In the simplest terms, highway congestion results when traffic demand approaches or exceeds the available capacity of the highway system. As vehicle demand approaches highway capacity, traffic flow begins to deteriorate. Flow is interrupted by spots of turbulence and shock waves, which disrupt efficiency. Then, traffic flow begins to break down rapidly, followed by further deterioration of operational efficiency.

Therefore, when demand is allowed to significantly exceed capacity, the flow rate drops well below optimum. In fact, speed can drop to nearly zero. With no intervention, freeway lanes can be counted on to fail, just when they are needed the most.

### **5. Demand, Under the Condition of “Full-Cost” Pricing**

The price-setting stipulations of “An Example of a Conforming Road-Use Fee Structure”, Features 1 through 6 of Condition 1, in conjunction with Condition 2, could be described as “full cost pricing”. It is not our responsibility to do an analysis to calculate what the average price per mile would need to be or to then determine how much driving would be reduced in reaction to this price. It could be that driving would decrease so much that congestion would disappear and the new problem would be to figure out what to do with the excess land buried under unneeded highway lanes and how to meet the large new demand for transit.

### **6. Political Pushback to the Notion of Full-Cost Pricing**

There are many, well-funded “think tanks” and political figures and institutions that argue against raising the cost of driving. So far they have been largely successful in keeping the taxes on driving low.

### **7. Other Opinions That a Pure Fuel Tax Is Becoming Obsolete**

There are many indications that more decision makers are adopting the view that the fuel tax either needs to be replaced or supplemented. We have undertaken no comprehensive search and evaluation to quantify this. However the following examples are presented, with the first three being taken from the same NCT article identified in Section-1 of this Section.

First the Chair of the CTC pointed out that, “People are driving more-fuel-efficient cars and ones that run on alternative fuels and buying less gas. As a result, they are paying less in gas taxes”. The author of the NCT article states that the CTC Chair and others are calling for “phasing out the gas tax,” in favor of a VMT fee.

Second, Will Kempton, director of the California Department of Transportation, told local officials in Valley Center recently “we need to make a transition to a new way of collecting transportation funds.” Kempton also said the state should consider following the lead of Oregon, which is exploring a tax based on the number of miles a person drives.

Third, Jim Earp, a California Transportation Commission member from Roseville, added, “Either that or we’re going to have to jack up the gas tax considerably.”

Fourth, the Christian Science Monitor editorial, February 27, 2009, "A road map to better US roads," says, "Congress should heed a panel that suggests replacing a tax on gas with one on miles driven."

<http://www.csmonitor.com/2009/0227/p08s01-comv.html> It goes on to say, "In Europe, the Netherlands will transition to a VMT by 2014 and Denmark by 2016. Changing behavior is the key to 21st century transport that must unclog crowded highways and reduce dependence on fossil fuels. Taxing miles alerts drivers to the real cost of using roads and can better motivate them to drive less. A VMT (fee) is the more reliable and efficient way to pay for transport. Its time has come."

Finally, according to a CNN report, <http://www.cnn.com/2009/POLITICS/02/20/driving.tax/>, Speaking to The Associated Press, Transportation Secretary LaHood, an Illinois Republican, said, "We should look at the vehicular miles program where people are actually clocked on the number of miles that they traveled."

## **8. Raising a Road-Use Fee Could Be Done By a Simple Majority**

The Sacramento Bee printed an article by Dan Walters, on January 20<sup>th</sup>, 2009, describing a proposal to help close California's budget gap.

<http://www.nctimes.com/articles/2009/01/20/opinion/walters/zd5e9d64561b6efd78825753e006c951a.tx>.

The key elements from the article are as follows.

- 1.) Senate President Pro Tem Darrell Steinberg, the scheme's father, insists that it's legal, basing that assertion on a 5-year-old opinion from the Legislature's legal office.
- 2.) The plan would eliminate excise and sales taxes on gasoline and raise other taxes to help close the budget deficit, then "backfill" the gasoline taxes with a new "fee" that would actually increase the bite on motorists by 50 percent, from 26 cents a gallon to 39 cents. **A "fee" can be imposed by a simple majority vote as long as it relates to actual services rendered by government.**

Note that this fee approach is relatively far from meeting all of the stipulations of this letter. However, it would represent significant progress.

## **Arguments in Favor of Road Use Fees**

This Section provides an analogy demonstrating why roads should be operated for the equal benefit of all. It presents some of the consequences of the current level of our state fuel tax. It argues that a road-use fee should include a vehicle miles traveled (VMT) component and that furthermore, a component should relate to congestion pricing (i.e. needs to account for *specific* time and place of travel). A road-use fee should account for environmental impacts, should protect low-income families, and contain privacy protections. It explains why revenue from a road use fee should be used to pay an effective property tax to municipalities. It argues that this resolution offers methods that would help to alleviate the state's budget problems. It states that it is easier to discuss setting a road use fee than it is to discuss increasing an excise tax on fuel. Finally, it briefly discusses some of the emerging technologies and the relationship between technology and this resolution.

### **1. Full-Cost Pricing**

Roads should be priced so that they are no longer an economic burden on those that choose to drive less than average. Yet, it is hard to be objective about roads. Here's an analogy.

Assume that California owned a large number of 2-bedroom apartments that it allowed families to live in if they paid a tax of \$500 a month, even though the market rental value of the apartments was \$1000 a month. Clearly, the people living in the apartments are the winners and all the other citizens of California are the losers, because if the state set the price to the market value, it would have additional money that it could either use for the benefit of all citizens or it could return the money to everyone as a tax rebate. Some might note that since there are a large number of these apartments, almost everyone that wants one could get one, so those that don't live in these 2-bedroom apartments are losing out because of their own poor choice. However, since not every citizen wants to live in these apartments, the State's practice is indefensible. The correct thing for the state to do would be to allow low-income citizens to remain in the rental units at the subsidized price of \$500 a month, stop calling the price-per-month a "tax" and instead call the price-per-month a "user fee", and set the price for the families that are not low income to the market value of \$1000 per month. In this case, the low-income families remain winners. Even though all the others are losers, they are losing much less than before. This assumes that the state takes the additional earnings and uses it in a way that benefits all citizens. Buying more 2-bedroom apartments would not qualify. This analogy's original operation is similar to what California does by underpricing road use fees, as described below.

## **2. Consequences of the Current Level of Fuel Tax**

### **a. Economic Inequity**

Because our state fuel tax is too low, funds derived from taxes (and fees) that are not related to the choice of driving a car must be used to support our system of public roads. Examples are our sales tax, our income tax, our property tax, and the development fees that increase many of our costs. In effect what is happening is that money is systematically *being taken* from those that drive less and *being given* to support those that drive more.

This violates a fundamental principle of our free market system. People should pay for what they use and, conversely, people should not be forced to pay for what they do not use. It is true that we often willingly violate this principle, for some higher purpose. Education, mass transit, and Section 8 housing are good examples. However, there is no valid reason to increase driving by making it artificially cheap to drive, or for that matter, to park a car. The facts about global warming suggest quite the opposite.

### **b. Global Warming Threat and the California Example of Road-Use Pricing**

From <http://www.sandiego.edu/EPIC/ghginventory/GHG-On-Road1.pdf.pdf>, we learn that in San Diego County, emissions from on-road vehicles are about 46% of regional GHG emissions. Many world leaders know that many of our citizens have taken all of the time and cost variables into account and then built their life around their automobiles. How can we expect the world to do its part to reduce GHG emissions, if they see us unwilling to reform the way we price the use of roads, so as to conform to the basic free-market principles that we claim to hold dear?

### **c. Other Pollution**

Besides GHG emissions it is well known that on-road transportation contributes significantly (around 50% by some accounts) to our air and noise pollution. Cars cause air and water pollution directly and indirectly. This occurs when they are manufactured, when their fuel is transported and refined (refineries are, by far, the biggest cause of ground-water contamination in California), and when they are driven.

#### **d. Urban Sprawl**

The dominance of the automobile is the primary reason for our sprawling, urban land-use patterns. For example, it is well known that a simple 4-lane freeway, with frontage roads, can consume 26 acres per mile. An acre of land can only park 117 cars. Sprawl has taken valuable farm land, wet lands, and wild-life habitat. It makes it more difficult to walk or to bicycle. It also makes it more difficult to provide or to use transit.

#### **e. Summary Statement**

GHG emissions, urban sprawl and air, water, and noise pollution are made worse by making driving seem artificially inexpensive to the public. Note that for every penny earned by raising the price per mile to drive to its correct value, a penny could be cut from other taxes and fees that are unrelated to driving. Secretary of Transportation Ray LaHood's statement ("we can't raise the gas tax in a recession") shows that he misses this important point. This point has been made by the Sierra Club, as shown in <http://www.sierraclub.org/policy/conservation/trans.aspx>, where it says, of subsidies to driving, "These subsidies should be publicly scrutinized and eliminated by appropriate fuel and carbon taxes, parking and road user charges, . . ."

### **3. The Use of the Gasoline Sales Tax**

As stated in Section III. 3, currently the *sales* tax on fuel must be used for the same purposes as the *excise* tax on fuel. This is contrary to the normal rule for sales taxes, whereby sales taxes are used for general-fund purposes, unrelated to the item sold. For example, the sales taxes from running shoes are not removed from the general fund to be used to build running facilities. Likewise, the sales tax on alcoholic beverages is not separated out to be used to subsidize the building of more drinking establishments. If we are going to end our unfortunate favoritism towards roads, we need to end the practice of using the sales tax from gasoline as if it were an additional fuel excise tax. This practice would be ended if the implied recommendations of this report were enacted. The sales tax on gasoline should continue, but the tax on the sale of gasoline should go to the general fund, as does the tax on the sale of other consumer items.

### **4. Reasons to Adopt a VMT Based, Road-Use Fee**

From a Global Warming perspective, there is a hierarchy of favored transportation modes.

Mode 0: Telecommuting (no need to leave the house)

Mode 1: Walking

Mode 2: Cycling (skate boarding and any other device-aided, non-motorized transportation mode)

Mode 3: Transit

Mode 4: Electric cars or cars that get great mileage

Mode 5: Other cars

In terms of reducing pressure to expand road capacity, Modes 0, 1 and 2 are many times more desirable than even Mode 4, which is many times better than Mode 5. The point here is that as much as we want to see more electric cars and more cars that get exceptional mileage, we should not lose sight of the fact that unless all road users pay their fair share, those people using Modes 0, 1 and 2 are not being fully rewarded for not using road capacity, and this is

poor environmental policy, based on the desirability factors suggested. All cars are large, manufactured devices with a finite life. They promote sprawl. People that routinely use Modes 0, 1 and 2 have often set up their lives so that they could drive less. Those life-style choices need to be fully rewarded. The statements of Sections 2a and 2d of this Section apply.

## **5. Reasons to Adopt Road-Use Pricing Methods Tied to *Specific* VMT**

### **a. Need to Support Section II's Feature 6**

The current fuel tax is simple and, in theory it could be raised to cover the costs of driving, for those vehicles that use fuel. Alternatively, it is easy to imagine odometers that transmit their values at scheduled times to a billing computer. With vehicle-recognition schemes, implemented at the pump or within the billing computer containing odometer data, it would be possible to expand these simple methods to support Features 1 through 5, Feature 7, and Feature 8. However, these simple methods would not support congestion pricing, Feature 6, which is sufficiently important that it must be identified and supported.

### **b. Value Feature 6: Congestion Pricing**

Various names have been proposed for Feature 6, including “congestion pricing” or “convenience pricing”. Regardless of the name, it is a powerful way to reduce our society’s propensity for expanding highways. Proponents of freeway expansion frequently mention the fact that highway “gridlock” harms our public safety because it can significantly delay emergency vehicles. Individuals in society see this in personal terms. We can all imagine a need to get home to attend to a child, or to get to an emergency room. The consequences of congestion can go well beyond being just a frustrating inconvenience. Sometimes people feel that they would pay almost anything to be able to drive at higher speeds. How many people have missed a plane, or a train, or a critical business meeting, “stuck in traffic”? Besides this, lanes also often support transit. Transit success requires dependable and reasonably fast bus travel. In addition, stop and go traffic wastes fuel, increases GHG, and increases unhealthy emissions.

“Convenience Lanes” could provide an option for drivers when they feel it is worth the extra money to drive beyond congestion speeds. This pricing also provides a means to keep one or more lanes operating close to their theoretical capacity, instead of at the greatly reduced flow rate that comes when demand is large. The pricing can adjust automatically so as to keep demand below capacity, on one or more lanes. This means that congestion in parallel lanes will clear sooner than if all lanes were allowed to stay severely congested.

“Convenience Lanes” also offer the hope of significant revenue generation, if enough people are willing to, in effect, bid up the price. (This will probably happen if the price of driving is kept low enough in regular lanes that there are still times and places where congestion is significant.) Feature 6 would require that proceeds (collection minus collection costs) be used for transit systems that would tend to reduce the congestion. The lanes and roads that are parallel to the “convenience priced” lanes can be counted on to fail to carry their capacity when serious congestion strikes. Fortunately, there is no comparable effect for transit. Although it is conceivable that transit demand could exceed transit carrying capacity, when this happens, the transit can be counted on to continue to carry its full capacity.

### **c. Feature 6 and Road Price Variability**

Some roads are relatively expensive to build; others are relatively inexpensive. There is no reason we have to settle for charging the same per-mile price for all roads. Similarly, driving at different times should be priced differently. It is well understood that freeways are sized and

expanded to facilitate peak driving times. Since it is more costly to provide the added capacity needed at peak times, it is reasonable to charge peak-time drivers more. Charging more at the times that demand is high will tend to smooth out traffic demand over various times of the day.

#### **d. Feature 6 and Pollution**

Feature 6 can reduce congestion. This is important because stop-and-go traffic emits more pollution and GHG emissions than lanes operating at “optimum speed” as identified above.

#### **e. Feature 6 Supported by the CTC**

These powerful arguments have evidently been recognized by the CTC. In their *Addendum to the 2007 Regional Transportation Plan Guidelines, Addressing Climate Change and Greenhouse Gas Emissions During the RTP Process*, adopted on May 29, 2008, they provide strong support to lane pricing.

[http://www.catc.ca.gov/programs/rtp/Adopted\\_Addendum\\_2007\\_RTP\\_Guidelines.pdf](http://www.catc.ca.gov/programs/rtp/Adopted_Addendum_2007_RTP_Guidelines.pdf),

In the CTC’s Pricing Strategies Section (Page 3), the CTC instructs Metropolitan Planning Organizations to “model adding pricing **to existing lanes**, not just as a means for additional expansion. **Variable/congestion pricing should be considered.**”

Variable/congestion pricing cannot be done without Section II’s Feature 6 of its Condition 1.

#### **f. Arguments to Support Road-Pricing Guideline**

There is widespread confusion regarding who owns existing lanes and what promises were made. Converting existing, “free” lanes to be lanes that are priced can be justified by explaining that fuel taxes have always been road-use fees and that any stated or implied promise that paying fuel tax entitled drivers, for all time forward, to drive free on the roads that the fuel taxes may have been used to fund was specious. Specifically, the claim that drivers “already paid” for roads through the payment of fuel taxes is incorrect because (i) many drivers have just started driving; (ii) many drivers that paid fuel tax for many years have died; and (iii) paying a fee to use a public road is no different than paying rent to use property and paying rent does not lead to quasi ownership. These same arguments can be used against statements supporting the idea that drivers can forever drive free over a bridge because the tolls have paid off the loan for the bridge.

### **6. Reasons for Features 2 – 5**

These features charge vehicles for their environmental impacts.

### **7. Reasons for Feature 7**

The ability of low-income families to be able to drive to work and other essential family errands must be protected. However, given our challenge of global warming, this needs to be “constructive charity”. The features shown in Section II suggest that a billing computer will probably be involved. If so, that computer’s database can, perhaps at the individual’s discretion, be supported with information such as current housing details, current salary, job location, occupation and job skills to include a full resume, childcare, location of family and friends, hobbies, or recreational pursuits, and other items that could be related to the individual’s current need to drive. When the software determines that the person qualifies for a reduced multiplier of the full cost of driving (a subsidy), it could then also run various programs to offer, in creative, tailored, form letters, suggestions for changing circumstances to reduce driving. This could involve a search for jobs, a search for suitable housing, a search for daycare, and a search for better locations to pursue hobbies or recreational pursuits. The

availability of transit would be considered in the software and would be offered. Job training could be suggested or offered at a discount. If circumstances support it, the person could also be asked if they would be interested in a class on riding a bicycle in traffic. Taking such a class could earn the person a financial award, perhaps to include a new or used bicycle. The software would put a high priority on helping the person achieve a lifestyle that requires less driving. As a last resort the software would take into account the congestion level of various routes and offer a driving route that requires a reduced subsidy. If no billing computer is involved, the person receiving the subsidy might be required to send in data to support the running of these programs to reduce driving and the subsidy to driving.

## **8. Reasons for Feature 8**

Privacy must be protected, unless confidential disclosure to law enforcement agencies is ordered by a judge based on reasonable cause. We currently rely on laws and judges to protect our privacy regarding what we say on the telephone, our emails, our internet activities, and the information we provide on our tax forms. This information could be both politically revealing and highly embarrassing, to the point where it could seriously degrade our personal and professional lives. In terms of protecting our democracy, it is especially important that our political activities be protected. Where we drive and park a car is also somewhat sensitive in this regard. However, in most cases it is less sensitive than our emails and what we say on the phone. Cell phone companies already have information about our travel. Many locations, such as Dallas, have “toll-tags” that record every time someone goes through a toll plaza and charges them accordingly. The conclusion is that the argument that many people will never accept a computer, with built in privacy protections, from having information about where we drive is overblown and not supported by the facts.

## **9. Reasons for Condition 2**

Railroads pay property tax on the land under their tracks. Utility companies pay property taxes on the land under their transmission lines. There is no reason that large highways should not pay a property tax for the land they take off the tax rolls in each community. The favored status of roads should be eliminated.

## **10. California's Budget Problem**

California currently has a large budget gap. Children may lose their health care and education cuts will probably be severe. State parks may close. Most state funding for transit may be cut. This strategy might help to reduce some of these cuts.

## **11. Raising the Fuel Tax vs. Pricing a Road-Use Fee**

There are advantages in reframing the question from should we raise the fuel tax to: Should we replace the fuel tax with a road-use fee and, if so, how should we set the price of the road-use fee? Section III. 2 showed that a 2/3rds vote is needed in the state legislature to raise a tax; while, as shown in Section III. 8, only a simple majority is needed to set and then raise a user fee. Besides this, there are a lot of common misunderstandings about our fuel taxes. Many think they are a mechanism whereby drivers somehow buy new roads. This confusion was discussed in detail in this Section's Subsection 5f. If we can move the discussion to one of how to properly set the price of road use, we will have already made large gains in framing the question to the advantage of environmentalists and everyone that recognizes that it is time to stop favoring driving.

## **12. Technology**

It is not our responsibility to pick the technologies that will ultimately be used in the implementation of the road-use pricing described. Email and phone conversations with employees of “Skymeter”, <http://www.grushhour.blogspot.com/>, indicate that they were ready to respond to a Request For Proposal (RFP) to implement VMT pricing in the Netherlands, to include every road in the country. Their proposal would have been that each car will have a GPS unit, about as large as an eye-glasses case, sitting on the dash. It will contain a database of roads and a variable set of pricing coefficients. The GPS software will determine the car’s location with sufficient accuracy so as to support software computing a running tabulation of charges, as the car is driven. They state that the final challenge was to design the software so that the unit would function when the car was being driven in the presence of GPS reflections, such as in city “canyons” which is to say around multiple large buildings. They have solved this problem with additional algorithms and have demonstrated this in the most severe conditions they could find. However, they don’t want to have to distinguish between lanes, suggesting that congestion pricing on large multi-lane roads, where pricing varies between parallel lanes, may require a Radio Frequency Identification (RFID) overlay pricing scheme, such as is currently used for “toll tags.”

There are probably several, perhaps even many, ways to accomplish road-use pricing that has the features described in this Section.

### **3.7.2 Conclusions**

The best strategies to reduce VMT are shown here, with the estimated driving reductions for each one shown in square brackets:

- Comprehensive (equitable and environmentally sound) road use fee pricing system, as could be installed by *Skymeter*; [15%]
- Unbundling the cost of car parking; [15%] (This estimate is based on Table 1 of Reference 3.)
- Good bicycle projects and bicycle education; [5%,] (This estimate should be checked by the League of American Bicyclists.)
- Stopping all freeway expansions and reconfiguring TRANSNET to be 67% for transit and 33% for road maintenance [10%]

These strategies could be implemented by 2020, not 2035, and would decrease per capita driving by a sum of at least 45% (15+15+5+10). The strategies to do this are primarily those that increase fairness for all, especially families that drive less than average.

## ABSTRACT

The *Introduction* shows documented driving reductions due to the pricing of parking. It notes that although the benefits of priced and shared parking are known, such parking has not been widely implemented, due to various concerns. It states that a solution, called “*Intelligent Parking*,” will overcome some of these concerns, because it is easy to use and naturally transparent. It asserts that this description will support a “Request for Proposal” (RFP) process. Eight background information items are provided, including how priced parking would help California achieve greenhouse gas reduction targets. A story demonstrates some of the key features of *Intelligent Parking*. Arguments for less parking, shared parking, and priced parking are made. Barriers to progress are identified. The fair pricing of parking is described. New ways to characterize transportation demand management are presented. Seven goals of *Intelligent Parking* are listed. Eleven definitions and concepts, that together define *Intelligent Parking*, are described. This includes a method to compute a baseline price of parking and how to adjust that price instantaneously to keep the vacancy above 15% (“Congestion Pricing”). An implementation strategy is described.

## INTRODUCTION:

It has been well established that appropriately priced parking will significantly reduce driving<sup>1</sup>. Most case studies presented in Table 1 are evaluations of the most general type of “car-parking cash-out”: *a program that pays employees extra money each time they get to work without driving*. They show that a price differential between using parking and not using parking will significantly reduce driving, even when transit is described as poor. Since driving *must* be reduced<sup>2</sup>, the pricing of parking is desirable.

Shared parking is also recognized as desirable because it can sometimes result in less parking being needed.

Although the advantages of pricing and sharing parking have been recognized for many years, these practices are still rare. This paper identifies some of the reasons for this lack of progress. The pricing and sharing method of this paper has a natural transparency and ease of use that would reduce many of the concerns. This paper also suggests that those governments that have the necessary resources can take the lead role in developing and implementing the described systems. These governments will recover their investments, over time.

This paper describes how parking facilities could be tied together and operated in an optimum system, named *Intelligent Parking*. The description of *Intelligent Parking* is sufficient to support a “Request for Proposal” process, leading to full implementation.

There are two distinct parts to *Intelligent Parking*. The first is how to set the price. The second is how to distribute the earnings. Briefly, the earnings go to the individuals in the group for whom the parking is built.

**Table 1      Eleven Cases of Pricing Impact on Parking Demand**

| <b>Location</b>                                              | <b>Number of Workers<br/>@ Number of Firms</b> | <b>1995 \$'s<br/>Per Mo.</b> | <b>Parking Use<br/>Decrease</b> |
|--------------------------------------------------------------|------------------------------------------------|------------------------------|---------------------------------|
| <b><i>Group A: Areas with poor public transportation</i></b> |                                                |                              |                                 |
| West Los Angeles                                             | 3500 @ 100+                                    | \$81                         | 15%                             |
| Cornell University, Ithaca, NY                               | 9000 Faculty & Staff                           | \$34                         | 26%                             |
| San Fernando Valley, Los Angeles                             | 850 @ 1                                        | \$37                         | 30%                             |
| Costa Mesa, CA                                               | Not Shown                                      | \$37                         | 22%                             |
| <b>Average for Group</b>                                     |                                                | <b>\$47</b>                  | <b>23%</b>                      |
| <b><i>Group B: Areas with fair public transportation</i></b> |                                                |                              |                                 |
| Los Angeles Civic Center                                     | 10,000+ @ "Several"                            | \$125                        | 36%                             |
| Mid-Wilshire Blvd, Los Angeles                               | 1 "Mid-Size" Firm                              | \$89                         | 38%                             |
| Washington DC Suburbs                                        | 5,500 @ 3                                      | \$68                         | 26%                             |
| Downtown Los Angeles                                         | 5,000 @ 118                                    | \$126                        | 25%                             |
| <b>Average for Group</b>                                     |                                                | <b>\$102</b>                 | <b>31%</b>                      |
| <b><i>Group C: Areas with good public transportation</i></b> |                                                |                              |                                 |
| U. of Washington, Seattle, WA                                | 50,000 employees, students                     | \$18                         | 24%                             |
| Downtown Ottawa, Canada                                      | 3,500 government staff                         | \$72                         | 18%                             |
| Bellevue, WA                                                 | 430 @ 1                                        | \$54                         | 39%*                            |
| <b>Average for Group, except Bellevue, WA Case*</b>          |                                                | <b>\$45</b>                  | <b>21%</b>                      |
| <b>Overall Average, Excluding Bellevue, WA Case*</b>         |                                                |                              | <b>25%</b>                      |

\* Bellevue, WA case was not used in the averages because its walk/bike facilities also improved and those improvements could have caused part of the decrease in driving.

## **PERTINENT BACKGROUND INFORMATION**

- Vehicle miles traveled (VMT) are a major cause of global warming and pollution<sup>2,3</sup>.
- California's Metropolitan Planning Organizations (MPOs) will need to adopt strategies that reduce vehicle miles traveled (VMT), in order to meet SB375 GHG reduction targets, to be issued by the California Air Resources Board in late 2010, for years 2020 and 2035<sup>2</sup>.
- The appropriate pricing of parking is one of the least costly documented tools to reduce VMT.
- New technologies, such as sensors feeding computer-generated billing, offer the potential to efficiently bill drivers for parking and alert law enforcement of trespassers.
- Reformed parking policies can increase fairness, so that, for example, people who use transit or walk do not have to pay higher prices or suffer reduced wages, due to parking.

- Methods to unbundle parking cost are inefficient unless they support the spontaneous sharing of parking spaces. Shared parking with unbundled cost would ultimately allow cities to require significantly less parking.
- Typical systems of timed parking and metered parking are far from ideal. Parking has no automated record keeping, so it is difficult to know where there is too much or too little.
- Good policies will eventually let cities turn parking minimums into parking maximums.

## **A GLIMPSE INTO A POSSIBLE FUTURE**

Jason is driving to work for the first time in several years. He has decided to save money by carrying home a new 3-D, big-screen computer, which he plans to purchase at a store near his office after work. He wanted to avoid paying delivery charges.

Things have been changing around his office development since they unbundled the cost of parking at the near-by train station. Many people who caught the early trains and lived close to the station stopped driving and parking in the best parking spaces; demand for housing close to the station went up; and wealthy riders, who insisted on driving, did so, confident that they could always find parking as close to the platform as their schedules required, due to congestion pricing. Who would have guessed how much those people were willing to pay? It was shocking. Parking-lot earnings, paid to round-trip train riders, meant that the net cost to ride the train went significantly down. Ridership and neighborhood vitality both went significantly up. All Jason knew was that the price to park at his office had been going up yearly because of increased land values. His parking-lot earnings from his office had been increasing almost every month, due to the ripple effect of train riders parking off-site at cheaper parking. Some of them were using his office parking.

As he pulls out of his driveway, he tells his GPS navigation unit his work hours (it already knew his office location), the location of the store where he plans to buy the computer, and his estimated arrival and departure times at the store. He tells the GPS unit he wants to park once, park no more than 1 block from the store, walk no more than 1 mile total, and pay no more than an average of \$2 per hour to park. He is not surprised to hear the GPS tell him that his request is impossible. He tells the GPS he will pay an average of \$3 per hour and learns that the GPS has located parking.

It guides him into a church parking lot. He hopes the church will use his money wisely. The GPS tells him the location of a bus stop he could use to get to work and the bus's next arrival time at the stop. With automatic passenger identification and billing, the bus has become easy to use, except that it is often crowded. Jason gets out of the car and walks to work, with no action required regarding the parking.

Three weeks later, when Jason gets his monthly statement for his charges and income for automotive road use, transit use, parking charges, and parking earnings, he finds that the day's parking did indeed cost about \$30 for the 10 total hours that he parked. He notes that the parking-lot earnings for his office parking averaged about \$10 per day that month. He then notices the parking lot earnings from the store, where he spent about \$1000 dollars. He sees that the parking-lot earnings percent for the store that month was 1.7%, giving him about \$17. So for the day, Jason only spent a net of about \$3 on parking. Then he realized that he should have had the computer delivered after all. If he would have bicycled that day, as he usually did, he would have still gotten the \$27 earnings from the two parking facilities and he would have paid nothing

for parking. So the choice to drive cost him \$30. He remembers that the delivery would have only been \$25 dollars. Oh well. He enjoyed his before-work and after-work walks.

## **THE CASE FOR LESS PARKING**

Less parking will support more compact development.<sup>1</sup> This makes walking and biking more enjoyable and less time consuming. There would certainly be less “dead space”, which is how parking lots feel to people, whether they arrive by car or not, after they become pedestrians.

Since parking can be expensive, less parking can reduce overhead costs significantly, such as leasing expense and parking-lot maintenance cost. Less overhead means more profit and less expense for everyone. A need for less parking can create redevelopment opportunities at existing developments and reduce project cost at new developments.

At new developments, car-parking costs could prevent a project from getting built.<sup>2</sup>

## **THE CASE FOR SHARED PARKING**

Shared parking for mixed uses means that less parking is needed. For example, shared parking could be used mostly by employees during the day and mostly by residents at night.

Fully shared parking means that very little parking would be off limits to anyone. In a central business district with shared parking, drivers would be more likely to park one time per visit, even when going to several locations. Pedestrian activity adds vitality to any area.

## **THE CASE FOR APPROPRIATELY-PRICED PARKING**

### **To Reduce Driving Relative to Zero Pricing**

#### ***Traditional Charging or Paying Cash-out Payments***

As shown in the Introduction, this relationship (pricing parking reduces driving) is not new.<sup>3</sup>

Using results like Table 1, at least one study<sup>4</sup> has used an assumption of widespread pricing to show how driving reductions could help meet greenhouse gas (GHG) target reductions. Dr. Silva Send of EPIC <http://www.sandiego.edu/epic/ghgpolicy/> assumes that all work locations with 100 employees or more in San Diego County will implement cash-out, to result in 12% less driving to work. Currently, almost all employees in San Diego County “park for free”, unless they happen to work in a downtown core area.

---

<sup>1</sup> This is especially true of surface parking, which only accommodates 120 cars per acre.

<sup>2</sup> On September 23, 2008, a panel of developers reviewed the Oceanside, Ca. “Coast Highway Vision” [http://www.ci.oceanside.ca.us/pdf/chv\\_finalvisionstrategicplan.pdf](http://www.ci.oceanside.ca.us/pdf/chv_finalvisionstrategicplan.pdf). Parts of this plan were described as smart growth.

At the review, developer Tom Wiegel said, “Parking is the number 1 reason to do nothing,” where “do nothing” meant “build no project.” The other developers at the meeting agreed.

<sup>3</sup> For many years the Victoria Transport Policy Institute (VTPI) has been recognized as a source of reliable information on “Transportation Demand Management”, or TDM.

From [http://www.vtpi.org/tdm/tdm72.htm#\\_Price\\_Parking](http://www.vtpi.org/tdm/tdm72.htm#_Price_Parking):

Even a relatively small parking fee can cause significant travel impacts and provide significant TDM benefits.

“TDM Benefits” refers to the many public and private benefits of having fewer people choosing to drive.

### ***Current, Best-Practice “Unbundling”***

The “best-practice” use of the phrase, “unbundled parking cost”, is to describe the case where either the cost of parking, for the case of a condominium, or the rent for parking, for the case of an apartment, is separated from either the purchase price and common fees or the rent of the dwelling unit.

This gives the resident families the choice of selecting the number of parking spaces they would like to rent or buy, including the choice of zero. This would tend to reduce the average number of cars owned per dwelling unit and, in this way, would also tend to reduce driving. Its major drawback is that this method does not encourage sharing.

### **To Increase Fairness and Protect the US Economy**

It is stated above that almost all employees in San Diego County “park for free”. Of course there is really no such thing as “parking for free”. So-called “free parking” always reduces wages or increases costs. At a work site, it reduces everyone’s wage, even those employees that never drive. At an apartment complex, so-called “free parking” increases the rent. Therefore, “free parking” at work or at apartments violates the fundamental rule of the free market, which is that people should pay for what they use and not be forced to pay for what they do not use. Parking should at least be priced to achieve fairness to non-drivers.

The US economy would also benefit. Reductions in driving would lead to reductions in oil imports, which would reduce the US trade deficit.<sup>4</sup>

### **BARRIERS TO PROGRESS**

Given all this, it might seem that the widespread pricing of parking should have happened by now. However there are barriers. In 2007, a majority of the City Council of Cupertino, Ca. indicated that they wanted their City Manger to negotiate reduced parking requirements with any company that would agree to pay sufficient cash-out payments. To this date, no company, including Apple Inc., has expressed an interest. Most companies probably perceive cash-out as expensive. Even if they realize they could get a reduced parking requirement in exchange for paying sufficient cash-out amounts and even if the economics worked in support of this action (quite possible where land is expensive), they want to stay focused on their core business, instead of getting involved in new approaches to parking, real estate, and redevelopment.

On the other hand, simply charging for parking and then giving all the employees a pay raise is probably going to run into opposition from the employees, who will feel that they would be losing a useful benefit.

In addition, neighbors fear the intrusion of parked cars on their streets. Permit parking, which could offer protection, is not always embraced. City Council members know that a sizable fraction of voting citizens believe that there can actually never be too much “free parking”,

---

<sup>4</sup> From [http://en.wikipedia.org/wiki/Balance\\_of\\_trade#Warren\\_Buffett\\_on\\_trade\\_deficits](http://en.wikipedia.org/wiki/Balance_of_trade#Warren_Buffett_on_trade_deficits), Warren Buffet wrote in 2006,

“The U.S. trade deficit is a bigger threat to the domestic economy than either the federal budget deficit or consumer debt and could lead to political turmoil. Right now, the rest of the world owns \$3 trillion more of us than we own of them.”

Professor Shoup's famous book<sup>5</sup> notwithstanding. Some Council members probably feel that way themselves.

It doesn't help that current methods of charging for downtown parking are often very inefficient.<sup>5</sup> For example, downtown Oceanside, California has parking meters that will only accept coins. Besides this, all their on-street, downtown parking is timed, with maximums from 10 minutes to 4 hours. These time limits are enforced by a city employee, who applies chalk from a tire to the street and then records the time. However, by watching the time and moving their car soon enough, drivers can avoid getting a ticket. Of course, they could instead drive to the mall and not have to worry about having coins or elapsed time since parking. It is not surprising that downtown merchants often object to charging for parking.

In summary, those that resist charging for parking, *based on their perceptions*, include

- Companies, *who fear the complexity and expense of paying cash-out payments*;
- Employees, *who fear of losing a current benefit*;
- City leaders, *who fear the political repercussions*;
- Downtown patrons, *who dislike the inconvenience and worry*;
- Downtown business owners, *who fear that it will drive away customers*.

## **THE COST, VALUE, AND FAIR PRICE OF PARKING**

### **Estimated and Actual Capital Cost**

#### ***Surface Parking***

One acre of surface parking will accommodate 120 cars. Land zoned for mixed use is sometimes expensive. At \$1.2 million per acre, the land for a single parking space costs \$10,000.

Construction cost should be added to this to get the actual, as-built cost of each parking space. Estimated cost can be determined by using appraised land value and construction estimates. For new developments, after the parking is constructed, it is important to note the actual, as-built cost.

#### ***Parking-Garage Parking***

One acre of parking-garage will accommodate considerably more than 120 cars. The construction cost of the garage and the value of its land can be added together to get the total cost. Dividing that total cost by the number of parking spaces yields the total, as-built cost of each parking space. Adding levels to a parking garage may seem like a way to cut the cost of each parking space, for the case of expensive land. However, there is a limit to the usefulness of this strategy because the taller the parking garage, the more massive the supporting structural members must be on the lower levels, which increases total cost. Parking-garage parking spaces are often said to cost between \$20,000 and \$40,000. The actual costs should be noted.

#### ***Underground Parking***

In order to compute an estimate for the cost of a parking space that is under a building, it is necessary to get an estimate of the building cost with and without the underground parking. The difference, divided by the number of parking spaces, yields the cost of each parking space. The

---

<sup>5</sup> According to Bern Grush, Chief Scientist of Skymeter Corporation <http://www.skymetercorp.com/cms/index.php>, often two-thirds of the money collected from parking meters is used for collection and enforcement costs.

cost or value of land plays no role in the cost of this parking. However, it does not follow that this parking is cheap. Underground parking spaces are often said to cost between \$60,000 and \$90,000 dollars each. Although there will be an “as built” cost of the building with the parking, there will never be an “as built” cost of the building without the parking. However, after the construction is done, the estimate for the cost of the underground parking should be reconsidered and re-estimated if that is needed. The final, best-estimate cost should be noted.

## **Value**

Initially, value and cost are the same. For surface parking and parking-garage parking, the value would initially be the same as the as-built cost. For underground parking, the value would initially be the same as the best-estimate cost. However, over time, the value must be updated. Both construction costs and land-value costs will change. The value assigned to a parking place should always be based on the current conditions.

## **Fair Pricing**

Parking space “values”, as described above, must first be converted to a yearly price by using a reasonable conversion factor. This conversion factor could be based on either the “cost of money” or the “earnings potential of money”. It is expected that this conversion factor would be 2% to 5% during times of low interest rates and slow growth; but could be over 10% during times of high-interest and high growth. For example, if the surface parking value is \$12,000 and it is agreed upon to use 5% as the conversion factor, then each parking spot should generate \$600 per year, just to cover capital costs. The amount needed for operations, collection, maintenance, depreciation, and any special applicable tax is then added to the amount that covers capital cost. This sum is the amount that needs to be generated in a year, by the parking space.

The yearly amount of money to cover capital cost needs to be re-calculated every year or so, since both the value and the conversion factor will, in general, change each year. The cost of operations, collection, maintenance, depreciation, and any special applicable tax will also need to be reconsidered.

Once the amount generated per year is known, the base price, per unit year, can be computed by dividing it (the amount generated per year) by the estimated fraction of time that the space will be occupied, over a year. For example, if a parking space needs to generate \$900 per year but it will only be occupied 50% of the time, the time rate charge is \$1800 per year. This charge rate per year can then be converted to an hourly or even a per-minute rate. The estimated fraction of time that the parking is occupied over a year will need to be reconsidered at least yearly.

## **NEW DEFINITIONS TO PROMOTE AN OBJECTIVE VIEW OF PRICING**

- The “fair price” means the price that accounts for all costs.
- The “baseline amount of driving” means the driving that results from the application of the fair price.
- “Zero transportation demand management” (“zero TDM”) is the amount of demand management that results when the fair price is used. It will result in the baseline amount of driving.
- “Negative TDM” refers to the case where the price is set below the fair price. This will cause driving to exceed the baseline amount. Since TDM is commonly thought to be an action that reduces driving, it follows that negative TDM would have the opposite effect.
- “Positive TDM” refers to the case where the price is set above the fair price. This would cause the amount of driving to fall below the baseline amount.

Clearly, so-called “free parking” is an extreme case of negative TDM. The only way to further encourage driving would be to have a system that pays a driver for the time their car is parked.

## **THE GOALS OF *INTELLIGENT PARKING***

- There is only one agency operating all parking. (“All parking” does not include driveways and garages in single-family homes.) *Intelligent Parking* is designed and installed by regional or state government, using low-bid contractors, with design and start-up costs covered by the overhead portion of collection fees.
- Nearly all parking is shared. Almost always, anyone can park anywhere. Those who want exclusive rights to parking will pay “24/7” (all day, every day).
- Parking is operated so that the potential users of parking will escape the expense of parking by choosing to not use the parking. This characteristic is named “unbundled” because the cost of parking is effectively unbundled from other costs.
- Parking is priced and marketed to eliminate the need to drive around looking for parking.
- Parking at any desired price is made as easy as possible to find and use.
- Records of the use of each parking space are kept, to facilitate decisions to either add or subtract parking spaces.
- The special needs of disabled drivers, the privacy of all drivers, and, if desired, the economic interests of low-income drivers are protected.

## **DEFINITIONS & CONCEPTS OF *INTELLIGENT PARKING***

### **Parking Beneficiary Groups**

There are at least 7 types of beneficiary groups. Note that in all cases, members of beneficiary groups must be old enough to drive.

- 1.) People who have already paid for the capital cost of parking. An example of this type of beneficiary group would be the owners of condominiums, where parking has been built and the cost is included in the price of the condominium. Note that although they have technically already paid for the parking, if they borrowed money to pay for some portion of the price, the cost is built into their monthly payment. This illustrates why the value of parking and the cost of borrowing money (rate of return on money) are key input variables to use to compute the appropriate base, hourly charge for parking.
- 2.) People who are incurring on-going costs of parking. An example of this type of beneficiary group is a set of office workers, where the cost of “their” parking is contained in either the building lease or the cost of the building. Either way, the parking costs are reducing the wages that can be paid to these employees.<sup>6</sup>
- 3.) People who are purchasing or renting something where the cost of the parking is included in the price. Examples of this beneficiary group are people that rent hotel rooms, rent an apartment, buy items, or dine in establishments that have parking.

---

<sup>6</sup> Such parking is often said to be “for the benefit of the employees”. Defining this beneficiary group will tend to make this statement true, as opposed to the common situation where the employees benefit only in proportion to their use of the parking.

- 4.) People who own off-street parking as a business. They could be the individual investors or could be a government or government-formed entity.
- 5.) People who are said to benefit from parking, even though the money for the parking has been supplied by a source that may have very little relationship to those that are said to benefit. An example of this group would be train riders that make round trips from a station which has parking that is said to be “for riders”. Students at a school with parking would be another example.
- 6.) People who are considered by many to be the logical beneficiaries of on-street parking. Owners of single-family homes are the beneficiaries of the parking that is along the boundaries of their property. The same status is given to residents of multi-family housing.
- 7.) Governments. Since they build and maintain the streets, they should get a significant benefit from on-street parking.

## **Unbundled Cost and Spontaneous Sharing**

“Unbundled cost” means those who use the parking can see exactly what it costs and those who don’t use the parking will either avoid its cost entirely or will get earnings to make up for the hidden parking cost they had to pay. This conforms to the usual rule of the free market where a person only pays for what they choose to use. Unbundled cost is fair.

“Spontaneous sharing” means that anyone can park anywhere at any time and for any length of time. Proper pricing makes this feasible.

### ***How to Unbundle***

The method of unbundling can be simply stated, using the concept of “beneficiary group” as discussed above. First, the fair price for the parking is charged. The resulting earnings<sup>7</sup> amount is given to the members of the beneficiary group in a manner that is fair to each member. Methods are described below.

### ***Why this Supports Sharing***

Members of a beneficiary group benefit financially when “their” parking is used. They will appreciate users increasing their earnings. They are also not obligated to park in “their” parking. If there is less-expensive parking within a reasonable distance, they might park there, to save money. This is fine, because all parking is included in the *Intelligent Parking* system.

### ***Computing the Earnings for Individuals***

*Intelligent Parking* must be rigorous in paying out earnings<sup>7</sup>. For a mixed use, the total number of parking spaces must first be allocated to the various beneficiary groups. For example in an office/housing complex, 63.5% of the parking might have been sold with the office. If so, the housing portion must be paying for the other 36.5%. For this case, it would follow that the first step is to allocate 63.5% of the earnings to the workers and 36.5% to the residents.

---

<sup>7</sup> The earnings amount is the revenue collected minus the collection cost and any other costs that will have to be paid due to the implementation of *Intelligent Parking*. The costs associated with the parking, paid *before* the implementation of *Intelligent Parking*, should *not* be subtracted from the revenue because they will continue to be paid as they were before the implementation of *Intelligent Parking*. Therefore, these costs will continue to reduce wages and increase the prices of goods and services.

How the monthly earnings are divided up among the members of the beneficiary group depends on the beneficiary group type. For each member, the group's total monthly earnings amount is always multiplied by a quantity and divided by the sum (the sum is the denominator) of that quantity, for all members.

For example, for each employee, the multiplier is the number of hours that the employee worked over the month while the denominator is the total number of hours worked by all employees over the month. At a school, for each student, the numerator is the total time spent at the school, over the month, while the denominator is the sum of the same quantity, for all the students.

For a train station with parking being supplied for passengers that ride on round trips of one day or less, the numerator is the passenger's monthly hours spent on such round trips, over the month; while the denominator is the total number of hours spent by all passengers on such round trips, over the month. Radio Frequency Identification (RFID) units on passengers could support an automated calculation of monthly charges for fares, as well as monthly hours on round trips.

At a shopping center, the numerator is the sum of the money spent by the shopper, over the month, while the denominator is the total amount of money spent by all shoppers over the month.

At a condominium, the numerator is the number of parking places that were paid for (directly or indirectly) by the resident family and the denominator is the total number of parking places at the condominium project; similarly, for apartment complexes.

### ***Where Earnings Are Low***

The goal is that if someone doesn't park, they don't pay, either directly or indirectly, because the earnings that they get will balance out their losses (like reduced wages, for example). However, charging for parking that few want to use will not sufficiently compensate the people that have been forced, or are being forced, to pay for such parking. The only remedy in this case is to redevelop the parking or lease the parking in some other way, for storage, for example. The earnings from the new use should go to those that are in the beneficiary group that was associated with the low-performing parking.

### ***Why This Method of Unbundling Will Feel Familiar to Leaders***

Developers will still be required to provide parking and will still pass this cost on, as has been discussed. There will be no need to force an owner of an exiting office with parking to break his single business into two separate businesses (office and parking).

Parking beneficiaries are identified that conform to traditional ideas about who should benefit from parking.<sup>8</sup>

### ***Unbundling the Cost of On-Street Parking***

The revenue from on-street parking in front of businesses will be split evenly between the city and the business's parking beneficiaries. All of the earnings from on-street parking in front of apartments or single-family homes will be given to the resident families.<sup>9</sup>

---

<sup>8</sup> Showing exactly where parking earnings go will reduce the political difficulties of adopting pay parking in a democracy where the high cost of parking is often hidden and rarely discussed.

<sup>9</sup> Although governments own the streets, often, back in history, developers paid for them and this cost became embedded in property values. Admittedly, how to allocate on-street parking earnings is somewhat arbitrary. With

### ***Special Considerations for Condominiums***

Unbundling for a condominium owner means that, although their allocated amount of parking has added to their initial cost, their allocated amount of parking also earns money for them. Unbundling for a condominium could also mean that an owner can choose to have control over a single or several parking places. Such parking spaces could be equipped with a red light and a green light. If the red light is lit, this will mean that the space is not available for parking, except for the person who is controlling the spot. If the green light is lit, it will mean that the space is available to anyone. A space that is being reserved with a red light is charged at the full price to the condominium owner that has control over the space. The owner that controls these spaces can change the state of the parking space (available or not available) by either a phone call, on line, or at any pay station system that might be in use for the system. After condominium owners experience the cost of reserving a space for themselves, they might give up on the idea of having their own, personal, unshared parking space; especially since *Intelligent Parking* will give most owners and their guests all the flexibility they need in terms of parking their cars.

Some people think that condominium parking should be gated, for security reasons. However, parking within parking garages needs to be patrolled at the same frequency level as on-street parking, which is enough to ensure that crime around either type of parking is very rare. Cameras can help make parking garages that are open to the public safe from criminal activity.

### ***Special Considerations for Renters***

Unbundling for renters means that, although their allocated amount of parking increases their rent, their allocated amount of parking also earns money for them. Therefore, their traditional rent (includes parking) is effectively reduced by the money earned by those parking spaces allocated to them. Renters will be motivated to either not own a car or to park in a cheaper location. Parking in a cheaper location is not a problem because all parking is part of the *Intelligent Parking* system. Renters will welcome anyone to park in “their” parking, because it will increase their earnings.

### ***Special Considerations for Employers***

At first, companies may want the option of offering “free parking” to their employees so as to be able to compete with traditional job sites. This means giving employees that drive every single day an “add-in” amount of pay so that the sum of the add-in and their parking-lot earnings equals their charge, for any given monthly statement. The operator of the parking, which sends out statements, can pay out the “add in” amount, in accordance with the company’s instruction. The company will then be billed for these amounts. There could be no requirement for the company to provide any such “add-in” amount to the employees that don’t drive every day. This would allow the company to treat its every-day drivers better than other employees and so this would be a negative TDM. However, this economic discrimination would be substantially less than the current, status-quo, economic discrimination, where drivers get “free” parking and non-drivers get nothing.

## **Clusters of Parking**

Clusters are a contiguous set of parking spaces that are nearly equal in desirability and thus can be assigned the same price. They should probably consist of from 20 to 40 spaces. For off-street

parking, they could be on either side of the access lane to the parking spaces, so that an observer could see the 20 to 40 cars, and get a feel for the vacancy rate. At a train station, clusters will normally be organized so that their parking spaces are approximately an equal distance from the boarding area. On-street clusters would normally conform to our current understanding of what a block is, which is to say from one cross street to the next cross street. The width of the street and the length of the block should be taken into account in defining on-street clusters of parking and in deciding if the parking on either side of the street should or should not be in the same cluster of parking spaces.

## **Examples of Good and Bad Technology**

### ***Parking Meters or Pay Stations***

Parking meters are a relic of an earlier period, before computers. Pay stations do not add enough usefulness to merit their inclusion in *Intelligent Parking*, except as a bridge technology. Once good systems are set up, pay stations should cost additional money to use because of their expense. It would be best to devise an implementation strategy that will minimize their use when the system is first put into effect and will take them out of service as soon as possible.

### ***Radio Frequency Identification Backed Up by Video-Based “Car Present” and License Recognition***

Government will eventually enter into an RFID (Radio Frequency Identification) age. Organizers of large athletic events already have. Organizers that put on large open-water swims, foot races, and bike rides have routinely used RFID for many years.<sup>10</sup> An RFID vendor in San Diego<sup>11</sup> states that passive RFID units cost less than \$5, are reliable, are durable, and they could be used to identify cars as well as people. He also sees no problem in implementing most of the features of *Intelligent Parking*.<sup>12</sup>

### ***Automatic Data Collection and Sending Out Statements***

Note that the “back end database” of Dr. Carta’s written statement<sup>12</sup> refers to the ability to send statements of earnings and billing to students.<sup>13</sup>

---

<sup>10</sup> For example, over 20,000 people ran the 2008 Bay-to-Breakers foot race in San Francisco. Each runner had a “chip” in their shoe lace. Each runner’s start time and finish time were recorded and all results were available as soon as the last runner crossed the finish line.

<sup>11</sup> David R. Carta, PhD, CEO Telaeris Inc., 858-449-3454

<sup>12</sup> Concerning a Final Environmental Impact Report-approved and funded new high school in Carlsbad, California, where the School Board has signed a *Settlement Agreement* to consider “*unbundled parking*”, “*cash-out*”, and “*pricing*”, Dr. Carta wrote, in a January 13<sup>th</sup>, 2010 written statement to the Board,

I wanted to send a quick note discussing the technical feasibility of tracking cars into a lot without impacting students or requiring the need for gates. Mike Bullock and I have discussed this project; it can be accomplished straightforwardly by utilizing Radio Frequency Identification and/or Video Cameras integrated with automated license recognition systems. The cars would need to register with the system at the start, but it would be fairly painless for the users after the initial installation. The back end database system can also be implemented both straightforwardly and at a reasonable price.

This is not necessarily a recommendation of the proposal for unbundled parking. Rather it is strictly an unbiased view of the technical feasibility of the proposal to easily and unobtrusively track cars, both registered and unregistered, into a fixed lot.

<sup>13</sup> In an earlier email on this subject, Dr. Carta wrote,

## ***Putting it Together***

Certainly, government, and in particular transit agencies and parking agencies, could use RFID-based technology. For example, when a person with an RFID unit which is tied to a billable address or a credit card with an open account gets on a bus or a train, they should not have to pay at that time, visit a pay station, or “swipe a card” that has a positive balance. Utility customers that pay their bills are not required to pre-pay. The same courtesy should be extended to transit riders, people that drive on roads, people that get parking-lot earnings, and people that park cars. There should be one monthly bill or statement, for all four activities.

## ***Global Positioning Systems GPS***

An alternative model is to have GPS systems in cars that would detect the car’s parking location, that location’s current charge rate, and would perform all of the charging functions in the car. The only information the parking-lot-enforcement system would need is whether or not a car being parked is owned by a bill-paying owner. The car owner’s responsibility would be to pay the bills indicated by the box in the car. The box would need to process a signal that a bill had been paid. It would also need to process pricing signals.

## ***Not Picking Winners***

The purpose of this report is to describe what an ideal system would do, *not* how it is done. How a proposed system works is left to the systems, software, and hardware engineers that work together to submit a proposal based on this description of what an ideal system does.

## **Privacy**

Privacy means that no one can see where someone has parked, without a search warrant. Also, the level of the detail of information that appears on a bill is selected by the customer.<sup>14</sup>

## **Ease of Use for Drivers**

For credit-worthy drivers that have followed the rules of the system, pay parking will not require any actions other than parking. Paying for all parking fees over a month is then done in response to a monthly billing statement. Parking will feel to the consumer like a service provided by a municipality, such as water, energy, or garbage. One important difference is that users belonging to a “beneficiary group” will get an earnings amount in their monthly statement. Those that earn more than what they are charged will receive a check for the difference. This ease of use will make all parking less stressful.

## **Base Price**

### ***Off-Street***

---

This is not too tough - we probably would integrate with a service that already sends physical mail from an electronic submission instead of re-inventing this wheel.

<sup>14</sup> License plates that have no RFID tags fail to use the best technology to accomplish the primary purpose of license plates, which is to identify and help intercept cars used in a crime. Identifying cars is a legitimate government goal. Protecting privacy is also a legitimate goal. Both goals can be realized with good laws, good enforcement, and good systems engineering.

Off-street parking is priced so that even if demand does not threaten to fill the parking beyond 85%, the money generated will at least equate to an agreed-upon return on the parking value and pay all yearly costs. Equation 1 shows the calculation of the hourly rate.

$$r_{BaselineHourly} = \frac{(r_{Investment} \times v_{Parking}) + c_{YOPD}}{(n_{HoursPerYear} \times f_{TO})} \quad (\text{Eq. 1})$$

where:

|                      |   |                                                                             |
|----------------------|---|-----------------------------------------------------------------------------|
| $r_{BaselineHourly}$ | = | the computed baseline hourly rate to park                                   |
| $r_{Investment}$     | = | yearly return on investment, such as .06                                    |
| $v_{Parking}$        | = | value of a parking space, such as (parking garage) \$40,000                 |
| $c_{YOPD}$           | = | yearly operations <sup>15</sup> plus depreciation, per space, such as \$100 |
| $n_{HoursPerYear}$   | = | number of hours per year, 24 x 365 = 8760 Hours per Year                    |
| $f_{TO}$             | = | fraction of time occupied, such as 0.55.                                    |

For the example values given, the base hourly rate of parking, to cover the cost of the investment, operations<sup>15</sup>, and depreciation is \$0.519 per hour. This could be rounded up to \$0.52 per hour. This price could also be increased to result in positive TDM, to reduce driving more than the fair-price, zero-TDM amount.

### ***On-Street***

If on-street parking is located within walking distance (one-quarter mile) of off-street parking, its base price is set equal to the closest off-street parking's base price. Otherwise, it is set to some agreed-upon value, like fifty cents per hour. However, on-street parking has a special meaning for downtown merchants and for neighborhoods, two powerful political forces in any city. Merchants that have few cars parking on their street, even though it is permitted, are probably failing in their businesses. They would like free parking to help draw visitors to their store front. Neighborhoods that are not impacted by parking would probably prefer no pricing. For these reasons, for any on-street parking cluster, no price is charged until the cluster occupancy reaches 50%. (Time of day is irrelevant.)

### **Congestion Pricing**

The time-rate price of parking is dynamically set on each cluster of parking, to prevent the occupancy rate from exceeding 85% (to reduce the need to drive around looking for parking). An 85% occupancy rate (15% vacancy) results in just over one vacant parking space per city block<sup>5</sup>. If the vacancy rate is above 30%, the price is left at the baseline hourly rate. If vacancies fall below 30%, the price can be calculated in a stair-step method, such as shown in Table 2.

Equation 2 is an alternative method.

In either case, the total charge is time parked, multiplied by the time-averaged, time-rate price. The base multiplier would be adjusted to be just large enough to keep the vacancy rate from falling below a desired level, such as 15%, so it is always easy to find parking.

---

<sup>15</sup> This includes money for policing, cleaning, maintenance, any applicable parking tax, and all collection costs. Collection costs will need to include an amount to recover the development and installation costs of *Intelligent Parking*.

**Table 2 Hourly Rates for 2 Base Multipliers and a Baseline Hourly Rate of \$0.52**

| Vacancy Rate | Base Multiplier = 2 |       |             | Base Multiplier = 2.5 |          |             |
|--------------|---------------------|-------|-------------|-----------------------|----------|-------------|
|              | Multiplication      |       | Hourly Rate | Multiplication        |          | Hourly Rate |
|              | Formula             | Value |             | Formula               | Value    |             |
| Above 30%    | $2^0$               | 1     | \$0.52      | $2^{50}$              | 1        | \$0.52      |
| 25% to 30%   | $2^1$               | 2     | \$1.04      | $2^{51}$              | 2.5      | \$1.30      |
| 20% to 25%   | $2^2$               | 4     | \$2.08      | $2^{52}$              | 6.25     | \$3.25      |
| 15% to 20%   | $2^3$               | 8     | \$4.16      | $2^{53}$              | 15.625   | \$8.13      |
| 10% to 15%   | $2^4$               | 16    | \$8.32      | $2^{54}$              | 39.0625  | \$20.31     |
| 5% to 10%    | $2^5$               | 32    | \$16.64     | $2^{55}$              | 97.6563  | \$50.78     |
| Below 5%     | $2^6$               | 64    | \$33.28     | $2^{56}$              | 244.1406 | \$126.95    |

$$r_{\text{HourlyRate}} = r_{\text{BaselineHourly}} \times (B^{(30-V)/5}), \text{ for } V < 30; r_{\text{BaselineHourly}}, \text{ otherwise (Eq. 2)}$$

where:

$r_{\text{HourlyRate}}$  = the congestion-priced hourly rate to park

$r_{\text{BaselineHourly}}$  = the baseline hourly rate to park, such as \$0.52 per hour (taken from from Eq. 1.

$B$  = the base of the multiplier being computed, such as 2.50

$V$  = the vacancy rate percent, such as 17.5, for 7 vacancies in a cluster of 40 spaces,  $100 \cdot (7/40) = 17.5$

For the example values given, the hourly rate of parking would be \$9.88 per hour.

## Pricing Predictions and Notifications

Drivers will develop strategies for their routine trips. The computer system that keeps records of parking use will also provide help for users. The *Intelligent Parking* website will direct a user to an appropriate cluster of parking if the user provides the destination location or locations, the time and date, and the hourly rate they wish to pay. If the walk is going to be long, the website could suggest using transit to get from the cheaply-priced parking to the destination. In such cases, the website may also suggest using transit for the entire trip.

Another user option is to specify the time, location, and the distance the user is willing to walk. In this case, the computer would give the cheapest cluster of parking available at the specified walk distance. The price prediction would be provided.

All price predictions would also have a probability of correctness associated with them. If a user can show that a computer has predicted a much lower price than what actually occurred, with a sufficiently high probability, it would be reasonable to charge the user the predicted price rather than the actual price.

Websites could routinely inform viewers when occupancy rates are expected to be unusually high, due to a special event (for example, a sporting event). The parking system website will always give current and predicted hourly rates for all locations. The hourly rates of parking will

also be available at a phone number and possibly at pay stations. The base-price hourly rate, for any parking cluster, would be stable and could therefore be shown on signs. Parking garage entrances could have large video screens showing both predicted and existing price. Users will also learn to look at parking and judge whether congestion pricing applies, or could apply, while their car is parked. It would not be long before these capabilities are added into GPS navigation systems.

## **Prepaid RFID**

To be inclusive, pay stations or convenience stores will offer a pre-paid RFID that can be set on the dashboard of a car. This will support drivers with poor credit or drivers who have not obtained the necessary equipment to support the normal, trouble-free methods. This will also work for drivers that do not trust the system to protect their privacy for a certain trip (by removing or disabling the permanent RFID) or for all trips. No billing would occur.

## **Enforcement**

The system would notify the appropriate law enforcement agency if an unauthorized car was parked. Authorized cars would need either a pre-paid RFID or equipment indicating that their owners had *Intelligent Parking* accounts and were sufficiently paid up on their bills.

## **IMPLEMENTATION**

This description of *Intelligent Parking* will help to implement efficient parking systems. Parking at train stations, schools, and government buildings could introduce many of these concepts. This description of *Intelligent Parking* is sufficient to support a “Request for Proposal” process, which could lead to full implementation. Widespread installation should be done by a government agency, to minimize actions required on the part of the private sector. Laws would simply require the cooperation of all private-sector and government entities.

## **SUMMARY**

A parking plan, *Intelligent Parking* has been described.

1. Technology will make it easy to use for most drivers.
2. Its parking is almost always shared, to support mixed uses.
3. It unbundles cost by charging and having earnings go to the parking beneficiaries.
4. Traditional groups, such as single-family home owners, employees, tenants, train riders, and students benefit from parking. The benefit is equal for drivers and non-drivers.
5. Baseline prices are computed primarily from the value of the parking and an agreed-upon rate of return. On-street parking is free until it is half full, at which time its base price often matches that of the closest off-street parking.
6. For all parking, price is dynamically increased to guarantee availability. Earnings are therefore only limited by what people are willing to pay.
7. Technology helps drivers find parking and decide if they want to drive or use transit.
8. Prepaid RFIDs provide service to those who have poor credit or don’t want to be billed.
9. Disabled and perhaps low-income drivers will have accounts that allow them to park at reduced prices and perhaps avoid congestion pricing. Specially designated spots might also be required for disabled drivers.

10. The system will provide reports showing where additional parking would be a good investment and where it would be wise to convert existing parking to some other use.
11. Privacy will be protected. Law enforcement officials would need a search warrant to see where someone's car has been parked. The level of detail on billing would be selected by the car's owner.
12. Implementations could begin in carefully selected locations and expand.

Global warming, air pollution, trade deficits, and fairness are some of the significant reasons that governments have a responsibility to implement *Intelligent Parking*.

## ACKNOWLEDGEMENTS

The following people have offered encouragement, specific information, and/or special insights.

# Equitable and Environmentally-Sound Car-Parking Policy at a Work Site

By Mike Bullock

[mike\\_bullock@earthlink.net](mailto:mike_bullock@earthlink.net)

Aug. 30, 2015

## Introduction

This paper describes a parking policy that distributes the benefit of parking to all employees, regardless of how often they choose to drive. It does this by

- Charging a fair price for the parking, per unit of time parked, and by
- Giving the total earnings (*total parking-lot earnings*) to the employees, such that each employee's share of the *total parking-lot earnings* is proportion to the time they spend at the work site served by the parking.

The following, additional, optional action would guarantee that no driver loses money under the policy:

- Adding a *must-drive bonus* to each driver's share of the *parking-lot earnings*, if it happened that their share of the *parking-lot earnings* is less than their parking-lot charge. This means that the employee's *must-drive bonus* would be equal to their *parking-lot charge* minus their share of the *parking-lot earnings*.

If an employer decided to pay a *must-drive bonus* to its employees, it would be possible to allow employees to effectively "opt out" of the program so they would not need to be mailed the car-parking statements. The system would feel like "free parking" to them.

Reference 1 describes a more comprehensive policy that will efficiently and conveniently unbundle the cost (or the benefit) of parking in all circumstances. It is available at the following URL: <http://sierraclub.typepad.com/files/mike-bullock-parking-paper.pdf>.

The system described herein is less complex because it does not include congestion pricing, price predictions, or policies that are unique to on-street parking. These features can be eliminated, because it is assumed that there will be an adequate supply of parking, so no congestion pricing is needed; that the price can be relatively stable, so no price predictions are needed; and finally, that employees can be successfully required to park only in their employee parking, so there is no need for new, on-street parking policies, designed to protect adjoining neighborhoods from the intrusion of additional parked cars. If the adjoining neighborhoods had permit parking with a 2-hour limit for cars with no permit, very few employees would ever park in those neighborhoods, in any case.

## **Rationale**

This system of “unbundled parking cost” will allow all stakeholders to see the actual value of the parking. It will reduce single-occupancy driving to work. Less driving will reduce traffic congestion, air pollution and greenhouse gas (GHG) emissions.

Parking is expensive to provide. Therefore, if no parking had been provided, the saved money could have been invested to increase employee salaries. The method described in this paper allows employees to gain some of that lost salary back, by driving less.

Providing free or underpriced parking only benefits employees that would drive every day, even if they had a method to recover some of their lost salary.

## **Methods**

The parking is operated on the behalf of the employees, as if it were their own business. Those that drive to work are therefore their own customers.

*Charge* for parking is proportional to time parked and is charged to the employee associated with the car. (A charge rate that is acceptable to all must be established.) For example, if sixty cents per hour is selected, the charging software could round off the parking duration time to the nearest minute and apply a one-cent-per-minute charge. The data-collection method could be implemented with RFID's on cars being detected at parking-lot entrances and exits. Unauthorized cars coming into the employee parking facility would be identified with license-plate detection and, if a car belonging to a felon is driven into the parking lot, a warning notice could be sent to authorities, if this is desired by the company leaders.

*Earnings* (net revenue, minus the cost of collection and distribution) are given to the employees; in proportion to the time they spend at the work site. This could be based on an employee's schedule or, for more accuracy, could be based on “time-at-the-work-site” data, collected using personal radio frequency identification units (RFIDs) and detectors that are tied to a central, implementing computer. The variables used to compute the amount of money to be paid to an employee are shown in Table 1. The corresponding formula is shown in Figure 1.

*Parking statements* are automatically sent out monthly, showing the individual's charges and earnings. If desired, the statements could include a *must-drive bonus*, so that no driver loses money under the system. The *must drive bonus* would probably need to come from funds available for employee compensation.

## **Implementation**

Since this is a new system, it would be prudent for the company leaders to have the vendor take the full responsibility for operating the system, for the first 10 years. This arrangement would ensure that the vendor would debug the system and continue to look for operational efficiencies, over the 10 year period. A sliding scale of vendor-compensation could be specified in the contract, as follows: The vendor could operate the system for 10% of the revenue, for the first 5 years; 5% of the revenue, for the next 3 years; and 2% of the revenue, for the final 2 years. For example, if it is assumed that, on average, 600 cars are parked for 8 hours, for 200 days per year, at a rate of 50 cents per hour, then the yearly revenue would be \$480,000 per year. The vendor would therefore collect \$240,000 over the first 5 years, \$72,000 over the next 3 years, and \$28,800 over the last two years. Figure 2 shows contact information and excerpts of received emails, from a San Diego vendor. This vendor has stated that the design and installation of a fully-automated system would be easy to perform.

**Table 1      Variables Used to Compute an Employee's Monthly Earnings**

| <b>Definitions to Compute an Employee's Monthly Earnings</b> |                                                    |
|--------------------------------------------------------------|----------------------------------------------------|
| <b>T<sub>Employee</sub></b>                                  | The Employee's Monthly Time at the Work Site       |
| <b>T<sub>AllEmployees</sub></b>                              | Total Monthly Time at the Work Site, All Employees |
| <b>E<sub>AllEmployees</sub></b>                              | Total Monthly Earnings from the Employee Parking   |

**Figure 1      Formula Used to Compute an Employee's Monthly Earnings**

|                                                                         |
|-------------------------------------------------------------------------|
| $E_{Employee} = T_{Employee} * ( E_{AllEmployees} / T_{AllEmployees} )$ |
|-------------------------------------------------------------------------|

## **Introducing a New Price Differential, for Driving, Compared to Not Driving**

Table 2 shows that introducing a price differential into the choice of how often to drive will decrease the amount of driving.

## **Other Benefits**

Depending on the work site's location and the size of its access roads, there could be a substantial decrease in local congestion, improving the health of all employees and those living near the congestion. This parking policy will show neighbors that the company is working to be a good citizen. This program will encourage active transportation, meaning

modes that provide exercise for the employees. It will also teach the employees the value of parking. It is recommended that the method of determining the selected rate of charge be shared with both the employees and the community at large. This program can be thought of as a demonstration project of a new approach to parking.

Carta, Ph.D., CEO</b><br><b>TELAERIS Inc.</b><br><b>Innovative Solutions and Rapid Development</b><br><b>9123 Chesapeake Dr., San Diego, CA 92123</b><br><b>+1.858.627.9708 : Office</b><br><b>+1.858.627.9702 : Fax</b><br><b>+1.858.449.3454 : Mobile</b><br><b>e-mail: <a href="mailto:David.Carta@Telaeris.com">David.Carta@Telaeris.com</a></b><br><b>skype: davidcarta</b> | <p>I reviewed your Intelligent Parking proposal and presentation in their entirety. The identification of vehicles which you suggest for student parking using commercially available RFID technologies is a fairly straightforward process. There are numerous, inexpensive passive (no battery required) RFID tags which have been specifically designed for use on cars and trucks. These tags are installed directly on license plates or windshields, can be read from up to 30 meters away, and can be read as cars drive up to 60 mph. Additionally, automatic license recognition systems, used in conjunction with RFID, can provide a high level of enforcement making it difficult to cheat the system, similar to the Fast Track system which allows tolls to be automatically collected.</p> <p>This is not too tough - we probably would integrate with a service that already sends physical mail from a electronic submission instead of re-inventing this wheel.</p> |

### **Green House Gas Impacts**

S-3-05 is a California Governor's Executive Order to drop the state's Year 2020 levels of greenhouse gas (GHG) emissions to the state's level of 1990 emissions and to drop the state's Year 2050 level of GHG emissions to 80% *below* the state's 1990 levels. If the world were to achieve similar reductions, the earth's level of atmospheric CO2 would be capped at 450 parts per million (PPM). Figures 3, 4, and 5 show how large 450 PPM is, compared to values over the last 800 thousand years. Reference 2 shows that the goal of S-3-05 is to limit atmospheric CO2 to 450 PPM and it also shows that even if this cap is achieved, the risk of a human catastrophe caused by global warming is significant. Reference 3's Figure 1 shows that a significant reduction in driving is critically needed.

### **Conclusion**

Adopting this program would benefit the employer, the employees, and the community, in many ways. They will all gain an added understanding of economics, technology, and the power of the free-market principle that sometimes it is better to have people pay for what they use and not force people to lose money for something they don't use. All the members

of the work-place community could take pride in being part of this pioneering effort to reduce driving and greenhouse gas emissions. It would be a demonstration of the fundamental features of Reference 1. It would set an example for other employers.

**Table 2**                      **Eleven Cases of Pricing Impact on the Amount of Driving**

| Impact of Financial Incentives on Parking Demand                                                                         |                                  |                      |                      |

TIME: 03:36:00 PM

DEPT: C-72

JUDICIAL OFFICER PRESIDING: Timothy Taylor

CLERK: Patricia Ashworth

REPORTER/ERM: Not Reported

BAILIFF/COURT ATTENDANT:

CASE NO: **37-2012-00101054-CU-TT-CTL** CASE INIT.DATE: 07/20/2012

CASE TITLE: **SIERRA CLUB vs. County of San Diego [E-FILE]**

CASE CATEGORY: Civil - Unlimited CASE TYPE: Toxic Tort/Environmental

---

**APPEARANCES**

---

The Court, having taken the above-entitled matter under submission on 04/19/2013 and having fully considered the arguments of all parties, both written and oral, as well as the evidence presented, now rules as follows:

1. Overview and Procedural Posture.

In this CEQA case, this court for the second time in the last 6 months is required to address the controversial topic of global climate change. The court last addressed this subject in *Cleveland Nat'l. Forest Foundation v. SANDAG*, Case No. 2011-00101593; that case is now on appeal (D063288). As noted in its December 2012 ruling, this court recognizes it is but a way station in the life of most CEQA cases, and it seems this one will likely fit this pattern.

Because the trial courts are not final, it is important that they be prompt, and the court has done its best in that regard. The petition was filed on July 20, 2012. The case was assigned to Judge Hayes, but the Sierra Club challenged her, and the case was reassigned to Dept. 72. ROA 9, 11. The petition was promptly served. ROA 10.

The parties were first before the court on November 6, 2012, when they sought a hearing date and supplied the court with a stipulated briefing schedule. The court granted the requests. ROA 15, 16. The County filed its answer on January 9, 2013 (ROA 19), and the briefing began in February, 2013. ROA 21-25. The 4300+ page Certified Administrative Record (AR) is contained on a compact disk which was lodged on April 4 (the CD lodged with the opening brief, ROA 22, was either blank or incompatible with the court's aging desktop computers). The court has reviewed the briefing and the record.

Sierra Club contends that the County's June 20, 2012 "Climate Action Plan" (CAP), which is AR 002-126, is insufficient and violates CEQA in several respects: it does not comply with mitigation measures spelled out in the County's 2011 Program EIR (PEIR), adopted in connection with the 2011

General Plan Update (GPU)(AR 0441 ff); it fails to satisfy the requirements for adopting thresholds of significance for greenhouse gas emissions (GHG); and it should have been set forth in a stand-alone environmental document rather than in an addendum to the PEIR. The County denies these claims, and asserts the CEQA challenge is time-barred, the CAP complies with all legal requirements, the use of an addendum was appropriate, and that all relief is barred by the Sierra Club's failure to notify the AG as required by Pub. Res. Code section 21167.7. Although briefed by Sierra Club, neither standing nor exhaustion are challenged by the County.

Following publication of a tentative ruling on April 16, the case was argued on the afternoon of April 19 by Cory Briggs, Esq. on behalf of Sierra Club, and Ellen Pilsecker, Deputy County Counsel, on behalf of the County. The arguments were focused and thoughtful. Following the arguments, the court took the matter under submission. The court's ruling follows.

## 2. Overview of the CEQA Process.

### A. The Court's Role in CEQA Cases.

In *Mira Mar Mobile Community v. City of Oceanside*, 119 Cal.App.4th 477, 486 (2004) (*Mira Mar Mobile Community*), the court explained that "[i]n a mandate proceeding to review an agency's decision for compliance with CEQA, [courts] review the administrative record de novo [citation], focusing on the adequacy and completeness of the EIR and whether it reflects a good faith effort at full disclosure. [Citation.] [The court's] role is to determine whether the challenged EIR is sufficient as an information document, not whether its ultimate conclusions are correct. [Citation.]" An EIR is presumed adequate. Pub. Res. Code § 21167.3, subd. (a).

Courts review an agency's action under CEQA for a prejudicial abuse of discretion. Pub. Res. Code § 21168.5. "Abuse of discretion is established if the agency has not proceeded in a manner required by law or if the determination or decision is not supported by substantial evidence." *Id.*; see *Mira Mar Mobile Community*, supra, 119 Cal.App.4th at 486; *County of San Diego v. Grossmont-Cuyamaca Community College Dist. ("Grossmont")*, 141 Cal. App. 4th 86, 96 (2006)(same).

In defining the term "substantial evidence," the CEQA Guidelines state: " 'Substantial evidence' ... means enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached. Whether a fair argument can be made ... is to be determined by examining the whole record before the lead agency. Argument, speculation, unsubstantiated opinion[,] narrative [or] evidence which is clearly erroneous or inaccurate ... does not constitute substantial evidence." CEQA Guidelines, § 15384(a). "In applying the substantial evidence standard, [courts] resolve all reasonable doubts in favor of the administrative finding and decision. [Citation.]" *Mira Mar Mobile Community*, supra, 119 Cal.App.4th at 486; *Grossmont*, supra, 141 Cal. App. 4th at 96.

Although the lead agency's factual determinations are subject to the foregoing deferential rules of review, questions of interpretation or application of the requirements of CEQA are matters of law. While judges may not substitute their judgment for that of the decision makers, they must ensure strict compliance with the procedures and mandates of the statute. *Grossmont*, supra, 141 Cal. App. 4th at 96.

### B. The Three Steps of CEQA.

CEQA establishes "a three-tiered process to ensure that public agencies inform their decisions with

environmental considerations." Banker's Hill, et al v. City of San Diego, 139 Cal. App. 4th 249, 257 (2006)("Banker's Hill"); see also CEQA Guidelines, § 15002(k)(describing three-step process).

#### First Step in the CEQA Process.

The first step "is jurisdictional, requiring that an agency conduct a preliminary review in order to determine whether CEQA applies to a proposed activity." Banker's Hill, supra, 139 Cal. App. 4th at 257; see also Guidelines, § 15060. The Guidelines give the agency 30 days to conduct this preliminary review. (Guidelines, § 15060.) The agency must first determine if the activity in question amounts to a "project." Muzzy Ranch Co. v. Solano County Airport Land Use Com. (2007) 41 Cal.4th 372, 380. "A CEQA ...project falls into one of three categories of activity which may cause either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment (§ 21065.)" Sunset Sky Ranch Pilots Assn. v. County of Sacramento (2009) 47 Cal.4th 902, 907.

As part of the preliminary review, the public agency must also determine the application of any statutory exemptions or categorical exemptions that would exempt the proposed project from further review under CEQA. See Guidelines, § 15282 (listing statutory exemptions); Guidelines, §§ 15300–15333 (listing 33 classes of categorical exemptions). The categorical exemptions are contained in the Guidelines and are formulated by the Secretary under authority conferred by CEQA section 21084(a). If, as a result of preliminary review, "the agency finds the project is exempt from CEQA under any of the stated exemptions, no further environmental review is necessary. The agency may prepare and file a notice of exemption, citing the relevant section of the Guidelines and including a brief 'statement of reasons to support the finding.' " Banker's Hill, supra, 139 Cal.App.4th at 258, citing Guidelines, §§ 15061(d), 15062(a)(3).

#### Second Step in the CEQA Process.

If the project does not fall within an exemption, the agency proceeds to the second step of the process and conducts an initial study to determine if the project may have a significant effect on the environment. (Guidelines, § 15063.) If, based on the initial study, the public agency determines that "there is substantial evidence, in light of the whole record ... that the project may have a significant effect on the environment, an environmental impact report [(EIR)] shall be prepared." [CEQA, § 21080(d).] On the other hand, if the initial study demonstrates that the project "would not have a significant effect on the environment," either because "[t]here is no substantial evidence, in light of whole record" to that effect or the revisions to the project would avoid such an effect, the agency makes a "negative declaration," briefly describing the basis for its conclusion. (CEQA, § 21080(c)(1); see Guidelines, § 15063(b)(2); Banker's Hill, supra, 139 Cal.App.4th at 259.)

The Guidelines and case law further define the standard that an agency uses to determine whether to issue a negative declaration. "[I]f a lead agency is presented with a fair argument that a project may have a significant effect on the environment, the lead agency shall prepare an EIR even though it may also be presented with other substantial evidence that the project will not have a significant effect." (Guidelines, § 15064(f)(1), italics added.) This formulation of the standard for determining whether to issue a negative declaration is often referred to as the "fair argument" standard. See Laurel Heights Improvement Assn. v. Regents of University of California, 6 Cal.4th 1112, 1134–1135 (1993). Under the fair argument standard, a project "may" have a significant effect whenever there is a "reasonable possibility" that a significant effect will occur. No Oil v. City of Los Angeles, 13 Cal.3d 68, 83-84 (1974). Substantial evidence, for purposes of the fair argument standard, includes "fact, a reasonable assumption predicated upon fact, or expert opinion supported by fact." § 21080, subd. (e)(1).

Substantial evidence is not argument, speculation, unsubstantiated opinion or narrative, evidence that is clearly inaccurate or erroneous, or evidence of social or economic impacts unrelated to physical impacts on the environment. § 21080, subd. (e)(2).

If the initial study reveals no substantial evidence that the project may have a significant environmental effect, the agency may adopt a negative declaration. Pub. Res. Code § 21080, subd. (c)(2); Guidelines, § 15070, subd. (b); Grand Terrace, supra, 160 Cal.App.4th at 1331; Save the Plastic Bag Coalition v. City of Manhattan Beach, 52 Cal. 4th 155, 175 (2011)(holding common sense is part of the substantial evidence analysis). "Alternatively, if there is no substantial evidence of any net significant environmental effect in light of revisions in the project that would mitigate any potentially significant effects, the agency may adopt [an MND]. [Citation.] [An MND] is one in which '(1) the proposed conditions "avoid the effects or mitigate the effects to a point where clearly no significant effect on the environment would occur, and (2) there is no substantial evidence in light of the whole record before the public agency that the project, as revised, may have a significant effect on the environment." (§ 21064.5 . . . )' [Citations.]" Grand Terrace, supra, at 1331-1332. The MND allows the project to go forward subject to the mitigating measures. Pub. Res. Code §§ 21064.5, 21080, subd. (c); see Grand Terrace, supra, 160 Cal. App. 4th at 1331.

### Third Step in the CEQA Process.

If no negative declaration is issued, the preparation of an EIR is the third and final step in the CEQA process. Banker's Hill, supra, 139 Cal. App. 4th at 259; Guidelines, §§ 15063(b)(1), 15080; CEQA, §§ 21100, 21151.

### C. The Environmental Impact Report.

Central to CEQA is the EIR, which has as its purpose informing the public and government officials of the environmental consequences of decisions before they are made. [Citation.] "An EIR must be prepared on any 'project' a local agency intends to approve or carry out which 'may have a significant effect on the environment.' Pub. Res. Code §§ 21100, 21151; Guidelines, § 15002, subd. (f)(1). The term 'project' is broadly defined and includes any activities which have a potential for resulting in a physical change in the environment, directly or ultimately. Pub Res. Code § 21065; Guidelines, §§ 15002, subd. (d), 15378, subd. (a); [Citation.]) The definition encompasses a wide spectrum, ranging from the adoption of a general plan, which is by its nature tentative and subject to change, to activities with a more immediate impact, such as the issuance of a conditional use permit for a site-specific development proposal." CREED v. City of San Diego, 134 Cal. App. 4th 598, 604 (2005).

"To accommodate this diversity, the Guidelines describe several types of EIR's, which may be tailored to different situations. The most common is the project EIR, which examines the environmental impacts of a specific development project. (Guidelines, § 15161.) A quite different type is the program EIR, which 'may be prepared on a series of actions that can be characterized as one large project and are related either: (1) Geographically, (2) As logical parts in the chain of contemplated actions, (3) In connection with issuance of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program, or (4) As individual activities carried out under the same authorizing statutory or regulatory authority and having generally similar environmental effects which can be mitigated in similar ways.'" Guidelines, § 15168, subd. (a); CREED, supra, 134 Cal. App. 4th at 605. As the court held in CREED, a program EIR may serve as the EIR for a subsequently proposed project only to the extent it contemplates and adequately analyzes the potential environmental impacts of the project. CREED, supra, 134 Cal. App. 4th at 615.

As noted in part 1 above, the EIR at issue in this case is of the latter variety, a PEIR.

Under CEQA, an EIR is presumed adequate (Pub. Resources Code, § 21167.3), and the plaintiff in a CEQA action has the burden of proving otherwise. (Preserve Wild Santee v. City of Santee, 210 Cal. App. 4th 260, 275 (2012), internal quotation marks omitted, quoting Concerned Citizens of South Central L.A. v. Los Angeles Unified School Dist. (1994) 24 Cal.App.4th 826, 836.) Courts review an agency's determinations and decisions for abuse of discretion. An agency abuses its discretion when it fails to proceed in a manner required by law or there is not substantial evidence to support its determination or decision. [§§ 21168, 21168.5; Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova (2007) 40 Cal.4th 412, 426-427 (2007) ("Vineyard")]. "Judicial review of these two types of error differs significantly: While [courts] determine de novo whether the agency has employed the correct procedures, 'scrupulously enforc[ing] all legislatively mandated CEQA requirements' [citation], [courts] accord greater deference to the agency's substantive factual conclusions." (Vineyard, supra, 40 Cal. 4th at 435.)

Consequently, in reviewing an EIR for CEQA compliance, courts adjust "scrutiny to the nature of the alleged defect, depending on whether the claim is predominantly one of improper procedure or a dispute over the facts." (Vineyard, supra, 40 Cal.4th at 435.) For example, where a petitioner claims an agency failed to include required information in its environmental analysis, the court's task is to determine whether the agency failed to proceed in the manner prescribed by CEQA. Conversely, where a petitioner challenges an agency's conclusion that a project's adverse environmental effects are adequately mitigated, courts review the agency's conclusion for substantial evidence. (Vineyard, supra, 40 Cal. 4th at 435.)

#### D. Further Requirements of CEQA.

In addition to the foregoing public process/decision maker information steps, the Legislature in enacting CEQA also intended to "provide certain substantive measures for protection of the environment. [Citations.] In particular, one court noted [Public Resources Code] section 21002 requires public agencies 'to deny approval of a project with significant adverse effects when feasible alternatives or feasible mitigation measures can substantially lessen such effects.' [Citation.] (Quail Botanical Gardens Foundation, Inc. v. City of Encinitas (1994) 29 Cal.App.4th 1597, 1601-1602, citing No Oil, Inc. v. City of Los Angeles (1974) 13 Cal.3d 68, 75 and Laurel Heights Improvement Assn. v. Regents of University of California (1993) 6 Cal.4th 1112, 1123 . . . ). The Legislature declared its intention in enacting CEQA "that all public agencies responsible for regulating activities affecting the environment give prime consideration to preventing environmental damage when carrying out their duties. [Citations.] CEQA is to be interpreted 'to afford the fullest possible protection to the environment within the reasonable scope of the statutory language.' " (Mountain Lion Foundation v. Fish & Game Com. (1997) 16 Cal.4th 105, 112.)

#### 3. RFJN.

Sierra Club, with its reply briefing, filed a Request for Judicial Notice to which was attached a copy of the AG's letter acknowledging receipt of a copy of the petition in July of 2012 (shortly after it was filed). The court grants the request for judicial notice under Evid. Code section 452(c) and (g). This conclusively eliminates the County's third affirmative defense and the argument under Pub. Res. Code section 21167.7 contained on pp. 14-15 of the County's brief. In fact, this argument was meritless from the outset, as Sierra Club filed a proof of service on the AG last July (ROA 8). In other words, the County's

argument that "the case file contains no indication that [the AG notification requirement] was met" was demonstrably untrue when the County's answer was filed and when its brief was filed. County Counsel forthrightly acknowledged this at the April 19 hearing.

#### 4. Discussion and Ruling.

Former Governor Schwarzenegger issued, in 2005, Executive Order S-03-05, which for the first time set a state goal of reducing greenhouse gas emissions. This Executive Order gave rise to the Global Warming Solutions Act of 2006 (AB 32), which is codified at H&S Code section 38500 et seq. Section 38550 provides:

"By January 1, 2008, the [Air Resources Board] shall, after one or more public workshops, with public notice, and an opportunity for all interested parties to comment, determine what the statewide greenhouse gas emissions level was in 1990, and approve in a public hearing, a statewide greenhouse gas emissions limit that is equivalent to that level, to be achieved by 2020. In order to ensure the most accurate determination feasible, the state board shall evaluate the best available scientific, technological, and economic information on greenhouse gas emissions to determine the 1990 level of greenhouse gas emissions."

In the 2011 PEIR for the GPU, the County concluded that the GHG and climate-change impacts from the County's own operations and from community sources were "potentially significant" both in relation to compliance with AB 32 and with regard to the updated general plan itself. AR 488 (end of first paragraph under "Summary"), 493 (end of "Summary" paragraph). Consequently, the County had to adopt a series of mitigation measures to render these impacts insignificant. AR 494-500. Among those mitigation measures was CC-1.2, which is the focus of Sierra Club's attack:

"Prepare a County Climate Change Action Plan with an update[d] baseline inventory of greenhouse gas emissions from all sources, more detailed greenhouse gas emissions reduction targets and deadlines; and a comprehensive and enforceable GHG emissions reduction measures that will achieve a 17% reduction in emissions from County operations from 2006 by 2020 and a 9% reduction in community emissions between 2006 and 2020. Once prepared, implementation of the plan will be monitored and progress reported on a regular basis." [AR 496]

The County undertook to prepare the CAP, in accordance with Mitigation Measure CC-1.2, within six months [AR 313-314]. The County did not do so; the CAP was not approved until nearly a year after the PEIR was certified.

The central questions in this case are whether the CAP was properly approved, and whether it meets the requirements of Mitigation Measure CC-1.2. Thus, the court rejects the County's first affirmative defense which is addressed on pp. 5-7 of the County's brief. These arguments are premised on the notion that because the GPU and PEIR were adopted in the summer of 2011, an action filed in July of 2012 cannot pass muster under the 180 day limitations period of Pub. Res. Code section 21167. But the court agrees with Sierra Club that the gravamen of its petition is not an attack on the PEIR, but rather an effort to enforce the PEIR's requirement of enforceable mitigation measures. The case law relied on by the County all arose in settings in which the mitigation measures themselves were challenged as inadequate, or the cases are otherwise inapplicable. This case was filed 30 days after the June 20, 2012 approval by the County of the CAP, and it is not time-barred.

Regarding the first central question identified above: the court finds the CAP should have been the subject of a supplemental EIR instead of an addendum to the PEIR that concluded the CAP is within the scope of the PEIR. (AR 16:1372, second sentence of last paragraph.) Thus, the CAP was not properly approved and violates CEQA.

There is no explanation and no substantial evidence to justify why the CAP was not subject to a supplemental EIR with public notice and opportunity for comment. There is no showing that the County properly considered whether the CAP is within the scope of the PEIR; a supplemental EIR would require the Board of Supervisors to confront this issue. Further, environmental review is necessary to ascertain whether the CAP met the necessary GHG emission reductions when considering the CAP is merely hortatory and contains no enforcement mechanism for reducing GHG emissions.

In this regard, the case has some similarities to *Center for Sierra Nevada Conservation v. County of El Dorado* (2012) 202 Cal.App.4th 1156 (County of El Dorado). That case, like this one, involved a program EIR for a general plan. *Id.* at 1175. One of the mitigation measures called for implementation of a mitigation fee program. The county later did an initial study for the fee program, and stopped short of a more complete environmental review. The court of appeal held a tiered EIR was required to examine the specific mitigation measures and fee rate, rejecting the argument that the fee program was merely implementation of the general plan. Here, the CAP "provides the specific details associated with the ... General Plan ... strategies and measures for greenhouse gas (GHG) emissions and reductions that were not available during program-level analysis of the General Plan" (AR 16:1357), and as such, the CAP should have been the subject of a supplemental EIR [as opposed to an IS followed by addendum to the PEIR]. Thus, the CAP was not properly approved and violated CEQA.

Turning to the second central question identified above: the court finds that even if the CAP was properly approved, it does not comport with the requirements of Mitigation Measure CC-1.2; thus, the CAP violates CEQA. In this regard, there is no substantial evidence in the AR that the CAP satisfies Mitigation Measure CC-1.2; in fact, the evidence in the AR discloses the reverse is true.

For instance, the AR shows the CAP fails to meet Mitigation Measure CC-1.2 GHG emission reduction goals and targets. The CAP admits "The CAP itself does not itself ensure reductions ..." [AR 2:74]; the CAP regards its goals and strategies as mere recommendations [AR 2:27 - "The goals and strategies recommended in the CAP ..."]; and the CAP describes itself as a "living document," a "working document," and "a platform for the County to build strategies to meet its emission-reduction targets" [AR 2:15, 73.] As the court noted in its December 2012 decision, the County's adoption of the CAP occurs "in a setting in which hundreds of thousands of people in [the County] live in low-lying areas near the coast, and are thus susceptible to rising sea levels associated with global climate change." There is no time for "building strategies" or "living documents;" as the PEIR quite rightly found, enforceable mitigation measures are necessary now.

The AR shows the CAP contains no detailed deadlines for GHG emission reductions. This is borne out by the consultant who prepared the CAP for the County pointing out early on "[t]he Draft CAP neglects to describe how the County will monitor the effectiveness of the plan and its component measures over time" [AR 83:1947, last paragraph]; the County's admission "the CAP did not set such dates" [County's opposition memorandum, page 11:21-22]; and the word "deadline" appears but once in the CAP, in describing Mitigation Measure CC-1.2 [AR 2:76.]

Further, the AR shows the CAP contains no enforcement mechanism for reducing GHG emissions. The

CAP's goals and strategies are mere recommendations [AR 2:27 - "The goals and strategies recommended in the CAP..."]; there is no indication in the CAP how the measures described for community activities (Chapter 3) and the County's operations (Chapter 4) can or will be enforced [AR 2:26-57, 59-63]; the County contends five of the CAP's twenty-seven GHG reduction measures are required under state law and thus enforceable but fails to address the other twenty-two reduction measures [County's opposition memorandum, page 9:1-8; and Exhibit A to County's opposition memorandum]; and no evidence is related in the AR that supports the "belief" of the County staffer that GHG emissions reductions can be achieved through only education and incentives [AR 20:1581 and AR 23:1629 -"It is important to note that, as currently written, none of these measures are mandates. We believe that the emission reduction can be achieved through education and incentives."]

At the April 19 argument, County Counsel suggested that some of the absent benchmarks can be found in the Minutes of the Board reflecting its approval of the CAP. Having reviewed the minutes, the court agrees with Sierra Club that the minutes do not set forth enforceable standards or create any mandatory duty that could later be enforced if not carried out.

As such, the CAP, even if it was properly approved, does not comport with the requirements of Mitigation Measure CC-1.2, and thus violates CEQA.

In view of the foregoing, the court finds it unnecessary to address the subsidiary dispute over whether the guidelines for determining thresholds of significance for GHG were adopted or not. Compare *Natter v. Palm Desert Rent Review Comm'n.*, 190 Cal. App. 3d 994, 1001 (1987); *Young v. Three for One Oil Royalties*, 1 Cal. 2d 639, 647-648 (1934).

Let a writ of mandate issue forthwith, directing respondent the County of San Diego to set aside its June 20, 2012 approval of the CAP. Counsel for petitioners is directed to forthwith submit same to the court for signature.

IT IS SO ORDERED.

COURT OF APPEAL, FOURTH APPELLATE DISTRICT

DIVISION ONE

STATE OF CALIFORNIA

SIERRA CLUB,

Plaintiff and Respondent,

v.

COUNTY OF SAN DIEGO,

Defendant and Respondent.

D064243

(Super. Ct. No. 37-2012-00101054-  
CU-TT-CTL)

APPEAL from a judgment of the Superior Court of San Diego County, Timothy Taylor, Judge. Affirmed.

Thomas E. Montgomery, County Counsel, and C. Ellen Pilsecker, Chief Deputy County Counsel, for Defendant and Appellant.

Law Office of Malinda R. Dickenson, Malinda R. Dickenson; Chatten-Brown & Carstens, Douglas P. Carstens and Josh Chatten-Brown for Plaintiff and Respondent.

This action arises out of the County of San Diego's (County's) 2011 general plan update, wherein the County issued a program environmental impact report (PEIR), and adopted various related mitigation measures. In this action the Sierra Club sought, in a

petition for writ of mandate, to enforce one mitigation measure adopted by the County: the Climate Change Mitigation Measure CC-1.2 (Mitigation Measure CC-1.2). With Mitigation Measure CC-1.2, the County committed to preparing a climate change action plan with "more detailed greenhouse gas [GHG] emissions reduction [GHG] targets and deadlines" and "comprehensive and enforceable GHG emissions reductions measures that will achieve" specified quantities of GHG reductions by the year 2020.

However, the Sierra Club alleged that instead of preparing a climate change action plan that included comprehensive and enforceable GHG emission reduction measures that would achieve GHG reductions by 2020, the County prepared a climate action plan (CAP) as a plan-level document that expressly "does not ensure reductions." The County also developed associated guidelines for determining significance (Thresholds).

According to the Sierra Club, review of the CAP and Thresholds project under the California Environmental Quality Act (CEQA) (Pub. Resources Code, § 21000 et seq.) was performed after the fact, using an addendum to the general plan update PEIR, without public review, without addressing the concept of tiering, without addressing the County's failure to comply with the express language of Mitigation Measure CC-1.2, and without a meaningful analysis of the environmental impacts of the CAP and Thresholds project.

The court granted the petition, concluding that the County's CAP did not comply with the requirements of Mitigation Measure CC-1.2 and thus violated CEQA. The court found that the CAP did not contain enforceable GHG reduction measures that would achieve the specified emissions reductions.

The County appeals, asserting (1) the statute of limitations bars the claim that the mitigation measures are not enforceable; (2) the CAP met the requirements of Mitigation Measure CC-1.2; and (3) that the trial court erred in finding that a supplemental EIR was required. We affirm.

## FACTUAL AND PROCEDURAL BACKGROUND

### *A. Executive Order S-3-05*

In 2005 then-California Governor Arnold Schwarzenegger issued Executive Order No. S-3-05,<sup>1</sup> which acknowledged California's vulnerability to the effects of climate change and established targets for reducing GHG emissions in California over time. Specifically, Executive Order No. S-3-05 set statewide targets for three points in time: 2010, 2020, and 2050. The target for 2010 (2010 Target) was to reduce emissions to the levels they were at in the year 2000. The target for 2020 is to reduce emissions to the levels they were at in 1990 (2020 Target). The target for 2050 is that emissions be 80 percent below the levels they were at in 1990 (2050 Target).

Executive Order No. S-3-05 was based on then-available climate science and represented California's share of worldwide GHG reductions necessary to stabilize climate. As the Attorney General explained, "Executive Order [No.] S-3-05 is an official policy of the State of California, established by gubernatorial order in 2005, and designed to meet the environmental objective that is relevant under CEQA (climate stabilization)."

---

<sup>1</sup> On March 24, 2014, the County requested that we take judicial notice of Executive Order No. S-3-05. We grant that request.

*B. The Legislature Addresses the Need for GHG Emission Reductions*

In response to Executive Order No. S-3-05, the California Legislature enacted the California Global Warming Solutions Action of 2006, Assembly Bill No. 32. (Health & Saf. Code, § 38500 et seq.) Consistent with Executive Order No. S-3-05, Assembly Bill No. 32 required the California State Air Resources Board (CARB) to determine 1990 levels of GHG emissions and then to establish "a statewide greenhouse gas emissions limit that is equivalent to that level, to be achieved by 2020." (Health & Saf. Code, § 38550.) Assembly Bill No. 32 also stated that GHG reductions must continue after 2020, requiring that the statewide greenhouse gas emissions limit established by CARB "remain in effect unless otherwise amended or repealed" (Health & Saf. Code, § 38551, subd. (a)) and further that "[i]t is the intent of the Legislature that the statewide greenhouse gas emissions limit continue in existence and be used to maintain and continue reductions in emissions of greenhouse gases beyond 2020." (Health & Saf. Code, § 38551, subd. (b).) Assembly Bill No. 32 also required that CARB "prepare and approve a scoping plan [for] achieving the maximum technologically feasible and cost-effective reductions in greenhouse gas emissions by 2020." (Health & Saf. Code, § 38561, subd. (a).)

In December 2008 CARB approved the scoping plan. The scoping plan "identifies California's cities and counties as 'essential partners' within the overall statewide effort, and recommends that local governments set a GHG reduction target of 15% below 2005-2008 levels by 2020." Thus, it was acknowledged that CARB would accept this target as a substitute for the 1990 level referenced in Assembly Bill No. 32 and Executive Order No. S-3-05.

### *C. The County's General Plan Update PEIR*

The County acknowledged in the general plan update PEIR that it needed to "reduce GHG emissions to 1990 levels by 2020" and that changes were required both in the community and in the County's operations, buildings, vehicle fleet, and with respect to its employee commutes, water, and waste.

A GHG emissions inventory was prepared as a special appendix (Appendix K). Appendix K set forth projected emissions reductions and assumptions then-available, and promised that the "Greenhouse Gas Reduction/Climate Action Plan, which will be prepared as an implementation strategy, will further detail the County's GHG emissions and how those reductions will occur."

There was extensive public comment on the general plan update, including from the California Attorney General:

"[W]e encourage the County to (1) commit in the General Plan to adopt by a date certain a CAP with defined attributes (targets, enforceable measures to meet those targets, monitoring and reporting, and mechanisms to revise the CAP as necessary) that will be integrated into the General Plan; (2) incorporate into the General Plan interim policies to ensure that any projects considered before completion of the CAP will not undermine the objectives of the CAP; and (3) for all GHG impacts the County has designated as significant, adopt feasible mitigation measures that can be identified today and that do not require further analysis." (Fn. omitted.)

### *D. Mitigation Measures*

The County thereafter promised to take a series of additional actions. These promises took the form of a group of climate change-related mitigation measures: Mitigation Measures CC-1.1 through CC-1.19 (the Mitigation Measures). The Mitigation

Measures included requirements to update, review, and implement County programs; implement a strategic energy plan; revise the zoning ordinance; coordinate with other entities; educate the public; reduce vehicle miles traveled and encourage alternative modes of transportation; and, based thereon, to revise the County guidelines for determining significance.

The County made the following finding with regard to Mitigation Measure CC-1.2:

"[Mitigation Measure] CC-1.2 requires the preparation of a County Climate Change Action Plan within six months from the adoption date of the General Plan Update. The Climate Change Action Plan will include a baseline inventory of greenhouse gas emissions from all sources and *more detailed greenhouse gas emissions reduction targets and deadlines*. The County Climate Change Action Plan *will achieve comprehensive and enforceable GHG emissions reduction* of 17% (totaling 23,572 MTC02E) from County operations from 2006 by 2020 and 9% reduction (totaling 479,717 MTC02E) in community emissions from 2006 by 2020. Implementation of this Climate Change Action Plan will contribute to meeting the [Assembly Bill No.] 32 goals, in addition to the State regulatory requirements noted above." (Italics added.)

Mitigation Measure CC-1.2 formed the basis for Mitigation Measure CC-1.8, which required "revision of the County Guidelines for Determining Significance based on the Climate Change Action Plan."

Mitigation Measure CC-1.8, in turn, formed the basis for Mitigation Measure CC-1.7, which required that the County guidelines for determining significance anticipated by Mitigation Measure CC-1.8 incorporate CARB's recommendation for a threshold for determining significance of impacts on climate change. Should the recommendation "not be released in a timely manner," the County would "prepare its own threshold."

As required by CEQA (Pub. Res. Code, § 21081.6), the County incorporated a mitigation monitoring and reporting program (MMRP) into the general plan update PEIR.

Included in the MMRP was a promise to achieve GHG reductions by 2020 through comprehensive and enforceable GHG emission reduction measures. In addition to committing to the 2020 Target, the County also committed to compliance with the Executive Order No. S-3-05 trajectory. The County found "significant impacts associated with substantial climate-related risks" such as those "on water supply, wildfires, energy needs, and impacts to public health" would occur as a result of its general plan update. However, as a result of its commitment to adopt a CAP and Thresholds, and other mitigation measures, the County was able to make a finding that the climate change impacts anticipated by the general plan update PEIR would be avoided or substantially lessened.

#### *E. The CAP and Thresholds Project*

According to the County, the CAP was prepared for the following purposes:

1. To mitigate the impacts of climate change by achieving meaningful greenhouse gas (GHG) reductions within the County, consistent with Assembly Bill No. 32, the governor's Executive Order S-3-05, and CEQA guidelines (Cal. Code Regs., tit. 14, § 15000 et seq. [CEQA Guidelines]).
2. To allow lead agencies to adopt a plan or program that addresses the cumulative impacts of a project.
3. To provide a mechanism that subsequent projects may use as a means to address GHG impacts under CEQA.

4. To comply with the 2011 adopted County General Plan Environmental Impact Report (EIR) Mitigation Measure CC-1.2, Preparation of a Climate Action Plan.

Although compliance with Mitigation Measure CC-1.2 was one purpose of the CAP, two of the four purposes relate to preparation of the CAP as a plan-level document so that environmental review could be avoided on future projects that were determined to be below specified "thresholds." (CEQA Guidelines, § 15183.5.) However, the CAP did not mitigate climate change impacts consistent with Assembly Bill No. 32 and Executive Order No. S-3-05, did not satisfy the plan-level requirements of CEQA Guideline 15183.5, and it did not meet the requirements of Mitigation Measure CC-1.2

Instead, the CAP expressly acknowledged the possibility that "communitywide inventories will indicate that the community is not achieving its reduction targets" and admitted that the CAP "does not ensure reductions." Further, the CAP did not include a meaningful analysis of "measures that extend beyond the year 2020." Rather, the County documented that instead of continuing to reduce GHG emissions after 2020, GHG emissions allowed as a result of the general plan update were anticipated to *increase* after 2020.

The CAP and Thresholds were presented to the planning commission and the board of supervisors as "the project." The Thresholds, like the CAP, purport to expressly facilitate post-2020 development that would have significant adverse climate change impacts, without any consideration of post-2020 climate science as required by Assembly Bill No. 32 and Executive Order No. S-3-05.

#### *F. The Comment Period*

The Sierra Club submitted extensive comments to the County. In particular, the Sierra Club commented on the need to take action consistent with climate science and achieve the Assembly Bill No. 32 and Executive Order No. S-3-05 GHG emissions reductions targets. The Sierra Club also provided specific examples of feasible GHG Reduction measures that would actually reduce GHG emissions and could be adopted without delay. The Sierra Club submitted additional comments and testified at the planning commission hearing, attempted to appeal the planning commission's decision, and testified at the board of supervisors hearing.

#### *G. Proceedings Before the Planning Commission*

The final agenda for the April 27, 2012 regular meeting of the County Planning Commission Regulation Meeting made no reference to the associated Thresholds, which were also presented to the planning commission. Despite acknowledging the significant climate change effects as well as the requirements of Assembly Bill No. 32 and Executive Order No. S-3-05, staff took the position that no additional environmental review was required. The planning commission voted to adopt staff's recommendation with one addition relating to installation of electric vehicle recharging stations.

#### *H. Proceedings Before the Board of Supervisors*

The Project was placed on the agenda for the June 20, 2012 board of supervisors meeting as "County of San Diego Climate Action Plan (District: All)." The staff report and supporting documents presented to the board of supervisors included (1) the CAP, (2) the Thresholds, (3) the environmental documentation, and (4) public documentation.

The environmental documentation included a memorandum referencing "CEQA Guidelines Section 15164 Addendum to the County of San Diego General Plan Update [PEIR] (SCH 2002111067)" (Addendum) which was dated the same day as the hearing, June 20, 2012. The addendum defined the project as "the CAP and Significance Guidelines." The addendum included attachments entitled "Environmental Review Update Checklist Form" (environmental checklist) and "Environmental Review Update Checklist for County of San Diego Climate Action Plan." The environmental checklist included a determination by staff that the "new information included in the CAP and Significance Guidelines represent minor technical additions to the previously certified EIR."

At the board of supervisors hearing, staff acknowledged that "[s]tate and local measures in the climate plan are insufficient to achieve our target in 2035" and explained that the CAP measures were not required, but rather that staff "believe[d]" that "education and incentives" might produce a result.

The County also documented that GHG emissions were anticipated to *increase*, not decrease, after 2020. Staff explained that the County would not comply with Executive Order No. S-3-05 because "the State's plan right now goes out to 2020." Staff further explained to the Board of Supervisors that the Thresholds would result in a less than significant finding for greenhouse gas emissions for future development projects.

Ultimately, the board of supervisors took the following actions:

1. Adopted environmental findings including in attachment C.

2. Adopted the plan titled "County of San Diego Climate Action Plan (Attachment A)."

The only findings made by the County were the following:

1. The environmental impact report (EIR) dated August 3, 2011 on file with the Department of Planning and Land Use (DPLU) as Environmental Review Number SCH 2002111067 was completed in compliance CEQA and the State and County CEQA Guidelines and that the Board of Supervisors has reviewed and considered the information contained therein and the Addendum thereto dated June 20, 2012 on file with DPLU and attached thereto; and
2. There were no changes in the project or in the circumstances under which the project was undertaken that involved significant new environmental impacts which were not considered in the previously certified EIR dated August 3, 2011, that there was no substantial increase in the severity of previously identified significant effects, and that no information of substantial importance had become available since the EIR was certified as explained in the environmental checklist dated June 20, 2012 and attached thereto.

*I. The Sierra Club Files Suit*

The Sierra Club filed a petition for writ of mandate, challenging the June 20, 2012 approval of the CAP and Thresholds project, including the associated environmental review. The Sierra Club alleged that the CAP did not meet the requirements of Mitigation Measure CC-1.2, the Thresholds were not adopted pursuant to the requirements of CEQA Guideline section 15064.7, and that an EIR should have been prepared.

*J. The Trial Court's Decision*

The trial court determined that the CAP did not comply with the requirements for a CAP as set forth in Mitigation Measure CC-1.2, and thus violated CEQA. The trial court found that the CAP neither contained enforceable GHG reduction measures that

will achieve the specified emissions reductions, nor detailed deadlines for GHG emission reductions.

The trial court further found that the approval process violated CEQA, noting: "There is no showing that the County properly considered whether the CAP is within the scope of the PEIR" and that "environmental review is necessary to ascertain whether the CAP met the necessary GHG emission reductions when considering the CAP is merely hortatory and contains no enforcement mechanism for reducing GHG emissions."

Further, the trial court determined that whether or not the Thresholds were adopted was a subsidiary issue that did not need to be reached in light of the trial court's decision on the CAP (which formed the basis for the Thresholds) and the process by which it was approved.

## DISCUSSION

### I. *STANDARD OF REVIEW*

The Sierra Club and the County agree as to the applicable standards of review.

In reviewing the County's actions under CEQA, we must determine whether there was "a prejudicial abuse of discretion." (Pub. Resources Code, § 21168.5.) "Abuse of discretion is established if the agency has not proceeded in a manner required by law, or if the determination or decision is not supported by substantial evidence." (*Mira Mar Mobile Community v. City of Oceanside* (2004) 119 Cal.App.4th 477, 486.)

"[A] reviewing court must adjust its scrutiny to the nature of the alleged defect." (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 435 (*Vineyard*).) Challenges to an agency's failure to proceed in the

manner required by CEQA are subject to a significantly different standard of review than challenges that an agency's decision is not supported by substantial evidence. (*Ibid.*)

Where the challenge is that the agency did not proceed in the manner required by law, a court must "determine de novo whether the agency has employed the correct procedures, 'scrupulously enforc[ing] all legislatively mandated CEQA requirements.'" (*Ibid.*)

Furthermore, when a prior environmental impact report has been prepared and certified for a program or plan, the question for a court reviewing an agency's decision not to use a tiered EIR for a later project "is one of law, i.e., 'the sufficiency of the evidence to support a fair argument.'" (*Sierra Club v. County of Sonoma* (1992) 6 Cal.App.4th 1307, 1318.) "[I]f there is substantial evidence in the record that the later project may arguably have a significant adverse effect on the environment which was not examined in the prior program EIR, doubts must be resolved in favor of environmental review and the agency must prepare a new tiered EIR, notwithstanding the existence of contrary evidence." (*Id.* at p. 1319, fn. omitted.) The court "must set aside the decision if the administrative record contains substantial evidence that a proposed project might have a significant environmental impact; in such a case, the agency has not proceeded as required by law." (*Id.* at 1317.)

## II. OVERVIEW OF CEQA

"The fundamental goals of environmental review under CEQA are information, participation, mitigation, and accountability." (*Lincoln Place Tenants Assn. v. City of Los Angeles* (2007) 155 Cal.App.4th 425, 443-444 (*Lincoln Place II*).) As the California Supreme Court has explained: "If CEQA is scrupulously followed, the public will know

the basis on which its responsible officials either approve or reject environmentally significant action, and the public, being duly informed, can respond accordingly to action with which it disagrees. [Citations.] The EIR process protects not only the environment but also informed self-government." (*Laurel Heights Improvement Assn. v. Regents of the University of California* (1988) 47 Cal.3d 376, 392 (*Laurel Heights*).)

CEQA requires a public agency to prepare an environmental impact report (EIR) before approving a project that may have significant environmental effects. (Pub. Resources Code, § 21100.) The EIR is "'the heart of CEQA' . . . an 'environmental alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return.'" (*Laurel Heights, supra*, 47 Cal.3d at p. 392.)

CEQA authorizes the preparation of various kinds of environmental impact reports depending upon the situation, such as the subsequent EIR, a supplemental EIR, and a tiered EIR. (Pub. Resources Code, §§ 21166, 21068.5, 21093, 21094.) Whereas the subsequent EIR and supplemental EIR are used to analyze modifications to a particular project, a tiered EIR is used to analyze the impacts of a later project that is consistent with an EIR prepared for a general plan, policy, or program. (CEQA Guidelines, § 15385; compare Pub. Resources Code, § 21166 & CEQA Guidelines §§ 15162, 15163 & 15164 [referencing "the project"] with Pub. Resources Code, § 21093 [stating that later projects may use tiering].)

CEQA requires that "environmental impact reports shall be tiered whenever feasible." (Pub. Resources Code, § 21093, subd. (b).) Tiering means "the coverage of

general matters in broader EIRs (such as on general plans or policy statements) with subsequent narrower EIRs . . . incorporating by reference the general discussions and concentrating solely on the issues specific to the EIR subsequently prepared." (CEQA Guidelines, § 15385; Pub. Resources Code, § 21068.5.) In the context of program and plan-level EIR's, the use of tiered EIR's is mandatory for a later project that meets the requirements of Public Resources Code section 21094, subdivision (b). (Pub. Resources Code, § 21094, subd. (a).)

Another requirement of CEQA is that public agencies "should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects." (Pub. Resources Code, § 21002.) "A 'mitigation measure' is a suggestion or change that would reduce or minimize significant adverse impacts on the environment caused by the project as proposed." (*Lincoln Place II, supra*, 155 Cal.App.4th at p. 445.)

If the agency finds that mitigation measures have been incorporated into the project to mitigate or avoid a project's significant effects, a "public agency shall adopt a reporting or monitoring program for the changes made to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment. The reporting or monitoring program shall be designed to ensure compliance during project implementation." (Pub. Resources Code, § 21081.6, subd. (a)(1).)

If a mitigation measure later becomes "impracticable or unworkable," the "governing body must state a legitimate reason for deleting an earlier adopted mitigation

measure, and must support that statement of reason with substantial evidence." (*Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1509 (*Lincoln Place I*)).

### III. ANALYSIS

#### A. Statute of Limitations Defense

The County asserts that the Sierra Club's claim that the mitigation measures it adopted are not enforceable is barred by the statute of limitations because the Sierra Club should have challenged the County's approval of the general plan update EIR, not the CAP. We reject this contention.

The petition was filed 30 days after the County's June 20, 2012 approval of the CAP. In addition, the lawsuit was filed 29 days after the County filed a notice of determination (NOD). The Sierra Club's July 20, 2012 petition was timely filed 29 days after. Thus, the County triggered the 30-day statute of limitations set forth in Public Resources Code section 21167, subdivisions (b) and (e).

The Sierra Club is not challenging the validity of the general plan update PEIR or the enforceability of the mitigation measures provided in that document. Rather, the Sierra Club is challenging the project before the Board of Supervisors on June 20, 2012, and seeks to enforce a key mitigation measure set forth in the EIR and MMRP - Mitigation Measure CC-1.2.

Further, the Court of Appeal in *Lincoln Place II*, *supra*, 155 Cal.App.4th 425 rejected a similar argument to that made by the County. In that case, a tenants' association sought to compel the City of Los Angeles to enforce mitigation measures

contained in a vesting tentative tract map issued by the city. The city argued that the 180-day statute of limitations contained in Public Resources Code section 21167 for challenges to approval of projects without determining whether they have a significant effect on the environment barred the plaintiffs' action. In rejecting that action, the Court of Appeal held "[t]he statute's plain language demonstrates it has no application to this case seeking to *enforce mitigating conditions*." (*Lincoln Place II*, at p. 453, fn. 23, italics added.)

Moreover, the cases cited by the County in support of its position are inapposite. The County cites *River Valley Preservation Project v. Metropolitan Transit Development Bd.* (1995) 37 Cal.App.4th 154 and *Friends of Davis v. City of Davis* (2000) 83 Cal.App.4th 1004 for the proposition that because the time period within which to challenge the general plan update EIR has expired, the EIR is conclusively presumed to have complied with CEQA. Here, however, the Sierra Club is not challenging the general plan update EIR, but the CAP and Thresholds project, and is seeking to enforce Mitigation Measure CC-1.2.

The County's reliance upon *Environmental Council of Sacramento v. City of Sacramento* (2006) 142 Cal.App.4th 1018 and *Mount Shasta Bioregional Ecology Center v. County of Siskiyou* (2012) 210 Cal.App.4th 184 is also unavailing. The petitioners in those actions were challenging the adequacy of the mitigation measures themselves. Here, the Sierra Club does not attack the adequacy of the mitigation measure in the general plan update PEIR. To the contrary, the Sierra Club's lawsuit is in *support* of the County's past findings and promises to achieve GHG Reductions.

*B. Failure To Proceed in a Manner Required by Law*

As detailed, *ante*, implementation of Mitigation Measure CC-1.2 was only one of the purported purposes of the CAP and Thresholds project. The CAP and Thresholds project also purports to be a plan-level document for use in review of later projects.

As we shall explain, *post*, with respect to the CAP as mitigation for a plan-level document, the County failed to proceed in the manner required by CEQA by proceeding with the CAP and Thresholds project in spite of the express language of Mitigation Measure CC-1.2 that the CAP "include . . . more detailed greenhouse gas emissions reduction targets and deadlines" and that the CAP "will achieve comprehensive and enforceable GHG emissions reduction" by 2020. With respect to the CAP as a plan-level document itself, the County failed to proceed in the manner required by law by failing to incorporate mitigation measures into the CAP as required by Public Resources Code section 21081.6.

*1. The County failed to adopt a CAP that complied with the requirements of Mitigation Measure CC-1.2*

"Mitigating conditions are not mere expressions of hope." (*Lincoln Place I, supra*, 130 Cal.App.4th at p. 1508.) Once incorporated, mitigation measures cannot be defeated by ignoring them or by "attempting to render them meaningless by moving ahead with the project in spite of them." (*Lincoln Place II, supra*, 155 Cal.App.4th at p. 450.) This is true even where subsequent approvals are ministerial. (*Katzeff v. California Department of Forestry & Fire Protection* (2010) 181 Cal.App.4th 601, 614 [public agency "may not authorize destruction or cancellation of the mitigation—whether or not

the approval is ministerial—without reviewing the continuing need for the mitigation, stating a reason for its actions, and supporting it with substantial evidence"].) If a mitigation measure later becomes "impractical or unworkable," the "governing body must state a legitimate reason for deleting an earlier adopted mitigation measure, and must support that statement of reason with substantial evidence." (*Lincoln Place I, supra*, 130 Cal.App.4th at p. 1509.)

a. *The CAP does not include enforceable GHG emissions required by Mitigation Measure CC-1.2*

When it adopted the general plan PEIR, the County promised to achieve specified GHG reductions by 2020. However, when it approved the CAP and Thresholds project, the County stated that the CAP does not ensure the required GHG emissions reductions. Rather, the County described the strategies as recommendations.

Until this litigation was initiated, the County described the CAP as the most critical component of the County's climate change mitigation efforts. The CAP was intended to "provide[] the specific details associated with [the General Plan] strategies and measures for greenhouse gas (GHG) emissions reduction *that were not available* during the program-level analysis of the General Plan." (Italics added.)

The County agreed to the mitigating requirement of a CAP containing "comprehensive and enforceable GHG emissions reduction measures that will achieve" the specified GHG Reductions by 2020. This is because, as the County acknowledges, Executive Order No. S-3-05 requires consistent emissions reductions each year from

2010 through 2020 and then a greater quantity of emissions reductions each year from 2020 through 2050.

The County asserts that "[f]ive of the reduction measures incorporated into the CAP are also embodied in state or federal law" and that "CEQA permits reliance on existing regulatory standards as mitigation when it is reasonable to believe compliance will occur."

However, the County acknowledges that these measures will not, alone, achieve the specified GHG emissions reductions by 2020. In fact, the record shows that without local measures the requirements of Assembly Bill No. 32 will not be met.

Further, the record demonstrates that many of the mitigation measures set forth in the MMRP are not likely to achieve GHG emissions reductions by 2020 as promised by Mitigation Measure CC-1.2 because they are not currently funded. The record show that the County has not funded essential programs like replacing its own vehicle fleet, implementing water conservation programs, preparing town center plans, and reducing water demand. The County cannot rely on unfunded programs to support the required GHG emissions reductions by 2020, as Mitigation Measure CC-1.2 requires.

Transportation is a major concern, which the County concedes is the largest source of community GHG emissions. The Sierra Club presented evidence below that driving reductions needed to achieve Assembly Bill No. 32 and Executive Order No. S-3-05 targets are not met. The County did not dispute this evidence. The record shows that transit-related measures are either unfunded, that the County is not making meaningful

implementation efforts, and in some instances that the County is acting contrary to mitigation measures incorporated into the general plan update PEIR.

For example, two of the four transportation measures, T1 (increase transit use) and T2 (increase walking & biking), rely on at least one unfunded program. In addition, measures T1 and T2, as well as T3 (increase ridesharing), also rely on "coordination" with SANDAG and/or other entities.

In response to Sierra Club's comments relating to the effectiveness of these measures as a result of current SANDAG (San Diego Association of Governments) priorities, the County did not request funds based on the fact that it does not control how SANDAG spends its money. As the County stated, "The County does not control regional plans or allocation of regional transportation funding." This position was rejected by the Supreme Court in *City of Marina v. Board of Trustees of the California State University* (2006) 39 Cal.4th 341, 367 [holding respondent could not disclaim responsibility for making payments without first asking for funds].

The CAP's transportation section also does not include an analysis of the County's own operations, and the record appears to include contradictions even over programs over which the County has exclusive control, such as replacement of its own vehicle fleet with alternatively fueled vehicles. Although the County suggests it will implement "1 % greater efficiency per year", the County has not formally bound itself to do so. Indeed, there is no mention of potential funding sources with respect to reductions related to County operations.

b. *The CAP contains no detailed deadlines for reducing GHG emissions*

As the trial court found, the CAP contained no detailed deadlines. The County argues on appeal that the 2020 goal and the timeframes set forth in the MMRP are sufficient to meet the requirement of "more detailed . . . deadlines." However, Mitigation Measure CC-1.2 expressly required that the CAP provide more detailed deadlines. If the County did not intend for the CAP to do anything further with respect to deadlines than already set forth, the County would not have used the word "more." Indeed, in addition to not providing the promised deadlines, the CAP acknowledges that it will not be effective unless it is updated.

c. *The evidence cited by the County*

The County asserts that CAP measures will be effective because "[p]articipation rates were discussed and modified," and the "feasibility of attaining reduction targets was assessed." However, the County does not cite any evidence in the record to support its belief that people will participate in the various programs to the extent necessary to achieve the reductions asserted, or even assert that feasible measures will actually be implemented.

Rather, the County cites to entire appendices and chapters of the CAP. However, information contained in appendices are "not a substitute for "a good faith reasoned analysis."" (*Vineyard, supra*, 40 Cal.4th at p. 442.) "The audience to whom an EIR must communicate is not the reviewing court but the public and the government officials deciding on the project." (*Id.* at p. 443.)

The County also asserts that the CAP "demonstrates a [GHG emissions] reduction of 19%." However, the CAP expressly states that it does not ensure reductions. Instead, the County's evidence relates to quantification of the respective measures. Quantifying GHG reduction measures is not synonymous with implementing them. Whether a measure is effective requires more than quantification, but an assessment of the likelihood of implementation. There is no evidence in the record that the above-referenced mitigation measures will make any contribution to achieving GHG emissions reductions by 2020.

*2. The County's failure to make findings regarding the environmental impact of the CAP and Thresholds project*

Instead of analyzing and making findings regarding the environmental effects of the CAP and Thresholds project, the County made an erroneous assumption that the CAP and Thresholds project was the same project as the general plan update. (*Sierra Club, supra*, 6 Cal.App.4th at p. 1320 ["section 21166 and its companion section of the [CEQA] Guidelines appear to control only when the question is whether more than one EIR must be prepared for what is essentially the same project"].) As a result, the County failed to render a "written determination of environmental impact" before approving the CAP and Thresholds project. (*No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal.3d 68, 81; Pub. Resources Code, § 21151.) This constitutes a failure to proceed in the manner required by law. (*No Oil, supra*, 13 Cal.3d at p. 81.)

By inaccurately assuming the CAP and Thresholds project was the same project as the general plan update, the County failed to analyze the environmental impacts of the

CAP and Thresholds project itself. (*Natural Resources Defense Council, Inc. v. City of Los Angeles* (2002) 103 Cal.App.4th 268, 283 [holding CEQA violated where "no evidence that the [County] formally addressed whether or not the [] project fell within the concept of a 'tiered' EIR"].) As a result, the County never made the required findings that the effects of the CAP and Thresholds project were examined, mitigated, or avoided. (Pub. Resources Code, § 21094, subd. (a).)

The facts of the present case, as the trial court found, are similar to *Center for Sierra Nevada Conservation v. County of El Dorado* (2012) 202 Cal.App.4th 1156 (*CSNC*). In *CSNC*, the county prepared a general plan and PEIR. (*Id.* at p. 1162.) In the PEIR, one of the mitigation measures was the preparation of a management plan, including a fee program, to mitigate the general plan's impacts on oak woodland habitat. (*Id.* at p. 1163.) The initial study concluded that the project was merely an implementation of the county's general plan. (*Id.* at p. 1176.)

The Court of Appeal rejected this argument, holding that a tiered EIR was required to examine the management plan since the PEIR did not include sufficient details, rejecting the argument that the management plan was merely an implementation of the general plan. (*CSNC, supra*, 202 Cal.App.4th at pp. 1176, 1184-1185.)

The County attempts to distinguish *CSNC* by asserting the general plan update PEIR analyzed the same environmental issue addressed in the CAP. However, the record reveals that the necessary details were not available to the County at the time the general plan update PEIR was certified. Indeed, no component of the project, the CAP or the Thresholds, had even been created at the time of the general plan update.

As the Court of Appeal in *CSNC* explained:

"That the preceding 2004 program EIR contemplated adverse environmental impacts resulting from development under the 2004 General Plan does not remove the need for a tiered EIR for the oak woodland management plan. . . . Here, the specific project—the oak woodland management plan (including Option B fee program)—required a tiered EIR to examine its specific mitigation measures and fee rate." (*CSNC, supra*, 202 Cal.App.4th at p. 1184.)

The general plan update anticipated implementation of mitigation measures—CC-1.2, CC-1.7, and CC-1.8—as mitigating conditions to mitigate the adverse climate change environmental impacts of the general plan update. Those measures were analyzed in the PEIR. However, the PEIR never considered the use of the CAP and the Thresholds as a plan-level program. Thus, the environmental impacts of its use needed to be considered in an EIR. (*NRDC, supra*, 103 Cal.App.4th at p. 281 [project did not arise until after PEIR and thus was not contemplated therein].)

The County contends that the Board of Supervisors made an "implied finding" that the CAP complied with Mitigation Measure CC-1.2 and that finding is "entitled to great deference." However, "such an 'implicit finding' does not satisfy CEQA's requirement of express findings." (*Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d 1011, 1037.) "[T]he board of supervisors must make findings . . . to permit a reviewing court to bridge the analytic gap between the evidence and the ultimate decision." (*People v. County of Kern* (1976) 62 Cal.App.3d 761, 777; see *Citizens for Quality Growth v. City of Mt. Shasta* (1988) 198 Cal.App.3d 433, 442 ["passing references to the mitigation measures are insufficient to constitute a finding, as nothing in City's resolutions binds it to follow these measures"].)

Moreover, even if "implied findings" were permissible, there can be no "interpretation" of Mitigation Measure CC-1.2 contrary to its express terms. (*Southern Cal. Edison Co. v Public Utilities Com.* (2000) 85 Cal.App.4th 1086, 1105 ["an agency's interpretation of a regulation or statute does not control if an alternative reading is compelled by the plain language of the provision"]; see *Santa Clarita Organization for Planning the Environment v. City of Santa Clarita* (2011) 197 Cal.App.4th 1042, 1062 [agency's "view of the meaning and scope of its own ordinance" does not enjoy deference when it is "clearly erroneous or unauthorized"].)

3. *The County failed to proceed in the manner required by law by failing to incorporate mitigation measures directly into the CAP*

As discussed, *ante*, one of the major differences between the climate change action plan anticipated by Mitigation Measure CC-1.2 in the general plan update PEIR and the CAP and Thresholds project as prepared, is that the general plan update PEIR did not analyze the CAP as a plan-level document that itself would facilitate further development. As a plan-level document, the CAP is required by CEQA to incorporate mitigation measures directly into the CAP:

"A public agency *shall provide the measures to mitigate or avoid significant effects on the environment are fully enforceable through permit conditions, agreements, or other measures.* Conditions of project approval may be set forth in referenced documents which address required mitigation measures or, *in the case of the adoption of a plan, policy, regulation, or other public project, by incorporating the mitigation measures into the plan, policy, regulation, or project design.*" (Pub. Resources Code, § 21081.6, subd. (b), italics added.)

As authority for the assertion that it did not need to incorporate enforceable mitigation measures into the CAP directly, the County cites *Twain Harte Homeowners Assn. v. County of Tuolumne* (1982) 138 Cal.App.3d 664, 689-690. However, *Twain Harte* was decided before enactment of Public Resources Code section 21081.6, subdivision (b), which, as discussed, *ante*, requires "in the case of the adoption of a plan" that mitigation measures be fully enforceable "by incorporating the mitigation measures into the plan . . . ."

"The purpose of CEQA is not to generate paper, but to compel government at all levels to make decisions with environmental consequences in mind." (*Bozung v. Local Agency Formation Com.* (1975) 13 Cal.3d 263, 283.) By failing to consider environmental impacts of the CAP and Thresholds project, the County effectively abdicated its responsibility to meaningfully consider public comments and incorporate mitigating conditions. In addition to the example discussed, *ante*, related to transportation impacts, the Sierra Club also provided examples of mitigation implemented by other regions to mitigate the effects of climate change in the energy sector. The County neither implemented nor responded to these examples which have already been implemented elsewhere.

#### 4. *The trial court's finding that the County must prepare an EIR*

As set forth in *Lincoln Place I*, a supplemental EIR must be prepared when a public agency determines a previously adopted mitigation measure is infeasible. (*Lincoln Place I, supra*, 130 Cal.App.4th at pp. 1508-1509.) In addition, CEQA guidelines,

section 15183.5, subdivision (b)(1)(F) provides that a plan for the reduction of GHG emissions should "[b]e adopted in a public process following environmental review."

The County's failure to comply with Mitigation Measure CC-1.2 and Assembly Bill No. 32 and Executive Order No. S-3-05 supports the conclusion that the CAP and Thresholds project will have significant, adverse environmental impacts that have not been previously considered, mitigated, or avoided.

*a. Substantial evidence supports the court's finding preparation of an EIR was required*

The County asserts that the substantial evidence standard of review applies to the question of whether a supplemental EIR was required, under which deference is given to an agency's determination. (*Latinos Unidos de Napa v. City of Napa* (2013) 221 Cal.App.4th 192, 200-202.) The Sierra Club, on the other hand asserts that the "fair argument" test applies, under which "deference to the agency's determination is not appropriate and its decision not to require an EIR can be upheld only when there is no credible evidence to the contrary." (*Sierra Club, supra*, 6 Cal.App.4th at p. 1318.) We conclude that under either standard, the trial court did not err in finding a supplemental EIR was required.

The fair argument versus substantial evidence test is of no moment because, here, there is no substantial evidence in the record supporting the County's erroneous conclusion that "activities associated with the CAP and Significance Guidelines are within the scope of the General Plan Program EIR."

The County does not dispute that "to avoid serious climate change effects, atmospheric GHG concentrations need to be stabilized as quickly as possible." In fact, the County warns that expected local adverse effects of climate change include "higher temperatures, [¶] a greater number of extremely hot days, [¶] changes in the pattern and amount of precipitation, [¶] decreased water supplies accompanied by increased demand, [¶] increased wildfire risk, [¶] changes in ecosystems, and [¶] decline or loss of plant and animal species." However, the CAP and Thresholds project was approved without the appropriate environmental analysis to avoid or mitigate these consequences. As the trial court found, "environmental review is necessary to ascertain whether the CAP met the necessary GHG emission reductions when considering the CAP is merely hortatory and contains no enforcement mechanism for reducing GHG emissions."

Moreover, as the County acknowledges, the details of the CAP "were not available during program-level analysis of the General Plan." For example, the general plan update PEIR did not provide a "baseline GHG emissions inventory; detailed GHG-reduction targets and deadlines; comprehensive and enforceable GHG emissions-reduction measures; and implementation, monitoring, and reporting of progress toward the targets defined in the CAP." In 2011 the County found that implementation of mitigation measures, including CC-1.2, CC-1.7, and CC-1.8, were part of the mitigation imposed to mitigate the climate change impacts of the general plan update. It cannot be said that failing to comply with Mitigation Measure CC-1.2, Assembly Bill No. 32, and Executive Order No. S-3-05 does not change the environmental conclusions in the general plan update PEIR.

Further, the general plan update PEIR did not contemplate that preparation of the CAP and Thresholds project was at the "plan-level." As a plan-level document, the CAP and Thresholds project was required to undergo environmental review as a matter of law. (CEQA Guidelines, § 15183.5, subd. (b)(1)(F).) The general plan update PEIR also did not contemplate that as a result of the CAP, "[m]ore projects will fall below the bright line threshold, and will not have to conduct detailed analysis", much less study the environmental impact of such. County staff, the planning commission, and the board of supervisors were all aware that approving the CAP and Thresholds project would allow more projects to avoid a climate change analysis, including projects with post-2020 climate change impacts without post-2020 environmental review.

Furthermore, in 2011, the County found that climate change impacts were mitigated not only by implementation of mitigation measures, but also by "compliance with applicable regulations" including Assembly Bill No. 32 and Executive Order No. S-3-05.

By contrast, the CAP and Thresholds project now acknowledges it does not comply with Executive Order No. S-3-05. Instead of maintaining a constant rate of GHG emissions reductions after 2020, as required by Executive Order No. S-3-05, the County admits that GHG emissions will instead increase after 2020. Thus, the County's own documents demonstrate that the CAP and Thresholds project will not meet the requirements of Assembly Bill No. 32 and Executive Order No. S-3-05 and thus will have significant impacts that had not previously been addressed in the general plan update PEIR.

The explanation given to the board of supervisors for failing to address the post-2020 impacts facilitated by the CAP and Thresholds project was that "the State's plan doesn't go out that far, and it would be speculative for us to do that."

However, contrary to the County's argument that it would be "speculative" to consider the environmental impacts of the CAP, the County has acknowledged that other agencies have, in fact, been able to do so. It is an abuse of discretion to reject alternatives or mitigation measures that would reduce adverse impacts without supporting substantial evidence. (CEQA Guidelines, §§ 15043, 15093, subd. (b).) The County's assumption that considering post-2020 impacts is "speculative" is not supported by substantial evidence. (Pub. Resources Code, § 21082.2, subd. (c) ["Argument, speculation, unsubstantiated opinion or narrative, evidence which is clearly inaccurate or erroneous . . . is not substantial evidence. Substantial evidence shall include facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts."].)

The Sierra Club provided feasible mitigation measures. The County rejected these mitigation measures without substantial evidence for doing so.

In sum, the CAP does not fulfill the County's commitment under CEQA and Mitigation Measure CC-1.2, to provide detailed deadlines and enforceable measures to ensure GHGF emissions will be reduced.

DISPOSITION

The judgment is affirmed. The Sierra Club shall recover its costs on appeal.

**RE: Oraft Environmental Impact Report for 2050 Regional Transportation Plan  
and Sustainable Communities Strategy**

Dear Chairman Stocks and Honorable Members of the Board:

Attorney General Kamala D. Harris submits the following comments on the Draft Environmental Impact Report (DEIR) prepared for the San Diego Association of Governments' (SANDAG) 2050 Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS).<sup>1</sup> While we recognize the difficulty of SANDAG's task- to prepare the first SCS in the State as required by SB 375<sup>2</sup>...our review of the DEIR for the RTP/SCS has revealed some significant legal problems, as set forth below. We believe that SANDAG has the ability to correct these problems and improve the RTP/SCS, which will benefit not only the San Diego region, but will help to set the standard for other Metropolitan Planning Organizations across California.

---

<sup>1</sup> The Attorney General submits these comments pursuant to her independent power and duty to protect the environment and natural resources of the State from pollution, impairment, or destruction, and in furtherance of the public interest. (See Cal. Const., art. V, § 13; Gov. Code, §§ 12511, 12600-12612; *D'Amico v. Bd. of Medical Examiners* (1974) 11 Cal.3d 1, 14-15.) This letter is not intended, and should not be construed, as an exhaustive discussion of the DEIR's compliance with the California Environmental Quality Act (CEQA).

<sup>2</sup> Senate Bill 375 (Chapter 728, Statutes of 2008).

## Comments on the DEIR

### Localized Air Pollution

The SANDAG region has some of the most serious local air quality problems in the State and the nation - in substantial part caused by vehicle emissions. The harm from these pollutants is not necessarily distributed equally throughout the region, but may be more concentrated in communities immediately adjacent to large-scale industrial and commercial development and major transportation corridors, and may more particularly affect certain segments of the population. As discussed below, our review of the DEIR indicates that SANDAG has set too low a bar for determining whether the air quality impacts of its RTP/SCS are significant, and, further, has failed to analyze the impacts of projected increases in pollution on communities that are sensitive or already overburdened with pollution, in violation of CEQA.

#### Background: Pollutants of Concern in the San Diego Air Basin

It is well established that "[t]he significance of an activity depends upon the setting." (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 718 [citing Cal. Code Regs., tit. 14, § 15064, subd. (b)]; see also *id.* at 721.) Accordingly, the significance of any added pollutant emissions must be judged in the context of an air basin that already exceeds health-based federal air quality standards. (See *ibid.*) The San Diego area was ranked by the American Lung Association this year as having the seventh worst ozone problem, and the fifteenth worst particulate pollution problem, in the nation.<sup>3</sup> Pollutants of concern in the San Diego air basin include ozone, the chemical commonly called "smog," which may permanently decrease lung function;<sup>4</sup> and particulate matter, which impairs lung function and can exacerbate asthma. Small particulate matter (2.5 microns in size or less), a component of diesel exhaust, is of particular concern, because it can penetrate deeply into the lungs, bypassing the body's defenses, and can carry carcinogens on the surface of the particles.

The seriousness of the localized air pollution problem as it exists today in the region can hardly be overstated. The area exceeded the health-based federal ozone standard on 24 days in 2009, and it exceeded the federal particulate standard on 4 days. The basin exceeded the more stringent California standard for ozone on 127 days in 2009, and the fine-particulate standard on 78 days. The area has a history of failing to meet applicable air quality objectives. The San Diego Air Pollution Control District (APCD) stated in its 2009 Regional Air Quality Strategy (RAQS) that it has not consistently met the Health and Safety Code's 5% per year ozone reduction target during any year during the 2003-2006 time period, and that the APCD expects reductions of only about 3% per year during the 2006-2009 time period. (San Diego APCD 2009-RAQS, p. 2.)

<sup>3</sup> American Lung Association, *State of the Air 2011*, at pp. 11, 13.

<sup>4</sup> Gauderman, et al., *The Effects of Air Pollution on Lung Development from 10 to 18 Years of Age* (Sept. 9, 2004) 351 *The New England Journal of Medicine* 1057-1068.

SANDAG's Focus on "Conformity" with the State Air Pollution Plans Fails Adequately to Address the Region's Serious Air Quality Problems.

Where an area exceeds federal air quality standards for air pollutants, federal law allows funding of the individual transportation projects listed in an RTP only if the RTP "conforms" to a federally approved state plan to meet those federal standards. The DEIR's analysis of whether localized air pollution resulting from the RTP/SCS is significant under CEQA focuses almost exclusively on whether such conformity is achieved. There are significant problems with this limited approach, which substitutes a determination of whether certain federal laws are met for SANDAG's obligation under CEQA to conduct a thorough analysis of the actual effects on the air and on public health that will result from the addition of the many hundreds of miles of highway expansion and extensions that are in the RTP/SCS.

California's most recent federally approved plan was prepared in 2007, and therefore does not reflect current conditions. The DEIR acknowledges that the federal EPA is expected to soon reclassify the San Diego Air Basin as in "serious" nonattainment of the federal ozone standard, a designation that requires attainment of the federal standard by June of 2013. (DEIR, p. 4.3-6.) Demonstrating conformity with the 2007 plan emissions budgets does not, by itself, show that relevant health effects created by the new pollution generated by the RTP/SCS have been analyzed and disclosed, or even that the relevant federal standards will be met. Instead, EPA's reclassification of the air basin as having worse air quality, and the imposition of such a short deadline for meeting the federal ozone standard, indicates a more serious air pollution problem that may require more stringent control measures to protect the public health.<sup>5</sup>

In addition, the DEIR fails to analyze whether the California standard for ozone, more stringent than the federal standard, will be met during the life of the RTP/SCS, or what the RTP/SCS's contribution to current or future violations of that standard will be. The DEIR appears to rely solely on the RAQS to meet the state ozone standard. (See DEIR at p. 4.3-29-30.) Yet, as noted, the region has not consistently met the RAQS 5% per year ozone reduction target. The fact that U.S. EPA is expected to reclassify the Basin as in "serious" nonattainment of the less stringent federal ozone standard would indicate that the RAQS standards have not been enough to prevent deteriorating air quality. Thus, any assumption that the RAQS will consistently achieve the 5% reduction target in the future is unsupported, and any assertion that the RAQS will attain the state ozone standard at a time certain unfounded. A full analysis is

---

<sup>5</sup> Even if conformity with federal standards in state-approved plans were an appropriate benchmark for significance under CEQA, the DEIR does not contain a quantitative analysis, using the most recent available air quality measurements as the baseline, to determine whether the federal air quality standards will actually be met, and what the public health consequences would be of adding the expected pollutant load from the RTP/SCS to existing conditions. (DEIR, at p. 4.3-14.)

needed to show that the emissions caused by the RTP/SCS at different time points during its life will not contribute significantly to violations of the state ozone standard in the San Diego Air Basin.

SANDAG Has Failed Adequately to Address Impacts to Public Health and Communities Already Burdened with Pollution.

We commend SANDAG for including in its DEIR a chapter entitled "Environmental Justice." (DEIR, ch. 4.06.) That section appears to focus primarily on the RTP/SCS's effect on access to transit by traditionally underserved communities. SANDAG has, however, failed to analyze other equally, if not more, significant effects of the RTP/SCS on communities currently experiencing environmental justice. The principal omission of the DEIR is the lack of any discussion of the impacts of the increased air pollution that will result from carrying out the RTP/SCS on communities already severely impacted by air pollution. As noted, CEQA requires that the significance of environmental impacts be considered in context. (*Kings County Farm Bureau, supra*, 221 Cal.App.3d at 718.) Such context may appropriately include (1) whether the region includes communities or subpopulations that may be particularly sensitive to increases in pollution; and (2) whether such communities or groups are already at or near their capacity to bear any additional pollution burden.

The DEIR does not identify whether the area affected by the RTP/SCS includes particularly sensitive communities that will be affected disproportionately by the acknowledged increase in pollution. "[A] number of studies have reported increased sensitivity to pollution, for communities with low income levels, low education levels, and other biological and social factors. This combination of multiple pollutants and increased sensitivity in these communities can result in a higher cumulative pollution impact." (Office of Environmental Health Hazard Assessment, *Cumulative Impacts: Building a Scientific Foundation* (Dec. 2010), Exec. Summary at p. ix.)<sup>6</sup> Research in other parts of California has shown that disadvantaged and minority communities are often exposed to unhealthy air more frequently and at higher levels than other groups.<sup>7</sup> Identifying these communities is an essential part of describing the relevant CEQA setting.

Once such communities are identified, SANDAG must analyze how the health of the residents in these communities would be expected to be particularly affected. As discussed, residents already are experiencing serious air pollution that is impacting health and welfare, and it is reasonable to assume that these effects currently are more concentrated in certain areas of the region, for example, in communities adjacent to large-scale industrial or commercial operations or transportation corridors used by heavy-duty trucks. In addition, viewed at the individual community scale, there may be synergistic adverse effects. For example, research

<sup>6</sup> Available at <http://oehha.ca.gov/ej/cipa123110.html>.

<sup>7</sup> Hall and Brajer, *The Benefits of Meeting Federal Clean Air Standards in the South Coast and San Joaquin Valley Air Basins* (2008) at 22-23.

has shown that increases in greenhouse gas emissions may result in localized ozone increases; such increases have been observed in California.<sup>8</sup>

We believe that particulate pollution may be of special concern to already burdened communities. As discussed, diesel particulate emissions have serious health effects, since they impact respiratory function and can exacerbate asthma. Further, diesel particulates are known to the State of California to cause cancer,<sup>9</sup> and have been listed by the Air Resources Board (ARB) as a toxic air contaminant.<sup>10</sup> The DEIR shows that particulate matter pollution will increase over the life of the RTP/SCS. (DEIR, Table 4.3-5, p. 4.3-25.) It also reports that the ARB estimated in 2000 - over a decade ago - that a subset of particulate pollution, fine particulates emitted by diesel vehicles, created an additional cancer risk of 720 cancer cases per one million persons exposed in the San Diego Air Basin. (DEIR, p. 4.3-8.) For comparison purposes, a private business must provide a warning if it exposes individuals to a chemical that poses an increased cancer risk often cases in one million people exposed. (Cal. Code Regs, tit. 27, § 25703(b).)

Despite this high cancer risk, and the DEIR's own recognition that particulate pollution will increase over the life of the RTP/SCS, the DEIR does not analyze what public health effects the increase in particulate matter will cause. Nor does it estimate what portion of the increase in particulate pollution will be carcinogenic diesel particulate matter, and disclose the public health effects that increase may cause. Such an analysis is required under CEQA, so that both the decision maker and the public can know the full consequences of the decision being made. (*Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1219-1220.) We are especially concerned that no analysis is presented either of the current risk from particulate pollution, nor of the impact of the projected increase in particulate pollution, on already overburdened or sensitive communities. Given the increase in particulate emissions shown in the DEIR, given the emphasis in the RTP/SCS on the Goods Movement Strategy for the San Diego region (RTP/SCS, Chapter 6), and given the DEIR's recognition that much of this goods movement will be accomplished by diesel trucks (DEIR, p. 4-16-8; see, also, RTP/SCS, Tech. Appdx. 4, p. 4 [estimating that roads and truckways will carry 90% by volume of goods through the region]), it is incumbent on SANDAG to fully analyze the public health consequences of the RTP/SCS in general, and of the Goods Movement Strategy, in particular.<sup>11</sup>

---

<sup>8</sup> Jacobson, *Enhancement of Local Air Pollution by Urban CO<sub>2</sub> Domes* (2010) Environ. Sci. Technol. 2497-2502. This phenomenon is of concern because, as discussed, under the RTP/SCS, vehicle miles travelled (VMT) trends up as the total number of vehicles on the road increases. (DEIR, pp. 4.12-16, 4.12-21, 4.12-24; contrast with Table TA 3.1, showing an overall decrease of 1% in VMT by 2050.) Increases in VMT cause increased emissions of greenhouse gases, which may in turn exacerbate localized pollution.

<sup>9</sup> Cal. Code Regs., tit. 27, § 27001.

<sup>1</sup> Cal. Code Regs., tit. 17, § 93000.

<sup>11</sup> See *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1219-1220, cited above.

The goal of an RTP/SCS is a sustainable community, and no community can be sustainable unless its public health is protected. Thus, while the inclusion of a separate chapter of the DEIR on environmental justice is commendable, the current analysis is deficient, and should be redone and expanded to disclose the full scope of the air pollution and public health consequences of the RTP/SCS, and to propose mitigation measures for those consequences that are proportional to the seriousness of the impacts. (*City of Marina v. Board of Trustees of the California State University* (2006) 39 Cal.4th 341, 361-62.) We would be happy to work with SANDAG in making this part of the DEIR more meaningful.

SANDAG Has Failed Adequately to Consider Feasible Mitigation for Localized Air Quality Impacts.

Although it finds the RTP/SCS's impacts on localized air pollution to be significant, the DEIR proposes almost no mitigation measures to reduce or offset these impacts. Instead, the DEIR states that "mitigation measures at the program level is [sic] infeasible" for ozone precursors and carbon monoxide, and defers all mitigation for these pollutants to individual project-level CEQA processes. (DEIR, pp. 4.3-46, 4.3-47, 4.3-48.) CEQA requires that project changes or mitigation either be adopted or shown through substantial evidence to be infeasible; the DEIR, however, does not make such a showing.

The DEIR offers virtually no evidence that program-level mitigation is actually infeasible, and the mitigation measures it does propose lack certainty and are incomplete. For example, compliance with future local land use plans (the scope of which is not now known) is identified as the only feasible mitigation for ozone-related impacts. (DEIR, p. 4.3-48.) Mitigation for fine particulate matter is not discussed separately from mitigation for coarse particulates, despite their different sizes, health impacts, and sources. The dust control measures in the DEIR are not shown to be effective against fine particulates, which come more from industrial processes and fuel combustion than from ground disturbance.. The DEIR's treatment of mitigation for conventional air pollution does not comply with CEQA's substantive mandate to mitigate all significant impacts. (Pub. Resources Code, §§ 21002, 21081(a).)

It is vital for the health of the San Diego region's public that all feasible mitigation be adopted and carried out to prevent further deterioration of the already unhealthy air, and it is also vital for the region's economy. Research shows consistently that the costs of reducing pollution are far outweighed by clean-air benefits such as increased worker productivity, increased agricultural outputs, and reductions in mortality and illness that result from cleaner air.<sup>12</sup> The research cited above -- finding minority communities more severely affected by air pollution -- also calculated the significant costs associated with polluted air in other air basins. Costs ranged

---

<sup>12</sup> On a nationwide basis, the Office of Management and Budget has estimated that the benefits of clean air regulations outweigh the costs by a ratio of about four to one. OMB, "Informing Regulatory Decisions: 2003 Report to Congress on the Costs and Benefits of Federal Regulations and Unfunded Mandates on State, Local, and Tribal Entities."

from \$1,250 per person per year in the South Coast Air Basin to \$1,600 per person per year in the San Joaquin Valley Air Basin, due to increased health care costs and emergency room visits, missed work and school days, and even premature deaths.<sup>13</sup> CEQA mandates that SANDAG improve its analysis of the feasibility of localized air pollution mitigation, and the economic benefits of cleaner air and healthier communities must be considered in the feasibility calculus.

### **Climate Change Impacts: Greenhouse Gas Emissions**

Before discussing the DEIR's treatment of GHG emissions, it is important first to establish the relevant context for evaluating significance. The climate is affected by the concentration of GHGs in the atmosphere. The concentration of carbon dioxide, the primary GHG, has increased from approximately 280 parts per million (ppm) in pre-industrial times to well over 380 ppm, according to the National Oceanic and Atmospheric Administration's (NOAA) Earth Systems Research Laboratory.<sup>14</sup> Almost all of the increase is due to human activities (such as fossil fuel use).<sup>15</sup> The current rate of increase in carbon dioxide concentrations is about 1.9 ppm/year; present carbon dioxide concentrations are higher than any time in at least the last 650,000 years.<sup>16</sup> GHGs persist in the atmosphere for decades and in some cases millennia.<sup>17</sup>

The atmosphere and the oceans are reaching their capacity to absorb GHGs without significantly (and perhaps abruptly) changing the Earth's climate. California is already seeing the effects of climate change. As the Resources Agency observed in its 2009 report, we already are experiencing sea level rise, coastal erosion, increased average temperatures, more extreme hot days and increased heat waves, fewer shifts in the water cycle, and increases in the frequency and intensity of wildfires. (Resources Agency, 2009 *Climate Adaptation Strategy* at p. 3.)<sup>8</sup> These effects are expected to increase with rising GHG levels in the atmosphere.

The burdens of climate change will not be shared equally. Future climate scenarios are expected to disproportionately affect, for example, the urban poor, the elderly and children, traditional societies, agricultural workers and rural populations. (Office of Environmental Health Hazard Assessment, *Indicators of Climate Change in California: Environmental Justice Impacts* (Dec. 2010) at p. 2.)<sup>19</sup>

<sup>18</sup> Available at <http://www.chmatechange.ca.gov/adaptation/>.

<sup>19</sup> Available at <http://oehha.ca.gov/multimedia/epic/epicl23110.html>.

In order to stabilize the climate and avoid the most catastrophic outcomes of climate change, we must substantially reduce our annual GHG emissions over time, achieving a low-carbon future by midcentury. California has memorialized this overarching environmental objective in law. Under AB 32<sup>20</sup>, by 2020, California must reduce its total statewide greenhouse gas emissions to the level they were in 1990. (Health & Saf. Code, § 38550). To achieve AB 32's 2020 target, total statewide greenhouse gas emissions must be reduced by approximately 15 percent from current (2008) levels. AB 32 implements Executive Order S-03-05 (2005),<sup>21</sup> which set the statewide 2020 target as an interim step to reducing statewide emission levels, by 2050, to 80 percent below 1990 levels. "The 2020 goal was established to be an aggressive, but achievable, mid-term target, and the 2050 greenhouse gas emissions reduction goal represents the level scientists believe is necessary to reach levels that will stabilize climate." (Air Resources Board (ARB), Scoping Plan at p. 4.)<sup>22</sup>

The emissions reductions required to reach our statewide climate objective are substantial. In the longer term, we must reduce our total GHG emissions by approximately four percent per year between 2020 and 2030, and our per capita emissions by slightly less than five percent per year during the 2020 to 2030 period, with continued reductions required through midcentury. (These reductions required are graphically illustrated by the chart from ARB's Scoping Plan, attached to this letter as Exhibit A.) One of the prime objectives of SB 375, a law supporting and complementary to AB 32, and of the requirement for Sustainable Communities Strategies, is to create a long-term downward trajectory for GHG emissions in California through transportation and land use strategies.

Given the seriousness of the climate change problem, and the enormity of our GHG reduction task, we are greatly concerned that, when viewed in context, the RTP/SCS seems to be setting the region on a course that is inconsistent with the State's climate objectives. Specifically, per capita GHG emissions from cars and light-duty trucks increase as compared to the previous year after 2020 (see RTP, Table 301 at p. 3-3), while AB 32 requires that we must aggressively and steadily reduce total per capita GHG emissions during this time period. (See Exhibit A.) Moreover, the total number of vehicle miles travelled (VMT) driven in the San Diego region will steadily increase over the life of the RTP/SCS over the 2010 baseline by 10%, 32%, and 51% in 2020, 2035, and 2050, respectively. (DEIR, pp. 4.12-16, 4.12-21, 4.12-24;

<sup>20</sup> Cal. Health and Safety Code, § 38,500, *et seq.*

<sup>21</sup> The DEIR states that the Executive Order "does not constitute a 'plan' for GHG reduction, and no state plan has been adopted to achieve the 2050 goal." (DEIR, pp. 4.8-29 to 4.8-30.) The DEIR therefore does not find the RTP/SCS's failure to meet the Executive Order's goals to be a significant impact. This position fails to recognize that Executive Order S-3-05 is an official policy of the State of California, established by a gubernatorial order in 2005, and designed to meet the environmental objective that is relevant under CEQA (climate stabilization). SANDAG thus cannot simply ignore it.

<sup>22</sup> Available at [http://www.arb.ca.gov/cc/scopingplan/document/adopted\\_scoping\\_plan.pdf](http://www.arb.ca.gov/cc/scopingplan/document/adopted_scoping_plan.pdf). The Scoping Plan was readopted by ARB on August 24, 2011.

contrast with Table TA 3.1.) Under the most optimistic figures presented in the DEIR, total VMT will drop only 1% over current levels by 2050. Moreover, the DEIR predicts that the 14.33 million metric tons of greenhouse gases (expressed as MMT of carbon dioxide equivalent) emitted by cars and light duty trucks in 2010 (DEIR, p. 4.8-5) will fall to 12.04 MMT in 2020 (DEIR, p. 4.8-20), based largely on statewide tailpipe and fuel standards, but will then begin rising again, to 12.94 MMT in 2035 and 14.74 MMT in 2050. (DEIR, pp. 4.8-23, 4.8-25, respectively.) Thus, although SANDAO will meet the SB 375 goals for per capita OHO targets for cars and trucks set for it by ARB in 2020 and 2035, the DEIR shows that total OHO emissions from cars and light-duty trucks in 2050 will increase over the 2010 emissions level.

The DEIR finds the impact of the RTP/SCS on OHO emissions to be not significant in 2020 (DEIR, p. 4.8-20), significant in 2035 (DEIR, p. 4.8-23), and significant in 2050 (DEIR, p. 4.8-25). SANDAO must, however, make a determination whether the project as a whole has significant climate change impacts. We believe strongly that it does. What the DEIR shows is that the suite of strategies relied on by SANDAO, which include a heavy reliance on roadway expansion projects, does not deliver OHO reductions that are sustainable in the long term. In fact, infrastructure and land use decisions made in the early years of the RTP/SCS may lock in transportation inefficiencies and preclude any realistic possibility of meeting the Executive Order's goal of an 80% reduction in OHO emissions. The DEIR states that "[t]otal land-use based OHO emissions in 2050 are projected to be 21.85 MMT CO<sub>2</sub>e, or 50 percent greater than OHO emissions in 2010 (Table 4.8-11)," (DEIR at p. 4.8-24.) The DEIR should address the impact of the draft RTP/SCS on this important long-term policy in greater detail.

The DEIR is legally deficient for the additional reason that it does not analyze potential changes to the project design or specific mitigation measures for the OHO emissions impacts from land use; it makes only a generalized promise to prepare future RTPs "to incorporate policies and measures that lead to reduced OHO emissions." (DEIR, p. 4.8-35.) Further, the DEIR proposes some mitigation measures for OHO emissions attributable to transportation, but does not include any transportation mitigation that relates to land use, nor does it show that any such measures would be infeasible. We believe that CEQA requires much more analysis of potential mitigation measures, and that postponing this discussion and analysis until future RTP/SCS's and individual projects is a violation of CEQA's substantive provisions. (Public Res. Code §§ 21002, 21081(a); see *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 89-96.) SANDAO has the authority to approve the RTP/SCS even if it will have substantial environmental impacts, and CEQA will not second-guess the wisdom of that choice, so long as substantial evidence supports SANDAO's findings. (Public Res. Code § 21081(b).) However, SANDAO may not approve an environmentally damaging project until and unless it has adopted all feasible mitigation measures or shown that further mitigation - including land use mitigation - is infeasible. The DEIR does not yet do so.

We recognize that this is the first SCS prepared in California, and that SANDAO is chaiting new territory. However, the legal requirements of CEQA, including the requirement to mitigate significant impacts to the extent feasible, are not satisfied simply because the RTP/SCS meets the targets contained in SB 375 for 2020 and 2035. CEQA demands a full analysis and all

Honorable Jerome Stocks  
Chair, Board of Directors  
September 16, 2011  
Page 10

feasible mitigation of every significant impact resulting from the implementation of the RTP/SCS, throughout the full life of the Plan. The DEIR does not now provide this for GHG emissions.

### **Comments on RTP/SCS**

Although we are not commenting directly on the legal adequacy of the RTP/SCS under SB 375, we concur in the comments submitted to SANDAG by the California Office of Planning and Research (QPR). As discussed above, we are particularly concerned that per capita greenhouse gas (GHG) emissions associated with cars and light-duty trucks (and associated co-pollutants like particulate matter) begin to rise after 2020. (See QPR comment letter at pp. 3-4; Draft RTP at p. 3-3, Table 3.1; see also DEIR at Tables 4.3-5, p. 4.3-25.) As OPR notes, this "implies that future growth will be unavoidably less transportation efficient, which counters SB 375's underlying purpose." (QPR comment letter at p. 3.) If the RTP/SCS in fact runs counter to SB 375's purpose to reduce transportation-related GHG emissions over time, this would bear on whether the effects of the plan should be considered significant under CEQA.

In addition, OPR's comments discuss a failure of the DEIR and RTP/SCS to fully disclose the methodology by which VMT was projected, making it difficult or impossible for the lay public to determine for itself whether the information presented in the two documents is accurate and supported by substantial evidence. This lack of transparency is also a crucial flaw under CEQA, a statute whose purposes include accountability as to governmental decisions that affect the environment. (*Laurel Heights Improvement Ass'n v. Regents of the University of California* (1989) 47 Cal.3d 376,392 [holding that "the EIR ... is a document of accountability" for the public officials who certify it].)

### **Conclusion**

We appreciate the difficulty of preparing the first SCS in California. We believe that SANDAG has not yet prepared a DEIR on the RTP/SCS that fully satisfies CEQA's requirements, and urge SANDAG to redo several parts of the DEIR, as described in our comments herein. This RTP/SCS presents SANDAG with an opportunity to integrate transportation and land-use planning in a way that reduces GHG emissions and harmful air pollution, and that produces other benefits such as increased mobility and better public health for all the region's residents, particularly its sensitive and already overburdened communities. We

would be happy to work with SANDAG to take the additional steps needed to take full advantage of this opportunity. We appreciate your consideration of our comments.

Sincerely,

/ *tf.A,,{4.,u.r-0*

BRIEF AMICUS CURIAE

3

INTEREST AND IDENTITY OF *AMICUS CURIAE* JAMES HANSEN

*Amicus Curiae* James Hansen, Ph.D., appears here in his individual capacity and not as a representative of any institution with which he is affiliated. The information and opinions in this brief are not necessarily those of any institution with which he is affiliated or those of any party

the relief sought by plaintiffs in their motion for preliminary injunction is needed to preserve a climate system that is conducive to the survival and wellbeing of our children and their progeny.

Dr. James Hansen directs the NASA Goddard Institute for Space Studies in New York City and is an Adjunct Professor of Earth Sciences at Columbia

was trained in physics and astronomy in the space science program of Dr. James Van Allen at the University of Iowa, receiving his Ph. D. in physics in 1967. Since the mid-1970s, Dr. Hansen has focused on computer simulations and studies of the Earth's climate, for the purpose of

1980s helped raise broad awareness of the global warming issue. In recent years Dr. Hansen has drawn attention to the danger of passing climate tipping points, producing irreversible climate impacts that would yield a different planet from the one on which civilization developed. As part of his work in recent years, Dr. Hansen has outlined steps that are needed to stabilize climate, with a cleaner atmosphere and ocean.

Dr. Hansen was elected to the National Academy of Sciences in 1995.

## SUMMARY OF ARGUMENT

Global warming due to emissions of greenhouse gases, mainly CO<sub>2</sub> from fossil fuel  
further change of atmospheric composition. Already-observed impacts of this warming include  
rising sea levels, increased atmospheric moisture resulting in more intense precipitation events,  
higher temperatures causing more frequent and intense heat waves and droughts, loss of sea ice,  
ice sheet mass and glaciers, expansion of the subtropics, acidification of the oceans, shifting  
distributions of plant and animal species, and an increasing rate of species extinctions.

Maintaining a climate that resembles the Holocene epoch, the world of a relatively stable  
climate system under which civilization developed, requires rapid reduction of fossil fuel CO<sub>2</sub>  
emissions and reforestation. Atmospheric CO<sub>2</sub> concentrations passed the level that is estimated  
to be safe on the long term in, approximately, 1988; global mean temperature now exceeds the  
Holocene peak; and unabated fossil fuel emissions continue to drive the Earth increasingly out of  
energy balance. Unless action is undertaken without further delay, so as to return the atmospheric  
concentration of CO<sub>2</sub> to safe levels, the world will reach points of no return. Effective action remains possible, but delay in undertaking sharp reductions  
in emissions will undermine any realistic chance of preserving a habitable climate system --  
needed by future generations no less than by prior generations.

Plaintiffs in this case seek a preliminary injunction to ensure that Defendants in this  
matter submit to the Court a plan to preserve the climate system, including a cap on CO<sub>2</sub>  
emissions at 2011 levels by 2013, and emissions reductions thereafter by a minimum of 6%  
annually. That prescription is consistent with scientific understanding of what is minimally  
needed to avert truly dangerous climate change and preserve the physical status quo of a  
stable climate system. Defendants' demonstrated disinclination to utilize his authority to act, and the fact that further  
delay vastly increases the risk of irretrievable damage to the climate system, action by this Court  
now is essential.

## ARGUMENT

### I. INTRODUCTION: THE RELEVANT STATUS QUO IS AN ATMOSPHERE THAT ENSURES A HABITABLE CLIMATE SYSTEM.

Amicus James Hansen also seeks to preserve the status quo; accordingly, this brief begins with an explanation as to what this implies for the global climate system.

Paleoclimate research conducted by Dr. Hansen and others establishes that for most of the Holocene period c the period of the most recent 10,000 years c 2FWYXGIFJÄYMTZÄ highly variable on a regional basis, has been characterized by reasonably constant mean global temperatures. James Hansen et al., *The Case for Young People and Nature: A Path to a Healthy, Natural, Prosperous Future* (attached hereto as Exhibit 1) at 6.<sup>1</sup> This constancy enabled the Greenland and Antarctic ice sheets to remain in near mass balance, sea levels to be relatively stable, species to diversify, and civilization to develop.

Largely due to the burning of fossil fuels, the atmospheric CO<sub>2</sub> concentration has climbed sharply in recent decades c from 316ppm in 1959 to 390ppm in 2010.<sup>2</sup> In that period, US CO<sub>2</sub> emissions more than doubled, from 2.83 to 5.67 billion metric tons.<sup>3</sup> The CO<sub>2</sub> concentration is now to a level not seen on Earth for at least 3 million years. Exhibit 1 at 6. The CO<sub>2</sub> increment functions as an added blanket on the planet, reducing the amount of heat that would otherwise be re-radiated to space and throwing the planet into energy imbalance. In response, Earth has warmed by approximately 0.8°C over the last century, likely exceeding the prior Holocene peak.

<sup>1</sup> See also, James Hansen and Makiko Sato, *Paleoclimate Implications for Human-Made Climate Change* 8-14 (2011).

<sup>2</sup> Mauna Loa CO<sub>2</sub> annual mean data from <http://www.esrl.noaa.gov/gmd/ccgg/trends/>.

<sup>3</sup> Carbon Dioxide Information Analysis Center (CDIAC), *National CO<sub>2</sub> Emissions from Fossil-Fuel Burning, Cement Manufacture, and Gas Flaring: 1751-2008*, <http://cdiac.ornl.gov/ftp/trends/emissions/usa.dat>. The text of this amicus brief here provides the data in units of CO<sub>2</sub> GÄZNSÄYMJÄ0gXÄHWCS-to-CO<sub>2</sub> conversion factor of 3.667.

*Exhibit 1* at 7-8. The already apparent impact of this warming is reviewed in the next section.

UNUJQNSCKWÄ2WYMFÄWKÄJSL^ÄCQFSÄYÄMÄUWBYÄQQÄTKÄSÄKÄSpheric CO<sub>2</sub> concentration.<sup>4</sup>

Avoidance of climate tipping points and subsequent points of no return<sup>5</sup> requires effective action to return the atmospheric CO<sub>2</sub> concentration to approximately 350ppm by the end of the century. *Exhibit 1* at 8. This would allow additional heat radiation to escape to space so as to WXYTÄWMJÄSUQPSÄW^ÄGQSHÄNYMTÄZHNNTSFQÄQÄMSLJLQÄTGfQÄRSL"Ä. Such action HIZQIÄXKGNÄQÄWYÄMÄHÄQÄPÄXYJÄPÄÄRÄMÄFYÄMZRFSÄKÄWÄSÄGZYÄWÄMÄQÄFÄRFÄITTRÄ this prospect.

The relevant status quo with respect to the present litigation, therefore, is an atmosphere whose composition of greenhouse gases ensures a relatively stable climate system conducive to the survival and well being of humanity and nature. This requires, then, action to restore the atmospheric CO<sub>2</sub> concentration to no more than 350ppm. In that we have currently overshoot this safe atmospheric concentration level, as discussed *infra*, failure to act with all deliberate speed in the face of the clear scientific evidence of the danger<sup>6</sup> functionally becomes a decision to eliminate the option of preserving a habitable climate system.

## II. GLOBAL WARMING HAS ALREADY REACHED THE DANGEROUS LEVEL AND, WITHOUT EFFECTIVE ACTION, WILL PRODUCE CATASTROPHIC AND IRRETRIEVABLE LOSSES.

4QTGQÄHQÄRÄMÄBLJÄITJÄSÄTUVBYÄRWQÄYÄMÄUTXÄXÄTKÄXÄMÄTYÄKYZWJ NSOW"ÄJ K"ÄJgSÄYTQÄÄYNSÄRMÄ-QÄWÄSÄOÄÄÄ,ÄXÄYÄ!ÄMÄNXÄFSÄRÄMÄSÄYÄMÄÄHQWÄ undermining human and natural systems, causing loss of life, and pressing species to extinction.

<sup>5</sup> *Id.*

<sup>6</sup> J. Hansen et al., Dangerous human-made interference with climate, *Atmos. Chem. Phys.*, 7, 2287, 2308 (2007)

Unless arrested by effective action, climate change will produce calamitous consequences for humanity and nature alike, as tipping points are reached and points of no return are crossed.<sup>7</sup> Present and future impacts are addressed in turn.

(a) Present Impacts

While, as noted, global warming to date measures 0.8°C above the 1880-1920 period,<sup>8</sup> it has already led to a 40 percent reduction and an accelerating downward trend in summer Arctic sea ice cover, and an even faster decline in its thickness. *Exhibit 1* at 4. Continental ice sheets of Greenland and Antarctica have begun to shed ice at a rate of several hundred cubic kilometers per year. *Id.* In the past decade, sea level increased about 3cmd a rate of about one foot per century, and nearly twice as fast as the rate of increase during the preceding century.<sup>9</sup> This rise has resulted in losses of coastal wetland areas and greater levels of damage from coastal flooding.<sup>10</sup> For example, in the United States, increased sea level has led to the loss of 1900 to storm surges like Hurricane Katrina.<sup>11</sup> Mountain glaciers, the source of fresh water to major world rivers during the dry season, are receding rapidly all around the world. *Exhibit 1* at 4. In 1850, Glacier National Park in Montana had 150 glaciers measuring larger than twenty-five acresd today, it has just twenty-five.<sup>12</sup>

<sup>7</sup> 5F SXJSAY AFQAN S YMVUNNSIQJQADAYMOCHQAHONRUMNSAYMKAQNSH maintained, gives rise to a specific consequence [and] the point of no return [as] a climate state beyond which the consequence is inevitable, even if climate forcings are reduced. Target CO<sub>2</sub> at 225.

<sup>8</sup> The 1880-1920 period is the earliest time at which instrumental data allows accurate specification of global temperature, and the temperature in that period is estimated to be close to pre-industrial temperature averaged over several centuries.

<sup>9</sup> Decl. James Hansen at ¶ 40, 2006 WL 4761053 (D. Vt. 2006).

Tropospheric water vapor and heavy precipitation events have increased. Droughts are more common, especially in the tropics and subtropics. *Exhibit 1* at 4. Coral reef ecosystems are being impacted by a combination of ocean warming and acidification from rising atmospheric CO<sub>2</sub>, resulting in a 1-2% per year decline in geographic extent. *Exhibit 1* at 4. World health experts have concluded with "very high confidence" that climate change already contributes to the global burden of disease and premature death with altered distribution of some infectious disease vectors.<sup>13</sup> Subtropical climate belts have expanded, contributing to more intense droughts, summer heat waves, and devastating wildfires in the southern United States, the Mediterranean and Middle East regions, and Australia. *Exhibit 1* at 4. Mega-heat waves have become noticeably more frequent, including the 2010 heat wave in Moscow and in Texas in 2011. *Exhibit 1* at 4. In the absence of global warming.<sup>14</sup>

(b) Future effects

Scientific prediction of long-term impacts from climate change is imprecise in part because of uncertainty about the relative speed with which amplifying feedbacks, including

*Exhibit 1* at 13. Citing the Paleoclimate record, Dr. Hansen and colleagues noted the following most recently:

Precise consequences of continuing [business as usual] emissions for several decades are difficult to define, because Earth has never experienced such a large rapid increase of climate forcings as would occur with burning of most fossil fuels this century. The closest analogy in Earth's history is probably the PETM (Paleocene-Eocene Thermal Maximum) in which rapid global warming of at least 5°C occurred. The PETM warming spike occurred in conjunction with injection of 3000-5000 GtC of carbon into the surface climate system during two 1-2 thousand year intervals separated by several thousand years. It is often assumed that the carbon originated from melting of methane hydrates, because of the absence of other known sources of that magnitude. PETM occurred during a 10-million year period of slow global warming, and thus methane release might have been a feedback magnifying that warming.

The PETM witnessed extinction of about half of small shelled deep ocean

<sup>13</sup> IPCC Working Group II.

<sup>14</sup> J. Hansen, M. Sato, R. Ruedy, Climate Variability and Climate Change: The New Climate Dice, Nov. 10, 2011.

animals that serve as a biological indicator for ocean life in general, but, unlike several other large warming events in Earth's history, there was little extinction of land plants and animals. An important point is that the magnitude of the PETM carbon injection and warming is comparable to what will occur if humanity burns most of the fossil fuels, but the human-made warming is occurring 10-100 times faster. The ability of life on Earth today to sustain a climate shock comparable to the PETM but occurring 10-100 times faster is highly problematic. Climate zones would be shifting much faster than species have ever faced. Thus if humanity burns most of the fossil fuels, Earth, and all species residing on it, will be pushed into uncharted climate change territory.

*Exhibit 1* at 13 (internal citations omitted).

Based on measurements of observed climate change, computer simulations of the climate emissions, as well as information from the paleoclimate record, Dr. Hansen and others have concluded that continued burning over several decades of fossil fuels renders multi-global warming refugees from highly populated low-lying areas . . . throwing existing global *Exhibit 1* at 14 (internal citations omitted).

These researchers note, as well, that acidification stemming from ocean uptake of a portion of increased atmospheric CO<sub>2</sub> is expected to increasingly disrupt coral reef ecosystem health, with potentially devastating impacts to certain nations and communities. *Exhibit 1* at 16. *Exhibit 1* at 4, illustrating that present atmospheric CO<sub>2</sub> levels are

Increased concentration of CO<sub>2</sub> and associated increased global temperatures will deepen impacts on human health, with children being especially vulnerable. *Exhibit 1* at 16. Climate threats to health move through various pathways, especially by placing additional stress on the availability of food, clean air, and clean water. *Exhibit 1* at 16 (*citing to* Bernstein and Myers, *Climate Change and Children's Health*, Current Opin. Pediatrics, 23, 221-226 (2011)). Other principle climate-related impacts on human health include heat waves, asthma and allergies, infectious disease spread, drought, pests and disease spread across taxa: forests, crops and marine life, and winter weather anomalies. *Exhibit 1* at 18 (Table 1).

As noted *supra*, climate zones are already shifting at rates that exceed natural rates of change; this trend will continue as long as the planet is out of energy balance, a conclusion eGXIA TSARUFWNXTSANKATWIA YSL\NYMAN decadal variability in climate XNQFYNTSXWA5BXJSIATYMXASLAYMFXAYMJAXMQFYATISMAHTRJXA comparable to the range of some species, the less mobile species will be driven to e] YSHYTS"f *Exhibit 1* at 15. In 2007, the Intergovernmental Panel on Climate Change (IPCC) summarized studies estimating species extinctions from additional global warming and estimated<sup>16</sup> that for global warming of 1.6°C or more, relative to pre-industrial levels, 9-31 percent of species will be driven to extinction, while with global warming of 2.9°C, an estimated 21-52 percent of species will be driven to extinction.<sup>17</sup>

### III. ACTION TO PHASE OUT CO<sub>2</sub> EMISSIONS IS URGENTLY REQUIRED, WHILE DELAY VIRTUALLY ENSURES CALAMITY.

The 2007 consensus statement by the IPCC, summarizing research through 2005, indicated that human-induced warming of Earth of approximately 2°C constituted dangerous climate change. From that, however, no conclusion logically could be drawn as to the danger inherent in lower levels of global warming.

Research by Dr. Hansen and others to assess this question has been spurred on by the realization, as described *supra*, that large climate impacts have commenced already, even though 2FWYXMQIARUerature response to the recent climb in atmospheric CO<sub>2</sub> is only 0.75°C above preindustrial levels. Hansen et al estimate that this warming is already at least 0.25°C above the prior Holocene maximum. *Exhibit 1* at 5. Empirical research showing an ongoing and

While new species evolved over hundreds of thousands and millions of years, such time scales are almost beyond human comprehension. Accordingly, if we drive many species to extinction we will leave a more desolate planet for our children, grandchillWS!ASIAKARSALJSJWYTSXAMAFSANSJF*Exhibit 1* at 15.

 12 keep the period of overshoot to an absolute minimum.

13 Two underlying reasons that such action must be undertaken without further delay is  
 14 NSINFYJÄNSÄ.RNHESÄSgXÄRTYÄWSYÄXWWM!ÄXÄRWJÄMWÄSÄÄNQZWYJÄNSÄÄSÄ  
 15 *infra*. First, a substantial share of any additional infusion of CO<sub>2</sub> lasts in the atmosphere for  
 16 HYSYZWÄÄÄÄ\MNQJÄÄMBSYSLTZXQHYXÄWZYMÄMÄÄUQPSJÄÄHFWNSQ!ÄFWYXÄg  
 17 YJRUVFZWÄÄUTSXJÄMÄÄWYFÄÄKÄNSLÄÄHÄTKÄÄMMWÄÄRXUMWÄÄH<sub>2</sub>  
 18 concentration is a function not only of recent emissions, but the persisting share of prior  
 19 emissions. Second, as a consequence of the long-lived nature of CO<sub>2</sub> and the fact that human-  
 20 derived emissions have already cause a substantial overshoot of the long-term safe atmospheric  
 21 concentration level, any substantial delay in undertaking effective action c even if such action  
 22 compelled a sharp cut-off of emissions c would render it impossible to return the atmospheric  
 23 CO<sub>2</sub> concentration to 350ppm within this century. Thus, as illustrated in Fig. 1b, if emissions of  
 24 CO<sub>2</sub> are allowed per business as usual for even two decades longer the concentration of CO<sub>2</sub> in  
 25 the atmosphere will not return, until the year 2150, to the nominally safe level of 350ppm even if  
 26  
 27  
 28

all such emissions were abruptly ceased in the year 2030.<sup>18</sup> In contrast, complete cessation in 2011 would return to the atmospheric CO<sub>2</sub> concentration to 350ppm by mid-century. *Exhibit 1* at 9.

Figure 1. (a) Decay of instantaneous (pulse) injection and extraction of atmospheric CO<sub>2</sub>, (b) CO<sub>2</sub> amount if fossil fuel emissions are suddenly terminated at the end of 2010, 2030, 2050. (Hansen et al., *The Case for Young People and Nature: A Path to a Health, Natural, Prosperous Future*.)

An abrupt cessation of all CO<sub>2</sub>, whether in 2011 or 2030, is unrealistic, in part because industry, other business, and consumers alike need time to retool and reinvest in emission-free options to fossil fuels. Accordingly, Hansen et al have proposed a glide path to secure an atmosphere whose CO<sub>2</sub> concentration is no higher than 350ppm. Their plan requires emission reductions of 6 percent annually, coupled with a program of reforestation. *Exhibit 1* at 10. This will achieve the goal of restoring the atmosphere to approximately 350ppm if the plan is commenced without delay, and then adhered to. However, consistent with the abrupt phase out scenarios discussed in the prior paragraph *supra*, if the 6 percent annual emission reductions are delayed until 2030, then the global temperature will remain above 1°C higher than preindustrial

<sup>18</sup> *Exhibit 1* at 9. Further, were the emission cessation to commence only after 40 years, Dr. Hansen estimates that the atmosphere would not return to 350ppm CO<sub>2</sub> for nearly a 1000 years. *Id.*

The present danger and impending calamities presented by continued CO<sub>2</sub> emissions, and the urgent need to get beyond fossil fuels before Earth is altered in fundamental respects c including its ability to sustain civilization c renders it a first-order tragedy that all serious attempts to address the problem in Congress to date either have been still-borne or killed after some debate. Equally tragic, the executive branch, including our current president, has declined to act with any degree of effectiveness to restrict CO<sub>2</sub> and other greenhouse gas emissions from the largest sources c bowing to industry pressure at virtually every turn even though, pursuant to *YMJĀ>ZRUĀDTZWĀQNSĀQTGFQĀ*ing decision, *Mass. v. EPA*, 549 U.S. 497 (2007), it *WYFNSXXĀMTWĀNYĀFMĀEGXJSĀKĀKHYNĀQIJ WXMĀNXĀNCGQĀKĀ.RNZXĀSEXJSĀ* *UTNSĀTĀYTĀZSIZJĀXFĀTKĀNĀEQĀKNSQĀNĀJXĀTĀLJWSRSYĀTONJX<sup>19</sup>* In the absence of political leadership, an Order by this Court granting the injunctive relief sought by plaintiffs in this matter may be the best, the last, and, at this late stage, the only real chance to preserve and restore the atmosphere and climate system.

Systematic reductions in CO<sub>2</sub> emissions, for the reasons provided by Dr. Hansen in his work cited throughout this amicus brief, must be undertaken in conjunction with reforestation so as to return the concentration of CO<sub>2</sub> in the atmospheric to a level no higher than 350ppm by the end of the century, if not sooner. Plaintiffs in this matter seek an Order by the Court to require

14

1 will restore the atmosphere and preserve a habitable climate system. This brief has established  
 2 that such action is urgently required. In particular, the failure to commence CO<sub>2</sub> reductions  
 3 without further delay, and to undertake other measures consistent with the prescription  
 4 developed by Dr. Hansen and others, and advanced in these proceedings by Plaintiffs, would  
 5 consign our children and their progeny to a very different planet, one far less conducive to their  
 6 survival.

7 Respectfully submitted this 14th day of November, 2011.
