Stationary Source Request_Phillips 66 Modernization_MH.xlsx

You don't often get email from mhanson@baaqmd.gov. Learn why this is important

Hi Meagan,

Attached is your request for:

1. Phillips 66 Modernization

The risk values are based off ARB's CEIDARS 2018 report which uses OEHHA 2015 methodology. Please refer to ARB's website for more information.

Note if you need a more detailed source list for the below facility#s, you will need to make a public records request.

17315	C & H Sugar Company, Inc
581	ST Shore Terminals LLC
17419	Air Liquide Large Industries US LP

Best Regards,

Matthew Hanson

Subject: Stationary Source Data Request - Rodeo, CA

CAUTION: This email originated from outside of the BAAQMD network. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Hi Areana,

I am writing to request stationary source data assistance. I have attached a stationary source inquiry form and PDF of the downloaded CSV for your reference.

Please let me know if you have any questions or need anything else.

Thanks,

Meagan

1.0 Introduction and Summary

Tesoro Refining & Marketing Company LLC, an indirect, wholly-owned subsidiary of Marathon Petroleum Corporation (herein referenced as Marathon), has applied for permits to construct and operate the proposed Martinez Renewable Fuels Project (project) at its existing Martinez Refinery (herein referenced as Martinez or facility) and Amorco Terminal. Site locations are shown in Figure 1-1 below. This report presents the results of a health risk assessment (HRA) prepared to demonstrate that toxic air contaminant emission increases associated with the project are below BAAQMD CEQA Thresholds of Significance.

Results of the HRA show that impacts from the project are well below BAAQMD CEQA thresholds. Details of the HRA follow.

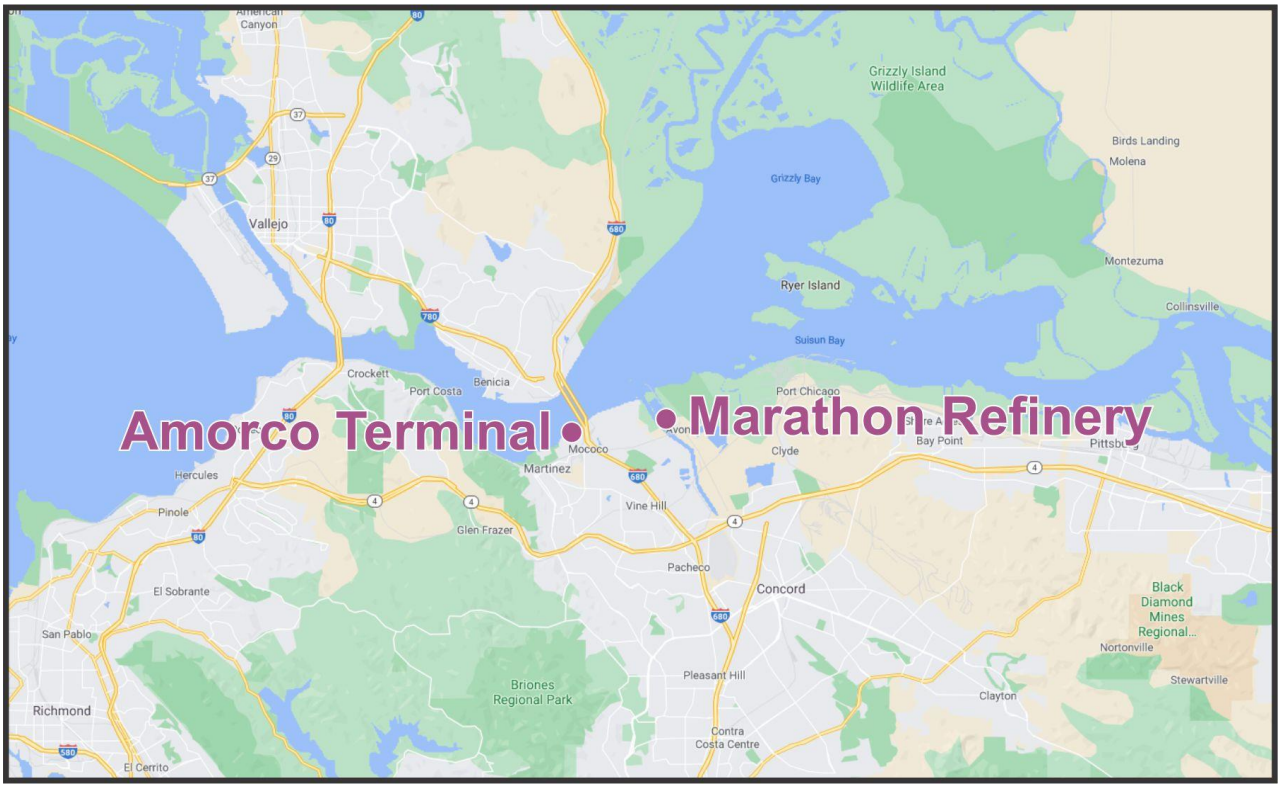

Figure 1-1 Locations of Marathon Facilities

2.0 Modeling Approach

2.1 Methodology

Project cancer and chronic risk were determined by subtracting pre-project risk from post-project risk at offsite receptors. This approach was taken to assess the impact of the project itself (i.e., to determine if the proposed project increased or reduced offsite risk).

Pre-project sources included all equipment associated with the project, including those that will be shut down, equipment that will be physically changed, and equipment that will undergo a change in the method of operation. Post-project sources included all new sources, equipment that will be physically changed, and equipment that will undergo a change in the method of operation. Mobile sources of diesel particulate matter, along with ship hoteling at the Avon and Amorco wharfs, were also included. Note that some of the post-project sources have no toxics in their emissions. Acute risk was based on post-project emissions only[1].

A separate modeling evaluation was performed for diesel particulate matter (DPM) emissions resulting from construction activities associated with the project. Construction activities at the facility are expected to take place over an estimated 22-month duration. Construction activities at the Avon wharf and at the Amorco wharf are expected to take place over approximately 3 months. Due to the different construction project durations, separate model runs were performed for the facility and wharf sources, and results were summed in a spreadsheet.

Modeling was performed following BAAQMD and OEHHA guidance[2]. All operational, mobile, and construction sources were assumed to emit 24 hours per day, 7 days per week. Hourly emission rates were assumed to be the annual emission rates divided by 8,760. As DPM is associated only with cancer and chronic risk, acute risk from construction activities was not evaluated.

---

[1] Because the maximum acute risk at any receptor could occur under different meteorological conditions for the pre-project and the post-project scenarios, subtracting pre-project maximum acute risk from post-project maximum acute risk would potentially provide inaccurate estimates of the increase (or decrease) in risk. Therefore, a conservative approach of only considering post-project emissions was taken. For any individual source with lower post-project emissions than pre-project emissions for a particular toxic chemical, acute risk from that chemical from that source would be reduced.

[2] Bay Area Air Quality Management District, BAAQMD Health Risk Assessment Modeling Protocol, December 2020.
California Office of Environmental Health Hazard Assessment (OEHHA) 2015. Air Toxics Hot Spots Program Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments, February 2015.

The results of the health risk assessment were compared to BAAQMD CEQA Thresholds of Significance[3]. The thresholds are shown below:

- Increased cancer risk of >10.0 in a million
- Increased non-cancer risk of > 1.0 Hazard Index (chronic or acute)

Results of the HRA show that impacts from the project are well below BAAQMD CEQA thresholds. For operational sources, post-project cancer and chronic risks were found to be lower than pre-project risks at all receptors (i.e., net risk values at all receptors were negative). Acute risk was evaluated based on post-project emissions only. Acute risks were found to be low at every potential receptor. For construction activities, cancer and chronic risk were well below CEQA thresholds.

2.2 Dispersion Model

The AMS/EPA Regulatory Model (AERMOD, v. 21112), the air dispersion model currently preferred by U.S. EPA and approved by the BAAQMD, was used for this analysis. AERMOD simulates the atmospheric transport and dilution of emissions from project sources. This mathematical model estimates dilution of emissions by diffusion and turbulent mixing with ambient air as the emissions travel downwind from a source. AERMOD can predict the resulting concentrations at specified locations of interest (commonly referred to as receptors). The model is capable of predicting impacts from any combination of point, area, and volume sources in terrain ranging from flat to complex.

2.3 Project Sources

2.3.1 Operational Sources

As described above, modeled sources include all new equipment, equipment that will be shut down, equipment that will be physically changed, and equipment that will undergo a change in the method of operation. Stationary sources were modeled as point, volume, and area sources as appropriate. Storage tanks were modeled as AREACIRC sources with the height set equal to the height of the tank and the radius set equal to the radius of the tank, with the exception of fixed roof tanks on vapor recovery which were modeled as point sources with location and parameters at the stack. Process unit fugitive piping component sources were modeled as volume sources with a release height of 10 feet. Cooling towers were modeled as volume sources with release heights based on actual cooling tower heights. Mobile sources consisted of locomotive engines, trucks traveling on paved roads within facility boundaries, and ship hoteling at the Avon and Amorco wharfs. Locomotive engines were modeled as a string of evenly-spaced volume sources along the segments of track where engines are expected to travel. Truck exhaust was modeled as line sources along the roads traveled to and from the various operational areas within the facility. Ship hoteling was modeled as point sources located in the approximate center of where ships are expected to berth at the Avon and Amorco wharves.

[3] Bay Area Air Quality Management District, California Environmental Quality Act Air Quality Guidelines, May 2017, Table 2-1.

Total pre- and post-project emission rates by substance are provided in Attachment A. A complete list of sources included in the modeling and their respective parameters are included in Attachment B. A map of the modeled sources is included as Figure C-1 in Attachment C. Source-by-source emission rates can be found in the electronic files provided in Attachment F.

2.3.2 Construction Sources

Construction sources included offroad diesel equipment such as lifts, air compressors, cranes, forklifts, generators, and tractors as well as onroad diesel vehicles such as pickup trucks, cement trucks, dump trucks, and water trucks. Offroad equipment were modeled as area sources, with a single area source encompassing construction activity within facility boundaries as well as an area source at the Avon wharf and an area source at the Amorco wharf where construction will take place. Onroad vehicles were modeled as line sources located along roads where travel is expected.

Construction DPM emission rates are provided in Attachment A. A list of construction emission sources included in the modeling and their respective parameters are included in Attachment B. A map of the modeled sources is included as Figure C-2 in Attachment C.

2.4 Terrain Characterization

AERMOD requires that each source in the analysis be categorized as being in either a rural or an urban setting. As most of the land in the immediate vicinity of the terminal is undeveloped, and the areas north of the facility are water, all sources were designated as rural.

Sources and receptors were modeled with consideration of terrain elevations. The AERMOD terrain processor (AERMAP) was used to calculate terrain elevations for each source and receptor from the U.S. Geological Survey (USGS) National Elevation Dataset (NED).

2.5 Building Downwash

When point sources are located near or on buildings or structures, the dispersion of the plume can be influenced. The wake produced on the lee side of the structure can cause the plume to be pulled toward the ground near the structure resulting in higher concentrations. This is called building downwash. Stack heights that minimize downwash effects are designated good engineering practice (GEP) stack heights.

The effects of building downwash have been examined in this modeling analysis. AERMOD uses the EPA-approved Building Profile Input Program with Plume Rise Model Enhancements (BPIP-PRIME) to provide input for the downwash analysis. This program calculates the GEP formula stack heights and direction-specific building dimensions for input to the dispersion calculations. BPIP-PRIME requires the input of building coordinates and heights, and stack coordinates; structures judged to have downwash potential were included.

2.6 Meteorological Data

A five-year dataset covering the years 2012, 2013, 2014, 2015, and 2017 for a meteorological station located at the Marathon Refinery was used. The data was processed using AERMET version 18081, the

AERMOD meteorological data preprocessor. A windrose showing a graphical distribution of wind speed and wind direction for the time period modeled is shown in Figure D-1 in Attachment D.

2.7 Receptors

Receptor spacing followed BAAQMD guidance and included the following:

- 20-m spacing along the fenceline
- 25-m spaced receptors out to 200 meters
- 50-m spaced receptors out to 500 meters from the facility boundary
- 100-m spaced receptors out to 2,000+ meters from the facility boundary

Additionally, sensitive receptors (hospitals, schools, and daycare centers) within the modeling domain were added. An additional set of receptors, spaced at 500 meters apart, was added to the far northern portion of the modeling domain for the construction modeling only, in order to fully capture the one per million residential cancer risk contour line.

Receptor heights above ground were set to 0.0 meters. This network is composed of Cartesian (X,Y) receptors with Universal Transverse Mercator (UTM) coordinates. The modeling was conducted using the North American Datum of 1983 (NAD83).

Figure C-3 plots the receptor locations. A total of 22,731 fenceline, grid, and sensitive receptors were included in the analysis (plus an additional 234 receptors for the construction modeling scenario). A list of the sensitive receptors is included in Attachment E. The closest sensitive receptor was located at the Floyd I. Marchus School, about 850 meters southeast of the southern boundary of the facility.

3.0 Risk Characterization

The air dispersion modeling is used to estimate normalized ground level concentrations based on an emission rate of one gram per second for each emission source (χ/Q or Chi over Q). Since ambient concentration is directly related to emission rate, the χ/Q is then multiplied in HARP by the emission rate for each substance from each source to obtain a ground-level concentration (GLC) resulting from each substance. Potential pathways of exposure to potential offsite receptors by each substance are identified (e.g., inhalation, dermal) and the appropriate algorithms are then used together with the χ/Q to estimate the concentration in air, soil, water, vegetation, and animals. The potential exposure levels to receptors are then estimated for each substance. HARP analyzes this data to calculate cancer risk and non-cancer risks. Default risk analysis methods were used, and default values for all pathways were used with the exception of the dermal pathway, which assumed a "cold" climate per OEHHA guidance. Per OEHHA guidance for HARP modeling, a deposition velocity of 0.02 m/s was assumed for the non-inhalation pathways.

The exposure pathways chosen for this analysis were inhalation, homegrown produce, dermal absorption, soil ingestion, and mother's milk for residential exposure and inhalation, dermal absorption, and soil ingestion for worker pathways. Pathways of fish ingestion, dairy milk ingestion, drinking water consumption, and meat ingestion were not used as the facility does not impact a local fishable body of water, grazing land, dairy, or water reservoir.

3.1 Carcinogens

The cancer health impacts are characterized as a cancer risk that represents the chances per million people of developing cancer. The cancer risk from each substance is added together to arrive at a total cancer risk. HARP calculates cancer risk based on annual average concentrations. Assumed exposure durations are provided in the table below.

Table 3-1 Exposure Duration Assumptions for Cancer Risk

Modeling Scenario	Residential Exposure	Worker Exposure	Worker Adjustment Factor
Operations	24 hours per day, 350 days per year over a 30-year period	8 hours per day, 250 days per year over a 25-year period	None
Construction	24 hours per day, 350 days per year over a 2-year period (facility area) or a 1-year period (wharf areas)	8 hours per day, 250 days per year over a 2-year period (facility area) or a 1-year period (wharf areas)	None

3.2 Non-Carcinogens

The non-cancer health impacts are characterized by a hazard index (HI). When more than one chemical is considered, it is assumed that the effects are additive provided the associated chemicals are expected to

have an adverse impact on the same target organ system (respiratory system, liver, etc.). Thus, chemical-specific hazard indices are summed to arrive at a hazard index for each target organ. For any organ system, a total hazard index exceeding 1.0 indicates a potential health effect. Although the assumption of additivity of exposure to multiple chemicals ignores possible antagonistic or synergistic interactions, this approach has been accepted by regulatory agencies as generally conservative.

4.0 Health Risk Results

BAAQMD CEQA Air Quality Guidelines provide Thresholds of Significance of an increased cancer risk of 10.0 per million and an increased non-cancer chronic or acute hazard index of 1.0. The predicted increase in health risks at maximally exposed offsite receptors resulting from the project are summarized below. As shown, the highest calculated cancer, chronic, and acute risks are below CEQA Thresholds of Significance. Therefore, project risk impacts are less than significant.

4.1 Operational Sources

The predicted increase in health risks at maximally exposed offsite receptors resulting from operational sources are given by category in Table 4-1 below. As shown, the highest calculated cancer and chronic risks are negative, indicating a reduction in risk, and increases in acute risk are below the CEQA Thresholds of Significance.

Table 4-1 Summary of Results at Maximally Exposed Offsite Receptors

Location	Risk/HI Value	Receptor Number	Easting (X) (m)	Northing (Y) (m)
Cancer Risk (Per Million)[4]				
Point of maximum impact (PMI)	-0.55	11755	576400	4204500
Chronic Hazard Index				
Point of maximum impact (PMI)	-0.00220	18609	574800	4212100
Acute Hazard Index				
Point of maximum impact (PMI)	0.336	192	581794.8	4210144.5
Residential receptor	0.097	8911	583750	4206400
Offsite workplace receptor	0.107	1646	583625	4206650
Sensitive Receptor	0.074	22708	584099	4205924

The maximum acute hazard index at the point of maximum impact (PMI) was 0.336, at a fenceline receptor on the northeast side of the facility near the water treatment surge ponds. The largest sources of risk were fugitive emissions associated with Stage 1 wastewater treatment (source ID 2001) and the bulk loading rack (source ID 1025) at 68.2% and 14.7%, respectively. The remaining sources responsible for the risk were primarily piping fugitives and storage tanks. The risk was almost entirely due to benzene (>98%). The target organ/system for the highest acute risk at the PMI was the immunological system.

The maximum acute hazard index at a residential receptor was 0.097 south of the facility across the California Delta Highway. The maximum acute hazard index at an offsite workplace receptor was 0.107,

[4] As cancer and chronic risk were below zero at all receptors, only the highest values are shown here.

located near the fenceline south of Mallard Reservoir. The maximum acute hazard index at a sensitive receptor was 0.074 at Concord Christian Schools located about one kilometer south of the facility. The locations of the maximum acute hazard indices are shown in Figure C-5.

4.2 Construction Sources

The predicted increase in health risks at maximally exposed offsite receptors resulting from construction sources are given by category in Table 4-2 below. As shown, the highest calculated cancer and chronic risks at residential, worker, and sensitive receptors are below the CEQA Thresholds of Significance. Note that as only diesel particulate matter (DPM) emissions were modeled from construction sources and no acute health risk assessment values have been developed for DPM, acute risk was not considered.

Table 4-2 Summary of Results at Maximally Exposed Offsite Receptors

Location	Risk/HI Value	Receptor Number	Easting (X) (m)	Northing (Y) (m)
Cancer Risk (Per Million)				
Residential receptor	2.65	4861	585025	4209500
Offsite workplace receptor	0.04	3444	584825	4208650
Sensitive Receptor	0.70	22689	579754	4207262
Chronic Hazard Index				
Residential receptor	0.0015	4861	585025	4209500
Offsite workplace receptor	0.0015	3444	584825	4208650
Sensitive Receptor	0.0004	22689	579754	4207262

The maximum cancer risk at a residential receptor was 2.65 per million, at a receptor located in a neighborhood east of the facility. The maximum cancer risk at a worker receptor was 0.04 per million, at a commercial/industrial area just east of Mallard Reservoir south of the eastern portion of the facility. The maximum cancer risk at a sensitive receptor[5] was 0.70 per million, at Las Juntas Elementary School located about 2,000 meters west of the southwestern facility fenceline.

The maximum chronic risks at the highest residential receptor, highest worker receptor, and highest sensitive receptor were very low (hazard index <0.01) and were found at the same locations as the respective maximum cancer risks.

[5] Cancer risk at sensitive receptors was conservatively calculated assuming 24 hours per day exposure, 350 days per year over a 30-year period (same as residential cancer risk).

5.0 Conclusion

This HRA shows that health risk impacts from the Martinez Renewable Fuels Project will be well below BAAQMD CEQA Thresholds of Significance. There is generally a significant reduction in operational source toxic emissions which results in a reduction in cancer and chronic risk, and any increase in acute risk will be insignificant. The increases in cancer and chronic risk associated with diesel particulate matter emissions from construction equipment are well below CEQA thresholds.

Attachment A

Emission Rates

Table A-1 Pre-Project Modeled Emission Rates – Operational Sources Modeling

CAS #	TAC Name	Emission Rate (lb/yr)	Emission Rate (lb/hr)
1080	Dibenzofurans (chlorinated) {PCDFs} [Treated as 2378TCDD for HRA]	9.77E-06	1.12E-09

Table A-3 Construction DPM Emission Rates

Project Component	Project Total Emissions (lbs)	Estimated Annual Emissions (lbs)
Off-road Diesel Construction Equipment – Main Facility	949.22	474.61
Off-road Diesel Construction Equipment – Avon Wharf	3.47	3.47
Off-road Diesel Construction Equipment – Amorco Wharf	0.94	0.94
Trucks – Employee North	1.25	0.63
Trucks – Employee South	3.43	1.71
Trucks – WWT South	0.37	0.18
Trucks – 3HDS South	0.36	0.18
Trucks – Main Material Yard South	1.82	0.91

Notes:

1. Facility construction expected to occur over an estimated 22-month period. Modeling assumed construction duration of 2 years with total emissions split evenly over each year. Truck emission sources listed above associated with facility construction.
2. Avon Wharf and Amorco Wharf construction expected to occur over an estimated 3-month period. Modeling assumed construction duration of 1 year. Truck traffic associated with wharf construction considered negligible.

1.0 Introduction and Summary

Tesoro Refining & Marketing Company LLC, an indirect, wholly-owned subsidiary of Marathon Petroleum Corporation (herein referenced as Marathon), has applied for permits to construct and operate the proposed Martinez Renewable Fuels Project (project) at its existing Martinez Refinery (herein referenced as Martinez or facility) and Amorco Terminal. Site locations are shown in Figure 1-1 below. This report presents the results of a dispersion modeling analysis prepared to demonstrate that emission increases of fine particulate matter with an aerodynamic resistance diameter of 2.5 micrometers or less ($PM_{2.5}$) associated with the project are below BAAQMD CEQA Thresholds of Significance.

Results of the modeling analysis show that impacts from the project are below BAAQMD CEQA thresholds. Details of the modeling analysis follow.

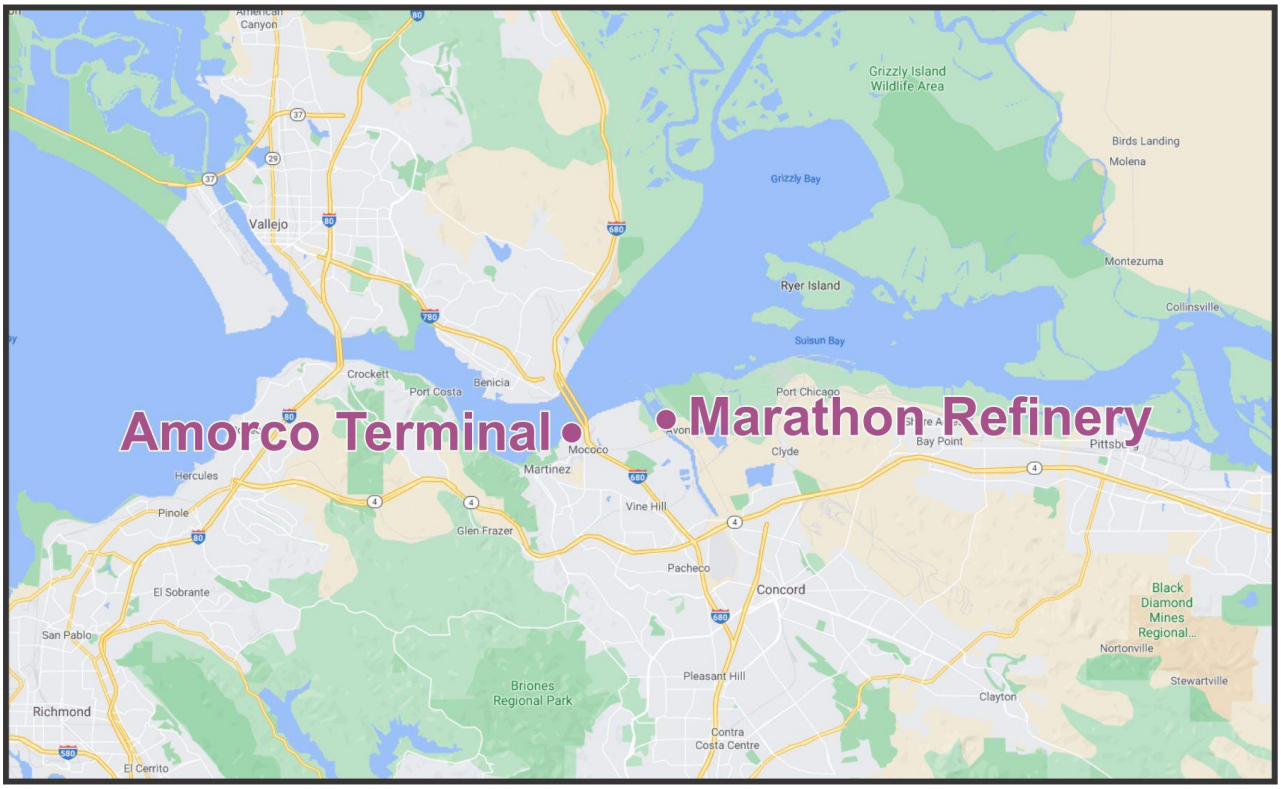

Figure 1-1 Locations of Marathon Facilities

2.0 Modeling Approach

2.1 Methodology

BAAQMD CEQA Guidelines[1] state that a project has a significant impact of there is an incremental increase of greater than 0.3 micrograms per cubic meter (µg/m^3) annual average $PM_{2.5}$. The modeling approach taken in this analysis was to subtract post-project annual average $PM_{2.5}$ concentrations from pre-project annual average $PM_{2.5}$ concentrations at receptors in the vicinity of the facility.

Pre-project sources included all equipment associated with the project, including those that will be shut down, equipment that will be physically changed, and equipment that will undergo a change in the method of operation. Post-project sources included all new sources, equipment that will be physically changed, and equipment that will undergo a change in the method of operation. Mobile sources of $PM_{2.5}$, along with ship hoteling at the Avon and Amorco wharfs, were also included.

Modeling was performed following BAAQMD guidance[2]. All sources were assumed to emit 24 hours per day, 7 days per week.

Results of the modeling analysis show that impacts from the project are below BAAQMD CEQA thresholds. Post-project $PM_{2.5}$ concentrations were found to be lower than pre-project concentrations at all receptors (i.e., net change at all receptors was negative).

2.2 Dispersion Model

The AMS/EPA Regulatory Model (AERMOD, v. 21112), the air dispersion model currently preferred by U.S. EPA and approved by the BAAQMD, was used for this analysis. AERMOD simulates the atmospheric transport and dilution of emissions from project sources. This mathematical model estimates dilution of emissions by diffusion and turbulent mixing with ambient air as the emissions travel downwind from a source. AERMOD can predict the resulting concentrations at specified locations of interest (commonly referred to as receptors). The model is capable of predicting impacts from any combination of point, area, and volume sources in terrain ranging from flat to complex.

2.3 Project Sources

As described above, modeled sources include all new equipment, equipment that will be shut down, equipment that will be physically changed, and equipment that will undergo a change in the method of operation. Combustion sources were modeled as point sources (stacks). Cooling towers were modeled as volume sources with release heights based on actual cooling tower heights. Coke screening and crushing as well as coke and sulfur loadout were also modeled as volume sources. The two coke silos were

[1] Bay Area Air Quality Management District, California Environmental Quality Act Air Quality Guidelines, May 2017, Table 2-1.
[2] Bay Area Air Quality Management District, BAAQMD Health Risk Assessment Modeling Protocol, December 2020.

modeled as area sources. Mobile sources consisted of locomotive engines, trucks traveling on paved roads within facility boundaries, and ship hoteling at the Avon and Amorco wharfs. Locomotive engines were modeled as a string of evenly-spaced volume sources along the segments of track where engines are expected to travel. Truck exhaust was modeled as line sources along the roads traveled to and from the various operational areas within the facility. Ship hoteling was modeled as point sources located in the approximate center of where ships are expected to berth at the Avon and Amorco wharves.

Source-by-source pre- and post-project emission rates are provided in Attachment A. A complete list of sources included in the modeling and their respective parameters are included in Attachment B. Maps of the modeled pre-project and post-project sources are included as Figure C-1 and Figure C-2, respectively, in Attachment C.

2.4 Terrain Characterization

AERMOD requires that each source in the analysis be categorized as being in either a rural or an urban setting. As most of the land in the immediate vicinity of the terminal is undeveloped, and the areas north of the facility are water, all sources were designated as rural.

Sources and receptors were modeled with consideration of terrain elevations. The AERMOD terrain processor (AERMAP) was used to calculate terrain elevations for each source and receptor from the U.S. Geological Survey (USGS) National Elevation Dataset (NED).

2.5 Building Downwash

When point sources are located near or on buildings or structures, the dispersion of the plume can be influenced. The wake produced on the lee side of the structure can cause the plume to be pulled toward the ground near the structure resulting in higher concentrations. This is called building downwash. Stack heights that minimize downwash effects are designated good engineering practice (GEP) stack heights.

The effects of building downwash have been examined in this modeling analysis. AERMOD uses the EPA-approved Building Profile Input Program with Plume Rise Model Enhancements (BPIP-PRIME) to provide input for the downwash analysis. This program calculates the GEP formula stack heights and direction-specific building dimensions for input to the dispersion calculations. BPIP-PRIME requires the input of building coordinates and heights, and stack coordinates; structures judged to have downwash potential were included.

2.6 Meteorological Data

A five-year dataset covering the years 2012, 2013, 2014, 2015, and 2017 for a meteorological station located at the Marathon Refinery was used. The data was processed using AERMET version 18081, the AERMOD meteorological data preprocessor. The model calculated 5-yr average $PM_{2.5}$ concentrations at each receptor; the 5-yr average was used to compare against the CEQA annual average $PM_{2.5}$ concentration threshold of 0.3 $\mu g/m^3$. A windrose showing a graphical distribution of wind speed and wind direction for the time period modeled is shown in Figure D-1 in Attachment D.

2.7 Receptors

Receptor spacing followed BAAQMD guidance and included the following:

- 20-m spacing along the fenceline
- 25-m spaced receptors out to 200 meters
- 50-m spaced receptors out to 500 meters from the facility boundary
- 100-m spaced receptors out to 2,000+ meters from the facility boundary

Additionally, sensitive receptors (hospitals, schools, and daycare centers) within the modeling domain were added.

Receptor heights above ground were set to 0.0 meters. This network is composed of Cartesian (X,Y) receptors with Universal Transverse Mercator (UTM) coordinates. The modeling was conducted using the North American Datum of 1983 (NAD83).

Figure C-3 plots the receptor locations. A total of 22,731 fenceline, grid, and sensitive receptors were included in the analysis. A list of the sensitive receptors is included in Attachment D. The closest sensitive receptor was located at the Floyd I. Marchus School, about 850 meters southeast of the southern boundary of the facility.

3.0 Modeling Results

AERMOD calculated the average $PM_{2.5}$ concentrations over the 5 years of meteorological data used in the modeling for pre-project and post-project sources. The $PM_{2.5}$ concentrations were greater for the pre-project case at all receptors. The largest decrease in average $PM_{2.5}$ concentrations at any receptor was 39.3 µg/m^3, and the smallest decrease was 0.03 µg/m^3. This indicates a reduction in any health risks associated with exposure to $PM_{2.5}$. Notably, the highest average $PM_{2.5}$ concentration when only considering post-project emissions was 0.12 µg/m^3.

4.0 Conclusion

This modeling analysis shows that health risk impacts associated with $PM_{2.5}$ emissions from the Martinez Renewable Fuels Project will be well below the BAAQMD CEQA Threshold of Significance for $PM_{2.5}$. Therefore, project impacts are below BAAQMD CEQA $PM_{2.5}$ thresholds and the proposed project would not result in a significant impact.

Appendix B-3

Project Consistency with 2017 Clean Air Plan

This Page Intentionally Left Blank

Project Consistency with 2017 Clean Air Plan

SS1: Fluid Catalytic Cracking Units in Refineries

Summary:
This control measure will reduce emissions of condensable particulate matter (PM) from fluid catalytic cracking units (FCCUs) at the four Bay Area refineries where these devices are operated, as well as gaseous precursors to the formation of secondary PM. These reductions will be achieved through Air District Regulation 6, Rule 5 (Rule 6-5), adopted in December 2015, ("Particulate Emissions from Refinery Fluidized Catalytic Cracking Units") and possible further amendments to this rule.

Project Consistency:
There will be no FCCUs in operation at the Rodeo Renewed facility after Project implementation. The measure will not apply to the Project.

SS2: Equipment Leaks

Summary:
This control measure would further reduce fugitive emissions of total organic gases (TOG) – including reactive organic compounds (ROG) and methane – from equipment leaks at petroleum refineries.

Project Consistency:
The Project is consistent with this measure because the facility will continue its fugitive emissions inspection and maintenance (I&M) program for detecting and repairing equipment leaks. The facility will no longer refine crude oil and will produce renewable fuels, further reducing emissions of TOG, ROG, and methane. Notwithstanding the absence of petroleum feedstocks, the Project will nevertheless operate in compliance with leak control measures.

SS3: Cooling Towers

Summary:
Petroleum refineries use cooling towers to return waste heat to the environment through the evaporation of water. Leaks in heat exchange systems can result in emissions of total hydrocarbons (THC) and, sometimes, toxic air contaminants (TACs). This control measure is intended to reduce THC and TAC emissions from cooling towers in petroleum refineries. The amendments to Air District Regulation 11, Rule 10, *Hexavalent Chromium Emissions from Cooling Towers* which has been renamed *Hexavalent Chromium from All Cooling Towers and Total Hydrocarbon Emissions from Petroleum Refinery Cooling Towers* were adopted by the Air District's Board of Directors on December 16, 2015.

Project Consistency:
The Project is consistent with this measure because the facility does use not cooling tower water treatments containing hexavalent chromium and will no longer refine crude oil and will produce renewable fuels, resulting in reduced emissions of THC and TAC. The Rodeo Renewed facility will be subject to applicable measures for cooling towers, such as the use of drift eliminators to control PM and TAC emissions.

SS4: Refinery Flares

Summary:
The Air District's refinery flare monitoring Regulation 12, Rule 11 (Rule 12-11) has been in place since 2003, and the flare reduction Rule 12-11 has been in place since 2005. Air District staff will review the results of these rules contained in flaring event reports from each of the five refineries in the Bay Area to identify amendments that may make the rules more effective at reducing emissions.

Project Consistency:
The Project is consistent with this measure because the facility will no longer refine crude oil and will produce renewable fuels. In addition, the Rodeo Renewed facility will be subject to applicable rules for flares that include recordkeeping and reporting of flaring events to the Air District.

SS5: Sulfur Recovery Units

Summary:
Each of the five Bay Area refineries operates one or more sulfur recovery units (SRUs) that produce marketable, elemental sulfur from gaseous sulfur compounds removed from petroleum feedstocks. SRUs in the Bay Area are subject to a 30-year old limit (both federal andAir District imposed via Rule 9-1) on sulfur dioxide (SO_2). This control measure is projected to reduce actual SO_2 emissions from sulfur recover units by about 68 percent based on current, achievable practices.

Project Consistency:
The Project is consistent with this measure because the facility will no longer refine crude oil and will produce renewable fuels, resulting in reduced SO_2 mass emissions. The remaining SRU will comply with this measure because it will incorporate Best Available Control Technology (BACT) as required under New Source Review (NSR) rules.

SS6: Refinery Fuel Gas

Summary:
The lightest components of crude oil separated by a refinery's atmospheric fractionator are methane and ethane, which are also the primary components of natural gas. These products, along with gases produced at other refinery process units, commonly called refinery fuel gas (RFG), are used as fuel in steam generators, process heaters, and other combustion units.

Because RFG contains naturally occurring sulfur compounds, it produces sulfur dioxide (SO_2) asa combustion byproduct.

Project Consistency:
The Project is consistent with this measure because the facility will no longer refine crude oil and will produce renewable fuels, resulting in reduced SO_2 emissions because renewable feedstocks are lower in sulfur than petroleum feedstocks. In addition, the Rodeo Renewed facility will be subject to applicable rules for refinery fuel gas that limit sulfur content.

SS7: Sulfuric Acid Plants

Summary:
Sulfuric acid is used as a catalyst in alkylation units at petroleum refineries. Over time, sulfuric acid is contaminated with petroleum products and needs to be regenerated.

The first step in the process is thermal decomposition of spent sulfuric acid in a furnace, producing sulfur dioxide (SO_2). The catalytic reaction oxidizing SO_2 to SO_3 (which then reactswith water to form fresh sulfuric acid) is an equilibrium reaction which is never 100 percent efficient. As a result, there is always some unreacted SO_2 that is vented to the atmosphere.

There are three acid plants associated with Bay Area refineries. The Tesoro Refinery near Martinez operates an acid plant; Eco Services in Martinez operates an acid plant as a support facility for the Shell and Valero refineries on a regular basis and serves as a backup facility for the Tesoro Refinery when Tesoro's acid plant is shut down; and Chemtrade West in Richmond operates an acid plant as a support facility for Chevron Products.

Project Consistency:
There is no sulfuric acid plant at the existing refinery, and none needed for the Rodeo Renewed facility. The measure will not apply to the Project.

SS8: Sulfur Dioxide from Petroleum Coke Calcining

Summary:
This control measure will limit emissions of sulfur dioxide (SO_2) from petroleum coke calcining by requiring that emission controls at coke calcining kilns remove an equivalent of 59 percent of the SO_2 created by the calcining process. These reductions will be achieved through Air District Regulation 9, Rule 14 (Rule 9-14), adopted in April 2016.

Project Consistency:
The Project is consistent with this measure because the existing coke calciner is currently subject to Rule 9-14 and will be shut down and demolished as part of the Project. The measure will not apply to the Project.

SS9: Enhanced NSR Enforcement for Changes in Crude Slate

Summary:
This measure would enhance the Air District's New Source Review (NSR) permit program to ensure that refineries are complying with all applicable NSR permit requirements when they change the type of crude oil they process, i.e., changes to the crude slate. This requirement would compel refineries to submit a permit application providing details of any significant change in crude slate, which would allow the Air District to review the change and determine whether it is subject to NSR requirements. Requiring a review of all such significant crude slate changes will allow the Air District to evaluate such changes in detail and ensure that they will comply with applicable NSR permitting requirements.

Project Consistency:
The Project is consistent with this measure because the Rodeo Renewed facility will not process crude oil. The measure will not apply to the Project.

SS10: Petroleum Refining Emissions Tracking

Summary:
On April 20, 2016, the Air District Board adopted Regulation 12, Rule 15 (Rule 12-15). The regulation includes provisions to: 1) improve petroleum refinery emission inventories of criteria pollutants, toxic air contaminants (TACs) and greenhouses gases (GHGs), 2) collect volume and composition data on crude oil and other feedstocks processed by refineries, and 3)expand refinery fenceline air monitoring. The improved emission inventory requirement also applies to five refinery support facilities.

Project Consistency:
The Project is consistent with this measure because the facility will no longer refine crude oil and will produce renewable fuels, reducing criteria pollutants, TACs and GHGs. In addition, the Rodeo Renewed facility will be subject to applicable rules for emissions monitoring, testing, recordkeeping, and reporting to the Air District.

SS11: Petroleum Refining Facility-Wide Emissions Limits

Summary:
This control measure would limit facility-wide emissions of greenhouse gases (GHG) and three criteria air pollutants - particulate matter (PM), oxides of nitrogen (NO_X), and sulfur dioxide (SO_2) - from Bay Area petroleum refineries through Air District Regulation 12, Rule 16.

Project Consistency:
The Project is consistent with this measure because the facility will no longer refine crude oil and will produce renewable fuels. The Project will reduce emissions of criteria air pollutants and GHGs compared to petroleum refining operations it replaces for a net air quality benefit.

SS12: Petroleum Refining Climate Impacts Limit

Summary:
This control measure would limit facility-wide carbon intensity at each Bay Area petroleum refinery through new Air District Draft Regulation 13, Rule 1. Carbon intensity limit for each refinery would be calculated on a simple-barrel basis, and require execution of cost-effective energy efficiency projects.

Project Consistency:
The Project is consistent with this measure because one of the main objectives of Rodeo Renewed is to "provide/maximize production of renewable fuels to assist California in meeting its goals for renewable energy, GHG emission reductions, and reduced Carbon Intensity (CI) for transportation fuels." The Project will reduce carbon intensity compared to petroleum refining operations it replaces for a net carbon benefit.

SS13: Natural Gas and Crude Oil Production, Processing and Storage

Summary:
Upstream natural gas and crude oil production, processing and storage operations are responsible for significant emissions of organic compounds including methane, a potent greenhouse gas (GHG), toxic air contaminants (TACs), and volatile organic compounds (VOCs). This control measure seeks to control fugitive and vented emissions from these operations by

working with the California Air Resources Board (ARB) on their upcoming oil and gas rule, andby potentially amending an existing Air District rule (Rule 8-37) to address any local concerns specific to the Bay Area.

Project Consistency:
The Rodeo Renewed facility will not be an oil and gas production facility. The measure will not apply to the Project.

SS16: Basin-Wide Methane Strategy

Summary:
This control measure seeks to better quantify and reduce emissions of methane, and its co-pollutants, from all sources throughout the Air District by implementing a coordinated strategy that combines research, rulemaking, collaborations with state agencies, and other programs.

Project Consistency:
The Rodeo Renewed facility will be subject to applicable measures for methane gas emissions, such as leak control measures.

SS17: GHG BACT Threshold

Summary:
This measure would lower the threshold at which facilities subject to the Air District's New Source Review permit program must implement the "Best Available Control Technology" to control their greenhouse gas (GHG) emissions below the current 75,000 tons per year (tpy) CO_2e. In addition, this threshold would apply to all regulated facilities, not just "major" facilities.

Project Consistency:
The Project is consistent with this measure because the facility will reduce GHG emissions relative to former crude oil refining operations and will produce renewable fuels, thus reducing GHG emissions in aggregate.

SS18: Basin-Wide Combustion Strategy

Summary:
This control measure seeks to stabilize and then reduce emissions of greenhouse gas (GHG), criteria air pollutant and toxic emissions from stationary combustion sources throughout the Air District by first establishing carbon intensity caps on major GHG sources, and then adoptingnew rules to reduce fuel use on a source-type by source-type basis.

Project Consistency:
The Project is consistent with this measure because the facility will no longer refine crude oil and will produce renewable fuels, reducing GHGs, criteria air pollutants, and TAC emissions from stationary sources at the facility. In addition, the Rodeo Renewed facility would be subject to applicable measures supporting a basin-wide combustion strategy.

SS20: Air Toxics Risk Cap and Reduction from Existing Facilities

Summary:
This control measure seeks to further reduce public exposure to toxic air contaminants (TACs) from existing facilities. New Regulation 11, Rule 18 (Rule 11-18) is expected to substantially reduce health risks from existing facilities that emit TACs, by requiring the implementation of all technically and economically feasible risk reduction measures at significant sources of TACs in these facilities. The rule also incorporates the Office of Environmental Health Hazard Assessment (OEHHA's) recently adopted (2015) Health Risk Assessment Guidelines into its required health risk estimation methodology.

Project Consistency:
The Project is consistent with this measure because the facility will no longer refine crude oil and will produce renewable fuels, reducing emissions of TACs from stationary sources at the facility. In addition, the Rodeo Renewed facility will be subject to Rule 11-18.

SS21: New Source Review of Toxic Air Contaminants

Summary:
Air District Regulation 2, Rule 5 (Rule 2-5) requires a health impact review for new and modified sources that emit toxic air contaminants (TACs) in excess of emissions trigger levels. It also establishes risk thresholds for mitigation and permit approval. The Air District conducts the health impact review in accordance with the California Office of Environmental Health Hazard Assessment (OEHHA) Health Risk Assessment Guidelines and the CARB/CAPCOA Risk Management Guidelines. These guidelines were revised in 2015. This measure would update the toxic New Source Review (NSR) program by incorporating the 2015 Health Risk Assessment (HRA) guideline revisions into the Air District's health impact review procedures. The use of the 2015 guidelines will increase the stringency of the toxics NSR program because the new health risk calculation procedures will result in higher cancer risk estimates for the same level of emissions.

Project Consistency:
The Rodeo Renewed facility will be subject to applicable provisions of the NSR program for affected equipment.

SS22: Stationary Gas Turbines

Summary:
In 2006, the Air District amended Regulation 9, Rule 9 (Rule 9-9), *Nitrogen Oxides from Stationary Gas Turbines*, applying the most stringent emission limits for oxides of nitrogen (NO_x) to larger stationary gas turbines. Less stringent limits were applied to small and mediumsized units. The Air District is considering whether more stringent limits are warranted for medium-sized gas turbines.

Project Consistency:
While this measure is not directly applicable to the Project, the Rodeo Renewed facility will be subject to the new rule NOx mass rate or concentration limits, as applicable.

SS28: LPG, Propane, Butane

Summary:
Investigate potential ROG reductions by regulating filling of, and leakage from LPG, propaneand butane tanks.

Project Consistency:
The Project is consistent with this measure because the facility will no longer refine crude oil and will produce renewable fuels, reducing emissions of ROG associated with LPG, propane and butane production. The Rodeo Renewed facility will be subject to the new rules to the extent relevant and applicable.

SS31: General Particulate Matter Emission Limitation

Summary:
Reduce the Air District's emissions limits for particulate matter.

Project Consistency:
The Project is consistent with this measure because the facility will no longer refine crude oil and will produce renewable fuels, reducing emissions of particulate matter such as carbon particles. The Rodeo Renewed facility will be subject to the new rules to the extent relevant and applicable.

SS32: Emergency Back-up Generators

Summary:
Emergency back-up generators (BUGs) provide power when primary sources are unavailable (e.g., during blackouts or brownouts). Most BUGs are powered by diesel fired engines that emit diesel particulate matter (DPM), a toxic air contaminant (TAC), and black carbon which contributes to climate change. Beginning with the year 2000, the federal government and the State of California have enacted progressively stricter emissions standards for diesel engines that power BUGs, but thousands of BUGs that do not meet current standards remain in operation. Draft Regulation 11, Rule 18 (Rule 11-18) will address health risks resulting from all significant sources of TAC emissions, including emergency BUGs.

Project Consistency:
The Project is consistent with this measure because the facility will produce renewable fuels including biodiesel, reducing emissions of TACs from emergency generators located in the Air District that switch from conventional diesel fuel to biodiesel. In addition, the Rodeo Renewed facility will be subject to Rule 11-18.

SS35: Particulate Matter from Bulk Material Storage, Handling and Transport, Including Cokeand Coal

Summary:
The Air District has been receiving complaints about black dust from petroleum coke and coal storage and transfer operations. This dust is leaving black residue on residential property and business equipment. For example, South Coast AQMD Rule 1158 addresses coke, coal (and elemental sulfur) storage and handling. The intent of this measure is to develop a new

regulation to control fugitive dust from bulk material operations throughout the Bay Area, including petroleum cokeand coal storage and handling operations.

Project Consistency:
The Project is consistent with this measure because the Rodeo Renewed facility will not handle coke or coal specifically, as the Carbon Plant will be shut down and demolished. However, the Project may handle feedstock and byproduct materials that have the potential to generate emissions of particulate matter in the form of fugitive dust. The Rodeo Renewed facility will be subject to applicable provisions of the measure to control fugitive dust from bulk material handling operations (e.g., water spray to suppress dust formation).

SS36: Particulate Matter from Trackout

Summary:
The intent of this measure is to develop a new regulation, Regulation 6, Particulate Matter; Rule 6: Trackout (Rule 6-6), to address mud and dirt that can be "tracked out" from construction sites, bulk material storage, and disturbed surfaces onto public paved roads wherevehicle traffic will pulverize the mud and dirt into fine particles and entrain them into the air.

Project Consistency:
The Rodeo Renewed facility will be subject to applicable measures to address PM generation from trackout. Specifically, the Project will require construction contractors to implement BAAQMD basic control measures as Best Management Practices (BMPs) that include trackout management.

SS38: Fugitive Dust

Summary:
Air District staff are currently developing amendments for Regulation 6, Particulate Matter, and Rule 1: General Requirements (Rule 6-1). In addition, Air District staff are developing specific targeted fugitive dust and particulate matter controls for proposed Rule 6-6: Trackout; proposed Rule 6-7: Asphalt Operations, and proposed Rule 6-8: Bulk Material Storage and Handling, Including Coke and Coal. This control measure proposes that Air District staff review and recommend controls for a broader range of more general sources of fugitive dust, such as large construction sites, and disturbed surfaces larger than 1 acre.

Project Consistency:
The Project is consistent with this measure because it will implement BAAQMD basic control measures as BMPs for fugitive dust during construction phases. The Project will not handle coke or coal, as the Carbon Plant will be shut down and demolished. In addition, the Project will be subject to applicable control measures for PM, fugitive dust, and trackout.

SS39: Enhanced Air Quality Monitoring

Summary:
The Air District will evaluate and enhance its capabilities, as resources permit, to monitor air quality on a region-wide basis, as well as on a localized basis in the impacted communities identified under the Air District's Community Air Risk Evaluation (CARE) program.

Project Consistency:
While this measure is not directly applicable to the Project, the Project is consistent with and supports this measure as it will continue to conduct fenceline air monitoring pursuant to BAAQMD regulations and AB 1647.

SS40: Odors

Summary:
This control measure would revise Air District Regulation 7 to reduce emissions of odorous substances and place emission limits on odor compounds. Revisions to Regulation 7 would also incorporate industry requirements to develop and identify odor management practices and control measures, and integrate odor detection technologies and evaluation methods. The rule amendment process would include reviewing the effectiveness of the current standards and consider best available technologies to reduce odors.

Project Consistency:
The Project is consistent with this measure because it is implementing an Odor Management Plan for the Rodeo Renewed facility. Consistent with the Odor Management Plan, the Rodeo Renewed facility will be subject to applicable measures to reduce and control odors from process equipment and materials handling.

TR17: Planes - Cleaner Aircraft Engines and Renewable Jet Fuel

Summary:
This measure consists of the efforts of the Federal Aviation Administration's (FAA) Continuous Lower Energy, Emissions and Noise (CLEEN) Program. The goals of the CLEEN Program include the development of new commercial aircraft engines by 2023-25 that would emit 60 to 75 percent fewer NOx emissions than current aircraft engines, as well as demonstrate the feasibility of jet fuel derived from crops and other renewable resources.

Project Consistency:
The Project is consistent with this measure because the Rodeo Renewed facility will have the capacity to produce renewable jet fuel that meets performance specifications.

TR20: Ships - Ocean-Going Marine Vessels

Summary:
This measure proposes implementation of a Green Ship Program (Program) based on a strategy in place at the Ports of Los Angeles and Long Beach. Financial incentives for cleaner Tier 2 and Tier 3 ocean-going vessels to call at the ports serve as the basis of the Program. The Program was initiated as part of the San Pedro Bay Ports Clean Air Action Plan. This measure also recognizes the need to monitor progress under such programs and augment them as necessary to ensure sufficient results.

Project Consistency:
While this measure is not directly applicable to the Project, the Project is consistent with and supports this measure because vessels that call at the Rodeo Renewed facility will be eligible to participate in this emissions reduction program.

TR21: Boats - Cleaner Commercial Harbor Craft

Summary:
This measure supports control technologies that could be deployed on commercial harbor craft to reduce emissions beyond what is required by the statewide Harbor Craft Regulation. Possible technologies include wind assist, hybrid systems, use of alternative fuels, retrofit of existing older marine engines with selective catalytic converters, and diesel particulate filters.

Project Consistency:
While this measure is not directly applicable to the Project, the Project is consistent with and supports this measure because the Rodeo Renewed facility will manufacture renewable fuels (e.g., biodiesel) for use in commercial harbor craft.

TR22: Construction, Freight and Farming Equipment

Summary:
The Air District will work to reduce emissions from off-road equipment used in the construction, freight handling and farming industries by pursuing the following strategies: 1) offering financial incentives between 2017 and 2030 to retrofit engines with diesel particulate filters or upgrade to equipment with electric or Tier IV off-road engines; 2) work with ARB, the California Energy Commission and others to develop more fuel-efficient off-road engines and drive-trains; and 3) work with local communities, contractors, freight handlers, farmers and developers to encourage the use of renewable electricity and renewable fuels, such as biodieselfrom local crops and waste fats and oils, in applicable equipment.

Project Consistency:
While this measure is not directly applicable to the Project, the Project is consistent with and supports this measure because the Rodeo Renewed facility will manufacture renewable diesel fuel for use in off-road equipment.

WA4: Recycling and Waste Reduction

Summary:
This control measure aims to reduce the amount of solid waste that the Bay Area sends to landfills by strengthening recycling programs and developing additional waste reduction strategies.

Project Consistency:
While this measure is not directly applicable to the Project, the Project is consistent with and supports this measure because the Rodeo Renewed facility will have the capacity to process a wide range of renewable feedstocks including fats, oils and grease (FOG) and feedstocks from other waste products. The Project will divert renewable feedstocks from conventional waste streams, including landfills. In addition, the Rodeo Renewed facility would be subject to applicable measures to increase recycling and reduce waste.

EN1: Decarbonize Electricity Generation

Summary:
This measure would focus on lowering carbon emissions by switching the fuel sources used in electricity generation. The measure would promote and expedite a transition away from fossil fuels used in electricity generation (i.e., natural gas) to a greater reliance on renewable energy sources (e.g., wind, solar). In addition, this measure would promote an increase in cogeneration, which results in useful heat in addition to electricity generation from a single fuelsource.

Project Consistency:
The Project is consistent with this measure because the Rodeo Renewed facility will generate lower carbon electric power than during former petroleum refining operations due to the use of renewable fuel gas as a part of its on-site fuel supply.
