                                            ***     MODEL SETUP OPTIONS SUMMARY       ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Ambient Ratio Method Ver 2 (ARM2) Used for NO2 Conversion
         with a Minimum NO2/NOx Ratio of  0.500
         and a Maximum NO2/NOx Ratio of  0.900
      * Model Uses URBAN Dispersion Algorithm for the SBL for   140 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =    260206.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Accepts FLAGPOLE Receptor . Heights.
      * The User Specified a Pollutant Type of: NO2

 **Note that special processing requirements apply for the 1-hour NO2 NAAQS - check available guidance.
   Model will process user-specified ranks of daily maximum 1-hour values averaged across the number of years
modeled.
   For annual NO2 NAAQS modeling, the multi-year maximum of PERIOD values can be simulated using the MULTYEAR
keyword.
   Multi-year PERIOD and 1-hour values should only be done in a single model run using the MULTYEAR option with a
   single multi-year meteorological data file using STARTEND keyword.

 **Model Calculates  1 Short Term Average(s) of:   1-HR
```

```
 **This Run Includes:    140 Source(s);       1 Source Group(s); and    2611 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    138 VOLUME source(s)
                 and:      2 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  18081

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)
          Model Outputs External File(s) of Maximum Daily 1-hr Values by Day (MAXDAILY Keyword)
          Model Outputs External File(s) of Maximum Daily 1-hr Values by Year (MXDYBYYR Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     1.00 ;  Decay Coef. =    0.000     ;  Rot. Angle =
    0.0
                  Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =
0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      4.2 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Ambient Ratio Method Ver 2 (ARM2) Used for NO2 Conversion
         with a Minimum NO2/NOx Ratio of  0.500
         and a Maximum NO2/NOx Ratio of  0.900
      * Model Uses URBAN Dispersion Algorithm for the SBL for   140 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =    260206.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Accepts FLAGPOLE Receptor . Heights.
      * The User Specified a Pollutant Type of: NO2

 **NOTE: Special processing requirements applicable for the 1-hour NO2 NAAQS have been disabled!!!
         User has specified non-standard averaging periods:
         High ranked 1-hour values are NOT averaged across the number of years modeled, and
         complete years of data are NOT required.

 **Model Calculates ANNUAL Averages Only

 **This Run Includes:    140 Source(s);       1 Source Group(s); and    2611 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    138 VOLUME source(s)
                 and:      2 AREA type source(s)
                 and:      0 LINE source(s)
```

```
                and:      0 RLINE/RLINEXT source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  18081

 **Output Options Selected:
         Model Outputs Tables of ANNUAL Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     1.00 ;  Decay Coef. =    0.000     ;  Rot. Angle =
    0.0
                  Emission Units = GRAMS/SEC                             ;  Emission Rate Unit Factor =
0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.9 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   NOVATO OPS NO2_ANN_JULY 2025.ERR

 **File for Summary of Results:   NOVATO OPS NO2_ANN_JULY 2025.SUM

1 Project Description

1.1 Introduction

This Health Risk Assessment (HRA) analyzes the possible health effects associated with toxic air contaminant (TAC) emissions generated by a proposed 28-pump Costco gasoline dispensing station located at 300 Vintage Way, Novato, California.

1.2 Executive Summary

The project proposes the construction of a fueling facility containing 28 fueling stations with three underground fuel storage tanks and an annual throughput of 36 million gallons of gasoline. The California Air Resources Board's (CARB) *Air Quality and Land Use Handbook: A Community Health Perspective* notes that gasoline dispensing facilities can be a source of TACs due to gasoline storage and refueling activities (CARB 2005). The primary concern is the effect of benzene, a known carcinogenic TAC, on sensitive land uses. While CARB notes that gasoline dispensing facilities are a relatively small contributor to total benzene emissions throughout the state, it also notes that large facilities can generate significant near source exposures and recommends a 300-foot separation between large gasoline dispensing facilities and sensitive land uses (CARB 2005). Exposure to TACs associated with gasoline dispensing facilities is dependent on a number of site-specific parameters, including facility throughput, site design and configuration, the presence of vapor recovery systems or other control technology, and meteorological conditions.

This HRA used site-specific air dispersion modeling to determine whether health risks presented to residents, and off-site workers, from the construction and operation of the project's proposed 28-pump gasoline dispensing facility exceed the Bay Area Air District's (Air District) health risk criteria. The Air District has health risk criteria for cancer risk and non-cancer risk (i.e., chronic and acute). Cancer risk is expressed as the incremental excess cancer risk, or the maximum number of new cancer cases projected to occur in a population of one million people due to exposure to a cancer-causing substance. Potential acute health risks include severe symptoms that develop rapidly and lead quickly to a health crisis due to exposure to a harmful substance, whereas chronic health risks include health crises, such as lung inflammation, immune suppression, and immune sensitization, which develop due to exposure to low levels of a harmful substance over a long period of time.

Typically, cancer risk is analyzed over a specific exposure duration, such as the average residency (50-percentile) of 9 years or high-end residency (95-percentile) of 30 years (OEHHA 2015). For example, a cancer risk of one in one million means that in a population of one million people, not more than one additional person would be expected to develop cancer as the result of the exposure to the substance causing that risk. Thirty (30) years is the exposure duration scenario recommended by the Air District for residential receptors. Twenty-five (25) years is the exposure duration scenario recommended by the Air District for worker receptors.

Version 22118 of CARB's Hotspots Analysis and Reporting Program (HARP 2) was used to determine the potential risk values associated with the project. The maximum exposed individual resident (MEIR) near the project site would be exposed to a 30-year excess cancer risk of approximately 1.70 in one million, which does not exceed the Air District's recommended cancer risk criteria of 10 excess cases of cancer in one million individuals. The maximum exposed individual off-site worker

(MEIW) would be exposed to a 25-year excess cancer risk of approximately 2.78 in one million, also below the Air District's threshold of 10 excess cancer cases per one million individuals. Chronic hazard index for the MEIR is 0.006 and for the MEIW is 0.082, below the Air District's threshold of 1. Acute hazard index for project is 0.11 for the MEIR and 0.47 for the MEIW, below the Air District's threshold of 1. $PM_{2.5}$ concentration for the MEIR is 0.01 $\mu g/m^3$ and MEIW is 0.16 $\mu g/m^3$, below the Air District's threshold of 0.3 $\mu g/m^3$.

Potential health risks to nearby sensitive receptors from the emission of TACs during operations at the proposed gasoline fueling facility were analyzed in accordance with the Air District's *Risk Assessment Procedures*, CAPCOA's *Gasoline Service Station Industrywide Risk Assessment Technical Guidance* (CAPCOA 1997, 2022), and the Office of Environmental Health Hazard Assessment (OEHHA) *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments* (OEHHA 2015).

1.3 Project Site and Description

The project encompasses an existing parking area adjacent to an existing Costco Wholesale store (Costco), on an approximately 1.15-acre portion of Assessor's Parcel Number 153-340-36 (project site). The project site is located within and adjacent to the Vintage Oaks Shopping Center in Novato. Vintage Oaks is located southeast of Highway 101 (US 101) and Rowland Boulevard freeway interchange. Figure 1 shows the location of the site in the region and Figure 2 shows the project site in its neighborhood context.

The project would construct a fuel facility (gas station) at an existing Costco Wholesale (Costco) at 300 Vintage Way. Costco is a membership-only store, and the proposed project would be for use by Costco members and not open to the general public who are not members. The project includes a 10,244-square foot fuel dispenser canopy, 14 dispensers (28 fueling positions), three 40,000-gallon gasoline underground storage tanks (UST), one 1,500-gallon additive UST, an approximately 125 square-foot controller enclosure, a vapor processing unit, directional striping, and an approximately 6,086 square-foot net increase in landscaped areas. Total annual throughput is estimated at 36 million gallons. The project would also modify Vintage Way to accommodate a left-turn pocket providing access to a driveway serving the project site. Figure 3 shows the proposed site plan.

2 Air Quality Background

2.1 Local Climate and Meteorology

The project site is located in Marin County, a subregion of the San Francisco Bay Area Air Basin (SFBAAB). The SFBAAB includes the counties of San Francisco, Santa Clara, San Mateo, Marin, Napa, Contra Costa, and Alameda, along with the southeast portion of Sonoma County and the southwest portion of Solano County. The major large-scale weather feature controlling climate in Novato is a large high-pressure system located in the eastern Pacific Ocean, known as the Pacific High. During winter months, marine air trapped in the lower atmosphere is often condensed into fog by the cool Pacific Ocean. Stratus-type clouds usually form offshore and move into the area during the evening hours. During winter months, the Pacific High becomes weaker and shifts south, allowing weather systems associated with the polar jet stream to affect the region. Low pressure systems produce periods of cloudiness, strong shifting winds, and precipitation. High-pressure systems are also common in winter, with low-level inversions that produce cool stagnant conditions.

2.2 Toxic Air Contaminants

A TAC is an air pollutant that may cause or contribute to an increase in mortality or serious illness or which may pose a present or potential hazard to human health. TACs may result in long-term health effects such as cancer, birth defects, neurological damage, asthma, or genetic damage, or short-term acute effects such as eye watering, respiratory irritation, runny nose, throat pain, and headaches. TACs are considered either carcinogenic or non-carcinogenic based on the nature of the health effects associated with exposure. For carcinogenic TACs, potential health impacts are evaluated in terms of overall relative risk expressed as excess cancer cases per one million exposed individuals. Non-carcinogenic TACs differ in that there is generally assumed to be a safe level of exposure below which no negative health impact is believed to occur. These levels are determined on a pollutant-by-pollutant basis.

TACs include both organic and inorganic chemical substances. One of the main sources of TACs in California is diesel engines that emit exhaust containing solid material known as diesel particulate matter (DPM); however, TACs may be emitted from a variety of common sources, including gasoline stations, motor vehicles, dry cleaners, industrial operations, painting operations, and research and teaching facilities. TACs commonly associated with gasoline dispensing stations include the organic compounds of benzene, ethylbenzene, naphthalene, toluene, xylene, hexane, and propylene. In particular, benzene is a known human carcinogen and can result in short-term acute and long-term chronic health impacts (United State Environmental Protection Agency [USEPA] 2012). Between 1990 and 2005, benzene in California's air was reduced by over 75 percent due to implementation of control technologies, such as vapor recovery systems, and reductions of benzene levels in gasoline (CARB 2005). Today, gasoline dispensing facilities account for a relatively small fraction of total benzene emissions.

2.3 Regulatory Background

The CARB and OEHHA has established health risk standards, while the local AQMDs are responsible for enforcing these standards. The Air District is the designated air quality control agency in the San Francisco Bay Air Basin.

2.3.1 Toxic Air Contaminants

In 1983, the California Legislature enacted a program to identify the health effects of TACs and to reduce exposure to these contaminants to protect the public health (Assembly Bill [AB] 1807: Health and Safety Code Sections 39650–39674). The Legislature established a two-step process to address the potential health effects from TACs. The first step is the risk assessment (or identification) phase. The second step is the risk management (or control) phase of the process.

The California Air Toxics Program establishes the process for the identification and control of TACs and includes provisions to make the public aware of significant toxic exposures and for reducing risk. Additionally, the Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, 1987, Connelly Bill) was enacted in 1987 and requires stationary sources to report the types and quantities of certain substances routinely released into the air. The goals of the Air Toxics "Hot Spots" Act are to collect emission data, identify facilities having localized impacts, ascertain health risks, notify nearby residents of significant risks, and reduce those significant risks to acceptable levels. The Children's Environmental Health Protection Act, California Senate Bill 25 (Chapter 731, Escutia, Statutes of 1999), focuses on children's exposure to air pollutants. The act requires CARB to review its air quality standards from a children's health perspective, evaluate the statewide air quality monitoring network, and develop any additional air toxic control measures needed to protect children's health.

2.4 Receptors

According to CARB, sensitive receptors include residences, long-term health care facilities, rehabilitation centers, convalescent centers, hospitals, retirement homes, schools, playgrounds, and childcare centers (CARB 2005). The closest sensitive receptor to the project site is the residential development located approximately 450 feet west of the project site. While not considered to be sensitive receptors under CARB’s definition, worker receptors are also considered in this analysis, including workers at the commercial building south of Vintage Way near the project site.

3 Impact Analysis

3.1 Methodology

To evaluate the potential impacts of TACs emitted during construction and operation of the proposed gas station component of the project, Rincon used CARB's Hotspots Analysis and Reporting Program (HARP 2) model. The USEPA's AERMOD atmospheric dispersion modeling system was used to determine concentrations to import into HARP2 for risk quantification. Potential health risks to nearby sensitive receptors from the emission of TACs during operations at the proposed gasoline fueling facility were analyzed in accordance with the Air District's *Health Risk Assessment Protocol* (Bay Area Air District 2020), CAPCOA's *Gasoline Service Station Industrywide Risk Assessment Technical Guidance* (CAPCOA 1997; CAPCOA 2022), and the OEHHA *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments* (OEHHA 2015).

According to the Risk Assessment Procedures, benzene, naphthalene, toluene, xylene and ethylbenzene are the only TACs with cancer toxicity values from gasoline dispensing facilities. Therefore, the risk analysis contained in this report only evaluates cancer risk associated with exposure to benzene, ethylbenzene, and naphthalene emissions for the gasoline station. Benzene, 1,3-butadiene, acetaldehyde, acrolein, and formaldehyde are the primary contaminants of concern for idling cars onsite. Modeling assumptions, emissions, and model inputs are available in Appendix A.

AERMOD requires meteorological and topographic data. Pre-processed meteorological data was obtained from the Air District's Gnoss Field station approximately 3.7 miles north of the project site. The dataset was developed by the Air District for use in AERMOD and includes five years of meteorological data between 2013 and 2017. AERMOD's Urban Dispersion option was applied based on an estimated population of 260,206 for Marin County.

3.1.1 Construction Air Dispersion Modeling

The Air District identifies construction activities as a common source of TAC and $PM_{2.5}$ emissions due to the operation of diesel-powered equipment and heavy-duty trucks that emit DPM (Bay Area Air District 2017). Although construction activity only occurs over a relatively short time period, it may increase TAC concentrations in the short-term at nearby sensitive receptors. DPM is the primary contaminant of concern for the project and would be the TAC emitted in the largest quantity, thus health risks were assessed as they relate to DPM exposure. The nearest sensitive receptors to the project site are single and multi-family residences located approximately 450 feet[1] west of the project site across US 101. Due to the short-term duration of project construction (3 months) and distance to the nearest receptors, residents would not be anticipated to be exposed to significant amounts of TACs from project construction. Maximum cancer risk, chronic risk, and $PM_{2.5}$ concentrations were determined for the residential properties located directly across the 101 Freeway within 1,000 feet of the project site and workers. Modeling sources were assigned as line volume sources to account for the demolition, building construction, paving, and architectural coating. Volume sources for construction equipment have a plume height of 2.6 meters, a width of 10 meters, and a release height of 1.3 meters. Construction activities were assumed to occur 10

[1] Measured from the fuel facility site boundary to the nearest residential building.

hours per day between 7 am and 5 pm and variable emissions were incorporated to limit emissions to this time period.

3.1.2 Operational Air Dispersion Modeling

Risk Assessment Procedures include a methodology for modeling speciated emissions commonly associated with gasoline dispensing stations. Gasoline emissions for the project site operations were speciated into benzene, ethylbenzene, n-hexane, naphthalene, propylene, toluene and xylenes. Gasoline emissions for on-road vehicles were speciated into benzene, ethylbenzene, n-hexane, naphthalene, propylene, toluene, xylenes, 1,3-butadiene, formaldehyde, acrolein, and acetaldehyde. Diesel emissions for on-road vehicles (fuel delivery trucks) were speciated into benzene, ethylbenzene, n-hexane, naphthalene, toluene, xylenes, 1,3-butadiene, formaldehyde, acrolein, acetaldehyde, and diesel particulate matter. In accordance with this methodology, emissions were modeled in AERMOD based on eight primary emissions sources associated with gasoline dispensing stations:

1. **Loading** – Loading emissions are point source emissions that occur when fuel tanker trucks unload gasoline to the storage tanks, displacing storage tank vapors and causing emissions through the vent pipe.
2. **Breathing** – Breathing emissions are driven by temperature and pressure changes in the storage tank and, like loading emissions, are considered a point source for modeling purposes.
3. **Refueling** – Refueling emissions are those that occur between the vehicle/nozzle interface. In AERMOD, refueling is modeled as a volume source.
4. **Spillage** – Spillage emissions result from evaporating gasoline that spills during vehicle fueling. In AERMOD, spillage is modeled as a volume source.
5. **Hose Permeation** – These emissions occur when gasoline, in liquid or vapor form, diffuses through the hose's outer surface to the atmosphere. Hose permeation is modeled as a volume source.
6. **Queuing** – These emissions occur while cars are idling waiting to access the gas pumps.
7. **Idling** – Emissions associated with fuel trucks idling at the station prior to or after tank filling activities.
8. **Trip emissions** – These emissions are associated with passenger and fuel truck travel to and from the site from the 101 freeway. In addition, trips were assigned as either new fuel truck trips, new passenger trips, diverted passenger trips, passby passenger trips, or passenger warehouse with gas trips. Trip lengths and directions associated with these trips were accounted for in the analysis.

The underground gasoline tanks are proposed to be located directly west of the fueling canopy. Therefore, truck idling, loading and breathing emissions sources were sited at the approximate location of the proposed storage tanks. Refueling, spillage, and hose permeation sources were sited at the approximate locations of the pumps based on the most recent project site plan, as such emissions would occur throughout the refueling area. Queueing for the passenger vehicles is assumed to encompass the area around and including the fuel pumps. Trip emissions are assumed along Rowland Boulevard based on the Transportation Impact Analysis by Kittelson & Associates Inc., dated February 2024.

The Air District procedures recommend gas station point source and volume source AERMOD parameters, provided in Table 1. Gasoline storage tank vents were assumed to have a rain cap and

an initial gasoline vapor vertical exit velocity of 0.01 meters per second. Flagpole height of 1.5 meters was applied, consistent with modeling guidance for AERMOD.

Table 1 Source Modeling Parameters

		Point Source Parameters			Volume Source Parameters	
Emissions Source	Release Height (m)	Diameter (m)	Temperature (Gas)(K)	Exit Velocity (m/s)	Initial Lateral Dimension (m)	Initial Vertical Dimension (m)
Site Operation Sources

Source: Bay Area Air District 2020; CAPCOA 1997

The gas station was assumed to operate 17 hours per day between 5 AM and 10 PM and variable emissions were incorporated to represent the emissions that occur during this period.

Speciated emissions factors per 1,000 gallons of throughput are based on CARB's *Gasoline Service Station Industrywide Risk Assessment Technical Guidance* (CARB 2022). Emissions calculations are based on a proposed maximum throughput of approximately 36 million gallons annually.

3.1.3 Risk Analysis

A uniform receptor grid was used to determine where maximum impacts would occur then discrete receptors were placed for worker and residential receptors at the receptor locations. Ten (10)-meter spacing was used for the closest worker receptors directly across Vintage Way, discrete residential receptors were placed at existing buildings and a 20-meter spacing was used for the uniform cartesian receptor grid for up to 1,000 feet from the site boundary. The receptor grid was offset slightly to the west as the property to the east is not developable. Fenceline receptors were also added at a 20-meter spacing around the project site. Figure 4 shows emissions sources and receptor locations.

Following the calculation of ground-level concentrations, construction cancer risks were calculated for a 6-month period (consistent with Air District guidance), operational residential cancer risks were calculated for a 30-year exposure duration using the Risk Management Policy (RMP) Derived

Method, selecting HARP 2's Inhalation, Soil Ingestion, Dermal, and Mother's Milk pathways. Residents aged 16 and older were assumed to spend 73 percent of their time at home. Residents under age 16 were assumed to attend a school or daycare proximate to their home; therefore, fraction of time at home values were not applied to this age group. For worker receptors, cancer risk was calculated using the OEHHA Derived Method for the Inhalation, Soil, and Dermal exposure pathways. A 25-year exposure duration for worker receptors was modeled. A worker adjustment factor of 3.57 for construction and 1.41 for operational was implemented to adjust risk for the amount of time workers would be present while pollutant emissions are occurring. For all risk scenarios, a deposition rate of 0.05 meters per second was applied.

3.2 Significance Thresholds

The Air District has developed significance thresholds for the emissions of TACs based on health risks associated with elevated exposure to such compounds. For carcinogenic compounds, cancer risk is assessed in terms of incremental excess cancer risk. A project would result in a potentially significant impact if it would generate an incremental excess cancer risk of 10 in one million (1×10^{-6}). Additionally, non-carcinogenic health risks are assessed in terms of a hazard index. A project would result in a potentially significant impact if it would result in a chronic and acute hazard index greater than 1.0 (Bay Area Air District 2023).

3.3 Modeling Results

Incremental excess cancer risk is an estimate of the added risk a person exposed to a specific source of a TAC may have of developing cancer from that exposure, with all other conditions held constant.

Maximum resident and worker cancer risks, as well as non-cancer risks and $PM_{2.5}$ concentrations, are presented in Table 2 for construction emissions, Table 3 for operational emissions, and Table 4 for combined construction and operational emissions. The MEIR is the modeled residential receptor experiencing the highest incremental excess cancer risk under 30-year residential exposure duration. The MEIW is the off-site work receptor experiencing the highest incremental excess cancer risk under a 25-year worker exposure duration. The modeling output is available in Appendices B and C. The locations of MEIs are indicated in Figure 4. As shown in Table 2, Table 3 and Table 4 incremental excess cancer risks, non-cancer risk, and $PM_{2.5}$ concentrations resulting from the construction and operation of the project would not exceed Air District thresholds.

Figure 4 Receptor Locations

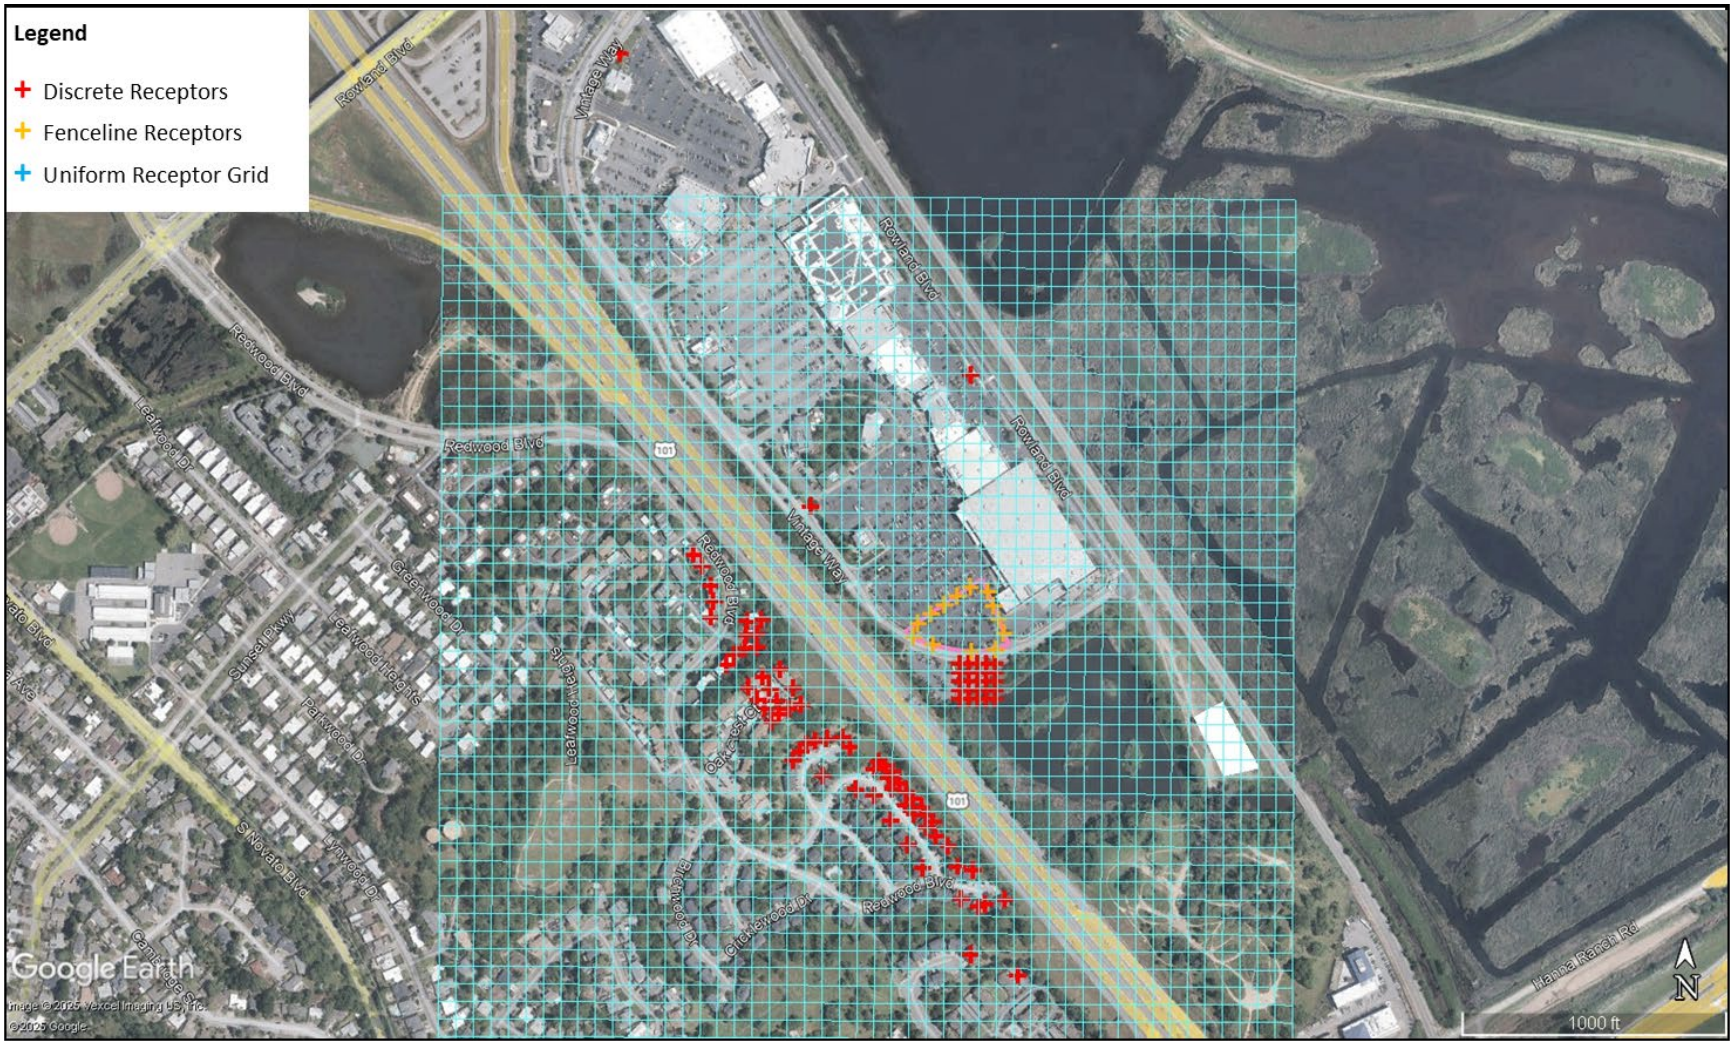

Table 2 Maximum Exposed Individual Risk – Construction

Gasoline Dispensing Facility	Cancer Risk	Hazard Index	Annual $PM_{2.5}$ ($\mu g/m^3$)
MEIR	0.12 in 1 million	0.0003	0.01
MEIW	0.12 in 1 million	0.0046	0.16
Significance Threshold	*10 in 1 million*	*1.0*	*0.3*
Exceeds Threshold?	**No**	**No**	**No**

Source: Appendices B and C

Table 3 Maximum Exposed Individual Risk – Operation

Gasoline Dispensing Facility	Cancer Risk	Chronic Risk	Acute Risk
MEIR	1.61 in 1 million	0.006	0.11
MEIW	2.66 in 1 million	0.082	0.47
Significance Threshold	*10 in 1 million*	*1.0*	*1.0*
Exceeds Threshold?	**No**	**No**	**No**

Source: Appendices B and C

$PM_{2.5}$ is not one of the pollutants associated with operational emissions for a gasoline station without diesel.

Table 4 Maximum Exposed Individual Risk – Combined

Gasoline Dispensing Facility	Cancer Risk	Chronic Risk	Acute Risk	$PM_{2.5}$ Concentration
MEIR	1.7 in 1 million	0.006	0.11	0.01
MEIW	2.78 in 1 million	0.082	0.47	0.16
Significance Threshold	*10 in 1 million*	*1.0*	*1.0*	*0.3*
Exceeds Threshold?	**No**	**No**	**No**	**No**

Source: Appendices B and C

$PM_{2.5}$ is not one of the pollutants associated with operational emissions for a gasoline station without diesel.

3.4 Cumulative Results

The Air District recommends that the cumulative impact of a project be assessed by evaluating current and proposed substantial sources of TACs, including roadways and stationary sources, within a 1,000-foot radius of the identified Maximally Exposed Individual Receptor (MEIR; Bay Area Air District 2023a). Existing potential sources within 1,000 feet of the MEIR include US 101 and nearby major streets. There are no permitted stationary sources within 1,000 feet of the MEIR (Bay Area Air District 2023b). Cumulative risk impacts to the MEIR from freeway and roadway sources along with railway sources were based on health risk and $PM_{2.5}$ concentrations obtained from raster data files of health risks associated with major roadways and highways provided by the Air District (Bay Area Air District 2022a, 2022b, 2022c). In addition, the Hanna Ranch Project, which is located south of the project site, could also incorporate a gasoline station similar to the size of the proposed project approximately 700 feet south of the project site. To account for potential cumulative risk from the development of this facility, the maximum residential risk was assumed to be the same for each. Risk was adjusted for distance using the Air District's distance determination tool. Table 5 summarizes cumulative health risk at the MEIR. As shown in Table 5, cumulative sources of TACs

would not exceed Air District's cumulative health risk thresholds at the MEIR or MEIW. Therefore, the health risk to nearby residents due to cumulative impacts would be less than significant.

Table 5 Cumulative Health Risk

Source	Cancer Risk	Chronic Risk	Acute Risk	$PM_{2.5}$ Concentration
MEIR	1.70 in 1 million	0.006	0.11	0.010
Hanna Ranch Gasoline Station	2.46 in 1 million	0.010	0.020	-
Roadway Risk	21.41 in 1 million	0.075	-	0.568
Railway Risk	0.91 in one million	<0.001	-	0.001
Cumulative Risk associated with the MEIR	**26.48 in one million**	**0.09**	**0.13**	**0.58**
MEIW	2.78 in 1 million	0.082	0.470	0.16
Hanna Ranch Gasoline Station	0.34 in 1 million	0.020	0.030	-
Roadway Risk	19.01 in 1 million	0.067	-	0.521
Railway Risk	1.25 in 1 million	<0.001	-	0.002
Cumulative Risk associated with the MEIW	**23.38 in 1 million**	**0.17**	**0.50**	**0.68**
Significance Threshold	*100 in 1 million*	*10.0*	*10.0*	*0.8*
Exceeds Threshold?	**No**	**No**	**No**	**No**

Source: Appendices B and C

$PM_{2.5}$ is not one of the pollutants associated with operational emissions for a gasoline station without diesel.

4 Conclusion

The proposed 28-pump gasoline dispensing station would not expose residents or workers to significant excess cancer risks associated with loading, breathing, refueling, spillage, or hose permeation emissions of benzene, ethylbenzene, and naphthalene. The analysis contained herein was conducted in accordance with the Air District recommended procedures. The analysis concludes that operation of the proposed gasoline dispensing facility would not expose nearby receptors to excess cancer risks exceeding the Air District thresholds.

Worker Adjustment Factor For HARP

Worker Adjustment Factor - HARP Operation

5:00 AM	10:00 PM	7days	Site Hours
8:30	5:00 PM	Mon-Fri	Offsite Receptor Hours

Equation 4.1

WAF = (Hresidentid/Hsource) X (Dresidentid/Dsource) X DF

1.41	WAF	Worker Adjustment Factor
24	Hresidential	Number of hours per day the longterm residential concentration is based on (24 hours)
17	Hsource	Number of hourse the source operates per day
7	Dresidential	Number of days per week the long-term residential concentration is based (7 days)
7	Dsource	Number of days the source operates per week
	DF	Discount facotr for when the source overalps with the receptors schedule

DF = (Hcoincident/Hworker) x (Dcoincident/Dworker)

1	DF	Discount factor assessing cancer patients
8.5	Hcoincident	Number of hours per day the offsite worker's schedule and the source emission scheduel overlap
8.5	Hworker	Number of hours the offsite worker works per day
5	Dcoincident	Number of days per week the offsite worker's scheudle and the source's emissions schedule overlap
5	Dworker	the number of days the offsite worker works per week

Worker Adjustment Factor - HARP Construction

10	hours	5 days	Construction Hours
8:30	5:00 PM	Mon-Fri	Offsite Receptor Hours

Equation 4.1

WAF = (Hresidentid/Hsource) X (Dresidentid/Dsource) X DF

3.57	WAF	Worker Adjustment Factor
24	Hresidential	Number of hours per day the longterm residential concentration is based on (24 hours)
10	Hsource	Number of hourse the source operates per day
7	Dresidential	Number of days per week the long-term residential concentration is based (7 days)
5	Dsource	Number of days the source operates per week
	DF	Discount facotr for when the source overalps with the receptors schedule

DF = (Hcoincident/Hworker) x (Dcoincident/Dworker)

1.06	DF	Discount factor assessing cancer patients
8.5	Hcoincident	Number of hours per day the offsite worker's schedule and the source emission scheduel overlap
8	Hworker	Number of hours the offsite worker works per day
5	Dcoincident	Number of days per week the offsite worker's scheudle and the source's emissions schedule overlap
5	Dworker	the number of days the offsite worker works per week

2022 CARB & CAPCOA Gasoline Service Station Industrywide Risk Assessment Look-up Tool
Version 1.0 - February 18, 2022

Required Value	User Defined Input	Instructions	
Annual Throughput (gallons/year)	36,000,000	Enter your gas station's annual throughput in gallons of gasoline dispensed per year.	
Hourly Dispensing Throughput (gallons/hour)	4000	The tool will calculate the maximum hourly vehicle fueling throughput based on annual throughput as defined by Table 10 of the 2020 Gasoline Service Station Industrywide Risk Assessment Technical Guidance Document (Technical Guidance). If a different value is desired please enter it into cell L4.	4000
Hourly Loading Throughput (gallons/hour)	8000	The tool will calculate the maximum hourly loading throughput based on annual throughput as defined by Table 10 of the Technical Guidance. If a different value is desired please enter it into cell L5.	8000
Meteorological Data	San Jose	Select appropriate meteorological data. Met sets provided include 2 rural (Redding and Lancaster) and 4 urban (Fresno, Ontario, San Diego, and San Jose) locations. Use whichever best correlates to your location. If you would like to use site-specific meteorological data please refer to the Variable Met Tool.	
Distance to Nearest Resident (meters)	371.72	Enter the distance to the nearest residential receptor in meters as measured from the edge of the station canopy. Please note that the value must be between 10 and 1000 meters. The distance you input will round down to the nearest receptor distance used in the Technical Guidance (e.g., 19m will return value at 10m distance).	
Distance to Nearest Business (meters)	371.72	Enter the distance to the nearest worker receptor in meters as measured from the edge of the station canopy. Please note that the value must be between 10 and 1000 meters. The distance you input will round down to the nearest receptor distance used in the Technical Guidance (e.g., 19m will return value at 10m distance).	
Distance to Acute Receptor (meters)	371.72	Enter the distance where acute impacts are expected in meters as measured from the edge of the station canopy. This can be the distance to the property boundary, nearest resident, nearest worker, or any other user defined location. Please note that the value must be between 10 and 1000 meters. The distance you input will round down to the nearest receptor distance used in the Technical Guidance (e.g., 19m will return value at 10m distance).	
Control Scenario	EVR Phase I & EVR Phase II	Select the appropriate control scenario for your gas station. Please refer to technical Guidance for an explanation of the different control scenarios. Almost all gas stations in California are equipped with EVR Phase I and EVR Phase II controls.	
Include Building Downwash Adjustments	no	Building downwash may over estimate risk results. High results should be investigated further through site-specific health risk assessment.	

Risk Value	Results
Max Residential Cancer Risk (chances/million)	2.46
Max Worker Cancer Risk (chances/million)	0.20
Chronic HI	0.01
Acute HI	0.02

2022 CARB & CAPCOA Gasoline Service Station Industrywide Risk Assessment Look-up Tool
Version 1.0 - February 18, 2022

Required Value	User Defined Input	Instructions	
Annual Throughput (gallons/year)	36,000,000	Enter your gas station's annual throughput in gallons of gasoline dispensed per year.	
Hourly Dispensing Throughput (gallons/hour)	4000	The tool will calculate the maximum hourly vehicle fueling throughput based on annual throughput as defined by Table 10 of the 2020 Gasoline Service Station Industrywide Risk Assessment Technical Guidance Document (Technical Guidance). If a different value is desired please enter it into cell L4.	4000
Hourly Loading Throughput (gallons/hour)	8000	The tool will calculate the maximum hourly loading throughput based on annual throughput as defined by Table 10 of the Technical Guidance. If a different value is desired please enter it into cell L5.	8000
Meteorological Data	San Jose	Select appropriate meteorological data. Met sets provided include 2 rural (Redding and Lancaster) and 4 urban (Fresno, Ontario, San Diego, and San Jose) locations. Use whichever best correlates to your location. If you would like to use site-specific meteorological data please refer to the Variable Met Tool.	
Distance to Nearest Resident (meters)	353.58	Enter the distance to the nearest residential receptor in meters as measured from the edge of the station canopy. Please note that the value must be between 10 and 1000 meters. The distance you input will round down to the nearest receptor distance used in the Technical Guidance (e.g., 19m will return value at 10m distance).	
Distance to Nearest Business (meters)	353.58	Enter the distance to the nearest worker receptor in meters as measured from the edge of the station canopy. Please note that the value must be between 10 and 1000 meters. The distance you input will round down to the nearest receptor distance used in the Technical Guidance (e.g., 19m will return value at 10m distance).	
Distance to Acute Receptor (meters)	353.58	Enter the distance where acute impacts are expected in meters as measured from the edge of the station canopy. This can be the distance to the property boundary, nearest resident, nearest worker, or any other user defined location. Please note that the value must be between 10 and 1000 meters. The distance you input will round down to the nearest receptor distance used in the Technical Guidance (e.g., 19m will return value at 10m distance).	
Control Scenario	EVR Phase I & EVR Phase II	Select the appropriate control scenario for your gas station. Please refer to technical Guidance for an explanation of the different control scenarios. Almost all gas stations in California are equipped with EVR Phase I and EVR Phase II controls.	
Include Building Downwash Adjustments	no	Building downwash may over estimate risk results. High results should be investigated further through site-specific health risk assessment.	

Risk Value	Results
Max Residential Cancer Risk (chances/million)	2.46
Max Worker Cancer Risk (chances/million)	0.20
Chronic HI	0.01
Acute HI	0.02

2022 CARB & CAPCOA Gasoline Service Station Industrywide Risk Assessment Look-up Tool
Version 1.0 - February 18, 2022

Required Value	User Defined Input	Instructions	
Annual Throughput (gallons/year)	36,000,000	Enter your gas station's annual throughput in gallons of gasoline dispensed per year.	
Hourly Dispensing Throughput (gallons/hour)	4000	The tool will calculate the maximum hourly vehicle fueling throughput based on annual throughput as defined by Table 10 of the 2020 Gasoline Service Station Industrywide Risk Assessment Technical Guidance Document (Technical Guidance).  ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for   148 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =    260206.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Accepts FLAGPOLE Receptor . Heights.
      * The User Specified a Pollutant Type of: PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:    148 Source(s);       6 Source Group(s); and    2612 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    147 VOLUME source(s)
                 and:      1 AREA type source(s)

                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  18081

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     1.00 ;  Decay Coef. =    0.000     ;  Rot. Angle =
    0.0
                  Emission Units = GRAMS/SEC                                ;  Emission Rate Unit Factor =
0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      4.6 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out
