# Executive Summary

Dudek was retained by the City of Downey Community Planning Department (City) to complete a cultural resources technical report (report) for the 12021 Woodruff Avenue Project (Project) in the City of Downey, California. This report includes the results of a California Historical Resources Information System (CHRIS) records search; coordination with the Native American Heritage Commission (NAHC); a pedestrian survey of the Project site by a qualified architectural historian; building development and archival research; development of an appropriate historic context for the Project site; and recordation and evaluation of one (1) industrial property over 45 years old for historical significance and integrity in consideration of National Register of Historic Places (NRHP) and California Register of Historical Resources (CRHR) designation criteria and integrity requirements. This report was prepared in conformance with California Environmental Quality Act (CEQA) Guidelines Section 15064.5 for historical resources and all applicable local guidelines and regulations.

Dudek reviewed the CHRIS records search results provided by the South Central Coastal Information Center (SCCIC) on August 11, 2020. No cultural resources were identified within the Project site as a result. The records search identified seven previously conducted cultural resources technical investigations within the 0.5-mile records search area. None of these studies overlap or are adjacent to the Project site. None of these studies identified impacts to cultural resources within the vicinity of the Project site. Additionally, the SCCIC records indicate that three previously recorded cultural resources exist within the surrounding 0.5-mile search radius. All three resources identified consist of built environment resources, none of which intersect or are adjacent to the Project site. No previously recorded prehistoric or historic-era archaeological resources were identified within 0.5-mile of the Project site as a result of the records search.

Dudek contacted the California Native American Heritage Commission (NAHC) on August 14, 2020 to request a search of the Sacred Lands File (SLF). Results of the SLF records search (received September 17, 2020) were negative. The NAHC suggested contacting eight Native American individuals and/or tribal organizations who may have direct knowledge of cultural resources in or near the Project site. No informal or formal outreach to these contacts has been initiated by Dudek.

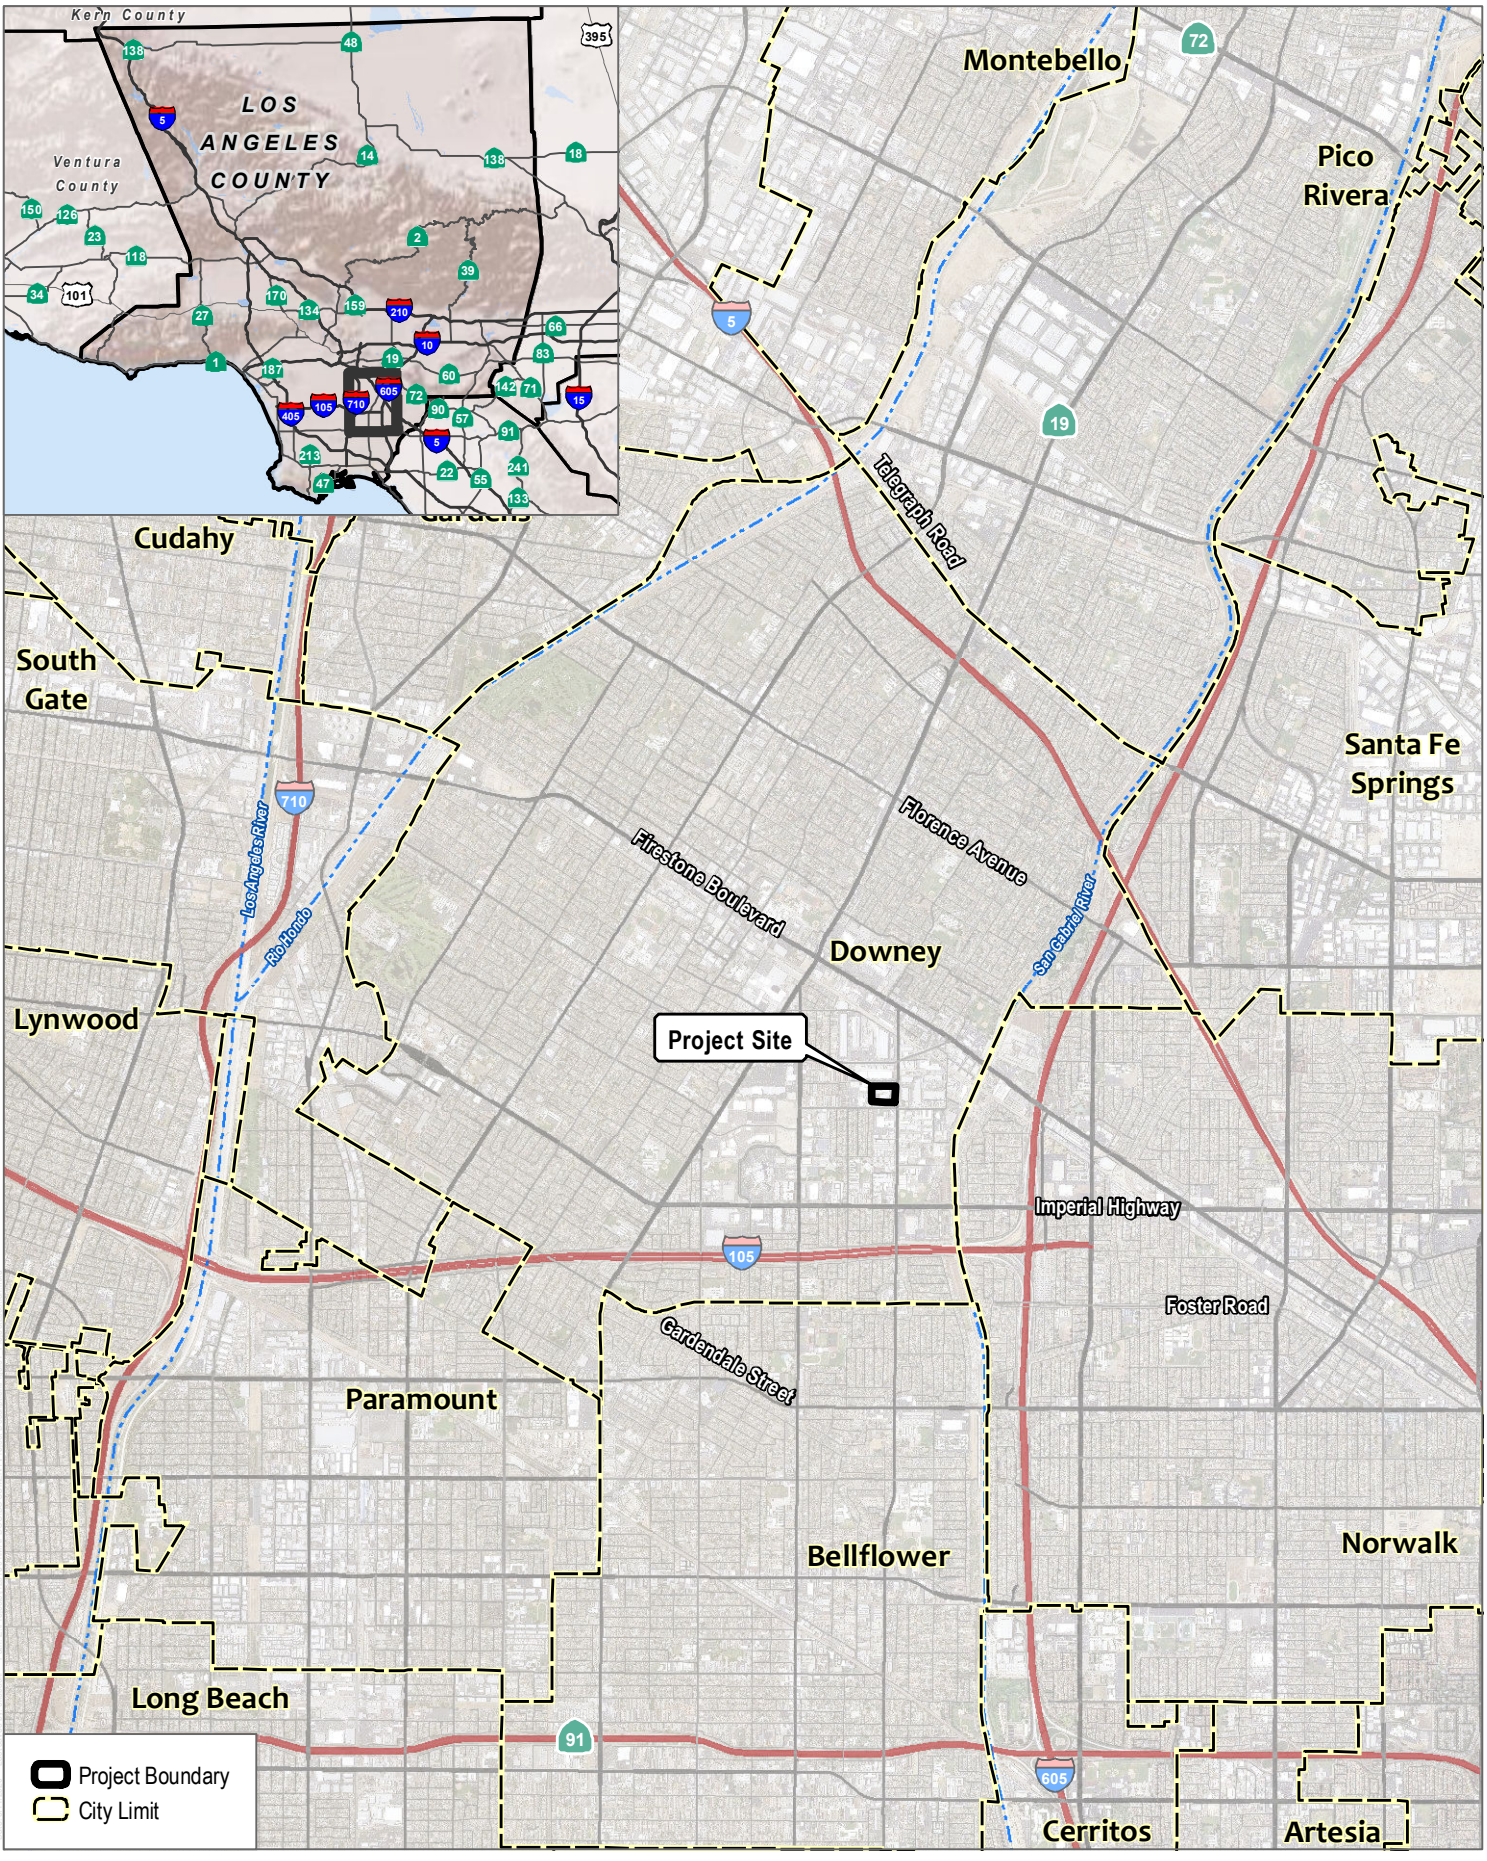
The Kirkhill Manufacturing Inc. facility (12021-12023 Woodruff Avenue) within the Project site does not appear eligible under any NRHP or CRHR designation criteria due to a lack of significant historical associations and architectural merit. Therefore, this property is not an historical resource for the purposes of CEQA.

As a result of Dudek's extensive archival research, field survey, NAHC coordination, and property significance evaluation, no cultural resources were identified within the Project site. Nor were any adjacent resources identified that could be indirectly impacted by proposed Project activities. Therefore, the Project would result in a less than significant impact to cultural resources under CEQA.

INTENTIONALLY LEFT BLANK

# 1 Introduction

Dudek was retained by the City of Downey to complete a cultural resources technical report for the 12021 Woodruff Avenue Project (Project) in the City of Downey (City), California. This report includes the results of a California Historical Resources Information System (CHRIS) records search; coordination with the California Native American Heritage Commission (NAHC); building development and archival research; a pedestrian survey of the Project site by a qualified architectural historian; development of an appropriate historic context for the Project site; and recordation and evaluation of one (1) industrial property over 45 years old for historical significance and integrity in consideration of National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), and City of Downey designation criteria and integrity requirements. This report was prepared in conformance with California Environmental Quality Act (CEQA) Guidelines Section 15064.5 for historical resources.



## 1.1 Project Location and Setting

The Project site is located in the southern portion of the City of Downey, which is located in the County of Los Angeles (County). Regionally, the City is bordered by the cities of Pico Rivera, Santa Fe Springs, Norwalk, Bellflower, Paramount, South Gate, and Commerce (Figure 1, Property Location). The Project site consists of a single parcel (Assessor's Identification Number (AIN) 6284-025-018). The addresses associated with the Project site are 12021-12023 Woodruff Avenue, Downey, California 90241. Locally, the Project site is immediately bounded by Woodruff Avenue to the east, and existing industrial/manufacturing uses to the north, west, and south (Figure 2, Detailed Property Location).

The City is approximately 12.8 square-miles in area and is located in the southeastern part of the County, approximately 14 miles and 12 miles northeast of the Ports of Los Angeles and Long Beach, respectively. There are four freeways that provide direct access to Downey: I-605 (San Gabriel River Freeway), which crosses the eastern portion of the City; I-5 (Santa Ana Freeway), which crosses the northern portion of the City; the I-105 intersection, which crosses the southern part of the City; and I-710 (Long Beach Freeway), which, although does not cross the City, is located west of the City and accessible via three major streets: Florence Avenue, Firestone Boulevard, and Imperial Highway (City of Downey 2005).

The City is bound by the Rio Hondo River channel to the west, Telegraph Road to the north; the San Gabriel River channel to the east; and Gardendale Street and Foster Road to the south. Most of the City was developed during the housing boom in the 1950s and 1960s. The City is a fully developed community with older buildings and very few vacant properties. Since residential uses occupy more than half of the City's land area, Downey is known mainly as a bedroom community. However, the City also provides a mix of other land uses such as open space, commercial, and manufacturing. Residential uses are located throughout the City; however, are predominantly located to the north, east, and west. Commercial uses are scattered throughout the north, east, south, and west. Manufacturing uses are primarily concentrated in the southeastern portion of the City.

12021 Woodruff Avenue Industrial Building Project

# 1.2 Proposed Project

The Project includes the demolition of an existing, 74,662-square-foot industrial building and construction of an approximately 44,162-square-foot tilt-up industrial building for truck terminal use. The proposed industrial building would include approximately 36,142 square-feet of warehouse space and 8,020 square-feet of office space. The new industrial building is intended to be used as a trucking terminal for distribution and logistics purposes. On-site activities will include storage of and/or consolidation of manufactured goods before the distribution to retail locations or other warehouses. Other than truck parking and storage, all activities will occur within the industrial building. The office space is intended to be used for office uses ancillary to the warehouse operation.

# 1.3 Project Personnel

This report and associated property significance evaluations was prepared by Dudek Architectural Historian Fallin Steffen, MPS. Fieldwork and research was conducted by Dudek Architectural Historian Sarah Corder, MFA. Dudek Archaeologist Adriane Gusick, BA, summarized the CHRIS records search results and contributed to this report. Dudek Archaeologist, Jennifer De Alba, BA, conducted Native American coordination. Dudek Lead Archaeologist Linda Kry, BA, acted as archaeological and ethnographic investigator, and contributed to this report. This report was reviewed for quality assurance/quality control by Dudek Principal Architectural Historian Samantha Murray, MA. Resumes for all key personnel are provided in Appendix A.

# 1.4 Regulatory Setting

### Federal

#### *National Register of Historic Places*

While there is no federal nexus for this Project, the subject property was evaluated in consideration of NRHP designation criteria. The NRHP is the United States' official list of districts, sites, buildings, structures, and objects worthy of preservation. Overseen by the National Park Service, under the U.S. Department of the Interior, the NRHP was authorized under the National Historic Preservation Act, as amended. Its listings encompass all National Historic Landmarks, as well as historic areas administered by the National Park Service.

NRHP guidelines for the evaluation of historic significance were developed to be flexible and to recognize the accomplishments of all who have made significant contributions to the nation's history and heritage. Its criteria are designed to guide state and local governments, federal agencies, and others in evaluating potential entries in the NRHP. For a property to be listed in or determined eligible for listing, it must be demonstrated to possess integrity and to meet at least one of the following criteria:

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:

A. That are associated with events that have made a significant contribution to the broad patterns of our history; or

B. That are associated with the lives of persons significant in our past; or

C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. That have yielded, or may be likely to yield, information important in prehistory or history.

Integrity is defined in NRHP guidance, "How to Apply the National Register Criteria," as "the ability of a property to convey its significance. To be listed in the NRHP, a property must not only be shown to be significant under the NRHP criteria, but it also must have integrity" (NPS 1990). NRHP guidance further asserts that properties be completed at least 50 years ago to be considered for eligibility. Properties completed fewer than 50 years before evaluation must be proven to be "exceptionally important" (criteria consideration to be considered for listing.

### State

#### *California Register of Historical Resources*

In California, the term "historical resource" includes but is not limited to "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (California Public Resources Code Section 5020.1(j)). In 1992, the California legislature established the CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (California Public Resources Code Section 5024.1(a)). The criteria for listing resources on the CRHR were expressly developed to be in accordance with previously established criteria developed for listing in the NRHP, enumerated below. According to California Public Resources Code Section 5024.1(c)(1–4), a resource is considered historically significant if it (i) retains "substantial integrity," and (ii) meets at least one of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.

(2) Is associated with the lives of persons important in our past.

(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.

(4) Has yielded, or may be likely to yield, information important in prehistory or history.

In order to understand the historic importance of a resource, sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource. A resource less than 50 years old may be considered for listing in the CRHR if it can be demonstrated that sufficient time has passed to understand its historical importance (see 14 CCR 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing in the NRHP are automatically listed in the CRHR, as are the state landmarks and

points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys.

### California Environmental Quality Act

As described further below, the following CEQA statutes and CEQA Guidelines are of relevance to the analysis of archaeological, historic, and tribal cultural resources:

- California Public Resources Code Section 21083.2(g) defines "unique archaeological resource."
- California Public Resources Code Section 21084.1 and CEQA Guidelines Section 15064.5(a) define "historical resources." In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource." It also defines the circumstances when a project would materially impair the significance of an historical resource.
- California Public Resources Code Section 21074(a) defines "tribal cultural resources."
- California Public Resources Code Section 5097.98 and CEQA Guidelines Section 15064.5(e) set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
- California Public Resources Code Sections 21083.2(b)-(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for archaeological and historic resources, including examples of preservation-in-place mitigation measures; preservation-in-place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

More specifically, under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(b).) If a site is either listed or eligible for listing in the CRHR, or if it is included in a local register of historic resources or identified as significant in a historical resources survey (meeting the requirements of California Public Resources Code Section 5024.1(q)), it is a "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(a)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines Section 15064.5(b)(1); California Public Resources Code Section 5020.1(q)). In turn, CEQA Guidelines section 15064.5(b)(2) states the significance of an historical resource is materially impaired when a project:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources; or

2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA.

Pursuant to these sections, the CEQA inquiry begins with evaluating whether a project site contains any "historical resources," then evaluates whether that project will cause a substantial adverse change in the significance of a historical resource such that the resource's historical significance is materially impaired.

If it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (California Public Resources Code Section 21083.2[a], [b], and [c]).

California Public Resources Code Section 21083.2(g) defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.

2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.

3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

Impacts to non-unique archaeological resources are generally not considered a significant environmental impact (California Public Resources Code section 21083.2(a); CEQA Guidelines Section 15064.5(c)(4)). However, if a non-unique archaeological resource qualifies as tribal cultural resource (California Public Resources Code Section 21074(c), 21083.2(h)), further consideration of significant impacts is required. CEQA Guidelines Section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. As described below, these procedures are detailed in California Public Resources Code Section 5097.98.

### California State Assembly Bill 52

Assembly Bill (AB) 52 of 2014 amended PRC Section 5097.94 and added PRC Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3. AB 52 established that TCRs must be considered under CEQA and also provided for additional Native American consultation requirements for the lead agency. Section 21074 describes a TCR as a site, feature, place, cultural landscape, sacred place, or object that is considered of cultural value to a California Native American Tribe and that is either:

On or determined to be eligible for the California Register of Historical Resources or a local historic register; or

A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1.

AB 52 formalizes the lead agency–tribal consultation process, requiring the lead agency to initiate consultation with California Native American groups that are traditionally and culturally affiliated with the project site, including tribes that may not be federally recognized. Lead agencies are required to begin consultation prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report.

Section 1 (a)(9) of AB 52 establishes that "a substantial adverse change to a tribal cultural resource has a significant effect on the environment." Effects on TCRs should be considered under CEQA. Section 6 of AB 52 adds Section 21080.3.2 to the PRC, which states that parties may propose mitigation measures "capable of avoiding or substantially lessening potential significant impacts to a tribal cultural resource or alternatives that would avoid significant impacts to a tribal cultural resource." Further, if a California Native American tribe requests consultation regarding project alternatives, mitigation measures, or significant effects to tribal cultural resources, the consultation shall include those topics (PRC Section 21080.3.2[a]). The environmental document and the mitigation monitoring and reporting program (where applicable) shall include any mitigation measures that are adopted (PRC Section 21082.3[a]).

### Senate Bill 18

The Local and Tribal Intergovernmental Consultation process, commonly known as Senate Bill (SB) 18 was signed into law September of 2004 and took effect March 1, 2005. SB 18 refers to PRC Section 5097.9 and 5097.995, which defines cultural places as:

- Native American sanctified cemetery place of worship, religious or ceremonial site, or sacred shrine (PRC Section 5097.9).
- Native American historic, cultural, or sacred site that is listed or may be eligible for listing in the California Register of Historic Resources pursuant to Section 5024.1, including any historic or prehistoric ruins, any burial ground, any archaeological or historic site (PRC Section 5097.993).

SB 18 established responsibilities for local governments to contact, provide notice to, refer plans to, and consult with California Native American tribes that have been identified by the NAHC and if that tribe requests consultation after local government outreach as stipulated in Government Code Section 65352.3. The purpose of this consultation process is to protect the identity of the cultural place and to develop appropriate and dignified treatment of the cultural place in any subsequent project. The consultation is required whenever a general plan, specific plan, or open space designation is proposed for adoption or to be amended. Once local governments have sent notification, tribes are responsible for requesting consultation. Pursuant to Government Code Section 65352.3(a)(2), each tribe has 90 days from the date on which they receive notification to respond and request consultation.

In addition to the requirements stipulated previously, SB 18 amended Government Code Section 65560 to "allow the protection of cultural places in open space element of the general plan" and amended Civil Code Section 815.3 to add "California Native American tribes to the list of entities that can acquire and hold conservation easements for the purpose of protecting their cultural places."

### California Health and Safety Code Section 7050.5

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. California Health and Safety Code Section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains can occur until the county coroner has examined the remains (Health and Safety Code Section 7050.5(b)). PRC Section 5097.98 also outlines the process to be followed in the event that remains are discovered. If the county coroner determines or has reason to believe the remains are those of a Native American, the county coroner must contact the NAHC within 24 hours (Health and Safety Code Section 7050.5(c)). The NAHC will notify the most likely descendant (MLD). With the permission of the landowner, the MLD may inspect the site of discovery. The inspection must be completed within 48 hours of notification of the MLD by the NAHC. The MLD may recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

### Local

#### *City of Downey Municipal Code*

The City of Downey does not maintain local designation criteria and appears to defer to the NRHP and the CRHR.

Article VIII, Chapter 8 of the Municipal code (Section 8700.03) defines "Historic Structures" as any structure that is:

(1) Listed individually in the National Register of Historic Places (a listing maintained by the Department of Interior) or preliminarily determined by the Secretary of the Interior as meeting the requirements for individual listing on the National Register;

(2) Certified or preliminarily determined by the Secretary of the Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined by the Secretary to qualify as a registered historic district;

(3) Individually listed on a State inventory of historic places in States with historic preservation programs which have been approved by the Secretary of the Interior, or;

(4) Individually listed on a local inventory of historic preservation in communities with historic preservation programs that have been certified by the State.

# 2 Background Research

## 2.1 CHRIS Records Search

On August 11, 2020, SCCIC Staff provided the results of a CHRIS records search for the Project and a half (0.5)-mile records search buffer. This search included their collections of mapped prehistoric, historic, and built environment resources, Department of Parks and Recreation Site Records, technical reports, and ethnographic references. Additional consulted sources included historical maps of the Project site, the NRHP, the CRHR, the Built Environment Resources Directory, the lists of California State Historical Landmarks, California Points of Historical Interest, and the Archaeological Determinations of Eligibility. Dudek reviewed the SCCIC records to determine whether implementation of the Project would have the potential to impact known and unknown cultural resources. The confidential records search results are provided in Appendix B.

### Previously Conducted Cultural Resources Studies

Results of the cultural resources records search indicated that seven previous cultural resource studies (Table 1) have been conducted within a 0.5-mile radius of the Project site between 1999 and 2010. None of these studies overlap or are adjacent to the Project site. Table 1, below, summarizes the previous cultural resources studies within the records search radius.

**Table 1. Previously Conducted Cultural Resources Studies within 0.5-Mile of the Project Site**

| SCCIC Report Number | Authors | Year | Title | Proximity to Project Site |
|---|---|---|---|---|
| LA-04834 | Ashkar, Shahira | 1999 | Cultural Resources Inventory Report for Williams Communications, Inc. Proposed Fiber Optic Cable System Installation Project, Los Angeles to Anaheim, Los Angeles and Orange Counties | Outside |

### Previously Recorded Cultural Resources

The SCCIC records indicate that three cultural resources have been previously recorded within 0.5-mile of the Project site (Table 2), none of which intersect or are adjacent to the Project site. All of the previously recorded cultural resources within the records search area consist of built environment resources.

Table 2. Previously Recorded Cultural Resources Within a 0.5-Mile Radius of the Project Site

| Primary (P-19-) | Trinomial (CA-LAN-) | Resource Age and Type | Resource Description | NRHP Eligibility | Recording Events | Proximity to Project Site |

# 2.2 Native American Coordination

**NAHC Sacred Lands File Search**

Dudek contacted the NAHC on August 14, 2020 and requested a review of the SLF. The NAHC replied via email on September 17, 2020, stating that the results of the SLF search were negative. The NAHC also suggested contacting eight Native American individuals and/or tribal organizations who may have direct knowledge of cultural resources in or near the Project site.

- Andrew Salas, Chairperson, *Gabrieleno Band of Mission Indians, Kizh Nation*
- Anthony Morales, Chairperson, *Gabrieleno/Tongva San Gabriel Band of Mission Indians*
- Sandonne Goad, Chairperson, *Gabrielino/Tongva Nation*
- Robert Dorame, Chairperson, *Gabrielino Tongva Indians of California Tribal Council*
- Charles Alvarez, *Gabrielino-Tongva Tribe*
- Lovina Redner, Tribal Chair, *Santa Rosa Band of Cahuilla Indians*
- Joseph Ontiveros, Cultural Resource Department, *Soboba Band of Luiseno Indians*
- Scott Cozart, Chairperson, *Soboba Band of Luiseno Indians*

Dudek initiated no informal tribal consultation to these individuals for the proposed Project at this time. Documentation of Dudek's coordination with the NAHC is provided in Appendix C.

### Assembly Bill 52 Consultation

The Project is subject to compliance with AB 52 (PRC 21074), which requires consideration of impacts to TCRs as part of the CEQA process, and that the lead agency notify California Native American Tribal representatives (that have requested notification) who are traditionally or culturally affiliated with the geographic area of the proposed Project. All NAHC-listed California Native American Tribal representatives that have requested project notification pursuant to AB 52 were sent letters by the City on [INSERT DATE WHEN AVAILABLE]. The letters contained a project description, outline of AB 52 timing, request for consultation, and contact information for the appropriate lead agency representative. Documents related to AB 52 consultation are on file with the City.

### Senate Bill 18 Consultation

The Project is subject to compliance with SB 18 (Government Code Section 65352.3), which requires local governments to invite California Native American Tribal representatives to participate in consultation about proposed General Plan and Specific Plan adoptions or amendments. The City is proposing an amendment to the General Plan for the Project and as such, initiated SB 18 consultation. All NAHC-listed California Native American Tribal representatives were sent notification letters by the City on [INSERT DATE WHEN AVAILABLE]. The letters contained a project description, request for consultation, and contact information for the appropriate lead agency representative. Documents related to SB 18 consultation are on file with the City.

## 2.3 Building Development and Archival Research

Building development and archival research were conducted for the Project site in an effort to establish a thorough and accurate historic context for the property significance evaluation, and to confirm the building development history of the Project site.

### City of Downey Building and Safety Division

On August 12, 2020, Dudek visited the City of Downey Permit Counter and obtained building permits and records for the subject property.

### Los Angeles County Office of the Assessor

On September 09, 2020, Dudek researched property characteristic records for the Project site in order to establish dates of construction.

### Historical Newspaper Search

Dudek reviewed historical newspapers covering the City of Downey and of the Greater Los Angeles area in an effort to understand the development of the Project site. All information obtained from the historical newspaper search was incorporated into the historic context.

### Historical Aerial Photographs

Historic aerial photographs of the Project site were available from Nationwide Environmental Title Research LLC (NETR) maps for the years 1952, 1953, 1963, 1972, 1994, 2003, 2004, 2005, 2009, 2010, 2012, 2014, and 2016 and from the University of California, Santa Barbara (UCSB), FrameFinder Maps for the years 1928, 1938, 1947, 1952, 1956, 1957, 1960, 1968, 1976, 1977, 980, 1981, 1983, 1988, 1994, and 1998.

The earliest aerial photograph dates from 1928 and indicates that the Project area was rural farmland in 1928. A few single-family residences line the east side of Woodruff Avenue between Stewart and Gray Road and Washburn Road. The region appears rural, with patches of moderately dense single-family residences and neighborhoods in the surrounding area, as well as an airport appearing west of Bellflower Boulevard by 1947. The San Gabriel River Channel appears by 1947 as well (NETR 2020; UCSB 2020).

The subject property at 12021-12023 Woodruff Avenue does not appear in aerial photographs until 1952. In this aerial the property appears with a semi-circular driveway in the portion of the property fronting Woodruff Avenue. Setback on the parcel, three distinctive buildings appears, two with double gabled roofs and one longer warehouse building with a single gable, all loosely arranged in a U-shaped plan. The front portion of the property appears landscaped with grass, but the rear portion of the property appears as gravel or pavement. Surrounding the property to the north and west is the same agricultural field visible in the 1928 aerial photograph. A large industrial property and large parking lot appear across the street from the subject property, on the east side of Woodruff Avenue (NETR 2020; UCSB 2020).

After 1952, the property appears to incrementally change. In the 1956 aerial photograph a small square gable-roofed building appears in the center of the property, and a long rectangular plan building appears at the rear of the property. By the 1960 aerial, an addition is made to the south-most building and north-most building, creating a clearer, symmetrical U-shaped plan. The front most building appears to have its roof altered to a side-gabled building. The front semi-circular drive appears to have been widened to accommodate a second lane, making the lawn smaller. In the 1968 aerial photograph, the middle building has an addition on the west side, filling a portion of the interior of the U-plan. By the 1976 aerial photograph, the interior area of the original U-shaped plan is completely filled by additions. Several more additions also extend from the west and Woodruff Avenue-facing elevations, creating a rough, rectangular plan building. The semi-circular drive is still present but the lawn portion has been reduced again to accommodate the building's expansion. Between 1977 and 1981 the last agricultural field adjacent to the subject property is replaced with an industrial property. The subject property is, by 1981, completely surrounded by industrial and commercial properties. Both Woodruff Avenue and Stewart and Gray Road near the subject property appear to host the majority of industrial properties in the area. Between 1983 and 1988 aerial photographs show a courtyard opened up the in the center of the building, creating a hollow rectangular-plan. Between 1988 and 1994 aerial photographs indicate that the additions along the Woodruff Avenue elevations appear to have been re-roofed, and the open area at the center of the rectangular plan was infilled again. According to aerial photographs, there are no notable changes to the property after 1994 (NETR 2020; UCSB 2020).

### Sanborn Fire Insurance Maps

City of Downey Sanborn Fire Insurance Maps for the years 1887, 1891, 1895, 1898, 1907, 1925, and 1925-1932 (revised) were reviewed for this Project, however, the Project site was not visible on any of the maps.

# 3 Cultural Setting

## 3.1 Prehistoric Overview

Evidence for continuous human occupation in Southern California spans the last 10,000 years. Various attempts to parse out variability in archaeological assemblages over this broad period have led to the development of several cultural chronologies; some of these are based on geologic time, most are based on temporal trends in archaeological assemblages, and others are interpretive reconstructions. To be more inclusive, this research employs a common set of generalized terms used to describe chronological trends in assemblage composition: Paleoindian (pre-5500 BC), Archaic (8000 BC–AD 500), Late Prehistoric (AD 500–1769), and Ethnohistoric (post-AD 1769). Terminology used to outline the cultural chronology is standard chronology made popular by Byrd and Reddy (2002) and is broadly consistent with the use of geologic time units (early, middle, and late Holocene) used by Byrd and Raab (2007).

**Paleoindian Period (pre-5500 BC)**

Evidence for Paleoindian occupation in the region is tenuous. Our knowledge of associated cultural pattern(s) is informed by a relatively sparse body of data that has been collected from within an area extending from coastal San Diego, through the Mojave Desert, and beyond. One of the earliest dated archaeological assemblages in the region is located in coastal Southern California (though contemporaneous sites are present in the Channel Islands) derives from SDI-4669/W-12 in La Jolla. A human burial from SDI-4669 was radiocarbon dated to 9,590–9,920 years before present (95.4% probability) (Hector 2006). The burial is part of a larger site complex that contained more than 29 human burials associated with an assemblage that fits the Archaic profile (i.e., large amounts of ground stone, battered cobbles, and expedient flake tools). In contrast, typical Paleoindian assemblages include large stemmed projectile points, high proportions of formal lithic tools, bifacial lithic reduction strategies, and relatively small proportions of ground stone tools. Prime examples of this pattern are sites that were studied by Emma Lou Davis (1978) on Naval Air Weapons Station China Lake near Ridgecrest, California. These sites contained fluted and unfluted stemmed points and large numbers of formal flake tools (e.g., shaped scrapers, blades). Other typical Paleoindian sites include the Komodo site (MNO-679)—a multi-component fluted point site, and MNO-680—a single component Great Basined Stemmed point site (see Basgall et al. 2002). At MNO-679 and -680, ground stone tools were rare while finely made projectile points were common.

Warren et al. (2004) claimed that a biface manufacturing tradition present at the Harris site complex (SDI-149) is representative of typical Paleoindian occupation in the region that possibly dates between 10,365 and 8,200 BC (Warren et al. 2004). Termed San Dieguito (see also Rogers 1945), assemblages at the Harris site are qualitatively distinct from most others in region because the site has large numbers of finely made bifaces (including projectile points), formal flake tools, a biface reduction trajectory, and relatively small amounts of processing tools (see also Warren 1968). Despite the unique assemblage composition, the definition of San Dieguito as a separate cultural tradition is hotly debated. Gallegos (1987) suggested that the San Dieguito pattern is simply an inland manifestation of a broader economic pattern. Gallegos's interpretation of San Dieguito has been widely accepted in recent years, in part because of the difficulty in distinguishing San Dieguito components from other assemblage constituents. In other words, it is easier to ignore San Dieguito as a distinct socioeconomic pattern than it is to draw it out of mixed assemblages.

The large number of finished bifaces (i.e., projectile points and non-projectile blades), along with large numbers of formal flake tools at the Harris site complex, is very different than nearly all other assemblages throughout the region, regardless of age. Warren et al. (2004) made this point, tabulating basic assemblage constituents for key early Holocene sites. Producing finely made bifaces and formal flake tools implies that relatively large amounts of time were spent for tool manufacture. Such a strategy contrasts with the expedient flake-based tools and cobble-core reduction strategy that typifies non-San Dieguito Archaic sites. It can be inferred from the uniquely high degree of San Dieguito assemblage formality that the Harris site complex represents a distinct economic strategy from non-San Dieguito assemblages.

San Dieguito sites are rare in the inland valleys, with one possible candidate, RIV-2798/H, located on the shore of Lake Elsinore. Excavations at Locus B at RIV-2798/H produced a toolkit consisting predominately of flaked stone tools, including crescents, points, and bifaces, and lesser amounts of groundstone tools, among other items (Grenda 1997). A calibrated and reservoir-corrected radiocarbon date from a shell produced a date of 6630 BC. Grenda (1997) suggested this site represents seasonal exploitation of lacustrine resources and small game and resembles coastal San Dieguito assemblages and spatial patterning.

If San Dieguito truly represents a distinct socioeconomic strategy from the non-San Dieguito Archaic processing regime, its rarity implies that it was not only short-lived, but that it was not as economically successful as the Archaic strategy. Such a conclusion would fit with other trends in Southern California deserts, where hunting-related tools were replaced by processing tools during the early Holocene (see Basgall and Hall 1990).

### Archaic Period (8000 BC – AD 500)

The more than 2,500-year overlap between the presumed age of Paleoindian occupations and the Archaic period highlights the difficulty in defining a cultural chronology in Southern California. If San Dieguito is the only recognized Paleoindian component in the coastal Southern California, then the dominance of hunting tools implies that it derives from Great Basin adaptive strategies and is not necessarily a local adaptation. Warren et al. (2004) admitted as much, citing strong desert connections with San Dieguito. Thus, the Archaic pattern is the earliest local socioeconomic adaptation in the region (see Hale 2001, 2009).

The Archaic pattern, which has also been termed the Millingstone Horizon (among others), is relatively easy to define with assemblages that consist primarily of processing tools, such as millingstones, handstones, battered cobbles, heavy crude scrapers, incipient flake-based tools, and cobble-core reduction. These assemblages occur in all environments across the region with little variability in tool composition. Low assemblage variability over time and space among Archaic sites has been equated with cultural conservatism (see Basgall and Hall 1990; Byrd and Reddy 2002; Warren 1968; Warren et al. 2004). Despite enormous amounts of archaeological work at Archaic sites, little change in assemblage composition occurred until the bow and arrow was adopted around AD 500, as well as ceramics at approximately the same time (Griset 1996; Hale 2009). Even then, assemblage formality remained low. After the bow was adopted, small arrow points appear in large quantities and already low amounts of formal flake tools are replaced by increasing amounts of expedient flake tools. Similarly, shaped millingstones and handstones decreased in proportion relative to expedient, unshaped ground stone tools (Hale 2009). Thus, the terminus of the Archaic period is equally as hard to define as its beginning because basic assemblage constituents and patterns of manufacturing investment remain stable, complemented only by the addition of the bow and ceramics.

### Late Prehistoric Period (AD 500-1769)

The period of time following the Archaic and before Ethnohistoric times (AD 1769) is commonly referred to as the Late Prehistoric (Rogers 1945; Wallace 1955; Warren et al. 2004); however, several other subdivisions continue to be used to describe various shifts in assemblage composition. In general, this period is defined by the addition of arrow points and ceramics, as well as the widespread use of bedrock mortars. The fundamental Late Prehistoric assemblage is very similar to the Archaic pattern, but includes arrow points and large quantities of fine debitage from producing arrow points, ceramics, and cremations. The appearance of mortars and pestles is difficult to place in time because most mortars are on bedrock surfaces. Some argue that the Ethnohistoric intensive acorn economy extends as far back as AD 500 (Bean and Shipek 1978). However, there is no substantial evidence that reliance on acorns, and the accompanying use of mortars and pestles, occurred before AD 1400. Millingstones and handstones persisted in higher frequencies than mortars and pestles until the last 500 years (Basgall and Hall 1990); even then, weighing the economic significance of millingstone-handstone versus mortar-pestle technology is tenuous due to incomplete information on archaeological assemblages.

## 3.2 Ethnographic Overview

The history of the Native American communities prior to the mid-1700s has largely been reconstructed through later mission-period and early ethnographic accounts. The first records of the Native American inhabitants of the region come predominantly from European merchants, missionaries, military personnel, and explorers. These brief, and generally peripheral, accounts were prepared with the intent of furthering respective colonial and economic aims and were combined with observations of the landscape. They were not intended to be unbiased accounts regarding the cultural structures and community practices of the newly encountered cultural groups. The establishment of the missions in the region brought more extensive documentation of Native American communities, though these groups did not become the focus of formal and in-depth ethnographic study until the early twentieth century (Bean and Shipek 1978; Boscana 1846; Geiger and Meighan 1976; Harrington 1934; Laylander 2000; Sparkman 1908; White 1963). The principal intent of these researchers was to record the precontact, culturally specific practices, ideologies, and languages that had survived the destabilizing effects of missionization and colonialism. This research, often understood as "salvage ethnography," was driven by the understanding that traditional knowledge was being lost due to the impacts of modernization and cultural assimilation. Alfred Kroeber applied his "memory culture" approach (Lightfoot 2005: 32) by recording languages and oral histories within the region. Ethnographic research by Dubois, Kroeber, Harrington, Spier, and others during the early twentieth century seemed to indicate that traditional cultural practices and beliefs survived among local Native American communities.

It is important to note that even though there were many informants for these early ethnographies who were able to provide information from personal experiences about native life before the Europeans, a significantly large proportion of these informants were born after 1850 (Heizer and Nissen 1973); therefore, the documentation of pre-contact, aboriginal culture was being increasingly supplied by individuals born in California after considerable contact with Europeans. As Robert F. Heizer (1978) stated, this is an important issue to note when examining these ethnographies, since considerable culture change had undoubtedly occurred by 1850 among the Native American survivors of California.

Based on ethnographic information, it is believed that at least 88 different languages were spoken from Baja California Sur to the southern Oregon state border at the time of Spanish contact (Johnson and Lorenz 2006, p.

34). The distribution of recorded Native American languages has been dispersed as a geographic mosaic across California through six primary language families (Golla 2007).

Victor Golla has contended that one can interpret the amount of variability within specific language groups as being associated with the relative "time depth" of the speaking populations (Golla 2007: 80) A large amount of variation within the language of a group represents a greater time depth then a group's language with less internal diversity. One method that he has employed is by drawing comparisons with historically documented changes in Germanic and Romantic language groups. Golla has observed that the "absolute chronology of the internal diversification within a language family" can be correlated with archaeological dates (2007:71). This type of interpretation is modeled on concepts of genetic drift and gene flows that are associated with migration and population isolation in the biological sciences.

The tribes of this area have traditionally spoken Takic languages that may be assigned to the larger Uto–Aztecan family (Golla 2007, p. 74). These groups include the Gabrielino (alternately Gabrieleño), Cahuilla, and Serrano. Golla has interpreted the amount of internal diversity within these language-speaking communities to reflect a time depth of approximately 2,000 years. Other researchers have contended that Takic may have diverged from Uto–Aztecan ca. 2600 BC–AD 1, which was later followed by the diversification within the Takic speaking tribes, occurring approximately 1500 BC–AD 1000 (Laylander 2000).

### Gabrielino (Gabrieleño)

Based on evidence presented through past archaeological investigations, the Gabrielino appear to have arrived in the Los Angeles Basin around 500 B.C. Surrounding native groups included the Chumash and Tataviam to the northwest, the Serrano and Cahuilla to the northeast, and the Juaneño and Luiseño to the southeast.

The names by which Native Americans identified themselves have, for the most part, been lost and replaced by those derived by the Spanish people administering the local Missions. These names were not necessarily representative of a specific ethnic or tribal group, and traditional tribal names are unknown in the post-Contact period. The name "Gabrielino" or "Gabrieleno" was first established by the Spanish from the San Gabriel Mission and included people from the established Gabrielino area as well as other social groups (Bean and Smith 1978; Kroeber 1925). Many modern Native Americans commonly referred to as Gabrielino/Gabrieleno identify themselves as descendants of the indigenous people living across the plains of the Los Angeles Basin. While distinct bands of the indigenous people of Los Angeles Basin have adopted their own unique name, the term Gabrielino is applied here.

The Gabrielino established large, permanent villages along rivers and streams, and lived in sheltered areas along the coast. Gabrielino lands included the greater Los Angeles Basin and three Channel Islands, San Clemente, San Nicolas, and Santa Catalina and stretched from the foothills of the San Gabriel Mountains to the Pacific Ocean. Tribal population has been estimated to be at least 5,000 (Bean and Smith 1978), but recent ethnohistoric work suggests a much larger population, approaching 10,000 (O'Neil 2002). Archaeological sites composed of villages with various sized structures have been identified through the Los Angeles Basin. Within the permanent village sites, the Gabrielino constructed large, circular, domed houses made of willow poles thatched with tule, each of which could hold upwards of 50 people (Bean and Smith 1978). Other structures constructed throughout the villages probably served as sweathouses, menstrual huts, ceremonial enclosures, and communal granaries.

Cleared fields for races and games, such as lacrosse and pole throwing, were created adjacent to Gabrielino villages (McCawley 1996).

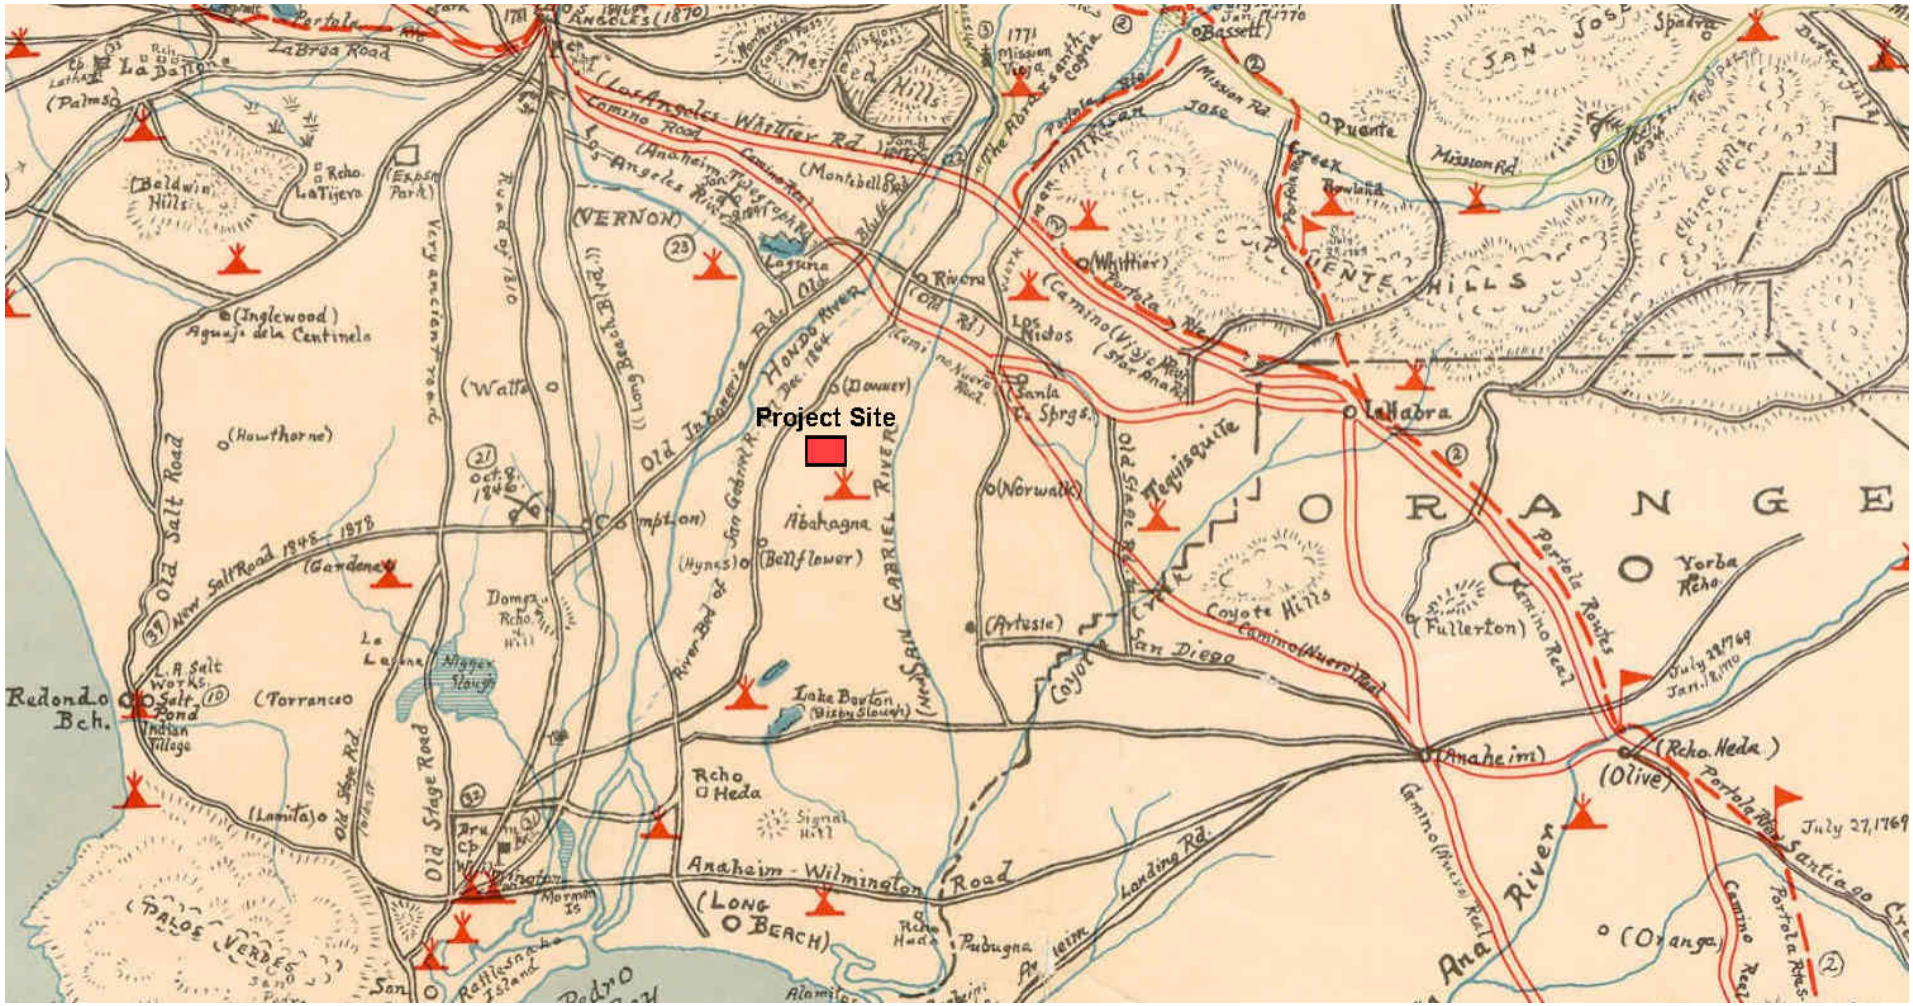
The largest, and best documented, ethnographic Gabrielino village in the vicinity was that of Yanga (also known as Yaangna, Janga, and Yabit), which was in the vicinity of the downtown Los Angeles (McCawley 1996:56-57; NEA and King 2004). This village was reportedly first encountered by the Portola expedition in 1769. In 1771, Mission San Gabriel was established. Yanga provided a large number of the recruitments to this mission; however, following the founding of the Pueblo of Los Angeles in 1781, opportunities for local paid work became increasingly common, which had the result of reducing the number of Native American neophytes from the immediately surrounding area (NEA and King 2004). Mission records indicate that 179 Gabrielino inhabitants of Yanga were recruited to San Gabriel Mission (King 2000:65; NEA and King 2004: 104). Based on this information, Yanga may have been the most populated village in the Western Gabrielino territory. Second in size, and less thoroughly documented, the village of Cahuenga was located slightly closer, just north of the Cahuenga Pass.

The environment surrounding the Gabrielino included mountains, foothills, valleys, deserts, riparian, estuarine, and open and rocky coastal eco-niches. Like most native Californians, acorns (the processing of which was established by the early Intermediate Period) were the staple food source. Acorns were supplemented by the roots, leaves, seeds, and fruits of a wide variety of flora (e.g., islay, cactus, yucca, sages, and agave). Fresh water and saltwater fish, shellfish, birds, reptiles, and insects, as well as large and small mammals, were also consumed (Bean and Smith 1978:546; Kroeber 1925; McCawley 1996).

Tools and implements used by the Gabrielino to gather and collect food resources included the bow and arrow, traps, nets, blinds, throwing sticks and slings, spears, harpoons, and hooks. Trade between the mainland and the Channel Islands Groups was conducted using plank canoes as well as tule balsa canoes. These canoes were also used for general fishing and travel (McCawley 1996).

The collected food resources were processed with hammerstones and anvils, mortars and pestles, manos and metates, strainers, leaching baskets and bowls, knives, bone saws, and wooden drying racks. Catalina Island steatite was used to make ollas and cooking vessels (Blackburn 1963; Kroeber 1925; McCawley 1996).

The Chinigchinich cult, centered on the last of a series of heroic mythological figures, was the basis of religious life at the time of Spanish contact. The Chinigchinich cult not only provided laws and institutions, but it also taught people how to dance, which was the primary religious act for this society. The Chinigchinich religion seems to have been relatively new when the Spanish arrived. It was spreading south into the Southern Takic groups even as Christian missions were being built. This cult may be the result of a mixture of native and Christian belief systems and practices (McCawley 1996).



Inhumation of deceased Gabrielino was the more common method of burial on the Channel Islands while neighboring mainland coast people performed cremation (Harrington 1942; McCawley 1996). Cremation ashes have been found buried within stone bowls and in shell dishes (Ashby and Winterbourne 1966), as well as scattered among broken ground stone implements (Cleland et al. 2007). Supporting this finding in the archaeological record, ethnographic descriptions have provided an elaborate mourning ceremony. Offerings varied with the sex and status of the deceased (Johnston 1962; McCawley 1996; Reid 1926). At the behest of the Spanish missionaries, cremation essentially ceased during the post-Contact period (McCawley 1996).

# 3.3 Ethnographic Research and Review of Academic Literature

Dudek cultural resources specialists reviewed pertinent academic and ethnographic literature for information pertaining to past Native American use of the Project site and vicinity. This review included consideration of sources commonly identified though consultation, notably the 1937 Kirkman-Harriman Historical Map (Figure 3). Based on this map, the Project site is immediately east of an unnamed road, in between the "Riverbed of San Gabriel" to the west and the "New San Gabriel River" to the east. The Project site is approximately 6.7 miles east of a historic battle site likely related to the October 8, 1846 Dominguez Rancho Mexican-American War location, approximately 2.5 miles southeast of the Old Jaboneria Road, and approximately 0.5 miles north of a Native American village referenced in the map as "Abahagna". It should be noted that this map is highly generalized due to scale and age and may be somewhat inaccurate with regard to distance and location of mapped features. Additionally, this map was prepared based on review of historic documents and notes more than 100 years following secularization of the missions (in 1833). Although the map contains no specific primary references, it matches with the details documented by the Portola expedition (circa 1769-1770). While the map is a valuable representation of post-mission history, substantiation of the specific location and uses of the represented individual features would require review of archaeological or other primary documentation on a case-by-case basis. No information relating to the village site mapped nearest to the Project was provided within the technical reports reviewed as part of the records search for this study.

Use of Gabrielino as a language has not been documented since the 1930s (Golla 2011). One study made an effort to map the traditional Gabrielino cultural use area through documented family kinships included in mission records (NEA and King 2004). This process allowed for the identification of clusters of tribal villages (settlements) with greater relative frequencies of related or married individuals than surrounding areas. Traditional cultural use area boundaries, as informed by other ethnographic and archaeological evidence, were then drawn around these clusters. The relative sizes of these villages were also inferred from their relative number of mission-period recruits. The largest village in the vicinity was likely Yabit (or Yanga), located approximately 12 miles to the northwest in the downtown Los Angeles area and may have been the most populated village in the Western Gabrielino territory (NEA and King 2004: 104). In general, the mapped position of Yanga has been substantiated through archaeological evidence, although the archaeological record has been substantially compromised by rapid and early urbanization throughout much of the region. No archaeological evidence of the nearest village on the 1938 Kirkman-Harriman map was provided in the SCCIC records search results or review of other archaeological information.

Based on review of pertinent academic and ethnographic information, the Project falls within the boundaries of the Gabrielino traditional territory, however, no Native American cultural resources have been previously documented in areas that may be impacted by the Project.

# 3.4 Historical Overview

Post-Contact history for the State of California is generally divided into three periods: the Spanish Period (1769–1821), Mexican Period (1821–1848), and American Period (1846–present). Although Spanish, Russian, and British explorers visited the area for brief periods between 1529 and 1769, the Spanish Period in California begins with the establishment in 1769 of a settlement at San Diego and the founding of Mission San Diego de Alcalá, the first of 21 missions constructed between 1769 and 1823. Independence from Spain in 1821 marks the beginning of the Mexican Period, and the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican–American War, signals the beginning of the American Period when California became a territory of the United States.

### Spanish Period (1769-1821)

Spanish explorers made sailing expeditions along the coast of southern California between the mid-1500s and mid-1700s. In search of the legendary Northwest Passage, Juan Rodríquez Cabrílllo stopped in 1542 at present-day San Diego Bay. With his crew, Cabrílllo explored the shorelines of present Catalina Island as well as San Pedro and Santa Monica Bays. Much of the present California and Oregon coastline was mapped and recorded in the next half-century by Spanish naval officer Sebastián Vizcaíno. Vizcaíno's crew also landed on Santa Catalina Island and at San Pedro and Santa Monica Bays, giving each location its long-standing name. The Spanish crown laid claim to California based on the surveys conducted by Cabrílllo and Vizcaíno (Bancroft 1885; Gumprecht 2001).

More than 200 years passed before Spain began the colonization and inland exploration of Alta California. The 1769 overland expedition by Captain Gaspar de Portolá marks the beginning of California's Historic period, occurring just after the King of Spain installed the Franciscan Order to direct religious and colonization matters in assigned territories of the Americas. With a band of 64 soldiers, missionaries, Baja (lower) California Native Americans, and Mexican civilians, Portolá established the Presidio of San Diego, a fortified military outpost, as the first Spanish settlement in Alta California. In July of 1769, while Portolá was exploring southern California, Franciscan Fr. Junípero Serra founded Mission San Diego de Alcalá at Presidio Hill, the first of the 21 missions that would be established in Alta California by the Spanish and the Franciscan Order between 1769 and 1823 (Bancroft 1885; Gumprecht 2001).

The Portolá expedition was the first known party of Europeans to set foot in the present-day boundaries of Los Angeles County in August 1769. Father Crespi called the campsite beside the river in the new territory, "Nuestra Señora la Reina de los Angeles de la Porciúncula" which translated to "Our Lady the Queen of the Angels of the Porziuncola." The Porziuncola is the name of the small chapel within the Papal basilica of Saint Mary of the Angels in Assisi, Italy where the Franciscan order was said to have started in the thirteenth century. Two years later, Friar Junípero Serra returned to the valley to establish the Mission San Gabriel Arcángel, on September 8, 1771. In 1776, following a series of floods, the mission was moved to a second, temporary site before being moved again to the present site in 1791 (Bancroft 1885; Hoover et al. 2002).

Four years after the founding the secular Spanish settlement in 1781, El Pueblo de Nuestra Señora de Los Angeles, Manuel Nieto received a provisional grant for Rancho Los Nietos in 1784. The immense grant encompassed all the land between the Santa Ana and the Rio Hondo (then-called the San Gabriel) Rivers, and between the ocean and the now-called Coyote Hills. The Rancho was later partitioned into smaller Ranchos by Nieto's heirs during the Mexican period (Hoover et al. 2002).

### Mexican Period (1821-1846)

A major emphasis during the Spanish Period in California was the construction of missions and associated presidios to integrate the Native American population into Christianity and communal enterprise. Incentives were also provided to bring settlers to pueblos or towns, but just three pueblos were established during the Spanish Period, only two of which were successful and remain as California cities (San José and Los Angeles). Several factors kept growth within Alta California to a minimum, including the threat of foreign invasion, political dissatisfaction, and unrest among the indigenous population. After more than a decade of intermittent rebellion and warfare, New Spain (Mexico and the California territory) won independence from Spain in 1821. In 1822, the Mexican legislative body in California ended isolationist policies designed to protect the Spanish monopoly on trade, and decreed California ports open to foreign merchants (Dallas 1955).

Extensive land grants were established in the interior during the Mexican Period, in part to increase the population inland from the more settled coastal areas where the Spanish had first concentrated their colonization efforts. The children of Manuel Nieto petitioned for the Mexican Governor to divide Rancho Los Nieto into six smaller Ranchos. The new ranchos included Rancho Loa Alamitos, Rancho Cerritos, Rancho Los Coyotes, Rancho Los Bolsas, Rancho Palo Altos, and Rancho Santa Gertrudes. Rancho Santa Gertrudes, where the proposed Project is located, was granted in 1834 to the widow of Antonio María Nieto, Josefa Cota de Nieto. The 21,713-acre Rancho encompasses present day Downey and Santa Fe Springs. The secularization of the missions (enacted 1833) following Mexico's independence from Spain resulted in the subdivision of former mission lands and establishment of many additional ranchos (Hoover et al. 2002).

During the supremacy of the ranchos (1834–1848), landowners largely focused on the cattle industry and devoted large tracts to grazing. Cattle hides became a primary southern California export, providing a commodity to trade for goods from the east and other areas in the United States and Mexico. The number of nonnative inhabitants increased during this period because of the influx of explorers, trappers, and ranchers associated with the land grants. The rising California population contributed to the introduction and rise of diseases foreign to the Native American population, who had no associated immunities.

### American Period (1846-Present)

The Mexican–American War ended with the Treaty of Guadalupe Hidalgo in 1848, ushering California into its American Period. Los Angeles was designated as one of the 27 original counties of California on February 18, 1850, shortly before California officially became a state with the Compromise of 1850. Beginning with the California Land Act of 1851, the new State of California recognized the ownership of lands distributed under Spanish and Mexican land grants if they were formally claimed to the United States Land Claim Commission within two years. The owner was required to furnish proof of ownership and the size of their property which led to lengthy court cases throughout the state and rulings that were delayed for extended periods (U.S. Congress 1851).

An American man from Kentucky named Lemuel Carpenter arrived in the vicinity of Rancho Santa Gertrudes during the 1830s. Following his marriage to the granddaughter of Manuel Nieto and niece of Josefa Cota de Nieto, María de Los Angeles Domínquez, Carpenter purchased Rancho Santa Gertrudes from Doña Cota de Nieto in 1843. Carpenter often disputed with the owners of the Rancho to the north, Rancho Paso de Bortolo, concerning the overlap of the two Ranchos at the northern boundary of his Rancho (Figure 4). Carpenter applied for legal claim to Rancho San Gertrudes under the California Land Act of 1851, however, the appeal process took over 12 years, in which time Carpenter began to default on the sizable loan he took out to purchase the Rancho. Rancho Santa

Gertrudes was seized from Carpenter in 1859 and sold at auction by the sheriff to John G. Downey and Dr. James P. McFarland. Downey and McFarland purchased 17,602-acres of Rancho Santa Gertrudes at a bargain rate of $3.40 per acre. The court process concluded after Carpenter's death, and resulted in the preparation of the 1862 Plat Map of the Rancho Santa Gertrudes by the U.S. Surveyor General (Figure 4) attributing ownership of Rancho Santa Gertrudes and the small disputed triangular section containing the subject property as Carpenter's property. Although Downey and McFarland formally owned the property by this point, their ownership of this section was not formally accepted until 1866 (Hoover et al. 2002; Jensen 1991; Da Rold 1979).

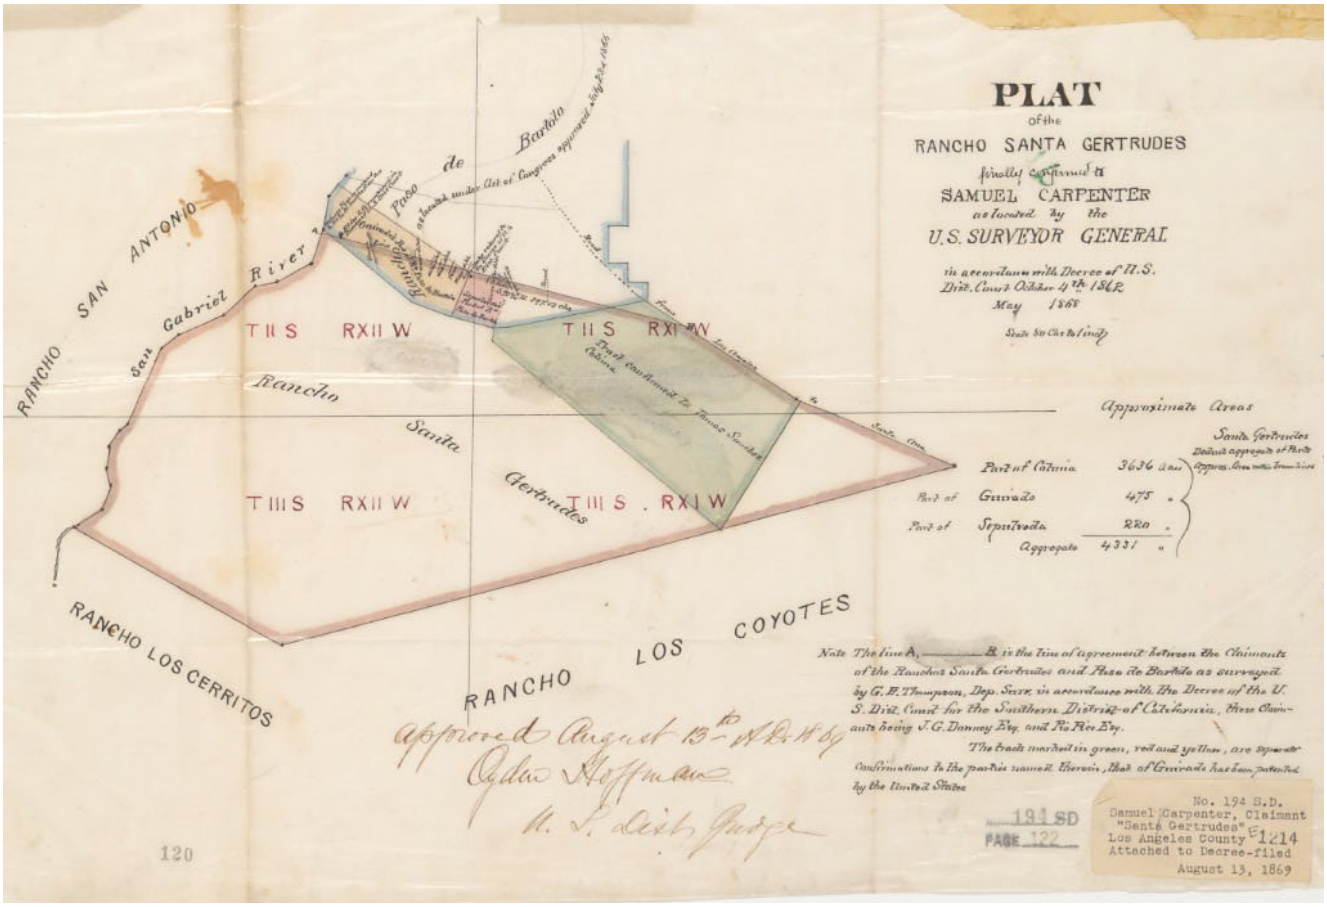

Figure 4. Plat of the Rancho Santa Gertrudes showing disputed northern territory overlap, 1866 (Bancroft Library, UC Berkley)

### Historical Overview of Downey

John Downey (b. 1827) emigrated from Ireland to the Washington D.C. where he trained as a druggist for several years before traveling in California in 1849 at the height of the Gold Rush. Downey partnered with McFarland and together they opened the second drug store in Los Angeles in 1850. Downey continued his assent through local politics after becoming a naturalized American in 1851 and joining the Los Angeles City Council thereafter. In 1860, shortly after he purchased Rancho Santa Gertrudes, Downey became the seventh Governor of the State of California. He returned to the Rancho in 1862 at the conclusion of his two-year term and began the process, alongside McFarland, of dividing 96-acres of the Rancho into small farms. This subdivision facilitated the transition of the Rancho from a cattle range into fertile, agricultural properties that would attract new settlers to Los Angeles

County. Governor Downey promoted the cultivation of oranges on the properties he sold, as he believed that the oranges would prove to be an extremely lucrative crop (Hoover et al. 2002; Latimer et al. 2010).

As Downey and McFarland subdivided and sold off portions of the Rancho during the 1860s and 1870s, the small communities of Gallatin and College Settlement organically developed, and then gradually grew together. When the Southern Pacific Railroad announced that they would route the railroad near, but not through either of the existing settlements, plans for a new, combined town surrounding the new depot developed. The settlement of Downey was officially established when Los Angeles County surveyor, Frank Lecouvreur, filed a map for the "Tract of the Downey Land Association" in October 1873. The map included two blocks devoted to the new Southern Pacific Railroad depot, which opened in April 1874. By the end of 1874, the fledgling town of Downey featured a hotel, three schools, two churches and a newspaper office (Downey Historical Society N.D.; Latimer et al. 2010).

As Governor Downey speculated when he advertised the Rancho Santa Gertrudes farms for sale, citrus fruit became an extremely successful crop. Valencia oranges were first grown on the farms surrounding the town of Downey in the 1870s, with Navel oranges following soon after. Other crops that thrived on the surrounding Downey farms included barley, castor beans, corn, English walnuts, sugar beets and potatoes. The arrival of the Southern Pacific Railroad in 1874 provided an efficient means to distribute the abundant agricultural products to a wider market, and in 1879 alone, 7,941,825-pounds of produce was transported from the Downey depot. By the 1890s, the northern portion of Downey was predominately populated by citrus orchards and was well-known as a citrus powerhouse. While Downey continued to prosper as a citrus-producing region well into the 20th century, it remained a predominately rural community during this period (Latimer et al. 2010).

During the late 1920s and the 1930s, aviation arose as a profitable industry in Downey. In March 1929, E.M Smith purchased a 73-acre ranch in southeast Downey that had been used to grow oranges and castor beans and established EMSCO Aircraft. Smith began building aircrafts onsite, constructed a 2,400-foot runway and various hangar buildings before the stock market crash later in 1929 caused EMSCO Aircraft to fold. In 1932, Smith rented the aviation-oriented property to an established aviation company owned by Bert Kinner, called the Security National Aircraft Company. Kinner gained early notoriety in the aviation field with his innovative "folding wing" design and he was also responsible for the design of the popular Kinner Airster plane, which was the first plane purchased by Amelia Earhart (Latimer et al. 2010).

In 1936, a seasoned aviation engineer named Gerard Vultee moved his company, Vultee Aircraft, from Glendale to the same facility that formerly housed both EMSCO Aircraft and the Security National Aircraft Company. Vultee saw significant success from the Downey plant, which employed over 500 people by 1938. After Vultee's death, the company was renamed the Consolidated Vultee Aircraft Corporation, or 'Convair' for short. By 1941, the Downey plant was responsible for the production of 15-percent of all military aircraft in the United States, including the B-13A, the Vultee BT-13 trainer, and B-24 Liberator bombers. Despite this, when the war effort came to a close, so too did the majority of production of military craft at the Downey plant. Limited projects carried the plant through the late 1940s including the Lark short range missile and the MX-774 ballistic missile before Convair moved operations from the Downey plant to San Diego in 1948 (Latimer et al. 2010; Blackburn 2009).

Another prominent aviation company that held military contracts through World War II, North American Aviation (NAA), did not experience the same economic downturn in the immediate post-war period. Instead, the El Segundo-based NAA saw a quick recovery that was fueled by federal contracts to produce the AJ Savage bomber, the T-6G, and the T-28 trainer aircrafts. NAA was also racing to produce jet-powered aircraft and began making use of the V-2 jet technology that was apprehended from Nazi Germany. In 1949, NAA established an additional production site

at the former Convair facility in Downey that would also serve as the headquarters for the NAA's new, Aerophysics Design Group. NAA's refocus towards the establishment the Aerophysics Design Group laid the foundation for the NAA Missiles Division, which produced the X-10 Navaho missile and the Hound Dog. The missile program also formed the basis for the NAA's transition into spacecraft engineering. The NAA Missiles Division secured the National Aeronautics and Space Administration (NASA) contract to design and build the test booster for the Mercury, Gemini, and Apollo space crafts, known as the Little Joe booster. Alongside the work of the NAA in Downey during the 1950s, the City also saw a rise in the number of new industries related to aeronautical and spacecraft design overall during this period (Blackburn 2009).

Following World War II, a surge of residential and industrial development throughout Los Angeles County caused the population of Downey to balloon from 12,000 people in 1940 to 86,000 people by 1960. The residents of Downey voted to officially incorporate the City in 1956. The County experienced dramatic industrial growth during this period, with a gain of 70 percent in the number of factories and 300 percent increase in manufacturing county-wide between 1939 and 1947. With the express support of the aeronautical engineering companies in Downey, by 1952, Los Angeles County was leading nationally in six areas of industry including; aircraft and aircraft parts; pumps and compressors; canned seafood; the motion picture industry; refrigeration and associated equipment; and heating a plumbing equipment (Latimer et al. 2010; LAT 1952).

Downey remained a dominant force in the aerospace engineering industry throughout the 1960s and the 1970s and is known colloquially as the "Cradle of the Cosmic Age" due to the development there of so many technologies considered instrumental to the advent of manned spacecraft. Today, Downey maintains a population of approximately 113,350 people, and although a majority of the City's workforce is now employed by the healthcare and social assistance industries, manufacturing is still considered the second largest driver of employment in the City (Blackburn 2009; Data USA 2020).

# 3.5 Kirkhill Manufacturing Inc. (1941-Present)

Thomas Kirk Hill founded The Mechanical Rubber Co. in the City of Los Angeles in 1919 to produce rubber seals and flexible connectors for plumbing and industrial use. In 1926, the company was renamed the Kirkhill Rubber Co. As the demand for rubber products grew, the company enlarged the original plant during the 1930s (Figure 5) (Kirkhill Inc. 2019).

Figure 5. The original Kirkhill Rubber Company building in 1938 (Kirkhill Inc. 2019)

Prompted by the escalation of the aeronautical industry in Los Angeles County in response to World War II, the Kirkhill Rubber Co. divided into two separate companies in 1941: Kirkhill Rubber Co. remained focused on the manufacturing of rubber products related to plumbing and industrial goods, while the new branch of the company, Kirkhill Manufacturing Inc., focused on the production of seals related to aerospace products (Kirkhill Inc. 2019).

In 1949, the Kirkhill Rubber Co. completed a new, 360,000-square foot facility in Brea, California, that was capable of employing over 1,000 people. The Brea facility was expanded by 50,000-square feet in 1950 allowing it to become the center of operations and production for both Kirkhill companies. In 1951, as the NAA developed new, jet propelled aircraft, Kirkhill Manufacturing Inc. established a comparatively smaller plant in Downey to maintain close proximity to the rapid-paced-development in the Downey aerospace industry. A permit for an expansion of the Downey plant in 1955 suggests that the plant employed only 60 people, which was a nominal fraction of the overall company employment during this period (LAT 1950; Kirkhill Inc. 2019; Permit #3611).

Both Kirkhill entities continued to expand during the 1960s, as Kirkhill products were utilized in the first manned trip to the Moon and also in the development of the F104 and DC-9 aircrafts. During the 1970s, Kirkhill Inc. maintained growth with the assistance of the space shuttle programs, the Titan intercontinental ballistic missile, and the Minutemen missiles (Kirkhill Inc. 2019).

During the 1990s, the two companies under the Kirkhill name were sold and renamed. In 1996, the former employees of Kirkhill Inc. purchased the company and manufacturing equipment and formed the Kirkhill Manufacturing Company. In 1998, Kirkhill Manufacturing Company was acquired by Esterline, which then merged in 1999 with TA Manufacturing and the company name became the Kirkhill-TA Company. This company found success in the manufacture of parts used in the reusable rockets for the Space Shuttle program, as well as components of the Boeing 777 aircraft. Despite the multiple changes in company ownership and structure since the 1990s, the Kirkhill name was retained as part of the new businesses. In 2019, Kirkhill Manufacturing Company celebrated its 100th anniversary as a company (Hexpol 2020; Kirkhill Inc. 2019).

## 3.6 Project Site History

Based on a review of historical aerial photographs (see Section 2.3 for a full aerial photograph review), the region of Downey that comprises the Project site remained undeveloped farmland until the late-1940s. Despite the busy Convair facility being located approximately 0.75-miles west of the Project site, the first industrial development along this stretch of Woodruff Avenue between Stewart and Gray Road and Washburn Road did not take place until the period between 1947 and 1951. The subject property, the Kirkhill Manufacturing Inc. building located at 12021-12023 Woodruff Avenue, first appears in the 1952 historical aerial photograph and Los Angeles County Assessor data indicates that it was constructed in 1951. The original architect for the facility as well as the architect(s) who designed the subsequent additions were not discovered during the course of research for this project. A 1958 photograph of the plant and a review of historical aerial photographs suggest that the plant has undergone numerous, major expansions that have effectually tripled the square-footage of the original Mid-Century Modern building (Figure 6). See Section 5.2, Identified Alterations, for an in-depth review of identified additions and alterations to the building over time (UCSB 2020; NETR 2020; Los Angeles Co. Assessor 2020).

Figure 6. Kirkhill Manufacturing Inc. building in Downey, c.1958 (Blackburn 2009)

# 3.7 Mid-Century Modern Architecture (1933-1965)

The Mid-Century Modern design movement includes architecture that is reflective of International and Bauhaus styles popular in Europe in the early 20th century. This architecture and its living designers (e.g., Mies Van der Rohe and Gropius) were disrupted by World War II and moved to the United States. During World War II, the United States established itself as a burgeoning manufacturing and industrial leader, with incredible demand for modern buildings to reflect modern products in the mid-20th century. As a result, many industrial buildings are often "decorated boxes"—plain buildings with applied ornament to suit the era and appear more modern without detracting from the importance of the activity inside the building. Following World War II, the United States had a focus on forward thinking, which sparked architectural movements like Mid-Century Modern. Practitioners of the style were focused on the most cutting-edge materials and techniques. Architects throughout Southern California implemented the design aesthetics made famous by early Modernists like Richard Neutra and Frank Lloyd Wright, who created a variety of modern architectural forms. Like other buildings of this era, Mid-Century Modern buildings had to be quickly assembled, and use modern materials that could be mass-produced. Both residences and offices designed in this style expressed its structure and materials, displayed large expanses of glass, and had an open interior plan (McAlester 2013; Morgan 2004).

Characteristics of the Mid-Century Modern style include:

- One- to two-stories in height
- Low, boxy, horizontal proportions
- Simple geometric forms with a lack of exterior decoration
- Commonly asymmetrical
- Flat roofed without coping at roof line; flat roofs hidden behind parapets or cantilevered canopies
- Expressed post-and-beam construction in wood or steel
- Exterior walls are flat with smooth sheathing and typically display whites, buffs, and pale pastel colors
- Mass-produced materials
- Simple windows (metal or wood) flush-mounted and clerestory
- Industrially plain doors
- Large window groupings

# 4 Field Survey

## 4.1 Methods

Dudek Senior Architectural Historian Sarah Corder, MFA, conducted a pedestrian survey of the Project site for historic built environment resources on August 12, 2020. The survey entailed walking around the exteriors of the Kirkhill Manufacturing Inc. property, documenting each wing with notes and photographs, specifically noting character-defining features, spatial relationships, observed alterations, and examining any historic landscape features on the property. The property is entirely developed and contains no exposed sediment; therefore, an archaeological survey was not completed. Dudek documented the fieldwork using field notes, digital photography, close-scale field maps, and aerial photographs. Photographs of the subject property were taken with a digital camera. All field notes, photographs, and records related to the current study are on file at Dudek's Pasadena, California, office.

## 4.2 Results

During the course of the pedestrian survey, Dudek identified a series of interconnected buildings that all function together as the Kirkhill Manufacturing, Inc. facility. The survey also indicated that the subject property grew and developed over time, with multiple sections of the now-interconnected buildings and wings being more than 45 years old, thus requiring recordation and evaluation for historical significance. Section 5 (Significance Evaluation) provides a detailed physical description of the subject property, as well as, the associated significance evaluation for the subject property under all applicable national, state, and local designation criteria and integrity requirements.

INTENTIONALLY LEFT BLANK

# 5 Significance Evaluation

In order to determine if the proposed Project will impact historical resources under CEQA, the Kirkhill Manufacturing Inc. property located at 12021-12023 Woodruff Avenue (AIN 6284-025-018) within the Project site was evaluated for historical significance and integrity in consideration of NRHP and CRHR designation criteria and integrity requirements. The City of Downey does not maintain cultural resource designation criteria and instead defers to the NRHP and the CRHR.

A detailed physical description of the property is provided below. The subject property presents as a one building with multiple wings and large-scale additions including the main office, the north warehouse, and the south warehouse. For the purposes of clarity, these three wings will be described separately below.

## 5.1 Kirkhill Manufacturing Inc. (12021-12023 Woodruff Avenue)

**Physical Description**

The subject property faces east onto Woodruff Avenue (Figure 7) and features three geographically distinct, yet interconnected building wings: the main office, the north warehouse, and the south warehouse. These individual areas of the building are comprised of multiple additions and expansions that have caused them to display a range in style, scale, and materials. The three main sections are connected by interior hallways, as well as, a paved, U-shaped access driveway and parking area that extends around the perimeter of the building on the north, west and south sides. A smaller U-shaped parking lot is located in front of the east (main) elevation of the main office wing, offers limited surface parking. This parking area is surrounded by modest landscaped areas and the remaining section of the original flat-brick company sign at the center of the drive.

Figure 7. Overview of Kirkhill Manufacturing Inc. property, view looking northwest across Woodruff Avenue (IMG_0352)

*Main Office (1951, multiple expansions)*

The main office wing is a one-story, Mid-Century Modern-style building featuring a flat roof and decorative breezeway block screens (Figure 8). The building is clad in a combination of flat brick and scored stucco in broad sections (Figure 9). The flat roof extends out to form a covered walkway along the front of the building. The primary entrance features a single, replaced full-lite door located at the center of the east (main) elevation that is surrounded by two fixed windows and a fixed transom (Figure 10). Each of the remaining tall, fixed rectangular windows on the building correspond to a breezeway block screen that diffuses the light entering the building. The north and south sections of the building shows evidence of multiple modifications and expansion over time displayed by incompatible rooflines and blunt transitions between exterior cladding materials (Figure 11).

Figure 8. Main office volume east (main) and south elevations, view looking northwest (IMG_0378)

Figure 9. Main office east (main) elevation showing decorative breezeway block screens situated in front of windows, view looking southwest (IMG_0414)

Figure 10. Primary entrance door on main office, view looking northwest (IMG_0423)

Figure 11. Main office volume north elevation shows the convergence of the various rooflines resulting from multiple additions, view looking south (IMG_0408)

*North Warehouse (1951, multiple expansions)*

The north warehouse portion of the building is located northwest of the main office and consists of two different utilitarian-style sections: a two-story section clad in ribbed metal siding atop a concrete masonry unit (CMU) substructure; and a tri-gable, one-story section which faces the western property line (Figure 12).

Figure 12. North warehouse showing the one-story, tri-gabled section in the foreground with the two-story section in the rear, view looking southeast (IMG_0495)

The two-story section of the north warehouse sits immediately behind the main office volume and features a shallow, front-facing gable roof supported by heavy steel framing (Figure 13). The roof is clad in ribbed metal material and contains multiple skylights as well as clerestory windows on the south elevation. A metal shed roof extends from the north elevation of the building to shelter a wide walkway full of equipment and machinery. The main entry point for this section of the building is a large roll-up metal door. Additional doors are found throughout the elevation, but they appear to function as emergency doors and not as primary points of entry.

Figure 13. Main office volume north elevation shows the convergence of the various rooflines resulting from multiple additions, view looking south (IMG_0467)

The one-story, tri-gabled section of the north warehouse is located to the west of the two-story section (Figure 14). This segment of the building is clad in a ribbed metal siding in both a metallic and white color. Each of the three, equally-sized bays contains a single or a double metal roll up door which provides access to the interior areas. The northern wall on this section is faced with CMU to correspond with the two-story section.

Figure 14. View of the one-story, gabled section of the north warehouse, view looking southeast (IMG_0493)

*South Warehouse (1951, multiple expansions)*

The south warehouse is located to the southwest of the main office wing and south of the north warehouse. This building section features a front gable roof and a west elevation clad in a ribbed metal material (Figure 15). The south elevation consists of a broad wall of built from CMU which runs the length of this elevation (Figure 16). The entire stretch of this elevation is punctuated only by two full-leaf doors, a metal roll-up door, a sliding glass door with a small metal awning, and two decorative breezeway block screens shading a window on the east side of the elevation.

Figure 15. South warehouse west elevation (left) and partial south (right) elevations, view looking northeast (IMG_0519)

Figure 16. South warehouse partial south elevation, view looking east (IMG_0534)

### Identified Alterations

Dudek staff visited the City of Downey Permit Counter on August 12, 2020 and reviewed all available permits pertaining to the subject property (AIN 6284-025-018). Observed alterations are also included in this section with dates stated where known:

- 1950. Electrical permit to install six new motors (#62280)
- 1954. 9,000-square foot, one-story addition (#70040)
- 1954. Electrical permit to install three new transformers (#23605)
- 1954. Electrical permit to install several new motors (#1721)
- 1955. 50-foot by 80-foot, one-story addition (#3611)
- 1955. Electrical permit to install four motors (#8114)
- 1956. Electrical permit to update electrical receptacles and fixtures (#8429, #6922, and #5007)
- 1956. Install wet standpipe (#6194 and #3510)
- 1959. Demolish and replace former fire-damaged office building (#28490)
- 1959. Install fire sprinkler system in new office building (#29671)
- 1968. Existing shipping office remodeled (#91845)
- 1971. 18,000-square foot warehouse addition and 13,000-square foot packaging area addition (# 31754)
- 1971. Install three-ton combined gas heating and air conditioning system (#65775)

- 1971. Pave approximately 50,000-square feet surrounding building (#61033)
- 1972. 8-foot tall, 120-foot long block fence (no permit #)
- 1973. 21,536-square foot warehouse addition (#80040)
- 1973. 14,268-square foot warehouse/office and lunch room addition (#80039)
- 1973. Install automatic fire sprinklers in new warehouses and office buildings (#84255)
- 1973. Added public sewer connection (#90479)
- 1974. 12-foot, 6-inches by 18-foot patio cover installed as lunch area (#15447)
- 1974. Install personnel sign (#04143)
- 1976. Add underground fuel storage tank (#46978)
- 1976. 3,024-square foot floor slab, building and canopy (#54228)
- 1976. Install fire sprinkler system (#56621),
- 1976. Install three water closets, two lavatories, and 1 drinking fountain (#45434)
- 2010. Install fire sprinkler system heads (#177-10)
- 2012. Install an approximately 33-square foot, non-illuminated sign (#BLD-12-00847)

Expansion of the Kirkhill Manufacturing Inc.

12021 Woodruff Avenue Industrial Building Project

INTENTIONALLY LEFT BLANK

## 5.2 NRHP/CRHR Statement of Significance

The subject property (12021-12023 Woodruff Avenue; AIN: 6284-025-018) does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of an existing historic district, based on the following significance evaluation.

**Criterion A/1: That are associated with events that have made a significant contribution to the broad patterns of our history.**

Archival research indicates that by the time the Downey branch facility of Kirkhill Manufacturing Inc. was completed in 1951, parent company Kirkhill Rubber Co. had already been manufacturing rubber products for aerospace projects for 10 years. Kirkhill Manufacturing Inc. produced products specifically for airplanes and was established in order to distinguish between the parent company, Kirkhill Rubber Co., which was founded in 1919 to make household and industrial plumbing components. As Downey earned a reputation as an epicenter of aerospace engineering, Kirkhill Manufacturing Inc. had the opportunity to produce parts for multiple aircrafts and space crafts produced in the area during the 1950s through the 1980s. Despite the facility's location in Downey and its proximity to the bustling NAA plant, the facility in Downey appears to have remained secondary in both production and staffing to the Kirkhill Manufacturing Inc. facility in Brea that was completed several years earlier in 1949. Archival research indicates the Brea plant served as the center of operations during this period, and the Downey location is not referenced in connection with any specific achievement credited to the Kirkhill Manufacturing Inc. Ultimately, the success of the company continues to be associated with the Brea facility, not the Downey location. The plant in Downey does not appear to have made a significant contribution to the local, state, or national history. While the current tenants of the building, Kirkhill Manufacturing Company Inc., continues to use the Kirkhill company name, the original Kirkhill Manufacturing Inc. was sold and restructured multiple times during the 1990s. Therefore, the current Kirkhill Manufacturing Company Inc. does not maintain continued association to the company started by Thomas Kirk Hill in 1919 that went on to assist in the engineering of aerospace industries in Downey. Consequently, the building does not retain integrity of association with the firm that established the branch of the Kirkhill Manufacturing Inc., in Downey in 1951. Moreover, with subsequent additions and alterations, the building no longer represents the time period in which the events for which the company gained notoriety within the field of aerospace design took place. For this reason, the property does not appear eligible under Criterion A of the NRHP or Criterion 1 of the CRHR.

**Criterion B/2: That are associated with the lives of persons significant in our past.**

Archival research did not indicate that any previous property owners or employees are known to be historically significant figures at the national, state, or local level. As such, this property is not known to have any historical associations with people important to the nation's or state's past. Therefore, the property does not appear eligible for the NRHP under Criterion B or CRHR under Criterion 2.

**Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.**

Construction of the subject property began in 1951 and the original building design would go on to receive five major additions in the years 1954, 1955, 1971, 1973, and 1976. The original 1951 footprint as displayed in the

1952 historical aerial photograph (see Figure 17) was an example of the modest Mid-Century Modern-style buildings designed for industrial and commercial uses following the end of World War II. Furthermore, the popularity of the architectural style in Southern California and its widespread use resulted in the creation of hundreds of buildings in this style that have a higher level of integrity, association with notable architects, and a higher level of architectural merit that that shown at the subject property. Therefore, the subject property cannot be considered a distinctive example of a Mid-Century Modern industrial building, nor can it be considered representative of a significant and distinguishable entity whose components lack individual distinction. Furthermore, as the original architect was not discovered during the course of research for this project, the building is not known to be the work of a master architect.

Following the multiple expansions and additions, the character-defining features including the low, boxy massing, articulated profile, grand semi-circular driveway, and original exterior cladding have been substantially altered. Although the building appears to retain the majority of the original breezeway block screens, later additions to the main office's east (main) elevation that are different in scale from the original building, also feature the same wide swaths of decorative block in the same pattern. This has resulted in a blurred distinction between the original design and features that were added at a later period. The property as a whole has been altered beyond recognition, diminishing the already modest architectural value of the property. These alterations and major additions have caused the building to lose integrity in the areas of design, materials and workmanship. For these reasons, the subject property does not appear eligible for listing in the NRHP under Criterion C or CRHR under Criterion 3.

**Criterion D/4: That have yielded, or may be likely to yield, information important in prehistory or history.**

The property is not significant under Criterion D of the NRHP or Criterion 4 of the CRHR as a source, or likely source, of important historical information nor does it appear likely to yield important information about historic construction methods, materials or technologies.

## 5.3 Integrity Discussion

The subject property retains integrity of location, as it remains in its original location. The Kirkhill Manufacturing Inc. property, including all three wings, have undergone major exterior alterations and large–scale additions beginning in the 1950s. The building sections do not retain their original plan and massing, and later additions are not consistent with the original Mid-Century Modern-style building. Therefore, the subject property does not retain integrity of design. The property does not retain integrity of setting, as the setting in all directions has been altered from a rural farmland with periodic industrial development when it was initially constructed, to dense residential development, parking lots, strip malls with anchoring grocery and retail stores. The size, scale, and density of this modern setting differs dramatically from the 1950s and 1960s. Although the original distinctive breezeway block screens on the east elevation remain intact, the subject property does not retain integrity of materials and workmanship, due to the introduction of modern materials on the main and side elevations. For instance, key design elements such as the scale, massing, cladding, signage, original semi-circular driveway, and doors have all been replaced or heavily altered. The subject property also does not retain integrity of feeling, as the property as a whole no longer presents as a Mid-Century Modern-style industrial building. While the current tenants of the building, Kirkhill Manufacturing Company Inc., continue to employ the Kirkhill company name, the original Kirkhill Manufacturing Inc. was sold and restructured multiple times during the 1990s and no longer maintains any association to the company started by Thomas Kirk Hill in 1919. Consequently, the building no longer retains integrity of association with the original firm that established the branch of the Kirkhill Manufacturing Inc., in

Downey. In summary, the subject property does not retain the requisite integrity and does not rise to the level of significance required for designation at the national, state or local levels.

# 6 Findings and Conclusions

## 6.1 Summary of Findings

No cultural resources were identified within the Project site as a result of the CHRIS records search, NAHC SLF search, extensive archival research, field survey, and property significance evaluation. The Kirkhill Manufacturing Inc. property located at 12021-12023 Woodruff Avenue (AIN: 6284-025-018) does not appear eligible for NRHP or CRHR due to a lack of significant historical associations, architectural merit, and physical integrity. Therefore, this property is not considered an historical resource for the purposes of CEQA. Further, no potential indirect impacts to historical resources were identified.

Due to previous ground-disturbing activities within the Project site, the probability of encountering any intact archaeological resources during construction activities is low. However, in the event that intact archaeological deposits are encountered/impacted by ground-disturbing activities associated with the Project, management recommendations to reduce potential impacts to unanticipated archaeological resources and human remains during construction activities are provided below.

## 6.2 Recommendations

The proposed Project would result in a less than significant impact to cultural resources, including historical and archaeological resources. No previously identified or new cultural resources were identified within the Project site as a result of the current study; therefore, no further management recommendations are necessary beyond standard protection measures to address unanticipated discoveries of archaeological resources and human remains (listed below).

### Unanticipated Discovery of Archaeological Resources

All construction crews should be alerted to the potential to encounter archaeological resources. In the event that archaeological resources (sites, features, or artifacts) are exposed during construction activities for the proposed Project, all construction work occurring within 100 feet of the find shall immediately stop until a qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards, can evaluate the significance of the find and determine whether or not additional study is warranted. Depending upon the significance of the find, the archaeologist may simply record the find and allow work to continue. If the discovery proves significant under CEQA or Section 106 of the NHPA, additional work such as preparation of an archaeological treatment plan, testing, or data recovery may be warranted.

### Unanticipated Discovery of Human Remains

In accordance with Section 7050.5 of the California Health and Safety Code, if human remains are found, the County Coroner shall be notified within 24 hours of the discovery. No further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains shall occur until the County Coroner has determined, within two working days of notification of the discovery, the appropriate treatment and disposition of the human remains. If the remains are determined to be Native American, the Coroner shall notify the NAHC in

Sacramento within 24 hours. In accordance with California Public Resources Code, Section 5097.98, the NAHC must immediately notify those persons it believes to be the MLD from the deceased Native American. The MLD shall complete their inspection within 48 hours of being granted access to the site. The MLD would then determine, in consultation with the property owner, the disposition of the human remains.

# Appendix A

## Preparer's Qualifications

# Sarah Corder, MFA

## Senior Architectural Historian

Sarah Corder is an architectural historian with more than 13 years of professional experience throughout the United States in all elements of cultural resources management, including project management, intensive-level field investigations, architectural history studies, and historical significance evaluations in consideration of the California Register of Historical Resources (CRHR) Register, and the National Register of Historic Places (NRHP), and local-level evaluation criteria. Ms. Corder has conducted numerous historical resource evaluations and developed detailed historic context statements for a multitude of property types and architectural styles, including private residential, commercial, industrial, educational, and agricultural properties. She has also provided expertise on numerous projects requiring conformance with the *Secretary of the Interior's Standards for the Treatment of Historic Properties*.

***Education***

*Savannah College of Art and Design*
*MFA, Historic Preservation, 2004*

*Bridgewater College*
*BA, History, 2002*

***Professional Affiliations***

*National Trust for Historic Preservation*

*Los Angeles Conservancy*

*California Preservation Foundation*

*Society for Architectural Historians*

Ms. Corder meets the Secretary of the Interior's Professional Qualification Standards for both Architectural History and History. She has experience preparing environmental compliance documentation in support of projects that fall under the California Environmental Quality Act (CEQA)/National Environmental Policy Act (NEPA), and Sections 106 and 110 of the National Historic Preservation Act (NHPA).

## Dudek Project Experience (2017-Present)

### Municipal

**Gilroy Citywide Historic Resources Inventory and Historic Context Statement, City of Gilroy, Gilroy, California (May 2018 – present, estimated completion date October 2019).** Dudek is currently working with the City of Gilroy to prepare a citywide historic context statement and update its 1986 historic resource inventory. As survey lead, Ms. Corder has already successfully completed reconnaissance-level survey of over 3,400 properties on time and within budget, submitted a draft historic context statement to the city, and has hosted a public kick-off meeting/outreach session that was well received by the community. Dudek has developed highly detailed and efficient iPad field forms that allow surveyors to record a property in less than 5 minutes and provide the City with real-time survey data.

**San Diego Dam and Reservoir Citywide Inventory, City of San Diego Public Utilities Department, San Diego, California (January 2017 – present, estimated completion date March 2019).** Dudek is currently in the process of preparing a historic context statement and significance evaluation of all dam infrastructure owned by the City's Public Utilities Department. The project involves evaluation of at least 10 dam complexes for historical significance in consideration of NRHP, CRHR, and City designation criteria and integrity requirements. While the project is still in progress, Ms. Corder has contributed extensively to archival research and has authored individual historic resource reports for Lower Otay Dam and El Capitan Dam.

**The Santa Monica City Yards Master Plan Project, City of Santa Monica, Los Angeles County, California (2017).** The City of Santa Monica retained Dudek to complete a cultural resources study for the proposed City Yards

Master Plan project site located at 2500 Michigan Avenue in the City of Santa Monica. The study involved evaluation of the entire City Yards site, including two murals and a set of concrete carvings for historical significance and integrity. As a result, the City Yards and its associated public art work was found ineligible under all designation criteria. Ms. Corder conducted building permit research and co-authored the technical report.

**LADWP West Los Angeles District Yard Project, City of Los Angeles, Los Angeles County, California (2017).** Dudek was retained by Los Angeles Department of Water and Power (LADWP) to complete a cultural resources study for a project that proposes demolition of five LADWP-owned administrative buildings and warehouses at the West Los Angeles District Headquarters located at 12300 West Nebraska Avenue. Dudek evaluated the yard for historical significance in consideration of NRHP, CRHR, and City of Los Angeles HCM criteria and integrity requirements. Ms. Corder's responsibilities for the project included the following: architectural history field survey and background research.

## Development

**Carol Kimmelman Sports and Academic Center Project, City of Carson, Los Angeles County, California (2018).** Dudek was retained to conduct a cultural resources study on the Victoria County Golf Course and associated recreation buildings for the proposed Kimmelman Sports and Academic Center. For the project, Ms. Corder conducted a record search, a pedestrian survey, archival and building development research, NRHP and CRHR evaluations, and impacts analysis. As a result of the historic significance evaluation, all golf course components associated with the Victoria County Golf Course were found not eligible under designation requirements. The project proposed to redevelop 87 acres of the northeastern portion Victoria Golf Course site for public recreation purposes, including 75,000 sq. ft. recreational buildings, and 22,000 sq. ft. of support buildings.

**Victoria Greens Project, City of Carson, Los Angeles County, California (2018).** Dudek was retained by the City of Carson Planning Division for a cultural resource inventory of three parcels at the intersection of Central Avenue and Victoria Street. Ms. Corder's responsibilities for the project included the following: architectural history field survey, building permit research, background research, preparation of DPR forms and authoring the cultural resources report. The project proposed to develop 176 new three-story townhomes on currently unused land on the northeast corner of Central Avenue and Victoria Street in the City of Carson.

**Birch Specific Plan 32-Unit Condo Project, City of Carson, Los Angeles County, California (2017).** Dudek was retained by the City of Carson to prepare a cultural resources report for a project that proposes to demolish approximately 6,200 square feet of existing residential buildings and roughly 5,850 square feet of pavement on the project site, and construct a 32-unit residential condominium community with on-grade parking, landscaping, and other associated improvements. The historical significance evaluation included three residential properties proposed for demolition. All properties were found not eligible under all designation criteria and integrity requirements. Ms. Corder's responsibilities for this project included the following: field survey, building permit research, background research, and co-authoring the final cultural resources report.

## Education

**John Adams Middle School Auditorium Replacement Project, City of Santa Monica, Los Angeles County, California (2018).** The Santa Monica-Malibu Unified School District retained Dudek write the Final Mitigated Negative Declaration for the John Adams Middle School Auditorium Replacement Project for the Santa Monica-Malibu Unified School District. The project proposed to demolish the existing auditorium and music building and replace them with a new performing arts center.

**Fullerton College Facilities Master Plan Program EIR, North Orange County Community College District, City of Fullerton, Orange County, California (2017).** The North Orange County Community College District (NOCCCD) contracted Dudek to evaluate all buildings and structures on campus over 45 years old that were proposed for demolition or substantial alteration as part of the proposed Master Plan Program. The study entailed conducting

archival and building development research, a records search, detailed impacts assessment, and development of mitigation measures for project conformance with the Secretary of the Interior's Standards for Rehabilitation. As a result of the significance evaluation, three historic districts and one individually eligible building were identified within the project area.

## Education

**Judicial Council of California Historical Resource Evaluation Report for the Santa Monica Courthouse, City of Santa Monica, Los Angeles County, California (2017)**. Dudek was retained by the Judicial Council of California (JCC) to prepare an evaluation of the Santa Monica Courthouse building, located at 1725 Main Street in the City of Santa Monica, California. To comply with Public Resources Code Section 5024(b), the JCC must submit to the State Historic Preservation Officer (SHPO) an inventory of all structures over 50 years of age under the JCC's jurisdiction that are listed in or that may be eligible for inclusion in the National Register of Historic Places (NRHP), or registered or that may be eligible for registration as a California Historical Landmark (CHL). The Santa Monica Courthouse was found not eligible for designation under all applicable criteria. Ms. Corder's responsibilities for the project included archival research and co-authoring the cultural resources report.

**Judicial Council of California Historical Resource Evaluation Report for the Figueroa Division Courthouse, City of Santa Barbara, Santa Barbara County, California (2017).** Dudek was retained by the Judicial Council of California (JCC) to prepare an evaluation of the Santa Monica Courthouse building, located at 118 E. Figueroa Street in the City of Santa Barbara, California. To comply with Public Resources Code Section 5024(b), the JCC must submit to the State Historic Preservation Officer (SHPO) an inventory of all structures over 50 years of age under the JCC's jurisdiction that are listed in or that may be eligible for inclusion in the National Register of Historic Places (NRHP), or registered or that may be eligible for registration as a California Historical Landmark (CHL). The Figueroa Division Courthouse was found not eligible for designation under all applicable criteria. Ms. Corder's responsibilities for the project included the following: background research and co-authoring of the final cultural resources report.

**Department of General Services Historical Resource Evaluation for the Normal Street Department of Motor Vehicles Site at 3960 Normal Street, San Diego, California (2017).** Dudek was retained by the State of California Department of General Services to complete a Historical Resources Technical Report for a project that proposes demolition and replacement of the Department of Motor Vehicles (DMV) building located at 3960 Normal Street in the City of San Diego. To comply with Public Resources Code Section 5024(b), DGS must submit to the State Historic Preservation Officer (SHPO) an inventory of all structures over 50 years of age under DGS's jurisdiction that are listed in or that may be eligible for inclusion in the National Register of Historic Places (NRHP), or that may be eligible for registration as a California Historical Landmark (CHL). The DMV was found not eligible. Ms. Corder's responsibilities for the project included background research for the historical resource technical report.

## Transportation

**Princeton Avenue Road Widening Project, City of Moorpark, Ventura County, California (2017).** Dudek was retained by Stantec and the City of Moorpark to prepare Caltrans-compliant cultural resource documentation for the Princeton Avenue Road Widening Project. The project includes approximately 0.75-miles of roadway widening and improvements, including sidewalks and bicycle lanes. Dudek prepared an ASR, HRER, and HPSR in support of this effort. Both properties were found ineligible under all designation criteria and integrity requirements. The reports are currently pending Caltrans District 7 approval. Ms. Corder's responsibilities for the project included background research for the required reports.

## Other California Project Experience (2009-2014)

**Crenshaw /LAX Transit Corridor Project, Los Angeles County, California (2011).** Ms. Corder conducted the architectural history survey and participated in the evaluation of over 100 built environment resources that may be affected by the Los Angeles County Metropolitan Transportation Authority's (Metro's) proposed Crenshaw/LAX Transit Corridor Project. The project is approximately 8.5 miles in length and is located within the cities of Los Angeles and Inglewood, Los Angeles County, California. Ms. Corder was involved in both architectural history field surveys and completion of over 100 DPR forms for the evaluation of built environment resources. The project was subsequently approved by SHPO with no comments. Client: Terry Hayes Associates, LLC; Agency: Metro.

**East Los Angeles College Satellite Campus Project, City of South Gate, Los Angeles County, California (2009).** Ms. Corder conducted the architectural history survey and participated in the evaluation of built environment resources for a land development project located in Los Angeles County, California. Client: Terry A. Hayes Associates, LLC.

**San Gabriel Trench Grade Separation Project (Phases I, II, and III); Cities of San Gabriel, Alhambra, and Rosemead, Los Angeles County, California (2008–2010, 2011-2014).** Ms. Corder conducted the architectural history survey and participated in the evaluation of over 100 built environment resources that may be effected by the a proposed grade separation located within the cities of San Gabriel, Alhambra, and Rosemead. The proposed project would lower a 2.2-mile section of Union Pacific Railroad tracks in the immediate vicinity of the historic Mission San Gabriel Arcángel. Ms. Corder was involved in both architectural history field surveys and completion of over 100 DPR forms for the evaluation of built environment resources. Client: Terry A. Hayes Associates, LLC.

**Wetlands Pocket Park Project, Los Angeles, California (2009):** Ms. Corder conducted the architectural history survey and participated in the evaluation of built environment resources for the project that was located on the site of a former rail yard for the City of Los Angeles Yellow Line. Client: City of Los Angeles Department of Public Works.

## Project Experience

### Development

**151 South Fairview Avenue Soils Testing Cultural Resource Monitoring, Salem Engineering Group Inc. Goleta, California.** Provided archaeological and paleontological monitoring in accordance with the monitoring and mitigation treatment plan stated in the environmental impact report. (August 2017) ~1 day

**235 North La Luna, Thomas and Kelly Adams, Ojai, California.** Performed Phase II investigation of field survey, excavation, and site inventory within and surrounding the project site to verify, in accordance with CEQA, the horizontal and vertical significance of the archaeological site CA-VEN-139 in Ojai, California, which was previously recorded as extending partially into the proposed project site. (January 2017)

**749-759 Ward Drive, The Mark Family Trust, Goleta, California.** Provided archaeological and paleontological monitoring in accordance with the monitoring and mitigation treatment plan stated in the environmental impact report. (March to May 2018) ~16 days

**Pacific Palisades Village 1, CAH Acquisitions Co. LLC, Pacific Palisades, California.** Provided archaeological and paleontological monitoring for the large mixed-use project in accordance with the monitoring and mitigation treatment plan stated in the environmental impact report. (July 2017) ~2 days

**Village at Los Carneros Lot 9 Archaeological Monitoring, Red Tail Acquisitions LLC, Goleta, California.** Provided archaeological and paleontological monitoring in accordance with the monitoring and mitigation treatment plan stated in the environmental impact report. (March 2018) ~2 days

**Montecito Avenue Pismo Phase I Archaeological Investigation, Studio Freeby, Pismo Beach, California.** Performed initial Phase I records search of the area within and surrounding the project site. (April 2018)

**Paradiso del Mare Construction, Farallon Dos Pueblos Investors LLC, Goleta, California.** Performed initial Phase I site inventory within and surrounding the project site. Provided archaeological and paleontological monitoring in accordance with the monitoring and mitigation treatment plan stated in the environmental impact report. (April 2018 to March 2019) ~6 days

**Tomate Canyon Ranch Concept Trail Alignment Extended Phase I Archaeological Investigation, Brooks Street, Goleta, California.** Performed extended Phase I field survey, site inventory and excavation within and surrounding the project site to verify, in accordance with CEQA, the nearby archaeological site CA-SBA-2439 did not extend into the project site. (May 2018)

**Village at Los Carneros Project Archaeological Monitoring, RCS–Los Carneros LLC, Goleta, California. Provided** archaeological and paleontological monitoring in accordance with the monitoring and mitigation treatment plan stated in the environmental impact report. (June 2017) ~2 days

**Ocean Meadows Residential, Ocean Meadows Investors, LLC, Goleta, California.** Performed initial Phase I intensive field survey and assisted in compiling the results of a records search and site inventory. (Feburary to March 2019)

**805 Agricultural Holdings, Helios Dayspring, Santa Barbara County, California.** Performed initial Phase I records search and field survey within and surrounding the project site. (July 2018)

**Rosewood Miramar PC, Caruso Affiliated, Montecito, California.** Provided archaeological and paleontological monitoring in accordance with the monitoring and mitigation treatment plan stated in the environmental impact report. (June 07, 2017)

**Bacara Executive Conference Center, Carey Watermark Investors Inc., Goleta, California.** Performed Phase II investigation of field survey, excavation, and site inventory within and surrounding the project site. (March to April 2018)

**North Side Specific Plan Parcel 22 Archaeological Resources, Direct Relief International, Goleta, California.** Provided archaeological and paleontological monitoring in accordance with the monitoring and mitigation treatment plan stated in the environmental impact report. Assisted in a Phase III excavation and performed the cataloging of artifacts recovered from the Phase III investigation, in accordance with CEQA. (September 2016 to November 2018)

**Marriott Residences Inn Cultural Resources Mitigation, R.D. Olson Development, Goleta, California.** Supported Dudek in the performance of cataloging and storing of artifacts recovered from a Phase III investigation, in accordance with CEQA. (September 2016 to January 2018)

**Cojo-Jalama Ranches, Coastal Resources LLC, Santa Barbara, California.** Performed initial Phase I intensive field survey within and surrounding the project site. (January 2017)

**Interfaith Food Closet, Auburn Interfaith Food Closet, Auburn, California**. Assisted in compiling the results of a Phase 1 records search. (May 2018)

**Phase I and II Archaeological Study, 5567 Calle Arena, Carpinteria.** Performed initial Phase I intensive field survey and site inventory revealing a previously recorded prehistoric site and state historic landmark (CA-SBA-7) extending within and surrounding the project site. Assisted in conducting a Phase II investigation to verify the horizontal and vertical significance in accordance with CEQA. (October 2017)

**101 Garden Street Property, Woodridge Capital Partners LLC, Santa Barbara, California.** Performed initial Phase I intensive field survey and assisted in compiling the results of a records search and site inventory. (December 2018 to Feburary 2019)

**2761 Cebada Canyon, Avo Vista Farms LLC, Lompoc, California.** Performed initial Phase I records search and field survey within and surrounding the project site. (May to July 2018)

**575 Brisa Del Mar Phase II Evaluation, Kyle Andeer, Santa Cruz, California.** Assisted a Phase II excavation within the project site to verify, in accordance with CEQA, the horizontal and vertical significance of an archaeological site, which was previously recorded as extending partially into the proposed project site. (November 2018)

**93 South Patera Lane, Apex Companies LLC, Goleta, California.** Performed extensive Phase I investigation of field survey, excavation, and site inventory within and surrounding the project site to verify, in accordance with CEQA, the horizontal and vertical significance of the archaeological site CA-SBA-58 in Goleta, California, which was previously recorded as extending partially into the proposed project site. Provided archaeological and paleontological monitoring in accordance with the monitoring and mitigation treatment plan stated in the environmental impact report. (December 2018 to May 2019)

**841 Cima Linda Lane, Darrell Becker, Montecito, California.** Performed a records search and field survey within and surrounding the project site for a Letter Report. (November 2018)

**125 Castro Canyon Road, Andrew James Jeknavorian, New Cuyama, California.** Performed initial Phase I records search and field survey within and surrounding the project site. (June 2018)

**7465 Hollister Ave, Daniel Guggenheim, Goleta, California.** Provided archaeological and paleontological monitoring in accordance with the monitoring and mitigation treatment plan stated in the environmental impact report. (May 2019) ~6 days

**Artis Senior Living, Artis Senior Living LLC, Rancho Cucamonga, California.** Performed initial Phase I field survey within and surrounding the project site. (July 2018)

**LinkedIn, Carpinteria, California.** Performed initial Phase I field survey within and surrounding the project site. (March 2019)

**Bacara Beach Facilities, Carey Watermark Investors Inc., Goleta, California**. Performed extended Phase I investigation of field survey, excavation, and site inventory within and surrounding the project site to verify, in accordance with CEQA, the nearby archaeological site CA-SBA-72 did not extend into the project site. (April 2019)

**130 Robin Hill Road, Santa Barbara County Employees Retirement System, Goleta, California.** Assisted in a Phase III excavation of CA-SBA-58, in accordance with CEQA. (May 2019)

## Energy

**Sales Pipeline and Solar Farm Project, Vaquero Energy Inc. – Petro Rock LLC, Santa Maria, California.** Performed initial Phase I field survey within and surrounding the project site. (November 2017)

**Strauss Wind Energy Project, BayWa Renewable Energy, Santa Barbara, California**. Performed initial Phase I site inventory and field survey within and surrounding the project site. Provided archaeological and paleontological monitoring in accordance with the monitoring and mitigation treatment plan stated in the environmental impact report. (June to December 2018) ~2 days monitoring

**Tres Amigos-Environmental Tech Studies, Terra-Gen Development Company LLC, Los Banos, California**. Performed initial Phase I field survey of the project site. (June 2018)

**Centennial Flats Solar Project, Eolus North America Inc., La Paz County, Arizona**. Performed initial Phase I field survey of the project site. (January 2019)

**Gonzaga Ridge Wind Farm, Scout Clean Energy LLC, Merced County, California.** Performed initial Phase I field survey of the project site. (September 2018)

**Fish Springs Solar Energy Center, NextEra Resources, Washoe County, Nevada.** Performed initial Phase I field survey of the project site. (August 2018)

## Municipal

**Lower Arroyo Burro Open Space Phase I Archaeological Investigation, City of Santa Barbara Department of Parks and Recreation, California.** Performed initial Phase I field survey of the project site. (September 2017)

**Rincon Multiuse Trail Completion, City of Carpinteria, California.** Performed initial Phase I records search within and surrounding the project site. (March 2018)

**Rey Road Archaeological Monitoring, City of Santa Barbara, California.** Providing archaeological monitoring in accordance with the monitoring and mitigation treatment plan stated in the environmental impact report. (August 2017) ~1 day

**Arroyo Burro Open Space Park Historic Assessment, City of Santa Barbara Department of Parks and Recreation, California.** Performed historic records and archival research, as well as an intensive field survey of the project site. (April to May 2018)

**5-Year On-Call Archaeological Services, City of Ventura, California.** Serving as qualified archaeologist to provide the City of Ventura on-call archaeological services including archaeological, historical, and Native American services, including but not limited to monitoring, archaeological record searches, historical research, architectural history, surveys for both prehistoric and historical resources, extended Phase I surveys, test excavations, data recovery, Native American coordination, coordination with the Native American Heritage Commission, AB 52 support, treatment protocols, feasibility/concept plan studies and recommendations, hiring and managing applicable subconsultants and specialty disciplines as required, preparation of management plans, design and implementation of mitigation methods. Potential projects include municipal infrastructure improvements such as domestic water distribution system, sanitary sewer collection system, storm drainage collection system and other undertakings as determined.

**Gilroy Citywide Historic Resource Inventory, City of Gilroy, California.** Assisted in a citywide survey of the historic built environment within the City of Gilroy. (Septmeber to October 2018)

**Waller Park Improvements, County of Santa Barbara Community Services Department, Orcutt, California.** Performed initial Phase I records search and field survey within the project site. (July 2018)

## Transportation

**High Speed Rail Geotechnical, Dragados-Flatiron Joint Venture, Fresno, California.** Assisted in the excavation of human remains, in accordance with NEPA and CEQA.

## Water/Wastewater

**Stormwater Resources Plan, Geosyntec Consultants, Santa Barbara County, California.** Performed initial Phase I records search and field survey within and surrounding the project site.

**CTP Export Sludge FM Final Design, South Orange County Wastewater Authority, Aliso Viejo, California.** Compiling Native American Response memos. (April 2018)

**Archaeological and Air Quality Study for Desal Conveyance Project, City of Santa Barbara, California.** Performed initial Phase I records search within and surrounding the project site. Assisted in compiling the results of a field survey. (January 2019)

**Emergency Technical Support, Montecito Water District, California.** Performed emergency technical services including intensive ground survey, archaeological and paleontological monitoring, and site inventory in conformance with emergency permit applications related to Montecito Water District's emergency repair of water pipes destroyed or damaged as a result of the catastrophic mudslide commencing January 9, 2018. The study tasks for this undertaking were carried out in a manner consistent with FEMA's regulatory responsibilities under Section 106 of the National Historic Preservation Act (36 CFR Part 800). (January to May 2019) ~14 days monitoring

## Relevant Previous Experience

**Archaeology Tech, Santa Barbara Trust for Historic Preservation, California.** Taught children, age's seven to ten, the fundamentals of archaeology: To assess what you expect to find before breaking ground, how to dig in a careful and methodical manner, how to dry screen, interpret what they have found, and how to fill out an archaeology form. (May 2017–June 2017)

**Intern, UCSB Data Collections Lab, Santa Barbara, California.** Performed Identification of marine shells commonly found among the Santa Barbara Channel Islands. Sorted, counted, weighed, and assisted with cataloging of artifacts. Organized lab to ensure things could be found quickly and referenced with ease. (January 2016–June 2016)

## Specialized Training

Institute for Field Research Field School, June–July 2016. Completed five weeks of field school focused on survey, site excavation, and artifact organization in Uspallata, Argentina.

# Adriane Gusick

## Associate Archaeologist

Adriane Gusick is an associate archaeologist with more than 18 years of experience in cultural resource management specializing in cultural resource studies with private, state, and federal regulatory agencies including National Historic Preservation Act (NHPA) Sections 106 and 110 and California Environmental Quality Act (CEQA) compliance extending primarily throughout Southern California. She has worked with Bureau of Land Management, the California Public Utilities Commission, California State Parks, the City and County of Los Angeles, Los Department of Water and Power, as well as numerous other local agencies and various military installations including the Marine Corps Air Ground Combat Center at Twentynine Palms, Marine Corps Base (MCB) Camp Pendleton, Naval Base Coronado, and Navy Installation San Clemente Island. She has experience in all aspects of project development from initial research, planning, and development to interpreting and synthesizing data in technical reports. Ms. Gusick has acted as project manager and field director on complex data recovery programs, managed multiple archaeology laboratories, worked as liaison between Native American tribes and clients, including assistance with AB-52, and has engaged in education and public outreach programs.

***Education***

*City of San Diego Certified Archaeology and Paleontology Monitor*

*City of San Diego Certified Archaeology Crew Chief*

*Occupational Safety and Health Administration (OSHA) 10-Hour Construction Safety Training*

*OSHA 40-Hour Hazardous Waste Operations Worker (HAZWOPER) training*

*Registered Nurse*

*Wilderness First Responder*

## Relevant Project Experience

**8th, Grand and Hope Project, Los Angeles, California.** Dudek was retained to conduct a tribal cultural resources (TCRs) study in support of a proposed 45-story mixed use project in Downtown Los Angeles. Ms. Gusick was co-author on the report. Responsibilities included identification of any known or likely TCRs that have been documented in the proposed project site through archival records and Native American coordination.

**Bellwood Avenue Project, Los Angeles, California.** Dudek was retained to conduct a TCR study for a project that proposes to develop a new eldercare facility on a 2.22-acre site in the West Los Angeles Community Plan are of the City of Los Angeles. Ms. Gusick was co-author on the report. Responsibilities included identification of any known or likely TCRs that have been documented in the proposed project site through archival records and Native American coordination.

**313-333 San Vicente Boulevard Project, Los Angeles, California.** Dudek was retained to conduct a TCR study for a project that proposes to develop a 19-story, multi-family residential building with 153 apartment units, and the deconstruction, reassembly, rehabilitation and limited alteration of the existing cathedral of Our Lady of Mount Lebanon – Saint Maronite Catholic Cathedral. Ms. Gusick was co-author on the report. Responsibilities included identification of any known or likely TCRs that have been documented in the proposed project site through archival records and Native American coordination.

**De Soto Trunk Line Project, Los Angeles Department of Water and Power, Los Angeles, California.** Dudek was retained to conduct a cultural resources study pursuant to CEQA and Section 106.for a project proposing to replace approximately 13,700 feet of riveted steel pipe of the De Soto Trunk Line located in West San Fernando Valley. Ms. Gusick was co-author on the report, and conducted archival research and Native American coordination

**Haynes Generating Station Demolition Project, Los Angeles County Department of Public Works, Malibu, California.** Dudek was retained to provide archaeological monitoring for a project that included the demolition of Units 3, 4, 5, and 6 at the Haynes Generating Station. Ms. Gusick provided the Worker Environmental Awareness Training and monitor training and coordination.

**Compton Boulevard over Compton Creek and Wilmington Avenue over Compton Creek Bridge Replacement Projects, Compton, California.** Dudek was retained to conduct a cultural resources study pursuant to CEQA and Section 106 of the National Historic Preservation Act (NHPA) and in conformance with Caltrans requirements. The proposed projects involve replacing the existing two-span Wilmington Avenue Bridge over Compton Creek and as well as the replacement of the two-span steel-girder Compton Boulevard Bridge with new two-span, pre-cast concrete bridges. The projects are being proposed by the LADPW in cooperation with Caltrans. Ms. Gusick drafted the Caltrans Archaeological Survey Report and performed the archival research and Native American coordination.

**River Supply Conduit Unit 7 Project, Los Angeles Department of Water and Power, Los Angeles and Burbank, California.** Dudek was retained to provide archaeological and paleontological monitoring and reporting for a major transmission pipeline in the LADWP water distribution system. Ms. Gusick provided the paleontological monitoring and provided monitor training and coordination.

**City Trunk Line South Project, Los Angeles Department of Water and Power, Los Angeles, California.** Dudek was retained to conduct a cultural resources study pursuant to CEQA and Section 106 for a project proposing to replace an old and deteriorating trunk line that was built in 1914 and has a history of leaks and breaks. Ms. Gusick co-authored the report, in addition to performing archival research, conducting the pedestrian survey, providing Native American coordination, and recording newly identified cultural resources.

**PP1&2 Transmission Line Conversion Project, Los Angeles Department of Water and Power, Santa Clarita Valley, Los Angeles County, California.** Dudek was retained to complete a cultural resources study for the Power Plant #1 and #2 to Olive #1 Transmission Line Conversion Project which is proposing to replace and convert an existing 120-mile length of 115 kilovolt (kV) double circuit transmission line. Ms. Gusick co-authored the report, in addition to performing archival research, conducting the pedestrian survey, providing Native American coordination, and recording newly identified cultural resources.

**North Hollywood West Well Field Water Treatment Project, Los Angeles Department of Water and Power, City of Los Angeles, Los Angeles County, California.** Dudek was retained to complete a CEQA –Plus cultural resources study for a project that proposes to address releases of 1,4-dioxane in groundwater that are migrating to the North Hollywood West Well Field by installing water treatment equipment at the well field. Ms. Gusick co-authored the report, in addition to performing archival research, conducting the pedestrian survey, and providing Native American coordination.

**Power Plant 1 Long Term Maintenance Program Project, Los Angeles Department of Water and Power, Los Angeles County, California.** Dudek was retained to complete a cultural resources study for a project that proposes to develop a long-term operations and maintenance program for the Power Plant 1 hydroelectric facility in San Francisquito Canyon north of Santa Clarita. Ms. Gusick was lead author on the report, performed archival research, conducted the pedestrian survey, and recorded newly identified cultural resources.

# Linda Kry

## Archaeologist

Linda Kry is an archaeologist with over 14 years' experience in cultural resource management specializing in various aspects of cultural resources investigations within Southern and Central California. Ms. Kry's experience includes archival research, reconnaissance surveys, artifact analysis, assisting CEQA lead agencies with Assembly Bill 52 and Senate Bill 18 notification and consultation process, and authoring technical reports pursuant to CEQA and Section 106 of the NHPA. Ms. Kry's extensive experience includes the management of cultural resources specialists in support of various aspects of cultural resources compliance, construction monitoring, Native American consultation, archaeological testing and treatment, and prehistoric and historical resource significance evaluations.

## Selected Project Experience

### Los Angeles County

**Buena Vista Project, LPC West, LLC (LPC), Los Angeles, California.** Archaeological lead for a cultural resources study in support of a high-profile development project in the heart of Chinatown. The project footprint includes the mapped alignment of the Zanja Madre network, a series of interconnected historic-era irrigation system that was established during the 1700s and discontinued in the early 1900s. The study included the use of a ground-penetrating radar (GPR) to locate the presence of the Zanja Madre within the Project's footprint. Conducted a GPR survey and contributed to the reporting of the GPR results and the impacts analysis for cultural resources in the CEQA document. The City of Los Angeles is the lead agency under CEQA.

**Specific Plan for the C-17 Transition Master Plan Study Area for the City of Long Beach, City of Long Beach, Long Beach, California.** Archaeological lead for a cultural resources study in support of the CEQA document analyzing impacts to cultural and tribal cultural resources within the Specific Plan area. The scope of work for the project involved building upon the C-17 Transition Master Plan developed previously to provide a strategic planning framework for attracting quality industries and improving the character, design, and functionality of the Specific Plan area. The City of Long Beach is the lead agency under CEQA.

**Jefferson at Avalon Specific Plan EIR, City of Carson, Carson, California.** The Project includes the demolition of existing buildings and the construction of a mixed-use development on three parcels. The Project includes 998 apartment units, 40 attached townhomes, a 9,600-square-foot food pavilion, a 165-room hotel, and a 2,500-square foot restaurant pad. The proposed Specific Plan would allow for a slightly higher level of development than proposed, with up to 1,200 dwelling units, 15,000 square feet of commercial/food service uses, and 200 hotel rooms. As archaeological lead, provided management oversight for the cultural study and conducted the impacts analysis for cultural and tribal cultural resources for the CEQA document in support of the Project. The City of Carson is the lead agency under CEQA.

**De Soto Trunk Line Project, Los Angeles Department of Water and Power, Los Angeles, California.** Archaeological lead for a cultural resources study pursuant to CEQA and Section 106 of the National Historic Preservation Act (NHPA),

including conducting the impacts analysis for cultural and TCRs in the CEQA document for the Project. Los Angeles Department of Water and Power (LADWP) is proposing to replace the portions of the De Soto Trunk Line located in West San Fernando Valley. The proposed project would increase the safety, capacity and reliability of LADWP's water system in the western San Fernando Valley.

**Coronado Trunk Line Project, LADWP, Los Angeles, California.** Technical lead for a Phase I cultural resources study pursuant to CEQA and Section 106, including conducting the impacts analysis for cultural and TCRs in the CEQA document for the Project. LADWP is proposing to construct a new 30-inch diameter welded steel pipe, approximately 7,200 feet in length. The proposed trunk line would add reliability and redundancy to the system.

**City Trunk Line South Project, LADWP, Los Angeles, California.** Archaeological lead for a cultural resources study pursuant to CEQA and Section 106 of the NHPA, including conducting the impacts analysis for cultural and TCRs in the CEQA document for the Project. Los Angeles Department of Water and Power LADWP is proposing to replace an old and deteriorating trunk line that was built in 1914 and has a history of leaks and breaks. The proposed trunk link will improve capacity, reliability, and flexibility in the water system.

**River Supply Conduit Unit 7 Project, LADWP, Los Angeles and Burbank, California.** Technical lead and monitoring coordinator for the River Supply Conduit (RSC) Unit 7 Project. The existing River Supply Conduit (RSC) is a major transmission pipeline in the LADWP water distribution system. The Project is critical to meet safety of water supplies, reliability of water infrastructure, and sustainability of water supply.

**Sand Canyon Resort, City of Santa Clarita, Santa Clarita, California.** Archaeological lead for a cultural resources study for a project that proposes to develop an abandoned, approximately 75-acre existing open space into a new resort and spa in an effort to become the premiere golf destination in northern Los Angeles County. Tasks include management of the technical study including the archival research, pedestrian survey, and reporting of the study results. Additionally, authored the Cultural and Tribal Cultural Resources chapters for the EIR.

**Creek at Dominguez Hills Project, Plentitude Holdings LLC, Carson, California.** As archaeological lead, provided management oversight and reporting for archaeological and tribal cultural resources (TCRs) to assist in the analysis of impacts in the CEQA document. The proposed Ppoject includes the development of a including a multi-use indoor sports complex, youth learning experience facility, indoor skydiving facility, public golf recreation facility, marketplace, clubhouse, recreation and dining center, restaurants, and a sports wellness center.

**Haynes Generating Station Demolition Project, Los Angeles County Department of Public Works, Malibu, California.** Archaeological lead and monitoring coordinator. The project included the demolition of Units 3, 4, 5, and 6 at the Haynes Generating Station (HnGS), which were originally constructed more than five decades ago, to minimize health and safety risks and reduce future maintenance.

**Old Topanga Road Over Old Topanga Creek Bridge Maintenance Repair Project, Los Angeles County Department of Public Works, Val Verde Area of Unincorporated Los Angeles County, California.** Archaeological lead for a cultural resources study pursuant to CEQA in support of a Mitigated Negative Declaration. Tasks include Assembly Bill (AB) 52 consultation support to identify known tribal cultural resources within the project's proposed Area of Potential Effect (APE) to analyze the potential impacts to cultural resources and provide mitigation to a less than significant level.

**Compton Boulevard over Compton Creek and Wilmington Avenue over Compton Creek Bridge Replacement Projects, Compton, California.** Archaeological lead for a cultural resources study pursuant to CEQA and Section 106 of the NHPA and in conformance with Caltrans requirements. As archaeological lead, tasks include coordination for a cultural resources study, including AB 52 consultation support, and preparation of Archaeological Survey Reports (ASRs) for each proposed project.

**City Trunk Line South Project, Los Angeles Department of Water and Power, Los Angeles, California.** Archaeological lead for a cultural resources study pursuant to CEQA and Section 106 of the NHPA. Los Angeles Department of Water and

Power is proposing to replace an old and deteriorating trunk line that was built in 1914 and has a history of leaks and breaks. The proposed trunk link will improve capacity, reliability, and flexibility in the water system.

**February 2019 Storm Repair Project, Los Angeles County Department of Public Works, Malibu, California.** Archaeological lead responsible for managing the cultural resources inventory and assessment of cultural resources within the project area in support of emergency guardrail replacement work in the Woolsey Fire burn area. Responsibilities also include coordinating Native American monitoring needs for the project.

**FLOR 401 E 7th Street Construction Monitoring, Skid Row Housing Trust, Los Angeles, California.** Project manager for construction monitoring for the development of 99 units of permanent supportive housing for homeless veterans and/or special needs populations, and affordable housing for low-income individuals in Downtown Los Angeles.

**Woolsey Fire Guardrails Replacement Project, Los Angeles County Department of Public Works, Malibu, California.** Archaeological lead responsible for managing the cultural resources inventory and assessment of cultural resources within the project area in support of emergency guardrail replacement work in the Woolsey Fire burn area. Responsibilities also include coordinating Native American monitoring needs for the project.

**2159 Bay Street Project, Los Angeles, California.** The proposed project includes the development of a three-building creative office campus that would be comprised of an eight-story commercial high-rise building with up to four levels of subterranean parking, and two two-story commercial buildings. As archaeological lead, provided management oversight and reporting for archaeological and tribal cultural resources (TCRs) to assist in the analysis of impacts in the CEQA document.

**LA Spring Street Project, Los Angeles, California.** The proposed Project involves a new mixed-use development proposed on a 70,192 square-foot (1.61-acre) site in the City of Los Angeles. As archaeological lead, provided management oversight and reporting for archaeological and TCRs to assist in the analysis of impacts in the CEQA document. The City of Los Angeles is the lead agency under CEQA.

**Palmetto Street Project, Eyestone Environmental, Los Angeles, California.** Conducted GPR testing for the Project to determine the location of the zanja system subsurface within the Project site to provide appropriate recommendations in support Project needs. Responsibilities included providing management oversight and reporting for a TCR report and an archaeological assessment/GPR report for the Project. Studies prepared are in support of the impacts analysis for archaeological and tribal cultural resources in the CEQA document. The City of Los Angeles is the lead agency under CEQA.

**8th, Grand and Hope Project, Eyestone Environmental, Los Angeles, California.** Archaeological lead providing management oversight and reporting for tribal cultural resources (TCRs) and archaeological studies in support of a proposed 45-story mixed-use project in Downtown Los Angeles studies to assist in the analysis of impacts in the CEQA document. Studies prepared are in support of the impacts analysis for archaeological and tribal cultural resources in the CEQA document. The City of Los Angeles is the lead agency under CEQA.

**Bellwood Avenue Project, Eyestone Environmental, Los Angeles, California.** Archaeological lead providing management oversight and reporting for a TCR study for a project that proposes to develop a new eldercare facility on a 2.22-acre site in the West Los Angeles Community Plan are of the City of Los Angeles. Studies prepared are in support of the impacts analysis for archaeological and tribal cultural resources in the CEQA document. The City of Los Angeles is the lead agency under CEQA.

**313-333 San Vicente Boulevard Project, Eyestone Environmental, Los Angeles, California.** Archaeological lead providing management oversight and reporting for a TCR study for a project that proposes to develop a 19-story, multi-family residential building and the deconstruction, reassembly, rehabilitation and limited alteration of the existing cathedral of Our Lady of Mount Lebanon – Saint Maronite Catholic Cathedral. Studies prepared are in support of the impacts analysis for archaeological and tribal cultural resources in the CEQA document. The City of Los Angeles is the lead agency under CEQA.

**1000 Seward Street Project, Los Angeles, California.** Archaeological lead providing management oversight and reporting for TCR study for a proposed development project in the City of Los Angeles. Study prepared is in support of the impacts analysis for TCRs in the CEQA document.

**1235 Vine Street Project, Plus Development, Los Angeles, California.** Archaeological lead providing management oversight and reporting for TCR study for a proposed development project in the City of Los Angeles. Study prepared is in support of the impacts analysis for TCRs in the CEQA document.

## Orange County

**1225 Cliff Drive Project, City of Laguna Beach, California.** As Project Manager, conducted and managed a cultural and paleontological Phase I study in support of the proposed development for the subject property.

**Protea Memory Care Facility Project, City of San Juan Capistrano, San Juan Capistrano, California.** Archaeological lead for a Phase I cultural resources study in accordance with CEQA and subject to California Assembly Bill 52 and Senate Bill 18, in support of a project that proposes to construct a 59-unit (72-bed) memory care facility.

## Riverside County

**South Campus Specific Plan and Village West Drive Extension Project, Unincorporated Riverside County, California.** The proposed Project involves an amendment to the existing Specific Plan to shift land uses between parcels to reflect the evolving community priorities and environmental regulatory landscape. As archaeological lead, conducted the impacts analysis for cultural and tribal cultural resources for the CEQA document in support of the Project. The analyses were based on a review of separate technical studies prepared in support of the Project. The March Joint Powers Authority is the lead agency under CEQA.

**Kaiser Permanente Moreno Valley Medical Center Master Plan, Kaiser Permanente, Moreno Valley, California.** Kaiser Permanente is proposing the development of an approximately 400-bed hospital, hospital support buildings, outpatient medical office buildings, a central utility plant, and surface and structured parking within their existing hospital campus through a three-phase plan. The City of Moreno Valley is the lead agency under CEQA. As the technical lead for the project, responsibilities include the management of a cultural resources study in support of the Project's CEQA document.

**San Jacinto II Wind Energy Repowering Project, Terra-Gen, LLC, Palm Springs, California.** The project involves the decommissioning of approximately 126 existing wind turbines and the construction and operation of up to seven new wind turbines on private lands under the jurisdiction of the City of Palm Springs and on federal lands administered by the Bureau of Land Management. Responsibilities as technical lead include the management of a Phase I cultural resources study in compliance with the provisions of local regulations, CEQA, and Section 106 of the National Historic Preservation Act of 1966.

## San Bernardino County

**Montclair Place District Specific Plan EIR, City of Montclair, Montclair, California**. The Project involved the redevelopment and expansion of Montclair Plaza, an indoor shopping mall that opened in 1968. The Project proposes the addition of 4,376 dwelling units over the next 30 years, and 1.64 million square feet of commercial uses, including a 200-key hotel. As the archaeological lead, provided management oversight and reporting for tribal cultural resources (TCRs) in support of a TCR EIR section for the Project. The City of Montclair is the lead agency under CEQA.

**City of Colton Modern Pacific 88-DU Residential Project, City of Colton, Colton, California.** Technical lead and field director for a Phase I cultural resources study and Extended Phase I subsurface probing effort in accordance with CEQA. The City of Colton proposed the development of 89-detatched single-family homes on an approximately 41.58-acre site within a single tract.

## Santa Barbara County

**130 Robin Hill Road Site Improvements Project - Phase III Data Recovery, Santa Barbara County, California.** Field supervisor for a Phase III archaeological data recovery program, which included excavation of units to evaluate an archaeological site. Archaeological excavations were conducted to provide the data necessary to evaluate the cultural deposits pursuant to CEQA requirements.

**Agoura East Village – Extended Phase I Archaeological Investigation, Agoura Hills, California.** Field Supervisor for an Extended Phase I Archeological Investigation, which was conducted in support of a proposed mixed-use development. The scope of work associated with the project, involved a pre-excavation intensive pedestrian survey, subsurface exploratory backhoe trenching, shovel tests pits, and the recordation of all findings for evaluation. Tasks included screening excavated soils for artifacts as well as observe backhoe trenching. Additional tasks included standard operations for shovel test pits.

**Strauss Wind Energy - Cultural Testing Program, Lompoc, California.** Served as Crew Chief for archaeological testing and data recovery efforts. Phase II Archaeological Investigation to evaluate the significance of multiple prehistoric sites identified within the project's Area of Potential Effect (APE) pursuant to CEQA and Section 106 of the National Historic Preservation Act (NHPA). A Phase III Archaeological Investigation was conducted to further assess the types of resources identified during the previous investigations.

**MWD Ocean View Avenue - Extended Phase I, Carpinteria, California.** Field Supervisor for an Extended Phase I Archaeological Investigation. The scope of work associated with the work included screening excavated soils for artifacts, observation of backhoe trenching, and standard operations for shovel test pits.

**Santa Barbara Police Station Technical Studies, Santa Barbara, California.** Field Supervisor for an Extended Phase I Archaeological Investigation. The scope of work associated with the work included screening excavated soils for artifacts, observation of backhoe trenching, and standard operations for shovel test pits.

## Ventura County

**Acorn I Energy Storage Project, Ventura County, California.** Archaeological lead for a Phase I cultural resources study.

# Samantha Murray, MA

## Historic Built Environment Lead / Senior Architectural Historian

Samantha Murray is a senior architectural historian with 14 years' professional experience in in all elements of cultural resources management, including project management, intensive-level field investigations, architectural history studies, and historical significance evaluations in consideration of the California Register of Historical Resources (CRHR), the National Register of Historic Places (NRHP), and local-level evaluation criteria. Ms. Murray has conducted hundreds of historical resource evaluations and developed detailed historic context statements for a multitude of property types and architectural styles, including private residential, commercial, industrial, educational, medical, ranching, mining, airport, and cemetery properties, as well as a variety of engineering structures and objects. She has also provided expertise on numerous projects requiring conformance with the *Secretary of the Interior's Standards for the Treatment of Historic Properties*.

***Education***

*California State University, Los Angeles*
*MA, Anthropology, 2013*

*California State University, Northridge*
*BA, Anthropology, 2003*

***Professional Affiliations***

*California Preservation Foundation*

*Society of Architectural Historians*

*National Trust for Historic Preservation*

*Registered Professional Archaeologist*

Ms. Murray meets the Secretary of the Interior's Professional Qualification Standards for both Architectural History and Archaeology. She is experienced managing multidisciplinary projects in the lines of transportation, transmission and generation, federal land management, land development, state and local government, and the private sector. She has experience preparing environmental compliance documentation in support of projects that fall under the California Environmental Quality Act (CEQA)/National Environmental Policy Act (NEPA), and Sections 106 and 110 of the National Historic Preservation Act (NHPA). She also prepared numerous Historic Resources Evaluation Reports (HRERs) and Historic Property Survey Reports (HPSRs) for the California Department of Transportation (Caltrans).

## Dudek Project Experience (2014-2019)

### Development

**Birch Specific Plan 32-Unit Condo Project, City of Carson, Los Angeles County, California (2018).** Dudek was retained by the City of Carson to prepare a cultural resources report for a project that proposes to demolish approximately 6,200 square feet of existing residential buildings and roughly 5,850 square feet of pavement on the project site, and construct a 32-unit residential condominium community with on-grade parking, landscaping, and other associated improvements. The historical significance evaluation included three residential properties proposed for demolition. All properties were found not eligible under all designation criteria and integrity requirements. Ms. Murray provided QA/QC of the final cultural resources report.

**Stickleback Movie Ranch Property Evaluation, Los Angeles County, California (2018).** Dudek was retained by the Metropolitan Water District of Southern California to complete a historical resource significance evaluation of the Stickleback Movie Ranch property, located in unincorporated Los Angeles County near Santa Clarita, California.

The study included a CHRIS records search of the Stickleback Movie Ranch property and a 0.25-mile radius; a pedestrian survey of the subject property for cultural resources; building development and archival research; recordation and evaluation of cultural resources identified within and around the Stickleback Movie Ranch portion of the study area; and an assessment of potential impacts to historical resources in conformance with CEQA and all applicable local municipal code and planning documents. The former Stickleback Movie Ranch and all associated buildings and structures were found not eligible under all NRHP, CRHR, and Los Angeles County designation criteria.

## Healthcare

**Kaiser Permanente Los Angeles Specialty Medical Center Project, Los Angeles, Los Angeles County, California (2019).** Dudek prepared a Historical Resource Assessment for the Kaiser Permanente Los Angeles Specialty Medical Center at 755-765 W. College Street in Los Angeles. Preparation of the report involved extensive archival research, reconnaissance level fieldwork, historic context development, building development descriptions, historical significance evaluations for buildings greater than 45-years in age, and DPR forms for the medical center buildings and structures that are proposed for demolition as part of the multi-phase project. As a result of the evaluations, all buildings were found not eligible for designation under all applicable national, state, and local designation criteria and integrity requirements. Ms. Murray provided QA/QC of the report and guidance on approach.

**Kaiser Permanente Los Angeles Medical Center Project, Los Angeles, Los Angeles County, California (2018).** Dudek prepared a Cultural Resources Report that involved extensive archival research, reconnaissance level fieldwork, historic context development, building development descriptions, historical significance evaluations, and DPR forms for six buildings greater than 45-years in age that are proposed for demolition as part of the multi-phase project. As a result of the evaluations, all buildings proposed for demolition were found not eligible for designation under all applicable national, state, and local designation criteria and integrity requirements.

## Municipal

**LACSD Gardena Pumping Station Project, Sanitation Districts of Los Angeles County, Gardena, California (2019).** Dudek prepared a Cultural Resources Technical Report for the Gardena Pumping Project. Preparation of the report involved site recordation, extensive archival research, historic context development, engineering feature development descriptions, historical significance evaluations, and State of California Department of Parks and Recreation Series 523 forms (DPR forms) for each building of the project. The project proposed to remove the 1929 and 1960 pumping plant above and below-ground structures, and two adjacent parcels containing commercial buildings (1954, 1957) and replace them with a larger capacity pumping plant facility. Ms. Murray provided oversight of all built environment components and provided QA/QC of all documents.

**LADWP De Soto Trunk Line Project, City of Los Angeles, Los Angeles County, California (2018).** Dudek was retained by Los Angeles Department of Water and Power (LADWP) to complete a cultural resources study for the De Soto Trunk Line Project. LADWP is proposing the replacement of portions of four existing water pipelines: De Soto, Roscoe, Canoga Topham, and Ventura Trunk Lines. The portions of the existing trunk lines that are proposed for replacement are aging, deteriorating, and nearing the end of their service life. As such, LADWP is proposing to replace these segments with new pipeline. The regulatory framework is CEQA Plus, as such the project was also subject to compliance with Section 106 of the NHPA. Ms. Murray provided QA/QC of the cultural resources report.

**The Santa Monica City Yards Master Plan Project, City of Santa Monica, Los Angeles County, California (2017).** The City of Santa Monica retained Dudek to complete a cultural resources study for the proposed City Yards Master Plan project site located at 2500 Michigan Avenue in the City of Santa Monica. The study involved evaluation of the entire City Yards site, including two murals and a set of concrete carvings for historical

significance and integrity. As a result, the City Yards and its associated public art work was found ineligible under all designation criteria. Ms. Murray conducted the intensive level survey, building permit research, co-authored the technical report, and provided QA/QC of the final cultural resources report.

**148 North Huntington Street, City of Pomona, Los Angeles County, California (2017).** Dudek was retained by the City of Pomona to conduct a cultural resources study for the remediation of the project site located at 148 North Huntington Street. The proposed project involves the excavation, removal, and off-site treatment of approximately 10,000 Cubic Yards (CYs) of contaminated soil due to the former presence of a manufactured gas plant (MGP) at the project site (currently the City of Pomona Water and Wastewater Yards). All buildings over 45 years of age within the project site were evaluated for the CRHR and local landmark eligibility as part of the Pomona Gas Plant site. The site was found not eligible with concurrence from the historic resources commission. Ms. Murray conducted the survey, prepared the evaluation, and authored the cultural resources report.

**LADWP West Los Angeles District Yard Project, City of Los Angeles, Los Angeles County, California (2017).** Dudek was retained by Los Angeles Department of Water and Power (LADWP) to complete a cultural resources study for a project that proposes demolition of five LADWP-owned administrative buildings and warehouses at the West Los Angeles District Headquarters located at 12300 West Nebraska Avenue. Dudek evaluated the yard for historical significance in consideration of NRHP, CRHR, and City of Los Angeles HCM criteria and integrity requirements. Ms. Murray co-authored the significance evaluation and provided QA/QC of the cultural resources report.

**LADWP Haynes Generating Station Units 3 through 6 Demolition Project, City of Long Beach, Los Angeles County, California (2017).** Dudek was retained by Los Angeles Department of Water and Power (LADWP) to complete a cultural resources study for a project that proposes demolition of Units 3-6 at the LADWP Haynes Generating Station. Ms. Murray evaluated the entire steam plant for historical significance in consideration of NRHP, CRHR, and City of Long Beach designation criteria and integrity requirements, and co-authored the cultural resources report.

**LADWP Green Verdugo Reservoir Improvement Project, City of Los Angeles, Los Angeles County, California (2017).** Dudek was retained by Los Angeles Department of Water and Power (LADWP) to complete a cultural resources study for a project that proposes facility updates at the reservoir site in order to ensure safe water quality. Ms. Murray evaluated the reservoir for historical significance in consideration of NRHP, CRHR, and City of Los Angeles HCM designation criteria and integrity requirements, and co-authored the cultural resources report.

**LADWP Upper Stone Canyon Reservoir Water Quality Improvement Project, City of Los Angeles, Los Angeles County, California (2016).** Dudek was retained by Los Angeles Department of Water and Power (LADWP) to complete a cultural resources study for a project that proposes to maintain and improve the quality, reliability, and stability of the Stone Canyon Reservoir Complex (SCRC) service area drinking water supply in order to continue to meet customer demand. Dudek prepared an updated evaluation of the reservoir in consideration of NRHP, CRHR, and City of Los Angeles HCM criteria and integrity requirements. Ms. Murray conducted the built environment survey, archival research, and co-authored the cultural resources report.

**LADWP Power Plant 1 Long-Term Maintenance Program Project, City of Los Angeles, Los Angeles County, California (2016).** Dudek was retained by Los Angeles Department of Water and Power (LADWP) to complete a cultural resources study for the proposed long-term maintenance of the flood control infrastructure in the vicinity of Power Plant 1. Ms. Murray prepared the cultural resources impacts assessment, co-authored the cultural resources report, and provided QA/QC of the cultural resources technical report.

## State of California

**Judicial Council of California Historical Resource Evaluation Report for the Stanley Mosk Courthouse, City of Los Angeles, Los Angeles County, California (2019).** Dudek was retained by the Judicial Council of California (JCC) to

prepare an evaluation of the Stanley Mosk Courthouse building, located at 111 N. Hill Street in the City of Los Angeles, California. To comply with Public Resources Code Section 5024(b), the JCC must submit to the State Historic Preservation Officer (SHPO) an inventory of all structures over 50 years of age under the JCC's jurisdiction that are listed in or that may be eligible for inclusion in the National Register of Historic Places (NRHP), or registered or that may be eligible for registration as a California Historical Landmark (CHL). Extensive research indicates that the building meets NRHP Criteria A and C; CRHR Criteria 1 and 3; the "important events" and "architecture" criteria for CHL; the "important to Los Angeles history" and "architecture" criteria for Los Angeles HCM; and Criteria 1, 2, and 3 for Los Angeles HPOZ for listing in any of these registration programs. Therefore, the Stanley Mosk Courthouse appears to be a historic resource for the purposes of California Public Resources Code 5024 and 5024.5. Ms. Murray managed the project and provided QA/QC of the final report.

**Judicial Council of California Historical Resource Evaluation Report for the Santa Monica Courthouse, City of Santa Monica, Los Angeles County, California (2017).** Dudek was retained by the Judicial Council of California (JCC) to prepare an evaluation of the Santa Monica Courthouse building, located at 1725 Main Street in the City of Santa Monica, California. To comply with Public Resources Code Section 5024(b), the JCC must submit to the State Historic Preservation Officer (SHPO) an inventory of all structures over 50 years of age under the JCC's jurisdiction that are listed in or that may be eligible for inclusion in the National Register of Historic Places (NRHP), or registered or that may be eligible for registration as a California Historical Landmark (CHL). The Santa Monica Courthouse was found not eligible for designation under all applicable criteria. Ms. Murray co-authored the report and provided QA/QC of the final cultural resources report.

**Department of General Services Historical Resource Evaluation for the Pomona Armory at 600 South Park Avenue, City of Pomona, Los Angeles County, California (2017).** Dudek was retained by the State of California Department of General Services to mitigate potential adverse effects to the Pomona Armory (600 South Park Avenue), a state-owned historical resource proposed to be transferred from State-ownership to a local agency or private owner. Ms. Murray prepared a detailed significance evaluation for the Pomona Park Armory in the consideration NRHP, CRHR, CHL, and City of Pomona designation criteria and integrity requirements, and prepared a single historic landmark application for the property. The Pomona Park Armory was locally designated after unanimous approval by the Historic Resources Commission and City Council. SHPO concurred with the evaluation findings and agreed that adverse effects had been adequately mitigated with no comments.

## Presentations

***Historical Resources under CEQA*. Prepared for the Orange County Historic Preservation Planner Working Group. Presented by Samantha Murray, Dudek. December 1, 2016.** Ms. Murray delivered a one-hour PowerPoint presentation to the Orange County Historic Preservation Planner Working Group, which included planners from different municipalities in Orange County, regarding the treatment of historical resources under CEQA. Topics of discussion included identification of historical resources, assessing impacts, avoiding or mitigating impacts, overcoming the challenges associated with impacts to historical resources, and developing effective preservation alternatives.

***Knowing What You're Asking For: Evaluation of Historic Resources*. Prepared for Lorman Education Services. Presented by Samantha Murray and Stephanie Standerfer, Dudek. September 19, 2014.** Ms. Murray and Ms. Standerfer delivered a one-hour PowerPoint presentation to paying workshop attendees from various cities and counties in Southern California. The workshop focused on outlining the basics of historical resources under CEQA, and delved into issues/challenges frequently encountered on preservation projects.

# Fallin Elizabeth Steffen, MPS

## Architectural Historian

Fallin Steffen is an architectural historian with 4 years' experience in historic preservation, architectural conservation, and cultural resource management. Ms. Steffen's professional experience encompasses a variety of projects for local agencies, private developers, and homeowners in both highly urbanized and rural areas, including reconnaissance- and intensive-level surveys, preparation of resource-appropriate and city-wide historic contexts, and historical significance evaluations in consideration of the NRHP, CRHR, and local designation criteria. Additionally, Ms. Steffen served as a commissioner on the Santa Cruz City Historic Preservation Commission and has participated in archeolgical fieldwork in the Bay Area. She meets the Secretary of the Interior's Professional Qualification Standards for Architectural History.

## Project Experience

**Gilroy Citywide Historic Resource Inventory, City of Gilroy, Santa Clara County, California (2020).** Dudek is currently bringing to completion a citywide historic context statement and historic resources inventory update of its outdated 1986 historic resource inventory. While the final approval hearings are pending for Summer 2020, Dudek has already hosted a public kickoff meeting/outreach session that was well received by the community, successfully completed reconnaissance-level survey of over 3,000 properties on time and within budget, and completed a draft citywide historic context statement. Over the course of this multi-year project, Ms. Steffen served as architectural historian and co-author for the citywide historic context statement, co-managed field work, and created building records and State of California Department of Parks and Recreation Series 523 forms (DPR forms) for thousands of surveyed properties.

**Santa Cruz Wharf Maintenance Project CEQA Compliance and USACE permitting- City of Santa Cruz, Santa Cruz, California (2020).** The purpose of this project is to replace and/or repair storm-damaged piles supporting the Santa Cruz Municipal Wharf in Santa Cruz, California. As lead architectural historian, Ms. Steffen conducted fieldwork and co-authored the Evaluation and Finding of Effect Report for the Santa Cruz Wharf Maintenance Project. The report was prepared in compliance with Section 106 and in support of the permitting process with the USACE. Although the Wharf had previously evaluated under CRHR and local Criteria by another historian in recent years, no NRHP Criteria evaluation existed. Ms. Steffen co-authored all documentation related to Wharf including the significance evaluation that recommended the Wharf as eligible under NRHP Criterion A for its continued associations with the industrial development, transportation, commerce, and recreation development of Santa Cruz and under C as a distinctive engineering structure known to be the longest wooden pier structure located along the United States Coast of the Pacific Ocean. Additionally, a detailed effects assessment determined that the proposed Wharf Maintenance project would have a less than significant impact on historical resources (CEQA)/no adverse effect on historic properties (Section 106).

**Juanita Avenue Project, City of Los Angeles, California (2019).** Dudek was retained to prepare a historic built environment report for the Juanita Avenue project, which proposed demolition of four properties within the City of

Los Angeles. Ms. Steffen served as architectural historian for the project and co-authored the historical resources evaluation report. Preparation of the report entailed extensive archival research, preparation of a historic context statement, building descriptions, review of building permits, significance evaluations for the buildings within the project area, and preparation of accompanying DPR forms.

**Campus-wide Historic Context Statement for California State University Long Beach, Long Beach, California (2019).** Ms. Steffen served as architectural historian and co-author of the historic context statement report analyzing the effect of master architect Edward Killingsworth on the development of the campus. Preparation of the historic context statement involved archival research, historic context development, in-person interviews of architects, review of building and landscape records, and coordination with Long Beach Heritage.

**California State University Long Beach Hillside Office/Commons Project, Long Beach, California (2019).** Dudek was retained by CSU Long Beach to prepare an architectural inventory and historic context for the campus and to evaluate the historic character of existing Administration Building located on the site of the proposed project. Ms. Steffen served as architectural historian for this project, preparing an appropriate historic context for the campus architect, Edward Killingsworth, who was responsible for designing a majority of buildings on the campus.

**The Santa Fe Springs Transitional Living Center Project, Santa Fe Springs, California (2019).** Dudek was retained to prepare a historical resources evaluation report for the Santa Fe Springs Transitional Living Center project, which proposed the alteration of a mixed-use property within the project area limits, located at 12000 Washington Boulevard. Ms. Steffen served as architectural historian for the project and co-authored the historical resources evaluation report. Preparation of the report entailed extensive archival research, the composition of an appropriate historic context focused on the history of Santa Fe Springs, evaluation of the built features of the property within the framework of NRHP, CRHP, and local designation requirements, and the preparation of accompanying DPR forms.

**Historical Resource Assessment for 855 North Sweetzer Avenue, West Hollywood, California (2019).** Ms. Steffen served as architectural historian of the historic resource assessment for 855 North Sweetzer Avenue in West Hollywood. The report included conducting a record search, developing the building development description, archival research, historical context development, historical significance evaluations, and preparation of DPR forms.

**601 East Montecito Street, Santa Barbara, California (2019).** The Housing Authority of the City of Santa Barbara retained Dudek to prepare a Historic Structures/Sites Report for a property located at 601 East Montecito Street. Ms. Steffen served as architectural historian for the project and co-authored the Historic Structures/Sites Report, which included the preparation of a building description including the various murals.

**Newell Creek Road Access Bridge Rehabilitation Memorandum Report, City of Santa Cruz, California (2019).** Dudek was retained by the City of Santa Cruz Water Department to review the proposed Newell Creek Access Road Bridge Rehabilitation project for potential impacts on historical resources during the course of repairs to the bridge's piers. The bridge was identified as a contributor to the Newell Creek Dam district as part of the 2018 historical resources evaluation report of the Newell Creek Dam complex. Ms. Steffen served as architectural historian for the project, conducting the intensive pedestrian survey of the project site and authoring the memorandum report ensuring that the project conformed to the Secretary of the Interior's Standards for the Treatment of Historic Properties.

**Oakmont/Tamarind Warehouse Project. Rialto, San Bernardino County, California (2018).** Ms. Steffen served as architectural historian and co-author of the Cultural Resources Report for the Oakmont/Tamarind Warehouse Project. Ms. Steffen contributed building development write-ups for the report. The project proposed to construct a 156,500 square feet, one story warehouse on six adjoining parcels on approximately 8 acres.

Project Description:

The project site consists of a single parcel (Assessor's Parcel Number 6284-025-018). The addresses associated with the project site are 12021-12023 Woodruff Avenue, Downey, California 90241 (see attached Records Search Map). The 6.31-acre site currently consists of an industrial building located directly west of Woodruff Avenue. The project site is entirely developed and is the current location for Kirkhill Manufacturing Company, Inc. (KMC), which manufactures rubber products.

The project would include the demolition of the existing, 74,662-square-foot industrial building and construction of an approximately 44,162-square-foot industrial tilt-up building for truck terminal use

**Re: 12021 Woodruff Avenue Industrial Building Project, Los Angeles County**

Dear Ms. Kry:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: steven.quinn@nahc.ca.gov.

Sincerely,

Steven Quinn
Cultural Resources Analyst

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The subject property faces east onto Woodruff Avenue (Figure 1) and features three geographically distinct, yet interconnected building wings: the main office, the north warehouse, and the south warehouse. These individual areas of the building are comprised of multiple additions and expansions that have caused them to display a range in style, scale, and materials. The three main sections are connected by interior hallways, as well as, a paved, U-shaped access driveway and parking area that extends around the perimeter of the building on the north, west and south sides. ***See Continuation Sheet**

B2. Common Name: Kirkhill Inc.
B3. Original Use: Manufacturing B4. Present Use: Manufacturing
***B5. Architectural Style:** Mid-Century Modern

***B6. Construction History:** (Construction date, alterations, and date of alterations)

The Kirkhill Manufacturing Inc. building located at 12021-12023 Woodruff Avenue, first appears in the 1952 historical aerial photograph and Los Angeles County Assessor data indicates that it was constructed in 1951. The original architect for the facility as well as the architect(s) who designed the subsequent additions were not discovered during the course of research for this project. A 1958 photograph of the plant and a review of historical aerial photographs suggest that the plant has undergone numerous, major expansions that have effectually tripled the square-footage of the original Mid-Century Modern building (Figure 11).

***P3a. Description (Continued):**

A smaller U-shaped parking lot is located in front of the east (main) elevation of the main office wing, offers limited surface parking. This parking area is surrounded by modest landscaped areas and the remaining section of the original flat-brick company sign at the center of the drive.

Figure 1. Overview of Kirkhill Manufacturing Inc. property, view looking northwest across Woodruff Avenue (IMG_0352)

***Main Office (1951, multiple expansions)***

The main office wing is a one-story, Mid-Century Modern-style building featuring a flat roof and decorative breezeway block screens (Figure 2). The building is clad in a combination of flat brick and scored stucco in broad sections (Figure 3). The flat roof extends out to form a covered walkway along the front of the building. The primary entrance features a single, replaced full-lite door located at the center of the east (main) elevation that is surrounded by two fixed windows and a fixed transom (Figure 4). Each of the remaining tall, fixed rectangular windows on the building correspond to a breezeway block screen that diffuses the light entering the building. The north and south sections of the building shows evidence of multiple modifications and expansion over time displayed by incompatible rooflines and blunt transitions between exterior cladding materials (Figure 5).

Figure 2. Main office volume east (main) and south elevations, view looking northwest (IMG_0378)

Figure 3. Main office east (main) elevation showing decorative breezeway block screens situated in front of windows, view looking southwest (IMG_0414)

Figure 4. Primary entrance door on main office, view looking northwest (IMG_0423)

Figure 5. Main office volume north elevation shows the convergence of the various rooflines resulting from multiple additions, view looking south (IMG_0408)

***North Warehouse (1951, multiple expansions)***

The north warehouse portion of the building is located northwest of the main office and consists of two different utilitarian-style sections: a two-story section clad in ribbed metal siding atop a concrete masonry unit (CMU) substructure; and a tri-gable, one-story section which faces the western property line (Figure 6).

Figure 6. North warehouse showing the one-story, tri-gabled section in the foreground with the two-story section in the rear, view looking southeast (IMG_0495)

The two-story section of the north warehouse sits immediately behind the main office volume and features a shallow, front-facing gable roof supported by heavy steel framing (Figure 7). The roof is clad in ribbed metal material and contains multiple skylights as well as clerestory windows on the south elevation. A metal shed roof extends from the north elevation of the building to shelter a wide walkway full of equipment and machinery. The main entry point for this section of the

building is a large roll-up metal door. Additional doors are found throughout the elevation, but they appear to function as emergency doors and not as primary points of entry.

Figure 7. Main office volume north elevation shows the convergence of the various rooflines resulting from multiple additions, view looking south (IMG_0467)

The one-story, tri-gabled section of the north warehouse is located to the west of the two-story section (Figure 8). This segment of the building is clad in a ribbed metal siding in both a metallic and white color. Each of the three, equally-sized bays contains a single or a double metal roll up door which provides access to the interior areas. The northern wall on this section is faced with CMU to correspond with the two-story section.

Figure 8. View of the one-story, gabled section of the north warehouse, view looking southeast (IMG_0493)

***South Warehouse (1951, multiple expansions)***

The south warehouse is located to the southwest of the main office wing and south of the north warehouse. This building section features a front gable roof and a west elevation clad in a ribbed metal material (Figure 9). The south elevation consists of a broad wall of built from CMU which runs the length of this elevation (Figure 10). The entire stretch of this elevation is punctuated only by two full-leaf doors, a metal roll-up door, a sliding glass door with a small metal awning, and two decorative breezeway block screens shading a window on the east side of the elevation.

**Identified Alterations**

Dudek staff visited the City of Downey Permit Counter on August 12, 2020 and reviewed all available permits pertaining to the subject property (AIN 6284-025-018). Observed alterations are also included in this section with dates stated where known:

- 1950. Electrical permit to install six new motors (#62280)
- 1954. 9,000-square foot, one-story addition (#70040)
- 1954. Electrical permit to install three new transformers (#23605)
- 1954. Electrical permit to install several new motors (#1721)
- 1955. 50-foot by 80-foot, one-story addition (#3611)
- 1955. Electrical permit to install four motors (#8114)
- 1956. Electrical permit to update electrical receptacles and fixtures (#8429, #6922, and #5007)

- 1956. Install wet standpipe (#6194 and #3510)
- 1959. Demolish and replace former fire-damaged office building (#28490)
- 1959. Install fire sprinkler system in new office building (#29671)
- 1968. Existing shipping office remodeled (#91845)
- 1971. 18,000-square foot warehouse addition and 13,000-square foot packaging area addition (#31754)
- 1971. Install three-ton combined gas heating and air conditioning system (#65775)
- 1971. Pave approximately 50,000-square feet surrounding building (#61033)
- 1972. 8-foot tall, 120-foot long block fence (no permit #)
- 1973. 21,536-square foot warehouse addition (#80040)
- 1973. 14,268-square foot warehouse/office and lunch room addition (#80039)
- 1973. Install automatic fire sprinklers in new warehouses and office buildings (#84255)
- 1973. Added public sewer connection (#90479)
- 1974. 12-foot, 6-inches by 18-foot patio cover installed as lunch area (#15447)
- 1974. Install personnel sign (#04143)
- 1976. Add underground fuel storage tank (#46978)
- 1976. 3,024-square foot floor slab, building and canopy (#54228)
- 1976. Install fire sprinkler system (#56621),
- 1976. Install three water closets, two lavatories, and 1 drinking fountain (#45434)
- 2010. Install fire sprinkler system heads (#177-10)
- 2012. Install an approximately 33-square foot, non-illuminated sign (#BLD-12-00847)

***B10. Significance (Continued):**

**Historical Overview**

Post-Contact history for the State of California is generally divided into three periods: the Spanish Period (1769–1821), Mexican Period (1821–1848), and American Period (1846–present). Although Spanish, Russian, and British explorers visited the area for brief periods between 1529 and 1769, the Spanish Period in California begins with the establishment in 1769 of a settlement at San Diego and the founding of Mission San Diego de Alcalá, the first of 21 missions constructed between 1769 and 1823. Independence from Spain in 1821 marks the beginning of the Mexican Period, and the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican–American War, signals the beginning of the American Period when California became a territory of the United States.

**Spanish Period (1769-1821)**

Spanish explorers made sailing expeditions along the coast of southern California between the mid-1500s and mid-1700s. In search of the legendary Northwest Passage, Juan Rodríquez Cabrillo stopped in 1542 at present-day San Diego Bay. With his crew, Cabrillo explored the shorelines of present Catalina Island as well as San Pedro and Santa Monica Bays. Much of the present California and Oregon coastline was mapped and recorded in the next half-century by Spanish naval officer Sebastián Vizcaíno. Vizcaíno's crew also landed on Santa Catalina Island and at San Pedro and Santa Monica Bays, giving each location its long-standing name. The Spanish crown laid claim to California based on the surveys conducted by Cabrillo and Vizcaíno (Bancroft 1885; Gumprecht 2001).

More than 200 years passed before Spain began the colonization and inland exploration of Alta California. The 1769 overland expedition by Captain Gaspar de Portolá marks the beginning of California's Historic period, occurring just after the King of Spain installed the Franciscan Order to direct religious and colonization matters in assigned territories of the Americas. With a band of 64 soldiers, missionaries, Baja (lower) California Native Americans, and Mexican civilians, Portolá established the Presidio of San Diego, a fortified military outpost, as the first Spanish settlement in Alta California. In July of 1769, while Portolá was exploring southern California, Franciscan Fr. Junípero Serra founded Mission San Diego de Alcalá at Presidio Hill, the first of the 21 missions that would be established in Alta California by the Spanish and the Franciscan Order between 1769 and 1823 (Bancroft 1885; Gumprecht 2001).

The Portolá expedition was the first known party of Europeans to set foot in the present-day boundaries of Los Angeles County in August 1769. Father Crespi called the campsite beside the river in the new territory, "Nuestra Señora la Reina de los Angeles de la Porciúncula" which translated

to "Our Lady the Queen of the Angels of the Porziuncola." The Porziuncola is the name of the small chapel within the Papal basilica of Saint Mary of the Angels in Assisi, Italy where the Franciscan order was said to have started in the thirteenth century. Two years later, Friar Junípero Serra returned to the valley to establish the Mission San Gabriel Arcángel, on September 8, 1771. In 1776, following a series of floods, the mission was moved to a second, temporary site before being moved again to the present site in 1791 (Bancroft 1885; Hoover et al. 2002).

Four years after the founding the secular Spanish settlement in 1781, El Pueblo de Nuestra Señora de Los Angeles, Manuel Nieto received a provisional grant for Rancho Los Nietos in 1784. The immense grant encompassed all the land between the Santa Ana and the Rio Hondo (then-called the San Gabriel) Rivers, and between the ocean and the now-called Coyote Hills. The Rancho was later partitioned into smaller Ranchos by Nieto's heirs during the Mexican period (Hoover et al. 2002).

**Mexican Period (1821-1846)**
A major emphasis during the Spanish Period in California was the construction of missions and associated presidios to integrate the Native American population into Christianity and communal enterprise. Incentives were also provided to bring settlers to pueblos or towns, but just three pueblos were established during the Spanish Period, only two of which were successful and remain as California cities (San José and Los Angeles). Several factors kept growth within Alta California to a minimum, including the threat of foreign invasion, political dissatisfaction, and unrest among the indigenous population. After more than a decade of intermittent rebellion and warfare, New Spain (Mexico and the California territory) won independence from Spain in 1821. In 1822, the Mexican legislative body in California ended isolationist policies designed to protect the Spanish monopoly on trade, and decreed California ports open to foreign merchants (Dallas 1955).

Extensive land grants were established in the interior during the Mexican Period, in part to increase the population inland from the more settled coastal areas where the Spanish had first concentrated their colonization efforts. The children of Manuel Nieto petitioned for the Mexican Governor to divide Rancho Los Nieto into six smaller Ranchos. The new ranchos included Rancho Loa Alamitos, Rancho Cerritos, Rancho Los Coyotes, Rancho Los Bolsas, Rancho Palo Altos, and Rancho Santa Gertrudes. Rancho Santa Gertrudes, where the proposed Project is located, was granted in 1834 to the widow of Antonio María Nieto, Josefa Cota de Nieto. The 21,713-acre Rancho encompasses present day Downey and Santa Fe Springs. The secularization of the missions (enacted 1833) following Mexico's independence from Spain resulted in the subdivision of former mission lands and establishment of many additional ranchos (Hoover et al. 2002).

During the supremacy of the ranchos (1834–1848), landowners largely focused on the cattle industry and devoted large tracts to grazing. Cattle hides became a primary southern California export, providing a commodity to trade for goods from the east and other areas in the United States and Mexico. The number of nonnative inhabitants increased during this period because of the influx of explorers, trappers, and ranchers associated with the land grants. The rising California population contributed to the introduction and rise of diseases foreign to the Native American population, who had no associated immunities.

**American Period (1846-Present)**
The Mexican–American War ended with the Treaty of Guadalupe Hidalgo in 1848, ushering California into its American Period. Los Angeles was designated as one of the 27 original counties of California on February 18, 1850, shortly before California officially became a state with the Compromise of 1850. Beginning with the California Land Act of 1851, the new State of California recognized the ownership of lands distributed under Spanish and Mexican land grants if they were formally claimed to the United States Land Claim Commission within two years. The owner was required to furnish proof of ownership and the size of their property which led to lengthy court cases throughout the state and rulings that were delayed for extended periods (U.S. Congress 1851).

An American man from Kentucky named Lemuel Carpenter arrived in the vicinity of Rancho Santa Gertrudes during the 1830s. Following his marriage to the granddaughter of Manuel Nieto and niece of Josefa Cota de Nieto, María de Los Angeles Domínquez, Carpenter purchased Rancho Santa Gertrudes from Doña Cota de Nieto in 1843. Carpenter often disputed with the owners of the Rancho to the north, Rancho Paso de Bortolo, concerning the overlap of the two Ranchos at the northern boundary of his Rancho (Figure 4). Carpenter applied for legal claim to Rancho San Gertrudes under the California Land Act of 1851, however, the appeal process took over 12 years, in which time Carpenter

began to default on the sizable loan he took out to purchase the Rancho. Rancho Santa Gertrudes was seized from Carpenter in 1859 and sold at auction by the sheriff to John G. Downey and Dr. James P. McFarland. Downey and McFarland purchased 17,602-acres of Rancho Santa Gertrudes at a bargain rate of $3.40 per acre. The court process concluded after Carpenter's death, and resulted in the preparation of the 1862 Plat Map of the Rancho Santa Gertrudes by the U.S. Surveyor General (Figure 12) attributing ownership of Rancho Santa Gertrudes and the small disputed triangular section containing the subject property as Carpenter's property. Although Downey and McFarland formally owned the property by this point, their ownership of this section was not formally accepted until 1866 (Hoover et al. 2002; Jensen 1991; Da Rold 1979).

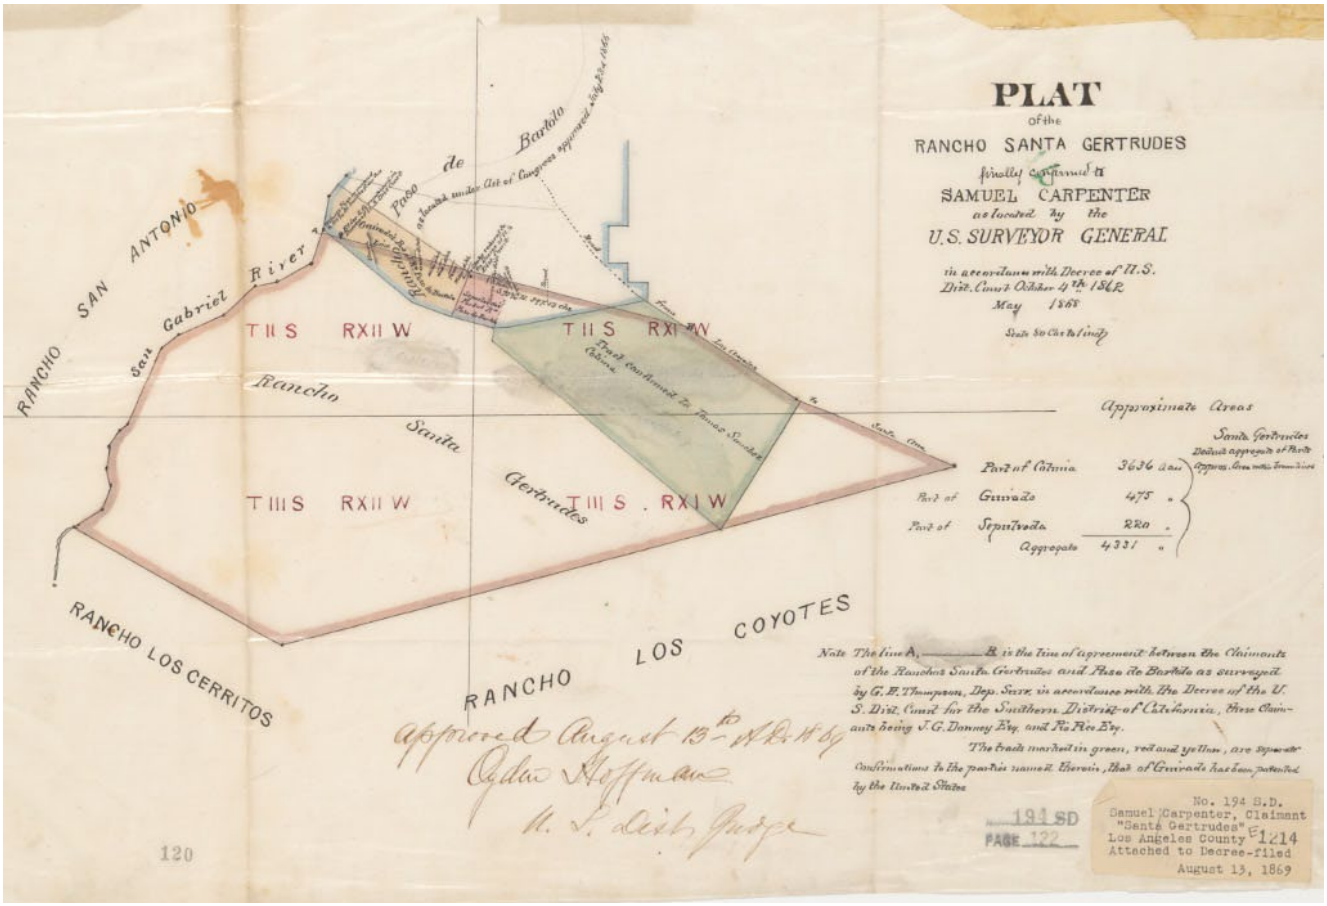

Figure 12. Plat of the Rancho Santa Gertrudes showing disputed northern territory overlap, 1866 (Bancroft Library, UC Berkley)

**Historical Overview of Downey**

John Downey (b. 1827) emigrated from Ireland to the Washington D.C. where he trained as a druggist for several years before traveling in California in 1849 at the height of the Gold Rush. Downey partnered with McFarland and together they opened the second drug store in Los Angeles in 1850. Downey continued his assent through local politics after becoming a naturalized American in 1851 and joining the Los Angeles City Council thereafter. In 1860, shortly after he purchased Rancho Santa Gertrudes, Downey became the seventh Governor of the State of California. He returned to the Rancho in 1862 at the conclusion of his two-year term and began the process, alongside McFarland, of dividing 96-acres of the Rancho into small farms. This subdivision facilitated the transition of the Rancho from a cattle range into fertile, agricultural properties that would attract new settlers to Los Angeles County. Governor Downey promoted the cultivation of oranges on the properties he sold, as he believed that the oranges would prove to be an extremely lucrative crop (Hoover et al. 2002; Latimer et al. 2010).

As Downey and McFarland subdivided and sold off portions of the Rancho during the 1860s and 1870s, the small communities of Gallatin and College Settlement organically developed, and then gradually grew together. When the Southern Pacific Railroad announced that they would route the railroad near, but not through either of the existing settlements, plans for a new, combined town surrounding the new depot developed. The settlement of Downey was officially established when Los Angeles County surveyor, Frank Lecouvreur, filed a map for the "Tract of the Downey Land Association" in October 1873. The map included two blocks devoted to the new Southern Pacific Railroad depot, which opened in April 1874. By the end of 1874, the fledgling town of Downey featured a hotel, three schools, two churches and a newspaper office (Downey Historical Society N.D.; Latimer et al. 2010).

As Governor Downey speculated when he advertised the Rancho Santa Gertrudes farms for sale, citrus fruit became an extremely successful crop. Valencia oranges were first grown on the farms surrounding the town of Downey in the 1870s, with Navel oranges following soon after. Other crops that thrived on the surrounding Downey farms included barley, castor beans, corn, English walnuts, sugar beets and potatoes. The arrival of the Southern Pacific Railroad in 1874 provided an efficient means to distribute the abundant agricultural products to a wider market, and in 1879 alone, 7,941,825-pounds of produce was transported from the Downey depot. By the 1890s, the northern portion of Downey was predominately populated by citrus orchards and was well-known as a citrus powerhouse. While Downey continued to prosper as a citrus-producing region well into the 20th century, it remained a predominately rural community during this period (Latimer et al. 2010).

During the late 1920s and the 1930s, aviation arose as a profitable industry in Downey. In March 1929, E.M Smith purchased a 73-acre ranch in southeast Downey that had been used to grow oranges and castor beans and established EMSCO Aircraft. Smith began building aircrafts onsite, constructed a 2,400-foot runway and various hangar buildings before the stock market crash later in 1929 caused EMSCO Aircraft to fold. In 1932, Smith rented the aviation-oriented property to an established aviation company owned by Bert Kinner, called the Security National Aircraft Company. Kinner gained early notoriety in the aviation field with his innovative "folding wing" design and he was also responsible for the design of the popular Kinner Airster plane, which was the first plane purchased by Amelia Earhart (Latimer et al. 2010).

In 1936, a seasoned aviation engineer named Gerard Vultee moved his company, Vultee Aircraft, from Glendale to the same facility that formerly housed both EMSCO Aircraft and the Security National Aircraft Company. Vultee saw significant success from the Downey plant, which employed over 500 people by 1938. After Vultee's death, the company was renamed the Consolidated Vultee Aircraft Corporation, or 'Convair' for short. By 1941, the Downey plant was responsible for the production of 15-percent of all military aircraft in the United States, including the B-13A, the Vultee BT-13 trainer, and B-24 Liberator bombers. Despite this, when the war effort came to a close, so too did the majority of production of military craft at the Downey plant. Limited projects carried the plant through the late 1940s including the Lark short range missile and the MX-774 ballistic missile before Convair moved operations from the Downey plant to San Diego in 1948 (Latimer et al. 2010; Blackburn 2009).

Another prominent aviation company that held military contracts through World War II, North American Aviation (NAA), did not experience the same economic downturn in the immediate post-war period. Instead, the El Segundo-based NAA saw a quick recovery that was fueled by federal contracts to produce the AJ Savage bomber, the T-6G, and the T-28 trainer aircrafts. NAA was also racing to produce jet-powered aircraft and began making use of the V-2 jet technology that was apprehended from Nazi Germany. In 1949, NAA established an additional production site at the former Convair facility in Downey that would also serve as the headquarters for the NAA's new, Aerophysics Design Group. NAA's refocus towards the establishment the Aerophysics Design Group laid the foundation for the NAA Missiles Division, which produced the X-10 Navaho missile and the Hound Dog. The missile program also formed the basis for the NAA's transition into spacecraft engineering. The NAA Missiles Division secured the National Aeronautics and Space Administration (NASA) contract to design and build the test booster for the Mercury, Gemini, and Apollo space crafts, known as the Little Joe booster. Alongside the work of the NAA in Downey during the 1950s, the City also saw a rise in the number of new industries related to aeronautical and spacecraft design overall during this period (Blackburn 2009).

Following World War II, a surge of residential and industrial development throughout Los Angeles County caused the population of Downey to balloon from 12,000 people in 1940 to 86,000 people by

1960. The residents of Downey voted to officially incorporate the City in 1956. The County experienced dramatic industrial growth during this period, with a gain of 70 percent in the number of factories and 300 percent increase in manufacturing county-wide between 1939 and 1947. With the express support of the aeronautical engineering companies in Downey, by 1952, Los Angeles County was leading nationally in six areas of industry including; aircraft and aircraft parts; pumps and compressors; canned seafood; the motion picture industry; refrigeration and associated equipment; and heating a plumbing equipment (Latimer et al. 2010; LAT 1952).

Downey remained a dominant force in the aerospace engineering industry throughout the 1960s and the 1970s and is known colloquially as the "Cradle of the Cosmic Age" due to the development there of so many technologies considered instrumental to the advent of manned spacecraft. Today, Downey maintains a population of approximately 113,350 people, and although a majority of the City's workforce is now employed by the healthcare and social assistance industries, manufacturing is still considered the second largest driver of employment in the City (Blackburn 2009; Data USA 2020).

**Kirkhill Manufacturing Inc. (1941-Present)**
Thomas Kirk Hill founded The Mechanical Rubber Co. in the City of Los Angeles in 1919 to produce rubber seals and flexible connectors for plumbing and industrial use. In 1926, the company was renamed the Kirkhill Rubber Co. As the demand for rubber products grew, the company enlarged the original plant during the 1930s (Figure 13) (Kirkhill Inc. 2019).

Figure 13. The original Kirkhill Rubber Company building in 1938 (Kirkhill Inc. 2019)

Prompted by the escalation of the aeronautical industry in Los Angeles County in response to World War II, the Kirkhill Rubber Co. divided into two separate companies in 1941: Kirkhill Rubber Co. remained focused on the manufacturing of rubber products related to plumbing and industrial goods, while the new branch of the company, Kirkhill Manufacturing Inc., focused on the production of seals related to aerospace products (Kirkhill Inc. 2019).

In 1949, the Kirkhill Rubber Co. completed a new, 360,000-square foot facility in Brea, California, that was capable of employing over 1,000 people. The Brea facility was expanded by 50,000-square feet in 1950 allowing it to become the center of operations and production for both Kirkhill companies. In 1951, as the NAA developed new, jet propelled aircraft, Kirkhill Manufacturing Inc. established a comparatively smaller plant in Downey to maintain close proximity to the rapid-paced-development in the Downey aerospace industry. A permit for an expansion of the Downey plant in 1955 suggests that the plant employed only 60 people, which was a nominal fraction of the overall company employment during this period (LAT 1950; Kirkhill Inc. 2019; Permit #3611).

Both Kirkhill entities continued to expand during the 1960s, as Kirkhill products were utilized in the first manned trip to the Moon and also in the development of the F104 and DC-9 aircrafts. During the 1970s, Kirkhill Inc. maintained growth with the assistance of the space shuttle programs, the Titan intercontinental ballistic missile, and the Minutemen missiles (Kirkhill Inc. 2019).
During the 1990s, the two companies under the Kirkhill name were sold and renamed. In 1996, the former employees of Kirkhill Inc. purchased the company and manufacturing equipment and formed the Kirkhill Manufacturing Company. In 1998, Kirkhill Manufacturing Company was acquired by Esterline, which then merged in 1999 with TA Manufacturing and the company name became the Kirkhill-TA Company. This company found success in the manufacture of parts used in the reusable rockets for the Space Shuttle program, as well as components of the Boeing 777 aircraft. Despite the multiple changes in company ownership and structure since the 1990s, the Kirkhill name was retained as part of the new businesses. In 2019, Kirkhill Manufacturing Company celebrated its 100th anniversary as a company (Hexpol 2020; Kirkhill Inc. 2019).

**Mid-Century Modern Architecture (1933-1965)**
The Mid-Century Modern design movement includes architecture that is reflective of International and Bauhaus styles popular in Europe in the early 20th century. This architecture and its living designers (e.g., Mies Van der Rohe and Gropius) were disrupted by World War II and moved to the United States. During World War II, the United States established itself as a burgeoning manufacturing and industrial leader, with incredible demand for modern buildings to reflect modern products in the mid-20th century. As a result, many industrial buildings are often "decorated boxes"—plain buildings with applied ornament to suit the era and appear more modern without detracting from the importance of the activity inside the building. Following World War II, the United States had a focus on forward thinking, which sparked architectural movements like Mid-Century Modern. Practitioners of the style were focused on the most cutting-edge materials and techniques. Architects throughout Southern California implemented the design aesthetics made famous by early Modernists like Richard Neutra and Frank Lloyd Wright, who created a variety of modern architectural forms. Like other buildings of this era, Mid-Century Modern buildings had to be quickly assembled, and use modern materials that could be mass-produced. Both residences and offices designed in this style expressed its structure and materials, displayed large expanses of glass, and had an open interior plan (McAlester 2013; Morgan 2004).

Characteristics of the Mid-Century Modern style include:

- One- to two-stories in height
- Low, boxy, horizontal proportions
- Simple geometric forms with a lack of exterior decoration
- Commonly asymmetrical
- Flat roofed without coping at roof line; flat roofs hidden behind parapets or cantilevered canopies
- Expressed post-and-beam construction in wood or steel
- Exterior walls are flat with smooth sheathing and typically display whites, buffs, and pale pastel colors
- Mass-produced materials
- Simple windows (metal or wood) flush-mounted and clerestory
- Industrially plain doors
- Large window groupings

**NRHP/CRHR Statement of Significance**

**Criterion A/1: That are associated with events that have made a significant contribution to the broad patterns of our history.**
Archival research indicates that by the time the Downey branch facility of Kirkhill Manufacturing Inc. was completed in 1951, parent company Kirkhill Rubber Co. had already been manufacturing rubber products for aerospace projects for 10 years. Kirkhill Manufacturing Inc. produced products specifically for airplanes and was established in order to distinguish between the parent company, Kirkhill Rubber Co., which was founded in 1919 to make household and industrial plumbing components. As Downey earned a reputation as an epicenter of aerospace engineering, Kirkhill Manufacturing Inc. had the opportunity to produce parts for multiple aircrafts and space crafts produced in the area

during the 1950s through the 1980s. Despite the facility's location in Downey and its proximity to the bustling NAA plant, the facility in Downey appears to have remained secondary in both production and staffing to the Kirkhill Manufacturing Inc. facility in Brea that was completed several years earlier in 1949. Archival research indicates the Brea plant served as the center of operations during this period, and the Downey location is not referenced in connection with any specific achievement credited to the Kirkhill Manufacturing Inc. Ultimately, the success of the company continues to be associated with the Brea facility, not the Downey location. The plant in Downey does not appear to have made a significant contribution to the local, state, or national history. While the current tenants of the building, Kirkhill Manufacturing Company Inc., continues to use the Kirkhill company name, the original Kirkhill Manufacturing Inc. was sold and restructured multiple times during the 1990s. Therefore, the current Kirkhill Manufacturing Company Inc. does not maintain continued association to the company started by Thomas Kirk Hill in 1919 that went on to assist in the engineering of aerospace industries in Downey. Consequently, the building does not retain integrity of association with the firm that established the branch of the Kirkhill Manufacturing Inc., in Downey in 1951. Moreover, with subsequent additions and alterations, the building no longer represents the time period in which the events for which the company gained notoriety within the field of aerospace design took place. For this reason, the property does not appear eligible under Criterion A of the NRHP or Criterion 1 of the CRHR.

**Criterion B/2: That are associated with the lives of persons significant in our past.**
Archival research did not indicate that any previous property owners or employees are known to be historically significant figures at the national, state, or local level. As such, this property is not known to have any historical associations with people important to the nation's or state's past. Therefore, the property does not appear eligible for the NRHP under Criterion B or CRHR under Criterion 2.

**Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.**
Construction of the subject property began in 1951 and the original building design would go on to receive five major additions in the years 1954, 1955, 1971, 1973, and 1976. The original 1951 footprint as displayed in the 1952 historical aerial photograph was an example of the modest Mid-Century Modern-style buildings designed for industrial and commercial uses following the end of World War II. Furthermore, the popularity of the architectural style in Southern California and its widespread use resulted in the creation of hundreds of buildings in this style that have a higher level of integrity, association with notable architects, and a higher level of architectural merit that that shown at the subject property. Therefore, the subject property cannot be considered a distinctive example of a Mid-Century Modern industrial building, nor can it be considered representative of a significant and distinguishable entity whose components lack individual distinction. Furthermore, as the original architect was not discovered during the course of research for this project, the building is not known to be the work of a master architect.
Following the multiple expansions and additions, the character-defining features including the low, boxy massing, articulated profile, grand semi-circular driveway, and original exterior cladding have been substantially altered. Although the building appears to retain the majority of the original breezeway block screens, later additions to the main office's east (main) elevation that are different in scale from the original building, also feature the same wide swaths of decorative block in the same pattern. This has resulted in a blurred distinction between the original design and features that were added at a later period. The property as a whole has been altered beyond recognition, diminishing the already modest architectural value of the property. These alterations and major additions have caused the building to lose integrity in the areas of design, materials and workmanship. For these reasons, the subject property does not appear eligible for listing in the NRHP under Criterion C or CRHR under Criterion 3.

**Criterion D/4: That have yielded, or may be likely to yield, information important in prehistory or history.**
The property is not significant under Criterion D of the NRHP or Criterion 4 of the CRHR as a source, or likely source, of important historical information nor does it appear likely to yield important information about historic construction methods, materials or technologies.

**Integrity Discussion**
The subject property retains integrity of location, as it remains in its original location. The

Kirkhill Manufacturing Inc. property, including all three wings, have undergone major exterior alterations and large-scale additions beginning in the 1950s. The building sections do not retain their original plan and massing, and later additions are not consistent with the original Mid-Century Modern-style building. Therefore, the subject property does not retain integrity of design. The property does not retain integrity of setting, as the setting in all directions has been altered from a rural farmland with periodic industrial development when it was initially constructed, to dense residential development, parking lots, strip malls with anchoring grocery and retail stores. The size, scale, and density of this modern setting differs dramatically from the 1950s and 1960s. Although the original distinctive breezeway block screens on the east elevation remain intact, the subject property does not retain integrity of materials and workmanship, due to the introduction of modern materials on the main and side elevations. For instance, key design elements such as the scale, massing, cladding, signage, original semi-circular driveway, and doors have all been replaced or heavily altered. The subject property also does not retain integrity of feeling, as the property as a whole no longer presents as a Mid-Century Modern-style industrial building. While the current tenants of the building, Kirkhill Manufacturing Company Inc., continue to employ the Kirkhill company name, the original Kirkhill Manufacturing Inc. was sold and restructured multiple times during the 1990s and no longer maintains any association to the company started by Thomas Kirk Hill in 1919. Consequently, the building no longer retains integrity of association with the original firm that established the branch of the Kirkhill Manufacturing Inc., in Downey. In summary, the subject property does not retain the requisite integrity and does not rise to the level of significance required for designation at the national, state or local levels.

## 1.0 Project Characteristics

### 1.1 Land Usage

| Land Uses | Size | Metric | Lot Acreage | Floor Surface Area | Population |
|---|---|---|---|---|---|
| General Office Building | 8.02 | 1000sqft | 0.00 | 8,020.00 | 0 |
| Unrefrigerated Warehouse-No Rail | 44.16 | 1000sqft | 6.31 | 44,162.00 | 0 |
| Parking Lot | 46.00 | Space | 0.00 | 28,540.00 | 0 |

### 1.2 Other Project Characteristics

| | | | | | |
|---|---|---|---|---|---|
| **Urbanization** | Urban | **Wind Speed (m/s)** | 2.2 | **Precipitation Freq (Days)** | 31 |
| **Climate Zone** | 9 | | | **Operational Year** | 2022 |
| **Utility Company** | Southern California Edison | | | | |
| **CO2 Intensity (lb/MWhr)** | 566.2 | **CH4 Intensity (lb/MWhr)** | 0.023 | **N2O Intensity (lb/MWhr)** | 0.00497 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics – GHG intensity data was updated based on the 2018 Power Content Label for SCE.

Land Use - Building square footage, parking lot area and lot acreage data values were provided by the project applicant.

Construction Phase - Construction schedule information was provided by the project applicant.

Off-road Equipment - Construction equipment information was provided by the project applicant.

Off-road Equipment - Construction equipment information was provided by the project applicant.

Trips and VMT - Odd trip values were rounded up to an even value.

Demolition - 3,200 tons of demolition debris was assumed based on information provided by the project applicant.

Grading - CalEEMod defaults were used.

Construction Off-road Equipment Mitigation - In compliance with SCAQMD Rule 402 watering twice daily and limiting speeds to 15 miles per hour on unpaved roads was assumed.

Vehicle Trips - Operational mobile source emissions were calculated in a spreadsheet model using ITE, CalEEMod and EMFAC data.

Operational Off-Road Equipment - Operational off-road equipment information was provided by the project applicant.

## 11.0 Vegetation

# 12021 Wooddruff Avenue - Construction LST Analysis

**South Coast AQMD Air District, Summer**

## 1.0 Project Characteristics

### 1.1 Land Usage

| Land Uses | Size | Metric | Lot Acreage | Floor Surface Area | Population |
|---|---|---|---|---|---|
| General Office Building | 8.02 | 1000sqft | 0.00 | 8,020.00 | 0 |
| Unrefrigerated Warehouse-No Rail | 44.16 | 1000sqft | 6.31 | 44,162.00 | 0 |
| Parking Lot | 46.00 | Space | 0.00 | 28,540.00 | 0 |

### 1.2 Other Project Characteristics

| | | | | | |
|---|---|---|---|---|---|
| **Urbanization** | Urban | **Wind Speed (m/s)** | 2.2 | **Precipitation Freq (Days)** | 31 |
| **Climate Zone** | 9 | | | **Operational Year** | 2022 |
| **Utility Company** | Southern California Edison | | | | |
| **CO2 Intensity (lb/MWhr)** | 566.2 | **CH4 Intensity (lb/MWhr)** | 0.023 | **N2O Intensity (lb/MWhr)** | 0.005 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics – GHG intensity data was updated based on the 2018 Power Content Label for SCE.

Land Use - Building square footage, parking lot area and lot acreage data values were provided by the project applicant.

Construction Phase - Construction schedule information was provided by the project applicant.

Off-road Equipment - Construction equipment information was provided by the project applicant.

Off-road Equipment - Construction equipment information was provided by the project applicant.

Trips and VMT - Odd trip values were rounded up to an even value. Trip distances were reduced to 1,000 feet to only account for vehicle travel at the project site.

Demolition - 3,200 tons of demolition debris was assumed based on information provided by the project applicant.

Grading - CalEEMod defaults were used.

Construction Off-road Equipment Mitigation - In compliance with SCAQMD Rule 402 watering twice daily and limiting speeds to 15 miles per hour on unpaved roads was assumed.

Vehicle Trips - Operational mobile source emissions were calculated in a spreadsheet model using ITE, CalEEMod and EMFAC data.

Operational Off-Road Equipment - Operational off-road equipment information was provided by the project applicant.

|---|---|---|---|---|---|
| **Urbanization** | Urban | **Wind Speed (m/s)** | 2.2 | **Precipitation Freq (Days)** | 31 |
| **Climate Zone** | 9 | | | **Operational Year** | 2022 |
| **Utility Company** | Southern California Edison | | | | |
| **CO2 Intensity (lb/MWhr)** | 566.2 | **CH4 Intensity (lb/MWhr)** | 0.023 | **N2O Intensity (lb/MWhr)** | 0.005 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics – GHG intensity data was updated based on the 2018 Power Content Label for SCE.

Land Use - Building square footage, parking lot area and lot acreage data values were provided by the project applicant.

Construction Phase - Construction schedule information was provided by the project applicant.

Off-road Equipment - Construction equipment information was provided by the project applicant.

Off-road Equipment - Construction equipment information was provided by the project applicant.

Trips and VMT - Odd trip values were rounded up to an even value. Trip distances were reduced to 1,000 feet to only account for vehicle travel at the project site.

Demolition - 3,200 tons of demolition debris was assumed based on information provided by the project applicant.

Grading - CalEEMod defaults were used.

Construction Off-road Equipment Mitigation - In compliance with SCAQMD Rule 402 watering twice daily and limiting speeds to 15 miles per hour on unpaved roads was assumed.

Vehicle Trips - Operational mobile source emissions were calculated in a spreadsheet model using ITE, CalEEMod and EMFAC data.

Operational Off-Road Equipment - Operational off-road equipment information was provided by the project applicant.

**South Coast AQMD Air District, Summer**

## 1.0 Project Characteristics

### 1.1 Land Usage

| Land Uses | Size | Metric | Lot Acreage | Floor Surface Area | Population |
|---|---|---|---|---|---|
| General Office Building | 8.02 | 1000sqft | 0.00 | 8,020.00 | 0 |
| Unrefrigerated Warehouse-No Rail | 44.16 | 1000sqft | 6.31 | 44,162.00 | 0 |
| Parking Lot | 46.00 | Space | 0.00 | 28,540.00 | 0 |

### 1.2 Other Project Characteristics

| | | | | | |
|---|---|---|---|---|---|
| **Urbanization** | Urban | **Wind Speed (m/s)** | 2.2 | **Precipitation Freq (Days)** | 31 |
| **Climate Zone** | 9 | | | **Operational Year** | 2022 |
| **Utility Company** | Southern California Edison | | | | |
| **CO2 Intensity (lb/MWhr)** | 566.2 | **CH4 Intensity (lb/MWhr)** | 0.023 | **N2O Intensity (lb/MWhr)** | 0.00497 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics – GHG intensity data was updated based on the 2018 Power Content Label for SCE.

Land Use - Building square footage, parking lot area and lot acreage data values were provided by the project applicant.

Construction Phase - Construction schedule information was provided by the project applicant.

Off-road Equipment - Construction equipment information was provided by the project applicant.

Off-road Equipment - Construction equipment information was provided by the project applicant.

Trips and VMT - Odd trip values were rounded up to an even value.

Demolition - 3,200 tons of demolition debris was assumed based on information provided by the project applicant.

Grading - CalEEMod defaults were used.

Construction Off-road Equipment Mitigation - In compliance with SCAQMD Rule 402 watering twice daily and limiting speeds to 15 miles per hour on unpaved roads was assumed.

Vehicle Trips - Operational mobile source emissions were calculated in a spreadsheet model using ITE, CalEEMod and EMFAC data.

Operational Off-Road Equipment - Operational off-road equipment information was provided by the project applicant.

## 1.0 Project Characteristics

### 1.1 Land Usage

| Land Uses | Size | Metric | Lot Acreage | Floor Surface Area | Population |
|---|---|---|---|---|---|
| General Office Building | 8.02 | 1000sqft | 0.00 | 8,020.00 | 0 |
| Unrefrigerated Warehouse-No Rail | 44.16 | 1000sqft | 6.31 | 44,162.00 | 0 |
| Parking Lot | 46.00 | Space | 0.00 | 28,540.00 | 0 |

### 1.2 Other Project Characteristics

| | | | | | |
|---|---|---|---|---|---|
| **Urbanization** | Urban | **Wind Speed (m/s)** | 2.2 | **Precipitation Freq (Days)** | 31 |
| **Climate Zone** | 9 | | | **Operational Year** | 2022 |
| **Utility Company** | Southern California Edison | | | | |
| **CO2 Intensity (lb/MWhr)** | 566.2 | **CH4 Intensity (lb/MWhr)** | 0.023 | **N2O Intensity (lb/MWhr)** | 0.00497 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics – GHG intensity data was updated based on the 2018 Power Content Label for SCE.

Land Use - Building square footage, parking lot area and lot acreage data values were provided by the project applicant.

Construction Phase - Construction schedule information was provided by the project applicant.

Off-road Equipment - Construction equipment information was provided by the project applicant.

Off-road Equipment - Construction equipment information was provided by the project applicant.

Trips and VMT - Odd trip values were rounded up to an even value.

Demolition - 3,200 tons of demolition debris was assumed based on information provided by the project applicant.

Grading - CalEEMod defaults were used.

Construction Off-road Equipment Mitigation - In compliance with SCAQMD Rule 402 watering twice daily and limiting speeds to 15 miles per hour on unpaved roads was assumed.

Vehicle Trips - Operational mobile source emissions were calculated in a spreadsheet model using ITE, CalEEMod and EMFAC data.

Operational Off-Road Equipment - Operational off-road equipment information was provided by the project applicant.

HARP2 - HRACalc (dated 19044) 9/16/2020 2:53:19 PM - Output Log

GLCs loaded successfully
Pollutants loaded successfully
Pathway receptors loaded successfully
**********
RISK SCENARIO SETTINGS

Receptor Type: Resident
Scenario: Cancer
Calculation Method: Derived

**********
EXPOSURE DURATION PARAMETERS FOR CANCER

Start Age: -0.25
Total Exposure Duration: 30

Exposure Duration Bin Distribution
3rd Trimester Bin: 0.25
0<2 Years Bin: 2
2<9 Years Bin: 0
2<16 Years Bin: 14
16<30 Years Bin: 14
16 to 70 Years Bin: 0

**********
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: True
Water: False
Fish: False
Homegrown crops: True
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

**********
INHALATION

Daily breathing rate: RMP

**Worker Adjustment Factors**
Worker adjustment factors enabled: NO

**Fraction at time at home**
3rd Trimester to 16 years: OFF
16 years to 70 years: OFF

**********
SOIL & DERMAL PATHWAY SETTINGS

Deposition rate (m/s): 0.02
Soil mixing depth (m): 0.01
Dermal climate: Warm

**********
HOMEGROWN CROP PATHWAY SETTINGS

Household type: HouseholdsthatGarden
Fraction leafy: 0.137
Fraction exposed: 0.137
Fraction protected: 0.137
Fraction root: 0.137

**********
TIER 2 SETTINGS

Tier2 adjustments were used in this assessment.  Please see the input file for details.
Tier2 - What was changed: ED or start age changed|
Calculating cancer risk
Cancer risk breakdown by pollutant and receptor saved to: C:\Users\dlarocca\Desktop\Air Quality Work\HARP2\Downey Op\DOWNEY OPERATIONAL HRA\hra\30yr3tricancerCancerRisk.csv
Cancer risk total by receptor saved to: C:\Users\dlarocca\Desktop\Air Quality Work\HARP2\Downey Op\DOWNEY OPERATIONAL HRA\hra\30yr3tricancerCancerRiskSumByRec.csv

HARP2 - HRACalc (dated 19044) 9/16/2020 10:29:08 AM - Output Log

GLCs loaded successfully
Pollutants loaded successfully
Pathway receptors loaded successfully
**********
RISK SCENARIO SETTINGS

Receptor Type: Resident
Scenario: Cancer
Calculation Method: Derived

**********
EXPOSURE DURATION PARAMETERS FOR CANCER

Start Age: 5
Total Exposure Duration: 5

Exposure Duration Bin Distribution
3rd Trimester Bin: 0
0<2 Years Bin: 0
2<9 Years Bin: 4
2<16 Years Bin: 1
16<30 Years Bin: 0
16 to 70 Years Bin: 0

**********
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: True
Water: False
Fish: False
Homegrown crops: True
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

**********
INHALATION

Daily breathing rate: RMP

**Worker Adjustment Factors**
Worker adjustment factors enabled: NO

**Fraction at time at home**
3rd Trimester to 16 years: OFF
16 years to 70 years: ON

**********
SOIL & DERMAL PATHWAY SETTINGS

Deposition rate (m/s): 0.02
Soil mixing depth (m): 0.01
Dermal climate: Warm

**********
HOMEGROWN CROP PATHWAY SETTINGS

Household type: HouseholdsthatGarden
Fraction leafy: 0.137
Fraction exposed: 0.137
Fraction protected: 0.137
Fraction root: 0.137

**********
TIER 2 SETTINGS

Tier2 adjustments were used in this assessment.  Please see the input file for details.
Tier2 - What was changed: ED or start age changed|
Calculating cancer risk
Cancer risk breakdown by pollutant and receptor saved to: C:\Users\dlarocca\Desktop\Air Quality Work\HARP2\Downey Op\DOWNEY OPERATIONAL HRA\hra\5yrStudenticancerCancerRisk.csv
Cancer risk total by receptor saved to: C:\Users\dlarocca\Desktop\Air Quality Work\HARP2\Downey Op\DOWNEY OPERATIONAL HRA\hra\5yrStudenticancerCancerRiskSumByRec.csv

# 1 Introduction

## 1.1 Purpose and Scope of the TIA

The purpose of this Transportation Impact Analysis (TIA) is to identify transportation impacts associated with the proposed 12021 Woodruff Avenue Industrial Building Project (proposed project) in the City of Downey (City), in Los Angeles County (County). This TIA has been prepared consistent with the requirements set forth in CEQA Guidelines Section 15064.3(b), the City's General Plan Circulation Element, the Los Angeles County Congestion Management Program (CMP), and Caltrans.

**The objectives of this TIA are to:**

- Document existing roadway, pedestrian, bicycle, transit, and traffic conditions, including intersection levels of service in the study area;
- Estimate trip generation, distribution, and assignment characteristics for the proposed project;
- Provide a Vehicle Miles Traveled (VMT) analysis per Senate Bill (SB) 743 and the updated California Environmental Quality Act (CEQA) Guidelines;
- Determine traffic levels of service (LOS) for study area intersections under the following scenarios:
  - Existing Conditions
  - Existing plus Ambient Growth plus Cumulative Projects (traffic from cumulative projects and ambient growth)
  - Existing plus Ambient Growth plus Cumulative Projects plus Project
- Identify CEQA-required mitigation measures for significant transportation impacts and/or other improvements needed to meet LOS standards (if any); and,
- Provide findings and recommendations based on the traffic analysis of the proposed project.

Figure 1 shows the project location and study area intersections. As shown in Figure 1, the study area is comprised of the following 5 intersections and two project driveways:

**Intersections**

1. Woodruff Avenue/Washburn Road
2. Woodruff Avenue/Stewart and Gray Road
3. Stewart and Gray Road/Firestone Boulevard
4. Interstate 605 (I-605) southbound ramps/Firestone Boulevard
5. I-605 northbound ramps – Hoxie Avenue/Firestone Boulevard

**Project Driveways**

- Driveway 1 (North)/Woodruff Avenue
- Driveway 2 (South)/Woodruff Avenue

## 1.2 Project Description and Location

The project includes the demolition of an existing, 74,662-square-foot industrial building and construction of an approximately 44,162-square-foot tilt-up industrial building for truck terminal use. The proposed industrial building would include approximately 36,142 square feet of warehouse space and 8,020 square feet of office space.

The new industrial building is intended to be used as a trucking terminal for distribution and logistics purposes. On-site activities will include storage of and/or consolidation of manufactured goods before the distribution to retail locations or other warehouses. Other than truck parking and storage, all activities will occur within the industrial building. The office space is intended to be used for office uses ancillary to the warehouse operation. Figure 2 illustrates the project's site plan, and the project's driveway access. The project is expected to be operational in the year 2022.

The project would contain the required number of parking stalls including 56 parking spaces for passenger vehicles (52 standard, 2 accessible parking, and 2 van accessible parking), 76 spaces for cargo containers, and 70 loading docks.

Regional access to the project site is primarily served by I-605, I-5, and I-105, while I-710 is located west of the City. The project is accessible via three major streets: Florence Avenue, Firestone Boulevard, and Imperial Highway. Local access to the project is provided via Woodruff Avenue, Stewart and Gray Road, and Washburn Road. The project access driveway at the northern edge of the site would provide full-access for passenger cars and inbound only (right-in/left-in) access for trucks. The project access driveway at the southern edge of the site would provide full access for passenger cars and outbound only (right-out/left-out) access for trucks.

# 1.3 Analysis Methodology

## 1.3.1 Vehicle Miles Traveled (VMT) Analysis for CEQA

On September 27, 2013, Senate Bill (SB) 743 was signed into law, which created a process to change the way that transportation impacts are analyzed under California Environmental Quality Act (CEQA). SB 743 required the Governor's Office of Planning and Research (OPR) to amend the CEQA Guidelines to provide an alternative to level of service (LOS) for evaluating transportation impacts. Under the new transportation guidelines, LOS, or vehicle delay, will no longer be considered an environmental impact under CEQA. OPR recommended Vehicle Miles Traveled (VMT) as the most appropriate measure of project transportation impacts for land use projects and land use plans. The updates to the CEQA Guidelines required under SB 743 were approved on December 28, 2018.

Under the new guidelines, VMT has been adopted as the most appropriate measure of transportation impacts under CEQA. The OPR's regulatory text indicates that a public agency may immediately commence implementation of the new transportation impact guidelines, and that the guidelines must be implemented statewide by July 1, 2020. The City of Downey has not adopted VMT specific TIA guidelines as of October 2020. Therefore, the OPR guidance provided in the Technical Advisory on Evaluating Transportation Impacts in CEQA, December 2018 have been used for VMT analysis in the TIA. All other details of applicable screening and VMT analysis methodology has been provided in Section 4 of the TIA.

The Updated CEQA Guidelines state that "generally, vehicle miles traveled (VMT) is the most appropriate measure of transportation impacts" and define VMT as "the amount and distance of automobile travel attributable to a project." It should be noted that "automobile" refers to on-road passenger vehicles, specifically cars and light trucks. Heavy-duty truck VMT could be included for modeling convenience and ease of calculation (for example, where models or data provide combined auto and heavy truck VMT). Other relevant considerations may include the effects of the project on transit and non-motorized travel.

## 1.3.2 Level of Service for General Plan Consistency

Level of service (LOS) is a tool used to describe the operating characteristics of the street system in terms of the level of congestion or delay experienced by vehicles with service levels range from A through F, with each level defined by a range of V/C ratios, as shown in Table 1.

**Table 1. Levels of Service Description**

| Level of Service | Definition |
|---|---|
| A | Free Flow/Insignificant Delays: No approach phase is fully utilized by traffic and no vehicle waits longer than one red indication. |
| B | Stable Operation/Minimal Delays: An occasional approach phase is fully utilized. Many drivers feel somewhat restricted within platoons of vehicles. |
| C | Stable Operation/Acceptable Delays: Major approach phases fully utilized. Most drivers feel somewhat restricted. |
| D | Approaching Unstable/Tolerable Delays: Drivers may have to wait through more than one red signal indication. Queues may develop but dissipate rapidly, without excessive delays. |

Table 1. Levels of Service Description

| Level of Service | Definition |
|---|---|
| E | Unstable Operation/Significant Delays: Volumes at or near capacity. Vehicles may wait through several signal cycles. Long queues form upstream from intersection. |
| F | Forced Flow/Excessive Delays: Represents jammed conditions. Intersection operates below capacity with low volumes. Queues may block upstream intersections. |

**Source**: HCM 6 (TRB 2016).

The study area intersections are analyzed in the TIA for the scenarios described below.

**Existing Condition**

The TIA includes a description of existing traffic conditions in the site vicinity, including existing intersections and freeway ramp intersections weekday AM and PM peak hour traffic volumes, and traffic operations. The existing condition is representative of the year 2020. it should be noted that some traffic counts were collected in July 2020 during the COVID-19 pandemic and were subsequently adjusted using historical traffic count data as described further in Section 6.

**Existing plus Project Condition**

This condition includes analysis of traffic operations under existing conditions with project-related traffic, added to the existing AM and PM peak hour intersection traffic volumes.

**Existing plus Ambient Growth plus Cumulative Projects Condition**

This condition includes the time that the proposed project is completed and were estimated by increasing the existing traffic counts by an ambient growth rate and adding traffic generated by other cumulative projects in the study area. Ambient growth rates were obtained from the Los Angeles County Congestion Management Program (Metro 2010) for the Downey Regional Statistical Area, and since the project would be operational in the year 2022, a total ambient growth of 0.24% per year and therefore 0.48% for 2 years was applied to existing traffic to estimate Existing plus Ambient Growth plus Cumulative Projects Conditions.

**Existing plus Ambient Growth plus Cumulative Projects plus Project Condition**

This condition includes analysis of traffic operations under the Existing plus Ambient Growth plus Cumulative Projects (described above) condition with project-related traffic added to the AM and PM peak hour traffic volumes.

#### 1.3.2.1 Intersections

The Intersection Capacity Utilization (ICU) methodology was used to assess level of service for signalized intersections within the study area that are not under Caltrans jurisdiction. The ICU method determines the volume-to-capacity (V/C) ratio on a critical lane basis and determines LOS associated with each critical V/C ratio pairings at a signalized intersection. The Traffix program was utilized to determine intersection LOS for all signalized intersections within the City's jurisdiction.

The Highway Capacity Manual, 6th Edition (HCM 6) methodology (TRB 2016) was used to assess level of service for intersections within Caltrans' jurisdiction and for unsignalized intersections within the study area. The HCM and ICU analysis methodologies describe the operation of an intersection using a range of LOS from LOS A (free-flow conditions) to LOS F (severely congested conditions). For HCM LOS is based on the corresponding control delay experienced per vehicle for unsignalized intersections, while for ICU LOS is based on the volume-to-capacity ratio of signalized intersections. The Synchro 10 LOS software was used to determine intersection LOS for unsignalized and Caltrans intersections and is consistent with the HCM 6 methodology. The Traffix program was utilized to determine unsignalized intersection LOS. Table 2 shows both the LOS values by delay ranges for unsignalized and Caltrans Intersection under HCM methodology, and volume-to-capacity ratio ranges for signalized intersections under the ICU methodology.

**Table 2. Levels of Service for Intersections using HCM Methodology**

| Level of Service | Unsignalized and Caltrans Intersections Control Delay (in seconds per vehicle) | Signalized Intersections V/C Ratio or ICU |
|---|---|---|
| A | < 10.0 | 0.00 – 0.60 |
| B | > 10.0 to < 15.0 | 0.61 – 0.70 |
| C | > 15.0 to < 25.0 | 0.71 – 0.80 |
| D | > 25.0 to < 35.0 | 0.81 – 0.90 |
| E | > 35.0 to < 50.0 | 0.91 – 1.00 |
| F | > 50.0 | > 1.00 |

**Notes:** V/C = volume-to-capacity; ICU = Intersection Capacity Utilization.
**Sources:** HCM 6 (TRB 2016) and ICU methodology.

### 1.3.2.2 General Plan Consistency Requirements

#### City of Downey General Plan Circulation Element

This analysis uses the LOS threshold provided in the Downey Vision 2025 Circulation Element of the current General Plan for the intersections located within the City of Downey. The Circulation Element defines acceptable LOS as "A," "B," "C," or "D," along with the following applicable policy and program:

- Policy 2.1.1. Maintain a street system that provides safe and efficient movement of people and goods.
  - Program 2.1.1.1. Maintain intersections and street segments at acceptable service levels and not worsen those intersections and street segments currently operating at unacceptable levels.

For the purposes of this analysis, an intersection would be found inconsistent with the City's Circulation Element if project traffic causes an intersection to go from an acceptable LOS to a deficient LOS. For intersections already operating at an unacceptable LOS, any increase in the volume-to-capacity ratio for intersections would be found inconsistent with the City's Circulation Element.

### 1.3.2.3 Caltrans Transportation Impact Study Guide

Caltrans released the Transportation Impact Study Guide (TISG) in May 2020 (Caltrans 2020), replacing the 2002 Guide for the Preparation of Traffic Impact Studies. Per the 2020 TISG, consistent with SB 743, Caltrans' primary review focus is VMT, replacing LOS as the metric used to evaluate transportation impacts in CEQA analyses. Caltrans

recommends use of the OPR recommended thresholds for land use projects and recommends following the guidance on methods of VMT assessment found in OPR's Technical Advisory (OPR 2018).

In addition to VMT, the 2020 TISG states that it may request a targeted operational and safety analysis to address a specific geometric or operational issue related to the State Highway System and connections with the State Highway System. Caltrans also notes that a future update of the TISG will include the basis for requesting transportation impact analysis not based on VMT and define elements to be included in non-VMT analysis.

## 1.4 Improvements for Level of Service Findings

As part of the final acceptance of the TIA, the City would review and approve any required improvements and/or fair share contributions necessary to improve the transportation-related deficiencies caused by the proposed development. These improvements would be included as part of the conditions of approval and should be in addition to any improvements required by any other departments. Fair share contributions identified in the TIA and subsequently listed in the conditions of approval shall be required before a building permit will be issued. Improvements required in the TIA and subsequently listed in the conditions of approval shall be completed prior to occupancy.

# 2 Existing Conditions

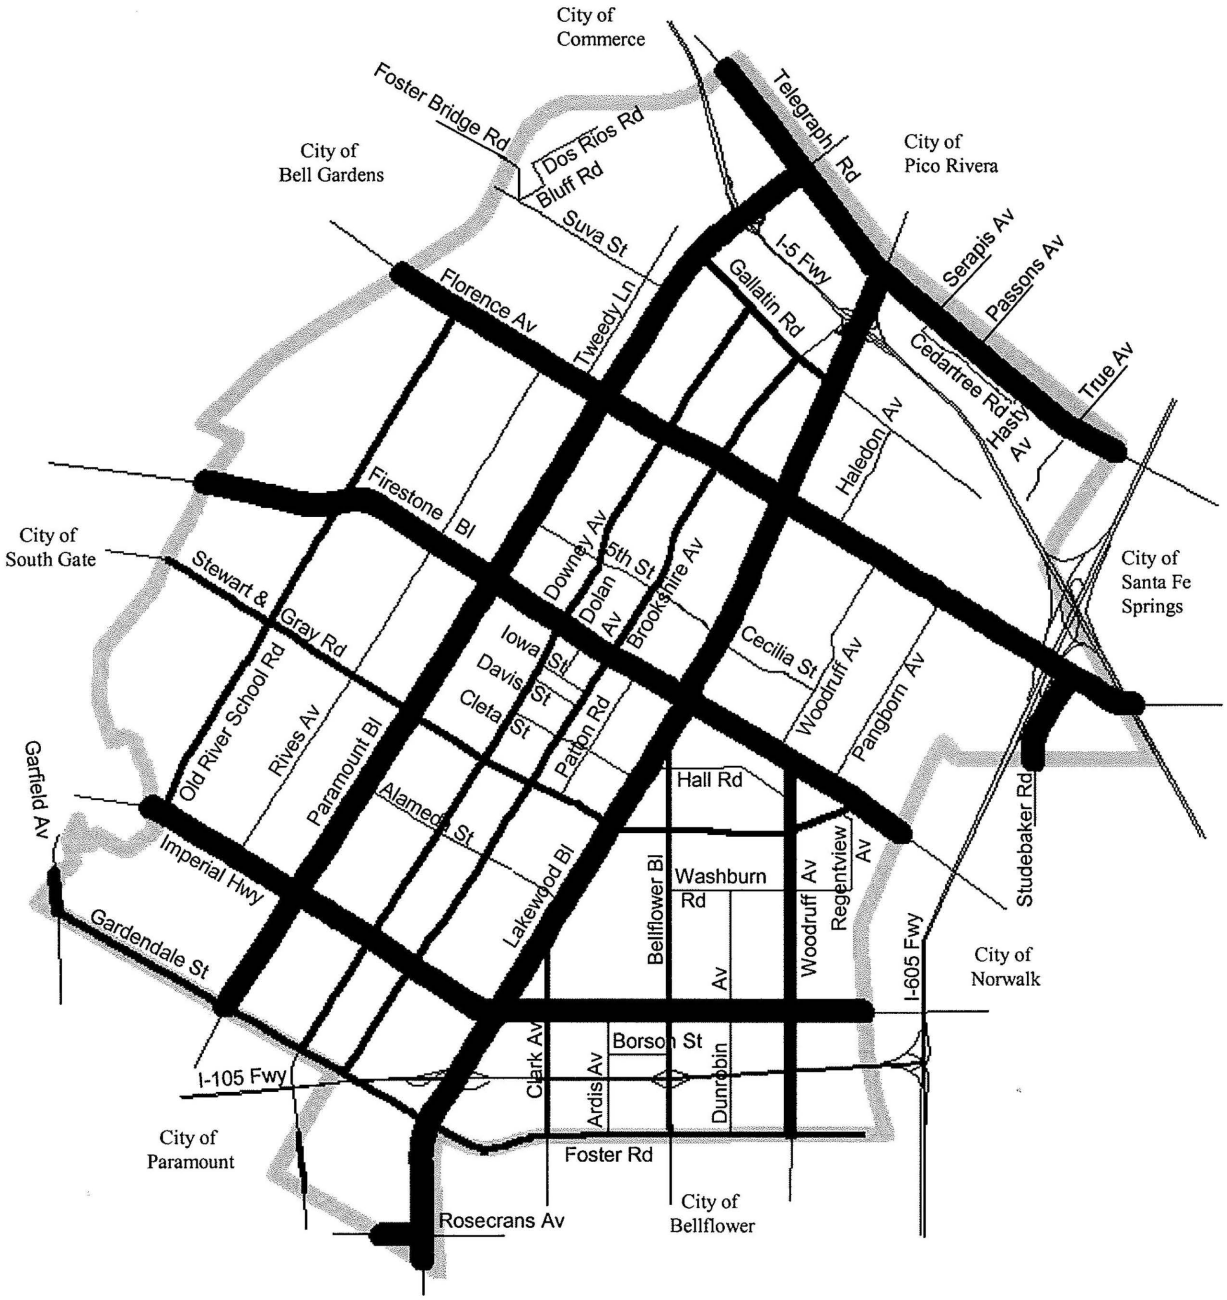
This section describes existing conditions within the study area. Characteristics are provided for the existing roadway, transit, bike and pedestrian facilities, peak hour intersection traffic volumes and traffic operations.

## 2.1 Roadway System

Regional access to the City of Downey is primarily provided via I-605, I-5, and I-105, while I-710 is located west of the City and accessible via three major streets: Florence Avenue, Firestone Boulevard, and Imperial Highway. Additionally, Firestone Boulevard serves as a primary connection point between Downey and the jurisdictions south of downtown Los Angeles. Figure 3 illustrates the Circulation Plan included in the City of Downey Circulation Element, and Figure 4 illustrates the truck routes in the City.

Characteristics of the existing street system within the study area are described below.

**Firestone Boulevard** is generally a north-south 6-lane divided roadway between Old River School Road and I-605, and 4-lane divided roadway east of I-605. The posted speed limit within the study area is 40 mph. There are paved sidewalks along either side of the roadway, and parking is generally not permitted along either side of the roadway. Firestone Boulevard is designated as a Major Arterial per the Circulation Element as shown in Figure 3 and is a designated as a "thru route" truck route as shown in Figure 4.



**Stewart and Gray Road** is generally an east-west 4-lane undivided roadway. The posted speed limit within the study area is 40 mph. There are generally paved sidewalks along either side of the roadway, and parking is not permitted along either side of the roadway. Stewart and Gray Road is designated as a Secondary Arterial per the Circulation Element as shown in Figure 3 and is a designated as a "thru route" truck route as shown in Figure 4.

**Woodruff Avenue** is generally a north-south 4-lane undivided roadway. The posted speed limit within the study area is 40 mph. There are paved sidewalks along either side of the roadway, and parking is generally permitted along either side of the roadway. Woodruff Avenue is designated as a Primary Arterial per the Circulation Element as shown in Figure 3 and is a designated as a truck route within the City as shown in Figure 4.

**Washburn Road** is generally an east-west 2-lane undivided roadway. The posted speed limit within the study area is 30 mph. There are paved sidewalks along either side of the roadway, and parking is generally permitted along either side of the roadway. Washburn Road is designated as a Collector per the Circulation Element as shown in Figure 3 and is a designated as a truck route within the City as shown in Figure 4.

## 2.2 Transit System

Currently, the City of Downey is served by the Los Angeles County Metropolitan Transportation Authority (Metro). Metrolink service in the City is provided via the Green Line at the Lakewood Boulevard Station, located approximately 1.5 miles southwest of the project site, as well as the Norwalk Station, located approximately 1 mile southeast of the project site (Metro 2018).

Additionally, the following Metro bus lines are located within 0.5 miles of the project site:

- Line 115 operates between Playa Del Rey and the Norwalk Metrolink Station with a peak service frequency of 15 minutes. Line 115 primarily operates along Firestone Boulevard within the City of Downey (Metro 2020a).
- Line 127 operates between Compton Station/MLK Jr. Transit Center and the Downey Deport Transit Center with a peak service frequency of 60 minutes. Line 127 primarily operates along Bellflower Boulevard within the City of Downey (Metro 2020b).

The nearest bus stops are located at Bellflower Boulevard/Washburn Road intersection, serving Line 127, and Firestone Boulevard/Stewart and Gray Road intersection, serving Line 115. Development of the project would not conflict with the existing bus routes or bus stops. Figure 5 depicts the City of Downey Transit and Bicycle Facilities within the study area.

## 2.3 Pedestrian and Bicycle Facilities

There are currently no designated bicycle facilities within the City of Downey, aside from the San Gabriel River Trail, as shown in Figure 5. The Southern California Regional Bikeway Shapefile (RBS) identifies potential bicycle routes within the City, also identified in Figure 5. Additionally, the Downey Bike Master Plan Implementation Phase 1 Downtown/Transit project under Capital Improvement Program (CIP) 19-14 would include installation of Class II bicycle facilities on nine roadway segments, bicycle parking facilities, and way-finding signs (City of Downey 2020b).

Woodruff Avenue, which runs adjacent to the eastern boundary of the project site, is generally built with paved sidewalks and pedestrian facilities along both sides of the street. Additionally, the Woodruff Avenue Pavement Rehabilitation project under CIP 14-14 would not only include rehabilitation of asphalt pavement on the roadway but would also include miscellaneous repairs of existing concrete sidewalks, curb and gutter, driveway approaches, and Americans with Disabilities Act-compliant curb access ramps. Development of the project would not conflict with the existing pedestrian or bicycle facilities and would include frontage improvements to pedestrian facilities around the project site.

## 2.4 Existing Traffic Volumes

Weekday AM and PM peak hour traffic counts were collected for the study area intersections for pre-pandemic and existing conditions. The peak hour traffic counts were adjusted to reflect the existing conditions as described in detail in Section 6. Raw traffic count worksheets are provided in Appendix A.

# 3 Project Traffic

This section documents the trip generation, distribution, and assignment of project traffic in the study area.

## 3.1 Trip Generation

As shown in Table 3, trip generation rates were obtained from the Institute of Transportation Engineers (ITE) Trip Generation, 10th Edition (ITE 2017) and 9th Edition (ITE 2012) for land use category Intermodal Truck Terminal (ITE Code 30), and employee trip generation rate for Manufacturing use. Additionally, passenger car equivalent (PCE) factors were applied to the trip generation estimates to account for truck traffic. The City of Fontana Truck Trip Generation Study Truck Terminal and the SCAQMD Warehouse Truck Trip Study Data Results and Usage Trip report were utilized to derive the vehicle split for each land use. Trip generation for the existing on-site operational activities were estimated and existing trip credit was used to calculate project's net trip generation. The trip generation rates, vehicle splits, and the resulting trip generation estimates for the project are summarized in Table 4.

**Table 3. Project Trip Generation for 12021 Woodruff Avenue Industrial Building Project**

| Land Use | ITE Code | Size/Units | | Daily | AM Peak Hour | | | PM Peak Hour | | |

| *Project Trip Generation W/PCE* | | | *972* | *77* | *87* | *164* | *80* | *74* | *154* |
| **Total Net Project Trip Generation (Project - Existing)** | | | **232** | **-5** | **58** | **53** | **41** | **14** | **55** |

**Notes:** ITE = Institute of Transportation Engineers; TSF = Thousand Square Feet; PCE = passenger car equivalent.

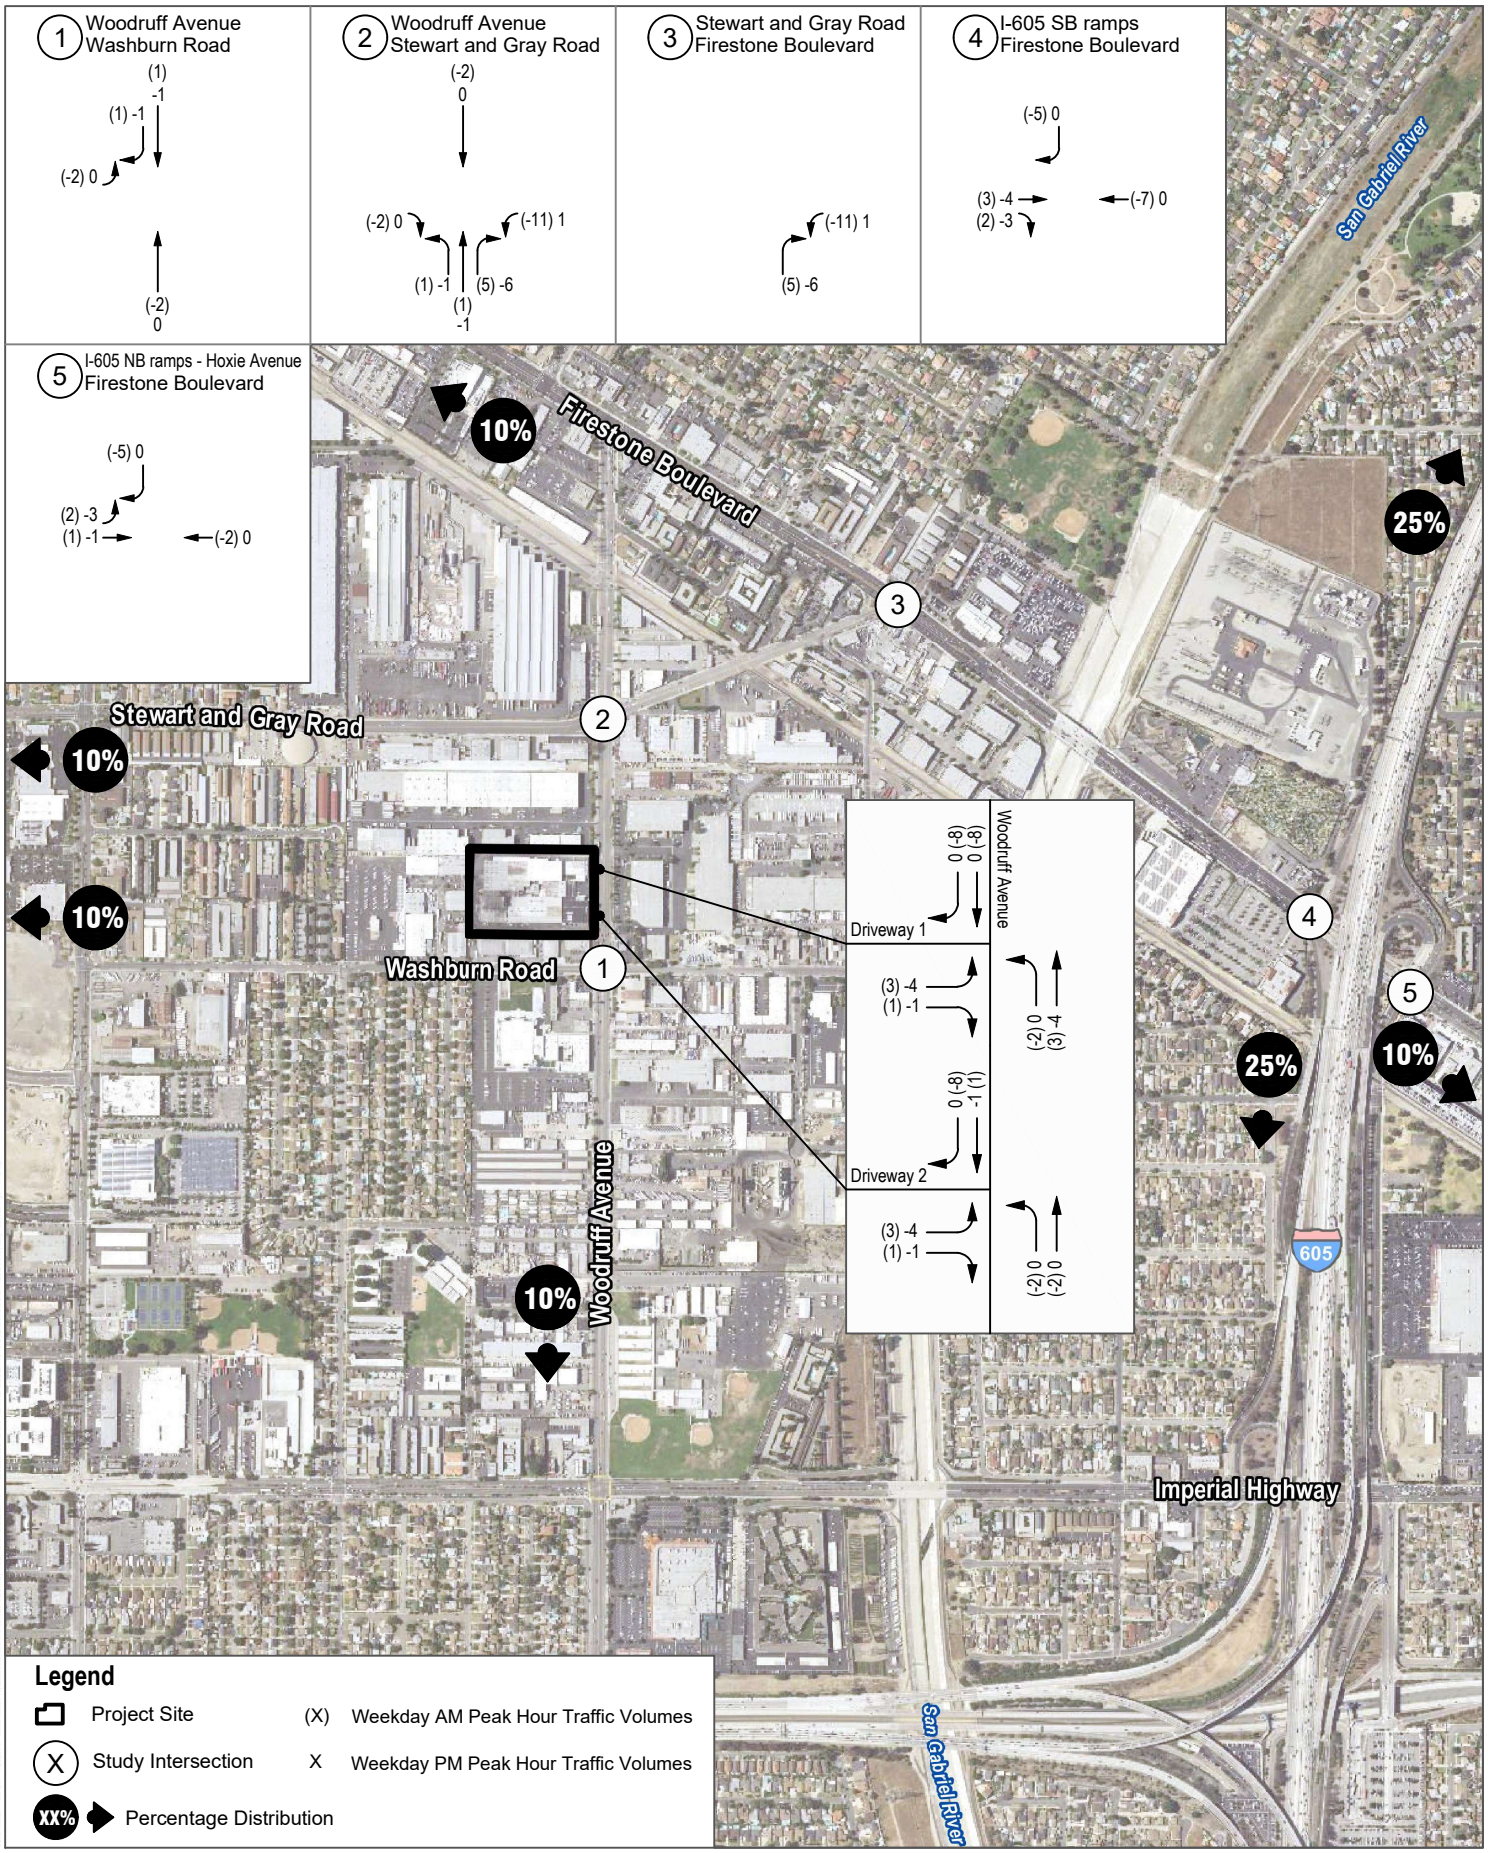
1 TRB 2017.

2 For Intermodal Truck Terminal, Daily Trip Rate was obtained from Trip Generation, 9th edition (ITE 2012).

3 Vehicle Mix and Percent from SCAQMD, Warehouse Truck Trip Study Data Results and Usage(SCAQMD 2014).

4 PCE factors are assumed to be 1.0 for passenger vehicles, 2.0 for medium trucks, and 3.0 for heavy trucks.

5 Vehicle Mix and Percent from Fontana Truck Trip Generation Study (City of Fontana 2003).



As shown in Table 3, after adjusting for the passenger car equivalent (PCE) factor, and using the vehicle mix and percentage splits, the project would generate approximately 232 net daily trips, 53 AM peak hour net trips (-5 inbound and 58 outbound), and 55 PM peak hour trips (41 inbound and 14 outbound).

## 3.2 Trip Distribution and Assignment

Project trip distribution percentages were based on logical travel paths to commute corridors and existing truck routes in the study area. Since the project is a truck terminal, the majority of project traffic would travel to and from I-605 and along truck route corridors.

Project traffic will utilize the two project driveways along Woodruff Avenue, both of which are full access for passenger vehicles. All truck inbound access will occur at the north project driveway, while all outbound truck access with occur at the south project driveway. Approximately 50% of passenger vehicle traffic is expected to travel along I-605 (25% north and 25% south), and 80% of truck traffic is expected to travel along I-215 (40% north and 40% south). Approximately 5% to 10% of passenger vehicle and/or truck traffic would travel along Firestone Boulevard, Stewart and Gray Road, Woodruff Avenue, or Washburn Road.

Project trips were assigned to the study area intersections by applying the above-referenced project trip generation estimates to the trip distribution percentages at each study area intersection. The project trip distribution and trip assignment for passenger vehicles is shown in Figure 6, while the project trip distribution and trip assignment for trucks (PCE-adjusted) is shown in Figure 7. The total project trip assignment is shown in Figure 8.

# 4 Vehicle Miles Traveled Analysis

CEQA Guidelines Section 15064.3(b) focuses on VMT for determining the significance of transportation impacts. As shown in the analysis below, the project's impact due to conflict or inconsistency with Section 15064.3(b) would be less than significant.

The CEQA Guidelines state that "generally, vehicle miles traveled (VMT) is the most appropriate measure of transportation impacts" and define VMT as "the amount and distance of automobile travel attributable to a project." It should be noted that "automobile" refers to on-road passenger vehicles, specifically cars and light trucks. Heavy-duty truck VMT could be included for modeling convenience and ease of calculation (for example, where models or data provide combined auto and heavy truck VMT). Other relevant considerations may include the effects of the project on transit and non-motorized travel. The OPR Technical Advisory (OPR 2018) provides guidance and tools to properly carry out the principles within SB 743 and how to evaluate transportation impacts in CEQA. The OPR Technical Advisory was utilized within this analysis as the primary source of analysis of VMT and transportation-related impacts.

## 4.1 Screening Criteria for VMT Analysis

The OPR Technical Advisory suggests that agencies may screen out VMT impacts using project size, maps, transit availability, and provision of affordable housing. The following represents the criteria applicable to the project for screening out further study.

- **Screening Threshold for Small Projects (110 daily trips or less):** As shown previously in Table 3, the project would generate approximately 232 net daily trips, 53 AM peak hour net trips (-5 inbound and 58 outbound), and 55 PM peak hour trips (41 inbound and 14 outbound). Since the project generates more than 110 trips per day, it cannot be assumed to cause a less-than-significant transportation impact.
- **Presumption of Less-Than- Significant Impact for Affordable Residential Development:** The project does not propose affordable residential units and is not a residential development.
- **Map- Based Screening for Residential and Office Projects:** This criterion applies to residential and office projects and currently, the City does not have VMT maps that can be utilized used to identify areas with low VMT for projects.
- **Presumption of Less-Than-Significant Impact Near High Quality Transit Corridor[1]:** As shown previously in Figure 5, City of Downey Transit and Bicycle Facilities, Metro Bus Line 115 operates with a service frequency of 15- minutes, between Playa Del Rey and the Norwalk Metrolink Station. Since the project is within 0.5 miles of a high-quality transit corridor (i.e., a fixed route bus service with service intervals no longer than 15 minutes during peak commute hours) it can be presumed to have a less-than-significant impact. Additionally, the Norwalk Metrolink station is located approximately 1 mile southeast of the project site.

[1] A Transit Priority Area is defined as a 0.5-mile area around an existing major transit stop or an existing stop along a high quality transit quality corridor per definition below:
California Public Resources Code, Section 21064.3 - 'Major transit stop' means a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods.
California Public Resources Code, Section 21155 - For purposes of this section, a 'high-quality transit corridor' means a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.

Furthermore, the presumption of less than significant does not apply if the project:

- Includes more parking for use by residents, customers, or employees of the project than required by the jurisdiction (if the jurisdiction requires the project to supply parking);
- Is inconsistent with the applicable Sustainable Communities Strategy (as determined by the lead agency, with input from the Metropolitan Planning Organization; or
- Replaces affordable residential units with a smaller number of moderate or high-income residential units.

The project does not include more parking than required by the City of Downey, as discussed previously in Section 1. Additionally, the project use (except for the western most portion of the project site which is designated as a Parking Buffer) is consistent with the City of Downey General Plan Land use designation of General Manufacturing. Furthermore, the project does not involve a residential component. Therefore, the above items would not apply to the project, and the project can be screened out under the proximity to high quality transit corridor screening criteria.

The project's employees would have access to a high-quality transit corridor, and the project would not provide more parking for use than required by the jurisdiction. A project-level detailed VMT analysis would not be required, and the project would not be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b); therefore, the impact would be less than significant. In addition, in an abundance of caution and to further minimize an already less-than-significant impact related to VMT, the project would implement a transportation demand management plan, as described in project design feature (PDF) TRA-1:

PDF-TRA-1 **Transportation Demand Management Plan:** Prior to issuance of a Business License, the tenant shall prepare a Transportation Demand Management plan to discourage single-occupancy vehicle trips made by employees, and encourage them to use alternative modes of transportation such as carpooling, taking transit, walking, and biking to/from the site. Examples of trip reduction measures may include, but are not limited to:

- Transit passes
- Car-sharing programs
- Telecommuting and alternative work schedules
- Ride sharing programs

Furthermore, the project is intended to be used as a trucking terminal for distribution and logistics purposes. On-site activities will include storage of and/or consolidation of manufactured goods before the distribution to retail locations or other warehouses. Thus, the project will serve as an intermediary land use between the Ports of Los Angeles and Long Beach and the next/final destination (warehouses) of the products shipped through the trucks-trailers using the project.

As discussed previously, there are four freeways that provide direct access to the City of Downey: I-710, I-605, I-5, and I-105. I-710 is located west of the City and accessible via three major streets: Florence Avenue, Firestone Boulevard, and Imperial Highway. Figure 4 illustrates the truck routes in the City. Firestone Boulevard, Woodruff Avenue, Stewart and Gray Road, and Bellflower Boulevard are designated truck routes that connect the City with neighboring jurisdictions. The City of Downey is located approximately 14 miles and 12 miles northeast of the Ports of Los Angeles and Long Beach, respectively. The proximity to freeway and ports would reduce the project's trips on other roadways and facilitate tractor trailer traffic destined for pick-up/drop-off of containers. The Ports of Los Angeles and Long Beach are the two largest container ports in the United States. The growth of the ports has been steady, and from its most recent cargo forecast it is forecast to double in the next two decades, according to its most recent forecast. The ports' growth would have a significant impact on local economy and directly or indirectly provides for more jobs in the region. Therefore, the City would benefit from developing the site as a use which that benefits from its proximity to the ports.

# 5 Project Access, Queuing and Safety Considerations

## 5.1 Project Access

As discussed previously in Section 1, access to the project site would be provided via two driveways along Woodruff Avenue. Both driveways would be unsignalized and would be approximately 40-feet wide:

- Driveway 1 (North) via Woodruff Avenue: Full access for passenger cars and inbound only (right-in/left-in) for trucks (no truck exit)
- Driveway 2 (South) via Woodruff Avenue: Full access for passenger cars and outbound only (right-out/left-out) for trucks (no truck entry)

Both driveways would lead to passenger vehicle parking lots on the northeast and southeast corners of the project site. The parking lots would be connected by a north-south through-lane, which provides additional passenger vehicle parking spaces along the eastern boundary of the site. On the west side of both parking lots would be a gated driveway leading to truck courts, truck parking stalls, and loading docks. The project would include 56 parking spaces for passenger vehicles (52 standard, 2 accessible parking, and 2 van accessible parking), 76 spaces for cargo containers, and 70 loading docks.

The driveways were analyzed were analyzed as two-way stop-controlled intersections per HCM methodology. The LOS at the project access driveways is summarized in Table 4 for Existing plus Ambient Growth plus Cumulative Projects plus Project scenario.

**Table 4. Project Access Level of Service**

| Scenario | Peak Hour | Driveway 1/Woodruff Avenue/ | | Driveway 2/Woodruff Avenue/ | |
|---|---|---|---|---|---|
| | | *Delay*[1] | *LOS*[2] | *Delay*[1] | *LOS*[2] |
| Existing plus Ambient Growth plus Cumulative Projects plus Project | AM | 18.6 | C | 10.1 | B |
| | PM | 23.9 | C | 20.0 | C |

**Notes:**
1 Delay in seconds per vehicle
2 Level of Service (LOS)

As shown in Table 4, all project access driveways are forecast to operate at satisfactory LOS, at LOS D or better, during both peak hours under all project analysis scenarios. The detailed LOS worksheets for all project access intersections are included in Appendix B.

# 5.2 Queuing Analysis

## 5.2.1 Project Access Driveways

A queuing analysis using the SimTraffic 10 software was prepared for all project driveways to assess the adequacy of off-site storage lanes along Woodruff Avenue into the project site under Existing plus Ambient Growth plus Cumulative Projects with and without the Project conditions. The intersection of Woodruff Avenue/Washburn Road was analyzed since the intersection is near the project driveways and the southbound left-turn lane flows into the two-way left-turn lane (TWLTL). Queuing worksheets are provided in Appendix C.

As shown in Table 5, none of the calculated 95th percentile (design) queues for the Existing plus Ambient Growth plus Cumulative Projects or the Existing plus Ambient Growth plus Cumulative Projects plus Project conditions, exceed storage capacities within the existing left-turn pockets or TWLTL along Woodruff Avenue into the project site. There is adequate storage capacity within the project site such that vehicles can queue on-site as needed.

## 5.2.2 Caltrans Off-Ramps

Due to the potential for the proposed project to add traffic to Caltrans facilities within the study area, the following Caltrans freeway off-ramps were analyzed for queuing impacts under Existing plus Ambient Growth plus Cumulative Projects with and without the Project conditions:

- I-605 southbound ramps/Firestone Boulevard
- I-605 northbound ramps - Hoxie Avenue/Firestone Boulevard

As shown in Table 6, peak 95th percentile queues are expected to exceed the storage pocket lengths in the following intersections and lanes:

- PM Peak Hour: I-605 southbound ramps/Firestone Boulevard (southbound left-turn lane)
    - This lane extends from the intersection to the freeway mainline, and it is expected that forecasted queues would extend past the gore point and into the mainline.
- AM and PM Peak Hour: I-605 northbound ramps - Hoxie Avenue/Firestone Boulevard (southbound right-turn lane)
    - This is a storage lane and adjacent lanes possess queues that are not forecast to extend to the freeway mainline.

However, when comparing the Existing plus Ambient Growth plus Cumulative Projects scenario with the addition of project traffic, the forecasted queues will either not change or will be slightly reduced from the baseline condition. For the I-605 southbound ramp, approximately 45 -feet of queue will be reduced with the addition of the project, approximately two vehicle car lengths. For the I-605 northbound ramps, forecasted queues are expected to remain the same with the addition of the project. Therefore, the project will not create a significant impact to the Caltrans freeway off-ramps, and hazards due to geometric design features will be less than significant.

## Table 5. Existing plus Ambient Growth plus Cumulative Projects plus Project Driveway and Project Access Queuing Summary

| Intersection | Movement | Pocket Length[1] | Existing plus Ambient Growth plus Cumulative Projects | | | | Existing plus Ambient Growth plus Cumulative Project plus Project | | | | Improvement Warranted |

**Source**: Appendix C.

**Notes:** SBL = southbound left lane; SBT – southbound through lane; SBTR = southbound through-right lane; EBLR = eastbound left-right lane; NBL = northbound left lane.

1 Measured in feet.

2 Based on 95th percentile (design) queue length in SimTraffic 10.

3 Length measured to approximate distance of south project driveway.

4 Length measured according to the distance as shown on the site plan from the driveway entrance to truck parking gate.

5 Length measured as available left-turn pocket or two-way left-turn lane.

6 Length measured as distance to nearest upstream driveway.

## Table 6. Existing plus Ambient Growth plus Cumulative Projects plus Project Caltrans Off-Ramp Queuing Summary

| Intersection | Movement | Pocket Length[1] | Existing plus Ambient Growth plus Cumulative Projects | | | | Existing plus Ambient Growth plus Cumulative Project plus Project | | | | Improvement Warranted |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | *AM Peak Hour* | | *PM Peak Hour* | | *AM Peak Hour* | | *PM Peak Hour* | | |
| | | | *95th Percentile Queue[2]* | *Exceeds Turn Pocket Length?* | *95th Percentile Queue[2]* | *Exceeds Turn Pocket Length?* | *95th Percentile Queue[2]* | *Exceeds Turn Pocket Length?* | *95th Percentile Queue[2]* | *Exceeds Turn Pocket Length?* | |
| I-605 southbound ramps/Firestone Boulevard | SBL[3] | 825 | 160 | No | 1,216 | **Yes** | 388 | No | 1,171 | **Yes** | No |
| | SBR | 275 | 229 | No | 241 | No | 254 | No | 237 | No | No |
| | SBR | 275 | 209 | No | 100 | No | 225 | No | 140 | No | No |
| I-605 northbound ramps - Hoxie Avenue/Firestone Boulevard | SBL | 275 | 60 | No | 210 | No | 69 | No | 208 | No | No |
| | SBLT[3] | 2,950 | 2,137 | No | 1,281 | No | 2,288 | No | 2,307 | No | No |

| | SBR[4] | 210 | 235 | **Yes** | 270 | **Yes** | 235 | **Yes** | 235 | **Yes** | No |

**Source**: Appendix C.

**Notes:** SBL = southbound left lane; SBR – southbound right lane; SBLT = southbound through-left lane; SBT = southbound through lane.

1 Measured in feet.

2 Based on 95th percentile (design) queue length in SimTraffic 10.

3 Primary off-ramp lane; approximate length measured from freeway mainline. Length measured from stop bar to gore line at mainline.

4 While queue exceeds storage lane, the total length of the off-ramp is greater than the queue, therefore queue would not impact the mainline lanes.

**XX** – Queue exceeds storage length; **XX** - Queue exceeds storage length and impacts the freeway mainline.

## 5.3 Pedestrian and Bicycle Access

There are adequate pedestrian facilities in the vicinity of the proposed project, and the frontage along the project site boundary along Woodruff Avenue will be maintained to ensure pedestrian access. The project would include a new concrete walkway to provide pedestrian access from Woodruff Avenue to the office component of the project. The area of the walkway traversing the parking lot would consist of decorative pavers.

Consistent with a plant palette approved by the City, a variety of trees, shrubs, and vegetated groundcovers would be planted throughout all required setbacks, including the eastern portion of the project site fronting Woodruff Avenue.

The project would not conflict with the existing or proposed bicycle facilities in its vicinity.

## 5.4 Truck Access

As the proposed project is a truck terminal, it is expected to generate heavy truck traffic. Sufficient curb radii are provided for both ingress to and egress from the project site along Woodruff Avenue. All internal drive aisles at the project driveways will be able to accommodate the type of trucks that will frequent the site. Furthermore, the restriction of inbound only truck traffic to the northern project driveway, and outbound only truck traffic to the southern project driveway, will maintain separation from opposing vehicle movements.

INTENTIONALLY LEFT BLANK

# 6 Existing Traffic Operations

The existing traffic controls and geometrics at the study area intersections is shown in Figure 9. This section details the existing traffic volumes and the existing intersection operations within the study area.

## 6.1 Traffic Volumes

Due to the closures and relative abnormal traffic patterns caused by the Covid-19 pandemic, existing weekday peak hour turning movement counts at the study intersections were adjusted and balanced to reflect pre-pandemic conditions. Weekday peak hour counts were obtained in July 2020 for the following signalized intersections adjacent to the project site:

- Woodruff Avenue/Washburn Road
- Woodruff Avenue/Stewart and Gray Road

Historical traffic counts for the AM and PM peak hour conditions for the following signalized intersections collected during a typical weekday non-holiday period were obtained.:

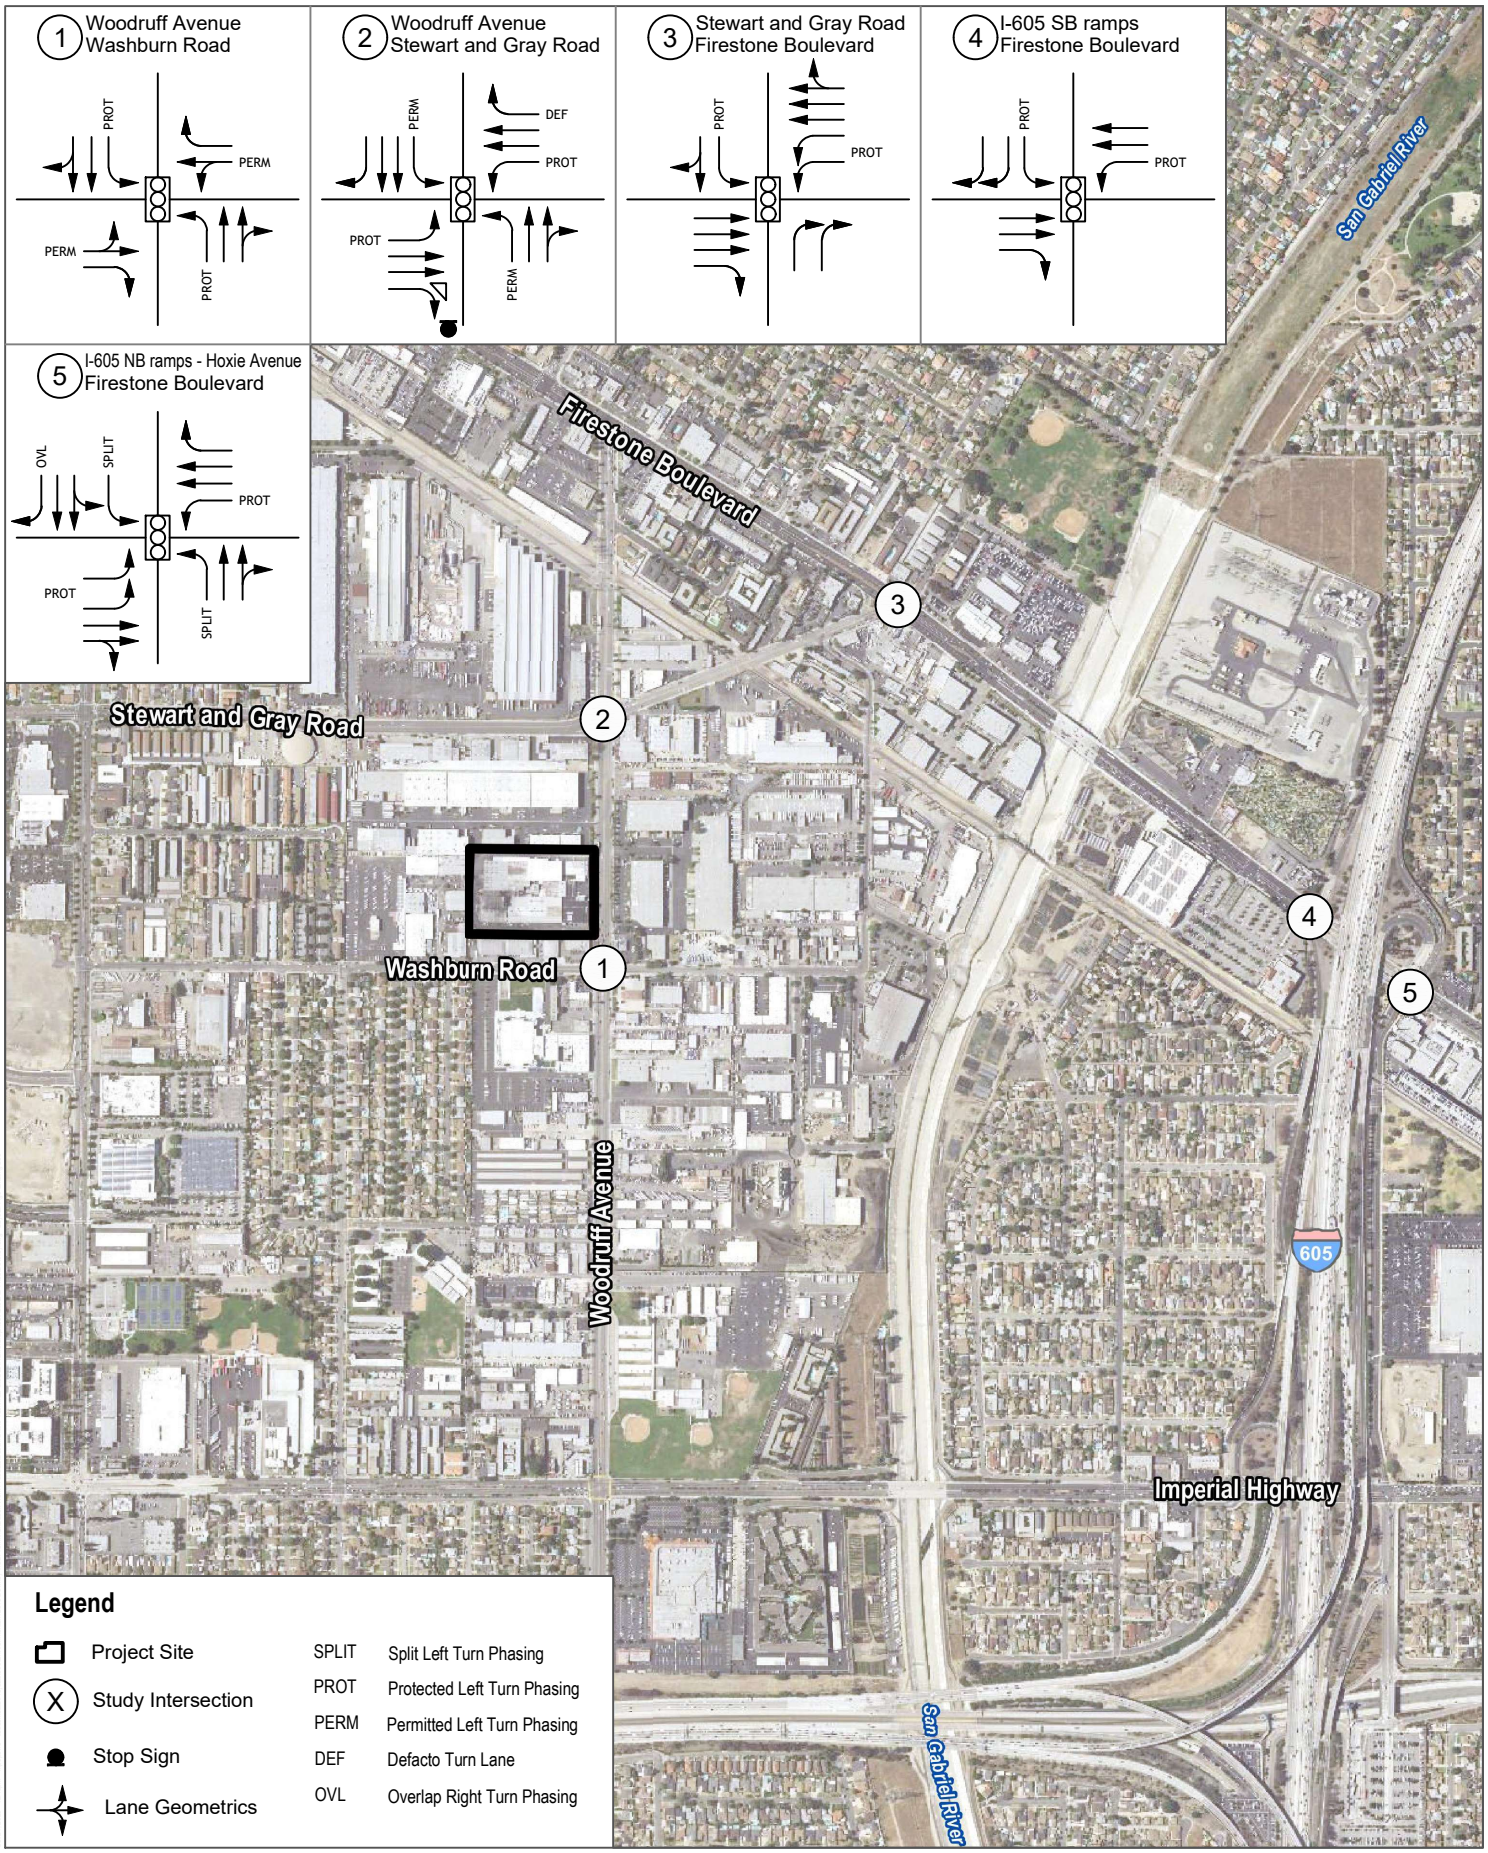
- Woodruff Avenue/Stewart and Gray Road – Year 2015
- Firestone Boulevard/Stewart and Gray Road – Year 2016
- I-605 southbound ramps/Firestone Boulevard – Year 2016
- I-605 northbound ramps – Hoxie Avenue/Firestone Boulevard – Year 2016

By calculating the difference between existing traffic count and historical traffic count data for the Woodruff Avenue/Stewart and Gray Road intersection, it was determined that the July 2020 traffic volumes were substantially lower due to the Covid-19 pandemic conditions. Thus, traffic volumes collected in 2020 were adjusted and balanced by utilizing the historical traffic count data from nearby intersections to reflect the typical conditions of study area intersections. Additionally, a growth rate of 1% per year for 4 years based on the growth rates listed from the year 2015 to 2020 Downey Regional Statistical Area (RSA) as described in the Los Angeles County Congestion Management Program (Metro 2010) was applied to traffic volumes on all study area intersections.

This existing conditions analysis focuses on the weekday daily, AM (7:00 a.m. to 9:00 a.m.) and the PM (4:00 p.m. to 6:00 p.m.) peak periods. The peak periods represent the highest volume of traffic for the adjacent street system. The adjusted existing weekday AM and PM peak hour volumes are summarized in Figure 10.

Signal timing sheets for the Caltrans signalized intersections were also obtained and utilized within the analysis.

## 6.2 Intersection Operations



An intersection LOS analysis was prepared for the existing conditions using the HCM 6th Edition methodology via the Synchro LOS software for Caltrans intersections and using the ICU methodology for all other signalized intersections as described in Section 1.3. Table 7 shows the results of the existing conditions analysis. LOS worksheets are provided in Appendix B.

As shown in the table, all the study area intersections are currently operating at satisfactory levels of service (at LOS D or better) for the intersections within the City of Downey. The intersections of Firestone Boulevard with I-605 ramps operate under the jurisdiction of Caltrans and are outside of the City of Downey boundaries; therefore, as no LOS standards are currently available per the updated Caltrans TISG (May 2020) as discussed in Section 1.3, no inconsistencies can be concluded.

## Table 7. Existing Peak Hour Intersection Level of Service

| No. | Intersection | Jurisdiction | Control/ LOS Method | AM Peak | | PM Peak | |
|---|---|---|---|---|---|---|---|
| | | | | *Delay or V/C*[1] | *LOS* | *Delay or V/C*[1] | *LOS* |
| 1 | Woodruff Avenue/Washburn Road | City of Downey | Signal/ICU | 0.636 | B | 0.508 | A |
| 2 | Woodruff Avenue/Stewart and Gray Road | City of Downey | Signal/ICU | 0.601 | B | 0.594 | A |
| 3 | Stewart and Gray Road/Firestone Boulevard | City of Downey | Signal/ICU | 0.505 | A | 0.511 | A |
| 4 | I-605 SB ramps/Firestone Boulevard | Caltrans | Signal/HCM | 29.6 | C | 18.3 | B |
| 5 | I-605 NB ramps - Hoxie Avenue/Firestone Boulevard | Caltrans | Signal/HCM | 108.5 | F | 66.8 | E |

**Source:** Appendix B.
**Notes:** LOS = Level of Service; HCM = Highway Capacity Manual; ICU = Intersection Capacity Utilization.
1 Delay in seconds per vehicle; V/C = volume-to-capacity ratio.

# 7 Existing plus Ambient Growth plus Cumulative Projects plus Project

This section includes analysis of traffic operation under Existing plus Ambient Growth plus Cumulative Projects plus Project conditions which represents the short-term horizon period when the proposed project is constructed and fully occupied.

## 7.1 Cumulative Projects

Cumulative projects are projects that are proposed and in the review process, but not yet fully approved; or, projects that have been approved, but not fully constructed or occupied. A list of cumulative projects was provided by the City of Downey and by the City of Norwalk. Based on review of the cumulative projects and locations, 8 cumulative projects were identified that would potentially add traffic to the study area. Figure 11 illustrates the locations of the cumulative project.

### 7.1.1 Cumulative Projects Trip Generation

Project trip generation estimates for the cumulative projects were derived using ITE Trip Generation, 10th Edition (2017) trip rates. As shown in Table 8, the cumulative projects are forecast to generate approximately 7,102 daily trips, 585 AM peak hour trips, and 523 PM peak hour trips.

**Table 8. Cumulative Project Trip Generation Summary**

| ID | Land Use | ITE Code | Size/Unit | | Daily | AM Peak Hour | | | PM Peak Hour | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | *In* | *Out* | *Total* | *In* | *Out* | *Total* |
| 1 | Woodruff Industrial Building (12120 Woodruff Ave) | 110 | 19.536 | TSF | 97 | 12 | 2 | 14 | 2 | 11 | 13 |
| 2 | Senior Housing (12850 Woodruff Ave) | 252 | 62 | DU | 229 | 4 | 8 | 12 | 9 | 7 | 16 |
| 3 | Kaiser Medical Building (9333 Imperial Hwy) | 610 | 141.364 | TSF | 1,515 | 86 | 40 | 126 | 44 | 93 | 137 |
| 4 | Downey Oasis Condos (9553 Firestone Blvd) | 221 | 8 | DU | 44 | 1 | 2 | 3 | 2 | 2 | 4 |
| 5 | Marriot Springhill Suites Hotel (9066 Firestone Blvd) | 310 | 140 | Rms | 1,170 | 39 | 27 | 66 | 43 | 41 | 84 |
| 6 | Starbucks Drive Thru (9002 Firestone Blvd) | 937 | 2.000 | TSF | 1,641 | 91 | 87 | 178 | 43 | 43 | 86 |

**Table 8. Cumulative Project Trip Generation Summary**

| ID | Land Use | ITE Code | Size/Unit | | Daily | AM Peak Hour | | | PM Peak Hour | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | *In* | *Out* | *Total* | *In* | *Out* | *Total* |
| 7 | Chick-fil-a (8818 Imperial Hwy) | 934 | 4.000 | TSF | 1,884 | 82 | 79 | 161 | 68 | 63 | 131 |
| 8 | Costco Carwash (12324 Hoxie Ave) | 948 | 3.675 | TSF | 522 | 13 | 13 | 26 | 26 | 26 | 52 |
| | | | | **Total** | **7,102** | **327** | **258** | **585** | **237** | **287** | **523** |

**Notes:** TSF = Thousand Square Feet; DU = Dwelling Unit; Rms = Rooms.

### 7.1.2 Cumulative Projects Trip Distribution and Assignment

The trips generated by the cumulative projects were distributed through the study area network using engineering judgment and logical commute corridors. Cumulative project trips were assigned based on distribution percentages on the roadway network. Figure 12 shows the cumulative projects traffic volumes for the peak hour conditions.

# 7.2 Existing plus Ambient Growth plus Cumulative Projects

## 7.2.1 Traffic Volumes

The Existing plus Ambient Growth plus Cumulative Projects analysis is representative of existing plus ambient growth plus cumulative project conditions. The traffic volumes for this scenario were estimated by increasing the existing traffic volumes by an ambient growth rate and adding traffic from approved/pending projects listed in Table 8 to existing traffic volumes. An ambient growth rate of 0.24% per year was derived from the growth rates listed in the Los Angeles County CMP for the Downey RSA Regional Statistical Area (year 2020 to 2025). The growth was applied based upon the projected opening year of the project being 2022; therefore, a total growth of 0.48% was added to the 2020 baseline existing traffic volumes to create the Existing plus Ambient Growth plus Cumulative Projects condition. Figure 13 illustrates the Existing plus Ambient Growth plus Cumulative Projects Peak Hour Traffic Volumes.

## 7.2.2 Intersection Operations

An intersection LOS analysis was prepared for the Existing plus Ambient Growth plus Cumulative Projects conditions using the HCM 6th Edition methodology via the Synchro LOS software for Caltrans intersections and using the ICU methodology for all other signalized intersections as described in Section 1.3. Table 9 shows the results of the Existing plus Ambient Growth plus Cumulative Projects analysis. LOS worksheets are provided in Appendix B.

As shown in the table, all the study area intersections will operate at satisfactory levels of service (at LOS D or better) for the intersections within the City of Downey. The intersections of Firestone Boulevard with I-605 ramps operate under the jurisdiction of Caltrans and are outside of the City of Downey boundaries; since LOS standards are currently available per the updated Caltrans TISG (May 2020) as discussed in Section 1.3, no inconsistencies can be concluded.

**Table 9. Existing plus Ambient Growth plus Cumulative Projects Peak Hour Intersection Level of Service**

| No. | Intersection | Jurisdiction | Control/ LOS Method | AM Peak | | PM Peak | |
|---|---|---|---|---|---|---|---|
| | | | | *Delay or V/C*[1] | *LOS* | *Delay or V/C*[1] | *LOS*[2] |
| 1 | Woodruff Avenue/Washburn Road | City of Downey | Signal/ICU | 0.642 | B | 0.514 | A |
| 2 | Woodruff Avenue/Stewart and Gray Road | City of Downey | Signal/ICU | 0.615 | B | 0.610 | B |
| 3 | Stewart and Gray Road/Firestone Boulevard | City of Downey | Signal/ICU | 0.524 | A | 0.531 | A |
| 4 | I-605 SB ramps/Firestone Boulevard | Caltrans | Signal/HCM | 31.0 | C | 19.5 | B |
| 5 | I-605 NB ramps - Hoxie Avenue/Firestone Boulevard | Caltrans | Signal/HCM | 120.8 | F | 73.6 | E |

**Source:** Appendix B.
**Notes:** LOS = Level of Service; HCM = Highway Capacity Manual; ICU = Intersection Capacity Utilization.
1 Delay in seconds per vehicle; V/C = volume-to-capacity ratio.

# 7.3 Existing plus Ambient Growth plus Cumulative Projects plus Project Traffic Operations

This section details the Existing plus Ambient Growth plus Cumulative Projects plus Project traffic volumes and the intersection operations within the study area.

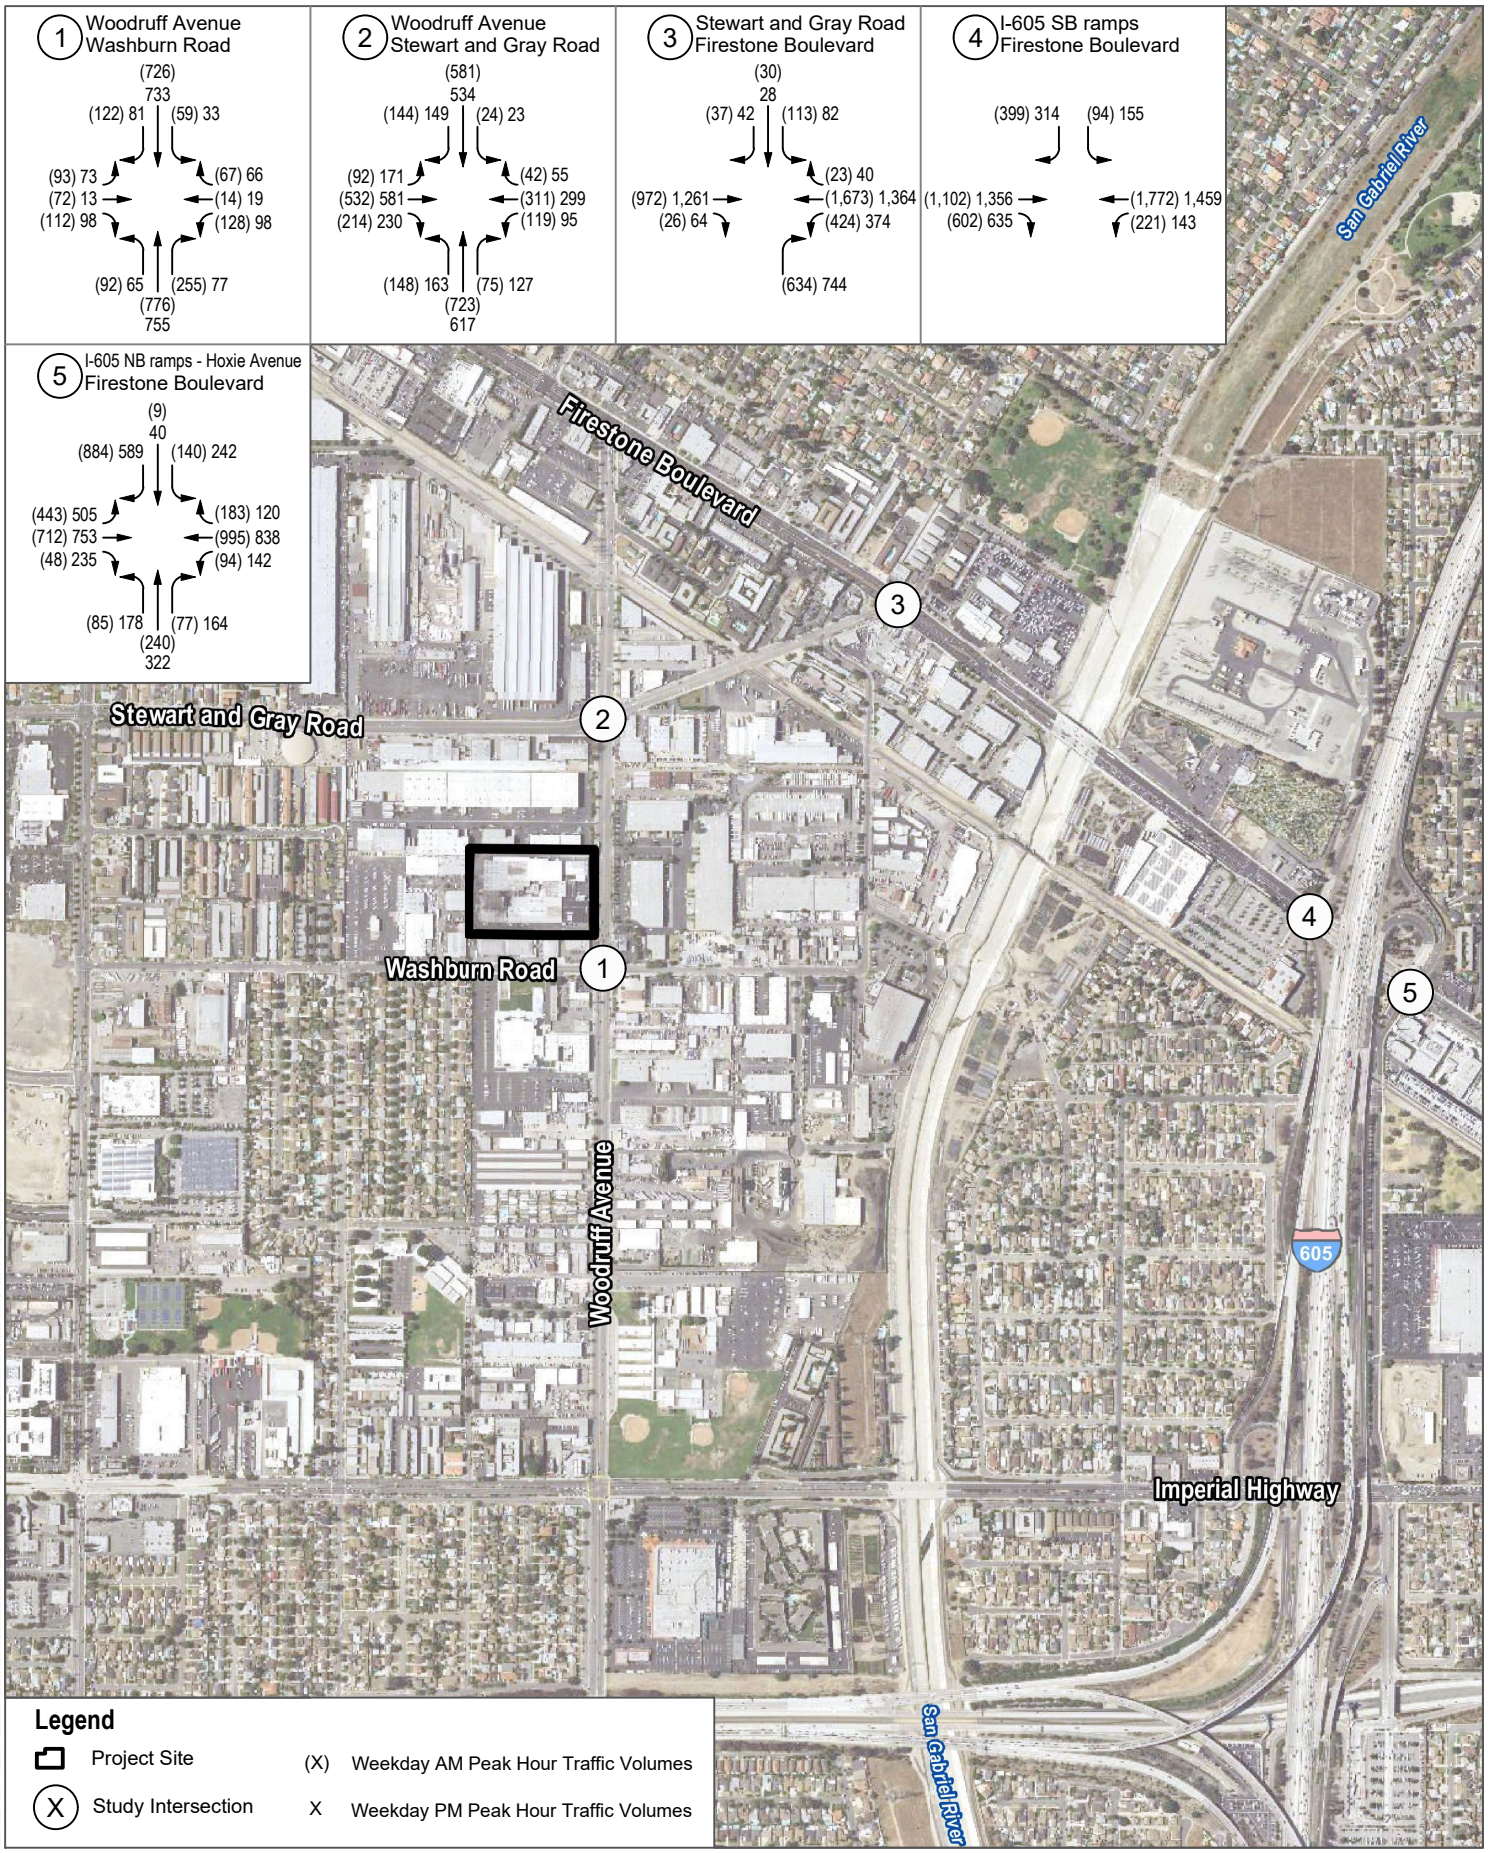
## 7.3.1 Traffic Volumes

Project traffic volumes shown in Figure 5 were added to the Existing plus Ambient Growth plus Cumulative Projects traffic volumes shown in Figure 13 to derive the Existing plus Ambient Growth plus Cumulative Projects plus Project traffic condition. Figure 14 shows the Existing plus Ambient Growth plus Cumulative Projects plus Project traffic volumes.

## 7.3.2 Intersection Operations

An intersection LOS analysis was prepared for the Existing plus Ambient Growth plus Cumulative Projects plus Project conditions using the HCM 6th Edition methodology via the Synchro LOS software for Caltrans intersections and using the ICU methodology for all other signalized intersections as described in Section 1.3. Table 10 shows the comparison of the Existing plus Ambient Growth plus Cumulative Projects and the Existing plus Ambient Growth plus Cumulative Projects plus Project analysis. LOS worksheets are provided in Appendix B.

As shown in the table, all the study area intersections will operate at satisfactory levels of service (at LOS D or better) for the intersections within the City of Downey. The intersections of Firestone Boulevard with I-605 ramps operate under the jurisdiction of Caltrans and are outside of the City of Downey boundaries; since no LOS standards are currently available per the updated Caltrans TISG (May 2020) as discussed in Section 1.3, no inconsistencies can be concluded.



Since all study area intersections are forecast to operate at LOS D or better under the Existing plus Ambient Growth plus Cumulative Projects plus Project conditions, the project would not cause a substantial direct or cumulative effect to intersection operations or result in an inconsistency with the City of Downey General Plan LOS standards. As discussed in Section 1.3, the intersections of Firestone Boulevard with I-605 ramps operate under the jurisdiction of Caltrans and are outside of the City of Downey boundaries; therefore, as no LOS standards are currently available per the updated Caltrans TISG (May 2020), no inconsistencies can be determined.

## Table 10. Existing plus Ambient Growth plus Cumulative Projects plus Project Peak Hour Intersection Level of Service

| No. | Intersection | Jurisdiction | Control/ LOS Method | Existing plus Ambient Growth plus Cumulative Projects | | | | Existing plus Ambient Growth plus Cumulative Projects plus Project | | | | Change in Delay or V/C[1] | | Inconsistent with City LOS Standard? | |

# 8 Project Impacts, Mitigation Measures, and Level of Service Improvements

## 8.1 Project Impacts per CEQA

### 8.1.1 VMT Analysis

As discussed in Section 4, the proposed project passes one of the OPR screening criteria, i.e., TPA Screening. A project-level detailed VMT analysis would not be required, and the project would not be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b); therefore, the impact would be less than significant. In addition, in an abundance of caution and to further minimize an already less-than-significant impact related to VMT, the project would implement a transportation demand management plan, as described in project design feature (PDF) TRA-1:

**PDF-TRA-1** **Transportation Demand Management Plan:** Prior to issuance of a Business License, the tenant shall prepare a Transportation Demand Management plan to discourage single-occupancy vehicle trips made by employees, and encourage them to use alternative modes of transportation such as carpooling, taking transit, walking, and biking to/from the site. Examples of trip reduction measures may include, but are not limited to:

- Transit passes
- Car-sharing programs
- Telecommuting and alternative work schedules
- Ride sharing programs

### 8.1.2 Access Analysis

**Queuing – Project Site Access**

The project site access driveways are forecast to operate at LOS C or better under Existing plus Ambient Growth plus Cumulative Projects plus Project conditions. Additionally, none of the calculated 95th percentile (design) queues for the Existing plus Ambient Growth plus Cumulative Projects or the Existing plus Ambient Growth plus Cumulative Projects plus Project conditions, respectively, exceed storage capacities within the existing left-turn pockets or TWLTL along Woodruff Avenue into the project site. There is adequate storage capacity within the project site such that vehicles can queue on-site as needed. No on-site or off-site queuing impacts are found.

**Queuing – Caltrans Facilities**

As discussed in Section 5.2.2, a queuing analysis was performed at the I-605/Firestone Boulevard off-ramps. When comparing the Existing plus Ambient Growth plus Cumulative Projects scenario with the addition of project traffic, the forecasted queues will either not change or will be slightly reduced from the baseline condition. For the I-605 southbound ramp, approximately 45-feet of queue will be reduced with the addition of the project, approximately two vehicle car lengths. For the I-605 northbound ramps, forecasted queues are expected to remain the same with

the addition of the project. Therefore, the project will not create a significant impact to the Caltrans freeway off-ramps, and hazards due to geometric design features will be less than significant.

**Pedestrian and Bicycle Access**

There are adequate pedestrian facilities in the vicinity of the proposed project, and the frontage along the project site boundary along Woodruff Avenue will be maintained to ensure pedestrian access. The project would include a new concrete walkway to provide pedestrian access from Woodruff Avenue to the office component of the project. The area of the walkway traversing the parking lot would consist of decorative pavers. The project would not conflict with the existing or proposed bicycle facilities in its vicinity.

No mitigation measures would be necessary for the proposed project.

# 8.2 Level of Service Findings

## 8.2.1 LOS Analysis

Under Existing plus Ambient Growth plus Cumulative Projects plus Project conditions, all study area intersections within the City of Downey continue to operate at LOS D or better. Per the City's applicable LOS consistency analysis, no substantial project-specific effect would occur in Existing plus Ambient Growth plus Cumulative Projects plus Project conditions. As discussed in Section 1.3, the intersections of Firestone Boulevard with I-605 ramps operate under the jurisdiction of Caltrans and are outside of the City of Downey boundaries; therefore, as no LOS standards are currently available per the updated Caltrans TISG (May 2020), no inconsistencies can be determined.

## 8.2.2 Improvement Measures

No inconsistencies with applicable plans can be concluded at the Caltrans study intersections regarding LOS; or for the City of Downey intersections. Therefore, in regards to project related deficiencies, no improvement measures recommended.

| HCM 6th Ctrl Delay | | 108.5 |
| HCM 6th LOS | | F |

**Notes**

User approved pedestrian interval to be less than phase max green.

User approved volume balancing among the lanes for turning movement.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

| HCM 6th LOS | F |

**Notes**

User approved pedestrian interval to be less than phase max green.

User approved volume balancing among the lanes for turning movement.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

| Intersection Summary | |
|---|---|
| HCM 6th Ctrl Delay | 73.6 |
| HCM 6th LOS | E |

Notes

User approved pedestrian interval to be less than phase max green.

User approved volume balancing among the lanes for turning movement.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

|---|---|
| HCM 6th Ctrl Delay | 115.9 |
| HCM 6th LOS | F |

**Notes**

User approved pedestrian interval to be less than phase max green.

User approved volume balancing among the lanes for turning movement.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

| Intersection Summary | |
|---|---|
| HCM 6th Ctrl Delay | 76.1 |
| HCM 6th LOS | E |

**Notes**

User approved pedestrian interval to be less than phase max green.

User approved volume balancing among the lanes for turning movement.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Project No.: **20G170-1**

Subject: **Geotechnical Feasibility Study**
Proposed Distribution Building
12021 Woodruff Avenue
Downey, California

Gentlemen:

In accordance with your request, we have conducted a geotechnical investigation at the subject site. We are pleased to present this report summarizing the conclusions and recommendations developed from our investigation.

We sincerely appreciate the opportunity to be of service on this project. We look forward to providing additional consulting services during the course of the project. If we may be of further assistance in any manner, please contact our office.

Respectfully Submitted,

SOUTHERN CALIFORNIA GEOTECHNICAL, INC.

# 1.0 EXECUTIVE SUMMARY

Presented below is a brief summary of the conclusions and recommendations of this investigation. Since this summary is not all inclusive, it should be read in complete context with the entire report. It should be noted that this investigation was focused on determining the geotechnical feasibility of the proposed development. **This report is not a design-level investigation. Future studies will be necessary to refine the preliminary design parameters that are presented within this report**.

**Geotechnical Design Considerations**

- Undocumented fill soils were encountered at all of the boring locations extending to depths of 2½ to 6½± feet below the existing site grades. Greater depths of artificial fill may be present at this site, such as near the existing buildings and other improvements.
- The results of laboratory testing indicate that some of the near-surface soils are moderately compressible when loaded.
- The proposed development is considered to be feasible with respect to the geotechnical conditions encountered at the boring locations at the site. However, remedial grading will be necessary in order to support the proposed structure on a conventional shallow foundation system. Preliminary remedial grading and foundation design recommendations have been provided herein, based on the preliminary site plans, assumed site grading, and assumed foundation loads.

**Liquefaction**

- Our site-specific liquefaction evaluation indicates that some of the on-site soils are subject to liquefaction during the design seismic event.
- The liquefaction analysis indicates total dynamic settlements ranging between 2.56 and 2.89± inches at the two (2) 50-foot-deep CPT locations. The liquefaction-induced differential settlements within the building area are expected to be on the order of 1½± inches. Assuming that the differential settlements occur across a distance of 50± feet, maximum angular distortions of about 0.0025± inches per inch would result.
- Standard practice dictates that the proposed building can be supported on shallow foundation systems, with the understanding that some cosmetic distress could occur due to liquefaction. Such distress will be typical of buildings of this type, in this area, in the event of a large earthquake.

**Preliminary Geotechnical Design Recommendations**

- Demolition of the structures associated with the existing development, including buildings, associated improvements, and the existing pavements will be required in order to facilitate construction of the new buildings. Debris resultant from demolition should be disposed of off-site. Alternatively, concrete and asphalt debris may be pulverized to a maximum 2-inch particle size, well mixed with the on-site soils, and incorporated into new structural fills or it may be crushed and made into crushed miscellaneous base (CMB). Concrete and asphalt debris may also be crushed to particle sizes between 2 and 4 inches and used for subgrade stabilization.
- Based on the results of our subsurface exploration, laboratory testing, and engineering analysis, remedial grading should be performed within the proposed building area, to remove

the existing undocumented fill soils, as well as the upper portion of the alluvial soils, and replace these materials as compacted structural fill.

- Preliminarily, the overexcavation within the building area is recommended to extend to depths of at least 3 to 6 feet below existing and proposed building pad subgrade elevations. Within the proposed building pad, the depth of overexcavation should be deepened in order to remove all existing undocumented fill soils. The overexcavation should also extend to a depth of at least 3 to 5 feet below bearing grade within the influence zones of any new foundations. These recommendations are subject to review and may be revised based on the results of the design-level geotechnical investigation.

**Preliminary Foundation Design Recommendations**

- Conventional shallow foundations, supported in newly placed compacted fill.
- 2,000 to 2,500 lbs/ft$^2$ maximum allowable soil bearing pressure.
- The design of the foundations will depend on the results of the future design-level geotechnical study. Minimum recommended reinforcement based on geotechnical conditions is expected to consist of at least six (6) No. 5 rebars (3 top and 3 bottom) in strip footings due to the presence of potentially liquefiable soils. Additional reinforcement may be necessary for structural considerations.

**Preliminary Floor Slab Recommendations**

- Conventional Slab-on-Grade, 6 to 7 inches thick.
- Steel reinforcement is expected to be necessary, based on the presence of potentially liquefiable soils. The actual floor slab reinforcement to be determined by the structural engineer. Additional reinforcement may be necessary for structural considerations.

**Preliminary Pavement Design Recommendations**

# 2.0 SCOPE OF SERVICES

The scope of services performed for this project was in accordance with our Proposal No. 20P274, dated June 30, 2020. The scope of services included a visual site reconnaissance, subsurface exploration, field and laboratory testing, and geotechnical engineering analysis to determine the geotechnical feasibility of the proposed development. This report also contains preliminary design criteria for building foundations, the building floor slab, and parking lot pavements. Based on the location of this site, this investigation also included a site-specific liquefaction evaluation. The evaluation of the environmental aspects of this site was beyond the scope of services for this feasibility study.

It should be noted that additional subsurface exploration, laboratory testing and engineering analysis will be necessary to provide a design-level geotechnical report, with specific foundation, floor slab, and grading recommendations for new structures.

# 3.0 SITE AND PROJECT DESCRIPTION

## 3.1 Site Conditions

The subject site is located on the west side of Woodruff Avenue, 150± feet north of Washburn Road in Downey, California. The site is also referenced by the street address 12021 Woodruff Avenue. The site is bounded to the north, west, and south by existing commercial/industrial buildings, and to the east by Woodruff Avenue.

The site consists of a rectangular-shaped parcel, 6.31± acres in size. Based on aerial photographs obtained from Google Earth, the majority of the site is developed with numerous contiguous buildings ranging from 4,200±ft² to 85,000± ft² in size. The buildings appear to be single-story structures of metal, masonry block, and/or concrete tilt-up construction supported on conventional shallow foundations with concrete slab-on-grade floors. The perimeter of the site is developed as a parking lot and material storage area. The ground surface cover in this area of the site consists of asphaltic concrete pavements which are in fair to poor condition.

Topographic information was provided by Thienes Engineering, Inc. The survey indicates that the site is relatively flat, with a gentle slope toward the southwest at a gradient of roughly 0.7 percent. The site elevations range from 106.16 feet msl in the north to 102.50 feel msl in the southwest area of the site.

## 3.2 Proposed Development

Based on the site plan (DAB 1.1) prepared by HPA Architecture, the site will be developed with one distribution building. The building will be 44,388± ft² in size and will be located in the central area of the site. The building will be configured in a cross-dock configuration with dock-high doors constructed along the north and south sides of the building. The eastern portion of the building will be utilized as an office. The building will be surrounded by asphaltic concrete pavements in the parking and drive lanes, Portland cement concrete pavements in the loading dock areas, and concrete flatwork and landscape planters in the eastern portion of the site. The existing structures will be demolished to facilitate the new construction.

Detailed structural information was not available at the time of this proposal. It is assumed that the building will be a single-story structure of concrete tilt-up construction. Typically, such buildings would be supported on conventional shallow foundations and concrete slab-on-grade floors. Based on the assumed construction, maximum column and wall loads on the order of 100 kips and 4 to 7 kips per linear foot, respectively, are anticipated. The proposed structure is not expected to include any below grade construction such as basements or crawl spaces.

Based on the conceptual storm drain plan, prepared by Thienes Engineering, Inc. (TEI), the site is expected to utilize on-site stormwater disposal. The infiltration system will consist of below-grade chambers located in the southeastern area of the site. The depth of the bottom of the

infiltration system was not known at the time of this proposal. However, based on similar projects in the area, we assume that the bottom of the infiltration system will be approximately 10 to 12 feet below the existing site grades.

# 4.0 SUBSURFACE EXPLORATION

## 4.1 Scope of Exploration/Sampling Methods

The subsurface exploration conducted for this project consisted of six (6) borings advanced to depths of 10 to 50± feet below the existing site grades. Two (2) of these borings were drilled within the proposed building area to depths of 50± feet as part of the liquefaction evaluation. One (1) of the borings was drilled within the proposed infiltration system area to a depth of 25± feet to verify the depth to groundwater. The three (3) remaining borings were drilled to a depth of 10± feet in the proposed parking and drive lane areas.

In addition to the borings, two (2) Cone Penetration Test (CPT) soundings were advanced to a depth of 50± feet. The two (2) 50±-foot CPT soundings were used in the liquefaction analysis.

Hollow Stem Auger Borings

The borings were advanced with hollow-stem augers, by a conventional truck-mounted drilling rig. Representative bulk and relatively undisturbed soil samples were taken during drilling. Relatively undisturbed soil samples were taken with a split barrel "California Sampler" containing a series of one inch long, 2.416± inch diameter brass rings. This sampling method is described in ASTM Test Method D-3550. In-situ samples were also taken using a 1.4± inch inside diameter split spoon sampler, in general accordance with ASTM D-1586. Both of these samplers are driven into the ground with successive blows of a 140-pound weight falling 30 inches. The blow counts obtained during driving are recorded for further analysis. Bulk samples were collected in plastic bags to retain their original moisture content. The relatively undisturbed ring samples were placed in molded plastic sleeves that were then sealed and transported to our laboratory.

Based on information provided by the client and the project environmental consultant, we understand that the subject site is an environmentally sensitive area due to potential contamination from the Boeing facility. Therefore, the cuttings generated by the drilling and sampling activities were contained within 55-gallon drums and transported to an assigned storage staging area off-site. In addition, the boreholes were backfilled with cement-bentonite grout upon completion of the borings.

Cone Penetration Test (CPT) Soundings

The CPT soundings were performed by Kehoe Testing and Engineering (KTE) under the supervision of an SCG engineer. The cone system used for this project was manufactured by Vertek. The CPT soundings were performed in general accordance with ASTM standards (D-5778). The cone penetrometers were pushed using 30-ton CPT rig. The cones used during the program recorded the cone resistance, sleeve friction, and dynamic core pressure at 2.5-centimeter depth intervals. Both of the CPT soundings were advanced to a depths of 50± feet. A more complete description of the CPT program as well as the results of the data interpretation are provided in the report prepared by KTE, enclosed in Appendix F of this report. The CPT soundings do not

result in any recovered soil samples. However, correlations have been developed that utilize the cone resistance and the sleeve friction to estimate the soil type that is present at each 2.5-centimeter interval in the subsurface profile. These soil classifications are presented graphically in the CPT report, enclosed in Appendix F.

The data generated by the cone penetrometer equipment has been reduced using CPeT-IT, V2.0, published by Geologismiki Geotechnical Software. The CPeT-IT program output as well as more details regarding the interpretation procedure are presented a report prepared by KTE, which is provided in Appendix F of this report.

General

The approximate locations of the borings and CPT soundings are indicated on the Boring and CPT Location Plan, included as Plate 2 in Appendix A of this report. The Boring Logs, which illustrate the conditions encountered at the boring locations, as well as the results of some of the laboratory testing, are included in Appendix B. The results of the CPT soundings are presented in the report prepared by KTE, included in Appendix F of this report.

## 4.2 Geotechnical Conditions

Pavements

Asphaltic concrete (AC) was encountered at all six (6) boring locations and both (2) CPT locations. The AC pavements consist of 3 to 5± inches of AC underlain by 3 to 8± inches of aggregate base.

Fill

Artificial fill was encountered at the ground surface all of the boring locations, extending to depths of 2½ to 6½± feet below existing site grades. The artificial fill soils mainly consist of loose to medium dense silty fine sands with trace clays, stiff clayey fine sands, loose to medium dense fine sandy silts with trace clays, and loose gravelly fine to coarse sands with trace silt. The artificial fill possess a mottled and disturbed appearance with occasional debris, resulting in the classification of artificial fill.

Alluvium

Native alluvium was encountered beneath the artificial fill at each of the six (6) boring locations, extending to at least the maximum depth explored of 50± feet below the ground surface. The shallow alluvial soils extending to a depth of 10± feet consist of loose to medium dense clayey fine sands, loose to medium dense silty fine sands with trace clays and medium to coarse sands, medium dense fine sandy silts, medium stiff to stiff silty clays, and medium stiff clayey silts. The deeper alluvial soils extending from a depth of 10 feet to the maximum explored depth of 50± feet consist of medium stiff clayey silts, medium dense silty fine sands, medium dense to dense fine sands, loose to stiff silty clays, and medium dense to dense fine to medium sands with trace fine gravel.

Groundwater

Groundwater was not encountered at any of the borings. Based on the lack of any water within the borings and the moisture contents of the recovered soil samples, the static groundwater table is considered to have existed at a depth in excess of 50± feet below existing site grades at the time of the subsurface investigation.

As part of our research, we reviewed readily available groundwater data in order to determine regional groundwater depths. Recent water level data was obtained from the California State Water Resources Control Board, GeoTracker, website: geotracker.waterboards.ca.gov. The nearest monitoring well on record is located approximately 1,456 feet northwest of the site. Water level readings within this monitoring well indicate a groundwater level of 81± feet below the ground surface in April 2019.

# 5.0 LABORATORY TESTING

The soil samples recovered from the subsurface exploration were returned to our laboratory for further testing to determine selected physical and engineering properties of the soils. The tests are briefly discussed below. It should be noted that the test results are specific to the actual samples tested, and variations could be expected at other locations and depths.

Classification

All recovered soil samples were classified using the Unified Soil Classification System (USCS), in accordance with ASTM D-2488. Field identifications were then supplemented with additional visual classifications and/or by laboratory testing. The USCS classifications are shown on the Boring Logs and are periodically referenced throughout this report.

Dry Density and Moisture Content

The density has been determined for selected relatively undisturbed ring samples. These densities were determined in general accordance with the method presented in ASTM D-2937. The results are recorded as dry unit weight in pounds per cubic foot. The moisture contents are determined in accordance with ASTM D-2216, and are expressed as a percentage of the dry weight. These test results are presented on the Boring Logs.

Consolidation

Selected soil samples were tested to determine their consolidation potential, in accordance with ASTM D-2435. The testing apparatus is designed to accept either natural or remolded samples in a one-inch-high ring, approximately 2.416-inches in diameter. Each sample is then loaded incrementally in a geometric progression and the resulting deflection is recorded at selected time intervals. Porous stones are in contact with the top and bottom of the sample to permit the addition or release of pore water. The samples are typically inundated with water at an intermediate load to determine their potential for collapse or heave. The results of the consolidation testing are plotted on Plates C-1 through C-4 in Appendix C of this report.

Maximum Dry Density and Optimum Moisture Content

One representative bulk sample was tested for its maximum dry density and optimum moisture content. The results have been obtained using the Modified Proctor procedure, per ASTM D-1557, and are presented on Plate C-5 in Appendix C of this report. These tests are generally used to compare the in-situ densities of undisturbed field samples, and for later compaction testing. Additional testing of other soil types or soil mixes may be necessary at a later date.

Expansion Index

The expansion potential of the on-site soils was determined in general accordance with ASTM D-4829. The testing apparatus is designed to accept a 4-inch-diameter, 1-inch-high, remolded sample. The sample is initially remolded to 50± 1 percent saturation and then loaded with a surcharge equivalent to 144 pounds per square foot. The sample is then inundated with water,

and allowed to swell against the surcharge. The resultant swell or consolidation is recorded after a 24-hour period. The results of the EI testing are as follows:

| Sample Identification | Expansion Index | Expansive Potential |
|---|---|---|
| B-1 @ 0 to 5 feet | 18 | Very Low |

Soluble Sulfates

A representative sample of the near-surface soils was submitted to a subcontracted analytical laboratory for determination of soluble sulfate content as a part of the referenced previous studies. Soluble sulfates are naturally present in soils, and if the concentration is high enough, can result in degradation of concrete which comes into contact with these soils. The results of the soluble sulfate testing are presented below, and are discussed further in a subsequent section of this report.

| Sample Identification | Soluble Sulfates (%) | Severity | Class |
|---|---|---|---|
| B-1 @ 0 to 5 feet | 0.005 | Not Applicable | S0 |

Corrosivity Testing

A representative bulk sample of the near-surface soils was submitted to a subcontracted corrosion engineering laboratory to determine if the near-surface soils possess corrosive characteristics with respect to common construction materials. The corrosivity testing included a determination of the electrical resistivity, pH, and chloride and nitrate concentrations of the soils, as well as other tests. The results of some of these tests are presented below.

| Sample Identification | Saturated Resistivity (ohm-cm) | pH | Chlorides (mg/kg) |
|---|---|---|---|
| B-1 @ 0 to 5 feet | 3,440 | 7.9 | 4.3 |

# 6.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of our review, field exploration, laboratory testing and geotechnical analysis, the proposed development is considered feasible from a geotechnical standpoint. **Based on the preliminary nature of this investigation, further geotechnical investigation(s) will be required prior to construction of the proposed development.** The recommendations contained in this report should be taken into the design, construction, and grading considerations. The recommendations are contingent upon all grading and foundation construction activities being monitored by the geotechnical engineer of record.

The Grading Guide Specifications, included as Appendix D, should be considered part of this report, and should be incorporated into the project specifications. The contractor and/or owner of the development should bring to the attention of the geotechnical engineer any conditions that differ from those stated in this report, or which may be detrimental for the development.

## 6.1 Seismic Design Considerations

The subject site is located in an area which is subject to strong ground motions due to earthquakes. The performance of a site specific seismic hazards analysis was beyond the scope of this investigation. However, numerous faults capable of producing significant ground motions are located near the subject site. Due to economic considerations, it is not generally considered reasonable to design a structure that is not susceptible to earthquake damage. Therefore, significant damage to structures may be unavoidable during large earthquakes. The proposed structures should, however, be designed to resist structural collapse and thereby provide reasonable protection from serious injury, catastrophic property damage and loss of life.

Faulting and Seismicity

Research of available maps indicates that the subject site is not located within an Alquist-Priolo Earthquake Fault Zone. Therefore, the possibility of significant fault rupture on the site is considered to be low.

Seismic Design Parameters

The 2019 California Building Code (CBC) provides procedures for earthquake resistant structural design that include considerations for on-site soil conditions, occupancy, and the configuration of the structure including the structural system and height. The seismic design parameters presented below are based on the soil profile and the proximity of known faults with respect to the subject site.

Based on standards in place at the time of this report, the proposed development is expected to be designed in accordance with the requirements of the 2019 edition of the California Building Code (CBC), which was adopted on January 1, 2020.

The 2019 CBC Seismic Design Parameters have been generated using the SEAOC/OSHPD Seismic Design Maps Tool, a web-based software application available at the website www.seismicmaps.org. This software application calculates seismic design parameters in accordance with several building code reference documents, including ASCE 7-16, upon which the 2019 CBC is based. The application utilizes a database of risk-targeted maximum considered earthquake ($MCE_R$) site accelerations at 0.01-degree intervals for each of the code documents. The tables below were created using data obtained from the application. The output generated from this program is included as Plate E-1 in Appendix E of this report.

The 2019 CBC requires that a site-specific ground motion study be performed in accordance with Section 11.4.8 of ASCE 7-16 for Site Class D sites with a mapped $S_1$ value greater than 0.2. However, Section 11.4.8 of ASCE 7-16 also indicates an exception to the requirement for a site-specific ground motion hazard analysis for certain structures on Site Class D sites. The commentary for Section 11 of ASCE 7-16 (Page 534 of Section C11 of ASCE 7-16) indicates that "In general, this exception effectively limits the requirements for site-specific hazard analysis to very tall and or flexible structures at Site Class D sites." **Based on our understanding of the proposed development, the seismic design parameters presented below were calculated assuming that the exception in Section 11.4.8 applies to the proposed structure at this site. However, the structural engineer should verify that this exception is applicable to the proposed structure.** Based on the exception, the spectral response accelerations presented below were calculated using the site coefficients ($F_a$ and $F_v$) from Tables 1613.2.3(1) and 1613.2.3(2) presented in Section 16.4.4 of the 2019 CBC:

**2019 CBC SEISMIC DESIGN PARAMETERS**

| Parameter | | Value |
|---|---|---|
| Mapped Spectral Acceleration at 0.2 sec Period | $S_S$ | 1.668 |
| Mapped Spectral Acceleration at 1.0 sec Period | $S_1$ | 0.598 |
| Site Class | --- | D* |
| Site Modified Spectral Acceleration at 0.2 sec Period | $S_{MS}$ | 1.668 |
| Site Modified Spectral Acceleration at 1.0 sec Period | $S_{M1}$ | 1.018 |
| Design Spectral Acceleration at 0.2 sec Period | $S_{DS}$ | 1.112 |
| Design Spectral Acceleration at 1.0 sec Period | $S_{D1}$ | 0.679 |

*The 2019 CBC requires that Site Class F be assigned to any profile containing soils vulnerable to potential failure or collapse under seismic loading, such as liquefiable soils. For Site Class F, the site *coefficients* are to be determined in accordance with Section 11.4.7 of ASCE 7-16. However, Section 20.3.1 of ASCE 7-16 indicates that for sites with structures having a fundamental period of vibration equal to or less than 0.5 seconds, the site coefficient factors ($F_a$ and $F_v$) may be determined using the standard procedures. The seismic design parameters tabulated above were calculated using the site coefficient factors for Site Class D, assuming that the fundamental period of the structure is less than 0.5 seconds. However, the results of the liquefaction evaluation indicate that the subject site is underlain by potentially liquefiable soils. Therefore, if the proposed structure has a fundamental period greater than 0.5 seconds, a site-specific seismic hazards analysis will be required and additional subsurface exploration will be necessary.

It should be noted that the site coefficient $F_v$ and the parameters $S_{M1}$ and $S_{D1}$ were not included in the SEAOC/OSHPD Seismic Design Maps Tool output for the 2019 CBC. We calculated these parameters-based on Table 1613.2.3(2) in Section 16.4.4 of the 2019 CBC using the value of $S_1$ obtained from the Seismic Design Maps Tool, assuming that a site-specific ground motion hazards analysis is not required for the proposed buildings at this site.

Ground Motion Parameters

For the purposes of the liquefaction analysis performed for this study, we utilized a site acceleration consistent with maximum considered earthquake ground motions, as required by the 2019 CBC. The peak ground acceleration (PGA) was determined in accordance with Section 11.8.3 of ASCE 7-16. The parameter $PGA_M$ is the maximum considered earthquake geometric mean ($MCE_G$) PGA, multiplied by the appropriate site coefficient from Table 11.8-1 of ASCE 7-16. The web-based software application SEAOC/OSHPD Seismic Design Maps Tool (described in the previous section) was used to determine $PGA_M$, which is 0.785g. A portion of the program output is included as Plate E-1 of this report. An associated earthquake magnitude was obtained from the USGS Unified Hazard Tool, Interactive Deaggregation application available on the USGS website. The deaggregated modal magnitude is 6.88, based on the peak ground acceleration and soil classification D.

Liquefaction

Research of the Whittier, California 7.5 Minute Seismic Hazard Zone Map, published by the California Geological Survey (CGS) indicates that the site is located in a designated liquefaction hazard zone. Therefore, the scope of this investigation included a detailed liquefaction evaluation in order to determine the site-specific liquefaction potential.

The liquefaction evaluation was performed using the reported historic groundwater depth of 5 feet. The primary reference used to determine the historic groundwater depths in this area is CGS Open File Report 98-28, the Seismic Hazard Evaluation of the Whittier Quadrangle.

Liquefaction is the loss of strength in generally cohesionless, saturated soils when the pore-water pressure induced in the soil by a seismic event becomes equal to or exceeds the overburden pressure. The primary factors which influence the potential for liquefaction include groundwater table elevation, soil type and plasticity characteristics, relative density of the soil, initial confining pressure, and intensity and duration of ground shaking. The depth within which the occurrence of liquefaction may impact surface improvements is generally identified as the upper 50 feet below the existing ground surface. Liquefaction potential is greater in saturated, loose, poorly graded fine sands with a mean ($d_{50}$) grain size in the range of 0.075 to 0.2 mm (Seed and Idriss, 1971). Non-sensitive clayey (cohesive) soils which possess a plasticity index of at least 18 (Bray and Sancio, 2006) are generally not considered to be susceptible to liquefaction, nor are those soils which are above the historic static groundwater table.

The liquefaction analysis was conducted in accordance with the requirements of Special Publication 117A (CDMG, 2008), and currently accepted practice (SCEC, 1997). The liquefaction potential of the subject site was evaluated using the empirical method developed by Boulanger and Idriss (Boulanger and Idriss, 2008, 2010, 2014). This method predicts the earthquake-induced liquefaction potential of the site based on a given design earthquake magnitude and peak ground acceleration at the subject site. This procedure essentially compares the cyclic resistance ratio (CRR) [the cyclic stress ratio required to induce liquefaction for a cohesionless soil stratum at a given depth] with the earthquake-induced cyclic stress ratio (CSR) at that depth from a specified design earthquake (defined by a peak ground surface acceleration and an associated earthquake moment magnitude). CRR is determined as a function of the corrected SPT N-value $(N_1)_{60\text{-}cs}$, adjusted for fines content. The factor of safety against liquefaction is defined as

CRR/CSR. Based on Special Publication 117A, a factor of safety of at least 1.3 is required in order to demonstrate that a given soil stratum is non-liquefiable. Additionally, in accordance with Special Publication 117A, clayey soils which do not meet the criteria for liquefiable soils defined by Bray and Sancio (2006), loose soils with a plasticity index (PI) less than 12 and moisture content greater than 85% of the liquid limit, are considered to be insusceptible to liquefaction. Non-sensitive soils with a PI greater than 18 are also considered non-liquefiable.

As part of the liquefaction evaluation, CPT-1 and CPT-2 were extended to depths of at least 50 feet. The borings were also drilled in close proximity to the CPT locations to provide physical samples for further analysis and support of the CPT data. The liquefaction potential for the on-site soils was evaluated the computer program CLiq V3.0.3.2, which was developed by Geologismiki, copyright 2007. The analysis method is based on Boulanger and Idriss 2014. The liquefaction potential of the site was analyzed utilizing a $PGA_M$ of 0.785g for a magnitude 6.88 seismic event. The potential settlements that could occur as a result of liquefaction for each of the potentially liquefiable layers was calculated. A copy of the program output is presented in Appendix G of this report.

Conclusions and Recommendations

The results of the liquefaction analysis have identified potentially liquefiable soils at both of the CPT soundings performed at the site. Soils which are located above the historic groundwater table or possess factors of safety of at least 1.3 are considered non-liquefiable. Several clayey strata encountered between depths of 5 and 50± feet are considered to be non-liquefiable due to their cohesive characteristics, as interpreted by the CPT. Several Atterberg limits tests were also performed on representative soil samples recovered at the boring locations, in order to confirm the cohesive characteristics of the on-site soils. Settlement analyses were conducted for each of the potentially liquefiable strata. The total dynamic settlement for each CPT location, based on the results of the dynamic settlement analyses (presented in Appendix G) are presented below:

- CPT-1: 2.89± inches
- CPT-2: 2.56± inches

Based on these total settlements, differential settlements of up to 1½± inches should be expected to occur during a liquefaction inducing seismic event. The estimated differential settlement could be assumed to occur across a distance of 50 feet, indicating a maximum angular distortion of about 0.0025± inches per inch.

Based on our understanding of the proposed development, it is considered feasible to support the proposed structure on shallow foundations. Such a foundation system can be designed to resist the effects of the anticipated differential settlements, to the extent that the structure would not catastrophically fail. Designing the proposed structure to remain completely undamaged during a major seismic event is not considered to be economically feasible. Based on this understanding, the use of a shallow foundation system is considered to be the most economical means of supporting the proposed structure.

In order to support the proposed structure on shallow foundations (such as spread footings) the structural engineer should verify that the structure would not catastrophically fail due to the predicted dynamic differential settlements. Any utility connections to the structure should be

designed to withstand the estimated differential settlements. It should also be noted that minor to moderate repairs, including re-leveling, restoration of utility connections, repair of damaged drywall and stucco, etc., would likely be required after occurrence of the liquefaction-induced settlements.

The use of a shallow foundation system, as described in this report, is typical for buildings of the type planned for this site, where they are underlain by the extent of liquefiable soils encountered at this site. The post-liquefaction damage that could occur within the buildings proposed for this site will also be typical of similar buildings in the vicinity of this project. However, if the owner determines that this level of potential damage is not acceptable, other geotechnical and structural options are available, including the use of ground improvement, deep foundations or a mat foundation.

## 6.2 Preliminary Geotechnical Design Considerations

General

The near-surface soils encountered within the proposed building area generally consist of low to moderate strength fill and native alluvium. The existing fill soils encountered at the boring locations extend to depths of 1½ to 6½± feet possess variable densities. The fill soils and near-surface alluvial soils are considered to represent undocumented fill based on their variable densities and compositions, therefore remedial grading will be necessary to remove and replace the existing fill and a portion of the near-surface alluvial soils as compacted structural fill.

The site plans indicate that the existing building will be demolished in order to facilitate the construction of the proposed building. Since no borings were performed inside the existing building, the presence and extent of any undocumented fill soils beneath the existing structure is presently unknown. Additionally, the demolition of the existing building and surrounding improvements, such as the foundations, utilities, and any other subsurface improvements is expected to cause significant disturbance to the near surface soils. Therefore, the recommended remedial grading should also remove any soils disturbed during demolition, prior to the placement of any compacted fill materials.

As discussed in the previous section of this report, potentially liquefiable soils were identified at this site. The presence of the recommended layer of newly placed compacted structural fill above these liquefiable soils will help to reduce surface manifestations that could occur as a result of liquefaction. The foundation design recommendations presented in the subsequent sections of this report also contain recommendations to provide additional rigidity in order to reduce the potential effects of differential settlement that could occur as a result of liquefaction.

We recommend that additional consolidation testing be performed during the design-level investigation, in order to determine the actual depth of overexcavation necessary to limit potential settlement of the soils underlying the proposed building area.

LA County Section 111 Statement

Based on the results of our geotechnical analysis, the proposed development will be safe with regard to landslides, settlement and/or slippage. In addition, the proposed development will not adversely affect the geologic stability of the adjacent properties. This finding is in accordance with Section 111 of the Los Angeles County Building Code.

Settlement

The recommended remedial grading will remove the existing undocumented fill soils as well as a portion of the near-surface native alluvium, and replace these materials as compacted structural fill. The native soils that will remain in place below the recommended depth of overexcavation will not be subject to significant load increases from the foundations of the new structure. Provided that the recommended remedial grading is completed, the post-construction static settlements of the proposed structure is expected to be within tolerable limits.

Expansion

Laboratory testing performed on representative samples of the near surface soils indicates that these materials possess a very low expansion potential (EI = 18). Therefore, no design considerations related to expansive soils are considered warranted for this site. We recommend that additional expansion index testing be performed at the time of the design-level geotechnical investigation and at the completion of rough grading in order to confirm the expansion potential of the near-surface soils at this site.

Soluble Sulfates

The results of the soluble sulfate testing indicate that a selected sample of the on-site soils correspond to Class S0 with respect to the American Concrete Institute (ACI) Publication 318 Building Code Requirements for Structural Concrete and Commentary, Section 4.3. Therefore, specialized concrete mix designs are not considered to be necessary, with regard to sulfate protection purposes. It is, however, recommended that additional soluble sulfate testing be conducted at time of the design-level geotechnical investigation and at the completion of rough grading to verify the soluble sulfate concentrations of the soils which are present at pad grade within the building areas.

Corrosion Potential

The results of laboratory testing indicate that the tested sample of the on-site soils possesses a saturated resistivity value of 3,440 ohm-cm, and a pH value of 7.9. These test results have been evaluated in accordance with guidelines published by the Ductile Iron Pipe Research Association (DIPRA). The DIPRA guidelines consist of a point system by which characteristics of the soils are used to quantify the corrosivity characteristics of the site. Resistivity and pH are two of the five factors that enter into the evaluation procedure. Redox potential, relative soil moisture content and sulfides are also included. Although sulfide testing was not part of the scope of services for this project, we have evaluated the corrosivity characteristics of the on-site soils using resistivity, pH and moisture content. **Based on these factors, and utilizing the DIPRA procedure, the on-site soils are not considered to be corrosive to ductile iron pipe.** It should be noted that SCG does not practice in the field of corrosion engineering, and therefore, the client may also wish to contact a corrosion engineer to provide a more thorough evaluation. Additional

laboratory testing should be performed during the design-level study in order to verify these findings.

A relatively low concentration (4.3 mg/kg) of chlorides was detected in the sample submitted for corrosivity testing. In general, soils possessing chloride concentrations in excess of 500 parts per million (ppm) are considered to be corrosive with respect to steel reinforcement within reinforced concrete. Based on the lack of any significant chlorides in the tested sample, the site is considered to have a C1 chloride exposure in accordance with the American Concrete Institute (ACI) Publication 318 Building Code Requirements for Structural Concrete and Commentary. Therefore, a specialized concrete mix design for reinforced concrete for protection against chloride exposure is not considered warranted. We recommend that additional corrosivity testing be performed at the time of the design-level geotechnical investigation in order to confirm the chloride exposure category.

Shrinkage/Subsidence

Removal and recompaction of the near-surface alluvium and fill soils is estimated to result in an average shrinkage of 7 to 14 percent. However, the estimated shrinkage of the individual soil layers at the site is highly variable, with individual strata ranging from 0 to 18 percent shrinkage. It should be noted that the potential shrinkage estimate is based on dry density testing performed on small-diameter samples taken at the boring locations. If a more accurate and precise shrinkage estimate is desired, SCG can perform a shrinkage study involving several excavated test-pits where in-place densities are determined using in-situ testing methods instead of laboratory density testing on small-diameter samples. Please contact SCG for details and a cost estimate regarding a shrinkage study, if desired.

Minor ground subsidence is expected to occur in the soils below the zone of removal, due to settlement and machinery working. The subsidence is estimated to be 0.1 feet.

These estimates are based on previous experience and the subsurface conditions encountered at the boring locations. The actual amount of subsidence is expected to be variable and will be dependent on the type of machinery used, repetitions of use, and dynamic effects, all of which are difficult to assess precisely.

Additional Geotechnical Investigation

As discussed above, the focus of the current phase of investigation was to determine the geotechnical feasibility of the proposed development at the subject site. Prior to preparing detailed grading or foundation plans, a site-specific, detailed geotechnical investigation should be performed. The purpose of this supplementary investigation will be to obtain more detailed data regarding the subsurface conditions at the subject site. The scope of this future investigation should be sufficient to provide detailed grading recommendations as well as foundation, floor slab, and pavement design recommendations.

## 6.3 Preliminary Site Grading Recommendations

The preliminary grading recommendations presented below are based on the design details that were available at the time of this report, and the subsurface conditions encountered at our boring locations. These recommendations are general and preliminary in nature, and should be confirmed as part of the future design-level geotechnical investigation.

Site Stripping and Demolition

Demolition of the existing structure and pavements will be necessary in order to facilitate the construction of the proposed development. Demolition should include all foundations, floor slabs, utilities and any other subsurface improvements that will not remain in place with the new development.

Demolition activities may result in moderate quantities of asphalt and concrete debris. These materials may be crushed to a maximum 2-inch particle size and blended with on-site soils for reuse as structural fill. These materials could also be crushed to a 4- to 6-inch particle size and used as stabilization material for use at the base of the recommended overexcavation, as discussed in a subsequent section of this report.

Treatment of Existing Soils: Building Pad

Remedial grading should be performed within the proposed building area in order to remove the artificial fill materials, the upper portion of the alluvial soils, and any soils disturbed during the demolition of the existing site improvements. The depth of overexcavation should be determined during the design-level geotechnical investigation. Undocumented fill soils were encountered at all of the boring locations extending to depths of 2½ to 6½± feet below the existing site grades. On a preliminary basis, overexcavation to depths of 3 to 6± feet below existing and proposed building pad grades should be anticipated. Some additional overexcavation should also be anticipated in localized areas of the site. The overexcavation recommendation within the foundation areas will likely be 3 to 5± feet below foundation bearing grade. Additional consolidation testing should be performed during the design-level geotechnical investigation. Additional overexcavation may be necessary if adverse conditions are encountered during the design-level investigation.

The overexcavation areas should extend at least 5 feet beyond the building perimeter and foundations, and to an extent equal to the depth of fill below the new foundations. If the proposed structure incorporates any exterior columns (such as for a canopy or overhang) the overexcavation should also encompass these areas.

**Based on conditions encountered at the exploratory boring locations, some zones of very moist soils will be encountered at or near the base of the recommended overexcavation.** Stabilization of the exposed overexcavation subgrade soils will likely be necessary. Scarification and air drying of these materials may be sufficient to obtain a stable subgrade. However, if highly unstable soils are identified, and if the construction schedule does not allow for delays associated with drying, mechanical stabilization, usually consisting of coarse crushed stone or geotextile, could be necessary. Crushed asphalt and concrete debris could

potentially be used as subgrade stabilization material as well. If stabilization is required, the geotechnical engineer should be contacted for supplementary recommendations.

After a suitable overexcavation subgrade has been achieved, the exposed soils should be scarified to a depth of at least 12 inches and moisture conditioned or air dried to achieve a moisture content of 0 to 4 percent above optimum moisture content. The subgrade soils should then be recompacted to at least 90 percent of the ASTM D-1557 maximum dry density.

The building pad areas may then be raised to grade with previously excavated soils or imported, very low expansive structural fill. All structural fill soils placed at the site should be compacted to at least 90 percent of the ASTM D-1557 maximum dry density.

Treatment of Existing Soils: Retaining Walls and Site Walls

The existing soils within the areas of any proposed retaining and site walls should be overexcavated to a depth of 2 to 4 feet below foundation bearing grade and replaced as compacted structural fill as discussed above for the proposed building pad. Any undocumented fill soils within any of these foundation areas should be removed in their entirety. The overexcavation should also extend to a depth of at least 2 to 4 feet beneath to bottom of any erection pads used to construct tilt-up concrete walls. The overexcavation subgrade soils should be evaluated by the geotechnical engineer prior to scarifying, moisture conditioning, and recompacting the upper 12 inches of exposed subgrade soils, as discussed for the building area. The previously excavated soils may then be replaced as compacted structural fill.

Treatment of Existing Soils: Parking Areas

Based on economic considerations, overexcavation of the existing fill soils and/or the surficial alluvial soils in the new parking areas is not considered warranted, with the exception of areas where lower strength, or unstable soils are identified by the geotechnical engineer during grading.

Subgrade preparation in the new parking areas should initially consist of removal of all soils disturbed during stripping and demolition operations. The geotechnical engineer should then evaluate the subgrade to identify any areas of additional unsuitable soils. The subgrade soils should then be scarified to a depth of 12± inches, moisture conditioned to 0 to 4 percent above optimum, and recompacted to at least 90 percent of the ASTM D-1557 maximum dry density. Based on the presence of variable strength alluvial soils throughout the site, it is expected that some isolated areas of additional overexcavation may be required to remove zones of lower strength, unsuitable soils.

The grading recommendations presented above for the proposed parking and drive areas assume that the owner and/or developer can tolerate minor amounts of settlement within the proposed parking areas. The grading recommendations presented above do not completely mitigate the extent of existing undocumented fill soils and low strength alluvium in the parking areas. As such, settlement and associated pavement distress could occur. Typically, repair of such distressed areas involves significantly lower costs than completely mitigating these soils at the time of construction. If the owner cannot tolerate the risk of such settlements, the parking and drive areas should be overexcavated to a depth of 2 feet below proposed pavement subgrade elevation, with the resulting soils replaced as compacted structural fill.

Treatment of Existing Soils: Flatwork Areas

Subgrade preparation in the new flatwork areas should initially consist of removal of all soils disturbed during stripping and demolition operations. The geotechnical engineer should then evaluate the subgrade to identify any areas of additional unsuitable soils. The subgrade soils should then be scarified to a depth of 12± inches, moisture conditioned to 0 to 4 percent above optimum, and recompacted to at least 90 percent of the ASTM D-1557 maximum dry density. Based on the presence of variable strength alluvial soils throughout the site, it is expected that some isolated areas of additional overexcavation may be required to remove zones of lower strength, unsuitable soils.

Fill Placement

- Fill soils should be placed in thin (6± inches), near-horizontal lifts, moisture conditioned to 0 to 4 percent above the optimum moisture content, and compacted.
- On-site soils may be used for fill provided they are cleaned of any debris to the satisfaction of the geotechnical engineer.
- All grading and fill placement activities should be completed in accordance with the requirements of the 2019 CBC and the grading code of the City of Downey/ County of Los Angeles.
- All fill soils should be compacted to at least 90 percent of the ASTM D-1557 maximum dry density. Fill soils should be well mixed.
- Compaction tests should be performed periodically by the geotechnical engineer as random verification of compaction and moisture content. These tests are intended to aid the contractor. Since the tests are taken at discrete locations and depths, they may not be indicative of the entire fill and therefore should not relieve the contractor of his responsibility to meet the job specifications.

Imported Structural Fill

All imported structural fill should consist of very low expansive (EI < 20), well graded soils possessing at least 10 percent fines (that portion of the sample passing the No. 200 sieve). Additional specifications for structural fill are presented in the Grading Guide Specifications, included as Appendix D.

Utility Trench Backfill

In general, all utility trench backfill soils should be compacted to at least 90 percent of the ASTM D-1557 maximum dry density. As an alternative, a clean sand (minimum Sand Equivalent of 30) may be placed within trenches and compacted in place (jetting or flooding is not recommended). Compacted trench backfill should conform to the requirements of the local grading code, and more restrictive requirements may be indicated by the City of Downey or County of Los Angeles. All utility trench backfills should be witnessed by the geotechnical engineer. The trench backfill soils should be compaction tested where possible; probed and visually evaluated elsewhere.

Utility trenches which parallel a footing, and extending below a 1h:1v plane projected from the outside edge of the footing should be backfilled with structural fill soils, compacted to at least 90 percent of the ASTM D-1557 standard. Pea gravel backfill should not be used for these trenches.

## 6.4 Construction Considerations

Excavation Considerations

The near surface soils generally consist of silty sands, fine sandy silts, and sands. These materials will likely be subject to caving within shallow excavations. Where caving occurs within shallow excavations, flattened excavation slopes may be sufficient to provide excavation stability. On a preliminary basis, the inclination of temporary slopes should not exceed 2h:1v. Maintaining adequate moisture content within the near-surface soils will improve excavation stability. All excavation activities on this site should be conducted in accordance with Cal-OSHA regulations.

Moisture Sensitive Subgrade Soils

Some of the near surface soils possess appreciable silt content and may become unstable if exposed to significant moisture infiltration or disturbance by construction traffic. In addition, based on their granular content, some of the on-site soils will also be susceptible to erosion. The site should, therefore, be graded to prevent ponding of surface water and to prevent water from running into excavations.

If the construction schedule dictates that site grading will occur during a period of wet weather, allowances should be made for costs and delays associated with drying the on-site soils or import of a drier, less moisture sensitive fill material. Grading during wet or cool weather may also increase the depth of overexcavation in the pad areas as well as the need for and/or the thickness of the crushed stone stabilization layer, discussed in Section 6.3 of this report.

Expansive Soils

The near-surface soils have been determined to possess a very low expansion potential (EI = 18). Therefore, care should be given to proper moisture conditioning the subgrade soils to a moisture content of 0 to 4 percent above the Modified Proctor optimum during site grading. All imported fill soils should have very low expansive (EI < 20) characteristics. In addition to adequately moisture conditioning the subgrade soils and fill soils during grading, special care must be taken to maintain moisture content of these soils at 0 to 4 percent above the Modified Proctor optimum. This will require the contractor to frequently moisture condition these soils throughout the grading process, unless grading occurs during a period of relatively wet weather.

Groundwater

The static groundwater table is considered to exist at a depth of 50± feet or more below existing grade. Therefore, groundwater is not expected to impact the grading or foundation construction activities.

## 6.5 Preliminary Foundation Design and Construction

Based on the preceding geotechnical design considerations and preliminary grading recommendations, it is assumed that the new building pad will be underlain by structural fill soils

used to replace existing fill and near surface alluvial soils. These new structural fill soils will extend to depths of at least 3 to 5 feet below proposed foundation bearing grade, underlain by 1± foot of additional soil that has been densified and moisture conditioned in place. Based on this subsurface profile, and based on the design considerations presented in Section 6.1 of this report, the proposed structure may be supported on shallow foundations.

Foundation Design Parameters

New square and rectangular footings may be designed as follows:

- Maximum, net allowable soil bearing pressure: 2,000 to 2,500 lbs/ft$^2$.
- Minimum longitudinal steel reinforcement within strip footings: Six (6) No. 5 rebars (3 top and 3 bottom), due to the liquefaction potential of the soils.
- The actual design of the foundations should be determined by the structural engineer.

General Foundation Design Recommendations

The allowable bearing pressures presented above may be increased by one-third when considering short duration wind or seismic loads. Additional reinforcement may be necessary for structural considerations. The actual design of the foundations should be determined by the structural engineer.

Estimated Foundation Settlements

Post-construction total and differential settlements of shallow foundations designed and constructed in accordance with the previously presented recommendations are estimated to be less than 1.0 and 0.5 inches, respectively. Differential movements are expected to occur over a 30-foot span, thereby resulting in an angular distortion of less than 0.002 inches per inch. These settlements are in addition to the liquefaction-induced settlements previously discussed in Section 6.1 of this report. However, the likelihood of these two settlements combining is considered remote. The static settlements are expected to occur in a relatively short period of time after the building loads being applied to the foundations, during and immediately subsequent to construction. It should be noted that the projected potential dynamic settlement is related to a major seismic event and a conservative historic high groundwater level. A detailed settlement analysis should be conducted as part of the design-level geotechnical investigation, once detailed foundation loading information is available.

Lateral Load Resistance

Lateral load resistance will be developed by a combination of friction acting at the base of foundations and slabs and the passive earth pressure developed by footings below grade. The following friction and passive pressure may be used to resist lateral forces:

- Passive Earth Pressure: 225 to 300 lbs/ft$^3$
- Friction Coefficient: 0.25 to 0.30

These are allowable values, and include a factor of safety. When combining friction and passive resistance, the passive pressure component should be reduced by one-third. These values assume that footings will be poured directly against compacted structural fill soils. The maximum allowable passive pressure is 2,500 lbs/ft$^2$.

## 6.6 Preliminary Floor Slab Design and Construction Recommendations

Subgrades which will support new floor slabs should be prepared in accordance with the recommendations contained in the ***Site Grading Recommendations*** section of this report. Preliminarily, the floor of the proposed structure may be constructed as a conventional slab-on-grade supported on newly placed structural fill. Based on geotechnical considerations, the floor slab may be preliminarily designed as follows:

- Minimum slab thickness: 6 to 7 inches
- Modulus of Subgrade Reaction: k = 100 to 150 psi/in
- Steel reinforcement is expected to be necessary, based on the liquefaction potential of the soils underlying the subject site.
- Slab underlayment: If moisture sensitive floor coverings will be used then minimum slab underlayment should consist of a moisture vapor barrier constructed below the entire area of the proposed slab which will incorporate such coverings. The moisture vapor barrier should meet or exceed the Class A rating as defined by ASTM E 1745-97 and have a permeance rating less than 0.01 perms as described in ASTM E 96-95 and ASTM E 154-88. A polyolefin material such as Stego® Wrap Vapor Barrier or equivalent will meet these specifications. The moisture vapor barrier should be properly constructed in accordance with all applicable manufacturer specifications. Given that a rock free subgrade is anticipated and that a capillary break is not required, sand below the barrier is not required. The need for sand and/or the amount of sand above the moisture vapor barrier should be specified by the structural engineer or concrete contractor. The selection of sand above the barrier is not a geotechnical engineering issue and hence outside our purview. Where moisture sensitive floor coverings are not anticipated, the vapor barrier may be eliminated.
- Moisture condition the floor slab subgrade soils to 2 to 4 percent above the Modified Proctor optimum moisture content, to a depth of 12 inches. The moisture content of the floor slab subgrade soils should be verified by the geotechnical engineer within 24 hours prior to concrete placement.
- Proper concrete curing techniques should be utilized to reduce the potential for slab curling or the formation of excessive shrinkage cracks.

The actual design of the floor slab should be completed by the structural engineer to verify adequate thickness and reinforcement.

## 6.7 Preliminary Retaining Wall Design and Construction

Although not indicated on the site plan, some small (less than 3 to 4 feet in height) retaining walls may be required to facilitate the new site grades. Retaining walls up to 5 feet in height will also be required in the loading dock areas. The parameters recommended for use in the design of these walls are presented below.

Retaining Wall Design Parameters

Based on the soil conditions encountered at the boring locations, the following parameters may be used in the design of new retaining walls for this site. We have provided parameters assuming the use of on-site soils for retaining wall backfill. The near surface soils generally consist of fine silty sands, and sandy silts and have been preliminarily assigned an estimated friction angle of 30 degrees when compacted to 90 percent of the ASTM-1557 maximum dry density. The design parameters provided below are based on the assumed friction angle and should be confirmed during the design-level geotechnical investigation.

If desired, SCG could provide design parameters for an alternative select backfill material behind the retaining walls. The use of select backfill material could result in lower lateral earth pressures. In order to use the design parameters for the imported select fill, this material must be placed within the entire active failure wedge. This wedge is defined as extending from the heel of the retaining wall upwards at an angle of approximately 60° from horizontal. If select backfill material behind the retaining wall is desired, SCG should be contacted for supplementary recommendations.

**RETAINING WALL DESIGN PARAMETERS**

| Design Parameter | | Soil Type |
|---|---|---|
| | | On-site Soils |
| Internal Friction Angle ($\phi$) | | 30° |
| Unit Weight | | 125 lbs/ft$^3$ |
| Equivalent Fluid Pressure: | Active Condition (level backfill) | 42 lbs/ft$^3$ |
| | Active Condition (2h:1v backfill) | 67 lbs/ft$^3$ |
| | At-Rest Condition (level backfill) | 63 lbs/ft$^3$ |

The walls should be designed using a soil-footing coefficient of friction of 0.25 to 0.30 and an equivalent passive pressure of 225 to 300 lbs/ft$^3$. The structural engineer should incorporate appropriate factors of safety in the design of the retaining walls.

The active earth pressure may be used for the design of retaining walls that do not directly support structures or support soils that in turn support structures and which will be allowed to deflect. The at-rest earth pressure should be used for walls that will not be allowed to deflect

such as those which will support foundation bearing soils, or which will support foundation loads directly.

Where the soils on the toe side of the retaining wall are not covered by a "hard" surface such as a structure or pavement, the upper 1 foot of soil should be neglected when calculating passive resistance due to the potential for the material to become disturbed or degraded during the life of the structure.

Seismic Lateral Earth Pressures

In addition to the lateral earth pressures presented in the previous section, retaining walls which are more than 6 feet in height should be designed for a seismic lateral earth pressure, in accordance with the 2019 CBC. Based on the current site plan, it is not expected that any walls in excess of 6 feet in height will be required for this project. If any such walls are proposed, our office should be contacted for supplementary design recommendations.

Retaining Wall Foundation Design

The retaining wall foundations should be supported within newly placed compacted structural fill. Foundations to support new retaining walls should be designed in accordance with the general Foundation Design Parameters presented in a previous section of this report.

Backfill Material

On-site soils may be used to backfill the retaining walls. However, all backfill material placed within 3 feet of the back wall face should have a particle size no greater than 3 inches. The retaining wall backfill materials should be well graded.

It is recommended that a properly installed prefabricated drainage composite such as the MiraDRAIN 6000XL (or approved equivalent), which is specifically designed for use behind retaining walls be used. If the drainage composite material is not covered by an impermeable surface, such as a structure or pavement, a 12-inch thick layer of a low permeability soil should be placed over the backfill to reduce surface water migration to the underlying soils. The drainage composite should be separated from the backfill soils by a suitable geotextile, approved by the geotechnical engineer.

All retaining wall backfill should be placed and compacted under engineering controlled conditions in the necessary layer thicknesses to ensure an in-place density between 90 and 93 percent of the maximum dry density as determined by the Modified Proctor test (ASTM D1557). Care should be taken to avoid over-compaction of the soils behind the retaining walls, and the use of heavy compaction equipment should be avoided.

Subsurface Drainage

As previously indicated, the retaining wall design parameters are based upon drained backfill conditions. Consequently, some form of permanent drainage system will be necessary in conjunction with the appropriate backfill material. Subsurface drainage may consist of either:

- A weep hole drainage system typically consisting of a series of 4-inch diameter holes in the wall situated slightly above the ground surface elevation on the exposed side of the wall and at an approximate 8-foot on-center spacing. The weep holes should include a 2 cubic foot pocket of open graded gravel, surrounded by an approved geotextile fabric, at each weep hole location.

- A 4-inch diameter perforated pipe surrounded by 2 cubic feet of gravel per linear foot of drain placed behind the wall, above the retaining wall footing. The gravel layer should be wrapped in a suitable geotextile fabric to reduce the potential for migration of fines. The footing drain should be extended to daylight or tied into a storm drainage system.

Weep holes or a footing drain will not be required for building stem walls.

## 6.8 Preliminary Pavement Design Parameters

Presented below are preliminary recommendations for the proposed pavements at the subject site. Grading recommendations for these pavement areas should be developed during the design-level geotechnical investigation.

Pavement Subgrades

It is anticipated that the new pavements will be primarily supported on a layer of compacted structural fill, consisting of scarified, thoroughly moisture conditioned and recompacted existing soils. The near-surface soils generally consist of silty sands and sandy silts. Based on their classification, these materials are expected to possess fair to good pavement support characteristics, with R-values in the range of 30 to 40. Since R-value testing was not included in the scope of services for this project, the subsequent pavement design is based upon a conservatively assumed R-value of 30. Any fill material imported to the site should have support characteristics equal to or greater than that of the on-site soils and be placed and compacted under engineering controlled conditions. It is recommended that R-value testing be performed after completion of rough grading. Depending upon the results of the R-value testing, it may be feasible to use thinner pavement sections in some areas of the site.

Asphaltic Concrete

Presented below are the recommended thicknesses for new flexible pavement structures consisting of asphaltic concrete over a granular base. The pavement designs are based on the traffic indices (TI's) indicated. The client and/or civil engineer should verify that these TI's are representative of the anticipated traffic volumes. If the client and/or civil engineer determine that the expected traffic volume will exceed the applicable traffic index, we should be contacted for supplementary recommendations. The design traffic indices equate to the following approximate daily traffic volumes over a 20 year design life, assuming six operational traffic days per week.

| Traffic Index | No. of Heavy Trucks per Day |
|---|---|
| 4.0 | 0 |
| 5.0 | 1 |
| 6.0 | 3 |
| 7.0 | 11 |
| 8.0 | 35 |

For the purpose of the traffic volumes indicated above, a truck is defined as a 5-axle tractor trailer unit with one 8-kip axle and two 32-kip tandem axles. All of the traffic indices allow for 1,000 automobiles per day.

| ASPHALT PAVEMENTS (R = 30) | | | | | |
|---|---|---|---|---|---|
| **Materials** | **Thickness (inches)** | | | | |
| | Auto Parking (TI = 4.0) | Auto Drive Lanes (TI = 5.0) | Truck Traffic | | |
| | | | (TI = 6.0) | (TI = 7.0) | (TI = 8.0) |
| Asphalt Concrete | 3 | 3 | 3½ | 4 | 5 |
| Aggregate Base | 3 | 6 | 8 | 10 | 11 |
| Compacted Subgrade | 12 | 12 | 12 | 12 | 12 |

The aggregate base course should be compacted to at least 95 percent of the ASTM D-1557 maximum dry density. The asphaltic concrete should be compacted to at least 95 percent of the Marshall maximum density, as determined by ASTM D-2726. The aggregate base course may consist of crushed aggregate base (CAB) or crushed miscellaneous base (CMB), which is a recycled gravel, asphalt and concrete material. The gradation, R-Value, Sand Equivalent, and Percentage Wear of the CAB or CMB should comply with appropriate specifications contained in the current edition of the "Greenbook" Standard Specifications for Public Works Construction.

Portland Cement Concrete

The preparation of the subgrade soils within concrete pavement areas should be performed as previously described for proposed asphalt pavement areas. The minimum recommended thicknesses for the Portland Cement Concrete pavement sections are as follows:

| PORTLAND CEMENT CONCRETE PAVEMENTS (R=30) | | | | |
|---|---|---|---|---|
| **Materials** | **Thickness (inches)** | | | |
| | Auto Parking & Drives (TI = 5.0) | Truck Traffic | | |
| | | (TI =6.0) | (TI =7.0) | (TI =8.0) |
| PCC | 5 | 5 | 5½ | 6½ |
| Compacted Subgrade | 12 | 12 | 12 | 12 |

The concrete should have a 28-day compressive strength of at least 3,000 psi. Any reinforcement within the PCC pavements should be determined by the project structural engineer. The maximum joint spacing within all of the PCC pavements is recommended to be equal to or less than 30 times the pavement thickness.

# 7.0 GENERAL COMMENTS

This report has been prepared as an instrument of service for use by the client, in order to aid in the evaluation of this property and to assist the architects and engineers in the design and preparation of the project plans and specifications. This report may be provided to the contractor(s) and other design consultants to disclose information relative to the project. However, this report is not intended to be utilized as a specification in and of itself, without appropriate interpretation by the project architect, civil engineer, and/or structural engineer. The reproduction and distribution of this report must be authorized by the client and Southern California Geotechnical, Inc. Furthermore, any reliance on this report by an unauthorized third party is at such party's sole risk, and we accept no responsibility for damage or loss which may occur. The client(s)' reliance upon this report is subject to the Engineering Services Agreement, incorporated into our proposal for this project.

The analysis of this site was based on a subsurface profile interpolated from limited discrete soil samples. While the materials encountered in the project area are considered to be representative of the total area, some variations should be expected between boring locations and sample depths. If the conditions encountered during construction vary significantly from those detailed herein, we should be contacted immediately to determine if the conditions alter the recommendations contained herein.

This report has been based on assumed or provided characteristics of the proposed development. It is recommended that the owner, client, architect, structural engineer, and civil engineer carefully review these assumptions to ensure that they are consistent with the characteristics of the proposed development. If discrepancies exist, they should be brought to our attention to verify that they do not affect the conclusions and recommendations contained herein. We also recommend that the project plans and specifications be submitted to our office for review to verify that our recommendations have been correctly interpreted.

The analysis, conclusions, and recommendations contained within this report have been promulgated in accordance with generally accepted professional geotechnical engineering practice. No other warranty is implied or expressed.

# BORING LOG LEGEND

| SAMPLE TYPE | GRAPHICAL SYMBOL | SAMPLE DESCRIPTION |
|---|---|---|
| **AUGER** |  | SAMPLE COLLECTED FROM AUGER CUTTINGS, NO FIELD MEASUREMENT OF SOIL STRENGTH. (DISTURBED) |
| **CORE** |  | ROCK CORE SAMPLE: TYPICALLY TAKEN WITH A DIAMOND-TIPPED CORE BARREL. TYPICALLY USED ONLY IN HIGHLY CONSOLIDATED BEDROCK. |
| **GRAB** |  | SOIL SAMPLE TAKEN WITH NO SPECIALIZED EQUIPMENT, SUCH AS FROM A STOCKPILE OR THE GROUND SURFACE. (DISTURBED) |
| **CS** |  | CALIFORNIA SAMPLER: 2-1/2 INCH I.D. SPLIT BARREL SAMPLER, LINED WITH 1-INCH HIGH BRASS RINGS. DRIVEN WITH SPT HAMMER. (RELATIVELY UNDISTURBED) |
| **NSR** |  | NO RECOVERY: THE SAMPLING ATTEMPT DID NOT RESULT IN RECOVERY OF ANY SIGNIFICANT SOIL OR ROCK MATERIAL. |
| **SPT** |  | STANDARD PENETRATION TEST: SAMPLER IS A 1.4 INCH INSIDE DIAMETER SPLIT BARREL, DRIVEN 18 INCHES WITH THE SPT HAMMER. (DISTURBED) |
| **SH** |  | SHELBY TUBE: TAKEN WITH A THIN WALL SAMPLE TUBE, PUSHED INTO THE SOIL AND THEN EXTRACTED. (UNDISTURBED) |
| **VANE** |  | VANE SHEAR TEST: SOIL STRENGTH OBTAINED USING A 4 BLADED SHEAR DEVICE. TYPICALLY USED IN SOFT CLAYS-NO SAMPLE RECOVERED. |

**COLUMN DESCRIPTIONS**

**DEPTH:** Distance in feet below the ground surface.

**SAMPLE**: Sample Type as depicted above.

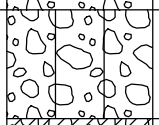
**BLOW COUNT**: Number of blows required to advance the sampler 12 inches using a 140 lb hammer with a 30-inch drop. 50/3" indicates penetration refusal (>50 blows) at 3 inches. WH indicates that the weight of the hammer was sufficient to push the sampler 6 inches or more.

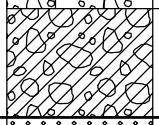
**POCKET PEN.**: Approximate shear strength of a cohesive soil sample as measured by pocket penetrometer.

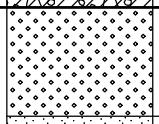
**GRAPHIC LOG**: Graphic Soil Symbol as depicted on the following page.

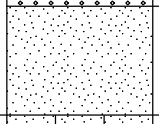
**DRY DENSITY**: Dry density of an undisturbed or relatively undisturbed sample in $lbs/ft^3$.

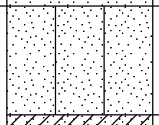
**MOISTURE CONTENT**: Moisture content of a soil sample, expressed as a percentage of the dry weight.

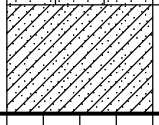


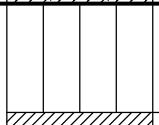


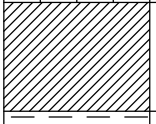


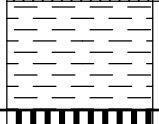


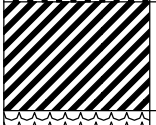


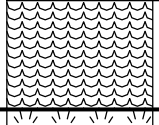


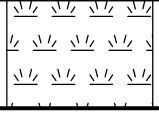












**LIQUID LIMIT**: The moisture content above which a soil behaves as a liquid.

**PLASTIC LIMIT**: The moisture content above which a soil behaves as a plastic.

**PASSING #200 SIEVE**: The percentage of the sample finer than the #200 standard sieve.

**UNCONFINED SHEAR**: The shear strength of a cohesive soil sample, as measured in the unconfined state.

# APPENDIX D

# GRADING GUIDE SPECIFICATIONS

These grading guide specifications are intended to provide typical procedures for grading operations. They are intended to supplement the recommendations contained in the geotechnical investigation report for this project. Should the recommendations in the geotechnical investigation report conflict with the grading guide specifications, the more site specific recommendations in the geotechnical investigation report will govern.

## General

- The Earthwork Contractor is responsible for the satisfactory completion of all earthwork in accordance with the plans and geotechnical reports, and in accordance with city, county, and applicable building codes.

- The Geotechnical Engineer is the representative of the Owner/Builder for the purpose of implementing the report recommendations and guidelines. These duties are not intended to relieve the Earthwork Contractor of any responsibility to perform in a workman-like manner, nor is the Geotechnical Engineer to direct the grading equipment or personnel employed by the Contractor.

- The Earthwork Contractor is required to notify the Geotechnical Engineer of the anticipated work and schedule so that testing and inspections can be provided. If necessary, work may be stopped and redone if personnel have not been scheduled in advance.

- The Earthwork Contractor is required to have suitable and sufficient equipment on the job-site to process, moisture condition, mix and compact the amount of fill being placed to the approved compaction. In addition, suitable support equipment should be available to conform with recommendations and guidelines in this report.

- Canyon cleanouts, overexcavation areas, processed ground to receive fill, key excavations, subdrains and benches should be observed by the Geotechnical Engineer prior to placement of any fill. It is the Earthwork Contractor's responsibility to notify the Geotechnical Engineer of areas that are ready for inspection.

- Excavation, filling, and subgrade preparation should be performed in a manner and sequence that will provide drainage at all times and proper control of erosion. Precipitation, springs, and seepage water encountered shall be pumped or drained to provide a suitable working surface. The Geotechnical Engineer must be informed of springs or water seepage encountered during grading or foundation construction for possible revision to the recommended construction procedures and/or installation of subdrains.

## Site Preparation

- The Earthwork Contractor is responsible for all clearing, grubbing, stripping and site preparation for the project in accordance with the recommendations of the Geotechnical Engineer.

- If any materials or areas are encountered by the Earthwork Contractor which are suspected of having toxic or environmentally sensitive contamination, the Geotechnical Engineer and Owner/Builder should be notified immediately.

- Major vegetation should be stripped and disposed of off-site. This includes trees, brush, heavy grasses and any materials considered unsuitable by the Geotechnical Engineer.

- Underground structures such as basements, cesspools or septic disposal systems, mining shafts, tunnels, wells and pipelines should be removed under the inspection of the Geotechnical Engineer and recommendations provided by the Geotechnical Engineer and/or city, county or state agencies. If such structures are known or found, the Geotechnical Engineer should be notified as soon as possible so that recommendations can be formulated.

- Any topsoil, slopewash, colluvium, alluvium and rock materials which are considered unsuitable by the Geotechnical Engineer should be removed prior to fill placement.

- Remaining voids created during site clearing caused by removal of trees, foundations basements, irrigation facilities, etc., should be excavated and filled with compacted fill.

- Subsequent to clearing and removals, areas to receive fill should be scarified to a depth of 10 to 12 inches, moisture conditioned and compacted

- The moisture condition of the processed ground should be at or slightly above the optimum moisture content as determined by the Geotechnical Engineer. Depending upon field conditions, this may require air drying or watering together with mixing and/or discing.

Compacted Fills

- Soil materials imported to or excavated on the property may be utilized in the fill, provided each material has been determined to be suitable in the opinion of the Geotechnical Engineer. Unless otherwise approved by the Geotechnical Engineer, all fill materials shall be free of deleterious, organic, or frozen matter, shall contain no chemicals that may result in the material being classified as “contaminated,” and shall be very low to non-expansive with a maximum expansion index (EI) of 50. The top 12 inches of the compacted fill should have a maximum particle size of 3 inches, and all underlying compacted fill material a maximum 6-inch particle size, except as noted below.

- All soils should be evaluated and tested by the Geotechnical Engineer. Materials with high expansion potential, low strength, poor gradation or containing organic materials may require removal from the site or selective placement and/or mixing to the satisfaction of the Geotechnical Engineer.

- Rock fragments or rocks less than 6 inches in their largest dimensions, or as otherwise determined by the Geotechnical Engineer, may be used in compacted fill, provided the distribution and placement is satisfactory in the opinion of the Geotechnical Engineer.

- Rock fragments or rocks greater than 12 inches should be taken off-site or placed in accordance with recommendations and in areas designated as suitable by the Geotechnical Engineer. These materials should be placed in accordance with Plate D-8 of these Grading Guide Specifications and in accordance with the following recommendations:

    - Rocks 12 inches or more in diameter should be placed in rows at least 15 feet apart, 15 feet from the edge of the fill, and 10 feet or more below subgrade. Spaces should be left between each rock fragment to provide for placement and compaction of soil around the fragments.

    - Fill materials consisting of soil meeting the minimum moisture content requirements and free of oversize material should be placed between and over the rows of rock or

concrete. Ample water and compactive effort should be applied to the fill materials as they are placed in order that all of the voids between each of the fragments are filled and compacted to the specified density.

- Subsequent rows of rocks should be placed such that they are not directly above a row placed in the previous lift of fill. A minimum 5-foot offset between rows is recommended.

- To facilitate future trenching, oversized material should not be placed within the range of foundation excavations, future utilities or other underground construction unless specifically approved by the soil engineer and the developer/owner representative.

- Fill materials approved by the Geotechnical Engineer should be placed in areas previously prepared to receive fill and in evenly placed, near horizontal layers at about 6 to 8 inches in loose thickness, or as otherwise determined by the Geotechnical Engineer for the project.

- Each layer should be moisture conditioned to optimum moisture content, or slightly above, as directed by the Geotechnical Engineer. After proper mixing and/or drying, to evenly distribute the moisture, the layers should be compacted to at least 90 percent of the maximum dry density in compliance with ASTM D-1557-78 unless otherwise indicated.

- Density and moisture content testing should be performed by the Geotechnical Engineer at random intervals and locations as determined by the Geotechnical Engineer. These tests are intended as an aid to the Earthwork Contractor, so he can evaluate his workmanship, equipment effectiveness and site conditions. The Earthwork Contractor is responsible for compaction as required by the Geotechnical Report(s) and governmental agencies.

- Fill areas unused for a period of time may require moisture conditioning, processing and recompaction prior to the start of additional filling. The Earthwork Contractor should notify the Geotechnical Engineer of his intent so that an evaluation can be made.

- Fill placed on ground sloping at a 5-to-1 inclination (horizontal-to-vertical) or steeper should be benched into bedrock or other suitable materials, as directed by the Geotechnical Engineer. Typical details of benching are illustrated on Plates D-2, D-4, and D-5.

- Cut/fill transition lots should have the cut portion overexcavated to a depth of at least 3 feet and rebuilt with fill (see Plate D-1), as determined by the Geotechnical Engineer.

- All cut lots should be inspected by the Geotechnical Engineer for fracturing and other bedrock conditions. If necessary, the pads should be overexcavated to a depth of 3 feet and rebuilt with a uniform, more cohesive soil type to impede moisture penetration.

- Cut portions of pad areas above buttresses or stabilizations should be overexcavated to a depth of 3 feet and rebuilt with uniform, more cohesive compacted fill to impede moisture penetration.

- Non-structural fill adjacent to structural fill should typically be placed in unison to provide lateral support. Backfill along walls must be placed and compacted with care to ensure that excessive unbalanced lateral pressures do not develop. The type of fill material placed adjacent to below grade walls must be properly tested and approved by the Geotechnical Engineer with consideration of the lateral earth pressure used in the design.

Foundations

- The foundation influence zone is defined as extending one foot horizontally from the outside edge of a footing, and proceeding downward at a ½ horizontal to 1 vertical (0.5:1) inclination.

- Where overexcavation beneath a footing subgrade is necessary, it should be conducted so as to encompass the entire foundation influence zone, as described above.

- Compacted fill adjacent to exterior footings should extend at least 12 inches above foundation bearing grade. Compacted fill within the interior of structures should extend to the floor subgrade elevation.

Fill Slopes

- The placement and compaction of fill described above applies to all fill slopes. Slope compaction should be accomplished by overfilling the slope, adequately compacting the fill in even layers, including the overfilled zone and cutting the slope back to expose the compacted core

- Slope compaction may also be achieved by backrolling the slope adequately every 2 to 4 vertical feet during the filling process as well as requiring the earth moving and compaction equipment to work close to the top of the slope. Upon completion of slope construction, the slope face should be compacted with a sheepsfoot connected to a sideboom and then grid rolled. This method of slope compaction should only be used if approved by the Geotechnical Engineer.

- Sandy soils lacking in adequate cohesion may be unstable for a finished slope condition and therefore should not be placed within 15 horizontal feet of the slope face.

- All fill slopes should be keyed into bedrock or other suitable material. Fill keys should be at least 15 feet wide and inclined at 2 percent into the slope. For slopes higher than 30 feet, the fill key width should be equal to one-half the height of the slope (see Plate D-5).

- All fill keys should be cleared of loose slough material prior to geotechnical inspection and should be approved by the Geotechnical Engineer and governmental agencies prior to filling.

- The cut portion of fill over cut slopes should be made first and inspected by the Geotechnical Engineer for possible stabilization requirements. The fill portion should be adequately keyed through all surficial soils and into bedrock or suitable material. Soils should be removed from the transition zone between the cut and fill portions (see Plate D-2).

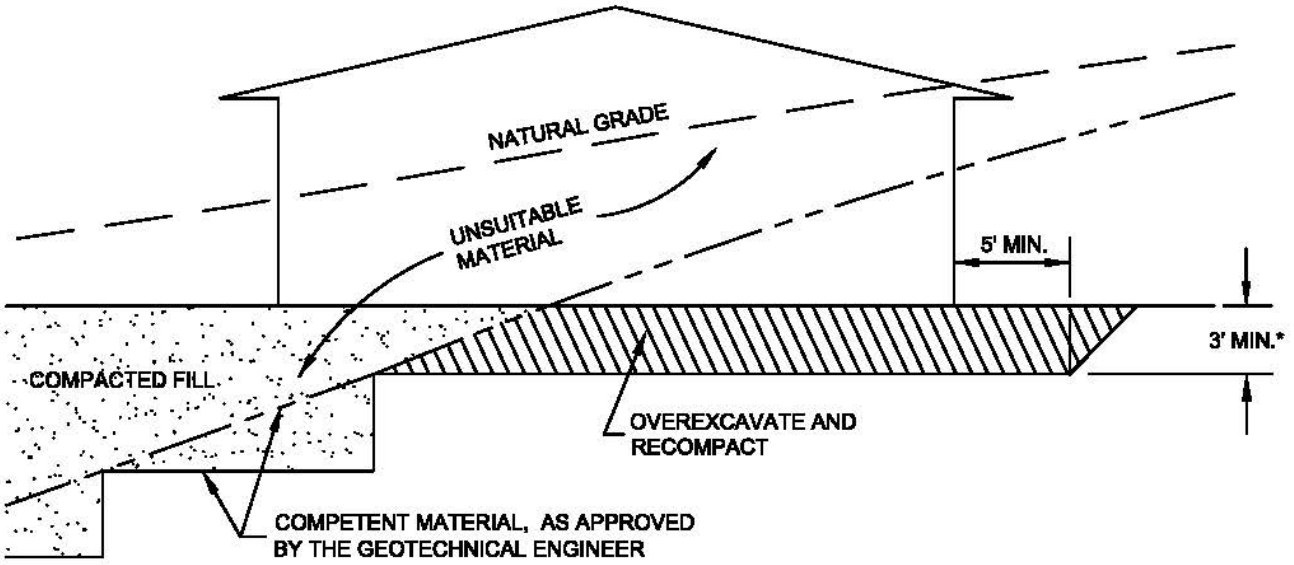
Cut Slopes

- All cut slopes should be inspected by the Geotechnical Engineer to determine the need for stabilization. The Earthwork Contractor should notify the Geotechnical Engineer when slope cutting is in progress at intervals of 10 vertical feet. Failure to notify may result in a delay in recommendations.

- Cut slopes exposing loose, cohesionless sands should be reported to the Geotechnical Engineer for possible stabilization recommendations.

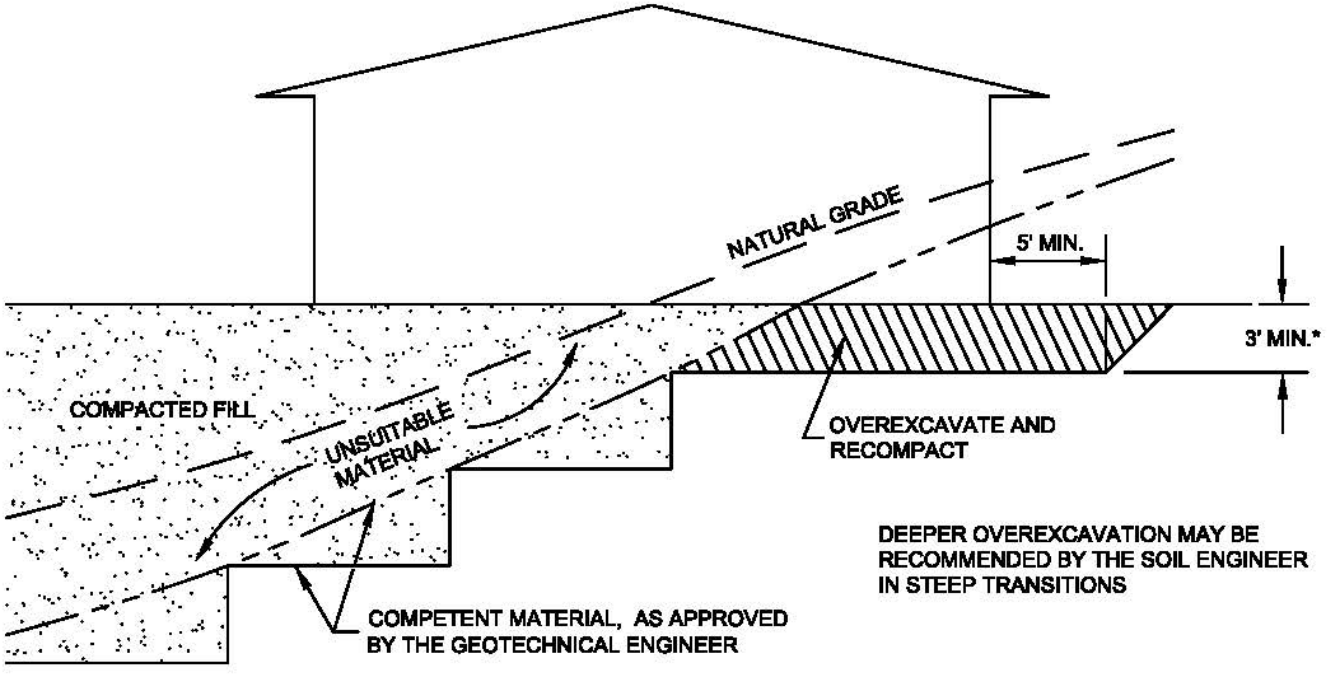
- All stabilization excavations should be cleared of loose slough material prior to geotechnical inspection. Stakes should be provided by the Civil Engineer to verify the location and dimensions of the key. A typical stabilization fill detail is shown on Plate D-5.

- Stabilization key excavations should be provided with subdrains. Typical subdrain details are shown on Plates D-6.



Subdrains

- Subdrains may be required in canyons and swales where fill placement is proposed. Typical subdrain details for canyons are shown on Plate D-3. Subdrains should be installed after approval of removals and before filling, as determined by the Soils Engineer.



- Plastic pipe may be used for subdrains provided it is Schedule 40 or SDR 35 or equivalent. Pipe should be protected against breakage, typically by placement in a square-cut (backhoe) trench or as recommended by the manufacturer.

- Filter material for subdrains should conform to CALTRANS Specification 68-1.025 or as approved by the Geotechnical Engineer for the specific site conditions. Clean ¾-inch crushed rock may be used provided it is wrapped in an acceptable filter cloth and approved by the Geotechnical Engineer. Pipe diameters should be 6 inches for runs up to 500 feet and 8 inches for the downstream continuations of longer runs. Four-inch diameter pipe may be used in buttress and stabilization fills.

## CUT LOT

**Total estimated settlement: 2.89**

**Abbreviations**

| | |
|---|---|
| $Q_{tn,cs}$: | Equivalent dean sand normalized cone resistance |
| FS: | Factor of safety against liquefaction |
| $e_v$ (%): | Post-liquefaction volumentric strain |
| DF: | $e_v$ depth weighting factor |
| Settlement: | Calculated settlement |

## Estimation of post-earthquake settlements

**Abbreviations**

| | |
|---|---|
| $q_t$: | Total cone resistance (cone resistance $q_c$ corrected for pore water effects) |
| $I_c$: | Soil Behaviour Type Index |
| FS: | Calculated Factor of Safety against liquefaction |
| Volumentric strain: | Post-liquefaction volumentric strain |

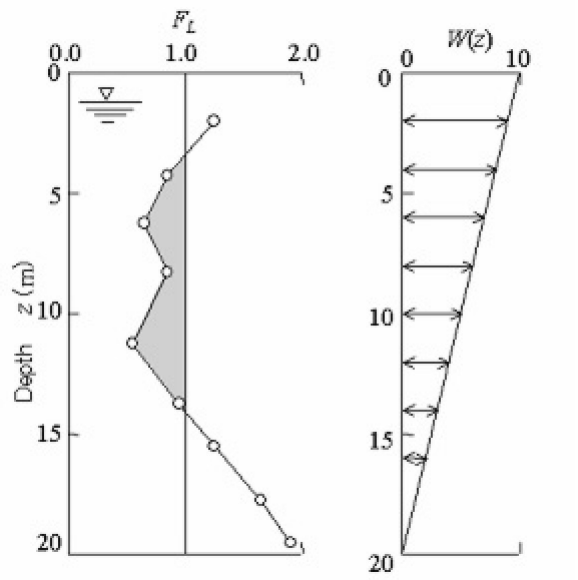
## Liquefaction Potential Index (LPI) calculation procedure

Calculation of the Liquefaction Potential Index (LPI) is used to interpret the liquefaction assessment calculations in terms of severity over depth. The calculation procedure is based on the methology developed by Iwasaki (1982) and is adopted by AFPS.



To estimate the severity of liquefaction extent at a given site, LPI is calculated based on the following equation:

$$\mathbf{LPI} = \int_0^{20} (10 - 0{,}5z) \times F_L \times dz$$

where:
$F_L$ = 1 - F.S. when F.S. less than 1
$F_L$ = 0 when F.S. greater than 1
z depth of measurment in meters

Values of LPI range between zero (0) when no test point is characterized as liquefiable and 100 when all points are characterized as susceptible to liquefaction. Iwasaki proposed four (4) discrete categories based on the numeric value of LPI:

- LPI = 0 : Liquefaction risk is very low
- 0 < LPI <= 5 : Liquefaction risk is low
- 5 < LPI <= 15 : Liquefaction risk is high
- LPI > 15 : Liquefaction risk is very high

**Graphical presentation of the LPI calculation procedure**

## Shear-Induced Building Settlement (Ds) calculation procedure

The shear-induced building settlement (Ds) due to liquefaction below the building can be estimated using the relationship developed by Bray and Macedo (2017):

$$Ln(Ds) = c1 + c2 * LBS + 0.58 * Ln\left(Tanh\left(\frac{HL}{6}\right)\right) + 4.59 * Ln(Q) - 0.42 * Ln(Q)^2 - 0.02 * B + 0.84 * Ln(CAVdp) + 0.41 * Ln(Sa1) + \varepsilon$$

where Ds is in the units of mm, c1= -8.35 and c2= 0.072 for LBS ≤ 16, and c1= -7.48 and c2= 0.014 otherwise. Q is the building contact pressure in units of kPa, HL is the cumulative thickness of the liquefiable layers in the units of m, B is the building width in the units of m, CAVdp is a standardized version of the cumulative absolute velocity in the units of g-s, Sa1 is 5%-damped pseudo-acceleration response spectral value at a period of 1 s in the units of g, and ε is a normal random variable with zero mean and 0.50 standard deviation in Ln units. The liquefaction-induced building settlement index (LBS) is:

$$LBS = \sum W * \frac{\varepsilon_{shear}}{z} dz$$

where z (m) is the depth measured from the ground surface > 0, W is a foundation-weighting factor wherein W = 0.0 for z less than Df, which is the embedment depth of the foundation, and W = 1.0 otherwise. The shear strain parameter (ε_shear) is the liquefaction-induced free-field shear strain (in %) estimated using Zhang et al. (2004). It is calculated based on the estimated Dr of the liquefied soil layer and the calculated safety factor against liquefaction triggering (FSL).

Engineering and Science, Inc.

# PHASE I ENVIRONMENTAL SITE ASSESSMENT REPORT

**Kirkhill**
12021 and 12023 Woodruff Avenue
Downey, California 90241

Report Date: September 26, 2018
Partner Project No. 18-220634.1

Prepared for:

**Prologis, Inc.**
Pier 1, Bay 1
San Francisco, California 94111

PARTNER
Engineering and Science, Inc.

September 26, 2018

Ms. Janet Frentzel
Prologis, Inc.
Pier 1, Bay 1
San Francisco, California 94111

Subject: Phase I Environmental Site Assessment
Kirkhill
12021 and 12023 Woodruff Avenue
Downey, California 90241
Partner Project No. 18-220634.1

Dear Ms. Frentzel:

Partner Engineering and Science, Inc. (Partner) is pleased to provide the results of the *Phase I Environmental Site Assessment* (Phase I ESA) report of the abovementioned address (the "subject property"). This assessment was performed in general conformance with the scope and limitations as detailed in the ASTM Practice E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.

This assessment included a site reconnaissance as well as research and interviews with representatives of the public, property ownership, site manager, and regulatory agencies. An assessment was made, conclusions stated, and recommendations outlined.

We appreciate the opportunity to provide environmental services to you. If you have any questions concerning this report, or if we can assist you in any other matter, please contact me at (818) 337-1203.

Sincerely,

Misty Ponce
Principal

# EXECUTIVE SUMMARY

Partner Engineering and Science, Inc. (Partner) has performed a Phase I Environmental Site Assessment (ESA) in general accordance with the scope of work and limitations of ASTM Standard Practice E1527-13, the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) and as set forth by the Master Services Agreement between Prologis and Partner dated April 18, 2013 for the property located at 12021 and 12023 Woodruff Avenue in the City of Downey, Los Angeles County, California (the "subject property"). The Phase I Environmental Site Assessment is designed to provide Prologis, Inc. with an assessment concerning environmental conditions (limited to those issues identified in the report) as they exist at the subject property.

### Property Description

The subject property is located on the west side of Woodruff Avenue just north of Washburn Road within an industrial area of Los Angeles County. Please refer to the table below for further description of the subject property:

| ***Subject Property Data*** | |
|---|---|
| **Addresses:** | 12021 and 12023 Woodruff Avenue, Downey, California 90241 |
| **Additional Addresses:** | None Identified |
| **Historical Addresses:** | None Identified |
| **Property Use:** | Industrial (zone M-2, General Manufacturing) |
| **Land Acreage (Ac):** | 6.31 +/- Ac (per Assessor's map) |
| **Number of Buildings:** | One (five separate additions) |
| **Number of Floors:** | One |
| **Gross Building Area (SF):** | 193,451 SF (per Assessor's records) |
| **Dates of Construction:** | 1951 to 1971 |
| **Assessor's Parcel Number (APN):** | 6284-025-018 |
| **Type of Construction:** | Concrete Tilt-Up/Concrete Block/Concrete Slab |
| **Current Tenants:** | Kirkhill, manufacturer of custom rubber products |
| **Site Assessment Performed By:** | Margaret Thomas and Kathy Lehnus of Partner |
| **Site Assessment Conducted On:** | September 6, 2018 |

The subject property is currently occupied by Kirkhill, a manufacturer of custom rubber products who has occupied all or part of the subject building since initial construction in 1951. The subject property consists of one large single-story building that was constructed in piecemeal fashion starting in 1951 that has a central open courtyard. Onsite operations consist of the manufacture of unvolcanized rubber from raw materials through a series of processes starting with large-scale mixing of a variety of polymers, fillers, and various grades of petroleum-based process oils through rubber injection molding, rubber compression molding, sponge rubber molding, and mold fabrication. Product is then warehoused and shipped through several loading dock areas. There are up to 30 hydraulic rubber presses on three lines within the eastern side of the manufacturing area, and various mixing equipment toward the west side of the manufacturing area. The building also includes two laboratories for research and development (R&D),

newer interior 2-story mixing equipment with batch-off conveyors, special mixing rooms, a cold room, warehouse storage, and office space.

Solid raw materials such as custom polymers, talc, neoprene, carbon black, monomers, and zinc are stored in 55-gallon drums and larger totes up to 300 gallons at the subject property. Liquids used in the process include lubricating oils, waste lubricating oil, and the process oils (classified as solvent refined in regulatory records). In addition to the current structure, the subject property is also improved with paved parking and driveways that extend around the building, front landscaping and exterior storage of raw materials, large dumpsters, empty containers, and other miscellaneous active and idle equipment.

According to available historical sources, the subject property was formerly open farm land from at least 1928 until it was developed in 1951. The property appeared to be occupied by row crops with no farm structures identified in aerial photographs. Occupants of the subject property have included Kirkhill Inc. (et. al, including Kirkhill Chemical) on the southern/manufacturing areas of the subject property, as well as tenants including Charcoal Masters International, Immanuel Industries Inc., Source One Staffing, Felchco Investment Group LLC, Cal Pipe Industries Inc., Cal Pipe Manufacturing Inc., Carnaval Access, Discount Advertising Xpress, Ikeep Inventing Corporation, Kollaborator Productions, Inc., Monster Sells, Hector Moran, Nomad Trading, Perimeter Defense Tech Inc., PTG International Inc., Standard industries and Kong Pet Toys on the warehouse/northern portions. Based on interviews with the site contact, it appears that the northern side of the subject property was leased at various times for warehouse and office space and light manufacturing operations.

The immediately surrounding properties consist primarily of industrial facilities including some office usage to the south and a restaurant to the southeast. The adjacent properties are zoned M-2 for industrial usage. None of the adjacent properties were identified to present an immediate environmental concern.

According to information reported by the State Water Resources Control Board GeoTracker website for a property located approximately 0.53-miles south of the subject property, at 9851 Imperial Highway, the depth of groundwater in the vicinity of the subject property is inferred to be approximately 33 to 53 feet below ground surface (bgs), with groundwater flow reported toward the southeast. In addition, during a 2013 Phase II ESA investigation conducted at the subject property, groundwater was encountered at 45 feet bgs (not sampled at the time).

### Findings

A *recognized environmental condition (REC)* refers to the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: due to release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment. The following was identified during the course of this assessment:

- All or part of the subject property building has been occupied by Kirkhill, a manufacturer of custom rubber products, since initial construction in 1951, utilizing raw materials including polymers, talc, neoprene, carbon black, monomers, and zinc as well as petroleum hydrocarbons as lubricating oils, waste lubricating oil, and the process oils (classified as a solvent refined in

regulatory records). Process oils are currently stored in three interior aboveground storage tanks (ASTs) (two 3,000-gallon ASTs and one 4,000-gallon AST) within the manufacturing area. In addition, the manufacturing area includes an internal hydraulic system comprised of a network of below-grade trenches and overhead piping that deliver a recirculated water and hydraulic oil mixture to the rubber presses and molding machines. Additionally, a central clarifier is present that is used primarily for boiler blowdown and cooling tower discharges. The clarifier previously received rinse water from a former tank wash out area that included acid and caustic tanks and rinse water tanks, which were used to clean molds, as the molds would get covered with rubber and need to be washed, which then discharged through the clarifier. The subject property operates a small electrical substation that includes one large pad-mounted transformer and additional electrical equipment situated within a chain link fence within the central courtyard, with apparent associated equipment on the interior adjacent wall. The transformer was not labeled indicating PCB content. The electrical equipment is not original and has been replaced at least once or twice. No staining or leakage was observed in the vicinity of the transformer equipment.

A prior Phase II ESA was conducted at the subject property by S&S Commercial Environmental Services, Inc., dated November 9, 2005, that identified high concentrations of diesel range and oil range petroleum in the soil located in the courtyard area to a maximum depth of 20 feet. The investigation included the advancement of 14 soil borings in the central courtyard area adjacent to the clarifier/discharge channel and cooling tower. Concentrations of diesel were reported as high as 54,100 milligrams per kilogram (mg/kg) at 5 feet bgs and 21,300 mg/kg at 20 feet bgs at the Boring SS-5 location. No volatile organic compounds (VOCs) or semi-VOCs were detected at SS-5 (the only boring analyzed for VOCs). Arsenic was detected at concentrations slightly above Cal-Hazardous levels, which was later determined to be an isolated area of 3 to 6 cubic yards of soluble arsenic above threshold limits that was left in place due to the presence of a capped surface. Additionally, the diesel and oil impacted soils were left in place and not remediated due to a reported clean earth interval between the last identified diesel impacted soil at 20 feet bgs and the maximum depth explored to 45 feet bgs.

Due to the known release of petroleum in the courtyard area and the number of years the subject property has operated as a rubber manufacturing plant, including the presence of subsurface conduits/trenches that carry a petroleum based cutting fluid and a clarifier that was previously used for wash down of rubber residues, soil beneath the concrete slab may be impacted with petroleum-based cutting oils or other constituents. Of note, polychlorinated biphenyls (PCBs) may be associated with historical usage of hydraulic equipment and electrical transformers on the subject property.

A *controlled recognized environmental condition (CREC)* refers to a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls. The following was identified during the course of this assessment:

- Partner did not identify controlled recognized environmental conditions during the course of this assessment.

A *historical recognized environmental condition (HREC)* refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. The following was identified during the course of this assessment:

- A total of four steel underground storage tanks (USTs) were formerly operated at the subject property, three of which contained diesel to fuel the two boilers associated with rubber molding (when the rubber products produced were volcanized), and one of which contained naphthene cutting oil. Three of the USTs (Tanks 1, 2, and 3) were located along the exterior south side of the subject property and were removed in 1989. A fourth UST (Tank 4 containing diesel) was abandoned in place in the central courtyard area in or around 1989. During the removal of Tanks 1 through 3, soil samples from beneath the tanks were tested and a release was detected; therefore, additional site investigation, excavation, and remediation work was performed in this area under the oversight of the Los Angeles County Department of Public Works (LACDPW). Subsequently, a No Further Action (NFA) letter was issued for Closure Permit Number 5999B by the Los Angeles County Department of Public Works, Waste Management Division (currently Environmental Programs Division) dated August 6, 1992, which pertains to the three exterior removed USTs. The abandoned in-place UST was assigned a separate Closure Permit Number of 6000B, which was not listed on the NFA letter. However, based on preliminary conversations with LACDPW staff, this appears to be an error in which Tank 4 should have been noted, as all four USTs appear to have been closed under this NFA letter.

An *environmental issue* refers to environmental concerns identified by Partner, which do not qualify as RECs; however, warrant further discussion. The following was identified during the course of this assessment:

- Partner noted exterior storage at the subject property including raw materials (covered) and unused hydraulic equipment, as well as approximately eight 55-gallon drums with no secondary containment, predominantly on the exterior west side of the building. Due to the presence of excessive storage covered with plastic sheeting (to protect raw material from sun exposure), this area was not fully accessed and evaluated by Partner. Partner noted that the observed drums were labelled as Non-Resource Conservation and Recovery Act (RCRA) hazardous waste solid, which is an oily debris, and Non-RCRA liquid waste oil. Minor oil staining was observed on the pavement under one of the drums that was covered with an absorbent material. According to site personnel, the waste is routinely collected by Express Oil Company, a third party vendor, on a regular basis. Based on the nature of the reported contents issuance of a Stormwater Pollution Prevention Plan (SWPPP), and lack of violations noted, the exterior storage is not expected to represent a significant environmental concern;

- The subject property formerly operated printing machinery, which is no longer conducted. The printing area was located in the southeast portion of the building that was constructed in 1973. This area is used for general storage at this time. According to reported information in a prior Environmental Audit Report dated 1990, small amounts of oil-based ink and methyl ethyl ketone (MEK) (35 gallons/year) were used. No drains or other subsurface conduits are located in this area. Former printing operations are not expected to present a significant environmental concern;
- Due to the age of the subject property buildings, there is a potential that asbestos-containing material (ACM) and/or lead-based paint (LBP) are present. Overall, all suspect ACMs and painted surfaces were observed in fair to good condition and do not pose a health and safety concern to the occupants of the subject property at this time. The identified suspect ACMs would need to be sampled to confirm the presence or absence of asbestos prior to any renovation or demolition activities to prevent potential exposure to workers and/or building occupants. A prior survey conducted in 1990 (Environmental Audit report by Tetra Tech February 1990) identified asbestos in drywall next to the cooling tower and office ceiling tiles (1,360 SF of material). The amount of asbestos containing drywall was not reported.

**Conclusions, Opinions and Recommendations**

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 of 12021 and 12023 Woodruff Avenue in the City of Downey, Los Angeles County, California (the "subject property"). Any exceptions to, or deletions from, this practice are described in Section 1.5 of this report.

This assessment has revealed evidence of a recognized environmental condition and environmental issues in connection with the subject property. Based on the conclusions of this assessment, Partner recommends the following:

- A limited subsurface investigation should be conducted in order to determine the presence or absence of soil and/or soil vapor contamination due to the current and historical use of the subject property;
- A Soil Management Plan (SMP) should be prepared to appropriately handle the known oil releases at the subject property and any unknown releases associated with the current and former industrial use;
- The NFA letter dated August 6, 1992, pertaining to the historical USTs at the subject property should be revised to clearly include Closure Permit Number 6000B for the abandoned in-place UST to avoid confusion in the future as to whether it was officially closed.
- An asbestos survey conducted in 1990 identified asbestos in the subject property building. It is not known if the survey was conducted for all equipment and building materials at the time; therefore, an asbestos survey should be performed and known ACM should be abated or removed for safety purposes (or an Operations and Maintenance (O&M) Program should be

implemented in order to safely manage the known and suspect ACMs located at the subject property).

# 1.0 INTRODUCTION

Partner Engineering and Science, Inc. (Partner) has performed a Phase I Environmental Site Assessment (ESA) in general conformance with the scope and limitations of ASTM Standard Practice E1527-13, the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) and as set forth by the Master Services Agreement between Prologis and Partner dated April 18, 2013 for the property located at 12021 and 12023 Woodruff Avenue in the City of Downey, Los Angeles County, California (the "subject property"). Any exceptions to, or deletions from, this scope of work are described in the report.

## 1.1 Purpose

The purpose of this ESA is to identify existing or potential Recognized Environmental Conditions (as defined by ASTM Standard E1527-13) affecting the subject property that: 1) constitute or result in a material violation or a potential material violation of any applicable environmental law; 2) impose any material constraints on the operation of the subject property or require a material change in the use thereof; 3) require clean-up, remedial action or other response with respect to Hazardous Substances or Petroleum Products on or affecting the subject property under any applicable environmental law; 4) may affect the value of the subject property; and 5) may require specific actions to be performed with regard to such conditions and circumstances. The information contained in the ESA Report will be used by Client to: 1) evaluate its legal and financial liabilities for transactions related to foreclosure, purchase, sale, loan origination, loan workout or seller financing; 2) evaluate the subject property's overall development potential, the associated market value and the impact of applicable laws that restrict financial and other types of assistance for the future development of the subject property; and/or 3) determine whether specific actions are required to be performed prior to the foreclosure, purchase, sale, loan origination, loan workout or seller financing of the subject property.

This ESA was performed to permit the *User* to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on scope of Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. §9601) liability (hereinafter, the "*landowner liability protections*," or "*LLPs*"). ASTM Standard E1527-13 constitutes "*all appropriate inquiry* into the previous ownership and uses of the *property* consistent with good commercial or customary practice" as defined at 42 U.S.C. §9601(35)(B).

## 1.2 Scope of Work

The scope of work for this ESA is in general accordance with the requirements of ASTM Standard E1527-13. This assessment included: 1) a property and adjacent site reconnaissance; 2) interviews with key personnel; 3) a review of historical sources; 4) a review of regulatory agency records; and 5) a review of a regulatory database report provided by a third-party vendor. Partner contacted local agencies, such as environmental health departments, fire departments, and building departments in order to determine any current and/or former hazardous substances usage, storage, and/or releases of hazardous substances on the subject property. Additionally, Partner researched information on the presence of activity and use limitations (AULs) at these agencies. As defined by ASTM E1527-13, AULs are the legal or physical

restrictions or limitations on the use of, or access to, a site or facility: 1) to reduce or eliminate potential exposure to hazardous substances or petroleum products in the soil or groundwater on the subject property; or 2) to prevent activities that could interfere with the effectiveness of a response action, in order to ensure maintenance of a condition of no significant risk to public health or the environment. These legal or physical restrictions, which may include institutional and/or engineering controls (IC/ECs), are intended to prevent adverse impacts to individuals or populations that may be exposed to hazardous substances and petroleum products in the soil or groundwater on the property.

If requested by Client, this report may also include the identification, discussion of, and/or limited sampling of asbestos-containing materials (ACMs), lead-based paint (LBP), mold, and/or radon.

## 1.3 Limitations

Partner warrants that the findings and conclusions contained herein were accomplished in accordance with the methodologies set forth in the Scope of Work. These methodologies are described as representing good commercial and customary practice for conducting an ESA of a property for the purpose of identifying recognized environmental conditions. There is a possibility that even with the proper application of these methodologies there may exist on the subject property conditions that could not be identified within the scope of the assessment or which were not reasonably identifiable from the available information. Partner believes that the information obtained from the record review and the interviews concerning the subject property is reliable. However, Partner cannot and does not warrant or guarantee that the information provided by these other sources is accurate or complete. The conclusions and findings set forth in this report are strictly limited in time and scope to the date of the evaluations. The conclusions presented in the report are based solely on the services described therein, and not on scientific tasks or procedures beyond the scope of agreed-upon services or the time and budgeting restraints imposed by the Client. No other warranties are implied or expressed.

Some of the information provided in this report is based upon personal interviews, and research of available documents, records, and maps held by the appropriate government and private agencies. This report is subject to the limitations of historical documentation, availability, and accuracy of pertinent records, and the personal recollections of those persons contacted.

This practice does not address requirements of any state or local laws or of any federal laws other than the all appropriate inquiry provisions of the LLPs. Further, this report does not intend to address all of the safety concerns, if any, associated with the subject property.

Environmental concerns, which are beyond the scope of a Phase I ESA as defined by ASTM include the following: ACMs, LBP, radon, and lead in drinking water. These issues may affect environmental risk at the subject property and may warrant discussion and/or assessment; however, are considered non-scope issues. If specifically requested by the Client, these non-scope issues are discussed in Section 6.3.

## 1.4 User Reliance

Prologis, Inc., engaged Partner to perform this assessment in accordance with an agreement governing the nature, scope, and purpose of the work as well as other matters critical to the engagement. All

reports, both verbal and written, are for the sole use and benefit of Prologis, Inc. Either verbally or in writing, third parties may come into possession of this report or all or part of the information generated as a result of this work. In the absence of a written agreement with Partner granting such rights, no third parties shall have rights of recourse or recovery whatsoever under any course of action against Partner, its officers, employees, vendors, successors or assigns. Any such unauthorized user shall be responsible to protect, indemnify and hold Partner, Client and their respective officers, employees, vendors, successors and assigns harmless from any and all claims, damages, losses, liabilities, expenses (including reasonable attorneys' fees) and costs attributable to such Use. Unauthorized use of this report shall constitute acceptance of and commitment to these responsibilities, which shall be irrevocable and shall apply regardless of the cause of action or legal theory pled or asserted. Additional legal penalties may apply.

This report has been completed under specific Terms and Conditions relating to scope, relying parties, limitations of liability, indemnification, dispute resolution, and other factors relevant to any reliance on this report. Any parties relying on this report do so having accepted the Terms and Conditions for which this report was completed.

## 1.5 Limiting Conditions

The findings and conclusions contain all of the limitations inherent in these methodologies that are referred to in ASTM E1527-13.

Specific limitations and exceptions to this ESA are more specifically set forth below:

- Interviews with past owners, operators, and occupants were not reasonably ascertainable and thus constitute a data gap. Based on information obtained from other historical sources (as discussed in Section 3.0), this data gap is not expected to alter the findings of this assessment;
- Partner submitted Freedom of Information Act (FOIA) request to the City of Downey City Clerk's office for original building and mechanical permits. As of the date of this report, this agency has not fulfilled Partner's request. Based on information obtained from other historical sources, this limitation is not expected to alter the overall findings of this assessment.
- Partner's view of the ground during the site assessment was obstructed due to excessive storage of raw materials, containers, bins, equipment, and other items stored on the exterior of the building. Additionally, the full view of the interior floors were largely impeded due to the presence of rubber mixing and rolling equipment. Based on information obtained from other historical sources, this limitation is not expected to alter the overall findings of this assessment.

# 2.0 SITE DESCRIPTION

## 2.1 Site Location and Legal Description

The subject property at 12021 and 12023 Woodruff Avenue in the City of Downey, California is located on the west side of Woodruff Avenue just north of Washburn Road within an industrial area of Los Angeles County. According to the Los Angeles County Assessor, the subject property is associated with Assessor's Parcel Number 6284-025-018 and is legally described as: Rancho Santa Gertrudes Sections, Township and Range Lot (Ex of St) Com N 175 feet from Southeast Corner of NE ¼ of Section 10 T3S R12W Th N 432.15 feet Th W 686.27 feet Th S to a line parallel ¼ of NE ¼ of Lot 10.

According to *Environmental Lien & AUL Report* prepared by AFX Research LLC, ownership is currently vested in Felchco Investment Group LLC since 2013.

Please refer to Figure 1: Site Location Map, Figure 2: Site Plan, Figure 3: Topographic Map, and Appendix A: Site Photographs for the location and site characteristics of the subject property.

## 2.2 Current Property Use

The subject property is currently occupied by Kirkhill, a manufacturer of custom rubber products and has occupied all or part of the subject building since initial construction in 1951. Kirkhill serves the original equipment manufacturer (OEM) industry and wholesale markets and is the original tenant of the subject building since 1951. The manufacture of products by Kirkhill has changed over the years with market demand; the main product currently manufactured is unvulcanized rubber produced in strips, blocks, and sheets. Onsite operations consist of the manufacture of rubber from raw materials through a series of processes starting with large-scale mixing of a variety of polymers, fillers, and various grades of petroleum-based process oils through rubber injection molding, rubber compression molding, sponge rubber molding, and mold fabrication. Product is then warehoused and shipped through several loading dock areas.

Several regulatory permits have been issued for the operation of equipment, storage of hazardous materials, and hazardous waste generation and industrial waste discharges to the municipal sewer system. Kirkhill reports the hazardous substances stored at the subject property through the California Environmental Reporting System (CERS), which most recently listed up to 38 chemical components that included solid raw materials such as custom polymers, talc, neoprene, carbon black, monomers, and zinc stored in 55-gallon drums and larger totes up to 300 gallons. Kirkhill uses polymers of different grades for custom orders. Liquids include petroleum hydrocarbons as lubricating oils, waste lubricating oil, and the process oil is classified as solvent refined in regulatory records. Process oils are currently stored in three interior aboveground storage tanks (ASTs) (two 3,000-gallon ASTs and one 4,000-gallon AST) within the manufacturing area. Various compressed gasses (oxygen, propane, argon, acetylene) are also used at the subject property. Open violations pertaining to hazardous materials storage were not reported by the City of Downey Fire Department or by site personnel. In addition, site personnel are not aware of any environmental impacts, enforcement orders or ongoing environmental investigations at the subject property at this time.

The manufacturing area includes an internal hydraulic system comprised of a network of below-grade trenches and overhead piping that deliver a recirculated non-contact cooling water and hydraulic oil mixture to the presses and molding machines.

A central clarifier is present that is used primarily for boiler blowdown and cooling tower discharges. The clarifier previously received rinse water from a former tank wash out area that included acid and caustic tanks and rinse water tanks, which were used to clean molds, as the molds would get covered with rubber and need to be washed, which then discharged through the clarifier. This operation is no longer conducted and all former wash tanks are gone. The earliest industrial waste discharge permit identified was issued to Kirkhill Inc. dated 1979 which listed the wastewater producing operations as blow down and bleed water from boilers and cooling tower, cleanup, and floor wash down. The constituents of wastewater discharges were listed solely as water. The rate of flow as reported as 1,752 gallons per day at that time. The active 2017 permit reported discharges as calcium stearate water, cooling tower bleed off, boiler blowdown, household washers, rinse water from molding wash rack, lab sinks, self-regenerating water softener backflush, and floor scrubber.

The subject property consists of one large single-story building that was constructed in piecemeal fashion starting in 1951 that has a central open courtyard. The manufacturing area seems to have been consistently on the southern portion of the building. There are up to 30 hydraulic presses on three lines toward the east side of the manufacturing area, and various mixing equipment toward the west side of the manufacturing area. The building includes two laboratories for R&D, newer interior 2-story mixing equipment with batch-off conveyors, special mixing rooms, a cold room, warehouse storage, and office space.

In addition to the current structures, the subject property is also improved with paved parking and driveways that extend around the building, front landscaping, and exterior storage of raw materials, large dumpsters, empty containers, and other miscellaneous active and idle equipment. The subject property maintains a storm water pollution prevention plan (SWPPP) for exterior storage of materials.

The subject property is designated for industrial development by the City of Downey.

The subject property was identified in the EDR regulatory database report, as further discussed in Section 4.2.

## 2.3 Current Use of Adjacent Properties

The subject property is located within an industrial area of the City of Downey. During the vicinity reconnaissance, Partner observed the following land use on properties in the immediate vicinity of the subject property:

***Immediately Surrounding Properties***

**North:** Industrial buildings at 12001, 12003, and 12005 Woodruff Avenue with identified occupants including Servpro (12001), Vulcan Casters (12003) and Storopack (12005)

**South:** Southeast Employment Center at 12049 Woodruff Avenue; The Reagan Banquet and Conference Center event venue at 9545 Washburn Road; Arc-Southeast Industries vocational and education center at 9501 Washburn Road; Stud Welding Products at 9459 Washburn

Road

**East:** Woodruff Avenue followed by a multi-tenant industrial building at 12010-20 Woodruff Avenue; and industrial building at 12000 Woodruff Avenue

**West:** Industrial building at 9451 Washburn Road (Wheel Creations PVD); and Stud Welding at 9455 Washburn Road

Four adjacent addresses were identified on the EDR regulatory database report, as discussed further in Section 4.2. None of the adjacent properties were identified to present an environmental concern.

## 2.4 Physical Setting Sources

### *2.4.1 Topography*

The United States Geological Survey (USGS) *Whittier, California* Quadrangle 7.5-minute series topographic map was reviewed for this ESA. According to the contour lines on the topographic map, the subject property is located at approximately 105 feet above mean sea level (MSL). The contour lines in the area of the subject property indicate the area is relatively flat with a slope in a southerly direction. The subject property is depicted as developed with the existing building in different stages of development in the topographic maps dating between 1964 to 1981, and is depicted as an area of general urban development on the most recent map dated 2012.

A copy of the most recent topographic map is included as Figure 3 of this report.

### *2.4.2 Hydrology*

According to topographic map interpretation, the direction of groundwater in the vicinity of the subject property is inferred to flow toward the south. The nearest surface water in the vicinity of the subject property is the San Gabriel River located approximately 0.36 mile east-southeast of the subject property at its nearest point. No settling ponds, lagoons, surface impoundments, wetlands, or natural catch basins were observed at the subject property during this assessment.

According to available information, a public water system operated by the City of Downey Department of Public Works serves the subject property vicinity. The City water supply and distribution system is composed of 20 groundwater wells located throughout the City and approximately 276 miles of distribution pipeline. The city wells provide one hundred percent of the domestic water supply. Partner contacted the City of Downey Public Works Department for information on the location of the city drinking water wells. The nearest city well to the subject property is located approximately 470 feet southeast (downgradient) of the subject property at 9643 Washburn Road. This is an active well that draws water from the Silverado Aquifer at a depth of approximately 540 feet bgs. No environmental issues were reported in connection with this well. This well undergoes annual groundwater testing as reported in the Annual Water Quality Report.

According to information reported by the State Water Resources Control Board GeoTracker website for a property located approximately 0.53 mile south of the subject property at 9851 Imperial Highway in Downey, the depth and direction of groundwater in the vicinity of the subject property is inferred to be approximately 33 to 53 feet below ground surface (bgs) and flow toward the southeast. This information

was collected during Second Quarter 2018 groundwater monitoring activities at this property. In addition, during a 2013 Phase II ESA investigation conducted at the subject property by PCI Environmental Services (PIC), groundwater was encountered at 45 feet bgs in two soil borings at PIC-1 and PIC-2 (but not sampled).

### *2.4.3 Geology/Soils*

The subject property is located within the San Gabriel River flood plain. Underlying soil consists of Pleistocene alluvial sediments. PIC's 2013 Phase II Investigation reviewed herein determined that to an approximate depth of 50 feet below surface, soil consists of brown, fine grained sand and silt overlying grey, clayey silt. The lithology is consistent with alluvial deposition within the San Gabriel River Flood Plain.

Based on information obtained from the USDA Natural Resources Conservation Service Web Soil Survey online database, the subject property is mapped as Urban land-Hueneme, drained-San Emigdio complex, 0 to 2 percent slopes (#1000). The landform is described as alluvial fans and the parent material is described as discontinuous human-transported material over mixed alluvium derived from granite and/or sedimentary rock.

### *2.4.4 Flood Zone Information*

Partner performed a review of the Flood Insurance Rate Map, published by the Federal Emergency Management Agency (FEMA). According to Community Panel Number 06037C1840F dated September 26, 2008, the subject property is mapped as located in Zone X, an area of 0.2 percent annual chance flood hazard.

A copy of the reviewed flood map is included in Appendix B of this report.

# 3.0 HISTORICAL INFORMATION

Partner obtained historical use information about the subject property from a variety of sources. A chronological listing of the historical data found is summarized in the table below:

| *Historical Use Information* | | |
|---|---|---|
| **Period/Date** | **Source** | **Description/Use** |
| 1896-1902 | Topographic Maps | Possible Small Farm House |
| 1928-1947 | Aerial Photographs, Previous Reports | Agricultural |
| 1951-Present | Aerial Photographs, City Directories, Topographic Maps, Previous Reports, Assessor's Records | Kirkhill Rubber Mfg/Industrial Usage |

According to available historical sources, the subject property was formerly open farm land going back to at least 1928 until it was developed in 1951. The property appeared to be row crops with no farm structures identified in aerial photographs; however, the property may have been developed in the late 19th Century with a farm home as shown on topographic maps, which had been removed by 1923. Anecdotally, farmers in the Downey area typically grew grain, corn, castor beans, and fruit, and by 1935, Downey was characterized as an orange-grove town.

Occupants of the subject property have included Kirkhill Inc. (et.al, including Kirkhill Chemical) on the southern/manufacturing areas of the subject property, as well as tenants including Charcoal Masters International, Immanuel Industries Inc., Source One Staffing, Felchco Investment Group LLC, Cal Pipe Industries Inc., Cal Pipe Manufacturing Inc., Carnaval Access, Discount Advertising Xpress, Ikeep Inventing Corporation, Kollaborator Productions, Inc., Monster Sells, Hector Moran, Nomad Trading, Perimeter Defense Tech Inc., PTG International Inc., Standard industries and Kong Pet Toys on the warehouse/northern portions. Based on interviews with the site contact, it appears that the northern side of the subject property was leased at various times for warehouse and office space.

## 3.1 Aerial Photograph Review

Partner obtained available aerial photographs of the subject property and surrounding area from Environmental Data Resources (EDR). The following observations were noted to be visible on the subject property and adjacent properties during the aerial photograph review:

| *Date: 1928, 1938, and 1947* | *Scale: 1"=500'* |
|---|---|
| **Subject Property:** | The subject property was depicted as open agricultural land planted with row crops with no structures present. Woodruff Avenue and Washburn Road were both present at that time. |
| **North:** | Agricultural land with no structures present |
| **South:** | Agricultural land with no structures present |
| **East:** | Agricultural land with no structures present |
| **West:** | Agricultural land with no structures present |

| *Date: 1953* | *Scale: 1"=500'* |
|---|---|
| **Subject Property:** | The subject property was constructed with approximately half the square footage of the current building primarily in the center and north side of the parcel and appeared as separate structures adjoined at the corners. The west side of the |

| ***Date: 1953*** | ***Scale: 1"=500'*** |
|---|---|
| | property was undeveloped land that may have remained agricultural, as it looked similar to the surrounding farm land that was present to the north and west |
| **North:** | Agricultural land with no structures present |
| **South:** | The existing Arc-Southeast Industries at 9501 Washburn Road was present that was constructed in 1952, per Assessor's records |
| **East:** | The area was developed with a large manufacturing facility with several long rectangular buildings and a rail spur that entered the property from the east. According to city directories, this facility was occupied by Darnell Corporation that developed the facility in 1951 for the manufacture of casters and rubber products such as bumpers and extrusions. The area closest to the subject property was a parking lot |
| **West:** | Agricultural land with no structures present |

| ***Date: 1963*** | ***Scale: 1"=500'*** |
|---|---|
| **Subject Property:** | The subject property building had expanded to the west and south since the 1953 photograph. The west side of the property remained undeveloped with no apparent usage. The southern and eastern portions of the property appeared to be used for parking |
| **North:** | Undeveloped land covered with vegetation that did not appear to be cultivated |
| **South:** | An additional development was present from 1953 at 9545 Washburn Road that was constructed in 1957 as well as the building at 9459 Washburn Road built in 1958 |
| **East:** | No significant changes noted |
