1.0 INTRODUCTION

This technical report contains the details of the CEQA air quality analysis, consisting of emissions inventory development, dispersion modeling and health risk assessment (HRA), conducted for the Phillips 66 Rodeo Renewed Project. It includes the evaluation of construction and operations. Emissions from operations were evaluated for both baseline activity levels and forecasted Project activity levels. The baseline for this analysis is represented by year 2019, except for marine transportation, for which the baseline is an average of the years 2017-2019. Project operational emissions includes incremental emissions from marine operations, rail operations, trucks, and stationary sources associated with the Project.

Construction of the Project would include the repurposing of the existing refinery equipment, adding new equipment to the Rodeo Site, demolition of the Carbon Plant, decommissioning of Pipeline Sites connecting the Santa Maria Refinery in San Luis Obispo, CA and the Rodeo Site in the Bay Area, and the demolition of the Santa Maria Site. In addition, marine emissions associated with a brief period of incremental vessel traffic occurring during the construction period are included as part of the construction inventory.

Because of the various geographical locations directly or indirectly involved with the Project, the operational emissions and construction emissions at various locations will be evaluated and/or documented as part of this analysis. Consistently, emissions and health risk associated with the Project operations and construction at various locations are evaluated according to the corresponding air quality thresholds from each air district as applicable to the analysis.

The technical report is accompanied by a series of attachments with files and figures supporting the analysis described here.

2.0 EMISSIONS

The analysis approach used in this document follows recommendations provided in the BAAQMD's 2017 CEQA Air Quality Guidelines. For further details of data, calculations, and assumptions used to determine Project-related emissions and associated public health risks that would be associated with the Project, refer to **Attachment A** (Construction Emissions, Mobile Source Emissions, Energy and Greenhouse Gases), **Attachment B** (Rodeo Refinery Stationary Source Emissions).

2.1 Construction Emissions

Construction of the Project would include the repurposing of the existing refinery equipment, adding new equipment to the Rodeo Site, Transitional Phase marine traffic, demolition of the Carbon Plant, decommissioning of Pipeline Sites and demolition of the Santa Maria Site. Construction emissions are estimated as shown in **Attachment A** and are allocated for each year of construction. Idling from trucks are included in the on-site construction sources. To be conservative, all on-road truck travel is assumed to take place on roadways and is allocated based on mile of roadway in the HRA.

2.1.1 Rodeo Refinery Construction and Demolition

The Project would involve construction and demolition activities at the Rodeo Refinery. All demolition and construction associated with the Rodeo Refinery would occur within the refinery boundary (except for one laydown area) and would be conducted in accordance with established procedures and best management practices and with applicable regulations and permits. Soil and construction debris generated by construction activities would be either re-used onsite or transported offsite for recycling or disposal as appropriate.

Construction and demolition activities would involve diesel-powered heavy equipment such as loaders, earthmovers, cranes, and concrete trucks, and lighter-duty equipment such as welders and compressors, some of which would also be diesel-powered. The use of diesel-powered off-road construction equipment and on-road trucks would result in criteria pollutant emissions from engine exhaust during the construction period and fugitive particulate matter emissions from road dust and wind erosion from earth-moving activities. Fugitive particulate matter emissions from vehicle road dust are based on CARB's methodology, using a composite silt loading factor based on the VMT-weighted distribution of the road types (local, corridors, major and freeways) in the region[1] because the exact route of the vehicles beyond the I-80 freeway is unknown. San Pablo avenue is the main roadway near the Project site accessed for construction traffic and is considered an arterial (i.e. major roadway) per the County's General Plan[2].

Construction would employ up to 500 workers at a time who would commute daily to and from the construction site mostly by means of private gasoline passenger vehicles; the construction workforce is expected to be drawn from the greater East Bay region, within a one-hour commute distance. Hauling trucks trips would range from a daily minimum of 10 round trips and a daily maximum of 165 round trips during the construction period.

Emissions for Rodeo Site activities were estimated through a bottom up approach using activity assumptions for expected construction equipment and vehicle trips provided by Phillips 66, combined with emission factors from CARB's OFFROAD2017 – ORION web database model (v1.0.1) used for

[1] Vehicle miles travelled road type distribution nearest city, Concord, CA from the Federal Highway Administration for is used to estimate average road type distribution in lieu of unavailable road type distribution for Rodeo, CA.

[2] Figure 5-2 of the County's General Plan. Available at //www.contracosta.ca.gov/DocumentCenter/View/30915/Ch5-Transportation-and-Circulation-Element?bidId=

construction equipment, and CARB's EMFAC2021 model for vehicle emission factors. The emission factors for construction equipment reflect a fleet mix of 90% Tier 4 for pieces >50HP, with the remaining equipment representing Bay Area air district default distribution in OFFROAD2017. The hauling trucks reflect a fleet of vehicles model year 2014 and newer. The remaining vehicles (worker and service vendors) represent the Bay Area air district default distribution in EMFAC2021.

For characterizing the Carbon Plant demolition emissions, the CalEEMod model version 2016.3.2 was used to determine associated equipment for demolition of general heavy industrial land use of square footage equivalent to that of the Carbon Plant. The number of hauling truck trips expected for the Carbon Plant demolition was based on Project estimates and entered into the model to determine vehicle emission associated with the Carbon Plant demolition.

During construction, a period of increased vessel traffic is expected, and therefore, concurrent emissions from incremental vessel traffic are included in the Rodeo Site construction total. This 7-month period of incremental vessel traffic is referred to as the Transitional Phase. Marine traffic emissions estimated are described in the Marine subsection below. Construction at the Rodeo Site and demolition at the Carbon Plant is assumed to occur over a period of 21 months starting from 2022 through 2024 across the various Project sites for purposes of determining emission factors and developing the analysis. However, an exact construction schedule for any of the construction elements is dependent on when applicable permits for the Project are obtained.

2.1.2 Santa Maria Site and Pipeline Sites

Decommissioning and demolition activities at the Santa Maria site would involve use of off-road construction equipment and on-road vehicles that produce criteria pollutant emissions. Emissions from these activities were calculated using emission factors from the CalEEMod emissions model version 2016.3.2 and equipment activity estimates. For emission estimating purposes, demolition at the Santa Maria Site was assumed to occur over an approximately one-year period for purposes of emissions calculations.

In addition, emissions from decommissioning cleaning and removal from service of segments of pipeline (i.e. pigging/pipeline blowdowns) and associated tanks connecting the Santa Maria Site and the Rodeo Refinery (i.e., Pipeline Sites) are included in the construction emissions compared against SLOCAPD, Santa Barbara County APCD and San Joaquin Valley APCD significant thresholds.

2.2 Operational Emissions

Existing operations at the Rodeo Site include refinery operations, trucking of materials into the refinery, rail shipments of products (butane) and shipping of feedstocks and products through the marine terminal. Operational emissions from the Project would occur at the Rodeo Site grounds and its Marine Terminal and along rail lines, roadways, and ship traffic lanes leading to and from the Rodeo Site. Existing operations at the Carbon Plant generate criteria pollutant emissions from stationary sources, rail operations and trucking. Similarly, the Santa Maria Site baseline includes emissions from rail operations, trucking and refinery operations. Connecting the Santa Maria Site and the Rodeo Site is a pipeline and a series of midstream pumping stations (i.e. the Pipeline Sites) that include combustion engines, tanks and fugitive components. Upon completion of demolition activities, emissions at the Carbon Plant Site, Santa Maria Site and the Pipeline Sites would be eliminated resulting in negative net emissions (against the baseline) related to these specific Project Sites. For purposes of the analysis emissions were calculated assuming Project operations would commence in 2024. The following methodologies were applied to estimate emissions for operational sources:

2.2.1 Marine

Marine sources at the Rodeo Site consist of tugs, barges, articulated tug barges (ATBs), and tanker vessels moving feedstock and product to and from the Marine Terminal. Emissions related to marine traffic result from vessel engine exhaust during hoteling at berth, transit across the San Francisco Bay, and anchorage events throughout the year. For analysis of marine traffic, an average activity of 2017 through 2019 was used.

Characteristics for tankers that visited the Rodeo Site marine terminal during the baseline were extracted from the IHS Fairplay vessel database (IHS Markit, 2018)[3]; vessel calls were categorized into deadweight tonnage size groups and average characteristics for each group (main engine kilowatts, auxiliary engine kilowatts, engine tier mix) were derived from the database. Barges visiting the terminal during the baseline were classified into two groups: non-self propelled barges (without a propulsion engine, pulled by tugboat) and ATBs which are self-propelled. For all barges types, characteristics were extracted from fleet specification sheets available in barge operator's website (Centerline, 2021)[4]. Tugs were broken down in two categories: assist tugs accompanying tankers and barges through transit and assisting with maneuvering, and tugboats pulling non-self propelled barges during transit. Future vessels projected to visit during the Project are assumed to have similar vessel specifications (engine loads, tier mix) than those of the same category in the baseline.

Vessel traffic, based on the three-year baseline average of 2017 through 2019, consisted of 80 tankers of various sizes (deadtonnage weight ranges) and 90 barges (non-self propelled and ATBs combined), and is estimated to increase to a total of 201 Handymax tankers and 161 ATB at full Project operation.

Tug and vessel emissions calculations are based on CARB's methodology guidance for harbor craft and OGVs (CARB, 2007, 2011, 2019)[5] and San Pedro Bay Ports Emissions Inventory Methodology Report (Starcrest, 2019)[6]. Vessels are assumed to operate on low sulfur marine diesel or gas oil (MGO), with 0.1% sulfur, consistent with CARB requirements. Detailed parameters and assumptions for marine emissions calculations are included in **Attachment A**.

Marine emissions in the HRA include the incremental increase in marine activity that is expected for the project and also includes the Transitional Phase vessel traffic as a part of the construction scenario. Three operating modes for shipping emissions were considered in the HRA: transiting, maneuvering, and at-berth hotelling. Anchorage takes place in anchorage areas 8 and 9 south of Treasure Island and are outside of the modeling domain; only those emissions in the modeling domain were incorporated into the HRA. For the ship and barge transiting emissions, emissions are allocated per mile of travel. Assist tugs' maneuvering emissions were allocated based on the fraction of total tug operating time per call spent assisting with maneuvering.

2.2.2 Rail

Rail sources at the Rodeo Site consist of linehaul locomotive moving butane railcars during the baseline, and linehaul locomotives moving feedstock rail cars during the Project. The rail rack uses a railway cargo handling off-road equipment, instead of a switcher locomotive, to assemble any trains. Emissions are generated by the diesel engines on the linehaul locomotives and from the railway cargo handling equipment. For the baseline, emission estimates are based on 2019 actual destination and counts of railcars to/from Rodeo Site across California. For the Project, the number of linehaul movements is expected to remain the same, but the number of rail cars is expected to increase from an average of 4.7 railcars per day in 2019 to 16 railcars per day during the Project. The Carbon Plant and Santa Maria Site had rail operations during the 2019 baseline. Because the Project would remove those facilities, emissions related to the rail activities in these Project sites would be eliminated during the Project.

Rail activity is calculated based on yearly linehaul movements at each site, expected trip lengths (miles) and weight of the cargo (tons) by rail cars, which combined determine the ton-mileage throughput of a project's rail operation. The ton-mileage is converted to annual fuel consumption using a fleet-wide fuel index, and consequently, grams-per-fuel-gallon emission factors are used to derive emissions. Rail emissions for all three Project Sites (Santa Maria, Rodeo and Carbon Plant) follow this methodology and reflect CA linehaul tier distributions based on CARB guidance (CARB 2021) [7] and consistent with a recent analysis of Rodeo Site rail emissions (Yorke, 2019)[8]. Emissions were estimated based on a fuel index derived from Union Pacific fleetwide average (Union Pacific, 2019)[9], activity defined by the Project site operations such as number of rail cars, loaded and tare rail car weights, linehaul visit frequency and trip route distribution, reflecting baseline and Project conditions.

Rail emissions in the HRA include incremental rail activity that is expected for the project. For the purposes of this health risk assessment, and because the direction of travel for the rail is unknown, it is assumed that 100% of the rail activity could go to the north-east of the Refinery, or to the south of the Refinery. Accordingly, rail emissions are double counted to ensure that the risks from rail emissions are conservatively evaluated. Rail emissions are allocated per mile of rail track included in the model.

2.2.3 Trucks

Trucks on-road vehicles traveling to/from the Rodeo Site consist of heavy-duty hauling diesel trucks and light duty worker vehicles. Truck related activity including roundtrips and mileage data are summarized in **Attachment A**. All hauling trucks were assumed to be diesel fueled. Baseline emissions from trucks were calculated based on 2019 actual truck trips and expected trip lengths within the Bay Area air district boundary; and for the Project, truck emissions were based on estimated truck trips related to refinery deliveries and waste by-products based on the Project design. Emission rates were obtained from CARB's EMFAC2021 onroad model and are based on Bay Area Air District fleetwide age distribution for T7 tractor trucks.

[9] Union Pacific Railroad Company (UP), 2019. *Class I Railroad Annual Report R-1*. https://www.up.com/cs/groups/public/@uprr/@investor/documents/investordocuments/pdf_up_r1_2019.pdf

Passenger worker vehicles are not expected to change as a result of the Project because the number of workers would not change with the Project. Therefore, emissions from passenger vehicles were not estimated, but one can presume that emissions resulting from passenger worker vehicles will decrease over time due to fleet turnover and improved vehicle efficiency associated with new model vehicles.

The Carbon Plant and Santa Maria Sites existing conditions include truck traffic related to their operation. Because these facilities would be removed as a result of the Project, the emissions related to these activities would cease, and therefore emissions are only estimated for the baseline. Truck trip emissions in 2019 for the Carbon Plant and Santa Maria were developed using EMFAC2021 emission rates for their corresponding Project Site air districts.

In the HRA, truck emissions are allocated per mile of roadway included in the model.

2.2.4 Stationary Sources

Emissions for existing stationary sources during 2019 (baseline) were developed by Phillips 66 for their annual permit requirements. Changes to individual units and processes are summarized in Section 1 Project Description. New emissions sources would include a renewable feedstock PTU. The PTU process uses reactors, vessels, tanks and other equipment for polyethylene removal, degumming, and adsorption processes. Some of this equipment operates under vacuum and others at atmospheric pressure. Each of the three PTU trains has a closed loop system to collect, control and discharge all vapors and gases from the process.

The PTU includes a fats, oils and grease recovery process that consists of tanks, vessels, centrifuges, and evaporator units to remove organic material from process wastewater before treatment at the existing facility wastewater treatment plant. Removed organic matter is concentrated to remove excess moisture before being loaded onto trucks for shipment outside of the facility. Some hot process streams would be cooled via a non-contact Wet Surface Air Cooler (WSAC), which would generate some particulate emissions from cooling water drift.

All tanks, process vessels, at the PTU are connected to a closed loop vapor collection system. The closed loop vapor collection system consists of pipes that collect vapor and potential odors from the PTU, preventing their release to the atmosphere. All collected vapors from the Closed Loop Vapor Collection Systems are sent to the Vapor Treatment System. Each Closed Loop Vapor Collection System/Treatment System will be a source of emissions. Collected vapors are treated for VOC removal using 2-stage treatment technology before being released to atmosphere. The proposed 1st stage treatment is biofilter and the 2nd stage unit is activated carbon adsorption. The biofilter includes a media which creates an ideal surface for bacteria to come in contact with the vapors. The bacteria aids in eliminating the fatty acids, and VOCs, with the final carbon treatment used as an air polishing stage. Per the manufacturer, this technology has a proven history of operating in multiple industries for over 20 years.

Each PTU train would also include several storage silos of dry materials called bleached earth and filter aid, which would be added to the feedstock during the treatment process. These silos would each be equipped with dust collectors to reduce the amount of particulate matter emissions from the dry materials.

Several (four) storage tanks at the Rodeo Facility would be physically modified or repurposed to handle renewable feedstocks and products. Changes would include the installation of geodesic domes, vapor control systems, or insulation. These modifications would affect the amounts of VOC emissions from each tank.

The Project would also include the installation of a thermal oxidizer and caustic scrubber (STU) near the U235 Sulfur Recovery Unit (SRU). Under Project operating conditions, the U235 SRU would no longer extract elemental sulfur from facility off-gas, and the STU would serve to control ammonia and hydrogen sulfide emissions that the SRU currently controls. Control of these emissions would require natural gas combustion in the thermal oxidizer, which would result in the generation of additional criteria pollutant emissions.

As a result of the Project, several process units would be shut down and no longer produce emissions. The Project includes the cessation of operations at the Carbon Plant and of the crude handling units, and sulfur recovery unit. Emissions associated with each of these process units would no longer occur following the Project, including associated fugitive VOC emissions from component leaks.

Detailed input parameters and assumptions associated with each of the new process units and future emissions estimates can be found in **Attachment B**.

Consistent with the discussion in **Attachment B**, only emissions from sources within the Refinery that are being altered, removed or added are included in the health risk assessment. If the sources are being removed, the future emissions are zero, whereas the baseline emissions use the baseline emissions. If sources are being altered, future emissions are the expected emissions under the new operating scenario. If the sources are new, emissions are estimated at the full permitted throughput.

The emissions for each pollutant and process whose emissions are required to be included in the HRA are provided in **Attachment A** for construction, marine, rail and truck emissions and in **Attachment B** for stationary source emissions. Annual average emissions are reported as pounds per year and grams per second. Maximum one-hour emissions are reported as pounds per hour and grams per second. Emissions (including annual average and maximum one-hour) used for each source group used in the modeling are listed in **Attachment C**, and further described below.

3.0 DISPERSION MODELING ASSUMPTIONS

The AERMOD modeling system, developed under the guidance of the American Meteorological Society/Environmental Protection Agency Regulatory Model Improvement Committee and adopted by the USEPA, was used to predict the dispersion of emissions from the Rodeo Facility's sources. The most recent version of AERMOD (version 19091) at the time the NOP was issued was used.

3.1 Modeling Options

AERMOD regulatory default parameters were employed. The land use was determined to be rural based on the Auer land use classification method. If less than 50% of the land use within a three-kilometer radius of the Rodeo Facility is urban, the rural land use is applicable. The area within three-kilometers of the Rodeo Facility is predominantly Type A4, Undeveloped, which is characterized as mostly wild grasses and weeds, lightly wooded and greater than 90% vegetation.

3.2 Modeling Domain and Receptors

The general location of the Rodeo Facility is shown in **Figure 3-1a**. A Post-Project Facility Map is shown in **Figure 3-1b**. A Cartesian grid representing off-site worker and residential receptors around the primary Project area were included in the dispersion modeling on a 100 meter (m) grid. In addition, locations in Vallejo were evaluated to ensure that any impacts from marine sources were evaluated. Finally, receptors in open space were placed at 100 m resolution to evaluate acute risks. Per risk assessment guidelines from 2015 Office of Environmental Health Hazard Assessment (OEHHA) Guidance Manual, a network of receptors was placed with sufficient resolution in order to identify the maximum impacted receptor. Accordingly, a denser grid of 25 m was placed around the areas of maximum impact for the residents and workers.

The same receptor grid as the most recent Phillips 66 Marine Terminal projects[10] was used, with some additions. Sensitive receptors are defined as facilities where sensitive receptor population groups (e.g., children, the elderly, the acutely ill, and the chronically ill) are likely to be located. These correspond to land uses that include residences, schools, childcare centers, retirement homes, convalescent homes, hospitals, and medical clinics. The closest sensitive receptors include a preschool facility, the St. Patrick's Elementary School, and the Rodeo Hills Elementary School, all in the Bayo Vista residential area of Rodeo, approximately 1.5 miles south of the Marine Terminal. Accordingly, these were simply evaluated as residential receptors.

Grid receptors were added for residential areas in Vallejo, to the north of the Marine Terminal, as well as residential areas along the coast to the Southwest of the Facility to parallel the vessel transiting model sources. **Figure 3-2** presents the modeled receptor locations.

3.3 Terrain Options

Terrain options employed within AERMOD include the Elevated setting and AERMOD DFAULT option. AERMAP (version 18081) was employed to obtain source and receptor elevations.

3.4 Source Parameters

The list below describes how each Project source from shipping, rail truck and new/modified Facility sources were represented in the air dispersion model:

- Ships, unpowered and powered (ATB) barges, and tugs:

10 Marine Terminal III Permit Application. 2017.

  - Transiting mode: Consecutive Volume Sources
  - Maneuvering mode: Adjacent Volume Sources
  - At-Berth mode: Point Sources
- Rail: Adjacent Volume Sources where day and night are separately modeled
- Trucks: Adjacent volume sources for the roads leaving the Refinery and nearby highway segments
- Stationary sources: Stationary source parameters were provided by Phillips 66
- Construction emissions as shown in Appendix B and are allocated for each year of construction. Idling from trucks are included in the on-site construction sources. To be conservative, all on-road truck travel is assumed to take place on roadways and is allocated based on mile of roadway.

Source parameters for the above modeled sources are provided in **Attachment D.** Each source type is discussed in detail below.

3.4.1 Marine Vessels

As noted earlier, marine emissions are divided into marine vessel transiting, maneuvering, and at-berth emissions. These are all described in this section.

3.4.1.1 Marine Vessel Transiting

Marine vessel transiting emissions occur from vessels moving between ports. Typically, both the main and auxiliary engines operate during transit, and in some cases the vessel's boilers also operate. Project transiting was modeled as far as approximately 10 nautical miles from the Marine Terminal. **Figure 3-3** shows the modeled transiting route within this 10 nautical mile boundary for all Project sources. Ships, barges, and tugs all travel along the same channels; therefore, all three vessel types were modeled with volume sources in the same spatial locations. The locations of the transit routes were provided by Phillips 66.[5]

Consecutive volume sources were used to represent vessel transiting emissions along the marked route. Initial lateral dimensions were calculated based on the width of the volume source following USEPA AERMOD guidance for a line source represented by adjacent volume sources.[11] Volume sources were spaced 50 meters apart based on the width of the volume sources. Release heights of 28.8, 7.3, and 7.3 meters were used for ships, barges, and tugs, respectively. Parameters for the tugs and barges are identical and conservative compared to other port EIRs.[12] Release heights for the vessels were based on release heights used in other refinery EIRs.[13] Initial vertical dimensions were calculated based on the release height following USEPA AERMOD guidance for an elevated source not on or adjacent to a building.[14] Emissions were distributed uniformly amongst all volume sources within a given leg.

[11] As per the USEPA AERMOD User's Guide, the initial lateral dimension of a line source represented by adjacent volume sources is the length of side (which in this case is the width of the channel) divided by 2.15. United States Environmental Protection Agency (EPA). 2004. User's Guide for the AMS/EPA Regulatory Model – AERMOD, Table 3-1. September. Available at: http://www.epa.gov/scram001/7thconf/aermod/aermodugb.pdf

[12] Port of Los Angeles (POLA). 2017. Berths 121-131 (Yang Ming) Container Terminal Draft Supplemental EIR.

[13] City of Richmond. 2014. Chevron Modernization DEIR. Appendix A4.3-HRA.

[14] As per the USEPA AERMOD User's Guide, the initial vertical dimension of an elevated source not on or adjacent to a building is the vertical dimension of the source divided by 4.3. United States Environmental Protection Agency (EPA). 2004. User's Guide for the AMS/EPA Regulatory Model – AERMOD, Table 3-1. September. Available at: http://www.epa.gov/scram001/7thconf/aermod/aermodugb.pdf

3.4.1.2 Maneuvering

Maneuvering emissions occur when vessels operate at slow speeds in-port, such as approaching berth. Typically, the main engine, auxiliary engines, and boilers all operate during maneuvering, though the main engine operates at lower loads than it would during transit. **Figure 3-4** shows the modeled areas of maneuvering. Barges and tugs all maneuver in the same areas adjacent to the wharf; therefore, these vessel types were modeled with volume sources in the same spatial locations. These maneuvering locations were provided by Phillips 66. Seventy-two adjacent volume sources were used to represent vessel maneuvering emissions. Initial lateral dimensions were calculated by dividing the length of side by 4.3, which is typical for large areas of emissions represented by adjacent volume sources, such as in the case of off-road equipment construction areas. The release heights and initial vertical dimensions were identical to those used in transiting. Emissions were distributed uniformly amongst all volume sources within the maneuvering area

3.4.1.3 At-Berth

At-berth (also known as hoteling) emissions occur when vessels are moored to berths. Typically, only the auxiliary engines, turbines and boilers operate at berth. **Figure 3-5** shows the modeled at-berth locations for all Project sources. There are three berths for vessel mooring, one to represent baseline tanker docking, and two to represent post-Project Handymax and barge docking, respectively. Point sources were used to represent these stationary at-berth emissions. Source locations and release parameters, including stack height, diameter, temperature, and exit velocity were taken from the Chevron Modernization EIR, as it represents vessels used to transport liquid fuels. These values were assumed to be representative of the baseline conditions as they were used to model the same types of vessels and the same type of refinery operations as the baseline conditions. The values were also validated to be conservative (i.e., result in higher risks) for the post-Project conditions by comparing them to a sampling of Handymax ship information provided by Phillips 66. The average stack height above sea level across all Handymax vessels provided (accounting for both full load and ballast conditions) was less than one meter shorter than the stack height modeled in the Chevron DEIR. Other stack parameters, including diameter, velocity, and temperature, were either less conservative than the Chevron DEIR parameters, or not available for all ships. Thus, the Chevron DEIR stack parameters were determined to be representative of the post-Project shipping scenario as well.

3.4.2 Rail

Rail source parameters were derived from the Roseville Rail Yard Study (CARB, 2004)[15]. The plume heights vary by day and night due to differences in atmospheric stability conditions. Daytime rail is assumed to occur from 6am – 6pm, which corresponds to AERMOD hours 7 - 18. Nighttime rail is assumed to occur from 6pm – 6am, which corresponds to AERMOD hours 1 - 6 and 19 - 24. The rail sources are shown in Figures 3-6a and 3-6b, and extends to the southern end of Rodeo, and the eastern end of Crockett.

3.4.3 Trucks

Truck source parameters were based on USEPA haul road guidance[16], which recommends the use of adjacent volume sources with the volume source parameters based on the height of the vehicles and the width of the roadway. Roadway emissions sources were placed on San Pablo Avenue and the

[15] CARB, 2004. Roseville Railyard Study. October. Accessed online June 2021 at: https://www.placer.ca.gov/DocumentCenter/View/2308/Roseville-Rail-Yard-Study-PDF

[16] https://www.epa.gov/sites/production/files/2020-10/documents/haul_road_workgroup-final_report_package-20120302.pdf

Cummings Skyway, as well as portions of the freeway that were near the populated areas being considered in the health risk assessment. The truck sources are shown in **Figure 3-7.**

3.4.4 Stationary sources

Stationary source parameters were based on design and operational data for existing sources. The PTU was modeled as a volume source that characterizes the general area of release from the PTU. The STU stack parameters were based on engineering design. The locations of the stationary sources are shown in **Figure 3-8**.

3.4.5 Construction Sources

Two types of sources are used to model construction: area sources that reflect on-site construction activities, and on-road sources that reflect on-road, offsite vendor and hauling emissions. The road-sources were developed as described in trucks, above. The area sources reflect the locations of construction, and emissions were allocated to those areas, as recommended by Phillips 66, and as shown in **Table 3-1.** The locations of the construction sources are shown in **Figure 3-9**.

Table 3-1. Apportioning of Construction Emissions

Source	Percent of Total Off-Road Construction Emissions
PTU	60.00%
Unit 246 (Source 434F)	15.00%
Unit 240 (Source 307F)	15.00%
Rail	1.43%
TK-100 (Source 97)	1.43%
TK-107 (Source 334)	1.43%
TK-153 (Source 108)	1.43%
Unit 110 Equipment Leaks (Source 438F)	1.43%
Unit 40 Equipment Leaks (Source 322F)	1.43%
Unit 76 Equipment Leaks (Source 318F	1.43%

3.5 Meteorological Data

Meteorological data is required by AERMOD to characterize the transport and dispersion of pollutants in the atmosphere. The meteorological data set used was the same as the most recent Phillips 66 Marine Terminal Projects[5], which was provided by BAAQMD to Phillips 66. The station is located on-site along the southwestern border of the Rodeo Facility along the boundary with Bayo Vista and Rodeo. The data set ("CP Rodeo") was processed with AERMET Version 16216 and includes five years of meteorological data from 1/1/2013 to 12/31/2017. The wind rose displaying that data is shown in **Figure 3-10**. Meteorological data files are included in **Attachment E**.

3.6 Carbon Monoxide Evaluation

The BAAQMD thresholds for carbon monoxide (CO) concentrations are to ensure that the impacts are below the California and National Ambient Air Quality Standards of 9.0 ppm and 20.0 ppm CO per

eight hour and one hour average, respectively. This section explains how CO was pre-screened and qualitatively evaluated for the Phillips 66 Rodeo Renewed Project CEQA analysis.

First, emissions estimates presented in the DEIR Section 4.3 show that the Project will result in a net decrease in CO emissions. Second, the BAAQMD has provided a screening methodology that provides the Lead Agency with a conservative indication of whether the implementation of the proposed project would result in CO emissions that exceed this threshold of significance. The proposed project would result in a less-than-significant impact to localized CO concentrations if the following screening criteria is met:

1. Project is consistent with an applicable congestion management program established by the county congestion management agency for designated roads or highways, regional transportation plan, and local congestion management agency plans.

2. The project traffic would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour.

3. The project traffic would not increase traffic volumes at affected intersections to more than 24,000 vehicles per hour where vertical and/or horizontal mixing is substantially limited (e.g., tunnel, parking garage, bridge underpass, natural or urban street canyon, below-grade roadway).

The analysis in the traffic section of this DEIR shows that all of the screening criteria are met. Therefore, there is no need for further analysis of this threshold.

4.0 HEALTH RISK ASSESSMENT

Consistent with the BAAQMD CEQA thresholds, a project's impacts are considered less than significant if the:

- acute and chronic hazard index (HI) is less than 1.0,
- lifetime incremental cancer risk is less than 10.0 in a million,
- annual average $PM_{2.5}$ concentration is less than 0.3 µg/m^3.

In addition, cumulative risks (which include the Project and surrounding sources) are less than significant if the:

- chronic hazard index is less than 10.0
- lifetime incremental cancer risk is less than 100 in a million
- annual average $PM_{2.5}$ concentration is less than 0.8 µg/m^3.

Excess lifetime cancer risk, chronic HI and acute HI were estimated using the Hotspots Analysis and Reporting Program (HARP2, version 18159), a program developed by the California Environmental Protection Agency Office of Environmental Health Risk Assessment (OEHHA). HARP2 combines AERMOD outputs, emissions estimates, chemical toxicities, and exposure assumptions to calculate health risk. HARP2 also has the capability of conducting multi-pathway health risk assessments which is required in this case as some of the TACs emitted have multi-pathway exposure routes. The exposure parameters provided in HARP2 were used in this assessment. Pollutants evaluated in the risk assessment in addition to those for which a multi-pathway assessment was conducted are identified in **Table 4-1**.

Table 4-1. List of Pollutants

Pollutant[1]	CAS Number		Pollutant (cont.)	CAS Number
1,3-Butadiene	106990		**Lead**	**7439921**

4.1 Construction and Operational Risk Results

For each Project case, cancer risks were calculated for the net change in pollutant concentrations between the Project and the Baseline over a 30-year lifetime exposure. As discussed above, two scenarios were evaluated:

- a 30-year exposure scenario for operations.
- the risks from construction and the interim marine activity (Transitional Phase)

The construction health risk assessment consists of two years of construction, plus marine emissions for the 7-month transitional period. The operational risk assessment includes 30 years of operation. The total project risk is the addition of risk from both construction and operation at any location for 30 years of exposure. That would mean either two years of construction (and transitional period) plus 28 years of operation, or 30 years of operation. Due to the childhood exposure factors, the first two years of exposure result in a higher cancer risk than subsequent years of exposure to the same concentration. Accordingly, by adding the risks for two years of construction (and transitional period) to 30 years of exposure to operations (which double counts the high childhood exposure), we present a very conservative (i.e., overestimate) of risk. The sum of the impacts for construction and operation at all of the operational MEIs (which are highly conservative) are shown in the cumulative results of this section and are all below the project level thresholds.

The HRA modeled all new and existing sources associated with the Project and included the net emissions change (increase or decrease) for each source. The effects of each source's net emissions change were analyzed at every receptor modeled in the HRA. This results in a comprehensive analysis which indicates the change in health risk from the Project at every receptor from every emissions source. The HRA may result in certain receptors showing an increase in health risks, and others showing a decrease in health risks relative to the baseline. It is the receptors corresponding to the maximum increase in risk, referred to as maximum exposed individual resident (MEIR) or worker (MEIW), that are used to compare to the significance criteria.

Table 4-3 and **Table 4-4** shows the results of the maximally exposed individual resident (MEIR) and worker (MEIW)[17] near the facility for cancer risk and chronic HI, as well as the Point of Maximum Impact (PMI) for acute HI for operation and construction. The analysis showed that cancer risk was below 10 in a million and both chronic HI and acute HI were below 1.0 for all receptor types mentioned above. The construction MEI is due north of the Philips 66 Refinery, whereas the operational MEI is in Vallejo. For operations, the maximum residential net cancer risk (8.33 in a million) is largely driven by contributions from marine vessels, while the net chronic HI (0.14), the acute HI (0.39) and PM2.5 concentration (0.22 ug/m^3) are being driven by stationary sources. Please note that HARP2 is picking up zero as the maximum risk for chronic HI, as it is the maximum of the negative values. Therefore, the actual chronic HI is lower than reported here. For construction, the maximum residential net cancer risk (7.71 in a million) is largely driven by emissions from heavy equipment and truck travel along San Pablo road. The net chronic HI (0.00606) and acute HI (0.05) from construction is very low. **Attachment G** shows the results for every receptor analyzed. The locations of the Operational MEIRs relative to the Project site are presented in Figures 3-11a and 3-11b, and Construction MEIRs in Figures 3-12a and 3-12b in Attachment I.

[17] Worker receptors were not included at the Air Liquide Facility as it was modeled as an operational source of toxic air contaminant emissions for the Project in the health risk assessment, following Air District Guidance, Rule 2-5-224 in:
https://www.baaqmd.gov/~/media/dotgov/files/rules/reg-2-rule-5-new-source-review-of-toxic-air-contaminants/documents/rg0205_120716-pdf.pdf?la=en&rev=1081d9cbe66a4044869d3ee6c4376d72

2. MEIR for chronic hazard index located at UTMx 567333, UTMy 4212103. MEIW for chronic hazard located at UTMx 566577, UTMy 4211924.
3. MEIR for PM2.5 located at UTMx 567308, UTMy 4212253.
4. MEI for acute hazard index located at UTMx 566488, UTMy 4210717.

Table 4-4. Construction MEIR Results for Residential and Worker for Cancer, Chronic, Acute

Type of Estimated Health Impact	Excess Lifetime Cancer Risk [1,5]	Chronic Hazard Index [2,6]	PM2.5 [3,7]	Acute Hazard Index [4,8]
	in a million	unitless ratio	(µg/m^3)	unitless ratio
Residential Receptor - 2 Years of Construction	7.71	0.006	0.027	n/a
Worker Receptor - 2 Years of Construction	0.17	0.009	n/a	n/a
Acute Receptor	n/a	n/a	n/a	0.05
BAAQMD significance Threshold	10.0	1.0	0.3	1.0
Exceed Threshold?	No	No	No	No

Notes:
1. MEIR for cancer risk located at UTMx 566126.85, UTMy 4211554.14. MEIW for cancer risk located at UTMx 565917.61, UTMy 4211339.26.
2. MEIR for chronic hazard index located at UTMx 566126.85, UTMy 4211554.14. MEIW for chronic hazard located at UTMx 565917.61, UTMy 4211339.26.
3. MEIR for PM2.5 located at UTMx 566126.85, UTMy 4211554.14.
4. MEI for acute hazard index located at UTMx 567,408, UTMy 4,212,228.
5. The 2 Year Construction cancer risk is 1.45 in a million at the Operational MEIR and 0.024 at the Operational MEIW. Operational MEI results and locations are presented in Table 4-3.
6. The 2 Year Construction chronic hazard index is 0.002 at the Operational MEIR and 0.002 at the Operational MEIW. Operational MEI results and locations are presented in Table 4-3.
7. The 2 Year Construction PM2.5 concentration is 0.005 at the Operational MEIR. Operational MEI results and locations are presented in Table 4-3.
8. The 2 Year Construction acute hazard index is 0.03 at the Operational MEI. Operational MEI results and locations are presented in Table 4-3.

Because the project impacts are below the thresholds in the BAAQMD CEQA Guidelines criteria for a contribution to any potential adverse cumulative air health risk impacts from either construction or operation, it would not contribute to any potential adverse air impact on sensitive receptors.

5.0 CUMULATIVE HEALTH RISK ASSESSMENT

This Technical Report also describes the cumulative health risk assessment conducted consistent with the BAAQMD CEQA Guidelines. Ramboll used the BAAQMD Stationary Source Screening Tool[18] to identify existing permitted stationary sources within 1,000 feet of the MEIR. Ramboll submitted a stationary source inquiry form to the BAAQMD to request updates and received the response in **Attachment H**. No stationary sources were identified as being within 1,000 feet of the MEIRs. BAAQMD provided information in a geographic information system (GIS) format that contained the risks from roadways greater than 30,000 average daily traffic (ADT) and railways.

The Air District's 2014 Major Roads and Highway screening raster files which are part of the BAAQMD Stationary Source Screening Tool rely on CARB's onroad emissions model, EMFAC2014 for calendar year 2017. EMFAC2014 assumes higher vehicle emission factors than EMFAC2021 for calendar year 2024, as shown in the table below. The BAAQMD has not updated the Stationary Source Screening Tool with EMFAC2021 emission factors. Between 2013 and 2017 the average daily traffic volumes on the section of I-80 adjacent to the refinery increased by 10.3% (from 117,000 to 129,000) and the peak hour volumes increased by 11.4% (7,900 to 8,800)[19]. Although traffic has increased slightly since 2013 in the direct vicinity of the Rodeo Refinery, the reduction in emission factors (up to 75%) greatly outweighs any increase in vehicle traffic in the newest model, as shown below (see Table 5-1). Therefore, the contribution of Major Roads and Highways to the cumulative risk using the current Major Roads and Highway screening raster files is larger than what the contributions would be using EMFAC2021 and provides a more conservative cumulative analysis.

Table 5-1. Comparison of EMFAC Emission Rates for BAAQMD Raster Files and Project Conditions

Pollutant	Average Contra Costa County Emission Rate (g/day)[1,2]			Total Contra Costa County Emission Rate (g/day)[1,2]		
	EMFAC2014, Calendar Year 2017	EMFAC2021, Calendar Year 2024 (Project)	% Difference to Project	EMFAC2014, Calendar Year 2017	EMFAC2021, Calendar Year 2024 (Project)	% Difference to Project
$PM_{2.5}$	11,791	2,965	-75%	613,156	254,989	-58%
PM_{10}	2,450	881	-64%	127,375	75,793	-40%

Notes:

1. EMFAC web version run for Contra Costa County in emission rates mode for all EMFAC2011 vehicle categories (including passenger vehicles, trucks, and buses), aggregated across vehicle model year, speed, and fuel type.
2. $PM_{2.5}$ emission rates include running exhaust (RUNEX) and tire-wear (PMTW) and break-wear (PMBW) emission processes, consistent with the emissions that would be modeled in a $PM_{2.5}$ HRA. PM_{10} emission rates only include the running exhaust (RUNEX) emission process, consistent with the emissions that would be modeled when using PM_{10} as a proxy for DPM in a cancer or chronic HI HRA.

The overall cumulative risks are shown in **Table 5-1.** Based on the project-level analysis included above, and the cumulative thresholds provided in Section 2 of this Appendix, the project would not have a cumulatively considerable impact.

[18] BAAQMD Screening Tool. Available online at https://baaqmd.maps.arcgis.com/apps/webappviewer/index.html?id=2387ae674013413f987b1071715daa65

Table 5-2. Summary of Cumulative Impacts at Project MEIR Using BAAQMD Recommended Methods

Nearby Sources[1]	Offsite Cancer MEIR	Offsite Chronic/$PM_{2.5}$ MEIR	
	Excess Lifetime Cancer Risk	Noncancer Chronic HI	$PM_{2.5}$ Concentration
	(in a million)	(unitless)	($\mu g/m^3$)
Existing Stationary Sources[2]	--	--	--
Roads/Highways[3,4]	5.8	--	0.18
Major Streets[4,5]	0.044	--	0.00093
Railways[4]	6.4	--	0.019
Project Net Operations	8.33	0.14	0.22
Project Construction[6]	1.45	0.002	0.005
Total	**22**	**0.15**	**0.42**
Exceeds Threshold?	**NO**	**NO**	**NO**
Threshold	**100**	**10**	**0.80**

Notes:

1. Details for each source are shown in the preceding tables. If the cell is marked with "--", no risk was calculated. For roadways, highways, major streets, and railways, chronic HI is not calculated in the BAAQMD screening tools.
2. Consistent with BAAQMD guidance, Ramboll included all facilities within 1,000 feet of the MEIRs as per the BAAQMD Stationary Source Screening Analysis Tool. No facilities were identified, therefore no values were adjusted accordingly for distance from the MEIRs using BAAQMD guidance.
3. Ramboll searched for additional nearby roads between 10,000 to 30,000 average daily trips and confirmed there are no roadways with average daily traffic between 10,000 and 30,000 trips per day within 1,000 ft of the cancer or chronic/$PM_{2.5}$ MEIRs.
4. Nearby major streets, highway, and railway cancer and $PM_{2.5}$ impacts were taken from BAAQMD raster files for the Project area. The BAAQMD's raster screening tools do not estimate chronic hazards since the screening levels were found to be extremely low. Thus, there are no chronic hazard values associated with highways, railways, or major streets.
5. Major streets, as evaluated in the BAAQMD raster screening tools, include all streets with average daily traffic above 30,000 trips per day.
6. Both the Project Operations and Construction risks include childhood exposure from 0-2 years. When added, this conservatively doubles the childhood exposure period. Actual cumulative projects risks are lower. Similarly, Chronic HI and $PM_{2.5}$ concentrations are averaged only over a year, where the maximum yearly concentration from construction and operation is reported from the Project and Construction Risks.

Abbreviations:

µg - microgram
HI - hazard index
m^3 - cubic meter
MEIR - maximum exposed individual receptor
$PM_{2.5}$ - fine particulate matter less than 2.5 micrometers in diameter

Note:
[1] The equation is: Emission Factor = (Particle Size Multiplier) x (sL)^0.91 x (Vehicle Weight)^1.02
[2] The average vehicle weight for onsite trucks is based on a modern tanker truck that holds 9,000 gal diesel fuel (approx. 31.7 tons fuel) and has a GVWR of 80,000 lbs (40 tons) (GVWR includes the weight of cargo). Therefore, a loaded fuel truck would weigh 40 tons and an empty fuel truck would weigh 8.3 tons. The average weight is therefore assumed to be approximately 25 tons. Trucks and autos would generally take different routes onsite.

Construction Table 18. Carbon Plant Demolition Carbon Plant Demolition Fuel Consumption	

Construction Table 11. Carbon Plant Demolition CalEEMod Inputs of Project Characteristics

Project Characteristic	Input Detail	Comments
Project Name:	Phillips 66 Carbon Plant Demolition	
Project Location:	Contra Costa County	*2101 Franklin Canyon Rd, Rodeo, CA 94572*
Climate Zone:	5	*Based on CalEEMod User's Guide and CEC (https://caenergy.maps.arcgis.com/apps/webappviewer/index.html?id=4831772c00eb4f729924167244bbca22)*
Utility Company:	PG&E	
Urbanization	Rural	
Start of Construction	To Be Determined (2024 chosen for emission estimating purposes)	
Operational Year:	To Be Determined (2024 chosen for emission estimating purposes)	
CO2 Intensity Factor: (lb/MWh)	641.35	*Default for PG&E*

Construction Table 12. Carbon Plant Demolition CalEEMod Project Land Use Assumptions

Project Land Use	CalEEMod® Land Use Type	CalEEMod® Land Use Subtype[1]	Land Use Size	Land Use Size Metric
Refinery	Industrial	General Heavy Industry	2,457	tsf

Note:

[1] Land uses as defined in CalEEMod®.

Construction Table 13. Carbon Plant Demolition Construction Schedule

Construction Phase Name	CalEEMod® Phase Type[1]	Phase Duration[2] (days)	Days per Week (days)	Assumptions
Demolition	Demolition	70	5	Based on CalEEMod default and project area measurement.

Note:

[1] Demolition phase assumes demolition of the existing facility (7,300,000 square feet) at the site.

[2] The construction work week was assumed to be 5 days per week, Monday through Friday.

Construction Table 14. Carbon Plant Demolition Carbon Plant Demolition Construction Trips

Construction Phase Name	Worker Trips per Day[1]	Vendor Trips per Day[1]	Total Hauling Trips[2,3]
Demolition	15	0	1,450

Note:

[1] Trips are presented as one-way trips and are based on CalEEMod® defaults. The one-way trip length for a worker trip is based on CalEEMod® defaults and is 13 mi.

[2] Trips are presented as one-way trips and represent the total trips for the phase. Hauling trips reflect project specific estimates of the volume of soil imported during Grading; and demolition waste hauled during the Demolition phase. The hauling trip distance for construction is assumed as the CalEEMod® default of 20 miles.

[3] Truck hauling one-way trips estimate based on project design basis (P66, 2021), communication 3/16/21

Construction Table 15. Carbon Plant Demolition Construction Equipment

Construction Phase Name	CalEEMod® Phase Type	CalEEMod Equipment Type	Equipment[1]	Hours per day[1]
Demolition	Demolition	Concrete/Industrial Saws	1	8
Demolition	Demolition	Excavators	3	8
Demolition	Demolition	Rubber Tired Dozers	2	8

Note:

[1] Equipment mix and operational hours for all demolition phases are based on project-specific information. Equipment mix and operational hours for the final grading phase is based on CalEEMod defaults. Equipment characteristics are based on CalEEMod® defaults.

Construction Table 16. Carbon Plant Demolition Demolition Material Estimates

Phase Name	Size Metric	Unit Amount[1,2]
Demolition	tons	11,995

Note:

[1] Debris quantity based on project-specific data.

[2] Debris density based on a CalEEMod default value of 1.2641662 tons per cubic yard. Available at: http://www.aqmd.gov/docs/default-source/caleemod/caleemod-appendixa.pdf. Accessed: February 2021.

Construction Table 17. Carbon Plant Demolition Carbon Plant Demolition Emissions by Phase

Source	Emissions (tons)										Emissions (MT)

Coker Areas	Demolition	1/24/2023	6/12/2023	100	100	
Amine, Utility, Sulphur, and Tail Gas Areas	Demolition	4/17/2023	7/21/2023	70	70	
Power Generation and Substation Area	Demolition	7/21/2023	8/10/2023	15	15	Assumed to take place following the last completed area.

Note:

[1] Construction Start and End Dates are only estimates and only represent the earliest time period when demo could start. More specific timing will be determined at a later date.

[2] The construction work week was assumed to be 5 days per week, Monday through Friday.

[3] Demolition phase assumes demolition of the existing facility (7,300,000 square feet) at the site.

Construction Table 22. Santa Maria Site Demolition Construction Trips

Construction Phase Name	Worker Trips per Day[1,3]	Vendor Trips per Day[1]	Total Hauling Trips[2]
Demolition	36	0	731

Note:

[1] Trips are presented as one-way trips and are based on CalEEMod® defaults. The one-way trip length for a worker trip is based on CalEEMod® defaults and is 13 mi.

[2] Trips are presented as one-way trips and represent the total trips for the phase. Hauling trips reflect project specific estimates of the volume of soil imported during Grading; and demolition waste hauled during the Demolition phase. The hauling trip distance for construction is assumed as the CalEEMod® default of 20 miles.

[3] Upper limit of 12 - 18 workers

Construction Table 23. Santa Maria Site Demolition Construction Equipment

Construction Phase Name	CalEEMod® Phase Type	Equipment Type	CalEEMod Equipment Type	Equipment[1]	Hours per day[1]
All demolition phases.	Demolition	Track Excavator with Hydraulic Shears, Breakers and Bucket Attachements	Excavators	4	10
All demolition phases.	Demolition	1 to 2 Articulating Man-Lifts 65 ft to 135 ft	Aerial Lifts	2	10
All demolition phases.	Demolition	80-Ton Hydraulic Crane	Cranes	1	10
All demolition phases.	Demolition	15-Ton Hydraulic Crane	Cranes	1	10
All demolition phases.	Demolition	1 to 2 Skid Steer Loaders - Bobcats	Skid Steer Loaders	2	10
All demolition phases.	Demolition	1 to 2 All Terrain Boom Forklifts	Rough Terrain Forklifts	2	10
All demolition phases.	Demolition	Generators	Generators	1	10
All demolition phases.	Demolition	Cutting Torches	Welders	1	10

Note:

[1] Equipment mix and operational hours for all demolition phases are based on project-specific information. Equipment characteristics are based on CalEEMod® defaults.

Construction Table 24. Santa Maria Site Demolition Demolition Material

Phase Name	Size Metric	Unit Amount[1,2]
Demolition	tons	7,393

Note:

[1] Debris quantity based on project-specific data.

[2] Debris density based on a CalEEMod default value of 1.2641662 tons per cubic yard. Available at: http://www.aqmd.gov/docs/default-source/caleemod/caleemod-appendixa.pdf. Accessed: February 2021.

Construction Table 28. Santa Maria Site Demolition Santa Maria Site Demolition Fuel Consumption

Fuel Consumption	CO_2 Emissions [2] (MT)	Gasoline Consumption[1] (gallons)	Diesel Consumption[1] (gallons)
Offroad	793.97	--	77,764
Onroad - Worker	34.05	3878	--
Onroad - Hauling	26.73	--	2,618

Note:
[1] The conversion factors for gasoline and diesel are 8.78 kg CO2/gallon and 10.21 kg CO2/gallon, respectively, per The Climate Registry, 2019. Available at: https://www.theclimateregistry.org/wp-content/uploads/2019/05/The-Climate-Registry-2019-Default-Emission-Factor-Document.pdf.
[2] Assumed all worker vehicles are gasoline-fueled and all haul trucks are HHDT and therefore diesel-fueled.
Assumed 100% of off-road equipment units are diesel-fueled.

Pipeline Sites Decommisioning Emissions

Project: Phillips66 Rodeo Renewed Project
Year: 2022-2023
Location: Various Air Districts in CA

Key Tables	Notes

Construction Table 29. Pipeline Sites decommissioning assumptions within BAAQMD

Blowdown events per day	2
Blowdown daily emissions limit (lbs VOC/day/event)	15
Tank cleaning projects per day	1
Emissions limit per tank cleaning project (lbs ROG+NOx/day)	5.2

Construction Table 30. BAAQMD IMPACT EVALUATION: Construction + Pipeline Sites Decommissioning

Second Year**	PM10 Exhaust (lb/day)	PM2.5 Exhaust (lb/day)	NOx (lb/day)	ROG (lb/day)
Rodeo Site Construction Equipment	0.6	0.5	17.7	2.2
Rodeo Site Construction Vehicles	0.1	0.1	6.7	0.2
Background Marine Terminal Incremental Traffic	6.0	5.6	228.0	12.2
Carbon Plant Demolition	0.3	0.2	6.5	0.6
Tank Decommissioning	-	-	1.1	4.0
Pipeline Decommissioning	-	-	-	30.0
Total	**6.9**	**6.4**	**260.1**	**49.3**
CEQA Threshold	82	54	54	54
Above Threshold?	No	No	Yes	No

Notes:
**Rodeo Site construction assumed schedule: 03/01/2023-04/01/2024

[1] Construction Start and End Dates are only estimates and only represent the earliest time period when activities could start. More specific timing will be determined at a later date.

[2] Emissions from the Carbon Plant future demolition activities are conservatively added to second year of construction period within BAAQMD. Construction start and end dates were assumed for purposes of estimating emission factors. More specific timing will be determined at a later date.

[3] Tank decommissioning emissions are based on the assumption of one tank cleaning project in a day

[4] Pipeline decommissioning emissions are based on the assumption of maximum two blowdown events in a day

Construction Table 31. Pipeline Sites decommissioning assumptions within San Joaquin Valley APCD

Blowdown events per day	daily limits n/a
Blowdown daily emissions limit (lbs VOC/day/event)	15
Tank cleaning projects per day	daily limits n/a
Emissions limit per tank cleaning project (lbs ROG+NOx/day)	5.2

Construction Table 32. SJVAPCD IMPACT EVALUATION: Pipeline Sites Decommissioning

Source	NOx (tons/yr)	ROG (tons/yr)
Tank Decommissioning	0.04	5.95
Pipeline Decommissioning	0.00	0.49
Total	**0.04**	**5.95**
CEQA Threshold	10	10
Above Threshold?	No	No

[1] Tank decommissioning emissions are based on the conservative assumption of 24 tanks cleaning project in a year (entire pipeline associated tanks)

[2] Pipeline decommissioning emissions are based on the highly conservative assumption of entire pipeline being decommissioned. In practice, only a fraction of the emissions will occur within the SJV APCD.

Construction Table 33. Pipeline Sites decommissioning assumptions within Santa Barbara County APCD

Blowdown events per day	daily limits n/a
Blowdown daily emissions limit (lbs VOC/day/event)	15
Tank cleaning projects per day	daily limits n/a
Emissions limit per tank cleaning project (lbs ROG+NOx/day)	5.2

Construction Table 34. Santa Barbara IMPACT EVALUATION: Pipeline Sites Decommissioning

Source	NOx (tons/yr)	ROG (tons/yr)
Tank Decommissioning	0.04	5.95
Pipeline Decommissioning	0.00	0.49
Total	**0.04**	**5.95**
CEQA Threshold	25	25
Above Threshold?	No	No

[1] Tank decommissioning emissions are based on the conservative assumption of 24 tanks cleaning project in a year (entire pipeline associated tanks)

[2] Pipeline decommissioning emissions are based on the highly conservative assumption of entire pipeline being decommissioned. In practice, only a fraction of the emissions will occur within the Santa Barbara APCD

Construction Table 35. Pipeline Sites decommissioning assumptions within San Luis Obispo APCD

Blowdown events per day	2
Blowdown daily emissions limit (lbs VOC/day/event)	15
Tank cleaning projects per day	3
Tank cleaning projects per quarter	3
Emissions limit per tank cleaning project (lbs ROG+NOx/day)	5.2

Construction Table 36. SLO APCD IMPACT EVALUATION: Demolition + Pipeline Sites Decommissioning

Daily Impact

Source	DPM (lb/day)	ROG+NOx (lb/day)
Santa Maria Demo Offroad Equipment	1.21	32.46
Santa Maria Demo Fugitive Dust	-	-
Santa Maria Demo Onroad Vehicles	0.00	0.79
Tank Decommissioning [1]	-	15.47
Pipeline Decommissioning [2]	-	30.00
Total	**1.22**	**78.72**
CEQA Threshold	7	137
Above Threshold?	No	No

[1] Tank decommissioning emissions are based on the assumption of 3 tanks cleaning projects in a day.

[2] Pipeline decommissioning emissions are based on the assumption of maximum of two blowdown events in a day

Construction Table 36. SLO APCD IMPACT EVALUATION: Demolition + Pipeline Sites Decommissioning

Quarterly Impact

Source	DPM (Quarterly Tons)	ROG + NOx (Quarterly Tons)	Fugitive 10 (Quarterly Tons)
Santa Maria Demo Offroad Equipment	0.04	1.06	0.00
Santa Maria Demo Fugitive Dust	-	-	0.02
Santa Maria Demo Onroad Vehicles	0.00	0.03	0.01
Tank Decommissioning [1]	-	0.87	-
Pipeline Decommissioning [2]	-	0.49	-
Total	**0.04**	**2.44**	**0.03**
CEQA Threshold : Tier 1	0.13	2.50	2.50
Above Threshold?	No	No	No
CEQA Threshold : Tier 2	0.32	6.30	
Above Threshold?	No	No	

[1] Tank decommissioning emissions are based on the assumption of maximum 3 tanks cleaning project per quarter

[2] Pipeline decommissioning emissions are based on the highly conservative assumption of entire pipeline being decommissioned. In practice, only a fraction of the emissions will occur within the SLO County.

[2] Conservatively assumed oldest Tier 2 engines (MY2007), consistent with Marine Terminal III Project (ERM, 2016)
[3] Load factors from San Pedro Ports Emissions Inventory Methodology Report. https://kentico.portoflosangeles.org/getmedia/3559520c-b85d-45ad-ad68-9947c34b980d/WV_FINAL_SPBP_Emissions_Inventory-_Methodology_4-25-19_scg

Marine Table 14. Harbor Craft time required to assist vessel (hr/one-way trip)

Tug Type	Maneuvering	Light 8 EastBound Route to Maneuvering + between Jobs transit	Mile Rock 1 nm west of Golden Gate Bridge to Light 8 EastBound Route	Pilot Station Sea Buoy to Mile Rock 1 nm west of Golden Gate Bridge + Travel to Vessel	Pilot Station Sea Buoy to Outer Ring of Bouys	Manuevering percent, time allocation
Barge Assist	0.29	5.08	1.90	1.42	0.00	3.3%
Barge Tug	0.29	1.47	1.90	0.83	0.54	5.8%

Note:
[1] The between jobs transit accounts for a tug leaving after vessel tied to wharf and one coming back before vessel leaving wharf. For large vessels there is an extra third tug required during maneuvering. Barges only require 1 assist tug.
[2] The estimated travel time between jobs was assumed to be estimated from a tug home base just off of Angel Island.

Note:
[1] ERM. 2016. Estimated Emissions Increases and Human Health Risk Impacts Associated with the Marine Terminal III Project. June
[2] Conservatively assumed oldest Tier 2 engines (MY2007), consistent with Marine Terminal III Project (ERM, 2016)
[3] Load factors from San Pedro Ports Emissions Inventory Methodology Report. https://kentico.portoflosangeles.org/getmedia/3559520c-b85d-45ad-ad68-9947c34b980d/WV_FINAL_SPBP_Emissions_Inventory-_Methodology_4-25-19_scg

Marine Table 54. HC time required to assist vessel (hr/one-way trip)

Tug Type	Maneuvering	Light 8 EastBound Route to Maneuvering + between Jobs transit	Mile Rock 1 nm west of Golden Gate Bridge to Light 8 EastBound Route	Pilot Station Sea Buoy to Mile Rock 1 nm west of Golden Gate Bridge + Travel to Vessel	Pilot Station Sea Buoy to Outer Ring of Bouys	Manuevering percent, time allocation
Barge Assist	0.29	5.08	1.90	1.42	0.00	0.03
Barge Tug	0.29	1.47	1.90	0.83	0.54	0.03

Note:
[1] The between jobs transit accounts for a tug leaving after vessel tied to wharf and one coming back before vessel leaving wharf. For large vessels there is an extra third tug required during maneuvering. Barges only require 1 assist tug.
[2] The estimated travel time between jobs was assumed to be estimated from a tug home base just off of Angel Island.

Rail Table 17. Summary of 2019 Baseline Butane Rail Rack Annual Emissions (tons/yr) by Route	

Rail Table 1. Butane Rail Rack Daily Process Parameters for 2019

Daily Parameter	Value	Units	Reference & Notes
Number of Tank Cars	5	cars/day	2019 data provided by Phillips (P66, 2021)
Butane Average Load per Car (bbl)	739	bbl/car	2019 data provided by Phillips (P66, 2021)
Butane Average Load per Car (gal)	31,026	gal/car	Calculated
Butane Weight per Car	75	short tons/car	Calculated
Butane to be Transported	354	short tons/day	Calculated
Tare Weight of Empty Tank Car	48.8	short tons/car	Ref: Eight-axle tank wagon for oil products, https://www.searates.com/reference/tank/
Daily Weight of Empty Tank Cars	249	tare short tons/day	Calculated Tare Weight
Daily Weight of Filled Tank Cars	603	gross short tons/day	Freight Weight + Tare Weight
Daily CHE Operating Hours	1	hr/day	2019 data provided by Phillips (P66, 2021)

Note**:**
[1] Daily process parameters are used to calculate daily inbound and outbound throughput.

Rail Table 2. Butane Rail Rack Annual Process Parameters for 2019

Annual Parameter	Value	Units	Reference & Notes
Number of Tank Cars	1,710	cars/year	2019 data provided by Phillips (P66, 2021)
Butane Average Load per Car (bbl)	739	bbl/car	2019 data provided by Phillips (P66, 2021)
Butane Average Load per Car (gal)	31,026	gal/car	Calculated
Butane Weight per Car	75	short tons/car	Calculated
Butane to be Transported	128,922	short tons/year	Calculated
Tare Weight of Empty Tank Car	48.8	short tons/car	Ref: Eight-axle tank wagon for oil products, https://www.searates.com/reference/tank/
Annual Weight of Empty Tank Cars	90,632	tare short tons/year	Calculated Tare Weight
Annual Weight of Filled Tank Cars	219,553	gross short tons/year	Freight Weight + Tare Weight
Annual CHE Operating hours	365	hr/year	2019 data provided by Phillips (P66, 2021)

Note**:**
[1] Annual process parameters are used to calculate annual inbound and outbound throughput.

Rail Table 3. Constants and Factors

Constants and Factors	Value	Units	Reference & Notes
Density of Butane	4.86	lbs/gal	Ref: Liquified Gas Conversion Chart (LACFD 2018). Available at: https://fire.lacounty.gov/wp-content/uploads/2019/08/Gas_Conversion_Chart.pdf
Density of Tallow	56.3	lbs/ft3	Ref: beef tallow, https://www.engineeringtoolbox.com/liquids-densities-d_743.html
Net Aggregated Fuel Consumption Index	963	ton-miles/gal	Calculated, includes idling
Percent of Train Weight for Locomotives	8.6%		Calculated
Pound to Gram	453.592	g/lb	
Density of Diesel Fuel	3200	g/gal	Ref: Emission Factors for Locomotives, EPA-420-F-09-025, April 2009. Available at: https://nepis.epa.gov/Exe/ZyPDF.cgi/P100500B.PDF?Dockey=P100500B.PDF
Class I Locomotive Fuel Consumption to Horsepower-Hour Conversion Factor	20.8	(hp-hr/gal)	Ref: Emission Factors for Locomotives (EPA 2009)
Class I Line-haul Brake Specific Fuel Consumption (BSFC)	154	(g/hp·hr)	Ref: Table 8.4., Ports Emissions Inventory Guidance: Methodologies for Estimating Port-Related and Goods Movement Mobile Source Emissions, EPA 2020. Available at: https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P10102U0.pdf
Fuel Sulfur Conversion Factor	97.8%		Ref: Emission Factors for Locomotives (EPA 2009)
Sulfur Content of Diesel Fuel	15	ppmw	Ref: California Diesel Fuel Standard (CARB 2014)
Molar Mass of SO_2	64	g/mol SO_2	
Molar Mass of S	32	g/mol S	
Diesel Carbon Conversion Factor	3.9	g CO_2/g fuel	Ref: 8.5.1.3 (EPA 2020)
Diesel Methane Conversion Factor	0.00025	g CH_4/g fuel	Ref: 8.5.1.4 (EPA 2020)
Diesel N_2O Conversion Factor	0.00008	g N_2O/g fuel	Ref: 8.5.1.5 (EPA 2020)
CO_2 GWP	1		Ref: IPCC Fifth Assessment Report
CH_4 GWP	25		Ref: IPCC Fifth Assessment Report

Rail Table 4. Distribution of Butane Rail Rack Cars in 2019

Route	Lag	Percent of cars	No of cars	Notes
BAAQMD		100%	1,573	18% of cars destination is within BAAQMD
common route		82%	1,289	3% of cars destination is within common route
southern route		38%	591	Southern route before splitting off to LA/AZ lag
	LA	37%	589	
	AZ	0%	0	
eastern route		26%	411	
northern route		16%	246	

Note**:**
[1] Number of cars is based on 2019 butane rail rack rail movement data provided by P66.

Rail Table 5. Butane Rail Rack Route Distribution for 2019

Segment No.	District	Estimated Route in Districts	Appx. Length	Units	Route	Lag	Percent of cars
1	BAAQMD	Rodeo to Bay Area AQMD Boundary	33.5	miles	BAAQMD		100%
2	YSAQMD	Yolo-Solano AQMD	18	miles	common route		82%
3	SMAQMD	Sacramento Metropolitan AQMD (northbound)	30	miles	common route		82%
4	PCAPCD	Placer County APCD (to & from Roseville)	4	miles	common route		82%
5	SMAQMD	Sacramento Metropolitan AQMD (southbound)	38	miles	southern route		38%
6	SJVAPCD	San Joaquin Valley APCD	276	miles	southern route		38%
7	EKAPCD	Eastern Kern APCD (to MDAQMD boundary)	74	miles	southern route	AZ	0%
8	MDAQMD	Mojave Desert AQMD	215	miles	southern route	AZ	0%
9	PCAPCD	Placer County APCD (to Nevada County Line)	70	miles	eastern route		26%
10	NSAQMD	Northern Sierra AQMD & Proximity	55	miles	eastern route		26%
11	PCAPCD	Placer County APCD (to Yuba County Line)	20	miles	northern route		16%
12	FRAQMD	Feather River AQMD	27	miles	northern route		16%
13	BCAQMD	Butte County AQMD	46	miles	northern route		16%
14	TCAPCD	Tehama County APCD	41	miles	northern route		16%
15	SHAQMD	Shasta County AQMD	76	miles	northern route		16%
16	SCAPCD	Siskiyou County APCD	87	miles	northern route		16%
17	EKAPCD	Eastern Kern APCD (to AVAQMD boundary)	58	miles	southern route	LA	37%

Methodology Source:
Table 4-7, 2017 Line haul Locomotive Model & Update, California Air Resources Board, Off Road Diesel Analysis Section, October 2017. Available at: https://ww3.arb.ca.gov/msei/ordiesel/locolinehaul2017ei.docx

Rail Table 8. Class I Line-Haul Emission Factors (g/gal)

Tier Level	PM_{10}	HC	NOx	CO	$PM_{2.5}$	VOC	SO_2
Pre-Tier	6.7	10.0	270.4	26.6	6.1	10.5	2.0
Tier 0	6.7	10.0	178.9	26.6	6.1	10.5	2.0
Tier 0+	4.2	6.2	149.8	26.6	3.8	6.6	2.0
Tier 1	6.7	9.8	139.4	26.6	6.1	10.3	2.0
Tier 1+	4.2	6.0	139.4	26.6	3.8	6.4	2.0
Tier 2	3.7	5.4	103.0	26.6	3.4	5.7	2.0
Tier 2+	1.7	2.7	103.0	26.6	1.5	2.8	2.0
Tier 3	1.7	2.7	103.0	26.6	1.5	2.8	2.0
Tier 4	0.3	0.8	20.8	26.6	0.3	0.9	2.0

Note:
[1] Unit conversion (g/bhp-hr to g/gal) from Rail Table 7.

Rail Table 9. Locomotive Composite Emission Factors for 2019

Criteria Pollutants/GHG	Emission Factor (g/gal)	Emission Factor (lb/1000 gal)
PM_{10}	2.9	6.4
$PM_{2.5}$	2.7	5.9
NOx	116.0	255.8
CO	26.6	58.7
VOC	4.7	10.3
SO_2	2.0	4.3
CO_2	10206	22500
CH_4	0.8	1.8
N_2O	0.3	0.6
CO_2e	10302	22713

Note:

[1] CO_2 is defined by U.S. EPA as 10,206 g CO_2/gal of fuel. (CARB 2017)

[2] CH_4 emission factors are estimated from BSFC using Equation 8.6 (EPA 2020)

[3] N_2O emission factors are estimated from BSFC using Equation 8.7 (EPA 2020)

[4] Emission factors are used in the calculation of all 2019 rail emissions

Rail Table 19. Carbon Plant Rail Rack Annual Process Parameters for 2019	
Rail Table 20. Distribution of Carbon Plant Rail Rack Cars in 2019	
Rail Table 21. Carbon Plant Rail Rack Route Distribution for 2019	
Rail Table 22. Cargo Handling Equipment Characteristics	
Rail Table 23. Cargo Handling Equipment Emission Factors	
Rail Table 24. Summary of 2019 Baseline Carbon Plant Rail Rack Daily Emissions (lbs/day)	
Rail Table 25. Summary of 2019 Baseline Carbon Plant Rail Rack Annual Emissions (tons/yr)	
Rail Table 26. Summary of 2019 Baseline Carbon Plant Rail Rack Daily Emissions (lbs/day) by Route	
Rail Table 27. Summary of 2019 Baseline Carbon Plant Rail Rack Annual Emissions (tons/yr) by Route	

Rail Table 18. Carbon Plant Rail Rack Daily Process Parameters for 2019

Daily Parameter	Value	Units	Reference & Notes
Number of Railcars	2.32	cars/day	3 visits per week/ 7 cars per week on avg (P66, 2021)
Petroleum Coke Weight per Car	90	short tons/car	(P66, 2021)
Petroleum Coke to be Transported	209	short tons/day	Calculated
Tare Weight of Empty Open Wagons	31	short tons/car	Ref: Six-axle all-metal open wagon, https://www.searates.com/reference/o
Daily Weight of Empty Open Wagons	78	tare short tons/day	Calculated Tare Weight
Daily Weight of Filled Railcars	287	gross short tons/day	Freight Weight + Tare Weight
Daily CHE Operating hours	1.1	hr/day	Calculated from annual, used 3 times per week

Note:
[1] Daily process parameters are used to calculate daily inbound and outbound throughput.

Rail Table 19. Carbon Plant Rail Rack Annual Process Parameters for 2019

Annual Parameter	Value	Units	Reference & Notes
Number of Railcars	362	cars/year	3 visits/7 cars per week (P66, 2021)
Petroleum Coke Weight per Car	90	short tons/car	(P66, 2021)
Petroleum Coke to be Transported	32,580	short tons/year	Calculated
Tare Weight of Empty Open Wagons	31	short tons/car	Ref: Six-axle all-metal open wagon, https://www.searates.com/reference/o
Annual Weight of Empty Open Wagons	12,188	tare short tons/year	Calculated Tare Weight
Annual Weight of Filled Railcars	44,768	gross short tons/year	Freight Weight + Tare Weight
Annual CHE Operating hours	178	hr/year	Carbon Plant data based on project design basis (P66, 2021)

Note:
[1] Annual process parameters are used to calculate annual inbound and outbound throughput.

Rail Table 20. Distribution of Carbon Plant Rail Rack Cars in 2019

Route	Lag	Percent of cars	No of cars	Notes
BAAQMD		100%	362	
common route		100%	362	
southern route		44%	160	Southern route before splitting off to LA/AZ lag
	LA	15%	54	
	AZ	23%	85	
eastern route		56%	202	
northern route		0%	0	

Note:
[1] Number of cars is based on 2019 rail rack rail movement data provided by P66.

Rail Table 21. Carbon Plant Rail Rack Route Distribution for 2019

Segment No.	District	Estimated Route in Districts - LOOKUP TABLE	Appx. Length	Units	Route	Lag	Percent of cars
1	BAAQMD	Rodeo to Bay Area AQMD Boundary	33.5	miles	BAAQMD		100%
2	YSAQMD	Yolo-Solano AQMD	18	miles	common route		100%
3	SMAQMD	Sacramento Metropolitan AQMD (northbound)	30	miles	common route		100%
4	PCAPCD	Placer County APCD (to & from Roseville)	4	miles	common route		100%
5	SMAQMD	Sacramento Metropolitan AQMD (southbound)	38	miles	southern route		44%
6	SJVAPCD	San Joaquin Valley APCD	276	miles	southern route		44%
7	EKAPCD	Eastern Kern APCD (to MDAQMD boundary)	74	miles	southern route	AZ	23%
8	MDAQMD	Mojave Desert AQMD	215	miles	southern route	AZ	23%
9	PCAPCD	Placer County APCD (to Nevada County Line)	70	miles	eastern route		56%
10	NSAQMD	Northern Sierra AQMD & Proximity	55	miles	eastern route		56%
11	PCAPCD	Placer County APCD (to Yuba County Line)	20	miles	northern route		0%
12	FRAQMD	Feather River AQMD	27	miles	northern route		0%
13	BCAQMD	Butte County AQMD	46	miles	northern route		0%
14	TCAPCD	Tehama County APCD	41	miles	northern route		0%
15	SHAQMD	Shasta County AQMD	76	miles	northern route		0%
16	SCAPCD	Siskiyou County APCD	87	miles	northern route		0%
17	EKAPCD	Eastern Kern APCD (to AVAQMD boundary)	58	miles	southern route	LA	15%
18	AVAQMD	Antelope Valley AQMD	29	miles	southern route	LA	15%
19	SCAQMD	South Coast AQMD	90	miles	southern route	LA	15%

Note:
[1] Segments lengths and percent of cars are used in the calculation of throughput for each air district.

Rail Table 22. Cargo Handling Equipment Characteristics

Vehicle Category	Model Year	Horsepower Bin	Fuel	Horsepower_Hours_hhpy	Load Factor	Daily CHE Operating hours

Rail Emissions

Project: **Phillips66 Rodeo Renewed Project**
Year: 2024 (Project)
Location: Rodeo Site, Rodeo, CA

Key Tables	Notes
Rail Table 33. Rodeo Site Rail Rack Daily Process Parameters for 2024	
Rail Table 34. Rodeo Site Rail Rack Annual Process Parameters for 2024	
Rail Table 35. Distribution of Rodeo Site Rail Rack Cars for 2024	
Rail Table 36. Rodeo Site Rail Rack Route Distribution for 2024	
Rail Table 37. 2024 Tier Distribution for Locomotive Engines	
Rail Table 38. Composite Emission Factors for Year 2024 for Locomotives	
Rail Table 39. Summary of 2024 Future Rodeo Site Rail Rack Daily Emissions (lbs/day) by AQMD/APCD	
Rail Table 40. Summary of 2024 Future Rodeo Site Rail Rack Annual Emissions (tons/yr) by AQMD/APCD	
Rail Table 41. Summary of 2024 Future Rodeo Site Rail Rack Daily Emissions (lbs/day) by Route	
Rail Table 42. Summary of 2024 Future Rodeo Site Rail Rack Annual Emissions (tons/yr) by Route	

Rail Table 33. Rodeo Site Rail Rack Daily Process Parameters for 2024

Daily Parameter	Value	Units	Reference & Notes
Number of Tank Cars	16	cars/day	Based on project design basis (P66, 2021)
Tallow Average Load per Car (bbl)	620	bbl/car	Based on project design basis (P66, 2021)
Tallow Average Load per Car (ft^3)	3,481	ft^3/car	Calculated
Tallow Weight per Car	98	short tons/car	Calculated
Tallow to be Transported	1,568	short tons/day	Calculated
Tare Weight of Empty Tank Car	42.2	short tons/car	Ref: CBTX DOT 111, https://www.gbrx.com/media/1466/tank29000.pdf
Daily Weight of Empty Tank Cars	732	tare short tons/day	Calculated Tare Weight
Daily Weight of Filled Tank Cars	2,300	gross short tons/day	Freight Weight + Tare Weight
Daily CHE Operating Hours	3.4	hr/day	Data based on project design basis (P66, 2021) operations, scaled from baseline based on cars per day

Note:
[1] Daily process parameters are used to calculate daily inbound and outbound throughput.

Rail Table 34. Rodeo Site Rail Rack Annual Process Parameters for 2024

Annual Parameter	Value	Units	Reference & Notes
Number of Tank Cars	5,840	cars/year	Based on project design basis (P66, 2021)
Tallow Average Load per Car (bbl)	620	bbl/car	Based on project design basis (P66, 2021)
Tallow Average Load per Car (ft^3)	3,481	ft^3/car	Calculated
Tallow Weight per Car	98	short tons/car	Calculated
Tallow to be Transported	572,271	short tons/year	Calculated
Tare Weight of Empty Tank Car	42.2	short tons/car	Ref: CBTX DOT 111, https://www.gbrx.com/media/1466/tank29000.pdf
Annual Weight of Empty Tank Cars	267,346	tare short tons/year	Calculated Tare Weight
Annual Weight of Filled Tank Cars	839,617	gross short tons/year	Freight Weight + Tare Weight
Annual CHE Operating Hours	1,243	hr/year	Data based on project design basis (P66, 2021) operations, scaled from baseline based on cars per day

Note:
[1] Annual process parameters are used to calculate annual inbound and outbound throughput.

Rail Table 35. Distribution of Rodeo Site Rail Rack Cars for 2024

Route	Lag	Percent of trains	Notes
BAAQMD		100%	
common route		100%	
southern route		100%	Common part before splitting off to LA/AZ lag
	LA	100%	
	AZ	100%	
eastern route		100%	
northern route		100%	

Note:
[1] Conservation assumption that all trains travel through eah route.

Rail Table 36. Rodeo Site Rail Rack Route Distribution for 2024

Segment No.	District	Estimated Route in Districts - LOOKUP TABLE	Appx. Length	Units	Route	Lag	Percent of trains
1	BAAQMD	Rodeo to Bay Area AQMD Boundary	33.5	miles	BAAQMD		100%
2	YSAQMD	Yolo-Solano AQMD	18	miles	common route		100%
3	SMAQMD	Sacramento Metropolitan AQMD (northbound)	30	miles	common route		100%
4	PCAPCD	Placer County APCD (to & from Roseville)	4	miles	common route		100%
5	SMAQMD	Sacramento Metropolitan AQMD (southbound)	38	miles	southern route		100%
6	SJVAPCD	San Joaquin Valley APCD	276	miles	southern route		100%
7	EKAPCD	Eastern Kern APCD (to MDAQMD boundary)	74	miles	southern route	AZ	100%
8	MDAQMD	Mojave Desert AQMD	215	miles	southern route	AZ	100%
9	PCAPCD	Placer County APCD (to Nevada County Line)	70	miles	eastern route		100%
10	NSAQMD	Northern Sierra AQMD & Proximity	55	miles	eastern route		100%
11	PCAPCD	Placer County APCD (to Yuba County Line)	20	miles	northern route		100%
12	FRAQMD	Feather River AQMD	27	miles	northern route		100%
13	BCAQMD	Butte County AQMD	46	miles	northern route		100%
14	TCAPCD	Tehama County APCD	41	miles	northern route		100%
15	SHAQMD	Shasta County AQMD	76	miles	northern route		100%
16	SCAPCD	Siskiyou County APCD	87	miles	northern route		100%
17	EKAPCD	Eastern Kern APCD (to AVAQMD boundary)	58	miles	southern route	LA	100%
18	AVAQMD	Antelope Valley AQMD	29	miles	southern route	LA	100%
19	SCAQMD	South Coast AQMD	90	miles	southern route	LA	100%

Note:
[1] Segments lengths and percent of cars are used in the calculation of throughput for each air district.

Rail Table 37. 2024 Tier Distribution for Locomotive Engines

Locomotive Diesel Engines	Percentage
Pre-Tier	0%
Tier 0	3%
Tier 0+	5%
Tier 1	0%
Tier 1+	29%
Tier 2	3%
Tier 2+	33%
Tier 3	20%
Tier 4	7%

Source:
[1] CARB 2021 Line-Haul Locomotive Emission Inventory. February Available at: ww2.arb.ca.gov/sites/default/files/2021-02/2021_line_haul_locomotive_emission_inventory_final.pdf

Rail Table 38. Composite Emission Factors for Year 2024 for Locomotives

Criteria Pollutants/GHG	Emission Factor (g/gal)	Emission Factor (lb/1000 gal)
PM_{10}	2.6	5.8
$PM_{2.5}$	2.4	5.3
NOx	112.4	247.8
CO	26.6	58.7
VOC	4.2	9.3
SO_2	2.0	4.3
CO_2	10206	22500
CH_4	0.8	1.8
N_2O	0.3	0.6
CO_2e	10302	22713

Note:

[1] CO_2 is defined by U.S. EPA as 10,206 g CO_2/gal of fuel. (CARB 2017)

[2] CH_4 emission factors are estimated from BSFC using Equation 8.6 (EPA 2020)

[3] N_2O emission factors are estimated from BSFC using Equation 8.7 (EPA 2020)

[4] Emission factors are used in the calculation of all 2024 rail emissions:

Base EF source: Table 4-7, 2017 Line haul Locomotive Model & Update, California Air Resources Board, Off Road Diesel Analysis Section, October 2017. Available at:https://ww3.arb.ca.gov/msei/ordiesel/locolinehaul2017ei.docx

Tier Distribution Source: CARB 2021 Line-Haul Locomotive Emission Inventory. Available at ww2.arb.ca.gov/sites/default/files/2021-02/2021_line_haul_locomotive_emission_inventory_final.pdf

Rail Emissions

Project: **Phillips66 Rodeo Renewed Project**
Year: 2019, 2024
Location: All Sites

Key Tables	Notes
Rail Table 43. Air Districts Abbreviations	
Rail Table 44. Air Districts Daily Significant Emissions Thresholds (lbs/day)	
Rail Table 45. Summary of Project Daily Incremental Emissions (lbs/day) by AQMD/APCD	
Rail Table 46. Daily Thresholds Evaluation	
Rail Table 47. Air Districts Annual Significant Emissions Thresholds (tons/year)	
Rail Table 48. Summary of Project Annual Incremental Emissions (tons/year) by AQMD/APCD	
Rail Table 49. Annual Thresholds Evaluation	

Rail Table 43. Air Districts Abbreviations

Air District	Abbreviation
Bay Area AQMD	BAAQMD
Yolo-Solano AQMD	YSAQMD
Sacramento Metropolitan AQMD	SMAQMD
Placer County APCD	PCAPCD
San Joaquin Valley APCD	SJVAPCD
Eastern Kern APCD	EKAPCD
Mojave Desert AQMD	MDAQMD
Northern Sierra AQMD	NSAQMD
Feather River AQMD	FRAQMD
Butte County AQMD	BCAQMD
Tehama County APCD	TCAPCD
Shasta County AQMD	SHAQMD
Siskiyou County APCD	SCAPCD
Antelope Valley AQMD	AVAQMD
South Coast AQMD	SCAQMD

Note:

[1] Shasta County AQMD has been abbreviated as "SHAQMD" to avoid confusion with the more commonly used "SCAQMD" as the abbreviation for South Coast AQMD.

Rail Table 44. Air Districts Daily Significant Emissions Thresholds (lbs/day)

Pollutant	BAAQMD	AVAQMD	BCAQMD	EKAPCD	FRAQMD	MDAQMD	NSAQMD	PCAPCD	SCAPCD	SCAQMD	SHAQMD	SJVAPCD	SMAQMD	TCAPCD	YSAQMD

[2] GHG emissions are calculated for truck routes within the California state boundary

Truck Table 4. Rodeo Site and Carbon Plant Onroad Fugitive Dust Emissions factors

Vehicle Type	CARB Roadway Category	Silt Loading (g/m2)	PM10 Particle Size Multiplier (g/mi)	PM2.5 Particle Size Multiplier (g/mi)	Average Vehicle Weight (tons)	Uncontrolled PM10 Emission Factor (g/VMT)	Uncontrolled PM2.5 Emission Factor (g/VMT)	Road Type Distribution for Concord, CA	Composite Uncontrolled PM10 Emission Factor (g/VMT)	Composite Uncontrolled PM2.5 Emission Factor (g/VMT)
Trucks	Local	0.32	1.00	0.15	25.0	9.45	1.42	6%	1.34	0.20
	Collector	0.032	1.00	0.15	25.0	1.16	0.17	7%		
	Major	0.032	1.00	0.15	25.0	1.16	0.17	29%		
	Freeway	0.015	1.00	0.15	25.0	0.58	0.09	57%		
LDVs	Local	0.32	1.00	0.15	2.4	0.87	0.13	6%	0.12	0.02
	Collector	0.032	1.00	0.15	2.4	0.11	0.02	7%		
	Major	0.032	1.00	0.15	2.4	0.11	0.02	29%		
	Freeway	0.015	1.00	0.15	2.4	0.05	0.01	57%		

Note:
[1] The equation is: Emission Factor = (Particle Size Multiplier) x (sL)^0.91 x (Vehicle Weight)^1.02
[2] The average vehicle weight for onsite trucks is based on a modern tanker truck that holds 9,000 gal diesel fuel (approx. 31.7 tons fuel) and has a GVWR of 80,000 lbs (40 tons) (GVWR includes the weight of cargo). Therefore, a loaded fuel truck would weigh 40 tons and an empty fuel truck would weigh 8.3 tons. The average weight is therefore assumed to be approximately 25 tons. Trucks and autos would generally take different routes onsite.

Location: Santa Maria Refinery, Arroyo Grande, CA

Key Tables	Notes
Rail Table 28. Santa Maria Refinery Rail Rack Daily Process Parameters for 2019	
Rail Table 29. Santa Maria Refinery Rail Rack Annual Process Parameters for 2019	
Rail Table 30. Santa Maria Refinery Rail Rack Route Length for 2019	
Rail Table 31. Summary of 2019 Baseline Santa Maria Refinery Rail Rack Daily Emissions (lbs/day)	
Rail Table 32. Summary of 2019 Baseline Santa Maria Refinery Rail Rack Annual Emissions (tons/yr)	

Rail Table 28. Santa Maria Refinery Rail Rack Daily Process Parameters for 2019

Daily Parameter	Value	Units	Reference & Notes
Number of Railcars	7.9	cars/day	Based on 2019 activity (P66, 2011). 1 visit per week/ 7.9 cars per week on avg
Petroleum Coke Weight per Car	100	short tons/car	Based on 2019 activity (P66, 2021)
Petroleum Coke to be Transported	787	short tons/day	Calculated
Tare Weight of Empty Open Wagons	43	short tons/car	Ref: Eight-axle open wagon, https://www.searates.com/reference/open/
Daily Weight of Empty Open Wagons	370	tare short tons/day	Calculated Tare Weight
Daily Weight of Filled Railcars	1156	gross short tons/day	Freight Weight + Tare Weight
Daily CHE Operating hours	2.0	hr/day	Based on 2019 activity (P66, 2021), 2 hours per week

Note:
[1] Daily process parameters are used to calculate daily inbound and outbound throughput.

Rail Table 29. Santa Maria Refinery Rail Rack Annual Process Parameters for 2019

Annual Parameter	Value	Units	Reference & Notes
Number of Railcars	409	cars/year	Based on 2019 activity (P66, 2011). 1 visit per week/ 7.9 cars per week on avg
Petroleum Coke Weight per Car	100	short tons/car	Based on 2019 activity (P66, 2021)
Petroleum Coke to be Transported	40,900	short tons/year	Calculated
Tare Weight of Empty Open Wagons	43	short tons/car	Ref: Eight-axle open wagon, https://www.searates.com/reference/open/
Annual Weight of Empty Open Wagons	19,234	tare short tons/year	Calculated Tare Weight
Annual Weight of Filled Railcars	60,134	gross short tons/year	Freight Weight + Tare Weight
Annual CHE Operating hours	104	hr/year	Calculated from daily, 2 hours per week

Note:
[1] Annual process parameters are used to calculate annual inbound and outbound throughput.

Rail Table 30. Santa Maria Refinery Rail Rack Route Length for 2019

Segment No.	District	Estimated Route in Districts	Appx. Length	Units	Percent of trains	Reasons & Remarks
1	SLOAPCD	San Luis Obispo APCD	4.5	miles	100%	Only one route
2	SBCAPCD	Santa Barbara County APCD	97	miles	100%	
3	VCAPCD	Ventura County APCD	52	miles	100%	
4	SCAQMD	South Coast AQMD	50	miles	100%	

Note:

[1] Phillips 66 Santa Maria Refinery Throughput Increase Project Final EIR, Appendix A

[2] Segment lengths and percent of cars are used in the calculation of throughput for each air district.

Notes:

[1] Baseline emissions for existing sources are from the facility's 2019 BAAQMD Regulation 12-15 Emissions Inventory. Source IDs may repeat to account for different categories of emissions occurring at a single source.

[2] Air Liquide emissions are not reported in this table as it is not a facility source. Emissions are separately presented in Stationary Source Table 15.

[3] Post-project emissions assumed to be equal to baseline emissions for sources not impacted by the project and set to zero for sources shutdown or demolished during the project. Emissions for new sources are presented in Stationary Source Tables 4-8. Emissions for existing sources affected by the Project are presented in Stationary Source Tables 9-23.

[4] The net change in POC emissions from new equipment components for U240, U246, Rail Unloading, U110, U40, and U76 are presented in a separate line item, rather than at each individual source.

Stationary Source Table 2

Notes:

1. Emissions by source are calculated in Stationary Source Tables 4 through 23.
2. Emission rates converted to g/s for health risk assessment assuming all sources operate continuously (365 days/yr, 24 hours/day).

RAMBOLL

Stationary Source Table 4
Wet Surface Air Cooler Emissions
Phillips 66 Company - San Francisco Refinery
Rodeo, CA

Throughput[1]

Value	Units
8,000	gpm
6	Circulations
12	MMgal/day
4,205	MMgal/yr

PM Emission Factor Derivation

Source	Percent Drift[2]	TDS[3]	PM EF[4]
	vol%	mg/L	lb/MMgal
WSAC	0.0005%	190	0.0079

PM Emissions

Source	PM_{10} Emissions[4]		$PM_{2.5}$ Emissions[4]	
	(lb/day)	(ton/year)	(lb/day)	(ton/year)
WSAC	0.55	0.10	0.55	0.10

Notes:

1. Throughput in gallons per minute based on engineering design. Daily and annual throughput calculated assuming continuous operation.
2. Percent drift based on engineering design. Drift eliminators will be installed.
3. Total dissolved solids (TDS) concentration estimated to be 140-190 mg/L by East Bay Municipal Water District. Maximum of range selected for most conservative emissions estimate.
4. Consistent with AP-42 Chapter 13 Section 4 methodology, all TDS conservatively assumed to be PM_{10}. For the purposes of estimating post-project emissions from new sources, PM_{10} also conservatively set equal to $PM_{2.5}$ emissions.

Abbreviations:

EF - emission factor
gpm - gallons per minute
L - liters
lb - pound
mg - milligrams
MMgal - million gallons
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter
TDS - total dissolved solids
yr - year

References:

Stationary Source Table 5
Vapor Collection System Emissions
Phillips 66 Company - San Francisco Refinery
Rodeo, CA

Vapor Flow Rate[1]	VOC Concentration[1]	VOC Flow Rate	VOC Emission Rate	
scfm	ppmv	scfm	lb/day	ton/yr
4,000	10	0.040	2.4	0.43

Notes:

1. All parameters are based on engineering design. VOC concentration is 10 ppmv at outlet of carbon canisters.
2. Daily and annual VOC emission rates calculated from VOC flow rate using the molar volume of an ideal gas at 70°F and 1 atm to convert from volume to moles and assuming all VOCs are methane to convert from moles to mass. Continuous facility operation is also assumed.

Abbreviations:

lb - pound
ppmv - parts per million by volume
scfm - standard cubic feet per minute
VOC - volatile organic compound
yr - year

Stationary Source Table 6
Unit 237 Sulfur Treatment Unit Emissions
Phillips 66 Company - San Francisco Refinery
Rodeo, CA

Operational Parameters[1]

Parameter	Value	Units
# Thermal Oxidizers	2	--
Natural Gas Firing Rate (per ThermOx)	7.4	MMBtu/hr
Natural Gas Firing Rate (Total)	14.8	MMBtu/hr
Natural Gas HHV	1,050	Btu/Scf
Natural Gas Flow	14,095	scf/hr
Hours per Day	24	hr/day
Days per Year	365	day/yr

RAMBOLL

Stationary Source Table 6
Unit 237 Sulfur Treatment Unit Emissions
Phillips 66 Company - San Francisco Refinery
Rodeo, CA

Notes:

1. Natural gas feed rate to each thermal oxidizer based on engineering design.
2. NOx, SO_2, and PM emission rates based on engineering design. POC, CO, and CO_2 emissions assumed to be from combustion, with emission factors from AP-42 Chapter 1, Section 4 "Natural Gas Combustion" Tables 1.4-1 and 1.4-2. Additional CO_2 emissions are expected due to the composition of the acid gas stream. This CO_2 emission factor is based on engineering design. The acid gas related CO_2 emissions shown above represent total Post-Project CO_2 emissions from this stream. For reporting purposes, all of the emissions are shown coming from Unit 237 and Unit 235 Post-Project CO_2 has been shown as zero (see Table 1).
3. TAC emissions are assumed to be from natural gas combustion, with the exception of sulfuric acid mist as discussed in footnote 4. Emission factors are from BAAQMD Petroleum Refinery Emissions Inventory Guidelines, Appendix A for "Heaters, Natural Gas". Emissions were calculated for each individual PAH compound (shown in italics) and then converted to a single emission rate of PAH as benzo(a)pyrene equivalents using the Potency Equivalency Factors (PEFs) provided in BAAQMD Regulation 2 Rule 5 footnote 8. Note that naphthalene is reported separately.
4. Particulate matter emissions are reported as sulfuric acid mist and thus these emissions are accounted for in both the CAP and TAC sections.

Abbreviations:

CAP - Criteria Air Pollutant
CO - carbon monoxide
CO_2 - carbon dioxide
GHG - Greenhouse Gas
HHV - higher heating value
hr - hour
lb - pound
lbmol - pound-mole
MMBtu - million British thermal units
MT - metric ton
NOx - nitrogen oxides
POC - Precursor Organic Compounds
PM_{10} - particulate matter less than 10 microns in diameter
scf - standard cubic feet
SO_2 - sulfur dioxide
TAC - toxic air contaminant
VOC - volatile organic compounds
yr - year

BAAQMD. 2005. Policy: Emission factors for Toxic Air Contaminants from Miscellaneous Natural Gas Combustion Sources. Available at: https://www.baaqmd.gov/~/media/Files/Engineering/policy_and_procedures/TACEmFacfromNatGasCombustion.as

Stationary Source Table 7
Material Handling Emissions
Phillips 66 Company - San Francisco Refinery
Rodeo, CA

Material Handling Emissions from Pre-Treatment Unit Silos and Day Hoppers[1]

Source Type	Material	Air Flow Rate[1]	Grain Loading[1]	Emission Rate per Source	Number of Sources	Criteria Air Pollutant Emissions			Toxic Air Contaminant Emissions			
						$PM_{10}/PM_{2.5}$ Emission Rate[2,3]			Crystalline Silica Content[4]	Crystalline Silica Emission Rate[3,5]		
		dscfm	grain/dscf	grain/min		lb/hour	lb/day	ton/yr	wt% of PM	lb/hour	lb/day	ton/yr
Silo	Bleached Earth	1,600	0.0015	2.4	12	0.25	5.9	1.1	0.050	0.012	0.30	0.054
	Filter Aid	1,600	0.0015	2.4	9.0	0.19	4.4	0.81	0.50	0.093	2.2	0.41
Day Hopper	Bleached Earth	665	0.0020	1.3	6.0	0.068	1.6	0.30	0.050	0.0034	0.082	0.015
	Filter Aid	665	0.0020	1.3	7.0	0.080	1.9	0.35	0.50	0.040	1.0	0.17
					Total Emissions	**0.58**	**14**	**2.5**	--	**0.15**	**3.6**	**0.65**

Notes:

1. Material handling dust emissions will be generated during transfer of bleached earth and filter aid from trucks to silos and from silos to day hoppers. Each transfer point is controlled by a baghouse. Dust filter control specifications and maximum air flowrate based on baghouse vendor data and are representative of a single source.
2. Particulate matter emissions are less than 1 micron, therefore PM10 and PM2.5 emission rates are equal.
3. Daily and annual emission rates calculated assuming continuous operation of the pre-treatment unit (24 hours per day, 365 days per year). Emissions only occur during loading.
4. Crystalline silica content from manufacturer's SDS. For each material, the upper end of the weight percent range was conservatively selected.
5. Crystalline silica emissions calculated by multiplying the PM emission rate for each material and train by the crystalline silica content.

Abbreviations:

ft^3 - cubic feet
hr - hour
lb - pound
m^3 - cubic meters
mg - milligrams
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter
PTU - Pre-Treatment Unit
yr - year

Stationary Source Table 8
Potential Equipment Component Emissions from Pre-Treatment Unit
Phillips 66 Company - San Francisco Refinery
Rodeo, CA

Process Component Counts[1]

Fugitive Component Type	PTU Train 1		PTU Train 2		PTU Train 3		FRU		Total Number of Components
	Oil	Waste Water	Oil	Waste Water	Oil	Waste Water	Oil	Waste Water

Pumps/All Others	64	5.0	45	5.0	64	5.0	--	43	231

POC Emission Factors[2]

Component Type	Equation	Leak Rate (ppm)	Emission Factor (kg/hr/comp)
Valves	2.27E-06(SV)^0.747	100	7.1E-05
Pumps	5.07E-05(SV)^0.622	500	0.0024
Others	8.69E-06(SV)^0.642	100	1.7E-04
Connectors	1.53E-06(SV)^0.736	100	4.5E-05
Pressure Relief Device	8.69E-06(SV)^0.642	500	4.7E-04

Emissions Calculations[3]

Fugitive Component Type	Total Number of Components	POC Emissions	
		lb/day	ton/year
Connectors	10,306	25	4.5
Valves	3,436	13	2.3
Pressure Relief Valves	154	3.8	0.70
Process Drains	--	--	--
Pumps/All Others	231	30	5.4
Total		71	13

Notes:

1. Process component counts based on engineering design.
2. Emission factors were calculated using equations from CAPCOA "California Implementation Guidelines for Estimating Mass Emissions of Fugitive Hydrocarbon Leaks at Petroleum Facilities" Table IV-3a. Leak rates are consistent with interim BAAQMD Guidance until BAAQMD's development and implementation of a heavy liquid leak rate is established and approved.
3. Emissions calculated assuming continuous facility operation (24 hours/day, 365 days/year).

Abbreviations:

hr - hour
kg - kilogram
lb - pound
POC - precursor organic compound
ppm - parts per million
PTU - Pre-Treatment Unit

References:

CAPCOA. California Implementation Guidelines for Estimating Mass Emissions of Fugitive Hydrocarbon Leaks at Petroleum Facilities. February 1999. Available online: https://ww3.arb.ca.gov/fugitive/impl_doc.pdf

Notes:

1. Counts are based on engineering design.
2. Emission factors were calculated using equations from CAPCOA "California Implementation Guidelines for Estimating Mass Emissions of Fugitive Hydrocarbon Leaks at Petroleum Facilities" Table IV-3a. Leak rates for all components in heavy liquid service are consistent with interim BAAQMD guidance until BAAQMD's development and implementation of a heavy liquid leak rate is established and approved. Leak rates for components in light liquid service vary by component type and are from 2019 R12-15 calculations for the facility. Consistent with CAPCOA guidance, drains are assumed to fall into the "Other" component category.
3. Emissions calculated assuming continuous facility operation (24 hours/day, 365 days/year).

Abbreviations:

hr - hour
kg - kilogram
lb - pound
POC - precursor organic compound
ppm - parts per million
PTU - Pre-Treatment Unit

Notes:

1. Speciation by stock obtained from facility's 2019 R12-15 Emissions Inventory or based on engineering design.
2. Speciations are used in the calculation of baseline and post-project equipment component TAC emissions (Stationary Source Table 11) and post-project tanks TAC emissions (Stationary Source Table 23).
3. Naphthalene speciations are only applicable for equipment component TAC emissions and TK-67 and TK-529, both of which operate at a high enough temperature for volatilization of naphthalene to occur. As shown in Stationary Source Table 16, however, the post-project stock for both TK-67 and TK-529 is Renewable Feedstock and thus zero naphthalene emissions are expected in the post-project scenario.
4. PAH speciations are only applicable for equipment component TAC emissions. None of the tanks included in this analysis operate at a high enough temperature for volatilization of PAH to occur.

Notes:

1. Baseline POC emissions by process unit and material service for existing equipment components were obtained from the facility's 2019 R12-15 Emissions Inventory. Only streams with a material service change in the post-project scenario are included. The POC emission rate is a function of the service type (LL, HL, GV) and independent of the exact material. Thus, POC emission rates are assumed to be constant between baseline and post-project scenarios for all material service changes. This conservatively includes the Crude-Blended (LL/HL to HL) to Renewable Feedstocks (HL) service change as well as the Butane (LL) to Renewable Feedstocks (HL) service change. This is conservative because the POC emission factor for LL service is higher than HL service. Additionally, it is accurate to assume the POC emission rate is constant for the Coker Heavy Naphtha to Sat Gas service change as LL and GV service rely on the same POC emission factors. POC emission factors for GV, LL, and HL service are shown in Stationary Source Table 9 and are consistent with CAPCOA guidance.
2. POC emissions associated with Post-Project net change in component counts are calculated in Stationary Source Table 9.
3. TAC emissions were calculated using the POC emission rates in the upper table with the material-specific TAC speciations in Stationary Source Table 10. Emissions were summed across streams at each process unit in order to obtain TAC emissions by process unit.

Abbreviations:

lb - pound
POC - precursor organic compounds
TAC - Toxic Air Contaminant
yr- year

		Post-Project	--	--	--	--	--	--	--	--	--

Notes:

1. Renewable feedstocks loading emission factor calculated based on AP-42 Chapter 5.2 methodology, as follows:

   EF = [Saturation Factor] * [Molecular Weight] *[TVP] / [Temperature in Rankine]

2. Renewable diesel loading emission factor reduced by 61% to account for clean and purge of vessels, based on the BAAQMD Rule 12-15 emissions inventory.
3. Saturation factor from AP-42 Table 5.2-1 for submerged ship loading.
4. Baseline TAC emissions from the facility's R12-15 Emissions Inventory. As shown in Stationary Source Table 10, neither Renewable Diesel nor Renewable Feedstocks contain TACs. Thus, zero TAC emissions are expected from marine loading operations in the post-project scenario.

Abbreviations:

bbl - barrel
EF - Emission Factor
F - Fahrenheit
lb - pound
Mgal - thousand gallons
psia - Pounds per Square Inch Actual
TVP - True Vapor Pressure

Notes:

1. Baseline emissions were obtained directly from the facility's 2019 BAAQMD Rule 12-15 Emissions Inventory.
2. Post-project emissions were estimated using baseline throughput and emissions and post-project projected rates.

Abbreviations:

CO - carbon monoxide
GHG - greenhouse gas
hr - hour
Mbbl - thousand barrels
Mgal - thousand gallons
MMBtu - million British thermal units
MT - metric ton
NOx - nitrogen oxides
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter
POC - precursor organic compounds
SO_2 - sulfur dioxide
yr - year

Notes:

1. Baseline throughput was obtained directly from the facility's 2019 R12-15 Emissions Inventory. Post-project throughput is based on engineering design.
2. Baseline emissions were obtained directly from the facility's 2019 R12-15 Emissions Inventory.
3. Post-Project emissions were calculated by multiplying the baseline emission rate by the ratio of the post-project throughput to baseline throughput.

Abbreviations:

hr - hour
Mgal - thousand gallons
MMBtu - million British thermal units
TAC - Toxic Air Contaminant
yr - year

			Total	**17**	**0.010**	**0.95**	**1.1**	**3.6**	**3.5**	**801,794**	**22**	**0.013**	**1.2**	**1.4**	**4.7**	**4.6**	**1,031,689**	**5.1**	**0.0031**	**0.29**	**0.34**	**1.1**	**1.1**	**229,895**

TAC Emissions[1,3]

Chemical	CAS	Baseline Emissions (lb/year)	Post-Project Emissions (lb/year)
Acetaldehyde	75070	105	137
Acrolein	107028	0.037	0.049
Benzene	71432	70	91
Ethyl Benzene	100414	5.4	7.0
Formaldehyde	50000	313	407
Hexane	110543	0.11	0.14
Methanol	67561	829	1,080
NH3	7664417	14	18
Naphthalene	91203	16	21
Phenol	108952	12	16
Propylene	115071	39	51
Sulfuric Acid	7664939	232	303
Toluene	108883	86	112
Xylenes	1330207	0.11	0.14

Notes:
1. Baseline CAP and TAC emissions from 2019 CEIDARS database.
2. GHG Emissions from 2019 California Mandatory Reporting Rule data.
3. Post-Project CAP and TAC emissions are assumed to scale with fuel combustion. GHG emissions are assumed to scale with hydrogen production.

Abbreviations:
CAP - Criteria Air Pollutant
CO - carbon monoxide
GHG - greenhouse gas
lb - pound
MT - metric ton
NOx - nitrogen oxides
PM10 - particulate matter less than 10 microns in diameter
PM2.5 - particulate matter less than 2.5 microns in diameter
POC - precursor organic compounds
SO2 - sulfur dioxide
TAC - Toxic Air Contaminant

Notes:

1. Baseline stock, bulk temperature, and throughputs for informational and not used for emissions calculations. Baseline (2019) inputs and emissions were obtained from facility's 2019 R12-15 emissions inventory.
2. Post-Project stock, bulk temperature, and throughputs based on engineering design. This data is used to calculate emissions following AP-42 Chapter 7 methodology.

Abbreviations:

bbl - barrel(s)
°F - degrees Fahrenheit
yr - year

Notes:

1. Tank parameters for baseline and post-project scenarios based on engineering design and are assumed to be equivalent for the majority of tanks. Bold font indicates a parameter that changed between the baseline and post-project scenarios.

2. Emissions calculations conducted using AP-42 Chapter 7 methodology. Any tank parameter required in the calculation but not shown above (such as operating pressure, tank condition, etc) is assumed to be default. Note that parameters specific to floating roof tanks are shown in Stationary Source Table 18.

Renewable Naphtha	FALSE	FALSE	FALSE	11	89	74	5.55	--	12.6	5,686	--
Renewable Jet Fuel	FALSE	FALSE	FALSE	0.029	162	130	7.0	2.5	14.0	9,804	--

Notes:

1. Stock parameters obtained from facility's 2019 R12-15 Inventory calculations or based on engineering design.
2. The density of Renewable Feedstock was obtained from the manufacturer's SDS. The molecular weight of liquid and vapor states is assumed to be equivalent and was derived using the extended form of the Riazi-Daubert equation, where the mean average boiling point was obtained from Yuan et al (2005) and the specific gravity was obtained from the manufacturer's SDS. The Antoine A Coefficient was conservatively derived to fix the annual average true vapor pressure at 0.0001 psia. This is a conservative estimate of laboratory results which indicated the true vapor pressure is several orders of magnitude smaller.

Abbreviations:

MWL - molecular weight, liquid

MWV - molecular weight, vapor

RVP - Reid Vapor Pressure

S - distillation slope

Notes:

1. Tank type and vapor control based on engineering design and are assumed to be representative of baseline and post-project conditions except as noted in the Physical Changes from Baseline to Post-Project column in the above table. See Stationary Source Tables 17 and 18 for additional tank parameters.

2. Descriptions of physical changes to be made to tanks based on engineering design and implemented in emissions calculation methodology. See Tables 17 and 18 for detailed overview of these changes.
3. Baseline stocks, throughput, and emissions obtained from the facility's 2019 R12-15 inventory calculations or based on engineering design. See Stationary Source Table 16 for details.
4. Post-Project stocks and throughputs based on engineering design, as shown in Stationary Source Table 16. Emissions were calculated using AP-42 Chapter 7 methodology. Detailed summaries of the tank parameters, stock parameters, and meteorological data used in these calculations are presented in Stationary Source Tables 16 through 20. Toxic emissions are presented in Stationary Source Tables 22 and 23.

Abbreviations:

bbl - barrel(s)
lb - pound(s)
POC - precursor organic compound(s)
yr - year

Attachment C-1

Table 1
Vessel Source Groups for Health Risk Assessments
Phillips 66 Company - San Francisco Refinery
Rodeo, CA

Notes:

1. Source groups were determined based on HRA modeling files provided by Phillips 66. Source group labels ending with B, 3, or 5 indicate where the vessel docks (see Figure 4.5). See Attachment D for more information on source group descriptions.

2. Source groups were not applied for transiting vessel activity that occurs only in zones 2, 3, or 4, as these zones are beyond the modeling distance of 18.3 km and therefore are not expected to impact the health risks. Source groups were also not applied for anchorage emissions, as these are expected to occur beyond the modeling distance of 18.3 km.

Attachment C-1

Table 2
Baseline Ocean Going Vessels Emissions Summary
Phillips 66 Company - San Francisco Refinery
Rodeo, CA

3-Year Average Baseline Ocean Going Vessel Marine Emissions:[1]

Notes:

1. Marine activity, including transit zone and zone distance, vessel type, engine type, and associated annual emissions, is provided in Attachment A. Emissions represent a 3-year average from 2017-2019 to create a representative scenario of baseline annual emissions.
2. Phillips 66 provided marine shipping HRA modeling information, including souce groups and dispersion files. The provided source groups were then allocated to vessels based on the transit type, zone of travel, vessel type, and engine type. See Table 1 for more information.
3. The emissions are scaled based on the ratio of the one-way zone distance and the model transit length of 18.3 km. Emissions in transiting zones beyond the modeling distance of 18.3 km, which occurs in Zones 2 and 3, are not accounted for in the health risks. Ship activity that occurs in multiple zones is scaled based on the zone distance to account for emissions that occur in Zone 1.
4. Annual emissions are converted into an emission rate per second assuming 24 hours of operation a day, 7 days a week, 365 days a year. HRA emissions from PM_{10} and HC are included for speciation of TACs, which can be seen in Table 4.

Abbreviations:

CH4 - methane
CO - carbon monoxide
CO2 - carbon dioxide
DPM - diesel particulate matter
HC - hydrocarbon
HRA - health risk assessment
lb - pound
nm - nautical mile
km - kilometers
NOx - nitrogen oxides
N2O - nitrous oxides
PM10 - particulate matter less than 10 microns in diameter
PM2.5 - particulate matter less than 2.5 microns in diameter
sec - second
SOX - sulfur oxides
TAC - toxic air contaminants
VOC- volatile organic compounds

Notes:

[1] Marine activity, including transit zone and zone distance, vessel type, engine type, associated annual emissions, and maneuvering percent is provided in Attachment A. Emissions represent a 3-year average from 2017-2019 to create a representative scenario of baseline annual emissions.

[2] Phillips 66 provided marine shipping HRA modeling information, including souce groups and dispersion files. The provided source groups were then allocated to vessels based on the transit type, zone of travel, vessel type, and engine type. See Table 1 for more information.

[3] The emissions are scaled based on the ratio of the one-way zone distance and the model transit length of 18.3 km. Emissions in transiting zones beyond the modeling distance of 18.3 km, which occurs in Zones 2 and 3, are not accounted for in the health risks. Ship activity that occurs in multiple zones is scaled based on the zone distance to account for emissions that occur in Zone 1.

[4] The assist tugboats that operate within Zones 1-3 also participate in maneuvering activity. To account for this portion of maneuvering activity, a percentage of the emissions are apportioned to the maneuvering tugboat (MAN_TUG) source group.

[5] Annual emissions are converted into an emission rate per second assuming 24 hours of operation a day, 7 days a week, 365 days a year.

[6] Harbor Craft emissions that are allocated to maneuvering do not take into account the distance scaling factor, as they are within the modeling distance of 18.3 km.

Abbreviations:

CH4 - methane
CO - carbon monoxide
CO2 - carbon dioxide
DPM - diesel particulate matter
lb - pound
HRA - health risk assessment
nm - nautical mile
km - kilometer
Nox - nitrogen oxides
N2O - nitrous oxides
PM10 - particulate matter less than 10 microns in diameter
PM2.5 - particulate matter less than 2.5 microns in diameter
sec - second
SOX - sulfur oxides
VOC- volatile organic compounds

Attachment C-1

Notes:

1. Table 4 compiles the baseline emissions by source group across Ocean Going Vessels and Harbor Crafts. Summed emissions across source groups are converted to grams. 72 adjacent volume sources were used to represent vessel maneuvering emissions all modeled at 1 g/s; therefore, maneuvering source group emissions were divided by 72. 369 adjacent volume sources were used to represent vessel transiting emissions all modeled at 1 g/s; therefore, transiting source group emissions were divided by 369.

Attachment C-1

Notes:

1. Marine activity, including transit zone and zone distance, vessel type, engine type, and associated annual emissions, is provided in Attachment A. Interim emissions represent a 7 - month period of marine activity during the second year of project construction before post - project marine operations begin. Health risks associated with interim emissions are accounted for in the construction HRA rather than in the Post-Project operations HRA. The construction HRA contains impacts that occur before Post-Project operation begins.

2. Phillips 66 provided marine shipping HRA modeling information, including souce groups and dispersion files. The provided source groups were then allocated to vessels based on the transit type, zone of travel, vessel type, and engine type. See Table 1 for more information.

3. The emissions are scaled based on the ratio of the one-way zone distance and the model transit length of 18.3 km. Emissions in transiting zones beyond the modeling distance of 18.3 km, which occurs in Zones 2 and 3, are not accounted for in the health risks. Ship activity that occurs in multiple zones is scaled based on the zone distance to account for emissions that occur in Zone 1.

4. Annual emissions are converted into an emission rate per second assuming 24 hours of operation a day, 7 days a week, 365 days a year. HRA emissions from PM_{10} and HC are included for speciation of TACs, which can be seen in Table 8.

Abbreviations:

CH4 - methane
CO - carbon monoxide
CO2 - carbon dioxide
DPM - diesel particulate matter
HC - hydrocarbon
HRA - health risk assessment
lb - pound
nm - nautical mile
km - kilometers
Nox - nitrogen oxides
N2O - nitrous oxides
PM10 - particulate matter less than 10 microns in diameter
PM2.5 - particulate matter less than 2.5 microns in diameter
sec - second
SOX - sulfur oxides
TAC - toxic air contaminants
VOC- volatile organic compounds

Attachment C-1

Notes:

[1] Marine activity, including transit zone and zone distance, vessel type, engine type, associated annual emissions, and maneuvering percent is provided in Attachment A. Interim emissions represent a 7 - month period of marine activity during the second year of project construction before post - project marine operations begin. Health risks associated with interim emissions are accounted for in the construction HRA rather than in the Post-Project operations HRA. The construction HRA contains impacts that occur before Post-Project operation begins.

[2] Phillips 66 provided marine shipping HRA modeling information, including souce groups and dispersion files. The provided source groups were then allocated to vessels based on the transit type, zone of travel, vessel type, and engine type. See Table 1 for more information.

[3] The emissions are scaled based on the ratio of the one-way zone distance and the model transit length of 18.3 km. Emissions in transiting zones beyond the modeling distance of 18.3 km, which occurs in Zones 2 and 3, are not accounted for in the health risks. Ship activity that occurs in multiple zones is scaled based on the zone distance to account for

[4] The assist tugboats that operate within Zones 1-3 also participate in maneuvering activity. To account for this portion of maneuvering activity, a percentage of the emissions are aportioned to the maneuvering tugboat (MAN_TUG) source group.

[5] Annual emissions are converted into an emission rate per second assuming 24 hours of operation a day, 7 days a week, 365 days a year.

[6] Harbor Craft emissions that are allocated to maneuvering do not take into account the distance scaling factor, as they are within the modeling distance of 18.3 km.

Abbreviations:

CH4 - methane
CO - carbon monoxide
CO2 - carbon dioxide
DPM - diesel particulate matter
HRA - health risk assessment
lb - pound
nm - nautical mile
km - kilometers
Nox - nitrogen oxides
N2O - nitrous oxides
PM10 - particulate matter less than 10 microns in diameter
PM2.5 - particulate matter less than 2.5 microns in diameter
sec - second
SOX - sulfur oxides
VOC- volatile organic compounds

Notes:

1. Table 8 compiles the interim emissions by source group across Ocean Going Vessels and Harbor Crafts. Summed emissions across source groups are converted to grams. 72 adjacent volume sources were used to represent vessel maneuvering emissions all modeled at 1 g/s; therefore, maneuvering source group emissions were divided by 72. 369 adjacent volume sources were used to represent vessel transiting emissions all modeled at 1 g/s; therefore, transiting source group emissions were divided by 369.

2. Increment emissions in column D represent the net increase in emissions associated with Interim operations. Increment + Baseline emissions in column E represent the combined Interim increment and baseline emissions. Health risks associated with interim emissions are accounted for in the construction HRA rather than in the Post-Project operations HRA. The construction HRA contains impacts that occur before Post-Project operation begins.

Notes:
1. Marine activity, including transit zone and zone distance, vessel type, engine type, and associated annual emissions, is provided in Attachment A. Post - project emissions are representative of anticipated marine activity during the project operations.
2. Phillips 66 provided marine shipping HRA modeling information, including souce groups and dispersion files. The provided source groups were then allocated to vessels based on the transit type, zone of travel, vessel type, and engine type. See Table 1 for more information.
3. The emissions are scaled based on the ratio of the one-way zone distance and the model transit length of 18.3 km. Emissions in transiting zones beyond the modeling distance of 18.3 km, which occurs in Zones 2 and 3, are not accounted for in the health risks. Ship activity that occurs in multiple zones is scaled based on the zone distance to account for emissions that occur in Zone 1.
4. Annual emissions are converted into an emission rate per second assuming 24 hours of operation a day, 7 days a week, 365 days a year. HRA emissions from PM10 and HC are included for speciation of TACs, which can be seen in Table 11.

Abbreviations:

CH4 - methane	Nox - nitrogen oxides
CO - carbon monoxide	N2O - nitrous oxides
CO2 - carbon dioxide	PM10 - particulate matter less than 10 microns in diameter
DPM - diesel particulate n	PM2.5 - particulate matter less than 2.5 microns in diameter
HC - hydrocarbon	sec - second
HRA - health risk assessn	SOX - sulfur oxides
lb - pound	TAC - toxic air contaminants
nm - nautical mile	VOC- volatile organic compounds
km - kilometers

Notes:

1. Marine activity, including transit zone and zone distance, vessel type, engine type, associated annual emissions, and maneuvering percent is provided in Attachment A. Post - project emissions are representative of anticipated marine activity during the project operations.
2. Phillips 66 provided marine shipping HRA modeling information, including souce groups and dispersion files. The provided source groups were then allocated to vessels based on the transit type, zone of travel, vessel type, and engine type. See Table 1 for more information.
3. The emissions are scaled based on the ratio of the one-way zone distance and the model transit length of 18.3 km. Emissions in transiting zones beyond the modeling distance of 18.3 km, which occurs in Zones 2 and 3, are not accounted for in the health risks. Ship activity that occurs in multiple zones is scaled based on the zone distance to account for emissions that
4. The assist tugboats that operate within Zones 1-3 also participate in maneuvering activity. To account for this portion of maneuvering activity, a percentage of the emissions are aportioned to the maneuvering tugboat (MAN_TUG) source group.
5. Annual emissions are converted into an emission rate per second assuming 24 hours of operation a day, 7 days a week, 365 days a year.

Abbreviations:

CH4 - methane	Nox - nitrogen oxides
CO - carbon monoxide	N2O - nitrous oxides
CO2 - carbon dioxide	PM10 - particulate matter less than 10 microns in diameter
DPM - diesel particulate matter	PM2.5 - particulate matter less than 2.5 microns in diameter
HRA - health risk assessment	sec - second
lb - pound	SOX - sulfur oxides
nm - nautical mile	VOC- volatile organic compounds
km - kilometers

Notes:

1. Table 11 compiles the post - project emissions by source group across Ocean Going Vessels and Harbor Crafts. Summed emissions across source groups are converted to grams. 72 adjacent volume sources were used to represent vessel maneuvering emissions all modeled at 1 g/s; therefore, maneuvering source group emissions were divided by 72. 369 adjacent volume sources were used to represent vessel transiting emissions all modeled at 1 g/s; therefore, transiting source group emissions were divided by 369.

Notes:

1. HRA emissions are calculated in Tables 2-10 and are shown in Table 12 as allocated by source group.

2. Boiler toxic air contaminant emissions are calculated based on speciated PM10 and hydrocarbon emissions. More information is provided in Table 11.

3. Baseline and interim berthing ships with boiler engine emissions use the source group HTLBLRB, whereas post-project berthing ship with boiler engine emissions use the source group HTLBL3.

Not modeling Carbon Plant

Notes

[1] Location, material type, round-trip trip length, source/destination information, and annual emissions in tons/yr can be found in Attachment A.

[2] Each line item represents one type of truck trip. Each truck trip passes through the same segment of highway and offsite route to the project site within the model boundary. Once onsite, each truck trip will take one of four routes: 1) to the PTU, 2) to the Sulfure Recovery Unit (SRU), 3) to the wastewater treatment plant (WWTP), or 4) to the coker. Each line item is identified to follow one of these four onsite routes based on the material it carries. Waste-by-product travels to the WWTP, product sulfur travels to the SRU, green petroleum coke and petroleum coke travel to the coker. All else travels to the PTU. Emissions must be allocated to the highway source group, offsite source group, and PTU/Sulfur/WWTP/Coker source groups

[3] A distance scale factor for each source group was calculated to account for the percent of total emissions that fall within the model boundary. This factor was calculated by taking the length of the route within the model boundary for each source group over the length of the one-way truck trip reported for each line item. This distance scale factor also accounts for the number of volume sources within each source group, according to the model set up.

[4] The emissions used for the HRA were calculated by taking the annual emissions, applying a distance scale factor, and dividing by the number of volume sources modeled for each source group.

Table 3
Baseline HRA Emissions

Source Group	Pollutant	CAS No.	Emissions (g/s)	Year	Phase	Control Scenario	Detail	Period

Notes

1. Location, material type, round-trip trip length, source/destination information, and annual emissions in tons/yr can be found in Attachment A.
2. Each line item represents one type of truck trip. Each truck trip passes through the same segment of highway and offsite route to the project site within the model boundary. Once onsite, each truck trip will take one of four routes: 1) to the PTU, 2) to the Sulfure Recovery Unit (SRU), 3) to the wastewater treatment plant (WWTP), or 4) to the coker. Each line item is identified to follow one of these four onsite routes based on the material it carries. Waste-by-product travels to the WWTP, product sulfur travels to the SRU, green petroleum coke and petroleum coke travel to the coker. All else travels to the PTU. Emissions must be allocated to the highway source group, offsite source group, and PTU/Sulfur/WWTP/Coker source groups
3. A distance scale factor for each source group was calculated to account for the percent of total emissions that fall within the model boundary. This factor was calculated by taking the length of the route within the model boundary for each source group over the length of the one-way truck trip reported for each line item. This distance scale factor also accounts for the number of volume sources within each source group, according to the model set up.
4. The emissions used for the HRA were calculated by taking the annual emissions, applying a distance scale factor, and dividing by the number of volume sources modeled for each source group.

Table 5
Project HRA Emissions

Source Group	Pollutant	CAS No.	Emissions (g/s	Year	Phase	Control Scenari	Detail	Period

Notes

1. Emissions are compiled by source group and pollutant analyzed for the net post-project emissions in 2024.

Table 1
Rail Source Groups

Source Group ID[1]	No. of Volume Sources[2]	Total Length (m)[2]	Total Length (miles)[2]
RAIL_NS	309	3,397	2.11
RAIL_EW	466	5,124	3.18
RAILCAR	192	--	--

Notes

1. The source groups represent the grouping of emissions under the model set up. RAIL_NS refers to the North/South segment of the railroad tracks and RAIL_EW refers to the East/West segment of the railroad tracks. Emissions for the railroad track were estimated for the full length of the tracks; as such, emissions are split into the North/South and East/West source groups using a distance scale factor determined by the length of each segment, as described in Tables 3, 4, 6, and 7. The RAILCAR source group is allocated to all cargo handling
2. The number of volume sources and total length for each source group is defined in the model set up.

Table 2

Baseline Cargo Handling Equipment Emissions

Pollutant	Daily Emissions (lbs/day)[1]	HRA Emissions (g/s)[2]
PM_{10}	1.30E-03	3.56E-08
$PM_{2.5}$	1.20E-03	3.27E-08

Notes

1. Daily baseline cargo handling emissions can be found in Attachment A.
2. Emission rates in g/s were calculated using 24 hr/day, 3,600 s/hr assumptions

Abbreviations

lbs - pounds

g - grams

s - seconds

hr - hour

PM - particulate matter

Notes:

[1] Emissions are compiled by source group and pollutant analyzed and convertedto g/s assuming 365 days a year, 24 hours/day, 7 days/week.

Abbreviations:

DPM - diesel particulate matter
g - grams
PM - particulate matter
s - seconds
yr - year

			Total	2.5E-07	3.3E-07	2.7E-07	3.6E-07		Total	6.4E-08	8.7E-08	8.7E-08	1.2E-07

Notes:

1. Project activity can be found in Attachment A
2. Annual emissions per mile were calculated by dividing the annual emissions by the one-way trip length.
3. Offsite and highway HRA emissions were calculated by scaling the emissions per mile by the length of the each source group, found in table 4, and converting to g/s by assuming 365 days/year, 24 hrs/day, 7 days/week.

Abbreviations:

DPM - diesel particulate matter
g - grams
mi - miles
PM - particulate matter
s - seconds
yr - year
