**TRAVEL ON PAVED ROADS**

Road Dust Equation

E [lb/VMT] = k*(sL)^0.91 * (W)^1.02 * (1-P/4N)

Where:
E = the particulate emission factor in units of pounds of particulate matter per VMT
k = the U.S. EPA AP-42 particle size multiplier ($PM_{10}$ = 0.0022 lb/VMT),
*Table 13.2.1-1 Particle Size Multipliers for Paved Road Equation of USEPA, 2011.*
sL = the roadway-specific silt loading in grams/square meter ($g/m^2$)
W = the average weight of vehicles traveling the road (California statewide default 2.4 tons)
P = number of "wet" days, when at least one site per county received at least 0.01 inch of precipitation during the annual averaging period,[9] and
N = the number of days in the annual averaging period (default = 365)

Calculation Methodology: USEPA AP-42, Paved Roads, Section 13.2.1, Revised January 2011:
http://www.epa.gov/ttn/chief/ap42/ch13/final/c13s0201.pdf
*Source: California Air Resources Board (CARB), Miscellaneous Process Methodology 7.9 — Entrained Road Travel, Paved Road Dust. Revised and updated March 2018.*

No assumed control on paved roads

**Silt Loading Factor**

*Source: CARB, 2018.*

**Table 3: California Default Statewide and Local Silt Loading Values**

| Silt Loadings (g/m2) | | | |
|---|---|---|---|
| **Freeway** | **Major** | **Collector** | **Local** |
| 0.015 | 0.032 | 0.032 | 0.32 |

| | |
|---|---|
| Total On-Site Paved Road Length | 2639.5 meters 1.64 miles |
| Paved Road Length to Concrete Channel | 800.9 meters 0.50 miles |

**TRAVEL ON UNPAVED ROADS**

Travel on Unpaved Surfaces

E [lb/VMT] = k*(s/12)^a * (W/3)^b

Where:
k = 1.5 for PM10 and 0.15 for PM2.5
a = 0.9 for both PM10 and PM2.5
b = 0.45 for both PM10 and PM2.5
s = surface material silt content (%)= 8.3
W = mean vehicle weight (tons) = 36
Calculation Methodology: USEPA AP-42, Unpaved Roads, Section 13.2.2, updated November 2006:
https://www.epa.gov/sites/production/files/2020-10/documents/13.2.2_unpaved_roads.pdf
Assumed control from watering= 75%
Unpaved Road Length 1612.3 meters 1.00 miles
Unpaved at Concrete Channel 242.7 meters 0.15 miles

**Travel on Unpaved Surfaces**

E [lb/VMT] = k*(s/12)^a * (W/3)^b

13.2.4.3 Predictive Emission Factor Equations

Total dust emissions from aggregate storage piles result from several distinct source activities within the storage cycle:

1. Loading of aggregate onto storage piles (batch or continuous drop operations).
2. Equipment traffic in storage area.
3. Wind erosion of pile surfaces and ground areas around piles.
4. Loadout of aggregate for shipment or for return to the process stream (batch or continuous drop operations).

Either adding aggregate material to a storage pile or removing it usually involves dropping the material onto a receiving surface. Truck dumping on the pile or loading out from the pile to a truck with a front-end loader are examples of batch drop operations. Adding material to the pile by a conveyor stacker is an example of a continuous drop operation.

(1)

$$E = k(0.0032)\ \frac{\left(\frac{U}{5}\right)^{1.3}}{\left(\frac{M}{2}\right)^{1.4}}\ \text{(pound [lb]/ton)}$$

where:

E = emission factor
k = particle size multiplier (dimensionless)
U = mean wind speed, meters per second (m/s) (miles per hour [mph])
M = material moisture content (%)

The particle size multiplier in the equation, k, varies with aerodynamic particle size range, as follows:

| Aerodynamic Particle Size Multiplier (k) For Equation 1 | | | | |
|---|---|---|---|---|
| < 30 μm | < 15 μm | < 10 μm | < 5 μm | < 2.5 μm |
| 0.74 | 0.48 | 0.35 | 0.20 | 0.053[a] |

[a] Multiplier for < 2.5 μm taken from Reference 14.

The equation retains the assigned quality rating if applied within the ranges of source conditions that were tested in developing the equation, as follows. Note that silt content is included, even though silt content does not appear as a correction parameter in the equation. While it is reasonable to expect that silt content and emission factors are interrelated, no significant correlation between the 2 was found during the derivation of the equation, probably because most tests with high silt contents were conducted under lower winds, and vice versa. It is recommended that estimates from the equation be reduced 1 quality rating level if the silt content used in a particular application falls outside the range given:

| Ranges Of Source Conditions For Equation 1 | | | |
|---|---|---|---|
| Silt Content (%) | Moisture Content (%) | Wind Speed | |
| | | m/s | mph |
| 0.44 - 19 | 0.25 - 4.8 | 0.6 - 6.7 | 1.3 - 15 |

To retain the quality rating of the equation when it is applied to a specific facility, reliable correction parameters must be determined for specific sources of interest. The field and laboratory procedures for aggregate sampling are given in Reference 3. In the event that site-specific values for

# Permanente Creek Restoration Project

**Santa Clara County, Annual**

## 1.0 Project Characteristics

### 1.1 Land Usage

| Land Uses | Size | Metric | Lot Acreage | Floor Surface Area | Population |
|---|---|---|---|---|---|
| User Defined Recreational | 1.00 | User Defined Unit | 0.00 | 0.00 | 0 |

### 1.2 Other Project Characteristics

| | | | | | |
|---|---|---|---|---|---|
| **Urbanization** | Rural | **Wind Speed (m/s)** | 2.2 | **Precipitation Freq (Days)** | 58 |
| **Climate Zone** | 4 | | | **Operational Year** | 2027 |
| **Utility Company** | Pacific Gas & Electric Company | | | | |
| **CO2 Intensity (lb/MWhr)** | 641.35 | **CH4 Intensity (lb/MWhr)** | 0.029 | **N2O Intensity (lb/MWhr)** | 0.006 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - Project information

Land Use - Placeholder land use. There will be no operational phase of the project, and construction data is custom to the Project.

Construction Phase - Obtained revised schedule from Lehigh on 1/24/23 - Construction Assumptions Attachment. Using the Applicant-provided schedule, some of the modeled workdays are 1 to 2 days more per phase than workdays provided by Applicant.

Off-road Equipment - Applicant-provided equipment list.

Off-road Equipment - Based on 1/24/23 Applicant provided data.

Off-road Equipment - Based on 1/24/23 Applicant provided data.

Off-road Equipment - Equipment list, number of equipment operation days, and hours/day used provided by Applicant. Average hours/day per phase estimated based on phase days.

Off-road Equipment - Based on 1/24/23 Applicant-proposed data.

Off-road Equipment - Based on 1/24/23 Applicant-proposed data.

Off-road Equipment - Based on Applicant-provided equipment list.

Permanente Creek Restoration Project - Santa Clara County, Annual

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

Off-road Equipment - Based on 1/24/23 Applicant data.

Off-road Equipment - Per 1/24/23 Applicant provided data

Trips and VMT - On-road vehicle emissions are estimated outside of CalEEMod using EMFAC 2020.4.0 and AP-42 emission factors.

Construction Off-road Equipment Mitigation - All trucks and equipment would be Tier 4 Final per Lehigh (6/8/21).

## 11.0 Vegetation

Permanente Creek Restoration Project - Santa Clara County, Winter

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

# Permanente Creek Restoration Project

**Santa Clara County, Winter**

## 1.0 Project Characteristics

### 1.1 Land Usage

| Land Uses | Size | Metric | Lot Acreage | Floor Surface Area | Population |
|---|---|---|---|---|---|
| User Defined Recreational | 1.00 | User Defined Unit | 0.00 | 0.00 | 0 |

### 1.2 Other Project Characteristics

| | | | | | |
|---|---|---|---|---|---|
| **Urbanization** | Rural | **Wind Speed (m/s)** | 2.2 | **Precipitation Freq (Days)** | 58 |
| **Climate Zone** | 4 | | | **Operational Year** | 2027 |
| **Utility Company** | Pacific Gas & Electric Company | | | | |
| **CO2 Intensity (lb/MWhr)** | 641.35 | **CH4 Intensity (lb/MWhr)** | 0.029 | **N2O Intensity (lb/MWhr)** | 0.006 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - Project information

Land Use - Placeholder land use. There will be no operational phase of the project, and construction data is custom to the Project.

Construction Phase - Obtained revised schedule from Lehigh on 1/24/23 - Construction Assumptions Attachment. Using the Applicant-provided schedule, some of the modeled workdays are 1 to 2 days more per phase than workdays provided by Applicant.

Off-road Equipment - Applicant-provided equipment list.

Off-road Equipment - Based on 1/24/23 Applicant provided data.

Off-road Equipment - Based on 1/24/23 Applicant provided data.

Off-road Equipment - Equipment list, number of equipment operation days, and hours/day used provided by Applicant. Average hours/day per phase estimated based on phase days.

Off-road Equipment - Based on 1/24/23 Applicant-proposed data.

Off-road Equipment - Based on 1/24/23 Applicant-proposed data.

Off-road Equipment - Based on Applicant-provided equipment list.

Permanente Creek Restoration Project - Santa Clara County, Winter

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

Off-road Equipment - Based on 1/24/23 Applicant data.

Off-road Equipment - Per 1/24/23 Applicant provided data

Trips and VMT - On-road vehicle emissions are estimated outside of CalEEMod using EMFAC 2020.4.0 and AP-42 emission factors.

Construction Off-road Equipment Mitigation - All trucks and equipment would be Tier 4 Final per Lehigh (6/8/21).

**Permanente Creek Restoration Project - EMFAC2021 Output**

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: County
Region: Santa Clara
Calendar Year: 2024, 2025, 2026, 2027, 2028, 2029
Season: Annual
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.

| Region | Calendar Year | Vehicle Category | Model Year | Speed | Fuel | Population | Total VMT | CVMT | EVMT | Trips | NOx_RUNEX | NOx_IDLEX | NOx_STREX | PM2.5_RUNEX | PM2.5_IDLEX | PM2.5_STREX | PM2.5_PMTW | PM2.5_PMBW | PM10_RUNEX | PM10_IDLEX | PM10_STREX | PM10_PMTW | PM10_PMBW | CO2_RUNEX | CO2_IDLEX | CO2_STREX | CH4_RUNEX | CH4_IDLEX | CH4_STREX |

[1]Values for construction areas (e.g. Concrete Channel, Rock Pile Area, etc.) are PM2.5 exhaust (since on-site fugitive PM2.5 can be mitigated with BMPs); values for paved and unpaved roads are entrained road dust.

# 1 BACKGROUND

## 1.1 INTRODUCTION

The purpose of this draft biological assessment (BA) is to review the Permanente Creek Restoration Project (Project) in sufficient detail to determine the extent to which it may affect any of the federally listed species described in Section 1.3, "Species Evaluated in the Biological Assessment." The species evaluated in this BA were derived from the federal endangered species list for species that may occur in the Action Area, as provided by the U.S. Fish and Wildlife Service (Service) on April 26, 2016 (Appendix A).

This BA has been prepared in accordance with requirements set forth under Section 7 of the federal Endangered Species Act (ESA) (16 U.S. Code [USC] 1536[c]). It initiates consultation with the Service and the National Marine Fisheries Service (NMFS) regarding effects of the Project on federally listed species.

Under provisions of ESA Section 7(a)(2), a federal agency that permits, licenses, funds, or otherwise authorizes activities must consult with NMFS and/or the Service, as appropriate, to prevent its action from jeopardizing the continued existence of any listed species or adversely modifying critical habitat (16 USC 1536[c]). A federal agency is required to consult if an action "may affect" listed species or designated critical habitat.

As defined in 50 Code of Federal Regulations (CFR) 402.2, the term "biological assessment" refers to the information prepared by, or under the direction of, the federal agency regarding listed species, species proposed for listing, and the designated and proposed critical habitat that may be present in the Action Area (see Section 1.2, "Action Area"), and the evaluation of a project's potential effects on those species and habitat. A BA must be prepared if listed species or critical habitat may be present in an area that would be affected by a "major construction activity." When a federal agency determines, through a BA or other review, that its action is "likely to adversely affect" a listed species or designated critical habitat, the agency must submit a request for formal consultation to NMFS and/or the Service. This consultation must take place within 90 days, then NMFS and the Service must prepare biological opinions (BOs) within the subsequent 45 days. The BOs present determinations by NMFS and the Service regarding whether the project would be likely to jeopardize the species or adversely modify its critical habitat. If a "jeopardy" or "adverse modification" determination is made, the BO must identify any reasonable and prudent alternative actions that could satisfy the purpose of and need for the project.

## 1.2 ACTION AREA

As defined by ESA guidelines, the "Action Area" is "all areas to be affected directly or indirectly by the federal action and not merely the immediate area involved in the action" (50 CFR 402.02). The Action Area includes all areas that would be directly or indirectly affected by project components. The Action Area for the Project consists of the 127.19-acre wetland delineation study area (see Exhibit 1), which is the area of potential direct effect, plus adjacent areas extending out to 500 feet, which compose the extent of potential indirect effects on water quality or wildlife dispersal that may occur outside of the construction area. The Action Area totals approximately 662.4 acres (see Exhibit 2). The Action Area focuses on a portion of Permanente Creek located south of the Lehigh Southwest Cement Company (Lehigh) Cement Plant, and is situated within the U.S. Geological Survey Mindego Hill and Cupertino Quadrangles. Elevations range from approximately 470 feet above mean sea level at the eastern boundary of the Action Area to 1,870 feet above mean sea level at the western boundary.

## 1.3 SPECIES AND HABITATS EVALUATED IN THE BIOLOGICAL ASSESSMENT

The Service provided an automated list to GEI Consultants on April 26, 2016, showing the federally listed and candidate species that potentially could be affected by the Project. All species on that list were analyzed for their potential occurrence within the Action Area and for the Project to affect those species. The species shown in Table 1 could be affected by the Project. The species listed in Table 2 are not anticipated to be affected by the Project. For the species in Table 2, a rationale for the "no effect" determination is provided.

### 1.3.1 SPECIES INCLUDED IN THE ANALYSIS

Based on the list provided by the Service (Appendix A) and the anticipated effects of the Project on listed species and their habitats in the Action Area, one species shown in Table 1—California red-legged frog (CRLF) (*Rana draytonii*), federally listed as threatened—is carried forward for effects analysis in this BA. This species is known to occur in the Action Area and may be affected by the Project.

**Table 1. Federally Listed or Candidate Species that May Be Affected by the Project**

| Species | ESA Listing Status | Critical Habitat Designated in the Action Area (Yes/No) | Potential to Occur in the Action Area |
|---|---|---|---|
| **Wildlife** | | | |
| California red-legged frog *Rana draytonii* | Threatened | No | This species is found in permanent and semi-permanent ponds or backwaters of streams. California red-legged frog is known to occur in Ponds 9, 21, and 22 (and adjacent to the Action Area at Pond 14), based on a series of focused surveys (WRA 2011). Permanente Creek in the Action Area contains suitable aquatic and upland habitat. |

Notes: BA = biological assessment; ESA = federal Endangered Species Act; Project = Permanente Creek Restoration Project
Source: Data compiled by AECOM in 2015

### 1.3.2 SPECIES ELIMINATED FROM FURTHER ANALYSIS

The species shown in Table 2 were eliminated from further analysis in this BA because their known range does not overlap with the Action Area, the Action Area does not contain suitable habitat for the species, or Project activities are not expected to affect the species or its habitat in the Action Area.

**Table 2. Federally Listed or Candidate Species that Are Not Expected to be Affected by the Project**

| Species | ESA Listing Status | Reasoning for No Effect Determination |
|---|---|---|
| **Plant Species** | | |
| San Mateo woolly sunflower *Eriophyllum latilobum* | Endangered | San Mateo woolly sunflower is restricted to shaded moist sites on steep grassy or sparsely wooded slopes of serpentine soils in San Mateo County. There is marginally suitable habitat for this species in the Action Area; however, the species was not detected during 2008 protocol floristic surveys and no occurrences are documented within 4.5 miles. Thus, this species is not expected to be affected by the Project. |

| Table 2. Federally Listed or Candidate Species that Are Not Expected to be Affected by the Project | | |
|---|---|---|
| Species | ESA Listing Status | Reasoning for No Effect Determination |
| **Fish and Wildlife Species** | | |
| Tidewater goby *Eucyclogobius newberryi* | Endangered | Tidewater goby is found in the Sacramento and San Joaquin Rivers and associated tributaries. Permanente Creek does not provide suitable habitat for this species and the species is not known to occur in the Action Area. |
| San Bruno elfin butterfly *Incisalia mossii bayensis* | Endangered | San Bruno elfin butterfly is found in coastal mountains near San Francisco Bay, in the fog belt of steep north-facing slopes that receive little direct sunlight. There is no suitable habitat for this species in the Action Area, and thus, this species is not expected to be affected by the Project. |
| California clapper [Ridgway's] rail *Rallus longirostris obsoletus* | Endangered | California clapper rail occurs in emergent marsh habitat in the San Francisco Bay region. The Action Area does not contain suitable habitat for this species. Therefore, this species is not expected to be affected by the Project. |
| California least tern *Sternula antillarum (=Sterna, =albifrons) browni* | Endangered | California least tern occurs in beach and scrub habitats along the Pacific Coast from San Francisco to Baja California, Mexico. The Action Area does not contain suitable habitat for this species. Therefore, this species is not expected to be affected by the Project. |
| San Francisco garter snake *Thamnophis sirtalis tetrataenia* | Endangered | San Francisco garter snake occurs in pond habitats and feeds primarily on California red-legged frogs. The species' historical range was the San Francisco Peninsula south to Santa Cruz County. This species is not known to occur in the Action Area. Therefore, this species is not expected to be affected by the Project. |
| California tiger salamander *Ambystoma californiense* | Threatened | California tiger salamander breeds in vernal pool habitat and spends the majority of the year in upland refugia habitat (burrows) up to 1.5 miles from breeding ponds. There is no suitable breeding habitat for this species in the Action Area and the Action Area is not within 1.5 miles of known breeding locations. The nearest known occurrences of tiger salamander to the Action Area are approximately 12 miles to the southeast. Therefore, this species is not expected to be affected by the Project. |
| Marbled murrelet *Brachyramphus marmoratus* | Threatened | Marbled murrelet breeds in coniferous forests near coasts, nesting on large horizontal branches high up in trees. This species is not known to occur in the Action Area and is not expected to be affected by the Project. |
| Bay checkerspot butterfly *Euphydryas editha bayensis* | Threatened | Bay checkerspot butterfly is found in areas with serpentine soils. There is no suitable habitat for this species in the Action Area, and thus, this species is not expected to be affected by the Project. |
| Delta smelt *Hypomesus transpacificus* | Threatened | Delta smelt is found in the Sacramento–San Joaquin Delta and associated tributaries. Permanente Creek does not provide suitable habitat for this species and the species is not known to occur in the Action Area. |
| Central California Coastal steelhead DPS *Oncorhynchus mykiss* | Threatened | Central California coastal steelhead are found in coastal drainages from the Russian River south to Aptos Creek, including drainages of San Francisco and San Pablo Bays east to the confluence of the Sacramento and San Joaquin Rivers. Although steelhead occur in Stevens Creek, which is hydrologically connected to Permanente Creek by the Permanente Creek Diversion Channel, the diversion channel is impassable for steelhead, which do not occur in Permanente Creek. Further, depending on rainfall and drought conditions, flows in upper Permanente Creek may not reach Stevens Creek through the diversion channel (Permanente Creek is typically dry upstream of the diversion structure). In addition, Stevens Creek is over 4 miles downstream of the Action Area and is unlikely to experience increased sedimentation or other adverse conditions as a result of the proposed action. Therefore, this species is unlikely to be affected by the Project. |

Notes: DPS = Distinct Population Segment; ESA = federal Endangered Species Act; Project = Permanente Creek Restoration Project
Source: Data compiled by AECOM in 2015

### 1.3.3 CRITICAL HABITAT IN THE ACTION AREA

ESA Section 3(5)A defines "critical habitat" as the specific areas in the geographical area occupied by the species where physical or biological features are found that are essential to the conservation of the species and may require special management considerations or protection. Designations of critical habitat also may include specific areas outside the geographical area occupied by the species, based on a determination that such areas are essential to the conservation of the species.

The Action Area does not contain designated critical habitat for any federally listed species. The closest designated critical habitat to the Action Area is for Central California Coastal Steelhead, approximately 4 miles downstream of the Action Area, in Stevens Creek. Critical habitat for CRLF in Unit SNM-2, is present approximately 2 miles southwest of the Action Area.

### 1.3.4 ESSENTIAL FISH HABITAT IN THE ACTION AREA

Section 305(b)(2) of the Magnuson Stevens Fishery Conservation and Management Act, as amended by the Sustainable Fisheries Act of 1996 (Public Law 104 267), requires that Essential Fish Habitat (EFH) be identified and described in federal fishery management plans and that federal agencies consult with NMFS on any activity that they fund, permit, or carry out that may adversely affect EFH for federally managed fish species. EFH includes those waters and substrate necessary for fish spawning, breeding, feeding, or growth to maturity.

The Pacific Fishery Management Council has identified and described EFH, adverse impacts, and recommended conservation measures for salmon in Amendment 14 to the Pacific Coast Salmon Plan. Freshwater EFH for Pacific salmon includes all currently viable waters and most of the habitat historically accessible to salmon. The Action Area is within the Coyote Creek U.S. Geologic Survey Hydrologic Unit, which is designated EFH for Chinook Salmon (*Oncorhynchus tshawytscha*). Permanente Creek is not currently viable habitat for Chinook Salmon, because it is inaccessible to salmon.

### 1.3.5 CONSULTATION TO DATE

Table 3 summarizes consultation that has occurred to date between the U.S. Army Corps of Engineers (USACE) and the Service.

**Table 3. Consultation with U.S. Fish and Wildlife Service**

| Date | Consultation | Summary of Topics |
|---|---|---|
| November 18, 2014 | Meeting at SFBRWQCB office | Interagency meeting at the SFBRWQCB office to discuss the project. USFWS, as well as CDFW and RWQCB staff were in attendance. |
| June 3, 2015 | Federal species list | AECOM received automated list from the Service of federally listed species that may occur in the Action Area. |
| July 8, 2015 | Pre-application meeting (USACE) | Pre-application meeting with USACE and USFWS to discuss the proposed action. |
| April 26, 2016 | Federal species list update | GEI Consultants received automated list from the Service of federally listed species that may occur in the Action Area. |

Note: Service = U.S. Fish and Wildlife Service
Source: Data compiled by GEI in 2016

# 2 PROJECT DESCRIPTION

## 2.1 PROJECT LOCATION

The Project site is located in unincorporated Santa Clara County west of Cupertino and in the eastern foothills of the Santa Cruz Mountains, a part of the California Coast Ranges between the San Francisco Bay Area and the Pacific Ocean (Exhibit 1). The Action Area consists of Permanente Creek and its floodplain adjacent to the southern boundary of the Permanente Quarry. Exhibit 2 depicts the Project location next to the Permanente Quarry. Most of the area around the creek is undeveloped and includes natural areas such as the Rancho San Antonio Open Space to the north. Areas downstream of the Action Area are highly urbanized and include the cities of Cupertino, Los Altos, Palo Alto, and Saratoga.

## 2.2 PROJECT PURPOSE AND OBJECTIVES

Pursuant to a negotiated consent decree in *Sierra Club v. Lehigh Southwest Cement Company and Hanson Permanente Cement, Inc.* (U.S. District Court, Northern District, Case No. 5:11-cv-06392-HRL) and a cleanup and abatement order issued by the San Francisco Bay Regional Water Quality Control Board (RWQCB) (CAO No. 99-018:Section 9), Lehigh, the current facility operator, and Hanson Permanente Cement, Inc., the landowner, propose to restore portions of the Permanente Creek streambed, banks, and floodplain.

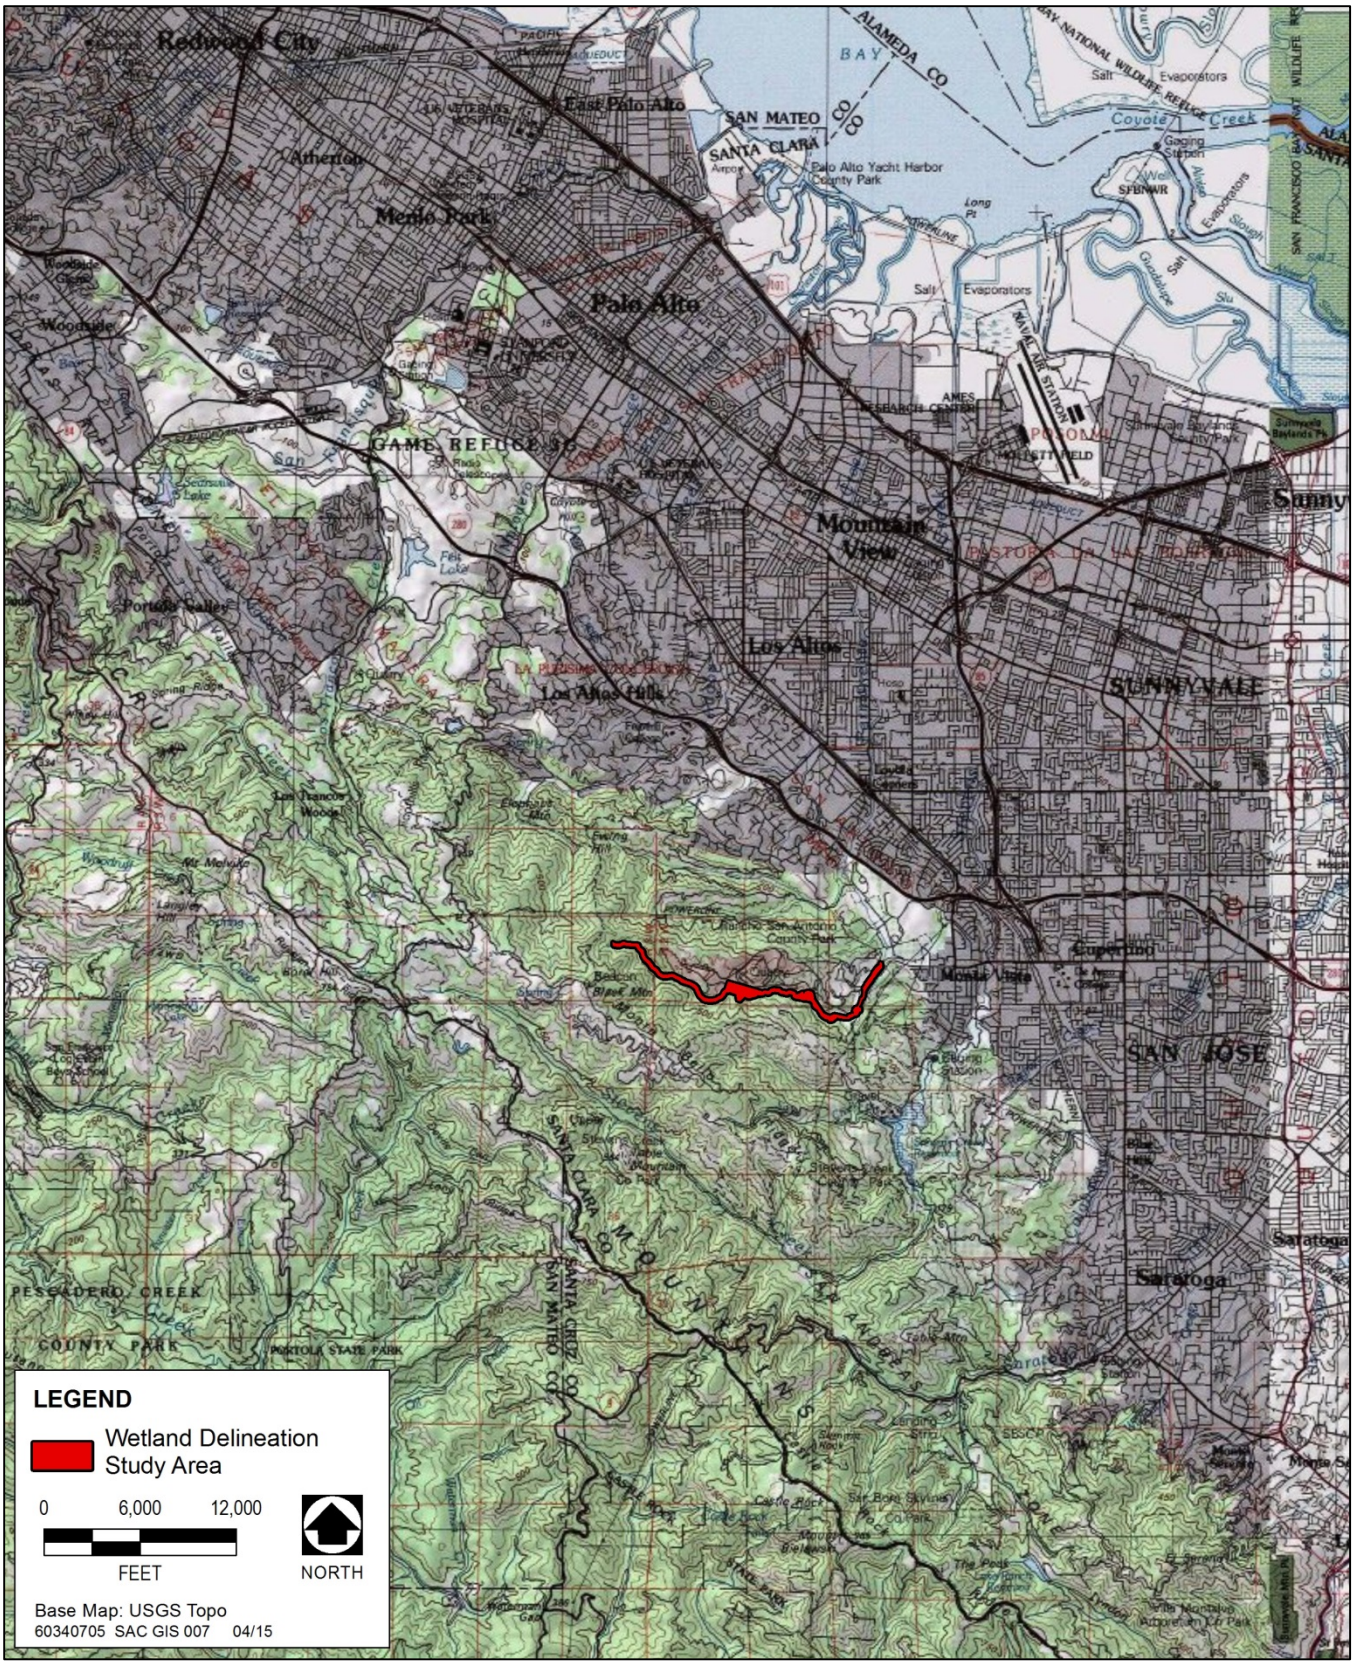
As part of the Project, Lehigh would remove a substantial volume of rock material (e.g., riprap, soil, debris) from specified areas in and/or adjacent to the creek, restore adjacent floodplain areas, and contour the stream to recreate meanders and match elevation controls created by bedrock. This may require removing an existing instream settling pond (Pond 13) and associated dam infrastructure. Second, to address additional downstream areas, Lehigh would remove culverts to create additional "daylighted" stream reaches, remove other concrete structures, remove an adjacent rock pile to provide additional space for meanders, and plant riparian vegetation along an existing concrete channel. Additional details regarding the restoration activities are provided below.

The proposed restoration of Permanente Creek has the following objectives:

- Remove mine-related materials from banks, and adjacent slopes of Permanente Creek.
- Restore streambed and floodplain hydraulics.
- Restore streambed hydrology and geomorphology, including stream meanders within the floodplain.
- Increase the quantity and quality of resident rainbow trout habitat.
- Improve and maintain riparian habitat on the banks and floodplain.
- Layback creek banks and adjacent hill slopes to provide stable slopes sufficient to prevent fill from entering the creek
- Remove or alter culverts and concrete structures to expose and create new streambed habitat.

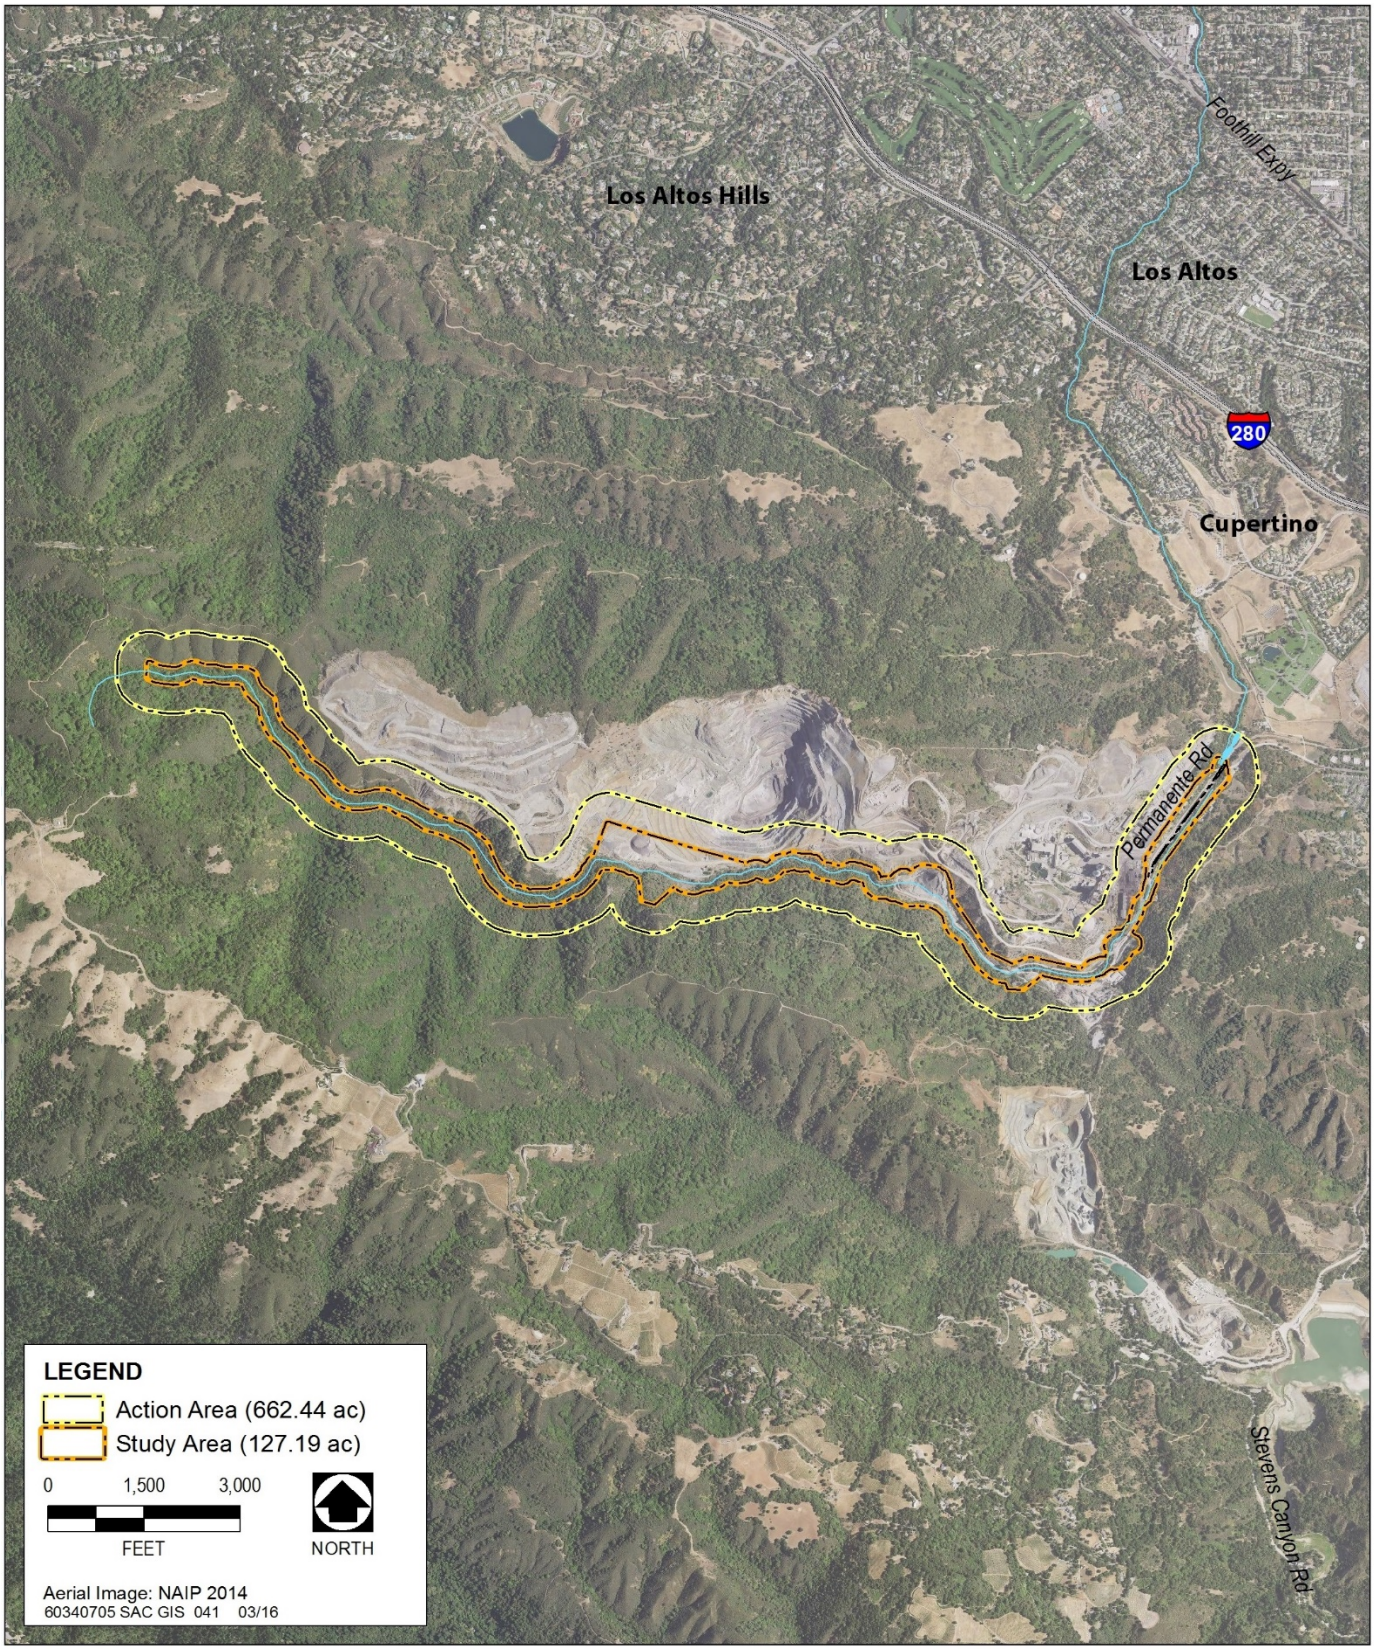
## 2.3 PROPOSED PROJECT

The Project would involve stream restoration on approximately 9,000 feet of Permanente Creek. In this length of the creek, portions of the streambed naturally achieve steep gradients (e.g., between 5% and >10%) and areas of exposed bedrock act as grade control points. The restoration would attempt to establish approximate pre-disturbance creek alignment and slopes in certain areas (*e.g.*, Reaches 17 and 18), and improve riparian habitat, including improvement to channel and stream bank stability and ecological/geomorphic function, based on current stream restoration approaches and engineering.



Source: Data compiled by AECOM in 2015

**Exhibit 1. Regional Location**



Source: Data compiled by AECOM in 2015, adapted by GEI 2016

**Exhibit 2. Action Area**

The Project, as fully depicted in the Project Design Drawings (Appendix B), would include realignment of the creek in several areas affected by rock material (*e.g*., riprap, soil, debris) from the adjacent mining operation. For example, rock material would be excavated in the "Material Removal Area" near Reach 17. The Project would involve removing this material, realigning the stream, and providing a floodplain bench area to restore natural geomorphic processes, allowing the stream to overtop its banks and meander within the stream corridor. Where Permanente Creek is incised in some areas, the restored streambed would be relatively shallow, allowing the stream to overflow its banks during substantial rainfall and inundate the floodplain. This beneficial stream process does not occur now in areas where the creek is channelized or constrained by fill or human-made structures in the floodplain. Restoring this process would provide natural removal of sediment and may provide some improvements in downstream water quality.

The proposed creek restoration plan has been developed over the last several years in consultation with the Sierra Club, and state, and federal agencies. In 2013, Lehigh and the Sierra Club signed a Consent Decree, outlining creek modifications that were based on certain assumptions. As actual design plans were prepared and consultation occurred with the California Department of Fish and Wildlife, the San Francisco Bay RWQCB, the U.S. Fish & Wildlife Service, and the U.S. Army Corps of Engineers, the project was modified as reflected in the enclosed design plans (Appendix B), and an amended Consent Decree was executed by the Sierra Club and Lehigh. Therefore, more recently, Lehigh and the Sierra Club developed a stream restoration plan that focuses on stream hydraulics, streambank and floodplain habitat, protection of resident/local fish populations, and improved wildlife habitat.

The Project would include the following components:

- establishing temporary access roads and staging areas for construction equipment and materials,
- completing a geotechnical investigation to support final design of the stream alignment,
- removing rock material from the adjacent quarry operation from the creek banks and bed,
- constructing new stream channel and floodplain areas,
- preparing stable side slopes,
- planting streambank and floodplain areas with riparian vegetation,
- removing human-made structures adjacent to the creek, and
- generally restoring the site.

The construction contractor would access the site through the main entrance off Permanente Road and would establish temporary access roadways that complement existing roadways in the area. This access would allow the contractor to drill geotechnical borings needed to inform the channel design, and to access the floodplain and stream channel during construction and habitat restoration. The construction contractor also would establish several construction staging areas for equipment storage, materials laydown, office trailers, and employee parking. During restoration, these areas would be used to store and prepare containerized plants before planting. Both the construction access roadways and the staging areas would be located to minimize erosion and loss of trees and other vegetation. It is anticipated that restoration activities would occur during the dry season, approximately May through September, over approximately five (5) consecutive seasons immediately after receipt of all necessary permits and approvals.

### 2.3.1 PROPOSED RESTORATION COMPONENTS

The subsections below describe the proposed features, construction methods, and measures Lehigh would use to minimize construction effects, and the required permits and approvals. Appendix B provides several design drawings and shows the overall layout of the proposed features and upgrades: the construction access roads and

staging area, culverts and other structures to be removed, locations of rock removal and slope stabilization, location and topographical design of the stream channel and floodplain improvements, and vegetation restoration location and components.

## 2.3.2 PROJECT CONSTRUCTION

Construction would be completed in the following steps as described in greater detail below:

- establishment of temporary access roads and staging areas for construction equipment and materials,
- geotechnical investigations to support final design of the stream alignment,
- removal of fallen rock material from the adjacent quarry,
- construction of new stream channel and floodplain areas,
- preparation of stable side slopes,
- planting of streambank and floodplain areas with riparian vegetation,
- removal of human-made structures adjacent to the creek, and
- general site restoration.

### SITE PREPARATION—ACCESS ROADS AND STAGING AREAS

Before construction, crews would establish access roads and staging areas at the Project site. The crews would access the site through the main entrance and would establish temporary construction-access roadways that would be designed to be a minimum of 14 feet wide. Establishing these roadways would allow the contractor to drill the geotechnical borings needed to inform final channel design and would provide access to the Project site during construction. The staging areas are required for storage of equipment and construction materials, office trailers, and employee parking. Seven staging areas are proposed. From west to east, two staging areas would be located near Culvert 10/11, one at Culvert 9, two at Culvert 8, one at Culvert 2, and one at Culvert 1. The access roads and staging areas would be located to minimize erosion and loss of trees and other vegetation.

### ROCK MATERIAL REMOVAL

The contractor would excavate rock material from affected stream reaches to move the toe of the slope to the north and restore the floodplain. Rock material would be removed within Reaches 8–12 (see the Project Design Drawings in Appendix B) by reducing the width of the adjacent roadway and removing rock material. Additional rock material would be removed within Reaches 17 and 18, and the toe of the north slope would be moved approximately 25 feet to the north. The material would be loaded into dump trucks, transported to an area within the adjacent Permanente Quarry, and used to support the future quarry reclamation process. Trees or stumps removed during excavation would be stored and used for habitat creation and restoration. The excavated areas would be graded to provide a level surface for channel excavation and planting. Brush, timber, and removed stumps not used for habitat restoration would be disposed of in accordance with local restrictions and regulatory requirements. Non-limestone rock would be used for streambank stabilization.

### CONSTRUCTION OF STREAM CHANNEL

The principal restoration action would be construction of a new stream channel within the newly restored floodplain areas created by removing rock material. The new channel would be designed to use the underlying bedrock where present to guide the channel's alignment and profile. The stream restoration would be designed to protect water quality by diverting stream flow around the construction area. The contractor would then excavate

the new stream channel within the floodplain area according to design specifications for channel depth that would allow overbanking at the desired interval while providing bank stability and adequate cover and shading. The stream channel would be excavated by heavy equipment such as excavators. The walls of the new channel would be shored or sloped to prevent collapse. The excavated material (non-limestone) would be used to backfill the old channel in areas where a new stream channel is constructed in a more desirable location. Generally, any removed limestone would be transported out of the stream channel and used in cement plant manufacturing and/or quarry reclamation. Based on current estimates, approximately 420,000 cubic yards of fill would be removed from the channel during rock removal and stream channel construction. The final volume is pending geotechnical excavations.

Pond 13 is an instream settling pond in Reach 13, created by a steel and concrete dam and associated steel half-culvert supported by concrete. These human-made structures would be removed. Based on bedrock locations to be determined during construction, the final design profile could allow Pond 13 to remain, and the dam would be replaced with a boulder grade control structure. However, if so dictated by bedrock, construction of the new channel would necessitate removal of the Pond 13 dam and the pond would be replaced by a new reach of the creek.

### STREAM HABITAT RESTORATION

Before allowing flow in the new channel, the contractor would plant native vegetation to stabilize the streambanks and to provide shading and bank habitat. Woody debris and instream vegetation would be placed to enhance instream cover habitat. Barriers would be removed and/or new passage routes would be established to enhance movement by local fish.

The contractor would then plant riparian vegetation along the new streambanks and in the floodplain in accordance with restoration design specifications. This would stabilize the new banks, reduce erosion, enhance riparian habitat, and enhance aquatic habitat. Planting locations would be selected to provide shade for the stream and cover for fish and other aquatic species. Table 4 provides a preliminary list of riparian plantings.

**Table 4. Species List**

| Scientific Name | Common Name |
|---|---|
| *Acer macrophyllum* | Big leaf maple |
| *Aesculus californica* | California buckeye |
| *Alnus rhombifolia* | White alder |
| *Baccharis pilularis* | Coyote brush |
| *Heteromeles arbutifolia* | Toyon |
| *Quercus agrifolia* | Coast live oak |
| *Rosa californica* | California wild rose |
| *Rubus ursinus* | California blackberry |
| *Salix laevigata* | Red willow |
| *Salix lasiolepis* | Arroyo willow |
| *Salvia mellifera* | Black sage |
| *Sambucus nigra* spp. *caerulea* | Blue elderberry |
| *Schoenoplectus californicus* | Tule |

Source: Data provided by WRA, Inc. in 2011 and updated by AECOM 2015 site surveys

After construction, the contractor would restore the areas used for staging and access roads to approximate preconstruction conditions by applying a hydroseed mix and installing permanent erosion and sedimentation controls. Hydroseeding would occur between September 1 and December 1. The success of the hydroseeded habitat would be judged based on performance standards including percent cover and species richness. Surface soils would be stabilized with mulch consisting of straw or erosion-control fabric that complies with storm water pollution prevention plan (SWPPP) standards. This process would be completed approximately 1 month after final grading is complete.

### 2.3.3 CONSTRUCTION SCHEDULE

Stream restoration would be completed over a period of approximately five dry/work seasons years, after permit procurement. The physical setting, mitigation, and schedule constraints would prohibit work in the rainy season. The proposed construction schedule also incorporates work windows to avoid or minimize effects on sensitive species. Each year, the initial activity would be to construct site access roads, install stream diversions and sediment controls, and perform geotechnical investigations as needed for design. The second activity would be to excavate rock material, create a new stream channel in those areas, and truck the excavated material to the quarry. Next, the stream would be prepared to receive streamflow by planting bank vegetation and allowing the streambed sediments to consolidate. In the final phase, flow would be diverted into the new channel. These activities would likely occur in each year during the work season over the life of the project.

The phasing of restoration activities in discrete segments of the stream would be planned to allow mitigation of sediment transport that may be caused by the work. Consideration in phasing would also be given to minimize the amount of stream area undergoing active disturbance at any one time.

Lehigh hopes to initiate construction at the start of the first work season following receipt of all authorizations. Construction activities would comply with all applicable local ordinances and would remain within the constraints established during the permitting and California Environmental Quality Act processes.

This page intentionally left blank.

# 3 ENVIRONMENTAL BASELINE CONDITIONS

Permanente Creek in the Action Area begins in the west at higher elevations. The creek flows easterly to lower elevations through a narrow corridor for approximately 3.25 miles, with the quarry to the north and steep mountain slopes (Exhibit 3) to the south, until it reaches Pond 13. In May 2015, portions of this area were observed to be dry (Exhibit 4). The creek then becomes more channelized (Exhibit 5) and flows through flatter terrain (Exhibit 6) for the remaining 1.15 miles until it exits the Action Area. Most of the wetland features mapped in the 662.4-acre Action Area are in the lower third of the drainage.

Source: Photograph taken by AECOM in May 2015

**Exhibit 3. Permanente Creek Drainage Upstream of Pond 13**

Plant community names present in the Action Area conform to *Preliminary Descriptions of the Terrestrial Natural Communities of California* (Holland 1986), where applicable. Community names from *A Manual of California Vegetation* (Sawyer et al. 2009) are provided in the text where applicable. Wetland community names conforming to *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin et al. 1979) are also given where appropriate. Vegetation communities identified in the Action Area consist primarily of upland mixed oak woodland and forest, ruderal grasslands, and a mix of native and nonnative trees composing a riparian corridor along Permanente Creek.

## 3.1 UPLAND HABITATS

### 3.1.1 OAK WOODLANDS AND FOREST

Oak woodlands and forest habitats (including California bay forest) make up the majority of the Action Area, and generally occur on the north-facing slopes above the Permanente Creek riparian zone. However, a narrow band of this habitat type also is present on the south-facing slope, above the riparian zone and below the chamise scrub habitat. The dominant tree species in this community include coast live oak (*Quercus agrifolia*), California bay (*Umbellularia californica*), and tanoak (*Notholithocarpus densiflorus*). Shrubs are prevalent and include poison oak (*Toxicodendron diversilobum*), western raspberry (*Rubus leucodermis*), creeping snowberry (*Symphoricarpos mollis*), and ocean spray (*Holodiscus discolor*). Forbs generally are sparse because little light penetrates to the forest floor; however, hillside woodland star (*Lithophragma heterophyllum*) was observed blooming during the May 2015 field reconnaissance survey. Approximately 0.80 acre of oak woodland forest and California bay forest is subject to potential direct effects as part of the Project (see Table 5 in Section 5, "Potential Project Effects").

### 3.1.2 RIPARIAN FOREST

Riparian forest habitat in the Action Area is restricted to a narrow band along Permanente Creek that includes California buckeye woodland, white alder riparian forest, and willow riparian forest. Dominant vegetation in the riparian forest communities along Permanente Creek includes Goodding's willow (*Salix gooddingii*), red willow (*S. laevigata*), arroyo willow (*S. lasiolepis*), white alder (*Alnus rhombifolia*), big leaf maple (*Acer macrophyllum*), western creek dogwood (*Cornus sericea* ssp. *occidentalis*), and California buckeye (*Aesculus californica*). Stinging nettle (*Urtica diotica*) and poison oak are abundant close to the creek channel. False Solomon's seal

(*Maianthemum racemosum*) and sweet cicely (*Osmorhiza berteroi*) were observed scattered along the creek channel in upstream areas of Permanente Creek. Approximately 3.57 acres of riparian forest are subject to potential direct effects as part of the Project (see Table 5 in Section 5, "Potential Project Effects").

### 3.1.3 MIXED SCRUB AND CHAPARRAL

Mixed scrub and chaparral (including chamise chaparral, mixed scrub, northern mixed chaparral, oak chaparral, and poison oak scrub) habitats typically are present in the Action Area on the south-facing slopes. These habitats are dominated by species with thick, waxy leaves and include coyote brush (*Baccharis pilularis*), chamise (*Adenostoma fasciculatum*), California sagebrush (*Artemisia californica*), and white-leaf manzanita (*Arctostaphylos viscida*). Other species include California buckwheat (*Eriogonum fasciculatum*) and naked buckwheat (*E. nudum*). Approximately 0.12 acre of mixed scrub and chaparral is subject to potential direct effects as part of the Project (see Table 5 in Section 5, "Potential Project Effects").

### 3.1.4 RUDERAL GRASSLAND/DISTURBED AND NONNATIVE ANNUAL GRASSLAND

Small portions of the eastern part of the Action Area are previously disturbed and support primarily ruderal (disturbance-related) species and nonnative grasses. These species include wild oats (*Avena* spp.), ripgut brome (*Bromus diandrus*), soft chess (*B. hordeaceus*), Italian ryegrass (*Festuca perennis*), filaree (*Erodium botrys* and *E. cicutarium*), small fescue (*Festuca microstachys*), California poppy (*Eschscholzia californica*), bird vetch (*Vicia cracca*), and birdsfoot trefoil (*Lotus corniculatus*) (WRA 2011). Approximately 5.12 acres of ruderal grassland and disturbed areas are subject to potential direct effects as part of the Project (see Table 5 in Section 5, "Potential Project Effects").

### 3.1.5 ROCK OUTCROP AND ACTIVE QUARRY

A rock outcrop is located south of Permanente Creek and the active quarry pit. Approximately 12.81 acres of rock outcrop and active quarry are subject to potential direct effects as part of the Project (see Table 5 in Section 5, "Potential Project Effects").

## 3.2 AQUATIC HABITATS

### 3.2.1 PERENNIAL STREAMS

Perennial waterways in the Action Area consist of approximately 5 miles of Permanente Creek. The creek's headwaters are located approximately 0.6 mile west of the western boundary of the Action Area. Permanente Creek is located in the Santa Cruz Mountains, and steep slopes constrain the channel through much of the Action Area. In the western portion of the Action Area, the channel is relatively narrow as the channel flows east, then widens as ephemeral tributaries contribute flow to Permanente Creek. Historic quarry operations affected portions of Permanente Creek upstream of Pond 13. Downstream, the creek is affected by rock material (*e.g.*, riprap, concrete debris), an alluvial fan of gravel, artificial fill narrowing the channel for roads, etc. In addition, portions of the Permanente Creek were realigned into a straight channel or placed into underground culverts. The creek flows east for approximately 5 miles and then north for approximately 8 miles until it enters Mountain View Slough, which drains directly into the southern portion of San Francisco Bay. Approximately 1.44 acre of perennial stream is subject to potential direct effects as part of the Project (see Table 5 in Section 5, "Potential Project Effects").

### 3.2.2 EPHEMERAL STREAMS OR DRAINAGES

A total of 15 unnamed ephemeral drainages are present in the Action Area. All but two of these ephemeral drainages form outside of the Action Area, high in the surrounding mountains. Approximately 0.02 acre of ephemeral stream and drainage is subject to potential direct effects as part of the Project (Table 5).

### 3.2.3 OFF-CHANNEL SETTLING PONDS/SEDIMENTATION BASINS

Several non-jurisdictional storm water sedimentation basins are present in the Action Area (Ponds 4A, 13B, 9, 17, 19, and 20). They were excavated in uplands and receive process water and storm water from the quarry pit (Pond 4A), or storm water from other areas of operations, to settle suspended solids. These ponds are actively managed as part of ongoing quarry operations. No settling ponds/sedimentation basins are subject to potential direct effects as part of the Project.

### 3.2.4 IN-STREAM/JURISDICTIONAL PONDS AND IMPOUNDMENTS

There are four in-stream or otherwise jurisdictional ponds or impoundments in the Action Area: Ponds 13, 14, 21, and 22 (Exhibit 7). A significant amount of riparian vegetation, including Gooding's black willow (*Salix gooddingii*), white alder (*Alnus rhombifolia*), and big leaf maple (*Acer macrophyllum*) is growing around the margins of the ponds. Dense growth of narrowleaf cattail (*Typha angustifolia*) surrounds Ponds 21 and 22. Approximately 0.50 acre of in-stream pond and impoundment is subject to potential direct effects as part of the Project (see Table 5 in Section 5, "Potential Project Effects").

### 3.2.5 WETLANDS AND MARSHES

Several wetlands and marshes are present in the Action Area. Most of the features are contiguous with Permanente Creek, but a few are connected via culvert. These wetlands are dominated by Pampas grass (*Cortaderia selloana*) and willow species, including arroyo willow (*Salix lasiolepis*), stinging nettle (*Urtica dioica*), mugwort (*Artemisia douglasiana*), water cress (*Nasturtium officinale*), and tall flat sedge (*Cyperus eragrostis*). Approximately 0.09 acre of wetland and marsh is subject to potential direct and indirect effects as part of the Project (see Table 5 in Section 5, "Potential Project Effects").

**Exhibit 7. Location of Ponds in Action Area**

# 4 BASIC BIOLOGY, LIFE HISTORY, AND BASELINE FOR CALIFORNIA RED-LEGGED FROG

CRLF was federally listed as threatened in May 1996 (61 *Federal Register* [FR] 25813, May 23, 1996). Critical habitat has been designated for this species and is discussed in further detail below. The *Recovery Plan for the California Red-Legged Frog* was also developed for CRLF in September 2002 (USFWS 2002).

## 4.1 SPECIES DESCRIPTION

CRLF is the largest native frog in the western United States (Wright and Wright 1949). The abdomen and hind legs of adults are often a red or salmon color. The back of a CRLF is characterized by small black flecks and larger dark blotches with indistinct outlines on a brown, gray, olive, or reddish-brown background color (Stebbins 2003). Dorsolateral folds are prominent. Tadpoles range from 0.6 inch to 3.1 inches long, and a line of very small, gold-colored spots becomes the dorsolateral fold (USFWS 2002). Adults are highly aquatic and are most active at night (USFWS 2002). CRLF also uses terrestrial habitat, especially after precipitation events, for nonmigratory forays into adjacent upland habitats and migratory overland movements to breeding sites. Movement of up to 1 mile from breeding to aestivation sites is typical (Stebbins 2003); however, CRLF has been reported to travel up to 2 miles between habitats (Bulger et al. 2003).

Breeding typically begins between November and mid-December and continues through April in most years, but is dictated by winter rainfall (Jennings and Hayes 1994). At breeding sites, males call in groups of three to seven individuals to attract females (Jennings and Hayes 1994). During amplexus (breeding posture), eggs are fertilized by the male while the female deposits the egg mass (Jennings and Hayes 1994). Larvae typically hatch in 6–22 days, and metamorphosis is usually completed in 4–5 months (Jennings and Hayes 1994; Bobzien et al. 2000). Males and females usually attain sexual maturity at 2 years and 3 years, respectively (Jennings and Hayes 1994).

## 4.2 HABITAT REQUIREMENTS AND RANGE

The CRLF historically ranged from Redding and Marin County in the north, south to northern Baja California, Mexico, and essentially throughout lowland California (Jennings and Hayes 1994). Since then, its range has been reduced to mostly isolated drainages within the Coast Ranges and near-coastal foothills. The Service notes that although the CRLF once occupied 46 counties, it now is known from only 22, with the greatest concentrations in Monterey, San Luis Obispo, and Santa Barbara Counties (USFWS 2002).

Optimal habitat for CRLF includes ponds, stream courses, permanent pools, and intermittent streams fed by drainage areas no larger than 115 square miles (USFWS 2002). This species occurs at elevations between sea level and 5,000 feet (USFWS 2002). Typical habitat characteristics include water depth of at least 2.5 feet, largely intact emergent or shoreline vegetation, and absence of competitors/predators such as bullfrogs (*Rana catesbeiana*) and largemouth bass (*Micropterus salmoides*) (Hayes and Jennings 1988). CRLF uses a wide variety of habitats in the absence of optimal conditions, such as temporary pools and streams and stock ponds. However, permanent aquatic habitat is essential to the survival of local CRLF populations. CRLF is threatened by potential degradation and loss of its habitat from agriculture, urbanization, mining, overgrazing, recreation, timber harvesting, nonnative-plant invasions, impoundments, water diversions, degraded water quality, use of pesticides, and introduced predators (USFWS 2002).

## 4.3 POTENTIAL TO OCCUR IN THE ACTION AREA

CRLF is known to occur in the Action Area. This species has been documented during repeated focused surveys and habitat assessments conducted from 1997 to 2014, protocol-level surveys performed in 2006 and 2007 (Jennings 2006, 2007), and incidental observations while conducting surveys unrelated to CRLF. Incidental observations of presumed CRLF in Pond 22 occurred in 2000 during fish surveys (WRA 2011). CRLF was detected in 2006 and 2007 during the protocol-level surveys in in-stream or adjacent wetlands, at Ponds 14, 21 (adjacent wetlands), and 22, on the eastern edge of the Action Area. CRLF was observed in Pond 9 during an August 2014 pre-construction survey conducted in anticipation of potential vegetation and silt removal (vegetation and sediment removal ceased after this observation). Breeding has been documented in Permanente Creek in Ponds 14 and 21 (WRA 2011). Aquatic habitat for CRLF was delineated and characterized in wetland delineations conducted for the Project in 2008 (WRA 2008) and again in 2015 (AECOM 2015).

Suitable aquatic breeding habitat for CRLF is present in several of the ponds created as impoundments along Permanente Creek, as well as ponds and wetlands adjacent to the creek (Appendix C). Surface water was observed in all ponds during field surveys in May 2015. Pond 9 was previously used as a settling basin for localized storm water and now only receives upwelling groundwater contributions; Pond 9 has suitable aquatic habitat that could potentially support breeding CRLF. This pond is approximately 3 feet deep and has a thick layer of green algae coating the bottom surface. Dense growth of narrowleaf cattail surrounds Ponds 9, 14, and 21. Instead of cattail, common horsetail (*Equisetum arvense*) is the dominant emergent vegetation present at Pond 13, mostly upstream of the pond. Pond 13 itself has relatively steep, vegetated sides and a maximum depth of 5 feet. Ponds 9, 21, and 14 are cattail marshes with open water that is approximately 3–4 feet deep. CRLF has not been documented in Pond 13. Cattail vegetation is absent at Pond 22 and the typical vegetation there is riparian species such as black willow and white alder.

Upstream of these ponds, aquatic habitat is generally not present in Permanente Creek in the Action Area because of lack of deep pools. The stream corridor, however, could still function as upland and dispersal habitat. CRLF are unlikely to occur in heavily disturbed portions on the north side of Permanente Creek adjacent to the quarry because of lack of cover, exposure to predation, and frequent vehicle traffic.

## 4.4 CRITICAL HABITAT

Critical habitat was first designated for CRLF in April 2006 (71 FR 19244, April 13, 2006) and was revised in March 2010 (75 FR 12816, March 17, 2010). In designating critical habitat for CRLF, the Service evaluated the following specific primary constituent elements of habitat:

> **Aquatic breeding habitat**: Low-gradient freshwater habitats, such as pools and marshes that should hold water for a minimum of 20 weeks in most years and have salinity less than 7.0 parts per thousand.
>
> **Nonbreeding aquatic habitat**: This habitat that could be defined as aquatic breeding habitat and also includes intermittent creeks, seeps, or springs that could provide refuge or foraging habitat during drought periods.

**Upland habitat**: Terrestrial habitat within 200 feet of aquatic habitat and could include riparian, grassland, or woodland habitats. Upland habitat considered suitable includes features that provide refuge for the species, such as active mammal burrows.

**Dispersal habitat**: This habitat can be a variety of upland habitat types, provided that it is free of barriers such as highways. The Service considers 1 mile a dispersal distance that in most cases will provide for connectivity between breeding habitats and nonbreeding aquatic and upland habitats.

The Action Area does not include designated critical habitat for CRLF. The closest designated critical-habitat unit to the Action Area is SNM-2 in San Mateo County, approximately 1.5 miles southwest of the Action Area.

This page intentionally left blank.

# 5 POTENTIAL PROJECT EFFECTS

## 5.1 INTRODUCTION

This section discusses potential effects of Project construction and operation on federally listed species and any designated critical habitat(s) or EFH that may occur.

The 24.47-acre Designated Restoration Plan Area lies within the 662.4-acre Action Area, and encompasses the portion of upland and aquatic habitats in the Action Area where potential direct effects to listed species could occur from construction activities (see Exhibit 8). Construction and restoration activities within each designated phase of restoration would be completed within a single season. Completion of all restoration phases would require several seasons to complete. Potential effects on listed species that may occur in the Designated Restoration Plan Area are estimated based on the maximum acreages of suitable habitat that could be affected by Project construction and maintenance. Potentially suitable habitat is classified based on literature review, site surveys, and/or desktop research. Under the ESA, direct effects are those that would be caused by the Project and would occur at the same time as the action (e.g., construction-related effects). Indirect effects are those that would be caused by the Project later in time, but would be reasonably certain to occur (e.g., operational effects). Avoidance and minimization measures for both direct and indirect effects are presented in Section 6, "Avoidance and Minimization Measures."

## 5.2 DIRECT AND INDIRECT EFFECTS ON CALIFORNIA RED-LEGGED FROG IN THE ACTION AREA

### 5.2.1 DIRECT EFFECTS

CRLF is known to occur within the Action Area. Suitable aquatic habitat for this species is present in the Action Area, associated with cattail marsh and stock ponds at Ponds 9, 13, 14, 21, and 22. Breeding has been documented at Ponds 14 and 21. Pond 13 is the only pond located within the Designated Restoration Plan Area and would be the only pond directly affected by Project construction. Although the Project would result in a net benefit for CRLF by expanding the available aquatic and upland refugia habitat, occupied aquatic and associated upland refugia and movement corridors may be affected temporarily during construction. Table 5 provides a breakdown of this direct effect acreage by community.

Of the 24.47 acres subject to direct effects, (the Designated Restoration Plan Area), construction activities associated with the Project would affect up to 11.66 total acres of potential CRLF aquatic and upland habitat (Table 6). Of these 11.66 acres of direct effect, at least 11.16 acres would include temporary effects, and up to 0.5 acre of habitat at Pond 13 may be permanently altered at. To date, CRLF has not been documented within Pond 13 (WRA 2011). As described in Section 2.3.2, *Project Construction*, a pond may remain in this location if bedrock conditions allow the dam to be replaced with a boulder grade control structure. Alternatively, the dam would be removed permanently, and a new reach of the creek would be constructed at the location. Under the latter scenario, the 0.5-acre pond would be converted to stream channel and associated riparian upland habitat.

| Table 5. Direct Effects by Community | | |
|---|---|---|
| Vegetation Community | Acres | Temporary or Permanent |
| Oak woodlands and forest | 0.30 | Temporary |
| California bay forest | 0.50 | Temporary |
| White alder riparian | 2.32 | Temporary |
| Willow riparian forest and scrub | 1.25 | Temporary |
| Northern mixed chaparral | 0.04 | Temporary |
| Mixed scrub | 0.03 | Temporary |
| Poison oak scrub | 0.05 | Temporary |
| Disturbed | 0.33 | Temporary |
| Ruderal grassland | 4.79 | Temporary |
| Rock outcrop | 0.07 | Temporary |
| Active quarry | 12.74 | Temporary |
| Perennial streams | 1.44 | Temporary |
| Ephemeral streams/drainage | 0.02 | Temporary |
| Instream ponds and impoundments | 0.50 | Permanent |
| Wetlands and marshes | 0.09 | Temporary |
| **Total** | 24.47 | |
| Source: Data compiled by AECOM in 2015 | | |

| Table 6. Effects on Suitable California Red-Legged Frog Habitats | | |
|---|---|---|
| | Acres of Directly Affected Suitable Habitat | Permanent or Temporary Effect |
| Aquatic habitat[1] | 1.55 | Temporary |
| Pond 13 (Conversion of pond habitat to stream channel and associated riparian upland habitat ) | 0.5 | Permanent |
| Riparian forest and scrub, grassland, scrub/chaparral, disturbed, and oak woodland for upland refugia and dispersal habitat[2] | 9.61 | Temporary |
| **Total** | 11.66 | |

Notes:

[1] Includes jurisdictional wetlands, potential waters of the United States, and sedimentation basin.

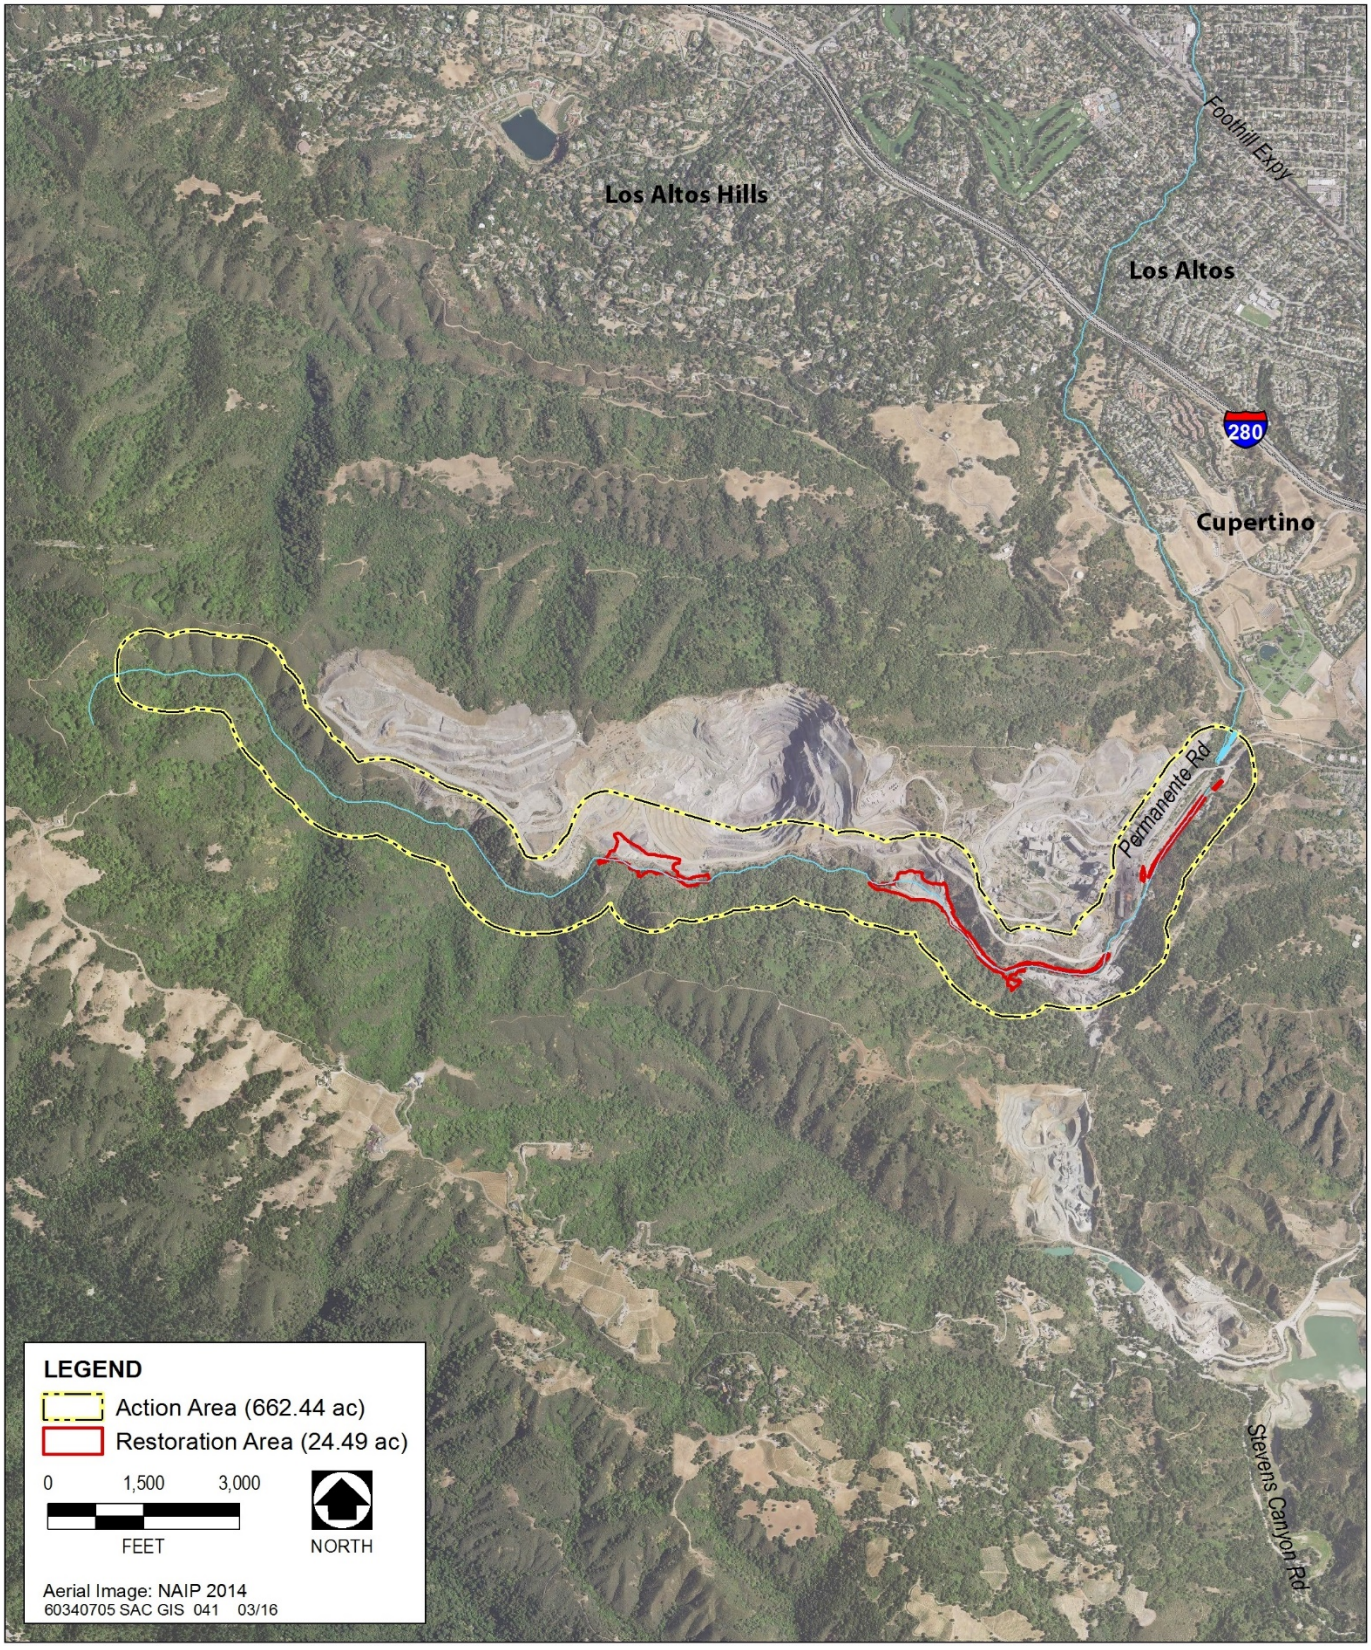
[2] All upland habitat within 200 feet of the area of direct disturbance was considered suitable for California red-legged frog with the exception of active quarry areas and rock outcrops.

Source: Data compiled by AECOM in 2015

Direct mortality of frogs may occur during ground disturbance activities in the suitable wetland and riparian woodland as a result of restoration activities or from being struck by construction vehicles in the construction or staging area. The Project would include activities in areas where CRLF has been documented. To avoid and minimize potential effects on CRLF, the Project would implement the conservation measures described in Section 6, "Avoidance and Minimization Measures."

### 5.2.2 INDIRECT EFFECTS

Potential indirect effects on CRLF include potential temporary degradation of water quality resulting from discharge of contaminants or sediment from construction, and alteration of the hydrology in Permanente Creek during creek restoration activities.



Source: AECOM 2015, adapted by GEI

**Exhibit 8. Designated Restoration Plan Area**

In addition, noise, visual disturbance, and vibrations from construction activity could cause CRLF individuals to vacate or avoid suitable habitat, potentially resulting in increased predation and stress associated with the temporary loss of movement and foraging habitat. In addition, increases in human concentrations and activity near suitable habitat may increase the number of native and nonnative predators attracted to trash or food left in the area. To avoid and minimize potential effects on CRLF, the Project would follow conservation measures, such as implementing standard best management practices for water quality, as described in Section 6.

## 5.3 EFFECTS ON CRITICAL HABITAT AND ESSENTIAL FISH HABITAT

### 5.3.1 CRITICAL HABITAT

Designated critical habitat for CRLF and Central California Coastal Steelhead are present near the Action Area. The nearest unit of CRLF critical habitat is approximately 2 miles to the southwest, but it is not hydrologically connected to the Action Area and would not be affected by the Proposed Action. Designated critical habitat for Central California Coastal Steelhead includes Stevens Creek, which is approximately 4 miles downstream of and hydrologically connected to the Action Area, via Permanente Creek and the Permanente Creek Diversion Channel. Because of the intermittent flows to Stevens Creek, and the distance downstream of Stevens Creek, it is very unlikely that any potential temporary increase in sedimentation or other adverse conditions that could result from the Proposed Action would extend to critical habitat in Stevens Creek. Therefore, no effect on designated critical habitat for CRLF or steelhead would occur.

### 5.3.2 ESSENTIAL FISH HABITAT

The Action Area is within the Coyote Creek U.S. Geologic Survey Hydrologic Unit, which is designated EFH for Chinook Salmon. Permanente Creek is currently inaccessible to salmon. Implementation of the proposed action would enhance habitat quality in Permanente Creek and would not diminish future potential to establish access to the creek for salmon. Therefore, no effect on salmon EFH would occur.

## 5.4 INTERRELATED AND INTERDEPENDENT ACTIONS

ESA Section 7(a)(2) requires agencies with regulatory authority over listed species to issue BOs, evaluating the direct and indirect effects of federal actions, and actions that are interrelated or interdependent with such actions. A BO must determine whether the actions being evaluated may appreciably reduce the listed species' likelihood of survival or recovery in the wild by reducing their productivity, numbers, or distribution.

No additional projects or actions associated with the Project analyzed in this BA are interrelated or interdependent on the Project. There are no related projects associated with the Project. The ongoing mining activities at the Lehigh site and the future reclamation of the mine and associated facilities are not dependent on the Project for their implementation or success.

## 5.5 CUMULATIVE EFFECTS

Cumulative effects on listed species and habitat include the effects of pending, and future state, tribal, local, or private actions that are reasonably certain to occur in the Action Area under consideration. The effects of projects that require a federal action are not considered in the cumulative-effects evaluation during Section 7 consultation evaluations because they are subject to separate consultation (USFWS and NMFS 1998). Also, the nonfederal

action must be located in the Action Area, or project site, that is evaluated in the Section 7 consultation process (USFWS and NMFS 1998).

No other projects are expected to occur in the Action Area as defined by this Project. Lehigh will continue implementing the approved off-channel reclamation plan for the existing quarry and surrounding areas, and the work described herein is expected to satisfy creek restoration obligations, of that reclamation plan.. Therefore, implementation of the reclamation plan is exempted from the cumulative impact analysis for this Project.

In addition, the stream restoration project is expected to result in improvement to and expansion of existing aquatic and upland habitat upon Project completion. Therefore, the Project is not expected to result in a cumulative effect on CRLF or its habitat. The Action Area does not contain designated critical habitat for CRLF; therefore, critical habitat would not be subject to cumulative effects from the Project.

This page intentionally left blank.

# 6 AVOIDANCE AND MINIMIZATION MEASURES

This section describes avoidance and minimization and habitat conservation measures that would be incorporated as part of the Project. The measures described in this section are proposed in part to avoid and minimize effects on the federally listed species (i.e., CRLF) that may occur in the Action Area.

## 6.1 STANDARD ENVIRONMENTAL COMMITMENTS

Lehigh would implement standard environmental protection measures (environmental commitments) during construction to minimize environmental effects and disruption of surrounding areas. These commitments include those required by State of California regulations as well as county ordinances. This would include completing stormwater permitting, and preparing and implementing a SWPPP as required by the San Francisco Bay RWQCB to minimize erosion and potential impacts on downstream water quality. The SWPPP would outline stormwater best management practices, such as placing sandbags around stormwater catch basins, silt fences around disturbed areas, and covers on excavated soil piles, and spraying disturbed areas using water trucks to minimize fugitive dust and dirt emissions. The Project would comply with city ordinances related to noise generation, traffic control, public notices, protection of historical resources, and protection of existing vegetation. The Project also would comply with state and local requirements to characterize and dispose of hazardous materials and recycle solid waste.

## 6.2 COMPLIANCE WITH PERMIT TERMS AND CONDITIONS

Lehigh would require its contractors and suppliers, its general contractor, and all of the general contractor's subcontractors and suppliers to comply with all terms and conditions of all required Project permits, approvals, and conditions. Lehigh ultimately would be responsible for the actions of its contractors regarding compliance with permit conditions.

Before the start of any ground-disturbing activity associated with construction of any Project feature that would affect waters of the United States, including wetlands, or waters of the state, Lehigh would obtain all necessary permits for the Project under Sections 404 and 401 of the Clean Water Act or the state's Porter-Cologne Water Quality Control Act.

All permits, regulatory approvals, and permit conditions for effects on wetland habitats would be secured before implementation of any grading activities in waters of the United States or wetland habitats, including waters of the state. Lehigh would commit to replacing, restoring, or enhancing on a "no net loss" basis (in accordance with USACE and the San Francisco Bay RWQCB) the acreage of all wetlands and other waters of the United States, if any, that would be removed, lost, and/or degraded with Project implementation.

Wetland habitat would be restored, enhanced, and/or replaced at an acreage and location and by methods agreeable to USACE and the San Francisco Bay RWQCB, as determined during the Section 404 and Section 401 permitting processes. Final mitigation ratios would be determined during the permitting process. All mitigation requirements determined through this process would be implemented before grading plans are approved.

Water quality certification pursuant to Section 401 of the Clean Water Act is required before issuance of the record of decision and a Section 404 permit. Before construction in any areas containing wetland features, Lehigh

would obtain water quality certification for the Project. Any measures required as part of the issuance of water quality certification would be implemented.

## 6.3 SPECIES-SPECIFIC AVOIDANCE AND MINIMIZATION AND HABITAT CONSERVATION MEASURES

Applicable avoidance and minimization measures from the 2014 Programmatic Biological Opinion for Section 404 Permits potentially affecting CRLF (USFWS 2014) were included in this biological assessment. The following conservation measures would be implemented before and during Project construction:

a) Prepare a Wetland Mitigation Plan. A qualified wetland biologist will prepare a wetland mitigation and monitoring plan (MMP) for impacts on wetlands and waters under state or federal jurisdiction. The MMP will outline the anticipated mitigation obligations for temporary and permanent impacts on waters of the United States, including wetlands, resulting from Project-related activities. The wetland MMP will include the following elements:

- Baseline information.
- Anticipated habitat enhancements to be achieved through onsite restoration actions.
- When possible, a preference for mitigation within the Permanente Quarry property, for impacts on both jurisdictional waters and wetlands.
- Performance and success criteria for habitat enhancement of Permanente Creek and adjacent features to compensate for impacts on other waters, including:
  - a replanting plan for appropriate native riparian woody vegetation;
  - an 80% overall revegetation planting success rate for mitigation areas over a 10-year period;
  - a minimum overall mitigation ratio of 1.1:1 acres for permanent impacts and 1:1 acres for temporary impacts;
  - plantings that are self-reliant, exhibit average or better health and vigor, and have observable growth in stems and leaves at least 2 years before the end of the 10-year monitoring period;
  - visual inspection of all revegetation sites during each growing season, with qualitative and quantitative measures of plant cover and performance;
  - observations of total percent plant cover in the planting area, natural recruitment of native species, and establishment of new nonnative species; and
  - annual monitoring reports submitted to the California Department of Fish and Wildlife and the San Francisco Bay RWQCB documenting revegetation conditions, including recommendations to adapt maintenance and replacement of failed plantings.

- Performance and success criteria for wetland creation or enhancement, including but not limited to the following:

  - At least 70% survival of installed plants for each of the first 3 years following planting.

  - Performance criteria for vegetation percent cover in years 1–4 as follows: at least 10% cover of installed plants in year 1; at least 20% cover in year 2; at least 30% cover in year 3; and at least 40% cover in year 4.

  - Performance criteria for hydrology in Years 1–5 as follows: 14 or more consecutive days of flooding, ponding, or a water table 12 inches or less below the soil surface during the growing season at a minimum frequency of 3 of the 5 monitoring years OR establishment of a prevalence of wetland obligate plant species.

  - Limitations on relative cover contributed by invasive plant species that can threaten the success of created or enhanced wetlands, as follows: no greater than 35% in year 1, 20% in years 2 and 3, 15% in year 4, and 10% in year 5.

  - Supplemental water provided by a water truck for the first 2 years following installation, if necessary. Any supplemental water must be removed or turned off for a minimum of 2 consecutive years before the end of the monitoring period, and the wetland must meet all other criteria during this period. At the end of the 5-year monitoring period, the wetland must be self-sufficient and capable of persistence without supplemental water.

  - At least 75 percent cover by hydrophytic vegetation at the end of the 5-year monitoring period. In addition, wetland hydrology and hydric soils as defined by the USACE (2008) must be present and defined as follows:

    - *Hydrophytic vegetation:* A plant community occurring in areas where the frequency and duration of inundation or soil saturation produce permanently or periodically saturated soils of sufficient duration to exert a controlling influence on the plant species present.

    - *Wetland hydrology:* Identified by indicators such as sediment deposits, water stains on vegetation, and oxidized rhizospheres along living roots in the upper 12 inches of the soil, or satisfaction of the hydrology performance criteria listed above.

    - *Hydric soils:* Soils that are saturated, flooded, or ponded long enough during the growing season to develop anaerobic conditions, which often are characterized by features such as redox concentrations that form by the reduction, translocation, and/or oxidation of iron and manganese oxides. Hydric soils may lack hydric indicators for a number of reasons. In such cases, the same standard used to determine wetland hydrology (when indicators are lacking) can be used.

  - 5 years after any wetland creation, performance of a wetland delineation to determine whether created wetlands are developing as planned. If they are not, remedial measures will be taken to meet the mitigation measure's performance standard.

- Monitoring and reporting requirements.

  - The wetland MMP also will include conceptual site-specific plans to compensate for wetland losses resulting from the Project and the USACE Section 404 permit terms. These may include but are not limited to the provision of on-site mitigation through wetland creation or enhancement of existing jurisdictional features; additional on-site wetland creation or enhancement; or off-site mitigation.

b) **Implement Riparian Mitigation.** The purpose of the Project is to restore wetland and riparian habitat along Permanente Creek. Stream restoration activities include hand planting of woody riparian vegetation, as well as seeding for understory riparian vegetation. Replacement and restoration plantings will restore and expand existing riparian habitat along Permanente Creek. The restoration and planting will be consistent with the revegetation plan prepared as part of the Amended Consent Decree with the Sierra Club and the approved *Reclamation Plan for Permanente Quarry* (WRA 2011), and the adopted mitigation monitoring and reporting program (Santa Clara County 2011). The 5-year performance standards identified in the revegetation plan include:

- species richness of two tree or shrub species per plot,
- 45 percent canopy cover,
- an average density of 200 plantings per acre, and
- 60 percent survival of plantings.

c) **Manage Wildlife Passage during Construction.** Wherever possible, Lehigh will enhance or construct wildlife passage for CRLF across access roads during construction. Accommodations will be made for terrestrial wildlife movement through existing culverts that convey hydrology.

d) **Designate a Point of Contact.** USACE will ensure that Lehigh implements the conservation measures of the BO and that Lehigh designates a point of contact for all inquiries for the duration of the construction period. The name and contact information will be provided to the Service no more than 30 calendar days before the date of initial ground disturbance. At least 14 calendar days before the date of initial ground disturbance, USACE will ensure that Lehigh submits a signed letter to the Service verifying they possess a copy of the BO and have read and fully understand their responsibilities.

e) **Allow Site Access to Agencies.** Lehigh will ensure that the Service, California Department of Fish and Wildlife, and/or their designated agents can immediately and without delay, access and inspect the Project site for compliance with the Project description, conservation measures, and reasonable and prudent measures included in the BO and evaluate Project effects on CRLF and its habitat.

f) **Implement a Worker Environmental Awareness Program.** The Service-approved biologist will conduct employee education training for employees working on earthmoving and/or construction activities. Personnel will be required to attend the presentation, which will describe the CRLF; avoidance, minimization, and conservation measures; legal protection of CRLF; and other related issues. Each attendee will sign an attendance sheet that includes his or her printed name, company or

agency, e-mail address, and telephone number. The sign-in sheet will be sent to the Service within 7 calendar days of the completion of the training.

g) **Minimize the Work Area.** Lehigh will limit the number of access routes, construction areas, equipment staging, storage, parking, and stockpile areas to the maximum extent possible. All Project-related traffic will be restricted to established roads, construction areas, equipment staging, storage, parking, and stockpile areas. These areas will be included in any preconstruction surveys and, to the maximum extent possible, established in previously disturbed locations.

h) **Enforce Seasonal Work Restrictions.** To the extent practicable, construction in the Permanente Creek channel and suitable pond habitats will be conducted during the dry summer months, between June 15 and October 15, to minimize potential impacts on moving or breeding CRLF.

i) **Post and Observe Construction Speed Limits.** A 10-mile-per-hour speed limit will be posted by Lehigh or its representatives at all construction locations except on roads with a posted speed limit. This speed limit will be observed by all Project personnel. On roads with posted speed limits, construction-related vehicles will observe the minimum safe speed.

j) **Conduct CRLF Preconstruction Surveys and Relocate Individuals.** Preconstruction surveys for CRLF will be conducted within 24 hours before the start of initial ground disturbance. The preconstruction surveys will be conducted by a qualified biologist, who will be preapproved by the Service and experienced in identifying CRLF. The biologist will consult with the Service before conducting the preconstruction surveys to coordinate on methodology for movement of CRLF individuals found in the work area. If CRLF are observed, a Service-permitted biologist will remove them from the construction site and temporarily relocate them to nearby suitable aquatic habitat.

   The Service-approved biologist will limit the duration of the handling and captivity of the CRLF to the minimum amount of time necessary to complete the task. If the animal must be held in captivity, it will be kept in a cool, dark, moist, aerated environment, such as a clean and disinfected bucket or plastic container with a damp sponge. The holding container will not contain any standing water.

   Lehigh will immediately notify the Service once the CRLF and the site are secure.

k) **Enforce a Litter Control Program.** A litter control program will be instituted at the Project site. All workers will ensure that their food scraps, paper wrappers, food containers, cans, bottles, and other trash are deposited in covered or closed trash containers. The trash containers will be removed from the Project site each working day.

l) **Restrict Pets and Firearms.** No pets will be permitted at the Project site. No firearms will be allowed at the Project site with the exception of those carried by authorized security personnel or local, state, or federal law enforcement officials.

m) **Stop Work during Rain Events.** To the maximum extent practicable, no construction activities will occur during rain events or within 24 hours following a rain event. A Service-approved biologist will inspect the construction area and all equipment/materials for the presence of CRLF before the resumption of construction activities after rain events. Any CRLF found in the construction area will be avoided and allowed to leave on its own or removed as agreed to under the Service-approved CRLF relocation methodology.

n) **Minimize or Avoid Nighttime Construction.** To the maximum extent practicable, nighttime construction will be minimized or avoided.

o) **Avoid Use of Woven Netting in Erosion Control Measures.** Plastic monofilament netting, loosely woven netting, or similar materials will not be used at the Project site because CRLF can become entangled in this material. Materials using fixed weaves, polypropylene, polymer, or other synthetic materials will not be used. Any materials found on-site will be immediately removed by Lehigh or its designated representatives.

p) **Control Dust.** If necessary, dust control measures will be implemented during construction. These measures will include regular truck watering of construction access areas and disturbed soil areas with water or organic soil stabilizers. Watering guidelines will be established to avoid excessive runoff into potential aquatic habitat for CRLF.

q) **Cover Trenches.** Trenches or pits 1 foot or deeper that will be left unfilled for more than 48 hours will be securely covered with boards or other materials to prevent CRLF from falling into them. If this is not possible, Lehigh will ensure that wooden ramps or other structures of suitable surface that provide adequate footing for CRLF are placed in the trench or pit to allow for their unaided escape. The trench, pit, or hole will be inspected by the Service-approved biologist each workday morning at least 1 hour before the initiation of work and in the late afternoon no more than 1 hour after work has ceased to ascertain whether any individuals have become trapped. If the ramps fail to allow the animal to escape, the Service-approved biologist will remove the CRLF and transport it to a safe location.

r) **Monitor Construction within Aquatic Habitats.** To minimize disturbance on CRLF, any restoration or grading within suitable aquatic habitat will be conducted under the supervision of a Service-approved biologist and first cleared of any CRLF by transferring them to suitable habitat where construction is not occurring, as agreed to by the Service. Before the initial ground disturbance, Lehigh will obtain approval of the relocation protocol from the Service in the event that a CRLF is encountered and needs to be moved away from the Project site.

   The construction site will be checked at the beginning of each day to confirm that CRLF have not reentered the site. CRLF that reenter the Project site will be relocated as designated by the Service.

s) **Provide Stop-Work Authority.** The Service-approved biologist will have oversight over implementation of all the conservation measures and have the authority and responsibility to stop Project activities if the biologist determines that any of the environmental requirements are not being fulfilled.

t) **Implement Dewatering Protocols.** If the work site is to be temporarily dewatered by pumping, intakes will be completely screened with wire mesh not larger than 5 millimeters to prevent CRLF from entering the pump system. Water will be released or pumped downstream at an appropriate rate to maintain downstream flows during construction. Upon completion of construction activities, any barriers to flow will be removed in a manner that will allow flow to resume with the least disturbance to the substrate.

u) **Remove Exotic Species.** The Service-approved biologist will permanently remove any aquatic exotic wildlife species such as bullfrogs and crayfish to the maximum extent possible during construction activities.

v) **Notify the Service If Take Occurs.** USACE will ensure that Lehigh reports any information to the Service about take or suspected take of listed wildlife species not exempted by the BO for the project. The Service will be notified via electronic mail and telephone within 24 hours from the time the information is received by Lehigh. Notification will include the species, number of individuals, sex (if known), date, time, location of the incident or of the finding of a dead or injured animal, how the individual was taken, photographs of the species animal, and names of persons who observed the take and/or found the animal. The individual animal will be preserved, as appropriate, and held in a secure location until instructions are received from the Service regarding the disposition of the specimen or until the Service takes custody of the specimen.

This page intentionally left blank.

# 7 CONCLUSIONS

Based on the biology and ecology of the federally listed species with the potential to occur in the Action Area, on the environmental baseline for the Action Area, and on the potential effects of the Project, implementing the Project may affect, and is likely adversely affect CRLF. The Project would have no effect on designated critical habitat or EFH.

**California Red-Legged Frog**: The Project may affect, and is likely to adversely affect CRLF through potential loss of individuals and disturbance of individuals or their habitat. However, with the exception of potential conversion of Pond 13 to stream channel and associated riparian habitat, these effects are expected to be localized and temporary. CRLF has not been documented within Pond 13, and conversion of this pond to other suitable CRLF habitat is not expected to result in loss of occupied aquatic habitat in the Action Area. Relatively few CRLF individuals would be affected given the quality of habitat on the site and the limited extent of the Project, both spatially and temporally. Furthermore, the restoration of Permanente Creek would result in a net long-term benefit to the species by increasing aquatic and upland habitat for CRLF. The Project would not jeopardize the continued existence of this species based on the limited effects of the Project and the limited local population size of CRLF in the Action Area. The Project is expected to result in increased carrying capacity for CRLF in the Action Area upon Project completion and therefore provide a net benefit to local CRLF populations.

**Critical Habitat**: The project would have no effect on designated critical habitat. The nearest unit of CRLF critical habitat is approximately 2 miles southwest of and is not hydrologically connected the Action Area. The Action Area is approximately 4 miles upstream of critical habitat for Central California Coastal Steelhead, and Project implementation is very unlikely to increase sedimentation or result in other adverse effects to this habitat.

**Essential Fish Habitat**: The project would have no effect on EFH for Chinook Salmon. Implementation of the proposed action would enhance habitat quality in Permanente Creek and would not diminish potential to establish access to the creek for salmon if the Permanente Creek Diversion Channel is altered as part of a future unrelated action.

# APPENDIX A

U.S. Fish and Wildlife Service Species List

# United States Department of the Interior

FISH AND WILDLIFE SERVICE
Sacramento Fish and Wildlife Office
FEDERAL BUILDING, 2800 COTTAGE WAY, ROOM W-2605
SACRAMENTO, CA 95825
PHONE: (916)414-6600 FAX: (916)414-6713

Consultation Code: 08ESMF00-2016-SLI-1351 April 26, 2016
Event Code: 08ESMF00-2016-E-02936
Project Name: Permanente Creek Restoration Project

Subject: List of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, under the jurisdiction of the U.S. Fish and Wildlife Service (Service) that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the Service under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

Please follow the link below to see if your proposed project has the potential to affect other species or their habitats under the jurisdiction of the National Marine Fisheries Service:

http://www.nwr.noaa.gov/protected_species/species_list/species_lists.html

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2)

of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

# Endangered Species Act Species List

There are a total of 12 threatened or endangered species on your species list. Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species. Critical habitats listed under the **Has Critical Habitat** column may or may not lie within your project area. See the **Critical habitats within your project area** section further below for critical habitat that lies within your project. Please contact the designated FWS office if you have questions.

| **Amphibians** | **Status** | **Has Critical Habitat** | **Condition(s)** |
|---|---|---|---|
| California red-legged frog *(Rana draytonii)*<br>Population: Entire | Threatened | Final designated | |
| California tiger Salamander *(Ambystoma californiense)*<br>Population: U.S.A. (Central CA DPS) | Threatened | Final designated | |
| **Birds** | | | |
| California Clapper rail *(Rallus longirostris obsoletus)*<br>Population: Entire | Endangered | | |
| California Least tern *(Sterna antillarum browni)* | Endangered | | |
| Marbled murrelet *(Brachyramphus marmoratus)*<br>Population: CA, OR, WA | Threatened | Final designated | |
| **Fishes** | | | |
| Delta smelt *(Hypomesus transpacificus)* | Threatened | Final designated | |

| | | | |
|---|---|---|---|
| Population: Entire | | | |
| steelhead *(Oncorhynchus (=salmo) mykiss)*<br>Population: Northern California DPS | Threatened | Final designated | |
| Tidewater goby *(Eucyclogobius newberryi)*<br>Population: Entire | Endangered | Final designated | |
| **Flowering Plants** | | | |
| San Mateo Woolly sunflower *(Eriophyllum latilobum)* | Endangered | | |
| **Insects** | | | |
| Bay Checkerspot butterfly *(Euphydryas editha bayensis)*<br>Population: Entire | Threatened | Final designated | |
| San Bruno Elfin butterfly *(Callophrys mossii bayensis)*<br>Population: Entire | Endangered | | |
| **Reptiles** | | | |
| San Francisco Garter snake *(Thamnophis sirtalis tetrataenia)*<br>Population: Entire | Endangered | | |

# Critical habitats that lie within your project area

The following critical habitats lie fully or partially within your project area.

| Amphibians | Critical Habitat Type |
|---|---|
| California red-legged frog *(Rana draytonii)*<br>Population: Entire | Final designated |

### GENERAL NOTES

1. TOPOGRAPHIC MAPPING WAS PERFORMED BY:
   WATERWAYS CONSULTING, INC.
   509 SWIFT STREET, UNIT A
   SANTA CRUZ, CA 95060
   SURVEY DATES; JUNE THROUGH AUGUST 2013, FEBRUARY THROUGH MAY 2014, MARCH 2015.
2. ELEVATION DATUM: NAVD88 BASED ON A FIELD TIE TO SANTA CLARA VALLEY WATER DISTRICT BENCHMARK ID: BM198 WITH AN ELEVATION OF 478.22'.
3. HORIZONTAL DATUM: NAD83 CALIFORNIA STATE PLANE, ZONE 3.
4. AERIAL PHOTO SOURCE:
   AERIAL PHOTOMAPPING SERVICES
   2929 LARKIN AVENUE
   CLOVIS, CA 93612
   PHOTOGRAPH DATE: JUNE 20, 2013
5. ELEVATIONS AND DISTANCES SHOWN ARE IN FEET AND DECIMALS THEREOF. CONTOUR INTERVAL IS 1 FOOT.
6. THIS IS NOT A BOUNDARY SURVEY. PROPERTY LINES, IF SHOWN, WERE COMPILED FROM RECORD INFORMATION AND FROM FIELD TIES TO EXISTING BOUNDARY MONUMENTATION. THE LOCATION OF THESE LINES IS SUBJECT TO CHANGE, PENDING THE RESULTS OF A COMPLETE BOUNDARY SURVEY.
7. TREE DIMENSIONS: TRUNK DIAMETERS SHOWN REPRESENT DIAMETER AT BREAST HEIGHT (DBH), MEASURED IN INCHES. DBH IS MEASURED 4.5 FT ABOVE GROUND FOR SINGLE TRUNKS AND TRUNKS THAT SPLIT INTO SEVERAL STEMS CLOSE TO THE GROUND. EACH TRUNK IS SHOWN AT MULTI-STEM TREES. ONLY THE LABEL OF THE DBH OF THE LARGEST TRUNK IS SHOWN FOR DRAWING CLARITY. WHERE TREES FORK NEAR BREAST HEIGHT, TRUNK DIAMETER IS MEASURED AT THE NARROWEST PART OF THE MAIN STEM BELOW THE FORK. FOR TREES ON A SLOPE, BREAST HEIGHT IS REFERENCED FROM THE UPPER SIDE OF THE SLOPE. FOR LEANING TREES, BREAST HEIGHT IS MEASURED ON THE SIDE THAT THE TREE LEANS TOWARD. TREES WITH DBH LESS THAN 8" ARE TYPICALLY NOT SHOWN.

   12"P = 12" DBH PINE
8. TREE SPECIES ARE IDENTIFIED WHEN KNOWN. HOWEVER, FINAL DETERMINATION SHOULD BE MADE BY A QUALIFIED BOTANIST. REFER TO THE LEGEND FOR TREE SPECIES SYMBOLS.
9. SURVEYED TREES INCLUDE:
   A. OAKS (QUERCUS SPP.) 5 INCHES OR LARGER DBH
   B. ALL OTHER TREES 12 INCHES OR LARGER DBH
   C. ALL MULTI-STEM TREES WITH A COMBINED DIAMETER OF 24 INCHES OR LARGER DBH

### PROJECT DESCRIPTION

THESE DRAWINGS PROVIDE 70% LEVEL DESIGNS FOR THE CONSTRUCTION OF CHANNEL AND FLOODPLAIN ENHANCEMENTS ON PORTIONS OF PERMANENTE CREEK AT THE PERMANENTE QUARRY PROPERTY IN SANTA CLARA COUNTY, CALIFORNIA.

THE DESIGNS ARE SUBJECT TO CHANGE BASED ON RESOURCE AGENCY COMMENTS, ENVIRONMENTAL REVIEW AND PERMIT ISSUANCE.

### TREE REMOVAL NOTES

1. DBH IS THE DIAMETER MEASURED AT BREAST HEIGHT.
2. WILLOWS TO BE REMOVED SHALL BE SALVAGED PER DETAIL 2, SHT. C23. THIS INCLUDES ALL UNMAPPED WILLOWS. WILLOWS TO BE SALVAGED FOR TRANSPLANTING WILL BE FLAGGED IN THE FIELD BY THE PROJECT ARBORIST.
3. ALL OTHER TREES REMOVED DURING CONSTRUCTION SHALL BE SALVAGED WITH ROOTWADS INTACT AND INCORPORATED ON BENCHES AS FLOODPLAIN ROUGHNESS LOGS. BRANCHES SHALL BE PLACED ON FLOODPLAIN BENCHES AND ADJACENT UPPER BANK SLOPES AS SLASH.

NOTES:

1. ALL EXISTING NATIVE TREES AND SHRUBS SHALL BE PROTECTED IN PLACE. EXISTING PLANT SPECIES INCLUDE, BUT ARE NOT LIMITED TO, PRUNUS ILICIFOLIA, QUERCUS AGRIFOLIA, SALIX LAEVIGATA, SALIX LASIOLEPSIS, AND UMBELLULARIA CALIFORNICA. WEED CONTROL ACTIONS SHALL BE PERFORMED AROUND EXISTING OAK SEEDLINGS, AS DESCRIBED BELOW, TO ENCOURAGE ESTABLISHMENT.
2. A THREE-FOOT DIAMETER AREA SHALL BE CLEARED AND GRUBBED AT EACH PROPOSED PLANTING LOCATION AND AROUND EACH EXISTING OAK SEEDLING. CLEARING AND GRUBBING AROUND OAK SEEDLINGS SHALL OCCUR BY HAND-WEEDING TO AVOID ANY ROOT DISTURBANCE OR PLANT DAMAGE.
3. PLANTING EXCAVATION SHALL NOT OCCUR WITHIN THE DRIP LINE OF EXISTING SHRUBS, WITHIN TEN FEET FROM THE TRUNKS OF EXISTING ESTABLISHED TREES, OR WITHIN FIVE FEET OF EXISTING OAK SEEDLINGS.
4. A QUALIFIED RESTORATION SPECIALIST SHALL CONFIRM THE LOCATION OF PROPOSED PLANTS AND OAK SEEDLINGS PRIOR TO PLANTING AND WEED CONTROL TO CONFIRM AVOIDANCE OF EXISTING VEGETATION.
5. DEPENDING ON THE CONDITION OF EXISTING SOILS, SOIL EXCAVATED FOR PLANTING MAY REQUIRE AMENDMENT WITH GREEN WASTE COMPOST. EXCESS SOIL SHALL BE USED TO FORM A WATERING WELL AROUND THE INSTALLED PLANT.
6. THREE TO FOUR INCHES OF MULCH AND/OR WEED MATS SHALL BE PLACED IN THE CLEARED AND GRUBBED AREA AROUND EACH INSTALLED PLANT OR OAK SEEDLING FOR WEED CONTROL AND MOISTURE RETENTION.

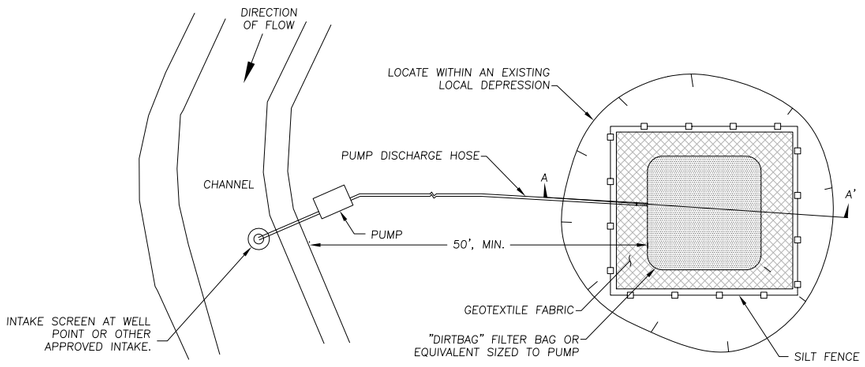
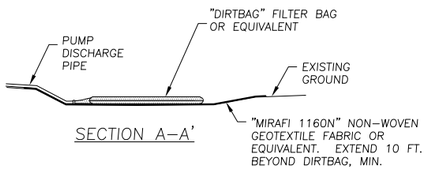
## TYPICAL DEWATERING PLAN
N.T.S. 1 C22 C22



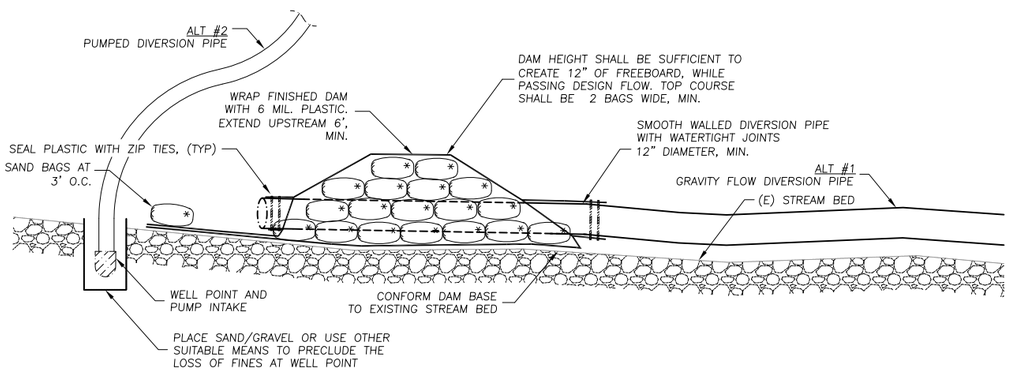


SECTION A–A'

### DEWATERING DISCHARGE AREA NOTES:
1. DEWATERING SHALL COMPLY WITH ALL PROJECT PERMITS.
2. THIS DETAIL REPRESENTS A POTENTIAL OPTION FOR DEWATERING OF WORK AREAS.
3. PROPOSED FILTRATION METHODS WILL BE FIELD–FIT TO EXISTING CONDITIONS AT THE TIME OF CONSTRUCTION, AS APPROVED BY THE ENGINEER.
4. TURBID WATER SHALL BE DISCHARGED AT A LOCATION WHERE THERE IS AN EXISTING DEPRESSION AT A MINIMUM OF 50 FEET FROM THE EXISTING CHANNEL. EXACT LOCATION TO BE APPROVED BY THE ENGINEER. WHERE NATURAL DEPRESSION CANNOT BE FOUND, FILTER BAGS, "BAKER TANKS" OR OTHER APPROVED MEANS SHALL BE EMPLOYED.
5. NO OVERLAND FLOW SHALL BE ALLOWED TO DRAIN FROM A DISCHARGE AREA TO AN EXISTING OR PROPOSED CHANNEL.

## WORK AREA DEWATERING DETAIL
N.T.S. 2 C22 C22

## DIVERSION NOTES
1. THE DIVERSION PLAN SHOWN IS SCHEMATIC. CONTRACTOR SHALL SUBMIT A SITE DIVERSION/DEWATERING PLAN FOR APPROVAL BY THE ENGINEER. THE BASIC REQUIREMENTS OF THE DIVERSION PLAN ARE SPECIFIED IN THE SPECIAL PROVISIONS.
2. THE TYPICAL DEWATERING PLAN SHOWN DEPICTS TWO SEPARATE TYPES OF DIVERSION STRUCTURES TO BE INSTALLED AND MAINTAINED DURING CONSTRUCTION. THESE STRUCTURES MAY BE USED SEPARATELY OR IN TANDEM AS NECESSARY TO MEET WATER QUALITY REQUIREMENTS.
3. DIVERSION PIPES MAY BE RELOCATED DURING CONSTRUCTION.



## DIVERSION DAM PROFILE
N.T.S. 3 C22 C22

NOTE: CONTRACTOR MAY USE ALTERNATE DAM DETAIL, SUBJECT TO APPROVAL OF THE ENGINEER AND THE PERMITTING AGENCIES.

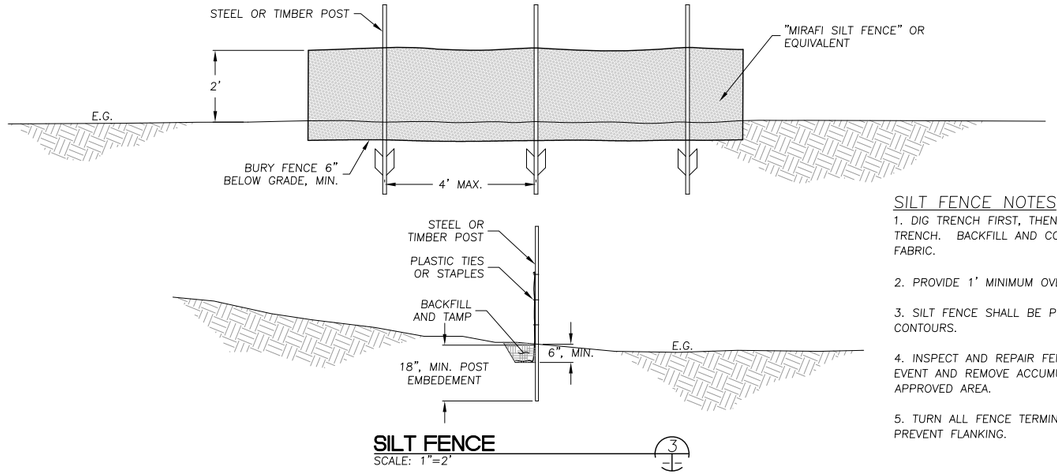
## LIVE STAKE BUNDLE

N.T.S. — 1

### LIVE STAKE BUNDLE NOTES:

1. LIVE STAKE BUNDLES TO BE INSTALLED WITHIN ENGINEERED STREAMBED MATERIAL ON EXCAVATED FLOODPLAINS AND WITHIN FLOODPLAIN ARMOR AT 7' ON-CENTER SPACING.
2. LIVE STAKE BUNDLES SHALL CONTACT NATIVE SOIL.
3. LIVE STAKE BUNDLES TO CONSIST OF LIVE STAKES 3/4"-2" IN DIA. AT THE BASAL END.
4. TOP ENDS OF STAKES SHALL BE BLUNT AND BASAL ENDS SHALL BE ANGLED AT 45 DEGREES.
5. PLACE LIVE STAKE BUNDLES COINCIDENT WITH THE ENGINEERED STREAMBED MATERIAL AND FLOODPLAIN ARMOR.
6. AFTER PLACEMENT, BACKFILL AND WATER-JET ALL VOIDS AROUND LIVE STAKE BUNDLES TO REMOVE AIR POCKETS.
7. AFTER INSTALLATION CLEANLY CUT EACH STAKE TO LEAVE 10" EXPOSED, MAX.

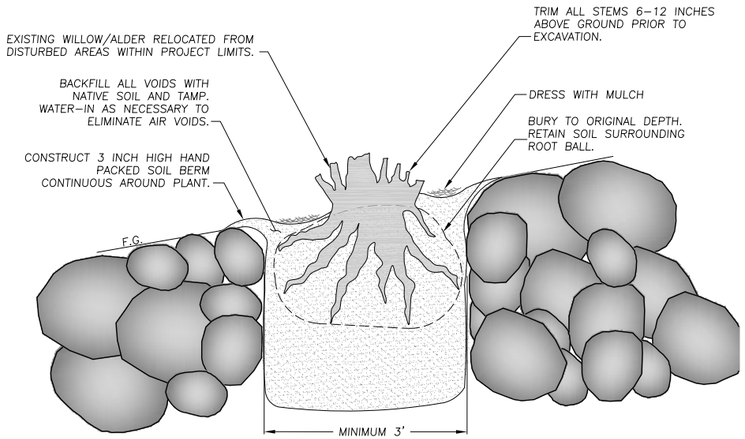


## SILT FENCE

SCALE: 1"=2' — 3

### SILT FENCE NOTES

1. DIG TRENCH FIRST, THEN ERECT FENCE IN TRENCH. BACKFILL AND COMPACT SOIL TO SECURE FABRIC.
2. PROVIDE 1' MINIMUM OVERLAP AT FENCE SPLICES.
3. SILT FENCE SHALL BE PLACED ON SLOPE CONTOURS.
4. INSPECT AND REPAIR FENCE AFTER EACH STORM EVENT AND REMOVE ACCUMULATED SEDIMENT, TO AN APPROVED AREA.
5. TURN ALL FENCE TERMINATIONS UPSLOPE TO PREVENT FLANKING.



## WILLOW TRANSPLANT DETAIL

SCALE: N.T.S. — 2

### WILLOW TRANSPLANT NOTES:

1. SALVAGE:
   - 1.1. LIVE SHRUBS TO BE SALVAGED FOR TRANSPLANTING WILL BE FLAGGED IN THE FIELD BY THE ENGINEER.
   - 1.2. PRIOR TO REMOVAL, LOP BRANCHES TO 6-12 INCHES ABOVE THE ROOT CROWN, USING SHARP, CLEAN TOOLS.
   - 1.3. REMOVE THE ROOTWAD AND A MINIMUM EIGHTEEN INCH LAYER (AT SIDES AND BASE) OF ROOTS AND SOIL FROM THE GROUND AND EITHER TRANSPORT DIRECTLY TO THE PROPOSED LOCATION FOR INSTALLATION, OR STORE AS OUTLINED BELOW. PERFORM SALVAGE AND RELOCATION IN SUCH A MANNER AS TO MINIMIZE HANDLING AND ASSOCIATED DISTURBANCE TO THE SOIL BOUND BY THE ROOTS.
   - 1.4. IMMEDIATELY COVER LIVE SHRUBS WITH A SINGLE LAYER OF SATURATED BURLAP TO PREVENT DESICCATION OF THE ROOTS, AND PLACED UNDER SHADE COVERING IF THE LIVE SHRUB IS NOT PLANTED WITHIN FIFTEEN MINUTES OF SALVAGE. CONTRACTOR SHALL MAINTAIN SATURATION OF THE BURLAP AND SOIL MASS UNTIL PLANTED.
   - 1.5. DO NOT STACK LIVE SHRUBS ON TOP OF ONE ANOTHER DURING STORAGE.
   - 1.6. IN NO EVENT SHALL SALVAGED ROOTWADS BE STORED FOR PERIODS EXCEEDING 72 HOURS, WITHOUT PRIOR WRITTEN PERMISSION OF THE ENGINEER.
2. INSTALLATION
   - 2.1. PLACE LIVE SHRUBS AT FLOODPLAIN LOCATIONS FLAGGED IN THE FIELD BY THE ENGINEER.
   - 2.2. PLACE THE EXCAVATED ROOTWAD IN A PRE-PREPARED HOLE. FILL THE HOLE WITH WATER IMMEDIATELY PRIOR TO PLANTING. SCARIFY THE SIDES OF THE PLANTING HOLE PRIOR TO PLANTING.
   - 2.3. REMOVE BURLAP PRIOR TO PLANTING. BACKFILL THE HOLE HALF WAY WITH NATIVE SOIL AND JET WITH WATER TO REMOVE VOIDS AFTER PLACEMENT. CONTINUE TO ADD SOIL AND WATER UNTIL THE SATURATED BACKFILL MATERIAL COVERS THE TOP OF THE ROOT CROWN TO THE APPROXIMATE ORIGINAL DEPTH OF SOIL, PRIOR TO SALVAGE.

C23 — 23 OF 25

## ROCK SPECIFICATIONS

THERE SHALL BE THREE CLASSES OF ROCK SPECIFIED ON THIS PROJECT;
(1) – ENGINEERED STREAMBED MATERIAL
(2) – FLOODPLAIN ARMOR
(3) – ROCK SLOPE PROTECTION (R.S.P.)

ALL IMPORTED ROCK SHALL CONFORM TO THE FOLLOWING QUALITY REQUIREMENTS:

1) ROCK SHALL BE RESISTANT TO WEATHERING AND WATER ACTION AND FREE OF ORGANIC OR OTHER UNSUITABLE MATERIAL. DO NOT USE SHALE, ROCK WITH SHALE SEAMS, OR OTHER FISSILE OR FISSURED ROCK THAT MAY BREAK INTO SMALLER PIECES IN THE PROCESS OF HANDLING AND PLACING.
2) ROCK SHALL BE SUB–ROUNDED TO SUB–ANGULAR IN SHAPE.
3) ROCK SHALL BE GRANITE OR HAVE A SPECIFIC GRAVITY EQUAL TO OR GREATER THAN THAT OF GRANITE.
4) COLOR AND TEXTURE SHALL BE CONSTANT THROUGHOUT THE STOCKPILE.

SAMPLES OF ALL IMPORTED ROCK SHALL BE PROVIDED TO THE ENGINEER FOR APPROVAL, PRIOR TO STOCKPILING ON SITE.

INDIVIDUAL ROCK CLASSES AND PLACEMENT METHODS ARE FURTHER DEFINED AS FOLLOWS:

### 1 – ENGINEERED STREAMBED MATERIAL

ENGINEERED STREAMBED MATERIAL SHALL CONSIST OF SANDS, GRAVELS, COBBLES, AND BOULDERS FREE OF ORGANIC MATTER, AND MEETING THE FOLLOWING GRADATION SPECIFICATIONS (REFER TO DRAWINGS FOR TYPE LOCATIONS):

#### TYPE 1 GRADATION:

| U.S. SIEVE SIZE | PERCENT PASSING (BY WEIGHT) |
|---|---|
| 18" | 100 |
| 12" | 60–85 |
| 8" | 40–60 |
| 4" | 25–40 |
| 0.6" | 10–20 |
| No. 4 | 5–10 |

#### TYPE 2 GRADATION:

| U.S. SIEVE SIZE | PERCENT PASSING (BY WEIGHT) |
|---|---|
| 30" | 100 |
| 24" | 60–85 |
| 12" | 40–60 |
| 4" | 25–40 |
| 0.6" | 10–20 |
| No. 4 | 5–10 |

#### TYPE 3 GRADATION:

| U.S. SIEVE SIZE | PERCENT PASSING (BY WEIGHT) |
|---|---|
| 40" | 100 |
| 30" | 60–85 |
| 16" | 40–60 |
| 8" | 25–40 |
| 4" | 15–25 |
| 0.6" | 10–15 |
| No. 4 | 5–10 |

#### TYPE 4 GRADATION:

| U.S. SIEVE SIZE | PERCENT PASSING (BY WEIGHT) |
|---|---|
| 48" | 100 |
| 36" | 60–85 |
| 20" | 40–60 |
| 10" | 25–40 |
| 4" | 15–25 |
| 0.6" | 10–15 |
| No. 4 | 5–10 |

A) ENGINEERED STREAMBED MATERIAL SHALL BE PLACED TO THE LINES, GRADES AND DEPTHS SHOWN ON THE DRAWINGS, OR AS DIRECTED BY THE ENGINEER. UNIFORMLY DISTRIBUTE LARGE STONES TO PRODUCE THE REQUIRED GRADATION OF ROCK. PREVENT CONTAMINATION OF ROCK MATERIALS BY EXCAVATION AND/OR EARTH MATERIALS.

B) FOLLOWING PLACEMENT, ROCK SURFACE SHALL BE JETTED WITH WATER TO IMPROVE COMPACTION AND EMBED THE FINES WITHIN THE MIX. JETTING SHALL START AT THE UPSTREAM LIMITS OF PLACEMENT AND PROGRESS DOWNSTREAM. JETTING SHALL CONTINUE UNTIL THE TURBIDITY LEVELS OF RUNOFF PRODUCED FROM THE JETTING PROCESS HAVE REACHED AN ACCEPTABLE LEVEL AS DETERMINED BY THE ENGINEER. ALL SEDIMENT–LADEN RUNOFF GENERATED BY THE JETTING OPERATIONS SHALL BE PUMPED TO A SETTLING TANK OR SIMILAR DEVICE TO REDUCE TURBIDITY TO ACCEPTABLE LEVELS, IN COMPLIANCE WITH PERMIT CONDITIONS, PRIOR TO DISCHARGE TO THE CREEK.

### 2 – FLOODPLAIN ARMOR

FLOODPLAIN ARMOR MATERIAL SHALL CONSIST OF SANDS, GRAVELS, COBBLES, AND BOULDERS FREE OF ORGANIC MATTER, AND MEETING THE FOLLOWING GRADATION SPECIFICATIONS (REFER TO DRAWINGS FOR TYPE LOCATIONS):

#### TYPE 1 GRADATION:

TYPE 1 FLOODPLAIN ARMOR SHALL COMPLY WITH THE ENGINEERED STREAMBED MATERIAL TYPE 1 GRADATION.

#### TYPE 2 GRADATION:

| U.S. SIEVE SIZE | PERCENT PASSING (BY WEIGHT) |
|---|---|
| 24" | 100 |
| 18" | 60–85 |
| 12" | 40–60 |
| 6" | 25–40 |
| 3" | 10–25 |
| No. 4 | 5–15 |
| No. 10 | 0–5 |

#### TYPE 3 GRADATION:

| U.S. SIEVE SIZE | PERCENT PASSING (BY WEIGHT) |
|---|---|
| 30" | 100 |
| 24" | 60–85 |
| 18" | 40–60 |
| 6" | 25–40 |
| 3" | 10–25 |
| No. 4 | 5–15 |
| No. 10 | 0–5 |

#### TYPE 4 GRADATION:

TYPE 4 FLOODPLAIN ARMOR SHALL COMPLY WITH THE ENGINEERED STREAMBED MATERIAL TYPE 4 GRADATION.

A) FLOODPLAIN ARMOR MATERIAL SHALL BE PLACED TO THE LINES, GRADES AND DEPTHS SHOWN ON THE DRAWINGS, OR AS DIRECTED BY THE ENGINEER. UNIFORMLY DISTRIBUTE LARGE STONES TO PRODUCE THE REQUIRED GRADATION OF ROCK. PREVENT CONTAMINATION OF ROCK MATERIALS BY EXCAVATION AND/OR EARTH MATERIALS.

B) FOLLOWING PLACEMENT, ROCK SURFACE SHALL BE JETTED WITH WATER TO IMPROVE COMPACTION AND EMBED THE FINES WITHIN THE MIX. JETTING SHALL START AT THE UPSTREAM LIMITS OF PLACEMENT AND PROGRESS DOWNSTREAM. JETTING SHALL CONTINUE UNTIL THE TURBIDITY LEVELS OF RUNOFF PRODUCED FROM THE JETTING PROCESS HAVE REACHED AN ACCEPTABLE LEVEL AS DETERMINED BY THE ENGINEER. ALL SEDIMENT–LADEN RUNOFF GENERATED BY THE JETTING OPERATIONS SHALL BE PUMPED TO A SETTLING TANK OR SIMILAR DEVICE TO REDUCE TURBIDITY TO ACCEPTABLE LEVELS, IN COMPLIANCE WITH PERMIT CONDITIONS, PRIOR TO DISCHARGE TO THE CREEK.

### 3 – ROCK SLOPE PROTECTION

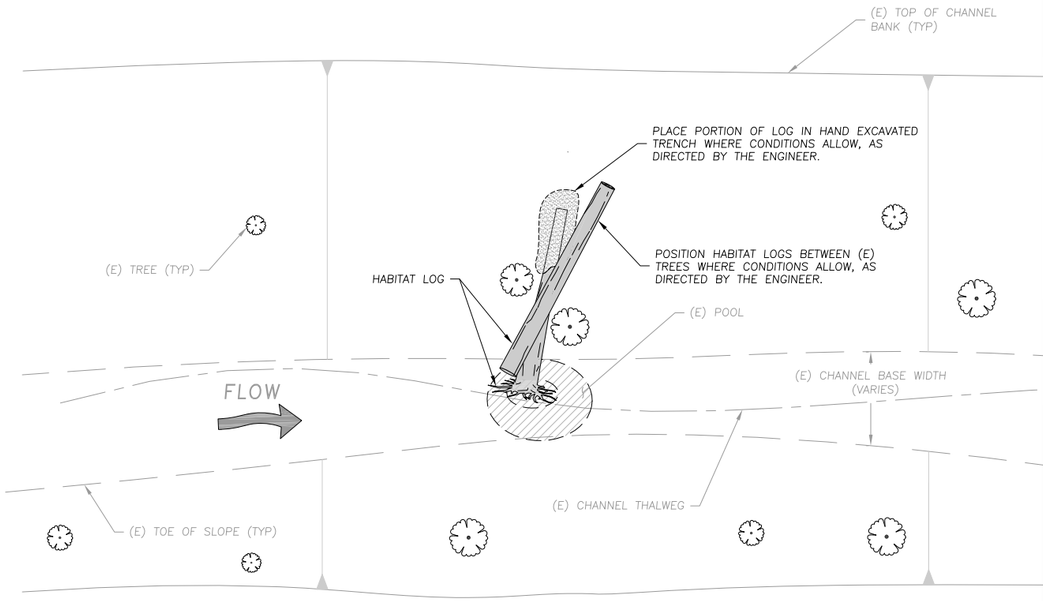
A) ROCK SLOPE PROTECTION SHALL CONFORM TO SECTION 72–2.02 MATERIALS OF THE STANDARD SPECIFICATIONS FOR 1/2 TON ROCK.

B) BACKFILL MATERIAL CONSISTING OF GRANULAR NATIVE STREAMBED MATERIAL SHALL BE USED TO BACKFILL VOIDS WITHIN THE ROCK SLOPE PROTECTION. IF GRANULAR NATIVE MATERIAL IS NOT AVAILABLE CONTRACTOR SHALL BLEND SAND, GRAVELS, AND NATIVE SOILS TO THE SATISFACTION OF THE ENGINEER FOR USE IN BACKFILLING THE RSP VOIDS.

C) BACKFILL MATERIAL SHALL BE PLACED TO MATCH THE FINISHED SURFACE OF THE RSP AND WATER JETTED TO FILL ALL VOIDS, AS DIRECTED BY THE ENGINEER.

ROCK SLOPE PROTECTION FABRIC
1. GEOTEXTILE FABRIC SHALL BE PLACED BELOW ROCK SLOPE PROTECTION.
2. GEOTEXTILE FABRIC SHALL BE NON–WOVEN, GEOTEX 1601, AS MANUFACTURED BY SYNTHETIC INDUSTRIES; OR MIRAFI 1160N, AS MANUFACTURED BY TC MIRAFI; OR APPROVED EQUAL.

INSTALLATION
1. PREPARE SURFACE TO RECEIVE THE GEOTEXTILE TO A RELATIVELY SMOOTH CONDITION, FREE OF OBSTRUCTIONS, DEPRESSIONS, DEBRIS, AND SOFT OR LOW DENSITY POCKETS OF MATERIAL.
2. PLACE AND SECURE A LAYER OF GEOTEXTILE FABRIC BELOW THE FIRST ROCK LAYER. AT THE TIME OF INSTALLATION, THE GEOTEXTILE SHALL BE REJECTED IF IT HAS DEFECTS, RIPS, HOLES, FLAWS, DETERIORATION, OR DAMAGE INCURRED DURING MANUFACTURE, TRANSPORTATION, OR STORAGE.
3. PLACE GEOTEXTILE WITH THE LONG DIMENSION PARALLEL TO FLOW AND LAID SMOOTH AND FREE OF TENSION, STRESS, FOLDS, WRINKLES, OR CREASES.



## HABITAT LOG PLAN
SCALE: 1" = 5'

### HABITAT LOG NOTES:

1. GENERAL

1.1. PLACE TWO HABITAT LOGS AT FOUR LOCATIONS PER REACH IN REACHES R14 TO R16 AND R19 TO R21 (SEE SHEET C2 FOR REACH LOCATIONS).

1.2. HABITAT LOGS SHALL BE LOCALLY SOURCED FROM EXISTING LIVE AND DEAD TREES. TREES TO BE SALVAGE WILL BE FLAGGED IN THE FIELD AT THE TIME OF CONSTRUCTION BY THE PROJECT ENGINEER AND ARBORIST. SALVAGE DOWNED TREES WHERE POSSIBLE, PREFERABLY WITH THE ROOTWAD INTACT. IF DOWNED LOGS ARE NOT AVAILABLE, THE PROJECT ARBORIST WILL IDENTIFY TREES TO BE FELLED. LOGS SHALL BE OAK, WILLOW, OR ALDER.

1.3. LOCATIONS FOR HABITAT LOG PLACEMENT WILL BE DETERMINED BY THE ENGINEER AND FISHERIES BIOLOGIST AT THE TIME OF CONSTRUCTION. FINAL LOCATIONS SHALL BE BASED ON LOCAL GEOMORPHIC CONDITIONS AND THE AVAILABILITY OF EXISTING POOLS AND SUITABLE LOGS, MEETING THE CRITERIA BELOW.

1.4. INCORPORATE HABITAT LOGS INTO EXISTING POOLS WHEN LOCALLY AVAILABLE.

2. LOG PLACEMENT AND DIMENSIONS

2.1. HABITAT LOG DESIGNS ARE SHOWN CONCEPTUALLY DUE TO THE INHERENT VARIABILITY OF MATERIAL PROPERTIES. THE DESIGN REQUIRES THAT THE ENGINEER OBSERVE INSTALLATION OF THE HABITAT LOGS TO ENSURE THE INTENT OF THE DESIGN IS MET. OBSERVATIONS WILL INCLUDE LOG SELECTION, PLACEMENT, AND ANCHORING STABILIZATION.

2.2. HABITAT LOGS SHALL BE A MINIMUM OF 12 FT. IN LENGTH AND 1 FT. IN DIAMETER, ALONG THE LENGTH OF THE LOG.

2.3. POSITION HABITAT LOGS BETWEEN EXISTING TREES WITH A PORTION OF THE LOG BURIED IN A TRENCH WHERE CONDITIONS ALLOW. CABLING WILL NOT BE EMPLOYED THEREFORE, LOGS MAY BE MOBILIZED DURING LARGE FLOODING EVENTS.

## GENERAL NOTES CONTINUED

1. ALL CONSTRUCTION AND MATERIALS SHALL CONFORM TO THE MAY 2010 EDITION OF THE STATE OF CALIFORNIA STANDARD SPECIFICATIONS, ISSUED BY THE DEPARTMENT OF TRANSPORTATION (HEREAFTER REFERRED TO AS "STANDARD SPECIFICATIONS").

2. THE ENGINEER SHALL BE NOTIFIED AT LEAST 48 HOURS PRIOR TO CONSTRUCTION. THE ENGINEER OR A DESIGNATED REPRESENTATIVE SHALL MONITOR THE CONSTRUCTION PROCESS, AS NECESSARY, TO ENSURE PROPER INSTALLATION PROCEDURES.

3. EXISTING UNDERGROUND UTILITY LOCATIONS:

   A. PRIOR TO BEGINNING WORK, THE CONTRACTOR SHALL CONTACT ALL UTILITIES COMPANIES WITH REGARD TO WORKING OVER, UNDER, OR AROUND EXISTING FACILITIES AND TO OBTAIN INFORMATION REGARDING RESTRICTIONS THAT ARE REQUIRED TO PREVENT DAMAGE TO THE FACILITIES.

   B. LOCATIONS SHOWN ARE COMPILED FROM INFORMATION SUPPLIED BY THE APPROPRIATE UTILITY AGENCIES AND FROM FIELD MEASUREMENTS TO ABOVE GROUND FEATURES READILY VISIBLE AT THE TIME OF SURVEY. LOCATIONS SHOWN ARE APPROXIMATE. THE CONTRACTOR IS CAUTIONED THAT ONLY ACTUAL EXCAVATION WILL REVEAL THE DIMENSIONS, SIZES, MATERIALS, LOCATIONS, AND DEPTH OF UNDERGROUND UTILITIES.

   C. THE CONTRACTOR SHALL BE SOLELY RESPONSIBLE FOR THE LOCATION AND/OR PROTECTION OF ALL EXISTING AND PROPOSED PIPING, UTILITIES, TRAFFIC SIGNAL EQUIPMENT (BOTH ABOVE GROUND AND BELOW GROUND), STRUCTURES, AND ALL OTHER EXISTING IMPROVEMENTS THROUGHOUT CONSTRUCTION.

   D. PRIOR TO COMMENCING FABRICATION OR CONSTRUCTION, CONTRACTOR SHALL DISCOVER OR VERIFY THE ACTUAL DIMENSIONS, SIZES, MATERIALS, LOCATIONS, AND ELEVATIONS OF ALL EXISTING UTILITIES AND POTHOLE THOSE AREAS WHERE POTENTIAL CONFLICTS ARE LIKELY OR DATA IS OTHERWISE INCOMPLETE.

   E. CONTRACTOR SHALL TAKE APPROPRIATE MEASURES TO PROTECT EXISTING UTILITIES DURING CONSTRUCTION OPERATIONS, AND SHALL BE SOLELY RESPONSIBLE FOR THE COST OF REPAIR/REPLACEMENT OF ANY EXISTING UTILITIES DAMAGED DURING CONSTRUCTION. CONTRACTOR TO CALL UNDERGROUND SERVICE ALERT (1-800-642-2444) TO LOCATE ALL UNDERGROUND UTILITY LINES PRIOR TO COMMENCING CONSTRUCTION.

   F. UPON LEARNING OF THE EXISTENCE AND/OR LOCATIONS OF ANY UNDERGROUND FACILITIES NOT SHOWN OR SHOWN INACCURATELY ON THE PLANS OR NOT PROPERLY MARKED BY THE UTILITY OWNER, THE CONTRACTOR SHALL IMMEDIATELY NOTIFY THE UTILITY OWNER AND THE CITY BY TELEPHONE AND IN WRITING.

   G. UTILITY RELOCATIONS REQUIRED FOR THE CONSTRUCTION OF THE PROJECT FACILITIES WILL BE PERFORMED BY THE UTILITY COMPANY, UNLESS OTHERWISE NOTED.

12. SHOULD THE CONTRACTOR DISCOVER ANY DISCREPANCIES BETWEEN THE CONDITIONS EXISTING IN THE FIELD AND THE INFORMATION SHOWN ON THESE DRAWINGS, HE SHALL NOTIFY THE ENGINEER PRIOR TO PROCEEDING WITH CONSTRUCTION.

13. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO BE FULLY INFORMED OF AND TO COMPLY WITH ALL LAWS, ORDINANCES, CODES, REQUIREMENTS AND STANDARDS WHICH IN ANY MANNER AFFECT THE COURSE OF CONSTRUCTION OF THIS PROJECT, THOSE ENGAGED OR EMPLOYED IN THE CONSTRUCTION AND THE MATERIALS USED IN THE CONSTRUCTION.

14. ANY TESTS, INSPECTIONS, SPECIAL OR OTHERWISE, THAT ARE REQUIRED BY THE BUILDING CODES, LOCAL BUILDING DEPARTMENTS, OR THESE PLANS, SHALL BE DONE BY AN INDEPENDENT INSPECTION COMPANY. JOB SITE VISITS BY THE ENGINEER DO NOT CONSTITUTE AN OFFICIAL INSPECTION. OBSERVATION AND TESTING SERVICES ARE REQUIRED BY THE GEOTECHNICAL ENGINEER AS OUTLINED IN THE GEOTECHNICAL REPORT. IT IS THE CONTRACTORS RESPONSIBILITY TO ENSURE THAT THE WORK IS COORDINATED WITH THE GEOTECHNICAL ENGINEER AND THAT REQUIRED TESTS AND INSPECTIONS ARE PERFORMED.

15. PROJECT SCHEDULE: PRIOR TO COMMENCEMENT OF WORK, CONTRACTOR SHALL PROVIDE ENGINEER A DETAILED CONSTRUCTION SCHEDULE FOR APPROVAL. THE CONTRACTOR SHALL NOT BEGIN ANY CONSTRUCTION WORK UNTIL THE PROJECT SCHEDULE AND WORK PLAN IS APPROVED BY THE ENGINEER. ALL CONSTRUCTION SHALL BE CLOSELY COORDINATED WITH THE ENGINEER SO THAT THE QUALITY OF WORK CAN BE CHECKED FOR APPROVAL. THE CONTRACTOR SHALL PURSUE WORK IN A CONTINUOUS AND DILIGENT MANNER TO ENSURE A TIMELY COMPLETION OF THE PROJECT.

16. THE CONTRACTOR SHALL BE RESPONSIBLE FOR DESIGN, PERMITTING, INSTALLATION, AND MAINTENANCE OF ANY AND ALL TRAFFIC CONTROL MEASURES DEEMED NECESSARY.

17. THE CONTRACTOR SHALL BE RESPONSIBLE FOR GENERAL SAFETY DURING CONSTRUCTION. ALL WORK SHALL CONFORM TO PERTINENT SAFETY REGULATIONS AND CODES. THE CONTRACTOR SHALL BE SOLELY AND COMPLETELY RESPONSIBLE FOR FURNISHING, INSTALLING, AND MAINTAINING ALL WARNING SIGNS AND DEVICES NECESSARY TO SAFEGUARD THE GENERAL PUBLIC AND THE WORK, AND PROVIDE FOR THE PROPER AND SAFE ROUTING OF VEHICULAR AND PEDESTRIAN TRAFFIC DURING THE PERFORMANCE OF THE WORK. THE CONTRACTOR SHALL BE SOLELY AND COMPLETELY RESPONSIBLE FOR COMPLIANCE WITH ALL APPLICABLE PROVISIONS OF OSHA IN THE CONSTRUCTION PRACTICES FOR ALL EMPLOYEES DIRECTLY ENGAGED IN THE CONSTRUCTION OF THIS PROJECT.

18. CONSTRUCTION CONTRACTOR AGREES THAT IN ACCORDANCE WITH GENERALLY ACCEPTED CONSTRUCTION PRACTICES, CONSTRUCTION CONTRACTOR WILL BE REQUIRED TO ASSUME SOLE AND COMPLETE RESPONSIBILITY FOR JOB SITE CONDITIONS DURING THE COURSE OF CONSTRUCTION OF THE PROJECT, INCLUDING SAFETY OF ALL PERSONS AND PROPERTY; THAT THIS REQUIREMENT SHALL BE MADE TO APPLY CONTINUOUSLY AND NOT BE LIMITED TO NORMAL WORKING HOURS, AND CONSTRUCTION CONTRACTOR FURTHER AGREES TO DEFEND, INDEMNIFY AND HOLD DESIGN PROFESSIONAL HARMLESS FROM ANY AND ALL LIABILITY, REAL OR ALLEGED, IN CONNECTION WITH THE PERFORMANCE OF WORK ON THIS PROJECT, EXCEPTION LIABILITY ARISING FROM THE SOLE NEGLIGENCE OF DESIGN PROFESSIONAL. NEITHER THE PROFESSIONAL ACTIVITIES OF CONSULTANT NOR THE PRESENCE OF CONSULTANT OR HIS OR HER EMPLOYEES OR SUB-CONSULTANTS AT A CONSTRUCTION SITE SHALL RELIEVE THE CONTRACTOR AND ITS SUBCONTRACTORS OF THEIR RESPONSIBILITIES INCLUDING, BUT NOT LIMITED TO, CONSTRUCTION MEANS, METHODS, SEQUENCE, TECHNIQUES OR PROCEDURES NECESSARY FOR PERFORMING, SUPERINTENDING OR COORDINATING ALL PORTIONS OF THE WORK OF CONSTRUCTION IN ACCORDANCE WITH THE CONTRACT DOCUMENTS AND APPLICABLE HEALTH OR SAFETY REQUIREMENTS OF ANY REGULATORY AGENCY OR OF STATE LAW.

19. THE CONTRACTOR SHALL MAINTAIN A CURRENT, COMPLETE, AND ACCURATE RECORD OF ALL AS-BUILT DEVIATIONS FROM THE CONSTRUCTION AS SHOWN ON THESE DRAWINGS AND SPECIFICATIONS, FOR THE PURPOSE OF PROVIDING THE ENGINEER OF RECORD WITH A BASIS FOR THE PREPARATION OF RECORD DRAWINGS.

20. THE CONTRACTOR SHALL BE RESPONSIBLE FOR MAINTAINING THE SITE IN A NEAT AND ORDERLY MANNER THROUGHOUT THE CONSTRUCTION PROCESS. ALL MATERIALS SHALL BE STORED WITHIN APPROVED STAGING AREAS.

21. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE PROTECTION AND PRESERVATION OF ALL SURVEY MONUMENTS OR PROPERTY CORNERS. DISTURBED MONUMENTS SHALL BE RESTORED BACK TO THEIR ORIGINAL LOCATION AND SHALL BE CERTIFIED BY A REGISTERED CIVIL ENGINEER OR LAND SURVEYOR AT THE EXPENSE OF THE CONTRACTOR.

## DEMOLITION NOTES

1. THE REMOVAL OF EXISTING IMPROVEMENTS SHALL BE PERFORMED IN ACCORDANCE WITH SECTION 15 OF THE STANDARD SPECIFICATIONS.

2. EXISTING IMPROVEMENTS, ADJACENT PROPERTY, TREES AND PLANTS, UTILITIES AND OTHER FACILITIES THAT ARE NOT REMOVED SHALL BE PROTECTED FROM INJURY OR DAMAGE RESULTING FROM THE CONTRACTOR'S OPERATIONS IN ACCORDANCE WITH SECTION 15.1 OF THE STANDARD SPECIFICATIONS.

## EARTHWORK NOTES

1. GRADING SUMMARY:
   TOTAL CUT VOLUME = 420,000 CY
   TOTAL FILL VOLUME = 5,000 CY

THE ABOVE QUANTITIES ARE APPROXIMATE IN-PLACE VOLUMES CALCULATED AS THE DIFFERENCE BETWEEN EXISTING GROUND AND THE PROPOSED FINISH GRADE, PREPARED FOR PERMITTING PURPOSES ONLY. EXISTING GROUND IS DEFINED BY THE TOPOGRAPHIC CONTOURS AND/OR SPOT ELEVATIONS ON THE PLAN. PROPOSED FINISH GRADE IS DEFINED AS THE DESIGN SURFACE ELEVATION OF EARTH TO BE CONSTRUCTED, AS SHOWN ON THE DRAWINGS. THE QUANTITIES HAVE NOT BEEN FACTORED TO INCLUDE ALLOWANCES FOR BULKING, CLEARING AND GRUBBING, SUBSIDENCE, SHRINKAGE, OVER EXCAVATION, AND RECOMPACTION, UNDERGROUND UTILITY AND SUBSTRUCTURE SPOILS AND CONSTRUCTION METHODS. QUANTITIES ARE SUBJECT TO CHANGE, PENDING EXCAVATION AND INSPECTION OF SUBSURFACE CONDITIONS AT THE "ROCK PILE" AND "OVERBURDEN REMOVAL" AREAS, WHICH WILL ULTIMATELY DETERMINE FINISH GRADE AT THESE TWO AREAS.

THE CONTRACTOR SHALL PERFORM AN INDEPENDENT EARTHWORK ESTIMATE FOR THE PURPOSE OF PREPARING BID PRICES FOR EARTHWORK. THE BID PRICE SHALL INCLUDE COSTS FOR ANY NECESSARY IMPORT AND PLACEMENT OF EARTH MATERIALS OR THE EXPORT AND PROPER DISPOSAL OF EXCESS OR UNSUITABLE EARTH MATERIALS.

2. ALL EXCESS SOILS SHALL BE REMOVED TO AN APPROVED DUMP SITE OR DISPOSED OF ON SITE AT A LOCATION TO BE APPROVED BY THE ENGINEER, IN A MANNER THAT WILL NOT CAUSE EROSION,

3. CLEARING AND GRUBBING, SUBGRADE PREPARATION AND EARTHWORK SHALL BE PERFORMED IN ACCORDANCE WITH SECTION 19 OF THE STANDARD SPECIFICATIONS, THESE DRAWINGS, AND THE TECHNICAL SPECIFICATIONS.

4. UNSUITABLE SOIL OR MATERIALS, NOT TO BE INCLUDED IN THE WORK INCLUDE:

   A. ORGANIC MATERIALS SUCH AS PEAT, MULCH, ORGANIC SILT OR SOD.
   B. SOILS CONTAINING EXPANSIVE CLAYS.
   C. MATERIAL CONTAINING EXCESSIVE MOISTURE.
   D. POORLY GRADED COURSE MATERIAL, PARTICLE SIZE IN EXCESS OF 6 INCHES.
   E. MATERIAL WHICH WILL NOT ACHIEVE SPECIFIED DENSITY OR BEARING.

5. FINE GRADING ELEVATIONS AND SLOPES NOT SHOWN SHALL BE DETERMINED BY THE CONTRACTOR IN THE FIELD TO OBTAIN DRAINAGE IN THE DIRECTION INDICATED. ALL FINAL GRADING SHALL BE SUBJECT TO APPROVAL OF THE ENGINEER.

6. THE TOP 6" OF SUBGRADE UNDER ALL PAVED SURFACES SUBJECT TO VEHICULAR USE SHALL BE COMPACTED TO A MINIMUM OF 95% RELATIVE COMPACTION, IN ACCORDANCE WITH ASTM-D1557 STANDARD. ALL OTHER FILL TO BE COMPACTED TO A MINIMUM OF 90% MAXIMUM DENSITY AS DETERMINED BY ASTM-D1557 AND SO CERTIFIED BY TESTS AND REPORTS FROM THE ENGINEER IN CHARGE OF THE GRADING CERTIFICATION.

7. FILL MATERIAL SHALL BE SPREAD IN LIFTS OF APPROXIMATELY 8 INCHES, MOISTENED OR DRIED TO NEAR OPTIMUM MOISTURE CONTENT AND RECOMPACTED. THE MATERIALS FOR ENGINEERED FILL SHALL BE APPROVED BY A REGISTERED GEOTECHNICAL ENGINEER. ANY IMPORTED MATERIALS MUST BE APPROVED BEFORE BEING BROUGHT TO THE SITE. THE MATERIALS USED SHALL BE FREE OF ORGANIC MATTER AND OTHER DELETERIOUS MATERIALS.

8. ALL CONTACT SURFACES BETWEEN ORIGINAL GROUND AND RECOMPACTED FILL SHALL BE EITHER HORIZONTAL OR VERTICAL. ALL ORGANIC MATERIAL SHALL BE REMOVED AND THE REMAINING SURFACE SCARIFIED TO A DEPTH OF AT LEAST 12 INCHES, UNLESS DEEPER EXCAVATION IS REQUIRED BY THE ENGINEER.

## GENERAL EROSION CONTROL NOTES

1. A DETAILED EROSION AND SEDIMENT CONTROL PLAN WILL BE PREPARED BY THE ENGINEER, PRIOR TO FINALIZATION OF THE CONSTRUCTION DOCUMENTS.

2. CONTRACTOR SHALL BE FAMILIAR WITH THE CONDITIONS OF APPROVAL OF ALL REQUIRED PROJECT PERMITS AND SHALL IMPLEMENT ALL REQUIRED BMP'S PRIOR TO COMMENCING GRADING OPERATIONS

3. CONTRACTOR SHALL UTILIZE ONLY THE APPROVED HAUL ROADS AND ACCESS POINTS (AS SHOWN ON THE DRAWINGS) FOR TRANSPORT OF MATERIALS AND EQUIPMENT.

4. BETWEEN OCTOBER 15 AND APRIL 15, EXPOSED SOIL SHALL BE PROTECTED FROM EROSION AT ALL TIMES. DURING CONSTRUCTION, SUCH PROTECTION MAY CONSIST OF MULCHING AND/OR PLANTING OF NATIVE VEGETATION OF ADEQUATE DENSITY. BEFORE COMPLETION OF THE PROJECT, ANY EXPOSED SOIL ON DISTURBED SLOPES SHALL BE PERMANENTLY PROTECTED FROM EROSION.

5. A STANDBY CREW SHALL BE AVAILABLE AT ALL TIMES FOR EMERGENCY WORK THAT MAY BE REQUIRED DURING THE RAINY SEASON (OCTOBER 15 THROUGH APRIL 15). NECESSARY MATERIALS SHALL BE AVAILABLE AND STOCKPILED AT CONVENIENT LOCATIONS TO FACILITATE RAPID CONSTRUCTION OF TEMPORARY DEVICES.

6. CONSTRUCT TEMPORARY EROSION CONTROL MEASURES AS SHOWN ON THE DRAWINGS AND/OR AS DIRECTED BY THE ENGINEER TO CONTROL DRAINAGE WHICH HAS BEEN AFFECTED BY GRADING AND/OR TRENCHING OPERATIONS.

7. CONSTRUCT AND MAINTAIN EROSION CONTROL MEASURES TO PREVENT THE DISCHARGE OF EARTHEN MATERIALS TO THE CREEK FROM DISTURBED AREAS UNDER CONSTRUCTION AND FROM COMPLETED CONSTRUCTION AREAS.

8. INSTALL ALL PROTECTIVE DEVICES AT THE END OF EACH WORK DAY WHEN THE FIVE-DAY RAIN PROBABILITY EQUALS OR EXCEEDS 50 PERCENT AS DETERMINED FROM THE NATIONAL WEATHER SERVICE FORECAST OFFICE: WWW.SRH.NOAA.GOV.

9. AFTER A RAINSTORM, ALL SILT AND DEBRIS SHALL BE REMOVED FROM SEDIMENT CONTROL MEASURES.

10. THE CONTRACTOR IS RESPONSIBLE TO KEEP IN FORCE ALL EROSION CONTROL DEVICES AND TO MODIFY THOSE DEVICES AS SITE PROGRESS DICTATES.

11. THE CONTRACTOR SHALL MONITOR THE EROSION CONTROL DEVICES DURING STORMS AND MODIFY THEM IN ORDER TO PREVENT PROGRESS OF ANY ONGOING EROSION.

12. THE CONTRACTOR SHALL CONTACT THE ENGINEER IN THE EVENT THAT THE EROSION CONTROL PLAN AS DESIGNED REQUIRES ANY SUBSTANTIAL REVISIONS.

## DIVERSION NOTES

1. GENERAL
   1.1. DIVERSION SYSTEMS SHALL BE INSTALLED TO DEWATER THE INDIVIDUAL PROJECT AREAS TO FACILITATE IN-STREAM CONSTRUCTION AND TO REDUCE THE POTENTIAL IMPACTS TO WATER QUALITY DOWNSTREAM OF THE PROJECT SITES.
   1.2. THE CONTRACTOR SHALL CONFIRM THAT A FAVORABLE LONG TERM WEATHER FORECAST (1 WEEK MIN.) IS OBSERVED PRIOR TO PLACEMENT OF DIVERSION STRUCTURE.
   1.3. PRIOR TO PLACEMENT OF DIVERSION STRUCTURE, FISH SHALL BE REMOVED FROM THE DIVERTED REACH, IN ACCORDANCE WITH SECTION 2.
   1.4. DIVERSION SYSTEM INSTALLATION SHALL NORMALLY BEGIN IN THE DOWNSTREAM AREA AND CONTINUE IN AN UPSTREAM DIRECTION. THE FLOW SHALL BE DIVERTED ONLY WHEN THE DIVERSION CONSTRUCTION IS COMPLETE.
   1.5. FOLLOWING ENGINEER'S APPROVAL OF THE COMPLETED WORK, DIVERSION SHALL BE REMOVED IMMEDIATELY, IN AN UPSTREAM DIRECTION.
2. FISH REMOVAL
   2.1. FISH SHALL BE REMOVED FROM THE DIVERTED REACHES BY A QUALIFIED FISHERIES BIOLOGIST, LICENSED FOR SUCH ACTIVITIES BY THE NATIONAL MARINE FISHERIES SERVICE AND THE CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE.
   2.2. BLOCK NETS SHALL BE PROVIDED AND INSTALLED BY THE FISHERIES BIOLOGIST. BLOCK NETS SHALL BE MAINTAINED BY THE CONTRACTOR BOTH UPSTREAM AND DOWNSTREAM OF THE WORK AREA, THROUGHOUT THE PERIOD OF CONSTRUCTION. MAINTENANCE INCLUDES PERIODIC REMOVAL OF ACCUMULATED DEBRIS, AS NECESSARY TO ENSURE FUNCTION. BLOCK NETS SHALL BE REMOVED BY THE FISHERIES BIOLOGIST AFTER THE DIVERSION IS REMOVED AND THE IN CHANNEL WORK AREA IS RE-WATERED.
3. DIVERSION SYSTEM
   3.1. THE CONTRACTOR SHALL INSTALL A TEMPORARY SEALED SANDBAG DAM TO CAPTURE AND DIVERT STREAM FLOW UPSTREAM OF THE PROJECT SITE. THE DAM AND METHOD OF SEALING SHALL BE PLACED AT AN APPROPRIATE DEPTH TO CAPTURE SUBSURFACE STREAM FLOW, AS NEEDED TO DEWATER THE STREAMBED.
   3.2. THE CONTRACTOR SHALL MAINTAIN THE DIVERSION DAM DURING THE COURSE OF CONSTRUCTION WORK.
   3.3. THE DIVERSION STRUCTURE SHALL BE CONSTRUCTED AS SHOWN ON THE DRAWINGS, OR AS DIRECTED BY THE ENGINEER IN THE FIELD.
   3.4. IN THE EVENT OF A SIGNIFICANT STORM, THE CONTRACTOR SHALL BE PREPARED TO TAKE NECESSARY MEASURES TO INSURE SAFE PASSAGE OF STORM WATER FLOW THROUGH THE PROJECT AREA, WITHOUT DAMAGE TO EXISTING STRUCTURES, OR INTRODUCTION OF EXCESSIVE SEDIMENT. THE CONTRACTOR SHALL BE RESPONSIBLE FOR ALL TEMPORARY EROSION CONTROL B.M.P.'S.
4. DEWATERING OF CONSTRUCTION AREAS
   4.1. ANY DEWATERING ACTIVITIES WHICH MAY BE REQUIRED FOR CONSTRUCTION PURPOSES SHALL BE CONDUCTED IN A MANNER WHICH DOES NOT RESULT IN AN EXCEEDANCE OF ANY WATER QUALITY REQUIREMENTS ESTABLISHED BY THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD.
   4.2. DISCHARGE OF WATER FROM THE DEWATERED CONSTRUCTION SITE, EITHER BY GRAVITY OR PUMPING, SHALL BE PERFORMED IN A MANNER TO PREVENT EXCESSIVE TURBIDITY FROM ENTERING THE RECEIVING WATERWAYS AND TO PREVENT SCOUR AND EROSION OUTSIDE OF THE CONSTRUCTION SITE. PUMPED WATER SHOULD BE PRE-FILTERED WITH SAND/GRAVEL PACK AROUND SUMPS FOR SUBSURFACE FLOWS AND A SILT FENCE OR HAY BALES AROUND PUMPS FOR SURFACE FLOW. PUMPED WATER SHALL BE DISCHARGED INTO ISOLATED LOCAL DEPRESSIONS, FILTER BAGS, SETTLING (BAKER) TANKS, OR TEMPORARY SEDIMENT BASINS, AS NECESSARY TO MEET WATER QUALITY REQUIREMENTS. WHERE WATER TO BE DISCHARGED INTO THE CREEK WILL CREATE EXCESSIVE TURBIDITY, THE WATER SHALL BE ROUTED THROUGH A SEDIMENT INTERCEPTOR OR OTHER FACILITIES TO REMOVE SEDIMENT FROM WATER.
   4.3. CONTRACTOR SHALL SUPPLY ALL NECESSARY PUMPS, PIPING, FILTERS, SHORING, AND OTHER TOOLS AND MATERIALS NECESSARY FOR DEWATERING.

# E2. Effects to Waters of the United States (GEI Consultants, Inc., 2021)

# ATTACHMENT B – EFFECTS TO WATERS OF THE UNITED STATES

## REASONS FOR DISCHARGE

Discharge of materials into waters of the United States would be required to achieve the objective of restoring portions of Permanente Creek to a more natural state, in accordance with the proposed creek restoration plan. The materials to be discharged to waters of the United States include materials to restore streambed hydrology, geomorphology, and floodplain hydraulics, and to provide habitat for resident rainbow trout.

### PROPOSED DISCHARGE OF DREDGE AND/OR FILL MATERIAL

The amount and types of material being dredged from, and/or discharged (filled) into, waters of the United States are provided in Table 1.

**Table 1.**
**Volume and Types of Dredge and Fill Material within Waters of the United States for the Proposed Project**

| Project Element | Action | Approximate Volume (cy) | Type of Material |
|---|---|---|---|
| Culvert 7 | Removal of existing culvert and reconstruction/reconfiguration of creek channel and bed. | 143 fill | Engineered streambed material |
| Culvert 8 | Removal of existing culvert and reconstruction/reconfiguration of creek channel and bed. | 180 fill | Engineered streambed material |
| Culvert 9 | Removal of existing culvert and reconstruction/reconfiguration of creek channel and bed. | 264 fill | Engineered streambed material |
| Culvert 10 | Complete removal of (buried) culvert and excavation of creek channel. | 288 cut | Native soil |
| Culvert 11 | Complete removal of (half-pipe) culvert and excavation of creek channel. | 223 cut | Native soil |
| Pond 13 | Removal of dam and reconfiguration of creek channel. | 1,613 cut | Native soil |

Source: Adapted by GEI Consultants, Inc. 2016, based on plans from WRA and Waterways Consulting, Inc. 2015.

### U.S. ARMY CORPS OF ENGINEERS JURISDICTION WITHIN THE PROJECT AREA

A wetland delineation was conducted for the proposed project by AECOM in 2015. The wetland delineation report was sent to the San Francisco District of the U.S. Army Corps of Engineers (USACE) on August 3, 2015. USACE met with AECOM staff on September 10, 2015 to review the delineation at the project site. Revised wetland delineation maps, including changes from the field visit, were sent to USACE on September 17, 2015. Lehigh Hanson is requesting a preliminary jurisdictional determination (PJD) for this project area. USACE confirmed receipt of the revised delineation maps and is in the process of verifying the delineation.

## EFFECTS TO JURISDICTIONAL WATERS OF THE U.S.

USACE jurisdictional acreages potentially affected by the proposed activity was calculated by placing the Computer-Assisted Design (CAD) engineering design information (provided by Waterways Consulting, Inc.) over the wetland delineation ArcGIS layers of the project area.

The proposed project would result in effects to a total of 2.052 acres of waters of the United States (see Figures 1 through 4). Effects to waters are a result of three main activities: native vegetation planting along the south slope (above bank) of the concrete-lined channelized portion of Permanente Creek, as shown on Figure 1; channel widening and reconstruction activities, as shown on Figures 2 and 3; and overburden material removal and stream reconstruction, as shown on Figure 4.

Within the native vegetation planting area, it is anticipated that there will be temporary effects to the concrete-lined portion of Permanente Creek. Approximately 0.43 acre of temporary effects would be a result of the need to use the creek channel for access to facilitate planting along the south slope above the channel. The area is very steep and the channel area is the best vantage to facilitate planting on the most downslope portions of the planting efforts.

The channel widening and stream reconstruction portion of the proposed project activities would have permanent effects to approximately 0.64 acres of non-wetland waters of the United States and 0.077 acre of wetlands. Permanent effects are a result of removal of existing in-stream culverts and replacement of these structures with a deeper and wider channel containing engineered streambed material that will restore stream hydraulics, hydrology, and geomorphology. Five culverts would be removed from the stream channel (Culverts 7, 8, 9, 10, and 11). Culvert removal would comprise excavating out the culverts and any fill materials covering the culverts, re-contouring the stream channel to design parameters, and placing the engineered streambed material on the bed and banks of the newly reconstructed channel. This would result in permanent effects to Permanente Creek due to permanent alteration of the existing channel conditions; however, the activities would not result in the net loss of waters of the United States. With the removal of the culvert, the overall restoration activities would include re-contouring the channel, as just mentioned, and creating a floodplain bench along the north bank of the creek with riparian plantings in the floodplain bench. This work would be done for approximately 4,770 linear feet of the stream channel. As part of this work, a tributary stream (T18) will also be re-contoured and reconstructed to have a more gradual and even slope. Currently, the confluence of the tributary and Permanente Creek is a small floodplain where a wetland (W4) has established. This is the circumstance of the creek channel being narrow and not able to accommodate all of the flows from the current tributary. With the reconstruction work in both channels occurring, it is expected that the wetland will be disturbed as part of the construction activities and once the streams have been restored, the wetland will not be re-established due to post-condition changes in hydrology, hydraulics, and geomorphology of the stream. Again, this will result in permanent effects to the wetland, but would not result in a net loss of waters as the stream channel would be replacing the wetland.

This is also the case for three wetlands (W5, W6, and W7) established on the margin of the existing creek channel within this channel widening area. It is expected that these wetlands will be removed (lost) due to post-condition changes in hydrology, hydraulics, and geomorphology of the stream. However, because there is no direct, physical disturbance anticipated to these wetlands, the effects are considered to be indirect permanent effects and changes. Finally, there is a “pond” at the upper limit of the channel widening area which is really an impoundment of the creek behind a dam. As part of the channel widening restoration design, the dam would be

removed and the “pond” area would be re-contoured and reconstructed as part of the creek channel. This would again result in permanent change to the pond area, resulting in loss of the pond, but not a net loss of waters of the United States.

Within the channel widening area, it is also anticipated that there would be 0.513 acre of temporary effects to non-wetland waters. The temporary effects would be a result of temporary disturbance within the creek channel for access and temporary work space to facilitate the restoration efforts. It is anticipated that the creek channel would be both the work area (for restoration), but because of the terrain, it would also need to be the access area for equipment to enter the channel.

The final area of work is the material removal area. Here overburdened material from historic operations has entered into the creek and is present along the banks and upland slopes adjacent to the creek and has changed the topography in the area significantly. The proposed activities include removal of the overburden material and deposition of the material in the quarry area within the cement plant for future use. Removal of the overburden material would be followed by reconstruction of the stream channel to a more natural profile and revegetation of the banks of the channel. This would result in temporary effects to five non-wetland waters (T6, P14, T7, P15, and T8) to improve the stream channels of these waters. There is also one wetland (W8) on the downstream end of T8, a tributary to Permanente Creek. Like W4, mentioned previously, this wetland would be permanently lost as a result of reconstruction of the tributary and creek stream channels, but there would not be a net loss of waters as the streams would replace the wetland area.

The acreages of effects to waters of the United States for the proposed project are shown in Table 2.

**Table 2.**
**Acreages of Jurisdictional Waters of the United States**
**Affected by the Proposed Project**

| Effect Type | Feature | USACE JD Category[1] | Action | Approximate Acreage |

# AVOIDANCE AND MINIMIZATION MEASURES

Lehigh Hanson would implement the following measures to avoid and minimize impacts to waters of the U.S.

## Avoidance and Containment of Shallow Slumps and/or Fallback of Overburden Material

In all areas requiring the use of excavators for grading (e.g., access road in-sloping, installation/repair of sedimentation basins, and removal of slide debris), Lehigh Hanson and/or its contractor shall begin excavations from the top of slope and proceed downward. Lehigh Hanson and/or its contractor shall begin excavations from the top of slope and proceed downward. Lehigh Hanson and/or its contractor shall not undercut sloped materials unless no other option is feasible as determined by a registered geotechnical engineer (e.g., excessively sloped or otherwise inaccessible terrain). In all areas where excavations would occur in sloped materials, Lehigh Hanson and/or its contractor shall install barriers immediately downslope of the activity. Downslope barriers shall be designed and installed in a manner that would be adequate to prevent overburden and/or native materials from falling, sloughing or sliding further downslope, or into Permanente Creek. Such measures may consist of temporary interlocking soldier piles, wooden shoring systems, wire mesh or other containment measures(s), and Lehigh Hanson and/or its contractor shall not be permitted to conduct excavation or grading activities downgradient of the barrier, or prior to its installation. The ultimate location, design and installation method of such measures shall be prepared and certified, or reviewed and approved by a California State registered geotechnical engineer.

## Interim Stormwater Control and Sediment Management

To minimize the discharge of sedimentation and metal constituents, particularly selenium, to watercourses, Lehigh Hanson shall implement the following stormwater and sediment management controls in addition to general best management practices (BMPs) required by the stormwater pollution prevention plan (SWPPP) in active and inactive reclamation areas. Lehigh Hanson shall:

- Segregate limestone materials from the non-limestone materials (breccia, graywacke, chert, and greenstone) by way of operational phasing to ensure that limestone materials are placed beneath and are covered by non-limestone materials. A California Professional Geologist shall oversee stockpiling, segregation, and placement of non-limestone materials.

- Stabilize inactive areas, such as temporary stockpiles or dormant excavations that drain directly or indirectly to Permanente Creek using an appropriate combination of BMPs to cover the exposed rock material, intercept runoff reduce its flow velocity, release runoff as sheet flow, and provide a sediment control mechanism (such as silt fencing, fiber rolls, or hydroseeded vegetation). Standard soil stabilization BMPs include geotextiles, mats, erosion control blankets, vegetation, silt fence surrounding the stockpile perimeter, and fiber rolls at the base and on side slopes.

- Temporarily stabilize active, disturbed reclamation areas undergoing fill placement before and during qualifying rain events expected to produce site runoff. Stabilization methods include combined BMPs that protect materials from rain, manage runoff, and reduce erosion. Reclamation activities involving grading, hauling, and placement of backfill materials cannot take place during periods of rain.

- In areas where fill slopes are steep and composed of loose material, controls shall be in place to prevent material from sloughing off into the Permanente Creek Restoration Area and Permanente Creek. These controls shall include debris/silt fencing placed on outer edge of grading and excavation operations back-

sloping excavations to prevent grade slope towards the creek, operations buffer areas that require the use of smaller grading equipment, temporary berms along the outer extent of operations closest to the creek, operator training regarding the prevention of triggering debris slides.

- Cover active haul roads with non-limestone materials where exposed limestone surfaces are present. Roads that undergo dust control by watering must have fiber rolls or equivalent runoff protection installed along the road side to reduce runoff and avoid drainage to Permanente Creek.

- Divert all runoff generated from disturbed active and inactive restoration areas to temporary basins, the Quarry pit, or temporary vegetated infiltration basins and kept away from drainage pathways directly entering Permanente Creek. To the extent possible, drainage of the non-limestone materials shall be diverted directly to sediment control facilities and natural surface drainages.

- Install up-gradient berms where limestone fines or stockpiles are placed, to protect against stormwater run-on, and install ditches and down-gradient berms to promote infiltration rather than run-off.

- Cover large limestone surfaces associated with restoration activities that would remain exposed during the rainy season with interim covers composed of non-limestone rock types.

- Inspect and maintain BMPs after each qualifying rain event to ensure their integrity.

- Regularly inspect all stormwater and erosion controls, especially before and following qualifying rain events. Inspections shall be documented and periodically reported. Any violations shall be corrected immediately.

- Provide adequate erosion control training to all equipment operators, site superintendents, and managers to ensure that stormwater and erosion controls are maintained and remain effective.

- Use only jute netting or other suitable replacement for erosion control in the Permanente Creek Restoration Area; no plastic monofilament shall be used for erosion control or other purposes, as California Red Legged Frogs and other wildlife may become entangled in it.

- Ensure that all stormwater, erosion, and sediment control BMPs are installed, inspected, maintained, and repaired under the direction of either a California certified engineer, geologist, or landscape architect, an American Institute of Hydrology registered professional hydrologist, or a certified erosion control specialist.

## PROPOSED COMPENSATORY MITIGATION

Although Lehigh Hansen proposes to permanently impact approximately 0.727 acre of waters of the United States (wetland and non-wetland waters combined), the proposed project, as designed, would result in enhancement of the 0.727 acre of waters of the United States resulting in functional lift of the existing jurisdictional acreage. The enhancements include improving the configuration and hydrology of Permanente Creek, removing an impoundment of the creek, removing culverts and restoring the creek bed under the culverts, creating a floodplain bench alongside the creek in select areas, and planting native riparian vegetation along the creek banks. The text of Nationwide Permit 27 states that if the proposed activities result in functional lift of the existing aquatic habitat, no compensatory mitigation is required. Lehigh Hansen believes the restoration effort will result in functional lift in upper Permanente Creek. Therefore, the proposed activities meet the specification of Nationwide Permit 27 and compensatory mitigation is not required for the project.

# ADDITIONAL INFORMATION,

## EFFECTS ON FEDERALLY LISTED SPECIES

The proposed project would result in potential adverse effects to the Federally listed California red-legged frog. A Biological Assessment has been prepared for the species and is included as Attachment D to this application package. The Biological Assessment only addresses USFWS-managed species.

The proposed project location is within a region mapped as Essential Fish Habitat (EFH) for Pacific salmon (specifically *Oncorhynchus kisutch* and *O. tshawytscha*) and critical habitat for Central California Coastal (CCC) steelhead (*O. mykiss irideus*) DPS. These USFWS- and NMFS-managed species cannot access habitat near the project site in upper Permanente Creek because the downstream Permanente Creek Diversion Channel is a highly effective barrier to fish passage since most of the creek's flow culminates in a 10-foot drop at the diversion fish can no longer ascend the stream.

Permanente Creek is a natural channel from its headwater downstream to Heritage Oaks Park, near Portland and Miramonte avenues, where the creek enters a concrete channel and eventually becomes the Permanente Creek Diversion Channel. The channel was built by the Santa Clara Valley Water District in 1959 and runs 1.3 miles to the east until passing into a culvert underneath Highway 85 to Stevens Creek. Virtually all winter flows from upper Permanente Creek are diverted east to Stevens Creek in order to prevent floodwaters from flowing in the original creek channel that runs through urban residential areas.

The diversion channel has altered the course of flow and the total length of Permanente Creek from 13.3 miles (from the headwaters to San Francisco Bay) to 9.3 miles (from the headwaters to the diversion channel’s junction with Stevens Creek just past Highway 85), and has essentially cut off the upper portion of Permanente Creek from the lower reaches. In addition, a combination of lack of flows and significant modification in the lower portion of the creek have degraded fish habitat such that no spawning or rearing habitat exists for these species.

## CULTURAL RESOURCES AND HISTORIC PROPERTIES

The proposed action was analyzed for cultural resources and historic properties and a cultural resources inventory report has been prepared. The final Cultural Resources Inventory Report is included as Attachment E.

# E3. Revegetation Plan (WRA, Inc. September 29, 2017)

ENVIRONMENTAL CONSULTANTS

**TECHNICAL MEMORANDUM**

**PERMANENTE CREEK RESTORATION PLAN: PLANTING PROGRAM**

**September 29, 2017**

## INTRODUCTION

This technical memorandum describes the conceptual planting program that will be a component of the Permanente Creek Restoration Plan. The Riparian Planting Sections (Sheets L1-L3) on the accompanying drawings have been completed in conjunction with the Stream Restoration Plan prepared by Waterways Consulting. The revegetation design is intended to meet the requirements of the Consent Decree between Lehigh Southwest Cement Company and Hanson Permanent Cement, Inc. and the Sierra Club effective June 18, 2013 and amended on February 22, 2016. This work is also informed by the extensive site investigations and pilot revegetation work that has been performed and documented in the Revegetation Plan (WRA 2012) prepared in conjunction with the Reclamation Plan for the facility. This plan was prepared by Megan Stromberg, Landscape Architect (California License 5535).

## RIPARIAN PLANTING

Proposed planting palettes and representative cross sections are provided in the attached drawings. The goal of the planting effort will be to create a native plant dominated habitat within restored sections of the creek that are similar to the surrounding natural areas. The representative cross sections are conceptual at this time, but are sufficient to demonstrate the level of planting needed for agency review and for initial permit applications. Additional detail will be provided as needed to complete the permitting process. Final drawings will be prepared after permit approval.

The north-facing banks along Permanente Creek can support a wider variety of tree and shrub species since they have less solar radiation and higher soil moisture. In addition, some reaches of the creek experience intermittent flows (Reaches 17 through 21) while the reaches below Pond 4A are mostly perennial. These conditions have been considered in the development of the riparian planting palettes. Specific planting plans identifying the best locations for each species will be developed in the final drawings.

Each riparian species was observed within the existing riparian habitat and evaluated for its proximity to the thalweg of the existing creek. Our plant palette tables provide the recommended elevation range above the design thalweg of the creek.

Trees and shrubs will be planted as container plants or seeds in the revegetation areas. Tree and shrub container plantings may require application of a layer of topsoil and/or soil-building materials to ensure adequate space for root development. In addition, irrigation or other watering methods will be included within a final plan as well as erosion control practices while plant materials are becoming established. Plants will be planted at a higher density than is expected at the end of the performance period to account for expected die-off. Replanting in subsequent years may be required to achieve desired stem density and cover. Adaptive management and the results from the Reclamation Plan pilot plantings will be used to determine which tree and shrub species will be planted, the most effective spacing and location, and species to use in replacement plantings if

necessary. The need for herbivory protection for specific vegetation species will be evaluated based on prior planting efforts. Weed mats or several inches of mulch may be placed around planted trees and shrubs to reduce competition and retain moisture.

## UPLAND REVEGETATION AND EROSION CONTROL

A preliminary erosion control stage will be incorporated prior to the riparian revegetation establishment to protect against sediment entering the creek and allow time for plants to establish. Bare surfaces will be covered with native grass, herb, and shrub species via hydroseeding a homogenous slurry of mulch, fertilizer, seed, and a binding agent over the areas to be revegetated. Other appropriate erosion control methods such as slope cross-drains, erosion control matting, and coir fibre rolls will be used. The native seed mix shown in Table 1 includes species that have proven successful in other revegetation efforts on the Permanente Quarry property and is recommended to provide erosion control and initial establishment of native shrubs, grasses and herbaceous species as needed in temporarily disturbed riparian areas. In upland areas, hydroseed with species listed in Table 2 will be applied to areas that have been disturbed.

Table 1. Erosion Control Species for Permanente Creek Riparian Areas

| SCIENTIFIC NAME | COMMON NAME | PURE LIVE SEED (lb / acre) | BULK SEED (lb / acre) |
|---|---|---|---|
| SHRUBS | | | |
| *Artemisia californica* | California sagebrush | 1 | 10 |

# E4. Temporary Riparian Vegetation Impact Assessment (Waterways Consulting, Inc., August 26, 2022)

# TECHNICAL MEMORANDUM

*To:* Carolina Addison, Lehigh Hanson Inc.

*From:* Waterways Consulting, Inc.

*Date:* August 26, 2022

*Re:* Permanente Creek Restoration Project, Temporary Riparian Vegetation Impact Assessment

## Introduction

This memorandum has been prepared in response to comments provided to the County of Santa Clara on May 13, 2021 by the California Department of Fish and Wildlife (CDFW) in response to the County's Notice of Preparation of the Supplemental Draft Environmental Impact Report for the Permanente Creek Restoration Project (PRCP).[1] The comments are regarding impacts to riparian vegetation associated with implementation of the PRCP included under the "Biological Resources, Long-term Impacts to Riparian Sensitive Community" section of the letter. The relevant paragraph under the "Riparian Vegetation Impacts" subsection has been reproduced below for reference.

> The revised 90% engineering designs appear to indicate that approximately 30 trees will be removed during Project construction. However, only larger trees to be removed were included in the designs (e.g., non-oak trees equal to or greater than 12-inch diameter). Sapling (1-inch to 4-inch diameter) and pole sized (5-inch to 11-inch diameter) trees are important to riparian vegetation structural complexity and habitat succession. Based on the current designs, impacts of the Project to riparian habitat may be underestimated. CDFW recommends that analysis of riparian vegetation impacts include trees less than 12 inches in diameter or based on area calculations for seedlings and saplings and understory vegetation. As discussed in the previous section of this letter, the long-term (e.g., 10-year) post-construction monitoring and adaptive management plan should include monitoring of revegetated areas and include performance standards to ensure establishment or maintenance of riparian habitat.

## Background

Waterways Consulting, Inc. (Waterways) staff completed an evaluation of riparian vegetation within the limits of areas to be impacted during implementation of the PCRP. This included field work to determine the species, size and number of trees and shrubs that will be removed during project construction as outlined below.

## Methods

Waterways walked the extents of each component project area to evaluate riparian impacts during July and August 2022. This included the Channel Widening Area, Rock Pile Area and Material Removal Area. Each project area was broken into multiple smaller areas for determining riparian vegetation impacts as

[1] The subject of the May 13, 2021 letter from CDFW to Mr. Robert Salisbury at the County of Santa Clara is "Permanente Creek Restoration Project, Notice of Preparation of a Supplemental Draft Environmental Impact Report, SCH No. 2021040331, Santa Clara County".

shown on Figures 1-10. Representative sample areas were evaluated where vegetation was very dense, and the findings were proportioned for estimating the impacts for the applicable reach of channel. Where the riparian corridor was reasonably open and Waterways staff were able to traverse a reach of channel, sample areas were not used and the riparian corridor within the limits of proposed grading was evaluated to determine vegetation impacts.

Species and diameter of trees and shrubs observed were recorded on field sheets for each riparian area assessed. Figure 1 provides an overview of the assessment area and Figures 2 - 10 show the limits of each riparian vegetation impact area. The upstream and downstream limits of each area were surveyed using a total station. Individual trees and shrubs were not surveyed as part of this assessment. Trees from the original mapping effort are shown on the drawings.[2] Solid lines shown on the Figures represent the limits of an assessment area. Dashed lines represent the boundary of sample areas within a larger assessment area with the color matching that of the assessment area. The boundary lines fall within the grading limits where an area is devoid of vegetation.

## Results

A table listing the area, species, diameter, and number of trees and shrubs documented in each assessment area is included on the attached Figures. A summary table is included below with the total estimated number of trees and shrubs that will be removed at each component project area and the estimated total for the project. Detailed summary tables that include species and diameter of trees and shrubs that would be removed at each component project area are attached.

**Table 1. Total Number of Trees and Shrubs Removed During Project Implementation**

| Project Location | Number of Trees/Shrubs Removed |
|---|---|
| Channel Widening Area | 271 |
| Rock Pile Area | 49 |
| Material Removal Area | 550 |
| Estimated Project Total = | 870 |

## Conclusion

The PCRP includes a robust revegetation effort to reestablish riparian vegetation along the restored channel reaches to help stabilize graded areas, provide cover and establish habitat complexity. While approximately 870 tree and shrubs will be removed during project implementation throughout an area of approximately 5.5 acres, over 7,000 tree and shrubs will be planted to reestablish and expand the riparian corridor along approximately 7.6 acres of restored riparian area.

[2] The trees shown on the Riparian Vegetation Impact Assessment Figures include trees surveyed during mapping efforts completed during 2013-2015. Some trees may have died since the initial mapping effort. Additional trees meeting the survey threshold used during the original mapping efforts may now exist within the mapped areas and are not shown on the figures.

*RIPARIAN IMPACT ASSESSMENT ANALYSIS:*
THESE DRAWINGS HAVE BEEN PREPARED TO ACCOMPANY THE TECHNICAL MEMORANDUM TITLED "PERMANENTE CREEK RESTORATION PROJECT, TEMPORARY RIPARIAN VEGETATION IMPACT ASSESSMENT", DATED 8/26/22, AND ASSIST WITH ESTIMATING TEMPORARY RIPARIAN VEGETATION IMPACTS THAT WOULD OCCUR DURING IMPLEMENTATION OF THE PERMANENTE CREEK RESTORATION PLAN. THE QUANTITY, SIZE AND SPECIES OF EXISTING TREES AND SHRUBS THAT WILL BE REMOVED DURING PROJECT IMPLEMENTATION WERE DOCUMENTED WITHIN THE AREAS SHOWN ON THE FOLLOWING FIGURES. SEE THE REFERENCED TECHNICAL MEMORANDUM FOR A DESCRIPTION OF ASSESSMENT METHODS AND RESULTS.

## Energy: Fuel Use Calculations

## SEIR Fuel Use Summary Tables

**2012 EIR**

| Scenario | Diesel | Gasoline |
|---|---|---|
| Baseline Fuel Use | 822,554 | 12,615 |
| Reclamation Plan Amendment Phase 1 Fuel Use | 2,327,866 | 7,933 |
| Maximum Annual Incremental Change | 1,505,312 | -4,682 |
| Percent Incremental Change | 183% | -37% |

**PCRP Fuel Use**

| Scenario | Diesel | Gasoline |
|---|---|---|
| Reclamation Plan Amendment Incremental Change Disclosed in 2012 EIR[a] | 1,505,312 | -4,682 |
| PCRP Fuel Use not Evaluated in the 2012 EIR | 38,077 | 898 |
| Net Fuel Use | 1,543,389 | -3,784 |
| Percent Incremental Change | 2.5% | 19.2% |

## PCRP Construction Fuel Use Estimates

**Total Fuel Use During Contruction**

| Fuel Type | Fuel Consumed (gal/proj) | Fuel Consumed (av. gal/yr) | Gallons Sold in Santa Clara County in 2020 | % Project gallons comp. to Co. gallons |
|---|---|---|---|---|
| Gasoline | 5,388 | 898 | 511,000,000 | 0.00018% |
| Diesel | 228,462 | 38,077 | 71,000,000 | 0.054% |

**Diesel Fuel Use for Off-road Construction Equipment**

| Phase Name | Equipment Type | HP | Units | Hours/day | Days | Total Hours | Use Factor (Gal/hr) | Total Gallons | Applicability Factors | Gallons Covered in SEIR |

**FROM** Robert Humphries; William Fowler, PG 4401, CEG 1401 **EMAIL bfowler@golder.com**

**GEOLOGIC AND GEOMORPHIC ASSESSMENT OF PERMANENTE CREEK, LEHIGH HANSON PERMANENTE QUARRY, SANTA CLARA COUNTY, CA**

## 1.0 INTRODUCTION

This technical memorandum provides the results of our geologic and geomorphic assessment of the Permanente Creek Restoration Plan – 90% Level Submittal, Waterways Consulting, Inc., dated 11/15/18 and updated 10/31/19 (the Project). The focus of the study was to determine if there were any specific areas of the proposed project which require further subsurface geotechnical exploration and testing to refine the project restoration design, so as to respond to comments dated February 14, 2019 from the County of Santa Clara Planning Office ("County"). Specifically, this work focused on a field assessment of the proposed alignment and longitudinal gradient of the proposed stream channel and how it compares to existing conditions. Particular attention was placed on the Rock Pile and Material Removal Area and the proposed depth of excavations required and stability of the adjacent creek sideslopes.

The scope of work for our study included a desktop data review, and site reconnaissance and mapping of the project area to evaluate the geologic conditions in conjunction with the proposed restoration design. The work product from our investigation includes a geologic map and cross sections of the project area, along with this technical memorandum. This memorandum includes:

- A brief presentation of the methods applied in this assessment
- A summary of pertinent supporting data from our previous investigations throughout the facility
- A geologic map and a description of the earth materials encountered along Permanente Creek
- A geologic and geomorphic assessment of the Permanente Creek channel profile
- A discussion of these results and their significance to the proposed Permanente Creek Restoration Plan
- Golder Associates Inc.'s (Golder) conclusions and recommendations regarding this assessment

Golder and the G logo are trademarks of Golder Associates Corporation

# 2.0 METHODS

## 2.1 Data Compilation and Review

Golder reviewed available existing data pertaining to the project including aerial photographs, historical USGS topographic and geologic maps, site boring logs, seismic data from previously completed work within the project area, the Waterways 90% plan set, and pertinent site and regional geologic data.

## 2.2 Site Reconnaissance

Golder conducted a site visit over three days from July 25 to 27, 2019. The field team consisted of three primary members, including a fluvial geomorphologist, a geohazards geologist, and a staff geologist. The field team was given a site orientation and tailgate safety briefing by a locally based senior technician with long term familiarity with the site and specific knowledge of creek access points and safety. Creek access is difficult, and locally hazardous, because of very steep terrain, heavy vegetation, and other obstacles such as loose rock, fallen trees, etc. This rugged terrain also severely limits access for drill rigs to many of the reaches of the creek.

Golder communicated with Waterways to discuss our initial opinions and received feedback as to what specific reaches or features needed further study, or have the most uncertainty, with respect to the 90% design effort to focus our field mapping efforts. The field mapping efforts focused on the reaches that include the following two areas: 1) Rockpile and 2) Material Removal Area. Note, however, that the entire project area was traversed on foot by the field reconnaissance team.

## 2.3 Field Mapping

The mapping focused on defining areas of mining disturbance, (e.g., overburden, roads, structures, etc.) versus native slopes and development of geologic cross sections in key locations (e.g., Rockpile and Materials Removal Area). The mapping also identified other pertinent geomorphic features such as native slope angles, natural shallow slides, areas of erosion, sediment accumulation, bedrock exposures, etc.

# 3.0 REGIONAL GEOLOGIC AND GEOMORPHIC SETTING

## 3.1 Bedrock Geologic Units

The bedrock materials exposed in the Quarry are part of the Permanente Terrane of the Franciscan Assemblage. The Franciscan Assemblage is comprised of highly deformed and variably metamorphosed, marine sedimentary rocks with submarine basalt (greenstone), chert, and limestone. The Franciscan is considered a tectonic mélange that was formed in the subduction zone between the Pacific tectonic plate and the North American plate. This plate boundary is now a transform, strike-slip plate boundary defined by the San Andreas Fault zone located about two miles southwest of the Quarry.

Golder has referenced two geologic map sources in our presentation of the geology of the Permanente Creek Basin (Figure 1). One set of maps comes from the Cupertino and Mindego Hills quadrangles (Dibblee and Minch 2007a and b), and the other comes from the San Francisco Bay Landslide Mapping Team (USGS 1997). Previous researchers have mapped the basin (Brabb 1970, Pulver 1979a and b).

## 3.2 Surficial Geologic Units

### 3.2.1 Overburden and Fill

Many of the south-facing slopes that flank Permanente Creek are mantled with varying thicknesses of overburden. These are generally described as side-cast fills that mantle existing canyon slopes and fill small

drainages and swales that formerly reported to Permanente Creek. The overburden deposits are of highly variable thickness, starting at the Rock Pile Area and continuing up through the Material Removal Area. A large percentage of this material within the Project area will be removed as part of the restoration effort.

The Rock Pile area is comprised of stockpiled material for production. The character of the overburden is variable but generally consists of fine to coarse gravel to angular cobble sized rock fragments. Elsewhere, overburden is a heterogeneous mixture of fines, sand, gravel and cobble sized fragments (i.e., greenstone, graywacke, cherts, and soil materials) but with small percentages of limestone.

### 3.2.2 Alluvium

This includes modern unconsolidated alluvial deposits along the active stream channel of Permanente Creek. These deposits are comprised of a poorly sorted mixture of cobbles, gravels, sand, silt and clay. Deposits range from a few inches thick in the upper reaches of the watershed where erosion has cut the channel down into bedrock, to tens of feet thick where the channel widens and deepens as it approaches the flatter terrain of the Santa Clara Valley.

### 3.2.3 Colluvium

Colluvial and slope wash deposits are common throughout the steep terrain of the Santa Cruz Mountains. In general, the natural slopes in the region are overlain with approximately one to two feet of soil and colluvial materials, which thicken to several feet or more in the larger natural swales in the region. Colluvium is generally described as predominantly clayey sand with gravel to clayey gravel, with some gravelly clay.

### 3.2.4 Ancient Natural Landslide Deposits

Several large, ancient landslides have been mapped by various investigators in various areas of the 3,510-acre Lehigh property, and throughout the broader foothill's region (Figure 1). These landslides are generally described as possible old landslides and considered to be early Holocene or possibly late- Pleistocene features. These are naturally occurring landslides that are not related to any modern day mining activities. Along the south flank of Permanente Creek, two large landslides are identified by Sorg and McLaughlin (1975) while Rogers and Armstrong (1973) map only one of the landslide features.

The presence of these ancient landslides, as well as much smaller surficial slides that occur along the canyon walls, and in steep zero-order drainages that report to Permanent Creek, reflects the young, steep geologic terrain that comprises the Santa Cruz Mountains. The relatively thin surficial failures that are common in this terrain are to be expected going forward with this Project both from natural sources—like the zero-order drainages along the south canyon wall—and potentially from restored natural grades once overburden is removed as part of the Project. Note that one of the primary goals of the creek restoration program is to remove specified overburden and fill materials and restore, to the extent practicable, natural slope angles both along the longitudinal profile of the creek and transverse to the creek (i.e., the creek banks).

## 3.3 Faulting and Seismicity

The San Andreas Fault zone is located approximately two miles southwest of the Quarry (Figure 1). The Sargent-Berrocal Fault Zone (SBFZ), part of the Santa Cruz Mountains front-range thrust fault system, parallels the San Andreas to the east and forms the eastern-most structural boundary to the Permanente Terrain.

Near the Quarry, the SBFZ consists of two northwest-trending, sub-parallel faults, namely the northeastern-most Monta Vista Fault Zone and the southwestern-most Berrocal Fault Zone (Sorg and McLaughlin, 1975) (Figure 1).

The Monta Vista Fault Zone is located approximately 1 mile to the northeast of the Quarry. A strand of the Berrocal Fault Zone lies beneath the Permanente Cement Plant area to the south of the EMSA, and extends west to other portions of the Quarry (Mathieson, 1982; Sorg and McLaughlin, 1975).

Using the 2008 Update of the United States National Seismic Hazard Maps (Peterson, et.al., 2008), which incorporates the findings of the Next Generation Attenuation Relation Project, Golder estimates that design peak ground accelerations should be approximately 0.57g for the site.

## 4.0 BASIN GEOMORPHOLOGY

The geomorphology of the Permanente Creek basin is influenced by multiple active geologic processes. The highly active tectonics of the San Andreas Fault and other nearby faults and fault zones result in a high rate of uplift and relatively frequent, high magnitude earthquakes. The tectonic activity has modified both the headwater basins and offsets lower elevations of landscape in juxtaposition to each other. The relatively frequent occurrence of high magnitude earthquakes is likely to have increased magnitude and occurrence of ancient, naturally-occurring landslides within the basin. Additionally, the highly variable rock types, tectonic histories, and geomechanical properties of the accretionary island arc geology of the Franciscan mélange have resulted in highly differential rates of erosion. These differential erosion rates are expressed in the varying morphologic characteristics of the basin.

As an added complexity, the carbonate units of the Franciscan complex have resulted in carbonate-rich water precipitating travertine deposits on the bed and banks of Permanente Creek. These travertine deposits interact with the self-forming step-pools of the steeper portions of the channel and contribute to a repeating cycle of travertine dam formation and breaching (Fuller et al. 2010). Additionally, the subsurface precipitation of travertine in the interstitial voids between sediment grains in sediment deposits increases the intergranular bond strength, making the sediment more resistant to erosion and potentially decreasing the rippability of the material.

In addition to the natural processes interacting with the basin morphology, the long history of mining in the basin has also substantially interacted with the surface processes defining the basin morphology. The very high rate of sediment supplied to the channel, in the form of overburden and fill placed along the margin of the stream channel during the early history of mining (1940s and 1950s), has resulted in aggradation of the channel in lower gradient portions of the channel.

### 4.1 Fault Influence

The drainage basins of the northeast side of the Santa Cruz mountains are characterized by geomorphic features that are controlled by faulting. The features include right-lateral deflected and offset drainages, drainages that follow lineaments, sidehill benches, closed depressions, aligned benches, linear scarps, linear troughs, saddles, and linear vegetation contrasts (Smith 1981).

In the downstream portion of the basin, the Monte Vista-Shannon fault zone defines geomorphic features. These features are believed to have been formed during the Pleistocene and possible Holocene. They include the reverse displacement of lower elevation sediment to higher elevations than those of their original deposition, forming benches, saddles, linear valleys, faceted spurs, scarps, linear range fronts, linear depressions, and associated vegetation contrasts (Bedrossian 1980, Hitchcock et al. 1994).

Similarly, the Jurassic and Cretaceous aged rocks of the Franciscan Complex are thrust over Pliocene and Pleistocene alluvial sediment of the Santa Clara Formation and younger Quaternary deposits (Sorg and

McLaughlin 1975, Wesling and Helley 1989, McLaughlin et al. 1991, Hitchcock et al. 1994). On the site, colluvial deposits are thrust over fluvial gravel of Permanente Creek, indicating late Pleistocene and possible Holocene displacement (Hitchcock et al. 1994).

Hitchcock and Kelson (1999) noted that coseismic deformation associated with the 1989 Loma Prieta earthquake, was coincident with geomorphic features suggestive of faulting along the Monte Vista-Shannon fault zone (Haugerud and Ellen 1990, Hitchcock et al. 1994, Langenheim et al. 1997). This could indicate that repeated localized contraction is in part coincident with the occurrence of Loma Prieta-type earthquakes. This would suggest a recurrence interval of about 400 years (Working Group on California Earthquake Probabilities 1996). Hitchcock et al. (1994) reported a late Pleistocene displacement rate across the Monte Vista fault zone of 0.3 ±0.2 mm/yr.

## 4.2 Hillslopes and Landslide Processes

The Santa Cruz Mountains are a steep and rugged terrain with a long history of landslide activity. The geomorphology of the Permanente Creek basin exhibits a high rate of dynamic change. This high rate of change, termed morphodynamics, is driven by the complex interaction between the dual processes of rapid uplift associated with the compressional tectonics along the San Andreas Fault system (as discussed above) and the relatively weak, easily erodible, and highly variable rocks of the Franciscan Complex.

The resulting topography forms narrow, steep sided, and actively eroding canyons. The Santa Cruz Mountains, and Permanente Creek canyon, are subject to both shallow (e.g., debris flows or “mudslides”) and deep landslides (e.g., large rotational slumps or translational block glides). Average slope angles in the canyon are approximately 25 degrees (or 2H:1V) which is reflective of the natural stability of the highly broken and sheared greenstone and mélange terrane. Steeper slopes, greater than 35 to 40 degrees, are locally observed in areas underlain by more competent limestone and graywacke bedrock but these are the exception.

## 4.3 Geotechnical Background and Considerations

Golder has a long history of geologic and geotechnical investigations at the Permanente Site starting in 2006 and continuing to present. The investigations include (but are not limited to) sector specific investigations of the quarry pitshell including existing landslides, both the EMSA and WMSA overburden stockpiles and foundation conditions, several investigations for updated storm water basins, a new crusher location and foundation, and a proposed water treatment plant location. In summary, we have an extensive library of material properties and corresponding stability analyses and therefore a good understanding of slope behavior for different types of materials and slope angles. Our geotechnical recommendations for slope design, discussed below, are based on this extensive background. A summary of material types and properties based on a number of our previous investigations is included in Appendix A.

From a geotechnical perspective, the proposed project primarily involves excavation and removal of man-made surficial deposits (i.e., overburden and artificial fills) to restore the creek channel and creek banks back to a more natural state. The intent is to remove the man-made surficial materials down to bedrock (or native soils) while minimizing excavations/cuts into bedrock or soil slopes. In general, excavations onto canyon slopes will only be done where the surfaces have been altered or affected by mining activities. Existing natural slopes will not be modified or excavated.

Our geotechnical recommendations for the Project include:

- Rock Slopes: Slopes greater than 20 feet in height in greenstone materials should not exceed slope angles of 2H:1V if possible. Slopes less than 20 feet should perform adequately at 1.5H:1V; however, localized areas of instability may be encountered. Cutslopes in limestone and graywacke greater than 20 feet in height should not exceed 1H:1V and slopes less than 20 feet should be limited to no steeper than 3/4H:1V.
- Fill or Soil Slopes: For planning purposes, permanent slopes comprised of overburden, alluvium, colluvium or other site-derived fill should not exceed 2H:1V.

Earlier versions of the Project included construction of retaining structures, or engineered structural elements, that warranted more detailed geotechnical investigations for design purposes. Retaining structures have been eliminated from the Project (with the exception of the Material Removal Area), and with other modifications, the main geotechnical considerations are limited to recommended slope angles for final slopes of previously filled or otherwise disturbed surfaces.

The Material Removal Area, and the Rock Pile Area, present the largest challenges due to depths of the cuts that are required, and the steep natural terrain underlying and comprising the hillslopes that are overlain by overburden. In some locations along creek banks, it is anticipated that cuts will expose natural surficial materials (i.e., colluvium and slope wash) as opposed to bedrock and may require localized cuts steeper than 2H:1V in order to daylight the cuts into natural slopes.

The Material Removal Area may require a retaining structure, depending on timing of the creek restoration project with respect to site operations, to preserve infrastructure and access associated with the Upper Water Treatment System (UTS). This is discussed in further detail in Section 6.2.

# 5.0 SITE RECONNAISSANCE AND GEOMORPHIC CHARACTERIZATION

The following section provides a summary of our geomorphic observations of the Project. All station references in this report are coincident with that used by Waterways on Sheets C2-C4 in their 90% restoration plan report (2019).

## 5.1 Overview of Permanente Creek Profile

The profile of Permanente Creek can broadly be classified into depositional reaches and bedrock reaches (delineated on Figure 2 as Reach A, Reach B, etc.). The processes that define these reaches are the rate that sediment is supplied to the channel and the rate at which the channel can convey the supplied sediment. The rate of sediment supply is controlled by hillslope processes and the rate that sediment is delivered to the channel. The rate of sediment transport is controlled by the channel geometry and the hydraulic characteristics of the reach. The channel hydraulics are directly coupled to the rate at which water is delivered to the channel.

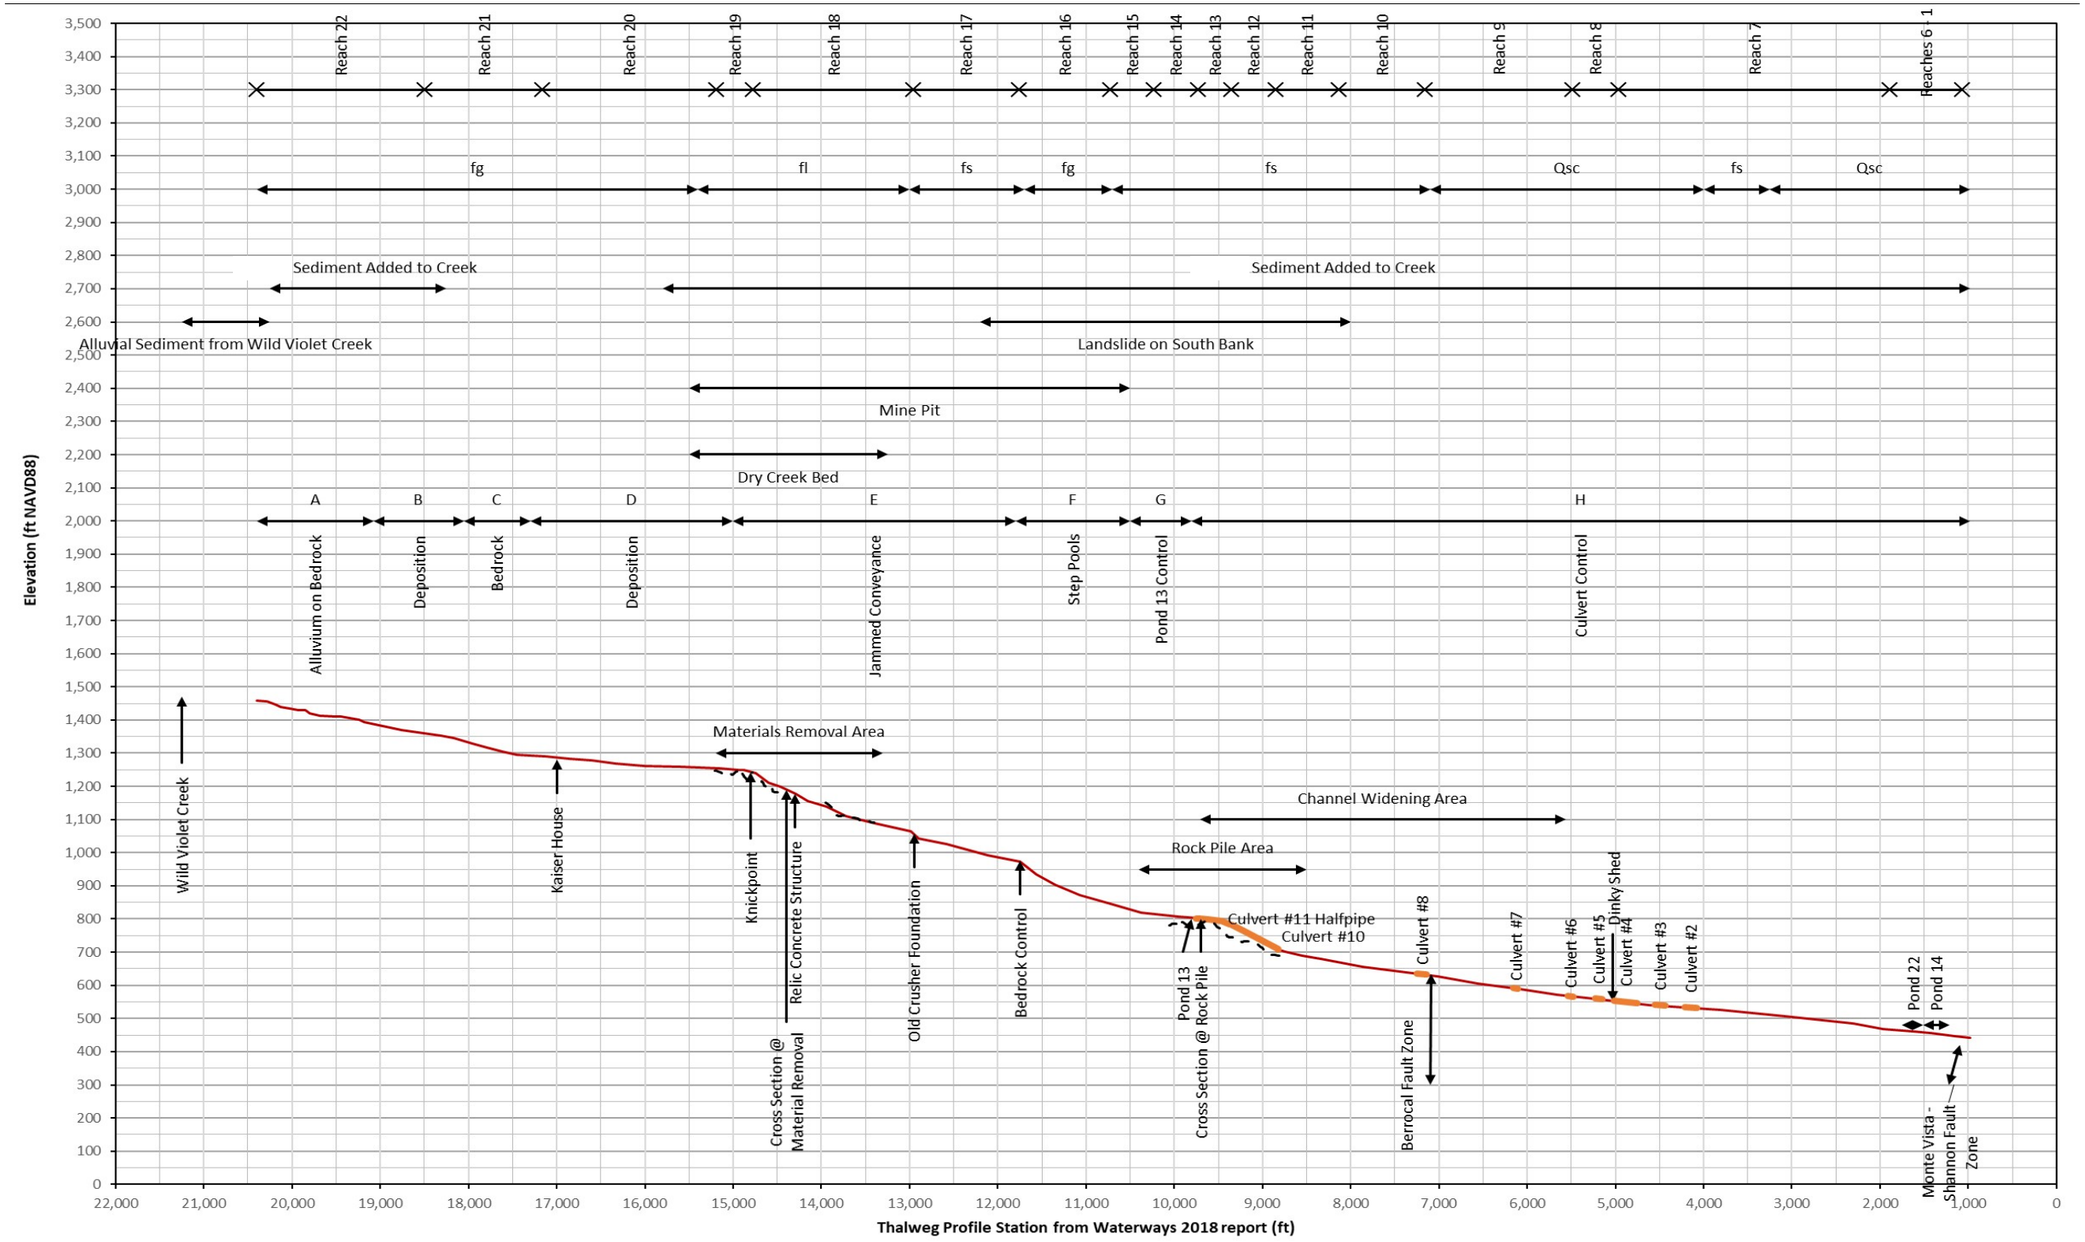

**Figure 2: Permanente Creek Profile with geomorphic and geologic delineations. Stationing from Waterways (2019).**

### 5.1.1 Reach A: Alluvium on Bedrock

The upstream most portion of the survey channel is characterized by alluvium in the form of travertine reinforced step pool morphology that partially covers a bedrock channel. The sediment supplied here is likely to come from natural processes and is likely partially supplied from an alluvial fan originating from Wild Violet Creek. Carbonate-rich water percolates from the south bank of the channel in this reach, indicating that the source of the carbonate-rich spring is likely within the Wild Violet drainage. Geologic maps (Dibblee and Minch 2007a and b) indicate that the limestone unit of the Franciscan complex outcrops within the Wild Violet drainage. The debris from this alluvial fan is being transported downstream and has deposited small terraces along both valley walls. These terraces are possibly abandoned by the modern hydraulic regime of the river and may be coupled to the debris flows originating from Wild Violet Creek.

### 5.1.2 Reach B: Deposition

This depositional reach is characterized by a relatively wide, low gradient, flat valley floor that extends for approximately 1,000 feet along the valley axis. In combination with downstream gradient controlled from the Bedrock reach, the sediment load is too great and too coarse for the local hydraulics to transport, resulting in deposition on the valley floor.

### 5.1.3 Reach C: Bedrock Control

The Bedrock controlled reach is relatively short (750 feet) and has a relatively low gradient (<2%), but the narrow bedrock channel maintains hydraulic and sediment continuity through this reach, resulting in a thin alluvial cover on a bedrock channel bed. It appears that this reach only receives sediment from the channel upstream and conveys almost all of this load through to the downstream reach.

### 5.1.4 Reach D: Deposition

This Deposition reach is characterized by the aggradation of sediment on the valley floor and relatively wide flat valley bottom that receives sediment from the upstream reach and the tributaries that confluence with Permanente Creek from the south. The downstream end of this reach is marked by the occurrence of a sharp change in channel gradient associated with a bedrock knickpoint. This portion of the landscape is within the Materials Removal Area. Further discussion of the implications of these features to the restoration plan are discussed in Section 6.

### 5.1.5 Reach E: Jammed Conveyance

The Jammed Conveyance is very steep (>9%), but due to the large quantity of material it receives, and the armoring effect of both the coarse sediment and the relict mining infrastructure within the channel, a large portion of this material remains within the reach. The geomorphic term ‘jammed’ describes steep channels that are clogged with debris (Zimmerman et al. 2010). Natural channels of this gradient are typically not depositional but rather erosional. The debris residing on the bed in this reach is immobile, and the modern channel alignment is constricted between the debris from the north and the south valley wall for much of this reach. The Material Removal Area is contained within the upstream portion of this reach.

### 5.1.6 Reach F: Step Pools

Downstream of the Jammed Conveyance, a large, mapped natural landslide borders the south bank of the river for the entirety of this reach. The large boulders from both mining and natural sources, as well as woody debris, form large, steep step-pools within this reach. Some of these step-pools appear to have been reinforced with travertine deposits, as evidenced by the relict abutment deposits on the channel margins.

### 5.1.7 Reach G: Pond 13 Control

The reach downstream of the Step Pools reach, appears to act as a gradient control. Although this gradient control may be driven by the back-water effect of the small reservoir at Pond 13, data from the Seismic survey indicates that this feature may be reinforced by naturally occurring bedrock ridges within the channel. A local bedrock ridge is present just downstream of Pond 13 (Figure 2).

### 5.1.8 Reach H: Culvert Control

Downstream from Pond 13 the channel is confined within culverts and canals that do not exhibit a morphologic connection to the adjacent landscape.

## 5.2 Geomorphic Observations

### 5.2.1 Knickpoints

In response to the dynamic changes driven by tectonic base level change, upstream propagating waves of erosion have migrated up Permanente Creek. The upstream most location of a given wave is marked by a distinct change in channel gradient, termed a knickpoint. Knickpoints characteristically migrate more rapidly through more easily erodible material, and more slowly through more erosion-resistant material (Whipple 2004).

**Figure 3 - Travertine Deposits**

The upstream most knickpoint with the assessed channel is located at Station 148+00 within the Material Removal Area (Figure 2). This reach is characterized by a relatively low gradient reach upstream of this point and a steep reach downstream. The steep reach downstream is simultaneously receiving and conveying a large quantity of material, typically composed of the finer fraction of the total sediment load, and aggrading the coarser fraction, composed of large boulders.

### 5.2.2 Travertine

Travertine is a form of limestone precipitate that forms when calcium carbonate-rich water undergoes changes that cause the mineral to transition from solution to a solid state. This transition is largely controlled by physical processes, such as changes in pressure, temperature, or pH, but it can be influenced by biological processes and hydraulic variability as well (Fuller et al. 2010). Golder observed two types of travertine formation in Permanente Creek. One in which stalactites grew out of the southern stream bank downstream of the confluence with Wild Violet Creek, and the other along large portions of the channel where naturally forming step-pools were reinforced by travertine deposition to form travertine dams (Figure 3). These dams display a history of repeated formation and breaching, as evidenced by the clasts of travertine conglomerate from older dams being incorporated into modern dams, as well as the relict abutments of older travertine dams remaining on the channel margins. This natural process has been taking place throughout geologic time along Permanente Creek.

### 5.2.3 Basin Capture

A process termed basin capture can occur whereby drainage networks and flow paths are rearranged through landscape modifying influences of tectonics and surface processes. This process can result in characteristic landscape features like wind gaps, where valley geometry and upstream drainage are mismatched, and fishhooks, where headwater streams exhibit a significant curved alignment where the drainage meets the basin edge. The fishhook morphology is observable in the Permanente Creek basin, and adjacent basins (Figure 4). Evidence of basin capture is significant to the current investigation as the changes in basin area related to basin capture can be associated with a dis-equilibrium between the channel morphology and the sediment regime of the river. More straightforwardly, this implies that the basin used to be bigger, and the current hydrologic regime may not be sufficient to transport the former natural sediment load.

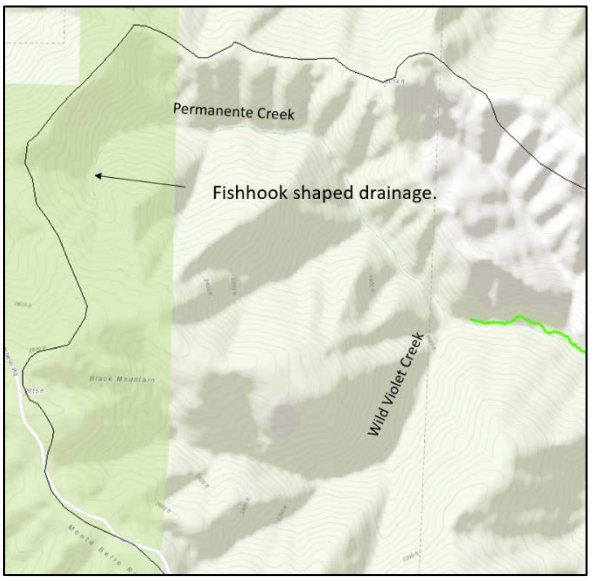

**Figure 4 – Fishhook shaped headwaters**

## 6.0 REVIEW OF RESTORATION DESIGN

This section provides an overview of the Waterways 90% design report (2019) with respect to the design basis and an evaluation of potential geotechnical issues for the Rock Pile and Material Removal Areas.

## 6.1 Geomorphic Design Basis

Waterways has based their geomorphic design on maintaining sediment transport continuity through the constructed reaches and proportionately distributing shear stresses across the channel bed and floodplain areas during floods to maintain a dynamic morphology without destabilizing the landscape. They optimized the design geometry by matching the hydraulics during flooding to the sediment size and transport rate of the channel. Additionally, design geometry incorporated the bankfull width and depth, and pool dimension and spacing relationships, of nearby reference watersheds and analog reaches (URS 2009). Waterways (2019) conducted hydrologic and hydraulic simulations of the restoration design and compared those results to fish passage capability, channel stability, flood conveyance, and sediment transport.

Waterways (2019) design specifications include the following primary elements:

- Engineered Streambed Material (ESM)
- Floodplain Armoring
- Vegetated Rock Slope Protection
- Vegetation Design
- Best Management Practices
- Engineered Woody Debris

- Slope Angle Guidance (Golder 2014)

## 6.2 Material Removal Area Design

**Location:** From Station 150+25 to 130+25

**General Description (Waterways):**

"This area has been modified by the placement of material within and adjacent to the channel… A seismic refraction analysis has been performed to estimate the depth to bedrock, in an effort to gain a clearer understanding of the pre-disturbance site geometry and allow a more informed evaluation of opportunities and constraints to enhancement.

Proposed cuts extend to depths of over thirty feet below existing ground, resulting in profile grades of 7.1% to 22.7%. These grades follow the peaks of the estimated subsurface bedrock profile. Final grades would be determined in the field to best fit bedrock exposures encountered during excavation."

**Design Elements and Objectives:**

- Removal of overburden/fill and a relic concrete structure, and moving the north toe of slope northward 25 feet along the majority of the project area, except near Pond 4A where it will move northward 16 feet;
- Construction of a new channel with floodplain bench areas with habitat elements that will help improve ecological complexity; and
- Installation of native vegetation.

### 6.2.1 Evaluation and Discussion of Materials Removal Area

A geologic and a geomorphic map of the Material Removal Area is presented in Figure 5. Longitudinal and thalweg profiles of this area are presented in Figures 6, 7 and 8. In general, both the cross section and long profile indicate that bedrock is close to the surface throughout the Material Removal Area with the exception of a few local areas where depths may be in the range of 15 to 20 ft bgs. The design approach used by Waterways notes that the estimated bedrock contacts as shown are approximate, and that the design will allow for the work to conform to and follow the bedrock surface as it uncovered during excavation.[1] Golder concurs with this general approach and doesn't believe any additional exploration would provide value to the design above and beyond the data provided by the seismic refraction surveys.

[1] It should be noted that where shown on included figures that the bedrock surface as interpreted from seismic refraction data is approximately located and will be field verified during construction.

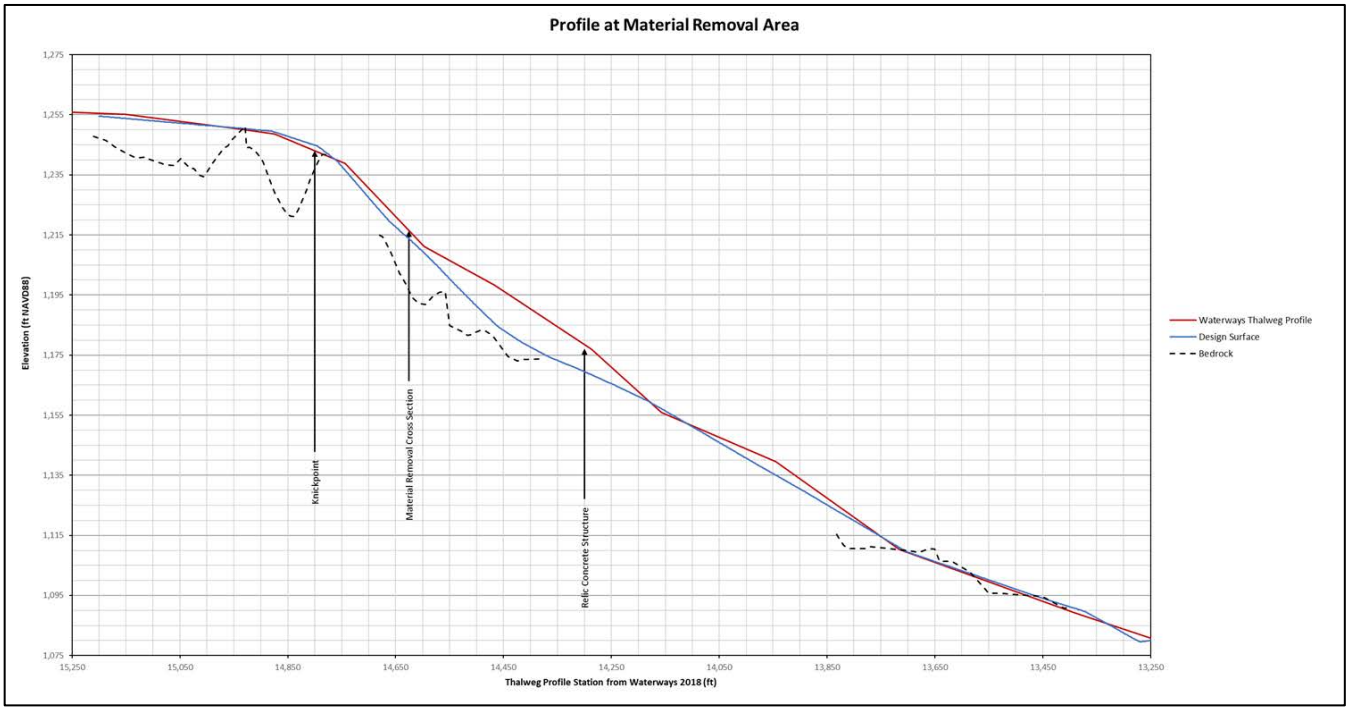

**Figure 6: Profile of Material Removal Area from Station 152+50 to 132+50.**

The following bullet points provide Golder's observations of the design as compared to conditions observed in the site reconnaissance and as informed by the seismic refraction survey data.

- At Station 148+00, bedrock close to the surface is likely the controlling feature of an upstream migrating knickpoint. The design shows the channel invert conforming to knickpoint and then potentially being established on exposed bedrock downstream of the knickpoint. We concur with this design approach. Additional design elements proposed including ESM and other profile control elements such as boulder weirs and sills should help to ensure stability of the knickpoint.
- Between Stations 146+50 and 142+50, the restoration design identifies a large quantity of material for removal from the channel. The relic mining infrastructure may play a role in defining the channel alignment and facilitating an armored surface on some of the debris. The result of the restoration efforts will increase the local gradient within this reach and extend the length of the high-gradient portion of the channel. Sheet C34 of the 2019 plan set provides additional details for Step-pool and cascade channel design segments in this reach to mitigate the local gradient. We concur with this approach and note that field engineering design modifications and follow on monitoring may be necessary to ensure that the post material removal channel geometry is stable.
- Between Stations 138+50 and 134+50, the seismic profiles indicate that bedrock may be encountered below design grade, but as the seismic profile lines were collected adjacent to the channel and not in the thalweg, Golder believes that bedrock may be exposed at relatively shallow depths along the thalweg. We understand that the intent of the design is to construct the channel on exposed bedrock

occurring within the proposed grading envelope and based on our reconnaissance we think this is generally achievable.

- There is a large relic concrete structure located in the left bank of the stream channel five to ten feet above the channel invert (143+00). There is a smaller relic concrete structure located in the channel further downstream. Golder understands that the removal of old mining infrastructure from the channel will increase the connectivity of the channel to the adjacent landscape and also that the relict structures may currently be contributing to the stability of this reach. We understand that weirs and steps will be constructed using material with a minimum size meeting the D50 of the specified material and a boulder sill w/ a minimum size meeting the D84. This design approach is intended to replace any potential stability relic structures are providing.
- The most challenging geologic and geotechnical issue in the Material Removal Area is the presence of the Upper Water Treatment System infrastructure, including the 1250 Pond and associated facilities located along the top of the creek bank and the access road to Permanente Creek. The lifetime of these facilities is uncertain at this time as they are required for on-going operations of the Facility. However, once reclamation is completed, they may no longer be necessary. If the facilities need to be protected during the creek restoration project, a retaining structure (e.g., Mechanically Stabilized Earth wall) will be necessary to maintain the road and the 1250 pond (as shown in Figure 4.0 of Waterways Updated Response Letter to the County dated 3-5-18 shown below). The retaining structure would be required as the design calls for pushing the north bank of the creek approximately 25 further north than current conditions.

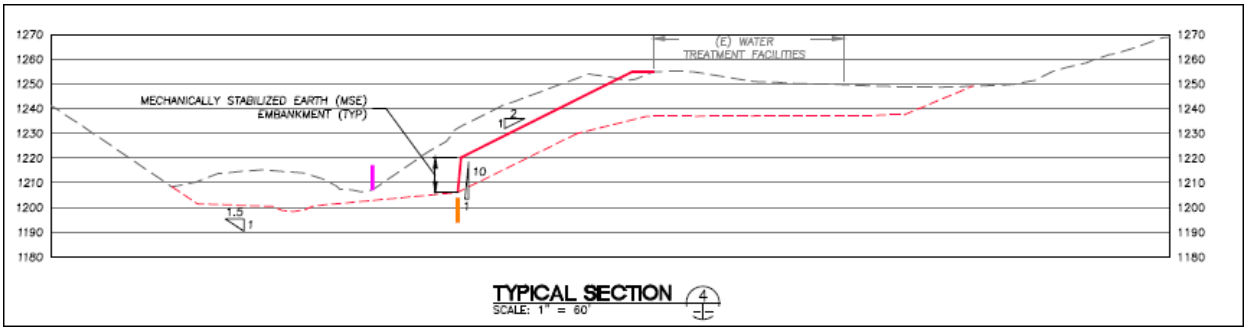

**Figure 7: Typical Section of Potential MSE Wall to protect Water Treatment Facilities**

- If a retaining structure is required, Golder recommends that a geotechnical investigation be performed along the alignment of the wall to verify depth to bedrock and to obtain appropriate design parameters for the design of the wall. However, depending on the timing of the restoration project, a retaining structure may not be necessary and therefore we recommend delaying any further investigation until such time it is needed. Figure 8 illustrates the design surface and bedrock conditions if the slope can be graded back at 2H:1V. This slope configuration meets Golder's general recommendations for cutslopes developed in surficial materials and is considered acceptable.

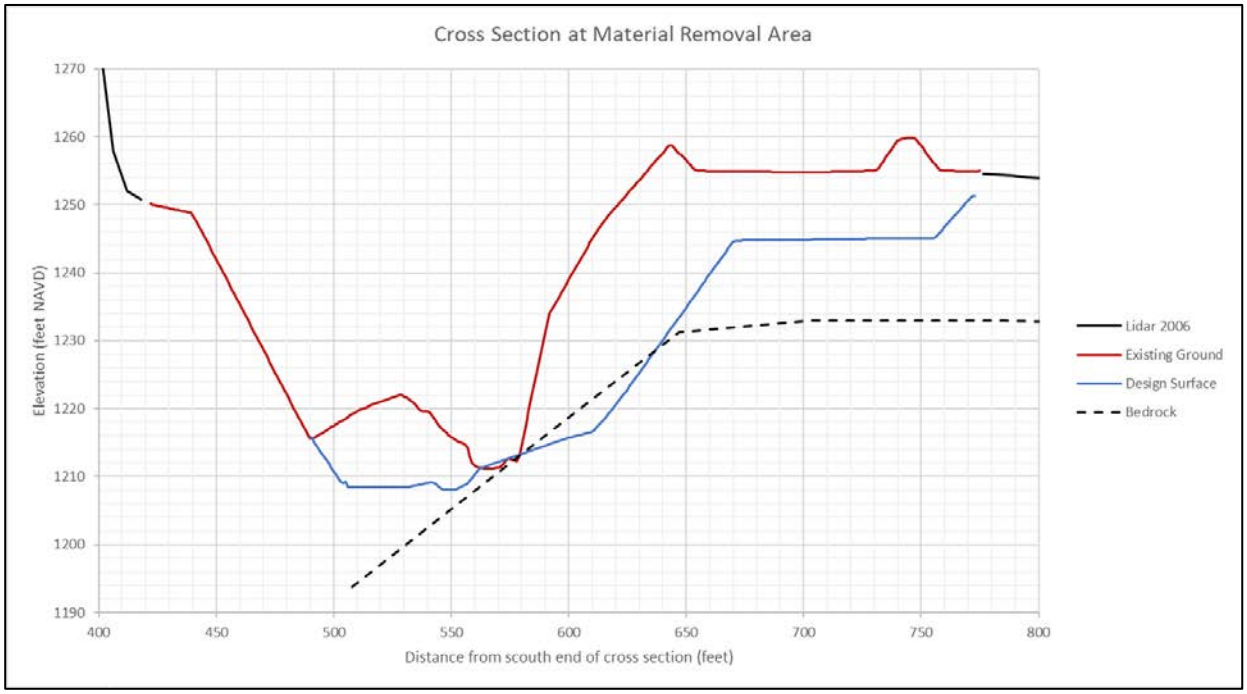

**Figure 8: Cross section at Material Removal Area. Located at Thalweg Profile Station 146+00. Note depth to bedrock is approximate and estimated based on seismic refraction data.**

## 6.3 Rock Pile Area Design

**Location:** From Station 104+50 to 85+50 within the Channel Widening Reach.

**General Description (Waterways 2019):**

"Extensive channel realignment and reconstruction is proposed throughout this area, including removal of Culverts #10 & #11 and the dam at Pond 13…. Cuts approximating thirty to forty feet of depth are required to accomplish this. The grading plan reflects the Lower Limit of Potential Design Channel Invert. The Upper Limit of Potential Design Channel Invert shown in profile has been established as a best fit to bedrock elevations that were estimated using a seismic refraction analysis and geotechnical borings. Final geometry will likely vary somewhat from that shown on the drawings, as necessary to conform to existing bedrock.

The rock pile and associated infrastructure will be removed to accommodate the lowered and widened channel…The slope exposed below the Rock Pile will be inspected by the Geotechnical Engineer or Project Engineering Geologist to evaluate the nature and stability of the exposed material and provide recommendations, as necessary, to ensure geotechnical stability of the slope and access road."

**Design Elements and Objectives:**

- Removal of concrete road segments and road-related fill material;
- Removal of 930 linear feet of culverts and daylighting of the creek that will help improve ecological complexity;
- Construction of a new channel with floodplain bench areas with habitat elements that will help improve ecological complexity;

- Removal of Rock Pile, retired Rock Plant conveyor system and associated infrastructure;
- Removal of Pond 13 dam/metal infrastructure; and
- Installation of native vegetation.

### 6.3.1 Evaluation and Discussion of Rock Pile Area

A geologic and a geomorphic map of the Rock Pile Area is presented in Figure 9. Cross sections and thalweg profiles of this area are presented in Figures 10 and 11. Appendix B includes Figure 1 from Waterways Updated Response Letter to the County dated March 5, 2018 showing the locations of exploratory borings drilled previously by Golder in the area of the Rockpile restoration work and boring logs. The following discussion provides additional observations of specific design elements as compared to conditions observed in the site reconnaissance and as informed by the seismic refraction survey data.

- In the Rock Pile Area, Golder's comparison of the restoration design with seismic survey results indicates that bedrock ranges from about 5 feet to approximately 25 feet below ground surface with significant relief along the longitudinal profile (Figure 10). As with the Material Removal Area, the design intent will allow for the work to conform to and follow the bedrock surface as it is uncovered during excavation.
- The interpreted depth to top of native alluvium or bedrock for borings along the proposed thalweg (Borings 1101 and 1103) is approximately 25 feet although native surficial materials were likely encountered approximately 5 to 10 feet shallower. Boring 1107, also along the thalweg but near the downstream limit of the area, encountered a concrete structure at approximately 7 feet bgs interpreted as being near original ground surface along the channel thalweg. The remaining borings were drilled upslope of the thalweg to evaluate depths of fill along the toe of the proposed slope. In general, these borings indicate depths of overburden along the toe of the slope in the range of 60 to 70 ft bgs.
- The bedrock surface depicted on Figure 10 is close to the "Upper Limit of Potential Design Channel Invert" as defined by Waterways (based on seismic lines and verification borings), whereas the grading plan included on the design drawings represents the "Lower Limit of Potential Design Channel Invert" to show the maximum extent of potential grading. It is our opinion based on the review of available data that the constructed profile will be close to the "Upper Limit" upstream of Rock Pile Design. In summary, it is our opinion that the design is reasonable, and additional exploration will not provide value to the design above and beyond the data provided by the seismic refraction surveys and previous completed borings.
- The seismic data also identifies a potential former bedrock channel, which extends through the Rock Pile Area that in some locations is north of the proposed thalweg (Figure 11). Golder understands that Waterways has, to the extent possible, re-occupied the historic thalweg; however, extensive grading would be required in some areas to realign the channel and move it further to the north to occupy the historic channel thalweg. We understand that pushing the toe of the slope further north is not considered feasible given that this would require significant flattening of the slope which would impact the extensive infrastructure located at the top of slope including the main access road and the crusher facility. Golder recommends that field engineering design modifications be applied to utilize existing

bedrock topography and historic thalweg to the extent possible to meet the desired restoration outcomes.

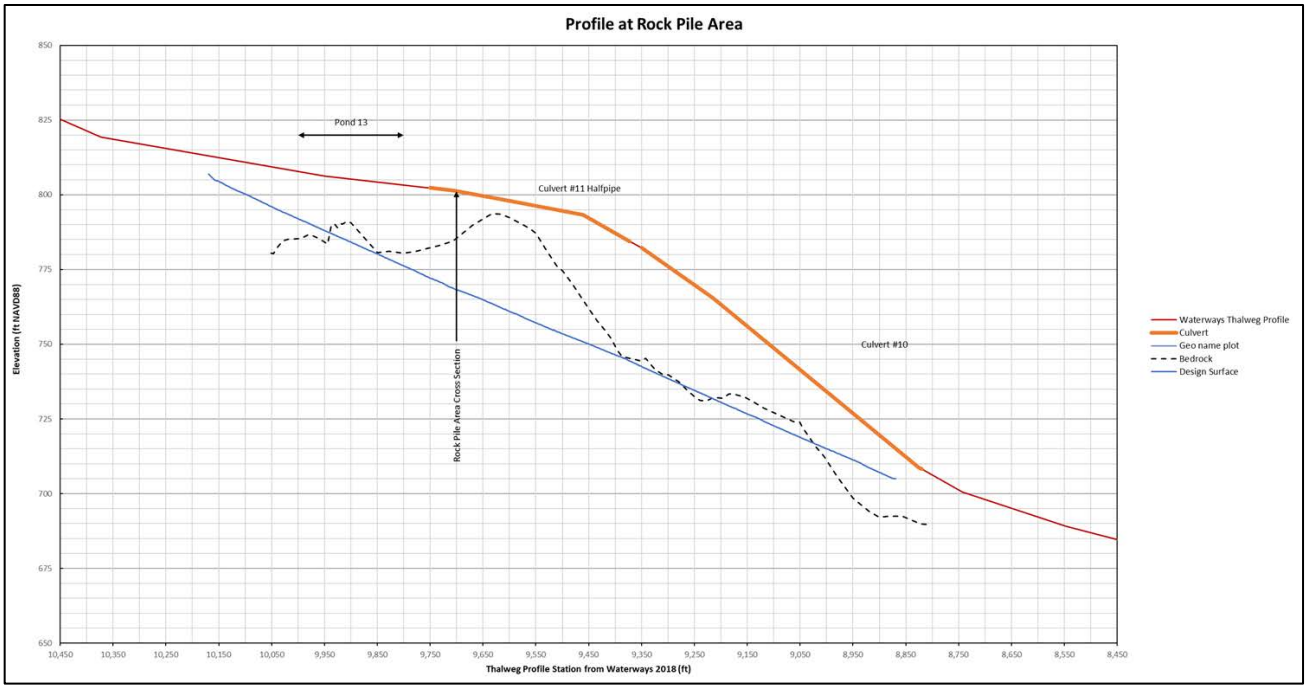

**Figure 10: Profile of Rock Pile Area from Station 104+50 to 84+50.**

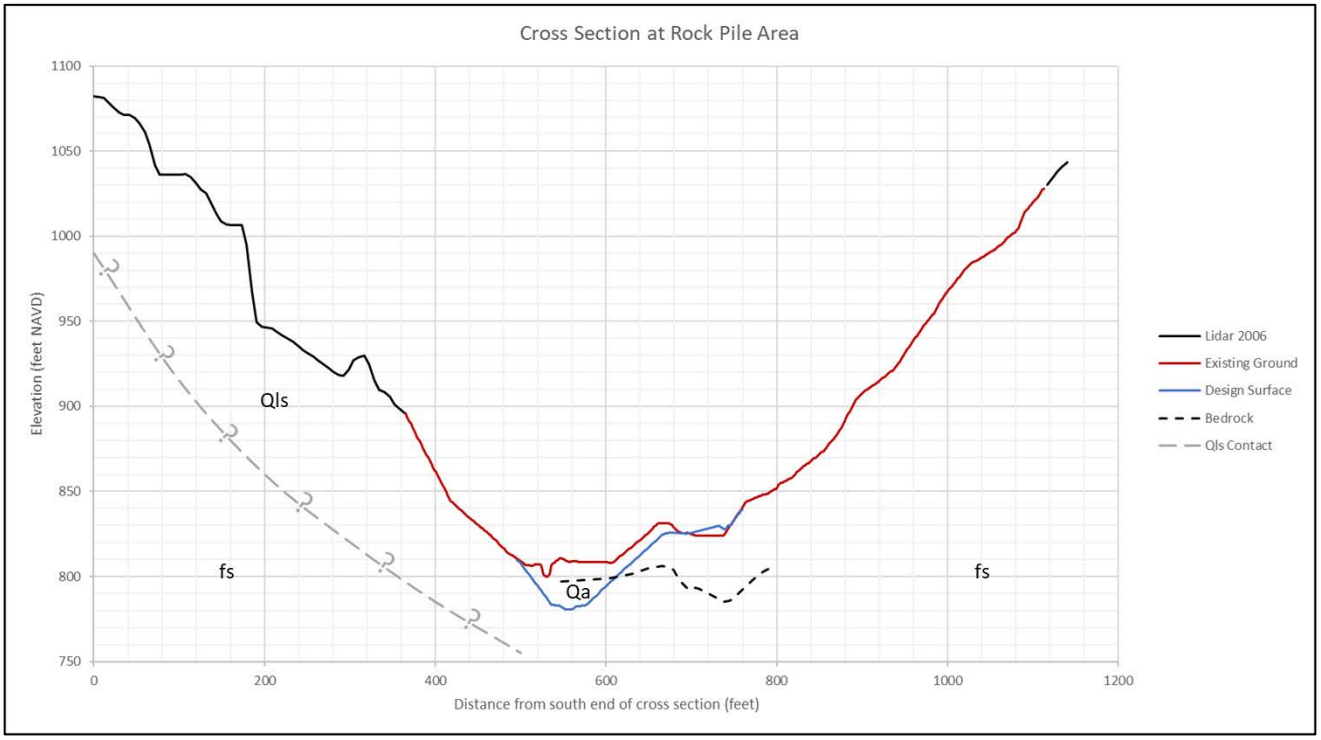

**Figure 11: Cross section at the Rock Pile Area. Located at Thalweg Profile Station 97+00.**

- The removal of the two culverts and creation of a floodplain with an inset channel in this reach will re-establish the lateral connectivity of the channel to the adjacent hillslopes. Reconnecting the channel to the adjacent landscape will have positive benefits as designed by Waterways, but it will also increase the potential for a laterally migrating channel to affect adjacent hillslopes. The north valley wall will consist of the excavated Rock Pile and the south valley wall is defined as a large, ancient landslide based on regional geologic mapping.
- The seismic data indicate that there is a bedrock ridge, oriented perpendicular to the valley axis, located just downstream of Pond 13. It appears that Pond 13, and/or the underlying more resistant bedrock, may be acting as a grade control structure on the reach upstream of Pond 13 (Figure 10).The channel morphology upstream of Pond 13 appears to have adjusted to this local gradient control and has resulted in the aggradation of sediment upstream of Pond 13. We understand that, the channel upstream of Pond 13 will be excavated into the stored sediment and depending on the depth to bedrock, a large proportion of these sediments will be removed as part of the restoration effort. In addition, we understand that grade control will be installed at the upstream limits of work under either Profile scenario.

# 7.0 CONCLUSIONS AND RECOMMENDATIONS

In this section, Golder summarizes the finding of our investigations and provides recommendations to facilitate the implementation of the Restoration Plan (Waterways 2018).

## 7.1 Adaptive Management and Monitoring

In our opinion, the most effective way to ensure a successful project is thorough engineering observation and field fitting of final profiles during excavation activities. This is the best way to achieve the goal of restoring natural profiles while minimizing excavation of native soils or bedrock materials. Note that this is a well-established concept first described and promoted by Karl Terzaghi as the “Observational Method” and was later described in detail by Ralph Peck (1969). The intent of the method is to balance the cost of investigation and design while still achieving a successful project through adaptive management in the field. The method entails designing to the most probable conditions rather than the most unfavorable conditions. Data gaps are filled by detailed observations during construction and designs are modified as needed.

It is important that stakeholders recognize that this is a restoration project, not an engineered stream channel, and this will by necessity entail restoration of new slopes to match previously existing slopes. This will require slope angles which, in some cases, may evidence stability just like the existing natural slopes. In our opinion, additional subsurface exploration will not alter this fundamental concept or improve the project outcome. Rather, it is understood by the Project team that shallow slides and/or erosion may occur on restored natural slopes.

## 7.2 Evolution of Design

The plan set is in general conformance with the applicable geotechnical recommendations as outlined in our “Preliminary Geotechnical Recommendations for Conceptual Level Permanente Creek Restoration Plans” dated April 28, 2014 (Golder 2014). We note that several structural construction elements that were part of the original project design in 2014 have been eliminated from the 2019 plan set. With the exception of a possible MSE wall in the Material Removal Area, structural elements such as gabions or retaining walls, which would warrant more detailed subsurface investigation and testing, are no longer part of the project.

## 7.3 Field Observations and Adaptive Management

As stated in the Field Engineering Notes section of the project plan notes (Sheet C28) stability of hillsides may necessitate:

- Field engineering and a field directed construction approach, i.e., field observations and adaptive design as discussed above
- Final geometries to be directed in the field by the Project Engineer to account for unanticipated subsurface conditions
- Flexibility with respect to final gradients and defined “grading envelopes” for channel gradients
- A narrowing of floodplain widths in areas where the final design profile approaches the lower limit of the grading envelope
- Slope benching to reduce slope angles and lengths in areas of disturbed terrain, and to control surface runoff and erosion while vegetation is established

We concur with the above recommendations, and the Field Engineering Notes in general, with respect to addressing and minimizing potential slope instabilities. We further recommend that the Project Geotechnical Engineer or Project Engineering Geologist inspect all interim and final cutslopes as the project progresses such that any potential areas of concern can be identified early in the process and remedial measures developed, if required.

## 7.4 Material Removal Area

The Material Removal Area may require a retaining structure, depending on timing of the creek restoration project with respect to site operations, to preserve infrastructure and access associated with the Upper Water Treatment System (UTS). Our understanding is that Waterways is recommending that work at the Material Removal Area is sequenced to occur after other portions of the project are constructed if the treatment facilities and Pond 1250 need to remain in place at the start of project implementation. Work would start with the Channel Widening Area and generally proceed upstream. The second phase of work would include the Rock Pile Area. The final stage of work would include the Material Removal Area.

If the MSE wall is required, then Golder recommends a geotechnical investigation be completed to prepare final design and construction plans. Based on the above construction sequence, there will adequate time to plan, permit and implement this investigation even after the project has started.

## 7.5 Rock Pile Area

The main geotechnical challenge for the proposed project is likely related to the Rock Pile Area which entails a reach of the creek where culverts will be removed, and a large stockpile of aggregate materials placed along the margin of the creek and up onto the hillside to a height in excess of 200 vertical feet. The estimated thickness of the rock pile ranges up to 100 feet. Estimated natural slopes angles underneath and above the rock pile are shown as steep as 1H:1V. We recommend inspection of these slopes by the Project Engineering Geologist or Geotechnical Engineer following the removals to evaluate the geologic conditions and stability of the exposed materials. If the removals expose bedrock, stability of the slopes should be adequate. However, if the cut leaves significant thicknesses of overburden in place, potential localized slope instability may be encountered. Golder

recommends that Lehigh and Waterways have contingency plans in place to design and implement remedial measures such as:

- Additional localized removals of loose or unstable materials
- Slope laybacks and benching
- Engineered drainage controls
- Buttresses or slope sections comprised of compacted rockfill

## 7.6 Travertine Deposits

The deposition of travertine between clasts in step-pools and dam-like structures, as well as deposited sediment that is accessed by the channel flow is likely to have increased the apparent strength of localized areas of alluvial materials along the channel. This cementation may make the removal of this material more difficult than anticipated and may play a role in long term channel stability. Golder recommends that this cemented material be left in place wherever possible to augment the restoration design.

**RE: SLOPE STABILITY ANALYSES, PERMANENTE CREEK RESTORATION PLAN, LEHIGH SOUTHWEST CEMENT COMPANY AND HANSON PERMANENTE CEMENT, INC. PERMANENTE QUARRY, CUPERTINO, CALIFORNIA**

Ms. Guerra,

Golder Associates Inc. (Golder) is submitting this technical memorandum to Lehigh Southwest Cement Company and Hanson Permanente Cement, Inc. (Lehigh) to present the results of our slope stability analyses of the proposed Rock Pile and mining overburden removal to the design finished grade related to Permanente Creek Restoration Plan, herein referred to as the Restoration Plan (Waterways, 2018)[1], at the Permanente Quarry in Cupertino, California. This work was performed in support of our response to comments dated June 25, 2021 compiled by ESA and submitted to the County of Santa Clara regarding the Permanente Creek Restoration Plan (PCRP).

The following sections provide a brief description of the analyses that were performed, the results and conclusions, and relevant slope stability analyses model outputs are provided as Attachment 1.

## 1.0 MODEL DEVELOPMENT

Golder analyzed cross-section C-C', shown on Sheets 19 and 21 of the Restoration Plan, 90% design submittal (Waterways, 2019). This cross-section location is considered critical for slope stability because it consists of, nominally, the greatest height of the rockpile overburden material (250 feet measured from toe to crest) and captures the steepest inclinations of both the existing rockpile (approximately 1.1H to 1.2H:1V) and underlying native metabasalt (aka greenstone) (approximately 1H: 1V). The geometry of the existing site conditions is based on topographic data per a survey collected by Lehigh in May 2011. The Restoration Plan provides additional information regarding the interpretation of the depth to the underlying native bedrock. The topographic data provided to Golder was truncated at the existing haul road on the north side of the creek at approximately elevation 1070 feet (El. 1070), therefore, model geometry north of the haul road was estimated based on measurements from Google Earth.

In lieu of piezometer data along cross-section C-C', Golder assumed a phreatic surface based on our understanding of the general subsurface water conditions along the south rim of the quarry as informed by long

[1] Waterways Consulting, Inc. 2019. Permanente Creek Restoration Plan Grading Plan 90% Design. Santa Clara County Grading Permit Submittal, October 31, 2019.

Golder and the G logo are trademarks of Golder Associates Corporation

term installation and data collection from vibrating wire piezometers installed between the quarry and Permanente Creek. The analyses performed here assumed the depth to water is approximately 75 feet below the existing haul road and declines through the native bedrock to a depth of approximately 20 feet below the existing culvert in the creek (near original creek thalweg elevation).

## 2.0 ANALYSES

Golder performed 2-dimensional, limit equilibrium slope stability analysis along cross-section C-C' using Slide2 Modeler, Version 9.012[2]. The analyses presented here used Spencer's method of analysis because it satisfies static horizontal and vertical equilibrium as well as moment equilibrium. These analyses evaluated circular failures only because the interpretation of the subsurface conditions indicate a block type failure is unlikely (i.e., no weak horizontal stratum). Critical slip surfaces and corresponding FOS were evaluated for local failures through upper and lower portions of the respective slopes as well as global failures that span from the ultimate crest to ultimate toe of the final slope configuration.

Golder analyzed the following four cases for slope stability:

1. The existing rockpile overburden given existing conditions.
2. The interpreted native bedrock following excavation and removal of the rockpile overburden and underlying thin surficial deposits.
3. The interpreted native bedrock surface in the creek bottom following excavation to the expected upper limit of the design finished subgrade of the creek per the Restoration Plan.
4. The interpreted native bedrock surface in the creek bottom following excavation to the expected lower limit of the design finished subgrade of the creek per the Restoration Plan.

As a limited sensitivity analysis, Golder evaluated each of the above four cases considering the assume phreatic surface described in Section 1 as well as under dry conditions to bracket the range of factors of safety (FOS).

## 3.0 GEOTECHNICAL PARAMETERS

The geotechnical parameters used in slope stability analyses are summarized in Table 1 and described below.

**Table 1: Summary of Geotechnical Parameters**

| Material | Unit Weight (pcf) | Cohesion (psf) | Effective Friction Angle (degrees) |
|---|---|---|---|
| Rockpile Overburden | 125 | 0 | 40 |
| Metabasalt/Greenstone | 165 | 6,480 | 30 |

Notes: pcf = pounds per cubic foot
psf = pounds per square foot

[2] Rocscience Inc. 2020. Slide 2 Modeler, 2D Limit Equilibrium Analysis for Slopes. Build Version 9.012. Build date December 11, 2020.

Golder assumed the rockpile overburden has a unit weight of 125 pounds per cubic foot (pcf) with 0 cohesion and an effective friction angle ($\Phi$') of 40 degrees. Its assumed friction angle corresponds to the rockpile's angle of repose and these assumed shear strength parameters yield a minimum static FOS of 1.0 which is reasonable considering the rockpile has performed well and appears stable since its placement.

Numerous previous analyses were performed by Golder[3] to back calculate, test, and develop shear strength parameters for the native greenstone at the site. These investigations and analyses determined the characteristics of the greenstone vary across the site with poorer quality greenstone generally observed in the northern portion of the quarry and better-quality rock located along the southern and southeastern portions of the site. The best geologic analog for the Rock Pile area is the nearby southern quarry rim which is located about 1500 feet west-northwest of the Rock Pile. The two areas are on trend with respect to the structural fabric of the quarry, and it is our opinion that they likely are underlain by the same general package of Franciscan bedrock comprised of a mixture of metabasalt and graywacke with associated interlayered limestone blocks.

Golder performed a detailed investigation and analyses of the south quarry area for the purpose of final pitslope design in 2008. The results of this work are included as Chapter 9 of our geotechnical report published in support of the updated 2011 Reclamation Plan. Four coreholes were installed in the south quarry rim and approximately 1500 feet of core were recovered and analyzed. Rock mass properties used for the pitslope design were developed from geotechnical core logging, point load testing, and laboratory testing of the core. Mohr-Coulomb strengths for the rock units were estimated from Hoek-Brown strengths using the computer program RocData, by Rocscience. Based on this previous work, Golder assumed the metabasalt/greenstone unit has a unit weight of 165 pounds per cubic foot (pcf) with 45 psi cohesion and an effective friction angle ($\Phi$') of 30 degrees.

## 4.0 RESULTS

The results of slope stability analyses are summarized in Table 2 and relevant model outputs are provided as Attachment 1.

[3] Golder Associates Inc. 2011. Geotechnical Evaluations and Design Recommendations (Revised), Permanente Quarry Reclamation Plan Update, Santa Clara County, California. December 2011.

**Table 2: Summary of Slope Stability Analyses**

| Case | Failure Mode | FOS | |
|---|---|---|---|
| | | Hypothetical Dry Conditions | Assumed Phreatic Surface |
| 1 – Existing Conditions | Upper Slope | 1.13 | 1.13 |
| | Lower Slope | 1.15 | 1.15 |
| | Global | 1.37 | 1.37 |
| 2 – Excavate Rockpile | Local (Upper Slope) | 2.09 | 1.98 |
| | Global | 2.32 | 2.05 |
| 3 – Excavate to Upper Limit of Finished Grade | Local (Upper Slope) | 2.09 | 1.97 |
| | Lower Slope | 5.58 | 5.13 |
| | Global | 2.14 | 1.87 |
| 4 – Excavation to Lower Limit of Finished Grade | Local (Upper Slope) | 2.09 | 1.98 |
| | Lower Slope | 4.92 | 4.37 |
| | Global | 2.13 | 1.83 |

## 5.0 CONCLUSIONS AND CONSIDERATIONS

The results of the analyses presented here indicate the proposed excavation of the existing rockpile as well as excavation to both the upper and lower limits of the finished subgrade of the creek per the Restoration Plan will exceed a static FOS of 1.8. These conclusions are based on the interpreted extent of the native metabasalt/greenstone beneath the rockpile as described in the Restoration Plan, the condition (and corresponding geotechnical parameters) of the native metabasalt/greenstone Golder assumed for the analyses, and the phreatic surface Golder assumed for the analyses.

As outlined in our response to comments, and our previous documents published in support of the Permanente Creek Restoration Plan, a qualified professional engineer or geologist is required to inspect and map the native bedrock that is exposed beneath the rockpile overburden to confirm, or modify, the assumptions made to perform these analyses. If the observed conditions are different than those assumed here, additional analyses may be required.

## 6.0 CLOSING

Please contact the undersigned if you have questions or require clarifications regarding the information provided in this memorandum.

# Sampling, Analysis, and Management Plan for Soil and Sediment Material from Maintenance Projects

**Description:**
Soil and sediment material that is generated from maintenance projects conducted at the Lehigh Permanente Facility (Site) will be sampled, analyzed, and managed according to this standard operating procedure (SOP). This document is intended to provide instructions to adequately manage soil and sediment from maintenance operations by specifying screening guidelines, testing requirements, and placement to conform to applicable Federal, State and Local regulations.

**Regulatory Framework:**
The San Francisco Bay Regional Water Quality Control Board (Water Board) issued Waste Discharge Requirements, Order No. R2-2018-0028, (WDRs) to Lehigh for the Permanente Facility. The WDR regulates discharges to land and governs wastes and activities that generate waste at the site that have the potential to impact groundwater and hydrogeologically connected surface waters. Operations and maintenance of Waste Management Units (WMUs) at the Facility, including the Eastern Material Storage Area (EMSA) and Western Material Storage Area (WMSA), must be conducted in accordance to California Code of Regulations (CCR) 27 (Title 27), section 13263 of the California Water Code (CWC) and the approved plans required by Waste Discharge Requirement Order No. R2-2018-0028. The purpose of the procedures set forth herein is to ensure that material placement resulting from soil and sediment removal from maintenance operations is consistent with the requirements established by the WDRs.

- **Responsibility**— Environmental Department
- **Applicability**— Sampling and sediment of creek sediment originated from culvert cleanout activities
- **Affected Area**— Culverts in Permanente Creek
- **Frequency**— As needed
- **Attachments**— Attachment A – Environmental Screening Levels
- **Safety**—Basic Plant mandated PPE is required

**Procedure:**
Soil or sediment samples will be collected by Lehigh personnel and sent to laboratory for analysis. Samples will be analyzed for parameters listed on Table 1 and results compared against the most recent, applicable Water Board's Tier 1 Environmental Screening Levels (ESLs) for soils and groundwater as modified (Attachment A contains the 2019 ESLs for metals, the primary constituents of concern), as described below.

The documentation required includes:

1. Reports of removed material volume, date of removal, and location
2. Field data sheets and testing results
3. Temporary storage location, including survey coordinates, if needed
4. Final placement location, including survey coordinates

5. Report with December Self-Monitoring Report.

**Sampling Guidelines:**

Samples will be collected and analyzed in a manner sufficient to characterize the material. Sampling and laboratory analysis will be conducted in compliance with the following requirements:

1. All analysis will be performed in accordance with EPA and California approved methods
2. Analysis of samples will be completed and reported by an analytical laboratory accredited by the California State Environmental Laboratory Accreditation Program and the National Environmental Laboratory Accreditation Program;
3. The laboratory detection limits for Modified Waste Extraction Test (WET) results must be below the applicable Tier 1 ESLs for groundwater;
4. The laboratory reporting limits will be reported on a dry-weight basis; and
5. The results of the laboratory analysis will be reported in a standard laboratory data package, including a summary of the quality control and quality assurance sample results and chain of custody documentation.

Discrete soil samples will be collected unless regulatory approval is obtained for collection of composite samples for a specific project or if the project is greater than acres (Table 2). Samples will be collected with dedicated sampling equipment (e.g., plastic scoops) when possible. Any non-dedicated sampling equipment will be decontaminated between sampling locations. Field data sheets documenting sampling collection date, time, location, personnel, weather conditions, and sample identification will be completed. Each sample will be logged on a chain-of-custody record, which will accompany the samples through collection and delivery to the analytical laboratory. Table 1 includes the analytical parameters and sampling schedule.

**Table 1: Laboratory Analytical Parameters**

| Analysis | EPA Analytical Method | Frequency |
|---|---|---|
| California Title 22 Metals (TTLC) | USEPA 6010B, 6020B, and/or 7471A | All |
| Modified WET California Title 22 Metals with DI Water | USEPA 6010B, 6020B, 1631E and/or 7471A | As necessary per TTLC results; minimum 1 out of 4 samples |
| VOCs | USEPA 82600/624 | 1 of 10 samples; minimum 1 sample per project |

# Sampling, Analysis, and Management Plan for Soil and Sediment Material from Maintenance Projects

| Analysis | EPA Analytical Method | Frequency |
|---|---|---|
| SVOCs | USEPA 8270/625/SIM | 1 of 10 samples; minimum 1 sample per project |
| PCBs and Pesticides (surface water only) | USEPA 8080/8081/608 | 1 of 10 samples; minimum 1 sample per project |
| TPH as diesel, motor oil, and gasoline | EPA 8015 | 1 of 10 samples; minimum 1 sample per project |
| Cyanide | EPA 335.4/10-204-00 | 1 of 10 samples; minimum 1 sample per project |

All samples will be analyzed for total metals via TTLC and a subset for leachability per the modified WET procedure. The WET results will be used to determine if metal concentrations in the soil or sediment have the potential to leach to groundwater. The WET results will be compared to the modified Tier 1 ESLs for groundwater. An additional subset of samples will be analyzed for other potential constituents of concern. These parameters, as well as the TTLC metal results, will be compared to the Tier 1 ESLs for soil.

The sampling schedule varies depending on the volume of soil or sediment to be displaced as part of the maintenance project. The frequency is listed on Table 2 and is based on the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) Information Advisory Clean Imported Fill Material Fact Sheet (https://dtsc.ca.gov/information-advisory-clean-imported-fill-material-fact-sheet).

**Table 2: Sampling Frequency for Evaluation of Material**

| **Area of Individual Area** | **Sampling Requirements per Area** |
|---|---|
| 2 acres or less | Minimum of 4 samples |
| 2 to 4 acres | Minimum of 1 sample every ½ acre |
| Greater than 10 acres | Minimum of 8 samples with 4 subsamples per location |
| **Volume of Stockpiled Material** | **Samples per Volume** |
| Up to 1,000 cubic yards | 1 sample per 250 cubic yards |
| 1,000 to 5,000 cubic yards | 4 samples for first 1000 cubic yards +1 sample per each additional 500 cubic yards |

| | |
|---|---|
| Greater than 5,000 cubic yards | 12 samples for first 5,000 cubic yards + 1 sample per each additional 1,000 cubic yards |

**Results Evaluation and Material Placement:**

The sampling results will be tabulated and reviewed. Based on the findings, the following scenarios will be followed.

1. If the results are below applicable Tier 1 ESLs, the removed soil and sediment material may be considered for backfill or cover material on site with regulatory notification and approval.
2. If the metal concentrations do not meet the applicable Tier 1 ESLs, but are below TTLC and/or STLC thresholds, additional characterization may be completed to determine the appropriate placement based on the following:
    a. If the material is determined to be a Group B mining waste similar to the material already present in the WMUs, the material will be placed and managed within a WMU (e.g., WMSA) in accordance with the Operations, Maintenance, and Contingency (OM&C) Plan.
    b. If the material is characteristically distinct from the Group B waste present in the WMUs, contains concentrations above applicable Tier 1 ESLs, and concentrations below TTLC and/or STLC thresholds, Lehigh will consult with the Water Board regarding the management and potential on and offsite disposal of these materials.
3. While not anticipated, if the results are above TTLC and/or STLC thresholds, the WATER BOARD will be notified and additional characterization will be completed to confirm the results and aid in determining appropriate management and disposal options. Upon completion of the additional characterization, Lehigh will seek the Water Board's concurrence on the management and disposal of these materials.

***Dewatering Analysis and Placement Requirements:***

1. Dewatering – If dewatering is conducted, additional characterization of the material may be conducted after dewatering has been implemented and soil is no longer saturated.
2. The water from the dewatering operations will be collected and sent to the on-site water treatment system(s) via the reclaim water system.
3. The soil or sediment will be moved to a selected dewatering location if necessary. Once the material is dewatered and characterized, the material will be managed and disposed of as appropriate based on this SOP.

# Sampling, Analysis, and Management Plan for Soil and Sediment Material from Maintenance Projects

Attachment A: Screening Values

| Metal | CAS No. | Tier 1 ESL Soil (mg/kg) | TTLC (mg/kg) | Tier 1 ESL Groundwater (µg/L)* | STLC (µg/L) |
|---|---|---|---|---|---|
| | | Total Metal | | WET Results | |
| Antimony | 7440-36-0 | 11 | 500 | 6.0 | 1500 |

Notes:

ESLs based on January 2019 (Rev. 1) Water Board ESL Workbook Tier 1 values for soil and groundwater unless otherwise noted.

* DI WET results to be compared to Tier 1 GW ESL.

** Freshwater Ecotox used instead of Saltwater Ecotox for the Aquatic Habitat Goal that comprises the GW Tier 1 ESL for selenium.

*** If the soluble chromium as determined by the TCLP is less than 5mg/L, and the soluble chromium as determined by the STLC test equals or exceeds 560mg/L, and the waste is not otherwise identified as a RCRA hazardous waste, then the waste is a non-RCRA hazardous waste.

**** Arsenic background levels are known to be above these screening levels.

# G3. Water Quality Evaluation (Golder Associates, August 26, 2022)

# TECHNICAL MEMORANDUM

**DATE** August 26, 2022 **Project No.** 31405507

**TO** Carolina Addison
Lehigh Hanson, Inc.

**FROM** George Wegmann, PG, CHg;
Bill Fowler, PG, CEG **EMAIL** **gwegmann@wsp.com**

**WATER QUALITY EVALUATION, PERMANENTE CREEK RESTORATION PROJECT, LEHIGH SOUTHWEST CEMENT COMPANY AND HANSON PERMANENTE CEMENT, INC., PERMANENTE QUARRY, CUPERTINO, CALIFORNIA**

## 1.0 INTRODUCTION

Golder Associates USA Inc. (Golder), a member of WSP, prepared this memorandum for Lehigh Southwest Cement Company and Hanson Permanente Cement, Inc. (Lehigh) to present the results of our assessment regarding the significance of potential water related impacts associated with specific elements of the proposed Permanente Creek Restoration Project (PCRP) adjacent to the Permanente Cement Plant and North Quarry (Permanente Site). The specific elements include:

- The type of onsite material(s) used for backfill or other restoration-related activities where those materials that may come in contact with the Permanente Creek watercourse, and recommendations related thereto;
- Expected geology of the restored creek channel that will come in contact with the Permanente Creek watercourse.

This evaluation is based on available geochemical characterization data and the conceptual site geochemical model prepared in accordance with applicable permits for the Permanente Site (*e.g.,* San Francisco Regional Water Quality Control Board (Water Board) Order No. R2-2018-002 (WDRs), and additional information or studies prepared in response to Water Code section 13267 Orders or as part of, site operations and reclamation-related activities. The scope of work for this evaluation included (1) a desktop data review of previous studies, (2) summarizing more recent rock unit characterization and creek sediment sampling, and (3) completing a site reconnaissance of the project area to evaluate the geologic conditions in conjunction with the proposed restoration design.

## 1.1 Background

The Permanente Site is located in Santa Clara County, California, west of the City of Cupertino. In response to a Cleanup and Abatement Order issued by the Water Board (Order No. 99-018) and as a result of a 2016 Amended Consent Decree entered into by Lehigh and the Sierra Club, Lehigh has committed to undertake the PCRP. Details regarding the scope of the PCRP are set forth in 2016 Amended Consent Decree and the 90% design documents prepared by Lehigh's consultant, Waterways, which were recently updated to incorporate regulatory agency and Santa Clara County comments to date, and submitted to the County on August 26, 2022 (90% Design drawings). The portion of Permanente Creek involved in the PCRP is located south/southeast of the Permanente Site, and the project involves, among other activities, removing material/sediment from Permanente Creek, laying back slopes, widening reaches, and ensuring stream bank stability and ecological/geomorphic function.

**Golder Associates USA Inc.**
425 Lakeside Drive, Sunnyvale, California, USA 94085 T: +1 408 220-9223 F: +1 408 220-9224

The headwaters of Permanente Creek are located approximately 2 miles west/southwest of the Permanente Site. Approximately 4.2 miles of Permanente Creek are adjacent or traverse through Lehigh's Permanente Site in a south/south-eastern/eastern "L" shaped direction, portions of which are included in the PCRP, including stretches of the Creek upstream of the Cement Plant that have been re-aligned into an open culverted channel or placed in underground culverts, or are subject to dam infrastructure (Pond 13). Flow in Permanente Creek continues in an eastern direction as it leaves the Permanente Site, flowing through the highly urbanized area Cities of Los Altos and Mountain View and into Mountain View Slough or Stevens Creek through the Stevens Creek Diversion Channel operated by the Santa Clara Valley Water District, which ultimately can reach the San Francisco Bay. The downstream hydrology of the Permanente Creek watershed has been substantially altered for flood protection purposes.

The Cement Plant and North Quarry at the Permanente Site have been operational since 1939 and has been a major source of cement for Santa Clara County. The facility contains two mining waste rock (also called "overburden") storage areas, the East Material Storage Area (EMSA) and West Material Storage Area (WMSA), largely comprised of soil and rocks excavated from the North Quarry, some of which may be accessed for onsite use as part of the PCRP as backfill. The North Quarry sits between the two storage areas, while the Cement Plant is located southwest of the EMSA (Attachment A, Figure 1).

## 1.2 Regional Geologic Setting

Most of the Site is underlain by complexly deformed and faulted rocks of the Franciscan Assemblage. The eastern portion of the Site, including portions of the Cement Plant and the EMSA, are underlain by Plio-Pleistocene rocks of the Santa Clara Formation, which in turn overlie the Franciscan bedrock. Overlying the bedrock are modern alluvial deposits associated with Permanente Creek, and relatively shallow surficial deposits comprised of soil and colluvium. The Miocene-age Monterey Formation lies just east of the Site in fault contact with the Franciscan basement rocks along the Monte Vista Fault System.

### 1.2.1 Bedrock Geologic Units

The bedrock materials exposed in the North Quarry are part of the Permanente Terrane of the Franciscan Assemblage. The Franciscan Assemblage is comprised of highly deformed and variably metamorphosed, marine sedimentary rocks with submarine basalt (greenstone) and limestone and, to a lesser extent, graywacke. The Franciscan is considered a tectonic mélange that was formed in the subduction zone between the Pacific tectonic plate and the North American plate. This plate boundary is now a transform, strike-slip plate boundary defined by the San Andreas Fault zone located about two miles southwest of the North Quarry. The Franciscan Complex contains complexly deformed marine sedimentary rocks and basalt, which were metamorphosed and altered during subduction and subsequent thrust faulting. The Santa Clara Formation, a late Tertiary-Pleistocene assemblage of conglomerate, sandstone, siltstone, and claystone sits unconformably on the Franciscan Complex in the eastern portion of the site. Surficial deposits of unconsolidated alluvial deposits, fill material, colluvium, landslide deposits, and surface soils overlie the bedrock units.

The geology of the Permanente Creek Basin is shown on Figure 2 (Attachment A) based on our site reconnaissance and two main geologic map sources: Cupertino and Mindego Hills quadrangles (Dibblee and Minch 2007a and b); and the San Francisco Bay Landslide Mapping Team (USGS 1997). Previous researchers have also mapped the basin (Brabb 1970, Pulver 1979a and b).

### 1.2.2 Surficial Geologic Units

Some of the south-facing slopes that flank Permanente Creek are mantled with varying thicknesses of overburden, which is a heterogeneous mixture of fines, sand, gravel and cobble-sized fragments (*i.e.,* greenstone, graywacke, and soil materials) but with small percentages of limestone. This same overburden

comprises most of the WMSA and EMSA. Regarding the south-facing slopes, they are generally described as side-cast fills that mantle existing canyon slopes and fill small drainages and swales that formerly reported to Permanente Creek. The overburden deposits are of highly variable thickness and exist adjacent to the Rock Pile Area[1] (see 90% Design drawings at Sheet C19) and Material Removal Area (see 90% Design drawings at Sheets C23 & C24); this material will be removed and relocated as part of the PCRP.

Modern unconsolidated alluvial deposits are present along the active stream channel of Permanente Creek. These deposits are comprised of a poorly sorted mixture of cobbles, gravels, sand, silt and clay. Deposits range from a few inches thick in the upper reaches of the watershed where erosion has cut the channel down into bedrock over thousands of years, to tens of feet thick where the channel widens and deepens as it approaches the flatter terrain of the Santa Clara Valley.

Colluvial and slope wash deposits are common throughout the steep terrain of the Santa Cruz Mountains. In general, the natural slopes in the region are overlain with approximately one to two feet of soil and colluvial materials, which thicken to several feet or more in the larger natural swales in the region. Colluvium is generally described as predominantly clayey sand with gravel to clayey gravel, with some gravelly clay. The alluvial and colluvial deposits contain a mixture of fines, sand, gravel and cobble-sized fragments (*i.e.*, greenstone, graywacke, and soil materials) but with small percentages of limestone.

### 1.2.3 Creek Bed Geology Summary

Most of the PCRP area is underlain by complexly deformed and faulted rocks of the Franciscan Assemblage as depicted on Figure 2 (Attachment A). The eastern portion of the project area, including portions by the Cement Plant and the EMSA, are underlain by Plio-Pleistocene rocks of the Santa Clara Formation. Overlying the bedrock are modern alluvial deposits associated with Permanente Creek (restricted to the eastern portion of the property), and relatively shallow surficial deposits comprised of soil and colluvium.

Figure 3 (Attachment A) depicts the profile of Permanente Creek, which can broadly be classified into depositional reaches and bedrock reaches (delineated as Reach A, Reach B, etc.). The processes that define these reaches are the rate that sediment is supplied to the channel and the rate at which the channel can convey the supplied sediment. The rate of sediment supply is controlled by hillslope processes and the rate that sediment is delivered to the channel. The rate of sediment transport is controlled by the channel geometry and the hydraulic characteristics of the reach.

The furthest upstream portion of Permanente Creek, upstream of the PCRP area, is characterized by alluvium in the form of travertine reinforced step pool morphology that partially covers a bedrock channel that is comprised of greenstone and limestone. The sediment supplied here is likely to come from natural processes and is partially supplied from an alluvial fan originating from Wild Violet Creek. Carbonate-rich water percolates from the south bank of the channel in this reach, indicating that the source of the carbonate-rich spring is likely within the Wild Violet drainage. Geologic maps (Dibblee and Minch) indicate that the limestone unit of the Franciscan complex outcrops within the Wild Violet drainage. The debris from this alluvial fan is being transported downstream and has deposited small terraces along both valley walls. These terraces are possibly abandoned by the modern hydraulic regime of the Creek and may be coupled to the debris flows originating from Wild Violet Creek.

Travertine is a form of limestone precipitate that forms when calcium carbonate-rich water undergoes changes that cause the mineral to transition from solution to a solid state. This transition is largely controlled by physical

[1] The Rock Pile area is comprised of stockpiled material for aggregate production, which is ongoing. The character of the Rock Pile is variable but generally consists of fine to coarse-grained gravel to angular cobble-sized rock fragments of limestone.

processes, such as changes in pressure, temperature, or pH, but it can be influenced by biological processes and hydraulic variability as well (Fuller, et al. 2010). Golder observed two types of travertine formation in Permanente Creek. One in which stalactites grew out of the southern stream bank downstream of the confluence with Wild Violet Creek, and the other along large portions of the channel where naturally formed step-pools were reinforced by travertine deposition to form travertine dams (Attachment A, Figure 3). These dams display a history of repeated formation and breaching, as evidenced by the clasts of travertine conglomerate from older dams being incorporated into modern dams, as well as the relict abutments of older travertine dams remaining on the channel margins. This natural process has been taking place throughout geologic time along Permanente Creek.

The primary geologic units within the PCRP area are mainly greenstone (including shear zones) and the Santa Clara Formation. Greenstone bedrock is present at Reaches 10-17 and 20-22 and Santa Clara Formation bedrock along reaches 1-9 (Attachment A, Figure 3). Limestone bedrock is present along Reaches 18 and 19, including south of the creek, and comprises less than 15% of the bedrock present along the PCRP area. Importantly, with regard to the material removal activities planned to occur in Reach 18, the bedrock surface within the creek channel has been unaltered by historical site activities (*i.e.,* no mining activities have occurred in the creek), and the PCRP activities will follow the contours of natural bedrock, and will not alter or change the bedrock surface or its profile as part of restoration construction activities (see 90% Design drawings at Sheet C23). The focus of the Project along the limestone bedrock reaches will be to remove loose material mantled on top of the bedrock.

# 2.0 DATA SUMMARY

## 2.1 Material Characterization

Historical mining activities have contributed surficial materials to Permanente Creek in addition to deposition from naturally occurring geologic and geomorphic processes. As part of site operations, regulatory efforts, and reclamation-related activities, a geochemical dataset has been compiled since 2008 to characterize the predominate Permanente Quarry rock types. The data includes work completed as part of the development of National Pollutant Discharge Elimination System (NPDES) permitting[2] and WDRs[3,4] as follows: (1) analysis on acid rock drainage (ARD) potential by acid base accounting (ABA) testing methods, (2) chemical and mineralogical composition by quantitative X-Ray Diffraction (XRD) and, (3) Total Threshold Limit Concentration (TTLC) and leaching potential via the California modified waste extraction test (WET) with deionized water and wall washing samples. The results have been previously summarized in several reports, including the Permanente Site's Conceptual Site Model (CSM) Update prepared in accordance with the WDRs,[5] and are discussed below along with supplemental information.

Golder previously completed sampling and testing of the following major units: limestone, greenstone, graywacke, Santa Clara Formation, and undisturbed soil/colluvium as summarized in the CSM Update.[6] In summary:

3 SLR, 2014, EMSA and WMSA Material Characterization, Permanente Quarry, Santa Clara, California.

4 Golder Associates, August 2014, WMSA and EMSA Runoff and Seep Investigation Report, Lehigh Southwest Cement Company and Quarry, 24001 Stevens Creek Boulevard, Cupertino, CA

5 Golder Associates, 2020, CSM Update and Proposed SMP, Lehigh Southwest Cement Company and Quarry, 24001 Stevens Creek Boulevard, Cupertino, CA. June 2020.

[6] Golder Associates, 2020 CSM Update and SMP, Lehigh Permanente. December 2020.

- No acid rock drainage potential was identified in the tested samples as would be expected based on the carbonate nature of the rock.
- The leachate testing indicates that greenstone and graywacke are not a significant source of metals.
- Greenstone samples reported higher leachate nickel concentrations as compared to limestone; however, the concentrations are below the San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels (ESLs) based on the California primary maximum contaminant for Freshwater Aquatic levels.
- Molybdenum and selenium leachate concentrations were generally greater in limestone samples compared to the other samples from greenstone and graywacke. Selenium leachate from the limestone has been detected above the Freshwater Aquatic ESL of 5 µg/L consistent with limestone wall washing results.[7]
- The selenium data supports the premise that the oxidation of sulfides in the limestone is the primary mechanism of generating leachable selenium.[8,9]

### 2.1.1 Sequential Leach Testing via Modified WET Method

In 2020, rock samples were analyzed using the modified WET method and were then subjected to four additional cycles of sequential leaching repeating the same method for a total of five leaching cycles to aid in evaluating long-term leachability. Limestone and greenstone, the predominate rock units, were selected for this analysis. The test results were compared to STLC thresholds and ESLs. Full tabulated leaching results are included as Table 1, Attachment B and time-series plots of the sequential leachate concentrations of the different materials is included as Attachment C. The results of the sequential leach testing are summarized as follows:

#### Limestone Samples

- STLC limits were not exceeded for any of the samples.
- Limestone leachate concentrations decreased over the leaching sequence for the following constituents: sulfate, chloride, total alkalinity, bicarbonate, antimony, calcium, magnesium, molybdenum, selenium, and vanadium.
- Limestone leachate concentrations were stable or at detection limits over the leaching sequence for the following constituents: carbonate, hydroxide, arsenic, beryllium, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, potassium, silver, sodium, thallium, and zinc.
- Sulfate, calcium, and magnesium concentrations were elevated in leachates from the medium-grade non-weathered limestone sample during leaches 1-3 compared to the other limestone samples.
- Barium leachate concentrations gradually increased for all limestone samples over the leaching period.

#### Greenstone Samples

- STLC limits were not exceeded for any of the samples.
- Greenstone leachate concentrations decreased over the leaching sequence for the following constituents: total alkalinity, bicarbonate, antimony, magnesium, potassium, selenium, and sodium.

---

[7] Golder Associates, 2011 Hydrogeologic Investigation, Lehigh Permanente. 2011.

8 Diener, A., Neuman, T., Kramar, U., Schild, D. 2012. Structure of Selenium Incorporated in Pyrite and Machinawite as Determined by XAFS Analysis. Journal of Contaminant Hydrology: 133 (30-39).

9 Presser, T. S. 1994. Geologic Origin and Pathways of Selenium from the California Coast Ranges to the West-Central San Joaquin Valley. Selenium in the Environment.

- Greenstone leachate concentrations were stable or at detection limits over the leaching sequence for the following constituents: chloride, sulfate, carbonate, hydroxide, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, nickel, silver, thallium, vanadium, and zinc.
- Total alkalinity, bicarbonate, arsenic, barium, magnesium, potassium, and sodium concentrations were higher in the non-weathered greenstone sample leachate compared to the weathered greenstone sample.
- The vanadium concentration was higher in the weathered greenstone leachate compared to the non-weathered greenstone sample across all leaching cycles.
- Aluminum concentrations in the weathered greenstone sample leachate increased between leaches 1-4 and plateaued after leach 4.

Overall, concentrations generally decrease with each leaching cycle, indicating that readily leachable parameters are depleted within a few flushing cycles and that the short-term metal leaching potential for the materials is low, and below regulatory thresholds. Furthermore, the greenstone samples exhibited less leachable concentrations than the limestone samples.

### 2.1.2 Material Characterization Summary

The leachate results indicate that greenstone and graywacke are not a significant source of metals to water. Limestone material is a potential source of selenium, though the potential is lesser in combined quantities and in a dynamic environment of a moving stream/creek. Specific observations include:

- Greenstone samples reported higher leachate nickel concentrations compared to limestone; however, the concentrations are below ESLs.
- Molybdenum and selenium leachate concentrations were predominantly greater in limestone samples as compared to the samples from greenstone and graywacke.
- Selenium leachate from the limestone was detected several times slightly above the Freshwater Aquatic ESL of 5 µg/L. The generation of leachable selenium decreases with subsequent leach tests.

The data supports the premise that the oxidation of sulfides in the limestone is the primary mechanism of generating leachable selenium—the primary constituent of concern. Following sulfide oxidation, water flow and/or infiltration is the primary transport mechanism for selenium transport. Greenstone and graywacke do not generate leachable materials at levels that would negatively affect groundwater or surface waters. Sampling and geochemical analysis of the greenstone and graywacke indicates a low potential to leach selenium and other metals at levels above surface or ground water quality standards, and that it is suitable to be used as fill material consistent with Water Board/WDR standards.

## 2.2 Background Water Samples and Bedrock Influence on Creek Water Quality

Water quality from the upstream headwaters has been monitored as part of the National Pollutant Discharge Elimination System (NPDES) permit sampling program. The upstream surface water results for selenium are consistently less than 1 ug/L. As noted in Section 1.2, bedrock limestone and associated travertine deposits are present in these areas. The results further support the premise that selenium production from oxidized limestone already present in the creek channel is finite. For this reason, we expect that the PCRP as designed, which proposes to remove material and follow the existing bedrock contours for the restored creek channel grade and elevation, will not contribute to increased in-stream concentrations of constituents of concern.

# 3.0 DISCUSSION AND RECOMMENDATIONS

For areas of the project where fill material is needed, it is recommended that onsite material comprised predominantly of greenstone or graywacke be used where needed for backfill, as both exhibit a low metals leaching potential under natural site conditions. Furthermore, greenstone is the prevalent native material at the Site and already encompasses the majority of the Permanente Creek basin. Based on the available data, we do not expect detrimental water quality impacts from the creek restoration activities (causing exceedance of applicable water quality standards) provided on-site materials adhere to the recommendations herein.

Further, the predominant areas where limestone is to naturally remain, e.g., Reach 18, will consist of non-disturbed bedrock, which, as demonstrated by upstream conditions, is not expected to contribute metals to the water column. Therefore, significant changes in the natural system will not occur and new source material will not be exposed to potentially undergo oxidation and mobilization of selenium based on the limestone bedrock present. As noted in Section 2.3, the water quality upstream of the PCRP is not impaired even though limestone bedrock and travertine deposits are present. As the bedrock surface in Reach 18 is inferred to have been exposed and undisturbed for a similar timeframe as the reaches upstream of the PCRP, impairment to water quality is not expected from the limestone bedrock section. Furthermore, as noted above, the production rate of leachable selenium from limestone decreases as the mobile fraction of selenium is depleted from the system. This process will be further expedited by removing potential sources (e.g., limestone material) via the PCRP, and the PCRP is not expected to interfere with those gains.

Notes:

Soluble Threshold Limit Concentrations (STLC) as per California Code of Regulations Title 22, Section 66261.24(2)(A) ESL listed is lower of freshwater aquatic or primary MCL;
As is based on background level.

* = the ESL and surface water quality objective (California Toxics Rule, 40 CFR section 131.38) are the same.

B = estimated value, below laboratory reporting limit; mg/l = milligrams per Liter

# G4. Seismic Refraction Survey (NorCal Geophysical Consultants, Inc. May 22, 2014)

NORCAL GEOPHYSICAL CONSULTANTS, INC.

May 22, 2014

Golder Associates, Inc.
425 Lakeside Drive
Sunnyvale, CA 94085

Subject: Seismic Refraction Survey
Sites 4 and 11
Permanente Quarry
Cupertino, California

NORCAL Job #14-245.15B

Attention: George Wegmann,

This report presents the findings of seismic surveys performed by NORCAL Geophysical Consultants, Inc. for Golder Associates, Inc. at Permanente Quarry in Cupertino, California. The surveys were performed during the period March 4 through 11th, 2014 by NORCAL Professional Geophysicist William J. Henrich, PGp 893. Geologist Jeff Linder and Field Technician Dave Walter of Golder Associates, Inc. provided field assistance throughout the duration of the survey.

## 1.0 SITE DESCRIPTION AND PURPOSE

The seismic surveys were conducted at two locations referred to as Area 11 and Area 4, as shown on Plates 1A and 1B, respectively. Both areas encompass sections of Permanente Creek which drains in a general west to east direction. The area north of the creek has been subjected to accumulations of overburden materials related to quarrying operations. Particle sizes of the mine wastes ranged from sand and gravel size up to boulders that, on the surface, were several feet across. The local bedrock consisted of greywacke (sandstone), greenstone and limestone belonging to the Franciscan Complex.

The purpose of the seismic survey was to determine the thickness of alluvium and alluvium-rock fills at accessible select areas within the stream channel, along parallel haul roads and areas north of the stream channel. This data will be used by others to assess volumes of unconsolidated materials needed to be removed for restoration to the original stream channel grade and configuration as part of a reclamation plan for the quarry.

## 2.0 METHODOLOGY

We collected seismic data using two methods known as seismic refraction (SR) and multi-channel analysis of surface waves (MASW). The SR method was used to determine the compressional (P-) wave velocity of subsurface materials. The P-wave velocity (Vp) of fill, sediments, and rock are dependent on physical properties such as compaction, density, hardness, and induration. However, other factors such as bedding, fracturing, and saturation also affect Vp.

Typically, low Vp is indicative of loose, dry soils, poorly compacted fill material, poorly to semi-consolidated sediments, or alternatively, deeply weathered and/or highly fractured rock. Moderate Vp usually indicates dense and highly compacted or saturated sedimentary deposits or fill, and/or moderately weathered and fractured sedimentary rock. High Vp typically represent un-weathered sedimentary (i.e., sandstone, conglomerate, meta-sandstone or basalt) bedrock. A more detailed description of the SR methodology is provided in Appendix A.

The MASW method was used to determine both the P-wave and the shear (S-) wave velocity of subsurface materials in areas where limited access precluded the use of the SR method. S-waves typically propagate through earth materials at roughly one-half the velocity of P-waves. However, S-wave velocities are more directly related to the strength of fill, sediments, and rock than P-waves. Furthermore, unlike Vp, S-wave velocity (Vs) is not affected by saturation. Typically, low Vs is indicative of loose, dry soils, poorly compacted fill material, poorly to semi-consolidated sediments, or alternatively, deeply weathered and/or highly fractured rock. Moderate Vs usually indicates dense and highly compacted sedimentary deposits or fill, and/or moderately weathered and fractured sedimentary rock. High Vs typically represent un-weathered sedimentary (i.e., sandstone, conglomerate, meta-sandstone or basalt) bedrock. A more detailed description of the MASW method is provided in Appendix B.

## 3.0 DATA ACQUISITION

SR surveys were conducted in two locations referred to as the Rock Pile Area (Area 11) and the Material Removal Area (Area 4). The SR surveys were conducted according to the procedures described in Appendix A. MASW soundings were conducted in Area 11 according to the procedures described in Appendix B. The salient features of the data acquisition procedures used in each area are described in the following sections.

### 3.1 AREA 11

In Area 11 we collected SR data from 8-lines ranging in length from 75- to 250-ft. The locations of these lines, labeled Line 1 through Line 8, are shown on Plate 1A. We also conducted two MASW soundings. The locations of the soundings, labeled MASW-9 and MASW-10 are also shown on Plate 1A. Where possible, the SR lines and MASW soundings were located within the stream channel. However, there were some areas where the lines had to be placed on adjacent compacted gravel roads because of the presence of dense vegetation, concrete linings or steel culverts within the channel.

### 3.2 AREA 4

In Area 4, we acquired SR data from 13-lines ranging in length from 125- to 250-ft. The locations and orientations of the SR lines are shown on Plate 1B. The SR lines were positioned within the stream channel and on the northern portions (hill slopes, access roads and parking area) of the site.

## 4.0 DATA PROCESSING

### 4.1 SEISMIC REFRACTION (SR)

The refraction data were processed as described in Appendix A. Elevation data were provided by Waterways Consultants, Inc. at each shot point location within every seismic line. These elevation data were incorporated into the final processed seismic models. Further information regarding specific data input and sample compilations can be found in Appendix A.

### 4.2 MULTI-CHANNEL ANALYSIS OF SURFACE WAVES (MASW)

The MASW data were processed according to the procedures described in Appendix B.

## 5.0 RESULTS

The results of the seismic refraction survey are illustrated by the seismic velocity cross-sections (profiles) shown on Plates 2 through 8. On each profile the vertical axis represents elevation above mean sea level (MSL) and the horizontal axis represents draped survey distance (Station) along each line. Color shaded areas represent the lateral and vertical extent of the seismic layers comprising each profile. Modelled layer depths (thicknesses) as described in the Appendix A were determined beneath each geophone. These data were interpolated/extrapolated beneath each shot point. The relationship between color and seismic velocity is indicated by the color scales plotted to the right of each seismic refraction profile. In order to indicate how velocity varies from line to line within each survey area, the same scale was used for every profile. The results obtained in each area are described in the following sections. Specific results are presented for areas where two or more seismic refraction profiles either cross each other or are in a local proximity. It was useful to group seismic lines in this manner because of common characteristics involving of topography, location or surface conditions.

## 5 .1 AREA 11

### 5.1.1 Lines 1 and 2 (Plate 2)

Lines 1 and 2 were located within the stream channel, just west of a retention pond, as shown on Plate 1A. During the survey, water from remote pumping was actively being discharged to the stream channel above the seismic lines. The profile for Line 1 indicates velocities (Vp) ranging from 1200- to 7200-ft/sec. Our interpretation of the data resolves this range into two seismic layers labeled V1 and V2 in order of increasing depth and velocity. We interpret V1as representing unconsolidated stream deposits and V2 as representing bedrock. The depth to rock ranged from 18- to 25-ft. The Profile for Line 2 indicates velocities (Vp) ranging from 1150- to 2550-ft/sec. Our interpretation of the data resolves this range into two seismic layers labeled V1 and V2 in order of increasing depth and velocity. Given the low velocities of these layers, we interpret both as representing unconsolidated stream deposits. The difference in velocity between the two layers is related to their relative degree of compaction. V2 has a higher velocity than V1 because it is more highly compacted, probably because of the overbearing weight of V1. Line 2 did not detect bedrock because it was a relatively short line length which limited the depth of exploration.

### 5.1.2 Line 3 – 6, MASW Soundings 9 and 10 (Plate 3)

Lines 3 through 5 were located on access roads that parallel the stream channel, as shown on Plate 1A. Line 6 was situated in open, gravel packed area that ranged from 40 to 60-ft north of a subsurface diversion channel. The profiles for Lines 3-6 indicate velocities (Vp) ranging from 2300- to 7800-ft/sec. Our interpretation of the data resolves this range into two seismic layers designated as V1 and V2 in order of increasing depth and velocity. We interpret V1 as representing unconsolidated materials, e.g. road fill and/or alluvium. Given the high velocity range of V2 (6850- to7800-ft/sec) we interpret it as representing bedrock. The depths to bedrock ranged from 8- to 35-ft bgs.

MASW Soundings 9 and 10 were located north of Seismic Refraction Line 3, as shown on Plate 1A. The MASW soundings were acquired for the purpose of assessing possible near surface high velocity layers and providing depth to bedrock information further north of the stream channel. The 1D MASW Velocity Models (9 and 10) shown at the top of Plate 3 indicate a near surface high velocity layer (Vs=1500- to 2000-ft/sec) that is 8- to 16-ft thick. We interpret this high velocity layer as representing compacted (by very heavy vehicle loads) road fill. The materials underlying the compacted fill have lower velocities (Vs=500- to1000-fps) and thus constitute a velocity inversion. This velocity inversion, which is typically about 8- to 9-ft thick, is characteristic of alluvium. It is underlain, at depths of 17- to 26-ft bgs by velocities (Vs) of about 1800-ft/sec. We interpret these velocities as being indicative of consolidated bedrock. The bedrock depth indicated by the MASW-9 model (about 17-ft) is more shallow than the depth

indicated by the Line 3 profile (23-ft) at its point of closest approach. Conversely, the bedrock depth indicated by the MASW-10 model (26-ft) is significantly greater than the 5- to 10-ft depth indicated by the Line 3 and Line 4 profiles at their points of closest approach to MASW-10. These factors highlight the erratic nature of the bedrock surface and can be, in part, attributed to the fact that MASW-9 and MASW-10 are 25-ft north of Lines 3 and 4.

Additionally, the MASW soundings were undertaken to provide a constraint on the seismic refraction results in the general area (Seismic Refraction Lines 3 and 4) as the MASW techniques can accommodate shallow velocity inversions in processing. The MASW bedrock depths (17- to 26-ft bgs) derived from MASW analysis thus formed an approximate magnitude range of values. Our seismic refraction results indicated that bedrock depths ranged from 5- to 35-ft bgs which is in the same order of magnitude as the MASW estimate of depths to bedrock in the general area.

### 5.1.3 Lines 7, 8 and 11(Plate 4)

Lines 7, 8 and 11 trend northward, away from the stream channel, as shown on Plate 1A. Lines 7 and 8 cross an uphill section of accumulated mine waste and packed surficial gravel. The local topography was highly variable and steep. Line 11 crosses a gently sloping, open, gravel packed area from the edge of a metal culvert up to point 50-ft distant from the rock discharge pile (Rock Pile). The profiles for Lines 7, 8 and 11indicate velocities ranging from 1850- to 5700-ft/sec. Our interpretation of the data resolves this range into two seismic layers designated as V1 and V2, in order of increasing depth and velocity. Because of its relatively low velocity and highly variable thickness, we interpret V1 as representing mine wastes and/or alluvium. We interpret V2 as representing bedrock. Beneath Lines 7 and 8, the depth to rock ranges from less than 10- to over 50-ft. The Time-Distance plot for Line 11 indicated a relatively high velocity V1 layer associated with the road bed. No characteristic higher V2 bedrock velocity layer was detected. Therefore, no modeling results are presented for this line.

## 5.2 AREA 4

### 5.2.1 Lines 12, 13, 14 and 15 (Plate 5)

Lines 12, 13 and 14 were situated within a relative wide section of the stream channel, as shown on Plate 1B. Line 15 was located along a man-made bench that parallels the stream channel, about 20-ft upslope from the channel. The profiles for the four lines indicate velocities (Vp) ranging from about 900- to 3550-ft/sec. Our interpretation of the refraction data resolves this velocity range into three layers labeled V1 through V3 in order of increasing depth and velocity. We interpret the V1 and V2 layers as representing unconsolidated stream deposits and V3 as representing weathered bedrock. The depth to rock (V2/V3 interface) ranges from 7- to 23-ft bgs.

The relatively low velocity of V3 (2800- to 3450-ft/sec) suggests that it comprises a very weak rock like a meta-shale. The profile for Line 15 indicates that bedrock deepens to the east (downstream), reaching a maximum depth of 36-ft-bgs at the east end of the line. This puts it at an elevation of 1190-1192-ft MSL, which corresponds to the bedrock elevations at the west end of Line 12 and the east end of Line 13.

**5.2.2. Lines 16 and 17 (Plate 6)**

Lines 16 and 17 were situated on top of a gravel packed, level parking area, as shown on Plate 1B. The profiles for both lines indicate velocities (Vp) ranging from 1150- to 6200-ft/sec. Our interpretation of the Line 16 and Line 17 data resolves this range into two seismic layers labeled V1 and V2 in order of increasing depth and velocity. We interpret V1 as representing fill and alluvium and V2 as representing bedrock. The depth to rock ranges from17- to 23-ft bgs.

**5.2.3 Lines 18, 19, 20 and 21 (Plate 7)**

Lines 18 through 20 were located within the active stream channel, as shown on Plate 1B. However, there was no water in the channel at the time the survey was conducted. Line 21 extended north and upslope from the west end of Line 19. The profiles for these lines indicate velocities (Vp) ranging from 1100- to 4150-ft/sec. Our interpretation of the data resolves this range into three layers labeled V1 through V3 in order of increasing depth and velocity. V2 is absent beneath Line 18 and V3 is absent beneath Line 19. We interpret the combined V1 and V2 layers, with velocities ranging from 1050- to 2650-ft/sec, as representing unconsolidated stream and slope deposits. However, below Lines 19 and 20, the V2 layer could represent decomposed bedrock or dense gravel deposits. In addition, our field observations indicate that, beneath Line 21, V2 could represent mining waste that contains a high percentage of boulder size fill. We interpret theV3 layer as representing bedrock with velocities, where defined, ranging from 3400- to 4150-ft/sec. The depth to rock ranges from about 8- to 32-ft.

**5.2.4 Lines 22, 23 and 24 (Plate 8)**

Line 22 and Line 23 were located on an access road, as shown on Plate 1B. This road leads to Pond 4 (not shown). Line 24 extended southeast and down slope, from the access road towards the stream channel. The profiles for the three lines indicate velocities (Vp) ranging from 1200- to 6700-ft/sec. Our interpretation of the data resolves the velocity range into two layers labeled V1 and V2 in order of increasing depth and velocity. We interpret V1 as representing unconsolidated stream deposits. We interpret V2 as representing bedrock. Beneath Lines 22 and 23, the computed depths to bedrock ranged from 18- to 30-ft bgs. Beneath Line 24, the depths to bedrock decrease in the down slope direction; ranging from 18-ft bgs near the access road to only 8-ft bgs at the southeast edge of the profile.

## 6.0 STANDARD CARE

The scope of NORCAL's services for this project consisted of using geophysical methods to characterize the subsurface. The accuracy of our findings is subject to specific site conditions and limitations inherent to the techniques used. We performed our services in a manner consistent with the standard of care ordinarily exercised by members of the profession currently employing similar methods. No warranty, with respect to the performance of services or products delivered under this agreement, expressed or implied, is made by NORCAL.

We appreciate having the opportunity to provide you with this information.

Respectfully,

NORCAL Geophysical Consultants, Inc.

William J Henrich
Professional Geophysicist PGp 893

# SEISMIC REFRACTION (SR)

# SEISMIC REFRACTION (SR)

## 1.0 METHODOLOGY

The seismic refraction method provides information regarding the seismic velocity structure of the subsurface. An impulsive (mechanical or explosive) source is used to produce compressional (P) wave seismic energy. The P-waves propagate into the earth and are refracted along interfaces caused by an increase in velocity. A portion of the P-wave energy is refracted back to the surface where it is detected by sensors (geophones) that are coupled to the ground surface in a collinear array (spread). The detected signals are recorded on a multi-channel seismograph and are analyzed to determine the shot point-to-geophone travel times. These data can be used along with the corresponding shot point-to-geophone distances to determine the depth, thickness, and velocity of subsurface seismic layers.

The seismic refraction technique is based on several assumptions. Paramount among these are that seismic velocity:

1) Increases with depth, and,
2) Is uniform within each layer over the length of the given spread.

In cases where these assumptions do not hold, the accuracy of the technique decreases. For example, if a low velocity layer occurs between two layers of higher velocity, the low velocity layer will not be detected and the depth to the underlying high velocity layer will be erroneously large. Also, if the velocity of a seismic layer varies laterally within a spread, those variations will be interpreted as fluctuations in the elevation of the underlying seismic layer.

## 2.0 DATA ACQUISITION/INSTRUMENTATION

Each SR line consisted of 24-geophones and 7-shot points distributed in a collinear array (spread). In most areas, the geophones were coupled to the ground surface by metal spike affixed to the bottom of each geophone case. In areas where the ground surface was too hard to penetrate (e.g. the road) the geophones were mounted on weighted pedestals that coupled them to the ground by their weight. The geophone intervals ranged from 3- to 10-ft depending on access. For each spread, the two end shot points were located one-geophone spacing beyond the end geophone at both ends of the spread. The remaining five shot points were evenly spaced along the spread. This distribution of shot points and geophones yielded total draped line lengths (end-geophone to end-geophone) ranging from 77- to 250-ft. The SR survey was designed to target the upper 15 to 50 feet of geologic material beneath each line, generally consisting of native soil, fill (mine waste) alluvium/stream deposits, weathered and un-weathered bedrock.

Data acquisition was initiated along each SR line by producing seismic energy using a mechanical source. Seismic energy was produced by impacting a metal strike plate on the ground surface with a 12-16 pound sledge hammer. The resulting seismic waveforms are recorded using a Geometrics ***Geode*** 24-channel engineering distributed array seismograph and Mark Products geophones with a natural frequency of 8-Hz. The seismic waveforms were digitized, processed and amplified by the Geode and transmitted via a ruggedized Ethernet cable to a field computer. There the data were archived for subsequent processing and displayed on the computers LCD screen in the form of seismograms. These were subsequently used to determine the time required for P-waves to travel from each shot point to each geophone in a given array (spread).

## 3.0 DATA ANALYSIS

The recorded seismic data were processed using the software package ***SeisImager*** which was written by Oyo Corporation (Japan) and distributed by Geometrics Inc. The first stage of seismic processing included compilation (7 shot points per line) and identification of first arriving P-wave energy. This process was conducted using ***Pickwin, Version 3.2.0.1*** (2004), which is part of the ***SeisImager*** package. A second interactive program ***Plotrefa, Version 2.8.0.1*** (2006) was used to assign geophone travel times, geophone/shot point surface elevations and velocity layer assignments to compute a 2D seismic velocity model based on these inputs. Example Time-Distance graph from a 7 shot point refraction line and inverted seismic layer model are presented in the following figures.

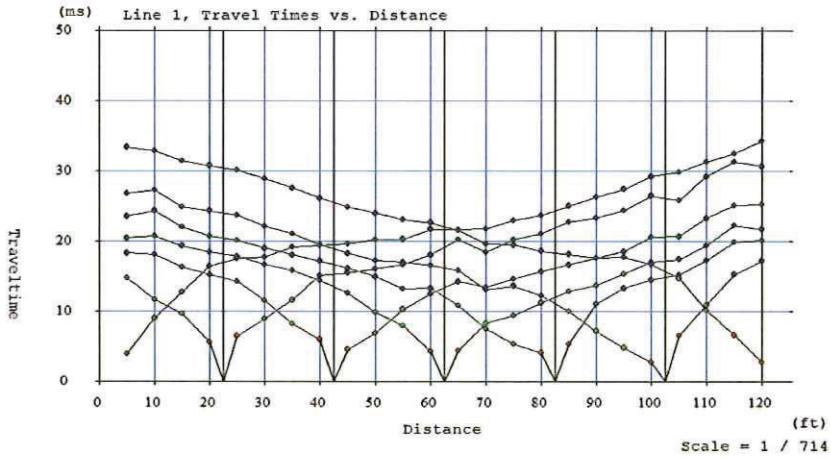

Figure 1 Example SR Time-Distance Graph, 24-geophones; 7 equal spaced shot points

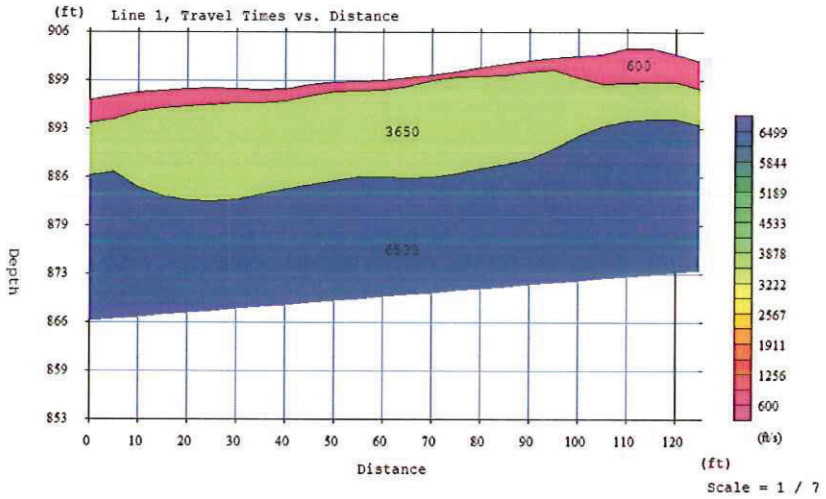

Figure 2 Time-Term Inverted Seismic Velocity Model

For this survey we have chosen an inversion routine that is based on the time-term method. The time-term method employs a combination of linear least squares and delay time analysis to invert the first arrivals into a velocity model. The model can consist of two or three velocity layers depending on the presence of significant line slopes that can be fitted to the first arrival times. Depths to the tops of the velocity layers are calculated below each geophone. For end and interior shot points the depths are extrapolated from the nearest geophone. This inversion as described above produces simplified velocity layers that, though generalized, will provide an adequate, useable characterization of the depth to bedrock.

## 4.0 LIMITATIONS

In general, there are limitations unique to the SR method. These limitations are primarily based on assumptions that are made by the data analysis routine. First, the data analysis routine assumes that the velocities along the length of each spread are uniform. If there are localized zones within each layer where the velocities are higher or lower than indicated, the analysis routine will interpret these zones as changes in the surface topography of the underlying layer. A zone of higher velocity material would be interpreted as a low in the surface of the underlying layer. Zones of lower velocity material would be interpreted as a high in the underlying layer.

Second, the data analysis routine assumes that the velocity of subsurface materials increase with depth. Therefore, if a layer exhibits velocities that are slower than those of the material above it, the slower layer will not be resolved. Also, a velocity layer may simply be too thin to be detected. Due to these and other limitations inherent to the SR method, the results of the SR survey should be considered only as approximations of the subsurface conditions. The actual conditions may vary locally. Other independent data (e.g., surface and borehole geology) should be integrated with SR data to enhance the subsurface interpretation.

# Appendix B

# MULTI-CHANNEL ANALYSIS OF SURFACE WAVES (MASW)

# MULTI-CHANNEL ANALYSIS OF SURFACE WAVES (MASW)

## 1.0 METHODOLOGY

When seismic energy is generated at or near the ground surface, seismic waves are produced. Those that travel along the ground surface are referred to as ground roll or surface waves. Those that propagate into the earth are referred to as body waves. When a vertical impact seismic energy source is used, the resulting surface waves account for more than two-thirds of the energy that is produced. As a result, surface waves are the most prominent signal on multi-channel seismic records. In addition, surface waves have dispersion properties that body waves lack. That is, different wavelengths have different penetration depths and, therefore, propagate at different velocities. This is referred to as dispersion. Since surface waves travel at 0.9 times the velocity of S-waves, it is possible to determine subsurface Vs by analyzing the dispersion of surface waves. Furthermore, since S-wave velocities are directly proportional to shear modulus, this provides a direct indication in the variation of stiffness (or rigidity) of subsurface materials.

Computer software and processing techniques developed by researchers at the University of Kansas have made it possible to analyze surface waves using a large number of shot points and geophones. This is referred to as multi-channel analysis of surface waves (MASW). Surface wave data are gathered in much the same way as high resolution seismic reflection data. Seismic energy generated by vertical impacts on the ground surface is detected by an array of closely spaced geophones (spread). The energy source and the geophones are sequentially moved along a profile as the survey progresses.

The data gathered from each shot point are analyzed to determine the variation in surface wave velocity versus frequency (dispersion curve). Computer software then inverts the dispersion curve to determine the variation in Vs versus depth. The data gathered from multiple shot points and geophone locations can be collated to produce a two dimensional (2D) cross-section showing the variation in Vs with depth and distance beneath a line.

## 2.0 DATA ACQUISITION/INSTRUMENTATION

Soundings MASW-9 and -10 each comprised an array of 24-geophones distributed at 3-ft intervals in a collinear array (spread). Seismic energy was produced at four shot points on each spread through multiple impacts with a 12-pound sledge hammer against a metal strike plate placed on the ground surface. The shot points were positioned at distances of 3- and 12-ft beyond the end geophones at both ends of each spread. The resulting seismic waveforms were recorded using a Geometrics ***Geode*** 24-channel distributed array seismograph and Oyo ***Geospace*** geophones with a natural frequency of 8-Hz. The seismograph was networked to a field computer where the data were displayed on a LCD screen for QA/QC review and archived for subsequent processing.

## 3.0 DATA ANALYSIS

The MASW data were processed using the software package ***SurfSeis 2.05*** which was developed by the Kansas Geological Survey. Using this software, the data acquired from each shot point were processed to develop an overtone display. This is a color contoured plot that depicts phase velocity as a function of frequency and signal amplitude. The overtone display serves as a guide in nominating the dispersion curve that is used by the inversion routine. However, prior to nominating the dispersion curve, the four overtones were merged into one in order to increase the signal to noise ratio and maximize the continuity of the display. The merged and enhanced overtone was then used as a guide in nominating the dispersion curve used in the inversion process. At the onset of the inversion routine the software created a 1D model comprising 10-layers. Starting values of depth, thickness, Vp, Vs and Poisson's ratio ($\alpha$) were assigned to each layer. The program then proceeded to refine the starting model through an iterative procedure in order to develop a 1D model that provided the best fit to the dispersion curve. In so doing, it was necessary that either Vp or $\alpha$ remain fixed during the inversion process. In this case, we opted to have $\alpha$ remain fixed, at a value of 0.4, so that the final model would provide the best indication of both Vp and Vs as a function of depth. The value of 0.4 was used for $\alpha$ because it is typical of most near surface earth materials.

# G5. Regional Hydraulic Geometry and Analogue Channel Assessment (Waterways Consulting, Inc., October 30, 2018)

# TECHNICAL MEMORANDUM - REVISED for 90% DESIGN

| | |
|---|---|
| *Prepared by:* | Waterways Consulting, Inc. |
| *Date:* | October 30, 2018 |
| *Re:* | Permanente Creek Restoration – Regional Hydraulic Geometry and Analogue Channel Assessment |

## Introduction

Waterways Consulting, Inc. (Waterways) is developing engineering drawings to restore portions of Permanente Creek that flow through the Permanente Quarry (Quarry) property and have been impacted by past mining activities. The proposed approach at two locations (the Rock Pile Area and Material Removal Area[1]) focuses on restoring the channel form to an approximation of the pre-mining channel geometry and providing suitable aquatic habitat for local species, including resident rainbow trout. The Quarry is situated on lands owned by Lehigh Hanson Heidelberg Cement Group on the east side of the Santa Cruz Mountains to the west of Cupertino. Quarry operations over the past century have resulted in significant channelization, the installation of numerous culverts and sedimentation basins, and considerable sediment inputs to Permanente Creek. The altered channel form and high sediment loads resulted in the degradation of the instream aquatic habitat.

The proposed restoration will remove overburden sediment and several culverts, rebuild the affected channel reaches, and restore impacted riparian and aquatic habitats. Restoring Permanente Creek at the Rock Pile and Material Removal Areas requires a complete reconstruction of the streambed. Consequently, there is a need to estimate the appropriate channel morphology to support the restoration design, including active channel widths, depths and pool geometries and spacing.

Regional curves, relating channel dimensions to drainage area, exist for the San Francisco Bay region (Dunne and Leopold 1978) (Figure 1). However, these curves are regional in nature, incorporating data from a range of landscape settings and channel morphologies. For example, channel geometries of the low gradient bottomlands of the Santa Clara Valley will vary from bedrock-controlled streams in the Santa Cruz Mountains that are higher gradient and more influenced by hillslope processes. Given that much of the proposed restoration activities are in higher gradient, confined reaches of Permanente Creek, the appropriateness of the regional curves can be improved by focusing the data on sites with a similar geomorphic setting. Focusing the dataset on sites in the Santa Cruz Mountains could greatly improve the use of the hydraulic geometry curves to constrain expected channel morphologies in the impacted reaches of Permanente Creek. Furthermore, field-based measurements of channel geometry within less impacted reaches of Permanente Creek and in adjacent watersheds that exhibit similar characteristics to Permanente Creek could both provide a test for and improve the quality of the developed relationships.

[1] Although the analogue study was developed to support design efforts for the Rockpile and Material Removal Areas of the Permanente Restoration Project, the results are applicable to other locations within the project area including Culverts #7 and #8 within the Channel Widening Area.

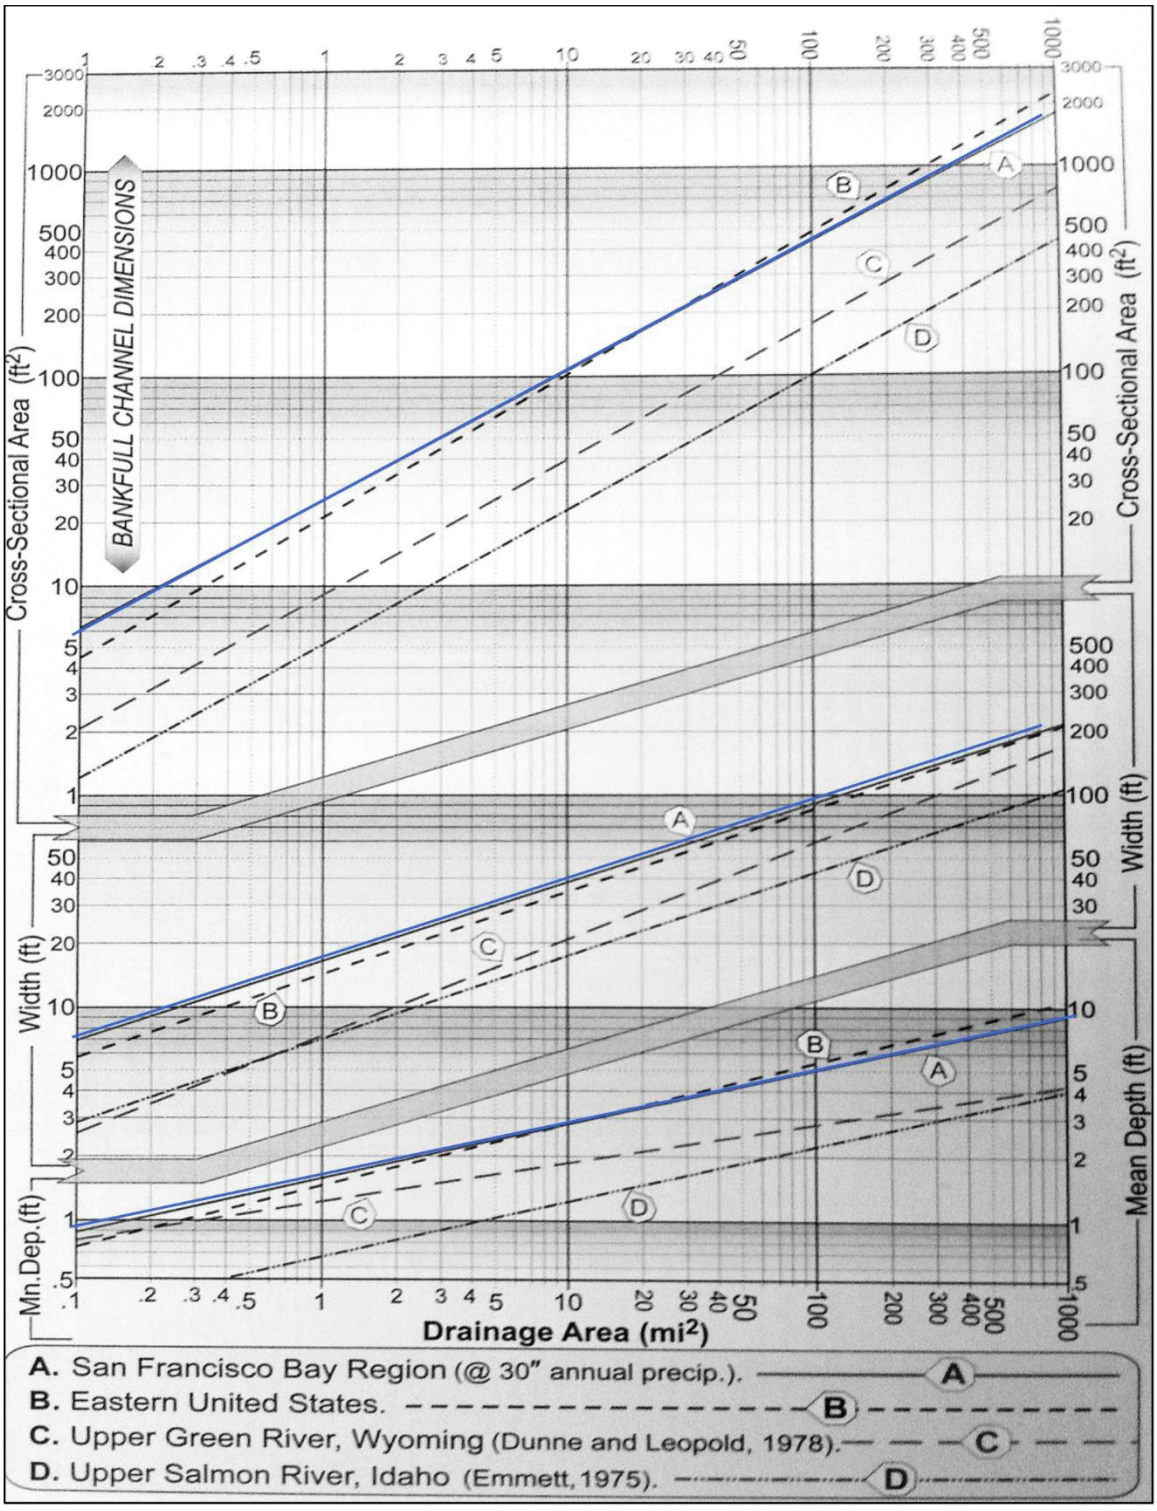

**Figure 1. Regional hydraulic geometry curves produced by Dunne and Leopold (1978) relating drainage area to bankfull depth, width and cross-sectional area. The blue lines highlight the regional curves for the San Francisco Bay Area.**

To create more site-specific curves, Waterways compiled data for the Santa Cruz Mountain sites that were included in the Dunne and Leopold (1978) curves for the San Francisco Bay region, surveyed two analogue stream channels close to the project area that were previously identified as having similar watershed and geomorphic characteristics as Permanente Creek (URS 2011)[2], and surveyed two segments of Reach 20 on Permanente Creek in what was considered a less impacted reach. These data were used to define reach-specific channel dimensions for the restoration effort. In addition, a longitudinal profile surveyed along portions of Permanente Creek where the channel morphology was determined to be more representative of natural conditions, was used to identify an appropriate size and spacing for pools to support the engineering design. This memorandum summarizes the findings of this work.

## Study Area

### *Santa Cruz Mountains*

The Santa Cruz Mountains have a complex geologic history, resulting in areas dominated by sandstone, limestone, igneous rocks (e.g., basalt), or metamorphic rocks (e.g., serpentine). The variable geologies result in different rates of erosion and the presence of different types of channel-forming sediment among streams that can be spatially close to each other. For example, Permanente Creek has abundant limestone that forms calcium carbonate precipitates that can bind rocks along the channel bed and banks. On the other hand, Stevens Creek is approximately one and one-half miles southeast of Permanente Creek and does not have limestone, and thus does not exhibit calcium carbonate precipitates.

Santa Cruz Mountain streams tend to be small headwater channels at the higher elevations and larger, alluvial streams at the lower elevations. The higher and mid-elevation streams generally flow through narrow valleys with steep hillslopes that restrict lateral channel movement. The steep hillslopes are susceptible to landslides and debris flows, especially following wildfire events. Entire reaches can be transformed during a debris flow and associated mudflow event. Debris flows can result in mobilization and deposition of sediment and debris across an entire valley bottom, leaving an aggraded valley consisting of an unsorted mix of materials. Subsequent high flows following a debris flow event reworks the aggraded material, with the active channel incising into the relatively uniform post-debris flow floodplain surface. Large roughness elements, including boulders and logs, become exposed as the channel incises into the debris flow surface, influencing the planform of the channel and providing local grade control for both the channel and floodplain. In higher gradient reaches, pools and riffles form in response to randomly spaced roughness elements. Along Permanente creek, debris flows prior to mining operations likely provided large wood and boulders that were incorporated into steep step-pool reaches and lower gradient riffle-pool reaches.

[2] The URS Plan was prepared to comply with the July 27, 1999 Cleanup and Abatement Order – 99-018 issued by the San Francisco Bay Regional Water Quality Control Board by preparation of a report that documented a field reconnaissance of Permanente Creek throughout the quarry facility identifying areas requiring stabilization, prioritizing stabilization activities at candidate sites, and preparing an implementation schedule.

Map identifying the location of the surveyed reference reaches for Permanente Creek.

FIGURE

**2**

### *Field Sites*

Waterways reviewed the URS Plan and studied published literature on the Santa Cruz Mountains to determine suitable reference reaches for Permanente Creek. We determined that a reach along Swiss Creek and a reach along Corte Madera Creek were the most appropriate reference reaches for Permanente Creek (Figure 2 and Table 1). The URS Plan described Corte Madera Creek and Swiss Creek as similar in drainage area, slope, and valley shape to Permanente Creek. Both creeks are in the Santa Cruz Mountains, relatively close to Cupertino, with precipitation regimes similar to the Permanente Creek watershed. Corte Madera Creek flows west and Swiss Creek flows east through confined, steep stream valleys, constrained on both sides by steep hillslopes prone to mass wasting and debris flow events. Both reference reaches are bedrock-controlled with a step-pool channel pattern formed by large boulders and other recently delivered colluvial deposits. Swiss Creek exhibited calcium carbonate precipitates within the active channel, similar to the calcium carbonate formations identified in Permanente Creek. In addition to the reference reaches in adjacent watersheds, a less impacted reach (Reach 20) within Permanente Creek was chosen to further support development of regional hydraulic geometries in support of the engineering design effort.

**Table 1. Basin Characteristics for the Field Sites and Permanente Creek.**

| | Swiss Creek | Corte Madera Creek | Permanente Creek |
|---|---|---|---|
| **Average annual precipitation (in)** | 33.8 | 38.6 | 34.2 |
| **Mean basin elevation (ft)** | 1,842 | 1,917 | 1,957 |
| **Dominant geology** | limestone, sandstone | sandstone, shale | limestone, sandstone |
| **Dominant hillslope process** | landslide/debris flow | landslide/debris flow | landslide/debris flow |
| **Average channel slope (%)** | 10.72 | 8.39 | 3.4 - 13.85 |
| **Drainage area (sq. miles)** | 0.8 | 1.4 | 2.7 |

## Analysis Approach

To develop the regional hydraulic geometry relationships, information from the USGS streamflow gage database was compiled for streams in the Santa Cruz Mountains. The focus of this data mining effort was the 1.5-year[3] recurrence discharge because it approximates the channel forming, or bankfull, discharge (Dunne and Leopold, 1978). To evaluate the performance of the curve and provide data for smaller watersheds, which was missing from the USGS dataset, we collected field data from the two adjacent watersheds and within Reach 20 of Permanente Creek with a specific focus on measuring channel geometries at bankfull indicators that were identified in the field.

### *Hydraulic Geometry using existing USGS gage data*

Waterways identified 33 USGS stream gages in the Santa Cruz Mountains, but only 14 of the 33 had sufficient peak flow records to be used in the hydraulic geometry analysis (Table 2). Ideally the gage sites would be limited to the eastern Santa Cruz Mountains near Cupertino and Santa Clara. However, since there are a limited number of gages with sufficient data, the 14 gages Waterways assessed are

[3] Previous iterations of this study focused efforts on the 2-year event. Results of that effort identified disparities between the gage-based analysis and the field-based analysis with the field-based analysis consistently under predicted bankfull widths and depths. This suggested that field-based bankfull indicators occurred at a discharge approximating the 1.5-year event rather than the 2-year event. These results, combined with comments from the reviewers prompted us to redo the analysis with a focus on the 1.5-year event rather than the 2-year event.

**Table 2. USGS gage sites used to develop regional hydraulic geometry curves.**

| Site Name | Location | Period of Record | Drainage Area (sq. miles) | 1.5-Year Flood Discharge (Bankfull) (cfs) | Estimated Bankfull Width (feet) | Estimated Bankfull Cross Sectional Area (sq. feet) | Estimated Bankfull Depth (feet) |

located throughout the eastern and western Santa Cruz Mountains. Despite the slightly wider than ideal geographic range, our gage analysis improves upon the current regional analyses by focusing on a smaller area and limiting gage sites to the Santa Cruz Mountains.

Waterways compiled the existing information available at each of the selected gaging sites, including drainage area, discharge, field measurements of channel width and cross-sectional area, and local channel slope near the gage. We imported the discharge data into HEC-SSP (U.S. Army Corps of Engineers 2010) and developed flood frequency curves (USGS, Bulletin 17b, 1982) for each gage site to estimate the 1.5-year recurrence interval discharge. We then reviewed measurements of channel width and cross-sectional area at each gage site to find measurements that were taken during a high flow event that approximated the 1.5-year recurrence interval discharge. Four of the gaging sites did not have channel width and cross-sectional area data recorded during a 1.5-year event, so we extrapolated based on the available data. We then estimated bankfull depth at each gage site by dividing channel

cross-sectional area by channel width. Banfull width, bankfull depth, and the 1.5-year flood discharge were plotted separately against drainage area. One outlier was identified and removed from the study.

## *Analogue Site Assessment*

Waterways surveyed a 200-foot reach of Corte Madera Creek, located downstream of the Alpine Road Trail culvert, a 171-foot reach of Swiss Creek, located approximately 500 feet upstream from the Peacock Court bridge, and two segments within Reach 20 of Permanente Creek totaling over 300 feet of channel. We chose reach locations that were beyond the influence of instream structures (e.g., culverts, bridges) and were representative of conditions within the reach. We used an auto-level to survey four channel cross section profiles at Corte Madera Creek, three channel cross section profiles at Swiss Creek, two sets of three channel cross-section profiles at Permanente Creek and a longitudinal profile at all four sites. Each channel cross section profile included the expanse of the valley floor and the identification of significant geomorphic features using field indicators, such as bankfull. In most cases, the field indicator used to estimate the bankfull width and depth was the base of mature trees.

Using the survey data, Waterways calculated the bankfull channel width and plotted each cross section to calculate their cross-sectional areas. We then divided each cross-sectional area by the surveyed bankfull width to determine average bankfull depth. We estimated drainage area for each field site using StreamStats (USGS 2012) and calculated channel slopes using the surveyed longitudinal profiles. Channel widths and hydraulic depths were determined for each cross-section and then averaged for each reach, or reach segment, to obtain a single channel width and depth for each creek at the estimated bankfull discharge. Two separate segments were surveyed in Reach 20 of Permanente Creek to identify differences in channel geometry based on differences in local channel slope with one segment having a local channel slope of 4.6% and the other a local channel slope of 8.2%.

## *Hydraulic Geometry Analysis*

Waterway combined the USGS gage site data with the field survey data to determine trends in channel geometry as a function of drainage area. We developed relationships between drainage area and bankfull width, bankfull depth, and the 1.5-year recurrence interval discharge. Trend lines were fit to the data to provide a predictive tool to estimate these parameters at specific restoration sites, most specifically the Rock Pile and Material Removal Areas (Figures 3, 4, and 5). Using the equation for each trend line, we solved for the predicted channel width and depth for specific restoration areas within Permanente Creek based on a drainage area of 2.7 square miles (Culverts 7 and 8), 2.54 square miles (Rock Pile), and 2.02 square miles (Material Removal Area). Table 3 summarizes the results of this analysis.

**Table 3. Channel Dimensions Calculated Using Hydraulic Geometry Relationships**

| Project Site | Drainage Area ($mi^2$) | Predicted Bankfull Width (ft) | Predicted Bankfull Depth (ft) | Cross Sectional Area ($ft^2$) |
|---|---|---|---|---|
| Culvert 7 | 2.70 | 17.9 | 2.3 | 31 |
| Culvert 8 | 2.70 | 17.9 | 2.3 | 31 |
| Rock Pile | 2.54 | 17.5 | 2.3 | 29 |
| Material Removal Area | 2.02 | 16.0 | 2.1 | 25 |

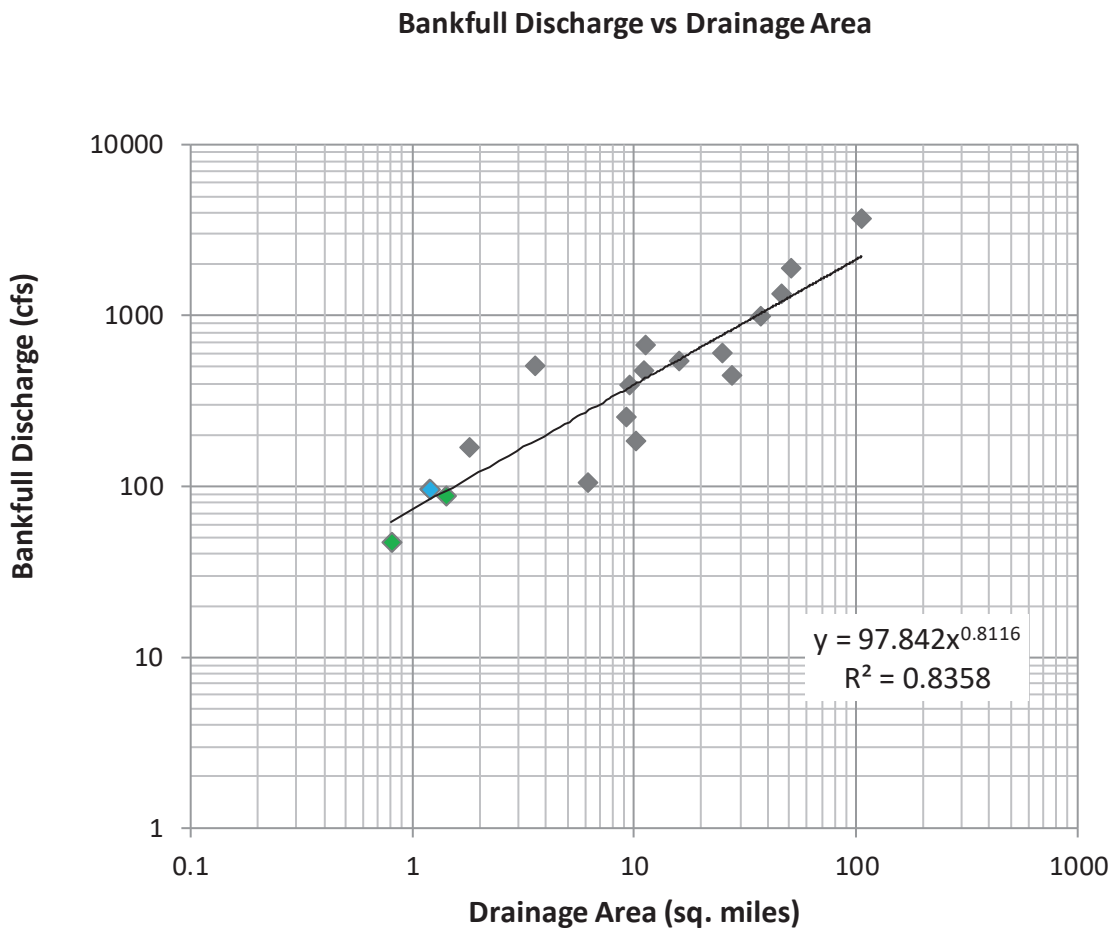

**Figure 5. Bankfull Discharge as a Function of Drainage Area for the Santa Cruz Mountains. The green data points are Swiss and Corte Madera Creeks. The blue data points are the sites on Permanente Creek.**

## *Pool Geometry*

An important design parameter for reach-scale restoration of Permanente Creek is pool length and pool spacing. Despite the legacy of impacts to Permanente Creek, it was determined that several reaches (R14-R16 and R20-R21) continued to exhibit naturally formed pool and riffle geometries that encompass a range of channel slopes. These conditions provided an opportunity to measure pool and riffle geometries, locally, to support the design effort, rather than measuring those parameters in other adjacent watersheds which may lack specific characteristics found in Permanente Creek such as the prevalence of calcium carbonate precipitates. Given the inherent variability in pool geometries associated with the debris flow morphology of the channel, it was important to collect data along entire reaches and summarize the information to convey averages and ranges of natural conditions. To convey the range of natural variability, longitudinal profile data was collected along the entire length of the identified reaches within Permanente Creek to calculate pool length and spacing in relation to reach-

scale channel gradients (Table 4). These data were then used to calculate pool statistics for each site-specific restoration area.

**Table 4. Statistics on Pool Length, Depth and Spacing (in feet) By Reach of Permanente Creek.**

| Reach # | Reach Avg Slope | Avg Pool Length (ft) | Median Pool Length (ft) | St. Dev Pool Length (ft) | Avg Pool Depth (ft) | Median Pool Depth (ft) | St. Dev Pool Depth (ft) | Avg Pool Spacing (ft) | Median Pool Spacing (ft) | St. Dev Pool Spacing (ft) |
|---|---|---|---|---|---|---|---|---|---|---|
| **21** | 5.1% | 13.6 | 11.6 | 6.3 | 0.6 | 0.6 | 0.3 | 211 | 150 | 212 |

## Results/Discussion

Dunne and Leopold's (1978) regional curves provide a predictive tool to estimate bankfull channel dimensions for Permanente Creek. Use of the Dunne and Leopold regional curves for the entire Bay Area estimated a bankfull width for the Permanente project area of approximately 17 to 25 feet and a bankfull depth of approximately 1.5 to 2.0 feet. Because these curves are regional and include a significant number of gage locations that are in a geomorphic setting that are different from the project area, regional curves that are more specific to the Permanente Creek project area were developed. Utilizing the more focused data set, which includes the USGS sites within the Santa Cruz Mountains and the field-based assessments sites on Permanente, Corte Madera and Swiss Creek, the curves predicted a bankfull width of 17.9 feet for Culverts 7 and 8, 17.5 feet for the Rock Pile Area, and 16.0 feet for the Material Removal Area and a bankfull depth of approximately 2.3 feet for Culverts 7 and 8, 2.3 feet for the Rock Pile Area and 2.1 feet for the Material Removal Area prior to mining-related impacts (Table 3). As expected, the Dunne and Leopold (1978) curves describe a wider and flatter channel, most likely due to the inclusion of lower gradient, unconfined, alluvial channels in the analysis. Table 5 includes ranges of bankfull channel dimensions for the areas where the channel will be reconstructed to provide for some variability and flexibility during construction since large non-uniform materials will be used in channel construction.

Measured channel slopes for Corte Madera and Swiss Creek, 8.4% and 10.7% respectively, are in the range of the design slopes at the Rock Pile and Material Removal Areas along Permanente Creek. Field observations of a step-pool channel morphology at these channel gradients suggest that Permanente Creek likely had a step-pool channel pattern in the steeper reaches prior to mining. This is supported by

the observed conditions in the reaches of Permanente Creek that were identified as having pool and riffle geometry that were representative of natural conditions.

The pool analysis, utilizing the surveyed longitudinal profiles along the more intact reaches of Permanente Creek, suggest that there is an inverse relationship between pool length and spacing relative to channel gradient (Table 4). Furthermore, lower gradient reaches exhibit higher overall pool length and spacing variability than higher gradient reaches. This supports the idea that higher gradient reaches (>8% channel slope) are more characterized by a step-pool morphology, whereas lower gradient reaches (4% to 8% channel slope) exhibit more of a pool-riffle morphology. Pool depth was fairly consistent across all of the evaluated reaches with pools ranging between 0.5 and 2 feet, independent of channel slope. This is likely due to the fact that pool depth may be more a function of the presence of localized roughness elements, and the fact that there are limited opportunities to scour deeper pools due to the composition of the bed material and associated natural armoring.

**Table 5. Proposed Channel Dimensions for Constructed Reaches**

| Project Site | Design Slope (%) | Design Slope Range (%) | Proposed Bankfull Width Min (ft) | Proposed Bankfull Width Max (ft) | Proposed Bankfull Depth Min (ft) | Proposed Bankfull Depth Max (ft) | Cross Sectional Area Min ($ft^2$) | Cross Sectional Area Max ($ft^2$) |
|---|---|---|---|---|---|---|---|---|

## INTRODUCTION

Lehigh Southwest Cement Company (Lehigh), a subsidiary of Lehigh Hanson, Inc., engaged Stantec Consulting Services Inc. (Stantec) to provide professional engineering services for geotechnical analysis related to proposed grading associated with the Permanente Creek Restoration Project (PCRP) at the Permanente Facility in Cupertino, California. An element of the PCRP involves removing material from the creek corridor and adjacent slopes. The PCRP design and grading plans are presented in the associated report prepared by Waterways (90% Designs, dated August 26, 2022). The grading plans were provided to Stantec by Waterways, and Stantec performed geotechnical analyses of the proposed slopes in support of the environmental review and subsequent permit applications.

This PCRP Stability Analysis has been prepared to assist Lehigh with upcoming environmental review and subsequent permit applications to relevant regulatory agencies. This report documents the results of static and pseudo-static slope stability analyses of the reclamation surface. The report does not contain the creek restoration design details and shall be reviewed in conjunction with Waterways' 90% Designs.

## BACKGROUND

The Permanente Facility is a limestone and aggregate mining operation, active since the late 1930's, in the unincorporated foothills of western Santa Clara County, approximately two miles west of the City of Cupertino, California. The Quarry occupies a portion of a 3,510-acre property (Permanente Property) owned by Hanson Permanente Cement, Inc. and operated by Lehigh.

The Permanente Property is situated in the rugged foothills along the eastern side of the Santa Cruz Mountains segment of the California Coast Ranges. This area of the Coast Ranges is characterized by moderately to steeply sloping hillsides ranging from approximately 500 to 2,000 feet (ft) above mean sea level (AMSL). The eastern side of the range is incised with eastern flowing drainages, including the Permanente Creek Drainage Basin, which flows through the central part of the Permanente Property, and flows through the Cities of Los Altos and Mountain View and into Mountain View Slough or Stevens Creek through the Stevens Creek Diversion Channel operated by the Santa Clara Valley Water District, which ultimately can reach the San Francisco Bay.

## GEOLOGIC SETTING

The geology in the project area is complex due to the faulting and deformation associated with the Franciscan Complex. This geologic unit consists of faulted limestone and metabasalts (greenstone) and also contains basalt, diorite, shale, sandstone, chert, greywacke, and schist. Structure in the area includes numerous low- and high-angle faults. Low-angle faults separate limestone units from greenstone units and

tend to follow the limestone bedding planes and typically dip to the southeast at 10° to 40°. High-angle faults, including the regional Berrocal Fault, are typically oriented in the northwest-southeast direction and dip at greater than 60°. The geology has been mapped several times by different geologists, and numerous drilling programs have been conducted. The results of these previous studies on the geologic units, structure, and interpretation were included in previous submittals (Golder 2011 and Foruria 2004).

## PREVIOUS GEOTECHNICAL EVALUATIONS

The geologic and geotechnical properties of the rocks present at the Permanente Quarry have been evaluated several times by several companies. Each investigation included drilling, laboratory testing, assessment of strength parameters for the various rock types encountered, and slope stability calculations. The rock strength parameters were based on laboratory data, rock mass rating (RMR) calculations, and back-analysis of landslide areas. The strength parameters for soil, greenstone overburden, and limestone have been consistent through multiple geotechnical analyses performed by multiple consultants, and these values are listed in Table 1. The strength parameters for greenstone vary significantly depending on the condition of the bedrock and particularly, the amount of weathering and shearing, and lower-bound values have historically been used for design purposes to be conservative. These lower-bound values are based on back-analysis of the Main Slide in the North Quarry. Laboratory data suggest the in-place greenstone may have significantly higher strength, particularly at depths greater than approximately 50 feet, where the bedrock has not been weathered. Site observations also suggest that greenstone strengths are often under-reported as several areas of the highwall are constructed in weathered greenstone, and these areas have maintained their integrity with 50-foot high benches with face angles of 60° to 70° (Golder 2011).

**Table 1: Historic Rock Strength Summary**

| Material | Unit Weight (pcf) | Cohesion (psf) | Φ' (°) |
|---|---|---|---|
| Limestone | 165 | 12,500 | 30 |
| Greenstone | 155-165 | 1,400-1,880 | 19-23 |
| Fault | 155 | 0 | 20 |
| Slide Debris | 135 | 0-700 | 20-23 |
| Greenstone Overburden | 125 | 0 | 35 |
| Soil | 120 | 200 | 30 |

## GEOTECHNICAL STABILITY EVALUATION

The slope stability analyses were modeled using the software Slide2 Modeler version 9 by rocscience, released in 2020. The software used limit equilibrium on slices of potential failure surface to calculate factor of safety (FoS). The models were evaluated under static and pseudo-static conditions, with horizontal ground acceleration, for the designed ramp configuration provided by the site using the Spencer method. The minimum FoS for each model evaluation is included in this report. The two types of analysis have been summarized in Table 2. The minimum acceptable factors of safety for the analyses are 1.3 for static conditions and 1.0 for pseudo-static conditions based on mining industry standards. For the pseudo-static model conditions, a horizontal seismic coefficient of 0.15 times the force of gravity (g) was applied to the

static condition models to be consistent with previous studies and to follow recommendations for earthquakes with magnitudes up to 8.25 (Golder 2011). To evaluate the slope stabilities, cross-sections were analyzed for the reclamation surface.

**Table 2: Stability Analyses**

| Analysis Type | Description | Minimum Acceptable Factor of Safety |
|---|---|---|
| Static Analysis | A limit equilibrium method of analysis which satisfies moment and force equilibrium to solve a slope stability problem. The output is a single FoS for the potential failure surface with the lowest FoS. | 1.3 |
| Pseudo-static Analysis | A limit equilibrium method of analysis which represents the effects of earthquake shaking by accelerations that create inertial forces. This is the simplest way to analyze the dynamic effects of earthquake loading of a soil or slope. The output is a single FoS for the potential failure surface with the lowest FoS. | 1.0 |

Site specific geotechnical information is available for each rock type on the property, and strength parameters for the material have been established in previous geotechnical analyses (Golder 2011). These strength parameters are based on laboratory testing, back-calculation, and published values for soil properties. These strength parameters are listed in Table 3.

**Table 3: Geotechnical Strength Parameters**

| Material | Unit Weight (pcf) | Cohesion (psf) | Phi' (Degrees) |
|---|---|---|---|
| Greenstone (Weathered) | 165 | 1,800 | 27 |
| Greenstone (Unweathered) | 165 | 12,500 | 30 |
| Limestone | 165 | 12,500 | 30 |

As previously discussed, the greenstone strengths can vary significantly depending on the degree of weathering, and Stantec focused on evaluating the greenstone strengths as part of this geotechnical investigation. The greenstone strengths were re-evaluated based on RMR classifications. The historic greenstone strength ($\phi$'=27° and cohesion=1,800 pounds per square foot [psf]) is suitable for areas that have been weathered and are near the surface. A stronger strength for greenstone is expected for bedrock at depths greater than 50 feet from the surface, which is "beyond" the surficial weathered zone. While this transition to competent bedrock has been demonstrated by drilling, Stantec has used the weathered greenstone strength values for all depths to be conservative. Similarly, there are likely areas with limestone

that would exhibit greater strengths, and these have also not been included in the geotechnical analyses to be conservative.

Stability analyses are focused on areas with greater excavation volumes, particularly the rock pile removal area (Section A) and the 1250 Pond area (Sections C and E); the cross-sections modeled align with Waterway's sections and Waterway's naming conventions have been retained for clarity between the reports. Stantec modelled multiple cross-sections in the Pond 1250 area to evaluate the stability under different slope configurations and excavation depths. The cross-sections extend to the top of the surrounding slopes to evaluate any impacts that the grading may have on the global stability. Stantec adjusted the limits of the analyses to evaluate both the global slope stability and the stability in the area immediately adjacent to the PCRP grading.

The configurations modeled as part of this analysis exceed the minimum acceptable factor of safety, as defined in Table 3. Generally, the elevated geotechnical stability results are from the shallow cut slopes associated with the PCRP grading plan. Results from the stability analyses are shown in Table 4. Printouts of the slope stability sections are attached.

**Table 4: Geotechnical Stability Analyses Results**

| Analysis Area | Analysis method | Section A | Section C | Section E |
|---|---|---|---|---|
| Cut Slope | Static | 1.8 | 3.0 | 2.3 |
| | Pseudo-Static | 1.7 | 2.8 | 2.2 |
| Global Slope | Static | 1.5 | 2.8 | 1.5 |
| | Pseudo-Static | 1.5 | 2.7 | 1.4 |

## CLOSURE

This report provides the analysis and supporting information needed to demonstrate that Lehigh Southwest Cement Company's plan for the PCRP meets design and performance requirements under static and seismic conditions. The PCRP will be excavated so that stable slopes remain. As mutual protection to Lehigh, the public, and Stantec, this report was submitted for exclusive use by Lehigh Southwest Cement Company. Our report and recommendations should not be reproduced in whole or in part without the supporting Waterways 90% Design report and our express written permission, other than as required in relation to agency review and submittals. A draft of this report was reviewed by personnel from Lehigh Southwest Cement Company.

# H1. Impacts and Mitigation Measures for the Final 2012 Permanente Quarry Reclamation Plan Amendment

# APPENDIX H1
## IMPACTS AND MITIGATION MEASURES FOR THE FINAL 2012 PERMANENTE QUARRY RECLAMATION PLAN AMENDMENT

This Appendix H1 is the same as Table ES-3 from the Draft 2012 EIR. Not all of the mitigation measures set forth below apply to the PCRP. Those that do apply are called out specifically in the Draft SEIR and are highlighted in light green below.

| Environmental Impact | Significance before Mitigation | Mitigation Measures | Significance after Mitigation |
|---|---|---|---|
| **Aesthetics, Visual Quality, and Light and Glare** | | | |
| **4.1-1:** Construction of the Project would have a substantially adverse effect on a scenic vista during an interim period. | Significant | None feasible | Significant and unavoidable |
| **4.1-2:** Monitoring and Maintenance of the Project would not have a substantially adverse long term effect on a scenic vista. | Less than significant | None required | Less than significant |
| **4.1-3:** Construction of the Project would substantially damage scenic resources within a state- or County-designated scenic highway or route during the period of time when active reclamation activities are occurring. | Significant | None feasible | Significant and unavoidable |
| **4.1-4:** Neither active reclamation activities nor monitoring and maintenance of the Project would result in long term substantial damage to scenic resources within a state- or County-designated scenic highway or route. | Less than significant | None required | Less than significant |
| **4.1-5:** The Project would alter and substantially degrade the existing visual character or quality of the Project Area during the period of time when active reclamation activities are occurring. | Significant | None feasible | Significant and unavoidable |
| **4.1-6**: The implementation of active reclamation activities would alter, but not permanently substantially degrade, the existing visual character or quality of the Project Area. | Less than significant | None required | Less than significant |
| **4.1-7:** Lighting required for the Project would not adversely affect daytime or nighttime views in the Project Area. | Significant | **Mitigation Measure 4.1-7:** No night lighting shall be allowed permitted on the east-facing slope of the EMSA or any other location within the EMSA that would be visible from public locations on the Santa Clara Valley floor including roadways. | Less than significant |
| **4.1-8:** The Project would not create new permanent sources of light or glare that would affect daytime or nighttime views in the area. | Less than significant | None required | Less than significant |
| **6-1:** Project construction activities could make a cumulatively considerable contribution a substantial adverse effect on a scenic vista and degradation of the existing visual character or quality of the Project Area. | Significant | None feasible | Significant and unavoidable |
| **Agriculture and Forestry Resources** | | | |
| (No impact) | | | |

**APPENDIX H1 (CONTINUED)**
**IMPACTS AND MITIGATION MEASURES FOR THE FINAL 2012 PERMANENTE QUARRY RECLAMATION PLAN AMENDMENT**

| Environmental Impact | Significance before Mitigation | Mitigation Measures | Significance after Mitigation |
|---|---|---|---|
| **Air Quality** | | | |
| **4.3-1:** The Project would generate emissions of criteria air pollutants which could contribute to existing nonattainment conditions and further degrade air quality. | Less than significant | None required | Less than significant |
| **4.3-2:** Project traffic associated with operational and reclamation activities would generate localized CO emissions on roadways and at intersections in the Project vicinity. | Less than significant | None required | Less than significant |
| **4.3-3:** The Project would expose people to increased levels of toxic air contaminants, which could lead to an increase in the risk of cancer. | Significant | **Mitigation Measure 4.3-3a:** Within 90 days of Project approval, the Applicant shall submit to the County and the BAAQMD a comprehensive inventory of all Project-related off-road construction equipment expected to be used during any portion of the Project. The inventory shall include the horsepower rating, engine production year, and projected hours of use or fuel throughput for each piece of equipment. The inventory shall be updated and submitted annually throughout the duration of the Project.<br><br>**Mitigation Measure 4.3-3b:** Within 90 days of Project approval, the Applicant shall provide a plan for approval by the County and the BAAQMD demonstrating that Project-related off-road equipment would achieve a Project (EMSA-specific) wide fleet-average 35 percent reduction in DPM emissions compared to the proposed fleet in the ALG report (ALG, 2011a) during Phase 1 of the Project. The plan shall be updated and submitted annually throughout the duration of the Project. Options for reducing emissions may include, but are not limited to:<br>• Using newer model engines (e.g., engines that meet U.S. EPA interim/final Tier 4 engine standards);<br>• Use of Retrofit Emission Control Devices that consist of diesel oxidation catalysts, diesel particulate filters, or similar retrofit equipment control technology verified by CARB (http://www.arb.ca.gov/diesel/verdev/verdev.htm);<br>• Use of low-emissions diesel products or alternative fuels;<br>• Use of alternative material handling options (e.g., conveyor system); or<br>• Other options as may become commercially available and verifiable.<br>; or<br>**4.3-3c:** The Applicant shall submit evidence establishing to the County's satisfaction that there are legally-binding restrictions precluding any occupancy of the caretaker's residence during the entirety of Phase 1 of the Project. | Less than significant |

## APPENDIX H1 (CONTINUED)
## IMPACTS AND MITIGATION MEASURES FOR THE FINAL 2012 PERMANENTE QUARRY RECLAMATION PLAN AMENDMENT

| Environmental Impact | Significance before Mitigation | Mitigation Measures | Significance after Mitigation |
|---|---|---|---|
| **4.3-4:** The Project would expose people to increased levels of toxic air contaminants, which could increase acute and chronic health risks. | Less than significant | None required | Less than significant |
| **4.3-5:** The Project would increase emissions of PM2.5, which could adversely affect human health. | Significant | **Mitigation Measure 4.3-5:** Implement Mitigation Measures 4.3-3a and 4.3-3b (or, alternatively, implement Mitigation Measure 4.3-3c). | Less than Significant |
| **Biological Resources** | | | |
| **4.4-1:** Project activities could result in adverse effects on special-status and migratory birds. | Less than significant | None required | Less than significant |
| **4.4-2:** Project activities could result in adverse effects on special-status bats. | Significant | **Mitigation Measure 4.4-2a: Use of Buffers near Active Roosts.** During the November 1 to March 31 hibernation season, work shall not be conducted within 100 feet of woodland habitat that provides suitable bat roosting habitat. Bat presence is difficult to detect using emergence surveys during this period due to decreased flight and foraging behavior. If a qualified bat biologist determines that woodland areas do not provide suitable hibernating conditions for bats and they are unlikely to be present in the area, work may commence as planned.<br><br>**Mitigation Measure 4.4-2b: Roosting Bats, Maternity Roosting Season.** Nighttime evening emergence surveys and/or internal searches within large tree cavities shall be conducted by a qualified biologist during the maternity season (April 1 to August 31) to determine presence/absence of bat maternity roosts within 100 feet of wooded Project boundaries. All active roosts identified during surveys shall be protected by a buffer to be determined by a qualified bat biologist. The buffer shall be determined by the type of bat observed, topography, slope, aspect, surrounding vegetation, sensitivity of roost, type of potential disturbance, etc. Each exclusion zone shall remain in place until the end of the maternity roosting season. If no active roosts are identified, then work may commence as planned. Survey results are valid for 30 days from the survey date. Should work commence later than 30 days from the survey date, surveys shall be repeated.<br><br>Operations may continue for many years. Surveys do not need to be repeated annually unless additional clearing of potential roosting or hibernation habitat could occur outside of the non-roosting season.<br><br>**Mitigation Measure 4.4-2c: Bat Roost Replacement.** All special-status bat roosts destroyed by the Project shall be replaced by the Applicant at a 1:1 ratio onsite with a roost suitable for the displaced species (e.g., bat houses for colonial roosters). The design of such replacement habitat shall be coordinated with CDFG. The new roost shall be in place prior to the time that the bats are expected to use the roost (e.g., prior to April 1 if the roost destroyed by the Project was used by a maternity colony), and shall be monitored periodically for 5 years to ensure proper roosting habitat characteristics (e.g., suitable temperature and no leaks). The roost shall be modified | Less than significant |

**APPENDIX H1 (CONTINUED)**
**IMPACTS AND MITIGATION MEASURES FOR THE FINAL 2012 PERMANENTE QUARRY RECLAMATION PLAN AMENDMENT**

| Environmental Impact | Significance before Mitigation | Mitigation Measures | Significance after Mitigation |
|---|---|---|---|
| | | as necessary to provide a suitable roosting environment for the target bat species. | |
| **4.4-3:** Project activities could result in adverse effects on the San Francisco dusky-footed woodrat. | Less than significant | None required | Less than significant |
| **4.4-4:** Project activities could result adverse effects on special status aquatic organisms. | Less than significant | Implement **Mitigation Measure 4.10-2a: Interim Stormwater Control and Sediment Management.** | Less than significant |
| **4.4-5:** Project activities could result in selenium-burdened runoff reaching aquatic habitats and, thereby, in deleterious effects to aquatic organisms and their prey base. | Significant | **Mitigation Measure 4.4-5: Selenium-related Impacts to Aquatic Habitat.** Implement Mitigation Measures 4.10-2a: Interim Stormwater Control and Sediment Management; 4.10-2b: EMSA Interim Stormwater Monitoring Plan; Mitigation Measure 4.10-2c: Monitoring and Determination of BMP Effectiveness for the EMSA; Mitigation Measure 4.10-2d: Monitoring and Determination of BMP Effectiveness for the WMSA and Quarry Pit; and Mitigation Measure 4.10-2e: Design, Pilot Testing, and Implementation of Selenium Treatment Facility or Alternative for the EMSA and/or the WMSA and Quarry Pit. | Significant and unavoidable |
| **4.4-6:** Project activities could result in the loss or degradation of riparian habitat associated with Permanente Creek. | Less than significant | None required | Less than significant |
| **4.4-7:** Project activities could result in the loss of native oak woodland as defined by Oak Woodlands Conservation Law. | Significant | **Mitigation Measure 4.4-7: Sudden Oak Death Minimization Measures.** To reduce the possibility of spreading Sudden Oak Death to oak woodlands in the Study Area, the Applicant shall implement the following measures:<br>• Prior to any reclamation work within the Project Area, equipment shall be sanitized, including shoes, pruning gear, trucks, and heavy equipment such as earthmoving, tree trimming, chipping, or mowing equipment. Except for trucks, this equipment shall remain onsite for the duration of Project activities and shall not be transferred between this and other worksites, as doing so increases the potential of transferring infected spores to or from another site.<br>• After the completion of work activities, any accumulation of plant debris (especially leaves), soil, and mud shall be washed off of equipment or otherwise removed onsite, and air filters shall be blown out.<br>• All contractors shall have sanitation kits onsite for cleaning equipment. Sanitation kits should contain chlorine bleach (10/90 mixture bleach to water) or Clorox Clean-Up or Lysol, scrub brush, metal scraper, boot brush, and plastic gloves.<br>• All organic material imported for mixing with Quarry pit backfill shall have been composted at a facility that meets the standards of Title 14 California Code of Regulations, Division 7, Chapter 3.1; alternative sources of organic material may be used if approved by the County of Santa Clara Agricultural Commissioner as being as effective as the composting process to sanitize | Less than significant |

**APPENDIX H1 (CONTINUED)**
**IMPACTS AND MITIGATION MEASURES FOR THE FINAL 2012 PERMANENTE QUARRY RECLAMATION PLAN AMENDMENT**

| Environmental Impact | Significance before Mitigation | Mitigation Measures | Significance after Mitigation |
|---|---|---|---|
| | | SOD-infected materials.<br>• All other imported fill material, soil amendments, gravel, etc. required for construction and/or restoration activities to be placed within the upper 12 inches of the ground surface shall be free of vegetation or plant material. | |
| **4.4-8:** Project activities could result in substantial adverse effects on wetlands and jurisdictional waters associated with Permanente Creek through direct removal, filling, hydrological interruption, or other means. | Significant | **4.4-8a: Wetland Identification and Avoidance.** A qualified wetland biologist shall physically delineate all federal and state waters and wetland features mentioned above and identified in the 2008 wetland delineation (WRA, 2008). This shall occur before any PCRA activities begin, and when feasible, reclamation activities shall completely avoid these areas. Silt fence shall be installed between jurisdictional waters or wetlands and areas sprayed with hydroseed to prevent filling of wetlands with tackifier or other hydroseed material. Use of hand-seeding or working with hand tools may be required to avoid equipment impacting wetlands.<br>**4.4-8b: Wetland Mitigation Plan.** If avoidance of jurisdictional waters or wetlands is not feasible, the following measures shall be implemented:<br>A qualified wetland biologist shall prepare a Mitigation and Monitoring Plan (MMP) for impacts to wetlands and waters under state or federal jurisdiction. The MMP shall outline the anticipated mitigation obligations for temporary and permanent impacts to waters of the state and/or U.S., including wetlands, resulting from PCRA activities. The MMP shall include:<br>• Baseline information;<br>• Anticipated habitat enhancements to be achieved through compensatory actions, including whether mitigation will occur within the Project Area along Permanente Creek or at an offsite location, as well as mitigation site location and hydrology;<br>• When possible, a preference for mitigation within the Permanente Quarry property, for impacts to both jurisdictional waters and wetlands;<br>• Performance and success criteria for habitat enhancement of Permanente Creek or other waterways to compensate for impacts to Other Waters, including:<br>– A replanting plan for appropriate native riparian woody vegetation, including but not limited to arroyo willow, white alder, California wild rose, and snowberry, bigleaf maple, western creek dogwood, and Oregon ash;<br>– An 80% overall revegetation planting success for all mitigation areas over a ten-year period; | Less than significant |

|---|---|---|---|
| of an historical resource pursuant to §15064.5 of the CEQA Guidelines and the County's Historic Preservation Ordinance. | | and their historic context of the contributing features of the Kaiser Permanente Quarry Mining District, including archival photo-documentation, mapping, and recording of historical and engineering information including measured drawings about the property according to the standards of the Historic American Building Survey/Historic American Engineer Record/Historic American Landscapes Survey (HABS/HAER/HALS), to be placed in a local public archive such as the Archives of the County of Santa Clara;<br><br>**Mitigation Measure 4.5-1b:** The Applicant shall salvage and/or relocate a representative portion of the Permanente Quarry Conveyor System and the remains of the early 1940s crusher, which constitute character-defining features that otherwise would be lost as a part of implementation of the Project; and<br><br>**Mitigation Measure 4.5-1c:** The Applicant shall prepare public information programs to educate the general public on the historic nature of the potential Kaiser Permanente Quarry Mining District, including but not limited to exhibits at the Quarry office, publications available at the Quarry office, and an online presentation available on the Applicant's website (www.lehighpermanente.com). | unavoidable |
| **4.5-2:** Project activities could cause an adverse change in the significance of an archaeological resource as defined in §15064.5 of the CEQA Guidelines. | Significant | **Mitigation Measure 4.5-2:** If cultural resources are encountered during Project implementation, the Applicant shall notify the County and all activity within 100 feet of the find shall halt until it can be evaluated by a qualified archaeologist and a Native American representative. Prehistoric archaeological materials might include obsidian and chert flaked-stone tools (e.g., projectile points, knives, scrapers) or toolmaking debris; culturally darkened soil ("midden") containing heat-affected rocks, artifacts, or shellfish remains; and stone milling equipment (e.g., mortars, pestles, handstones, or milling slabs); and battered stone tools, such as hammerstones and pitted stones. Historic-period materials might include stone, concrete, or adobe footings and walls; filled wells or privies; and deposits of metal, glass, and/or ceramic refuse. If the archaeologist and Native American representative determine that the resources may be significant and cannot be avoided, they shall notify the County and an appropriate treatment plan for the resources shall be developed by the Applicant in consultation with the County and the archaeologist. Measures in the treatment plan could include preservation in place (capping) and/or data recovery. The archaeologist shall consult with Native American representatives in determining appropriate treatment for prehistoric or Native American cultural resources. Ground disturbance shall not resume within 100 feet of the find until an agreement has been reached as to the appropriate treatment of the find. | Less than significant |
| **4.5-3:** Project activities could directly or indirectly destroy a unique paleontological resource or site. | Significant | **Mitigation Measure 4.5-3:** If a paleontological resource is encountered during implementation of the RPA, the Applicant shall notify the County and all activity within 100 feet of the find shall halt until it can be evaluated by a qualified paleontologist as defined by the Society of Vertebrate Paleontology Guidelines (SVP, 1995). The paleontologist shall evaluate the resource and determine its significance. If significant, the paleontologist shall notify the County and the Applicant, in consultation with the | Less than significant |

| Environmental Impact | Significance before Mitigation | Mitigation Measures | Significance after Mitigation |
|---|---|---|---|
| | | County and the paleontologist, shall prepare a treatment plan such that the fossil would be recovered and scientific information preserved. The paleontologist shall implement the treatment plan in consultation with the County and Applicant prior to allowing work in the 100-foot radius to resume. | |
| **4.5-4:** Project activities could disturb human remains, including those interred outside of formal cemeteries. | Significant | **Mitigation Measure 4.5-4:** In the event that human skeletal remains are encountered, the Applicant is required by Health and Safety Code Section 7050.5, Public Resources Code Section 5097.98, Title 14 California Code of Regulations Section 15064.5(e), and County Ordinance No. B6-18 to immediately notify the County Coroner. Upon determination by the County Coroner that the remains are Native American, the coroner shall contact the California Native American Heritage Commission, pursuant to subdivision (c) of §7050.5 of the Health and Safety Code and the County Coordinator of Indian affairs. No further disturbance of the site shall be made except as authorized by the County Coordinator of Indian Affairs in accordance with the provisions of state law and the County Ordinance. If artifacts are found on the site, a qualified archaeologist shall be contacted along with the County Planning Office. No further disturbance of the artifacts shall be made except as authorized by the County Planning Office. | Less than significant |
| **Energy Conservation** | | | |
| **4.6-1:** The Project would include means for avoiding or reducing wasteful and/or unnecessary consumption of energy. | Less than significant | None required | Less than significant |
| **Geology, Soils, and Seismicity** | | | |
| **4.7-1:** Rock and soil slopes constructed as part of the proposed reclamation of the EMSA, Quarry pit, and WMSA could fail under static or seismic forces if not properly engineered and constructed. | Significant | **Mitigation Measure 4.7-1: Avoidance and containment of shallow slumps and/or fall-back of overburden material.** In all areas requiring the use of excavators for grading within the PCRA (e.g., access road in-sloping, installation/repair of sedimentation basins, and removal of slide debris), the Applicant and/or its contractor shall begin excavations from the top of slope and proceed downward. The Applicant and/or its contractor shall not undercut sloped materials unless no other option is feasible as determined by a registered geotechnical engineer (e.g., excessively sloped or otherwise inaccessible terrain). In all areas of the PCRA where excavations would occur in sloped materials, the Applicant and/or its contractor shall install barriers immediately downslope of the activity. Downslope barriers shall be designed and installed in a manner that would be adequate to prevent overburden and/or native materials from falling, sloughing or sliding further downslope, or into Permanente Creek. Such measures may consist of temporary interlocking soldier piles, wooden shoring systems, wire mesh or other containment measures(s), and the Applicant and/or its contractor shall not be permitted to conduct excavation or grading activities downgradient of the barrier, or prior to its installation. The ultimate location, design and installation method of such measures shall be prepared and certified, or reviewed and | Less than significant |

**APPENDIX H1 (CONTINUED)**

| Environmental Impact | Significance before Mitigation | Mitigation Measures | Significance after Mitigation |
|---|---|---|---|
| | | approved by a California State registered geotechnical engineer. | |
| **4.7-2:** In the event of a major earthquake in the region, seismic ground shaking could result in injury to site workers, damage to Quarry equipment and structures, or trigger slope failures. In addition, a large earthquake on the San Andreas Fault could result in minor ground deformation along traces of the Berrocal or Monte Vista Fault Zones. | Less than significant | None required | Less than significant |
| **4.7.3:** Earthmoving and other ground disturbance associated with the phased reclamation of the site could temporarily promote accelerated erosion and soil loss. | Less than significant | None required | Less than significant |
| **Greenhouse Gas Emissions** | | | |
| **4.8-1:** The Project could result in an increase in greenhouse gas emissions and contribute to climate change. | Significant | **Mitigation Measure 4.8-1a: Develop Annual GHG Inventory.** The Applicant shall become a reporting member of The Climate Registry. Beginning with the first year of the Project and continuing for the duration of the Project, the Applicant shall conduct an annual inventory of GHG emissions and shall report those emissions to The Climate Registry. The annual inventory shall be conducted according to The Climate Registry protocols and third-party verified by a verification body accredited through The Climate Registry.<br><br>**Mitigation Measure 4.8-1b: Greenhouse Gas Emissions Reduction Plan.** The Applicant shall prepare, submit for County and BAAQMD approval, make available to the public, and implement a Greenhouse Gas Emissions Reduction Plan (GHG Plan) containing quantifiable strategies to ensure that the Project-related incremental increase of GHG emissions does not exceed 1,100 MT $CO_2e$ per year. The GHG Plan shall include, but not be limited to, the following measures:<br><br>1. Replacement of on-road and off-road vehicles and construction equipment with lower GHG-emitting engines, such as electric or hybrid.<br>2. Use of the Overland Conveyor System, powered by electric motors, to move more than 75 percent of the waste rock from the West Materials Storage Area (WMSA) to reclaim the Quarry pit.<br><br>If the Applicant is unable to reduce the Project-related incremental increase of GHG emissions to below 1,100 MT $CO_2e$ per year using the above measures, the Applicant shall offset all remaining Project incremental emissions above that threshold. Any offset of Project emissions shall be demonstrated to be real, permanent, verifiable, enforceable, and additional. To the maximum extent feasible, as determined by the County in coordination with the BAAQMD, offsets shall be implemented locally. Offsets may include but are not limited to, the following (in order of preference):<br><br>1. Onsite offset of Project emissions, for example through development of a renewable energy generation facility or a carbon sequestration project (such | Less than significant |

**APPENDIX H1 (CONTINUED)**
**IMPACTS AND MITIGATION MEASURES FOR THE FINAL 2012 PERMANENTE QUARRY RECLAMATION PLAN AMENDMENT**

| Environmental Impact | Significance before Mitigation | Mitigation Measures | Significance after Mitigation |
|---|---|---|---|
| | | as a forestry or wetlands project for which inventory and reporting protocols have been adopted). If the Applicant develops an offset project, it must be registered with the Climate Action Reserve or otherwise approved by the BAAQMD in order to be used to offset Project emissions. The number of offset credits produced would then be included in the annual inventory, and the net (emissions minus offsets) calculated.<br>2. Funding of local projects, subject to review and approval by the BAAQMD, that would result in real, permanent, verifiable, enforceable, and additional reduction in GHG emissions. If the BAAQMD or County of Santa Clara develops a GHG mitigation fund, the Applicant may instead pay into this fund to offset Project incremental GHG emissions in excess of the significance threshold.<br>3. Purchase of carbon credits to offset Project incremental emissions to below the significance threshold. Carbon offset credits must be verified and registered with The Climate Registry, the Climate Action Reserve, or other source that is approved by the California Air Resources Board as being consistent with the policies and guidelines of the California Global Warming Solution Act of 2006 (AB 32), or available through a County- or BAAQMD-approved local GHG mitigation bank or fund. | |
| **4.8-2:** The Project could conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHG. | Less than significant | None required | Less than significant |
| **Hazards and Hazardous Materials** | | | |
| **4.9-1:** The Project could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. | Less than significant | None required | Less than significant |
| **4.9-2:** The Project could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. | Less than significant | None required | Less than significant |
| **4.9-3:** Sedimentation and detention basins planned for erosion and flood control at the Project site could provide breeding grounds for vectors. | Less than significant | None required | Less than significant |

| Environmental Impact | Significance before Mitigation | Mitigation Measures | Significance after Mitigation |
|---|---|---|---|
| **Hydrology and Water Quality** | | | |
| **4.10-1:** Post-reclamation conditions in the East Materials Storage Area (EMSA), West Materials Storage Area (WMSA), and Quarry pit would increase selenium concentrations in Permanente Creek to levels exceeding baseline conditions and RWQCB Basin Plan objectives. | Significant | **Mitigation Measure 4.10-1a: Professional Geologist Verification of Non-Limestone-Containing Material Use.** A California-certified Professional Geologist shall be onsite during reclamation to verify that non-limestone run-of-mine rock is used as cover on the EMSA and WMSA. In addition, the Geologist shall observe and document activities associated with placing the final overburden on the Quarry pit (i.e., ensuring that organic material is mixed to specifications). Using visual and field testing methods, with occasional bulk sampling and laboratory analysis, the geologist shall observe and document the type of rock placed over the limestone-containing material during reclamation activities. The geologist shall inspect and document whether limestone is present at the source area (Quarry pit and WMSA), whether limestone rock is transported from the source area to segregation stockpiles, and whether limestone is present within the lifts of the proposed 1-foot layer of run-of-mine cover rock (in the EMSA, WMSA, and Quarry pit). Inspection involves observing the excavation, hauling, stockpiling, and placement of the non-limestone cover material, performing a visual assessment of the rock, and conducting random spot sampling and field testing of suspect rock fragments. If observation, field testing, or laboratory analysis indicates that significant amounts of limestone are intermixed with the supposed non-limestone cover material, the geologist shall document its presence, temporarily halt fill operations, and notify the County Planning Office and field superintendent. Once notified, the Applicant shall remove the limestone-containing materials and then perform verification field sampling in addition to laboratory verification. | Less than significant |
| **4.10-1 (cont.)** | | Mitigation Measure 4.10-1b: Verification Water Quality Monitoring. The Applicant shall implement the following water monitoring and verification program within 90 days of Project approval and continue the program throughout the backfilling and reclamation phases and for 5 years following completion of reclamation. As part of this program, the Applicant shall:<br>• Collect quarterly Quarry pit water samples and analyze for general water chemistry and dissolved and total metals, including selenium.<br>• Perform quarterly electrical conductivity and pH measurements of the Quarry water.<br>• Measure and record daily volumes of any water that is pumped from the pit area.<br>• Conduct annual seep surveys in March or April of each year within the Quarry pit. Any seeps identified shall be sampled for general water chemistry and minerals and dissolved metals, and the seep flow rate shall | |

| Environmental Impact | Significance before Mitigation | Mitigation Measures | Significance after Mitigation |
|---|---|---|---|
| | | be estimated.<br>• Perform routine testing of each of the various rock types that comprise the overburden to further characterize bulk and leachable concentrations of key metal constituents (selenium in particular). Such testing shall be performed until the average concentrations and the variability within a rock type is no longer changing significantly as new data are gathered.<br>• Sample and test runoff from the EMSA and WMSA throughout and following reclamation to confirm the concepts and closure plans (i.e., that cover with non-limestone material and revegetation results in runoff water quality that meets Basin Plan Water Quality Objectives and all other applicable water quality standards). Stormwater runoff monitoring and sampling shall be conducted following the placement and final grade of the 1-food-run-od-mine non-limestone cover material to ensure that surface water discharging from this cover does not contain selenium at concentrations exceeding the Basin Plan Water Quality Objectives. Three rounds of representative surface water samples shall be collected and analyzed to verify rock cover performance prior to the placement of the vegetative growth layer.<br>• The data obtained through this mitigation measure shall be used to reevaluate the water balance components such as runoff and groundwater inflow and the water quality associated with these within the last five years of active mining. Based on the results of any refined water balance and water quality projections, the Applicant shall also review and refine the water management procedures.<br>• Reclamation of the Quarry Pit, EMSA, and WMSA areas shall not be considered complete until 5 years of water quality testing as described above demonstrate, to the satisfaction of the Director of Planning and Development, that selenium in surface water runoff and any point source discharges has been reduced below all applicable water quality standards, including Basin Plan Objectives. | |
| **4.10-2:** Interim reclamation activities within the Project Area would contribute concentrations of selenium, Total Dissolved Solids (TDS), and sediment in Permanente Creek. | Significant | **Mitigation Measure 4.10-2a: Interim Stormwater Control and Sediment Management.** To minimize the discharge of sedimentation and metal constituents, particularly selenium, to watercourses, the Applicant shall implement the following stormwater and sediment management controls in addition to general BMPs required by the SWPPP in active and inactive reclamation areas throughout Phases 1, 2 and 3 of the Project. The Applicant shall:<br>• Segregate limestone materials from the non-limestone materials (breccia, graywacke, chert, and greenstone) by way of operational phasing to ensure that non-limestone materials are placed beneath and are covered by non- | Significant and unavoidable |

| Environmental Impact | Significance before Mitigation | Mitigation Measures | Significance after Mitigation |
|---|---|---|---|
| | | limestone materials. A California Professional Geologist shall oversee stockpiling, segregation, and placement of non-limestone materials.<br>• Stabilize inactive areas, such as temporary stockpiles or dormant excavations that drain directly or indirectly to Permanente Creek using an appropriate combination of BMPs to cover the exposed rock material, intercept runoff, reduce its flow velocity, release runoff as sheet flow, and provide a sediment control mechanism (such as silt fencing, fiber rolls, or hydroseeded vegetation). Standard soil stabilization BMPs include geotextiles, mats, erosion control blankets, vegetation, silt fence surrounding the stockpile perimeter, and fiber rolls at the base and on side slopes.<br>• Temporarily stabilize active, disturbed reclamation areas undergoing fill placement before and during qualifying rain events expected to produce site runoff. Stabilization methods include combined BMPs that protect materials from rain, manage runoff, and reduce erosion. Reclamation activities involving grading, hauling, and placement of backfill materials cannot take place during periods of rain.<br>• In areas such as the WMSA where fill slopes are steep and composed of loose material, controls shall be in place to prevent material from sloughing off into the PCRA and Permanente Creek. These controls shall include debris/silt fencing placed on outer edge of grading and excavation operations back-sloping excavations to prevent grade slope towards the creek, operations buffer areas that require the use of smaller grading equipment, temporary berms along the outer extent of operations closest to the creek, operator training regarding the prevention of triggering debris slides.<br>• Cover active haul roads with non-limestone materials where exposed limestone surfaces are present. Roads that undergo dust control by watering must have fiber rolls or equivalent runoff protection installed along the road side to reduce runoff and avoid drainage to Permanente Creek.<br>• Divert all runoff generated from disturbed active and inactive reclamation areas to temporary basins, the Quarry pit, or temporary vegetated infiltration basins and kept away from drainage pathways entering Permanent Creek. To the extent possible, drainage of the non-limestone materials shall be diverted directly to sediment control facilities and natural surface drainages.<br>• Install up-gradient berms where limestone fines or stockpiles are placed, to protect against stormwater run-on, and install ditches and down-gradient berms to promote infiltration rather than run-off.<br>• Replace the limestone rock and materials that are currently used in the | |

|---|---|---|---|
| | | existing BMP ditches and cover or otherwise separate runoff from limestone rock in the existing sediment pond embankments.<br>• Cover large limestone surfaces that would remain exposed during the rainy season with interim covers composed of non-limestone rock types.<br>• Inspect and maintain BMPs after each qualifying rain event to ensure their integrity.<br>• Reconstruct or reline all existing stormwater conveyances and check dam structures that are constructed or lined with limestone rock using non-limestone material (greenstone, breccias, greywacke, metabasalt), available at the Quarry.<br>• Regularly inspect all stormwater and erosion controls, especially before and following qualifying rain events. Inspections shall be documented and periodically reported. Any violations shall be reported and corrected immediately.<br>• Provide adequate erosion control training to all equipment operators, site superintendants, and managers to ensure that stormwater and erosion controls are maintained and remain effective.<br>• Use only jute netting or other suitable replacement for erosion control in the PCRA; no plastic monofilament shall be used for erosion control or other purposes, as California Red legged Frogs and other wildlife may become entangles in it.<br>• Ensure that all stormwater, erosion, and sediment control BMPs installed, inspected, maintained, and repaired under the direction of either a California certified engineer, geologist or landscape architect, an American Institute of Hydrology registered professional hydrologist, or a certified erosion control specialist.<br>**Mitigation Measure 4.10-2b: EMSA Interim Stormwater Monitoring Plan.** The Applicant shall develop a stormwater sampling plan that would supplement preexisting surface water monitoring required by General Industrial Storm Water and Sand and Gravel NPDES Permit and be designed specifically to monitor surface water during reclamation activities in active and inactive excavation and backfill areas. The purpose of this plan is to evaluate performance of temporary BMPs and completed reclamation phases at the EMSA and to identify areas that are sources of selenium (measured on total recoverable basis), sediment, or high TDS. At a minimum, the plan shall require the Applicant to inspect BMPs and collect water samples for analysis of TDS and metals, including selenium, within 24 hours after a qualifying rain event and sample non-stormwater discharges when they occur. If elevated selenium, sediment, or TDS is | |

|---|---|---|---|
| which could result increased storm water runoff rates and on- or offsite flooding. | | Applicant shall design and construct detention facilities that would 1) manage increased runoff caused by the reclaimed Quarry pit, 2) reduce excessive discharges to Permanente Creek, and 3) develop the capacity to detain and release the 100-year flow using onsite detention basins while optimizing groundwater infiltration. The final drainage design shall ensure that offsite, downstream flows would not cause an increased flooding potential or lead to hydromodification effects. In addition to the detention facilities for the Quarry pit, the Applicant shall ensure that the desiltation ponds proposed in other smaller project areas such as the EMSA, are engineered to function as detention basins and manage 100-year peak flow to the extent practical. The Applicant shall also consider a broader watershed approach and consult with SCVWD on ways to detain peak flows offsite in relation areas of existing flooding and to the current SCVWD flood control improvement project. Design considerations for onsite detention basins shall include the following performance standards. The basin shall be designed to:<br>• Maintain turbidity of receiving water outflows within discharge limitations for Permanente Creek, as set forth by the San Francisco Bay Regional Water Quality Control Board Basin Plan or other more stringent, site-specific limitations set forth by the RWQCB.<br>• Effectively drain between storm events within the period of time specified by the Santa Clara County 2007 Drainage Manual.<br>• Enhance the settlement of fine sediment while limiting the potential for sediment- laden water to be discharged to Permanente Creek.<br>• Incorporate appropriate sediment traps (i.e., low areas that promote sediment settlement) in areas away from outflow structures to limit discharge of sediment at high flow periods.<br>• Control surface water inflows to the detention facility using energy reduction features (i.e., rip-rap aprons, vegetated swales) to reduce inflow velocity and agitation of sediment within the basin.<br>• Infiltrate surface water to the extent practicable while accounting for and protecting the local groundwater condition and water quality<br>In addition to the detention facilities for the Quarry pit, the Applicant shall ensure that the desiltation ponds proposed in other smaller project areas such as the EMSA, are engineered to function as detention basins and manage 100-year peak flow to the extent practical. | reclamation is complete would adversely alter surface water flows to Permanente Creek. | significant | | significant |
| **4.10-6:** The Project would alter the existing drainage pattern of the site, which could result in increased stormwater ponding, accumulation of selenium, and flooding. | Significant | **Mitigation Measure 4.10-6: Stormwater Control to Avoid Ponded Water and Selenium Accumulation.** The Applicant shall incorporate drainage features into the final drainage design for the Quarry pit area to eliminate the potential for surface ponding on the floor of the Quarry pit once it has reached its final elevation (990 amsl). The drainage design for the finished Quarry pit fill shall include engineered elements (e.g., conveyance channels, infiltration galleries) that facilitate groundwater recharge and percolation from limestone areas to groundwater in the Quarry backfill with the objective of accommodating high groundwater elevation without creating surface water bodies that may contain elevated levels of selenium. These measures shall be incorporated into the design of the additional basin proposed for the floor of the Quarry pit once the floor is raised to its final elevation. | Less than significant |

# H2. 2012 Conditions of County Approval

# FINAL CONDITIONS OF APPROVAL

**Approved by Planning Commission, June 7, 2012 and modified by the Board of Supervisors on June 26, 2012**

**(ATTACHMENT TO THE RESOLUTION, EXHIBIT 1)**

MEETING DATE: June 7, 2012

FILE NUMBER 2250-13-66-10P-10EIR (M1)

NAME (Mine Operator): Hanson Permanente Cement, Inc. (Lehigh Southwest Cement)

**PROJECT DESCRIPTION**:

Reclamation Plan Amendment (RPA) for Lehigh Permanente Quarry, located at 24001 Stevens Creek Boulevard, in unincorporated Santa Clara County. The RPA amends and supersedes the previously approved 1985 Permanente Quarry Reclamation Plan for a 20-year period to satisfy the reclamation requirements of the Surface Mining and Reclamation Act of 1975. The RPA encompasses 1,238.7 acres within the Mine Operator's 3,510-acre ownership. The reclamation activities will be implemented in three phases over an estimated 20-year period. Phase I is approximately nine years, and involves reclamation activities in the EMSA and continuation of existing mining activities in the WMSA and Quarry Pit. Phase II is approximately five years, and includes reclamation activities within the WMSA and Quarry Pit. During Phase II, the WMSA overburden stockpile will be moved via a conveyor system to use as backfill of the Quarry Pit. The EMSA will be reclaimed during Phase II or sooner. Phase III is approximately 5 years, and involves removing the equipment, buildings and unnecessary roads from the Project area. Reclamation activities in the Permanente Creek Reclamation Area will occur during all three phases described above.

The conditions of approval of the RPA are not intended by the Planning Commission to prevent or interfere with more stringent requirements that have or may be imposed by the RWQCB or any other agency or court. Nothing in these conditions alters or has any limiting effect on the jurisdiction of any other agency, including the Regional Water Quality Control Board and the California Air Resources Board.

**APPLICATION APPROVED SUBJECT TO CONDITIONS STATED BELOW BASED ON PLANS AS SUBMITTED.**

**GENERAL REQUIREMENTS:**

1. The conditions of approval contained herein shall supersede and replace all previous conditions of approval from the 1985 Reclamation Plan approval.

2. All development, operations, and reclamation that occur under this RPA shall be consistent with the approved plans, unless modified per these conditions. The approved plans include maps, drawings, tables, and a narrative description within the RPA prepared by EnviroMINE Incorporated, including Attachments A through J, dated December 13, 2011 and received by the County on December 15, 2011. Plans also include engineered drawings prepared by Chang Consultants, dated December 12, 2011 (appended to the RPA), and Reclamation Water Quality prepared by Strategic Engineering & Science, Inc., dated December 2011 (RPA, Attachment G), and replacement Sheet 7 of 13 for Basin 40A by Chang Consultants, received by the County on March 13, 2012.

3. Within 60 days of approval of the RPA, Mine Operator shall submit six (6) copies plus one electronic copy of a "Final" RPA, incorporating changes required per the conditions of approval for the RPA, Mitigation Monitoring and Reporting Program, and Final Environmental Impact Report.

4. Within 60 days following approval of the RPA, the Mine Operator shall submit to the Planning Manager or the Manager's designee (hereinafter referred to as Planning Manager), legal descriptions for all affected parcels of real property. Pursuant to Section 2772.7 of the Public Resources Code, specifically referred to as SMARA, the County will record a Notice of Reclamation Plan Approval with the County Recorder's Office covering those parcels affected by the approved RPA. The notice shall read: *"Mining Operations conducted on the hereinafter described real property are subject to a RPA approval by the County of Santa Clara Planning Commission. A copy of said approved RPA is on file with the Department of Planning and Development, located the Santa Clara County Government Center, East Wing, 7$^{th}$ Floor, 70 W. Hedding Street, San Jose, CA 95110."* The Mine Operator shall be responsible for all the reasonable costs associated with recording said notice.

5. If reclamation is not complete on or before June 30, 2032, the Mine Operator shall file an application for an amendment to the reclamation plan prior to that date.

6. The proposed end use following reclamation is hillside open space.

7. The Mine Operator shall be responsible for paying all reasonable costs associated with work by the Department of Planning and Development, or with work conducted under the supervision of the Department of Planning and Development, in conjunction with, or in any way related to the conditions of approval identified in this RPA, the mitigations contained in the Mitigation Monitoring and Reporting Program, and the annual SMARA inspections and annual review of financial assurance cost estimates. This includes but is not limited to costs for staff time, attorney's fees, consultant fees, and direct costs associated with report production and distribution.

8. An Annual Report shall be prepared by the County each year that summarizes compliance with the RPA and conditions of approval, Mitigation Monitoring and

Reporting Program, and annual SMARA inspections and review of financial assurance cost estimates.

a. Annual Report shall be presented to the Planning Commission at a public meeting by December of each year, starting in 2013.

b. Mine Operator shall provide a reasonable amount of funding to the Department of Planning and Development for all aspects of report preparation, including but not limited to reimbursement for staff time, consultant fees, attorney's fees, and direct costs associated with report production and distribution.

c. Mine Operator shall provide by October 1 of each year, the information requested by the Planning Manager that is needed for the preparation of the Annual Report.

d. The County will include information provided by the Regional Water Quality Control Board related to the Water Board's determination regarding the Mine Operator's compliance with water quality standards, including waste load allocation and other permitting requirements, and the effectiveness of best management practices (BMPs) on the site.

9. If at any time the Planning Manager determines that the Quarry is not in compliance with the RPA, Mitigation Monitoring and Reporting Program, or any condition of approval, and as such is in violation of the RPA, the Director may take any and all actions necessary to ensure compliance with the Plan in accordance with applicable laws and regulations.

10. Copies of the RPA Mitigation Monitoring and Reporting Program, approved plans, conditions of approval shall be maintained at the premises of the Permanente Quarry, 24001 Stevens Creek Boulevard, at all times: one copy of all the documents shall be stored in the administration building at this location and one copy of all the documents shall be stored in the mine operations office.

11. By October 1 of each year, starting in 2012, the Mine Operator shall provide to the Planning Manager a report summarizing the date of the annual training, topics reviewed, and list of all employees attending the training. The Mine Operator shall annually train all mining staff, including outside vendors, contractors, or consultants who are responsible for implementation of any part of the mine operations or reclamation at Permanente Quarry, on the requirements and provisions of the RPA, the conditions of approval, and the MMRP.

12. Within 60 days following approval of the RPA, the Mine Operator shall submit to the Planning Manager a copy of its Storm Water Pollution Prevention Plan (SWPPP) of the approved RPA, which is hereby appended to the RPA by reference. The Mine Operator is responsible for providing the Department of Planning and Development with any and all updates to the SWPPP.

13. All mitigation measures contained within the Mitigation Monitoring and Reporting Program (MMRP) prepared for the project are adopted as conditions of approval and noted as such. The language contained within the MMRP shall be the guiding language for implementation of the condition or measure unless as modified within these conditions of approval.

14. By August 1st of each year, or as required by the Santa Clara County SMARA Inspection Program, the Mine Operator shall submit annually Financial Assurance Cost Estimates (FACE) to the Planning Manager for review and approval, which shall serve as the basis for the amount of financial assurances required of the Mine Operator, account for disturbed and those lands to be disturbed in the following year by the surface mining operations, inflation, and reclamation of lands accomplished in accordance with the approved RPA. Cost estimates shall utilize the most up to date cost figures for the San Francisco Bay Area and shall include appropriate costs for all materials to be utilized, labor rates, and equipment rates utilized in calculating the FACE. Upon approval of the FACE by the County and review by the State Office of Mine Reclamation (OMR), the Mine Operator shall post an acceptable Financial Assurance mechanism with the Department of Planning and Development prior to commencing any disturbance in areas not previously disturbed by the mining operation.

**OTHER AGENCIES/JURISDICTIONS**

15. Copies of all violations or abatement notices, requests for reports or information related to this RPA and its authorized uses by federal, state, or local jurisdictions/agencies, or subsequent modification of another agency's permit or submission of an application for any permit to another agency shall be provided to the Planning Manager within 10 business days of the County's request.

**SEVERABILITY**

16. If any of the RPA conditions of approval, or RPA approval, are held to be invalid, that holding shall not invalidate any of the remaining conditions or limitations set forth.

17. If any condition(s) of approval is invalidated by a court of law, and said invalidation would change the findings and/or mitigation measures associated with the approval of this RPA, the amendment may be reviewed, at the discretion of the Planning Commission, and substitute feasible condition(s)/mitigation measures may be imposed to adequately address the subject matter of the invalidated condition(s).

**DUTY TO DEFEND AND INDEMNIFY**

18. As a condition of RPA approval, including adjustment, modification or renewal, the Mine Operator agrees to:

    a. Defend, at the Mine Operator's sole expense, any action brought against the County by a third party challenging either its decision to approve the RPA or the manner in which the County is interpreting or enforcing the conditions of the RPA; and

    b. Indemnify the County against any settlements, awards, or judgments, including attorney's fees, arising out of or resulting from any such action.

19. Upon demand from the County, the Mine Operator shall reimburse the County for any court costs and or attorney's fees which the County may be required by a court to pay as a result of any such action the Mine Operator defended or which it had control of the defense. The County may, at its sole discretion, participate in the defense of any such action, but such participation shall not relieve the Mine Operator of its obligations under this condition.

20. The Mine Operator agrees to defend, indemnify and hold harmless the County, its agents, officers and employees, from any claim, action or proceeding against the County, to challenge any portions of the EIR certification, reclamation plan process or approval. In addition to damages, indemnification includes reimbursing the County for staff and consultant cost, and attorney's fees (including claims for private Attorney General fees).

21. Neither the approval of the RPA or compliance with conditions of approval shall relieve the Mine Operator from any responsibility otherwise imposed by law for damage to persons or property, nor shall the issuance of any RPA or related permit serve to impose any liability upon the County of Santa Clara, its officers, employees or agents for injury or damage to persons or property.

**RECLAMATION REQUIREMENTS**

22. Within 60 days of RPA approval, the RPA limit of disturbed area surrounding the northern and eastern edges of the EMSA, the northern and western edges of the WMSA, and the perimeter of the Rock Plant area shall be clearly demarcated in the field and shall remain in place until final reclamation has been completed. On an annual basis, demarcation shall be modified to encompass the RPA boundaries nearest the areas subject to surface mining and reclamation, as shown on aerials submitted per Condition #23. Demarcated areas shall be located and marked in the field by a licensed land surveyor or registered civil engineer authorized to practice land surveying. Demarcation shall use orange construction fencing or other brightly colored material acceptable to the Planning Manager.

23. At the same time as the proposed Annual Report each year, the operator shall submit to the Planning Manager a surveyed coordinate list file obtained by Global Positioning System (GPS), prepared by a licensed land surveyor or registered civil engineer authorized to practice land surveying, to be reviewed and approved by

the County Surveyor, identifying the limits of reclamation, with aerial photographs of the RPA area, annotated to illustrate (a) where surface mining and reclamation activity occurred within the prior 24 months and (b) areas where mining and reclamation activities will occur in the next 24 months. Existing topographic data shall be included with the aerial photographs, and the operator shall provide projected topographic data demonstrate how the topography will look two years later. The aerial photographs must be flown and taken biennually between June 1 and June 30 starting with June 2013. If requested by the Planning Manager or Planning Commission the materials shall be in a readable scale.

24. Reclamation of finished slopes and benches shall commence at the earliest feasible date once the slopes and benches are established, as set forth in the RPA.

25. Rockfills, where used, should be spread in lifts not exceeding five-feet in thickness by tracked equipment, and compacted by track-walking or wheel-rolling using heavy dozers (Caterpillar D-9 or larger) and/or fully loaded rubber-tired hauling equipment, respectively. A minimum of three passes should be performed for each lift.

26. Within 60 days of RPA approval, Mine Operator shall submit a site plan identifying area(s) where topsoil, dirt, soil amendments shall be retained and used in the reclamation and re-vegetation process. Soil stored for reclamation purposes shall be clearly identified and marked in the field.

27. The Mine Operator shall safeguard stockpiles of topsoil or overburden to be used for reclamation from wind and erosion by using controls including, but not limited to, hydroseeding, erosion control mats, and coir wattles (aka "straw wattles").

28. The Mine Operator shall use soil amendments, in accordance with the RPA, to improve the effectiveness of the soils used for re-vegetation of final slopes. Re-vegetation shall satisfy the criteria identified in the RPA. Reporting of the test plots for the re-vegetation criteria identified in the RPA shall be submitted to the County as part of the Mine Operator's annual report. Re-vegetation shall include only plant materials identified in the re-vegetation palette contained in the approved RPA. The Mine Operator shall follow the "test plot" program in the RPA to determine the appropriateness and success rates of the proposed re-vegetation palette identified in the RPA. Reporting on the test plot program shall be part of the Mine Operator's annual report submitted by the County and shall be prepared by a qualified biologist.

29. Re-vegetation of all reclaimed slopes within the RPA Boundary shall meet the minimum success criteria listed in the approved RPA before any completed phase of reclamation may be deemed reclaimed by the County and Office of Mine Reclamation (OMR).

30. The Planning Manager shall have authority to administratively review and approve minor revisions to the re-vegetation palette contained in the approved RPA. Status report shall be given to the Planning Commission after any revisions and presented at the next available Planning Commission meeting.

31. Equipment, structures, nonessential roads, as identified in the RPA, shall be removed from the project area prior to that area being deemed reclaimed by the County and OMR.

32. Construction or demolition waste or any other foreign materials are prohibited from being stored in overburden or used in reclamation. Overburden shall be compacted, tested, and documented to demonstrate it will support post-mining uses. Regarding compaction, testing, and documentation of the overburden, documentation shall be submitted to the Planning Manager within 30 days of completion.

33. Stilling basins shall be maintained in good conditions and cleaned of silt and debris as necessary. A report shall be submitted to the Planning Manager as part of the Annual Report, fully depicting total quantities of silt removed from the basins (reported in cubic yards or tons) and where such silt is placed on the site or off the site.

34. The Mine Operator shall comply with the conditions of permits and plans required by and issued from the Regional Water Quality Control Board (RWQCB), including but not limited to approval of the Permanente Creek Restoration Plan and water discharge permits. The Mine Operator shall provide copies of all permits to the Planning Manager within 10 business days of issuance by RWQCB.

35. Reclamation shall be deemed complete by the County and State Office of Mine Reclamation (OMR) once reclamation has been performed to the terms of the approved RPA, and required monitoring and inspections have demonstrated compliance with the reclamation performance standards and mitigation measures as prescribed in the Mitigation, Monitoring and Reporting Program, including compliance with all pertinent permits or other requirements for reclamation issued by non-Santa Clara County public agencies, including but not limited to the RWQCB and the State Department of Fish and Game.

36. The Mine Operator shall comply with the conditions of permits required by and issued from the Bay Area Air Quality Management District (BAAQMD). Upon request by the County, the Mine Operator shall provide copies of all permits, and amendments to the Planning Manager within 10 business days of the request.

37. The Mine Operator shall obtain and comply with all applicable permits required by the Santa Clara County Hazardous Materials Division of the Department of Environmental Health. The Mine Operator shall provide copies of all permits to the Planning Manager within 10 business days of issuance.

*Permanente Creek Restoration Area (PCRA)*

38. Within 30 days of final RPA approval, submit to the Planning Manager a detailed schedule describing the implementation actions to control sedimentation, remove limestone boulders, and stabilize slopes within the Permanente Creek Restoration Area in the Summer and Fall of 2012, consistent with the RPA.

39. **Limestone Boulder Removal**. By October 15, 2012, per the RPA, identified limestone boulders in the PCRA shall be removed. In addition, any limestone boulders identified in the future shall be removed. Submit to the Planning Manager by August 1, 2012, a report and map summarizing the field inspection and identification of all limestone boulders in the PCRA. Submit to the Planning Manager by December 15, 2012, a report and summarizing the actions to remove all limestone boulders in the PRCA, consistent with the "Best Management Practice for Removal of Limestone Boulders from Permanente Creek" (Attachment J to the RPA).

40. **Permanente Creek Restoration**. Prior to the start of Permanente Creek restoration activities in Phase III for PCRA subareas 3, 4, 5 and 7, as identified in the RPA, the Mine Operator shall submit to the Planning Manager a Permanente Creek Restoration Plan. The Restoration Plan shall include the elements of the Permanente Creek Long Term Restoration Plan (URS, March 11, 2011) to the extent set forth in the RPA. The Restoration Plan shall include, at minimum, engineered drawings for creek restoration, a riparian re-vegetation plan, hydrology / hydro-geomorphology studies supporting concepts to be used in creek restoration, and a long term monitoring and reporting program. The Creek Restoration Plan shall be reviewed and approved by the County prior to implementation. The Mine Operator shall obtain all necessary permits and approvals from all applicable local, state, and federal authorities, including without limitation the Regional Water Quality Control Board, Department of Fish and Game, and U.S. Army Corps of Engineers to implement the work.

41. Prior to the start of any grading or any grading activity that affects jurisdictional resources of the California Department of Fish and Game, Regional Water Quality Control Board, or U.S. Army Corps of Engineers, the Mine Operator must provide to the Planning Manager proof of permits / clearances (or documentation that a permit is not needed).

**ENVIRONMENTAL CONDITIONS AND EIR MITIGATION MEASURES**

*Light and Glare:*

42. No night lighting shall be allowed or permitted on the east-facing slope of the EMSA or any other location within the EMSA that would be visible from public locations on the Santa Clara Valley floor including roadways. *(Implements Mitigation Measure 4.1-7)*

*Air Quality – Health Hazards Risk:*

43. Within 90 days of final RPA approval, the Mine Operator shall submit to the County and BAAQMD a comprehensive inventory of all RPA-related off-road construction equipment expected to be used during any portion of the RPA period. The inventory shall include the horsepower rating, engine production year, and projected hours of use or fuel throughout for each piece of equipment. The inventory shall be updated and submitted annually to the Planning with the Annual Report, throughout the duration of the RPA. *(Implements Mitigation Measure 4.3-3a)*.

44. Within 90 days of final RPA approval, the Mine Operator shall provide a plan for approval by the Planning Manager and BAAQMD demonstrating that off-road equipment to be used for Reclamation of the EMSA would achieve an average 35 percent reduction in Diesel Particulate Matter (DPM) emissions compared to the proposed fleet described in the ALG report (Ashworth Leininger Group, December 13, 2011) during RPA Phase I. The plan shall be updated and submitted annually to the Planning Manager, with the Annual Report each year throughout the duration of the RPA. Options for reducing emissions may include, but are not limited to:

    a. Using newer model engines (e.g. engines that meet US EPA interim/final Tier 4 engine standards).

    b. Use of Retrofit Emission Control Devices that consist of diesel oxidation catalysts, diesel particulate filters, or similar retrofit equipment control technology verified by CARB (www.arb.ca.gov/diesel/verdev/verdev.htm)

    c. Use of low emissions diesel products or alternative fuels;

    d. Use of alternative material handling options (e.g. conveyor system); or other options as may become commercially available and verifiable. *(Implements Mitigation Measure 4.3-3b).*

45. In lieu of Condition No. 43 and No. 44 (Mitigation Measures 4.3-3a and 4.3-3b), the Mine Operator may submit within 90 days of the RPA approval evidence establishing to the Planning Manager's satisfaction that there are legally binding restrictions precluding any occupancy of the caretaker's residence located at 2961 Stevens Creek Boulevard, Cupertino (APN 342-63-003) during the entirety of Phase I of the Project. *(Implements Mitigation Measure 4.3-3c)*

*Biological Resources- Avian Species*

46. **Avian Species - Preconstruction Surveys.** Ground disturbance into undisturbed areas and vegetation (tree and shrub) removal should occur between September 1 and January 30, outside of the breeding season for most bird species. If ground disturbance or tree and shrub removal occurs between February 1 and June 15, preconstruction surveys will be performed within 14 days prior to such activities to determine the presence and location of nesting bird species. If ground disturbance or removal of vegetation occurs between June 16 and August 31, pre-construction surveys will be performed within 30 days prior to such activities.

Thirty (30) days prior to the start of any ground disturbance into undisturbed areas or vegetation removal, the Mine Operator shall submit to the Planning Manager a copy of a contract with a qualified ornithologist to conduct pre-activity surveys.

The pre-construction surveys shall be submitted to the Planning Manager no later than five (5) business days prior to the start of such activities. If the tree removal or vegetation clearing shall occur during the non-nesting season, submit documentation both before and after tree removal / vegetation clearing confirmation completion of work within this time frame.

47. **Avian Species - Use of Buffers for to Avoid Nests**. If preconstruction surveys determine that active nests are found close enough to the land clearing and tree removal area to be disturbed by these activities, the ornithologist, in consultation with CDFG, will determine the extent of a construction-free buffer zone (typically 250 feet) to be established around the nest to prevent nest abandonment and direct mortality during construction.

*Biological Resources- Bat Species*

48. **Bat Species - Non-Roosting Season**. Removal of potential bat roost habitat (buildings, large trees, snags, vertical rock faces with interstitial crevices) or construction activities within 250 feet of potential bat roost habitat should occur in September and October to avoid impacts to bat maternity or hibernation roosts. *(Implements Mitigation Measure 4.4-2a).*

49. **Bat Species – Maternity Roosting Season.** If removal of potential bat roost habitat cannot occur during September and October, bat roost surveys will be conducted to determine if bats are occupying roosts.

    Nighttime evening emergence surveys and/or internal searches within large tree cavities shall be conducted by a qualified biologist during the maternity season (April 1 to August 31) to determine presence/absence of bat maternity roosts within 100 feet of wooded Project boundaries. All active roosts identified during surveys shall be protected by a minimum buffer determined by a qualified bat biologist, in consultation with California Department of Fish and Game (CDFG). The buffer shall be determined by the type of bat observed, topography, slope aspect, surrounding vegetation, sensitivity of roost, type of potential disturbance. Each exclusion zone shall remain in place until the end of the maternity roosting season. If no active roosts are identified, then work may commence as planned. Survey results are valid for 30 days from the survey date. Should work commence later than 30 days from the survey date surveys shall be repeated. Operations may continue for many years. Surveys do not need to be repeated annually unless additional clearing of potential roosting or hibernation habitat could occur outside of the non-roosting season.

    Thirty days prior to the removal of potential bat roost habitat, the Mine Operator shall submit to the Planning Manager a copy of a contract with a qualified

biologist to conduct pre-activity surveys. The pre-construction surveys shall be submitted to the Planning Manager no later than five (5) business days prior to the removal of any potential habitat. *(Implements Mitigation Measure 4.4-2b)*.

50. **Special Status Bat Species- Hibernation Season**. During the November 1 to March 31 hibernation season, work shall not be conducted within 100 feet of any woodland habitat (as identified in the Draft EIR Figures 4.4-1 through 4.4-4), unless a qualified bat biologist determines that woodland areas do not provide suitable hibernating conditions for bats and they are unlikely to be present in the area.

    Submit a report by a qualified bat biologist to the Planning Manager verifying the absence of suitable habitat as described above if work is proposed within 100 feet of woodland habitat between November 1 and March 31. *(Implements Mitigation Measure 4.4-2a)*

51. **Special Status Bat Species - Maternity Season Emergence.** Any trees felled during vegetation removal will not be chipped or otherwise disturbed for a period of 48 hours to allow any undetected bats potentially occupying these trees to escape. *(Implements Mitigation Measure 4.4-2b).*

52. **Bat Roost Replacement.** All special-status bat roosts destroyed by the Project shall be replaced by the Mine Operator at a 1:1 ratio onsite with a roost suitable for the displaced species (e.g., bat houses for colonial roosters). The design of such replacement habitat shall be in consultation with CDFG. The new roost shall be in place prior to the time that the bats are expected to use the roost (e.g., prior to April 1 if the roost destroyed by the Project was used by a maternity colony), and shall be monitored periodically for 5 years to ensure proper roosting habitat characteristics (e.g., suitable temperature and no leaks). The roost shall be modified as necessary to provide a suitable roosting environment for the target bat species. *(Implements Mitigation Measure 4.4-2c)*

*Biological Resources- Dusky Footed Woodrat*

53. **San Francisco Dusky Footed Woodrat.** Within 30 days prior to initial ground disturbance in woodland or scrub/chaparral communities, (as identified in the Draft EIR Figures 4.4-1 through 4.4-4), conduct pre-construction surveys for active woodrat stick nests that could be directly impacted. Surveys should take place in all suitable habitat types within the Project Area. Any stick nests within active work areas will be flagged and dismantled under the supervision of a biologist. If young are encountered during the dismantling process, the material shall be placed back on the nest and remain unmolested for three (3) weeks in order to give the young enough time to mature and leave of their own accord. After that period, the nest dismantling process may begin again. Nest material shall be moved to suitable adjacent areas (oak woodland, scrub, or chaparral) that will not be disturbed. If construction does not occur within 30 days of the pre-construction survey, surveys shall be repeated.

Sixty (60) days prior to initial ground disturbance within woodland or scrub / chaparral communities, the Mine Operator shall submit to the Planning Manager a copy of a contract with a qualified biologist to conduct pre-activity surveys. The pre-construction surveys shall be submitted to the Planning Manager no later than five business days prior to the start of initial ground disturbance.

54. To reduce indirect impacts on San Francisco dusky-footed woodrat by attracting urban-adapted predators, trash and food waste shall be disposed of in proper waste receptacles and emptied on a regular basis. Additionally, quarry personnel, contractors, and visitors shall not feed wildlife within the Permanente Property and appropriate site signage and employee education shall facilitate this condition.

*Biological Resources- Invasive Plants, Sudden Oak Death*

55. **Introduction of Invasive Plants or Pathogens**. If regulated or restricted plant materials are to be transported between the Project Area and a location in a non-infested county or state, the spread of the Sudden Oak Death pathogen shall be avoided by obtaining the necessary certificates of transport pursuant to the regulations described in the Biological Resources Assessment prepared for the Lehigh Permanente Quarry by WRA Environmental Consultants, dated December 2011.

56. **Sudden Oak Death.** To reduce the possibility of spreading Sudden Oak Death to oak woodlands in the Study Area, the Mine Operator shall implement the following measures:

    a. Prior to any reclamation work within the Project Area, equipment shall be sanitized, including shoes, pruning equipment, trucks, and heavy equipment such as earthmoving, tree trimming, chipping, or mowing equipment. Except for trucks, this equipment shall remain onsite for the duration of Project activities and shall not be transferred between this and other worksites, as doing so increases the potential of transferring infected spores to or from another site.

    b. After the completion of work activities, any accumulation of plant debris (especially leaves), soil, and mud shall be washed off of equipment or otherwise removed onsite, and air filters shall be blown out.

    c. All contractors shall have sanitation kits onsite for cleaning equipment. Sanitation kits should contain chlorine bleach (10/90 mixture bleach to water) or Clorox Clean-Up or Lysol, scrub brush, metal scraper, boot brush, and plastic gloves.

    d. All organic material imported for mixing with Quarry pit backfill shall have been composted at a facility that meets the standards of Title 14 California Code of Regulations, Division 7, Chapter 3.1; alternative sources of organic material may be used if approved by the County of

Santa Clara Agricultural Commissioner as being as effective as the composting process to sanitize SOD-infected materials.

e. All other imported fill material, soil amendments, gravel, etc. required for construction and/or restoration activities to be placed within the upper 12 inches of the ground surface shall be free of vegetation or plant material. *(Implements Mitigation Measure 4.4-7)*

*Biological Resources- Wetlands*

57. **Wetland Identification and Avoidance.** A qualified wetland biologist shall physically delineate all federal and state waters and wetland features identified in the 2008 wetland delineation (WRA, 2008) before any Permanente Creek Reclamation Area (PCRA) activities begin, and when feasible, reclamation activities shall avoid filling these areas unless authorized by the appropriate permitting agencies. Silt fence or other appropriate barriers and buffer zones shall be installed between jurisdictional waters or wetlands and areas sprayed with hydroseed to prevent filling of wetlands with tackifier or other hydroseed material; alternatively, the use of hand-seeding or working with hand tools may be utilized to avoid filling wetlands. *(Implements Mitigation Measure 4.4-8a)*

    Prior to the start of PCRA activities, the wetland biologist shall submit a report to the Planning Manager showing the wetland areas delineated and the installation of all fencing and barriers (photos and map).

    This condition shall not apply to Phase III Permanente Creek Restoration Activities in subareas 3, 4, 5 and 7, as identified in the RPA. Such Activities are expected to require an independent review and permitting process, as described in the RPA.

58. **Wetland Mitigation Plan.** If filling of jurisdictional waters or wetlands is not feasible, the following measures shall be implemented:

    a. A qualified wetland biologist shall prepare a wetland Mitigation and Monitoring Plan (MMP) for impacts to wetlands and waters under state or federal jurisdiction. The MMP shall be submitted for review and approval by the Planning Manager, and as required by law by the Regional Water Quality Control Board and US Army Corps of Engineers. The MMP shall outline any anticipated mitigation obligations for temporary and permanent impacts to waters of the state and/or U.S., including wetlands, resulting from PCRA activities. The MMP shall include:

        i. Baseline information;

        ii. Anticipated habitat enhancements to be achieved through compensatory actions, including whether mitigation will occur within the Project Area along Permanente Creek or at an offsite location, as well as including mitigation site location and hydrology;

iii. When possible, a preference for mitigation within the Permanente Quarry property, for impacts to both jurisdictional waters and wetlands;

iv. Performance and success criteria for habitat enhancement of Permanente Creek or other waterways to compensate for impacts to Other Waters, including:

1. A replanting plan for appropriate native riparian woody vegetation, including but not limited to arroyo willow, white alder, California wild rose, and snowberry, bigleaf maple, western creek dogwood, and Oregon ash;

2. An 80% overall re-vegetation planting success for all mitigation areas over a ten-year period;

3. A minimum overall mitigation ratio of 1.1:1 acres for permanent impacts and 1:1 acres for temporary impacts;

4. Plantings that are self-reliant, exhibit average or better health and vigor and have observable growth in stems and leaves at least two years prior to the end of the ten-year monitoring period;

5. Visual inspection of all re-vegetation sites during each growing season, with qualitative and quantitative measures of plant cover and performance;

6. Observations of total percent plant cover in the planting area, natural recruitment of native species, and establishment of new non-native species; and

7. Annual monitoring reports submitted to CDFG and RWQCB documenting re-vegetation conditions, including recommendations to adapt maintenance and replacement of failed plantings.

b. Performance and success criteria for wetland creation or enhancement including, but not limited to, the following:

i. At least 70 percent survival of installed plants for each of the first three years following planting.

ii. Performance criteria for vegetation percent cover in Years 1-4 as follows:

1. at least 10 percent cover of installed plants in Year 1;

2. at least 20 percent cover in Year 2;

3. at least 30 percent cover in Year 3;

4. at least 40 percent cover in Year 4.

c. A performance criteria for hydrology in Years 1-5 as follows:

i. Fourteen or more consecutive days of flooding, ponding, or a water table 12 inches or less below the soil surface during the growing season at a minimum frequency of three of the five monitoring years; OR establishment of a prevalence of wetland obligate plant species.

ii. Invasive plant species that threaten the success of created or enhanced wetlands should shall not be allowed to contribute relative cover greater than 35 percent in year 1, 20 percent in years 2 and 3, 15 percent in year 4, and 10 percent in year 5.

d. MMP monitoring reports shall be submitted to the Planning Manager and responsible permitting agencies. *(Implements Mitigation Measure 4.4-8b)*

*Biological Resources- California Red Legged Frog (CRLF)*

59. To minimize disturbance to dispersing or foraging CRLF, all grading activity within PCRA subareas 4 through 7 shall be conducted during the dry season, generally between May 1 and October 15, or before the onset of the rainy season, whichever occurs first, unless exclusion fencing is utilized. Construction that commences in the dry season may continue into the rainy season if exclusion fencing is placed around the construction zone to keep the frog from entering the construction area.

60. Pre-construction surveys for CRLF shall be conducted prior to construction activities within PCRA subareas 4 through 7. If CRLF are observed in the construction area or access areas, they shall be removed from the area by a USFWS permitted biologist and temporarily relocated to nearby suitable aquatic habitat.

61. Because dusk and dawn are often the times when CRLF are most actively foraging, all restoration activities within PCRA subareas 4 through 7 shall cease one half hour before sunset and shall not begin prior to one half hour after sunrise. Additionally, restoration activities shall not occur during rain events, as CRLF are most likely to disperse during periods of precipitation.

*Cultural Resources*

62. The Mine Operator shall document the physical characteristics and their historic context of the contributing features of the Kaiser Permanente Quarry Mining District, including archival photo-documentation, mapping, and recording of historical and engineering information including measured drawings about the property according to the standards of the Historic American Building Survey/Historic American Engineer Record/Historic American Landscapes Survey (HABS/HAER/HALS), to be placed in a local public archive such as the Archives of the County of Santa Clara.

Verification of documentation as described above shall be submitted to the Planning Manager within sixty (60) days prior to removal of the Permanente Quarry Conveyor System as described under Condition #63. *(Implements Mitigation Measure 4.5-1a)*

63. Prior to any of the following: modification, relocation, removal, or demolition of the Permanente Quarry Conveyor System, the Mine Operator shall salvage and/or relocate a representative portion of the Permanente Quarry Conveyor System and the remains of the early 1940s crusher, which constitute character-defining features that otherwise would be lost as a part of implementation of the Project.

    Verification of salvage / relocation as described above shall be submitted to the Planning Manager within thirty (30) days prior to start of mining / reclamation activities in the existing Conveyor System and 1940's crusher area. Conveyor is located west of the EMSA and southeast of the Quarry Pit, the crusher is located south of the Quarry Pit adjacent to Permanente Creek (reference Historic Resource Evaluation, Permanente Quarry Facility Comprehensive Reclamation Plan Project – Lehigh Southwest Cement Company, prepared by Archives and Architecture, LLC, October 2011). *(Implements Mitigation Measure 4.5-1b)*

64. At least sixty (60) days prior to commencement of any work as described above Condition #63, the Mine Operator shall prepare public information programs to educate the general public on the historic nature of the potential Kaiser Permanente Quarry Mining District, including but not limited to exhibits at the Quarry office, publications available at the Quarry office, and an online presentation available on the their website (currently, www.lehighpermanente.com). Verification of documentation as described shall be submitted to the Planning Manager. *(Implements Mitigation Measure 4.5-1c)*

65. If cultural resources are encountered during Project implementation the Mine Operator shall notify the Planning Manager and all activity within 100 feet of the find shall stop until the cultural resource is evaluated by a qualified archaeologist and a Native American representative. Prehistoric archaeological materials might include obsidian and chert flaked-stone tools (e.g., projectile points, knives, scrapers) or toolmaking debris; culturally darkened soil ("midden") containing heat-affected rocks, artifacts, or shellfish remains; and stone milling equipment (e.g., mortars, pestles, handstones, or milling slabs); and battered stone tools, such as hammerstones and pitted stones. Historic-period materials might include stone, concrete, or adobe footings and walls; filled wells or privies; and deposits of metal, glass, and/or ceramic refuse.

    If the archaeologist and Native American representative determine that the resources may be significant and cannot be avoided, they shall notify the Planning Manager and an appropriate treatment plan for the resources shall be developed by the Mine Operator in consultation with the Planning Manager, and the archaeologist. Measures in the treatment plan could include preservation in place (capping) and/or data recovery. The archaeologist shall consult with Native

American representatives in determining appropriate treatment for prehistoric or Native American cultural resources. Ground disturbance shall not resume within 100 feet of the find until an agreement has been reached as to the appropriate treatment of the find. *(Implements Mitigation Measure 4.5-2)*

66. If a paleontological resource is encountered during implementation of the RPA the Mine Operator shall notify the Planning Manager, and all activity within 100 feet of the find shall stop until it can be evaluated by a qualified paleontologist as defined by the Society of Vertebrate Paleontology Guidelines (SVP, 1995). The paleontologist shall evaluate the resource and determine its significance. If significant, the paleontologist shall notify the Planning Manager. The Mine Operator, in consultation with the County and the paleontologist, shall prepare a treatment plan such that the fossil would be recovered and scientific information preserved. The paleontologist shall implement the treatment plan in consultation with the Planning Manager and Mine Operator, prior to allowing work in the 100-foot radius to resume. *(Implements Mitigation Measure 4.5-3)*

67. In the event that human skeletal remains are encountered, the Mine Operator is required by Health and Safety Code Section 7050.5, Public Resources Code Section 5097.98, Title 14 California Code of Regulations Section 15064.5(e), and County Ordinance No. B6-18 to immediately notify the County Coroner. Upon determination by the County Coroner that the remains are Native American, the coroner shall contact the California Native American Heritage Commission, pursuant to subdivision (c) of §7050.5 of the Health and Safety Code and the County Coordinator of Indian affairs. No further disturbance of the site shall be made except as authorized by the County Coordinator of Indian Affairs in accordance with the provisions of state law and the County Ordinance. If artifacts are found on the site, a qualified archaeologist shall be contacted along with the Planning Manager. No further disturbance of the artifacts shall be made except as authorized by the Planning Manager. *(Implements Mitigation Measure 4.5-4)*

*Geological and Soils*

68. **Avoidance and containment of shallow slumps and/or fall-back of overburden material.** In all areas requiring the use of excavators for grading within the Permanente Creek Reclamation Area (PCRA) (e.g., access road in-sloping, installation/repair of sedimentation basins, and removal of slide debris), the Mine Operator and/or its contractor shall begin excavations from the top of slope and proceed downward. The Mine Operator and/or its contractor shall not undercut sloped materials unless no other option is feasible as determined by a registered geotechnical engineer (e.g., excessively sloped or otherwise inaccessible terrain). In all areas of the PCRA where excavations would occur in sloped materials, the Mine Operator and/or its contractor shall install barriers immediately downslope of the activity. Downslope barriers shall be designed and installed in a manner that would be adequate to prevent overburden and/or native materials from falling, sloughing or sliding further downslope, or into Permanente Creek. Such measures may consist of temporary interlocking soldier piles,

wooden shoring systems, wire mesh or other containment measures(s). The Mine Operator and/or its contractor shall not be permitted to conduct excavation or grading activities downgradient of the barrier, or prior to its installation. The ultimate location, design and installation method of such measures shall be prepared and certified, or reviewed and approved by a California State registered civil geotechnical engineer.

Thirty days (30) prior to the start of all excavation / grading activities as described above, submit to Planning Manager a plan showing the installation of all downslope barriers as described above. *(Implements Mitigation Measure 4.7-1)*

69. Within thirty (30) days following approval of the RPA, submit a Geotechnical Engineer's Plan Review letter that confirms the RPA, as modified by other conditions of approval, conforms with the recommendations presented in Golder's Report (RPA Appendix C, dated November 2011). In regards to the EMSA, specifically, the letter must verify that the plans indicate where the native slope is steeper than 2.5H:1V, the topsoil and colluvium will be over-excavated within the area extending inward 100 feet from the toe of the outer slope.

70. The geotechnical design recommendations provided by Golder Associates (RPA Appendix C, November 2011) are being implemented as part of the ongoing stockpiling activities within the EMSA and as a condition of approval Project. The measures are identified below:

    a. Foundation preparation should be completed prior to fill placement of the outer 50 feet beneath the EMSA fill. Foundation preparation should consist of over-excavation of outer 50 feet of topsoil, organic materials (trees, brush, grasses), fine-grained colluvium with a Plastic Index greater than 25, or other unsuitable soils until firm bedrock, granular soils, or clay soils with a Plastic Index less than 25 are exposed. If the exposed foundation surface is inclined at 5H:1V or steeper, the over-excavation distance from the outer slope should be extended from 50 feet to 100 feet. Furthermore, the fill placed on slopes of 5H:1V or steeper should be benched into the slope with individual bench heights of at least 2 feet and up to approximately 5 feet.

    b. A qualified California Registered Professional Geologist, Certified Engineering Geologist, or a California Registered Civil Engineer with geotechnical experience should inspect the foundation preparation to ensure all unsuitable materials are removed prior to placement of the outer 50 to 100 feet of EMSA fill.

    c. If seepage or wet zones are observed in the foundation, suitable drainage provisions should be incorporated into the foundation prior to fill placement. Suitable drainage provisions include the placement of a blanket of free-draining sand or gravel over the seepage/wet zone in conjunction with a perforated, polyvinyl (PVC) or high-density polyethylene (HDPE) drain pipe that drains positively toward and daylights at the slope face.

The sand or gravel drainage material should be fully covered with a minimum 8-oz/square yard, non-woven, geotextile filter to provide separation from the EMSA materials.

d. The fine waste materials shall be placed in lifts not to exceed 8-feet, and offset a minimum of 30 feet from the final slope face. Each lift of fine waste should be allowed to dry before being covered by overburden material. Each lift shall be overlain by a minimum 25-foot thick lift of overburden.

e. Any modification to the EMSA fill geometry including increases to the maximum overall slope inclination, maximum inter-bench slope inclination, slope height, or footprint shall require an additional or revised slope stability analysis.

*Greenhouse Gas Emissions (GHG)*

71. **Develop Annual GHG Inventory.** The Mine Operator shall become a reporting member of The Climate Registry. Beginning with the first year of the Project and continuing for the duration of the Project, the Mine Operator shall conduct an annual inventory of GHG emissions and shall report those emissions to The Climate Registry. The annual inventory shall be conducted according to The Climate Registry protocols and third-party verified by a verification body accredited through The Climate Registry.

    Within 90 days of approval of the RPA, the Mine Operator shall submit documentation verifying registration with The Climate Registry to the Planning Manager. Copies of annual reporting to Climate Registry shall be submitted to the Planning Manager by October 1 of each year. *(Implements Mitigation Measure 4.8-1a)*

72. **Greenhouse Gas Emissions Reduction Plan.** The Mine Operator shall prepare, submit for County and BAAQMD approval, make available to the public, and implement a Greenhouse Gas Emissions Reduction Plan (GHG Plan) containing quantifiable strategies to ensure that the Project-related incremental increase of GHG emissions does not exceed 1,100 MT Co2e per year. The GHG Plan shall include, but not be limited to, the following measures:

    a. Replacement of on-road and off-road vehicles and construction equipment with lower GHG-emitting engines, such as electric or hybrid.

    b. Use of the Overland Conveyor System, powered by electric motors, to move more than 75 percent of the waste rock from the WMSA to reclaim the Quarry pit.

    The Greenhouse Gas Emissions Reduction Plan shall be submitted to the Planning Manager within 90 days of final RPA Approval. *(Implements Mitigation Measure 4.8-1b)*

73. **Greenhouse Gas Offsets.** If the Mine Operator is unable to reduce the Project-related incremental increase of GHG emissions to below 1,100 MT Co2e per year per Condition #72, the Mine Operator shall offset all remaining Project incremental emissions above that threshold. Any offset of emissions related to the RPA shall be demonstrated to be real, permanent, verifiable, and enforceable. To the maximum extent feasible, as determined by the County in coordination with the BAAQMD, offsets shall be implemented locally. Offsets may include but are not limited to, the following (in order of preference):

    a. Onsite offset of Project emissions, for example through development of a renewable energy generation facility or a carbon sequestration project (such as a forestry or wetlands project for which inventory and reporting protocols have been adopted). If the Mine Operator develops an offset project, it must be registered with the Climate Action Reserve or otherwise approved by the BAAQMD in order to be used to offset Project emissions. The number of offset credits produced would then be included in the annual inventory, and the net (emissions minus offsets) calculated.

    b. Funding of local projects, subject to review and approval by the BAAQMD, that would result in real, permanent, verifiable, enforceable, and additional reduction in GHG emissions. If the BAAQMD or County of Santa Clara develops a GHG mitigation fund, the Mine Operator may instead pay into this fund to offset Project incremental GHG emissions in excess of the significance threshold.

    c. Purchase of carbon credits to offset Project incremental emissions to below the significance threshold. Carbon offset credits must be verified and registered with The Climate Registry, the Climate Action Reserve, or other source that is approved by the California Air Resources Board as being consistent with the policies and guidelines of the California Global Warming Solution Act of 2006 (AB 32), or available through a County- or BAAQMD-approved local GHG mitigation bank or fund.

    Documentation verifying that offsets have been accomplished, if required, must be submitted for review and approval to the Planning Manager and BAAQMD within 90 days of final RPA Approval. *(Implements Mitigation Measure 4.8-1b)*

*Hydrology and Water Quality:*

74. **Certified Geologist Verification of Non-Limestone-Containing Material Use.** A California Certified Engineering Geologist shall be onsite during reclamation to verify that non-limestone run-of-mine rock is used as cover on the EMSA and WMSA. In addition, the Geologist shall observe and document activities associated with placing the final overburden on the Quarry Pit (i.e., ensuring that organic material is mixed to specifications). Using visual and field testing methods, with occasional bulk sampling and laboratory analysis, the geologist shall observe and document the type of rock placed over the limestone-containing material during reclamation activities. The geologist shall inspect and document whether limestone is present at the source area (Quarry Pit and WMSA), whether

limestone rock is transported from the source area to segregation stockpiles, and whether limestone is present within the lifts of the proposed 1-foot layer of run-of-mine cover rock (in the EMSA, WMSA, and Quarry Pit). Inspection involves observing the excavation, hauling, stockpiling, and placement of the non-limestone cover material, performing a visual assessment of the rock, and conducting random spot sampling and field testing of suspect rock fragments. If observation, field-testing, or laboratory analysis indicates that significant amounts of limestone are intermixed with the supposed non-limestone cover material, the geologist shall document its presence, temporarily halt fill operations, and notify the Planning Manager and field superintendent. Once notified, the Mine Operator shall remove the limestone-containing materials and then perform verification field sampling in addition to laboratory verification. *(Implements Mitigation Measure 4.10-1a)*

Within ninety (90) days of final RPA Approval, the Mine Operator shall submit to the Planning Manager a copy of a contract or an employee resume employed by the Mine Operation that is a California-certified Engineering Geologist responsible to conduct monitoring as described above. Quarterly reports shall be submitted from the Geologist to the Planning Manager describing effectiveness of mitigation and monitoring during final reclamation as described above.

75. The County reserves the right to retain, if it deems necessary, at the expense of the Mine Operator, a third-party California-certified Engineering Geologist, to provide independent oversight or monitoring to implement Condition #74.

76. **Verification and Water Quality Monitoring**. Within ninety (90) days of RPA approval, the Mine Operator shall begin and continue throughout the backfilling and reclamation phases and for 5 years following completion of reclamation and for 5 years following the start of groundwater discharge from the Quarry Pit into Permanente Creek as described on page 4.10-39 of the Final Environmental Impact Report, a Verification and Water Quality Monitoring Program. The Mine Operator shall implement the following:

    a. Collect quarterly Quarry pit water samples and analyze for general water chemistry and dissolved and total metals, including selenium.

    b. Perform quarterly electrical conductivity and pH measurements of the Quarry water.

    c. Measure and record daily volume of any water that is pumped from the pit area.

    d. Conduct annual seep surveys in March or April of each year within the Quarry pit. Any seeps identified shall be sampled for general water chemistry and minerals and dissolved metals, and the seep flow rate shall be estimated.

    e. Perform routine testing of each of the various rock types that comprise the overburden to further characterize bulk and leachable concentrations of key metal constituents (selenium in particular). Such testing shall be

performed until the average concentrations and the variability within a rock type is no longer changing significantly as new data are gathered.

f. Sample and test runoff from the EMSA and WMSA throughout and following reclamation to confirm the concepts and closure plans (i.e., that cover with non-limestone material and re-vegetation results in runoff water quality that meets Basin Plan Benchmarks and all other applicable water quality standards, including, but not limited to, a site specific NPDES permit for the Quarry and a TMDL for selenium in Permanente Creek. Stormwater runoff monitoring and sampling shall be conducted following the placement and final grading of the 1-foot run-of-mine non-limestone cover material to ensure that surface water discharging from this cover does not contain selenium at concentrations exceeding Basin Plan Benchmark values. Three rounds of representative surface water samples shall be collected and analyzed to verify rock cover performance prior to the placement of the vegetative growth layer.

g. Sample and test groundwater discharge from the Quarry Pit into Permanente Creek following reclamation as described on page 4.10-39 of the Final Environmental Impact Report to confirm that water quality in discharge meets Basin Plan Benchmarks and all other applicable water quality standards.

h. The data obtained through this mitigation measure shall be used to reevaluate the water balance components such as runoff and groundwater inflow and the water quality associated with these within the last five years of active mining. Based on the results of any refined water balance and water quality projections, the Mine Operator shall also review and refine the water management procedures. *(Implements Mitigation Measures 4.4-5 and 4.10-1b.)*

All testing data shall be submitted to the Planning Office with the Annual Report by October 1 of each year.

77. Reclamation of the Quarry Pit, EMSA, and WMSA areas shall not be considered complete until 5 years of water quality testing as described above demonstrate to the satisfaction of the Planning Manager that selenium in surface water runoff and any point source discharges has been reduced below all applicable water quality standards, including Basin Plan Benchmarks.

78. Within 90 days of RPA approval, the Mine Operator shall implement the following stormwater and sediment management controls in addition to general BMPs required by the SWPPP in active and inactive reclamation areas throughout Phase I, II, and III of the RPA. The Mine Operator shall:

    a. Segregate limestone materials from the non-limestone materials (breccia, graywacke, chert, and greenstone) by way of operational phasing to ensure that non-limestone materials are placed beneath and are covered by non-

limestone materials. A California Professional Geologist shall oversee stockpiling, segregation, and placement of non-limestone materials.

b. Stabilize inactive areas, such as temporary stockpiles or dormant excavations that drain directly or indirectly to Permanente Creek using an appropriate combination of BMPs to cover the exposed rock material, intercept runoff, reduce its flow velocity, release runoff as sheet flow, and provide a sediment control mechanism (such as silt fencing, fiber rolls, or hydroseeded vegetation). Standard soil stabilization BMPs include geotextiles, mats, erosion control blankets, vegetation, silt fence surrounding the stockpile perimeter, and fiber rolls at the base and on side slopes.

c. Temporarily stabilize active, disturbed reclamation areas undergoing fill placement before and during qualifying rain events expected to produce site runoff. Stabilization methods include combined BMPs that protect materials from rain, manage runoff, and reduce erosion. Reclamation activities involving grading, hauling, and placement of backfill materials cannot take place during periods of rain.

d. In areas such as the WMSA where fill slopes are steep and composed of loose material, controls shall be in place to prevent material from sloughing off into the PCRA and Permanente Creek. These controls shall include debris/silt fencing placed on outer edge of grading and excavation operations back-sloping excavations to prevent grade slope towards the creek, operations buffer areas that require the use of smaller grading equipment, temporary berms along the outer extent of operations closest to the creek, Mine Operator training regarding the prevention of triggering debris slides.

e. Cover active haul roads with non-limestone materials where exposed limestone surfaces are present. Roads that undergo dust control by watering must have fiber rolls or equivalent runoff protection installed along the road side to reduce runoff and avoid drainage to Permanente Creek.

f. Divert all runoff generated from disturbed active and inactive reclamation areas to temporary basins, the Quarry pit, or temporary vegetated infiltration basins and kept away from drainage pathways entering Permanent Creek. To the extent possible, drainage of the non-limestone materials shall be diverted directly to sediment control facilities and natural surface drainages.

g. Install up-gradient berms where limestone fines or stockpiles are placed, to protect against stormwater run-on, and install ditches and down-gradient berms to promote infiltration rather than run-off.

h. Replace the limestone rock and materials that are currently used in the existing BMP ditches and cover or otherwise separate runoff from limestone rock in the existing sediment pond embankments.

i. Cover large limestone surfaces that would remain exposed during the rainy season with interim covers composed of non-limestone rock types.

j. Inspect and maintain BMPs after each qualifying rain event to ensure their integrity.

k. Reconstruct or reline all existing stormwater conveyances and check dam structures that are constructed or lined with limestone rock using non-limestone material (greenstone, breccias, greywacke, metabasalt), available at the Quarry.

l. Regularly inspect all stormwater and erosion controls, especially before and following qualifying rain events. Inspections shall be documented and periodically reported. Any violations shall be corrected immediately.

m. Provide adequate erosion control training to all equipment and mine operators, site superintendants, and managers to ensure that stormwater and erosion controls are maintained and remain effective.

n. Use only jute netting or other suitable replacement for erosion control in the PCRA; no plastic monofilament shall be used for erosion control or other purposes, as California Red Legged Frogs and other wildlife may become entangled in it.

o. Ensure that all stormwater, erosion, and sediment control BMPs are installed, inspected, maintained, and repaired under the direction of either a California certified engineer, geologist, or landscape architect, a registered professional hydrologist, or a certified erosion control specialist.

Implementation of the Best Management Practices described above shall begin within 30 days of final RPA Approval. Prior to October 1, 2012, the Operator shall provide a report, with photos, documenting and demonstrating that the aforementioned BMP's are being implemented in all areas as described above. Prior to October 15 of each year, a County Inspector shall verify installation of the aforementioned BMP's. Inspection of BMP's by a County Inspector shall occur monthly between October 15 and April 15 for each year when interim reclamation activities occur. *(Implements Mitigation Measures 4.4-5 and 4.10-2a)*

79. **Interim Stormwater Monitoring Plan.** Prior to the start of reclamation activities, the Mine Operator shall develop a Stormwater Monitoring Plan for sampling and testing stormwater, that would supplement preexisting surface water monitoring required by General Industrial Storm Water and Sand and Gravel NPDES Permit and any other applicable permits designed to specifically monitor surface water during reclamation activities in active and inactive excavation and backfill areas, and locations where water discharges to Permanente Creek. The purpose of this plan is to evaluate performance of temporary BMPs and completed reclamation phases and to identify areas that are sources of selenium (measured on recoverable basis), sediment, or high TDS. At a minimum, the plan shall require the Mine Operator to inspect BMPs and collect water samples for analysis of TDS and metals, including selenium, within 24 hours after a

qualifying rain event and sample non-stormwater discharges when they occur. If elevated selenium, sediment, or TDS is identified through sample analysis, the Mine Operator shall identify the source and apply any new or modified standard BMPs available. BMPs that show sign of failure or inadequate performance shall be repaired or replaced with a more suitable alternative. Following implementation, the Mine Operator shall retest surface water to determine the effectiveness of such modifications, and determine whether additional BMPs are necessary. *(Implements Mitigation Measures 4.4-5 and 4.10-2b)*

For Phase I, submit the Stormwater Monitoring Plan for Phase I to the Planning Manager for review and approval prior to October 1, 2012.

For Phase II and III, submit a Monitoring Plan to the Planning Manager for review and approval sixty (60) days prior to the start of Phase II.

Stormwater testing results shall be submitted to Planning Manager on a monthly basis between October 15 and April 15 of each year. If a qualifying rain event did not occur during any month during this period (and stormwater testing was not conducted), notification shall be submitted to the Planning Manager in lieu of testing results.

80. **Monitoring and Determination of BMP Effectiveness for the EMSA**:

    a. Within 30 days of RPA approval, sampling and testing shall occur within 24 hours after a qualifying rain event. If no qualifying rain event occurs within 30 days of RPA approval, then testing shall begin at the first qualifying rain event. Testing shall be conducted in accordance with the Interim Stormwater Monitoring Plan developed and approved in accordance with Condition #79.

    b. If test results for two consecutive years show that stormwater discharging from the EMSA into Permanente Creek exceeds total recoverable selenium of Basin Plan Water Quality Objective, currently 5 μg/L (micrograms per liter), or other applicable discharge requirement as determined by the RWQCB, then the County shall schedule a public hearing before the Planning Commission to determine whether the Mine Operator is complying with stormwater discharge requirements. For purposes of triggering Planning Commission review, the sampling shall occur at locations where water discharges to Permanente Creek.

    c. If the Planning Commission determines that the Mine Operator is not complying with discharge requirements, then the operator shall install a treatment system (or alternative) as described in Condition #82. *(Implements Mitigation Measures 4.4-5 and 4.10-2c)*

81. **Monitoring and Determination of BMP Effectiveness for the WMSA and Quarry Pit**

a. Within 30 days of the start of reclamation activities for Phase II, the Mine Operator shall conduct monthly water sampling and testing results in compliance with the Interim Stormwater Monitoring Plan, as described under Condition #79.

b. If test results for two consecutive years show that selenium levels are higher than base levels, then the County shall schedule a public hearing before the Planning Commission to determine whether the reclamation activities are causing an increase in total selenium above the base levels. "Base levels" shall be defined as water testing results for an average for two years immediately prior to start of Phase II reclamation for discharge into Permanente Creek from the WMSA and Quarry Pit. For purposes of triggering Planning Commission review, the sampling shall occur at locations where water discharges to Permanente Creek.

c. If the Planning Commission finds that reclamation activities are causing an increase in selenium over base levels, then the Mine Operator shall install a treatment system (or alternative) as described under Condition #82. *(Implements Mitigation Measures 4.4-5 and 4.10-2d.)*

82. **Design, Pilot Testing, and Implementation of Selenium Treatment Facility or Alternative for the EMSA and/or WMSA and Quarry Pit.**

a. Within 30 days of RPA approval, the Mine Operator shall begin designing a treatment facility (or alternative) and pilot system for discharge into Permanente Creek. The treatment shall be designed to achieve the Basin Plan Water Quality Objective for selenium (total recoverable selenium of 5 μg/L) for discharge from the EMSA as defined in Condition #80, and/or to achieve the "base level" standard for the WMSA and Quarry Pit as defined in Condition #81 *(reference to Mitigation Measures 4.10-2d)*.

b. The Mine Operator shall complete design, pilot testing, and feasibility analysis for a treatment facility within 24 months of RPA approval or by such other time as may be prescribed by the RWQCB.

c. The Planning Commission shall hold a public hearing no later than 30 months after RPA approval to determine feasibility of the treatment facility (or alternative). The Planning Commission may defer the public hearing if the RWQCB determines that additional time is necessary to complete the design, pilot testing, and feasibility analysis. If the Planning Commission determines that a treatment facility is feasible, the Planning Commission shall also establish a timeline for implementing the treatment facility.

d. Construction, installation, and operation of a treatment facility (or alternative) shall be required if discharge requirements are not met as described under Conditions # 80 and # 81 based on a determination of the Planning Commission, and if it has been determined feasible by the Planning Commission following a public hearing. *(Implements Mitigation Measures 4.4-5 and 4.10-2e.)*

*Downstream Flood Protection*

83. **Construction of Onsite Detention Facility.** The Mine Operator shall design and construct detention facilities that would 1) manage increased runoff caused by the reclaimed Quarry pit, 2) reduce excessive discharges to Permanente Creek, and 3) develop the capacity to detain and release the 100-year flow using onsite detention pond basins while optimizing groundwater infiltration. The final drainage design shall ensure that offsite, downstream flows would not cause an increased flooding potential or lead to hydro-modification effects. Design considerations for onsite detention basins shall include the following performance standards:

    a. Maintain turbidity of receiving water outflows within discharge limitations for Permanente Creek, as set forth by the San Francisco Bay Regional Water Quality Control Board Basin Plan or other more stringent, site-specific limitations set forth by the RWQCB.

    b. Effectively drain between storm events within the period of time specified by the Santa Clara County 2007 Drainage Manual.

    c. Enhance the settlement of fine sediment while limiting the potential for sediment-laden water to be discharged to Permanente Creek.

    d. Incorporate appropriate sediment traps (i.e., low areas that promote sediment settlement) in areas away from outflow structures to limit discharge of sediment at high flow periods.

    e. Control surface water inflows to the detention facility using energy reduction features (i.e., rip-rap aprons, vegetated swales) to reduce inflow velocity and agitation of sediment within the basin.

    f. Infiltrate surface water, to the extent practicable and consistent with the water-quality recommendations for the backfill material as described in the RPA, while accounting for and protecting the local groundwater condition and water quality.

    g. In addition to the detention facilities for the Quarry pit, the Mine Operator shall ensure that the desiltation ponds proposed in other smaller project areas such as the EMSA, are engineered to function as detention basins and attenuate stormwater flows to the extent practical. The Mine Operator shall also consider a broader watershed approach and consult with Santa Clara Valley Water District (SCVWD) on ways to detain peak flows offsite in relation to areas of existing flooding and to the current SCVWD flood control improvement project. *(Implements Mitigation Measure 4.10-4)*

84. **Stormwater Control to Avoid Ponded Water and Selenium Accumulation**. The Mine Operator shall incorporate drainage features into the final drainage design for the Quarry pit area to eliminate the potential for surface ponding on the floor of the Quarry pit once it has reached its final elevation (990 amsl). The drainage design for the finished Quarry pit fill shall include engineered elements (e.g., conveyance channels, infiltration galleries) that facilitate groundwater

recharge and percolation from limestone area to groundwater in the Quarry backfill with the objective of accommodating high groundwater elevation without creating surface water bodies that may contain elevated levels of selenium. These measures shall be incorporated into the design of the proposed basin for the floor of the Quarry pit once the floor is raised to its final elevation. (*Implements Mitigation Measure 4.10-6*)

Prior to the start of Phase III, submit final drainage design demonstrating compliance with the standards described above.

85. Any body of water created during the operation of the quarry, both during excavation and processing the material, shall be maintained to provide for mosquito control and to prevent creation of any health hazards or public nuisance.

86. Sixty (60) days following RPA approval, the Mine Operator shall provide to the Planning Manager revised plans that show redesigned rip-rap energy dissipaters per the Association of Bay Area Governments (ABAG) standard for the 25 year storm for all discharge points on the reclamation plans.

*Noise*

87. The Mine Operator shall prohibit all heavy equipment operations in the northeasterly 11.5 acres of the EMSA (as shown in Draft EIR, Figure 4.13-8) during nighttime hours (i.e., between 10:00 p.m. to 7:00 a.m.). *(Implements Mitigation Measure 4.13-1a)*

88. The Mine Operator shall either: (1) limit all operations in the EMSA within 1,600 feet of the caretaker's residence (as shown in Figure 4.13-8) to no more than one 8-hour shift per day, or (2) submit evidence establishing to the County's satisfaction that there are legally-binding restrictions precluding any occupancy of the caretaker's residence during the entirety of Phase 1 of the RPA. *(Implements Mitigation Measure 4.13-1b)*

*EMSA Equipment*

89. Within thirty (30) days of the RPA Approval, the Mine Operator shall post a sign inside all mine equipment operating in the EMSA area with the text from Condition #42 (Light and Glare) and Conditions # 87 and # 88 (Noise). The sign shall be posted prominently within view of the vehicle operator. Within 30 days of the RPA approval, the Mine Operator shall submit to the Planning Manager photo documentation demonstrating compliance of this.

90.
