**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
**Model Uses NO WET DEPLETION.  WETDPLT  =  F

**Model Uses URBAN Dispersion Algorithm for the SBL for  3880 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   2189641.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
       1. Stack-tip Downwash.
       2. Model Accounts for ELEVated Terrain Effects.
       3. Use Calms Processing Routine.
       4. Use Missing Data Processing Routine.
       5. No Exponential Decay.
       6. Urban Roughness Length of 1.0 Meter Assumed.

**Other Options Specified:
       ADJ_U*   - Use ADJ_U* option for SBL in AERMET
       CCVR_Sub - Meteorological data includes CCVR substitutions
       TEMP_Sub - Meteorological data includes TEMP substitutions
```

```
**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of:  DPM

**Model Calculates PERIOD Averages Only

**This Run Includes:   3880 Source(s);       1 Source Group(s); and     454 Receptor(s)

               with:     33 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                and:   3847 VOLUME source(s)
                and:      0 AREA type source(s)
                and:      0 LINE source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with      0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date:  16216

**Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   -36.00 ;  Decay Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                             ;  Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =     10.5 MB of RAM.

**Input Runstream File:          aermod.inp
**Output Print File:             aermod.out

**Detailed Error/Message File:   6627b DHS 109 - 2nd 14 years.err
**File for Summary of Results:   6627b DHS 109 - 2nd 14 years.sum

APPENDIX D

CALEEMOD MODEL ANNUAL EMISSIONS PRINTOUTS

6627 DHS 109 - Phase 1

Riverside-Salton Sea County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Light Industry	68.06	1000sqft	1.56	68,060.00	0
Industrial Park	360.00	1000sqft	8.26	360,000.00	0
Other Asphalt Surfaces	19.00	Acre	19.00	827,640.00	0
Other Non-Asphalt Surfaces	10.45	Acre	10.45	455,202.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.4	**Precipitation Freq (Days)**	28
Climate Zone	10			**Operational Year**	2021
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

6627 DHS 109 - Phase 1 - Riverside-Salton Sea County, Annual

Project Characteristics -

Land Use - P1 - 39.27 ac- includes 428,060 sf bldgs (84.1% cultivation = 360,000 sf), 6.35 ac power plant site, 179,499 sf (~4.1 ac) basins, & ~50% P1 paving prkg/on-site rdwys (=~19 ac).

Construction Phase - Construction anticipated to start no earlier than July 2019 and end in Q4 2021. P1 to be operational in 2021.

Off-road Equipment -

Off-road Equipment - Building Construction Phase CalEEMod defautl timing decreased by ~30%, equipment has been increased by ~30%.

Off-road Equipment -

Off-road Equipment -

Grading - Site anticipated to balance.

Architectural Coating - SCAQMD Rule 1113 limits architectural coatings to 50g/L VOC. Architectural coatings have been mitigated to 30 g/L VOC for buildings & 100 g/L VOC for parking areas.

Vehicle Trips - Per TIA, 4.96 trips/TSF light industrial & 1,339 trips/920 TSF = 1.46 trips/TSF cultivation. Light industrial 21.4% trks (C-W) & 78.6% autos (CNW). Industrial Park 95% autos (C-NW) & 5% trks (C-W)

Energy Use - Per applicant, Phase 1- IP ~8,272,268.8 kWh/yr & GI ~4,897,095.2 kWh/yr. Converted to kWh/sf/yr & title-24, non-title 24 & lighting based on default %.

Sequestration - Per the landscape architect, ~836 new trees to be planted on-site. Split per bldg square foot. P1 is 33% bldf sf = 276 trees.

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation - 0

Energy Mitigation - Natural fueled turbine power generators, chillers, solar panels on bldng rooftops & prkng shade structures. Solar to provide ~28,788,662 kWh per year for Phase 1.

Waste Mitigation -

Fleet Mix - Revised vehicle mix per TIA for Light Industrial use of 78.6% Autos, 8% 2-Axle Trucks, 3.9% 3-Axle Trucks & 9.5% 4+ Axle Trucks & industrial park (cultivation use) of 95% autos & 5% 2-axle trucks.

1.3 User Entered Comments & Non-Default Data

6627 DHS 109 - Phase 2 - Riverside-Salton Sea County, Annual

Project Characteristics -

Land Use - Phase 2- 29.56 ac w/ 428,060 sf bldgs (65.41% cultivation = 280,000sf), 46,217 sf (~1.06 ac) basins, ~50% P2 paving prkg/on-site rdwys (=~14.78ac), & remainder 3.89 acres landscaping.

Construction Phase - Construction anticipated to start no earlier than October 2021 to Q3 2023. P2 to be operational in 2023. Default timing used.

Grading - Site anticipated to balance.

Architectural Coating - SCAQMD Rule 1113 limits architectural coatings to 50g/L VOC. Architectural coatings have been mitigated to 30 g/L VOC for buildings & 100 g/L VOC for parking areas.

Vehicle Trips - Per TIA, 4.96 trips/TSF light industrial & 1,339 trips/920 TSF = 1.46 trips/TSF cultivation. Light industrial 21.4% trks (C-W) & 78.6% autos (C-NW). Industrial Park 95% autos (C-NW) & 5% trks (C-W).

Energy Use - Per applicant, Phase 2- IP ~8,272,268.8 kWh/yr & GI ~4,897,095.2 kWh/yr. Converted to kWh/sf/yr & title-24, non-title 24 & lighting based on default %.

Sequestration - Per the landscape architect, ~836 new trees to be planted on-site. Split per bldg square foot. P2 is 33% bldf sf = 276 trees.

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation -

Energy Mitigation - Natural fueled turbine power generators, chillers, solar panels on bldng rooftops & prkng shade structures. Solar to provide ~28,788,662 kWh per year for Phase 2.

Waste Mitigation -

Fleet Mix - Revised vehicle mix per TIA for Light Industrial use of 78.6% Autos, 8% 2-Axle Trucks, 3.9% 3-Axle Trucks & 9.5% 4+ Axle Trucks & industrial park (cultivation use) of 95% autos & 5% 2-axle trucks.

1.3 User Entered Comments & Non-Default Data

6627 DHS 109 - Phase 3 - Riverside-Salton Sea County, Annual

Project Characteristics -

Land Use - Phase 3 is 15.98 ac w/ 214,030 sf bldgs (65.41% cultivation - 140,000 sf), ~50% P3 paving prkg/on-site rdwys (=~7.99 ac), & remainder 3.08 acres landscaping.

Construction Phase - Construction anticipated to start no earlier than October 2023 and be completed by Q4 2025. P3 to be operational in 2025.

Off-road Equipment - Building Construction Phase CalEEMod defautl timing cut in half, equipment has been doubled.

Off-road Equipment -

Grading - Site anticipated to balance.

Architectural Coating - SCAQMD Rule 1113 limits architectural coatings to 50g/L VOC. Architectural coatings have been mitigated to 30 g/L VOC for buildings & 100 g/L VOC for parking areas.

Vehicle Trips - Per TIA, 4.96 trips/TSF light industrial & 1,339 trips/920 TSF = 1.46 trips/TSF cultivation. Light industrial 21.4% trks (C-W) & 78.6% autos (CNW). Industrial Park 95% autos (C-NW) & 5% trks (C-W).

Energy Use - Per applicant, Phase 3- IP ~23,229,377.3 kWh/yr & GI ~2,448,547.6 kWh/yr. Converted to kWh/sf/yr & title-24, non-title 24 & lighting based on default %.

Sequestration - Per the landscape architect, ~836 new trees to be planted on-site. Split per bldg square foot. P3 is 17% bldf sf = 142 trees.

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation -

Energy Mitigation - Natural fueled turbine power generators, chillers, solar panels on bldng rooftops & prkng shade structures. Solar to provide ~14,394,331 kWh per year for Phase 3.

Waste Mitigation -

Fleet Mix - Revised vehicle mix per TIA for Light Industrial use of 78.6% Autos, 8% 2-Axle Trucks, 3.9% 3-Axle Trucks & 9.5% 4+ Axle Trucks & cultivation use o 95% autos & 5% 2-axle trucks.

1.3 User Entered Comments & Non-Default Data

6627 DHS 109 - Phase 4 - Riverside-Salton Sea County, Annual

Project Characteristics -

Land Use - Phase 4 is 19.69 ac w/ 214,030 bldgs (65.41% cultivation = 140,000sf), ~50% P4 paving prkg/on-site rdwys (~9.845ac), 2.4 acres of basins, & remainder 2.53 acres landscaping.

Construction Phase - Construction anticipated to start no earlier than October 2025 and end in Q4 2027. P4 to be operational in 2027.

Grading - Site anticipated to balance.

Architectural Coating - SCAQMD Rule 1113 limits architectural coatings to 50g/L VOC. Architectural coatings have been mitigated to 30 g/L VOC for buildings & 100 g/L VOC for parking areas.

Vehicle Trips - Per TIA, 4.96 trips/TSF light industrial & 1,339 trips/920 TSF = 1.46 trips/TSF cultivation. Light industrial 21.4% trks (C-W) & 78.6% autos (CNW). Industrial Park 95% autos (C-NW) & 5% trks (C-W).

Energy Use - Per applicant, Phase 4- IP ~4,136,134.4 kWh/yr & GI ~2,448,547.6kWh/yr. Converted to kWh/sf/yr & title-24, non-title 24 & lighting based on default %.

Sequestration - Per the landscape architect, ~836 new trees to be planted on-site. Split per bldg square foot. P4 is 17% bldf sf = 142 trees.

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation -

Energy Mitigation - Natural fueled turbine power generators, chillers, solar panels on bldng rooftops & prkng shade structures. Solar to provide ~14,394,331 kWh per year for Phase 4.

Waste Mitigation -

Fleet Mix - Revised vehicle mix per TIA for Light Industrial use of 78.6% Autos, 8% 2-Axle Trucks, 3.9% 3-Axle Trucks & 9.5% 4+ Axle Trucks & industrial park (cultivation use) of 95% autos & 5% 2-axle trucks.

CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CONSTRUCTION ANALYSIS ONLY - Off-site improvements

Land Use - Off-site improvements to include ~450 TSF of roadway improvements on 15th Avenue from Atlantic Avenue to Little Morongo, Atlantic Avenue from 16th Avenue to Dillon Rd, & 16th Avenue from Atlantic Avenue to the west project boundary.

Construction Phase - Off-site improvements anticipated to occur during grading of Phase 1 (grading modeled as 7/1/2019-10/11/2019).

Grading -

Energy Use -

Construction Off-road Equipment Mitigation -

Off-road Equipment - Off-site grading phase increased by ~1/3 the default timing; therefore, ~1/3 less equipment needed.

APPENDIX E

POWER RECLAMATION FACILITY INFORMATION

DHS 109 Power & Reclamation Plant
Utilities Generation Summary

The DHS 109 Power and Reclamation Plant (Power Plant) basis of design is to simply produce energy and reclaim normal waste bi-products and combine into one vertically integrated facility. The Power Plant wills serve as an off-grid source of energy and be distributed throughout the DHS 109 Industrial Park site via a microgrid power system. The Power Plant will meet energy plant level reliability in operation and all building code & regulatory requirements. The facility will also meet an N+1 equipment environment (installed spares for equipment to prevent single points of failure of the Power Plant being provided).

The Power Plant will produce up to 60 Mega Watts (MW) of power by using natural gas fired turbine generators for production of the electrical power. No interconnect agreement with any electric utility company has been agreed to at this time. If a connection to the Southern California Edison (SCE) grid would become available in the future, it would serve as "backup" to the DHS 109 microgrid power system to support the facility when more than one turbine generator is out of service or in an extended maintenance period.

The proposed Power Plant has been sited on the building containing condo lots 28, 29, 30 and 31 of the DHS 109 Industrial Park proposed Tentative Parcel Map. The four parcels provide a combined site area of 4.78 Acres and a building footprint of 95,410 SF. While only one building is being proposed to house the Power Plant, all buildings with frontage on Atlantic Avenue will be covered by the Major CUP in the event that additional space for Power Plant facilities is needed (i.e., substation or pump station). The current plan is to co-locate the power generation and all reclamation processes into one large building for a synergistic look to the DHS 109 project in building appearance and design.

The proposed Power Plant structure will house all of the power and reclamations facilities equipment at ground level or in the below grade basement piping gallery level. The exterior of the building will look and feel like the surrounding buildings although slightly taller at 55 feet above grade. Some windows and door areas may be replaced by louvers and larger doors for equipment access. The architectural finishes and general symmetrical arrangement of building fenestration will also remain proportionally equivalent in scale. The proposed building(s) to house the Power Plant equipment will consist of similar architectural vernacular as the buildings proposed within the DHS 109 Industrial Park project. The access plans with sidewalks and parking areas will change slightly with

conversion of parking to streets, landscaping, sidewalks or screened ground level equipment yards for storage and staging to service the facility.

The interior of the buildings will house the power generation, CO2 extraction, boilers, absorption chillers, bio-digesters, water filtration, water cooling, heat exchanger, and pumping equipment. The building will have a basement level with a 26 foot clearance height for housing of the filtration, pumping, switch gear, and piping gallery headers that supply the utility tunnel site distribution system.

Our assumptions are the planned use of standard natural gas fired turbine generator sets available from multiple vendors. The turbine generators will produce at high voltage 12.8 Kilovolt (KV), 3 phase, 60 Hertz (Hz) electrical power distribution to our microgrid system. The use of medium voltage downstream equipment for the DHS 109 Industrial Park point of use is planned.

Power generation waste heat recovery by using the exhaust gases from the turbine generator sets provide an opportunity to extract the waste heat and will allow for the following recovery options, the generation of low-pressure steam, the generation of hot water, or any combination of the two. One of the functional objectives of the Power Plant is to cool down the exhaust stream in order to enable higher operating efficiencies for the power resulting in lower cost of production and lower GHG emissions.

Additional project benefit will be realized by cooling down the exhaust gases to facilitate the CO2 recovery and reuse by the cultivation users within the industrial park. The low-level waste heat can be used to generate: (1) electricity – using Organic Rankine Cycle generators for bottoming power cycle – power can then be used to drive mechanical reclamation process systems with anticipation of generation at 4,160 Volts (V), 3 Phase, 60 Hz level for interior distribution/use; and (2) direct chilled water – using low pressure steam or hot water (or a combination of the two) to run Absorption Chillers to create 45 degree Fahrenheit chilled water for sale to the agricultural users within the industrial park.

Chilled water for cultivation and comfort cooling is made during the waste heat recovery process. The cooling water is used for management of the grow room temperature and humidity, enabling capture of water given off during plant transpiration then the condensed water is collected and returned to the Power Plant and enables the recycling of water. Generation of chilled water and other processes drive the requirement to install cooling water towers to remove the lowest level of waste heat. Providing a centralized chilled water system will benefit the Power Plant system through the utilization of large chillers as being more efficient than multiple small chilling systems and takes advantage

of the free cooling from the recovery of the waste heat from power generation.

Pure reverse osmosis (RO) quality water is produced by the water treatment system to upgrade municipal water and recycled (grey) water to high standards which allow for use by the agricultural tenants within the DHS 109 Industrial Park. The economies of scale play in the production of agricultural feed water for use by end users. Additional enhancements are consistency in management of wastewater being conveyed to Mission Springs Water District and associated compliance with discharge permits, provide agricultural feed water of high quality to end users to reduce crop failure issues, generation of make-up Boiler Feed Water if generation of low-pressure steam is an economically desirable choice in

A fire water system will be required for both the Power Plant and the Industrial Park to meet code. It is anticipated that the sizing of the distribution mains will need to address the future phases of installation. The benefit would be a simplified overall local system.

Grey and cultivation wastewater recovery treatment, the quantities and quality of the wastewater will be a function of the type of reclaim water treatment system used. The wastewater is anticipated to be available as a byproduct of humidity control (water of plant respiration), collection of process drains (wash down water, etc.) from both Power Plant and client systems, and recycling of process dilution water used in the Bio-Digestion system(s).

Water Company distribution as a private Power Plant with control over the distribution in the private Industrial Park, a common/single point of connection is likely to be defined by the City of Desert Hot Springs and/or Mission Springs Water District. Distribution of this potable water within the Industrial Park would be an additional service sold to the client by the Power Plant. Use of this potable water to the end users can be limited (metered) to ensure the clients do not attempt to divert the water to uses which the Power Plant is providing systems for already Use of this potable water should be installed to provide for domestic use only (kitchens, showers, toilets, etc.).

CO2 gas – generation and distribution**,** Carbon Dioxide (CO2) gas is used to enrich the growing atmosphere of the crops to improve productivity of the plants (typically greater than a 30% increase). Concentration is typically increased from 200-350 parts per million (ppm) ambient concentration to 1,500-2,000 ppm growth room concentration. Human safety is of concern when concentrations are greater than 2,000 ppm. Capture of the CO2 is anticipated to be from the cooled exhaust gases of the turbine generator sets. Distribution from the Power Plant is envisioned to be in the form of a gas. This minimizes the amount of energy required for capture and eliminates the cost of liquefaction (compression, cooling and storage of liquid CO2). The distribution system can be limited

to piping and surge tanks. Back up storage of liquid CO2 on site will be needed to support the Power Plant concept.

The Agricultural Organic Waste management is done an onsite by a collection and processing system. The organic waste is collected then recycled through the use of Bio-Digester and Enzyme technology producing a 'Bio Fuel' for use in power generation. Green Organic waste from a licensed cultivation facility, by regulation, must currently be cataloged and disposed of via a tracking system to a licensed landfill facility accepting Class 3 Hazardous Waste material.

The scale of the DHS 109 project warrants installation of a licensed waste disposal system for the project that responds to regulatory compliance requirements and minimizes the risk associated with taking the material off site. This also reduces the traffic trips and overall project carbon footprint. The Power Plant reclamation plan is to install a Bio-Digestor system to facilitate capture and destruction of the green waste. A Bio- Digestor system would require input of low-level waste heat and potentially decrease the load to the Cooling Water Tower segment and a reduction in its size.

RE: BIOLOGICAL RESOURCE ASSESSMENT, JURISDICTIONAL DELINEATION, COACHELLA VALLEY MULTIPLE SPECIES HABITAT CONSERVATION PLAN CONSISTENCY ANALYSIS DHS 109 PROPERTIES – SOUTHEAST CORNER OF 15th AVENUE AND LITTLE MORONGO ROAD IN THE CITY OF DESRT HOT SPRINGS

Dear Mr. Shiozaki

Jericho Systems, Inc. (Jericho) is pleased to provide this letter report that details the results of a general Biological Resources Assessment (BRA) that includes habitat suitability assessments for nesting birds, Burrowing owl (*Athene cunicularia*) [BUOW], Coachella Valley milk-vetch (*Astragalus lentiginosus* var. *coachellae*), a Jurisdictional Waters Delineation (JD), and a Coachella Valley Multiple Species Habitat Conservation Plan Consistency Analysis for the 109 DHS properties proposed by The Altum Group located in the City of Desert Hot Springs.

This report is designed to address potential effects of any development to designated Critical Habitats and/or any species currently listed or formally proposed for listing as endangered or threatened under the federal Endangered Species Act (ESA) and the California Endangered Species Act (CESA), or species designated as sensitive by the California Department of Fish and Wildlife (CDFW), or the California Native Plant Society (CNPS).

Attention was focused sensitive species known to occur locally. This report also addresses resources protected under the Migratory Bird Treaty Act, federal Clean Water Act (CWA) regulated by the U.S. Army Corps of Engineers (USACE) and Regional Water Quality Control Board (RWQCB) respectively; and Section 1602 of the California Fish and Game Code (FCG) administered by the CDFW. Additionally, the Project is located adjacent to the Upper Mission Creek/Big Morongo Canyon and Willow Hole Conservation Areas under the Coachella Valley Multiple Species Habitat Plan (CVMSHCP) and consistency analysis was performed to determine Project requirements under the Plan.

SITE LOCATION

The Project site encompasses approximately 108 acres within Accessor Parcel Numbers (APNs) 665-050-028, 665-080-005, and 665-080-007 and is located at the southeast corner of Little Morongo Road and 15th Avenue in the City of Desert Hot Springs, Riverside County (Figures 1 & 2). The site falls within the *Desert Hot Springs* USGS quadrangle at Township 03 South, Range 04 East, Section 1 within the San Bernardino Baseline and Meridian.

ENVIRONMENTAL SETTING

The surrounding local area of Desert Hot Springs sits at the northwestern entrance to Coachella Valley and south of the Big Morongo Canyon Preserve. The climate is characterized as hot, dry summers and mild winters with an average annual rainfall of approximately five inches. Elevations within the specific parcels are relatively consistent, ranging from approximately 890'-950' above mean seal level with highest elevations at the northwest section of the parcel.

Hydrologically, the Project site is within the Mission Creek Hydrologic Sub-Area (HSA 719.42) which comprises a 73873-acre drainage area within the larger Little Morongo Creek-Morongo Wash Watershed (HUC 181002010404). The Project site is situated in Upper Coachella Valley Hills and Valleys ecoregion. The Upper Coachella Valley Hills and Valleys ecoregion is surrounded by mountains except for the south, which leads to agricultural lands and the Salton Sea. Alluvial deposits are prominent in this region, with sand deposits surrounding some areas. Many species are threatened by habitat loss, and native California fan palms occur within the canyons of the Indio Hills.

METHODS

As stated above, the objective of this document is to determine whether the Project area supports special status or otherwise sensitive species and/ or their habitat, and to address the potential effects associated with the Proposed project on those resources. Prior to conducting the field study, species and habitat information was gathered from the reports related to the specific project and relevant databases for the *Desert Hot Springs* and *Seven Palms* (due to the parcel's proximity) USGS quadrangles to determine which species and/or habitats would be expected to occur on site. These sources include:

- U.S. Fish and Wildlife (USFWS) threatened and endangered species occurrence GIS overlay;
- USFWS Information for Planning and Consultation System (IPaC);
- California Natural Diversity Database (CNDDB) *Rarefind 5*;
- CNDDB Biogeographic Information and Observation System (BIOS);
- California Native Plant Society Electronic Inventory (CNPSEI) database;
- Calflora Database;
- USDA Natural Resources Conservation Service (NRCS) Web Soil Survey;
- USFWS National Wetland Inventory;
- Environmental Protection Agency (EPA) Water Program "My Waters" data layers
- USFWS Designated Critical Habitat Maps

Jericho biologist, Shay Lawrey conducted a general biological resources assessment on August 1, 3, and 6, 2019, with an emphasis on special-status species known to occur in the area. Ms. Lawrey has advanced degrees in biology and multiple years of experience surveying biological resources within Southern California. Ms. Lawrey conducted the systematic and comprehensive survey during calm weather, between the hours of 6 am and 1 pm. Weather conditions during the survey consisted of clear days with temperatures ranging from 78 to 109 degrees Fahrenheit with winds averaging five miles per hour

Wildlife species were detected during field surveys by sight, calls, tracks, scat, or other signs. In addition to species observed, expected wildlife usage of the site was determined per known habitat preferences of regional wildlife species and knowledge of their relative distributions in the area. The

focus of the faunal species surveys was to identify potential habitat for special status wildlife within the project area. Disturbance characteristics and all animal sign encountered on the site are recorded in the results section.

Regarding jurisdictional waters, Ms. Lawrey looked for indicators of active surface flow and corresponding physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris. Suspected jurisdictional areas were checked for the presence of definable channels, soils, and hydrology. Evaluation of potential federal jurisdiction followed the regulations set forth in 33CFR part 328 and the USACE guidance documents and evaluation of potential State jurisdiction followed guidance in the Fish and Game Code and A Review of Stream Processes and Forms in Dryland Watersheds (CDFW, 2010).

Clean Water Act – US Army Corps of Engineers Jurisdiction

The lateral extent of potential USACE jurisdiction was measured at the Ordinary High Watermark (OHWM) in accordance with regulations set forth in 33CFR part 328 and the USACE guidance documents. To be considered a jurisdictional wetland under the federal CWA, Section 404, an area must possess three (3) wetland characteristics: hydrophytic vegetation, hydric soils, and wetland hydrology.

Hydrophytic vegetation: Hydrophytic vegetation is plant life that grows, and is typically adapted for life, in permanently or periodically saturated soils. The hydrophytic vegetation criterion is met if more than 50 percent of the dominant plant species from all strata (tree, shrub, and herb layers) is considered hydrophytic. Hydrophytic species are those included on the 2016 National Wetland Plant List (Arid West Region) (Lichvar, 2016). Each species on the list is rated per a wetland indicator category, as shown in Table 2. To be considered hydrophytic, the species must have wetland indicator status, i.e., be rated as OBL, FACW or FAC.

Table 1. Wetland Indicator Vegetation Categories

Category	Probability
Obligate Wetland (OBL)	Almost always occur in wetlands (estimated probability >99%)
Facultative Wetland (FACW)	Usually occur in wetlands (estimated probability 67 to 99%)
Facultative (FAC)	Equally likely to occur in wetlands and non-wetlands (estimated probability 34 to 66%)
Facultative Upland (FACU)	Usually occur in non-wetlands (estimated probability 67 to 99%)
Obligate Upland (UPL)	Almost always occur in non-wetlands (estimated probability >99%)

Hydric Soil: Soil maps from the USDA-NRCS Web Soil Survey were reviewed for soil types found within the project area. Hydric soils are saturated or inundated long enough during the growing season to develop anaerobic conditions that favor growth and regeneration of hydrophytic vegetation. Generally, hydric soils are dark in color or may be gleyed (bluish, greenish, or grayish), resulting from soil development under anoxic (without oxygen) conditions.

Wetland Hydrology: The wetland hydrology criterion is satisfied at a location based upon conclusions inferred from field observations that indicate an area has a high probability of being inundated or saturated (flooded, ponded, or tidally influenced) long enough during the growing season to develop anaerobic conditions in the surface soil environment, especially the root zone (USACE, 1987 and 2008b).

California Department of Fish and Wildlife

Evaluation of CDFW jurisdiction followed guidance in the Fish and Game Code and A Review of Stream Processes and Forms in Dryland Watersheds (CDFW, 2010). Specifically, CDFW jurisdiction would occur where a stream has a definite course showing evidence of where waters rise to their highest level and to the extent of associated riparian vegetation.

RESULTS

The database searches identified 34 sensitive species (14 plant, 19 vertebrate, 1 invertebrate) and 2 sensitive habitats within the *Desert Hot Springs* and *Seven Palms Valley* USGS 7.5-minute series quadrangle (Attachment B: Figure 3). A full summary of these results is outlined in Attachment A. Database searches revealed that the northern portion of the project falls within the USFWS-designated critical habitat (Figure 4) for Coachella Valley milk-vetch (*Astragalus lentiginosus* var. *coachellae*). Of the 34 sensitive species identified burrowing owl, Coachella Valley milk-vetch, and Coachella Valley fringe-toed lizard are discussed in detail below because their presence has either been determined and/or the site is adjacent to core habitat as identified in the CVMSHCP.

Soils are well drained, consisting of Carsitas cobbly sand, 2 to 9 percent slopes, Carsitas gravelly sand 0 to 9 percent slopes, Carsitas fine sand, 0 to 5 percent slopes, and Myoma fine sand, 0 to 5 percent (Figure 5) with slopes facing southeast. By the USDA (2019) soil series descriptions:

- The Carsitas series consists of very deep, somewhat excessively drained soils that formed in alluvium from granitoid and/or gneissic rocks. The Carsitas soils are on alluvial fans, fan aprons, valley fills, dissected remnants of alluvial fans and in drainageways. Slopes range from 0 to 30 percent. The mean annual precipitation is about 75 millimeters (3 inches) and the mean annual air temperature is about 25 degrees C (77 degrees F).
- The Myoma series are typically light olive-gray fine sands that are formed from sand blown from recent alluvium. Soils are alkaline and occur in elevations ranging from 200’ below sea level to 1,800’ above sea level.

Vegetation on site consists of *Larrea tridentata* Shrubland alliance (Sawyer, Keeler-Wolf, 2018), with species including, creosote bush (*Larrea tridentata*), brittlebush (*Encelia farinosa*), mustard (*Brassica tournefortii*), burrow weed (*Ambrosia dumosa*), burrobrush (*Ambrosia salsola*), cholla (*Cylindropuntia ssp*.), and *Schismus ssp*.

Burrowing owl (BUOW)

BUOW are known to occur locally within suitable habitat areas. BUOW is a ground-dwelling owl typically found in arid prairies, fields, and open areas where vegetation is sparse and low to the ground. The BUOW depends on the presence of mammal burrows, i.e. ground squirrel burrows to provide shelter from predators, inclement weather and to provide a nesting place. They are also known to make use of human-created structures, such as cement culverts and pipes, for burrows. They feed primarily on insects but will also take small rodents, birds, and reptiles. They are active during the day

and night, generally observed in the early morning hours or at twilight. The breeding season for BUOW is February 1 through August 31. The BUOW is not listed under the State or Federal Endangered Species Act but is considered both a State and federal SSC. The BUOW is a protected by the international treaty under the Migratory Bird Treaty Act of 1918 and by State law under the California Fish and Game Code (CDFG Code #3513 & #3503.5).

Per the definition provided in the *2012 CDFG Staff Report on Burrowing Owl Mitigation*, "Burrowing owl habitat generally includes, but is not limited to, short or sparse vegetation (at least at some time of year), presence of burrows, burrow surrogates or presence of fossorial mammal dens, well-drained soils, and abundant and available prey." Therefore, the project site and immediate vicinity contains suitable habitat for this species for the following reasons:

- *Presence of mammals on site that create burrows appropriate for BUOW.*
- *Vegetation on site is not dense with expanses of open ground.*
- *Soils are well-drained*

Ms. Lawrey confirmed the presence of BUOW on the Project site in the north east corner on May 12 and 13, 2016 while conducting a focused survey walking transects spaced 30 meters apart and the CNDDB shows detections of BUOW within the southwestern portion of the Project site. During the 2019 survey BUOW individuals were detected again on site within the northeastern portion in the same locations as previously mapped in 2016. No new BUOW detections were made in 2019.

Coachella Valley milk-vetch

The Coachella Valley milk-vetch is a winter annual (sometimes perennial) herb in the *Astragalus* genus that grows in elevations from 200' to 2,100' in less than 25 locations within the Coachella Valley. Number of individuals varies greatly depending on annual precipitation, which makes population numbers difficult to estimate. Coachella Valley milk-vetch grows erect up to 12 inches tall and can be identified by its silky, white hairs, pink/magenta flowers, two to four-inch leaves, and pear-shaped leaflets. It flowers from February to May and drops seed pods to the ground to be dispersed by wind. Coachella Valley milk-vetch is currently threatened by ongoing development within Coachella Valley and invasive species. Habitat includes dunes and sandy flats, along the disturbed margins of desert washes, in sandy soils in creosote bush scrub, and in course, sandy soils adjacent to roadsides. While the species grows in sand dunes, it is not a direct obligate. Therefore, the Project site and immediate vicinity contain suitable habitat for this species for the following reasons:

- Creosote bush scrub with sandy soils occur on site
- The Project site occurs adjacent to the Morongo Wash, and desert washes are also utilized as habitat for the species
- The Project site occurs adjacent to existing roadsides, which are also utilized as a habitat for this species.

Coachella Valley milk-vetch has confirmed presence on/adjacent to the Project site recorded in the CNDDB from 2006. This species was not found on site during focused surveys in 2016 or 2019.

Coachella Valley fringe-toed lizard

The Coachella Valley fringe-toed lizard is a highly-specialized reptile adapted to fine sand habitats typically referred to as 'blow sands'. Enlarged scales on the lizard's feet help it travel along the loose

sands it inhabits and are the origin of its name 'fringe-toed'. Coachella Valley fringe-toed lizard has a wedge-shaped nose to burrow through sands and specialized nostrils to allow it to breath under sand without inhaling particles. They hibernate through the winter and are active during daytime. When summer temperatures become too extreme, the Coachella Valley fringe-toed lizard will burrow into the sand as refuge from the heat and emerge during early morning and late evening.

Habitat on site consists of creosote scrub with sandy soils. Per the CNDDB, the Project site is within a polygon confirmed for Coachella Valley fringe-toed lizard from 2013; however, this polygon is approximately 62 square miles and is nonspecific. No aspect of the site supports the aeolian soils required by this species. All soils on site have been stabilized over time and no sand dunes exist. This species is presumed absent.

Nesting Birds and Raptors

The site is suitable for use by raptors for foraging purposes. The project site and immediate surrounding areas do contain habitat suitable for nesting birds in general, including the shrubs on site.

Nesting birds are protected under the MBTA which provides protection for nesting birds that are both residents and migrants whether they are considered sensitive by resource agencies. The MBTA makes it unlawful to take, possess, buy, sell, purchase, or barter any migratory bird listed under 50 CFR 10, including feathers or other parts, nests, eggs, or products, except as allowed by implementing regulations (50 CFR 21). The direct injury or death of a migratory bird, due to construction activities or other construction-related disturbance that causes nest abandonment, nestling abandonment, or forced fledging would be considered take under federal law. The USFWS, in coordination with the CDFW administers the MBTA. CDFW's authoritative nexus to MBTA is provided in FGC Sections 3503.5 which protects all birds of prey and their nests and FGC Section 3800 which protects all non-game birds that occur naturally in the State.

Jurisdiction Waters

The Project site is bordered on the west by the Mission Creek channel and on the east by the Morongo wash. (Figure 6). Jurisdictional waters do not occur within the property boundaries. None of the following indicators are present on site: riparian vegetation, facultative, facultative wet or obligate wet vegetation, harrow marks, sand bars shaped by water, racking, rilling, destruction of vegetation, defined bed and bank, distinct line between vegetation types, clear natural scour line, meander bars, mud cracks, staining, silt deposits, litter- organic debris. No jurisdictional waters occur on site.

The Project does occur within the Federal Emergency Management Agency (FEMA)-mapped area for 100-year flood zones (Figure 7). Flood control for washes and creeks are detailed further in the CVMSHCP.

CVMSHCP Consistency Analysis

The CVMSHCP is a regional multi-agency conservation plan that provides for the long-term conservation of approximately 240,000 acres of open space and 27 plant and animal species in the Coachella Valley. The stated overall goal of the CVMSHCP is, "… to enhance and maintain biological diversity and ecosystem processes while allowing future economic growth." The CVMSHCP balances environmental protection and economic development objectives in the plan area and simplifies compliance with endangered species laws.

The Plan is subdivided according to specific resource conservation goals that have been organized according to geographic areas defined as Conservation Areas that serve as natural habitat for covered species. These areas are identified as Core, Essential, or Other Conserved Habitat for special-status plant, invertebrate, amphibian, reptile, bird, and mammal species, Essential Ecological Process Areas, and Biological Corridors and Linkages. For each Conservation Area, Conservation Objectives and required measures are articulated for conserving Core Habitat for covered species, Essential Ecological Processes necessary to maintain habitat viability, Biological Corridors and Linkages as needed, and the less common Conserved Natural Communities.

Conservation Goals are managed within the Conservation Areas as a Reserve System. The Conservation Goals of the CVMSHCP Reserve System are:

- Represent native ecosystem types or natural communities across their natural range of variation in a system of conserved areas.
- Maintain or restore self-sustaining populations or metapopulations of the species included in the Plan to ensure permanent Conservation so that Take Authorization can be obtained for currently Listed Species (animal species) and Non-listed Species can be covered in case they are listed in the future.
- Sustain ecological and evolutionary processes necessary to maintain the functionality of the conserved natural communities and Habitats for the species included in the Plan.
- Maximize connectivity among populations and avoid Habitat fragmentation within Conservation Areas to conserve biological diversity, ecological balance, and connected populations of Covered Species.
- Minimize adverse impacts from OHV use, illegal dumping, edge effects, exotic species, and other disturbances in accordance with the Management and Monitoring Programs.
- Manage the Conservation Areas adaptively to be responsive to short-term and long-term environmental change and new science.

Under the CVMSHCP, a Take Authorization, except for three of the covered species, is allowed for covered activities in accordance with the federal Endangered Species Act (ESA) and the California Natural Community Conservation Planning Act. Covered activities include development permitted or approved by local permittees, which includes new projects approved pursuant to county and city general plans. Take activities are limited within Conservation Areas.

Mitigation for the impacts of development on the covered species and their habitats is through payment of a fee to the City of Coachella which is in turn used by the Coachella Valley Conservation Commission to minimize and mitigate impacts of the Taking and provide for conservation of the covered and non-covered species through the acquisition and maintenance of habitat.

The Project site occurs within CVMSHCP boundaries but does not occur within a Conservation Area (Figure 8). However, the Upper Mission Creek/Big Morongo Canyon and Willow Hole Conservation Areas border the eastern and western boundaries of the Project parcels. The Project therefore, is outside of the jurisdiction for the Conservation Areas under the CVMSHCP, but still subject to Federal, State, and local regulations. Development of the Project site will comply with Land Use Adjacency Guidelines as described in Section 4.5 of the CVMSHCP which are guidelines is to avoid or minimize indirect effects from Development adjacent to or within the Conservation Areas.

The following Land Use Adjacency Guidelines shall be considered for projects adjacent to Conservation Areas and shall be implemented where applicable.

Drainage

A Stormwater Pollution Prevention Plan (SWPPP) and Water Quality Management Plan (WQMP) will be developed as part of this Project to prevent the release of toxins, chemicals, petroleum products, exotic plant materials or other elements that might degrade or harm biological resources or ecosystem processes within the adjacent Conservation Area and to ensure that the quantity and quality of runoff discharged to the adjacent Conservation Area is not altered in an adverse way when compared with existing conditions.

Toxics

The Project does not propose the release of any chemicals and as such, will not result in any discharge to the adjacent Conservation Area.

Lighting

In order to minimize the effects of lighting on to the adjacent Conservation Areas, the Project lighting design will direct lighting toward the developed area and shield it from the adjacent Conservation Area.

Noise

If the Project will generate noise levels in excess of 75 dBA Leq hourly, setbacks, berms, or walls, as appropriate, shall be incorporated to minimize the effects of noise on the adjacent Conservation Area

Invasives

Invasive, non-native plant species shall not be incorporated in the landscape for land uses adjacent to or within a Conservation Area. Landscape treatments adjacent to a Conservation Area shall incorporate native plant materials to the maximum extent feasible. The plants listed in Table 4-113 found on page 4-180 of the CVMSHCP shall not be used adjacent to a Conservation Area.

CONCLUSIONS AND RECOMMENDATIONS

There are confirmed sightings and burrows occupied by burrowing owl on site from Jericho's field surveys. The CNDDB has confirmed records from 2013 within the Project site as well. A qualified biologist(s) will conduct a pre-construction presence/absence survey for burrowing owl at between 14 and 30 days prior to ground disturbance and the second within 24 hours of ground disturbance. If burrowing owl are documented within the Project impact area, a plan for avoidance or passive exclusion shall be made in coordination with the CDFW. If the survey is negative, the Project may proceed without further restrictions related to burrowing owls.

The site is mapped within USFWS-designated critical habitat for Coachella Valley milk-vetch, appropriate habitat for the species is present on site (creosote scrub), and the species has confirmed presence on the site recorded in the CNDDB from 2006. Coachella Valley milk-vetch is a Covered Species under the CVMSHCP; therefore, a focused survey is not required for this species. However, focused surveys for plant species that have a moderate to high potential to occur that are not Covered

Species under the CVMSHCP but are CNPS List 1 or 2 species are recommended. Surveys should be conducted between March and April. These species include Arizona spurge (*Euphorbia arizonica*) and spiny-hair blazing star (*Mentzelia tricuspis*). The surveys should be conducted according to the "Protocals for Surveying and Evaluating Impacts to Special Status and Native Plant Populations and Naturual Communities" (CDFW 2018 or most recent version).

The site conditions are not suitable to support Coachella Valley fringe-toed lizard no further action is warranted or required.

The vegetation on site does have a potential to support nesting birds and foraging raptors such as red-tailed hawks. Therefore, to reduce the potential impacts to nesting birds, the following is recommended:

- Bird nesting season generally extends from February 1 through September 15 in southern California and specifically, April 15 through August 31 for migratory passerine birds. To avoid impacts to nesting birds (common and special status) during the nesting season, a qualified Avian Biologist will conduct pre-construction Nesting Bird Surveys prior to project-related disturbance to nestable vegetation to identify any active nests. If no active nests are found, no further action will be required. If an active nest is found, the biologist will set appropriate no-work buffers around the nest which will be based upon the nesting species, its sensitivity to disturbance, nesting stage and expected types, intensity and duration of disturbance. The nests and buffer zones shall be field checked weekly by a qualified biological monitor. The approved no-work buffer zone shall be clearly marked in the field, within which no disturbance activity shall commence until the qualified biologist has determined the young birds have successfully fledged and the nest is inactive.

The site does not occur within a Conservation Area but does occur adjacent to the Upper Mission Creek/Big Morongo Canyon and Willow Hole Conservation Areas within the CVMSHCP.

Please do not hesitate to contact me at 909-915-5900 should you have any questions or require further information.

Shay Lawrey, President
Ecologist/Regulatory Specialist

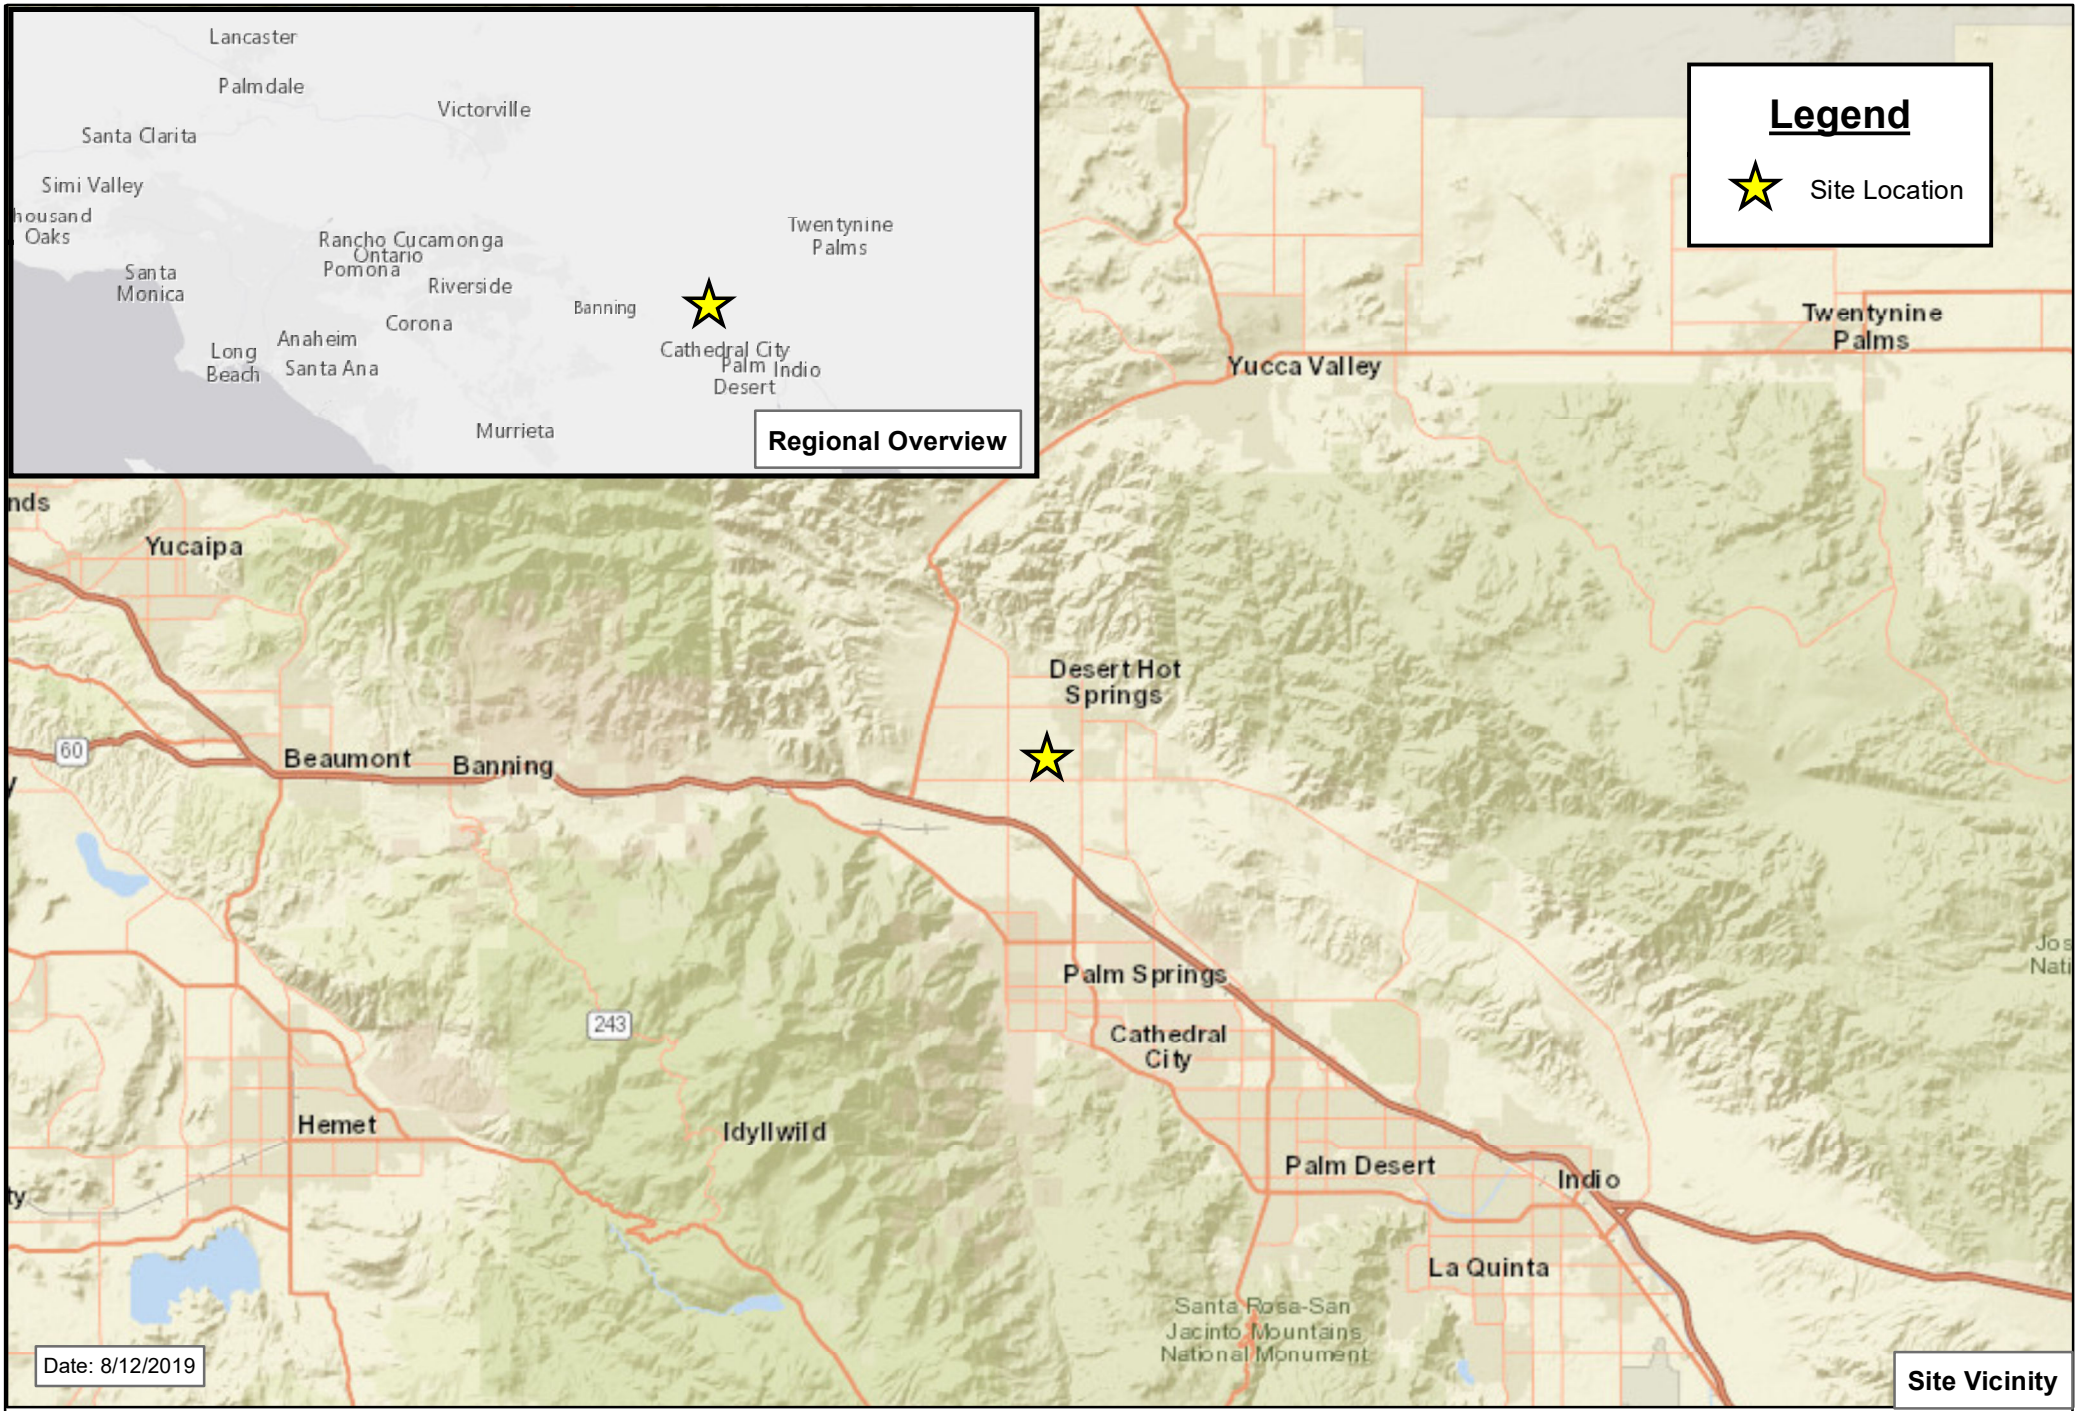
ATTACHMENT A – TABLE OF DOCUMENTED OCCURENCES

Attachment A – Table of Database Queries (CNDDB, IPAC, CNPSEI)

Scientific Name	Common Name	Federal Status State Status Other Status	Habitat	Potential To Occur
Mammals				
Chaetodipus fallax pallidus	pallid San Diego pocket mouse	None None CDFW Species of Special Concern	Desert wash | Pinon & juniper woodlands | Sonoran desert scrub Desert border areas in eastern San Diego County in desert wash, desert scrub, desert succulent scrub, pinyon-juniper, etc. Sandy, herbaceous areas, usually in association with rocks or coarse gravel.	Desert habitat with sandy soils and nearby rocks are present on the Project site. Species has a moderate potential to occur.
Corynorhinus townsendii	Townsend's big-eared bat	None None BLM Sensitive | CDFW Species of Special Concern | IUCN Least Concern | USFS Sensitive | WBWG High Priority	Broadleaved upland forest | Chaparral | Chenopod scrub | Great Basin grassland | Great Basin scrub | Joshua tree woodland | Lower montane coniferous forest | Meadow & seep | Mojavean desert scrub | Riparian forest | Riparian woodland | Sonoran desert scrub | Sonoran thorn woodland | Upper montane coniferous forest | Valley & foothill grassland Throughout California in a wide variety of habitats. Most common in mesic sites. Roosts in the open, hanging from walls and ceilings. Roosting sites limiting. Extremely sensitive to human disturbance.	No mines, caves, or structures that function as roosting habitat are within the Project site. Potential to occur is low.
Neotoma lepida intermedia	San Diego desert woodrat	None None CDFW Species of Special Concern	Coastal scrub Coastal scrub of Southern California from San Diego County to San Luis Obispo County. Moderate to dense canopies preferred. They are particularly abundant in rock outcrops, rocky cliffs, and slopes.	Rock outcrops are within the Project site, and the species is abundant in a variety of desert habitats. Species has a high potential to occur.
Ovis canadensis nelsoni	Peninsular Bighorn Sheep	Endangered Threatened CDFW Fully Protected | USFS Sensitive | BLM Sensitive	Alpine | Alpine dwarf scrub | Chaparral | Chenopod scrub | Great Basin scrub | Mojavean desert scrub | Montane dwarf scrub | Pinon & juniper woodlands | Riparian woodland | Sonoran desert scrub Eastern slopes of the Peninsular Ranges below 4,600 ft elevation. This DPS of the subspecies	Habitat is not in upland area and no detections have occurred within a 3-mile radius (Figure 3). Potential to occur is low.

Scientific Name	Common Name	Federal Status State Status Other Status	Habitat	Potential To Occur
			inhabits the Peninsular Ranges in southern California from the San Jacinto Mountains south to the US-Mexico International Border. Optimal habitat includes steep walled canyons and ridges bisected by rocky or sandy washes, with available water.	
Ovis canadensis nelsoni pop. 2	Peninsular bighorn sheep DPS	Endangered Threatened CDFW Fully Protected	Alpine | Alpine dwarf scrub | Chaparral | Chenopod scrub | Great Basin scrub | Mojavean desert scrub | Montane dwarf scrub | Pinon & juniper woodlands | Riparian woodland | Sonoran desert scrub Eastern slopes of the Peninsular Ranges below 4,600 ft elevation. This DPS of the subspecies inhabits the Peninsular Ranges in southern California from the San Jacinto Mountains south to the US-Mexico International Border. Optimal habitat includes steep walled canyons and ridges bisected by rocky or sandy washes, with available water.	Habitat is not in upland area and no detections have occurred within a 3-mile radius (Figure 3). Potential to occur is low.
Perognathus longimembris bangsi	Palm Springs pocket mouse	None None BLM Sensitive | CDFW Species of Special Concern	Desert wash | Sonoran desert scrub Desert riparian, desert scrub, desert wash and sagebrush habitats. Most common in creosote-dominated desert scrub. Rarely found on rocky sites. Occurs in all canopy coverage classes.	Desert wash is within 500' of the Project site, and creosote scrub is present on site. Species has a moderate potential to occur.
Xerospermophilus tereticaudus chlorus	Palm Springs round-tailed ground squirrel	None None BLM Sensitive | CDFW Species of Special Concern	Chenopod scrub | Sonoran desert scrub Restricted to the Coachella Valley. Prefers desert succulent scrub, desert wash, desert scrub, alkali scrub, and levees. Prefers open, flat, grassy areas in fine-textured, sandy soil. Density correlated with winter rainfall.	Desert scrub (creosote) with sandy soils occurs on the Project site. Species has low to moderate potential to occur.
Birds				

Scientific Name	Common Name	Federal Status State Status Other Status	Habitat	Potential To Occur
Aquila chrysaetos	golden eagle	None None BLM Sensitive | CDF Sensitive | CDFW Fully Protected | CDFW Watch List | IUCN Least Concern | USFWS Birds of Conservation Concern	Broadleaved upland forest | Cismontane woodland | Coastal prairie | Great Basin grassland | Great Basin scrub | Lower montane coniferous forest | Pinon & juniper woodlands | Upper montane coniferous forest | Valley & foothill grassland Rolling foothills, mountain areas, sage-juniper flats, and desert. Cliff-walled canyons provide nesting habitat in most parts of range; also, large trees in open areas.	Montane habitat is not in the Project site. Potential to occur is low.
Athene cunicularia	burrowing owl	None None BLM Sensitive | CDFW Species of Special Concern | IUCN Least Concern | USFWS Birds of Conservation Concern	Coastal prairie | Coastal scrub | Great Basin grassland | Great Basin scrub | Mojavean desert scrub | Sonoran desert scrub | Valley & foothill grassland Open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably, the California ground squirrel.	Open, dry habitat with well-drained soils and species is confirmed on site.
Empidonax traillii extimus	Southwestern Willow Flycatcher	Endangered Endangered NABCI Red Watch List	Riparian woodland with multiple canopy layers and slow-flowing waters. Riparian woodlands in Southern California.	Riparian woodland is not present on the Project site. Potential to occur is low.
Falco mexicanus	prairie falcon	None None CDFW Watch List | IUCN Least Concern | USFWS Birds of Conservation Concern	Great Basin grassland | Great Basin scrub | Mojavean desert scrub | Sonoran desert scrub | Valley & foothill grassland Inhabits dry, open terrain, either level or hilly. Breeding sites located on cliffs. Forages far afield, even to marshlands and ocean shores.	Desert scrub with dry, open terrain occurs within the Project site. Species has a moderate potential to occur.
Toxostoma lecontei	Le Conte's thrasher	None None CDFW Species of Special Concern | IUCN Least Concern | NABCI Red Watch List	Desert wash | Mojavean desert scrub | Sonoran desert scrub Desert resident; primarily of open desert wash, desert scrub, alkali desert scrub, and desert succulent scrub habitats.	Open desert scrub occurs on the Project site. Species has a moderate potential to occur. Species was not observed during survey.



Scientific Name	Common Name	Federal Status State Status Other Status	Habitat	Potential To Occur
		| USFWS Birds of Conservation Concern	Commonly nests in a dense, spiny shrub or densely branched cactus in desert wash habitat, usually 2-8 feet above ground.	
Vireo bellii pusillus	least Bell's vireo	Endangered Endangered IUCN Near Threatened | NABCI Yellow Watch List	Riparian forest | Riparian scrub | Riparian woodland Summer resident of Southern California in low riparian in vicinity of water or in dry river bottoms; below 2000 ft. Nests placed along margins of bushes or on twigs projecting into pathways, usually willow, Baccharis, mesquite.	Riparian forest/scrub does not occur on the Project site. Potential to occur is low.
Reptiles				
Crotalus ruber	red-diamond rattlesnake	None None CDFW Species of Special Concern | USFS Sensitive	Chaparral | Mojavean desert scrub | Sonoran desert scrub Chaparral, woodland, grassland, & desert areas from coastal San Diego County to the eastern slopes of the mountains. Occurs in rocky areas and dense vegetation. Needs rodent burrows, cracks in rocks or surface cover objects.	Rocky areas are within the Project site and scrub occurs on site. Species has a moderate potential to occur.
Gopherus agassizii	desert tortoise	Threatened Threatened IUCN Vulnerable	Joshua tree woodland | Mojavean desert scrub | Sonoran desert scrub Most common in desert scrub, desert wash, and Joshua tree habitats; occurs in almost every desert habitat. Require friable soil for burrow and nest construction. Creosote bush habitat with large annual wildflower blooms preferred.	Desert scrub occurs on site and desert wash occurs within 500'. Species has a low potential to occur.
Phrynosoma blainvillii	coast horned lizard	None None BLM Sensitive | CDFW Species of Special Concern | IUCN Least Concern	Chaparral | Cismontane woodland | Coastal bluff scrub | Coastal scrub | Desert wash | Pinon & juniper woodlands | Riparian scrub | Riparian woodland | Valley & foothill grassland Frequents a wide variety of habitats, most common in lowlands along sandy washes with scattered low bushes.	Species is a habitat generalist. Species has a moderate to high potential to occur.

Scientific Name	Common Name	Federal Status State Status Other Status	Habitat	Potential To Occur
			Open areas for sunning, bushes for cover, patches of loose soil for burial, and abundant supply of ants and other insects.	
Phrynosoma mcallii	flat-tailed horned lizard	None None BLM Sensitive | CDFW Species of Special Concern | IUCN Near Threatened	Desert dunes | Mojavean desert scrub | Sonoran desert scrub Restricted to desert washes and desert flats in central Riverside, eastern San Diego, and Imperial counties. Critical habitat element is fine sand, into which lizards burrow to avoid temperature extremes; requires vegetative cover and ants.	Desert wash exists within 500' of the Project site, and slopes on site are relatively flat. Species has a moderate to high potential to occur.
Uma inornata	Coachella Valley fringe-toed lizard	Threatened Endangered IUCN Endangered	Desert dunes | Desert wash Limited to sandy areas in the Coachella Valley, Riverside County. Requires fine, loose, windblown sand (for burrowing), interspersed with hardpan and widely-spaced desert shrubs.	Windblown sand is absent. Soils are stabilized on site. Species has a low potential to occur.
Insects				
Stenopelmatus cahuilaensis	Coachella Valley jerusalem cricket	None None IUCN Vulnerable	Desert dunes Inhabits a small segment of the sand and dune areas of the Coachella Valley, in the vicinity of Palm Springs. Found in the large, undulating dunes piled up at the north base of Mt San Jacinto.	Dune habitat is not present on sielte. Potential to occur is low.
Plants				
Abronia villosa var. aurita	chaparral sand-verbena	None None 1B.1	Chaparral, Coastal scrub, Desert dunes Sandy soils 75-1600 m	Desert habitat with sandy soils occurs on the Project site. Species has low potential to occur.
Aloysia wrightii	Wright's beebrush	None None 4.3	Joshua tree woodland, Pinyon and juniper woodland rocky, often carbonate 900-1600 m	Site elevations are ~330 m. Elevations are too low for species to occur. Potential to occur is low.
Astragalus lentiginosus var. coachellae	Coachella Valley milk-vetch	Endangered None 1B.2	Desert dunes | Sonoran desert scrub Sonoran desert scrub, creosote scrub, desert dunes.	Creosote scrub with sandy soils occurs on the Project site within USFWS-

Scientific Name	Common Name	Federal Status State Status Other Status	Habitat	Potential To Occur
			Sandy flats, washes, outwash fans, sometimes on dunes. 35-695 m.	designated Critical Habitat (Figure 4) and a confirmed 2006 presence on site. Species has moderate potential to occur. Species was not observed during 2016 and 2019 surveys.
Astragalus tricarinatus	triple-ribbed milk-vetch	Endangered None 1B.2	Desert wash | Joshua tree woodland | Sonoran desert scrub Joshua tree woodland, Sonoran desert scrub. Hot, rocky slopes in canyons and along edge of boulder-strewn desert washes, with *Larrea* and *Encelia*. 455-1585 m.	Site elevations are ~330 m. Elevations are too low for species to occur. Potential to occur is low.
Chorizanthe xanti var. leucotheca	white-bracted spineflower	None None BLM Sensitive | 1B.2 | USFS Sensitive	Coastal scrub | Mojavean desert scrub | Pinon & juniper woodlands Mojavean desert scrub, pinyon and juniper woodland, coastal scrub (alluvial fans). Sandy or gravelly places. 365-1830 m.	Site occurs ~30 m lower than recorded occurrences; however, 30 m is a relatively small amount of altitude and habitat on site is desert scrub with sandy soils. Species has a low potential to occur.
Dodecahema leptoceras	slender-horned spineflower	Endangered Endangered 1B.1	Chaparral | Cismontane woodland | Coastal scrub Chaparral, cismontane woodland, coastal scrub (alluvial fan sage scrub). Flood deposited terraces and washes; associates include Encelia, Dalea, Lepidospartum, etc. Sandy soils. 200-765 m.	Sage scrub does not occur on the Project site. Potential to occur is low.
Eriastrum harwoodii	Harwood's eriastrum	None None BLM Sensitive | 1B.2	Desert dunes. Sandy soils. 15-1100m.	Dune habitat is not present on site. Potential to occur is low.
Eschscholzia androuxii	Joshua Tree poppy	None None 4.3	Joshua tree woodland, Mojavean desert scrub Desert washes, flats, and slopes; sandy, gravelly, and/or rocky 585-1685 m	Site elevations occur around 320 m. Site elevations occur lower than the plant has been recorded
Euphorbia arizonica	Arizona spurge	None None	Sonoran desert scrub. Creosote bush scrub. Sandy soils. 150-900 m.	Creosote bush scrub occurs on the Project site. Species

Scientific Name	Common Name	Federal Status State Status Other Status	Habitat	Potential To Occur
		2B.3		has moderate potential to occur.
Euphorbia misera	cliff spurge	None None 2B.2	Coastal bluff scrub | Coastal scrub | Mojavean desert scrub Coastal bluff scrub, coastal scrub, Mojavean desert scrub. Rocky sites. 3-430 m.	Typical habitat association does not occur on site. Potential to occur is low.
Linanthus maculatus ssp. maculatus	Little San Bernardino Mtns. linanthus	None None BLM Sensitive | 1B.2	Desert dunes | Desert wash | Joshua tree woodland | Mojavean desert scrub | Sonoran desert scrub Desert dunes, Sonoran desert scrub, Mojavean desert scrub, Joshua tree woodland. Sandy places. Usually in light-colored quartz sand; often in wash or bajada. 135-1220 m.	Desert scrub within 500' of desert wash occurs on the Project site. Potential to occur is low.
Mentzelia tricuspis	spiny-hair blazing star	None None 2B.1	Mojavean desert scrub Mojavean desert scrub. Sandy or gravelly slopes and washes.150-1280 m.	Sandy soils in desert scrub occurs on the Project site. Species has moderate to high potential to occur.
Nemacaulis denudata var. gracilis	slender cottonheads	None None 2B.2	Coastal dunes | Desert dunes | Sonoran desert scrub Coastal dunes, desert dunes, Sonoran desert scrub. In dunes or sand. -50-400 m.	Dune habitat is absent from the site. Potential to occur is low.
Selaginella eremophila	desert spike-moss	None None 2B.2	Chaparral | Sonoran desert scrub Sonoran desert scrub, chaparral. Shaded sites, gravelly soils; crevices or among rocks. 225-1570 m.	Sandy soils in desert scrub occurs on the Project site. Potential to occur is low.
Habitats				
Desert Fan Palm Oasis Woodland	Desert Fan Palm Oasis Woodland	None None	Riparian woodland	Habitat does not occur on site.
Mesquite Bosque	Mesquite Bosque	None None	Riparian forest	Habitat does not occur on site.

Re: Update to Phase I Cultural Resources Survey
Tentative Parcel Map No. 32706; Assessor's Parcel Nos. 665-080-005 and -007
City of Desert Hot Springs, Riverside County, California
CRM TECH Project Numbers 1433/3345

Dear Shaul Mezrahi:

At your request, CRM TECH has completed a cultural resources records search, a historical background review, Native American consultation, and a field inspection on Tentative Parcel Map No. 32706 in the City of Desert Hot Springs, Riverside County, California. The subject property consists of approximately 108 acres of undeveloped land on the west side of Atlantic Avenue and between 15th Avenue and 16th Avenue, in the southwest quarter of Section 1, T3S R4E, San Bernardino Baseline and Meridian (Figs. 1, 2). This letter presents a summary of the methods, results, and final conclusions of these research procedures.

Background

As you know, the project area was previously included in a standard Phase I cultural resource survey completed by CRM TECH in 2004, which also covered additional land to the west of the current project area (Hogan et al. 2004; see Attachment A). The scope of that study also included a records search, historical background research, and a systematic field survey, but did not include consultation with Native American representatives.

The results of the study indicated that no "historical resources," as defined by the California Environmental Quality Act (CEQA), were present within the area surveyed (Hogan et al. 2004:9). Therefore, CRM TECH recommended to the City of Desert Hot Springs a finding of *No Impact* regarding cultural resources (*ibid.*:10). Because the 2004 study is now 14 years old, the research procedures implemented during this study are designed as an update to reexamine and confirm the findings.

Records Search

The records search for this study was conducted by CRM TECH archaeologist Nina Gallardo, B.A., on May 15, 2018, at the Eastern Information Center (EIC), University of California, Riverside. The results of the records search indicate that other than the 2004 CRM TECH survey (#6295 in Fig. 3) and two reconnaissance-level surveys completed prior to that in 1972 and 1982 (#71 and #1473 in Fig. 3), no additional cultural resources studies have occurred within the project area, although a linear survey for a power transmission line was completed along the southern and western project

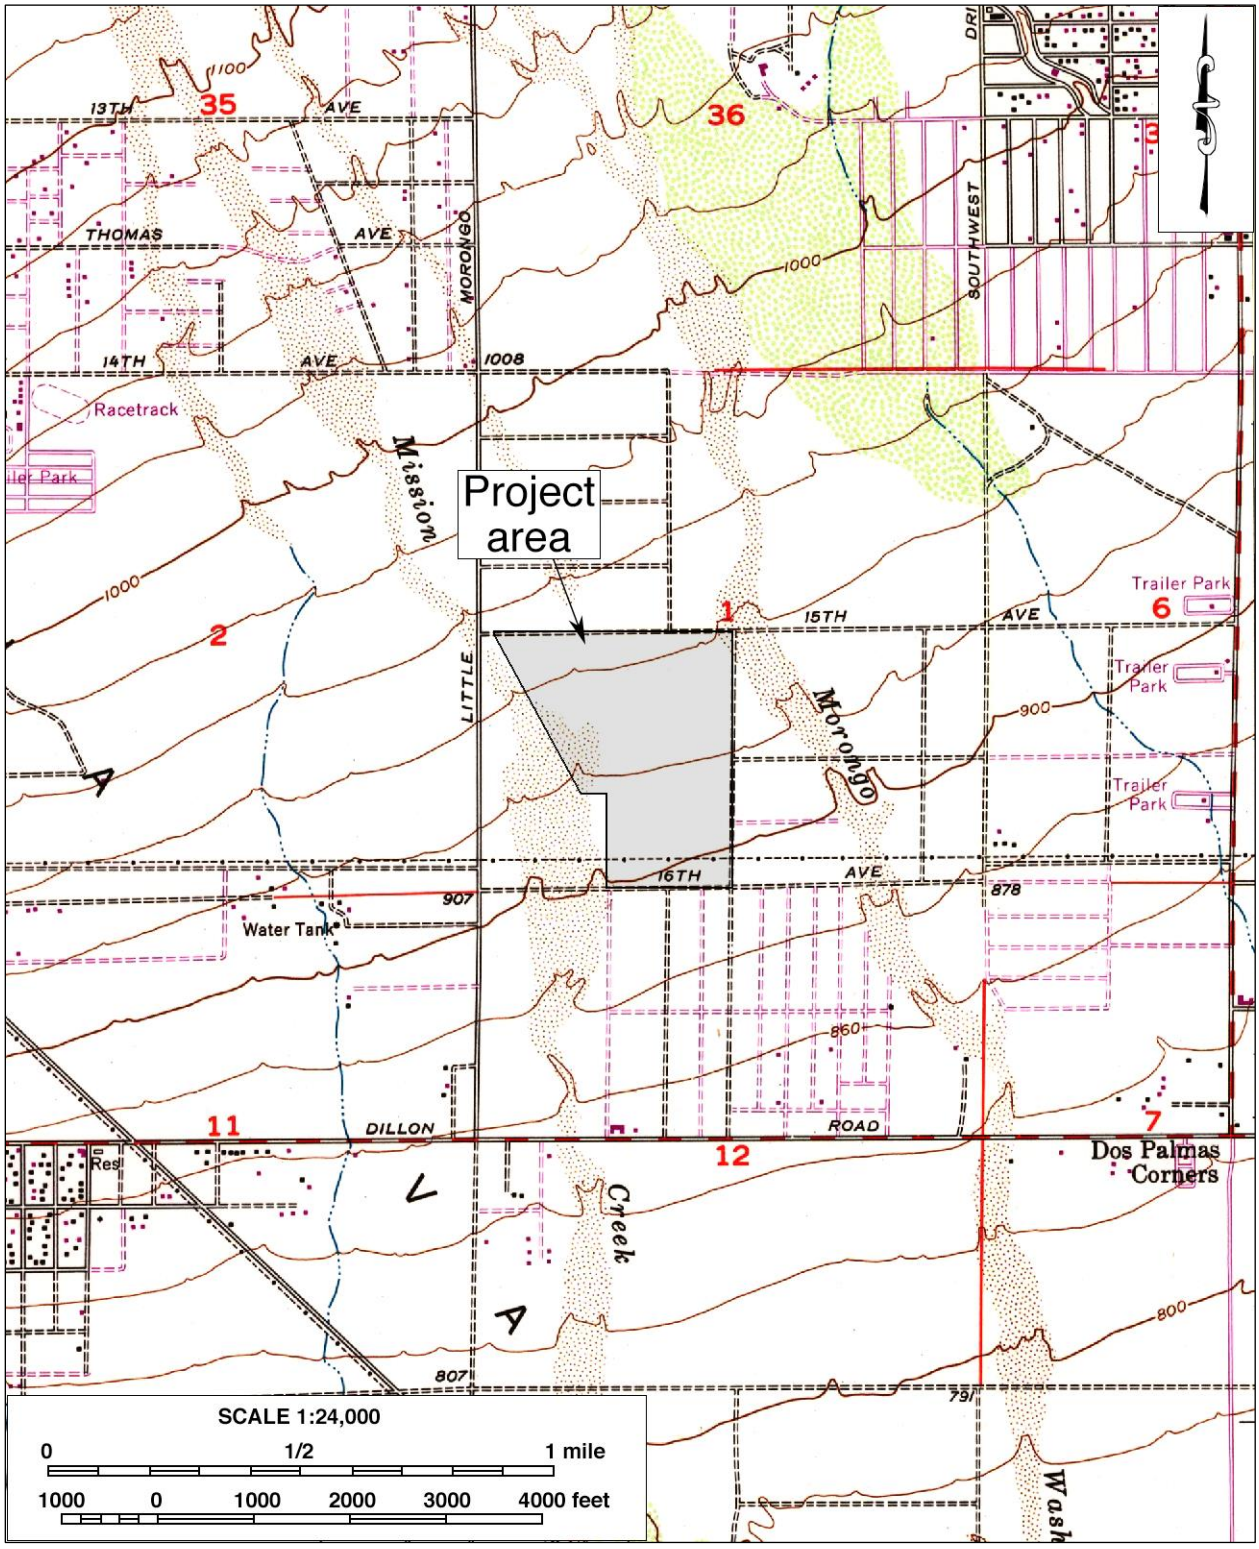

Figure 1. Location and configuration of the project area. (Based on USGS Desert Hot Springs, Calif., 7.5 quadrangle, 1978 edition)

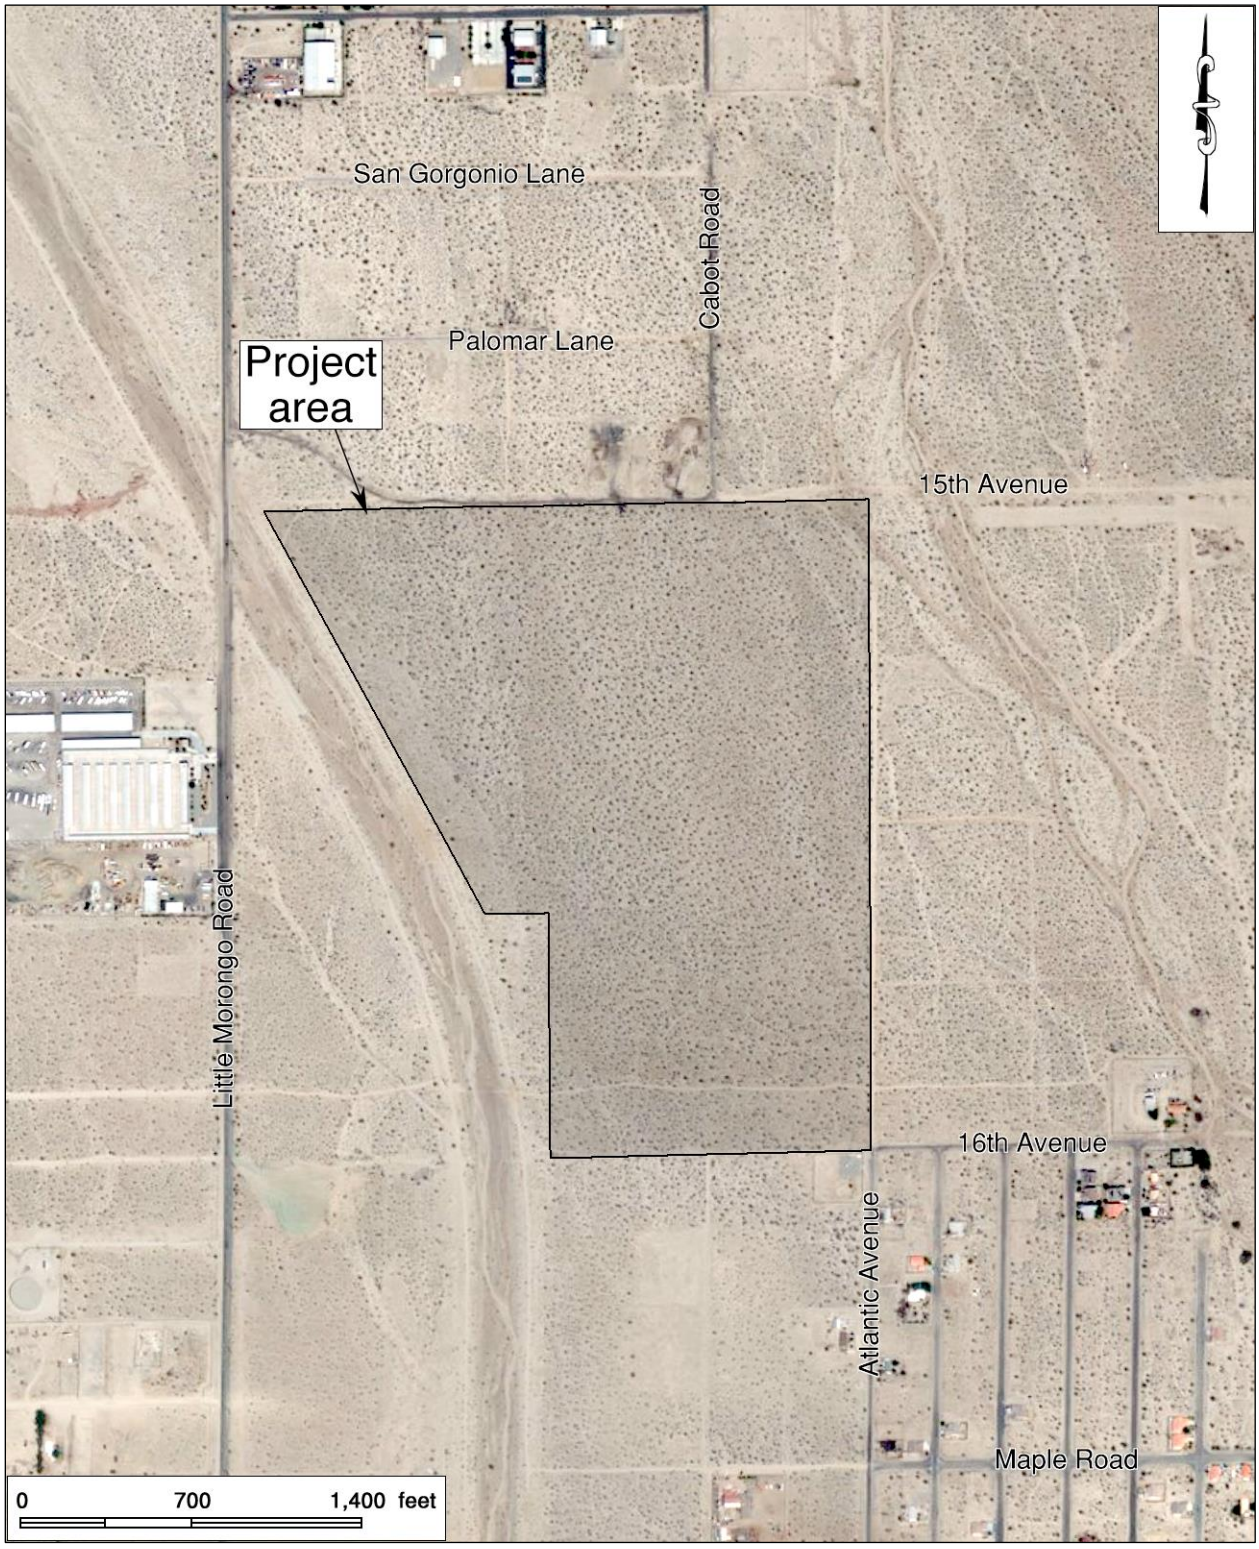

Figure 2. Aerial image of the project area. (Based on Google Earth imagery)

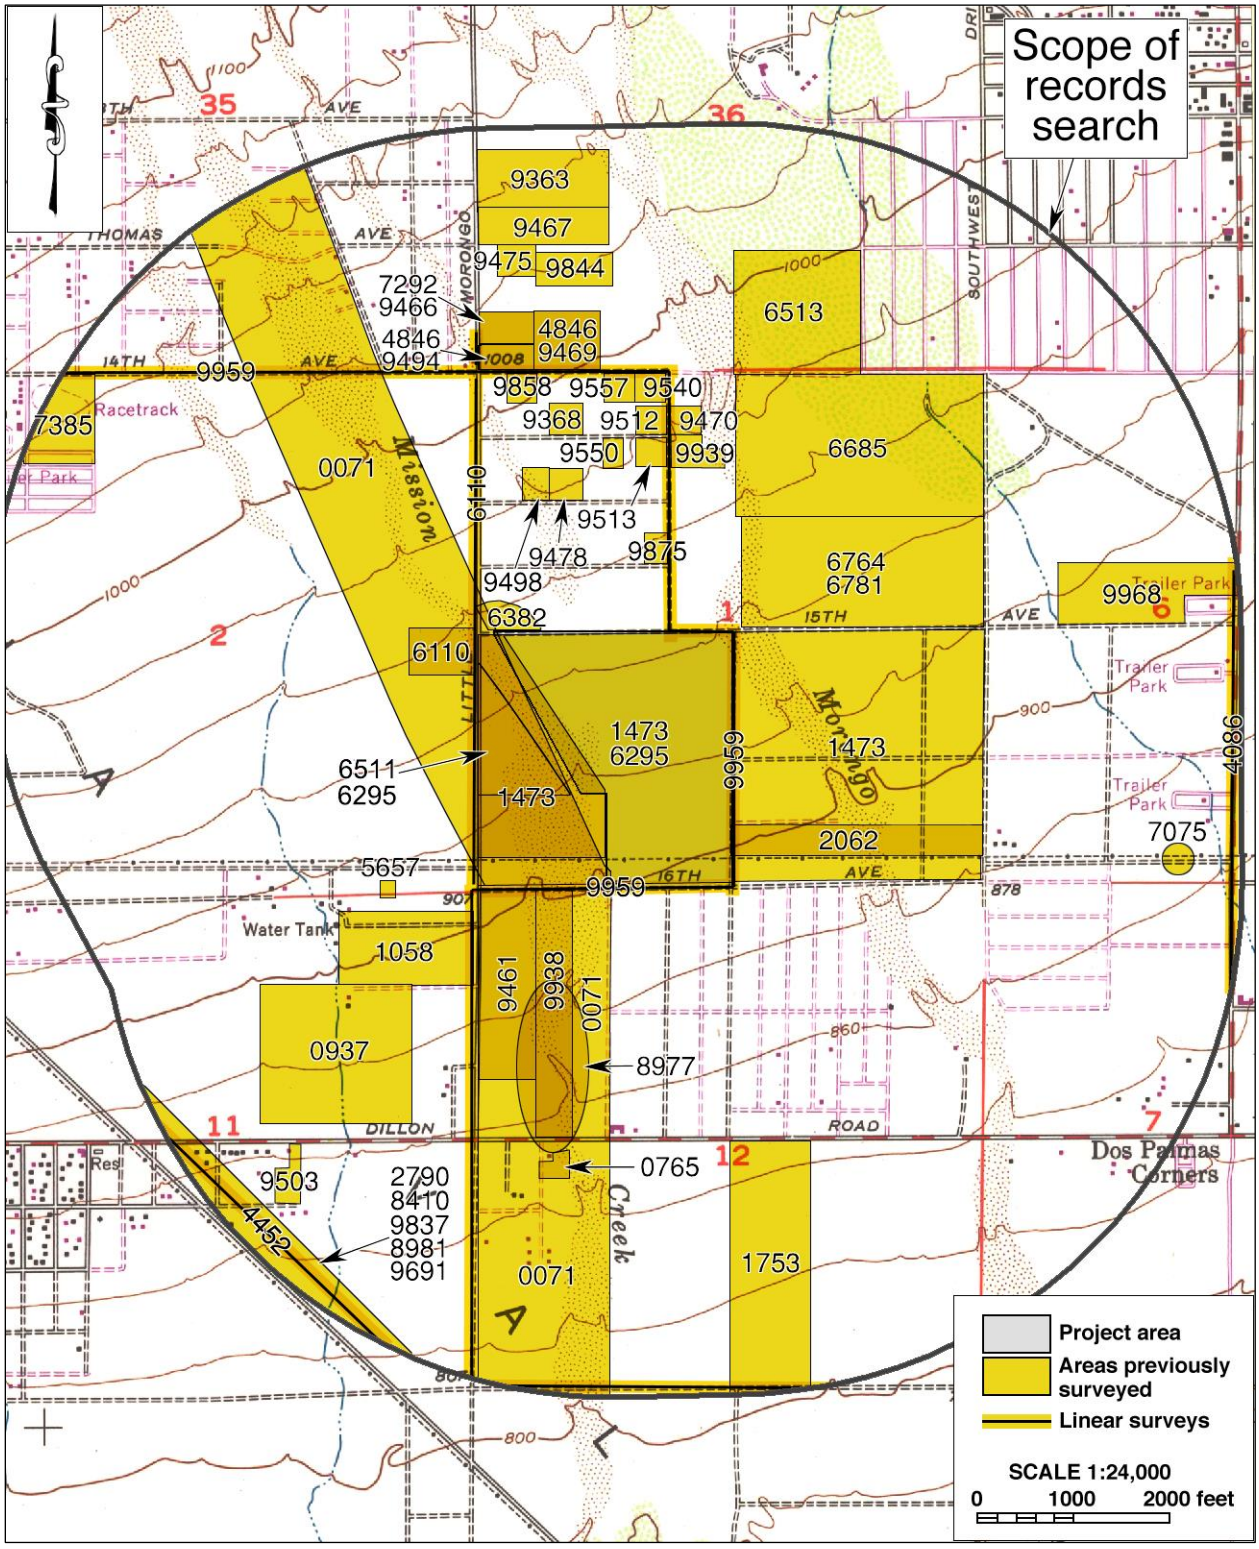

Figure 3. Previous cultural resources studies in the vicinity of the project area, listed by EIC file number. Locations of historical/archaeological sites are not shown as a protective measure.

boundaries in 2017 (#9959 in Fig. 3). No cultural resources have been recorded within or adjacent to the project area.

Outside the project area but within a one-mile radius, EIC records show that as of today more than 50 other cultural resources studies have been completed on various tracts of land and linear features, a dramatic increase from the seven previous studies noted in 2004 (Hogan et al. 2004:6). Seven additional archaeological sites and three isolates—i.e., localities with fewer than three artifacts—have been recorded into the California Historical Resources Inventory since 2004, bringing the total number of known cultural resources within the scope of the records search to 12, as listed below in Table 1.

Table 1. Previously Recorded Cultural Resources within the Scope of the Records Search

Primary #	Trinomial	Description
33-001808	CA-RIV-1808	Pottery scatter with 30+ buffware fragments, probably from the same vessel
33-008410	N/A	Dillon Road, ca. 1930s
33-013553	CA-RIV-7487H	Early 20th century refuse deposit
33-015964	CA-RIV-8283	A single mortar on a boulder located on disturbed alluvium
33-024248	CA-RIV-11907H	Early 20th century refuse deposit
33-026629	CA-RIV-12533H	Historic-period refuse scatter
33-026642	CA-RIV-12546H	Historic-period refuse scatter
33-026643	CA-RIV-12547H	Historic-period refuse scatter
33-026684	CA-RIV-12575H	Historic-period refuse scatter
33-026869	N/A	Isolate: matchstick filler vent-hole can
33-026870	N/A	Isolate: matchstick filler vent-hole can
33-026871	N/A	Isolate: all-steel flat top beverage can

As Table 1 shows, two of the archaeological sites were of prehistoric—i.e., Native American—origin, consisting of a bedrock milling feature and a ceramic scatter. Both of the sites were located nearly a mile away, to the northwest and the southwest of the project location. The other 10 known cultural resources, including seven of the sites and all three isolates, dated to the historic period. One of the sites represents Dillon Road, which was originally built by the Metropolitan Water District of Southern California (MWD) during the construction of the Colorado River Aqueduct in the 1930s. All of the other sites and isolates consisted of refuse deposits, the nearest one being a few hundred feet north of the project location. Since none of these 12 cultural resources was found in the immediate vicinity of the project area, none of them requires further consideration during this study.

Historic Background Review

Historical background research for this study was conducted by CRM TECH principal investigator/ historian Bai "Tom" Tang, M.A. In addition to the sources consulted during the 2004 study, such as historic maps and published literature in local history, aerial photographs that have become available since 2004 were also examined for further information. Taken between 1972 and 2018, the aerial photographs are available at the NETR Online website and through the Google Earth software.

As stated in the 2004 report, the project area remained vacant and undeveloped throughout the historic period (Hogan et al. 2004:6). Besides the various dirt roads along the project boundaries, another dirt road was shown to extend across the southernmost portion of the property in an east-west direction at least by 1972, following the course of a power transmission line that was known to

be present by the 1950s (USGS 1957; NETR Online 1972). To the present time, the power line and the accompanying road have remained the only notable man-made features within the project area (NETR Online 1972-2014; Google Earth 1996-2018).

According to historical sources, the power line across the project area was originally constructed in 1932-1933 by the MWD in preparation for the Colorado River Aqueduct project (Binney 1938; MWD 1939:32-33). Running a total distance of 196 miles, the 66-kv transmission line delivered electric power from a Southern California Edison (SCE) substation in Colton to MWD construction sites along the aqueduct route through a 33-kv distribution network totaling 290 miles (*ibid.*). The main line was built of No. 4/0 copper cable strung on suspension insulators and wood-pole H-frame or wishbone structures (MWD 1939:44).

Field Inspection

On June 7, 2018, CRM TECH archaeologist Daniel Ballester, M.S., conducted a reconnaissance-level field survey of the project area. The survey was completed by walking the perimeter of the entire project area as well as a series of parallel east-west transects at 50- to 100-meter (approximately 165- to 330-foot) intervals. The purpose of the field reconnaissance was to confirm and update the field observations from 2004. Ground visibility at the time of this survey was good to excellent (80%-100%) due to the sparsity of the vegetative cover (Fig. 4).

During the field survey, a power transmission line was observed along the course of the 1930s MWD main line, accompanied by a narrow, nondescript dirt access road that demonstrates no distinctively historical character. Evidently an active component of the SCE's local distribution system, the transmission line in existence today features wooden poles that appear to be of modern

Figure 4. Current condition of the project area. (Photograph taken June 7, 2018; view to the northwest from the southeastern corner of the property)

origin. Instead of H-frame or wishbone structures with suspension insulators, the poles in and near the project area carry unbraced up-swept arms with pin-mounted insulators (Fig. 4).

Since none of its physical features was found to be of historical origin, the existing power line was determined to be a modern replacement of the original MWD line and was thus not recorded as a potential "historical resource." No other remnants of human activities dating to the prehistoric or historic period were encountered throughout the field survey. Scattered modern refuse was observed on the property, especially along the project boundaries, but none of the items is of any historical or archaeological interest.

Native American Consultation

On May 10, 2018, CRM TECH requested a Sacred Lands File records search from the State of California Native American Heritage Commission (NAHC; see Attachment B). In the meantime, CRM TECH notified the nearby Agua Caliente Band of Cahuilla Indians of the upcoming archaeological fieldwork and invited tribal participation (see Attachment B). In a reply dated May 11, the NAHC reports that the Sacred Lands File identifies no Native American cultural resources in the project area but recommends that local Native American groups be contacted for further information. For that purpose, the NAHC provided a list of potential contacts in the region (see Attachment B).

Following the NAHC's recommendations and previously established consultation protocol, on May 18, 2018, CRM TECH sent written requests for comments to representatives of all 12 tribes of Cahuilla and/or Serrano heritage in the surrounding region as well as the Twenty-Nine Palms Band of Mission Indians, whose reservation is located partially in the Coachella Valley (see Attachment B). In all, 11 of the 34 individuals on the NAHC's referral list were contacted, the rest of them being representatives of Kumeyaay, Kitanemuk, and Tataviam tribes in San Diego and Los Angeles Counties. In addition to or in lieu of some of the individuals recommended by the NAHC, CRM TECH contacted the following designated spokespersons for the tribes on cultural resources issues, as recommended by the tribal government staff:

- Judy Stapp, Director of Cultural Affairs, Cabazon Band of Mission Indians;
- Bobby Ray Esparza, Interim Cultural Director, Cahuilla Band of Indians;
- Raymond Huaute, Tribal Historic Preservation Officer, Morongo Band of Mission Indians;
- Jessica Mauck, Cultural Resources Analyst, San Manuel Band of Mission Indians;
- Gabriella Rubalcava, Environmental Director, Santa Rosa Band of Cahuilla Indians.

As of this time, five tribal representatives have responded in writing (see Attachment B). Among them, Jessica Mauck of the San Manuel Band indicated that the project area was located outside the tribe's ancestral territory. Therefore, the San Manuel Band declined to participate in further consultation regarding this project. Raymond Huaute of the Morongo Band identified the project location as a part of the tribe's traditional use area and requested a copy of this report for tribal review.

Judy Stapp of the Cabazon Band, Bobby Ray Esparza of the Cahuilla Band, and Victoria Martin, Tribal Secretary for the Augustine Band of Cahuilla Indians, stated that their tribes had no

information on any Native American cultural resources in the project area. However, Ms. Martin suggested archaeological or Native American monitoring during ground-disturbing activities associated with the project, encouraged further consultation with other tribes in the project vicinity, and requested immediate notification of any Native American cultural resource discoveries during the project, while Mr. Esparza requested to be kept informed of further development of the project.

Conclusion and Recommendations

Based on the research results summarized above, CRM TECH concludes that the original finding of the 2004 study—that the proposed development of the property will not cause a substantial adverse change to any known "historical resources" (Hogan et al. 2004:10)—remains valid and appropriate. Accordingly, CRM TECH reiterates the 2004 recommendations to the City of Desert Hot Springs:

- No further cultural resources investigation will be necessary for the proposed project unless development plans undergo such changes as to include areas not covered by the 2004 study and the current study.
- If buried cultural materials are discovered during any earth-moving operations associated with the project, all work in that area should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds.

Thank you for this opportunity to be of service. If you have any questions or need further information regarding this study, please do not hesitate to contact our office.

Sincerely,

Bai "Tom" Tang, M.A.
Principal, CRM TECH

USGS Desert Hot Springs, Calif., 7.5' Quadrangle
Section 1, T3S R4E, San Bernardino Base Meridian

MANAGEMENT SUMMARY

In September, 2004, at the request of Robert J. Mainiero, P.E., CRM TECH performed a cultural resources study on approximately 115 acres of vacant land in the City of Desert Hot Springs, Riverside County, California. The subject property of the study includes Tentative Parcel Map Nos. 32705 and 32706, which encompass four existing parcels, APNs 665-080-005 to -008. It is located on the east side of Little Morongo Road and between Avenue 15 and Avenue 16, in the southwest quarter of Section 1, T3S R4E, San Bernardino Base Meridian. The study is part of the environmental review process for the proposed subdivision of the property for light industrial use. The City of Desert Hot Springs, as Lead Agency for the project, required the study in compliance with the California Environmental Quality Act (CEQA).

The purpose of the study is to provide the City of Desert Hot Springs with the necessary information and analysis to determine whether the proposed project would cause substantial adverse changes to any historical/ archaeological resources that may exist in or around the project area, as mandated by CEQA. In order to identify and evaluate such resources, CRM TECH conducted a historical/archaeological resources records search, pursued historical background research, and carried out an intensive-level field survey.

Through the various avenues of research, this study did not encounter any "historical resources," as defined by CEQA, within or adjacent to the project area. Therefore, CRM TECH recommends to the City of Desert Hot Springs a finding of *No Impact* regarding cultural resources. No further cultural resources investigation is recommended for the project unless development plans undergo such changes as to include areas not covered by this study. However, if buried cultural materials are encountered during any earth-moving operations associated with the project, all work in that area should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds.

INTRODUCTION

In September, 2004, at the request of Robert J. Mainiero, P.E., CRM TECH performed a cultural resources study on approximately 115 acres of vacant land in the City of Desert Hot Springs, Riverside County, California (Fig. 1). The subject property of the study includes Tentative Parcel Map Nos. 32705 and 32706, which encompass four existing parcels, APNs 665-080-005 to -008. It is located on the east side of Little Morongo Road and between Avenue 15 and Avenue 16, in the southwest quarter of Section 1, T3S R4E, San Bernardino Base Meridian (Fig. 2). The study is part of the environmental review process for the proposed subdivision of the property for light industrial use. The City of Desert Hot Springs, as Lead Agency for the project, required the study in compliance with the California Environmental Quality Act (CEQA; PRC §21000, et seq.).

CRM TECH performed the present study to provide the City of Desert Hot Springs with the necessary information and analysis to determine whether the proposed project would cause substantial adverse changes to any historical/archaeological resources that may exist in or around the project area, as mandated by CEQA. In order to identify and evaluate such resources, CRM TECH conducted a historical/archaeological resources records search, pursued historical background research, and carried out an intensive-level field survey. The following report is a complete account of the methods, results, and final conclusion of the study.

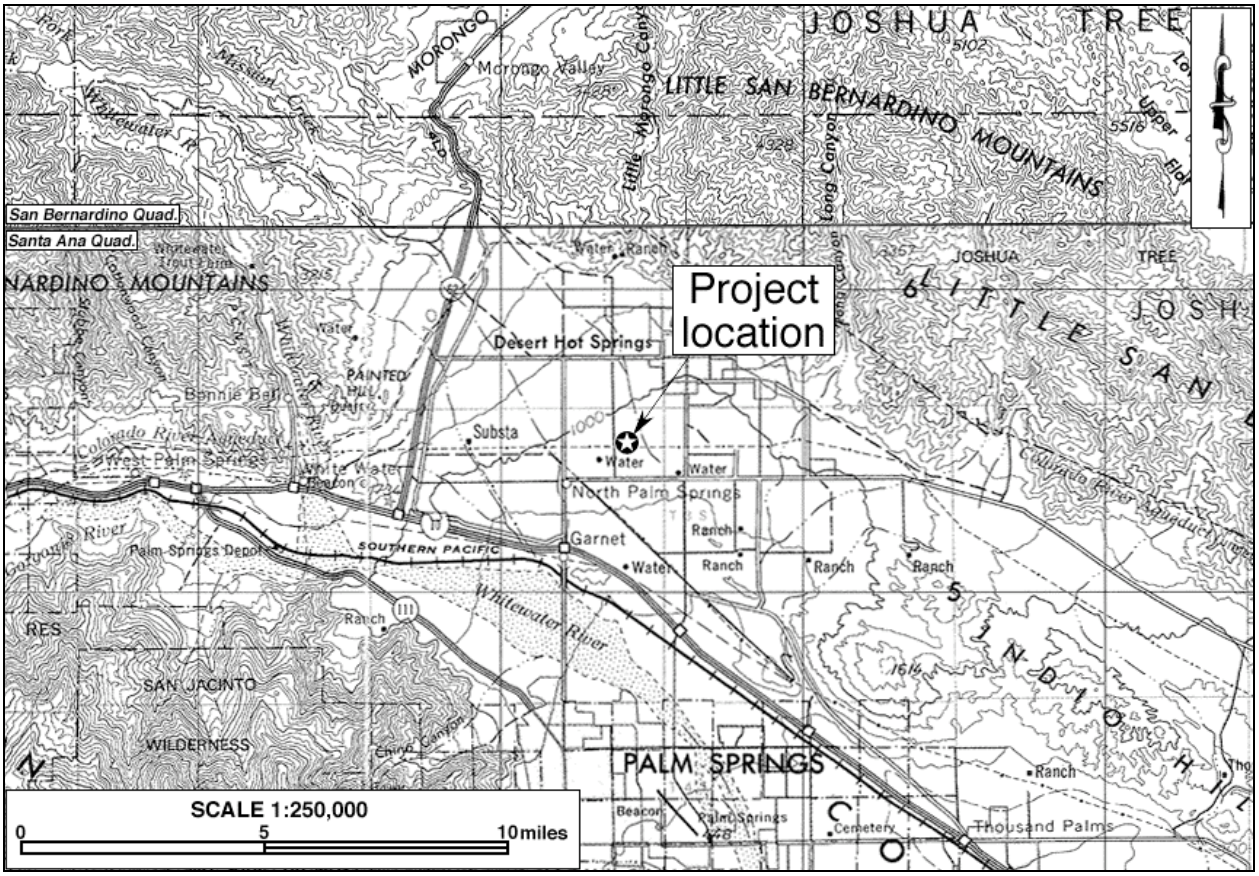

Figure 1. Project vicinity. (Based on USGS San Bernardino and Santa Ana, Calif., 1:250,000 quadrangles [USGS 1969; 1979])

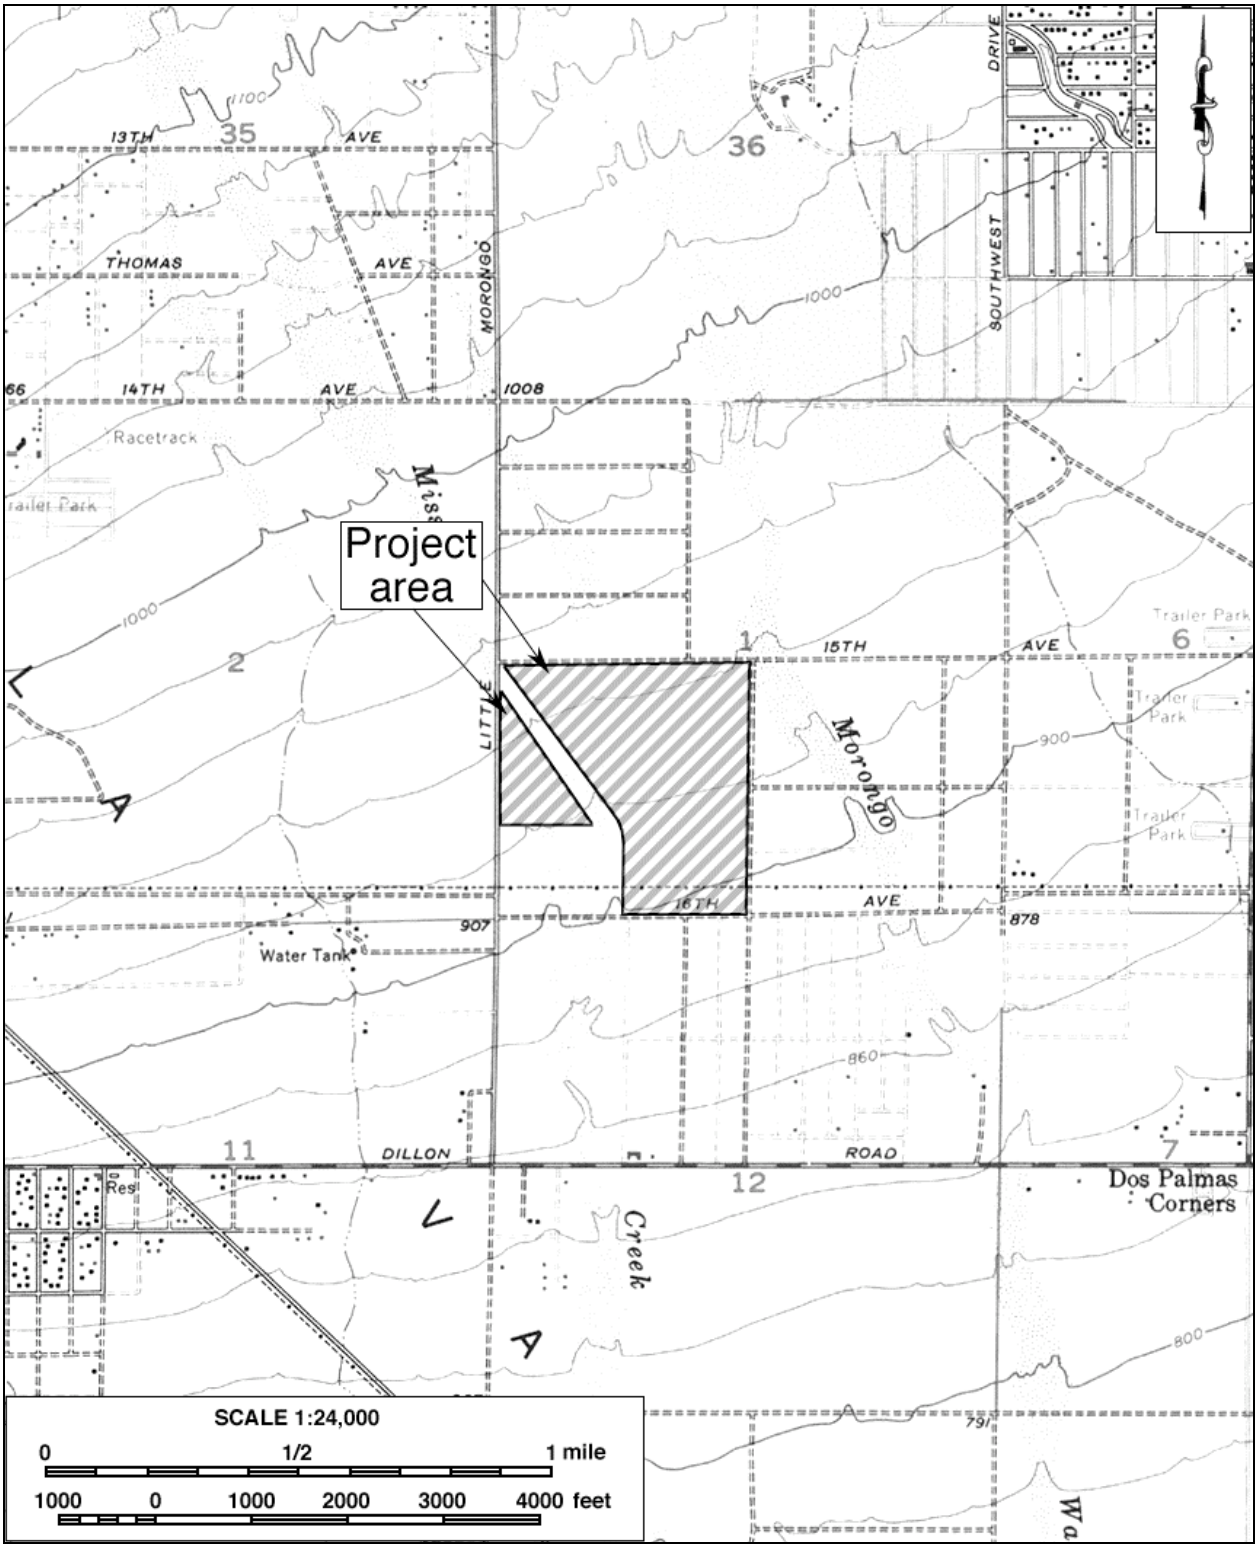

Figure 2. Project area. (Based on USGS Desert Hot Springs, Calif., 1:24,000 quadrangle [USGS 1978])

SETTING

CURRENT NATURAL SETTING

The project area is situated in the Coachella Valley, a northwest-southeast trending desert valley that constitutes the western end of the Colorado Desert. Dictated by this geographic setting, the climate and environment of the project area and its surrounding region are typical of southern California's desert country, marked by extremes in temperature and aridity. Temperatures in the region reach over 120 degrees in summer, and dip to near freezing in winter. Average annual precipitation is less than five inches, and average annual evaporation rate exceeds three feet.

More specifically, the project area is situated on vacant land with the Mission Creek traversing through the property in a northwest-southeast direction separating the two Tentative Parcel Maps. The terrain is relatively level, with elevations increasing slightly from approximately 900 feet above mean sea level on the southern edge to 950 feet at the northwest corner. The project area is bounded on the north and south by Avenue 15 and Avenue 16 and on the east and west by Atlantic Boulevard and Little Morongo Road, respectively, and is surrounded mostly by undeveloped land. The soil on the subject property is composed of light-gray, coarse-grained sand, with a mixture of approximately 25% pea-sized pebbles. The soil is poorly sorted and loosely compacted, and also contains scattered rocks ranging from pebble to cobble size. Vegetation on the property consists of creosote, ephedra, cholla cactus, indigo bush, brittle bush, sand paper plant, and other scattered desert grasses. The project area is littered modern trash and pieces of concrete.

Figure 3. Overview of the current natural setting of the project area. (Photo taken on September 15, 2004; view to the east)

CULTURAL SETTING

Ethnohistoric Context

The Coachella Valley is a historical center of Native American settlement, where U.S. surveyors noted large numbers of Indian villages and *rancherías*, occupied by the Cahuilla people, in the mid-19th century. The Cahuilla, a Takic-speaking people of hunters and gatherers, are generally divided by anthropologists into three groups, according to their geographic setting: the Pass Cahuilla of the San Gorgonio Pass-Palm Springs area, the Mountain Cahuilla of the San Jacinto and Santa Rosa Mountains and the Cahuilla Valley, and the Desert Cahuilla of the eastern Coachella Valley.

The Cahuilla did not have a single name that referred to an all-inclusive tribal affiliation. Instead, membership was in terms of lineages or clans. Each lineage or clan belonged to one of two main divisions of the people, known as moieties. Members of clans in one moiety had to marry into clans from the other moiety. Individual clans had villages, or central places, and territories they called their own, for purposes of hunting game, gathering food, or utilizing other necessary resources. They interacted with other clans through trade, intermarriage, and ceremonies.

Population data prior to European contact are almost impossible to obtain, but estimates range from 3,600 to as high as 10,000 persons. During the 19th century, however, the Cahuilla population was decimated as a result of European diseases, most notably smallpox, for which the Native peoples had no immunity. Today, Native Americans of Pass or Desert Cahuilla heritage are mostly affiliated with one or more of the Indian reservations in and near the Coachella Valley, including Torres Martinez, Augustine, Agua Caliente, Cabazon, and Morongo.

Historic Context

In 1823-1825, José Romero, José Maria Estudillo, and Romualdo Pacheco, leading a series of expeditions in search of a route to Yuma, became the first noted European explorers to travel through the Coachella Valley. However, due to its harsh environment, few non-Indians ventured into the desert valley during the Mexican and early American periods, except those who traveled across it along the established trails. The most important among these trails was the Cocomaricopa Trail, an ancient Indian trading route that was "discovered" in 1862 by William David Bradshaw and became known after that as the Bradshaw Trail. In much of the Coachella Valley, this historic wagon road traversed a similar course to that of present-day Highway 111. During the 1860s-1870s, the Bradshaw Trail served as the main thoroughfare between coastal southern California and the Colorado River, until the completion of the Southern Pacific Railroad in 1876-1877 brought an end to its heyday.

Non-Indian settlement in the Coachella Valley began in the 1870s, with the establishment of railroad stations along the Southern Pacific Railroad, and spread further in the 1880s, after public land was opened for claims under the Homestead Act, the Desert Land Act, and other federal land laws. Farming became the dominant economic activity in the valley, thanks to the development of underground water sources, often in the form of artesian wells. But it was not until the completion of the Coachella Canal in 1948-1949 that farmers

in the arid region obtained an adequate and reliable water supply. The main agricultural staple in the Coachella Valley, the date palm, was first introduced around the turn of the century. By the late 1910s, the date palm industry had firmly established itself, giving the region its celebrated image of "the Arabia of America." Starting in the 1920s, a new industry, featuring equestrian camps, resort hotels, and eventually country clubs, gradually spread throughout the Coachella Valley, and since then transformed it into southern California's leading winter retreat.

The present-day City of Desert Hot Springs is among the communities that were largely created by the Coachella Valley's resort industry. Although sporadic settlement took place in the vicinity as early as 1908, the city owes much of its early development to the abundance of hot mineral water along the San Andreas fault line. J. W. Coffey, who subdivided the Desert Hot Springs townsite in 1933, is also credited with first tapping into the hot mineral water for commercial use by drilling a 300-foot well (Gunther 1984:151). Advertised in the early and mid-20th century primarily for its potential for health spas and convalescent homes, Desert Hot Springs saw sufficient growth by 1944 to warrant the establishment of a post office. After a further growth spurt during the post-WWII boom, Desert Hot Springs incorporated as a city in 1963.

RESEARCH METHODS

RECORDS SEARCH

On September 14, 2004, CRM TECH archaeologist Adrián Sánchez Moreno (see App. 1 for qualifications) conducted the historical/archaeological resources records search at the Eastern Information Center (EIC), University of California, Riverside. During the records search, Moreno examined maps and records on file at the EIC for previously identified cultural resources in or near the project area, and existing cultural resources reports pertaining to the vicinity. Previously identified cultural resources include properties designated as California Historical Landmarks, Points of Historical Interest, or Riverside County Landmarks, as well as those listed in the National Register of Historic Places, the California Register of Historical Resources, or the California Historical Resource Information System.

HISTORICAL RESEARCH

Historical background research for this study was conducted by CRM TECH historian Bai "Tom" Tang (see App. 1 for qualifications) on the basis of published literature in local and regional history and historic maps depicting the project vicinity. Among maps consulted for this study were the U.S. General Land Office's (GLO) land survey plat maps dated 1856 and the U.S. Geological Survey's (USGS) topographic maps dated 1901, 1940-1941, and 1957-1958. These maps are collected at the Science Library of the University of California, Riverside, and the California Desert District of the U.S. Bureau of Land Management, located in Moreno Valley.

FIELD SURVEY

On September 15, 2004, CRM TECH archaeologists Thomas J. Melzer and Michelle Bunn (see App. 1 for qualifications) carried out the intensive-level, on-foot field survey of the project area. During the survey, Melzer and Bunn walked parallel north-south transects

spaced 15 meters (ca. 50 feet) apart. In this way, the ground surface in the entire project area was systematically and carefully examined for any evidence of human activities dating to the prehistoric or historic periods (i.e., 50 years ago or older). Ground visibility throughout the project area was excellent (90-100%). The results of the survey are discussed below.

RESULTS AND FINDINGS

RECORDS SEARCH RESULTS

According to records on file at the Eastern Information Center, the project area was apparently covered by two reconnaissance level surveys completed in 1972 and in 1982, respectively (Fig. 4), but no cultural resources were recorded on or adjacent to the property during those surveys. Outside the project boundaries but within a one-mile radius, EIC records show at least seven other previous cultural resources studies covering various tracts of land and linear features. As a result of these surveys, two archaeological sites, one prehistoric—i.e., Native American—and one from the historic period, were identified and recorded within the scope of the records search. The historic-period site, located just southwest of the project area, consisted of a residence and barn originally known as Walker Ranch, which dates to 1915. The prehistoric site, located further southwest consisted of a ceramic scatter of presumably the Salton Buff type. Neither of these previously recorded sites was located in the immediate vicinity of the project area, and thus neither of them requires further consideration during this study. Because the project area was surveyed more than 10 years ago at a reconnaissance level, it was necessary to re-survey the area for cultural resources again at an intensive level.

HISTORICAL RESEARCH RESULTS

Historic maps consulted for this study indicate that no man-made features of any kind were noted within or adjacent to the project area throughout the 19th century (Figs. 5, 6), reflecting the "late booming" of the Desert Hot Springs area. In 1897-1898, the only permanent evidences of human activities in the vicinity were a few roads, none of which traversed within a mile of the project location, and the Southern Pacific Railroad, some three miles to the south (Fig. 6). By 1940-1941, with the creation of the town of Desert Hot Springs nearby a few years before, a few scattered buildings had appeared in the vicinity, and the precursor to Little Morongo Road had emerged along the western boundary of the project area (Fig. 7). Between 1940 and the 1950s, Desert Hot Springs and the Coachella Valley experienced a significant growth spurt, but the land within the project boundaries was evidently vacant and undeveloped as late as 1958 (Figs. 8), and has remained so to the present time.

FIELD SURVEY RESULTS

The intensive-level field survey produced completely negative results for potential cultural resources. The entire project area was closely inspected for any evidence of human activities dating to the prehistoric or historic periods, but none was found. No buildings, structures, objects, sites, features, or artifacts more than 50 years of age were encountered during the field survey.

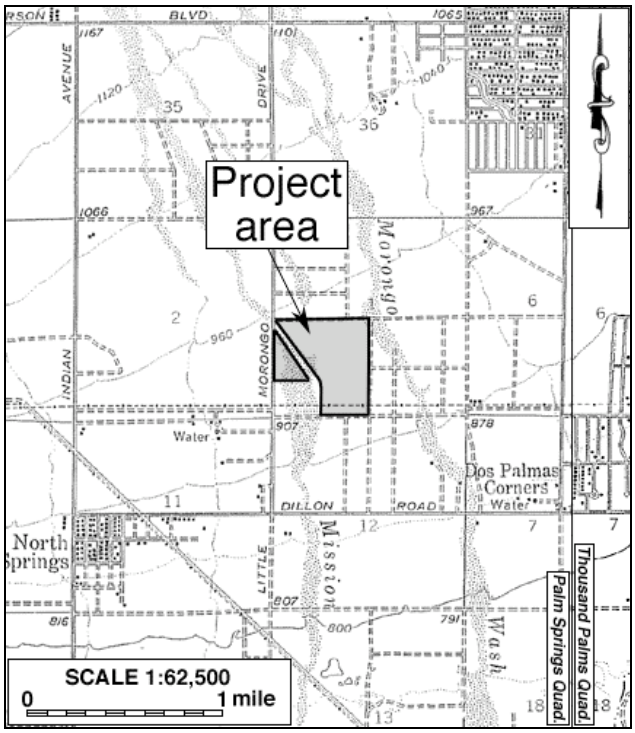

Figure 8. The project area and vicinity in 1951-1958. (Source: USGS 1957; 1958)

DISCUSSION

The purpose of this study is to identify any cultural resources within or adjacent to the project area, and to assist the City of Desert Hot Springs in determining whether such resources meet the official definitions of "historical resources," as provided in the California Public Resources Code, in particular CEQA.

According to PRC §5020.1(j), "'historical resource' includes, but is not limited to, any object, building, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California." More specifically, CEQA guidelines state that the term "historical resources" applies to any such resources listed in or determined to be eligible for listing in the California Register of Historical Resources, included in a local register of historical resources, or determined to be historically significant by the Lead Agency (Title 14 CCR §15064.5(a)(1)-(3)).

Regarding the proper criteria for the evaluation of historical significance, CEQA guidelines mandate that "a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources" (Title 14 CCR §15064.5(a)(3)). A resource may be listed in the California Register if it meets any of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
(2) Is associated with the lives of persons important in our past.
(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
(4) Has yielded, or may be likely to yield, information important in prehistory or history. (PRC §5024.1(c))

As discussed above, the records search, the historical research, and the field survey have all produced negative results, and no buildings, structures, objects, sites, features, or artifacts more than 50 years of age were encountered in the project area. Based on these findings, and in light of the criteria listed above, this study concludes that *no historical resources exist within or adjacent to the project area*.

RECOMMENDATIONS

CEQA establishes that "a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment" (PRC §21084.1). "Substantial adverse change," according to PRC §5020.1(q), "means demolition, destruction, relocation, or alteration such that the significance of a historical resource would be impaired."

Since no historical resources were encountered during the course of this study, CRM TECH presents the following recommendations to the City of Desert Hot Springs:

- No historical resources exist within or adjacent to the project area, and thus the project as currently proposed will cause no substantial adverse change to any known historical resources.
- No further cultural resources investigation is necessary for the proposed project unless development plans undergo such changes as to include areas not covered by this study.
- If buried cultural materials are discovered during any earth-moving operations associated with the project, all work in that area should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds.

CONCLUSION

The foregoing report has provided background information on the project area, outlined the methods used in the current study, and presented the results of the various avenues of research. Throughout the course of the study, no "historical resources," as defined by CEQA, were encountered within or adjacent to the project area. Therefore, the City of Desert Hot Springs may reach a finding of *No Impact* regarding cultural resources, with the condition that any buried cultural materials unearthed during earth-moving activities be examined and evaluated by a qualified archaeologist prior to further disturbances.

PERSONNEL QUALIFICATIONS

PRINCIPAL INVESTIGATOR/HISTORIAN
Bai "Tom" Tang, M.A.

Education

1988-1993	Graduate Program in Public History/Historic Preservation, UC Riverside.
1987	M.A., American History, Yale University, New Haven, Connecticut.
1982	B.A., History, Northwestern University, Xi'an, China.
2000	"Introduction to Section 106 Review," presented by the Advisory Council on Historic Preservation and the University of Nevada, Reno.
1994	"Assessing the Significance of Historic Archaeological Sites," presented by the Historic Preservation Program, University of Nevada, Reno.

Professional Experience

2002-	Principal Investigator, CRM TECH, Riverside, California.
1993-2002	Project Historian/Architectural Historian, CRM TECH, Riverside, California.
1993-1997	Project Historian, Greenwood and Associates, Pacific Palisades, California.
1991-1993	Project Historian, Archaeological Research Unit, UC Riverside.
1990	Intern Researcher, California State Office of Historic Preservation, Sacramento.
1990-1992	Teaching Assistant, History of Modern World, UC Riverside.
1988-1993	Research Assistant, American Social History, UC Riverside.
1985-1988	Research Assistant, Modern Chinese History, Yale University.
1985-1986	Teaching Assistant, Modern Chinese History, Yale University.
1982-1985	Lecturer, History, Xi'an Foreign Languages Institute, Xi'an, China.

Honors and Awards

1988-1990	University of California Graduate Fellowship, UC Riverside.
1985-1987	Yale University Fellowship, Yale University Graduate School.
1980, 1981	President's Honor List, Northwestern University, Xi'an, China.

Cultural Resources Management Reports

Preliminary Analyses and Recommendations Regarding California's Cultural Resources Inventory System (With Special Reference to Condition 14 of NPS 1990 Program Review Report). California State Office of Historic Preservation working paper, Sacramento, September 1990.

Numerous cultural resources management reports with the Archaeological Research Unit, Greenwood and Associates, and CRM TECH, since October 1991.

Membership

California Preservation Foundation.

PRINCIPAL INVESTIGATOR/ARCHAEOLOGIST
Michael Hogan, Ph.D., RPA*

Education

1991	Ph.D., Anthropology, University of California, Riverside.
1981	B.S., Anthropology, University of California, Riverside; with honors.
1980-1981	Education Abroad Program, Lima, Peru.
2002	Section 106—National Historic Preservation Act: Federal Law at the Local Level. UCLA Extension Course #888.
2002	"Recognizing Historic Artifacts," workshop presented by Richard Norwood, Historical Archaeologist.
2002	"Wending Your Way through the Regulatory Maze," symposium presented by the Association of Environmental Professionals.
1992	"Southern California Ceramics Workshop," presented by Jerry Schaefer.
1992	"Historic Artifact Workshop," presented by Anne Duffield-Stoll.

Professional Experience

2002-	Principal Investigator, CRM TECH, Riverside, California.
1999-2002	Project Archaeologist/Field Director, CRM TECH, Riverside.
1996-1998	Project Director and Ethnographer, Statistical Research, Inc., Redlands.
1992-1998	Assistant Research Anthropologist, University of California, Riverside
1992-1995	Project Director, Archaeological Research Unit, U. C. Riverside.
1993-1994	Adjunct Professor, Riverside Community College, Mt. San Jacinto College, UC Riverside, Chapman University, and San Bernardino Valley College.
1991-1992	Crew Chief, Archaeological Research Unit, U. C. Riverside.
1984-1998	Archaeological Technician, Field Director, and Project Director for various southern California cultural resources management firms.

Research Interests

Cultural Resource Management, Southern Californian Archaeology, Settlement and Exchange Patterns, Specialization and Stratification, Culture Change, Native American Culture, Cultural Diversity.

Cultural Resources Management Reports

Author and co-author of, contributor to, and principal investigator for numerous cultural resources management study reports since 1986.

PROJECT ARCHAEOLOGIST
Adrián Sánchez Moreno, B.A.

Education

1999 B.A., Anthropology (with emphasis in Archaeology), University of San Diego.
2003 "Native American Ceramics Workshop," presented by the San Diego County Archaeological Society, Santa Catarina de los Pai Pai, Baja California, Mexico.
2003 "Native American Basketry Workshop," presented by the San Diego County Archaeological Society, San José de la Zorra, Baja California, Mexico.
2002 "Historic Archaeology Workshop," presented by Richard Norwood, Base Archaeologist, Edwards Air Force Base; presented at CRM TECH, Riverside.

Professional Experience

2003 Field Crew, survey and excavation on Isla de Cedros, Baja California, Mexico.
2000- Project Archaeologist, CRM TECH, Riverside.
- Surveys, excavations, data recovery, monitoring, faunal analysis, mapping, and records searches.

1999 Field Crew, excavation on Marine Corps Air Station, Camp Pendleton. K.E.A. Environmental, San Diego.
1999 Field Crew, excavation at Freedmen's Cemetery site in Alexandria, Virginia. URS Greiner Woodward & Clyde.
1999 Field Crew, survey and excavation in Guerrero Negro, Mexico.
- Including identification of osteological specimens.

1999 Field Crew, excavation at Lake Chapala, Baja California, Mexico.
- Excavation and cataloguing of lithic artifacts from the oldest known site in Baja California.

1998 Field Crew, petroglyph survey in San Pedro Atacama, Chile.
- Focusing on identification of possible habitation and petroglyph sites.

PROJECT ARCHAEOLOGIST
Thomas J. Melzer, B.A.

Education

2004 B.A., Anthropology/Cultural Resources Management, California State Polytechnic University, Pomona.

Experience

2004- Project Archaeologist, CRM TECH, Riverside.
2002 Archaeological Field Technician, Death Valley National Park Archaeological Site Resources Condition Assessment Project, California State Polytechnic University, Pomona, Foundation; directed by Dr. Mark W. Allen.
- Survey and assessment of previously recorded sites; co-author of final report.

2001-2002 Archaeological Field Technician, Red Mountain Archaeological Project, California State Polytechnic University, Pomona; directed by Dr. Mark W. Allen.
- Survey, test excavation, laboratory analysis of artifacts.

PROJECT ARCHAEOLOGIST
Michelle O. Bunn, B.A.

Education

2003 B.A., Anthropology, California State University, San Bernardino.
1996 A.S., Botany, College of the Desert.

2004 "California State Paleontology Certification Program," Anza Borrego Desert State Park.

Professional Experience

2004- Project Archaeologist/Paleontologist, CRM TECH, Riverside.
- Preparing archaeological/paleontological reports;
- Conducting archaeological/paleontological field surveys;
- Participating in various archaeological/paleontological testing, mitigation, and monitoring programs.

2003- Volunteer Paleontologist, Anza Borrego Desert State Park.
- Conducting paleontological field surveys;
- Participating in paleontological recovery programs;
- Conducting laboratory identification and preparation of fossil specimens;
- Curating fossil collections.

2003-2004 Education Program Manager (Natural Science), Palm Springs Desert Museum.
- Supervise and develop educational components for natural science exhibitions;
- Develop lesson plans and exhibition-related teachers' packets;
- Organize museum natural science bus trips and extended trips.

1998- Naturalist, Covered Wagon Tours.
- Provide educational tours with emphasis on the natural and cultural history of the Coachella Valley.

1998- Independent Contractor.
- Conduct studies on the ethnobotany and natural history of the Coachella Valley.

1996-2003 Education Specialist (Natural Science), Palm Springs Desert Museum.
- Instruction in classes for students K-7 grades;
- Design and write exhibition-related student periodical, exhibit text, and newspaper articles;
- Conduct natural history bus tours, lectures, workshops, and docent training;
- Supervise plant transect surveys as well as animal care and collection.

Memberships

Coachella Valley Archaeological Society (current president).
ABDSP Paleontology Society.
Natural and Cultural History Outreach.

Subject: Update to cultural study and participation in fieldwork for TPM No. 32706; Assessor's Parcel Nos. 665-080-005 and -007 (CRM TECH # 3345)

Hello,

I'm emailing to inform you that CRM TECH will be conducting an update to a previously completed historical/archaeological resources study (#1433) for the above-referenced project (CRM TECH # 3345). I'm contacting you to see if the tribe would like to participate in the field survey for the project and we will contact the tribe again when we have a specific time and date for the fieldwork. We would appreciate any information regarding the project area. We will be sending an NA scoping letter with additional information very soon. I'm attaching the proposed project area map and other information.

Thank you for your time and input on this project.

RE: Proposed TPM No. 32706, Assessor's Parcel Nos. 665-080-005 and -007 (CRM TECH No. 3345) Project, City of Desert Hot Springs; Desert Hot Springs USGS Quadrangle, Riverside County, California

Dear Ms. Gallardo:

A record search of the Native American Heritage Commission (NAHC) *Sacred Lands File* was completed for the area of potential project effect (APE) referenced above with negative results. Please note that the absence of specific site information in the *Sacred Lands File* does not indicate the absence of Native American cultural resources in any APE.

Attached is a list of tribes culturally affiliated to the project area. I suggest you contact all of the listed Tribes. If they cannot supply information, they might recommend others with specific knowledge. The list should provide a starting place to locate areas of potential adverse impact within the APE. By contacting all those on the list, your organization will be better able to respond to claims of failure to consult. If a response has not been received within two weeks of notification, the NAHC requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact via email: gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton

RE: Proposed Tract Parcel Map No. 32706 Project
Assessor's Parcel Nos. 665-080-005 and -007
108.25 Acres in the City of Desert Hot Springs
Riverside County, California
CRM TECH #3345

Dear Ms. Garcia-Plotkin:

I am writing to bring your attention to an ongoing CEQA-compliance study for the proposed project referenced above. The project entails a development for light industrial use on approximately 108.25 acres of land that is located west of Atlantic Avenue and between 15th and 16th Avenues, with a wash on the western boundary, in the City of Desert Hot Springs (APNs 665-080-005 and -007). The project area was originally surveyed by CRM TECH in 2004 and no cultural resources were identified at that time. The accompanying map, based on the USGS Desert Hot Springs, Calif., 7.5' quadrangle, depicts the location of the project area in Section 1, T3S R4E, SBBM.

In a letter dated May 11, 2018, the Native American Heritage Commission reports that the sacred lands record search identified no Native American cultural resources within the project area, but recommends that local Native American groups be contacted for further information (see attached). Therefore, as part of the cultural resources study for this project, I am writing to request your input on potential Native American cultural resources in or near the project area.

Please respond at your earliest convenience if you have any specific knowledge of sacred/religious sites or other sites of Native American traditional cultural value in or near the project area, or any other information to consider during the cultural resources investigations. Any information or concerns may be forwarded to CRM TECH by telephone, e-mail, facsimile, or standard mail. Requests for documentation or information we cannot provide will be forwarded to our client and/or the lead agency, namely the City of Desert Hot Springs.

We would also like to clarify that, as the cultural resources consultant for the project, CRM TECH is not involved in the AB 52-compliance process or in government-to-government consultations. The purpose of this letter is to seek any information that you may have to help us determine if there are cultural resources in or near the project area that we should be aware of and to help us assess the sensitivity of the project area. Thank you for your time and effort in addressing this important matter.

Respectfully,

Nina Gallardo
Project Archaeologist/Native American liaison
CRM TECH

Hi Nina,

Thank you for contacting the San Manuel Band of Mission Indians (SMBMI) regarding the above referenced project. SMBMI appreciates the opportunity to review the project documentation, which was received by our Cultural Resources Management Department on 18 May 2018. The proposed project is located just outside of Serrano ancestral territory and, as such, SMBMI will not request consulting party status or elect to participate in the scoping, development, and/or review of documents created pursuant to these legal and regulatory mandates.

Regards,

Jessica Mauck

Dear Ms. Gallardo,

The Cahuilla Band of Indians received your letter on May 18, 2018 regarding the Proposed Tract Parcel Map No. 32706 Project (APN 665-080-005) and -007 in the City of Desert Hot Springs, Riverside County, CA. The Cahuilla band does not have knowledge of any cultural resources/sites within or near the project area. Although the project is outside the Cahuilla reservation boundary, it is within the Cahuilla traditional land use area. We respectfully request to be notified of all updates and/or changes with the project moving forward and appreciate your help in preserving Tribal Cultural Resources in your project.

Respectfully,

BobbyRay Esparza

108.25 Acres in the City of Desert Hot Springs, Riverside County, California
CRM TECH #3345

Dear Ms. Gallardo -

Thank you for the opportunity to offer input concerning the development of the above-identified project. We appreciate your sensitivity to the cultural resources that may be impacted by your project, and the importance of these cultural resources to the Native American peoples that have occupied the land surrounding the area of your project for thousands of years. Unfortunately, increased development and lack of sensitivity to cultural resources has resulted in many significant cultural resources being destroyed or substantially altered and impacted. Your invitation to consult on this project is greatly appreciated.

At this time we are unaware of specific cultural resources that may be affected by the proposed project. We encourage you to contact other Native American Tribes and individuals within the immediate vicinity of the project site that may have specific information concerning cultural resources that may be located in the area. We also encourage you to contract with a monitor who is qualified in Native American cultural resources identification and who is able to be present on-site full-time during the pre-construction and construction phase of the project. Please notify us immediately should you discover any cultural resources during the development of this project.

Very truly yours,

Victoria Martin
Tribal Secretary

CRM TECH Contract #3345

Dear Ms. Gallardo:

Thank you for contacting the Cabazon Band of Mission Indians concerning cultural resource information relative to the above referenced project.

The project is located outside of the Tribe's current reservation boundaries. The Tribe has no specific archival information on the site indicating that it may be a sacred/religious site or other site of Native American traditional cultural value within the project area.

We look forward to continued collaboration in the preservation of cultural resources or areas of traditional cultural importance.

Best regards,

Judy Stapp
Director of Cultural Affairs

Re:
CRM TECH CONTRACT #3345 – Desert Hot Springs No. 32706

Dear,
Nina Gallardo
Project Archaeologist/Native American Liaison
CRM TECH

Thank you for contacting the Morongo Band of Mission Indians (MBMI) Cultural Heritage Department regarding the above referenced project(s). After conducting a preliminary review of the project, the tribe would like to respectfully issue the following comments and/or requests:

☐ The project is located outside of the Tribe's aboriginal territory and is not within an area considered to be a traditional use area or one in which the Tribe has cultural ties. We recommend contacting the appropriate tribe(s) who may have cultural affiliations to the project area. We have no further comments at this time.

☒ The project is located within the Tribe's aboriginal territory or in an area considered to be a traditional use area or one in which the Tribe has cultural ties. In order to further evaluate the project for potential impacts to tribal cultural resources, we would like to formally request the following:

- ☒ A thorough records search be conducted by contacting one of the California Historical Resources Information System (CHRIS) Archaeological Information Centers and a copy of the search results be provided to the tribe.
- ☒ Tribal monitor participation during the initial pedestrian field survey of the Phase I Study of the project and a copy of the results of that study. In the event the pedestrian survey has already been conducted, MBMI requests a copy of the Phase I study be provided to the tribe as soon as it can be made available.
- ☐ MBMI Tribal Cultural Resource Monitor(s) be present during all required ground disturbing activities pertaining to the project.

☐ The project is located with the current boundaries of the Morongo Indian Reservation. Please contact the Morongo Cultural Heritage Department for further details.

Please be aware that this letter is merely intended to notify your office that the tribe has received your letter requesting tribal consultation for the above mentioned project and is requesting to engage in consultation. Specific details regarding the tribe's involvement in the project must be discussed on a project by project basis during the tribal consultation process. This letter does not constitute "meaningful" tribal consultation nor does it conclude the consultation process. Under federal and state law, "meaningful" consultation is understood to be an ongoing government-to-government process and may involve requests for additional information, phone conferences and/or face-to-face meetings. If you have any further questions or concerns regarding this letter, please contact the Morongo Cultural Heritage office at (951) 755-5139.

Sincerely,

Raymond Huaute
Tribal Historic Preservation Officer
Morongo Band of Mission Indians

Subject: Geotechnical Update

Ref: Geotechnical Investigation report prepared by Sladden Engineering dated September 2, 2004; Project No. 544-4433, Report No. 04-09-614
Geotechnical Update prepared by Sladden Engineering dated May 9, 2018; Project No. 544-4433, Report No. 18-05-226

In accordance with your request, we have reviewed the above referenced geotechnical report prepared for the project site as it relates to the design and construction of the proposed industrial development. The project site identified as Tentative Tract No. 32706 includes APN's 665-080-005 & 007 and APN 665-050-028 located in the Desert Hot Springs area of Riverside County, California. It is our understanding that the proposed industrial buildings will be of relatively lightweight wood-frame, steel frame, reinforced masonry or reinforced concrete tilt-up construction and will be supported upon conventional shallow spread footings and a concrete slab on grade.

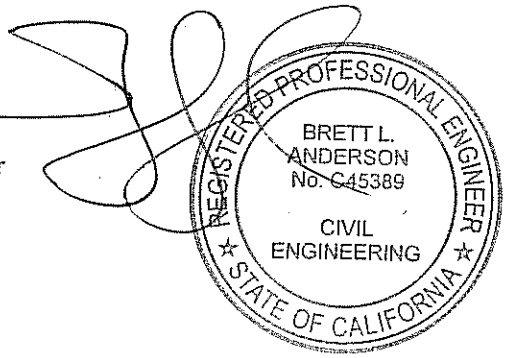
The referenced Geotechnical Investigation report includes recommendations pertaining to the design of industrial building foundations and for remedial grading. Based upon our review of the referenced report and our understanding of the proposed construction, it is our opinion that the structural values and remedial grading recommendations provided in the referenced Geotechnical Investigation report remain applicable for use in the design and construction of the proposed industrial complex.

In order to provide uniform foundation support, we recommend over-excavation and re-compaction throughout the proposed building areas. The building areas should be over-excavated to a depth of approximately 2 feet below existing grade or 2 feet below the bottom of the footings, whichever is deeper. The exposed soil should than be scarified to a depth of 1 foot, moisture conditioned and recompacted to at least 90 percent relative compaction. The excavated material may then be replaced as engineered fill material. Fill material should be placed in thin lifts at near optimum moisture content and compacted to at least 90 percent of maximum density. Over-excavation should be observed by a representative of Sladden Engineering and compaction should be verified by testing.

In our opinion, the structural values provided in the referenced Geotechnical Investigation report remain applicable for use in foundation design. Footings should extend at least 12 inches beneath lowest adjacent grade. Isolated square or rectangular footings at least 2 feet square may be designed using an allowable bearing value of 2000 pounds per square foot. Continuous footings at least 12 inches wide may be designed using an allowable bearing value of 1800 pounds per square foot. Allowable increases of 200 psf for each additional 1 foot of width and 250 psf for each additional 6 inches of depth may be utilized if desired. The maximum allowable bearing pressure should be 3000 psf. The allowable bearing pressures are for dead and frequently applied live loads and may be increased by 1/3 to resist wind, seismic or other transient loading.

Resistance to lateral loads can be provided by a combination of friction acting at the base of the slabs or foundations and passive earth pressure along the sides of the foundations. A coefficient of friction of 0.45 between soil and concrete may be used with dead load forces only. A passive earth pressure of 300 pounds per square foot, per foot of depth, may be used for the sides of footings that are placed against properly compacted native soils.

The bearing soil is non-expansive and falls within the "very low" expansion category in accordance with California Building Code (CBC) classification criteria.



The seismic design category for a structure may be determined in accordance with Section 1613 of the 2016 CBC or ASCE7. According to the 2016 CBC, Site Class D may be used to estimate design seismic loading for the proposed structures. The 2016 CBC Seismic Design Parameters are summarized below.

Risk Category (Table 1.5-1): II
Site Class (Table 1613.3.2): D
S_S (Figure 1613.3.1): 2.784g
S_1 (Figure 1613.3.1): 1.030g
F_a (Table 1613.3.3(1)): 1.0
F_v (Table 1613.5.3(2)): 1.5
S_{MS} (Equation 16-37 {F_a X S_S}): 2.784g
S_{M1} (Equation 16-38 {F_v X S_1}): 1.545g
S_{DS} (Equation 16-39 {2/3 X S_{MS}}): 1.856g
S_{D1} (Equation 16-40 {2/3 X S_{M1}}): 1.030g
Seismic Design Category: E

Although the subject property is located within a County of Riverside designated liquefaction hazard zone, historic groundwater maps for the site vicinity indicate historic high groundwater levels of approximately 80 to 100 feet below the existing ground surface in the vicinity of the site. Based upon the depth to groundwater in the site vicinity, it is our opinion that the potential for liquefaction impacting the subject site is "negligible".

If you have questions regarding this letter or the referenced report, please contact the undersigned.

Respectfully submitted,
SLADDEN ENGINEERING

Desert Hot Springs, California

Subject: Geotechnical Update

Ref: Geotechnical Investigation report prepared by Sladden Engineering dated September 2, 2004; Project No. 544-4433, Report No. 04-09-614

In accordance with your request, we have reviewed the above referenced geotechnical report prepared for the project site as it relates to the design and construction of the proposed industrial development. The project site identified as Tentative Tract #32706 includes APN's 665-080-005, 007 and APN 665-050-028 is located in the Desert Hot Springs area of Riverside County, California. It is our understanding that the proposed industrial buildings will be of relatively lightweight wood-frame, steel frame, reinforced masonry or reinforced concrete tilt-up construction and will be supported upon conventional shallow spread footings and a concrete slab on grade.

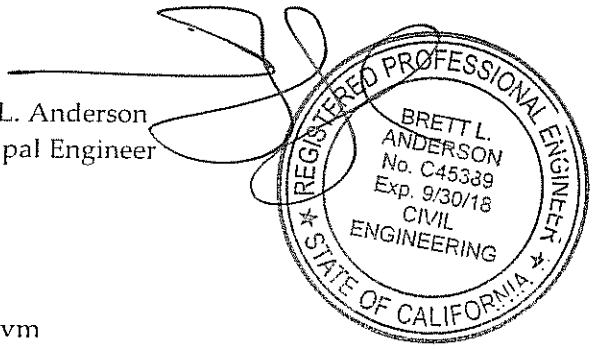
The referenced report includes recommendations pertaining to the design of the industrial foundations and for remedial grading. Based upon our review of the referenced report and our understanding of the proposed construction, it is our opinion that the structural values provided in the referenced report should be applicable for the design and construction of the proposed industrial foundations.

In order to provide uniform foundation support, we recommend over-excavation and re-compaction throughout the proposed building areas. The building areas should be over-excavated to a depth of approximately 2 feet below existing grade or 2 feet below the bottom of the footings, whichever is deeper. The exposed soil should than be scarified to a depth of 1 foot, moisture conditioned and recompacted to at least 90 percent relative compaction. The excavated material may then be replaced as engineered fill material. Fill material should be placed in thin lifts at near optimum moisture content and compacted to at least 90 percent of maximum density. Over-excavation should be observed by a representative of Sladden Engineering and compaction should be verified by testing.

In our opinion, the structural values provided in the referenced geotechnical report remain applicable for use in foundation design. Footings should extend at least 12 inches beneath lowest adjacent grade. Isolated square or rectangular footings at least 2 feet square may be designed using an allowable bearing value of 2000 pounds per square foot. Continuous footings at least 12 inches wide may be designed using an allowable bearing value of 1800 pounds per square foot. Allowable increases of 200 psf for each additional 1 foot of width and 250 psf for each additional 6 inches of depth may be utilized if desired. The maximum allowable bearing pressure should be 3000 psf. The allowable bearing pressures are for dead and frequently applied live loads and may be increased by 1/3 to resist wind, seismic or other transient loading.

Resistance to lateral loads can be provided by a combination of friction acting at the base of the slabs or foundations and passive earth pressure along the sides of the foundations. A coefficient of friction of 0.45 between soil and concrete may be used with dead load forces only. A passive earth pressure of 300 pounds per square foot, per foot of depth, may be used for the sides of footings that are placed against properly compacted native soils.

The bearing soil is non-expansive and falls within the "very low" expansion category in accordance with California Building Code (CBC) classification criteria.



The seismic design category for a structure may be determined in accordance with Section 1613 of the 2016 CBC or ASCE7. According to the 2016 CBC, Site Class D may be used to estimate design seismic loading for the proposed structures. The 2016 CBC Seismic Design Parameters are summarized below.

Risk Category (Table 1.5-1): I/II/III
Site Class (Table 1613.3.2): D
S_S (Figure 1613.3.1): 2.747g
S_1 (Figure 1613.3.1): 1.015g
F_a (Table 1613.3.3(1)): 1.0
F_v (Table 1613.5.3(2)): 1.5
S_{MS} (Equation 16-37 {F_a X S_S}): 2.747g
S_{M1} (Equation 16-38 {F_v X S_1}): 1.522g
S_{DS} (Equation 16-39 {2/3 X S_{MS}}): 1.832g
S_{D1} (Equation 16-40 {2/3 X S_{M1}}): 1.015g
Seismic Design Category: E

Although the subject property is located within a County of Riverside designated liquefaction hazard zone, historic groundwater maps for the site vicinity indicate historic high groundwater levels of approximately 80 to 100 feet below the existing ground surface in the vicinity of the site. Based upon the depth to groundwater in the site vicinity, it is our opinion that the potential for liquefaction impacting the subject site is "negligible".

Subject: Geotechnical Investigation

Presented herewith is the report of our Geotechnical Investigation conducted at the site of the proposed approximately 115 acre industrial development to be located on the southeast corner of Little Morongo Road & 15th Avenue in the City of Desert Hot Springs, California. The investigation was performed in order to provide recommendations for site preparation and to assist in foundation design for the proposed residential structures.

This report presents the results of our field investigation and laboratory testing along with conclusions and recommendations for foundation design and site preparation. This report completes our original scope of services as outlined in our proposal dated June 28, 2004.

We appreciate the opportunity to provide service to you on this project. If you have any questions regarding this report, please contact the undersigned

Respectfully submitted,

APPENDIX C - 1997 UBC Seismic Design Criteria

INTRODUCTION

This report presents the results of our Geotechnical Investigation performed in order to provide recommendations for the design and construction of the proposed mixed use industrial development. The approximately 115-acre project site is located on the southeast corner of Little Morongo Road and 15th Avenue in the City of Desert Hot Springs, California. The proposed development will include commercial and industrial buildings along with various site improvements. The associated site improvements will include paved roadways, concrete driveways, concrete walkways, various underground utilities, and landscape areas.

SCOPE OF WORK

The purpose of our investigation was to determine certain engineering characteristics of the near surface soils on the site in order to develop recommendations for residential foundation design and site preparation. Our investigation included field exploration, laboratory testing, engineering analysis and the preparation of this report. Evaluation of environmental issues or hazardous wastes was not within the scope of services provided. Our investigation was performed in accordance with contemporary geotechnical engineering principles and practice. We make no other warranty, either express or implied.

PROJECT DESCRIPTION

The approximately 115-acre project site is located on the southeast corner of Little Morongo Road and 15th Avenue in the City of Desert Hot Springs, California. It is our understanding that the proposed commercial and industrial buildings will be of relatively lightweight reinforced concrete tilt-up, reinforced masonry or steel frame construction and will be supported by conventional shallow spread footings and concrete slabs on grade. The associated site improvements will include paved roadways, concrete walkways and driveways, landscape areas and various underground utilities.

The project site is presently vacant and the ground surface is covered with scattered desert brush, weeds and minor debris. The project site has an overall downward slope to the south. The southern property boundary is formed by Avenue 16 and the northern property boundary is formed by Avenue 15. Little Morongo Road forms the western property boundary and the property to the west remains vacant. There are existing underground and overhead utilities along the nearby streets. There is a noticeable natural drainage course trending the southwestern portion of the site.

Based upon our previous experience with lightweight concrete tilt-up, reinforced masonry and steel frame structures, we expect that isolated column loads will be less than 80 kips and wall loading will be less than 4.0 kips per linear foot. Grading is expected to include cuts and fills to match the nearby elevations. To construct elevated building pads and to accommodate site drainage. This does not include removal and recompaction of the bearing soils within the building areas. If the anticipated foundation loading or site grading varies substantially from that assumed, the recommendations included in this report should be reevaluated.

SUBSURFACE CONDITIONS

The site is underlain primarily by slightly silty fine to coarse-grained alluvial sands with gravel and cobbles. The alluvial sands were fairly uniform in composition and contained varying amounts of gravel and cobbles. In general, the site soils are somewhat loose near the surface but density generally increases with depth. The site soils were found to be dry throughout the depth of our exploratory borings.

Laboratory classification testing indicates that the near surface soils consist primarily of slightly silty fine to coarse-grained sands with varying amounts of gravel and cobbles. The presence of cobbles resulted in shallow refusal within several of our borings. Expansion testing indicates that the surface soils are non-expansive and fall within the "very low" expansion category in accordance with the Uniform Building Code classification system. The somewhat loose and dry conditions suggest that the near surface native soils may be susceptible to detrimental settlements due to the anticipated foundation loading and the introduction of water.

Groundwater was not encountered within our borings and is expected to be in excess of 100 feet below the existing ground surface within the vicinity of the site. Groundwater should not be a factor in foundation design or construction.

CONCLUSIONS AND RECOMMENDATIONS

Based upon our field and laboratory investigation, it is our opinion that the proposed mixed-use commercial/industrial development is feasible from a soil mechanic's standpoint provided that the recommendations included in this report are considered in building foundation design and site preparation. Due to the somewhat loose and potentially compressible conditions of some of the near surface soils, remedial grading including overexcavation and recompaction or compaction in-place is recommended for the proposed building areas. We recommend that remedial grading within the proposed building areas include recompaction of the primary foundation bearing soils in order to provide a uniform mat of compacted soils beneath the building foundations. Specific recommendations for site preparation are presented in the Site Grading section of this report.

Groundwater was not encountered within our borings and groundwater is expected to be in excess of 100 feet below the existing ground surface in the vicinity of the site. Due to the depth to groundwater, specific liquefaction analyses were not performed. Based upon the depth to groundwater, the potential for liquefaction and the related surficial affects of liquefaction impacting the site are considered negligible.

The site is located within an active seismic area of Southern California within less than 1 kilometer of the San Andreas fault system. Strong ground motion resulting from earthquake activity along the nearby fault systems is likely to impact the site during the anticipated lifetime of the structures. Structures should be designed by professionals familiar with the geologic and seismic setting of the site. As a minimum, structure design should conform with Uniform Building Code (UBC) requirements for Seismic Zone 4. Pertinent seismic design parameters as included within the 1997 UBC are summarized in Appendix C.

Caving did occur within each of our exploratory borings and the surface soils will be susceptible to caving within deeper excavations. All excavations should be constructed in accordance with the normal CalOSHA excavation criteria. On the basis of our observations of the materials encountered, we anticipate that the subsoils will conform to those described by CalOSHA as Type C. Soil conditions should be verified in the field by a "Competent person" employed by the Contractor.

The surface soils encountered during our investigation were found to be non-expansive. Laboratory testing indicated an Expansion Index of 0 that corresponds with the "very low" category in accordance with UBC Standard 18-2. If imported soils are to be used during grading, they should have an Expansion Index of less than 20.

The following recommendations present more detailed design criteria that have been developed on the basis of our field and laboratory investigation.

Foundation Design: The results of our investigation indicate that either conventional shallow continuous footings or isolated pad footings, which are supported upon properly recompacted soils, may be expected to provide satisfactory support for the proposed industrial structures. Recompaction should be performed as described in the Site Grading Section of this report.

Footings should extend at least 12 inches beneath lowest adjacent grade. Isolated square or rectangular footings at least 2 feet square may be designed using an allowable bearing value of 2000 pounds per square foot. Continuous footings at least 12 inches wide may be designed using an allowable bearing value of 1800 pounds per square foot. Allowable increases of 200 psf for each additional 1 foot of width and 250 psf for each additional 6 inches of depth may be utilized if desired. The maximum allowable bearing pressure should be 3000 psf. The allowable bearing pressures are for dead and frequently applied live loads and may be increased by 1/3 to resist wind, seismic or other transient loading.

Care should be taken to see that bearing soils are not allowed to become saturated from the ponding of rainwater or irrigation. Drainage from the building areas should be rapid and complete.

The recommendations made in the preceding paragraphs are based on the assumption that all footings will be supported upon properly compacted soil. All grading shall be performed under the testing and inspection of the Soils Engineer or his representative. Prior to the placement of concrete, we recommend that the footing excavations be inspected in order to verify that they extend into compacted soil and are free of loose and disturbed materials.

Settlements: Settlements may result from the anticipated foundation loads. These estimated ultimate settlements are calculated to be a maximum of 1 inch when using the recommended bearing values. As a practical matter, differential settlements between footings can be assumed as one-half of the total settlement.

Lateral Design: Resistance to lateral loads can be provided by a combination of friction acting at the base of the slabs or foundations and passive earth pressure along the sides of the foundations. A coefficient of friction of 0.45 between soil and concrete may be used with dead load forces only. A passive earth pressure of 300 pounds per square foot, per foot of depth, may be used for the sides of footings that are poured against properly compacted native soils.

Passive earth pressure should be ignored within the upper 1 foot except where confined (such as beneath a floor slab). When used in combination, either the passive resistance or the coefficient of friction should be reduced by one-third.

Retaining Walls: Retaining walls may be required to accomplish the proposed construction. Cantilever retaining walls may be designed using "active" pressures. Active pressures may be estimated using an equivalent fluid weight of 35 pcf for native backfill soils with level free-draining backfill conditions.

For walls that are restrained, "at rest" pressures should be utilized in design. At rest pressures may be estimated using an equivalent fluid weight of 55 pcf for native backfill soils with level free-draining backfill conditions.

Expansive Soils: Due to the prominence of non-expansive soils on the site, special expansive soil design criteria should not be necessary for the design of foundations and concrete slabs-on-grade. Final design criteria should be established by the Structural Engineer.

Concrete Slabs-on-Grade: All surfaces to receive concrete slabs-on-grade should be underlain by recompacted soils as described in the Site Grading Section of this report. Where slabs are to receive moisture sensitive floor coverings or where dampness of the floor slab is not desired, we recommend the use of an appropriate vapor barrier. Vapor barriers should be protected by sand in order to reduce the possibility of puncture and to aid in obtaining uniform concrete curing.

Reinforcement of slabs-on-grade in order to resist expansive soil pressures may not be required however, reinforcement will have a beneficial effect in containing cracking due to concrete shrinkage. Temperature and shrinkage related cracking should be anticipated in all concrete slabs-on-grade. Slab reinforcement and the spacing of control joints should be determined by the Structural Engineer.

Soluble Sulfates: The soluble sulfate concentrations of the surface soils were determined to be less than 66 parts per million (ppm). This is within the usual allowable limits for the use of Type II cement and the use of Type V cement or special sulfate resistant concrete mixes should not be necessary.

Shrinkage and Subsidence: Volumetric shrinkage of the material that is excavated and replaced as controlled compacted fill should be anticipated. We estimate that this shrinkage could vary from 10 to 15 percent. Subsidence of the surfaces that are scarified and compacted should be between 0.1 and 0.2 tenths of a foot. This will vary depending upon the type of equipment used, the moisture content of the soil at the time of grading and the actual degree of compaction attained.

These values for shrinkage and subsidence are exclusive of losses that will occur due to the stripping of the organic material from the site, the removal of oversized materials and the removal of debris, trees and other subsurface obstructions.

General Site Grading: All grading should be performed in accordance with the grading ordinance of The City of Desert Hot Springs and/or Riverside County, California. The following recommendations have been developed on the basis of our field and laboratory testing:

1. **Clearing and Grubbing:** Proper clearing of any existing vegetation, associated root systems, and debris will be very important. All surfaces to receive compacted fill should be cleared of roots, vegetation, debris, and other unsuitable materials that should be removed from the site. Soils that are disturbed due to the removal of the surface vgetation and debris should be replaced as controlled compacted fill under the direction of the Soils Engineer.

2. **Preparation of Building Areas:** In order to provide firm and uniform bearing conditions we recommend overexcavation and recompaction throughout the building and foundation areas. The building areas should be overexcavated to a depth of at least 2 feet below existing grade or 2 feet below the bottom of the footings, whichever is deeper. The exposed surface should then be moisture conditioned and compacted so that a minimum of 90 percent relative compaction is attained. Fill material may then be placed as recommended in Item 4 below.

   Because the site soils are granular in nature, we expect that compaction may be attained to a depth of 2 or 3 feet with proper moisture conditioning and compaction from the surface with heavy grading equipment. If the recommended depth of compaction can be attained in this manner, overexcavation may not be necessary.

3. **Preparation of Surfaces to Receive Compacted Fill:** Other areas to receive compacted fill should be brought to near optimum moisture content and compacted to a minimum of 90 percent relative compaction.

4. **Placement of Compacted Fill:** Fill materials consisting of on-site soils or approved imported granular soils, should be spread in thin lifts, and compacted at near optimum moisture content to a minimum of 90 percent relative compaction. Imported material shall have an Expansion Index not exceeding 20. The contractor shall notify the Soils Engineer at least 48 hours in advance of importing soils in order to provide sufficient time for the evaluation of proposed import materials.

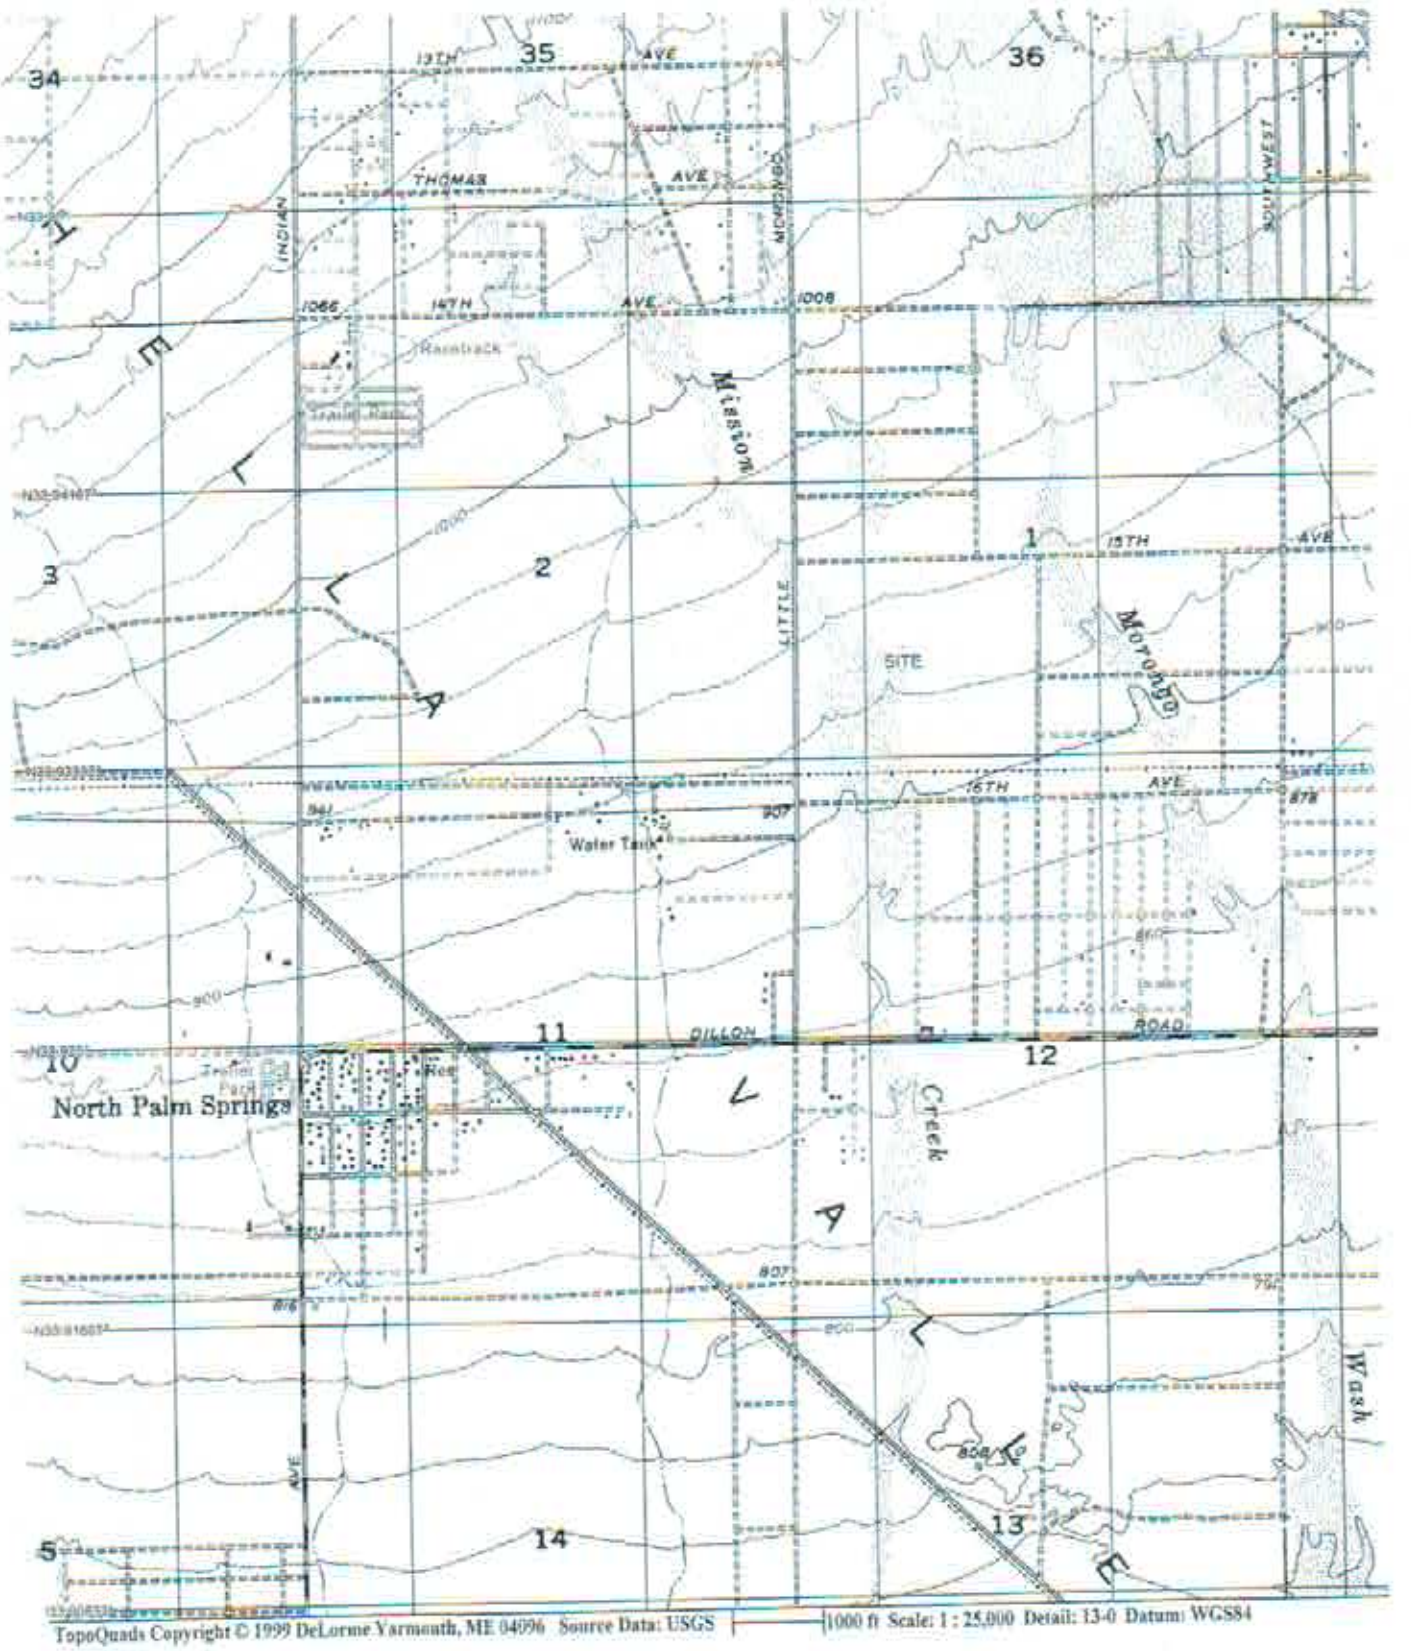
   The contractor shall be responsible for delivering material to the site that complies with the project specifications. Approval by the Soils Engineer will be based upon material delivered to the site and not the preliminary evaluation of import sources.

Our observations of the material encountered during our investigation indicate that compaction will be most readily obtained by means of heavy rubber-wheeled equipment and/or vibratory compactors. At the time of our investigation, the subsoils were found to be very dry. A more uniform and near optimum moisture content should be maintained during recompaction and fill placement.

5. **Preparation of Slab and Paving Areas:** All surfaces to receive asphalt concrete paving or concrete slabs-on-grade, should be underlain by a minimum compacted fill thickness of 12 inches. This may be accomplished by a combination of scarification and recompaction of the surface soils and placement of the fill material as controlled compacted fill. Compaction of the slab and pavement areas should be to a minimum of 90 percent relative compaction.

6. **Testing and Inspection:** During grading tests and observations should be performed by the Soils Engineer or his representative in order to verify that the grading is being performed in accordance with the project specifications. Field density testing shall be performed in accordance with acceptable ASTM test methods. The minimum acceptable degree of compaction should be 90 percent of the maximum dry density as obtained by the ASTM D1557-91 test method. Where testing indicates insufficient density, additional compactive effort shall be applied until retesting indicates satisfactory compaction.

GENERAL



The findings and recommendations presented in this report are based upon an interpolation of the soil conditions between the exploratory boring locations and extrapolation of these conditions throughout the proposed building area. Should conditions encountered during grading appear different than those indicated in this report, this office should be notified.

This report is considered to be applicable for use by MacArthur Engineering for the specific site and project described herein. The use of this report by other parties or for other projects is not authorized. The recommendations of this report are contingent upon monitoring of the grading operation by a representative of Sladden Engineering. All recommendations are considered to be tentative pending our review of the grading operation and additional testing, if indicated. If others are employed to perform any soil testing, this office should be notified prior to such testing in order to coordinate any required site visits by our representative and to assure indemnification of Sladden Engineering.

Our investigation was conducted prior to the completion of plans for the project. We recommend that a pre-job conference be held on the site prior to the initiation of site grading. The purpose of this meeting will be to assure a complete understanding of the recommendations presented in this report as they apply to the actual grading performed.

APPENDIX A

FIELD EXPLORATION

For our field investigation, 12 exploratory borings were excavated on July 29, 2004 using a truck mounted hollow stem auger rig (Mobile B53) in the approximate locations indicated on the site plan included in this appendix. Continuous logs of the materials encountered were made on the site by a representative of Sladden Engineering. Boring logs are included in this appendix.

Representative undisturbed samples were obtained within our borings by driving a thin-walled steel penetration sampler (California split spoon sampler) or a Standard Penetration Test (SPT) sampler with a 140-pound hammer dropping approximately 30 inches (ASTM D1586). The number of blows required to drive the samplers 18 inches was recorded in 6-inch increments and blowcounts are indicated on the boring logs.

The California samplers are 3.0 inches in diameter, carrying brass sample rings having inner diameters of 2.5 inches. The standard penetration samplers are 2.0 inches in diameter with an inner diameter of 1.5 inches. Undisturbed samples were removed from the sampler and placed in moisture sealed containers in order to preserve the natural soil moisture content. Bulk samples were obtained from the excavation spoils and samples were then transported to our laboratory for further observations and testing.

APPENDIX B

Laboratory Testing
Laboratory Test Results

APPENDIX B

LABORATORY TESTING

Representative bulk and relatively undisturbed soil samples were obtained in the field and returned to our laboratory for additional observations and testing. Laboratory testing was generally performed in two phases. The first phase consisted of testing in order to determine the compaction of the existing natural soil and the general engineering classifications of the soils underlying the site. This testing was performed in order to estimate the engineering characteristics of the soil and to serve as a basis for selecting samples for the second phase of testing. The second phase consisted of soil mechanics testing. This testing including consolidation, shear strength and expansion testing was performed in order to provide a means of developing specific design recommendations based on the mechanical properties of the soil.

CLASSIFICATION AND COMPACTION TESTING

Unit Weight and Moisture Content Determinations: Each undisturbed sample was weighed and measured in order to determine its unit weight. A small portion of each sample was then subjected to testing in order to determine its moisture content. This was used in order to determine the dry density of the soil in its natural condition. The results of this testing are shown on the Boring Logs.

Maximum Density-Optimum Moisture Determinations: Representative soil types were selected for maximum density determinations. This testing was performed in accordance with the ASTM Standard D1557-91, Test Method A. The results of this testing are presented graphically in this appendix. The maximum densities are compared to the field densities of the soil in order to determine the existing relative compaction to the soil. This is shown on the Boring Logs, and is useful in estimating the strength and compressibility of the soil.

Classification Testing: Soil samples were selected for classification testing. This testing consists of mechanical grain size analyses and Atterberg Limits determinations. These provide information for developing classifications for the soil in accordance with the Unified Classification System. This classification system categorizes the soil into groups having similar engineering characteristics. The results of this testing are very useful in detecting variations in the soils and in selecting samples for further testing.

SOIL MECHANIC'S TESTING

Direct Shear Testing: One bulk sample was selected for Direct Shear Testing. This testing measures the shear strength of the soil under various normal pressures and is used in developing parameters for foundation design and lateral design. Testing was performed using recompacted test specimens, which were saturated prior to testing. Testing was performed using a strain controlled test apparatus with normal pressures ranging from 800 to 2300 pounds per square foot.

Expansion Testing: One bulk sample was selected for Expansion testing. Expansion testing was performed in accordance with the UBC Standard 18-2. This testing consists of remolding 4-inch diameter by 1-inch thick test specimens to a moisture content and dry density corresponding to approximately 50 percent saturation. The samples are subjected to a surcharge of 144 pounds per square foot and allowed to reach equilibrium. At that point the specimens are inundated with distilled water. The linear expansion is then measured until complete.

1997 UBC Seismic Design Criteria

1997 UNIFORM BUILDING CODE SEISMIC DESIGN INFORMATION

The International Conference of Building Officials 1997 Uniform Building Code contains substantial revisions and additions to the earthquake engineering section in Chapter 16. Concepts contained in the code that will be relevant to construction of the proposed structures are summarized below.

Ground shaking is expected to be the primary hazard most likely to affect the site, based upon proximity to significant faults capable of generating large earthquakes. Major fault zones considered to be most likely to create strong ground shaking at the site are listed below.

Fault Zone	Approximate Distance From Site	Fault Type (1997 UBC)
San Andreas	<2 km	A
San Jacinto	40.0 km	A

Based on our field observations and understanding of local geologic conditions, the soil profile type judged applicable to this site is So, generally described as stiff or dense soil. The site is located within UBC Seismic Zone 4. The following table presents additional coefficients and factors relevant to seismic mitigation for new construction upon adoption of the 1997 code.

Seismic Source	Near-Source Acceleration Factor, N_a	Near-Source Velocity Factor, N_v	Seismic Coefficient C_a	Seismic Coefficient C_v
San Andreas	1.5	2.0	$0.44N_a$	$0.64N_v$
San Jacinto	1.0	1.0	$0.44N_a$	$0.64N_v$

I. PURPOSE AND SCOPE

The purpose of this study is to determine the 100-year off-site flows for Mission Creek and Morongo Wash tributary to Tentative Parcel Map (TPM) 37235 and the 100-year peak on-site storm runoff generated by the project area. The study was performed based upon the existing condition for the off-site drainage areas of Mission Creek and Morongo Wash and the local drainage area tributary to the 15th Street. The study was also performed based on the existing (pre-project) and proposed (post-project) development conditions for the on-site drainage areas in order to determine the increase in storm runoff due to development of the project site. The computed flow rates will be used to provide the proposed project with flood protection from Mission Creek and Morongo Wash and to preliminarily size the proposed on-site drainage systems. Additionally, it will be used as reference for the project WQMP.

The scope of the study includes the following:

1. Determination of the hydrological nodal points and tributary drainage areas within the hydrological limits of influence of the project site.
2. Determination of the 100-year storm flows tributary to the hydrological nodal points based upon the existing condition for the off-site and on-site areas and proposed (post-project) condition for the on-site areas utilizing the Civil Design Software and Rational Tabling program for Riverside County.
3. Determination of the size and location of the proposed drainage facilities required to flood-protect the proposed project site without adversely impacting the existing drainage condition utilizing the Flowmaster Program based on the Normal-Depth method.
4. Determination of the 100-year flood hazard elevations for Mission Creek and Morongo Wash adjacent to the project utilizing the HEC-RAS Program.
5. Preparation of the preliminary drainage study, hydrology and flood hazard maps, and preliminary drainage facilities plan.

II. PROJECT SITE AND DRAINAGE AREA OVERVIEW

TPM 37235 is located in the city of Desert Hot Springs in Riverside County. The project is approximately 2.8 miles north of Interstate 10 along Little Morongo Road. It is bounded by 15th Street to the north 16th Street to the south, Atlantic Avenue and Morongo Wash to the east, and Little Morongo Road and Mission Creek Wash to the west (see Figure 1 on next page). This 110-acre commercial development project consists of 58 lots with sizes ranging from 0.85 to 1.92 acres per lot. The sizes of the proposed development pads within each lot range approximately from 33,533 square-feet (0.77 acres) to 83,591 square-feet (1.92 acres).

The off-site drainage area covered by this plan is approximately 154 square miles (98,796 acres) and on-site area of approximately 110 acres. The upper portion of the off-site

drainage areas tributary to TPM 37235 is characterized by mountainous terrain ranging in slopes from 5 percent to 50 percent. This portion of the off-site area is covered with typical mountain vegetation and contains several meandering drainage courses that are sandwiched between steep, rugged hillsides. For the lower portion of the watershed area, it consists of alluvial fans with moderate slopes ranging from 2 percent to 4 percent. For the most part, the valley floor is covered with desert brush and several alluvial streams. About half of the lower area of the Morongo Wash drainage area is developed while the Mission Creek drainage area is sparsely peppered with small-sized developments. The majority of the project site drains southerly into existing natural fluvial streams that eventually confluence with Mission Creek and Morongo Wash near the I-10 freeway. Increase in storm runoff generated by the project site will be mitigated thru implementation of on-site retention basins along with post-construction BMPs as proposed in the project WQMP.

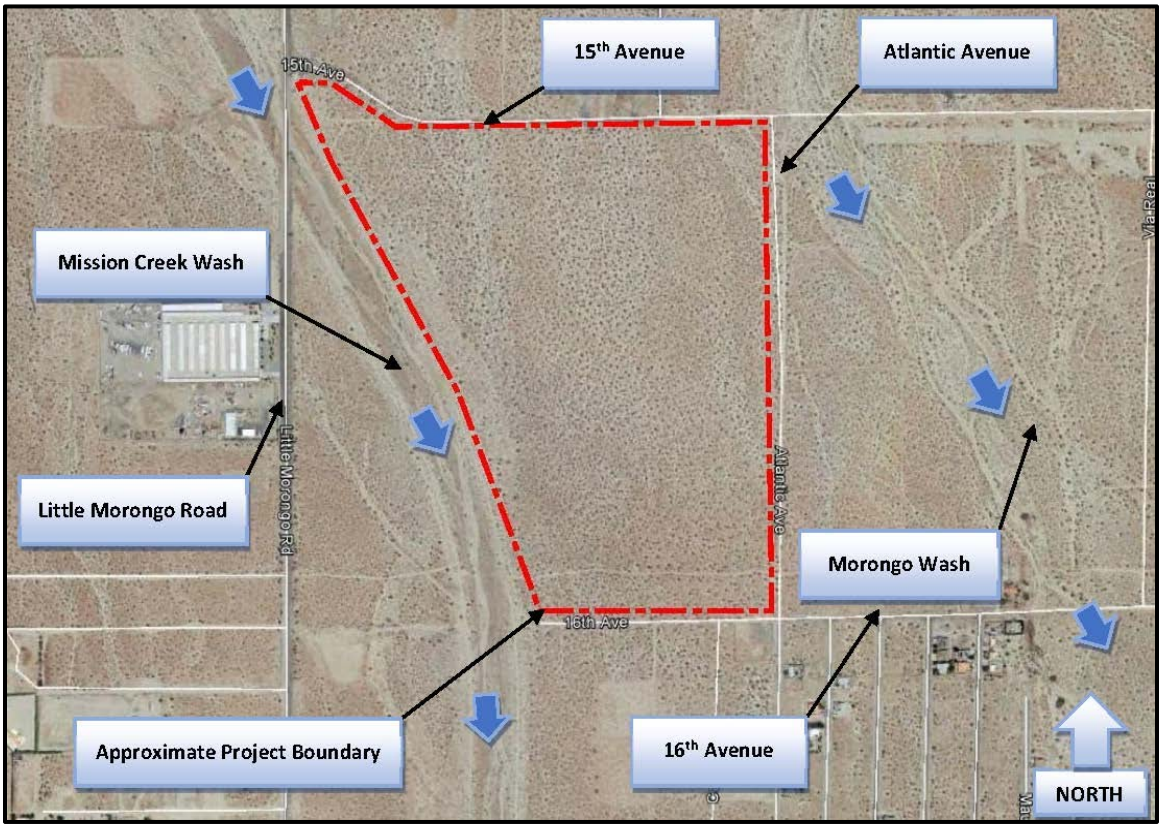

Figure 1: Project Location Map

Review of the Federal Emergency Management Agency (FEMA) Floodplain Maps No. 06065C0885G and 060650895G dated August 28, 2008 indicates that the project site is mapped as Zone "AO". According to FEMA, Flood Zone "AO" is defined as "River or stream flood hazard areas, and areas with a 1% or greater chance of shallow flooding each year, usually in the form of sheet flow, with an average depth ranging from 1 to 3 feet. Average flood depths derived from detailed analyses area shown within these zones". Implementation of the proposed drainage plan for TPM 37235 should provide the project

with drainage protection from the 100-year storm event without adversely impacting the existing drainage conditions of the adjacent area.

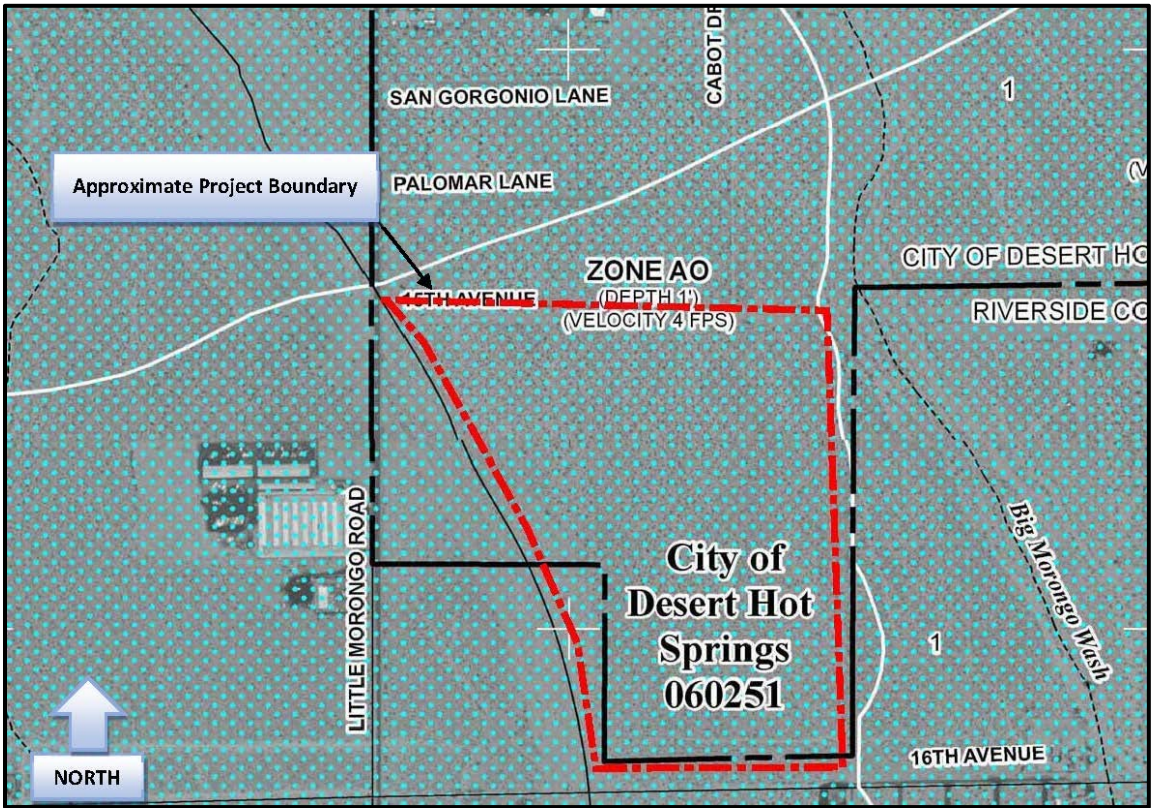

Figure 2: FEMA Map No. 06065C0885G and 06065C0895G, dated 8/28/2008

III. HYDROLOGY

Drainage basin boundaries and points of storm flow concentration were determined utilizing the existing project site topography, USGS map, Google Earth and the roadway and grading layout shown on TPM 37235. Field investigations were conducted to verify the relative accuracy of the drainage boundaries.

Exhibit "A" depicts the on-site hydrology map for the existing condition based on the rational tabling method. The results of the calculations are included in Appendix A. Exhibit "B" depicts the on-site hydrology map for the proposed condition based on the rational tabling method. The results of the calculations are included in Appendix B. Exhibit "C" depicts the on-site hydrology map for the proposed condition based on the unit-hydrograph method. The results of the calculations are included in Appendix C. Exhibit "D" depicts the off-site hydrology map for the local off-site drainage area tributary to 15th Street based on the existing condition using the rational tabling method. The results of the calculations are included in Appendix D. Exhibit "E" depicts the off-site hydrology map for Mission Creek and Morongo Wash based on the existing condition. The results of the calculations are included in Appendix E.

The Riverside County Hydrology Manual (Ref. 2) was used to develop the hydrological parameters for the 100-year storm event. Computations were performed using the RRIV (rational tabling method for on-site areas) and UNRIV (unit-hydrograph method for off-site areas for Mission Creek and Morongo Wash) computer program developed by CivilCadd/CivilDesign (CDD).

The rainfall values and slope of intensity duration curves used for the study were obtained from the maps contained in the RCFC&WCD hydrology manual. For the on-site areas and off-site areas tributary to the project site, the rainfall value used for the 100-year/1-hour storm event is 1.6 inches. For the off-site areas for Mission Creek and Morongo Wash, the rainfall values used for the 2-year/24-hour storm event range from 1.4 inches to 4.0 inches while the 100-year/24-hour storm event range from 4.5 inches to 12.0 inches. The slope of intensity duration curve used for both the on-site and on-site hydrology is 0.58.

The study area for the on-site hydrology consists of Hydrologic Soil Group A. Soil Group A was also used for the off-site hydrology tributary to the project site. For the off-site areas for Mission Creek and Morongo Wash, soil groups A, B, C, and D were used. Antecedent Moisture Condition (AMC) 2 was used for both the on-site and off-site areas. The land-use category descriptions used in the hydrologic analysis for the on-site and off-site areas tributary to the project site was "Undeveloped – Poor Cover" while the on-site proposed condition was "Commercial". For the off-site areas for Mission Creek and Morongo Wash, the RI number used was 82 with an impervious cover ranging from 0.00 to 0.02 and an average Manning's n-value ranging from 0.038 to 0.039.

The computed 100-year peak storm flow values for the off-site drainage areas from Mission Creek and Morongo Wash are shown on Table 1. The table shows both the "clear-water" and "bulked flow". The 100-year "bulked" flows were determined by multiplying the "clear-water" flows by a bulking factor of 1.51 (51 percent) and 1.43 (43 percent) for Mission Creek and Morongo Wash, respectively. This bulking factor was applied using the US Army Corps of Engineers Los Angeles District Debris Method (Ref. 3) to account for debris and sediment that will co-mingle with the "clear-water" flow, which is typical for desert alluvial conditions.

Table 1: Summary of 100-year Hydrologic Study Results for Mission Creek and Morongo Wash

Flooding Source	Nodal Point	Drainage Area (Square Miles)	100-Year "Clear-Water" Flow Rate (CFS)	100-Year "Bulked" Flow Rate (CFS)
Mission Creek	101	43	13,734	20,601
Morongo Wash	201	112	26,609	38,051

100-year flows emanating from local off-site drainage areas tributary to 15th Street are shown on Table 2. A bulking factor of 1.25 (25 percent) was used to determine the bulked

flows The results of the 100-year and 10-year flows generated on-site are shown on Exhibit "B".

Table 2: Summary of 100-year Hydrologic Study Results for Local Off-site Areas Tributary to 15th Street

Nodal Point	Drainage Area (Acres)	100-Year "Clear-Water" Flow Rate (CFS)	100-Year "Bulked" Flow Rate (CFS)
105	182	251	334
202	17	38	51
303	37	73	96
402	14	30	37

IV. FLOOD HAZARD ANALYSIS

The flood hazard analysis was prepared for Mission Creek and Morongo Wash as shown on Figure 3. Hydraulic models of Mission Creek and Morongo Wash were developed using project aerial topographic map (NAVD 88) with 1-foot contour intervals provided by The Altum Group (January 2017).

Figure 3: HEC-RAS Study limits

There were 20 stream sections used in the analysis for Mission Creek spanning a total reach length of 3,951 feet while Morongo Wash has 8 stream sections over a total reach length of 926 feet.

With the project being designated as a FEMA Mapped Zone AO, the hydraulic models were developed to determine the depths and limits of the 100-year flooding from Mission Creek and Morongo Wash and how the flooding will impact TPM 37235.

HEC-RAS was used to compute the hydraulic variables for the washes under peak flow condition for the 100-year storm events including the "bulked flow" conditions using the US Army Corps of Engineers Los Angeles District Debris Method (Ref. 3). The 100-year "bulked" flows were determined by multiplying the "clear-water" flows by a bulking factor of 1.51 (51 percent) and 1.43 (43 percent) for Mission Creek and Morongo Wash, respectively. This bulking factor was applied to account for debris and sediment that will co-mingle with the "clear-water" flow, which is typical for desert alluvial conditions.

HEC-RAS (Version 4.1.0) is a product of the Hydrologic Engineering Center (HEC) of the US Army Corps of Engineers.

A Manning's N-values of 0.030 was assigned for the stream bed and channel overbanks, respectively, throughout the length of the study reach for both washes. The Manning's N-value was derived from aerial map and field review of the reaches to be modeled, considering the various components that contribute to flow resistance – i.e. bed material size, irregularity, vegetation type and density, etc. It should be noted that there is some uncertainty in assigning Manning's N-values along natural streams. In reality, the values can change during the event being modeled, due to bedform development, changes in flow depth, loss of vegetation, and changes in geometry. The Manning's N-values assigned for this study are considered reasonable for purposes of this study, but are by no means exact. To conform to FEMA's flood mapping requirements, sub-critical flow regime was used for the hydraulic models.

The results of the 100-year HEC-RAS calculations for Mission Creek and Morongo Wash are shown in Appendix D while Appendix E shows the stream cross sections.

Exhibit G shows the locations of the cross-sections used in the hydraulic models as well as the upstream and downstream limits of the streams. More importantly, it shows the 100-year water surface elevation at each cross section for both washes in relation to the grading layout of TPM 37235 (Ref. 1) to show which building pads could be potentially affected by Mission Creek and Morongo Wash during the 100-year storm event.

From the results of the HEC-RAS study, it is evident that Mission Creek and Morongo Wash have the potential to adversely impact portions of TPM 37235 and inundate the site during the 100-year storm event. Mitigation measures to protect TPM 37235 from flooding are described in the next section of this study.

V. HYDRAULIC ANALYSIS AND PROPOSED PRELIMINARY DRAINAGE PLAN

Hydraulic calculations were prepared in support of the preliminary drainage plan for TPM 37235. The plan proposes a system of drainage channels and underground storm drains to intercept and convey the storm flows generated by the project site and the off-site areas emanating from the north. The proposed drainage system will be designed to perpetuate the existing drainage flow pattern to the maximum extent practical. Many of the underground drainage facilities are proposed to be placed under the streets while open channels are proposed along the north side of the project site. Four (4) retention/water quality basins are proposed as described in this study report and the project Water Quality Management Plan (WQMP).

Manning's N-value of 0.015 was used for the proposed drainage improvements with concrete while an N-value of 0.025 was used for the earthen channel.

The improvements proposed by this plan are shown on Exhibit "F", which is enclosed in the back of this report. This exhibit not only shows proposed preliminary alignments, but pertinent preliminary size information, as well as the design flow rates.

The hydraulic calculations in support of the proposed drainage improvements are included in Appendix E. Computations for the Normal Depth method were performed using the Flowmaster computer program developed by Bentley.

The following is a brief description of the recommended drainage improvements proposed in this preliminary drainage plan:

Lines "A-1" and "A-2"

Lines "A-1" and "A-2" system is a combination of earthen channel and underground reinforced concrete box (RCB) that is proposed to intercept and convey the local off-site "bulked" 100-year storm flows of 53.9 ft^3/sec and discharge them into Morongo Wash adjacent to the east side of the site. Line "A-1" and "A-2" system is located along the north side of the site, just south of 15th street and slopes from west to east. Line "A-1" is a trapezoidal shaped earthen channel with a bottom width of 4 feet and height of 6 feet. Line "A-1" includes several parkway drains that are designed to intercept, convey and outlet the tributary flows into the channel. Adequate riprap aprons will be provided at the parkway drain locations to protect the earthen channel from scour. The earthen channel then transitions into a 3-foot high, 4-foot wide RCB as it goes under Street "A". This portion of the system under Street "A" is designated as Line "A-2". From that point, it heads easterly and discharges the flows into Morongo Wash via an earthen trapezoidal shaped channel. The outlet will consist of a headwall and riprap apron to reduce the exiting flow velocities in order to maintain the integrity and functionality of the channel. Construction of this outlet on Morongo Wash may require a permit from an environmental resource agency.

Lines "B-1" and "B-2"

Lines "B-1" and "B-2" system is a combination of concrete channel and underground reinforced concrete pipe (RCP) that is proposed to intercept and convey the local off-site "bulked" 100-year storm flows of 336.2 ft^3/sec and discharge them into Mission Creek adjacent to the west side of the site. The Lines "B-1" and "B-2" system is located along the north side of the site, just south of 15th street and slopes from east to west and then north to south. Line "B-1" is a concrete channel, trapezoidal shaped, with a bottom width of 4 feet and height of 5 feet. Line "B-1" includes several parkway drains that are designed to intercept, convey and outlet the tributary flows into the channel. It then transitions into Line "B-2", which is a 78-inch RCP as it goes under and follows Street "F" and outlets into Mission Creek. The outlet will consist of a headwall and riprap apron to reduce the exiting flow velocities in order to maintain the integrity and functionality of the channel. Construction of this outlet on Mission Creek will require an encroachment permit from RCFCD. Additional permits from environmental resource agencies may also be required.

Line "C" System (Lines "C-1", "C-2" and "C-3")

Line "C" system is an underground drainage system proposed to intercept and convey the combined 100-year storm flow of 29.2 ft^3/sec and discharge them into the proposed Basin "C". It is located on Street "F", south of Street "E. The Line "C" system consists of an underground RCP that varies in size from 24-inches to 30-inches and it generally slopes west

to east.

Line "D"

Line "D" system is an underground drainage pipe proposed to intercept and convey the combined 100-year storm flow of 9.7 ft^3/sec and discharge them into the proposed Basin "C". It is located southeast of Building Pad 19. Line "D" is an underground RCP that is 18-inches in size and it generally slopes east to southwest.

Line "E" System (Lines "E-1" and "E-2")

Line "E" system is an underground drainage system proposed to intercept and convey the combined 100-year storm flow of 10.3 ft^3/sec and discharge them into the proposed Basin "B". It is located on Street "D", east of Street "F. The Line "E" system is an underground RCP that varies in size from 18-inches to 24-inches.

Line "F" System (Lines "F-1", "F-2", and "F-3")

Line "F" system is an underground drainage system proposed to intercept and convey the combined 100-year storm flow of 26.4 ft^3/sec and discharge them into the proposed Water Quality Basin "B". It is located on the south end of Street "F". The Line "F" system is an underground RCP that varies in size from 18-inches to 36-inches and it generally slopes south to north. The Line "F" system serves as outlet for Line "G".

Line "G" System (Lines, "G-1" and "G-2" and Lat. "G-1")

Line "G" system is an underground drainage system proposed to intercept and convey the combined 100-year storm flow of 10.0 ft^3/sec and discharge them into the proposed Line "F". It is located on the south end of Street "F". Line "G" is an underground RCP that varies in size from 18-inches to 24-inches and it generally slopes east to west.

Line "H" System (Lines "H-1 and H-2")

Line "H" system is an underground drainage system proposed to intercept and convey the combined 100-year storm flow of 200.9 ft^3/sec and discharge them into the proposed Basin "A". It is located at the south end of Street "A". Line "H" is an underground RCP varies in size from 24-inches to 60-inches that generally slopes west to east. Line "H" serves as outlet for Line "I".

Line "I" System (Lines "I-1", "I-2", "I-3", and "I-4" and Lats. "I-1", "I-2", "I-3", and "I-4")

Line "I" system is an underground drainage system proposed to intercept and convey the combined 100-year storm flow of 184.8 ft^3/sec and discharge them into the proposed Line "H". It is located at the south end of Street "A". Line "I" is an underground RCP that varies in size from 36-inches to 60-inches and it slopes north to south.

Line "J"

Line "J" is an underground drainage pipe proposed to intercept and convey the combined 100-year storm flow of 15.0 ft^3/sec and discharge them into the proposed Basin "A". It is located on the southeast end of the site. Line "J" is an underground RCP that is 24-inches in size and it slopes east to west.

Basin "A"
Basin "A" is a combination of a retention basin and water quality basin that is proposed to retain and mitigate on-site flows generated by TPM 37235. The basin slope is 2:1 and it has a total storage flow volume of approximately 46.56 acre-feet. The Line "H" and "J" drainage systems discharge their flows into Basin "A".

Basin "B"
Basin "B" is a combination of a retention basin and water quality basin that is proposed to retain and mitigate on-site flows generated by TPM 37235. The basin slope is 2:1 and it has a total storage flow volume of approximately 1.76 acre-feet. The Line "E" and "F" drainage systems discharge their flows in to Basin "B".

Basin "C"
Basin "C" is a combination of a retention basin and water quality basin that is proposed to retain and mitigate on-site flows generated by TPM 37235. The basin slope is 2:1 and it has a total storage flow volume of approximately 2.69 acre-feet. The Line "C" and "D" drainage systems discharge their flows in to Basin "C".

Basin "D"
Basin "D" is a combination of a retention basin and water quality basin that is proposed to retain and mitigate on-site flows generated by TPM 37235. The basin slope is 2:1 and it has a total storage flow volume of approximately 1.76 acre-feet. Basin "D" is designed to capture flows that are generated from the northwest area of the site where the proposed Southern California Edison Substation is to be constructed in the future.

Flood Hazard Mitigation against Mission Creek and Morongo Wash Flooding

In order to protect TPM 37235 from flooding caused by Mission Creek during the 100-year storm event, the perimeter wall along the west side of Street "F", from 15th Street down to 16th Street, will be designed to accommodate a combination of flood wall and screen wall. Conversely, the perimeter wall along the east side of Atlantic Avenue, from 15th Street down to the southerly limit of Lot 33 will be designed to accommodate a combination of flood wall and screen wall. The actual height of the flood wall along with the depth of the footing will be determined during the final design phase of this project.

VI. FINDINGS

The existing (pre-project) and proposed (post-project) conditions hydrology analyses evaluated the runoff generated by on-site areas at common discharge points. Table 1 (next page) tabulates the peak flow rates resulting from the analyses performed for the nodal points of interest as shown on the Exhibit "A" – Onsite Existing Condition Hydrology Map and Exhibit "B" – Onsite Proposed Condition Hydrology Map.

Table 3: Hydrology Results for On-site Areas

LOCATION	EXISTING CONDITION			PROPOSED CONDITION			FLOW INCREASE (CFS)
	NODAL POINT	AREA (ACRES)	Q_{100} (CFS)	NODAL POINT	AREA (ACRES)	Q_{100} (CFS)	
Project Site	103 & 203 & 304*	29.13	202.9	*	29.13	308.2	***105.3***

*Flow rate was added directly with no time of concentration adjustment.

The hydrology calculations indicate that the 100-year storm flows have increased by 105.3 ft^3/sec from existing to proposed conditions. This increase in the flow rate is attributed to the difference in land-use designation (from undeveloped to developed condition). This flow increase of 128.7 ft^3/sec will be mitigated through implementation of Basins "A", "B", "C" and "D". These basins will be designed to fully retain the tributary flows. Dry wells will be provided to drain the basin flows.

The FEMA Floodplain Maps and Flood Hazard Analysis Results indicate that TPM 37235 is adversely impacted by flows emanating from Mission Creek and Morongo Wash during the 100-year flood event. Implementation of the proposed flood hazard mitigation measures will provide TPM 37235 with 100-year flood protection from these two major streams. Additionally, implementation of the proposed drainage systems will protect the proposed development from local off-site and on-site 100-year storm flows without adversely impacting adjacent and downstream properties.

**** CONFLUENCE OF MAIN STREAMS ****
------------------------------------------------------------------------------
The following data inside Main Stream is listed:
In Main Stream number: 2
Stream flow area =      2.180(Ac.)
Runoff from this stream =      7.553(CFS)
Time of concentration =   17.10 min.
Rainfall intensity =     3.314(In/Hr)
Summary of stream data:

Stream   Flow rate      TC            Rainfall Intensity
 No.       (CFS)       (min)                 (In/Hr)

1      144.185     18.55                  3.161
2        7.553     17.10                  3.314
Largest stream flow has longer time of concentration
Qp =    144.185 + sum of
          Qb         Ia/Ib
           7.553 *    0.954 =      7.204
Qp =    151.390

Total of 2 main streams to confluence:
Flow rates before confluence point:
     144.185       7.553
Area of streams before confluence:
       45.460        2.180

Results of confluence:
Total flow rate =    151.390(CFS)
Time of concentration =    18.549 min.
Effective stream area after confluence  =     47.640(Ac.)

Process from Point/Station      213.000 to Point/Station      214.000
**** CONFLUENCE OF MAIN STREAMS ****
------------------------------------------------------------------------------
The following data inside Main Stream is listed:
In Main Stream number: 2
Stream flow area =      2.180(Ac.)
Runoff from this stream =      4.824(CFS)
Time of concentration =   17.82 min.
Rainfall intensity =     2.103(In/Hr)
Summary of stream data:

Stream   Flow rate      TC            Rainfall Intensity
 No.       (CFS)       (min)                 (In/Hr)

1       90.701     19.67                  1.986
2        4.824     17.82                  2.103
Largest stream flow has longer time of concentration
Qp =     90.701 + sum of
          Qb         Ia/Ib
           4.824 *    0.944 =      4.556
Qp =     95.257

Total of 2 main streams to confluence:
Flow rates before confluence point:
      90.701       4.824
Area of streams before confluence:
       45.460        2.180

Results of confluence:
Total flow rate =     95.257(CFS)
Time of concentration =    19.667 min.
Effective stream area after confluence  =     47.640(Ac.)

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

TRI-8 Builders - S/N 615

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

TPM NO. 37235
PROPOSED CONDITION - ON-SITE
AREA "A"
100YR

Drainage Area = 77.96(Ac.) = 0.122 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 77.96(Ac.) = 0.122 Sq. Mi.
Length along longest watercourse = 5010.00(Ft.)
Length along longest watercourse measured to centroid = 1530.00(Ft.)
Length along longest watercourse = 0.949 Mi.
Length along longest watercourse measured to centroid = 0.290 Mi.
Difference in elevation = 80.80(Ft.)
Slope along watercourse = 85.1545 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.095 Hr.
Lag time = 5.68 Min.
25% of lag time = 1.42 Min.
40% of lag time = 2.27 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
77.96	1.35	105.25

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
77.96	4.30	335.23

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.350(In)
Area Averaged 100-Year Rainfall = 4.300(In)

Point rain (area averaged) = 4.300(In)
Areal adjustment factor = 99.98 %
Adjusted average point rain = 4.299(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
77.960	32.00	0.900

Total Area Entered = 77.96(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
32.0	32.0	0.742	0.900	0.141	1.000	0.141
					Sum (F) =	0.141

Area averaged mean soil loss (F) (In/Hr) = 0.141
Minimum soil loss rate ((In/Hr)) = 0.070
(for 24 hour storm duration)

AREAA24100

Soil low loss rate (decimal) = 0.180

English Rainfall Data (Inches) Input Values Used

English Units used in output format

TPM NO. 37235
PROPOSED CONDITION - ON-SITE
AREA "A"
200YR (1.3 HIGHER THAN 100YR)

Drainage Area = 77.96(Ac.) = 0.122 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 77.96(Ac.) = 0.122 Sq. Mi.
Length along longest watercourse = 5010.00(Ft.)
Length along longest watercourse measured to centroid = 1530.00(Ft.)
Length along longest watercourse = 0.949 Mi.
Length along longest watercourse measured to centroid = 0.290 Mi.
Difference in elevation = 80.80(Ft.)
Slope along watercourse = 85.1545 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.095 Hr.
Lag time = 5.68 Min.
25% of lag time = 1.42 Min.
40% of lag time = 2.27 Min.
Unit time = 5.00 Min.
Duration of storm = 1 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
77.96	0.70	54.57

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
77.96	2.03	158.26

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 0.700(In)
Area Averaged 100-Year Rainfall = 2.030(In)

Point rain (area averaged) = 2.030(In)
Areal adjustment factor = 99.93 %
Adjusted average point rain = 2.029(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
77.960	32.00	0.900

Total Area Entered = 77.96(Ac.)

RI AMC2	RI AMC-3	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
32.0	52.0	0.552	0.900	0.105	1.000	0.105
					Sum (F) =	0.105

Area averaged mean soil loss (F) (In/Hr) = 0.105
Minimum soil loss rate ((In/Hr)) = 0.052
(for 24 hour storm duration)

Soil low loss rate (decimal) = 0.180

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

MORONGO WASH & MISSION CREEK
EXISTING CONDITION
AREA "A"
100YR-3HR

Drainage Area = 27294.00(Ac.) = 42.647 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 27294.00(Ac.) = 42.647 Sq. Mi.
Length along longest watercourse = 128045.00(Ft.)
Length along longest watercourse measured to centroid = 64610.00(Ft.)
Length along longest watercourse = 24.251 Mi.
Length along longest watercourse measured to centroid = 12.237 Mi.
Difference in elevation = 7588.00(Ft.)
Slope along watercourse = 312.8950 Ft./Mi.
Average Manning's 'N' = 0.038
Lag time = 2.663 Hr.
Lag time = 159.78 Min.
25% of lag time = 39.95 Min.
40% of lag time = 63.91 Min.
Unit time = 5.00 Min.
Duration of storm = 3 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
64.00	0.70	44.80
873.00	0.80	698.40
6086.00	1.00	6086.00
6077.00	1.10	6684.70
5221.00	1.20	6265.20
8085.00	1.30	10510.50
888.00	1.40	1243.20

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
11.00	2.20	24.20
750.00	2.25	1687.50
15630.00	2.50	39075.00
10527.00	2.75	28949.25
376.00	3.00	1128.00

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.155(In)
Area Averaged 100-Year Rainfall = 2.596(In)

Point rain (area averaged) = 2.596(In)
Areal adjustment factor = 90.82 %
Adjusted average point rain = 2.358(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
27294.000	82.32	0.000

Total Area Entered = 27294.00(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
82.3	82.3	0.218	0.000	0.218	1.000	0.218
					Sum (F) =	0.218

Area averaged mean soil loss (F) (In/Hr) = 0.218
Minimum soil loss rate ((In/Hr)) = 0.109
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

MORONGO WASH & MISSION CREEK
EXISTING CONDITION
AREA "A"
100YR-6HR

Drainage Area = 27294.00(Ac.) = 42.647 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 27294.00(Ac.) = 42.647 Sq. Mi.
Length along longest watercourse = 128045.00(Ft.)
Length along longest watercourse measured to centroid = 64610.00(Ft.)
Length along longest watercourse = 24.251 Mi.
Length along longest watercourse measured to centroid = 12.237 Mi.
Difference in elevation = 7588.00(Ft.)
Slope along watercourse = 312.8950 Ft./Mi.
Average Manning's 'N' = 0.038
Lag time = 2.663 Hr.
Lag time = 159.78 Min.
25% of lag time = 39.95 Min.
40% of lag time = 63.91 Min.
Unit time = 5.00 Min.
Duration of storm = 6 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
771.00	1.00	771.00
3913.00	1.20	4695.60
7109.00	1.40	9952.60
6003.00	1.60	9604.80
6833.00	1.80	12299.40
2665.00	2.00	5330.00

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
25.00	2.50	62.50
816.00	2.75	2244.00
7847.00	3.00	23541.00
9434.00	3.50	33019.00
8038.00	4.00	32152.00
1134.00	4.50	5103.00

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.563(In)
Area Averaged 100-Year Rainfall = 3.522(In)

Point rain (area averaged) = 3.522(In)
Areal adjustment factor = 93.49 %
Adjusted average point rain = 3.292(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
27294.000	82.32	0.000

Total Area Entered = 27294.00(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
82.3	82.3	0.218	0.000	0.218	1.000	0.218
					Sum (F) =	0.218

Area averaged mean soil loss (F) (In/Hr) = 0.218
Minimum soil loss rate ((In/Hr)) = 0.109
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

MORONGO WASH & MISSION CREEK
EXISTING CONDITION
AREA "A"
100YR-24HR

Drainage Area = 27294.00(Ac.) = 42.647 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 27294.00(Ac.) = 42.647 Sq. Mi.
Length along longest watercourse = 128045.00(Ft.)
Length along longest watercourse measured to centroid = 64610.00(Ft.)
Length along longest watercourse = 24.251 Mi.
Length along longest watercourse measured to centroid = 12.237 Mi.
Difference in elevation = 7588.00(Ft.)
Slope along watercourse = 312.8950 Ft./Mi.
Average Manning's 'N' = 0.038
Lag time = 2.663 Hr.
Lag time = 159.78 Min.
25% of lag time = 39.95 Min.
40% of lag time = 63.91 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
382.00	1.40	534.80
423.00	1.60	676.80
839.00	1.80	1510.20
3571.00	2.00	7142.00
5583.00	2.50	13957.50
6284.00	3.00	18852.00
7196.00	3.50	25186.00
3016.00	4.00	12064.00

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
565.00	4.50	2542.50
580.00	5.00	2900.00
1409.00	6.00	8454.00
3123.00	6.50	20299.50
7020.00	7.00	49140.00
6934.00	8.00	55472.00
6683.00	10.00	66830.00
980.00	12.00	11760.00

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 2.928(In)
Area Averaged 100-Year Rainfall = 7.965(In)

Point rain (area averaged) = 7.965(In)
Areal adjustment factor = 95.74 %
Adjusted average point rain = 7.626(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
27294.000	82.32	0.000

Total Area Entered = 27294.00(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
82.3	82.3	0.218	0.000	0.218	1.000	0.218
					Sum (F) =	0.218

Area averaged mean soil loss (F) (In/Hr) = 0.218
Minimum soil loss rate ((In/Hr)) = 0.109
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

TRI-8 Builders - S/N 615

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

MORONGO WASH & MISSION CREEK
EXISTING CONDITION
AREA "B"
100YR-1HR

Drainage Area = 71502.00(Ac.) = 111.722 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 71502.00(Ac.) = 111.722 Sq. Mi.
Length along longest watercourse = 142370.00(Ft.)
Length along longest watercourse measured to centroid = 51555.00(Ft.)
Length along longest watercourse = 26.964 Mi.
Length along longest watercourse measured to centroid = 9.764 Mi.
Difference in elevation = 7936.00(Ft.)
Slope along watercourse = 294.3182 Ft./Mi.
Average Manning's 'N' = 0.039
Lag time = 2.642 Hr.
Lag time = 158.53 Min.
25% of lag time = 39.63 Min.
40% of lag time = 63.41 Min.
Unit time = 5.00 Min.
Duration of storm = 1 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
1570.00	0.60	942.00
27321.00	0.65	17758.65
42611.00	0.70	29827.70

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
9637.00	1.40	13491.80
24939.00	1.50	37408.50
36926.00	1.60	59081.60

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 0.679(In)
Area Averaged 100-Year Rainfall = 1.538(In)

Point rain (area averaged) = 1.538(In)
Areal adjustment factor = 71.33 %
Adjusted average point rain = 1.097(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
71502.000	81.52	0.020

Total Area Entered = 71502.00(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
81.5	81.5	0.227	0.020	0.223	1.000	0.223

AREAB1100

Sum (F) = 0.223

Area averaged mean soil loss (F) (In/Hr) = 0.223
Minimum soil loss rate ((In/Hr)) = 0.111
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

Slope of intensity-duration curve for a 1 hour storm =0.5800

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

MORONGO WASH & MISSION CREEK
EXISTING CONDITION
AREA "B"
100YR-3HR

Drainage Area = 71502.00(Ac.) = 111.722 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 71502.00(Ac.) = 111.722 Sq. Mi.
Length along longest watercourse = 142370.00(Ft.)
Length along longest watercourse measured to centroid = 51555.00(Ft.)
Length along longest watercourse = 26.964 Mi.
Length along longest watercourse measured to centroid = 9.764 Mi.
Difference in elevation = 7936.00(Ft.)
Slope along watercourse = 294.3182 Ft./Mi.
Average Manning's 'N' = 0.039
Lag time = 2.642 Hr.
Lag time = 158.53 Min.
25% of lag time = 39.63 Min.
40% of lag time = 63.41 Min.
Unit time = 5.00 Min.
Duration of storm = 3 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
62.00	0.70	43.40
4858.00	0.80	3886.40
41803.00	1.00	41803.00
15401.00	1.10	16941.10
6524.00	1.20	7828.80
2854.00	1.30	3710.20

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
1157.00	2.00	2314.00
39.00	2.20	85.80
17407.00	2.25	39165.75
48175.00	2.50	120437.50
4724.00	2.75	12991.00

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.038(In)
Area Averaged 100-Year Rainfall = 2.447(In)

Point rain (area averaged) = 2.447(In)
Areal adjustment factor = 83.66 %
Adjusted average point rain = 2.048(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
71502.000	81.52	0.020

Total Area Entered = 71502.00(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
81.5	81.5	0.227	0.020	0.223	1.000	0.223
					Sum (F) =	0.223

Area averaged mean soil loss (F) (In/Hr) = 0.223
Minimum soil loss rate ((In/Hr)) = 0.111
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

MORONGO WASH & MISSION CREEK
EXISTING CONDITION
AREA "B"
100YR-6HR

Drainage Area = 71502.00(Ac.) = 111.722 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 71502.00(Ac.) = 111.722 Sq. Mi.
Length along longest watercourse = 142370.00(Ft.)
Length along longest watercourse measured to centroid = 51555.00(Ft.)
Length along longest watercourse = 26.964 Mi.
Length along longest watercourse measured to centroid = 9.764 Mi.
Difference in elevation = 7936.00(Ft.)
Slope along watercourse = 294.3182 Ft./Mi.
Average Manning's 'N' = 0.039
Lag time = 2.642 Hr.
Lag time = 158.53 Min.
25% of lag time = 39.63 Min.
40% of lag time = 63.41 Min.
Unit time = 5.00 Min.
Duration of storm = 6 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
1907.00	1.00	1907.00
27456.00	1.20	32947.20
31797.00	1.40	44515.80
7180.00	1.60	11488.00
3162.00	1.80	5691.60

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
1879.00	2.50	4697.50
3215.00	2.75	8841.25
52197.00	3.00	156591.00
12628.00	3.50	44198.00
1583.00	4.00	6332.00

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.350(In)
Area Averaged 100-Year Rainfall = 3.086(In)

Point rain (area averaged) = 3.086(In)
Areal adjustment factor = 88.41 %
Adjusted average point rain = 2.729(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
71502.000	81.52	0.020

Total Area Entered = 71502.00(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
81.5	81.5	0.227	0.020	0.223	1.000	0.223
					Sum (F) =	0.223

Area averaged mean soil loss (F) (In/Hr) = 0.223
Minimum soil loss rate ((In/Hr)) = 0.111
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

MORONGO WASH & MISSION CREEK
EXISTING CONDITION
AREA "B"
100YR-24HR

Drainage Area = 71502.00(Ac.) = 111.722 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 71502.00(Ac.) = 111.722 Sq. Mi.
Length along longest watercourse = 142370.00(Ft.)
Length along longest watercourse measured to centroid = 51555.00(Ft.)
Length along longest watercourse = 26.964 Mi.
Length along longest watercourse measured to centroid = 9.764 Mi.
Difference in elevation = 7936.00(Ft.)
Slope along watercourse = 294.3182 Ft./Mi.
Average Manning's 'N' = 0.039
Lag time = 2.642 Hr.
Lag time = 158.53 Min.
25% of lag time = 39.63 Min.
40% of lag time = 63.41 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
313.00	1.40	438.20
1354.00	1.60	2166.40
8861.00	1.80	15949.80
30826.00	2.00	61652.00
18470.00	2.50	46175.00
8118.00	3.00	24354.00
3560.00	3.50	12460.00

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
774.00	4.50	3483.00
4341.00	5.00	21705.00
19072.00	6.00	114432.00
13608.00	6.50	88452.00
25471.00	7.00	178297.00
6358.00	8.00	50864.00
1878.00	10.00	18780.00

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 2.282(In)
Area Averaged 100-Year Rainfall = 6.657(In)

Point rain (area averaged) = 6.657(In)
Areal adjustment factor = 92.98 %
Adjusted average point rain = 6.190(In)

Sub-Area Data:

AREAB24100

Area(Ac.)	Runoff Index	Impervious %
71502.000	81.52	0.020

Total Area Entered = 71502.00(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
81.5	81.5	0.227	0.020	0.223	1.000	0.223
					Sum (F) =	0.223

Area averaged mean soil loss (F) (In/Hr) = 0.223
Minimum soil loss rate ((In/Hr)) = 0.111
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

APPENDIX F: HYDRAULIC ANALYSIS FOR PROPOSED DRAINAGE FACILITIES BASED ON NORMAL-DEPTH METHOD

CB #1 & #2
Worksheet for Curb Inlet On Grade

Project Description	
Worksheet	CB #1 & #2 (ON G
Type	Curb Inlet On Grad
Solve For	Length

Input Data		
Discharge	11.40	cfs
Efficiency	1.00	
Slope	.0177	ft/ft
Gutter Width	1.50	ft
Gutter Cross Slope	.0800	ft/ft
Road Cross Slope	0.0200	ft/ft
Mannings Coefficie	0.015	
Local Depression	4.0	in
Local Depression W	4.00	ft

Results		
Curb Opening Length	36.92	ft
Intercepted Flow	11.40	cfs
Bypass Flow	0.00	cfs
Spread	15.39	ft
Depth	0.40	ft
Flow Area	2.4	ft²
Gutter Depression	1.1	in
Total Depression	5.1	in
Velocity	4.68	ft/s
Equivalent Cross Slop	.0503	ft/ft
Length Factor	0.99	
Total Interception Len	37.14	ft

CB #3 & #4
Worksheet for Curb Inlet On Grade

Project Description	
Worksheet	CB #3 & #4 (ON G
Type	Curb Inlet On Grad
Solve For	Length

Input Data		
Discharge	17.80	cfs
Efficiency	1.00	
Slope	.0177	ft/ft
Gutter Width	1.50	ft
Gutter Cross Slope	.0800	ft/ft
Road Cross Slope	0.0200	ft/ft
Mannings Coefficie	0.015	
Local Depression	4.0	in
Local Depression W	4.00	ft

Results		
Curb Opening Length	47.41	ft
Intercepted Flow	17.80	cfs
Bypass Flow	0.00	cfs
Spread	18.32	ft
Depth	0.46	ft
Flow Area	3.4	ft²
Gutter Depression	1.1	in
Total Depression	5.1	in
Velocity	5.20	ft/s
Equivalent Cross Slop	.0453	ft/ft
Length Factor	0.99	
Total Interception Len	47.69	ft

CB #5
Worksheet for Curb Inlet In Sag

Project Description	
Worksheet	CB #5 (SUMP)
Type	Curb Inlet In Sa
Solve For	Spread

Input Data		
Discharge	6.6	cfs
Gutter Width	0.0	ft
Gutter Cross Slope	0.0000	ft/ft
Road Cross Slope	0.0100	ft/ft
Curb Opening Leng	4.0	ft
Opening Height	0.72	ft
Curb Throat Type	orizontal	
Local Depression	4.0	in
Local Depression W	4.0	ft

Results		
Spread	40.3	ft
Throat Incline Ang	90.0	degree
Depth	0.40	ft
Gutter Depressio	0.0	in
Total Depression	4.0	in

CB #6
Worksheet for Curb Inlet In Sag

Project Description	
Worksheet	CB #6 (SUMP)
Type	Curb Inlet In Sa
Solve For	Spread

Input Data		
Discharge	3.7	cfs
Gutter Width	0.0	ft
Gutter Cross Slope	0.0000	ft/ft
Road Cross Slope	0.0100	ft/ft
Curb Opening Leng	4.0	ft
Opening Height	0.72	ft
Curb Throat Type	orizontal	
Local Depression	4.0	in
Local Depression W	4.0	ft

Results		
Spread	27.4	ft
Throat Incline An	90.0	degree
Depth	0.27	ft
Gutter Depressio	0.0	in
Total Depression	4.0	in

CB #7
Worksheet for Curb Inlet In Sag

Project Description	
Worksheet	CB #7 (SUMP)
Type	Curb Inlet In Sa
Solve For	Spread

Input Data		
Discharge	13.4	cfs
Gutter Width	1.5	ft
Gutter Cross Slope	0.0800	ft/ft
Road Cross Slope	0.0200	ft/ft
Curb Opening Leng	14.0	ft
Opening Height	0.72	ft
Curb Throat Type	orizontal	
Local Depression	4.0	in
Local Depression W	4.0	ft

Results		
Spread	21.1	ft
Throat Incline An	90.0	degree
Depth	0.51	ft
Gutter Depressio	1.1	in
Total Depression	5.1	in

CB #8
Worksheet for Curb Inlet In Sag

Project Description	
Worksheet	CB #8 (SUMP)
Type	Curb Inlet In Sa
Solve For	Spread

Input Data		
Discharge	3.0	cfs
Gutter Width	1.5	ft
Gutter Cross Slope	0.0800	ft/ft
Road Cross Slope	0.0200	ft/ft
Curb Opening Leng	4.0	ft
Opening Height	0.72	ft
Curb Throat Type	orizontal	
Local Depression	4.0	in
Local Depression W	4.0	ft

Results		
Spread	11.9	ft
Throat Incline An	90.0	degree
Depth	0.33	ft
Gutter Depressio	1.1	in
Total Depression	5.1	in

CB #9
Worksheet for Curb Inlet In Sag

Project Description	
Worksheet	CB #9 (SUMP)
Type	Curb Inlet In Sa
Solve For	Spread

Input Data		
Discharge	6.5	cfs
Gutter Width	0.0	ft
Gutter Cross Slope	0.0000	ft/ft
Road Cross Slope	0.0100	ft/ft
Curb Opening Leng	4.0	ft
Opening Height	0.72	ft
Curb Throat Type	orizontal	
Local Depression	4.0	in
Local Depression W	4.0	ft

Results		
Spread	39.9	ft
Throat Incline An	90.0	degree

APPENDIX I: DEBRIS YIELD CALCULATIONS USING THE US ARMY CORP OF ENGINEERS LOS ANGELES DISTRICT DEBRIS METHOD

MISSION CREEK

DEBRIS YIELD CALCULATIONS USING USCE EQUATION 4: LOG Dy = 0.94 (LOG Q) + 0.32 (LOG RR) + 0.14 (LOG A) + 0.17 (FF)

Area (Acres)	Area (SM)	Difference in Elevation (FT)	Length of Longest Watercourse, L (FT)	Length of Longest Watercourse, L (MI)	RR	Total Flow Rate, Q (CFS)	Unit Flow Rate, Q (CFS/SM)	Total Flow Volume (AF)	Total Flow Volume (CY)	FF	Log Dy	Unit Debris Yield (CY/SM)	Total Debris Yield (CY)	A/T	Adjusted Unit Debris Yield (CY/SM)	Adjusted Total Debris Yield (CY)
27,294.00	42.65	7,588.00	128,045.00	24.25	312.89	13,734.00	322.04	4,740	2,064,554,400	3.92	4.44	27,760	1,183,857	0.90	24,984	1,065,472

BULKING FACTOR CALCULATIONS:

LACFCD

Bulking Factor, Fb = 1 + [D/120,000]

Fb = 1.21

Factor of Safety = 25%

Adj. Fb = 1.51

Hamilton, MacArthur, and Vanoni (HM&V)

Bulking Factor, $F_b = 1/(1-C_Y)$ where $Cy = Vs/(Vs+Vw)$

Cy = 0.000516

Fb = 1.00

Factor of Safety = 25%

Adj. Fb = 1.25

MORONGO WASH

DEBRIS YIELD CALCULATIONS USING USCE EQUATION 5: LOG Dy = 1.02 (LOG Q) + 0.23 (LOG RR) + 0.16 (LOG A) + 0.13 (FF)

Area (Acres)	Area (SM)	Difference in Elevation (FT)	Length of Longest Watercourse, L (FT)	Length of Longest Watercourse, L (MI)	RR	Total Flow Rate, Q (CFS)	Unit Flow Rate, Q (CFS/SM)	Total Flow Volume (AF)	Total Flow Volume (CY)	FF	Log Dy	Unit Debris Yield (CY/SM)	Total Debris Yield (CY)	A/T	Adjusted Unit Debris Yield (CY/SM)	Adjusted Total Debris Yield (CY)
71,502.00	111.72	7,936.00	142,370.00	26.96	294.32	26,609.00	238.17	8,653	3,768,900,680	3.98	4.29	19,335	2,160,156	0.90	17,402	1,944,141

BULKING FACTOR CALCULATIONS:

LACFCD

Bulking Factor, Fb = 1 + [D/120,000]

Fb = 1.15

Factor of Safety = 25%

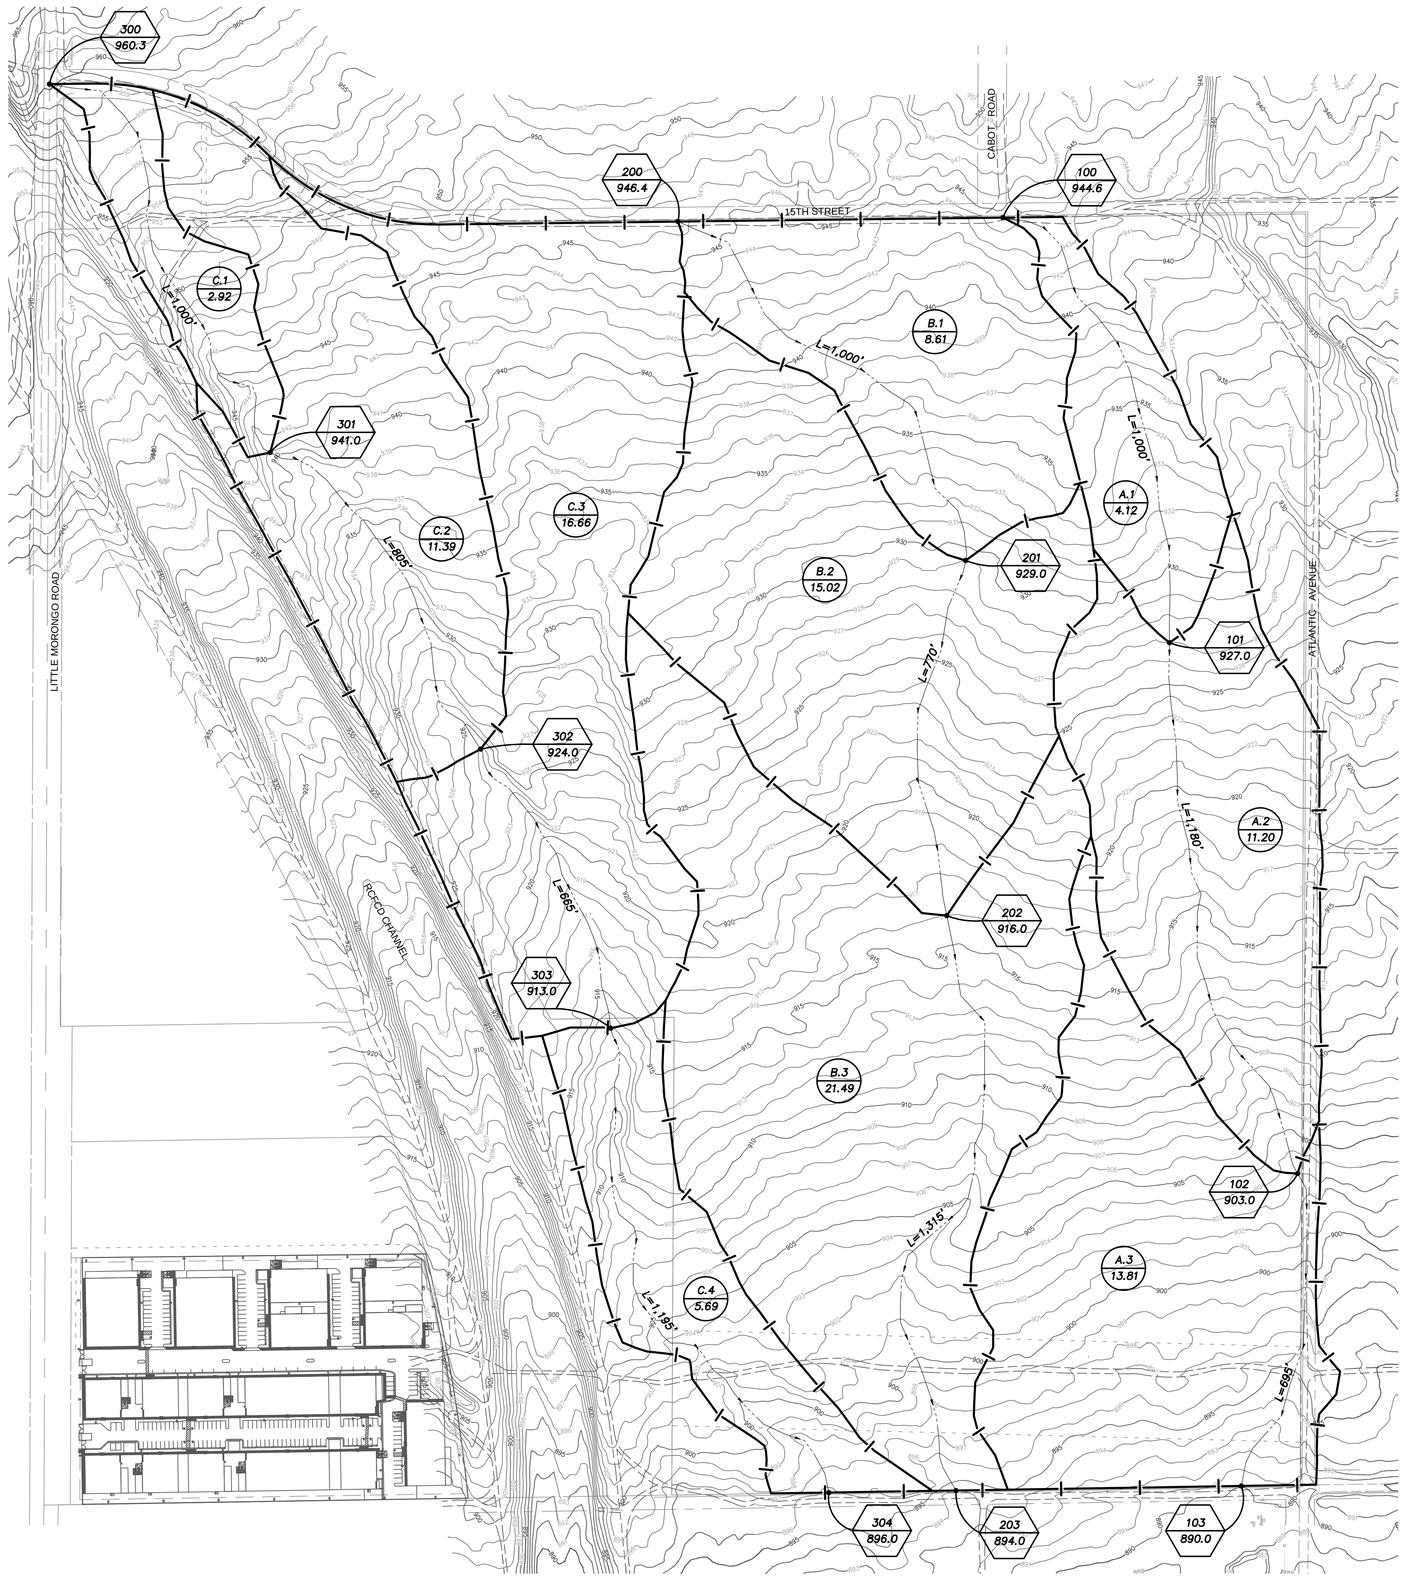
Adj. Fb = 1.43

Hamilton, MacArthur, and Vanoni (HM&V)

Bulking Factor, $F_b = 1/(1-C_Y)$ where $Cy = Vs/(Vs+Vw)$

Cy = 0.000516

Fb = 1.00



Factor of Safety = 25%

Adj. Fb = 1.25

EXHIBITS

EXECUTIVE SUMMARY

PURPOSE AND OBJECTIVES

The purpose of this report is to provide an assessment of the noise impacts associated with development and operation of the proposed DHS 109 Business Park (Tentative Parcel Map No. 37235) project and to identify mitigation measures that may be necessary to reduce those impacts. The noise issues related to the proposed land use and development have been evaluated in light of applicable federal, state and local policies, including those of the City of Desert Hot Springs.

Although this is a technical report, effort has been made to write the report clearly and concisely. A list of acronyms and glossary are provided in Appendix A and Appendix B of this report to assist the reader with technical terms related to noise analysis.

PROJECT LOCATION

The project site is located east of Little Morongo Road between 15th Avenue and 16th Avenue in the City of Desert Hot Springs. Project site APNs include: 665-080-005, 665-080-007, and 665-050-028. Figure 1 shows the project location map.

PROJECT DESCRIPTION

The project site is proposed to include an industrial park consisting of 57 condo lots that will accommodate a combination of general light industrial, cannabis (cultivation, manufacturing, distribution, etc.), and large scale energy/utility facilities land uses on approximately 109 acres. The proposed project will include 236,180 square feet of general light industrial uses, 761,770 square feet of industrial park (cannabis activity), and 286,230 square feet for large-scale energy/utility uses for a total of 1,284,180 square feet. The northwestern most portion the project site (approximately 4.5 acres) will remain undeveloped. The proposed project will include 4 retention basins, totaling 4.28 acres. The remainder of the project site will be developed with a roadway system with approximately 2,879 parking stalls provided, including 38 American's Disabilities Act (ADA) parking stalls. Furthermore, the proposed project will include carports to provide adequate shade cover for onsite parking. Proposed carports will also be designed for installation and operation of photovoltaic (PV) panels to provide onsite electricity.

PROJECT IMPACTS

Construction Impacts

Worst-case construction noise levels could reach 87.2 dBA L_{eq} and 91.0 dBA L_{max} at the property line of the proposed project. The nearest sensitive receptor is located approximately 270 feet southeast of the proposed project's southern property line. Project construction noise levels may reach up to 63.5 dBA L_{eq} and 66.9 dBA L_{max} at this receptor. These noise levels will substantially exceed ambient noise levels and may temporarily annoy adjacent and nearby residents. However, compliance with City Ordinance 9.04.030 will limit impacts to day-time hours and avoid nighttime and early morning impacts when people are generally more sensitive to noise. Implementation of Mitigation Measures 1-5 in Section 8 of this report will further reduce construction noise levels during the day.

Noise Impacts to Off-Site Receptors Due to Project Generated Trips

Existing and Existing Plus project noise levels along acoustically significant area roadways were modeled utilizing the FHWA Traffic Noise Prediction Model FHWA-RD-77-108 in order to quantify the proposed project's contribution to increases in ambient noise levels.

For off-site project generated noise, increases in ambient noise along affected roadways due to project generated vehicle traffic is considered substantial if they result in an increase of at least 3 dBA CNEL and: (1) the existing noise levels already exceed the applicable land use compatibility standard for the affected sensitive receptors set forth in the City's General Plan; or (2) the project increases noise levels by at least 3 dBA CNEL and raises the ambient noise level from below the applicable standard to above the applicable standard.

Per the noise modeling, all of the modeled roadway segments are anticipated to change the noise a nominal amount (approximately 0.02 to 1.834 dBA CNEL). Therefore, a change in noise level would not be audible and would be considered less than significant. No mitigation is required.

Noise Impacts to Off-Site Receptors Due to On-Site Operational Noise

The operational activities associated with the proposed project were modeled using the SoundPLAN noise model to assess potential noise impacts to nearby single-family detached residential dwelling units. Specifically, these activities include power plant equipment noise, parking lot noise, heating and air conditioning units (HVAC), and loading and unloading.

Land zoned for open space and conservation borders the site to the west; land zoned for light industrial development borders the site to the north and south, and for part of the eastern project boundary. Land adjacent to the northeast corner of the project site is zoned for rural desert residential land uses. There are existing single-family residential land uses in the general vicinity but not immediately adjacent to the project site.

As shown in Table 6, existing measured noise levels at nearby sensitive receptors range between 36.4 and 44.8 dBA L_{eq}, and modeled project operational noise levels are expected to range between 30.0 and 43.0 dBA L_{eq}. Project operations will not result in substantial increases in ambient noise levels.

As shown in Figures 6 and 7 modeled exterior project operational noise levels range between 30.3 and 52.8 dBA L_{eq} in the project vicinity and are unlikely to exceed the City's exterior noise criteria of 65 dBA L_{eq} or the City's interior noise criteria of 45 dBA L_{eq}. Typical residential construction provides 15 dB of reduction with a windows open condition and 20 dB of reduction with a windows closed condition. Impacts related to project operation will be less than significant. No mitigation is required.

Power plant, parking lot, HVAC and loading and unloading activities are not expected to exceed the City's noise level standard for residential properties of 65 dBA L_{eq} at any existing residential land uses. Operational noise impacts would be less than significant. No mitigation measures are required.

Groundborne Vibration Impacts

Construction equipment is anticipated to be located at a distance of at least 270 feet or more from any receptor. Temporary vibration levels associated with project construction would be less than significant. Therefore, impacts associated with construction activities would be less than significant. No mitigation is required.

CONSTRUCTION NOISE REDUCTION MEASURES

In addition to adherence to the City of Desert Hot Springs's policies found in the Noise Element and Municipal Code limiting the construction hours of operation, the following measures are recommended to reduce construction noise and vibrations, emanating from the proposed project:

1. During all project site excavation and grading on-site, construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturer standards.

2. The contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the project site.

3. Equipment shall be shut off and not left to idle when not in use.

4. The contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise/vibration sources and sensitive receptors nearest the project site during all project construction.

5. Jackhammers, pneumatic equipment and all other portable stationary noise sources shall be shielded and noise shall be directed away from sensitive receptors.

1. INTRODUCTION

This section describes the purpose of this noise impact analysis, project location, proposed development, and study area. Figure 1 shows the project location map and Figure 2 illustrates the project site plan.

PURPOSE AND OBJECTIVES

The purpose of this report is to provide an assessment of the noise impacts associated with development and operation of the proposed DHS 109 Business Park (Tentative Parcel Map No. 37235) project and to identify mitigation measures that may be necessary to reduce those impacts. The noise issues related to the proposed land use and development have been evaluated in light of applicable federal, state and local policies, including those of the City of Desert Hot Springs.

Although this is a technical report, effort has been made to write the report clearly and concisely. A list of acronyms and glossary are provided in Appendix A and Appendix B of this report to assist the reader with technical terms related to noise analysis.

PROJECT LOCATION

The project site is located east of Little Morongo Road between 15th Avenue and 16th Avenue in the City of Desert Hot Springs. Project site APNs include: 665-080-005, 665-080-007, and 665-050-028. Figure 1 shows the project location map.

PROJECT DESCRIPTION

The project site is proposed to include an industrial park consisting of 57 condo lots that will accommodate a combination of general light industrial, cannabis (cultivation, manufacturing, distribution, etc.), and large scale energy/utility facilities land uses on approximately 109 acres. The proposed project will include 236,180 square feet of general light industrial uses, 761,770 square feet of industrial park (cannabis activity), and 286,230 square feet for large-scale energy/utility uses for a total of 1,284,180 square feet. The northwestern most portion the project site (approximately 4.5 acres) will remain undeveloped. The proposed project will include 4 retention basins, totaling 4.28 acres. The remainder of the project site will be developed with a roadway system with approximately 2,879 parking stalls provided, including 38 American's Disabilities Act (ADA) parking stalls. Furthermore, the proposed project will include carports to provide adequate shade cover for onsite parking. Proposed carports will also be designed for installation and operation of photovoltaic (PV) panels to provide onsite electricity.

Project Components

Industrial Development

Numbered condo lots 1 through 55 will be developed with modular industrial buildings. Two different modular buildings will be used. Building Type A will encompass a single numbered lot. Lots developed with Building Type A will include a 23,210 square-foot structure. Building Type B will encompass four numbered lots. Lots developed with Building Type B will include a 95,410 square-foot structure.

Construction and operation of the proposed modular industrial buildings will follow an approach to use natural "energy reduction" by design that will incorporate the latest proven technology in:

- Building envelope design with a combination of shading, insulation and high-performance coating materials;

- Water service, purification and treatment design that would use a dual waste system for both solid and liquid waste, the "brown water" and condensate harvesting would be collected, treated and reused in the "non-potable" water systems;
- Building heating and cooling systems would use a combination of absorption and vapor compression equipment for both process and space cooling and Liquid-to-Liquid "Heat Exchangers" for process and space heating;
- Lighting and illumination design would use a combination of natural and LED lighting technology coupled with digital control systems; and
- Building automation systems design would use load monitoring and shedding technology to optimize power generation and minimize power demand through AI software "Smart" technology that identifies and optimizes energy use patterns.

Power and Reclamation Facility

The proposed project will include a power and reclamation facility (PRF) that includes a combination of alternative energy source design features that will provide energy and reclamation services to the project site. Lots 28-31, 32-35, and 47-50 located on the frontage of Atlantic Avenue encompass three Type B buildings that will be decimated for construction and operation of the PRF. Each building utilized for the PRF proposes a maximum height of 55 feet to compensate for the proposed exhaust columns (i.e., boilers). The proposed PRF buildings are the farthest buildings located away from Little Morongo Road and the proposed parapets would obscure views of the exhaust columns of the PRF. The applicant is requesting for an administrative height variance for all dedicated buildings for the proposed PRF for an addition of up to five (5) feet for purposes of allowing sufficient operational height for PRF features such as the proposed cooling towers. Lack of provision of the requested five (5) feet would affect operational capability of the proposed PRF and prevent for alternative energy production and reclamation capabilities.

The PRF will use a combination natural gas fired turbines and reciprocal engines, while the proposed project's peak power generation will be done through a combination of thermal and photovoltaic (PV) solar arrays coupled with battery and thermal energy storage systems. The PRF will also include chilled water and heating water loops to use the waste heat from the onsite power generation to provide heating and air conditioning through the use of absorption chilling for process and space cooling and heat transfer fluid to water heat-exchangers for space and process. In tandem with the solar panel carports, the PRF is anticipated to produce more energy than is needed for the proposed project.

The PRF will meet utility level reliability in operation and comply with all applicable building code and regulatory requirements. The PRF will meet an N+1 equipment environment that ensures that the PRF's systems remain available and operational in the event of component(s) failure. Furthermore, the PRF would operate as a semi closed-loop facility through utilization of reclaimed waste products (i.e., exhaust gases, green waste, wastewater, etc.) derived from onsite operations (i.e., cannabis cultivation) and operations within the PRF itself. The reclaimed waste products will serve as feedstocks for the various power and reclamation systems of the PRF.

The power and reclamation facility will provide the following power and reclamation services:

Electrical Power Generation

Within the PRF, natural gas fired turbine generators would be used as the source of electrical power generation for the proposed project. Natural gas fired turbine generators are proposed to be built in phases concurrent with the proposed phasing of the proposed project buildings. The overall production capacity of the natural gas fired turbines at project build-out would be 60 megawatts (MW). The proposed phased development (discussed below) of the natural gas fired turbine generators would be the following:

- Phase 1 = 20 MW Production Capacity

- Phase 2 = 20 MW Production Capacity
- Phase 3 = 10 MW Production Capacity
- Phase 4 = 10 MW Production Capacity

The natural gas fired turbine generators would be designed to provide local export of excess power to neighboring uses if an agreement between the applicant, City and the local energy purveyor is established at a future time. For purposes of analysis, the natural gas fired turbine generators would not be exporting any excess power to neighboring uses.

Waste Heat Recovery (Steam and Hot Water Systems)

Waste heat recovery, of the PRF, would utilize exhaust gases from the natural gas fired turbine generators to provide an opportunity to extract further low-level heat in order to allow for either the generation of low pressure steam, generation of hot water, or any combination of the two. Conversion of exhaust gases into low-level heat can allow for generation of electricity and direct chilled water. Electricity generation would use Organic Rankine Cycle generators for bottoming power cycle to generate power that can be used to drive mechanical chillers/refrigeration systems. Direct chilled water would utilize lower pressure steam or hot water (or any combination of the two) to run absorption chillers to produce chilled water for sale to agricultural users within the industrial park.

Chilled Water

Chilled water would be produced within the PRF and be used for management of the grow room temperature and humidity within each modular industrial building.

Generation of chilled water requires the installation of cooling water towers within the PRF to address final disposition of lowest level of waste heat. Cooling water towers will require significant water and power to operate, however, are more efficient relative to multiple smaller chilling systems which would otherwise be installed within each proposed industrial modular building. Sizing of the cooling towers will be determined at final design of the proposed project.

Pure (Reverse Osmosis) Quality Water

The PRF would include a reverse osmosis (RO) water treatment system to upgrade municipal water and recycled (grey) water to high standards which allows distribution for use by potential agricultural tenants within the proposed project. The RO water treatment system would facilitate management of wastewater and associated compliance with discharge permits. Additionally, the RO water treatment system would provide an agricultural feed of high-quality water to agricultural tenants of the proposed project to reduce crop failure issues.

Fire Water System

The PRF would include a fire water system to serve the entire project site in order to meet the regulatory requirements for the proposed project. It is anticipated that the sizing of the distribution mains will need to address future build-out of the proposed project.

Grey/Wastewater Recovery Treatment

The PRF will include grey/wastewater recovery treatment to reclaim onsite wastewater generated in office buildings from sinks, baths, washing machines, etc. Grey/wastewater is anticipated to be available from the following onsite sources:

- Byproduct of humidity control (water of plant respiration);

- Collection of process drains (wash down water, etc.) from both utility and proposed building systems;
- Recycling of process and dilution water used in the Bio-Digestion system(s) of the PRF; and
- Cooling Tower.

Water Distribution

The PRF will have the capability to serve as a point of distribution of potable water for domestic uses only to the proposed buildings.

Carbon Dioxide gas – Generation and Distribution

Carbon dioxide (CO_2) gas is used to enrich the growing atmosphere of the crops to improve productivity of the plants. Capture of carbon dioxide is anticipated to be captured from the cooled exhaust gases of the natural gas fired turbine generators. Several technologies exist for capture and will be evaluated for best economic value versus the production need prior to final design.

Agricultural Waste Management

The PRF will include a Bio-Digester system to facilitate capture and management of agricultural waste produced onsite. Agricultural waste from the production facilities must be cataloged and disposed of via a tracking system to a licensed landfill facility in the State. Several landfill facilities are operating in the greater Los Angeles area. Provision of onsite waste management services via installation of a licensed agricultural waste disposal system (Bio-Digester system) would benefit potential tenants of the proposed project through minimization of the risk of transfer of agricultural waste, greenhouse gas (GHG) emissions of routine transport trips to a licensed landfill facility, and overall cost of such routine waste transport.

The Bio-Digester system would require input of low-level heat and could utilize the recovered waste low-level waste heat mentioned above.

The site plan is shown in Figure 2

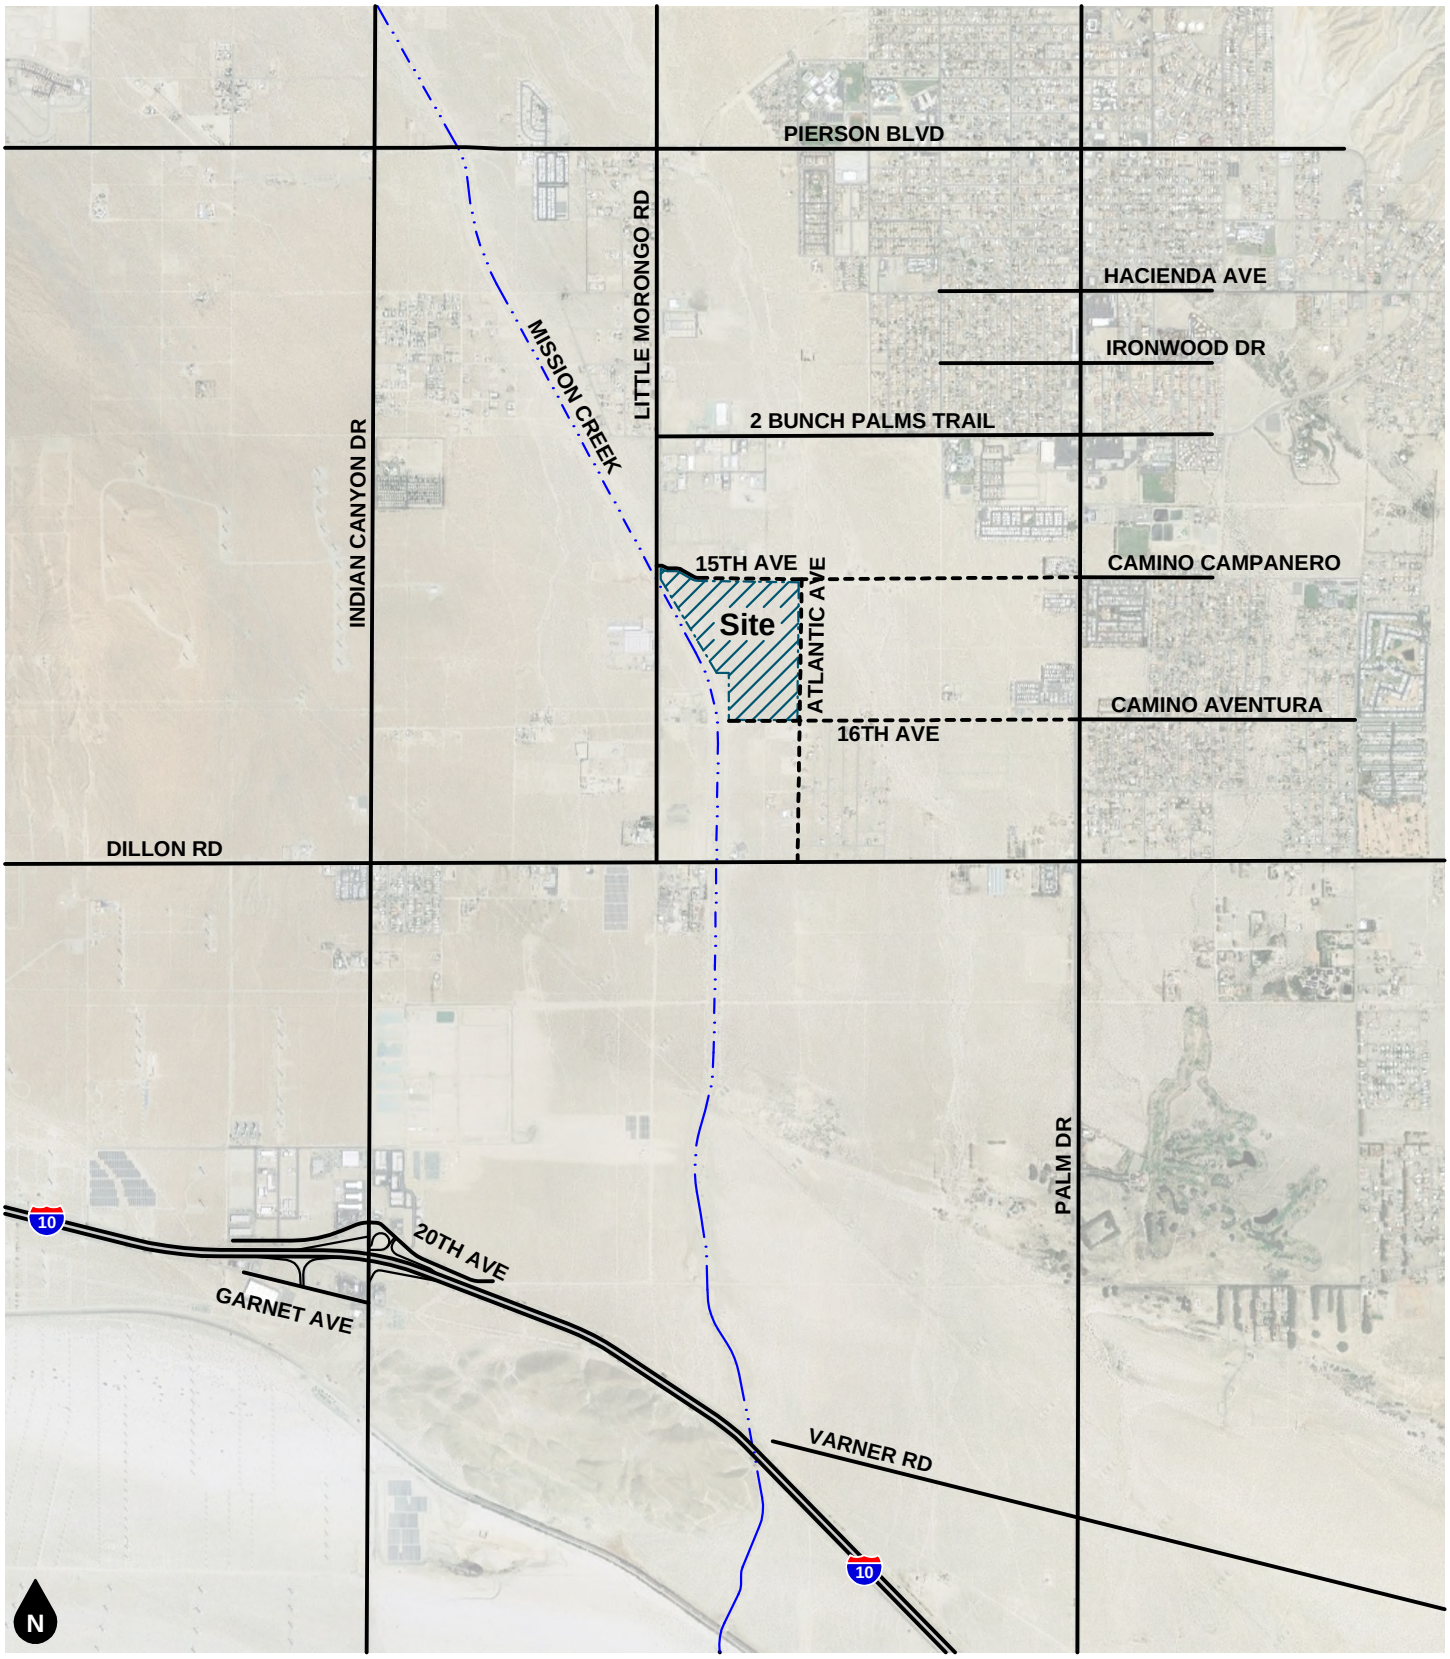

Figure 1
Project Location Map

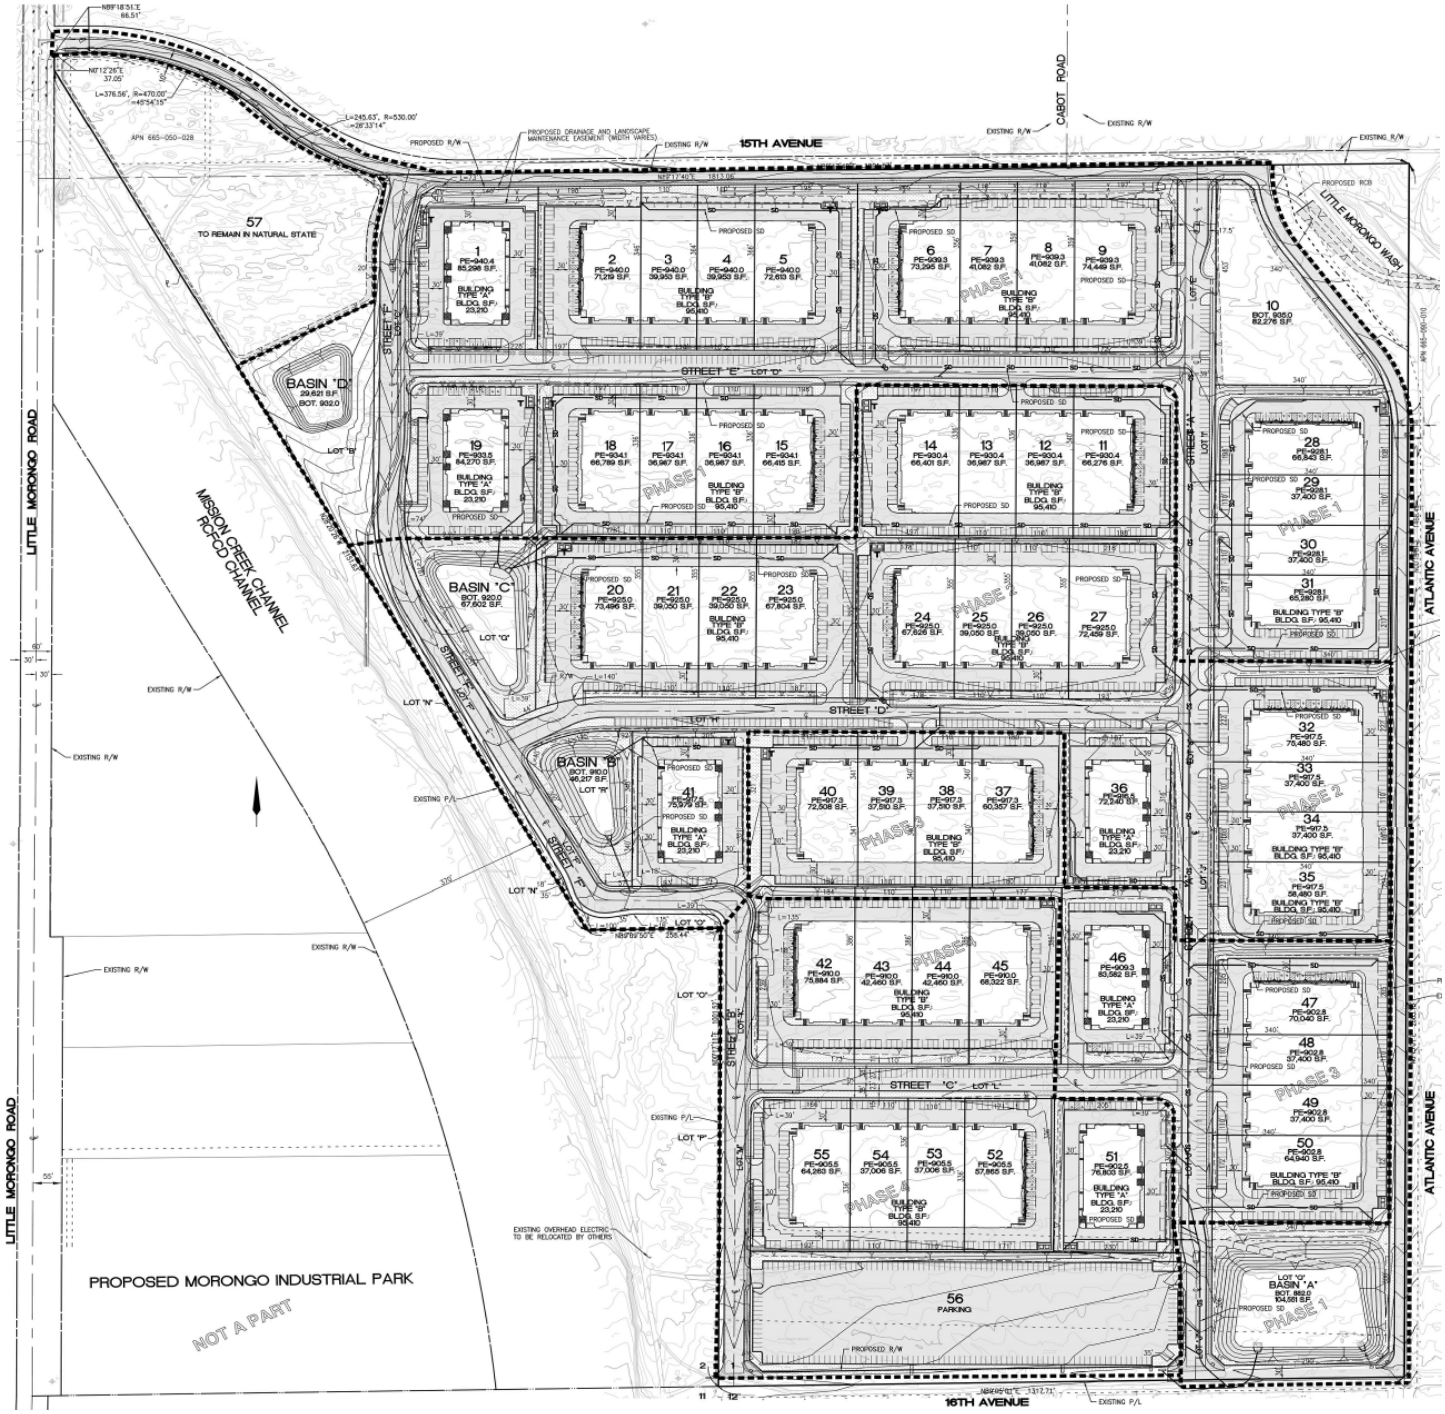

Figure 2
Site Plan

2. NOISE AND VIBRATION FUNDAMENTALS

NOISE FUNDAMENTALS

Sound is a pressure wave created by a moving or vibrating source that travels through an elastic medium such as air. Noise is defined as unwanted or objectionable sound. The effects of noise on people can include general annoyance, interference with speech communication, sleep disturbance, and in extreme circumstances, hearing impairment.

Commonly used noise terms are presented in Appendix B. The unit of measurement used to describe a noise level is the decibel (dB). The human ear is not equally sensitive to all frequencies within the sound spectrum. Therefore, the "A-weighted" noise scale, which weights the frequencies to which humans are sensitive, is used for measurements. Noise levels using A-weighted measurements are written dB(A) or dBA.

From the noise source to the receiver, noise changes both in level and frequency spectrum. The most obvious is the decrease in noise as the distance from the source increases. The manner in which noise reduces with distance depends on whether the source is a point or line source as well as ground absorption, atmospheric effects and refraction, and shielding by natural and manmade features. Sound from point sources, such as air conditioning condensers, radiates uniformly outward as it travels away from the source in a spherical pattern. The noise drop-off rate associated with this geometric spreading is 6 dBA per each doubling of the distance (dBA/DD). Transportation noise sources such as roadways are typically analyzed as line sources, since at any given moment the receiver may be impacted by noise from multiple vehicles at various locations along the roadway. Because of the geometry of a line source, the noise drop-off rate associated with the geometric spreading of a line source is 3 dBA/DD.

Decibels are measured on a logarithmic scale, which quantifies sound intensity in a manner similar to the Richter scale used for earthquake magnitudes. Thus, a doubling of the energy of a noise source, such as a doubled traffic volume, would increase the noise levels by 3 dBA; halving of the energy would result in a 3 dBA decrease. Figure 3 shows the relationship of various noise levels to commonly experienced noise events.

Average noise levels over a period of minutes or hours are usually expressed as dBA L_{eq}, or the equivalent noise level for that period of time. For example, $L_{eq(3\text{-}hr)}$ would represent a 3-hour average. When no period is specified, a one-hour average is assumed.

Noise standards for land use compatibility are stated in terms of the Community Noise Equivalent Level (CNEL) and the Day-Night Average Noise Level (DNL). CNEL is a 24-hour weighted average measure of community noise. CNEL is obtained by adding five decibels to sound levels in the evening (7:00 PM to 10:00 PM), and by adding ten decibels to sound levels at night (10:00 PM to 7:00 AM). This weighting accounts for the increased human sensitivity to noise during the evening and nighttime hours. DNL is a very similar 24-hour average measure that weights only the nighttime hours.

It is widely accepted that the average healthy ear can barely perceive changes of 3 dBA; that a change of 5 dBA is readily perceptible, and that an increase (decrease) of 10 dBA sounds twice (half) as loud. This definition is recommended by the California Department of Transportation's Technical Noise Supplement to the Traffic Noise Analysis Protocol (2013).

VIBRATION FUNDAMENTALS

The way in which vibration is transmitted through the earth is called propagation. Propagation of earthborn vibrations is complicated and difficult to predict because of the endless variations in the soil through which waves travel. There are three main types of vibration propagation: surface, compression and shear waves. Surface waves, or Raleigh waves, travel along the ground's surface. These waves carry most of their energy along an expanding circular wave front, similar to ripples produced by throwing a rock into a pool of water.

Compression waves, or P-waves, are body waves that carry their energy along an expanding spherical wave front. The particle motion in these waves is longitudinal (i.e., in a "push-pull" fashion). P-waves are analogous to airborne sound waves. Shear waves, or S-waves, are also body waves that carry energy along an expanding spherical wave front. However, unlike P-waves, the particle motion is transverse or "side-to-side and perpendicular to the direction of propagation".

As vibration waves propagate from a source, the energy is spread over an ever-increasing area such that the energy level striking a given point is reduced with the distance from the energy source. This geometric spreading loss is inversely proportional to the square of the distance. Wave energy is also reduced with distance as a result of material damping in the form of internal friction, soil layering, and void spaces. The amount of attenuation provided by material damping varies with soil type and condition as well as the frequency of the wave.

Vibration amplitudes are usually expressed as either peak particle velocity (PPV) or the root mean square (RMS) velocity. The PPV is defined as the maximum instantaneous peak of the vibration signal in inches per second. The RMS of a signal is the average of the squared amplitude of the signal in vibration decibels (VdB), ref one micro-inch per second. The Federal Railroad Administration uses the abbreviation "VdB" for vibration decibels to reduce the potential for confusion with sound decibel.

PPV is appropriate for evaluating the potential of building damage and VdB is commonly used to evaluate human response. Decibel notation acts to compress the range of numbers required in measuring vibration. Similar to the noise descriptors, L_{eq} and L_{max} can be used to describe the average vibration and the maximum vibration level observed during a single vibration measurement interval. Figure 4 illustrates common vibration sources and the human and structural responses to ground-borne vibration. As shown in the figure, the threshold of perception for human response is approximately 65 VdB; however, human response to vibration is not usually substantial unless the vibration exceeds 70 VdB. Vibration tolerance limits for sensitive instruments such as magnetic resonance imaging (MRI) or electron microscopes could be much lower than the human vibration perception threshold.

3. EXISTING NOISE ENVIRONMENT

SENSITIVE NOISE RECEPTORS

The State of California defines sensitive receptors as those land uses that require serenity or are otherwise adversely affected by noise events or conditions. Schools, libraries, churches, hospitals, and residential uses make up the majority of these areas. In addition, the City of Desert Hot Spring's General Plan Noise Element identifies sensitive receptors as residences, schools, libraries, churches, hospitals, nursing homes, and resort areas. The General Plan also states that parks, golf courses and other outdoor activity areas can be sensitive to noise disturbances as well.

Sensitive receptors that may be affected by project generated vehicular trips include the single-family detached residential dwelling units located as close as approximately 0.05 miles (~270 feet) to the southeast, 0.53 mile to the southwest, and 0.60 mile to the northeast of the project site. Mobile home parks are located approximately 0.65 miles to the northeast and 0.75 miles to the east of the project site. In addition, Two Bunch Palms Elementary School is located approximately 0.62 miles northeast of the project site.

EXISTING NOISE LEVELS

An American National Standards Institute (ANSI Section SI4 2013 Class 1) Larson Davis model LxT sound level meter was used to document existing ambient noise levels. In order to document existing ambient noise levels in the project area, five (5) 15-minute daytime noise measurements were taken between 10:44 AM and 3:06 PM on August 10, 2020. In addition, one (1) long-term 24-hour noise measurement was also taken from August 10, 2020 to August 11, 2020. Field worksheets and noise measurement output data are included in Appendix C.

As shown on Figure 5, the noise measurements were taken near the residential use located east of West Drive (STNM1), near the school and residential uses to the northeast of the project site (along West Drive) (STNM2), north of the project site along Palomar Lane (STNM3), near the at the nearest residential uses to th west of the project site (along Vermillion Drive) (STNM4), near the closest residential uses to the south of the project site (along Atlantic Avenue) (STNM5), and at the southeastern boundary of the project site (near Atlantic Avenue) (LTNM1). Table 1 provides a summary of the short-term ambient noise data. Table 2 provides hourly interval ambient noise data from the long-term noise measurement. Short-term ambient noise levels were measured between 36.4 and 46.2 dBA L_{eq}. Long-term hourly noise measurement ambient noise levels ranged from 35.9 to 56.5 dBA L_{eq}. The dominant noise sources were from wildlife, wind, machinery, and residential noise.

Table 1

4. REGULATORY SETTING

FEDERAL REGULATIONS

Federal Noise Control Act of 1972

The U.S. Environmental Protection Agency (EPA) Office of Noise Abatement and Control was originally established to coordinate federal noise control activities. After its inception, EPA's Office of Noise Abatement and Control issued the Federal Noise Control Act of 1972, establishing programs and guidelines to identify and address the effects of noise on public health, welfare, and the environment. In response, the EPA published Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety (Levels of Environmental Noise). The Levels of Environmental Noise recommended that the L_{dn} should not exceed 55 dBA outdoors or 45 dBA indoors to prevent significant activity interference and annoyance in noise-sensitive areas.

In addition, the Levels of Environmental Noise identified 5 dBA as an "adequate margin of safety" for a noise level increase relative to a baseline noise exposure level of 55 dBA L_{dn} (i.e., there would not be a noticeable increase in adverse community reaction with an increase of five dBA or less from this baseline level). The EPA did not promote these findings as universal standards or regulatory goals with mandatory applicability to all communities, but rather as advisory exposure levels below which there would be no risk to a community from any health or welfare effect of noise.

In 1981, EPA administrators determined that subjective issues such as noise would be better addressed at lower levels of government. Consequently, in 1982 responsibilities for regulating noise control policies were transferred to State and local governments. However, noise control guidelines and regulations contained in EPA rulings in prior years remain in place by designated Federal agencies, allowing more individualized control for specific issues by designated Federal, State, and local government agencies.

STATE REGULATIONS

State of California General Plan Guidelines 2017

Though not adopted by law, the State of California General Plan Guidelines 2003, published by the California Governor's Office of Planning and Research (OPR) (OPR Guidelines), provides guidance for the compatibility of projects within areas of specific noise exposure. The OPR Guidelines identify the suitability of various types of construction relative to a range of outdoor noise levels and provide each local community some flexibility in setting local noise standards that allow for the variability in community preferences. Findings presented in the Levels of Environmental Noise Document (EPA 1974) influenced the recommendations of the OPR Guidelines, most importantly in the choice of noise exposure metrics (i.e., L_{dn} or CNEL) and in the upper limits for the normally acceptable outdoor exposure of noise-sensitive uses.

The OPR Guidelines include a Noise and Land Use Compatibility Matrix which identifies acceptable and unacceptable community noise exposure limits for various land use categories. Where the "normally acceptable" range is used, it is defined as the highest noise level that should be considered for the construction of the buildings which do not incorporate any special acoustical treatment or noise mitigation. The "conditionally acceptable" or "normally unacceptable" ranges include conditions calling for detailed acoustical study or construction mitigation to reduce interior exposure levels prior to the construction or operation of the building under the listed exposure levels. The City of Desert Hot Springs has incorporated these guidelines in the City's General Plan Noise Element.

California Environmental Quality Act

The California Environmental Quality Act Guidelines (Appendix G) establishes thresholds for noise impact analysis. This noise study includes analysis of noise and vibration impacts necessary to assess the project in light of the following Appendix G Checklist Thresholds.

Would the project result in:

a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Substantial increases in ambient noise levels are usually associated with project construction noise (temporary) and project operational noise (permanent).

Project Construction Noise: Construction noise sources are regulated within the City of Desert Hot Springs under Section 9.04.030 of the City's Municipal Code which prohibits construction between the hours of 5:00 PM of each day and 7:00 AM of the next day, except when daylight savings time is in effect. During such time as daylight savings time is in effect in the City, no such activities shall be permitted between the hours of 6:00 PM of each day and 6:00 AM of the next day. No such activities shall be permitted on Sundays.

Project Operational Noise (permanent): The proposed project has the potential to generate on-site and off-site noise. For on-site generated noise, the City of Desert Hot Springs Municipal Code Section 17.40.180 states that exterior noise levels shall not exceed 65 dBA and interior noise levels shall exceed 45 dBA in residential areas.

For off-site project generated noise, increases in ambient noise along affected roadways due to project generated vehicle traffic is considered substantial if they result in an increase of at least 3 dBA CNEL and: (1) the existing noise levels already exceed the applicable land use compatibility standard for the affected sensitive receptors set forth in the City's General Plan; or (2) the project increases noise levels by at least 3 dBA CNEL and raises the ambient noise level from below the applicable standard to above the applicable standard.

b) Generate excessive groundborne vibration or groundborne noise levels?

As shown in Table 9, the threshold at which there is a risk to "architectural" damage to historic and some older buildings is a peak particle velocity (PPV) of 0.25, at older residential structures a PPV of 0.3, and at new residential structures a PPV of 0.5. Table 8 shows that a PPV of 0.04 is the threshold at which groundborne vibration becomes distinctly perceptible in regards to annoyance. Impacts would be significant if construction activities result in groundborne vibration of 0.25 PPV or higher at a sensitive receptor.

Furthermore, Section 17.40.300 of the City of Desert Hot Springs states no vibration associated with any use shall be permitted which is discernible beyond the boundary line of the property.

California Department of Transportation (Caltrans)

The California Department of Transportation has published one of the seminal works for the analysis of ground-borne noise and vibration relating to transportation- and construction-induced vibrations and although the project is not subject to these regulations, it serves as useful tools to evaluate vibration impacts. These guidelines recommend that a standard of 0.2 inches per second (in/sec) PPV not be exceeded for the protection of historic and some old buildings (California Department of Transportation, 2020). This is the appropriate threshold for construction related ground-borne vibration impacts.

LOCAL REGULATIONS

City of Desert Hot Springs General Plan Noise Element

The City of Desert Hot Springs General Plan has Land Use Compatibility for Community Noise Exposure standards, shown in Table 3. The interior and exterior noise standards are in terms of the Community Noise Equivalent Level (CNEL). The standards state that for residential land uses, exterior noise exposure levels of up to 60 CNEL are considered "normally acceptable" and noise levels of up to 65 CNEL are considered "conditionally acceptable". Heavy Commercial/Industrial land uses are considered "normally acceptable" in environments where the noise level reaches up to 75 CNEL.

The City of Desert Hot Springs General Plan Noise Element includes the following goals and policies that pertain to the proposed project.

Goal

A noise environment providing peace and quiet that complements and is consistent with the City's spa resort and residential character and the various mix of land uses comprising the community.

Policy 1
The potential of land use patterns, associated traffic and its distribution, and individual development shall be assessed for their potential to generate adverse and incompatible noise impacts, and significant impacts identified shall be appropriately mitigated.

Policy 2
Protect noise sensitive land uses, including residences, resorts and community open space, schools, libraries, churches, hospitals and convalescent homes from high noise levels from both existing and future noise sources.

City of Desert Hot Springs Municipal Code

City of Desert Hot Springs Municipal Ordinances applicable to the evaluation of the proposed project in this analysis include the following:

Section 8.12.030 of the Municipal Ordinance states it is unlawful for any person to make, suffer, permit, allow, continue, or cause to be made, suffered, permitted, allowed, or continued, within the City limits or within 200 feet thereof, any noise disturbance. Per Section 8.12.020 a noise disturbance is any sound that:

1. Endangers the safety or health of any person;
2. Disturbs a reasonable person of normal sensitivities; or
3. Endangers personal or real property.

Section 8.12.090 of the Municipal Ordinance states that it is unlawful for any person to cause, suffer, allow, or permit any of the following outside of the following hours: Monday through Friday, 7:00 AM through 6:00 PM; Saturday, 8:00 AM through 6:00 PM and Sunday, 9:00 AM through 5:00 PM.

- Loading, unloading, opening, closing or other handling of boxes, crates, containers, building materials, garbage cans, or similar objects in such a manner as to cause a noise disturbance across a residential real property boundary.
- Operating any mechanically powered saw, sander, drill, grinder, lawn or garden tool, or similar device so as to cause a noise disturbance across a residential real property boundary.

Section 8.12.100 of the Ordinance states that it is unlawful for any person to cause, suffer, allow or permit any construction, drilling or demolition work, or the use of tools or equipment therefore, between the hours

of 5:00 PM of each day and 7:00 AM of the next day, except when daylight savings time is in effect. During such time as daylight savings time is in effect in the City, no such activities shall be permitted between the hours of 6:00 PM of each day and 6:00 AM of the next day. No such activities shall be permitted on Sundays.

Section 9.04.030 of the Ordinance states except as herein otherwise provided, no person shall be engaged or employed nor shall any person cause any other person to be engaged or employed in any work of construction, erection, alteration, or repair, addition to or improvement of any building, structure, road or improvement to realty between the hours of 5:00 PM of each day and 7:00 AM of the next day, except when daylight savings time is in effect. During such time as daylight savings time is in effect in the City, no such activities shall be permitted between the hours of 6:00 PM of each day and 6:00 AM of the next day. No such activities shall be permitted on Sundays.

Section 17.40.180 No loudspeaker, bells, gongs, buzzers, mechanical equipment or other sounds, attention attracting, or communication device associated with any use shall be discernible beyond any boundary line of the parcel, except fire protection devices, burglar alarms and church bells. The following provisions shall apply:

A. In residential areas, no exterior noise level shall exceed 65 dBA and no interior noise level shall exceed 45 dBA.

C. The minimum acceptable surface weight for a noise barrier is 4 pounds per square foot (equivalent to 3/4-inch plywood). The barrier shall be of a continuous material which is resistant to sound including: (1) masonry block; (2) precast concrete; or (3) earth berm or a combination of earth berm with block concrete.

D. Noise barriers shall interrupt the line of sight between noise source and receiver.

Section 17.40.300 of the Ordinance states no vibration associated with any use shall be permitted which is discernible beyond the boundary line of the property.

Table 3
City of Desert Hot Springs Land Use Compatibility Guidelines for Noise

Land Use Category	Community Noise Equivalent Level (CNEL)					
	55	60	65	70	75	80
Residential Land Uses: Single-family & Multi-family, Group Quarters, Mobile Homes						
Transient Lodging: Hotels & Motels						
School Classrooms, Libraries, Churches, Hospitals, Nursing Homes, & Convalescent Hospitals						
Recreation Land Uses: Golf Courses, Open Space (with walking, bicycling, or horseback riding trails, etc.)						
Office Buildings, Personal Business, & Professional Services						
Commercial Land Uses: Retail Trade, Movie Theaters, Restaurants, Bars, Entertainment Activities, Services						
Heavy Commercial/Industrial: Wholesale, Manufacturing, Utilities, Transportation, Communications						
Auditoriums, Concert Halls, Amphi-theaters, Music Shells (may be sensitive receptors or generators)						
Sports Arenas, Outdoor Spectator Sports						

Normally Acceptable:	Specified land use is satisfactory, based up the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.
Conditionally Acceptable:	New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed insulation features included in the design. Conventional constuction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.
Normally Unacceptable:	New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise reduction features included in the design.
Clearly Unacceptable:	New construction or development should generally not be undertaken.

5. ANALYTICAL METHODOLOGY AND MODEL PARAMETERS

This section discusses the analysis methodologies used to assess noise impacts.

CONSTRUCTION NOISE MODELING

A worst-case construction noise scenario was modeled using the Federal Highway Administration's Roadway Construction Noise Model (RCNM). Modeling parameters and output are provided in Appendix D. RCNM utilizes standard noise emission levels for many different types of equipment and includes utilization percentage, impact, and shielding parameters.

FEDERAL HIGHWAY ADMINISTRATION (FHWA) TRAFFIC NOISE PREDICTION MODEL

Existing and Existing Plus Project noise levels along roadways affected by the proposed project and along roadways that may affect the proposed project were modeled utilizing the FHWA Traffic Noise Prediction Model - FHWA-RD-77-108.

The FHWA Traffic Noise Prediction Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). Adjustments are then made to the REMEL to account for: total average daily trips (ADT), roadway classification, width, speed and truck mix, roadway grade and site conditions (hard or soft ground surface). Surfaces adjacent to all modeled roadways were assumed to have a "hard site" to predict worst-case, conservative noise levels. A hard site, such as pavement, is highly reflective and does not attenuate noise as quickly as grass or other soft sites. Possible reductions in noise levels due to intervening topography and buildings were not accounted for in this analysis.

Existing and Existing Plus Project average daily traffic volumes were obtained from the project's Traffic Impact Analysis (Ganddini Group, Inc., 2019). Vehicle/truck mixes and D/E/N splits for use in acoustical studies published by the Riverside County Department of Industrial Hygiene were utilized for noise modeling. The City of Desert Hot Springs does not have vehicle/truck mixes or Day/Evening/Night (D/E/N) splits published for use in acoustical studies. Existing Plus Project vehicle mixes were calculated by adding the proposed project trips to existing conditions. FHWA spreadsheets are included in Appendix E.

SOUNDPLAN NOISE MODEL

The SoundPLAN acoustical modeling software was utilized to model project operational worst-case stationary noise impacts from the proposed project to adjacent sensitive uses (e.g., residences). SoundPLAN is capable of evaluating stationary noise sources (e.g., parking lots, heating and ventilation units (HVAC), drive-thru menus, carwash equipment, vacuums, etc.). The SoundPLAN software utilizes algorithms (based on the inverse square law) to calculate noise level projections. The software allows the user to input specific noise sources, spectral content, sound barriers, building placement, topography, and sensitive receptor locations. In addition to the information provided below, noise modeling input and outputs assumptions are provided in Appendix F.

Peak hour operational noise levels were modeled utilizing representative sound levels in the SoundPLAN model. Modeled noise sources include power plant equipment, loading and unloading activities, parking lot noise, and HVAC equipment.

Power Plant Equipment Noise

Plans detailing the proposed equipment and sound power levels for the proposed power plant are provided in Appendix F. In order to estimate exterior noise levels associated with equipment located inside a structure and/or below ground, the sound power level, associated with the loudest above ground equipment (85 Lw) minus 20 dB (to account for the attenuation provided by the structure and parapets) was applied to the outside

walls of all of the proposed power plant buildings. This same methodology was also applied to a horizontal plane at the elevation of the highest equipment.

Parking Lot Noise /Cargo Loading/Unloading

Typical parking lot noise includes car doors slamming, engines starting-up, alarm activation and car pass-by's. Loading and unloading activities associated with the proposed project are expected to include the loading and unloading of pallets and smaller packages. Parking lot noise and cargo loading/unloading was calculated using SoundPLAN a SoundPLan noise reference spectral data and a representative noise level of 60 dB Leq / square meter.

Mechanical Equipment (HVAC Units) Noise

A noise reference level of 67.7 dBA at 3 feet (sound power level of 78.7 dB) was utilized to represent rooftop 5 Ton Carrier HVAC units.[1] A rooftop HVAC plan is not available at the time of this analysis so the exact location and number of units per building were estimated. A total of 42 rooftop units were modeled on the proposed rooftops. The noise source height for each HVAC unit was assumed at one (1) meter above the roof top. Roof tops are assumed to be approximately 18 feet above grade. The power plant structures were modeled at a height of 55 feet above grade.

[1] MD Acoustics, LLC Noise Measurement Data for RTU –Carrier 50TFQ0006 and car alarm.

6. IMPACT ANALYSIS

This impact discussion analyzes the potential for project construction noise and operational noise to cause an exposure of person to or generation of noise levels in excess of established City of Desert Hot Springs noise standards related to construction noise, transportation, and stationary related noise impacts both to the proposed project and caused by the proposed project.

IMPACTS RELATED TO CONSTRUCTION NOISE

Construction noise varies depending on the construction process, type of equipment involved, location of the construction site with respect to sensitive receptors, the schedule proposed to carry out each task (e.g., hours and days of the week) and the duration of the construction work. Development of the proposed project will generally be completed in four phases, grading, facility construction, paving, and application of architectural coatings.

Typical noise sources and noise levels associated with construction are shown in Table 4. Site grading would generate the loudest noise levels. A worst-case construction noise scenario was modeled using the Road Construction Noise Model (RCNM) provided by the FHWA assuming the use of a grader, two backhoes, a dozer, scraper, and a water truck (modeled as a dump truck). All equipment was modeled operating simultaneously at staggered distance between 25 and 350 feet from the property line. The RCNM modeling did not take into account any possible shielding affects associated with existing or proposed intervening structures or topography and therefore represents a worst-case scenario. Modeling input and output data are included in Appendix D.

Worst-case construction noise levels could reach 87.2 dBA L_{eq} and 91.0 dBA L_{max} at the property line of the proposed project. The nearest sensitive receptor is located approximately 270 feet southeast of the proposed project's southern property line. Project construction noise levels may reach up to 63.5 dBA L_{eq} and 66.9 dBA L_{max} at this receptor. These noise levels will substantially exceed ambient noise levels and may temporarily annoy adjacent and nearby residents. However, compliance with City Ordinance 9.04.030 will limit impacts to day-time hours and avoid nighttime and early morning impacts when people are generally more sensitive to noise. Implementation of Mitigation Measures 1-5 in Section 7 of this report will further reduce construction noise levels during the day.

NOISE IMPACTS TO OFF-SITE RECEPTORS DUE TO PROJECT GENERATED TRIPS

The proposed project is expected to generate 3,665 passenger car equivalent trips per day (ADT).[2] A worst-case project generated traffic noise level was modeled utilizing the FHWA Traffic Noise Prediction Model - FHWA-RD-77-108. Traffic noise levels were calculated at 50 feet from the centerline of the analyzed roadway. The modeling is theoretical and does not take into account any existing barriers, structures, and/or topographical features that may further reduce noise levels. Therefore, the levels are shown for comparative purposes only to show the difference in with and without project conditions. Roadway input parameters including average daily traffic volumes (ADTs), speeds, and vehicle distribution data is shown in Table 5. The potential off-site noise impacts caused by an increase of traffic from operation of the proposed project on the nearby roadways were calculated for the following scenarios:

[2] Per the most recent Traffic Impact Analysis (TIA) prepared for the proposed project (Ganddini Group, Inc. May 2019). The TIA was based on a previous version of the proposed site plan that included 364,180 square feet of general light industrial use and 920,000 square feet of industrial park (cannabis activity) use for a total building square footage of 1,284,180 square feet. Therefore, the off-site traffic analysis provided in this report is conservative and shows a worst-case analysis as the general light industrial and industrial park square footages have since been decreased to 236,180 square feet of general light industrial uses and 761,770 square feet of industrial park (cannabis activity) use. The square footage of the Power Reclamation Facility buildings equals the square footage reduction of the industrial uses.

Existing Year (without Project): This scenario refers to existing year traffic noise conditions and is demonstrated in Table 5.

Existing Year (With Project): This scenario refers to existing year plus project traffic noise conditions and is demonstrated in Table 5.

For off-site project generated noise, increases in ambient noise along affected roadways due to project generated vehicle traffic is considered substantial if they result in an increase of at least 3 dBA CNEL and: (1) the existing noise levels already exceed the applicable land use compatibility standard for the affected sensitive receptors set forth in the City's General Plan; or (2) the project increases noise levels by at least 3 dBA CNEL and raises the ambient noise level from below the applicable standard to above the applicable standard.

As shown in Table 5, measured and modeled existing traffic noise levels range between 60.9-80.0 dBA CNEL and the modeled existing plus project traffic noise levels range between 62.7-80.0 dBA CNEL at 50 feet from the centerline of each road segment.

All modeled roadway segments are anticipated to change the noise a nominal amount (between approximately 0.04 to 1.83 dBA CNEL). Therefore, a change in noise level would not be audible and would be considered less than significant. No mitigation is required.

NOISE IMPACTS TO OFF-SITE RECEPTORS DUE TO ON-SITE OPERATIONAL NOISE

The operational activities associated with the proposed project were modeled using the SoundPLAN noise model to assess potential noise impacts to nearby single-family detached residential dwelling units. Specifically, these activities include power plant equipment noise, parking lot noise, heating and air conditioning units (HVAC), and loading and unloading. Modeling parameters are discussed in Section 5 of this report. Very conservative modeling assumptions were made. All noise sources were assumed to be in operation continuously.

Land zoned for open space and conservation borders the site to the west; land zoned for light industrial development borders the site to the north and south, and for part of the eastern project boundary. Land adjacent to the northeast corner of the project site is zoned for rural desert residential land uses. There are existing single-family residential land uses in the general vicinity but not immediately adjacent to the project site. These have been identified as receivers on Figures 6.

As shown in Table 6, existing measured noise levels at nearby sensitive receptors range between 36.4 and 44.8 dBA L_{eq}, and modeled project operational noise levels are expected to range between 30.0 and 43.0 dBA L_{eq}. Project operations will not result in substantial increases in ambient noise levels.

As shown in Figures 6 and 7 modeled exterior project operational noise levels range between 30.3 and 52.8 dBA L_{eq} in the project vicinity and is unlikely to exceed the City's exterior noise criteria of 65 dBA or the City's interior noise criteria of 45 dBA Leq. Typical residential construction provides 15 dB of reduction with a windows open condition and 20 dB of reduction with a windows closed condition. This impact is less than significant.

Consistency with Applicable Standards

Power plant, parking lot, HVAC and loading and unloading activities are not expected to exceed the City's noise level standard for residential properties of 65 dBA L_{eq} at any existing residential land uses. Operational noise impacts would be less than significant. No mitigation measures are required.

VIBRATION IMPACTS

This impact discussion analyzes the potential for the proposed project to cause an exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels. The City of Desert Hot Springs Municipal Code Section 17.40.300 prohibits vibration which is discernible beyond the boundary line of any property.

There are several types of construction equipment that can cause vibration levels high enough to annoy persons in the vicinity and/or result in architectural or structural damage to nearby structures and improvements. For example, as shown in Table 7, a vibratory roller could generate up to 0.21 PPV at a distance of 25 feet; and operation of a large bulldozer (0.089 PPV) at a distance of 25 feet (two of the most vibratory pieces of construction equipment). Groundborne vibration at sensitive receptors associated with this equipment would drop off as the equipment moves away. For example, as the vibratory roller moves further than 100 feet from the sensitive receptors, the vibration associated with it would drop below 0.0026 PPV. It should be noted that these vibration levels are reference levels and may vary slightly depending upon soil type and specific usage of each piece of equipment.

Annoyance to Persons

The primary effect of perceptible vibration is often a concern. However, secondary effects, such as the rattling of a china cabinet, can also occur, even when vibration levels are well below perception. Any effect (primary perceptible vibration, secondary effects, or a combination of the two) can lead to annoyance. The degree to which a person is annoyed depends on the activity in which they are participating at the time of the disturbance. For example, someone sleeping or reading will be more sensitive than someone who is running on a treadmill. Reoccurring primary and secondary vibration effects often lead people to believe that the vibration is damaging their home, although vibration levels are well below minimum thresholds for damage potential. (California Department of Transportation, 2020)

As shown in Table 8, vibration becomes distinctly perceptible to people in buildings at a PPV of 0.04.

At 270 feet, which is the distance to the closest off-site building, the single-family residential use to the south, use of a vibratory roller would be expected to generate a PPV of 0.006 and a bulldozer would be expected to generate a PPV of 0.003. Use of either a vibratory roller or a bulldozer would not be considered annoying to nearby sensitive receptors.

Furthermore, at 480 feet, which is the distance to the next closest off-site building, the industrial building to the west, use of a vibratory roller would be expected to generate a PPV of 0.002 and a bulldozer would be expected to generate a PPV of 0.001. Use of either a vibratory roller or a bulldozer would not be considered annoying to nearby sensitive receptors.

Architectural Damage

Vibration generated by construction activity generally has the potential to damage structures. This damage could be structural damage, such as cracking of floor slabs, foundations, columns, beams, or wells, or cosmetic architectural damage, such as cracked plaster, stucco, or tile. (California Department of Transportation, 2020)

Table 9 identifies a PPV level of 0.25 as the threshold at which there is a risk to “architectural” damage to historic and some old buildings. Temporary vibration levels associated with project construction would be less than significant. No mitigation is required. Vibration worksheets are provided in Appendix G.

*RMS velocity in decibels, VdB re 1 micro-in/sec

Table 8
Guideline Vibration Annoyance Potential Criteria

Human Response	Maximum PPV (in/sec)	
	Transient Sources	Continuous/Frequent Intermittent Sources
Barely perceptible	0.04	0.01
Distinctly perceptible	0.25	0.04
Strongly perceptible	0.9	0.10
Severe	2.0	0.4

Notes:
Source: California Department of Transportation. Transportation and Construction Vibration Guidance Manual, Chapter 7 Table 20, April 2020.

(1) Transient sources create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory

Table 9
Guideline Vibration Damage Potential Threshold Criteria

Structure Condition	Maximum PPV (in/sec)	
	Transient Sources	Continuous/Frequent Intermittent Sources
Extremely fragile historic buildings, ruins, anceint monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial buildings	2.0	0.5

Notes:

Project Operational Noise Contour Peak Hour (Leq)

7. MEASURES TO REDUCE IMPACTS

CONSTRUCTION MITIGATION MEASURES

In addition to adherence to the City of Desert Hot Springs's policies found in the Noise Element and Municipal Code limiting the construction hours of operation, the following measures are recommended to reduce construction noise and vibrations, emanating from the proposed project:

1. During all project site excavation and grading on-site, construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturer standards.

2. The contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the project site.

3. Equipment shall be shut off and not left to idle when not in use.

4. The contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise/vibration sources and sensitive receptors nearest the project site during all project construction.

5. Jackhammers, pneumatic equipment and all other portable stationary noise sources shall be shielded and noise shall be directed away from sensitive receptors.

APPENDIX A

LIST OF ACRONYMS

Term	Definition
ADT	Average Daily Traffic
ANSI	American National Standard Institute
CEQA	California Environmental Quality Act
CNEL	Community Noise Equivalent Level
D/E/N	Day / Evening / Night
dB	Decibel
dBA or dB(A)	Decibel "A-Weighted"
dBA/DD	Decibel per Double Distance
dBA L_{eq}	Average Noise Level over a Period of Time
EPA	Environmental Protection Agency
FHWA	Federal Highway Administration
L_{02},L_{08},L_{50},L_{90}	A-weighted Noise Levels at 2 percent, 8 percent, 50 percent, and 90 percent, respectively, of the time period
DNL	Day-Night Average Noise Level
$L_{eq(x)}$	Equivalent Noise Level for '"x" period of time
L_{eq}	Equivalent Noise Level
L_{max}	Maximum Level of Noise (measured using a sound level meter)
L_{min}	Minimum Level of Noise (measured using a sound level meter)
LOS C	Level of Service C
OPR	California Governor's Office of Planning and Research
PPV	Peak Particle Velocities
RCNM	Road Construction Noise Model
REMEL	Reference Energy Mean Emission Level
RMS	Root Mean Square

APPENDIX B

DEFINITIONS OF ACOUSTICAL TERMS

Term	Definition
Ambient Noise Level	The all-encompassing noise environment associated with a given environment, at a specified time, usually a composite of sound from many sources, at many directions, near and far, in which usually no particular sound is dominant.
A-Weighted Sound Level, dBA	The sound level obtained by use of A-weighting. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear.
CNEL	Community Noise Equivalent Level. CNEL is a weighted 24-hour noise level that is obtained by adding five decibels to sound levels in the evening (7:00 PM to 10:00 PM), and by adding ten decibels to sound levels at night (10:00 PM to 7:00 AM). This weighting accounts for the increased human sensitivity to noise during the evening and nighttime hours.
Decibel, dB	A logarithmic unit of noise level measurement that relates the energy of a noise source to that of a constant reference level; the number of decibels is 10 times the logarithm (to the base 10) of this ratio.
DNL, Ldn	Day Night Level. The DNL, or Ldn is a weighted 24-hour noise level that is obtained by adding ten decibels to sound levels at night (10:00 PM to 7:00 AM). This weighting accounts for the increased human sensitivity to noise during the nighttime hours.
Equivalent Continuos Noise Level, L_{eq}	A level of steady state sound that in a stated time period, and a stated location, has the same A-weighted sound energy as the time-varying sound.
Fast/Slow Meter Response	The fast and slow meter responses are different settings on a sound level meter. The fast response setting takes a measurement every 100 milliseconds, while a slow setting takes one every second.
Frequency, Hertz	In a function periodic in time, the number of times that the quantity repeats itself in one second (i.e., the number of cycles per second).
L_{02}, L_{08}, L_{50}, L_{90}	The A-weighted noise levels that are equaled or exceeded by a fluctuating sound level, 2 percent, 8 percent, 50 percent, and 90 percent of a stated time period, respectively.
L_{max}, L_{min}	L_{max} is the RMS (root mean squared) maximum level of a noise source or environment measured on a sound level meter, during a designated time interval, using fast meter response. L_{min} is the minimum level.
Offensive/ Offending/ Intrusive Noise	The noise that intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of sound depends on its amplitude, duration, frequency, and time of occurrence, and tonal information content as well as the prevailing ambient noise level.
Root Mean Square (RMS)	A measure of the magnitude of a varying noise source quantity. The name derives from the calculation of the square root of the mean of the squares of the values. It can be calculated from either a series of lone values or a continuous varying function.

APPENDIX C

NOISE MEASUREMENT FIELD WORKSHEETS

Noise Measurement
Field Data

Project Name: DHS 109 Power Plant Project, City of Desert Hot Springs. **Date:** August 10, 2020

Project #: JN 19273

Noise Measurement #: STNM1 Run Time: 15 minutes (1 x 15 minutes) **Technician:** Ian Gallagher

Nearest Address or Cross Street: 16550 West Drive, Deset Hot Springs, California.

Site Description (Type of Existing Land Use and any other notable features): Project Site: Vacant land with 16th Ave to south, Atlantic Ave to east, 15th Ave to north, & drainage channel to west. Noise Measurement Site: West Drive and a Single-family dwelling unit to east, vacant land surrounding.

Weather: Sunny, clear blue skies, hot. **Settings:** SLOW FAST

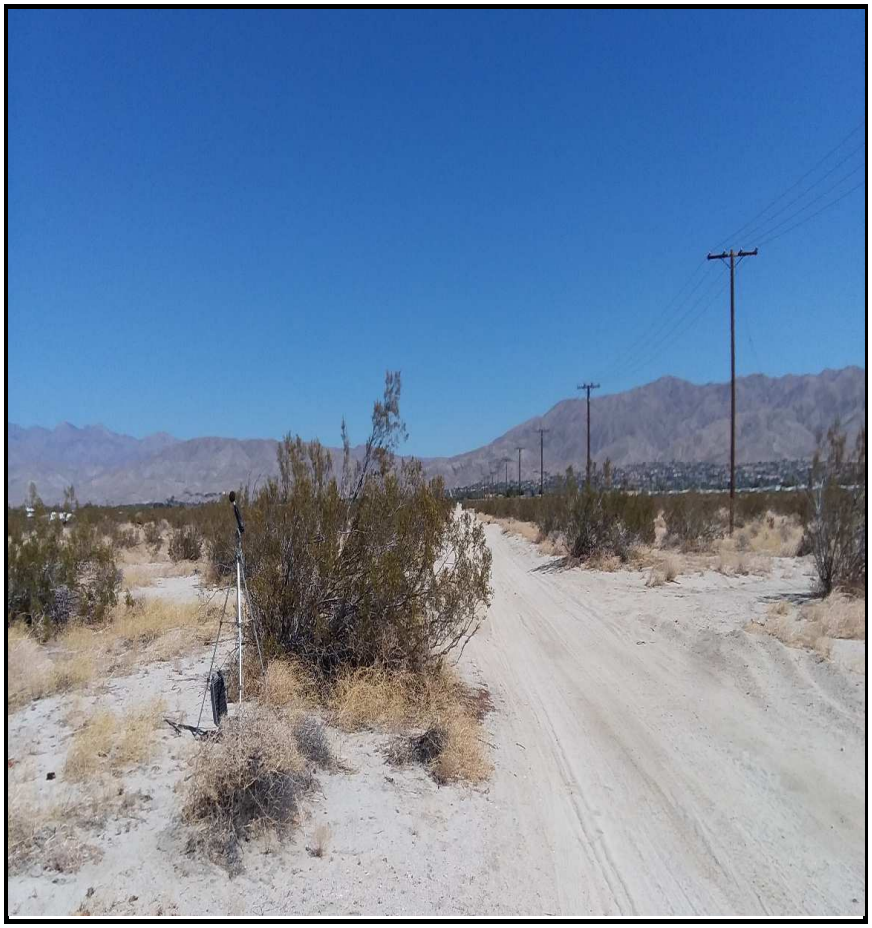
Temperature: 99 deg F **Wind:** 5-10mph **Humidity:** 14% **Terrain:** Flat

Start Time: 10:44 AM **End Time:** 10:59 AM **Run Time:**

Leq:	37.2	dB
Lmax	56.8	dB
L2	44.3	dB
L8	38.8	dB
L25	34.5	dB
L50	32.0	dB

Primary Noise Source: Wildlife, bird noises, bird song, day crickets. Breeze blowing through desert shrubbery.

Secondary Noise Sources: Slight traffic ambiance from vehicles traveling on Palm Drive and Dillon Road. Distant jet and propeller air traffic.



NOISE METER:	SoundTrack LXT Class 1	**CALIBRATOR:**	Larson Davis CAL250
MAKE:	Larson Davis	**MAKE:**	Larson Davis
MODEL:	LXT1	**MODEL:**	Cal 250

Noise Measurement
Field Data

Project Name: DHS 109 Power Plant Project, City of Desert Hot Springs. **Date:** August 10, 2020

Project #: JN 19273

Noise Measurement #: STNM4 Run Time: 15 minutes (1 x 15 minutes) **Technician:** Ian Gallagher

Nearest Address or Cross Street: West of Little Morongo Rd & Vermillion Dr, Lat/Long: 33°55'57.76"N 116°32'1.74"W

Site Description (Type of Existing Land Use and any other notable features): Project Site: Vacant land with 16th Ave to south, Atlantic Ave to east, 15th Ave to north, & drainage channel to west. Noise Measurement Site: Vermillion Drive north with vacant land further north, vacant land to east & south, & a single-family residential use to west.

Weather: Sunny, clear blue skies, hot. **Settings:** SLOW FAST

Temperature: 105 deg F **Wind:** 10-15mph **Humidity:** 9% **Terrain:** Flat

Start Time: 1:43 PM **End Time:** 1:58 PM **Run Time:**

Leq: 40.4 dB

Lmax 53 dB

L2 47.1 dB

L8 43.1 dB

L25 40.7 dB

L50 38.3 dB

Primary Noise Source: Wildlife, bird noises, bird song, day crickets. Breeze blowing through desert shrubbery.

Secondary Noise Sources: Slight traffic ambiance from vehicles traveling on Little Morongo Rd & Dillon RD. Distant jet and propeller air traffic.

NOISE METER:	SoundTrack LXT Class 1	**CALIBRATOR:**	Larson Davis CAL250
MAKE:	Larson Davis	**MAKE:**	Larson Davis
MODEL:	LXT1	**MODEL:**	Cal 250
